The most prevalent form of food sacrifice is the offering of food to ancestors, which takes place daily at millions of home altars in China, Korea, and Japan, under the influence of Confucian and Shintō traditions. Practitioners of the Yoruba and other African traditions also give food and drink to ancestors, as the ancient Greeks, Romans, and Egyptians did in their time. The Shintō priests of Japan offer food sacrifices—clean, fresh whole foods, fish, and fruits and rice—to the *kami*, or divinities who are said to inhabit eight million places in the islands of Japan. Regular worship takes place at striking waterfalls, impressive rocks, and dignified trees where the *kami* are believed to dwell; along with presentations of food, petitions from local people are read to the *kami*. At the center of the Shintō system are offerings of rice planted by the emperor to Amaterasu, the goddess of the sun and ancestor of the imperial house.

FASTING AND DIETING. One of the most universal of religious practices, fasting can be done for reasons that range from repentance for sins to the cultivation of mystical experience. For Muslims, fasting during the month of Ramaḍān stands as the fourth among five pillars of Islam. Muslims may not eat, drink, smoke, or engage in sex between sunrise and sunset during the month of Ramaḍān; those who are sick or traveling are supposed to fast an equal number of days at another time. The fast commemorates the month in which the first revelations of the Qurʾān were given to Muḥammad; Muslims often teach that the hunger and thirst of this month makes them more sensitive to the needs of the poor and more aware of their dependence on God.

Jews undertake two briefer, but more intense fasts, also abstaining from drink and sex as well as from food: from sunset to the next sunset on the Day of Atonement, Yom Kippur, which completes the New Year’s holiday in the fall, and during the summer on Tisha B’Av, to commemorate the destruction of the Temple. Roman Catholics and Orthodox Christians fast for forty days called Lent, between Ash Wednesday and Easter, every spring; among Catholics, the rules of this fast have been relaxed in recent years. Lent involves no periods of complete denial of food and drink, but only abstinence from meat on certain days and a commitment to eat less every day. Among the devout, there is a tradition of voluntarily giving up a favorite food or drink, both to repent for sin and to provide money for charity. A celebration called Mardi Gras (French for “fat Tuesday”) or Carnival often precedes the beginning of Lent, especially in Latin countries.

In many religions, monks and nuns and ascetics use restricted diets as a means to heighten awareness in prayer or meditation and to lessen the passions of the body. Under the Christian Rule of St. Benedict, each monk was allowed one

pound of bread per day and a pint of wine, but meat was not recommended except for the sick. Monks in Thailand do not eat after noon, in imitation of the Buddha.

Many holidays that involve fasting from grain and beans for periods of two or three days punctuate the Hindu calendar. On those days, Hindus may subsist on milk and fruits that have become *prasāda* by being offering at a temple. In the twentieth century, Mahatma Gandhi added a political dimension to the Hindu tradition of fasting by his hunger strikes, which Gandhi employed both in order to convince the British to set India free and to convince the people of India to stop a religious war between Hindus and Muslims. Going beyond politics to spirituality, Gandhi taught that people should always eat according to a standard of “meagerness,” keeping a perpetual fast in which they took food as medicine, in the interests of promoting clear thinking. Calling a “full” meal “a crime against God and man,” Gandhi urged his followers not to allow food to make them sensual.

Late in the twentieth century, the rise of industrialized food production and marketing led to an epidemic of obesity, especially in the United States, which led in turn to a proliferation of diet plans and programs. Many of these programs take on spiritual connotations. Compulsions to diet, in the forms of anorexia and bulimia, have killed many young women and attracted attention from historians of culture. A historian of Christianity, Caroline Walker Bynum, pointed out that medieval ascetics like Catherine of Siena, though she may have killed herself with fasting, did so in order to gain power and control, while modern anorexics are driven by social pressure to their unhealthy behavior.

THEORETICAL PERSPECTIVES. In an attempt to make sense out of the array of food customs that have been documented in both ancient and modern societies at all stages of their development, scholars have traveled many different roads seeking common elements that would justify the organization of food customs into intelligible categories. For example, writers since Moses Maimonides (d. 1204) have suggested that hygiene motivated the Jewish food taboos. Maimonides said that pork contained too much moisture and so caused indigestion and denounced the filthiness of pigs; moderns have pointed to the danger of trichinosis from undercooked pork. The facts that parasitic diseases were not recognized until the nineteenth century and that permitted foods may also bear disease work against this perspective, though the experience of consequences as a factor in food taboos also forms part of an evolutionary perspective that could have some validity.

On the other hand, China developed a system of food wisdom even more elaborate than that of the Jews, and just as concerned with health and with spiritual well-being, without any taboos at all. As anthropologist Marvin Harris has said, the Jewish law could have completely eliminated trichinosis by outlawing undercooked pork. Clearly, the social structure and circumstances of each society need to be considered in understanding how the world’s religions regulate food.

In *Purity and Danger* (1966), Mary Douglas focused on spiritual pollution as a common element in food taboos. Following the perspective of Émile Durkheim, Douglas argued that religions provide their adherents with a sense of identity. Identity is constructed through patterns of social behavior, such as those involved in the production, preparation, and consumption of food. Cleanliness, in this context, becomes an attribute of anything that strengthens group identity by contributing to the order of the universe. Applying this perspective to Judaism, Douglas saw the law of Moses as dividing the world into three types of creatures: those whose natural environment is either land, sea, or sky (see *Lev. 12* and the creation story of *Genesis*). Creatures that seem “mixed,” such as flightless birds or animals that live in the sea without fins (or with legs, like lobsters and crabs), are taboo.

Following this reasoning, pork becomes “unclean” because it violates another category, that dividing Israel from its neighbors. Douglas noted the command to be holy that surrounded the passages on food in the Torah, and she observed that the root meaning of the Hebrew *kadosh*, translated “holiness,” is “to set apart or to cut off.” According to the Torah, holiness is an attribute of God, and God wants Israel to be holy; therefore, Israelites must not eat the pork (or many other foods) that their Canaanite and Egyptian neighbors ate. The prohibition of pork would then be one of many laws, such as those prohibiting intermarriage with Canaanites or prohibiting any image of Israel’s God, that were meant to keep the identity of Israel cleanly defined, or “holy.” Though this argument has some force, it remains true that Israel borrowed many things, such as the architecture of the Temple and the words of many Psalms, from Canaanite models. The modern sense of ancient Israel’s uniqueness may reveal as much about the work of later rabbis and the need of Christians to find heroic origins for their own religion as it does about the reasons for ancient Israelite law.

Observing that Muslims also do not eat pork, though they do eat camels and other animals prohibited by the Torah, Marvin Harris offered an evolutionary perspective on this law, contending that religions tend to promote behaviors that help their followers to survive. At first this would seem paradoxical with regard to a pork taboo, because the pig is a very efficient source of protein, converting food to meat much more quickly than other animals. However, Harris noted, in arid climates the pig becomes very expensive with regard to water; he finds that the Christian-Muslim divide in the Balkans corresponds to a divide between heavily forested land, friendly to pigs, and dry regions. Harris used the same reasoning to explain why the Aryans, who ate cattle before entering the dry Indian subcontinent, came to revere “mother cow” and to use her only for plowing and hauling and for milk as Hinduism developed.

Psychoanalytic explanations for food customs have begun from the infant–mother bond in nursing and the instinctual relations that this may establish between eating and sex. Many cultures, from the Lele of West Africa to modern

Orthodox Jews, have forbidden women from cooking during menstruation; the Bemba of central Africa keep children from eating food prepared by those who have not purified themselves by a ritual after sex. Perhaps the command of the Torah not to boil a kid in its mother's milk arose in order to forbid a kind of culinary incest that Canaanites practiced to promote fertility. Japanese menus still offer a "mother-child udon," or bowl of noodles that contains both chicken and egg, and the title still makes some diners cringe.

Seeking a psychological root for food rules in the realms of cognition and linguistics, Claude Lévi-Strauss proposed that all thought and language begins with binary oppositions such as self/other, human/animal, and nature/culture. In the domain of food, objects are classified according to the binary of cooked/rotten, between which the midpoint is raw. Lévi-Strauss classified the processes of food preparation, beginning with roasting, boiling, and smoking, along the continuum between cooked and rotten. He concluded that roasted food remained most similar to the raw and therefore was understood as possessing the most natural strength and prestige, while boiled food stood closer to rotten, weaker but more civilized, because boiling required a pot rather than a spit, and also more closely associated with rebirth (as in the cauldron of immortality that appears in many cultures). Lévi-Strauss thought that processes like frying, baking, and smoking, with variation depending on oils and spices, could be located along the same continuum between cooked and rotten in every civilization.

Abandoning the quest for universal systems, such functional anthropologists as A. R. Radcliffe-Brown, Bronislaw Malinowski, and Franz Boas have emphasized that every social group must be understood on its own terms, and that food forms part of a system that both expresses and reinforces the roles people play in helping the group to function. For example, they would say, women who contribute large dowries and exercise authority tend to eat with men of the same social status and to eat the same foods, while women in polygamous families who exercise no authority eat with the children and eat different foods. From this perspective, taboos on menstruating women preparing food arise from the definition of women by their availability for sex and for childbirth. Taboos on specific foods may reflect the low status (or the status as enemies) of people who possess that food.

Anthropologists have also observed symbolic uses of food that seem suitable to societies at various levels of social and technological development. Research has revealed, for example, that hunter-gatherer societies have much in common, whether they live in desert regions, the Arctic, India, or Africa. According to Joseph Campbell, one of the earliest analysts of world mythologies, hunter-gatherers tend to address prayer and sacrifice to a cosmic force (or a god) that stands apart, acting as master of the game animals. Campbell went on to say that when a group takes up agriculture, rituals and myths appear in which the cosmic force or god dwells within the object sacrificed, so that the sacrifice brings forth

its own effects. The development of large communities with formal political authority brings another stage, at which large festivals and more serious sacrifice (often demanding human victims) begins to be seen as necessary to renew the supply of food each year. The human sacrifices of ancient China before the Shang dynasty, of ancient Rome in the arenas, and of the Incas and Aztecs in America lend some plausibility to this view.

FOOD IN THE RECENT HISTORY OF RELIGIONS. Since the worldwide distribution of foods that began with Columbus after 1492, and especially since the emergence of the empirical science of chemistry around 1650, a revolution has taken place with regard to the values placed upon food, at least in the Western world. Before then, both life and digestion were thought of as processes that resembled cooking, and the foods considered best were those that had cooked longest, with the most complex sets of ingredients, so that they could balance the humors of the body. The blancmange and the puddings of England and France, served with cooked drinks and spiced wines, the moles and sauces of Latin America, and the samosas and curries of India survive from those days. But after the seventeenth century, fermentation became the model of life, and high value was placed on fresh and roasted foods that could spoil quickly. Roasted meats, salads, fruits, and clear or sparkling wines came to dominate the tables of the West.

The goal of diet wisdom shifted from maintaining balance to returning to nature. Sometimes food became the means to a spiritual goal, expressed in terms of returning to nature or even regaining the innocence of Eden. Especially in the United States and in England, partisans of "diet reform," a program that advocated whole-grain flour, a minimum of cooking, and often vegetarianism, attempted to engage the conscience of the Christian world. Religious leaders like Sylvester Graham, a former minister and inventor of Graham flour, and John Harvey Kellogg, physician and inventor of the corn flake, profoundly influenced eating habits. Whole denominations, such as Kellogg's Seventh-day Adventists, emerged to embrace vegetarianism. Pledges against all use of alcohol prevailed among the Methodists, Baptists, Mormons, Presbyterians, Congregationalists, and even some Roman Catholics of the United States, until the nation passed a constitutional amendment prohibiting alcohol in 1919. The failure of Prohibition did not end the connection between diet and righteousness for American Christians. As Daniel Sack has documented, the menus of church suppers shifted from steak, brandy, and cigars in the 1890s to a mixture of ethnic foods in the 1950s to tofu and sprouts in the 1970s and then to starvation dinners, dramatizing the problem of world hunger, in the 1990s.

FOOD AND SOCIAL JUSTICE. In the twentieth century, many Christians, especially in the United States and England, began to see food as a primary field of social action and ethical responsibility. The Salvation Army, the Catholic Worker movement, the Universal House of Prayer, and many indi-

vidual churches made soup kitchens and pantries for the poor into the center of their mission. Such organizations as CARE, Oxfam, and Bread for the World—a specifically Christian lobbying group, incorporated in Washington to influence U.S. policy—tried to ameliorate the unequal distribution of food in the world. Theorists including Arthur Simon of Bread for the World and Francis Moore Lappe, author of *Diet for a Small Planet*, argued that meat consumption stole grain from the starving and pointed out the inequities of a world market in which such food-exporting countries as the Philippines sent fruit to the United States while their own people starved. Several boycotts of food engaged religious groups and had clear effects: a boycott of California grapes in the 1960s helped to organize farmworkers; a boycott of Nestlé products in the 1980s modified the company's policy of promoting infant formula to women who could not get clean water; a boycott of Campbell's soup led to the company negotiating with its workers. Concern for animal rights led to a new kind of vegetarianism, in which people abstained from meat not because they were fasting or avoiding bad *karma*, but because industrial farm conditions seemed inhumane or because animals were seen as sentient beings whose right to live equaled that of a human.

GLOBALIZATION. The profusion of meat, potatoes, tomatoes, and corn from the Americas added new whole foods to the world's diet. Industrialization and modern transportation, refrigeration and freezing, petrochemical fertilizers, and hydrogenated fats and genetically modified crops have made vast resources available to the rich and the middle classes of all nations, while the world market in food has sometimes exacerbated inequities and hunger. Millions who once lived in stable, subsistence economies now work in industry for more money but run the risk of famine.

Resistance against and adaptation to globalization have sometimes taken religious forms. In 2003, U.S. military actions in the Muslim world sparked both a boycott of American products and the development of substitutes, such as Qibla Cola and Mecca Cola. Globalizing corporations have also shown a willingness to adapt to religious preferences: in India, McDonald's offered an extensive vegetarian menu, including the Maharaja Mac and eggless mayonnaise, prepared in separate kitchen areas by staff wearing green aprons. Even the nonvegetarian section served no beef but only chicken burgers and curry. Meanwhile in Israel, at the start of the twenty-first century, all 110 McDonald's guaranteed kosher beef, while seven were actually kosher restaurants, serving no dairy and closing on the Sabbath. Seventy-one McDonald's were operating in Saudi Arabia in the early twenty-first century, including two in Mecca, observing Muslim food laws. Both Detroit, Michigan, and Sydney, Australia, had *halāl* McDonald's, where potatoes are fried without animal fat and all meat is slaughtered by Muslim butchers. Increasing numbers of immigrants and people exploring their heritage in every part of the world have given evidence that food customs often provide the most enduring forms of religious practice.

FOOLS, HOLY SEE CLOWNS; DRAMA; HUMOR AND RELIGION

FORTUNA was the Latin (and perhaps also the Sabine) goddess of the incalculable element in life. Her name is derived from the Latin word *fors* (“luck”). Cults dedicated to various manifestations of Fortuna existed throughout Latium—attested at Tusculum, Signia, Cora, Ostia, and especially at Praeneste—as well as in Rome and Antium. Etruscan civilization also included worshipers of Fortuna; the Etruscans placed a great deal of importance on the idea of fate.

In Rome, Fortuna did not belong to the oldest stratum of cults traditionally connected with King Numa Pompilius. She is one of the Sabine divinities listed by Varro in his *De lingua Latina*. King Servius Tullius considered Fortuna to be his special patron and friend; consequently, he built two of the oldest temples dedicated to her in Rome. One of these temples, in the Forum Boarium, was associated with the temple of Mater Matuta; the other, on the right side of the Tiber River, was specifically known as Fanum Fortis Fortunae.

Scholars believe the sanctuary of Fortuna in the Forum Boarium dates back to the very beginning of urban life in Rome. Recent excavations have shown that sacred life in the Forum Boarium began around 575 BCE, when the first floor of the forum was laid. The ancient house of worship consisted solely of an open area with an altar in the center; the first actual temples identified with the temples of Mater Matuta and Fortuna were not built until the end of the sixth century BCE and later reconstructed by Camillus in 395 BCE.

Fortuna was also related to the goddesses of childbirth and fecundity, the Matralia, whose feast day was celebrated on June 11. Two other temples were dedicated to her in 293 BCE and 17 CE. In general, Fortuna appealed to the lower classes of Roman society, particularly to slaves; they considered her a benefactor, rather than a menace. The cult often prayed for fertility or for success in certain endeavors.

Married women worshiped Fortuna Muliebris, whose sanctuary was located at the fourth milestone on the Via Latina. She also played a part in the legend of Coriolanus, which attributed the founding of the temple to Coriolanus's mother and wife. On April 1, all women worshiped Fortuna Virilis, associated with Venus, by praying and taking ritual

baths in men's bathhouses. This goddess is known only from the *fasti* and literature, especially from accounts of the aforementioned particular rite; this custom must have occurred relatively recently, however, because public baths were built in Rome during the second century BCE. Originally, Fortuna Virilis probably was the guardian spirit of men, *viril*. In addition to protecting the sexuality of men, she was supposed to help women to obtain the men's love.

Most scholars doubt the existence of a special cult of Fortuna Virgo. According to Wissowa, the Fortuna of the Forum Boarium was indeed a women's deity, but Fortuna Virgo may be a later name. This goddess eventually came to be called *Virgo* or *Virginalis*, but only three ancient writers recorded the epithet.

Fortuna Equestris received a temple of her own in 173 BCE, after a victory of the Roman cavalry; similarly, a temple to “Fortune of this day” (Fortuna Huiusce Diei) celebrated the victory by Q. Lutatius Catulus at Vercellae in 101 BCE. Chapels and altars to Fortuna Bona, Fortuna Mala, Fortuna Dubia, Fortuna Publica, and others multiplied, along with dedications to the Fortuna of certain localities. These minor monuments took more notice of the negative aspects of Fortuna. Later imperial temples, constructed in Rome and elsewhere, connect Fortuna, always positively, with the emperors (Fortuna Augusta, Fortuna Redux).

The sanctuary of Fortuna Primigenia at Praeneste (modern-day Palestrina) presented Fortuna as *filia primigenia*, or “first daughter” (of Jupiter?), a most unusual notion in a Latin context. Scholars have speculated about a possible Indo-European, Etruscan, or Greek influence. In his *De divinatione*, Cicero adds to the confusion by describing the Fortuna of Praeneste as Jupiter's nurse. The building, excavated by Italian archaeologists, dates to approximately the second century BCE, but the cult itself, famous for its oracle, is certainly much older. After a period of friction with Roman authorities, the cult of Fortuna Primigenia was introduced from Praeneste to Rome toward the end of the Second Punic War, where it became very popular. The first temple to Fortuna Primigenia erected on the Quirinal was soon followed by two other temples built on the same hill. Another famous center of the cult of Fortuna with an oracle was located in Antium. Here, for unexplained reasons, people worshiped two Fortunas.

The diffusion of the cult of Fortuna throughout Italy and the Latin West was influenced by the corresponding Greek cult of Tyche. This connection is evident in the iconography of Fortuna, who is often represented, as was Tyche, as a standing woman with a rudder in her right hand and a cornucopia in her left hand. Furthermore, both Tyche and Fortuna were sometimes depicted as possessing several attributes of Isis. The influence of Tyche is also clear in literary texts (for instance, in works by Horace and Seneca) that try to clarify the nature of Fortuna. Whereas in cult, her most typical attributes—the cornucopia, the rudder, and the globe—symbolized Fortuna as the giver of material blessing

and as the arbiter of human destiny, in literature, her symbols accentuated fickleness and unreliability. Thus, the wheel was a common literary attribute of Fortuna, a symbol of her ever-changing nature. Other ways authors alluded to Fortuna's fickleness in literature included: portraying her as standing upon a stone or upon a sphere; as possessing wings, with which she could easily fly away; as roaming in the world without settling anywhere; and as expressing her ever-shifting favor or disfavor by her countenance, her smile, and her thundering voice. Goddess Fortuna was occasionally identified with Nemesis and associated with Felicitas and Bonus Eventus.

Two varieties of Fortuna came to have a great importance during the Roman Empire: Fortuna Augusta or Augusti, the guardian spirit of the Emperor, an equivalent of his Genius; and Fortuna Redux, the power that guarded the return of the Emperor from dangerous foreign journeys. Both deities were recorded on numerous votive inscriptions and coins; the honor paid to Fortuna Augusta and Fortuna Redux expressed loyalty to the state and to the reigning emperor. Though Christianity as a doctrine was incompatible with the pagan idea of Fortuna, the entity did not quite disappear; rather, she evolved into both an inherited literary figure and a pagan deity.

ARNALDO MOMIGLIANO (1987)
CHARLES GUITTARD (2005)

FORTUNE SEE CHANCE; FATE

FOUCHER, ALFRED (1865–1952), was a French Indologist and specialist in Buddhist archaeology. Alfred C. A. Foucher studied in Paris, under the guidance of Sylvain Lévi, and in India (1895–1897), where he combined philosophical training at the Sanskrit College of Banaras with "militant" archaeology through extensive pilgrimages to several places of historical interest.

Foucher was a pioneer in the area of religious archaeology with his study of the relation between artistic representations and their doctrinal and literary background. His field of predilection was the area known as Gandhara (roughly, those portions of Afghanistan and Pakistan between the Hindu Kush mountains and the Indus River), where the Indian and Greek worlds had been in contact at around the beginning of the common era. The publication of Foucher's *L'art gréco-bouddhique du Gandhâra: Étude sur les origines de l'influence classique dans l'art bouddhique de l'Inde et de l'Extrême-Orient* extended over half a century and comprised three volumes: volume 1, *Introduction; Les édifices; Les bas-reliefs* (1905); volume 2, *Images* (1922); and volume 3, *Additions et corrections; index* (1951). Though criticized for some of its conclusions regarding chronology and style, this work remains the most accurate sourcebook on early Buddhist iconography.

Foucher's interest in Gandhara received a new impulse when Afghanistan opened its frontiers to archaeological investigation. Foucher, who was then working at the Archaeological Survey of India (1919–1921), was immediately *à pied d'œuvre* as the first director of the Délégation Archéologique Française en Afghanistan (1921–1925). In Afghanistan, as previously in Northwest India, his habit of methodically following the itinerary of Xuanzang, his natural gift for observation, and his archaeological insight led Foucher to remarkable discoveries in Haḍḍa, Kāpīṣī-Bēgrām, Bāmiyān, Balkh, and the Lampaka-Laghman region. The gist of these discoveries is expressed in a work accomplished with the collaboration of his wife, Eugénie Bazin-Foucher, *La vieille route de l'Inde de Bactres à Taxila* (2 vols., 1942–1947). Foucher also collaborated with John Marshall in editing the three huge volumes of *The Monuments of Sanchi* (1939), a work focused on the main Buddhist site of central India.

The clear-sightedness of Foucher as an archaeologist was no doubt the result of his deep penetration of the Indian tradition. Foucher, who used old texts as guides in his archaeo-

logical researches, in turn used monuments for a better understanding of Buddhism and especially of its founder, Śākyamuni Buddha. Foucher's best-known book, *La vie du Bouddha* (1949; English trans., 1963) is, significantly, subtitled *D'après les textes et les monuments de l'Inde*. Foucher was aware of all the difficulties of such a biography. In 1894 he had translated from German into French Hermann Oldenberg's study of the Buddha's life (*Le Bouddha, sa vie, sa doctrine, sa communauté*, 2d ed., 1903), which remains the best "positive" history of the Buddha following the Pali sources. At the same time, Foucher was much in contact with Émile Senart, who had proposed a mythical interpretation of the life of the Buddha. In the 1930s, Foucher had also witnessed the brilliant attempt at a new interpretation of Buddhism through archaeology and sociology made by his young contemporary Paul Mus. It was only at the end of his life that Foucher's own biography of the Buddha came to maturation. This book shows the geographical (centers of pilgrimages) and historical (superposition of hagiographical patterns) influences on the tales surrounding Śākyamuni. It remains the most satisfactory approach toward the personality of the historical Buddha as he has been seen through the Asian tradition.

Though deeply original in his method and his achievements, Foucher cannot be isolated from a golden age of French philological studies of which he is a typical representative. Even if different in spirit, his *La vie du Bouddha* recalls the much earlier *Vie de Jésus* (1863) by Foucher's fellow Breton, Ernest Renan. Foucher's systematic inventory of architectural remains and iconographical documents as an approach to an understanding of Buddhism has a parallel in the encyclopedic research on Christian symbolism done by his contemporary Émile Mâle.

Besides his already mentioned sojourns in India and Afghanistan, Foucher lived for a time in French Indochina (1901 and 1905–1907), where he succeeded his friend Louis Finot as the director of the École Française d'Extrême-Orient, and in Japan (1925–1926), where he established with Sylvain Lévi the Maison Franco-Japonaise.

BIBLIOGRAPHY

In addition to the writings mentioned above, Foucher's *The Beginnings of Buddhist Art and Other Essays in Indian and Central-Asian Archaeology* (London, 1917) should be noted. Although outdated, it remains a testimony to his exactitude, clarity, and elegance. For bibliographic data, see Shinshō Hanayama's *Bibliography on Buddhism* (Tokyo, 1961); *Bibliographie bouddhique*, 32 vols., compiled by Marcelle Lalou (Paris, 1928–1967); and Henri Deydier's *Contribution à l'étude de l'art du Gandhâra* (Paris, 1950). A biographical sketch of Foucher can be found in Alfred Merlin's "Notice sur la vie et les travaux de M. Alfred Foucher," in *Académie des Inscriptions et Belles Lettres: Comptes rendus* (Paris, 1954), pp. 457–469.

HUBERT DURT (1987)

FOUNTAIN. The word *fountain* derives from the Latin *fons*, meaning "source." As physical phenomena serving as the material basis of hierophanies (appearances of the divine), fountains may be described as the flowing of pressurized water up and out through an aperture from some hidden depth below the earth's surface. As hierophanies, they manifest locally the flowing of diverse creative, recreative, or transformative potentialities from depths beyond the ordinary or profane plane of existence. There is no single sort of potentiality attributed in common to all sacred fountains in the world's religions, but a number of potentialities are severally attributed to them, for example, healing powers, oracular powers, rejuvenating powers, and so forth. Likewise, no single divinity is regarded as a manifestation common to all fountains; the various named and nameless gods, spirits, and nymphs of fountains are particular to individual instances. Furthermore, sacred significance is attributed seemingly no less to artificial than to naturally occurring fountains.

The typical attributes of fountains reflect diverse metaphoric images expressive of the principal water potentiality, the cosmogonic; cosmogonic water is viewed as pristine, as formless, as eternal, as receptive, as living, as chaotic. For example, the creative power of fountains can be understood as one manifestation of the world-creating power itself, and the water of fountains as homologous to the cosmogonic water from which creation arises and into which it dissolves, like the Babylonian waters of Apsu or the Vedic watery source of all things and all existence.

Some fountains are sacred as sources of divine power. In times of drought, for example, the priest of the god Zeus Lykaios in Arcadia cast an oak branch into the mountainside spring, activating the spring's power to make rain.

Again, some fountains restore to an original or pristine condition those who bathe in them or drink from their waters. It was thought, for instance, that when the goddess Hera or the members of her cult bathed in the Nauplian spring, they became virginal again. The pristine state is homologous to the virginal aspect of the cosmogonic waters before the creative act. Thus, fountains of youth manifest a forever self-renewing potentiality for creation. In Brahmanic legend the fountain of youth typically renews power or vigor, but it does not bestow immortality. However, in other legends immortality is granted. In the Greek romance of Alexander by Pseudo-Callisthenes, Alexander's cook accidentally discovers a fountain that bestows immortal life. In Islamic folklore, the figure Khidr is mentioned as the only being who gained immortality by drinking from the fountain of life, which represents the principle of eternal existence.

Some fountains function as principles or causes of life itself. For example, in the prophet Ezekiel's vision of Yahveh's regenerated Temple, a spring flows out from under the Temple. Its waters cause perpetually bearing fruit trees to spring up at once along its banks. This water demonstrates two additional potentialities attributed to certain sacred fountains, namely, healing and fructifying powers. "Fish will

be very plentiful, for wherever the water goes it brings health, and life teems wherever the river flows" (*Ez.* 47:1–12).

In Babylonian religious thought, Apsu, the water of creation, is called "house of wisdom," or the house of Ea, god of wisdom. Wisdom, supernatural insight, oracular vision, and poetic inspiration are other typical attributes of various sacred fountains. For example, the gods in Germanic mythology determine the world's fate beside the Spring of Mímir, and the Germanic tribes had "springs of justice" where justice was meted out. Among the Romans, the priestess of Carmentis sang of the newborn child's destiny after drinking from a spring, and likewise the Greek priestess of Apollo at Delphi delivered oracles after drinking from the Castalian Spring. The Greek muses, goddesses of inspiration, were originally nymphs connected with springs.

Finally, the dissolving power of a fountain's water, its chaotic quality, is the typical attribute manifested by both those fountains having the positive potential for sacred cleansing and also those bringing insanity or terrible loss. The Greek term *numpholēptos*, meaning "insane, senseless, beside oneself with fright," is related to the poetic word for water, *numphē*. Similarly, in Germanic folklore the female spirits of certain springs stole children or seduced their human lovers to destruction.

RICHARD W. THURN (1987)
Revised Bibliography

FOUR NOBLE TRUTHS. All strands of the Buddhist tradition recognize in the four noble truths (Skt., *catvāry āryasatyāni*; Pali, *cattāri ariyasaccāni*) one of the earli-

est formulations of the salvific insight gained by the Buddha on the occasion of his enlightenment. For the Theravāda tradition, the discourse on the four truths constitutes part of the first sermon of the Buddha, the *Dhammacakkappavattana Sutta*, delivered in the Deer Park near Banaras to his five original disciples. The standard formulaic enumeration of the four truths as found in this discourse is as follows:

This, monks, is the noble truth of *dukkha* ["suffering"]: birth is *dukkha*, old age is *dukkha*, disease is *dukkha*, dying is *dukkha*, association with what is not dear is *dukkha*, separation from what is dear is *dukkha*, not getting that which is wished for is *dukkha*; in brief, the five groups of grasping [i. e., the five *khandhas*; Skt., *skandhas*] are *dukkha*. And this, monks, is the noble truth of the uprising [*samudaya*] of *dukkha*: this craving, which is characterized by repeated existence, accompanied by passion for joys, delighting in this and that; that is to say, craving for sensual desires, craving for existence, craving for cessation of existence. And this, monks, is the noble truth of the cessation [*nirodha*] of *dukkha*: complete dispassion and cessation of craving, abandonment, rejection, release of it, without attachment to it. And this, monks, is the noble truth of the path [*maggā*] leading to the cessation of *dukkha*; just this Noble Eightfold Way; that is to say, proper view, proper intention, proper speech, proper action, proper livelihood, proper effort, proper mindfulness, proper concentration. (*Samyutta Nikāya* 5.420ff.)

These four noble truths (formulaically, *dukkha, samudaya, nirodha, magga*) constitute a "middle way" between rigorous asceticism and sensual indulgence. The twin foci of truths are craving (Skt., *trṣṇā*; Pali, *taṇhā*) and ignorance (*avidyā*), craving to hold that which is impermanent, grasping for substantiality where there is no abiding substance, and not knowing that this orientation inevitably yields unsatisfactoriness (Pali, *dukkha*; Skt., *duḥkha*). Hence the twin foci draw attention to the fundamental cause (*samudaya*) of *dukkha*, and meditation on *dukkha* leads to a discernment that craving and ignorance are its matrix.

The eightfold path, the fourth of the four noble truths, provides a means especially adapted to lead one into salvific insight, a way conforming completely to the Buddha's own salvific realization. In this sense, the eightfold path is the proper mode of religious living, one that subsumes ethics into soteriology.

Although some uncertainty remains among scholars as to whether the passage quoted above indeed represents the earliest formulation of the Buddha's teaching, in the early phase of the Buddhist tradition in India (the so-called Hīnayāna phase) the four noble truths played a major role in shaping the fundamental orientation to religious living on the part of Buddhists. Early Buddhist schools in India differed in their interpretations of the four noble truths, but uniformly regarded its underlying thematic structure as one informed by metaphors of healing: symptom-disease, diagnosis-cause, elimination of cause, treatment or remedy. With

the rise of the Mahāyāna tradition the four noble truths became less central as a fundamental statement of the life situation and one's mode of engagement in a soteriological process, but continued to be revered as a fundamental part of the Buddha's early teachings.

THERAVĀDA INTERPRETATIONS. The Theravāda Buddhist tradition is prevalent in contemporary Sri Lanka, Myanmar, and Thailand. For at least two millennia it has regarded the four truths as constitutive of its central soteriological doctrine. As a result, considerable effort has been expended in the tradition on its exegesis. In an extended discussion on the four noble truths, Buddhaghosa, in his fifth century CE classic, *Visuddhimagga* (The path of purity), comments at one point on the meaning of the term *sacca* ("truth"):

For those who examine [truth] closely with the eye of salvific wisdom [*paññā*], it is not distorted, like an illusion, equivocated, like a mirage, and of an undiscoverable inherent nature, like the self among sectarians, but, rather, it is the pasture of noble gnosis [*ñāna*] by means of its actual, undistorted, authentic condition. Just like [the characteristics of] fire, like the nature of the world, the actual undistorted, authentic condition is to be understood as the meaning of truth. (*Visuddhimagga* 16.24)

Among the many interpretations offered by Buddhaghosa for the existence of four, and only four, truths is the Buddha's realization that the evolution of suffering, its cause, the devolution of suffering, and *its* cause are fully comprehensive of an analysis of the human condition and the way to liberation through it. (See *Visuddhimagga* 16.27.) Other analyses of the four truths suggest that the first Truth relates to the basis of craving; the second, to craving itself; the third, to the cessation of craving; and the fourth, to the means to the cessation of craving. Similarly, the truths may be viewed as pertaining, respectively, to the sense of attachment, delight in attachment, removal of attachment, and the means to the removal of attachment. (See *Visuddhimagga* 16.27–28.) According to the *Dhammacakkappavattana Sutta*, the practitioner is to cultivate a fourfold awareness of the four truths in which *dukkha* is to be fully understood; the origin of *dukkha*, abandoned; *nirodha*, realized; and *magga*, cultivated. The Theravāda commentarial tradition has maintained that the soteriological moment arises in the simultaneity of this fourfold awareness. (See *Visuddhimagga* 22.92.)

Although the tradition continued to elaborate analyses of the four truths arranged according to various numerical configurations (most frequently with the number sixteen), it has held to the conviction that when the truths are fully penetrated and soteriologically known it is by one knowledge, through a single penetration, and at one instant. This knowledge of the four truths, they aver, is in and of itself salvific.

The Theravāda has continued to interpret the Eightfold Path as comprising three basic elements deemed integral to religious living at its fullest: *sīla* (Skt., *śīla*), or moral virtue; *samādhi*, or meditative concentration; and *paññā* (Skt.,

prajñā), or salvific wisdom. Proper view and intention are classed as salvific wisdom; proper speech, action, and livelihood are classed as expressions of moral virtue; and proper effort, mindfulness, and concentration are classed as forms of meditative concentration.

Finally, the tradition has utilized the notion of "emptiness" (Pali, *suññatā*; Skt., *śūnyatā*) in the analysis of the four noble truths. Buddhaghosa wrote:

In the highest sense, all the truths are to be understood as empty because of the absence of an experiencer, a doer, someone extinguished, and a goer. Hence this is said:

For there is only suffering, no one who suffers,
No doer, only the doing is found,
Extinction there is, no extinguished man,
There is the path, no goer is found.

Or alternatively,

The first pair are empty
Of stableness, beauty, pleasure, self;
Empty of self is the deathless state.
Without stableness, pleasure, self is the path.
Such, regarding them, is emptiness. (*Visuddhimagga* 16.90)

MAHĀYĀNA INTERPRETATIONS. Although the Theravāda tradition applied the notion of "emptiness" in negating permanence, abiding happiness, and substantiality as legitimate descriptions of sentient life, it is within the Mahāyāna that one finds emptiness as a designation of reality in the highest sense. As part of the general critique of "substantiality" carried out by the Prajñāpāramitā literature, even the four truths are declared void of real existence. In this analysis, suffering, the origin of suffering, the cessation of suffering, and the path to the cessation of suffering are themselves "empty."

In the *Saddharmapuṇḍarīka Sūtra* (*Lotus Sūtra*), the old standard formulas of the epithets of the Buddha and characteristics of *dharma* are repeated for the Tathāgata Candrasūryapradīpa and his preaching, but the four noble truths are only mentioned by title—there is no elaboration. The *Saddharmapuṇḍarīka* proclaims that such teaching is taken up and absorbed into the one comprehensive and central soteriological message (i.e., the "single vehicle"; *ekayāna*) of the sūtra.

Although the four noble truths are not featured in their earlier formulation in many Mahāyāna texts, the basic theme nonetheless persists: Life is awry, craving and ignorance are the cause, one's life can be changed, and a way or means that brings this about is available. For example, the verse text of Śāntideva's *Bodhicaryāvatāra* does not contain the complete formula of the four noble truths. Prajñākaramati, a commentator on this great text, even points to the one verse (chap. 9, verse 41) where he finds a contrast clearly presented between the four noble truths and the "teaching of emptiness." Yet even though a fundamental shift in the understanding of the path to liberation has taken place in this and other Mahāyāna texts, the underlying assessment as to the cause of suffering, that is, the basic thematic structure of the four truths, remains unchanged.

In the *Madhyamakakārikā*, Nāgārjuna provides an incisive, penetrating analysis of the four noble truths. He maintains that *duḥkha*, which evolves from the interplay of the constituents of individuality and the objects of perception, can no longer be seen as having any fundamental ontological status, even in *saṃsāra*, the fleeting “whirl” of repeated existence. The same is true, for that matter, of *saṃsāra* itself, or even of *nirvāṇa*: All is emptiness (*śūnyatā*).

Thus, the older-formulated Eightfold Path, which provided the remedy for the disease (*duḥkha*) of undisciplined and uninformed human existence, yielded with this shift in worldview to another formulation of the soteriological process, to another religious orientation that is also to be cultivated—the *bodhisattva* path. Although the ontological interpretation of the four noble truths underwent change in the cumulative development of the Buddhist tradition, as in the case of the great Chinese Buddhist thinker Zhiyi (538–597), the fundamental theme that the inadequacy of human life results from craving and ignorance, which can be eradicated by following the path to enlightenment taught by the Buddha, has continued.

JOHN ROSS CARTER (1987)
Revised Bibliography

FOX, GEORGE (1624–1691), was the chief founder and early leader of the Quakers, a popular movement without clergy, ritual, or sacraments, gathered from among English Puritan Separatists. Despite frequent imprisonments, he traveled throughout Britain, North America, and northern Europe, calling hearers to experience directly the Spirit of God, met as “the Light of Christ” or “Truth” within each person. Those who were open and obedient to the Light he called upon to gather as “Children of Light” and to bear witness to God’s power, which was to conquer the world without outward violence in “the Lamb’s War.” Fox also gave structure to gatherings, or Meetings of Friends, and wrote 270 tracts and 400 “epistles.”

Fox was the son of a Puritan weaver of Fenny Drayton in Leicestershire. As a young man he was apprenticed as a cobbler and shepherd; his sensitivity to temptations caused him intense strain, which in 1643 drove him away from his family and then from a series of prominent Puritan clergy and congregations whom he had sought out in the Midlands and in London. By contacts with Separatist and Baptist groups, and perhaps also among Ranters and Familists, he acquired beliefs about the inward nature of heaven, the Last Judgment, the sacraments, and Christ’s “heavenly body.” He experienced in 1646 and 1647 a series of “openings,” or insights, into the Bible, much of which he knew by heart: namely, that true ministers are not made at universities; that Christ within “can speak to thy condition”; that Christ too experienced and conquered temptation; that the source of temptation is the evil within human hearts. Notably, Fox saw evil in his own heart, where “there was an ocean of darkness and death, but an infinite ocean of light and love, which flowed over the ocean of darkness.”

Having faced his dark impulses, he called others to “the witness of God within them,” which would “judge and guide them”—not into a vicarious righteousness but into a total purging and obedience. When he began preaching in the Midlands he was jailed at Derby in 1650–1651 for blasphemy, having glimpsed perfect holiness as he “was come up in spirit through the flaming sword into the paradise of God.” He refused a captaincy in Oliver Cromwell’s army, because he “lived in the virtue of that life and power that took away the occasion of all wars.” In 1651 he preached through northern Yorkshire, winning his chief colleagues, Nayler, Dewsbury, Farnworth, and Aldam. In 1652 he went northwest by way of Pendle Hill, where he had a vision of “a great people to be gathered,” and he went on to win to his cause several groups of Separatists who met on Firbank Fell and in villages around the English Lake District. Swarthmoor Hall, home of Margaret Fell and her family, became the center for a mass movement throughout the poorly served moorland parishes of Westmorland and Cumberland, despite jailings and mob violence in several towns. In 1654, a “valiant sixty” of the newly won Quaker men and women, mainly yeomen farmers, spread out on foot throughout Britain as “publishers of Truth,” announcing “the Day of the Lord.”

Fox recalled them that winter to plan their further work and to have them agree to report their travels to Swarthmoor. In 1655 Fox was sent as a prisoner to London, which had already become a Quaker center through casual contacts and earlier missions. Freed by Oliver Cromwell, Fox talked sympathetically with him, attempting without success to persuade him to end the parish system.

While traveling through southern England to Lands End, Fox was jailed in Launceston's "Doomsdale" dungeon for a harsh winter, during which his colleague James Nayler let some women disciples stir up a breach between the two leaders and stage in Nayler's honor a reenactment of Palm Sunday at Bristol. Nayler was tried for blasphemy before Parliament and savagely punished, but this episode, offending England's growing conservatism from 1656 through 1658, cast a shadow over the Quakers. To rally them, Fox encouraged older Quakers to visit the struggling meetings already gathered for weekly worship in silence, while younger Friends carried the Quaker message overseas to Ireland, continental Europe, and the American colonies. Fox was mainly near London as the Puritan Commonwealth fell apart, and he went through weeks of doubt and exhaustion when the Quakers were asked by a radical Puritan government to provide Commissioners of Militia to protect twenty years' gains in justice and freedom. Fox's warning against reliance on arms became a standard to which Quakers could point after the returning Royalists in 1660 accused Friends of plotting rebellion against Charles II. Fox also organized weekly meetings of Quaker men and women leaders in London and wrote piecemeal his only long theological book, *The Great Mystery* (1659). Between and after two more long imprisonments for refusing the Oath of Allegiance (and all oaths) and defying the 1664 Conventicle Act, Fox again visited Quaker meetings throughout England and Ireland to set up a network of men's and women's monthly and quarterly meetings for local groups and for counties. At Bristol on October 17, 1669, he married Margaret Fell, eleven years a widow; though his letters to her were curiously formal, he began to express to her the affection and humor others had loved in him.

After the 1670 Second Conventicle Act, when Fox and thousands of "Nonconformists" to the Anglican church were again arrested, the Indulgence of 1672 freed him to sail with twelve other Quakers to visit Quaker groups in the American colonies. They proclaimed their Christian orthodoxy to the governor of Barbados and gathered into regular meetings the Friends of Jamaica and Chesapeake Bay and later those in New England and Virginia. Guided by Indians through the forests of New Jersey, Fox would urge Quakers to colonize there in 1675. Returning to England in June 1673, Fox was again imprisoned and seriously ill at Worcester in December. Later, recovering his health slowly at Swarthmoor Hall, Fox dictated to Margaret's son-in-law Thomas Lower the text of his *Journal*. In 1677 Fox traveled with William Penn and Robert Barclay to visit small Quaker groups in Holland and

northwestern Germany. Fox revisited Holland in 1684 but spent most of his last years in or near London, where he died on January 13, 1691. Penn witnessed that "abruptly and brokenly as sometimes his sentences would fall from him . . . it showed that God had sent him, that he had nothing of man's wit or wisdom, so that he was an original, being no man's copy. He had an extraordinary gift in opening the Scriptures. But above all the most awful, living, reverent frame was his in prayer."

HUGH BARBOUR (1987)

FOXES. The fox has enjoyed immense popularity as a character in the fables of many cultures, from those of Aesop to those of "Uncle Remus" to Leoš Janáček's opera *The Cunning Little Vixen*. It was once believed in Wales and Germany that witches assume the form of foxes. In fact, foxes were sometimes burned in the midsummer fires.

In the mythology of the North American Indians the fox as a male animal character is well known for its craftiness and slyness. Especially among the California Indians the fox plays a prominent role in trickster and other tales. In many

instances Fox is a trickster's companion, and at times he deceives Coyote and eats the food that Coyote has procured for himself. The fox also appears as a female animal in a cycle of fox tales widespread among the North American Indians. A poor man, living alone, comes home at night to find his house in order and his dinner on the fire. He discovers that every morning a vixen comes to his hut, sheds her skin, and becomes a woman. Having stolen the skin, he makes her his wife. They live in happiness for many years until she discovers the skin, puts it on, and runs away. This scenario of the "mysterious housekeeper" is also found among the Inuit (Es-kimo) in Greenland and Labrador, as well as among the Koriak of northeastern Siberia.

In Inner Asia, among the Buriats, the fox is known as a guide to the land of the dead; when the hero Mumonto lifts up a large black stone and shouts "Come here," a fox appears in the opening under the stone and says, "Hold fast to my tail."

Chinese folklore is rich in the motif of the fox who transforms itself into an attractive woman and seduces young men. Foxes are capable of this transformation through the study of Chinese classics or through erotic tricks. Foxes who study the classics acquire first the power to become humans, then immortals, and finally gods. In many stories, young foxes are depicted as sitting in a circle, listening to an old white fox at the center expounding the classics. Foxes can assume human form, if at first only briefly, through the absorption and accumulation of the *semen virile* of a male sex partner; by seducing humans, usually young men, foxes steal life essence and add it to their own. For example, an ambitious young man who has retired to a deserted cottage or temple to prepare for the state examinations is visited at dusk by a beautiful young woman who becomes his mistress. Her erotic skill is such that he becomes exhausted and dies. Fox-women sometimes sincerely love their human paramours and help them with their studies, but they seldom return the life essence they have stolen. Occasionally, the parents or friends become aware of the situation in time and call in either a shaman or a Faoist specially trained in fox exorcism and drive her away.

Folk belief in the fox is still alive in Japan; the fox is considered to be most skillful of animals in transforming itself into human form, often female. It is feared as a wicked animal that haunts and possesses people. But, at the same time, the fox is respected as the messenger of *inari*, the beneficent rice goddess Uka no Mitama, of Shintō religion.

MANABU WAIDA (1987)
Revised Bibliography

FRANCISCANS is the common designation for a number of religious communities professing to live according to the ideals of Francis of Assisi (1181/1182–1226). In 1206 Francis withdrew to the margins of society to adopt the life of a penitent hermit. His vocation received a decisive focus in 1208, when others joined him and he was inspired to "live according to the pattern of the Holy Gospel," as he called it, "following the footsteps and teaching of our Lord Jesus Christ" (*Testament*, 14; *Earlier Rule*, 1.1 [*Francis of Assisi: Early Documents*, I: 63–64, 125]). Within Francis's lifetime his followers organized into three distinct but related orders: his own Lesser Brothers; communities of contemplative women under the leadership of Clare of Assisi (d. 1253), known now as Poor Clare nuns; and the Brothers and Sisters of Penance, laypersons who wished to remain in the midst of society, later commonly known as the Third Order. Although they differed in their manner of expression, all were based on Francis's vision of a gospel way of life. The concrete implications of this vision have often led to bitter internal dissension over the course of Franciscan history.

The Order of Lesser Brothers (the literal meaning of *Ordo Fratrum Minorum*, commonly translated as Friars Minor) began as a largely lay movement of hermits and itinerant preachers. They lived on a mere subsistence level, without any permanent residences, supporting themselves by whatever trade they knew or by begging. Despite the radical nature of this way of life, Francis and his companions received initial papal approbation in 1209/1210. However, the new order underwent a rapid transformation over the ensuing decades. First of all, its phenomenal growth—by 1221 there were about three thousand brothers—demanded greater internal discipline and organization. At the same time the papacy recognized in the movement a potent instrument of church reform and increasingly intervened to oversee and channel its growth. Cardinal Hugolino di Segni, later Pope Gregory IX, played an important role in these developments. Historians have long debated Francis's own attitude toward this process, already evident in the definitive 1223 version of his rule. In any event by midcentury the friars were primarily engaged in the official pastoral ministry of the church, especially preaching and hearing confessions. The friars increasingly abandoned their hermitages to settle down in

urban residences attached to a church, where they adopted more traditional patterns of religious life and pursued theological studies. In light of the new demands placed upon them, the brothers' rigorous observance of poverty was relaxed by several papal interventions. The houses of the order at such academic centers as Paris and Oxford soon produced some of the greatest masters of Scholastic theology, such as Bonaventure, John Duns Scotus, and William of Ockham.

Within the order, however, there was a significant resistance to these new directions. Toward the end of the thirteenth century, various minority factions, known collectively as Spirituals, demanded a literal observance of the rule and refused to submit to the modifications accepted by the majority of friars. The increasingly bitter internal conflict eventually led to the outright persecution of the Spirituals, culminating in a decision by John XXII in 1323 to brand as heretical the opinion that Christ and his apostles had led a life of absolute poverty. The Friars Minor thus gradually conformed to the practice of common ownership of property that was standard among other religious orders.

During the latter part of the fourteenth century, however, a reaction set in, with small groups of friars receiving permission to retire to remote houses to observe a more primitive form of Franciscan life. This movement, known as the Observant reform, gained momentum in the next century under such leaders as Bernardino of Siena, ultimately achieving virtual autonomy within the order. Nevertheless, relations between those friars who accepted this reform and those who did not, known as Conventuals (from the *conventi*, or large houses, they favored), grew increasingly acrimonious, leading Leo X in 1517 to divide the order into two independent congregations.

Over the course of the sixteenth century, the contemporary zeal for church reform continued to spawn new movements within the order, motivated by the desire for even stricter forms of Franciscan life. The largest of these, the Capuchins, so called because of the distinctive hood (*cappuccino*) of their habit, played a prominent role during the Counter-Reformation as popular preachers; they achieved the status of an independent congregation in 1619. Other groups of stricter observance—Discalced, Recollect, and Reformed friars—attained a large measure of autonomy while remaining under the leadership of the Observant general. Despite this fragmentation, the Friars Minor prospered between 1500 and 1750, a period that also witnessed a vast missionary effort by Franciscans, who accompanied Spanish, Portuguese, and French colonial expansion. By 1760 the Friars Minor had reached their peak membership, totaling 135,000 in their three branches.

Franciscans, especially the Conventuals, suffered greatly during the years 1760–1880, when secularizing government policies in Europe and Latin America restricted traditional religious orders. However, in the latter part of the nineteenth century a revival took place, accompanied by critical research into early Franciscan sources. Also, under papal initiative, the

various groups within the Observant branch were reunited in 1897 under the simple name of the Order of Friars Minor. After 1965, Franciscans experienced a period of profound renewal and transition in the wake of the Second Vatican Council, which emphasized a return to the founding vision of Francis. In 2002 there were 16,300 Friars Minor, 10,800 Capuchins, and 4,500 Conventuals. There is also a small community of friars, the Society of Saint Francis, in the Anglican Church.

The Poor Clares, sometimes referred to as the Second Order, date from 1212, when Clare, of a noble Assisi family, renounced her social status and received the habit from Francis. Under his direction, Clare and her companions followed a simple form of life, but Cardinal Hugolino intervened in 1219, prescribing regulations that emphasized monastic observances, such as a strict cloister. Clare managed to gain approval for her own rule embodying her vision of poverty in 1253. Because each monastery of Poor Clares is largely autonomous, practices have varied greatly. A reform, analogous to the Observance among the friars, was begun by Colette of Corbie in the fourteenth century. In 2002 there were more than eight hundred monasteries of Poor Clares with fourteen thousand nuns.

Francis can be called the founder of the Brothers and Sisters of Penance, or Third Order, only in an analogous sense. His preaching of gospel conversion moved many of his hearers to reform their lives, and so he sought to prescribe for these individuals a way of life appropriate to their respective social conditions. Some became hermits, whereas others continued to live in their own homes but formed confraternities for mutual support. Rules for these local groups were developed in 1221; the fraternities developed closer relations with the friars over the course of the century. This Order of Penance was characterized by a simple way of life, engaging in works of charity, and the refusal to bear arms. The tertiaries were a potent religious and social force in late medieval society. In the latter part of the thirteenth century, some of these Franciscan penitents began living together in communities, eventually binding themselves under religious vows. The rule of this Third Order Regular received definitive form in 1521. During the nineteenth century there was a veritable explosion of congregations of women following this rule devoted to teaching, nursing, and other charitable activities. In 2002 there were over 450 distinct congregations of Franciscan sisters, with approximately 100,000 members and about 1,500 male members of the Third Order Regular. Meanwhile, the secular Franciscan fraternities continued to expand, but their countercultural way of life increasingly conformed outwardly to general societal norms; they numbered over one million in 2002. After Vatican II both branches of the Third Order revised their rule of life, attempting to return more closely to their original inspiration.

BIBLIOGRAPHY

A general survey of the entire Franciscan movement is Lázaro Iríarte de Aspúrz, *Franciscan History: The Three Orders of St. Francis of Assisi* (Chicago, 1982). For the medieval period, John R. H. Moorman, *A History of the Franciscan Order: From Its Origins to the Year 1517* (Oxford, 1968) is valuable. However, research during the late twentieth century significantly nuanced the understanding of early Franciscan history. The biographical sources on Francis, valuable for the understanding of the early movement, have been gathered in *Francis of Assisi: Early Documents*, ed. Regis J. Armstrong, J. A. Wayne Hellmann, and William J. Short, three volumes (New York, 1999–2001). A good summary is Maria Pia Alberzoni et al., *Francesco d'Assisi e il primo secolo di storia francescana* (Turin, Italy, 1997). David Burr, *The Spiritual Franciscans: From Protest to Persecution in the Century after Saint Francis* (University Park, Pa., 2001), provides an excellent survey of that movement. Maurice Carmody, *The Leonine Union of the Order of Friars Minor, 1897* (St. Bonaventure, N.Y., 1994), presents the nineteenth-century revival. The best introduction to the Third Order Regular women's congregations is Raffaele Pazzelli, *The Franciscan Sisters: Outlines of History and Spirituality* (Steubenville, Ohio, 1993).

DOMINIC V. MONTI (1987 AND 2005)

FRANCIS OF ASSISI (Giovanni Francesco Bernardone, 1181/2–1226) was a Christian saint and the founder of the Franciscans. John was Francis's baptismal name, but a fondness for France on the part of his merchant father and an acknowledgment of the national origin of his mother prompted the parents to call him Francis. Endowed with a jovial disposition and the means to pamper it, Francis enjoyed the good life of his times; this life was, however, interrupted when his hometown warred with neighboring Perugia. Inducted, imprisoned, and then released, Francis returned home with his military ambitions dampened. A business career with his father held no attraction.

Francis's conversion was the culmination of a period of prayerful reflection in a local grotto, an encounter with a leper, an invitation from God to repair Assisi's abandoned chapel of San Damiano, and Francis's study of *Matthew 10*, which imparted to him a sense of irreversible dedication to the kingdom of God. Within a few months (by April 1208) others asked to share his life, and thus a brotherhood was born.

In 1209 Francis journeyed to Rome to seek papal approval for the brotherhood. After some hesitation, Innocent III gave verbal assent to the rule authored by Francis, who then returned to Assisi and remained at the chapel of the Portiuncula; from there the brothers, two by two, preached gospel renewal. Intent on extending this preaching, Francis departed for Syria, but bad weather hampered the venture. Later a more successful journey took him to meet the sultan in Damietta. In 1212 Francis offered the religious habit to the young noblewoman Clare, and quickly other young women from Assisi sought to share her way of life at San

Damiano, forming the order known as the Poor Clares. In 1215 the Fourth Lateran Council promulgated reforms championed in his preaching.

In 1220 Francis resigned his post as head of the Franciscans. Still, with more than five thousand brothers, his involvement continued. After reworking his rule, Francis submitted it to Pope Honorius III in 1223, and it received written approval. That same year Francis presented a living Christmas crèche at Greccio, which encouraged the popularity of that custom in subsequent centuries. At Alverna he received the stigmata (the wounds of Christ crucified), thereby reflecting outwardly that which he interiorly imitated.

Though suffering serious illness in his last years, Francis composed his intensely joyful "Canticle of Brother Sun." The closing strophe addresses "Sister Death," whom he welcomed on October 3, 1226. Within two years Francis was proclaimed a saint. In 1939 he was officially offered to Italy as its patron; in 1979 he was recognized by Pope John Paul II as the patron saint of ecology.

As Francis's brotherhood increased in size, his work encompassed the nurturing of followers including the Poor Clares and the Secular Franciscans (laymen and -women who wished to follow Francis). Franciscans were not committed to one particular work but engaged in whatever labors their travel and presence brought them. Francis's work and thought indicate a living, ecclesial faith that seeks to be for and with the poor.

Central to every aspect of his life was Francis's experience of the trinitarian God. He wanted to reveal the Father to all by imitating the Son through the inspiration of the Holy Spirit. Like his Lord, he was eager to make his way back to the Father and to summon all creation to accompany him on that painful but peaceful journey. An adult innocence aided him in transcending the spirit-matter dichotomy, making him a sublime example of both the spirituality of matter and the materialization of spirit.

Francis embraced voluntary poverty because he wanted to imitate his Lord, who had made himself poor (*2 Cor.* 8:9). In this poverty Francis found a freedom that fostered fraternity. The poor, in their more evident dependence on God, reminded Francis of the mystery of divine sympathy and of each creature's intrinsic poverty. In the spirit of poverty he urged his brothers to renounce their desire to dominate, and though called to minister to all, to favor labor among the lepers and farmhands.

Aware that the Roman Catholic church was capable of taming the gospel, Francis persisted in the belief that Christ was to be found in this institution, especially in the Eucharist. He sought a cardinal protector for the Franciscan order and acknowledged the pontiff to be the final arbiter in spiritual matters. Although Francis's relations with the Curia Romana may have weakened his project, the majority of scholars submit that his relation to the hierarchy was loyal, challenging, and constructive.

Movements for peace and for the marginalized have in Francis a ready patron. He sent his brothers out, not against but among the Saracens, and he required that all his followers (lay included) not bear arms. His pursuit of Lady Poverty inspires those of every age who seek simplicity. His fondness for animals and nature has deepened humanity's understanding of the interrelatedness of all creation grounded in a creator whose richness it reflects.

Francis managed to steer a course that avoided the excesses of feudal authority and of the bourgeois pursuit of money. In his rule he taught his followers to use only that which was needed, to own nothing, and to renounce any desire to dominate; he insisted that authority for the *minores* (those who wished to lead a biblically inspired simple life) meant fraternal service. The church, although initially cautious, soon adopted some of his insights for its own apostolic strategy; between 1218 and 1226 six papal bulls were issued relating to aspects of his vision. The Holy See recognized that the manner of his preaching touched the lives of the people; it also gave the vernacular a new respectability and provided themes for artists such as Cimabue and Giotto. Though no intellectual, Francis's emphasis on humanity inspired the deeply incarnational systems of Bonaventure and of Duns Scotus.

Francis's legacy to the Christian tradition was a revitalized gospel that clearly perceived many forms of brotherhood: with superiors—once, having been denied by a bishop the right to preach in his diocese, Francis exited, paused, reentered, and resubmitted his petition successfully; with strangers—in his rule of 1221 he calls for a simple, nonpolemical style of missionary presence; with the underclass—when a brother asked if it were proper to feed some robbers, he responded affirmatively, for in every person he saw a possible thief and in every thief a possible brother or sister; with nature—he urged his brothers when establishing the boundaries of their shelters not to build walls but to plant hedges. The movement founded by Francis offered the church a new form of gospel commitment. It combined a contemplative life with an apostolic work that was mobile, diverse, and urban. Although it was a consecrated life, it was not removed from daily concerns.

BIBLIOGRAPHY

Kajetan Esser, the scholar most responsible for the critical texts of Francis's writings, discusses 181 manuscripts in his *Opuscula Sancti Francisci Assisiensis* (Rome, 1978) and his *Rule and Testament of St. Francis* (Chicago, 1977). The excellent *Francis and Clare: The Complete Works* (New York, 1982), edited by Regis J. Armstrong and Ignatius Brady, offers a list for the first time in English of Francis's authentic writings (twenty-eight in all) and inauthentic writings (including the popular "Peace Prayer"). The most practical single volume for primary sources remains *St. Francis of Assisi: Writings and Early Biographies, English Omnibus of the Sources* (Chicago, 1973), edited by Marion A. Habig. It includes lives of Francis by

Celano and by Bonaventure, *The Little Flowers of Saint Francis* (a treasure of fourteenth-century popular literature), and an extensive bibliography, though not always reliably translated. Classic biographies include Omer Englebert's astute *Saint Francis of Assisi* (Chicago, 1965), and Father Cuthbert of Brighton's accurate *Life of St. Francis of Assisi* (London, 1912). Paul Sabatier's *Life of St. Francis of Assisi* (London, 1894) is provocative. Of the more than sixty modern biographies, G. K. Chesterton in *St. Francis of Assisi* (London, 1923) captures his heart and Nikos Kazantzakis in *Saint Francis: A Novel* (New York, 1962) presents a poet. A former mayor of Assisi, Arnaldo Fortini, in his *Francis of Assisi* (New York, 1981), offers an invaluable historical appendix. Anglican bishop J. R. H. Moorman presents, in his new edition of *Saint Francis of Assisi* (London, 1976), a precise historical life. Leonardo Boff characterizes Francis, in *Saint Francis* (New York, 1982), as a model for human liberation.

RAYMOND J. BUCHER (1987)

FRANCKE, AUGUST HERMANN (1663–1727), was, after Spener, the major spokesman for early Lutheran Pietism. Francke was born in the Hanseatic city of Lübeck on March 22, 1663. Both his father and his maternal grandfather were prominent jurists, and young August was more or less expected to take up a learned career. Because the Francke household was pervaded by the piety of Johann Arndt (1555–1621), it was quite natural for August to prepare himself for the Lutheran ministry. Accordingly, he studied at Erfurt and Kiel, and finally received his master of arts degree from the University of Leipzig. For religious reasons he refused further academic preparation, though much of his time continued to be spent in private study. Thus he emerged from his student career superbly prepared not only in philosophy, theology, and biblical studies but with considerable competence in Latin, Greek, Hebrew, Italian, French, and English, besides his native German.

As the result of an experience of a conscious religious awakening (1687), Francke joined the circle of Spener's followers and eventually became the leader of the Spenerian renewal movement of continental Protestantism. The University of Halle, to the faculty of which he was appointed in 1691, quickly became the intellectual center of Lutheran Pietism. His pioneer work in establishing an imposing array of educational and charitable institutions attracted much attention in Europe. His extensive system of connections included a large segment of European nobility as well as several European courts. The periodic reports of his work, such as *Segensvolle Fußstapfen* (translated into English in 1706 under the title *Liber Pietatis Hallensis*), spurred educational, charitable, missionary, and ecumenical impulses not only on the continent but in England and in the English colonies of North America. Under Francke's guidance the Canstein Bible Institute, begun in 1710, satisfied the ever-increasing need for cheap Bibles and devotional aids. The theological works issuing from Francke's pen and from Halle were a major factor

in substituting biblical for dogmatic theology and ethically oriented concerns for purely theological discourses in Protestant pulpits. At the zenith of his career Francke was widely respected as an innovative pastor, theologian, educator, organizer of charitable institutions, promoter of domestic and foreign missions, and advocate of a new vision of ecumenical cooperation.

BIBLIOGRAPHY

Important for Francke study is still D. Gustav Kramer's *August Hermann Francke*, 2 vols. (Halle, 1880–1882), though dated in many respects. The best biography is the scholarly, very appreciative study by Erich Beyreuther, *August Hermann Francke, 1663–1727* (Marburg, 1956). For Francke's theology, Erhard Peschke's *Studien zur Theologie August Hermann Franckes*, 2 vols. (Berlin, 1964–1966) is indispensable. Peschke also edited a selection of Francke's works titled *Streitschriften* (New York, 1981). Available in English are Gary Stattler's *God's Glory and the Neighbor's Good: A Brief Introduction to the Life and Writings of August Hermann Francke* (Chicago, 1982) and a small selection of Francke's writings in Peter C. Erb's *The Pietists: Selected Writings* (Ramsey, N.J., 1983).

F. ERNEST STOEFFLER (1987)

FRANK, JACOB. Yakov ben Lev (1726–1791), cynosure of the last large Jewish messiah-event, took the surname Frank at his baptisms in Poland in 1759 and 1760, when he also added the name Joseph and became Jacob Joseph Frank. The surname had become attached to him as an epithet that in Yiddish denoted a Turkish Jew and in Turkish denoted a European Jew. He himself never explained which he was, contenting himself with the ambiguity of the reference. Frank acted out the role of a Jewish messiah in the territory of the Ottoman Empire in Poland and in Bohemia and Germany from about 1750 until he died in a fit in Offenbach, to be succeeded by his daughter, Ewa.

Though Frank presented himself as the inheritor of Shabbetai Tsevi (1626–1676) and Barukhya Russo (d. 1721), his forerunners in this tradition, he did not do so in their urban Turkish environment, nor was his doctrine theirs. Frank defined both of them to his inner circle of disciples, the twelve Brothers and fourteen Sisters, as predecessor messiahs in the tradition of failed messiahs, and he discarded the entire qabbalistic system associated with them and their messianic roles in favor of an original mythology and cult management whose major characteristics were duplicity and a tyrannical authority shrouded in mystery. To the false conversions to Islam of Tsevi and Barukhya in Turkey, Frank added a false conversion to Roman Catholicism in Christian lands. He gave his name to three separate movements known as *Frankist*—the first being a community of Polish Shabbateans who had been adherents of the Dönme sect in Salonika into which he inserted himself in Turkey and, thereafter, in Poland; the second, his personal following; and the third in Bohemia, in which he played no active part.

Shortly after his own conversion, the Inquisition had him imprisoned for thirteen years in the fortress shrine of Częstochowa under suspicion of perpetrating a hoax and an attempted insurrection. His closest followers remained faithful to him. While Frank promoted a combination of obedience to himself and disingenuous behavior towards those outside his circle, many of his followers either sought their way back to Judaism or became Christians within his own lifetime, excepting those who had been part of the original company of adherents or who were with him at his courts in Brno and Offenbach after he regained his freedom and left Poland at the time of the Russian invasion in 1773.

In Brno and especially in Offenbach, Frank played the part of a noble maintaining a large court and retinue, and he sought to interfere in European politics in the West and East. Before his conversion he had persuaded Turkish powers that he would bring the Jews to Islam and promote the interests of the Ottoman Empire in Europe, and he had gained government support. After his entry into western lands, he sought, with the same degree of sincerity, to serve the interests of Prussia and Austria. Here his performance achieved greater success. His daughter Ewa served as a social and sexual pawn to attract social prestige, and Frank gained for a time the backing of Joseph II of Austria, among others.

In the intellectual and political society of early modern Europe, Frank was a familiar figure. To enlightened Christians and proselytizing millennialists he was a Jew converted to Christianity and a freethinker typified by mysterious connections and magic and secret riches. He was also seen as a herald of liberation from the oppression of gender, class, regime, religion, and mores, including sexual ones. To some Jews, he augured assimilation, enlightenment, political power, and millennial redemption. To other Jews, especially rabbinic figures, Frank was not just one more in a colorful crew of anomians or antinomians, leaders of the gullible from the time of Jesus through the contemporary movement of Hasidism—he was a catastrophe; the ultimate false messiah; the ruin of hope, faith, and religion; the diabolic climax of that history.

Frank served anti-rabbinic belligerents as their figurehead in two debates (Kamieniec, 1757; Lwów, 1759), though he did not seek these opportunities out; the debates were produced by the Polish Catholic authorities together with the remnants of Shabbatean followings. The theses argued in these debates—the last great public Christian-Jewish disputations, the first concluding with the last major public burning of Jewish books before the modern period—included old themes, such as the falsity of the Hebrew Bible in its rabbinic interpretation, as well as the blood libel and some novelties. The Frankists sought to achieve a separate existence and maintain for themselves many elements of Jewish culture while converting to Christianity and proclaiming the truth of the *Zohar* and its ostensible Trinitarianism. Frank wanted to establish the anti-rabbinic disputants as his own followers and gain a separate and autonomous commu-

nity. The neighboring village of Iwanie was actually granted to them by Augustus III following the first disputation. The history of Frankism as Polish Shabbateanism ends here and is well documented in the recent work of Pawel Maciejko.

From the time in Iwanie through the years of his imprisonment, the establishment of his court in Brno and then in the palaces of the prince of Isenburg in Offenbach, Frank taught his own doctrine to the circle of the Brothers and Sisters, and records of the history of the group were kept. A lot of these materials remain and have received some study. The conduct of the sect can be studied through entries in the internal history, the *Chronicle*; Frank's own doctrine is found in the *Collection of the Words of the Lord*. In these works one sees Frank's talent in adapting himself to changing circumstances and persuading his followers to remain steadfast. The *Collection* displays Frank's prowess as the innovator of several literary forms, including threefold (allegorical) tales. Other contemporary observers have left a large body of accounts of his peculiar activities and self-presentation during this period, and these have been employed by later scholars. There are clear connections between this Frankism and developments in Hasidism in terms of the configuration of its leadership, as well as its characteristic literary modalities.

The third branch of Frankism in Bohemia, especially Prague, before, during, and after the disputations was, like the first, rooted in the continuation of Shabbateanism and can be associated with modernizing movements in Judaism, including assimilation. This variety knows almost nothing of Frank, his deeds, or his teachings.

HARRIS LENOWITZ (2005)

FRANKEL, ZACHARIAS (1801–1875), was the founder, in Germany, of Historical Judaism, the forerunner of Conservative Judaism in America. A member of the first generation of modern rabbis, Frankel fashioned a multifaceted career as pulpit rabbi, spokesman for political emancipation, critic of radical religious reform, editor, head of the first modern rabbinical seminary, and historian of Jewish law.

Frankel was born in Prague, then still the largest Jewish community in Europe, into a financially comfortable family with a distinguished lineage of rabbinic and communal leaders. His education combined traditional immersion in Jewish texts with systematic exposure to secular studies in a manner that was still far from typical. In 1830 he received his doctorate from the University of Pest and in 1831 acquired the post of district rabbi of Litoměřice, becoming the first Bohemian rabbi to hold a doctorate. His advocacy of changes in the synagogue service, the education of the young, and the training and role of the rabbi brought him, in 1836, an invitation from the government of Saxony to occupy the pulpit in Dresden as chief rabbi of the realm. Despite several subsequent offers from the much larger and rapidly growing Jewish community of Berlin, Frankel stayed in Dresden until 1854, when he was called to become the first director of the new rabbinical and teachers' seminary in Breslau. By 1879, four years after his death, the seminary had instructed some 272 students and had placed nearly 120 teachers, preachers, and rabbis in the most important Jewish communities in Europe.

A self-styled moderate reformer in matters of religion, Frankel formulated his program of "positive, historical Judaism" in the 1840s to stem the rising tide of radical religious reform. Against the Reform movement's unbounded rationalism, Frankel defended Judaism's legal character, the sanctity of historical experience, and the authority of current practice. The term *positive* pointed to prescribed ritual behavior (*halakhab*) as the dominant means for the expression of religious sentiment in Judaism, while the term *historical* designated its nonlegal realm, sanctified by time and suffering.

What gives Frankel's definition its dynamic quality is the role of the people. Genuine reform evolves organically from below and not by fiat from above. It is for this reason that Frankel repudiated the innovations of the three rabbinical conferences of the 1840s; whether dictated by political considerations or the canons of reason, their measures did violence to prevailing sentiment and practice.

On a popular level Frankel tried, as author and editor, to deepen Jews' loyalty to the past by offering them a brand of heroic history that stressed cultural achievement. As a scholar Frankel was the preeminent modern rabbinist of his generation, and he devoted a prolific career to introducing the concept of the development of Jewish law over time. Using the method as well as the ideology of Friedrich C. Savigny's *geschichtliche Rechtswissenschaft*, Frankel tried to recover and analyze the stages of legal evolution, from Alexandrian exegeses of scripture to medieval rabbinic *responsa*. In the process he left enduring contributions to the modern study of the Mishnah and the Palestinian Talmud.

Frankel's undogmatic research on the Mishnah challenged the traditional image of the ancient rabbis as transmitters rather than creators of the oral law and provoked a bitter assault in 1861 from the Neo-Orthodox camp of Samson Raphael Hirsch. Growing religious polarization served to clarify denominational lines and forced Frankel to occupy the middle ground.

Two institutions created by Frankel embodied, amplified, and disseminated his vision of Historical Judaism. *Die Monatsschrift für Geschichte und Wissenschaft des Judentums*, which he edited for eighteen taxing years (1851–1868), provided its readers with a balance of high-level popularization and critical scholarship, setting the standard for all later nineteenth-century journals of Jewish studies. Similarly, the Breslau seminary, which he led for twenty-one years, transformed rabbinic education by integrating modern scholarship with traditional piety and requiring its graduates to be both spiritual leaders and practitioners of *Wissenschaft*.

ISMAR SCHORSCH (1987)
Revised Bibliography

FRANKFORT, HENRI (1897–1954), was an archaeologist and historian of religion. Frankfort began his studies

at the University of Amsterdam, where he studied history, but he transferred to the University of London in order to work under Flinders Petrie in Egyptian archaeology. He always preferred, however, to designate himself as a historian.

In 1922, Frankfort became a member of Petrie's expedition to Egypt, and from 1924 to 1925, he studied at the British School of Archaeology in Athens. He obtained his M.A. from the University of London in 1924 and his Ph.D. from the University of Leiden in 1927. From 1925 to 1929 he served as director of the excavations of the Egypt Exploration Society at Tell al-'Amarna, Abydos, and Erment. In 1929 he accepted the directorship of the Iraq expedition of the University of Chicago's Oriental Institute, which he held until 1937, when excavations were discontinued. In 1932, Frankfort was appointed research professor of Oriental archaeology at the Oriental Institute and associate professor of the ancient Near East at the University of Amsterdam. He served as acting chairman of the Department of Near Eastern Languages and Literatures at the University of Chicago during World War II. In 1949 he accepted the post of director of the Warburg Institute in London and was appointed professor of the history of preclassical antiquity at the University of London.

Frankfort's first major work, *Studies in Early Pottery in the Near East* (1924–1927), was of fundamental importance for Near Eastern archaeology. He was the first to classify and date ancient Near Eastern ceramics and thus to make it a basic means of periodization and relative dating. Of similarly fundamental importance was his later study of cylinder seals, for which he identified characteristic features for successive periods, thereby establishing a relative dating system for this important and very numerous class of objects. The resulting study, *Cylinder Seals: A Documentary Essay on the Art and Religion of the Ancient Near East* (1939), is not only important to archaeologists but also presents the student of religion with a wealth of data on mythology and ritual.

The results of the various expeditions directed by Frankfort in Egypt and Iraq were published in a series of preliminary and final reports, partly by Frankfort alone, and partly by him and members of the staff. Among the former, the valuable volumes *Sculpture of the Third Millennium B.C. from Tel Asmar and Khafajah* (1939), *More Sculpture from the Diyala Region* (1943), and *Stratified Cylinder Seals from the Diyala Region* (1955) should be mentioned. Of more general purview are the important studies *Archaeology and the Sumerian Problem* (1932) and *The Birth of Civilization in the Near East* (1951). An overview of ancient Near Eastern archaeology is given in his *The Art and Architecture of the Ancient Orient* (1954).

Of special interest to historians of religion is *The Intellectual Adventure of Ancient Man* (1946), which was later reissued under the title *Before Philosophy* (1963). The lecture series on which this book is based was organized by Frankfort, and he and his wife contributed the introductory and concluding chapters, "Myth and Reality," a penetrating and

clear analysis of the logic of mythopoeic thought, and “The Emancipation of Thought from Myth,” which traces the road from mythical to genuinely philosophical thought. During the time that Frankfort initiated and contributed to these lectures, he finished the two larger studies, *Ancient Egyptian Religion: An Interpretation* (2d ed., 1949), and the influential *Kingship and the Gods: A Study of Ancient Near Eastern Religion as the Integration of Society and Nature* (1948). Frankfort’s method of approach is that of phenomenology of religion, which respects the religious commitment and values reflected in the data studied. The aim of the latter work is well expressed in the subtitle, and the treatment of both Egyptian and Mesopotamian materials, with attention both to their characteristic similarities and to their differences, lends depth to the study. Frankfort was deeply aware that an understanding of religious data can be gained only in terms of the general culture in which the religion in question is embedded and from which the specific meanings of its symbols are derived. This position is given its most complete methodological statement in his Frazer Lecture of 1951, published as *The Problem of Similarity in Ancient Near Eastern Religions* (1951), where he argues cogently against a comparative method that would emphasize general similarities and neglect specific differences, for it is the latter that hold the true clues to understanding: “Once again, then, our danger lies in the similarities themselves, for it is—as always—the cultural context which holds the secret of their significance.”

In addition to works cited in the text, see Frankfort’s lectures published in the *Journal of the Warburg and Courtauld Institutes*: “State Festivals in Egypt and Mesopotamia” (vol. 15, 1952, pp. 1–12), “The Dying God” (vol. 21, 1958, pp. 141–151), “Heresy in a Theocratic State” (vol. 21, 1958, pp. 152–161), and “The Archetype in Analytical Psychology and the History of Religion” (vol. 21, 1958, pp. 166–178). For an obituary notice written by Pinhas Delongaz and me, see “Henri Frankfort, 24 II 1897–16 VII 1954,” *Journal of Near Eastern Studies* 14 (1955): 1–3; this piece is followed by a bibliography compiled by J. Vindenaess.

New Sources

The three lectures mentioned above have had a seminal influence on the comparative study of Near Eastern religions. They have been collected together and published in a book, Henri Frankfort, *Il dio che muore. Mito e cultura nel mondo preclassico* (Florence, 1992), Italian translation by Gabriella Sacandone Matthiae, with an important introduction by the archaeologist Paolo Matthiae.

THORKILD JACOBSEN (1987)
Revised Bibliography

FRASHÖKERETI. The Avestan term *Frashokereti* (“making wonderful” or “rehabilitation” of existence) corresponds to *Frashgird*, the Middle Persian term for the Last Judgment, or final day of humanity’s existence. The Avestan

term derives from the expression “to make existence splendid.” The concept is eschatological and soteriological and, already present in the *Gāthās*, is at the basis of Zoroastrian doctrine. With this concept Zarathushtra (Zoroaster) abolished the archaic ideology of the cosmic cycle and of the eternal return modeled on atemporal archetypes, proclaiming the expectation of, and hope for, an *eschaton*. He thus introduced a linear conception of cosmic time, an innovation in religious thought that had an enormous influence on humanity’s subsequent spiritual history. According to his doctrine, the final event will be completed not because of a cosmogonic ritual but by the will of the creator: the resurrection of the body and last judgment are essential and significant aspects of the Frashokereti.

In the *Gāthās* the Frashokereti is felt to be near, but later Zoroastrianism developed an eschatological doctrine situating it further off in time, within the concept of a Great Year divided into three periods, each a millennium in length and each beginning with the coming of a Saoshyant, a savior born of the seed of Zarathushtra. The last of these will be the Saoshyant par excellence, the maker of the final Frashokereti.

The Frashokereti is described in one of the hymns of the Avesta (*Yashts* 19). It declares that *druj*, the “lie,” the principle or deity of evil, will be brought down; the *daiva* Aeshma, “fury,” will be destroyed by a bloody mace; the *daiva* Aka Manah (“bad thought”) will be overcome; hunger and thirst will be defeated; and the great god of evil, Angra Mainyu, deprived of his power, will be driven to flight.

The Pahlavi literature of the ninth and tenth centuries CE furnishes further details. The Frashgird will be announced by positive signs: the abolition of meat as a food for humans and its gradual replacement by an increasingly spiritual diet, without milk, water, or plants; the progressive fading of concupiscence; and so forth. Finally, after the resurrection of the body and after a test by molten metal, through which all, both just and unjust, must pass, there will take place a great, eschatological sacrifice of a bull. Its fat, mixed with white *haoma*, will make the drink of immortality for all humankind.

GHERARDO GNOLI (1987)
Translated from Italian by Roger DeGaris

FRAVASHIS, beneficent and protective guardian spirits whose services must be secured by means of ritual offerings, are an essential element of the religious structure of Zoroastrianism. They play an important role in the frequency of rainfall and are responsible for guaranteeing the prosperity and preservation of the family. As the spirits of the dead, they are the protagonists in a great feast held on the last night of the year. They are thought to preexist human beings and to survive them.

The *fravashis* do not appear in the *Gāthās*. In the Avesta, the first mention of them occurs in the *Yasna Haptanhāiti*, and an entire hymn (*Yashts* 13) is dedicated to them.

The conception of the *fravashi* has all the characteristics of an archaic, pre-Zoroastrian belief that was later absorbed and adapted by the tradition. Examples of these characteristics include their identification with the spirits of the dead (Söderblom, 1899, pp. 229–260, 373–418) and their warlike nature.

As the spirits of the dead the *fravashis* have often been compared to the Roman *manes* or to the Indian *pitarah*; as warlike beings, they have been compared with the Germanic valkyries or to the Indian Maruts, the company of celestial warriors. In particular, in the context of the Indo-European tripartite ideology, the *fravashis* are seen as a Zoroastrian substitute for the Maruts (Dumézil, 1953); both are linked to the concepts and ethics of the Aryan *Männerbund*. Most likely, Zoroastrianism absorbed this ancient concept, typical of a warrior society, through its ties to the cult of the dead and reinterpreted the *fravashis* as combatants for the rule of Ahura Mazda. We find such a zoroastrianization in the myth told in the third chapter of the *Bundahishn* (Book of primordial creation), which relates that the *fravashis* chose to be incarnated in material bodies in order to fight Ahriman and the evil powers instead of remaining peacefully in the celestial world.

The etymology of the word *fravashi* is uncertain. Originally it may have been used to designate the spirit of a deceased hero who was endowed with **vrti*, "valor" (Bailey, 1943, pp. 107ff.); or it may have expressed the theological concept, fundamental to Zoroastrianism, of choice, **fra-vrti* (Lommel, 1930, pp. 151, 159–163) or that of the profession of faith (Hoffmann, 1979, p. 91; Schlerath, 1980, pp. 207ff.).

GHERARDO GNOLI (1987)
Translated from Italian by Roger DeGaris

FRAZER, JAMES G. (1854–1941), was a British anthropologist and historian of religion. James George Frazer, the eldest of four children, was born in preindustrial Glasgow, the son of a successful pharmacist. His parents were devout members of the Free Church of Scotland, a conservative sect that in the 1840s had broken away from the (Established) Church of Scotland on matters of church governance. Accordingly Frazer was raised in an atmosphere of deep piety, which, be it noted, he later said that he did not find oppressive.

Frazer early showed academic promise and entered the University of Glasgow at the then not unusually early age of fifteen. There, he writes in a genial memoir composed at the end of his life, three important things occurred: He conceived his lifelong love of the classics, he came to see that the world is governed by a system of unvarying natural laws, and he painlessly lost the religious faith of his childhood.

Frazer did brilliantly at Glasgow but soon realized that although Scottish education gave him a broader background

than an English one would have, its standards were not as high. After taking his degree at Glasgow he therefore matriculated at Trinity College, Cambridge, in 1874 for a second baccalaureate. He took second place in the classical tripos of 1878. A dissertation on Platonic epistemology gained him a fellowship at Trinity in 1879, which after three renewals was granted for life; he was a fellow of Trinity for more than sixty years.

In 1896 Frazer married Mrs. Elizabeth (Lilly) Grove, a French widow with two children who had become a writer out of economic necessity. She wrote an early and important volume on the history of the dance, along with many playlets in French for schoolroom use. She soon became convinced that the academic world was overlooking her husband's merits and strove mightily to advance his career (he was the stereotype of a research scholar, unworldly and shy). She also arranged for his work to be translated into French, which meant that Frazer was very well known in France after the war. Frazer was knighted in 1914, became a fellow of the Royal Society in 1920, and was awarded the Order of Merit in 1925.

Frazer's first scholarly writing, from which his interest in anthropology can be said to date, came about through his friendship with William Robertson Smith (1847–1894), the eminent Scottish theologian and comparative Semiticist. More than any other person, Smith was responsible for disseminating the results of German biblical scholarship in Great Britain at the end of the century. For his pains he became the defendant in the last significant heresy trials in Great Britain. Although he was exonerated, Smith had become too notorious for provincial Scotland and therefore accepted an appointment in Cambridge. Among his many other activities, he was editor of the ninth edition of the *Encyclopaedia Britannica* and as such was always looking for likely contributors. Meeting his countryman Frazer at Trinity, Smith soon set him to work. Because in those days encyclopedias were brought out a volume at a time, and because the volumes through the letter *O* had already appeared. Frazer was assigned articles beginning with *P* and subsequent letters. Thus it was that he came to write the important entries "Taboo" and "Totem," which launched him into the then sparsely populated field of anthropology.

In 1889 Frazer wrote to the publisher George Macmillan offering him a manuscript on magic, folklore, and religion in the ancient world. Macmillan accepted *The Golden Bough*, and it was published in two volumes in the following year. It was generally well received, the reviewers noting Frazer's impressive erudition and stylistic gifts. As soon as he had brought out the first edition, Frazer began preparing an enlarged second edition, which duly appeared in three volumes in 1900. The third and final edition, in twelve volumes, came out from 1911 to 1915. It is this massive version that Frazer himself abridged in 1922; he produced a thirteenth volume, *Aftermath*, in 1936.

The Golden Bough merits special attention because it remains Frazer's best-known work, but it hardly exhausts his contribution to the historical and anthropological study of ancient and "primitive" religion. In 1898 he published *Pausanias's Description of Greece*—a translation of Pausanias's report of his travels—accompanied by five volumes of commentary, maps, and plates, all of which represented fifteen years of work. Pausanias, who in the second century CE prepared this guidebook to his country, was especially curious about religion and inquired ceaselessly about artifacts and rituals that had survived in the countryside but were no longer extant in Athens. Pausanias's record is frequently the only surviving witness of many phenomena of ancient Greek folk religion. His travels constituted an ideal text for Frazer, permitting him to use his classical as well as his comparative anthropological knowledge.

Among Frazer's other major productions in the history of religion are *Lectures on the Early History of the Kingship* (1905); *Totemism and Exogamy* (1910), which gave Freud much data as well as the idea for a title (*Totem and Taboo*, 1911); *Folk-Lore in the Old Testament* (1918), which arose out of Frazer's study of Hebrew; and an edition of Ovid's *Fasti* (1929). The *Fasti* is a narrative poem organized around the cycle of the Roman holidays, and, like *Pausanias*, it gave Frazer an opportunity to employ the whole of his considerable scholarly equipment.

The Golden Bough was noteworthy because it offered something that had not been done before in English: a treatment from the philosophical, evolutionary point of view, delivered in sonorous and untechnical language, of the beliefs and behavior of the ancient Greeks and Romans as if they were those of "primitives." By the end of the nineteenth century, the classical world had lost much of the privileged status it had enjoyed since the Renaissance as the origin and repository of the greatest that had ever been thought and said. Indeed eighteenth- and nineteenth-century classical historiography was largely demythologizing in its impulse. But because of the centrality maintained by the classics in the educational curriculum and thus in the training and habit of mind of the governing classes in Great Britain, it came as a shock to a cultured reader when Frazer insisted on the ways in which life and thought in classical antiquity strongly resembled, overall and in detail, those of the "primitives" (or "savages") who had become well known to Europeans as a result of the imperialist expansion of the eighteenth and especially the nineteenth century.

Although many scholars have disagreed with some or all of it, the argument of *The Golden Bough* may fairly be said by now to have become part of the basis of modern culture (at least on the level of metaphor), and many educated people who employ its argument are unaware of its origins. Briefly, the work purports to be an explanation of a curious ritual combat that took place, according to ancient sources, in classical times in the town of Aricia outside Rome. In a grove at Nemi a "priest" stood guard at all times, awaiting

a challenger to his supremacy. The rule of the place was that any runaway slave who managed to reach the grove would gain his freedom if he succeeded in killing its guardian; with such success, however, came the obligation to assume the role of priest, and to kill or be killed in turn. In Frazer's view, this combat cannot be understood solely or wholly in terms of Roman religion; instead its elements must be analyzed comparatively (by adducing examples of analogous behavior from other "primitive" societies). He asserts that the guardian of the grove was a priest-king, who, like all such in primitive societies, literally incarnated the well-being of the community and thus had to be kept alive and well at all costs. This leads to a discussion of the strategies, both actual and symbolic (such as taboo, magic, sacrifice, and scapegoats), that such communities undertook to keep the king from weakness or death. At the heart of the work is a lengthy analysis of the complex of myth and ritual in the religions of the ancient eastern Mediterranean, all of which turn on death and resurrection and whose themes are often played out in seasonal combats and other fertility ceremonies. The main rites discussed are those of Attis, Adonis, Osiris, and Dionysos, all of whom Frazer understands as divine protagonists in the same, ubiquitous, recurrent vegetational drama.

The actual goings-on in the grove at Nemi are, Frazer finally admits, merely pretexts, for he is in fact interested in something more important: nothing less than the laws that describe the workings of the "primitive mind," which by definition is less well developed than the norm. Although this mind is inaccessible directly, it may be studied nevertheless, by adopting (from the work of the pioneering German folklorist Wilhelm Mannhardt) "the law of similarity": when customs are similar in different societies, one may then infer that the motives of the people performing them are also similar. This follows from the then generally accepted idea (advanced by E. B. Tylor) that the human race has evolved in a uniform fashion, mentally as well as physically. Further, because in Frazer's view the mentality of the primitive "Aryan" was still extant in that of the modern European peasantry because the peasantry still participated in a mental universe untouched by modern thought, it was therefore appropriate to compare the behavior of these so-called modern primitives (peasants and underdeveloped tribal societies) with that of historical societies of the ancient world in order to extract laws of primitive mental functioning.

Finally, however, Frazer was interested in even bigger game than primitive epistemology. For although in his survey of the dying-and-reviving gods of the eastern Mediterranean Frazer never mentions the name of Jesus, only the slowest of his readers could have failed to make the comparison between the pagan rites that result from an imperfect (because irrational) understanding of the universe and contemporary Christianity. Frazer employed the "objective," scientific comparative method as a weapon to finally dispatch Christianity as an outworn relic of misunderstanding, credulity, and superstition. There can be no doubt that his subli-

mal message was successfully delivered: The many uses of Frazerian arguments and images in the literature and cultural analysis of the post-World War I period (the most well-known of which is T. S. Eliot's *The Waste Land*) are ample testimony to that. (In addition, the Frazer papers in the library of Trinity College, Cambridge, contain many unsolicited letters from readers, educated and otherwise, that thank Frazer for having finally dispelled the veil of illusion from before their eyes as to the "real" nature of Christianity.)

As time has passed, Frazer's affinities are increasingly seen to be with those polymath scholars who, periodically since the Renaissance, have had the vision and industry to attempt a description and interpretation of the entire phenomenon of religion. Living when and where he did conferred several advantages on him. First, only by the end of the nineteenth century had European imperialism gone far enough to open up virtually the entire tribal world. Thus Frazer's was the first generation for which the data existed to permit a credible, anthropologically based worldwide conspectus of religious behavior. Second, the triumph of Darwinism automatically promoted as self-evidently correct any explanatory model that was based on evolutionary premises. If mind had developed in a linear fashion, as Frazer (and Tylor) believed, then a rigid, uniform progression from magic through religion to positive science seemed a plausible description of the pathway toward understanding that humanity had in fact taken.

From a current point of view, however, viewing Frazer from the other side of a gulf produced by a nightmarish century and by many years of anthropological fieldwork and much greater philosophical and methodological sophistication, he seems himself to be a relic of a habit of thought that, if not exactly primitive, then is at least of long ago and far away. His extreme empiricism and antitheoretical inclination made him a victim, finally, of his mountains of data. At the same time, he could never have presented such a stirring picture of the long evolutionary struggle of humanity toward self-understanding had he not been so willing to use simple categories under which to organize his data.

Frazer's professional descendants are many and various, as are their evaluations of his work. For English-speaking anthropologists, he is seen mainly as a horrible example of the "armchair school" of anthropology that was swept away by the advent of fieldwork. Historians of religion hold him in higher esteem, probably because the comparative method (of which his work is the greatest exemplar) is still in guarded use in that discipline. Finally, his name stands highest among literary critics and cultural historians, to whose field he made no explicit contribution.

It may be most reasonable to situate Frazer in a grand tradition—one that understands religion humanistically and therefore regards it as a perennially appropriate subject for discourse with the educated reader—that has been eclipsed in the present day as a result of the aspirations to scientific status of anthropology. One may see him, then, despite his

obvious limitations, as a scholar whose vision and literary gifts ensure him a permanent place in the ranks of those who have expanded the modern idea of the mysterious past of humanity.

ROBERT ACKERMAN (1987)
Revised Bibliography

FREEMASONS. The name for members of Freemasonry, the largest fraternal organization in the world, Freemasons are linked to numerous other rites, degrees, and orders collectively termed *Masonic*. Originally two words, *Free Mason*, the compound *Freemason* became standard by the nineteenth century. The term stands for "free and accepted mason," an accepted or "honorary" mason who is both freeborn (not bonded in servitude) and "free" from the original "operative" definition of *masonry*, the trade of stonecraft used to build churches and cathedrals throughout medieval Europe. Although there are records of noncraftsmen or "nonoperatives" joining earlier operative guilds, such as that of Elias Ashmole and Christopher Wren of Oxford, purely nonoperative "lodges" where Freemasons met were not publicly disclosed until the formation of the Grand Lodge of England in London in 1717. A Freemason (or simply "Mason") from about this time, and as outlined in the official *Constitutions* (1723 and 1738), was basically a "speculative" mason who, having undergone three degrees of initiation, lived a moral life devoted both to teachings derived from a symbolic understanding of the stonemason's craft and to the three great Masonic principles of brotherly love, relief, and truth.

Secrecy—and a certain mystique—has surrounded and continues to surround the Freemason rituals of initiation and moral instruction, yet Freemasonry, or "the Craft," is not in principle a "secret society" in the subversive social or political sense, since respect for lawful authority is a hallmark of Masonic teachings. Though sometimes viewed as representing a specific or even "revolutionary" political agenda, Freemasons have been found on both sides of major political and social conflicts in modern times. Moreover, information regarding the history, rituals, and proceedings of Freemasonry is readily available in public libraries, in bookstores, and on the Internet. In certain instances, the names of members and even the existence of the order in some parts of the world where Freemasonry has spread were withheld from political authorities that were undemocratic, dictatorial, or generally inimical, such as those of Nazi Germany, Communist Russia, Fascist Italy, Catholic Spain, and most Islamic countries today. On the other hand, political groups, such as the nineteenth-century Grand Orients in Spain and Portugal, have sometimes masqueraded as Freemasons.

As modern fraternal orders in secular societies, Masonic lodges and related organizations are open to public scrutiny, and membership is publicly displayed in almost all cases. Secrecy aside, one of the most engaging contemporary issues is whether Freemasonry is a "religion" or not. Membership requires a belief in a supreme being and the immortality of the soul, and there are ample references, albeit symbolic, to

religious symbols, personalities, and places in the rituals. Yet while the order testifies to its own archaic religious and even mythical roots, Freemasonry today resists the appellation of “religion” in the sectarian sense, encouraging only “that religion to which all men agree.” Also, not claiming tax exemption as a religious body, the order aims to transcend individual religious differences and unite men of diverse backgrounds in common cause under a symbolic notion of God as the great architect of the universe. Religious tolerance and liberty of conscience have been among the principles of Freemasonry since its inception.

Despite the great importance of Freemasonry and other secretive societies in any accurate description of the rise of Western civilization, few historians of religion have undertaken a comprehensive study of the history and cultural significance of Freemasonry in its various dimensions. In recent years, social scientists and historians of ideas (Clawson, 1989; Carnes, 1989; Jacob, 1991) have sought to understand the significance of Masonry within the larger spheres of religious fraternalism, gendered cultural systems, and the rise of modern democracy and civil society. In addition, competent historians within the fraternity (Hamill, 1992 and 1994; Roberts, 1961) have maintained active lodges of research with accessible archives. And as a wider net of scholars begin to tap the formidable amount of archival material available on Freemasonry worldwide, its significance as a vital factor in Western cultural history will be further appreciated. In addition, the rich symbolism found in Masonic rites can provide a treasure trove for ritual specialists, semioticians, phenomenologists, and gender scholars.

HISTORY. Recent scholarship has placed the historical emergence of Freemasonry either in England or Scotland between 1600 and 1717. Yet the origin of Freemasonry is still perceived by the lay observer as a tangled web of mystery and opacity, due partly to the institution’s use of ancient legendary history in its rituals and ceremonies, and to the fragmentariness of the early records of Masonic meetings, many of which may have been destroyed in the Great Fire of London in 1666. The confusion is heightened by a surfeit of origin theories—propounded by both Masons and non-Masons—that are largely untenable, such as proposals that the order has roots in the Druids, Gnostics, Egyptian pharaohs, the mysteries of Isis and Osiris, Phoenicians, Dionysiac Artificers, Vedic Aryans, Zoroastrians, Rosicrucians, the Jewish Qabbalah, Hermeticism, Essenes, or the Crusades. While aspects of these traditions permeate some Masonic rites and derivative orders, their direct influence during the seventeenth century is elusive and has been difficult to document. In fact, the precise historical circumstances of the transition from a medieval operative guild system, largely Catholic in orientation, to a nonoperative, gradually de-Christianized, non-denominational fraternity still remains to be adequately described and analyzed. Notwithstanding these conditions, it is perhaps most useful to divide Masonic history into two parts: legendary, the period for which there is virtually no authentic documents but only myths and legends; and historic,

the period for which authentic documents appear (c. fourteenth century and after).

Legendary Masonic history. The legendary period of Masonic history as outlined within the tradition is founded upon a unique blend of biblical, Greco-Roman, and Afro-Asiatic personalities, places, symbols, and events. James Anderson’s *Book of Constitutions* of 1723 and 1738, with nearly 150 pages of Masonic “history” tracing Freemasonry from Adam right up to Anderson’s own time, was a benchmark in establishing and perpetuating the more influential aspects of the legendary histories, including the Temple of Solomon. Anderson, a Scottish Presbyterian minister, drew upon earlier manuscripts known as *Old Charges* that were associated with operative guilds from the fourteenth to seventeenth centuries. From the perspective of these sources, stonemasonry was viewed in ancient times as nearly synonymous with geometry and architecture, knowledge of which was a privileged or secret possession available only through direct transmission between craftsmen. The legendary origins of stonemasonry, or the “royal art,” as it was called by Anderson and understood by medieval craftsmen, formed the basis upon which modern speculative Freemasonry was constructed. As such, the following may be construed as a linear account of the legendary history of Freemasonry as understood by members of the Craft in the eighteenth century. While also historically untenable, this scenario follows what the mainstream tradition had more-or-less accepted within its ranks as representing the most effective means to convey symbolic teachings pertaining to Masonic truths and virtues.

The almighty architect (God) created the universe according to the principles of geometry, and lastly created Adam in his own image. Possessing the divine knowledge of geometry as delivered to him, Adam built the first temple or place of worship in Eden, and lived in an innocent state. Then, despite his fall from grace, Adam retained this wisdom and taught his sons Cain, who built a city, and Seth, who taught his offspring. Later, the sons of Lamech perfected the arts of metallurgy, music, and tent construction; Enoch, anticipating a cataclysm (flood), built two pillars and engraved on them the sciences of geometry and masonry. According to the oldest manuscripts of the *Old Charges*, it was Hermes in Egypt who recovered one of the pillars and was able to restore the art of geometry by passing it on to the Egyptian pharaohs. But, according to Anderson, it was Noah who built the ark by the principles of geometry and, with his sons and their descendents, brought masonry into the postdiluvian world after settling on the plain of Shinar (Tigris and Euphrates). Anderson refers to a mason as a “true Noachite,” since the universal religious principles taught to Noah by God in the Bible represented important Masonic teachings. The descendants of Shem built the Tower of Babel under the direction of Nimrod who allegedly presided over the first Masonic organization in Babylon. After the destruction of the tower and the confusion of languages, the masons were able to preserve their teachings by devising a system of signs

and passwords, and Nimrod succeeded in building an empire in Assyria at Nineveh, and passing on the wisdom to the Chaldean Magis of Persia. The descendants of Ham brought masonry into Egypt and Canaan, and the descendants of Japheth brought it into Greece, Italy, Great Britain, and America. The names of Pythagoras and Euclid are also included in these legendary histories, as well as the role of the mysteries of Osiris and Isis as prototypes for the use of symbolism in initiatory rituals.

Abraham, schooled in the builders' art in ancient Mesopotamia, answered God's call and moved his family to Canaan, where he taught geometry to the Canaanites, as well as to his own offspring. Their descendants, the Hebrews, were eventually enslaved in Egypt but rose up under Moses, who was learned in Egyptian masonry. After leading his people into the wilderness accompanied by an ark that was designed by divine geometrical instruction, Joshua and the Israelites established the masonic arts once again in Canaan, where preparations were later begun under King David for a magnificent temple to their God.

The biblical aspects of Freemasonry that relate to King Solomon's Temple reflect a closer alliance with recorded history. Though Solomon is briefly mentioned as part of the Masonic chain in the earliest manuscripts of the *Old Charges*, Solomon and his Temple are central to Anderson's account in which the Masonic lodge itself becomes a symbolic replica of the Temple, influencing successive generations of Freemasons. Anderson portrays King Solomon as the Grand Master of Jerusalem who was assisted in the construction of the Temple by "masons" and carpenters sent by Hiram, King (or Grand Master) of Tyre. Among the workers is the chief architect, Hiram Abif, a stonemason. In the biblical books of *Kings* and *Chronicles* (1 *Kgs.* 7:13–50; 2 *Chr.* 4), there is mention of a Hiram from Tyre who is "filled with wisdom and understanding" and is primarily a worker in brass and metals. Building upon the biblical story, the Masonic version portrays Hiram Abif as a master mason who was murdered before completion of the Temple by ruffians for not revealing the secret master's word (i.e., password and signs). The legend of Hiram Abif, including his murder and "resurrection," became a death-and-rebirth allegory that is dramatized within the third degree ritual of today's Craft. The initiated master mason is imparted with the master's word and continues the line of succession, protecting this "intellectual property" into the future.

After describing events surrounding the destruction of the Second Temple, and its rebuilding under Herod, Anderson continues in his narration with Jesus Christ as the Grand Master of the Christians who rose again from the dead. Then he focuses primarily on the architectural achievements of the Romans and how the Royal art was then preserved through the Middle Ages by the patronage of the British monarchy, right up until the time of the stonemasons and the first non-operative lodges.

Historic period. The Historic period of Freemasonry has been traced by scholars (Clawson, 1989; Jacob, 1991; Hamill, 1992 and 1994) to these same periodic gatherings and confraternities of operative stonemasons engaged in the building of medieval churches and cathedrals in England and Europe. The earliest manuscripts associated with the work and moral symbolism of the stonemasons, the *Old Charges*, date from the late fourteenth century and are also called the "Gothic Constitutions." Besides tracing the legendary history of the Craft of masonry, as shown above, they contain specific moral instructions that are enjoined upon members as apprentices, fellow craftsmen (or journeymen), and master masons. It is probable that secrecy dates from this period, when knowledge of the building techniques of individual master masons was restricted to guild members.

Freemasonry as an official public institution is normally dated from the establishment of the first national Masonic organization, the Grand Lodge of England, a result of the combination of four smaller lodges of nonoperative (non-craftsmen) masons at the Goose and Gridiron Alehouse, London, on June 24, 1717. While nonoperatives were included in operative masons clubs or guilds, no cooperative network of nonoperative lodges had been formally announced. The history of Freemasonry during this period is documented primarily through publications, private diaries, journals, minutes, and newspaper accounts. The Craft attracted royal patronage by 1720, and many of its early members in London were also connected to the Royal Society and the circle surrounding Isaac Newton.

The Masonic lodge became a radically new blend of aristocrat, commoner, Catholic, Protestant, and Jew, by which new ideas of liberty, equality, and fraternity were celebrated. Many Masons in Europe at this time were distinguished figures of the Enlightenment, including Voltaire, Edward Gibbon, Goethe, Johann Herder, Johann Fichte, Wolfgang Amadeus Mozart, Joseph Haydn, Alexander Pope, Jonathan Swift, and John Theophilus Desaguliers, an Anglican priest of Huguenot ancestry who became the order's third elected Grand Master. Mozart wrote an entire set of Masonic musical works for his lodge, as well as *The Magic Flute* (1791), an opera rich in Masonic symbolism.

The introduction of Freemasonry into France by 1725 signified the transition from a largely nonpolitical organization into a body that was also identified with the Jacobite cause for the restoration of the Stuart monarchy in England (King James). The descendants and followers of the exiled James II, who had died in 1701, found sympathizers on the continent, especially in Catholic France, who viewed Masonry as a means of infiltrating themselves back into English society. Though the Grand Lodge of France was nominally in control, there was a proliferation of new Masonic orders and exotic degrees that went beyond expectation. Under the direction of Chevalier Michael Ramsay, a Scottish pro-Stuart Catholic Freemason, the initial three-degree ritual of the English Craft tradition was enlarged into a system of *hautes*

grades, or high degrees, which greatly influenced the nature of the fraternity. In order to align Freemasonry with Scotland and the Stuarts, Ramsay made the claim in a famous speech that Freemasonry really originated from the Knights Templar, a monastic order protecting the Crusades that had been disbanded and persecuted by the pope in the fourteenth century, but which had sought asylum in Scotland until it resurfaced as Freemasonry. The Templar origin theory continues today in the works of John Robinson and Michael Baigent, as well as in some recently popular novels and films. Appealing to the French taste for high-sounding titles and rituals, and the continental aversion toward building trades, Ramsay initially contrived a series of three chivalric degrees that initiated the candidates into a kind of knighthood unknown to the British lodges. Numerous degrees were later added that included Rosicrucian, Gnostic, qabbalistic, and Hermetic elements (Knight of the Sun, twenty-eighth degree in the Scottish Rite), so that by the end of the nineteenth century there were literally hundreds of degrees offered by various Masonic and quasi-Masonic organizations, many of which were open to women.

Regarding certain occult aspects of Freemasonry, recent scholarship has shed light on the Hermetic and possibly Rosicrucian influences on the historical founding of Freemasonry. Building upon the work of Francis Yates, David Stevenson has shown plausible connections between early Freemasonry in Scotland, Hermeticism, Rosicrucian “invisible” brotherhoods (Lutheran mystical groups), and the ancient art of memory in the sixteenth century. According to Stevenson, the art of memory, originally a technique for improving the memory by visualizing rooms in a building, became, under the influence of the sixteenth-century Hermeticist Giordano Bruno, a magico-religious art for the ascent of the soul, and it was adapted into Masonry to fix the mind on images and symbols in the Masonic temple. As such, late Renaissance fascinations with Egyptian hieroglyphics, alchemical searches for immortality, Neoplatonism, and architecture were all persuasive factors in the genesis of the fraternity.

The higher degrees that survived into mainstream Freemasonry were later grouped into two principal rites, or systems: the Scottish Rite of thirty-three degrees, which was originally derived from the French but flourished in America; and the York Rite, a system of advanced degrees said to originate in York, England. The Scottish Rite, built upon the earlier Rite of Perfection of twenty-five degrees, was brought to the West Indies by Stephen Morin and formally established in the United States by 1801 in Charleston, South Carolina, where it was enlarged to thirty-three degrees. Albert Pike (1809–1891) rewrote all of these degrees during his term as Supreme Commander of the Ancient and Accepted Scottish Rite.

British Freemasonry, organized into separate Irish, Scottish, and English grand lodges, remained nonpartisan during the political-religious disputes of the eighteenth century.

While there were some Protestant Christian advocates among the members, the order removed any requirement that its initiates be Christians with the adoption of the *Constitutions* of 1723, revised in 1738 by James Anderson. Largely as a result of British imperial expansion, initially among the military, lodges of Freemasons were established in North America, India, the West Indies, and throughout the world.

During the latter half of the eighteenth century, a rival grand lodge was formed by disaffected Irish and Scottish Masons that divided English-speaking Freemasonry for sixty years. Calling themselves “Antients” and the others “Moderns,” this schism was finally healed in 1813 with the formation of the United Grand Lodge of England under the leadership of the duke of Sussex, who had been Grand Master of the Moderns. This division had led to the addition of the Holy Royal Arch to the basic three-degree system. While not of the highly imaginative character of continental degrees, the York Rite or Royal Arch provided Freemasons with a set of degrees that proposed to impart the ineffable name of deity to the degree’s recipient. This rite was incorporated into the British Masonic system and also included Knights Templar and Knights of Malta degrees. Initially an Antient invention, the York Rite won wide acceptance throughout the Masonic fraternity in the nineteenth century.

The vital contribution of Freemasonry toward the establishment of the United States is confirmed by modern scholarship. Founding fathers like George Washington, Benjamin Franklin, John Hancock, and James Monroe, as well as the Marquis de Lafayette and a host of others, played key roles in making the ideals of Freemasonry a reality by creating America as a kind of Masonic “Temple of Virtue” that produced model citizens. Many of the principles laid down in the United States Constitution are essentially Masonic principles: liberty, freedom of conscience, religious tolerance, pursuit of happiness, and separation of church and state. Most federal and state government buildings were consecrated with Masonic ceremonies. In addition, Freemasonry became almost synonymous with patriotism toward America’s “civil religion.” Famous patriotic Masons like Irving Berlin (“God Bless America”) and John Philip Sousa (“Stars and Stripes Forever”) wrote stirring songs and marches, while lesser-known Masons designed the capital city of Washington, D.C., created the Statue of Liberty, and sculpted the faces on Mount Rushmore.

Freemasonry in the nineteenth and twentieth centuries continued to develop along the lines established by the differing English and French models. English, Irish, and Scottish Freemasonry shaped the fraternity and its teachings in Canada, the United States, the West Indies, India, and much of Africa. The impact of the French tradition, with its rationalistic and politicized emphasis, was more deeply felt in Austro-Hungary, Spain, Portugal, Italy, and Latin America. By 1877, communication between these two groups had virtually ceased, when the Grand Orient of France removed the requirement that its initiates declare a belief in the existence

of God as the “Great Architect of the Universe.” In English-speaking areas, Freemasonry has in general prospered as a support to constitutional, democratic government.

One notable blemish on the Craft was the anti-Masonic episode in the United States. The abduction and suspected murder of William Morgan of Batavia, New York, in 1829 caused a widespread reaction against Freemasonry throughout the country. Morgan had published an exposé of its rituals and had brought considerable wrath upon himself from the fraternity, yet no solid evidence of his murder has been brought forward. Other secret societies, including Phi Beta Kappa and college social fraternities that are derived from the Freemasons, were also publicly affected, largely as a reaction against the perceived influence of political and social elites. This situation also precipitated the first American political party convention, that of the Anti-Masonic Party in 1832.

MASONIC TEACHINGS. Since 1717, Masonic teachings have retained a remarkable continuity and consistency. Membership in Freemasonry is comprised essentially of three steps or “degrees.” The prospective candidate, after initial screening and interviewing, is initiated into the first degree as “entered apprentice,” passed to second degree as “fellowcraft,” and raised to the third degree as “master Mason,” usually within a year. In place within Masonic ritual by 1730, the completion of all three degrees in succession made a man a full Mason, with all the rights and privileges of lodge fellowship, but also with expectations of participation in leadership succession, charitable work, and submission of dues. As part of the transformation from operative to speculative (initiated and living according to Masonic virtues) Masonry, each of the three degrees has employed within its structure “working tools” of the operative stonemasons, transformed from raw implements into symbols of Masonic teachings. The entered apprentice degree uses the 24-inch gauge and the common gavel, the former symbolic of dividing the hours of the day into three periods of service to God, charity, and rest, and the latter symbolic of removing vices and superfluities of life (i.e., forming the perfect ashlar out of the rough or imperfect stone, itself symbolic of the new candidate). The fellowcraft degree utilizes the plumb, square, and level to symbolize walking upright before God and fellow humans, honesty (“fair and square”), and equality (“on the level”). The third degree of master Mason utilizes the trowel in order to spread (“the cement of”) brotherly love. In this degree, the legendary architect of King Solomon’s Temple, Hiram Abif, is portrayed in a drama whereby he is symbolically slain by ruffians for not revealing Masonic secrets, and then “resurrected,” thus serving as a paradigm for the rebirth of the candidates into a new life.

In addition to the above tools, there are three immovable “jewels” of the lodge, the rough ashlar (unpolished state of noninitiation), the perfect ashlar (ideal “polished” state of Masonic life), and the trestleboard (the rules and designs given by the “Great Architect of the Universe,” the symbolic name for God). Each implement as used in the lodge both

illustrates and confers specific Masonic teachings and obligations that are spoken as part of a “catechism” memorized by the candidate for each degree. All Masonic degrees are related to the transformation of the human personality from a state of darkness to light (“light in masonry”), symbolic of a higher level of human moral perfection destined to reach the “celestial lodge above,” the term used for immortality beyond death.

Because Freemasonry has transposed a system of moral and noetic teaching upon a graded institutional structure, it has often been deemed a threat to confessional and orthodox religion. The basis for such assumptions is the fraternity’s use of symbols that describe the change of personal moral character and human awareness by stages or degrees. These degrees have been interpreted as a plan for spiritual redemption without penance and forgiveness of sin. A study of the basic ceremonials and teachings, however, suggests that the goal of Masonic initiation is not actually redemption in the literal sense, but rather a shift in the initiate’s perception toward the betterment of his personal moral character.

The lack of central authority and the multitude of Masonic degrees and ceremonials make it impossible to state unequivocally that Freemasonry is religious in any final or conclusive sense. Since Pope Clement XII’s encyclical *In eminenti* in 1738, the Roman Catholic Church has proscribed Masonic affiliation for Catholics, with excommunication as the penalty. The emancipation of Jews was one of the by-products of the Enlightenment, and was ascribed to Masonic influence. As such, the free admission of Jews into lodges of equal fellowship with Christians evoked further condemnation by the Roman Catholic Church. Moreover, the identification of major southern European and Latin American revolutionary leaders, such as Giuseppe Mazzini, Giuseppe Garibaldi, Simón Bolívar, Bernardo O’Higgins, and José Julián Martí y Pérez, with Freemasonry created more tension by the end of the nineteenth century, especially during the First Vatican Council (1869–1870). More recently, the Lutheran Church-Missouri Synod and the Southern Baptist Convention in the United States and the General Conference of the Methodist Church in England and Wales have legislated claims that Freemasonry is a system of faith and morals outside of the Christian tradition.

Beside suspicions of philo-Semitism, including the fictional notion of a worldwide Jewish-Masonic conspiracy, Christian opposition to Freemasonry stems from the alleged elements of deism, natural religion, and Neoplatonism in Masonic rituals that suggest the perfectibility of humanity rather than its sinful nature and need of redemption in Christ (see Whalen, 1958). However, many churches that maintain a less exclusive understanding of revelation have been much more tolerant of Freemasonry’s belief in a universal brotherhood of humanity under the fatherhood of God. Many Christians today continue to enjoy both Masonic and Christian fellowship. Moreover, in parts of the world where religions other than Christianity prevail, the volume of sa-

cred law used in Masonic lodges corresponds to the prevalent book or scripture: in India, the Vedas or *Bhagavadgītā*; in Muslim countries where Masonry is permitted, the Qur'an; and in Israel, the Torah. As such, Freemasonry does not advocate deism or any other specific religious doctrine, stressing that members pursue their religious life outside of the fraternity, yet live a moral life according to universal principles of brotherly love, relief, and truth.

At the beginning of the twenty-first century, Freemasonry has a worldwide membership of approximately seven million people. It is governed by independent national grand lodges, except in the United States, Canada, and Australia, where grand lodges are organized by state or province. All Freemasons maintain membership in a specific lodge, yet are welcomed as fellow Masons in most places of the world where Freemasonry thrives.

Freemasonry has also provided a working structure or model for secret organizations. During the nineteenth century, many new fraternal orders were created that in some way were derivative of Freemasonry. The Knights of Columbus is a Masonic-like order for Catholics only, and the Order of B'nai B'rith has a Jewish clientele. There is an endless list of these, including Odd Fellows, Elks, Moose, Rotary, Kiwanis, Lions, and Eagles. Even such occult groups as Gardnerian Witchcraft, the Theosophical Society, and the Hermetic Order of the Golden Dawn are not without Masonic influence.

More closely within the Masonic fold are the groups that require initiation into the three Craft degrees. Beside the Scottish and York Rites, there is the Ancient Arabic Order of the Nobles of the Mystic Shrine (Shriners), which has a visible Islamic theme to its rituals, and, along with the Grotto, provides a recreational dimension to fraternity life that is also strongly committed to charity in the form of burn clinics and hospitals for crippled children. The Order of DeMolay is designed for young men, and Acacia is the name for the Masonic college fraternity.

Freemasonry is by no means an exclusively male concern. Since ancient times, women have also bonded together into sisterhoods, both religious and secular. The Eleusinian Mysteries in ancient Greece, and the various women's orders in the Roman, medieval, and Renaissance periods, are precursors for what came to be referred to as adoptive Masonry, established in France about 1775. The Adoptive Rite, designed for wives, sisters, widows, and daughters of Freemasons, consisted of four degrees: apprentice, companion, mistress, and perfect mistress. Numerous Masonic rites and orders that included women proliferated in the nineteenth century, including Co-Masonry.

The most famous and successful of the adoptive or androgynous orders (orders that include both men and women) emerged in the United States in 1868 under the guidance of Robert Morris, an active Freemason. This group is called the Order of the Eastern Star, and it has over two million

women members worldwide. Their rituals, utilizing a five-pointed star, consist of five degrees drawn from the examples of five biblical heroines: Adah (Jephtha's daughter; *Judges* 11: 29–40), Ruth, Esther, Martha, and Electa (alluded to in 2 *John*). Florence Nightingale was one of their famous patron members. Other Masonic orders for women include the White Shrine of Jerusalem and the Order of Amaranth, with Job's Daughters and Rainbow Girls for young women. Beside these, there are now several full-fledged women's grand lodges in the United States, which are independent of male Freemasonry. These groups, like most Masonic organizations, engage in various charitable activities. While Freemasonry is racially mixed, there are also independent, largely black, grand lodges. The largest of these African American lodges is Prince Hall, named after a freed slave in eighteenth-century Massachusetts who received a charter from London. Many notable African Americans, such as Booker T. Washington and W. E. B. Du Bois were Prince Hall Masons, as were jazz musicians Louis Armstrong, Duke Ellington, Count Basie, and Nat King Cole.

FAMOUS MASONS. Any assessment of the Masonic fraternity must acknowledge the wide range of membership that cuts across religious, ethnic, cultural, and racial lines. The list below includes names of some Masons who have distinguished themselves in service to both Masonry and the society in which they lived.

Stephen Austin, "Father of Texas"; Luther Burbank, American naturalist; Robert Burns, Scottish poet; Marc Chagall, Russian artist; Walter Chrysler, American car manufacturer; Winston Churchill, English statesman; Ty Cobb, American baseball legend; Davy Crockett, American frontiersman; Cecil B. De Mille, American filmmaker; Arthur Conan Doyle, English author; W. C. Fields, American comedic actor; John Glenn, American astronaut; Pasha Ismail, Egyptian viceroy and builder of the Suez Canal; Jerome Kern, American composer; Rudyard Kipling, English writer; Charles Lindbergh, American aviator; Charles H. Mayo, American physician and co-founder of the Mayo Clinic; Andrew Mellon, American industrialist; Motilal Nehru, Indian politician and father of Jawaharlal Nehru; Norman Vincent Peale, American Protestant clergyman; Pedro I, first king of Brazil; Paul Revere, American Revolutionary War hero; Sugar Ray Robinson, American boxing champion; Roy Rogers, American actor; Antoine Sax, Belgian inventor of the saxophone; Walter Scott, Scottish novelist and poet; Jean Sibelius, Finnish composer; Arthur Sullivan, English composer; Leo Tolstoy, Russian author; Swami Vivekananda, Hindu ascetic and philosopher; John Wayne, American actor; and Oscar Wilde, Anglo-Irish writer.

United States presidents who were Masons include George Washington, James Monroe, Andrew Jackson, James Polk, James Buchanan, Andrew Johnson, James Garfield, William McKinley, Theodore Roosevelt, William H. Taft, Warren G. Harding, Franklin D. Roosevelt, Harry S. Truman, Lyndon B. Johnson, Gerald R. Ford, and Ronald Reagan.

GUY L. BECK (2005)

FREE WILL AND DETERMINISM. Free will is a moral, religious, and social concept that is central to philosophy and most religions. It has been argued that the basis of freedom lies in the contingency of natural events. Though this line of reasoning has been by and large abandoned, for freedom to exist at all the concept of strict universal causality will have to be suspended, at least in the moral sphere. Another line of thought sees the foundation of freedom in spirituality: The soul, as immaterial, is not subject to the deterministic laws of nature. Whatever the explanation, belief in free will amounts to the conviction that, as individuals, human beings are endowed with the capacity for choice of action, for decision among alternatives, and specifically that, given an innate moral sense, humans can freely discern good and evil and choose the good, though they often do not. Determinism is the philosophical view that, given certain initial conditions, everything that ensues is bound to happen as it does and in no other possible way; thus nothing in nature is contingent, nor is there any room for human freedom. The partisans of a "hard" determinism hold that none of one's actions is free, but only appear to be so; consequently, moral responsibility is an illusion as well; "soft" determinists, or compatibilists, believe that while one's actions are indeed caused, one is nevertheless free, since causality does not compel one's will.

PHILOSOPHICAL INTERPRETATIONS. In Greek antiquity the idea of free will was clearly derived from the difference be-

tween free individuals and slaves, in modern times from the political structures of rising democratic electoral systems. A whole lineage of philosophers tried to reconcile the idea of determinism, the theological one in particular, with that of free will as uninhibited intentional action. Early Greek thought regarded free will as the denial of all intrinsic limitations upon the pursuit of voluntary goals. Plato shows in the *Republic* that social structures and moral conventions can be masterminded and manipulated at will. Both Socrates and Plato shifted the locus of freedom from the power to affect external events to the inner exercise of will and conviction. For Aristotle the power of free will lies in the capacity of thought to harmonize itself not only with God but with the good and the good life (*On Interpretation*, chap. 9). To be free meant to be rational. According to Augustine of Hippo (*On Free Will*), God's foreknowledge of events does not curtail the capacity to choose and indeed the necessity of doing so, since God's knowledge of eternity is somewhat akin to that of a ubiquitous present. The will is certainly free and there is no reason to believe that God's knowledge of the object of the will should impair its freedom in any way. Humanity's freedom is to love God and act upon its own will. In accordance with the same line of argument, Boethius (*On the Consolation of Philosophy*) defined eternity as "the simultaneous and complete possession of infinite life." Thomas Aquinas similarly held that God's eternal vision could in no way cause one's actions (*Summa theologiae* 1.14.13).

Modern philosophers struggled with the dilemma of divine foreknowledge and human freedom by redefining the latter, for instance, as "lack of constraint" (Hobbes); others, for example, Descartes, emphasized the infinity of the will in espousing the true and rejecting the false even though human understanding may be limited. Spinoza conceived of human free will as self-determination; Leibniz, as a form of uncaused spontaneity, which was later to be equated with "freedom from indifference." It followed from these views that God could never be blamed for human errors. Yet this concept of a mind causally undetermined, inexplicably free, was found unsatisfactory and was replaced by Locke's concept of preference as cause (opposed to the previous idea about the irrelevance of judgments to one's will), and by Hume's argument that a free action is one that could have been avoided. For Kant, determinism is phenomenal and freedom is noumenal, since the pure practical reason upon which one freely acts lies outside the realm of causation and makes up the essence and autonomy of moral life. Hegel and his left-wing followers looked upon freedom and necessity as two sides of the same coin, two ideas dialectically interconnected through "knowledge" or "understanding": Freedom is necessity understood. Other nineteenth-century idealists, called libertarians, tended to postulate a special entity, the "self," which uses the body as a causal instrument while being itself immune to causation. The materialists, to the contrary, had favored since antiquity an almost total subordination of freedom to the necessary or contingent play of natural and social forces outside of both individual and divine control.

RELIGIOUS INTERPRETATIONS. The essential presupposition of most major religions is that humans are born with freedom of choice. Free will is the capacity to choose among courses of action, objectives, things, desires, and so forth, and also to assume full moral responsibility for them. For the will to be free it is therefore necessary that there be no direct coercion, serious compulsion, or distortion of truth (for example, through propaganda or brainwashing) and also that alternatives for choice be at hand. A variety of conditions in society will allow for a variety of beliefs and the free exercise of human choice. Classically, this idea is defined as the absence of obstacles to the realization of various freedoms; it has a negative aspect, *freedom from* (want, fear, et al.), and a positive one, *freedom for* (worship, creativity, symbolic acts of speech, et al.). Religious freedom, including, but not reducible to, freedom of worship, illustrates the inseparability of these aspects, being at the same time freedom from spiritual coercion (for example, forcibly inculcated atheism, active proselytism) and freedom for the consciousness to believe, the individual to practice, and the community to exercise the rules of conduct and rituals of its own tradition.

The principle of determinism, which claims that the states of the universe, including human volition, are to be rigidly deduced from previous causes, and that nothing could be other than it is or was, is a negation of free will. To the extent that they involve moral responsibility, all religions must recognize that a human being is a free agent. However, the presupposition of monotheistic religions that the one God is not only omnipotent but also omniscient seems to annul the power of free decision in humanity, which leads to the contradiction of one being held responsible for some courses of action for which one is actually not responsible.

Most religions have sought a theological solution to this dilemma. In Hinduism, even though the blame for evil is usually cast upon the god who causes human imperfections and thus dooms humanity to downfall, people are still held morally responsible for their woes, as they are for corrupting other human beings; parents are considered morally responsible for their children's—even physical—constitution. A concept present across the board in Asian religions, from Jainism and Brahmanism to Buddhism, Sikhism, Parsi, and animistic religions, is *karman*, which mainly points to action and reaction in the long series of reincarnations but is erroneously understood sometimes as rigid universal determinism, fate, or even retributive justice. Actually *karman* encompasses the unity and interrelatedness of all phenomena, their fundamental contingency, and the acts or rituals (*karman*) capable of destroying the bonds of transmigration. Under the law of *karman* an individual is essentially free to accept or to attempt to change the chain of cosmic events. There are many oscillations (from myth to myth and scripture to scripture) and ambiguities concerning the status of the individual in the cosmos: On the one hand, he or she might be considered as a passive entity subject to the laws of the universe, now weakened and contaminated, now strengthened and purified, by

the flow of events; on the other hand, the individual enjoys a certain amount of spontaneous freedom. In any case, the goodness to which one should aspire is the integration and the harmony of ambivalent features rather than their dissociation. This is what makes the Hindu concept of free will radically different from the Judeo-Christian one.

There are two main concepts designating freedom in Indian philosophy: The one is *svāraj* (self-rule), which appears already in the *Chāndogya Upaniṣad* and has definite social, political, and moral connotations; the other is *mokṣa*, which has the psychological and metaphysical connotations of deliverance, emancipation, and release. There is both a tension and a synthesis between the two, out of which the real notion of freedom in Hinduism emerges. *Mokṣa* is, however, the ultimate goal of Hindu religion. It is freedom from *karman* and bondage, which in turn is freedom from ignorance, a freedom to be attained not after death but here and now through physical and mental discipline. Biological and social freedom is a necessary yet not sufficient condition for its achievement.

In Judaism, a person is born free because he or she is created in the image of God (who is free). Also, it is God's goodness that is reflected in human freedom. The faithful are to abolish completely their will in favor of God's. Yet, according to the teachings of the Bible, human obligations flow from two sources: divine law and the voice of inner conscience. In the Talmud, the *mitsvot* appear as absolute prescriptions, that is, decrees to be followed by man. Jewish philosophers, nevertheless, and particularly those influenced by Hellenism (e.g., Philo Judaeus and Josephus Flavius), insist on the heteronomous nature of the *mitsvot*, which are also an explicit expression of natural law. Judaism offers little evidence for the idea that events in the life of an individual might have been "fated" (in the Greek sense of *moira*); yet the major collective occurrences in the life of the people of Israel were commanded and predetermined by God. As lord of history and judge, God both rules over nature and determines the end result of human deeds and conflicts. God may sometimes be portrayed in the Hebrew scriptures (*Is.* 34:17) as a caster of lots. In the rabbinical period, the belief emerged that God did predetermine major events such as the dates of birth, death, and marriage in the individual's life. Outside of these, however, there was no predetermination. Nothing could abolish the free will and therefore the moral responsibility of the person.

Islam holds the belief that major events are fated and decreed by God; this allows one to affirm the underlying uniformity and rationality of the universe. The concept of fate, however, was borrowed from pre-Islamic Arabic literature, especially from poetry that was not necessarily religious. It became subordinated in Islam to a divine predestination that by itself does not preclude the actual freedom of the individual's will. More and more, Islamic theologians shun the attribute of fatalism bestowed upon the Muslim religion. "Fate" is often a label given after the fact; to say that something is

fated is to give an easy and weak explanation to an otherwise inexplicable event. The argument is that while in God's mind everything is determined in advance, the active believer is wholly ignorant of this determination and therefore enjoys fully the freedom to choose.

Christianity is among the major religions that emphasize the freedom of humanity to the last consequence. Even the existence of evil in face of the omnipotence of God is justified in terms of the supremacy of humankind's essential freedom to adopt its own goals and to choose its own course of action. The controversy between Augustine of Hippo and Pelagius as early as the fifth century set the scene for what was to be an ongoing theological debate in Western Christianity. To Augustine's almost exclusive emphasis on indwelling grace, Pelagius, a British monk who lived in Africa and was condemned for heresy by two synods, opposed the notion that the human, unassisted free will acts in a sovereign way in bringing about or jeopardizing human salvation. In the sixteenth century, Erasmus of Rotterdam defended the church doctrine of free will against Martin Luther's aggressive denial of it and Luther's affirmation of humankind's complete dependence upon God's grace. Protestant theology with Zwingli, Wyclif, Calvin, and their followers steadily upheld the soteriological and metaphysical doctrine of predestination.

In Mādhyamika Buddhism, freedom from pain, which implies a complete, blissful regeneration of humankind, is achieved by the elimination of all conceptual constructions at their very roots: the duality between "is" and "is-not." The spiritual discipline of attaining enlightenment or achieving Buddhahood through the resolution of the painful conflict between the private and the social good is conducive to wisdom, *prajñā*, which is itself liberating. To achieve freedom is mainly a negative process consisting in the elimination of hindrances that obscure the real, such as attachment, aversion, and all mental fictional constructions. *Śūnyatā* as the intellectual intuition of voidness is equated with freedom.

Avowedly the relationship between free will and determinism is one of paradox, that is, of mutual implication and repulsion occurring simultaneously. This paradox can more or less be dissolved by relegating free will to the realms of spiritual awareness, psychologically lived reality, and practical (moral) action; whereas determinism and predestination would belong to the actual ontological and existential givenness of things and events in the world. Attempts at solving this paradox have led some theistic process philosophers and theologians (e.g., Charles Hartshorne) to want to weaken the divine attributes of omniscience and omnipotence. It is not God's unsurpassable power but his monopoly on it that is denied. This should allow for openness and indeterminacy in the future in which humanity's options can be exercised freely. The present stage of the philosophical discussion of free will and determinism in relation to both cosmology and individual existence involves sophisticated epistemological arguments from the theory of explanation, causality, the

symmetry of past and future, and the theory of human action.

FREE WILL AND PREDESTINATION: AN OVERVIEW

Free will and predestination constitute a polarity in many of the religions of the world: is salvation determined by a divine choice or is it a matter of personal self-determination? *Free will* in this article does not refer to the general philosophical problem of the will’s freedom but to the specific meaning and function of willing and self-determination in the process of salvation. Some religious thinkers have sharply distinguished between the will’s freedom in the material and civil affairs of life and its freedom or unfreedom with regard to the spiritual life, and it is with the latter that this article is concerned.

At least two ways of thinking about the freedom of the will in spiritual matters have been common: free will as a freedom of choice, whereby one does freely what one has also had the power to choose to do, and free will as the absence of compulsion, whereby one willingly does what one does without actively choosing what is done. The latter has been described as voluntary necessity. In the first of these meanings of freedom, freedom seems incompatible with divine determination; in the second, it does not, and is opposed not to causality but to constraint.

Predestination as it is treated in this article is separated from the general consideration of providence, determinism, and fate, and refers only to the voluntary divine choice of certain groups or individuals for salvation. Sometimes predestination is considered as a part of divine providence, namely, that aspect of the divine determination of all things that refers to the supernatural end of souls, as opposed to the determination of persons with regard to all else or of the natural order. But predestination is to be sharply distinguished from some forms of determinism and from fatalism, which do not necessarily involve the theistic concept of a personal deity making conscious choices. *Determinism* may mean any one of a number of systems claiming that all events cannot occur otherwise than they do, sometimes without reference to deity. *Fate* suggests an impersonal determining force that may even transcend the gods.

The terms *election* and *reprobation* have meanings related to predestination. One traditional use of these terms considers predestination the larger divine act, which encompasses the separate decrees of election (predestination to salvation) and reprobation (predestination to damnation). *Reprobation*, however, is seldom used now, and *election* is more commonly simply substituted for *predestination*, because it seems more positive in its connotations. In biblical studies, *election* has been the preferred term for referring to divine choice.

Predestination has been considered not inevitably contradictory to free will. Sometimes both are held together as paradoxical, yet complementary, aspects of truth; but more classically, free will is understood not as freedom of choice but as voluntary necessity. That is, where freedom means the absence of compulsion, necessary acts determined by God

nonetheless can be freely done. Almost all predestinarian theologies have therefore maintained that the predestined will acts freely and with consequent responsibility for its actions, even though it lacks the power to choose its actions. In this sense of freedom, even the decree of reprobation has been seen as compatible with responsibility and not as entailing a divine compulsion to do evil. This compatibility of free will and predestination has historically been a commonplace of Augustinian and Calvinistic theology in Christianity, and of Islamic theology through its doctrine of acquisition. Even such a materialistic determinist as Thomas Hobbes thought that necessary acts were entirely voluntary and therefore responsible acts. It is this that sharply distinguishes predestination from fatalism, which may entail compulsion to act in a certain way. Roman Catholic theology refers to any predestinarian doctrine that proceeds without reference to the will's freedom as the error of predestinarianism. Only in rare cases in Christian and Islamic theology has that way of understanding predestination appeared.

OCCURRENCE IN THE HISTORY OF RELIGIONS. The issue of free will and predestination in relation to salvation arises in those religions that believe in a personal, omnipotent God, and thus has appeared mainly in Judaism, Christianity, and Islam. But it has also occurred in ancient Greece and India among certain groups that have had a similar religious understanding.

Ancient Greece. Ancient Greek monotheism, centering on the figure of Zeus, came near to personal theism in Stoicism, particularly among the later Stoics who believed in immortality. They considered Zeus a universal mind and will determining all things, including the virtue by which good persons resigned themselves to the inevitable; through this providence elect souls triumphed over the sufferings of earthly existence.

Judaism. In Judaism, the Deuteronomic tradition especially accents Yahveh's choice of Israel as his people. In the Hebrew scriptures, the stories of Moses, Samuel, Isaiah, and Jeremiah show God's choice of particular persons to fulfill special offices. But this election, whether of persons or of the group, is grounded by the Hebrew scriptures in the divine initiative, not in the chosen object, and involves special tasks and responsibilities more than special privileges. The will's freedom of choice in obeying God's commandments is clearly asserted in many passages of the Hebrew scriptures, as, for example, in *Deuteronomy* 30:15–20. The apocryphal book of *Ben Sira* asserts that God does not lead persons astray but created them with the freedom not to sin (15:11–17).

Josephus Flavius, in describing the Pharisees to his Hellenistic audience, said that they considered all events predestined but still did not deprive the human will of involvement in decisions about virtue and vice. The Sadducees he described as rejecting determinism altogether (*Jewish Antiquities* 13.171–173; *Jewish War*, 2.162–166). The Essenes were the most predestinarian of the Jewish groups, if the Qumran texts are to be attributed to them. The Qumran lit-

erature teaches that God created the spirits of men to be cast in the lots of either good or evil and that salvation is divinely initiated and based on God's choice. Nonetheless, the Essenes also maintained human accountability for evil. Elsewhere in the Judaism of the Hellenistic age, Philo Judaeus upheld the will's complete freedom.

Rabbinic literature taught both God's foresight and providence directing all things and human freedom of choice with respect to the doing of good or evil. A saying of 'Aqiva ben Yosef juxtaposes them: "All is foreseen and yet freedom is granted" (*Avot* 3:15). Some rabbinic sayings suggest that everything about a person's life is determined by God except for the soul's obedience to God (B. T., *Ber.* 33b, *Meg.* 25a, *Nid.* 16b). This matter did not become a serious question for Jewish thinkers until contact with Islamic speculations in the tenth century, when Sa'adyah Gaon took up the problem. He and all the medieval Jewish philosophers maintained the will's freedom of choice. But Maimonides alluded to the view of "uninformed" Jews that God decrees that an individual will be either good or evil when the infant is being formed in the womb (*Mishneh Torah*, Repentance 5.2).

Christianity. Predestination has had a more central place in Christian thought. The theme of predestination to salvation appears strongly in the Pauline literature, especially the *Letter to the Romans*. For Paul, predestination results from the divine initiative and is grounded in grace, so that no one may boast of being saved by his own efforts. Paul also speaks of God's hardening of the hearts of unbelievers (*Rom.* 9:18).

In spite of the numerous New Testament references to predestination, patristic writers, especially the Greek fathers, tended to ignore the theme before Augustine of Hippo. This was probably partly the result of the early church's struggle with the fatalistic determinism of the Gnostics. Augustine, writing against the Pelagians, taught that God predestined to salvation some out of the mass of sinners, passing by the rest and thus leaving them to just condemnation for the sins they willingly committed. Augustine thought that the will was unable to do the good that God commanded unless aided by grace. To do evil willingly was a slavery to sin from which grace rescued those whom God had chosen. Augustine had many medieval followers in this doctrine, including Gotschalk in the ninth century, who stated the doctrine in an extreme fashion, and Thomas Bradwardine in the fourteenth century, who opposed those he considered his Pelagian contemporaries. Thomas Aquinas was also a predestinarian, but he treated the doctrine in the context of God's providence as a whole. On the other hand, such medieval Scholastics as John Duns Scotus and William of Ockham sought to reconcile God's prescience with human freedom of choice.

In the Renaissance and Reformation there was a revival of predestinarian thinking. Lorenzo Valla was the main representative of determinism among Renaissance philosophers, while almost all of the major Protestant reformers found the doctrine of predestination useful in their insistence upon the

primacy of divine grace in salvation. Luther (and Lutheranism, in the Formula of Concord) soon backed away from the extreme predestinarian teaching of his early *Bondage of the Will* and taught only election to life, with the possibility of falling from grace. The Reformed churches, following their teachers Huldrych Zwingli, Martin Bucer, John Calvin, and Peter Martyr Vermigli, gave the doctrine an important role in the defense of grace in salvation and also taught double predestination, but still insisted on the freedom of the will, which they understood in the Augustinian sense of voluntary necessity. Later Scholastic Reformed theologians, such as Theodore Beza, William Perkins, and Franciscus Turretinus, gave the doctrine of predestination a central role in their theological systems. An important eighteenth-century defense of the Reformed view of predestination and the freedom of the will came from Jonathan Edwards in colonial Massachusetts. The Church of England adopted the predestinarian theology of the Reformers in its Thirty-nine Articles and in the first century of its existence generally taught the Reformed view of the matter.

The Roman Catholic theology of the same period, especially that of the Jesuits, stressed human responsibility in the process of salvation, with Luis de Molina maintaining the position of “congruism,” that is, of grace as efficacious according as the will cooperates with it. Countering this was a revival of Augustinian theology, represented by the Spanish Dominican Domingo Bañez and by Cornelis Jansen in the Netherlands. The Jansenists in France, including Blaise Pascal, considered the Jesuits Pelagian. Predestination has not been an important theme in more modern Roman Catholic theology, and Catholic treatments of Augustine tend to focus on other aspects of his thought.

In the later history of Protestantism, emphasis upon predestination has generally declined, and freedom of choice in salvation has frequently been asserted. From the beginning, few of the Anabaptists were predestinarian. Some of the early Protestant reformers, including Heinrich Bullinger and Theodor Bibliander, were cautious in their treatment of predestination, and the Dutch Reformed theologian Jacobus Arminius (1560–1609) asserted that God predestined to salvation those whom he foresaw would believe. This assertion of the will’s freedom of choice in salvation came to be known as Arminianism and gained ground among English Protestants throughout the seventeenth century. In the next century John Wesley adopted it as the theology of Methodism, and it generally made headway among evangelicals who wanted to be able to make straightforward appeals for conversions. Thus its avowal by the nineteenth-century American evangelist Charles G. Finney influenced many in the formally Calvinistic Presbyterian and Congregationalist denominations, although his contemporary, the Princeton theologian Charles Hodge, continued to uphold double predestination in its Scholastic form. The liberal Protestant theology of the nineteenth and early twentieth century usually rejected any form of predestinarian theology. But in the

twentieth century, two Reformed theologians, Emil Brunner and Karl Barth, have attempted reformulations of predestination while abandoning its more unpalatable features.

Islam. Free will and predestination have been important issues in Islamic thought. Basic to Muhammad’s religious experience was a sense of God’s power, majesty, and judgment. The Qur’ān exhorts submission before the divine sovereignty and declares even that “God leads astray whom he pleases and guides whom he pleases” (*sūrah* 74:34). But the Qur’ān also presupposes choice on the part of persons who have been summoned by revelation. Early in the history of Islam, the predestinarian emphasis was reinforced by a general Arab cultural belief in fate, and some Muslims thought that God permitted Satan’s irresistible incitement to evil. But one of the first groups of Islamic philosophers, the Mu’tazilah, argued that, however much other events were determined beforehand, there was a free human choice of good or evil. Later Muslim theologians, emphatically teaching predestination, nonetheless tried to reconcile it with free will through varying interpretations of the doctrine of acquisition. According to this doctrine, man is regarded as voluntarily willing his actions and thus “acquiring” them, even though God has created these acts so that they occur by necessity. Such a viewpoint has many parallels with Augustinianism, and generally Islam is no more fatalistic than is Christianity.

Hinduism. The main traditions of Hinduism and Buddhism do not posit a personal deity with an omnipotent will, and thus the polarity of free will and predestination in relation to the salvation of souls has not been so prominent as in Judaism, Christianity, and Islam. The doctrine of *karman* can constitute a kind of determinism whereby an individual’s lot in life is determined by his behavior in past lives, but the doctrine can also imply that a soul is in charge of its future destiny; its modern proponents therefore sometimes consider the doctrine to imply freedom more than fatalism. But in either case, *karman* is usually seen not as the willing of a personal deity but as the workings of an impersonal force.

However, some schools of Hinduism maintain personal theism and an omnipotent God and consequently wrestle with the problem of free will and predestination. For example, the Vaiṣṇava sect of Madhva (1238–1317) believed that Viṣṇu predestined some souls to blessedness and others to damnation, simply for his good pleasure and not because of the merits or demerits of the souls themselves. A more cautious theology of predestination appeared in the interpretation of the Vedānta by Rāmānuja (fl. c. 1100). He taught that the souls of some persons were led to repentance by a divine initiative, but he also held that the choice of good or evil nonetheless included personal acts performed by means of a God-given freedom. Rāmānuja’s followers divided over the extent to which divine power controlled souls. The Tenkalai, or “cat school,” taught that God’s irresistible grace saves some souls the way the mother cat carries her young by the nape of the neck, while the Vaṭakalai, or “monkey school,” taught that God’s grace and the human will cooper-

ate in salvation the way the infant monkey clings to the mother.

AS A PHENOMENON OF RELIGIOUS EXPERIENCE. The notion of the freedom of the will in relation to salvation arises out of the everyday experience of free choice and personal responsibility. There seems to be a human need to feel in control of one's life. Modern experience has been especially characterized by a sense of autonomy, and this has abetted the assumption of the will's freedom of choice with reference to salvation.

Belief in predestination, on the other hand, represents and abstracts from the experience of creatureliness before the majesty of the divine. It was Friedrich Schleiermacher (1768–1834) who first looked at predestination as a transcript of subjective piety, concluding that it was an element in the religious person's consciousness of dependence upon God. Following Schleiermacher, Rudolf Otto attempted a phenomenology of the "creature feeling" that he thought lay behind the doctrine of predestination. As Otto interpreted it, the idea of predestination was rooted not in speculative thought but in religious self-abasement, the "annulment of personal strength and claims and achievements in the presence of the transcendent," and thus was "an immediate and pure expression of the actual religious experience of grace." The one who receives grace feels that nothing has merited this favor, and that it is not a result of his own effort, resolve, or achievement. Rather, grace is a force that has grasped, impelled, and led him. Predestination is thus a numinous experience of awe in the face of the *mysterium tremendum*.

Besides being rooted in the human sense of createdness and of grace, predestination as a religious phenomenon also depends on a sense of trust and confidence in the reliability of the divine and in its power to complete what has been begun in the creature. Such belief in an ordered world and rejection of the sheer fortuitousness of things is an important element of much religious consciousness and leads to a sense of assurance about God's purpose and about one's own spiritual security. Ernst Troeltsch thought that it was in the interest of the assurance of salvation that predestination became such a central doctrine in Protestant theology.

Belief in predestination may also be regarded as arising from the search for a purely spiritual religion, for it has the effect of stripping away all concrete mediation and leaving the soul alone before God. It was this that led Max Weber to consider belief in predestination as functionally related to the process of the elimination of magic from the world. This aspect of predestinarian religion has been greatly attractive to religious reformers, for the doctrine can become a means to sweep away much accumulation of religiosity.

Another aspect of belief in predestination as a matter of religious experience is that it has had the effect, not (as might be supposed) of giving rise to fatalistic acquiescence, but of energizing the will for the fulfillment of divinely assigned tasks. Thus Calvinist theologians spoke of predestination as election to holiness.

AS A PROBLEM OF RELIGIOUS THOUGHT. While beliefs concerning free will and predestination may be rooted in religious experience, they are also connected to certain intellectual concerns and puzzlements. One motive for such reflection has been the simple observation that some believe while others do not—is this fact the consequence of personal freedom of choice or of divine predetermination?

Reflection on divine omnipotence has led to the inference that the divine choice must be the determining factor in salvation. If some things were excepted from the general principle that all things occur by virtue of a divine causality, then God would seem to lack the efficacy to bring his purposes to fruition. Even the bare acknowledgment of divine foreknowledge seems to entail determinism, for if God knows what will happen from eternity, it must necessarily happen in that way or else his knowledge would be rendered erroneous. And though it may be argued that God foresees actual human choices, nonetheless when the time for those choices arrives, they cannot be other than they are; this is precisely what identifies an event as predetermined. Opponents of this viewpoint have maintained, however, that foresight is not a cause and that therefore a foreseen event need not be a determined one.

Still, the doctrine of predestination has probably been rooted primarily not in this kind of consideration but in the theological need to maintain the gratuitousness of salvation. To connect this with predestination effectively rules out any possibility of human merit.

Theologies that have asserted the will's freedom of choice in salvation have, on the other hand, focused on different theological needs, primarily those of preserving human responsibility in the process of salvation and God's goodness and justice in the governing of his creation. If salvation is entirely God's gift, how can those left out be held responsible? In the modern period, the Augustinian definition of freedom as absence of constraint has not been widely persuasive, in spite of the fact that many elements of contemporary thought, especially in relation to heredity, have provided some basis for considering human freedom in this way.

The problem of theodicy, in Christian thought in particular, seems almost inevitably to rely on the assumption of human freedom of choice in salvation. Even the Puritan poet John Milton, in seeking to "justify the ways of God to man," fell back upon an assertion of such freedom.

Several considerations may be brought forward in religious thought in order, if not exactly to solve, then at least to extenuate this problem. One approach is simply to acquiesce to the polarity of free will and predestination as a paradox. Another consideration is Augustine's argument that God exists not in time but in the qualitatively different state of eternity. Thus since for God there is no past or future, there is no priority of time for his foresight or decree in relation to the events of salvation; priority is implied only by our inadequate language. A further Augustinian consideration is

that, since the evil of an evil act is a deficiency of being, it requires no divine causality at all. Evil is only a falling away from the good (and from freedom) and hence needs no positive causality.

BIBLIOGRAPHY

There are several useful introductions to the subject: C. H. Ratschow, Erich Dinkler, E. Kähler, and Wolfhart Pannenberg's "Prädestination," in *Die Religion in Geschichte und Gegenwart*, 3d ed. (Tübingen, 1957–1965), and Henri Rondet and Karl Rahner's "Predestination," in *Sacramentum Mundi: An Encyclopedia of Theology*, edited by Karl Rahner (New York, 1968–1970), both of which give an extensive bibliography in several languages; Giorgio Tourn's *La predestinazione nella Bibbia e nella storia* (Turin, 1978); and Vernon J. Bourke's *Will in Western Thought: An Historico-Critical Survey* (New York, 1964).

Rudolf Otto's *The Idea of the Holy* (1923), 2d ed. (London, 1950), offers a classic phenomenological analysis of the problem. Discussion of the general historical significance of predestination appears in my *Puritans and Predestination* (Chapel Hill, N.C., 1982), pp. 191–196. For the Bible and ancient Judaism, see Harold H. Rowley's *The Biblical Doctrine of Election* (London, 1950), Eugene H. Merrill's *Qumran and Predestination* (Leiden, 1975), and George Foot Moore's "Fate and Free Will in the Jewish Philosophies according to Josephus," *Harvard Theological Review* 22 (October 1929): 371–389. Two rather traditional Christian theological investigations of the problem, the first Protestant and the second Roman Catholic, are Gaston Deluz's *Prédestination et liberté* (Paris, 1942) and M. John Farrelly's *Predestination, Grace, and Free Will* (Westminster, Md., 1964). A more recent Christian theological treatment is Paul K. Jewett, *Election and Predestination* (Grand Rapids, Mich., 1985). For Indian thought, see Sarvepalli Radhakrishnan's *Indian Philosophy*, 2d ed., 2 vols. (London, 1927–1931), pp. 659–721, 731–751, and Rudolf Otto's *Die Gnadenreligion Indiens und das Christentum* (Gotha, 1930), translated by Frank H. Foster as *India's Religion of Grace and Christianity* (New York, 1930). The standard work on this subject for Islam is W. Montgomery Watt's *Free Will and Predestination in Early Islam* (London, 1948).

DEWEY D. WALLACE, JR. (1987 AND 2005)

FREE WILL AND PREDESTINATION: CHRISTIAN CONCEPTS

In an effort to explain the roles of human and divine agency in the accomplishment of salvation, Christian theologians have formulated concepts of free will and predestination. The concepts entered the creeds of the churches. The notion of predestination introduces the matter of time-order in affirming that God made a decision or decree about who over the course of the ages would be saved by Christ *prior* to any decision or action that those who are saved might take during

their lifetime in relation to their own salvation. Following Augustine and Paul, theologians and the creeds have usually maintained that God's decision occurred "before the foundation of the world." In the face of this emphasis on God's previous power of decision, the notion of free will affirms the human role that might appear to be overridden thereby, and acknowledges the power of human decision within the process of salvation. The two notions exist in a paradoxical relationship with each other, and they turn on an understanding of history.

A widely held but mistaken opinion identifies the notion of predestination as a concept peculiar to Calvinists since the sixteenth century, asserting that Calvinist traditions have denied or rendered irrelevant the notion of free will. On the contrary, all Christian traditions that honor the ancient creeds have in some way affirmed both free will and predestination. They have, however, meant very different things by these concepts and have given them different roles in relation to each other. In recent times, churches have tended to mute their references to predestination, allowing the discourse to continue in a new form outside of ecclesiastical and theological milieux as a debate about freedom and determinism.

THE ISSUES AND THE SCRIPTURES. That the question arises—and that it persists—may be attributed to the human experience of being able to choose responsibly among real options while at the same time being overwhelmed by forces apparently beyond human ability to choose. Christians have used the doctrines of free will and predestination as their means of expressing these contrary experiences—on the one hand, the certitude of salvation as God's act; on the other hand, the human responsibility to believe and do what is right.

Christians have related these two concepts to many others, including God's sovereignty and grace, divine foreknowledge of future human acts, divine election in relation to human merits, eternity and time, causation, and the process of salvation. They have raised periodic warnings against trying to penetrate the mystery of salvation, against impugning the justice or the mercy of God, and against making God the author of evil.

Advocates of all positions have appealed to the Bible, even though the biblical scriptures do not contain what one might call doctrines or concepts of free will and predestination, nor even these words. The Latin term *praedestinatione* derives from the creation of an abstract noun from the translation of the Greek verb *proorizo*, which refers to deciding or setting limits on something beforehand. The word occurs six times in four passages in the New Testament: *Acts of the Apostles* 4:28, *Romans* 8:28–30, *1 Corinthians* 2:7, and *Ephesians* 1:3–14. The King James translation of the Bible renders the *Romans* passage this way: "For whom he did foreknow, he also did predestinate to be conformed to the image of his Son. . . . Moreover whom he did predestinate, them he also called. . . ." In constructing the concept, theologians had to piece together the several passages in keeping of some

sense of logic, and the ways they did this led to differences. Commonly they linked *proorizo* with a time metaphor from *Ephesians* 1 about God “choosing us” “before the foundation of the world.” This they augmented with Paul’s references in *Romans* 9 to one Old Testament passage about God’s “hardening the heart of Pharaoh” and another about God choosing Jacob instead of Esau even before these twins were conceived. Over the ages, through this process of turning verbs into nouns and metaphors into concepts, theologians have built a logical edifice of considerable magnitude. The process has passed through four phases so far.

FROM SCRIPTURE TO EARLY AUGUSTINE. Paul’s writings in the Bible formed the basis of all future treatments. For three hundred years after Paul, theologians were content to produce commentaries on the pertinent passages. Following the lead of Clement of Alexandria (fl. c. 200 CE), however, they interpreted *proorizo* as depending upon *proginosko* (foreknow)—those whom God foreknew would believe, God decided upon beforehand to save. The chief concern was to combat the concept of fatalism and affirm that humans are free to do what is righteous. Thus Origen fought the Gnostics toward the middle of the third century, and Augustine wrote *On Free Will* against the Manichaeans (c. 397). Origen asserted that humans were created with free will in the sense “that it is our own doing whether we live rightly or not, and that we are not compelled, either by those causes which come to us from without, or, as some think, by the presence of fate.”

AUGUSTINE THROUGH THE 1400s. Augustine changed his emphasis as a result of a challenge from Pelagius, who sought to defend human free will against Augustine’s apparent denial of it in his *Confessions* (400): “Grant us what you [God] command, and command us what you will.” In numerous treatises written over the succeeding two decades against Pelagius and those later called semi-Pelagians, Augustine gradually created the doctrine of predestination and established the terms in which virtually all subsequent discussions have carried on. He stated that God created humans with the free will to choose between good and evil. By choosing evil they lost their free will fully to do God’s will, and thereafter needed God’s grace to be saved and to live righteously. In *On the Predestination of the Saints* (428–429) Augustine claimed that God’s gift of grace is prepared for by God’s prior decision from eternity to predestine some to salvation. On this view, grace then comes as the effect of that predestination. God supremely predestined Christ to be the Son of God and called all those predestined for salvation to become members of Christ’s body. Those so elected do indeed choose by their free will to believe, but since they are the elect, their “will is prepared by the Lord.” In Augustine’s view, none of this depends on divine foreknowledge of future human merits. In the *City of God* (413–426) he claims that God has “a plan whereby he might complete the fixed number of citizens predestined in his wisdom, even out of the condemned human race.” God decides on the plan in eternity (an everlasting present) and foreknows in one sweeping vision the whole of

time (the course of the past, present, and future). In *Enchiridion* (421) Augustine taught what came to be called “double predestination,” that God not only in his mercy predestines some to salvation but in his justice predestines the rest to damnation or reprobation.

A succession of church councils culminating in the Council of Orange (529) elevated Augustine’s position to the status of orthodoxy. Thereafter the view not quite accurately attributed to the Pelagians—that original sin has no power to keep humans from using their free will to gain their own salvation—was deemed unacceptable. The Council of Quiercy (853), responding to the concept of double predestination as elaborated by Gottschalk (848), declared that view unacceptable as well. The council held that while God surely preselects some to salvation, he merely leaves the remainder of humanity in their freely chosen sin with its predestined consequence of eternal punishment.

Between roughly 1050 and 1450, numerous theologians worked in Augustine’s lineage to construct logical definitions of free will or predestination. They included Anselm of Canterbury (d. 1109), Peter Lombard (d. 1160), Duns Scotus (d. 1308), William of Ockham (d. 1349?), John Wyclif (d. 1384), Lorenzo Valla (d. 1457), and others. In his *Summa theologiae* (1266–1273), Thomas Aquinas gathered and elaborated a great array of logical distinctions to explain the concepts of free will and predestination: sufficient and efficient grace, habitual and actual grace, operating and cooperating grace, unconditional and conditional necessity, antecedent and consequent will, primary and secondary cause, and so on. According to Thomas, predestination was “the planned sending of a rational creature to the end which is eternal life.” It “presupposes election, and election [presupposes] love.” Thomas believed that his logic would show that none of this impairs free will.

REFORMATION THROUGH THE 1800s. The rupture of Latin Christendom called the Reformation led to a proliferation of positions roughly analogous to the pluralism of ecclesiastical traditions produced after the 1520s. A brief statement by Martin Luther (1520) that appeared to deny free will prompted Desiderius Erasmus to write *On the Freedom of the Will* (1524) in the hope of settling the matter simply. Instead of a resolution, however, the ensuing debate initiated a controversy lasting four hundred years. By the time it ended, theologians in virtually all traditions had attempted definitions of the concepts of free will and predestination, and every major church tradition had built some statement of the concepts into its creed.

Erasmus picked up a concept that Thomas and others had used about cooperating grace and brought the analogous concept of cooperating will or assisting will into the discussion. Erasmus asserted that the will of God “preveniently moves the [human] will to will.” Yet, humans do indeed will and achieve something. He concluded that *Philippians* 2:12–16 “certainly teaches that both humans and God work.” Luther retorted with *On the Bondage of the Will* (1525), denying

any possibility of cooperation between God and human will. The term *free will*, he claimed, applies only to God or to the “lower choices” that humans make about everyday matters. All matters pertaining to salvation “depend on the work of God alone,” the only power able to free the will from bondage to sin. Luther adopted Augustine’s position on predestination. The Lutheran Formula of Concord (1576) stated: “The predestination or eternal election of God extends only to the good and beloved children of God, and this is the cause of their salvation.” Concerning the nonelect, the formula urged caution when speaking of reprobation.

Caution had become necessary, the Lutherans thought, because of John Calvin’s views. In his *Romans* (1540) and *Institutes of the Christian Religion*, Calvin adopted Augustine’s views and followed Luther in rejecting the notion of divine and human cooperation in salvation. By the final edition of the *Institutes* (1559), however, he defined predestination expansively to include double predestination: “By predestination we mean the eternal decree of God, by which he determined with himself whatever he wished to happen with regard to every person. All are not created on equal terms, but some are preordained to eternal life, others to eternal damnation.” A succession of Reformed creeds, including the French Reformed Confession (1559), the Scots Confession (1560), the Belgic Confession (1561), and the Second Helvetic Confession (1566), adopted Calvin’s teachings, excepting the notion of the nonelect. On this point they urged caution or, as in the Belgic Confession, affirmed that God was “just, in leaving others in the fall and perdition wherein they have involved themselves.” Of the Reformed creeds, only the Westminster Confession (1647) adopted double predestination. The Canons of Dordt (1619) condemned the formulation presented by Jacobus Arminius and the Remonstrants’ creed (1610) concerning God’s assisting or cooperating grace. Arminius had characterized predestination as God’s eternal decree by which he determines to save through Christ “those who, through the grace of the Holy Spirit, shall believe on this his Son Jesus” and who by cooperating grace are enabled to persevere to the end. Many generations later Jonathan Edwards wrote his *Freedom of the Will* (1754) against the Arminians. The mainstream of the Baptist tradition sided with the Calvinists against the Arminians in adopting the New Hampshire Confession (1833) and the Louisville Abstract of Principle (1859).

In the Anglican tradition, the Thirty-Nine Articles of the Church of England (1563, 1571) followed Calvin on both free will (article 10) and predestination (article 17), but not on double predestination. The Irish Articles (1615), written by James Ussher, included double predestination. Anglican theologians, from Richard Hooker (1590s) to J. B. Mozley (author of *Predestination*, 1855) sought various ways to affirm both predestination and free will.

For the Roman Catholic tradition, the Council of Trent treated the matter in its Decree on Justification (1547). The decree spoke of God’s prevenient grace and associated it with

predestination. But the council took issue with Luther and Calvin, declaring that God disposes people “through his quickening and assisting grace, to convert themselves to their own justification, by freely assenting to and cooperating with that grace.” Certitude about being among the predestined came only when salvation was complete for those who persevered to the end. The Jesuit Luis de Molina expanded upon Trent in his *Concordia* (1588), in which he presented the concept of the concurrence of assisting grace with free will. Predestination, for Molina, depends on a *scientia media* by which God, when preordaining some to salvation, takes into account how each person would use free will in all possible circumstances. Cornelis Jansen wrote *Augustinus* (1640) to combat Molina, Trent, and the logical distinctions devised by Thomas Aquinas and the Thomists. He proposed a revival of Augustine’s views in order to defeat any suggestion of concurrence and cooperation between divine and human will. A papal bull condemned Jansenism in 1653.

Among Eastern Orthodox, the Russian Orthodox Confession (1643) and the Confession of Jerusalem (1673) responded to the Lutherans, Calvinists, and Trent by reaffirming the pre-Augustinian belief that God predestines some to glory and others to condemnation solely because “he foreknew the one would make a right use of their free will and the other a wrong.” They affirmed synergism, the working together of God’s prevenient grace and human free will throughout a lifetime of perseverance.

In 1784, John Wesley, founder of what became the Methodist tradition, prepared the Articles of Religion, a revision of the Anglican Thirty-nine Articles. In them he omitted reference to predestination but retained a notion of divine “prevenience,” i.e., the human free will to believe depends on “the grace of God by Christ preventing [i.e., going before] us.” In *Predestination Calmly Considered* (1752) and other writings, Wesley himself had affirmed predestination in the form of what he called conditional election, God’s eternal choice of some to be saved, based on foreknowledge of their future belief. He contended that unconditional election not based on such foreknowledge is really the same thing as double predestination.

THE TWENTIETH AND TWENTY-FIRST CENTURIES. In 1920, Max Weber pronounced predestination to be the cardinal doctrine of Calvinism and gave impetus to the view that the attached the notion to Calvinists in particular. Throughout the twentieth century, however, theologians as diverse as William Temple (Anglican), Karl Rahner (Roman Catholic), Karl Barth and G. C. Berkouwer (Reformed), and Wolfhart Pannenberg (Lutheran) gave significant attention to the concepts of free will and predestination. Church statements from Vatican II and the Lutheran-Roman Catholic dialogue in the United States to the Synod of the Christian Reformed Church referred positively to both concepts. At the same time, many Christian thinkers let the subject drop, in keeping with the declaration by the World Conference on Faith and Order (1937) that theories about how the truths of

God's grace and human free will might be reconciled are not part of the Christian faith. In any case, over the ages the vast host of Christians, not being theologians, have apparently had little awareness of, or concern about, what the theologians said on the subject. As Christians have become more appreciative of metaphor and the nuances of history, and more wary of logical abstraction, philosophers not thinking as Christians have filled the void with their own concepts of freedom and necessity, free will and determinism.

FREE WILL AND PREDESTINATION: ISLAMIC CONCEPTS

Free will and predestination has been a prominent topic in Islamic religious thinking. For Muslims, the basis of the discussion is found in the Qur'an and to a lesser extent in *hadīth* (reports from and about Muḥammad often called "traditions"), some of which reflect pre-Islamic Arab beliefs.

PREDESTINATION IN PRE-ISLAMIC ARABIA. Something is known of the outlook of the pre-Islamic Arabs from what has been preserved of their poetry. In this we find a strong belief that much of human life, especially misfortune, is determined by time (*dahr, zaman*). It has sometimes been thought that time here is the same as fate, but since the same determination of human life is sometimes attributed to "the days" or even "the nights," the idea of time must be uppermost. Time here is not something to be worshiped but rather a natural fact, not unlike "the course of events."

In particular, it was believed that a person's *ajal*, the term or the date of the person's death, was determined or predetermined. A person destined to die on a certain day would die then, no matter what he or she did. It was also believed that a person's *rizq*, "provision" or "sustenance," that is, food, was also determined. This fatalistic attitude helped the nomads to survive in the harsh conditions of desert life. In the Arabian deserts the regularities of nature experienced elsewhere tended to be replaced by irregularities. One who tried to take precautions against all eventualities would become a nervous wreck, but a readiness to accept whatever happened fatalistically reduced anxiety and thus was an aid to survival. It is to be noted, however, that in the belief of the nomads it is the outcome of human actions that is determined, not the actions themselves.

PREDESTINATION IN THE QUR'ĀN. The belief of the pre-Islamic Arabs in the control of events by time is described in the Qur'an (*sūrah* 45:24): "There is only our present life; we die and we live, and time [*dahr*] alone destroys us." The conception of the *ajal*, or term of life, also occurs several times, but it is God who both fixes the *ajal* beforehand and then brings about the person's death: "He is the one who created you from clay, and then fixed an *ajal*" (6:2); "God will not defer [the death of] any person when his *ajal* comes" (63:11). There is thus a sense in which God takes over the functions of time; indeed, there is a *hadīth* that reports that the Messenger of God said that God said, "The sons of Adam insult *dahr*, but I am *dahr*." There are also several passages in the Qur'an in which it is stated or implied that humankind's fate is not merely determined by God beforehand but also written down: "No misfortune has happened either in respect of the land or of yourselves but it was in a book before we [God] brought it about" (57:22). A clear statement of the uselessness of trying to avoid what has been predetermined is given in a passage about those who criticized Muḥammad's decision, when attacked in Medina by the Meccans, to go out to Mount Uhud to fight: "If you had been in your houses, those for whom killing was written down would have sallied out to the places of their falling" (3:154). The Qur'an also speaks of God as the source of man's *rizq*, or provision: "He lavishes *rizq* on whom He wills, or stints it" (30:37); this may be regarded as a reflection of the common experience in desert life that one tribe might have plenty while a neighboring tribe was starving.

Just as the pre-Islamic Arab did not believe that his acts were predetermined, but only their outcome, so this seems to be all that is implied by the Qur'anic statements about *ajal* and similar matters. All Muslims hold that human freedom in some sense and human responsibility in acting are implied in the Qur'anic teaching that God judges mortals on the Last Day and that their good and bad deeds are weighed in balances. Human freedom is not necessarily contradicted by such verses as: "Do not say of anything, I am doing that tomorrow, without [adding], If God wills" (18:23); ". . . to him of you who wills to go straight; but you will not [so] will, unless God wills" (81:28). Such verses may be under-

stood as expressing God's control of the outcome of acts. But a number of verses also speak of God guiding and aiding people or of leading them astray and abandoning them: "If God wills to guide anyone, He enlarges his breast for Islam" (6:125); "He leads astray whom He wills and guides whom He wills" (16:93), so that those whom he guides become believers and those whom he leads astray become unbelievers.

Other verses, however, assert that this guiding or leading astray is, as it were, in recompense for what the people in question have done previously: "Those who do not believe in God's signs, God does not guide" (16:104); "He leads astray none but the wrongdoers" (2:26). The phrase "leading astray" might be compared with God's "hardening of the heart" of the pharaoh and others in the Bible. One verse (18:28) specifically points to the ability of humans to choose to believe or not. It states, "The truth is from your Lord, so let him who will, believe; and let him who will, disbelieve." Verses such as 90:9–10, "Have we not created for him two eyes and a tongue and two lips and guided him in the highways, but he will not attempt the steep," and 4:31, "God wishes to explain to you and to guide you into the ordinances of those who were before you," also suggest human choice in responding to God's guidance. The numerous verses in the Qur'an that exhort humans to ponder the "signs" of nature around them that reflect God's majesty and power and to draw moral lessons from the fate of previous generations are also suggestive of human choice in and responsibility for their actions.

UMAYYAD APOLOGETIC AND QĀDARĪ OPPOSITION. Most modern students of Islamic history have tended to suppose that the Umayyad dynasty, which ruled from AH 41 to 132 (661–750 CE), was not very religious. This view is based, however, on the acceptance of pro-Abbasid, anti-Umayyad propaganda and is not borne out by documents of the Umayyad period such as the poems of Jarir and al-Farazdaq. In these it becomes clear that the Umayyads, besides justifying their rule on traditional Arab lines, had a theological defense of their legitimacy: they held that the caliphate had been bestowed on them by God in the same way as the Qur'an (2:30) described the bestowing of a caliphate on Adam. This meant taking the word *Khalīfah*, or caliph, in the sense of "deputy" rather than of "successor," which it can also mean, and from this they argued that to oppose their decisions was to oppose God.

It was because of this theological position of the Umayyads that some of their opponents adopted what came to be known as the Qādarī heresy. This includes various slightly different formulations, all asserting human free will in some form. One version held that a person's good acts came from God and his bad acts from himself. From this it would follow that the bad acts of an Umayyad caliph were from himself and not from God, and thus good Muslims could oppose such acts without making themselves unbelievers. The first to subscribe to the Qādarī heresy is usually said to have been Ma'bad al-Juhani, who participated in an armed revolt that

began in 701, and who was executed three years later upon the collapse of the revolt. Many of the participants in this revolt, however, were not among the Qādirīyya. Another person frequently mentioned as holding Qādarī views was Ghaylan al-Dimashqī. For a time he was a government official and was friendly with more than one caliph, but his political program, while including Qādarī ideas, went beyond it; in 730 the caliph Hisham became suspicious of the program and had Ghaylan executed. For the next twenty years there are many references to Qādarī opponents of the Umayyad regime, especially in Syria. After the replacement of the Umayyad dynasty by the Abbasid in 750, the Qādarī movement lost much of its political *raison d'être* and either faded out or was absorbed into the rationalist Mu'tazili movement.

Earlier scholars attributed the belief in free will to Christian influence; Ghaylan was indeed of Coptic origin, while Ma'bad was said to have derived his views from a Christian. From what has just been said, however, it would appear that the doctrine of free will was brought into Islamic discussions not primarily because it was held to be true but because it served a useful purpose in internal Islamic political discussions.

AL-ḤASAN AL-BAŞRĪ. The most important name connected with these theological questions is that of al-Ḥasan al-Başrī (d. 728). From his own lifetime or shortly afterward scholars debated whether he was a Qādarī or not, and both views were vigorously asserted. Distinguished Western scholars early in the twentieth century continued the debate. In 1933, however, there was published a long *risāla*, or epistle, written for the caliph 'Abd al-Malik by al-Ḥasan in defense of his views on this topic. From this treatise it is possible to give an account of what he believed. The Qur'an is central for him and is the source of his arguments. Against the predestinarians who quoted verses about God's leading astray, he replies with other verses that imply that those led astray were already wrongdoers and had in some form chosen evil. He also contends that the fact that God knows that some people will disbelieve is only descriptive; that is, he knows that by their own free choice they will disbelieve, but his knowledge does not predetermine their unbelief. He holds that the verse quoted above about misfortunes being in a book (57:22) applies only to wealth and material things and not to belief or unbelief, obedience or disobedience. He further holds that when the Qur'an speaks of people acting or willing, they really do so, and their acts are not predetermined. He takes verse 33:38 to mean, "God's command [*amr*] is a determination [*qadar*] determined," and then argues that God determines human behavior only by commanding certain acts and prohibiting others. In this way, he can maintain that God creates only good and that evil comes from human beings or from Satan.

Politically al-Ḥasan al-Başrī was critical of the Umayyads. The later scholar Ibn Qutaybah (d. 889) thought him a Qādarī in some respects and told how some of his friends would say to him, "These princes [the Umayyads] shed the

blood of Muslims and seize their goods and then say, 'Our acts are only according to God's determination [*qadar*].'" To this Ḥasan would reply, "The enemies of God lie." Ḥasan's remark must be understood in the light of his identification of God's determination with his command, but the Umayyads were doubtless taking *qadar* in the traditional sense of prior effective determination. Despite his critical attitude al-Ḥasan resolutely refused to join any insurrection against the Umayyads and urged his friends and disciples to do likewise. In view of all these facts, al-Ḥasan's position might fairly be described as moderately Qādarī.

A more extreme form of Qādarī doctrine may be encountered in the positions adopted by the Khārījī group known as the Shābiyya about two decades after al-Ḥasan's treatise. They went as far as to say that God has no foreknowledge whatsoever of the actions of humans and their destinies and humans are left entirely to their own will and discretion. This kind of extreme position was attacked by the Umayyad caliph Umar II (d. 720) in an epistle he composed against Qādarī beliefs.

PREDESTINATION IN THE *HADĪTH* (TRADITIONS). Western scholars formerly thought that all *ḥadīth* were predestinarian and saw in this the reason why al-Ḥasan al-Baṣrī based his arguments on the Qur'ān and not on *ḥadīth*. There are indeed a few *ḥadīth* that express an opposite view, but the most likely reason for the absence of *ḥadīth* from al-Ḥasan's arguments is that at the time he was writing they were not regarded as having the authority later ascribed to them and perhaps were not widely known and circulated. Had they been generally regarded as authoritative, he would surely have had some argument against them. It was the jurist al-Shāfi'ī, about a century after al-Ḥasan, who gave *ḥadīth* an assured place in Islamic thought as one of the "roots of law," and by his time, the study of *ḥadīth* had become much more extensive.

It will suffice here to mention some of the best-known predestinarian *ḥadīth*. One was the report that the Prophet had said, "The first thing God created was the pen; then he said to it, 'Write all that will happen until the Last Day.'" Another group of sayings of the Prophet speaks of an angel being entrusted with the child in the womb and asking God to determine whether it is male or female, whether it is to be fortunate or unfortunate, what is its *rizq* and what its *ajal*. Again, in connection with the act of a Muslim fighter at the Battle of Uhud, who took his own life when his battle wounds became unbearable, the Prophet is reported to have said, "One man will work the works of the people of Paradise until he is only an arm's length from it, and then the book will overtake him, and he will work the works of the people of Hell and enter it," while in the case of another man the reverse will happen. Associated with such *ḥadīth* were some reported remarks by early Muslims to the effect that, if one wants to avoid hell, one must believe that God determines both good and bad, and that what reaches one could not have missed one, and what misses one could not have reached one.

It will be noticed that these predestinarian *ḥadīth* to some extent reflect pre-Islamic attitudes.

THE MOVE AWAY FROM QĀDARĪ THOUGHT. In the last half-century of the Umayyad period it seems likely that many of the religious scholars who were critical of the rulers were also sympathetic with at least a moderately Qādarī view, while those who supported the rulers inclined to predestinarian views. Among such views, however, two levels may be distinguished: (1) the belief that what happens to people is predetermined, but not their own acts; (2) the belief that both what happens to them and their own acts are predetermined. At a later period emphasis came to be placed less on God's predetermination of happenings and acts than on his present control of them.

Although something of the old pre-Islamic Arab predestinarianism was still strong among many Muslims and, because associated with God, felt to be part of Islam, it was difficult to express this sentiment under the Umayyads without seeming to approve all their actions. With the coming of the Abbasids, however, all this was altered. Belief in human free will lost most of its political relevance, and the expression of predestinarian views no longer suggested approval of an unjust government. Although those Qādirīyya who were primarily political were located chiefly in Syria, the main academic discussions took place in Basra among the followers and disciples of al-Ḥasan al-Baṣrī, where two opposing trends can be discerned, one toward more libertarian views, the other toward predestinarianism. Just as in pre-Islamic times belief in a predetermined *ajal* and similar matters helped to reduce anxiety, so the belief that God was in control of all events and that no disaster could happen to one except by his will relieved anxiety and gave confidence. The trend toward predestinarianism grew stronger not only in Basra but throughout the Islamic world, and some form of belief in God's control of events became an article in Sunni creeds.

As this happened and as Qādarī views came to be regarded as heretical, there was a rewriting of history. Those with strong predestinarian or determinist views were unhappy to think that many great earlier scholars, their intellectual predecessors, had been tainted with heresy. They therefore emphasized the role of Ma'bad al-Juhami and Ghaylan al-Dimashqī in the origination and spread of Qādarī ideas, since these were men who had been rebels and also under foreign influence. A little later stories were spread to discredit one particular member of al-Ḥasan's circle, 'Amr ibn 'Ubayd, and to suggest that he was worse than his contemporaries: besides being the leader of the libertarians among al-Ḥasan's followers, he had been elevated to the position of a founding father of the Mu'tazilah.

The Arabic name of the sect, Qādirīyya, itself bears witness to the struggle between the two trends among religious scholars generally. Like most early names of sects it is a nickname, but the curious point is that it is those who hold that the *qadar* is man's and not God's who are called "*qadar*-

people.” Texts now published show that there was a time when each side in the dispute called the other “Qādarī.” In his book on sectarian views, al-Ash‘arī (d. 935) mentioned that his own party had been called “Qādarī,” but continued, “the Qādarī is he who affirms that the *qadar* is his own and not his Lord’s, and that he himself determines his acts and not his Creator.” There was no Qādirīyya, properly speaking, after the Umayyad period, but some scholars used the name as an offensive nickname for the Mu‘tazilah.

Even in the heyday of the Qādirīyya there was never a single clearly defined Qādarī sect. What made one a Qādarī was one article of belief, either that defined by al-Ash‘arī or something like it, but this belief could be combined with a variety of beliefs on other matters. When the Abbasids came to power, many continued to believe in human free will but at the same time had views on the new political problems, and it was chiefly on the basis of these other views that sectarian names were bestowed. As a result the name Qādarī gradually died out, and after the first half-century of the Abbasid period is hardly found except as an alternative to Mu‘tazili.

MU‘TAZILAH AND ASH‘ARĪYAH. By the time of the caliph al-Ma‘mun (r. 813–833), the Mu‘tazilah had defined their sect as based on five principles, of which free will was only one. At the same time, some of the leading Mu‘tazilah had important positions at the caliphal court. Just after 847, however, official policy changed abruptly; the Mu‘tazilah fell from favor, while the government abandoned their doctrine of the createdness of the Qur‘ān and on that and other points supported the central Sunnī position. The Mu‘tazilah are chiefly remembered as the group that first developed the discipline of *kalām*, that is, the use of Greek philosophical concepts and methods of argument. Gradually, however, some scholars realized that *kalām* could be used also to defend more generally acceptable doctrines than those of the Mu‘tazilah. The creation of a nonheretical Sunnī *kalām* is traditionally attributed to al-Ash‘arī, but it is now realized that in this he had several predecessors. Most of our information, however, is about the debates between Mu‘tazilah and Ash‘arīyah.

Within the discipline of *kalām* the discussions about free will took a new direction and were chiefly concerned with God’s control of human acts in the present. This did not imply abandoning the belief that God had predetermined these acts, since it could be held that in controlling them in the present he was acting in accordance with his foreknowledge of what he had predetermined. The Ash‘arī view was that God created human acts by creating in the agent at the moment of action the power to do the particular act. The Mu‘tazilah agreed that the act came about through a power created by God, but held that this power was created by God before the act and was a power to do either this act or its opposite. In this way they left a place for the agent’s choice.

For the Mu‘tazilah in general, God’s justice (theodicy) was a main concern of their discussions on free will and determinism. The notion of divine justice, influenced by Greek

logic, militated against the idea that God could create and condone evil or unjust acts. Such acts are rather to be attributed solely to human choice and will. This belief was further linked to God’s role as judge in the afterlife when he will reward or punish humans for their commission of good and evil deeds. The Mu‘tazilah argued that if God sent people to hell as punishment for predetermined acts for which they were not responsible, he would be acting unjustly, and this was unthinkable. Their position was rooted in Qur‘anic verses such as 3:104: “God does not wish injustice to the worlds;” 22:10, “God is not unjust to His servants;” and 4:81, “Whatever afflicts you of bad is from yourself.”

The Ash‘arīyah met this argument with the formula that human acts are God’s creation and the agent’s “acquisition” (*kasb*); this term could also be translated as “making one’s own” or “having credited to one.” In effect the Ash‘arīyah were saying that, although the act is God’s creation, it is also in some unspecified way the human agent’s act. The term *kasb* and the derivative *iktisab* hark back to Qur‘ān 2:286, which states, “God will not burden any soul beyond its capacity. It will enjoy the good which it has acquired and bear the evil for the acquirement of which it labored.” The term’s usage in the context of free will and predestination is attributed to an early figure, Dirar b. ‘Amr, one of the Mu‘tazilah, who is somewhat of an obscure character. Other scholars, even Sunnī theologians like the Māturīdīyah, found the term *kasb* obscure and unsatisfactory and called the Ash‘arīyah “determinists” (*mujbirah*). The eponym of the Māturīdīyah, Abū Manṣūr al-Māturīdī (d. 944) from Samarkand, Transoxiana, steered a middle path between the total predestinarian stance of the Jabriyya and the total free will of the Mu‘tazilah, a position that became better known and more influential in the later period. He was essentially in favor of the doctrine of free will, with the qualification that God as the sole creator of the universe creates all acts as well. However, according to his school of thought, humans possess the freedom to choose their actions before their commission, so that they “acquire” these actions by virtue of the choices they make. This notion of “acquisition” is different from al-Ash‘arī’s, since the latter proposed that humans acquire the capacity to perform their actions at the very moment of their commission. *Kasb* continues to have its place in general Sunnī thought and fresh generations of scholars have introduced new subtleties.

SHĪ‘Ī VIEWS. Early Shī‘ī views tend to diverge considerably from later “orthodox” points of view on free will and determinism. The eighth-century Shī‘ī theologian Hisham b. al-Hakam (d. 795–796) maintained that human acts are created by God. He also believed that God has no foreknowledge of human actions or of things because his knowledge does not exist until the object of it exists.

An early Shī‘ī belief attributed changeability to God’s will, referred to in Arabic as *bada’* (“mutability”), which allowed for change in an earlier divine ruling. Such beliefs were considered by the later Imamiyya to be “extremist,” particu-

larly since the concept of *bada'* had to be squared with God's omniscience. Thus, to effect a reconciliation, mainstream Imāmī thought proposed the idea that God in his dealings with humans is motivated by considerations of what is most expedient (*al-aslah*) and the best for humankind. Therefore, *bada'* can be explained as pointing to the susceptibility of the divine will to change should circumstances change, requiring a different determination.

The Imāmīs, in general, subscribe to the doctrine of divine determination with a nod in the direction of free will; Ismā'īlī views are not dissimilar. The Zaydī Shī'ī are closer to the Mu'tazilah in their views.

MODERNIST VIEWS. Modernist Muslim commentators insist that the Qur'an should be read holistically. Taking certain verses out of context and interpreting them atomistically has been conducive to the view that the Qur'an encourages belief in predestination. Read as a whole, the Qur'an endorses, however, the concept of human freedom in choosing one's belief and of human responsibility for their actions. God has foreknowledge of human actions, but this divine knowledge does not compel humans to commit sin. Mu'tazili influence is detected in these positions, tempered by an acknowledgment of God's creative power over everything, including all human acts. Muḥammad 'Abduh (d. 1905), and Fazlur Rahman (d. 1988), for example, were prominent exponents of the modernist view.

FRENZY. The English word *frenzy* comes through the Latin *phrenesis* from the Greek *phren*, meaning the midriff, the heart, the upper part of the body, the diaphragm, the lungs or pericardium—that is, that part of the body held responsible for passions and thought. The ultimate derivation of the word is from the Indo-European **gwhren-*, meaning the diaphragm, the seat of intellect, understanding, and thought. The term will be used in this entry in its restricted sense, to refer not to mental derangement, madness, or folly generally but to a seizure of violent agitation or wild excitement, to uncontrollable rage or to delirious fury.

Although "frenzy" is not an established category in religious studies, the term occurs frequently in the description of a number of religious states and activities, and its occurrence is often interpreted in religious terms. It is related to such categories as "enthusiasm," "mania," "fury," "inspiration," "intoxication," "spirit possession," and "ecstasy," and, like these states, it is characterized by a certain spontaneity, an autonomy, as if beyond the control of the individual, as if coming from without or from deep within him. In the *Phaedrus* (244ff.), Plato distinguishes several types of frenzy (*mania*) that impart gifts to humans: the frenzy of the seer who reveals the future; that of the consecrated mystic who absolves one from sin; that of the poet possessed by the Muses; and that of the philosopher. In common parlance, however, *frenzy* usually has an aggressive connotation.

Three manifestations of frenzy will be considered here: frenzy as the result of combat (*furor*), frenzy as a symptom of certain culturally specific psychotic syndromes (*amok*), and frenzy as a stage of trance understood as spirit possession. The juxtaposition of these three manifestations of frenzy should not be considered synthetic. The term *frenzy* should, in my opinion, be used descriptively in specific contexts and not isolated as a separate and separable category of religious experience.

FUROR. It has been reported in both legend and history that in the heat of battle certain warriors enter into a delirious fury, attacking anyone in their reach. Moroccan Arabs recount, for example, that Sīdinā 'Alī, the prophet Muḥammad's son-in-law, whom they regard as the ideal warrior, was once in combat with the Jews. Blood flowed up to his stirrups, so great was his prowess. When he had killed all of the Jews, he turned on his own people and would have slaughtered them too, had not one of them, a beggar, asked him for a crust of bread (*barakah*, lit., "blessing"). This request cooled down his frenzy (*ḥashimīyah*), for he knew that only an Arab was fool enough to beg from him in his state. Roman legend has it that after one of the Horatii had defeated three enemy brothers, the Curiatii, he turned in furor on his sister, who, in mourning for one of them, had revealed the "feminine" weakness of a lover's grief.

In an analogous Celtic tale, Cú Chulainn, the hero of the Ulster legend, while still a child defeated the three sons of Nechta, the enemy of his people, and returned to his capital still in a frenzy. There he spurned the queen, who tried

to divert him by making crude sexual advances. As he was momentarily distracted, his men seized him and threw him into a vat of cold water to cool him down. From then on Cú Chulainn kept his furor in reserve for battle. Georges Dumézil suggests that this tale of initiatory combat relates to the domestication of savage frenzy—the ideal of prehistoric Italic, Celtic, and Germanic warriors—and its submission to legionary discipline. To the psychoanalytically oriented, the tale is concerned with the conversion into disciplined military aggression of the warrior's uncontrolled rage toward his mother, or toward women more generally, and, by extension, toward his own weakness symbolized by women.

AMOK. There are a number of culture-bound reactive syndromes, the so-called ethnopsychoses, that involve frenzied behavior. The best known of these “hypereridic rage reactions” is amok, which occurs primarily in Malaysia and Indonesia. The *pengamok*, the person who runs amok, usually suffers from neurasthenia, chronic illness, or a loss of a sense of social order and, with time, comes to experience an increasingly threatening external pressure that frightens or enrages him. Suddenly, as if to escape this pressure, he runs wild, attacking people, animals, and objects around him, even himself. He then falls into a stupor and awakes depressed and without any memory of his having run amok. Amok has occurred among warriors dedicated to self-sacrifice, and it has been explained as an escape from the pervasive Malay-Indonesian sense of fatalism and concern for propriety (*alus*). As the occurrence of amok peaked in the nineteenth century, with Western contact, it has been regarded as a transitional reaction to modernization.

Similar hypereridic reactions have been reported elsewhere, for example, in New Guinea (wild-man behavior, *negi negi, lulu*), in Malawi (*misala*), and in Puerto Rico (*mal de pelea*). Just as frenzied behavior occurs in certain hypermanic disorders, so it occurs in other culture-bound reactive syndromes. Ainu women of northern Japan afflicted with *imu* burst out aggressively or flee in panic after seeing a snake and then, within minutes, fall into catalepsy, echo those about them, and execute orders automatically. Inuit (Eskimos) suffering from *piblotko*, or Arctic hysteria, tear off their clothing, run around, throw things, and imitate animals. Northern Algonquian-speaking Indians of Canada who are possessed of a *windigo* spirit are overcome with a frenzied craving for human flesh and are said to pounce on men, women, and children and devour them ravenously. Frenzied behavior is often interpreted as spirit possession or as the result of sorcery.

SPIRIT POSSESSION. Frenzy has often been associated with spirit possession. The herdsman's description of the Bacchantes, worshiping Dionysos, in Euripides' *The Bacchae* (ll. 677–774) is a classic example. Having himself escaped attack, the herdsman watches as the possessed women attack the villagers' grazing cattle.

And then
you could have seen a single woman with bare hands

tear a fat calf, still bellowing with fright,
in two, while others clawed the heifers to pieces.
There were ribs and cloven hooves scattered everywhere,
and scraps smeared with blood hung from the fir trees.
And bulls, their raging fury gathered in their horns,
lowered their heads to charge, then fell, stumbling
to the earth, pulled down by hordes of women
and stripped of flesh and skin more quickly, sire,
than you could blink your royal eyes. Then,
carried by their own speed, they flew like birds
across the spreading fields along Asopus' stream
where most of all the ground is good for harvesting.
Like invaders they swooped on Hysiae
and on Erythrae in the foothills of Cithaeron.
Everything in sight they pillaged and destroyed.
They snatched the children from their homes. And when
they piled their plunder on their backs, it stayed in place,
untied. Nothing, neither bronze nor iron,
fell to the dark earth. Flames flickered
in their curls and did not burn them.

(*The Bacchae*, trans. Arrowsmith, ll. 736–758)

Euripides' description has become a model in Western discourse for literary descriptions of Dionysian worship (e.g., Thomas Mann's in *Death in Venice*) and indeed for scientific description of the frenzy of the spirit possessed.

In many exorcistic rites the spirit-possessed moves from a gentle, “dreamy,” somnambulistic trance into a frenzied one in which he or she loses all control of behavior. Thus, in Balinese folk dramas (*sanghyangs*) an entranced dancer will imitate, say, a pig, lumbering about on all fours, grunting and groveling, and then suddenly, often on provocation from the audience, he will fall into frenzy, darting, leaping, thrashing about, wallowing uncontrollably in the mud, shaking in convulsions, and struggling against those who try to pin him down. Doused with water, he grows quiet. The frenzied stage of trance possession is usually followed by torpor and exhaustion. Such frenzies, as in *The Bacchae*, seem to be facilitated by group participation and excitement.

Revised Bibliography

FREUD, SIGMUND (1856–1939), originator of psychoanalysis, a method of treating those mental disorders commonly designated as the neuroses. Psychoanalysis began as a method of healing, but became also a psychological theory of personality or mind and a general theory of culture—of morality, group life, society, history, art, and religion. When treating his patients, Freud found it necessary to emphasize their unconscious feelings and thoughts, which, precisely because they were unacknowledged, created symptoms. Freud believed that dreams and dream symbolism were keys to his patients’ unconscious thinking, and also to their symptoms. It was therefore inevitable that his method of treatment would generate theoretical concepts important for understanding the human mind, and that these in turn would lead him to psychological conclusions about the cultural meanings of the symbols found in religious myths, beliefs, and rituals. Freud’s psychoanalytic theory is widely accepted by scholars in many different fields, and Freud is commonly ranked with Karl Marx, Max Weber, Friedrich Nietzsche, and Émile Durkheim as one of the architects of the modern world. But scholars of religion also acknowledge that Freud has made a lasting contribution to their understanding of the religious thought and life of humankind.

LIFE AND PRINCIPAL WORKS. Freud’s personal beginnings contain little to suggest his later achievements. Born into a large Jewish family of modest means in Freiberg, Moravia (now Příbor, Czech Republic), he was four when his father, a wool merchant, moved the family to Vienna, where Freud spent all but the last year of his life. As a youth, he received an excellent education that emphasized both classics and science. For a while he contemplated a career in law or in politics, but finally decided upon scientific work and attended medical school at the University of Vienna, from which he graduated in 1881. A year later he became engaged to Martha Bernays, whom he subsequently married.

Partly for financial reasons and partly on account of official anti-Semitism (it was customary for the university to pass

over Jewish candidates for research positions), Freud shifted his career goals to the medical practice of psychiatry. He became interested in hysterical patients, and began to collaborate with the eminent Viennese physician Josef Breuer.

Freud and Breuer discovered that the symptoms of hysterical patients diminished as they were encouraged to talk about the intense feelings they held toward those close to them. Freud also noticed that dreams were included in these reports, and he began to evolve his theory that both dreams and hysterical symptoms disguised deeply felt and deeply feared thoughts and feelings. At the end of his period of collaboration with Breuer, Freud began to write his first and most famous book, *The Interpretation of Dreams* (1900). This work contained the essence of all his major ideas about the neuroses, about dreams, and about psychoanalytic treatment—and also the essence of his theory that religious symbols and myths are modeled upon dreams.

In the 1910s and 1920s, Freud’s reputation grew. New patients came, and he continued to publish papers and to gather students about him. Many of these men and women underwent psychoanalysis with Freud, and studied his ideas. Among the more eminent were the Swiss psychiatrist Carl Gustav Jung and the socialist Alfred Adler. In 1908 the first international congress in psychoanalysis was held in Salzburg, and in 1909 Freud and Jung gave lectures at Clark University in Massachusetts. The most important of Freud’s many publications during these decades were *Introductory Lectures on Psychoanalysis* (1915), which explained psychoanalytic theory and practice to a lay audience; *Group Psychology and the Analysis of the Ego* (1921), in which Freud analyzed the psychological forces beneath the group behavior of armies and churches; and *The Ego and the Id* (1923), a theoretical treatise on the fundamental psychological structures of the human mind.

Although Freud throughout his life created new works of psychological observation and interpretation, which brought him ever greater recognition, the 1920s produced a major shift in his person and thought, one whose effects persisted to his death. The aftermath of World War I, the death of a beloved daughter, and the discovery of a cancerous growth in his jaw, all forced upon him a reflective and resigned attitude, which in turn fueled his most profound studies of culture and religion. Taking up arms in the time-honored conflict between science and religion, Freud asserted (in *The Future of an Illusion*, 1927) that psychoanalysis was but the latest and most compelling scientific argument against the consolations of religion. Three years later, in *Civilization and Its Discontents*, he addressed the oppressive quality of contemporary social life, arguing that society itself carried within it the mechanisms that created neurotic conflict. In his last major work, *Moses and Monotheism* (1939), written in sections over the 1930s, Freud returned to his own Jewish origins and searched for a positive estimate of that religion, arguing—paradoxically—that Western monotheism was an ascetic force that supported the renunciations required by scientific endeavors.

When the Nazis persecuted the adherents of psychoanalysis and forced Freud to leave his home, he fled to London, where—aged, ill, persecuted, and famous—he died on the eve of World War II.

PSYCHOANALYTIC THEORY. While Freud's psychoanalysis is really a threefold discipline—clinical treatment of neurotic conflict, general theory of personality, and theory of culture and religion—it is important to realize that he generalized from the first to the second and from both to the third. Therefore, all expositions of his thought about religion should begin with the psychoanalytic method and its clinical context, usually referred to as the analytic situation.

Two concepts form the foundation of the analytic situation, the unconscious and childhood. All deliberate, intentional, and conscious life, for the healthy adult and the neurotic alike, is constantly subject to influence by an unconscious dimension of feeling, willing, and intending. Freud often referred to the unconscious as a portion of mental life split off from, and existing alongside of, the system of conscious mental processes. This separation first occurs during the years of childhood. Because of the prolonged and at times virtually total dependency of the infant upon caretakers, some of the strong feelings of love, hate, envy, and jealousy—in short, portions of all the fundamental wishes and fears of living and being—are forgotten or forced out of awareness. These thoughts and feelings, which Freud described as repressed, live on in the normal activities of the adult, making their appearance symbolically in dreams, slips of the tongue, jokes, and love relationships. The normal adult is capable of introspection and self-analysis when unconscious wishes and thoughts press for attention.

However, under conditions of stress produced by the various tasks and responsibilities of living, even the healthy adult can falter. In such cases, the mental organization of the person returns to earlier patterns of regulation, a process known as regression, and neurotic symptoms (for example, phobias or irrational fears, obsessional ideas, or compulsive acts) serve to defend against the return. Because persons in this condition can no longer control portions of their behavior, psychoanalytic treatment is helpful for them. In the analytic situation the patient allows his or her thoughts and feelings, and especially dreams, to flow freely (in "free association") without moral or intellectual control and in doing so forms an intense, irrational, emotional bond with the doctor. Freud called this bond "transference." Because the transference relation embodies old and forgotten childhood memories, the doctor can interpret the bond in the light of dreams and fantasies, gradually bringing the repressed wishes back under the control of conscious life.

THEORY OF CULTURE AND RELIGION. Contrary to much opinion on the subject, Freud recognized religion as a complex phenomenon, and his estimate of it was both appreciative and skeptical. He was more interested in religion than he was in any other manifestation of culture. He rarely approached religion in the abstract, instead always seeing it in

the context of culture as a whole—the social arrangements and systems of symbols that integrate a community of people. Understood as a system of authoritative beliefs about the world, which includes moral guides and the consoling sense of specialness that authoritativeness confers, religion is the historical force that energizes the forms assumed by culture. Freud therefore wrote about art, humor, morality, fairy tales, legends, myths, and rituals, without always attempting to make sharp distinctions among them.

The key to Freud's appreciative stance toward religion lies in his psychology of myth and in particular in his theory that myths are to be understood after the fashion of dreams, although they are collective rather than individual dreams. By noting parallels between dreams and myths, Freud transformed the model of dream interpretation into a tool for research into the psychological character of culture. Both dreams and myths, he felt, are imaginative structures composed of symbols organized along a narrative line. Both are produced by unconscious forces, for myths as well as dreams are experienced as given to individuals, rather than as being created by them. As such, both display mechanisms of symbol formation, whereby figures in dreams and myths take on shifting roles and significances. Both are therefore creative activities of the human mind.

But Freud also observed that dreams expressed the wishes, desires, and fantasies of his patients and were closely related to their motives and intentions. He concluded that myths are collective or group fantasies. Behind the apparent diversity of human societies and cultures there persist certain primordial or typical human situations—the conflicts between parents and children and between the children themselves, conflicts surrounding perennial human issues such as sexuality, death, envy, gratitude, hate, and love. Because these psychological constants or universals are shared by all people, and because they are so pervasive, powerful, and threatening, they are repressed to some degree by everyone, but they reappear for all to see in the myths of each society. A myth, then, represents the shared unconscious wishes of a group, and the psychological interpretation of myth discloses the nature of these wishes.

For example, in fairy tales a king and queen can represent shared unconscious ideas and fears about fathers and mothers, just as princes and princesses represent those held by sons and daughters. A witch can symbolize a hateful, unempathic mother, and a savage monster may suggest aggressive wishes too powerful for individual consciousness or an individual dream to support. Of the world religions, Freud was especially interested in Judaism and Christianity. The idea of God the Father in Judaism represents shared unconscious wishes for a totally powerful and morally perfect group father. Christianity's devotion to Jesus Christ, the Son of God, expresses the Western preoccupation with the anxiety sons experience in relation to their fathers. Catholicism's adoration of the Virgin discloses an intense idealization of motherhood, which Protestant families subsequently reject-

ed. The omnipresence of explicitly sexual themes in the myths of Indian religions contrasts with their absence in Western religious traditions, whose asceticism betrays anxiety over bodily desires.

Freud's skeptical attitude toward religion derived from his training in physiology, neurology, and medicine, which emphasized causality, energy, and rigorous objectivity. But these scientific ideas also served a moral purpose for Freud. He believed that the most profound unconscious human wish was for a grandiose sense of specialness, which he called "narcissism," and that both science and psychoanalysis could reduce or modify this narcissism, or self-love. On the other hand, religion indulged and encouraged self-love by conferring upon people the illusion that they were special or privileged by virtue of their relation to an all-powerful and all-loving god. Freud cited the Western discovery that the earth revolved around the sun. As a result of that scientific insight, people could no longer think of themselves as central points in a divine drama. The theory of evolution deprived people of the wish to see themselves as special beings created by an omnipotent god. And Freud believed that his own discovery of the unconscious shattered the grandiose belief in the supreme capacities of human reason. Each scientific discovery was a blow to human narcissism and to the religious doctrine that supported it. Freud concluded that belief in an all-powerful divine being with whom one had a special relationship forestalled, rather than facilitated, new knowledge about the world—for in each case religious leaders had mounted the strongest objections to these discoveries.

CONTRIBUTION TO THE STUDY OF RELIGION. Because of Freud's appreciation of the power of religious symbols, and despite his skeptical stance toward religion, his theories exercised an important influence upon the religious thought of post-World War II Europe and, especially, America. By this time his ideas had become widely acknowledged, and the leaders of religious communities wanted to use them and to respond to his challenge. In particular, Paul Tillich and Mircea Eliade deserve mention here.

Paul Tillich was convinced that an overly rational society had cut the Christian faith off from its historic depths and from its role as a shaper of culture. He hailed the secular Freud's concept of the unconscious roots of religious reality as an attempt to restore what he called a depth dimension to human reason and cultural life. Even Freud's skeptical side Tillich incorporated into theology, arguing that modern churches had become authoritarian and oppressive to human depth, and that Freud's objections to religion were in this sense well founded. Tillich likened Freud to a biblical prophet whose attacks on the idolatry of the faithful were mounted in the service of a deeper, more transcendent reality.

Alongside Tillich's theological analyses of culture, a second movement emerged, led by the renowned historian of religions Mircea Eliade. Like Tillich, Eliade believed that contemporary culture was excessively rational and technological and that a renewal of a religious kind was essential. But

unlike Tillich, Eliade turned to primitive religions and to Eastern traditions and myths to renew the life of modern humans. Eliade wrote that Freud's view of myth as an unconscious imaginative structure and the links he had built between dreams and myths would enrich the dry, technical tones of modern life, and that both could be used to reinstate a religious view of humanity. In fact, Eliade described the history of religions as a metapsychoanalysis, by which he meant that religion added a dimension to the foundations supplied by Freud.

Yet neither Tillich nor Eliade could tolerate Freud's skepticism, his view that once the unconscious meaning of a religious myth was disclosed, then the consoling sense of specialness that belief conferred would necessarily be given up in the interest of a broader psychological self-understanding. The task of advancing this thought was left to the sociologist Philip Rieff, who devised the term *psychological man*, to describe a new type of person in modern society, one who had accepted Freud's interpretations and had accordingly adopted a psychological rather than a religious ethic. Rieff's view called attention to the roles of religion and psychoanalysis as competing social forces in Western history, a focus ignored by Tillich and Eliade, who had centered their efforts on the more speculative aspects of Freud's theories of religion.

However, Freud's contribution to the study of religion did not end here. A new generation of scholars working with post-modern understandings has advanced quite different readings of Freud and his contribution to the study of religion. These scholars teach and write in universities and colleges rather than in seminaries and theological facilities, as did Tillich and Eliade, and the topics and methods they choose belong to the humanities and the social sciences. But there is also irony in these new developments. As noted, neither Tillich nor Eliade could tolerate Freud's skepticism about religion—his theories of religion were helpful, but only up to a point. On the other hand, post-modern scholars of religion make no such distinction and instead submit all of his writings to a generalized cultural critique, sometimes finding that what was "skeptical" for the theologian may be meaningful to the scholar of religion.

BIBLIOGRAPHY

Freud's psychological writings have been collected for the English-language reader in *The Standard Edition of the Complete Psychological Writings of Sigmund Freud*, 24 vols., translated from German under the general editorship of James Strachey (London, 1953–1974). Each of Freud's publications in this definitive edition is prefaced by valuable information regarding date of composition and of first publication, relevant biographical details, and a short discussion of its leading ideas in relation to Freud's thought as a whole.

The best single book on Freud's life, social circumstances, and major ideas is Peter Gay, *Freud: A Life for Our Time* (New York, 1988). Philip Rieff's careful, thorough, and clearly written book *Freud: The Mind of the Moralizer* (1959; 3d ed.,

Chicago, 1979) remains the best overall discussion of Freud's social, philosophical, and religious ideas. Rieff also analyzes the impact of psychoanalysis upon both the Western religious heritage and contemporary society. An excellent illustration of the use of Freud's approach to dream symbolism to interpret social and cultural symbols is Bruno Bettelheim's *The Uses of Enchantment: The Meaning and Importance of Fairy Tales* (New York, 1977). The best theological discussion of Freud's theory of religious experience is to be found in Paul Tillich's *The Courage to Be* (New Haven, 1952). The many implications of psychoanalysis for the historical study of religious myths are clearly stated by Mircea Eliade in *Myths, Dreams and Mysteries* (New York, 1960). A post-modern reading of Freud's thought as a whole with an emphasis upon the interplay between his psychology of religious faith and his theory of femininity is Judith Van Herik's *Freud on Femininity and Faith* (Berkeley, Calif., 1982).

PETER HOMANS (1987 AND 2005)

FREYJA ("Lady"), the daughter of Njörðr (Njord) and sister of Freyr, is the main Scandinavian goddess of the group of gods known as the Vanir. Although no extant source tells how she came to the world of the Æsir—the dominant group of gods—allusions to her arrival in their citadel Ásgarðr (Ásgard) suggest that there was a myth about this that has since been lost. According to Snorri Sturluson (1179–1241), Freyja is the noblest of goddesses, equal in dignity to Óðinn (Odin)'s wife Frigg. She lives in a grand hall, shares dominion over the dead with Óðinn, and travels in a cart pulled by cats. People often invoke her in matters of love. Incestuous marriage was usual among the Vanir, and it is likely that Freyja was married to her brother. The Æsir frowned on this practice, and once Freyja becomes a member of their community, she takes a different husband, Óðr (Odr). The name of this obscure deity is related to *Óðinn*, and the pair Óðr/Freyja may be a doublet of Óðinn and his wife Frigg. Freyja bore Óðr two daughters, Hnoss ("jewel") and Gersimi ("treasure"). These names are synonyms and most likely are later poetic reflections of the goddess herself. Freyja and Óðr's marriage was apparently not a happy one, as Óðr disappeared on long journeys, and Freyja wept tears of red gold in his absence. She looked for him in many countries and assumed various names in her wanderings. She is said to have owned a garment that allowed its wearer to take the shape of a falcon. Like her brother Freyr, Freyja rides a boar; hers is named Hildisvíni ("battle swine"). It has shining golden bristles and was made for her by the dwarves. Pigs are sacred to her as they are to Freyr, and one of her names is Sýr ("sow").

Freyja is often in demand as a bride. The Æsir agree to give away Freyja, the sun, and the moon to the master builder of Ásgarðr if he finishes by the first day of summer, and when the giant Hrungnir becomes drunk at a feast at Ásgarðr, he threatens to destroy the citadel and all its inhabitants except for Freyja and Þórr's wife Sif, whom he will keep for

himself. The giant Þrymr (Thrymr) steals Þórr's hammer Mjöllnir in order to have something of enough value that the Æsir would exchange Freyja for it. The gods ask Freyja to go to Þrymr, but she indignantly refuses, saying that such a journey would make everyone think that she was eager for sex. Þórr retrieves Mjöllnir himself by going to Þrymr dressed as a bride and taking his hammer when it is brought out as part of the wedding ceremony.

Freyja's personality is complex: she is said to enjoy "love poetry," an erotic genre that was forbidden in Iceland under threat of banishment (Ström, 1975, p. 151). Her lustfulness is often stressed, not only by Loki, who denounces her as incestuous and grossly promiscuous (*Lokasenna* sts. 30 and 32), but also in other eddic poems such as the *Hyndluljóð* (sts. 30–31), where she is described as "running through the night in heat like [the goat] Heiðrún [Heidrun]." Her unfaithfulness to her husband is accentuated as well: "Under your apron still others have crept" (Hollander, 1962, p. 135). *Sorla þáttr*, a story in a late fourteenth-century manuscript, tells how she slept with four dwarfs in order to obtain the famous necklace Brisingamen, which they had forged. Such behavior is in keeping with the personality of a fertility goddess, but the story as a whole is a Christian creation intended as a demonstration of the evils of paganism, and its depiction of Freyja as a malicious near-giantess and as Óðinn's mistress is much more likely to be the author's invention than a reflection of authentic pagan tradition. Freyja's association with the cat is another hint at her lasciviousness, since the cat was considered by Norsemen to be a most lascivious animal. In the case of Freyja, the feline is the equivalent of the lions and panthers associated with such ancient Near Eastern fertility goddesses as the Dea Syria or Cybele.

Freyja also goes under such other names as *Hörn*, a term often occurring in skaldic kennings for "woman" and related to the Old Norse term *horr* ("flax" or "linen"); it also occurs in a few place-names and points to the worship of the goddess as deity of the flax harvest in eastern Sweden (Vries, 1967, p. 331). As *Mardöll* she appears in poetic circumlocutions for "gold" such as *Mardallar tár* ("Mardöll's tears"). She is also known as *Gefn*, a name derived from the verb *gefa* ("give") and referring to the concept of the fertility goddess as the generous dispenser of wealth, goods, and well-being. This term is also preserved in the name of the Matronae Gambiae and Dea Garmangabis, recorded in the Rhineland in Roman times. Freyja has therefore been connected with Gefjun, who plowed the island of Sjælland away from the Swedish mainland with the help of her four sons. There are indeed some striking parallels between Freyja and Gefjun, as suggested by Loki's reference (*Lokasenna*, st. 20) to Gefjun's seduction of a "fair-haired lad" (possibly Heimdallr) who gave her a necklace (presumably Brisingamen) in exchange for her favors. Though the Eddas treat them as separate deities, Gefjun can hardly be anything but a local incarnation of the omnipresent fertility goddess. Another possible hypostasis of Freyja is the beautiful Mengloð ("necklace-glad"), who lives

in the company of nine maidens on top of the Lyfjaberg (the “mount of [magical] healing herbs”), surrounded by a wall of flickering flames (Vries, 1967, pp. 328–329).

Freyja’s association with the dead has been understood as an expression of the opposition between physical death and fertility. Together with her shape-changing garment, this association also suggests a connection with shamanism. Another connection with shamanism is *seiðr*, a special kind of sorcery Freyja practiced that allowed her to see the future and do harm to others. The possession by the spirits that this entailed was considered to be too much like sexual penetration to be appropriate to men, so Freyja taught *seiðr* only to the Æsir goddesses and to Óðinn, who was willing to risk shameful effeminacy for its power. Sagas describe *seiðr* rituals performed by women in a variety of Norse communities.

Although one might expect that the goddess of love would be worshiped in private ceremonies, in fact the cult of Freyja was a public one. According to the testimony of Nordic place-names, the cult was comparatively old and was widely dispersed over Scandinavia, though it is not always easy to determine whether the toponyms refer to Freyr or to Freyja (Vries, 1967, pp. 308–310). The greatest concentration seems to be along the west coast of Norway and in the Swedish Uppland, and the name of the deity is joined with terms meaning “lake,” “grove,” “hill,” “field,” and “meadow,” as well as “sanctuary” and “temple.” An anecdote about the tenth-century Icelandic poet Hjalti Skeggjason throws light on Freyja’s important position in heathen religion: at the general assembly in 999 he composed this mocking verse, “I don’t like barking gods; I consider Freyja to be a bitch,” and was promptly outlawed for blasphemy.

EDGAR C. POLOMÉ (1987)
ELIZABETH ASHMAN ROWE (2005)

FREYR (Lord), the son of Njörðr and the brother of Freyja, is one of the Vanir hostages in Ásgarðr and is the main fertility god of ancient Scandinavia. According to Snorri Sturluson (1179–1241), Freyr is said to be handsome and powerful. The noblest of the gods, he rules over rain, sunshine, and growing plants. People invoked him for peace, good crops, and wealth. He made women happy and freed captives (*Lokasenna*, st. 37). He is a courageous fighter, and his name occurs in poetic circumlocutions for *warrior*, such as “spear-Freyr.” He is represented as the ancestor of the Swedish kings under the name *Yngvi-Freyr* (Yngvi is the eponym of the royal family of the Ynglings), a name also associated with *Ing* (Gmc. Ingw[az]) in the Old English *Runic Poem* and the eponym of the Germanic tribal group the Ingvaeones, but the relationship between Freyr, Yngvi, and Ingwaz is not fully understood.

Among Freyr’s prized possessions is the dwarf-made ship *Skíðblaðnir* (Built of Slats; *Grimnismál*, st. 44); according to Snorri, it can be folded up and carried in a pouch, but, when needed, it can carry the whole company of the Æsir, weapons and all, and always sails with a favorable wind. The motif of the wonderful boat is significant because of the close association of ships with fertility cults, from their representation on Scandinavian Bronze Age rock carvings to medieval rites. Another important present from the dwarfs is Freyr’s golden boar, *Gullinbyrsti* (Golden Bristle) or *Slíðrugtanni* (Razor Tooth), who runs faster than a horse and shines brightly at night.

IN MYTHOLOGY. Freyr is involved in few myths. The best known is told in the eddic poem *Skírnismál* (The lay of Skírnir). Seeing the beautiful giantess Gerðr, daughter of Gymir, from a promontory overlooking all the world, Freyr falls deeply in love with her. Pining away, he sends his servant Skírnir (possibly a double of Freyr, who is elsewhere described as *skírr* [bright, shining, pure]) to woo her. The journey to Gymir’s home is hazardous, and Skírnir reaches it only because Freyr’s horse, which he is riding, can jump over the circles of flames protecting the property. At the gate, Skírnir finds savage dogs and a shepherd sitting on a mound, who tells him he must be either doomed or dead to have come so far. Skírnir is nevertheless greeted by Gerðr, who offers him mead. As he begins his plea for her love on behalf of Freyr, he tries to entice her with presents—the apples of eternal youth, a magic arm ring, and Freyr’s invincible sword—but he meets with refusal. Switching from blandishments to threats, Skírnir ominously warns Gerðr that she will be exiled and will waste away, ugly and desolate and plagued

by lust, for having incurred the wrath of the Æsir; worse still, he will deliver her by magic to a three-headed fiend from hell, to quench her thirst with “stalings of stinking goats” (Hollander, p. 72). Intimidated, Gerðr gives in and promises to meet Freyr after nine nights in a “trysting glade” called Barri.

This myth seems quite archaic, and even if one sets aside the interpretations associating the story with any fertility ritual, there can be no doubt that sex and fertility lie at its core. The myth has also been interpreted as reaffirming the patriarchal structure of Old Norse society, depicting a male-female struggle for power and providing a matrix for resolving conflict between different families through a system of exchange and intermarriage. One of the conditions imposed on the Vanir hostages was that they give up their custom of incest, which left only giantesses for Freyr and his father to marry, as the Æsir did not want the male Vanir to marry upward, into their own group. However, the incorporation of giantesses into Ásgarðr imposed strains on the Æsir’s social hierarchy, and at the gods’ last battle at Ragnarök, Freyr is killed by the giant Surtr because he did not have his sword, contributing to the defeat of the Æsir as a whole. The loss of the sword, with which Loki insults Freyr (*Lokasenna*, st. 42), emphasizes the separation of the fertility function from the warrior function and implies the weakening effects of sexual obsession. Snorri’s *Ynglingasaga* calls Gerðr the wife of Freyr and mentions their son Fjölfnir, but this may be a post-pagan development undertaken to create a coherent dynastic origin.

Besides Skírnir, Freyr has two other servants (*Lokasenna* sts. 43–46): Byggvir, meaning “grain of barley” (as suggested by the reference to the quern [a hand-turned grain mill] in stanza 44), and Beyla, whose name Georges Dumézil interpreted in 1973 as a diminutive of the Germanic word for “bee,” in spite of insuperable phonological difficulties. Such names would make these figures symbolic of beer and mead, the inebriating beverages used in ceremonial activities. However, it may be more correct to connect Beyla with the Old Norse *baula* (cow) and to see the couple as representatives of the two aspects of Freyr’s functional domain: agriculture and animal husbandry.

Freyr and Gerðr have been identified as the man and woman depicted on Viking Age gold plates from Jæderen, Norway. She holds an object that could be a branch with leaves and a flower, and the man touches her cheek or her breast with his hand in a gesture of endearment. The clear erotic elements in this depiction seem to be entirely in keeping with the sexual connotations of fertility cults.

FREYR WORSHIP. Little is known directly about the worship of Freyr, but it held a prominent place in Sweden, where he was the principal god as well as the divine ancestor of the royal house. Adam of Bremen (IV:26), writing around 1070 and using eyewitness accounts, describes the triad of gods worshiped at the time in the temple at Uppsala. He notes that the statue of Freyr is endowed with a huge sex organ and

adds that all kinds of “lewd practices that remain better unmentioned” accompanied the ceremonies of Freyr’s cult. One version of the king’s saga about Olaf Tryggvason includes a tale about a fugitive Icelander who joins the priestess of Freyr as she travels from farm to farm in Sweden in a chariot with a statue of Freyr in a wagon; this was believed to bring good harvests. The young man soon takes the place of the statue, and when the priestess becomes pregnant, the people take it as a sign of divine favor. Although this episode is probably intended to mock paganism, the practice it describes is confirmed from other sources, such as Tacitus’s account of the procession of Nerthus. A late Icelandic saga (*Vatnsdæla saga*, ch. 10) notes that one devotee of Freyr carried an amulet of the god around with him in a bag, a practice substantiated by the find in Rällinge, Sweden, of a small yet phallic Viking Age statuette.

Toponymy supplies strong evidence of the spread of his cult: place-names incorporating *Freyr* are numerous in Sweden, especially in the agricultural area of Svealand. Similarly, the god’s name combines with words for fields, meadows, and so on in agricultural regions of Norway, and it appears in a few places in eastern and southeastern Iceland. Here the traditional elements preserved in the Icelandic saga about a chieftain named Hrafnkell attest to the veneration of Freyr; he was a “priest of Freyr” (Old Icelandic *Freyrsgóði*), to whom he had dedicated a stallion. When a servant desecrated the horse by riding it in spite of Hrafnkell’s stern warnings, Hrafnkell killed him. However, Hrafnkell’s enemies captured the stallion and pushed it over a cliff after covering its head with a bag, as if they were afraid of the power in its eyes. Desecration of horses belonging to Freyr is also attributed to the missionary king, Olaf Tryggvason, who destroyed a sanctuary of the god in Norway.

The horse is not the only animal closely associated with Freyr; several sources relate the offering of a bull or an ox to Freyr. The boar was also considered suitable for sacrifice to Freyr, particularly at Yuletide, a critical period when the forces of fertility needed to be stimulated. Adam of Bremen (IV: 27) reported that at times up to seventy-two bodies of men, horses, and dogs would hang together in a grove near the temple at Uppsala, but he did not say which victims were dedicated to which gods.

The rationale for these sacrifices was presumably concern for good crops; this is suggested by the story of the death of the euhemerized Freyr related in *Ynglingasaga* (ch. 10). When “King Freyr” succumbed to long illness he was secretly buried, and people were made to believe he was still alive. For three years, their tribute—first of gold, then of silver, and ultimately of copper coins—was poured into Freyr’s funeral mound, and good seasons and peace endured. This story has often been compared to the occultation of the Thracian god Zalmoxis, but as Mircea Eliade showed in *Zalmoxis, the Vanishing God* (1972), this comparison is not valid.

EDGAR C. POLOMÉ (1987)
ELIZABETH ASHMAN ROWE (2005)

FRICK, HEINRICH (1893–1952), German religious thinker. The term *religious thinker* characterizes Frick as a scholar who endeavors to combine two potentially conflicting attitudes: Christian theological piety and the ability to analyze in a religio-historical way his own religion and the religions of others.

Born in Darmstadt, Hesse, Frick during his childhood belonged to Bible youth groups. He studied Protestant theology and Arabic in Giessen and Tübingen. He received his licentiate in theology in 1917 from the University of Giessen and joined the Lutheran ministry in Darmstadt. In 1918 he earned his doctorate, also at Giessen; his thesis was *Ghazali's Selbstbiographie: Ein Vergleich mit Augustins Konfessionen* (Al-Ghazālī's *Autobiography: A Comparison with Augustine's Confessions*; 1919). Frick began his academic career in 1919 as privatdocent in *Religionswissenschaft* and missiology at the Technische Hochschule, Darmstadt. He moved to the University of Giessen in 1921, from which he was called to Marburg as successor to Rudolf Otto, whose professorship in systematic theology was, for Frick, extended to include *Religionswissenschaft* and missiology. In addition, he became director of the Religionskundliche Sammlung, a collection of religious materials from many religions of the world that had been founded by Otto in 1927.

Frick's bibliography contains more than 150 items, most of them articles, reports, prefaces, lectures, speeches, sermons, and statements. Of his few books, only one pertains to *Religionswissenschaft* proper, that is, *Vergleichende Religionswissenschaft* (Comparative study of religions; 1928). Here he

lucidly develops his typology of religions, analyzing parallels between historical religions of different origin, as well as their respective "peculiarities." He concludes his argument by presenting three fundamental typological phenomena as essentially characteristic of religion: the Catholic-Protestant dissension (religio-historical); the polarity of mystical and believing piety (religio-psychological); and, crucial to the "quality" a religion has, the alternative of symbolization in space or time (religio-philosophical). The book aims at demonstrating that comparative religion is an "indispensable branch of effective theology" (p. 134), in that it proves the necessity of choice between several religious possibilities and offers empirical arguments for a "clear answer to the question why we cling to the gospel in spite of all the parallels and in spite of all the attractions in non-Christian religion" (p. 132).

This theological intention did not prevent Frick from developing, here and in other publications, points of comparison between religions that have since been generally accepted. It was an approach he had already adopted in his thesis comparing al-Ghazālī with Augustine, and again in his reviews and articles on special problems, for example, "Der Begriff des Prophetischen in Islamkunde und Theologie" (The concept of the prophetic in Islamic studies and theology), in *Festschrift P. Kable* (1935); and in his programmatic writings, two examples: *Das Esvangelium und die Religionen* (The Gospel and religion, 1933); and in his article "Christliche Grundbegriffe in ihrer Besonderheit gegenüber Fremdreigionen" (Fundamental Christian ideas in comparison with other religions), *Evangelische Missionzeitschrift* (1944): 193–205, 233–255.

Motivated by a lifelong sensitivity to secularistic tendencies and the "crisis of religion," Frick summed up his views on *Religionswissenschaft* near the end of his life in two lectures on *Religionsphaenomenologie* (1950) and *Religionswissenschaft* (1951). Casting doubt on the moral right of neutrality in the field of *Religionswissenschaft* at a time when modern humanity had become more and more irreligious, Frick called upon his colleagues to search for a synthesis of the venerable religio-cultural traditions and modernity. In his opinion the "most important task of present *Religionswissenschaft* and related fields in all the scholarly faculties is to fulfill its modest but irremissible part in this."

MARTIN KRAATZ (1987 AND 2005)

FRIENDS, SOCIETY OF SEE QUAKERS

FROBENIUS, LEO (1873–1938), was a German ethnologist and philosopher of culture. Leo Viktor Frobenius was born July 29, 1873, in Berlin, where he spent his early years. Even in his youth he devoted himself enthusiastically to the investigation of African cultures, collecting all available written and pictorial material that dealt with particular ethnological motifs. (Later, these materials became the matrix for an Africa archive that Frobenius assembled.) Despite the fact that he never received a high school diploma and did not complete a university program, Frobenius achieved extraordinary success in his scientific pursuits.

Stimulated by the work of Heinrich Schurtz (whom Frobenius claimed as his teacher), Friedrich Ratzel, and Richard Andree, Frobenius was responsible for introducing a new way of scientific thinking into the field of ethnology. His new concept, hinging on the term *Kulturkreis* (“culture circle”), first appeared in his 1898 work *Der Ursprung der afrikanischen Kulturen* (The origin of African civilization). Unlike other scholars, who put the term to one-dimensional uses, Frobenius developed the concept of *Kulturkreis* into an all-encompassing cultural morphology. His method involved the notion that individual elements of culture should be investigated according to their placement within the organic whole of which they are parts. According to Frobenius, this method provides a way for understanding the complex, historical nature of cultures.

Frobenius’s primary concern was for the investigator’s recognition of the essence of culture in general. Frobenius found that cultures display “biological” characteristics similar to those of living organisms. He drew parallels between a culture’s stages and the elements of an organic life cycle, using terms such as *Ergriffenheit* (“emotion,” by which Frobenius meant to signify a culture’s youth), *Ausdruck* (“expression,” or a culture’s maturity), and *Anwendung* (“utilization,” its old age). Every culture, argued Frobenius, possesses laws that determine its process independently of the individual human beings who participate in the culture. He labeled this inherent power with the Greek word *paideuma* (“what is acquired by learning”) and devoted an entire book, *Paideuma: Umrisse einer Kultur- und Seelenlehre* (Outline of a theory of culture and spirit; 1921), to this theme. *Paideuma* is also the title of a periodical, established by Frobenius in 1938, devoted to the problem of cultural morphology. Although the philosophy of culture espoused by Frobenius has been disputed, he is still considered an ethnological field-researcher of the first order.

Frobenius went on twelve research expeditions to various parts of Africa to document the lives of tribal peoples. In addition, he studied the most important rock-painting sites of both northern and southern Africa. The results of his ethnological researches were presented in a work entitled

Und Afrika sprach, 3 vols. (1912–1913; translated as *The Voice of Africa*, 2 vols., 1913). He also published a series of twelve volumes of folk tales and poems under the general title *Atlantis* between 1921 and 1928; these have proved to be particularly rich source materials for historians of religions. He summarized his research in *Kulturgeschichte Afrikas* (1933).

Frobenius’s impact upon the world outside his professional field is demonstrated by the fact that the Senegalese politician and poet Léopold Senghor has credited Frobenius with helping to foster a revitalization of self-awareness among present-day Africans. The materials collected on Frobenius’s many expeditions were brought together in 1922 to be housed at the newly founded Institute for Cultural Morphology in Munich. In 1925 the institute was removed to Frankfurt, where Frobenius received an honorary lectureship in the department of ethnology and cultural studies at the university. In 1934 he was appointed director of the Municipal Ethnological Museum in Frankfurt. Shortly after his sixty-fifth birthday, Frobenius died at his residence on Lake Maggiore in Italy.

OTTO ZERRIES (1987)

Translated from German by John Maressa
Revised Bibliography

FRIGS AND TOADS. The frog or toad is a lunar animal par excellence. Its shape or behavior is reminiscent of the moon; it swells and shrinks, submerges under water but emerges again, and hides under the ground in winter but reappears in spring. The frog lives according to the lunar rhythm. In fact, a great many myths speak of a frog in the moon. According to the Chinese, the moon has not only an evergreen cassia tree and a rabbit but also a frog inside it. Thus the *Tianwen* section of the *Chuzi* (fourth or third century BCE) asks: "What is the peculiar virtue of the moon, the brightness of the night, which causes it to grow once more after its death? What does it advantage to keep a frog in its belly?"

The frog, then, is naturally associated with all sorts of aquatic elements such as water, rain, ocean, and flood. Frogs are said to croak incessantly before it rains, or to announce or bring rain by croaking. They are usually mentioned in the innumerable rites for inducing rain. North American Indians see in the moon the primeval toad, which contained all the waters and caused the flood by discharging them over the earth. According to the Kurnai of southeastern Australia, once upon a time all the waters were swallowed by a huge frog; the other animals tried in vain to make him laugh until the eel danced about, twisting itself into the most ridiculous contortions, whereupon the frog burst into laughter and the waters rushed out of his mouth and produced the flood. The frog sometimes plays a part in the precosmogonic period when there is nothing but water. A Huron myth narrates how several animals descended in vain into the primeval waters, until the toad returned successfully with a little soil in its mouth; the soil was placed on the back of the tortoise, and the miraculous growth of the land then began.

Significantly, the frog is also associated with the principles of evil and death. According to Altaic beliefs, the creation of man and woman by the god Ülgen was marred by the devil Erlik. Consequently, the god decided to destroy them, but changed his mind when a frog proposed that humankind exist under the curse of mortality. In Iranian mythology the frog appears as a symbol or embodiment of the evil spirit or the most important of its creatures. In Inner Asian cosmogonic myths—apparently colored by Iranian influence—frogs are among those animals that, together with lizards, worms, and mice, come out of the hole made in the earth by the satanic figure. In Africa the frog emerges sometimes as the messenger of death. At the time of beginning, say the Ekoi of Nigeria, the duck was charged by God with a message of immortality to humankind, whereas the frog was given a message of death. The frog got to the earth first, delivered his message, and thus brought death to humankind.

MANABU WAIDA (1987)
Revised Bibliography

FRYE, NORTHROP. The reputation of Northrop Frye (1912–1991) as a literary theorist was originally based upon his *Anatomy of Criticism* (1957), a book that sought to provide a structural framework for the study of literature through an analysis of its various modes, symbols, myths, images, and genres. The *Anatomy*, heralded for a generation as a twentieth-century *Poetics*, had a large following in the 1960s and 1970s, and twenty years after its publication it was the most frequently cited book in the arts and humanities by a writer born in the twentieth century. Seventeen translations of the *Anatomy* into thirteen languages (as of 2003) attest to its international standing. But some thirty books followed in the wake of the *Anatomy*, and the scope of Frye's work as a whole has come into focus with the publication of his collected works. While *Anatomy of Criticism* will remain an important twentieth-century study of literary conventions, it seems likely that Frye's major contribution will be defined by the books that serve as bookends of his career: at the beginning, *Fearful Symmetry: A Study of William Blake* (1947), and at the end, his two books on the Bible and literature, *The Great Code* (1982) and *Words with Power* (1990)—as well as his posthumous *The Double Vision* (1991).

Frye grew up in a Methodist environment in Moncton, New Brunswick. Although he rejected at an early age what he saw as the constraining features of fundamentalism and the oppressive demands of Methodist moral piety, he never abandoned his Protestant roots, particularly its low-church, dissenting traditions and the Methodist emphasis on experience. In 1929, at age seventeen, he entered Victoria College in Toronto as a "church student," and on completing his undergraduate honors degree in philosophy, he enrolled at Emmanuel College, the theology school at Victoria University. The papers he wrote at Emmanuel, collected in *Northrop Frye's Student Essays* (1997), show how deeply he immersed himself in the comparative mythology of James Frazer (1854–1941), Oswald Spengler's (1880–1936) theory of the organic rhythms of cultural history, Reformation theology, and the Romantic cultural revolution. Several of these essays also addressed the relationship of religion and art. Frye's basic insights came to him early, and these student essays contain an embryonic form of many of the deductive frameworks he subsequently developed. At age twenty-two Frye wrote, "religion and art are the two most important phenomena in the world; or rather the most important phenomenon,

for they are basically the same thing” (*Correspondence*, 1966, vol. 1, pp. 425–426). This was an insight that Frye spent the next fifty-six years exploring.

Frye’s interest in religion is, therefore, in many ways obvious: he became an ordained minister in the United Church of Canada; early in his career he wrote an extraordinary essay on American civil religion and another one on the relation of the church to society; at Victoria College, where Frye spent his entire career, he taught a course on the Bible for forty-four years; and he addressed religious subjects on numerous occasions (*Northrop Frye on Religion* [2000] contains forty-three texts, including a number of eloquent sermons and prayers). But having an interest in religion would be not be unusual for any thinker who engaged as expansive a range of literary, social, and cultural issues as Frye did. That would be the weak claim. The strong claim would be that religion was absolutely central to practically everything he wrote, the base upon which he built the massive superstructure that was his life’s work. The reasons for the strong claim have become more insistent and the argument more convincing with the publication of Frye’s notebooks, diaries, and other manuscripts.

Frye remarked on several occasions that all of his ideas derived from William Blake (1757–1827), a deeply religious poet, the code of whose “prophecies” Frye was more responsible than anyone else for deciphering. The most important thing Blake taught Frye was the religious vision of radical immanence. Blake insists, says Frye, that “everything God does comes through man—the consciousness and imagination of man. . . . God becomes man in order that we may be as he is” (Cayley, 1992, p. 54). Theologically, this is the doctrine of the incarnation, though Frye was not inclined to speculate on such paradoxes in theological terms—in what he called the second-phase language of discursive thought with its emphasis on subjects and objects. His approach was through the first-phase language of metaphor. “The metaphorical approach,” he said, “moves in the direction of the identity of God and man” (Cayley, 1992, p. 183). This means that the principle of identity, which makes the paradoxical claim that two different things are the same thing, lies behind Frye’s speculation on both religion and art. Identity is also a principle of myth: in our earliest stories, which are stories about gods, the gods are themselves identified with forces in nature. In such hyphenated words as *sky-god* or *river-god* the hyphen really functions as an equal mark, identifying the sky or the river with the god. *Mythos* or narrative, moreover, has to do with the loss and regaining of identity, or recognition of self by both literary characters and readers, which is the general topic of *The Secular Scripture* (1976).

Metaphor and myth, then, lie behind Frye’s imaginative approach to the Bible in *The Great Code* and *Words with Power* and in the lectures on the Bible that he gave at Victoria College, published in *Northrop Frye’s Notebooks and Lectures on the Bible and Other Religious Texts* (2003). The Bible for Frye was the primary text in the Western literary imagina-

tion, becoming for him a touchstone for studying what he called “positive analogies” in nonbiblical stories and images. His approach always moved away from the historical and doctrinal toward the poetic. But although he was known primarily as a literary critic, his lifelong project took the form of a religious quest and the structures he built for containing his expansive vision were fundamentally religious. “I am an architect of the spiritual world,” Frye wrote in his *Late Notebooks* (2000, vol. 1, p. 414).

The architecture of this world was formed by a number of key terms that appear throughout Frye’s work—what he called his “verbal formulas.” Chief among these are (1) *interpenetration*, an idea that developed from his reading of Spengler, Alfred North Whitehead (1861–1947), David Bohm (1917–1992), and the sūtras of Mahāyāna Buddhism, and that, like *identity*, represented the erasing of the subject-object duality; (2) the *participating apocalypse* or revelation, which was the final stage of the reading process, opening up “myths to live by and metaphors to live in” and the gospel of love; (3) *kerygma*, the voice of proclamation that comes from the other side of the poetic; (4) *purgatory*, which represents the pilgrimage that serves as a crucible for the purified mind and the emancipated vision; (5) *anagnorisis* or recognition, which Frye associates with rebirth and renewed visionary perception; and (6) the *dialectic of Word and Spirit*, the goal of which was to reach spiritual insight.

Frazer and other comparative mythographers, including Carl Jung (1875–1961) and Mircea Eliade (1907–1986), were important in Frye’s early work in helping him define the principles of myth, archetype, and ritual. In his late work such thinkers are displaced by G. W. F. Hegel (1770–1831), whose *Phenomenology of Spirit* (1807) Frye saw as the great philosophic statement of *anabasis*. Both Frye and Hegel climb a spiraling ladder to a higher level of being, except Frye moves upward by way of the language of myth and metaphor. Frye said, “If Hegel had written his *Phenomenology* in *mythos*-language instead of in *logos*-language a lot of my work would be done for me” (*Late Notebooks*, 2000, vol. 1, p. 192). About the same time he wrote, “The rush of ideas I get from Hegel’s *Phenomenology* is so tremendous I can hardly keep up with it” (*Late Notebooks*, 2000, vol. 2, p. 631). Blake remained Frye’s guiding light throughout his career, but Stéphane Mallarmé (1842–1898) was another important presence in his visionary poetics. In Mallarmé, Frye discovered a completely metaphoric and symbolic world, a world where divinity can be expressed only by the poetic word but which ultimately moved beyond the poetic. In his various accounts of Mallarmé the distinction between literature and religion tended to collapse.

Frye never escaped from his Christian roots, nor did he want to: the words *Christian* and *Christianity* appear more 3,400 times in his work. But he had more than a passing interest in Eastern religious traditions, and his notebooks reveal that he was deeply engaged with esoteric and mystical religious traditions. His library contains more than 250 annotat-

ed books that can be labeled *esoterica*, ranging from Alexandrian hermeticism through the medieval mystics to various forms of the occult, including alchemy, astrology, Gnosticism, magic, mysticism, Rosicrucianism, channeling, the tarot, numerology, astral projection, New Age science, Theosophy, synchronicity, and qabbalism. Frye had no interest in these traditions as matters of belief, but they did confirm his contention that poetic thought is schematic, and they contained grammars of literary and religious symbolism. He was drawn to the esoteric traditions only to the extent that he could make imaginative use of them.

Frye was a schematic thinker (he could hardly put pen to paper without a diagram in mind), but he was also a dialectical thinker, his mind repeatedly moving back and forth between opposing poles of reference: knowledge and experience, space and time, stasis and movement, the individual and society, tradition and innovation, Platonic synthesis and Aristotelian analysis, engagement and detachment, freedom and concern, *mythos* and *dianoia*, the world and the grain of sand, immanence and transcendence, and hundreds of other oppositions. A second feature of Frye's expansive body of work was its drive toward unity—an effort to get beyond the oppositions that he repeatedly introduced. He always resisted the Kierkegaardian either/or solution. But unity was not achieved at the expense of variety, and he never tires of insisting that opposites are never resolved by reconciliation, harmony, or agreement. They are typically resolved, rather, by the process of the Hegelian *Aufhebung*, a dialectic in which oppositions are, in the triple meaning of the term, canceled, preserved, and raised. The movement of passing through negation to another level of vision is present in the conclusions of each of the eight chapters of *Words with Power*, and it is operative as well in the final pages of each of the four chapters of *The Double Vision*.

Frye's own purgatorial journey, as he called it, took the form of a quest romance. The goal of this quest—the existential vision that came from the other side of the poetic—was for Frye, the Everlasting Gospel, in Blake's phrase, or the gospel of love. Charity or *agapē* is the note that is sounded in the conclusions of Frye's last three books. But the structural poetics that Frye developed in *Anatomy of Criticism* remained with him to the end. Therefore, to see Frye as a religious visionary and architect of the spiritual world is to consider his work less in revisionary terms than in expanded ones.

SEE ALSO Literature, article on Literature and Religion.

BIBLIOGRAPHY

The authoritative texts of Frye's published and previously unpublished writings are being issued in the Collected Works of Northrop Frye (Toronto, 1996–), under the editorship of Alvin A. Lee. As of 2003, thirteen of the more than thirty volumes had appeared: *The Correspondence of Northrop Frye and Helen Kemp, 1932–1939* (2 vols., 1996); *Northrop Frye's Student Essays, 1932–1938* (1997); *Northrop Frye on Religion,*

(2000); *Northrop Frye's Late Notebooks, 1982–1990* (2000; 2 vols.); *Northrop Frye's Writings on Education* (2000); *The Diaries of Northrop Frye, 1942–1955* (2001); *The "Third Book" Notebooks of Northrop Frye, 1964–1972* (2001); *Northrop Frye on Literature and Society, 1936–1989* (2002); *Northrop Frye on Modern Culture* (2002); *Northrop Frye on Canada* (2003); and *Northrop Frye's Notebooks and Lectures on the Bible and Other Religious Texts* (2003). The remaining volumes are expected at the rate of two per year.

Frye's major books are *Fearful Symmetry* (Princeton, 1947), *Anatomy of Criticism* (Princeton, 1957), *The Great Code* (New York, 1982), and *Words with Power* (New York, 1990). His essays have been collected in *Fables of Identity* (New York, 1963), *The Stubborn Structure* (Ithaca, N.Y., 1971), *Spiritus Mundi* (Bloomington, Ind., 1976), *Northrop Frye on Culture and Literature* (Chicago, 1978), *On Education* (Markham, Ont., 1988), *Myth and Metaphor* (Charlottesville, Va., 1990), *Reading the World* (New York, 1991), and *The Eternal Act of Creation* (Bloomington, Ind., 1993). His essays on Canadian literature and culture are in *The Bush Garden* (Toronto, 1971) and *Divisions on a Ground* (Toronto, 1982). Other significant books include *The Educated Imagination* (Toronto, 1963), *T. S. Eliot* (Edinburgh, U.K., 1963), *The Well-Tempered Critic* (Bloomington, Ind., 1963), *The Return of Eden* (Toronto, 1965), *The Modern Century* (Toronto, 1967), *A Study of English Romanticism* (New York, 1968), *The Critical Path* (Bloomington, Ind., 1971), *The Secular Scripture* (Cambridge, Mass., 1976), *Creation and Recreation* (Toronto, 1980), and *The Double Vision* (Toronto, 1991). His books on Shakespeare are *A Natural Perspective* (New York, 1965), *Fools of Time* (Toronto, 1967), *The Myth of Deliverance* (Toronto, 1983), and *Northrop Frye on Shakespeare* (Markham, Ont., 1986). Twenty-two interviews with Frye are collected in *A World in a Grain of Sand* (New York, 1991).

ROBERT D. DENHAM (2005)

FUDŌ, the "Immovable One" (Skt. Acala, also Acalanātha Vidyārāja), is one of the most popular esoteric Buddhist deities in contemporary Japan. Fudō is most frequently colored black or dark blue and portrayed as sitting or standing on a large stone which, according to the commentary by Śubhākarasiṃha (637–735), represents both the heaviness of the obscurations (Skt. *kleśa*) and the immovability of the thought of awakening (Skt. *bodhicitta*). This ambiguity is typical of tantric thought in which the obscurations are non-dually identical with awakening (Jpn. *bonnō soku bodai*).

Fudō is encircled by flames that are produced by his state of concentration. These flames themselves are described as being "garuda-headed," that is, shaped like the head of the mythic garuda bird, said to be able to eat snakes without harm. For this reason, the garuda is taken as a symbol of the power of Buddhist teachings to transform the three poisons of ignorance, greed, and hatred. Fudō's hair is braided and hangs down on one side of his face, his eyes are crossed or bulging from anger, and two fangs emerge from his mouth—usually one pointed up, the other down. He holds in his right hand a *vajra* (a ritual implement representing a thunderbolt) sword that cuts through the delusions of sentient beings. Sometimes a dragon is coiled around the sword. In his left hand he holds a noose which is used to pull sentient beings toward awakening. His *mantra* is "*naumaku sanmanda bazaradan senda makaroshada sowataya un tarata kan man*" (Skt. "*namaḥ samanta vajrāṇāṃ caṇḍa mahāroṣaṇa sphotaya hūṃ traḥ hām māṃ*"), meaning "Praise all *vajras*, Violent and Exceedingly Wrathful One, destroy (all delusions)." The *mudrā* (yogic hand position) used in ritual for Fudō is

formed by extending the fore- and middle fingers of both hands straight out, and curling the thumb, ring and little finger into the palm. The right hand is held palm down, and the left hand palm up. This represents Fudō's *vajra* sword and its scabbard, respectively.

He is considered to be the chief of the five Kings of Wisdom (Jpn. Godai Myōō, Skt. Vidyārāja, also translatable as "Mantra Kings" given the ambiguity of the Sanskrit *vidya*, meaning both wisdom and *mantra*), who appear wrathful in their function as protectors of the *buddhadharma*. The other four Kings of Wisdom are Trailokyavijaya (Jpn. Gōzanze), Kuṇḍalin (Jpn. Gundari), Yamāntaka (Jpn. Daiitoku), and Vajrayakṣa (Jpn. Kongoyasha). Fudō frequently appears accompanied by children, most commonly two (Jpn. Kongara and Seitaka), or eight children.

Fudō appears in both of the two *maṇḍalas* of the Shingon tradition, the Matrix Maṇḍala (Skt. *garbhakośadhātu maṇḍala*, Jpn. *taizōkai mandara*) described in the *Mahāvairocana sūtra*, and the Diamond World Maṇḍala (Skt. *vajradhātu maṇḍala*, Jpn. *kongōkai mandara*) described in the *Vajrasekhara sūtra*. In the former, below the central assembly is the "mansion of the mantra holders," within which Fudō is central.

The temple of Tōji ("Eastern Temple," Kyōtō) as redesigned by Kūkai beginning in 839 has as its altar a sculptural *maṇḍala*. One of the three groupings is that of the five Kings of Wisdom. Fudō is in the center, with Gōzanze to the east, Gundari to the south, Daiitoku to the west, and Kongōyasha to the north. These directions are symbolic, rather than literal, and are associated with specific colors according to the Chinese system of five elements.

Fudō also appears together with the other Kings of Wisdom at the center of the *maṇḍala* used in the *Ninnō-kyō Hō*, an elaborate esoteric rite centering on the recitation of the *Benevolent Kings Sūtra* (Jpn. *Ninnō-kyō*). In this *maṇḍala* he is shown seated, with a *vajra* sword in his right hand, and a *dharma* wheel (Jpn. *bōrin*, Skt. *dharmacakra*) in his left. Much more commonly performed today, however, is the protective fire ritual (Jpn. *sokusai goma*) with Fudō as the chief deity. In the training for Shingon priests this is the final ritual practiced.

Fudō is considered to be the wrathful manifestation of Mahāvairocana Buddha, the central cult figure of Shingon Buddhism. Under the theory of "original form, trace manifestation" (Jpn. *honji-suijaku*), Fudō is identified with Amaterasu, the sun goddess who is the ancestress of Japan's imperial family.

Fudō is linked with the widespread practice of cold water austerities, the practice of bathing in cold water, thought to stimulate internal energy, during which his *mantra* is commonly recited; the cult of Shugendō, mountain ascetics who engage in the practice (along with other austerities) are one vehicle for the spread of Fudō's popularity. Shugendō practitioners also construct large, outdoor fire rit-

uals (Jpn. *saito goma*) in which Fudō plays a central role. Such rituals continue today, both in traditional Shugendō settings and in such new religions as Agon shū.

The association of cold water austerities with Fudō is found in the literary record. For example, the *Heike monogatari* tells of the cold water austerities of the warrior Mongaku, who vows to stand under the waterfall at Kumano in mid-winter for twenty-one days, reciting the *mantra* of Fudō. After eight days, Mongaku collapses a second time and is revived by Kongara and Seitaku, who reassure him that Fudō, who is residing in Tūṣita heaven, has heard his invocations. Now reinspired, he returns to the waters which, because of the divine protection that has been extended to him, now feel warm, though winter gales blow around him. He is able to successfully complete the twenty-one days as he had vowed.

Whereas the iconography of Fudō became fairly standardized in Japan, his appearance is more varied in the Indian sources. In addition to the one-faced and two-armed form found, for example, in the *Sādhnamālā*, there is a one-faced and six-armed form and a three-faced and four-armed form (both found in the *Niṣpannayogāvalī*), and a three-faced and six-armed form (found in the *Piṇḍīkrāma-Sādhana*). In a painting from central Tibet (c. 1200), Fudō is the central figure, depicted kneeling in a position that has his right foot and left knee on the ground (Skt. *acalāsana*), and with three eyes.

Fudō is also named Caṇḍamahāroṣaṇa (the “fierce and greatly wrathful one”), the main figure of the *Caṇḍamahāroṣaṇa* tantra, classified in the Tibetan system as one of the *anuttarayoga* tantras. In this text he teaches his consort while they are in sexual union, and is identified as a manifestation of Akṣobhya, whose quality is an unshakable resolve to attain awakening. It has also been suggested that Fudō is related to Śiva, for whom Acala is an epithet. They share the attribute of immovability, and the iconographic detail of dark blue or black color.

FUJIWARA SEIKA (1561–1619) was a Japanese Confucian scholar of the early Tokugawa period. Once regarded as the founder of Tokugawa neo-Confucianism, Fujiwara Seika is today understood increasingly as a transitional figure in the development of an intellectually self-contained Confucianism out of the Zen-flavored Confucianism that flourished in the Gozan Zen temples of the Muromachi period.

Seika was a twelfth-generation descendant of the thirteenth-century court poet Fujiwara no Teika, but his immediate forebears were small local lords in the Harima area (present-day Hyōgo prefecture). A younger son, at the age of seven or eight he was sent to study at a Zen temple in the area where, it so happened, the priests were interested in Confucianism. When he was eighteen, his father and elder brother were killed in battle, and the family’s ancestral lands were lost. Through the mediation of two uncles who were priests at important Zen temples in Kyoto, Seika, who had taken refuge in the capital, became a priest at the major Zen center of Shōkokuji. There, as was common practice, he pursued the study of Confucian texts as an adjunct to his training as a Zen priest. Gradually he formed a deeper commitment to Confucianism, and in his mid-thirties he left the temple and devoted himself to the study of Confucianism.

In 1596, at the age of thirty-five, Seika attempted to go to China to study Confucianism with an authentic master. The attempt was unsuccessful, but he was able to broaden and deepen his understanding of Confucianism through contact with Korean scholars captured by Japanese troops during Toyotomi Hideyoshi’s invasion of Korea and brought back to Japan. At his urging, the captive scholars were set to copying out the Four Books and the Five Classics, while he punctuated the copied text in Japanese according to the Song and Ming neo-Confucian commentaries. Individual classics had been punctuated previously by Japanese scholars using the neo-Confucian interpretations, but this was the first instance in which one person systematically punctuated all the central texts of Confucianism. Seika’s plan to make his punctuated edition available in published form went unrealized, but the plan itself and his comprehensive rather than piecemeal approach to the basic Confucian texts stand as landmarks in the history of Confucianism in Japan.

In other ways, too, Seika took steps to establish Confucianism as a self-sufficient intellectual tradition independent

of Buddhism. For some time after leaving Shōkokuji Seika continued to dress as a priest, but in 1600 he formally manifested the shift in his intellectual allegiance by adopting a style of dress patterned after that of the Chinese scholar-official class. The same year he lectured on Chinese historical works before Tokugawa Ieyasu, founder of the Tokugawa shogunate, and engaged the Zen monks present in a debate over the respective merits of the Confucian and Buddhist approaches to life. Seika refused an invitation to serve Ieyasu on a permanent basis, but he maintained informal ties as a scholar with a number of daimyo.

Although Seika took action that contributed to the development of Confucianism as a public teaching (in contrast to the “secret transmission” tradition of medieval scholarship) institutionally independent of Buddhism, his writings on Confucianism reveal lingering traces of Zen ideas. Seika objected to the otherworldly orientation of Buddhism, but his emphasis on “stilling the mind” so as to allow it to return to its original state of good reflects the influence of the Zen concept of enlightenment and of the views of late Ming scholars such as Lin Chaoen, who had attempted a fusion of Zen, Confucian, and Daoist teachings. For this Seika was criticized by later Confucian scholars, including his disciple Hayashi Razan.

FULANI RELIGION SEE FULBE RELIGION

FULBE RELIGION. The Fulbe are groups of pastoralists, semipastoralists, farmers, and city dwellers who constitute large minorities in the Sahelian countries stretching

from the Atlantic Ocean to the Red Sea (Mauritania, Senegal, Gambia, Guinea, Mali, Burkina Faso, Niger, Nigeria, Chad, Cameroon, and Sudan). Also called Fulani, Fellata, and Peul, these people (with an estimated population in the early twentieth century of around twenty-five million) have played a significant role in West African history and attracted the attention of European observers of African societies. While a majority had become Muslims from the eighteenth century, they possess a strong cattle-herding tradition that antedates their Islamic allegiance.

The Fulbe speak Fulfulde (also called Pulār), a language of the West Atlantic branch of Niger-Congo languages. The northern section of the West Atlantic branch includes Wolof, Serer, and Fulfulde, which are the dominant languages of Senegal but were in earlier times spoken farther north, in today’s Mauritania. The early Fulbe probably left some of the rock paintings of cattle and herders in the area that gradually became the Sahara. In the last millennium largely nomadic Fulbe have progressively migrated from this location to the east, as far as Cameroon and Chad. In recent centuries they have spread into the Sudan. Until the eighteenth century most of these Fulbe maintained a pastoral lifestyle and had relatively little attachment to Islam.

The intensive Islamization of the Fulbe since the eighteenth century makes it difficult to recapture pre-Islamic Fulbe religion. However, the Malian Fulbe intellectual Amadou Hampaté Ba and the French ethnographer Germaine Dieterlen, who recorded an initiation text from a Senegalese informant and made a French translation and commentary titled *Koumen*, have provided a very suggestive statement. Koumen, the initiation ceremony, consists of twelve chapters, or clearings, in which the first human herder acquires knowledge of cattle and the world. The world is governed by the eternal and all-powerful God. God designates Canaba, who usually takes the form of a serpent, to be the guardian of cattle, and Koumen to be Canaba’s herder. It is Koumen, often in the form of a child, and his wife Foroforodu who actually provide instruction to the novice Sile (a local variation of Sulayman or Solomon). At the end of the story Sile becomes the first *silatigi*, master of the bush and pastoral life. The story reveals the close ties among men, cattle, land, and vegetation—the trees, vines, and creeping plants that supply the staffs, cords, calabashes, and other vital instruments, as well as the shrines where Sile must demonstrate his attachment to God and the numerous spirits that populate the universe. A rich symbolism of color and number runs throughout the text. Yellow, red, black, and white correlate respectively with fire, air, water, and earth; with east, west, south, and north; and finally with the four original lineages of the Fulbe: Jal or Jallo, Bâ, Sō, and Bari. Sile gradually learns to read the symbolism and to use the configuration of cattle of different coats to divine the proper course of action.

While the Koumen ritual is quite specific to the Fulbe, many of its features recall the religious beliefs and practices of other people living in the region of Senegal and Mali. The

silatigi resembles a priest-king. His progress in understanding parallels the learning process that takes place in other initiations. The serpent Canaba recalls the importance of serpents in Soninke and Mandinka symbolism, and his path down the Niger River repeats the trajectory of Mande creation myths. The story also suggests the importance of military leadership, the social stratification characteristic of the Western Sudan, and through the evocation of Solomon, the influence of the Jewish, Islamic, and Christian heritage. A blacksmith who is a member of an artisan caste aids Sile in his initiation. Sile is expected to demonstrate *pulaaku*, the Fulbe code of honor, shame, and restraint. This code is often defined in contrast to the behavior of slaves, who do not have an affinity for cattle and do not know how to act in general. The slave is seen to be crude, naive, irresponsible, and dark in color; he or she resembles the other black, non-Fulbe populations of West Africa. *Pulaaku* resembles the codes of a number of other stratified societies in West Africa who distinguish sharply between the conduct that one may expect of the noble and free strata and the behavior that one must tolerate from slaves and the people of caste—the hereditary corporations of blacksmiths and other trades. In general, *pulaaku* and the whole ritual of Koumen are consistent with pastoral Fulbe custom across the Sahelian zone. In the present state of knowledge they can be considered representative of pre-Islamic Fulbe beliefs and practices.

Until the eighteenth century the Fulbe were not in the forefront of forming states or practicing Islam in the western and central Sudanic region. The Timbuktu scholars who wrote the chronicles called the *Ta'rikh al-Fattāsh* and *Ta'rikh al-Sudān* in the sixteenth and seventeenth centuries regarded some Fulbe as the enemies of Islam, agriculture, commerce, and cities. Beginning in the eighteenth century Fulbe in several locations took the lead in establishing specifically Islamic states and societies. They used the process of *jihād*, or war against unbelievers, to reverse regimes that they considered pagan or nominally Muslim, appoint leaders who were knowledgeable in the faith, and erect educational and judicial systems in which Islamic law would be learned and practiced. While they failed to implement all of their ideal, they did spur, for the first time, the permanent development of an Islamic culture in the countryside outside of the capitals and commercial centers. The leaders in this process were scholars and sedentary Fulbe who were already at some distance from the predominantly pastoral pre-Islamic tradition. Over time they developed new genealogies where the four original Fulbe lineages were all descended from 'Uqba, usually identified with 'Uqba ibn Nāfi', the Arab conqueror of much of North Africa in the seventh century CE. This origin is widely accepted by Fulbe of all persuasions today.

The first two of these Islamic revolutions occurred in the eighteenth century in the two Fūtas, regions fairly close to the Atlantic Ocean. The leaders in Fūta Jalon, the mountainous zone of Guinea, created an elaborate system of Islamic instruction in Fulfulde as well as Arabic. The Fulfulde sys-

tem, based on a modified Arabic alphabet, was designed to reach the women, pastoralists, and others who were unlikely to acquire the ability to read and write for themselves. The people of Fūta Tōro, the middle valley of the Senegal River, became known as the Tokolor, a word that served to distinguish them from the Fulbe who were less committed to the establishment of an Islamic state and culture.

The most important revolution occurred in Hausaland, or northern Nigeria. In the early 1800s Usuman (also called Uthman or Usman) dan Fodio, his brother 'Abdullāh, and his son Muhammadu Bello launched the *jihād* against the ruling class of the Hausa state of Gobir. Dan Fodio's students and allies then carried the campaign against other states and established new settlements beyond Hausaland. By 1812 a vast new confederation had emerged with its principal center at Sokoto, in northwest Nigeria. Dan Fodio and his associates wrote a large number of influential treatises that became the standard texts for the practice and spread of the faith in the western and central Sudan. The last revolution occurred in the middle delta of the Niger River, between the towns of Segu and Timbuktu and created the caliphate of Hamdullāhi around 1820. The movement led by 'Umar Tāl put an end to this regime in 1862.

Fulbe scholars also played an important role in spreading the Qādirīyah and Tijānīyah Islamic orders, which could be practiced in the countryside, away from the large mosques, schools, and courts of the towns. One can say that the Fulbe supplied the most important agents of Islamization in West Africa in the nineteenth century.

Many Fulbe have remained relatively marginal to these processes of state formation and Islamization. Despite devastating droughts in the 1980s, they have tried to sustain their pastoral economy and lifestyle in the regions of West Africa that are more suited to grazing than to agriculture. For all public purposes they are Muslim; they observe the obligations incumbent on all members of the faith. In their family life and relationship to cattle, they observe the customs and values reflected in the Koumen ceremony.

Revised Bibliography

FUNCTIONALISM is the analytical tendency within the social sciences—most notably, sociology and social anthropology—that exhibits a particular interest in the functions of social or cultural phenomena. In its most traditional form, functionalism has claimed that all items and activities in a system should be explained in reference to their objective consequences for the system as a whole. Thus the pivotal meaning of *function* is the objective consequence of an activity or phenomenon for the system of which it is a part. A secondary—but nonetheless significant—meaning of *function* in social science is similar to the use of the term in mathematics. When it is stated that x is a function of y , it is meant that x varies in direct proportion to variation in y . In social science this perspective on the concept of function has to do with interrelatedness. The dominant and the secondary meanings are linked as follows. The notion of function as consequence for the state of the system suggests that all phenomena in the system are considered, at least initially, as being relevant to the system's persistence. It is then but a small move to the postulate that all phenomena in a system are interrelated and that a change in one aspect will have implications for all others and for the system as a whole.

THE EARLY FRENCH SCHOOL. The functional analysis of religion played quite an important part in the development of the functional orientation in social science as a whole. Of more immediate relevance, however, is the fact that the functional analysis of religion has also played a very significant part in the development of the sociology and anthropology of religion. The functional orientation has a long history, but it was during the French Enlightenment of the eighteenth century that the seeds were fully sown for the explicit crystallization of sociological functionalism in the second half of the nineteenth century. Many eighteenth-century French philosophers and protosociologists were interested in the possibility of a form of society that would operate according to principles of rationality and enlightenment, without what they saw as the impediments of religious dogma and clerical predominance. On the other hand, many of these thinkers were also concerned with what could take the place of religious faith and practice in a prospective rational-secular society. Thus one of the earliest and most influential of the Enlightenment philosophers, Jean-Jacques Rousseau (1712–1778), maintained that a society needed a civil religion—a religion concerned not with the traditional matters of faith

and practice in relation to a supernatural being or realm but rather with the generation and maintenance of involvement in, and respect for, the society as such. He, like a number of his contemporaries, was well aware that religion had, among other things, traditionally performed significant functions of legitimation. In fact, at the end of the eighteenth century the leaders of the French Revolution made a great effort to replace traditional Catholic symbols and rituals with “secular-religious” ones.

The awareness of crucial links between religion and politics grew in a period when, in many parts of Europe, there was a widespread challenge to the intrinsic validity of religious belief and the traditional church (above all in predominantly Catholic countries). Yet despite the conviction that traditional religion had had deleterious consequences for society, it was affirmed that the functions supposedly performed by religion still had to be met. One particularly significant version of that perspective was provided in France by Claude Henri, Comte de Saint-Simon (1760–1825), who maintained that religion was a society's most significant political institution. That idea was later developed by Alexis de Tocqueville (1805–1859), who studied the relationship between religion and democracy. Tocqueville's particular interest was in the prospects for democracy in France, given the predominance there of Catholicism and the conviction of many intellectuals that democracy and religion were incompatible. Tocqueville tried to show that American evangelical Protestantism fostered the American democratic spirit. In so doing, he sought to disprove the claim that religion necessarily inhibited or disrupted democracy, and subsequently argued that, with modification, Catholicism could support democracy in France.

While Tocqueville did not argue explicitly in terms of what came to be called functionalism, he helped crystallize the sociological view that religion performs vital social functions. In the case of Saint-Simon, however, the functional orientation had been somewhat more explicit. After having celebrated the emergent industrial order and noted its antipathy to religion, Saint-Simon concluded that a “New Christianity” was necessary to provide commitment and vitality to the new industrial type of society. With Saint-Simon's protégé, Auguste Comte (1798–1857), an even more calculated functional orientation appears. Often spoken of as the father of sociology, Comte advocated a secular science of society, to be based on a “positive” philosophy that had been made possible by the epochal demise of theological and metaphysical modes of thought. Sociology should become the cognitive keystone of modern societies. Sociology and sociology-based ethics were to take the place of religion. However, late in life Comte—in parallel with Saint-Simon—restructured his views and argued that a “religion of humanity” was required in order to guarantee commitment to and respect for society. In that regard Comte made elaborate proposals for France concerning festivals, rituals, functionaries, and symbols for the religion of humanity.

SPENCER. It was the work of the English philosopher Herbert Spencer (1820–1903) that gave the concept of function and the functional orientation in sociology their first fully explicit renderings. Spencer argued that societies are organisms and that one should conceive of the former in the same terms as the latter. Thus he articulated the two main principles outlined earlier: the interrelatedness of all items in a system (most importantly the whole society) and the referring of items within a system to the functioning of the system as a whole. Spencer was, moreover, an evolutionist, which at that time implied, among other things, a belief that as societies progressed to an advanced evolutionary condition, they relied less and less on religious thought and practice. For Spencer, the main institutions of an advanced society were incompatible with religion, while the society as a whole operated increasingly in terms of contractual relationships among individuals (although Spencer did believe that the evolutionary engine was driven by a mysterious force that gave purposeful direction to societal change).

DURKHEIM. Unlike Saint-Simon and Comte, Spencer never showed signs of retreating from his own views concerning the (unproblematic) demise of religion. And it is in terms of this difference between Spencer and Saint-Simon that the seminal work of the French sociologist Émile Durkheim (1858–1917) can best be approached. Durkheim's work was based partly on a rejection of Spencer's highly secular conception of modern societies, even though it maintained some features of Spencer's methodological functionalism. At the same time, Durkheim was taken with the ways in which Saint-Simon and Comte had come to appreciate the functional significance of religion. He believed, however, that they had erred in first seeing society as bereft of religion and then attempting to add religion to it. What Durkheim sought, most elaborately in *The Elementary Forms of the Religious Life* (1912), was a way in which to ground religion in society itself.

In his early methodological work Durkheim argued that the sociologist should work with two basic explanatory concepts: function and cause. *Function* had to do with the general needs of the societal organism that a social phenomenon served, while *cause* referred to those features of society that more directly facilitated a phenomenon. Durkheim was eager to dissociate himself from those who closely related function to ends or purposes. He insisted that there is no mysterious final cause of societal patterns or change and that one should not think of function as having to do with the intentions lying behind the establishment of institutions. (On the latter point Durkheim argued that social phenomena do not generally exist for the useful results that they produce.) In his early writing on the forms of social solidarity, Durkheim reacted to Spencer by maintaining that all contractual relationships must be based on *precontractual* elements of society. His interest in religion developed largely in the attempt to comprehend precisely what those precontractual elements are. From the outset, Durkheim had been concerned with the issue of morality in modern societies.

While seeking a sociological understanding of the foundations of morality, he endeavored to show that, for moral principles to have social weight, they must be more than logically persuasive. Durkheim contended that the principles of moral reason adumbrated by Immanuel Kant in the eighteenth century could be socially operative only insofar as they were socially imperative. He wanted to know, in other words, on what the obligatory character of morals rest.

Durkheim eventually reached the full-fledged conclusion that the primary function of religion lay in its distinction between the sacred and the profane. Religion, said Durkheim, has to do with sacred things. It is "the serious life." Religion is crucial in providing individuals with freedom from unchecked desire, in highlighting the moral character of the collectivity, and in binding individuals together within the latter. Durkheim is often interpreted as having simply emphasized the positive, integrative functions of religion. That was indeed a significant aspect of his theory of religion (which was at the same time a theory of society), yet Durkheim was also deeply concerned with the social sources, the causes, of religious belief and practice, as well as with the larger ramifications of religion in human life. Although Durkheim's work was almost certainly the most vital contribution to the functionalist orientation in sociology and to the functionalist analysis of religion in sociology and social anthropology, his ideas were developed in specific reference to what he perceived as a moral crisis in modern societies. This is true even though his major work on religion referred mostly to the primitive religious life of Australian Aborigines and even though he was greatly inspired by the writing of the French historian Fustel de Coulanges on religion in ancient Rome and Greece and by that of the Scotsman W. Robertson Smith on ancient Semitic religion.

Because, in terms of Durkheim's own definition of religion as involving the distinction between the sacred and the profane (rather than being defined, more narrowly, as belief in supernatural beings), religion had been ubiquitous in all civilizations, Durkheim concluded that it must have been functionally essential to all societies. Yet he was acutely aware that traditional religious faith had become increasingly fragile. In articulating his own theory of religion, Durkheim emphasized at the outset that religion, in contrast to magic, is fundamentally a collective phenomenon and that, in religion, ritual is as important as belief. In those terms he set about showing how, at least in primitive societies, the basic categories of religious belief are established and maintained through the collective experience of social structure. In religious ritual individuals experience acutely a dependence upon society; indeed, religious worship can be thought of as the celebration of that dependence. In his most radical terms, Durkheim suggested that the real object of religious worship is society, not God. His main point, however, was that it is from one's experience of society that one obtains the sense of something transcendent and authoritative. Yet Durkheim denied that he was making a judgment about the intrinsic

validity of religious belief. Rather, he concentrated upon showing both the social conditions and the social functions of religion. As far as modern societies are concerned, Durkheim asserted that there is now a need for new religious forms that would perform the same kind of function as traditional religion but in a less spiritualistic way. In the tradition of Rousseau, Durkheim argued the need for new forms of civil religion and saw religion as critical in the periodic regeneration of societies.

MALINOWSKI AND RADCLIFFE-BROWN. Durkheim's writing had a great effect on those social anthropologists of the 1920s and 1930s who sought to redirect anthropological inquiry away from speculative evolutionism toward more analytically rigorous fieldwork. The two major figures in that regard were the Polish-born Bronislaw Malinowski (1884–1942) and the British-born Alfred Radcliffe-Brown (1881–1955), both of whom employed functional orientations in the study of primitive societies, including the religious aspects thereof. Malinowski's functionalism centered upon two claims: first, that any particular society is a unique, functioning whole, and, second, that the social arrangements and cultural forms obtaining in a society have functional significance in relation to the psychological needs of individuals. Thus in spite of his interest in the functional interrelatedness of social institutions and practices, Malinowski saw their most fundamental functional significance in their meeting the psychological needs of individuals. In contrast, Radcliffe-Brown took a more self-consciously Durkheimian position. He advocated a systematic science of society, involving comparative analysis of the structural patterns of societies with respect both to their overall cohesiveness and to the functional requirements of societies as systemic wholes. Both Malinowski and Radcliffe-Brown wrote about religion in their respective functional terms.

PARSONS AND HIS CRITICS. Among those sociologists and anthropologists of religion who have written entirely within the twentieth century, the most prolific analyst of religion was the American Talcott Parsons (1902–1979). Deeply, but by no means only, influenced by Durkheim, Parsons in the 1950s acquired the reputation of being the functionalist par excellence. From Durkheim, Parsons took the basic idea that religion is a universal feature of human life. However, he expressed strong reservations concerning Durkheim's attempt to talk not merely about the functional significance of religion but also about its social-structural bases. In the latter regard, said Parsons, Durkheim was often a reductionist, in the sense of reducing religion to society. In contrast, Parsons himself considered religion to be the pivotal aspect of the realm of cultural values, beliefs, and symbols. According to Parsons, patterns of culture operate in varying degrees of independence from social structure and certainly cannot be reduced to the latter. Culture provides meaning, general morality, expressive symbols, and basic beliefs to systems of social action and to individuals. Religion also relates systems of human action to what Parsons called "ultimate reality." He maintained that questions concerning the ultimate

boundary of human action and interaction constitute a universal attribute of human life. Parsons's attempt to establish what for a long time he called a structural-functional form of general sociological theory has met with considerable criticism from the late 1940s onward. One of Parsons's most influential critics has been the American sociologist Robert Merton (1910–2003), who has attempted to systematize functional analysis so as to overcome what he has regarded as its weaknesses. Religion has figured strongly in his discussion.

Merton argues that many functionalists have singled out the integrative functions of religion—mainly in reference to certain primitive societies—while neglecting its potentially disintegrative consequences, or dysfunctions. They have also, he maintains, confused two issues: whether what is indispensable to society is the phenomenon, such as religious belief, or only the function supposedly met by such a phenomenon. Merton emphasizes the dangers of viewing the phenomenon itself as indispensable and suggests that sociologists develop a clear conception of functional alternatives. As an example of such an alternative, he proposes that the positive functions of religion might well be provided by something other than religion in its conventional sense (e.g., secular ideology).

Merton also raises the question as to whether functionalism is—as many of its critics have charged—inherently conservative. His conclusion is that it is not. Even though the main modern tradition of antireligion—Marxism—regards religion as a consequence of an economically exploitative society, it also looks upon religion as performing integrative functions in precommunist societies. Religion, in Marxist perspective, inhibits social change. Thus functional analysis can be used from both conservative and radical standpoints. Indeed, since the 1960s a clear strand of Marxist functionalism has concerned itself with the persistence of capitalist societies and the function religion plays in that persistence.

Issues arising from the long debate about the functional form of analysis have been central to the controversy concerning the degree to which the modern world is characterized by secularization. For the most part, functionalists have resisted the thesis of extensive secularization, on the grounds that the functions performed by religion are essential to all societies. Thus Parsons tended to argue that even though a society may manifest ostensibly atheistic sentiments, it is still subject to the functional imperative of relating to ultimate reality. It was the hallmark of Parsons's approach to religion (and here he followed Durkheim) that one should not be overly constrained by the particular, substantive forms that religion has taken historically. In contrast to Spencer, Parsons argued that religion does not lose significance as human society evolves; rather, religion takes on increasingly general forms as societies become more differentiated and complex.

RECENT FUNCTIONALIST THEORETICIANS. A particularly radical type of functionalism was proposed by the German

sociologist Niklas Luhmann (1927–1998). Luhmann argued that religion can no longer provide an overarching set of integrative values to a society. Unlike Parsons, who maintained that religious values and beliefs become more general but still remain overarching as societal evolution proceeds, Luhmann insisted that the social differentiation central to societal evolution has now gone so far that religion is but one subsystem among many. Religion is now “free” to concentrate on its primary function of answering purely religious—as opposed to social, economic, political, and scientific—questions.

Some of Luhmann’s ideas overlap with those of the British sociologist Bryan Wilson, an adamant proponent of the secularization thesis. Wilson’s argument hinges upon his claim that the historically latent functions of religion—*latent* is Merton’s term for hidden, unrecognized functions—have become increasingly manifest (i.e., consciously recognized) and are now fulfilled by other social agencies, while historically manifest functions of religion—those providing guidelines for salvation—have been undermined. The main process that has both undermined the manifest and made manifest the latent functions of religion is the supplanting of communities by rationally organized, impersonal, and functionally specialized societies.

CONCLUSION. Even though functional analysis has been a frequent target of hostile critique, it has been continuously pivotal in the sociological and anthropological analysis of religion. And while there have undoubtedly been phases of crude functionalism—expressed in bland statements concerning the universality of religion and its beneficial consequences, as well as attempts to reduce religion to its societal consequences—it is nonetheless impossible to address the topic of religion in social-scientific terms without careful attention to its functional significance vis-à-vis other aspects of human life. Indeed, that perspective has pervaded modern consciousness, in the sense that religion is increasingly discussed and assessed in relation to its consequences for individuals and societies.

BIBLIOGRAPHY

The classic work in the tradition of functionalism is Émile Durkheim’s *The Elementary Forms of the Religious Life* (1915; reprint, New York, 1965). An important discussion of functional analysis, with particular reference to religion, appears in Robert K. Merton’s *Social Theory and Social Structure* (New York, 1968), pp. 73–138. Anthony F. C. Wallace’s *Religion: An Anthropological View* (New York, 1966) contains an extended discussion of the functions of religion in several types of society. A flexible functionalist theory of religion is offered in J. Milton Yinger’s *The Scientific Study of Religion* (New York, 1970). Relevant discussions of the history of the sociology of religion and of functionalist approaches are contained in my book *The Sociological Interpretation of Religion* (New York, 1970). Much of Talcott Parsons’s theory of religion is found in his study *The Evolution of Societies* (Englewood Cliffs, N.J., 1977). For a lengthy discussion of Parsons’s work on religion, with an extensive bibliography, see *Sociological Analysis* 43 (Winter 1982), a special issue edited

by me. A functionalist interpretation of religion in the modern world is provided by Bryan R. Wilson in his *Religion in Sociological Perspective* (Oxford, 1982), while the radically functionalist theory of Niklas Luhmann is presented in his *Funktion der Religion* (Frankfurt, 1982). Analyses of civil religion in the tradition initiated by Rousseau, with reference also to Tocqueville, are provided in neofunctionalist terms by Robert N. Bellah and Phillip E. Hammond in their *Varieties of Civil Religion* (San Francisco, 1980).

AN OVERVIEW
MESOAMERICAN FUNERAL RITES

FUNERAL RITES: AN OVERVIEW

Death is not only a biological occurrence leaving the corpse as a residue that must be administered to; it is also, and more importantly, a sociocultural fundamental because of the beliefs and representations it gives rise to and the attitudes and rituals it brings about. It is of course understood that rites are the immediate extension of beliefs, and that funeral rites, in particular, are the conscious cultural forms of one of the most ancient, universal, and unconscious impulses: the need to overcome the distress of death and dying.

This article will take the word *rite* in its anthropological sense; that is, in a larger sense, quite apart from liturgical or theological concerns. A rite, then, is a ceremony in which behaviors, gestures and postures, words or songs uttered, and objects handled, manufactured, destroyed, or consumed are supposed to possess virtues or powers or to produce specific effects. Centered on the mortal remains or its substitute, then on whatever survives of those—material traces or souvenir relics—funeral rites may reveal three finalities. First, it is believed that they preside over the future of the departed, over both the metamorphosis of the corpse and the destiny of the person, whenever death is defined as transition, passage, or deliverance. Second, they attend to the surviving close kin, mourners who must be consoled and reassured. Finally, they participate in the revitalization of the group that has been disturbed by the death of one of its own. Very often in traditional societies, in Africa and more often in Asia (notably in China), the funeral rites are presented as a theater of renewal, with acted parts, mimes, dancers, musicians, and even clowns.

Funeral rites are so important that the presence of the participants becomes a strict obligation, particularly in traditional societies. In traditional Africa, funeral rites are the most resistant to the pressure of acculturation. A function of the rite essential to the social group is easily seen; after all, numerous psychiatrists affirm that many problems derive from the guilt arising when one hurries over obsequies or comes out of mourning too soon.

CHIEF MOMENTS IN FUNERAL RITES. Funeral rites may comprise numerous ceremonies. The Toraja of Sulawesi (Celebes) see four fundamental stages. During the first, the deceased is said to be ill: Washed, dressed, and adorned, he may be nurtured for as long as a year. Then comes the first festivity, lasting from five to seven days, with sacrifices, lamentations, songs, and dances; this marks the difficult passage from life to death and ends with a provisional interment inside the house. During the following intermediary period, these festivities increase. Finally the ultimate ceremony is performed, requiring several months of preparation during which winding-sheets, cenotaphs, and, most notably, an effigy (the famous *tau-tau*) are employed, not without ostentation; it concludes with the burial and the installation of the deceased in the beyond.

The succession of funerary acts sometimes takes on a bureaucratic tone, particularly in Chinese Daoism, where the main part of the rite is devoted to drawing up documents and contracts with the gods. Especially noteworthy are the consultation of cosmic forces in order to determine propitious days and places for the rites; the *gongde*, or acquisition of merits for the deceased; the *pudu*, or offerings for wandering souls; and the ritual for liberating the soul.

Nevertheless, to determine the chief moments of funerals, anthropologists use the formulation, however incorrect, of the double funeral, which implies rites of separation followed by intervals varying from a few weeks to several years,

followed by rites of integration that put an end to the mourning.

Separation rites. In most traditional societies, the passage from decay to mineralization dictates the two chief moments in the funerary ritual. The first funeral, or separation rite, is for the purpose of “killing the dead,” as the Mossi of Burkina Faso say—in other words, killing what remains alive in the dead person by breaking the emotional bonds that unite him to the community. While the corpse decays, simultaneously corrupt and corrupting, it is terribly vulnerable and dangerous. Two attitudes, contradictory yet complementary, orient the conduct of the living toward the dead: solicitude and rejection, shown in a symbolic or realistic manner according to points of view that vary with each ethnic group.

Solicitude begins immediately after death, tinged with commiseration and fear: The dead person is given food, gongs are sounded to scare away evil spirits, the corpse is washed and purified, and its evolutions are watched, especially if the body lies in state for a long time (from three to twelve days among the Miao of Southeast Asia). It is dressed, its natural orifices are stopped, and, most important, the wake is organized. This can be the occasion for big reunions and a large-scale ritual. For the Maori of New Zealand it is an intensely dramatic ceremony, the key moment of the funeral rite, accompanied by songs, cries, lamentations, elegies, and more or less generous meals, depending on the fortune of the deceased. To multiple meals the Inca of Peru added games of dice with very complex symbolism. The outcome of the game was supposed to orient the soul of the deceased so as to help him attain heaven. The dead person participated by influencing the manner in which the dice fell, thereby revealing whether he was well or ill disposed toward the player. The deceased's possessions were divided according to the results.

When respectful solicitude has soothed the dead, rejection asserts itself. Once the last homages are rendered, the deceased is invited to rejoin his ancestors or to prepare for his afterlife (metamorphoses, reincarnation, sojourn with God, etc.). To overcome his hesitation, a number of methods are used: One may tie him down securely or mutilate him (poke his eyes out, break his legs); lose him by returning suddenly from the cemetery by a detour; or arrange to deposit him at the foot of a mountain or on the far side of a river he cannot cross. In compensation, sometimes an effigy remains at home as a substitute for him, or he may be promised an annual invitation. Because the decaying of the corpse constitutes a risk that its double will prowl in the village, the relatives submit to the constraints of mourning, which puts them outside the social circuit. The specific purpose of these interdictions is to separate all those contaminated by the corpse's decay. Curiously enough, in India the Toda have a single term, *kedr*, which simultaneously designates the corpse, the state of mourning, and the interval between the first and second funerals. A statement made by a dying Maori

chief to his son likewise clarifies the problem: "For three years your person must be sacred and you must remain separated from your tribe . . . for all this time my hands will be gathering the earth and my mouth will be constantly eating worms . . . then when my head falls on my body, awake me from my sleep, show my face the light of day, and you shall be *noa* [free]" (Hertz, 1970, p. 33). Therefore, when mineralization, whether natural or artificially accelerated, sets in, it is a sign that the deceased has fulfilled his posthumous destiny. He has passed the initiatory tests imposed on him; he has rejoined the ancestors or the gods; or perhaps he is ready for metempsychosis or reincarnation.

Rites of integration and the cessation of mourning.

In almost all traditional societies, double funerals are held. After a delay varying from a few weeks to ten years, according to the ethnic group and the resources at the family's disposal, a final ceremony takes place that confirms the deceased in his new destiny and confers on his remains a definitive status. Like the integration of the dead person, this ritual consecrates the reintegration of the mourners into the group: Order is reestablished and interdictions are lifted. As a rule, the bones are exhumed and then treated in different ways according to local traditions: Washed, dried, sometimes covered with ocher, they are preserved as visible relics, placed in containers, buried again, or even pulverized and mixed with ritual beverages. In sub-Saharan Africa, the latter custom is quite prevalent, especially among Bantu-speaking peoples. Among the Bamileke of Cameroon, the inheritance of skulls according to rigorous rules symbolically secures the collective memory and the continuity of the clam. In Madagascar the *Famadihana* (which has been wrongly translated as "turning over the corpses") gives way to costly festivities: When a family decides to celebrate the cult of its dead, they proceed from opening the tombs and changing the winding-sheets to rewrapping and reburial with great ceremony, before an audience in a state of great jollity. For two days songs, dances, music, processions, and festivities punctuate the ritual manipulations.

In Borneo, the *Olo Nyadju* give themselves up to analogous states on the occasion of *Tiwah*. Along with some degree of fasting, the majority of Indonesian ethnic groups do the same thing. This bone cult, which is generally referred to as an ancestor cult, flourishes among the American Indians, in China, and elsewhere, and still has its equivalent in Europe. There is hardly any difference between the old Chinese who carefully brushes his ancestor's bones and the skeleton washer of Neapolitan cemeteries who, two years after the burial, when the corpse has dried out, washes the bones in front of the families before putting them in a marble urn. In the French provinces, the custom of the anniversary meal and mass is clearly a response to the same fantasies of reestablishing order.

Indeed, the ritual of secondary obsequies ending in definitive burial has a twofold justification in the imagination. First of all, the transfer of the bones to another place com-

pletes the purification process. It is as if the earth has been corrupted by the decaying body, necessitating the removal of the purified bones to an unsullied location. Second, although the provisional inhumation is always individual, the final burial is very often collective. Such is the custom of the *Goajiro* Indians in Venezuela: Three years after death, the bones are sorted and dried, then exposed during a funeral wake. They are then transferred into a large urn, where the remains of all the dead from the matriline or the matrilineage are gathered together. Thus, communal reunion of the sublimated remains follows the isolation of impure decay.

On the other hand, Western ossuaries, by virtue of their anonymous character, have hardly any impact on an individualistic society. At the very most, as "display cases" they provide the "exposition of the bones" as an aid to meditation. "Let us come to the charnelhouse, Christians; let us see the skeletons of our brothers," says a Breton song. In any case, if inhumation in a common ditch is judged shocking and infamous by us, the collective ossuary does not scandalize anyone. In fact, it can be seen as a solution to the problem of cemetery space and an orientation for a new cult of the dead. The possibility has even been raised of reintegrating the sacred into cemeteries in the form of an "ossuary-necrology" that would reassemble the community of the dead and make the living sensitive to the bonds uniting them to the past.

With the second funeral, therefore, the fate of the deceased has been settled. To borrow the vivid language of the *Mossi* of Burkina Faso, the ritual of integration "makes the dead live again." From then on, grief no longer has reason to exist. The marginal period has permitted the mourning work to be finished. But, in any case, is not ritualization, like elegance, a way of charming anguish? At this stage, interdictions are always relaxed. After undergoing purifying baths and multiple reparation sacrifices, the mourners are reintegrated into the group. Thanks to the symbolic support of the bone, life on every level henceforth reasserts all its rights—both the life of the metamorphosed deceased and the life of the group from which he emerged. Once the decaying flesh and the signs of death have disappeared, the imperishable vestige is left with its charge of symbols. Funeral rites thus have the capacity "to reduce any object at all to significance, let it pass over to the other side of the gulf" (Maertens, 1979, p. 236). This can be clearly seen in the following set of processes: decay? mineralization; excluded mourners? reintegrated mourners; oversignificant corpse? hypersignificant remains.

In Vietnam, ritual constitutes what is called the "transfer of life": While the body is buried in a tomb defined according to the rules of geomancy, the soul, set on a tablet that itself is enclosed in a box covered with a red and gold case, becomes the protective ancestor that one venerates and prays to at the family altar.

A qualifying remark must be inserted: The conditions of death (place, moment, means) orient the meaning of the rite. The evil dead person, for example, can be deprived of

a funeral, or may have the right to only a truncated or clandestine funeral; he will never become an ancestor or know happiness. Status, age, and sex also play a determining role in the elaboration of ceremonies.

SOME KEY RITES. Only a few fundamental rites concerning the good death will be considered, because of their quasi-universality and the depth of the fantasies that they express.

Attendance at death, certification of death, and interrogation. If to die far away from home or to die a violent death is usually equivalent to a bad death in traditional societies, it is not only because uncertainty is alarming but also, and more importantly, because the dying cannot be helped. Mothering, making secure, and taking charge of the dying person, who is consoled, caressed, and helped to die for the same reason he was helped to be born, is a universal constant. This attitude has a religious aspect. To take only one example, the importance to elderly and very sick people of the Christian last sacraments is known, including the purifying aspersion that evokes baptism and redemption through the passion and the resurrection, as well as the profession of faith and, when possible, the Eucharist. As for the anointing of the sick, recall that this new ritual, although it abandons the expiatory aspect and gives only a circumstantial role to the effacement of sin, nevertheless insists on help by grace.

It is important to make sure that the deceased is really dead. Besides interpreting tangible signs such as the stopping of the breath and the heart, one can call on the diviner, the priest, or the doctor. There are also other ways of making sure: Right after the death of a Chinese, one of his close kin climbs the roof of the house to “call back his soul”; if it does not return, there is no doubt about his death. While for the Toraja of Sulawesi the deceased is not dead but only ill (as noted), among the Tibetans and the Miao (Hmong) the deceased must be informed that he is really dead because he does not know that he is: “The illness fell on the rocks and the rocks could not bear it. Then it slid into the grass, but the grass could not carry it. And that is why, O Dead One, the illness has come to you. The earth could not bear the illness, so the illness reached your soul. That is why you have found death” (Georges, 1982, p. 183). Then, with great kindness and consideration, they explain to him what he needs for the great journey: bamboos to communicate with the survivors or the gods, the “wooden house” (coffin), the hemp shoes, alcohol, food, and the cock that will show him the way. The announcement of the death also obeys precise rules. Women’s lamentations punctuated by cries, drums, and bells, as well as symbolic formulas and the sending of messengers, are the most frequent practices.

In traditional societies, another notable belief is that the corpse is simultaneously alive and dead. It no longer has a voice, but in its fashion it speaks. No one hesitates to question it in order to learn why it died or, sometimes, its desires concerning the transmission of its possessions; only little children and fools escape this rite, because “they don’t know what they say.” Among the Diola of Senegal, the dead per-

son, tied to a bier, is supported by four men, and people take turns asking it questions. If the corpse moves forward when questioned, the response is positive; if it moves backward, it is negative; if it wavers in the same place, it is indicating hesitation. Among the Somba of Benin, “no” is expressed by a rocking from left to right, and “yes” by a rocking from back to front. For the Senoufo of the Ivory Coast, leaning to the left indicates the deceased’s agreement, and leaning to the right, his disagreement. It sometimes happens that the dead person bears down on one of those present in order to demand that questions be put to him (the Diola) or requires that the carriers be changed in order to pursue the rite (the Lobi of Burkina Faso). Substitute objects sometimes replace the corpse at the time of the interrogation, on condition that they participate in its vital forces. An assegai with the hair of the deceased is an adequate substitute for the Boni of Guyana, while a tree trunk containing his nails and body hairs suffices for the Bete of the Ivory Coast. If the death was willed by God or the ancestors, a frequent occurrence among the Egba of Benin and the Orokaiva of New Guinea, the group feels reassured. But if it resulted from a crime, witchcraft, or violation of a taboo, the fault must be immediately atoned for and the guilty punished. In its way, by its voiceless word the corpse plays an important role in social regulation.

Laying out the dead: purification and mothering rituals. The funeral rite proper begins with the laying out of the corpse, which, in its essential aspect, is equivalent to an authentic purification, a symbolic prelude to rebirth. A holy task among the Jews and especially in Islam, it is a matter of divine obligation, thus of *‘ibādāt*, involving a relationship with God and not just a social function. Laying out the corpse is universal and rigorously codified in ancient societies. In the West Indies, especially in the Antilles and in Haiti, this ritual is reminiscent of that of the midwife. Death, like birth, demands a certain ceremonial that is no less than the “transitory reintegration in the indistinct,” to borrow Mircea Eliade’s expression. By placing, for example, a vat of water underneath the couch where the corpse is lying, one symbolically reestablishes the sources of life (amniotic fluid). One is again assured that the soul, which has just left the body, will not disappear into nothingness, and that the deceased, thus purified, will be reborn in another world.

Among the Agni-Bora of the Ivory Coast, there is a similarity between the grooming of the newborn baby and the grooming of the deceased: Holding the naked body on their knees, old women wash it with three successive rinses, perfume it, and dress it. For the baby, the rite is always accompanied by singing; the washing is done from the head to the feet with the right hand. In the case of the deceased, however, the rite is executed in silence with the left hand, and proceeds from the feet to the head. This is because birth is an arrival, and rebirth a departure. In the European countryside the laying out is still the work of the “woman who helps” (the midwife), who is also the “woman who does the dead.” The laying out of the dead is again an act of mothering.

Among the Miao, the deceased is rubbed with a warm towel without being undressed; then is dressed in new clothing finished off with a richly decorated kimono. The head is wrapped in a turban, and—an important detail—the feet are shod in felt or leather shoes with curled tips, like those sold by the Chinese. Sometimes the duty of one of the relatives is to make these shoes. The dead must depart with good shoes for the trip about to be undertaken. A harquebusier comes up to the deceased and forewarns deferentially: “Now we are going to fire a few shots that will accompany and protect you for the whole length of your trip. Don’t be afraid.”

Display of the deceased: the corpse detained. Aside from punitive exhibition (desecration of the corpse) in the case of a bad death, when a devalued dead person is deprived of a funeral, the display of the corpse reflects the noblest intentions (valorization of the corpse).

In traditional societies, where death is a public affair involving the whole community, display of the corpse is almost a general rule. It is stretched out on a mat, on a funeral bed, or in a coffin, placed in the mortuary in a special case or in the open air, or suspended at the top of a tree or on a scaffold in the middle of the village square. Sometimes it even presides over its own funeral. The presentation varies according to places and beliefs, but most often it is done in state, with all the symbols that recall the deceased’s social function. In Senegal, the dead Diola appears much as if he were alive, but with his most beautiful clothes, his bow and arrows if he was a good hunter, his farming implements and sheaves of rice if he was a good farmer. The horns of cows he sacrificed during his life and heads of cattle are exhibited to emphasize his wealth. The ostentatious display of belongings is frequent. Sometimes the dead person is displayed in the midst of his herd, as among the Karamojong of Uganda and certain Indians of North America. The length of time for displaying the dead and his goods may vary according to his wealth: Among the Dayak of Borneo, it ranges from one to six years. Another custom, peculiar to the Sioux, is to suspend the head and tail of the dead person’s horse on the same scaffold on which he is exposed. Display of the dead seems to serve a double function: to show the dead that he is being rendered the homage due him by offering him to view in his best light, and to show him as a model of the role he played in the group. The dead person is glorified as having accomplished his mission, and the aura with which he is endowed is reflected on the collectivity, which thus reaffirms the identity and cohesion it so needs upon losing one of its members.

In southern Sulawesi, the Toraja still use the effigy, or *tau-tau*, especially for the deceased of high rank. This figure, made of breadfruit wood according to strict rules, must resemble the deceased as much as possible (same sex, height, face), though often with improvements. Dressed in the dead person’s clothing and adorned with jewels, necklaces, and bracelets, it is the object of numerous rites whereby it is in turn animated and made to die, wept over and consecrated. At the end of a very long ceremony, the corpse, swathed in

its winding-sheets, is raised on a platform below which is placed the *tau-tau*. Both then preside over the buffalo sacrifices and receive their part of the offerings. Finally, when the corpse goes back to the sepulcher for the last time, its representative is permanently exhibited as near as possible to the tomb. For the Toraja, the effigy becomes more than a ritual object associated with death; it is, if not the deceased, at least its visible double.

In the West today, the embalmed corpse lies in state in funeral homes. It is still a matter of rendering homage to one no longer alive, and of facilitating the mourning work by conserving a better image of the departed: The mortician’s work spares the dead person the stigma of death for a time and gives the impression that the deceased is sleeping in peace. The essential thing is that the dead person should be present, recognizable to his or her family (to a certain extent, a disfigured corpse is tantamount to an absent one). The certainty of the person’s death can be borne more easily than the uncertainty surrounding his or her absence and silence.

In this respect, wakes have a soothing value, supposedly for the departed and certainly for the survivors. The sacred and the profane are mixed. In Spain, rosaries and responses are recited. People speak of the deceased, because to speak of the deceased is to be with the deceased again. And if sometimes the conversation turns to funny stories, this does not imply a lack of respect for the dead but a pleasant relationship with the deceased. At one extreme, these wakes are almost feast days. Perhaps this is because in some villages, like the Aragonese village of Leciñena, the immediate neighbors cook the celebrated *tortas*, a kind of brioche made only on feast days (the Feast of the Virgin, a marriage) and for a death wake.

When there are mourners, especially female ones, display of the dead facilitates the sincere and organized expression of emotions through praise of the departed, invitations to return among the living (visits, possession, reincarnation), reproaches or invectives concerning his cruelty in leaving his close kin, and advice for his posthumous destiny. This is how the rhapsodist addresses the deceased Miao after the ritual offering of the cock: “Take it and eat. Henceforth you will have the cock’s soul with you. Follow it. Hurry and look for the silk suit you wore at birth. You will find it hidden under the earth [an allusion to the placenta of the newborn, which is always carefully buried near the house in which he was born]. Now leave” (Georges, 1982, p. 187). Again dressed in his silk garment and guided by the cock, the soul of the dead person then sets out on the long journey the singer is chanting about. Finally, before the final farewells, the dead person may be transported into the village and the fields, visiting for the last time the places where he lived, and communing with himself before the altars where he made sacrifices.

Food given to the dead and in homage to the dead. This article will mention only briefly the offering of victuals to the dead, whether during the funeral or at the moment

of burial. To help the deceased on the long journey, the Aztec burned food with the deceased—usually a fat little dog with a tawny coat—to help him or her cross the rivers on the infernal route. This rite, common to almost all cultures, corresponds to a widespread belief: The offerings are the indispensable viaticum that permits the dead to survive the transitory journey into the world of the ancestors. The sacrifices offered simultaneously play the same role, albeit symbolically.

Better yet is the common meal that accompanies funerals almost everywhere. A practical necessity justifies it: Those who have come to honor the dead and console the close kin must be fed. The importance of the feast is often such that it takes on the dimensions of a potlatch: In numerous ethnic groups, brief rites are initiated at the time of death, and the funeral services are deferred until sufficient reserves of rice, palm wine, and cattle have been set out. In the view of traditional mythologies, it is a communal event in which the dead person participates: A seat, plate, or part of the food (often the best) is reserved for the deceased, or a descendant represents the deceased, or the table is set in the presence of the corpse—diverse customs showing an intention to intensify the relationship with the deceased and to persuade the group that he or she is not completely dead. In Western societies, the funeral meal is a means of appeasing grief by reinforcing the bonds that unite the living in the absence of the dead. The meal following the death is like a birth for the talkative and hungry community of the living, which has been wounded, split up, and interrupted by the death.

But all these reasons are valid only on an obvious level. On the symbolic level, the funeral meal is a way of retaining the dead person, and on these grounds, it is a substitute for the cannibalistic meal. In Haiti, the funeral meal is appropriately termed a *mangé-mort*, just as in Quebec, where the expression *manger le mort* is still in use. In fact, the manducation of the corpse is connected to a universal fantasy that psychoanalysts neatly term “the exquisite corpse” (an expression borrowed from surrealist poetry). Obeying the pleasure principle, the fantasy mechanism of the exquisite corpse responds to the trauma of loss through the desire for incorporation of the lost object. Amorous fusion with the other is then achieved in an exaltation that, in the real world, would perhaps be secret. The dead person is fixed and assimilated in their best features; one who devours the deceased makes the deceased one’s own in spite of all taboos. In this connection, there is a strange Mexican custom that does not even disguise the necrophagic intention. On the Day of the Dead, an extraordinary commercial activity mobilizes the whole population: Superb confections are sold that represent the skulls and skeletons of the dead, ravishing or burlesque in appearance, with first names engraved in order to help the customers make their choices.

CONTROLLING DECAY. Decay is the justification for all funeral rites. Everything is brought into play in order to tame it (display of the corpse), hide it (winding-sheets, the sar-

cophagus), forbid it absolutely (embalming and mummification, incineration, cannibalistic ingestion), retard it (corporeal attentions), or accelerate it (towers of silence; see below). A profound need underlies all these approaches to decay: to stabilize the deceased in an indestructible medium—a stage marking the reconciliation of the community with his death. These remains—mummy, relic, ashes, or bones—all civilizations, without exception, persist in preserving.

Tamed or accelerated decay. Conditions of exposure may eventually accelerate the mineralization of the corpse. Sunlight and even moonlight, as well as a smoky fire, are believed to contribute, but the body is sometimes also offered to birds of prey and other carnivores, or to ants. In the Tibetan tradition, corpses were torn apart by the *ragyapas* (“dismemberers”) and thrown to the dogs, so that the bones would be stripped much faster. But the most spectacular example is given by the towers of silence built in the seventeenth century, particularly in Iran by the Zoroastrians. According to the sacred texts of the *Zand*, the corpse is the essence of impurity. It is therefore out of the question to pollute “the things belonging to the good creation” by carrying out the final burial of a decomposing body. Hence the custom of exposing the body in a remote location known to be frequented by carnivorous animals. Vultures, in particular, are the purifiers that disencumber the dead person of rotting flesh, the medium of demonic infection. From this came the practice, which spread little by little, of building towers of rock especially designed to isolate corpses and avoid their contaminating presence during the purification process. The interior of the “tower of silence,” or *dakhma*, consists of a platform inclined toward a central pit. Cells (*pāvis*) hollowed out in three concentric circles receive the corpses—men in the outer zone, women in the middle zone, and children toward the central pit. In this case, in which the custom of second obsequies no longer takes the symbolic form of the commemorative meal, the dried bones are thrown down twice a year into the depths of the pit. There, under the combined effect of the sun and the lime that is spread there, the bones are transformed into dust. The pit branches into four canals for the evacuation of rainwater, which is received and purified in four subterranean pits where carbon and sand clarify it. Formerly, the remains were removed periodically, to be kept in an ossuary: Cleansed of all impurities, they testified that the soul was ready for the final ceremonies.

Decomposition accepted but hidden. Obviously, the cemetery is a place where remains are preserved and concealed. The feminine and maternal valence of the earth responds to a universal fantasy: “Naked I came out of the maternal womb; naked I shall return there” (*Jb.* 1:21). In African cosmogonic thought, burial in Mother Earth, the source of fertility and dwelling place of the ancestors, takes on a quasi-metaphysical significance. The same symbolism serves for other forms of interment, such as the deposit of the corpse in grottos or in funeral jars that evoke the uterine cavity. The earth is indeed the place *par excellence* for trans-

formations. Not only does one plow seeds into it at the time of sowing, but it is also a mediator in all rites of passage: The corpse is entrusted to it at the time of the funeral, as are neophytes' nail clippings, hair, and other fleshly remains from initiation rites and the placenta and umbilical cord at birth. Burial can also, in a sense, transform the land. Thus the Hebrews did not begin to bury their dead until as a people they became sedentary; burial is always connected to the ownership of land, that is, to the appropriation of a "promised land," without doubt, a way of salvation.

One could go on forever describing the infinite variety of types of cemeteries (mass burial sites or scattered individual crypts, as in Madagascar; at the heart of the village or far-flung) and types of tombs (simple ditches to elaborate mausoleums to modern, efficient columbaria for cremated bodies). In many systems of burial the distinction between social classes is still, as it were, heavily felt.

The corpse's position in the tomb is no less variable: seated; stretched out on its back or side; in the fetal position; even on its stomach, as was once the case in Western cultures for adulterous women; or standing, in the manner of some military men or heroes of the American West. The orientation of the body can also be important. For some emigrant groups, it is toward the country of birth. For populations that traditionally ascribe birth to sunrise and death to sunset, the deceased must have the head to the east in order to be in position for rebirth. On the other hand, medieval Christians who wanted to be buried facing the direction from which salvation came placed the head toward the west so that the deceased could face Jerusalem. Similarly, Muslims are buried on their right side, turned toward Mecca.

The necropolis does not exist in India or Nepal because ashes are thrown into the sacred rivers, nor is it commonly of importance in sub-Saharan Africa. But where it does exist, the cemetery is still a symbol charged with emotion, sometimes arousing fear and melancholy, sometimes calm and reflection. In this regard one must praise Islamic wisdom, by which the very texture and functions of the cemetery maintain a state of relative osmosis between the living and the dead. The cemetery (*maqbarah*) is often designated by the more euphemistic term *rawdah* ("garden"). Certainly, its ground has often been consecrated to that use by a pious tradition, but it is not closed. The dead rest there on the bare ground in a simple winding-sheet, thus returning to the elements. In both senses of the term, it is open to nature. But it is open to society, too. The belief prevails that bonds exist with the bodies of the deceased before the Last Judgment and that for the living to visit the tombs is a praiseworthy act and, what is more, a deed that will be considered in their favor then. The cemetery is also a traditional place to go for a walk: Women often meet there on Fridays.

Prohibited decay. Setting aside the still rare phenomenon of cryogenation (in which the deceased wait in liquid nitrogen until the time when people will know how to re-

store them to life), there are three common forms of prohibited decay.

Cannibalism, decay, and mineralization. Robert Hertz (1970) has emphasized the particular function of cannibalism that spares the dead person the horror of a slow and ignoble decomposition and brings the bones almost immediately to their final state. This is obviously true for endocannibalism, when it is practiced on revered dead persons. There is no doubt that the purpose of cannibalism is to prohibit rotting. On the one hand, consumption of the flesh occurs as soon as possible after death, and, because the flesh is usually cooked, putrefaction does not begin in the course of consumption. On the other hand, inquiries among populations with a tradition of cannibalism clearly reveal the finality of the act: "In this way, we knew where he [the dead] was and his flesh would not rot," said the Australian Turrbals (Hertz, 1970, p. 24, n. 1). This is also the view expressed by the Merina, according to a historical Malagasy document of the last century: "Our kinsman is dead; what shall we do with his body, for he was a man we loved?" Some answered, "Since he is dead, let us not bury him but let us eat him, because it would be sad to see him rotting in the ground." (ibid., p. 28).

Cannibalism promotes mineralization, but intentions toward the corpse in this regard differ according to whether endocannibalism or exocannibalism is involved.

Endocannibalism refers us back to the traditional scheme of the double funeral: On the first occasion, the dead person is buried in the earth or, similarly, in the belly, where human digestion prepares its accelerated passage to mineralization; on the second occasion, the remaining bones are handled with respect and receive the final obsequies. The destruction resulting from the manducation is only a mutation of forms that symbolically achieve a kind of conservation: incorporation. In a sense, ingestion could be interpreted as embalming transferred to the oral register. As for exocannibalism, however, the situation is different, at least concerning the treatment of the remains. The cannibal feast undoubtedly implies incorporation and, by its reference to myths of origin, it can take the form of a veritable primitive mass in which the bread and wine are really flesh and blood. But whereas the vital force animating the enemy's corpse is assimilated, his bones and uneaten parts may be abandoned or held up to ridicule. The Ocaina Indians of the Peruvian Amazon suspend the enemy's penis from a necklace worn by the victor's spouse; the mummified hands are used as spoons, the bones as flutes, and the painted and exposed skull serves as a ritual bell.

The cremated corpse. According to many mythologies, the purifying fire is above all liberating. In Bali, as long as the fire has not reduced the corpse to ashes, the dead person is impure; he continues to wait, his spirit not yet separated from his body. According to many beliefs, fire is the promise of regeneration and rebirth. Through fire, a superior level of existence can be attained. According to Greek mythology,

Herakles stretched himself out on the pyre of Mount Oeta, while Zeus announced to the other gods that Herakles was about to become their equal: The fire would relieve him of his human part, immortalize him, and make him divine. The same theme is found in the Upaniṣads, the classic texts of Hinduism. It is therefore not the impurity of the corpse that is implicated in the cremation ritual, but the impurity of the body and the human condition. Ashes are the proof of that impurity; if the body were perfect, it would burn without ashes.

The destiny of the remains varies. In Japan, the bones are traditionally divided between two containers, one of which is buried at the place of cremation and the other in the natal village of the deceased. In Thailand, part of the remains are collected in an urn kept at home, while the remainder is buried at the foot of the pyre, kept in a reliquary monument, or even thrown into a river. In India, custom formerly demanded that the ashes be deposited in a tomb. Later a rule was imposed that still persists today: Because fire is the son of the waters, funeral rites should summon first one and then the other. Also, the ashes and noncalcinated bones are sprinkled with water, and cow's milk and coconut milk as well, before being thrown into the Ganges, the sacred river that flows from Śiva's hair. The same procedure is followed in Nepal and in Thailand, where other sacred rivers conduct the deceased downstream toward his celestial residence. In Bali, the remains are thrown into the sea after having been meticulously sorted by the relatives, washed in sacred water, arranged on white linen, and inserted into a dried coconut adorned with flowers. Finally, there is the particular case of the Yanoama Indians of Venezuela, who crush the remaining bones after the incineration of their warriors, in order to consume them mixed with game dishes or beverages in the course of a communal meal.

Cremation can be assimilated to all other modes of provisional burial, and people who burn their dead conform in many respects to the classic scheme of the double funeral, but with different means and a shortened duration. The first funeral, corresponding to the ritual of the exclusion of the dead, soothes the corpse and leads it to a purification that can be accomplished only by the process of decay. Those who cremate the dead find the equivalent of the first funeral in the rites that accompany the handling of the body during the generally short period between death and combustion on the pyre. The second obsequies, which concern the charred and purified remains, correspond to the rites of integration of the dead in his status in the beyond, while mourning is lifted for the survivors.

Preservation of bodies. Egyptian embalming practices are famous. The long, difficult techniques only make sense, however, in the framework of the osirification ritual that makes the dead person a god through assimilation with Osiris. Before, during, and after the technical manipulations, an extremely complicated ceremony took place, which undoubtedly explains the long duration of the treatment and

the great number of participants. Invocations, readings, and prayers punctuated each act of the embalmers, whose very gestures were strictly regulated. Afterlife was not possible unless the liturgy was observed in its minutest details. "You will not cease living; you will not cease to be young, for always and forever," cried the priest at the end of the embalming. Then the last ceremony could be performed: the opening of the mouth. In the purification tent or at the entrance to the tomb, the gestures of the officiating priest were accompanied by aspersions, offerings, and sacrifices, fumigations with incense, and magico-religious formulas. With the end of his adz the priest touched the dead person's face in order to reintroduce the vital energy.

In addition, mummies discovered in South America and the testimony of Spanish chroniclers affirm that the Inca, for example, embalmed their dead. The technical success of their mummies seems not to have been as spectacular as that of the Egyptian mummies, especially if one remembers that the Inca empire occurred relatively close to the current time (at the end of the Middle Ages). The body was treated with different ingredients (honey, resin, and herbs) and painted with *roucou* (a vegetable dye); the viscera, preliminarily removed, were prepared and kept separate in a receptacle. The dry climate and the burial methods (a hole in a rocky wall, or a funeral jar) were favorable for preservation. Like the pharaohs, the sovereigns were the objects of particular care. An illustrated story from the sixteenth century, whose author, Huaman Poma, was of Inca origin, recounts the royal funeral ritual: The embalmed Inca, adorned with his emblems, lay in state for a month; at his sides were placed women and servants, likewise embalmed, to serve him in the other world. Although the techniques were rudimentary, there is good reason to assume that a very precise ritual was used to increase efficacy. Thus, the funeral offerings deposited next to the body appeased the maleficent spirits that caused decomposition. Indeed, because the life principle (the *aya*) remained in all parts of the corpse, rotting involved the destruction of the individual. On the other hand, if the body was preserved, the spirit of the dead could be reincarnated in a descendant. This belief in a second birth appears to explain the fetal position of corpses found in tombs and funeral jars.

Whatever the modalities, one can agree with Robert Hertz that it is legitimate "to consider mummification as a particular case derived from provisional interment" (Hertz, 1970, p. 20). If the interval separating death from final burial corresponds to the duration necessary for mineralization or desiccation, then a symmetry exists between the Egyptian rite and that of certain archaic ethnic groups. It is only when the embalming is concluded "that the body, having become imperishable, will be conducted to the tomb, that the soul will leave for the country of Ialou, and that the mourning of the survivors will come to an end." The waiting period, that is, the time necessary to achieve mineralization, can be reduced only by a manipulative intervention; it has not changed meaning at all, even if in this case the corpse is the equivalent

of the body in its apparent totality (a mummy) or in part (a trophy head), rather than the residue of bones and ashes.

CONCLUSION. This article has, as it were, painted a composite picture of funeral rites, in which it can be seen that they border on the *stricto sensu* sphere of the sacred. It may in fact be argued that, thanks to rites—those of former times especially, and to a lesser degree those of today—everything is brought into play in order to put death (even if accepted) at a distance, and eventually to make fun of it or tame it by permitting the community, when it feels concerned, to pull itself together. This is why funeral rites can shift the drama of dying from the plane of the real to that of the imaginary (by displacements and metonymy, symbols and metaphors), and it is in this that their efficacy resides. To reorganize the society disturbed by death and to console the survivors even while the deceased is being served and his or her destiny oriented—these are the two fundamental aims of funeral customs. In all regions, then, such rites are simultaneously defined first as liturgical drama with its places and scenes, its actors and their scripts, and also as individual or collective therapies (one might recall Nasser's moving funeral). In this respect, traditional cultures have inexhaustible resources of rich symbolism that the modern world has forgotten.

Indeed, modern life, especially in an urban milieu, entails multiple mutations that are probably irreversible on the level of ritual, and perhaps disquieting for the psychic equilibrium of one's contemporaries. Many practices are simplified or omitted: The wake is impossible at the hospital or in tiny apartments; condolences and corteges are practically eliminated. Consider, for example, today's laying out of the dead: For the impurity of former times, the pretext of hygiene is substituted; for respect for the corpse as subject, obsession with or horror of the corpse as object; for family deference, the anonymity of an indifferent wage. In the same way, the signs of mourning have fallen into disuse—society has passed from “mourning clothes in twenty-four hours” to twenty-four hours of mourning!—and it is unseemly to show one's sorrow. People care less and less about the deceased, who sink into the anonymity of the forgotten; fewer and fewer masses are said for the repose of their souls, while the scattering of ashes eliminates the only possible physical support for a cult of the dead. If, at least on the imaginary plane, rites once primarily concerned the deceased, today they primarily concern the survivors. Thus, to take only one example, the new Roman Catholic ritual of anointing the sick tends to deritualize and desacralize death itself as an essential mutation. It is truly the disappearance of death, considered as a passage, that is witnessed by others.

Without a doubt, humankind today is condemning itself to a dangerous cultural void concerning rites and their symbols. One may well ask if funerals, expedited in the “strictest intimacy,” do not dangerously deprive people of a ritual that would help them to live.

FUNERAL RITES: MESOAMERICAN FUNERAL RITES

Mesoamerican peoples practiced a rich variety of funeral rites based on a fundamental and widely shared vision of death as a regenerative social and cosmic power. Several types of sacred practices associated with death existed from the Pre-classic period (2500 BCE–200 CE) until the arrival of the Spanish. The discussion that follows will survey two general kinds of rites associated with the dead: *funerary rites* and *mortuary rites*. Funerary rites were those actions performed after

the death of an individual. Their goal was to dispose of the body, ensure the arrival of the soul to the netherworld, and socialize the loss. *Mortuary rites*, on the other hand, equipped individuals with an *object* or *offering*. The more common examples are sacrificial offerings, which were performed since very early times.

A third type of death ritual appears in the archaeological and ethnohistorical evidence during the late Postclassic period (900–1521 CE). In this ritual practice the remains of the deceased were not actually present. These were divinatory rites aimed at either causing the death of an enemy or rival, as well as rites aimed at protecting someone from magical aggressions and bad omens. A large numbers of rites dedicated to deities associated with death and dying were also widely practiced throughout Mesoamerican history.

FUNERALS IN AGRICULTURAL SOCIETIES. The first agricultural settlements were consolidated during the Preclassic period. Archaeological representations of skeleton-like beings in motion and images that show the duality of life and death date from this period. These are the earliest references to a belief in life after death.

Tlatilco, in the central highlands, is one of the settlements showing the most complex funerary practices. In this site, which flourished around 1000 BCE, bodies were buried under inhabited rooms, a practice that has been interpreted as an attempt at preserving the force of the deceased in the domestic space. The bodies of the dead were accompanied by funerary goods of different qualities, and in some instances the remains of a dog were buried next to the deceased.

In western Mexico, funerary practices were unusually important; most interesting is the construction of “shaft tombs,” which consisted of a vertical tunnel leading to one or more funerary chambers excavated in volcanic tuff. The region has been sacked by grave robbers, and only a few intact graves have been explored, such as the one found in Huitzilapa, Jalisco, dated to 65 CE. The excavation of that site revealed a seven-meter-deep shaft and two funerary chambers. Three individuals had been laid in each of them, together with extraordinary pottery. Researchers have speculated that this was the burial shaft of an important family.

Other findings in western Mexico are also important, such as those in Chupícuaro, in the Mexican state of Guanajuato, a settlement characterized by its funerary arrangements. The remains of dogs were found next to human skeletons in excavated burial sites, suggesting that, since earlier times, these animals were considered as companions in the journey to the netherworld. Similarly, various offerings consisting of garments and tools the deceased may have used while living were found next to adults, while necklaces and musical instruments were placed in the tombs of children.

In the Maya region, individuals were buried near domestic spaces or ceremonial buildings. The bodies were laid in graves or funerary chambers and in some cases placed in

side pots. While some burial sites contain a single individual, others contain several, with articulated skeletal remains and disarticulated bones. This variety could be attributed to regional funerary variations and to the identity of the dead. Offerings of varying quality were usually placed in the sites, and on special occasions the bodies were covered with red paint or a green stone was placed in the mouth of the deceased. The latter custom lasted into later periods.

As for mortuary rites, the collection of “trophy skulls” seems to begin at this time, as evidenced in the Maya region, the Toluca Valley, and Tlatilco. Bone fragments found at the latter site present evidence of cuts, showing that bodies were also used for other purposes. With time, such practices would become fundamental throughout Mesoamerica.

FUNERARY RITES IN THE CLASSICAL CITIES (200–600 CE). Important cities were created during this period including the magnificent cosmopolitan center, Teotihuacan, which was built as a replica of the sacred universe. During an era of splendor, known as the Classic period, Teotihuacanos practiced elaborate funerary rituals. Archaeological records show the careful preparation of the deceased body, primarily in the form of funerary bundles and offerings. Typically, individuals were buried under the floor of homes of both commoners and elites, and the tombs included funerary offerings. Cremations took place in some areas of the city, a funerary practice associated with the élite.

Archaeological work in Teotihuacan has revealed that it had political and cultural relations with many others parts of Mesoamerica. For example, different funerary patterns existed in various parts of the city, especially in what is referred to as the Oaxaca barrio. Excavations have uncovered a number of tombs placed under the floor of domestic areas. The graves, in the style of the great Monte Albán culture that flourished far to the south of Teotihuacan, were characterized by the presence of an access with doorjambs and glyphs carved in the stone. Precious figurines and urns done in the Oaxacan style also accompanied the burials of human beings.

The tradition of the shaft tombs continued in the western regions of Mesoamerica, while new ritual forms also began to emerge. One example of such a change can be found in Loma Alta and Loma Guadalupe, funerary islands located in Michoacán. In the former, individual were buried, and in some instances the rites included the cremation and subsequent pulverization of the bones. Loma Guadalupe served as a sort of cemetery, and several central tombs were surrounded by a series of smaller ones. The sepulchers could be used several times, and in some instances bones were removed to be transported elsewhere. An area devoted to food preparation has also been identified in the complex, perhaps associated with a ceremony that complemented the burial.

Classic Maya culture developed the elaborate practice of constructing royal tombs. In Calakmul, in the Mexican state of Campeche, the tomb of the ruler known as Jaguar-Claw was explored by a multidisciplinary team that concluded that

the funeral bundle had been set on a wooden frame and finely decorated with marine elements. The exploration was performed so carefully that it allowed for the recovery of residues of lime, canvas, palm, and resins that accompanied the body of the individual, which had been adorned with jadeite jewels and a funerary mask. Jaguar-Claw was buried with two companions, a male child and a woman wearing a headdress, a funerary treatment associated with the élite.

Two examples of luxurious tombs were found in Palenque: the tomb of King Pacal and that of the so-called Red Queen. In the first site, the remains of the ruler were set in a monolithic sarcophagus; the cover was carved with the image of a character from whose chest grew a maize plant. The king was dressed in a luxurious green stone mask and was accompanied by several offerings and by the remains of individuals sacrificed at his burial. The monumental funerary pyramid was built specifically to house his tomb. The Red Queen was also buried in a monolithic sarcophagus with treasures made of jade, pearls, and shells. Her body was covered with cinabrio, a red mineral that colored the grave. Access to the site was through a set of stairs, and several companions were also sacrificed in her honor. The identity of the Red Queen still remains unknown, and she could be related to King Pakal.

Oaxaca was another area where funerals played an important role. Monte Albán, one of the main sites in the region, is characterized by burial sites placed in yards or rooms. The quality of the burials was a function of the identity of the deceased, since tombs range from very simple ones to those showing complex funerary architecture, including underground structures. Offerings were of great quality and included urns with figurines representing the gods and remains of dogs. The tombs were reused, and each time a new body was placed in them the skeletal remains already there were piled up to make more room.

The lavish funerary architecture developed for the ruling Zapotec class seems to re-create the opulence of the palaces. A classic example is the tomb at the archaeological site known as Huijazoo, an important underground complex. Nine steps lead to a vestibule that opened into two chambers and a yard that culminated with the main funeral chamber. Mitla is another Oaxacan city famous for its lavish funerals and the cross-shaped tombs placed under its palaces. Centuries later, in the Postclassic period, Zapotec tombs were reused by the Mixtecs, who used them to inter their leaders with offerings that are veritable treasures. Such is the case of the famous "Tomb Seven" in Monte Albán.

Oaxacan evidence related to domestic settings is also interesting because human burials were placed under the floors of homes that continued to be inhabited by the descendants of the deceased. The living and the dead shared a daily common space linking generation with generation.

REGIONAL CAPITALS AND FUNERARY RITES. Upon the fall of Teotihuacan during what has become known as the Epi-

classic period (650–900 CE) a process of decentralization in Mesoamerica led to the formation of potent, regional city-states such as Xochicalco, Cholula, and Tajin. Xochicalco, in the state of Morelos has yielded impressive sepulchers inside religious buildings and domestic settings. In the context of sacred architecture, the persons were buried with fine anthropomorphic plates and other green-stone jewelry, while domestic burials included ceramic offerings. The site is also known because of an artificial terrace called "the cemetery," where twenty-one burial sites and a "trophy skull" were found.

Cholula was another important city in the highlands where funerals had great importance. Archaeological findings have revealed that funerary practices were carried out in relation to age, gender, and possibly the social occupation of the deceased. The city showed an increment in cremation practices, as demonstrated by thirty urns filled with the remains of bones that had been exposed to the fire and placed on the southern end of the great pyramid.

Another majestic city of that time was Tajín, on the Gulf of Mexico. Besides funerary sites, the evidence from the city exemplifies the importance of sacrifice and postmortem treatment, especially decapitation, which played a fundamental role in ritual ball games.

ARCHAEOLOGY, HISTORICAL SOURCES, AND FUNERALS.

During the Postclassic period (1200–1521 CE) war became uncommonly important, as did expansionism and sacrificial practices. There is ample evidence of funerary practices from this period, such as the ample historical record devoted to describing the funerals of the ruling class. Just as there are coincidences in the beliefs in an afterlife throughout the Mesoamerican region, there are also some similarities in funerary practices among the three most powerful groups of the period: the Maya, Tarasc, and Mexica, or Aztec. For the three peoples, two variables determined the type of funerary rite to be followed: the cause of death and social position. In the case of the Mexica, the *teyolia*, or soul, of the deceased had four basic destinations. Mictlan, the underworld, was the destination of those who died of common illnesses or old age. Those who died for a reason associated with water traveled to Tlalocan, a place of plenty that was presided over by Tlaloc, the god of rain. It was believed that the soul of nursing children traveled to the place known as Chichihuaauhcuahco, where they were fed by a nursing tree. Warriors who fell in battle went to the Sun Heaven, as did women who died giving birth. It was believed that the former received the sun at dawn and drove it towards its zenith, where they handed it over to the latter. To each form of death there was a corresponding funerary geography and a special treatment for the corpse.

Those who died of common illness or old age were cremated or buried, depending on their place in the social hierarchy. Upon the death of an individual, the body was washed and a green stone was placed in its mouth to symbolize the heart of the deceased, where the soul was located. The body

was covered with blankets that were tied, forming a funerary bundle that received offerings useful in the journey to the afterlife, while the geographic instructions that would allow the soul to complete its cosmic destiny were detailed. If the deceased was a member of the *élite*, the body was cremated and placed next to offerings in a wooden funerary pyre that included a red dog. If it was a ruler, companions were sacrificed next to him, and their hearts were cast into the fire. The ashes were collected and placed in a container that was to be buried. Archaeological evidence from the Great Temple in Tenochtitlan shows that cremated remains of the dignitaries could be divided into several urns and buried in different places. On the other hand, historical sources suggest that when the individual was a commoner, the body was buried with very simple offerings.

The bodies of those who died by water were clad with paper adornments and had seeds placed in their mouths. The body was buried directly into the earth, as if it were a seed. Apparently, nursing children were also buried. It was believed that the nursing tree that would care for them was located in Tlalocan.

When a woman died in labor, she received a particular funerary arrangement. Her body was washed, dressed in new garments, and taken to a special temple for burial. The body had to be cared for, since some of its parts were believed to have magical powers. The bodies of warriors fallen in battle were also treated differently, even though their soul journeyed to the sun just like those of laboring women. Warrior funerals were collective acts and included processions and dances performed by the relatives of the deceased. Usually, the corpses were left in the battlefield, while bundles of wood representing the deceased were built in Tenochtitlan; the bundles were cremated after receiving offerings and orations, and the ashes were buried in a special place. These effigies of the funerary bundle allowed for the socialization of the death.

Funerary goods offered to the deceased can be classified as follows: (1) objects that were part of the funerary dowry; these objects signified the sacred exchange of energies between the life and death of the individual and Mexicas believed that these items could help the soul in the journey; (2) offerings to be handed to the deities of the netherworld once the deceased arrived there; (3) goods that functioned to make the ritual work effectively, such as the wood used in cremation. In more elaborated funerals, sacred practices such as music and ritual dance were common. It is also evident that some *élite* funerals included the sacrifice and self-sacrifice of special companions of the deceased. Ethnohistorical documents relate that the immediate and extended aftermath of a funeral was regulated by ritual. There were impositions of specific periods of mourning as well as the crafting and delivery of elaborated speeches aimed at consoling the family of the deceased.

Several tombs found in the Maya area had been set in places of worship, temples, and under living spaces. Similarly

to what transpired in the central highland, the historical record confirms the preparation of the body and the placing in the mouth of a stone or maize kernels. Also, some offerings seem to be associated with the needs of the deceased in the journey to the netherworld. Although individuals were usually buried, other treatments have also been documented depending on the identity, occupation, or cause of death. The tombs of commoners were usually dug under homes or behind them, and the dwellings were abandoned, unless they were inhabited by many people. The deceased could be buried with the tools they had used in life for their occupations; for example, priests were buried with their sacred books.

Among the Maya, cremation was a late practice that extended into colonial times and was reserved for the *élites*. Friar Diego de Landa, who made a vast historical record in Yucatan during his labor of evangelization, wrote about the cremation of the Lords of Izamal and how their ashes were placed in pots, with temples were built above them. He also tells how the ashes of dignitaries were kept as relics inside of statues. As for the Lords of Cocom, de Landa records an unusual treatment for the bodies, which were decapitated, cooked, and defleshed; the ritual culminated with the modeling, in bitumen, of the likeness of the deceased over its bones. The archaeological record shows variation in funeral practices, often associated with religion or the identity of the individual. Thus it is possible to find graves, caves, funeral constructions, funerary chambers, sarcophagi, and vessels, all used as graves for the inhabitants of the Maya region.

In the powerful western state of Michoacán, funerals were very similar to those of the Mexica. When a dignitary died, the body was prepared and richly clad. A second funerary bundle was prepared with blankets and placed over the deceased. According to the colonial account of Friar Jerónimo de Alcalá, during the funeral of the king some forty individuals were sacrificed to serve their lord in the netherworld. The body was cremated and the ashes collected in blankets and adorned with a turquoise mask and other jewelry. This bundle was buried at the foot of the most important temple. The ritual was very solemn, and on subsequent days a large portion of the population was in mourning. In contrast, commoners were buried with simple offerings that reflected their social status.

The great diversity and wealth of the Mesoamerican funerary rites contrasts with the standardization imposed by the Christian religion after the arrival of the Spanish. Death in war and epidemics, together with the imposition of funeral taxes and the prohibition of crematory practices, were difficult to assimilate for the indigenous population. With time, syncretism developed and new funerary practices emerged. Today, it is still possible to identify in some communities some elements associated with pre-Columbian beliefs, such as the notion of the dog as a companion to the underworld, the tradition of processions and ritual games, and the offering of food, copal, and other gifts. These elements, combined with some that are typically Spanish, and the new ritual

forms represent the wealth of funerary customs of modern Mexico.

XIMENA CHÁVEZ BALDERAS (2005)
Translated from Spanish by Fernando Feliu-Moggi

FUSTEL DE COULANGES, N. D. (1830–1889), was a French historian, best known as author of *La cité antique* (1864). Numa Denis Fustel de Coulanges would perhaps be surprised to find himself the subject of an entry in this encyclopedia. He entered the École Normale Supérieure in Paris in 1850, and chafed under the strictly conventional classical education imposed by the regime of Napoléon III; if the revolutionary movements of 1848 left him with a lasting fear of civil war and violence, as expressed above all in his thesis on Polybius's approval of the Roman conquest of Greece (1858), the counterreaction engendered his equally persistent anticlericalism.

Fustel taught in Strasbourg from 1861 to 1870, then in Paris at the Sorbonne and the École Normale, of which he was director from 1880 to 1883. He saw himself as a scientific historian, examining evidence systematically and without preconceptions. Throughout his life, the main target of his critical scrutiny was the belief that primitive society was democratic. In *La cité antique* Fustel criticized the view that the concept of personal liberty was born in the ancient city-state and that in early Greek and Roman society there was no private ownership of land. Later, in the first volume of his *Histoire des institutions politiques de l'ancienne France* (1875), Fustel asserted that the determining influence in French history did not come from the Frankish invaders but from the Roman legacy in Gaul; finally, in his book *Recherches sur quelques problèmes de l'histoire* (1885), he argued that the primitive, democratic village community, which held land in common, could not be found even in Germany.

Fustel's reputation as a founding father of the sociology of religion is based largely on his assertion that religious ideas could have a decisive effect in the formulation of a society's social and economic structure. In *La cité antique* Fustel argues that the practice of worshiping ancestors determined the form of the family and the patrilineal form of lineage (*gens*) that grew out of it. The private ownership of land was derived from ancestor worship. A man was buried in the fields he had farmed, and because his descendants were obliged to care for his tomb they could not allow the land that contained it to pass out of the family. Religion tied culture and

social structure to nature. To care for family tombs was natural and needed no explanation (or so it seemed to Fustel and his contemporaries, though the cemetery had only recently become a place of pilgrimage in their own time). At more complex levels of social organization religion was linked to nature in a different way: People worshiped gods who were believed to control physical forces and whose rites could be shared by a wide circle.

Pagan religion thus followed the contours of social organization. The paganism of the Gauls merged easily into that of the Romans as the Gauls became latinized. Fustel dismisses druidism as a brief interlude; he viewed the druids as professional religious specialists whose doctrines and practices did not arise naturally from social life. The power of the druids had been based on a close alliance with the native political elite who turned away from them after the Roman conquest.

Fustel's treatment of Christianity is more complex. Early Christianity, he thought, was truly democratic in its organization. With its incorporation into the empire, the structure of the church became more hierarchical, mirroring the structure of political society. Fustel became somewhat torn between his dislike of priestly hierarchy and his desire to see the church as the vehicle by which Roman social organization was preserved and transmitted to medieval France. Because it was separate from the state and grew up initially without official recognition, the church constituted an alternative source of authority on which the conception of the individual's rights against the state could be based; but contraposition to the state also turned the church into a political organization. In his early *Mémoire sur l'île de Chio* (1856) Fustel showed how the opposition between the Roman Catholic and the Greek Orthodox churches became the focus of hostility between Greeks and Franks.

Émile Durkheim and the structural-functionalists followed and extended Fustel's insight into the relation between religion and social structure. Louis Dumont has revived his idea of a link between Christianity and individualism in his *Essais sur l'individualisme* (1983). Fustel's complex attitude toward the priesthood and his interest in the relation between church and state form part of a chapter of nineteenth-century intellectual history that has yet to be written.

BIBLIOGRAPHY

The English edition of *The Ancient City* (Baltimore, 1980) contains an introduction by Arnaldo Momigliano and myself. A new French edition, with an introduction by François Hartog, was published in Paris in 1984. Fustel's other work on religion is to be found in the *Histoire des institutions politiques de l'ancienne France*, 6 vols. (Paris, 1888–1893), *Nouvelles recherches sur quelques problèmes de l'histoire* (Paris, 1891), and *Questions historiques* (Paris, 1893); all were edited posthumously by Camille Jullian. Jane Herrick's *The Historical Thought of Fustel de Coulanges* (Washington, D.C., 1954) contains useful material on Fustel's attitude to religion. Further bibliography and information on Fustel's intellectual background can be found in Arnaldo Momigliano's "The

Ancient City of Fustel de Coulanges," in his *Essays in Ancient and Modern Historiography* (Oxford, 1977), pp. 325–343.

S. C. HUMPHREYS (1987)
Revised Bibliography

FYLGJUR are fetches and guardian spirits in Old Norse literary tradition. The term apparently derives from the Old Norse verb *fylgja* (to accompany), but it is homonymous with, and perhaps identical to, the word for "afterbirth" or "placenta." The singular noun *fylgja* denotes two distinct groups: fetches in animal form and guardian spirits in female form.

Fylgjur in animal form are most often wolves or bears, but many other animals are attested, such as oxen, boars, and such birds as eagles, falcons, and hawks. These figures appear to people primarily in dreams and warn of impending death, danger, or some future event. Frequently the *fylgja* is that of the doomed or threatened man's enemy.

These conceptions appear to reflect notions, common in Norse and later Scandinavian tradition, of the soul operating out of the body. In their textual context they must be viewed as part of a broader tradition of portents and dreams, but the animal form of the *fylgjur* may relate to the phenomena of the werewolf and the man-bear. The emphasis on beasts of battle suggests the cult of Óðinn, the most important shape-changer of Scandinavian myth and religion. Óðinn was known for his ability to send his soul out from his body and for sending his companion ravens out into the world as scouts. The animal form of Óðinn's berserkers may also be relevant.

The female *fylgjur* share many features with *idísir* and *hamingjur*, and more distantly with *landvettir*, Norns, and valkyries; there is little terminological consistency. Unlike the animal *fylgjur*, they are not the alter egos of individuals. Their actions are to some extent comparable to those of the animal *fylgjur* in that they sometimes appear in dreams and portend death or foretell the future, but they generally act in sympathy with a central individual rather than in enmity, giving counsel, good fortune, or aid in battle. These *fylgjur* may attach to a single individual or an entire family. They may be related to the cult of the *matronae*, attested from the Roman period in Germany.

BIBLIOGRAPHY

A full treatment of the literary evidence is provided in Else Mundal's *Fylgjemotiva i norrøn litteratur* (Oslo, 1974). Helpful

for the larger context are Dag Strömbäck's *Tidrande och diserna* (Lund, Sweden, 1949) and Folke Ström's *Diser, norner, valkyrjor* (Stockholm, 1954). On the Indo-European background of the cult of Óðinn and the role of animals, especially dogs and wolves, see Kris Kershaw, *The One-eyed God: Odin and the (Indo-) Germanic Männerbünde* (Washing-

ton, D.C., 2000). E. O. G. Turville-Petre's "Liggja fylgjur þínar til Íslands," originally published in 1940 and reprinted in his *Nine Norse Studies* (London, 1972), distinguishes between the primarily concrete *fylgja* and the primarily abstract *hamingja*.

JOHN LINDOW (1987 AND 2005)

G

GADJERI. The name *Gadjeri* (*Gadjari*, *Kadjeri*) is known over a wide area of northern Australia. It means “old woman,” implying status and not necessarily age. Gadjeri is also the “sacred mother,” or “mother of us all,” and the theme of birth, death, and rebirth is pervasive throughout all of the myths concerning her. She symbolizes the productive qualities of the earth—of all natural resources, including human beings. But it is people, and not natural species, who came from her uterus in the creative era of the Dreaming. Among a number of language groups from the Roper River westward, she is called Kunapipi (or Gunabibi), which means “uterus,” “penis incision” (and, by extension, “vagina”), and “emergence” (referring to rebirth). In that same area she is also called Mumuna or Mumunga, a bull-roarer that, when swung, is her voice. In the northwest, on the Daly River and at Port Keats, as in the central-west part of the Northern Territory, she is also a bull-roarer named Kalwadi, although the term *Gadjeri* is more generally used; at Port Keats her local name is Mutjingga (“old woman”). In the southeastern Kimberley and southward into the Western Desert, she is known as Ganabuda. Mostly the Mother is a single mythic being, but in some cultural areas she may be identified with two females of equivalent characteristics, while the term *Ganabuda* may refer to a mythic group of women.

Gadjeri is often associated with two or more of her daughters, the Munga-munga, or Manga-manga, who play an important role in the mythic constellations of men and women in both secret-sacred and open-sacred ritual activities. The Munga-munga are sometimes referred to as the Kaleri-kalering, a name also used for a group of mythic men. The Mother’s husband is Lightning or Rainbow Snake.

Baldwin Spencer (1914, pp. 162, 164, 213–218) first mentioned the term *Kunapipi* as the name of a bull-roarer used by people living in the areas of the Katherine and Roper rivers. The myth he recorded relates to a “big man” named Kunapipi who carries about with him woven bags containing spirit children. At one place he removes male children and places them on grass in an enclosed area surrounded by a raised mound. After decorat-

ing them as circumcision novices, he divides the children into two groups (moieties) and into subsection categories and gives them “totemic” affiliations—instituting present-day social organization. He also carries out circumcision and subincision rituals that attract visitors from outlying areas. When the rituals are over he kills and eats some of the visitors, then vomits their bones—not whole bodies, as he had expected. Two men who escape from him go in search of their relatives, and together they all return to kill Kunapipi. When they cut open his belly, they find two of his “own children,” who are recovered alive. Spencer recounts an additional myth relating to a woman whose Dreaming is Kunapipi and who possesses a Kunapipi bull-roarer: She too is responsible for leaving spirit children at particular places. Together with a number of other women of the same mythic affiliation, she performs rituals. These are observed by a mythic man who sees that the women have a bull-roarer and takes it from them. As a result, the women lose their power to carry out this form of secret-sacred ritual.

Actually, Spencer seems not to have been referring to Kunapipi as a male at all, but as a female. In the Alawa language group, Gadjeri is said to have emerged from the sea to rest on a sandbank at the mouth of the Roper River (Berndt, 1951, p. 188) and then to have proceeded upstream. In one Mara version, Gadjeri, as Mumuna, eats men who were enticed to her camp by her daughters, the Mungamunga. She swallows them whole but vomits their bones; she had expected them to emerge whole and to be revived. This happens on a number of occasions with different men, each time without success. Eventually, she is killed by relatives of the men she has eaten (Berndt, 1951, pp. 148–152). A crucial point here is the one made by the Aborigines who told this myth: “They didn’t come out like we do, they came out half and half.” That is, in Kunapipi ritual men enter the sacred ground, which is the Mother’s uterus, and leave it reborn. The myth here emphasizes not cannibalism but the dangerous nature of this ritual experience.

When the Kunapipi cycle entered eastern Arnhem Land, it was adapted to local mythology (see Warner, 1958, pp. 290–311; Berndt, 1951, pp. 18–32ff.). In western Arnhem Land, two mythic Nagugur men, smeared with blood and grease, are credited with bringing the Kunapipi ritual complex. As they travel about the country they carry with them a Rainbow Snake (Ngalyod, in female form) wrapped in paper bark. In the rituals carried out in this area, a trench (*ganala*) symbolizes the Mother’s uterus and is identified with Ngalyod; snake designs are incised on its inner walls (Berndt and Berndt, 1970, pp. 122–123, 138–142).

W. E. H. Stanner (1960, pp. 249, 260–266) gives a Murinbata (Port Keats) version of the Old Woman, or Mutjingga, myth. She swallows children whose mothers have left them for her to look after. Once the mothers return, they find the children missing and search without success; two men, Left Hand and Right Hand, eventually find Mutjingga hidden under the water. When she emerges, they kill her,

open her belly, and remove the children, still alive, from her womb. They clean them, rub them with red ocher, and give them headbands, which signify that an initiation ritual has taken place. Although the myth differs from the Mara account in content, it is symbolically the same. Stanner, however, interpreted it as pointing to a “wrongful turning of life”; to him, the killing of Mutjingga was a kind of “immemorial misdirection” which applied to human affairs, and living men were committed to its consequences (see Berndt and Berndt, 1970, pp. 229, 233–234). Evidence from other cultures does not support the contention that “a primordial tragedy” took place in the myth. On the contrary, its format is consistent with that of other Kunapipi versions: It concerns the symbolism of ritual death and rebirth. Mutjingga is also linked in myth, but not in ritual, with Kunmanggur (Rainbow Snake), whom Stanner (1961, pp. 240–258) regarded as “the Father,” complementing Mutjingga as “the Mother.” In Port Keats, Kunmanggur dies in order to ensure that fire is available to human beings.

This pervasive theme of birth, death, and rebirth receives constant emphasis in the central-western Northern Territory Gadjeri. In drawings, for instance, the Mother is depicted with men and women “flowing from” her into a “ring place” (the sacred ground). She may also be shown as a composite structure of poles and bushes, decorated with meandering designs of feather down and ocher and wearing a pearl-shell pubic covering suspended from a hair waistband (see Berndt and Berndt, 1946, pp. 71–73). Furthermore, unlike many other deities or mythic beings, she does not change shape: She is not manifested directly through a natural species. Human birth is transferred to the nonhuman dimension through divine intervention, made possible through human ritual; that is, human ritual releases the Mother’s power to make species-renewal possible. The central-western Gadjeri complex is quite close to the mainstream Kunapipi cultic perspective of the Roper River, except that the Mother’s death is mentioned only obliquely in the central-western interpretation. For example, in regard to subincision, which is an integral part of her ritual, it is said that the blood which results from the regular opening of the penis incision is symbolic of that shed by the Mother when she was killed. But blood is also life-giving, and through this the Mother lives on spiritually and physically in her daughters, the Mungamunga.

In the northern and central-west areas of the Northern Territory, Gadjeri is ritually dominant, with or without the presence of the Rainbow Snake. In the fringes of the Western Desert her rituals focus mainly on other mythic beings. The Walbiri are a case in point. Their major mythic beings are the male Mamandabari pair. While this mythic constellation is classified under a Gadjeri heading and called “Big Sunday” (Meggitt, 1966, pp. 3ff.), and its ritual paraphernalia and symbolism are specific to Gadjeri, there is no reference either to the Mother or to her daughters. She is treated almost as a presiding deity who stands some distance away from ritual

performance. The Mamandabari are similar to the two mythic Nagugur (of western Arnhem Land) who act as intermediaries. But what the Nagugur do is carried out in the name of Kunapipi, and this is not the case with the Mamandabari. Nevertheless, an important clue to the relationship between the Walbiri and Mara Kunapipi versions is to be found in a number of songs they hold in common (Meggitt, 1966, pp. 26–27).

In the southeastern Kimberley, Gadjeri is represented by the Ganabuda group of women, who are included in several of the mythic and ritual Dingari cycles. These Dingari are made up of an accretion of myths that are not necessarily woven into an integrated pattern. In them, the Ganabuda move from one site to another, either following or preceding a group of Dingari men who are concerned with initiating novices (see Berndt, 1970, pp. 216–247). In one excerpt, the Munga-munga walk ahead of the Ganabuda women, who are burdened with sacred *daragu* boards. During the course of their travels, they encounter a mythic man, who is astonished to see not only what they are carrying but also that they are swinging bull-roarers—because the men had none of these things. At night he sneaks up and steals their power, which resides under the armpits of the Ganabuda. In that way, men obtained ritual power.

In another excerpt, Dingari men sit within their ring place while the Ganabuda remain some distance away in their own camp. The women discover that some young men (novices) are among the older men. They meet some of the young men and have intercourse with them. When the older men find out about this, they become angry. They light a bush fire, which sweeps across the countryside, burning many of the young men to death. The Ganabuda escape the fire by submerging themselves in a lake. When the fire has passed by, they discover what has happened. Overwhelmed by grief and anger, they go in search of the older men and kill some of them in revenge.

Again, this last mythic incident represents, symbolically, a typical initiatory sequence: removal of novices from the authority of their “mothers,” their seclusion from women (that is, their ritual death, expressed in their mythic death by fire), and the grief of the women at the loss of the young men (the women take revenge on the older men). In short, the Mara myth provides a glimpse of the Kunapipi Mother who has not perfected the ritual process of death and rebirth. She must therefore die in order to live spiritually in the form of her emblematic representation. In the Mutjingga myth the process is taken a step further, with the removal of the children alive from her womb. The central-western Northern Territory example gives assurance that Gadjeri has perfected the ritual process of death and rebirth: She is the epitome of all physical and spiritual renewal.

The Ganabuda mythology, on the other hand, poses a paradox which is not so easily explained. The answer lies in the nature of Western Desert mythology and ritual, which, although it emphasizes seasonal renewal and the growth of

all species, also underlines the essential unpredictability of natural phenomena and the vulnerability of human beings. Gadjeri’s womb is still fertile, but there are still many dangers associated with the ritual (and human) implementation of her life-giving power.

RONALD M. BERNDT (1987)

GAGE, MATILDA JOSLYN. Matilda Joslyn Gage (1826–1898), suffragist, abolitionist, and religious radical, was born March 24, 1826, in Cicero, New York, and spent her entire life within a thirty-mile radius of nearby Syracuse, raising her family of four with her husband, the merchant Henry H. Gage. Gage was the youngest member of the National Woman Suffrage Association (NWSA) leadership triumvirate (with Elizabeth Cady Stanton and Susan B. Anthony), presiding over the Executive Committee of the NWSA

for most of the 1870s and 1880s while heading the New York State Suffrage Association. The three women, editors of the first three volumes of the *History of Woman Suffrage* (1881–1887), “will ever hold a grateful place in the hearts of posterity,” predicted the *Woman’s Tribune* in 1888.

A prolific writer and thorough researcher, Gage edited a suffrage newspaper for four years (*The National Citizen and Ballot Box*, 1878–1881) and contributed as correspondent to newspapers across the country. She wrote about the superior position of Haudenosaunee (Iroquois) women while she supported native sovereignty and treaty rights. Gage was a chief architect of the campaign of nonviolent civil disobedience in the 1870s that saw NWSA women refusing to pay their taxes, voting illegally, and petitioning Congress for relief from their political disabilities. Gage dropped out of the suffrage cause after what she perceived as a conservative takeover of the woman’s movement in 1889, which she unsuccessfully moved to prevent.

The greatest danger at the time, Gage believed, was an attempt by Christian fundamentalists to place God in the Constitution and prayer in the public schools. Turning to what she believed was her grandest, most courageous work, Gage formed the Woman’s National Liberal Union (1890) to challenge the religious right’s drive to merge church and state. The organization, which lasted only a year, also strove to free woman from the “bondage” of the church, which “enslaved her conscience and reason.”

Gage published her magnum opus, *Woman, Church, and State* in 1893, and Anthony Comstock, the press censor of the United States Postal Service, immediately banned the book from public school libraries, threatening to arrest anyone who made the book available to children. A powerful indictment of the church’s primary role in the oppression of women, the book also exposed the institutionalized sexual abuse of women and children by the priesthood and documented gynocidal witch-burnings (nine million European women, Gage estimated, murdered by the church and later the state over a 500-year period). Gage argued that the early church had accepted the equal feminine nature of the divine, and women served at the altar and administered the sacrament until 824, when the Council of Paris removed women from religious duty. Women were then slowly forced out of the priesthood and the female in the godhead was removed.

Beginning in the 1870s, Gage charged in her writing and speeches that the foundation of the Christian church became the theory that woman brought sin and death into the world. The result was idolatry, a worship of the masculine, Gage told the International Council of Women in 1888. God punished Eve’s sin by putting woman in subordination and servitude to man; women’s second-class position in all areas—political, legal, educational, industrial, and social—resulted from this mythological story, Gage explained. The church required women to pledge obedience to their husbands in the marriage ceremony. When canon law became the foundation for common law, married woman’s subordi-

nate position rendered her “dead in the law,” without rights or even legal identity.

The great underlying creative principle is female, Gage reasoned, a fact recognized by all ancient nations, where goddesses were seated everywhere with gods, and often considered superior to them. Gage believed that returning the motherhood of God to the place of sacredness from which it had been removed by the patriarchal Christian overthrow was critical to elevating the position of women. Women were not the only victims of Christianity; the authority of the Bible had been used to justify slavery and oppose science, art, invention, and all reform movements. Considering religious belief tantamount to the death of the soul, Gage celebrated the greatest lesson of her life—to think for herself—given in childhood by her father. She embraced moral relativism, believing that no absolute moral standard exists, but that what is considered right changes over time and from culture to culture.

While nominally a church member throughout her life—she joined the Baptist Church in childhood and her name stayed on the church rolls until shortly before her death—Gage’s religious journey took her through membership in the American Theosophical Society (1885) and a serious investigation of the paranormal.

A contributor to the *Woman’s Bible*, which Elizabeth Cady Stanton edited (1895–1898), Gage moved from her interpretation of the Bible as history or mythology to a reading of it as an occult work of ancient mysteries written in symbolic language. She suggested that the *Book of Revelation*, understood from this perspective, may be read as a work about woman’s spiritual powers.

Gage remained hopeful about the future of women who were rising up against the “tyranny of Church and State” in the most important revolution the world had yet seen. It “will shake the foundations of religious belief, tear into fragments and scatter to the winds the old dogmas upon which all forms of Christianity are based,” she predicted at the conclusion of *Woman, Church, and State*. The result “will be a regenerated world.”

Gage died March 18, 1898, and was buried in the Fayetteville, New York, cemetery under a tombstone blazoning her motto: “There is a word sweeter than mother, home or heaven. That word is Liberty.”

BIBLIOGRAPHY

A full-length comprehensive biography of Gage’s life and work has yet to be written. Sally Roesch Wagner’s monograph, *Matilda Joslyn Gage: She Who Holds the Sky* (Aberdeen, S.Dak., 2002), and Leila R. Brammer’s *Excluded from Suffrage History: Matilda Joslyn Gage, Nineteenth-Century American Feminist* (Westport, Conn., 2000) pave the way. Several reprint editions of Gage’s magnum opus, *Woman, Church, and State*, are available, including one from Humanity Books (Am-

herst, N.Y., 2002); the Modern Reader's edition, published by Sky Carrier Press (Aberdeen, S.Dak., 1998) and edited by Sally Roesch Wagner, is the only one containing a bibliography documenting Gage's extensive research. Gage's papers are available on microfilm from the Schlesinger Library, and her woman's rights scrapbooks from the Library of Congress, Rare Books Division. With Elizabeth Cady Stanton and Susan B. Anthony, Gage edited the first three volumes (1881–1887) of *History of Woman Suffrage* (reprint, Salem, N.H., 1985). Gage's important address, "Woman in the Early Christian Church," was delivered at the International Council of Women's Religious Symposium (Report of the International Council of Women, Washington, D.C.: National Woman Suffrage Association, 1888, pp. 401–407). In addition to the newspaper she edited, the *National Citizen and Ballot Box* (1878–1881), Gage wrote extensively for *The Revolution* (1868–1871). Two good sources for her religious views are *The Index* ("The Church, Science, and Woman," April 29, 1886) and *The Woman's Tribune* ("The Foundation of Sovereignty," April 1887).

SALLY ROESCH WAGNER (2005)

GAIA theory was first proposed by the English scientist James Lovelock in 1979 to explain how and why, as life appeared on the planet and grew abundant, its evolution and the earth's evolution merged into a single dynamic system he called *Gaia*. Lovelock was aware that this was the Greek name for a primordial cosmic goddess who was also a primal earth deity. He used the name and has continued to use it, in spite of criticism from some scientists, because of its metaphoric power. It conveys, he says, the idea of a superorganism composed of all life tightly coupled with the air, the oceans, and the surface rocks. By the end of the 1980s there existed sufficient evidence, models, and mechanisms to develop the theory further through transdisciplinary scientific research in cooperative projects between those working in such apparently disparate fields as practical ecology, ocean science, evolutionary biology, biochemistry, geology, and climatology.

Continuing this research, Lovelock and others have shown that Gaia self-regulates at a global scale through life-environment interactions, and that as a result the earth has remained in a habitable state over billions of years. The theory suggests that its habitability results from three intrinsic properties and one extrinsic property of living organisms. First, all organisms alter their environment by taking in free energy and excreting high-entropy waste products in order to maintain a low internal entropy. Second, organisms grow and multiply, potentially exponentially, thus providing an intrinsic positive feedback to life (the more life there is, the more life it can beget). Third, for each environmental variable there is a level or range at which the growth of a particular organism is maximum. Extrinsically, the fact that organisms both alter and are constrained by their environments in these ways means that feedback between life and its environment is inevitable.

In 2001 more than one thousand scientists signed the Amsterdam Declaration on Global Change, which states: "The Earth System behaves as a single, self-regulating system comprised of physical, chemical, biological and human components." This view sees the earth as a unified whole and humans as organic members of the entire community of life on earth. There is no question of human life being external to or independent of the planetary system's self-regulatory functioning, or of its common environmental resources, climatic variables, or ecosystem constraints. That being so, we need to take account of how we rely on and use those resources and adapt to those constraints. As Lovelock himself says, perhaps the greatest value of Gaia theory lies in its metaphor of a living earth. This reminds us that we are part of it and that human rights are constrained by the needs of our planetary partners.

Some religious implications follow from perceiving the earth and ourselves in this way. First, whatever is deemed sacred or holy in life cannot be separated out in any absolute sense from whatever we understand as the whole of existence. It may instead be seen as the internal transcendence of every living being. But as that cannot be divorced from the environment that supports life or from the interactions in which each being is connected with all others, so we cannot reduce the sacred to any one manifestation of being but must extend the concept to the whole dynamic system of relationships between God and the world. Lovelock says that Gaia, like life, is an emergent phenomenon, one that is comprehensible intuitively but difficult or impossible to analyze by reduction. Similarly, sacredness is an emergent property of life, one that cannot be analyzed reductively by separating it out or cutting it off from the interactions of daily life.

Second, if we accept that our species evolved in the same way as every other species, we cannot assume that we were created at a particular moment in time outside the processes or flow of evolution. Neither can we claim absolute privileges for our species in respect of our use of the earth's material resources. Nor can we assert that we alone know, through some divine revelation extraneous to or cut off from daily life, how our species began or what will happen to us at the end of time. Practically, we cannot assume that the earth and its resources evolved and now exist solely for our use.

Gaia theory therefore raises critical questions about the anthropocentrism of major Christian doctrines where they infer that: (1) the earth was created solely for our sake, so that its creatures and resources exist primarily for our benefit; (2) the revelation of God is fully contained in human words addressed to and historically recorded by humans; (3) death was brought into the world as punishment for one man's sin rather than being an evolutionary necessity; or (4) the life and death of Jesus is solely "for" human salvation from sin and death.

It also puts in question the traditionally vertical nature of hierarchical Christian imagery. This places God above angels, men, and women in descending order of value and im-

portance, so that the earth and its creatures are presumed created in a position of subservience to human beings because they are of less value to God. The metaphoric power of the religious language of dominance based on this valuation system authorizes human domination over the entire household of life and claims it in God's name. The intrinsic value and sacredness of the more-than-human world in the sight of God is implicitly negated or at best reduced.

The practical effects of such claims to human exceptionalism are now evident in the exploitation through industrialization and technologization of the earth's resources. The scale of their extraction and the extent of their use and consequent waste far outstrip that of their natural replacement or disposal. Seen within the context of a relational understanding of human interactions with the environment, and of human rights constrained by those of our planetary partners, the implications of this exploitation for social justice are far-reaching.

The implications are of particular concern to four classes of people singled out in the documents proceeding from the 1992 United Nations Conference on Environment and Development as being most at risk from environmental degradation, most vulnerable to its effects, and most powerless to do anything about it: women, children, indigenous peoples, and the poor. Yet the dominant free-market model of development and continuing growth presupposes that the resources needed to sustain it are and will be available, and that thanks to science and technology, together with the spread and improvement of education, we shall be able to hand on a better global situation than the one we inherited. The presupposition behind this expectation is, of course, that the global biophysical environment will sustain this growth. Numerous research projects into the health of that environment, however, show precisely the opposite. Decline in fish stocks and freshwater supplies are well-publicized examples. The fact too that many of the poorest human communities live in battle zones, or are refugees from territories devastated by war, offers them little hope of redress for the loss of their pastures and access to clean water.

Yet human interdependence within Gaia means that we are all in some way implicated in and diminished by the contemporary expansion of militarist regimes and the consequent destruction of biodiversity and loss of material resources. Arms industries today use the chemical, physical, and biological resources of the planet to produce sophisticated weapons through the expenditure of billions of dollars and massive amounts of human energy. In 1994 the amount of weapons available was computed at twenty thousand kilograms of explosive for every person on the planet. By the year 2000 the available weapons-grade plutonium was the equivalent of a million atomic bombs. This waste of planetary resources is compounded by the fact that such weapons exist solely to destroy life and its support systems within Gaia.

Commitment to as nonviolent a lifestyle as possible is, therefore, an obviously appropriate response to a deepening

understanding of the single, self-regulating planetary system within which we belong. Religions such as Jainism and Buddhism have made a nonviolent ethic an inherent and coherent part of a religiously inspired worldview. Now, Gaia theory is reminding Christians that Jesus—believed by them to be the authentic revelation of God—taught love of enemies, forgiveness, and nonretaliation for insults. He claimed that God has a direct interest in sparrows and in each flower of the field, was renowned for healing bodies, and died on a cross erected by military power, his own body pierced and broken after death by military weapons.

If, therefore, as Lovelock asserts, we each contribute, according to our kind, to the continuous and consistent relationships between organisms and their environments that constitute the support system of all life on earth, the adoption of as nonviolent a lifestyle as possible is a positive contribution to Gaia from a religious, ethical, and scientific perspective. This nonviolence is more than the negation of violence. It is a rational and spiritually powerful commitment to living in a way that asserts the sacredness of Gaia.

ANNE PRIMAVESI (2005)

GALEN (130?–200? CE, or later) was a Greek physician and philosopher. The last and greatest medical scientist of antiquity, Galen exercised an unparalleled influence on the development of medicine. Galen was born in Pergamum (modern Bergama, Turkey), an important city in western Asia Minor, the only son of Nikon, an architect and geometer. He was educated by his father until the age of fourteen, when he began to attend lectures in philosophy. When Galen was sixteen his father decided that he should become a physician and thereafter spared no expense in his education. After studying under prominent medical teachers in Pergamum, Galen traveled to Smyrna in western Asia Minor, Corinth in Greece, and Alexandria in Egypt, to study medicine.

At the age of twenty-eight he returned to Pergamum, where he was appointed physician to the school of gladiators. This position provided him with broad medical experience that laid the foundation of his later career. In 161 Galen left Pergamum for Rome, where he quickly established a reputation as a successful physician and made many prominent acquaintances. He returned to Pergamum in 166, claiming as the reason the envy of his colleagues, but more probably to escape a severe plague. Shortly after his return, however, he was summoned by the emperor Marcus Aurelius to Aquileia (at the head of the Adriatic), where he was engaged in preparations for war against the Germans. Galen followed the emperor to Rome in 169 and avoided further military service by gaining appointment as physician to the emperor's son Commodus. His position gave him the leisure to pursue medical research, writing, and lecturing, which he did with great success. Not much is known of Galen's later career. He continued to attend Commodus after he ascended the throne in 180 as well as Septimius Severus, who became emperor in 193. The date of Galen's death is uncertain. One source states that he died at the age of seventy, which would be about 200 CE. However, according to Arab biographers, he lived to be more than eighty, which would place his death later than 210.

Galen was one of the most prolific authors of classical antiquity. He wrote more than four hundred treatises. Many of his works have been lost, including a large number of his philosophical treatises that were destroyed in a fire in the Temple of Peace at Rome in 191. Nearly 140 works in Greek that have survived either in whole or in part are attributed to Galen. Some are of doubtful genuineness and others are spurious. Still other works, while lost in Greek, are extant in Latin and Arabic translations. His writings are extremely diverse and include works on anatomy, pathology, therapeutics, hygiene, dietetics, pharmacy, grammar, ethics, and logic, as well as commentaries on Hippocrates and Aristotle. Most of his extant works deal with medicine. Galen wrote clear Attic Greek, but he was prolix and diffuse and his works are not easy to read. Moreover, he was vain, tactless, and quarrelsome, and his writings are often characterized by a polemical tone.

Galen was a brilliant student of anatomy. His exactness in dissecting primates and other animals (from which he drew inferences for human anatomy) was unequalled in the ancient world. His understanding of the human body and medicine followed traditional lines. He admired Hippocrates, whom he regarded as the repository of medical wisdom, and he claimed merely to reproduce his doctrines. Thus he accepted humoral pathology, which viewed health as the product of an equilibrium of the four humors. The basic principle of life for Galen was the *pneuma* ("spirit"), which he thought responsible for many vital processes. Galen's medical theory is deeply indebted to philosophy, the study of which he believed was essential to the education of a physician. He did not follow exclusively the teachings of any one philosophical school, though he was deeply influenced by Aristotle. As an eclectic, he borrowed freely from most philosophical schools with the exception of the Skeptics and Epicureans, whose doctrines he opposed.

Galen's writings reveal a strong teleological emphasis. He believed that everything had been made by the Creator (or Demiurge) for a divine purpose and that the entire creation bears witness to his benevolence. In his treatise *On the Usefulness of the Parts of the Human Body* he expresses the belief that true piety lies in recognizing and explaining the wisdom, power, and excellence of the Creator rather than in offering a multitude of sacrifices. He accepted the Aristotelian principle that nature does nothing in vain and he attempted to show that every organ was designed to serve a particular function. In the minutest detail the human body exhibits its divine design.

Although Galen believed in one god, his depiction of him as a divine craftsman was drawn not from Judeo-Christian sources, but from Plato's *Timaeus*, as was his argument from design. He criticized Moses for holding (in the account of creation in *Genesis*) the doctrine of *creatio ex nihilo* and the belief that nature was created as an act of God's sovereign will. Galen was acquainted with both Jews and Christians and he refers several times in his philosophical and

medical works to their beliefs. He was the first pagan writer to treat Christianity with respect as a philosophy rather than, like most educated Romans, as a superstitious sect. He admired Christians for their contempt of death, sexual purity, self-control in regard to food and drink, and their pursuit of justice: in all of which he regarded them as not inferior to pagan philosophers. He criticized Christians and Jews, however, for their refusal to base their doctrines on reason rather than solely on faith and revealed authority. A group of Roman Christians in Asia Minor, led by Theodotus of Byzantium, attempted in the late second century to present Christianity in philosophical terms. They are said to have admired Galen and it is likely that they were influenced by his philosophical works. They taught an adoptionist Christology, and for this and other heresies they were excommunicated by church authorities.

Galen enjoyed an enviable reputation in his own time both as a physician and as a philosopher. Soon after his death he came to be recognized as the greatest of all medical authorities. His eclecticism, which permitted him to take what was best from all medical sects, his claim to reproduce the ideas of Hippocrates, the encyclopedic comprehensiveness of his medical works, and his greatness as a scientist were largely responsible for his influence. Because his writings were voluminous they were summarized in handbooks, synopses, and medical encyclopedias. The pre-Galenic medical sects gradually disappeared and were replaced by an all-embracing Galenic system that united medicine and philosophy and came to dominate medicine for over a millennium. As anatomical and physiological research ceased in late antiquity, medicine became increasingly scholastic and was taught from a selection of Galen's works.

Galen's direct influence was initially greater in the Byzantine East, where his ideas were relayed by medical encyclopedias, than in the Latin West. In the ninth century many of his works were collected and translated into Arabic and Syriac by Hunayn ibn Ishaq, a Nestorian Arab physician, and his school. In the course of the eleventh century they were translated from Arabic into Latin and Hebrew and came to dominate medicine in the West just as they had dominated Byzantine and Arabic medicine. The authority of Galen was regarded as second only to that of Aristotle. Although a pagan, he appealed equally to Jews, Muslims, and Christians, who found his teleology and monotheism compatible with their own faiths. The appearance of his collected Greek works in the sixteenth century spurred new interest in Galen and led to a revival of medical experimentation. It was during the Renaissance that his reputation reached its apex, but it soon began to be challenged by new discoveries, particularly in the fields of anatomy and physiology. Nevertheless, ideas championed by Galen (particularly humoral pathology) continued to influence medical theory until the nineteenth century.

BIBLIOGRAPHY

The only complete edition of Galen, with Latin translation, remains C. G. Kühn's *Claudii Galeni Opera Omnia*, 20 vols. (1821–1833; reprint, Hildesheim, 1964–1965). While the text is unreliable, Kühn's edition is still useful in the absence of critical editions of most of Galen's works. Several of Galen's treatises have been translated into English. See in particular *Galen on the Usefulness of the Parts of the Body*, 2 vols., translated and edited by Margaret T. May (Ithaca, N.Y., 1968). A representative selection of extracts from Galen's writings is found in *Greek Medicine*, edited and translated by Arthur John Brock (London, 1929), pp. 130–244.

Brief but reliable introductions to Galen and his background are D. E. Eichholz, "Galen and His Environment," *Greece and Rome* 20 (1951): 60–71; and G. W. Bowersock; *Greek Sophists in the Roman Empire* (Oxford, 1969): 59–75. Aspects of Galen's life and work are explored in the composite volume *Galen: Problems and Prospects*, edited by Vivian Nutton (London, 1981). Several of Nutton's essays that deal with Galen's career are reprinted in *From Democedes to Harvey: Studies in the History of Medicine*, edited by Nutton (London, 1988). On Galen's theology and his attitudes to Christians and Jews, see Richard Walzer's *Galen on Jews and Christians* (Oxford, 1949); and Fridolf Kudlien's "Galen's Religious Belief," in *Galen: Problems and Prospects* (cited above). On the influence of Galen on medical thought, see Owsei Temkin's *Galenism: Rise and Decline of a Medical Philosophy* (Ithaca, N.Y., 1973).

GARY B. FERNINGREN (1987 AND 2005)

GALILEO GALILEI (1564–1642) is considered to be the father of modern science. Born at Pisa, Italy, Galileo received some of his early schooling there. He then was sent to the ancient Camaldolese monastery at Vallombroso, where, attracted by the quiet and studious life, he joined the order as a novice. His father, however, wished him to study medicine and took him to Florence, where Galileo continued his studies with the Camaldolese monks until he matriculated at the University of Pisa in 1581. During his student years at Pisa, Galileo is said to have made his celebrated observation of the sanctuary lamp swinging like a pendulum from the cathedral ceiling and to have thereby discovered that the time taken for a swing was independent of the size of the arc, a fact that he used later for measuring time in his astronomical studies.

Finding that his talents for mathematics and philosophy were increasingly being recognized, Galileo gave up his medical studies and left the university in 1585, without a degree, to begin lecturing at the Florentine academy. There he published an account of his invention of the hydrostatic balance (1586) and then an essay on the center of gravity in solid bodies (1588), which won him a lectureship at Pisa. In 1592 he was appointed professor of mathematics at the renowned University of Padua, where he remained for eighteen years. There, in 1604, he published his laws of motion of falling bodies in his book *De motu*.

In 1597 Galileo wrote to Johannes Kepler that he had been a Copernican “for several years.” Having heard in Venice of the newly invented telescope, Galileo immediately constructed one of his own and in 1610 announced many astronomical discoveries. These included his discovery that the Milky Way is made up of innumerable stars and his observation of the satellites of Jupiter. He also made observations of sunspots and of the phases of Venus. Thus he vastly expanded astronomical knowledge and challenged the established natural philosophy, which was based on Aristotelian ideas that had been reconciled with Christian doctrine by Thomas Aquinas. Shortly after the publication of these discoveries, Galileo was appointed philosopher and mathematician to the grand duke of Tuscany.

In 1613, Galileo’s *Letters on Sunspots* was published. Its preface claimed that Galileo had been the first to observe sunspots, an assertion that generated bitter resentment among some Jesuit scholars (who had an arguable claim to priority of observation) and that eventually had serious consequences for Galileo. In this book, he first stated in print his unequivocal acceptance of Copernican astronomy, challenging a basic postulate of the Aristotelian view by insisting that all celestial phenomena should be interpreted in terms of terrestrial analogies. Furthermore, Galileo wished to make science independent of philosophy by his assertions that the essence of things cannot be known and that science should concern itself only with the properties of things and with observed events. It was the philosophers rather than the theologians who were the early opponents of the Copernican system and, insofar as he supported it, of Galileo’s work. No doubt they were also put off by Galileo’s extremely high opinion of himself, and they exploited personal jealousies and resentments against him and tried to enlist the aid of theologians in condemning both Copernican ideas and Galileo’s advocacy of them.

Not until 1616, seventy-three years after the publication of Copernicus’s *De revolutionibus orbium coelestium* (On the revolution of the heavenly spheres), did the Theological Consultors of the Holy Office declare it “false and contrary to Holy Scripture” and recommend that Copernicus’s book be “suspended until corrected.” Cardinal Roberto Bellarmino had earlier written to Galileo warning him to confine himself to the realm of hypothesis until demonstrative proof could be produced. When Galileo went to Rome to defend his position, he was officially cautioned neither to hold nor to defend the Copernican ideas. And Galileo, good Catholic that he was (and remained), agreed.

Throughout, Galileo maintained that the purpose of scripture is not to teach natural philosophy and that issues of faith and issues of science should be kept separate and should be settled on different grounds. He quoted Tertullian approvingly: “We conclude that God is known first through nature, and then again, more particularly, by doctrine; by nature in his works, and by doctrine in his revealed word.” He also cited Cardinal Cesare Baronius, a contemporary, who

had quipped, “The Bible tells us how to go to Heaven, not how the heavens go.”

The appearance of the great comets in 1618 stirred up much controversy, which Galileo joined by writing his *Discourse on Comets*, annoying the philosophers still further because of his anti-Aristotelian bias. In 1623, Galileo published *The Assayer*, which he dedicated to Urban VIII, the new pope, who was much more favorably disposed toward intellectuals and their work than his predecessor had been. In 1624, Galileo visited Rome and had six audiences with the pope. In 1632, Galileo published his *Dialogue on the Two Great World Systems*. Having intended this book to be “a most ample confirmation” of the Copernican opinion, Galileo in effect had ignored the spirit of the instructions given him by the church in 1616. Nevertheless, during the trial that followed the publication of the *Dialogue*, Galileo maintained that he had obeyed the instructions to the letter.

Galileo’s trial in 1633 marked the beginning of what has since become a cliché—namely, the idea that science and religion must inevitably be in conflict. Also, Galileo is often seen as science’s first martyr in the perennial battle between the church and the spirit of free inquiry. There is no question that the church took a wrong position (contrary to its own tradition in such matters as established by Augustine and Thomas Aquinas); this much was acknowledged by a statement made by John Paul II in 1979, and it was underscored by the Vatican’s publication, in 1984, of all documents from its archives relating to Galileo’s trial. However, a considerable amount of blame for Galileo’s persecution must also fall on the philosophers. Indeed, the decree of sentence issued by the Holy Office was signed by only seven of the ten cardinal-judges.

Unlike innumerable martyrs who have accepted torture or even death for the sake of their convictions, Galileo chose, most unheroically, to abjure his beliefs. (The myth that he, on leaving the tribunal, stamped his foot and said, “Yet it [i.e., the earth] does move,” was invented by Giuseppe Baretta in 1757 and has no basis in fact.) Galileo’s sentence was then commuted; there was no formal imprisonment. He was allowed to move back to his country estate near Florence, where he resumed his writing. His *Discourses concerning Two New Sciences*, regarded by many as his greatest scientific contribution, was published in 1638.

SEE ALSO Bellarmino, Roberto; Copernicus, Nicolaus.

BIBLIOGRAPHY

The best scientific biography of Galileo, tracing the historical development of his thought, is Stillman Drake’s *Galileo at Work* (Chicago, 1978). A knowledgeable presentation of Galileo’s philosophy is Ludovico Geymonat’s *Galileo Galilei: A Biography and Inquiry into His Philosophy of Science* (New York, 1965). For Galileo’s theological views and accounts of his trial, the following three books are indispensable: Giorgio de Santillana’s *The Crime of Galileo* (New York, 1955), Jerome J. Langford’s *Galileo, Science and the Church* (Ann

Arbor, Mich., 1971), and Stillman Drake's *Galileo* (New York, 1980). The play by Bertolt Brecht, *Galileo* (New York, 1966), is tendentious and historically unreliable. Galileo's own views and remarks concerning the relationship between science and religion are scattered throughout his many letters and other writings. Among these the most important are his *Letter to the Grand Duchess Christina* (1615) and *The Assayer* (1623); both of these have been translated by Stillman Drake and are published in his *Discoveries and Opinions of Galileo* (Garden City, N.Y., 1957). The latest, and perhaps the final, effort made by the Roman Catholic church to repair its wrong decision in the case of Galileo is represented by the publication, by the Pontifical Academy of Sciences, of *I documenti del processo di Galileo Galilei* (Rome, 1984), which contains transcriptions of documents relating to Galileo's trial that had been held in the Vatican archives.

Revised Bibliography

GALLICANISM. The political dominance of the papacy during a period of the high Middle Ages was necessarily a temporary phenomenon. In central Europe the political fragmentation that followed Charlemagne's attempt at imperial restoration was not reversed by the efforts of successive German dynasties to establish hegemony and to extend their power beyond the Alps. But in western Europe, territories were consolidated that would ultimately become national states. Their growth in size and complexity, together with developments in secular education, favored the employment of laity rather than ecclesiastics in public office. As the opportunity to build larger state units increased, so did the state's determination to assert its power over agencies within its territory. On the international level this would limit the papacy's capacity to intervene in temporal conflicts; within states, it led to a tightening of lay control over the church's tangible assets.

These changes in the relations of power inevitably brought conflict. In England tensions between crown and church are visible in the twelfth century; in France the harangue of King Philip IV (the Fair) before the first meeting of the Estates General in 1302 is a dramatic statement of the rights of the crown over against the church. In the aftermath of the schism that split the papacy between popes and antipopes, Charles VI spoke of "the traditional liberties of the French church." The fifteenth- and sixteenth-century Spanish monarchy combined centralization with control of the

church, and the popes surrendered many ancient prerogatives. In some countries the process of realignment of power culminated in the total control of the church during the Protestant Reformation; in other countries it could promote or retard Catholic reformation. In Roman Catholic countries the doctrine of the state's ascendancy over the church received a variety of names: Gallicanism in France, Febronianism in the German states, cameralism or Josephism in the Habsburg lands, and regalism in Mediterranean countries.

Generically, this swing back to lay dominance in public affairs was a corollary of the growth of modern state power. An early formulation in a decree of the French king Charles VII—the Pragmatic Sanction of Bourges, 1438—contains the major elements that subsequently would be emphasized first, the supremacy of the king over the pope in the temporal affairs of the French church, with a rejection of the pope's right to intervene in these matters; second, the supremacy of regularly convened general councils over the papacy; and third, the cooperation of the crown and the episcopacy in settling French ecclesiastical issues.

Because the boundary between temporal and spiritual is never unambiguous, and because various interest groups interpreted these "Gallican liberties" to meet their specific needs, it is proper to distinguish several Gallicanisms. Royal Gallicanism sought the extension of state power over ecclesiastical appointments and properties, generally through negotiation. Academic Gallicanism usually enlisted a majority of Sorbonne doctors, who strongly defended the independence of the church and the dignity of the papacy but saw the need for some limitations to papal power. The episcopal Gallicanism of the bishops insisted on the control of their dioceses while accepting the crown's full temporal sovereignty in church affairs and the pope's full sovereignty in spiritual matters. Finally, the parliamentary Gallicanism of the superior courts claimed that the Pragmatic Sanction represented the constitution of the French church and that they were its guardians and interpreters; hence no papal document or agent could enter France without prior approval of the Parliament of Paris, which could also declare its jurisdiction over all church issues (*appel comme d'abus*).

The classic statement of Gallicanism appeared in a conflict between King Louis XIV and Pope Innocent XI involving royal financial control over vacant dioceses. The assembly of the French clergy in 1682 sought to reestablish peace by clearly defining the respective powers of pope, king, and bishops. The Four Gallican Articles, drawn up by the very orthodox bishop Jacques-Bénigne Bossuet of Meaux, were intended to be conciliatory. In substance they declared that (1) kings are not subject to any ecclesiastical power in temporal matters; (2) the reservations of the Council of Constance (1414–1418) on the spiritual supremacy of the pope still apply; (3) the pope is obliged to heed the customs and canons of the Gallican church in the exercise of his functions; and (4) the pope is supreme in matters of faith, but his decisions are not final unless they are confirmed by the judgment

of the episcopacy. Although the popes ignored these decrees, Gallicanism retained considerable influence in eighteenth-century France and was generally taught in the seminaries. The Civil Constitution of the Clergy (1790), so decisive in fixing the religious pattern of the French Revolution, had a strong Gallican flavor, as did the seventy-seven Organic Articles unilaterally appended to the Concordat of 1801 by Napoleon.

The clearest example of parliamentary Gallicanism was its use by the Jesuits' Jansenist enemies, who employed it skillfully in securing the suppression of the Society of Jesus in France in 1764. Although many factors contributed to this condemnation, it could not have happened without the strong Gallican—and hence anti-Jesuit—orientation of the judicial bodies.

Gallicanism reached the flood tide of its political influence in the Revolutionary and Napoleonic eras; thereafter its strength ebbed. The sufferings and occasionally the heroism of the popes during this prolonged crisis evoked wide sympathy, not exclusively among the Roman Catholic populations. The disappearance or weakening of the Old Regime monarchs, who had been friendly to Catholicism while striving to control it, created a new political atmosphere in which isolated or persecuted Catholics turned to the papacy for protection. Improvements in communications and other features of modernization assisted. Nearly everywhere in the nineteenth century, ultramontanism, the antithesis of Gallicanism, triumphed. It is ironic that during the century when European nationalism reached its culmination, official Catholicism moved toward greater accent on its international features. Although the early stages of the modern national state system favored the development of Gallicanism, the maturation of the national state saw its virtual disappearance.

GAMALIEL THE ELDER SEE GAMLIEL THE ELDER

GAMBLING. The religious significance of gambling is, in effect, twofold. Many religious traditions, especially the great religions, in their works of legislation and codification, promote as their orthodox norm a prohibition against, or at least discouragement of, gambling. On the other hand, in many cultures gambling takes on religious significance in connection with myths and rituals.

This twofold simplification, however, addresses gambling only insofar as it takes on overt religious significance. No discussion of gambling would be complete, however, without acknowledging its covert religious significance, particularly in cultures that prohibit it or, having adopted a secularized attitude, look upon it as something nonreligious or merely "cultural." Although beyond the main focus of this essay, it is evident that much of what goes on in the name of secular, cultural, or even legalized gambling is both enhanced by the flaunting or circumvention of traditional prohibitions and heightened by ritualized procedures too numerous to mention, by special "sacred" and "liminal" times (the American Superbowl) and places (casinos in remote or international spots), and by a cast of mythological characters and aspirations (the cool, passionate, roving, or desperate gambler; the jackpot winner).

In definitional terms, religious gambling is not easily separated from games and divination. Because gambling cannot be discussed without reference to games, this article shall deal with games only where they are the focus of wages and stakes. As for divination, the use in certain cases of similar implements (lots, bones, dice) and the occurrence of similar attitudes to unseen forces are not sufficient to support the frequently aired view that gambling derives from divination (Tylor, 1871). One does not, in fact, need implements or games at all to gamble. This article shall, however, refer to the drawing of lots and other forms of divination where their use is similar or related to that of gambling practices.

GAMBLING IN TRADITIONAL CULTURES. Unless one adopts a diffusionist perspective and attempts to derive all forms of

gambling from ancient Near Eastern or other Asian prototypes, the prevalence of gambling rites and myths in archaic cultures strongly suggests that the origins of religious gambling are irretrievable. Archaeologists have suggested that the painted pebbles found in the Mas d'Azil caves in the Pyrenees, from the Mesolithic period, are gambling implements. The earliest known dice and board game is that found in the Sumerian royal tombs at Ur, from about 2600 BCE. Gambling can only be assumed here, as with Indus Valley dice from about 2000 BCE and Egyptian (1990–1780 BCE), Cretan (1800–1650 BCE), and Palestinian (c. sixteenth century BCE) finds, some of which resemble cribbage boards. Evidence of ball games and gaming boards from Mesoamerican cultures, of types that continue to be played in that area today, is also traceable to about 1500 BCE. And *Rgveda* 10.34 provides the first gambler's lament in its "Hymn to Gambling" (c. 1200 BCE). The games of ancient cultures appear not only to be similar to those found in recent and contemporary field contexts but to have had in some cases—such as the Mesoamerican—remarkable continuity from past to present. As the religious significance of gambling is clearly more in a state of living "expression" than belated "application" (Jensen, 1963, pp. 59–64) in contemporary tribal cultures, such cultures present the best evidence for understanding the religious dimensions of gambling in general.

Unfortunately, ethnographic discussion of "sacred" gambling is uneven. There is sufficient documentation to be confident that it is found on all continents and probably among most, if not all, tribal communities. Many games and implements have been described and collected from around the world, but few studies have examined the cultural and religious significance of gambling at the field level in any detailed way. The only thorough field research on gambling seems to be Geertz's study of the Balinese cockfight, and in that situation its rather covert religious significance is tied in with the Balinese version of popular Hinduism (Geertz, 1973). Nonetheless, Geertz's findings and insights are illuminating with respect to a wider view of religious gambling.

Generally, one finds two models for understanding the archaic religious significance of gambling: Geertz's notion of "deep play," a consuming passionate involvement drawing on deeply ingrained cultural codes and strategies, and the pervasively cited notion that gambling games draw on "cosmic symbolism," or have "cosmic significance." Because Geertz mentions calendrical and cosmological ideas that bear upon the choice and placement of cocks (p. 427), it is evident that the two approaches are not antithetical. In fact, the "cosmic significance" clearly lends itself to the "deepening" of the play.

The cosmological significance of gambling games was maintained by Culin, author of several monumental works on games. In his book on North American Indian games, he summarizes the common pattern of references to gambling games in the origin myths of numerous tribes:

They usually consist of a series of contests in which the demiurge, the first man, the culture hero, overcomes some opponent, a foe of the human race, by exercise of superior cunning, skill, or magic. Comparison of these myths . . . discloses the primal gamblers as those curious children, the divine Twins, the miraculous offspring of the Sun. . . . They live in the east and the west; they rule night and day, winter and summer. They are the morning and evening stars. Their virgin mother, who appears also as their sister and wife, is constantly spoken of as their grandmother, and is the Moon, or the Earth, the Spider Woman, the embodiment of the feminine principle in nature. Always contending, they are the original patrons of play, and their games are now played by men. (Culin, 1907, p. 32)

In Culin's Zuni example, the emblems of the Twin War Gods, their weapons, are classified fourfold in accord with the four directions and are interchangeable with their gaming implements. Thus, for example, stick dice are arrows, shafts, or miniature bows (*ibid.*, p. 33). A correlation between dice and weapons is also made in the Hindu *Mahābhārata* epic.

It is not, in fact, difficult to advance the principle that every game, ancient or modern, creates a miniature cosmos, its arena, rules, apparatus, and players comprising a unique spatiotemporal world that reflects and symbolizes aspects of known and accepted cosmological structures. This is as true of Monopoly, football, or cricket as it is of more traditional games such as snakes and ladders, which in its Indian context symbolized a difficult ascent to heaven (Grunfeld, 1975, pp. 131–133). There are many examples from American Indian cultures of counting boards, playing boards, and ball-game courts having "gateways" or quadrants that correspond to the four directions; to the alternating seasons; to the equinoctial points; to tribal divisions such as men versus women, married women versus single women, old men versus young men; and to moiety divisions identified with heaven and earth, changes in the seasons, or other cosmological referents (Culin, 1907, pp. 34–208 *passim*). In his careful study of the Mesoamerican ball game, Humphrey (1979) thus allows that "there seems to be no question" that it "was based on a kind of cosmic symbolism." He suggests that the movement of the ball represented the course of heavenly bodies through dualistically conceived upper and lower worlds, the two sides thus enacting the struggle between light and darkness, summer and winter, life and death. The ancient Chinese game of pitchpot (see Yang, 1969, pp. 138–165) may rely on cosmological notions of the pot (or, sometimes, the gourd) as a container of the world and symbol of primal chaos. Also striking in this connection is the ancient Aztec board game of *patolli*, which has evident formal similarities with the South Asian game of *pachisi*. Arguments over whether the similarities are due to diffusion or independent use of similar cosmological structures have remained unresolved since the late nineteenth century. In any case, Beck (1982, pp. 199–205) has argued cogently for the cosmological significance of *pachisi*. The pieces move around the four-armed board, representing the world quarters, in a way that follows the reverse (counter-

clockwise) movement of the sun through the houses of the zodiac. The four-sided dice are identified with the four Indian ages (*yugas*). The goal of returning to the center thus suggests a triumph over spatiotemporal conditions.

Geertz's discussion of the Balinese cockfight draws its concept of deep play from Jeremy Bentham (1748–1832), the English economist and philosopher, who uses the term to refer to situations in which stakes are so high that participation is irrational. At the cockfight, two kinds of bets are made: even-money center bets between the two cock owners and their allied supporters, and side bets on odds made among the assembled crowd. As a rule, the larger the center bets, the more even are the odds reached in the crowd. Interest and "depth" are thus enhanced by making the outcome appear as unpredictable as possible. But the size of the center bet also "deepens" the stakes for the cock owners. For the stakes here are not just material, but are matters of honor, esteem, status, and, also, delight in bringing oblique affront to the opponent. Except for addicted gamblers, who are drawn—usually to their ruin—to the small center bet and long odds matches, real status remains largely unaffected, because victories and losses tend to balance out. But the deep play at status reversals and reclamations of status is real enough in its psychological and social impact. Only men play, while on the periphery of the cockfight, roulette and other gambling games of sheer chance are operated by concessionaires for women, children, the poor, and others who find themselves excluded.

"Deep-play" cockfighting is thus for "the solid citizenry" and resembles an "*affaire d'honneur*" (Geertz, 1973, pp. 435–436). Moreover, it pits not merely individuals against each other, but corporate groups—most notably, whole villages and patriarchal descent groups. Support money for the central bet comes from other members of the group, and even side-betting against the cock of one's group is considered disloyal. The cock owners thus have not only their own status at stake, but their status within their respective groups and that of the groups themselves.

All of this is displayed "in a medium of feathers, blood, crowds, and money" (*ibid.*, p. 444) that arouses the deepest passions but is rounded off with furtive payments that affirm a cultivated embarrassment at such personal identification with the world of demonic and animal violence. For the cockfight is also, fundamentally, an encounter with the demonic: "a blood sacrifice offered, with the appropriate chants and oblations, to the demons in order to pacify their ravenous, cannibal hunger" (*ibid.*, p. 420). The fights are regularly performed in connection with temple festivals and as collective responses to such natural evils as illness, crop failure, and volcanic eruptions.

A correlation between status—in the largest sense—and deep-play gambling can certainly be found. The importance of status is reflected in the fact that gambling is frequently the province of kings, heroes, and aristocrats: the models of what comes down to the present as the genteel bettor. Hum-

phrey (1979, pp. 141–146) has applied Geertz's categories to the aristocratic patronage of the Mesoamerican ball game. But still better confirmation for such an analysis comes from descriptions of the North American Huron Indian dice games collected by Culin (1907, pp. 105–110). Sacrificial offerings of tobacco to the spirits of the game precede the action. Sometimes whole townships and even tribes contend. In one eight-day game between townships, every inhabitant of each party threw the dice at least once. Players with lucky dreams were sought out for the casting:

At this game they hazard all they possess, and many do not leave off till they are almost stripped quite naked and till they have lost all they have in their cabins. Some have been known to stake their liberty for a time. . . . The players appear like people possessed, and the spectators are not more calm. They all make a thousand contortions, talk to the bones [i. e., throw the dice], load the spirits of the adverse party with imprecations. . . . They quarrel and fight, which never happens among [them] but on these occasions and in drunkenness. (*ibid.*, pp. 105–106)

Women and girls play the same game, but only separately and under inferior conditions: with different numbers of dice, and throwing by hand on a blanket rather than with a dice box or basket as the men do (*ibid.*, p. 107).

Gambling on one's freedom is an ultimate status wager and is a type of bet instanced in many cultures. Another suggestive feature of deep play that emerges here is the significance of "stripping," for being willing to gamble all one possesses may both literally and figuratively involve such an outcome. Loss of status is thus potentially far more than just loss of face. As Geertz remarks, there is both a literal and a metaphoric significance—sustained by the Balinese language as in the English—to the Balinese cockfighter's identification with his cock (Geertz, 1973, pp. 417–418). I shall note important recurrences of this gambling-stripping correlation, which has a wide range of effects, from deep humiliation to eroticism. Obviously, strip poker is a "secular" example of the latter orientation.

Ritualized gambling thus seems to rely on both its cosmological significance and its character as deep play. The forces of chance draw the contestants into deep involvement in a context that allows for both the regulated breakdown and the creative redefinition of the structural roles by which society and cosmos operate—a context that the games reflect. The games thus have the character of liminal passage rites, or ordeals (Humphrey, 1979, p. 144), as well as of reiterations of the cosmogony, the reestablishment of cosmos out of chaos. Such initiatory and cosmogonic overtones have been detected in the dice match that concluded the ancient Indian sacrifice of royal consecration, or *rajasuya*. In playing dice on even terms with members of different castes, the king overcomes the forces of chance, chaos, and confusion by his triumph (Heesterman, 1957, pp. 140–157). As is often the case in ritual gambling, the game is rigged to assure the desired outcome. But the important point is that the partici-

pants submit to the principles of the game. Similar initiatory and cosmogonic overtones are found in contexts where gambling is performed for the sick, over the dead, or at turning points in the seasons (for examples, see Culin, 1907, pp. 108–115; Hartland, 1924–1927, pp. 168–169; Jensen, 1963, p. 60).

PROHIBITIONS ON GAMBLING. The principles by which different religions have denounced or prohibited gambling are revealing on two fronts. First, they reflect the axiomatic theological and cultural values operative in the respective traditions. Second, they often provide theologically and culturally attuned indications of what it is that is so appealing about what they seek to oppose. Not surprisingly, cosmological significance and deep-play involvement are among the condemned attractions.

In *Isaiah* 65:11–12, gambling is thus one of the ways by which Israel provokes the Lord: “[You] who set up a table for Fortune and fill cups of mixed wine for Destiny, I will destine you to the sword.” Gad (Fortune) and Meni (Destiny) were gods of fortune, possibly of Syrian or Phoenician origin. The polemic against gambling is thus made in the same terms as that against idolatry, which in turn is a polemic against involvement in false cosmologies ruled by false gods. The context also suggests that such gambling was, at least to the mind of the prophet, one of the alluring vices of acculturation besetting Israel. This attitude persists in Talmudic and rabbinic prohibitions against a variety of games, from the Greek Olympics to cards and chess, which Jews regarded themselves as having adopted from their neighbors. But it is particularly those games that involve gambling that are singled out for condemnation. The Mishnah declares twice that dice players and pigeon racers are disqualified from appearing as witnesses in a court of justice (*R. ha-Sh. 1.8; San. 3.3*), and the medieval Sefardic philosopher Mosheh ben Maimon (Maimonides, 1135/8–1204) extends the ban to include those who play chess for money (Commentary on *Sanhedrin 3.3*). This disqualification rests on the principle that gamblers are guilty of facilitating acts of robbery and are thus, in effect, criminals. Curiously, gamblers are similarly disqualified in Hindu law books, joined to thieves, assassins, and other dangerous characters for being “incompetent on account of their depravity” and persons in whom no truth can be found (*Narada Smṛti 1.159, 1.178; Bṛhaspati Dharmasāstra 7.30*).

The passage from *Isaiah* also introduces another strain of condemnation: Using the same Hebrew root in two words, Yahveh “destines” to the sword those who tempt “Destiny.” Such a scene is, in fact, played out in another passage from *Isaiah*, where the *rabshakeh* (field marshal) of the Assyrian king Sennacherib challenges Israel to a wager over horses, and to an additional (though implied) theological wager—expressed by boasts referring to Yahveh as a fallible god like those of the surrounding nations—that Yahveh cannot deliver Israel. The wager over the horses is ignored, but the arrogant theological presumption of the affront to the

Lord results in the salvation of Jerusalem and Sennacherib’s death by the sword (*Is. 36–37*).

If gambling was denounced in the Bible, however, the casting of lots was not. The throwing of lots with the Urim and Tummim (Yes and No), articles kept in the priest’s apron, was accepted as a means of discerning the divine will. Thus Saul was chosen by lot to be king (*1 Sm. 10:20–21*); rural priests were chosen by lot to serve in Jerusalem (*1 Chr. 24–25*); and Matthias was selected by lot to become Judas’s successor as the twelfth apostle (*Acts 1:26*). In these instances, the casting of lots cannot be called gambling. But it is also evident that Israel knew of the use of lots for gambling, though the references suggest that it was only other nations that so employed them. In *Joel 3:1–3*, Yahveh speaks of bringing judgment upon the nations for “having divided up my land” and “cast lots for my people.” And in *Psalms 22:16–18*, the psalmist, seeing himself dead, describes the “company of evildoers” who “divide my garments among them, and for my raiment cast lots.” It is this latter passage that is taken in *John 19:23–24* as a prophecy of the scene at Jesus’ crucifixion, where the Roman soldiers divide up the crucified Christ’s garments and gamble for his seamless tunic. Here the symbolism of stripping and gambling accentuates the deepest humiliation and suffering (see *Mk. 15:16–20, 25; Mt. 27:28–29, 36*).

Early Christian canon law condemned gambling in no uncertain terms. Two of the so-called Apostolic Canons (41, 42) prohibited both laity and clergy, under pain of excommunication, from engaging in games of chance. And at the Council of Elvira (306 CE), the seventy-ninth canon decreed a year’s banishment from communion for anyone guilty of gambling. But restrictions of later councils were directed toward the clergy, and only certain games (especially cards and dice) were forbidden (Slater, 1909, pp. 375–376). Such relaxing of restrictions on lay gambling has facilitated church sponsorship of bingo and lottery games in fund-raising efforts. The same is true in Orthodox churches.

Christian condemnations of gambling gather their fullest force in Puritan writings. According to the doctrine of predestination, because every action is foreordained, matters of so-called chance are in the hands of God alone. To invoke God in the name of fortune is to offend him “by making him the assistant in idle pleasures” (Knappen, 1939, p. 439). Similarly, man is but a steward of his goods, which ultimately belong to God. Thus he must not wager what is truly God’s (Paton, 1924, p. 166). Furthermore, losers at gambling tend to express themselves in curses.

A rather practical Islamic stance is expressed in the Qur’ān when Muḥammad discourages wine and a form of gambling with arrows in which the loser pays for a young camel that is slaughtered and given to the poor: “In both there is sin and profit to men; but the sin of both is greater than the profit of the same” (Palmer, 1880, p. 32).

The Hindu law books are full of cautionary remarks on gambling. As noted already, gamblers are judged incompe-

tent witnesses in matters of law. There are statements that gambling makes one impure, and that the wealth obtained by gambling is tainted. Most significant, however, is a passage from the *Laws of Manu* concerning the duties of kings: Of the royal vices, ten are born of pleasure and eight of anger, and all end in misery; of the ten that “spring from love of pleasure,” the most pernicious are drinking, dice, women, and hunting (7.45–50). This list of four vices recurs in the *Mahābhārata* (3.14.7) in the mouth of the divine Kṛṣṇa when he denounces the epic’s famous dice match. Kṛṣṇa adds that gambling is the worst “desire-born” vice of all. Thus one seems to have here a condemnation of gambling as deep play. This correlation between gambling and desire is at the very heart of the Indian meditation on gambling, for actions born of desire are binding to this world. Yet in Hindu terms it is also the things of desire—including the four just mentioned—that draw people to the divine. Thus, whereas Kṛṣṇa here warns of gambling’s dangers, when he reveals his “supernatural manifestations” in the *Bhagavadgītā* he claims to be identical with the game of dice itself: “I am the gambling of rogues” (10.36).

Buddhist tradition sustains the same critique of gambling without such accent on the ambiguity. In the sixteenth chapter of the *Parabhava Sutta*, the Buddha includes addiction to women, strong drink, and dice as one of eleven combinations of means whereby men are brought to loss. The text contrasts these eleven roads to ruin with the one path to victory: loving the *dhamma*, the Buddha’s teaching. Elsewhere, monks are warned that numerous games and spectacles—including combats between elephants, horses, buffalo, bulls, goats, rams, and cocks; various board games; chariot racing; and dicing—are addictive distractions and detrimental to virtue (*Tevijja Sutta*, *Majjhima Sīlam* 2–4).

GAMBLING GODS, DEMONS, AND HEROES. Yet even the gods—not to mention their demonic adversaries—are wont to gamble. Yahveh makes an implied wager with Satan that Job will remain blameless and upright when deprived of all he has (*Jb.* 1:6–12). In Christian traditions, the devil continues to gamble for the human soul, as in Stephen Vincent Benét’s story *The Devil and Daniel Webster* (1937). In Tibet, an annual ceremony was performed in which a priest representing a grand lama played dice with a man dressed as a demonic ghost king. With fixed dice, the priest won, chasing the demon away and confirming the truth of the teaching (Waddell, 1895, p. 512). In India, the two lowest of the four dice throws are demonic. Thus in the epic story of Nala and Damayantī, one demon (Dvāpara) enters the dice, and the other (Kali) “possesses” the hero, dooming him to lose all he has won (*Mahābhārata* 3.55–56). But the Hindu gods play anyway, and are even, as we have seen, identified with gambling. This is true not only of Kṛṣṇa but, more decisively, of Śiva, who is from very early times the lord of gamblers, and who plays dice in classical myths with his wife Parvati.

As noted, Indian dice are named after the four ages (*yugas*), which “roll” four by four a thousand times within

the larger time unit of the *kalpa*. The dice play of the divine couple thus represents the continuity of the universe and their absorption with and within it. This “deep play” is one expression of the theological concept of *līlā*, literally “divine play” or “divine sport.” The game’s disruption holds the implication of the end of the universe (the *mahāpralaya*), while its resumption holds the implication of the recreation (the cosmogony). But insofar as the game is associated with the rise and fall of the *yugas*, it is played ritually at liminal temporal junctures in which the continuity of the universe is imperiled. Śiva and Pārvatī thus provide the mythic model for those who play dice ritually at the festival of Dīvālī (Dīpāvalī), which marks a traditional new year. And it is at the mythic juncture of the Dvāparayuga and the Kaliyuga that the great dice match of the *Mahābhārata* occurs.

One of the most important themes that unites the dice play of Śiva and Pārvatī with the dice match of the *Mahābhārata* is that of stripping. The stakes for which Śiva and Pārvatī play are their clothes and ornaments. When Śiva loses his loincloth, he gets angry, goes off naked, or refuses to pay up. Pārvatī points out that he never wins, except by cheating (O’Flaherty, 1973, pp. 204, 223, 247). Thus it never comes to pass that both of them are reduced to nakedness, which would imply their merger as Śiva and Śakti, Puruṣa and Prakṛti, at the *mahāpralaya*. What is striking about the dice match in the *Mahābhārata* is that after the five Paṇḍava brothers have gambled away everything, even their freedom and their wife-in-common, Draupadī, the culminating act is the attempt by the winners (the Kauravas) to disrobe the heroine in front of her husbands and the whole assembly. As Draupadī is an incarnation of the Goddess, the miraculous intervention by Kṛṣṇa that prevents her stripping is a sign that the dissolution of the universe will not occur in untimely fashion during the intra-*yuga* period in which the story is set.

It is seen, then, that divine gambling involves persistent encounters with the demonic. Hindu materials carry this theme to great depths, accentuating a continuum between demonic possession and divine rapture. In South Indian *terukkūttu* (“street-drama”) folk plays that enact the epic story, the attempts by the Kaurava Duṣṣāsana to disrobe Draupadī result in his demonic possession, while Draupadī at the same time experiences the most sublime *bhakti* (“divine love”). On the divine-demonic turf of gambling, in fact, no hero can hope to win without recourse to the powers that hold the demonic in check. The hero is thus the one who is willing to take the risk, even against the seemingly highest odds. It is striking how many epics include episodes of gambling, and even more striking how frequently the “good” hero loses, awaiting final triumph or vindication elsewhere. This occurs not only in the *Mahābhārata* but in Indian folk epics as well. In the Tamil folk epic *The Elder Brother’s Story*, the twin brothers play six games of dice with Viṣṇu at intervals preceding dramatic turns of fortune, the last of which is their death (Beck, 1982, p. 143). In the Telugu epic

The Heroes of Palnādu, a cockfight wager divides irreparably the two camps of half brothers, and a game of tops and a dice match between another set of younger brothers in the heroic camp foreshadow the events that lead to their death. In recent years, actual cockfights have been outlawed at the festivals at which these stories are recited (Roghair, 1982, pp. 30 and 62–295 passim). In the Tibetan epic of Gesar of Ling, the hero repeatedly plays *mōs* (see Waddell, 1895, pp. 465–474), a game of divination using colored pebbles, before his adventures. Here the lots fall out in the divine hero's favor. In the Mwindo epic of the Nyanga people of the Congo Republic, the hero Mwindo plays *wiki*, a gambling game with seeds. Mwindo plays in the underworld against the supreme divinity of fire, first losing everything and then winning it back, in an effort to reclaim his antagonistic father from the underworld with a view toward their reconciliation.

Yet there is another dimension to the stance of the heroic gambler that figures, at least metaphorically, in all the great religions of faith: that of the person who may lose everything, or be stripped like Job or Draupadī, but will not gamble away salvation. In positive terms, this is the wager that God exists, the famous wager that Pascal set forth with such precision in his *Pensées* (1670):

But here there is an infinity of infinitely happy life to be won, one chance of winning against a finite number of chances of losing. That leaves no choice; wherever there is infinity, and where there are not infinite chances of losing against that of winning, there is no room for hesitation. You must give everything. And thus, since you are obliged to play, you must be renouncing reason if you hoard your life rather than risk it for an infinite gain, just as likely to occur as a loss amounting to nothing. (Kraillsheimer, 1966, p. 151)

Pascal is thus at pains to show that the central bet, as in the Balinese cockfight, is for even money.

ALF HILTEBEITEL (1987)
Revised Bibliography

GAMES are analytically distinguished from other forms of contest by being framed as "play" and from other forms of play by their competitive format and the institutional—public, systematic, and jural—character of their rules. The

American anthropologist Gregory Bateson (1972, pp. 177–193) has described the universal semantic process by which behaviors are framed as play. Conventionalized signals create a “metamessage” that instructs players not to take the behaviors they engage in as denoting what those behaviors would denote in other, nonplay, contexts. In this sense, game actions are “untrue.” A nip is not a bite, a bullfight is not a hunt, a checkmate is not a regicide, a soccer match is not a war, a wrestling bout or footrace is not a cosmogony or theogony, regardless of overt similarities in the words, objects, gestures, emotional states, or social categories of persons involved. The framing of contests as play makes them self-referential in several ways, shifting attributed motivation to intrinsic enjoyment and sociability, turning means into ends in themselves, and understanding extrinsic outcomes as “mere” contingencies.

Yet, paradoxically, as Bateson and many other theorists of play have noted, the prior and consensual assertion of untruth, in the sense of disconnection from standard meanings, makes assertions of truthful correspondences between the worlds of nonplay and play possible, likely, and even predominant over a discourse of “set-apartness.” Like other play forms, games are about boundaries and the boundaries between boundaries. Games create, in the phrases of the English psychoanalyst D. W. Winnicott (1971), a world of “transitional objects,” a realm of the “not-not-true.” Freedom from denotation makes rich freedom for connotation, for human individuals and groups to re-represent their lives to themselves in “experimental” ways. Alternative or virtual realities, including those asserted by religion, can thus be tested against what the phenomenologist Alfred Schutz termed “the paramount realities of everyday life.”

PLAY IN CULTURE: THE RELIGIOUS CHARACTER OF GAMES.

Contest and representation are basic aspects of play, argued the Dutch historian Johan Huizinga in his manifesto *Homo Ludens*, and they may “unite in such a way that the game ‘represents’ a contest or else becomes a contest for the best representation of something” (1955, p. 13). The materials of games are drawn from the sociocultural world and at the same time stand in figurative relations—metaphoric, analogical, symbolic—with it. “The more profound, double sense of ‘social game,’” said the German sociologist Georg Simmel, “is not only that the game is played in a society (as its external medium) but that, with its help, people actually ‘play’ ‘society,’” including the society of the gods (1950, p. 50). Particularly where enjoyment, competition, and gambling supply strong motivations to attend to the progress and outcome of games, this setting of the empirical world in juxtaposition with “another” world can lead to an interrogation of their relationship sufficient to involve ultimate epistemological questions and functional necessities of human existence. On this general ground, the appearance of game forms in the religious mythologies and cults of various peoples has been explained by writers and scholars, some of whom have gone on to find in the ludic process a mode of transcendence and,

therefore, an essential aspect of the religious imagination itself.

Among Western humanists, Huizinga has perhaps been the boldest in this regard. In *Homo Ludens*, he argued for “the identity of play and ritual” and even claimed, on the authority of Plato, that the sacred can be comprised in the category of play (pp. 18–19). “God alone is worthy of supreme seriousness,” so Huizinga translated Plato (*Laws* 7.803), “but man is made God’s plaything, and that is the best part of him. . . . What then is the right way of living? Life must be lived as play, playing certain games, making sacrifices, singing and dancing, and then a man will be able to propitiate the gods, and defend himself against his enemies, and win the contest.” Whether Plato really meant to identify “play and holiness” so thoroughly can be disputed. Moreover, as the final clause of Huizinga’s reading of Plato suggests, classicists have found reason to doubt that the “for-their-own-sake” character Huizinga believed crucial to “true play and games” was really present or developed in classical Greek ideology.

From the famous stadium games to the isomorphic agonistic ethos and format in other cultural domains, elements that together comprise what historians and sociologists from Jakob Burckhardt (1898–1902) to Alvin W. Gouldner (1965) have styled the “Greek contest system,” functional requirements, inextricably civic and religious, do not appear to have been culturally “bracketed off” as contingencies in the classical world, as they have been in that stream of European thought that Huizinga so well represented. In Greek mythology and theology, in notable contrast to Christianity, the gods themselves played games, chartered the games of human beings, and intervened in them as “co-players.” In athletic games—as the poetry of Pindar makes evocatively plain—individual fate, the polity, and the divine world found a preferential idiom of communication in archaic and classical Greek culture, such that an *axis mundi*, in the sense discussed by Mircea Eliade, could be created in the person of the victorious athlete.

The Olympic games, the Delphic oracle, and Homeric poetry emerged together in the eighth century BCE as pan-Hellenic institutions, just as the segmentary and rivalrous city-state was arising as the dominant form of social organization within the Greek world. Relations among these key institutions are apparent in the traditions of the ancient Olympic games. Homeric theology and hero cults came to inform the charter myths of the games at Olympia, and a famous oracle at Delphi (where crown games were also celebrated) “renewed” the sanction from Zeus, to whose worship the Olympic festival was devoted. The great games gave rise to practices seeking to distinguish Greek from non-Greek (*barbaroi* were not to compete at Olympia) and to mediate between Greek mythic and human time. Though its significance is much debated, the reckoning of dates according to the formula “in the second year of the Olympiad in which so-and-so won the *stade*” provided Greece with her main cal-

endar of historical time beyond city-state and regional limitations.

One mythic tradition ascribes the foundation of the Olympic games to Idean Herakles, another to Pelops's victory over King Oenomaus in a chariot race for the latter's daughter Hippodamia ("horse woman"). Here, as in the related story of Atalanta in the Greek corpus and in other Indo-European contexts, comparative mythologists such as James G. Frazer, Georges Dumézil, Eliade, and Bernard Jeu have recognized a repeated pattern associating sacred marriage (*hieros gamos*), an implicit theogony (often of newer gods over older ones), the acquisition of transforming technology (fire, the horse, metallurgy, the chariot), the domestication of invader kings ("Dorians" in the Greek case), and the athletic race that embodies, mediates, and "resolves" these generative contests between vigorous and dying god-kings, male and female, earth and heaven, nature and culture, cosmos and history.

Games transform ambiguous, perturbed, or disputed potentials and conditions into certain outcomes, and this is one reason for their widespread association, in myth or in practice, with such ritualized natural and social transitions as seasonal cycles, birth, initiation, marriage, funerals, and warfare. Furthermore, games necessarily incorporate a dialectic between hierarchy and equality, two central organizing principles of human social arrangements and cognitive functioning. From an (at least asserted or presumed) equality before the rules of the game results a ranked hierarchy of outcomes. Societies and theologies differ in the relative valuation placed on hierarchy and equality in human and divine affairs and, thus, differentially emphasize one or the other pole in games. Yet for all known social types, games appear, in the expression of the French anthropologist Claude Lévi-Strauss, to be "good to think with" and, as the present-day Olympic games forcefully illustrate, may permit highly diverse and rivalrous social formations to compete cooperatively. If games have been seen as "the moral equivalent of war," it is because warfare and other means of political and ideological domination, including religion, have their moral dimensions.

Ingomar Weiler (1981) finds the "contest system" not limited to Greece but widespread in the ancient Mediterranean world, and scholars like Huizinga emphasize parallels to the Greek and Roman materials in non-Western warrior-states. In the Hindu *Mahābhārata*, the world is conceived as a game of dice between Śiva and his queen (8.2368, 8.2381), and a dice match for the kingdom sets off the conflict between the Kauravas and the Pāṇḍavas that organizes the epic. "I am the dicing of tricksters," says Kṛṣṇa in the *Bhagavadgītā* (10.36), and forms of *līlā*, or sacred play, are widely associated with this god and his worship. According to Marcel Granet (1930), the Chinese cosmic duality of *yin* and *yang* replayed important social dualisms; festal, magical competitions of many sorts were both the central agencies for regenerating life in the early "tribal" period and a means by which the later transformation to state institutions was ac-

complished. The Spanish philosopher Ortega y Gasset likewise argued for the "sportive origin of the state" out of primitive institutions of ritual contest involving both cosmological and social sanctions.

The ethnology of nonliterate "primitive" societies provided further rich material for such humanistic speculations. In his elaborate compendium *Games of the North American Indians*, Stewart Culin observed the common occurrence of game motifs in the origin myths of a wide variety of linguistically and culturally unrelated tribes. The complementarity in rivalry of the "divine twins"—associated with oppositions between night and day, winter and summer, east and west, morning and evening stars, consanguinal and affinal kin—or of a demiurgic First Man or First Woman with monsters, nature, or each other is a widespread motif. In folklore, culture-creating heroes—Coyote, Raven, or Spider—are frequently trickster beings whose fondness for games, as with other supernaturals, is both a source of their power and a means by which they can be manipulated for human moral or material purposes. As to adult human games, which he divided into those of "chance" and those of "dexterity," Culin concluded that "In general, [they] appear to be played ceremonially, as pleasing to the gods, with the object of securing fertility, causing rain, giving and prolonging life, expelling demons, or curing sickness" (Culin, 1975, p. 34).

THEORIES REGARDING THE "DESACRALIZATION" OF GAMES. This stress on the religious character of games in the cultures of exotic or prestigiously ancestral "others" was generated by and contributed to those broader evolutionist trends of European thought variously styled "rationalization," "modernization," and "secularization." Huizinga and other philosophers of history, while seeking to show the essential unity of humankind in play, nevertheless saw games as becoming progressively "secularized" through "universal cultural history." British classicists, most notably Jane E. Harrison, proposed the view that games—like such other forms of cultural expression as theater, dance, music, and poetry—had separated from an original religious ritual matrix in the primitive and ancient worlds. Where games were seen to retain magical or religious elements, such as peasant Shrovetide football matches in the "folk cultures" of early modern France and England or the grand *sumō* tournaments of Shintō Japan or the various martial arts competitions in monastic communities of the Near and Far East, these were interpreted as backward "survivals" of an archaic past in "fossil" social structures still partially attuned in cult to cosmological and agricultural rhythms. Such views fit well with the nineteenth-century development of Western social science, centered around a purported evolutionary passage—"of potentially universal significance," as Max Weber put it—from "traditional" to "modern" societies under the impact of the industrial revolution and modern science. From important means by which communities represented their ultimate concerns to themselves and engaged in imitative worship, games became associated, in such Western eyes, with the sphere of secular leisure, recreation, mass entertainment:

“mere games” of undoubted commercial or social value but of little sacred or spiritual significance.

While still very influential, the “modernization” point of view has been criticized as Eurocentric and imperialist. Moreover, social history has shown that in the West itself religion has not regularly and inevitably declined and that the cultural history of forms like games has not followed any simple unilinear pattern. As symbolized by the emperor Theodosius’s suppression of the Olympic games as a “pagan rite,” early Christianity did indeed oppose itself to Greek (and certainly Roman) traditions of public games, save in the appropriation of athletics as an ascetic metaphor by canonical writers like the apostle Paul. A centuries-long tradition culminating in continental and English “puritanism” did seek to suppress games, gambling, and other forms of folk amusement as “works of the devil” that turned the Christian away from sober religious duty, the social predominance of the churches, and disciplined labor. Through much of the twentieth century, religious leaders and sociologists alike have attributed declining church attendance, where it has occurred, in part to the increasing popularity of sports events and other kinds of mass recreation on the Sabbath.

Yet contrary trends are everywhere in evidence. In the Middle Ages, the church may have turned against the cult of the body in athletic games, but it attached itself to the medieval tournament. In the contemporary *palio* horse race of Siena, Italy, which dates back to the eleventh century, the cult of the Virgin Mary and priestly blessings of the rival *contrade* are central features of the ritual contest. In nineteenth-century England, devout Anglican schoolmasters and Christian socialists, like Thomas Hughes and Charles Kingsley, played the central role in elaborating the ideology of “muscular Christianity,” that combination of athletic games, virility, fair play, courage, and defense of the weak associated with a new *imitatio Christi*, on the one side, and with English colonialism, on the other. Many contemporary English soccer clubs are descended from church organizations, and missionaries in the British Empire sought not only to suppress the indigenous games of conquered peoples, particularly those with overt sexual and magical content, but to replace them with cricket, soccer, hockey, and running as “schools of Christian character.” Upon decolonization in “new nations”—as East African long-distance running, Trobriand and Caribbean cricket, and Indian field hockey indicate—these game forms have often been retained, but transformed to reaccommodate indigenous cultural values or to serve “civil” or “national” religion, whether in the form of an explicit cult of the state or a more diffuse “functional equivalent” of traditional religious institutions. In dialectical concert with enduring ludic forms bent to “nativist” purposes—West African wrestling, Native American running (see Nabokov, 1981), central Asian *buzkashi*, Japanese *sumō*, or the Balinese cockfight made famous by the anthropologist Clifford Geertz (1972)—such transformations of imposed forms illustrate the inadequacies of any unilinear or evolu-

tionary theory of world history and the place of games within it. Again in the Judeo-Christian context, home of such theories, present-day developments—from a skiing pope, decorated with the Olympic Order, to the incipient interlock between the directorates of the World Council of Churches and the International Olympic Committee, to the widespread activity of Christian athletes in domestic and foreign missionizing—further illustrate the labile relations between religion and games. Nor are such relations limited to practical and institutional exigencies. The recent “theology of play” movement in Christian religious circles (see Moltmann, 1972), with its rebellious attempt to reshape the image of the deity and its arguments that in the freedom and joy of games and festivity humans achieve a foretaste of the kingdom of heaven, suggests how the potentials for transcendence in play must ever draw religion into a dialogue with ludic form and experience. Even religions whose orthodox or mainstream versions may find less explicit place for play in their theophanies, cults, and ethics—Judaism, Christianity, and Islam, perhaps in contrast to Hinduism, Buddhism, and many tribal religions—must preoccupy themselves with what comparative religionist David L. Miller (1970, p. 14) calls “the game game,” that effort to discover, articulate, and conform to an “ultimate reality” that sets a limit to divine and human manipulation.

GAMES AND SOCIAL LIFE. Dissatisfaction with evolutionist or modernization perspectives has led to closer attention by theorists to the types and internal properties of games. The French sociologist of religion Roger Caillois suggested in *Man, Play, and Games* (1961) that games can be usefully placed along a continuum from *paidia* (relatively unstructured, spontaneous, labile forms typified by many children’s games) to those of *ludus* (more conventionalized, jural, and elaborated forms). All true games, however, minimally involve specification of a goal for action, delimitations of space and time, selection of some subset of possibilities in a total action field as relevant and permissible (the “moves” of the game), rules for the initial apportioning of resources and roles and their reapportioning in the course of play, and criteria for evaluating the outcomes (success or failure, winning or losing). By selectively emphasizing features of this core structure of games, a number of classification schemes have been generated to reveal dominant metaphysical assumptions and to model theoretically how individuals and groups “play society.”

Like most continental game theorists, Caillois focused on the experiential aspects of game types. Seeking not merely a sociology of games but a “sociology derived from games,” Caillois subsumed all games under four categories: *agon* (competition), *alea* (chance), *mimicry* (simulation), and *ilinx* (vertigo). This scheme is helpful in parsing the religious functions associated with types of games: cosmological, eschatological, moral contests; divination; imitative magic and ceremonial; altered states of consciousness. But it has generated little insight of a truly comparative nature. Actual games contain combinations of these aspects—all games are in

some sense competitive, for example—and all religions accommodate these functions. The insights of psychoanalysis, which sees in play and games the disguised representation of unconscious conflicts and a compulsion to repeat “primitive” traumas so as to master them, have been limited by inattention to cultural context and to the complexity and variety of game forms. Continental structuralism of the psychological sort associated with Piaget finds an important place for children’s games in characterizing mental development, and the anthropological sort associated with Lévi-Strauss (1966, pp. 30–33) has revealed much of the symbolic “logic of the concrete” that connects games to myth, ritual, and kinship. Yet in the search for universal structures of mind these theories also overlook social and historical context, and their contributions have been largely methodological.

British and North American social scientists, on the other hand, have largely focused on the strategic and role-playing aspects of games, exploring them from the functional standpoint of social integration, decision making, and value transmission. “Game theory” in the social and information sciences has produced taxonomies of rational calculation and strategic choice among individual actors seeking to maximize their payoffs in the face of uncertainty and limited resources. Critics, however, have found “game theory” to be a fundamental misnomer, since play, under its aspects of intrinsic motivation and Batesonian framing, is missing or unaccounted for in such understandings of social action. “Game theory” has contributed little to the analysis of specifically religious institutions.

Social psychologists have focused on the role playing and socialization features of games to construct fundamental questions about the organization of the self itself. George Herbert Mead pointed to the youngster’s ability to play a single position in a baseball game while articulating that role with all of the others on the field as a sign of and a means toward development of a “reflexive self,” incorporating the expectations of others in the context of the “generalized other” represented by the total game. Erving Goffman (1967, 1974) still further stressed the aspects of role-playing, mimicry, dissimulation, and the “rules for breaking the rules” in building an explicit theory from the now popular metaphorical utterance, “social life is a game.” The human self is seen by Goffman to be endlessly preoccupied with “the arts of impression management,” ludic yet ever-watchful to define situations so as to prevent embarrassment to oneself and others. Like formal “game theory,” social psychologies built from the model of games have contributed less to the understanding of social institutions per se, including religious ones, than they have to understanding individual and small-group processes of negotiation. At the same time, such theories do implicitly challenge authoritative ontologies and conventional understandings of divine affairs in Western cultures.

While games undoubtedly serve to reproduce or to rebel against dominant social structures and ideologies, they have

been seen by recent anthropologists as speculative enterprises as well, means by which human communities discover their dominant values in the first place and formulate alternatives to them. Victor Turner—who like Huizinga saw cultural life as a process of passage from institutional structure to ludic, “antistructural” recombination, to the incrustations of structure once again—extended analysis of religious ritual to understand play forms in this way (1974). Clifford Geertz (1972), who sees the interpretation of experiences as in and of itself a human necessity, argues that the Balinese cockfight is a form of “social metacommentary,” a “story the Balinese tell about themselves,” a function likewise ascribed to religious ritual. Other anthropologists (Don Handelman and I, for example) find it important to stress the differences between games and ritual as collective hermeneutics. On the Batesonian level of metacommunication, ritual does seem to be framed differently from play. Ritual asserts a priori that all statements within it are true and not untrue and creates a world of “let us believe” rather than of “let us make believe.”

Such distinctions make it possible to recognize complex performance types that incorporate both rite and game, like the *palio* or the Olympics, and depend for their power on moving actors and audiences back and forth from frame to frame. Then too, activities are reframed through the course of a people’s history. Alexander Lesser (1978) has shown how the Pawnee hand game passed from a form of amusement to a religious salvation ritual and back again between 1865 and 1930, a process reminiscent of athletics in nineteenth-century England. What is discovered as possible (or impossible) in play and given organized display in games may be asserted by ritual as undeniable. Whether this is the essential relation between games and religion we will not know until greater conceptual clarity and theoretical sophistication are brought to bear on the vast new findings in the ethnology and social history of games, such that a ludic equivalent to Max Weber’s comparative “economic ethics of the world religions” is achieved.

BIBLIOGRAPHY

The charter discussion of the Greek “agonistic” system is found in Jakob Burckhardt’s *Griechische Kulturgeschichte*, 4 vols. (Berlin, 1898–1902), translated by Palmer Hilty in abridged form as *History of Greek Culture* (New York, 1963). On the classical world, see also Alvin W. Gouldner’s *Enter Plato* (New York, 1965). In the soundest scholarly guide to athletic games in the ancient Mediterranean world, *Sport bei den Völkern der alten Welt* (Darmstadt, 1981), Ingomar Weiler argues against the uniqueness of Greece in this area, a position taken by Johan Huizinga as well. Huizinga’s *Homo Ludens* (Boston, 1955) remains the essential manifesto on the role of play in culture, including relationships between games and religion. Victor Turner extends his discussion of religious ritual to include the role of play in culture in “Liminal to Liminoid, in Play, Flow and Ritual,” *Rice University Studies* 60 (Summer 1974): 53–92.

Roger Caillois presents a taxonomy of games, intended both to refine Huizinga's insights and to organize cross-cultural material in more useful fashion, in *Man, Play, and Games* (New York, 1961). Among ethnological compendia on games in "primitive" societies, Stewart Culin's *Games of the North American Indians* (1907; Washington, D.C., 1975) has been the most widely cited. On running as practiced by Native Americans, see Peter Nabokov's *Indian Running* (Santa Barbara, Calif., 1981). Anthropological case studies of special value include Alexander Lesser's *The Pawnee Ghost Dance Hand Game* (Madison, Wis., 1978) and Clifford Geertz's "Deep Play: Notes on the Balinese Cock Fight," *Daedalus* 101 (1972): 1–38. On China, see Marcel Granet's *Chinese Civilization* (London, 1930).

David L. Miller's *Gods and Games* (New York, 1970) is indicative of the Christian "theology of play" movement and contains valuable discussions of the role of games in contemporary existential, linguistic, and mathematical philosophy. Also see Jürgen Moltmann's *Theology of Play* (New York, 1972).

Gregory Bateson's fundamental contribution to understanding play and games as forms of metacommunication is contained in "A Theory of Play and Fantasy," in his *Steps to an Ecology of Mind* (New York, 1972). Erving Goffman develops the view of social life as a game in several works, including *Interaction Ritual* (Garden City, N.Y., 1967) and *Frame Analysis* (New York, 1974). Also see Georg Simmel's discussion on social reality as play in *The Sociology of Georg Simmel*, translated and edited by Kurt H. Wolff (Glencoe, Ill., 1950). On the role of play in human development, see D. W. Winnicott's *Playing and Reality* (London, 1971). Claude Lévi-Strauss's discussion of the different logics of games and rituals is found in his *The Savage Mind* (Chicago, 1966). Don Handelman considers related problems in his "Play and Ritual: Complementary Forms of Metacommunication" in *It's a Funny Thing, Humour*, edited by A. J. Chapman and H. Foot (London, 1977), pp. 135–192. Complex performance forms joining games and rites are the subject of my "Olympic Games and the Theory of Spectacle in Modern Societies," in *Rite, Drama, Festival, Spectacle* (Philadelphia, 1984), pp. 241–280.

JOHN J. MACALOON (1987)

GAMLI'EL OF YAVNEH, also known as Gamli'el II, was a Palestinian tanna, rabbi, patriarch (*nasi*), and head of the academy at Yavneh in the late first and early second century. In contrast to contemporary authorities, who either bear no title or, more often, are referred to by the title *rabbi*, Gamli'el was accorded the apparently honorific title *rabban*, which he shares with other leaders of the patriarchal house (see *Avot* 1.16, 1.18). His traditions are recorded in the Mishnah and related texts.

Gamli'el bore major responsibility for the centralization of rabbinical authority at Yavneh following the war with the Romans in 66–70. Succeeding the apparent founder of that academy, Yoḥanan ben Zakk'ai, Gamli'el was in a position to guide the rabbinical effort in the reconstruction of a nation that had seen its spiritual center in the Jerusalem Tem-

ple destroyed, a nation that lacked clear leadership. To address this challenge, Gamli'el supported the religious ascendancy of the Yavneh academy and the political and religious authority of a Sanhedrin reconstituted under his leadership. He was later believed to have had a hereditary claim on the patriarchy.

It is reported that Gamli'el sometimes conducted this campaign in an undiplomatic manner, but he won the support of contemporary rabbinical authorities. To assure a centralized authority, he insisted on the power of his court to fix the calendar for all of Jewry, to ensure the consistency of observance. To similar ends he demanded that individuals bow to the decision of the collective rabbinate in disputes, an insistence that in one instance is believed to have led to the ban on Eli'ezer ben Hyrcanus (B.T., *B.M.* 59b) and in another caused Yehoshu'a ben Ḥananyah to transgress what by his reckoning was Yom Kippur (*R. ha-Sh.* 2.8–9). Nevertheless, he is described as declaring that this demand was not to assure his own honor, but to assure that "disputes not be multiplied in Israel" (B.T., *B.M.* 59b).

In response to the vacuum left in the wake of the Temple's destruction, tradition bears witness to Gamli'el's activity in establishing ritual and prayer norms. His academy formalized the eighteen-benediction prayer (Shemoneh 'Esreh) that has been employed in various forms to this day. Perhaps to facilitate its acceptance as the core of Jewish daily worship, he allowed formal representatives to recite the prayer for untutored individuals. In addition, Gamli'el contributed significantly to the formulation of a post-Temple Passover Seder.

Appropriately to the image of patriarch, Gamli'el is described as having had extensive exchanges with "philosophers" and others outside the Judaic tradition. Gamli'el's son Shim'on reports that "in my father's house five hundred [children] studied Greek wisdom . . . because they were close to the authorities" (B.T., *Sot.* 49b; Tosefta, *Sot.* 15.8). Sources relate that Roman authorities were sympathetic to Gamli'el and the Judaism that he taught, and that Gamli'el occasionally reciprocated their sympathy.

Gamli'el's status is enhanced by the stories of his extensive travels, including a trip to Rome. He is also described as wealthy and spoiled, and his relationship with his righteous slave, Tabi, is legendary.

Gamli'el was apparently a person of great piety and sensitivity. He was strict with himself, even when lenient with others, and he refused to excuse himself from his responsibilities to heaven for even one moment. To alleviate the immense burden put upon surviving relatives who had to see to the burial of their deceased, Gamli'el had himself buried in simple shrouds, a practice followed by Jews to this day.

Gamli'el's traditions are outstanding for the relatively high proportion that are set down in narrative form. This is probably connected to his patriarchal authority at a crucial period in history. He came to serve as a model for the rabbinic community. Also notable is the absence of significant con-

tributions to criminal statutes, reflecting perhaps the diminished authority of the early patriarchate in this area.

DAVID KRAEMER (1987)
Revised Bibliography

GAMLIEL THE ELDER (fl. first half of the first century CE), properly Rabban ("our teacher") Gamli'el the Elder; the first Jewish teacher with this title. Gamli'el was a son or grandson of Hillel and likewise was regarded in rabbinic tradition as a *nasi'* (head of the court). He is designated "the Elder" in Talmudic literature apparently to distinguish him from Gamli'el of Yavneh (Gamli'el II) with whom he is often confused, and he is referred to as a Pharisee and "teacher of the Law" in *Acts of the Apostles* (5:34).

Gamli'el appears frequently in tannaitic sources, where his various *taqqanot* (enactments) are recorded. The following examples from Mishnah *Gittin* (4.2–3) were considered "for the general welfare":

1. A man who wishes to invalidate a divorce document that he has already sent to his wife must convene a court in her town rather than elsewhere. Otherwise she may mistakenly believe the document is still valid and remarry.
2. Both parties to a divorce are required to use all of the names by which they are known when signing the document.
3. All witnesses to the delivery of the document must sign it.

These *taanot* were especially intended to benefit women. Similarly, Gamli'el permitted a woman to remarry based on

the testimony of one witness to the death of her husband, rather than the two generally required by Jewish law (*Yev.* 16.7). Of special interest are the letters that Gamli'el is reported to have dictated on the steps of the Temple (*Tosefta San.* 2.6 and parallels). Those sent to "our brethren" in the upper and lower south (Daroma) and in the upper and lower Galilee contained reminders pertaining to tithes. Another directed to "our brethren" in Babylonia and Media and to all other exiles of Israel announced the leap year. It was said (*Sot.* 9.15) that "when Rabban Gamli'el the Elder died, the glory of the Torah ceased and purity and abstinence perished."

In *Acts* (5:34ff.), Gamli'el (Gamaliel) pleads with fellow members of the Sanhedrin to free the apostles. Elsewhere in *Acts* (22:3), Paul states that he was brought up "at the feet of" Gamli'el from whom he gained knowledge of the "ancestral law." The tendency has been to view these traditions in the context of Luke's apologetic. The later, apocryphal Christian tradition transformed Gamli'el into a secret Christian (*Ps. Clement. Recogn.* 1:65–67) and into a martyr who died in the process of trying to defend and protect Stephen (*Discourse of Gregory, Priest of Antioch*). There is also an apocryphal, *Gospel of Gamaliel*, which relates events pertaining to Good Friday.

SEE ALSO Jewish Religious Year; Pharisees.

BIBLIOGRAPHY

The references to Rabban Gamli'el the Elder in Talmudic literature are collected and analyzed in volumes 1 (pp. 341–376) and 3 (pp. 272f., 314f.) of Jacob Neusner's *The Rabbinic Traditions about the Pharisees before 70*, 3 vols. (Leiden, 1971). Neusner questions Gamli'el's association with Beit Hillel and regards him as more of a "public official" and leader within the Pharisees than a "sectarian authority" of that party. A discussion of Gamli'el and some of the earlier assessments of him appears in Alexander Guttman's *Rabbinic Judaism in the Making: A Chapter in the History of the Halakhab from Ezra to Judah I* (Detroit, 1970), pp. 177–182. Information on Gamli'el in the Christian tradition can be found in volume 2 (pp. 367ff.) of Emil Schürer's *The History of the Jewish People in the Age of Jesus Christ, 175 B.C.–A.D. 135* (1901–1909), a new English version revised and edited by Géza Vermès, Fergus Millar, and Matthew Black (Edinburgh, 1979). Morton S. Enslin questions whether Paul actually "sat at Gamaliel's feet" and the extent of his rabbinic training, in "Paul and Gamaliel," *Journal of Religion* 7 (July 1927): 360–375. On Gamli'el and the apologetic of Luke, see Jeffrey A. Trumbower, "The Historical Jesus and the Speech of Gamaliel (*Acts* 5:35–39)," *New Testament Studies* 39.4 (1993): 500–517. For an in-depth discussion of the historical issues pertaining to Gamli'el and Paul, see Bruce Chilton's discussion in *The Anchor Bible Dictionary*, II (1992), 904–906.

STUART S. MILLER (1987 AND 2005)

GĀNAPATYAS are a sect of Hindus who regard Gaṇeśa (Ganapati) as their supreme object of devotion. They view

Gaṇeśa, the elephant-faced son of Śiva and Parvati, as the form of ultimate reality (*brahman*) that is accessible to the senses, the mind, and (through devotional practices) the heart. Most Hindus worship Gaṇeśa along with other deities because he is the god who overcomes obstacles and makes rites and other undertakings effective. Gāṇapatyas share this view but extend it to make Gaṇeśa their central deity, either as their family or clan patron-god (*kuladevatā*) or their personal lord (*iṣṭadevatā*). Devotion in the first case tends to be more formal and take place during specific ceremonies and festivals, while the second form of devotion is more likely to be personal, informal, and intense.

Although Gāṇapatyas may be found in many parts of India and from many castes, the sect has found its most articulated cultic expression in western India, in the Marathi-speaking region of Maharashtra, among high-caste Hindus. The sect rose to prominence in the region between the seventeenth and nineteenth centuries CE, during the rule of the Marathas. Gaṇeśa worship is also important in South India, where a number of temples are dedicated to him.

Gāṇapatya groups first appeared between the sixth and ninth centuries CE, and worshiped their deity in various forms according to the prevailing Brahmanic and Tantric practices. Two Sanskrit Purāṇas, the *Gaṇeśa* and the *Mudgala*, date from the twelfth and fourteenth centuries CE, respectively. These Purāṇas recount and celebrate the myths of Gaṇeśa's triumphs over demons on behalf of the gods and his devotees. They also include instructions for ritual performance and hymns of praise. Since the seventeenth century there has been a steady flow of devotional literature in both Sanskrit and Marathi.

In Maharashtra, devotion to Gaṇeśa has centered around eight shrines (*aṣṭavināyakas*) clustering around the city of Poona (Pune) and the nearby village of Cincvad, and associated with Gaṇeśa's most famous devotee, Morayā Gosāvī (d. 1651). For the past three centuries Cincvad has served as the administrative center for the sect in the region. The Gāṇapatya tradition enjoyed the patronage of Hindu, and at times Muslim, kings. The *brahman* Peshwas, the hereditary rulers of the Maratha empire after the death of its founder, Śivajī, contributed substantially to the construction of shrines and financing of rituals during the eighteenth and early nineteenth centuries. That patronage continued for a while under British rule, but gradually diminished and has been replaced by contributions from the faithful. As Gaṇeśa's popularity among the masses of Hindus has increased in contemporary times, the Gāṇapatya shrines have prospered.

The sect regards Morayā Gosāvī as its spiritual progenitor. Tradition holds that Morayā migrated from southern India to the Gaṇeśa shrine at Moragaon (70 kilometers southeast of Poona), where he experienced a series of visions of Gaṇeśa. In one vision Gaṇeśa told him that he would incarnate himself in his devotee and remain in his lineage for seven generations. Morayā Gosāvī's own religious charisma

and the tradition of living deities in the shrine at Cincvad contributed largely to its religious significance in the region. In 1651 Morayā Gosāvī underwent *jīvansamādhi*, or entombment while alive, in a chamber beneath the shrine, and thereby passed out of visible existence. Devotees believe he attained release (*mokṣa*) from rebirth and that his presence continues to endow the shrine with sacred significance. Several of Morayā Gosāvī's descendants are likewise enshrined at Cincvad. Devotees come there both to honor the image of Gaṇeśa and receive its auspicious sight (*darśana*), and to worship the shrines of Morayā Gosāvī and his descendants.

Twice each year the priests at Cincvad, along with thousands of devotees, take an image of Gaṇeśa from this shrine to the temple at Moragaon, where Morayā Gosāvī received his visions, about a hundred kilometers to the southeast. The second annual pilgrimage coincides with the intensely popular Gaṇeśa festival that is celebrated particularly in the towns and cities of Maharashtra in August and September.

Many Gāṇapatyas make periodic pilgrimages to receive the auspicious viewing of Gaṇeśa at his eight shrines. Devotees maintain that it is particularly salutary to visit all eight shrines in a single pilgrimage.

BIBLIOGRAPHY

The works by Gāṇapatyas remain almost entirely untranslated into Western languages. Part of the *Gaṇeśa Purāṇa* has been translated and edited by Kiyoshi Yoro in *Gaṇeśagītā: A Study, Translation with Notes, and a Condensed Rendering of the Commentary of Nilakaṇṭha* (The Hague, 1968). The most complete collection of Gāṇapatya literature and lore in Marathi is Amarendra L. Gadgil's *Śrī Gaṇeś Koś* (Poona, India, 1968). A survey of the Gāṇapatyas in the context of the myth and ritual traditions of Gaṇeśa can be found in my book *Gaṇeśa: Lord of Obstacles, Lord of Beginnings* (New York, 1985). Excellent discussions of the sect and its political significance appear in G. S. Ghurye's *Gods and Men* (Bombay, 1962) and in Laurence W. Preston's "Subregional Religious Centres in the History of Maharashtra: The Sites Sacred to Ganesh," in *Images of Maharashtra: A Regional Profile of India*, edited by N. K. Wagle (Toronto, 1980).

PAUL B. COURTRIGHT (1987)

GANDHI, MOHANDAS (1869–1948), political leader, social reformer, and religious visionary of modern India. Although Gandhi initially achieved public notice as a leader of India's nationalist movement and as a champion of nonviolent techniques for resolving conflicts, he was also a religious innovator who did much to encourage the growth of a reformed, liberal Hinduism in India. In the West, Gandhi is venerated by many who seek an intercultural and socially conscious religion and see him as the representative of a universal faith.

RELIGIOUS INFLUENCES ON GANDHI. Mohandas Karamchand Gandhi was born into a *bania* (merchant caste) family

in a religiously pluralistic area of western India—the Kathiawar Peninsula in the state of Gujarat. His parents were Vaiṣṇava Hindus who followed the Vallabhācārya tradition of loving devotion to Lord Kṛṣṇa. His father, Karamchand Uttamchand, the chief administrative officer of a princely state, was not a very religious man, but his mother, Putalibai, became a follower of the region’s popular Prānāmi cult. This group was founded in the eighteenth century by Mehraj Thakore, known as Prānañāth (“master of the life force”), and was influenced by Islam. Prānañāth rejected all images of God and, like the famous fifteenth-century Hindu saint Narsinh Mehta, who came from the same region, advocated a direct link with the divine, unmediated by priests and ritual. This Protestant form of Hinduism seems to have been accepted by Gandhi as normative throughout his life.

Other enduring religious influences from Gandhi’s childhood came from the Jains and Muslims who frequented the family household. Gandhi’s closest childhood friend, Mehtab, was a Muslim, and his spiritual mentor, Raychandbhai, was a Jain. Early contacts with Christian street evangelists in his home town of Porbandar, however, left Gandhi unimpressed.

When Gandhi went to London to study law at the age of nineteen he encountered forms of Christianity of quite a different sort. Respecting vows made to his mother, Gandhi sought meatless fare at a vegetarian restaurant, where his fellow diners were a motly mix of Theosophists, Fabian Socialists, and Christian visionaries who were followers of Tolstoi. These esoteric and socialist forms of Western spirituality made a deep impression on Gandhi and encouraged him to look for parallels in the Hindu tradition.

When, in 1893, Gandhi settled in South Africa as a lawyer (initially serving in a Muslim firm), he was impressed by a Trappist monastery he visited near Durban. He soon set up a series of ashrams (religious retreat centers) supported by Hermann Kallenbach, a South African architect of Jewish background, whom Gandhi had met through Theosophical circles. Gandhi named one of his communities Tolstoi Farm in honor of the Christian utopian with whom he had developed a lively correspondence. While in South Africa Gandhi first met C. F. Andrews, the Anglican missionary to India who had become an emissary of Indian nationalist leaders and who eventually became Gandhi’s lifelong friend and confidant. It was through Andrews that Gandhi met the Indian poet Rabindranath Tagore in 1915, after Gandhi had returned to India to join the growing nationalist movement. Tagore, following the practice of Theosophists in South Africa, designated Gandhi a mahatma, or “great soul.”

GANDHI’S RELIGIOUS THOUGHT. Although the influences on Gandhi’s religious thought are varied—from the Sermon on the Mount to the *Bhagavadgītā*—his ideas are surprisingly consistent. Gandhi considered them to be Hindu, and in fact, they are all firmly rooted in the Indian religious tradition. His main ideas include the following.

1. *Satya* (“truth”). Gandhi equated truth with God, imply-

ing that morality and spirituality are ultimately the same. This concept is the bedrock of Gandhi’s approach to conflict, *satyāgraha*, which requires a fighter to “hold firmly to truth.” While Gandhi did not further define the term, he regarded the rule of *ahimsā* as the litmus test that would determine where truth could be found.

2. *Ahimsa* (“nonviolence”). This ancient Indian concept prohibiting physical violence was broadened by Gandhi to include any form of coercion or denigration. For Gandhi, *ahimsa* was a moral stance involving love for and the affirmation of all life.
3. *Tapasya* (“renunciation”). Gandhi’s asceticism was, in Max Weber’s terms, “worldly” and not removed from social and political involvements. To Gandhi, *tapasya* meant not only the traditional requirements of simplicity and purity in personal habits but also the willingness of a fighter to shoulder the burden of suffering in a conflict.
4. *Swaraj* (“self-rule”). This term was often used during India’s struggle for independence to signify freedom from the British, but Gandhi used it more broadly to refer to an ideal of personal integrity. He regarded *swaraj* as a worthy goal for the moral strivings of individuals and nations alike, linking it to the notion of finding one’s inner self.

In addition to these concepts, Gandhi affirmed the traditional Hindu notions of *karman* and *dharma*. Even though Gandhi never systematized these ideas, when taken together they form a coherent theological position. Gandhi’s copious writings are almost entirely in the form of letters and short essays in the newspapers and journals he published. These writings and the accounts of Gandhi’s life show that he had very little interest in what is sometimes regarded as emblematic of Hinduism: its colorful anthropomorphic deities and its reliance upon the rituals performed by Brahmanic priests.

It is not his rejection of these elements of Hindu culture that makes Gandhi innovative, however, for they are also omitted by the leaders of many other sects and movements in modern India. What is distinctive about Gandhi’s Hinduism is his emphasis on social ethics as an integral part of the faith, a shift of emphasis that carries with it many conceptual changes as well. Gandhi’s innovations include the use of the concept of truth as a basis for moral and political action, the equation of nonviolence with the Christian notion of selfless love, the broadening of the concept of *karmayoga* to include social service and political action, the redefinition of untouchability and the elevation of untouchables’ tasks, and the hope for a more perfect world even in this present age of darkness (*kalīyuga*).

Gandhi’s religious practices, like his ideas, combined both social and spiritual elements. In addition to his daily prayers, consisting of a simple service of readings and silent contemplation, he regarded his daily practice of spinning cotton as a form of mediation and his campaigns for social

reform as sacrifices more efficacious than those made by priests at the altar. After Gandhi retired from politics in 1933, he took as his central theme the campaign for the uplift of untouchables, whom he called *harijans* ("people of God"). Other concerns included the protection of cows, moral education, and the reconciliation of Hindus and Muslims. The latter was especially important to Gandhi during the turmoil precipitated by India's independence, when the subcontinent was divided along religious lines. It was opposition to Gandhi's cries for religious tolerance that led to his assassination, on January 30, 1948, by a fanatical member of the Hindu right wing.

GANDHI'S LEGACY. Since Gandhi's death, neither Indian society nor Hindu belief has been restructured along Gandhian lines, but the Gandhian approach has been kept alive in India through the Sarvodaya movement, for which Vinoba Bhave has provided the spiritual leadership, and Jaya Prakash Narayan the political. Gandhi has provided the inspiration for religious and social activists in other parts of the world as well. These include Martin Luther King, Jr., and Joan Baez in the United States, E. M. Schumacher in England, Danilo Dolci in Sicily, Albert Luthuli in South Africa, Lanza del Vasto in France, and A. T. Ariyaratna in Sri Lanka.

Over the years, the image of Gandhi has loomed larger than life, and he is popularly portrayed as an international saint. This canonization of Gandhi began in the West with the writings of an American Unitarian pastor, John Haynes Holmes, who in 1921 proclaimed Gandhi "the greatest man in the world today." It continues in an unabated flow of homiletic writings and films, including David Attenborough's *Gandhi*, one of the most widely seen motion pictures in history. At the core of this Gandhian hagiography lies the enduring and appealing image of a man who was able to achieve a significant religious goal: the ability to live simultaneously a life of moral action and spiritual fulfillment. For that reason Gandhi continues to serve as an inspiration for a humane and socially engaged form of religion in India and throughout the world.

SEE ALSO Ahimsa; Bhave, Vinoba; King, Martin Luther, Jr.; Tagore, Rabindranath.

BIBLIOGRAPHY

Gandhi's own writings are assembled in his *Collected Works*, 89 vols. (Delhi, 1958–1983). Many briefer anthologies are available, however, including *The Gandhi Reader*, edited by Homer Jack (New York, 1961). A reliable biography is Judith Brown's *Gandhi: Prisoner of Hope* (New Haven, Conn., 1989). The religious ideas of Gandhi are best explored in Margaret Chatterjee's *Gandhi's Religious Thought* (Notre Dame, Ind., 1983) and Raghavan Iyer's *The Moral and Political Thought of Mahatma Gandhi* (New York, 1973). The concept of *satyāgraha* is explicated and put into comparative perspective in Joan Bondurant's *Conquest of Violence: The Gandhian Philosophy of Conflict*, rev. ed. (Berkeley, 1965), and my *Gandhi's Way: A Handbook of Conflict Resolution* (Berkeley, Calif., 2003). Gandhi's saintly politics are de-

scribed in Lloyd I. Rudolph and Susanne Hoeber Rudolph's *Gandhi: The Traditional Roots of Charisma* (Chicago, 1983), and his image as a universal saint is discussed in my essay "St. Gandhi," in *Saints and Virtues*, edited by John Stratton Hawley (Berkeley, 1986).

MARK JUERGENSMEYER (1987 AND 2005)

GAṆEŚA ("lord of the group") is the elephant-headed Hindu deity. Also called Vināyaka ("leader"), Gajānana ("elephant-faced"), Gaṇādhipa ("lord of the group"), Eka-danta ("one-tusked"), Lambodara ("potbellied"), Vighnarāja ("lord of obstacles"), and Siddhadāta ("giver of success"), he is the son of Śiva and Pārvatī, and leader of Śiva's group of attendants (*gaṇas*). His special province within the Hindu pantheon is to remove and create obstacles to various undertakings. His images are found both in temples dedicated exclusively to him and, more frequently, as doorway guardians of temples to other deities, especially Śiva and Pārvatī. Gaṇeśa enjoys widespread devotion from Hindus of various sectarian affiliations and ranks. Hindus who regard him as their principal deity of devotion are called Gaṇapatyas; they are located primarily in southern and western India.

Gaṇeśa's historical origins are obscure. Early Vedic literatures refer to a Gaṇapati ("lord of the group") and to Hastimukha ("elephant-faced"), and devotees regard these references as evidence for Gaṇeśa's Vedic roots. It is more likely that these epithets refer to Bṛhaspati, Indra, or Śiva. Numismatic evidence suggests that Gaṇeśa originated in the first century CE. Sculptural evidence places his entry into the Hindu pantheon about four centuries later. Literarily and iconographically, Gaṇeśa is well established in myth and cult by the fifth century within the general framework of Saivism, although he receives worship by Hindus of various devotional and sectarian orientations for his general role as the overcomer of obstacles.

Gaṇeśa's mythology centers on several themes: his birth, beheading and restoration, lordship over the *gaṇas*, associations with demons, and powers as creator and remover of obstacles. Stories in the Purāṇas and vernacular folklore traditions tell of occasions when Pārvatī created Gaṇeśa out of the substance, sometimes called *mala* ("dirt") or *lepa* ("rubbing"), rubbed off the surface of her body and formed into the shape of a handsome youth. Once, while Śiva was absent and deep in meditation, Pārvatī commanded this young man to guard her private quarters from all intruders. When Śiva returned and sought entry into Pārvatī's presence, the young man barred the door. During the battle that followed, Śiva beheaded the youth. Pārvatī became angry and demanded that Śiva restore him at once. Śiva sent out his group of attendants (*gaṇas*) to find the first available head, which happened to belong to an elephant. Śiva restored the youth with the elephant's head and gave him command over his group of *gaṇas*, thus naming him Gaṇapati or Gaṇeśa, Lord of the Group. Śiva also told all gods and

brahmans that Gaṇeśa must be worshiped first before all other undertakings, ritual or otherwise, or else their efforts would come to ruin.

Gaṇeśa is also called Vināyaka, meaning “leader.” The early Dharmasūtra literature, predating the above-mentioned myths of Gaṇeśa, describes rituals prescribed to ward off *vināyakas*, evil demons who possess their victims and cause them to act in strange and inauspicious ways. Gaṇeśa’s dwarfish torso resembles the iconography of these *vināyakas*. Some scholars have suggested that Gaṇeśa may originally have been a member of this class of demons but gradually achieved brahmanical recognition and gained admittance into its pantheon as the son of Śiva and Pārvatī.

In receiving the head of the elephant, Gaṇeśa also takes on some of the symbolism associated with elephants in Indian culture. Elephant motifs frequently are found at the bases of temples, appearing to hold up the massive edifices. Elephants guard the doors of temples and serve as the vehicles for deities and royalty. Gaṇeśa also serves in these protective capacities as the remover and placer of obstacles.

PAUL B. COURTRIGHT (1987)
Revised Bibliography

GANGES RIVER. The Ganges (Gaṅgā), considered the holiest of India’s rivers, is 1,560 miles long. Rising at Gangotri in the Himalayas, this great river flows through the North Indian plain and into the Bay of Bengal. To Hindus, the Ganges is the archetype of all sacred waters; she is a goddess, Mother Gaṅgā (Gaṅgā Mātā), representative of the life-giving maternal waters of the ancient Vedic hymns; above

all, she is the symbol *par excellence* of purity and the purifying power of the sacred. These affective and symbolic values of the Ganges hold true for all Hindus, irrespective of sectarian differences.

CELEBRATION OF THE GODDESS-RIVER. According to Hindu belief, the Ganges purifies all that she touches. Her entire course is a pilgrimage route for the faithful. Millions of Hindus visit the preeminent *tīrthas* (“crossings,” places of pilgrimage) that mark her path: the source at Gangotri; Hardwar (also called Gaṅgādvāra, “gateway of the Ganges”), where the river enters the plain; Prayāg (present-day Allahabad), where she joins both the holy Yamnūā (Jumna) and the mythical river Sarasvatī, thus earning the name Trivenī (“river of three currents”); Kāśī (Banaras), abode of the god Śiva and the holiest city of the Hindus; and Gaṅgāsagar, where the Ganges enters the sea. Pilgrims go to these places to bathe in the Ganges, to drink her water, to worship the river, and to chant her holy name. Especially in Banaras, many come to cremate their kin, to deposit the ashes of the dead in the river, or to perform religious rites for their ancestors. Some come to spend their last days on the banks of the river, to die there and thus “cross over” the ocean of birth and death. Holy men, widows, and others who have dedicated themselves to the contemplative life live in numbers in the sacred places along the Ganges. They in turn attract millions who congregate at periodic festivals and fairs, the greatest of which is the Kumbha Melā, celebrated every twelve years in Prayāg. All who come to the Ganges come in the firm belief that bathing in this river, even the mere sight of Mother Gaṅgā, will cleanse them of their sins, taking them a step nearer to final release (*mokṣa*). Those who cannot make the trip can partake of the river’s sacred water from the sealed jars that pilgrims carry home. Ganges water is given to participants and guests at weddings, as well as to the sick and the dying; it validates Hindu oaths; and in an ancient daily rite, every devout Hindu invokes the Ganges, along with the other sacred rivers, to be present in the water in which he bathes. The purifying powers of the Ganges are great indeed.

THE GANGES IN MYTHOLOGY AND ICONOGRAPHY. The Vedic Aryans celebrated the Indus, not the Ganges, and her tributaries as their “seven sacred rivers.” It is in the epics *Mahābhārata* and *Rāmāyaṇa* (roughly fourth century BCE), which reflect Aryan settlement in the Ganges Plain, that the Ganges takes her place at the head of seven holy rivers that are now geographically spread over all of India. The principal myths of the Ganges are found in the epics and the Purāṇas (mythological texts that include the lore of sacred places), and in Sanskrit hymns of praise such as the *Gāṅgālaharī* (The waves of the Ganges) by the seventeenth-century poet Jagannātha. The central myth of the Ganges is the story of her descent (*avatāra*, *avataraṇa*) from heaven to earth, a story narrated with variations in several texts (*Rāmāyaṇa*, “Bāla Kāṇḍa” 38–44; *Mahābhārata* 3.104–108; *Skanda Purāṇa*, “Kāśī Khaṇḍa” 30). In response to the great and steadfast penance of King Bhagīratha, the sky-river Ganges agreed to descend to earth in order to purify the ashes of the sixty thou-

sand sons of Bhagīratha's ancestor Sagara, who had been burned by the wrath of a sage (Kapila) whom they had offended. The great ascetic god Śiva caught the falling stream in his matted hair in order to soften the blow on earth; the Ganges followed Bhagīratha to the sea, whence she flowed into the netherworld to fulfill her mission. This myth explains several of the Ganges's names, including Bhāgīrathī ("she who descended at Bhagīratha's request") and Tripathagāminī ("she who flows through the three worlds"). The descent of the Ganges is the subject of a famous seventh-century rock sculpture at Mahabalipuram in South India.

In the Vaiṣṇava version of the descent myth, the Ganges is said to have descended when Viṣṇu, as Trivikrama who measured heaven and earth, pierced the vault of heaven with his upraised foot. The association of the river with both great gods of Hinduism points to the universality of the Ganges in Hinduism. In minor myths the river is portrayed as the mother of the *Mahābhārata* hero Bhīṣma and the mother of Skanda-Kārttikeya, who was born from Śiva's seed flung into the Ganges.

The Ganges' most sustained association is with the god Śiva himself. Not only does she flow through his hair, she is considered to be his wife, along with Pārvatī, the other daughter of the god of the Himalaya, Himavat. As powerful river and goddess-consort, the Ganges is *śakti*, the feminine energy of the universe, and the female aspect of the androgynous Śiva. Like Śiva and the ambrosial moon on his head, the Ganges—whose life-sustaining ambrosial waters flow from the realm of the moon—is connected with both life and death.

The themes of purification, life, and death that appear in the myths and rites associated with the Ganges are also expressed in her iconography, especially in the representation of the Gaṅgā and Yamnuā as goddesses carved on either side of the entrances of Hindu temples of the medieval period (roughly from the fifth to the eleventh century CE). Ancient symbols of fertility (trees, vegetation, overflowing pots, the female herself) appear in these images; yet the Ganges rides on a *makara* ("crocodile"), who represents the dangers of death as well as the abundance of life. As "goddess of the threshold" the Ganges no doubt initiates, purifies, and blesses with worldly prosperity the devotee who enters the sacred realm of the temple; at the same time, in the esoteric symbolism of Yoga and Tantra, the river-goddess is said to represent *idā*, one of the *nāḍīs* (subtle channels) through which one's energy is activated in order to achieve the supreme realization of the self—final release from worldly existence. However, in the last analysis, for the average Hindu it is not a matter of esoteric interpretation but of simple faith—reinforced by popular texts—that the goddess-river Ganges is the most accessible and powerful agent of salvation available to him or her in the *kaliyuga*, the present dark and degraded age of humankind.

BIBLIOGRAPHY

Diana L. Eck's essay entitled "Gaṅgā: The Goddess in Hindu Sacred Geography," in *The Divine Consort: Rādhā and the Goddesses of India*, edited by John Stratton Hawley and Donna M. Wulff (Berkeley, Calif., 1982), pp. 166–183, is the best introduction to the religious significance of the Ganges in Hinduism. The same author has a good discussion of the Ganges in the context of Kāśī, the holy city of the Hindus, in chapter 5 of *Banaras: City of Light* (New York, 1982). Spectacular visual images of the Ganges and the life along her banks, accompanied by a highly informative and readable introductory text, may be found in *Gaṅgā: Sacred River of India*, photographs by Raghubir Singh, introduction by Eric Newby (Hong Kong, 1974). Steven G. Darian's *The Ganges in Myth and History* (Honolulu, 1978) is a solid, well-written, well-illustrated historical study of the many dimensions of the Ganges. Finally, Heinrich von Stietencron's *Gaṅgā und Yamnuā: Zur symbolischen Bedeutung der Flussgöttinnen an indischen Tempeln* (Wiesbaden, 1972) is an excellent scholarly work on the symbolism of the iconography of the great river-goddesses in Hinduism.

INDIRA VISWANATHAN PETERSON (1987)

GANJIN (Chin., Jianzhen; 688–763) was a Buddhist Vinaya master from China who introduced procedures for ordaining Buddhist clergy into Japan and who established the Rishshu, or Vinaya school, of Buddhism there. Ganjin's birthplace was Yangzhou, a prosperous shipping town in eastern China. There he underwent tonsure at a local temple in 701. Four years later he received the *bodhisattva* precepts, a set of vows administered as a sign of devotion to Mahāyāna Buddhist principles.

At the age of nineteen, Ganjin traveled to China's traditional capitals of Luoyang and Chang'an to study at the major centers of Buddhist learning. His primary field of training was Vinaya, the ancient rules and procedures governing the life and behavior of Buddhist priests and nuns. Interest in the Vinaya had peaked in China a century earlier, and a formal school, the Lüzong, was established to preserve and promote clerical practices based on the *Sifenlü* (T.D. no. 1428), the version of the Vinaya inherited from the Dharmaguptaka school of India. This Vinaya, which lists 250 precepts for priests and 348 for nuns, was Hīnayāna in origin, but it became the basis for ordination and clerical discipline in the overwhelmingly Mahāyāna schools of China and Japan. Ganjin himself took the 250 precepts at the time of his full ordination in 708, a year after his arrival in Chang'an. In 713, at the age of twenty-five, he returned to Yangzhou and began his own career as a Vinaya master. Over the next thirty years Ganjin distinguished himself as one of the most eminent Buddhist teachers in central China. He is said to have ordained more than 40,000 priests during his career and to have conducted formal lectures on the Vinaya on 130 occasions.

In 733 the Japanese imperial court sent two Buddhist priests, Eiei and Fushō, to China to enlist Vinaya masters to

administer ordinations in Japan. There was great concern in Japan that all the ordinations performed up to that time were not valid, because the requisite number of duly ordained priests prescribed by the Vinaya had never been present to officiate. The Japanese felt it important to rectify this breach. Authentic ordination, they believed, made the clergy legitimate heirs of the Buddha's teachings and endowed them with religious and worldly power to act in behalf of Buddhism. Eiei and Fushō first succeeded in recruiting a young Vinaya master named Daoxuan from Luoyang. He arrived in Japan in 736, but was hampered in conducting ordinations for lack of the required number of ordained participants. In 742 they went to Yangzhou to seek Ganjin's assistance. He too was sympathetic, and he resolved to travel to Japan himself to oversee ordinations. But the path leading Ganjin to Japan was long and treacherous, involving five unsuccessful voyages thwarted by pirates, shipwreck, and arrest by civil authorities. During the course of these events Ganjin lost his eyesight and Eiei lost his life. Finally, in 753, on his sixth attempt, Ganjin reached the shores of Japan accompanied by twenty-four disciples whose participation would validate ordination ceremonies. Ganjin was sixty-five years old at the time.

In early 754 Ganjin and his entourage were welcomed into the Japanese capital of Nara with great fanfare. Within weeks he set up a temporary ordination platform at the Tōdaiji, the imperial temple in the capital, and performed the first proper ordination on Japanese soil. The following year he established a permanent ordination platform at the Tōdaiji, all according to the meticulous specifications of the Vinaya tradition in China. The establishment of specific locations for ordination had the effect of tightening control over the clergy, because entrance into the priesthood could be regulated by those overseeing ordination. This centralizing of authority, as well as the Vinaya's emphasis on strict discipline, suited the government's desire to harness Buddhism for its own interests. Ganjin, as the preeminent figure in this ordination process, was named to the Sōgō council, the ecclesiastical body responsible to the government for Buddhism's activities. He served in this capacity from 756 until his resignation in 758. A year later Ganjin was granted land on which to build his own temple. He constructed the Tōshōdaiji and spent the remaining four years of his life there instructing priests in the intricacies of the Vinaya. These followers formed the core of the Risshu in Japan. Ganjin died at the Tōshōdaiji in 763 at the age of seventy-five. His great contribution to Japan was the institution of ordination procedures and the delineation of clerical discipline. This model of discipline was later challenged by Saichō, who sought to substitute the *bodhisattva* vows of Mahāyāna for the clerical precepts of Hīnayāna. Nonetheless, Ganjin's system persisted alongside Saichō's as the traditional path of ordination in early Japanese Buddhism.

BIBLIOGRAPHY

The most important work in Western languages on Ganjin is a French study by Takakusu Junjirō, "Le voyage de Kanshin en Orient, 742-754," *Bulletin de l'École Française d'Extrême-Orient* 28 (1928): 1-41 and 29 (1929): 47-62. This is a translation of a biography written in 779 by the Japanese scholar Mabito Genkai entitled *Tō Daiwajō Tōsei den* (T.D. no. 2089). In Japanese there are numerous studies of Ganjin, including Ishida Mizumaro's *Ganjin: Sono shisō to shōgai* (Tokyo, 1958) and Ando Kōsei's *Ganjin Wajō*, "Jinbutsu soshō," no. 146 (Tokyo, 1967).

AN OVERVIEW
GARDENS IN INDIGENOUS TRADITIONS
ISLAMIC GARDENS

GARDENS: AN OVERVIEW

Gardens are enclosed spaces, distinguished from the fields where staple crops are grown and from the rocks, forests, marshes, and tundra of the wilderness. There are zoological gardens, and parks for animals, but plant gardens do not usually find room for more than a few colorful birds and fish. The transcendental feelings inspired by ornamental gardens may be divided into Western and Eastern categories, with "Western" understood broadly as encompassing traditions associated not only with Christianity but also with Islam, and with the geographical line dividing Western from Eastern running through the subcontinent of India. In the West, nature has traditionally been conceived of as something to be conquered, and religious thought runs to extremes: the Day of Judgment, the triumph of the good, and the annihilation of evil. In the East, many religious traditions have sought to accommodate human beings to the world around them and to comprehend dualisms within an overarching whole. These differences find expression in the formal gardening of the West and in the landscape gardening of the East, and perhaps also in the fact that Western gardens are made for walking in, while Eastern ones are for sitting in, with separate pavillions for painting, composing poetry, practicing one's calligraphy, and (in recent centuries) drinking tea.

WESTERN RECREATIONAL GARDENS. The religions that inherited the traditions of the Old Testament, namely, Islam and Christianity, were founded in the desert. Their scriptures dwelt on the life-giving properties of water, foliage that was refreshing to the eye, and shade that was restful for the body. A man was blessed by being told he would be "like a watered garden" (*Isa.* 58:11) and cursed with the prospect of becoming "as a garden that hath no water" (*Isa.* 1:30). Wells and fountains quickened plant growth, and the trees that water brought to life provided both nourishment and fuel. Christians valued green herbs for their medicinal prop-

erties, and in seventeenth-century England Andrew Marvell envisaged paradise as “a green thought in a green shade.” Green became the color of Islam itself, and a just king, as the Mughal emperor Akbar said when he invaded Kashmir in 1585 BCE, enabled his subjects to sit in the shade of tranquillity. Above all, the influence of the desert environment appeared in the way in which, in the West, the garden was seen as an oasis, in stark contrast to the barren wastes outside. The sense of the faith, or of the church, as an enclosure, a refuge from a hostile environment, was paramount (though a missionary church might be described as a garden without walls). Confusingly, there was another more puritanical tradition in which the roles were reversed, and the garden, with its luxury, was condemned as the scene of temptation, while the wilderness was celebrated as the true garden.

Gardeners, inspired by the supposition of a Garden of Eden at the beginning of history, aimed to re-create the conditions thought to have existed in the original garden, with its mild climate and its never-failing supply of flowers and fruit. The gardener brought order out of chaos, and gardens were laid out in regular patterns, with right angles and straight lines to extend humankind’s dominion over fallen nature. Both the Garden of Eden and the future Heaven were commonly conceived of as formal gardens. The tradition that Eden was watered by four rivers led Muslim gardeners from Persia to Spain tenaciously to reproduce the *chahar bagh*, a rectangular enclosure divided into four quarters by two streams crossing at right angles. It was an approach that combined easily with humanist ideas—derived from the classical civilizations of Persia, Greece, and Rome—of the regular pattern as the triumph of human intelligence and of abstract principles of mathematics and law. In Europe, plans of grounds attached to a Roman villa, to a medieval monastery, or to a Renaissance palace are not dissimilar, and it is not always easy to disentangle spiritual influences from secular ones, though it seems safe to say that the inspiration behind the greatest of all geometrical gardens, at Versailles, was at least half worldly.

Where religious influences predominated every plant was imbued with symbolic spiritual meaning. Trees opened their arms in the gesture of the prayer of supplication, and the branches of an orchard bowed toward God. The silver on the topside of the leaves of the poplar reflected the light of heaven, while the dark side beneath served as a reminder of earth—or hell. The cypress (represented in so many central Asian carpets) stood both for mortality, because it did not sprout when felled, and for everlasting life, because it was evergreen. The violet genuflected. The lily epitomized the purity and the pomegranate the fruitfulness of a woman. Muslims believed that the rose, which enjoys primacy of esteem among Western gardeners, had been created from a drop of perspiration that fell from the Prophet’s forehead as he was carried up into Heaven. The rosebush prayed standing upright, and the fragrant flowers budding among its thorns were interpreted as tokens of God’s mercy emerging

from God’s wrath. In both Islam and Christianity this kind of imagery led writers like Rābi‘ah al-‘Adawīyah (d. 801 CE) to speak of “the real gardens and flowers” being “within.” It was only when people’s stonelike nature had been broken down into dust by affliction that their hearts could become gardens blessed by rain and have roses grow out of them.

The early symbolism of the garden in Islam ran parallel to that in Christianity, though the Muslim Paradise, with its *hūrīs*, its green brocades, and its nonintoxicating wines, was painted in more literal detail than the Christian Heaven. Where Christian tradition diverged from Islam was in the identification of the garden with specific occasions in the life of Christ. The “garden enclosed” of the *Song of Songs* was interpreted to refer to the Virgin Mary, whose womb was an oasis so select that none but the Holy Spirit could enter in. Adam had been a gardener. Through Adam, death came into the world. Christ, who had conquered death, therefore made his first appearance after the resurrection dressed in a gardener’s clothes.

EASTERN COSMIC GARDENS. In China and Japan, both the awesome mountains and the streams that issued from them were thought to be possessed by spirits, and they were considered to be alive, like plants, animals, and human beings themselves. Space was organized from the center outward, and gardens were designed by professional geomancers, who surveyed the spiritual contours of the sites according to the science of *feng-shui*. The selection of rocks was a matter for the connoisseur. Everything was conceived within a mindset that has been called *universisme*, and the primary objective of landscape gardening was to raise people’s understanding to the level of the cosmos. This was achieved through the art of *shan shui*. Rocks, pools, and streams were said to represent the physical geography of a region, such as the mountains of Central Asia and the seas of the eastern coast, or (in Daoist philosophy) the skeleton of the whole earth and the arteries that nourished it. To the Buddhist, the garden furnished a lesson on time. The flowers opened and withered within in a month. The seasons revolved. But stone decayed on a far longer time scale that turned the present into a moving infinity. The symbolism was as varied and extensible as the clouds that gathered around the mountain peaks.

The garden contained both friendly and unfriendly spirits. But threatening spirits were not persecuted as they might have been in the West: they were either left undisturbed (for example, by not digging the ground too deeply) or frustrated (as in the case of the demons who traveled in straight lines, who were thwarted through the construction of zigzag bridges). The universe, like the garden, was influenced by rival but related forces. The Chinese spoke of the *yin* and the *yang*, the Japanese of the *in* and the *yo*. *Yin* was female, passive, and weak; *yang* was male, active, and virile. In China, mountains were male, pools female; hence a mountain stood for intelligence, a lake for feeling. In Japan the more stylized gardens sometimes contained both male and female rocks—five erect, four recumbent. In both countries, gardens expressed

conceptions about youth and age, growth and decay. The trunk of the tree upon which the “youthful” plum blossom hung resembled an old person’s body, crooked and bent. Flowers were esteemed for being “as lovely in their withering as in their first florescence,” and the samurai were compared to the blossom of the cherry—having a short life and an exquisite end. The *Yuan Ye* (a treatise on gardening, dating from the end of the Ming period) records that “when a remarkable tree was about to bloom,” people moved their beds outdoors in order that they might be able to observe how the flowers expanded “from childhood to maturity and finally faded and died.”

Nowhere is the contrast between East and West more apparent than in their respective attitudes to night and moonlight. In the West, day was connected symbolically with good, night with evil. The creatures that moved by night, such as bats, owls, and foxes, were repellent, ominous, or crafty, and the moon was contemned as a second-rate luminary. In China, on the other hand, day and night were accorded equal status, and night was said to raise men and women to the stars. Pavilions were built and furnished for the contemplation of the moon, Chinese poets sang of the moonlight “washing its soul” in the garden pool, and the *Yuan Ye* encouraged its readers to look forward to the day when they might even “dig in the moon[light] on the top of a mountain.”

In the East a miniature garden might be esteemed as highly as an estate, and (as in the West) it was sometimes said that it was not necessary to own a property at all. Fictive gardens were held in high regard, and the most perfect garden of all was “the garden that isn’t really here”—the one that existed only in the imagination. Real or imaginary, the garden was recognized as a representation of people’s own lives containing symbols of the qualities respected in a human being. The cedar, resisting the storm, represented the beholder’s own struggle with adversity, and the chrysanthemum, which braved the autumn frosts, was admired for its courage. Death itself lost some of its terrors when understood in the context of a continuous cycle of decay and regrowth. Much of Chinese gardening sought to encourage acceptance of humanity’s lot. But gardens in the East could also express a yearning for transcendence. Daoists spoke of the Blessed Isles of the Eastern Sea, and many Buddhists have believed in a land, presided over by the Amida (*Amitābha*) Buddha, where lotus flowers holding the souls of the faithful bloom upon the waters of a brilliant lake—paradisaic concepts for which there have been parallels in the West. More often than not, however, Buddhists have thought in terms of *nirvāṇa*, or a release from the cycle of reincarnation, and for this there is no Western equivalent. The Indian youth of the *Matsya Purāṇa* (c. 500 CE), who had passed through lives by the thousand and who had in his time been a beast of prey, a domestic animal, grass, shrubs, creepers, and trees, looked forward not to a better world but to release from self. In China the highest aspiration open to a landscape gardener

was to imitate the Hang painter Wu Daozi, who is said to have entered into the scene he had created, merged with his masterpiece, and been seen no more.

SUBSISTENCE GARDENS. In recreational and cosmic gardens, long-lived trees, graceful foliage, and fragrant flowers have provided abundant material for religious symbolism. Orchards and fruit gardens, in which beauty and utility are combined, have also inspired their share of spiritual imagery, and the Bible contains many allegories concerning vines, figs, olives, and palms. Herb gardens and physic (medicinal) gardens have contributed their quota. But the kitchen garden, which supplies so much, does not seem to feed the imagination, and the Bible includes only one reference to the cucumbers, melons, leeks, onions, and garlic that the Israelites remembered having eaten in Egypt (*Num.* 11:5). The planting at Villandry shows how even the dominant tradition of classical French parterre gardening can be reinterpreted in terms of the potager. But this is an exception. In both West and East, class values have prevailed. The norm among aristocracies, and even among the middle classes, has been to place the vegetable garden out of sight. Historically, priests of all religions have kept their hands clean and been supported from the surplus created by the population at large. Monastic communities, withdrawn from the world, are the only ones to have embraced manual labor as a providential discipline. In both West and East, Benedictine and Zen Buddhist monks have placed gardening upon a par with prayer and meditation and supported themselves by growing their own food. Much of the virtue lies in the humble nature of the work.

Real-life peasants and laborers, on the other hand, with families to feed, know that in temperate latitudes the skills involved in planning and maintaining a subsistence garden are greater than those called for in a recreational or cosmic garden, because most of the edible plants are annuals. There is little time to compensate for failures, and sowings must succeed or the family will go without. The labor is unremitting, and, understandably, the rewards are associated with the satisfaction of the stomach rather than the refinement of the soul. Things are different in parts of the tropics where three crops may be harvested in a year and the division between extensive fields and intensive gardens breaks down. There, the subsistence garden may assume an idealized form. All over Southeast Asia, where high levels of light, heat, and moisture; the rapid growth of plants; and recycling of vegetable and animal waste allow a family to produce all their own food and fuel upon a tiny holding, there are self-reliant peasants living in ecological harmony with a bountiful nature. In Melanesia a twentieth-century study of the Trobriand Islanders found that even their staples (yams and taro) were grown in aesthetically pleasing gardens, and that skill in gardening determined social rank. Every stage from the clearing of the land, through the sowing, weeding, and thinning, to the gathering and display of the produce was carried out with the aid of the appropriate magic, and the spirits of the dead were invited to attend the harvest feast.

ALTERNATIVES. Sensuality has always wrestled with spirituality for the soul of the garden. In the West, Priapus and Venus presided over Greek and Roman gardens, and remain better known, to this day, than Saint Phocas and Saint Fiacre, the patron saints of gardening. No amount of Marian imagery could conceal the erotic meaning of the *Song of Songs*, and in the thirteenth century the *Roman de la Rose* contraposed a garden of courtly manners and passionate love to the ecclesiastically approved one of lowered eyes and chaste thoughts. In the eighteenth and nineteenth centuries, Voltaire challenged and Darwin overthrew the concept of gardening as an innocent activity. The struggle for survival is every bit as wasteful, and as blind (or cruel), in a garden as it is in the wilderness. The difference is that there are more human interventions. Even these do not appear, since Freud, as blameless as they once did. Gardeners are autocrats who draw arbitrary distinctions between plants and weeds. Except, perhaps, in India, they wage chemical warfare and carry out mass exterminations. Many—like the Chinese mandarins who were encouraged, when they fell from favor, to retire and take up gardening—are in denial, working off their frustrations by philosophically rationalizing the pleasures of an enforced rural retreat.

In addition to its literal sense, the word *garden* has frequently been used as a literary term, to mean an anthology. More than one collection of improving stories or homilies has been titled *A Garden of Flowers*, and others in this vein have been titled gardens of “consolation,” “repose,” or “contentment.” But the word has become detached from its religious context. Many people no longer agree with Dorothy Frances Gurney that they are “nearer God’s Heart in a garden than anywhere else on earth.” J. M. Brinnin, who began writing poetry when he was a student at Harvard in the 1930s, thought of “garden” as “tragedy up to its generous eyes.” Faced with the rise of the Fascist dictators, “even the illiterate snake,” he wrote, must know “the garden is political” (the title of a collection of his poems published in New York in 1942). Within the last half-century others have offered readers gardens of disorder, evil, ignorance, illusion, lies, malice, poisons, and scandal. At the beginning of the twenty-first century, the meanings and associations of the word are still being contested.

SEE ALSO Flowers; Geomancy; Paradise.

BIBLIOGRAPHY

Few books on gardening pay sufficient attention to the significance of religious symbolism. Among those that do, the best general history remains Marie Luise Gothein’s *A History of Garden Art*, 2 vols. (1928; New York, 1966). Islamic gardens may be studied in Elizabeth B. Moynihan’s *Paradise as a Garden in Persia and Mughal India* (New York, 1979) and in a collection edited by Elizabeth B. MacDougall and Richard Ettinghausen, *The Islamic Garden* (Washington, D.C., 1976), one of the publications arising out of the colloquia held annually at Dumbarton Oaks since 1971. For medieval European gardens see Marilyn Stokstad’s essay “Gardens in

Medieval Art,” written for the Gardens of the Middle Ages exhibition organized by the Spencer Museum of Art, University of Kansas, Lawrence, in 1983, and Teresa McLean’s *Medieval English Gardens* (London, 1981). The “garden enclosed” of the *Song of Songs* is the subject of Stanley N. Stewart’s study *The Enclosed Garden: The Tradition and the Image in Seventeenth-Century Poetry* (Madison, Wis., 1966). Some effects of the discovery of America on European gardeners’ attempts to re-create the Garden of Eden are outlined in John Prest’s *The Garden of Eden: The Botanic Garden and the Re-Creation of Paradise* (New Haven, Conn., 1981). Osvald Sirén’s *China and Gardens of Europe of the Eighteenth Century* (New York, 1950) traces the influence of Chinese garden design upon the adoption of the landscape garden in Europe, particularly in England. The distinctive features of the successive periods of Japanese gardening are best conveyed in Teiji Ito’s *The Japanese Garden: An Approach to Nature* (New Haven, Conn., 1972), and Norris Brock Johnson’s article “Geomancy, Sacred Geometry, and the Idea of a Garden; Tenryu-ji Temple, Kyoto, Japan,” *Journal of Garden History* 9, no. 1 (1989): 1–19. One of the earliest works written in English about Chinese gardening ideals, Dorothy Graham’s *Chinese Gardens* (London, 1938), still contains valuable insights. More recent studies include Jan Stuart’s “Ming Dynasty [1368–1644] Gardens Reconstructed in Words and Images,” *Journal of Garden History* 10, no. 3 (1990): 162–172, and David L. Hall and Roger T. Ames’s “The Cosmological Setting of Chinese Gardens,” *Studies in the History of Gardens and Designed Landscapes* 18, no. 3 (1998): 175–186. Rolf A. Stein’s *The World in Miniature: Container Gardens and Dwellings in Far Eastern Religious Thought*, translated by Phyllis Brooks (Stanford, Calif., 1998), continues the great tradition of French Far Eastern studies. A special issue edited by Léon Vandermeersch, “L’Art des jardins dans les pays Sinisés: Chine, Japon, Corée, Vietnam,” *Extreme-Orient, Extreme-Occident* 22 (2000), covers the whole region and is invaluable. Bronislaw Malinowski’s *Coral Gardens and Their Magic. A Study of the Methods of Tilling the Soil and of Agricultural Rites in the Trobriand Islands*, 2 vols. (London, 1935), is a classic anthropological study. Michael Niedermeier’s “‘Strolling under Palm Trees’: Gardens—Love—Sexuality,” *Journal of Garden History* 17, no. 3 (1997): 186–207, touches on the garden as a setting for erotic love.

JOHN PREST (1987 AND 2005)

GARDENS: GARDENS IN INDIGENOUS TRADITIONS

Gardens are of economic importance and also of aesthetic and social significance for indigenous peoples who sustain themselves by the cultivation of vegetables and grains. They may be the subject or locus of myth, and they are regularly the focus of ritual. Where subsistence gardening is the major economic activity, people usually have some food gardens close to their homes and others farther afield. In many societies, gardening is complemented with hunting and/or fishing.

Among the Iroquois (Haudenosaunee) of North America, cultivation of the “Three Sisters” (corn, beans, and

squash) provided vegetables, while the hunting of deer and other animals provided meat. Moreover, the Iroquois grew sacred tobacco for use in ceremonies. Like the Three Sisters, sacred tobacco is said to have first grown from the body of the Corn Mother, the woman who died after giving birth to Right-Handed Twin (the Creator) and the Left-Handed Twin. Iroquois gardening and hunting were supported by and celebrated in an annual ritual cycle that attended to the sun and moon and seasonal changes and gave thanks for both wild and domesticated fruits. These calendrical ceremonies included Bush Dance, Maple, Seed Planting, Moon, Sun, After Planting, Strawberry, Blackberry, Bean, Thunder, Little Corn, Green Corn, Our Sustenance, Harvest, End of Summer, and Midwinter (Sturtevant, 1985, p. 147). (Some of these ceremonies continue to be celebrated in Iroquois communities.) Iroquois ceremonies acknowledged the thunder spirits. In the American Southwest, among the Hopi, Zuni, and Navajo, the rain spirits were even more significant. They were entertained in festivals and were encouraged to provide the moisture that the land and the people needed. Ceremonies for rain spirits remain an important focus in the agricultural cycles of the Southwest.

In colonial and postcolonial situations, subsistence economies have coexisted with cash economies, and gardening is no longer the only means of obtaining the food necessary for life. People may have income from wage labor or from an introduced form of gardening—cash cropping. Cash cropping often destroys traditional subsistence, because land once used for subsistence gardens may be taken over for the growing of crops such as coffee and tea to the detriment of a people's self-sufficiency. As well as being a primary source of food, the garden is also a metaphor for the meeting of life's needs. In Papua New Guinea, for example, a worker refers to his or her pay packet as *gaden bilong mi* (my garden). Similarly, gardening may be seen as homologous with other cultural domains such as marriage, exchange, speech, and weaving. Metaphors from gardening may be used to discuss sexual relations, and the maintenance of social alliances may be described in terms of planting and weeding.

Gardening includes not only practical endeavors such as clearing land, tilling soil, planting, and weeding, but also symbolic processes: rituals performed at crucial stages in the gardening process, spells or prayers recited to encourage plant growth and to ward off pestilence, and festivals to celebrate the harvest. Both the manual labor and the ritual activities are "work" for gardens. Rituals usually accompany the seasonal cycle of the crops, and ritual interventions to address crises such as disease or drought are made as warranted. Some societies employ garden specialists to carry out rituals; in others the gardeners themselves perform the necessary rituals or there may be a sharing of rituals. The practical side of gardening in indigenous societies has changed over time with the introduction of new crops, implements, and gardening techniques. Similarly, the spread of religious traditions such as Islam, Christianity, and Buddhism has occasioned changes

in the ritual processes performed for the benefit of gardens. In many parts of Oceania and Africa, Christians include prayers for gardens in their church services, and they pray to God as they plant, weed, and harvest. The understanding that both practical work and religious work are necessary for successful outcomes continues to pervade the practice of subsistence gardeners around the world, whether they rely on their indigenous religion, on an introduced religion, or on both. Their welfare depends upon engaging the powers of garden fertility.

Probably the best-known ethnographic account of gardening is Bronislaw Malinowski's *Coral Gardens and Their Magic* (1935), which describes the gardening techniques and rituals of the matrilineal people of the Trobriand Islands, whose livelihood depends on gardening and fishing. In the communities Malinowski studied from 1915 to 1918, the garden magician is an hereditary specialist who coordinates a series of rituals that parallel stages in the gardening cycle and encourages people in the communal labor necessary for the gardens. "Gardening," Malinowski writes, "is associated with an extremely complicated and important body of magic, which, in turn, has its mythology, traditional charters and privileges. Magic appears side by side with work, not accidentally or sporadically as occasion arises or as whim dictates, but as an essential part of the whole scheme" (vol. 1, p. 55). He continues, "Gardening, and effective gardening at that, with a large surplus produce, lies at the root of all tribal authority as well as of the kinship system and communal organization of the Islanders. The gardens of the community are not merely a means to food; they are a source of pride and the main object of collective ambition" (vol. 1, p. 66).

Throughout Oceania the vegetables that make up the daily diet are grown by the family. Gardens are devoted to yams, taro, bananas, green leafy vegetables, beans, corn, and other crops. Flowers, which are used for body decoration, as part of traditional rituals, and to decorate churches for Christian services, may be grown at the border of the vegetables or in separate plots. Tobacco is frequently grown at the edge of gardens. In general, agricultural labor is divided between the sexes so that a man does the work of clearing land (e.g., felling trees, breaking up the soil), making drainage ditches, and fencing, whereas his wife plants and weeds. In many places a woman uses a digging stick for planting, weeding, and harvesting. Before planting, the couple performs a ritual to ensure a good crop. For example, in parts of the Papua New Guinea highlands it is common to bury egg-shaped fertility stones in the garden and to rub digging sticks with pig fat. In some places a couple may have sex in a new garden before planting takes place, and for some communities the garden is the regular place for sexual activity. Generally, women plant, tend, and harvest the sweet potatoes and green leafy vegetables, and men care for trees that provide fruit and nuts and tend the sugarcane and corn. In some areas men are also responsible for taro and yams. Women need to work in their gardens every day and to harvest tubers each day to

feed their families and pigs; men's crops require less attention. It is common for crops to be designated as male or female according to who cares for them and in relation to their physical characteristics.

Writing of the Kuma of the Wahgi Valley in the New Guinea highlands as they were in the 1950s, anthropologist Marie Reay describes how during preparations for a major ceremony, a small rite is performed with the overt intention of promoting garden fertility. The men and boys carry toy bows and arrows, of the kind used in rites expressing traditional hostilities, and give them to a sorcerer, who holds them against a bundle of fresh leaves from the sweet potato vine. An orator announces that the fathers and grandfathers of all who are present are to be honored in the dance about to begin. Then the sorcerer returns the bows and arrows to the owners, each with a piece of sweet potato vine, which is later planted. Garden fertility is expressed both verbally and in the handling of sweet potato leaves. Traditional hostilities are implied in the use of toy bows and by the presence of the sorcerer. Thus, the rite for garden fertility is linked not only to the physical environment but also to the social situation. The Kuma expect their clan to prosper if they continue their fathers' and grandfathers' hostilities (Reay, 1959, p. 158).

In much of sub-Saharan Africa, gardens are dedicated to staple grain crops and tubers. Flowers may be grown either within the vegetable or grain garden or in separate plots. Flowers are cultivated for medicinal or culinary use or, less often, for decoration. Depending upon the particular culture and its contemporary religious patterns, prayers for gardens may be addressed to God, to nature spirits, or to spirits of the dead. In southern Africa among the Nguni, the myth of *Inkosazana yase zulweni* (the Princess of the Sky) describes a mythological figure who personifies vegetation and fertility. She is goddess of the corn and presides over the growth of the grain. It is said that from her the people learned how to brew beer. Moreover, she has the power to bring rain. She is said to visit the earth in the spring, and her visit is celebrated with festivals. People appeal to her for alleviation of misfortune and for protection from disease. In the summer (December) the Nguni hold a first fruits ceremony when the corn and other vegetables are ready to eat (Krige, 1950, pp. 197–200).

Rain-making specialists are common in Africa, where so much of the country is dry and the lives of people and crops depends upon rain (Mbiti, 1991, p. 134). As in Oceania, there are rituals for making new fields, for planting and weeding, for first fruits and for harvest (Mbiti, 1991, pp. 135–136). African gardening, like Oceanian gardening, is part of a total way of life and is related to other cultural processes. The Dogon cultivate land in squares following the pattern of the flat roof of the celestial granary of Dogon myth. Traditional cultivation, according to Ogotemmêli, the wise man who related his understanding of the Dogon world to the French anthropologist Marcel Griaule, "is like weaving; one begins on the north side, moving from east to west

and then back from west to east. On each line eight feet are planted and the square has eight lines recalling the eight ancestors and the eight seeds" (Griaule, 1965, p. 77). "Moreover," says Griaule, "weaving is a form of speech, which is imparted to the fabric by the to-and-fro movement of the shuttle on the warp; and in the same way the to-and-fro movement of the peasant on his plot imparts the Word of the ancestors, that is to say, moisture, to the ground on which he works, and thus rids the earth of impurity and extends the area of cultivation round inhabited places" (p. 77). The original French title of Griaule's work, *Dieu d'Eau: entretiens avec Ogotemmêli* (Water god: Conversations with Ogotemmêli), points to the central importance of moisture in the world of Dogon gardeners.

Food and fertility are foci of all religions. Supplicants ask for their daily bread and pray for the fruitfulness of the land, the fecundity of flocks, and the flourishing of human beings. The emphasis on food and fertility is most obvious among those who tend gardens for their livelihood. Their myths and their rituals tell of their dependence on the powers of fertility, and through practical work and symbolic work they assert what control they can over their garden-world.

GARDENS: ISLAMIC GARDENS

Islamic gardens represent cultivated spaces across the diverse span of Muslim history and geography, created and set apart from wilderness of various kinds. They were designed to enhance the humanly constructed environment, to ornament the landscape, and to symbolize cultural and religious values and aspirations. As such, they are together with architecture and the arts among the most significant and enduring of Muslim expressions of the role and relationship of nature in its broader sense to human beings. Gardens and landscape architecture in Muslim societies have been an important expression of ethical assumptions about stewardship, ecology, and beauty. This heritage of spaces and values has in recent times come under increasing pressure because of very high levels of demographic change, desertification (the degradation of formerly cultivated land), burgeoning urban growth, and general neglect.

GARDENS IN THE QUR'ĀN. The Arabic word for garden (*jannah*) is used in the Qur'ān for paradise, the reward of the hereafter. There are a number of other references to the notion of the garden in the Qur'ān: *al-firdaws* (Q 23:11) originating from the Old Persian (*paridaīza*), and *al-rawda* (Q 30:15 and 42:22), with reference to the lush greenery of the garden. One of the settings in the Qur'anic narrative of creation (Q 2:34, 7:19) is the primordial garden where the first-created pair of human beings is placed. The garden is therefore also among God's creations and the theater in which the initial human drama unfolds. On one level it represents the ideal environment in which the first humans can subsist, close to God and in balance and harmony with nature. In an Arabic term referring to a Qur'anic verse, the word *ayah* also signifies a sign from nature. The human trespass, the act of disobeying God's command, results in dismissal from the garden and a sojourn on earth. The promise of the return to the garden—that is, the promised abode of the hereafter—is held out as the goal of human life; but until the return, the garden remains an aspiration and expectation, even a memory, that human imagination might be able to recreate on earth. Among the main features of the garden in paradise is water, an oft-repeated reference. The Qur'ān refers to the four rivers that flow in paradise (47:15)—rivers of water, milk, honey, and wine. Springs are mentioned and named, the best-known being *kawthar* (108:1) and *tasnim* (83:27), from which the righteous may drink. Trees with fruit are to be found in abundance. Among the trees specifically designated is the lote-tree, a symbolic reference, which in Muslim tradition signifies the tree of life and knowledge marking the boundary of the “garden of refuge” (53:14–15); the *tūbā*, the tree of blessing; and fruit-bearing trees producing grapes, pomegranates, and other fruits.

This evocative, subtle, and richly symbolic historicized garden is the promised home of the righteous; in it the once-living share eternal joy among beings of great beauty, male and female. The latter, which are called houris, are compared to pearls and are eternally virgins, providing companionship, solace and love. The dominant themes that mark the lives

of the garden's inhabitants are peace, reunion with families and communities, security, intimacy, luxury—and overwhelmingly, the joy of knowing that they have pleased God and that he is pleased with them. According to the Qur'ān, the return to God is the supreme joy of the righteous.

ISLAMIC GARDENS IN HISTORY. Muslim rule and territorial control expanded rapidly during Islam's first two centuries, eventually encompassing significant areas around the Mediterranean Sea as well as former Byzantine and Sassanian-ruled territories in North Africa, Spain, the Middle East and Central Asia. This diversity of landscapes, climates, and geographical settings influenced the utilization and development of land. Patterns of existing use and the availability of water were major factors in transforming the landscape to mirror the changes in control, settlement, and cultural values.

Persia had a long history of gardens that predated Islam, a tradition that Muslims adopted and continued. Many of the earlier examples of Persian gardens have not survived; recent excavations, however, provide evidence of the extensive development of gardens under successive dynasties. The original Persian garden (*bāgh*) was irrigated by canals diverted from a river or stream. The new towns and cities under Muslim rule, including capital cities like the Baghdad of the Abbasids, contained several gardens influenced by the Persian pattern. Rulers continued to build gardens in newly established population centers, using existing water installations or creating new channels for irrigation. Muslim travelers' accounts from the medieval period describe a profusion of richly endowed gardens, public and private, with fountains and pavilions. One of the patterns that came to dominate the design of these gardens, though not exclusively, was the *chahār-bāgh*—the foursquare garden, often linked to the Qur'anic allusion to the four rivers of paradise. The Safavid gardens, particularly in Isfahan, are a fine example and extension of this foursquare style.

The Muslim Umayyad rulers of Andalusia continued Roman and local Spanish traditions in order to develop exquisite gardens, some of which survive in the early twenty-first century, as in the Alhambra. The excavations of the Umayyad palace city, Madīnat al-Zahra, destroyed in the eleventh century, reveal the presence of gardens, fountains, and pavilions. Most of these structures were created to reflect a symmetrical design, organized to present dramatic vistas, and also to afford a sense of privacy, intimacy, and leisure. It has been suggested that these gardens were framed within a geometrical pattern intended to reflect order, authority, and symmetry in nature as well as in society, thus simultaneously evoking religious, aesthetic, and political meanings. Another historical example of extensive garden construction is that of the Mughal period in Central and South Asia. Several of these gardens have survived in Afghanistan, India, and Pakistan. They illustrate connections with new landscapes combined with visions of spaces that mark transitions to the afterlife and the rich imagery of the Qur'ān.

The Qur'anic image of the garden and the rich enhancement of landscape throughout Muslim history have made these concepts a fertile source for Muslim poetry and literature. Two of the classics of Persian literature, Sa'di's *Rose Garden*, or *Gulistân* (c. 1256 CE), and his *Fruit Orchard*, or *Bustan* (c. 1257), are inspired in their form as well as their imagery by garden motifs. Much of Muslim mystical poetry builds on the symbolic meanings of the garden, its geometrical design, water, profusion, greenery, the budding of the rose, the bee among the flowers, the harmony of form and essence, and the transient and created nature of the earthly garden. The archetypal space is the site of the meaning of human life, its exalted destiny as well as the focus of its memory. The garden may represent both the place of transition as well as arrival, and of ultimate repose in the world or an anticipation of the hereafter.

ISLAMIC GARDENS IN MODERN TIMES. Pressures resulting from population growth, urbanization, climate change, and economic underdevelopment have led to the neglect, degradation and even extinction of public and private green spaces across the Muslim world. Many of the emerging Muslim nation-states and societies have sought to restore and revive their gardens through local initiatives or assistance from global organizations committed to preservation, restoration, and recreation. The erosion of the heritage is now balanced by such new efforts as the landscaping around the airport in Jakarta, the Bagh-e-Ferdowsi in Tehran, the reforestation project on the campus of a university in Ankara, and the Al-Azhar Park project in Cairo. There are many other cases that need to be addressed to repair both natural and human-made disasters. The heritage of gardens is inseparable from the vitality of culture in the Muslim world and the ecological aspirations of human beings that transcend time and space.

AZIM NANJI (2005)

GARIFUNA RELIGION. The Garifuna are an ethnic group numbering roughly 300,000 with communities in some 40 villages dotting the Caribbean coasts of Nicaragua, Honduras, Guatemala, and Belize. Their traditional ancestor-focused religion presents a multilayered confluence of Amerindian, African, and Roman Catholic influences.

HISTORY. The Garifuna are descendants of Africans and Amerindians (Carib and Arawak) who shared the island of Saint Vincent beginning in the second half of the seventeenth century. *Garifuna* is properly the name of their language, which is affiliated with the Arawak linguistic family. The term is derived from *Kalinago*, the ethnic title used by Island Carib Amerindians to describe themselves but misrecognized by Christopher Columbus as "Carib." Europeans called the Garifuna "Black Caribs" because of the group's apparent African ancestry. That appellation was in common usage until the shift to Garifuna as a standard ethnic name after the middle of the twentieth century.

The African presence on Saint Vincent derived in part from survivors of a slaver shipwreck near the island dated to 1635. Most probably, then, their African origins derived from the slave trade out of the ports of west central Africa. The African presence also derived from Carib raids that carried slaves from European colonies and from the arrival of fleeing African maroons from neighboring Barbados and elsewhere. By 1674, according to accounts from the Jesuit missions, the "Black Carib" numbered as many as the "Red" Island Carib on Saint Vincent. Reports from 1700 indicate that they had already founded settlements separated from the Island Carib Amerindians.

After 1783 Saint Vincent became a permanent British colony and was slotted for sugar production. Following a period of military resistance in the Second Carib War (1795–1797), a British naval convoy deported approximately five thousand Garifuna to Roatan, an island just off the coast of Central America. Though half of those deported died in transit, their survivors settled the Central American coast early in the 1800s. This became the new homeland, the site of their reconstitution as a distinct ethnic group with its own specific set of religious practices.

RELIGIOUS TRANSCULTURATION. Garifuna religion provides a stunning example of the religious transculturation that occurred throughout the Caribbean Basin during the colonial period. Seventeenth-century missionary accounts of the Island Carib Amerindians describe religious leaders known as *piaye* or *boyé*. These were shamans who used gourd rattles and tobacco to cure patients of illnesses attributed to malignant spirits through their mastery and mediation of tutelary ancestral spirits. They are also recorded as performing divination. The "Black Caribs" adopted this religious office and techniques from their Saint Vincent hosts. Garifuna religion continues to rely upon the leadership of such shamans, still called by the similar title of *buyei*. They orchestrate and direct sophisticated ritual performances under the influence of the helping spirits of benevolent ancestors (*hiuruha*). Other

aspects of early Island Carib Amerindian religion, like the belief that a person is constituted by multiple souls, including the “heart-soul” (*uwani*) as the seat of agency and will and the “spirit double” (*afurugu*) that may wander during dreams and after death, remain a vital part of contemporary Garifuna religion as well. These bear witness to the legacy of Island Carib Amerindian societies, many of them now nearly assimilated or extinct, in Garifuna religious life.

Traditional west central African religious practices also left their mark on Garifuna religion. The most elaborate ritual performances, called *diigi*, utilize three drums to guide dances that culminate in spirit possession by returning ancestors, called *gubida*, who are feted as they dance and consult with the living. Drummers’ use of polyrhythmic meter for dances like the *punta*, once a funerary dance, and the *junkunnu*, a mask dance, punctuate and offset the use of monorhythms like the *amalihani*. These complex drumming patterns recall in music and dance the west central African legacy.

Catholicism also played a key role in Garifuna religion as it assumed its current form after 1797. All traditional Garifuna religious actors also consider themselves to be Catholic, and Catholicism provides the overall mythic structure within which the ancestor religion is maintained. Malignant (*mafia*) spirits, for example, typically associated spatially with “the bush” (*el monte*), are considered manifestations of the devil, while positive spirits are regarded as agents of the high God (*Bungiu*). Postmortem rituals (see below) begin with “masses” (*lemesi*) adapted from official Roman Catholic liturgy and continue with novenas (ninth-night masses) and anniversary masses performed to remember and appease the dead. Catholic saints are prominent on Garifuna altars, and specific saints like Esquipula and Anthony are called upon as sources of solace and assistance.

SMALL-SCALE RITUAL EVENTS. Since the overall mythic and ethical structure of Garifuna religion is provided by Roman Catholic Christianity, the distinguishing characteristics of Garifuna religion are found in its sophisticated complex of ritual practices. Moreover since specific beliefs and ethical postures vary widely in relation to popular adaptations of Catholicism, correct ritual practice is particularly crucial to Garifuna religious identity. Myths and belief remain largely implicit, embedded in ritual performance.

In general, rituals are focused on the problem of death and the transfer in status from living human being to exalted ancestor (*gubida*). Though the dead remain a source of power for the living, they must also be helped by living family members as they take the steps from this world to their status as recently departed spirits (*ahari*) and then to one of finally becoming *gubida* in the otherworld. The otherworld is called *Sairi*, the home of the ancestors, and is often physically located on Saint Vincent. The postmortem journey is simultaneously one of progressive spiritual advance and one of geographic traverse, or return, to the lost homeland. The ritualization of death is therefore in part an expression of dia-

sporic consciousness, a means of looking back to a paradise lost.

Insofar as the ritual obligations to the dead are not adequately performed by the living, ancestors register their complaints through signs experienced by the living as nightmares, bad luck, accidents, and unexplained illnesses. Garifuna religion is in this sense rigorously this-worldly. It is concerned with alleviating concrete material problems by contemplating them and acting upon them as ruptures in the relations between of the living and the ancestors. These crises are addressed through a sequence of ritual interventions that demand progressively more serious investments. The ability to prosper in the material world is therefore understood as directly related to and contingent upon the attention devoted to the family ancestors’ “advance” through the spirit world.

Veluria. When a member of the community dies, the corpse of the deceased is placed in a coffin and laid out in his or her house for public viewing. Candles are lit and placed at each corner, and near the coffin a simple altar is erected on a low table, including holy water and statues of Catholic saints. Crepe-paper streamers are hung in a canopy over the body. Friends and relatives arrive at the wake and hold vigil through the night, drinking coffee and rum (*aguardiente* or *guaro*), playing cards, and talking. At dawn the corpse is interred in a graveyard that is nearby yet spatially removed from the village. The burial is accompanied by wailing laments and the pouring of rum into the grave by family members and friends.

Amuidahani. Between six months and several years after the death, the family “bathes” the deceased. A small pit is dug immediately adjacent to the home, and a fresh change of clothes for the departed is suspended above it. Family members and intimate friends pour liquids into the pit, variously including freshwater, saltwater, strained cassava water, herbal infusions, and favored beverages like coffee and rum. Tobacco and favorite foods may be offered as well. Following the “bathing” of the deceased, the pit is closed. The ritual is small and intimate in nature, of short duration, and does not require the presence of the *buyei* as officiant.

Lemesi. Around a year following death, as well as later if called for by the ancestor through divination by the *buyei*, a “mass” is held for the spirit of the deceased (*ahari*), who is viewed as still present in the village. The occasion marks the end of a period of mourning for the spouse who survives the dead and, as an occasion marking the return to everyday life, is conspicuously festive. Food and beverages are served, and the celebrative *punta* dance is drummed and danced in the yard. The *punta* is typically comprised of a circle into which a man and a woman enter in pairs, two at a time. The dance entails the rhythmic oscillation of the hips while holding the upper body perfectly still and the facial expression calm. It celebrates both the life of the deceased and the ongoing force of the community despite the loss of one of its members.

Women gathered for the purpose sing “women’s songs” (*abaimahani*), standing in a line with little fingers linked and thrusting the arms forward in rhythmic concert, a gesture suggestive of shared labor. The song lyrics recall the struggles of family life and loyalty and sometimes speak from the perspective of the ancestors, pleading to not be forgotten. Men’s songs (*arumabani*) are ideally presented in similar fashion, though since the twentieth century it has become increasingly challenging to find a choir of males able and willing to perform the old songs. This is because of a common male pattern of leaving the village for long durations in order to find work. The lyrics of men’s songs often recall the necessity and dangers of travel for labor far from home and the longing to return.

In addition traditional tales (*iruga*) may be told, often humorous trickster-like narratives. The festivities continue until dawn.

MAJOR RITUAL EVENTS. While the foregoing are required in all cases, the most elaborate postmortem rituals, the *chugu* and the *dügü*, are called for only when specifically requested by an ancestral spirit. When a family member suffers unusual misfortune, recurring nightmares, or unexplained illnesses or pains, he or she may consult a shaman (*buyei*). With the patient seated before the *buyei*’s altar (*gule*), the *buyei* lights a candle, smokes his or her pipe, and summons his or her tutelary spirits (*hiuruha*) by blowing the vapor of rum from the mouth over the altar. This activates it. Blowing smoke over the head of the patient, he or she consults with his or her spirits to “read” the nature of the problem at hand, depending on the movement of the smoke and the insights granted by tutelary spirits (*hiuruha*). This ritual act is called *ar-airaguni*, “bringing down the spirits.” If the problem is one caused by the ancestors (*hasandigubida*), he or she negotiates with the afflicting spirit to decipher what it requires. This may be a *misa*, a *chugu*, or in the most serious of cases, a *dügü*. Together with the patient, and taking account of the family’s financial resources, the shaman then plots the course of action.

Chugu. The *chugu*, literally the “feeding” of the dead, is a one- to two-day ceremony officiated by a *buyei*. In addition to all of the elements included in a “mass,” it entails the assembly of a greater number of relatives and the preparation of large quantities of food offerings, including roosters (*gayu*) offered for sacrifice. Since a more intimate communication with the dead is required than in a “mass,” the *buyei* erects his or her personal altar (*gule*) in the house where the *chugu* will take place. There he or she places the symbols of his or her key helping spirits as well as the implements of the shaman’s vocation: the maracas (*sirisi*) used to call the spirit, the wand (*murewa*) used to communicate with and control the spirit should possession trance occur, and bottles of rum and tobacco used to purify the room and to activate, or “heat,” the altar. Traditional foods are prepared, including most importantly the sacrificed roosters (*gayu*) and cassava bread (*ereba*), to present an abundant table to the dead. Women’s

and men’s songs are performed at length, and the spirit may also be celebrated with *punta* dancing. Much rum is consumed to create the atmosphere of exuberance and generous abundance believed to be favored by the ancestors.

At the conclusion of the day’s events, the *buyei* concocts a nog of beaten eggs and hot rum (*furunsu*). Each participant places his or her full cup upon the altar while making requests of the ancestor before exchanging the cup with another participant. The exchanged communal drink unites the group. Finally, the *buyei* “burns the table,” pouring rum over its surface and igniting it in flame. A strong blue flame reveals the ancestor’s approval of the offering and indicates that the precipitating symptoms of bad luck or illness that evoked the *chugu* should subside.

Dügü. Just as the *chugu* contains all the elements of the “mass,” the *dügü* contains all the elements of the *chugu*, such that the larger ritual encompasses the smaller in the style of Chinese boxes. *Dügü* is short for *adugurahani*, “mashing down the earth,” perhaps referring to the long periods of dance that are required of participants. It is regarded as the fullest expression of Garifuna religion and is a major ritual event that is prepared for a full year and performed over a week’s duration. It typically occurs many years after the death of a family member and only when mandated by a *buyei* and his or her spirit helpers. Announcements about the *dügü* circulate for at least a year to insure that sufficient funds can be raised for sacrifices of roosters, pigs, and sometimes a cow and to feed a crowd of participants that may number in the hundreds for a week’s time. All family members, even those residing in the United States, are obligated to attend. Indeed the ritual’s efficacy depends on a complete demonstration of family unity to resolve the perceived crisis. It is arguably the emotional dramatization of family unity itself that provides in part the experience of the ritual as a healing cure.

First, a ceremonial house (*gayunere* or *dabuyaba*) must be constructed in “traditional” palm-thatch style on the beach. The *dügü* formally begins with the “return of the fishermen,” a group sent three days prior to catch fish in the “traditional” way in the offshore cays. They arrive at dawn, attired as Garifuna ancestors wearing helmets of woven palm, and are greeted with exuberant songs by family members attired in matching red-dyed uniforms. They are given rum and cigarettes and are laid in hammocks, just as the ancestors will be later in the ritual when they are incorporated in living bodies of dancers through spirit possession.

Over the next two days follows a sequence of dances both to honor the ancestors and create the conditions for their arrival in possession. First are the *amalahani*, dances to honor the ancestors. These continue for up to four hours at a time, brought to crescendo by the shaman, who exhorts the large group until some are possessed by ancestors. Transformed into known figures from the past, they make requests and are soothed with rum and food. Living family members

may ask questions, in response to which the ancestors give counsel.

Throughout the second and third day, the food offering (*chugu*) is prepared. Roosters—one required from each attending nuclear family—are sacrificed, massive amounts of rum assembled, and tables loaded with the most traditional Garifuna foods. The food is piled high on a wooden table and left for the ancestors' consumption. After the spirits "eat," the assembled participants also take their fill, rejoicing in the luxurious abundance far exceeding that of everyday life. At the close of the day, what remains of the spirits' food is buried in the ground or returned to the sea, taken by canoe and deposited in the deeps.

Finally, the shaman guarantees the ancestors' acceptance of the offerings. Pouring rum on the table, he or she feeds the flame and tips the table to all sides, as in the *chugu*. There is great joy, and all rush to wipe the sacralized liquor on their bodies as a balm for all pains. Reunited family groups run to enter the sea together in a temporary moment of *com-munitas*.

As the *dügü* summons and placates ancestors, it also reinforces family bonds among the living. This has become increasingly important as a third of the Garifuna have emigrated to the United States since the middle of the twentieth century. The *dügü* takes on new import and meaning for those residing abroad, serving the purpose of communicating the experience of home through the dense, compact form of ritual performance. Territoriality, or consciousness of place, is fortified above all in this central ritual performance. With increased migration, the *dügü* appears to be gaining in the frequency of its performance rather than suffering a decline.

NEW DEVELOPMENTS. Migration to cities like New York has sparked a new identity consciousness of the Garifuna's African roots. Religious leaders in New York have begun to conceive of their traditional practices within the purview of other African diaspora religions like Cuban Santería and Haitian vodou. This new form of indigenous syncretism justifies a view of the Garifuna as a dramatically innovative religion, especially as it is reshaped in the new contexts of U.S. urban centers. As Garifuna religious leaders in the United States return periodically to perform rituals in Honduras, Belize, and Guatemala, they carry with them a new identity consciousness. This will likely have transformative effects on homeland religious performance as well.

The second key contemporary issue of Garifuna religion is the rise of evangelical Christian sects since around 1980 in homeland villages. Converts to the new churches disavow all connections to traditional practices, which are regarded as diabolical. The use of dance, tobacco, rum, and altars are vehemently rejected, leading to the dismissal not only of Catholicism but of virtually all traditional rites. This creates friction within families and between village factions and generates new conundrums for traditional practices like the *dügü*, since in that ritual all members of the family are re-

quired to be present. When evangelicals refuse to attend such events, they are accused of jeopardizing the rituals' efficacy and therefore also the physical safety of everyone in their kin group. While such disputes are divisive, they also serve as explanations of future accidents, bad luck, and illnesses. The disputes therefore incite ritual as much they compromise it.

"Migrating Bodies, Circulating Signs: Brazilian Candomblé, the Garifuna of the Caribbean, and the Category of 'Indigenous Religions.'" *History of Religions* 41, no. 4 (2002): 301–328. The essay compares types of religious dislocations and creative responses for the cases of Brazilian Candomblé and the Garifuna of Honduras and in New York City. The essay begins to elaborate and theorize the relation between migration and contemporary religious change.
- Kerns, Virginia. *Women and the Ancestors: Black Carib Kinship and Ritual*. 2d ed. Urbana, Ill., and Chicago, 1997. A valuable text on Garifuna religion and ritual performance for its attention to women as the primary carriers and transmitters of tradition.
- Melendez, Armando Crisanto. "Religious Elements of the Garifuna Culture and Their Connotations in the Americas." In

African Creative Expressions of the Divine, edited by Kortright Davis and Elias Farajajé-Jones, translated by Dorothea Lowe Bryce, pp. 121–128. Washington, D.C., 1991. A short, descriptive account of Garifuna beliefs from an important Garifuna choreographer, historian, and cultural activist.

Sanford, Margaret. "Revitalization Movements as Indicators of Completed Acculturation." *Comparative Studies in Society and History* 16 (1974): 504–518. A provocative essay arguing that religious revitalization, including the Garifuna case, is correlated with general acculturation or assimilation such that revivals are possible indicators of cultural distress.

Suazo, Eusebio Salvador. *Irufumali: La doctrina esotérica garifuna*. Tegucigalpa, 2000. A bilingual (Spanish and Garifuna) account of the *buyei*'s knowledge from a Garifuna writer, acquired through interviews with practicing shamans.

Taylor, Douglas. *The Black Carib of British Honduras*. New York, 1951. The text offers several important chapters on Garifuna beliefs in relation to the soul and Garifuna ritual practices. Taylor brought rare linguistic depth to his descriptive task.

PAUL CHRISTOPHER JOHNSON (2005)

GARVEY, MARCUS. Marcus Mosiah Garvey (August 17, 1887–June 10, 1940), the founder of the Universal Negro Improvement Association (UNIA), led the largest mass movement among African Americans and can be regarded as one of the founding fathers of Pan-Africanism and the Black Consciousness movement.

Garvey was born in Saint Ann's Bay, Jamaica. During the first decade of the twentieth century, he was involved in the labor movement and advocated for labor reforms in his paper, the *Watchman*. But he quickly became disillusioned and grew skeptical about the ability of unions to bring about meaningful improvements in the lives of blacks, and about the willingness of whites to cooperate in achieving such a goal. After a brief stint working for the United Fruit banana plantation in Costa Rica, he moved to London, where he came under the influence of Duse Muhammad Ali and wrote articles for his paper, *Africa Times and Orient Review*. While he was in London, Garvey was inspired with a new vision after reading Booker T. Washington's *Up from Slavery*. When he returned to Jamaica in 1914, Garvey quickly formed the UNIA, whose purpose was to unite Africans from all over the world in a common purpose of uplift.

Following Washington's Tuskegee model, Garvey's first program was the establishment of a trade school. This effort never enjoyed success, however, due primarily to lack of financial resources. Washington invited Garvey to visit Tuskegee but died a few months before Garvey arrived in New York City in March 1916. Garvey began introducing himself at different churches and sharing his vision. By 1918 he had started a weekly, the *Negro World* that grew in circulation to fifty thousand. By 1919 Garvey had raised enough funds to purchase an auditorium on West 138th Street in Harlem called Liberty Hall, where throngs came to hear his spell-

binding oratory. The popularity of Garvey and his movement grew exponentially after he launched his project to purchase ocean steamers to trade with Africa and take black people back to Africa. Blacks purchased stocks in his company, the Black Star Line, at five dollars per share. Over half a million dollars was raised, and the first ship was purchased in the first year. The UNIA's first international convention, attended by thousands of delegates from every part of the world, was held at Liberty Hall and Madison Square Garden in August 1920. The convention proclaimed Garvey the provisional president of the Republic of Africa and adopted a Declaration of the Rights of the Negro Peoples of the World.

Garvey's movement also had a religious component. Garvey did not think blacks could ever acquire a strong sense of self-esteem while worshipping a white God and a white Savior. He argued that God, Christ, and Mary were black. In 1921 the UNIA's chaplain general, George Alexander McGuire, formed the Good Shepherd Independent Episcopal Church and authored *The Universal Negro Catechism* and *The Universal Negro Ritual*. McGuire and Garvey disagreed over forming a separate denomination, and McGuire then formed the African Orthodox Church.

The Black Star Line's financial difficulties contributed significantly to Garvey's demise and the decline of his movement. The ships purchased were unsound, and the organization lacked the resources to repair them after two disastrous ventures. By 1921 two of Garvey's ships were inoperable. African American critics of Garvey's movement, including the leader of the National Association for the Advancement of Colored People, W. E. B. Du Bois, instigated Garvey's arrest for mail fraud. Garvey was tried and convicted in 1923; he was sentenced to five years in prison and fined \$1,000.

Garvey was pardoned by President Calvin Coolidge in 1927 and was deported to Jamaica, where he tried unsuccessfully to rebuild his movement. In 1935 he moved to London and published a periodical, the *Black Man*. He died of a stroke in June 1940. Even though he achieved few of his goals, Garvey's name is still revered among black nationalists.

JAMES ANTHONY NOEL (2005)

GASTER, THEODOR H. Theodor H. Gaster (1906–1992) was a renowned Semiticist and follower of James G. Frazer. He was born in England, the son of the folklorist Moses Gaster, who was Romanian by birth and a legendary linguist and scholar of Judaica. When the family immigrated to England, Moses Gaster became chief rabbi of the Sephardic Jewish community in London. He was also a leading Zionist, and Theodor “recalled that the first draft of the Balfour Declaration [which announced the British aim of creating a homeland for Jews] was prepared in his father’s home. For a time, Theodor, along with his young friends Abba Eban and Isaiah Berlin, would go from door to door in London soliciting donations on behalf of this future homeland” (Hiers and Stahmer, 1995, p. 64).

Theodor Gaster was educated in private schools in London. He received an undergraduate degree in classics from the University of London in 1928 and a master’s degree in Near Eastern archaeology, also from the University of London, in 1936. His master’s thesis, a preview of his key work, was titled “The Ras Shamra Texts and the Origins of Drama.” His mastery of languages was extraordinary, and he was “one of the last generation of scholars equally at home in Classical, Ancient Near Eastern, and multiple modern languages” (Hiers and Stahmer, 1995, p. 65).

With few academic positions open to Jewish scholars, Gaster held a series of museum and library appointments for the first part of his professional life. His first major appointment came in 1928, as curator in the Department of Egyptian and Semitic Antiquities at the Wellcome Research Institution and Museum in London. He served there until 1932 and again from 1936 to 1939. In 1935 he became literary editor of the *Jewish Daily Post*, contributing an array of scholarly and popular articles almost daily during the nine months of its existence.

In 1937 Gaster became lecturer on biblical and Near Eastern archaeology at New College and Institute of Archeology of the University of London, where he served until 1939. In the 1930s he published innumerable scholarly articles on Ras Shamra and the Bible.

In 1939 or 1940 Gaster moved from London to New York and began work on a Ph.D. at Columbia University. While pursuing his doctorate he continued to publish prolifically. In 1941 and 1942 he was editorial secretary for the Institute of Jewish Affairs of the American Jewish Congress, and in 1943 he was executive secretary for the Conference on Jewish Relations. From 1943 to 1945 he was managing editor of *Jewish Social Studies* and frequently contributed articles on Judaica, the Bible, and the ancient and modern Near East. In the mid-1940s he also began contributing to *Commentary*, and in the mid- to late 1940s he published articles on the Bible in the *Jewish Quarterly Review*.

In the early 1940s Gaster apparently missed securing a professorship in Jewish learning at Duke University because his comparativist bent was considered insufficiently tradi-

tional. In 1942 he began teaching part time in the graduate school at Columbia University, and in 1945 he also began teaching part time at Dropsie College, in Philadelphia. From 1946 to 1950 he was a lecturer on Semitic civilization at New York University. From the mid-1940s until the mid-1960s, he was a visiting professor at many colleges and universities in the United States and three times at the University of Leeds.

Gaster’s first full-time American post came in 1945, when he served for a year and a half as chief of the Hebraic Section of the Library of Congress in Washington, D.C. In 1951 and 1952, he was a Fulbright Professor in the history of religions at the University of Rome, and in 1961 he was a Fulbright Professor in biblical studies and history of religions at the University of Melbourne.

Most of the books for which Gaster is best known were published in the 1950s, including his translation of the Dead Sea Scrolls, widely admired for its felicitousness; *Thespis*, his application of the Frazerian myth-and-ritual theory to the ancient Near East and beyond; and his abridgment and updating of James Frazer’s *The Golden Bough* (*The New Golden Bough* [1959]), in which he retained the theory but updated the data. This abridgment was of Frazer’s third twelve-volume edition of his opus, which Frazer himself had abridged into one volume in 1922. Gaster’s final major work, the two-volume tome *Myth, Legend, and Custom in the Old Testament* (1969), was similarly an abridgment and updating of Frazer’s *Folk-lore in the Old Testament*.

Only in 1966, at the age of sixty, did Gaster secure a permanent full-time academic post, as professor of religion at Barnard College, the women’s undergraduate division of Columbia University. He helped revamp the curriculum and served a term as chair. He continued to lecture widely, and from 1971 to 1981 he was professor of religion and director of ancient Near Eastern studies at Dropsie College, by then renamed Dropsie University. Upon his retirement from Barnard, he was once again a visiting professor at many American universities. He relocated to Florida to teach for several years at the University of Florida. He died in Philadelphia, where he had moved in 1988.

As a theorist, Gaster’s main contribution was his distinctive brand of myth-ritualism—the theory that connects myth to ritual. Gaster assumed that existing versions of the theory downplayed myth in favor of ritual, and he strove to accord myth the same importance as ritual. Certainly the original version of myth-ritualism, that formulated by William Robertson Smith, made myth secondary to ritual, but it is debatable whether succeeding versions of the theory did.

Gaster’s myth-ritualist scenario, which he painstakingly sought to reconstruct for the ancient Near East, derives from Frazer, whose dual and ultimately incompatible versions of myth-ritualism Gaster sought to combine. In Frazer’s first version, the king is human and merely plays the role of the god of vegetation, who dies and, through the imitation of

his rebirth, is magically reborn. In Frazer's second version the king is himself divine and is killed outright and replaced, with the soul of the god of vegetation thereby automatically transferred from the incumbent to his successor. For Gaster, the king either is god or merely represents god. It is simply not clear which he is asserting. On the one hand, according to Gaster, the king is literally or symbolically killed and replaced annually. Here Gaster is using Frazer's second version. On the other hand, according to Gaster, the killing and replacing of the king parallels the death and rebirth of the god of vegetation and, by magical imitation, causes the rebirth of the god. Here Gaster is using Frazer's first version. Followers of Frazer other than Gaster have also become confused in trying to reconcile actual regicide (king as divine) with magical imitation (king as human).

For Frazer, the myth of the death and rebirth of the god of vegetation explains the ritual. It is the script of the ritual. For Gaster, the myth does more than explain the ritual. By itself, the ritual operates on only the human plane. Myth connects ritual to the divine plane. The renewal sought thereby becomes spiritual and not merely physical. Rather than simply explicating the inherent, physical meaning of ritual, as Frazer did, Gaster saw myth as giving ritual its spiritual meaning. In this sense he accords myth a status at least equal to that of ritual. To do so, he must in fact be confining himself to Frazer's first myth-ritualist scenario, for only here is the myth of the god to be found.

GAUḌAPĀDA, Indian philosopher, was the reputed *para-ma-guru* ("teacher's teacher") of Śaṅkara. Information about Gauḍapāda is scant and has been subject to scholarly controversy. In what is now regarded as a fantastic thesis, Max von Walleiser professed in his *Der ältere Vedanta: Geschichte, Kritik und Lehre* (Heidelberg, 1910) that Gauḍapāda never existed at all. However, both V. Bhattacharya (1943) and T. M. P. Mahadevan (1969) have argued convincingly that Gauḍapāda was a real person, the author of what is called *Āgama Śāstra* or *Gauḍapādīyakārikā*, or simply *Māṇḍūkyakārikā*.

The name *Gauḍa* indicates that he must have come from Gauḍadesā ("Gauḍa country"), or Bengal. On the authority of the *Śārīrakamīmāṃsābhāṣya-vārttika* of Bāla-kṛṣṇananda Sarasvatī (seventeenth century CE), it is known that in the country of Kurukṣetra (north of present-day Delhi), near the Hīravatī River, there lived a group of people who had migrated from Bengal (and hence were called Gauḍas); the most eminent among them was one Gauḍapāda. Exactly when Gauḍapāda lived has also been a matter of controversy. Some scholars place him in the fifth century CE, but this theory contradicts the traditional belief that he was Śaṅkara's teacher's teacher, for Śaṅkara is generally assumed to have flourished somewhere between 788 and

820 CE. Another assumption is that Gauḍapāda was a contemporary of Apollonius of Tyana, who traveled to India in the first century CE. This, however, is highly conjectural, and would place Gauḍapāda at an earlier, and even less likely date.

According to Ānandagiri (a pupil of Śaṅkara), Gauḍapāda lived the final part of his life in Badarikāśrama, the holy residence of Nara-Nārāyaṇa, and spent his time in deep meditation on the lord (Nārāyaṇa-Kṛṣṇa). Greatly pleased with Gauḍapāda, the lord thus revealed to him an insight into the quintessence of Upaniṣadic wisdom, which he recorded in his *Māṇḍūkya-kārikā*. Commenting on Gauḍapāda's *Āgama-Śāstra*, a certain Śaṅkara (perhaps identical with the great Śaṅkara) remarked that nondualism had been recovered from the Vedas by Gauḍapāda in order to refute the dualism of the Sāṃkhya masters.

The *Āgama Śāstra* is divided into four *prakaraṇas*, or chapters. It is regarded as a commentary on the brief, enigmatic Upaniṣad called *Māṇḍūkya*. Only in the first chapter are the *mantras* of the *Māṇḍūkya* discussed. Then the author goes on to establish the Advaita ("nondual") doctrine by arguing against the dualists, such as the Sāṃkhya philosophers, and the pluralists, such as the Nyāya philosophers. His doctrine is called the *ajātivāda*, or the "theory of nonorigination." The paradox of permanence and change is invoked to show that causation or origination of new things is unintelligible. The Sāṃkhya philosophers who say that the cause persists in, and is identical with, the effect (*satkāryavāda*), and the Nyāya philosophers who say that the cause creates the effect, which was nonexistent before (*asatkāryavāda*), oppose each other and both, thereby, are refuted; this then points toward the truth of the view of nonorigination, that is, that nothing can originate. Creation is only an illusion; the diversity of the world has only a dreamlike existence, for the ultimate reality is a nondifferential unity.

It is believed that Gauḍapāda was strongly influenced by Buddhism, especially by the Yogācāra school. It has even been suggested that the *Āgama Śāstra* is actually a Buddhist text. But while the influence of Buddhist doctrines and arguments upon Gauḍapāda is undeniable, it would be wrong to conclude that he was a Buddhist. The fourth chapter of the *Āgama Śāstra* undoubtedly includes much Buddhist material. But it is still safe to conclude that Gauḍapāda was an early Vedāntin who must have influenced Śaṅkara in the development of his celebrated nondualism.

Revised Bibliography

GAUTAMA SEE BUDDHA

GE HONG (283–343) was a Chinese writer on alchemy and Daoism. Although a number of works have been attributed to Ge Hong, the only incontestable source for his thought is his *Baopuzi* (The master who embraces simplicity). This consists today of twenty "inner chapters" on Daoist themes, fifty "outer chapters" on more Confucian topics, and an account of his own life. In both portions of his work Ge demonstrates an encyclopedic eclecticism that has caused later scholars a certain amount of difficulty in assessing his ideas.

To understand Ge Hong's intellectual orientation, it is necessary to know his cultural situation. Ge was a member of the old aristocracy that had lived in the lands south of the Yangtze since the Han dynasty and had served in the separatist kingdom of Wu that in 222 succeeded the Han in South China. The Wu state was conquered from the north by the Jin in 280, but the expulsion of the Jin court from North China by barbarian invasions in the early fourth century forced this new regime to transfer its capital to present-day Nanjing. This demoralizing cultural invasion further accentuated the southern aristocrats' loss of independent political power, for the southerners saw themselves as the true heirs of Han civilization, unlike the northern immigrants, who had abandoned much of the Han heritage. Ge at first had some hopes of a political career under the Jin, but the premature death of his patron forced him to turn increasingly to a life of scholarship. As a consequence, his writings manifest an urge to collect the various strands of the old culture of pre-Jin times and make from them a compendium of southern intellectual conservatism. Dominant in this is a defense of local occult traditions against introduced religious and philosophical ideas.

To what degree Ge, the political outsider, managed to compensate for his disappointments by becoming a master of the occult is not clear. Recent scholarship has preferred to see him as an enthusiast who derived his knowledge from written sources more than from initiation into secret lore. But Ge used this knowledge to the full to defend his thesis that any person may become a genuine immortal. In arguing against those who interpreted immortality as a symbol of liberation from human limitations and against those who believed that immortals were born, not made, Ge provides a treasure trove of information on ancient techniques for achieving immortality. Ge's references to the alchemical preparation of elixirs of immortality have attracted the atten-

tion of modern historians of science, but he provides information on much else besides: sexual and other physiological practices, the use of talismans, herbal aids to longevity, lists of occult texts, and heterodox cults to be avoided. Because by the end of the fourth century, the religious situation in south China had been transformed totally by outside influences and internal developments, the *Baopuzi* constitutes virtually the only source for this type of lore at an earlier period.

Although the exact date of the *Baopuzi* is unknown, it would appear to have been substantially completed by 317. The Jin court bestowed on Ge honorary, politically powerless appointments in the following decade, but thereafter Ge seems to have sought to distance himself from court life in favor of alchemical pursuits. He managed eventually to obtain a posting to the far south (present-day North Vietnam) in order to search for the ingredients of the elixir of immortality. He was detained en route in present-day Guangdong and remained there, on Mount Luofu, until his death. His contemporaries readily believed that this was a feigned death and that he had in fact reached his goal of immortality.

Despite the philosophical Daoist underpinnings that he provides for his repertory of techniques, Ge Hong's contributions to the development of Daoism were in a sense negligible. His approach to the beliefs that he recorded remained a purely individual one, and his writings, in all their contradictory richness, can in no way be taken as representative of the religion of any particular body of believers. Indeed, the group religious practices of his day seem to have fallen largely outside the scope of his research. Nonetheless he may be seen as the first of a number of southern aristocrats with similar concerns. Such later figures as Lu Xiuqing (406–477) and, especially, Tao Hongjing (456–536), though priests in the mainstream of Daoist belief, maintained Ge's emphasis on broad erudition and surpassed him in critical scholarship. But for Daoists and non-Daoists alike, the *Baopuzi* remained one of the most widely cited apologies for the pursuit of immortality.

BIBLIOGRAPHY

James R. Ware's *Alchemy, Medicine, and Religion in the China of A.D. 320: The Neipian of Ge Hong* (Cambridge, Mass., 1967), provides a complete translation of the "inner chapters" of the *Baopuzi* and of Ge's autobiography. Jay Sailey's *The Master Who Embraces Simplicity: A Study of the Philosopher Ge Hong, A.D. 283–343* (San Francisco, 1978) translates the autobiography, plus twenty more of the "outer chapters"; a lengthy study of Ge Hong and his thought is also appended. Neither volume is beyond criticism, but taken together they give a good picture of the diversity of Ge Hong's work.

T. H. BARRETT (1987)
Revised Bibliography

GEIGER, ABRAHAM (1810–1874), rabbi, foremost exponent and ideologue of Reform Judaism in nineteenth-century Germany and outstanding scholar of *Wissenschaft des Judentums* (the modern scholarly study of Judaism). Geiger was born in Frankfurt, where he received a distinguished, traditional Talmudic education. He was also attracted to secular studies and in 1833 received his doctorate from the University of Bonn for a work entitled *Was hat Mohammed aus dem Judenthume aufgenommen* (What did Muhammad take from Judaism?), a study that measured Judaism's influence on early Islam. In 1832 Geiger became rabbi in Wiesbaden, and there he set out to rescue Judaism from medieval rabbinic forms that he regarded as rigid, unaesthetic, and unappealing to Jews of contemporary cultural sensibilities. He did this by initiating reforms in the synagogue service and by calling, in 1837, for a conference of Reform rabbis in Wiesbaden. Moreover, he hoped to show how the academic study of the Jewish past could be enlisted as an aid in the causes of Jewish political emancipation and religious reform through the publication of the *Wissenschaftliche Zeitschrift für jüdische Theologie* (1835–1847).

Geiger became embroiled in controversy in 1838 when the Breslau Jewish community selected him as *dayyan* (religious judge) and assistant rabbi over the strong protests of the Breslau Orthodox rabbi, Solomon Tiktin. Indeed, because of this opposition, Geiger could not accept the position until 1840. Upon Tiktin's death in 1843 Geiger became rabbi of the city. There he continued his activities on behalf of Reform, playing an active role in the Reform rabbinical conferences of 1845 and 1846, held respectively in Frankfurt and Breslau.

Geiger's undiminished commitment to the academic study of Judaism and his belief in the need for a modern rabbinical seminary to train rabbis in the spirit of modern Western culture and *Wissenschaft des Judentums* led, in 1854, to the creation of the Jüdisch-Theologisches Seminar in Breslau. Geiger was bitterly disappointed, though, when the board of the seminary decided to appoint as principal the more conservative Zacharias Frankel instead of himself. It was not until 1872, two years after Geiger had come to Berlin as a Reform rabbi to the community, that his dream of directing a modern rabbinical seminary came to fruition. For in that year the Hochschule für die Wissenschaft des Judentums was established, with Geiger at its head. He remained director of this center for the training of Liberal rabbis until his death.

Geiger's scholarship was prodigious and profound. His most influential work, *Urschrift und Uebersetzungen der Bibel* (The original text and translations of the Bible; 1857), advo-

cated the methodology of biblical criticism, and a host of other scholarly and polemical articles and books displays his broad knowledge of all facets of Jewish history and culture. These publications reveal his determination to make Judaism an integral part of Western culture and indicate both his theological bent and his ability to employ historical and philological studies in the cause of religious reform.

Geiger's work, carried out in the context of *Religionswissenschaft*, pointed to the evolutionary nature of the Jewish religion and, under the influence of Schleiermacher, allowed him to focus on the inwardness of the Jewish religious spirit. Having thereby mitigated the force of tradition, Geiger was able, in terms borrowed from Hegel, to view Judaism as a universal religion identified with the self-actualization of the Absolute. He therefore downplayed nationalistic elements in the Jewish past, denied them any validity in the present, and justified Jewish separateness in the modern world by speaking of Judaism's theological uniqueness and spiritual mission. Nevertheless, Geiger, unlike his more radical colleague Samuel Holdheim, represented a moderate approach to Reform. He refused to serve a Reform congregation that separated itself from the general Jewish community, he observed Jewish dietary laws, and he urged the retention of traditional Jewish laws of marriage and divorce. In addition, he favored the observance of the second day of the festivals and, like his more conservative peer Frankel, spoke of "positive-historical" elements in Judaism.

BIBLIOGRAPHY

The best English introduction to Geiger's life and writings appears in *Abraham Geiger and Liberal Judaism*, compiled and edited by Max Wiener and translated by Ernst J. Schlochauer (Philadelphia, 1962). David Philipson's *The Reform Movement in Judaism* (New York, 1967) also contains a great deal of information about Geiger's career and thought. Geiger's own views of Judaism are summarized in a series of lectures he delivered in Frankfurt that have been translated by Charles Newburgh as *Judaism and Its History* (New York, 1911). Jakob J. Petuchowski provides interesting insights into Geiger's approach to Judaism and contrasts him with Samuel Holdheim in the article "Abraham Geiger and Samuel Holdheim: Their Differences in Germany and Repercussions in America," *Leo Baeck Institute Yearbook* 22 (1977): 139–159. Finally, Petuchowski has edited a series of essays by several eminent scholars on the meaning and significance of Geiger's career and scholarship in a work entitled *New Perspectives on Abraham Geiger* (Cincinnati, 1975).

GE MYTHOLOGY. Before Brazilian expansion diminished their territories, the widely scattered, generally independent and isolated groups that speak languages of the Ge family occupied a large expanse of the Brazilian interior, from approximately 2° to 28° south latitude, and from 42° to 58° west longitude. They are usually grouped into three branches on the basis of linguistic similarities: the northern Ge (the Kayapó, Suyá, Apinagé, and the various Timbirá groups in the Brazilian states of Pará, Mato Grosso, Goiás, and Maranhão), the central Ge (the Xavante and Xerente, in the states of Mato Grosso and Goiás), and the southern Ge (the Kaingán and Xokleng, in the states of São Paulo, Santa Catarina, and Rio Grande do Sul).

In addition to their language affiliation, the Ge-speaking groups share a tendency to occupy savanna or upland regions away from rivers, to live in relatively large semi-permanent villages, and to subsist on extensive hunting and collecting and some degree of horticulture. Compared with other lowland groups in South America, the Ge have a fairly simple material culture and very complex forms of social organization involving moieties, clans, and name-based groups. Their rites of passage are long and elaborate. Several non-Ge-speaking groups on the Brazilian central plateau also have some of these traits. Among the most important of these are the Boróro and Karajá.

The French anthropologist Claude Lévi-Strauss has convincingly demonstrated that similarities among the myths of the Americas do exist. Ge mythology is, however, significantly different in content and emphasis from that of other large language families in lowland South America (the Tupi, Arawak, Carib, and Tucanoan). The complexity of Ge and Boróro social organization, the elaborateness of their rites of passage, and the apparently secular nature of many of their narratives have challenged scholars to explain the importance of their myths. Lévi-Strauss uses Ge and Boróro myths as a point of departure in his four-volume *Mythologiques* (1964–1971; translated as *Introduction to a Science of Mythology*, 1969–1981), and some of his most careful critics have used those myths to discuss his work or to investigate the sociological context of myths in general. Ge mythology thus occupies an important place in the study of South American mythology both because of the challenges the narratives themselves present and because of the ways a number of distinguished scholars have confronted them.

NARRATIVE STYLES. Most anthropologists who write about lowland South American mythology use the word *myth* to refer to any narrative, be it cosmogonic, historical, or apparently anecdotal, because genre distinctions are difficult to establish for cosmologies that have no deities. The Ge have many different styles of oratory, formal speech, and song; the narration of myths constitutes only a small part of this repertoire. The word *myth* covers a number of distinct narrative

styles, which vary from the relatively fixed chanted texts of some Xokleng myths to fairly flexible narrative forms that closely resemble the European folktale in style and content. The definitions of genre differ from group to group. Among the Xavante, story, history, and dreams are apparently equated; other groups separate events of the distant past from those of the more recent past and again from the experience of dreams.

With the exception of some ritualized performances among the southern Ge, myths are neither secret nor restricted as to the time or place they may be told. They are often recounted at night, by men or women, to children or adults, and mix adventure, humor, ethics, and cosmogony in a way that delights the audience regardless of its age. The narrator imitates sounds and the voices of the characters with considerable musicality, and his or her gestures often add dramatic impact. Many myths have parts that are sung. Questions are often interjected by the audience, and in response the narrator may expand upon some point or another.

Ge myths published in collections are almost exclusively in the third person, but in performance they are not restricted to that format. Performance style varies greatly, which reflects the difference between an oral narrative and a written text. Many performances are almost entirely in dialogue form with a minimum of narrative explanation; the context is largely implicit, and the narrator presumes the audience has previous knowledge of the story. Members of the society have heard the stories from birth, and any given performance is an ephemeral event and so not preserved.

CONTENT AND SETTING. Compared with the mythology of the other major language groups in Brazil, Ge mythology exhibits in its subject matter little elaboration of the spirit world, an absence of genealogical myths about ancestors, and little cosmological complexity. Here Ge cosmology must be distinguished from Ge mythology. Ethnographies of the Ge societies report beliefs in several types of spirits, in an afterlife in a village of the dead, and in shamans who travel to the sky. Ge mythology, however, rarely describes either these beliefs or their origins.

One of the difficulties scholars have had in interpreting Ge myths is their apparent unrelatedness to other aspects of society, including the elaborate Ge ceremonial life. Some South American societies explain the present by referring to the way the ancestors behaved; but among Ge speakers myths rarely make direct reference to the present in their description of events that involve ethical dilemmas and social processes central to the society. No detailed native exegesis of the stories has been reported; the Ge rarely use a myth to interpret anything other than the narrative itself.

Ge mythology generally focuses on the relationships between the social world of human beings and the natural domain of the animal and the monstrous. The main actors are humans, animals, and beings that are both human and animal. The setting is usually the village and surrounding jun-

gle, although some myths relate a visit to the sky or to a level below the surface of the earth. Because the subject of the myths is the tension between correct social behavior and incorrect or animal-like behavior, rather than the establishment of a given character as a deity or ancestor, the actors of one myth very rarely appear in another. Recurrent features are not individuals but rather relationships (brothers-in-law, siblings, parents and children, formal friends), settings (the villages or the forest), and animals (deer, jaguars, tapirs, wild pigs). All these appear regularly in the myths. An exception to this singularity of character is a series of stories about Sun and Moon found among the northern and central Ge.

TRANSFORMATION MYTHS. The central event in a Ge myth is usually a transformation, involving, for example, the change of a continuity into discontinuity, as in the origin of night and death; or the acquisition of an object that transforms society, such as fire, garden crops, and ceremonies that humans are said to have obtained from animals.

The origin of fire. A good example of a transformation myth is that of the origin of fire, versions of which have been collected from most Ge communities. Lévi-Strauss (1969) and Turner (1980) have analyzed it extensively. The following version was recorded among the Suyá; for the complete version, see Wilbert (1984).

A long time ago the Suyá ate meat warmed in the sun because they had no fire. One day a man takes his young brother-in-law into the forest to look for fledgling macaws to take back to the village, where they will be raised for their feathers. The two walk a long way. The man sets a pole against a rock ledge, and the boy climbs up to look at a nest. When the man asks the boy what the young birds in the nest look like (i.e., whether they have enough feathers to survive in the village), the boy shouts down, "They look like your wife's pubic hair." (This insulting response is a very funny moment for Suyá audiences, who always laugh heartily and repeat the question and response several times for effect. The exact incident that results in the boy's being left in the nest varies among the different Ge groups.) Angered, the man throws aside the pole and leaves the boy up in the nest, where he grows very thin and is gradually covered with bird excrement. After some time a jaguar comes walking by. Seeing the boy's shadow, the animal pounces on it several times, then looks up and sees the boy. The boy tells the jaguar of his difficulty, and the jaguar asks him to throw down the fledglings. The boy does so, and the jaguar gobbles them up. Then it puts the pole against the cliff and tells the boy to descend. Although terrified, the boy finally climbs down and goes with the jaguar to its house. When they arrive, the boy sees a fire for the first time. It is burning on a single huge log. The jaguar gives the boy roasted meat to eat. A threatening female jaguar arrives. (The degree of threat varies among the different Ge groups.) The jaguar gives the boy more meat and shows him the way home. When he arrives at the village, he tells the men that the jaguar has fire. They decide to take it from the jaguar. Taking the form of different animal species, the

men go to the jaguars' camp where they find the jaguars asleep. They place hot beeswax on the eyes and paws of the jaguars, which then run screaming into the jungle. The men-animals pick up the fire log and run with it back to the village, in the style of a burity-palm log relay race. First a rhea carries the fire log, then a deer, then a wild pig, then a tapir. The frog wants to carry the log and in spite of objections is allowed to do so. The log is so hot the frog runs with it to the water and drops it in. The fire goes out. "The fire is dead!" everyone shouts in consternation. Then the toucan, the curassow, and other birds run up, their head and neck feathers bright red because they have been swallowing the live coals that have fallen from the log. They vomit the coals onto the ashes, and the fire starts up again. The tapir picks up the log again and runs with it all the way to the village. When they arrive, the men return to human form and divide the fire among all the houses. Ever since then the Suyá have eaten roasted meat.

The origin of the Savanna Deer ceremony. The myth of the man who is turned into a savanna deer by a jealous rival, representative of another type of transformation story, is cited as the origin myth of a ceremony still performed today by the Suyá; for the complete version, see Wilbert (1984).

Once, before the Suyá had learned the Savanna Deer ceremony, they were painting and preparing for a Mouse ceremony. In this ceremony the adult men take a few young women for collective sexual relations. While some of the men leap, dance, and sing, others choose the women who will take part in this activity, and take them to the men's ceremonial camp. One man is very possessive about his young wife. To prevent her from being taken as a sex partner for the ceremony, he sings standing next to her in the house. He does not leave her to sing in the men's house. Another man wants to have sexual relations with the woman and is angered by the husband's attentiveness. The angry man is a witch who can transform people or kill them. He decides to transform the woman's husband. The husband begins to sweat as he dances. His dance cape sticks to his head and will not come off. He tries to pull it off, but it has grown on and has begun to stick to his neck and back as well. "Hey!" he shouts, "I am being transformed into something bad!" He leaves his wife and goes to the men's house, where he sings all night along with the other caped singers. The next morning the singers' sisters strip them of their capes, and so the men stop dancing and singing, but the husband keeps on (he cannot stop, for his cape will not come off). The men shout at him to stop singing. He keeps dancing and singing. Suddenly he rushes off into the forest, still singing. Later his relatives go off to find him, and after several days they find him near a lake, his body bent over. The rattles tied to his legs have begun to turn into hooves. Antlers fan out above his head. He is singing. (Here the narrator usually sings the song the man-deer is supposed to have been singing.) The men who find him listen to his song. One man tells the others, "Listen and learn our companion's song," and they sit and lis-

ten. (Here the narrator usually sings the rest of the man-deer's song.) Then the husband becomes a forest deer. He still lives there at the lake. People have seen him there recently. Today the Suyá sing his songs in the Savanna Deer ceremony.

THE ANALYSIS OF GE MYTHOLOGY. Early collections of Ge myths were usually appended to ethnographic accounts of the societies, with little commentary. With the appearance of Lévi-Strauss's *Mythologiques*, however, scholarly interest in Ge mythology increased dramatically. These four volumes have engendered tremendous controversy, but they nonetheless provide an entirely new perspective on the mythology and cosmology of the Americas.

Lévi-Strauss argues that certain empirical categories, such as raw and cooked, fresh and decayed, and noisy and silent, are conceptual tools that the native populations of the Americas use to elaborate abstract ideas and to combine these ideas in the form of propositions. Amerindian mythology is thus a kind of philosophical speculation about the universe and its processes, but one that uses principles quite foreign to Western philosophy. These propositions are best discovered through an analysis that treats myths as elements of a nearly infinite body of partial statements, rather than through an analysis that isolates individual narratives. According to Lévi-Strauss, myths should be interpreted only through other myths, to establish similarities or differences. He further argues that the myths of one society can be interpreted through the myths of surrounding societies, or even through those of distant societies on the same or another continent.

Lévi-Strauss's work must be evaluated in two distinct ways. First, one must consider his comparative method. While the debate on structural analysis in anthropology and literature is extensive, much of the criticism of *Mythologiques* has centered on Lévi-Strauss's removal of myths from the contexts of the societies in which they are told, and on his preferring instead to compare them with the myths of very different societies. Lévi-Strauss (1981), writing in defense of his method of analyzing the native cosmologies of the Americas as a whole (rather than what he claims are individual manifestations, i.e., the myths of a particular society), defines his objective as being that of attempting to understand the workings of the human mind in general.

Second, one must consider whether those categories that Lévi-Strauss highlights as central to cosmologies across the Americas actually are important to specific societies. There is general agreement that they are, and some of the categories delineated by Lévi-Strauss have even proved to be keys to the analyses of the cosmologies of groups about which Lévi-Strauss had no information whatsoever. There is no doubt that the study of South American societies has been revolutionized by Lévi-Strauss's analyses of myth.

Although Lévi-Strauss's work is highly suggestive, his analyses do not answer the questions social anthropologists usually pose about myths: Why is it that a given people tells

a given story and how does the mythology relate to other aspects of the society? Few anthropologists are satisfied with analyses that treat myth, religion, and cosmology as isolated phenomena. An alternative tradition of interpreting Ge myths derives from the founders of sociological and anthropological theory: Karl Marx, Max Weber, Émile Durkheim, and their followers. A number of important works have examined the relationship between Ge myths and other features of Ge-speaking societies. These authors often use some version of a structural method derived from Lévi-Strauss, but they employ it to quite different ends. They either analyze a myth of a single Ge society or compare a myth found in different groups to show how variations in the myth are paralleled by variations in specific features of the social organization. In this way they support the argument that myths and social processes are related in particular ways.

The most systematic and challenging of these alternative analyses is the work of the American anthropologist Terence Turner (1977, 1980), who combines his reanalysis of a Kayapó myth of the origin of fire with an extensive critique of Lévi-Straussian structuralism. Turner shows that every event, object, and relationship in the fire myth has particular relevance to specific features of Kayapó social organization, social processes, and cosmology. He argues that, for the Kayapó, the telling of myths plays an important part in their understanding of their lives.

Other analysts have related myth to general ethical propositions (Lukesch, 1976), to issues of domestic authority (DaMatta, 1973), to messianic movements, and to the ways in which the Ge societies have confronted conflict and contact with Brazilian society. All these analyses take into account the social, political, and ethical contexts of which Ge myths are always a part, and they have considerably advanced the understanding of the role of myths in tribal societies.

The two very different traditions of scholarship this article has described—the study of myths as logical propositions using categories found throughout the Americas and the study of myths within their specific social context—have stimulated the study of Ge narrative itself and have also resulted in the increasingly careful collection and greater availability of adequate texts. With improved recording technology, greater interest in the performative aspects of verbal art, and the contributions of missionaries who are themselves specialists in textual exegesis, there has been a vast improvement in the accuracy of published narratives. While early collections of myths were usually narrative summaries derived from dictation in Portuguese, more recent works have included exact transcriptions of longer Portuguese versions, careful transcriptions of recordings made in the native languages, collections recorded and translated by the Indians themselves, and bilingual publications designed for use as primers by the groups who tell the myths. These improved collections will allow specialists and nonspecialists alike to better understand the myths and evaluate analyses of them.

BIBLIOGRAPHY

The outstanding English source for Ge myths is Johannes Wilbert's *Folk Literature of the Gê Indians*, 2 vols. (Los Angeles, 1979, 1984). In addition to assembling and translating the major published collections, Wilbert has indexed the 362 narratives using the Stith Thompson folk-literature motif index, which may aid comparative work. Texts collected and translated by Indians at a Salesian mission appear in Bartolomeu Giaccaria and Adalberto Heide's *Jeronomo Xavante conta mitos e lendas* and *Jeronomo Xavante sonha contos e sonhos* (both, Campo Grande, Brazil, 1975). Anton Lukesch presents an analysis of the major propositions of Kayapó mythology in *Mythos und Leben der Kayapo* (Vienna, 1968), translated as *Mito e vida dos índios Caiapós* (São Paulo, 1976). For ethnographic background on the Ge, see Curt Nimuendajú's *The Eastern Timbira* (Berkeley, Calif., 1946) and David Maybury-Lewis's edited volume *Dialectical Societies: The Gê and Bororo of Central Brazil* (Cambridge, Mass., 1979). Nimuendajú gives a detailed description of a single society, and Maybury-Lewis provides a good background on the sociological issues among the northern and central Ge. Claude Lévi-Strauss's four volumes on Amerindian mythology, published originally in French (Paris, 1964–1971), have been translated into English as *The Raw and the Cooked* (1969), *From Honey to Ashes* (1973), *The Origin of Table Manners* (1978), and *The Naked Man* (1981). My own *Nature and Society in Central Brazil: The Suyá Indians of Mato Grosso* (Cambridge, Mass., 1981) demonstrates that many of the ideas and categories Lévi-Strauss discovered through the analysis of Ge mythology are indeed to be found in other aspects of the cosmology, social organization, and values of the Suyá, one of the northern Ge groups. For a critique of Lévi-Straussian structuralism and a reanalysis of one of the Ge myths, see Terence S. Turner's "Narrative Structure and Mythopoesis: A Critique and Reformulation of Structuralist Concepts of Myth, Narrative and Poetics," *Arethusa* 10 (Spring 1977): 103–163; and "Le dénicheur d'oiseaux en contexte," *Anthropologie et sociétés* 4 (1980): 85–115. Roberto DaMatta's "Mito e autoridade domestica," in his *Ensaio de antropologia estrutural* (Petrópolis, Brazil, 1973), is an excellent example of how the analysis of a single myth common to two societies can reveal differences in their social organization.

GENDER AND RELIGION: AN OVERVIEW

The subtle patterns and dynamic of gender pervade all areas of religion, both explicitly and implicitly, whether fully recognized or unacknowledged. Widely debated and often misunderstood, gender concerns have immense significance in contemporary culture as they are part of the international political and social agenda of most countries in the world. The Gender Development Index has recorded the global monitoring of existing gender gaps since 1996, and it provides clear evidence of how much still needs to be done before a truly equitable gender balance is reached. Critical gender perspectives have made a significant difference to most academic fields, including the study of religion. Yet many scholarly publications on religion still seem to give little or no recognition to the profound epistemological, methodological, and substantive changes that contemporary gender studies, especially women's scholarship and feminist theories but also the growing field of men's studies in religion, have produced over the last thirty years. Sometimes seen as profoundly threatening, or disdainfully dismissed because of ignorance, misunderstanding, or other factors of personal and institutional resistance, the engendering of religions and their study provides a great challenge to contemporary scholarship.

The symbolic order and institutional structures created by religions have deeply affected and inspired human existence over millennia; they continue to do so for countless people in today's postmodern world. Their abiding importance is too great not to be affected by the transformations caused by the emergence of critical gender awareness as a genuinely new development in the history of human consciousness. This entry provides a general introduction to the most frequently debated issues and complex patterns that pertain between gender and religion, followed by a series of articles dealing with area- or tradition-specific discussions of gender.

WHAT GENDER MEANS AND DOES NOT MEAN. It needs to be made clear right at the start that "gender" is not a synonym for "women," although it is often mistaken as such for two reasons: first, gender studies originally developed out of women's studies and draw to a large extent on feminist scholarship in different disciplines; second, gender studies in practice remain necessarily more concerned with women than men because of the need to overcome the deeply entrenched, traditional invisibility and marginalization of women in history, society, and culture. It is essential, however, to recognize that gender studies always concern men as well as women, their respective identities, representations, and individual subjectivities, as well as their mutually interrelated social worlds and the unequal power relations between them.

Although there exists a growing movement of "men's studies," inspired by the theoretical and practical developments of women's and feminist studies, it has as yet less momentum and commands less urgency to pursue profound political and social changes, given continuing widespread male dominance and the almost universal privileging of males in most societies of the world. Thus, there often exists a considerable cognitive dissonance between women's and men's understanding of "gender studies."

Equally widespread is the failure to problematize gender and recognize its radical, multidimensional potency. Although "gender" is now a widely used term, its complex and changing meanings are seldom fully grasped or critically reflected upon. Religion and gender are highly contested fields, and both need careful mapping to bring their manifold interactions into people's awareness and into the practices of scholarship. This does not happen spontaneously but involves decisive effort and agency, requiring what has been aptly called "making the gender-critical turn" (Warne, 2000b), since gender-critical thinking is neither "natural" in the current social context nor has it been historically available before the modern era. Thus, gender awareness is grounded in a self-reflexive, critical consciousness that has to be acquired.

Gender studies first developed in the social sciences during the late 1960s and 1970s through the investigation of human sexual differences and roles. A new binary distinction came into existence in which "sex" was associated with the biological differences between women and men, whereas "gender," previously used a grammatical term for distinguishing nouns, was transferred from a linguistic to a social context in order to distinguish the historically and culturally developed interpretations of what it means to be a man or a woman in different societies and cultures. Biological sex was seen as naturally given, whereas gender was understood to have been historically and socially constructed, often influenced by dominant religious teachings.

From then on the word *gender* has been fiercely debated and given multiple meanings, leading to a plethora of theoretical positions. From gender being taken as a sociobiological category to being completely deconstructed or simply understood performatively and discursively, the transformation of gender from its former merely grammatical application to nouns into a major analytical category in the study of history and society has spurred so many analyses and specialized studies that a newcomer can get thoroughly confused. Numerous rhetorical stances of great abstraction and abstruseness have been adopted, often appearing to obfuscate more than help, with the result that the distinction between sex and gender is now less clear than first assumed. Not only is gender a "useful category of historical analysis," as Joan Wallach Scott (1996) has so persuasively argued, but it is now also a category beset by pitfalls and problems, as Judith Butler's *Gender Trouble* (1990) and many others have clearly demonstrated. "Gender" is the title of one of twenty-two

conceptual essays in *Critical Terms for Religious Studies* (ed. Mark Taylor, 1998). In this essay Daniel Boyarin states that now,

when we study gender within a given historical or existing culture, we understand that we are investigating the praxis and process by which people are interpellated into a two- (or for some cultures more) sex system that is made to seem as if it were nature, that is, something that has always existed. The perception of sex as a natural, given set of binarily constructed differences between human beings, then, is now seen as the specific work of gender, and the production of sex as “natural” signifies the success of gender as a system imposing its power. (p. 117)

A lucid discussion of different subsets within the category of gender, and of different frameworks and strategies affecting its interpretation, is found in Randi R. Warne’s article “Gender” in *Guide to the Study of Religion* (2000a, pp. 140–154; see also Juschka, 1999, 2001), describing the relationship between sex and gender as either homologous, analogous, or heterogeneous. What emerges from all these discussions is that the sex-gender distinction, however understood, is linked to binary oppositions, hierarchical ordering, and unequal access to power and resources, so that one can speak of a rigid “gender system” that has operated in most societies in the past and still exists in many in the present. The different roles and images associated with both sexes, and gender-differentiated patterns of power, status, and authority, vary enormously in different cultures, but if these have been created as well as changed in the past because of changing material and ideological conditions, it must also be possible to transform gender inequalities and gender relations in the present (Bonvillain, 1998; see chap. 8, “Gender and Religion”). This is a powerful argument for individual and societal gender transformation within a new global context of pluralism and diversity. It is this alternative—some may say utopian—vision of a different kind of reality, of greater justice and equality for all human beings of whatever sex, that has inspired social reformers and women campaigners since the onset of modernity, and some individuals much earlier than that.

GENDER STUDIES AND RELIGION. Gender studies have arrived rather later in the study of religion than in most other fields. At present there still obtains a harmful “double blindness” in which most contemporary gender studies, whether in the humanities, social sciences, or natural sciences, remain extraordinarily “religion blind,” whereas far too many studies in religion are still quite “gender blind.” It can be legitimately asked, however, what relevance contemporary gender insights may possibly have for the age-old beliefs of religion? To what extent can the study of religion benefit from the nuanced and highly sophisticated theoretical arguments of current gender debates? To give a satisfactory answer to such questions requires much conscious effort and many practical changes. Neither gender nor religion are stable, transhistorical categories; both function within specific sociohistorical

contexts and large semantic fields. The complex controversies surrounding the meaning of both prove that we are dealing here not only with definitional minefields or merely academic matters but with issues of advocacy, personal commitment, ethical engagement, and fundamental choices about the nature of one’s life and society.

Many religious teachings and practices, especially scriptural statements, religious rites, beliefs, theological doctrines, institutional offices, and authority structures, are closely intertwined with and patterned by gender differences, even when gender remains officially unacknowledged and is deemed invisible (to untrained eyes). The existing social and religious arrangements are considered “natural” or normatively prescribed by sacred scriptures and other religious teachings, handed down by tradition from the ancestors or “God-given,” and thus unalterable. It is only since the Enlightenment and the onset of modernity that the existing gender arrangements of traditional societies and religious institutions have been radically called into question, leading to the emergence of the modern women’s movement.

The first wave of this women’s movement, from the late eighteenth through the nineteenth and early twentieth centuries, forms an essential part of the great transformations of modernity. Increasingly, historical studies provide new evidence that the motivation for women seeking greater freedom, equality, and participation in all areas of society, including religion, did not stem from secular philosophical and political developments alone but was also rooted in biblical teaching, shared by Jews and Christians, that women and men are created in the image of God. This was reinterpreted in a new, strongly egalitarian way, never understood in this manner in the past (Børresen, 1995). Theological ideas impacted women reformers far more than has hitherto been acknowledged; that applies even to so radical a thinker as Mary Wollstonecraft (Taylor, 2003), and similarly radical theological reflections can be found in the writings of Florence Nightingale (Webb, 2002). Nineteenth-century Europe and America witnessed the parallel development of women’s organized social and political movements and, at the same time, the expansion of their religious activities, opening up new religious roles for women. The religious roots of the struggle for women’s rights (Morgan, 2002; Zink-Sawyer, 2003) and the complex historical dynamic operating between religious faith and feminist consciousness are increasingly receiving more attention. Existing studies have so far focused mainly on women in Christianity and Judaism, with a growing focus on Islam as well. But a great deal more comparative research is needed to show the strength of motivation arising from concurrent secular and religious commitments of women from many different religious traditions engaged in working to abolish the traditional social and religious constraints of women’s lives.

The second wave of the women’s movement, which emerged during the latter part of the twentieth century, took a strongly self-reflexive, theoretical, and critical turn, express-

ing itself in militant feminist theory and politics and celebrating “global sisterhood.” Feminism aims to overcome the universal oppression of women and to achieve their full humanity, so that women can speak with their own voices, from their own experience, their own subjectivity, agency, and autonomy—all terms that by now have become thoroughly theorized but also further problematized. Some argue that these concepts of autonomous subjectivity are themselves derived from the inherently androcentric, liberal worldview of post-Enlightenment Western thought and that they cannot be applied universally across boundaries of gender, culture, race, and class, but always function pluralistically.

There also exists a third wave feminism, sometimes referred to as “postfeminism,” not meaning the end of feminism but accepting a multiplicity of feminisms, linked to theoretical reflections on femininities as well as masculinities. A more self-critical theorizing developed under the influence of psychoanalysis, poststructuralism, postmodernism, and postcolonialism, which also affected the development of gender studies that, in turn, had evolved out of women’s and feminist studies. Feminist epistemology and theory as well as practical feminist strategies have opened up new experiences and questions that bear on gender relations in terms of both women and men. To work for greater gender justice, however understood, requires profound social, political, economic, religious, and cultural transformation for both sexes. At a practical level, therefore, gender studies impact on education and politics, on social work and care, on development work, on ecological and peace issues, on the media, and on academic scholarship. Like religious studies, gender studies are characterized by a pluralistic methodology and complex multidisciplinary. It might even be more appropriate to speak of *transdisciplinarity*, because gender patterns are so pervasive in their potential implications that they transcend traditional disciplinary boundaries. Gender studies have also a strong international orientation, and while recognizing existing social, racial, ethnic, and sexual diversities as well as many individual nuances, their central insights are immensely important and relevant across traditional national, cultural, and religious boundaries. The basic ideas of women, feminist, and gender studies first emerged in Western societies; by now they have become globally diffused and have also been considerably transformed in their intellectual and practical applications to a wide range of social and religious issues within very diverse local contexts around the world.

CENTRAL CONCEPTS AND CONCERNS. Much of the feminist critique of society and culture focuses on patriarchy and androcentrism. Although the word *patriarchy* often refers to diverse theories of history and society, now often discredited, in the widest sense patriarchy means an all-male power structure that privileges men over women. Most religions still conform to this pattern in terms of their institutional organization and official representation. Moreover, most religions were founded by men, although there also exist a few women-led religions, especially among marginal, small-scale, and tribal groups (Sered, 1994). In most religions male reli-

gious figures (whether ascetics, monastics or yogins) and male religious communities are normally given more public recognition, respect, authority, and power than women’s religious groups, however numerous and large. Similarly, traditional religious texts are almost exclusively the creation of men, and male interpretations of these texts hold authoritative status. The experience of men has been taken as normative without taking into account the experiences and thoughts of women, who are relegated to subordinate roles or, at worst, are completely suppressed in many foundational religious texts and excluded from significant religious rites. It is worth mentioning that the word *patriarchy* itself is of religious provenance, since it originally described “the dignity, see, or jurisdiction of an ecclesiastical patriarch” and “the government of the church by a patriarch or patriarchs” before it came to mean “a patriarchal system of society or government by the father or the eldest male of the family; a family, a tribe or community so organized” (*Oxford English Dictionary*). Patriarchy can also be understood as the structuring of society around descending hierarchies of fatherhood, whether understood as Father God, the supreme authority of a king, a lord, or *paterfamilias*. In recent theoretical debates, especially those influenced by Freudian psychoanalysis and French feminist theorists, much use is made of the concept of “phallogocentrism,” referring to the structuring of society around the values of the phallus as the ultimate symbol of power and activity, so that women represent absence, lack, and passivity. Another term is “phallogocentrism,” that is to say the *logos*, word and thought, is centered on phallic male categories. Other debates have contrasted the historically dominant patriarchies across the world with earlier social structures of matriarchies, probably largely hypothetical, symbolizing alternative values and power structures linked to the authority of the mother rather than that of the father and centered on the worship of the Goddess. Today’s feminist scholars generally regard the term *matriarchy* as misleading while discussing with renewed interest whether *prepatriarchal* societies ever existed and to what extent Goddess worship correlates with women’s religious and social leadership (Gross, 1996; Raphael, 1996).

Religious beliefs, thoughts, and practices are not only profoundly patriarchal but often also thoroughly *androcentric*, that is to say predominantly, if not exclusively, shaped by male perspectives and experiences. Androcentrism, a term first introduced by the American sociologist Lester F. Ward in 1903, not only refers to the privileging of the human male, especially in language and thought, but also means that male experience has been one-sidedly equated with all human experience and taken as a universal norm by men and women alike, without giving full and equal recognition to women’s knowledge and experience. The use of *man*, the male and masculine, as a universal category for the generically “human,” is exclusionary since it erases women as subjects. The opposite of androcentrism is *gynocentrism*, the privileging of female experience and perspective, which is comparatively rare. Another widely used term is *sexism*, referring to

the organization of social life and attitudes that not only sharply differentiates between different gender roles but also privileges and values one sex over the other. Juschka (2001, pp. 2–3) makes a helpful distinction between *androcentrism* as a falsifying male perspective and actual *misogyny* as an active negative attitude toward women as *female*. The inherent androcentrism of the study of religions was pointed out early in the pioneering collection of essays *Beyond Androcentrism* (Gross, ed., 1977).

Whereas sex is usually understood in a binary way, as consisting of two mutually exclusive categories of male and female, feminists have used gender in association with difference and diversity, in terms of multiple, rather than single, versions of femininities and masculinities that call into question general claims about women and men. Thus “the concept of gender has served as a flexible container for difference. . . . Lacking any stable content, the categories ‘women’ and ‘men’ acquire meaning through their use in particular contexts” (Bondi and Davidson, 2002, p. 336). As gender is not a stable essence but a fluid category linked to identity creation, world building, and boundary maintenance of social roles, it may be preferable to use an active, dynamic verb rather than a noun. “Engendering” is an action linked to perceiving, performing, reflecting, and enacting, and it is therefore more appropriate to speak about “(en)gendering religion” (Warne, 2001) or “doing gender in religion” than to speak about gender *and* religion in an additive manner. Religion and gender are not simply two parallel categories that function independently of each other; they are mutually *embedded* within each other in all religions, suffusing all religious worlds and experiences. It is because of this deep hidden embeddedness that gender is sometimes so difficult to identify and separate out from other aspects of religion until one’s consciousness is trained into making a “gender-critical turn.”

In terms of intellectual developments, a double paradigm shift has occurred. The first happened when women’s studies—descriptive, phenomenologically and empirically oriented—developed into more critical, self-reflexive, and theoretically oriented feminist studies. The second paradigm shift has taken place with the further development of feminist studies into gender studies. But “paradigm shift” is too tame an expression for what is really happening, which is a shaking of foundations, a radical remapping of our intellectual, academic, and social landscapes. It has become increasingly obvious that it is not simply a question of bringing women’s experience and knowledge into view but of radically restructuring the existing balance between genders. As in many other fields, we are not simply dealing with a reinterpretation of texts and traditions but with a complete repositioning of bodies of knowledge, a rearrangement and remapping of everything that relates to religion, society, and culture. As women’s studies and feminist studies of religion have gained more institutional recognition over recent decades, some women scholars feel resistant toward gender

studies because their development may mean the loss of some of the recent gains made. But feminist separatism apart, many female, and some male, scholars now work within a gender-critical framework and use gender-inclusive rather than exclusive models in their thinking. Strongly articulated gender theories possess considerable explanatory power and potential for the study of religion. Gender studies can of course be appropriated for conservative ends, even fundamentalist purposes (Hawley, 1994; Jeffery and Basu, 1998), or they can be used to reinforce androcentric bias through focusing on the analysis of masculinity without taking feminist theoretical insights into account. Gender studies in religion thus represent a complex field of many contradictory parts still in need of much further development, but they also hold much promise for new creative perspectives and approaches in religious scholarship.

NEW METHODOLOGIES AND SCHOLARSHIP. The introduction of feminist perspectives into the study of religion has been celebrated as an epistemological as well as a spiritual revolution. The rise of feminism relates both to an academic method and a new social vision (Gross, 1993, pp. 291–304). Female religion scholars have developed a practical “participatory hermeneutics,” involving advocacy and personal engagement, as well as a theoretically sophisticated “hermeneutics of suspicion,” which critically examines all traditional knowledge and practices of religion. These have to be thoroughly analyzed and deconstructed so that unequally weighted gender differences become clearly visible and reconstructed in a different way. June O’Connor (1989) has defined this task as “rereading, reconceiving and reconstructing religious traditions.” By “rereading” she means that religious phenomena have to be examined with regard to women’s presence and absence, their words and silences; “reconceiving” requires the retrieval and recovery of lost sources and suppressed visions, the reclaiming of “women’s heritage”; “reconstructing” the past draws on new paradigms for thinking, understanding, and evaluating it differently. These expressions point to a dynamic of transformation, indicating that a profound change in thought and social structures is deliberately sought and worked for.

The development of women’s studies in religion thus counteracts the deficiency and partiality of scholarship by retrieving women’s forgotten histories and buried voices, their unacknowledged experiences hidden in the official histories of the past. Critical feminist theories were developed, based on the specificity and difference of women’s experience, leading to endless debates, especially as some forms of “cultural feminism” claimed that women’s experience is not only different from men’s but morally and perhaps even spiritually superior to that of men, a theme that goes back at least as far as the Romantics.

Critical gender studies in religion have conclusively demonstrated that there are no gender-neutral phenomena. Everything is subtly, and often invisibly, patterned by a gender dynamic operating in language, thought, experience, and

institutions. Traditional religiously defined and socially prescribed gender roles, if rigidly enforced, can become dehumanizing prisons, even though anthropological, historical, and comparative studies provide overwhelming evidence that gender roles are also remarkably fluid across different religions and cultures. At the present stage of humanity's global experience it is no longer possible to work with exclusive, hegemonic models of language, thought, or anything else, derived from only one gender. Historical descriptions, analyses, and theories need to take all genders and their differences into account, whether shaped by race, class, culture, religion, sexuality, or other identity markers. The theorization of multiple voices, of subjectivity and agency, of difference and identity, of standpoints and positionality, of liberation and transformation, is central to feminist thought. Its debates have anticipated several of the critical stances of postmodernism in destabilizing categories and in arguing against essentialist and universalist stances. Feminists have pioneered new epistemological insights, not only in terms of *what* we know but *how* we come to know, how knowledge is constructed, psychologically as well as socially. These theoretical advances of feminist theory have deeply influenced men's studies, leading to a new understanding of the construction of maleness, manhood, and masculinities. Both women's studies and men's studies, although approached from different gender perspectives, have to work in a gender-inclusive rather than gender-exclusive way in order to achieve further intellectual and social breakthroughs. At present, however, maleness has not yet been theorized to the same extent as femaleness.

Women's and men's studies in religion are both marked by critical and constructive approaches. There is the question of what remains *usable* of the past when religious texts and histories are reread from a critical gender perspective. The impact of gender analysis, coupled with an ethical commitment to gender justice, will lead to a deconstruction as well as a reconstruction of religious traditions and practices. At present this process has barely begun, and setbacks are unavoidable. Moreover, the deconstruction of an essentialist understanding of masculinity is only in its early stages (Doty, 1993; Berger, Wallis, and Watson, 1995). "Men doing feminism" (Digby, 1998), though still a largely Western project, is bound to gain momentum and widespread diffusion across contemporary cultures. More inclusive, critical "gender thinking" will therefore dislocate individual and social identities, creating the possibility for new social arrangements and new religious developments across the globe. Men's studies in religion have produced innovative research on religion and masculinities, male sexuality and spirituality, and male identities and bodies in relation to the gender-sensitive understanding of God and divinities (Eilberg-Schwartz, 1994; Boyd, Longwood, and Muesse, 1996; Krondorfer, 1996; Bradstock, Gill, Hogan, and Morgan, 2000), but there is still a long way to go before these developments catch up with women's studies in religion.

Yet further thinking is represented by queer theories, primarily debated within gay, lesbian, and feminist theo-

gies dealing with sexuality and the production of raced and gendered bodies, much influenced by Michel Foucault's influential work on the history of sexuality. Such theories call into question how what counts as "normal" heterosexuality comes into existence, is legitimated and maintained as well as transgressed and subverted, so that concepts of identity, power, and resistance have to be critically reexamined. The "queering" of religion raises many ethical and theological questions, not fully discussed at present, so that it is still too early to predict whether queer thinking will have the same influence as feminist theories on what is a complex new field of scholarship in the study of religion (sometimes also called LGBT studies, relating to lesbian, gay, bisexual, and transgendered people) with far more resources on the web than in existing gender studies on religion. For an introduction to these discussions see *Fear of a Queer Planet* (Warner, 1993) and *Religion Is a Queer Thing* (Stuart, 1997).

Such studies from radically different perspectives highlight in a new way how monotheistic systems are male dominated and heterosexually structured (Boyarin, 1997) and how the "queering" of the body relates to wider issues of ordering gender relations, society, and configurations of power linked to ambiguous religious histories and teachings. It is therefore to be welcomed that new body theologies are being developed from both male and female perspectives (Nelson, 1992; Raphael, 1996; Isherwood and Stuart, 1998). These have their roots mainly in Christian thinking, but many other religious traditions possess rich resources for constructing alternative approaches to the body and its religious significance. For Asian perspectives see the SUNY (Albany) series on "Body in Culture, History, and Religion" edited by Thomas P. Kasulis and his colleagues. Contemporary Western discussions, marked by fluid postmodern instabilities and much experimentation, are continuously evolving in this area, so that new concepts such as "transgender" and "omni-gender" are created to illuminate, and perhaps even to overcome, the multiple but still oppositional meanings of gender (Mollenkott, 2001).

Women's religious lives and roles in different religious traditions across the world, previously rarely examined at all, have now been studied from many different perspectives. A pioneering publication was *Unspoken Worlds: Women's Religious Lives* (Falk and Gross, eds., 2001, originally published in 1980 and subtitled *Women's Religious Lives in Non-Western Cultures*), followed by many others on women's roles and rituals in different religions, the records and writings left by women, and their exclusion or participation in religious rites and institutions. *An Anthology of Sacred Texts By and About Women* (Young, ed., 1994) was another milestone, presenting important scriptural sources on women in the major religious traditions, including women's own voices. Several recurring themes reveal the ambiguities affecting the image of women cross-culturally, such as the widespread association of women with both evil (through their body, sexuality, menstruation taboos, and death) and wis-

dom; sex role reversals in mythical and other stories of gender conflict; the figure of the ideal and exceptional woman; and the existence of many female religious experts, recognized for their charismatic authority without, in most cases, holding official institutional roles. Further evidence of casting women into particular stereotypes and make them submit to the moral rules of male-dominated society, often enforced by the teachings of religion, is provided by *Female Stereotypes in Religious Traditions* (Kloppenborg and Hanegraaff, eds, 1995). An absolutely indispensable reference work, and pioneering achievement, is the two-volume *Encyclopedia of Women and World Religion* (Young, ed., 1999), reflecting the diversity and richness of current theoretical debates and empirical data in contemporary scholarship on women's, and to some extent also men's, studies in religion. There exists no comparable reference work yet that offers a similar summation of gender studies and men's studies in religion.

Several feminist scholars have attempted feminist reconstructions of religious traditions as different as Judaism, Buddhism, and Sikhism, as well as Christianity, and the number of gender-critical studies on Islam and other traditions is also steadily growing. Some essay collections reflect constructive efforts in reinterpreting several religious traditions (Cooey, Eakin, and McDaniel, 1991), but most feminist challenges have been addressed to Judaism and Christianity, especially in North America and Europe. The rise of ever newer forms of feminist theologies has spawned remarkable voices of difference, from womanist to *mujerista* and Asian-American theologies, which have given birth to women doing Christian theology around the whole world, from Asia to Africa, Australia to Latin America, Europe to North America. The most challenging theoretical questions facing feminism and gender studies, admittedly from a largely Western point of view, are discussed in *Feminism in the Study of Religion: A Reader* (Juschka, ed., 2001). The pluralism of methods and interpretive strategies in current gender thinking on different religious experiences, texts, histories, and practices is evident from *Gender, Religion and Diversity: Cross-Cultural Perspectives* (King and Beattie, eds., 2004). By taking up a self-reflexive, critical position, several contributors to this volume, both female and male, show that these debates are more than sophisticated academic arguments; in practical terms they involve a strong commitment to gender justice and social transformation, whether in Judaism, Buddhism, Hinduism, Christianity, or Islam in different parts of the world.

This is not the place to pursue a trenchant critique of the androcentrism and defectiveness of previous scholarship, but the above examples provide ample evidence that now, when women are no longer merely occasional objects of male inquiry but have acquired the necessary academic education, professional training, and expertise to pursue the study of religion at all levels, they have increasingly become scholars in their own right who critically examine themselves as objects of analysis and debate. This historically recent development has led to new questions in the study of religion, which in

turn have produced masses of new data and theories, opening up yet more new research fields. With the arrival of gender studies, this process has crossed yet another threshold of complexity that will contribute to an eventual thorough re-mapping of the entire field of religion and radically alter some of its underlying research presuppositions. The influential paradigm established by Mircea Eliade, reflected in the very existence of this encyclopedia, has received much scholarly comment and criticism, but these have not yet thoroughly addressed the hidden gender imbalances and implicit androcentrism of his entire *oeuvre*. Except for some brief essays (King, 1990; Christ, 1991, 1997: pp. 80–86), the defective construction of his *homo religiosus*, who remains quite literally “religious man” without including the religious worlds of *femina religiosa*, has not been sufficiently critiqued, and the specific dynamic of gender relations underlying his *Patterns in Comparative Religion* also awaits further deconstruction.

SIGNIFICANT RESEARCH THEMES. A critical analysis of religious texts, histories, and historiographies in terms of their embedded “lenses of gender” (whether androcentrism, essentialism, or gender polarization) raises some intriguing issues. These can be grouped into three systematic clusters of research themes that contemporary scholars pursue from historical, phenomenological, philosophical, and comparative perspectives. Related to external and internal aspects of religion, these topics reveal the interstructured personal and institutional dynamics of power, authority, and gendered hierarchies that have patterned religious life in many different and often subtly invisible ways throughout history.

The first cluster concerns primarily, though not exclusively, the social and institutional aspects of religion with regard to the respective roles and status that different religious traditions accord to men and women. What access do women have to full participation in religious life, to religious authority and leadership, when compared with that of men? Have women formed distinct religious communities and rites of their own where their independent authority is acknowledged and not abrogated by male hierarchical structures? Are specific religious rites gender inclusive or exclusive, and which are the ones that exclude either women or men? Do both sexes have the authority to teach and interpret the foundational texts and central practices of the tradition? Comparative historical studies show that generally women hold higher positions in archaic, tribal, and noninstitutionalized religions than in highly differentiated traditions that have evolved complex structures and hierarchical organizations over a long period of time. Women magicians, shamans, healers, visionaries, prophetesses, and priestesses are found in primal and ancient religions, and in tribal and folk religions today. Comparative studies also provide much evidence that, during the formative period of a religion, at the time of a new religious founder or prophet when a “discipleship of equals” (Schüssler-Fiorenza) may exist, women often have a more egalitarian position, greater influence, and even leadership, whereas subsequently they are often relegated to

secondary roles, losing much of their independent agency. Examples are found among women in early Buddhism, in the Jesus movement and early Christianity, or among the women associated with Muḥammad's work, or with nineteenth-century Christian missionary movements. Women religious founders and leaders are comparatively rare. They are more prominent in new religious movements that have come into existence in quite different religious and cultural contexts since the nineteenth century (e.g., Miki Oyasama and Mary Baker Eddy, founders of Tenrikyō and Christian Science, respectively; other examples are women leaders in African and South American new religions). Women can rise to religious leadership more easily within small religious groups outside the mainstream tradition, but modernity has also created space for many new religious roles within the mainstream (Wessinger, 1996). The charismatic, rather than institutional, authority of women is recognized in both traditional and new religions, but today a greater number of women religious leaders and teachers exist than in the past (Puttick, 1997; Puttick and Clarke, 1993). Several Christian denominations now ordain women as priests, and modern Hinduism knows of many women gurus, such as Ananda Mayi Ma and others.

The second cluster of research themes centers on the fluid area of religious language and thought, raising challenging questions about the entire symbolic order and the role of the imaginary in religion. How are male and female gender differences discursively constructed, culturally inscribed, and socially reproduced? Do different sacred scriptures and religious traditions project images of women as strong and powerful as those of men? Or does their language remain exclusive and androcentric, subordinating, disempowering, excluding, and oppressing women? What are the gendered patterns and symbols of their language of creation and salvation? How are the sacred, ultimate reality and the divine conceptualized, and how is feminine and masculine sacrality understood and valued? The evaluative gender hierarchy of religious language is equally inscribed in religious attitudes to the body, sexuality, and spirituality (for Jewish perspectives on body, sexuality, and gender see Eilberg-Schwartz, 1994; for Christian perspectives see Brown, 1988; Thatcher and Stuart, 1996; the gendered patterns of relations between sexuality and the sacred are richly documented by Nelson and Longfellow, 1994; Raphael, 1996). The widespread sacralization of virginity, and the spiritually privileged position accorded to asceticism and monasticism in many religions, especially in Jainism, Buddhism, and Catholic Christianity, have fueled profoundly misogynist views in the gender dynamics of numerous religious traditions, but a comparative-critical study of these phenomena from a self-reflexive gender perspective still remains to be written.

The narrow prison of gender symbols encloses the historically and socially located human perceptions of divine immanence and transcendence. Dominant androcentric images of God have been symbols of power and oppression not

only for many women but also for many colonial people. Now recognized as limiting rather than liberating, they are radically called into question by contemporary theologians of both sexes, especially Jewish and Christian feminists. Where are the symbols and images of a feminine Divine, the female figures of wisdom, of the Spirit? Analyzing religious texts and teachings from a female gender perspective can lead to surprising new insights into human experience of the Divine, whether in gendered patterns of mystical experience or in the intimate presence of the Spirit within our bodies and in the natural world, as recognized by contemporary ecofeminism and the new ecofeminist spirituality (Adams, 1993; Cuomo, 1998). Discussions about the possibility and necessity of a divine feminine, accompanied by a revalorization of the body and the maternal, take central place in the lively debates of contemporary critical philosophers and theologians (Jantzen, 1998). These have been much influenced by the linguistic turn of postmodernism and the rise of psycholinguistics, especially its revolutionary use by French feminist theorists (Irigaray, Kristeva, Cixous, and others), which has strongly impacted Western philosophers of religion (Anderson, 1998; Jantzen, 1998; Joy, O'Grady, and Poxon, 2002, 2003). Feminist philosophers of religion are now engaged in sharply critiquing a traditionally almost exclusively male discipline shaped by problematic biases of gender, race, class, and sexual orientation. Different feminist theologians and biblical scholars have also taken up the topic of gender with much vigor (see Sawyer, *God, Gender and the Bible*, 2002).

A third cluster of research questions relates to the usually least visible (except for outward religious practices, and perhaps also spirit possession), the most internal, personal aspects of religion, that is to say religious and mystical experiences. How far are these differently engendered? To what extent are their occurrences, descriptions, images, and symbols gender specific? Are men's perception and pursuit of spirituality often quite different from women's spirituality? These questions can be applied to both the continuing and cumulative experience of ordinary day-to-day religious practice and to the extraordinary experiences of religious virtuosi, such as saints and mystics. Most religions seem to validate the ordinary lives of women in terms of domestic observances and family duties rather than encourage their search for religious knowledge and spiritual perfection. How far do different traditions prohibit or encourage women to seek a spiritual space of their own and follow demanding spiritual disciplines in the same way as men? By rejecting traditional sociobiological gender roles through becoming ascetics, yoginis, *sannyasinis*, or nuns, Jaina, Buddhist, and Christian women have pursued nontraditional, and sometimes extraordinary, paths of spiritual devotion and attainment, although the gendering of Hindu renunciation is a mostly modern phenomenon (Khandelwal, 2004). Women had to struggle to create their own religious communities; their gender always provoked male resistance to their claim to autonomy and power, so that their activities remained controlled and constrained by

male hierarchies. Nowhere is this more evident than in the rich lives of Christian nuns in whose cloisters and convents appeared outstanding women scholars, mystics, artists, political activists, healers, and teachers over many centuries, whose biographies often reflect intensive gender struggles over power and authority (McNamara, 1996), also evident from the critical study of Christian mysticism (Jantzen, 1995).

It is especially the area of women's religious experience, in both the ordinary sense of religious devotions and duties and the special sense of a particular religious calling, that provides a rich field for contemporary research. It is important to investigate also the strongly affirmative and life-sustaining resources that countless women have found through the ages, and still find today, in a faith transmitted to them through the beliefs, practices, and spiritual heritage of a specific religious tradition. Such research provides a counterbalance to the more restrictive and oppressive role that religion has played in many women's lives.

Moving from religious experience and practice to the systematic articulations of faith that produced a wealth of philosophical and theological learning in all religious traditions, we largely meet worlds *without* women, as is all too evident from sacred and scholarly literatures, official histories of religious institutions, and more recently the historiographies and research monographs of Western scholars of religion (King, 1993). Women's religious worlds, experiences, and thought have on the whole made few contributions to these developments until the modern period. Gender studies and other intellectual advances have awakened us to such important themes as self and subjectivity; human identity and representation; authority and power relations; masculinity and femininity; body, sexuality and spirituality; and how to think and speak of ultimate reality and human destiny, of individuals and community, in a newly gendered, and sometimes transgendering, way. Feminist theologians and theologians have reimaged God and Goddess or explored affinities with process thought (Christ, 2003); they have suggested alternative conceptualizations using androgynous and monistic models for ultimate reality; they have reshaped religious rites and invented new ones through creating either separate women's rituals or more inclusive liturgies. Many contemporary changes in religious practice are the result of an altered gender awareness, but many further social and institutional transformations of a more substantial kind are still needed. Discussions about the relationship between immanent, contingent gender experiences and perceptions of transcendence and divine otherness, or the nature of the sacred and numinous, continue unabated. However, too often these are still predicated on an essentialist dualism between the spirit as masculine and the body, whether female or male, as feminine, and they often perpetuate the traditional appropriation of the realm of transcendence and the spirit by men.

The above discussion of a wide range of research themes shows that a rereading of religions from a critical gender per-

spective reveals the existence of gendered texts and traditions, gendered hierarchies of power, gendered symbols of the sacred, gendered bodies and minds. The analysis of this wealth of new material is a truly daunting task and remains an ongoing one. There also arises the central question of whether gender studies in religion will be able to make a significant contribution to creating a postpatriarchal world by moving from dualistic and exclusive gender constructions to new social projects of gender reconciliation, implying profound personal and social transformations.

PROMINENT CONTEMPORARY DEBATES AND NEW DIRECTIONS. The relationship between gender and religion is still made more complex through debates about diversity and difference, a concept much hyped by postmodernism ever since Derrida's "*différance*" highlighted the disjuncture between objects of perception and their meanings as symbols or representations. Difference can mean many things; among others it can stand for a multiplicity of voices and meanings, for varied subject positions of the same individual, or it can negate the possibility of any particular authoritative account. It thus undercuts any essentialist position in debates about race, gender, and ethnicity. "Diversity" is sometimes used interchangeably with "difference," but they are conceptually distinct:

Difference carries negative value baggage, while diversity differentials are captured by difference. The trick is to recognize difference as a fragmentation into insignificant units of resistance. By holding onto a concept of difference nuanced by a concept of diversity, significant political and intellectual action against oppression remains effective. (Juschka, 2001, p. 430).

The recognition of diversity has led to the realization that everywhere pluralities abound whereas singularity is rare. Thus, gender studies, feminisms, feminist theologies, sexualities, spiritualities, and many other categories are now more often expressed in the plural rather than the singular.

Difference is also correlated with "otherness," not only that of different experiences and social locations, of gender orientations and identities, but the multiple "otherness" of religious differences within and across specific cultures; there is the diversity of methods and approaches in understanding such differences; there is the "otherness" of one gender to another, especially the "otherness" of women for men, as traditionally understood. The social and political violence exercised by the West toward the "otherness" of "non-Western" cultures, whether through imperialism, orientalism, or neo-colonialism, has come under fierce criticism that also impacts the gender and religion debate (Armour, 1999; Donaldson and Kwok, 2002). The history and concerns of feminist theory have to some extent paralleled those of postcolonial theory. Writing from the perspective of postcoloniality, feminist researchers perceive woman as a "colonized" subject relegated, like subject people of former colonies, to the position of "other" under various forms of patriarchal domination. The "epistemological violence" of Western religious and theologi-

cal discourse toward other cultures and religions has come under fierce critique, as have debates about racial differences, which are being subverted through critiquing whiteness and its false neutrality, theorizing white also as “race” or de-emphasizing the importance of the category of “race” altogether. The essentialist understanding of race characterizes what is now called Whitefeminism, and new critiques of limited, essentialist perspectives of Whitefeminist theory and Whitefeminist theology, as well as religious studies theory, are being developed (Armour, 1999; Keller, 2004). One can argue, especially from the universalist, inclusive vision inherent in many religions, that there exists only one race, and that is the human race. One of the most significant issues is who has been counted as “human” in the past and who was marginalized as “other,” “outsider,” “barbarian,” and “nonhuman.” This raises the burning question of what it really means to be a human person today in the light of critical gender thinking (Nelson, 1992; Smith, 1992) and when taking into account all the other differentiations that pattern our multicultural, multiracial, and religiously plural global world.

Contemporary discussions are deeply affected by the processes of globalization, which produce transformative resources for religious worldviews, interreligious contacts and communication, and the international study of religions. Many of these depend on the globally diffused use of English, criticized by some as neocolonial form of dominance. These arguments are also present in gender debates, since more writings and scholarly communications about gender and its relevance for religion take place in English than in any other language. In postcolonial writing the “alchemy of English” (Kachru, 1986) is widely debated. Its usefulness as a non-native medium of communication is its perceived “neutrality” in that it cannot be automatically aligned with particular indigenous religious or ethnic factions, and therefore can be used just as much for imparting local, non-Western values as Western values. Thus, it is rather one-sided to see this hegemony of one Western language above others mainly negatively, for the global use of English can also be valued positively as an enabling means of wider communication and an empowering challenge for social and personal transformation. In the gender debate, people whose mother tongue is not English may initially feel at a disadvantage, but native English speakers are not necessarily better off, because a critical gender awareness always requires a new perception and the learning of a new vocabulary, linked to new attitudes and changed practices. Learning to make the “gender-critical turn” is an ongoing self-reflective process that everyone who embarks on the exciting journey of gender exploration must undergo, whatever their language.

These multiple new perspectives, now increasingly subsumed under “postcolonial studies,” have spawned lively controversies on race, gender, ethnicity, nationalism, orientalism, discourse, body, and other topics, creating numerous formulations of hybridity rather than genuinely correlative

or integral frameworks. These controversial ideas have also considerably influenced religious studies theory, although it is presently impossible to assess whether this tendency to identify ever more differences will have any lasting intellectual or practical impact on gender and race relations. Concepts of difference and diversity are also much discussed by feminist theologians seeking to account more appropriately for religious diversity and pluralism in feminist theological discourse.

Many further issues, whether theoretical or praxis-oriented, can only find brief mention. The influential critical theory of the Frankfurt School has itself been critiqued by feminists for its gender essentialism, although its male practitioners provide valuable insights into woman-as-object of masculine thought. Challenging the oversights of critical theory, Marsha Hewitt (1995) contends that it nonetheless possesses considerable emancipatory potential for feminist theology and religious theorists. Yet one can also argue that excessively complex theoretical elaborations remain ultimately barren and are just another example of the violence of abstraction. Faith-engaged activists in different religious groups and basic communities are consciously praxis-oriented in fighting the gendered pattern of violence against actual human beings, so starkly apparent in numerous contemporary conflict and war situations. The study of gender, religion, and violence has attracted increasing interest, and so has the topic of human rights and religion, including a growing awareness of women’s human rights in relation to their religious traditions and cultures, whether Hindu, Buddhist, Muslim, or other (Jeffery and Basu, 1998; King, 2004; Svenson, 2000). The Malaysian scholar-activist Sharon Bong argues that although problematic in challenging the secularity of human rights discourse, it is essential, in fact “a moral and political imperative to negotiate women’s human rights with cultures and religions,” in order to complement other strategies for their empowerment (Bong, 2004, p. 241).

Also of great concern is the topic of religious fundamentalism, where research is only beginning to pay attention to gender differences, especially how women are affected by fundamentalist teachings and practices of different religions (Hawley, 1994; Howland, 1999) and the efforts made by conservative and Christian evangelical groups in redefining traditional gender roles in the light of changing social practices (DeBerg, 1990).

Randi Warne concludes one of her gender articles by saying:

As long as we distinguish humans as “women” and “men,” and as long as these distinctions carry symbolic meaning and cultural authority which shape human life possibilities, the concept of gender will be essential to any adequate analysis of religion. Gender as an analytical category, and gendering as a social practice, are central to religion, and the naturalization of these phenomena and their subsequent under-investigation have had a deleterious effect on the adequacy of the scholarship

that the scientific study of religion has produced. Until the scientific study of religion becomes intentionally gender-critical in all of its operations, it will unwittingly reproduce, reify and valorize the nineteenth-century gender ideology which marks its origins, rendering suspect any claims to the scientific generation of reliable knowledge it seeks to make. (2000a, p. 153)

This is a bold statement, except that religion and gender do not concern the production of reliable knowledge alone. The reworking of language, thought, and theories, of knowledge and scholarship, are essential, but not sufficient, for creating a profoundly different, more gender-just and equitable world for all humans peopling this globe. To rethink sex, gender, and religion, we have to imagine that creative alternatives are available and that a nonhierarchical, more caring and participatory world can come into existence that is not aligned along a single, masculine model of sameness, but offers more spaces for rich cultural and religious differentiation. I agree with Christine Delphy that “perhaps we shall only really be able to think about gender on the day when we can imagine non-gender” (quoted in Juschka, 2001, p. 422).

The rich variety of gender entries on specific religious traditions that follow this article amply demonstrates that critical, transformative gender perspectives now affect the study of all religions and are consciously being taken up cross-culturally by scholars of both genders. Their research has created challenging perspectives of enquiry and produced a wealth of new scholarly work, as is evident from the following bibliography and those supplied on each religious tradition.

BIBLIOGRAPHY

Gender as an Analytical Category

Nancy Bonvillian, *Women and Men: Cultural Constructs of Gender* (Upper Saddle River, N.J., 1998); Judith Butler, *Gender Trouble: Feminism and the Subversion of Identity* (New York and London, 1990); Joan Wallach Scott, “Gender: A Useful Category of Historical Analysis,” *American Historical Review* 91, no. 5 (1986): 1053–1075; reprinted in *Feminism and History: Oxford Readings in Feminism*, edited by Joan Wallach Scott, pp. 152–180 (Oxford and New York, 1996). A very helpful, lucid account about locating and refiguring

gender is provided by Liz Bondi and Joyce Davidson, “Troubling the Place of Gender,” in *Handbook of Cultural Geography*, edited by Kay Anderson, Mona Domosh, Steve Pile, and Nigel Thrift, pp. 325–343 (London, Thousand Oaks, New Delhi, 2002); for the politics of interpretation regarding sex and gender see Terrell Carver, *Gender Is Not a Synonym for Women* (London and Boulder, Colo., 1996).

The problematic nature of masculine gender constructions is discussed in Maurice Berger, Brian Wallis, and Simon Watson, eds., *Constructing Masculinity* (New York and London, 1995) and William G. Doty, *Myths of Masculinity* (New York, 1993); see also Tom Digby, ed., *Men Doing Feminism* (New York and London, 1998). For a provocative philosophical enquiry into gender dualities and the gender system in relation to conceiving humanity and the communal project of democracy, see Steven G. Smith, *Gender Thinking* (Philadelphia, 1992).

Reference Works

Maggie Humm, *The Dictionary of Feminist Theory*, 2d ed. (Upper Saddle River, N.J., 1995) helps to clarify many basic concepts and theories of the social sciences that have impacted the study of religion. For historical and descriptive details on women in different religious traditions, see the series edited by Arvind Sharma and Katherine K. Young, *The Annual Review of Women in World Religions* (Albany, N.Y., from 1991 onwards). Theoretical and methodological issues are addressed in *Feminism and World Religions*, edited by Arvind Sharma and Katherine K. Young, (Albany, N.Y., 1999) and in *Methodology in Religious Studies: The Interface with Women’s Studies*, edited by Arvind Sharma (Albany, N.Y., 2002). Much historical data on religion, women, and men are found in the five volumes of *A History of Women in the West*, edited by Georges Duby and Michelle Perrot (Cambridge, Mass., 1992–1994).

Often-cited readers that have assumed the status of classics, with mostly material on Judaism, Christianity, and new religions in the West, are *Womanspirit Rising: Feminist Reader in Religion*, 2d ed., edited by Carol P. Christ and Judith Plaskow (San Francisco, 1992); *Weaving the Visions: New Patterns in Feminist Spirituality*, edited by Judith Plaskow and Carol P. Christ (San Francisco, 1989); and *The Politics of Women’s Spirituality. Essays by Founding Mothers of the Movement*, 2d ed., edited by Charlene Spretnak (New York, 1994).

Other Works

Darlene M. Juschka, ed., *Feminism in the Study of Religion: A Reader* (London and New York, 2001). An indispensable collection of articles dealing with wide theoretical issues, from women doing the study of religion to critical discourses, race, gender, sexuality, and class. Key texts from the last thirty years, grouped thematically, and introduced by excellent discussions on the impact of feminism on the study of religion. Serinity Young, ed., *An Anthology of Sacred Texts By and About Women* (New York and London, 1994). A wide-ranging selection of textual sources on women in different sacred writings. Serinity Young, ed. *Encyclopedia of Women and World Religion*, 2 vols. (New York, 1999). A superb reference work for first orientation; contains rich bibliographical sources on the fast-growing field of women’s and feminist studies in religion. The premier journal disseminating feminist scholarship in religion is the *Journal of Feminist Studies*

in *Religion*, published twice a year since spring 1985. It now invites “a variety of contributions that focus on women’s experience or on gender as a category of analysis, and that further feminist theory, consciousness, and practice” (Spring 2003).

Individual Monographs and Multiauthor Volumes

Chosen from a large range of publications on gender studies in religion, the selection of the following titles was guided by several criteria: 1. use of theoretical and comparative gender discussions as well as reference to both genders; 2. cross-cultural and comparative examples from a wide range of religious and cultural traditions, by authors from different nationalities writing in English; 3. primary emphasis on the most significant works published since 1990, most of which include substantial bibliographies listing important earlier publications.

Adams, Carl J., ed. *Ecofeminism and the Sacred*. New York, 1993. The word *ecofeminism*, coined only in 1974, covers a wide, and sometimes contradictory, range of interests in the reevaluation—and resacralization—of woman and nature, reflected in this collection of essays.

Ahmed, Durre S., ed. *Gendering the Spirit: Women, Religion, and the Post-Colonial Response*. London and New York, 2002. Fascinating postcolonial articles on feminism, religious traditions, and spirituality from South Asia. Includes section on violence against women in Hinduism, Christianity, and Islam.

Anderson, Pamela Sue. *A Feminist Philosophy of Religion: The Rationality and Myths of Religious Beliefs*. Oxford and Malden, Mass., 1998. Uses feminist psycholinguistics, standpoint epistemology, the idea of the philosophical imaginary, and a modified Kantianism to challenge the premises of Anglo-American analytical philosophy and to construct a daring, new feminist philosophy of religion.

Armour, Ellen T. *Deconstruction, Feminist Theology and the Problem of Difference: Subverting the Race/Gender Divide*. Chicago and London, 1999. Sophisticated deconstruction of “race” and “difference,” critiquing Whitefeminist theology and theory.

Bong, Sharon A. “An Asian Postcolonial and Feminist Methodology: Ethics as a Recognition of Limits.” In *Religion, Gender and Diversity: Cross-Cultural Perspectives*, edited by Ursula King and Tina Beattie, pp. 238–249. London and New York, 2004. Based on research into the standpoints of Malaysian female and male faith- and rights-based activists to change the lives of women. A fuller account of the same argument is found in Sharon Bong, “Partial Visions: Knowing through Doing Rights, Cultures and Religions from an Asian-Malaysian Feminist Standpoint Epistemology,” Ph.D. diss., Lancaster University, 2002.

Børresen, Kari Elisabeth, ed. *The Image of God: Gender Models in Judaeo-Christian Tradition*. Minneapolis, 1995. Provides rich historical evidence from early Jewish, Christian, medieval, and modern writers to show that the understanding of God is closely interrelated with and dependent on dominant gender models prevalent during specific historical periods.

Boyarin, Daniel. *Unheroic Conduct: The Rise of Heterosexuality and the Invention of the Jewish Man*. Berkeley, Calif., 1997. In contrast to the prevailing warrior and patriarch image, this book offers a valuable alternative model of masculinity in

terms of the ideal of a gentle, receptive male. Originating from the Talmud and further developed in other Jewish texts, this model provides helpful resources for constructing alternative gender norms.

Boyarin, Daniel. “Gender.” In *Critical Terms for Religious Studies*, edited by Mark C. Taylor, pp. 117–135. Chicago and London, 1998. Succinct summary of some leading gender theoreticians, with discussion of some biblical texts and their rabbinic and Christian interpretations of gender differences.

Boyd, Stephen B., W. Merle Longwood, and Mark W. Muesse, eds. *Redeeming Men: Religion and Masculinities*. Louisville, Ky., 1996. Hailed as a groundbreaking book at publication, this book examines the dynamics of power and the role of religion in shaping masculine identities. It established men’s studies in religion as a serious scholarly field.

Bradstock, Andrew, Sean Gill, Anne Hogan, and Sue Morgan, eds. *Masculinity and Spirituality in Victorian Culture*. Basingstoke, U.K., and New York, 2000. Contemporary Western gender relations still owe much to norms set down by Victorians, so far mainly studied in terms of their construction of femininities. Written by historians, these essays explore the alternative construction of masculinities, drawing on Christian (and one Jewish) examples from nineteenth-century England. Particularly fascinating is the concept of the “Christian soldier,” a man fighting for his nation as well as his God.

Brown, Peter. *The Body and Society: Men, Women, and Sexual Renunciation in Early Christianity*. New York, 1988. A magisterial work on attitudes to sexuality and the body, and on sexual renunciation, in early Christianity.

Christ, Carol P. “Mircea Eliade and the Feminist Paradigm Shift.” *Journal of Feminist Studies in Religion*, vol. 7, no. 2 (1991): pp. 75–94. Through examining Eliade’s *A History of Religious Ideas*, Christ shows the androcentric bias of its author and the lack of recognition given to the importance of women and Goddesses in the history of religion.

Christ, Carol P. *Rebirth of the Goddess. Finding Meaning in Feminist Spirituality*. New York, 1997; repr. 1998. Drawing on feminist Christian and Jewish sources this book articulates a feminist theology and ethics. It includes a discussion of the resistance to Goddess history and a critical analysis of Eliade’s work (pp. 80–86).

Christ, Carol P. *She Who Changes. Re-Imagining the Divine in the World*. New York and Basingstoke, U.K., 2003. A creative philosophical synthesis reflecting on Goddess/God in conversation with the process philosopher Charles Hartshorne, this book argues for the adoption of a “feminist process paradigm” in approaching the Divine.

Clark, Elizabeth A. “Engendering the Study of Religion.” In *The Future of the Study of Religion: Proceedings of Congress 2000*, edited by Slavica Jakelić and Lori Pearson, pp. 217–242. Leiden and Boston, 2004. This article traces the development from women’s studies in religion to gender studies and men’s studies in religion. Profusely referenced, it provides clear evidence for the transformative impact of gender analysis on contemporary studies of religion, with the majority of examples drawn from Christianity.

Cohen, Jeffrey Jerome, and Bonnie Wheeler, eds. *Becoming Male in the Middle Ages*. New York and London, 2000. A title that breaks new ground in deconstructing male identities in the

- Middle Ages. Drawing on gender, feminist and queer theories, the contributors to this volume examine how sexuality, society, and religious worldviews shaped the medieval Christian and Jewish understanding of different masculinities.
- Cooley, Paula M., William R. Eakin, and Jay B. McDaniel, eds. *After Patriarchy: Feminist Transformations of the World Religions*. Maryknoll, N.Y., 1991. In looking for a postpatriarchal age, the female and male authors of this book reveal how far-reaching the transformations of world religions must be in order to find a liberating core that will be emancipatory for all.
- Cuomo, Chris J. *Feminism and Ecological Communities: An Ethic of Flourishing*. London and New York, 1998. Argues persuasively for an ecological feminism that links theory and practice. Questioning traditional feminist analyses of gender and caring, the author asks whether women are essentially closer to nature than men, and how to link the oppression of women, people of color, and other subjugated groups to the degradation of nature.
- DeBerg, Betty A. *Ungodly Women: Gender and the First Wave of American Fundamentalism*. Minneapolis, 1990. Shows how issues of sexual identity and gender-differentiated behavior are central to the emergence of American fundamentalism. Not only analyzes women and femininity but also sheds much light on how fundamentalist men understand their own masculinity in relation to shaping their families and church communities.
- Donaldson, Laura E., and Kwok Pui-lan, eds. *Postcolonialism, Feminism and Religious Discourse*. London and New York, 2002. Cross-cultural perspectives that combine postcolonial thinking on religion, culture, and feminist discourse. Theoretical essays are supplemented by case studies from Hinduism, Islam, Judaism, and black American women's cultural and religious experience.
- Eilberg-Schwartz, Howard. *God's Phallus and Other Problems for Men and Monotheism*. Boston, 1994. This study, which has been called a masterpiece, uncovers the inherent anxieties regarding male identity and sexuality in ancient Israelite religion and modern Judaism and provides a gender-sensitive critique of the God concept of monotheism.
- Eilberg-Schwartz, Howard, and Wendy Doniger, eds. *Off with Her Head! The Denial of Women's Identity in Myth, Religion and Culture*. Berkeley, Calif., 1995. A fascinating collection of essays on women in Hinduism, Judaism, Buddhism, Christianity, and Islam based on the argument that the objectification of women as sexual and reproductive bodies results in their symbolic "beheading" and practical relegation to silence and anonymity.
- Falk, Nancy Auer, and Rita M. Gross, eds. *Unspoken Worlds: Women's Religious Lives*. 3d ed. Belmont, Calif., 2001. First published in 1980, these essays deal with women's religious roles and experiences, their agency, power, and innovation, and their religious strategies in coping with male-dominated systems in a wide range of different religious traditions.
- Gross, Rita M. *Buddhism after Patriarchy: A Feminist History, Analysis, and Reconstruction of Buddhism*. Albany, N.Y., 1993. The first feminist reconstruction of the Buddhist tradition, this book contains two theoretically challenging methodological appendices: a) "Here I stand: Feminism as Academic Method and as Social Vision"; b) "Religious Experience and the Study of Religion: The History of Religions."
- Gross, Rita M. *Feminism and Religion: An Introduction*. Boston, 1996. Provides an excellent overview of the whole field of feminist research and women's studies in religion, using a large comparative framework rarely found in other publications.
- Gross, Rita M., ed. *Beyond Androcentrism: New Essays on Women and Religion*. Missoula, Mont., 1977. Influential set of essays on methodology criticizing the prevailing androcentrism in the study of religions.
- Hawley, John Stratton, ed. *Fundamentalism and Gender*. New York and Oxford, 1994. Extensive discussion of the meaning of fundamentalism, but no analysis of the concept of gender itself, which is, as so often, applied exclusively to women, with studies on American fundamentalism, Indian Islam, Hinduism, Japanese New Religions, and modern Judaism.
- Hewitt, Marsha Aileen. *Critical Theory of Religion: A Feminist Analysis*. Minneapolis, 1995. A perceptive analysis of the theoreticians of the Frankfurt School, which highlights the androcentric and misogynistic aspects of their work while drawing on their new insights for developing a feminist critical theory of religion.
- Howland, Courtney W. "Women and Religious Fundamentalism." In *Women and International Human Rights Law*, edited by Kelly D. Askin and Doreen M. Koenig, pp. 533–621. Ardsley, N.Y., 1999. Meticulously researched article on the challenge of different religious fundamentalisms to the liberty and equality rights of women. Includes a vast number of references to other publications on this important theme of great international relevance.
- Isherwood, Lisa, and Elizabeth Stuart. *Introducing Body Theology*. Sheffield, U.K., 1998. Helpful survey on current discussions about embodiment, embodied theology, spirituality, and ecology, as well as the "queering of the body" and gender relations from a largely Christian perspective.
- Jantzen, Grace M. *Power, Gender and Christian Mysticism*. Cambridge, U.K., 1995. Considered to be the first deconstructionist approach to Christian mysticism, analyzing the differently structured gendered rhetoric of male and female mystics. Argues for the plurality of Christian mysticisms and against its essentialist, experiential understanding, but sees mysticism rather as sets of social relations and representations informed by gender-differentiated power structures.
- Jantzen, Grace M. *Becoming Divine: Towards a Feminist Philosophy of Religion*. Manchester, U.K., 1998. Drawing on Irigaray, Derrida, and Levinas, Jantzen explores the possibility of a new imaginary of religion that would replace a masculinist symbolic preoccupied with mortality and death by a feminist one based on natality and flourishing.
- Jeffery, Patricia, and Amrita Basu, eds. *Appropriating Gender: Women's Activism and Politicized Religion in South Asia*. New York and London, 1998. Explores the paradoxical relationship of women to religious politics in India, Pakistan, Sri Lanka, and Bangladesh. Different gender identities emerge according to social, local, and political context in the struggle for national self-definition.
- Joy, Morny, and Eva K. Neumaier-Dargay, eds. *Gender, Genre and Religion: Feminist Reflections*. Waterloo, Ontario, 1995.

- Challenging collection of gendered reflections on methodological perspectives, disciplinary discourses, and substantive issues of religious practice across different religious traditions.
- Joy, Morny, Kathleen O'Grady, and Judith Poxon, eds. *French Feminists on Religion: A Reader*. London, 2002. Contains selections from the works of Irigaray, Kristeva, Clément, Cixous, and Wittig, with helpful introductions.
- Joy, Morny, Kathleen O'Grady, and Judith Poxon, eds. *Religion in French Feminist Thought: Critical Perspectives*. London, 2003. This selection of articles by different authors complements *French Feminists on Religion* (2002). It deals with Irigaray, Kristeva, Cixous and Clément, and Wittig.
- Juschka, Darlene M. "The Category of Gender in the Study of Religion." *Method and Theory in the Study of Religion* 11, no. 1 (1999): 77–105. Lucid discussion of some major feminist theorists, followed by reviews of Ursula King, ed., *Religion and Gender* (Cambridge, U.K., 1995) and J. Stratton Hawley, ed. *Fundamentalism and Gender* (New York, 1994).
- Kachru, Braj B. *The Alchemy of English: The Spread, Functions and Models of Non-Native Englishes*. Oxford, 1986. Examines the uses of English in postcolonial countries, showing how English is often still perceived as a language of prestige, power, and opportunity, without some of the limitations attributed to native languages, and with the additional potential for developing attitudes of neutrality and new forms of creativity.
- Kasulis, Thomas P., Roger T. Ames., and Wimal Dissanayake, eds. *Self as Body in Asian Theory and Practice*. Albany, N.Y., 1993. Investigates the relationship between self and body in the Indian, Japanese, and Chinese philosophical traditions, with some attention given to gender differences.
- Kawahashi, Noriko, and Masako Kuroki, eds. "Feminism and Religion in Contemporary Japan." *Japanese Journal of Religious Studies* 30, nos. 3–4 (Fall 2003). The articles provide an overview of feminist debates on religion in Japan; deal with women in Japanese new religious movements, but also in traditional Buddhism and Christianity. They also mention that women's studies research was introduced into Japanese universities from the 1980s onwards, but since the 1990s the emphasis has increasingly moved to gender studies. Volume 10, numbers 2–3 (1983) of the *Japanese Journal of Religious Studies* were devoted to "Women and Religion in Japan."
- Khandelwal, Meena. *Women in Ochre Robes: Gendering Hindu Renunciation*. Albany, N.Y., 2004. A great contribution to the understudied topic of female renunciators in the Hindu tradition; through examining contemporary *sannyasinis* and women gurus, it reveals alternative models of Hindu femininity and sheds light on South Asian gender constructs.
- King, Ursula. "Women Scholars and the *Encyclopedia of Religion*." In *Method and Theory in the Study of Religion* 2, no.1 (1990): 91–97. Critique of the implicit (and sometimes explicit) androcentrism underlying some of the entries of the first edition of the *Encyclopedia* (1987) and the invisibility of past women scholars of religion.
- King, Ursula. "Rediscovering Women's Voices at the World's Parliament of Religions." In *A Museum of Faiths: Histories and Legacies of the 1893 World's Parliament of Religions*, edited by Eric J. Ziolkowski, pp. 325–343. Atlanta, 1993. Highlights the historical contributions of women to the emergent interfaith movement. Discusses the nineteen women plenary speakers (out of a total of 190) and examines four of these in detail. More historical research is needed to recover women's considerable contributions to the historic World's Parliament and its impact on the development of the academic study of religion, and thereby make good a missing dimension in the historiography of the discipline.
- King, Ursula. "Hinduism and Women: Uses and Abuses of Religious Freedom." In *Facilitating Freedom of Religion or Belief: A Deskbook*, edited by Tore Lindholm, W. Cole Durham, Jr., and Bahia G. Tahzib-Lie, pp. 523–543. The Hague, 2004. Published in a substantial reference work on religious freedom in relation to human rights, including the status and rights of women, this article highlights the tensions between the right to freedom to live a life of human dignity and worth and the freedom of an ancient religious tradition, sometimes practiced in denial of the human rights of Indian women.
- King, Ursula, ed. *Religion and Gender*. Oxford and Cambridge, Mass., 1995. Based on the Religion and Gender Panel of the XVIth International Congress of the International Association for the History of Religions (Rome, 1990), this volume contains challenging theoretical reflections and empirical investigations on gender in the study of religion, as examined by an international group of women scholars.
- King, Ursula, and Tina Beattie, eds. *Religion, Gender and Diversity: Cross-Cultural Perspectives*. London and New York, 2004. Discussion by an international group of scholars of a wide range of gender-sensitive issues in the contemporary study of religion. Includes among others postcolonial, race, gender, and class perspectives; gender archaeology; biblical gender strategies; feminist theological approaches to the Holocaust; the gendering of missionary imperialism; questions of Muslim women's identity; of Christian *Dalit* women; of male theological reflections; and debates about different sexual orientations.
- Kloppenborg, Ria, and Wouter J. Hanegraaff, eds. *Female Stereotypes in Religious Traditions: Studies in the History of Religions*. Leiden, 1995. A fine discussion of remarkably widespread, ambiguous stereotypes used to control women in male-dominated societies, whether in the religions of ancient Israel and Mesopotamia, Zoroastrianism, Judaism, medieval Christianity, Islam, Indian Sufism, Hinduism, Buddhism, Tibetan religions, or even modern Neopaganism.
- Krondorfer, Björn, ed. *Men's Bodies, Men's Gods: Male Identities in a (Post)Christian Culture*. New York, 1996. An excellent collection of essays that reflects the increasingly self-critical and theoretically sophisticated stances of the growing field of men's studies in religion.
- Marcos, Sylvia, ed. *Gender, Bodies, Religions*. Adjunct Proceedings of the VIIth Congress for the History of Religions. Cuernavaca, Mexico, 2000. Contains a cross-cultural set of papers on methodological concerns in the study of gender and religion, approaches to bodies and reproductive issues in religion, and several case studies grouped under culture, religion, and gender.
- McNamara, Jo Ann Kay. *Sisters in Arms: Catholic Nuns through Two Millennia*. Cambridge, Mass., and London, 1996. A highly acclaimed study of the history of Catholic nuns in the Western world. Women created their own space in religious

- communities where they could evolve spiritually, intellectually, and emotionally, but also continually had to struggle against male church hierarchies and the restrictions of their gender roles by society.
- Mollenkott, Virginia Ramey. *Omnigender: A Trans-Religious Approach*. Berkeley, Calif., 2001. Carefully constructed gender boundaries are dismantled here, and sex-gender binaries are replaced by a new “omnigender” paradigm, a rainbow of varying degrees of genderedness among humanity. Written from a Christian perspective.
- Morgan, Sue, ed. *Women, Religion, and Feminism in Britain*. Basingstoke, U.K., and New York, 2002. A collection of essays written from a variety of Christian and Unitarian approaches, which through their discussion of specific female figures highlight the complex interaction between religious belief and feminist activism.
- Nelson, James B. *Body Theology*. Louisville, Ky., 1992. Discusses the theological and ethical authenticity of the human body as sexed body and deals with sexual theology, men’s issues, and biomedical ethics. A masterful construction of what may well be a major shift in Western understanding of what it means to be a human person.
- Nelson, James B., and Sandra P. Longfellow, eds. *Sexuality and the Sacred: Sources for Theological Reflection*. Louisville, Ky., 1994. Excellent essays from a Christian theological perspective that views sexuality as part of divine revelation and considers sex as integral to spirituality. Includes material on gender orientation, gender relations, and women’s and men’s experience, but also rare discussions of sexuality in relation to disability, aging, HIV, and AIDS.
- O’Connor, June. “Rereading, Reconceiving and Reconstructing Traditions: Feminist Research in Religion.” *Women’s Studies* 17, no. 1 (1989): 101–123. A frequently cited article that discusses how religious texts, histories, and traditions have to be reinterpreted from a gender-critical perspective.
- O’Grady, Kathleen, Ann L. Gilroy, and Janette Gray, eds. *Bodies, Lives, Voices: Gender in Theology*. Sheffield, 1998. Deals with women’s voices rather than more inclusive gender theory, deemed as “modish” (p. 267) in this volume. Discusses representations of women in sacred texts and theologies; the need to recover the heritage of women; and the relevance of feminist theory for canonical texts. With the exception of Tamil Christian *Dalits*, this is an entirely Western, white-feminist study with no attention to cross-cultural issues or to religious diversity.
- Puttick, Elizabeth. *Women in New Religions: In Search of Community, Sexuality and Spiritual Power*. Basingstoke, U.K., and New York, 1997. Challenges the view that women, who make up more than half the members of new religious movements, are exploited by charismatic male leaders; discusses interrelated issues of sexuality, spirituality, and power.
- Puttick, Elizabeth, and Peter B. Clarke, eds. *Women as Teachers and Disciples in Traditional and New Religions*. Lewiston, Ky., 1993. Wide-ranging case studies of women’s religious leadership, from early Christian Egypt to contemporary new religious groups in Hinduism, Buddhism, and Islam, to Bahian Candomblé, esoteric groups in Italy, and modern paganism.
- Raphael, Melissa. *Theology and Embodiment: The Post-Patriarchal Reconstruction of Female Sacrality*. Sheffield, U.K., 1996. Important study of goddess feminism and female sacrality. Drawing on many feminist writers, it looks at the female body as a medium of divine creative activity and discusses the ethical implications of taking female sacrality seriously.
- Sawyer, Deborah F. *God, Gender and the Bible*. London and New York, 2002. Illuminating discussion of Hebrew and Christian scriptural texts in the light of postmodern ideas about gender and power; shows that both maleness and femaleness are constructed in the light of divine omnipotence and that biblical writers use female characters strategically in order to undermine human masculinity and elevate the biblical God.
- Schüssler Fiorenza, Elisabeth. *In Memory of Her: A Feminist Theological Reconstruction of Christian Origins*. New York and London, 1983. A classic of feminist biblical interpretation, which presents the history of Christian women in the early Jesus movement as a “discipleship of equals” with men.
- Sered, Susan Starr. *Priestess, Mother, Sacred Sister: Religions Dominated by Women*. New York and Oxford, 1994. Looks at twelve cross-cultural examples of religions where women take a leadership role in religious practices and are often also the major participants, concluding that these occur mostly in matrifocal societies and that such practices focus especially on women’s concerns as mothers.
- Stuart, Elizabeth. *Religion Is a Queer Thing: A Guide to the Christian Faith for Lesbian, Gay, Bisexual and Transgendered People*. Sheffield, U.K., 1997. An example of a distinctive, radical Christian queer theology questioning the assumptions that underlie many doctrines and practices of the tradition.
- Svenson, Jonas. *Women’s Human Rights and Islam: A Study of Three Attempts at Accommodation*. Lund, Sweden, 2000. Examines Muslim participation in the international debate about women’s human rights by analyzing the methods employed in interpreting religious sources in the works of the religious studies scholar Riffat Hassan, sociologist Fatima Mernissi, and legal studies and human rights scholar Abdullahi Ahmed an-Na’im. Different versions of Islam compete for recognition as the “true” representation of the divine will.
- Taylor, Barbara. *Mary Wollstonecraft and the Feminist Imagination*. Cambridge, U.K., 2003. This scholarly study of Wollstonecraft’s thought provides a fascinating account of her intellectual world and personal history and gives for the first time careful attention to the role that religion played in her work, thus opening a new chapter in feminist studies of this influential thinker.
- Thatcher, Adrian, and Elizabeth Stuart, eds. *Christian Perspectives on Sexuality and Gender*. Grand Rapids, Mich., and Leominster, U.K., 1996. Contains a wide-ranging set of essays on Christian attitudes to the body, sexuality, and gender, with a primary focus on contemporary issues rather than historical discussions.
- Warne, Randi R. “Gender.” In *Guide to the Study of Religion*, edited by Willi Braun and Russell T. McCutcheon, pp. 140–154. London and New York, 2000a. Very accessible conceptual clarification of the key features, historical development, and associated subsets of the category of “gender,” including a critical assessment of its contribution to the scientific study of religion.
- Warne, Randi R. “Making the Gender-Critical Turn.” In *Secular Theories on Religion: Current Perspectives*, edited by Tim Jen-

sen and Mikael Rothstein, pp. 249–260. Copenhagen, 2000b. Illustrates brilliantly how gender thinking is neither natural nor neutral, and argues that a radical shift in thinking is required to make a “gender-critical” turn in all areas, including the study of religion.

Warne, Randi R. “(En)gendering Religious Studies.” In *Feminism in the Study of Religion*, edited by Darlene M. Juschka, pp. 147–156. London and New York, 2001. A passionate, but measured and well-supported, plea to implement the radical implications of gender-critical thinking to all theoretical and practical areas of religious studies.

Warner, Michael. *Fear of a Queer Planet: Queer Politics and Social Theory*. New Brunswick, N.J., 1993. Anthology of essays described as pioneering in trying to push gay identity politics beyond its limitations in gay and lesbian studies, and highlighting the involvement of both political and religious figures in regulating sexual conduct.

Webb, Val. *Florence Nightingale: The Making of a Radical Theologian*. St. Louis, 2002. Carefully crafted study of Nightingale’s little-known religious works that shows that her one aim in life was to organize religion, not hospitals. This analysis reveals her as an amazingly original woman thinker who anticipated feminist and process theological insights, applying gender criticisms far ahead of her time to Victorian society and the Christian churches.

Wessinger, Catherine, ed. *Religious Institutions and Women’s Leadership: New Roles inside the Mainstream*. Columbia, S.C., 1996. Focused on the United States, the essays in this volume demonstrate how a growing number of new leadership roles have become available for Protestant, Catholic, and Jewish women. This is an ongoing process, slowed down by women hitting what has been called a “stained-glass ceiling.” Contains a comprehensive chronological survey (pp. 347–401) of key events for women’s religious leadership in the United States during the nineteenth and twentieth centuries.

Zink-Sawyer, Beverly. *From Preachers to Suffragists: Women’s Rights and Religious Conviction in the Lives of Three Nineteenth-Century American Clergywomen*. Louisville, Ky., and London, 2003. By studying the religious rhetoric and theological ideas of Antoinette Brown Blackwell, Olympia Brown, and Anna Howard Shaw, three of the earliest women to be ordained in the United States, the author examines the religious roots of the women’s rights movement, so often primarily understood as a secular movement.

URSULA KING (2005)

GENDER AND RELIGION: HISTORY OF STUDY

Any consideration of the historical development of gender and religion as a field of enquiry over the late twentieth century and the early twenty-first century must acknowledge the central role of feminism. From the beginning of the feminist movement a strong connection was made between the status of women and the authorizing function of religion (specifically Christianity) in maintaining gender inequalities. At the same time, however, attention was paid to its emancipatory potential. For example, campaigns for the abolition of slavery

and extension of political rights to women were motivated by Christian ethical teachings. Furthermore moves to improve the status of women within ecclesiastical hierarchies were made: in 1853 the Congregational Church in New York ordained the first female minister, the Reverend Antoinette Brown (1825–1921), and in the early 1840s Oberlin College in the United States enrolled a small number of women into its theological school, having started admitting women to higher education in 1837. As Ursula King has noted, “Women’s admission to theological studies [was] the most important contributory factor in making women theologically literate, thus enabling them to contribute to theological debates on their own terms” (Ursula King, 1990a, p. 278).

Despite these positive initiatives, a number of prominent suffragists highlighted the oppressive role of Christianity in maintaining the inferior status of women. For example, in 1893 Matilda Joslyn Gage (1826–1898) published *Woman, Church, and State*, which is generally accepted as the first attempt to offer a historical account of the subordination of women within the Christian tradition. She was, however, viewed by many within the suffrage movement as dangerously radical and was marginalized in historical accounts of the movement. Elizabeth Cady Stanton (1815–1902) suffered a similar fate following her publication of *The Woman’s Bible* (1895–1898)—coedited by Gage and Susan B. Anthony (1820–1906)—a reworking of the Christian Bible in which all recognizably “antifeminist” passages were excised in order to demonstrate its marginalization of women. Despite the negative reception of her work among fellow suffragists, the significance of her contribution is seen by contemporary feminist theologians to lie in her initiation of a “long overdue process of biblical interpretation by and for women” (Isherwood and McEwan, 1993, p. 50). This work was taken up vigorously from the 1960s onward in the context of the women’s liberation movement.

FEMINISM AND RELIGIOUS STUDIES: 1960–1990. The 1960s saw a number of rights-based movements emerge: black liberation and the Civil Rights movement, sexual liberation, gay liberation, the anti-Vietnam War movement, and the women’s liberation movement or second wave feminism. Throughout the decade the women’s liberation movement established itself as a major political force across Europe, North America, India, and elsewhere. Betty Friedan’s *The Feminine Mystique* (1963) heralded the beginning of the women’s liberation movement in the United States. Friedan identified what she called “the problem that has no name”—a “mystique” she defined as the sense of worthlessness that women experienced due to their financial, intellectual, and emotional dependence on men.

Context: The women’s liberation movement. By 1970 women’s liberation had come of age in North America. In the same year the first British conference on women’s liberation was held in Oxford marking the founding of the British movement; Germaine Greer published *The Female Eu-*

nuch, arguing that sexual liberation was the key to women's liberation; Shulamith Firestone published *The Dialectic of Sex: The Case for Feminist Revolution*, in which she identified "sex class"—the condition of women as an oppressed class—and articulated a central tenet of radical feminism, that men's domination of women is the fundamental form of oppression; and Kate Millet published *Sexual Politics*, an analysis of patriarchy as a socially conditioned belief system that masquerades as the natural order.

The defining concerns of the feminist movement were quickly apparent. Firstly, feminists agreed that in every society that divided the sexes into bifurcated cultural, economic, or political spheres women were less valued than men. Secondly, key concepts like "patriarchy," "androcentrism," "sexism," and "misogyny" were formulated to explain the universal oppression of women. The idea of misogyny was a fundamental concept for the women's movement, seen as a lens through which all cultural and social practices, both historical and contemporary, could be viewed and explained, while patriarchy was viewed as the ubiquitous structure that enabled the elaborate expression of misogyny across a wide range of cultural, political, and intellectual systems. Thirdly, feminists critiqued the paradigms that placed men above women or represented them as the norm. Fourthly, feminists theorized an autonomous female identity where women's bodies and feminine activities were prioritized and represented as positive in contrast to the centuries-old portrayal of femininity as a source of danger, impurity, and evil. Finally, feminist activism was organized around the principle that women could collectively change their social position and identity by advocating equal employment and reproductive and sexual rights and by resisting all forms of gender-based discrimination.

However, despite broad agreement regarding the feminist assessment of the position of women, the women's movement was challenged by black feminists who experienced both sexual and racial discrimination (see Hull, Scott, and Smith, 1982; see also Ware, 1992, which shows that racism infected relations between white and black women even in the earliest stages of the feminist movement), and by lesbian feminists (see Myron and Bunch, 1975). Both groups argued that second wave feminism was overdominated by white, middle-class, and heterosexual agendas that were visibly unable (or even unwilling) to account for and challenge the multiple axes of oppression produced in the intersections between class, race, and sexuality. In other words, the plurality of women's material realities was mistakenly conflated with the universal and homogenous category "Woman," and this had the effect of erasing important differences between women. The failure of the leaders of the women's liberation movement to take the challenges of their fellow feminists seriously and to integrate their concerns resulted in the splintering of the movement.

If feminism was losing its way as a unified political movement, it was increasingly making its presence felt in

universities as feminists recognized the powerful role of educational institutions in shaping cultural values and meanings. Women's studies departments and programs were established from the late 1960s onward as academic feminists sought to transform the androcentric basis of knowledge production and to challenge the omission of female perspectives. By the early 1980s women's studies had been an established field for over a decade, despite considerable hostility from those feminist activists who viewed it as a regrettable alliance with establishment values and a depoliticization of feminism. However, feminist theory did distinguish itself from mainstream academic scholarship by emphasizing its overtly political nature and its commitment to social, epistemological, and material change; feminist religious studies were no exception.

Content: Feminism and religious studies. Ursula King has noted the invisibility of religious studies within feminist and women's studies curricula and anthologies, and this can be attributed to the prevalent assumption among feminists that religion had little to offer women (Ursula King, 1990a, p. 275; 1995, pp. 219–220). Nonetheless some scholars working in the 1970s and 1980s, influenced by the insights of the women's liberation movement, began to examine religious traditions critically, at first in confessional contexts and then in the secular study of religions. June O'Connor has summarized their efforts as "rereading, reconceiving, and reconstruction" informed by questions regarding "women as subject," "sensitivity to and criticism of the manner in which [religious] traditions . . . have been studied and . . . formulated," and a concern with "our scholarly angles of vision, our research methods and approaches" (O'Connor, 1989, pp. 101–102). Accordingly four main preoccupations characterized work in the field during this period:

1. scholars exposed the androcentrism and misogyny of the Christian and, to a lesser extent, the Jewish traditions;
2. women were identified as a legitimate category of analysis as well as active agents of religious practice and study, with women's experiences being promoted as a credible and corrective hermeneutical tool;
3. new forms of female-centered religiosity were explored;
4. epistemological and methodological tools were developed in order to challenge the androcentric bias of mainstream scholarship in theology and religious studies.

Scholars began theological reflection from an engaged, although expressly critical, stance and initiated a movement away from the presentation of divinity as male within Christianity and Judaism. The quest was initially a personal and religious one: a question of finding, reshaping, and transforming symbols of divinity that would legitimize women's experiences and produce a positive sense of female identity.

Mary Daly's *The Church and the Second Sex* (1968) was a milestone, inaugurating a new era of feminist theological

reflection marked by the systematic critique and reformulation of Christian doctrine from the perspective of women's experience. Following Daly, writers like Rosemary Radford Ruether (1983b, 1985), Elisabeth Schüssler Fiorenza (1983), and Judith Plaskow (1990) contributed to a lively and wide-ranging discourse based explicitly around the spiritual needs of contemporary women and the need to reform Christianity and Judaism from the standpoint of feminism.

However, Daly quickly moved to question whether or not Christianity was capable of reform or in fact irredeemably sexist. In 1971, as the first woman preacher at the Harvard Memorial Church, she spoke on the theme "The Women's Movement: An Exodus Community," inviting women in the congregation to leave the church together as a way of symbolically rejecting women's subordination within the church:

We cannot really belong to institutional religion as it exists. It isn't good enough to be token preachers. It isn't good enough to have our energies drained and co-opted. Singing sexist hymns, praying to a male god breaks our spirit, makes us less than human. The crushing weight of this tradition, of this power structure, tells us that *we do not even exist*. Let us affirm our faith in ourselves and our will to transcendence by rising and walking out together. (Daly, 1972, p. 335)

Daly followed this up in 1973 with *Beyond God the Father*, marking the start of a protracted debate among feminist theologians regarding the extent to which religious commitment could be compatible with feminist goals and beliefs. Those who, like Daly, suggested that the only feasible option for Christian feminists was to abandon the tradition and create a new one based on women's contemporary religious experience were described as post-Christian feminists or as separatists (see Hampson, 1996). Other feminist theologians responded to Daly's work by offering their own critiques of the Christian tradition but, rather than rejecting it, affirmed that it was capable of reform (see Ruether 1974, 1981; Tribe, 1978). They worked to produce new models that could act as correctives to oppressive ideologies and were broadly characterized as reformists. However, as with the broader women's movement, the issue of how to define women's experience became a contested area with the emergence of the distinctive voices of black and Womanist, Asian, Latin American (*mujerista*), and lesbian feminist theologians, which, while present from the beginning, began to find fuller expression in the 1980s.

The analysis of misogyny as well as the forms and conceptual underpinnings of patriarchy were related preoccupations in the area of feminist religious studies in the 1960s and 1970s. Feminist writers maintained that women had been deprived of their history (conceived of as originally matriarchal), that their unique religious contributions had been excised through a series of patriarchal interventions, and that the promotion of God as male in many religions had damaged women's relationships to both divinity and each other.

A feminist project, known broadly as the Goddess movement or Feminist Spirituality, aimed to re-create and reimagine women's history and religious experience utilizing myth, folklore, and the archaeology of material culture. It was predicated on the conviction that what was lost in history could be recovered and would create a space for a feminine spirituality that centered on the Goddess and women's experience. Writers within the movement attempted to redefine the relationship between masculine and feminine aspects of deity by inverting their relative status so that the feminine was viewed as more originary and relevant to women's spiritual expression.

The Harvard archaeologist Marija Gimbutas's work provided a scholarly framework for the Goddess movement's account of matriarchal prehistory, giving it both an imprimatur of authenticity and a credible historical genealogy. She focused on the prehistoric cultures of Southeast Europe, featuring discoveries in "old Europe" of numerous "female" statues in stone, bone, ivory, and clay (some with pregnant bellies, large, exaggerated breasts, and stylized vulvae), as evidence for matriarchal societies in the Paleolithic and Neolithic eras (Gimbutas, 1982; 1989). The Goddess movement as well as Gimbutas's work have been severely critiqued from a variety of disciplinary perspectives, all of which have challenged the historical verifiability of its claims and have leveled charges of essentialism and reversed patriarchy (see Wood, 1996; Goodison and Morris, 1998; Eller, 2000).

In spite of the work highlighting women's historical subordination within religious traditions, feminist theologians as well as scholars of religions also drew attention to women as active agents and religious innovators in their own right. Within the context of feminist theology, this concern was a response to the contemporary controversy over the role of women in the church, particularly over the ordination of women. Much early scholarship was therefore concerned with women's leadership in the church in different historical periods. An important example was *Women of Spirit: Female Leadership in the Jewish and Christian Traditions* (Ruether and McLaughlin, 1979), which argued that although women had been excluded from institutional leadership roles, in the past they had held important positions. It was thus important to present women's involvement in the history of the Christian tradition as a way of contributing to its reformation. Studies exploring exceptional religious women, such as Clarissa Atkinson's *Mystic and Pilgrim: The Book and the World of Margery Kempe* (1983) and Elizabeth Dreyer's *Pasionate Women: Two Medieval Mystics* (1989), also appeared.

Cross-cultural studies in the field of feminist religious studies also kept pace, investigating the relationship between the treatment of women within religious traditions and their position in wider social systems, demonstrating how women's strategies of resistance and innovation emerged within a multitude of religious traditions, and assessing the ambiguity of feminine symbolism within many religious systems. Notable among these were Carol P. Christ and Judith

Plaskow (1979), Yvonne Yazbeck Haddad and Ellison Banks Findly (1985), Clarissa W. Atkinson, Constance H. Buchanan, and Margaret R. Miles (1985), Caroline Walker Bynum (1987), Judith Plaskow and Carol P. Christ (1989), and Ursula King (1989).

A further trend was scholarship that addressed the neglect of women's perspectives and data within religious studies. The first of these—*Women and Religion*, edited by Judith Plaskow and Joan A. Romero—appeared in 1974, followed by Denise Lardner Carmody's *Women and World Religions* (1979). The first truly cross-cultural, nonconfessional volumes were published by Nancy Falk and Rita Gross (1980) and Ursula King (1987). Falk and Gross aimed to locate women's religious lives in a variety of traditions at the center of their study rather than the periphery, as was traditionally the case in religious studies. Numerous publications rendering women's participation in religious traditions more visible quickly followed (for example, Sharma, 1987). Studies focusing on the position and roles of women within single traditions were also produced (for example, Paul, 1979; Jacobson and Wadley, 1977; Al-Hibri, 1982).

The field of "Women and Religion" now gained limited recognition at the institutional level. Harvard Divinity School established a women's caucus in 1970, preparing the ground for the introduction of the Women's Studies in Religion program in 1973; the American Academy of Religion (AAR) introduced the "Woman and Religion" section to its annual conference; the Fourteenth International Association of the History of Religions (IAHR) Congress in Winnipeg in 1980 included a panel on "Femininity and Religion"; the British Association for the Study of Religion (BASR) titled its 1989 conference "Religion and Gender"; and Lancaster University established the first master's program in Women and Religion in the United Kingdom in the same year (Ursula King, 1990a, pp. 279–280). Although this work was vital for the recognition of female agency within religious traditions, it was generally ineffectual in challenging the androcentric bias of religious studies. Instead, a women-centered approach was seen within the field to be of concern only to women and with little to contribute to broader methodological debates. This was clear from the lack of integration of feminist perspectives in core syllabi, the comparatively low volume of publication in the area, the unsatisfactory profile of the subject at international conferences, the struggle to encourage university libraries to stock copies of relevant publications, and the underrepresentation of academics researching women in university departments (see Ursula King, 1990a; 1995a).

Feminist scholars in the study of religions thus began to offer methodological reflections in order to confront the androcentrism of the field. Rita Gross's pioneering article "Methodological Remarks on the Study of Women in Religion" (1974) and her book *Beyond Androcentrism: New Essays on Women and Religion* (1977) were the first to promote a feminist methodology in religious studies. Rosemary Rue-

ther contributed her article "The Feminist Critique in Religious Studies" (1983a) to a volume on the impact of feminist studies in academia, and the *Encyclopedia of Religion* (Eliade, 1987) commissioned two articles on the topic: "Women's Studies" by Constance Buchanan and "Androcentrism" by Ruether (however, see King 1990b for a critique of the encyclopedia's failure to integrate feminist perspectives and for presenting an androcentric view of religion).

It was because of the entrenched marginalization of female perspectives at the empirical and institutional levels that the inclusion of feminist theory in the mainstream development of religious studies began to be framed in terms of offering a paradigm shift. Carol P. Christ (1987; see also 1989, 1991) was the first to suggest that the integration of feminist scholarship could ensure conceptual change and renewal within the discipline and would provide a necessary corrective to its androcentric foundations. Randi Warne (1989) also characterized the growth of women's studies in religious studies as "a brave new paradigm," drawing attention to the epistemological significance of the feminist challenge to the foundational premises of religious studies. Warne further made a connection between institutional structures, the feminist study of religions, and the status of women working within the field, suggesting that religious studies "must ensure that its departments are materially constructed in such a way that the presumption of male privilege is not maintained" (Warne, 1989, p. 43).

GENDER AND RELIGION FROM THE 1990S. The analysis of "male privilege" had of course been a central preoccupation of much feminist scholarship from the 1960s onward. However, a shift in emphasis emerged as scholars increasingly recognized the need to consider critically not only constructions of femininity and female identity but also the way they interacted with notions of maleness, especially insofar as they were articulated and promoted in social systems. The development of gender studies as an adjunct to women's studies was a result of this recognition. Feminist scholars from the 1970s onward thus theorized gender as a system of signs or signifiers assigned to sexually dimorphic bodies that acted to distinguish the social roles and meanings those bodies could have. They argued that gender was a social construct configured, enacted, and maintained in social systems and institutions rather than being biologically innate. Peggy Reeves Sanday and Ruth Gallagher Goodenough, for example, signaled discomfort with the decontextualized study of women found in much feminist work. They preferred instead to examine "gender meaning and gender representation" in order to draw out the "contradictory and variable views of maleness and femaleness" in different cultures (Sanday and Goodenough, 1990, p. 5). It also became problematic to discuss female and male relations and roles without taking into consideration the influence of cultural and social variables such as class, race and ethnicity, and sexuality as well as the colonialist distortion of knowledge production in the West.

Context: Gender theory. The emergence of gender studies in the 1990s as a separate field of enquiry was also

the result of an increase in epistemological reflection informed by the critiques of poststructural, postcolonial, and queer theory, each of which problematized the dominant (European) humanist presentation of identity as homogeneous, universal, and self-evident. Feminist scholarship was not exempt. For example, Chandra Talpade Mohanty, keen to develop a culturally contextualized “formulation of autonomous, geographically, historically, and culturally grounded feminist concerns and strategies,” offered a powerful criticism of the “colonialist move” in some Western feminist scholarship on women in the third world, particularly insofar as it appropriated the “production of the ‘third world woman’ as a singular monolithic subject” (Mohanty, 1991, p. 51).

Another intervention in gender studies was signaled by Judith Butler, who sought to unmask the ways binarized gender categories supported inequitable gender hierarchies and compulsory heterosexuality. She asked, “What new shape of politics emerges when identity as a common ground no longer constrains the discourse on feminist politics? And to what extent does the effort to locate a common identity as the foundation for a feminist politics preclude a radical inquiry into the political construction and regulation of identity itself?” (Butler, 1999, p. xxix). Butler’s work was instrumental in the foundation of a new area of inquiry, queer theory, that attended to the social construction of normative and deviant sexual behavior. Queer theory followed feminist and gay-lesbian studies in rejecting the idea that sexuality was determined solely by biology. Instead, sexuality was seen as a complex array of social codes and forces, individual activity, and institutional power-shaping ideas of sexual normativity or deviancy (see Sedgwick, 1990; Jagose, 1996; Warner, 1999).

Another significant shift that contributed to the move from women’s studies to gender studies was the emergence of critical and self-reflexive masculinity studies that historicized and analyzed dominant constructions of maleness and was attentive to the differences among men. Pioneering studies were by Harry Brod (1987a, 1987b); Michael S. Kimmel (1987); David D. Gilmore (1990); William G. Doty (1993); and Roger Horrocks (1994).

Content: Gender theory and religion. The study of religions was certainly, if belatedly, influenced by the emergence of gender studies, and studies emerged that embraced the shift from a women-centered approach to the consideration of gender as a central category for critical reflection. The first scholars to acknowledge the potential of gender theory to illuminate the complex interrelationship of male and female roles within religious traditions were Caroline Walker Bynum, Stevan Harrell, and Paula Richman (1986). Studies exploring the connections between gender and religion, with a new theoretical sophistication, rapidly appeared, most notably by Bynum (1991), Leila Ahmed (1992), Grace M. Jantzen (1995), and Ursula King, whose groundbreaking edited volume *Religion and Gender* (1995) offered wide-ranging critiques of the gender-blindness of religious studies, reflections

on the gendered nature of research, gender-critical perspectives on the empirical study of women in a variety of religious traditions, and reconsiderations of feminist spirituality.

Critical studies of masculinity and religion were inaugurated by Stephen B. Boyd, W. Merle Longwood, and Mark W. Muesse, who offered a comprehensive and provocative insight into masculinities and male experiences as specific and varying sociohistorical and cultural formations. The editors acknowledged their “tremendous debt to the influence of feminist theory,” and the essays were built on the assumption that the construction of dominant forms of masculinity within religious traditions was problematic and in need of revision (Boyd, Longwood, and Muesse, 1996, p. xiii). Several other notable books in the area followed (Capps, 2002; Raines, 2001; Putney, 2001; Moore, 2001; Monti, 2002), and it is likely to prove an increasingly fruitful area of research in the coming years.

Issues regarding sexuality and religion also received attention, building on the earlier work of gay and lesbian theologians. Richard Hasbany’s *Homosexuality and Religion* (1989) was a pioneering work exploring the dilemmas institutional religion posed for gays and lesbians. In the late 1990s studies of sexuality developed a new heuristic cogency as explorations were extended to issues of embodiment and corporeality (Coakley, 1997; Grovijahn, 1998; Carrette, 2000), the insights of gay-lesbian and queer theory (Schipfert, 1999; Neitz, 2000), the place of homosexuality within religious traditions (Bouldrey, 1995; Stuart, 1997; Shallenberger, 1998; Rogers, 2002), gay-lesbian perspectives on the study of religions (Johnson, 2002; Althaus-Reid, 2001; Gill, 2004), and the intersections of race, sexuality, and gender (Carrette and Keller, 1999; Hayes, Porter, and Tombs, 1998).

Theoretical reflections on the conceptual underpinnings of the study of religions from the standpoint of gender theory were another influential trend. Marsha Aileen Hewitt (1995), Grace Jantzen (1998), and Pamela Sue Anderson (1998) offered impressive epistemological reflections on the discursive ideologies operating within the study of religions. Attention was also increasingly paid to the theories of the poststructural “feminist” scholars—Julia Kristeva, Hélène Cixous, and Luce Irigaray among others—as a means of reflecting on and critiquing the gendered nature of religious discourse (see Crownfield, 1992; Joy, O’Grady, and Poxon, 2002, 2003).

The most important and timely theoretical perspectives to emerge, however, were those of postcolonialist scholars critical of the ethnocentrism of the field of gender and religion. Their interventions have paralleled broader debates regarding the colonialist legacy of the study of religions (see McCutcheon, 1997; Flood, 1999; Richard King, 1999; Fitzgerald, 2000) and have led to accusations of the complicity of gender-theoretical scholars in the social, political, and epistemic violence exercised by the West toward non-Western cultures. Research challenging Western gender-critical schol-

ars to reflect upon the relationship between scholarship and the ethics of representation from the perspective of non-Western “others” has proliferated (see Durre Ahmed, 2002), and Western scholars are beginning to respond to these critiques. Ursula King and Tina Beattie’s volume *Gender, Religion, and Diversity* (2004) testifies to a new willingness to engage in dialogue, to challenge core assumptions, and to learn from the perspectives of non-Western gender-critical scholars. It is clear, however, that much work remains to be done. As Chandra Mohanty has suggested, “Western feminist writing on women in the third world must be considered in the context of the global hegemony of western scholarship—i.e., the production, publication, distribution and consumption of information and ideas” (Mohanty, 1991, p. 55).

Gender-critical scholars are therefore faced with the daunting task of dismantling and reforming the certainties of key feminist insights in order to ensure that the perspectives of postcolonial theorists are heard and acted upon. Given the scope and passionate engagement of gender scholarship in the late twentieth century and early twenty-first century, it is to be hoped that the task is taken up with the same commitment to social justice and transformation that has guided the field from its beginning.

SIÂN HAWTHORNE (2005)

GENDER AND RELIGION: GENDER AND HINDUISM

There are many ways to approach women's and gender studies in Hinduism. A more-descriptive, less-analytical approach usually deals with the traditional scriptural injunctions relating to women, the concept of *strīdharmā*, feminine archetypes, symbolic structures, divine manifestations, and the ways these matters impact both male and female religious practices and identities. For example, the image of Hindu women (a supposedly homogeneous group essentially different from both Hindu men and non-Hindu women) is often derived from two categories of sacred texts: the Vedas, the oldest and most authoritative Indian texts (c. 1500–600 BCE) and *Manusmṛti*, the best-known prescriptive text and the most commonly cited source of Hindu *dharma* (c. second century BCE–second century CE).

WOMEN IN THE ANCIENT TEXTS. The first group of texts confirms that there were women seers in the Vedic age (approximately 1 percent of the hymns of the *Rgveda* are attributed to women) and women philosophers capable of debating with men (Gārgī and *Maitreyī* in the Upaniṣads), that the sacrificer's wife played an instrumental (if far from equal) role in public rituals, and that a woman's primary function was to be the mother of sons. According to the much later text, *Manusmṛti*, women were denied access to learning altogether. Marriage for a woman was equated with religious ini-

tiation (*upanayana*) for a man, the service she offered her husband was equated with his religious studentship, and her performance of household duties was equated with his worship of the sacrificial fire (*Manusmṛiti* 2.67); that is, her domestic duties constituted her religious life. The importance of procreation gave rise to the image of her womb as a field. The passivity of the field was assumed: The husband sowed the seed, which determined the crop, and because he was (ideally) the owner of both field and produce, it was essential to guard both from other men. The subordination of the wife was ensured by the criteria for choosing a bride. Men were advised to marry girls considerably younger than themselves (the ideal gap was sixteen to eighteen years) from families of the same or lower status and from families with which there were no existing kinship ties to soften her experience of isolation.

Whereas the religious life (*dharma*) of a man was usually described in terms of his class (*varṇa*; i.e., according to his membership of the priestly, ruling, mercantile, or servant class) and stage in life (*āśrama*; i.e., according to whether he was a religious student, a married householder, a hermit, or a renunciate), that of a woman focused solely on the cultural expectations of the good wife (*strīdharmā*). Thus the narrative and prescriptive literature is full of glorifications of the ideal wife often startlingly juxtaposed with dire pronouncements regarding the inherently wicked nature of women (*strīsvabhāva*). That this was a strategy for the control of women is evidenced by the total lack of a parallel opposition between the ideal husband and the essential wickedness of all men. Cultural archetypes reinforce these patterns. In the *Rāmāyaṇa*, for example, male figures include Rāma (exemplar of the ruling class) and Hanumān (exemplar of the devoted servant). Conversely, for women, Sītā represents the perfect wife, and Kaikeyī stands for the inherent wickedness of women.

There are, however, other representations of the male–female relationship. According to Sāṅkhya philosophy, for example, all existence is derived from two principles: *puruṣa* (the irreducible self—male, aloof, and perfect) and *prakṛti* (the manifest world, defined as female, needing attention, longing to serve, and the cause of the male self’s entrapment in existence). The *puruṣa-prakṛti* dichotomy is clearly intended to apply to all existence and all individuals, including women. However, the cultural stereotypes underlying the philosophical message are undeniable, as is the implication that the truly religious man must abandon both women and the world if he is to attain his goal. In the context of devotional religion (*bhakti*), the male–female relationship receives a different emphasis: God is supreme, the only male in a world of devotees represented as feminine. In the worship of Kṛṣṇa, for example, male devotees imagine themselves as women in their devotion to their Lord, whereas female devotees have the advantage of being naturally subservient in their devotion.

Another twist is provided by the concept of the divine feminine (*śakti* or *pakti*). Although many goddesses are de-

picted as consorts rather than as independent deities, there is the widespread notion that divine power is feminine (*śakti*, meaning “power,” is a feminine noun). According to this view, without *śakti*, the gods are powerless, and the ultimate power of the universe is that of Devī, the Great Goddess.

A more critical and reflective approach reveals that the very discussion of women and, more recently, gender in Hinduism has evolved within the context of and in specific response to complex historical developments from the early nineteenth century onward. Generally speaking, the history of women’s studies and gender studies tends to follow a three-phase pattern. In the first phase, scholars look for and research sources and key individuals that can in some sense add women to a preexisting framework, the latter sometimes referred to as men’s studies to emphasize the need for the missing component of women’s studies. In the second phase, there is a movement away from the “men’s studies plus women” approach toward finding ways to analyze and challenge the gender ideology inherent in the dominant discourses defining both women and men within the relevant patriarchal structures. In the third phase, the focus shifts once more, this time away from an exclusive focus on gender toward an articulation of more nuanced discourses that take into account issues of race, class, and ethnicity as well as gender.

This three-phase pattern may also be applied to the study of Indian religions and, more specifically, to the study of gender and Hinduism. In the Indian case, however, it is essential to realize that an acute interest in the role and position of women, at this point referred to as the *woman question*, predated the women’s studies phase by more than one hundred years. The primary context of the woman question was political of course, but the relevance of these discussions to the study of religions is unambiguous. Indeed it is always important to view the debates on Indian and Hindu women against the background of the political paradigms dominant in India at the time: the discourses accompanying the British colonial enterprise, the narratives embedded in the Indian nationalist project, or the impassioned rhetoric of fundamentalism. A coherent history of the study of women and gender in relation to the study of Hinduism emerges only when these two models (i.e., the woman question and women’s and gender studies) and these two disciplines (i.e., religion and politics) are made to work together.

THE WOMAN QUESTION. The woman question arose directly from India’s encounter with colonialism. As Ashis Nandy noted in his groundbreaking work *The Intimate Enemy* (1983), colonial powers consistently viewed colonized peoples as weak and effeminate. Accordingly, to justify their particular colonial enterprise, the British portrayed the entire indigenous population of India as feminine, that is, as requiring protection. The need for vigorous intervention was further supported by what, in colonial discourse, was widely agreed to be the lamentable position of Indian (primarily Hindu) women. Whereas Hindu women were perceived to

be in urgent need of social reform or uplift, Hindu men were believed to be innately incapable of providing it—hence the need for British intervention to achieve the necessary reforms. Examples of this type of discourse may be found in numerous publications ranging from James Peggs's *India's Cries to British Humanity* (rev. ed., 1830) to Katherine Mayo's polemical *Mother India*, a best seller in England and the United States from its publication in 1927.

The list of women-related social reforms advocated by the British is long; the eradication of child marriage, especially the marriage of child brides because of the high probability that they would become child widows; the remarriage of widows; the abolition of female infanticide, sati (the death of a woman on her husband's funeral pyre), and *kulīn* polygamy in Bengal (where the need for high-caste brahman girls to marry before they reached puberty and to marry only high-caste men had led to the practice of *kulīn* men of all ages being paid to marry large numbers of prepubertal *kulīn* girls without further economic obligation); and the education of women. Some of the reforms were counterproductive. For example, the regulations introduced in the Bengal presidency in 1812 distinguished between two categories of sati: voluntary sati (considered legal, perhaps even praiseworthy) and coerced sati (deemed illegal and to be condemned). Widely interpreted as a sign of government approval, this intended reform in fact led to a temporary increase in the incidence of sati in Bengal. What was less clear was how relevant these reforms were to most Hindu women, especially in the rural areas and among the urban lower classes. Most of the reforms involved only the urban middle classes, often substituting a restrictive British model of womanhood for traditional Hindu norms. The formation of the *bhadramahila* (gentlewoman), the concept of the ideal feminine as constructed by the Westernized male sections of the Bengali middle classes and largely internalized by their female counterparts, is paradigmatic in this respect.

It is significant that this early focus on women in India partly coincides with first-wave feminism in the West (c. 1850–1950) and shares many of the latter's attributes. In particular many Victorian feminists (e.g., Harriet Martineau [1802–1876], Annie Besant [1847–1933], and Josephine Butler [1828–1906]) constructed their own images both of British imperialism and of Indian Hindu womanhood, reserving a special place for what they believed was (British) women's essentially caring role in the imperial project. For most of these early feminists, the plight of Indian women was merely an extension of their own political campaigns for women's rights in the West. By stressing the Otherness and what they saw as the essential dependence of Indian women, Victorian feminists used the example of Indian women to bolster their own aspirations. At the other end of the spectrum of first-wave Western feminism stood the feminism of articulate, often Western-educated, Hindu women. Examples include Pandita Ramabai (1858–1922), author of *The High-Caste Hindu Woman* (1887) and herself a high-caste

child widow; Cornelia Sorabji (1866–1954), who read law at Oxford before returning to Calcutta to work on behalf of women living in *purdah* (the confinement of women to the inner rooms of the home and to the invisibility of a palanquin when outside it); twenty-four-year-old Rukhmabai, whose determination not to live with a husband to whom she had been married at the age of eleven (case filed in 1884) sparked off a major political debate in both England and India; and the formidable Tarabai Shinde, who wrote a tract in Marathi in 1882 in response to the celebrated case of Vijayalakshmi, a young brahman widow condemned to death for the murder of her illegitimate baby. These remarkable individuals provided both a link between Western feminism and indigenous women's organizations and living models that resisted Victorian constructions of Indian women.

There was also the widespread idea, in Britain and among the emerging elites in India, that the position of women in a given culture was a mark of its degree of civilization, hence the significance attributed by both British colonizers and colonized Indians to social reforms relating to women. This idea has recurred throughout the history of the study of women and gender in India. As many scholars have argued, women figure in these public debates as symbols (or indeed as one monolithic symbol, “Woman”) of the moral health of the Hindu tradition as discussed by men rather than as owners of views and voices in their own right. The battle between tradition and modernity continues to be fought over the bodies, minds, and images of women.

Unsurprisingly the Indian response was to produce positive historical accounts of the position of women. This was in part a defense of Indian masculinities (by distinguishing between the sexes) and in part a defense of Indian culture (by expounding the past or potential glories of Indian womanhood). The recovery of Indian culture, or tradition, from colonial slurs came to mean the construction of the “traditional woman” as adapted from a fixed eternal past encapsulated in religious texts. In the early stages of the nationalist movement, especially in early- and mid-nineteenth-century Bengal, the woman question sat center stage. For its reformist wing, accused by its opponents of being overly influenced by Western liberalism, the low status of women was seen as one of the two great evils of Hindu society (the other was caste).

Ram Mohan Roy campaigned against sati. Vidyasagar fought to promote widow remarriage (1855) and—as a *kulīn* brahman himself—the abolition of *kulīn* polygamy (1871, 1873). In the 1870s the Brahma Samaj, a society dedicated to the reform of Hinduism, was twice divided on the marriage laws and the age of consent. In the ensuing debates on a range of issues relating to women, both sides sought their evidence within the textual sources of Hinduism, that is, in ancient Sanskrit religious texts composed and disseminated by the male brahman elite. Most of the works written during this period belong to the nationalist school. The prime example is A. S. Altekar's still influential and often reprinted over-

view, *The Position of Women in Hindu Civilisation* (1978/1938). A common starting point for such accounts was the conviction that Indian Hindu women had once enjoyed high status and that therefore contemporary problems must be the result of centuries of oppression by a series of invaders, notably the Muslims. These studies tended to glamorize the position of women in the supposedly glorious Vedic age, to focus on high-caste Hindu women within the family setting at the expense of other castes and other settings, and to exhibit a particular interest in sensational practices (now deemed essentially non-Hindu) such as female infanticide, child marriage, polygamy, seclusion, the deprivations of enforced widowhood, and sati. Particularly disturbing are the frequent overtones of both casteism (i.e., the denigration of low-caste women in favor of the higher castes) and communalism (i.e., anti-Muslim rhetoric). Although the simplistic explanatory framework of these early publications is flawed, the work that went into this phase constituted a useful foundation for the study of gender in Hinduism. Indeed scholars working in this area in the twenty-first century continue to respond to and critique discourses relating to the woman question.

WOMEN'S STUDIES. After Indian independence was achieved in 1947, the number of studies on women's roles within the family and on educated middle-class urban working women increased. Until the late 1960s, however, when the women's movement in the West gained momentum (known as second-wave feminism), there was little interest in rural or lower-caste women or in asking questions about the varieties of women's experiences and perspectives. Early examples of scholarly work in this phase include *Bengali Women* (1972), Manisha Roy's account of the lives of upper- and middle-class Hindu women in Calcutta, and *Women in India* (1977), the now-classic study by Doranne Jacobson and Susan S. Wadley of themes relating to Hindu women both in ancient tradition and in the lives of real women in contemporary India.

The term *women's studies*, borrowed from the West in the early 1970s, was used increasingly after the United Nations declaration of 1975 as International Women's Year and of the period 1975 to 1985 as International Women's Decade. The Committee on the Status of Women in India was appointed in 1972. The report on its findings revealed that "large masses of women in this country have remained unaffected by the rights guaranteed to them by the Constitution and laws enacted since Independence" (Committee on the Status of Women, 1974, preface). In 1979 the feminist journal *Manushi* began publishing articles on women in Indian society and culture, including items relating to religion. By the 1980s the link between women's studies and the women's movement, and thus its feminist agenda, was firmly established. Although the primary focus of women's studies was the rights of Indian women, there was a general consensus among scholars working in the field that religious ideology played a powerful role in maintaining the status quo.

Madhu Kishwar, a prominent Indian activist and (with Ruth Vanita) one of the founders of *Manushi*, explained:

The pervasive popular cultural ideal of womanhood has become a death trap for too many of us. It is woman as selfless giver, someone who gives and gives endlessly, gracefully, smilingly, whatever the demand, however unreasonable and however harmful to herself. She gives not just love, affection and ungrudging service but also, if need be, her health and ultimately her life at the altar of duty to her husband, children and the rest of her family. (Kishwar and Vanita, 1984, p. 6.)

The key to understanding the roles and images of both historical and contemporary Indian Hindu women was seen to lie in the precepts, rituals, myths, and narratives of a patriarchal religious tradition or complex of traditions: Hinduism in its broadest sense. This gave rise to a range of woman-centered studies of Hindu beliefs and practices in the 1980s. Examples include Susan Wadley's volume on the "powers" of Tamil women (1980); Lina Fruzzetti's study of the "gift of a virgin" in Bengali Hindu marriage rituals (1982); Lynn Bennett's work on the religious lives of high-caste Hindu women in Nepal (1983); Meredith Borthwick's exploration of the *bhadramahila* model of femininity in late-nineteenth-century and early-twentieth-century Bengal (1984); and Julia Leslie's analysis of the religious behavior of women (*strīdharmā*) as prescribed in an eighteenth-century Sanskrit text (1989). The main aim of this phase was to make women more visible within Hinduism, both the experiences and perspectives of Hindu women themselves and what the various Hindu traditions said about them. Like the woman question before it, the women's studies approach remained an integral part of the study of gender and Hinduism (e.g., Leslie, 1991; Bose, 2000).

POSTCOLONIAL CRITICISM. The publication of Edward Said's celebrated *Orientalism* in 1978 is usually regarded as the start of postcolonial theory. Although Said himself was criticized for his lack of attention to women, postcolonial criticism in general may be seen to act as a bridge in the transition from Indian women's studies to the study of gender in Hinduism. A prime example of this phase is the work of Lata Mani on the colonial discourse on sati. Mani argued:

Tradition is reconstituted under colonial rule and, in different ways, women and brahmanic scripture become interlocking grounds for this rearticulation. Women become emblematic of tradition, and the reworking of tradition is largely conducted through debating the rights and status of women in society. Despite this intimate connection between women and tradition, or perhaps because of it, these debates are in some sense not primarily about women but about what constitutes authentic cultural tradition. (Mani, 1989, p. 90)

This article was included in the groundbreaking volume *Recasting Women*, edited by Kumkum Sangari and Sudesh Vaid (1989). In seeking to reveal the relationship between colonial and indigenous patriarchies and between both patriarchies

and feminism, these essays on Indian women in the context of the colonial history of India set the pattern for this phase.

The 1980s also saw the emergence of a school of history referred to as subaltern studies. Often regarded as the most significant achievement of South Asian cultural studies, the focus of this collective enterprise was to contest dominant modes of knowledge and knowledge production. What was previously regarded as a history of Indian elites was now construed as a history of subaltern groups. The inclusion of women among these subaltern groups gave rise to an unclear and uncomfortable relationship between subaltern studies and feminism. Kamala Visweswaran (1996), for example, distinguished between the figure of Woman (universalized and essentialized) as subaltern and “subaltern women,” locating her own argument in the nonessentialized subject.

Alongside the feminist challenge to subaltern studies, feminist historiography focused on questions of voice, agency, and resistance with a particular interest in the oral histories of women. Examples include Malavika Karlekar’s (1993) use of biographies, memoirs, and letters to present the “voices” of some remarkable women in nineteenth- and twentieth-century Bengal and Rosalind O’Hanlon’s (1994) translation and analysis of Tarabai Shinde’s 1882 diatribe on the ways men have silenced and disempowered Indian women.

This transitional phase was one of critique and revelation. Patriarchal constructions of Hindu women—whether those of the colonial British, those of Indian nationalists, or those of what may be termed Hindu “traditionalists”—were closely analyzed, whereas the perceptions of real Hindu women were brought into the foreground. This approach too became an integral part of the study of gender and Hinduism.

GENDER STUDIES. Overlapping with the initiatives already described, the study of gender rather than women dates from the end of the twentieth century and the beginning of the twenty-first century. In line with this shift in focus, *Samya Shakti*, the journal of women’s studies edited by Malavika Karlekar and first published by the Centre for Women’s Development Studies in Delhi in 1983, was in 1994 renamed the *Indian Journal of Gender Studies*. This phase was marked by a continuing concern with the explosive mix of religion and politics and an increasing interest in the gendered aspects of nationalist and communalist rhetoric (e.g., Sarkar and Butalia, 1995). In addition greater attention was paid to the diversities of women’s religious and cultural experiences and to racial, ethnic, caste-related, regional, economic, and life-cycle differences (e.g., Malhotra, 2002). New research interests emerged too: women as subjects rather than as objects of study (e.g., Kumar, 1994); Hindu notions of masculinity (e.g., Sax, 1997); the androgyne, eunuch, or third sex (e.g., Zwilling and Sweet, 2000); Third World and Indian feminisms, usually defined in opposition to Western feminism (e.g., Gedalof, 1999); the vexed question of who speaks for whom (whether texts or informants for the subjects of study,

researchers for texts and informants, men for women, higher castes for lower castes, Western women for Hindu women, or educated middle-class urban feminists for rural and low-caste Hindu women); and gender theory, especially in relation to the Other.

An interesting development in this phase was the publication of a particularly large number of edited volumes with gender as their focus. This type of publication made it possible to arrange a comprehensive collection of essays on a broad topic, taking advantage of the work of scholars in a wide range of disciplines and fields and giving rise to new levels of sophisticated thought. As some of these volumes demonstrated, there was also an increased contribution from male scholars researching aspects of gender and Hinduism.

THE IMPACT OF WOMEN’S AND GENDER STUDIES. The impact of women’s and gender studies on the scholarly understanding of the Hindu tradition has been dramatic. Part of this change may be traced to the numbers of women scholars joining the ranks of the predominantly male disciplines of Indology, anthropology, and Indian studies generally. Textual and text-historical studies showed an increasing awareness of the implications of the (usually but—as became clear—not exclusively) high-caste male brahman authorship of the texts under discussion and allowed the subaltern perspectives of both women and lower castes to emerge. Strikingly different examples include Wendy Doniger’s extensive work on gender and myth in ancient India (e.g., Doniger, 1973, 1980, 1999); a wealth of writing by women in thirteen Indian languages brought to the attention of the English-reading public for the first time by Susie Tharu and K. Lalita (Tharu and Lalita, 1991, 1993); and the application of the tools of feminist theory and those of the Hindu tradition to the study of women in the textual traditions of Hindu India (Patton, 2002). As a result of these and other works on women, men, and gender, scholarly interpretations of religious texts and ideas expanded to include more nuanced sociocultural and gendered understandings of prescriptive utterances, ritual implications, and soteriological paths.

In the fields of the anthropology and sociology of Indian religions, a new awareness of the significance of the sex of both scholar and informant, together with an increasing number of studies by women of women, radically altered understandings of the Hindu tradition. An earlier tendency to attribute a coherent group identity to Hindu women (and, to a lesser degree, Hindu men) was replaced by a greater awareness of individual, caste, class, and regional differences in the communities studied. North India was particularly well served. For example, *Listen to the Heron’s Words*, an ethnographic study of some North Indian villages published in 1994 by Ann G. Gold and Gloria G. Raheja, challenged local ideologies of gender and kinship that routinely subordinate women to men. In Rajasthan, Lindsey Harlan (2003) examined narratives relating to Rajput masculinity, the hero as protector, sacrificial victim, and devoted “goddesses’ henchman.” In Maharashtra, Anne Feldhaus (1995) considered the

feminine imagery associated with rivers and the special relationship between water and female divinity in the gendered religious meanings of Hinduism. Studies of South India include Anthony Good's (1991) focus on female puberty rituals in Tirunelveli, linking them with notions of female sexuality, myth, and religious tradition in southern India and Sri Lanka, and Karin Kapadia's (1995) analysis of the impact of caste and class on concepts of gender among so-called "untouchables" in a village in Tamil Nadu.

This new awareness of the implications of gender was also felt in specific subject areas. In relation to Hindu goddesses, for example, there was an outpouring of academic works. The earlier publications focused on descriptive material, locating sources, distinguishing the names and attributes of different goddesses, explaining the associated myths and symbols against a largely Pan-Indian background (e.g., Kinsley, 1986). Foundational text-historical studies focused on, for example, the *Devīmāhātmya* (Coburn, 1984); the tension between the independent goddess Devī and what Lynn Gatwood (1985) calls the "spouse goddess"; the feminine principle and its relation to the rise of goddess worship (Pinchman, 1994); the South Indian folk goddess Draupadī as presented in oral and classical epics (Hiltebeitel, 1999); and Tantric goddesses (Kinsley, 1997). There were also several wide-ranging edited volumes on Hindu goddesses and female divinities (e.g., Hawley and Wulff, 1996; Pinchman, 2001). Although some of these authors did not focus on the implications of their work for Hindu women, some did. For example, William S. Sax's 1991 research on Nandādevī, a goddess worshipped in high-altitude Hindu villages in the central Himalayas of North India, revealed that her widespread popularity derived from the fact that her mythology paralleled—and therefore provided emotional, cultural, and religious support for—the daily lives of local women. Some studies were more gender-critical, even overtly feminist, than others. For example, Ellen Goldberg's (2002) analysis of the *ardhanārīśvara* form of the god Śiva, carefully defined as "the Lord who is half woman," combines both traditional Indian and contemporary feminist approaches. Finally, there was a new interest in the appropriation of Indian goddess mythology by the West. For example, a volume of essays exploring the ways in which the goddess Kālī is worshipped and understood in South Asian and Western settings and discourses (McDermott and Kripal, 2003) and another examining how far Hindu goddesses may be seen either to empower women ("Is the Goddess a Feminist?") or to serve the interests of patriarchal Hindu culture (Hiltebeitel and Erndl, 2000).

Early studies of ritual tended to favor the public or formal arena involving male priests and actors. As interest in women and gender issues increased, greater attention was paid both to the apparently marginal roles of women in ancient public rituals (e.g., Jamison, 1996) and to the changing religious roles of women in modern forms of Hinduism (e.g., Heller, 1999). Of particular interest were women's do-

mestic rituals: their seasonal performance of vows (*vrata*, *vrata*) to maintain the health and well-being of their husbands and families, their periods of fasting, their special *pūjās* (e.g., Pearson, 1996). Accounts of sexuality in the context of Hinduism began with general explorations of Hindu culture (e.g., Kakar, 1989) and led in time to more in-depth studies such as the analysis of menstruation and female sexuality in early Indian texts (Leslie, 1996), an exploration of sexuality and mysticism in the life and work of the male saint, Ramakrishna Paramahansa (1836–1886) (Kripal, 1998), and a collection of essays on same-sex sexuality and cultural identity in South Asia (Vanita, 2002). The implications of gender theory and postcolonial criticism for the study of dowry and dowry deaths allowed research in this area to move on from text-historical analysis and data collection to more sophisticated critical approaches (e.g., Oldenburg, 2002). Studies of sati continued apace, each generation of scholars adding a new angle or approach to the ongoing discussion. Similarly widowhood was studied by historians, text specialists, and anthropologists, resulting in both empirical data and conceptual insights. Whereas male saints, *ṣṛīs* (seers), ascetics, and gurus were already visible in scholarly research, their female counterparts now emerged in a range of accounts of women saints and female ascetics (e.g., Khandelwal, 2004) as well as in studies of key individuals, such as Lopāmudrā (Patton, 1996) and Ānandamayī Mā (Hallstrom, 1999). There was also a growing interest in the gender implications of male asceticism (e.g., Chowdhury-Sengupta, 1996). The changing, often conflicting, approaches of the emerging discipline of gender studies in relation to Hinduism was especially highlighted by the scholarly treatment of the temple woman or *devadāsī*. Blanket denunciations of what in colonial times was seen as a form of sexual slavery were replaced by explorations of ritual power, eternal auspiciousness, individual agency, and postcolonial presentations of *devadāsī* reform in colonial India (e.g., Marglin, 1985; Orr, 2000; Kannabiran and Kannabiran, 2003).

The increasing significance in the twenty-first century of nationalist politics in India, and of diaspora Hinduism generally, suggests that the study of gender in relation to both these topics will continue to develop. Other areas that will no doubt attract further research include the dominance of Western (especially American) metanarratives and the Othering of non-Western women in the scholarly writing of Western feminists; the impact on both Sanskrit studies and the study of Hinduism of the greater numbers of Hindu women entering these disciplines; the gendering of philosophical ideas; the representation of ambiguous sexualities; relationships between myth, text, or ritual on the one hand and historical or contemporary social realities on the other; and the integration of critical and gender theory into existing approaches to the study of Hinduism.

The study of gender in Hinduism has progressed through a series of overlapping yet transformative phases: the woman question, women's studies, postcolonial criticism,

and a more full-fledged gender studies proper. Each phase emerged from and grafted itself onto what preceded it with the result that, although everything has changed, there is little that has been entirely lost. With such radical shifts in perspective accomplished, it is hard to anticipate where the next hundred years will lead in this particularly challenging aspect of Hindu studies.

JULIA LESLIE (2005)

GENDER AND RELIGION: GENDER AND JAINISM

The birth act for the study of gender concerns in Jainism is undoubtedly the publication of Padmanabh S. Jaini's *Gender and Salvation: Jaina Debates on the Spiritual Liberation of Women* (1991). Jaini's monograph goes to the heart of the Jain tradition by dealing with a gender-based issue that is crucial to it and that marks one of the clearest differences between its two main ideological currents, the Śvetāmbara and the Digambara Jains (born from a split that probably took place in the beginning of the common era). Some of the other factors that encouraged reflecting on the place of women in the Jain tradition in the last 15 to 20 years, which run parallel to the general trend of developing reflection on the role of women in all traditions, are the following: an increasing interest in Jainism among female scholars (e.g., anthropologists, philologists) who, in the Indian context, have easier access to nuns or laywomen than their male colleagues; an interest for Jainism explicitly motivated by a gender-based approach; a growing consciousness of the immense wealth of tradition and issues represented by women in Jainism; and an increasing number of publications, especially in the United States, on the broad topic of women and religion. Before this, many of those who studied Jainism had noticed the numerical potential represented by women, especially in the monastic orders of the Śvetāmbara Jains, without really exploring the topic.

WOMEN AND SALVATION. The Jain religious discourse shares universal prejudices against women, who are viewed as temptresses and symbols of attachment, fickleness, and, above all, treacherousness. Acts of deception (*māyā*) are considered a woman's main characteristic, to the extent that deceitfulness comes to be adduced as an explanation for sex-differentiation: "As a result of manifesting deception a man in this world becomes a woman. As for a woman, if her heart is pure, she becomes a man in this world" (Maheśvarasūri, *Nānapancamīkāhā* 3.17, tenth century).

However, the main question is whether the basic inequality between man and woman as such can be neutralized. The most original contribution of the Jains to world religions undoubtedly concerns the theological consequences of their image of woman and their vivid debates about women's abil-

ity to gain salvation. The position on this radically separates the Digambaras and the Śvetāmbara and is linked to the correlated question of nudity viewed, or not, as a prerequisite. For the former, whose name means "sky-clad," acceptance of nudity by the mendicants is a symbol of their perfect detachment from everything, whether material possession or any moral defilement.

Because the underlying idea is that a woman can by no means go naked because of her specific physiology and innate impurity due to the presence of numerous subtle microscopic beings in her body, she is not considered to be able to reach emancipation as a woman. She has to be reborn as a man first. This perspective may be one reason why nuns are less numerous than monks among the Digambaras. The "white-clads," on the other hand, focus on a more internal approach: Provided an individual is able to fulfill the right faith, right knowledge and right behavior, which are the only necessary conditions for attaining the ultimate goal, gender does not matter. From the beginning of the common era up to the twenty-first century, this debate about female religiosity has been continuously sustained in many texts—all written by male ascetics. Authors from the two groups have done their best to provide logical arguments and closely conducted discussions in favor of their respective opinions, trying to go beyond mere postulates. Some, for instance, have devised a fine analysis of the notion of *gender*, which they see as different from *sex*, through a Sanskrit term (*veda*) meaning, in fact, *libido*, thus transcending the physiological sex distinction.

WOMEN AND MYTHOLOGICAL CATEGORIES: THE JINAS. Theological debates on women and emancipation are mirrored in the construction of gender in myth. Basically atheistic, the mythology of the Jain tradition centers around the lives of its Ford-makers (*Tīrthaṅkaras*, or Jinas), who number twenty-four. Like other humans, the Jinas are beings who have gone through the world of transmigration and have been born under different shapes among gods, animals, or human beings. In their last incarnation, they are human beings who soon leave the worldly life and become religious mendicants to entirely devote themselves to the practice of asceticism, which results in perfect knowledge (*kevala-jñāna*) and finally emancipation. Accounts of the Jinas' biographies are an important part of the literary tradition. Both Śvetāmbaras and Digambaras agree that twenty-three out of these twenty-four Jinas are men, but they disagree about number nineteen, named Malli (linguistically an ambivalent form because *i* nominal stems can be masculine and/or feminine). The Digambaras unanimously tell that Malli (or Mallinātha) was a boy who lived the ordinary career of a Jina and occasionally consider the absence of any feminine image as a proof that Malli is masculine. The Śvetāmbaras, on the other hand, state that Malli became a Jina during her last birth as a woman. The Śvetāmbara narrative enhances the ambivalence of the woman status as seen by this religious group: Malli had to be a woman as a kind of atonement for some act of deception committed in a former existence, but, at the same time, she had earned a type of *karman* leading

to become a Jina. The fact that the Śvetāmbaras include in their canon a specific text narrating the life of Malli, whereas all Jinās are not provided with a full-fledged individual biography, indicates their desire to stress their sectarian specificity regarding this point. However, there are linguistic and stylistic features that show that even Śvetāmbaras may not have wished to insist too much on Malli's femininity as such. Once she has decided to renounce the world because she was considered only as a sexual object by several young men who all wanted to marry her, she follows the same path as other Jinās and is given the same masculine titles (e.g., Mallijina, Mallinātha, *bhagavant*, *arabant*, *svāmin*). In other words, a woman can gain emancipation, but the nonemphasis on femininity is the way to reach it. This could explain that (except for a dubious case) no visual representation of Malli with any feminine sexual characteristic is available. This fact is, to some extent, in accordance with the idea that Jinās are pure emancipated souls who cannot be shown as human beings, but is in contradiction with the sexually marked sculptural representations of naked Jinās.

WOMEN IN THE LIFE OF MAHĀVĪRA. The fundamental theological difference between Śvetāmbaras and Digambaras—the latter having a basically negative view of women—explains their divergence of thought regarding the role of women in the life of their teacher, Mahāvīra, the twenty-fourth Jina. The Digambaras' position suffers no compromise: Mahāvīra cannot be conceived as subjected to women in any way. Albeit the young handsome son of a princely family, he renounces the world as perfectly chaste and never surrenders to the delights of love, thus embodying the perfect ascetic. On the contrary, several features underline the key role of women in this Jina's biography as told by the Śvetāmbaras: (1) although reluctant to do so, Vardhamāna (Mahāvīra) accepts his parents' command to get married; (2) he fathers a daughter; and (3) she becomes the wife of Vardhamāna's elder sister's son (instance of cross-cousin marriage documented in western India) and her husband is responsible for an important schism in the community. This probably intentional stress on feminine lineage may be a part of a strategy meant to underline sectarian identity against the Digambaras (and perhaps also against the Buddhists because Gotama is said to have fathered a son). The desire to describe Mahāvīra as a perfect householder before he renounces the world is perhaps a way to make the ideal he represents closer to the ordinary man and is a less extremist view more in accordance with the accepted current social patterns.

WOMEN IN WORSHIP: MYTHICAL FIGURES. In worship, female mythical figures, connected with grammatically feminine concepts, occupy a central place. Iconography testifies to a fairly ancient cult rendered to the mothers of the Jinās, and especially to Marudevī, the mother of the First One, who is said to have been the first emancipated soul. Knowledge, a cardinal concept in Jain doctrine, takes shape in figures that are all feminine. This applies to the goddess Sarasvatī, who is as important for the Jains as she is for other Indians, to the *vidyādevīs*, who are representations of various

sciences (*vidyā*, a feminine noun), and to the "eight mothers" (*mātṛkās*; a group of eight basic notions of Jain ethics). The main feminine deities of the Jain tradition, however, are the female attendants (*Yakṣiṇīs*) attached to the main Jinās. Among them, Cakreśvarī, Padmāvātī and Ambikā (respectively connected with the twenty-second, twenty-third, and twenty-fourth Jina) have gradually become independent figures and occupy an outstanding place, being invoked by devotees who seek their protection on specific occasions of their daily lives. While the Jinās appear as distant spiritual ideals, these female deities are nearer to the human world and its difficulties and could have a role more prominent than their male counterparts (the *Yakṣas*).

HEROINES. Storytelling, an important pedagogical means of Jainism that takes various forms in various languages, functions significantly in the construction of gender. The lives of female legendary protagonists inform the minds of Jain women by providing identification patterns to be followed or avoided. In the virtually inexhaustible gallery of portraits, the Jinās' mothers and the sixteen *Mahāsatīs* are prominent. In short, the following key roles are illustrated by female characters: (1) willing or unwilling donor of alms (to be viewed in the light of the importance of food); (2) strong and faithful adherents to the basic principles of Jainism and propagators of the Jain faith to adverse members of the family; (3) virtuous and faithful wives despite dangerous situations putting life-safety at risk; and (4) renouncers of domestic life (e.g., the famous Rājimatī, dear to all Jain hearts; as her future husband renounced worldly life on the day of his marriage, she overcame her suffering, decided to become a nun, and later resisted the seductive attempts of her husband's elder brother).

WOMEN AND SOCIETY: RELIGIOUS ORDERS. Gender does not seem to have ever been an issue as far as the creation of a female order is concerned. When the community was structured by Mahāvīra, the main expounder of the doctrine (around the fifth century BCE), it was right away described as fourfold, including women as two of its components: laywomen (*śrāvikā*) and nuns (*sādhvī*), beside laymen and monks. This is recognized by all Jains, whether Śvetāmbara or Digambaras, and has not given rise to any discussion or embarrassment whatsoever (contrary to what happened in the beginnings of the Buddhist tradition).

Whether in ancient scriptures or in modern times (at least among Śvetāmbaras), statistics are clear: Nuns largely outnumber monks. However, higher number does not mean higher rank. In the specific texts devoted to the exposition of the monastic code developed by the Śvetāmbaras as a part of their canon, no explicit inequality between monks and nuns is recognized, but the patterns of redaction rest on the underlying thought that a woman, being unsteady by nature, needs more control. General rules applying to monks and nuns are largely similar, but there are additional and stricter rules that are meant to restrict options open to nuns in activities connected with their daily routine—especially food regu-

lations. On the other hand, their independence and freedom are limited by a general subordination to the monks: (1) Even when having a long religious life, they may be under the authority of junior monks; (2) they need more years than their male colleagues to reach high positions in the religious hierarchy; and (3) nuns have their own religious titles that imply an inferior rank than those of monks.

NUNS AND LEADERSHIP. This last point is best exemplified in the organization of the Terāpantha movement, a modern subsect of the Śvetāmbaras mostly active in Rajasthan. When it originated in the eighteenth century, a single teacher (*ācārya*) was the head of both monks and nuns. The regular increase of nuns resulted in the institution of a female head (*pramukhā*) who commands smaller units. However, her role is that of a coordinator; she is not considered as the female counterpart of the *ācārya*, who is the decisional authority, and she remains subordinate to him. In fact, Jainism does not know of any female as a leader of a religious group of some significance. The only exception to this is very recent, rather marginal and locally based in Gujarat. It is represented by the case of Campābhen Mātājī (1918–1993) who became the leader of the Kānji Svāmī Panth, a twentieth century neo-Digambara movement, after the death of its founder in 1980 and who is credited with quasi-divine powers and knowledge of previous births.

NUNS AND SOCIETY. To some extent, monastic tasks are gender-based and tend to reproduce the distribution of domestic tasks in the secular world (e.g., sewing, mending of robes and other objects). Still, the fact that “religion serves as both a creative and conservative force in women’s lives” (Vallely, 2002, pp. 21, 215.) accounts for the appeal that monastic life does have for young Jain women. In addition, “the value of chastity is one way concepts about women and renunciation combined in a manner favorable to female renunciation in Jainism. This connection between Jain wives and renouncers is strong enough, when combined with various other factors, to encourage more women than men to renounce in the Jain tradition” (Fohr, 2001, p. 1). The asymmetries between nuns and monks in the communitarian hierarchy and the domestic roles assigned to nuns are not enough to alter this tendency.

In the modern context, the educational level of Jain nuns is a prominent issue. Theoretically, there is no avowed distinction between nuns and monks as regards access to sacred scriptures. Jainism (as well as Buddhism) basically admits access for all and differs, in this respect, from the orthodox Hindu tradition, in which women were traditionally refused access to the Vedas. However, in practice, all the orders within Jainism do not have the same position. Although some of them (e.g., Terāpanthins and Sthānakvāsins) claim that monks and nuns can study all texts, others (e.g., part of the Mūrtipūjaks) state that the nuns’ abilities are less and prevent them from being in a position to study certain difficult or controversial canonical texts, especially those connected with the monastic code.

The efforts of some prominent nuns, who try to make use of their prestige and influence to promote women’s education, must however be underlined. They profess that before getting religious initiation, the young girls must undergo a probational period during which they will be given at least basic knowledge not only in Jainism but also in grammar or literature. Promoting women’s education is moreover an important point of the Terāpanthin subsect. It is being implemented through a special category of nuns who are officially free from certain rules restricting their movements and can visit distant institutions in India or abroad to pursue academic research. Although nuns are allowed to hold public sermons, not many of them do so. More often, they are seen surrounding the preaching monk and carefully listening to him: “*Sadhvis* are regarded first and foremost as ‘devotees.’ . . . The *sadhvi* is still evaluated according to the *pativrata* virtues of devotion, surrender, and self-sacrifice. These traditional virtues prescribed for women are not substituted for but rather supplemented with values more accordant with those of the ascetic ideal” (Vallely, 2002, pp. 215, 218).

Study of history also shows that in the past scriptural sources are essentially authored by or ascribed to male renouncers or are male-oriented. The few female religious figures whose names have come to us are sources of inspiration for men (e.g., Yākinī-mahattarā for Haribhadra, c. eighth century). In recent times, a few highly charismatic nuns have been able to express themselves through their autobiographies (e.g., Āryikā Jñānamati, 1990) or through the redaction of religious pamphlets, but no really breaking-through dogmatical treatise is known to have been composed by any woman of the tradition. A further dissymmetry appears in the field of worship. Worship of female deities or deified concepts is one thing; worship of human female teachers another one. Whereas images of male renouncers of some importance are common, at least in some groups, this is still an exceptional fact in the case of nuns.

ROLES FOR LAYWOMEN. As for Jain laywomen, their roles are mostly oriented toward the two areas in which the otherwise prevalent gender hierarchy is at least partly reversed: preparation of food and performance of rituals, for which the men are completely dependent on them. In a tradition such as Jainism, food is far from being a minor question. The observation of specific dietary rules is one of the clearest means to ensure sectarian identity. Thus the woman at home functions as a guardian or a modifier of the tradition through the various roles ascribed to her. She is the one who offers alms to the begging Jain mendicants who come at her door, which implies that she masters a minute sequence of actions and rules. She is also the one who prepares the meals for the family and decides whether a rule like the one that forbids eating after sunset will be observed or not, and she knows which type of food has to be cooked depending on the day (i.e., festival, ordinary). Finally, the woman is also the one who has a full command on the complicated calendar and typology of fasts that regulate the Jains’ lives. Fasting is actually the

true women's penance and a way for them to gain a high reputation of religiosity.

Reproduction of the community is in their hands through the handling of marriages and the imparting of basic teachings to young generations. This latter task is mainly done through the telling of Jain legends and stories, the old stock of which is continuously kept alive thanks to new versions, which the women mainly come to know in translations or rephrasing in modern languages, or by interaction with the religious order (e.g., sermons or personal conversations). Religious hymns form another category of literature in which women are quite proficient.

Creating such hymns, chanting, and reciting are manifestations of feminine religiosity at work in domestic as well as in temple rituals. Again, the risk of oversimplifying the situation is to be avoided: Differences exist among subjects as to whether women are to be allotted the same rights as men in worshipping the images. Fundamentalists hold that they should never be allowed to enter the innermost sanctuary and to touch the idols because they can never reach the indispensable degree of purity to do so, whereas others restrict direct contact to certain circumstances or temporary impurity only. The groups among the Jains who do not worship images, however, lay more stress on internal worship. Hence, their conceptions are more egalitarian. Recent studies have underlined that women have the real authority as far as conduct and performance of ritual itself are concerned, an area of religiosity in which they assess their power against the male sponsors.

Thus gender issues are indeed prominent both in Jain history and its contemporary realization. The construction of gender appears as a complicated process. In mythology and soteriology there is a clear and apparently irreconcilable divergence between the two main sects, although the woman-favoring tendency of Śvetāmbara Jainism should not be emphasized too much. Moreover, there is a true conception of gender that goes beyond physiological characteristics. At an institutional level, Jainism is basically man-centered, but there are signs to show that the numerical pressure of female renouncers may lead to an interesting evolution. Jain laywomen also have a key role both as reproducers of traditional values and as dynamic factors in Indian society in general.

BIBLIOGRAPHY

Please see the following works on Jainism in English: Walther Schubring, *The Doctrine of the Jains*, translated from the German, 2d ed., rev. (Delhi, 2000) and Helmuth von Glasenapp, *Jainism: An Indian Religion of Salvation*, translated from the German (Delhi, 1999), have a traditional approach which may not appeal to some but are extremely useful and should not be forgotten. Padmanabh S. Jaini's *The Jaina Path of Purification* (Delhi, 1979), with emphasis on

the Digambara point of view, and Paul Dundas's *The Jains*, 2d ed. (London, 2002), with a vast bibliography, are indispensable.

An overview of various issues connected with the question of women in the frame of Jainism in history and in the contemporary world can be found in Nalini Balbir's "Women in Jainism," in *Women in Indian Religions*, edited by Arvind Sharma. (New Delhi, 2002) pp. 70–107; see also "Women in Jainism," in *Religion and Women*, edited by Arvind Sharma (New York, 1994), pp. 121–138. Padmanabh S. Jaini's *Gender and Salvation: Jaina Debates on the Spiritual Liberation of Women* (Berkeley, Calif., 1991) is a pioneering work. It is an in-depth study accompanied by translations and detailed discussions. The issue of gender and mythology is discussed in John E. Cort's article "Medieval Jain Goddess Traditions," *Numen* 34, no. 2 (December 1987): 235–255. As for the biography of the nineteenth Jina, Mallī, who, according to the Śvetāmbaras, was a female, see *Mallī-Jñāta. Das achte Kapitel des Nāyādharmakāhāo im sechsten Aṅga des Śvetāmbara Jainakanons*, edited and translated into German by Gustav Roth (Wiesbaden, Germany, 1983) or Hemacandra's version in his *Triṣaṣṭīśalākāpuruṣacarita*, English translation by Helen W. Johnson, vol. 4 (Baroda, India, 1954). For monastic regulations as they are defined by the Śvetāmbara canon, see *Kalpasūtra*, English translation of Schubring's German translation by May S. Burgess, *The Indian Antiquary* 39 (1910): 257–267.

First-hand accounts by Jain nuns themselves are not numerous. Hence Āryikā Jñānamatī's autobiography written in Hindi under the title *Merī smṛtiyām* (My memories) (Hastinapur, India, 1990) deserves a mention as containing information about monastic daily life, commitments, and politics. Occasionally nuns' achievements or biographies come to the fore. For example, see the Felicitation Volume *Sādhvīratna Puṣpavatījī Abhinandan Granth*, edited by Dines Muni (Udaipur, India, 1987) in honor of a Sthānakvāsī nun, and other such publications (in Hindi or Gujarati) locally available in India.

Four monographs, written by Western women, are valuable sources of information about encounters with Jain women: N. Shanta's *The Unknown Pilgrims. The Voices of the Sadhvis. The History, Spirituality, and Life of the Jaina Women Ascetics*, translated from the French [*La voie jaina*] by Mary Rogers (Delhi, 1997) is based on classical sources and on modern information; Anne Vally's *Guardians of the Transcendent. An Ethnography of a Jain Ascetic Community* (Toronto, 2002) is based on fieldwork done in Ladnun (Rajasthan). M. Whitney Kelting's *Singing to the Jinas: Jain Laywomen Mandal Singing and the Negotiations of Jain Devotion* (Oxford, 2001) is a refreshing analysis of female roles as assumed by those who are not ascetics. Their lively presence is felt throughout the book through their songs of devotion. Sherry Elizabeth Fohr's "Gender and Chastity: Female Jain Renouncers" (Ph.D. diss., University of Virginia, 2001) shows, on the basis of extensive conversations with nuns, how the fundamental value of chastity is instrumental in renunciation and how Jainism provides an appropriate frame for its successful achievement. Josephine Reynell's articles—especially "Women and the Reproduction of the Jain Community," in *The Assembly of Listeners*, edited by Michael Carrithers and Caroline Humphrey (Oxford, 1991), pp. 41–65—are at

tempts at defining women's role in contradistinction to their male counterparts, whereas Marie-Claude Mahias's *Délivrance et convivialité. Le système culinaire des Jaina* (Paris, 1985), whose investigation is based on field-work conducted in Delhi, looks at the role of Jain women in connection with rules relating to food habits, which are so crucial for the definition of a Jain identity. Other valuable insights are found in Josephine Reynell, "Honour, Nurture, and Festivity: Aspects of Female Religiosity amongst Jain Women in Jaipur" (Ph.D. dissertation, University of Cambridge, 1985).

Scattered but valuable observations on the role of women are found in several ethnographic studies such as Lawrence A. Babb's *Absent Lord: Ascetics and Kings in a Jain Ritual Culture* (Berkeley, Calif., 1996), Ravindra K. Jain's *The Universe as Audience: Metaphor and Community among the Jains of North India* (Shimla, India, 1999), and James Laidlaw's *Riches and Renunciation: Religion, Economy, and Society among the Jains* (Oxford, 1995).

NALINI BALBIR (2005)

GENDER AND RELIGION: GENDER AND BUDDHISM

Early in the history of Western scholarship about Buddhism, several well-known women scholars wrote significant studies about the role of women in early Buddhism. C. A. F. Rhys Davids's translation of the *Therīgāthā* (The songs of the female elders) was published in 1909, and in 1930 I. B. Horner published the very significant book, *Women under Primitive Buddhism*. However, by the mid-twentieth century, these works had been largely forgotten and scholars almost never discussed how gender affects Buddhists' lives or the practice of their religion. Scholarship had become almost androcentric, giving us knowledge only about what men thought and did, proceeding as if women were not part of the religious community. Furthermore, these studies rarely discussed cultural and religious attitudes toward women, or the presence of female divine beings. Such omissions were typical of scholarship in general, not only Buddhist studies or religious studies.

When the second wave of feminism began in the mid-1960s, people did not immediately regard scholarship about religion as a feminist issue, but by the late 1970s a small group of scholars, mainly women, were keenly aware of the inadequacies of androcentric scholarship and its failure to provide a complete or accurate picture of whatever religion was being studied. In addition, many people were discussing the perceived injustices of male-dominated religions, including Buddhism. After a hiatus of almost fifty years during which no significant studies of gender and Buddhism had appeared, in 1979 Diana Y. Paul published her translation and commentary, *Women in Buddhism: Images of the Feminine in Mahāyāna Tradition*. In the following decade, interest in the topic of gender and Buddhism increased greatly, in keeping with scholarship in general and the culture at large. Many significant and provocative articles appeared, and in 1988

Sandy Boucher published *Turning the Wheel: American Women Creating the New Buddhism*, a semipopular account of American women Buddhist reformers of the tradition. By then concerns about gender and Buddhism had become an issue not only for scholars of Buddhism but also for Buddhist practitioners, who were, if anything, more aware of and more concerned about the issues than were the scholars. The first comprehensive book-length account of gender and Buddhism written by a scholar-practitioner appeared in 1993 when Rita Gross published *Buddhism after Patriarchy: A Feminist History, Analysis, and Reconstruction of Buddhism*. In the following ten years, a significant number of books, some scholarly, some more oriented to Buddhist practitioners, appeared. During that same period, scholars began to pay more attention to gender in their research and in general surveys of Buddhism and introductory textbooks.

AN OVERVIEW OF BUDDHISM AND GENDER. There is a certain ambiguity in the study of gender in general, not just in Buddhist studies. Do scholars genuinely mean *gender*, or do they, in effect, say *gender* but mean *women*? Writings on Buddhism and gender will always discuss women's roles and images of women, but they may have little to say about how the gender discriminations found in all religions affect men. And unless the term *gender* is in the title of a book or chapter, it usually does not contain much information about how gender practices affect either women or men.

In Buddhism's 2,500-year-long history, several generalizations about gender stand out. First, it could be argued that the most significant distinction within the Buddhist community is not between women and men, but between monastics and laypeople. In ancient India at the time of the Buddha, it was commonly believed that the householder lifestyle was simply too distracting and busy, filled with children and work, for a person to be able to make any significant progress toward deep understanding of reality and the consequent peace brought by such knowledge. The Buddha himself renounced his wealth, family, and social position for a life of religious seeking, and he ordained many followers as monks and nuns throughout his life. The prestige of the monastic lifestyle has never diminished in Buddhism, with the possible exceptions of Japanese Buddhism and newly converted Western Buddhists. Given the centrality of monasticism in Buddhist life, the presence or absence of a nuns' order is a significant gender issue in Buddhism. Though many Buddhist sources report the Buddha's initial hesitation to initiate a nuns' order, it did begin and has persisted, with many ups and downs, in most parts of the Buddhist world. Restoring the nuns' ordination in those parts of the Buddhist world where it has been lost, or to which it never was transmitted, is an important contemporary issue in Buddhism.

A second generalization is that there have been two radically different opinions about gender, and especially about the status of female rebirth in the Buddhist world, in all periods of Buddhist history, and in all forms of Buddhism. One opinion states that gender does not matter, that gender is ir-

relevant because both women and men can uncover the true nature of enlightened mind and that enlightened mind is not one iota different in women than it is in men. The other opinion states that gender does matter a great deal and that it is much more fortunate to be reborn as a man because of the social privileges that go with male rebirth. Monks always had more prestige than nuns and were better supported. The major institutions of Buddhism, including the nuns' order, have always been male dominated, though that is changing in contemporary times, especially among Western converts to Buddhism. Modern reformers have pointed out that these two well-entrenched traditional attitudes about gender are incompatible, for if gender is irrelevant, there can be little basis for awarding men social privilege and domination of Buddhist institutions.

EARLY INDIAN BUDDHISM AND DEVELOPMENTS IN SOUTH ASIA. Regarding gender, the most significant debate about early Buddhism, the Buddhism of the Buddha's day and the next three to five hundred years, is whether or not its basic view is misogynistic, that is, hating and fearing females and everything female. Male monasticism tends to produce literature, directed to monks, about the dangers of contact with women, and these are plentiful in the literature of this period. Some commentators interpret these passages as evidence that early Buddhism had strongly negative views of women. Others, however, argue that these remarks directed to monks are not the whole story, and that these passages about the dangers of contact with women are more about the weakness of men's discipline than about the inherent faults of women. The latter argument is bolstered by the existence of flourishing and highly accomplished nuns in early Buddhism, and by the high regard in which laywomen donors were held. Certainly nuns were not equal to monks in the modern sense of the term, but they nevertheless had a degree of freedom and independence that was rare in the ancient world. Their lifestyle is well represented in the *Therīgāthā*.

Almost every account of early Buddhism also tells the story of the Buddha's reluctance to allow women to ordain as nuns at all, along with that story's depressing coda about the eight special rules that subordinate all nuns to all monks, even the newest novice. Most also include the prediction that the Buddhist religion would only endure half as long as it otherwise would have because women had been admitted to the order. But scholars who have done textual analysis on these passages have expressed doubts about the origin of these stories and comments. Some suggest that they more likely came from a later period, some hundreds of years after the life of the Buddha when Buddhism was splitting apart into several mutually incompatible denominations, not from the Buddha himself or his times.

Buddhism first spread to Sri Lanka as a result of missionary efforts on the part of Emperor Aśoka of India in the third century BCE. It is said that Aśoka's daughter herself initiated the nuns' order there, and it was Sri Lankan nuns who went to China in the fifth century CE to initiate the nuns'

order there. These Chinese nuns' ordination lineages are the source of most lineages for nuns' ordination in the contemporary world. However, after the eleventh century CE, Sri Lankan Buddhism saw the demise of the nun's order. The consensus of scholarship is that nuns' ordination never reached other Southeast Asian countries.

In the contemporary Theravāda world, reviving nuns' ordination is a hotly contested issue, though those in favor of reviving it may be slowly winning the battle. Conservatives argue that the Buddha did not want to ordain nuns in the first place and that the nuns' order can be revived only by the next Buddha—who is not expected to appear anytime soon. But women from Theravāda countries receive ordination from Chinese and Korean lineages and return to their Southeast Asian homes as fully ordained nuns. Though the nuns often face severe censure, especially in Thailand, gradually nunneries are being reestablished anyway. The first nuns' ordination to occur in a Theravāda country in over a thousand years took place in Sri Lanka in 1998.

MAHĀYĀNA BUDDHISM. The origins of Mahāyāna Buddhism are still debated, but all would agree that it was present by five hundred years after the time of the Buddha, about the beginning of the common era. It is also often claimed that Mahāyāna Buddhism was more inclusive of laypeople and women than other forms of Buddhism found in India at that time, but there is little evidence for this claim in Buddhist institutional practices of the period and no historical women stand out in accounts of Mahāyāna Buddhist history. However, Mahāyāna literature sometimes also presents a very different picture of possible or ideal roles for laypeople, and especially for women. They are sometimes the heroes of Mahāyāna texts, and they are then portrayed as far more knowledgeable than their male opponents, who are representatives of the more established schools of Buddhism. Furthermore, texts that portray women as knowledgeable heroes are not minor, unimportant texts, but are among the most popular and influential texts. Such texts are also quite numerous.

Portrayals of accomplished women and girls range from those in which the woman changes her female body into a male body as a sign of her superior understanding, to portrayals in which she teaches unchallenged by anyone for taking on what is usually understood as a male role. The most famous episode in which a female transforms herself into a male occurs in the *Lotus Sūtra*, an Indian text that became especially important in East Asian Buddhism. The heroine is the eight-year-old daughter of the Nāga king, an improbable candidate for high spiritual attainment not only because of her gender but because of her age. Mañjuśrī, an important *bodhisattva* in the Mahāyāna pantheon vouches for her, and she proclaims that she will teach the *dharma* (Buddhist teachings), but Śaripūtra, one of the most important elders and disciples of the Buddha in the literature of older forms of Buddhism, objects that a female could not possibly be able to teach. After some debate with Śaripūtra, as the text delicately puts it, her "female organ disappeared and the male organ became visible."

This passage has been interpreted and commented upon many times. More conservative commentators have claimed that this passage indicates that women cannot become enlightened, but must first change into men, a rather common Asian Buddhist claim. If even the Nāga princess must change into a man, they would argue, surely all other women must become men before they can become enlightened. For most women, of course, this sex change will not happen until a future life, but the fact that “deserving women” will be reborn as men is claimed by some as proof that traditional Buddhism does not practice sex discrimination. However, more recent feminist commentators on this text have claimed that the problem pointed to by this text is not the Nāga princess’s femaleness, but the obtuseness of Śāripūtra and the other male naysayers. Only something as abrupt and unlikely as an instantaneous sex change can convince these ideologically fixated, conservative men, who simply cannot hear true *dharma* when it comes out of a woman’s mouth. The fact that the Nāga princess has the ability to magically change her sex as a last resort to demonstrate her skill to these men only enhances her claim to superior understanding. While Buddhist stories frequently include the motif of magical powers resulting from high meditative attainments, only the most advanced practitioners can accomplish such feats.

Another famous passage occurs in the *Vimalakīrti Nirdeśa Sūtra*. Śāripūtra is again debating with a highly accomplished woman, a so-called goddess who has been studying for twelve years in Vimalakīrti’s palace. Śāripūtra is impressed with her knowledge and comments that someone who knows as much as she does should be a man. He then challenges her to change herself into a man. She replies that she had been looking for the innate characteristics of the female sex for twelve years, without success, so there was nothing that could be changed. When Śāripūtra persists with his objections, she suddenly changes him into a woman and herself into a man. The goddess, now a man, asks the female Śāripūtra if she (he) can find the essential nature of his newly female sex. A confused Śāripūtra replies that he cannot even figure out how he became a woman. Then the goddess changes Śāripūtra back into a man and herself back into a woman and asks Śāripūtra about the “female form and innate characteristics.” A much chastened and wiser Śāripūtra replies, “The female form and innate characteristics neither exist nor do not exist,” an answer much more in accord with Mahāyāna teachings on emptiness.

A final motif found in Mahāyāna texts portrays women teaching the *dharma*, but male challenges are defeated purely with logic, without recourse to sex changes. The logic is that, because emptiness of any essence is the only trait common to all things, no specific traits, such as maleness or femaleness, have true existence. They are only appearances. A woman named Jewel Brocade is challenged by a male elder who claims that supreme perfect enlightenment, which is very difficult to attain, cannot be attained in a woman’s body. She replies that if enlightenment cannot be attained

in a female body, then it cannot be attained in a male body either. Why? Because the thought of enlightenment is neither male nor female, and that which perceives through emptiness is neither male nor female. The text in which this story is embedded then concludes that “the *dharma* is neither male nor female.”

It is difficult to assess the impact of these passages and ideas upon the actual lives of Buddhist women until we have more historical data and research. Although we know that monastic ordination lineages disappeared in many parts of the Buddhist world, it survived in China, one of the most important early sites for the development of Mahāyāna scriptures and ideology. Although androcentrism and misogyny continued to mark much of the Mahāyāna monastic world, exceptional women were, on occasion, able to found flourishing nunneries and to have influence in both religion and politics. Several collections recording the lives of nuns in East Asia survive, and recent work on nunneries in Japan has produced intriguing evidence of the multiplicity of contexts in which Buddhist women could thrive.

TANTRIC BUDDHISM IN TIBET. A late development in Buddhism, often called “Tantric Buddhism” or Vajrayāna, is of special interest to the question of the place of women, since it advocated sexual practice as a means to advance spiritually. Tantric Buddhism in India has only begun to be studied as a historical phenomenon, and there are many difficult interpretive questions for that study, given the often shockingly antinomian practices that the Buddhist tantric scriptures sometimes recommend. Scholarly knowledge is on somewhat firmer ground in its study of Tibetan Buddhism, and it is useful to consider that case in this context, since Vajrayāna Buddhist literature and practices had exceptional durability in Tibet throughout its Buddhist period.

Buddhism came first to Tibet from north India in the seventh century CE. A second dissemination gained momentum in the eleventh century. Women figure to some extent in both disseminations, and the Vajrayāna Buddhism that dominates Tibet often portrays female figures in art. There are also several important women in Tibetan Buddhist historical accounts.

Though there were many novice nuns in Tibet, most scholars think that full ordination for nuns never reached Tibet. In Tibetan Buddhism, however, a third, less well-known option of being a forest recluse, who has not taken monastic vows but who has taken on much more serious spiritual obligations than the average layperson, has always been prestigious and popular. Many women opted for this alternative, which gave them more freedom and prestige than they had in male-dominated monastic universities. (There were no equivalent educational institutions for women, and novice nuns were often trained only in chanting and other minor disciplines.) These people often lived alone in caves or retreat huts or with a small group of companions, both male and female, and women were much more likely to receive serious training in meditation as forest recluses than in

the monastic universities. However, it would be inaccurate to claim that women and men were equal in the modern sense of the term.

A famous female figure in Tibetan Buddhism was Ye shes mtsho rgyal (Yeshe Tsogyel), who is thought to have lived in the seventh century CE. She became the partner and colleague of the Indian Padmasambhava, often considered to be the founder of Tibetan Buddhism, though he was not the first Indian to propagate Buddhism in Tibet. Though modern scholars are not convinced that Ye shes mtsho rgyal actually existed, she is given a prominent place in many Tibetan historical narratives, and liturgies that invoke Padmasambhava usually also invoke her. She is regarded as fully enlightened, no less realized than any of the great male teachers revered by Tibetan Buddhists. Another woman, Ma gcig lab sgron (Machig Labdron, c. 1055–1149), was important during the second transmission of Buddhism to Tibet. Her story is complex, but she is often credited with initiating *god* (*chöd*) practice, an important Vajrayāna practice designed to destroy clinging to one's selfhood, which is key to attaining enlightenment according to Buddhist teachings. It is also claimed that this is the only practice that went from Tibet to India, reversing the usual pattern.

The most controversial aspect of Vajrayāna Buddhism is its widespread use of sexual symbolism and its purported use of sexuality itself as a religious ritual. There is no doubt that sexuality is one of the central symbols of Vajrayāna Buddhism, which means that feminine symbolism is much more prominent in Vajrayāna Buddhism than in any other form of Buddhism. The basic meaning of this symbolism is non-duality or inseparability, one of the central teachings of Mahāyāna and Vajrayāna Buddhism. Within that dyadic unity, the female often symbolizes wisdom and the male often symbolizes compassion; their union symbolizes the inseparability and equality of wisdom and compassion. Likewise, the female symbolizes emptiness and the male symbolizes form. Their union symbolizes the inseparability of form and emptiness, or relative and absolute truth.

As for sexuality itself, both Ye shes mtsho rgyal and Ma gcig lab sgron are said to have had several sexual partners, and the stories of many great Tibetan teachers include accounts of their consorts. Their sexual experiences are considered part of the meditation practice rather than a purely secular or mundane activity. Evaluating the status of the female partners has been controversial. Many modern scholars think that the women were usually mere ritual implements used by male practitioners to enhance their meditative attainments, although some have argued that the women truly were partners and equals of the men. Despite great curiosity about these practices, they are closely guarded by Tibetans.

BUDDHIST FEMALE FIGURES. Several important females figure in the stories from the earliest period of Buddhism—the Buddha's mother, his wife, the woman who encouraged him to eat after severe fasting, the daughters of Māra who tempted him, the earth goddess who witnessed his generosity,

Prajāpatī, the first nun, and other female disciples. Mahāyāna Buddhism developed a pantheon of deified figures, and in Vajrayāna Buddhism there are countless meditation deities whose status is often equal to that of a buddha. Many of these are female. In Mahāyāna Buddhism, there are also mythic *bodhisattvas* on the way to full enlightenment or enlightened buddhas of other eras and world systems. The mythic *bodhisattvas* are far more advanced than any human beings, but they are still on the path. Often they are models of key Buddhist virtues, such as wisdom and compassion. These too are sometimes female.

It is noteworthy that as soon as Buddhists began to imagine and pray to such Buddhist mythical figures, they began to invoke female as well as male figures. One of the first major female enlightened figures to develop was Prajñāpāramitā, the personification of wisdom and emptiness. She is cast as the “mother of all the buddhas,” because to become enlightened, a buddha had to realize the wisdom she represented. Another important female *bodhisattva* is Tārā, a personification of compassion and one of the most popular figures in Tibetan Buddhism. She is frequently invoked by ordinary people. She is extremely compassionate and effective; she can save one from any kind of danger or provide any kind of benefit and is often called upon to do so.

In Vajrayāna Buddhism, mythic females are at least as numerous as male mythic figures, and they participate in all the same activities as their male counterparts. The importance of sexual symbolism, if nothing else, would translate into the presence of many mythic females. However, females also function independently as meditation deities and as *dharmā* protectors, the two main functions of “deities” in Vajrayāna Buddhism. While they are often portrayed as beautiful and gentle, they are just as likely to be portrayed as wrathful and ugly, by conventional standards. If equality between male and female mythic figures is sought, Vajrayāna Buddhist iconography is perhaps one of the places where it is found.

It is important, however, to remember that high regard for mythic females does not necessarily translate into high status, freedom, or equality for human women. One of the most common mistakes in discussing gender and religion is to answer questions about gender with information about female deities and other mythic females. While such information is an important part of the topic of gender and religion, it is often used to gloss over and ignore inequality between women and men and the suppression of human females. This mistake is especially common in discussions of Vajrayāna Buddhism, probably because its intense regard for mythic females is so unusual.

MODERN BUDDHISM IN ASIA AND THE WEST. Two reform movements are especially significant in modern Buddhism—the increasing importance of lay meditation and the engaged Buddhist movement. Both are important in all forms of Buddhism, but Western Buddhism is almost entirely a lay

movement, something very unusual in the history of Buddhism, and the engaged Buddhist movement is more prominent in Asia, though there are many Western counterparts.

Regarding attention to gender, the engaged Buddhist movement is somewhat disappointing, as it rarely engages in gender analysis or critiques male-dominant gender arrangements, whether within the Buddhist world or outside it. Every other major current social issue is discussed, and activists try to reform many economic and social injustices. But, like many reform movements throughout history, male dominance is exempted from such criticism. This is the case with both Asian and Western versions of the engaged Buddhist movement.

The lay meditation movement does not explicitly focus on gender either, but many laywomen do participate in meditation intensives, which would have been unusual in earlier forms of Buddhism. It would be expected that Western Buddhism, still in its infancy, would largely be a lay movement; the economic basis to support monastics and monasteries, so well developed in Asia, is completely lacking in the West. Extensive participation in meditation practices by laypeople in modern Asian Buddhism is also on the rise. Until recently, it was thought that laypeople did not have the time or the discipline to engage in meditation, but many Asian teachers are now willing to instruct laypeople, both women and men. In addition, there is a worldwide Buddhist women's movement. Several newsletters are devoted to this topic and one of the organizations, Sakyadhita, holds international conferences every two years. Central issues have included reinstating the nuns' order in countries where it has been lost and improving the education of nuns in other countries. Credit for the reintroduction of the nuns' order in Sri Lanka and support for nuns in other Theravāda countries goes to this movement. The education of Tibetan nuns has also been vastly improved, and nuns have begun to engage in practices that were never done by earlier nuns, such as debating and drawing sand *mandalas*. Chinese and Korean nuns' orders are stronger than ever, and nuns usually outnumber monks.

The beginnings of large-scale conversion to Buddhism by Westerners coincided with the second wave of feminism, and many early converts also had feminist consciousness. Explicitly feminist loyalties were controversial for many Buddhists, but the way Western Buddhism has taken shape owes a great deal to feminism nevertheless. From the beginning of the movement in the 1970s, women participated in all aspects of Buddhist life and practice in equal numbers with men. This was a new experience for Asian male Buddhists who were teaching in the West, but they did nothing to discourage their women students and gradually began to empower them to teach, just as they empowered male students. As a result, by the mid-1990s almost half the Western *dharma* teachers were women, something totally unprecedented in the history of Buddhism.

GENDER AND RELIGION: GENDER AND SIKHISM

Although Sikh scripture offers valuable insights on gender, Sikh scholarship has not paid enough attention to this topic. The Sikh religion originated and developed within a “doubly” patriarchal milieu. Between the birth of the founder (Gurū Nānak in 1469) and the death of the tenth gurū (Gurū Gobind Singh in 1708), the Hindu society of North India succumbed to Muslim rulers from outside—Turks, Afghans, and Mughals. In the old Hindu caste society women were completely subjugated to their husbands, and under the new Muslim regime women had to stay in purdah. As a result all women, both Hindu and Muslim, ended up suffering from both forms of subjugation. Witnessing the multiple op-

pression of Indian women, the Sikh gurūs empathized with them and emphasized gender equality in sublime verse. They tried to open up a window of opportunity for women. But the ideals of the Sikh gurūs have been distorted because their lives and their words were recorded, interpreted, and taught primarily by male elites. And so gender becomes a complicated and convoluted issue for Sikhism.

HISTORICAL CONTEXT. Gurū Nānak’s close association with his mother (Tripta), sister (Nānaki, after whom he was named), and wife (Sulakhni) was crucial in shaping his social and religious consciousness, which was then carried on by his nine successor gurūs. Though Sikh scholarship scarcely mentions these female figures, the simple *janamsākhī* narratives highlight the subtle awareness these women possessed. Mata Tripta is a noble woman who understands her son and can see into his unique personality—much more so than his father Kalu. Even the midwife Daultan is struck by the extraordinary qualities of the child she delivers. And like Mary Magdalene, who was the first woman to have witnessed the resurrection of Christ, Nānak’s sister Nānaki is the first person to recognize Nānak’s enlightenment. Sulakhni’s role, however, is ambiguous, as if the *janamsākhī* authors did not quite know how to deal with Nānak’s “wife.”

Women became equal partners in the first Sikh community established by Gurū Nānak in Kartarpur. Both men and women participated in formulating the fundamental Sikh institutions of *sevā* (voluntary labor), *langar* (community meal), and *sangat* (congregation). Sikh men and women listened and recited sacred hymns. Together they cooked and ate *langar*. Together they formed a democratic congregation without priests or ordained ministers.

The pattern of inclusivity set up by Gurū Nānak in Kartarpur continued on, and women were not excluded by any of the Sikh gurūs from any aspect of religious life. In fact their vital participation in varied dimensions is deeply etched in popular memory. For example, Mata Khivi, wife of Gurū Angad (Nānak II), is fondly remembered for her liberal direction of *langar*. With Mata Khivi’s generous supervision and her plentiful supply of *kheer* (rice pudding), *langar* became a real feast rather than just a symbolic meal. Gurū Amar Das (Nānak III) even assigned leadership roles to women. In order to consolidate the growing Sikh faith, he created a well-knit organization and set up twenty-two *manjīs* (groups) covering different parts of India. Along with men, women served as supervisors of these communities.

Bibi Amaro, the daughter of Gurū Angad and Mata Khivi, became a liaison between the second and the third gurūs. A popular narrative recounts that a contemplative Amar Das was totally mesmerized by a verse of Gurū Nānak recited from the lips of Bibi Amaro. When he expressed his wish to meet the gurū who had been invested with such a rich legacy, Bibi Amaro enthusiastically escorted Amar Das to her father, Gurū Angad. Amar Das immediately became Gurū Angad’s disciple and eventually succeeded him to the guruship, becoming Nānak III.

Gurū Amar Das's daughter Bibi Bhani had a tremendous impact on the historical development of Sikhism. Gurū Amar Das composed the Sikh wedding hymn (*lavan*) for her marriage with Ram Das and later chose Ram Das to be the fourth Sikh gurū. Bibi Bhani is also important because she donated the site of Amritsar to the Sikh community. She had been given this site by Emperor Akbar. It was on this land that her son Arjan, the fifth Sikh gurū, built the Harī Mandir and enshrined the sacred *Gurū Granth Sāhib*.

Mata Jitoji and Mata Sahib Devan are remembered as vital protagonists in the rite of *amrit* initiation. Mata Jitoji was Gurū Gobind Singh's first wife. When Gurū Gobind Singh was stirring water with his double-edged sword in the accompaniment of scriptural recitations at Anandpur during the 1699 spring festivities of Baisakhi (the first day of the Indian New Year), it was Mata Jitoji who added sugar puffs to the bowl. The *amrit* prepared by the gurū and Mata Jitoji fed the new family of the Khālsā and continues to nourish generations of Sikhs, physically and psychologically. When initiates sip the drink, they renounce their past with all its caste, class, and professional restrictions and claim their new identity with Gurū Gobind Singh and Mata Sahib Devan as their two equally important parents. Mata Sahib Devan was Gurū Gobind Singh's third wife. Tradition has it that their marriage was not physically consummated. Though she was not a biological mother, Sahib Devan became the spiritual mother of the Khālsā.

Gurū Gobind Singh's mother, Mata Gujari, and his second wife, Mata Sundari, are also important in Sikh history. The ninth gurū was often absent and was martyred when his son was only nine. So Mata Gujari had to raise Gurū Gobind Singh as a single parent. She imparted great wisdom and heroism not only to him but also to her grandsons. After the tenth gurū's death, it was Mata Sundari who provided guidance to the Sikhs. She appointed Bhai Mani Singh to manage the sacred shrines at Amritsar and commissioned him to collect the writings of Gurū Gobind Singh. Edicts issued under her seal and authority (*bukamnamas*) were sent out to Sikh congregations. Mata Sundari boldly rejected schismatic groups who tried to claim succession to guruship.

With Gurū Gobind Singh one also has the inspiring case of Mai Bhago. She was a courageous woman from the Amritsar district who rallied men to fight for the gurū against the imperial forces. She herself fought for the gurū in the battle at Muktsar in December 1705 and was injured. Thereafter she accompanied Gurū Gobind Singh as one of his personal bodyguards. Sikhs have built shrines in memory of her.

Sikh history is thus replete with excellent paradigms of women leading Sikh institutions of *sangat* and *langar*, reciting sacred poetry, fighting boldly against oppression and injustice, and generating liberating new rituals. But this feminizing process was not limited to the family members of gurūs; it was not just for women closely associated with them or for women of the elite. Rather, the Sikh faith opened up a wide horizon for all women, irrespective of caste, class, or

marital status. They were all equal partners with men in Sikh practices and spiritual growth.

SCRIPTURAL CONTEXT. Sikh scripture, the *Gurū Granth Sāhib*, promotes gender equality in numerous ways. By designating the divine as numeral "One" at the very outset, it discards centuries-old images of male dominance and power and opens the way to experiencing the transcendent One in a female modality. The text offers a vast range of feminine symbols and imagery: the ontological ground of all existence is *mata*, the mother; the divine spark within all creatures is *joti*, the feminine light; the soul longing to unite with the transcendent One is *subagan*, the beautiful young bride; the benevolent glance coming from the divine is the feminine *nadar*, grace. Sikh scripture continuously provides readers with a multivalent and complex feminine imagery. This variety in turn presents a host of options through which men and women can become who they choose to be.

Images of conception, gestation, childbirth, and lactation are unambiguously and powerfully present. Again and again scriptural verses remind Sikhs that they are created from the mother's blood, lodged in her womb, and first nurtured by her milk. The *Gurū Granth Sāhib* is unique in world scriptures in celebrating the centrality of menstrual blood (*Gurū Granth*, 1022, 706). Shunned as a private, shameful process, menstruation is acknowledged in Sikh scriptures as an essential, natural, creative process. Life itself begins with it. In fact Gurū Nānak reprimands those who stigmatize as polluted the garment stained with menstrual blood (*Gurū Granth*, 140). The *Gurū Granth Sāhib* also condemns pollution associated with childbirth and customs of purdah and sati.

The Sikh gurūs were men, but they expressed their love for the divine in the female gender. They do not repress or stunt themselves in male-female dualisms. Feeling the infinite intensely within, they openly identify with the female person, her psyche, her tone, her sentiments, and they trace the transcendent as both father and mother, male and female. Inspired by the infinite One, their verse spontaneously affirms woman's body, her activities, her dressing up, her tenacity, her longing. Throughout the *Gurū Granth Sāhib*, she is the model in forging a sensual and palpable union with the transcendent. In both praxis and poetry, the Sikh gurūs created an opening through which women could achieve liberty, equality, and sorority.

CONTEMPORARY CONTEXT. Unfortunately the empowering scriptural message has not been heeded. The radically uplifting female concepts, symbols, and images permeating the *Gurū Granth Sāhib* are simply neglected. The fundamentally patriarchal culture of the Punjab has continued to reproduce malestream interpretations, and other factors have produced androcentric attitudes in Sikh society. For instance, during the flamboyant regime of Māharājā Ranjit Singh, male dominance increased, and the practices of purdah and sati, which were condemned by the gurūs, found their way into the upper echelons of Sikh society. The British admiration for

the “martial” character and the strong physique of the Sikh men (who were recruited into the British imperial army in disproportionately large numbers) generated a vigorous new patriarchal discourse—attaching patriotism and paternalism to the “brotherhood of the Khālsā.” And twenty-first-century globalization is accelerating old patriarchal customs.

Sikh ethics is oriented toward this world. It affirms the body and the primacy of human relationships. There is no priesthood in Sikhism, so both men and women are free to read and recite the sacred verse at home or in public, and anybody from within the *sangat* (congregation) can be chosen to lead worship. The written laws of the Sikh religion grant full equality to men and women in all spheres—religious, political, domestic, and economic. But it is the unwritten laws that govern daily life, and these are quite different.

Public worship. Women play an active role in devotional practices at home, but leading public worship is a privilege restricted to men. Daily ceremonies like *prakash* (opening of the *Gurū Granth Sāhib*) and *sukhasan* (putting it to rest in the evening) in *gurdwaras*, the annual celebrations of Baiskahi and *gurpurabs* (birthdays or death anniversaries of the gurūs), and all rites of passage for Sikh men and women are conducted and administered almost exclusively by men. Gender distinctions do play a significant role because the superior role and privilege of men in public is unconsciously taken into the home, with the result that male domination is reproduced in the family, home, and Sikh society at large.

Rites of passage. In Sikhism there are four rites of passage: name giving, *amrit* initiation, marriage, and death. Though these rites are theoretically the same for both men and women, they end up being quite different in Sikh practice. For example, both male and female children are named in consultation with the holy book. Sikhs do not even have different names for boys and girls: the addition of the name *Kaur* (meaning “princess”) for girls and *Singh* (meaning “lion”) for boys indicates the gender of the child. This is another great feature traceable to Gurū Gobind Singh, for he freed women from the lineage of fathers and husbands. But this liberating phenomenon is buried under ancient discriminations against girls. The “same” name-giving ceremony ultimately depends on the “biology” of the child: the celebrations are more elaborate and joyous, with huge *langars*, for his name giving but not for hers.

Sikh initiation is also open to both men and women, and both are to wear the same five symbols. However, Sikh identity has been monopolized by masculinity, for it is the Sikh male, with his topknot or turban, who has come to represent all Sikhs. Boys are privileged in all spheres of Sikh life. Calendrical festivals, like the Punjabi winter ritual of Lohri, are celebrated only in Sikh homes where a boy is born. While parents and grandparents of a boy happily dole out money and gifts around crackling bonfires, the parents and grandparents of a girl remain sad during the cold dark nights of Lohri. Affluent Sikh families have also begun to celebrate the

dastar bandhan (turban tying) with great pomp and show. This tying of the turban for the first time is becoming a popular rite of passage for boys.

The obsession for sons is so great among Sikhs that modern technology is abused to abort female fetuses. Ultrasound and other technologies are misused to preserve the legacy, business, property, and status of fathers and their sons. From the moment of birth the son and daughter are chartered out different roles and given a whole different set of obligations. Victims of false consciousness themselves, mothers and grandmothers continue to perpetuate double standards.

Sikh marriages are traditionally a simple and profound affair, but they have become extremely opulent, with extravagant dowries and exorbitant gifts to the daughter and her in-laws for every rite, ritual, and festival. The Sikh scriptural verse stating that “bride and groom are one spirit in two bodies” has no significance. It is taken for granted that the daughter leaves her natal home and joins her husband and his family. When there is a death in the family, it is the mother or wife’s natal family that must offer a turban (in the case of a male) or a *dupatta* (in the case of a female)—and cash accompanies both modes of accoutrement. When a daughter dies, no matter what age or stage of life she may have been at, it is her natal family’s responsibility to supply the meal following the cremation. From her birth till her death the daughter is a debit in the family economy.

Sikh *Rahit Maryada*. In its attempt to formalize the message of the gurūs, an ethical code called the *Rahit Maryada* was developed by Sikh reformers in the middle of the twentieth century. This code provides several rules to combat female oppression. Twice it makes the point that Sikh women should not veil their faces. It prohibits infanticide and even association with people who would practice it, although there is no prohibition against abortion. It allows widows to remarry and it underscores that the ceremony be the same as that of the first marriage. According to the Sikh *Rahit Maryada*, Sikhs should be free of all superstitions and not refuse to eat at the home of their married daughter. Dowry is prohibited.

Again many of these explicit rules are simply not followed. Out of “respect” for their daughters, Sikh parents will not accept a penny from their working daughter nor sip water in her married home. She is their prized “object,” and so the ancient gender codes dating back to the Hindu *Manusmṛiti* text continue to govern Sikh life.

Gender issues in global society. With their enterprising spirit and love of adventure, Sikhs travel to distant corners of the world. At first only men migrated, but after the elimination of U.S. national quotas in 1965, there has been a dramatic surge in the Sikh population, both male and female, all across North America. Sikh women arrive not only as wives, mothers, daughters, and sisters but also independently to pursue education or enter a variety of careers. Like

their male counterparts, they are energetic and enterprising, but even in the New World the talents and potential of many Sikh women continue to be stifled by age-old societal norms. How to preserve Sikh identity in the contemporary world is a vital concern for Sikhs across the globe. Threatened by modernity and affluence, patriarchal formulations become even more stringent. Since women are literally the reproducers of the community, the preservation of “Sikhness” falls primarily on them. As a result Sikh women are subjected to manifold restrictions. Control over their reproductive rights leads to the reproduction of the family’s identity and that of the Sikh community at large. “Honor” or *izzat*, which is identified with manliness and belongs to hierarchical and patriarchal systems, has come to be a central code of the Sikhs. Being a model community, Sikhs try to cover up female feticides, physical and psychological abuse, dowry deaths, and even “honor killings.”

The economic and social demands of Sikh masculinity are so strong and pervasive that the teachings of the gurūs against objectionable treatment of women go unheeded. The egalitarian and liberating message of Sikh scripture has yet to be applied in daily lives and fully experienced by men and women alike.

GENDER AND RELIGION: GENDER AND CHINESE RELIGIONS

Chinese religious history opens with a shocking gender anomaly: a powerful priestess-class of shamanesses speaking the gods’ own voices in the high court ritual of the Shang dynasty (c. 1766–1027 BCE). Through ritual performance these women conducted purifications, summoned the rain and healed the ills of the state, and, as one ancient dictionary, the *Shuowen jiezi*, stated, “caused the gods to descend into them through the medium of dance.” Nor were these powerful mystics honorary men. By virtue of their female and sexual natures they served as the proper conduit for the divine. Through ritual exposure of their breasts to the sun they bought the rain, and, if later poetic recastings of the rites were true, they legitimized the king with a sexual encounter that mimicked a divine marriage with the goddess. They were, as E. H. Schafer phrased it, “the kingdom’s rightful rainmakers” (1951, p. 137). Of course, it would seem as if little in the way of customary assumptions about Chinese religion would allow for such a class of women. Bureaucratic, imperial, hierarchical, canonically rigid, clerical, and masculine—these are the frequently named features of Chinese religion. But, if Mircea Eliade is right in his observations made on religion over 50 years ago (that religions encode not just one pattern of human-divine contact, but rather the “multiple modalities of being in the world” [1957, p. 15] and that religion reveals a world that is “transpersonal, significant and sacred” [1957, p. 18], whose sanctity can be revealed to the worshiper through the theurgic summons in “rites of ecstasy”), then the figure of the feminine ecstatic should not be impossible. And, indeed, this survey of gender in China’s religions will reveal that the hierarchical, bureaucratic model is a limited paradigm, and that ecstatic communication by female officiants, as well a varied cast of women mystics, adepts, religious teachers, and goddesses all share the religious stage with the sober deities of a divine bureaucracy.

The major concerns of gender studies in China have been several: the excavation of lost voices within competing narratives (especially feminine voices), the methods of suppression of marginalized voices, cultural tautologies and the demonization of the feminine, the complicity of women in these tautologies, and, more recently, the theory of agency, whereby constructs of the feminine are not defined exclusively by larger power structures that victimize women, but as constructs that offered limited freedoms within the framework of masculine definition. The history of gender studies in the field begins explicitly with one of these issues, namely, suppressed narratives. Chinese philologists of the Republican Period (1911–1949), eager perhaps to overturn the radically

conservative philological thrust of the Manchu, with its court-approved manipulation of the Confucian tradition, rigorously explored the counter-traditions and subtexts of Shang and Zhou (c. 1150–256 BCE) cultures. They hoped to establish the ways court-centered expositions of sanctity and legitimacy suppressed alternative constructs of the divine. They reconsidered epigraphy, the Confucian classics, and ancient poetry to retrieve the lost practices of popular and local cultures. Chen Mengjia, Wen Yido, Gu Jiegang, Marcel Granet, Edward Erkes, and Henri Maspero were among the first to uncover the significance of the goddesses Chang E, the lunar goddess; Nü Wa, the snail woman; and Xi He, the sun goddess, as well the authority of divine conduits called *wu* or shamanesses. A second generation of academics (e.g., E. H. Schafer, David Hawkes, Wolfram Eberhard, and Chang Kuang-chih) also retrieved the buried references to feminine sanctity in language, myth, and folklore.

The most important development in the field of gender studies, however, has come not from methodological innovation but from the exploitation of previously under-used materials. In some real sense, even into the 1950s, Qing dynasty (1644–1911) scholarly and political conservatism dominated much academic consideration of literary, cultural, and religious studies. The “little tradition,” in all its manifestations, was considered beneath consideration, and consequently the vast issues of what shaped the culture beyond the walls of the court were neglected. But with the advent of research into uncensored documents with foci on regional, urban, and rural life—resources not winnowed, organized, and reproduced in the great Qing dynasty compendia—the construct of gender in religion has opened up. Recent scholars have exploited these sources, finding a canon of the counter-tradition and thereby remade the map of both male and female religious practice and ideation. They have, in particular, explored a plethora of sources that came with the expansion of the publication industry beginning in the Song dynasty (960–1279): *mirabilia*, *Precious Scrolls*, *Goodness Books*, ballads, pious tales, vernacular fiction, dramas, and popular songs as well as classical sources such as private journals (*biji*), classical fiction, hagiography of the sectarian cults, gazetteer accounts of regional practice, temple records, accounts of secret societies and lay organizations, hagiography, and poetry religious canon. All these sources are now used by scholars to open up the consideration of both masculine and feminine narratives in China’s religious history.

Parsing China’s religious life into the major religious traditions of Confucianism, Daoism, Buddhism, and popular religion has served bibliographers well. Worshipers and the worshiped, however, have found these neat divisions to be permeable. Popular religions have shaped Daoism, Indian Buddhism saw extraordinary shifts and elaborations as it became subject to the gravitational pull of local religions, and both sectarian and syncretic religions have thrived in complete ignorance of denominational categories; all, in fact,

have given the lie to the neatness of the four categories. Considerations of gender further disturbs these categories for it is in looking at feminine and masculine icons of, for example, the sacred fool and the ecstatic, the divine marriage and ascetic, that we will find more of Eliade than the Qing bibliographer. But for the purposes of an overview we will yield to the familiar and exploit these four divisions as our method of organization.

POPULAR RELIGION. Popular religion—also referred to as folk religion, lay religion or diffused religion—is a vast aggregation of practices that includes shamanism, calendrical holiday festivals, ancestor worship, geomancy, ritual practices to assuage demonic influence, apotropaic practice tied to chronology and calendar, and prediction based on physical features of the human anatomy, the landscape, the detection of randomly heard voices, patterns of bird migration, and so on. Often this diffuse religion is defined by negatives: It lacks a centralized, clerical hierarchy, a large corpus of written, canonized texts, court affiliation, and an institutional identity. It is polytheistic to say the least, including door guardians, stove gods, a spirit of the privy, drought demons, avenging ghosts, a god of wealth, protectors of childbirth, drunken rebel-gods, astral spirits that cause disease or family strife, and ghosts, sprites, or demons of specific features of the landscape, whether mountain, roadside, river way, or neighborhood. There are many divine narratives: journeys to paradise or hell, supernatural visitations, and stern karmic principles of divine revenge. The connection to the divine can be through a class of mediums or through direct and personal discernment of the numinous. In the aggregate, popular religion is a kind of highly articulated and fully annotated animism. It mystifies the specific features of daily life and defines spirituality as a kind of esoteric knowledge of the divine signatures in nature, conveying, with a stunning degree of confidence, that life is, in some sense, sacramental.

Governing elites tend to favor a cooperative leadership class, the unimpeded collection of resources, and a religious practice that, in proving the connection of the state to the divine, legitimizes the state’s efforts to perpetuate itself. Popular religions, however, reenact the powerful concerns and uncensored dramas of micro-cultures of individuals, families, clans, towns, regions, covenant affiliations, and ethnic groups. In the cults that thrive in such subcultures, views of sexuality, love, and lineage, of death and grief, of prosperity, production, and harvests, as well as of family continuities, community conflicts, and the connection (or lack of connection) between individual and state all find expression with some degree of autonomy from elite mandates. For women, who are excluded explicitly from the sites and definitions of power, as well as for men who may be rebels or misfits, it is in local religious practice that more complex and varied expressions of sanctity and identity are found than in centrally monitored religious practice. Thus, assessing these cults and practices, myths, and beliefs from the perspective of gender helps provide an astonishing illumination of the observer’s field of vision, exposing a primordial soup of feminine

archetypes and narratives and of feminine symbolic structures and thaumaturgic practices. Gender issues tend to reveal that official practice, although an efficient veneer, yet masks a powerful religious substrata.

Feminine sanctity and feminine religious power assert themselves vividly in popular religion, for however patriarchy may be lauded or reviled in elite tradition, in popular religion it is in some aspects blithely ignored. In popular religion, women are the domestic ritualists, the mediums, the warrior-saints, the magical adepts, and mystics. Female divinities benefit or terrify at every level, from the plethora of local ghosts appeased at uncountable numbers of riverside shrines to the great goddesses such as the Celestial Empress and the Eternal Mother. Yet this powerful aggregation of feminine practice and ideation has struggled as well, subjected to censorship and banishment. In the case of one of these practices—shamanism—we can see, in fact, a clear dialectic of the competing narratives of a vernacular feminine religious discourse eclipsed but never silenced by the orthodoxies of elite discourse. This dialectic, however, tells us much about how constructs of feminine sanctity survive without benefit of orthodox canon and centralized sponsorship, and proves not only the innate resiliency of the iconography of the feminine, but reveals as well the cultural mechanisms that help sustain the narratives.

Shamanism—condemned as heterodox and licentious, banned and declared illegal, denied the ample support accorded many religious cults—represents the prototypical suppressed feminine voice. Shamanism begins before either Daoism or Confucianism takes shape, in the Shang dynasty. It was central to court ritual, as the female—and to a lesser extent male—shamans constituted a class of divine conduits who revealed the voices of the gods through rituals of divine possession and the performance of ecstatic dance and speech. In the Shang dynasty shamanesses were the chief officiants in a court scapegoat drama, whereby the sins of the community were expiated through harsh sacrifice (often by maiming, drowning, or exposure to fire). Their ritual disfigurement or deaths purified the land in times crisis, especially times of drought and perceived astronomical anomalies. Nor were they mere ritual actors, but honored members of a ruling caste, serving as great officers of the court. During the Han dynasty (206 BCE–220 CE) through the Tang dynasty (618–907), due specifically to the influence of Confucianism, shamanism increasingly became a cultural outlaw, practiced in the breach. Wide-scale suppression of the cults relegated shamanic practice to the status of licentious rites, although literati noted that its “foolish rituals for healing the sick continued to delude the people” in more remote regions of the empire (Cass, 1999, p. 50).

The efforts of literati and court notwithstanding, however, shamanism was consistently practiced and is known today throughout South China and in Taiwan and Hong Kong. In her research on the cult of the Medieval shamaness Chen Jinggu, titled “The Woman at the Water’s Edge,”

Brigitte Bapandier found shamanic practice to be a solid feature of the local religious landscape. Like the shamanesses of the Shang period, the shamaness is “of the waters” (i.e., “the Woman at the Water’s Edge”), and her help is sought times of drought, conception, and childbirth. She is a warrior-saint as well, pictured in statues and texts on horseback, armed with sword and whip, accompanied by her divine generals. Her current worshipers insist that her avatars have fought in many wars, including the Vietnam War and the Gulf War. Thus, despite banishment, shamanic practice has survived intact in local cultures. The survival of this regional voice has seemed surprising to some, as court orthodoxies, preserved in written instruments, should logically dominate regional cultures. Yet recent scholarship has proven that person-to-person, oral transmission is as effective as court methods of perpetuation; indeed, local religious practice thrives on the oral, the intimate, and the immediate. Popular rituals and vernacular entertainments preserve iconography faithfully, pilgrimage and religious teachers convey practice among temple networks, and merchant culture spreads folk traditions through merchant associations along expanding canal and sea routes. Thus, notwithstanding the efforts of the Tang court (618–906) to abolish shamanesses as heterodox, of the Qing court (1644–1911) to eliminate warrior-adepts as treasonous, of the courts of the People’s Republic of China to eradicate local female mediums as feudal superstition, a multitude of feminine religious expression are surviving—if not thriving—at the local levels. In other words, as Bapandier has pointed out, if all the mediums in a town in Fujian were arrested, the practices would reassert themselves after the cadres left.

Shamanism has not, however, been limited to local practice, but has found re-expression in multiple features of the cultural landscape, surviving as one of the most powerful archetypes in Chinese mythology. The shamanic iconography of the feminine is explicitly concerned with the ambiguous power of the feminine, allying the feminine with the polarities of both fertility and danger. The iconic imagery of her mythos epitomizes her ambiguity; she is allied with water, blood, and the yin polarity. In religion, this elaboration of the feminine is often repeated, seeping through the boundaries that separate one religion from another. Shamanic constructs of the feminine inform as well the rhetorical streams that feed both the arts and cultural myths. In poetry, history, fiction, and drama, as well as in sex-based archetypes, the contours of shamanism are seen repeatedly. In fiction, in particular, this watery, lethal, and sexually powerful woman, often allied with snakes or water-borne creatures, thrives; she is seen in vernacular and classical stories, expatriate fiction from all over the globe, and finally recast in film and television.

CONFUCIANISM. Confucianism, allied with the imperial court, presents the greatest contrast with popular religions. It has a meticulously maintained written canon, an institutional hierarchy with a rigorously apprenticed and centrally selected membership consisting of officiants and practition-

ers, and speaks generally with a unified voice—thus, firmly occupying center stage in the official version of China's religious history. It evolved during the Zhou dynasty (c. 1150–256 BCE) from an aggregation of practices centered around the aristocratic cult of ancestor worship. Beginning in the Han dynasty (206 BCE–220 CE) Confucian beliefs were rigorously inculcated through the institution of what became the Examination System whereby entrance to political life required memorization of the Confucian canon. Confucianism was interlocked as well with the state cult, a set of theocratic practices sanctifying both the living family and the ancestral line of the emperor. Essential to Confucianism, especially in the late imperial periods—Song (960–1279) through Qing (1644–1911)—was the development of practices centered around the concept of the sacred lineage, or *zong*. A natural outgrowth of the cult of ancestor worship and the principles of piety, the practices of the sacred lineage formulated the family as a cult space. By this construct ancestors maintained active watch over the conduct of the living sending benefits or crises depending on the worth of the family's actions. In turn, individuals of the family lived consecrated lives, with all the myriad details of domestic life measured by the compass of family piety, examined carefully for ritual flaws.

The requirements of the sacred lineage created powerful resonances in constructs of both masculine and feminine sanctity. In Confucianism the ideal exemplar for both women and men was extreme self-sacrifice. For men, ideals of sanctity were rigorous. Men were idealized as lie, ardently heroic, or fiercely dedicated. The perceived magical connection to the ancestors required scarring personal sacrifice and an intense moral standard. Men realized the ideal through suicide in times of severe national crisis and through bold and dangerous challenges to corrupt power. Nor were these heroes of Confucianism simply icons of the state orthodoxy but exemplars told of in popular literature. Novels, drama, and short fiction lionized Confucian heroes who sacrificed their lives, configuring absolute dedication to the values of piety, loyalty, humaneness, or propriety as heroic feats of personal glory equal to the daring accomplishments of knights errant and warriors.

For women the pattern of divinity was extremely harsh; once a woman was engaged or married, her obligations to the sacred lineage (*zong*) of her fiancé or husband redefined her as a consecrated vessel dedicated to the continuation of the line. Women realized Confucian forms of sanctity through motherhood, through the role of the family matriarch, and through stern maintenance of the teachings of the *Ju*. Much has been made of the idealization of the masculine and the patriarchal in Confucianism; but, Confucianism also greatly mystified and idealized motherhood and the mother-son dyad. In fact, in novels and confessional journals women often appear as more powerful, more dedicated, and more memorable than men in a Confucian family. The apotheosis of the feminine ideal was achieved through the notion of martyrdom, whereby a daughter, fiancée, wife, daughter-in-

law, or niece sacrificed herself to resolve the crisis occurring to the lineage. In the case of the death of the spouse, the martyred wife or fiancée committed suicide or dedicated her life to widow-solitude. If an elder in the family was ill, the cult required a woman to concoct from pieces of her own flesh a magically healing soup to be consumed by the ill patient. She thus became a *zhen nü*—literally, a sacred woman, often translated as filial, martyred, or chaste woman. Nor did these acts simply express moral ideals but were considered acts of transcendence that could serve the community as sources of divine efficacy. Locals worshiped at the shrines erected to commemorate the sacred woman, and it was believed the spirits of martyred women could relieve droughts or ward off disasters. This cult was of less significance in the ancient and medieval periods, but became highly influential in the late imperial periods, as the concept of the *zong*—or sacred lineage—became more fully articulated.

Despite the importance of these women as local cult figures, their worship was by no means purely a matter of local customs, however. As Katherine Carlitz (1997), Jonathan Chaves (1986), and Mark Elvin (1984) have pointed out these cults functioned in state worship. The female martyrs were publicly acknowledged as talismans of imperial legitimacy and as emblems of the state's connection to the ancestral line. They were recognized with imperial shrines and parades of local officials and immortalized in the historical canon. Nor was the state naïve about the pragmatic implications in these local cults. Martyred women cults functioned explicitly as vehicles for imposing centralized Confucian values on the local mores of distant localities. The court explicitly used the martyred women cult and the worship of the city-god to manipulate local worship and local loyalties. Fear of the power wielded by popular feminine cults may be a factor as well in state sponsorship. In some cases, it is clear that the government deliberately adapted local popular cults dedicated to female ghosts: the Bureau of Rites co-opted local worship of the waterside divinity and declared them to be *zhen nü* and a riverside ghost became, by imperial decree, a Confucian martyred woman. It may seem that the local river-ghost is a distant cousin of the harsh exemplar of family piety; yet, they share certain features. Drought relief, maiming and physical sacrifice, and the accretion of local worshippers were the patterns of feminine sanctity of both the martyred wife and the shaman.

DAOISM. Daoism, like Confucianism, arose out of Zhou-era (c. 1150–256 BCE) ritual and beliefs, centered possibly around rituals of healing, alchemy, and the arts of longevity. Early Daoism of the Zhou period was articulated first by the two elliptical and brilliant writers known as Master Lao and Master Zhuang. They emphasized nonpurposive action and rejected the worldly, the hierarchical, and the mundane, celebrating intuitive insight over reason and suggesting the existence of specific esoteric practices that lead to the state of transcendence. From the late Han (206 BCE–220 CE) and through the Six Dynasties period (220–589) Daoism sees elaborate articulations of practice and belief: the growth of

large centers of worship centered around the teachings of the celestial master Zhang Daoling, the growth of a Daoist monastic movement, the development of a Daoist church with hierarchy and canon, the elaboration of the teachings of inner and outer alchemy, and the affiliations of secret societies and millenarian rebellious movements. Daoism is still practiced throughout Asia, especially in Taiwan, Southeast China, and Hong Kong. The celestial master in Taiwan is head of the Daoist church.

As with Confucianism, there is an elaborate hierarchical structure of officers and rigorously compiled and edited canon and codified ritual practice. Yet unlike Confucianism, Daoism has been pervasively shaped by the feminine discourse of the divine, for in the case of Daoism, a centralized hierarchical religion has not become a vehicle for masculine ideations of the divine. One reason for the richness of feminine narratives is precisely Daoism's long and profound connection to popular religion. Daoism has had a porous border with the rituals and beliefs of popular religion, especially shamanism. Exorcisms, purification rites, illness as punishment for ritual flaws, escorting the souls of the dead, and maimed mediums speaking in trance the words of the spirit world are all practices that have traveled from local practice to Daoist practice as easily as the skilled exorcist traveled to the realms of the dead. Daoism, in fact, mined popular practice, for, as Kenneth Dean noted, "Daoism seeks to channel the energies of the shamanic substratum" (1993, p. 9). Likewise, K. Schipper observed, with radical simplicity, "Daoism is the written tradition of local cults" (cited in Dean, 1993, p. 12).

Of course, many Daoist clerics have been eager to distinguish their practices from popular practice (especially blood sacrifices) but the liturgist's contempt for local practice reflected more a kind of sibling rivalry than structural distinctions between separate species. The implication for gender is obvious—popular religion is veined through and through with feminine narratives of the divine.

Even at the earliest stages of the formation of Daoism, in the earliest cosmological constructs, clear ideations of the feminine existed. Specifically the Zhou era texts of Laozi and Zhuangzi have multiple references to the great female, the dark valley, and, of course, the polarities of yin and yang. Analyses of these early texts to establish the significance of the feminine have, however, provided only limited satisfaction. The problem is not that such analyzes are groundless, because clearly the duality of yin and yang did profoundly shape the construct of Daoist iconography and beliefs, but that the texts are so terse, oracular, and elliptical, with little in the way of contemporaneous philological context, that the issue of the feminine in early Daoism is difficult.

The problem of inadequate context, however, is mitigated in the Han and Six Dynasties, in which texts are found presenting the pantheon, prayers, and ritual description, as well as texts recommending the religious, social, and domestic functions for both men and women. In these articulations of belief and practice, the role of the feminine becomes ex-

PLICIT, and feminine narratives are present in cosmology, myth, hagiography, and in descriptions of ritual practice and church leadership. Beginning with texts appearing in the third century, women appear alongside men as officers of the church, as female masters—both married and unmarried—who take on female disciples. Women in these texts have direct access to transcendence, govern in local parishes, and join religious organizations. Some women of the Dao are described in the domestic context as well. Wives and mothers are registered in the church as women dedicated to the Dao, proving that, even in the confines the family, "a woman could have a complete religious status of her own" (Overmyer, 1981, p. 100).

If women in the Daoist church had explicit importance, female saints and divinities ranked importantly in the Daoist pantheon. The Jade Girl, the Plain Girl, divine emissaries, immortals, and saints of the alchemical arts such as the Furry Woman and the Woman of the Great Polarities all had dedicated followers and temples throughout the empire. Daoist worshipers in the thousands gathered as well to worship the Goddess of the Azure Clouds, Bixiyuanjun, at her temple near the top of Mount Tai in Shandong. Indeed, a healthy portion of the Daoist pantheon was female. One of the most powerful goddesses was the Queen Mother of the West. Suzanne Cahill (1993) traced this cult of this goddess of kingship rites and of longevity. The Queen Mother of the West was patron saint of artists and of aristocratic women and was especially important to mystics and adepts who practiced astral travel. Many dedicated their lives to her at Daoist monasteries and abbeys.

As with the saintly women of Confucian practice, female mystics and divines were important to the court; many were brought to the capital to serve as "living auspicious omens," signs that the dynasty was blessed by the Dao. Some mystics gathered adherents in monasteries and hermitages in remote mountain sites; these teachers were maintained in monastic life by contributions from all classes of society from the poor to the aristocratic. Female religious leaders could gather worshipers even at their own homes in urban areas; the mystic Tan Yang Zi in the late Ming dynasty (1368–1644) gathered thousands of adherents in the city of Suzhou, and many of her followers were high-ranking members of the official class. Woman warriors were often allied as well with Daoist practice; the demon-quelling sword of the Daoist exorcist was her typical weapon. But these mystic-warriors summoned up dangerous political currents in her cult, and they were often allied with millenarian rebellions. As with popular practice Daoism has found drama, poetry, and fiction to be useful allies. From the medieval period come the Capeline Cantos, the songs of Daoist priestesses, as well as paens to goddesses. In the Late Imperial periods vernacular dramas, stories, and chantefables spread the mythoi of the goddesses and saints through urban areas. Daoism has provided one of the fullest possible articulations of feminine sanctity in China's religious history.

BUDDHISM. If Daoism opened its gates to the feminine, Buddhism, when it was first introduced to China, was less hospitable. The same groundswell of feminine archetypes that radiated through popular religion and Daoism, however, was no less active in Buddhism, and where Buddhism touched those ancient assumptions about the sanctity of the feminine, it found a feminine voice impossible to ignore. As Buddhism grew in China, it did not spread its influence like vat of dye spilled on the landscape, coloring all local practice and iconography in its path; rather, it transmogrified, changing and adapting to Chinese cultural assumptions, to local practices and native Chinese religious imperatives. And these changes in Buddhism tell, in turn, about the power of local religious narratives and, again, about the authority of native feminine ideations of the divine.

Buddhism entered China during the Han dynasty (206 BCE–220 CE) and dominated the religious landscape in the northern kingdoms of the Six Dynasties (220–589) period. Buddhist theocracies in northern China ensured that Indic Buddhism grew solid roots. Beginning in the Tang dynasty (618–906), Buddhism took firm hold empire-wide and, by the time of the Song dynasty (960–1279), had important centers in both the North and South. For both men and women, Buddhism presented problems specifically allied with gender. One debate centered on the configuration of feminine sanctity, or lack thereof. Women in Indic Buddhist doctrine were, as Diana Paul described it, “secular, powerless, profane and imperfect” (1985). Indian Buddhist construction of the divine was explicitly masculine; women’s bodies were impure. “There are neither hell-beings, hungry ghosts, animals or women in the Pure Land,” observed the Qing theorist Peng Shaosheng (cited in Grant, 1994, p. 77). Passage through karmic reincarnations—whereby a woman shed her female form—was required before a woman could, as a man, enter the Western Paradise. Both Indian Mahāyāna texts and Chinese Pure Land texts were explicit on the contaminated nature of the feminine.

If women were constructed as impure and incapable of divinity, however, the worshipers of popular Buddhist cults neglected to notice. Setting dogma aside, they implicitly reconfigured the feminine in Buddhism as sacred. The major example of this reconfiguration occurs in the change in the worship of the Indic god, the *bodhisattva* Avalokiteśvara. Chinese worshipers seized the notion of a god of mercy and, over time, over the course of the Tang and Song eras, recreated him as a goddess. Chün-fang Yü detailed brilliantly the change whereby Avalokiteśvara becomes the Goddess of Mercy, Guan Yin. Yü found that Buddhism was specifically changed through contact with native cults and, like Daoism, definitions of divinity were profoundly shaped by the gravitational pull of feminine narratives. Yü traces the transformation of god to goddess by “examining the relationship between Buddhism and indigenous cultural and religious traditions” (2001, p. 489), finding that the male god of mercy adapted to local beliefs, in which female divinities

brought rain, watched over children, and relieved suffering. Thus, the male god of mercy became a white-robed goddess for Chan monks, a water-moon goddess for the literati, protectress of sailors for coastal worshipers, and finally a child-giving goddess for common folk. Orthodox monks of the monastic centers—like the disapproving clerics in the Daoist church—were quick to criticize the transformation of the god from male to female as heterodox practice, yet the pull of local belief proved too strong. The Goddess Guan Yin did, finally, redefine Buddhist sanctity as feminine; she became, in fact, one of the major Buddhist ideations of divinity. Ultimately, in the sectarian religions in late imperial China, she dominated in the pantheon, regarded as holding supreme position as creator and ruler of the universe. Ironically, it is just through such radical recalibrations of notions of the divine, attended by increased numbers of devotees to her cult, that Buddhism in Asia survived and still thrives. Her cult center on Putoshan Island, off the Yangzi Delta coast near Ningbo, was expensively and massively refurbished by donors from all over Asia at the beginning of the 1990s.

Chinese definitions of the domestic sanctity (i.e., idealized concepts of motherhood) also shaped Buddhist rituals and narratives. The Buddhist ritual drama of Mulian, one of the most popular ritual-narratives in China, reshaped Buddhist configurations of female impurity. Mulian was a saint whose chief work was the rescue of his mother from hell—a hell ordained for her by the doctrine of female corporeal corruption. Yet the ritual drama enacted to large audiences at temples and holiday congregations was, in effect, an enactment of the rituals of filial piety. Audiences seemed rather more interested in notions of the son’s dedication than the mother’s contamination. The tale of a mother’s corporeal contamination was a weak shadow plot, inherently less interesting than the tale of piety for the mother. Thus Chinese concepts shaped the narrative which, in turn, helped resolve the inherent cultural conflict between Confucian piety toward motherhood and Buddhist revulsion for the female body. Elite Buddhist practice was no less subject to native reconfigurations. Chan (or Zen) Buddhism altered important aspects of gender-based sanctity. Beatta Grant (1996) has pointed out that although Pure Land Buddhism was explicit on feminine corporeal contamination, because Chan emphasized enlightenment, rather than passage to Paradise, Chan was more receptive to female students and masters. In fact, from the Chan *yulu* (discourse records of disciples) it is known that women served as teachers, pupils, and even “holders of the lineages” in Chan Buddhism.

In the late imperial period—Song through Qing—lay organizations contributed importantly to the expansion of feminine divine narratives and patterns of feminine worship. Beginning in the twelfth century, lay organizations began in affiliation with monastic organizations, but by the sixteenth century lay organizations were independent of monasteries, often located in urban areas of the South. These organizations had large numbers of female worshipers and an inde-

pendent female leadership structure, they practiced economic support through tithing, and the members participated in a host of devotional activities: convocation and pilgrimage, large scale donation to build and sustain temples and monasteries, gathering at festivals to see ritual drama, reading or listening to vernacular tales and hagiography, and listening to teachers in public or in private. Whatever the regulations may have been for the cloistered woman—and many literati were at pains to remind women of these regulations—public congregation, study, religious dedication, travel, and even marriage-resistance societies were among the ideals for lay Buddhist worshipers. In addition to the practices allied with lay organizations, ritual dramas and vernacular hagiographies also expanded the constructs of feminine worship and sanctity, specifically offering women an ideal distinctly different from the ideal of domestic confinement. The immensely popular story of Miao Shan—celebrated in pilgrimage, ritual, and popular literature—articulates the conflict between family piety and devotion to Buddhist practice, offering an exemplar of Buddhist sainthood. Miao Shan converts her father before achieving apotheosis as the incarnation of Guan Yin.

In considering gender in Chinese religions the lines of two competing narratives can be clearly traced: the hierarchical, masculine, institutionalized, often state-sponsored paradigm and, in contrast, the regional paradigm that is, in varying degrees, charismatic, vernacular, and often feminine. Of course, these vernacular narratives are not fully transparent for court and state cultures do not typically condone variant constructs of sanctity. Indeed, the female narratives, in particular, often exist in competition with the hegemonic elaboration of sanctioned orthodoxies. The court and now the Communist Party regularly attack these micro-religions, measuring the competition they offer to mandarin pieties. But these religious narratives are linked to a thriving undercurrent of religious cultures and are a vigorous subcategory of the transpicuous in China, their cults summoning wide-scale support among both male and female worshipers and, in some cases, dominating regional subcultures. Thus the feminine and regional paradigm does not present a small voice in the religious chorus; rather, it is animated, energetic and forceful—able, in fact, to alter radically the orthodoxies of institutional religious traditions. Moreover, this dialectic between competing paradigms of sanctity unveils something useful about Chinese cultural history, revealing not only the elaborate and protean panorama that is Chinese religious history, but also enabling us as well to confront the bland assumptions made in ignorance of conflicts of interpretation that China is unchanging, monolithic, dynastic, imperial, and masculine.

VICTORIA CASS (2005)

GENDER AND RELIGION: GENDER AND JAPANESE RELIGIONS

The history of the study of gender in Japanese religion could be characterized by the observation made by Ursula King, concerning religious studies in general, that the field has remained resistant to important disciplinary changes brought about by gender studies and feminist thought (King, 2002, p. 372). This tendency seems stronger in the Japanese academic field, where introducing concepts of gender and feminism is often seen as insinuating a particular political agenda or a lack of scholarly neutrality. From an academic gender and feminist perspective, in turn, religion is seen as a tool of patriarchy that is still used to oppress and alienate women (see, e.g., Ōgoshi, 1997). In this sense, gender and feminist studies maintain an awkward relationship with religious studies in Japan.

One is, however, beginning to see the impact of gender and feminist studies on Japanese religions. Japanese religious circles have been informed by gender studies and feminism

since the mid-twentieth century, and movements to reform religious organizations are taking root as a result. These movements have commonalities with feminist theology movements in Europe and the United States that use feminism for critical leverage to reform male-dominated Judeo-Christian religions (Kawahashi and Kuroki, 2003).

Space constraints prevent this entry from tracing women's roles and how they were perceived in Shintō, Buddhism, Confucianism, or other religious traditions. Rather, this overview of gender in Japanese religions will identify important debates and isolate points that deserve greater attention in terms of both methodology and empirical research.

IMPACT OF GENDER STUDIES. Barbara Ruch (2002) and Bernard Faure (2003) have written essential studies for considering the impact of gender studies on Japanese Buddhism. Studies of women and Buddhist history have shifted significantly away from a focus on institutions and activities of male priests. Questions are posed in ways that reveal this reversal. Instead of asking how the "Buddhism" of patriarchs, Buddhist orders, and doctrines viewed women, the approach informed by gender studies asks, from a woman's viewpoint, how women perceived Buddhism, how they were marginalized, and what roles women fulfilled and aspired to within their various social constraints and limitations. This signifies, above all, a project to consider how women's religious activities influenced the history of Japanese Buddhism (Katsuura, 2003, p. 2). Ruch presents the collaboration of Japanese and American scholars who examined women in premodern Japanese Buddhist history from that perspective.

Such research examines how gender has informed the world and history of Buddhism. Thus Faure aims to explicate Buddhist conceptions of women and gender in order "to see how the history and doctrine of Buddhism were changed because of its relationship with women" (Faure, 2003, p. 14). Such an approach, he finds, also reveals how "ascetic religion" and male-dominated Buddhist communities were feminized and domesticated.

As Faure attempts to demonstrate, Buddhist women's history does not progress teleologically from oppression to emancipation. Japanese Buddhist historians' rereadings of historical sources substantiate his point. The linear notion that elitist ancient Buddhism denied women salvation, which was later extended to them for the first time by more democratic Kamakura Buddhism, is mistaken (Yoshida, Katsuura, and Nishiguchi, 1999). The *Nihon ryōiki*, a ninth-century collection of didactic tales, already depicted a Buddhism that did not reject women and vividly described women living within that faith (Nakamura, 1973). The *henjō nanshi* doctrine that women experience five obstructions and cannot achieve salvation in a female body became widespread by the medieval period. However, women were not strictly constrained by the Buddhist view that women had to be taught by men (Katsuura, 2003, p. 61). Not just passive recipients of patriarchal Buddhist teachings, women also resisted and appropriated those teachings. There is a need to ex-

amine relationships between Buddhism and various types of women, including nuns, lay followers, the mothers and wives of priests, and folk shamanic practitioners, from this perspective.

Similarly, Confucian tradition was often generalized as an ideological and cultural force that made the women of Asia victims of patriarchy, but modern studies show that women resisted patriarchal norms. Dorothy Ko, Jahyun Kim Haboush, and Joan Piggott (2003) affirm that women in Confucian cultures should not be portrayed merely as suffering victims or heroic rebels but also as "agents of negotiations who embraced certain aspects of official norms while resisting others" (Ko, Haboush, and Piggott, 2003, p. 1).

This perspective also applies to the experiences of women in Japan's new religions. The new religions are sustained by their women memberships. These women are commonly represented as a troubled category, and new religions generally teach them to step back and humble themselves in order to achieve this-worldly benefits. Such strategies religiously sanction traditional, existing gender roles and therefore do not lead to an amendment of gender role assignments.

Helen Hardacre (1984) terms these "strategies of weakness" by women who are economically dependent upon male householders. Hardacre further asserts that features of gender ideology found in fundamentalist religion also exist in such Japanese new religions as Reiyūkai and Seichō-no-Ie. These religions take a "characteristically conservative stance in regard to family, gender, and interpersonal relations" that she finds analogous, in its sexual discrimination, to fundamentalist religion, which places women in positions subservient to men and forces them to be self-sacrificing (Hardacre, 1994, pp. 113, 119). However, this generalization is countered by newer studies. Women in the new religions have adopted a strategy of working from traditional domestic roles sanctioned by their religions and may also appear to lack critical attitudes toward the oppressed positions assigned them. Further studies, however, expose the error of concluding that these women simply accede to submissive positions in male-controlled institutions without taking any interest in criticizing or reforming their religious communities (Usui, 2000, 2003).

Usui Atsuko argues against a conventional view that sees women in new religions as a special category in modern society dealing with some kind of problem caused by their disadvantageous and relatively deprived social standing. To depict women in new religions as supporting male-dominance ideology in order to compensate for their feelings of deprivation, Usui says, leads to the experiences of these women being erased (Usui, 2003, pp. 221–222). She describes religious groups that emphasize the development of psychic or spiritual powers without essentializing gender categories, presenting these as instances of how, even in new religions, traditional gender ideology does not lead to the exclusion of women's religious experience.

As this implies, the experiences of women in the new religions are characterized by diversity. It may be difficult to claim agency by self-assertion in a context like religion, where self-transcendence is valued and emphasis is placed on new communal groups based on self-transcendent relationships. Nevertheless, future researchers would do well to conduct detailed fieldwork while attending to the agency of female believers. Theories relating to women's agency will no doubt require refinement. It is necessary to consider, for example, how women are able to enact values traditionally associated with femaleness without succumbing to their own subordination. This is not to counter the conventional model of victimized women by reifying exceptional, heroic figures in history, needless to say.

Throughout Japanese religious history, women's religious roles have been inextricable from belief in the "spiritual power of women." This was brought to light with the publication of *Imo no chikara* (Women's power) in 1940 by Yanagita Kunio, the founder of Japanese folklore studies. Yanagita viewed women as innately possessing a mystical spiritual power that originated in their reproductive capability. He believed that, by virtue of "female-specific physiology and emotional nature," women possessed various religious abilities. Carmen Blacker (1975) describes female shamanic practitioners who fit this view.

Critics point out, however, that Yanagita's view of women's spiritual endowment actually obscured discriminatory practices against them. They criticize Yanagita for imposing the view, based on biological essentialism, that women's spiritual power is inherent, natural, and universal in all women. In other words, Yanagita, who identified that mystical power with women's unique reproductive function, is indicted for essentialist views of female gender (Kawahashi, forthcoming [a]). Tanaka Takako shows how Yanagita excessively emphasizes women's reproductive power, which is linked with worship of female deities. Used uncritically, she states, this approach risks generating the facile fantasy that all women are worshipped as goddesses (Tanaka, 1996, p. 182).

Kuraishi Atsuko (1995) also criticizes Yanagita and other male folklorists for overemphasizing women's spiritual power. Although Yanagita writes that "in the past, the women in each household invariably served the deities, and it appears that the wisest among the women was the most superior priestess [*miko*]," he does not discuss specifically how ordinary housewives functioned as priestesses in their households (Yanagita, 1990, p. 25). According to Kuraishi, Yanagita's notion conveys his image of the ideal housewife. Citing Yanagita's statement that "women must make it their first precept to do everything possible to take care of the home, bear and rear good children, and never fail in performance of the memorial rituals for the ancestors," Kuraishi suggests that Yanagita's actual motive here was to turn women into the reservoir of Japanese traditions (Kuraishi, 1995, pp. 94–97).

The research done by Yoshie Akiko (1996) is important for understanding the ritual roles of women in Japanese religious history and their relationships to male ritual specialists. Contrary to Yanagita, who claimed that ritual observances were intrinsically the unique province of women, Yoshie points out that this cannot be verified throughout history and stresses that ancient rituals were performed by women and men acting together. Yoshie explains that the sexual union of women and men was considered an important aspect of ritual, and rituals for fertility were sustained by faith in the primal power of such sexual union (Yoshie, 1996, p. 20). Moreover, as she points out, women's ritual participation in this kind of sexual practice raises the possibility of a connection with the crucial role women played in agricultural labor. Consequently, as Yoshie suggests, the dramatic advances in farming technology and the structural changes in agriculture that took place toward the end of Japan's medieval period conclusively depreciated the significance of women's specific functions in the labor of farming and other such endeavors. At the same time, the practice of invoking fertility by means of sexual ritual also lost its importance (Yoshie, 1996, pp. 250–251).

It would, of course, be a mistake to think that Japan's folk religious tradition uniformly oppressed women, denying them opportunities to participate in religious activities or activate their spiritual nature. It would also be a mistake, however, to interpret the interaction between women and religion entirely within the framework of "women's power" or the "supernatural endowment of women," ignoring the locality and the particularized contexts of individual experience.

Okinawa, as one such context, has received increasing attention. Situated midway between Kyushu and Taiwan, Okinawa is Japan's southernmost prefecture, and Okinawan religion has been largely treated as a subset of Japanese religion. Yanagita, for example, derived his thesis of "women's power" from Okinawa. He actually borrowed this key term, which he used to describe indigenous Japanese beliefs, from the Okinawan context, thus fostering an illusory notion of Okinawa as representative of Japan's ancient past. Subsequent studies, however, have highlighted the distinctive gendered nature of Okinawan religious culture and its allocation of authority to females. These studies have also recognized Okinawa's value in world religious history. The fact is that in Okinawa, unlike the Japanese mainland, it is an everyday occurrence for housewives to act as priestesses, praying to the *hinukan* hearth deity enshrined in the kitchen to appeal for the family's well-being and happiness. Women nearly monopolized priest-like roles in village communities and kin groups and even at the state level during the time of the Ryukyu kingdom, which lasted until 1879. The Okinawan belief in *onarigami*, where sisters become the spiritual guardians of their brothers, is another characteristic distinguishing Okinawan from Japanese culture (Kawahashi, 2000; Wacker, 2003). Also unlike the Japanese mainland, Okinawa has al-

most no pollution beliefs associated with women, who are thus not excluded as unclean from ritual sites.

FEMALE GENDER AND RITUAL UNCLEANNESS IN JAPANESE RELIGIOUS CULTURE. While women were seen in Japanese religious history as possessors of spiritual power, there was also a view that women are polluted and must be kept apart from sacred things. Shintō notions of women's pollution, for example, are discussed in Yusa Michiko (1994). These are implicated in *nyonin kinsei* and *nyonin kekkai*. *Nyonin kinsei* is the practice of forbidding women to enter, reside, or perform religious practice in temples, shrines, sacred mountains, and ritual sites. *Nyonin kekkai* demarcates the boundary of a ritual space that women cannot enter. Some sacred mountains that traditionally upheld *nyonin kekkai* have been opened to women, while others, such as Mount Ōmine in Nara, maintain the exclusion. This is the subject of ongoing dispute, as demonstrated, for example, by a signature drive in 2004 demanding the lifting of *nyonin kinsei* at Mount Ōmine. Suzuki Masataka (2002) acknowledges criticism of *nyonin kinsei* as discriminatory, maintaining that his stance is not to condemn the practice but to clarify the processes whereby it came into being and to delineate its changes, if any (Suzuki, 2002, p. 4). Suzuki seems to be distancing himself from the polarization in accounts of *nyonin kinsei* as either discriminatory or religiously meaningful. Indeed, some suggest *nyonin kinsei* is an important ritual mechanism for male religious practitioners to acquire spiritual power. Yet the argument that sacred mountains had to be sealed off from women for the sake of male acquisition of spiritual power naturally raises the question of why men took priority over women. Ushiyama Yoshiyuki (1996), examining this problem as a Buddhist historian, identifies three basic reasons for the origination of *nyonin kinsei*: (1) the notion of women's blood pollution; (2) adherence to Buddhist precepts; and (3) the disdain shown to women in Buddhist scriptures. Ushiyama holds that while conventional accounts overemphasize pollution, the focus should instead be on the Buddhist precept against sexual indulgence, which is applicable to both genders, and suggests that the notion of blood pollution was a later development (Ushiyama, 1996, pp. 75–78).

In any event, researchers must attend not only to the logic and history underlying the practice but also to the perception of women themselves vis-à-vis the practice. It is necessary to examine how the perpetual or temporary exclusion of woman from a locus of cultural value is implicated in the situations of women in the early twenty-first century.

Another important issue in interactions between religion and gender in Japan is *mizuko kuyō* (memorial rituals for aborted fetuses and miscarried or stillborn babies), interpretation of which has occasioned various exchanges among researchers (Kawahashi, forthcoming [b]). The study of gender issues in Japanese religion, as in other traditions, must be positioned within a dialectic between research to refine existing theories of gender and feminism on the one hand

and thoroughgoing fieldwork and rereading of historical texts on the other. It must also take into account contemporary maneuvers by Japanese women (and men) to reform religious communities as well as influences on Japanese society at large from religions that have been changed by feminist thought.

REFORM MOVEMENTS. One example is a women's movement that formed in Japanese Buddhist circles during the 1990s (Kawahashi, 2003). This is a diverse group that includes, among others, wives of male priests, female priests (nuns), women who are a combination of both, and women who do not belong to any particular Buddhist order. Their project is to amplify the voice of women in the Buddhist community by a variety of means, including workshops and the publication of workshop findings. They also aim to form networks across sectarian boundaries for information exchange. They seek, by means of women's participation, to transform present-day Buddhism to provide gender equality. The commitment of these women extends beyond the boundaries of any particular school. They envision a new Buddhism that empowers the women of the early twenty-first century, and their project necessitates reinterpretation of conventional, male-centered Buddhist history and doctrine in light of their own experiences.

These women, who find it natural to resist gender-discriminatory constructions, are building a fuller awareness of how patriarchal Buddhist orders have thwarted women's realization of their own religiosity. This is not to say that Buddhism is a primary cause of Japanese patriarchal structures, nor does their criticism make such a claim. This project seeks rather to find truths in Buddhism that point a way to freedom for women, and this is their rationale for redirecting Buddhism toward affirmation of women's experiences in their own life context.

The discipline of religious studies remains rather unaware of its habit of reducing other religious traditions to fit into Western categories. It is important to recognize, however, that the rise of non-Western feminism makes it necessary to consider feminisms in the plural. Researchers who categorize Japanese women as silenced victims of patriarchy and their religious experiences as strategies of the weak will be called on to be reflexively aware and critical of whether their own interpretations are imposing a Western (or some other) agenda on their subject. At the same time, the religious world in Japan must no longer dismiss the study of gender issues in Japanese religions as a problem for women, and therefore secondary, but instead improve the quality of researchers and raise the level of work in the field through institutional reform.

GENDER AND RELIGION: GENDER AND JUDAISM

Feminist studies of gender and Judaism widely agree that, at least until the late 1970s, it is masculinity that has been almost exclusively generative of Judaism's authoritative religious and historical knowledge and leadership. Underpinning and perpetuating the secondary status of Jewish women are a male God, the male "founder," Abraham, and leader, Moses, a traditionally male rabbinical establishment historically subsequent to a hereditary male priesthood, and a male messiah in the times to come. Until the late twentieth century, most women (even those in relatively liberal circles) have known communal Judaism and Jewish thought from the perspective of the marginal other. Despite the existence of women of outstanding piety throughout Jewish history, and a very few instances of female scholars in the rabbinic and early modern periods particularly, women have not been the speaking subjects but the silent objects of Jewish discourse. They have not been the rabbinic commentators, decision makers, theologians, mystics, or philosophers. Matters concerning women have been discussed by male practitioners, usually in texts written by men and for men as problems or exceptions to what is normally the (masculine) case. The male Jew has been the normative Jew, and remains so in Orthodox communities. It is further arguable that recent change in the religious educational and devotional opportunities for Orthodox women is only to a degree and of a kind permitted by men within an essentially masculine dispensation.

JEWISH FEMINISM AND THE FEMINIST STUDY OF RELIGION. Judaism is founded on principles of justice and compassion that have driven social change through three millennia. It is therefore not surprising that the political impetus and methodological presupposition of the study of gender and Judaism have been loosely situated within the Jewish feminist movement and feminist criticism of intrareligious discrimination against Jewish women. The latter's foundational prophetic call that Judaism should institute an eleventh commandment—"Thou shalt not lessen the humanity of women"—that would be faithful to its own ethical judgment on the world remains as powerful a motivation today as it did when it was first articulated in 1979 by Cynthia Ozick.

Ozick's "eleventh commandment," which is intended more socially than theologically, nonetheless underpins all subsequent Jewish feminist theology. Jewish feminist theology is a critical theology that subjects Jewish texts, images, and practices to feminist analysis. In particular, it has been noted that biblical, rabbinic, and mystical Jewish theology includes images of the divine that are at least nominally feminine, such as Hochmah, Wisdom, and Shekhinah, the in-dwelling presence of God. The qabbalistic understanding of Shekhinah as a feminine element within God through whom God interacts with the world has recently been explored by Elliot Wolfson (1995). The mystical longing for a reunion of the male and the female elements within God has inspired Jewish feminists to envision the mending (*tikkun*) of history and of the cosmos itself. The more gender-neutral terms for God, such as *HaMakom* (the Place) and *HaShem* (the Name), also help to ground Jewish feminist theological reflection in the tradition. However, Judaism is a practical religion before it is a doctrinal religion, and therefore few Jewish women would ascribe a central place to theology in feminist Jewish Studies.

But Jewish feminism, like other feminisms, has a first as well as second wave period. After the rise of Jewish modernity in the early nineteenth century, the Reform movement's insistence on the freedom to choose the type and degree of one's Jewish commitment led to the creation of several types of Jewish feminism interconnected by their emphasis upon justice and relational values. Before the Holocaust, Jewish women's proto-feminist or first wave activism was channeled through political, educational, and welfare organizations that were often maternalist in character. The second wave Jewish feminism of the late 1960s was as much the result of disenchantment with early twentieth-century Jewish politics in the trade union, communist, and Zionist movements in Europe and North America and in the new settlements in Palestine, all of whose political radicalisms had largely failed to offer women the leadership roles their rhetoric of equality had seemed to promise them. By the end of the 1980s Jewish feminism had become a significant movement found across the spectrum of observance, bar that of the more closed communities of Ultra-Orthodoxy.

The different types of Jewish feminism fall into three categories. Jewish feminism within modern Orthodoxy seeks to adapt Jewish law to better serve women's interests, though only so far as Torah might permit; liberal Jewish feminism seeks equality with Jewish men through the ethical reform of tradition; and ultra-liberal or "postmodern" Jewish feminism offers a woman-centered approach (as in Gottlieb, 1995) that might include elements of the contemporary Goddess feminist spirituality considered to be historically continuous with ancient Israelite women's syncretistic practice. However, Judaism has tended to be a practical and social religion before it has been a speculative one and the view that Jewish feminist goals will be achieved by *halakhic* reform rather than through a revised or reformed theology has predominated.

By the end of the twentieth century, the study of gender and Judaism was no longer as politicized as it had been through the 1970s and 1980s by the Jewish feminist project. The question of whether Judaism either oppresses or liberates women had given way to the more nuanced study of gendered and intra-gendered difference. Two key insights have tempered the recent feminist study of gender and Judaism. The first of these is the recognition that Jewish women's experience is historically, socially, geographically and culturally diverse. Second is the observation that throughout the history of Judaism, women have led different types of authentically Jewish lives within and sometimes despite the constraints of their gender roles. Since what a young Jewish woman from London or New York may consider liberating may not be what an older Jewish woman from a Kurdish or Ethiopian Jewish community in Israel might consider liberating, the study of gender and Judaism has had to ask more nuanced questions of its subjects and no longer presumes to judge on behalf of other (non-academic) women whether Judaism is a source of fulfillment for them or not. Western religious detraditionalization also contextualizes the study of gender and Judaism. The spiritual "turn to the self" and the shift in late modern religious observance into what is effectively a lifestyle choice are reflected in feminist studies of Judaism that are concerned with decentralizing the position of canonical texts and studying the individual woman as an autonomous religious agent, defining and controlling the meanings of a Jewish life for herself.

Inevitably, studies in gender and Judaism have sought to correct Jewish scholarship's obliviousness to its own traditionally male perspective and have focused instead on the neglected particularities of women's experience of and representation in Judaism and Jewish culture. However, it is important to note, as Daniel Boyarin (1997) has done, that the interrelation between Jewish constructions of masculine and feminine roles, virtues, and symbols is a complex one, and it is not only popular anti-Semitic discourse that has "feminized" male Jews. Judaism in the post-biblical Diaspora presented an ideal Jewish male whose receptivity and orientation towards the family has challenged and continues to challenge Western assumptions of masculine dominance and aggression and which has made him an object of desire for Jewish women. The ideal male Ashkenazic Jew in the years before the establishment of the State of Israel and still in some Ultra-Orthodox circles today, while never effeminate, has been studious, otherworldly, and compassionate. Jewish masculinity is not traditionally defined economically by a man's being the main breadwinner or by macho physical prowess, but by the prestige of his religious scholarship. The people of Israel have also been feminized in being cast as God's (sometimes adulterous) wife. Conversely, it is widely argued that the Israeli establishment has legitimized its militarism by "feminizing" diasporic victims of persecution, especially survivors of Nazism, and defining the male Jew as the tough Israeli soldier—a secular reincarnation of the Israelite warrior of the biblical period.

JEWISH WOMEN'S HISTORY. Early Second Wave Jewish feminist historiography, in common with other such feminist historiographies, was something of an exercise in "contribution" history whose purpose was to rescue exceptional Jewish women's achievements from undeserved obscurity. Two such women who have become relatively well-known by these means are the nineteenth-century Hasidic female *tsaddiq* (a Hasidic leader noted for piety and learning) Hannah Rachel Verbermacher (also known as the Maid of Ludmir) and Regina Jonas, who in 1935, before her death in Auschwitz, was privately ordained as a Reform rabbi. Gradually, however, Jewish feminist historiography has yielded a sense not only of the contributions of women but also of the precedent and diversity of their experience, enabling scholars to question received periodizations of Jewish history and to redraw the boundaries of Jewish tradition.

The historiography of Jewish women begins with that of the biblical period. The picture that emerges from a wealth of popular and scholarly publications on the historical and literary roles of women in the Hebrew Bible is a mixed one of female vulnerability, oppression, rivalry, deceit, courage, loyalty, and wit. The picture changes over time as monarchical government replaces the political dispensation of ancient Israel around 1050 BCE. In some narratives, the Bible suggests that women in ancient Israel could, even if only exceptionally, enjoy the roles of prophet (such as Miriam in *Exodus* 15:20, Huldah in *2 Kings* 22:14, and Noadiah in *Nehemiah* 6:14); judge, prophet, and military leader (such as Deborah in *Judges* 4–5); and wise women (such as the "witch" of Endor in *1 Samuel* 28:3–25). The bonds of loyalty between women are poignantly expressed in *Ruth* 1:16–19, and the power of sisterly solidarity in the story of the daughters of Zelophehad (*Numbers* 27). Yet other narratives present highly sexualized images of female power as seductive rather than authoritative, as in the story of Jael in *Judges* 4:17–22 and in the stories of the matriarchs, where women are the biological rather than religio-political movers of Jewish redemption history and the narrative emphasis is on the birth and lineage of sons, not daughters.

Rather differently, scholars on the Jewish academic and spiritual left have used biblical texts and archaeological studies of the ancient Middle East to show that Israelite religious practice—especially that of women who were gradually excluded from the public cult of Yahweh during the monarchical period—was syncretistic and accommodated the local goddess cult of Asherah (see *2 Kings* 23:7). This body of research has funded feminist theological moves towards more gender-inclusive models of the Jewish God.

In its study of the post-biblical period, Jewish feminist historiography, like Jewish feminist anthropology, has challenged the normativity and centrality of *halakhic* Judaism in androcentric Jewish studies by noting the many local exceptions to its rule. Despite periods of intense persecution and ghettoization, Jewish women's lives have been led in complex interaction with non-Jewish religious and cultural communi-

ties. Ross Kraemer, for example, has argued that although Hellenization is generally regarded by Jewish historians in a negative light, diasporic Jewish communities in this era may have been less sexually segregated than later ones and may have offered (elite) women more access to public life than those more closely regulated by rabbinic law. Bernadette Brooten's now classic research into Greek and Latin inscriptions (1982) suggesting that women held leadership positions in late antiquity has also fuelled the argument that the legislation of gender roles in rabbinic law and custom has not necessarily prevailed in all parts and periods of the Jewish world. More generally, since Jewish studies has privileged the study of formal, communal masculine practice over female religious practice, feminist historians such as Chava Weissler (1998) have attended to how women have effectively integrated their ordinary relational and practical concerns with their spirituality and messianic hopes.

The study of gender and the Holocaust has been gaining momentum and prominence since the mid 1980s. Feminist historians have shown that the "Final Solution" was not gender-blind; women's gender-specific experience of the Holocaust cannot be subsumed into that of men. Without in any sense ranking women's suffering above men's, feminist historians such as Joan Ringelheim and Myrna Goldenberg were among the first to ask how Nazism placed Jewish women in "double jeopardy" as objects of both its anti-Semitism and its misogyny so that they endured, in Myrna Goldenberg's well-known phrase, "different horrors in the same hell." As mothers of future Jewish generations and less adaptable to the grueling physical requirements of slave labor than men, women and their children were the immediate targets of the Nazi genocide. Although women's chances of survival were generally greater in the early years of the Holocaust, by 1942 women were more likely than men to be deported to the death camps where, especially if pregnant or accompanied by children, women were also more likely than men to be selected for immediate death. Diverse recent studies (such as those of Nechama Tec [2003] and Melissa Raphael [2003]) have explored the ethical, spiritual, and theological dimensions of women's resistance to dehumanization through care of others during the Holocaust.

THE ROLE AND STATUS OF WOMEN IN RABBINIC JUDAISM.

The corpus of rabbinic law and ethics in the Mishnah and, later, the Talmud, was complete by approximately 700 CE. This literature is not of merely antiquarian interest: through continual reinterpretation it has continued to provide a religious framework that regulates, if to widely varying degrees, the familial, economic, and social life of the whole Jewish community other than that of secular Jewry.

Rabbinic Judaism's understanding of the female role as one centered around the marital home can be summarized in the three positive commandments (sometimes regarded as punitive reminders of Eve's disobedience) that remain women's gender-specific obligations in Orthodox Judaism today. These are to light the Sabbath candles (*nerot*), to sepa-

rate and burn a portion of the dough when baking the Sabbath loaf (*hallah*), and to observe the laws of menstrual or family purity that regulate physical contact between husbands and wives (*niddah*). Women are also obligated to observe the Sabbath, the dietary laws, and all other *halakhic* prohibitions.

There is no doubt that rabbinic literature contains misogynistic texts that enumerate women's supposed vices, derogate them as sources of sexual temptation and menstrual impurity, classify them as subordinated, immature, or defective others, and show a marked preference for the birth of sons over daughters. In rabbinic Judaism, women's testimony is generally inadmissible in a religious court as it is classed with, among others, that of minors, slaves, and the deaf and the blind. (Though since the 1951 Equality of Women's Rights Act in Israel, at least there has been some easing of the disqualification under Israeli civil law.)

Nonetheless, Judith Romney Wegner (1994) has shown that the late second-century Mishnah does not accord the same status to women throughout their lives, and it distinguishes between dependent girls and wives and relatively autonomous women, the latter being those divorcees, widows, and unmarried adult daughters who could control their property and arrange their own marriages, relatively free of male authority. While rabbinic patriarchy subordinates women to men and has on this and other grounds been rejected by liberal Jews as archaic, rabbinic Judaism is, then, more flexible than might be immediately apparent.

Admittedly on its own terms, rabbinic law respects the practical, emotional, and embodied interests of women and accords them rights to finance, medical care, and sexual satisfaction. Most notably, rabbinic law adjusted the more rudimentary biblical law so as to better protect women's interests. The classic case of a Western rabbinic ruling that broke with biblical and previous rabbinic law (a *takkanah*) was the ban on polygyny (actually already sharply in decline) ascribed to Rabbi Gershom ben Yehudah in the tenth century CE. (Orthodox feminism regards this *takkanah* as a precedent for sexually egalitarian proposals that appear to abrogate the law.) Other *takkanot* ascribed to Gershom ben Yehudah also tempered the inequalities of biblical marital practice, especially arbitrary divorce against a woman's will and without financial settlement. The rabbis were also generally opposed to wife-beating and permitted contraception to wives in certain medical circumstances. Although "acquired" from their fathers, wives are not, under rabbinic law, the purchased property of husbands; it is rather that marriage makes them unavailable to other men. Although, to this day, Orthodox Jewish law gives men alone the right to initiate divorce since it was they who have created the marriage bond, the *ketubah* or marriage "contract" describes a husband's financial and other duties to his wife. The case of the *agunah* or "anchored" woman who no longer lives with a husband who will not grant her a divorce is, however, an inequality to which some Orthodox rabbis have sought to provide solutions and against which feminists are still campaigning.

Generally speaking, the degree to which legal alleviation of sexual discrimination is permissible varies according to whether the community understands the whole Torah—written and oral—as the direct ordination and self-revelation of God (the Orthodox and especially Ultra-Orthodox view) or as divinely inspired but historically conditioned and of human authorship (the Reform perspective).

THE ROLE AND STATUS OF WOMEN IN ORTHODOXY. Orthodoxy—itself a spectrum of observance and cultural orientation—broadly continues to resist any construal of gender equality other than that summarized by the apologetic formulation “equal but different.” Largely excluded from active participation in public ritual, women’s traditional role is a supporting, enabling one (see BT Berakhot, 17a). Men and women’s religious practice and orientation is considered complementary. Women are, by custom, not law, responsible for nurturing a sense of Jewishness in young children and for the infusion of a Jewish atmosphere and peace (*shalom bayit*) into the home. (Indeed, sociologists have sometimes argued that Jewish women’s emotional and practical investment in family identity and continuity has made them rather less susceptible to secularization and assimilation than men.)

With certain important exceptions, such as eating unleavened bread at Pesach or reading the Megillah at the festival of Purim, Orthodoxy exempts women from those positive commandments whose observance is ordained for a specific time. So, for example, a woman is obligated to pray, but not at the times set for certain prayers and services. A woman’s presence cannot be counted towards the quorum of ten men required for communal prayer. The classic rationale for such gendered exemptions or cultural prohibitions-in-effect can be either pragmatic or theological. Pragmatically, since women’s first duties are to the welfare of husbands and children, the performance of religious duties cannot also be expected of them. Theologically, appeal may be made to the divine ordination of the gendered economy. Critics, however, have claimed that women’s exemption from most time-bound positive commandments effectively privatizes a woman’s religious life and subordinates her spirituality to the material needs of others. That women have also been strongly discouraged from the observance of certain commandments, such as those of religious study, that are not time-bound has also been questioned.

In response to such criticism, Orthodox commentators point out that after the destruction of the Second Temple in 70 CE, Jewish sacred space relocated from the Temple to the home, study house, and synagogue. As a locus of the holy, the post-biblical home has sacralized a woman’s religio-domestic labor, namely the sustenance of relationships with her husband and children, her maintenance of a kosher kitchen, and her preparation for the Sabbath and other home-based religious festivals. Orthodox women’s lives are, arguably, comprehensively spiritualized by their observance of *halakhab* (daily law) since this regulates rather than denigrates bodily needs and appetites.

Although regarded with skepticism by most feminists as a compensatory rhetorical strategy that safeguards male dominance and impoverishes Jewish women’s religious lives, Ultra-Orthodox apologetics also consider women to be on a higher and more intuitive spiritual plane than men who must therefore shoulder a greater burden of religious duty in order to approach God. After the manner of the virtuous, tireless woman (*eshet chayil*) of *Proverbs* 31, wives are idealized or—from the Ultra-Orthodox perspective—esteemed as those whose “innate” spirituality needs no special training and allows them a more immediate relation to God.

While the requirements of feminine modesty (*tzniut*) may be interpreted by feminists as a means of controlling female sexuality, the traditional Jewish attitude toward sex is not prudish. While some periods of Jewish history have produced male devotional groups with ascetic tendencies, sexual abstinence plays no role in contemporary Jewish spirituality; celibacy is not considered vocational or meritorious, and men (not women) are commanded to procreate. In Hebrew, marriage (*kiddishin*) means sanctification, and marital sexuality is a sign and symbol of the covenant of love between God and Israel. Of course, Orthodox Judaism imposes clear moral restraints upon the sexual urge, and its satisfaction is exclusively heterosexual and marital. Nonetheless, pleasure is both legitimate and desirable. Men are obligated to satisfy the sexual needs of their wives. Indeed, the rabbinic laws of *onah* (women’s sexual rights) schematize the husband’s religious obligation to give regular sexual satisfaction to his wife. While he must never force himself upon her, she is entitled to sexual pleasure regardless of whether she is fertile, pregnant, or postmenopausal.

Only the most traditional of Orthodox Jewish women observe the laws of menstrual purity that require the physical separation, but not the seclusion, of women from men for roughly twelve days a month—as well as a period following the birth of a child (fourteen days followed by a further sixty-six days for a girl, and half of that—seven days plus thirty-three days—for a boy). While a boy child enters into the covenantal relation between God and the people of Israel by circumcision on the eighth day after birth, the birth of girl children is now usually celebrated in synagogue on her first Sabbath, though it is the father who recites the blessing of thanksgiving.

The laws of sexual segregation in worship intensified from the end of the third century of the common era and are still observed to varying degrees in Orthodox communities. Among the Ultra-Orthodox, there is also sexual segregation at communal celebrations that would involve the social mixing of men and women. While Judaism does not require the seclusion of women in the home (especially not in communities residing in non-Islamic countries), the vocation of Ultra-Orthodox women is largely confined to the rearing of large families and, in some cases, to paid work within the community where women may be employed to teach or care for young children. Orthodoxy does not necessarily confine

women to the private sphere insofar as the customary equation of the private and domestic spheres does not straightforwardly apply to religious Jewish life. The domestic, familial sphere is not that of women alone: men practice Judaism in the domestic sphere, as well as in the public spheres of worship and study. In Judaism, the private sphere is essentially the secular sphere of the individual, while it is the religio-communal sphere of ritual, congregational, and legal leadership that is the public one. This means that Orthodox Jewish women have historically undertaken paid work and conducted business in the secular public sphere since this is classed as a private transaction.

Perhaps what is most significant to the study of gender and Judaism is the gendered inequality of power signaled by the language of male permission in relation to change; Orthodox women remain the dependent objects of male rulings. For the foreseeable future at least, it seems unlikely that Orthodoxy will permit systemic change as that would entail no less than a reconfiguration of divinely ordained gender roles in the Jewish home and family that would be considered inimical to the revelation and spirit of biblical and rabbinic tradition.

The matter can be summarized as follows. On the one hand, the revitalization of Orthodoxy in resistance to secular modernity has seen the reinforcement of an ideology of traditional sexual complementarity and an emphasis on the role of the Jewish family in rebuilding the worldwide Jewish community after the Holocaust. As Lyn Davidman points out (1991), this re-inscription of gender difference has been strongly supported by Orthodox women who can find stability, security, identity, continuity, authenticity, and respect for motherhood and homemaking in conservative ideologies of Jewish femininity. On the other hand, and irrespective of the conflict between traditional and progressive Jews over the role of women in Judaism, concerns for the survival of Judaism have focused Orthodox attention on giving women just some of the communal roles and responsibilities the contemporary Western sexual-political climate would lead them to expect.

GENDER AND JEWISH EDUCATION. As itself an act of worship, the study of Torah is integral, not supplementary, to Jewish practice. In post-biblical Judaism, where study of the Torah replaced cultic worship as the means of knowing and observing God's commandments, it has been the father's obligation to teach his son Torah. Just as women were not priests, so too they were not to be scholars. By custom rather than law, women were and are urged to induct children, especially girls, into the ambience and domestic practicalities of the tradition. Women and girls are exempt from the study of Torah on the grounds that women are exempt from acts that a father is obligated to undertake for his son, namely teaching him Torah (BT Kiddushin 29a). In fact, the Talmud records some disagreement over Rabbi Eli'ezer's somewhat extreme opinion that the education of girls unravels the meaning of Torah into nonsense or obscenity, and it records

the names of several learned rabbinical wives and daughters, best known of whom was Beruriah, wife of Rabbi Me'ir of the second century CE.

The religious educational opportunities for girls and women are clearly not equal to men's. Yet the degree of gendered inequality has differed according to women's class, economic standing, geographical location, and historical period. Scholarly Jewish women in the wealthy Sephardic families of the early modern period were, for example, more numerous than those of affluent Ashkenazic families in central and eastern Europe who, as the centuries progressed, were more inclined to offer girls a high level of secular rather than religious education.

It is not only feminist criticism that has produced a widespread change in attitudes toward women's religious education across the spectrum of Jewish Orthodoxy. It is also recognized by Orthodoxy that arresting the widespread contemporary decline in Jewish observance and population is in part at least dependent on women's informed commitment. To prevent the influence of secular values (especially those of Jewish feminism, which is widely misread as a secular project), the end of the twentieth century saw Orthodoxy making new provision of role-specific religious education for women—one that was both a product and cause of Jewish women's increased historical, textual, and linguistic competence in Judaism. (Note though, that like Ultra-Orthodox men, Ultra-Orthodox women do not normally participate in secular higher education.)

Orthodoxy is now seeking to redress some of the gendered inequalities of opportunity in Jewish religious education, though not to remove them entirely. In contemporary Israel, the cultural and economic influence of American Jewry has encouraged the establishment of religious educational establishments offering Jewish women from all over the world opportunities to study to ever higher levels of *halakhic* competence and to train as advocates for other women in religious courts, particularly in cases of divorce. A more advanced Jewish education has also enabled women to conduct prayer services even if modesty requires those to be conducted only for other women. However, such services are still not permitted in synagogues in Great Britain and parts of the American Orthodox community. Women in Orthodox communities are also not called up to recite the blessings accompanying the chanting of a portion of the Torah or to read from the Torah itself, since that might suggest that the men of the community are not proficient to do so.

REFORM AND CONSERVATIVE MOVEMENTS. The religious emancipation of Jewish women in liberal Jewish communities was subsequent to the humanistic ethic of *Haskalah* (Jewish Enlightenment) and to the civic emancipation of Western European Jewry. Over time, women in Reform communities have come to enjoy equal access to positions of educational and synagogal leadership and full participation in Jewish rites of passage. Since 1972 in the United States and 1975 in Britain, women have been ordained as

rabbis. In the United States, the Conservative movement—a middle way between Orthodoxy and Reform—has also gradually instituted the equality of women and men and has given women access to rabbinical training since 1983. However, Conservative Judaism has a greater concern for maintaining continuities with Jewish law, and its congregations vary in their attitude to change. Other than in the most progressive communities on the liberal spectrum, marriage and ordination are still refused to Jewish lesbians and gay men.

Sexist language has been either tempered or eliminated from liberal liturgies, though the evocation of the divine as “God-She” remains controversial in all but the alternative quarters of progressive Judaism. As well as giving women equal access to the rituals marking religious maturity (bar mitzvah for boys, bat mitzvah for girls) new rituals have been devised in Britain and the United States by women rabbis and others to change the self-image and consciousness of women. Such rituals solemnize gender-distinctive life-changing events—whether these be traumas such as mastectomy or miscarriage or celebrations such as menarche and childbirth—to which the tradition, so often concerned with the ownership and control of women’s sexuality and reproductiveity, has not previously attended. Despite such attention to female difference there has been some feminist concern that in gaining equality with men, Reform and Conservative Jewish women have become, in effect, honorary men, while men have not become honorary women. The most prominent leadership roles are also still most commonly held by men, partly in ecumenical deference to the Orthodox community, with whom Reform and Conservative Judaism wishes to maintain cooperation and dialogue.

MELISSA RAPHAEL (2005)

GENDER AND RELIGION: GENDER AND CHRISTIANITY

Christianity has always been a gendered tradition—as indeed have most religions—insofar as sexual difference has formed an organizing focus for its doctrines, practices, and institutions. This has been more evident in Catholic and Orthodox forms of Christianity than in Protestantism, but the gendered hierarchies that have prevailed in Christian institutions from the time of Saint Paul persisted largely unchallenged until the middle of the twentieth century. Since then churches have faced a widespread intellectual challenge to their understanding of gender, arising partly out of the influence of feminism but primarily generated by a significant number of women becoming academic theologians and biblical scholars for the first time in history. Rosemary Radford Ruether's pioneering work of feminist theology, *Sexism and God-Talk*, first published in 1983, asks, "Can a male savior save women?" (Ruether, 1993, p. 116).

As a growing number of feminist theologians and, more recently, gender theorists have developed ever more refined forms of analysis in their studies of Christian doctrine, history, spirituality, and ethics, Ruether's question opens into a complex landscape in which the sexed human body occupies a central but often veiled position, inviting both redemptive and critical readings of tradition. Elizabeth Schüssler Fiorenza's (1983) advocacy of "a hermeneutics of suspicion" has influenced two generations of biblical scholars whose increasingly nuanced methods of interpretation are transforming the ways in which biblical texts are understood and applied with regard to gender constructs and sexual relationships. Although Western in origin, these intellectual revolutions have impacted non-Western cultures, so the question of Christianity and gender has become one of far-reaching significance for the doctrines and practices of the churches worldwide.

However, feminist and gender studies have so far been more thorough in their analyses of femininity and womanhood than of masculinity and manhood, so much of what still passes for normative humanity in Christian texts and practices is in fact male humanity, misleadingly represented as the generic human being. Until this masculine particularity is acknowledged, the Christian understanding of the human condition will continue to be shaped by implicitly androcentric perspectives. Despite forty years of feminist scholarship, the theological establishment remains, for the most part, highly conservative, and perspectives informed by feminism or gender theory are either ignored or marginalized in the majority of theological curricula.

If traditional Christian beliefs and practices have been problematized by feminism and gender studies, the question also arises as to how far these academic debates reflect the concerns of people's daily lives as they seek to live out their Christian faith in different contexts. For many, traditional forms of Christianity provide a bulwark against what are perceived to be the corrosive effects of secularization and materi-

alism on religious values, and this generates considerable resistance to feminism. Given that a majority of women worldwide continue to regard the family as their most significant area of responsibility and commitment, the Christian defense of the family might in many situations be an important factor in the struggle for gender justice. In other situations, however, Christian beliefs associated with marriage, motherhood, fertility, and sexuality define women too narrowly in terms of domestic roles and responsibilities, so Christian family values can be experienced as repressive in terms of gender justice and human flourishing. Such questions feed into the larger question about what is meant by “the full humanity of woman” and what kind of transformations of belief and practice are necessary for Christianity to create a spiritual and social environment in which both sexes are able to live out the belief that human beings, male and female, are made in the image of God and are called to participate in the creative activity of God in sustaining, healing, and shaping the world (Ruether, 1993, p. 18).

The phrase *gender and Christianity* therefore opens into a kaleidoscopic range of insights that is constantly refigured as new perspectives come into view. As the scholarship of gender becomes more critically refined, early feminist critiques of religious traditions are being supplanted by methods that seek greater sensitivity to questions of historical, cultural, sexual, racial, and economic diversity. There is also a growing attentiveness to issues of gender at the more conservative end of the Christian theological spectrum, so the study of gender, sexuality, and embodiment is by no means the exclusive preserve of feminist scholars. What follows then is a brief overview of a picture that is in an ongoing state of development, so summarizing general trends necessarily risks some misrepresentation of the individual lives and communities that make up the gendered dimensions of the Christian story.

DOCTRINAL AND SOCIAL PERSPECTIVES. The Christian tradition has been marked by deep ambivalences with regard to the significance of human embodiment and gender in terms of both sexual and social relationships. Christianity has always affirmed the goodness of the material world, including the human body, as having been created by God and redeemed by Jesus Christ. However, Christianity has also tended to adopt a negative attitude toward the body in recognition of its susceptibility to suffering and death, which are associated with sin. The original goodness of creation is believed to have been distorted by the effects of humanity’s rebellion against God, and thus the body is a site of particular struggle and conflict in the Christian’s desire to be reconciled to God. In terms of sexuality this has become deeply bound up with issues of temptation, sin, and fallenness, symbolically associated with Eve’s temptation in the Garden of Eden, so a great deal of Christian anxiety has been focused on human sexuality in general and female sexuality in particular. Given the opaque and sometimes inscrutable relationship between gender constructs and sexual embodiment, this makes the task of unraveling Christian beliefs about gender particu-

larly difficult, because embedded deep within these one often encounters a cluster of unacknowledged fears to do with the female body. In this Christianity may not be different from many other religions, but the Christian doctrines of the incarnation of Christ and the resurrection of the body mean that, in theory at least, this should be the most body-affirming of all religions. That its legacy has been more ambiguous is at least partly bound up with the ongoing failure of some parts of the Christian tradition to fully incorporate human sexuality into their vision of the goodness of creation.

The Christian understanding of human nature is premised on a belief in the dignity and equality of every human being in the eyes of God, and the Christian community of the baptized has been represented as one in which all divisions are overcome. Thus in his Letter to the Galatians, Paul writes, “There is no longer Jew or Greek, there is no longer slave or free, there is no longer male and female; for all of you are one in Christ Jesus” (*Gal.* 3:28). However, for most of Christian history women have occupied positions of subordination to men, being subject to restrictions that have precluded the full participation of both sexes in the formation of Christian faith and practice.

The New Testament texts and Apocryphal literature of the first three centuries attest to a struggle by male authority figures to control and delineate the role of women in Christian life and worship, suggesting a trend toward women holding positions of authority in some parts of the early church and a resistance to this trend in other parts. Whatever equality women may have enjoyed in these early centuries, however, their roles soon became circumscribed within authority structures modeled on the social order of imperial Rome. As a result, the institutions, beliefs, and practices of the Christian tradition have been constructed around the values of a patriarchal hierarchy, in which the authority of a Father-God is mediated through descending ranks of paternal leadership, from kings, princes, and bishops to lords, leaders, husbands, and fathers. Some feminist theologians argue that this patriarchal structure is consolidated and perpetuated in the centrality of the Father-Son relationship to the Christian understanding of Jesus as the Son of God.

However, this largely homogenous master narrative needs to be understood in relation to the diverse contexts that have allowed a plurality of beliefs, devotions, and relationships to flourish within Christian traditions. If gendered hierarchies have been carefully preserved in the texts and institutions of the church, attentiveness to the practices of Christianity suggests a more complex reality of shifting sexual relationships and values. For example, Christian men whose writings express misogynistic ideas have often enjoyed close relationships with women in the roles of spiritual director, confessor, and friend, suggesting a level of social and sexual interaction that may not be reflected in the textual legacy. Women such as Teresa of Ávila (1515–1582), whose writings suggest the internalization of sexual stereotypes, often used these as rhetorical devices to challenge male authority

figures. Moreover, although the body has always been more determinative for women than for men and female embodiment continues to function as a basis for exclusion rather than inclusion, for example, with regard to ordination in the Roman Catholic and Orthodox Churches, gender was understood symbolically rather than biologically in the pre-modern church. So in different contexts maternal or feminine characteristics have been attributed to men and masculine characteristics to women to express certain social functions or personal characteristics. Moreover theological relationships between God, creation, Christ, the church, and Mary are described in a range of nuptial and familial metaphors and analogies, so it is impossible to identify any straightforward binary opposition between male and female when one analyzes the dynamics of Christian gender symbolism.

The separation between Eastern and Western Christianity since the eleventh century has also produced different concepts of the significance of gender. The Orthodox Church, influenced by thinkers such as Origen (c. 185–254) and Gregory of Nyssa (c. 335–c. 395), holds that matter, including the sexual human body, is a secondary feature of creation. Sexual embodiment is contingent upon the coming of death into the world and the need for procreation, so sexual difference does not have ontological significance and will not be a feature of the resurrected person. From the time of Augustine (345–430), the Roman Catholic tradition has understood the material world, including the sexed human body, as part of the original goodness of creation and therefore as ontologically significant. The resurrected body will be male or female, just as it was in the beginning. In the Orthodox Church, the Virgin Mary represents an iconic and mystical maternal presence at the heart of liturgy and prayer, symbolizing both awe and compassion but dissociated from later Western ideas of maternal femininity. Catholic representations of Mary have been influenced by cultural stereotypes associated with humanism, the Renaissance, and Romanticism, so that they have become heavily invested with changing ideals of motherhood and femininity. These symbolic representations both reflect and shape social values and meanings, so many different ways of seeing and relating are encoded within them in terms of gender, society, and doctrine. Since the Reformation, the increasing diversification of Christianity has led to multiple ways of understanding gender relations. Whereas the mainstream Protestant denominations have tended to uphold traditional gender distinctions and hierarchies, at least until the latter part of the twentieth century, movements such as Quakerism have been more egalitarian in their ideas and practices. Protestantism has by and large placed less emphasis on the symbolic or philosophical significance of sexuality, and therefore its representation of sexual difference has been expressed more in biblical and moral terms than in terms of eschatology, ontology, and symbolism.

THE BIBLE AND THE EARLY CHURCH. The Bible is a necessary but not a sufficient starting point for any study of Chris-

tianity and gender. From as early as the first century CE the Christian belief that God had become human in Jesus Christ was interpreted according to the symbolism of the *Genesis* narrative of creation and the Fall. This means that the story of Adam and Eve in *Genesis* 1–3 has had a formative influence on Christian beliefs about the divine image and the relationship between the sexes, understood both in terms of the original relationship among God, nature, woman, and man and in terms of the fall and its aftermath.

Christ is described as the Second Adam in the Pauline epistles, and by the end of the first century this imagery had been extended to include the Virgin Mary as the New Eve in the writings of Justin Martyr (c. 100–165 CE) and Irenaeus, bishop of Lyons (c. 130–200 CE). According to this interpretation, just as the first woman, Eve, brought death to the human race by disobeying God and eating the forbidden fruit, so the New Eve, first woman of the new creation in Christ, brought life to the human race by obeying God by agreeing to become the mother of the savior, Jesus Christ. This identification of Mary with Eve became invested with the language of sexuality, seduction, and sin associated with Eve and purity, obedience, and grace associated with Mary in a way that introduced a dualistic tendency into the Christian understanding of woman. In addition the Christian belief that patriarchal hierarchies are ordained by God for the good ordering of society has been justified through an appeal to the order of creation in *Genesis* 2, in which God created the woman after the man to be his helpmate.

The influential biblical scholar Phyllis Trible challenges this interpretation by offering a careful analysis of the language and meanings of the Hebrew text, and there is now widespread scholarly acceptance that a pervasive ideology of gender has shaped Christian readings of *Genesis*. Biblical writings about God, humankind, and sexual difference have also been interpreted by Christians through the lens of the Greek philosophical tradition, so the *Genesis* narrative has been overlaid with concepts about the essential nature of femininity and masculinity that are alien to the tradition of the Hebrew Scriptures. Thus Christianity has to a large extent constructed its understanding of gender not only around the Bible but around philosophical beliefs that associate masculinity with reason, transcendence, virtue, and divinity and femininity with emotion, immanence, moral weakness, and the body.

Although the interpretation of *Genesis* is crucial for an understanding of the symbolic construction of gender in Christianity, the New Testament offers numerous insights into the historical role of women as well as men in the ministry of Jesus and the early church. The Gospels, in particular the Gospels according to Luke and John, represent women as faithful disciples of Jesus, participating in his public ministry in a way that may have defied the sociosexual conventions of first-century Palestine. Figures such as Martha and Mary of Bethany, Mary Magdalene, the Samaritan woman at the well, and Mary the mother of Jesus feature at significant mo-

ments in the Gospel stories not as silent and submissive followers but as women who often appear to challenge or question Jesus and to contribute to a deeper understanding of his mission. Saint Paul's letters name a number of women who were leaders and patrons of early Christian communities. They include Prisca, Phoebe, and Junia, the latter two referred to as a deacon and an apostle respectively (*Rom.* 16). However, the Deutero-Pauline and Pastoral epistles represent a more complex picture with regard to gender relations. They include instructions to women to submit to men's authority in the church (compare *1 Tm.* 11–15) and to be subject to their husbands (compare *Col.* 3:18, *Eph.* 5:22) while enjoining husbands to love their wives as Christ loves the church (compare *Eph.* 5:25).

Studies of the early church suggest that women had considerable influence in the formative years of Christianity, with Apocryphal literature of the second century, such as the Acts of Thecla and the Gospel of Mary, providing rich additional sources to the biblical text. Whether these stories are rooted in history or legend, they are indicative of a complex process of negotiation and conflict around issues of gender and leadership in early Christianity.

The first four centuries after Christ saw the transition of Christianity from a marginal and persecuted minority to the official religion of the Roman Empire. In her study of patristic theology, Virginia Burrus argues that the conversion of the Roman Empire to Christianity created a crisis of identity for the church's male leaders, who found themselves having to occupy positions of authority defined according to imperial criteria of manliness. She suggests that this identity crisis had a lasting influence on Christian gender constructs in terms of masculine subjectivity, feminine alterity, and the fatherhood of God.

THE MIDDLE AGES. If women lost some of their early influence with the growing institutionalization of the church, they nevertheless continued to play a significant role in Christian leadership and theological reflection in late antiquity and the early Middle Ages. Although this was an era when the lives of the vast majority of men and women escape the historical record, evidence exists that women were included among the educated elite who ran the monasteries and religious institutions of the early medieval world. Abbesses such as Hilda of Whitby (d. 680), Lioba (700–780) and Hildegard of Bingen (1098–1179) were responsible for mixed monasteries in which women as well as men were educated in the context of religious life. The emergence of women's historians since the 1960s has seen a growing body of scholarship devoted to the recuperation of these neglected historical figures.

However, the eleventh-century Gregorian reforms marked the beginning of an era in which power in the church became more centralized and clericalized, which made it more difficult for women to gain access to theological education or positions of religious authority.

The establishment of the schools and universities in the twelfth and thirteenth centuries restricted theological education to celibate male scholars, and the institution of compulsory priestly celibacy intensified misogynistic attitudes toward women and female sexuality, assisted by the widespread dissemination of Aristotelian philosophy through the influence of Scholasticism. Women became more closely associated with the affective, devotional life of faith expressed in the vernacular, whereas male clerics became the custodians of theology and doctrine expressed in the highly stylized Latin of Scholasticism, signaling the beginning of a linguistic and conceptual division between Christian theology and spirituality that would have considerable implications for the understanding of gender.

Yet these changes also brought new opportunities for the expression of women's spirituality that appealed not to the authenticating norms of theology for its legitimacy but to a direct encounter with divine revelation. The next few centuries saw the emergence of women mystics, such as Julian of Norwich (1342–c. 1416) and Catherine of Siena (1347–1380), whose ideas have had an enduring influence on the Catholic tradition. The Beguines, a lay movement of women that flourished across northern Europe from the late twelfth century, produced a number of women spiritual writers, such as Mechthild of Magdeburg (c. 1212–1282), author of *The Flowing Light of the Godhead*, Hadewijch of Antwerp (thirteenth century), and Marguerite Porete (1280–1310), author of *The Mirror of Simple Souls*, who was burned at the stake for heresy. The Beguines were condemned at the Council of Vienne (1311–1312) and had virtually disappeared by the early fifteenth century, attesting perhaps to the vulnerability of women's religious visions and practices in male-dominated traditions. Their male counterparts, the Beghards, were numerically less significant, but they too fell under suspicion of heresy and immoral practices.

The twelfth century also saw the emergence of a new trend in Christian spirituality that affected both men's and women's devotional writings. From the time of Bernard of Clairvaux (1090–1153), the *Song of Songs* became a key text for the expression of the Christian longing for Christ, leading to forms of prayer and devotion in which the soul is represented as the feminine beloved and bride of Christ, expressing "herself" in sometimes highly eroticized metaphors of feminine desire. This constituted a significant change in the Christian understanding of gender, which had until then associated femininity unambiguously with frailty, moral weakness, and carnal susceptibility, with masculine virtue being the Christian ideal for both sexes. The emergence of a more positive understanding of femininity in Christian spirituality was partly due to the influence of the courtly love tradition, with the language of the troubadours being appropriated to express the feminine soul's desire for Christ or the celibate male's devotion to the Virgin Mary. Much work remains to be done on the ways in which this feminized language of prayer and mysticism bears the marks of sexual difference,

but scholars such as Caroline Walker Bynum (1992) and Grace Jantzen (1995) see a tendency to focus more directly on the body and on physical manifestations of devotion associated with the Eucharist and with practices of asceticism and self-mortification in women's writings. Bynum suggests that the medieval belief that associated the soul with masculine divinity and the body with the female flesh coupled with belief in the virgin birth, which eliminated the male body's role in the conception of Christ, led women to identify Christ's humanity with their own female embodiment.

The medieval church was part of a complex social world that offered limited opportunities to women but that also celebrated motherhood as a flourishing social institution. The church itself was a Holy Mother whose sacraments were woven into the practices of everyday life, including women's domestic activities associated with pregnancy, childbirth, and motherhood. The image of the Virgin Mary as a solitary and unique example of womanhood, "Alone of All Her Sex," to quote the title of Marina Warner's (2000) influential book, is challenged by medieval art and devotion that suggest a more communal sense of female sainthood, with the Apocryphal figure of Saint Anne, mother of the Virgin Mary, occupying a position in fifteenth-century devotion second only to that of her illustrious daughter. Toward the end of the fifteenth century the cult of Saint Joseph, the putative father of Christ, began to eclipse that of Saint Anne, so the patriarchal groupings of medieval art and devotion were gradually replaced by the more modern grouping of the Holy Family comprising Mary, Joseph, and the infant Christ.

However, the fifteenth century also brought a new threat to women in the form of the witch hunts, which altogether spanned some four hundred years of Western history, from 1400 to 1800. It is impossible to calculate how many witch trials there were, but conservative estimates are in the range of 60,000 to 100,000 people killed, of whom two-thirds were women, including Joan of Arc (1412–1431). Recent scholarship suggests that these women were victims not primarily of medieval Catholicism, as has often been believed, but of the combined forces of science, rationalism, and religion in the sixteenth and seventeenth centuries, which recorded the greatest number of witch trials. It is impossible to calculate the impact of the witch hunts on the development of Christian thought and practice when one considers that the tens of thousands killed were probably among the most creative and independent-minded of Europe's Christian women, and the fate they suffered must have silenced many others who may otherwise have written and spoken out. It must, however, be borne in mind that this wave of destruction spanned the late medieval and early modern period, and therefore, from the historical perspective of women, to some extent it overshadows the Reformation.

THE REFORMATION AND THE ENLIGHTENMENT. The Reformation saw the emergence of new forms of Christianity, in which the sacramentality and symbolism of the medieval Catholic Church yielded to a more literate and moralistic

form of Christianity based on the authority of Scripture and on individual faith in Jesus Christ. Although this did little to destabilize the gendered hierarchies of Christian theology and practice, it did provide limited opportunities for women to play an active role in the development of new Christian communities and churches. Reformers such as Martin Luther (1483–1546) and John Calvin (1509–1564) rejected the Catholic belief that celibacy was a higher ideal than married life, so marriage came to be understood in more positive terms as a partnership of love and mutual support. However, the vocation to religious life had provided medieval women with an alternative to the often oppressive demands of marriage and motherhood, and some scholars, including William Monter (1987) and Merry Wiesner (1990), argue that women after the Reformation became more narrowly identified with the domestic sphere, with a subsequent loss of public influence and visibility. Moreover the Reformation purged Protestant Christianity of maternal feminine imagery associated with the Virgin Mary, the women saints, and the maternal church, contributing to the emergence of a culture that was more vigorously patriarchal and masculine in its values, politics, and beliefs. With the transition to an increasingly scientific and rationalized worldview after the seventeenth century, the symbolic and spiritual significance of gender began to yield to a more literalistic understanding of human sexuality, so the sexed body increasingly became positioned not in terms of its sacramental and social significance but in terms of scientific definitions and moral prescriptions.

The Enlightenment constituted a change from a social order grounded in the appeal to divine revelation and scriptural authority to a vision of society informed by a belief in reason, personal liberty, and the social contract. This did not immediately change the status of women, and indeed its initial impact on women's lives may have been far from positive, but it laid the foundations for the liberal democracies in which women have ultimately gained a degree of social and political recognition that they were never able to achieve under the theocracies of the Christian tradition. Yet if the male philosophers of the Enlightenment saw a fundamental conflict between reason and faith (even though their ideas remained deeply rooted in Christian theology), it is by no means certain that women shared this perception. Gerda Lerner, in the introduction to the second volume of her study of *Women and History* (1993), describes how she discovered "the significance to women of their relationship to the Divine and the profound impact the severing of that relationship had on the history of women. . . . The insight that religion was the primary arena on which women fought for hundreds of years for feminist consciousness was not one I had previously had" (Lerner, 1993, pp. vii–viii). Mary Wollstonecraft (1759–1797), widely recognized as an early pioneer of the feminist movement, based her appeal for women's equality not only on Enlightenment values of reason, education, and the individual's right to political and social participation but on her faith in the compassion, wisdom, and mercy of God. If in the early twenty-first century

those Enlightenment values are in their twilight years and new, as yet unpredictable, forms of social organization are appearing on the horizon, it remains to be seen to what extent Christianity may continue to offer women a language of divine wisdom to counter the political and social prejudices of powerful men.

THE NINETEENTH CENTURY. The industrial revolution and the rise of capitalism in Protestant societies saw the establishment of what in the early twenty-first century some refer to as the traditional Christian family, although in reality this modern concept does not reflect the diverse social arrangements of the premodern family. Working-class life has rarely allowed men and women the luxury of playing out gendered stereotypes, but the image of Christian family life became identified in the nineteenth century with the clearly delineated gender roles and relationships of the middle classes. While the husband went out to work in commerce and industry where Christian ideals were inevitably compromised, the wife and mother, the “angel in the home,” upheld Christian faith and values in the domestic realm. Thus nineteenth-century Protestant piety was to some extent associated with the sphere of femininity, with a gentle Jesus reflecting a domesticated ideal embodied in the good wife. Indeed during the nineteenth century church congregations were increasingly made up of more women than men, suggesting a gradual withdrawal of men from religion. The mid-1850s saw the emergence of “muscular Christianity,” associated with writers such as Thomas Hughes and Charles Kingsley and later influencing American ministers such as Thomas Wentworth Higginson. This trend, which emphasized the masculinity of Christ and the manly virtues of the Christian faith, may have been a backlash against the perceived feminization of the churches and against the nascent women’s movement.

However, these dominant social paradigms should not be allowed to eclipse the more radical opportunities that Christianity continued to offer to women. Josephine Butler (1828–1906) and Florence Nightingale (1820–1910) were activists whose work was rooted in a radical Christian theology and a profound personal piety. Butler’s work with prostitutes exposed and challenged the trenchant hypocrisies of Victorian England, a society in which a rigid morality defined by Christian values masked the widespread exploitation and abuse of the poor and a flourishing sex trade in the cities. Evangelicalism afforded nineteenth-century Western women a public space from which to speak as missionaries, social reformers, and educators, even if their activities continued to be defined and restricted by men. The nineteenth century also saw the emergence of new women’s religious communities in the Catholic Church, with the formation of religious orders committed to mission, education, and health care. Again these belonged within ecclesial and social structures governed by men, but they provided a means by which women could make a significant contribution to the public dimension of Christian life, extending their influence beyond the domestic sphere and allowing for considerable levels of social mobility and spiritual influence. In the United

States the woman’s suffragist Elizabeth Cady Stanton (1815–1902) pioneered what one day became feminist biblical criticism, and Harriet Tubman (1819/1820–1913) was one of many African American women whose triumphs over slavery inspired later generations of Christian theologians and writers. The emergence of independent African American churches in nineteenth-century America created a form of Protestant Christianity enlivened by the rhythms and gestures of African music, dance, and spirituality, which has afforded African American men and women a space in which to express their Christian faith free from the oppressive influences of racism and white domination. American feminist theologians and gender theorists in the twenty-first century work at a complex intersection of questions having to do with gender, race, and class in their explorations of the relationships among slavery, gender injustice, and Protestantism in the formation of modern American social values.

CHRISTIANITY AND GENDER IN CONTEMPORARY CULTURE.

The twentieth century saw the widespread demise of the Christian faith across much of Western society, at least in its traditional and institutionalized forms, accompanied by a rapid growth in Christianity in some non-Western cultures, most notably in Africa and South Korea. The changed horizons opened by feminist and postcolonialist perspectives have brought new challenges and opportunities to Christian theology, as some of its most fundamental doctrinal and ethical claims have been called into question. The emergence of the contemporary women’s movement in Western society coincided with the Second Vatican Council (1962–1965), an epoch-making event in the Catholic Church that opened the way to a much greater degree of participation by women and other previously excluded groups in theological reflection and formation. The result has been the ongoing transformation of Christian theology and practice, as theologically educated men and women address questions of doctrine, sexuality, social justice, and gender relations from an increasingly wide spectrum of cultural, economic, and intellectual localities. By the end of the twentieth century women were being ordained as priests and ministers in numerous Christian denominations, including the Church of England, with women bishops being ordained in some parts of the worldwide Anglican communion, and the issue of women’s ordination became an increasingly divisive question in the Roman Catholic Church. According to the [religioustolerance.org](http://www.religioustolerance.org) website, one in every eight American clergy is a woman, and in 1997 women constituted 30 percent of North American theology graduates (see <http://www.religioustolerance.org/femclrg6.htm>). Christian beliefs about marriage and sexuality have been challenged by the decline in marriage and rising divorce rates in Western societies. This has been accompanied by a growing desire for religious recognition and affirmation at all levels of church life by gays and lesbians in Western churches, to the consternation of many non-Western Christians who remain committed to a more conservative understanding of Christian sexual values.

These challenging new movements have provoked a backlash, with the reassertion of conservative values in both the Catholic and the Protestant churches and the emergence of fundamentalist Christian movements that tend to adopt a highly literalist approach to biblical teachings on questions of sexual ethics and gender relations. In the United States the organization Promise Keepers seeks to reestablish Christian family values by appealing to men to accept their responsibilities as husbands and fathers, with the concomitant expectation that women should perform their roles as dutiful wives and mothers. In Roman Catholicism the papacy of John Paul II has been remarkable in many ways, but it has seen the reassertion of traditional sexual values and gender stereotypes over some of the liberating tendencies of the postconciliar church. Perhaps the most traumatic event in this context was the publication of the papal encyclical, *Humanae Vitae*, by Pope Paul VI in 1968. This set out a vision of marriage that was revolutionary in its affirmation of the value of married love and sexuality but that, in its reiteration of the Catholic Church's opposition to artificial birth control, provoked an ongoing crisis of authority in the Catholic Church.

The social, demographic, and intellectual developments of the twentieth century mean that Christianity is undergoing a continuing crisis in its understanding of gender and sexuality, calling into question beliefs, practices, and authority structures that have prevailed almost unchallenged since the fourth century with regard to the different roles of men and women, the significance of human sexuality, and the ways in which these have been inspired and legitimated by the Christian understanding of God. It is impossible to predict what the church of the twenty-second century may look like or to what extent it will make sense to speak of the church at all. Some may see the future as a series of schisms, reformations, and revolutions that will lead to a global plurality of movements, sects, and cults loosely rooted in the Christian tradition, whereas others may have a more positive view of the Christian potential for unity and reconciliation after centuries of conflict and division. But it is likely that, whatever other changes take place, the Christian understanding of what it means to be male and female created in the image of God is one of the most urgent and complex questions of this age, and the ways in which Christians respond to that question will shape the churches of the future in profound and unforeseeable ways.

- West, Elizabeth A. *One Woman's Journey: Mary Potter—Founder—Little Company of Mary*. Richmond, Va., 2000. West draws on the insights and analyses of feminist theology for her careful biography of the founder of the Roman Catholic religious order Little Company of Mary. Her book gives an insight into the issues that shaped religion in Victorian England in terms of gender and denominational differences between Catholics and Protestants.
- Wiesner, Merry. "Luther and Women: The Death of Two Marys." In *Feminist Theology: A Reader*, edited by Ann Loades. London, 1990. Wiesner argues that the Reformation was in many ways a retrogressive step for women, closing off opportunities previously afforded by religious life and restricting women's options to marriage and motherhood.
- Williams, Delores J. *Sisters in the Wilderness: The Challenge of Womanist God-Talk*. Maryknoll, N.Y., 1993. Williams offers a critical evaluation and reinterpretation of Christian theology and biblical interpretation from the perspective of African American women.
- Wollstonecraft, Mary. *A Vindication of the Rights of Woman* (1792). London, 1992. A pioneering feminist work that draws on philosophical, theological, and biblical perspectives in its spirited defence of women's rights.

TINA BEATTIE (2005)

GENDER AND RELIGION: GENDER AND ISLAM

During the twentieth century a new gender discourse focusing mostly on women's roles and rights in Islam emerged in various parts of the Muslim world. As is the case in the West, this gender discussion is not uniform, and it is greatly influenced by local cultures and conditions. The division between men and women pervades Muslim culture from the teachings of the Qur'an to its language of Arabic, which carefully distinguishes between male and female. Based on the assumed asymmetry between the sexes, gender discourse in Islam concerns itself mainly with issues of power and inequality caused by patriarchal hierarchies that over time were strengthened by the religious, social, and cultural environment. Only recently and in a few places (e.g., in the writings of the American scholar Scott Siraj al-Haqq Kugle [2003]) has gender discourse started to include marginalized women and men, such as homosexuals. However, Muslim scholarship has always recognized the existence of hermaphrodites, who upset the division between the sexes.

Those involved in contemporary gender discourse operate from various ideologies. Their activities are manifold and include creating public awareness concerning gender issues, reforming laws and policies that are detrimental to women, and rediscovering women's histories. They find their inspira-

tion in varying sources, from the United Nations' Universal Declaration of Human Rights to Islamic jurisprudence (*fiqh*). This movement has become wide-ranging, and it addresses, for example, women's health issues, domestic and public violence against women, the rights of women to education and work, democratic rights, children's rights, and human rights. In many Muslim countries some of these issues are still considered taboo.

The perceptions of Islam of those involved in gender activities are not monolithic. What binds most of them, however, is that their religion provides the core existential ground for their understanding of gender discourse. The theological reinterpretation of authoritative religious texts is in most cases fundamental to developing new understandings about gender in Islam. Revision of male-centered readings is unavoidable, since these were often influenced by the surrounding culture, which led to a gap between women's reality and the teachings of the Qur'an that promote gender equality.

Since many Muslim countries continue to be governed by regimes that fail to provide basic needs for their citizens, those fighting for gender equality often face insurmountable difficulties. In spite of this reality, critical voices have come into existence that connect across the Muslim world, nowadays via the internet; they are developing a discourse on human rights, religious rights, and civil society that seeks social change for men and women, and empowerment of women in the public and religious sphere. The awarding of the 2003 Nobel Peace Prize to the Iranian Muslim human rights activist Shirin Ebadi (b. 1947) was a victory for all involved in this new gender discourse, for she is a living example of their agenda.

HISTORY OF THE STUDY OF GENDER CONCERNS. The process of rethinking the roles and rights of women in Islam first surfaced at the end of the nineteenth century in disparate places within the Muslim world. At that time, calls for changes in women's conditions emerged in countries ranging from Iran, to India (Bengal), Egypt, and Turkey. Women's voices (among others, Aisha Taymour [1840–1902], from Egypt) became heard via poems, stories, and essays, while women and men (e.g. Rokeya Sakhawat Hossein [1880–1932], from Bengal) started to demand education for girls and to question the practices of veiling, segregation, and polygyny. Qāsim Amīn's *Tahrīr al-Mar'a* (The liberation of woman, 1899) stressed the need for women's education. As Leila Ahmed (1992) has pointed out, these objectives were not pursued for the sake of women, but served as a tool to resist colonialism and to transform society into modernity.

The Egyptian Muslim scholar Muḥammad 'Abduh (1849–1905) entered the debate when he called for a correct understanding of Islam by returning to its original sources—the Qur'an and *ḥadīth*. He interpreted these sources using the method of *ijtihād* (independent investigation of the religious sources), and when necessary he bypassed the teachings of the four legal schools of Islam, the *madbhabs*. Using this method, described as *modernist*, Muḥammad 'Abduh placed

Qur'anic verses about women's comprehensive veiling and seclusion, polygyny, and the husband's unilateral divorce rights in their original social and cultural contexts, and he argued that because those contexts had changed, their application in modern times had to be adapted as well.

'Abduh's new hermeneutical methods presented an alternative to traditionalist scholars (*'ulamā'*), and opened the way for equality between men and women based on Islamic teachings. The *'ulamā'* used the method of *taqlid* (that is, to follow the opinions of established scholars of the Muslim past), and applied the teachings of jurisprudence (*fiqh*, the interpretation of the *sharī'ah*) via the four *madbhabs* of Islam. Traditionalist scholars are still prevalent in many Muslim countries, and their views on women often resemble those of Islamist or fundamentalist Muslims. They teach gender-polarized roles, male authority in the public realm, complementary roles for men and women, and equity but not equality in women's roles vis-à-vis men.

By the early twentieth century, the intellectual, educational, and philanthropic activities of upper- and middle-class Muslim women translated into organized associations, such as the Egyptian Feminist Union set up by Huda Sha'rawi (1879–1947), who in 1923 publicly removed her veil upon her return from a gathering of the International Women's Alliance in Rome. Union members were the first women who wrote about women's rights based on the Qur'an; they argued that veiling the face was not a Qur'anic injunction.

In 1917, the Muḥammadīyah-related organization for women called 'Aisiyah started in Indonesia, with efforts focusing on the religious and secular education of women. Education and journalism were women's most successful ways to advance their cause. Periodicals discussed the veil, women's segregation, Islamic rules, and issues of personal status law, including polygyny. Men welcomed these activities because they considered women to be actors in the national struggles for independence, and in many Muslim countries (Egypt, Turkey, Indonesia), the gender discourse on women remained connected to issues of secular nationalism and national advancement until these countries gained independence from colonial powers.

Around the 1960s, the focus of gender discourse changed. After independence, social reforms by the new nation-states provided education for all and a certain degree of legal protection for women via reformed legal codes. The 1979 revolution in Iran and the rapid transformation of economic and social structures in many Muslim countries triggered a process of redefining Muslim identities that led, among other things, to the ascendancy of Islamist groups. Saudi Arabia encouraged this development by using its oil wealth to spread the puritanical Wahābī interpretation of Islam. Gender discourse regressed in countries where Islamists took control of the government, such as Iran, Afghanistan, Pakistan, Bangladesh, and Sudan. For example, the government of Omar Hassan al-Bashir (who came to power

in 1989) in Sudan dismissed women from public employment and limited their mobility by enforcing the rule that they must be accompanied by a *mahram* (male guardian), and the Taliban in Afghanistan prevented women's access to education and healthcare altogether.

Concurrent with these new forces, the feminist movements that emerged in several countries started to take new directions, more or less becoming divided between secular and Muslim activism. Women benefiting from state-provided education acquired the intellectual tools to address issues, such as women's legal position, health, and work, without the assistance of men. In 1972, the Egyptian medical doctor Nawal El Saadawi published the book *Al-mar'a wa al-jins* (Women and sex), which dealt with sex, religion, and women's circumcision. The book raised awareness about women's sexual oppression across the Muslim world, unleashing intense reaction, especially from the conservative *'ulamā'*.

Programs emerged that focused on local customs particularly detrimental to women. Women in such African countries as Egypt, Sudan, Ethiopia, Djibouti, Ghana, and Kenya started to question the practice of female genital mutilation, while honor killings became an important topic in the gender debate in Egypt, Jordan, Palestine, and Iraq. These practices were virtually unknown in Southeast Asia and most parts of sub-Saharan Africa. Other groups in Algeria, Nigeria, Iran, Sudan, Pakistan, and Malaysia started to fight the imposition of *sharī'ah* and research its consequences for women.

Awareness about gender issues was also raised by international initiatives such as the United Nations Convention on the Elimination of All Forms of Discrimination against Women (1979) and the United Nations Decade for Women (1975–1985). Later, the International Conference on Population and Development in Cairo (1994) and the World Conference on Women in Beijing (1995) helped boost networking among women activists all over the Muslim world.

Seminal works by Muslim scholars such as Fatima Mernissi and Leila Ahmed analyzed the conditions and mechanisms of women's oppression and exposed the ambiguity of interpretations of Islamic texts and jurisprudence. These writers called for just readings of those texts, readings that were sensitive to the point of view of women. Several women scholars of Islam took up this challenge and the phenomenon of Muslim feminism was born. The early modernist movement positioned women's rights within a program of renewal in Islamic society. It removed many roadblocks for women; however, as several scholars have observed, it did not fundamentally change unequal gender relations and left the system intact. Others argued that by ignoring jurisprudence, the modernist focus on the Qur'an failed to address the underlying law system of the *fiqh* that directly ruled women's lives, for example, in matters of marriage and divorce. In order to bring about fundamental changes in the Muslim injunctions concerning women, they proposed a re-

interpretation of the rules of the *fiqh*, which were formed in the ninth century and are susceptible to flaws caused by human intervention.

By the 1990s, broadly speaking, three approaches of feminism (*nisā'īyyah*) shaped Muslim discourse: secular, Muslim, and Islamist.

Secular feminism. *Secular feminism* is an amorphous term in the Muslim world. It seldom indicates religious indifference (or atheism), although feminists such as Nawal El Saadawi have insisted on their secular identity. *Secular* refers to those whose activism is not directly based on the Islamic tradition but who struggle for women's rights within the framework of universal values and principles. To them, religion should be restricted to the private and spiritual domains. It also carries reference to the type of activities undertaken. Secular feminists do not have a unified, clear agenda, but in many Muslim countries their efforts to improve women's conditions are met with accusations that they are tarnishing local culture and religion with Western ideas.

To be secular does not necessarily mean "rejecting Islam." In order to underscore this reality, Margot Badran (2002) speaks of "feminism with Islam."

Most women's organizations in the Muslim world are secular in approach, and their agendas are manifold. For example, the Arab Women's Solidarity Association, formed in 1982, which gained headlines in 1992 when it had to move from Egypt under pressure from Islamists, focuses on eliminating honor killings. Egypt is also home to the FGM (female genital mutilation) Task Force, formed in 1994, as well as a coalition of about seventy organizations and individuals under the umbrella of the Egyptian Commission for Population and Development. Some movements congregate under the umbrella of human rights: for example, Women for Women's Human Rights in Turkey. There are too many such organizations to mention, but they form important sources of women's empowerment and civil resistance. For example, the Turkish Women's Movement against Sexual Assault was the first group in an Islamic country to offer legal assistance to victims of sexual assault. The Network of Women Living under Muslim Laws in southern France and the Pakistani Action Forum, founded in 1981, were formed in response to the introduction of the *sharī'ah* penal code in various countries. Apart from these grassroots activities, political parties often have women's branches that pursue a specific agenda to advance conditions for women in certain areas of life.

Muslim feminism. The term *Muslim feminism* emerged in the 1990s and was used in the writings of Muslims to describe a new gender paradigm. It refers to Muslim men and women who ground their methods and ideas in Islamic knowledge, and most of them articulate that the true spirit of the Qur'an teaches gender equality and social justice. Some Muslim feminists, however, follow the view that women and men complement each other rather than being

equal. Muslim feminists reinterpret the Qurʾān in a woman-centered fashion using the methodologies of *ijtihād* and *tafsīr* combined with the tools of social science, psychology, history, anthropology, medicine, and so on. In doing this, as Azza Karam (1998) has observed in Egypt, women who wish to engage in the official discourse of the ‘*ulamā*’ have met with great resistance.

Some scrutinize the various formulations of *sharīʿah* (Lebanese Aziza al-Hibri, Pakistani Shaheen Sardar Ali), or re-examine the *ḥadīth* and Qurʾān (Moroccan Fatima Mernissi, Turk Hidayet Tuksal, Riffat Hassan, and Asma Barlas, the latter two originally from Pakistan). In principle, these feminists follow modernist methodology. This has caused the pendulum to swing back to traditionalist methodologies that focus on *fiqh*. Muslim scholars such as Khaled Abou El Fadl argue that true gender equality has been obscured by the patriarchal thinking of Islamic jurisprudence as consolidated in the ninth century. A narrow modernist focus on the Qurʾān and *ḥadīth* only avoids the real problems that are inherent to the legal system. Hence the advice of Kecia Ali that “progressive Muslims cannot afford to ignore jurisprudence” (2003, p. 182). This approach requires extensive knowledge of the Islamic sources.

In Indonesia, the traditionalist organization Nahdlatul Ulama started to apply this method in the 1980s to promote an agenda of justice and social change. Inspired by Abdurrahman Wahid, religious leaders teamed up with feminists to organize the first Islam-based program in the world that advocated women’s reproductive rights. Women’s groups related to Nahdlatul Ulama, such as the Yayasan Kesejahteraan Fatayat, followed this method, focusing on other aspects of Islamic rights for women. This trend also emerged in Iran with representatives such as Hojjat al-Islam Seyyed Mohsen Saʿidzadeh (who is prominent in Ziba Mir-Hosseini’s *Islam and Gender*, 1999), and the journals *Farzanah* and *Zanan*.

These neo-traditionalists are especially interested in reinterpreting the regulations of Muslim personal status law, which is part of the *sharīʿah* and regulates marriage, divorce, and inheritance. They argue that, for example, in order to address the inherent inequalities within the marriage contract, one has to understand the mind frame of the jurists who interpreted the *sharīʿah* and saw it as a contract of ownership of the husband over the wife in exchange for a dower. This involved rights of the husband over the wife (he could, for example, forbid her to leave the house). Neo-traditionalists argue that it does not advance the cause of women to narrowly focus on the rights assigned to her by the Qurʾān and ignore the fact that, based on jurisprudence, the majority of Muslim men still see marriage as a modified contract of ownership.

Many Muslim feminists strive to align the Qurʾanic teachings about justice with those of universal human rights. The agenda of this philosophy includes such issues as women’s reproductive rights, violence against women, domestic violence, homosexuality, prostitution, democratic

rights, and the rights of children and of religious minorities in Muslim countries. Some of these issues still form unspeakable taboos in many parts of the Muslim world. Ironically, all groups discussing gender, from Islamists to progressive feminists, agree that the greatest challenge facing women in Islam is their lack of religious expertise. Where women have gained access to Islamic institutions of higher learning, they can participate in the rereading of the classical religious texts that traditionally were interpreted by men. Women with the required religious knowledge have moved into positions of religious authority, and they have become scholars of Islam and judges. This is still rare in most Muslim countries, and can mainly be witnessed in Indonesia and the United States, and increasingly in Iran.

Examples of Muslim feminist organizations are the Sisters in Islam in Malaysia; Rifka Annisa, Indonesia’s first Islamic-based center for women suffering from domestic violence; the women’s branches of Muḥammadīyah and Nahdlatul Ulama; and groups centered around the Iranian journals mentioned earlier.

Islamist feminism. Islamist feminism has grown with the onset of Islamist organizations; it stresses complementarity between men and women, rather than equality and male authority over women. This approach bases women’s rights on the Islamic *sharīʿah* and favors an Islamic state. Islamists especially reject what they consider to be influences from the West. Both male and female Islamists extol a woman’s role as mother and wife. They rely on the ideas of male ideologues, such as the Egyptian Sayyid Quṭb (1906–1966), who viewed the family, with a division of labor between husband and wife, as the basis of society. This philosophy led, for example, to women in secular Turkey demanding the right to wear the veil in universities and public offices, and to Muslim women in former Soviet republics calling for the application of polygyny as a tool for achieving women’s protection and for allowing the surplus of women to give birth and fulfill their roles as mothers. This view, however, does not mean that all Islamists reject political roles for women.

Islamists claim a return to the fundamentals of faith and to a pure tradition unpolluted by modern influences. Islamists can be intolerant of other views and seek power to impose their ideology by, among other things, controlling women and their sexuality, especially their reproductive faculties. This is accomplished by, for example, denying them access to any form of birth control. Mernissi (1991a, pp. 98–99) has observed that since the 1980s Islamism has displayed a growing obsession with women’s bodies and social roles, and has promoted texts by misogynist Islamic scholars from the thirteenth through nineteenth centuries. Some Islamists promote practices such as polygyny and early marriage as a means of preventing immorality. For the latter reasons the Shīʿī practice of *mutʿah* (temporary marriage) has increased in some Sunnī communities. In order to safeguard women’s modesty, Islamism imposes dress codes that vary from the face veil of *hijāb* to the *chador* that covers a woman from head to toe.

Younger Islamists such as Heba Raouf (b. 1965) from Egypt argue that while being faithful to their roles as wives and mothers, women can occupy the highest public functions as long as they are qualified. Egypt produced the earliest and most prominent women Islamist activists: Zaynab al-Ghazālī (b. 1917), who in 1936 set up the Muslim Women's Association for Islamist women, lauding women's family duties and obligations; Safinaz Qazim (b. 1939), who vigorously campaigns for an Islamic society; and Heba Raouf, who is active in the Muslim Brotherhood–Labor Party Alliance, writes a woman's page in its newspaper, *Al-Sha'b*, and is one of the founders of the *Islam Online* website. These activists combat women's oppression and see Islam as the main tool of liberation. They publicize their views via writing, campaigning, and advising, while considering Western feminism as divisive and individualistic.

GENDER DISTINCTIONS IN THE QUR'ĀN. The Qur'ān presents a double message concerning the status and rights of women. It considers women and men equal in their religious observance (Qur'ān 33:35); they can both, for example, lay claim to paradise (40:8). The Qur'ān also states that both males and females share the same origin because they were created from the same spirit (*nafs*) (4:1, 6:98, 7:189). The Qur'ān does not acknowledge original sin because both Eve and Adam were equally tempted by Satan (7:20–22). It refers to husband and wife as each others' "garments" (2:187), recognizes a mother's burden of childbirth (46:15), and comments on the age of weaning (2:233). In principle, the Qur'ān assigns to women considerable rights: they retain their financial independence after marriage and are entitled to maintenance, a dowry, and inheritance.

However, these egalitarian texts have counterparts, such as verse 4:34, which some interpret as allowing men to beat their wives in cases of disloyalty, disobedience, or ill conduct. Prejudiced interpretation of this verse can lead to severe domestic violence. The same verse contains the much debated phrase that "men are in charge of [or the protectors of *qawwāmūn 'alā*] women because God has given the one more than the other, and because they support them from their means." Traditionally this verse has been explained as referring to a man's superiority over women. However, feminist interpretation has pointed out that *qawwāmūn* refers to the fact that men should provide for their wives in their role as mothers. Apart from the Qur'ān there is an abundance of traditions, alleged to be from the Prophet, that confirm women's secondary position, stating, for example, that the majority of those entering hell are women.

The original interpreters of the Qur'ān were Middle Eastern men. Muslim feminists argue that these interpretations, as transmitted via the *fiqh*, are replete with instances where universal teachings from the Qur'ān were confused with local customs and values. Muslim feminists consider this to be most detrimental to women. Like the Qur'ān, most of the *fiqh* discussions are in principle ungendered; apart from distinctions with regard to menstrual purity, both men

and women follow the same rules of purity, and there are no gender distinctions in the ritual obligations. The main gender differences concern the areas of marriage, divorce, inheritance, and child custody. Together these form the so-called personal status law, which is part of the *sharī'ah*-based Muslim family law that is widely debated in the Muslim world.

MUSLIM FAMILY LAW. Muslim family law is based on Islamic law, and in principle it is meant to improve the status of Muslim women. Early Egyptian reformers reinterpreted the law, trying to adhere to classical legal principles in the light of modern conditions, in an attempt to improve women's rights. The most widely followed code used to be based on the Hanafī school. Important contemporary changes in the legal code allow women to enter stipulations in the marriage contract and to protect their position in case of divorce. Tunisia's code (1957) provides the strongest rights for women; it bans polygyny, repudiation (*ṭalāq*), forced marriage, and the requirement that male guardians act on behalf of women. Many countries follow a middle course by including a minimum age for marriage, expanding women's rights to divorce, and restricting a man's right to polygyny. Because legal changes still comply with local patriarchal cultures and the demands of the conservative religious establishment, the rules of the personal code remain a central issue in the gender debate. For example, based on the Qur'ān (2:226–237; 65:1), many countries preserve the husband's unilateral right to divorce while Muslim women can only apply for a divorce on specific grounds.

With the rise of Islamism, there have been attempts to abandon family legal reforms under the banner of "return to the *sharī'ah*." For example, after the revolution in 1979 in Iran, reforms introduced by the previous regime—increasing the minimum marriage age, restricting men's access to polygamy and unilateral divorce—were repealed. After Muslim activists protested that the new laws caused women great injustice and suffering, many of the abandoned reforms were brought back gradually. In 1992, the Iranian parliament amended the divorce laws to give women better protection in marriage, and in 2002 it increased the minimum age of marriage for girls from 9 to 13.

A few differences stand out between classical Sunnī and Shī'ī law. Divorce is more difficult under Shī'ī law because it requires the presence of two witnesses in pronouncing the divorce statement (*ṭalāq*). While Sunnī marriage only ends through death or divorce, Shī'ī law allows a man to contract an unrestricted number of temporary marriages. Activists consider this union detrimental to women because it leaves them without legal rights; for example, they are not entitled to the husband's inheritance.

Shī'ī inheritance law, however, is more favorable towards women. While Sunnī law in the absence of a son allows the daughter only half of the estate, or in some cases gives precedence to agnates, Shī'ī law allows a daughter to inherit the entire estate.

RELIGIOUS AND DOMESTIC OBSERVANCES IN SUNNĪ AND SHĪʿĪ ISLAM. Domestic Muslim observances vary greatly depending on local cultures and traditions. Women are expected to fulfill the duties that are believed to form the basic obligations of all believers. They have to suspend these duties when ritually impure because of the flow of blood. Apart from that, the Qurʾān and *fiqh* do not differentiate male and female rules of worship. Depending on the country, a woman's state of impurity leads to restrictions in mosque attendance and recitation, learning, or touching of the Qurʾān.

The roles of women in religious or cultural-religious activities vary greatly over the Muslim world. Women's activities can include participating in religious vocations as preachers, specialists of the Qurʾān, or teachers of religion, or leading folk religious events such as the *zār*, a trance ceremony of healing for those who are possessed by spirits. Women also fulfill semi-religious roles in rituals connected with pregnancy, birth, and early childhood.

Although women live secluded in some places such as Bangladesh, northern Nigeria, and northern Sudan, this practice is virtually unknown in other regions. Ideas about seclusion shape women's public role in society, sometimes resulting in the denial to women of the most basic education.

Depending on the local culture, a certain code of conduct for women is identified with Islamic religion. Handbooks concerning duties and good manners instruct women, for example, on how to behave toward their family, neighbors, and other social contacts. Some teachings of such books gained a degree of religious authority after they were adopted into local *fiqh* texts. The moral code for women varies accordingly; while in the Middle East issues of honor and virginity are central to a family's reputation, they do not feature as such in public discussions in Southeast Asia.

MOSQUE ATTENDANCE. According to a *ḥadīth*, the prophet Muḥammad condemned those who sought to prevent women's attendance at the mosque. He also encouraged women to attend the liturgical events associated with the two main Islamic festivals: ʿĪd al-Fiṭr after Ramaḍān, and ʿĪd al-Aḍḥā after the *ḥājj*. In addition, women who were menstruating or unmarried and kept from public view were allowed to attend mosque (although menstruating women did not perform the prayer). Later scholars banned young women from mosques, eventually extending this rule to older women as well, fearing deleterious consequences and quoting a *ḥadīth* that a woman's prayer is more meritorious when performed at home.

Women's mosque attendance differs from country to country and may even differ between rural and urban areas. Although in the main mosque in Mecca men and women pray together, mosques mostly have separate women's sections, and few women attend the Friday prayers. In some cases, women have built their own houses of worship (Indonesian: *musholla*; Arabic, *muṣallan*); Indonesian Muḥammadiyah women built *musholla* as early as the 1920s.

Nowadays, many mosques include women who preach (but not the Friday sermon) and teach Islamic lessons for other women. Islamic boarding schools for girls (in Indonesia, Pakistan, Iran, and Iraq) provide extensive religious education and opportunities for women to worship, with women leading daily ritual and *tarāwīḥ* prayers during Ramaḍān. Women preachers are gaining popularity due to information technology. Cassettes with their sermons are widely sold, and women preachers even appear on television. Some women who have memorized the Qurʾān are allowed to recite on television and in mosques during nonritual gatherings. For example, in Indonesia Maria Ulfa, who won the 1980 national Qurʾān reciting competition, regularly appears on television.

WOMEN ŠUFĪS, SAINTS, AND SANCTUARIES. In the formative period of Islam, women had distinctive roles in Sufism as disciples of Šūfī masters or as masters themselves. The most famous of them was Rābiʿah al-ʿAdawīyah (d. c. 801) whose poems and sayings were published in 1928 by Margaret Smith (2001). While her legacy is well-known, many Šūfī women have vanished from history as their voices were incorporated into men's writings, but Muslim women scholars such as Rkia Elaroui Cornell have begun to rediscover them. In spite of their muffled voices, there have always been women who were regarded as saints, such as the Afghan mystic Hazrat Babajan (d. 1931) and Hagga Zakīyya of Cairo (1899–1982). Believers were healed through their prayers or consoled by their gift of clairvoyance.

Women's participation in Šūfī rituals diminished as public opinion accepted traditions about their spiritual and intellectual inferiority to men. Concurrent with the diminishing of their role in official Islamic discourse, with some exceptions, women were pushed to the margins of Šūfī rituals and ceremonies. At the same time, women have continued to play significant roles in rituals surrounding the graves of saints, and women have traditionally been the majority of those visiting shrines to seek blessing or help in solving such problems as infertility. But they do not participate in the *dhikrs*, and they confine their activities to seeking blessings or participating in public festivals (*maulids*). In some places in South Asia women can be itinerant singers or poets and keepers of saints' shrines. Some women saints remained famous after death; the shrines of Zaynab, the Prophet's daughter, in Cairo, Lalla Imma Tifellut in Algeria, and Mai Supran in Punjab continue to attract visitors.

THE IMPACT OF GENDER STUDIES. The impact of gender studies in the Muslim world is undeniable and expresses itself in numerous ways. After gaining independence from colonial powers, Muslim nation-states strove to strengthen the public and private position of women by revising personal status law, improving women's education, and providing opportunities for work.

The modernist approach to interpreting the Qurʾān as proposed by Muḥammad ʿAbduh influenced numerous scholars throughout the Muslim world. Interpretations sen-

sitive to the needs of women forced the traditional ‘*ulamā*’ to reconsider their positions. Both sides defended their respective points of view in a plethora of books on gender and Islam. Muslims on all sides of the spectrum started to rediscover the social and historical contexts in which the interpretation of the Qurʾān and *fiqh* were developed. Some have proposed that the way to avoid the influence of negative human interference with the holy texts is to discern the divine, universal principles from within the human interpretations that arose from a cultural and geographic context.

Voices of women have penetrated the public domain and have influenced the academic study of Islam and general attitudes concerning women. On the Aljazeera television channel women are partners in debates about Islam. Women have also set up their own Qurʾān study groups and begun searching for their own histories. They have even started to participate in the reinterpretation of holy texts, the final bastion of male power.

In spite of the fact that gender debates remain controversial in many parts of the Muslim world, their influence reaches beyond issues of male and female. Muslim feminists such as Riffat Hassan, who wrote about equality and justice in Islam, are now engaged in studies on the compatibility between Islam and basic human rights. In some countries (e.g., Indonesia) advocates of women’s rights also increase awareness of such issues as economic conditions and poverty, the plight of prostitutes, and debates on democratic rights. As women have become active agents in reflecting on the rules and guarantees granted by Islam, they have triggered a wave of self-reflection that can range from progressive Islam to Islamist expressions. Although in some countries women have had to cope with setbacks in the gender debates, their higher levels of education have opened doors that can never be closed. Women are not only recapturing their own history, they are also shaping it, now that they can read for themselves what the Qurʾān and the holy texts teach. This means that in spite of contrary images in some countries, gender discourse has changed and is still profoundly changing Muslim societies in all parts of the globe.

NELLY VAN DOORN-HARDER (2005)

GENDER AND RELIGION: GENDER AND ZOROASTRIANISM

The extant documents produced by members of the faith and the nontextual materials influenced by Zoroastrian beliefs substantially represent religious manifestations of male discourses. Those writings and items helped contour feminine parameters within a society that was largely patriarchal. Yet, if the present is any guide to the past, religious issues must have been viewed and interpreted differently by members of each gender. Likewise, ritual acts must also have been practiced differentially by members of each gender because some female-specific rites still persist despite lack of sanction by the magi or male clergy who oversee most canonical ceremonies.

HISTORY OF THE STUDY. When gender issues were initially addressed in scholarly studies of Zoroastrianism, a picture quite different to societal realities was generated. Zoroastrianism was depicted as a faith embodying many Enlightenment and Protestant values, whose male and female followers had long been equal. The female gender was routinely held in a most dignified position, and any negative statements or imagery were deviations from orthodox tradition. So when women were discussed, directly or *inter alia*, the tone reflected laudation for gender equality. That conclusion became well entrenched in scholarship and continues in more recent studies. When it has come under question, there have been staunch defenses tinged with apologetics. There are more traditional discussions of gender-related questions, as well. Some such works are broadly based. Others focus on narrower themes such as the Achaemenid period, the Sassanid dynasty, and modern times or on such issues as religious archetypes, rituals, iconography, incest, law, clothing, and art.

On the other hand, certain recent expansive examinations—on trends in Zoroastrianism, contemporary Parsi communities in India, and doctrines of purity and rites of purification—are informed by gender theory and methodology. Furthermore, studies on misogyny within scripture and theology, differential ritual requirements and actions, access

and goals of education, and present-day demographic patterns are gradually reshaping the parameters for research on Zoroastrianism. So too are studies on classical stereotypes influencing views of ancient Iranian society.

INFLUENCE OF DOCTRINE. Gender-based aspects in Zoroastrian doctrine are multifaceted, complex, and at times contradictory. Study of the religion's ancient history through its earliest texts is complicated by the Avestan language's root nouns being grammatically feminine. But the religion's earliest practitioners began anthropomorphizing abstract concepts and attributing biological or natural genders to those concepts. As a result, the divine and demonic spirits of Zoroastrianism display gender-specific characteristics that shaped how devotees viewed their societies and the roles of men and women.

The basic doctrinal dichotomy within Zoroastrianism is between *asha* (*arta*, *ardā*) or "order" equated to "righteousness," opposing *druj* or *drug* (*druz*) "confusion," equated to "evil" (*Gāthās* 30.3–6, 45.2). *Asha* is grammatically neuter, whereas *druj* is feminine. Two primordial eternal entities are believed to have chosen between order and confusion: Spenta Mainyu (Spēnāg Mēnōg) or the holy spirit, equated with Ahura Mazda (Ōhrmazd), "the wise lord," or creator—now regarded as God—for making the religiously appropriate choice, and Angra Mainyu (Ahreman, Ahriman, Ganāg Mēnōg), "the angry spirit," or destroyer—now regarded as the devil—for not deciding rightly. The grammatical gender of Ahura Mazda/Spenta Mainyu, and Angra Mainyu/Ganāg Mēnōg were transformed into biological gender as male during personification of the concepts that each represented—and depicted as such on rock reliefs commissioned by Sassanid monarchs.

Druj also became a designation for demonic creatures in general—that is, those spirits who had chosen to do harm—and for specific manifestations of evil. In its broadest sense, that word was utilized both in masculine and feminine grammatical gender; yet many of the *druj* were regarded as female. One specific materialization was supposed to be Druksh Nasush (Druz ī Nasush), or the ghoul of corpses and carrion. Zoroastrians in antiquity, the Middle Ages, and premodern times clearly viewed her as a demoness who preyed upon humans, polluted their bodies after death, and spread that pollution to the living. Grammatically feminine, Druksh Nasush would still be denounced in the late seventeenth century as "the most impudent, constantly polluting, and deceptive of all the demonic spirits" (New Persian *Farziyāt nāme, Book of Obligatory Duties*, p. 10). By the eighteenth century, the hold that *druj* had on Zoroastrian diabolology had begun to decline in the wake of science. Yet even today, the notion of *druj* persists as a symbol of evil among Zoroastrian generally, while Druksh Nasush is still regarded as a potential source of impurity that vitiates rituals.

Another fundamental aspect of doctrine where gender dichotomies emerged was the heptad known as the *amesha spentas*, or holy immortal spirits linked to Ahura Mazda.

Among them, Haurvatāt (Hordād, Khordād), "integrity, wholeness," and Ameretāt (Amurdād, Awerdād), "immortality, rejuvenation," were the female spirits thought to counter thirst and hunger plus heal and restore all good creatures to order, through their personification of liquids and vegetation respectively (*Tishtar Yasht* 8.47, *Zamyād Yasht* 19.96). By medieval times their gender affiliation began shifting toward neuter entities whose function was society's "protection through wholeness and immortality" (*Dēnkard*, "Acts of the Religion," ninth century, pp. 415, 416). Spenta Ārmaiti (Spandarmad, Aspandarmad), who personified "holy devotion," serves as the spiritual mother of life and an ensurer of fertility. Veneration of all three—Haurvatāt, Ameretāt, and Spenta Ārmaiti—still remains central to both male and female Zoroastrians.

Opposing the *yazatas*, spirits worthy of worship in Zoroastrian belief, stand *daēvas* (*dēws*) or demonic spirits allied with Angra Mainyu. Prominent among those evil entities is thought to be Āzi (Āz), "concupiscence, lust." Although bearing a grammatically masculine epithet, "demon-spawned," in the *Avesta*, by medieval times Āzi had come to be regarded as the mistress of demonic hordes that ravage humanity. By then, she was firmly associated in Zoroastrian cosmogony with the downfall and demise of the primeval androgyne named Gayō Maretan (Gayōmard). She was denounced by medieval Zoroastrian writers as the "most malcontent and rapacious" and "most oppressive of demonic spirits" whose "covetous eye is limitless." Only with the advent of modern science has the Āzi's hold on Zoroastrian piety declined to simply a word for greed, paralleling use of the term *āz* in New Persian. Perceived as even more dangerous an embodiment of lust was a *daēva* known as Jahikā (Jēh). Mentioned only briefly in the *Avesta*, during the Sassanid period (third to seventh centuries) she was transformed by the magi into the mistress and assistant of Angra Mainyu. It was the Jēh who supposedly reinvigorated Angra Mainyu after the initial battle with Ahura Mazda, then introduced lust to humanity. Therefore, this demoness came to be viewed as the primordial *jēh*, "whore."

IMPACT OF MYTHOLOGY. The dualism between order and confusion that shaped both doctrines and gender perceptions left its imprint on cosmogony, apocalyptic, and eschatology as well. The first human couple, Mashya, or man, and Mashyāna, or woman, who were born from Gayō Maretan's semen, are believed to have succumbed to lying and worshipping *daēvas*, resulting in their damnation. Mashyāna, in particular, was blamed for the act of demon worship. This tale, influenced in part by the biblical story of Adam and Eve, resulted in words of admonishment directed at all women—past, present, and future—attributed to Ahura Mazda: "If I had found another vessel from which to produce man, I would never have created you." That rebuke also urged women to be wary of Jahikā because "sexual intercourse is for you [women] like the taste of the sweetest food." Jahikā was said to have mated with Angra Mainyu to "defile women

so that they in turn could corrupt men and cause abandonment of appropriate duties.”

Such ideas justified a medieval misogyny. Therefore, although men were enjoined that the ideal women were physically persons whose “head, buttocks, and neck are shapely, feet are small, waist is slender, breasts are like quinces, eyes are like almonds, and hair is black, shiny, and long,” they were also urged to ensure that wives were “chaste, of solid faith, and modest” (*Pahlavi Texts* 117).

Negative attitudes toward women based on glorification of female physicality and denunciation of female sexuality shaped Zoroastrian ideas on the afterlife. According to one late Young Avestan text, the soul of a righteous Zoroastrian will be greeted by his religious *daēnā* (*dēn*), “conscience,” in the form of “a beautiful girl, glorious, well-shaped, statuesque, with prominent breasts” who would lead him to paradise or heaven (*Hadōkht Nask* 2.9), a theme echoed in Middle Persian exegesis. The soul of an unrighteous Zoroastrian would encounter his *daēnā* “in the form of the naked Jahikā” who was described as a noxious creature. Beauty and sensuality became rewards, together with palaces, gardens, and fountains, for those men who upheld *asha* while alive. No premodern scriptural or exegetical passages refer directly to women encountering their *daēnās* after death. Only in modern Zoroastrian thought, with the breakdown of gender-particular ideas about the afterlife to more abstract notions, has it become acceptable to assume that women too encounter their consciences as manifestations of good or bad deeds.

Ancient Zoroastrian writings about the afterlife also included the idea of judgment after death preceding consignment to heaven, limbo, or hell. During medieval and premodern times, Middle Persian commentaries and miniature paintings on the inhabitants of heaven and hell presented a disproportionate number of women condemned to suffer at the hands of demons in hell until the final resurrection. Those images reinforced the notion that women were more prone to evil behaviors, including sexual profligacy, adultery, impurity, idolatry, sorcery, and strife. The popularity of such ideas began to attenuate only in the twentieth century, as part of a larger decline in diabolism and religious-based misogyny among economically, educationally, and socially upward-mobile Parsis and Irani (or Iranian) Zoroastrians.

CONSEQUENTIAL REGULATIONS AND RITUALS. Owing to the impurity associated with corpses through the demoness Nasush, and because Zoroastrians regard earth, fire, water, and earth as holy creations by Ahura Mazda, bodies would not be buried at land or sea nor cremated. So, the magi developed a disposal system in which human corpses would be given final rites, including purification, then exposed—initially in remote areas, subsequently in funerary towers open to the sky—until the flesh had been desiccated or consumed by wild animals (as first noted by Herodotus, the fifth-century BCE Greek historian). These practices continued among many Zoroastrian communities until the eighteenth century but have declined—except in large Indian cit-

ies like Mumbai and in the Pakistani city of Karāchi—in favor of inhumation because of an attenuation in diabolism and an inability to practice exposure of corpses in Iran and Western countries.

The origin of a female biological process, menstruation, came to be explained by medieval diabolism rather than physiology. Menstruation was said to have begun when Jahikā revived Angra Mainyu in hell after the devil had been initially defeated by Ahura Mazda. Upon being comforted by Jahikā, the devil “arose from his stupor, kissed her face, and the pollution called menstruation appeared on her” (*Bundahishn* 4.5). Using lust as a tool, Jahikā supposedly transferred menstruation to Mashyāna and all subsequent generations of women. Consequently, menses became in religious terms a periodic sign of women’s affliction by evil. Likewise, because blood and afterbirth tissue were also feared as falling under Drukhsh Nasush’s control and becoming pollutants, procreation—which was otherwise regarded as a religiously meritorious function for bringing new devotees to life—took on negative aspects. To prevent women from ritually polluting men and precincts during menstruation and after childbirth, they were isolated, then underwent purificatory ablutions. These customs have largely fallen into disuse in modern times.

The most dramatic consequence of associating female physiology with demonology was the exclusion of women from all ranks of the magi or hereditary male clerical class. The barrier against ordination into the priesthood still remains firm worldwide. Texts have even suggested that married women fulfill obligatory prayers through daily service to their families. As a result, women’s religiosity has been channeled into female-specific rites such as the ever-popular visiting of *pīrs*, or shrines, and making of *sofres*, or votive offerings in Iran. Among the Parsis of modern India, women religious leaders have emerged within the Ilm-e Khshnum mystical movement and, further from the mainstream, in a Nag Rāni, or cobra queen, cult.

CHANGING GENDER RELATIONS WITHIN SOCIETY. In ancient times, authority within the home lay with the elder male of each household. It was prayed that a wife would give birth to illustrious sons, a practice continued by traditionalist Parsis and Irani women today through recitation of the *Hōm Yasht*, “Devotional Poem to Haoma.” By the age of fifteen, all boys and girls would be initiated into the religion and regarded as adults for religious and legal purposes—still standard among all Zoroastrian communities worldwide. At that age, girls were also regarded as marriageable. Marriage involved obtaining the consent of a woman’s parents. During the Achaemenid period (seventh to fourth centuries BCE), the *taumā*, or family, continued as the central focus of domestic life. Women’s participation in Zoroastrian religious rites before fire altars is attested by very occasional images on seals. Yet women were not always required to follow the faith of their husbands. So non-Zoroastrian women married to Zoroastrian noblemen seem to have continued their own devo-

tions. Private intergender relations in Parthian (third century BCE to third century CE) and Sassanid (third to seventh centuries) times seem to have conformed largely to previously established tenets. Women were expected to have remained virginal until marriage. Induced abortions were forbidden because children were regarded as new devotees. Sexual intercourse with a pregnant woman was forbidden in case harm occurred to the developing fetus.

In late antiquity and the early Middle Ages, Zoroastrian women were generally not required to veil themselves when venturing outside their residences. Nor did the art of the Sassanid period depict specific women with overt sensuality—they were usually depicted modestly wearing flowing robes. However, generic representations of women on metalwork and stonework in particular were highly sensual, with figures often partially clad or nude. Under the laws of Sassanid Iran, based on medieval Zoroastrian beliefs, each woman's consent had to be obtained at least technically prior to a marriage contract being entered into on her behalf by a male guardian. A wife's legal standing within her husband's household depended, among other factors, on her own social class prior to marriage, the stipulations of the marriage contract, and whether she gave birth to sons for her husband. Ranks among wives included those of *pādixsbāy*, or "lawful, main wife"; *chagar*, or "dependent, levirate wife"; *xwasrāy*, or "self-sufficient, independent, wife" who had chosen her own husband; and *ayōkēn*, or "ancillary wife," specifically a woman whose male children through the marriage were legal successors to her father or brother. While polygyny as a religiously sanctioned practice was attested among Zoroastrians from ancient times, the evidence for polyandry, on the other hand, is so meager as to demonstrate its observance was highly unusual among Zoroastrians. Polygyny was phased out by the faith's leaders during the early 1900s as a practice no longer in conformity with modernity.

Most taxing on medieval Zoroastrian women were the beliefs equating menstruation with impurity, and the isolation practices involved. These seem to have been some factors that influenced Irani Zoroastrian women's conversion to Islam between the eighth and thirteenth centuries CE. Another factor was that of Zoroastrian women adopting the faith of their Muslim husbands.

Attitudinal change, spurred on by secularization and westernization, has produced new challenges for orthodox religious practices. One main issue of recent concern to Zoroastrians is the status of children born to women married to men of other faiths. The traditional, patriarchal structure of Zoroastrianism has generally accepted the children of a Zoroastrian father and non-Zoroastrian mother, but not vice versa. Many Zoroastrian women in the United States, Canada, England, and Australia have begun raising their children as Zoroastrians, taking them to religious classes and fire temples and having them initiated into the faith by liberal magi. Such initiations are not recognized by a majority of Zoroastrian clerics and laypersons in India, however, where the issue remains highly controversial.

The status of Zoroastrian women, first among the Parsis and then among the Iranis, began major reorientation through access to Western-style secular education in the nineteenth century. Initially, girls were educated at home by tutors. School-level education became widespread for both genders in India by the early 1900s and quickly extended to the university level. Among the Parsis in particular, English became the language of rapidly urbanizing and secularizing families. By 1931, 73 percent of Parsis women were literate. By the 1980s, 68 percent of Parsis women held university degrees. Educated Parsis women began entering the economic workforce, mingling with both Zoroastrians and non-Zoroastrians on a regular basis. Similar processes took place among Iranis in the twentieth century. These women have begun choosing professional careers over marriage and domesticity, resulting in close to a quarter of them remaining unmarried by the 1980s. Both within the traditional homelands—Iran and India—of Zoroastrianism and within the new diaspora communities in the West that formed in the twentieth century, women remain the predominant sustainers and transmitters of religiosity from one generation to the next. More Zoroastrian women (75 percent) practice religious rites daily than do men (60 percent). Additionally, through prominent roles in the lay leadership at communal centers and through service as editors of the most widely read and influential Zoroastrian newsletters—such as *FEZANA Journal* in North America and *Parsiana* in the Indian subcontinent—they play a major function in directing attention to socioreligious issues impacting on both genders and in championing religious reform.

GENDER AND RELIGION: GENDER AND ANCIENT NEAR EASTERN RELIGIONS

The remarkable continuity of Mesopotamian civilization can be traced in its literature, public architecture, and city planning from the late fourth millennium BCE, when, almost simultaneously, urbanism and writing appeared, to 323 BCE and the death of Alexander the Great in Babylon. Mesopotamia's economic base was agricultural, but the social foundation was the city, embodied by the temple of the city god or goddess. Prosperity depended on a two-way relationship in which divine benevolence was encouraged by correct human ritual and ethical behavior. The largest temples owned much of the city's lands and employed thousands of people. From the end of the third millennium, kings asserted enough control over temples that important religious establishments became political extensions of the palace. The religious lives of common people, however, revolved around the patriarchal family's ancestral spirits and patron god or goddess.

The earliest writings from Mesopotamia are in Sumerian, a linguistic orphan unrelated to any known language. By the middle of the third millennium, however, Akkadian, a Semitic language related to Hebrew, began to displace Sumerian. Cuneiform, a wedge-shaped script written on clay tablets, was invented by the Sumerians but adapted for writing

Akkadian. Some half-million cuneiform tablets recovered from ruined cities, supplemented by archaeological discoveries, have been the main sources of information about ancient Mesopotamia.

Ugarit on the northeastern Mediterranean coast is one of several Bronze Age cities in north Syria (also among them are Ebla, Emar, and Alalakh) with rich caches of cuneiform texts written in Akkadian or Ugaritic, a Semitic language related to Hebrew. Each Syrian city and its temples reflect a mix of Mesopotamian, Hittite, north Syrian, and local traditions. In Syria as in Mesopotamia, family religion centered on a patron deity and ancestral spirits.

GENDER IN ANCIENT NEAR EAST STUDIES. A systematic study of gender and religion in Mesopotamia or northern Syria has yet to be written. Assyriology, the technical (albeit imprecise) term for the study of ancient Mesopotamia, has been only minimally affected by gender analysis. Beyond innate conservatism, the abundance of available data, especially textual data, can daunt the most stouthearted of Assyriologists. The genealogy of gender studies in Assyriology begins in the 1970s with feminist scholars who focused on the retrieval of women's lives in textual and archaeological sources. Studies of women at Ugarit and other north Syrian cities have barely ventured beyond this level of inquiry largely because so much data is still lacking. Although only men are mentioned as praying at Ugarit, one cannot conclude women did not pray, for example.

Since the late 1980s a growing number of Assyriologists have demonstrated an awareness that gender and sexuality are human creations, or "constructions," operating within a social matrix of power relations, a matrix in which religion is an active ingredient. Assyriologists have begun to question their own scholarly assumptions, categories, and methodologies, acknowledging that even ostensibly objective works—the standard dictionary of Akkadian, for example—exhibit gender bias. As such, gender theory promises to open up new directions of inquiry. For example, gender is not marked in Sumerian; however, in literary Sumerian, goddesses use a distinct dialect called *Emesal* whose dynamics might be clarified by the application of gender theory. Archaeologists, too, have set aside their earlier confidence that artifacts are value-neutral, for they are aware that ideology and biases of many types inform the questions asked in the process of excavation and data analysis.

THE NATURE OF THE EVIDENCE. Textual sources for goddesses and the religious experience of women in Mesopotamia include traditional mythological texts, liturgical hymns and temple liturgies, god lists, offering lists, omen lists, votive dedications, seal inscriptions, and personal and place names. With far fewer texts from north Syrian cities such as Ugarit, Alalakh, or Emar, the application of gender theory there constitutes a greater challenge.

Writing was invented to manage and control economic records. However, almost simultaneously, writing became an instrument for managing and controlling society. Thus, texts

preserve traditions about deities and kings, but they do not necessarily represent the experience or mindset of the average Mesopotamian or Ugaritian whose temples were run by the city's upper class. Cuneiform texts generally reflect the concerns of an exclusive group of male elites from royal, administrative, and/or land-holding circles who either could read themselves or employed scribes. Few women, even in the third millennium when the goddess Nisaba was the patron of scribes, were literate, and still fewer became scribes. Nevertheless, the same administrative system that produced the texts affected every level of society.

Archaeologists' interests have in the past mirrored the subjects of the texts they excavated: temples and palaces, city plans and fortifications, elite burials. However, beginning in the 1960s, archaeologists began to investigate the ecology of the cultivated countryside, diet, domestic architecture, and gendered space in the farmhouses, city neighborhoods, temples, and palaces. These new avenues of inquiry complement the data from cylinder seals, amulets, votive sculpture, and figurines that provide a visual record of gendered imagery in the ancient Near East. Mesopotamian grave goods, personal ornament, body image, and nudity have all been subjects of gender theory-based studies.

GODDESSES, WOMEN, AND POWER. Twentieth-century scholars under the influence of Sir James Frazer's *The Golden Bough* believed that ancient Near Eastern religion centered on a "cult of fertility" characterized by lurid sexuality, an impression informed more by the fantasies of male scholars than by the data, although, to be fair, this view derived ultimately from biblical discourse against non-Israelite religion and from Herodotos. Fertility is now considered to be one of many interwoven principles in ancient Near Eastern religion, just as scholars recognize three interconnected spheres of religious activity: temple/priest religion, royal religion, and folk/popular religion. Of the three, popular religion seems to have been the primary locus of female religious activity. Also untenable today are claims (uncritically endorsed by the contemporary "goddess movement") that ancient Near Eastern goddesses could be equated with one original divine "Mother," or that all goddesses' powers derived from their biology. Across the ancient Near East, both male and female deities bestowed fertility.

Four deities of one family consistently lead Mesopotamian god lists: An/Anu (father and sky god); Ellil/Enlil (god of kingship and executive action); Enki/Ea (god of wisdom and fresh water); and Inanna/Ishtar (goddess of sexual love and war). In the third millennium there were a multitude of prominent goddesses besides Inanna, some with family-based roles such as mother (e.g., Ninhursaga), spouse (e.g., Ninlil), or sister (e.g., Geshtinanna). Other goddesses supervised activities such as grain cultivation, sheep herding, writing, weaving, and pottery and jewelry making. Gula was one of several healing goddesses (male gods brought pestilence); divination, purification, and supplication all had patron goddesses. The queen of the underworld was Ereshkigal, Inanna's sister.

In the old Akkadian period (2350–2150 BCE) some 39 percent of city deities were female. Yet by the middle of the second millennium, most of the leading goddesses seem to have been eclipsed by male gods. The tradition of goddesses as creators did not disappear, but, except for Inanna/Ishtar, male deities came to dominate the world of the gods. The reasons for this are debated; a leading theory connected the transformation with the rising power of Semitic populations whose chief deity was the warrior storm god. More recently, scholars suspicious of ethnic arguments and aware of the role gender can play in the discourse of power have looked instead to changes in political structure with the rise of militarism. When Sargon of Akkad (2334–2279 BCE) united the Mesopotamian cities into the first empire, a new imperialist/royalist discourse, in which human women and goddesses had less influence, entered the Mesopotamian consciousness. The exclusion of women may relate to their exclusion from warfare; Inanna/Ishtar's continued prominence is explained by her association with war. It is unclear, however, whether the disappearance of goddesses from texts of this period reflects a change in popular perception, or a conscious attempt to shape a new "imperialist" ideology.

The three most prominent north Syrian goddesses in the second millennium texts—Asherah, Anat, and Astarte—are usually described as fertility goddesses. Asherah was consort of the high god, El; Anat, sister and consort of the storm god, Baal, was also goddess of war. Baal was also paired with Astarte. At Ugarit, unlike in Mesopotamia, the sun was a goddess, Shapshu, who was associated with wisdom and life and death transitions and also controlled human fate and ruled the world of lesser divinities. The goddess Usharaya supervised oaths, justice, and divination, the latter an exclusively male profession in the human realm. Ugaritic texts mention only royal women as sacrificing or otherwise officiating in the cult, reinforcing the impression, from a probably skewed text-base, that official religion reinforced the ideology of royal religion.

As the second millennium progressed in Mesopotamia, even royal women lost their former high positions in the cult, just as so many goddesses seem to have lost theirs. Inanna/Ishtar's ongoing popularity has been attributed not only to her martial qualities but also to her gender-transgressive nature; in her physical violence, insatiable sexual appetite, freedom from pregnancy, and flouting of patriarchal family mores, the divine Inanna defines by negative example the proper behavior of mortal women in a patriarchal society—a dynamic that also underlies the Greek Amazon tradition. In first-millennium Assyria, for example, Ishtar was preeminent, but women were not. In the visual record, too, women appear less often.

The Babylonian *Enuma elish*, the most famous Mesopotamian creation myth (dating to the second half of the second millennium), serves as a central witness to this so-called marginalization of the goddesses. This was an essentially political myth exalting Babylon, its god Marduk, and kingship.

In the myth the gods are created first, beginning with a sexual mingling between the goddess/matrix Tiamat (salt water) and the god Apsu (fresh water). In the second part of the myth, the active younger generation of gods disturbs the more passive Apsu and Tiamat and, roused to anger, Apsu tries unsuccessfully to destroy them. Tiamat marches out with her army to avenge her spouse's defeat. As the other younger gods quail, Marduk taunts them for fearing to fight a woman, and he becomes king by single-handedly battling Tiamat to the death. His victory is narrated in language reminiscent of rape, with phallic arrows flying into Tiamat's mouth to pierce her distended belly. Marduk creates the ordered universe from Tiamat's carcass and sets up a barrier to confine Tiamat's waters, now considered to be the embodiment of chaos. Goddesses are absent from all the creative activity that follows the killing of Tiamat. Tiamat, acknowledged at one point in the myth as "she who gave birth to them all," may represent the religious order of Mesopotamia's past when goddesses and women enjoyed more power.

Nevertheless, it is far from clear whether Mesopotamian worship of powerful female deities correlates with higher status for mortal women. On the one hand, in Sumer each city god or goddess was "married" to a human of the opposite sex called an *En* who administered the temple. There is also evidence for women (notably Enmebaragesi of Kish) ruling in their own name rather than as wife of a king. On the other hand, according to Sumerian and Akkadian royal ideology, the king ruled by virtue of being the chosen spouse of Inanna, a case of a man empowered by a female deity. A woman could achieve priestly power and status as *En* of a prominent male—not female—city god. Enheduanna, daughter of Sargon of Akkad and perhaps the first named author in history, was the *En* of Nanna, the moon god at Ur, and supervised his temple. On a contemporary votive disk from Ur she oversees a ritual, accompanied by a male priest and two male attendants. Yet Enheduanna's authority, like that of her *En* grandnieces, must also be assessed through the lens of her royal status and Sargon's political policies.

Sacred marriage (*Hieros gamos*), perhaps the most famous Mesopotamian religious ritual, represented an empowering union of the human and the divine. It served politically to demonstrate the king's leading role in mediating social and political harmony, of which fertility was one essential aspect. Into the early second millennium the ritual may have involved an actual act of sexual intercourse between the king and a human representative of the goddess Inanna. However, the failure of scholars, despite their best efforts, to determine the identity of Inanna's surrogate suggests the ritual may have been a poetic metaphor. In later centuries the sacred marriage rite flourished, but as an explicitly symbolic encounter centered on the cult statue.

Several Ugaritic ritual texts (all of the second millennium) hint at a symbolic sacred marriage between the king and Pidray, daughter of the royal family's patron deity, Baal. The marriage, as in Mesopotamia, served the political purpose of

affirming an alliance between the human and divine royal families. In Emar, the Nin-Dingir priestess, chosen from a leading family, "married" the storm god, but only through symbolic ritual gestures, and here, too, the marriage ritual reinforced social integration among the elites of the city.

SEXUALITY, FERTILITY, AND CREATION. In Mesopotamian mythology creation comes about by procreation or by manufacture. The *Enuma elish* includes both techniques. In the earliest Sumerian sources of the third millennium, creation resulted when the god An (heaven) and the goddess Ki (earth) "talked" to each other; a slightly later text celebrates the goddess Nammu (subterranean waters) as the creator "who gave birth to the universe." Another story tells how Enki created the world by modeling bits of clay, the same technique used by mother goddesses Nammu and Aruru to create humans. Different Mesopotamian myths credit various male and female deities with the creation of humans; in the *Enuma elish* the god Ea (Sumerian Enki) fashions humans to free the gods from work. Two Sumerian myths, "Enki and Ninmah" and "Enki and Ninhursag," describe a fertility contest between Enki and a mother goddess. The first story ends by acknowledging the necessity for semen and womb alike, but Enki, the male principle, triumphs in the second.

In Syria, too, both goddesses and gods are associated with creation and fertility. Although no Ugaritic creation myth has yet been identified, El was creator of all and Asherah was progenitress of the gods. In mythic texts Baal and El rather than fertility goddesses bestow children on their human (male) protégés. Anat, like Inanna/Ishtar, transgressed gender conventions with her extravagant violence and exuberant sensuality.

Among gods and humans fertility depended upon male sperm and divine blessing, yet goddesses and female spirits ensured safe pregnancy and childbirth in both Mesopotamia and Ugarit. Mesopotamian divination texts and women's petitionary prayers for pregnancy—to deities of both sexes—express an anxiety that sin on the woman's part has caused her infertility. On the other hand, men were likely to blame their own sexual dysfunction on women, perceiving dangers from female power out of proportion to women's marginal status; the problem could be the Evil Eye, a female bird-like creature, or it could be gender-inappropriate behavior, such as the woman on top in sexual intercourse, or it could be witchcraft, a power associated with women as well as foreign men or other socially marginal groups.

A careful reading of mythological texts reveals distinctive sexualities for men and women. The lyrics of the Sumerian Love Songs celebrating the courtship of Inanna and her consort, Dumuzi, arguably speak in a "woman's voice," employing a feminine discourse of sexuality that exults in the pleasures of the vulva. Popular (male) expressions of sexuality are more evident. In Sumerian texts gods (notably Enki/Ea) satisfy their supercharged sex drives by raping goddesses. Therapeutic metaphors based on animal sexual behavior pre-

dominate in male potency incantations. Frustrated by love, a man could resort to sexually explicit love magic, and despite claims to the contrary in modern anthologies, no such texts can be interpreted unambiguously as expressions of female desire.

THE COMPLEXITIES OF “PATRIARCHAL” CULTURE. In Mesopotamia and Syria the patriarchal family (*bit abim*—“father’s house”) was the essential construct of social order, operative no less in the king’s court or divine households. Families were patrilinear (descent traced through the father) and patrilocal (the wife lives with her husband’s family). In contrast to the modern concept of the person as an independent individual, each man or woman shared a family group identity, a notable factor when considering gender and sexuality. The *paterfamilias* maintained and managed the family’s property, which included the sexuality and fertility of its women as well as family honor, an essential, if intangible social currency. Although society condemned a wife who engaged in sex outside of marriage, married men could resort to prostitutes of both sexes without legal sanction.

Marriage, even the sacred marriage, was a social and economic contract between two families. Religion played a role in the wedding ceremonies, most visibly when the bride relinquished her own family gods and ancestors along with her family identity to realign herself with her husband’s family and gods. The veilings that ritualized the bride’s transformations demonstrate how gendered clothing (the veil) symbolized both identity and male–female dynamics within a marriage. Similarly, at Emar, the “marriage” of the Nin-Dingir priestess to Baal required a veil, shaving, and anointing.

Gender roles followed expected patriarchal trajectories, with women’s lives centered on home and family. For most women, status and security depended on marriage and fertility, and in the Mesopotamian textual record, women’s religiosity is most apparent in these contexts. Across the ancient Near East, women were particularly visible and active in connection with birth and death: as midwives skilled in magic, medicine, and purification; as birth goddesses and spirits; as female mourners, both familial and professional. By being “not-male” and thus possibly less “human,” women possessed a liminality that could mediate between modes of being. They participated in but did not lead the domestic cult of the family god or goddess and spirits of foremothers and fathers. Yet these spirits and divinities required feeding with food prepared by family women, a phenomenon which points to complex interconnections between food, religion, and gender.

Public position and power were primarily male prerogatives, although in the third millennium and in the Old Babylonian period (early second millennium) women are more visible in the textual and visual record and seem to have enjoyed greater access to recognized positions of power. Only men inherited prominent priestly offices or owned a share in lucrative priestly prebendaries (“time-shares”). Nevertheless, women comprised a sizable portion of the workforce in

vast temple and palace complexes that functioned essentially as wealthy extended households. These institutions were usually headed by men, but women—both enslaved and free—contributed as agricultural workers, craftspeople, and cultic functionaries, particularly dancers and singers. (At Ugarit, nonroyal women appear only as cult musicians.) Temples also supported destitute widows and the poor who had “given” themselves to the deity. How these women’s “professional lives” should be understood in the context of the patriarchal family is unclear.

Whereas scholars formerly saw female “sacred prostitutes” all over the Near East, they now detect a complex range of female cultic offices whose exact nature remains elusive. Terms once thought to refer to “sacred” prostitution are now understood to describe women who worked in the cult establishment. Some may have been prostitutes not because the cult required ritual sex but because of monetary vows women, even married women, had made to the deity in exchange for a pregnancy, cure from illness, or other favor. Some female cult functionaries, such as the Sumerian female *Ens* or Old Babylonian *naditu* priestesses, were “dedicated to the god” and barred from childbearing.

In Mesopotamia and north Syria, only men were professional incantation priests, exorcists, or diviners, although there were female prophets at Mari. Male practitioners scorned the female diviners, necromancers, and other women skilled in magic arts to whom unsatisfied clients or the poor could turn. (Although the practice of folk religion by women at Ugarit or Emar is probable, no texts mention them.)

The dynamics of gender and sexuality in Mesopotamia often preclude simple binary oppositions such as male–female, wife–prostitute, or domestic–public. Categories for men and women might seem fixed in Mesopotamian legal texts, but they were more nuanced in real-life situations. For example, the stereotyped *harimtu* of literature (e.g., the harlot Shamhat in *Gilgamesh*) was in real life not a prostitute but a single woman independent of the patriarchal household and thus a person whose sexuality was not regulated. Her nonconformity to conventional gender expectations comes across in the primary texts as disturbing and problematic.

Gendered status fluctuated for men and women along a spectrum of innate and acquired characteristics including age, marital status, class, and race. At birth a Mesopotamian child’s gender had to be ritually fixed by placing a spindle and hair ornament before a baby girl, a baton or axe before a baby boy. Besides male and female, Mesopotamian gender categories included also the castrated male and even a non-male/nonfemale. Female homosexual activity is unrecorded, but male homosexual intercourse is well attested, although treated in omen and legal texts with ambivalence. Male functionaries in the cult of Inanna/Ishtar (goddess of love and war) practiced ritual transvestitism. Cross-gendering discourse makes a striking appearance in Assyrian treaty curses

and war rhetoric: defeated soldiers are said to “turn into women”; from the male perspective, a man’s gendered identity turns upon the public perception of his honor, itself a social construction.

IMAGERY. In Mesopotamian art, images of the male and female bodies—clothed or unclothed—reflected and reinforced concepts of gender. In the third millennium, somewhat squat-figured nude or seminude male priests pour libations or carry offerings while a clothed woman priestess/official (*viz.*, the Warka Vase; the Enheduanna disk) may preside but not visibly “act.” The priests are gendered male by their genitalia or distinctive short skirt; the women not so much by the subtle swell of breasts as by clothing and hairstyle. For male priests, the shaved head and beard signal ritual purity, a state from which women were excluded by virtue of their biological “lack.”

Depending on the context, male nudity could mean purity, quasi-divine heroism with a touch of the erotic, or humiliation and death. From the later third millennium on, the tall, nude, bearded male hero with rippling muscles who kills monsters is physically indistinguishable from male gods in “Battle of the Gods” scenes, hence the convention of clothed but godlike, “hypermasculine” kings who mediated between humans and the divine (e.g., the Naram Sin stele or Assyrian royal stelae). Across the ancient Near East, the only passive/submissive nude males are defeated, dead, and/or captive enemy soldiers whose bodies lack the careful definition of divine or “noble” males.

Votive portrait statues commissioned by elite Sumerian women to serve as substitute selves in the temple before the statue of the deity embody elite Sumerians’ ideals of conventional womanhood. Like male votives, they are clothed with no emphasis on sexual attributes. Male votives are more plentiful, but access to the god seems to have been equally available to these male and female stand-ins. Only Inanna/Ishtar (or associated goddesses) was shown nude or semiclothed. Rather than fertility *per se*, female nudity seems to have represented the mysterious divine power (Sumerian: *me*) of eroticism and sexuality, arguably a female-gendered symbol of access to or proximity to the divine. Unfortunately, no one has yet satisfactorily determined whether the countless frontally nude female figurines of popular culture represent goddesses or mortals. Textual evidence confirms that images of female nudity could serve to stimulate male libido. By contrast, when a woman or goddess is clothed, her breasts and torso are hardly articulated at all. In the first millennium, clothed women appear only as captives on Assyrian reliefs, in whose gendered visual language “woman” signified humiliation.

Although Ugarit and north Syria shared close cultural affinities with Mesopotamia, their artistic repertoire was Egyptianizing. Ugaritic bronze figurines of the seminude “smiting god” (probably Baal) recall pharaonic images that shared Mesopotamia’s visual discourse of heroic maleness. Kings, both human and divine, are clothed. Female imagery

consists primarily of small pendants and plaques with a frontally nude female figure reminiscent of the Egyptian goddess Hathor but of uncertain identity, although she is often identified as Asherah.

CONCLUSION. Precisely because modern Western culture conceives itself as the direct heir of biblical and classical cultures, feminists and gender theorists in these fields have pursued an open agenda of exposing—“deconstructing”—ancient discourses of oppression in order to identify similarly unacknowledged discourses in the contemporary world. The perceived remoteness of Mesopotamia from modern culture (with the exception of the contemporary goddess movement) may diminish the urgency with which similar issues are addressed by assyriologists; nevertheless, representations of femaleness, maleness, and even transgenderedness within the complex cultures of Mesopotamia and north Syria have a role to play in the ongoing human quest for self-understanding.

GENDER AND RELIGION: GENDER AND ANCIENT MEDITERRANEAN RELIGIONS

Scholars reading ancient texts from a feminist stance have long identified the problematic of studying women's experience through men's records of history and male accounts of religious beliefs and practices. In naming the problem, or deconstructing how history has been presented, the way is made open to allow for reconstructions that are not necessarily inscribed with the "male gaze." Knowledge of the ancient world is fragmentary not only because it lacks a credible picture of women's lives but also because there is a void when it comes to those who belonged to anything other than an elite class or to specific geographical areas. In attempting to overcome these restraints, a variety of methodologies need to be employed to read the variety of ancient ethnographic evidence available to reconstruct women's experiences. The method of "reading against the grain," for example, can be employed to examine prohibitive legislation aimed at women's behavior and ask what were women actually doing that prompted such prohibitions. In addition certain types of evidence (e.g., epigraphic data from tombs, art, and artifacts; domestic archaeological finds) become central rather than peripheral. These can be studied as primary sources alongside written texts.

A pioneering classical scholar in the field of gender and religion and in the use of alternative methodologies for research was Jane Ellen Harrison (1850–1928). She argued, for example, in her original thesis (1882) that the evidence from ancient Greek vases offered commentaries on myth and ritual comparable with that of Homer's *Odyssey*. As second-wave feminism began to make inroads into the academic world from the late 1960s and to gain credence in the disciplines of the humanities and social sciences, studies of gender in the ancient Mediterranean world began to emerge. The publication in 1975 of Sarah B. Pomeroy's social history text *Godesses, Whores, Wives, and Slaves: Women in Classical Antiquity* set a milestone for the subject and clearly demonstrated how religion cannot be separated out and studied in a vacuum apart from other matters, family, economics, politics, law, and so on. Religion in all its forms was an intrinsic part of life, intertwined with the seasons, birth, marriage, and death, and it resonated with the hopes and fears of men and

women throughout their lives. *The Roman Mother* by Suzanne Dixon and *The Family in Ancient Rome: New Perspectives* by Beryl Rawson are examples of subsequent studies that demonstrate this intimate relationship among religion, family, and society. Mary Beard's work on Roman religion, particularly the cults of Magna Mater and Vesta, marks the convergence of the "third wave" in terms of gender study and classical studies. Informed by contemporary gender theory, Beard has uncovered the complexity of gender roles and how they were constructed, both male and female, in antiquity and demonstrated their divergence from the bipolarity of gender as played out or at least recounted in modernity.

In attempting to reconstruct women's lives in the ancient world in the light of sparse hard evidence, religious cults and their accompanying myths and rites represent a vital piece in the jigsaw. Religions reflect the experiences and expectations, fulfilled and unfulfilled, of their adherents and thus present mirror images of particular times and places, albeit on a cosmic scale. Religion thus can offer another insight into women's lives in the ancient world as the rich variety of beliefs and practices in effect act out society, politics, and legislation of the day.

The rich variety of beliefs and practices that make up the religions of the ancient Mediterranean reflects a long relationship of intermingling of the Egyptian, Hellenistic, and Roman worlds. This intermingling can be traced to the ascendancies of the great empires of the ancient world, beginning with Alexander the Great in the fourth century BCE and the engagement between Egyptian and Hellenistic cultures and seen to culminate in the rich tapestry of religion that was woven during the zenith of the Roman Empire. Some of the oldest beliefs and practices of the ancient Mediterranean stem from Egypt, and these reappear throughout ancient history as they are adopted and adapted for new contexts across the various empires.

GENDER IN THE ANCIENT WORLDS. When one examines Egypt itself, one discovers that the evidence is particularly scarce regarding the lives of women in ancient Egypt except for those at the pinnacle of this highly stratified society. In the time of the Middle Kingdom (2125–1650 BCE), for example, the wives and mothers of the pharaohs could wield significant influence and power, as witnessed by the evidence from their tombs. From the early dynastic period the pharaoh was identified with the sky god Horus and the son of the sun god Re. His Great Royal Wife was fully human, and her role of producing the royal heir was of supreme importance. The future king would be endowed with the unique divine-human nature that would enable him to act on behalf of both gods and human beings. In the time of the New Kingdom (1650–1069 BCE), Queen Hatshepsut succeeded in claiming the throne on the death of her husband and half brother. She based her claim to the throne on her own divine birth, which is detailed on the walls of her mortuary temple at Deir al-Bahri. The mural shows how the god Amun-Re, in the form of her father, Thutmose I, approaches her moth-

er Ahmose, who conceives the goddess-king, the female Horus. Hatshepshut was depicted in the same manner as a male pharaoh, with a bare chest and short skirt (a guise used in the Hellenistic period to depict Cleopatra VII).

Less specifically, ancient Egypt was a rich resource for later empires that wished to broaden their religious as well as territorial boundaries, and the Roman Empire in particular was eager to import Egyptian religious practices into its cities across the empire and into the heart of Rome itself. Thus Egyptian myths with their accompanying cults offer windows into the lives and expectations of men and women not only in ancient Egypt but also throughout the ancient world. Their influence lasted until accession of Christianity as the dominant religion (but also beyond that time, when their influence on that religion is taken into account). A key example is the myth of Osiris and Isis, which can be traced back at least to the time of the first dynasty (beginning of the fourth century BCE).

Within the Hellenistic world, women in ancient Greek society led secluded lives, residing in the private domestic sphere and protected from the public arena. In the upper echelon of Greek society women who were not slaves and who were married to a head of a household led lives of seclusion away from male company, spending most of their time in the *gynaikonitis*, the women's quarters. However high their social ranks, women had no political voice or means of participation as citizens. Religious rituals, however, were an exception to the norm and provided a public function for women and a context in which they could contribute to the welfare of the city-state. Moving down the social ladder, one finds the sexes mingling more freely in the public arena, where female slaves, for example, worked alongside and served men. Foreign women worked as entertainers for male audiences, providing music, dancing, and escorts as well as sexual pleasures.

In contrast to at least the women of high social rank in Greek society, women living under the sociopolitical system of the Roman Empire enjoyed relative freedom. In the third century BCE the notion of "free marriage" as one of the legal forms of marriage was introduced. In this new system a woman remained attached to her former family, she retained her own property, and she had the freedom to divorce her husband. This is in contrast to earlier types of marriage in ancient Rome, *in manu*, for example, which literally means "in the hand of," that is, a wife was under the full control of her husband. A Roman wife could have a high profile not only in household management, where she had the task of overseeing male servants and slaves, but also in the education of her children. Prior to coming of age, sons and daughters of noble families were educated together, but as adulthood approached a sharp distinction was made between the sexes when boys were prepared for citizenship and a public career. Roman society remained patriarchal to the core, but in negotiating its boundaries, women within the nobility could realize a limited emancipation that blurred the distinction be-

tween domestic and public. A woman could develop a home-based industry in a larger household, for example, managing slaves in the production and distribution of cloth. Furthermore the Punic Wars of the third century BCE resulted in a huge death rate among men of the Roman Empire and left many women the sole heirs of the father's, brother's, or husband's estate. However, a noblewoman's power, wealth, education, and relative freedom were a world away from a slave woman's powerlessness, poverty, illiteracy, and servitude. For many women living in Roma society, life was little different from women in ancient Greek society, and thus the myths and rituals of the gods and goddesses resonated with their life experiences and their hopes and fears.

DEMETER AND PERSEPHONE. One goddess cult of ancient Greece that belonged to the great mystery religions and was particularly popular with women, although not exclusively so, was that of Demeter. Athenians celebrated the mysteries of this great cult at Eleusis as well as in the ancient Greek colonies of Sicily and southern Italy. This religion tended to remain limited to the religious experience of Greeks and Greek colonists possibly because the central myth and ritual of the cult reflected so closely the lives and expectations of women in Greek society. This feature is illustrated by the *Homeric Hymn to Demeter*, composed most probably in the late seventh century or early sixth century BCE at Eleusis, which describes a young girl's journey from puberty to womanhood. It describes how Demeter grieves for her daughter Persephone (also called Kore, "maiden"), who was first abducted by Hades and taken to the underworld and then given to him in marriage by Zeus. The stricken mother deserts Olympus, the sphere of the gods, for the world of mortals and goes to Eleusis, where she asks the people to build a temple for her. Unappeased, Demeter brings devastation to crops and cattle, ignoring the intercessory pleas from Zeus's divine envoys. She asks only for a glimpse of her daughter. Zeus has no choice but to agree to Demeter's terms, and he sends his messenger Hermes to the underworld to negotiate with Hades. Hades agrees to allow Persephone to see Demeter. Persephone pours out her heart to her mother and is consoled. Zeus decides to let mother and daughter remain together for two-thirds of each year, but Persephone must return to Hades for the remainder of the year. Content, Demeter allows the earth to be fertile once more, and the people of Eleusis continue their worship of her.

The importance of the Demeter and Persephone myth to Greek religion has been thought to stem from its connections with the seasons and the crucial issue of fertility. The centrality of female characters reflects the obvious links between women and birth. The depiction of marriage as beginning with rape is a common feature of Greek myth, as is the traumatic separation of young daughters from their mothers. The fathers are usually the instigators of this painful process, and although the anguish is well documented, marriage itself as the normative institution within society is not questioned.

THE ROMAN EMPIRE. The actual content of the Eleusinian mysteries remains hidden from the scrutiny of modern schol-

ars, but there is evidence for many religious activities and devotions that focused on Demeter, some of which continued in popularity down into the Roman Empire. The Demeter myth reinforces traditional Greek practices regarding women's lives, in particular their rite of passage from daughter to wife, mirrored by the Demeter myth. The myth is a commentary on the way life is in Greek society, and by remembering it in the religious rites and devotions associated with it, the values of that society are reinforced.

Whereas the Demeter and Persephone devotions served the needs of women progressing from girlhood to womanhood, the devotions to Artemis and Hera focused on protection and success in childbirth and these cults were prohibited to slaves and foreigners. The third age of womanhood is represented by the goddess Hecate, regarded in negative terms as a haggish, cronelike demon and in positive terms as a goddess who could protect, grant success, and act as an advocate.

In contrast, the Greek myth of the Amazonian women seems then to contradict one general presumption concerning the lives of Greek women. It is about women who reject marriage and the confines of domesticity. It describes a society that prefers matrilineal descent to patrilineal and a society in which liberated women even engaged in active warfare. In its earliest forms the myth may have functioned as a mirror of a preclassical society. For instance, in the archaic epic of the sixth century the Amazons are described as female warriors who, with their Queen Penthesilea, who was killed by Achilles, battled against Bellerophon and Herakles. However, the status of the Amazon stories clearly changed by the fifth century as they began to fulfill a role within Athenian society of representing an inversion of the natural and preferred status of women. The Amazon women are now depicted as the female counterparts of the centaurs, the mythical, bestial, and violent rapists. Their representations in later centuries depict how alien such ideas would be to the patriarchal nature of Greek society. They are said to live in a totally female society, only venturing out for sex so they can conceive children. Only female babies are welcome, male offspring are offered for adoption or castrated or even killed. Diodorus Siculus, writing in the first century BCE, describes how Amazon men behave like women—tending home and children and cultivating women's skills, such as weaving. Thus the Amazonians are held up as the antithesis to Athenian society.

ADONIS AND DIONYSOS. The popularity of the Demeter and Persephone myth and the religious devotions associated with them as goddesses testifies both to the close bonds between women in Greek society and to how society sacrificed those bonds to the "higher" cause of marriages arranged by men. The participation of women in the male cults of Adonis and Dionysos could suggest a certain dissatisfaction among women with their given status and role. Neither Adonis nor Dionysos belongs to the essentially Greek hierarchy of gods, the Olympians; both have foreign pedigrees. Adonis has a Semitic name and is regularly associated with the dying and rising deities of the ancient Near East. In the male cults gods

were closely associated with goddesses, Adonis with Aphrodite, his consort, Dionysos with Semele, his mother. Some of these cults had ceremonies designed to encourage women to be uninhibited. Dionysos, for instance, was the god of wine, and his worship naturally provided occasions for uninhibited behavior. Rituals associated with Dionysos range from the rather sedate Lenaia (from *lenai*, another name for Dionysos's devoted maenad), in which food and drink offerings accompany the ceremonial entry of the god's mask into the sanctuary for worship, to the more erotic Anthesteria, the winter wedding festival between Basilinna, the wife of the *archon basileus*, and Dionysos.

THE RITES OF THE BACCHAE. More extreme, however, were the rites recorded in *The Bacchae*, a play written as early as the late fifth century BCE by Euripides (c. 480–406 BCE). The Bacchae are the women followers of Dionysos, and they are also known by the more pejorative term *maenads*, from the verb *mainomai*, meaning "to be driven mad." The myth of Dionysos is recounted in many ancient sources, but Euripides drew the classic description of Dionysiac ecstasy, the source for accounts in later centuries.

According to Euripides' *Bacchae*, Dionysos introduced his rites in Thebes to avenge the injustices perpetrated against his mother Semele, who had been dishonored by the lies spread about by her sisters, Agave, Autonoe, and Ino. On hearing that Semele was pregnant, the sisters discounted her own truthful account that she had conceived through Zeus and instead told the story that she had been impregnated by a mortal. They said that her father, Cadmus, had persuaded her to lie and say it was Zeus. This, the sisters explained, was why Semele had been struck dead by one of Zeus's thunderbolts. However, Dionysos explains that his mother had in fact been the victim of the jealous Hera's thunderbolt. This was shot while his father Zeus grabbed him from his mother's womb, saving him from being a victim of Hera's jealous plot.

The revenge of Dionysos for his mother's honor is directed at his aunts. He induces insanity on them, and they and bands of women followers dance off to the countryside, wearing fawn skins with snakes around their necks, leaves and branches in their hair, and each with a wand (*thyrsos*) in her hand. They feed wild animals with their breast milk before they behave wildly—ripping animals apart, wrecking villages, abducting children. They are impervious to the missiles hurled at them by the men of the villages, who suffer terrible wounds from the women's wands. There are many such details recounting the anarchic behavior of the Bacchae as they maniacally devour the countryside.

Dionysos's revenge reaches its climax when his aunt Agave dismembers what she perceives to be a wild animal but is actually her own son Pentheus in disguise. She is allowed to regain her sanity in time to recognize the torn body of her son just as she brings it to her father. The outcome is that the dynasty of Cadmus is destroyed, Agave is exiled, and the city of Thebes becomes a center for the worship of Dionysos.

The account of Euripides implicitly details many of the features associated with Dionysiac rites known from artistic impressions on vases down the centuries—the lively dancing and dressing up in animal skins and various types of vegetation. The actual ceremonies remained the secret knowledge of initiates, and this secrecy motif was intensified by the rites being practiced at night, attracting many rumors and exaggerated imaginings from those outside the cult. The sexual nature of these rites seem to belong to the fantasies of external perception rather than the reality of the religion itself.

Classical scholars have had to weigh the evidence of the written accounts of the Dionysiac myths against what has been discovered from classical representations in various artworks. There is insufficient external evidence from Euripides' time to determine whether he based his account of the myth on the actual practices of the Dionysos cult as he knew it. It may be that his work actually provided the descriptions on which later rites were based. According to the myth, women are the main participants, the Bacchae. Pentheus is the only man mentioned, and he appears not as a man but disguised as a wild beast.

THE HELLENISTIC PERIOD. The evidence increases during the Hellenistic period. Plutarch (before 50–after 120 CE) refers to women's ecstatic rites associated with Dionysos, describing how some women got trapped in severe weather while they were celebrating winter rites for Dionysos. He also described how a group of maenads, in their ecstatic state, had strayed in to the territory of the enemy, but thanks to the protection of the women of that town, Amphissa, they survived. It is also at this time that the cult of Dionysos spread to Italy and then to Rome, noted later, in negative terms, by Livy (59 BCE–17 CE). Livy's account of one particular episode that occurred in 186 BCE gave Bacchae-type rites their debauched, orgiastic, and corrupt reputations. Livy recounts how a young man had to flee to avoid initiation into the cult at the shrine of Semele, which had introduced male participants. Livy's descriptions of the Dionysian Bacchae included the practice of male self-castration and gross ornamentation for its male priests. Livy wrote his account some 150 years after the events he described, and it is heavily dependent on the work of earlier Roman historians, conservative characters such as the elder Cato (234–149 BCE). Livy's later reconstruction of the bacchanalian scandal betrays many traces of the moral outrage of his historian forefathers.

ISIS. Isis was the focus of another Oriental cult imported into Roman culture. It had particular associations for women in terms of both its priesthood and its popularity. The Egyptian myth that lies at the heart of the rites of Isis is a familiar one of sibling rivalry. According to Plutarch's version, a king of Egypt, the god Osiris, has a brother, Typhon, and two sisters, Isis and Nephthys. Typhon conspires against his brother to gain power, luring him into an ornate treasure chest, which he then seals and throws into the Nile. Isis, who has been incestuously involved with Osiris since they shared the same womb, goes looking for her lost brother. In her search she

discovers that Osiris has also been on sexual terms with their sister Nephthys, who has given birth to a son. Nephthys left this baby exposed to die because she was actually married to her other brother, the villain Typhon. Isis saves the child, named Anubis, who remains with her and becomes her attendant and protector. Continuing her search for Osiris, Isis finds the treasure chest on the river shore at Byblos, and she becomes pregnant, presumably by her dead brother, or she may have already been pregnant by him (Plutarch does not clarify this detail). Their child is Horus, a popular and significant figure in the rites associated with Isis and Osiris. Meanwhile Typhon comes across the treasure chest again, opens it, and cuts up his brother's body into fourteen pieces, which he scatters over the waters of the Nile. Distraught with news of this act, Isis combs the river marshes for the pieces and finds them all save for the penis, which some fish have eaten. Osiris then returns from the underworld and trains his son Horus to avenge Typhon on his behalf.

During the Hellenistic period, the Greeks identified Isis with Aphrodite, although she was much more than the goddess of love. Transported to Rome, the Isis and Osiris rites understandably lost their connections with the Nile. One dramatic rite in which the image of the river setting survived, however, was the March festival of Navigium Isidis, richly described by Apuleius (c. 123–c. 170 CE) toward the end of the second century CE. A great procession of women and men, mostly dressed in white linen, followed by priests carrying the sacred objects and the gods themselves (i.e., a person dressed as Anubis and a cow representing Isis) made their way to a nearby riverside (in Apuleius's account it was at the port of Cenchreae). A grand sailing boat was then purified by the high priest and launched by the devotees. Other rites (e.g., the Festival of Isia) retained the clear pattern of the myth, reenacting the death of Osiris and the mourning and searching of Isis, culminating in the joy of resurrection. In addition to the festivals there were daily rituals at the temple in which the figure of Isis was cleaned and dressed.

The Isis cult was not exclusive to women, but because two of the central characters, Isis and Nephthys, were female, women were given prominence in any ceremony that reenacted the myth. Apuleius's description from the second century CE makes it clear that the cult of Isis was popular among women of all classes in Italy and the western provinces: "Then followed a great crowd of the Goddess' initiates, men and women of all classes and every age, their pure white linen clothes shining brightly" (Apuleius, *Metamorphoses*, 18, in Graves, 1951). Pictorial evidence also exists. For example, in a first century CE wall painting from Pompeii, a ritual at a temple of Isis is depicted, and the popularity of this cult among women is reflected by the number of female figures represented.

The central focus of the cult of Isis is the relationship between a man and a woman. Its incestuous nature serves to intensify the bond. It embodies perfect heterosexual love that triumphs even over death, and as such it supports the Greco-

Roman ideal of the foundation of the family. It is tempting to interpret civic support of this cult as an attempt to endorse the family and the status quo of society and women's devotion to it as their acquiescence. Alternatively the cult so perfectly represented the expectations of Greco-Roman women that it provided sanction and sanctification for their lives. Another factor to explain the cult's popularity among women may have been linked to the countless military campaigns that characterized the years of the late republic and early empire, which left so many married women as widows. Living in that reality, rites that focused on a couple separated by death yet reunited by a love stronger than death would surely have special significance for women.

MAGNA MATER. The goddess Magna Mater, or Cybele, was imported into Rome from Pessinus in Asia Minor in 204 BCE and became one of Rome's foremost cults. It was equally popular among men and women, although its rituals, which revolved around the jealousy of the goddess over her lover's infidelity, more explicitly reflect women's experiences. As was the practice in the case of foreign cults, it was given legal status in Rome through recourse to the Sibylline Books. It was a cult traditionally associated with the city of Troy, to which the origin of the Roman race was traced, and therefore could be regarded almost as an ancient Roman religion. In Rome an image of Magna Mater was set up in the heart of the city on the Palatine Hill. Although not her consort, Attis is the individual most closely associated with the goddess. The central theme of the many and varied legends describing Attis's relationship with Magna Mater focuses on the young mortal Attis, caught up in an ecstatic frenzy instigated by the goddess because she was jealous of his relationship with another woman. When in this frenzy Attis castrates himself and dies, the goddess brings him back to life.

One well-recounted aspect of the Magna Mater cult was the taurobolium, the killing of a bull. This was a particularly gory practice in which the animal was sacrificed in such a way to ensure the sacrificer was spattered with its blood. This messiness distinguishes the Magna Mater cult from the normal cultic practice of Roman religion in which the priest remained unstained throughout the sacrificial slaughter.

VESTAL VIRGINS. In the context of women's participation in religion in the Greco-Roman world, Vestal Virgins have furnished popular images and language down the centuries of Western culture, and this familiarity has tended to give them a prominence out of keeping with the religious situation of their time. Their numbers, for example, were minimal—six in total. They were a crucial factor, however, in Roman perceptions of the relationship between their city and the deities who protected it. The Vestal Virgins were chosen for their unique office before they had reached puberty, between the ages of six and ten. Once chosen they were celibate for thirty years and devoted to the task of tending the sacred fire of the round temple of Vesta at the center of the Forum. This shrine was the oldest of the Forum and—according to the account of Pliny the Elder (23–79 CE) who noted, however,

that as a man he would have had no access to the shrine—it had no image of the goddess Vesta but contained a sacred phallus (*fascinum*), the Di Magni (i.e., household gods of Troy), and a sacred Trojan image of Athena known as the Palladion. The Vestal Virgins as a group are unique in social, political, and religious terms. Beard (1980), in recognizing their distinctive status, has noted similarities between them and aristocratic males as well as affinities with unmarried women and matrons. The celibacy of the Vestal Virgins was jealously guarded, and Plutarch described that if any of their number was discovered to have broken her vow, she was ceremonially buried alive.

The high priest of the cult was male. In fact the first emperor, Augustus (c. 27 BCE–14 CE), was elected high priest in 12 BCE, and when this happened he created a shrine to the goddess Vesta in his own home on the Palatine. Even the emperor, as high priest of the cult, could not enter the shrine—that privilege was reserved for its female virginal attendants. He could as high priest, however, carry out their execution. This office could be seen as yet another element in Augustus's search for infinite power and immortality.

The power of the Vestal Virgins was a visible reality in many aspects of the lives of these females, but these were in effect young women without any sexual autonomy. They were offered in the selection process for the Vestal Virgins at the age of six by their parents, and if chosen they were committed to that life for a minimum of thirty years. As noted, their sexuality was controlled or rather restricted by the state, and any independent act to exercise their own wills in this respect was met with execution by the hand of the male high priest. They did receive abundant privileges, such as attending senatorial dinner parties, going to the theater with the imperial women, and guarding precious documents of state. These privileges reflect the belief among Romans that these women were the true guardians of Rome, its purity and its potency.

BONA DEA. Another popular cult in Rome, associated with Roman matrons, was the cult of Bona Dea, the “good goddess.” Her proper name was Fauna, understood as the daughter or sometimes the wife of Faunus, otherwise known as Pan. She was worshipped exclusively by women, and her official annual nocturnal rite was celebrated in early December in the house of the chief magistrate, led by his wife and assisted by the Vestals. This was a cult particularly associated with the *matronae*, who were distinguished as a group by their respectability; that is, they were legally married and therefore able to produce rightful heirs, and they were freeborn. They wore particular clothes: a long dress (*stola*) and a distinctive headband. They were involved in many religious festivals in Rome, but the Bona Dea cult was a particular focus for them. In fact the Bona Dea cult seems to have been elitist not only in terms of gender but also in terms of its popularity among the freed classes. Knowledge of the Bona Dea cult is, as so often, restricted to male descriptions, which are suspect because men were excluded from all the preparations and cele-

brations. One detailed account comes from Cicero (106–43 BCE), who was directly involved because his residence as magistrate was the venue for the December rite. His account is highly subjective because at the time (63 BCE) he was involved in a political struggle, and he interpreted particular happenings as signs to himself from the goddess. The next year a man tried to infiltrate the festival, this time at the house of Julius Caesar, who held the praetorship that year, by disguising himself as a female harp player. The infiltrator was recognized as Clodius, a prominent member of Roman elite society whose aim, it was alleged, was to seduce Caesar's wife during the celebrations. He denied the charge and was found not guilty, a result, according to Cicero, that came from a bribed jury.

This event formed the basis of Juvenal's (c. 55–130 CE) lively and erotic pastiche, which may be seen as a lurid undermining by male commentators of female religious practices (Juvenal, 1991, Satire 6). It would seem to be the case, however, that these rites did allow women an opportunity to behave in a more free and unrestrained manner than public events would normally allow. Hendrik H. J. Brouwer paints a convincing picture from all the available evidence of the December rites, at which women could drink undiluted wine, for example, and have boisterous songfests accompanied by female musicians. This party atmosphere developed when the ritual part of the evening—the sacrifice of a pregnant pig in front of the cult statue of Bona Dea brought from the temple—was completed.

Greco-Roman religious practices are filled with diversity and variety on a huge scale. It is impossible to make general observations about religions in the light of the extreme diversity, including a great number of variables, such as local political interest, geographical features, and fusion of residual culture with imported practices. It is clear, however, that religion expressed women's experiences—emotional and physical—from becoming young women to their lives as mature matrons. Religion is not only a reflection of those experiences but a prescriber and reinforcer of them.

INFLUENCE ON CONTEMPORARY WOMEN'S SPIRITUALITY. Religions of the ancient Mediterranean not only resounded with the experiences of men and women in the ancient world. In modern times the myths and cults of antiquity have furnished contemporary religious trends. In the context of the West, along with its colonial history, the monolithic religious system of Christianity was in the ascendancy from the time of Emperor Constantine in the early fourth century until modern times, and it gave shape and form to Western civilization and served as a means of defining tradition. In sum, religions of the ancient Mediterranean provide a “pre-traditional” range of religious expression that is reflected in the contemporary period of the “posttraditional.” This has been true especially in the context of feminist spirituality, where traditional religion, identified as patriarchal, has often been rejected or radically transformed. The goddess, who takes various forms in ancient Mediterranean religions, has

been a particularly rich resource for women attempting to construct a spirituality with women's experience at its core. Key feminist scholars who have drawn on goddess mythology from ancient Mediterranean cultures for contemporary women's spirituality include Carol Christ, Starhawk, and Charlene Spretnak. These writers originally experienced traditional religion but use the resources of ancient goddess spirituality, that is, pretraditional religious experience, to take them beyond those traditions to posttraditional goddess spirituality.

DEBORAH F. SAWYER (2005)

GENDER AND RELIGION: GENDER AND CELTIC RELIGIONS

The ways in which gender identities are embedded in religious rituals, symbols, institutions, and language reflect changing social and political power structures, especially in relation to women. One effect of this wider debate has been to look to the past to provide paradigms in which access to power and influence in the institutions of religious life have been more equally balanced. Since ancient Greek writers first identified the Celts as *keltói*, this group has provided a powerful symbol of otherness for the perception of women and their function in religious contexts in Celtic society. The issue of gender, and how this shaped concepts of sacredness in the religious behavior of the Celts, has been a topic of discussion since the late nineteenth century, and ideas of Celtic pagan and Christian spirituality have played a prominent role in alternative spirituality movements since the second half of the twentieth century.

HISTORICAL SOURCES. The main sources for information about Celtic religion come from archaeological evidence, the testimony of classical writers, and narrative material preserved by western Celtic groups, such as the Irish, Welsh, and Scots. Because much of the context has been lost or the commentary has come from outsiders, these sources present certain difficulties. Classical authors give information on religion and gender roles, but they often used Celtic behavior to comment on themselves. A number of mythological narratives are preserved as later written texts, but the time gap between them and a more ancient past means that themes in medieval texts cannot be assumed to reflect the survival of ancient religious practices. Another factor is the changed attitude to the nature of Celtic culture. Whereas once scholars assumed similarity and continuity between ancient Celts and later cultures in Britain, Ireland, and Brittany, since the 1980s there has been less emphasis on folk migrations and on supposed connections between continental and insular

Celts and more emphasis on the effects of literacy and the introduction of Roman culture and Christianity. It is more difficult, therefore, to argue for Pan-Celtic deities or long-term continuance of religious behavior. The picture to emerge from this reassessment suggests that there was no centralized Celtic pantheon, although some deities had extensive spheres of influence. Participation in religious life also seems to have been more varied. The druids were an elite religious caste functioning in western areas of Gaul, Britain, and Ireland, and their role overlapped with that of bards and poets in the post-Roman world. The organization of religion in other areas such as Galatia or Celt-Iberia is less well known. However, despite these limitations, it is possible to consider some of the gender issues as they related to religion among groups of Celts in the ancient world and in the early cultures of insular groups such as Ireland and Wales.

The Roman geographer Strabo (64 BCE–24 CE) makes the tantalizing suggestion that gender tasks among the Celts were the reverse of those among Romans. In the context of religion, writers mention druids, and a few suggest the presence of female druids. According to the Roman historian Tacitus (c. 55–120 CE), black-robed, screaming women accompanied the druids during the Roman assault on their stronghold on Mona (Anglesey) in 60 CE. The fourth-century CE *Historia Augusta* has three references to female druids in Gaul. Two utter spontaneous prophecies to two emperors, whereas the emperor Aurelian (c. 215–275 CE) consults Gaulish druidesses directly. Even if these women were stereotyped figures of prophecy and magic, the links among druidry, power, and women are clear.

Women appear elsewhere in religious roles. The Greek writer Plutarch (before 50–after 120 CE) mentions Camma, wife of a Galatian ruler and priestess of a goddess identified with Artemis who shared a poisoned drink with a suitor to avenge her husband's death. Although the drink of milk and honey had underworld associations and the rite took place in the temple where Camma was a priestess, the passage emphasizes her loyalty as a wife, rather than her religious role. Two Roman historians, Tacitus (c. 55–120 CE) and Dio Cassius (c. 155–235 CE) described the revolt led by the famous British queen Boudicca in 60 CE. Boudicca's comment that it was unusual for Britons to follow a woman war-leader may reflect Roman unease about women, rather than her actual words. The fact that she offered a hare to the tribal goddess before battle, combined with the after-battle atrocities such as cutting off the breasts of captured women, may indicate that Boudicca's leadership had a religious dimension.

The Roman geographer Strabo quoted a description from the Greek writer Posidonius (second–first century BCE) of an all-female cult among the Samnitae tribe. The women, identified as worshipers of Dionysos, inhabited an island off the western coast of France and only left to have sex to produce children. An annual rite of reroofing a temple occurred during daylight hours on a single day. Any woman who dropped roofing material was torn to pieces. The description

hints that the sacrificial victim was chosen in this way, because the account notes that the victim was jostled. Pomponius Mela (first century CE) mentions an island on which a male deity sleeps while nine women priests attend a perpetual fire under a cauldron. There is a striking parallel between these early accounts and two later references. One occurs in a medieval Welsh poem, “The Spoils of Annwn,” which describes a supernatural journey to a land where nine women keep a fire burning under a cauldron. The other, from medieval Ireland, claims that the site of Saint Brigid’s Church at Kildare incorporated a pre-Christian sanctuary where women tended a sacred flame.

The archaeological evidence includes images of female deities and inscriptions addressed to them. Men, who controlled the wealth, dedicated most of these monuments, but women also feature as dedicatees. Most inscriptions date from the Romano-Celtic period (first century BCE–fourth century CE) and indicate the importance of female deities rather than the position of women in religion. Devotion to deities did not follow strict gender lines, and men and women alike left votives at shrines dedicated to both male and female deities. In so far as deities such as the *dea nutrix* were associated with childbirth or pregnancy, her devotees and perhaps officials were likely to be female, but the goddess Epona, associated with horses and horse craft, was popular among the Roman cavalry. A number of Romano-Celtic statuettes of women suggest female religious activity, although it is unclear, given the date of this material, whether the activity was specifically Celtic. However, a bronze statuette of a veiled woman from South Shields (Tyne and Wear), a naked bronze female dancer from Neuvy-en-Sullias (Loiret), and a wooden image of a veiled woman wearing a torc from Chaumelières (Puy-de-Dôme) are associated with Gaulish or British religious sites and could depict devotees or officials. Chaumelières was the site of the sanctuary of Sequana, goddess of the source of the Seine, and an important healing center with an extensive dormitory and hospital complex for those seeking cures. Women probably played a role in both religious and healing activities here and at similar shrines. Religion was an aspect of public life open to women in the ancient world, and other continental iconography depicts women, either as devotees or officials, worshipping at altars or in processions. The names of Gaulish and British women priests are recorded in connection with classical cults, and at least one Gaulish woman dedicated a temple altar to a native Gaulish goddess.

INTERPRETATION OF SOURCES AND LATER DEVELOPMENTS. Religion, particularly an aspect like gender, is difficult to reconstitute from archaeological evidence. However, it is possible to infer some ritual significance from the placement of burials, such as the woman interred within a ritual enclosure at Libenice in Bohemia (fourth century BCE) or two distinctive female burials from Wetwang Slack in Yorkshire (third century BCE)—one buried with an elaborate chariot and the other with a sealed bronze box. It has been suggested that native British rites continued as a countercultural religion

designated as witchcraft after the introduction of Christianity and continue into the twenty-first century. There is no basis for such an extreme position, but possible negative gender roles are indicated from a small number of burials, mostly older women, in which the heads or jaws have been removed and placed beside the corpse. A striking occurrence of *bnas brictom* (Gaulish, meaning “women of magic”) is inscribed on a lead curse tablet from Larzac in France (c. 90 CE). The exact meaning is unclear, but this, unlike other curses, indicates that the women themselves have power to harm.

Irish literature features female figures with supernatural powers such as the Morrígan, Eriu, and Danu, who may be late reflexes of Celtic land or sovereignty goddesses. In medieval Welsh literature, the character Rhiannon from a medieval Welsh tale, whose name means “Great queen” (Rigantona), has been linked with the Gaulish and British goddess Epona. Female druids and seers are mentioned in Irish sources and druidic imagery clusters significantly around some of them. Fedhelm from the Ulster cycle (seventh to eleventh centuries CE) studied in Alba, a reflection of the druid’s long apprenticeship as mentioned in classical sources, and appears with the sole purpose of uttering prophesies. Although this material cannot directly reflect Celtic religion or women’s roles in it, the pattern presented by the classical authors is one in which women participated in, rather than were excluded from, ritual activity. Taken as a whole, archaeological evidence and narrative texts support rather than contradict this.

Between the third and sixth century CE, Christianity was introduced to Gaul, Britain, and Ireland. The degree to which the new religion absorbed, subsumed, or coexisted with pagan culture is a complex topic linked to the controversial concept of a distinctive Celtic Church. The cult of the holy well has been the focus of much speculation on pre-Christian survival, but even here there is little direct archaeological evidence for continuity between pagan deities and later saints. Nevertheless, hagiographers endowed both male and female saints with pseudo-divine characteristics, and the complex cult of the Irish Saint Brigid of Kildare suggests that a pagan site was transferred to a holy woman, Brigid, who died in 524 CE. Women exercised considerable power and influence in early Christian foundations in Ireland and Wales, although here too it is not clear how much of this carried over from pagan structures and how much was the result of increased status introduced by the new religion.

MODERN REVIVAL. Issues of gender in Celtic religion and in early Christianity have been informed by the revival of interest in Celtic culture since the end of the nineteenth century. Romantic nationalism and Romantic feminism have undoubtedly over-interpreted the sources, but modern developments in paganism and Celtic spirituality draw crucial metaphors from images of a powerful goddess figure who embodied female power in a unified pre-Christian world and the idea that such a figure was intimately bound up with the cycle of nature. Since the middle of the twentieth century,

women have become an important force in modern druidry and in the move toward a more inclusive spirituality. The popularity of modern paganism and Celtic spirituality is strengthened by the assumption that Celtic religion could survive domination by Roman culture and Christianity. Supposed survival, despite external domination, is an essential feature of countercultural rebellion, and the image of a united Celtic world in which women were given a voice in religion is powerful whatever the discontinuity between modern religious developments and historical sources.

BIBLIOGRAPHY

There is no overall scholarly study of gender in Celtic religion from the ancient to modern period; however, Philip Freeman's *WarWomen and Druids: Eyewitness Reports and Early Accounts of the Ancient Celts* (Austin, Tex., 2002) makes useful comments on the relevant classical references. A. Pelletier's *La Femme dans la société gallo-romaine* (Paris, 1974) considers the position of women in Gaul, whereas Lindsey Allason-Jones's *Women in Roman Britain* (London, 1989) covers British society. Miranda Green's *Celtic Goddesses Warriors Virgins and Mothers* (London, 1995) surveys both society and mythology into the early Christian period. Christina Harrington's *Women in a Celtic Church: Ireland 450–1150* (Oxford, 2002) gives a detailed and authoritative view of religious life in Ireland, whereas Jane Cartwright's *Y Forwyn Fair, Santesau a Lleianod Agweddau a diweirdeb yng Nghymru'r Oesodd Canol* (Cardiff, 1999) examines images of the virgin, female saints, and nuns in medieval Wales. Elissa Henken's *Welsh Saints, A Study in Patterned Lives* (Woodbridge, U.K., 1991) examines the hagiography of gender, and Dorothy Bray's "The Image of Saint Brigit in the Early Irish Church," *Etudes Celtiques* 24 (1987): 209–215 considers the growth of this important cult, a theme developed by Elva Johnston's "The Pagan and Christian Identities of the Irish Female Saint," in *Celts and Christians New Approaches to Religious Traditions of Britain and Ireland*, edited by Mark Atherton, pp. 60–79 (Cardiff, 2002).

The study of gender in Celtic religion is linked to general attitudes to the Celts and to the concept of Celtic Christianity. Two articles by Wendy Davies, "Celtic Women in the Early Middle Ages," in *Images of Women in Antiquity*, edited by Averil Cameron and Amélie Kuhrt, pp. 145–66 (London, 1983) and "The Myth of the Celtic Church" in *The Early Church in Wales and the West*, edited by Nancy Edwards and Alan Lane, pp. 12–21 (Oxford, 1992), help to clarify the issues and define the parameters of the argument. Gearóid Ó Cruaioich's *The Book of the Cailleach* (Cork, 2003) surveys all aspects of the "divine female" motif in Irish. The Scottish journalist and folklorist Lewis Spence popularized the idea of Celtic religion as benevolent and magical nature worship in which women played an important role. Books such as *Boadicea, Warrior Queen of the Britons* (London, 1937) and *The Magic Arts in Celtic Britain* (London, 1945) have influenced popular approaches to the subject. Good surveys of modern Celtic paganism and Celtic spirituality are Ronald Hutton's *The Pagan Religions of the Ancient British Isles* (Oxford, 1990) and Marion Bowman's "Contemporary Celtic Spirituality,"

in *New Directions in Celtic Studies*, edited by Amy Hale and Philip Payton, pp. 69–91 (Exeter, U.K., 2000). Many Internet sites contain information drawn from secondary sources or personal experience. These sites attest to the enormous interest in women's spirituality and to the importance of Celtic images in providing metaphors for this to be expressed.

JULIETTE WOOD (2005)

GENDER AND RELIGION: GENDER AND AUSTRALIAN INDIGENOUS RELIGIONS

Indigenous Australian women's religious beliefs and practices and the nature of gender relations in Aboriginal societies continue to be the subject of considerable debate. Do women have ceremonies that are secret and sacred to them? Do their rituals implicate the entire society or only women? Should gender relations be represented as egalitarian, complementary, or hierarchical? What has been the impact of the colonization of traditional lands, the forced removal of children, and the policies of assimilation and self-determination on women and men's religious beliefs and relationships? Is it possible to generalize for the entire continent, or given that Indigenous people live in different situations across the country, is it only possible to document change for specific groups?

PROBLEMS WITH THE SOURCES. For a number of reasons, women's voices are barely heard, especially in nineteenth-century and early- to mid-twentieth-century sources. Indigenous women, women anthropologists, and historians women have contested the validity of the male-dominated record. Silences, cultural assumptions regarding the "proper role" of women, and paradigms locating women outside the religious domain have rendered women mute. Influential texts, such as Sigmund Freud's *Totem and Taboo* and Émile Durkheim's *The Elementary Forms of the Religious Life*, written by theorists with no direct fieldwork experience in Australia, cast women as the profane and "other." When women's experience, self-knowledge, and woman-focused activities are confined to the realm of the everyday, the mundane, and the hearth and home, the question does not arise as to whether the ceremonies women perform may have significance beyond the profane business of women's bodies. For these theorists, women have magic but nothing that could properly be called religion. Thus when Géza Róheim, heavily influenced by Freud's psychoanalytical approach, worked in the 1930s in Central Australia and addressed women's lives, he asked about their everyday preoccupations but not about religion.

In her 1979 article "Aboriginal Women and the Notion of 'The Marginal Man,'" Catherine Berndt traced the ways women in the records of nineteenth-century observers are routinely depicted as downtrodden slaves of their menfolk, objects for sexual barter, and the instigators of fights. In this schema women's politics are cast as squabbles, and the decision-making power they enjoy by virtue of being the eco-

conomic mainstay for their hunting and gathering is rendered invisible. The trend continued well into the twentieth century. Denied agency, women are shadows in the landscape: they cannot and do not speak directly of their lives, beliefs, and practices. Women are “feeders, breeders and follow the leaders” (Cawte, 1974, p. 140).

The written record is further impoverished because most observers were men and, with the strict sex-division of labor, they faced practical difficulties in undertaking research among Indigenous women. Those who were accompanied by their wives sometimes recorded their wives’ observations on Indigenous women or those of the wives of missionaries. But more often, where they make reference to women, male researchers have relied on Indigenous men for information regarding women’s activities and status. These men, however, have been reluctant or unable to discuss what is sometimes referred to as “women’s business.”

Some insights are available from women who have set down their observations in fiction and diaries. Mrs. Aeneas Gunn, drawing on her experiences in the Roper River region of the Northern Territory, told the story of “Bett-Bett” in *The Black Princess* in 1905. For the most part the few trained women who undertook fieldwork in Australia did not focus on Indigenous women. Some ignored women, preferring to work on more “scholarly” prestigious topics. Some, like the journalist and self-taught anthropologist Daisy Bates (1863–1951), lived among and wrote about Indigenous peoples in Western and South Australia. Bates faithfully recorded aspects of women’s ceremonial lives, had little time for women, and as a product of their times, assumed that male authority was part of the “natural order” of things.

Nancy Munn’s careful documentation of Warlpiri women’s ceremonies, sand drawings, and body paintings, published in 1973 in *Walbiri Iconography*, added to the richness of Central Australian desert ethnographies. But in pursuing her structural analysis, Munn focused more on the men’s ceremonies, including the secret ones she was privileged to attend. She does not record having attended any secret women’s ceremonies. Her conclusion that men held the keys to cosmic order echoed the 1972 opinion of Kenneth Maddock, in *Australian Aborigines*, that women’s ceremonies are small and personal whereas men’s ceremonies addressed broader societal concerns. On the basis of more explicitly feminist research and evidence in Aboriginal land claims, Maddock revised his position for the 1982 edition of that work.

In an effort to reclaim women from the sources and to explore why Indigenous women do not see themselves as the drudges of their society, women researchers began exploring the silences in the ethnographic and historical record. In the 1845 journal entries of the explorer and administrator Edward John Eyre, Fay Gale found evidence of women-only ceremonies among the people of the southern Murray River region of South Australia for her 1989 article “Roles Revisited.” In rereading the 1901–1902 journal of Francis Gillen,

who accompanied Baldwin Spencer on his travels through central and northern Australia, Diane Bell found data that did not appear in their ethnographies—it did not mesh with the evolutionary models of Spencer. But as she pointed out in her 1983 *Daughters of the Dreaming*, it did indicate that women’s affiliations to the Dreaming were not mediated through men.

WOMEN SPEAK. The 1939 publication of Phyllis Kaberry’s *Aboriginal Woman: Sacred and Profane* established that Indigenous women had secret ceremonies. This was work undertaken by a woman who went into the field to study women and who was prepared to interrogate Durkheim’s sacred and profane dichotomy. Her portrait of independent women, rich in ritual knowledge and expertise, stands in stark contrast to the findings of W. Lloyd Warner that women were born profane and made little sacred progress through life. Kaberry worked in the Kimberley region of Western Australia and Warner in Arnhem Land in the north of Australia, but regional differences do not adequately explain the divergent portraits. Kaberry’s monograph continues to be read as a book about women in the Kimberleys and Warner’s as a text on religion.

Catherine Berndt’s work in the 1940s and 1950s confirmed and extended Kaberry’s findings to South Australia, the Northern Territory, and other parts of Western Australia. Likewise Annette Hamilton, working in the eastern Western Desert, documented the existence of women’s secret ceremonies in her 1979 Ph.D. thesis. On the basis of her fieldwork and land claim experience in Central Australia in the 1970s and 1980s, Diane Bell detailed the breadth, depth, and power of women’s religious lives; explored their control over women’s residential and ceremonial spaces; and demonstrated that *yawulyu* (land-based ceremonies) and *yilpinji* (love magic or emotional management ceremonies) are structured along the same principles of ritual reciprocity as men’s ceremonies.

Françoise Dussart, writing of her 1980s fieldwork with the Warlpiri of Central Australia, focused on the elements of competition and obligation of both men and women ritual leaders and revisited the centrality of kinship. Zohl Dé Ish-tar, working at Wirrimanu (Balgo, Western Australia) where Catherine Berndt had spent many years, traced the internal struggles of this complex community in her 2003 Ph.D. dissertation. Accounts of women’s art, music, and dance have further fleshed out dimensions of the dynamic and vibrant religious lives of Indigenous women. The ethnomusicologist Linda Barwick’s 2000 recordings and accompanying texts are the first commercially available of the *yawulyu* style of Warumungu women from Tennant Creek, Central Australia. Jennifer Biddle’s article “Inscribing Identity: Skin as Country in the Central Desert” offers a closer look at the significance of women’s body painting.

In land claims brought under the Aboriginal Land Rights (Northern Territory) Act (1976), women offered testimony regarding their religious ties to land and their knowl-

edge of myth through *yawulyu* performances. A 1979 report of Justice John Toohey, the then Aboriginal land commissioner, made special mention of the significance of women's ceremonies. In government-sponsored reports, Indigenous women across Australia have spoken out about their community, family, and individual concerns.

The portrait of women's religious lives that emerges from these accounts is that in the desert regions of central, western, and southern Australia and in the Kimberleys both men and women have ceremonies that are closed to the other. However, there are also ceremonial moments where each has a presence at the rituals of the other. Knowledge is earned. The sages of the society are the "old people." The nubile young wenches who caught the eye of some commentators were not repositories of the sacred and secret law.

Bringing women into active voice in the ceremonial domain has been the work of women. To explore what was going on in women-only domains required a woman researcher, one who could be trusted with women's secrets. Catherine Berndt worked with women while her husband worked with men. They provided gendered perspectives on the same communities, stories, and ceremonies, and their access deepened as they aged. Bell described taking her two children into the field in the mid-1970s and how she was instructed in the ceremonial responsibilities of a mother of a boy nearing the age of initiation and a girl approaching marriageable age.

By the 1980s Indigenous women were adding to an already extensive body of literature, but little of it addressed religious beliefs and practices directly. Rather, they presented autobiographical material, emphasized survival, and located women's strengths within families and communities. As she documented the ravages of dispossession on her people in New South Wales in her 1978 film *My Survival as an Aboriginal*, Essie Coffey highlighted the strength she derived from her family. Hyllus Maris and Sonia Borg told the history of two hundred years of occupation of Indigenous lands in *Women of the Sun*, the 1983 four-part television series with a woman as the central figure in each episode. Sally Morgan's 1987 international best seller, *My Place*, traced her quest for identity through a maze of secrets in her Western Australian family.

Many more stories of survival in the face of loss and trauma came to light in 1996 with the publication of *Bringing Them Home*, a report on the "stolen generations," children forcefully removed from their parents in the name of assimilation. Other women are now coming forward to share their stories. Doris Kartinyeri's *Kick the Tin* (2000) told her story for future generations.

Although women's ceremonial life was imperiled by missionary activity and government policies of assimilation, particularly in the heavily settled part of Australia, fragments of knowledge of the beliefs and practices of earlier generations have survived and are held dear by those who have

earned the right to know. In the stories of survival, there are glimpses of the continued importance of family attendance at various ceremonies, including funerals. These gatherings serve to unite communities and celebrate kinship ties, as they did in the premissionary days.

Indigenous women continue to explore their relationship to feminism and the women's movement. For some, the women's movement offered new insights and opportunities. Others have explored distinctively indigenous modes of representing their struggles as Indigenous women and express ambivalence and sometimes hostility to what they see as a white women's movement.

GENDER RELATIONS. Here also the record is impoverished. Throughout the nineteenth century and much of the twentieth century, male dominance was accepted as an accurate depiction of gender relations, which were usually discussed in terms of role and status. Evidence of women's rituals constituted a challenge to this view, but it has not entirely dislodged the model of male dominance as universally applicable. Rather, from the 1970s onward there is greater nuance and complexity to the way gender relations are presented.

For Central Australia there is general agreement that women enjoy prestige and respect by virtue of their secret and sacred ceremonies, and this is apparent in their rights in and responsibilities for sacred sites and country. This contrasts with Arnhem Land, where polygyny is common, the separation of the sexes is not as dramatically marked, and women's ritual activity does not have the wide reach of women's ceremonies in the desert regions.

In *The Tiwi of North Australia* (1960) C. W. M. Hart and Arnold Pilling describe older women as toothless old hags. In *Tiwi Wives*, researched in the 1960s but not published until 1971, Jane Goodale found Tiwi women to be wise individuals. Unlike the practice throughout most of the Australia continent, Tiwi men and women of Melville and Bathurst Islands are initiated at the same ceremonies, but women are not expected to be innovators. That is men's work. Goodale characterized male-female relations as structurally unequal.

In their contributions to the 1970 landmark publication of *Woman's Role in Aboriginal Society*, Isobel White surveyed the literature and concluded that women were not pawns or chattels of men but "junior partners" (White, 1970, p. 26), whereas Catherine Berndt opted for a "two sex model, dependence and interdependence" (Berndt, 1970, pp. 39–48). Diane Barwick provided a nuanced account of Indigenous women's strategies in nineteenth-century Victoria as they took advantage of the opportunities afforded by mission and government stations to transform their roles within traditional patriarchal society and to enjoy the status of emancipated women (Barwick, 1970, pp. 31–38).

In 1979 John Bern, working in the Roper River area and echoing Warner's pronouncement on women's profane lives, argued that religion is the domain where status is conferred,

and religion is a male domain. A year later Hamilton explored what might constitute a challenge to this ideology. She argued that in the eastern Western Desert women's matrilineal ties, autonomous religious lives, and lower polygyny rates than farther north in Arnhem Land constituted a structural impediment to the consolidation of male dominance. Fred Myers, working with the Pintupi of Central Australia, has conceded that women's ceremonies are of importance but, like Maddock's 1982 revised position, sees the scale of men's ceremonies, their elaborate nature of preparations, and their integrative scope as indicative of their greater importance.

Echoing the work of Kaberry and Hamilton, Diane Bell in 1983 wrote of female autonomy and the complementarity of the sexes in Central Australia. She argued that the life on settlements (reservations) provided many opportunities for women's ceremonies and indeed intensified the need for those ceremonies that concern resolution of conflict. Women on cattle stations (ranches) have fewer opportunities for large gatherings of women but often have been able to remain closer to their sacred places and country.

In her reconsiderations of women and anthropology in 1984, Kay Saunders called for a reintegration of male and female perspectives. Reviewing the last twenty-five years of the twentieth century, Francesca Merlan, in "Gender in Aboriginal Social Life: A Review" (1988), noted the difficulty presented by the range of views and claims that much of what purports to address gender relations too often focuses on women's position in the society. Lester Hiatt, in *Arguing about Aborigines*, recognizes that age and gender are critical factors in any conceptualization of gender relations but with his characterization, "double gendered gerontocracies," allows that the weight attached to either may or does vary across the continent (Hiatt, 1996, p. 77).

MYTH AND RITUAL. There are myths that explore themes of sexuality, sexualized power, and gender relations; myths that are known to women, and ones that are the domain of men; and gendered versions of the same myth wherein women and men emphasize aspects of ancestral activities that are relevant to their roles. From South Australia come men's stories of the whale, *kondoli*, and the theft of fire, his jealously guarded possession, and those of women about the old people riding whales and calling to whales, as if these large warm-blooded creatures were kin. Both women and men talk of the return of the whales to the waters of the Southern Ocean as a prophecy of the return of strength to their culture and communities.

Women feature in a number of Dreaming stories, some of which, like that of the Seven Sisters (the Pleiades) and the Mungamunga, traveling women who traverse the continent, interact with other Dreamings and establish rites of passage for women. In her 1965 article Catherine Berndt enumerated examples of present-day male ownership of myths that once belonged to women, the most well-known being the Djang'kawu sisters from northeastern Arnhem Land.

Myths are redolent with sexual imagery and make note of the aberrant and the taboo. Thus sex between mothers-in-law and sons-in-law leads to social disorder. Women's *yilbin-ji* songs of Central Australia may be used to attract or spurn a lover and to restore harmony.

In the central desert regions *yawulyu* ceremonies are the responsibility of senior women, and through their performance they make the country "come up green" and speak of "growing up" the country as one "grows up" children. In Warlpiri one is *kirda* for the country of one's father and *kurdungurla* for the country of one's mother's father. Other rights flow through mother's mother and father's mother, place of birth, and a number of idiosyncratic factors.

In the preparation of sacred objects for a ceremony, women may sing and speak of the significance of the stories that give meaning to their actions. Songs and designs painted on bodies, the ground, and ritual paraphernalia function as mnemonics and may be explored in greater detail in associated myths. Stories may be told when women are out hunting and gathering, and it is here that children first learn to name their country.

Adults tell myths, but the audience may be children, or it may be highly restricted on the basis of gender, age, family, and country affiliations. As one ages and grows in wisdom, the inside meanings of stories become available. This layering of knowledge may take one from a simple story told to scare children, such as the Mulyewongk (*bunyip*) of South Australia, to deeper and deeper meanings of significance to men and male initiation and to women and child rearing.

GENDER IN PUBLIC. Controversies regarding the value to be accorded to research findings by women working with women persist and extend beyond the walls of academe. Between 1994 and 2001 the weight accorded to the claim that a group of Ngarrindjeri women in the southeast of Australia had secret knowledge of sacred sites was contested in a number of legal cases. Diane Bell and Chris Kenny provide diametrically opposed readings of the Ngarrindjeri issues. Ultimately the women were vindicated in the decision by Justice John von Doussa in 2002 in the Federal Court, but the hearings, media coverage, and anthropological and community divisions generated by the matter illustrate how contentious "women's business" remains. The lives of the women pursuing protection for the sites had been profoundly altered by the missionary presence and assimilation policies—including the forced removal of children—and there was little in the ethnographic record to support their claims. However, the assertion of several Ngarrindjeri men and women that the Seven Sisters Dreaming traveled through their country could be substantiated from a number of sources. The politicized women of the so-called "settled south" were pitted against the traditional women of the "remote" communities and their authenticity as believers contested. Women-focused accounts were called biased, and the reflexive accounts where the researcher discussed the impact her pres-

ence has had on the collection of data were said to lack the objectivity of earlier positivist accounts.

Since the late 1980s the issue of violence against women has emerged as a highly emotive issue. Numerous reports have documented the increasing incidences of rape and physical abuse of women and children, and this has led to a lively debate concerning gender relations in traditional society and the weight to be accorded to the legacy of the gendered violence of the colonial frontier. Anthropologists and historians have debated the nature of the transformation of gender roles on the frontier. Berndt argued that women were advantaged by their privileged access to the hearth and home of the colonizers. Bell argued that women's lives were privatized by their domestication and that during the self-determination era men were groomed as leaders and negotiations were male to male. Assumptions regarding women's chattel-like status fueled the argument that violence against women was tolerated in "traditional" society. In response to Bell's call to all Australians to pay attention to intraracial rape, Indigenous women, such as Huggins, have argued that this is their business. This debate continues, as Bell documented in "White Women Can't Speak" and as "Tidda's Manifesto" illustrated.

Traditional religion is tied to place and firmly embedded in the kinship system. For a number of reasons, however, including dispossession of land, forceful removal of children, work requirements, and education, many people no longer live on their ancestral land. New spiritualities, in dialogue with different Christian modalities, formulations of social justice, environmentalism, and ecofeminism, have emerged. The hierarchical ordering of ancestral powers within these new theologies privilege male-identified beings, whereas some of the New Age romanticizations of the noble savage and the earth as mother articulate a female principle.

GENDER AND RELIGION: GENDER AND OCEANIC RELIGIONS

Oceania, a vast area encompassing a variety of social and religious systems, is often divided into three regions: Polynesia, Melanesia, and Micronesia. In Polynesia, with its chiefs and ascribed ranks, a woman's position depends more on rank than on gender. The populations of Polynesia are historically related, and there are similarities in social patterning throughout the region, including the system of hereditary ranking. Sherry Ortner observes: "Sensualism, eroticism, and a high level of sexual activity are actively cultivated throughout the area. Homosexuality is unstigmatized. Relations between men and women are relatively harmonious and mutually respectful" (Ortner, 1981, p. 359). Melanesia, to the west, shows greater diversity in social organization, whereas Micronesia, to the north, is closer to the chiefly patterns of Polynesia. The Melanesian cultures of highlands New Guinea are often described as egalitarian, but the egalitarianism refers to relations among men and not to social relations across genders. Traditionally the peoples of Oceania have engaged in subsistence horticulture. People grew crops such as taro, sweet potato, breadfruit, bananas, coconuts, and various green vegetables. Gardening, supplemented with cash cropping and wage labor, remains the basis of their economies and is an important metaphor for life's work.

APPROACHES. Those who have studied gender and religion in Oceania have approached their subject from various perspectives. A male bias pervades the observations of early missionaries and colonial officials in the Pacific, and much early anthropological study was done by men who lacked access to the religious practices and ideas of Pacific women. At the beginning of the twenty-first century the large majority of the peoples of Oceania were Christian, and thus Christian understandings were reflected in their ideas and practices. At the same time, as many young people moved to urban centers for education and work, understandings of gender derived from ancestral traditions and from Christianity were changing.

Margaret Mead, the pioneering anthropologist who studied male and female identity in several societies in Oceania, also used her research as a basis for exploring "male" and "female" in the United States. For those who have followed her, there has been a convergence between interest in gender relations in their home cultures and in the cultures they study. In the last three decades of the twentieth century, as scholars worldwide turned their attention to the cultural construction of gender, a profusion of studies focused on Oceanian societies. Marilyn Strathern's doctoral dissertation, later published as *Women in Between* (1972), presented the

mediating roles played by women of the Mount Hagen area of Papua New Guinea and foreshadowed the feminist anthropology that soon challenged the ways scholars studied Oceania. Strathern is remarkable not only for her feminist anthropology but also for her interrogation of the relations between feminism and anthropology. In *The Gender of the Gift* (1988) she suggested that the study of gender relations in Melanesia has been distorted by the assumptions of Western anthropologists who have imposed several Eurocentric binary oppositions—such as nature and culture, female and male, subject and object, domestic and public—on their Melanesian data. Her observation could be extended to all of Oceania.

Much of the post–World War II writing on the patrilineal societies of highlands New Guinea emphasized male domination, male cults, and male fears of menstrual pollution. Later studies gave more attention to understandings of women’s roles and female spirits in fertility-oriented cults and rituals. In the early 2000s accounts of violence toward women in Papua New Guinea and other parts of the Pacific caused researchers to ask to what extent violence has a traditional mandate and to what extent it is the result of rapid and disorienting political and socioeconomic change. Some scholars of highlands New Guinea societies, among them Alletta Biersack and Lisette Josephides, have argued that men take advantage of women just as in capitalist societies those with means exploit the working classes. In analyzing the relationship between masculinity and motherhood in an Eastern Iatmul (Papua New Guinea) society, Eric Silverman drew on the distinction the literary theorist Mikhail Bakhtin makes between the “moral” and the “grotesque.” Eastern Iatmul men, according to Silverman, “idealize an image of motherhood that is nurturing, sheltering, cleansing, fertile, and chaste, in a word, moral. But men also fear an equally compelling image of motherhood that is defiling, dangerous, official, aggressive, and carnal, hence, grotesque” (Silverman, 2001, p. 2). The ideology and ontology of Eastern Iatmul masculinity are established, he argued, through “an unresolvable dialogue with motherhood” (Silverman, 2001, p. 159).

Describing the situation on Vanatinai, literally “Motherland,” a small island southeast of the main island of New Guinea in the Louisiade Archipelago, Maria Lepowsky depicted male-female relationships as markedly different from those of the highlands. Vanatinai, she says, is a place where “there are no ideologies of male superiority and female inferiority.” In this matrilineal society, “Both women and men give and receive ceremonial valuables, foodstuffs, goods made by women such as clay cooking pots, sleeping mats, and coconut-leaf skirts, and goods made by men such as carved hardwood bowls and lime spatulas” (Lepowsky, 1993, p. viii). Women and men may both lead mortuary rituals and participate in a range of ritual activities, and women figure prominently in myth as shapers of the culture. From their mothers and their mothers’ brothers, women and men equally inherit land, the use rights over forest and reef areas, and

valuables. The postmarital residence pattern is bilocal. Women, Lepowsky maintained, “are construed as life-givers, nurturing children and yams, and feeding the heirs of the deceased in mortuary ritual” (Lepowsky, 1993, p. 302).

FERTILITY, SPIRITS, AND POWER. Food and fertility are major concerns of Oceanian communities and are the foci of ritual. It could be argued that the religions of Oceania consist of symbolic processes directed to the fertility of land and community. Throughout Oceania agricultural labor is divided between the sexes, with men clearing land and breaking up the soil for new gardens and women doing the planting and weeding. The actual distribution of tasks varies from place to place, and in many societies men take care of “male” crops, such as bananas, whereas women are responsible for staple “female” crops. Their cooperation is represented in the conjunction of male and female in garden rituals. In some places a couple will have sex in a new garden before planting takes place. In male cults of the New Guinea highlands there are “father” and “mother” officiants, both of whom are male. Thus gender is not only a social reality but also an idiom for thinking about the fruitfulness of vegetal and social life.

In Oceania economics and religion are not separate domains. Practical physical work and symbolic work (ritual) intersect in gardening, fishing, and exchange activities. Oceanian societies put a great emphasis on wealth exchanges. Men and women participate differently in these exchanges, with men taking the more public role in oratory and the transaction of valuables and women supporting their husbands and brothers by such activities as raising pigs, weaving mats, preparing tapa, providing food, and offering hospitality to guests. At the same time women also have exchange networks—mainly with other women—in which mats, baskets, net bags, and food products are transacted.

The religions of Oceania vary in their ideas about and practices concerning spirits and gods. Everywhere people interact with a variety of gods and spirits. Spirits of the dead are believed to have an ongoing relationship with the living. Following death, the spirit of the deceased is encouraged by gifts and entreaties to move on to its next destination. Many societies have practiced ancestor veneration, inviting the deceased members of the community to join in periodic festivals. In some areas people retain the skulls of the deceased for ritual presentation of food and dance. In chiefly societies cults honor the spirits of chiefs and high-ranking members of noble lineages. In highlands New Guinea the male cults typically honor the collective spirits of the patriline and in many societies provide for the initiation of males (Godelier, 1986; Herdt, 1982).

Where male cults flourish or once flourished, a female spirit may also be venerated. The Female Spirit, known as Payame Ima among the Duna of Papua New Guinea, is associated with parts of the environment, with other spirits, with human welfare, and with witchcraft (Stewart and Strathern, 2002, pp. 93–109). She dwells in the high forest where the wild pandanus nut trees grow and is regarded as an owner

of these trees. She also dwells in forest pools, and people may cast pieces of pork into these pools as offerings to her. She can possess men and women and thereby endow them with abilities such as the power to heal, to divine, or to identify witches. She may endow ritual experts with the powers necessary to ensure the growth of boy initiates. These ritual experts must be bachelors at the time the relationship is established and remain so while they carry out their role in the initiation cult. Payame rewards her male devotees with shiny, healthy skin.

In her form as the Yuro Ima, the spirit of the Strickland River, she directs wild game, including wild pigs and cassowaries, so that hunters can catch them. She also gives inspiration to the singers of the *pikono* epic cycles that recount some of her own actions in helping humans. Payame Ima has a dangerous side, however. Gabrielle Stürzenhofecker points out that for the Duna, witchcraft is conceived of as a predominantly female power that men see as threatening their control over women. Witches are portrayed as mobile and attracted by valued foods, characteristics usually associated with men. The Female Spirit, she says, is “described as both originator of, and the protector against, female witchcraft” and “powerfully encapsulates the duality inherent in the relations between the sexes” (Stürzenhofecker, 1998, p. 10). Comparable understandings of witchcraft are found throughout Oceania. A rash of witch accusations and killing of witches in the Eastern Highlands Province of Papua New Guinea in the 1990s may well be a scapegoating response to social changes that have disempowered men.

In Polynesia and also in parts of Melanesia and Micronesia, sacred power is denoted by the related terms *mana* and *tapu*. *Mana* is understood as a state of being in which a person or object is temporarily or permanently under the influence of gods, spirits, or powers. The *mana*, or supernatural power, of chiefs is a largely innate and inherited quality. *Tapu*, often glossed as “forbidden,” may, when used in reference to gods, chiefs, and temples, also be translated as “sacred.” The “sacred maid” of western Polynesia is at the same time powerful and forbidden. In Samoa she is supposed to be a chief’s sister’s daughter but might in fact be his daughter (Mead, 1949). She leads a group of unmarried girls and untitled men’s wives who are responsible for hosting visitors to the village. Unlike other unmarried young women, the sacred maid is under strict sexual constraint and is expected to retain her virginity until marriage. The prestige of the village is vested in her.

MYTH AND RITUAL. In Oceania, as in other regions of the world, the identities and relationships of men and women are explored in myth and song. A myth widespread in Polynesia tells of a woman called Hina (in some places Sina or Ina) who lived long ago and who established women’s activities, such as the making of tapa cloth. In one version of the myth Hina falls in love with a handsome chief, Tinirau (or Sinilau), who lives on a faraway island. She runs away from her family and swims across the sea (or rides on the back of

a turtle or a shark) in order to marry him. In another version Hina is seduced by Tuna (Eel) while bathing. The trickster hero Maui realizes what is happening and kills the eel. Hina buries her lover’s head, and it grows into the first coconut palm or, in a version narrated by the Maori of Aotearoa–New Zealand, the lover is chopped into many pieces that grow into the different species of eel. Some versions of the Hina myth tell that the heroine climbed up to the moon, where she can still be seen seated under a banyan tree beating tapa cloth. Maori narratives maintain that the moon is the true husband of all women, an idea found among many peoples of Oceania.

Whereas culture heroes and heroines may lay down patterns for human behavior, myths also explore the tensions between males and females. In many New Guinean cultures it is narrated that women were the trustees of ritual sacra such as bamboo flutes until they were stolen by men and came to be played in the male cult to impersonate the spirits (Silverman, 2001; Gillison, 1993). When men play the flutes in the context of the men’s cult, they are doing something that originally, the narratives say, belonged to women. Moreover their ritual activities are held to produce on a social level what female reproduction does on a biological level. Gillian Gillison describes how, among the Gimi, men and women have their separate but complementary sets of myths that inform the understanding of kinship, marriage, and exchange relationships (Gillison, 1993).

Oceanian cultures understand that power resides in individual, social, and cosmic life. Ritual is the means to tap into power. Even in modern circumstances it is usual for women to carry out rituals for the “growing up” of children, for the fruitfulness of crops, for healing, and for success in attracting men. Similarly men carry out rituals for fishing and hunting, for success in exchanges, for healing and the overcoming of misfortune, and for finding and keeping sexual partners. Some, but not all, cultures in Oceania have rituals for the making of men (Godelier, 1986; Herdt, 1982; Langness, 1999) and the making of women (Lutkehaus and Roscoe, 1995).

Many societies in Oceania employ traditional processes for entry into marriage. These usually involve the exchange of wealth items between the families of the couple and, in the case of patrilineal societies, require a larger payment on the part of the man’s supporters to compensate for the child-bearing capacity and labor that are transferred from the woman’s family to the man’s family. Traditionally marriage in Oceania marked not only the union of a couple but the alliance of groups. Marriages that are entered into in traditional ways are usually also celebrated with Christian ceremonies, and indeed some people have only a Christian ceremony.

Periodic rituals to empower the land and to restore the collective good punctuate traditional Oceanian religious systems. If fertility is a major focus of ritual, the restoration of well-being through healing processes is its complement. Ev-

everyone knows some herbal remedies as well as spells and ritual actions for healing, but specialist healers, both male and female, command a larger repertoire. Some inherit their healing practice and are trained in it by a parent or other relative. Others may receive healing power through a religious experience. While overall there are more male than female healers, the situation differs from place to place, and even societies that once relied exclusively on male practitioners have seen women assume the practice of healing.

WOMEN'S LEADERSHIP. In the old Pacific, women of high rank in the chiefly societies exercised social and ritual roles, and throughout the area women participated in rituals concerned with land and garden fertility and with the growth and health of children and animals. Senior women initiated the young, and there were women who functioned as healers. Women priests are documented in the Solomon Islands (Burt, 1993, pp. 58, 138, 145, 271). Since the arrival of Christianity, which came first to the eastern parts of Oceania—to Tahiti in 1797 and to Hawai'i in 1820—and then made its way westward, women have also assumed roles of leadership in Christian communities. Some have become pastors in Protestant denominations, although not all denominations permit female ministers; some have served as catechists and evangelists; many have become Catholic and Anglican sisters. A missionary couple from the Cook Islands, Ruatoka and his wife Tungane, went to Papua in 1873 and served there for the rest of their lives. The first Papuan to be baptized, Aruadera, turned to Christ during a Sunday service in which Tungane was presenting the Christian message.

All the Christian denominations in the Pacific have fostered women's groups, and women's fellowships have frequently been a base for social activism. While Christianity provided some scope for women's agency, European missionaries tended to impose Western understandings of appropriate female behavior and family patterns on Pacific Islanders, resulting in changes in dress, housing, and domestic life (Jolly and Macintyre, 1989).

A variety of religious and social movements, some of which have been dubbed "cargo cults," emerged in Oceania in response to colonial and missionary activity. Women have played a role in these movements as mediums and diviners and sometimes as leaders. In Samoa a religious movement that came to be known as the Siovili Cult, after its male founder, arose about 1830 shortly after the introduction of Christianity by the London Missionary Society and lasted until about 1865. Siovili preached the imminent arrival of God's son, Sisu, with judgment to follow. God spoke through Sisu by way of Siovili and other mediums, many of whom were women. The leaders also carried out healings. It seems that this movement was a bridge between the old religion in which families and local communities paid homage to local gods and the Christian era with its universal God.

In Papua New Guinea too the transition from indigenous religions to Christianity gave rise to movements in which women functioned as mediums or prophets. In the

early 1940s a Mekeo prophetess, Philo of Inawai'i, experienced dreams and revelations in which she understood that the mother of Jesus, "Our Mother Mary heavenly chief," was addressing her and asking her to work for the renewal of faith in her Catholic community (Fergie, 1977, p. 163). Part of Philo's message was that traditional values and Christianity are not incompatible. There were also male leaders in Philo's movement, some of whom took an anti-European and antimission stance. With the coming of World War II to Papua New Guinea, the Inawai'i movement faded. Philo married, and when she was interviewed by Deane Fergie in the 1970s, she was working as a healer in her village.

Philip Gibbs describes the leadership of women in the God Triwan movement, which started in the Catholic Pom-pabus parish in the Enga Province of Papua New Guinea in 1989 and spread to other parishes. The movement, which is characterized by divination and prophecy and, as in Philo's movement, devotion to Mary, was still active in the early twenty-first century. A number of scholars have described the emergence in Christian communities in Papua New Guinea of "spirit women," Christian spiritualists who share much in common with traditional male spiritualists embarking on soul journeys and acting as mediums (Lohmann, 2003, pp. 53–54).

Lorraine Sexton describes a women's movement known as Wok Meri (in Tok Pisin, "women's work") that began in the Eastern Highlands and Simbu Provinces of Papua New Guinea in the 1960s. Groups of women under the direction of senior women, called "big women," accumulated money and entered into exchange relationships with other groups. A mother group symbolically gave birth to daughter groups, with women tracing their Wok Meri ancestry through several generations. Members of the groups told Sexton that they were protesting against men's wastefulness in using money to buy beer and play cards and that they were showing their own competence and setting an example for both women and men to follow. Thus Wok Meri spoke to the responsibility women assume for their families and communities in a time of change. From the "sacred maids" of Samoa, to Christian evangelists, to spirit women and "big women," the agency of women in Oceania has been shaped both by social environments and by innovations in times of transition.

GENDER AND RELIGION: GENDER AND AFRICAN RELIGIOUS TRADITIONS

Gender has been variously defined in diverse contexts. For this entry, however, *gender* may be understood to refer to defined capacities and attributes assigned to persons based on their alleged sexual characteristics. Gender, then, is a construct within a people's living experience, embedded in the base of their philosophy and manifested at theoretical and pragmatic levels of their polity. Because gender is never independent of other social systems, it would be futile to consider it as a fixed and immutable construct; rather, it is a process. Further, gender classifications permeate a culture's cosmic perception and may be discernible in its language, storehouse of wisdom, rituals, and philosophy. Gender thus presents itself in every sector of a culture's experience of everyday life and philosophy of life. Gender classifications may be evident in perceptions of the ecosystem and supernatural forces.

HISTORICAL GENDER STUDIES IN AFRICAN RELIGIOUS TRADITIONS. History as a reference to past centuries will be misplaced if applied to the study of gender in African religious traditions, which include African indigenous religions, Christianity, and Islam. The latter two religions are classified as African religious traditions because of their influence on African culture. No longer can Islam and Christianity be described as foreign religions to Africa, as the people, through the prism of culture, have produced unique brands of Christianity and Islam (Olajubu, 2003). This misplacement of history may occur because basic assumptions concerning gender are conceptualized in Africa, rather than because of a deliberate attempt to ignore them (King, 1995) or as an indication of ignorance about gender studies in religion. African concepts of gender are integral to the people's religious experience and by implication their social life as well. Consequently, to perceive and pursue as a separate field the study of gender in African religious traditions would be misguided.

Possible reasons for granting cognizance to the study of gender in religion in Africa since the 1970s are multifarious. First, the global attention accorded to "women's issues" or the "female question" has influenced the need for scholars to delineate African gender construction within and outside of religion. Second, there arose the need to differentiate African conceptions and construction of gender from gender construction in other cultures. Third, interpretations given to gender construction in African ritual practice by some non-African scholars may be described as controversial, especially when compared to interpretations given by Africans participating in such rituals. Fourth, a good understanding of gender construction is essential to an understanding of African religious traditions. Religion is a belief system permeat-

ing all sectors of lived experiences. It exerts a profound influence on people's conception of gender. Indeed, in Africa religion is the basic principle from which gender construction is derived.

Works by scholars on gender in African religious traditions give a prime importance to ritual and the fluidity of African gender construction. Issues of cross-dressing, female cultic functionaries, and spirit possession are critically analyzed to substantiate the multidimensional complexities of gender construction in African religious traditions.

MYTHIC CONTEXTS IN CONSTRUCTING GENDER. The underlying basis of African gender issues could be located in the people's mythology, especially in cosmological myths. Myth, as a conveyor of meaning for that which history offers no explanation, provides a paradigm for gender construction and power relations. Myth supplies explanations for values and meanings in people's lives. As a model for human activity, myth elucidates the connections between the supernatural and the natural. Consequently, the roles played by the female and male personae in mythical narratives have profound implications for the expected roles of females and males in society. Some prominent attitudes on gender are signified in African mythological narratives, including, fertility, motherhood, cleansing, healing, deviance, and interdependent gender relations, as well as ambiguous perceptions of the body and of blood. These attitudes are reflected in narratives on traditions of the goddesses, sacred power, rituals, and cosmology.

African cosmological accounts often submit that God, the supreme being, created the world, nature, animals, and humans. Also, the consensus is that God created the first humans as male and female, "even if the exact methods of creating man differ according to the myths of different peoples" (Mbiti, 1969, p. 93). The Boshingo of Luanda's cosmological myth, for example, states that Bumba (God) was in terrible pain at the beginning of time, and retched and strained and vomited up the sun. After that, light spread over everything. Later, Bumba vomited the moon, stars, animals, and last of all, humans (Eliade, 1967). Moreover, some African creation myths record tension in gender relations and the sanction of God for mutual respect between male and female (Badejo, 1996; Olajubu, 2003). The Yoruba cosmological myth states that Olodumare (God) sent seventeen primordial divinities to earth at the beginning of time, Osun being the only female among them. The sixteen male divinities ignored Osun and excluded her from all decisions. In reaction to this, Osun gathered all women together and formed the Iya Mi group, which disrupted the smooth running of the universe with their powers, and the earth became ungovernable for the sixteen other primordial divinities. Olodumare advised them to make peace with Osun so that all might be well again. This they did, and everything returned to normal (Badejo, 1996, Olajubu, 2003). References to God's distribution of power to the female and the male in different areas may also be discerned from some of these accounts (Adediran, 1994).

Cosmological accounts in Africa thus prescribe and entrench complementary gender relations that find expression in the religious interactions of men and women, as well as in their relations in the polity. Consequently, female leadership roles and access to power in religion are anchored on divine provisions that are validated by these cosmological narratives. Again, these narratives confirm the African preference for areas of specialization for the female and the male. Whereas the obvious area of authority in the polity is in the custody of men, women control the base of men's public authority through mystical powers. An example of such power is demonstrated by the Iya Mi group of the Yoruba, where the women wield tremendous influence in an informal and often invisible but effectual way. Men are seen on the thrones and in official settings as rulers, yet perceived as unable to stand without the help of the invisible base. In general, interdependency and mutual sustenance mark African gender relations.

In African indigenous religions, deities who serve as lieutenants to the supreme being are both female and male. These gods and goddesses derive their authority and function from God. The conduct and interaction of goddesses in African religious narratives provide models for female roles at the religious and social levels. For instance, goddesses are usually represented as "givers" of children, as being in charge of bodies of water, and as possessing healing abilities for effecting physical and psychological well-being. Consequently, a study of goddesses would provide tools for evaluating and analyzing the status of women in African indigenous religions, as well as for assisting in analysis of the inherent gender dynamics in the traditions. For example, just as goddesses assume maternal roles to ensure fertility, motherhood and fertility are important features assumed for African women. Mystical dimensions of feminine empowerment reinforce roles that are linked to female procreative attributes.

Female religious alliances, such as the Iya Mi association among the Yoruba, wield tremendous cultural influence, and often link their powers to the women's access to fertility and motherhood (Olajubu, 2003, p. 17). Similarly, African indigenous religions often ascribe to women the ability to heal. This healing aptitude may be exhibited by women as individuals in their capacities as priestesses and healers, or in a collective as a religious group, such as the *zaar* cults of Ethiopia, Somalia, Egypt, and Eritrea. As wives to gods, goddesses are said to possess independent mystical powers, which they display independently or in conjunction with their husbands. Goddesses are sometimes perceived as wives in polygamous settings, just as polygamy often prevailed as a widespread social practice in Africa.

In addition, goddesses are presented as industrious beings who are often well off financially. In the same vein, African women are hardworking and prosperous, sometimes more so than their husbands. Similarly, African indigenous religions conceive of women as possessing mystical powers, which they are at liberty to use in the service of a personal

agenda. Some refer to this mysticism as “witchcraft.” Often, allegations of witchcraft indicate some level of fear or awe concerning women’s lives and physiology, although these indications do not obliterate cases of witchcraft.

Goddesses are closely connected to the governance of some African communities. Osun, the goddesses of cool waters in Osogbo, Nigeria, is closely connected with the sovereignty of the town and the king. Osun is recognized as the owner of the land on which Osogbo stands. She is reported to have defended the people during wars, and provides for the people as well, including the provision of money, health, and peace. Appreciation for her care is demonstrated yearly in an elaborate festival that attracts devotees from within and outside Nigeria (Olupona, 2000). The king of Osogbo (Ataoja) rules in behalf of Osun; her support is crucial to the success of every endeavor in the land. Indeed, the state in which Osogbo is located is named after her. The relationship between Osun and the king and the indigenes of Osun State is that of mother and children.

SYMBOLIC CONSTRUCTION OF GENDER STUDIES IN AFRICAN RELIGIOUS TRADITIONS. As a social category, gender appears to influence the work of many scholars; this influence is reflected by their research in African religious traditions, as well as in African economics, government, and the media. Many scholars offer tangential evidence of their interest in gender studies in their writings on subjects other than religion. Some of these scholars are Kemene Okonjo (1978), Filomena Steady (1987), Karin Barber (1991), Bolanle Awe (1992), Molaria Ogundipe-Leslie (1994), Ifi Amadiume (1998), Mary Kolawole (1998), Anne Wynchank (1998), and Oyeronke Oyewumi (1999). Many other scholars focus their analysis of gender on African Christian, Islamic, and traditional religions: Judith Gleason (1987), Niara Sudarkasa (1987, 1996), Teresa Okure (1989), Rabiatu Ammah (1992), Deidre Crumbley (1992), Teresa Hinga (1992), Musimbi Kanyoro (1992), Anne Nasimiyu-Wasike (1992), Mercy Amba Oduyoye (1992, 1995), Sophie Oluwole (1993), J. Lorand Matory (1994), Amina Mama (1995), Diedre Badejo (1996), Flora Edouwaye S. Kaplan (1997), Dorcas Akintunde (2001), Mei-Mei Sanford and Joseph Murphy (2001), and Oyeronke Olajubu (2003).

Previously, gender studies in African indigenous religions have focused on rituals and symbols. Emanating from these studies are notions of fluidity in gender construction and the complexity attending gender as a social tool for religious analysis. This focus is especially true in light of other competing categories, such as seniority and lineage affiliation. African indigenous religions exhibit ritual features of transvestitism and interchangeable gender characteristics. Another feature is that women traditionally assume roles of leadership as priestesses, diviners, and healers. Furthermore, African religions view women as predominant participants in spirit possession. Scholars have propounded theories from different perspectives to explicate spirit possession and its implication for gender studies. Spirit possession in African in-

digenous religions bestows temporary respect and authority on women in some contexts, while in others it extends permanent benefits to the social status of women.

Symbols persistently reinforce the complexity of gender construction in African indigenous religions as conveyors of meaning in diverse contexts. Such symbols can occur as works of art, such as the sculpted birds that appear on elements of authority (e.g., crowns, staffs of office) among the Yoruba (Nigeria), or they can be hidden, such as the dance steps that are performed during the Nandi (Kenya) female initiation rites. An overriding principle for symbolism is interdependency in terms of gender relations. Symbols reinforce the authority of women who engage in their sphere of specializations (e.g., fertility), just as symbols reinforce the authority of men (master of the herd); neither could subsist without the other. Again, from these symbols, we may infer that the assumption of a total exclusion of females or males from any particular sphere in these indigenous religions is erroneous.

The introduction of Christianity to Africa began in the early centuries of the Christian era with the establishment of the Ethiopian and Coptic churches, though European missionary activities spanned (intermittently) the fourteenth to nineteenth centuries. Missionaries who introduced Christianity to Africa relegated women to the domestic domain, a division entrenched in biblical interpretations. However, with the emergence of the African independent, charismatic, and Zionist churches, the need to renegotiate gender relations became a relevant issue. Contributing to this need was the mass movement of worshipers from orthodox churches to the African independent, charismatic, and Zionist churches because African culture influenced the prevailing rituals in these churches. As examples of such influence, women assumed roles of leadership and symmetry of form in leadership cadres. Nearly all gender studies of African Christianity began because of these developments. Examples of such works include publications by J. Renita Weems (1991), Amba Mercy Oduyoye and Musimbi Kanyoro (1992), Musimbi Kanyoro and Nyambura Njoroge (1996), W. Musa Dube (2001), and M. Teresa Hinga (2002).

The history of gender studies in Islamic Africa is recent. On the one hand, there is the attempt to tease out feminist passages from the Qurʾān and strip away patriarchal interpretations that hindered previous appreciation. Such passages include the prophet Muḥammad’s statements enjoining respect and appreciation for women and equity between the male and female. Emphasis in this regard has been on *taqwa* (piety), which is required of all adherents irrespective of sex by Allah (Mernissi, 1995 and Wadud, 1999).

There is the perspective that prioritizes the influence of African culture in paradigms concerning women, and this influences the women’s understanding and practicing of Islam. A model is the leadership role of women in African culture, now manifested in various Islamic forms. This trend has manifested in two main ways. Some women following Islam

in Nigeria claim divine calling to devote all their time to prayers and healing practices for clients who come to them. This has consequently elevated the status of such women in Islam. Second, because of the identified need to take the African culture seriously for the propagation of Islam, women are now installed as chiefs in the mosque's structures. Titles among the Yoruba of Nigeria include the *Iya Addini* (woman leader) and *Otun Addini* (assistant to the woman leader).

It may be surmised then that an understanding of gender constructions in Africa is significant to any meaningful analysis and evaluation of African religious traditions.

RIGIDITY AND FLEXIBILITY IN GENDER CONSTRUCTION: THE RITUAL SPHERE. The realm of ritual has proven versatile for displaying gender construction and deconstruction. Central to these attempts is the perception in African cultures of blood, especially menstrual blood. The presence or absence of menstrual blood contributes significantly to the construction of gender in religion. In its absence, the patriarchy views the female to be as pure as a virgin and fit for the habitation of the deity in the form of, for example, votary maids, adolescent girls dedicated to certain deities until the age of marriage. These girls are forbidden to engage in sexual relations and their upbringing is closely monitored. Votary maids bring messages to the adherent at worship or festival periods during spirit possession sessions, and observe diverse types of taboos to reinforce their separation unto the deity concerned. River goddesses are often known to have votary maids. In the presence of menstrual blood, the patriarchy views the female, usually a wife, as suspect, even though she is extolled as a mother. This ambiguous status of the female accommodates serious compromises for power relations between the genders. In addition, access to power and authority are consequences of these classifications. In African indigenous religions, then, menstrual blood evokes joy and yet instills limitation. However, among some Africans, limitations are not a consequence of contamination but a means of avoiding a clash of powers. The sacred domain is perceived as the abode of power, just as menstrual blood, which contains potential life, is considered a conveyor of power. Thus, there is a need to separate these two realms of power to avert a clash; this is particularly true of the Yoruba belief system.

African dual perspectives on blood restrict women's access to sacred space during menstruation. Often this restriction is temporary, but it could explain the prevalence of post-menstrual women in leadership cadres. However, current research shows increasing numbers of women of childbearing age in positions of leadership in African indigenous religions, and priestesses may be of any age. In addition, there are females who occupy important positions in male religious groups. Such women play symbolic roles, ranging from keepers of secrets, to the "mothers" of males, including the *iya magba* ("Magba's mother" of the Egúngún Yoruba religious group). These female roles exemplify the African notion of interdependency, mutuality, and compassion of gender relations. Furthermore, the ambivalence marking African expecta-

tations and assumptions for female status become evident. Whereas some myths may describe women as unable to keep secrets, women in certain domains are indeed the keepers of secrets.

Gender relations often manifest themselves as a cultural fluidity corresponding to a ritual domain of indigenous religions. This fluidity tends to reinforce complex gender constructions. For instance, legendary goddesses are known to possess "wives" (devotees, votary maids, and mediums), just as certain gods do. Some community rulers are considered to be "wives" of their affiliate deities, who may be perceived as male or female (Matory, 1994). Moreover, certain Yoruba priests of *Şango* are transvestites who take on the role of the male "wives" of the deities by wearing female costumes and plaiting their hair in a feminine style. Alternatively, when under the influence of certain deities, some female mediums of various religious groups exhibit characteristics generally associated with males. For example, while possessed by *Şango* (Elegun *Şango*), female mediums become "aggressive" under *Şango*'s masculine authority.

African cultures often correlate group solidarity with gender construction. Group formations are expected of females in many sectors of the African polity, including economics, religion and social settings. While females practice group solidarity in many African religious traditions, males cannot be said to do the same. To explain this widespread practice of female solidarity, scholars of religion have propounded various theories. Whereas some perceive such solidarity as resistance against patriarchal suppression, others see it as an attempt to create an alternative space to empower women. In any case, clearly the motif of female group formation forms a salient feature of African religious traditions.

CONTEMPORARY FEMINIST SCHOLARSHIP AND AFRICAN RELIGIOUS TRADITIONS. Available research and publications on gender and religions in Africa are few. Nonetheless, publications by African female scholars on gender are increasing, which explains the significant impact such works have had on the study of African religious traditions. Although their focuses vary, these works generally pursue the following set of goals (sometimes a single work may fulfill two or more of these conditions): (1) to offer analysis of gender constructions in African religious traditions from the feminine perspective by allowing women to tell their stories rather than imposing constructed meanings on data; (2) to seek paradigms and models from past African religious experiences, spanning history and mythology for the construction of gender relations in contemporary African religious life; (3) to offer new feminist interpretations and meanings for familiar but patriarchal narratives in African religious tradition and to utilize this for balanced gender relations; and (4) to correct assumed meanings for certain aspects of African rituals by taking serious cognizance of meanings ascribed to such rituals by the participants.

African scholars of religion are beginning to restructure the academic constructions of gender by exposing the biased

implications proffered by colonial constructions of gender. The colonial experience in Africa instituted a disruption of gender structures by separating the integrated African domains of public and private space. This divisiveness, however, was attenuated in African religious traditions by an entrenched cultural recognition accorded female leadership prescribed in oral narratives. Viewed from a different perspective, the exposure of African religious traditions to the African diaspora since the 1970s has been tremendous. This exposure is particularly true of Yoruba religion, which can boast of adherents in every continent of the world. The movement of practitioners of Yoruba religion travels both ways between the continent and the diaspora. Priests and priestesses of Yoruba religion travel to the Americas and Europe to train and educate adherents, just as some adherents visit Africa regularly for training and renewal of energies. Consequently, this exposure has produced reliable research that compares and contrasts indigenous African religions with their variations in the Americas, especially Brazil, Cuba, and other parts of the Caribbean (Benard and Moon, 2000; Sanford and Murphy, 2001).

Such innovative research contributes to African scholarship by advocating cooperation among practitioners of diasporic and continental African religions. This cooperation has informed conferences, workshops, and symposia on the continent, as well as in the United States and Europe. The exchange of gender studies and religious traditions between the diaspora and Africa is producing fresh perspectives in understanding religious rituals.

Academic materials for investigating African religious traditions from a female perspective are now available in print and on the internet. Consequently, feminist scholars on gender and African religious traditions are establishing women's studies departments and gender institutes in African universities. Examples of such centers include the African Gender Institute at the University of Cape Town, South Africa, and the Institute of Women and Gender studies at the Makerere University in Kampala, Uganda.

OYERONKE OLAJUBU (2005)

GENDER AND RELIGION: GENDER AND NORTH AMERICAN INDIAN RELIGIOUS TRADITIONS

To pursue the theme of gender in North American Indian religious traditions is to bring the construction of gender, long in process, of ancient civilizations into dialogue with the concerns of the present. It necessarily involves a task of identifying carefully what gender means in traditional native cultures and defining the ways, past and present, that this aspect of culture can be assessed. Moreover it requires a critical appraisal of the propriety and accuracy of the conclusions made by those interpreters who were not inside the culture. Especially it demands a clear presentation of the relation of gender and religion, because this varies greatly from Western to traditional cultures.

THE CONSTRUCTION OF GENDER. The construction of gender—indeed even the understanding of it—always takes place in the wider project of imagining the shape of the cosmos as a whole. It is well known that the foundational insight of North American Indian traditions is that everything is dynamically alive, with relationships rather than rules as its laws. In such a world nothing and no one stands alone, but each is related to every other and the whole. Thus all is holy, sacred. The primary quality of each aspect is the spiritual nature of its being, which underlies the unique form that communicates its identity. This identity is not the external form but the complex reality of the inner life of that being. Gender as such is clearly related to this spiritual identity and is deeper than sexual marks of differentiation. These outer forms may change over a lifetime; the inner identity does not.

Significantly native peoples have a more diverse recognition of gender as it manifests itself in human life. Is it the early encounter with dualism that caused the western European world to see gender as only dual and complementary, male or female? Native peoples, over a long period of historical experience, recognized a third and even a fourth gender. Perhaps this cultural difference explains the cognitive dismay experienced by the European travelers as well as the curiosity of the early anthropologists and ethnologists. Among the distorted reactions were the harsh punishments dealt by the

Spanish conquistadores and the Jesuits who were unable to distinguish sexual identity in native terms from unlawful sexual acts.

Proper recognition of the insights of earlier researchers should be given. The spectrum of those who studied Native American culture ranges from the onset of colonization into the twenty-first century and in manners as diverse as enlightened description (e.g., parts of the *Jesuit Relations*) to hostile rejection of cultural forms. In the broad phylum of objective scholars, ethnologists and anthropologists (male and female) have contributed significant portrayals. Worthy of note is the work of Ruth Landes among the Ojibwa and Ruth Densmore's ambitious project to record (and thus preserve) the ritual music of many diverse peoples. The presence of such women in the ranks of social scientists opened the door to appreciation of women's contribution to culture and its core of religious meaning.

Despite the criterion of scientific objectivity, however, each observer brings a structured view of particular reality to the efforts to encounter and understand a different people. Thus in the New World, as in Asia, the predominant frame of reference was that of the Western world. It could not have been avoided in fact. But this perspective has often clouded the view of native peoples. It is certainly the case that the strong influence of Christianity caused the perception of women, of native religion, and of the central place of women in society to be distorted in perception and description. There are of course some great exceptions to this, but they are not the predominant view.

FEMALE CONCEPTS OF SACREDNESS. A powerful example of cultural dissonance is reflected in the early views that native religious traditions were pagan and based on superstition. Scholars of the nineteenth and twentieth centuries (e.g., James Walker, Owen Dorsey, Ruth Benedict, and William Fenton), in their earnest efforts to portray and understand the meaning of the dense ritual complexes across the continent, rescued the great body of native religious insights from vanishing. The growing contributions of contemporary native scholars—women and men—have created a more realistic and profound view of indigenous native religious beliefs and practices.

One particular aspect that merits attention is the fascinating dialogue between native concepts of the sacred and those of Western Christianity. In concert with the emergent feminist movement, women scholars have emphasized the particularity and richness of native concepts of the sacred. This is a large subject; thus it is only possible to give a few examples.

In one of the earliest works on gender in native America, *The Sacred Hoop* (1986), Paula Gunn Allen offers a richness of description as she strives to recover the feminine in native traditions. From her own perspective as a Laguna Pueblo woman, she describes the overwhelming feminine aspect of the southwestern peoples but also reveals the parallels in

other areas of the country. It is clear from her reflections and memories that there is the closest connection between a creatrix, Thought Woman, and the structure of reality as it proceeds from her sacred work.

At the center of all is Woman, and nothing is sacred . . . without her blessing, her thinking. . . . She is a spirit who pervades all, who created all reality and languages. This originating power is female in her primacy and potency. She is the mother of all, and as her surrogate, Mother Earth enfolds and nurtures all creation. (Allen, 1986, pp. 13–14)

Thus the Keres people see her as the source of all life, bringer of corn, agriculture, weaving, social systems, religion, ritual, memory, and so on. In her vast presence she is honored as Mother and Father of all peoples and all creatures. Her power is manifest in generativity and so is much broader than maternity. Earth and women are linked as homologous parts of creation; their sacred role stems from their relation to Thought Woman.

THE CONSTRUCTS OF GYNOCOCRACY. Allen then demonstrates that this feminine aspect of the sacred is related to social structures of gynococracy—a distinctive feature of native society that she sees as the predominant form of North American peoples before the coming of the Europeans. This is borne out by the current structures of Pueblo life, especially the Hopi, but also by the central role held by women in the confederacies of the Northwest and Southeast. Less obvious to the British was the powerful role of women among the Iroquois, but early records of encounter noted the high place of women among the Creek and Cherokee, because they were encountered in diplomatic missions.

There is a rich and growing literature on the subject of gender by native scholars and interested others. Credit should be given to one of the first pioneers, the Lakota anthropologist Beatrice Medicine. She initiated work by native women (e.g., Paula Gunn Allen, Patricia Albers, Marla Powers) who set about telling the stories of women in Native America. This is not to say that early students did not depict the life and development of native women. The shifting of history, however, ensured that what most caught their attention were the men who, throughout the nineteenth century, emblazoned across history the image of the heroic warriors and buffalo hunters who were fighting for the very survival of their culture.

In reality survival of a tribe depended on the full cooperation of all its members. Because biology makes women the bearers of children, they are also the keepers of the hearth. Yet in many native societies this was only one aspect of a much broader area of responsibility. All over the continent women have traditionally been associated with the earth. As previously noted, all reality is gendered, and the connection of women to the great source of nurture that is the earth reveals the enormous holiness and power with which she is endowed. This powerful connection appears in many nations in the great stories that preserve their heritage. Thus in the

Iroquois origin story the Sky-Woman is the first of the People Above to begin the process of external creation. As she falls from the Sky World, she is supported by birds with their wings outstretched until at last a creature of the waters offers her a resting place. Her rescuer is Grandmother Turtle, and it is from the initial encounter of these persons that Iroquois life begins. The theme of women's power continues, as Sky-Woman's child gives birth to the twin sacred persons who will establish the full creation. Similarly in the Lakota story of the White Buffalo Calf Woman a Sacred Woman comes from Wakan Tanka and brings the great gift of the Sacred Pipe, then and now the symbol of the people's link to the Great Mystery. In the Cheyenne story of creation Maheo, the All-Father, makes man and woman from two ribs taken from his side (implying an equal origination). And among the Navajo, Changing Woman is crucial to the creation of the Navajo and their world. Her presence is believed to ensure cosmic balance, and each girl is initiated into her role and image during Kinaaldá, the female initiation rite.

These stories attest to the high regard for the feminine in creation. This respect traditionally had great influence in shaping the life roles of native women. It is well known that the Iroquois League valued the advice and wisdom of women so much that the representative sachems could not be named or selected without the consent of the women. Historically women had the power to temper the balance of power of the war chiefs by counterbalancing them with men who sought peace. Even in the early twenty-first century the proper protocol for Atatarho, the chief of the sachems, is to have a woman as his mediator. Thus the traditional customs witness to the essential balance of male and female to ensure right order.

Among the agricultural peoples (e.g., the Hopi), the women owned the fields and therefore the store of food that was the source of their people's lives. Women were also expected to have talents in craft making (beading, pottery), and often there is a mythic person who is considered to impart this gift (e.g., Spider-Woman, Double-Faced Woman). The power of female fertility received great respect; in fact periods of fertility necessitated that a woman stay away from ritual spaces as well as from hunters and warriors. Her power was viewed not as impurity but as a power capable of interfering with and subverting male power. A woman was viewed by many nations as the heart of her people. The Cheyenne say it well: "A nation is not conquered until the hearts of its women are on the ground."

A crucial part of any study of gender rests on the ways it is constructed in any society. Before the advent of sociology and psychology, this issue was considered a natural dimension of traditional education. As such it was taught in an imitative and exponential way, not as part of logical discourse (though this too had its place, specifically at puberty ceremonies, in which care was given to define sexual and gender roles). But traditional education involves a broader method than classroom learning. An entire clan group was respon-

sible for imaging the roles adults have in contributing to the support of the whole group. Thus an intensive web of instruction accompanied a child from earliest years to the major threshold of adult initiation. This was true for girls and boys in a framework that allowed notice to be taken of those who did not quite fit the category.

WOMEN IN RITUALS. The place of women in rituals, and the links perceived between them and the rationale and goal of the ritual, is perhaps most strikingly seen in rites of initiation. One strong example (representative of many others) can be found in the Navajo ceremony of *Kinaaldá*. In origin and purpose it illustrates the feminine aspect of ritual practice as well as the connection between such rites and the common good that ritual aims to support. The rite of *Kinaaldá* derives from the Navajo story of their creation or emergence. In it a powerful spirit, miraculously placed on the earth's surface, creates the first humans from her own flesh. She is called Changing Woman because she embodies all the seasons of life as well as of nature. She is unvaryingly benevolent and continues to nurture her people, especially through Blessing-way, the chantway that is her gift, and through *Kinaaldá*.

What occurs in this Navajo ritual is a careful process intended to make the pubescent young girl a Navajo woman in potency and reality. This is accomplished by molding the girl into the image of Changing Woman and encouraging her to earnestly begin to emulate her model's qualities as woman through her contributions to the people. Thus physical strength, endurance, creativity, fruitfulness, and many skills and qualities are transferred to her during this special time when she is especially open to formative influences. The initiate is instructed to invite Changing Woman into her life, and in the realism of Navajo belief, this does happen. Thus the young woman is considered to be a special source of power for life and healing during this time. The rich ceremonial details of dress, painting, and ritual acts portray the transformation of the young girl into this powerful and benevolent spirit. Through this she is prepared to contribute to her people in life-giving ways throughout her life.

The remembered traditions of the peoples of North America reveal that the role of women in society and ritual is of utmost importance. Thus the varying ways of conducting the sun dance on the Plains insisted on the presence of the Sacred Woman at the heart of the ritual. This example demonstrates that, even in cultures that in historic times were seen as masculine (i.e., the warrior tradition that was so obvious to the invaders from the east), the whole could not be complete without the sacred presence of women. Any study of the elaborate ritual acts that made up the sun dance shows the profound understanding that the feminine is a necessary, constituent part of cosmic reality. Thus it is complementarity, rather than emphasis on a male or female hierarchy, that most accurately represents the religious understanding of native peoples of North America.

The sun dance represents not only thanksgiving for the gifts of life but also a primary moment to bring healing to

the people. The role of healing is central to indigenous religions and in North America involved both genders. Because it was a uniquely important spiritual calling, this role was usually entered through a call in a dream or a vision and a period of specific instruction by an elder, experienced religious authority. This vocation was not restricted to men, but a different path was usual for women. In the many stories that exist of medicine women, it is clear that they could not exercise their full spiritual power until they were past menopause. Specifically, although they could offer herbs for healing, they were not to engage in the profound act of spiritual healing. Similar to the principle that menstrual blood could interfere with the exercise of power, in carrying out her role the medicine woman did not risk the conflict of sacred powers. Among the many tribes in which the medicine tradition was inherited (nonlinearly), women also served the people. In some places (e.g., California) only women became medicine people.

WOMEN IN SOCIETY. The role of males in traditional native societies varied with regard to geographical location, modes of subsistence, and the shape of major cultural myths. But seen against the broad background of the prehistoric past, all had internalized the primary occupation of ancestors—the endeavor to win survival through hunting. The skills and perceptual acuteness needed for successful hunting created an ideal that perhaps found its apex in the Plains Indian buffalo-hunting culture. But strong masculine images were noted in most cultures Europeans encountered, and these emerge in the accounts shared by the people themselves as they surveyed their oral histories. Here, as with the female gender, the essence of the male person was regarded as in process and as eventually completed in a spiritual encounter with sacred power. This reveals that the virtue associated with the strong male image were not merely natural but part of a complex relationship with the creative power that fills all life.

The myths tell of the first peoples looking for a homeland and sources of life. They are portrayed as knowing their weakness and welcoming the interventions by gods or spirits who come to assist them.

A paradigmatic story comes from the Navajo, who fall into error regarding the essential balance of men and women, male and female, in life on Mother Earth. They are gently led to reunite by the intervention of a spirit who manifests the vitality and rightness of that balance in himself. In the Lakota story of extended beginnings, the prototypical warrior, Stone Boy, works arduously to make the earth safe for the people, and in the story of the founding of the League of the Hodenosaunee, the prophet Deganawidah finds it necessary to temper the uncontrolled warlike nature of Atatarho, whom he defeats by skillful diplomacy. A powerful transformation takes place when the ferocious warrior chief surrenders his passions and agrees to be the servant of all—the chief of chiefs who holds the council fires together. The Iroquois honor this memory of the shift from uncontrolled

aggression to diplomatic means to achieve harmony both within and around them.

Because the male was required to support not only his family but all those in need, much depended on developing a pattern of learning that relied on fostering certain virtues. Courage was paramount, but skill in tracking, patience in waiting, and the will to endure privations—often for long periods of time—were also crucial. These skills, although important, are minor compared to the habits of mind and soul. Thus many people valued generosity and altercenteredness and viewed the whole as contributing to the attainment of honor. Much was expected of the man, and the burden this could impose was often felt as heavy. Anthony F. C. Wallace's study of the Seneca, based on a lifetime of work by others, such as William Fenton, illustrates how such pressure was in need of a means to release it without shaming the warrior. He notes the wisdom of a community that paid great attention to dreams, seen as early as the 1600s, as "wishes of the soul" and the acumen of soul that instituted a way private dreams could be enacted at the Midwinter (New Year's) Festival and answered in appropriate ways by the community. It is important to note here that the Iroquois, remembered by history as fearsome warriors, were actually part of a matriarchal society and that one of the most highly regarded warrior societies on the Plains was that of the Cheyenne, who were renowned for their courage and discipline and spirit of sacrifice. Their allies and friends the Lakota remarked that the Cheyenne women deserved as much honor as their men, being famed for their character and the extraordinary companionship, which they provided in peace and war.

The activities that occupied warriors concerned the support and defense of the people—both very serious responsibilities. They were also encouraged to hone their skills in sports and gaming and did so with relish, but the reality of their role was never far from their minds. Even though the level of aggression was magnified greatly by the dislocations and impact of colonization, raiding had a large part in life on the Plains and the severely impacted Northeast. One example shows what was really at stake in such skirmishes. Many peoples vied for honor by successfully getting away with horses or other goods by skillful stealth. The highest honor in fact was credited to the person who had the bravery to get close enough to a living enemy to touch him or her and escape with his or her own life intact.

More seriously, in the epic years of the final battles for freedom of the northern Plains Indians, the Lakota and Cheyenne each had a band of volunteers who joined sacred societies such as the Kit Fox Society or the Dog Soldiers. Each man had vowed to defend his people to the point of death. The Dog Soldiers wore a sash that, dismounting, they tied to the ground in the forefront of the battle. They understood the price and were willing to pay it. The descendants of the warrior societies of North American Indians have volunteered to fight in the major battles of the twentieth and twenty-first centuries. They have continued to distinguish the vital heritage from which they come.

GENDER RECOGNITION. Because sacred power is inextricably related to gendered living, it is not surprising that the freedom and creativity of that sacred power is ultimately the key to gender in Native America. Although the roles of women and men are clearly defined, they also are not strictly limited to sexual identity. It is not uncommon to find men, as among the Hopi, who do the weaving or to find women who are capable of excelling in manly arts. Apparently it is hard to limit the creative power of the sacred. Thus no one was surprised when a sister of a Cheyenne warrior, seeing him struck from his horse in battle, raced to take his place. Though Buffalo Calf Road Woman is vividly remembered, it was viewed as natural for her to assume that role.

More tellingly the recognition of other genders can be traced to a similar foundation. This aspect of gender has been captured in some early accounts, mostly in an objective way. Women such as Ruth Benedict (1887–1948), Alice Kehoe, Ruth Landes (1908–1991), Margaret Mead (1901–1978), and Ruth Underhill (1883–1994) actually strove to present sensitive descriptions based on intensive conversations in the field. But the real breakthrough occurred only in the last quarter of the twentieth century with the work of Walter Williams, Sabine Lang, and Paula Gunn Allen among others. What their contributions reveal is that a large range of gender issues have escaped the net of scholarship. The reasons are understandably many. So much of native culture has been interpreted by outsiders looking in that the deepest parts of sacred traditions have been carefully guarded. Part of that reality is the long-standing recognition of the existence of more than two genders, framed by the steady opposition of Christian Euro-Americans. Sadly some of these prejudices have crossed over during the difficult period of forced education that had assimilation as its goal. Traditional language, customs, and values were targeted for extinction. An inevitable part of this was the imposition of mores that are culturally alien to the native peoples. Thus the subject of diverse models of gender is often met with embarrassment, and some persons whose identity is neither male nor female have met with intolerance on their own reservations.

There is, however, a powerful lesson to learn from the traditional understanding (admittedly complex) of gender diversity. The kinship circle, which embraces all of life for a native person, includes a variety of gendered persons whose place in the community is determined by careful identification of recognized gender characteristics. Thus the designation of someone as a *winkte* among the Lakota or as a *nádleeh* among the Navajo rests on qualities that indicate a person's role in society rather than sexual identity. Growing contemporary research reveals a traditional past in which wide gender variety was regarded as part of the natural order. In some societies such persons were believed to possess special powers that could help the community flourish. The term *two-spirit*, in favor at the beginning of the twenty-first century, has been chosen to indicate the connection of such persons to the spiritual world, in particular their special place in ritual.

Early anthropological research brought the biases and categories of the Western worldview to the study of gender variances. Faced with a complex image of wide diversity in this area, the reports of these scholars could neither embrace nor appreciate the rich universe of meaning they had encountered. One example is the common use of the French term *berdache*, which is not only taken from a foreign context but is also burdened with a specific meaning (e.g., homosexuality, transvestism, hermaphroditism) unsuited to the broader universe that emerged at early encounters. Although this term was intended as a positive description of North American Indian customs, it could not begin to translate the rich diversity in balance with a view that all things are in dynamic process toward the cosmic purpose of everything that exists—*hozho*. The rich diversity in gender is not exceptional but rather a vital dimension of a multifaceted reality. The classification given by Wesley Thomas at the 1993 Wenner-Gren Conference in Washington, D.C., offered four main classifications known by the Navajo: feminine female, masculine male, masculine female (*nádleehi*), and feminine male (*nadleehi*). He notes that a crucial difference separates Western and traditional Navajo concepts relating to gender, sexuality, and sexual relationships. Thus a relationship between a female-bodied *nádleeh* (masculine female) and a woman or one between a male-bodied *nadleeh* (feminine male) and a man are not seen as homosexual in traditional Navajo culture.

That gender was distinguished from sex is clarified in a seminal paper (never published but widely circulated) by the highly regarded Lakota anthropologist Beatrice Medicine in 1979, revised as part of Patricia Alber and Beatrice Medicine's, *The Hidden Half: Studies of Plains Indian Women* (1983). Beatrice Medicine notes that the traditional vocation of the *winkte* included roles as ritualist, artist, specialist in production of women's crafts, herbalist, seer, namer of children, and (perhaps most interesting) rejection of the warrior's role. Among the highly disciplined Plains Indians, the warrior's place was greatly esteemed. To reject it required conviction and courage. Thus the *winkte* occupied a unique place in traditional Lakota society, as did the equivalent in many other cultures. It was Beatrice Medicine's intent to examine the changes wrought by urbanization imposed by the Bureau of Indian Affairs. For the young men and women transplanted to urban and intertribal settings, adaptation was a difficult process. One of the dimensions of native life that did not transfer well was the area of gender diversity. In a larger society unable to deal with ambiguities, labels were hastily applied. The distinction between gender and sex is perhaps too foreign for general acceptance, and certainly the circumstances of invasive cultural drifts onto the reservations complicated this area of culture. Thus the traditional context has been harder to retain, both on and off traditional lands. Medicine sadly notes that native *winkte* have experienced discrimination not only in the mainstream society but also at home. Thus a dimension of native spiritual understanding that has so much to offer the Western world has suffered a

unique form of repression. The emerging voices and research in the twenty-first century of mainstream gay activists and their eagerness to lift from oppression victimized others holds a promise of a battle that could result in a better resolution.

Clearly, there is an innate link between gender and North American Indian religious traditions. Due to its limited scope, it can only be a summary of an exceedingly rich field. Through the early efforts of anthropologists and ethnologists to describe and understand them, through the great generosity of the people who were convinced of the need to speak, and now through the growing numbers of Native Americans who are speakers for themselves, a rich tapestry of variegated beauty is emerging. Their world is so much older than that of Euro-Americans, and their insights into the nature of reality enrich the story of the world's religions. They speak of wholeness, of complementarity, mutuality, and of harmony. Their image of difference is one that strives for unity yet preserves distinctness as the proper order of creation.

GENDER AND RELIGION: GENDER AND MESOAMERICAN RELIGIONS

Religion forms an integral part of everyday life for indigenous peoples of Mesoamerica. Indeed, religious beliefs and practices cannot be separated from politics, healing, production, and other aspects of life. This article explores the relationship between religion and gender in Mesoamerica, or Middle America, a region extending from Central Mexico to Honduras. The area designates the territories where the ancient Aztec and Maya cultures flourished. Contemporary descendants of these cultures have retained core elements of the Mesoamerican cultural tradition despite a legacy of imperialist invasions. The sections below on the pre-Columbian and colonial periods focus on the Nahuatl-speaking ethnic groups of Central Mexico, including Mexicas, commonly referred to as Aztecs. The section on contemporary religions focuses on Mayas of Chiapas, Mexico.

RESEARCH ON GENDER IN MESOAMERICAN RELIGIONS. A gendered perspective on Mesoamerican religions began to emerge in the scholarly literature in the 1960s. Prior to this time scholars were mainly preoccupied with male forms of power in both the material and spiritual realms. The Spanish chroniclers who came to Mesoamerica in the sixteenth century included Bernardino de Sahagún, Alonso de Zorita, Diego Durán, and Toribio Motolinía. They were influenced by Christian beliefs and practices and by their patriarchal ideology. Their writings give little attention to the important role women played in religion or in other aspects of life, although they do describe the gender dualities of Mesoamerican deities and the independence of women.

Ethnographers conducting research before the 1960s tended to generalize from data about men to communities at large, although they did note the gender specialization that characterized Mesoamerican life. They reported that involvement in religion was a daily aspect of life for women, comple-

menting men's more formal roles in ritual events. Influenced by the women's movement in the 1970s, anthropologists, historians, and art historians brought a critique of Eurocentric assumptions about religion and gender to their research on Mesoamerican religions. Their studies indicate the significant economic, social, and spiritual roles women filled in Mesoamerica before and after the Spanish invasion. Subsequent scholarship has avoided sweeping generalizations by focusing on the local variations in gender arrangements and religious beliefs and practices across time and space. These studies have changed the way scholars view many traditional dichotomies, such as the domestic/public, sacred/secular, and natural/cultural spheres.

Feminist critiques of the marianismo/machismo dichotomy proposed by the political scientist Evelyn Stevens exemplify progress in refining understandings of gender in Mesoamerica. In a 1973 article, "Marianismo: The Other Face of Machismo," Stevens based marianismo on the Virgin Mary and defined it as "the cult of female spiritual superiority which teaches that women are semi-divine, morally superior to, and spiritually stronger than men" (Stevens, 1973, p. 91). Feminist scholars, such as Marysa Navarro, have criticized marianismo for labeling nonindigenous women throughout Latin America as passive, self-sacrificing, and dependent; for lack of grounding in any specific cultural, geographic, or historical context; and for ignoring the many ways that Latin American women have participated in political movements to challenge gender inequalities.

PRE-COLUMBIAN PERIOD. Gender roles are never static across time, geography, or social groups. Prior to the ascendancy of the Aztec state, gender roles in central Mexico had an egalitarian base, and gender was more fluid and negotiable than the first European chroniclers reported. In "Gendered Deities and the Survival of Culture," the anthropologist June Nash documents how changes in Aztec political structure transformed religious symbols and the position of women relative to that of men. Prior to the development of state-level societies, the core social unit in Mesoamerican societies was kinship-based, composed of clans. Later these clans became the basis for complex social stratification. During the formative period of what became the Aztec state (beginning around 800 CE), many deities were dual gender or androgynous figures. Coatlicue, Mother of the Gods, embodied opposites: life and death, night and day, light and dark, and male and female. But by the time of the reign of Itzacóatl (1429–1440), the Aztec empire was a military state with distinct class and gender stratification. During this period, Huitzilopochtli, the male sun god and war deity, replaced earlier androgynous deities.

Significant class distinctions within the Aztec state divided the nobles, who held political office and controlled the economic resources, from the *macehuales* (commoners) who paid rent and made up the majority of the population. Gender roles varied by class. The daughters of the nobles attended the *calmecac* (school for the elite) and could become

priestesses. Commoners of both genders filled important ritual roles in their homes and fields.

Although the Aztec state denied women leadership roles, they had equal rights with men legally and economically. They were active producers, healers, and priestesses. A number of scholars describe gender parallelism among Aztec women, with males and females filling different but complementary roles. Most women's work was centered in the home and included weaving, spinning, sweeping, cooking, and caring for children. These tasks were highly valued and had a sacred significance; the home was a place of power. Aztecs compared women's work in childbirth to men's roles as warriors. While priests swept the temples, women swept their homes to defend them against danger and chaos. Wives of warriors swept not only at dawn but at noon and dusk, marking the sun god's path and assuring their husbands' success in battle. As further assurance, women placed their weaving shuttles, symbols of their husbands' weapons, on temple altars.

COLONIAL PERIOD. The Spanish colonization of Mesoamerica in the sixteenth century led to dramatic changes in the social and spiritual lives of the locals. Millions of indigenous people were killed by disease, warfare, overwork, and murder. Whole villages were relocated and given new Christian names. By the early 1600s, Catholic churches had replaced Aztec ceremonial centers. Men and women were pressed into service and forced to pay tribute in the form of woven goods and agricultural products.

Spanish colonial priests and friars brought with them dualistic philosophical premises that profoundly contradicted those of the indigenous people. They emphasized free will, for example, while indigenous people tended to stress collective will, particularly at the household level, where marriages were tied to household production. In *Weaving the Past*, the ethnohistorian Susan Kellogg describes how the Spaniards focused on married couples rather than the extended family groupings that were so important in Mesoamerica. Friars exhorted young women to protect their virginity and to seek enclosure through acting modestly, covering their bodies fully, and staying home as much as possible. In some parts of Mesoamerica, priests constructed dwellings where young betrothed men and women came to stay until marriage. Yet priests gave no practical instructions to women and their daughters on how to sequester themselves when they were forced to work outside their home to provide tribute and to survive.

Physical intimidation of women became part of the fabric of life in colonial society. In indigenous communities, the tensions between native and colonial views of proper gender roles undoubtedly fueled the increasing violence toward native women. Men were forced into patriarchal roles in societies where gender equality and cooperation remained a strong principle, and in response to these stresses, many native men resorted to hitting their wives and sometimes to murder. Alcohol abuse was often a factor in the violence. The

church encouraged native women to submit to their husbands' authority and to endure violent behavior, further undermining traditional complementary roles.

Native women were not passive in the face of these abuses. Kellogg explores the religious and spiritual roles women used to gain power and deal with the violence and stresses of colonial life. They served as midwives, *curanderas* (healers), sweepers of the church, and guardians of young women. As guardians, matrons escorted, advised, and protected young girls in schools run by the church. In both Nahua and Maya communities, women also became members of *cofradías*, religious confraternities dedicated to the cult of a particular saint or aspect of the Christian deity. These offices allowed women some continuity in authority roles as priestesses and helped maintain a parallel gender structure in government.

During the sixteenth century, the Spanish attempted to enforce their belief system by linking the once-powerful female deities and women's roles as healers and midwives to evil and sorcery. In spite of these associations, some female-oriented beliefs, symbols, and practices persisted. Especially in central Mexico among the Nahuas, female deities were powerful symbols of fertility, sexuality, important foods, and other resources. Friars saw these deities as symbols of pagan beliefs that needed to be expunged. They were never entirely successful in eliminating them, however, due in part to their fear of entering native homes or places of worship, which they believed were tainted by the devil and would endanger their souls.

During the colonial era, the Virgin Mary was the only major sacred female figure Christianity had to offer to the indigenous people. Many women reported that they communicated with the Virgin as well as with Jesus, God, the saints, and demons. These women were viewed as mystics if they lived in convents, where they were tightly controlled. The Monasterio of Corpus Cristi, the first convent for indigenous women, was established in Mexico City in 1724. Only the daughters of the indigenous nobles were accepted as novices in the convent. Most indigenous women did not live in convents, and they were often punished for their revelations. In or outside of convents, women's intimate communications with spiritual beings challenged the male church hierarchy's authority as the only legitimate mediators between human beings and spiritual beings.

Over the years native peoples infused the basic Catholic symbol of the Virgin Mary with new meanings. They found in her both an ally and a symbol of their empowerment and liberation. She is often associated with revitalization movements initiated by indigenous people during the colonial era. Several of these movements incorporated armed uprisings, which simultaneously resisted Spanish domination and reasserted indigenous beliefs and practices. A vision of the Virgin inspired the 1712 revolt in the Mayan community of Cancuc in Chiapas. A young woman named María de Candelaria reported that the Virgin Mary had appeared to her and asked

that a chapel be built. When the local Spanish priests refused to recognize the visitation, thirty-two indigenous towns joined in a revolt against Spanish control. Their leaders claimed that Saint Peter, the Virgin Mary, and Jesus had called them to create an indigenous priesthood and to liberate themselves from Spanish power. Over a six-month period in 1712 and 1713, Spanish soldiers and their supporters suppressed the uprising. Subsequently, colonial officials instituted minor economic reforms to placate the indigenous population, however these reforms had little effect on reducing their impoverishment.

THE TWENTIETH CENTURY. Prior to the mid-twentieth century, most Mayan peoples of southern Mexico and Guatemala practiced a form of folk Catholicism commonly referred to as Traditionalism, which creatively combines beliefs about Mayan deities with local understandings of Catholicism. Central to Traditionalism are prayer, pilgrimages to places of sacred significance, and festivals carried out in honor of saints on important feast days. By the 1970s and 1980s thousands of indigenous peoples throughout Mesoamerica began to abandon Traditionalism in favor of Protestant churches and progressive Catholicism.

Traditionalism. In indigenous communities in Mexico and Guatemala, women play important roles that assure the physical as well as emotional, social, and spiritual well-being of both individuals and communities. For example, women take on important cargos, work on behalf of their communities, literally burdens or weights. Women's cargos include reciting prayers, preparing traditional foods, weaving ceremonial cloths and garments, and working alongside their husbands in a year-long series of obligations to a particular saint. Women often receive the call to serve a cargo from a saint in a dream or vision. After receiving the call, they request their husbands' assistance to fill the cargo. In many indigenous communities, cargo service underscores the complementarity and interdependence between males and females.

Women gain status and heat, a sign of spiritual strength, by working as midwives, healers, and cargo holders. Conceptions of human development among many Mesoamerican peoples see a person starting life in a cold state and then becoming hotter and hotter as he or she matures through serving his or her community. At death a person returns to a cold state. Women can acquire as much heat as men if they fulfill many duties for their communities. Women who communicate with powerful Christian and native deities on behalf of individuals and their communities are respected for their heat and knowledge. These women also enjoy significant independence, often traveling long distances in the night to visit people in need of their services.

Several key conceptions of deities from pre-Hispanic times survive in contemporary Mesoamerica. In highland Chiapas, earth, moon, caves, water, and the Virgin Mary are believed to embody powerful female spiritual forces. The sun is associated with a male god and Jesus Christ. A mother/

father/ancestor/protector deity, called Totilme'il in Tzotzil-speaking towns and Me'tiktatik in Tzeltal-speaking towns, is important in daily life. Androgynous conceptions of deities exist as well. In San Pedro Chenalhó, Holy Cross, one of the three patron deities, is said to be androgynous and capable of both benevolent and malevolent acts. Dual and androgynous deities in contemporary Mesoamerican communities suggest that fluid and complementary symbols of gender exist alongside patriarchal ones.

Catholicism. Beginning in the 1960s, the Latin America Catholic Church underwent dramatic changes. The historic meetings of the Second Vatican Council between 1962 and 1965 and the Latin American bishops meeting in Medellín, Colombia, in 1968 emphasized the structural roots of poverty and called on the church to take concrete actions to end injustice. A progressive Catholicism began to spread in regions of Mexico, Guatemala, El Salvador, Honduras, and Nicaragua. It followed the "preferential option of the poor," placing marginalized peoples at the center of the church's work. Although class rather than gender was the primary concern, the Catholic Church attempted to involve women more fully in its work by training them as workshop leaders and catechists.

Since the 1970s in Mesoamerica, women have been particularly active in Christian base communities, small groups of men and women who meet to discuss their faith and interpret the conditions of their lives through the lens of Catholic doctrine. Through participation in base communities and in other lay roles, women perform important social, religious, and political work in their communities. They also question traditional gender roles, like the division of domestic tasks. Many women began their work in social activism in the Catholic Church. For example, Rigoberta Menchú, an indigenous woman of Guatemala and Nobel Peace laureate, first became involved in social activism as a catechist. In her 1984 autobiography, Menchú recalls the powerful experience of reading biblical stories of men and women who struggled to lead their people from oppression.

In the 1970s in Mexico's southeastern state of Chiapas, women throughout the Catholic diocese of San Cristóbal de Las Casas began to participate in local groups in which they read the Bible and discussed their problems. The most significant problems women face are poverty, racism, alcohol, and domestic violence. In 1992 these grassroots groups became formally linked through the Diocesan Coordination of Women (CODIMUJ). In hundreds of local groups throughout the diocese, the women of CODIMUJ meet to critique unequal gender relations and also to challenge structural forms of oppression, such as racism, political repression, and destructive economic policies.

Protestantism. Many indigenous people in southern Mexico and Guatemala began to convert to Protestantism beginning in the 1970s, with the Pentecostal and Presbyterian churches attracting the largest numbers of converts. (Studies estimate that 20 to 30 percent of the residents of

Guatemala and Chiapas are Protestant.) Through affiliation with Protestant churches, poor women find support in surviving dramatic social and economic changes and in some cases for challenging gender subordination.

The anthropologist Linda Green notes that evangelical churches in Guatemala provide a safe space where Mayan widows of the civil war create new forms of community and share emotional, psychological, and material support. Protestant congregations allow native people to reestablish a lost sense of community by creating fictive kin ties, calling one another *hermano* (brother) and *hermana* (sister). As people reconstruct their lives in times of social upheaval, they draw on past and present events, creatively blending indigenous worldviews with Christian ones. For example, it is not uncommon for Protestant converts to seek the assistance of traditional healers to treat grave illnesses. Through participation in new Christian churches, men and women redefine gender roles, relations, and ideologies by challenging social problems, such as alcoholism, domestic violence, and spousal abandonment. Women often initiate conversion within households, realizing the specific benefits they gain from ideologies that encourage men to stop drinking. Women's acts of conversion and activities in all-women's groups are part of a broader autonomy movement that sends a powerful message to outsiders that indigenous peoples can control their own affairs. Men have responded to women's new roles in a variety of ways, sometimes converting to new religions after their kinswomen convert, other times punishing their kinswomen for making major changes in their households.

RELIGION IN SECULAR MOVEMENTS. Religion is important even in secular movements in Mesoamerica. In contemporary Chiapas, the uprising of the Zapatista Army of National Liberation (EZLN) in 1994 was one aspect of a broad revitalization movement that began to build in the 1970s as a response by indigenous people to their waning control over their lives. Women have played a prominent role in the EZLN uprising, both as military insurgents and as members of civilian support bases who provide material aid to Zapatistas and implement Zapatista programs. The EZLN is a secular movement but includes people from a range of religious affiliations, including Catholics, Presbyterians, Pentecostals, Seventh-day Adventists, and Traditionalists among others. It differs from previous revolutionary models in respecting the religious choice of each member. Members of Zapatista base communities commonly pray before meetings, read the Bible together, and attend religious celebrations.

Women play central roles in base communities by reevaluating their ancestral traditions and bolstering those that serve their own and their households' well-being. The traditions women say they want to preserve are those that do not require centralized or hierarchically organized leadership and in which women have considerable authority. These include preparing altars to welcome back the souls of deceased loved ones on the Day of the Dead; preparing traditional foods daily and for special ceremonies; healing through herbs,

prayer, and dream analysis; using a falsetto voice to show respect for elders who have held community cargos; contributing to pilgrimages three times a year to water holes and other sacred places; and weaving and wearing traditional clothing brocaded with ancestral cosmological motifs.

GENDER AND RELIGION: GENDER AND SOUTH AMERICAN RELIGIONS

Religion is central to South American society. Daily life and major events are marked, celebrated, and aided by the performance of religious rituals derived from a range of traditions, including Andean, Inca, shamanism, Catholicism, and Protestantism. In agricultural areas planting and harvesting are imbued with religious meaning. Marriage, healing, and even travel require celebration of religious rituals. Religion in South America also reflects and reproduces gender norms in the society. Forms of veneration, rituals of healing, rites of reconciliation, and specific religious cults follow gender lines.

RESEARCH ON GENDER AND RELIGION IN SOUTH AMERICA.

The gender specificity of religious belief, practices, and rituals in pre-Columbian South America defied the logic of the Spanish who invaded the region in the sixteenth century. The principle characteristics of Andean and Inca religion are gender parallelism and complementarity, which reflect and reinforce social organization. By contrast, Spanish Mediterranean monotheistic religion in which a supreme male deity dominated supported a patriarchal model of the society in which men presided over the family and society. Spanish chroniclers misunderstood Andean and Inca religion and condemned religious practices that defied the patriarchal model by suggesting they were the work of the devil. Inca worship of a masculine Sun as the principle deity and of the feminine Moon as its counterpart seemed to the Spanish a result of diabolical intervention. Although they did not understand them, Spanish chroniclers recorded their observation of gendered practices of worship and of male and female deities. Their accounts provide researchers with insight into the gendered cosmology and practices of pre-Columbian South American society. Spanish clergy, including Pedro de Cieza de León, José de Acosta, Cristóbal Alborno, Pablo José de Arriaga, Bernabé Cobo and Martín de Murua, whose goal was to eradicate local religion and establish Catholicism, also provide much of the available source material for understanding pre-Columbian South American religion. Andean and Inca manuscripts, including the Huarochirí Manuscript, and the accounts of Felipe Guamán Poma de Ayala and "El

Inca” Garcilaso de la Vega provide knowledge from an indigenous perspective. Researchers have examined these accounts using gendered categories of analysis to gain insight into the female, male, and androgynous components of Andean and Inca religion.

Archaeological evidence has also provided insight into the gender specificity of religion and ritual in South American society. Archaeological remains are subject to different interpretive challenges because analysis of them reflects contemporary assumptions about gender and worship. As a result, women’s roles depicted in artifacts were sometimes ignored or misinterpreted. For example, in 1980 Anne-Marie Hocquenghem and Patricia J. Lyon identified a figure with long braids and feminine dress depicted in a Peruvian Moche “Sacrifice Scene” as a Moche priestess. Their interpretation was contested by researchers who identified this figure as male. Only in 1991 when the remains of a tomb where the ritual had been enacted in practice was found and the participant’s bones were identified as female did researchers concur with Lyons and Hocquenghem that the image in the picture was that of a woman. Even with this recognition, the female figure was ascribed lower status than that of her male counterparts in the Sacrifice Scene. Two men depicted in the Sacrifice Scene often were identified as Moche warrior-priests and rulers, whereas the female figure was identified as a priestess rather than a ruler.

Irene Silverblatt’s influential book, *Moon, Sun, and Witches* (1987), was among the first to provide a gendered analysis of Andean and Inca religion and the impact of Spanish Conquest. Using Spanish sources, Silverblatt concluded that gender parallelism and complementarity were core characteristics of Andean cosmology and of the organization of religious cults. She argued that the Incas used gender ideologies and religious practices to extend their control over Andean communities. Kathryn Burns’s *Colonial Habits: Convents and the Spiritual Economy of Cuzco, Peru* (1999) carried a gendered analysis of religion into the colonial period. She demonstrated that the Spanish used religion and gender to assert control over the Incas and to establish a colonial order. Burns examines the Spanish foundation and development of two Catholic convents in the Inca capital of Cuzco. She argues that, by facilitating an inextricably linked exchange of prayer and material resources with the people of Cuzco, women religious played a central role in what she describes as the spiritual economy of colonial society. This research is complemented by ethnographic studies (e.g., Allen, 1988, Glass-Coffin, 1998) that illustrate the centrality of gendered practices of religion in contemporary Andean society, suggesting that elements of pre-Colombian religious ideals of Andean parallelism and complementarity survived Spanish conquest.

ANDEAN PARALLELISM. Andean parallelism and complementarity are perhaps best illustrated by Pachamama and Pachatira. Pachamama, literally Mother Earth, is said to embody the generative forces of the earth and to sustain society by

providing nourishment. She cannot, however, realize her procreative powers without a male celestial counterpart and is often paired with Illapa (or Rayo), the god of thunder and lightning, who dominates the heavens and provides the rain necessary for crop production. Pachamama is also inextricably linked with Pachatira, a temporal and material dimension of the earth associated with masculinity. Pachamama and Pachatira appear to represent different aspects of the pacha’s nature as both a nurturing figure, yet also a potentially angry force that may punish people and requires their worship and sacrifice in exchange for sustaining them. Pachamama/Tirakuna may appear as distinct manifestations of Mother Earth with Tirakuna seen as sacred places identified as “Fathers” and Pachamama as the earth as a whole. Thus, rather than being completely separate, Pachamama/Tirakuna are distinct manifestations of a gendered Mother Earth.

Pierre Duviols observed that gender parallelism transcended life so that when elite Andean people died, they were transformed into two entities: a *mallqui*, the mummy of the live person and the feminine half that represented the seed of future generations, and the *huaca*, the masculine half, a phallic rock that represented the inseminating force. Thus like the Pachamama/Tirakuna the individual reflected a unified whole that was nonetheless gender distinct. Similarly Andean couples are known as the single composite word, *warmi-qhari* (woman-man), suggesting that couples represent a unified whole. This assumption is reflected in the mandate that only couples may perform religious cargos—elective offices held for a one-year term by male community members charged with responsibility for overseeing civil and religious activities crucial to indigenous communities’ survival—like that of fiesta sponsors.

RELIGION, GENDER, AND STATE EXPANSION: INCAS TO SPANISH. From 1200 to 1400 CE the Incas embarked on a program of expansion and conquest over surrounding Andean communities, which would lead them to control an area that spanned a third of the South American continent. Irene Silverblatt argues that the Incas, recognizing Andean religious practices and beliefs, used gender ideologies to mask their control. They sought to graft Inca divinities onto local Andean religious structures, thereby using them to establish legitimacy and authority. Central to this assertion was the Incas’ establishment of a masculine Sun as the principal deity from whom all Inca men descended and who presided over the Inca kingdom, and a feminine Moon from whom all Inca queens descended and who presided over the earth and the sea. Thus the Inca kings were said to be sons of the Sun, and the Inca queens were the daughters of the complementary feminine Moon. The Incas made Mamacocha (Mother Sea) a descendant of the Moon and proclaimed her mother of all waters: streams, rivers, and mounting springs. Andean cosmology asserted that Pachamama’s daughters embodied highland products and provided Andean people with knowledge of them and methods of cultivation. Saramama was associated with maize; Axomama, with potatoes; Cocamama, with coca; Coyamama with metals; and Sañumama, with

clay. The Incas used this ideology by claiming that an Inca queen, Mama Huaco, had introduced the sowing of corn in the Andes, thus attributing to her the base for the survival of Andean communities and the Inca kingdom. The Incas thus used Andean cosmology to expand their empire.

The Incas also used gender and women to extend their control over communities through a system of female cults, marriage, and sacrifice. Chaste girls, *acllas*, were selected from Andean communities and they became virginal wives of the Sun. They were separated from their communities and sent to *acllawasis* (*aclla* houses) located in each province's state-run capital. After they were selected these virginal girls might become permanent servants to Inca divinities, or they might marry Incas or other men chosen by Incas. Those girls who served the deities were taught "women's tasks" including spinning, weaving, and the preparation of *chicha* and special foods that they provided for the service to the Inca king and gods. Although some Andean girls were selected as *acllas*, others were chosen for sacrifice. The number of human sacrifices appears to have increased during the Inca Empire and new ideals about human offerings developed. The Inca directed and controlled human sacrifice and used a variety of methods, including strangulation, burial, cremation, removal of heart and offering blood and heart while burning the body, and throat cutting in which the victims blood was offered. The Inca also buried victims alive or left them to die of exposure on mountains after they had been made insensible by drink or blows to the head.

These sacrifices were gender and age specific. Male sacrifices often involved bloodletting, whereas female sacrifices consisted of death by a nonblood-releasing means and burial. Most sacrifices were of prepubescent children who were selected by their communities for their beauty and brought to the Inca capital, Cuzco, where they were presented in a public ceremony. After the ceremony the children of the *capa cocha* ritual were returned to their communities where they were buried alive and then established as a local cult often overseen by their own family members. These sacrifices enhanced the community's privilege within the Inca kingdom and that of the girls' fathers and family members within their own communities. It provided a means of expanding Inca control.

The Spanish sought to establish patriarchal Catholicism in the Andes, and they introduced a distinct conception of sin. Although they did not understand Andean gender parallelism or complementarity, the Spanish nonetheless used gender to assert their authority and to expand their control. Because the Spanish did not share the same culture with the Andean and Inca people they sought to conquer, they relied on force and violence. Burns observes that during a brief respite in the violent conflict that threatened to destroy the nascent colonial society in Peru, the conquistadores established Santa Clara Catholic Convent in the Inca capital of Cuzco. Half a century later a second convent would be built in Cuzco atop the ruins of *acllawasi*. Santa Clara's purpose was

to transform the daughters of Inca queens and Spanish conquistadores into culturally Spanish women who might either become nuns to serve God or marry Spanish men. Among the first entrants to the convent was the last Inca ruler's six-year-old daughter. These girls were wrested violently from their Inca mothers so they might be transformed. Although the purpose of Santa Clara convent was to create culturally Spanish girls of the mestiza women, the conquistadores' efforts were thwarted by the Spanish Abbess Francisca de Jesús and the small minority of Spanish nuns who distinguished themselves from their mestiza counterparts by donning a black veil. The black veils established the Spanish nuns as culturally superior to the mestiza nuns who were forced to wear white veils. Spanish nuns thereby reproduced the racial distinction the Spanish conquistadores sought to eradicate through religious training of mestiza girls. Both the Inca and the Spanish requisitioned daughters of the defeated to serve as participants in religious cults and as their spouses. Gender-specific religious imposition was central to the expansion of the Inca and Spanish states.

Whereas mestiza girls entered Santa Clara convent, Andean girls could enter *beatas* founded in Cuzco at the end of the seventeenth century, the Spanish golden age in the region. In contrast to Santa Clara convent where mestiza girls were subject to the authority of Spanish nuns and distinguished from them by a white veil marking their inferiority, Andean girls in *beatas* were autonomous. They redefined themselves and established themselves as honorable women by virtue of their religious faith, practice, and knowledge. Indigenous women became abbesses of the *beatas* and even defended themselves and their community against Spanish officials. They thus enjoyed greater autonomy than both their mestiza counterparts and Andean and mestizo men who were barred from becoming clergy or directing their own seminaries. Andean women who did not enjoy the formal protection of the church were subject to abuse, including rape, by Spanish clergy.

RITUALS OF HEALTH AND HEALING. Gender parallelism and complementarity remain central to contemporary South American religion and are evident in rituals of marriage, health, and healing. The interdependence of men and women is considered a natural state of things and is reflected in the term *warmi-qhari* (woman-man) to refer to a couple. Formal marriage with a Catholic religious ceremony usually occurs many years after a couple has been established and has had children and often occurs in the context of a larger religious fiesta. Single adults are considered unnatural and cannot fulfill specific religious or civic cargoes in the community. Marriage also continues to serve as a means of allying distinct social groups with girls from less powerful families, who are considered "more Indian," marrying boys from more powerful families.

Religious fiestas, which mark specific points in the harvest and celebrate communities' founding saints, require sponsorship by couples within each community. Some fiestas

require two sponsors because together they form a *warmi-qhari*. The junior sponsor in a fiesta is said to act like a woman, suggesting the fluidity of gender and its relation to specific roles. During fiestas, although men and women share the same physical space, they are separated within it to conform with the Andean ideals of a masculine and feminine.

Rituals of health and healing conform with the ideal of a gender division of labor and are infused with religious belief and practice. Joseph W. Bastien found, for example, that in Bolivia misfortune rituals designed to eliminate misfortune are usually carried out by a *warmi yachaj* (female diviner), whereas a *qari yachaj* (male diviner) performs good-fortune rituals to set in motion favorable events. The symbolic system of the Bolivian Aymara people avers to men stability and mountains and contrasts them with women associated with rivers and a natural cycle of dissolution and renewal. Women are seen to be especially appropriate for performing misfortune rites because their menstrual cycle enables them to experience a flow like that of rivers. The flow of blood cleanses them just as one needs to be cleansed of misfortune by returning it to a river so it can follow the natural cycle of dissolution and renewal. Male diviners, by contrast, help to fix good fortune by offering symbols of llama fat and fetus to the earth shrines of the region.

Men become shamans by encountering and surviving the masculine Illapa (Rayo), or lightning. The highest shamans survive this encounter three times. By contrast, women become midwives by recognizing their calling in dreams or giving birth to children seen as special or unusual. The dreams of midwives often include images of the Virgin Mary or Catholic saints who may appear among herbs in a garden, which become central to the women's curative role. There is a confluence of Andean and Catholic imagery in the calling of the midwife suggesting that conversion to Protestantism may be incompatible with the traditional practice of midwifery.

In Northern Peru men and women work as *curanderos*, participating in the same tradition of curing through a *mesa* and the ingestion of the San Pedro cactus. Men are, however, more openly associated with this tradition of healing, whereas women are often identified as *bruja*s, sorceresses who transform themselves into black cats, ducks, pigs, and goats, engage in reunions with the devil, and cast spells. Bonnie Glass-Coffin attributes this distinction to a fiction created by Spanish clergy who identified female *curanderas* as witches—a perception that became popularized. One result of this perception is that it is more difficult to find female *curanderas* because they hide their practices.

Among the Warao in Venezuela, couples serve together as shamans. The wife of a male light shaman comes to be known as *shinakarani* (Mother of Seizure) because of her ability to save her husband from seizures resulting from ritualized nicotine consumption. The *shinakarani*'s role is modeled after that of the experience of the first light shaman, who suffers a nicotine seizure when he enters the celestial House

of Tobacco Smoke and is saved by his wife who transforms into a frigate bird and covers the light shaman with her body and wings to save him from the seizure.

CATHOLICISM AND PROTESTANTISM. Until the 1960s most men and women in South America identified themselves as Catholic, although their practices might have included distinctly indigenous elements. In the 1950s and 1960s a new form of Catholicism strongly influenced by the Second Vatican Council and the rise of liberation theology was established in many South American countries. This Catholicism, which emphasized the transformative potential of this life rather than focusing on salvation in the next life, had an especially strong impact among women. In rural communities, indigenous women came to serve as Catholic catechists whose role was to discuss church doctrine and the bible with their communities. In urban communities, especially those composed of recent migrants from rural areas, Catholic women formed associations for prayer and community service. *Comedores populares* (community kitchens) were established by women with the assistance of lay and religious Catholic leaders. Through these associations women began to redefine their place in society and their relations with men.

During the same period of the 1960s and 1970s, a number of Protestant denominations, as well as Jehovah's Witnesses, Church of Latter-day Saints, and other religious groups, began to attract converts in South America. Protestants have, so far, received the greatest attention from researchers. Those who have focused on women's conversion emphasize the opportunity that Protestantism offered women to escape the system of fiestas, which was associated with alcohol consumption and costly expenditures. Lesley Gill suggests that Protestantism offered women migrants in new urban communities a means of explaining and coping with suffering. She also argues that Protestantism allows women to exert indirect control over abusive or neglectful spouses. Finally, Gill emphasizes that many women identify simultaneously as Protestant and Catholic or may go through a series of conversions rather than retaining a fixed religious identity. By converting to a new faith, women and men change their religious beliefs and practices and gain a means of transforming gender norms and thus their relations with each other and with society. Indeed, because religion is central to South America, where it reflects and reproduces gender norms, it is also central to understanding changes in gender and society.

SUSAN FITZPATRICK BEHRENS (2005)

GENDER ROLES. Gender roles are the culturally defined behaviors deemed appropriate for a man or a woman. A role is essentially performative. One learns how to play a masculine or feminine role, what is acceptable and what is not, how one should behave, think, evaluate oneself and others in a gendered manner. While age, ethnicity, class, and many other factors also have culturally prescribed norms, gender is the most universal and salient social organizing principle.

SEX AND GENDER. Following Margaret Mead's influential work *Sex and Temperament in Three Primitive Societies*

(1935), feminist studies made a distinction between sex, regarded as biological, and gender, which is culturally constructed. Thus with few exceptions, one is born male or female according to chromosomal makeup and secondary sexual characteristics. One is socialized into masculine or feminine roles through culture. The link between maleness and masculinity and femaleness and femininity is made to appear natural and therefore unchangeable, constructing power and dominance hierarchies that generally leave men in control of women and children. Gender hierarchies are legitimized by recourse to ideology, ritual, and mythology.

Gayle Rubin coined the term *sex/gender systems* to describe the way in which kinship systems define roles and statuses in a manner that often contradicts genetic relationships. An example of this is woman-woman marriage among the Nuer of the Sudan. Fatherhood is defined through the payment of cattle as bride-price. Where a woman owns cattle, she can acquire a wife and will be regarded as the social father or pater of children born to her wife, regardless of the identity of the biological father or *genitor*. Rubin pointed out that every individual and each new generation has to learn to enact their sexual destinies and their statuses within the system. Sex and gender are not biological facts that emerge of and by themselves but are historical creations of specific societies. Oppression is experienced not only as a woman but as a result of having to be a woman, that is, by taking on feminine roles. Phyllis Chesler argued that psychological differences between the sexes are also the result of sex-role conditioning and that expectations of feminine roles are dysfunctional. To successfully conform to the stereotype of femininity in Western society is a prescription for failure or madness.

In contemporary Euro-American societies there is a tendency to regard genetics (and therefore biological sex) as essential and deterministic, with a gene to explain every aspect of behavior. Among social scientists, however, there is a move toward seeing sexuality as part of gender relations, theoretically inseparable from them rather than possessing an essential prior ontology. Sexual violence against women and violence against gay men are the result of institutional structures, ideologies, and practices that assign greater value to masculinity and to heterosexuality than to femininity and homosexuality. Governments and religious organizations are among those institutions that seek to maintain and reproduce the gender roles that permit such violence.

A theoretical focus on the body has also undermined the distinction between sex and gender. Judith Butler, in her influential work *Gender Trouble* (1999), argues, following a Lacanian perspective, that the loss of the maternal body leads to a perpetual displacement of the object of desire and that gender identity is a refusal of that loss "encrypted" on the body. Gender, described by Butler as a "literalizing fantasy," then appears as "natural fact." "Becoming" a gender involves "a laborious process of becoming *naturalized*, which requires a differentiation of bodily pleasures and parts on the basis of

gendered meanings" (Butler, 1999, p. 89). Cultural norms, referred to by Butler as "the law," that prescribe heterosexuality and gender roles and proscribe homosexuality and incest, give the appearance of being subsequent to sexuality. In reality they are the effects, temporally and ontologically, of culture; the product of culture rather than prior to or outside culture (Butler, 1999, p. 94).

THE "NATURALNESS" OF GENDER ROLES. In the seminal article "Is Female to Male as Nature Is to Culture?" (1974) Sherry Ortner argued that a defining characteristic of human societies is that they are engaged in a process of generating and sustaining systems of meaning that enable them to transcend the most basic, natural limits of existence. Rituals, for instance, are a way of manipulating and regulating the relationship between natural forces and human life. Culture is seen as something that works on and transforms nature and in that sense is superior to it. According to Ortner, women are seen as closer to nature than men because of their biology and childbearing role. Women's more intimate form of relating can be seen simultaneously as a more natural and "lower" and as a morally superior "higher" position—as either ignoring or transcending social categories. Feminine symbols also demonstrate this polarized ambiguity. Women can be exalted (as goddesses, dispensers of justice, and occupants of the moral high ground) or debased (as witches, dispensers of the evil eye, castrating mothers). In either case the symbolic woman is "rarely within the normal range of human possibilities" (Ortner, 1974, p. 86). If culture is thought of as superior to nature, it is a small step to viewing men as superior to women.

Ortner later clarified her position, stating that while the distinction between "nature" and "culture" is not universal, the "*problem of the relationship* between what humanity can do, and that which sets limits upon those possibilities, must be a universal problem" (Ortner, 1996, p. 179). Gender is always situated at what Ortner refers to as the nature-culture border—the body. In most if not all societies the two sets of oppositions, nature and culture and female and male, "move into a relationship of mutual metaphorization" so that "gender becomes a powerful language for talking about the great existential questions of nature and culture" and vice versa (Ortner, 1996, p. 179). The asymmetry of these categories, in which the masculine and culture are valued above the feminine and nature, reflects the notion that culture is about the transcendence of nature.

NATURE, GENDER, AND MYTHOLOGY. In her book *Female Power and Male Dominance* (1981) Peggy Reeves Sanday contests Ortner's claim that because men are associated with culture and it is culture's job to control nature, men are universally regarded as having the right to control women. Sanday does admit to the "permeability between the categories of female and nature" in some societies but not all. She refers to such societies as having an inner orientation with a "reciprocal flow between the power of nature and the power inherent in women" (Sanday, 1981, p. 5). In such societies the

control and manipulation of these forces is left to women and to sacred natural symbols; men are largely extraneous to this domain and must be careful lest they antagonize earthly representatives of nature's power (namely women). Sanday argues that men are not unequivocally aligned with "culture" (defined as the transcendence of the natural givens of existence by means of systems of thought and technology). They are part of nature not only in their physicality but also in their need or desire to kill. "Men hunt animals, seek to kill other human beings, make weapons for these activities, and pursue power that is *out there*" (Sanday, 1981, p. 5). These more exterior life-taking activities of men are referred to as an outer orientation. Societies vary in the extent to which they value an inner or outer orientation, the powers of women and respect for reproduction versus the role of men and their more destructive externalized power. This is not a dichotomy between nature and culture, terms that are in fact hard to define and that arguably have no cross-cultural reference. Sanday's survey of "simpler societies" led her to conclude that there is a basic conceptual symmetry between the sexes in which "women give birth and grow children; men kill and make weapons. Men display their kills (be it an animal, a human head, or a scalp) with the same pride that women hold up the newly born" (Sanday, 1981, p. 5).

The variations in sex-role plans found in different societies show that they are cultural constructions rather than genetic. Historical and political factors as well as the environment in which people live affect the ways in which they interact. Sex-role plans in turn change the social and natural environment. Sanday identified four basic templates relating to the sexes. These can be segregated or merged, with decision-making powers vested in one sex or shared. These four types can be combined in various ways. Among the Mbuti of the Ituri Forest in central Africa, for example, the sexes are merged and decision-making powers shared. Among the Iroquois confederacy of North America, on the other hand, sexual differentiation was extreme, while decision making was still shared between the sexes. In both these societies the sex-role scripts give women both secular and religious power. Their cosmologies and rituals display a generally positive attitude to the world and the place of humans within it. In societies in which decision making is shared, female or paired deities are given prominence. In societies in which males dominate and women are relegated to a subordinate role in both sacred and secular domains, there is an emphasis on a male godhead. The sexes are also invariably segregated, as among the Hausa of northern Nigeria or Yanomamo of Venezuela and Brazil.

The environment appears to be a crucial variable in determining gender roles and the valuation given to men and male symbols or women and female symbols. Where large game is hunted, whether or not these animals are a nutritionally important part of the diet, Sanday argues that the major source of power is seen as a supreme being who resides in the sky or in animals. In fact any environmental tension,

whether created by food scarcity, climactic unpredictability, warfare, or political uncertainty, tends to move a society in the direction of an outer orientation, male dominance, and androcentric mythology. Sanday suggests that there is transference of anxiety from the external world, which is beyond control, to women, who may be taken as symbolic representatives of the natural world. A lack of environmental security therefore correlates with control of women and male domination. If, on the other hand, the world is experienced as benign, an inner orientation develops in which both the environment and women are seen as partners rather than as sources of danger to men and to society as a whole.

TRANSCENDING, CONFOUNDING, AND SUBVERTING GENDER. There are many ways in which heterosexual masculine and feminine roles are challenged, undermined, reworked, and transformed in societies around the world. Such incidences reveal the ways normative gender roles based on biological sex require concerted social effort to construct and maintain and are far from “natural” and self-evident. One of the most widely reported examples of multiple genders is the berdache, “two spirits” or “man woman” found among more than 150 First Nation groups in the Americas. While sometimes described as an institutionalized form of gender reversal in which a person of one anatomical sex takes on the roles, attire, and status of the opposite sex, the variety of practices actually involved have led some scholars to use the term “third sex” or to think in terms of multiple genders. It is argued that Rubin’s distinction between sex and gender (and sexuality) cannot be universally applied and that other societies conceive of the human person in ways that make no sense of such distinctions. In many cases North American “two spirits” have specific religious or occupational roles and may have a mythological account of origins distinct from that of men or women, so that it makes more sense to conceive of them as a third gender than as people who simply cross gender, according to Will Roscoe’s book, *Changing Ones: Third and Fourth Genders in Native North America* (1998).

Another example of a group that transcends a binary gender classification is the *hijra* of India, anatomical males who identify and dress as females, forming a religious caste with their own mother goddess. Like the classical Galli of Greco-Roman mythology or eunuchs in much of the ancient world, the gender roles assigned to such a “third sex” are linked to specialist religious and administrative functions. They may be chosen by the individual or assigned by others. In Western religious tradition nuns have also been described as a “third sex” (Hastrup, 1978). They share many features of the *hijra* in the sense of forming a separate religious “caste” that both ignores (through celibacy) and transcends (by taking on some roles normally reserved for male priests) normative heterosexuality. Western gay and lesbian people have also utilized the notion of multiple genders as a way of overcoming the prescriptive binary gender roles associated with compulsory heterosexuality.

FIONA BOWIE (2005)

GENEALOGY. As formal structure, genealogy is foremost an intellectual discipline. Its concern is with recording and putting into systematic order the histories of families, differentiating them by rules of descent and allocating to each a share of those enduring human valuables that consist of privileges and honors, titles and powers. Although grounded in myth and circumscribed by tradition and, thus, seemingly a rote and rigid subject, genealogy is to be understood rather as a product of informed speculative reasoning about metaphysical, specifically ontological, matters. Its subject matter goes beyond the listing of pedigrees. It identifies and differentiates the forces and generative sources that give shape to and regulate the entire universe of life. From its cosmological concepts, it draws implications for human conduct and for the structure of the social order. Most directly, genealogies connect human families with their mythical origins, joining them as kinfolk within the universal community of gods, spirits, and other forms of life.

PRINCIPLES OF GENEALOGY. The genealogical discipline exercises a controlling influence upon everyday life, for it is the source of the morality and of the principles of systematic order that bind systems of descent into clans, lineages, and similar groupings. Among tribal societies especially, the genealogical order frequently dictates all social relations. In early and more complex traditional societies, where only royalty and related families come within its scope, the genealogical system acts as the focus of authority. In sum, for pre-industrial societies the genealogical discipline is unitary and unifying, joining the social and the religious forms by demonstrating that society is an extension of the mythical era of original creations. From this unitary perspective, the gods, spirits, and ancestral beings who brought human beings into existence are themselves drawn into the human sphere. In more recent times, genealogical interest has been reduced. Stripped of its religious and cosmological associations, genealogy serves, at most, the general purpose of celebrating ethnicity.

The general model for making genealogical distinctions is drawn from nature. This is most clearly exemplified in totemic systems, whose family lines are represented as descended from animals or other distinctive natural forms. Each line of descent appears as a species and therefore stands as one among all the other natural varieties of life. In nontotemic systems, the special qualities attributed to particular human ancestors serve the same purpose of distinguishing the lines

of descent. Thus, human founders of clans and lineages are held to be the primary sources of the vigor and continuity of their descendants, as are totemic ancestors. In both systems, the natural species exemplify the traits of continuity and social immortality that human societies seek through their own genealogies.

As a process, differentiation appears as the signifier of forces that promote growth and development. The natural evolution commonly depicted in creation myths begins with relatively amorphous beings and proceeds systematically to final stages of specificity. This understanding of the natural direction of life underlies the metaphoric assumption that takes the contrast between the chaotic and the structured in ritual and myth to be analogous to the contrast between the deathlike and the vigorous in social life. Accordingly, genealogical systems—the primary promulgators of differentiation—are impelled to drive toward singularity, to single out families and persons for special distinction as principal bearers of vital powers.

Essentially, all the systematic modes of differentiation upon which genealogical systems are constructed express some concept of generative powers. The rules of primogeniture and of relative seniority of descent generally concern the special nature of powers presumed to lie in primacy, that is, in the original conditions that generated forms and natural processes. The rules of descent by gender (matriline, patriline, bilaterality) stem from the distinctive generative powers of femininity and masculinity. The rules governing direct and collateral lines reflect closeness to the central sources, and those that differentiate between long and short genealogies involve issues of inherent longevity. Each mode of descent has the added significance of being the appropriate mode of transmission of powers, and each member of a genealogical chain has stature as a designated and graded conveyor.

In substance, the characteristic modes of genealogical transmission impose a powerful order upon social structures. They regulate marriage and other social relations, and they determine the formal lines of social divisions and the character of dependency in subordinate branches. In keeping with the general idea of a genealogical system as an organism that grows and branches, lineages are quite commonly envisioned as vegetative.

The social and cosmological implications of genealogical differentiation are realized most fully in lineage structures. In contrast to clans, which only imply and therefore generalize their putative connections to founders, lineages depend upon true pedigrees, upon the real chain of names and their sequences, and often upon the sequences of outstanding events that demonstrate the potency and special quality of the names. Genealogical traditions and related rituals evoke, reanimate, and, in some sense, reincarnate ancestors. Remembering the long line of ancestors by name (in Polynesia, as far back as ninety-nine generations) is an act of piety that, even in tribal societies, imposes the technical

requirement of creating the scholarly and priestly craft of official genealogist for royal and noble lines.

Aristocracy, understood as a social system in which a singular descent line has come forward as the focus of generative powers, may take shape among clans as well as among lineages, drawing upon their common genealogical rules. But it is the specificity of the lineage and its greater adeptness for drawing fine distinctions that endow royalty with the extra degree of moral authority for governing. The lineage is so much the social instrument of royalty that it readily becomes its own characteristic form of organization. Even among tribal societies, among whom organic unities are the common norm, it is not exceptional for chiefly lines to be the exclusive protagonists of the lineage system, and for all others to fall into a binlike category of relatively generalized descent. The Kwakiutl and some Polynesians, who are discussed below, illustrate what are, in effect, the social fractures in a system of descent.

It may seem paradoxical that lineages, although they are buttressed by deeply held human convictions about the binding powers of common descent, should, in fact, promote, as a matter of principle, counter tenets of antagonisms, oppositions, and structural divisions. Yet, these forms of divisiveness are not accidental but are the complements of systems that transmit singular powers. Powers must demonstrate efficacy; efficacy invites contention. As a consequence, aristocratic lineages must sustain themselves, not by their genealogical authority alone, but by the abilities of their actual rulers to balance sometimes conflicting claims of birth and force.

SYSTEMS OF GENEALOGY. Thus, their orderly premises notwithstanding, genealogical systems are variable. They are subject to the vicissitudes of history that ultimately erode the most formidable structures, as well as to the variability that is allowed by their rules and to the ambiguities of situation that disturb any social order. One cannot hope to describe the varieties of genealogical systems encyclopedically. The following examples from tribal societies and from ancient and more recent civilizations are not necessarily the most characteristic, but they call attention to special features that pertain to the general nature of genealogies.

The Cubeo. The Cubeo, tropical forest Indians of the Colombian Vaupés, exemplify genealogical aristocracy as developed within the constraints of a subsistence economy. Even within the meager material setting of slash-burn root horticulture, supplemented by fishing and hunting, the rudimentary form of aristocracy exhibited by the Cubeo resembles, in many formal respects, the hierarchical structures and the patterns of dominance and subordination of the more complex civilizations, indicating that aristocracy may be less a product of material than of genealogical factors. Cubeo society is an organization of ranked, exogamic, and patrilineal sibs (clans), who are joined together in a confraternity (phratry) for what are largely ritual purposes. The sibs exchange wives with those of similar rank in a corresponding phratry.

The rank of the sibs was preordained and revealed in the order of birth from an underground dwelling that brought into being the first set of fraternal ancestors, the founders of sibs. The names of their descendants have entered into the genealogies of the sibs, to be inherited in alternate generations by the grandchildren. The personal names, like "souls," carry the immortality of the descent lines and, the Cubeo believe, promote the growth of the children who bear them.

The names are but one of four elements that enter into the substance of the genealogies. The others are sacred trumpets and flutes that bear the names and represent the original ancestors; the life souls that are apportioned to each of the sibs; and, finally, the figure of a sacred anaconda, in whose elongated form the sibs are imagined as ranked segments extending from the head to the tail. The anaconda symbolizes the animal nature of human beings and their kinship with the animal world. These four elements characterize the Cubeo genealogical structure as a complex conveyor of vital forces that ensure their ethnic continuity and are therefore central to their religious and ritual purposes, namely, to maintain connections with founding ancestors. "When we remember our ancestors," the Cubeo proclaim, "we bring them to life." For them, the act of re-creating the ancestors in memory is comparable to the original creation, when the Creator willed people into existence by means of his own imaginative thought.

The correspondence of the hierarchical order of the sibs to the order in which the first ancestors emerged is also, in essential respects, a memorial to the circumstances of their origins; they are designated by genealogical relations as older brother/younger brother, and as grandparent/grandchild; by an original distribution of ritual powers, as chiefs, priests, shamans, warriors, and servants; and, by their place as segments of the body of the sacred anaconda, they are assigned a fixed order of residence along the rivers they occupy. The highest ranks, corresponding to the head of the anaconda, live toward the mouth of the river; the servants, toward the source. Thus the genealogical system—recapitulating in each generation the generative conditions of origins as an action of creative remembering—encompasses the main areas of Cubeo social and religious existence.

The Kwakiutl. A similar genealogical system, but one notable for the unusual significance it attaches to hereditary personal names, prevails among the Kwakiutl Indians of Vancouver Island. The qualities commonly attributed to personal names imply the presence in them of spiritual or magical powers, a "name soul," as, for example, among the Inuit (Eskimo). The Kwakiutl seem to have elevated the concept of name soul to a high level of concreteness, thereby bringing to the surface a mystical attribute of names that in other cases exists only by implication. Their treatment of names suggests how pedigrees may indeed constitute a great chain of being.

In Kwakiutl genealogies, each personal name stands for a desirable attribute of being, ordinarily a special power, and the ensemble of ancestral names covers the range of attributes

and powers that govern life and death and control valued possessions. Even as it is a specified segment of the patterned mosaic of life forces, each name also has existence as a being, as a spiritual personage who is attached to and yet may have an existence apart from its bearer. The bearer is no ordinary being either, having been set apart and sanctified in having met the genealogical qualifications of seniority. Among the Kwakiutl tribes, which once numbered in the tens of thousands, only a very small number of personal names are of this type; all others are scorned as “made-up.” The real names are the exclusive property of a nobility of chiefs, the secular and religious leaders. The remainder are the names of commoners, people who cannot claim descent from mythical ancestors.

The chiefly or spiritual names possess an autonomy congruent with their character as ancestral incarnations, and, as such, they impose their natures upon those who bear them. Under certain circumstances they stand apart entirely. Thus, a chief who possesses several names, some belonging to different divisions of the tribe, might engage in ritual transactions with his distant name as though it were another person. He might present this name with gifts, or, under other circumstances, go through a sham marriage with a name attached for this purpose to his arm, for example. Kwakiutl genealogies are histories of the acquisition and descent of all such names and of their intrinsic properties. Chanted at all important ceremonial events, the family history is a repository of its accumulated powers and capacities.

Polynesian societies. Cubeo and Kwakiutl genealogical systems are noteworthy examples of aristocracy that is deeply enlaced in mythological and shamanistic conceptions and, therefore, politically undeveloped. Polynesian societies offer contrasting examples. Perhaps because their religions are more fully theistic and relatively free of these other associations, the Polynesians were able to move in another direction. Upon similar genealogical principles, and upon an equally undifferentiated economy, Polynesian societies produced such relatively modern institutions as socioeconomic stratification and centralized territorial states. Thus, the capability of a genealogical system to evolve or to elaborate a new social order is never a function of rules of descent alone. New patterns emerge when genealogical rules are joined to an appropriate religious doctrine. In Polynesia, that doctrine has been based upon a concept of *mana*, a force that animates all of nature and characterizes the energetic properties of all substance. In principle, *mana* descends from the gods to the human generations in measured proportions as defined by the genealogical rules. Senior lines are richly endowed with *mana* and are energized and hence ennobled by it; the junior descent lines are left behind as the weakly endowed commoners.

Conceptualized as an efficient force manifested objectively in results—on the battlefield, in the fields of production, in the perfection of craft skills, in personal charisma, in the efficacious management of religious rituals—*mana* is

not automatically and indisputably the gift of inheritance. Its possessor has also to demonstrate worthiness by standing up to challenge. Nevertheless, although the conviction that the powers that animate and bestow efficacy move by the generative forces of genealogical rules may yield to the acid test of actual events, it is never abandoned. When lower ranks win royal power by force, as they occasionally do, from time to time, they are still obliged to discover genealogical authority for their new office. Genealogical guilds guard the sanctity of royal and noble pedigrees.

Polynesian societies differ in the way each has managed to sustain the shifting balances between the genealogical and the pragmatic. The Maori of New Zealand exemplify relatively close adherence to traditional genealogical criteria. The Samoans, the Easter Islanders, and the Mangaianians demonstrate a greater flexibility in following the traditional rules of descent. The emergent states and stratified societies of Tonga, Tahiti, and Hawaii, for example, reveal a seemingly typical developmental cycle that moves from traditionalism to greater openness and, finally, to the consolidation of hereditary rule, but within the framework of a markedly restructured social order.

Major civilizations. The histories of major civilizations—those of classical Greece, Japan, or England, to take but three examples—show their genealogical life as comparable, in many respects, with that in tribal societies. Hesiod assembled from the body of Homeric mythology a genealogical order of the gods that allotted to each of them appropriate honors, titles, and cosmological functions, and described “how the gods and men sprang from one source.” Theogony emerges as one aspect of cosmogony. The gods, humans, and the fully differentiated natural order evolve in these genealogical tales within a turbulent atmosphere, in a setting of disputes for power among contending forces, very much as they do in tribal creation myths. The patterns set by the gods, the immortals, in their evolution define the courses of human history.

The genealogists of archaic and preliterate Japan assembled from ancient myths a comparable cosmogony. Heaven and Earth, initially formed from Chaos, after several generations produced the god Izanagi and the goddess Izanami, who gave birth first to the islands of Japan, then to other gods, and, finally, after many generations and much social disorder, to humans. The first mikado was granted sovereignty by the sun goddess and, as a link in the succession of the gods, became the center of the national religious cult. Similarly, each distinguished family or clan also claimed its derived divinity from other gods and from ancestral association with emperors. The Japanese chronicles of hereditary titles authenticated the social and religious organization.

Christianity, in principle, breaks with the tenet of the traditional genealogical order that claims divine descent, but it leaves essentially untouched the issues of sanctity and an even deeper concern with singularity and inequality. Even the egalitarian Quakers in England succumbed to the temp-

tation of differentiating major from minor family lines. As for English royalty, it had found in the Roman Catholic church, itself the heir to the political institutions of the Roman Empire, the questionable but powerful bases for claiming the “divine right of kings” as an authority for absolute power. The Glorious Revolution of 1688 set that thesis to rest, and later monarchs settled for the moderate option of divine approval.

Through the long course of English history, the constant principle of monarchy, starting with the Celtic rule of the fourth century BCE, is one of singular descent from divinely graced or otherwise extraordinary leaders. Except for kinship with the royal house, no other fixed principles for succession to the throne, as for example primogeniture, were established in England before the thirteenth century. As is common in such systems, genealogical authority fostered social unity when it was strong and wars for succession when it was weak. Social and cultural unity has been the aim and, to a considerable extent, the accomplishment of the genealogical order—which achieved its apotheosis in aristocracy—until relatively recent times.

NONGENEALOGICAL SUCCESSION. Tibetan Buddhism, or Lamaism, illustrates the contrary qualities of a dynastic order from which genealogical succession has been totally banished. In the fifteenth century, the monastery of Dge lugs pa (Gelug pa), a celibate order and the original seat of the Dalai Lama dynasty, promulgated a doctrine of successive reincarnations as the mode of accession to divine authority. They believed that the Dalai Lama would be reborn in some infant unrelated and unknown to him, and that through this reincarnation, he would continue his work of enlightenment. Discovered after an exhaustive search that brought to light his divine traits and evidence of an earlier existence, the new Dalai Lama was trained for his post during an interim regency. The Tibetan doctrine set aside traditional considerations of individuality and family distinction so that the divine presence, a manifestation of the Buddha, would appear directly, albeit in human form. However, whatever forcefulness this system gained through directness of access to the religious source was at least partly dissipated by the dispersal of its constituencies. Unaffiliated to a systematic line of succession, Lamaist adherents were free to join any one of numerous monasteries, each of which was headed by an abbot, himself the incarnation of a lesser lama.

BIBLIOGRAPHY

Meyer Fortes was perhaps the most original and perceptive of anthropological authorities on genealogical issues. His *Kinship and the Social Order: The Legacy of Lewis Henry Morgan* (Chicago, 1969), a central work on the subject, is a most useful summary and refinement of his position with a rich bibliography of theoretical and ethnographic sources. For the Cubeo, the only work thus far is my *The Cubeo: Indians of the Northwest Amazon*, rev. ed. (Urbana, Ill., 1979), based on field work. Two exceptional studies on Barasana Indians,

also of the Colombian Vaupés, that examine genealogical conceptions from structuralist and symbolist perspectives are Christine Hugh-Jones's *From the Milk River: Spatial and Temporal Processes in Northwest Amazonia* (Cambridge, U.K., 1979) and Stephen Hugh-Jones's *The Palm and the Pleiades: Initiation and Cosmology in Northwest Amazonia* (Cambridge, U.K., 1979). Taken together, the bibliographies in these three works are close to all-inclusive for this region. The best single-volume access to the very extensive literature on the Kwakiutl from the writings of Franz Boas and his native collaborator, George Hunt, is Boas's difficult but authoritative study, *The Social Organization and the Secret Societies of the Kwakiutl Indians* (1895; reprint, New York, 1970). A recent and useful interpretation of Kwakiutl culture and society that draws upon much of the Boas and Hunt texts is my *The Mouth of Heaven: An Introduction to Kwakiutl Religious Thought* (New York, 1975), which includes a bibliography of the published Boas field studies. There is no better introduction to the nature of Polynesian societies than the writings of one of Polynesia's native sons, Te Rangi Hiroa (Sir Peter Buck), of Maori descent and one-time director of the Bernice P. Bishop Museum at Honolulu. His greatest work is *The Coming of the Maori* (Wellington, 1952), an intimate yet anthropologically professional study. My *Ancient Polynesian Society* (Chicago, 1970) focuses more directly on genealogical issues because it is a study of variations in the forms of Polynesian aristocracy.

On the subject of the genealogies of the Greek gods, the principal sources are Hesiod's *Theogony* and *Works and Days*, conveniently available in the English translation by Hugh G. Evelyn-White in his *The Homeric Hymns and Homerica* (Cambridge, Mass., 1967). As background on the ancient period, M. I. Finley's *The Ancient Greeks* (New York, 1977) is both authoritative and succinct. For Japanese sources, the general work of choice is George B. Sansom's familiar classic, *Japan: A Short Cultural History*, rev. ed. (New York, 1962), to be used, however, in conjunction with the source book on the Japanese genealogical and historical chronicles, as compiled by Ryusaku Tsunoda, Wm. Theodore de Bary, and Donald Keene, *Sources of Japanese Tradition*, 2 vols. (New York, 1958). On the genealogies of the royal lines of England, G. M. Trevelyan's *History of England*, new illust. ed. (London, 1973), the *Oxford History of England*, especially volume 3, and Austin Lane Poole's *Domesday Book to Magna Carta, 1087–1216* (Oxford, 1955), are particularly noteworthy for their historical insights.

Revised Bibliography

GENETICS AND RELIGION. Science in general, and molecular genetics and the new science of genomics in particular, contest with claims of faith on the same terrain. Genetics is a complex, irreducible set of knowledge about the large molecule DNA, which by its structure and function transmits information about how proteins are made and folded in particular ways. DNA regulates the biochemical properties of all living cells. The unique feature of DNA is that it is the structure for the replication of coded information of the sort that can be transmitted across generations. This information is held in the DNA molecules in the cells of the human gametes—sperm and eggs that recombine to found a fertilized egg do so by recombining pieces of the DNA of each into a newly composed molecule with the codes from each genetic parent.

INTRODUCTION. The ability to recombine DNA is a feature of all living organisms and offers a defining and definitive set of norms and explanations for behaviors and biological processes that are highly conserved across many species. Genetic codes are so similar that much human genetic information is shared with other mammals, especially related primates. Mutations in these codes, often as small as a single allele difference, have been traced as causative to devastating diseases, and many more diseases are being identified as having genetic difference as their causation. It is likely that genetic causation in a more complex fashion will be found to be the cause for many diseases, including many long thought to be behavioral, such as depression, schizophrenia, and addictive behavior. This story is the largely acceptable story of modern molecular biology.

As such, genetic explanations for how the world functions, what can be known about the world, what one can hope for in the future, what a self is, what a family means, and the role of free will all challenge what has historically been the province of religion—a moral location in which what humans desire and what they can achieve have long been mediated. In large part, genetics and religion ask the same sort of questions: What does it mean to be human? What does it mean to be free? And what must I do about the suffering of others?

Further complicating the issue is that “genetics” refers to both the acquisition of the knowledge of how the molecules of DNA and RNA copy information and build programs within the cell—how the intricate “machineries” and pathways are reconstructed—as well as to how the molecules are interpreted, categorized, and cataloged. It has long been understood that how humans define, name, abstract, and group nature shapes how they see the world and provides a sense of self and possibility within the world. Finally, “genet-

ic” also refers to the growing group of interventions into the code of the molecule itself, first by testing and then by attempting to alter the code into more auspicious variations.

Genetics in this last sense began with studies of plant and animal heredity. Working primarily with fruit flies, geneticists began creating—with exposure to radiation—the same sort of distinctive phenotypical variations observed in nature within species; through breeding the geneticists noted how the variation was transmitted and how it was expressed. This was a technique that followed biblical accounts of Jacob’s goat herd, in which Jacob bred spotted goats to increase his portion of the herd, drawing on centuries of accumulated wisdom in agricultural societies. Gregor Mendel (1822–1884), an Austrian monk, also relied on the tradition of observing phenotypes, breeding, and noting hereditary traits. Fruit fly geneticists, then, drew on all of this material, and in the 1960s, after the invention of the electron microscope, were able to see the long chains of chromosomes along which the DNA was arranged in patterns. They were able to view how variations such as white and not red eyes, wrinkled or frizzled wings inside of smooth ones, or winglessness altogether could be predicted by linking trait to gene and therefore apply “forward genetics” (the breeding of a strain of model organisms from these variations).

Later advances allowed the gene itself to be diced and spliced (using chemicals to cut the gene at specified intervals) and then recombined to make new strains of mice or flies or worms entirely. These new strains would breed true because the trait spliced into the gene would persist. In fact, given the way that the genetic code is already highly conserved across species in nature, slices of DNA from one organism could be—and were—spliced into other species entirely, giving rise to a host of “created” organisms capable of enacting the DNA instructions of one species inside the body of another. Such knowledge led to an explosion of interest and capacity to understand many tricky problems in medicine, such as how addiction, mental illness, and cognition might function; how embryos develop; and how immune systems regulate response and apoptosis—all breakthrough insights that have already transformed clinical medicine.

Hence, the science itself suggested a use, much as the structure of DNA suggested a function. It is both the observation and notation of the world of molecular biology—its structure—and the alteration of the world at the molecular level—its function—that raise concerns about genetics in the communities of faith and in the scholarship of religion.

The issues can be grouped into several sorts of concerns, each of which has generated a considerable literature of commentary and response. Without exception, the articles of social and religious critiques of genetic science begin with the admission that genetic science holds enormous potential, yet their authors then write about their concerns and fears—rooted in the final analysis—that use of impermissible knowledge might lead to humans “playing God” (Peters, 2003).

ISSUES OF THE WORLD TO COME. For many commentators (such as Audrey Chapman, Leon Kass, and Francis Fukuyama) the problem of genetics is that humans have a particular telos. The ends of human life are shaped, in the view of these commentators, by both the finality of death and the sense of an afterlife. “The world to come” is the world in a resurrected body, in an afterlife, or in a messianic age. In this sense, then, the present moment, and the embodied life, is meant to be one of befallenness and affliction, not the source of perfection or the site for the final telos of human life. For many, including Stanley Hauerwas and Sondra Wheeler, the proper regard toward illness is one of witness and of comfort in the knowledge that “this story is not the end of the story for persons of faith.” For medical researchers, the outcomes for which they strive are to provide a future based in a steady accumulation of advanced scientific knowledge that will lead to greater control over the outcome and the prevention of illness and injury. When researchers speak of curing genetic illness with heritable genetic interventions, and of cures both in this generation and in the next, many religious scholars and clergy with strong views of a heaven then fear a “post-human future.” It is, for them, a future in which perfected humans are no longer subject to illness, disability, or even death. Is the “world to come” brought about by human creativity and effort? Or ought human yearning strive toward a divine reward? If aging and death are events to be mediated by religious faith, can such pivotal events be altered, either temporally or fundamentally, without destroying the fragility and vulnerability that makes one human? Genetic research, argues these scholars, is dangerous in its very structure, for its precise aim is to alter the future, to seek control over the ultimate causation.

To be sure, not all religious scholars take the position that the future is fundamentally sacred, nor that the particular condition of humanity in the early twenty-first century is the defining moment of humanity. For Jewish and Islamic scholars, among them Robert Gibbs, Laurie Zoloth, Elliot Dorff, and Abdul Aziz Sachedina, the duty to heal and the obligations embraced by medicine are a form of charity and debt restoration. In these traditions, as well as in some arguments advanced by Hindu and Buddhist scholars, the duty to the world to come entails medical research, healing, and an ongoing effort on behalf of one’s progeny. For Jewish scholars—whose tradition has at best a muted set of texts about the afterlife—one’s world to come is the world of the next generation. Hence, the idea that humanity is itself constituted in its morbidity and mortality is a weaker claim. Such scholars note that the condition of the human person, and most especially the human life span—which doubled in the last half of the twentieth century—is not fixed, but has in fact remarkably improved. These scholars are generally more supportive of genetic research, for they proceed from a model that suggests improved health, greater freedom from disease, and lessening infant and maternal mortality (the results of earlier research) have led to increasing capacities for human pursuits.

ISSUES OF PATERNITY AND HERITAGE. Linking the resistance about the genetic elimination of illness—and the pushing back of death and aging—is the idea that one’s genetic self is the true self, the essential identity. This raises problems for religious scholars on the many fronts of the issue. For some, the idea that genetic identity is fixed supports the argument that the DNA, once created, is the self as an integrated system at conception. For others, issues of a DNA heritage are troubling if the DNA is “taken” from them, and the sample molecule used in any way. Additionally, ethical problems can arise when genetic knowledge is used to suggest that illness, behavior, or traits are traceable to ethnogeographic evolutionary narratives. It is true, finally, that for all religious scholars, the genome mapping and the haplotype grouping of human phenotypes raises issues of ethnicity, family, kinship, membership, and identity. Should genetic relatedness be privileged over other kinship ties? Is it proper to seek one’s genetic origins, and to what purpose? Can valuations and status (such as the Cohen status for Jews) long understood to orally transmitted and trusted be challenged by genetic testing?

ISSUES OF ILLNESS AND SUFFERING. For early Christians, the act of healing was a core component of the liturgy (James Keenan). A central problem that religion sought to address was that of befallenness and the role of the healer, which manifested itself in two ways. First, religious faith and the act of prayer was seen, throughout much of antiquity, as at least as effective as a cure when medical and surgical interventions were largely futile. Second, illness was understood as predominately spiritual in nature, and causation for illness was linked in many traditions to a failure to understand—or to comply or properly enact—one’s relationship to God, gods, or, for some Eastern religions, the path of spirituality itself. Hence addictive patterns, aggression, or schizophrenia, as well as tuberculosis, leprosy, and plague, were all linked to personal or larger social flaws. The response, therefore, that made sense to people in such cases was a proper regard for one’s relationship to the divine world and word. Priests became the source of healing.

However, genetic causation reconfigures causality—especially if the disease can be modeled and studied in animals (the core method for understanding diseases genetically). If mice can be made more or less aggressive or more or less fearful by genetic alterations, as evidenced by the work of Lee Silver, then what is the role of moral activity and of religious training in the moral path? If addictive behavior (including sexual behavior) can be traced to genetic allelic variation, then what is the role of judgments in such cases? Further, because most genetic researchers understand the complexity of the gene-to/in-environment relationship, then if the malfunction of genes in particular environmental locations triggers diseases and disease susceptibility, what use is it to pray for reversal, or to hope that correct moral activity will result in a cure? What is to be made of claims that the “gene in my body makes me a glutton?” Does the search for

a genetic predisposition to sexual orientation make behavior more or less acceptable to faith communities?

Here again, the responses vary. For many Christian scholars, including Stanley Hauerwas, Lisa Sowle Cahill, and Leon Kass, the activity of suffering calls forward a response that places Christianity at the center. For Jewish scholars, most notably Emmanuel Levinas, “suffering is nothingness . . . is evil itself” (Levinas, 1988). In this view, one must turn to any means—including genetic research and therapies—to address the suffering of the other. In direct contrast to the Christians who fear genetics as a gesture towards that which makes people “post-human,” the response is that modernity and medicine is the basis of humanity.

ISSUES OF ENHANCEMENT OF CAPACITIES AND THE ISSUE OF JUSTICE AND EQUALITY. Religious scholars have been wary of a trajectory of healing both for its own sake as well as with a slippery slope potential in that genetic research intended for curing illness—such as muscle tissue repair in muscular dystrophy—could then lead to enhancement—for example, muscle tissue repair for athletic prowess. This enhanced world would be one of brutalized beings. These scholars believe it would be a world in which unenhanced “wild types”—likely to be the poor—would be even further disadvantaged as a result of class and ethnogeographic fates.

Because religion seeks to address fundamental issues of justice, the problem of difference is a primary concern. The project of genetic research (and the gene banking projects in particular), as well as the clinical translation of the genome project, brings to the forefront concerns of justice on a tangible, local level. It is here that the similarities and differences between humans can be found. This is not only true on a species level, at which regions are mapped in search of single nucleotide polymorphism (SNP) patterns to provide answers about population genetics, but also true at the cross-species level, where homologs and orthologs are used to define highly conserved regions of the human genome and to set up model organism systems to track genetic difference and diseases. It is the powerful combination of this data—this way of understanding biology and this new computational ability to use the data—that will allow humans a keener understanding of the ways in which they differ. Biological differences are, in fact, laden with variations in value that are at times instrumental, and, as well, symbolic. Humans value some differences more than others, however. For example, as rational actors, we value rationality; as embodied beings, we value strength, potency, and longevity.

Theories of justice, however, rely on insights that differ from those of science, which holds to the seventeenth-century ideas of natural reason, close observation, and objective methodology to study nature in its particulars. The basis for modern-day ideas of justice were created, in part, by discourses about freedom and liberty, and made possible by rationality and democracy: a self was able to make a clear social contract in a society governed by law. The emerging science of the twentieth century—both the social and the natural sci-

ences—provided support for social contract theories by arguing that humans were largely alike, that skin color made no clinical difference of distinction. The issue of justice as shaped by human identities and differences has long been understood as a matter of human capacity shaped by both moral choice and by environment.

Genetic knowledge complicates this and makes it visible: in fact, it will warrant a confrontation of a serious problem, one noted by scholars in disabilities studies for decades. Genetic knowledge will reveal human differences and similarities in unexpected ways, and people will begin to understand not only single gene protein causation, but propensities for variation that underlie complex and common diseases and predispositions and propensities. These will suggest pathways to difference, diseases, traits, and behavior. Social relationships and social categories had long been assumed to match obvious phenotypical variation. However, in the post-genomic era, human understanding will become increasingly complicated.

Theories of justice based on the changing knowledge base are still in contention. What will the response be when it is found that humans are not precisely “equally endowed”? And, how will humans create theories of justice and just policy based on significant and fundamental inequality in propensities or in potential difference? How will social ethics be reconceptualized in a world that is, on a biological level, fundamentally unjust? Is it possible to go beyond the requirements of the law to protect privacy and confidentiality—problems that were first imagined in the early years of genetic research and that are now being enacted? Is it possible to achieve a creative and truly bold reflection on how these newly understood “selves” function as citizens in a world that is rent by robust difference in ability yet connected by relationships across previously understood categories? And what will the meaning of genomic relationships be for theories of justice and citizenship?

ISSUES OF IDENTITY, ETHNICITY AND CITIZENSHIP. When the Lemba of Southern Africa claimed to be Jews (Tudor Parfitt, Mark Thomas) or when the Melungians of Appalachia claimed to be Portuguese (Carl Elliott) the claims were widely considered dubious at best, and fanciful at worst. In the age of genetics, African Lemba and American Melungians are tested for variations on the Y chromosome, as well as in the mitochondrial DNA, to more fully investigate such claims. The claims of religion have long sought definitions along the call of nationalisms. Genetic knowledge in this area, as well, provides a powerful deconstruction of some narratives, while it reifies others.

ISSUE OF GENESIS NARRATIVE: HUMANITY AND FREEDOM. Of all the protuberance in the field of genetics and religion, none is as resonant as the claim that in seeking genetic knowledge, the very “book of life” itself (Watson, 2003) is revealed. By seeking such knowledge, the act of creation (the most godlike divine act) is challenged by hubristic scientists. If the reach toward the forbidden knowledge is completed,

can catastrophe be far behind? In fact, the Abrahamic narrative of *Genesis* in the Hebrew Scripture—and echoed in other creation narratives in other sacred texts—is that of violation, fall, and redemption or escape. For Jewish thinkers like Rachel Adler, humanity's acts are rather more complex, as they are in some of the reconsideration of Christian narratives, such as those of Ted Peters.

The challenge to the essential narrative of genesis by genetics can be seen in at least two ways. First, genetic sciences deconstruct the boundaries of the nuclear family by allowing the separation of genetic heritage, gamete production, and the development of an embryo in a woman's womb. Gametes can be generated, but some detractors fear that gametes will also be commodified, sold, advertised, and fertilized outside the norms of a passionate embrace—and even more so outside the bounds of a nuclear family. The genesis drama of infertility and the promised fecundity has been similarly addressed by advanced reproductive techniques and sophisticated genetic screening. Additionally, embryos are the subject of discourse long before the birth in the debate of what is the moral status of embryos? Genetic knowledge allows humans to imagine the self in smaller, more atomized parts, rather than as an inevitable whole, and the genesis narrative of the singularity of the family has to now be reread in this new context. The second challenge to the essential narrative of genesis by genetics is that the genesis narrative questions the ability and limits of human naming, manipulation, and control of nature

ISSUES OF NATURE. Catholic moral theology and many native religious traditions, as studied by Mary Churchill, contend that nature itself has moral boundaries and moral limits. To violate them, suggests Leon Kass, is at the risk of “moral repugnance” (Kass, 2002), in that certain uses or even investigations in genetics or genomics threaten to undermine a moral universe at the most basic of foundations. Nature, in this argument, is normative. Its existence suggests moral authorities that predate human habitation, and thus humans (seen here as outside of nature and therefore a threat to it) can illegitimately befoul nature by radically altering it quickly or imprudently. Other theologians, including Laurie Zoloth and Ronald Green, have used terms such as *tikkun olom* (repair of the world) within Jewish thought. Additionally, Peters has argued strongly that human persons are “created co-creators” (Peters, 2003), and thus entitled to intervene across nature's boundaries. This leads to the question: Does human free will also include the free will to investigate in this way? Religious scholars vary in their answers.

CONCLUSION. Genomic and genetic research has transformed both humankind's fundamental knowledge of biology as well as its basic strategies for transforming the understanding of illness, aging, and disability. These historic developments offer extraordinary promise for the translation of basic knowledge into concrete clinical responses for the prevention and treatment of disease and the improvement of human health and welfare. Such knowledge offers hope

not only for medicine but also for significant social discourse and thoughtful critical responses to personal and public health issues that potentiate poverty and despair.

The dramatic promise of genetics and genomic research offers an opportunity for the deepest and most reflective civic debate on the nature, meaning, and intent of human identity and difference. It poses questions of what is humanity, freedom, and free will, as well as illuminates the problems of what is to be done about the suffering of others. How will the engine of scientific knowledge drive policy, practice, and culture as people collectively confront the ethical, legal, and social implications of human genomic and genetic research? How does humanity attend to issues regarding access, human rights, the autonomous consent of subjects, and the fragile freedom of the research enterprise itself? What new languages, theories, and policies of ethics, theologies, philosophies, and law will need to be created along with the creation of genomic knowledge? And who should craft these new concepts? What policy should emerge to define the ethical boundaries for the use of genomics?

Now that the basic science of bioinformatics and genomics has allowed the sequencing of the human genome and several other animal models, the pace of application and use of DNA sequencing, haplotype mapping, proteomics, and SNP patterning will accelerate. As new and more complex genomic data sets are made public, new research strategies envisioned, and biological processes at the heart of all medicine elucidated, this new data and analysis, as well as the translational research it allows and promotes, will engender new issues for the application and use of genetics.

The use of this information also engenders new challenges in a social understanding and use of genomic knowledge regarding the complex human relationships that make up a just human society. New theories of justice will be needed for the new persons and the new identities framed by the social and scientific knowledge of human and animal models of genomics. Genomics will reveal differences and unexpected similarities among us that will challenge long-held ideas about health, disability, and behavior, thus creating complex challenges in how a fair society is structured. Such differences and identities create new relationships, with new possibilities for alliances and divisions.

Such abilities and disabilities are also weighted differently—and not neutrally—in our society and this raises four challenges in genetic research. First, how will humans learn from such data and how will these create new and complex theories, languages, and practices of social justice? Second, how can humanists, lawyers, and social scientists understand the new science, methods, and cultures of basic biological research engendered by genomics? Third, how can the public understand and participate in genomic knowledge, and how can medical personnel guide this translation of basic science to the clinic? And, fourth, how can policy leaders shape new science and health care policy for a new era of genomic knowledge?

Religion in the late twentieth and early twenty-first centuries played a prudential role in this debate—often invoking the precautionary principle as their positions: avoid the action if there is doubt about its safety or consequence. Yet even this claim rests on a notion of fated inevitability—that a course is set in motion and will unfold unless humans intervene. However, inaction changes the future as surely as does action. As genetic knowledge increases, scholars will need to turn to the text of their faiths and reason and raise new questions. Can religions be another source of wisdom in guiding changes as they occur? Will the concerns of religion's voice be heard—and heard fairly—by the science community? And, furthermore, will all voices—including the religious voice in support of research science—be fairly heard?

Long before science began to shape the modern world, religious faith struggled to incorporate contemporary changes into its world—the theories of Galileo and Charles Darwin, for example, were first rejected, then widely accepted—and the centuries-long relationship between faith traditions and the world that surrounded them created religions of tremendous vigor, creativity, and energy. Further research is needed to track the relationship between science and religion as the field of genetics unfolds.

GENGHIS KHAN SEE CHINGGIS KHAN

GENNEP, ARNOLD VAN (1873–1957), French anthropologist, was born in Ludwigsburg, Germany, his father a descendant of French emigrants. When van Gennep was six, his parents divorced, and his mother returned to France with him. Several years later she married a doctor who had a summer practice at a spa in the French province of Savoy. Van Gennep's attachment to this region, which he considered his adopted homeland, dates from these years. He was to travel through Savoy, village by village, collecting ethnographic and folkloric materials.

Van Gennep had a diversified and original university education at the École Pratique des Hautes Études and the École des Langues Orientales in Paris; his studies included general linguistics, ancient and modern Arabic, Egyptology, Islamic studies, and studies of the religions of primitive peoples. He possessed a rare gift for learning languages. For seven years he was in charge of translation at the Ministry of Agriculture in Paris, but he gave up this post, the only one that the French government ever offered him, in order to devote himself to his personal research. From 1912 to 1915, he taught ethnology at the University of Neuchâtel in Switzerland. After being expelled for having expressed doubts

concerning Swiss claims to total neutrality during World War I, he made his living by the publication of numerous articles and periodic reports, lecturing, and commissioned translations.

His voluminous production can be divided into two periods separated by his most important work, *Les rites de passage* (1909). The concept that he discovered here permitted him, during the second part of his life, to devote himself entirely to the ethnography and folklore of France. In the first part he had been occupied with the problems posed by the English school of anthropology, concerning totemism, taboo, the original forms of religion and society, and the relationships between myth and rite. But he had approached these anthropological commonplaces with a certain originality. For example, in his study, based on documents collected in Madagascar, of the problems of taboo, he not only sees the expression of religious institutions and attitudes but also emphasizes the social effects of taboo, which creates, maintains, or transforms the order of nature, and which consolidates the bonds between a single clan's members, between animal and human members of a clan, between ancestors and descendants, and between humans and gods. Taboo, he believed, is both a social and religious institution. The appearance of his work *L'état actuel du problème totémique* (1920), which purported to be a provisory summation of works on totemism, was in reality, as Claude Lévi-Strauss says, the "swan song" of speculations on totemism. The personal theoretical position of van Gennep in this work is pre-functional: Totemism has as its function to maintain the existing cohesion of the social group and to assure its continuity, which the totem symbolically represents.

Van Gennep's main contribution remains the idea of "rites of passage," which he put forward and developed in the book of that title. By *rite of passage* he means any ceremony that accompanies the passage from one state to another and from one world, whether cosmic or social, to another. Each rite of passage includes three necessary stages: separation, boundary, and reaggregation (or the preliminal, the liminal, and the postliminal). Van Gennep also introduced other important ideas. By emphasizing "ceremonial sequence," van Gennep demonstrates the importance of the process of "unfolding" in rituals and in the relations that exist between rituals. He also introduces the concept of the "pivoting" of the sacred—that is, the idea that the sacred is not an absolute but rather an alternating value, an indication of the alternating situations in which an individual finds himself. Every individual, in the course of his life, passes through alternations of sacred and profane, and the rites of passage function to neutralize for the social group the harmful effects of the imbalances produced by these alternations.

Van Gennep was a nonconformist with regard to his ideas, which obliged him to live at the periphery of academic institutions. His most original contribution in the field of anthropology was to show profound connections between the social and religious spheres.

Revised Bibliography*

GENSHIN (942–1017), also known by the title Eshin Sōzu, was a Japanese Buddhist priest of the Tendai sect and patriarch of Japanese Pure Land Buddhism. Genshin was born in the village of Taima in Yamato Province (modern Nara prefecture) to a family of provincial gentry named Urabe. By his mid-teens he had entered the Tendai priesthood and had become a disciple of Ryōgen (Jie Daishi, 912–985), one of the most eminent clerics of the age. Little is known of Genshin's early career except that he presided at an important Tendai ceremony in 973 and five years later, when he was thirty-six, wrote a learned treatise on Buddhist metaphysics (*abhidharma*), the *Immyōronsho shisōi ryaku-chūshaku*.

Shortly thereafter, Genshin's interests seem to have changed. In 981 he wrote a work on a Pure Land Buddhist theme, the *Amida Butsu byakugō kambō* (Contemplation upon Amida Buddha's wisdom-eye), and in 985 he completed the work for which he is chiefly known, the *Ojōyōshū* (Essentials of Pure Land rebirth). The *Ojōyōshū* was one of the first works on a Pure Land theme to have been composed in Japan. It signaled not only a shift in Genshin's interests but also the beginning of a transition in the history of Japanese Buddhism. In this work Genshin quotes 654 passages from some 160 Buddhist scriptures on the most important themes of Pure Land Buddhism—on the sufferings of the six paths of transmigration and especially the torments of hell, on the pleasures and advantages of Amida (Skt., Amitābha) Buddha's Pure Land, and on the way to achieve transmigratory rebirth into Amida's Pure Land, the cultivation of *nembutsu* (reflection on the Buddha). This latter subject is treated in voluminous detail. There are descriptions of methods

of difficult, meditative *nembutsu* (*kannen nembutsu*, envisualizing Amida's form and meditating on his essence), of easy, invocational *nembutsu* (*shōmyō nembutsu*, calling on the name of Amida Buddha in deep devotion), of *nembutsu* for ninety-day sessions, and of *nembutsu* for the hour of death. The faith that should accompany *nembutsu* and abundant confirmation of its efficacy and merits are set out as well. Throughout the work, Genshin repeatedly deplores the sufferings of this world and urges his readers, whether they be rich or poor, laity or clergy, to seek emancipation through reliance on the compassion of Amida Buddha. The *Ōjōyōshū* became one of the most popular works on a Buddhist theme in the history of Japanese literature.

In the year following the completion of the *Ōjōyōshū*, Genshin and other Pure Land devotees, both clergy and laymen, formed a devotional society called the Nujugo Zammai-e (Nembutsu Samadhi Society of Twenty-five). Genshin's *Ōjōyōshū* no doubt served as an inspiration and guide to the devotional exercises of this society.

In Genshin's life and works can be seen the beginning of a shift in Japan from elite, monastic Buddhism to popular, devotional Buddhism. The *Ōjōyōshū* itself is an attempt to reconcile these two types of faith. It teaches, for example, that meditative *nembutsu* is the highest form of spiritual cultivation, because it can bring about enlightenment in the present life, but that simple invocational *nembutsu* is excellent also, especially for laypeople and sinners, because it can result in rebirth in the next life into Amida Buddha's Pure Land and eventual enlightenment there. Thus Genshin's major significance lies in his contribution to the growth of a Pure Land movement in Japan.

For the common people, he vividly depicted the Pure Land Buddhist worldview of painful transmigration in this world versus the bliss of Amida's Western Pure Land, instilling a fear of the former and deep longing for the latter. To the intelligentsia and clergy, he introduced the vast literature of continental Pure Land Buddhism and an elaborate structure of Pure Land, especially *nembutsu*, theory and practice. For all Japanese, he offered the possibility of salvation based only on sincere devotion and simple *nembutsu* practice. Genshin's teachings were a major inspiration for Hōnen (1133–1212), founder of the Jōdoshū sect of Japanese Buddhism, and Genshin is considered one of the seven patriarchs of the Jōdō Shinshū sect.

BIBLIOGRAPHY

Major works of Genshin, in addition to the *Ōjōyōshū*, include the *Ichijō yōketsu* (Essentials of the one vehicle) and *Kanjin ryakuyōshū* (Essentials of esoteric contemplation). For his complete works, see *Eshin Sōzu zenshū*, 5 vols. (Sakamoto, Japan, 1927–1928).

Works on Genshin in English are few. My study *The Teachings Essential for Rebirth: A Study of Genshin's Ōjōyōshū* (Tokyo, 1973) gives an outline of the development of Pure Land

thought up to Genshin and an analysis of the *nembutsu* theory and practice of the *Ōjōyōshū*. In Japanese, Ishida Mizumaro's *Kanashiki mono no sukui: Ōjōyōshū* (Tokyo, 1967) summarizes Genshin's life and the Pure Land teachings of the *Ōjōyōshū*. Ishida has also edited the *Ōjōyōshū* and translated it into modern Japanese in his *Ōjōyōshū: Nihon Jōdokyō no yoake*, 2 vols. (Tokyo, 1963–1964).

ALLAN A. ANDREWS (1987)

GEOGRAPHY. A deeply rooted aspect of human behavior, the ordering of space is an activity that consists of establishing differences between places in terms of varied functions and degrees of meaning. Among peoples of diverse religious traditions, the most significant places are identified with special spiritual presences, qualities that set certain locales apart from ordinary, profane space. Charged with supernatural power, sacred places function as fixed points of reference and positions of orientation in the surrounding world. With the passage of time, sacred places become invested with accumulations of mythical and historical meanings in complex layers of cultural memory. When joined by paths, processional ways, or great routes of pilgrimage, sacred places form networks that may embrace local village or tribal lands, large nations, or vast regions of the globe occupied by major civilizations. These networks form sacred geographies—webs of religious meaning imposed upon the land—where natural features and human-made symbols establish communication between the earthly and the spiritual, embodying collective values and shared norms of conduct. Sacred geographies form a unifying ground, a lasting source of remembrance and renewal for the most important aspects of individual and communal life in many cultural traditions.

The creation of sacred geographies is behavior partly anterior to the development of culture, for it stems from the marking, exploitation, and defense of territories that join humankind to the larger animal kingdom. But the articulation of landscapes with symbolic imagery and the way in which such landscapes are made to reflect layers of mythology and history also correspond to patterns of thought and complex ways of recording meaningful events that seem peculiar to humankind. The widely different ways in which sacred geographies have been organized show how humans have sought to grasp the perceived world and how they have explained their place within the cosmic schema. An examination of sacred geographies thus points to patterns of environmental cognition and ordering and to the wide range of spatial definitions that have evolved in response to different cultural needs, historical circumstances, and ecological possibilities.

This article focuses on four examples of sacred geography. They correspond to the symbolic landscapes of peoples of strikingly different social and cultural complexities who inhabit regions of varied ecologies. The first example is from the Australian Aborigines, whose gathering and hunting life in an austere desert environment was connected to systems

of sacred places embedded within nature and unmarked by monumental art or architecture. These places, arranged in certain patterns within tribal territories, were thought to have been established by ancestral heroes in the Dreaming—the time of first creation. The second example is from the Maya Indian community of Zinacantan in southern Mexico, a farming people whose culture stems from an ancient native heritage. These Indians have evolved a pattern of centralization in their sacred geography that echoes similar structures among other peoples of sedentary farming life. The third example is from imperial China, where ancient beliefs concerning the worship of earth, water, and sky were expressed at great mountain shrines and in the sacred precincts of the imperial capital. In China is found the creation of a sacred geography closely tied to the concerns of a powerfully centralized state. The last example touches upon the sacred geography of medieval Europe. Though politically disunited, the peoples of Europe followed routes of pilgrimage to the periphery of Christendom and held Jerusalem, the Sacred City, to be the center of their world.

ABORIGINAL AUSTRALIA. The Australian Aborigines are counted among the oldest human races. Their ancestors migrated from Southeast Asia perhaps thirty thousand years ago, when land bridges between New Guinea and Australia were almost certainly exposed. Throughout the millennia the Aborigines pursued an austere gathering and hunting life that was admirably adapted to their barren habitat. The Neolithic agricultural revolution never reached these isolated lands, where nomadic bands traveled within well-defined tribal territories, following seasonal rhythms in the unending search for food. But the inhabitants did not perceive the natural environment in economic terms alone; it was also seen as a storehouse of memory, replete with supernatural meanings. The flat, seemingly featureless terrain contained an invisible, magical domain in which hills, rocks, water holes, and groves were charged with sacred powers and mythical associations. Though apparently obeying the randomness of nature, such features were seen as well in terms of a specific order; people expressed their connection to them through pictographs, rock alignments, wooden sculptures, caches for totemic objects, and ceremonial places designed according to prescribed rules of organization.

The sacred sites of the Aborigines marked places where events in the Dreaming took place. This concept, which is central to Aboriginal cosmogony, concerns a time when heroes and heroines wandered over a land where there were no hills, water holes, or living things. The paths and camping places of these heroes are sacred places described in myths. The ancestral heroes also brought fire to the people as well as the laws by which people live; many such heroes eventually transformed themselves into trees, boulders, and other natural features, thus creating the landscape that exists at present. A symbolic order that related to the time of origins and the travels of creators, rather than the cardinal directions, was called into being. In these austere settings, no sharp divisions were made between animals, plants, inanimate objects, and

humankind. The ancestral heroes were not distant entities but integral components of the land, and they were made part of the experience of daily life through religious reenactments of events of the Dreaming. Joined by a network of sacred places, the land itself became symbolic, affirming a coherence of the physical and mythological domains. Among the Aborigines, sacred geography was the source of authority as well as the source of tribal identity. The latter was based on a title to the land that went back to the time of first creation.

ZINACANTAN. Conquest, colonialism, and the advances of industrial civilization have often spelled destruction or major alteration for traditional religions. In North America, forcible removal of Indian populations from old homelands frequently meant social disintegration for those whose religious sense of belonging to a specific landscape had been destroyed. But colonial cultures have also often produced a range of creative adaptations, as subjected peoples evolved syncretistic religions in which ancient sacred geographies continued to play traditional functions. Latin America, among Indian communities in former Spanish possessions from the Rio Grande Valley in New Mexico to the Bolivian Andes of South America, is especially rich in such instances.

Among many examples that could be discussed, the community of Zinacantan in the high, forested mountain country of Chiapas, southern Mexico, is particularly well documented. The inhabitants are a Maya people, ultimately descended from those who built city-states in southern Mexico, Guatemala, and the Yucatán Peninsula during the first centuries CE. Today, these farming people live in hamlets dispersed throughout the hills, around a civic and religious center that consists of a church, school, and administrative buildings.

The visible sacred geography of Zinacantan incorporates mountains, caves, water holes, and human-made crosses erected at shrine sites at determined locations around the civic and religious center. Mountains have important economic meaning in the life of Zinacantan, but certain peaks are also considered to be homes of ancestral deities who live within. These ancestors control the mists and vapors that rise to form rain clouds on the peaks; they are able to direct the rain clouds over the community. Crosses, placed on pathways around the mountains surrounding the Zinacantan center, were borrowed by the Indians from the symbolic forms of Spanish Christianity. But the crosses are not seen in Christian terms; they are perceived as spiritual openings for communication with ancestral beings. Cave shrines are also places for communication with Yahval Balamil, the earth lord, who dwells beneath the surface of the land; he may also be reached through prayers in caves, at sinkholes, and at springs throughout the Zinacantan domain. Sacrificial offerings are regularly made, especially at the sites of cross shrines. They are most often performed by people walking on ceremonial circuits around the whole community. Shamans are the main ritualists, performing prayers and making offerings

on behalf of patients. Processions of other worshipers may also follow ceremonial circuits, usually moving in counter-clockwise direction. The village church and its Christian images are also frequently included in the processional itineraries. The circuits around Zinacantan are a way of establishing boundaries, a way of saying "This is our sacred center, through which the holy river flows and around which our ancestral gods are watching over us." Circuits are replicated on many levels around individual fields, houses, or other objects, symbolically establishing property rights as well as marking social spaces in the Zinacantan world. The community and land at Zinacantan are infused with the sense of being whole and sacred; sacred geography places the living community in an intimate religious bond with its natural setting and with the ancestors and gods that dwell within that setting.

IMPERIAL CHINA. The sacred geographies of tribes or small agrarian communities are usually encompassed by paths or roadways within relatively restricted zones. But the development of ancient empires embracing vast regions and diverse populations posed different problems of spatial symbolism. For rulers, the problem was to create symbolic orders that might tend to unify such disparate domains and polities. Great ritual centers were designed to communicate the religious and political concerns of state organizations. The symbolic structure of such places expressed the idea of a sacred geography in microcosm, through the use of monumental art and architecture.

In China, where continuity of religious themes has been maintained over millennia, imperial ritual was especially focused on two outstanding places. The first was a sacred mountain, Tai Shan, the central and most important of five sacred mountains associated with the cardinal directions and center. The worship of mountains has an ancient history in China, attested by early texts that describe peaks and the appropriate rites to be celebrated there. Some were local shrines affecting small areas, but others were majestic sovereigns that extended their influence over immense regions. These old beliefs surrounded Tai Shan, and the sacred place gradually was invested with imperial monuments throughout the centuries. In effect, the mountain became a symbol of the cosmos and the state. The mountain was given royal title during the Tang dynasty in 725, inaugurating a practice followed by successive emperors. These honorific names underlined the conception of the mountain as a producer of life forces. It was identified with rain clouds and fertility and figured as an object of worship in spring rites of planting and at the fall harvest season. It was also seen as a symbol of stability and permanence and as a preventer of droughts, floods, and earthquakes. Indeed, it was a divinity with a sacred force that could be touched by prayers and sacrifice.

Just as the mountain was a symbol of order in the natural environment, so did the emperor personify the social and moral order. A close relationship developed between ruler and mountain, for the emperor was the pivot between society

and nature. But both the emperor and the mountain were subordinate to Heaven, for it was through the mandate of Heaven that all harmony and validation derived. These relationships were spelled out in the elaborate system of monuments with which Tai Shan was equipped. At the summit, an open circular platform was constructed for the Feng sacrifices, which consisted of burnt offerings to the heavens. Below, toward the base of the mountain, a polygonal open altar was constructed for the Shan sacrifices in honor of the earth. Between these key altars were a host of subsidiary temples dedicated to lesser nature divinities, ancestral heroes, and various miraculous saints and hermits. There were also commemorative monuments to various emperors, a school, a library, a Confucian temple, and many other sacred places scattered among the crags and groves. The whole site was simultaneously a symbol of the land, the empire, and the cosmos—a great unifying topographic icon.

The symbolic order that governed Tai Shan also informed the cosmic imagery of ritual centers within the imperial capital. In Beijing, sacred enclosures featured open platform altars to the sky and earth, with subordinate temples to the sun, moon, and agriculture, each with its own complement of satellite monuments, altars, and secondary buildings. The Chinese love of order, hierarchy, and classification governed the orientation and symbolic ornament of the temples, with their gleaming white marble and carved imagery of mountains, clouds, water, and earthly or celestial dragons. These cosmic figures expressed the notion of a sacred geography in abstract form, becoming universal symbols. The magnificent altars, with their surrounding concourses and processional paths, formed the setting for imperial rites where the emperor offered sacrificial covenants to heaven and earth. The sacrifices expressed a complementary relationship to one another. The mysterious, limitless heights of heaven and the regular movements of the celestial bodies symbolized Heaven's regulative power to keep the universe in stable order and to produce the proper succession of seasons. This power was especially important to an agricultural people, and through sacrificial acts the emperors expressed the harmony of a well-ordered society within the universal schema.

MEDIEVAL EUROPE. The sacred geographies of the Far East and among the Indian peoples of the Americas tend to express a correspondence between humanity and nature and to be arranged in patterns of centralization. By contrast, the sacred geography of medieval Europe did not focus on a single European capital but was cast instead as a vast network that ran through many lands, leading to pilgrimage cities at the extremities of Christendom. From central and southern France, pilgrimage routes ran south over the Pyrenees, converging on a road that led across northern Spain to Santiago de Compostela, the tomb of the apostle James. Another route threaded down the Italian Peninsula to Rome. There, amid the ruins of antiquity, the pilgrim might meditate upon the early saints and martyrs and visit the old Lateran—the Mother Church and seat of the earthly Vicar of Christ. But the most perilous of routes led farther south to the port of

Brindisi, and from there by ship across the Mediterranean, to the most distant, mysterious, and sacred of all goals, the city of Jerusalem.

The physical realities of this complex geography were translated in terms of a mythological hierarchy on thirteenth-century maps. These charts reveal a vision in which the horizontal surface of the earth was shown as a flat disc, with Jerusalem, the Holy City, marked clearly at the center. The outline of the Mediterranean Basin was summarily drawn, as were the features of Europe. Peripheral and unknown regions were shown to be the realms of bizarre or fabled races, sometimes held at bay behind great walled enclosures. On a vertical axis above Jerusalem, the Savior presided over the celestial sphere, while ferocious demons patrolled the infernal regions below. Such imagery was not primarily meant to illustrate an actual, material geography but rather a spiritual landscape whose central earthly icon, Jerusalem, could be interpreted on different levels. It was the Holy City of Palestine, the goal of pilgrims and crusaders; a symbol of the church; a metaphor for the Christian soul; and an analogy for the heavenly Jerusalem, the final Promised Land.

Such patterns were repeated in microcosm throughout Christendom in the art and architecture of cathedrals. In France, where these buildings reached their highest expression, sculpture, architecture, and stained glass formed a symbolic code to show the order of nature, to represent an abstract of history, and to summarize spiritual values. Within the soaring naves of the great cathedrals, at once mysterious and secure against the outside world, the assembled congregation saw the mirror of creation. Yet, like the maps, these buildings represented an essentially interior world, expressing the aims and aspirations of the innermost consciousness of the community. Such sacred places, joined in the larger network of routes to distant centers of faith, formed a sacred geography of a tradition that denied the physical world to emphasize instead theological, conceptual, and belief-oriented values that urged people to rise up, away from the earth, above animals, plants, and inanimate objects, toward a transcendent God.

CONCLUSION. This article summarizes the structure of four sacred geographies in societies that range from the level of tribal bands to complex civilizations. In all cases, sacred geographies have the functions of creating a sense of place and of creating a certain order in the world. Through the use of symbols, networks of meaning are imposed upon the land; such spatial orders clarify the difference between places by illustrating what is thought to be significant in the perceived world. These symbols may be natural features, such as mountains, lakes, or rivers; they may be pictographs or markings; or they may be elaborate works of art and architecture accompanied by writing. In the context of a landscape, such symbolic systems communicate the difference between sacred and profane space and answer the universal theme of establishing connections between a population and a time and place of origin.

Beyond such essential functions, sacred geographies are as varied as religions. These differences are the result of specific cultural and historical factors as well as geographical conditions. The circumstances of a wandering life in an isolated region; the need to form or unify a state organization; the pattern of an early chain of missions or military conquests; the lasting prestige and sacred quality of an ancient civic and religious center—these and countless other factors may determine how sacred geographies are shaped. By incorporating the imagery of history and related information, sacred geographies make visible a cultural or ethnic domain and signal territorial possession.

The study of sacred geography is especially important in understanding the processes of cultural history, particularly among peoples whose traditions are not documented in writing or whose traditions may be recorded in partly deciphered hieroglyphic texts and figural imagery. In Africa, Oceania, and the Americas, where the native spiritual and intellectual heritage was largely transmitted orally, major archaeological sites must be decoded without textual sources, and early European reports of contact are colored by an Indo-European outlook. Among these peoples, the broad patterns of sacred geography provide indispensable insight on the role of religious thought and symbolism in the evolution of civilization.

Revised Bibliography

GEOMANCY is a form of divination based on the interpretation of figures or patterns drawn on the ground or other flat surface by means of sand or similar granular materials. The term is also used for the interpretation of geographic features. Among the Chinese, in particular, this practice of geomancy is rooted in traditional philosophic conceptions of the relationship that exists between human beings and the vital forces of their environment and the need to achieve a harmonious balance between the two to ensure well-being.

The Western form of geomancy, widespread in the Arab world, was also of importance in medieval Europe, where it was closely linked with alchemy and astrology. Geomancy of this kind is likely to have originated in the ancient Near East and may also have been developed further by Greek mathematical speculations. In the eighth and ninth centuries, during the period of Arab cultural florescence and expansion, it became systematized and was then widely distributed from its center to Byzantium and across North Africa and into Spain. From Spain it was also probably spread along a second route into Christian Europe. From Egypt and North Africa, geomancy was carried south with Islam and then even beyond, so that it is now found both in West Africa (for example, among the Yoruba of Nigeria) and in East Africa, including Madagascar.

The Arab system called *ram'l* ("sand") is based on complex mathematical calculations and involves conceptions of an orderly universe. Its numerical order provides the under-

lying framework for all other Western systems of geomancy. The fundamental common feature of geomancy is a pattern of binary oppositions of markings grouped into sixteen combinations of four positions. In both the Arab system and that of medieval Europe (*ars punctatoria*), points or lines were drawn on sand in a pattern based on chance. In the Yoruba system (Ifa), which has been particularly well described, markings are based on the casting of palm kernels or cowrie shells according to prescribed procedures. For each of the resulting figures, from among a total of 256 possible combinations and permutations there is a set of verses that the diviner (*babalawo*) will have memorized to interpret the pattern and to apply to the case at hand. In general, the aim of this practice is not to divine future events but to discover the supernatural causes of present situations and their remedies.

In the European system the sixteen figures are related to astronomical signs of the planets and the zodiac; the scheme also includes four elements and four qualities. Although various authors have offered divergent interpretations of this system, its basic structure is remarkably constant and has been integrated into different philosophical conceptions with striking flexibility.

The system of medieval European geomancy appears to have had a brief revival in the occultism of the nineteenth century. The African systems are still viable, and forms of the Yoruba practice, in particular, have even been discovered in the Americas, notably in Cuba and Brazil.

Less complex systems of geomancy, apparently unrelated to those of the West, are to be found in Tibet in the form of "stone divination" and "pebble divination." These systems each have their own sets of rules, recorded in manuals. They are quite distinct from those discussed above.

The term *geomancy* is also used to refer to *feng-shui* ("winds and waters"), the traditional Chinese technique for determining propitious locations for towns, dwellings, and tombs. This system, which is still in very widespread use, concerns the distribution over the earth, by winds and water currents, of various terrestrial and atmospheric emanations that are believed to exert important influences on people. In addition to being a system of calculations for establishing favorable sites, geomancy is also a method for discerning the causes of human illness and suffering. Geomancers may claim that these causes lie in the negative influences on people of badly placed residences or of the unfortunate positioning of the tombs of ancestors, who consequently send illness and misfortune to their descendants as expressions of anger. Moreover, a given dwelling or tomb, which was originally well placed, may, in time, have its geomantic position shifted as a result of changes in the area, such as new constructions that produce an alteration in the balance of positive and negative currents. A geomancer will not only divine such causes but will also seek to remedy the situation by recommending reburial at a better spot, changing the position of a tomb, or urging the building of a wall or other structure to modify the direction of the currents. Because of the belief that illness

may be due to such influences, geomancers must be included in any list of traditional Chinese diagnosticians and medical practitioners.

Revised Bibliography

GEOMETRY. During the last two millennia BCE, the period that produced most religious texts, geometry (lit., “earth measurement,” from Greek *gaia*, *ge*, “the earth,” and *metrein*, “to measure”) was essentially a “geometrical algebra” with a focus on number. Problematic allusions to number and space, which abound in sacred texts, are presumably inspired by this early mathematical protoscience. During the much later development of Christianity and Islam, Euclidean geometry—based, so it seemed, on irrefutable deductive logic built from definitions, postulates, and theorems—became the rational paradigm for all sciences, including theology. The discovery of other geometries in the last two centuries has brought the realization that Euclidean geometry is merely a special case within a wider realm. Efforts to rid mathematics of its logical paradoxes have taught that perfect consistency and certainty are unattainable in rational thought. These developments, together with a new awareness of the complexity of physical space and a better understanding of how culture shapes perceptions, have dramatically altered philosophical dogmatism, making ancient and Eastern modes of thought more congenial to the modern West and contributing to the problems of contemporary religion.

NEOLITHIC CULTURES (6000–3500 BCE). In southeastern Europe and the Near East, Neolithic peoples decorated the surfaces of cult objects with geometric motifs—circles, ovals, parallel lines, chevrons, triangles, squares, meanders, and spirals. These abstract designs came to abound in the folk arts of most of the cultures of the globe, seemingly irrespective

FIGURE 1. *Geometric Symmetry.* Simple design sequences, such as appear on Neolithic pottery, weaving, and basketry, suggest applied knowledge of propositions in geometry and arithmetic.

of time, of the degree of civilization attained, or of concomitant skill in the realistic depiction of natural objects such as animals, human faces, leaves, and landscapes. Creation myths inherited from Mesopotamia and Egypt of the third and second millennia BCE and later from Palestine, China, and Greece, as well as those recorded in modern times in the Americas, Africa, and Oceania show that the act of divine creation is universally conceived as an ordering, a shaping and selection that brings a world, a cosmos, into being. During the Neolithic period, the abstract geometrical motifs that ornament dress, vessels, walls, and other artifacts found in the earliest shrines and villages were expressions of an intuitive identification of order with the sacred and a consequent mobilization of aesthetic feeling in control of design.

In *A History of Mathematics* (1968), Carl B. Boyer observes that pottery, weaving, and basketry, from the time of their Neolithic origins, “show instances of congruences and symmetry, which are in essence parts of elementary geometry.” To Boyer, “simple sequences in design”—such as translations, rotations, and reflections (see figure 1)—“suggest a sort of applied group theory, as well as propositions in geometry and arithmetic.” Formal propositions did not appear, however, until the Greeks initiated them in the fifth and fourth centuries BCE. Group theory was not developed until the last two centuries; only recently has it been extended to cover the geometric symmetries in space that were already a concern in Palestinian stoneware, for instance, as early as 10,000 BCE. The oldest mathematical texts, dating from circa 1900 to 1600 BCE, show that geometry developed historically as “the science of dimensional order,” in close alliance with arithmetic and algebra, although “the ‘spaciness’ of space and the ‘numerosity’ of number are essentially different things” (Alfred North Whitehead, *An Introduction to Mathematics*, 1911).

“There is a direct correlation between complexity of weaving and sophistication of arithmetic understanding.”

FIGURE 4. *Geometrical Algebra*. The square root of 2 can be visualized as the diagonal of a square.

FIGURE 3. *Geometrical Algebra*. The binomial $(a + b)^2 = a^2 + 2ab + b^2$ can be visualized as a problem in geometry.

FIGURE 5. *Geometry of the Plane*. A triangle inscribed in a semicircle is a right triangle.

Walter A. Fairservis notes in *The Threshold of Civilization* (1975). In a settlement like that at Çatal Hüyük in central Turkey, occupied before 6500 BCE, the frame posts of the houses are filled in with sunbaked bricks made from molds, furnishing strong economic motivation for knowing precisely “how many bricks were necessary for each wall”; hence, “counting and notation were very much a part of the cultural scene.” Far cruder artifacts—sequences of notches incised in bone, studied by Alexander Marshack (1972)—suggest “systems of lunar and other notation” that push the origins of arithmetic far back into Paleolithic times, twenty-five thousand and more years ago. Modern archaeologists and anthropologists are thus producing alternative theories to those of Herodotos (fifth century BCE), who believed geometry began in Egypt, motivated by the necessity of reestablishing boundaries after the annual Nile floods, and by Aristotle (fourth

century BCE), who also assumed an origin in Egypt, but because “there the priestly caste was allowed to be at leisure.” **ANCIENT EGYPT.** Chief sources of knowledge of early Egyptian geometry are the Moscow Papyrus (c. 1890 BCE) and the Rhind Papyrus (c. 1650 BCE). The emphasis here is always on calculation, so that their geometry “turns out to have been mainly a branch of applied arithmetic” (Boyer, 1968). The concept of geometric similarity is applied to triangles, and there is a rudimentary trigonometry. There is a good approximation to π in the formula that computes the area of a circle by constructing a square on eight-ninths of its diameter (see figure 2). In addition, the Egyptians knew the formulas for elementary volumes and correctly calculated the volume of a truncated pyramid.

Modern scholars, however, are disappointed to find so little cause for the high estimation in which the Greeks later held Egyptian science. Respect for the organizational and engineering skills required for the building of palaces, canals, and pyramids, for example, is tempered by the realization that such civic projects entail little more than what Otto Neugebauer (1969) calls “elementary household arithmetic which no mathematician would call mathematics.” Neugebauer concludes: “Ancient science was the product of a very few men; and these few happened not to be Egyptian.” Of far greater interest is what was happening in Babylon.

Tetractys		Algebraic value	Arithmetic example
point	0	()	1
line	0 0	a b	2 3
plane	0 0 0	a^2 ab b^2	4 6 9
solid	0 0 0 0	a^3 a^2b ab^2 b^3	8 12 18 27

FIGURE 6. *The Pythagorean Holy Tetractys*. Note the modern algebraic formula and the Pythagorean arithmetic example in smallest integers.

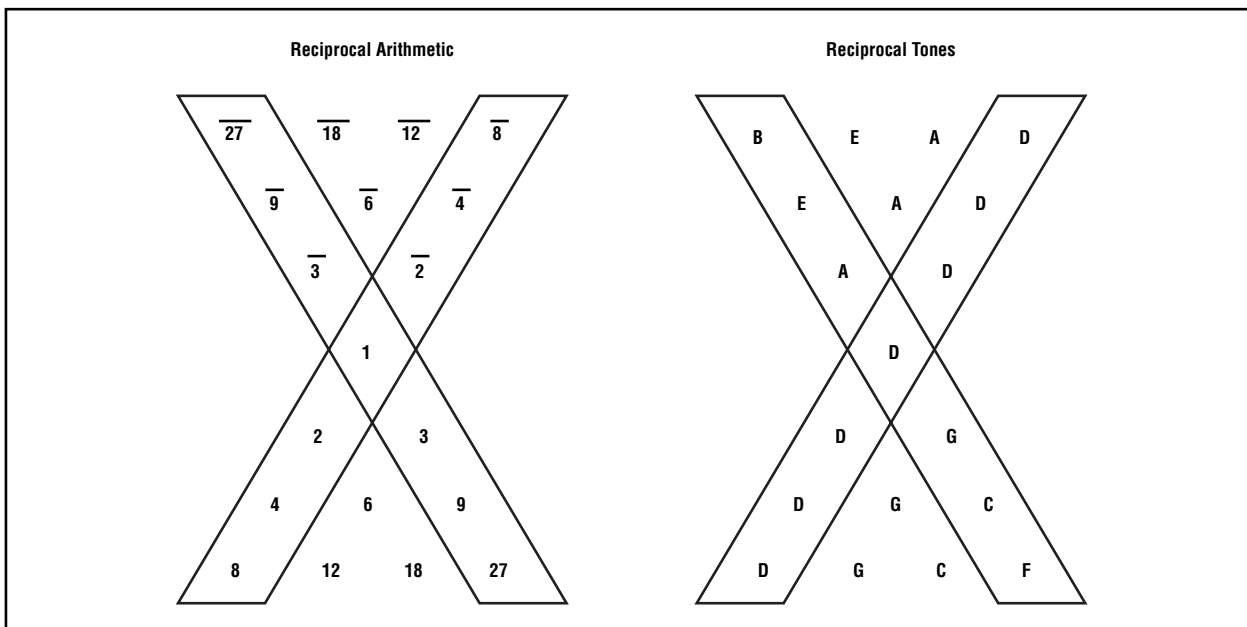

FIGURE 7. *Plato's Timaeus Cross (X)*. This pattern reveals at a glance the Platonic theorem that between square numbers there is one geometric mean and between cube numbers there are two. The result is continuing geometric progression in every direction around the center. This construction is a stage in the process by which Plato develops the cubes of 2 and 3 into the model “world soul.” Arithmetic doubles are known as octave equivalences to a musician and as modular identities to a mathematician.

BABYLON. Several hundred baked-clay tablets about the size of the palm of the hand, incised with neatly crowded rows of cuneiform inscriptions, provide more information about the mathematical sciences in Babylon circa 1900 to 1600 BCE than exists for any other place or time preceding the *Elements* of Euclid, circa 320 BCE. Standard tables of multiplication of reciprocals and a place value notation on base sixty facilitated computation at a level Neugebauer compares with that of Europe in the early Renaissance, more than three thousand years later.

Babylonian geometry, like that of Egypt, was still “applied algebra or arithmetic in which numbers are attached to figures” (see figure 3). The ratio between the side and diagonal of a square (i.e., the square root of two) was computed correctly to about one part in a million (see figure 4). Ratios

between the areas of a pentagon, hexagon, and heptagon and those of squares built on one side were closely approximated, as was the value of π . A geometric concept of similarity is applied to circles, and perhaps also to triangles. An angle inscribed in a semicircle is known to be a right angle (see figure 5). The Pythagorean theorem (which holds that the square on the hypotenuse of a right triangle is equal to the sum of the squares on the other two sides) was understood in all its generality a thousand years before Pythagoras. One tablet, known as Plimpton 322, develops a set of fifteen “Pythagorean triplets” (three numbers defining right triangles, such as 3,4,5) in a sequence in which acute angles vary by approximately one degree. This “prototrigonometry,” unsuspected until the tablet was translated, is one of the most astonishing mathematical achievements of the ancient world. It demonstrates empirical knowledge of a general formula:

Assuming integers p and q with $p > q$, and taking $p = 2$ and $q = 1$, the 3,4,5 triplet emerges as follows:

SIDE	SIDE	HYPOTENUSE
$2 pq$	$p^2 - q^2$	$p^2 + q^2$
$2 (2 \times 1) = 4$	$4 - 1 = 3$	$4 + 1 = 5$

It was from the Babylonians, rather than from the Egyptians, that the Greeks inherited the fund of empirical insights that they transformed into an exact science. The example just cited—in which the ratio of the musical octave, 2:1, is transformed into the Pythagorean triplet 3,4,5—is the foundation of Plato’s cosmogony, and it may turn out to be one of the most important clues to the numerology of the ancient world.

GREEK TRANSFORMATION OF EGYPTIAN AND BABYLONIAN KNOWLEDGE. Researchers are still trying to unravel the story of how the Greeks, in less than three centuries (600–300 BCE), transformed geometry—inherited essentially as an art of making arithmetical relations visible—into a science based on definitions, postulates, and theorems (and appealing therefore to an invisible *logos*). Material inherited from Egypt and Babylon through Thales (c. 585 BCE), and Pythagoras (c. 550 BCE) was riddled with confusion between exactness and approximation. A new “dialectical” spirit arose with Parmenides (c. 475 BCE) and his followers. Precise definition, always elusive, was the new goal that Socrates (d. 399 BCE) applied to moral and ethical questions by appealing to “harmonic” examples from the Pythagorean geometry of the vibrating string. Plato’s affection for dialectics and his emphasis on abstraction bore unexpected fruit in Aristotle’s rejection of his teacher’s Pythagorean methods: “Dialectics is merely critical where philosophy claims to know” (*Metaphysics* 1004b). Aristotelian “first philosophy” developed a new syllogistic rigor in the generation after Theaetetus (c. 414–c. 369 BCE) and Eudoxus (c. 400–c. 350 BCE), who changed the method and enlarged the scope of mathematics. Another generation later, Euclid’s *Elements* completed the mathematical transformation so successfully that the only traces of earlier Greek mathematics that survive must be gleaned from his work. Little else was deemed worth copying.

For current understanding of geometrical symbolism in ancient religions, the Greek transformation has almost no meaning. Although Christianity and Islam are historically young enough to have been affected by the transformation, their holy books show virtually no influence of the new Greek science. (A possible notable exception is the opening line of the *Gospel of John*: “In the beginning was the Logos.”) Plato, the first author in history whose works have survived intact, made an extended commentary on the mathematical bias in his philosophy and offers the richest insight into the intentionality that inserted so many mathematical elements in ancient mythology. The musical geometry at the heart of his mathematics was common to both East and West; its simplest pragmatic formula is found in China.

HARMONIC COSMOLOGY IN CHINA AND GREECE. The natural, or counting, numbers (1, 2, 3, . . . , infinity) are a primordial image of order. Developed systematically into Pythagorean triplets, they lead to a prototrigonometry of the plane. Applied systematically to the geometry of a vibrating string, they link the magical realm of tone with the numbers that measure the world. To use economical modern concepts, the octave ratio 1:2 becomes the cyclic module (Plato’s matrix, or “universal mother”) in which the even numbers are “modular activities” (doubling and halving merely produce further “octave identities”) and the odd numbers are “modular residues” (meaning that they define new pitches within the octave matrix). To build a scale, the simplest procedure is to follow the old Chinese rule of adding or subtracting one-third (from any reference pipe or string length). This is the geometrical analogue of the musical procedure of tuning by ear: A subtraction of one-third correlates with the musical interval of an ascending perfect fifth (3:2); an addition of one-third correlates with the descending perfect fourth (4:3). To avoid fractions in the arithmetic, the reference length must contain one factor of three for every “tone child” to be generated. The Chinese pentatonic (five-tone) scale must therefore be generated from $3;84 = 81$.

<i>Tone</i>	C	G	D	A	E
<i>Number</i>	81	54	72	48	64
<i>Operation</i>	-1/3	+1/3	-1/3	+1/3	+1/3

Rearranged into scale order, this number sequence has a reciprocal “twin” that defines frequency ratios:

<i>Tone</i>	C	D	E	G	A
<i>Length ratio</i>	81	72	64	54	48
<i>Frequency</i>	64	72	81	96	108

Both Chinese and Greek cosmology are projections from this tonal geometry, reducible to continued operations with the prime number 3. Note that the defining operation started on $34 = 92 = 81$. Ancient China was conceived as 1/81 part of the whole world, that is, as 1/9 of one of the nine “great continents.” China was also considered to be divided into nine provinces, so that each Chinese province was 1/729 of the whole world; now $36 = 93 = 729$ is the base for the same tuning calculation when it is extended through seven tones for the complete diatonic scale, also standard in China in the fifth century BCE. At about the same time, Philolaus, a Greek Pythagorean philosopher, conceived the year as made up of “729 days and nights,” a number that would seem to come from nowhere but such a musical cosmology. Plato linked the seven tones in this set to the sun, moon, and five planets; later, Ptolemy (second century CE) linked the scale to the zodiac.

The numbers 64 and 81, on which the alternate scale progressions commence, and the number 108, largest in the set of pentatonic frequency values, are immortalized in various ways. In China there are 64 hexagrams in the *Yi jing* divination text. The numbers $82 = 64$ and $92 = 81$ have been the favored squares on which to construct the Hindu fire

altar since Vedic times (c. 1500 BCE). The number 108, upper limit in the set, is the number of beads in the Buddhist rosary. The tuning pattern itself has recently been discovered (but without numbers) on an Old Babylonian cuneiform tablet from circa 1800 BCE.

The set of twelve consecutive tones generated by the above procedure constitutes a chromatic scale. In ancient China each twelve tones in turn became the tonic of the standard pentatonic scale for a particular calendric period. Throughout Chinese history the bureau of standards remained wedded to a tonal geometry: The length of a pitch pipe (an end-blown hollow tube) sounding the reference tone determined the standard for both weights and volumes. Each new regime established a new reference pitch; today there is the record of dozens of successive changes in the bureau of standards as the reference pitch oscillated over the range of about the interval of a sixth.

Unless one knows the musical procedure, the Daoist formula for the creation of the world sounds mystical: “The Dao [the Way] produced one, the one produced two, the two produced three, and three produced the ten thousand things [everything].” The creation myth related by Plato in the *Timaeus* similarly develops the world’s harmonical soul and body from the numbers 1, 2, 3. Pythagoreans frankly announced that, to them, “All is number,” and Aristotle quotes them as saying, “The world and all that is in it is determined by the number of three.” Plutarch describes planetary distances in the Philoaus system as “a geometrical progression with three as the common ratio.” For eight hundred years Greek astronomers toyed with variations on this planetary motion (c. 1600 CE) while still looking for the right tones to associate with each celestial body. East and West, the “geometry” of heaven and earth was musical and profoundly trinitarian while astronomy was being gestated.

The Greek view of this tonal-planetary geometry points in the direction of a more abstract mathematical system. The Pythagorean “holy tetractys” was a pebble pattern symbolizing continuing geometric progression from a point through a line and a plane to the “solid” dimension (see figure 6). Plato takes advantage of the double meanings of integers (both as whole numbers and as reciprocal fractions) to generate the material for a seven-tone scale at the cube dimension ($3^3=27$; see figure 7). Nicomachus (fl. c. 100 CE), writing an introduction to Plato, simplifies the double view of the multiplication table 2×3 up to the limit of $36 = 9^2 = 729$ (see figure 8.) Stones, musical tones, planets, numbers, and geometry are all part of one vast Pythagorean synthesis, replete with symbolic cross-reference and a supporting mythology. An exasperated Aristotle mocked it; Euclid made it obsolete.

The problem of “excess and deficiency” with which a musician wrestles in adjusting the geometry of the string by ear had its arithmetical analogue in the ancient problem of making approximations between the areas of a circle and square and the volumes of a sphere and cube. Thus harmonics was a paradigm for an ethics of moderation; “nothing too

much,” the Greek ideal, had its counterpart in Confucian concepts of morality and behavior. Thousands of years earlier, the Egyptians had conceived the scales of Maat as the “great balance” on which the heart of the deceased was figuratively weighed to test its fitness for immortality. Thus the wisdom literature of the ancient world shows remarkable parallels between cultures.

The historical record is so fragmented, however, that interpretation of geometric symbols remains speculative. Modern studies in the neurophysiology of vision and in related psychological inferences suggest that schematic, geometric relations play decisive roles. The universal acceptance of the octave ratio 1:2 is further evidence of human psychophysical norms that could generate correspondence between cultures that were never in contact. While they can neither fully document the paths of cultural diffusion nor even claim that diffusion is necessary, researchers cannot entirely rid themselves of suspicion that there was a great deal more diffusion than can be proven.

PROBLEMS IN ANCIENT GEOMETRIC SYMBOLS. It is easy to imagine that the ancient stone circles that abound in Europe and America linked people to events in the sky—that the twenty-eight poles arranged in a circle for the lodge of the Arapaho Indians’ Sun Dance, for instance, may correspond to twenty-eight lunar mansions; that the twelve sections of the Crow tribe’s lodge for that ceremony may allude to the months of the year; and that other cultures possessed similar symbols of earth, sky, and calendar (Burckhardt, 1976). But many familiar symbols are more puzzling. Why, for instance, did the Pythagoreans take a five-pointed star (see figure 9) as their special symbol? Is it because each line cuts two others in “mean and extreme ratio” (meaning that the whole lines is to the longer segment as the longer is to the shorter) so that the figure symbolizes both “continuing geometric progression” (the world’s “best bonds,” for Plato) and a victory over the “darkness” of the irrational? Could the Hindu “drum of Śiva” (see figure 10)—with its inverted triangles and the interlocked triangles of the star-hexagon (see figure 11), prevalent in Indian and Semitic cultures—be related to the Pythagorean symbols in figures 6 and 7?

The so-called Pascal triangle (see figure 12), containing the coefficients for the expansion of the binomial $(a+b)^2, 3, 4, 5, 6$ was known to Pingala (c. 200 BCE) as Mount Meru, the Hindu-Buddhist holy mountain. Pingala interpreted this triangle as showing the possible variations of meter built from monosyllables, disyllables, trisyllables, and so on. Could this “Mount Meru” be related to the holy mountains of other Eastern religions? Is the Pythagorean tetractys simply the Greek form of older holy mountains? Is it significant that the Sumerian symbol for mountain is a triangular pile of bricks (see figure 13), aligned in a pattern Pythagoreans found useful for numbers? Is the hourglass shape of the later Buddhist holy mountain simply a geometric variation of the “drum of Śiva”?

1	2	4	8	16	32	64	= F
	3	6	12	24	48	96	= C
		9	16	36	72	144	= G
			27	54	108	216	= D
				81	162	324	= A
					243	486	= E
						729	= B

FIGURE 8. *Nicomachus's Triangle*. Nicomachus presents Plato's reciprocal material in figure 7 in the form of a multiplication table for 2×3 , extended to $36 = 9 \times 3 = 729$ to avoid fractions. Note that he describes the numbers written out from left to right rather than arranged in the form of the Greek letter chi (X) that Plato specified.

Translation of the ancient Babylonian mathematical texts now makes clear that the computational sophistication achieved four thousand years ago was so great that the sacred texts of all peoples must be studied with new alertness for evidence of rational—and not merely poetic—inspiration. The old Sumerian-Babylonian gods possessed straightforward numerical “nicknames” (used for scribal shorthand) in sexagesimal (base sixty) notation; the three great gods—Anu-An, whose numerical epithet was 60 (written as a large 1), Ea-Enki, associated with 40, and Enlil, associated with 50—are functional equivalents of Plato's 3,4,5 Pythagorean genetic triad. Could some of the ancient religious mythology turn out to be mathematical allegory?

It seems curious that the ancient Greek altar at Delphi is built on cubic dimensions, as are the chapel of the Egyptian goddess Leto that Herodotos saw in the city of Buto, the Vedic fire altar, the Holy of Holies in Solomon's temple, and the ancient Sumerian ark (first to “rescue a remnant of mankind from the flood”). The name of the most sacred Islamic shrine, the Ka'bah at Mecca, literally means “cube,” and the city of New Jerusalem in the *Book of Revelation* is also measured in such dimensions. All of these cubic consonances between various religions suggest that poetic religious imagination has had a geometrical, “protoscientific” component for a very long time.

GEOMETRY SINCE EUCLID. The thirteen books of Euclid's *Elements* culminate in a treatment of the five regular, or Platonic solids—tetrahedron, cube, octahedron, dodecahedron, and icosahedron—each with uniform sides and angles and all capable, when replicated, of closely packing three-dimensional, abstract space. Euclid mastered the transformational symmetries of these “rigid” bodies.

In the third century BCE Archimedes did important work on the area of the surface of a sphere and of a cylinder and on their respective volumes, and Apollonius carried the study of conic sections (ellipse, parabola, and hyperbola) to its highest development. Later Greek authors made further

FIGURE 9. *Pythagorean Symbol*. Each line cuts two others in “mean and extreme” ratio.

FIGURE 10. *The Drum of Siva*. Note the hourglass shape attributed to Mount Meru, and compare with Plato's Timaeus pattern in figure 7.

advances in geometry, but the great wave of development that had begun scarcely four hundred years earlier was spent.

Later Hindu talent has been mainly arithmetic and algebraic; theorems on the areas and diagonals of quadrilaterals in a circle were contributed by Brahmagupta (c. 628 CE). Important Arab contributions to the solution of cubic equations by the method of intersecting conics were summarized by 'Omar Khayyam (c. 1100 CE). European development has been rapid since Kepler's time; it was Kepler who introduced the concepts of the infinitely great and the infinitely small, which Euclid had carefully excised from consideration. The invention of analytic geometry by Pierre de Fermat and René Descartes in the seventeenth century led to a new integration of geometry and algebra.

The contributions of Euclid's *Elements* to the invention and development of the physical sciences during all these centuries is inestimable. His kind of logical, geometrical argument is the basis for Archimedes' formalization of the laws

FIGURE 11. *Star Hexagon*. Indian and Semitic symbol.

FIGURE 13. *Sumerian Symbol for a Mountain*. The triangular arrangement is the pattern that Pythagoreans found useful for numbers.

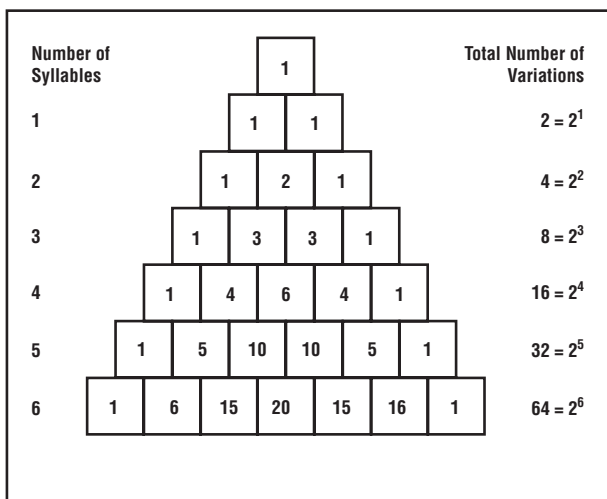

FIGURE 12. *Pascal's Triangle*. Known to Piṅgala (ca. 200 B.C.E.) as "Mount Meru," the Hindu and Buddhist holy mountain.

of the lever; for the Greek development of astronomy as a physical science (by Hipparchus, Ptolemy, and others); for Galileo's work on the dynamics of the inclined plane; for Kepler's laws of planetary motion; for Newton's laws of planetary gravitational dynamics; and for an endless host of related physical sciences. Euclidean geometry, still being improved today, has thus been one of the Western world's most powerful engines of progress. The *Elements* has been "the most influential textbook of all times" (Boyer, 1968), and it was long assumed to be as certain a guide to geometry as the Bible to absolute truth. God, it was confidently asserted, is a geometer.

During the nineteenth century, which Boyer calls the "golden age of geometry," this almost-perfected world of traditional, Euclidean-inspired mathematical physics exploded with a creative energy, leading to a crisis in the very founda-

tions of mathematics. For example, one of the several new geometries that appeared, projective geometry, has nothing to do with measurement. Several "non-Euclidean" geometrics, by N. I. Lobachevskii, Wolfgang Bolyai, and G. F. B. Riemann, omit Euclid's famous sixth postulate concerning parallel lines, always somewhat suspect, to create equally logical geometries of even wider generality.

The favored status of Euclidean geometry has evaporated. There are no longer any assumptions that command universal assent, no systems of logic powerful enough to validate themselves even in mathematics. Mathematics has thus lost some of its certainty even while multiplying its powers. Einstein's notion of "space-time," with its curvatures and paradoxes, has relegated Euclidean geometry to the role of a convenient tool for certain modern intuitions within a severely limited local space. Space perception itself has been proved culturally biased; intuition can be taught new tricks. Space has also multiplied its hallowed three dimensions beyond any possibility of imagining; today the number of its dimensions is the number of independent variables in various formulas.

With the shattering of mathematical certainty and the ending of the idolatry of Euclidean rationalism, Western scientists in particular have felt a new attraction to the philosophical skepticism of Vedic poets and to Daoist and Buddhist feeling for how the world behaves. The ancient worldview was created in imagination; today imagination is still proving more powerful than logic. In the ferment of this present age, mathematics and physics are committed, perhaps more clearly than ever—but as an act of faith rather than of reason—to the primordial affection for symmetry, guided less by reason than by aesthetic feeling for elegance and beauty.

BIBLIOGRAPHY

For a basic textbook in Euclidean geometry and in the various non-Euclidean modern geometries, see H. S. M. Coxeter's *Introduction to Geometry* (1961; reprint, New York, 1969), notable for the elegant compression it achieves by rigorous pursuit of symmetry and of the "group" of transformations this includes. The history of geometry is set within the wider context of the whole of mathematics and the contributions

of nations and individuals treated with great fairness in Carl B. Boyer's *A History of Mathematics* (New York, 1968). On the early period, Otto Neugebauer's *The Exact Sciences in Antiquity*, 2d ed. (New York, 1969), has become a classic. The transformation of Egyptian and Babylonian empirical knowledge into Greek science is studied in B. L. van der Waerden's *Science Awakening*, translated by Arnold Dresden (New York, 1963). Richard J. Gillings's *Mathematics in the Time of the Pharaohs* (Cambridge, Mass., 1972) is an effort to balance the somewhat negative views of mathematicians toward Egyptian science.

A splendidly illustrated study of Paleolithic stone and bone counting records is Alexander Marshack's *The Roots of Civilization* (New York, 1972). Neolithic symmetry in pottery and weaving designs is richly illustrated in Marija Gimbutas's *The Goddesses and Gods of Old Europe, 6500–3500 B.C.* (Berkeley, Calif., 1982). Modern concepts of symmetry are formalized, with great respect toward ancient craftsmen who explored it intuitively, in Hermann Weyl's *Symmetry* (Princeton, N.J., 1952).

Applications of traditional geometry to religious art and architecture can be found in Robert Lawlor's *Sacred Geometry: Philosophy and Practice* (New York, 1982) and Titus Burckhardt's *Art of Islam: Language and Meaning*, translated by J. Peter Hobson (London, 1976). A stone-by-stone analysis of the geometry employed by the several builders of a great cathedral is masterfully displayed in John James's *The Contractors of Chartres*, 2 vols. (Beckenham, U.K., 1980).

For a development of the tonal-geometrical symbolism hidden in ancient religious and philosophical texts, see my books *The Myth of Invariance* (New York, 1976), *The Pythagorean Plato* (Stony Brook, N.Y., 1978), and *Meditations through the Quran* (York Beach, Maine, 1981).

GERMANIC RELIGION

This entry consists of the following articles:

AN OVERVIEW
HISTORY OF STUDY

GERMANIC RELIGION: AN OVERVIEW

From the linguistic point of view, the Germanic people constitute an archaic branch of the Indo-European family. The earliest Germanic culture that archaeologists identify as such is the so-called Jastorf culture, a cultural province of northern Europe in the Early Iron Age (c. 600 BCE) covering present-day Holstein, Jutland, northeast Saxony, and western Mecklenburg. When Germanic tribes entered into written history in the works of classical authors such as Caesar and Tacitus, they had spread south towards the Rhine and the wooded hills of southern Germany, so that their closest neighbors were the Celts in Gaul. To the east their neighbors were the Balts and the Scythians and Sarmatians, Iranian tribes that roamed the plains of Russia. To the north they were in contact with the Sámi and the Finns. Although the Germanic people were primarily pastoralists, they also practiced agriculture and hunting. Their social organization was originally geared towards egalitarian communalism, but as contact with the Roman Empire changed economic conditions, a more diversified society developed in which wealth and rank tended to prevail, although nominally power still rested in the hands of the Thing, the assembly of all free men able to carry arms.

The post-Roman era saw the establishment of Germanic kingdoms in England and Scandinavia, some of which remained pagan for a surprisingly long time. The English adopted Christianity early in the seventh century, the Danes in the 960s, the Norwegians around 995 to 1000, and the Swedes not until the twelfth century. During the Viking age, pagan Scandinavian communities established themselves in Ireland, the Isle of Man, and northern and eastern England, and eventually accepted Christianity as they became assimilated. Iceland, which was settled in the late ninth century, was also a pagan Scandinavian country, although it was not a kingdom. Subject to the same missionary pressures as Norway, Iceland accepted Christianity in 999 or 1000. The pagan Scandinavian communities in Orkney, Shetland, and the Faroe Islands were converted at about the same time.

SOURCES. Our knowledge of Germanic religion comes from many different sources. A large number of Bronze Age rock carvings in southern Scandinavia are often referenced in descriptions of the religion's earliest phase, but these have to be interpreted with caution. For one thing, it is not certain that the creators of these carvings were Germanic. For another thing, the sets of pictures they present are particularly complex and mix many different kinds of symbols: ships, chariots, men plowing, people reveling to the sound of lurs and other musical instruments, worshipers carrying solar disks, and imprints of feet and hands. To call one figure among those the "spear god," for example, because of its larger size, and identify it as the spear-carrying Óðinn is conjectural at best. We cannot altogether dismiss the testimony of these petroglyphs, but quite possibly they are part of a kind of nature cult that cannot be fully connected with the pantheon later worshiped in the same places. Indisputably Germanic are gravesites and bog finds that provide information

about funeral rites and sacrificial offerings. Monuments from the Roman period bear inscriptions with the names of Germanic deities, and classical writers refer to Germanic gods under their *interpretatio Romana*. The fourth- and fifth-century “Age of Migration” and the following period, when the Germanic kingdoms became established in western Europe, yield only meager documentation of the religion of the people who precipitated the downfall of the Roman Empire. However, place-name studies show the geographic extent of the cults of various gods, the antiquity of those cults, and the nature of a god’s powers (for example, whether a god was worshiped by fishermen on the seacoast or by farmers in the interior), and the large number of runic inscriptions tell us something about pagan gods, priests, magic, and the remembrance of the dead. In literary sources such as chronicles, saints’ lives, legal texts, and instructions to priests, Christian authors mention the pagan gods by name as they describe their cults and the actions taken by missionary kings and bishops and evangelizing saints against their worship. A considerable number of Scandinavian myths are transmitted in the lays of the *Poetic Edda*, some of which may date to the ninth century, but the bulk of our information about Scandinavian mythology comes from the thirteenth-century retellings and explanations compiled by Snorri Sturluson in his *Prose Edda*. The sagas describe life in pagan Iceland, Norway, and Sweden and contain numerous details on religious practices and specific forms of worship, as well as on the shift from paganism to Christianity. Like the other texts from the pens of Christian authors, the sagas have to be used with caution as a source of information on early Scandinavian belief and rites, but some of that information is certainly credible because it is confirmed by other kinds of evidence. Christian authors also copied a few charms and spells, which shed light on particular aspects of popular religion and superstition. One non-Christian source is the Arab diplomat Ibn Fadlan, who in 921 was on his way to the Bulgar court when he encountered a group of Scandinavian traders (Rūs’) on the Volga. They had stopped to perform funeral rites for one of their companions who had died on the trip, and Ibn Fadlan’s account of the cremation, accompanied by the drugging and killing of a woman to serve the deceased in the next world, is an amazing piece of early ethnography.

THE CREATION MYTH. In the *Prose Edda*, Snorri gives a complete description of creation that combines a number of older sources that are not always consistent with each other. The major Eddic poems used by Snorri are the *Lay of Vafþrúðnir* and the *Lay of Grímnir*, which more or less duplicate each other, and *Völuspá* (Prophecy of the Seeress); but he also derives some details from sources lost to us and adds some deductions of his own. Quoting *Völuspá* (st. 3), Snorri stresses that at the beginning of time there was nothing but a great emptiness called Ginnungagap (“a void filled with magical forces”). According to the poem, “When Ymir lived, in earliest times, there was neither sand, nor sea, nor chill waves,” whereas Snorri’s prose explains, “In the beginning not anything existed; there was no sand, nor sea, nor cooling waves.”

Snorri’s version probably reflects the older tradition, because the idea of an empty space and a world of mere potentiality preceding creation seems to belong to the ancestral heritage of the Germanic people (cf. the well-known cosmogonic hymn of the *Rgveda* [10.129]: “There was neither nonbeing nor being; nor was there space nor the sky above”).

The first parts of the cosmos to emerge were Niflheimr (“dark world”), the sunless, misty world of death that lies in the north, and the blazing hot world of Muspell (the fire that would consume the earth) in the south. The antiquity of the association of death with the north is seen in Stone Age graves, which are oriented in this direction. Much later, the main or high seat in medieval Scandinavian houses—called *ondvegi* (way of the spirit) and supposed to be the seat of the ancestor—is located to the north. And in magical rites, water flowing northward is related to the kingdom of death. The antiquity of the concept of a fiery southern realm is seen in the occurrence of the Old High German word *muspilli* in a tenth-century Bavarian eschatological poem, where it designates the universal fire at the end of the world. In Niflheimr was a well called Hvergelmir (“resounding kettle”), from which eleven rivers flowed. According to Snorri, the showers pouring out of Niflheimr whipped up the rivers, and the spray froze, so that layer after layer of ice piled up in Ginnungagap. The sparks and glowing embers flying out of Muspell met the hoarfrost and the ice, and from the slush and heat, life emerged in the shape of an anthropomorphic being named Ymir or Aurgelmir. From this primal giant sprang the dreadful brood of the frost giants, whom he engendered by sweating out a male and a female from under his left arm. In addition, one of his legs begat a son with his other leg. Here Snorri has merged two traditions that the *Lay of Vafþrúðnir* keeps separate: in stanza 21 of the poem, Ymir is named as the giant involved in the formation of the world, but in stanzas 29–35, Vafþrúðnir, the oldest living giant, explains to Óðinn that the genealogy of the giants began with Aurgelmir, who fathered Þrúðgelmir, who fathered Bergelmir, who fathered Vafþrúðnir himself.

No direct source is available for the account of the origin of the gods that Snorri gives next: the melting rime has taken the shape of a cow, Auðumla, whose name contains the Old Norse word for “riches” and another term connected with the English dialect word *hummel* or *humble* (hornless cow), presumably designating a “rich hornless cow.” This cow feeds Ymir with the milk flowing from her udders, a tradition paralleling that of the primeval cow in Indo-Iranian mythology. Auðumla gets her own food by licking the salty ice blocks, which she shapes into another primal being, Búri, who begets a son, Borr. Borr marries Bestla, the daughter of the giant Bölþorn (“evil thorn,” a term still used in the Jutland dialect [*bøltorn*] to designate a “scrappy, violent person”). Borr and his wife have three sons: Óðinn, Vili, and Vé. The three divine brothers kill the giant Ymir, and the flow of blood gushing from his wounds drowns all the frost giants except Bergelmir, who escapes mysteriously with his

family to continue the race. Now the three gods set about building the earth. The body of Ymir is carried into the middle of the great void; his blood forms the sea and the lakes, his flesh the earth, his skull the sky (with a dwarf at each corner, as if to hold it up), his hair the trees, his brain the clouds, his bones the mountains, and so on. Sparks flying from Muspell form the stars and heavenly bodies, and the gods order their movements, determining the divisions of time. The resulting world is circular, surrounded by a vast ocean. In the middle of the earth the gods establish Miðgarðr (“dwelling place in the middle”), a residence for mankind that is strengthened by a fence made from Ymir’s eyebrows, and they provide land on the shore for the giants to settle down. The next task of the gods is the creation of man. Finally, they build Ásgarðr (“dwelling place of the Æsir”), their own residence.

A number of elements of the Eddic creation myth point to very old traditions. For example, the cow is a typical fertility symbol, and Auðumla reminds us of the celestial cow in Middle Eastern and South Asian myths. Further, in the myth of Ymir, two motifs have apparently merged: the engenderment of primeval beings and the creation of the world from parts of his body. The idea of an ancestral progenitor is already found in the classical sources about Germanic religion: Tacitus, in the second chapter of his *Germania*, tells of Tuisto, born from the earth, who begets Mannus, the common ancestor of the Germanic tribes. These names are quite revealing. *Tuisto* is related to the English word *two* and designates a bisexual being (cf. Ger. *Zwitter*). This androgynous ancestor resembles Ymir, who has other parallels in Indo-Iranian mythology, where the Old Indic *Yama* (cf. Av. *yima*, “twin”) is supposed to have had incestuous relations with his twin sister. *Mannus* not only corresponds to the English word *man* but also has striking parallels in India, where *Manu* is the ancestor of man, and in ancient Phrygia, where the ancestor of the Phrygians is *Mánes*.

The three main Germanic tribes derive their names from the sons of Mannus, and in at least two cases show similar associations with deities. The Inguaeones, a tribe from the North Sea region, is linked with the minor god *Ingw[az], the male counterpart of the mother goddess. An Old English runic poem indicates that he was venerated in southern Scandinavia (indeed, the Danes are called Ingwine [“friend of Ing”] in the Old English poem *Beowulf*, lines 1044 and 1319), and his association with Freyr is illustrated by the Old Norse compound *Yngvifreyr* (Gmc. *Ingwa-fraujaz). Although little information is provided about his cult, he is undoubtedly associated with fertility, as is shown by the runic poem’s reference to his wagon (cf. the sacred wagon kept in the grove of the Earth Mother, Nerthus. Yngvi is also considered the ancestor of the Yngling dynasty in Sweden. The tribe of the (H)erminones, whose territory extended from the lower Elbe southward into Bohemia, derive their name from Germanic **ermīna-/ermuna-* (mighty, lofty), a common divine epithet. (In Old Norse, Jörmunr is another name for

Óðinn. In Saxon, [H]irmin is the god corresponding to Mars, and the name for the *axis mundi* is Irminsul. In Old High German, the compound *irmingot* [mighty god] occurs in the poem *Hildebrandslied*.) The tribe of the Istaevones of the Weser-Rhine area are not related to any specific deity, but their name is perhaps connected with Gothic *aistan*, meaning “honor” or “worship.”

The idea of dismembering a giant to create the world is found also in Middle Eastern and other traditions. An Iranian myth preserved in Manichaeism is the closest to that of Ymir, as it equates a giant’s skin with the sky, his flesh with the earth, his bones with the mountains, his hair with plants, and his blood with the sea. Here there can be no question of mutual influence, diffusion, or borrowing from a common source. Taking into consideration the Puruṣa myth in the *Rgveda* (10.90), which explains in a similar way the origin of the world and society through the sacrifice of primal man and the projection of his bodily parts into the macrocosm, it is clear that the Germanic creation story is a reflex of an old Indo-European myth. Bruce Lincoln (1986) has elaborated the complex data about creation in various Indo-European traditions into a coherent scenario in which the first priest, *Manu-, kills his twin brother, *Yemo-, the first king, thus performing the first sacrifice. As a result of this act the world is created, and *Manu- fashions the earth and heavens as well as the three social classes from his brother’s body. The female bovine that appears in the European version of the myth originally fed and cared for the twins before the creative act. Against this background, many of the archaic elements in the Germanic tradition appear in a new and broader light.

THE GERMANIC COSMOS. After its creation, the Germanic cosmos consisted of nine worlds. Man lives in the center of the universe, and the major Germanic traditions concur in calling his dwelling place “the central abode” (Goth., *Midjungards*; OHG, *Mittilgart*; OE, *Middangeard*; ON, *Miðgarðr*). But the center is also where the gods built their residence, Ásgarðr. It is described as spacious, with numerous dwellings, surrounded by a beautiful green pasture, *Iðavöllr*, and by a palisade built by a giant. In addition to these places and *Niflheimr* and *Muspell*, there were also *Álfheimr* (“world of the [light] elves”), *Svartálfheimr* (“world of the dark elves”), *Vanaheimr* (“world of the Vanir”), *Jötunheimr* (“world of the giants”), and *Útgarðr* (“outer abode”), the dangerous world of demons, giants, and other frightening creatures.

Germanic myth evinces a real fear of this no-man’s-land outside the settlement, and the idea of the frontier is there all the time, with the gods serving to ward off dangers from the wild. The islanders and the people along the shore believed that a universal ocean surrounds the earth, with an unfathomable abyss at the horizon and a huge snake curling at the edge to hold the world together. The serpent is called the *Miðgarðr* serpent or *Jörmungandr*; according to Snorri, this monstrous ophidian bit its tail—a concept that does not

occur in the Eddic poems but that is quite common in Eastern religions and that was introduced in Scandinavia by medieval Christian scholarship. The symbol (similar to the *ouroboros* in Jungian psychology) may be borrowed, but the concept is old, as the name *Jörmungandr* shows. Connected with *jörmungrund* (meaning “earth” in st. 20 of the *Lay of Grímnir*), *jörmun-* (also a name of Óðinn) is an adjective meaning “great, powerful, lofty,” and *gandr* means “magic wand.” The compound *eormengrund* also appears in *Beowulf* (line 859).

When the gods go out into the world, it seems that the universal ocean does not exist for them, for in every direction they move on solid ground. The north and the east are particularly dangerous, being the abodes of demons, and the south will become so at the end of time, at Ragnarök, when the fire giant Surtr (“black,” cf. English *swarthy*) will lead a host of monsters against the gods in their last battle. To the west lies the ocean. The old Germanic tradition of ship burials implies the concept of a world of the dead beyond the sea, a view perhaps borrowed from the Celts and manifested in the Irish legends about the “islands of the blessed.” This concept is also reflected in the idea of a ship of death (made from the fingernails of corpses) that sails from the world of the demons at Ragnarök.

For the Germanic people in Norway, Útgarðr must have been represented by the high mountains and the arctic territories to the north. The road is over land; Skírnir (servant of the god Freyr) rides to Útgarðr on Freyr’s horse (the *Lay of Skírnir*, st. 10), and the adventures of Þórr always take him eastward. There lie the realms of the giant Hymir, who lives at the “end of the world”; of the giants Þrymr and Hrymr (*Völuspá* 49); and the “iron forest” (ON, *járnviðr*), where the brood of demons is born (*Völuspá* 39). There is a great river at the border of Miðgarðr, with a boatman, Hárbardr, to take people over. The frost giants live in the north, and Loki will seek refuge with them.

As has been mentioned, the world of the dead was thought to lie to the north. One concept of it was as a hall: the cold, dark, wet house of the witch Hel. In st. 43 of the *Lay of Vafþrúðnir*, the giant says that he has seen all the worlds, and Niflhel (“dark Hel”) below them, which perhaps leads to Snorri’s impression of it as being underground, for he says: “Helvegr liggir niðr ok norðr” (“The way to Hel lies downward and to the north”). The Old Norse term *Hel* (hiding) applies to both the place and its ruler. The belief in this underworld seems to be common to all Germanic cultures. In 915 a poet celebrating a victory of the Saxons over the Franks wonders whether there will be enough room in “hell” for all those who fell in the battle. Despite the later development of the name, Hel was not originally a place of punishment, but it was an unpleasant place to spend the afterlife. (Snorri, evidently influenced by the Christian concept of Hell, does describe Niflhel as “the lowest world where the wicked go.”) An elaborate description is given in the Eddic sources: the approaches are protected by terribly noisy rivers,

such as Valgláumir, Gjöll, and Sliðr, which, according to *Völuspá* (st. 35), “is filled with swords and knives.” This picture is apparently influenced by Christian visionary literature; similar is st. 27 of the *Lay of Grímnir*, which also mentions the river Geirvimul (“swarming with spears”). There is a bridge over Gjöll, guarded by a giantess. The Greek hellhound Kerberos also has his parallel in Eddic tradition: the lay *Baldur’s Dreams* (sts. 2 and 3) mentions a dog that comes out of Hel. The realm of Hel is also surrounded by a fence whose gates open only for the dead.

The sky is the abode of the gods in the later conception of the Germanic people, which transfers Ásgarðr to heaven. The changing views of Valhøll are a typical example of the shift. Originally, it was a subterranean hall for warriors killed in combat. Later it was connected with Óðinn and became the heavenly residence of his heroic retinue. These are human warriors who die in battle and who will form Óðinn’s army against the monsters at Ragnarök. According to Snorri, the warriors amuse themselves by fighting each other during the day and feasting every evening. (The contrast between Hel and Valhøll was presumably meant to encourage men to fight to the death, for all other kinds of death would send the deceased to Hel.) Valhøll is a huge palace with 540 doors so large that 800 warriors can exit through each (*Lay of Grímnir*, sts. 23–24). Over the gate and gable a wolf and an eagle are mounted, just as Charlemagne is said to have had an eagle nailed on his palace.

Like the netherworld, the sky is linked with the world by a bridge, this one guarded by the god Heimdallr; it is called Bilröst (“waving road”) or Bifröst (“shivering road”), names signifying the rainbow. In st. 29 of the *Lay of Grímnir*, the “bridge of the gods” is described as “ablaze with flames.” Here the concept may represent the Milky Way, which the forces of evil from Muspell will walk at the twilight of the world, and which, in many religious systems, is described as the “path of the souls.”

THE COSMIC TREE. The nine worlds are also linked by the ash tree Yggdrasil, which rises to the sky, its branches spreading over the entire world (*Völuspá*, st. 2). It is supported by three roots, which respectively stretch to the world of the dead (Hel), the world of the frost giants, and the world of men. At the foot of the tree are several springs: the spring of the goddess of fate, Urðr (*Völuspá*, st. 19) and the wells of Mímir (*Völuspá*, st. 28) and Hvergelmir (*Lay of Grímnir*, st. 26). Snorri tried to relate these three springs to the three roots, but it may be there was only one well, known under different names according to its symbolic functions as the source of wisdom (Mímir), of fate (Urðr), or of the rivers of the world (Hvergelmir). Yggdrasil has other characteristics and associations. For example, it is always green, and according to *Völuspá* (st. 19), a clear vivifying liquid called *aurr* drips down from the tree. Its branches are home to an eagle who carries between its eyes a hawk named Veðrfölnir (“faded by the weather”). A squirrel named Ratatoskr (“rat tooth”) leaps up and down the tree, conveying words of

abuse exchanged between the eagle and the monstrous *Níðhoggr* (“corpse-devourer”), one of the many snakes gnawing at the roots of the tree. Four deer gambol about the branches, eating the shoots. As well as being the location of the gods’ daily council meeting, the cosmic tree is also an *axis mundi*; it props up the sky like the central pole of a tent holding up the roof. The idea of propping up the sky was part of the Germanic heritage, as is shown by the Irminsul, a Saxon “idol” destroyed by Charlemagne in 772 and described by the medieval historian Rudolf of Fulda as a huge tree trunk—*universalis columna, quasi sustinens omnia* (a universal column, as if holding up everything).

According to the contemporary testimony of Adam of Bremen in his history of the bishops of Hamburg, *Yggdrasill* was represented near the temple in Uppsala by a gigantic evergreen tree. What kind of tree is it? “Nobody knows,” says Adam. *Völuspá* describes it as an ash, which definitely reflects the western Scandinavian tradition, but scholars have assumed that in eastern Scandinavia it could have been a yew. The yew was venerated in Gaul, and classical writers mention its importance in Germania as well. The name *Yggdrasill* itself is ambiguous. The second element, *drasill*, is a poetic word for “horse,” but the first element might be either *Ygg*, a name for Óðinn (i.e., “Óðinn’s horse”), or the adjective *ygg* (“frightening”). In either case, the dreadful mount appears to represent the gallows, thus implying a connection with Óðinn, who was known as “the god of the hanged.” The identification of *ygg-* with the Old Norse term *ýr* (“yew”) is less plausible on linguistic grounds.

The symbolism of the tree is extremely important, as it is mirrored in other traditions. In ancient Babylonia, for example, a cosmic tree, *Kiskanu*, grew in a holy place; radiant with shining lapis lazuli (symbolizing the starry night), it stretched towards the primeval waters. This was the dwelling place of Ea (the god of fertility and skills such as agriculture, arts and crafts, and writing), and his mother Bau (the goddess of plenty) rested there as well. Babylonian pictures of the tree sometimes show it surrounded by goats or with a bird poised on it. In ancient India, the universe is symbolized by an inverted tree, with its roots in the sky and its branches spreading over the earth, representing the downpouring of the sun’s rays. *Yggdrasill* has sometimes been compared with the tree of life in the Hebrew scriptures, but there is no proof of any Judeo-Christian element in the concept of *Yggdrasill*. The presence of the eagle and the snake, however, reminds us of the cosmological motif found in Indian mythology, where the combat of Garuda with the reptile symbolizes the struggle between light and darkness (the eagle is a sun bird, whereas the snake belongs to the underworld). The liquid dripping from the tree can be compared with the streaming milk and honey in the Semitic myths of paradise, with *amṛta* (the Old Indic beverage of immortality identified with mead), and with the honeydew spread by the *Aśvins*. In *Völuspá* (st. 27), the tree is described as secreting a clear liquid (*heiðr*) that must be the “sap of life.” The element *heiðr*

also appears in the name of the magical goat *Heiðrún*, whose udders every day fill *Valhöll*’s cauldrons with mead for Óðinn’s retinue.

THE WAR OF THE ÆSIR AND THE VANIR. The Germanic gods are divided into two groups, the Æsir and the Vanir. Following the medieval practice of etymologizing, Snorri says that the Æsir’s name shows that they came from Asia, but this interpretation does not appear to reflect any authentic tradition. Jordanes, the sixth-century historian of the Goths, cites a Gothic word *ansis* (or *anses*) that is glossed as “demigods.” This element also occurs in men’s names such as the Gothic *Ansila*, the Burgundian *Ansemundos* (cf. ON, *Ásmundr*), the Langobardic *Ansegranus*, and the Old High German *Ansgar* and *Anshelm*. Together with the Old Norse term *áss*, these words derive from the Germanic **ansuz*, designating some type of deity. The feminine form preserved in the southern Germanic divine name *Vibansa* might refer to a war goddess if **wih-* is an alternative form of **wig-* (“combat”; OHG and OE, *wig*; ON, *vig*). The Æsir, however, are ruling gods, which makes it more plausible to associate their name with the Hittite word *hashshush* (king) than with the Old Indic prefix *asu-* (breath of life), as is usually suggested.

The name *Vanir* has been connected with the Old Norse word *vinr* (friend), with *Venus* (the Latin name for the goddess of love), and with the Sanskrit *vānas-* (lust), an etymology very suitable for fertility gods. *Vanir* has also been related to the Sanskrit *vānam* (water; cf. the latinized Slavic ethnic name *Veneti*, meaning “people of the waters”), an interpretation made doubtful by the fact that the Vanir as a group are not aquatic deities, although one of them, *Njǫrðr*, is associated with the sea. Overall, the Vanir are fertility gods.

In the mythological “now,” the Vanir live in peace with the Æsir, but this was not always the case. At the dawn of time, a bitter war was fought between the two groups, which Snorri reports (with varying details) in two different works, *Ynglinga Saga* (the first part of his history of the kings of Norway) and the *Edda*. The former is an euhemeristic narration of the early life of the Æsir in “Asia” (ON, *Ásaland*, *Ás-heimr*). Their neighbors, the Vanir, lived in Vanaland or Vanaheimr, in the vicinity of the Tanais (the classical name for the River Don). Óðinn leads his army against the Vanir, but they resist vigorously. The two sides are alternately victorious, and they loot each other’s territory until they grow tired of fighting and conclude a peace that puts them on equal footing. They exchange hostages: the Vanir *Njǫrðr* and his son *Freyr* are transferred to the world of the Æsir, and the Æsir in turn deliver *Mímir* and *Hœnir* to the Vanir. As *Mímir* is very wise, the Vanir reciprocate by sending “the cleverest among them”—*Kvasir*—to the Æsir. In the *Edda*, however, Snorri claims that *Kvasir* was created from the saliva of the Vanir and the Æsir when they spat into the communal cauldron at the conclusion of the peace. Other evidence linking *Kvasir*’s blood to the mead of poetic inspiration suggests that this second version is closer to the original. In addi-

tion to the formal transfer of Njǫrðr and Freyr to Ásgarðr, the Vanir goddess Freyja (Njǫrðr's daughter and Freyr's sister) also ends up living with the Æsir. No extant myth explains how this came to pass, but hints in *Vǫluspá* suggest that Freyja went to Ásgarðr during the war, disguised as a witch named Gullveig, with the intention of corrupting the Æsir with greed, lust, and sorcery. Perhaps her visit was even the initial cause of the Æsir-Vanir conflict. This mythological war has been seen as a reflection of an actual religious war or the replacement of one cult with another, but it has also been taken as a symbolic explanation of the existence of different aspects of divinity.

THE PANTHEON. The earliest written testimony we have about the religion of the Germanic peoples is a statement by Julius Caesar in the sixth book of his account of the Gallic Wars indicating that they worshiped the sun, the moon, and Vulcan, which is generally taken to mean "fire." However, there is no trace of a moon cult in the Germanic territories, and the role of fire in cult and ritual seems to have been rather limited in historical times. Possibly Caesar was reporting an archaic version of Germanic religion, or perhaps his information was just inaccurate. Fortunately, the data supplied some 150 years later by Tacitus provide a fairly accurate picture of what must have been the structure of the Germanic pantheon in his time (end of the first century CE).

According to Tacitus, the main god is Mercury, whose Latin name, Mercurius, is a Roman interpretation of the Germanic name *Woðan[az]. This is confirmed by the translation of the Latin weekday-name *Mercurii dies* (Mercury's day) into the Germanic *Woðniz-dag[az] ("Woden's day"; cf. Eng., *Wednesday*; Du., *woensdag*). Mercury is flanked by Mars and Hercules. The former represents the Germanic god *Tiw[az], whose name is preserved in the English *Tuesday* (OE, *Tiwesdæg; cf. Lat., *Martis dies*). The latter is usually interpreted as representing the Germanic champion of the gods, *Pun[a]r[az], although, as thunder god, he was also equated by Latin writers with Jupiter, as is shown by the translation of the Latin weekday-name *Jovis dies* into "Thor's day" (Eng., *Thursday*; Ger., *Donnerstag*; Du., *donderdag*). As Mercury/*Woðan[az] is the only Germanic god credited by Tacitus with receiving human sacrifice, many scholars assume that the *regnator omnium deus* (god reigning over all) venerated by the Suevian tribe of the Semnonēs in their sacred grove and honored as their ethnic ancestor with regular human sacrifices must be the same deity, though perhaps Allan Lund (1990) is right in claiming that he must have been worshiped as an eponymous founder under the name *Semno.

Tacitus also refers to other locally worshiped Germanic deities such as Nerthus ("Mother Earth"), for whom the Ingaevonic people hold a yearly pageant during which they celebrate the powers of fertility that she incarnates, or the divine twins whom he calls Alcīs (Gmc., *Alhiz) and equates with the Roman twins Castor and Pollux. In both cases he supplies a few details about cult and ritual, specifying, for exam-

ple, that Nerthus shrouds herself in mystery. She remains hidden in a curtained chariot during her peregrinations among her worshipers, only her priest can approach her, and after the completion of her ceremonial journey she is bathed in a secret lake, but all those who officiate in this lustration rite are drowned afterward to maintain the "sacred ignorance" about her. Similarly, Tacitus indicates that the priests of the Dioscuri among the eastern Germanic Naharvales wear feminine attire, which presumably includes their long hair, a feature closely associated with the Germanic divine twins. Moreover, he points out that these deities are not represented by any image or statue, which corroborates his general statement about the aniconic character of Germanic religion—" [They] do not think it proper to portray gods with any kind of human countenance" (*Germania* 9)—but is at least partly contradicted by the archaeological finds of some roughly hewn stakes offering a rudimentary anthropomorphic representation of the gods.

In the *Annals*, Tacitus refers to other Germanic deities, such as Tamfana, whose sanctuary was an important center of cultural activities in the territory of the Marsi (between the Lippe and the Ruhr rivers). Her "temple" was allegedly leveled by the Romans during the celebration of an autumnal festival in 4 CE. Its very existence contradicts Tacitus's statement in the *Germania* that the Germanic people "refuse to confine their gods within walls" and the contention that worship generally took place outdoors and in the woods, as with the Frisian goddess Baduhenna, near whose sacred grove a Roman detachment was massacred.

In the Roman period, inscriptions provide further information about the deities venerated by the Germanic people within the boundaries of the empire, such as Nehalennia, whose sanctuary near Domburg on the Dutch island of Walcheren has yielded an abundance of altars and statues. She was worshiped mainly by seamen and traders, mostly natives of the northwestern provinces of the Empire, who dedicated the monuments to the goddess in return for the help received from her. Her attributes (cornucopias, specific fruits, dogs, etc.) characterize her as a fertility goddess with strong chthonic overtones, but she apparently also shares the patronage of navigation with Isis, whose presence Tacitus mentions "among part of the Suevians" (presumably the Hermunduri, who were in close contact with the Roman province of Noricum where the cult of Isis had been integrated with that of the national goddess Noreia).

Important also were the *matres* or *matronae* (mothers or matrons), whose worship is documented by votive stones with dedicatory inscriptions found mainly in the territory of the Ubii on the left side of the Rhine in the second and third centuries CE. Their worshipers belonged essentially to the lower classes but also included some high-office holders in the Roman administration and army. The *matres* were invoked for protection against danger and catastrophes or for the prosperity of the family, and were described as bestowing their blessings generously, as such epithets as *Gabiae* (givers),

Friagabis (generous donors), and *Arvagastiae* (hospitable ones) indicate. As they often appear in groups of three and seem to be associated with the fate and welfare of man, they have been compared with the Norns, especially as one stone carries the inscription “Matrib[us] Parc[is],” referring directly to the *interpretatio Romana* of the three deities of fate.

The picture that emerges from the data of the Roman period can be summarized as follows:

- The sovereign god *Woðan[az] (identified with Mercury) may have taken over the prominent place originally occupied by the old Indo-European sky god *Deiwos (Gmc., *Tiwaz; Gk., Zeus; ON Týr), who has still preserved a sufficiently prominent position among certain tribes (e.g., the Chatti) for the spoils of the enemy to be dedicated to him and *Woðan[az] jointly.
- The divine champion Þun[a]r[az] is identified with the thunder god Jupiter or with Hercules.
- The divine twins, the *Alhiz, identified with Castor and Pollux, were venerated locally, especially among the eastern Germanic tribes.
- The fertility deities were worshiped regionally and had associated functions such as the protection of navigation or the determination of man’s fate; they include Nehalennia, the *matres* or *matronae*, Nerthus, and *Ingw[az].

Although poorly documented, the Germanic pantheon of the Migration and post-Migration periods shows an apparent continuity in this system:

- *Woðan[az] remains the supreme god and is honored as the ancestor of royal lineages; there is also some evidence of his connection with magic. *Tiw[az] recedes to the background but is perhaps to be identified with the tribal god of the Saxons, whose name occurs together with Woden and Thunaer in the abjuration formula the Saxons had to pronounce with their baptismal vows during the forcible conversion campaign conducted by Charlemagne. The third name in the abjuration formula, *Saxnote*, is ambiguous: it can either mean “sword companion” or denote a “sacrificial” god. Although the former interpretation fits in with the statement in the chronicles about the cult of “Mars” among the Saxons and could be connected with the presence of the cosmic pillar Irminsul in their main sanctuary (a reference to *Tiw[az]’s original function as sky god), the latter would make more plausible Dumézil’s suggestion that the Saxon triad Thunaer-Woden-Saxnote corresponds to the Scandinavian trinity Þórr-Óðinn-Freyr in the Uppsala temple. Saxnote could indeed be a god of the tribal community, just as Freyr is *folkvaldi* (leader of the people). Saxnote would presumably have been sacrificed to, as was Freyr, the *blótgoð Svía* (sacrificial god of the Swedes).
- *Þun[a]r[az], the thunder god, progressively gains prominence as the divine representative of the warrior class.

• Although there is no direct evidence of a cult of the divine twins, their functional role is euhemerized in the figures of the twin founding heroes of various Germanic groups, such as Hengist and Horsa for the early Saxons in Great Britain, Raos and Raptos for the Vandalic Haddingi, and Ibor and Aio for the Winnili (Lombards). The names Hengist and Horsa (related respectively to Ger. *Hengst*, “stallion,” and Eng. *horse*) remind us of the association of the divine twins with horses. In Greek they are referred to as *leuko polo* (“with white horses”) and in ancient India they are known as the Ásvinau (“possessors of horses”). The names Raos and Raptos (related respectively to Ger. *Rabe* [yard] and Eng. *rafter*) reflect the aniconic representation of the Dioscuri by beams, which occurred also in ancient Sparta, and in the shape of the Latin letter *H* or the Greek letter (pi). The Langobardic terms *ibor* (presumably from Gmc. **ebur*-, “boar”) and *aio* (Gmc. **agio*, “edge, sharp side of a blade”) may refer to the sharp tusks of the wild boar, an animal also closely associated with the fertility deities Freyr and Freyja, with whose domain the divine twins also have direct links.

• Besides the already mentioned references to *Ingw[az], a number of names of deities associated with fertility occur, such as Erce, a name apparently borrowed from Celtic and used to designate Mother Earth in an Old English charm; Phol (OHG, *Vol*), appearing together with Woden and Balder in the Old High German Merseburg spell; Friia and Frig, the Old High German and Old English names, respectively, for the Germanic goddess identified with Venus, whose name survives in the German *Freitag* and the English *Friday*. The often assumed existence of a spring deity, *Austro, from whose name the word *Easter* (Ger. *Ostern*) is supposedly derived, is, however, doubtful: it rests on an interpretation of the Old English term *Eostrae* by Bede (672/3–735 CE) and has no backing either in cult or myth; it has recently been more convincingly explained as a Christian missionary term.

• There are also a few minor deities such as Fosite, to whom an island was consecrated at the juncture of the Frisian and Danish territories. He is known only from a reference in the life of Saint Willibrord, but his name shows a striking similarity to that of the Scandinavian god Forseti, whose specific function according to the *Lay of Grímnir* is to settle all disputes; he is the son of Baldr and lives in Glitnir, a hall “propped with gold and shingled with shining silver” (st. 15). Forseti’s name is transparent: it means “presiding [over the Thing],” but no satisfactory explanation can be given for the loss of the [r] in Fosite, so that the connection between Fosite and Forseti remains conjectural.

Our knowledge of the Scandinavian development of the Germanic pantheon in the Viking age is much more detailed, for we have a fair amount of pagan poetry (copied in Chris-

tian times, but dating back to the ninth and tenth centuries) that mentions the gods and the myths about them. The blossoming of literature in medieval Iceland after the conversion also provides ample information about the pagan gods and cults of the Germanic North. Moreover, reports from various non-Scandinavian sources attest to the prevalence of the worship of Þórr among the Vikings. This is also confirmed by studies that show no people and very few places named after Óðinn, but many people and places named after Þórr. This situation should not be misinterpreted: Óðinn was the sovereign god, but he was the deity associated primarily with the warrior elite, whereas Þórr was worshiped by the majority of the people. The cult of Týr remained widespread only in Denmark, although his name appears frequently in West Norse poetry because it means simply “god” and was often used in synonyms for Óðinn.

The comparativist Georges Dumézil considered the common Indo-European “ideology” to have consisted of three principles or “functions” (the maintenance of cosmic and juridical order; the exercise of physical force; and the promotion of physical well-being, fertility, and wealth), and he interpreted the gods of the various groups of the Indo-Europeans’ descendants as representing these “functions.” Óðinn and Týr he saw as co-sovereigns, the former representing the magical aspect of the first “function” and the latter its juridical aspect. Þórr represented the second “function,” including its manifestation in war, and Njǫrðr, Freyr, and Freyja represented the third “function.” Such a presentation, however, oversimplifies the picture of the Scandinavian system, which fails to show the characteristic slant towards war in the second “function,” as Dumézil himself acknowledges. All the deities supposedly representing different “functions” have some association with war. Óðinn intervenes in battles to give victory to his favorites, and Þórr frequently engages in hand-to-hand combat with giants of both sexes. Even the Vanir gods seem to acquire some of the Æsir’s combative spirit when they move to Ásgarðr, as when the peaceful Freyr, who had given up his sword to obtain the favors of a beautiful giant maiden, faces the giant Beli without a weapon and kills him with a hart’s horn. And while Óðinn collects half of the heroes who die on the battlefield to join his retinue in Valhǫll, it is certainly striking that Freyja gets the other half. Fertility is another area that is not easily compartmentalized as Dumézil would have it. The thunder god Þórr was the protector of the peasant class, which depended on the weather for its crops, but he shares control of the atmosphere with Njǫrðr, who controls the path of the wind and, as sea god, counteracts the effects of the thunderstorms, quieting the sea and smothering the lightning-sparked fires. Furthermore, some very important aspects of the major deities are not covered by Dumézil’s labels. For example, Óðinn is as much the god of “inspired cerebral activity” as he is the god of sovereignty, but his role as the patron of the poets cannot be explained by Dumézil’s system. And although Óðinn manifests his sovereign power through potent magical interventions, he is definitely not the only one to wield magical

powers. The Vanir use *seiðr*, an effeminate form of sorcery that the Æsir deem despicable but which Óðinn nevertheless is keen to learn from Freyja. Finally, Óðinn’s ability to change shape is more than matched by the metamorphoses of Loki. It is also shared by certain giants such as Suttungr, who pursues Óðinn in the shape of an eagle, or Þjazi, who also assumes the shape of an eagle to follow the trickster Loki. Indeed, complex figures such as Loki and Heimdallr do not fit into Dumézil’s neat matrix at all.

Loki is extremely difficult to classify. Originally a giant, he nevertheless played an important part in the decisions and activities of the gods. Although primarily a mischievous trickster, Loki cannot be described as an “evil demon.” He is restless and inventive, deceptive and unreliable. Frequently causing trouble for the gods, he usually redeems himself by solving the problem he created. Ultimately he goes too far when his delight in mischief leads to the death of Óðinn’s son Baldr, utterly outraging the whole divine world and resulting in his being chained up until Ragnarǫk. Dumézil sees in him an incarnation of impulsive intelligence, but this interpretation is disputable. There is no trace of any cult devoted to Loki, nor are any people or places named for him.

Heimdallr occupies a similarly marginal position in the pantheon. It is not even clear to which group of gods he should be assigned. Apparently he offered up his *hljóð*, which was hidden as a pledge under the cosmic tree, Yggdrasill, as did Óðinn his eye. Óðinn appropriately received exceptional vision and Heimdallr was gifted with extraordinary aural perception: “He can hear the grass grow on the earth and the wool on sheep.” It has therefore been assumed that the Old Norse term *hljóð*—generally translated “horn” in this context (*Völuspá*, st. 27) but usually meaning “silence, listening, hearing, what is heard”—must designate one of Heimdallr’s ears. Offering up a body part in exchange for a major attribute is a characteristic feature of the most important Æsir, Óðinn and Týr. (The latter sacrificed his hand in order to guarantee a pledge that enabled the gods to fetter the monstrous wolf Fenrir, and in return assumed the role of protector of the Thing and patron of the law.) As guardian of the gods and watchman of Ásgarðr, Heimdallr assumes a military function, which would make him a second-function god in the Dumézilian system, like Þórr (with whom he shares the tendency to imbibe great quantities of mead). But the Eddic *Poem of Þrymr* (*Þrymskviða*, st. 15) describes him as one of the Vanir and able to “fathom the future.” His affinity with the ram further complicates matters: was he originally a god of sheep breeders, as Freyr was a god of wheat growers and pig breeders?

The minor deities are also problematic. Some of them, such as Ullr, an archer god living in Ýdalir (“yew dales”) in Ásgarðr, can be integrated into the tripartite functional scheme. His importance is made clear by Óðinn’s statement in the *Lay of Grímnir* (st. 42) that among all the gods, Ullr especially will grant his blessing to him who “first quenches the fire.” The most sacred oaths are sworn by Ullr’s ring, and

as a stepson of Þórr, he has close connections with the warriors. He is invoked by those engaged in single combat, and the poetic circumlocution an “Ullr of battle” means “a warrior.” According to the evidence of place-names, he was the object of an extended cult in Norway and Sweden, where he was called Ullinn, but there he eventually seems to have been overshadowed by Þórr, Freyr, and Freyja. There is practically no trace of him in Denmark, which instead has many places named for Týr. This is rather significant in light of the story of Ullr’s temporary usurpation of Óðinn’s throne, as narrated by Saxo Grammaticus: Óðinn had committed a grievous breach of his royal majesty by assuming a feminine disguise, and as a result of this disgrace he was replaced by Ullr, who reigned for ten years. When Óðinn was restored, Ullr (whose name, latinized into *Ollerus*, means “glory, brilliance”) fled to Sweden but was killed afterward by Danes. In view of Ullr’s connection with oath-taking, Dumézil sees in this episode an illustration of the complementary nature of the two aspects of sovereignty, the inspired and the majestic. The latter, with its juridical connotations, is illustrated by Saxo’s second story of Óðinn’s temporary ouster from power. Óðinn’s fall this time is brought about by the misconduct of his wife, Frigg, and he is replaced by a magician called Mithotyn, who introduces all kinds of innovations that the people dislike. As a result, Óðinn is welcomed back while Mithotyn flees and is eventually killed on the Danish island of Fyn. In this story, Dumézil has seen the contrast between the unitary and rather ill-defined religion of Óðinn and the analytic religion of Mithotyn (actually *Mitoðinn, from ON *mjötur*, “measurer,” meaning “dispenser of fate”), who introduces rules where there were none. As Dumézil puts it, “The lawyer replaces the inspired, and his very precision makes him hatable!” (Dumézil, 1939, p. 224).

Bragi is another lesser god about whom little is known. His name seems to be related to the Old Norse word *bragi*, which designates “poetic form,” and he is described as the “foremost of poets,” being in this way in competition with Óðinn as patron of poetry. In the Eddic poem *Loki’s Slanging Match* (*Lokasenna*, sts. 8–15) he bickers with Loki, who chides him for his lack of courage in combat. Obviously, his power is in speech, and his eloquence is strengthened by the magic of the runes carved on his tongue. Bragi is the husband of Iðunn, the guardian of the apples that ensure the eternal youth of the gods. The only myth relating to her tells that Loki delivered her and her apples to the giants. Catastrophe ensues when everyone in Ásgarðr grows old and infirm. They summon Loki before their council and compel him to retrieve Iðunn and her apples. The trickster flies to Jötunheimr in the shape of a falcon to recover Iðunn and her precious possessions from the clutches of the giant Þjazi. The latter pursues Loki in the form of an eagle and is killed when he tries to fly into Ásgarðr. Although apples were not cultivated in Scandinavia until late in the Middle Ages, the theme of this story must be quite old, as the Norwegian poet Þjóðólfr of Hvin refers to Iðunn and the “old-age medicine” of the gods in his composition *Hauströlöng*, composed around the

year 900. The desire of the giants for a goddess as well as for outrageous rewards from the Æsir is again illustrated by the story of the “master builder” of the divine stronghold, who requests Freyja as payment for his work and demands the sun and the moon to boot, obviously intending to plunge the world into darkness and sterility.

Very little information is given about the other goddesses, apart from Freyja:

- Frigg, Óðinn’s wife, is the devoted mother of Baldr; she lives in Fensalir (“marshy halls”), attended by her confidant Fulla. Loki claims that she shared her sexual favors with her husband’s brothers, Vili and Vé (*Lokasenna*, st. 26), and Saxo also refers to her loose morals, which trigger the episode with Mithotyn.
- Jörð (“earth”), the mother of Þórr, is also known under the name of Fjörgyn, which may mean “goddess of the furrow” (cf. Gmc., **furho*; OHG, *fur[u]h*; OE, *furh*; Fris., *furge*; Ger., *Furche*; Eng., *furrow*). Her male counterpart is Fjörgynn, who is believed to be either the father or the lover of Frigg, because the latter is called *Fjörgyns mæ*r (*Lokasenna*, st. 26: “Fjörgynn’s maiden”). Fjörgynn’s name, however, is related to the set of terms derived from the Indo-European term **perkw-* and associated with thunder, craggy mountains, and the oak tree. Among them are the Lithuanian name *Perkunas* (“thunder”; cf. Slav., **Perunu*), the Gothic word *fairguni* (“mountain”; cf. Lat., *Hercynia silva*, a wooded mountain range in ancient Germany), and the Latin word *quercus* (oak), as well as the Langobardic *feraha aesculus* and the Old High German *ferah-eih*, both of which designate a type of oak tree (cf. OE, *furh*; OHG, *for[a]ha*, “fir”). These etymological links rest on the age-old perception of the predilection of lightning for rocky spots and oak trees and reflect the correlations established between them in Indo-European myth and tradition.
- The goddess Gefjun is said to have torn away a sizable chunk of land from Sweden and dragged it away to form the Danish island of Sjælland. To perform this deed, she turned her four giant-begotten sons into oxen and yoked them to a plow. Although she is mentioned as a separate deity in *Lokasenna* (st. 20), she seems to be a hypostasis of Freyja, who is also known as Gefn (“giver”), a name befitting a fertility goddess. Loki, indeed, reproaches Gefjun for having “lured to lust” Heimdallr, who gave her a precious jewel—presumably the mysterious “sea kidney” (ON, *hafnyra*, probably referring to a piece of amber) he had won in an epic battle with Loki—even before she “threw [her] thighs about him” (a behavior paralleling that of Freyja for the possession of the valuable Brising Necklace). How Snorri can describe her as a virgin, served by women who die unmarried, remains unexplained.
- Sif, the wife of Þórr and the mother of Ullr by another

male deity, plays a rather unobtrusive part in the society of the Æsir, but although she is shy and retiring, Loki claimed to have enjoyed her favors (*Loki's Slanging Match*, st. 54), and apparently Óðinn was aware of it, because he warns Þórr that “someone sleeps in her bower with Sif” (*Song of Hárbardr*, st. 48). This explains why Loki dares to cut off Sif's hair, a punishment normally inflicted on adulteresses. But Þórr does not believe in the unfaithfulness of his wife and compels Loki to go to the dwarves to obtain hair made out of gold that will replace her lost locks. This story accounts for the poetic circumlocution “Sif's hair,” which means “gold.”

In many cases it is questionable whether some deities named by Snorri are anything more than local variants of major gods, used primarily to provide variation in poetic language. Thus we have no myths relating to goddesses such as Eir (“the best of physicians”), Sjöfn (who brings people to love), and Lofn (“permission,” who brings together those who cannot marry).

THE CREATION OF MAN. The Germanic myth of the creation of man appears in two versions, that in *Völuspá* (sts. 17–18) and that in Snorri's *Edda*. In both cases, three deities are involved: the Æsir in the former and the sons of Borr in the latter. Walking along the shore, the gods find two tree trunks, which they animate and endow with various qualities. In the *Völuspá* account, Óðinn gives them breath and soul, Hœnir gives them feeling and sense, and Lóðurr gives them craft, bearing, and color. In Snorri's account, the first god gives them breath and life, the second god gives them consciousness and movement, and the third god gives them faces, speech, hearing, and sight. Close parallels to this myth are lacking. Hesiod mentions that Zeus created a race of men from ash trees, and indeed in the Old Norse name of the first man is *Askr* (ash tree). There is also some correspondence with an Indic tale in which a sculptor, a goldsmith, a weaver, and a priest whittle a piece of sandalwood into the shape of a pretty woman. The sculptor shapes it, the weaver dresses it, the goldsmith adorns it with jewels, and the priest breathes life into it through his incantations. The basic idea in these myths is the same—a human being is fashioned out of a piece of wood—but the elaboration of the theme is totally different. In the Indic tale, giving life is the crowning act of the long process of shaping a human being; in the Germanic myth, the triad of gods creates the primordial being right away. What characterizes the Eddic account is the unity of the creative act by direct divine intervention in spite of the distribution of the human qualities by three different gods. It is interesting, therefore, to examine how these gifts relate to the nature and function of the deities involved.

In Snorri's version, the gods in question are the sons of Borr: Óðinn, Vili, and Vé, the same group that created the world by dismembering the primal giant Ymir. As Vili and Vé are little more than hypostases of Óðinn, the whole process of creation is ascribed to that supreme god (perhaps a Christian-influenced effort to reduce the triad of gods to

one). *Völuspá*'s version of man's creation undoubtedly represents an older tradition. That man would receive the breath of life from Óðinn is in keeping with his position as the sovereign god, meting out life-giving power (ON, *önd*, “breath”; the translation “soul” has Christian implications that the Old Norse term acquires only later). Óðinn's name (Gmc., *Wōðan[az]) derives from a root meaning “to blow” and includes the connotation “life-giving power” in some of its derivations; it is cognate to Old Irish *fáith* (seer, prophet) and Latin *vātes* (soothsayer). Óðinn is indeed the inspired god, the prince of the poets, the master of the divinatory runes, and the wielder of awesome magical powers. The Germanic stem of his name, *wōþ-, also appears in German as *Wut* (rage). Adam of Bremen thus correctly interpreted Óðinn's name as “furor” in his description of the pagan gods worshiped at the temple at Uppsala. The Old Norse term *óðr*, usually translated “mind, reason, understanding,” is the gift of Hœnir, according to *Völuspá* (st. 18). But *óðr* is also used as an adjective meaning “mad, furious, vehement; eager, impatient,” all of which point to either strong emotional stress or lack of control over the power of reasoning. The inspired cerebral activity expressed by *wōþ- can indeed verge on ecstasy; thus, the name of the mead of poetic inspiration, *óðrærir*, literally means “rousing to the point of ecstasy.” Stanza 18 of *Völuspá* is the only context in which *óðr* is assumed to have the meaning “mind, reason, understanding,” and the main reason for ascribing this meaning to it here is the parallel text by Snorri, in which the second god endows man with *vit ok hræring* (wit and movement), with special focus on *vit* (intelligence). However, *hræring* need not apply only to physical movement. It occurs in compounds and phrases pointing clearly to emotions, so that Snorri's use of *vit* in association with *hræring* may well indicate specifically the movements of the mind that *óðr* expresses in *Völuspá*.

This misinterpretation of *óðr* is also ascribable to the fact that Hœnir is often described as a wise god; his name is supposed to be derived from a root meaning “to make keen, to sharpen,” so that he would be the god who sharpens the mind. Dumézil calls him “the patron of the deep, invisible part of intelligence” (Dumézil, 1986, p. 227). This view is based on two events. First, when the giant Þjazi, in the shape of an eagle, asks Hœnir for a full share of the meal the gods are cooking, Hœnir does not answer but cannot help breathing heavily with anger. Second, whenever he attends the assembly of the Vanir as a chief and fails to get Mímir's advice, Hœnir does not take a stand, but merely states “Let others decide!” Dumézil considers Hœnir's refusal to commit himself to be the only wise attitude under the circumstances, and contrasts it with Loki's rashness, which turns into disaster when he tries to beat Þjazi with a stick after the giant snatches four pieces of meat from the gods. In the case of the assembly, Dumézil suggests that Mímir and Hœnir represent complementary symbolizations of human thought processes: Mímir represents the “collective consciousness” on which we rely for decision making, and without which individual thought (i.e., Hœnir) is worthless. Dumézil's explanation is

ingenious but far from convincing, for all the texts show Hœnir as unable to act on his own, and although that may not make him weak-minded, as various scholars have suggested, it hardly makes him a “god of reflective thought.” Rather, he is the instrument of divine inspiration, the one who utters the message conveyed by another’s wisdom. In the absence of Mímir (his source of inspiration), he remains silent at the assembly, and therefore he is described as the most fearful of all gods because he cannot act without being advised. After Ragnarøk, he will function as priest, consulting the oracles (i.e., interpreting the signs given by an outside power, again as the vehicle of divine inspiration). It is in this capacity that he is instrumental in endowing man with “inspired mental activity” (*óðr*); thus some scholars have also considered him a hypostasis of Óðinn.

The third god in the divine triad, Lóðurr, is more difficult to define functionally, for he is hardly known outside this context. (Elsewhere he is described simply as a friend of Óðinn, an association he shares with quite a few gods in the Scandinavian pantheon.) Because in other contexts Óðinn and Hœnir are closely associated with Loki, scholars have also attempted to equate Lóðurr with Loki (as a god of fire) on the basis of etymological speculations, but the arguments advanced to back up this hypothesis have all proved untenable. The identification of Lóðurr with the term *logaporr*, which occurs with the name *Woðan* and *Wigiponar* in the runic inscription on the Nordendorf Fibula (first half of the seventh century) is also disputable: *logaporr* is presumably cognate with the Old English *logor* or *logeer* (wily, crafty), applying to magicians. This connection with magic, with the connotation of plotting mischief, could fit the personality of Óðinn fairly well, so that Lóðurr might just be another hypostasis of this god. But before overriding the etymological difficulties connected with this view, it is advisable to examine more closely the gifts bestowed by Lóðurr upon the primal human couple: according to the text, he gives them *lá*, *leti*, and *litir góðir*. The last of these means “good colors,” implying good health and also physical beauty, which was considered a sign of noble ancestry among the Germanic people. (Thus it is Beowulf’s handsome appearance that distinguishes him from his companions, and the Anglo-Saxon poet uses for this peerless appearance the very same term that Snorri uses to qualify the gift of the third deity.) *Leti* means “noise, voice” or “gestures, attitude” and refers specifically to manners in other contexts. Since Snorri specifies speech, hearing, and sight as the gifts of the third deity to the first human couple, it is obvious that Snorri’s account represents a different tradition from that of *Völuspá*. The term *lá* is problematic because its etymological connections are difficult to assess. The usual translation, “blood,” rests on a disputable interpretation of a single line of poetry. In another poetic context the term is associated with the adjective *sölr* (pale, yellow), suggesting the interpretation “sallow-complexioned.” This would imply that *lá* means “look, mien.” Lóðurr would then have given man his mien and good complexion (i.e., his physical appearance). The only

corroboration for this interpretation is provided by the Tocharian term *lek* (appearance, mien), derived from the same Indo-European root. An alternate solution would be to interpret *lá* as “hair” (from Gmc., **lawo*, “cutting”), showing the same semantic development as the Sanskrit cognate *lava-* (cutting, wool, hair). Thus the Eddic line could well be interpreted as “Lóðurr gave hair and fair complexion to man.” If Óðinn and Hœnir bestow essentially spiritual qualities upon man, whereas Lóðurr provides him with his physical aspect, Lóðurr must be a god presiding over the physical aspects of life, closer to nature than the lofty Æsir. In other words, he must be one of the Vanir, part of the old Germanic fertility cult. His name may be connected with the Old Norse term *ló* (produce of the land). Swedish place-names indicate that there was a Germanic hypostasis of the great goddess of fertility named **Liudgoða*, and her male counterpart, **Loðverr*, could survive in Lóðurr as a divinity of generation and growth and protector of the ethnic community.

THE MEAD OF POETIC INSPIRATION. The ability to compose poetry was highly valued by the Scandinavians, and it is not surprising that the patron god of poetry was the sovereign deity Óðinn himself. Moreover, the special language used in Norse poems made extensive use of allusions to the gods and supernatural beings such as giants and dwarves. For these reasons, the myth about the mead of poetic inspiration must have been of particular importance. It exists in several versions, but the gist is that malicious dwarves killed Kvasir (the being created in token of the accord between the Æsir and the Vanir) and brewed a mead from his blood that would bestow the ability to compose poetry. The dwarves were forced to relinquish this magical substance to the giants, who guarded it jealously, although they did not drink of it themselves. Óðinn obtains the mead by seducing its giantess guardian, swallowing it all, changing himself into an eagle, flying to Ásgarðr, and spewing it out into three crocks the Æsir had ready. This story illustrates the dichotomy between the gods, who are associated with culture and craft, and the giants, who are associated with the hostile natural environment. It also illustrates the dichotomy between the gods’ ostensible motivation, which is the benevolent desire to make good use of a magical substance, and their behavior, which includes deceit, seduction, and theft. This myth must be part of the Indo-European heritage, for it has parallels with stories told about the Indian god Indra, who has an encounter with the monster Mada (“Drunkeness”) and who is also the recipient of *soma*, the intoxicating sacrificial liquor that gives poetic ability, immortality, and knowledge of the divine. As with the mead of poetic inspiration, *soma* was brought to the gods by an eagle or possibly Indra in the form of an eagle.

THE DEATH OF BALDR. The story of Baldr’s fate is probably the most moving and most controversial of all the Scandinavian myths. In this story, best known from Snorri’s *Edda*, Óðinn’s resplendent son Baldr is plagued by evil dreams of impending death. To protect against any danger, his mother, Frigg, exacts an oath from everything in the world not to harm him, but neglects the puny mistletoe. Jealous of the at-

tention Baldr receives in the games of the gods, Loki, in the disguise of a woman, wheedles the secret of Baldr's invulnerability out of his mother. He then persuades Baldr's blind brother, Höðr, who has been prevented by his infirmity from any participation in the sportive tossing of objects at Baldr, to throw a dart of mistletoe. Under Loki's guidance the missile hits Baldr and kills him. The gods are stunned, and while preparations for Baldr's burial are in progress, they send out Hermóðr on Óðinn's horse to the kingdom of Hel to entreat the goddess of the netherworld for the release of the unfortunate god. Meanwhile, Baldr's wife, Nanna, dies of grief and her body is carried onto the ship Hringhorni ("curved prow"), where she joins her husband on the funeral pyre. As for Hermóðr, he returns with the message that Baldr will be released only on the condition that "everything in the world, both dead and alive, weeps for him." Immediately the Æsir dispatch messengers all over the universe to request everyone and everything to weep Baldr out of Hel's clutches. Even the stones and the metals participate in the universal grief, but a giantess called Þökk says she has no use for Baldr; as far as she is concerned, Hel can keep him! Þökk is actually Loki in disguise, and thus he succeeds in preventing the return of Baldr, who will only come back after Ragnarök. Scholarly interpretations of this myth are many and conflicting, but it worth mentioning that the story underscores the limitations of the Æsir, who for all their power essentially rule the universe for a single generation and are then destroyed.

THE END OF THE WORLD. The destruction of the world hangs over the gods and man as a permanent threat. *Ragnarök* (fate of the gods) or *aldar rök* (the fate of humankind) has been misinterpreted as *ragnarøkkr* (twilight of the gods). The Old Norse term *rök* means "course of events, destiny, fate." The Germanic apocalyptic vision of the end of time appears in *Völuspá*, presumably composed during the wane of paganism at the end of the ninth or the beginning of the tenth century. As Jan de Vries has indicated, the anonymous poet must have been a pious man, still convinced that sufficient faith in paganism persisted to promote a rebirth, but one who borrowed too much from Christianity to be considered a truly pagan seer (de Vries, 1956–1957, vol. 2, pp. 395–396). It is therefore difficult to assess how much of his worldview is genuinely Germanic and how much his vision of the future and his yearning for a "brave new world" free of strife and lies is shaped by Christian influences.

The prelude to the final catastrophe is the murder of Baldr, but the elements of decay appear to have been present in the world from the start. The *Lay of Grímnir* (st. 36) describes the cosmic tree Yggdrasill as having "the hart browsing above, its bole rotting, and Níðhöggr gnawing beneath"; it is weakened more than humankind suspects. Initially the gods appear to enjoy an idyllic life in the shining plain of Iðavöllr, where they relax and play chess after building shrines and making gold jewels, until three giant maidens come to disturb the serenity of this garden of delight. These are the Norns, who bring uncontrollable fate into the Germanic world. From the moment of their arrival, events take

their inescapable course. Tension grows between the Æsir and the Vanir, and the strife worsens into a war when the seeress Gullveig brings the corruption of greed, lust, and witchcraft into Ásgarðr. Peace is temporarily restored and hostages are exchanged, but the age of innocence is gone. The gods can no longer be trusted; they break their most solemn promises or resort to trickery to avoid fulfilling them. Then comes the worst, the treacherous killing of Baldr by the throwing of the mistletoe, the missile in the hand of his blind brother Höðr, guided by the perfidious Loki. Punishment follows for the criminal, but the fateful action has triggered the chain of events that will culminate in ultimate disaster, with one horrible scene following upon another.

In *Völuspá* the seeress describes the river of the netherworld, full of sharp blades, and the shore of death with Hel's hall, whose walls are "clad with coiling snakes." Through the river wade perjurers, murderers, and adulterers, and the serpent Níðhöggr feeds on corpses along its banks. She also describes the evil brood of Fenrir in the Iron Woods to the east, the wolves that will devour the sun and the moon. The sun grows dim, the weather "woe-bringing"; a horribly long winter will bring famine, as described in the *Lay of Vafþrúðnir* (st. 44). The final doom is heralded by a couple of obscure stanzas in which three roosters crow to call up the fighters—giants, Óðinn's warriors in Valhøll, and the dead in Hel's realm—for the last combat. Now the forces of evil break loose: the hellhound Garmr breaks its fetters, and in the world of men, fratricidal struggles erupt everywhere; the bonds of kinship are disregarded ("woe's in the world, much wantonness"), and no respect for human life remains. Heimdallr, the watchman of the gods, blows his horn, the cosmic tree Yggdrasill shakes in its roots, the world serpent "wallows in giant rage," and the ship of death breaks its moorings. All the forces of destruction move in. Loki leads the "witless hordes" of giants, and Surtr, the lord of Muspelheim, arrives from the south with the fire demons that will set the world ablaze. The mountains totter, heaven is rent apart, and men tread the path of Hel. In the final clash the gods meet their fates: Óðinn is slaughtered by the wolf Fenrir but is avenged by his son Víðarr; Þórr meets his archfoe, the earth-girding serpent, and they kill each other; Freyr dies in single combat with Surtr. The sun turns dark, the stars fall from the sky, and the blazing earth sinks into the sea.

But this apocalypse does not mean that all is lost. The earth, which was originally lifted from the primeval waters by Óðinn and his brothers, reemerges purified and regenerated from the deep into which it had sunk. A new breed of gods meet again in the green pastures and find the chessmen left by the Æsir. Baldr and Höðr are reborn to dwell in perfect harmony in the divine halls, and henceforth guiltless men will live forever in a gold-roofed abode called Gimlé. A mighty unnamed deity will reign over all, but evil has not been completely eradicated, for Níðhöggr, the awful dragon carrying corpses in its pinions, is still roaming over the plains.

Völuspá, whose description of the fate of the gods has been presented here, does not constitute our only source

about Ragnarök, nor does it strictly reflect popular beliefs about the end of time. The Eddic poems often contain divergent versions of certain episodes, and Snorri, who gave a detailed account of the same events in his *Edda*, quotes from all the sources available to him. Thus, describing Óðinn's tragic end and Víðarr's vengeance, Snorri prefers the cruder and more primitive version of the *Lay of Vafþrúðnir*, in which Víðarr, wearing a shoe made of all the leather pared off from men's shoes at the toes and heels since the beginning of time, pulls apart Fenrir's jaws. The strange similarity between the action of Víðarr and that of Lugh in the Irish tradition of the Second Battle of Magh Tuiredh, along with the association of the Celtic god Lug(us) with cobblers, may indicate that this strange reference to the origin of Víðarr's footwear reflects a very old, no longer well-understood tradition associating this Germanic deity with the shoemakers. Therefore, the *Völuspá* version, which states that Víðarr "hews the son of Hveðrungr to the heart," presumably represents a younger form of the story. In any event, there was a widespread intimation of the impending catastrophe affecting the gods in the Scandinavian world. This is widely demonstrated by numerous references in court poetry. For example, in a poem commissioned by the widow of the Norwegian king Eirik Bloodaxe (killed in England in 954), Eirik is assumed to have been called to Valhøll by Óðinn, who needed him for the impending final conflict: "The grey wolf [Fenrir] is glaring at the dwellings of the gods, ready to jump." Similarly, Eyvindr the Plagiary celebrated the Norwegian king Hákon the Good (d. 960) by saying: "Unfettered will fare the Fenrir-wolf and ravage the / realm of men ere that cometh a kingly prince as / good to stand in his stead" (Hollander, 1964, p. 127).

RELIGIOUS PRACTICES AND MORALITY. Apart from Ibn Fadlan's account of a Scandinavian funeral, there are few wholly reliable sources of information about pagan religious practices. Icelandic sagas contain characters who are pagan priests, seeresses, witches, and sorcerors, and they describe rituals such as fortune-telling, "baptism," funerals, sanctifications of land and temples, oath-taking, sacrifices, and feasts of sacrificial meat (in Iceland, often horse meat). The sagas are products of the Christian age, however, and for several reasons are liable to give inaccurate accounts of paganism. Nonetheless, we know that pagan Scandinavians had temples where sacrifices were conducted, and that the function of the priest was an important one. In addition, certain rites such as fortune-telling and sacrificing to the elves were conducted on individual farms.

Germanic and Scandinavian paganism was by no means a monolithic religion. Both the pantheon and religious practices evolved over time and were different in different places, facts of which medieval Scandinavians were dimly aware. For example, in his prologue to his history of the kings of Norway, Snorri discusses what he calls "The Age of Burning" (when the dead were cremated and memorial stones with runic inscriptions were erected in their memory) and "The Age of Barrows" (when the dead were inhumed and an artifi-

cial hill of earth was raised over their graves). Longships sometimes served as the coffins of kings and other people of rank, as in the Sutton Hoo burial in England and the Oseberg burial in Norway, and in Sweden the barrows were long, pointed ovals—the shape of the "footprint" of a longship. It is not clear whether this attests to a belief that the dead needed a ship to travel to the next world, or whether the ship (actual or symbolic) was considered something that would be useful in the afterlife, like the weapons or household tools that were sometimes placed in graves. There were also different beliefs regarding the afterworld. Norse mythology and court poetry focus on the life in Valhøll of the warriors killed in battle, but the Icelandic sagas attest to beliefs that a dead person would spend the afterlife feasting with companions in his grave mound or would join his kin, who would be "living" in a nearby cliff or mountain. These beliefs were very likely to have originated in Norway, the homeland of many of the original settlers of Iceland. Finally, in addition to the geographic distribution of the cults of a particular god, Norse paganism seems to have involved no restrictions or requirements regarding an individual's beliefs. According to the sagas, at least, one person could be a devotee of Þórr, whereas his neighbor was a devotee of Freyr. From a very early period, Germanic and Scandinavian pagans were rarely wholly isolated from Christianity, and a certain amount of syncretism undoubtedly resulted. The sagas, for example, tell of one Icelander who prayed to Christ while he was ashore but to Þórr while he was at sea.

The value system of Germanic paganism had to do with people's actions rather than their thoughts, feelings, or beliefs. There was no religious moral code defining particular "virtues" or "sins"; instead, Germanic law, culture, and custom embodied a system in which certain actions would bring honor or dishonor to an individual. Shame might or might not be felt by someone who had brought dishonor upon himself, but a person's reputation was a product of his or her interaction with the community, not a matter between that person and a god. Generally speaking, showing bravery in battle, generosity in gift-giving and hospitality, and taking blood-vengeance in response to a killing or murder would enhance a man's honor. Generosity also enhanced a woman's honor, as did urging men to honorable actions and dying with them should their hall or farm be attacked. Cowardice and miserliness brought dishonor. There was no dishonor in amassing as much wealth as one could, only in not being generous with what one had. In the end, neither one's honor nor one's belief in a god or the gods seems to have been relevant to one's fate after death, despite the acceptance of the concepts of Valhøll and Hel. Malicious people sometimes returned as destructive ghosts or revenants to harm the living, but there were ways of laying them to rest. The peaceful dead would be served in the afterlife by the things burned or buried with them (clothing, jewelry, weapons, tools, and household items, sometimes extending to food, dogs, horses, and servants), and in this world their reputations would live on

after them “for as long as the northern part of the world is inhabited.”

For the Indo-European creation myths, see Bruce Lincoln's *Myth, Cosmos, and Society: Indo-European Themes of Creation and Destruction* (Cambridge, Mass., 1986). On the Germanic pantheon, see E. O. G. Turville-Petre's general work *Myth and Religion of the North* (London, 1964) and Georges Dumézil's general study *Gods of the Ancient Northmen* (Berkeley, Calif., 1973). Other standard works on the topic include Jan de Vries's *Altgermanische Religionsgeschichte*, 2d ed., 2 vols. (Berlin, 1956–1957); R. L. M. Derolez's *Götter und Mythen der Germanen* (Darmstadt, Germany, 1959; Einsiedeln, Switzerland, 1963); and Régis Boyer's *La religion des Anciens Scandinaves* (Paris, 1981). Hilda R. Ellis Davidson's *Gods and Myths of Northern Europe* (Baltimore, 1964) is written for a wider public. A more controversial work is Åke V. Ström's *Germanische Religion*, vol. 19 of *Die Religionen der Menschheit* (Stuttgart, 1975). A better summary, strongly influenced by Georges Dumézil, is Werner Betz's “Die altgermanische Religion,” in Wolfgang Stammer's *Deutsche Philologie im Aufriss*, vol. 3 (Berlin, 1957). Succinct presentations are found in Lennart Ejerfeldt's contribution to the *Handbuch der Religionsgeschichte*, vol. 1, edited by Jes P. Asmussen and Jørgen Laessøe (Göttingen, 1971), pp. 277–342; and in Eduard Neumann and Helmut Voigt's entry in *Wörterbuch der Mythologie*, vol. 2 of *Das alte Europa*, edited by H. W. Haussig (Stuttgart, 1972). On Tacitus, compare J. G. C. Anderson's *Cornelii Taciti De origine et situ Germanorum* (Oxford, 1961), Rudolf Much's *Die Germania des Tacitus erläutert*, edited by Wolfgang Lange and Herbert Jankuhn (Heidelberg, Germany, 1967), and Allan Lund's *Zum Germanenbild der Römer: eine Einführung in die antike Ethnographie* (Heidelberg, Germany, 1990). On the sovereign gods, consult Georges Dumézil's *Les dieux souverains des Indo-Européens* (Paris, 1977). On the divine twins, compare Donald Ward's *The Divine Twins: An Indo-European Myth in Germanic Tradition* (Berkeley, Calif., 1968) and Georges Dumézil's *From Myth to Fiction: The Saga of Hadingus* (Chicago, 1973), especially pp. 109–120. Dumézil's early views are found in *Mythes et dieux des Germains: Essai d'interprétation comparative* (Paris, 1939); a later comparative work is his *Loki* (Paris, 1986). Margaret Clunies Ross takes an anthropological approach in *Prolonged Echoes: Old Norse Myths in Medieval Northern Society*, vol. 1 (Odense, Denmark, 1994). John Lindow surveys the scholarship in *Scandinavian Mythology: An Annotated Bibliography* (New York, 1988) and also applies anthropological theory to the myth of Baldr in *Murder and Vengeance among the Gods: Baldr in Scandinavian Mythology* (Helsinki, Finland, 1997). The encyclopedia-style entries of Phillip Pulsiano's *Medieval Scandinavia: An Encyclopedia* (New York, 1993), Rudolf Simek's *Dictionary of Northern Mythology* (Cambridge, U.K., 1993),

and John Lindow's *Handbook of Norse Mythology* (Santa Barbara, Calif., 2001) are very detailed. For Germanic beliefs about the afterlife, see Hilda Roderick Ellis's *The Road to Hel: A Study of the Conception of the Dead in Old Norse Literature* (New York, 1968). Thomas A. DuBois examines the dynamic interrelationships of the various religions of pagan Scandinavia in *Nordic Religions in the Viking Age* (Philadelphia, 1999). An English translation of Snorri's euhemeristic history is provided by Lee M. Hollander, *Heimskringla: History of the Kings of Norway*, by Snorri Sturluson (Austin, Tex., 1964)

GERMANIC RELIGION: HISTORY OF STUDY

This article concentrates on the most recent phase of the history of scholarship on Germanic religion. A 1956 study by Jan de Vries provides a detailed review of work up to the middle of the twentieth century, and 1985 reviews by Joseph Harris and John Lindow cover developments up to the early 1980s.

SCHOLARSHIP TO THE LATE NINETEENTH CENTURY. Medieval scholars of Germanic religion were divided into two camps. Euhemerists such as Snorri Sturluson (1179–1241) argued that the pagan gods were men who had migrated to Sweden from Troy but who were believed by the local inhabitants to be divine. In contrast, demonists such as the editors of the sagas about King Olaf Trygvason (r. 995–1000) held that the pagan gods were manifestations of Satan. Knowledge of the pagan religion was never lost, as is shown by the existence of two versions of Snorri's *Edda* that were set down in seventeenth-century Iceland. However, the systematic study of Germanic mythology began with the publication in 1835 of Jacob Grimm's work on Teutonic mythology. Although his etymologies and interpretations are now largely rejected, his collection of materials was nonetheless a rich one and a monument to romanticism's interest in the Germanic past.

After Grimm, the nineteenth century witnessed various trends in the interpretation of myth. First were the nature interpretations, according to which the myths represented seasonal change and the gods represented phenomena such as storms, thunder, and fire. Among the general mythologists who worked with Germanic materials, Max Müller connected all myths with the cycle of the sun and Adalbert Kuhn offered meteorological interpretations. Among those specializing in Germanic religion, Wilhelm Mannhardt emphasized agricultural rites; some British scholars, such as Edward B. Tylor, postulated that the Germanic tribes were animists who believed in spirits and demons; and others, including Andrew Lang, interpreted myths as dreams. Scholars were also interested in using Germanic material to study still earlier societies: Müller, Kuhn, and Wilhelm Schwartz used comparative approaches to reconstruct proto-Germanic and Indo-European religions. This direction of research was superseded by the so-called folklore mythology, which began

with Wilhelm Mannhardt's 1875 study of forest and field cults, and the use of folklore customs to interpret Germanic mythology continued for some seventy-five years. (Sir James Frazer's monumental *The Golden Bough* [1911–1915] is based on this line of research.)

Toward the end of the nineteenth century, monographs were devoted to major deities, including Rudolf Much's to the sky god and Vilhelm Grönbech's to religion and ethical and spiritual concepts. Germanic mythology also became of interest to philologists. Sophus Bugge questioned the originality of Germanic mythology with his revolutionary hypotheses about the origin of Germanic myths, which he held were derived entirely from Christian and classical thought. His theories were defended especially by Elard Hugo Meyer, who associated them also with the older natural-mythological interpretations, but all these views have lost acceptance. (Archaeological studies do hint at some Roman influence on the early development of the Scandinavian pantheon, and Christianity is now considered to have had an influence on Scandinavian paganism itself as well as on the textual sources, as Kaarle Krohn, Anne Holtsmark, and others have shown.) Eugen Mogk criticized the supposed reliability of Snorri's *Edda* and thus drew attention to the fundamental problem of the trustworthiness of Old Norse sources.

EARLY TWENTIETH CENTURY: FORMATIVE YEARS. The period from around 1900 to World War II saw a consolidation of the field, and the resulting view of Germanic religion, in its basics, is that still held at the turn of the twenty-first century. Walter Baetke described the Germanic peoples' concept of the holy, their ideas about fate, and their system of values; Magnus Olsen used place-names as a new source for the research of Germanic religion; and Grönbech examined the role of religion in the lives of the Germanic people and its influence on cult and custom. Ritual activity was the focus of the interpretations of Otto Höfler, who examined the links of mythology and cult and the significance of the cult in the lives of individuals. His argument for the existence of a cult group of warriors linked with Óðinn has found objections but no real refutation. Franz Rolf Schröder used both Germanic and non-Germanic parallels and relations in his study of the religions of the Indo-European peoples, although not all his theories are still accepted. Axel Olrik, who from 1892 to 1894 had produced a study of Saxo Grammaticus (c. 1150—after 1216) that has never been superseded, was joined by Hans Ellekilde for a still largely respected study of Scandinavian mythology that made substantial use of comparative material.

Yet another comparativist, Georges Dumézil, arrived at a "three-function" theory of Indo-European mythology. He considered the common Indo-European ideology to have consisted of three principles—the maintenance of cosmic and juridical order, the exercise of physical force, and the promotion of physical well-being—and he interpreted the gods of the various groups of the Indo-Europeans' descendants as representing these "functions." He saw Óðinn and

Týr as co-sovereigns, each dedicated to one of the elements of the first function; Þórr represented the second function, and Njörðr, Freyr, and Freyja the third. Despite some reservations, such as the objection to Dumézil's identification of Þórr as a war god, this theory has gained in importance since the 1950s. In 1956 and 1957, the second edition of de Vries's magisterial two volumes on the history of Germanic religion brought this newer work together with the older scholarship of historicists such as Karl Helm, who depended on philological and archaeological evidence. De Vries also presented findings from the study of folklore and place-names. His opus is the most extensive handbook of Germanic religion and is still useful, albeit insufficiently critical of the Nordic literary sources.

Studies of Old Norse mythology experimented with the functionalist and structuralist theories of the 1940s and 1950s, but in the main—except for Dumézil's brand of structuralism—the historicist (or literary-philological or positivist) approach of the nineteenth century is still in force. This line of thinking assumes that each myth had a single "original" form and meaning that can be reconstructed and that is the primary object of study. The neohistoricist or "new philological" approach of scholars such as Thomas A. DuBois, in contrast, assumes that myths may have had different meanings for different communities at different times. The latter approach is also seen in late-twentieth- and early twenty-first-century archaeologically based studies of Germanic religion. Archaeology also supplies new primary sources for the study of Germanic religion; for example, Karl Hauck argues that the human figures on Migration Age (late fourth century—early seventh century) bracteates represent Germanic divinities. (Bracteates are Germanic medallions, probably inspired by Roman coins, that depict figures and scenes that are still not fully understood.) Although not all of his identifications have been accepted, the evidence of the bracteates is considered relevant.

LATE TWENTIETH CENTURY. Despite some overinterpretation, place-name studies continue to be a productive field for the study of Scandinavian paganism. For example, in a 1999 paper, Alexandra Pesch searches the kings' sagas for interpretations of the ninth-century Oseberg (near Oslo) ship burial and then examines this information in light of the archaeological and place-name evidence. The former indicates that the burial is that of a pagan seeress or priestess rather than that of a queen, and the latter suggests that Oseberg (if from *Ásabergr*, meaning "mountain of the gods") may, like Uppsala, have been a center for the worship of several deities. The silence of the sagas regarding a heathen cult center or sacral landscape in this part of Norway reminds us that when it comes to early Scandinavian history, the sagas are far from preserving a full account of events.

Old Norse myth and Scandinavian society. One important development in the second half of the twentieth century was the idea that the well-documented Old Norse myths should be treated separately from the poorly documented

Scandinavian pagan rituals. Earlier, Frazer's view of ritual as the dramatization of myth had influenced pre-World War II scholars of Old Norse myth such as Magnus Olsen and Bertha Phillpotts and to some extent postwar scholars such as Holtmark, Einar Haugen, and Anders Andrén. Scholars such as Margaret Clunies Ross, John Lindow, and Jens Peter Schjødt rely on the relationship between myth and ritual in non-Western societies to argue that myth and ritual are probably not as closely interrelated as Frazer and his followers thought. Following Victor Turner, such "anthropological" studies of Old Norse myth treat it as one symbolic form among the many that a society accesses during ritual performance, and following Émile Durkheim, they assume that myths express certain social and cultural realities for the people who create and use them. Drawing on semiology, these studies further consider mythology as a system of interrelated elements, and they avoid investigating myths on an individual basis.

Despite these common assumptions, scholars taking the anthropological approach have posited quite different aspects of society as central to Scandinavian mythology. Clunies Ross focuses on issues of exogamy as the source of tension between the Æsir, the Vanir, and the giants. She argues that the Æsir are unwilling to give their women in marriage to members of the other groups, as this would acknowledge that they are all of equal status, but the resulting unions between giantesses and Vanir and the various ploys to obtain Æsir women sow the seeds of the Æsir's own destruction. Lindow focuses on the social mechanism of the blood feud, which was the chief means of maintaining social stability both for the Æsir and for the Icelanders who worshiped them. The ongoing feud between the giants and the gods reflected a social reality that the Icelanders knew well, but the murder of the god Baldr, which sets brother against brother, is evidence of a fatal flaw in a strategy that is supposed to lead to resolution.

Germanic paganism and Christianity. The assumption that religions are not static but are changing and pluralistic is also productive for studies of the interaction of Germanic paganism with Christianity and other religions. For example, DuBois argues that the extensive and long-term intercultural contacts between the pagan Norse, the Sámi, and the Finns, and then between these groups and various kinds of Christianity, resulted in the continuous alteration of their religious traditions. DuBois shows that Christian notions of burial made inroads into the practices of Nordic pagans long before these people officially accepted the new religion. Concepts about the afterlife underwent transformations as well, with pagan communities adjusting their beliefs in line with Christian doctrines prior to their conversion. It is likely that Christian rites and beliefs affected traditions such as ship burial and Ragnarök, which rise in prominence during the late pagan era.

Lindow and John McKinnell have concentrated on the interaction of Christianity and Scandinavian paganism and

on the question of Norse-Christian syncretism. Lindow argues that Norse mythology cannot be interpreted without reference to Christian influence, which may have been considerable, as the two cultures had ample opportunities to meet in an enormous number of contexts. Old myths may have been reworked in Christian forms; new versions may have emphasized certain aspects of the "original" myths for reasons related to Christian theology, or the new versions may have assimilated Christian modes of expression or imitated Christian forms. McKinnell sees the possibility of syncretism in tenth-century Norway, as archaeological and textual evidence points to an important Christian presence in Norway before the missionary efforts of King Olaf Trygvason, and Peter Foote has pointed out the peculiarities of early Icelandic Christianity.

A different matter is the use of pagan iconography for a wholly Christian purpose, as when Christian sculptors in Viking Age England put scenes of Ragnarök on their crosses as a way of emphasizing the parallels between the two religions and simultaneously showing that the old religion had been replaced and surpassed by the new. Yet another aspect of the interaction between Scandinavian paganism and Christianity that has received recent scholarly attention is the learned, medieval context in which the myths are preserved. Such studies clarify the material and render less significant the gulf between pagan Scandinavia and the recording of the mythology centuries later in a Christian context.

With the exception of de Vries, whose history of the study of religion (translated into English in 1967) is widely cited, scholars of Germanic religion and Scandinavian mythology have been medievalists first and scholars of comparative religion and mythology a distant second, most likely because of the specialized skills necessary to study the primary sources. The anthropological studies of Norse myth are the most up-to-date with respect to theory, but of the internationally famous mythographers of the twentieth century, only Dumézil has had a major impact on the study of Scandinavian mythology. Claude Lévi-Strauss's ideas have been injected into Dumézil's system by Einar Haugen, and his principles have been applied to certain eddic poems, but he has not himself been concerned with Germanic materials. Similarly, the theoretical orientation of Joseph Campbell has been used by Loren Gruber to examine the role of rites of passage in the eddic poem *Hávamál*, but Campbell's own treatment of Germanic material has been incidental. Mircea Eliade, however, included many Norse references to Óðinn in his study of shamanism, and the Norse applications of his theories of the sacred and profane or myth of the eternal return are obvious.

BIBLIOGRAPHY

Translated excerpts from nineteenth-century German scholarship on Germanic religion are provided by T. A. Shippey and An-

dreas Haarder in *Beowulf: The Critical Heritage* (New York, 1998). Jan de Vries's survey is found in the first volume of the second edition of his *Altgermanische Religionsgeschichte* (Berlin, 1956–1957), and the reviews by Joseph Harris and John Lindow appear in *Old Norse—Icelandic Literature*, edited by Carol Clover and John Lindow (Ithaca, N.Y., 1985). Another bibliographic resource is Lindow's *Scandinavian Mythology: An Annotated Bibliography* (New York, 1988). Fine examples of his recent work are "Bloodfeud and Scandinavian Mythology," *Alvissmál* 4 (1994): 51–68, and *Murder and Vengeance among the Gods: Baldr in Scandinavian Mythology* (Helsinki, 1997). Anthropological approaches are also pursued by Margaret Clunies Ross in the two volumes of *Prolonged Echoes: Old Norse Myths in Medieval Northern Society* (Odense, Denmark, 1994–1998) and in the essays she edits in *Old Norse Myths, Literature and Society* (Odense, Denmark, 2003) as well as by Thomas A. DuBois in *Nordic Religions in the Viking Age* (Philadelphia, 1999). An interdisciplinary approach was the focus of a conference whose proceedings are published in *Words and Objects: Towards a Dialogue between Archaeology and History of Religion* (Oslo, 1986), edited by Gro Steinsland; Steinsland's own study of Norse mythology is in *Det bellige bryllup og norrøn kong-eideologi: En analyse av hierogami-mytten i Skírnismál, Ynglingatal, Háleygjatal, og Hyndluljóð* (Oslo, 1991). The foremost modern scholar of Germanic ritual is Jens Peter Schjødt; for references to his work, see his essay "Myths as Sources for Rituals—Theoretical and Practical Implications" in Clunies Ross (2003). Peter Foote's study, "Secular Attitudes in Early Iceland," appeared in *Medieval Scandinavia* 7 (1974): 31–44, and Alexandra Pesch's paper on the Oseberg ship burial, "Die Oseberg-'Saga' in ihrer Vielschichtigkeit," is found in *Die Aktualität der Saga. Festschrift für Hans Schotmann*, edited by Stig Toftgaard Andersen (Berlin, 1999), pp. 177–199. Jan de Vries's general history of the study of religion was translated into English as *Perspectives in the History of Religions* (Berkeley, Calif., 1967), translated and with an introduction by Kees W. Bolle.

ELIZABETH ASHMAN ROWE (2005)

GERSHOM BEN YEHUDAH (c. 965–1028), German halakhist and Jewish communal leader. Despite the many uncertainties surrounding Gershom's life and historical role, it is clear that he was the central figure in the crystallization of Ashkenazic learning and communal organization in pre-Crusade Europe. A generation or two after his death Gershom was already termed Ma'or ha-Golah ("light of the exile"), a title reflecting the perception of both his spiritual stature and his historical impact.

Gershom's origins are not known, but it is likely that his immediate ancestry was French. He spent his adult life in Mainz, where in addition to writing commentaries on the Talmud and some liturgical poetry, he trained the men who were to be the mentors of Rashi. Gershom's personal life reflected the most painful experiences of medieval Jewish life: his son (and, according to one report, his wife as well) converted to Christianity. His poetry expresses the reality of persecution and the yearning for redemption.

Gershom's major contribution is revealed in his *responsa* and in the enactments (*taqqanot*) attributed to him. The *responsa* on questions of Jewish law are of course rooted in Talmudic literature, but they expose an original, decisive legal mind grappling with the central problems of his day. Some of his *responsa* dealt with Jews who converted to Christianity under duress, encouraging their return to Judaism by smoothing their path back to the community; others relaxed prohibitive regulations on Jewish-gentile commerce and empowered the community to govern more effectively by transferring to local communal leadership powers of compulsion that in Talmudic law are granted to central rabbinical courts. Matters of communal governance as well as issues of general social import were at the heart of the enactments attributed to Gershom.

The actual relationship between Gershom and the communities in whose name the enactments are also recorded is shrouded in obscurity, but present scholarly consensus sees Gershom as the central, driving figure behind this legislation. The enactments provide, inter alia, that the minority in a community must accept the authority of the majority, that taxes in dispute are to be paid before they are litigated, and that a defendant in a civil suit may be brought before a court in any community. These *taqqanot* were of great historical significance in legitimating community governance. Other enactments, such as those that prohibit marriage with more than one wife at the same time (permitted by both biblical and Talmudic law) and that forbid a husband to divorce his wife against her will, remain decisive for modern Jewish law and society. Both enactments reflect the status achieved by women in Gershom's society. While originally designed for the German communities of the Rhineland, they were gradually accepted by world Jewry.

BIBLIOGRAPHY

The most comprehensive discussion of Gershom's life and achievement is in Abraham Grossman's *Hakhmei Ashkenaz hari'shonim* (Jerusalem, 1981), pp. 106–174. Louis Finkelstein, in *Jewish Self-Government in the Middle Ages* (1924; reprint, Westport, Conn., 1972), pp. 20–36, 111–139, presents the enactments attributed to Gershom in both the original Hebrew and in translation and discusses questions of authorship, provenance, and impact. Ze'ev W. Falk, in *Jewish Matrimonial Law in the Middle Ages* (Oxford, 1966), discusses the relationship between Gershom's enactments on monogamy and divorce and similar norms in Christian Europe.

GERALD J. BLIDSTEIN (1987)

GERSONIDES (1288–1344), French mathematician and philosopher, known also as Levi Ben Gershom and, in rabbinic texts, by the acronym RaLbAG (Rabbi Levi ben Gershom). Born in Bagnols, Gersonides lived most of his life in Orange and Avignon. Little else is known about him other than where he resided in Provence under the protection of

the popes. Gersonides says almost nothing about his personal life, but some scholars have speculated that he may have functioned as a community rabbi, as a banker, or both. Given the nature of his writings and where he lived, it is not unreasonable to speculate that in addition to his involvement with the Jewish community, he may have taught astronomy/astrology in the papal university, medical school, or court. Gersonides is generally acknowledged to be the greatest and most independent medieval Jewish philosopher after the death of Moses Maimonides (Mosheh ben Maimon, 1135/8–1204). Of those rabbis who based their religious thought on the philosophy of Aristotle, Gersonides is the most thorough and rigorous; his major work in this area is *The Wars of the Lord* (1329). Gersonides also dealt with rabbinics, philosophy, mathematics, medicine, and astronomy.

In rabbinics Gersonides wrote commentaries on the Pentateuch, the Former Prophets, *Proverbs*, *Job*, *Song of Songs*, *Ruth*, *Ecclesiastes*, *Esther*, *Daniel*, *Ezra*, *Nehemiah*, and *1 and 2 Chronicles*, as well as a commentary on the thirteen hermeneutic rules of Yishma'el ben Elisha' (a tanna of the first and second centuries) and a commentary on the tractate Berakhot of the Babylonian Talmud. In philosophy he published a treatise on direct syllogisms and supercommentaries on the middle commentaries and résumés of Ibn Rushd (1126–1198). In medicine he is known to have written a remedy for the gout. In mathematics he composed a treatise on algebra and a commentary on parts of Euclid's *Elements*.

Finally, Gersonides published a major treatise on astronomy (1340), which Moritz Steinschneider identified as *Sefer Tekhumah*, which consists of 136 chapters. (A summary of this more detailed work is contained in the second part of the fifth book of *The Wars of the Lord*.) What is of particular interest to historians of science is that the work contains significant modifications of the systems of Ptolemy and al-Bitruji, as well as useful astronomical tables. The work also includes a description of an instrument, which he calls a *maggalleh 'amuqqot* (detector of depths), which he invented for making precise astronomical observations. The work was praised and extensively quoted by Giovanni Pico della Mirandola in his *Disputationes adversus astrologiam divinatricem* (1495). In general Gersonides' instrument is considered the most useful tool developed to assist measurements in astronomy prior to the development of the telescope, and historians of science regard Gersonides as one of the most important European astronomers before Galileo.

The Wars of the Lord deals only with those questions that Maimonides either resolved in direct opposition to Aristotelian principles or explained so obscurely that Maimonides' own view cannot be determined. These questions are discussed in six treatises on, successively, the nature of the soul (i.e., psychology), prophecy (i.e., revelation), God's knowledge, divine providence, the nature of the celestial spheres (i.e., cosmology), and the eternity of matter (i.e., cosmogony).

In each treatise, every question is systematically discussed. First, Gersonides lists all of the different positions that had previously been taken on the issue in question. He then presents a critical analysis of each view, and in so doing lists every form of argument for each position and judges the extent to which each argument is and is not valid. Following this, he states his own view, and he then shows how each of the arguments given for other positions, to the extent to which they are valid, supports his own position. Finally, he demonstrates that his position is in agreement with the correct meaning of the Torah.

Gersonides' theory of divine knowledge was one of the most controversial parts of his work. In the subsequent history of philosophy it led some Jewish thinkers to condemn his work (e.g., Shem Tov ibn Shem Tov, c. 1390–1440) and others to follow him (e.g., Barukh Spinoza, 1632–1677). Gersonides argued that all terms correctly predicated of God and man are such that those terms apply primarily to God and derivatively to humans. Hence, the term-knower refers primarily to how God knows, and by reference to divine knowledge the term is applied to human beings. As their creator, God knows all things as they are essentially in and of themselves. In contrast, human beings, with the assistance of the Active Intellect, know these creations through their senses as effects. God knows everything, but he knows it in a single act of knowledge. The content of divine knowledge is expressible in human terms as an infinite conjunction of distinct universal, conditional propositions. Concerning a specific entity or fact, whereas human beings may know it accidentally, as a particular, through sense reports, God knows it essentially, as a unique individual, through his intellect. Gersonides' opponents interpreted this thesis to amount to a denial that God knows particulars, with the consequence that God is limited in knowledge and power.

Possibly the most original part of Gersonides' work was his cosmology. The concluding treatise of *The Wars of the Lord* consists of a detailed demonstration, based on astronomy and physics, of the existence of the different heavenly intelligences (angels) and the uniqueness of the ultimate intelligence (God). In terms of its philosophical and scientific elements, this treatise constitutes the most sophisticated work of theology in the history of Judaism. In it, Gersonides argues that this unending universe was created in time, not out of the remains of some previously existing universe but out of nothing. However, the "nothing" from which the world was created is not absolutely nothing; instead, it is an eternal, unformed matter, unlike any other matter of which we can conceive. Gersonides' account of this matter may be the most original part of the work. It is significantly different from the theory of prime matter found in any other work of Jewish, Muslim, or Christian philosophy. But to give an adequate account of it involves a technical discussion that goes beyond the confines of this essay. Suffice it to say that Gersonides' theory of prime matter bears some resemblance to the use by Hermann Cohen (1842–1918) of the term *ori-*

gin in his application of the infinitesimal calculus to ontology, and it may have parallels with the kind of high-energy radiation from which the universe originated, according to those astrophysicists who support the Big Bang theory.

BIBLIOGRAPHY

A full list of the published writings of Gersonides can be found in Bernhard Blumenkranz's *Auteurs juifs en France médiévale* (Toulouse, France, 1975), pp. 65–69. An extensive bibliography of secondary sources is given in Menachem M. Kellner's "Gersonides, Providence, and the Rabbinic Tradition," *Journal of the American Academy of Religion* 42 (1974): 673–685.

The best source for information about Gersonides' life are two essays by Joseph Shatzmiller, one in Hebrew (in *Studies in the History of the Jewish People and the Land of Israel* 2 [1972]: 111–126) and the other in French (in *Gersonide en son temps*, edited by Gilbert Dahan [Louvain, Belgium, and Paris, 1991], pp. 33–43). With reference to English translations of primary sources, Abraham Lassen has published an English translation of Gersonides' commentary on the Book of Job under the title *The Commentary of Levi ben Gerson (Gersonides) on the Book of Job* (New York, 1946). Furthermore, an English translation of the entire *Wars of the Lord* has been published by Seymour Feldman (Philadelphia, 1984–1999). In addition, there are three English translations of separate treatises, each of which contains valuable commentaries: on treatise 3, see Norbert M. Samuelson's *Gersonides' The War of the Lord, Treatise Three: On God's Knowledge* (Toronto, 1977); on treatise 4, see J. David Bleich's *Providence in the Philosophy of Gersonides* (New York, 1973); and on treatise 6, see Jacob J. Staub's *The Creation of the World according to Gersonides* (Chico, Calif., 1982).

Gersonides' positions on divine knowledge and providence, as well as his cosmogony, are inherently connected with his cosmology. As yet no one has undertaken the difficult task of translating his treatise on astronomy. However, considerable light on his cosmology is given in the many publications of Bernard R. Goldstein, especially *The Astronomy of Levi ben Gerson* (New York, 1985).

NORBERT M. SAMUELSON (1987 AND 2005)

GESAR. As is the case with most epic texts—*Rāmāyaṇa*, *Gilgamesh*, and *King Arthur*, for example—little is known of the historical and artistic genesis of the Gesar epic (Tibetan, *Gling Ge sar gyi sgrung*), a complex and lengthy narrative relating the heroic deeds of the divine king Gesar. The earliest known written version of the epic dates back to 1716, when it was translated—possibly from Tibetan—into Mongolian on the orders of the Manchu emperor. Different versions are attested: the Eastern Tibetan from Khams province (Eastern Tibet); the so-called Amdo Tibetan from a province in northeastern Tibet; the Western Tibetan from Ladakh, an oral version that has affinities with both the Eastern and

Amdo versions, though it is shorter than the Eastern one; and the Mongolian one, which boasts a great number of episodes that cannot be found in the other versions. Hunza (northeast Pakistan), Lepcha (northeast Nepal), Buriat (North Mongolia), Khalkha (Mongolia), and Kalmuk (Siberia) versions are also recorded. Regardless of discrepancies among all versions, the core of the epic, which is made of six or seven episodes (sometimes called the proto-epic), has been extant since the seventeenth century at the latest.

THE EPIC: HISTORICAL BACKGROUND AND LINKS WITH BUDDHISM. Whether a real person lies behind the epic hero Gesar is still debated. One of the earliest written instances of his name (as Gesar, king of Phrom) appears in a ninth-century Tibetan manuscript, and the name also appears on a coin that may refer to the king of a Central Asian kingdom in the ninth or tenth century. For most Tibetans he is an eleventh-century historical figure who ruled Ling (Tibetan, *Gling*), a principality in Khams, that reached its peak in the thirteenth and fourteenth centuries. It has been suggested that Khrom (or Phrom, pronounced "Throm") could be a distant echo of Rome, via the Turkish word *Rûm* that designated Rome or Byzance, while Gesar would refer to *Kaisar*, the Turkish word for "king" or "emperor," derived from Caesar. But Gesar is also seen as a Buddhist character, since he is considered as an emanation of both Avalokiteśvara, the *bodhisattva* of compassion (also embodied in the Dalai Lamas of Tibet) and Padmasambhava (the semi-legendary introducer of Tantric Buddhism in Tibet in the eighth century). He fights in the name of the Buddhist doctrine and the well-being of all men—or, more precisely, Tibetans.

Whether the original epic (if ever there was such a thing) was devoid of references to Buddhism is hard to tell, but it came to pervade most of the narrative. For instance, between wars Gesar is described not as ruling his kingdom but as going into spiritual retreat until a vision summons him to fight another battle against another enemy. Most songs in the epic begin with an invocation of Buddhist or pre-Buddhist local deities and often include a sermon on important aspects of Buddhism. Although certain sects of the Tibetan clergy have shown hostility towards the epic, its content was gradually infused with Buddhist themes until famous Tibetan lamas of the nineteenth century assimilated Gesar to a Buddhist protective *dgra lha* (war deity). Moreover, the recitation of some episodes have come to acquire a ritualistic dimension: *Hor gling*—the battle against Hor—is associated with the fight against demons, and *Stag gzic nor gyed*—the battle for the wealth of Tagzig—with an increase of wealth. The Manchu emperors of China (1644–1911) identified Gesar with the Chinese god of war, and a cult to Gesar (Mongolian, Geser) has existed in Mongolia since the seventeenth century.

THE EPISODES. Most versions of the epic begin with three famous episodes: the decision of the assembly of gods to send a savior (the future Gesar) to defend the world, and more particularly Tibet, against the forces of evil (the episode

called *Lha gling*); Gesar's childhood as the despised and ugly child Jo ru (the episode called *'Khrungs gling*); and Jo ru's unexpected victory at a horse race at the age of thirteen, whereby he becomes the respected and impressive Gesar, marries the beautiful princess' Brug mo (Drugmo) and becomes the king of the community of Ling (the episode called *Rta rgyug*). These are followed by a succession of narratives describing how, riding his supernatural horse and leading his thirty brave companions and his army, Gesar wages a series of wars against four foreign kingdoms and eighteen Tibetan principalities. The episodes always end with Gesar's victory and the pledge of the subdued armies to become his allies in conquests to come—as well as with the plundering of the enemies' wealth and its redistribution to the people of Ling. The last episode recounts how he rescues his mother from Hell. For Tibetan believers, Gesar is now residing in Shambala, a hidden realm from where he will come back to save humanity and Buddhism. A characteristic of this epic is its open ending; in the twentieth century at least two new episodes were added.

The total number of episodes is difficult to assess. The latest figures vary from 120 to 200, of which about 100 had been published by the early twenty-first century. Another peculiarity of the epic concerns its elaboration, which rarely resorts to literary creation, although a few episodes present themselves as rewritings of previously known versions. New episodes mostly appear through vision and revelation to either Buddhist masters or laypersons, who claim to be reincarnations of characters of the epic and whose previous life they recall, thereby “creating” a new episode. There also exist “treasure-bards” (Tibetan, *gter sgrung*) who “discover” episodes hidden in their mental continuum, in the same way as Buddhist “treasure-discoverers” (Tibetan, *gter ston*) discover Buddhist teachings or narratives thought to have been hidden in a previous time by Padmasambhava.

BARDS. Until the Chinese takeover of Tibet in the 1950s, most versions were passed on orally and few were committed to the written form, as manuscripts or, more rarely, xylographs (i.e., woodblock prints). Amateur performers would recite and sing it, and professional wandering bards (Tibetan, *sgrung mkhan* or *sgrung pa*) would roam the country narrating a few episodes in which they specialized. An estimate by Tibetan and Chinese researchers showed that the total number of bards in Tibet early in the twenty-first century varies between 100 and 140. Female bards are very rare, although women play an important part in the narrative (as mothers, wives, aunts, mistresses, etc.). A bard's performance usually alternates between short prose narrative parts and lengthy versified (often heptasyllabic) monologues in the form of songs. On average, one episode may contain between fifty and one hundred songs, the melody varying according to the character they represent. There are also melodies for certain types of songs (visions, prophecies, etc.). Bards would sometimes accompany their performance with painted prompts (Tibetan, *sgrung thang*) on which they would show the scenes referred to in their narrative.

In most cases, bards learn their craft from another bard or from a family member and rely on either a written text or their memory (Tibetan, *bshad sgrung*—literally, “narrating bard”—is a sub-category of the generic *sgrung mkhan* or *sgrung pa* category). But the most appreciated bards are those whose performance shares common characteristics with certain aspects of Tantric Buddhism and Tibetan “folk,” pre-Buddhist religion. Called *'bab sgrung* (oracular or divine bards), they are often illiterate nomads who become bards after a serious illness and ensuing visions. They recite episodes of the epic in a state of trance during which they are said to be possessed by one character of the epic who retells the event from his or her point of view. In some instances, they begin their recitation as soon as they put on their “epic hat” (Tibetan, *sgrung zhwa*). One of the most famous of these bards, Grags pa (Drak pa) (1904?/6?–1986), could recite as many as twenty-five episodes of the epic (equivalent to fifteen thousand pages of a modern text). In the rarest cases, bards can “read” an episode by looking at the surface of a mirror (Tibetan, *spra sgrung*) or looking at an empty white page. In these cases, the bard has not memorized the episode, he is in a state of inspired trance.

APPROPRIATION OF THE EPIC. The widespread popularity of the epic and its protagonists in Tibet may be explained by the part everyday Tibetan life plays in its narrative—a rare instance in a literature usually dominated by Indian models aloof from the Tibetan world. This popularity may in turn explain why several authorities have vied for its appropriation. As mentioned already, some Buddhist clergy incorporated Gesar into the Buddhist pantheon; the Buddhist tone of a number of passages in the epic can thus be explained as an attempt at exploiting its popularity among the nomads and peasants of Tibet to spread the Buddhist doctrine further. At a more esoteric level, Gesar's battles are sometimes presented as a symbol of the Buddhist follower's struggle toward Enlightenment. Since the takeover of Tibet by China in the mid-twentieth century, the Chinese cultural authorities have supported research on the epic, which represents, in their eyes, a rare case of popular, secular culture within the Buddhist-dominated Tibetan civilization. In response, Tibetans have been quick to associate Gesar (either the divine king or the epic narrative) with Tibetan cultural revival and nationalism and to cherish it as a depository of distinct and authentic Tibetan culture.

BIBLIOGRAPHY

The Gesar epic has greatly benefited from support by Chinese authorities, and not a year passes without a new episode being published in China, where the publication of a forty-volume edition, based partly on the twentieth-century bard Drakpa's recitation, is in progress. In Bhutan, K. Tobgyal and M. Dorji edited *The Epic of Gesar* (Thimphu, Bhutan, 1979), a heterogenous and somehow haphazard compilation in thirty-one volumes. Episodes are also published in India under the auspices of the exiled Tibetan community.

Only parts of the Gesar epic have been translated into Western languages: A. H. Francke collected and published a transla-

tion of the Ladakhi version of the epic at the turn of the twentieth century; see his *A Lower Ladakhi Version of the Kesar Saga* (New Delhi, 2000). An edited synthesis of a version from Eastern Tibet can be found in A. David-Néel's *La vie surhumaine de Guésar de Ling, le héros tibétain* (Paris, 1931, 1995), translated into English as *The Superhuman Life of Gesar of Ling* (rev. ed., London, 1959). In his *L'Épopée tibétaine de Gesar dans sa version lamaïque de Ling* (Paris, 1956), R. A. Stein partly translated a nineteenth-century xylograph that contained three episodes of the core epic. *Gesar! The Epic Tale of Tibet's Great Warrior-King*, adapted by Zara Wallace (Berkeley, Calif., 1991) is the updated and rephrased prose edition of a 1927 English translation of the 1716 Mongolian version of the epic, via a 1839 German translation.

In the 1990s, D. J. Pennick used preexisting translations to rewrite the core epic for an opera libretto (*The Warrior Song of King Gesar*, Boston, 1996). This version has retained the alternance of prose and poetic passages and is clearly formulated for a Western audience. R. Kornman and a team of translators have undertaken the integral translation of the nineteenth-century version used by R. A. Stein for his 1956 summarized translation (cf. *supra*). It is due for publication in 2004. Some episodes were translated into German by M. Hermanns in *Das National-Epos der Tibeter Gling König Gesar* (Regensburg, Germany, 1965) and by R. Kaschewsky and P. Tsering in *Gesars Anwehrkampf gegen Kaschmir (Zentralasiatische Studien 6 [1972]: 273–400)* and *Die Eroberung der Burg von Sum-pa* (Wiesbaden, Germany, 1987). The most thorough study to date of the epic remains R. A. Stein's *Recherches sur l'épopée et le barde au Tibet* (Paris, 1959). An updated summary of R. A. Stein's views can be found in his "Introduction" to the 1979 Thimphu version (reprinted in *Tibet Journal* 6, no. 1 [1981]: 3–13).

S. Hummel's *Eurasian Mythology in the Tibetan Epic of Ge-sar* (Dharamsala, India, 1998) suggests the existence of German and Greek mythological influence in a restricted number of the epics's episodes. His views, although tentative and sometimes far-fetched, nevertheless present original mythical and literary openings to links between Central Asian and Tibetan cultures, and his lengthy bibliography includes many German-language sources. M. Helferr is the author of a musicological study of some songs of one episode of the epic, titled *Chants dans l'épopée tibétaine de Ge-sar d'après le livre de la Course de cheval* (Paris, 1977). In the 1990s, S. G. Karmay dedicated three interesting articles to the epic, which can all be found in *The Arrow and the Spindle: Studies in the History, Myths, Rituals and Beliefs in Tibet* (Kathmandu, Nepal, 1998): "Gesar: the Epic Tradition of the Tibetan People" is a good summary of the epic in a Tibetan context; "The Theoretical Basis for the Tibetan Epic" gives a clear chronological order of the epic and considers the kingdom of Gling in its relationship to its neighbors, taking into account both historical sources and episodes of the epic; and "The Social Organization of Gling and the Term *phu nu* in the Gesar Epic" shows how a study of kinship as presented in the epic can be used as a source for a political and social analysis of traditional Tibetan nomad society.

G. Samuel has also undertaken a study of Gesar and its relationship to anthropology, shamanism, music, and so on. For an overview of the epic and the state of the field, see for in-

stance, his "Gesar of Ling: The Origins and Meaning of the East Tibetan Epic," in *Tibetan Studies: Proceedings of the 5th Seminar of the International Association for Tibetan Studies, Narita 1989* (Narita, Japan, 1992), edited by Shoren Ihara and Zuiho Yamaguchi; "Ge sar of gLing: Shamanic Power and Popular Religion," in *Tantra and Popular Religion in Tibet* (New Delhi, 1994), edited by G. Samuel, H. Gregor, and E. Stutchbury; "The Gesar Epic of East Tibet," in *Tibetan Literature: Studies in Genre* (Ithaca, N.Y., 1996), edited by José Ignacio Cabezon and Roger R. Jackson; and "The Epic and Nationalism in Tibet," in *Religion and Biography in China and Tibet* (Richmond, U.K., 2002), edited by Benjamin Penny.

For an early twenty-first century assessment of the appropriation of Gesar by China before and above all after 1950, see L. Maconi's "Gesar de Pékin? Le sort du Roi Gesar de Gling, héros épique tibétain, en Chine (post-)maoïste," in *Formes modernes de la poésie épique: nouvelles approches* (Brussels, 2004), edited by Judith Labarthe. Research on Gesar is also very active in China and Tibet: a number of episodes of the epic have been translated into Chinese, and a Chinese magazine is dedicated to the epic (*Gesaer yanjiu jikan* [Gesar studies]). See also Yang Enhong's *Minjian shihen: Gesaer yiren yanjiu* (Popular divine poets: Study on the singing tradition of "King Gesar"; Beijing, 1995), and her "The Study of Singing Tradition of the Tibetan Epic *King Gesar*" (*IIAS Newsletter* 18 [1999], p. 16), a short and documented article in English presenting a typology of bards. See also monographs and articles by 'Jam dpal rgya mtsho (Chinese, Jianbian Jiacao) and Gcod pa don grub (Chinese, Jiaoba Dongzhu), two Tibetan specialists. For a study of Gesar in Mongolia and Tibet, see W. Heissig's *The Religions of Mongolia* (London, 1980), his *Ge-ser Studien: Untersuchungen zu den Erzählstoffen in den "neuen" Kapiteln des mongolischen Geser-Zyklus* (Opladen, Germany, 1983), and his *Fragen der mongolischen Heldendichtung* (Wiesbaden, Germany, 1982, 1985, and 1987), which he edited and which contains several contributions on Gesar as well as translations of some episodes. N. Poppe and Ts. Damdinsüren also dedicated many articles to the fate of the epic in Mongolia. See also Klaus Sagaster's article in the first edition of this encyclopedia for a short and synthetic presentation of Gesar, especially in the Mongolian context (*Encyclopedia of Religions* 1987: 536–537).

FRANÇOISE ROBIN (2005)

GESTURES SEE POSTURES AND GESTURES

GETO-DACIAN RELIGION. The Getae and the Dacians were ancient Thracian peoples who lived in Moesia, on the northern plain of the river Danube, and in the Carpathian Mountains, approximately in the territory of modern-day Romania and Moldova. Although the religion of the Getae and the Dacians escapes complete reconstruction, it forms, nevertheless, like the religion of the ancient Celts, one of the most interesting chapters in the history of Indo-European religions outside the Greco-Roman world. Despite

the rationalistic tendency of some scholars to diminish the importance of religion among these peoples, evidence indicates that the foundation of the state consisting of the Getae and the Dacians was a result of theocratic ideas. These ideas stemmed from the worship of Zalmoxis, possibly an ancient religious reformer to whom the beginnings of Getic kingship are also related. Later on, Zalmoxis was divinized, a process that has frequent parallels in ancient Greece.

As for the Dacians, testimonies explicitly relate their name to the Phrygian word *daos* ("wolf"). Paul Kretschmer's etymology, which derives *dakoi* from the Indo-European **dhawo-s* ("wolf"), has been supported by Vladimir Georgiev and has received an exhaustive historico-religious comment from Mircea Eliade (1972). Eliade claims that the Dacians, like several other Indo-European peoples, formed a *Männerbund* based on the idea of ritual lycanthropy. Young Dacian warriors were probably trained to imitate the behavior of ferocious wolves. This has nothing to do with the Getae's legendary contempt for death, however, as that was based on the Zalmoxean promise of immortality. In all probability the message of Zalmoxis referred to a paradise in which valiant warriors would survive after death in a state of perpetual happiness.

Greek evidence, starting with Herodotos, establishes a close relationship between Zalmoxis and Pythagoras. The set of religious ideas whose origin is attributed to Zalmoxis indeed presents resemblances with Pythagoreanism. Besides immortality, Zalmoxis is said to have also taught a highly praised form of psychosomatic medicine based on charms, whose purpose was to heal the soul together with the body. Plato gives a vivid and enthusiastic account of Zalmoxean medicine in the dialogue *Charmides* (156d–157c). This medical tradition was apparently long-lived: Late in the third century CE forty-seven Dacian names of medicinal plants were inserted in the famous *Materia medica* of the Greek physician Dioscurides and in *De herbis*, attributed to Apuleius.

ZALMOXEAN PRIESTHOOD. The cult of Zalmoxis had strong connections with kingship. Plato, in fact, reports that Zalmoxis was king of the Getae (*Charmides* 156d), but Strabo (*Geography* 7.3–5) says that Zalmoxis was priest of the most important god of the Getae, that he became associated with kingship, and that he later was himself worshiped as a god; he was supposed to live in a cave on the sacred mountain Kogaionon, where only the king and his messengers could visit him. Sacred priesthood continued down to Strabo's time (first century BCE). The sacred cave must have been the most ancient place where the god was worshiped and his priests dwelled. In Herodotos's time (fifth century BCE) a sanctuary of Zalmoxis must have existed, for Herodotos (*Histories* 4.95) relates the legend that Zalmoxis had had an underground chamber built and that he hid himself there for three years, after which he reappeared. Such a sanctuary, with a vast underground complex, has been found at Sarmizegetusa Regia (modern-day Grădiștea Muncelului, Romania).

Jordanes, the historian of the Goths, born in Moesia in the sixth century, mingled the traditions of the Goths with those of the Getae in order to give the former the prestige of an ancient and superior population. He composed a list of Zalmoxean priests from the epoch of Burebista (c. 80–44 BCE) to the time of the Dacian king Decebalus (d. 106 CE). The series opens with the well-known Decaeneus (Dicineus), Burebista's counselor, who may have decisively contributed to the latter's power and to the origin of his kingship. Decaeneus taught the Getae philosophy, physics, ethics, logic, and astronomy. In particular he introduced them to the secrets of astrology, planetary revolutions, phases of the moon, measurement of the sun's size, and cosmic revolutions. Jordanes's testimony has been too lightly dismissed in the past. Decaeneus actually taught the Getae cosmology, astrology, and astronomy as well as introducing them to one of the most intriguing of ancient calendars, whose mystery has not been yet convincingly explained. Decaeneus's successors were the priests Comosicus and Coryllus, both of them kings, the latter in Dacia. Probably this Coryllus (sometimes called Cocrilus or Scorilus) was the immediate predecessor of Decebalus, who was the last king of the Daco-Getae and was finally defeated by the Roman emperor Trajan in 106 CE.

This list of Zalmoxean priests seems to contradict a second list also furnished by Jordanes (*De origine actibusque Getarum* 39), according to which the king Zalmoxis came after Decaeneus. In fact, Jordanes is obviously not referring here to chronology; he says only that among the Getae the most important thinkers were first (*prius*) a certain Zeutas, then (*post etiam*) Decaeneus, and then again (*tertiium*) Zalmoxis. One should infer from this that the predecessor of Decaeneus was Zeutas, not that Decaeneus was followed by Zalmoxis, who is simply the legendary founder of the Geto-Dacian priesthood; in fact, Decaeneus was followed by Comosicus. The name *Zeutas* is related to the southern Thracian name *Seuthes* and further to the Avestan term *haotar*, signifying an Iranian priest. Therefore, *zeutas* may simply be a generic term signifying Thracian priests.

PYTHAGOREAN PATTERNS. The geographer Strabo, quoting the Stoic philosopher Posidonius, was the first to give precious, but confused, information about the *ktistai* living in continence and abstinence, and the *abioi* (lit., "lifeless," i.e., strangers to normal life conditions) of whom Homer tells (*Iliad* 8.5–7). Strabo (7.3.5) also reports that Zalmoxis introduced vegetarianism among the Getae.

The Jewish historian Josephus Flavius (first century) compares the life of the ascetic Essenes with that of "those among the Dacians who are called *pleistoi*" (*Jewish Antiquities* 18.22). It seems that this text should be left without emendation. Following Posidonius and Strabo, the deep religious concern of the Geto-Dacians (*spoude, theosebeia, pietas*) was a commonplace of antiquity.

The word *pleistoi* has received different interpretations, but it seems to be connected with the Thracian god Plei-

storos (Herodotos, 9.119). Gheorghe Mușu has sought its etymology in the Indo-European root **ple(is)*, meaning “to be full”; hence *pleistoi* would mean “bearers of fullness” (Mușu, in Vulpe, 1980). In a rather obscure article, Mihai Nasta has accepted the emendation *pleistois* in *polistais*, from *polizein*, meaning “to instruct in the spirit of the city [*polis*]; to polish” (Nasta, in Vulpe, 1980). The most probable etymology, however, is that proposed by Eugen Lozovan (1968), who reads *pleistoi* as a paronomasia of the Thracian **pleiskoi*, from the Indo-European **pleus-*, meaning “hair, lock.” Hence, the *pleistoi* would be “hair bearers,” that is, bearers, or wearers, of a woolen bonnet.

This explanation receives further confirmation from Jordanes (71), who reports that the headgear of the noble and wise priests of the Getae, called *pilleati*, was a tiara (*pilleus*). The rest of the people had no *pilleus*; thus they were *capillati*, or “bareheaded.” Scholars have claimed that Jordanes’s report was based on a misinterpretation of Dacian nobles as priests, because traditionally the *pilleus* was the distinctive sign of Geto-Dacian aristocracy. This observation is wholly irrelevant, however, because Geto-Dacian kingship had many of the characteristics of a theocracy, and the religious initiation of nobles was probably different from that of the common people. Thus, the *pilleati* could very well have been trained as priests. As often as not, Geto-Dacian high priesthood coincided with kingship.

THE CALENDAR TEMPLE AT SARMIZEGETUSA REGIA. In chapter 70 of his *De origine actibusque Getarum*, Jordanes presents a portrait of Getic warriors that has met only skepticism among modern scholars. According to Jordanes, the Getic warriors used the short time between battles to study the properties of plants and the secrets of the starry heavens. An astonishing confirmation of this picture has been provided by the decipherment of the meaning of the calendar temple discovered among the monumental ruins of Sarmizegetusa Regia, an impressive stronghold in the Carpathian Mountains that was the center of the Daco-Getic priesthood before the Roman conquest. The first hypotheses, put forward by D. M. Teodorescu, Constantin Daicoviciu, G. Charrière, and Hadrian Daicoviciu, have been recently replaced by an improved interpretation based on algorithms, proposed by Serban Bobancu, Cornel Samoilă, and Emil Poenaru (1980).

The calendar temple is composed of two circular sanctuaries made of pillars and slabs of stone and andesite and of wooden pillars plated with terra-cotta, disposed in regular patterns. The forms and materials correspond to different units of the Dacian calendar. According to the demonstration of Bobancu, Samoilă, and Poenaru, the Dacians used as their principal time measure a fluctuating week consisting of from 6 to 8 solar days. A Dacian year was composed of 47 such measures and had, accordingly, from 364 to 367 days. After one 13-year cycle the calendar needed a one-day correction, which was marked separately on a series of pillars indicating such cycles. After one “century” of 104 years, or

8 cycles of 13 years each, a new one-day correction was needed and marked. On a larger rectangular calendar, a 520-year time quantum could be measured, that is, a cycle of five Dacian centuries, after which a one-day correction was needed again. Besides the 104-year “centuries,” the Dacian calendar also worked with 91-year “centuries,” that is, 7 cycles of 13 years each.

Besides this “civilian” calendar, the Dacians also used a religious calendar, composed of 60 weeks of six days each. A 68-day correction, marked on a circle composed of 68 pillars, was exactly the astronomical operation needed after the passage of a 13-year cycle. Sophisticated and precise as it was, the Dacian calendar had a simple and effective method of use. After termination of each time quantum (week, year, 13-year cycle, 91-year and 104-year “centuries,” 520-year period), a successive unit, represented by an architectural element (e.g., a pillar, a slab), was marked; this unit had another form and/or was made of a material different from that used for the preceding unit. The system of correspondences consists of distinguishing the different values of the circles of the sanctuaries and the different regular units of which each circle is composed. Once this is known, the whole pattern becomes predictable, and even a child or a modern scholar could be easily trained to keep the periodic marking.

Easy as it might seem in practice, such a calendar would be based on very complex mathematical principles. It would reach such a remarkable precision that after 2,275 years, corresponding to 175 cycles of 13 years, the time as given by the calendar would differ from the astronomical time by only 38.88 seconds. This is much too precise to be true.

The calendar temple at Sarmizegetusa Regia was not built before Decebalus, but it must have been based on a system discovered by Decaeneus. It provides perhaps a confirmation of Jordanes’s characterization of the religious life of the Geto-Dacians.

BIBLIOGRAPHY

The written sources on the religion of the Geto-Dacians are contained in *Fontes historiae Dacoromaniae*, 2 vols., edited by Virgil C. Popescu et al. (Bucharest, 1964–1970). On Thracian religion in general, Gawrill I. Kazarow’s article, “Thrake (Religion),” in *Realencyclopädie der Altertumswissenschaft*, vol. 6 (Stuttgart, 1937), can still be profitably consulted, and an extensive bibliography can be found in Mircea Eliade’s *Zalmoxis, the Vanishing God: Comparative Studies in the Religions and Folklore of Dacia and Eastern Europe* (Chicago, 1972).

For detailed study of the northern Thracians, the following works are recommended. In Romanian, Hadrian Daicoviciu’s *Dacii*, 2d ed. (Bucharest, 1972), and I. I. Russu’s article in *Anuarul Institutului de Studii Clasice* 5 (1944–1948): 61–137 are both essential works. Ion Horațiu Crișan’s *Burebista and His Time*, Bibliotheca Historica Romaniae Monographs, no. 20 (Bucharest, 1978), translated into English from his second edition, is useful for its description of the old sanctuary at Sarmizegetusa Regia. Radu Vulpe’s *Studia Thracologi-*

ca, in French, contains important articles on Burebista and Decaeneus, and the *Actes du Deuxième Congrès International de Thracologie*, vol. 3, *Linguistique, ethnologie, anthropologie*, edited by Vulpe (Bucharest, 1980), contains several interesting articles by Ioan Coman, Gheorghe Mușu, Mihai Nasta, and others. A still useful survey of some problems connected with the religion of the Geto-Dacians is Eugen Lozovan's "Dacia Sacra," *History of Religions* 7 (February 1968): 209–243. The best interpretation of the calendar temple at Sarmizegetusa Regia and a discussion of earlier hypotheses are presented by Serban Bobancu, Cornel Samoilă, and Emil Poenaru in *Caldendarul de la Sarmizegetusa Regia* (Bucharest, 1980), which includes a useful English summary on pages 183–190.

Revised Bibliography

GHAYBAH, the Arabic word for "concealment," in the sense of absence from human sight, is applied by various Shī'ī Muslim groups to the condition of one or another imam who disappeared rather than died and whose life is believed to have been prolonged (in a paradisaical state or in God's presence) until his foreordained return as *mahdī* (the Expected Deliverer) to initiate the eschatological drama concluding history.

EARLY HISTORY. The Qur'an contrasts the invisible or hidden spiritual realm (*al-ghayb*) with the observable world of human experience. Drawing upon prototypes of such eschatological prophet figures as Moses and Jesus, the first generations of Muslims embraced the view that certain prophets were withdrawn by God from the eyes of mortals, among them Jesus, Idrīs (Enoch/Hermes), Ilyās (Elijah), and Khidr. The Qur'anic description of the crucifixion of Jesus (4:157–159) and legends of the bodily incorruptibility and the ascension and future return of a Mosaic-type prophet contributed to the focusing of such expectations on various members of the prophet Muḥammad's family. 'Alī ibn Abī Ṭālib, the prophet's cousin and son-in-law, may have been the first given this honor by a small group of extremists among his partisans, the Sab'īyah, who refused to admit his death after his assassination in 661. After the martyrdom of Ḥusayn ibn 'Alī at Karbala in 680, another son of 'Alī, Muḥammad ibn al-Ḥanafīyah (d. 700?) became the center of millenarian hopes in the revolt of al-Mukhtār and the Kaysānīyah that occurred in 686 at Kufa in lower Iraq.

The Kaysānīyah drew an explicit parallel between a "doctetic" understanding of the passion of Christ and the concealment and eventual return of their imam. Speculation about the concealment of the imam was tied to the doctrine of return (*al-raj'ah*) in terms of a this-worldly, bodily resurrection before the end time to accomplish eschatological vengeance upon the wicked and victory and justice for the righteous.

THE LATER SHĪ'ĀH. The early tendency of "stopping" at a certain claimant to the imamate who was seen to be in concealment and awaiting his near-return helped fragment the energies of the original Shī'āh. Historical circumstances determined the continuity of the Imamiyah or Twelver Shī'ī line of imams until the death in 874 of the eleventh imam, al-Ḥasan al-'Askarī, whom tradition holds to have secretly fathered a son four years before his death, namely the twelfth or Hidden Imam, Muḥammad al-Mahdī. During the minor *ghaybah* from 874 to 941 this person's earthly existence and

near-return was accepted by the Twelver communities, whose allegiance was given to at least four successive *safirs*, or agents, the direct deputies of the Mahdi, especially in his juristic and financial functions. After 941 comes the era of the major *ghaybah*, in which the Twelver scholar-lawyers (*mujtahids* or *faqīhs*) collectively fulfill the functions of the imam's agents as an independently learned body of religious authorities. In the major *ghaybah* the Mahdi's concealment is seen as total and, though in earthly occultation, he is held to communicate to the faithful by virtue of his participation in the hierarchy of the invisible worlds.

The early Ismā'īlī Shī'ah eschewed the notion of a miraculous prolongation of life for the imam and emphasized a continuing line of succession to the imamate that included temporary or cyclical periods of concealment termed *satr*. They centralized the spiritual and cosmic role of the imam developed earlier by the radical Shī'ah. The Druze, however, maintain belief in the *ghaybah* of their founders, the Fatimid caliph al-Ḥākim and Hamzah. The two major branches of the Fatimid Ismā'īlīyah both revere a living line of successive imams: For the Nizārī Ismā'īlīyah he is the present Aga Khan, while the Mustā'li Ismā'īlīyah or Bohoras hold that the present imams are in earthly concealment and are represented by a continuing line of *dā'īs*, or agents acting as heads of the community.

For the Twelver Shī'ah, the need for a visible stand-in for the Hidden Imam, or Mahdi, has been assuaged by belief in his continuing efficacy and necessary suprahistorical role. Dream visions and transcendent appearances were occasions for the imam to momentarily break his concealment, while popular eschatology dwelt on the apocalyptic scenario of his triumphant return or the miraculous nature of his concealment. Shī'ī theosophical treatments expanded the cosmic role of the concealed imam and his presence in the spiritual realm of prophets and saints. Ṣūfī treatments of *ghaybah* have interiorized it by focusing on the complementary experience of *hadrah*, "presence" with the divine. Ṣūfīs revered the popular figures of prophetic longevity such as Khiḍr as well as the invisible yet active hierarchy of saints headed by the *qutb*, or spiritual axis.

BIBLIOGRAPHY

For descriptions of the early views on *ghaybah*, consult Israel Friedlaender's "The Heterodoxies of the Shiites in the Presentation of Ibn Hazm," *Journal of the American Oriental Society* 28 (1907): 1–80 and 29 (1908): 1–183. The Twelver doctrine of the concealment is well depicted by A. A. Sachedina in *Islamic Messianism* (Albany, N.Y., 1981), while the period of the minor *ghaybah* is treated in apologetic fashion by Jassim M. Hussain in *The Occultation of the Twelfth Imam* (London, 1982). Wilferd Madelung's articles, "Authority in the Twelver Shiism in the Absence of the Imam," in *La notion d'autorité au Moyen-Âge*, edited by George Mak-

disi et al. (Paris, 1982), pp. 163–174, and "Shiite Discussion on the Legality of the *kharāj*," in *Proceedings of the Ninth Congress of Arabic and Islamic Studies* (Leiden, 1981), pp. 193–202, deal with the claim of the Shī'ī scholars to deputyship of the Hidden Imam. The esoteric Shī'ī approach can be sampled in Henry Corbin's study, "Divine Epiphany and Spiritual Birth in Ismailian Gnosis," in *Man and Transformation*, vol. 5 of *Papers from the Eranos Yearbooks*, edited by Joseph Campbell (New York, 1964), pp. 69–160, first published in the *Eranos-Jahrbuch* 23 (1954): 141–249.

DOUGLAS S. CROW (1987)

GHAZĀLI, ABŪ ḤĀMID AL- (AH 450–505/1058–1111 CE), named Muḥammad ibn Muḥammad ibn Muḥammad, was the distinguished Islamic jurist, theologian, and mystic who was given the honorific title Ḥujjat al-Islām (Arab., "the proof of Islam").

LIFE. Al-Ghazālī was born in the town of Ṭūs, near modern Mashhad (eastern Iran), and received his early education there. When he was about fifteen he went to the region of Gorgān (at the southeast corner of the Caspian Sea) to continue his studies. On the return journey, so the story goes, his notebooks were taken from him by robbers, and when he pleaded for their return they taunted him that he claimed to know what was in fact only in his notebooks; as a result of this incident he spent three years memorizing the material.

At the age of nineteen he went to Nishapur (about fifty miles to the west) to study at the important Nizāmīyah college under 'Abd al-Malik al-Juwaynī (d. 1085), known as Imam al-Ḥaramayn, one of the leading religious scholars of the period. Jurisprudence would be central in his studies, as in all Islamic higher education, but he was also initiated into Ash'arī theology and perhaps encouraged to read the philosophy of al-Fārābī and Ibn Sīnā (Avicenna). He later helped with teaching and was recognized as a rising scholar. When al-Juwaynī died, the powerful vizier of the Seljuk sultans, Nizām al-Mulk, invited him to join his court, which was in fact a camp that moved about, giving al-Ghazālī the opportunity to engage in discussions with other scholars.

In 1091, when he was about thirty-three, he was appointed to the main professorship at the Nizāmīyah college in Baghdad, one of the leading positions in the Sunnī world; it can be assumed that the appointment was made by Nizām al-Mulk, the founder of the colleges bearing his name. After just over four years, however, al-Ghazālī abandoned his professorship and adopted the life of an ascetic and mystic.

Something of al-Ghazālī's personal history during these years in Baghdad may be gleaned from the autobiographical work he wrote when he was about fifty, entitled *Al-munqidh min al-dalāl* (The deliverer from error). This work is not conceived as an autobiography, however, but as a defense of his abandonment of the Baghdad professorship and of his subsequent return to teaching in Nishapur about a decade later. It is also not strictly chronological but was given a schematic

form. In it, he describes his intellectual journey after the earliest years as containing a period of skepticism lasting “almost two months,” when he doubted the possibility of attaining truth. Once he ceased to be completely skeptical, he set out on a search for truth among four “classes of seekers [of truth],” namely, the Ash‘arī theologians, the Neoplatonic philosophers, the Ismā‘īliyah (whom he calls the party of *ta‘līm*, or authoritative instruction), and finally the Ṣūfīs, or mystics. He writes as if these were four successive stages in his journey, but in fact they must have overlapped; it is virtually certain that he gained some knowledge of mysticism during his early studies at Ṭūs and Nishapur. The period of skepticism, too, could only have come after he had some acquaintance with philosophy, because philosophical considerations were involved.

The first encounter, according to this scheme, was with the *mutakallimūn*, or rational theologians. These were, of course, the Ash‘arīyah, by whom he had been trained and among whom he is reckoned. In the *Munqidh* he complains that their reasoning is based on certain presuppositions and assumptions that they never try to justify, but which he cannot accept without some justification. In effect what happened was that he found in philosophy a way of justifying some of the bases of Ash‘arī theology. This can be seen in his principal work of Ash‘arī theology, *Al-iatiṣād fī al-i‘tiqād* (The golden mean in belief), where he introduces many philosophical arguments, including one for the existence of God. Until the end of his life he seems to have held that Ash‘arī theology was true so far as it went, and in his chief mystical work, *Ihyā’ ‘ulūm al-dīn* (The revival of the religious sciences), he includes an Ash‘arī creed of moderate length; this is known as *Al-risālah al-qudsīyah* (The Jerusalem epistle) and was probably composed before his extensive study of philosophy.

The second encounter of his intellectual journey was with Greek philosophy and, in particular, the Arabic Neoplatonism of al-Fārābī and Ibn Sīnā. He had probably been introduced to philosophy by al-Juwaynī, but he began the intensive study of it early in his Baghdad professorship. Because philosophy, with other Greek sciences, was cultivated in institutions distinct from the colleges for Islamic jurisprudence and theology and was looked on with disapproval, al-Ghazālī had to study the books of the philosophers by himself. He describes how he devoted to this activity all the free time he had after lecturing to three hundred students and doing some writing. In less than two years he managed to gain such a thorough understanding of the various philosophical disciplines that his book, *Maqāṣid al-falāsifah* (The views of the philosophers), gives a clearer account of the teaching of Ibn Sīnā on logic, metaphysics, and physics than the works of the philosopher himself. After another year’s reflection on these matters, al-Ghazālī wrote a powerful critique of the metaphysics or theology of the philosophers entitled *Tabāfut al-falāsifah* (The inconsistency of the philosophers). His argument against the philosophers is

based on seventeen points on which he attacks their views as heretical and on three others on which he regards the philosophers as infidels. In discussing the seventeen points al-Ghazālī demonstrates the weaknesses of the philosophers’ arguments for the existence of God, his unicity, and his incorporeality, and he rejects their view that God is a simple existent without quiddity and without attributes, their conception of his knowledge, and some of their assertions about the heavens and the human soul. The three points contrary to Islam are that there is no resurrection of bodies but only of spirits, that God knows universals but not particulars, and that the world has existed from eternity. Underlying the detailed arguments is his conviction that the philosophers are unable to give strict logical proofs of their metaphysical views. He therefore turned away from them also in his search for truth.

His third encounter was with a section of the Ismā‘īliyah who held that true knowledge was to be gained from an infallible imam. It seems doubtful whether he seriously expected to gain much from such people. He did, however, study their views carefully, partly because the caliph of the day commanded him to write a refutation of them. He had little difficulty in showing that there were serious inadequacies in their teaching.

His final encounter was with Sufism; he had already realized that this mysticism entailed not only intellectual doctrines but also a way of life. After four years in Baghdad he felt himself so involved in the worldliness of his milieu that he was in danger of going to hell. The profound inner struggle he experienced led in 1095 to a psychosomatic illness. Dryness of the tongue prevented him from lecturing and even from eating, and the doctors could do nothing to alleviate the symptoms. After about six months he resolved to leave his professorship and adopt the life of a Ṣūfī. To avoid any attempts to stop him, he let it be known that he was setting out on the pilgrimage to Mecca. Actually he went only to Damascus, living there as a Ṣūfī for more than a year, and then made the pilgrimage to Mecca in 1096. Some six months after that he was back in Baghdad and then seems to have made his way by stages back to his native Ṭūs. There he established a *khānāqāh* (hostel or convent), where some young disciples joined him in leading a communal Ṣūfī life. The genuineness of his conversion to Ṣūfism has sometimes been questioned by Muslim scholars, and it has been suggested that he left his professorship because he was afraid his life was in danger on account of political involvements. To judge from his own account, however, religious considerations were uppermost in his mind.

The Muslim year 500 (which began on September 2, 1106 CE) marked the beginning of a new century. Muḥammad was reported to have said that God would send a “renewer” (*mujaddid*) of his religion at the beginning of each century, and various friends assured al-Ghazālī that he was the “renewer” for the sixth century. This induced him to take up an invitation from the vizier of the provincial gov-

error in Nishapur to become the main professor in the Nizāmīyah college there. He continued in this position for three or possibly four years and then returned to Ṭūs, probably because of ill health; he died there in 1111. His brother Aḥmad, himself a distinguished scholar, describes how on his last day, after ablutions. Abū Ḥāmid performed the dawn prayer and then, lying down on his bed facing Mecca, kissed his shroud, pressed it to his eyes with the words, "Obediently I enter into the presence of the King," and was dead before sunrise.

WORKS. More than four hundred titles of works ascribed to al-Ghazālī have been preserved, though some of these are different titles for the same work. At least seventy works are extant in manuscript; it is clear, however, that some of these, chiefly works of a mystical character, have been falsely attributed to al-Ghazālī, though in the case of one or two the inauthenticity is not universally admitted. Certain of these works are written from a standpoint close to that of the philosophers, and earlier scholars, regarding them as authentic, were led to suppose that before his death al-Ghazālī came to adopt the views he had previously attacked, or else that in addition to his publicly expressed views, he held esoteric views which he communicated only to a select few. Since about 1960, however, scholars have been aware of a manuscript written four years after his death, which bears a colophon stating that the short work it contains was completed by al-Ghazālī about a fortnight before he died. This work is *Iljām al-‘awāmm ‘an ‘ilm al-kalām* (The restraining of the common people from the science of theology), and in it he writes as a Shāfi‘ī jurist who, at least up to a point, accepts Ash‘arī theology. It is also known that just over two years earlier he had completed a long and important work on the principles of jurisprudence, *Al-mustasfā* (The choice part, or essentials); this was presumably one of the subjects on which he lectured at Nishapur. These facts make it inconceivable that at the end of his life al-Ghazālī adopted the heretical views he had previously denounced, and thus they strengthen the case for regarding as inauthentic works containing views that cannot be harmonized with what is expressed in books such as the *Munqidh* and the *Ihyā’*.

The genuine works of al-Ghazālī range over several fields. One of these is jurisprudence, which is dealt with in several early works, as well as in the much later *Mustasfā* mentioned above. These are the works most often referred to in connection with al-Ghazālī during the two centuries after his death. Most of these legal works were presumably written before he went to Baghdad. At Baghdad he turned to philosophy, producing the *Maqāṣid* and the *Tabāfut*, the exposition and critique of the Neoplatonic philosophers. About the same time, he wrote two small books on Aristotelian logic and a semi-philosophical work on ethics (which may, however, contain some interpolations). He also relates that it was in Baghdad that he composed for the caliph al-Mustazhir the refutation of Ismā‘īlī thought known after the patron as the *Mustazhirī*. His exposition and philosophi-

cal defense of Ash‘arī doctrine in the *Iqtisād* must have been written either shortly before or shortly after leaving Baghdad.

For some time after that, al-Ghazālī’s literary occupation seems to have been the composition of his greatest work, the *Ihyā’ ‘ulūm al-dīn*. It consists of four "quarters," each divided into "books" or chapters; a complete English translation would probably contain at least two million words. The first quarter, entitled "the service of God," has books dealing with the creed, ritual purity, formal prayer (*ṣalāt*), other types of prayer and devotion, almsgiving, fasting, and the pilgrimage. The second quarter deals with social customs as prescribed in the *sharī‘ah* and has books on eating habits, marriage, acquiring goods, traveling, and the like; it concludes with a book presenting Muḥammad as an exemplar in social matters. The third quarter is about "things destructive," or vices, and, after two general books on "the mysteries of the heart" and how to control and educate it, gives counsel with regard to the various vices. The fourth quarter on "things leading to salvation" deals with the stages and aspects of the mystical life, such as penitence, patience, gratitude, renunciation, trust in God, and love for him. In most of the books al-Ghazālī begins with relevant quotations from the Qur‘ān and the *ḥadīth* (anecdotes about Muḥammad, sometimes called traditions) and then proceeds to his own exposition. His overriding aim seems to be to show how the scrupulous observance of all the external acts prescribed by the *sharī‘ah* contributes to the inner mystical life.

Al-Ghazālī presents a simpler version of the way of life to which the *Ihyā’* points in *Bidāyat al-bidāyah* (The beginning of guidance). Other works of interest from his mystical period are an exposition of the ninety-nine names of God with the short title *Al-maṣṣad al-asnā* (The noblest aim) and a discussion of light symbolism centered on the "light verse" of the Qur‘ān (24:35) and entitled *Mishkāt al-anwār* (The niche for lights). There is also a Persian work, *Kīmiyā’ al-sa‘ādah* (The alchemy of happiness), covering the same ground as the *Ihyā’* but in about half the compass.

Among the works of doubtful authenticity is a refutation of Christianity with the title *Al-radd al-jamīl ‘alā ṣarīḥ al-injīl* (The beautiful refutation of the evidence of the gospel). Even if this is not by al-Ghazālī, it is of course an interesting document of roughly his period, and the same is true of the spurious mystical works.

THE ACHIEVEMENTS OF AL-GHAZĀLĪ: PHILOSOPHY, THEOLOGY, AND MYSTICISM. At the present time it is still difficult to reach a balanced judgment on the achievement of al-Ghazālī. After the first translation of the *Munqidh* into a European language (French) was published in 1842, many European scholars found al-Ghazālī such an attractive figure that they paid much more attention to him than to any other Muslim thinker, and this fashion has been followed by Muslim scholars as well. His importance has thus tended to be exaggerated because of relative Western ignorance of other writers. This ignorance is now rapidly decreasing, but care is still needed in making an assessment of al-Ghazālī.

Part of al-Ghazālī's aim in studying the various philosophical disciplines was to discover how far they were compatible with Islamic doctrine. He gave separate consideration to mathematics, logic, physics, metaphysics or theology (*ilāhīyāt*), politics, and ethics. Metaphysics he criticized very severely in his *Tabāfut*, but most of the others he regarded as neutral in themselves, though liable to give less scholarly persons an unduly favorable opinion of the competence of the philosophers in every field of thought. He himself was very impressed by Aristotelian logic, especially the syllogism. He not only made use of logic in his own defense of doctrine but also wrote several books about it, in which he managed to commend it to his fellow-theologians as well as to expound its principles. From his time on, many theological treatises devote much space to philosophical preliminaries, and works on logic are written by theologians. The great positive achievement of al-Ghazālī here was to provide Islamic theology with a philosophical foundation.

It is more difficult to know how far his critique of philosophy led to its disappearance. Arabic Neoplatonic philosophy ceased to be cultivated in the East, though there was an important Persian tradition of theosophical philosophy, but there had been no philosopher of weight in the East since the death of Ibn Sīnā twenty years before al-Ghazālī was born. In the Islamic West philosophy following the Greek tradition continued until about 1200 and included a refutation of al-Ghazālī's *Tabāfut* by Ibn Rushd (Averroës), so that the decline in the West cannot be attributed to al-Ghazālī.

Sufism had been flourishing in the Islamic world for more than two centuries. Many of the earliest Ṣūfīs had been chiefly interested in asceticism, but others had cultivated ecstatic experiences, and a few had become so "intoxicated" that they seemed to outsiders to claim unity with God. Such persons often also held that their mystical attainments freed them from duties such as ritual prayer. In al-Ghazālī's time, too, yet other Ṣūfīs were becoming interested in gnostic knowledge and developing theosophical doctrines. For these reasons many of the 'ulamā', or religious scholars, were suspicious of all Sufism, despite the fact that some of their number practiced it in a moderate fashion without becoming either heretical in doctrine or antinomian in practice. Al-Ghazālī adopted the position of this latter group and, after his retirement from the professorship in Baghdad, spent much of his time in ascetical and mystical practices. The *khānāqāh* that he established at Ṭūs was probably not unlike a monastery of contemplatives. His great work the *Ihyā'* provides both a theoretical justification of his position and a highly detailed elucidation of it which emphasized the deeper meaning of the external acts. In this way both by his writing and by his own life al-Ghazālī showed how a profound inner life can be combined with full observance of the shari'ah and sound theological doctrine. The consequence of the life and work of al-Ghazālī was that religious scholars in the main stream of Sunnism had to look more favorably on the Ṣūfī movement, and this made it possible for ordinary Muslims to adopt moderate Ṣūfī practices.

BIBLIOGRAPHY

Two older books still have much of value, though they make use of works probably falsely attributed to al-Ghazālī: A. J. Wensinck's *La pensée de Ghazzālī* (Paris, 1940) and Margaret Smith's *Al-Ghazālī the Mystic* (London, 1944); the latter includes a full account of his life. My *Muslim Intellectual: A Study of al-Ghazali* (Edinburgh, 1963) looks at his life and thought in its intellectual context. In *La politique de Ghazālī* (Paris, 1970), Henri Laoust gives some account of his life as well as of his political thought. Hava Lazarus-Yafeh's *Studies in al-Ghazzali* (Jerusalem, 1975) includes among other things discussions of authenticity on the basis of linguistic criteria. The fullest account of all works ascribed to him, with extensive consideration of questions of authenticity, is Maurice Bouyges's *Essai de chronologie des œuvres de al-Ghazālī*, edited by Michel Allard (Beirut 1956). The following are a few of the numerous translations available: my *The Faith and Practice of al-Ghazālī* (London, 1953) has translations of the *Munqidh* and *Bidāyat al-hidāyah*; Richard J. McCarthy's *Freedom and Fulfillment* (Boston, 1980) has translations of the *Munqidh* and "other relevant works" with introduction and notes; William H. T. Gairdner's *Al-Ghazzālī's Mishkāt al-anwār* (The Niche for Lights; 1924; reprint, Lahore, 1952) is a translation with introduction of a mystical text; Muḥammad A. Quasem's *The Jewels of the Qur'ān: al Ghazālī's Theory* (Bangi, Malaysia, 1977), a translation of *Jawāhir al-Qur'ān*, shows how the Qur'ān was understood and used by Ṣūfīs; Robert C. Stade's *Ninety-nine Names of God in Islam* (Ibadan, 1970) is the descriptive part of *Al-maṣṣad al-asnā*.

A general overview of the *Ihyā'* is given in G.-H. Bousquet's *Ghazālī, Iḥyā' 'Ouloum ed-dīn, ou vivification des sciences de la foi; analyse et index* (Paris, 1955). Translations of separate books include Nabih Amin Faris's *The Book of Knowledge* (book 1; Lahore, 1962); *The Foundations of the Articles of Faith* (book 2; Lahore, 1963); *The Mysteries of Purity* (book 3; Lahore, 1966); *The Mysteries of Almsgiving* (book 5; Lahore, 1974); *The Mysteries of Fasting* (book 6; Lahore, 1968); E. E. Calverley's *Worship in Islam* (book 4; 1925; reprint, Westport, Conn., 1981); Muḥammad A. Quasem's *The Recitation and Interpretation of the Qur'ān* (book 8; Selangor, Malaysia, 1979); D. B. Macdonald's "Emotional Religion in Islam as Affected by Music and Singing" (book 18), *Journal of the Royal Asiatic Society* (1901): 195–252, 705–748; and (1902): 1–28; Leon Zolondek's *Book XX of al-Ghazālī's Ihyā'* (Leiden, 1963); and William McKane's *Al-Ghazali's Book of Fear and Hope* (book 33; Leiden, 1965).

GHOST DANCE. The Ghost Dance was the major revivalist movement among nineteenth-century North American Indians. Dating from about 1870, it had its culmination in the 1890–1891 "messiah craze" of the Plains, which caused the last Indian war in the Dakotas. The name *Ghost*

Dance refers to the ritual round-dances that were thought to imitate the dances of the dead and were performed to precipitate the renewal of the world and the return of the dead. There were other American Indian ceremonial dances that were called ghost dances—for instance, a ritual dance among the Iroquois. However, it was the messianic Ghost Dance of 1890 that attracted general attention because of its message and consequences. It has been considered prototypical of other revivalist movements among North American Indians, so much so that most later movements have been classified as “ghost dances” (La Barre, 1970).

HISTORY. Strictly speaking, there have been two Ghost Dances, closely connected with each other and almost identical in form and cultic performance.

The 1870 Ghost Dance. The Ghost Dance movement of 1870 was introduced on the Walker Lake Reservation in Nevada by a Northern Paiute Indian, Wodziwob (“gray hair,” 1844–1918?). During a trance he was conveyed to the otherworld, where he learned that the dead were soon to return, that the disappearing game animals were to be restored, and that the old tribal life would come back again. In order to hasten this change, people had to perform round dances at night, without fires. This Ghost Dance lasted some few years among the Paiute, several middle and northern California tribes, and some Oregon Indians.

Wovoka and the Ghost Dance of 1890. One of Wodziwob’s inspired adherents was Täwibo (“white man”), who despite his name was a full-blooded Northern Paiute. He had a son, Wovoka (“the cutter,” 1856–1932). Wovoka lived in Mason Valley, Nevada, where he served as a farmhand to a white family named Wilson, and because of this association he went under the name of Jack Wilson. During an eclipse of the sun, probably in January 1889, he fell into a trance and was transported to the supreme being in the sky. In this vision the supreme being showed him the land of the dead and the happy life there, and promised that the living would have a reunion with the deceased, providing a series of rules were followed.

At this point the information divides. To the whites, Wovoka said that the reunion would take place in the otherworld if people behaved correctly (i.e., did not lie, steal, or fight) and performed the round dance. To the Indians, he announced the speedy coming of the dead (who would be guided by a cloudlike spirit that was interpreted as Jesus) as well as the return of game and a lasting peace with the whites. The round dance would more quickly bring about this change. The scene was to be on earth, not in the otherworld. It is obvious that, to the Indians, Wovoka presented the same message, in many ways, as Wodziwob.

The round dance was the same as well. It was conducted on four or five consecutive nights. Men and women danced together in a circle, interlacing their fingers and dancing round with shuffling side steps. The dance was exhausting, although not continuous, and no fainting spells or visions were reported.

This second Ghost Dance appeared when the Plains tribes had been subjugated and their old style of living was on the wane. The freedom-loving Plains Indians looked for an escape, and in their desperation they found it in the Ghost Dance. Emissaries were sent over to the “Messiah,” Wovoka (who in fact had claimed only to be a prophet, not a messiah), and were instructed in his doctrine. However, the Plains delegates misinterpreted the message to mean that the whites would be driven off or exterminated. The Ghost Dance spread like fire among the Plains Indians, and in particular the Arapaho, Cheyenne, Lakota, Kiowa, and Caddo became staunch believers. Dancing songs expressed the wishes of the arrival of the dead and praised the Father above.

The Lakota added several new traits that were in line with their visionary and militant ethos: they became entranced while dancing; they pondered military action against the whites; and they covered their upper bodies with white “ghost shirts,” decorated with spiritual emblems. The ghost shirt was supposed to protect the wearer magically against enemy bullets. It was probably patterned on Mormon garments worn by the Paiute for protection from bodily harm.

Although the Lakota plans for action were very vague, their frenetic dancing in the summer and fall of 1890 released countermeasures from the suspicious white authorities in the Dakotas, resulting in the so-called Ghost Dance Uprising. Highpoints of this development were the arrest and assassination of the famous Lakota leader Sitting Bull and the massacre at Wounded Knee at the end of December 1890, when Hotchkiss guns indiscriminately killed men, women, and children in Big Foot’s camp.

After these catastrophic events, enthusiasm for the Ghost Dance ebbed. Some groups continued dancing, but their expectations of the coming of the dead were projected to a distant future. The last Ghost Dances were held in the 1950s, among Canadian Dakota and Wind River Shoshoni.

THREE MAIN ROOTS. It is possible to find three main roots of the Ghost Dance: earlier religious movements stimulated by Christian missions, shamanic experiences, and indigenous rituals. Of these sources, the impact of earlier syncretic movements has been thoroughly analyzed, beginning with James Mooney’s famous study (1896). The import of native religious development has been properly studied only relatively recently. Scholars have, of course, been aware of changes in the Indian’s spiritual, cultural, and military background that may have triggered the outbreak of the Ghost Dance. There is no unanimity of opinion, however, as to whether readjustment to a new sociopolitical situation or predominantly religious drives steered the development. The overwhelming majority of scholars, all of them anthropologists, favor the first view, whereas historians of religions prefer the latter.

The impetus for the Ghost Dance revivalism was the Indians’ enforced contact with an expanding white civilization beginning in the 1860s. Because of growing white settle-

ments, the white military takeover, and the introduction of white jurisdiction, there was no more room for the continuation of the old native existence, in particular for the hunters and gatherers of the West. Their independent cultures ceased rapidly, sometimes even abruptly, as on the Plains: the whole culture of the northern Plains tribes, built on hunting buffalo, collapsed when in 1883 the last herd of buffalo was exterminated. The Indians had to adjust to white people's culture and, in part, to their values, in order to survive. At the same time the Indians drew on their past to mobilize a desperate spiritual resistance against the overwhelming white influence. In this reactive effort they combined Christian or Christian-derived elements with indigenous ideas and rituals to form a resistance ideology.

Earlier religious movements. The formation of mixed ("acculturated") ideologies is part of American Indian religious history since the beginning of European colonization: The restitutional ("nativistic") doctrines launched by the Tewa Indian Popé (1680–1692) and by Neolin, the so-called Delaware Prophet (around 1760), are among the better-known early instances. These prophets proposed an ethical and religious program. In many respects Neolin set the pattern for subsequent prophets, including those of the Ghost Dance: an inspired person who suffers from the ways of the white people enforced upon the Indian people, who long for a return to the good old Indian ways, and who experiences an ecstasy or similar state. In his vision the prophet is brought to the Master of Life, from whom is obtained instructions about a right life. Provided this road is followed, the prophet is told, the game will return, the whites will be driven away, and the old life will be restored. No wonder that such enchanting messages fostered Indian wars, like Pontiac's uprising, which was inspired by Neolin's prophecies.

While the messages of the prophets reflected a yearning for old value patterns, they were in fact deeply dependent on Christian missionary teachings. Exhortations to believers to refrain from liquor, adultery, lying, and murder and to show brotherly friendliness, even beyond tribal boundaries, reveal more or less Christian ethical precepts. Where the abandonment of traditional fetishes and rituals was propagated, as by the Shawnee prophet Tenskwatawa, Christian value judgments are easily recognizable. The very idea that the Supreme Being had to introduce the new religious program through revelation to a prophet also speaks of Christian influence. The hope for the day of salvation, or the coming liberation, implies a linear view of history and an eschatological goal, ideas that were never American Indian, but are thoroughly Christian.

Shamanic experiences. The second root of the Ghost Dance is shamanic experience. Although the instigators of the revivalist movements were prophets (i.e., ecstasies who had received their calling from God) and not shamans (i.e., vocational ecstasies acting on behalf of their fellowmen), the difference is a minor one, for shamans often receive their calling from spirits. There was definitely a Christian background

to the Indian conception of the prophet, his reception of an eschatological message after a comatose experience, and his direct contact with a more or less christianized God. However, the pattern of spiritual communication is very much shamanic. Wovoka, for instance, was himself a medicine man, and fell repeatedly into self-induced trances. It was during these séances that he visited the otherworld and received his messages. Of course, the destination of his soul was the heaven of God, not the spirit land of the dead; these were two different realms in most Native American beliefs.

The Ghost Dance had its precursors in movements that crystallized around shamans. Leslie Spier (1935) retraced the Ghost Dance ideology to an older "Prophet Dance" founded on the intense relations of the living with the dead on the Northwest Coast and the Plateau. The Prophet Dance ideology contained such elements as a world cataclysm, renewal of the world, and the return of the dead. World renewal and the return of the dead could be hastened by the performance of the "dance of the dead." The Prophet Dance had its basis, according to Spier, in the periodic cataclysms (earthquakes) to which the region is subject and in the shamanic visits to the dead.

Round-dance ritual. The third main root of the Ghost Dance is, as Michael Hittman (1973) has observed, the indigenous round dance. The latter has been interpreted by some scholars as simply a dance for entertainment, but there is much evidence that the Basin round dance, performed around a pole or cedar tree, was a religious ceremony—the Father Dance, offered with thanksgivings to the Master of Life for food, rain, and health. In the Ghost Dance this old ceremony was given a new, eschatological meaning.

BIBLIOGRAPHY

The classic in the field is still James Mooney's *The Ghost-Dance Religion and the Sioux Outbreak of 1890* (1896; reprint, Chicago, 1965). It is a reliable account of Mooney's field visits, just after the Lakota conflict, to a number of tribes that performed the Ghost Dance. Other general works, but less professional, are Paul Bailey's *Wovoka: The Indian Messiah* (Los Angeles, 1957) and David H. Miller's *Ghost Dance* (New York, 1959). In a wider setting of so-called crisis cults, the Ghost Dance religion has been discussed in, among other works, Weston La Barre's *The Ghost Dance* (Garden City, N.Y., 1970).

The discussion of the Ghost Dance has, in comparative works on prophetism, messianism, and millenarianism, concentrated on terminological, psychological, and acculturation problems, whereas the specialized works on the Ghost Dance have paid attention primarily to its origins. Pathbreaking has been Leslie Spier's *The Prophet Dance of the Northwest and Its Derivatives: The Source of the Ghost Dance* (Menasha, Wis., 1935). Spier's idea of an exclusively aboriginal origin of the Ghost Dance religion is today in doubt, but much of his work remains extremely useful.

The grounding of the 1890 Ghost Dance in Wodziwob's movement of the same name twenty years earlier has directed scholars' attention to the latter. The details of the 1870 movement have been excellently clarified in Cora Dubois's *The 1870 Ghost Dance* (Berkeley, Calif., 1939). A new orientation, which argues for the mutual independence of the 1870 and 1890 movements, is represented in Michael Hittman's "The 1870 Ghost Dance at the Walker River Reservation: A Reconstruction," *Ethnohistory* 20 (1973): 247–278.

The connection of the Ghost Dance with the Father Dance has been worked out in my book, *Belief and Worship in Native North America*, edited by Christopher Vessey (Syracuse, N.Y., 1981); see especially "The Changing Meaning of the Ghost Dance as Evidenced by the Wind River Shoshoni," pp. 264–281.

ÅKE HULTKRANTZ (1987)

GHOSTS. In western Germanic languages words similar to the modern English *ghost* and the German *Geist* seem to be derived from roots indicating fury, wounding, or tearing in pieces. The spelling with *gh* in English appeared first in a work printed by William Caxton in the fifteenth century, influenced probably by a similar Flemish form. The term *ghost* has been used in various ways, to mean soul, spirit, breath, the immaterial part of man, moral nature, a good spirit, an evil spirit, and, in liturgical and dogmatic language, to designate the spirit of God as the "Holy Ghost." It has chiefly signified the soul of a deceased person appearing in a visible form, and hence has given rise to such phrases as *a ghost walking*, *raising a ghost*, or *laying a ghost*. It may be called "an apparition" or "a specter." In any case, the prevailing modern sense is that of a dead person manifesting its presence visibly to the living.

Other words are used to describe comparable phenomena, but with some differences. A fetch is, like the German *Doppelgänger*, the apparition of a living person. A wraith is an apparition or specter of a dead person or an immaterial appearance of someone living forewarning his own death. The Irish often speak of fetches, and the Scottish of wraiths. More generally, a phantom, from the Greek *phantasma*, is sometimes unreal or immaterial, an illusion or dream-image, a specter or ghost. A phantasm may be the same thing, but Edmund Gurney and others in *Phantasms of the Living* (1886) discussed as phantasms "all classes of cases where . . . the mind of one human being has affected the mind of another . . . by other means than through the recognized channels of sense" (vol. 1, p. 35). A poltergeist, from the German *poltern* ("to make noise") and *Geist* ("spirit") is regarded as a noisy spirit remarkable for throwing things about. Since the nineteenth century the French word *revenant* (lit., "one who comes back"), has been used in English to describe a being who returns from the dead.

The word *ghost* most commonly refers to a dead person who haunts or simply appears before the living, sometimes with a message or warning. The notion has been popular in

literature. While Shakespeare wrote one play involving fairies and another involving witches, ghosts were an important feature in several of his works: Hamlet's father, Caesar, and Banquo all appear as ghosts. Hamlet's father—called a ghost, a spirit, an apparition, an illusion, and more than fantasy—expresses a belief in the activities of ghosts: "I am thy father's spirit; / Doom'd for a certain term to walk the night, / And for the day confin'd to fast in fires, / Till the foul crimes done in my days of nature / Are burnt and purg'd away" (1.5.9–13).

THE BIBLE AND THE QUR'ĀN. The Hebrew scriptures have few references to ghosts. Isaiah attacked the practice of consulting "the mediums and the wizards who chirp and mutter" (*Is.* 8:19). This refers to the spiritualistic séance, forbidden but vividly illustrated in the story of the medium of Endor, consulted by Saul. She was said to raise up the dead prophet Samuel out of the earth, saying "An old man comes up, and he is covered with a robe" (*1 Sm.* 28:14). Samuel was not a haunting ghost, although he brought a fatal warning for Saul.

In *Psalms* 88:12 the grave is called the land of forgetfulness, and later Judas Maccabaeus makes sacrifices to free the dead from their sins (*2 Mc.* 12:45). In the apocryphal *Wisdom of Solomon* (17:15) lawless men are said to be troubled in their sleep by specters, apparitions, and phantoms. Otherwise ghosts are not mentioned except in the older translations where death is described as surrendering the spirit, "giving up the ghost."

In the New Testament there are also few references. When the disciples saw Jesus by night, on or by the sea, they were afraid, thinking him an apparition or ghost (*phantasma*; *Mark* 6:49; this is the only occurrence of this word in the New Testament). In one of Luke's accounts of the resurrection the disciples were terrified, supposing that they had seen a spirit (*pneuma*), but Jesus assured them that this could not be so, for he had flesh and bones that a spirit had not (*Lk.* 24:37–39). Lazarus might be called a revenant, but he was not, strictly speaking, a ghost, since he came out of the grave alive (*Jn.* 11:44). Later Christian insistence upon the "resurrection of the flesh" (*sarx*), as in the Apostles' Creed, also precluded "ghostly" survival and postulated instead a restoration of the full personality.

In developing Christian doctrine theologians discussed the nature of angels, good spirits, bad spirits, the resurrection of the dead, heaven, hell, and purgatory. But belief in ghosts and their possible return to earth was left indeterminate, neither accepted nor rejected. All Souls' Day, the commemoration of the faithful departed, has been universally celebrated in the Western church since the tenth century, and prayers at Mass request "to the souls of all thy servants a place of cool repose, the blessedness of quiet, the brightness of light . . . forgiveness and everlasting rest."

In practice many Christians have believed in ghosts and in haunted places, and this is said to have been particularly

true among Germanic peoples. The survivors owed numerous duties to the departed, and unless honor and rituals were accorded, it was thought that the dead might return to take vengeance or reclaim their former property. Those who had died untimely or unnatural deaths, such as women in childbirth, might become wandering spirits. To this day stories are related in Europe about old monasteries or rectories where restless spirits are said to appear. Rituals of exorcism have been practiced, with restrictions, both to cast out evil spirits and to lay wandering ghosts to rest.

In the Islamic world the soul or self (Arab., *nafs*; cf. Heb. *nefesh*) was at first distinguished from the breath or wind (Arab., *rūh*; cf. Heb. *ruah*), but the words came to be used interchangeably and are applied to the human spirit, angels, and genii (*jinn*). Theologians teach that at death the soul goes to a first judgment and then remains in the grave until the final resurrection. Edward A. Westermarck stated in *Ritual and Belief in Morocco* (1926, vol. 2, p. 246) that while it was believed that dead saints might appear to the living and the dead might come to see their friends but remain invisible, "as to ordinary dead people I have been assured over and over again that the dead do not walk, and I remember how heartily my friends . . . laughed when I told them that many Christians believe in ghosts." However, the Moroccans believed that the dead would be angry if they were offended by anyone and would punish him, and if children did not visit the graves of their parents they would be cursed by them. The voices of some of the dead were thought to be audible in cemeteries, though only good people, children, and animals could hear them. If a person had been killed, the spot would be regarded as haunted, and passersby might hear him groan.

Among Berber-speaking tribes there were said to be more traces of the belief in apparitions of the dead than among Arabic-speaking Moroccans. Some of the Tuareg of the Sahara claimed that ghosts had been seen at night near cemeteries. In Egypt many stories have been told of apparitions of dead people, and Arabian bedouin believe that spirits of the wicked haunt the places of their burial and that the living should avoid passing cemeteries in the dark.

The jinn may be thought to haunt burial grounds and many other places, but they are fiery spirits and not dead people. Ghouls (Arab., *ghūl*) are monsters thought to haunt cemeteries and feed on dead bodies. An 'ifrit is mentioned in the Qur'ān (27:39) as "one of the jinn," and in the *Thousand and One Nights*, in the story of the second shaykh, it is said that a benevolent Muslim woman "turned into an 'ifritah, a jinniyah." She changed her shape, saved her husband from drowning by carrying him on her shoulders, and told him that she had delivered him from death by the grace of God, since she believed in him and in his Prophet. In Egypt the word 'ifrit came to mean the ghost of a man who had been murdered or suffered a violent death.

AFRICA. In many parts of Africa ghosts are thought to appear to give warning or seek vengeance. Among the Ashanti of

Ghana, a man who has committed suicide is called a wandering spirit, unable to find rest and refused entry into the land of spirits, roaming between this world and the next until his appointed time of death. If such a suicide is reborn, he will come back as a cruel man who might again suffer a bad end. At one time criminals who were executed had powerful charms tied on them to prevent their ghosts returning to harm the executioners. Some of the dead had their heads shaved and painted red, white, and black so that they would be recognized if they walked as ghosts.

The Ga of the Ghana coastline think that the spirit of one who dies violently or prematurely wanders about for forty days as a ghost, angry at his early death and jealous of other people's pleasures. Those who go out late at night pursuing such pleasures may be pursued in turn by ghosts until they die of heart failure. Ghosts are said to be recognizable by their fiery breath and red mouths: red is the color of witches, fairies, and ghosts, but ghosts dislike white and may be kept away if one throws white cloths on the ground.

A common belief in the Ivory Coast is that the dead may return to their homes at night to steal children from their mothers' arms. Here and elsewhere widows must keep in mourning for months or years, often in rags, lest their dead husbands return and have sexual intercourse with them, which would have fatal results. Fishermen drowned at sea, hunters lost in the forest, people struck by lightning or burnt in fires, and others who die of diseases like smallpox or leprosy may not receive burial rites and so become ghosts, living in the "bad bush." Months after the death or disappearance, the family performs mourning ceremonies and lays the ghost to rest.

When infant mortality is high, a succession of dying children may be thought to be incarnations of the same child over and over again. The Yoruba of Nigeria call such babies "born to die" (*abiku*), and if one comes a third time and dies it is said that "there is no hoe" to bury it with. Marks are made on the body of the stillborn or dying baby to prevent the ghost from returning or to make the ghost recognizable.

In central Africa the Ila of Zambia think that some spirits are captured by witches and become their ghost-slaves, causing disease and sometimes possessing people. Like poltergeists, such ghosts reputedly attack people, knock burdens off their heads, or break axes and hoes. Ghosts are often thought to speak in unnatural ways, in guttural voices or twittering like birds, and some are said to be very small, with bodies reversed so that their faces are at the back of their heads. They appear in dreams, show anger at neglect, demand sacrifice, or cause sickness. Although stories are told that seem to imply that ghosts have objective or even physical existence, they are regarded as spiritual entities who only take the essence or heart of sacrifices.

In the region of Zaire the word *zumbi* is used for spirits of the dead and ghosts, and in Haiti it becomes *zombie*, a *revenant*, or one of the "living dead," whose soul has been

eaten by a witch or whose corpse has been revived by a sorcerer for evil purposes.

SOUTH AND EAST ASIA. In popular Indian belief various words may be used for ghosts. The term *bhūta*, something that has been or has become, refers to the ghost of a dead person, one who has died a violent death or has not had a proper funeral ceremony, or it may apply generally to a good or evil spirit. In the *Bhagavadgītā* (9.25) the *bhūta* is a ghost or goblin, an inferior but not necessarily an evil being. A *preta* (“departed”) is the spirit of a dead person before the obsequies are performed or an evil ghost; it also may be the spirit of a deformed person or of a child that died prematurely. A *yakṣa* is generally a benevolent spirit although sometimes classed with *piśācas* and other malignant spirits and ghosts; such terms are used loosely and often overlap.

Ghosts and demons in India are believed to haunt cemeteries or live in trees, appearing in ugly or beautiful forms and requiring food and blood. The special guardian against ghosts is the monkey god Hanuman, the “large-jawed”; his worshipers offer coconuts to him and pour oil and red lead over his images, taking some of the oil that drips off to mark their eyes as a protection. The lighting of lamps at the Dīvālī or Dīpavālī festival at the new year is also said to drive away ghosts and evil spirits.

Performance of Śraddha funeral ceremonies is essential in India for the rest of the departed spirit, in order to provide food for it and to prevent it from becoming an evil spirit. Special Śraddha is performed for those who died violently, as they would be likely to become haunting ghosts. Infants who die do not receive ordinary Śraddha, but presents are given to brahmans on their behalf.

Buddhist dialogues discuss various states after death. In the *Milindapañha* (294) there are said to be four classes of ancestors (*peta*), only one of which lives on offerings from benefactors; the others feed on vomit, are tormented by hunger and thirst, or are consumed by craving. Any of these may be ghosts. In Sinhala another word (*holman*) indicates similar dangerous beings. These appear at night as naked white figures, especially in cemeteries, and sunset, midnight, and dawn are the most dangerous times for their activities. One of them, Mahasōnā, perhaps meaning “great cemetery,” puts his hand on the backs of wanderers in graveyards at midnight, marks them with his imprint, and kills them with shock. *Peta* may be offered inferior food, as well as drugs or excrement, and if they act as troublesome poltergeists they are exorcized. Another term for ghostly creatures, *bhūtayā* (“has been”) may be substituted for *peta* and other words for demons and harmful spirits.

Burmese Buddhists believe that although all beings pass on to rebirth, most go first to one of four “states of woe” as an animal, demon, ghost, or inhabitant of hell. Rebirth as a human being is an exception, one of “five rarities.” Monks may be reborn as ghosts. One account of five heads of a monastery who died in quick succession attributed the premature

deaths to the ghost of the original incumbent, who had owned the monastery personally and died before appointing a successor. Those who followed were usurpers, and as a ghost he caused their deaths. As a consequence the villagers decided to abandon that monastery and build a new one for the next abbot.

In Thailand the Indian word *preta* is used for the ghosts of the recently dead, who may have been condemned to hell or to wander the earth. Although not harmful to humans they may be disgusting and gigantic in appearance. Because of their tiny mouths they suffer from constant hunger and thirst. Relatives may transfer merit to the *pretas* by extra gifts to monks; some writers consider *pretas* to be the inversion of the Buddhist monk. Mural paintings in Buddhist temples of South Asia often depict both the joys of paradise and the sufferings of unhappy spirits.

In China a ghost (*kuei*; f., *yao*) was the spirit of someone who had died an unusual death, often as the result of crime. Ghosts of bandits were thought to linger near the place of their execution, and if a woman had a difficult labor it was attributed to her having passed near such a place during pregnancy and having offended one of the bandit ghosts. The ghost might try to oust the rightful soul during labor and be born as the woman’s son.

Under Buddhist influence souls were thought to live in zones of formlessness until the time of rebirth. They were fed by surviving relatives, and if nobody cared for them they would haunt people. In the seventh month after death there was a great festival for “hungry souls,” when the priests would recite texts not only for relatives but for the souls of strangers and those without anyone to care for them. Meals, models of houses, and paper money were dedicated to the dead and burned as offerings. Especially in southern China, paper boats, often with a host of deities aboard or with lanterns in the shape of lotus flowers, were set drifting down rivers to light the way for spirits and ghosts to cross the river of transmigration. If sickness or calamity afflicted the community, however, it was attributed to inadequate propitiation of ghosts.

In Japanese belief one category of the ancestral dead is that of wandering angry ghosts. Neglected ancestors may quickly change from benevolent beings to vicious, cursing tyrants, attacking their families in painful ways until proper food and potent texts are offered to them. There are also spirits with no particular affinity (*muenbotoke*), those who die childless or without kin to worship them, and they may attack any stranger whose weakness lays him open to spiritual possession.

The most dangerous ghosts are those of people who die violently, are murdered, or die in disgrace. They become angry spirits (*onryō*) requiring rituals for appeasement. In the literature of the eighth to the tenth century there are striking examples of these furious ghosts, such as the story of Prince Sawara. After horrifying starvation, exile, and death by poi-

son, he was said to have brought a whole series of calamities on the country. And a minister who died in 903 in disgrace and exile was credited with a succession of natural disasters thanks to his furious ghost. In early times discontented ghosts were depicted in animal or natural form, but in later *nō* plays they appear as ordinary men and women who are finally revealed as ghosts in horned masks and long red wigs.

Notions of ghosts and spirits as restless, perhaps unburied or unavenged, beings with a message to convey or a task to fulfill abound in popular belief in many countries, although there may be little formal doctrine or orthodox teaching in the scriptures to support these ideas.

BIBLIOGRAPHY

The larger dictionaries provide examples of the ways in which *ghost* and similar words have been used, especially the complete or the "compact" edition of the *Oxford English Dictionary*, 2 vols. (Oxford, 1971). Biblical and ecclesiastical dictionaries rarely discuss ghosts, but the *Shorter Encyclopaedia of Islam* (1953; reprint, Leiden, 1974) has a useful article on the soul (*nafs*). Edward A. Westermarck's *Ritual and Belief in Morocco*, 2 vols. (1926; reprint, New Hyde Park, N. Y., 1968), is a treasury of popular beliefs. African beliefs have been collected in my *West African Psychology* (London, 1951). For Indian rituals Margaret S. Stevenson's *The Rites of the Twice-Born* (1920; reprint, New Delhi, 1971) is still valuable. There have been more recent studies of Buddhist countries: Richard F. Gombrich's *Precept and Practice* (Oxford, 1971) on Sri Lanka; Melford E. Spiro's *Buddhism and Society*, 2d ed. (Berkeley, Calif., 1982) on Burma; Stanley J. Tambiah's *Buddhism and the Spirit Cults in North-East Thailand* (Cambridge, 1970) on Thailand; and Carmen Blacker's *The Catalpa Bow* (London, 1975) on Japan.

GEOFFREY PARRINDER (1987)

GHOST THEORY SEE MANISM

GIBBONS, JAMES (1834–1921), American Roman Catholic churchman, archbishop of Baltimore, cardinal. The fourth child and eldest son of immigrant parents, James Gibbons was born in Baltimore on July 23, 1834. After a sixteen-year (1837–1853) sojourn in Ballinrobe, County Mayo, Ireland, where he received his early education, Gibbons returned to the United States and settled in New Orleans. Acting on a long-held desire to seek ordination, he studied for the priesthood at Saint Charles College in Ellicott City, Maryland, and at Saint Mary's Seminary in Baltimore. He was ordained a priest for the archdiocese of Baltimore in 1861.

Gibbons's career in the parish ministry ended in 1865 when Archbishop Martin Spalding made him his secretary. Thereafter, Gibbons experienced a swift rise through the

ranks of the hierarchy. In 1868 he was named the first vicar apostolic of North Carolina and elevated to the rank of bishop; in 1872 he became the bishop of Richmond, Virginia; in May 1877 he was named coadjutor archbishop of Baltimore with right of succession; and in October 1877 he became the archbishop of Baltimore upon the death of James R. Bayley.

In assuming leadership of the archdiocese of Baltimore, Gibbons found himself in a position of great importance and high visibility in the American Catholic church. As the oldest diocese in the United States and the see within whose boundaries the national capital fell, Baltimore and its bishops enjoyed a degree of ecclesiastical and political prestige that other dioceses and bishops did not possess. These factors, together with Gibbons's longevity, his elevation to the cardinalate (1886), his accessibility to public officials and his personal friendship with every president from Cleveland to Harding, his tactful and conciliatory mode of governing, his irenic attitude toward non-Catholics, and the phenomenal success of his catechetical *Faith of Our Fathers* (1876), combined to make him the outstanding American Catholic churchman of his time.

Although he is justly famous for his contributions to such intramural Catholic projects as the founding of the Catholic University of America (1889) and the establishment of the National Catholic War/Welfare Council (1917), Gibbons's place in American Catholic history is really the result of the use he made of the prestige of his office and his personal talents in addressing four major problems that confronted the American church between 1877 and 1921: immigration, industrialization, nativism (the xenophobic reaction of Americans to immigrants), and Vatican apprehensions concerning American religious pluralism. Gibbons clearly saw that these four problems were interrelated, for all were concerned with the underlying problem of effecting some rapprochement between the Catholicism he loved and the American political and cultural life he revered. With his fellow americanizing bishops, John Ireland and John Keane, he sought both to assuage the fears of nervous nativists and to insure the internal unity of the church by advocating a pragmatic policy of assimilation that urged immigrant Catholics to adopt the language and mores of the host culture. His program did not endear him to German-American Catholics, but, combined with his conspicuous patriotism during the Spanish-American War and World War I, and his writings in praise of the American political system, it did much to enhance both his and his church's reputation as bulwarks of patriotism.

The same desires to demonstrate the social utility of the church to the nation, to insure the internal health of the church, and to protect the church from detractors animated Gibbons's defense of the Knights of Labor before the Roman Curia. His advocacy of the Knights as well as his work to reconcile New York's socially minded Father Edward McGlynn to the church earned him the reputation of a labor advocate

comparable to Pope Leo XIII (1878–1903) and Cardinal Manning of Westminster in the universal church, and of a force for social peace at home.

While Gibbons enjoyed some measure of success in his attempts to demonstrate the compatibility of Catholicism and American life to non-Catholic Americans, the signal failure of his career was his inability to demonstrate the same either to conservative members of the American hierarchy or to Roman authorities who saw only a dangerous and corrosive indifferentism in the americanizers' praise of and accommodation to American mores. Leo XIII's condemnation of Americanism in 1899 (*Testem benevolentiae*) came as a stunning blow to Gibbons and his colleagues at the same time that it heartened the conservative followers of Archbishop Michael A. Corrigan of New York. In time, however, Gibbons's reputation in Rome was rehabilitated, and when he died in 1921 he was acknowledged by both his co-religionists and his fellow citizens to have been the dominant force in the American Catholic church.

JOSEPH M. MC SHANE (1987)

GIFT GIVING. The exchange of gifts is one of the most telling characteristics of human culture and, according to some authorities, may form the original basis of economics. From a religious perspective, gift giving has two primary aspects with many variations. First, gift giving is incorporated in a variety of ways within the religious customs and sanctions that regulate social behavior. Second, in the sense of offering, gift giving is an essential aspect of sacrifices ritually presented to a deity or deities. In both aspects the process of gift giving may involve distribution of the gift within the selected social group to which it is appropriate; it may also

entail the destruction of all or part of the thing given, to signify its disappearance into the metaphysical realm.

THE POTLATCH AS A MODEL FOR GIFT GIVING. With regard to the social aspect of gift giving, Marcel Mauss's *Essai sur le don* (1925), translated as *The Gift* (1954), shows gift giving to be the very means by which value can be taught and understood in a society, provoking humans to productivity but at the same time inspiring a sense of an intangible presence in the things distributed. Mauss seems to regard the potlatch—an elaborate celebration entailing the lavish display and distribution of the host's possessions—as the most significant form of gift giving, possessing both religious significance and profound consequences for the development of economic systems. The gifts associated with the potlatch, as practiced by the Kwakiutl Indians, include both tangible, useful materials (such as blankets, boats, and food), and an entirely symbolic article—the most valuable *prestation* of all (Mauss's term, signifying the repayment of an obligation)—namely, a hatchet-shaped copper plaque.

The potlatch originated along the rich coast of northwestern North America. Many tribes in these regions adopted the potlatch, but the system appears in its most elaborate and well-recorded form among the Kwakiutl. It has been greatly modified as native peoples have become increasingly assimilated into the dominant white culture. Historically, the Kwakiutl were among the most thoroughly stratified tribes imaginable; they were fundamentally divided into two large groups, the *naqsala*, or nobility, and the *xamala*, or commoners. Every person, noble or common, belonged to further-interrelated subgroups within the overall structure of tribes and to *numina*, or subdivisions, within the particular tribe. The nobles, and even the commoners, were identified within all the interlocking groups by discrete honorific titles and by a system of seating according to rank. In the formalized feasting that was the ritual setting for the act of prestation, this seating system had much to do with the way in which goods were distributed.

In one respect, the potlatch system might be thought of as a means of increasing one's capital through interest on loans. One's status in the community was linked to the munificence with which one disposed of one's capital in the feasts. The capital consisted of what was regarded as valuable during a particular period: blankets, fish oil, food, shells, and slaves were such goods in premodern times. To cite an example, the list of gifts given in a potlatch in 1921 included the following items: Hudson Bay blankets, canoes, pool tables, bracelets, gaslights, violins, gasoline-powered boats, guitars, dresses, shawls, sweaters, shirts, oaken trunks, sewing machines, basins, glasses, washtubs, teapots, cups, bedsteads, bureaus, and sacks of flour and sugar (Rohner, 1970, p. 97). All of the items on this list were given to differentially ranked individuals. The pool tables, regarded as equivalent to the copper plaque (or "copper"), went to men of very high status. Glasses, washtubs, teapots, and cups went to women of various ranks. Thus, the distributor invested capital that gave

him high status in the community and that was loaned, in a sense, in the expectation that all the items would be returned with interest at a future potlatch. Indeed, the interest was very precisely calculated; in the case of blankets, the return due at the end of one year was double the number of blankets given. The return of these loans (which were not solicited but had to be accepted, according to the system) was the occasion for the giving of new loans, much as it was the occasion for the potlatch feast. The purpose of the potlatch among the Kwakiutl was not to accumulate goods but to show one's ranked status in the community by the level of munificence one displayed. Some writers have compared the gift giving at the potlatch to a kind of warfare or war game in which the bestowal of extravagant gifts could inflict serious "wounds" on other participants.

Although it has not been commented on by leading writers, an analysis of the potlatch system reveals more than a few traits in common with the Hindu caste system, which likewise assigns rank during feasting in communal settings, and which includes a large element of redistribution of economic resources. Indeed, those who ranked highest on the curve of potlatch status owned not only goods in quantity but sacred names that could be distributed only during the communal feast; moreover, the highest-ranking regarded themselves as an exclusive group and had only limited contact with those lower in the system. Similar elements can be found in the caste system, wherein the caste name, sometimes irrelevant to the actual work performed, is understood to define an inescapable social status—indeed, the bestowal of magical and sacred names is an almost universal phenomenon throughout the Hindu religious system. Of course, this does not mean that the potlatch gift-giving system is the same as the caste system. But if Mauss's original insight is true, then the socially sanctioned distribution of gifts and other tokens of relationship, fraught with historical and structural significance as these things are, may be an irreducible element in human culture. The potlatch and caste systems are perhaps instances of a general principle. The universal relevance of these systems is clear, even in the apparent particularity of this description:

The potlatch is more than a legal phenomenon; it is one of those phenomena we propose to call "total." It is religious, mythological and shamanistic because the chiefs taking part are incarnations of gods and ancestors, whose names they bear, whose dances they dance and whose spirits possess them. It is economic; and one has to assess the value, importance, causes and effects of transactions which are enormous even when reckoned by European standards. The potlatch is also a phenomenon of social morphology; the reunion of tribes, clans, families and nations produces great excitement. People fraternize but at the same time remain strangers; community of interest and opposition are revealed constantly in a great whirl of business. Finally, from the jurist point of view, we have already noted the contractual forms and what we might call the human element of the contract, and the legal status of the contracting par-

ties—as clans or families or with reference to rank or marital condition; and to this we now add that the material objects of the contracts have a virtue of their own which causes them to be given and compels the making of counter-gifts. (Mauss, 1967, pp. 36–37)

Caste relations in traditionalist Hindu society are problematic even today because of the threat of "pollution through contact." Mauss's idea is that such "pollution" is a sort of inversion of gift giving, for no matter what the degree of contact, there is some sort of giving involved, even if limited to the exchange of services. Mauss asserted that things given were still perceived to have links with the persons giving them. This characteristic of gifts would seem to be inescapable even in modern perceptions of their ultimate value, whether or not they are overtly sanctified by religion (as, for example, the blessed rings exchanged in a Christian wedding ceremony). After all, the caste system would have no power if it were not understood that everyone in the society exists of necessity in an intrinsic relation with everyone else. What is the basis of that relationship if not the exchange of goods and services, even if this must lead, at times, to measures to avoid the perceived consequences of pollution through contact?

MAUSS REVISIONISTS. Although the interesting interpretation of the potlatch by Mauss will certainly remain a point of reference for understanding gift giving, other authors have investigated the phenomenon from different theoretical perspectives and on the basis of other field research. Annette B. Weiner, in *Inalienable Possessions: The Paradox of Keeping-While-Giving* (1992), is concerned that in the Trobriand Islands, New Zealand, Samoa, and Hawai'i (Oceania) the special role of women in the creation of value through their reproductive and cultural productivity has been slighted in the history of the interpretation of gift giving, not just in the work of Mauss, but also in later works by Bronislaw Malinowski, Émile Durkheim, Claude Lévi-Strauss, and others. She bases her analysis upon a factor that is present in the exchange of gifts in these societies and that can also be found in the Kwakiutl potlatch system. As the title of her work suggests, the issue is that gift giving, or other connected bestowals, such as the granting of titles and sacred names, involves a heroic effort to maintain in one's own possession the most prestigious potential gifts while giving away quantities of other gifts that enhance or maintain the giver's prestige. Such a mandate is based upon a cosmological imperative from the imaginary other world. Status, as among the Kwakiutl, is of paramount importance in the social systems of Oceania and is not linked solely or even primarily to the roles of men in the hierarchy.

Weiner makes her most telling distinctions in describing the differences between *alienable* and *inalienable* possessions. It is the former that the society manufactures in sufficient quantities, often primarily through the production by women of fine woven mats, leaf skirts, and other commodities, to meet the requirements of gift giving in the particular social context. On the other hand, women also produce espe-

cially desirable mats and other types of “cloth” that are imbued with *mana* (a kind of sacrality). These items are linked to the reproductive power of female sexuality and cultural productivity, and they are inalienable. Other objects, such as shell arm bracelets (*mwali*) and necklaces (*soulava*), are also in this category. The ceremonial exchange of such goods is called *kula*. Somewhat like the system of the Kwakiutl, and found almost universally in the human world, gift giving is mandatory under certain ritual conditions, including, for example, when selecting a marriage partner (engagement), at weddings, at births, on recognized festivals, at the accession to high status of individuals in the society, at burials, and the like. For Weiner, what other anthropologists have failed to recognize is the essential role that women play in these systems, not only as cultural producers, but also as the recipients of the status connected with particular, inalienable possessions. Throughout Oceania there are numerous examples of women of high status—even chiefs, or, in Hawai’i, queens—who possess by right the inalienable items that it is their duty to maintain for the prestige of family and lineage. The greatest anxiety, underlying the alienable-inalienable dialectic, is that, however entrenched the inalienable potential gift may seem to be in one’s own possession, occasions may arise when—because of defeat in warfare or as compensation for crimes such as murder, or due to other nearly catastrophic events—the gift must be surrendered to someone else. The requirements of gift giving under the social mandate of the group may demand such surrender when, through failure to produce substitutes in sufficient quantity, the inalienable possession itself must be surrendered to meet the social requirement.

According to Weiner, one of the ways that these societies maintain the integrity of particular lineages and their most valued possessions (titles and commodities) is through their extreme emphasis upon the brother-sister relationship. It is this factor that contributes substantially to the high status of women in these societies. The sister, even after her marriage, is in constant communication and relationship with her brother, even though he is married to another woman. Their relationship is often sanctified by a myth of a primordial incestuous sibling marriage that was the foundation of their lineage. The intensity of the link, which seems in part to be created to avoid the possible loss of familial, inalienable possessions, is carried to such lengths in the Trobriand Islands that the mother’s brother, rather than the natural father, has “jural authority” over his sister’s children (Weiner, 1992, p. 71). In Hawai’i the highest ranking families were actually the result of sibling marriages (p. 82), and, thus, brother-sister incest was not taboo—although it was taboo, in spite of the emphasis upon the brother-sister relationship, in most other areas of Oceania.

Maurice Godelier, in *The Enigma of the Gift* (1999), undertakes an exhaustive review, particularly of Mauss, with whom he agrees in many respects, and of Lévi-Strauss, with whom he agrees less, but also of Malinowski, Durkheim, and

Weiner. Even though originally trained as a philosopher, Godelier claims the prerogative to comment on their work because he became an anthropologist and did fieldwork among the Baruya, a tribe that lives in the Eastern Highlands of New Guinea. He wishes to change Weiner’s formula of “keeping-while-giving” to “keeping-for-giving,” which he believes is a clearer way of stating the situation. Godelier goes on to say, subjecting Lévi-Strauss to criticism in the process, that “although Annette Weiner does not make the distinction between the imaginary and the symbolic, I would point out in passing that it is highly likely that the valuables, treasures and talismans which are not given but are kept are those which concentrate the greatest imaginary power and, as a consequence, the greatest symbolic value” (p. 33). What he means in particular is that Lévi-Strauss is wrong when he insists that *mana* and similar terms for the sacred are merely empty signifiers to make up for a lack of adequate language to refer to the intangible. Rather, Godelier thinks the whole of gift giving is wrapped up in the imaginary background of the social construct, which in itself can be thought of as “the total gift.” In language that suggests the exquisite, even ineffable, way that gift giving plays this role—essentially of a religious nature, although Godelier does not believe that the human imaginary has any real links to a transcendent reality—he says something like the following in several places:

From the moment most social relations in a society exist as and through the creation of personal bonds, as relations between persons, and from the moment these bonds are established by means of exchanging gifts which themselves entail the transfer and shifting of “realities,” which can be of any kind (women, children, precious objects, services) as long as they lend themselves to being shared, all of the objective social relations which form the basis of a society (the kinship system, political system, and so forth), together with the intersubjective personal relations which embody them, can be expressed and “materialized” by the exchange of gifts and counter-gifts and by the movements, the trajectories followed by the “objects” of these gift-exchanges. (Godelier, 1999, p. 104)

Godelier makes a greater distinction than either Mauss or Weiner between *agonistic* and *non-agonistic* gift exchanges (1999, p. 48 et passim). The former, of which the potlatch is the exemplary type, implies the sometimes nearly warlike level of competition and is more absorbed in the transfer of the inalienable property, which may be an almost ineluctable goal that can lead to violence. The *non-agonistic* gift exchange, on the other hand, is much less fraught with tension.

The theoretical positions outlined above are drawn from field research among social groups whose imaginary construction of the gift-giving totality has been largely emptied of meaning in the economy of industrial nations and of its symbolic value in the modern Western way of life. Indeed, these studies give us great insight into the origins of the processes of exchange; but now, despite the preponderance of state-regulated or encouraged transfers to the most needy of

the means to live, there may be a hankering after some unrealizable past state of human history. Godelier says very trenchantly, “When idealized, the ‘uncalculating’ gift operates in the imaginary as the last refuge of a solidarity, of an openhandedness which is supposed to have characterized other eras in the evolution of humankind. Gift-giving becomes the bearer of a utopia (a utopia which can be projected into the past as well as into the future)” (1999, p. 208). The major religions of the world, with their immense literary and cultural heritages, must be understood to have evolved their own rich complexities in the realm of gift giving, and these can only be indicated briefly and selectively in what follows.

GIFTS FOR THE GODS. In light of the foregoing conceptual frameworks and their implied universal applicability to social systems, it may be said that the characteristics of ritual gift giving provide a central element in religious life. What transpires at the social level, in the continuing drama of human relations, is reflected in the structure of the relationship between the human and the divine, as conceived in a particular group or religion. Much of the ritual in world religions symbolically connects hierarchy with the distribution of gifts, an act that is so powerful in the social relationship itself. Through Weiner’s insight we might also theorize that most ritual behavior, religious charity, and religiously sanctioned social norms and behaviors participate in the alienable-inalienable tension of “keeping while giving” to the extent that these enhance status in the community and, also, imply an inalienable gift, such as a particularized salvation.

Hinduism. In the way that gifts were offered to the gods, Hinduism divides into two periods, characterized by the offerings presented in the so-called Vedic sacrifice and by the apparently endless variety of offerings of the later Hindu temple cult with its corollaries in household and sectarian worship. The gifts given to the gods in the Vedic sacrifice had relation to the organically perceived universe, which was, as the *Upaniṣad* says, “all food” (*Taittirīya Upaniṣad* 2.2). It appeared to the Vedic sacrificer that if the universe were to have the strength to keep running, certain foods had to be immolated on the Vedic fire altar. The ritual, as it has come down to us today, appears in several different forms. Great public rituals are now less common than before, although they are still performed on occasion. The numerous Brahmanic rituals, including the *San̄dhya Vandanā* (the daily service) and those connected with domestic life, and others oriented toward the welfare of departed spirits, involved simple offerings of ghee (clarified butter), water, grains, coconuts, and the like. In the *Śrāddha* ceremony for the dead, *pin̄ḍa* (rice balls) were believed to assuage the spirits. The more elaborate ceremonies in ancient times included animal sacrifices and the pressing of the *soma*, a type of intoxicant that was notably given to the god Indra to enable him to perform vigorously in his battle with *Vṛtra*, a cosmic monster. Horses and humans were slain in the sacrifices. The deities of the Vedic period had negative as well as positive traits; as in the context of other ritual systems, the offerings to the higher powers could bring benefits in reciprocation or ward

off dangerous interventions. These are sometimes called the *do ut des* (I give that you may give) and *do ut abeas* (I give that you may go away) aspects of a ritual transaction.

In the period following 600 BCE, in the aftermath of the growing anthropomorphization of the deity (perhaps stimulated by the art and ritual of Buddhism and Jainism), the characteristic offerings in worship were likened to the food and gifts given to exalted human beings. Thus, it has often been mentioned that the style of Hindu temple worship is patterned after the court life of ancient India. The deity is considered to be the most respectable and powerful associate of humanity, a visitor from another realm who condescends to dwell for a time within images in temples, and who can be approached with gifts, services, art, music, and literature. In fact, gifts from the whole realm of human creativity can be offered to him. Two examples will be illustrative. It has been observed that among the later Kṛṣṇaite sects of North India, that of the Vallabha Sampradāy (founded by Vallabhācārya, 1479–1531), whose fervent love of the child Kṛṣṇa results in a daylong ceremonial offering of food, is the most lavish in “ritualistic materialism,” if one may call it that. On special holidays, such as Kṛṣṇa’s birthday, a mountain of food is prepared by the devotees and brought to the shrine to be offered to the image. Whenever offered, the food becomes *prasāda*, a kind of sacrament imbued with the power of the deity (because touched by him in a spiritual sense) and given back to the worshipers for their own consumption. Money offerings are given for the *prasāda*, which is, in effect, sold. The receipts are used to maintain the temple property, the priestly class, and the like. On the other hand, some gift-giving ceremonies are not at all lavish; a simple ceremony performed in the household for family members and guests or for a ladies’ association that meets regularly by turn in members’ homes for worship may entail the preparation of a simple meal or sweets, first offered to the deity and then given to the participants in the ceremony.

On holidays, it is common throughout India to provide new clothing for family members, servants, and other dependents during the feast of *Dīvalī* (October to November). This is the time when merchant castes close out their books and the goddess *Lakṣmī* is implored for an abundance of profit in the coming year. Sweets are exchanged between close friends and business associates. As for other special occasions, perhaps the most oppressive practice of gift giving in Hinduism, likewise representative of an aspect of caste or subcaste behavior, is the system of exchanges between a bride’s family and a groom’s family, sometimes observed for a number of years both before and after the marriage proper. The prevailing custom places the burden upon the bride’s family, and the demands are so excessive that responsible parents in the poorer classes are frequently forced into penury to provide a daughter with a husband. It is not unheard of for a father to commit suicide so that his insurance money can be used to pay off the resulting indebtedness.

Buddhism. There is a type of gift giving that is explicitly meant to relieve the needs of the poor and the destitute.

Almsgiving, as this is called, likewise has a role to play in the economy of ascetic life, wherein monks and nuns live under some kind of vow of poverty and must therefore be supported by the actively working laity. Since Buddhism is a religion in which the monastic community (in its maintenance and perfecting of life in the *dharmā*) is the main focus, it follows that almsgiving will be a general practice among Buddhists.

Apart from this necessary form of gift giving, Buddhism teaches generosity, self-giving, and even gift giving as illustrative of different aspects of the way toward *nirvāṇa*. For example, the *jātaka* stories that began to circulate early in the Buddhist period but were not completed before the fifth century CE demonstrate how the Buddha exemplified certain great lessons of life prior to his final emancipation. In his previous lives he was a *bodhisattva* and appeared in various embodiments. One of the *jātaka* tales tells how the Buddha-to-be practiced the virtues leading to emancipation while in the body of a hare. He taught the other animals—the jackal, the otter, and the monkey—to give alms, keep the precepts, and observe fast days. In observing their rule, the hare instructed his disciples on a certain fast day to give as alms to any stranger who might visit them food that they had obtained in the course of their usual ways. He himself vowed—since hares live on vegetation alone—to offer his own body as food to any meat-eating stranger who might approach him on the fast day. A heavenly being, made aware of the hare's vow, came to earth disguised as a *brahman* and tested each of the animals in turn as to the sincerity of its vow to offer hospitality after its own kind. The hare in due course threw himself into the fire to provide the *brahman*'s supper; but the heavenly being prevented the hare's being burned and, to commemorate his magnanimity, drew a likeness of his face on the moon to be admired thenceforth by all on earth.

Gift giving is also mentioned in one of the most famous works of the Mahāyāna tradition, the *Saddharmapundarīka Sūtra*. Therein, the *bodhisattva* illustrates in numerous ways his vocation as savior of humanity, suffering in the endlessly repetitive world of *saṃsāra*. The *bodhisattva* offers to deluded humanity the gift of a paradisiacal afterlife as an inducement to abandon the gross physical world. The paradises of the *bodhisattva*, particularly that of Amida Buddha in the West, are filled with jeweled trees; sparkling, diamantine sands; and enchanting birds and flowers; together with fountains and the like. This paradise is meant to provide a mediating position between the world of *saṃsāra* and the absolute state of *nirvāṇa*. The *bodhisattva* vows to take all beings together into that emancipated state. The Buddhist parables of the burning house and the prodigal son are parallel tales illustrating the means by which one might, through gifts, relieve one's obsession with the material world in favor of the higher world. Thus, the children in the burning house are offered gifts to induce them to leave the house and come outside. The kindly, concerned father is the figure of the *bodhisattva*, likewise offering an escape from the material world into para-

dise. In the story of the prodigal son, deluded humanity is represented by a wealthy father who finds his lost son after many years; the father tries to change his son's attitude toward himself by giving him gifts and positions of responsibility. This can be understood to refer to the training in spiritual life through which, with the *bodhisattva*'s help, the aspirant is brought into a state of awareness regarding the true nature of the world and the need for emancipation from it. Works in the Pali canon, such as the *Dakkhiṇāvī-bhaṅga Sutta* and the *Sigālovāda Sutta*, give precise instructions for the giving of gifts to monks and the giving of gifts between the laity and in connection with the Buddhist holidays.

Chinese religions. Reading the colorful sixteenth-century novel *The Golden Lotus*, which reflects life in China in the twelfth century, one gathers that in that period in China the well-positioned gift was an absolute essential for the improvement of one's social and economic position, for gaining preference at the court of the emperor, or for placating judges in the courts of law (see Egerton, 1972). Indeed, the novel affords a vivid object lesson on the ways in which bribes not only can move one up the ladder but also, as the companions of other vices, can bring one to one's doom, as is the case with the novel's hero Ximen Qing (or Ch'ing Hsi-men). It has sometimes been said of the Confucian doctrine that it not only attempted to inculcate a reasonable morality on the basis of equity between human beings, as expressed in the so-called silver rule ("Do not do unto others what you would not have them do unto you"), but it also came to terms with what was perceived to be the natural inequality between persons. Giving and receiving gifts within the hierarchical Chinese society was an inevitable aspect of rank differentiation. Those highest in rank received the most expensive and most numerous gifts. Analogously, the ceremonial life of the public cult involved the emperor's presenting gifts at the altar of heaven within the so-called Forbidden City in Beijing, both at the winter solstice and at other times. Precious stones and costly cloth were among the offerings. Lower-ranking officials throughout the empire offered their respective gifts to the gods—to the city god, for example. This activity was consonant with the custom of making offerings at the shrines of family ancestors. Gifts of incense and fruits were regularly presented before the ancestral tablets.

The rites offered to the spirits of Confucius and other sages included sacrifices of pigs and oxen; the great deities of the Daoist pantheon were given wine, cakes, and meat offerings. Indeed, it is not too farfetched to see the development of Chinese cuisine in part as an outgrowth of ritual life. Feasts were regularly a part of the offerings made by individuals in the Daoist and Buddhist temples. In the latter case, vegetarianism required the development of a special cuisine so that the proper foods could be offered to monks and others under similar vows.

Rituals for the departed often included the burning of effigies of material objects, such as imitation money or a tomb made of paper. In contemporary rituals even such

modern accoutrements of life as refrigerators and cars may be constructed of paper and burned in the temple furnace with appropriate reverence under the axiom that the thing itself is less important than the thought behind it.

As already noted in the discussion of the potlatch and the Hindu caste system, sociological theory lends credence to the applicability of the potlatch as an analogue to many systems of social organization. Marcel Granet, in *Danse et légendes de la Chine ancienne* (1926), proposed a relationship between the potlatch and the prefeudal (early or pre-Shang dynasty) system of China, which was influential in the formation of Confucius's ideas of the ideal social order. This position has been examined in the work of Eugene Cooper (1982), who argues convincingly for its validity.

Judaism. Diaspora Judaism's theory of almsgiving and charity was built on a thoroughgoing moral system. The record of sacrifices in the Hebrew scriptures—offerings given to God according to the seasons and particular festivals and the day-to-day demands of ritual—has been preserved by some Jews in synagogue worship through recitations from *Exodus*, *Leviticus*, and *Numbers* in the Orthodox preliminary morning service contained in *Ha-siddur ha-shalem* (see Birnbaum, 1949). With the destruction of the Temple in 70 CE it was no longer possible to maintain the offerings in the prescribed setting; the Jewish community's concern with the purity of food, however, dictated that there be a class of specialists in the ritual slaughter of animals (for food purposes if not for offering to God). With the establishment of the State of Israel, various groups, both Jewish and Christian (although there is considerable disagreement on the issue in Judaism), are making preparations for the rebuilding of the Temple in Jerusalem and for the reestablishment of ritual sacrifices. Of course, other offerings besides animals were made as well; these included grain, oil, incense, and wine, and some vestige of them remains both in Sabbath observances in the Jewish home and in the Passover meal.

Of the popular holidays, two in particular are connected with gift giving within the family or among friends. The better known, perhaps, is the custom at Hanukkah of giving gifts (money and other things) to children on each of the eight nights of the festival. Much is made in contemporary Jewish discussion of the need to maintain some kind of distinction between this Jewish observance and the Christmas festival of Christians, particularly since both occur at approximately the same time of year. The playing of games of chance, which of course relate to the potential of gift giving for the redistribution of valuables within the social community, is also a part of the Hanukkah observance.

Purim, which commemorates the rescue of the Jews from the evil minister Haman in the court of the king of Persia, is an occasion for exchanging food. The legend itself is told in the *Book of Esther*, which is read in the synagogue on the holiday in a mood of revelry compared sometimes to that of Carnival in Latin Christian countries. *Shalah Manos* is the custom of sending gifts of food from house to house

on Purim; the type of food given is that which can be eaten and drunk on the same day.

Christianity. As with the history of Buddhism, the history of Christianity reveals the development of an elaborate system of gift giving for the maintenance of the institutions of the church, the clergy, and the monastic communities. During the earliest centuries of the church, persecutions were a constant threat, and the Christian community had to develop its own system of finances, since its survival was outside the concern of the state. From the time of Constantine (early fourth century) onward, the church received state recognition and was able to capitalize on its status to attract enormous endowments; with the advent of Muslim rulers in many Eastern Christian lands, however, the church was once again reduced to tense relations with the state. It survived in part through the generosity of the laity, and in part through official support, for even in Islamic lands the church was to a certain extent and at certain times patronized by the rulers. Gifts of lands and other wealth were given to the Church of the East (sometimes called Nestorian), which before the thirteenth century had spread into China and India. The Christian church of Kerala in South India received, until modern times, regular patronage from the Hindu rulers of the region. The right of the Christian community (and other religious communities) to receive gifts unencumbered by excessive government interference is an issue in the modern world. Specific exemptions from taxes and benefits for giving gifts are written into the laws to encourage the support of religious institutions.

The ritual life of Christianity is permeated with the idea of the gift and gift giving. The elements of the Eucharist—the bread and the wine, which are widely called the Holy Gifts—are offered to God as a “sacrifice,” and according to some theologies they become the body and blood of Christ in an unbloody reproduction of the crucifixion. Other theologies describe these gifts as being received by God and sanctified to become the body and blood of Christ through the power of the Holy Spirit. The custom whereby the laity prepare and offer the bread and the wine of the Eucharist has been revived in some Christian bodies. In addition to the elements of the Eucharist and the paraphernalia that accompany it, such as chalices, monstrances, tabernacles of precious metal, and the like, the Christian churches have received uncountable offerings in the form not only of money but also of vestments, paintings, architecture, and sculpture—gifts representing the full range of human creativity. These gifts still constitute a principal part of the heritage of Western civilization. Although sometimes limited by theological constraints, Protestant churches have likewise encouraged gift giving through the arts. With the modern secularization of public life, however, the impetus to artistic creativity in connection with the religious gift-giving impulse seems to have been diverted.

Caught somewhere between the sacred and the profane is the gift-giving extravaganza carried out, now virtually

around the world, in the name of the infant Christ, who was born in Bethlehem and whose birth is widely celebrated on December 25. The precedent for exchanging gifts on the Christian festival is based on the visit of the wise men from the East to the Christ child, even though their time of arrival at Bethlehem is commemorated on January 6. The date of Christmas was chosen, it is said, in order to attract the interest of the non-Christian masses of Europe who celebrated the winter solstice.

Islam. At least from what one gathers in reading the *ḥadīth* (traditions of Muḥammad, the Prophet of Islam), the Islamic idea of gift giving is but an extension of the underlying concept of alms, expressed in the two Arabic words *zakāt* and *ṣadaqah*. Perhaps because there are no sacrifices or sacraments in the usual religious sense in Islam—in other words, no way of transmuting a material object through a religious ceremony from the merely physical plane to a “new mode of being”—all events in Islamic religious practice tend to take on a moral overtone; righteousness is the primary goal of religious life. In general, it appears that goodness in Islam is thought of as consequent upon obedience to the command of God to act in certain ways. Generosity may be expressed in a great number of actions that reflect the moral earnestness of a discipline enjoined by a higher power. The myriad customs and observances of Islamic law and tradition are further extensions of the original act of submission, which is a call to acknowledge faith in the one God. The prophet Muḥammad represents the ultimate degree of perfection in answering the call. Meditation on the minutiae of his life remains the source of the moral earnestness that is the characteristic of Islamic ethics.

In the realm of gift giving, the so-called poor tax, or *zakāt*, can be understood as a practical example for all types of giving. Both in the Qurʾān and in the traditions of Muḥammad, the believer is constantly reminded that his days on earth are but a brief interlude, beyond which lies the state of bliss in paradise, provided the believer has merited a reward in the afterlife. In the prostration of prayer, believers are reminded that they are gazing into the pit of the grave where the two angels of paradise or hell will come to direct the soul to its intermediate state prior to the Last Judgment. The poor tax, especially as it impinges on human possessions, reflects this ascetic attitude toward the term of human existence; it is meant to make the Muslim believer deliver from his possessions a fixed amount annually—at the feasts of the end of Ramaḍān (the lunar month of fasting) and during the *ḥājj* (the pilgrimage to Mecca)—for the relief of certain classes in Muslim society.

In the larger sense of sharing what one possesses, the term *ṣadaqah* is used—for example, in the *Mishkāt al-maṣābīḥ* (see Robson, 1963–1965). In book 12, *On Business Transactions*, several chapters are devoted to gifts. The Prophet encouraged the setting aside in “life tenancy” of lands whose produce would maintain certain charitable activities, such as the provision of food for travelers. There are

several references to gift giving within the family context in order to assure evenhandedness.

The problem of reciprocity in gift giving is also addressed in chapter 17, part 2, of the *Mishkāt*, wherein the Prophet is asked whether one must return equally for any gift received. His advice is to return equally if possible; if it is not possible, then an expression of sincere thanks and prayerful intercession will suffice. In general, the Prophet encouraged gift giving between neighbors and among members of the community in order to stimulate mutual good feelings. Perfume was one of the Prophet’s favorite gifts in this connection. Even today, when Muslims gather for prayer in the mosque, it is counted a righteous act for them to offer perfume from a small container to their fellow worshipers. To be clean and sweet-smelling is a gift to those with whom one associates, particularly at the time of prayer. It is also considered an act of gift giving to offer a smile rather than a dour look to a fellow human.

CHARLES S. J. WHITE (1987 AND 2005)

GILGAMESH, a Sumerian hero, god, and ruler of the city-state Uruk, is the subject of a classic epic poem that Mesopotamian tradition attributes to the priest-exorcist and scribe Sin-leqi-unnini. The poem was the product of a lengthy compilation effort, which resulted in the composition of the national poem of Babylon. Until the 1990s there were five known Sumerian works that described the deeds of Gilgamesh, king of Uruk. The Sumerologist Samuel Noah Kramer identified them as: “Gilgamesh and Agga,” “Gilgamesh and Hubaba,” “Gilgamesh and the Bull of Heaven,” “Gilgamesh, Enkidu, and the Underworld,” and “The Death of Gilgamesh.” The environment in which they were conceived and composed has been generally regarded as the court of the third dynasty of Ur (c. 2100–2000 BCE), whose sovereigns sought to trace a direct link between the figure of Gilgamesh and the royalty of Uruk. Giovanni Pettinato has suggested that a 107-line text found in 1975 at Tell Mardikh-Ebla is related to the Gilgamesh saga. This text, and the entire library from which it comes, can be dated to

2500 to 2400 BCE. The events described in this text concern relations between the king of Uruk and the city of Aratta. The narrative fits well with the tradition of epic wars between the royal dynasty of Uruk and the colony founded in an indeterminate location in Iran: both King Enmerkar and Lugalbanda, the supposed divine father of Gilgamesh, waged war against Aratta according to the four epics that concern these figures.

A new version of “The Death of Gilgamesh,” rediscovered at Me-Turan in 1979, serves to confirm the narrative translated by Kramer, while also, because it is more complete, opening up new avenues of understanding concerning the complex nature of Sumerian civilization. This version verifies for the first time the Sumerian custom of collective burial, something for which there is archaeological evidence at Ur and Kish, but which had not been previously confirmed by epigraphic sources. This text also includes confirmation of the legend of Uruk, the son of Gilgamesh, specifically named in the Sumerian King List as Gilgamesh’s son and successor to the throne of Uruk. Similarly, a new version of “Gilgamesh and the Bull of Heaven” was found there in 1979.

Unfortunately the authors of Sumerian narratives featuring Gilgamesh are unknown to us, and scholars are not certain whether it is pure chance that the series of Gilgamesh poems is attributed to a single author. According to a catalog of authors and texts from the neo-Assyrian period, rediscovered in the library of Assurbanipal and published by W. G. Lambert (1962), the series of Gilgamesh was conceived by Sin-leqi-unnini, who according to Lambert lived between the thirteenth and twelfth centuries BCE, at the end of Kassite power in Babylon, and more precisely at the moment when Babylon, under Nebuchadrezzar I, managed to obtain its independence from foreign rule.

CONTENTS OF THE EPIC. The classic epic, while consisting of a reconstruction of a literary work conceived and composed in the Old Babylonian period, should be considered as a single unified composition. Sin-leqi-unnini was not simply responsible for a brief summary in twelve tablets of the story from earlier times; it can be said with some certainty that he, in a sense, reconsidered and re-created the entire story from scratch.

An important piece of evidence for the unity of the classical epic is the presence of a prologue, as well as an epilogue found at the end of Tablet XI, where part of the prologue is repeated. Tablet XII is generally considered by scholars to be an appendix to the epic. Its contents consist of a literal translation of part of the Sumerian story known as “Gilgamesh, Enkidu, and the Underworld.”

The epic may be divided as follows:

1. Prologue: The hero Gilgamesh (Tab. I.1–51).
2. Enkidu, the alter ego of Gilgamesh (Tab. I.52–II.155ff.).
3. Gilgamesh, Enkidu, and the monster Hubaba (Tab. II.184–V.266).

4. Gilgamesh, Enkidu, and the Bull of Heaven (Tab. VI.1–182).
5. Death of Enkidu and despair of Gilgamesh (Tab. VI.183–VIII.207ff.).
6. Gilgamesh in the quest for immortality (Tab. IX.1–X.325).
7. Only the gods have the gift of life (Tab. XI.1–302).
8. Epilogue (Tab. XI.302–308).
9. Fate of humankind in the afterlife (Tab. XII.1–154).

INTERPRETATION OF THE EPIC. No interpretation of the epic should be separated from an analysis of the work of Sin-leqi-unnini. Closely connected to this is another investigation concerning the identity of the two main characters as divine or human. Thus far, we have spoken of the “epic” or “saga,” putting into this category both the Sumerian stories and the various poetic versions that have Gilgamesh as their main hero, regarding them as *res gestae*, whether of a historical or legendary figure. A review of various scholarly interpretations indicates that the second problem cannot be decisively resolved. Although the majority of scholars are convinced that the king of Uruk is a historical figure, Pettinato and others think that Gilgamesh did not exist in a historical sense, but is instead a god who has been made into a historical figure.

The first interpreters of the work of Sin-leqi-unnini, which was discovered in 1872 by George Smith among the thousands of fragments of the library of Assurbanipal at Nineveh, were concerned with defining its nature. Apart from its real or supposed parallels with stories told in the Bible—the example of the universal flood on Tablet XI marks the beginning of an argument so heated that it has been called “the war between the Bible and Babel”—scholars have sought to explain the deeper meaning of the work centered upon Gilgamesh.

Hugo Winckler and Heinrich Zimmern came to the conclusion that the Gilgamesh poem was a myth concerning the sun god and in particular was constructed like the myth of the Dioscuri. Otto Weber confirmed this view, and pointed out that the twelve tablets contain clear reference to the signs of the zodiac. For Weber, the poem’s basic theme is the journey of the sun through its twelve phases over the course of the year, with the figure of Gilgamesh functioning as an allusion to the sun god and Enkidu representing the moon. For these scholars, there are clear antecedents of the adventures of Odysseus in the *Epic of Gilgamesh*, as well as of the labors of Herakles and the later voyages of Alexander the Great.

Heinrich Schneider claimed that all the characters in the epic were either powerful gods or second-rate divine beings who, like Gilgamesh, had been made into human figures. Schneider also argues that the friendship between Gilgamesh and Enkidu corresponds to the medieval ideal of chivalry, and he defines the Old Babylonian story as heroic and the Ninevite story as chivalrous.

Meanwhile Peter Jensen’s lengthy *Das Gilgamesch-Epos in der Weltliteratur* (The *Epic of Gilgamesh* in world literature, 1906) attempted to show the astral and mythological nature of the work. For Jensen, the epic was a description of the events that took place in the heavens during the course of the year, especially the heliacal rising of the stars. Notwithstanding Jensen’s passion and deep convictions, important biblical scholars, such as Hermann Gunkel and Hugh Gressmann, not only categorically refuted alleged biblical parallels, but denied the mythical nature of the *Epic of Gilgamesh*, considering it rather as pure saga, clearly parallel to the romance of Alexander.

In 1923 the German scholar Arthur Ungnad, completely abandoning any mythical interpretation, argued that the epic was an ethical work and the forerunner of Homer’s *Odyssey*. Although Ungnad does not propose that the Greek author copied the work of Sin-leqi-unnini, he has no doubts that the Greeks adapted and retold sagas from the East to suit their own temperament. A year later Hermann Häfker argued that the Gilgamesh epic was an entirely historical work, with its guiding theme being the problem of life and death. In 1937 there appeared an important contribution by the Swedish scholar Sigmund Mowinckel, in which he defends the divine nature of Gilgamesh and interprets the entire work as the description of a god who dies and rises again, a commonplace in the context of history of religions.

A completely different view was proposed by Benno Landsberger. For him the work is the national epic of the Babylonians and Gilgamesh is the personification of the ideal human being for the Babylonians. The predominant theme in the epic then is the problem of the eternal life, discussed using the familiar example of *Faust*.

Mythological interpretations were not completely abandoned however. Beginning in 1958 scholars such as Franz Marius Theodor Bohl and Igor M. Diakonov continued to hold this position, with Bohl stating that what lay behind the epic was a religious war between the followers of the cults of Ishtar and those of Shamash and Marduk, while for Diakonov the figures of Gilgamesh and Enkidu are personifications of the sun god and moon god.

Geoffrey S. Kirk argued that the *Epic of Gilgamesh* has as its theme the contrast between nature, represented by Enkidu, and culture, represented by Gilgamesh. For Thorkild Jacobsen, on the other hand, the poem contains a description of the process by which human beings become mature, moving from innocent and reckless adolescence to the awareness of values that are more real, though less apparent. This leads to a psychoanalytical interpretation: the love of Gilgamesh for Enkidu is the love of an adolescent boy for one of his peers, before discovering love for women.

Giorgio Buccellati interprets Gilgamesh in terms of wisdom. After analyzing the epic’s various themes, such as impurity, fear, the wanderer’s life as opposed to family life, and the uncertainty between dreams and reality, Buccellati concludes:

The emphasis is shifted from the object of the search, life, to the actual effort of the search as such, to the assumptions upon which it is based, and to the consequences for the person who carries it out: these consequences are not external, as in the pursuit of a particular benefit, perhaps even physical life itself, but rather they are internal, deeply psychological and are concentrated upon the spiritual change of the person who is undertaking the search. (Buccellati, 1972, p. 34)

One of the first scholars to stress the central nature of the theme of friendship in the *Epic of Gilgamesh* was Landsberger, who wrote that one of the fundamental motifs of Sin-leqi-unnini's work is the ideal of a noble friendship between Gilgamesh and Enkidu, which not even death can erase. Indeed, from their first meeting after their battle in the streets of Uruk and then later in the dreams Gilgamesh has, the deep bond between these two characters is emphasized, to the extent that it has been compared to love for a woman. The troubled quest for eternal life also shows how much Enkidu means to Gilgamesh. However, the rejection of the love offered by Ishtar is not to be read as the repudiation of love for women, as Landsberger has it, but rather in a much more profound manner, as concerning the future destiny of the king of Uruk.

Other scholars have considered friendship to be the central theme of the epic, including Lubor Matouš, but in particular Giuseppe Furlani, who in an article titled "L'Épopée de Gilgameš come inno all'amicizia" (*The Epic of Gilgamesh as a hymn to friendship*) and then in the introduction to his 1946 translation of the epic, asserts that he is obliged to "revise the fundamental, central theme of the epic" in that "the epic of Gilgamesh is truly a hymn to friendship, a long-lasting friendship enduring even beyond the grave, between Gilgamesh of Uruk and Enkidu, shining, eternal examples of faithful friends" (Furlani, 1946, p. 587). Furlani further states that "the central and underlying idea of our poem has been thought of as a discussion of the problem of life and death. . . it seems to me instead that this idea should now be abandoned and we should recognize that the epic is in reality a hymn to friendship" (Furlani, 1946, p. 589).

Following Landsberger, who sets the problem of human existence at the heart of the epic, Alexander Heidel considered its central theme to be a meditation on death in the form of a tragedy. Heidel argues that the epic confronts the bitter truth that death is inevitable: all human beings must die. Matouš and A. Leo Oppenheim also stressed that the underlying theme of the work is the search for eternal life.

Readers of the epic of Sin-leqi-unnini should first take full account of the prologue: in the first eight lines, the author repeatedly identifies knowledge with wisdom. For him the adventures of Gilgamesh consist of a series of important staging points, necessary to reach a final end, which the author correctly identifies as the wisdom of his hero. The author advises the reader that this is the key to the text. As Buccellati emphasizes, seeing other motives or themes means

considering the staging points and methods of approach to this ideal as ends in themselves. Therefore, an accurate reading of the poem cannot ignore the fundamental motifs proposed by its author. The fact that the author then mentions the troubled quest for eternal life as an essential part of the hero's personal journey, and that Gilgamesh, in attaining wisdom, has experienced all kinds of suffering, only serves to confirm the critical nature of wisdom in interpreting the work.

Scholars are in general agreement that the epic may be divided into two parts: the first narrates the marvelous adventures of the two heroes and their epic deeds, the killing of the monster Hubaba and the Bull of Heaven; the second part describes how Gilgamesh, who is two-thirds god and one-third human, is forced to deal with the eternal human problem of death. Gilgamesh tries to overcome death, and he hopes that he will receive a conclusive answer from the hero of the flood, but as we learn from Tablet XI, even this semidivine being does not succeed, and it is perhaps in this failure that Sin-leqi-unnini sees the logical ending of his work. This would be surprising however, since the author opens his work by praising the wisdom of Gilgamesh, so this must mean that he does not consider these events to be a failure as such. The treatment of the figure of Gilgamesh throughout the epic could not allow for such a dismal ending: the king of Uruk, besides being two-thirds god, is the paradigm of a true king. If the interpretation proposed below regarding the "plant of life" is correct, Gilgamesh is showing himself to be a true king at the very moment of his failure.

The real answer to all the problems of Gilgamesh has been seen in the final gift of Utanapishtim to the king, when he reveals to Gilgamesh the existence of a special plant. This interpretation is based upon an insertion accepted by the majority of scholars at line 270 in Tablet XI, which says: "You will obtain life." But nothing in the text justifies an insertion of this kind. The gift of Utanapishtim is defined as "a plant of restlessness," and Gilgamesh explains the nature of the plant: "It is reputed to turn an old man back into a man in his prime. So I want to eat the plant and become young again." This leads to the conclusion that Gilgamesh, by eating the plant, would be returned to a youthful state, with all its anxiety and restlessness. Hence the interpretation of the plant as an elixir of youth: by eating the plant, Gilgamesh would have been returned to the position he was in during the first part of the epic. The fact that he lost the plant is a further sign of the greatness of this king. Gilgamesh had not forgotten that a king is responsible for the fate of his subjects and he loses the plant precisely because he wanted to share it with his fellow citizens. His first thought when he is given the plant is to take it back to Uruk and feed it to the old.

However, the gift of Utanapishtim was not available for the whole of humanity, but reserved for Gilgamesh alone, perhaps as a reward for all his travels and his tenacious quest in pursuit of the unattainable ideal of eternal life. When Gil-

gamesh wanted to share this with other people, the serpent became its sole beneficiary: "Gilgamesh on that day sat down and wept / and the tears rolled down his cheeks." In these two lines the scribe expresses the diverse emotions of the hero, the first being his inability to fulfill his royal duty. Yet this admission itself marks the attainment of complete wisdom, of a maturity that is the legacy of a true king of Mesopotamia.

GIOVANNI PETTINATO (2005)
Translated from Italian by Paul Ellis

GILLEN, FRANCIS JAMES, AND BALDWIN SPENCER. Baldwin Spencer and Frank Gillen both

came to Australia in the latter half of the nineteenth century. Gillen arrived in Adelaide from Ireland, still in his mother's womb, in 1855 and was born later that year, while Spencer, born in England in 1860, migrated to Melbourne as a young man in 1887. Their backgrounds and careers were very different, yet they formed a remarkable ethnological partnership after first meeting in 1894. Gillen, the son of a laborer, received minimal formal education and chose a career in the postal service, eventually going to work on the Overland Telegraph Line that connected Adelaide and Darwin after 1872. Spencer, the son of bourgeois parents, was educated at a private school and at the University of Oxford, where he later became a fellow.

Spencer came to Australia to take up a chair in biology at the University of Melbourne, and it was in his capacity as biologist on the Horn Scientific Expedition to central Australia that he met Gillen in Alice Springs. By that time Gillen had long been an enthusiastic amateur ethnographer, and he was also the local magistrate and sub-protector of Aborigines. Spencer and Gillen became close friends, with Gillen's ethnographic enthusiasm firing Spencer's preexisting but tangential anthropological interests. When Spencer returned to Melbourne, he and Gillen corresponded feverishly about anthropological and other matters, and Spencer invited Gillen to contribute to the anthropological report of the expedition. In 1896 Gillen helped some local Arrernte (Arunta, Aranda) groups to stage a large-scale ceremony in Alice Springs, which Spencer attended. The records of this ceremony were added to those that Spencer and Gillen had conspired to produce mainly through long-distance correspondence, culminating in their 1899 landmark ethnography, *The Native Tribes of Central Australia*.

In 1901 Spencer and Gillen were both given leave to undertake ethnographic research in remote South Australia and the Northern Territory. The material generated from this trip considerably broadened their ethnographic base, resulting in a second major monograph, *The Northern Tribes of Central Australia*, published in 1904. Gillen's health declined dramatically after this and he died in 1912. Spencer, however, went on to cement his reputation as Australia's foremost expert on Australian Aborigines, undertaking further ethnographic research in the far north of the Northern Territory from 1911 to 1912 and in central Australia in 1923 and 1926, and producing further volumes. Among other things, he updated his and Gillen's 1899 study by publishing the two-volume *The Arunta: A Study of a Stone Age People* in 1927. Spencer died two years later on Tierra del Fuego, during an ethnographic expedition to the Yahgan Indians.

Gillen published very little by himself, mainly acting as a remote field-worker sending information to Spencer in Melbourne. It was Spencer who penned their jointly authored monographs, although Gillen's contribution went beyond the mere provision of data. Reflecting a not uncommon contemporary pattern, the formally educated Spencer acted as a kind of hinge between the metropolitan centers

of Europe, where there were furious debates about the origins of religion and society, and the remote outpost of Alice Springs, where Gillen allegedly dwelt cheek by jowl with living representatives of the Stone Age. Spencer's evolutionist outlook was most specifically informed by his biologist's commitment to Darwinian principles, but it was also influenced at various stages by debates initiated by commentators such as Edward Tylor and James Frazer and ethnographers such as Lorimer Fison and Alfred Howitt. For his part, Gillen's outlook was informed partly by Spencer's prompts and questions, partly by his own reading of contemporary ethnography, and partly by inspiration derived from his life experiences. While Gillen deferred to Spencer as a trained scientist and sought to emulate the objectivity of the scientific establishment in general, his letters to Spencer indicate that his appreciation of Aboriginal religion was also inspired by a somewhat mischievous gift for comparing "Stone Age" myths and rituals with biblical tenets and solemn Christian practices.

Spencer and Gillen's detailed ethnographic descriptions provided material out of which many of the best-known general accounts of "primitive" religion were partly constructed. Émile Durkheim's *The Elementary Forms of the Religious Life* (1912) relied heavily on Spencer and Gillen's ethnography, as did some of the work of James Frazer (particularly *Totemism and Exogamy* [1910]) and Sigmund Freud (including parts of *Totem and Taboo* [1913]). The 1899 and 1904 ethnographies were widely acclaimed and taken up by the academic establishment as setting new standards in ethnographic reporting. They also excited the popular imagination, with Spencer eventually compiling volumes (*Across Australia* [1912] and *Wanderings in Wild Australia* [1928]) to meet the demand from the nonacademic market, in the process turning "the Arunta" and many aspects of their culture into household names.

All of Spencer and Gillen's books heavily reflect contemporary primitivist concerns with totemism, magic, kinship, and marriage, but the question of totemic religion is always most central. In 1899 the authors devoted no less than nine consecutive chapters to Arrernte totemism and its attendant mythology, ritual, and sacred paraphernalia. The 1904 book was similar and also popularized the term *dream times*, a translation of the Arrernte word *alcheringa* (*altyerrenge*). This term later evolved into *Dreamtime* or *Dreaming*, both of which are now widely used by Aborigines and non-Aborigines alike to describe indigenous Australian cosmology. The 1899 and 1904 books also popularized the Arrernte term *churinga* (*tywerrenge*), which, in its original context, refers to wooden or stone sacred objects and other things associated with totemic ancestors. As a result of the recent worldwide rush to embrace Aboriginal art and spirituality, *churinga* is now best known as a designer clothing label, whose shirts, sweaters, and other items carry totemic designs.

Spencer and Gillen's reputation is primarily based on their detailed descriptions of Arrernte and other Aboriginal

people's lives. But while their apparently "raw" ethnography was an important way station on the road to contemporary anthropological fieldwork practice, they also provided muted conceptual insights into "primitive" religion, a fact that has often been obscured by their work's appropriation into more famous and explicit theoretical frameworks put forward by the likes of Durkheim, Frazer, and Freud. At a time when European scholars such as Frazer were questioning whether Aborigines had anything that could genuinely be labeled religion, Spencer and Gillen never balked at describing certain Aboriginal ceremonies and beliefs as "sacred." Indeed, detailed comparisons of passages from Spencer and Gillen with related ones from Durkheim's *Elementary Forms of Religious Life* suggest that Durkheim developed certain aspects of his sacred–profane dichotomy, at least insofar as it applied to totemism, from the descriptive language employed by Spencer and Gillen. On the other hand, Durkheim, like Frazer and others, also tended to simultaneously overtheorize and oversimplify the complex dimensions of Aboriginal totemism described by Spencer and Gillen. In that respect, Spencer and Gillen's intermediary position between the sometimes wild European theorizing about "primitive" religion and the little understood empirical complexities of Aboriginal ritual and belief remains critically important. That importance is measured by the extent to which the ethnographers' descriptions have stood the test of time in relation to the more radical revision of the theoretical systems that were allegedly confirmed or discredited by Spencer and Gillen's data. Of particular note in this regard was their conclusive demonstration that Aboriginal totemism was not in any simple or singular way connected to clans or group exogamy.

Howard Morphy argues that Spencer and Gillen's detailed accounts of Arrernte myth and ritual have a phenomenological character. Spencer and Gillen most certainly did not have phenomenological sensibilities in any formal sense, but their ethnographic accounts were firmly based on experience and attention to detail in the observation of ritual action and, to a lesser extent, the expression of religious sentiment. But the work of Spencer and Gillen's ethnographic and intellectual rival, the Lutheran missionary Carl Strehlow in *Die Aranda- und Loritja-Stämme in Zentral Australien* (1907–1920), truly was phenomenological, and the balance Strehlow provided in this respect made it regrettable that his work was not used nearly as extensively as Spencer and Gillen's in many European circles. Géza Róheim suggests in "Psycho-analysis of Primitive Cultural Types" that, while Spencer and Gillen's approach to Aboriginal religion was essentially "behaviorist," being based on observation but lacking in the kinds of insights that emerge from an intimate knowledge of Aboriginal languages, Strehlow's approach, premised firmly on fluency in Arrernte and painstaking translation work, was that of lifeless exegesis ("lifeless" because of Strehlow's self-imposed ban on attending "heathen" ceremonies). In that sense, Spencer and Gillen's ethnographic descriptions of Arrernte religion are best appreciated in conjunction with Strehlow's parallel contemporary account.

A more singular appreciation of the mutual interpenetration of “word” and “flesh” in Arrernte religion did not occur until the next generation of ethnographers, particularly with the psychoanalytic approach of Róheim and with the intensive ethnographic work of Carl Strehlow’s son, Theodore (T. G. H.) Strehlow (for example, in *Aranda Traditions* [1947] and *Songs of Central Australia* [1971]).

Although Spencer and Gillen had firm evolutionist sensibilities, these were hardly reflected in their actual descriptions of sacred myths and ceremonies. These accounts stand out today as authoritative treatises on Aboriginal, especially Arrernte, religion, marking them off from the grander theoretical systems that were built on them and which have wearied with time. On the other hand, the accounts reveal a partiality of their own and are best treated as part of a larger corpus that gives a more rounded and intelligible picture of classical religion in central Australia. That religion persists in a recognizable form today, with Spencer and Gillen’s books and collections sometimes making a significant contribution to the ongoing vitality of ancestral law. Books such *The Native Tribes of Central Australia* are treated with considerable fear or reverence by contemporary Aborigines because of the sacred material that they contain, and they may even be stored in secret places alongside other sacred objects, some of which are being repatriated to Aboriginal custodians from Spencer and Gillen’s museum collections. The fate of these objects, and of the totemic religion connected with them, could not have been foreseen by either Spencer or Gillen, but it is certainly ironic that the two ethnographic pioneers should be posthumously playing the role of totemic ancestors in this “primitive” religious revival.

JOHN MORTON (2005)

GILSON, ÉTIENNE (1884–1978), was an educator, lecturer, author, and historian of medieval philosophy. Born in Paris, Gilson was a Christian believer and lifelong promoter and defender of the intellectual life of the church. He treasured his Roman Catholic schooling but discovered his love for philosophy in a secular lycée and at the positivistic Sorbonne. Convinced that before doing philosophy one had to learn what philosophy already existed, he entered upon a career of exact historical study, following the principled meth-

od that would mark all his work: to study the original writings of the great thinkers, to understand their thought within its historical context, and to present their teaching objectively.

Under competent Cartesian scholars Gilson concentrated on the modern classics but did his research on the medieval sources used by Descartes. While teaching in the lycées (1907–1913), he completed his dissertation on the scholastic texts utilized by Descartes for his doctrine of freedom. Following his doctorate (1913) he was appointed to teach at Lille, then (after World War I) at Strasbourg, and from 1921 on at Paris. In these national universities Gilson introduced regular study of the medieval theologian-philosophers. His courses on Thomas Aquinas, Augustine of Hippo, and Bonaventure were published and became standard tools for medieval scholars. Studies of other medieval authors provided the substance of his teaching for fifty years in Paris and at Toronto (in the research institute he founded there in 1929) and of his masterwork, *History of Christian Philosophy in the Middle Ages* (1955).

What is more significant, these studies led him to hold firmly to two controversial positions:

- (1) A distinct Christian philosophy is a matter of historical fact: It is the speculations of theologians about questions in principle accessible to natural reason.
- (2) The Thomism of Thomas Aquinas, rather than that of his interpreters, is the unique instance of a Christian philosophy that best mirrors Catholic thinking and that grounds the truths achieved by all other Christian philosophies. Thomism is the philosophy of a theologian and is characterized both by its metaphysics of being, which holds that what is real and intelligible is so by virtue of its act of existing, and by its theses on the integrity of human intelligence and on the realism and evidentiality of knowledge.

Although these are controversial theses, Gilson was so sure of his own position that in more than forty books and countless articles he rarely engaged in argument about them.

Gilson the historian brought the thought of the Middle Ages to the attention of twentieth-century scholars. Gilson the philosopher sparked in his European and North American audiences an active engagement in philosophical and theological issues that had long been dormant. In 1949 the French philosopher Jacques Maritain, remarking on the apostolic quality of Gilson's career, asserted that his championship of Christian intellectual issues in France had lent courage to and secured a hearing for the less hardy. There is little doubt that his promotion of the study of medieval thought and his outspoken defense of his convictions have been of lasting benefit not only to academic scholars but also to religious believers.

BIBLIOGRAPHY

Gilson's numerous works and the extensive writings about him are cited in Margaret McGrath's 1,210-item *Étienne Gilson: A*

Bibliography (Toronto, 1982). Some major works by Gilson available in English are *The Spirit of Medieval Philosophy* (New York, 1936), an abridged version of *L'esprit de la philosophie médiévale*, 2 vols. (Paris, 1932); *The Christian Philosophy of St. Thomas Aquinas*, 5th ed. (New York, 1956); and *History of Christian Philosophy in the Middle Ages* (New York, 1955). The first of a number of appreciative symposia was that by Jacques Maritain and others, *Étienne Gilson: Philosophe de la Chrétienté* (Paris, 1949). The official biography was produced by a former student and colleague, Laurence K. Shook, *Étienne Gilson* (Toronto, 1984).

LINUS J. THRO (1987)

GIMBUTAS, MARIJA (1921–1994) was an archaeologist, prehistorian, and influential interpreter of Stone Age religion. Born January 23, 1921, in Vilnius, the capital of Lithuania, Gimbutas grew up in a progressive and well-educated family. Her parents were both physicians who founded the first hospital in Lithuania. The family belonged to a circle of the best-known intellectuals and artists of their time in Eastern Europe. Even as a young girl, Marija developed a wide range of interests and talents; among other interests, she proved to be a highly gifted musician. In 1937–1938 she participated in an ethnographic expedition to southeastern Lithuania. This trip was the beginning of her lifelong attraction to folklore, an interest that had a prominent influence on her work in archaeology and her studies of prehistoric civilizations and cultures. In 1938 Gimbutas began to study linguistics at the University of Kaunas. The next year, after Vilnius had been freed from Polish occupation, Gimbutas returned to the Lithuanian capital. There she resumed her studies of folklore and began to collect materials from various regions of Eastern Europe.

ACADEMIC CAREER. Following the invasions of Lithuania, first by the Soviet Union and then by Nazi Germany, Gimbutas joined the underground resistance movement. Nonetheless she still completed her graduate studies in archaeology in 1942. She immediately began to publish articles on Baltic archaeology, mythology, and folklore. By now she was married and a mother. Together with her husband and daughter, she went to Tübingen, a German university where she completed her doctorate on prehistoric burials in Lithuania.

Gimbutas did not want to return to Lithuania after the end of World War II because her country had been integrated into the Soviet Union. She immigrated instead to the United States in 1949. The following year, she started working at Harvard University; in 1955 she was appointed a research fellow at Harvard's Peabody Museum. After 1964 she accepted a position at the University of California, Los Angeles. Gimbutas became involved in a wide range of projects concerning archaeological excavations in southeastern Europe and began to interpret her findings synthetically in light of her knowledge of folk art, folk tales, and Baltic mythology. This synthetic approach formed the core of her work and made Gimbutas's descriptions of Stone Age culture and reli-

gion vividly three-dimensional. At the same time, however, her synthetic approach is also what made her work so problematic.

Gimbutas's hypotheses assumed a distinctive shape over time. By the end of her life she was able to present a congruent picture of Neolithic civilization in her late publications, *The Language of the Goddess* (1989) and *The Civilization of the Goddess* (1991). She introduced one of her most important theories as early as 1956 at an international conference in Philadelphia. She claimed that the early and, as she believed, highly unified agricultural civilization of southeastern Europe was destroyed by mounted herdsmen and warriors, whom she named "Kurgan people" after the Russian word *kurgan*, meaning "hillock." Gimbutas hypothesized that the Kurgan people were Indo-Europeans who entered Europe from 4000 BCE onward and brought their patriarchal hierarchies with them—a type of social structure that had previously been unknown in southern Europe but soon gained ascendance there.

EVALUATIONS OF GIMBUTAS'S WORK. The Kurgan theory plays a crucial role in Gimbutas's large-scale ideas about European prehistory, for it provides an explanation for the disappearance of what she called "Old Europe"—a presumably matriarchal and goddess-worshipping civilization that was overcome by newer forms of social structure dominated by patriarchal structures and beliefs. It is not easy, however, to reconstruct the evolution of her ideas about the organization of a civilization called "Old Europe."

The main criticism of Gimbutas's work concerns her methodological inaccuracies. Nowhere did she ever inform her readers about the ideas she drew on or the tools she used for her reconstruction of cultural and religious meaning in prehistory—a period for which there are virtually no extant written historical sources. Gimbutas seems to have been acquainted with G. W. F. Hegel's philosophy of history and certainly with J. J. Bachofen's ideas but cites them nowhere in her work. Moreover she never once addressed the obvious similarities between her own work and the concepts of these two cultural theorists. Instead, she insisted that she gained her insights solely from archaeological materials that revealed to her an inherent "archaeomythology"—although she constantly referred to folklore from much later periods for parallels to supposedly prehistoric ideas. In addition Gimbutas's belief that cultural change can only have been brought about through military invasions by the Kurgan people—while at the same time ignoring other possible explanations—point to an oversimplified Darwinian view of history. Consequently the byways of Gimbutas's epistemological journeys seem to have been completely unclear to her throughout her career. In various interviews she claimed intuition as an important source of her information but did not offer the interviewers any further explanation of the connections between her intuitive ideas and the archaeological materials.

Gimbutas had initially been interested in determining the origins of culture in the Baltic area, but as she worked

her archaeological investigations widened into an exploration of the general origins of a Pan-European prehistoric culture. In the course of her research she reached out far over the East and later the whole of Europe, where she detected an antagonism between the kind of Bronze Age culture imported by the assumed Indo-Europeans, or Kurgan people, and the previous Stone Age culture of "Old Europe." The latter term was meant to designate a homogeneous culture of Neolithic agricultural societies that emerged in eastern and central Europe in the seventh millennium BCE and in western Europe during the fifth millennium BCE. Gimbutas assumed the existence of important connections between these European societies and parallel developments in Asia Minor.

Gimbutas thought that her theories about archaeomythology allowed her to explain the symbolism of a vast amount of archaeological materials from different periods and different regions of prehistoric Europe. Archaeomythology as a scholarly methodology, however, is viewed as highly problematic by most contemporary archaeologists and prehistorians. Gimbutas drew together numerous unconnected discoveries and interpreted the finds in the light of much later written sources and folkloric artifacts. Neither her concept of a Kurgan people nor her belief in a unified and coherent Stone Age culture in "Old Europe" has been accepted by mainstream academia. Nevertheless Gimbutas herself had a firm interest in Neopaganism, and her ideas are extremely popular in certain feminist circles in the early twenty-first century. They have made substantial contributions to contemporary beliefs about goddess-centered cultures. In the early 2000s Gimbutas's most prominent successor, Joan Marler, teaches archaeomythology at the California Institute of Integral Studies in San Francisco.

As an inspiration for alternative religions in the early twenty-first century, Gimbutas's books are also of special interest to students of contemporary belief. Gimbutas seemed to project recent ideas and ideals into a remote past insofar as she detected primary religious concerns for peace and ecology in Stone Age culture. According to her interpretation, the religion of Stone Age people revered a monotheistic goddess who could appear in many forms. Gimbutas understood "the Goddess" as a representation of the generative as well as the destructive forces of nature. Her entire research focused almost exclusively on statuettes and figurines that she had detached from their archaeological contexts and interpreted in light of her goddess theory.

Gimbutas constructed an ingenious picture of the Stone Age religious mind-set that will probably never be proven entirely right or wrong as a result of the lack of written sources that could explain the meanings of Neolithic figurines, symbols, and icons. The application of later testimonies to these artifacts is certainly questionable. In favor of Gimbutas's approach, however, such testimonies often offer the only possibility for the researcher to make some sense of prehistoric archaeological materials. In any case Gimbutas's lifework provides a wealth of materials and provocative stimuli for

readings of Stone Age religions. One particular problem that arises in assessing Gimbutas's work is that Gimbutas herself remained unaware of her own inclinations toward nineteenth-century theories about the history of culture and the inner dynamics of cultural developments. Shorn of this important background, her ideas may seem to be simply quixotic. Equally importantly her work tends to be either defended or rejected out of hand with little attention to the support that subsequent scholarship might offer. An appropriate challenge for the future would be a careful review of Gimbutas's ideas in the light of contemporary discussions of cultural theory.

BIBLIOGRAPHY

Gimbutas's lifework is summarized in her two late and highly influential books, *The Language of the Goddess* (San Francisco, 1989) and *The Civilization of the Goddess* (San Francisco, 1991). An important earlier monograph is *The Gods and Goddesses of Old Europe 7000 to 3500 BC: Myths, Legends and Cult Images* (San Francisco, 1974). The title was changed in the second edition to *The Goddesses and Gods of Old Europe* (San Francisco, 1982). Appreciations of her approach are included in Joan Marler, ed., *From the Realm of the Ancestors: An Anthology in Honor of Marija Gimbutas* (Manchester, Conn., 1997), and in a collection of articles in the *Journal of Feminist Studies in Religion* 12, no. 2 (1996). Substantial criticism from mainstream archaeology is summarized in Brigitte Röder, Juliane Hummel, and Brigitta Kunz, *Göttinnendämmerung: Das Matriarchat aus archäologischer Sicht* (Munich, Germany, 1996).

GINĀN. A popularization of the Sanskrit word *jñān* ("contemplative knowledge"), the term *ginān* is used by the Nizāri Ismā'īliyah of Indo-Pakistan to refer to any one of the approximately eight hundred poems believed to have been composed by the Ismā'īlī *pirs* or *dā'īs* ("missionaries") between the thirteenth and early twentieth centuries. Composed in several Indian dialects and employing popular folk meters and indigenous musical modes, the *gināns* vary considerably in length. The shortest ones consist of four to five verses, while longer ones, called *granth*s and distinguished by specific titles, may have well more than a thousand verses. The *gināns* are still sung and recited today as an integral part of religious ceremonies. Usually all members of the community who are present at such ceremonies participate in the recitation of the *gināns*.

The *gināns*, which often have several themes, may be classified into five major types according to the theme of greatest importance:

- (1) "Conversion" *gināns* portraying Islam and specifically

its Ismā'īlī form as the completion of the Vaiṣṇava Hindu tradition, and also including accounts that give Ismā'īlī dimensions to traditional figures of Hindu mythology as well as hagiographic accounts of the great Ismā'īlī *pirs* (the *Das Avatar*, for example).

- (2) *GINĀNS* dealing with a wide variety of eschatological and cosmological themes (such as *Brahmā Gāyatrī*).
- (3) Didactic *gināns* imparting ethical and moral instruction for the conduct of worldly and religious life (such as *Moman Chetāmaṇī*).
- (4) *GINĀNS* connected with mysticism, including guides for an individual's spiritual progress, literary expressions of the composers' mystical experiences, and petitions for spiritual union or vision (*Anant Akhādo* and *Satveṇī*, for example).
- (5) *GINĀNS* for recitation at certain religious rituals or at specific festivals such as the birthday of the Prophet or the Ismā'īlī imam, Nawrūz (New Year), and so forth (*Nawrūznā dīn sohāmaṇā*, for example).

GINZA. Among their many books, the Gnostic Mandaeans of Iraq and Iran rank the voluminous *Ginza* ("treasure"), their "holy book," as the most important. It is studied by priests, and its presence is required at the performance of the major Mandaean rituals. In the seventh century of the common era, during the Islamic conquest, the Mandaeans assembled the *Ginza* in order to gain status as a "people of the book," allowed to resist conversion to Islam. The work, separated into *Right Ginza* and *Left Ginza*, contains a number of myths concerning the creation of the world and of human beings, descriptions of the human lot on earth, moral teachings, polemics against other faiths, and hymns. In Mandaeism generally, "right" and "left" are connected to the otherworldly and the earthly realms, respectively. However, in the case of the two parts of *Ginza*, the designations seem to contradict this pattern, for *Right Ginza* contains a great deal of cosmogonic and anthropogonic material, while the left part deals with the otherworldly fate of the soul.

Left Ginza, which has been called a "book of the dead," falls into three parts. *Left Ginza* 1.1–2 describe the death of Adam, who is reluctant to leave behind his body as well as his wife and children. Part 1.4 portrays the soul's journey

through the purgatories (*matarata*) between the earth and the Lightworld, the pristine upper world. The last two parts are composed of hymns for the soul rising to the Lightworld after the death of the body. The hymns of the twenty-eight sections of *Left Ginza 2* concentrate on the complaints of the soul (here, *mana*, “vessel”) in the earthly world. A helper is sent from the Lightworld to aid the soul. Some of the sixty-two *Left Ginza 3* hymns are among the ritually used death-mass (*masiqta*) hymns, the oldest datable texts in Mandaeism (c. third century CE). Thus, these cultic texts testify to the antiquity of the *masiqta*, the “raising up” ceremony for the soul and the spirit at the death of the body.

In *Right Ginza*, helper figures command a central position. Two main envoys are Manda d-Hiia and Hibil, although a large tractate, *Right Ginza 15*, portrays several other messengers. In *Right Ginza 5.1*, Hibil descends to the underworld prior to the creation of the earth, in order to prevent an attack on the Lightworld by the powers of the underworld. He returns with Ruha, the spirit, the vital element necessary for human and earthly life. Extensive stories about the creation of the world and the human lot are found in *Right Ginza 3* and 10. John the Baptist, the Mandaean prophet, expounds his teachings in *Right Ginza 7*. In view of the use of the Arabic form *Yahya* for John in this text, it was probably written in the seventh century. Polemics against Judaism, Christianity, Islam, and other religions characterize *Right Ginza 9.1*, and moral instructions and warnings against surrender to evil powers recur in *Right Ginza 1, 2, 8, 13, 16, and 17*. *Right Ginza 18*, written in the seventh century, is a Mandaean “history of the world” that ends in an apocalypse. This tractate closes *Right Ginza*.

Several European libraries possess *Ginza* manuscripts. The oldest, in the Bibliothèque Nationale in Paris, dates from 1560. In 1867, Heinrich Petermann published a largely useless edition and translation of *Ginza*. Mark Lidzbarski's 1925 version remains thus far the classical edition and translation. The new translation of *Ginza* undertaken by Kurt Rudolph will take into account the many discoveries of Mandaean texts and the advances made in studies on Mandaeism since Lidzbarski's time.

SEE ALSO Manda d'Hiia; Mandaean Religion.

BIBLIOGRAPHY

The most reliable edition and translation of the Mandaean “holy book” was published in German under the editorship of Mark Lidzbarski as *Ginza: Der Schatz; oder, Das grosse Buch der Mandäer* (Göttingen, 1925; new edition in preparation by Kurt Rudolph). Representative *Ginza* material is included in *Gnosis: A Selection of Gnostic Texts*, vol. 2, *Coptic and Mandaean Sources* (Oxford, 1974), edited by Werner Foerster. Kurt Rudolph's *Theogonie, Kosmogonie und Anthropogonie in den mandäischen Schriften* (Göttingen, 1965) offers a historical analysis of the traditions portrayed in the *Ginza* tractates. For his most recent view on *Ginza*, one may consult Rudolph's “Die mandäische Literatur,” in *Zur Sprache und Literatur der Mandäer: Studia Mandaica I* (Berlin, 1976), edited by Rudolf Macuch.

JORUNN JACOBSEN BUCKLEY (1987)
Revised Bibliography

GINZBERG, ASHER. Asher Ginzberg (1856–1927), best known by his pen-name Ahad Ha'am (meaning, literally, “One of the People”) was the most influential intellectual in the Zionist movement in its formative years in the late nineteenth and early twentieth centuries. He produced, in the form of many highly influential Hebrew-language essays, a thorough-going reassessment of Judaism that deemphasized the centrality of religion and saw culture, writ large, as the true basis for Jewish life in the past and present. Born in Skvira, Ukraine, he was raised on a rural estate as a Hasidic prodigy, but by his early thirties he was able to read Russian, English, French, and German and was a Jewish nationalist devotee of Herbert Spencer and John Locke. His life was spent mostly in Odessa, London, and Tel Aviv (where he died), and he worked as a businessman, an editor, and, eventually, as a tea company manager. He served on the executive committee of the proto-Zionist Hovevei Zion, founded in the mid-1880s. He was also the founding editor of the influential Hebrew-language journal *Ha-Shiloach* and a close advisor to Chaim Weizmann (1874–1952) in the negotiations leading to the Balfour Declaration of 1917. He vigorously denied an interest in political leadership, insisting that his public activity—even his extensive journalistic work—had been thrust upon him unwillingly. But his aspirations were considerable, and at their core was the desire to reconstruct the spiritual and political foundations of contemporary Jewish life.

For several decades after the publication in 1889 of his first significant published article, “Lo zeh ha-derekh” (This is not the way), Ginzberg was Hebrew's most important essayist. His spare, ironic prose set new standards, and his Jewish nationalist teachings were vigorously promoted and debated, lacerated, and celebrated. He communicated a program that drew at one and the same time on the modernist presumptions of the Jewish enlightenment and the social optimism of European liberalism, and that managed to promise Jewish authenticity shorn of theology but inspired by aspects still more basic and enduring as taught, as he saw it, by history. At its core his was an extended, if eclectic philosophy of history.

It was culture, he argued, that had held the Jews together, with their faith in the paramount importance of intellect and an uncompromising belief in justice. These features of Jewish culture permitted it to accommodate itself to outside

influences without losing itself. Hence, Jewish history was a tale of principled, dexterous accommodation to cultures that Jews made their own, but this ability was, increasingly, lost to them in modernity.

Overwhelmed already in the West by political emancipation and concomitant assimilation (which, he believed, was beginning to make substantial inroads in Eastern Europe, too), Jews had to deflect this onslaught without rejecting modernity. Hence, a Jewish homecoming was essential, with Jews returning to their original, creative site in the land of Israel. There, in a Hebrew-speaking milieu they would build a “spiritual center” (as he came to call it) that would grow into a self-sufficient economic and political entity. Its influence would recast Judaism elsewhere, transforming it from an increasingly moribund faith into a vibrant national culture.

Zionism as promoted by Theodor Herzl (its leader—and Ahad Ha’am’s chief nemesis—from 1896 to his death in 1904) was shortsighted in its stress on diplomacy and tone deaf to Jewry’s paramount cultural needs. Not anti-Semitism, as Herzl argued, but the prospect of Jewish cultural absorption in a larger, dangerously open society was the most critical prospect facing the Jewish people.

A key to Ginzberg’s abiding reputation is his having been the first Zionist of stature to highlight the darker side of Arab-Jewish relations in Palestine. He insisted that what others saw at the time as merely skirmishes between Jews and Arabs were, in fact, threats to the Jewish nationalist enterprise and that this resistance must dampen Jewry’s more ambitious and unrealistic claims. As early as his 1891 essay “Emet me-eretz yisarel” (Truth from the land of Israel), he argued that the brutal treatment of Arabs by some Jews was itself a tragic, potentially disastrous response to Jewish subjugation; if left unchecked, such behavior could devastate Zionism. The weight he gave to this issue—especially in the last decade of his life—placed it, albeit tenuously, on the Zionist agenda.

Ginzberg’s impact was extensive but also equivocal. He sought at first to build a political movement in the form of a semi-secret group called the Bnei Moshe (The Sons of Moses) that would recast the priorities of Jewish nationalism as a whole. This exercise failed in its political aspirations but left a considerable imprint on the thinking of many of Zionism’s most influential figures, including Chaim Weizmann and Martin Buber.

Ahad Ha’am had a major impact on others, too, especially on those who shaped modern Judaism’s cultural priorities. Devotees included Hayyim Nahman Bialik (1873–1934), the most important Hebrew poet in Zionism’s classical period; the founder of Qabbalah studies, Gershom Scholem (1897–1982); and the first chancellor of Hebrew University, Judah Magnes. Ahad Ha’am was embraced as a primary inspiration by prestate bi-nationalists (who at their most radical phase eschewed the prospect of Jewish majority

rule for Jews), and the American Reconstructionist religious movement of Mordecai Kaplan (1881–1983). In Israel, Ginzberg became best known, arguably, as an exemplary craftsman of Hebrew whose prime clientele, for many years, was schoolchildren taught to emulate his style.

Ginzberg raised many more questions than he answered. He was best as a critic, and while he sought to write a full-length book encapsulating his understanding of Jewish ethics, it was never written. Still, his many essays provide a framework for an ethically informed, self-consciously Jewish, modern political terminology. His insights continue to influence political debates over Zionism, Jewish theology, and conceptions of Jewish culture, its boundaries, and its prospects.

STEVEN J. ZIPPERSTEIN (2005)

GLASENAPP, HELMUTH VON (1891–1963), was a German Indologist. Von Glasenapp was born in Berlin to a “cheerful and gregarious” father who, though a lawyer and banker, was known as an expert on Goethe, and an art-loving mother who “tended to take everything in life seriously” (Glasenapp, 1964, pp. 11–12). As a scholar of Indian religions, Otto Max Helmuth von Glasenapp would come to embody these same traits of communicativeness, broad-mindedness, and care, and, indeed, to prescribe them as necessary features of Indological research.

An event of such “decisive significance” that he recalled the exact date—June 30, 1908—occurred when von Glasenapp was not yet seventeen years old (Glasenapp, 1964, p. 28). He walked into a bookstore in Berlin and purchased the works of the German philosopher, Arthur Schopenhauer (1788–1860). The impressionable young scholar was so taken by Schopenhauer’s high regard for Indian philosophy and religion, especially Buddhism, that he began reading widely in those fields. Although, two years later, von Glasenapp would enroll as a law student at Tübingen, he continued to pursue his interest in Indology, and beyond. In addition to his coursework in law, he visited seminars in Western philosophy and, under the Indologist Richard Garbe, the history of religions (*Allgemeine Religionsgeschichte*). Continuing his studies at Munich, von Glasenapp took courses in Sanskrit and Pali, as well as in psychology, economics, literature, classics, and theology. Von

Glasenapp's studies culminated in what he called "Benares on the Rhein" (Bonn) in 1914 with a doctoral dissertation under Hermann Jacobi, "Die Lehre vom Karman in der Philosophie der Jainas nach den Karmagranthas dargestellt," and finally, a *Habilitationsschrift* in 1918, also under Jacobi, entitled *Madhvas Philosophie des Vishnu-Glaubens*.

Von Glasenapp's subsequent career commenced in Berlin in 1920 as *Privatdozent*. During this period, he published *Der Hinduismus* (1922), *Der Jainismus* (1925), and *Brahma un Buddha: Die Religionen Indiens in ihrer geschichtlichen Entwicklung* (1926). In 1928 he was called to the professorship of Indology at Königsberg. This productive period saw the publication of nearly a dozen books, including the influential *Der Buddhismus in Indien und im Fernen Osten* (1936) and a pioneering study of esoteric or Vajrayāna Buddhism, *Buddhistische Mysterien* (1940). Although the *Rektor* of the university at Königsberg, one Professor von Grünberg, was an avid Nazi, von Glasenapp was spared the fate of his Jewish colleagues and many others who, like himself, refused to join the party. Von Glasenapp subscribes this good fortune to his "calm demeanor and isolated discipline" (i.e., Indology), as well as to his reputation as an abstracted and "unworldly" (*weltfremd*) scholar (Glaseapp, 1964, p. 155).

In 1946 von Glasenapp was called back to where he had begun, the university at Tübingen, for the final phase of his career. By the time he retired in 1959, he had published numerous additional books, including *Die Philosophie der Inder* (1949), *Vedānta und Buddhismus* (1950), and *Buddhismus und Gottesidee* (1954). In all, von Glasenapp's publication record includes a staggering output of 692 books, articles, book reviews, book chapters, *Festschrift* contributions, editions, and newspaper features. Helmuth von Glasenapp died in June 1963 from injuries sustained in an automobile accident.

The greatest legacy of von Glasenapp remains unfulfilled. In his posthumously published autobiography, *Meine Lebensreise: Menschen, Länder und Dinge, die ich sah* (literally, "My Life's Journey: People, Countries, and Things that I Saw"), von Glasenapp articulates a vision of Indology that combines the talents of "those who can read the texts, but don't know what they say" and those who "understand the contents, but can't translate them" (Glaseapp, 1964, p. 294). Von Glasenapp saw this as an unfortunate rift in the way that Indology was practiced. On the one side are those scholars for whom the linguistic structure (*sprachliche Form*) of a text is the most important matter; on the other side are those for whom the sole matter of scholarly interest is the intellectual-cultural content (*geistig-kulturelle Inhalt*). Aware of German Indology's origin in comparative linguistics, von Glasenapp discouraged the philologists of his day from living up to their reputation as practitioners of "the science of the trivial" (*die Wissenschaft des Nicht-Wissenswerten*) (p. 298). This reputation, he argued, stemmed from their "preference for things that do not contribute to the realization of the intellectual content" of a work (p. 298). A rich and stimulating

Indology, by contrast, is one in which the scholar cultivates various methods of research culled from a variety of disciplines, and then skillfully transmits the results to his readers. As examples of this craft, von Glasenapp cites the "great Indologists" of an earlier generation: Max Müller, Albrecht Weber, Richard Pischel, Hermann Jacobi, and Heinrich Lüders. As these examples indicate, von Glasenapp envisioned an Indology that indeed valued linguistic rigor, but placed it in the service of "the great goal—of making comprehensible an alien way of thinking" (p. 302).

BIBLIOGRAPHY

In his autobiography, *Meine Lebensreise: Menschen, Länder und Dinge, die ich sah* (Wiesbaden, Germany, 1964), the interested reader will find a multilayered account of von Glasenapp's extensive travels, studies, career, and personal observations on numerous social and intellectual topics. Zoltán Károlyi's *Helmuth von Glasenapp: Bibliographie* (Wiesbaden, Germany, 1968) provides an exhaustive list of von Glasenapp's writings, as well as literature, newspaper articles, magazine pieces, and other items, on von Glasenapp. For a summary of von Glasenapp's most important works, see Jacques Waardenburg's *Classical Approaches to the Study of Religion: Aims, Methods, and Theories of Research*, vol. 2: *Bibliography* (The Hague, 1974), pp. 89–91. Virtually all of von Glasenapp's works are exclusively in German. The English-speaking reader may refer to von Glasenapp's *Buddhism and Comparative Religion and Other Essays* (Kandy, Sri Lanka, 1967).

GLENN WALLIS (2005)

GLOBALIZATION AND RELIGION. Globalization refers to the historical process by which all the world's people increasingly come to live in a single social unit. It implicates religion and religions in several ways. From religious or theological perspectives, globalization calls forth religious response and interpretation. Yet religion and religions have also played important roles in bringing about and characterizing globalization. Among the consequences of this implication for religion have been that globalization encourages religious pluralism. Religions identify themselves in relation to one another, and they become less rooted in particular places because of diasporas and transnational ties. Globalization further provides fertile ground for a variety of noninstitutionalized religious manifestations and for the development of religion as a political and cultural resource.

GLOBALIZATION. The term *globalization* is of quite recent provenance. It first appeared in the business and sociological literature of the 1980s, but by the end of the century it had become a broadly invoked expression in both academic and popular discourse around the world. Along the way, it has acquired a variety of meanings that it is well to understand at the outset. They share the common element implied in the word: all parts of the world are becoming increasingly tied into a single, globally extended social unit. Among the variants, however, by far the most widespread sees globalization primarily in economic terms, referring mostly to more

recent developments in the operation of global markets, capital, and multinational corporations. A related view adds mass media and cultural components to the economic dimension, stressing the degree to which primarily Western, and especially American, firms have been spreading their products and way of life to all corners of the world. Economic globalization therefore focuses on the ways that global capitalism incorporates the world's regions into a single system. The role of states informs a further perspective, one that concentrates on global or international political relations, usually with a parallel emphasis on the hegemonic power of Western countries. Individual states, in this frame of analysis, appear as the primary actors in a globally extended system of such states.

In all of these versions, there are those variants that regard the process as a quite recent development and others that locate its beginnings decades and sometimes centuries in the past. There are also differences of opinion as to whether the process is generally good or mostly bad. Much of the literature is in fact quite critical, seeing the global as a kind of homogenizing imposition on the local, a development in which the strong, overtly or insidiously, presume their ways upon the comparatively weak, dominating or excluding the latter. A further approach to globalization, however, looks at this contrast of the global and the local differently, laying less stress on homogenizing economic and political institutions that impose themselves from above and rather more on local and global movements, networks, and organizations that also contribute to making the world more of a single place, sometimes parallel to the more hegemonic institutions, sometimes in consonance with them, sometimes even in express opposition to them. This sort of globalization from below focuses on a wide variety of phenomena, from international nongovernmental organizations and networks among global migrants to antiglobalization, women's, and environmental movements. In part to distinguish this sort of globalization from the economic and political kind, some literature speaks in this regard of the development of a transnational civil society. Moreover, perspectives of this sort stress the renewed importance of cultural differences under conditions of globalization. The world is not just becoming the same; it is also becoming more pluralistic. It is almost exclusively under this meaning of globalization that religion appears as part of the process rather than as either irrelevant bystander or victim.

Various scholars have offered interpretative theories of globalization. Often these theories correspond closely to one of the dominant meanings of the term. One finds, for instance, theories of the global capitalist economic system or of the global state political system. Several efforts, however, seek to incorporate the various meanings as different aspects of a single process, often thereby setting the global and the local in dialogical relation rather than in opposition to one another. These approaches argue that local adaptations of globalized structures like capitalism, nationalism, or mass media are actually constitutive of the global; that globaliza-

tion is not properly understood if we think of it only as a kind of imperialistic spread from one region to the rest of the world. In other words, the particular ways that people in different parts of the world—including those in rich Western countries—have responded to the context of globalization are what globalization is all about. Global factors become global by being localized or particularized around the world, and the local thereby takes on potentially global or universal significance. Among the many implications of such a perspective is that what are sometimes called global flows? (of people, ideas, information, products, and other forms) do not go just in one direction, say from America and Europe out to the rest of the world. They also move the other way (reverse flows) and among regions other than the powerful Western ones (cross-flows). Thus, for example, African musical styles and Asian martial arts have a significant effect on North American and European art and culture; and migrants from Indonesia and Bangladesh seek work in the Middle East, all the while maintaining links and sending remittances to their home countries. These relations also contribute to globalization—are in their own way just as constitutive of it as Coca-Cola and the World Bank.

RELIGION AND GLOBALIZATION. The dialogical approaches to globalization, in conjunction with those that stress globalization from below, are of special significance when it comes to the topic of religion. By far the greatest portion of the by now vast literature on globalization completely or almost completely ignores religion, the partial exception being the attention that Islamicist political extremism receives. This absence can perhaps be attributed to the dominance of economic and political understandings of globalization, including among those observers who look at the phenomenon from within religious traditions. Yet even though a great many of the works that focus on globalization from below—for instance, much of the literature on global migration and ethnicity—also gives religion scant attention, it is among these approaches that one finds almost all the exceptions to this general pattern, probably because these are the only ones that, in principle, allow non-economic or nonpolitical structures like religion a significant role in globalization.

Consideration of the relation between religion and globalization involves two basic possibilities. There are, on the one hand, religious responses to globalization and religious interpretations of globalization. These are, as it were, part of doing religion in a globalizing context. On the other hand, there are those analyses of globalization that seek to understand the role of religion in globalization and the effects of globalization on religion. They focus on observing religion in a global society. By far the largest portion of the literature that relates religion and globalization is of the former sort, and therefore it is well to begin there.

RELIGIOUS PERSPECTIVES ON GLOBALIZATION. A great many religious commentators understand globalization as at once a largely economic, imperialistic, and homogenizing process. They share the economic/mass cultural/political per-

spective, evaluating globalization as anywhere from a threatening challenge to the manifestation of evil in our world. In many respects globalization in this segment of the literature is a successor term for what used to be censured as the capitalist system or cognate terms. Accordingly, globalization results in violence and the unjust oppression of the majority of people around the world. It threatens local and indigenous cultures, imposing a particularly heavy burden on women. It is the chief cause of global and local environmental degradation, again to the principal detriment of the mass of marginalized humanity. Such theologically inspired positions are not restricted to the representatives of a particular religious tradition. Thus, for example, Christians, Buddhists, Muslims, Jews, and those speaking from indigenous traditions all arrive at similar critical assessments of globalization. And far from being a characteristically religious perspective, such arguments are quite common in the overall literature, whether recognizably religious or not. What they imply, among other consequences, is that religion and religious sensibilities are at root outside of and contrary to globalization, that globalization and religion are fundamentally incommensurate. Another segment of both the religiously inspired and the secular literature, while often sharing many of the negative judgments, nonetheless sees a much closer relation between the two. As noted, these observers almost invariably share the broader meanings of globalization, especially the dialogical and from below perspectives.

Religious insider perspectives do not necessarily limit themselves to opposition, however. Some theologically oriented observers argue that religion has an essential role in shaping globalization; that the negative outcomes of globalization point to the need for a positive global ethic, which religions can provide. The efforts led by Hans Küng in this direction are perhaps the most well known. For Küng, not only does the globalized world require a guiding global ethic, but key to the development of that ethic is harmonious relations and dialogue among the world's religions. The combination signals a dialogical understanding of globalization that Küng shares with many other observers. Here it applies to religion: the globalized whole depends for its viability on the contribution of religion, yet this contribution presupposes a plurality of particular religions that come to understand themselves in positive relation to one another. Unity and diversity are both constitutive of the global. This core assumption of Küng's Global Ethic Project points to general features of how those contributions to the globalization debate that do not ignore religion have sought to understand its role in the process: as an important dimension of globalization that exhibits the characteristic dynamic tension between global and local, between homogeneity and heterogeneity, between the universal and the particular.

RELIGION AND RELIGIONS IN GLOBALIZATION. Globalization perspectives seeking to include religion have taken several directions of which the following are likely the most significant. Certain approaches analyze religion as a global or transnational institution, whose diverse manifestations oper-

ate to a large extent independently of economic and political structures and that bind diverse regions of the world together in ways comparable to global trade, international relations, mass media, sport, communications media, or tourism. A second but related focus of observation is the role that religious systems play as powerful cultural resources for asserting identity and seeking inclusion in global society, especially among less powerful and marginalized populations. It is in this context that religio-political movements, including so-called fundamentalisms, receive the most focused attention. A third strategy goes even further, attempting to show how the formation, reformation, and spread of religions have been an integral dimension of globalization as such. From this angle, what we today conceive as the most typical forms of religion and even the typical understandings that we have of religion are themselves outcomes and reflections of the historical process of globalization. Although these three directions are by no means mutually exclusive, for the sake of presentation they can be treated separately. Each implies a somewhat different theoretical emphasis, and each also tends to focus on different empirical manifestations of religion in our world.

RELIGION AS TRANSNATIONAL INSTITUTION. The relative absence of religion from many globalization perspectives and theories is in some respects quite surprising, especially when one looks at the issue historically. Of the forces that have in the past been instrumental in binding different regions of the world together, in creating a larger if not exactly a geographically global system, economic trade and political empire have certainly been the most obvious; but in conjunction with these, it is equally clear that what we today call religions have also at times played a significant role. Hindu civilization at one time spread throughout South and Southeast Asia. Buddhist teaching and monastic traditions linked together the vast territories from Sri Lanka and the Indian subcontinent, through Afghanistan and China to Korea, Japan, and most of Southeast Asia. In the early Middle Ages the Christian church was the only institution that overarched and even defined as a single social unit that northwestern portion of the Eurasian landmass known as Europe. And this largely over against its neighbor, Islam, which by the twelfth century CE had succeeded in weaving a socio-religious tapestry that extended from Europe and sub-Saharan Africa through all of Asia into the far reaches of Southeast Asia. It informed without doubt the largest world system before the arrival of the modern era.

Yet perhaps most important in this regard is that, as the European powers expanded their influence around the globe between the sixteenth and twentieth centuries, thus setting the conditions for contemporary truly worldwide globalization, Christian religion and Christian institutions were throughout that entire period key contributors to the process. The churches accompanied European colonizers in Africa, the Americas, and Australasia; Christian missions, whether independently or in conjunction with secular authorities, sought conversions in all corners of the globe. In

consequence, today the vast majority of globally extended religious institutions are in fact Christian organizations and movements. A wide variety of these include, for instance, the Roman Catholic Church (along with many of its religious orders), several Protestant and Eastern Orthodox churches, the World Council of Churches, Seventh-day Adventists, the worldwide Pentecostal movement, and Jehovah's Witnesses. Christian missions still crisscross the world: American missionaries are to be found in Latin America, Africa, and Asia; African and Latin American Christians conduct missions in Europe and the United States; Australians serve in India; South Koreans are a major presence in southern Africa; and everyone is trying to spread the word in the countries of the former Communist bloc.

Although Christian establishments thus dominate numerically, they are far from being alone among transnational religious institutions. Muslim movements and organizations such as the Sūfī and neo-Sūfī *ṭarīqah*, or brotherhoods (for example, Naqshbandīyah, Murīdīya, Qādirīyah), reform movements like the Pakistani Tablighi Jamaat and the Turkish Milli Görüş, and unity foundations like the World Muslim Congress or the World Muslim League are broadly established in different regions. They are far from negligible in importance. Buddhist organizations such as the Foguangshan or the Sōka Gakkai have a worldwide presence as do Hindu movements like the Ramakrishna Math and Mission, the Vishva Hindu Parishad, and the Sai Baba movement. Parallel examples could be mentioned for other both major and minor religions ranging from Judaism, Sikhism, and Bahā'ī to Mormonism, Scientology, and the Brahmā Kumaris.

The specific literature on any of these is fairly substantial. Yet with some exceptions, notably Christian manifestations like the Roman Catholic Church and Pentecostalism, globalization perspectives have not concentrated on these perhaps most obvious of global religious forms as a characteristic dimension of the globalization process. Instead, a growing literature has been focusing on religion in the context of global migration. The more or less permanent displacement of large numbers of people from diverse regions and cultural backgrounds to many other parts of the world, but notably from non-Western to Western countries, has like few other phenomena brought home to an increasing range of observers just how much humanity is now living in a single world where identity and difference have to be renegotiated and reconstructed. Dialogical theories of globalization and those that stress globalization from below have been particularly apt to analyze the consequences of global migration, but the issue is not missing from many that understand globalization primarily in economic or political terms. Like global capitalism or international relations, this question is not susceptible to easy understanding on the basis of theories that take a more limited territory, above all a nation-state or a region like Europe, as their primary unit of analysis. In the context of the various other structures that make the world a smaller

place, global migrants in recent times maintain far stronger and more lasting and consequential links with their countries of origin. Globalization approaches allow a better understanding of why they have migrated, what they do once they migrate, and the dynamics of their integration or lack thereof into their new regions.

Given that religious institutions, religiously informed worldviews, and religious practice are so often instrumental in these processes, the growing number of efforts to understand religion's role among global migrants is not surprising. Such contributions have focused on the concrete religious institutions of the migrants in their new homes, the immigration and integration policies and attitudes of the host countries, the transnational links and flows that the migrants maintain, and the influence of these diasporic communities on the global religions that are usually involved. Not infrequently in such analyses, the sorts of transnational religious organizations and movements just mentioned are salient topics, since the migrant communities are often instrumental in bringing about, developing, and maintaining their global character. Thus, for instance, we have consideration of Senegalese *murīd* presence in the United States, Taiwanese Foguangshan establishments in Canada, Turkish Süleymanli communities in Germany, Tablighi Jamaat mosques in Great Britain, Japanese Buddhist temples in Brazil, as well as African or Latin American Pentecostal churches in North America and Europe. As this illustrative list demonstrates, the bulk of this literature reflects the fact that it is people in Western countries that carry out most of such globalization analyses. This imbalance needs yet to be corrected. Nonetheless, the examples do demonstrate one of the important ways that globalization perspectives are being applied to religion, and conversely how the analysis of religion is coming to inform theories of globalization themselves. Moreover, the consideration of the role of transnational religious institutions in the context of global migration already implicates the second way that religion has been understood as a significant contributor to globalization processes, and that is as a cultural, but especially political resource.

RELIGION AS CULTURAL AND POLITICAL RESOURCE. People who migrate from one part of the world to another in search of a better life often depend on their religions and their religious institutions to address an array of attendant problems. Religion can furnish them with a strong sense of identity and integrity in a situation where they may be strangers. Churches, temples, mosques, *gurdwaras*, and synagogues can serve as a home away from home where one can speak one's language, eat one's food, congregate with people who share one's situation, and even attain a measure of status that one is denied in the new host society. For many poorer migrants, religious institutions offer vital social services that make survival and establishment in the new land even possible. They may also provide a principal conduit for maintaining ties with the places of origin. In these circumstances religion both is the means for global connectivity and makes up important content of global flows. Globalization affords condi-

tions for the elaboration of new and expanded transnational establishments whose primary reason for existence is religious but that also serve an array of other purposes. They are at the same time, however, important local institutions, places where people go in their everyday lives for everyday reasons. Thus, to take but one example, a Christian church founded by Mexican migrants in Atlanta is an important community resource for its participants, but it may also have ties with the church back in the Mexican village from which most of them originate, providing financial and other resources for that village church as well. The religious institution properly speaking includes both localities and is not properly understood unless one takes both into consideration. Globalization perspectives afford that inclusive view.

The role of religion in providing, broadly speaking, cultural resources in a global context is not limited to the situation of migrants, however. Globalization, irrespective of which meaning one favors, implies a kind of compression of space in which the upheaval and uprooting characteristic of the migratory experience are the lot of a great many of the world's people, whether they leave their homes or not. Parallel circumstances in Africa and Latin America can serve to make this similarity clear. Both these continents have large regions and large populations that are effectively excluded from the main globalized power structures, yet their lives are nonetheless profoundly affected by them. Religion and religious institutions are important resources for responding to the situation. In Latin America, for instance, one reason for the rapid rise of Pentecostal Christian churches along with significant growth among Afro-Brazilian religions like Candomblé and certain Roman Catholic movements is that these institutional religious forms provide people with ways of understanding themselves and coping in a world where their situation is changing and often precarious. They afford people narratives with attendant life practices by which they can give themselves a meaningful and dignified place in this world. Religion lends them a measure of power. Even more clearly, in sub-Saharan Africa above all Christian and Islamic organizations, centers, networks, and movements offer large numbers of people at least some access to an institution that actually functions reasonably to their benefit. Although they are localized institutions and largely in the control of local people, a far from insignificant part of the appeal of these religious establishments is that they have links to and represent access to the wider globalized world. This has always been one of the attractions of both Christianity and Islam; they have in effect been global religions for many centuries. In today's world they continue to fill that role. The degree to which religions contribute to the globalized circumstance as well as their character as globalized institutions becomes evident in these cases.

As noted earlier, the one phenomenon that has attracted the most attention to the global significance of religions is the proliferation of effective religio-political movements in almost all regions of the world. From the rise of Hindu na-

tionism in India and the heavy political involvement of certain Buddhist organizations in Japan to the many highly politicized Islamicist movements in countries as diverse as Iran, Indonesia, and Nigeria, politicized religion has been a constant feature of the global world since at least the 1960s and in many respects well back into the nineteenth century. Although the literature often analyzes them under the somewhat tendentious label of fundamentalisms, two of their most basic features illustrate quite clearly how relevant they are for theories of globalization and how they manifest the global nature of so much contemporary religion.

The first is simply that they have arisen in so many different countries, and almost always on the basis of the traditions and institutions of one of the globally recognized religions such as Islam, Christianity, Judaism, Hinduism, Sikhism, or Buddhism. Religions that are very different from one another provide the resources for remarkably similar political movements. The fact that one of the broadly homologous modern states is invariably implicated by such movements is one reason for this similarity, but so is the explicitly global view that they typically represent. Whether one takes the Islamic revolution in Iran, the religious Zionists of Israel, the Christian Right in the United States, liberation theological movements in Latin America, Sōka Gakkai in Japan, the Hindu nationalism of the Rashtriya Svayamsevak Sangh in India, or a host of other examples, most of these movements have justified themselves explicitly in global terms, in addition to local or national ones. Even the Islamicist Taliban in Afghanistan, a movement with hardly any global consciousness when it formed in the early 1990s, very much saw itself in global terms by the time the American-led invasion ousted its government in 2001. What these religio-political movements therefore also demonstrate once again is how localized religion does not have to be globally extended, let alone positive toward the process of globalization, for it to be globally relevant and therefore for globalization theories to be useful in understanding them.

RELIGION AND RELIGIONS AS GLOBALIZING SYSTEM. A further theoretical approach to the role of religion and religions in globalization goes beyond the idea that religious worldviews and institutions have participated in the process. It focuses on the degree to which both modern institutional forms and modern understandings of religion are themselves manifestations of globalization. With the centuries-long development of what is today a globally extended society, religion came to inform what is today a globally extended religious system consisting primarily of a series of mutually identified and broadly recognized religions. These religions, in virtually every region of the globe, include Christianity, Islam, Hinduism, and Buddhism, but a variable list of other religions receives almost as broad legitimacy. Among these are Judaism, Sikhism, Daoism, and Jainism, followed again by another set of less consistently or more regionally accepted ones such as Bahā'ī, Shintō, Candomblé, African Traditional Religions (ATR), Scientology, and so forth. The idea that religion manifests itself through a series of distinct religions

may seem self-evident to many people, including a great many of their adherents. Yet that notion is historically of quite recent provenance. In Europe, where this understanding first gained purchase, it dates back at the earliest to the seventeenth century. Elsewhere, such as in most regions of Asia, one must wait until at least the nineteenth century. Its development and spread is entirely coterminous with the period most theories identify as the prime centuries of globalization.

For this approach to religion and globalization, the construction of the religious system is not only recent. It is also quite selective; not every possible religion, not everything possibly religious counts. Symptomatic of both aspects are ongoing and recent debates among scholars of religion concerning the meaning of the concept and its supposed Eurocentrism. One perspective in these controversies has it that religion is at best an abstract term, useful for certain kinds of analysis but not something real that is actually out there in the world. A prime argument in support of this position is how the ideas of religion as a separate domain of life and of the distinct religions are so demonstrably products of relatively recent history and so clearly attendant upon and implicated in the concomitant spread of Christian and European influence around the world. Another is that religions is empirically too narrow, as what is meant by them does not cover nearly everything in our world that is manifestly religious using slightly different notions of religion. Cogent as such arguments are, however, they point exactly to what the theory under review states: a peculiar way of understanding religion and institutionally embodying religion has developed in conjunction with and as an expression of the process of globalization. It is accepted and contested right around the world. Similar to global capitalism and the global system of sovereign states, the idea and its putting into practice exclude as well as include. It also involves power and imposition, as do all human institutions. And just as antiglobalization movements are themselves important manifestations of that which they seemingly oppose, so too is contestation—whether academic, theological, or broadly political—with reference to religion and the religions symptomatic of the social and cultural reality that it contests.

A strict corollary of this theory, a consequence of the selective nature of this religious system, is that new religions will constantly try to form and that much religiosity will escape the system. The existence of this global religious system, simultaneously at the global and local levels, therefore spawns its constant development and the constant challenging of the way it operates. That idea leads logically to consideration of the religiousness of the global system itself.

RELIGION, GLOBALIZATION, AND THE HUMAN CONDITION. More than a few theories of globalization explicitly address what one might call its ideal dimension, the way it shapes how people understand the nature and purpose of the world and their place in it. Given that such questions of ultimate concern or purpose often appear as defining features of reli-

gion, this ideal dimension can also be conceived as its religious dimension, although thereby not necessarily referring to the role of religious traditions and institutions in it. One can divide the analyses of this dimension of globalization according to whether it is seen as a positive or negative feature, and whether unity or diversity of vision dominates.

Positive and unitary interpretations come in a number of variants. There are still a few that see globalization as inevitably moving the world toward a future of ever greater material prosperity, political democracy, and technological progress shared equitably among all peoples. Far more numerous are those that share ideals such as equality and inclusion of all people in the benefits of global society, perhaps under the rubric of universal human rights; but they consider that at the very least human society has a long way to go before these are realizable, and that certain features of globalization actually stand in the way of their realization. Several perspectives grounded in institutionalized religion fall under this heading, for instance, the already discussed Global Ethic Project led by Hans Küng, or the Justice, Peace and Integrity of Creation program of the World Council of Churches. Typically, these and other examples consider such values as equality among peoples, religions, classes, and genders to be completely unquestionable. With equal self-evidence they exhibit strong ecological sensibility and valorize the natural environment. Into this category also belong those social-scientific approaches that stress the global preponderance of idealized models, especially models of progressive economy, the nation-state, education, legal structures, mass media, art, and culture.

Unitary but negative visions share most of these characteristics but reject the idea that any of these developments can have a positive outcome. Sometimes these take world-rejecting communitarian directions, advocating retreat from the globalized world. Ironically perhaps, it is not uncommon for these visions to espouse precisely the sort of egalitarian values typical of the positive versions but insist that this is only possible in a separated—and usually quite small-scale—society. Some subdivisions of environmental and back-to-nature movements exemplify this possibility. In many respects they are mirror images of globalized society, and in that respect reflections of it. By contrast, there are those rejections of a unitary globalization that insist on the unique validity of a particular culture or society. Some so-called fundamentalist visions fall in this category, but it must be stressed how comparatively rare they are. The Afghan Pash-tun Taliban, in contrast to most Islamicist perspectives, may have been one of the few.

Pluralist visions of the world are variations on the unitary ones, putting greater stress on, respectively, the difference or the irreconcilability of diverse worldviews. The clash of civilizations model made famous by Samuel Huntington is representative of a negative version, dependent as it is on the idea—not to say ideal—that quasi-essential civilizations with particular characteristics actually exist logically prior to

the globalized context in which mutually identifying them might make sense. Pluralist positive perspectives, by contrast, are even more mere variations on the unitary variety: the value of pluralist and egalitarian inclusion here is simply more strongly emphasized.

What is therefore especially noteworthy of all these representations of globalization's ideal dimension is just how close they are to one another. Without in the least underplaying the degree to which globalization entails vast differences in power and influence among different regions and different people; without denying the significant contestation, even conflict, between different visions of what the global world is or should be; this seeming narrowing of alternative world visions may in the end be one of the most powerful symptoms of the social reality which the idea of globalization seeks to name.

BIBLIOGRAPHY

- Ahmed, Akbar S. *Islam, Globalization and Postmodernity*. London, 1994. An earlier work that deals well with the challenges that globalization presents for one of the major religions that is not Christianity. It explodes the myth that Islam is somehow fundamentally antiglobal or incapable of responding positively.
- Appadurai, Arjun. *Modernity at Large: Cultural Dimensions of Globalization*. Minneapolis, 1996. A much cited and influential work that presents globalization from below and stresses the contested, pluralistic, and even chaotic character of globalization. It pays little attention to religion in any form.
- Bauman, Zygmunt. *Globalization: The Human Consequences*. London, 1998. An excellent work not only in terms of the problematic outcomes of globalization but also in the way that it clearly shows how globalization involves a dialogical simultaneity of the global and the local.
- Beck, Ulrich. *World Risk Society*. London, 1999. In focusing on the idea of risk among other concepts, this work presents a perspective on global society that stresses its somewhat unique features. It is in this way good for understanding how global society is different from nonglobal ones.
- Berger, Peter L., and Samuel P. Huntington, eds. *Many Globalizations: Cultural Diversity in the Contemporary World*. Oxford, 2002. A compendium of chapters written by people in a wide variety of different countries, it is valuable for appreciating how globalization is constituted as much by local response and appropriation as by homogenizing imposition.
- Beyer, Peter. *Religion and Globalization*. London, 1994. The first work entirely dedicated to the topic from the perspective of a theory of globalization, it focuses primarily on religion as a political resource in the context of global society.
- Beyer, Peter, ed. *Religion im Prozeß der Globalisierung (Religion in the Process of Globalization)*. Würzburg, 2001. A collection of theoretical and empirical articles about globalization and the possible place of religion in it. Contains a chapter in which the editor outlines key aspects of his theory of a global religious system.
- Braman, Sandra, and Annabelle Sreberny-Mohammedi, eds. *Globalization, Communication and Transnational Civil Society*. Cresskill, N.J., 1996. A good representative sample of contributions that stress globalization from below and thereby the dimensions of globalization not subsumed under economic and political perspectives.
- Castles, Stephen. *Ethnicity and Globalization: From Migrant Worker to Transnational Citizen*. London, 2000. A work that focuses on the important process of transnational migration and its consequences, it is representative of much such work that, while important, tends to ignore religion almost completely.
- Chidester, David. *Savage Systems: Colonialism and Comparative Religion in Southern Africa*. Charlottesville, Va., 1996. A fine analysis of the modern development and use of the idea of religion as exemplified in the colonial history of South Africa. It demonstrates both the selectivity and the recentness of this development.
- Coleman, Simon. *The Globalisation of Charismatic Christianity: Spreading the Gospel of Prosperity*. Cambridge, U.K., 2000. Although largely an analysis of the Pentecostalism of one Swedish church, this work simultaneously shows how understanding this important Christian phenomenon benefits from a globalization perspective.
- Ebaugh, Helen Rose, and Janet Saltzman Chafetz, eds. *Religion across Borders: Transnational Migrant Networks*. Walnut Creek, Calif., 2002. The outcome of research on immigrant religious communities in Houston, Texas, this work shows graphically how migrant religion is at the same time very local and very global in its connections and meanings.
- Haynes, Jeff. *Religion in Global Politics*. London and New York, 1998. An excellent survey of religio-political movements and implications around the world.
- Held, David, and Anthony McGrew, eds. *The Global Transformations Reader: An Introduction to the Globalization Debate*. Cambridge, U.K., 2003. A good compendium of most aspects of the globalization debate, including the many and contested meanings of the term. Religion, however, is not well covered.
- Hopkins, Dwight N., Lois Ann Lorentzen, Eduardo Mendieta, and David Batstone, eds. *Religions/Globalizations: Theories and Cases*. Durham, N.C., 2001. A collection of case studies, some theoretical, some empirical. Articles on Africa, Southeast Asia, and Latin America are particularly valuable.
- Huntington, Samuel P. *The Clash of Civilizations and the Remaking of World Order*. New Delhi, 1996. The classic statement of the thesis. A notable aspect of the work is that Western civilization in particular is called to take note.
- Juergensmeyer, Mark, ed. *Global Religions: An Introduction*. Oxford, 2003. A collection of articles, mostly about each of the major world religions, with overview articles attached. Good for getting a sense of some of the issues involved in each of the five majors along with African and indigenous traditions.
- Küng, Hans. *A Global Ethic for Global Politics and Economics*. Translated by John Bowden. New York, 1998. A critical examination of what this influential Catholic theologian believes is needed for a healthier globalization.
- Levitt, Peggy. *The Transnational Villagers*. Berkeley, Calif., 2001. An excellent work that shows just how difficult it is to under-

- stand the lives of contemporary global migrants if one does not take the global into perspective. The author also appreciates the importance of religion.
- Martin, David. *Pentecostalism: The World Their Parish*. Oxford, 2002. To some extent a comparison of Latin America and Europe, the book emphasizes the simultaneously local and global character of this Christian movement. Also contains excellent theoretical reflections on the issue from a sociological perspective.
- Meyer, Birgit, and Peter Geschiere, eds. *Globalization and Identity: Dialectics of Flow and Closure*. Oxford, 1999. A collection of works on Africa, another region where the local and global occur simultaneously. Good attention to religious dimensions.
- Meyer, John W., John Boli, George M. Thomas, and Francisco O. Ramirez. "World Society and the Nation-State." *American Journal of Sociology* 103, no. 1 (1997): 144–181. A succinct statement of an important theory of globalization that posits the existence of a world polity in which globalized models inform what people do in all parts of the world. Also stresses the ideal or religious dimension of globalization overall.
- Nederveen Pieterse, Jan. *Globalization and Culture: Global Melange*. Lanham, Md., 2003. A good statement of globalization as what the author calls hybridization, not the juxtaposing of preexisting cultural identities so much as the recreation of these identities and thereby their creative mixing and reinvention.
- Prazniak, Roxann, and Arif Dirlik, eds. *Places and Politics in an Age of Globalization*. Lanham, Md., 2001. Another work that stresses the simultaneity of global and local with special attention to marginalized groups, women, and environmental issues.
- Robertson, Roland. *Globalization: Social Theory and Global Culture*. London, 1992. The thus far classic statement of a highly influential and dialogical theory of globalization by the sociologist who first used the term technically and consistently in the 1980s. Sensitive to the importance of religion in the process.
- Rothstein, Mikael, ed. *New Age Religion and Globalization*. Aarhus, 2001. A collection that debates an important domain of noninstitutionalized religiosity, with special emphasis on the question of whether New Age is basically Western or by now also global.
- Rudolph, Susanne Hoeber, and James Piscatori, eds. *Transnational Religion and Fading States*. Boulder, Colo., 1997. A collection of articles primarily on Islam and Christianity. Contains a fine chapter by José Casanova on the Roman Catholic Church.
- Scholte, Jan Aart. *Globalization: A Critical Introduction*. London, 2000. A very good introductory work on the entire question with some sensitivity to the role of religion.
- Stackhouse, Max L., and Peter J. Paris, eds. *God and Globalization: Religion and the Powers of the Common Life*. Harrisburg, Pa., 2000. A collection of different perspectives including good theological reflections on the globalization process.
- van Binsbergen, Wim, and Rijk van Dijk, eds. *Situating Globality: African Agency in the Appropriation of Global Culture*. Leiden, 2004. A further work on the important region of Africa. Well-balanced, with good emphasis on religion, both Islam and Christianity, and on women.
- Van der Veer, Peter, ed. *Conversion to Modernities: The Globalization of Christianity*. London, 1996. A collection of articles on the particularization of Christianity in diverse parts of the world that demonstrates the degree to which this has also become a non-Western religion.
- Vásquez, Manuel A., and Marie Friedmann Marquardt. *Globalizing the Sacred: Religion across the Americas*. New Brunswick, N.J., 2003. A very fine work that demonstrates in ethnographic detail, focusing on Latin America and the United States, how the highly localized religions of migrants and marginalized peoples have a global dimension. A good example of globalization from below.
- Wallerstein, Immanuel. *The Modern World System*. 3 vols. New York, 1974–1980. An early and classic work on the historical development of the global capitalist system, it presents an excellent theoretical and empirical analysis of economic globalization.

PETER BEYER (2005)

GLOSSOLALIA (from the Greek *glōssa*, “tongue, language,” and *lalein*, “to talk”) is a nonordinary speech behavior that is institutionalized as a religious ritual in numerous Western and non-Western religious communities. Its worldwide distribution attests to its antiquity, as does its mention in ancient documents. It is alluded to in the Hebrew scriptures and in the New Testament, as in the well-known narration in the *Acts of the Apostles* about events on the Day of the Pentecost. There are references to it in the Vedas (c. 1000 BCE), in Patañjali’s *Yoga Sutras*, and in Tibetan Tantric writings. Traces of it can be found in the litanies (*dhikars*) of some orders of the Islamic Sufi mystics.

Early ethnographic reports of glossolalia treated it with contempt, calling it “absurd nonsense, gibberish scarce worth recording,” while Christian theologians tended to think of it as an exclusively Christian phenomenon, peculiar, according to some, to apostolic times. Modern-day forms of glossolalia were classed as abnormal psychological occurrences, possible evidence of schizophrenia or hysteria, because researchers observed it only in mental patients. The situation started to change when, as the result of interest renewed by the upsurge of the Pentecostal movement, field-workers began to examine glossolalia as a part of religious ritual.

In an article published in 1969, for instance, Virginia H. Hine reported on a comparative anthropological investigation of the Pentecostal movement in the United States, Mexico, Haiti, and Colombia, combining the use of questionnaires, interviews, and participant observation (*Journal for the Scientific Study of Religion* 8: 212–226). Her functional analysis showed glossolalia to be a component in the process of commitment to a movement, with implications for both personal and social change. This conclusion agrees in

substance with numerous ethnographic reports from non-Western societies, where glossolalia often appears before or during the initiation of religious practitioners.

A few years before Hine's study, the pathology model of glossolalia was refuted by L. M. Vivier-van Etveldt (M. D. diss., University of the Witwatersrand, Johannesburg, 1960). He tested two carefully matched groups, one made up of members of a church that practiced glossolalia and the other made up of members of a traditional orthodox reformed church where such behavior was not accepted. A number of psychological tests, such as the Thematic Apperception Test (TAT) and the Personality Factor Test developed by James Cattell, indicated no inherent weakness in the neural organization of the glossolalists. On the contrary, they appeared to be less subject to suggestion and better adjusted than their conservative counterparts. By implication, this finding should put to rest the numerous allegations that shamans, who frequently utter glossolalia, are psychotic. The salient difference between a religious practitioner and a mental patient lies in the fact that the latter is unable to control his behavior ritually.

As to formal properties, glossolalia is a nonordinary speech event in the sense that it consists of nonsense syllables. In contrast with natural languages, its syllables and segments are not words; that is, they do not exhibit the attribution of meaning, and they are not strung together according to rules of grammar. For this reason, linguists reject the interpretation of glossolalia as xenoglossia (from the Greek *xenos*, "stranger," and *glōssa*, "language"), which claims that glossolalia is some foreign language that could be understood by another person who spoke it. William J. Samarin, a linguist working with English-speaking Christian groups, regards glossolalia instead as a type of pseudolanguage. In his 1972 article "Variation and Variables in Religious Glossolalia" (*Language in Society* 1: 121–130), he defines it as "unintelligible post-babbling speech that exhibits superficial phonological similarity to language without having consistent syntagmatic structure and that is not systematically derived from or related to known languages." He notes that glossolalia is repetitive and can be subdivided into macrosegments, which are comparable to sentences; microsegments, which are reminiscent of words; and sounds. There is also a pattern of stress and pitch. According to Samarin, speakers of English have an "English accent" in glossolalia; that is, their sounds are English speech sounds. He attributes these regularities to a particular style of discourse that practitioners assume by imitating certain preaching styles.

This writer's own fieldwork and laboratory research have led to somewhat different conclusions. As a psychological anthropologist and linguist, the author of this article conducted participant observation in various English-, Spanish-, and Maya-speaking Pentecostal communities in the United States and Mexico as well as with the founder of a new religion in Japan. In addition, tape recordings of non-Christian rituals from Africa, Borneo, Indonesia, and Japan were com-

pared. The results indicated that when all features of glossolalia were taken into consideration—that is, its segmental structure (such as sounds, syllables, and phrases) and its suprasegmental elements (namely, rhythm, accent, and especially overall intonation)—they seemed cross-linguistically and cross-culturally identical. Laboratory tracings that used a level recorder, which registers changes in pressure density (in this case, intonation), confirmed these impressions at least in the case of intonation. This method is also suitable for distinguishing glossolalia from such other nonordinary speech events as sleep talking and talking during hypnotic regression (see this writer's 1981 article "States of Consciousness: A Study of Soundtracks," *Journal of Mind and Behavior* 2: 209–219). The latter finding is important, because many ethnographic observers consider the behavior of which glossolalia is a part to be hypnotically induced, which in view of these results is in error.

Self-reporting by ethnographic consultants and observation of their behavior indicate the presence of a changed state of consciousness during glossolalia, ranging from minimal to quite intense. This author therefore attributes the cross-cultural agreements in the features of glossolalia to these neurophysiological changes, collectively and popularly called trance, and defines glossolalia as a vocalization pattern, a speech automatism that is produced in the substratum of the trance and that reflects directly, in its segmental and suprasegmental structures, the neurophysiological processes present in this changed state of consciousness.

Put more simply, whatever takes place in the nervous system during a trance causes utterance to break down into phrases of equal length, provided the pauses are also included. That is, using a concept taken from music rather than linguistics, it causes the phrases to be divided into bars, each of which is accented on the first syllable, and it causes the bars to pulsate, to throb rhythmically in a sequence of consonant-vowel, consonant-vowel. And it is this writer's belief that the trance state is responsible for the haunting intonation of glossolalia; never varying, it rises to a peak at the end of the first third of the unit utterance and drops to a level much lower than that at the onset as it comes to a close.

The sounds of glossolalia do not necessarily reflect the inventory of the speaker's language, for they frequently include phones not found in a speaker's native tongue. English speakers, for instance, often use /a/ as a high central, unrounded vowel, the so-called continental sound, which does not occur in English, and Spanish speakers in Mexico may use /ō/ (the long, closed *o*, as in the German word *Öse*), which is not a Spanish vowel. In addition, shrieks as well as barking, whistling, grunting, growling, and many other so-called animal sounds have also been reported.

Although glossolalia is often described as a spontaneous outburst, it is, actually, a learned behavior, learned either unawarely or, sometimes, consciously. The fact that individual congregations with a stable membership tend to develop their own characteristic glossolalia "dialect" indicates that

learning has occurred, and the many traditional forms in which glossolalia appears in non-Western societies are obviously taught. These include such conventions as speaking individually, in groups, and in the form of a dialogue, often heard in the Japanese new religions, and singing.

As the foregoing characterization of glossolalia indicates, one probably needs to view trance as the primary behavior, on which vocalization is superimposed and into which the practitioner switches with the help of a large variety of stimuli, such as singing, dancing, clapping, and drumming. Present research suggests that this trance—a frenzy, rapture, ecstasy, or, in more neutral terms, an altered state of consciousness—involves a single, generalized neurophysiological process. Barbara W. Lex, a medical anthropologist, holds that what is involved is an alternation between two different arousals of the nervous system. This tunes the nervous system and releases tension, thus accounting for the beneficial effects of the experience. Observations of Christian and non-Western religious communities alike indicate that apparently anybody with a normal physical endowment is able to initiate this process and to switch into a trance. Differences in personality, treated extensively by early researchers, apparently do not enter into the picture.

An association between trance and glossolalia is now accepted by many researchers as a correct assumption (see, for instance, Williams, 1981). Thus, if one recognizes trance as the primary, generating process of the features of glossolalia, one could then conclude that a vocalization consisting only of nonsense syllables, no matter how varied, may in fact represent a cultural convention and that other types of speech could also be uttered while the practitioner is in a trance, with the trance, of course, still expressing itself in some form or other. Field observation shows that this is indeed true. Nonsense syllables may occur in combination with words from the vernacular and/or a foreign language—such as “Come, Jesus” and “Hallelujah,” which are often heard from American Pentecostals—without disturbing the accent pattern or intonation of the utterance, its trance features. In the circumpolar region, many shamans, among the Inuit (Eskimo), the Saami (Lapps), Chukchi, the Khanty (Ostiaks), the Yakuts, and the Evenki, use in their religious rituals secret languages that consist of a mixture of nonsense syllables and the vernacular. Just like a natural language, these secret trance dialects are taught by the master shamans to their neophytes.

From Africa, there are reports of a secret religious trance language used exclusively by women. Bakweri women living on the slopes of Mount Cameroon speak a “mermaid language” in ritual context, which is taught to adolescent girls when they are ready for initiation. A girl’s readiness is indicated by her “fainting,” that is, experiencing a trance, and by her ability, while in this altered state of consciousness, to understand some of the mermaid language as it is spoken to her by a mature woman. No details of this language are known outside the tribe, for the male ethnographer was

barred from learning it. (See Edwin Ardener, “Belief and the Problem of Women,” in *The Interpretation of Ritual*, edited by J. S. La Fontaine, London, 1972, pp. 135–201.) It is probably a mixed form, for he mentions that scraps of the mermaid language are common currency even among Christian, educated, urban Bakweri women. This suggests that these “scraps” may have turned into words or that they were not originally nonsense syllables but had specific, assigned meanings.

When speaking in a trance, a practitioner may use no nonsense syllables at all, employing instead only the vernacular. If the principal pronouncement is in nonsense syllables, however, as, for instance, among Christians speaking in tongues or among the nomadic, reindeer-hunting Chukchi of Siberia, an “interpretation” may be provided. Such interpretations exhibit a distinct, trance-based rhythm and an intonation whose exactness cannot be reproduced in the ordinary state of consciousness. This is the same phenomenon exhibited in the many forms of “inspired,” prophetic speeches, heard around the world, in which a scanning rhythm imparts a poetic quality to the utterance. In such speeches words are sometimes truncated, and rules of grammar violated, overridden by the exigencies of the trance. Even communicative intent may have to be altered. Thus the demons who spoke through the trance of a German university student, Anneliese Michel, could ask no questions because in spoken German the tone of an interrogative must rise at the end, while all trance utterances have a pronounced drop. (See this author’s book about this case, *The Exorcism of Anneliese Michel*, New York, 1981.)

The case of Anneliese Michel brings up the question of what kinds of religious experience are commonly expressed by glossolalia. In her case, the experience was that of possession, and glossolalia was the voice, the “language,” of the demons that she reported were possessing her. Possession is one of the most frequent ritual occasions for the use of glossolalia. In possession, an entity from the sacred dimension of reality is experienced as penetrating the respective person. In Christian contexts, the entity is most usually the Holy Spirit, and glossolalia is then felt to be its language. The Holy Spirit is experienced as power, not as personality, but other spirits—for instance, those of the dead of the Trobriand Islanders, ancestral spirits in Africa, and various spirits in Haitian vodou—have pronounced personality traits that are expressed in glossolalia. Western observers of possession may speak of role playing, but the experience is more that of being in the presence of a discrete being. The voice of the possessing being differs from that of the possessed practitioner. Anneliese Michel’s demons spoke with a deep, raspy, male voice, and each one—there were six all told—exhibited distinct characteristics; Judas was brutal, for instance, and Nero effeminate. In vodou, female mediums are often possessed by male *lwa* (spirits), in which case a similar change in voice and, of course, in comportment takes place. In Umbanda, an Afro-Brazilian healing cult, possession by the child spirit

will bring about an equally dramatic voice modification. Siberian shamans may be possessed by helpers in the form of animal spirits, and their speech then consists of animal voices, or “animal language.” A similar change in language takes place when the shaman turns into an animal, which is a different experience, however.

According to a generally held belief, illness will result if a noxious being of the sacred dimension of reality possesses a person. Therefore, the harmful entity needs to be expelled, or exorcised. The method by which this is done depends on the tradition prevailing in the religious community in question. The ritual specialist carrying out the exorcism may merely recite a required formula while remaining in the ordinary state of consciousness—as was done for Anneliese Michel by a Catholic priest who spoke the exorcistic prayers from the *Rituale romanum*—or he may enter a trance and utter glossolalia, usually a mixed version, which is thought to influence the actions of demons. This happens in Tantric exorcistic rituals in Tibet, for instance, and during healing sessions among Buddhists of northern Thailand.

Communication by glossolalia is instituted not only with unfriendly beings, of course. On a tape recording made in Borneo a female healer can be heard calling her helping spirit. In the *zār* cult of Ethiopia, the shamans talk to the *zārs* (spirits) in a “secret language.” The shamans of the Semai of Malaysia use glossolalia to invite the “nephews of the gods” to a feast, and the Yanomamö Indians of Amazonia chant while in trance to their *hekura* demons, calling them to come live in their chests.

Quite generally, glossolalia cannot be considered a symbol. Rather, it is a medium of communication that directly informs both the participants and the onlookers of a ritual about the presence of and contact with the powers or the beings of the sacred dimension of reality—about the Holy Spirit who is baptizing a convert, perhaps, or about the appearance of any one of the multitude of entities that inhabit sacred realms.

BIBLIOGRAPHY

Three books, published simultaneously in 1972, discuss glossolalia from different angles. My own work, *Speaking in Tongues: A Cross-Cultural Study of Glossolalia* (Chicago, 1972), provides a linguistic analysis of glossolalia and a descriptive study of the entire behavior; John P. Kildahl, in *The Psychology of Speaking in Tongues* (New York, 1972), takes up the relationship between personality variables and the practice of glossolalia; and William J. Samarin, in *Tongues of Men and Angels: The Religious Language of Pentecostalism* (New York, 1972), seeks to answer the question of why people speak in tongues by placing the behavior in social context. A comprehensive review of the research into glossolalia ten years later, including references to non-Western material, can be found in Cyril G. Williams's *Tongues of the Spirit: A Study*

of Pentecostal Glossolalia and Related Phenomena (Cardiff, 1981). An anthology edited by Irving I. Zaretsky and Mark P. Leone, *Religious Movements in Contemporary America* (Princeton, N.J., 1974), gives a panoramic view of the multitude of religious movements in the United States, many of which use glossolalia. For a good description of glossolalia in a non-Western society, see Arkadii Federovich Anisimov's “The Shaman's Tent of the Evenks and the Origin of the Shamanistic Rite,” translated from Russian by Dr. and Mrs. Stephen P. Dunn, in *Studies in Siberian Shamanism*, edited by Henry N. Michael (Toronto, 1963).

GNOSTICISM: GNOSTICISM FROM ITS ORIGINS TO THE MIDDLE AGES [FIRST EDITION]

Gnōsis (“knowledge”) is a Greek word of Indo-European origin, related to the English *know* and the Sanskrit *jñāna*. The term has long been used in comparative religion to indicate a current of antiquity that stressed awareness of the divine mysteries. This was held to be obtained either by direct experience of a revelation or by initiation into the secret, esoteric tradition of such revelations.

PRE-CHRISTIAN GNOSIS. The experience of gnosis was highly esteemed at the beginning of our era in various religious and philosophical circles of Aramaic and Greco-Roman civilization. It is a key word in the scrolls of the Jews of the Essene sect found at Qumran. In the canonical *Gospel of John*, Jesus is quoted as having said at the Last Supper: “This is [not ‘will be’] eternal life, that they know [not ‘believe in’] Thee

[here and now], and know Jesus Christ, whom thou hast sent" (*Jn.* 17:3). Not even the prevailing philosophy of the time, so-called Middle Platonism, was completely beyond the influence of this general movement. Middle Platonism was primarily religious and otherworldly; it distinguished between discursive reasoning and intuition and taught the affinity of the soul with the godhead, basing these teachings on an oral tradition of the Platonic schools. The writings of Hermes Trismegistos ("thrice-greatest Hermes," identified with the Egyptian god Thoth) reflect the same atmosphere. These eighteen treatises, of which *Poimandres* and *Asclepius* are the most important, originate in the proverbial wisdom of ancient Egypt. A saying in a recently discovered Armenian collection attributed to Hermes Trismegistos is "He who knows himself, knows the All." The author of *Poimandres* expresses the same insight: "Let spiritual man know himself, then he will know that he is immortal and that Eros is the origin of death, and he will know the All." And to illustrate this saying the author tells the story of a divine being, Anthropos (Man), who becomes enamored of the world of (lower) nature and so falls into a material body. Most Hermetic treatises take up a short saying and expound on it in this manner. They also preserve the impact of Egyptian mythology. The ancient Egyptians spoke freely about sexual intercourse and about the homosexual behavior of their gods. The explicit sexual imagery of Egyptian mythology was adopted in a Hermetic prayer that addresses the spouse of God in the following words: "We know thee, womb pregnant by the phallus of the Father."

The idea of emanation was also prominent in Egyptian religion. Egyptian myth depicts the Nile as tears of the sun god Re. This concept too is found in Hermetic literature. On the other hand, the same writings show the influence of Greek philosophy; indeed, there was a Platonic school of Eudorus in Alexandria. And the impact of the biblical book of *Genesis* and that of Jewish mysticism are only too obvious. Christian influences, though, are completely absent from the so-called *Corpus Hermeticum*. The treatises in this group of works were all written around the beginning of the Christian era in Alexandria. They appear to be the scriptures of a school of mystics, a sort of lodge that practiced spiritualized sacraments such as "the bath of rebirth," a holy meal, and the kiss of peace.

GNOSTICISM. Ever since the congress on the origins of Gnosticism held at Messina, Italy, in 1966, scholars have made a distinction between gnosis and Gnosticism. *Gnosticism* is a modern term, not attested in antiquity. Even the substantive *Gnostic* (Gr., *gnōstikos*, "knower"), found in patristic writings, was never used to indicate a general spiritual movement but was applied only to a single, particular sect. Today Gnosticism is defined as a religion in its own right, whose myths state that the Unknown God is not the creator (demiurge, YHVH); that the world is an error, the consequence of a fall and split within the deity; and that man, spiritual man, is alien to the natural world and related to the deity and becomes conscious of his deepest Self when he hears the

word of revelation. Not sin or guilt, but unconsciousness, is the cause of evil.

Until recent times the Gnostic religion was almost exclusively known by reports of its opponents, ecclesiastical heresiologists such as Irenaeus (c. 180 CE), Hippolytus (c. 200), and Epiphanius (c. 350). Not until the eighteenth century were two primary sources, the Codex Askewianus (named for the physician A. Askew) and the Codex Bruceanus (named after the Scottish explorer James Bruce), discovered in Egypt. These contained several Coptic Gnostic writings: (1) *Two Books of Jeû* from the beginning of the third century; (2) book 4 of *Pistis Sophia* from about 225; and (3) *Pistis Sophia*, books 1, 2, and 3, from the second half of the third century. To these can now be added the writings found near Nag Hammadi in Upper Egypt in 1945. The stories told about the discovery are untrustworthy. The only certain fact is that, to date, about thirteen of the codices (books, not scrolls) comprising some fifty-two texts are preserved at the Coptic Museum in Old Cairo. They have been translated into English by a team under James M. Robinson (1977). Not all these writings are Gnostic: the *Gospel of Thomas* (114 sayings attributed to Jesus) is encratic; the *Thunder, Whole Mind* is Jewish; the *Acts of Peter and the Twelve Apostles* is Jewish-Christian; the *Prayer of Thanksgiving* is Hermetic; and the *Authoritative Teaching* is early Catholic (characterized by a monarchic episcopacy, a canon of holy writings, and a confession of faith). But the *Epistle of Eugnostos* and the *Apocryphon of John* lead us back very far, close to the sources of Gnosticism in Alexandria.

Origins. The hypothesis once supported by Richard Reitzenstein, Geo Widengren, and Rudolf Bultmann that Gnosticism is of Iranian origin has been abandoned; the alleged Iranian mystery of the "saved savior" has been disproved. At present, many scholars are inclined to believe that Gnosticism is built upon Hellenistic-Jewish foundations and can be traced to centers like Alexandria, which had a large Jewish population, much as the city of New York does today. Polemics in the writings of the Jewish philosopher Philo, who himself was an opponent of local heresies, make it clear that he knew Jewish groups that had already formulated certain basic elements of Gnosticism, although a consistent system did not yet exist in pre-Christian times.

The divine Man. The prophet Ezekiel tells us in the first chapter of the biblical book that bears his name that in 593 BCE, dwelling in Babylonia, he beheld the personified Glory of the Lord, who would not abandon him even in exile. This figure, at once Light and Man, is described as having a form like the appearance of Adam, or "Man" (*Ez.* 1:26). This vision became a stock image of Jewish mysticism. As early as the second century BCE, the Jewish Alexandrian dramatist Ezekiel Tragicus alludes to the same figure in his Greek drama *Exodus*, fragmentarily preserved in the *Praeparatio evangelica* (9.29) of the Christian bishop Eusebius. In the play, Moses in a dream beholds a throne on top of Mount Sinai. Upon this throne sits Man (Gr., *ho phōs*) with

a crown on his head and a scepter in his left hand. With his right hand he beckons Moses to the throne, presents him with a crown, and invites him to sit beside him on an adjacent throne. Thus is Moses enthroned at the right hand of God. A parallel passage is found in Palestinian Judaism: according to the founding father 'Aqiva' ben Yosef (early second century BCE), there are two thrones in heaven, one for God and one for David (B. T., *Hag.* 14a). This is the oldest extant reference to Adam Qadmon, who later became the central figure of qabbalistic literature. Somewhat later, in the *Book of Daniel*, written soon after 168 BCE, this same figure is called the Son of Man (i.e., "divine Man"). The same figure is found in the Gospels. In the Fourth Gospel, the Son of Man is referred to as the Glory of God, which comes from heaven, touches the earth for a moment, is incarnated in the man Jesus, and eventually returns to the heavenly realm. In the letters of Paul, the Glory is called the last Adam (comparable to Ezekiel's *kavod*), who is from heaven and should be distinguished from the first Adam of *Genesis* 1 and 2, who is from the earth. In the Hellenistic world this divine Man is identified with the Platonic idea of man.

Plato himself never says that there is such a thing as an "idea of man." In the dialogue *Parmenides* this philosopher ridicules the concept of an *eidos anthrōpou* (130c). Probably this passage reflects a debate of Platonists among themselves and with other schools. It would seem that the Skeptics denied the idea of man a separate existence because then empirical man and his idea would have something in common, and this would require a new idea, the "third man." In several Middle Platonic sources, however, the idea of man is supposed to exist. The translator of Ezekiel in the Septuagint identifies the figure of divine Man with the Platonic idea when he translates the phrase *demut ke-mar'eh adam* (*Ez.* 1:26) as *homoiōma hōs eidos anthrōpou*, a hellenizing quotation of Plato.

The same figure is to be found in the Hermetic *Poimandres*, clearly influenced by Alexandrian Jews. This writing relates how God generated a son to whom he delivered all creatures. The son is androgynous, equally Phos (Man, Adam, Light) and Zoe (Eve, Life). This being, who is still to be distinguished from the Logos, descends in order to create but falls in love with nature and assumes a material body. That is why human beings are both mortal and immortal. And yet the human body has the form of the original Man. This view is very Jewish and has parallels in rabbinical literature: not the soul but the human body was created after the image and likeness of God.

A next stage is reached in Philo's works. He never quotes *Ezekiel* 1:26 about the Glory of God resembling the form of a man, and yet he must have been familiar with mystical speculations about this divine figure. Philo calls *logos* "Man after his [God's] image" or "Man of God" and identifies the *logos* with the idea of man: incorporeal and neither male nor female. Yet he polemicizes against the concept that this heavenly Man was androgynous: "God made man," he says,

"made him after the image of God. Male and female he made—now not 'him' but 'them'" (*Who Is the Heir* 164). Obviously, before Philo there must have been Jewish thinkers who claimed that the heavenly Man was androgynous. Such circles originated the Anthropos model of *gnōsis*, which is found in the doctrine of Saturninus (Antioch, c. 150). In his system, the female figure is completely absent. Our world is said to have been created by seven angels, the seven planets. Thereupon the Unknown God manifested his shining image, the Glory of the heavenly Man. The angels of creation tried to detain this Anthropos but were unable to do so; it returned to heaven at once. Thereupon the angels shaped a human body in the likeness of the heavenly Man. But this creature was unable to stand erect and slithered upon the earth like a worm. The heavenly Adam, having pity on the earthly Adam, sent to him the spark of life, the Spirit, which raised him up and made him live. It is this spark that at death hastens back to its spiritual home, whereas the body dissolves into its constituent elements.

Variations of the myth of Saturninus are found in quite a few of the writings from Nag Hammadi. Valentinus (c. 150) alludes to this myth when, in a preserved fragment, he states that the Adam of *Genesis* inspired awe in the angels who created him because he had been fashioned after the pre-existent Anthropos. Mani (216–277) refers to the same story when he relates that in the beginning the Primal Man is sent out to combat the powers of darkness. This Archanthropos is overpowered and forced to leave "the Maiden who is his soul" embedded in matter. The entire world process is necessary to shape the Perfect Man so that the original state of androgyny (male and maiden at the same time) will be restored. All these speculations presuppose the god Man of *Ezekiel* 1:26. Moreover, it is possible that Paul was familiar with the same concept when he said that Christ was both the power (*dunamis*) and the wisdom (*sophia*) of God (*1 Cor.* 1:24).

Sophia. In the *Wisdom of Solomon*, part of the Greek and Roman Catholic Bible, written in Alexandria close to the beginning of the Christian era, personified wisdom, called Sophia, is said to be a holy spirit or the Holy Spirit, which penetrates the All. She is also referred to as the effluence of God's glory, an emanation of eternal light, and an immaculate mirror of God's activity. She is described as the beloved both of the wise man and of God, even more as the spouse of the Lord (*Wis.* 8:30).

In the *Thunder, Whole Mind*, from the same period and milieu, Sophia manifests herself as the wisdom of the Greeks and the *gnōsis* of the barbarians, the saint and the whore, the bridegroom and the bride. Over and over, she introduces these startling and paradoxical revelations with the formula "I am."

According to the eighth-century BCE inscriptions found near Hebron and in the Negev, the God of Israel had a foreign spouse, the Canaanite goddess Asherah. And in the fifth century BCE, Jewish soldiers garrisoned in Elephantine (near Aswān, Egypt) venerated another pagan fertility goddess

called Anat Yahu, the wife of the Lord. Prophets and priests in Judea did all they could to represent Yahveh as exclusively male and to delete all traces of the primeval matriarchy. But Wisdom survived as Hōkhmah, especially in Alexandria.

This is the basis of the Sophia model of *gnōsis*, which finds expression in the teaching of the famous Samaritan Simon, who was attracted to and yet rejected by incipient Christianity (*Acts* 8). The Samaritans, the last survivors of the ten tribes of northern Israel, were and are heterodox Jews who keep the Law while rejecting the rest of the Bible. They transmit a certain tradition about Wisdom as the personal creator of the world. According to Simon, Wisdom, the spouse of the Lord, was also called Holy Spirit and God's first idea, the mother of all. She descended to the lower regions and gave birth to the angels by whom the world was created. She was overwhelmed and detained by these world powers that she might not return to her abode. She was even incarnated and reincarnated in human bodies, such as that of the Helen of Greek myth and poetry. Finally, she came to dwell as a whore in a brothel of Tyre in Phoenicia, where Simon, "the great power" of God, found and redeemed her. In the *Apocryphon of John* as well as in the school of Valentinus, this Sophia model has been combined with the Anthropos model. Both are pre-Christian in origin.

The Unknown God and the demiurge. The rabbis of the first Christian centuries complain repeatedly of the heretics (*minim*) who taught the existence of two gods. Dissident Jewish teachers believed that God had a representative, bearing his name Jao (the abbreviation of YHVH), who was therefore called Jaol. According to this view, Jaol sat upon a throne next to God's throne and was therefore called Metatron (a Greek loanword). In reality, however, Jaol is nothing but an angel, the most important angel, the one who is called the angel of the Lord in the Hebrew Bible. Some dissident Jews called Magharians said that all anthropomorphisms in the Old Testament applied not to God himself but to this angel, who is also said to have created the world. In a Samaritan (i.e., heterodox Jewish) source called *Malef*, which is late but transmits earlier traditions, it is stated that the angel of the Lord formed the body of Adam from dust of the earth and that God breathed the breath of life into him.

Such views must have been known already to Philo of Alexandria, who polemicizes against them yet at the same time calls the Logos, who is instrumental in creation, both "a second god" and "archangel" on the one hand and "Lord" (YHVH) and "Name" (i.e., YHVH) on the other. Jewish Gnostics such as Simon and Cerinthus affirm that the demiurge (identified with YHVH) was in fact this angel of the Lord, who had not yet rebelled against God. In the *Apocryphon of John* the angel is called Saklas (Aramaic for "fool") because he does not know that there is a God greater than he. Valentinus, Marcion, and Apelles, who were familiar with the myth contained in the *Apocryphon of John*, all held that the demiurge was an angel. This is a typically Jew-

ish concept. A non-Jew, when suffering under the misery of the world, would simply have declared that the *Genesis* story was a myth without truth; he could not have cared less about the origin of Jewish law. Only those who had been brought up to believe every word of the Bible and to cling to the faith that God is one, and who yet found reason to rebel against their inheritance, would have inclined toward the Gnostic solution: God is one and the Bible reveals the truth, but anthropomorphisms such as the handicraft of a creative workman and personal lawgiving are to be attributed to a subordinate angel.

The god within. The biblical *Book of Genesis* relates that God blew the breath of life into the nose of Adam, transforming him into a living being (*Gn.* 2:7). Already in certain passages of the Old Testament (*Jb.* 34:13–15, *Ps.* 104:29–30), this breath is identified with the spirit of God. That is especially clear in the Dead Sea Scrolls: "I, the creature of dust, have known through the spirit, that Thou hast given me." The Alexandrian Jews have integrated and amplified this concept. They were familiar with Greek philosophy and knew that the Orphics, Plato, and the Stoics considered the human soul to be a part of the deity. They were influenced by the Stoic Posidonius (c. 100 BCE), according to whom "the daimon in us [the spirit] is akin to and of the same nature as the Daimon [God] who pervades the All." The oldest translators of the Septuagint rendered "breath" (Heb., *ne-shamah*) in *Genesis* 2:7 as "spirit" (Gr., *pneuma*). This variant is evidenced by the Old Latin Version (*spiritus*) translated from the Septuagint. Philo polemicizes against this particular translation because it deifies sinful man (*Allegorical Interpretation* 1; 13). And yet the Alexandrian *Wisdom of Solomon*, still included in every Roman Catholic Bible, declares explicitly that God's incorruptible *pneuma* is in all things (12:1). Most Gnostics preserved this tendentious translation and made it the basis for their mythological speculations. It enabled them to tell how it came to pass that the Spirit sleeps in man and how it can be made conscious. So it is with Valentinus and Mani. Few people nowadays are aware that these mythologems presuppose a consensus of virtually all Greek philosophers and have a biblical foundation.

JEWISH GNOSTICISM. The themes discussed above are the basic elements that contributed to the rise of a Jewish Gnosticism, whose myth is contained in the *Apocryphon of John* and other related writings found at Nag Hammadi. The church father Irenaeus attributed this doctrine to the *gnōstikoi*. With this name he indicates not all those whom modern scholars call "Gnostics" but only the adherents of a specific sect. It is misleading to call them Sethians (descendants of Seth, the son of Adam), as some scholars do nowadays. Notwithstanding its name, the *Apocryphon of John* (a disciple of Jesus) contains no Christian elements apart from the foreword and some minor interpolations. It can be summarized as follows: from the Unknown God (who exists beyond thought and name) and his spouse (who is his counterpart and mirror) issued the spiritual world. The last of the spiritual entities, Sophia, became wanton and brought forth

a monster, the demiurge. He organized the zodiac and the seven planets. He proclaimed: "I am a jealous god, apart from me there is no other." Then a voice was heard, teaching him that above him existed the Unknown God and his spouse. Next, the "first Man in the form of a man" manifested himself to the lower angels. He is the Glory of *Ezekiel* 1:26. His reflection appears in the waters of chaos (cf. the mirror of the Anthropos in *Poimandres*). Thereupon the lower angels created the body of Adam after the image that they had seen, an imitation of the Man, who clearly serves as an ideal archetype for the human body. For a long time the body of Adam lay unable to move, for the seven planetary angels were unable to raise it up. Then Sophia caused the demiurge to breathe the *pneuma* he had inherited from her into the face of his creature. So begins a long struggle between the redeeming Sophia and the malicious demiurge, the struggle for and against the awakening of human spiritual consciousness.

Written in Alexandria about the beginning of the Christian era, the myth of the *Apocryphon of John*, a pivotal and seminal writing, combines the Anthropos model and the Sophia model. It is very complicated and confusing but had enormous influence in the Near East, where so many remnants of great religions survive today. (In the 1980s, for example, there were 420 Samaritans and 30,000 Nestorians.) Even today some 15,000 Mandaeans (the Aramaic term for Gnostics) live in Iraq and Iran. Their religion features ablutions in streaming water and a funerary mass. When a Mandaean has died, a priest performs a complicated rite in order to return the soul to its heavenly abode, where it will receive a spiritual body. In this way, it is believed, the deceased is integrated into the so-called Secret Adam, the Glory, the divine body of God. This name confirms that, along with the Anthropos of *Poimandres* and the Adam Qadmon of later Jewish mysticism, this divine and heavenly figure is ultimately derived from the vision of the prophet Ezekiel. In Mandaean lore Sophia appears in degraded form as a mean and lewd creature called the Holy Spirit. The creation of the world is attributed to a lower demiurge, Ptahil, a pseudonym for the angel Gabriel (who, according to both the Mandaeans and the Magharians, is the angel who created the world).

The apostle Paul (or one of his pupils) maintains that Christ, who is for him the second Adam, is "the head of his Church, which is his body" (*Eph.* 1:22–23). The Christian is integrated into this body through baptism. Mandaean speculations about the Secret Adam may elucidate what Paul meant. In defining his view of the church as the mystical body of Christ, the apostle may be reflecting a familiarity with comparable Jewish and Hellenistic speculations about the *kavod* as the body of God. As a matter of fact, it has become clear from the verses of Ezekiel Tragicus that such ideas circulated in Alexandria long before the beginning of our era. They surfaced in Palestine toward the end of the first century CE in strictly Pharisaic circles that transmitted secret, esoteric traditions about the mystical journey of the sage through the

seven heavenly places to behold the god Man on the throne of God. The author of the writing *Shi'ur Qoma*, the "measurement of the Body" of God, reports the enormous dimensions of the members of the Glory. The Orphics had taught that the cosmos was actually a divine body. Already early in Hellenistic Egypt similar speculations arose; these were the origin of the remarkable speculations of Palestinian rabbis concerning the mystical body of God. (These speculations ultimately led to the *Zohar*.) It is no coincidence that the Glory is called Geradamas (Arch-Adam) in some Nag Hammadi writings, Adam Qadmaia in Mandaean sources, and Adam Qadmon in medieval Jewish Gnosticism.

In the ninth century several groups of Islamic Gnostics arose in southern Iraq, where several other Gnostic sects had found refuge during late antiquity and where the Mandaeans continue to live today. The best-known Islamic Gnostics are the Ismā'īlīyah, of which the Aga Khan is the religious leader. Mythological themes central to their religion are (1) the cycles of the seven prophets; (2) the throne and the letters; (3) Kuni, the creative principle, who is feminine (a typical remythologizing of a monotheistic Father religion); (4) the higher Pentad; (5) the infatuation of the lower demiurge; (6) the seven planets and the twelve signs of the zodiac; (7) the divine Adam; and (8) the fall and ascent of the soul.

Since the discovery of the Nag Hammadi codices it has been established that these themes are best explained as transpositions into an Islamic terminology of the Gnostic mythemes that are found in the *Apocryphon of John* and kindred documents of Jewish Gnosticism.

CHRISTIAN GNOSIS. According to a reliable tradition, Barnabas, a missionary of the Jerusalem congregation, was the first to bring the gospel to Alexandria, a relatively easy journey. Egyptian Christianity is Judaic in origin, not gentile, and the great Egyptian Gnostics seem all to have been of Jewish birth. The adherents of Basilides claimed: "We are no longer Jews and not yet Christians." The followers of Valentinus reported: "When we were Hebrews, we were orphans." Basilides and Valentinus both proclaimed a God beyond the Old Testament God, and both were familiar with the myth of the *Apocryphon of John*, which they christianized. The case of Marcion is similar: he was so well-informed about the Hebrew Bible and its flaws that his father, a bishop, may well be presumed to have been Jewish. Through a certain Cerdo, Marcion came to know an already existing Gnostic system. Those who reject the god of the Old Testament obviously no longer hold to the Jewish faith, but nevertheless still belong ethnically to the Jewish people. Both Valentinus and Marcion went to Rome and were excommunicated there between 140 and 150. Basilides, who stayed in Alexandria, remained a respected schoolmaster there until his death. The Christians in Alexandria were divided among several synagogues and could afford to be tolerant, for a monarchic bishop did not yet exist and their faith was pluriform anyhow. Basilides, Valentinus, and Marcion were Christocentric and let themselves be influenced by the *Gospel of John* and the letters of Paul.

Marcion. When Marcion, a rich shipowner from Sinope in Pontus (on the Black Sea), was excommunicated, he organized an enormous alternative church that persisted for a long time, especially in the East (e.g., in Armenia). Marcion was a violin with one string, a religious genius with one overpowering idea: God, the Father of Jesus, was not the Hebrew YHVH. Like the Gnostics, he distinguished between the Unknown God (whom he felt to be the only genuine God) and a lower divinity, the demiurge, who is responsible for creation and interacts with man. Above all, Marcion was fascinated by Paul's *Letter to the Galatians*. Following Paul, he contrasted the Law of the Old Testament and Israelite religion with the "gospel of forgiveness," which revealed the goodness of God.

Like his hero Paul, Marcion was overwhelmed by the unconditional and unwarranted love of God for poor creatures. This led him to deny the Gnostic idea that man's inmost Self is related to the Godhead. For Marcion, man is nothing more than the creation of a cruel demiurge; the loving God who has rescued him, without any ulterior motive but simply out of a freely bestowed loving kindness, is totally alien to man, his nature, and his fate.

Until Augustine, no one understood Paul as well as Marcion; yet Marcion, the one genuine pupil, misunderstood Paul as well. Notwithstanding his dialectics, Paul never rejected the created world, sexuality, or the people of Israel, as did Marcion.

Basilides. Basilides was active as the leader of a school in Alexandria in the time of the emperors Hadrian (r. 117–138) and Antoninus Pius (r. 138–161). He seems to have been one of those many liberal Jews who had left behind the concept of a personal lord for belief in the Unknown God. Yet he was never excommunicated and remained a respected member of the church of Alexandria until his death.

Basilides must have known the earlier Alexandrian, pre-Christian myth contained in the *Apocryphon of John*. He too begins his cosmogony with the Unknown God, "the not-being God, who made a not-yet-being world out of nothing" by bringing forth a single germ of the All. This germ was the primeval chaos. From it in due time one element after another arose on high, while below there remained only the so-called third sonship, or the Spirit in the spiritual man.

When the time was right, Jesus was enlightened at his baptism in the river Jordan (a typically Jewish-Christian notion). He is considered to be the prototype of all spiritual men, who through his revealing word become conscious of their innermost being, the Spirit, and rise up to the spiritual realm.

When the entire third sonship has redeemed itself, God will take pity on the world, and he will allow the descent of "the great unconsciousness" upon the rest of mankind. Thereafter no one will have even an inkling that there was ever anything like the Spirit. Basilides foresees a godless and classless society.

Valentinus. The greatest Gnostic of all times was the poet Valentinus. Despite his Latin name, he was a Greek born in the Nile Delta around the year 100 and educated in Alexandria. He and his followers did not separate from the church of Alexandria but created an academy for free research, which in turn formed a loose network of local groups within the institutional religion. Even among his opponents Valentinus became renowned for his eloquence and genius.

According to his own words, his views originated in a visionary experience in which he saw a newborn child. This vision inspired a "tragic myth," expressed by Valentinus in a psalm that described how the All emanates from the ground of being, called Depth, and his spouse, called Womb or Silence. Together they bring forth the Christ, or Logos, upon whom all aeons (half ideas, half angels) depend and through whom the All is coherent and connected. Through the revelation of Christ, Valentinus experienced the wholeness of the All, the fullness of being, and the nonentity "I and Thou" (known in Hinduism as *advaita*). Not dualism but duality is the underlying principle of reality, according to Valentinus: God himself is the transcendental unity of Depth and Silence; the aeons of the pleroma (spiritual world) are a diametrical union of the masculine, or creative, and the feminine, or receptive, principles; Christ and Sophia (Wisdom) are a couple (separated for a while on account of the trespass and fall of Sophia but in the end happily reunited). Man and his guardian angel, or transcendental counterpart, celebrate the mystical marriage of bride and bridegroom (the Ego and the Self). Polarity (Gr., *suzugia*; Lat., *coniunctio*) is characteristic of all things spiritual. On the basis of this metaphysical view, Valentinus and his followers valued both sex and marriage, at least for the pneumatics. A preserved fragment from the school of Valentinus gives the following interpretation of Jesus' statement in the *Gospel of John* that the Christian lives in the world but is not from it (*Jn.* 17:14–16): "Whosoever is in the world and has not loved a woman so as to become one with her, is not out of the Truth and will not attain the Truth; but he who is *from* the world and unites with a woman, will not attain the Truth, because he made sex out of concupiscence alone." The Valentinians permitted intercourse only between men and women who were able to experience it as a mystery and a sacrament, namely, those who were pneumatics. They forbade it between those whom they called "psychics" (Jews and Catholics) or "hylics" (materialists), because these two lower classes knew nothing but libido. As the only early Christian on record who spoke lovingly about sexual intercourse and womanhood, Valentinus must have been a great lover.

The Jung Codex. On May 10, 1952, at the behest of the Jung Institute in Zurich, I acquired one of the thirteen codices found at Nag Hammadi in 1945. In honor of the great psychiatrist who helped to put this manuscript at the disposal of competent scholars, it is called the Jung Codex. It contains five Valentinian writings:

1. The *Prayer of the Apostle Paul*.

2. The *Apocryphon of James* is a letter purporting to contain revelations of the risen Jesus, written by James, his brother. In reality, it contains Valentinian speculations grafted onto the root and fatness of the olive tree planted beside the waters of the Nile by Hebrew missionaries from Jerusalem (c. 160).
3. The *Gospel of Truth* is a meditation on the true eternal gospel proclaimed by Christ to awaken man's innermost being, the unconscious Spirit, probably written by Valentinus himself in about 150.
4. The *Epistle to Rheginos concerning the Resurrection* is adequate explanation of Paul's view on the subject: already, here and now, man anticipates eternal life, and after death he will receive an ethereal body.
5. The so-called *Tripartite Treatise* is a systematic and consistent exposition of the history of the All. It describes how the Spirit evolves through the inferno of a materialistic (pagan or "hylic") phase and the purgatory of a moral (Jewish and Catholic or "psychic") phase to the coming of Christ, who inaugurates the *paradiso* of final consummation, in which spiritual man becomes conscious of himself and of his identity with the Unknown God. The author, a leader of the Italic (Roman) school of Valentinianism, was most likely Heracleon (c. 170). It was against this shade of Valentinian gnosis that Plotinus, the Neoplatonic philosopher, wrote his pamphlet *Against the Gnostics* (c. 250).

LATER DEVELOPMENTS. Scholars have always admitted that Origen (c. 180–254), the greatest dogmatician of the Greek church, had much in common with the Valentinians: the spirits fall away from God and become souls before the creation of the world; the world purifies the soul; Jesus brings not only redemption to the faithful but also gnosis to the pneumatics. But whereas Valentinus was said to have taught predestination physics (the teaching that spiritual man was saved by nature), Origen on the contrary allegedly stressed free will. The *Tripartite Treatise* has undermined this apologetic position. There evil is no longer a tragic neurosis that befell Sophia but a free decision. Moreover, this writing is thoroughly optimistic: all is for the best in the best of all possible worlds, and providence educates mankind toward the realization of complete consciousness, as in Origen's soteriology. Some path led from the tragic view of Valentinus to the optimism of Heracleon, and from Heracleon to Origen was only one step more.

The Valentinians of Carthage spoke Latin, whereas the Christians in Rome spoke Greek. Translating their technical terms from Greek, the Valentinians coined Latin equivalents of *infinite*, *consubstantial*, *trinity*, *person*, and *substance*. These terms were eventually adopted by the Roman Catholic church. If ever there was a community that created a special language, it was the school of Valentinus at Carthage.

Mani. Gnosticism became a world religion when Mani (216–277) founded his alternative Christian church, which

existed for more than a thousand years with adherents in lands from the Atlantic Ocean to the Pacific. From his fourth until his twenty-fifth year Mani was raised in a Jewish-Christian community of Baptists, followers of the prophet Elxai (c. 100). There he heard, first, that Jesus was "the true prophet," a manifestation of God's glory (*kavod*) who was first embodied in Adam, then revealed himself to the Old Testament patriarchs and was ultimately incarnated in the Messiah, Jesus. He also heard, second, that baptisms and ablutions were necessary for salvation and, third, that God was the origin of evil since Satan was the left hand of God. He modified the first belief, identifying himself as the seal of the prophets, who included the Buddha and Zarathushtra in the East and Jesus in the West. The second belief he rejected; in fact, he admitted no sacraments at all. Against the third belief he, being a cripple, rebelled with all his might. Evil, in Mani's view, did not originate in the world of light but had its source in a different principle, the world of darkness, matter, and concupiscence.

Influenced by encratic asceticism of the Aramaic Christians of Asia, Mani rejected marriage and the consumption of alcohol and meat, and he designated among his followers an upper class of the elect who lived according to the Sermon on the Mount and a lower class of auditors who were allowed to have wives or concubines and to practice birth control. But very much in the spirit of Valentinus was Mani's primary religious experience. The basis of his entire myth, the encounter with his "twin" or transcendental Self, is Gnostic, very much in the spirit of Valentinus: "I recognized him and understood that he was my Self from whom I had been separated." Mani encountered his spiritual Self at the age of twelve and encountered it a second time at the age of twenty-five. He felt constantly accompanied by his twin, and when he died a martyr in prison he was gazing at this familiar. The encounter with one's twin is central to the life of every Manichaean. The mystery of conjunction, the holy marriage of Ego and Self, is thereby democratized. To illustrate this process, Mani related a myth that is indebted to earlier Gnostic movements. For Mani the world is in truth created by the Living Spirit, a manifestation of God, and not by a lower demiurge. But a split within the deity takes place when the archetypal Man loses in the battle against darkness, is thus overwhelmed, and abandons his soul as sparks of light dispersed throughout the material world and mankind. Man is contaminated in this way by concupiscence, an evil force from the world of darkness. The entire world system is devised to save these light elements and to restore man as Perfect Man in his original purity and integrity.

Augustine (354–430) was a Manichaean auditor for more than nine years before he became a Father of the Roman Catholic church. During that period he wrote a treatise (since lost), *On Beauty and Harmony*, in which he stated that the asexual mind was linked with a completely alien element of ire and concupiscence. As a heresy-hunter he later maintained that concupiscence was not created by God but

was instead a consequence of the Fall. The assertion that the reproductive instinct is not a part of human nature does certainly have Manichaean overtones.

The Middle Ages. Manichaeism disappeared completely in the West and had no successors there: the term *medieval Manichee* is a misnomer. And yet Christianity during the Middle Ages both in western and in eastern Europe was not monolithically orthodox. Gnosticism flourished at that time. Such books as *Montaillou* by Emmanuel Le Roy Ladurie and *The Name of the Rose* by Umberto Eco have drawn the attention of a large public of interested outsiders to the existence of dualistic sects such as the Cathari in southern France and northern Italy and the Bogomils (or “friends of God”) in Yugoslavia and Bulgaria, because their views resemble those of the ancient Gnostics. Indeed, their affiliation with ancient Gnosticism, if somewhat complicated, is well established.

The Paulicians were typically Armenian sectarians who, persisting into modern times, turned up in 1837 in the village of Arh’wela (in Russian Armenia) with their holy book, the *Key of Truth* (eighth century). Two versions of their doctrine exist. According to one, Jesus was adopted to be the son of God. According to the second version, there are two gods; one is the Father in heaven, while the other is the creator of this world. This can be explained in the following way: Christianity was introduced to Armenia from Edessa at an early date, and Edessa owed its (adoptionist) Christology to Addai, the Jewish-Christian missionary from Jerusalem. When Roman Catholicism was established as the state church in 302 by Gregory the Illuminator, the Christians of Armenia were branded as heretics. Marcionites and Gnostics had taken refuge in these marginal and mountainous regions. They united with the adoptionists to become one sect, the Paulicians, soon a warlike group. The emperors of Byzantium deported quite a few of them to the Balkans, especially to Bulgaria. It was there that the sect of the Bogomils originated, characterized by the belief that the devil (Satanael) created and rules this world. Their influence spread to the West, and from the beginning of the eleventh century gave rise to the church of the Cathari, which was strong in southern France and northern Italy. Thus Gnosticism was never completely suppressed but survived into the Middle Ages.

Modern gnosis. The gnosis of modern times, launched by the shoemaker Jakob Boehme (c. 1600), was generated spontaneously as a result of direct experience. It differs from ancient Gnosticism in that it derives not only the light but also the darkness (not only good but also evil) from the ground of being. Inspired by Boehme is the influential gnosis of the English poet and artist William Blake (1757–1827), the only authentic Gnostic of the entire Anglo-Saxon world. It is in the school of Boehme that the scholarly study of Gnosticism has its roots, beginning with the *Impartial History of the Churches and Heresies* (1699) by Gottfried Arnold. In this extremely learned work all heretics, including all Gnostics, are represented as the true Christians—innocent and slandered lambs.

Ever since, the study of Gnosticism has been an accepted academic subject in Germany, but in Germany alone. In his youth Goethe read Arnold’s book and conceived his own Gnostic system, as reported in his autobiography. Toward the end of his life Goethe recalled the love of his youth when he wrote the finale to *Faust*, the hierophany of “the Eternally Feminine,” a version of the Gnostic Sophia, the exclusive manifestation of the deity. Johann Lorenz von Mosheim and other great historians also took gnosis quite seriously. The brilliant August Neander, who belonged to the conservative reaction to the Enlightenment called the Great Awakening Revivalism (*Erweckungsbewegung*), wrote his *Genetic Evolution of the Most Important Gnostic Systems* in 1818. Ferdinand Christian Baur, a prominent Hegelian, published his monumental *Christian Gnosis* in 1835, in which he defends the thesis that gnosis was a religious philosophy whose modern counterpart is the idealism of Schelling, Schleiermacher, and Hegel, all based upon the vision of Boehme. According to Baur, even German idealism was a form of gnosis. Yet when “the people of poets and thinkers” became, under Bismarck, a people of merchants and industrial workers, this wonderful empathy, this fantastic feel of gnosis, was almost completely lost.

Adolf von Harnack (1851–1930), the ideologue of Wilhelm’s empire, defined Gnosticism as the acute, and orthodox as the chronic, hellenization (i.e., rationalization) and hence alienation of Christianity. At the time it was difficult to appreciate the experience behind the Gnostic symbols. Wilhelm Bousset, in his *Main Problems of Gnosis* (1907), described this religion as a museum of hoary and lifeless oriental (Indian, Iranian, Babylonian) fossils. The same unimaginative approach led Richard Reitzenstein, Geo Widengren, and Rudolf Bultmann to postulate an Iranian mystery of salvation that never existed but was supposed to explain Gnosticism, Manichaeism, and Christianity.

Existentialism and depth psychology were needed to re-discover the abysmal feelings that inspired the movement of gnosis. Hans Jonas (*The Gnostic Religion*, 1958) has depicted these feelings as dread, alienation, and an aversion to all worldly existence, as if the Gnostics were followers of Heidegger. In the same vein are the writings of Kurt Rudolph, the expert on Mandaeism.

Under the influence of Carl Gustav Jung, I and other scholars (e.g., Henri-Charles Puech and Károly Kerényi) have interpreted the Gnostic symbols as a mythical expression (i.e., projection) of self-experience. As a lone wolf, the Roman Catholic convert Erik Peterson suggested that the origins of Gnosticism were not Iranian or Greek but Jewish. The Gnostic writings from Nag Hammadi have shown Jung and Peterson to be in the right. At last the origins, development, and goal of this perennial philosophy have come to light.

GNOSTICISM: GNOSTICISM FROM ITS ORIGINS TO THE MIDDLE AGES [FURTHER CONSIDERATIONS]

The term *Gnosticism* was coined in the eighteenth century to designate a composite ensemble of sects that arose from the late first century to the fourth century CE. These sects were classified by the Church Fathers among the earlier Christian heresies. Their adepts, in contrast with common believers, claimed to be endowed through an extraordinary revelation with spiritual awareness (Gk. *gnōsis*) concerning both God's hidden nature and the true human self, and to have deduced from that a mythological or theosophical account of the universe, the origin of evil, and otherworldly salvation. But the Gnostic phenomenon as a whole deserves a more flexible approach. Inasmuch as these sects, for the most part, were building up an entire doctrinal system of their own rather than simply discussing existing Christian doctrine (unlike later Christological or Trinitarian heresies), Gnosticism could hardly be reduced to an odd variant of Christianity; it was something quite original, although its dependence on the Judeo-Christian background remains central. Moreover, since the Gnostic movement existed historically in many diversified forms and single perspectives, any attempt at a specific definition is unsuitable. According to the Messina Congress (Bianchi, 1967), the name *Gnosticism* should be limited to the "Gnostic systems of the second century" referred to by Church Fathers and contemporary original texts; otherwise one should rather speak of *Gnosis* with its generic meaning of "knowledge of the divine mysteries." This is, of course, a compromise formula, which cannot obscure the fact that the foregoing roots of the second-century systems belong fully to the complexity of the Gnostic phenomenon.

THE EVIDENCE. Until the mid-twentieth century, the major sources for Gnosticism were the Church Fathers who dealt with heretics, the heresiologists (mainly Irenaeus, Hippolytus, Clement of Alexandria, and Epiphanius); some New Testament apocryphal writings (*Acts of Thomas*, *Acts of John*); and the double (Greek and Latin) version of a didactic romance falsely ascribed to Clement of Rome (*Pseudo-Clementines*). The only available Gnostic texts in the Coptic language, dating to the fourth century, were the two *Books of Jeu* and the so-called *Scriptum sine titulo* (*Bruce Codex*,

from the purchaser's name, 1769) and the *Pistis Sophia* (*Askew Codex*, 1772). The *Corpus Hermeticum*, composed between the second and the fourth centuries and known in Europe since the Renaissance, is also commonly considered to be a Gnostic document. The *Corpus Hermeticum* numbers sixteen treatises in Greek, followed by fragments reportedly by the Byzantine erudite John of Stobi, Macedonia (Stobaeus), in which the salvific role of *gnōsis* is stressed in a pagan Greek-Egyptian framework. A dramatic increase in scholarly knowledge on Gnosticism took place thanks to the discovery in 1945 of the thirteen codices of Nag Hammadi, Egypt, which contained the *Apocryphon of John* (in four versions) and the *Gospel of Thomas*, along with forty-eight other remarkable writings in Coptic. All Nag Hammadi texts are thought to have been translated from Greek originals of the second or third century.

HISTORICAL OUTLINE: THE EMERGENCE STAGE. The earliest forms of Gnosticism (c. 50–120 CE) originated within different religious milieus of the late-first-century Middle East, in which a sectarian nonrabbinical Judaism and a still fluid and creative Christian mission were unfolding, sometimes reacting upon one another.

Baptist Samaritan sects. The movement founded by John the Baptist split in several offshoots (Jesus' group included therein) after John's death around 27 CE. In one of these sects, headed in turn by three Samaritans (Dositheus, Simon, and Menander), there emerged for the first time the idea that the world was the creation of more or less depraved angels who "ignored" the existence of the highest God—a striking radicalization of the apocalyptic angelology that was widespread in contemporary Judaism. The baptismal ritual therefore accomplished not only the remission of sins but also a regeneration, by means of which the natural death allotted to humans by the ruling angels could be overcome.

Analogously to concurrent Christian preaching, the Samaritan baptist sect requested from its adherents a belief in the person of the founder, or actual leader, who was viewed as the embodiment of God's power, spirit, or wisdom, and as the redeemer and revealer of true "knowledge." But unlike Christianity, this knowledge was given a marked mythological aspect. Irenaeus reports (1.23) that Simon drew up a mythical theology according to which God's personified power and wisdom (Gk. *dunamis, ennoia*) had been seized or raped by the wicked angels, and imprisoned successively in many female bodies, at last appearing as Simon's own concubine Helen, a former prostitute. Simon himself would have been the incarnation of the supreme God descended on earth to release her.

While the Simonian myth still seemed to be a personal adaptation of the prophet Hosea's story (*Hos.* 3:1), a decisive step toward an anti-biblical and anti-Jewish attitude was made by Saturninus (or Satornil, possibly an Aramaic version of the Latin name) operating around 100 CE in Antioch, Syria, where the sect had moved under Menander. Working out a combined interpretation of *Genesis* 1:27 and 2:7, Sa-

turninus taught that seven angelic powers (a plain allusion to the Jewish godhead) fashioned a puppy resembling the image of the higher God in the form of a man. The inanimate *gōlem* was given by God the spirit of life, through which he gained a higher-ranking status than his fabricators (Irenaeus 1.25). This narrative was variously echoed in later Gnostic mythology. Hippolytus (6.9–18) reports an abstract of an alleged Simonian writing, *Great Revelation*, in which nothing of the Ennoia-Helen myth is mentioned. It seems a qabbalistic Midrash of *Genesis* 1–2, enriched with philosophical references. The godly first principle, symbolized as “fire,” has a double nature, a standing one (Gk. *estōs*) and a dynamic one; the latter includes seven “powers,” of which the seventh represents the divinity as concealed inside every being. This book was presumably written in the late second century.

Jewish-Christianity. Other offspring of the former baptist movement joined the Christians. The outcome of such mingling was the so-called Jewish-Christianity prevailing in Palestine and Syria, which, besides the baptismal ritual, maintained the basic observances of the Mosaic Torah. The Jewish-Christians held the “Christ” (Messiah) to be an eternal aspect of God’s hidden nature, his “spirit” and “truth,” who revealed himself throughout sacred history wearing the flesh of elected men or prophets (this idea of a forthcoming revelation can be traced back to the Dead Sea Scrolls). Such a function of the “true prophet” had been performed in the past by Adam, Seth, Enoch, Melchizedek, Moses, and more recently by Jesus, an ordinary human being on whom the “Christ” would have been “poured” in the moment of his baptism. The *Pseudo-Clementines* and the heresiological accounts about Cerinthus, the Nazoraeans, and the Hebionites illustrate such an interpretation of the Jesus figure (Irenaeus 1.26; Hippolytus 7.33–34; Epiphanius 28–30).

Around 100 CE a dissident Babylonian Jew named (or nicknamed) Elcasai began to preach about an ecstatic experience he would have had, in which the Christ, along with his “sister” (or spouse), the spirit, appeared to him in their eternal form as a male and a female figure of colossal size (Hippolytus 9.13; Epiphanius 19). Elcasai gathered a new baptist congregation (perhaps a proper religion more than a sect, somewhat similar to the Mandaeans of Iraq) with a foremost apocalyptic doctrine, in addition to a peculiar Christian ingredient: Christ was apparently both God’s son and a divine substance scattered everywhere (*Cologne Codex*, p. 97), as is also said in the *Gospel of Thomas* (77, and cf. Epiphanius 26.3). The young Mani took over this topic, probably while growing up in the center of this congregation in lower Mesopotamia. From the Parthian territory Elcasaitic, the movement spread rapidly into Roman Syria and gained adherents among the Christians of the Roman capital.

Christian radicalism and theosophy. The early Christian communities that broke with Jewish national religion (though keeping much of Judaic lore and symbolism) be-

came, in a different way, original settings of Gnostic ideas. The starting point seems to have been a radicalization of the teachings of the apostles Paul and John, particularly in the sharp antithesis between flesh and spirit, the stressing of charismatic faculties and performances, and the rejection of the Jewish Law, which was viewed as imposed by defective angelic powers called *archons*. Some Christian thinkers drew the assumption, which is found throughout the history of Gnosticism, that the spirit (or the soul) alone is both object and subject of salvation, since all flesh belongs to the evil realm of the archons. They consistently denied Jesus’ real incarnation and bodily resurrection. The followers of Jesus should also have no concern for their bodies, because only souls can be saved, namely by faith. Two radical consequences were in keeping with this rationale: the “elects” could either abolish any socially acknowledged norm, pursuing asceticism instead (Encratites: Clement, *Stromateis* 3.6 and 13), or they could yield themselves to immorality, since they had no ethical requirement with which to comply during their earthly existence (Nicolaites: Clement 3.4; Epiphanius 25).

Most likely, such milieus diffused the word *gnōstikos* (rarely attested in Greek, maybe an adaptation of the Hebrew *maskil*), which usually designated the conscious, well-cultivated Christian believer, but was also used by Christian radicals to describe themselves, insofar as they presumed a deeper insight and felt they were allowed an unrestrained freedom. Only in a few cases, however, did the term serve as a self-definition for Gnostic sects.

The Christianity of Alexandria, Egypt, became a veritable cradle of Gnosticism. The local church had a Jewish-Christian origin, gaining its members from both the Hebrew minority and the Greek majority of the town. The latter became dominant after the collapse of the Jewish community with the revolt of 115 to 117, giving anti-Jewish attitudes the upper hand. The Alexandrian ambience encouraged theological inquiry, which was developing freely since no definite border between “orthodoxy” and “heresy” existed yet. Various cultural patterns were available for Christian intellectuals (*gnōstikoi*) in conformity with their different backgrounds: Judaic apocalypticism, speculation on divine wisdom (as it had been undertaken by Philo), Greek philosophy, and Hellenistic mystery religions.

The transition from the Christian radical meaning of *gnōstikos* to “Gnostic” in the modern sense is exemplified by Carpocrates, a Greek Alexandrine active in the first decades of the second century. Carpocrates taught that Jesus was an ordinary man whose soul had realized the existence of a higher unknown God; Carpocrates therefore despised Jewish customs as devotion to maleficent world-ruling angels. Carpocrates and his son Epiphanes led a libertine sect of self-named Gnostics that combined extreme Pauline antinomism with topics borrowed from ancient Greek sophists (e.g., the appreciation of “nature” against social convention) and Jesus worship with syncretistic cults (Irenaeus 1.25; Clement 3.2).

Similar views were held later by Prodicus, the Antitacti (Clement 3.4), and other sects hinting at re-evaluating the negative figures of the Old Testament, such as the Cainites (Irenaeus 1.31).

A different perspective is offered by what was possibly the earliest Gnostic document known to us (c. 100), a Nag Hammadi treatise in the form of a letter, titled by the alleged author's name, *Eugnostos the Blessed*. It is a theosophical account of the supreme godhead displayed as a fourfold structure that expands progressively: (1) the all-transcendent God; (2) his likeness, the Light Man or the Father; (3) the latter's son, the Son of Man; and (4) the Son of the Son of Man, or the Savior. Figures 2 to 4 each include a female partner named *Sophia* (wisdom). The fourth couple engenders 365 "magnitudes" or space-time dimensions (aeons) in the shape of angels, who typify the cosmic order. Such a revelation of a quadripartite godhead was rooted in Judaic mystical circles building on *Ezekiel* 1. Christianity is not mentioned in the text, but the references to *Father*, *Son*, and *Savior* can hardly be understood as other than Christian suggestions. Sometime later the *Eugnostos* treatise was more explicitly Christianized when its contents were recycled under the title *Sophia of Jesus Christ* (Nag Hammadi codex III).

MATURE GNOSTICISM (C. 120–200). The Gnostic movement reached its acme during the Antonine age. There was a proliferation of groups, each having a distinctive rationale, even if links existed among at least a few of them and some aspects might occasionally be shared. Little is known about the social composition of such groups. In the Syrian and Egyptian countryside the adepts were poor farmers, but in the towns the groups included wealthy citizens, merchants, and intellectuals. Members of these groups apparently had no interest in political issues. In this time of religious persecution, Catholics were blaming Gnostics for practicing dissimulation.

Sethite-Barbeloite Gnosis. One self-designated Gnostic School, according to Irenaeus (1.11, 30), introduced a female as a full member into the male scheme of the quadripartite godhead (*Eugnostos*) and made her the protagonist of a myth that explained the origin of evil by means of an accident that occurred in the divine "family." There are two versions of the myth. In one version the fourfold scheme is personified as an androgynous figure with prevailing female traits called Barbēlō ("God-[is]-in-the-Four" in Aramaic), the Daughter-Spouse of God, who generates the Son (Christ) and the chief of the lower angels or archons, Yaldabaoth (Aramaic *yalda*, "youth"), a caricature of the biblical creator. Barbēlō prostitutes herself to the archons willingly (unlike the Simonian Ennoia myth) and consequently some part of her divine *dunamis* falls in their hands, forming human souls to be rescued (Epiphanius 25.3, 26.10). In the second version a female member of the quaternary named Holy Spirit, Wisdom (Gk. *Sophia*), or "Harlot" (Gk. *Prounikos*) ventures to the outer darkness and gives birth there to Yaldabaoth, the minor God who creates the world

along with a cohort of maleficent archons. Later she repents. An interpretation of the *Genesis* narrative, similar to that of Saturninus, follows. The elevation of the first human, created by the archons as their servant, is illustrated by an inverted exegesis of the biblical episode about the tree of knowledge: Yaldabaoth forbids eating from the tree, but Adam is induced to contradict him (antinomism) by Sophia, temporarily embodied in Eve (or in the serpent). So what the Bible explained as a sin becomes here advancement, through which Adam obtains the *gnōsis* and the divine *pneuma* inherited thereafter by his third son, Seth (Irenaeus 1.30, Epiphanius 37.3).

Both versions have been revised and amalgamated in the *Apocryphon of John*, composed in Egypt around 120, which gives the standard form of the story (Nag Hammadi codex II). In this text, Barbēlō and Sophia are two distinct figures. Barbēlō, the likeness of the absolute, produces a complicated structure of aeons (the *plerōma*) among which the heavenly Seth (linked to Christ) is exalted as the ancestor of the Gnostic "race," having as an earthly counterpart Adam's son. Sophia is a subordinate aeon who carries the responsibility for the rise of the evil powers, but who also brings about human salvation. Jesus plays a key role as an earthly apparition of the heavenly Seth. The Sethites believed in predestination, as usual in sectarian circles. Only the true "seed of Seth" is saved because it shares the divine "pneumatic" nature and ought to return to its "place" of belonging; the other humans, creatures of the archons, have nowhere to go after death, so their spiritless souls are recycled in the lower world through reincarnation. The main Sethite ritual was baptism.

Recent scholarship has labeled the doctrines contained in the *Apocryphon of John* and related Nag Hammadi texts as Sethian Gnosticism. This is confusing, considering that the only "Sethians" mentioned in ancient sources are two later sects (Hippolytus 5.19–22 and Epiphanius 39), whose views had nothing in common and who had nothing to do with so-called Sethian Gnosticism. Of course the symbolic figure of Seth (Klijn, 1977) could be applied in very different contexts.

Gospel of Thomas. This masterwork of Gnostic literature was composed in northern Syria around 120 CE—the final accomplishment of an alternative Jesus tradition based on the "Lord's sayings" (*logia*) and not on biographical narrative. There are 114 such *logia* collected in Nag Hammadi Codex II, many of them converging with or altering verses of the canonical Gospels, but presumably other compilations existed, as can be inferred from references in the sources (Hippolytus 5.7.20). Any mythological frame is absent. Jesus is portrayed as a teacher who spoke in riddles and symbols. The central Gnostic notion is that of the "inside Man" or "Light-Man"—that is, the divine self (not the human "soul") hidden in the "garment" of flesh (24, 37). Being the everlasting "image" of God, this "inside Man" precedes earthly life and will be encountered in glory after death (18, 19). The "Hymn of the Pearl" in the *Acts of Thomas* (108–112) reflects such an idea.

Basilides was a prominent Christian theologian of Alexandria in the mid-second century CE. Only a few fragments of his ponderous works are extant. His main issue was the notion of divine grace assuring the salvation of the elects, a theory the heresiologists interpreted as natural predestination (frag. 11). Deeply influenced by Platonism, Basilides imputed sin to the embodiment of souls (frags. 6, 7) and explained human suffering as the consequence of sins committed in a previous existence (thus admitting reincarnation) since God should by no means be the cause of evil (frags. 4, 5). Basilides' disciples gave to his teachings a distinct Gnostic mark, as evidenced by the divergent reports of Irenaeus (1.24) and Hippolytus (7.20–27). Irenaeus's report looks like *Eugnostos*: a divine quaternary (denominated by Greek philosophical concepts) followed by 365 angels; God's first-born Son descends assuming the likeness of Jesus in order to free souls from the cosmic powers, but he only seemingly suffers death on the cross (docetism). Hippolytus's report also includes a divine quadruplet comprising the transcendent God and three "sonships." The third sonship falls into the lower regions under the rule of the archons and becomes the human souls; the archons acknowledge, however, the primacy of the true God and are converted to Him. Finally, Jesus, a man of the archontic world enlightened by the Spirit, preaches the gospel to bring about the rise of the third sonship to its due place.

Valentinus was another famous Christian theologian, Egyptian by birth, who taught in Rome in about the same period, well cultivated both in Platonic-Pythagorean philosophy and in Judaic mysticism. Valentinus described in fascinating imagery the likeness between God and humans, the intelligible sphere and the worldly reality sphere (frags. 1, 5), and the struggle inside the human "heart" between demonic influences and the Father's grace through Jesus the savior, the latter being conceived in a docetic way (frags. 2, 3). Analogously to Basilides, his thought was given a major Gnostic facet by his disciples. Valentinianism thus became the most dangerous adversary for the heresiologists, who provide an extensive account of it (Irenaeus 1.1–15, Hippolytus 6.29–36).

Valentinianism shares many features with Sethite-Barbeloite systems, though omitting their nomenclature. The myth of the aeon Sophia's fall is the central event. It is motivated, however, not through the crude sexual symbolism of the "Harlot" but by her willful emulation of the Father's generative act. Her incapacity to do so brings about the material world with its Fabricator (Demiurge), a defective but righteous God. Adam is given flesh and soul by the Demiurge, and *pneuma* (the divine self) by the repentant Sophia, but only one of his three sons (Seth) inherits it (Theodotus 54). Consequently there are three "natures" of humans: the "material" ones (*bulikoi*), who end in perdition; the "morally endowed" ones (*psukhikoi*), capable of a lower-range salvation; and the "spiritual" ones (*pneumatikoi*), predestinated to return to their divine place, having been appropriately instructed by Jesus' revelation.

Leading representatives of Valentinianism were Heraclion (who wrote a famous commentary on the *Gospel of John*), and Ptolemy, both operating in Rome. Driven out of the Roman church, the Valentinians spread their congregations in Syria and Egypt. Another community was founded in southern Gaul by Marcus the Magician, a noteworthy thinker who interpreted the Valentinian *plērōma* on behalf of a symbolic speculation about numbers and alphabet letters. This reflects a Jewish esoteric background.

Marcion. Coming from Asia Minor, "Little Mark" (Gk. *Markiōn*) preached in Rome around 150 CE his original vision of Christianity, which was grounded upon the antithesis between the righteous but merciless God of the Old Testament, who is the Demiurge of the material world, and the higher God of love, who sent Jesus Christ in order to free believers from the yoke of the law. Whether Marcion's theology can be classified as Gnostic is a long-debated question, but a few links are indeed evident, at least with some Gnostic groups: the distinction between the transcendent, "foreign" God and the creator; the emphasized anti-Jewish tendency; the idea of a purely spiritual salvation that excludes resurrection; and the docetic interpretation of the Jesus figure, denying his natural birth and bodily reality. The Marcionites were following a rigidly ascetic morality.

Serpent Gnostics. A few sects assumed their denomination after the "snake" symbol: the Naassenes (Heb. *nāḥās*), also self-designated "Gnostics"; the Ophites or Ophians (Gk. *ophis*); and the Serpentarians (Lat. *serpens*). Moreover, the snake symbol is given a certain role by the Perates (from the Greek "nomads," or maybe from the Aramaic name of the Euphrates River), the Sethians, and the followers of an otherwise unknown Justin. The common geographical setting was Syria-Mesopotamia. The Ophites shared the Prounikos myth with the so-called Gnostic school and stressed the revealer function of the serpent toward Adam and Eve. Ritual handling of snakes was reportedly performed (Epiphanius 37). The Serpentarians' doctrine had the widespread Gnostic scheme of seven devilish archons of the material world (the Jewish God among them), arisen by a transgression of one member of the upper divine quaternary. Curiously, not a word about serpents is reported in the source (Theodoretus 11.78).

Once more a very different face of the Gnostic phenomenon is offered in the sects reported by Hippolytus (5.7–27). The general frame in this case is a triadic system of principles: (1) the supreme God; (2) an intermediary divine entity, sometimes associated with the serpent; and (3) matter, chaos, or darkness. According to the Naassenes, the heavenly Man—God's primary self-revelation—is lured by an earthly *gōlem* that resembles him, and he pours his "spirit" into the *gōlem*. The spirit remains consequently caught within human souls, but will be delivered as a result of Jesus' descent to earth. The snake (but also the phallus) symbolizes the spirit's yearning toward the highness. The Naassenes were eager to collect a huge amount of evidence derived from the Hellenis-

tic mystery cults in order to indicate that pagan religion was also pursuing similar tenets and had similar purposes.

For the Perates, the serpent represents God's Son, swinging between the mutually opposed Father and matter. His serpentine movements imprint the forms of the fatherly powers on shapeless matter, which thence produces the multiplicity of living beings in the natural world. However, this scheme, borrowed from Plato's *Timaeus*, assumes here a negative meaning because worldly becoming is mastered by malignant astral forces from which the divine forms need to be saved. The serpent, portrayed as *logos* or Christ, implements also a revealer and a redeemer function. The creed of the Sethians is very similar. Numberless powers contained in the three principles (light, spirit, and darkness) clash and the natural world is grounded on the resulting mixture, with an awful winged serpent symbolizing the force that rules it. Christ disguises himself as a serpent in order to assist incognito the salvation of the spiritual particles dispersed in nature. The *Paraphrasis of Šēm* (Nag Hammadi Codex VII) matches this doctrine, but the savior is named here *Derdekeas* instead of Christ. The Sethian myth anticipates Manichaeism in several features.

Another triadic system, but without snake symbolism, was held by the Docetes (Hippolytus 8.8–9), a Christian sect with an optimistic view analogous to that of Valentinus and Basilides. Christ is the common "fruit" generated by all the powers of the three principles. Being more of a comprehensive symbol than a real person, Christ is thought to assume as many faces as there are religious visions trying to grasp his mystery.

Hermetism. The opening *Corpus Hermeticum* treatise, *Poimandres* (the meaning of the title is unclear) is close to the Gnostic mythical narrative. The second-born God's Son, named Man (the former being the Demiurge), is lured down by his own luminous likeness, which he has cast on lower Nature, while Nature becomes enamored of him and embraces him warmly on his descent. This mutual misunderstanding grounds the conjunction of spiritual and material elements, which make up human reality. The revelation of Hermes, "the thrice most Great" (*trismegistos*), was an attempt to appraise pagan tradition on behalf of Platonic concepts, but Judaic influences were also involved (*Corpus Hermeticum* III). Unlike the Gnostics, Hermetism suggested a predominantly positive vision of the world as upholding divine providence, immortality of the soul, and free will. Only the earthly sphere is affected by evil, due to the presence of matter, astral powers, demons, and fate. Through philosophical reflection, the enlightened one releases himself from bodily bounds and awakens to the awareness of his divine self (*Corpus Hermeticum* X, XII, XIII).

LATER DEVELOPMENTS (C. 200–390). During the third century the increasing aversion of the Catholic Church toward heretics, along with a general setback in the cultural and economic conditions of the Roman Empire, led to a decline of the Gnostic movement. Rebuffed by official Chris-

tianity, Valentinian and Marcionite congregations survived for a time in Asia, keeping a low profile. The more cultivated Sethite-Barbeloite sectarians attempted instead to find a new haven within Platonic philosophy, but encountered disdain from Plotinus (*Enneads* 2.9), whose lectures some of them had been attending in Rome around 260. The last masterworks of Gnostic literature were composed in this circle: *Zostrianos*, *Allogenes*, and *Marsanes* (Nag Hammadi Codices VIII, X, XI). Unlike earlier Sethite writings, there is little interest in mythology or the destiny of humankind in these works; the *plērōma* with its hierarchy of divine beings is nothing but a figured frame in which the inner meditation of the elect takes place, like an ecstatic voyage, mounting stage by stage until the identification of the true self with the One.

In the Constantinian age many sects were still abiding in the Syrian-Palestinian countryside: Elcasaites, Sethians, Archontics, Severians, Audians (Epiphanius 19, 38, 40, 45, 70; Theodoretus 11.63). These were mostly tiny ascetic groups, the last one notably pro-Jewish, whose rationales repeated in narrower form the topic of the wicked archons and the struggle of the elects against them. This same struggle was also interpreted by some fanciful Egyptian antinomian sects (Epiphanius 26.3–4) in the form of free sex performed as a sacramental rite and representing the appropriate means for impoverishing the archons of the life-energy they would have snatched from Barbēlō and concealed in human bodies.

The writings of the *Bruce* and *Askew* codices belong to the devotional ascetic side of Egyptian late Gnosticism. They offer an abstruse and overwrought description (with Sethite nomenclature) of the full-scale *plērōma*, ranging from the Godfather down to the earth, with passwords allowing the souls of deceased Gnostics to cross the angelic boundaries and ascend safely to the upper levels. When Christianity became the state religion of the Roman Empire in 391, all these sects went underground or over to Manichaeism, which carried out in its own way the heritage of Gnostic thought.

GENERAL OVERVIEW. What we now call *Gnosticism* is actually nothing but a set of topics singly elaborated, sometimes with similarities, by multifarious sects, each of which had a different origin and a peculiar placing at the crossroads of Judaism, Christianity, and the Hellenistic religions. These sects had in common only a kind of insight—a hermeneutics—that aimed to grasp a deeper truth in the existing religious or philosophical tradition, a truth that professional clerics and philosophers would have been unaware of.

Three elements were amalgamated through the implementation of such a project. The first was the investigation of the supreme deity above all ethnically determinate gods, which comes from Judaic esotericism. This deity is not a single being but a structure, thus bearing in its own complexity—and consequent fragility—the premise for the occurrence of evil described in mythical language (the same topic will be found in the Qabbalah). God is moreover the inexhaustible life energy (Light) that all inferior aeons, angels,

and demons are yearning to share or to seize. Light essentially shines out of itself, and thus brings about the hidden God's likeness, revealing itself in human form either as heavenly Man or as Light-Man inside earthly humans. Salvation, as an actual process, means the recovery of the divine substance fallen outwards and scattered in the material sphere under the rule of the cosmic powers; from a subjective viewpoint, the discovery of one's deepest self.

Secondly, there is the Christian element. Salvation cannot be accomplished by moral deeds or by philosophical learning unless God's grace intervenes through the descent and commitment of a savior—it does not matter if the savior is named *Christ* or has another name—who restores his “brothers” to the place to which they belong. The stress on the symbolic features of the redeemer figure forms the basic difference with respect to the more realistic Catholic Christianity.

But Gnosticism is not only engaged in theological speculation, because awareness of “mysteries” implies a better knowledge of the natural and historical world. That is the third element—the acquaintance of most Gnostic groups with Hellenistic culture. Because this world, though degraded, displays somehow an “imitation” (*tupos*) of the divine realm, both natural phenomena and the achievements of human culture can be exploited in order to recognize therein traces and evidence of Gnostic truth.

Wallis and Jay Bergman, eds., *Neoplatonism and Gnosticism* (Albany, N.Y., 1992); and John D. Turner, *Sethian Gnosticism and the Platonic Tradition* (Louvain, Belgium, and Paris, 2001).

ALDO MAGRIS (2005)

GNOSTICISM: GNOSTICISM FROM THE MIDDLE AGES TO THE PRESENT

To a large extent Gnosticism in antiquity and later is part of a discourse meant to determine “the other” as “heretic” for the sake of shaping an identity for the Jewish, Christian, and Islamic orthodoxies. Hence, when discussing Gnosticism in any period of the history of religions, it must be kept in mind that one is dealing with the construction of a world-view that always served to emphasize “difference” in order to exclude individuals and groups from the “legitimate.” Since late antiquity, certain forms of thought and, in particular, combinations of certain forms of thought, have been perceived as undesirable and therefore heretical. The undesirable elements that made up Gnostic heresies were the division of the world and humankind into a realm of light and a realm of darkness, individual (i.e. not church-controlled) encratism, individual spiritual charisma, and sometimes a blurring of gender boundaries.

THE NOTION OF GNOSTICISM IN THE CONTEXT OF WESTERN CULTURE. Although the emerging Christian orthodoxies succeeded in defeating the Gnostic trends inherent in their cultural and religious heritage, Gnosticism did survive and made considerable contributions to the European (including the Jewish component) as well as to the Islamic history of ideas.

Following the suppression of larger Gnostic movements from the second to the mid-fourth century CE, the earliest Gnostic-type heretic appears to be Priscillian of Ávila, consecrated as bishop in 380, done away with as a heretic in 385. The case of this very erudite Spanish nobleman shows how Christian orthodoxy confined itself by banishing from Christian thought and practice cosmological and anthropological dualism, unauthorized religious authority, non-institutional encratism, and the quest for class and gender equality. From this point, Gnostic patterns of thought and belief are particularly noticeable in subversive, counterculture movements. A number of historians of religions and philosophers share the

opinion that Gnosticism as a form of thought ought not to be limited to the full-blown systems of later antiquity, but can also be applied to other currents. This opinion relies on a certain view of a mainstream Western culture. According to this view, Western culture is world-affirming in that, first, there is a link between the universe and a positively acknowledged God as its creator and second, divine providence has determined this world as the place for humankind. Against this background, Gnosticism is often defined as a *Weltanschauung* that rejects this basic affirmation, hence its countercultural character. Interpreted in this mode, Gnosticism appears as “foreignness of the world” (*Weltfremdheit*, according to the German philosopher Peter Sloterdijk) or “metaphysical revolt” (Sloterdijk and Macho, 1991).

THE DYNAMICS OF MONISM AND DUALISM IN GNOSTICISM. The impact of Gnostic thought on the Western history of ideas is most obvious in the appearance of dualistic heresies during the Middle Ages, but can by no means be limited to them. On the contrary, Gnosticism can only be understood fully when one gives weight to the dynamics of dualism and monism in this distinct type of world-view. This is particularly important in dealing with neo-Gnosticism, because most of the transmission of Gnostic themes from antiquity through the Middle Ages—including medieval Islam and early modern Europe—remains obscure. The subliminal but seemingly ever-present potential for new Gnostic uprisings may be explained by Gnosticism’s basis in more acceptable mystical versions of Jewish, Christian, and Islamic faith.

The core of Gnostic theology appears to be an all-encompassing God who is described in negative terms (such as immeasurable, invisible, and ineffable) and who therefore must be completely detached from the cosmos. The concept of an anti-God—(often identified with the God of the Old Testament) evolves primarily out of a Gnostic group’s identity struggle with its broader cultic milieu. This pattern can be detected throughout the history of Gnosticism and explains the sometimes sudden revivals of rebellious dualistic separatism. Whereas monism is usually expressed through philosophical speculation and theories, Gnostic dualism is communicated through myths—usually creation myths—that transform the rejection and persecution members experience into a vivid metaphysical drama. These myths relate the origins of the Gnostic people in purely spiritual realms of the silent god, the fall of one of his creatures, and the subsequent evolution of psychic and physical layers of existence, where orthodox opponents reside. The fallen figures—the Primal Man (in Jewish Gnosticism and in Manichaeism), Sophia or Lucifer (in Christian Gnosticism), Kūni or Iblīs (in Islamic Gnosticism)—deserve special attention, for according to Gnostic understanding they can also provide salvation. This concept of salvation obviously points to the monistic matrix from which Gnostic dualism develops.

The peculiar dynamics of dualistic myths and monistic mysticisms may explain why some world-friendly religious movements have been characterized as Gnostic. Although

Christian mysticism describes an internal path of the individual soul to God, the label “Gnosticism” has also been applied to attempts at knowing God and the spiritual through the world, emphasizing the word *through*. Actually, it would be more adequate to classify such efforts as “Hermetic.” Gnosticism and Hermeticism were closely intertwined in late antiquity, and Manichaeism, as well as some texts found in Nag Hammadi (e.g. *Asclepius; On the Origin of the World; The Paraphrase of Shem*), reveal a generally pro-cosmic attitude. Interest in Hermeticism was renewed in the Renaissance and taken up by Christian heretics. In early modern times this led to a new fusion of Hermetic ideas with Christian Gnosis, which was called *Pansophy* (Overall Wisdom) or *Natural Philosophy*.

DEVELOPMENTS OF JEWISH AND ISLAMIC GNOSIS IN THE EARLY MIDDLE AGES. Jewish speculative and apocalyptic thought provided a rich source of semi-Gnostic cosmologies during the Middle Ages. Gnostic thought was communicated through the circulation of the *Sefer Yetsira*, edited probably in the ninth century. The text is essentially non-dualistic, showing the earliest roots of the Qabbalistic systems, which appeared in fully developed systems some centuries later.

Gnostic, Manichaean, Jewish, and Christian messianic ideas are likely to have influenced the first representatives of Shīʿah Gnosis. Just as Simon Magus was the archheretic of Christian Gnosis, the archheretic of Islamic *ghulūw* (“exaggeration”) was ʿAbdallāh ibn Sabaʿ al-Hamdānī. The only available biographical information about him says that he was of Jewish origin, a follower of the prophet Muḥammad’s son, the martyr ʿAli. He taught in the Iraqi town Kūfa that ʿAli had not really died but would reappear as the Mahdi in order to establish the kingdom of God.

Shīʿah movements, such as the Ismāʿīlīs, tend to endow their inspired messengers and salvational figures with cosmological significance. The *Kitāb al-Kashf* (*Book of Disclosure*), for example, relates the Ismāʿīlīs doctrine of the seven *imāms* (interpreters of divine teachings and themselves of otherworldly origin) to a cosmology with Qabbalistic traits, according to which God first created the letters of the alphabet. He creates them initially in two heptads (lines of seven). The first one corresponds to the prophets acknowledged widely by Shīʿah movements: Adam, Noah, Abraham, Moses, Jesus, Muḥammad, and the Mahdi, who is still to come. The second heptad corresponds to the seven Ismāʿīlīs *imāms*. As in the Qabbalah, the cosmos is symbolized by script. Another early Ismāʿīlīs tractate, the *Book of the Heptad and the Shadows* (*Kitāb al-haft wa al-aẓilla*), describes how God creates seven heavens and paradises, which are also, although more vaguely, connected to the *imāms*.

CHRISTIAN DUALISTIC HERESIES DURING THE MIDDLE AGES. After the case of Priscillian in the fourth century, the Byzantine as well as the Catholic orthodoxy succeeded in suppressing features considered Gnostic, but when people started to question the socio-economic order and the religious and intellectual premises upholding it, interest in an-

cient alternative forms of Christianity was renewed, particularly in the major European cities.

In the fourth and fifth centuries, adherents of Gnostic ideas who were fleeing church persecution sought refuge in Armenia. By the end of the seventh century, the Paulician movement emerged in Armenia and the northern regions of Syria. The movement’s name was probably derived from their high regard for the apostle Paul. The first Paulician known to us by name was Constantine of Mananalis; he was said to have received his teachings in Samosata on the upper Euphrates. The Paulicians combined radicalized Pauline ideas with strong, even militant, demands for the Byzantine church to act in accordance with the early Christian idealization of poverty. Persecuted by both Christians and Muslims, the Paulicians were nearly destroyed in the eighth century but managed to gain importance again under the reformer Sergius Tychikos (d. 835). A large number of them were killed during the reign of the Byzantine empress Theodora, but Paulicianism survived in remote areas of the Byzantine Empire. The last retreat for Paulicians was Thrace, where their presence was still recorded in 1116.

Another dualistic movement containing unequivocally Gnostic elements burst forth in medieval Bulgaria under the influence of the Paulician mission. This heresy was named after its founder Bogomil, who was a village priest in the region south of Skopje, today belonging to Macedonia. The Bogomilian uprising took place in the second half of the tenth century, when southern parts of Bulgaria (which during the Middle Ages included wide areas of the Balkan between the Black and the Adriatic Seas) were being reconquered by Byzantium. As in the case of Paulicianism, the struggle of the Bogomils was not only one of heresy against orthodoxy, but also involved politics and social concerns. Paulicians and Bogomils were mostly peasants, whereas the Byzantine orthodoxy represented the land-owning ruling classes.

Cosmological and anthropological dualism, antinomianism, docetism, anticlericalism, encratism, and dietary restrictions characterized Bogomilism. Its mythic repertory clearly shows a derivation from ancient sources. According to the Bogomilian story of creation, God brought forth the four elements of fire, water, earth, and air and established his divine kingdom, which consisted of seven heavens inhabited by the angels. The angels were supposed to serve God and to fight on his behalf. One of them, Satanael, rebelled against the creator and therefore was banished to Earth. As a result, Satanael created a world for himself, separating water and earth. Although sunlight was of divine origin, Satanael brought forth the other forces of nature, such as rain, wind, and thunderstorms. Then he created life-forms and human beings as his servants. In the process, he managed to confine a number of angels in material bodies. As a consequence, human beings partake of the divine as well as the satanic creation, so that the cosmic dualism of good and evil is inherent in each person. Like Gnostic movements of antiquity, the

Bogomils had their own Christology. Christ was one of the divine ambassadors sent out to humankind to promote its salvation. He took human shape through his mother Mary but was never human in his essence. In order to prevent Christ's mission, Satanael arranged for his crucifixion, but Christ's suffering was only superficial. Three days after the crucifixion, Christ appeared on Earth again, put Satanael in chains, and cast him into hell. Nevertheless, Satanael escaped and renewed his reign on earth, with the help of worldly rulers and orthodox theologians.

Gnostic or Manichaean mythology must have survived in the frontier districts of the Roman Empire and mixed with local religious traditions, particularly with a pagan belief in spirits, which appear as demons in the Bogomilian belief. It is impossible, however, to determine more precisely what forces shaped the Bogomilian world-view. From the Bulgarian regions, Bogomilism spread to Thrace and Asia Minor and reached the capital of the Byzantine Empire in the eleventh century as an underground movement. Here it changed its character and spread among members of the middle classes and even within monastic communities. Bogomilian missionaries had a great deal of success during the twelfth century, particularly in Serbia and Bosnia, where orthodox church structures were weak. The Bogomils began to develop a church-like hierarchy themselves, but as a consequence they lost their attractiveness for the peasantry, which had made up the core of the movement. Hence, in the thirteenth century it started to decline. However, the final extinction of Bogomilism in Southeastern Europe and Asia Minor only took place with the conquest of these areas by the emerging Ottoman Empire.

Meanwhile Bogomilism had also spread westwards, probably mainly through refugees from the Balkan areas, to northern Italy and the South of France and contributed to the emergence of the Cathar movement. Like Bogomilism in the East, Catharism in Western Europe was a reservoir of heretical and folkloristic currents, loosely bound up by Gnostic-type cosmological mythologies that located metaphysical evil on the side of the Catholic Church. However, a lot of eleventh-century sectarians continued to go to the official church and to take sacraments. Their somewhat ambiguous attitude has been called crypto-heretic. Cathars also strongly venerated parts of the scripture. Although they rejected most of the Old Testament, they used the *Gospel of John* and the *Apocalypse of John* for dualistic and allegorical exegesis. In addition, the Cathars used apocryphal texts.

Although the Cathar myths and theological creeds closely resembled those of the Bogomils, they were less opposed to organization and more inclined to form their own well-ordered, although decentralized, communities. Cathar churches were established in northern Italy and southern France. They consisted of two classes of people: the pure *perfecti*, who could not get involved in any worldly affairs, did not marry, and were strongly committed to a selective vegetarian diet. Even the permitted plants had to be prepared by

the *credentes*, the ordinary adherents of Catharism, who were allowed to marry and work for the sake of the community.

Despite local persecutions during the eleventh century, the Cathar churches spread widely through the southern and central parts of Western Europe. A particular stronghold emerged in the area of Toulouse, where the popularity of Catharism coincided with a supportive political situation. Because of power shifts in France, a political vacuum developed in the area of Toulouse. A local ruler tried to fill the void and made Catharism the state religion of his territory. This situation provoked a massive response against the Cathars. A crusade was organized against them in 1208 and a second one in 1227. The latter resulted in the fall of Montségur in 1244, the last place of refuge for a large Cathar community. Small, scattered groups survived in the southern European mountain regions for about another century.

MEDIEVAL QABBALAH. Medieval Qabbalah, which reached its climax at the end of the thirteenth century with the *Zohar* (Book of Glow), clearly shows Gnostic tendencies but never resulted in a mature cosmological dualism. On the contrary, the *Zohar* presents the construction of the universe as a (however fragile) harmony of divine forces. No element was viewed as essentially evil or satanic, but there was an inherent danger within the system that one of the *sefirot* (aspects of God) might become independent. Gnosticism claimed that this had already happened in the creation process, but the *Zohar* did not.

The Qabbalist who came closest to Gnostic concepts was Isaac Luria (1534–1572). He taught a small circle of adherents in Safed. Lurianic Qabbalah was very influential for its doctrine of *tsimsum*. According to this doctrine, God “contracts” within himself, thus creating a space that is deprived of God and can be filled up with creation. In his description of the further process of creation, Luria employed the Gnostic dualistic pattern of the fundamental opposition between light and darkness: The first human being (*Adam Kadmun*) emerges from the divine light that radiated into the space emptied by *tsimsum*. Out of *Adam Kadmun*'s face flashed the *sefirot*-lights, which were supposed to be collected in vessels prepared for them. Some of these vessels, however, broke and were then filled up with dark matter, while their fragments fell down, void of creation.

PANSOPHY AND NATURAL PHILOSOPHY IN EARLY MODERN TIMES. Renaissance scholarship and philosophy in Western Europe was profoundly influenced by Qabbalah and Hermeticism but did not develop the world-denying and rebellious overtones typical of dualistic Gnostic mythologies.

Mythic, dualistic gnosis was once more recognizable in seventeenth- and eighteenth-century Germany. There the enormous influence of Paracelsus (c. 1493–1541) had created an intellectual climate that offered a fertile soil for Gnostic currents. Paracelsian Pansophy (Overall Wisdom) prepared the way for German natural philosophy, which was mainly concerned with integrating nature into Lutheran theology. To natural philosophers, it seemed obvious that not only hu-

mankind, but also nature as a whole, is incomplete when measured against the original divine plan for creation. In order to explain this gap and to develop a strategy of salvation for fallen nature, the philosophers drew upon Gnostic mythology. The most creative and impressive new version of Gnostic cosmogonic myth was put forward by Jakob Böhme (1575–1624). In his visionary exegesis of biblical texts, Böhme resembled ancient Gnostic authors. According to him, nature had been born out of the original abyss and developed in seven stages. These stages corresponded to the Qabbalistic *sefirot*, which Böhme also referred to as *Source-Spirits* (*Quellgeister*). The first Source-Spirit to emerge from the abyss of nothingness was Desire; followed by the god of Sensibility (*Stachel der Empfindlichkeit*); then by Anxiety (*Angst*) or Feeling (*Gemüt*); by Fire or Spirit; by Light or Love; by Resonance (*Hall*), Word, or Mind (*Verstand*); and by Body, Being, or Material Nature. The Godhead, in this process of unfolding, shows itself as a dynamic, dramatic, and even dialectical primal aetherical substance from which the immaterial as well as the material world take form. However, God is not fully responsible for the existence of matter. Matter came into being as a result of the fall of the rebellious angel Lucifer, who refused subordination to a higher will, just as the primal androgynous human being would do later. In his theology, Böhme avoided cosmological dualism. The fall took place within the one and only essentially divine realm. Instead of making Lucifer and the primal androgyne genuinely evil forces, Böhme emphasizes the role of divine freedom that can be used in accordance with the will of the Godhead or against it.

Friedrich Christoph Oetinger (1702–1782), another important representative of German nature-philosophy, studied Böhme thoroughly and was also acquainted with Lurianic Qabbalah. For him, God represented life as a unity and interplay of different forces and possibilities. In the Godhead, the components of this complex interplay are indissolubly interwoven, whereas in nature they can be separated. The human fall, according to Oetinger, has no cosmological grounds but was rather a misperception. Oetinger's emphasis on insight as a prerequisite for salvation could be construed as Gnostic, Oetinger's definition of insight is different. Oetinger's Gnosis is one of synopsis (*Zentralerkenntnis*) in order to perceive the inherent unity of nature and God. Gnosticism in the narrower, dualistic sense, on the contrary, means by Gnosis the recognition of the two fundamentally opposing realms of light and darkness.

THE THEME OF THE REVOLUTIONARY AGAINST GOD. The metaphysical revolt that is often ascribed to Gnosticism is a rebellion not against God's creation, but rather against the limitations of knowledge. In *Genesis*, God forbade Adam and Eve to eat fruit from the Tree of Knowledge in the Garden of Eden. The snake, who convinced Eve to violate this prohibition, was often interpreted as the devil or Satan in younger sources. In their typical mode of re-evaluating biblical traditions, some Gnostics interpreted Satan as a positive figure who wanted to bring human beings divine knowledge, which

the Old Testament God maliciously withheld from them. In various biblical and apocryphal traditions, Satan is equated with Lucifer, or the Islamic Iblīs. Other despisers of God's law, Cain in particular, also evoked Gnostic sympathy.

The theme of the light-bringing revolutionary has inspired several prominent authors. John Milton (1608–1674) and Johann Wolfgang Goethe (1749–1832) both show a great fascination with the rebellious angel who became the devil. In his epic *Paradise Lost* (1667), Milton described with a great deal of empathy Satan's expulsion from the heavenly realm, his renewed advance toward it, and his seduction of Eve. Goethe, who throughout his life was dissatisfied with Christian doctrine, created a personal theology. At the end of the eighth book of his autobiographical work *Dichtung und Wahrheit* (1811–1833), he introduces a myth that is clearly an imitation of Gnostic models: A primal Godhead creates another Divine Being as a reflection of itself and then a third one as a reflection of the two. When the fourth being is created, it no longer resembles the three preceding ones, thus introducing difference and contradiction to the divine world. The fourth being is Lucifer, who then creates his own worlds and forgets his origin. His pride and conceit finally cause his fall. In Goethe's drama *Faust* (1790–1832), the figure of the devil, here named Mephisto, plays a crucial role and is considered important for humankind's search for knowledge and spiritual development, although in the end he shall not triumph by possessing the human soul completely.

The fallen angel appears again in Alphonse de Lamartine's *La Chute d'un ange* (1838). Here the angel Cédar asks God to let him become a human being, because he wants to win the love of a woman. The epic was conceived as the first part of a comprehensive account of the fate of humankind from its divine origins through the many failures recorded in history. Apart from *La chute d'un ange*, Lamartine wrote only the final part of this epic, *Jocelyn* (1836), about a woman who dies as a result of caring for those sick with the plague.

Victor Hugo (1802–1885) undertook a similar narrative of human history in his *La légende des siècles* (1859), but the story lacks the typically Gnostic idea of light before darkness. However, Hugo's interpretation of history as a mythic battle between two hostile principles and his empathy for the Cain may remind the reader of Gnostic attitudes.

GNOSTICISM AND ROMANTICISM. Natural philosophy was still of considerable importance in the age of European and North American Romanticism. Emphasis had shifted, however, from the concordance of God and nature to the power of the self, which could be equated with the human being, the divinity, or nature. By viewing the self as the creative source of everything, the Romantics transcended the traditional Christian boundaries separating the individual, God, and the world. Their aim was a new unity centered in the self, which led them to face yet another dichotomy, that of the personal and the all-self. The Romantic experience of a

multifaceted, at times fragmented, human self gave rise to new dualistic concepts that could be extended to the whole cosmos. Again we see that dualistic Gnostic systems are products not only of speculative pessimistic minds, but also of social unrest. In London, the Gordon Riots of June 1780 were suppressed in an effort to avert a larger revolutionary movement such as that which soon followed in France. English authors took up Gnostic metaphors to serve as mouthpieces for revolutionary ideas. William Blake (1757–1827) developed a unique allegorical approach to biblical texts and rewrote various aspects of the creation story in a Gnostic fashion. Blake avoided cosmological dualism, but his esteem for the free and independent human spirit, which he shared with many other Romantic poets, let him take up the typical Gnostic motif of the Divine Man. The Divine Man was in essence God himself and provoked the envy of some of the angels. In Blake's works, this figure is named Albion (a symbol for England) Orc (another name for Lucifer), Jesus Christ, or Prometheus. Orc rebels against Urizen, who represents both George III and his rule in Britain and also the Father-god of the Old Testament. Orc brings the new social order that is expected to be established with the return and reign of Christ. In his most highly acclaimed poetic work, *Prometheus Unbound*, Percy Bysshe Shelley (1792–1822) presents Prometheus as a symbol of hope for the suppressed and wretched masses in English cities during the time of industrialization.

Many Romantics were engaged with the dark side of being—with night as the fold of existence, and with death and its various stages of fading and decay. In some cases this resulted in a semi-Gnostic denigration of nature and the conditions of human life, which became the typical features of Romantic *Weltschmerz* (pain or melancholy about the world). For example, in *Dialogue of Nature and an Icelander*, Giacomo Leopardi (1798–1837) depicts nature as a pitiless persecutor of desperate humans and concludes that it is impossible to discover the meaning of a universe that sustains itself by regularly killing its inhabitants. Because of this conclusion, Leopardi cannot be called a Gnostic. Gnostic pessimism typically features a refractory dualism: The good and meaningful exist in the realm of light and in souls that become aware of their divine origin. Leopardi, however, rejects not only the goodness of this-worldly creation, but the existence of goodness and meaningfulness anywhere. Lord Byron's (1788–1824) poetry, too, lacks the rebellious spirit of mythic Gnosticism that believes that a better world can be achieved. Byron's Cain is guided by Lucifer to see a meaningless world that is created not by demonic forces, but by the human self.

Other important representatives of Romantic *Weltschmerz* were Arthur Schopenhauer (1788–1860), whose philosophy was inspired more by Buddhism than by Gnosticism, and Mihai Eminescu (1850–1889), who praised the Romantic genius as the only possible surmounter of the weary world.

GNOSTICISM, ANTI-SEMITISM, AND RACISM. By the end of the nineteenth century, extreme nationalist and anti-Semitic groups emerging in Germany co-opted Romanticism for their own purposes. They reshaped the Romantic worldview so that the decisive force in the world was no longer the human self, but race. In the 1920s and 1930s various trends culminated in a mixture of racism and esotericism, called *Ar-osophy* (Wisdom of the Aryans). The Aryan myth was very simple. In its various versions, it told a story about the original dwelling places of the Aryans—either Thule (an island in the North Sea close to the pole but also equated with Iceland) or Shambala (located in Central Asia, most often in the Tibetan mountains)—to which they had come as survivors of Atlantis. The Aryans were characterized only by their physical appearance: they were supposed to have light skin and blond hair, and their only “ethical” requirement was to keep their race pure. Their racial purity made them superior to all other races. Hence, the Aryans were called to fight the forces that could contaminate their pure race, which meant that they should fight other races. The Aryans considered the Jews, who, according to the myth, had begun to infiltrate the Aryan race with alien blood and spirit the race most hostile and dangerous to them. According to Artur Dinter (1876–1948), an author who wrote extensively about religious ideas coming out of the *Völkische Bewegung*, the Jews were the lowest incarnations of originally spiritual beings after the fall. Therefore, Dinter explained, the Jews were intensely inclined to the material world and bound up with it. Thus, the racial battle between Jews and Aryans was interpreted as a battle between matter (darkness) and spirit (light). The hijacking of a mythic pattern known from Gnosticism for an ideological foundation of radical anti-Semitism is not as surprising as it may seem, for the Jews were shown as descendents of the demiurge, the Old Testament God and antagonist of the realm of light in Gnostic myths from the second and third centuries CE.

GNOSTICISM IN MODERN AND POSTMODERN PHILOSOPHY. A number of important currents and themes of nineteenth- and twentieth-century philosophy have been related to patterns of thought derived from Gnosticism: the Hegelian theory of consciousness and knowledge, the Marxist doctrine of dialectical rather than logical progress in history; the death of God proclaimed by nihilism, the epistemological arguments of phenomenology, the notion of the human self in existentialism, and several features of postmodernism.

Georg Friedrich Wilhelm Hegel (1770–1831) outlined a universal theory according to which history is a process of the Divine Spirit becoming conscious of itself. This process is executed in three steps: First the Spirit is enclosed in itself, second it separates from itself and recognizes itself as “other,” and third of the Divine Spirit integrates his experience by means of a return of the formerly differentiated aspect, which leads to an affirmation at a higher level. The first step parallels the dwelling of purely intelligible beings in the Gnostic *pleroma*, the second parallels the alienation of the spirit as the

psychic and material world, and the third parallels state of Gnosis, the spiritual knowledge of the self about itself.

Karl Marx (1818–1883) adopted the Hegelian idea about dialectical development but imbued it with a materialistic instead of an idealistic conception of the world. Moreover, Marx stated explicitly that the knowledge about dialectics was not to be promoted in order to analyze the world, but to change it. According to Hegel, knowledge as a concluding synthesis about dialectical progression was still possible for an individual mind, but for Marx and other intellectual leaders of the Communist movement it was only possible as a totality of social practice. Some interpreters (Eric Voegelin and Boris Groys, for example) view this practical knowledge or wisdom—as opposed to various competing forms of analytical knowledge—to be in congruence with salvational Gnosis.

Gnostic attitudes that shaped Soviet ideology have also been detected in Russian philosophies of religion, particularly in the writings of Vladimir Solov'ev (1853–1900) and in nihilism. Friedrich Nietzsche's (1844–1900) nihilistic statement that God is dead can be interpreted as a rejection of the transcendent God of Judaism and Christianity for the sake of a self-divinization of humankind. Interestingly, critics of nihilism such as Eric Voegelin (1901–1985) and René Girard (1923–) use religious terminology themselves when they label nihilism “demonic.” Thus, their arguments against nihilism appear as the direct successors of those by the Christian heresiologists against ancient Gnosticism. Hans Blumenberg (1920–1996) claims that the philosophies of Hegel and Marx do not draw upon Gnosticism. For him, modernism has surmounted Gnosticism's world-rejection and replaced it with a world-affirming trust in a rational understanding of the cosmos and the human situation. Because postmodernism calls into question this trust in rationality, it has also been suspected of Gnostic tendencies. Peter Koslowski (1952–) has advocated a Gnostic approach to the world, which he defines as an awareness of its fundamental deficiency. By acknowledging the world's deficiency and its need for improvement, humankind can, according to Koslowski, proceed in wisdom.

Although little attention has been devoted to the analogies between Gnosticism and the phenomenology of Edmund Husserl (1859–1938), with its aim at overcoming the differences between consciousness and Being, the Gnostic inclinations of Heideggerian phenomenology (existentialism) are generally agreed on. Hans Jonas (1903–1993), in his seminal study *Gnosis und spätantiker Geist* (1964), pointed to Heidegger's use of Gnostic terminology when explaining the situation of humankind as “thrown into the world.” According to Jonas, the demonization of the universe combined with the idea of a transcendent acosmic self led to close parallels between existentialism and Gnosticism. Moreover, a thorough analysis by Barbara Merker (*Selbsttäuschung und Selbsterkenntnis—Zu Heideggers Transformation der Phänomenologie Husserls*, 1988) showed that Heidegger's main work *Sein und Zeit* (1927) relied on Gnostic myths.

THE VARIETY OF NEO-GNOSTICISMS IN THE TWENTIETH CENTURY. Other neo-Gnostic trends of the twentieth century grew out of the variety of Romantic conceptualizations of Gnosis. Optimistic outlooks focused on the sacralization of self that was prevalent in Romanticism, which grew out of the Gnostic belief in the divine origin of humankind. In Hermann Hesse's (1877–1962) novel *Demian* (1919) and the works of Carl G. Jung (1875–1961) the Gnostic path was reinterpreted as humanity's search its sacred origin. Insofar as recent esoteric currents, such as the New Age movement, have contained Gnostic themes and motifs, they were particularly attracted by the possibility of self-salvation, often coupled with a claim for self-fulfillment through an awareness of humankind's own divinity. An example of developed dualistic neo-Gnosticism in newer religious movements can be found in the teachings of Colombian Samael Aun Weor (1917–1977), whose ideas gained an audience outside his homeland. Not much is known about his life or the sources from which he drew his eclectic ideas. He obviously depended heavily on Theosophy and the “sexual magic” of Aleister Crowley and the OTO (Ordo Templi Orientis). But whereas Crowley had been an excessive libertine, Weor advocated sexual magic within “sacred matrimony,” matrimony understood in its bourgeois sense. His dualism was not so much cosmological as directed against what he saw as flaws of modern societies, among them Communism, women's liberation, and homosexuality. Nevertheless, Weor believed in an “eternal battle between YHWH and Christ,” which was reflected in occasional anti-Semitic utterances.

To counter the focus on human self-realization, some thinkers have proposed the idea of an unworldly, non-human, and remote God who resembles the God of Gnosticism. The late Max Horkheimer (1895–1973) wrote about God as “Completely Other”; Karl Barth (1886–1968) developed a paradoxical negative theology in which God was incomprehensible to human thought and religion; and Simone Weil (1909–1943) was convinced that God cannot be present in the realm of time.

In reaction to the more than 52 million who died in World War II, Theodor Adorno (1903–1969) wrote *Minima Moralia* (1951), which is in part a Gnostic work. Adorno criticizes the immorality, materialistic consumerism, and general corruption of the world and thereby resurrects several Gnostic myths (for example, the myth of the descent of Great Ignorance upon the world). But unlike Romantic representatives of *Weltschmerz*, Adorno still allows for hope. However, because his hope is for a Messiah rather than for self-salvation, it is not Gnostic. Romanian-French philosopher Émile Michel Cioran (1911–1995) presented a more pessimistic expression of Gnosticism. In his book *Le mauvais démiurge* (1969), he drew on fragments of Gnostic ideas in order to unfold his own post-Nietzschean nihilistic and perspectivist philosophy. However, it must be emphasized that Cioran's explicitly anti-systematic approach not only lacks the salvational hope of Gnosticism proper, but also the inner

consistency of Gnostic myth. Fernando Pessoa (1888–1935) revived Romantic *Weltschmerz* and combined it with Gnostic motifs. His poem *No túmulo de Christian Rosencreutz* immediately reminds the reader of Gnostic myths of descent.

In such stories as *La révolte des Anges* (1914) by Anatole France (1844–1924) and *Doktor Faustus* (1947) by Thomas Mann (1875–1955), twentieth-century literature took up the themes of the rebellious angel, Satan, and the human seeker who follows his path. Mann's *Doktor Faustus* was meant to represent the situation of German intellectuals whose over-reflexivity had led to mental paralysis. To overcome the crisis, the lead character, Adrian Leverkühn, flees into irrational ecstasy—a gift from the devil, who takes him in the end. Mann criticizes Gnosticism by using Gnostic metaphors to describe Nazi Germany. In his controversial 1988 novel *The Satanic Verses*, Salman Rushdie (1947–) played with the theme of the fallen angel, blending motifs from the time of Muḥammad with those from contemporary London. Rushdie uses the images of archangel Gabriel and Satan (Iblīs in Islamic mythology) to draw attention to racist perceptions of immigrants in Great Britain.

GNOSTICISM IN FANTASY LITERATURE. Gnostic concepts are very often relevant in fantasy novels. J. R. R. Tolkien's (1892–1973) trilogy *The Lord of the Rings* (1954–1955) tells about a Manichaean-style battle against Darkness. Middle-earth, Tolkien's fictitious world, has to defend itself against a major attack from the army of Sauron the Great. Sauron resides in Mordor, a realm of shadows, and is called the Dark Lord. He is the chief henchman of the more abstract Dark Power threatening to absorb the light of Middle-earth. However, Tolkien also brings in other themes that are foreign and even opposed to Gnostic myths, such as the importance of compassion and the danger of power.

Philip Pullman (1946–) comes very close to Gnostic views and attitudes in the trilogy *His Dark Materials* (*The Golden Compass*, 1995; *The Subtle Knife*, 1997; *The Amber Spyglass*, 2000). Inspired particularly by the works of William Blake and Milton's *Paradise Lost*, Pullman takes up the Gnostic depiction of the Old Testament God who refuses to let human beings have a certain kind of knowledge. In contrast to historical Gnosticism, this knowledge is not about the origin and true nature of light-beings, but about the ultimate identity of spirit and matter. Lord Asriel plays the role of Satan, trying to gain access to the higher worlds. His daughter Lyra, who is called "the new Eve," disobeys God, as represented by the church.

GNOSTICISM IN RECENT SCIENCE AND SCHOLARSHIP. The term *gnosis* is often used to name an approach that refuses to exclude the spiritual dimensions of reality. Thus anti-positivistic methods in academic work are sometimes labeled Gnostic. Since some scholars in the sciences as well as the humanities concede only to so-called objective forms of knowledge, they try to stigmatize insights that are based on other methodologies. In the 1970s, for example, a circle of scientists in the United States who were concerned with "al-

ternative" research methods that led to non-mainstream results were known as the Gnostics of Princeton. Arthur Young (1923–), the founder of the Berkeley Institute for the Study of Consciousness, referred explicitly to Gnostic views when explaining cosmic developments and the significance of the human self.

The research on Gnosticism, and even the discipline of the history of religions has come under suspicion of inherent Gnosticism. In an article from 1987, Manfred Sommer (1945–) characterized Hans Jonas's interpretation of gnosis as *Endgestalt der Gnosis* (the final shape of gnosis). The author observes a self-entangledness that is reflected not only in Gnostic thought, but even in research about Gnosticism. Similar observations can be made about the scholarship of Gilles Quispel (1916–), who is heavily influenced by Carl Gustav Jung. Steven Wasserstrom in his book *Religion after Religion: Gershom Scholem, Mircea Eliade and Henry Corbin at Eranos* (1999) has pointed out that three major founders of this discipline were phenomenologists and therefore heirs to Gnostic traditions. Again, the use of the term *gnosis* by these scholars, and particularly by their interpreter Wasserstrom, is highly inconsistent. It shows once more that the label *Gnostic* is used to label any kind of dissatisfaction with mainstream ideologies, whether orthodox theology or orthodox academia (as in Scholem's fear of a "professorial death," for example), as well as for attacks and counterattacks from either side.

BIBLIOGRAPHY

There are very few one-volume works dealing explicitly with neo-Gnosticism. The most important attempt to comprehend the continuity of Gnostic motifs from medieval through modern times is Ioan P. Couliano, *The Tree of Gnosticism: Gnostic Mythology from Early Christianity to Modern Nihilism* (San Francisco, 1990). For the intertwinement of monism and dualism in Gnostic thought, see Julia Iwersen, *Gnosis zur Einführung* (Hamburg, 2001). An interesting anthology of Gnostic writing in the religions, philosophy, and literature throughout history is provided by Peter Sloterdijk and Thomas H. Macho, eds., *Weltrevolution der Seele: Ein Lese- und Arbeitsbuch der Gnosis von der Spätantike bis zur Gegenwart*, 2 vols. (Düsseldorf, 1991). Various scholarly articles on Gnosticism in ancient and modern intellectual currents are collected in Barbara Aland, ed., *Gnosis: Festschrift für Hans Jonas* (Göttingen, 1978). Articles in the volume of special interest include: Giulia Sfameni Gasparro, "Sur l'histoire des influences du gnosticisme" and Gilles Quispel, "Hermann Hesse und Gnosis." Other resources on the topic can be found in Peter Koslowski, ed., *Gnosis und Mystik in der Geschichte der Philosophie* (Zurich and Munich, 1988), which includes contributions on Paracelsus, Böhme, Oetinger and many other important thinkers, as well as a particularly interesting article by Boris Groys on Gnosticism in Soviet ideolo-

gy. The classic study by Arthur O. Lovejoy, *The Great Chain of Being: A Study of the History of an Idea* (Cambridge, Mass., 1964) can be used as an introduction to the Gnostic theme of otherworldliness, although it treats only the philosophical side and excludes the mythic dimensions of Gnosticism. For all other issues raised in this article, the reader needs to consult specialized studies on movements, writers, and philosophers, such as Martin Erbstöcker, *Ketzer im Mittelalter* (Leipzig, 1984), which is very good on the social and economic roots of medieval Gnostic heresies. Relations between Shī'ah movements and Gnosticism are discussed by Heinz Halm in *Kosmologie und Heilslehre der frühen Isma'iliya: Eine Studie zur islamischen Gnosis* (Wiesbaden, 1978) and *Die islamische Gnosis: Die extreme Schia und die 'Alawiten* (Zurich and Munich, 1982). A very good source for Gnostic trends in early modern times, with special reference to Goethe, is Rolf Christian Zimmermann, *Das Weltbild des jungen Goethe* (2 vols., Munich, 1969–1979; first volume reprinted in 2002). Albrecht Schöne, *Götterzeichen, Liebeszauber, Satanskult: Neue Einblicke in alte Goethetexte* (Munich, 1982) is an interesting examination of Gnostic theology in Goethe's *Faust*. Regarding Gnosticism and Romanticism, see Ioan P. Coulianu, "The Gnostic Revenge. Gnosticism and Romantic Literature," in Jacob Taubes, ed., *Gnosis und Politik* (Munich and Paderborn, 1984). For an examination of the Gnostic aspects of certain Romantic poets, see Patrizia Girolami, *L'Antiteodicea: Dio, dei, religione nello "Zibaldone" di Giacomo Leopardi* (Florence, 1995) and David V. Erdman, *Blake: Prophet against Empire* (1954, 3d ed., New York, 1991). The best study of Gnosticism and Nazism is Ekkehard Hieronimus, "Dualismus und Gnosis in der völkischen Bewegung," in Jacob Taubes, ed., *Gnosis und Politik*, pp. 82–89 (Munich and Paderborn, 1984). Another good resource is Nicholas Goodrick-Clarke, *The Occult Roots of Nazism: Secret Aryan Cults and Their Influence on Nazi Ideology* (New York, 1985, 1992), which takes a broader, less specific approach. Gnostic anti-Semitism within the full scale of history is examined by Micha Brumlik, *Die Gnostiker: Der Traum von der Selbsterlösung der Menschen* (Frankfurt, 1992). On Gnosticism in modern philosophies, see "Wissenschaft, Politik und Gnosis" (1959), in *The Collected Works of Eric Voegelin*, edited by Manfred Henningsen, Vol. 5, *Modernity without Restraint: Political Religions; the New Science of Politics; and Science, Politics, and Gnosticism*, (Columbia, Mo., and London, 1999). The opposing view is offered by Hans Blumenberg, *The Legitimacy of the Modern Age* (Cambridge, Mass., 1985). Interrelations between Gnosticism and postmodernism are extensively treated by Peter Koslowski, *Die Prüfungen der Neuzeit: Über Postmodernität, Philosophie der Geschichte, Metaphysik, Gnosis* (Wien, 1989). For Gnostic influence on Heidegger's philosophy, Barbara Merker's *Selbsttäuschung und Selbsterkenntnis—Zu Heideggers Transformation der Phänomenologie Husserls* (Frankfurt am Main, 1988) is of special importance. Hans Jonas's *Gnosis und spätantiker Geist: Erster Teil: Die mythologische Gnosis* (Göttingen, 1934; reprint, 1964) was the groundbreaking study of Gnosticism in the light of existentialism. The English edition of *The Gnostic Religion: The Message of the Alien God and the Beginnings of Christianity* 2d ed. (Boston, 1963) is considerably shorter and therefore an incomplete presentation of Jonas's approach. Thirty years later, Kurt Rudolph edited the continuation of Jonas's work on Gnosticism, *Gnosis und spätantiker*

Geist. Zweiter Teil: Von der Mythologie zur mystischen Philosophie (Göttingen, 1993). It is of particular interest for connections Jonas made between Gnosticism and Christian mysticism, and for his explanation of the transformation of dualistic myths into a monistic worldview. This volume also includes Jonas's important article "Gnosis, Existentialismus und Nihilismus," which was first published in 1973. In *The Modern Revival of Gnosticism and Thomas Mann's Doktor Faustus* (New York, 2002), Kirsten J. Grimstad examines various intellectual trends at the end of the nineteenth and beginning of the twentieth century in their relation to Gnosticism. This work also includes remarkable chapters on Jung and Jonas, as well as a discussion of Gershom Scholem's treatment of Jewish mysticism. Grimstad's work shows a solid familiarity with relevant historical discussion. For Gnosticism in science, see Raymond Ruyer, *La Gnose de Princeton* (Paris, 1974) and Arthur Young, *The Reflexive Universe: Evolution of Consciousness* (New York, 1976). On Gnosticism within Hans Jonas's work, see Manfred Sommer, "Metaphysikkritik als Gnosis," in Willi Oelmüller, ed., *Metaphysik heute? [=Kolloquien zur Gegenwartsphilosophie 10]* (Paderborn, 1987). Gilles Quispel's important works are *Gnosis als Weltreligion* (Zurich, 1951); two volumes of *Gnostic Studies* (Leiden, 1973–1974) and *Gnosis: De derde component van de Europese cultuurtraditie* (Utrecht, 1988), which includes contributions by several authors on the meaning of Gnosticism in European culture. A condensed form of Quispel's views is found in "Gnosis and Psychology," in Bentley Layton, ed., *The Rediscovery of Gnosticism*, vol. 1, *The School of Valentinus* (Leiden, 1980). Steven M. Wasserstrom's *Religion after Religion: Gershom Scholem, Mircea Eliade, and Henry Corbin at Eranos* (Princeton, 1999) is a highly stimulating investigation into supposedly Gnostic epistemologies in the history of religions, although it obscures in a typically heresiological way its own ideological bases in Kantian and positivist philosophy. Wouter Hanegraaff's "On the Construction of 'Esoteric Traditions,'" in Antoine Faivre and Wouter Hanegraaff, eds., *Western Esotericism and the Science of Religion: Selected Papers Presented at the 17th Congress of the International Association for the History of Religions, Mexico City 1995*, pp. 11–61 (Leuven, 1998) is valuable for its analysis of various interpretations of Gnosticism and esotericism, although the author seems unaware of the influence of Kantian metaphysics when proposing an "empirical method."

JULIA IWERSEN (2005)

GNOSTICISM: GNOSTICISM AS A CHRISTIAN HERESY

The pluralism of early Christianity in regional faith and praxis, as well as the shifting lines of authority within the first and second centuries, make it difficult to draw the sharp boundaries required to exclude a particular opinion or group as heretical. In *Against Heresies*, Irenaeus says that his predecessors were unable to refute the Gnostics because they had inadequate knowledge of Gnostic systems and because the Gnostics appeared to say the same things as other Christians. Christian Gnostics of the second century claimed to

have the esoteric, spiritual interpretation of Christian scriptures, beliefs, and sacraments. Their orthodox opponents sought to prove that such persons were not Christians on the grounds that Gnostic rites were occasions of immoral behavior, that their myths and doctrines were absurd, and that their intentions were destructive to true worship of God. In short, it appears that Gnostics were defined as heretics by their opponents well before they stopped considering themselves to be spiritual members of the larger Christian community.

Three periods characterize the interaction of Gnosticism and Christianity: (1) the late first century and early second century, in which the foundations of Gnostic traditions were laid at the same time that the New Testament was being written; (2) the mid-second century to the early third century, the period of the great Gnostic teachers and systems; and (3) the end of the second century into the fourth century, the period of the heresiological reaction against Gnosticism.

The fluid boundaries of Christianity in the first period make it difficult to speak of Gnosticism at that time as a heresy. Four types of tradition used in the second-century Gnostic systems were developed in this period. First, there was a reinterpretation of *Genesis* that depicts the Jewish God as jealous and enslaving: freedom means escaping from bondage to that God. Second, there arose a tradition of Jesus' sayings as esoteric wisdom. Third, a soteriology of the soul's ascent to union with the divine from the popular forms of Platonism was adopted. And fourth, possibly, there was a mythical story of the descent of a divine being from the heavenly world to reveal that world as the true home of the soul. Each of the last three types of tradition lies behind conflicts or images in the New Testament writings.

Some scholars have argued that the incorporation of the sayings of Jesus into the gospel narrative of his life served to check the proliferation of sayings of the risen Lord uttered by Christian prophets. The soteriology of the soul's divinization through identification with wisdom has been seen behind the conflicts in *1 Corinthians*. Second-century Gnostic writings use the same traditions from Philo that scholars invoke as parallel to *1 Corinthians*. The question of a first-century redeemer myth is debated in connection with the Johannine material. While the image of Jesus in the *Gospel of John* could have been developed out of existing metaphorical traditions and the structure of a gospel life of Jesus, the Johannine letters show that Johannine Christians were split over interpretation of the gospel. Both *1 John* and *2 John* condemn other Christians as heretics. Heretics deny the death of Jesus and may have held a docetic Christology. Though perhaps not based on the myth of a descending redeemer, the Johannine images contributed to second-century Gnostic developments of that theme as applied to Jesus.

The second century brought fully developed Gnostic systems from teachers who claimed that their systems represented the inner truth revealed by Jesus. During this period, the Greek originals of the Coptic treatises were collected at

Nag Hammadi. From the orthodox side, Irenaeus's five books refuting the Gnostics marked a decisive turn in Christian self-consciousness. These were followed by the anti-Gnostic writings of Hippolytus, Clement of Alexandria, Origen, Tertullian, and Epiphanius. Though Irenaeus may have drawn upon earlier anti-Gnostic writings, such as Justin's lost *Suntagma*, his work suggests a turn toward the systematic refutation of Gnosticism. Rather than catalog sects and errors, Irenaeus turned to the refutation of Gnostic systems using the rhetorical skills and *topoi* of philosophical debate. At the same time, he sought to provide a theoretical explication of orthodox Christian belief that would answer arguments advanced by Gnostic teachers. He apparently had considerable information about Valentinian speculation, as well as some of the earlier sources of Valentinian mythology.

Like the other heresiologists, Irenaeus attacked Marcion as well as Gnosticism. Marcion provided an easier target to identify as a "heresy" because he rejected the Old Testament and established a Christian canon consisting of edited versions of *Luke* and the Pauline letters. Marcion was concerned to set the boundaries between himself and the larger Christian community in a way that the Gnostic teachers who claimed to provide the spiritual interpretation of Christianity were not. Irenaeus provided two guidelines for drawing the boundary that would exclude Gnostic teachers from the Christian community. The first is reflected in the *regula fidei* of his *Against Heresies* (1.10.3), which gives topics about which legitimate theological speculation is possible and consequently rules out much of the cosmological speculation of the Gnostic teachers. The second guideline is Irenaeus's rejection of Gnostic allegorization of scripture. He insists that biblical passages must mean what they appear to mean and that they must be interpreted within their contexts. In book five, Irenaeus argues that the Gnostics failed to support their claims for a spiritual resurrection in *1 Corinthians* 1:50 because they ignored the eschatological dimensions of the verses that follow.

The heresiologist's concern to draw boundaries between orthodox Christianity and Gnostic teachings ran counter to the practice of second-century Gnostics. Several of the Nag Hammadi treatises were apparently composed with the opposite aim. Writings such as the *Gospel of Truth* and the *Tripartite Tractate* drew explicit connections between Gnostic teaching and both the teaching practice and the sacramental practice of the larger Christian community. Other Gnostic writings fell within the developing patterns of ascetic Christianity in Syria and Egypt (e.g., *Gospel of Thomas*, *Book of Thomas the Contender*, *Dialogue of the Savior*). The ascetic tradition tended to reject the common Christian assumption that baptism provides a quality of sinlessness adequate to salvation and to insist that only rigorous separation from the body and its passions will lead to salvation. Such ascetic groups did, of course, draw sharp boundaries between themselves and the larger world of believers, but the preservation of the Nag Hammadi codices among Egyptian monks sug-

gests that the division between ascetic and nonascetic Christians may have been stronger than that between “heretic” and “orthodox,” even into the fourth century in some areas.

Other Gnostic writings show that the efforts of heresiologists to draw boundaries against Gnostics resulted in repressive measures from the orthodox side and increasing separation by Gnostics (cf. *Apocalypse of Peter*, *Second Treatise of the Great Seth*). The *Testimony of Truth*, apparently written in third-century Alexandria, not only contains explicit attacks on the beliefs of orthodox Christians but also attacks other Gnostic sects and teachers like Valentinus, Isidore, and Basilides. The author of this Gnostic work considers other, nonascetic Gnostics as heretics. However, the author still holds to something of the nonpolemical stance that had characterized earlier Gnostic teachers, saying that the true teacher avoids disputes and makes himself equal to everyone. Another example of the effectiveness of the orthodox polemic in defining Gnostics as heretics is found in what appears to be a Gnostic community rule that calls for charity and love among the Gnostic brethren as a sign of the truth of their claims over against the disunity of the orthodox in *Interpretation of Knowledge*. This call reverses one of Irenaeus’s polemical points that the multiplicity and disunity of Gnostic sects condemn their teaching when contrasted with the worldwide unity of the church.

Some scholars think that this third period, in which the Gnostics were effectively isolated as “heretic” by orthodox polemic, led to a significant shift within Gnostic circles. Gnosticism began to become dechristianized, to identify more with the non-Christian, esoteric, and hermetic elements within its traditions. Gnostics became members of an independent esoteric sect, moved toward the more congenial Mandaean or Manichaean circles, existed on the fringes of Alexandrian Neoplatonism in groups that emphasized thaumaturgy, or joined the monks in the Egyptian desert, where they found a kindred spirit in the combination of asceticism and Origenist mysticism. Those associated with Manichaeism or Origenism would continue to find themselves among the ranks of heretical Christians. The rest were no longer within the Christian sphere of influence.

BIBLIOGRAPHY

Anyone interested in Gnosticism should obtain the English translation of the Nag Hammadi codices edited by James M. Robinson, *The Nag Hammadi Library in English* (San Francisco, 1977). Another book that studies the structure and the apologetics of the Gnostic dialogues from the Nag Hammadi collection is my *The Gnostic Dialogue: The Early Church and the Crisis of Gnosticism* (New York, 1980). The only other reliable treatments of the new material and its significance for the interaction of Gnosticism and early Christianity are scholarly writings. Three volumes, containing papers by leading scholars in German, French, and English, provide

important treatments of the subject: *Gnosis: Festschrift für Hans Jonas*, edited by Barbara Aland (Göttingen, 1978); *The Rediscovery of Gnosticism*, vol. 1, *The School of Valentinus*, and vol. 2, *Sethian Gnosticism*, edited by Bentley Layton (Leiden, 1980–1981). The best study of the Gnostic polemic against orthodox Christianity is Klaus Koschorke’s *Die Polemik der Gnostiker gegen das kirchliche Christentum* (Leiden, 1978).

PHEME PERKINS (1987)

GNOSTICISM: HISTORY OF STUDY

The problem of the origin of Gnosticism has been approached in Western culture with methods and results that are sometimes in clear disagreement. Perhaps the first to deal with the subject critically was Gottfried Arnold, who wrote in 1699 the *Unparteiische Kirchen und Ketzer Historie (Impartial History of the Church and of Heresy)*—a work that influenced the poetry of Goethe in a Gnostic sense—although the subject was previously mentioned in by G. P. Marcossius’s *De Vitis Secretis et Dogmatibus omnium Haereticorum*, printed in Cologne in 1569.

However, it was only with Johann Lorenz von Mosheim (1694–1755) that the study of Gnosticism came to the fore as an independent discipline. In his degree thesis entitled “*Institutiones christianae maiores*” (Helmstadt, 1739) the future Protestant pastor and theologian described *gnōsis* as an Eastern philosophy that had rapidly expanded of its own accord from Greece and Chaldea (=Mesopotamia), and reached as far as Egypt. This doctrine, almost by a process of osmosis, would have taken certain elements from Jewish thinking. In its turn, the Jewish world would also have drawn themes from Gnostic thought, using them in its polemic against Greek philosophy. In the analysis of Mosheim we can already discern in a nutshell a substantial part of the themes developed by later historiography.

The works of J. Horn and Ernest Anton Lewald partly disagree with Mosheim. According to them, the sources of Gnosticism could be traced back to the land and teaching of Zoroaster, thus forming the basis for that successful interpretation which considered ancient Gnosticism a classic example of dualist philosophy. However, the works of Johann August Neander and Jacques Matter follow the same line of interpretation as Mosheim. The extensive work of Matter describes *gnōsis* as the emergence at the heart of Christianity of all the cosmological and theosophical speculation which formed the greater part of Eastern religions and which had been adopted in the West by the Neoplatonists. This doctrine therefore arose as a synthesis of themes drawn from the philosophical works of Plato, Aristotle, the Avesta, the Qabalah, and the Eleusinian and Orphic mysteries. If the work of Matter provided Gnostic doctrine with a certain notoriety and cultural dignity on the one hand, it was nevertheless an interpretation based upon a particularly stereotyped view of the East, and very much a product of its time.

From the very beginning there has been an attempt to reconstruct the possible relationship between Gnosticism

and Judaism: in 1846 Heinrich Graetz, in his book *Gnostizismus und Judentum*, tried to prove Gnostic influence on a number of rabbinical traditions. Decades later, Moritz Friedländer would reverse the methodological model of Graetz, stressing Jewish influence upon Gnosticism and thus giving rise to a fresh line of interpretation which has lasted to the present day.

INFLUENCE OF THE *RELIGIONSGESCHICHTLICHE SCHULE*. In 1851, study of Gnosticism was given a new impetus thanks to the discovery of the *Philosophumena* or, rather, *The Refutation of All Heresies*, a work attributed to Hippolytus of Rome, which over the years has seen numerous editions and translations, including those by Paul Wendland and Miroslav Marcovich, to mention two that are very different. In 1853 came the work of F. C. Baur, *Das Christentum und die christliche Kirche der drei ersten Jahrhunderte*, which assembled an impressive range of comparative material and formed the basis for the bold speculations of scholars of the *Religionsgeschichtliche Schule*, especially Johann Franz Wilhelm Bousset (1865–1920) and Richard Reitzenstein (1861–1931). In the years that followed the publication of the work of Baur, there were significant researches by Gustav Volkmar, Gerhard Uhlhorn, and particularly Richard Adelbert Lipsius (1830–1892), who was responsible for a critical study of the Ophite Gnostic system and a monumental article on Gnosticism in the *Allgemeine Enzyklopaedie*.

The fundamental idea of placing Gnosticism in the context of Greek philosophy and in particular Platonic philosophy dates from the 1880s and is restated in the work of Manuel Joel. Some of the interpretations that regard Gnosticism as a philosophical phenomenon originating from the very heart of Christianity are the thinking and researches of Adolph Hilgenfeld (1823–1907) and Adolf von Harnack (1851–1930), scholarly philologists belonging to the so-called School of the History of Dogma.

In a certain way prefigured by the studies of ancient syncretism by Albrecht Dieterich, the pan-Egyptian theories of M. A. Amelineau, and the pan-Babylonian theories of Wilhelm Anz and Konrad Kessler, the School of the History of Religions put forward the theory that Gnosticism was a phenomenon that predated Christianity, and that so-called Christian *gnōsis* represented merely a particular and at times even marginal aspect of this. The work of Bousset, *Hauptprobleme der Gnosis*, is central to these hermeneutics. Despite the critical review of Carsten Colpe, it is a text that is still of fundamental importance to today. Bousset studied the various Gnostic motifs such as dualism, the myth of the descent of the Savior, and the ascension to heaven and the figure of the Mother of Light, tracing their origins back in the form of Iranian/Mesopotamian syncretism. Another very important scholar, classical philologist, and religious historian who concerned himself with the origins of Gnosticism was Eduard Norden (1868–1941) in his work *Agnostos Theos*. Even if in this book the topic was not dealt with explicitly, Norden assumes the existence of a pre-Christian Gnosticism, basing

this interpretation on material derived from hermetic literature.

The high point of the historical religious trend was undoubtedly the *Das iranische Erlösungsmysterium* of Reitzenstein. Preceded by a work on hermetic literature and by one on mystery religions, the “Iranian Salvation Mystery” is an analytical development of several of the themes already set out in the works of Bousset. The central motif for Reitzenstein is the event which he defines as “The Savior Saved,” namely the Messenger, the primordial man who descends to matter to set free the Light Soul. If God is light and a part of that light remained trapped in the world, when God comes down into the world in the form of the envoy to free it, by saving it he also saves himself. Reitzenstein, in support of the Iranian nature of these themes, refers to a supposed “Fragment of Zarathushtra,” a spurious text which later philological criticism would identify as being a Manichaean literary creation and thus not Zoroastrian.

Reactions to the works of the *Religionsgeschichtliche Schule* were not long in coming: in 1925 in Paris the second edition of Eugène de Faye’s book, *Gnostiques et gnosticisme*, was published. In this it was possible to catch a glimpse of several approaches, including an analysis of sources aiming to prove the existence of the *Syntagma* of Justin—the first true list of heresies—hypothetically reconstructed from pseudo-Tertullian and Epiphanius; an analysis of the individual features of various Gnostic systems; and the forceful statement that Gnostic philosophy predated its mythology. In short, de Faye intended to describe a Christian Gnosticism that was independent from previous Iranian or Mesopotamian religious models.

The Iranian hypothesis of the *Religionsgeschichtliche Schule* was also the basis of the exegetic work by the Protestant theologian Rudolf Bultmann (1884–1976). Studies on Mandaeism by the philologist and Semitist Mark Lidzbarski had a decisive influence on Bultmann in his interpretation of John’s Gospel: the passages where Jesus is considered a heavenly messenger who has come down to bring revelation to humanity had certain parallels in Mandaean literature. For Bultmann the fourth Gospel represents the outcome of and reaction to a pre-Christian myth deriving directly from a Gnostic Mandaean milieu.

Harnack had defined Gnosticism as a phenomenon involving the “acute Hellenization of Christianity” (Harnack, 1893–1904). In stark contrast with this definition were the claims of Bousset and Reitzenstein, according to whom Gnosticism was a pre-Christian religious movement of Iranian/Mesopotamian origin. The controversy also involved the Iranist Hans H. Schaeder, at first a supporter of Reitzenstein in the joint work *Studien zum antiken Synkretismus* (Leipzig, 1926). A follower of the philosopher Oswald Spengler, Schaeder went on to describe hermeneutics according to which Gnosticism is seen as a combination of elements that were Greek in form but Eastern in content. This trend was continued by Hans Leisegang in his work *Die Gnosis*, which

confirmed the dual nature of the Gnostic phenomenon but nonetheless stated its single origin, developed from the amalgamation of those two religious elements.

The work of Hans Jonas (1903–1993), *Gnosis und spätantiker Geist*, occupies an intermediate position. It is a work which is set out as the first genuine synthesis on the Gnostic problem. Jonas's work uses two main interpretative sources: the comparative material assembled by the *Religionsgeschichtliche Schule* (in particular Bousset and Reizenstein), and the existentialist theological hermeneutics of Bultmann (which is in turn indebted to the philosophy of Martin Heidegger). For Jonas, the central kind of *gnōsis* is "Syro-Egyptian," as distinct from the "Iranian" sort: the first has an emanative "de-evolutive" structure which finally produces a rebellious Demiurge; in the second there is an absolute dualism of two principles, in which the cosmos arises from the dismemberment of an original being (a typical Indo-Iranian motif). Jonas, however, as subsequently noted by Ioan Petru Culianu and Giovanni Casadio, omits to take into account the so-called Triadic Gnostic Systems that are usually defined as "Sethian," in which there are three main principles involved: Light, the *pneuma* (spirit), and Darkness. Starting from what he calls *das Prinzip der Konstruktion*, Jonas traces in Syro-Egyptian *gnōsis*, in addition to a large number of influences derived from hermetic and mystery writings, a new factor, that of regarding the world (= *kosmos*) as an ontological evil from which it is necessary to be set free. From this point of view God is therefore the one who saves humans from the world. The relationship between God and the world is developed in a cosmological and anthropological antithesis: if on the one hand God is the opposite of the world, on the other hand the *pneuma*, which is hidden in the human body, is opposed to the *psyche* and *hyle* (soul and matter). The earthly world has a totally autonomous beginning: it is Darkness, a substance which is "real" only in contrast to its opposite, Life, the shining *pleroma* (fullness). God and the world are absolutely incompatible. Such an idea is an absurdity to the Greek mind, and the anti-Gnostic *Ennead* of Plotinus is a confirmation of this. It is thus impossible to ascribe the origins of the Gnostic phenomenon to Platonic speculation. The Fathers of the Church were no less unresponsive to this idea of denial of the world, and thus rejected the possibility that the origin of Gnosticism should be found in the heart of the Christian church. As regards the figure of the Demiurge, he should not be identified with the Devil: his portrayal comes both from Platonic doctrines and from Jewish beliefs on creation. For Jonas, the most distinctive form of Gnostic dualism is the Syro-Egyptian emanative system, in which the passage from the perfection of the world of light to the disorder of the earthly world is marked by the *hybris* (arrogance) of an intermediate creature, Sophia. On the other hand, according to Jonas, the Iranian kind of Gnosticism would represent an antic cosmic adaptation of a preexisting, specifically Iranian dualism.

JUDEO-CHRISTIAN ORIGINS. A large number of scholars eventually supported the theory of the Jewish or Judeo-

Christian origin of Gnosticism. As has been said, one of the first and main exponents of this tendency was Friedländer in his *Der vorchristliche jüdische Gnosticismus*. He insisted in particular that there existed a popular religious feeling in the heart of Judaism, within which apocalyptic and subsequently Gnostic speculation emerged. In this hermeneutic vein, according to the writings of Erik Peterson (1890–1960) and Jean Daniélou (1905–1974), the first Gnostic writers should be sought in Jewish apocalyptic. Hans Joachim Schoeps offers a similar interpretation, in which he stresses the presence of a "Gnostic Judaism" in the writings of the Qumran community. Another scholar, Robert McLachlan Wilson, has noted the relationship between post-Christian Gnosticism and the Judaism of the Diaspora in his book *The Gnostic Problem* (1958). His conclusions tend to define the Gnostic phenomenon as being strongly influenced by the religious representations of post-Diaspora Judaism. In discussion of the work of Wilson, a German scholar, Alfred Adam, has set out evidence of the clear presence of Aramaic borrowings in the *nomina numina* of Gnostic mythology, a line of interpretation also pursued by the Coptic scholar Alexander Böhlig (1912–1996). The works of the U.S. scholar Birger A. Pearson are also important with regard to the hypothesis concerning Judaism. He has studied the Gnostic texts of Nag Hammadi for evidence of their possible sources and interpolations in Jewish writings.

The most complete description of the existence of a genuine Gnosticism at the heart of Jewish tradition is, however, by two scholars of exceptional talent: Gershom G. Scholem (1897–1982) and Gilles Quispel (b. 1916). Scholem is responsible for the "discovery" of mystic Jewish *gnōsis*, found in the ecstatic vision of the merkavah, the "chariot" or "throne" on which God sits in *Ezekiel* 1:26. Analysis of merkavah literature led Scholem to redefine the problem of Gnostic origins. First of all, these merkavah texts in many regards go back to orthodox Judaism and some are datable to the beginning of the fourth century CE. With tremendous erudition Scholem demonstrates that Gnostic documents considered "Christian" assume certain fundamental connections with the mysticism of the merkavah. Thus when Saint Paul describes his ascension into paradise, to the "third heaven," he borrows words from Jewish mysticism; thus it is also probable that the visionary author of *The Shepherd of Hermas*, and Valentinus were aware of Jewish speculation on the name of God; the documents of the Valentinian Gnosis, especially the *Excerpta ex Theodoto*, reveal the influence of teaching imparted in Jewish esoteric circles. For Scholem, in the end, this mystic Gnosticism of the merkavah was not outside the sphere of Halakhic tradition: it would eventually develop motifs and attitudes already present in orthodox rabbinical teaching of the law, upon which apocalyptic eschatology had exerted a marginal influence, expressing in the first decades of the Christian era the restlessness and religious revival of a large part of the Jewish world. The coptologist and religious historian Gilles Quispel has a related viewpoint, but expresses it differently. "Gnosis minus Christentum ist Gno-

sis" (Quispel, 1951); with this assumption Quispel claims independence and originality for Gnosticism as regards the philosophical and religious currents of Hellenistic and Roman syncretism. On the one hand, in line with the Jungian psychology of which Quispel is an adherent, *gnōsis* is a unique religious self-contained experience, namely a mythical projection involving the search for the true essence of the human person (=the self); on the other hand, Quispel traces the origins of this original pattern of thinking to a specific branch of Alexandrian Judaism. From this cultural milieu—more recently defined as “The Hermetic Lodge of Alexandria”—originated the thinking on the cosmos and on the human race found in the highly developed visions of Valentinus, if not directly those of Origen (185–254). Quispel is indebted, albeit indirectly, to the method of the *Religionsgeschichtliche Schule*; Giovanni Casadio has indeed noted how the pan-Judaic hypothesis regarding the origin of Gnosticism expressed by Quispel reflects the method and conclusions of the pan-Iranian hypothesis of Reitzenstein and his followers: heterogeneous aims then!

In the wake of the works of Scholem and Quispel followed the researches of Guy Gedaliahu Stroumsa (Judaic and Gnostic origins of the Manichaean myths), Jarl Fossum (Samaritan origins of Gnostic myths), and Nathaniel Deutsch. Deutsch in particular took up the ideas of Scholem on the mysticism of the merkavah, going into more detail on the subject as regards the mythological description in the Mandaeen Gnostic texts. J. C. Reeves studied the Jewish Gnostic contributions as the basis of Manichaean texts such as *The Book of Giants*, arriving at an original definition of Syrian-Mesopotamian *gnōsis* in which elements drawn from Iranian tradition also converged.

According to the study of the patrologist Robert M. Grant, *Gnosticism and Early Christianity*, Gnosticism originated from the remains of the apocalyptic eschatological expectations after the fall of Jerusalem. The hope that the kingdom of YHWH would come to pass on earth had guided and sustained the people of Israel. From the Maccabean revolt to the fall of Jerusalem in 70 CE, to the extreme revolt of Bar Kosebah under Hadrian, a bloody chain of events left a deep mark on the destiny of the “people of YHWH.” The failure of the eschatological hope to be fulfilled on earth thus signified the outbreak of a tremendous spiritual crisis, which led to the appearance of new religious forms. From the belief that the God of this world has not managed to fulfill the hopes of his people comes rejection of the world, which, together with eschatological dualism, are the characteristic features of Gnosticism. The outer fringes of Judaism (e.g., the Essene community of Qumran, the Jewish circles influenced by the Iranian/Chaldaean “theology” of the “Hellenized Magi,” the Judaism of the Diaspora in direct contact with the Aramaic Syro-Mesopotamian world) provided the materials which were united in the synthesis of the great Gnostic masters of the second century CE.

A hermeneutic work, which is somewhat similar to Grant's but which draws rather puzzling conclusions, is that

by Ioan Petru Culianu (1950–1991), a Romanian scholar linked to the school of Ugo Bianchi (1922–1995). According to Culianu the origin of Gnostic nihilism can be found in the problem of the “Angels of the Nations”: in ancient Judaism there existed a belief that every nation on earth had its own representative in the heavenly court, and the Jews expected direct political advantages because their heavenly representative was God himself, or the archangel Michael, who occupied the first place next to God. The fall of the Second Temple in 70 CE profoundly altered this vision. As Rome had conquered Palestine, and the occupation of the Holy Land had begun to seem unending, this seemed to indicate only one thing: Samael, the angel of Rome, had replaced God or Michael in the role of leader of the Angels of the Nations; like the power of Rome itself, Samael was an evil angel, the equivalent of Satan. To this hermeneutic hypothesis, Culianu added a precise, detailed phenomenology of Gnostic myths, studied in a diachronic manner. In the work of Culianu the interlinking of Gnosticism and modern nihilist thought is particularly important, a topic analyzed impartially and sometimes relentlessly, which has had a significant effect on the work of the Italian philosopher and scholar Elémire Zolla (1926–2002).

GREEK PLATONIC ORIGINS. In its theoretical layout the work of Culianu is certainly indebted to the research of another significant Italian scholar, Ugo Bianchi, who was responsible for organizing the important Congress of Messina in 1966 on the origin of Gnosticism. An ardent supporter of the Orphic and Platonic origins of the key themes of Gnosticism, Bianchi further maintained that Gnostic mythology reabsorbed and redeveloped archaic material, which can be identified by ethnological and folkloric research. To this last aspect of the question, he dedicated a specific volume (*Il dualismo religioso*), an important work which laid bare the analogies and possible relationships between Gnostic myths and the sphere of religious ethnography. The hypothesis of a purely Greek Platonic origin of Gnostic theodicy is also present in the works of Simone Pétrement, a French scholar and follower of the philosopher Simone Weil. Pétrement, following at times slavishly in the footsteps of Harnack, maintains that Gnosticism is a phenomenon involving the Hellenization of Christianity, in which religious elements give rise to a political theology of rebellion against every kind of social oppression; this is a hermeneutic concept that is definitely borrowed from the Marxist ideology of Weil. Consideration of social and political themes is also found in the research of the American scholar Elaine Pagels, who has made particular study of the balance of power as the basis of the contradiction between Gnostic thought and the church hierarchy. On the relations between the origins of Christianity and Gnosticism, the works of Manlio Simonetti (b. 1926) and Christoph Marksches (b. 1962) should also be considered.

A German religious historian, Carsten Colpe (b. 1929), in a famous early work critically revisited the ideas of the *Religionsgeschichtliche Schule*, demonstrating that many of the

hypotheses proposed by Reitzenstein were without foundation. Over the years Colpe has produced a series of fundamental analyses that aim to untangle the various syncretic elements that are intertwined in the original Gnostic texts. Despite Colpe's criticisms, the Iranist interpretation of the Gnostic phenomenon has been articulately expounded in the work of another historian of religions, the Swedish scholar Geo Widengren (1907–1996). Widengren has improved upon the research of his predecessors, identifying the origin of Gnosticism in a particular esoteric and philosophical tendency in the Mazdean religion Zurvanism. According to Widengren, such wisdom traditions, along with the ideas of the Aramaic Mesopotamian world, gave rise to the *gnōsis* of the Mandaeans and consequently in a whole series of documents ascribed to what he has defined as "Parthian gnosis." The hybrid production based on Iranian and Mesopotamian materials in the context of the kingdom of Parthia is further at the root of a complex syncretism that runs through apocalyptic texts such as *The Book of Enoch* or more typical Qumran texts such as *The War Rule*, examples of an intertestamental Judaism that was beginning to interpret everything according to Gnostic canons. The research of Widengren and the fascinating work of the *Religionsgeschichtliche Schule* have found support in the work of the Italian Gherardo Gnoli (b. 1937), a scholar who has forcefully pointed out the Iranian roots of the Gnostic phenomenon. In Gnoli we also find Manichaeism redefined as an "Iranian Gnostic religion." An attempt to find a middle way between the extreme positions cited has been made by the German Kurt Rudolph (b. 1929), who as well as stressing the Hellenistic Greek and Judaic Aramaic substratum of the origins of Gnosticism also emphasizes the presence of Iranian material.

NAG HAMMADI. The discovery in the 1940s at Nag Hammadi, ancient Chenoboskion, of an entire library of Gnostic texts written in Coptic has given a new impetus to studies concerning the origins of Gnosticism. This literary corpus was discovered by Jean Doresse, a Coptologist whose fame has been eclipsed by that of Henri-Charles Puech (1902–1986). Puech was responsible for an outstanding series of works on Gnostic phenomenology; mention should be made of his work *La gnose et le temps*, which was inspired by the Swiss psychoanalyst Carl Gustav Jung (1875–1961) and dealt with the correspondence between the conceptions of space and time in Gnostic demiurgy. The school on Gnosticism and dualism begun by Puech has been continued in the work of his pupil Michel Tardieu, a keen supporter of historicophilological method but also the first to use the approach of structural anthropology in interpreting the Gnostic myths. We should also recall in the same context the work of Antoine Guillaumont on Semitic expressions in the Gnostic texts.

The disputes and controversies involving the rediscovery and publication of the Coptic corpus of Nag Hammadi have resulted in a large number of editions and versions of the Gnostic tracts. Between the 1950s and the 1970s various translations were circulated (published mainly in the pages

of academic reviews) with parallel texts in Coptic. Mention should also be made of the pioneering works of Puech, Quispel, Pahor Labib, Walter Till, Guillaumont, Jan Zandee, Soren Giversen, Rudolf Kasser, Hans-Martin Schenke, Martin Krause, and Bentley Layton. Recently a critical edition and translation of the Gnostic texts of Nag Hammadi has been completed by a group of international scholars led by James M. Robinson, who is in charge of the Coptic Gnostic Library Project of the Institute for Antiquity and Christianity of Claremont (California). A series of predominantly but not exclusively French-speaking scholars (Jacques É. Ménard, Bernard Barc, Paul-Hubert Poirier, Michel Roberge, Louis Painchaud, Wolf-Peter Funk, Jean-Marie Sevrin, Einar Thomassen, John Turner, and others) at the University of Laval in Quebec in Canada are working on a French translation with critical text, equipped with monumental theological historical commentary on all the Nag Hammadi texts.

EZIO ALBRILE (2005)

Translated from Italian by Paul Ellis

GOATS SEE SHEEP AND GOATS

GOBLET D'ALVIELLA, EUGÈNE (1846–1925), was a Belgian historian of religions, jurist, politician, and grand master of Freemasonry (which means, in Belgium, that one is anticlerical). Count Goblet d'Alviella was the first professor of history of religions at the Université Libre (i.e., "free thinking") of Brussels, of which he was rector from 1896 to 1898. He was militant as a freethinker in trying to have the teaching of religion in schools replaced by that of the science of religion.

Goblet d'Alviella divided the study of religions into three disciplines: "hierography," "hierology," and "hierosophy." Hierography describes the development of each of the known religions. Hierology, by comparing religions, tries to formulate laws of evolution of religious phenomena; it thus "makes up for the paucity of information, in any given race or society, about the history of a belief or an institution, by appealing to the environment or period." Hierology is purely factual, while hierosophy is a philosophical attempt at classifying the various conceptions of humanity's relations with "superhuman beings."

Although lacking special philological training, Goblet d'Alviella studied, in hierography, various domains: Egyptian

religion, Mithraism, Greek religion, Christianity, and Hinduism. In hierology, his most notable work was *La migration des symboles* (1891), in which he studied the forms, meanings, and migrations of such religious symbols as the swastika, the sacred tree, and the winged disk. The winged disk, for instance, originated in Egypt as a symbol of the sun and was adopted by the Syrians, the Hittites, the Assyrians, and the Persians, with additions and transformations in both form and meaning. In hierosophy Goblet d'Alviella studied Rationalist churches, the belief in immortality, the Buddhist catechism, progress, syncretism, and the crisis of religion.

BIBLIOGRAPHY

A large number of Goblet d'Alviella's articles are reprinted in book form under the title *Croyances, rites, institutions*, 3 vols. (Paris, 1911). Three of his works exist in English translation: *Contemporary Evolution of Religious Thought in England, America, and India* (New York, 1886); *The Migration of Symbols* (London, 1894); and his Hibbert Lectures of 1891, *Lectures on the Origin and Growth of the Conception of God as Illustrated by Anthropology and History* (London, 1892). A good summary of Goblet d'Alviella's work can be found in the article by Julien Ries in the *Dictionnaire des religions* (Paris, 1984).

GOD: GOD IN THE HEBREW SCRIPTURES

The God of Israel is the major character in the Hebrew scriptures. Although he is not mentioned in the *Book of Esther* or in the *Song of Songs*, God appears in all the remaining twenty-two books of the Hebrew Bible. Within these books God is depicted as creator, provider, and lawgiver. Most of the writers assume that he is just, that he has a special relation with the people of Israel, and that he hearkens to prayer. But because the Bible is not a systematic theological treatise and because not all internal contradictions were removed by its editors, we find major disagreements among the writers about the crucial elements of Israelite faith, including concepts of God.

BIBLICAL TERMINOLOGY OF THE DIVINE. The proper name of the God whose exclusive worship is demanded by the bib-

lical authors is written consonantly as *YHVH*. This tetragrammaton, attested more than 6,600 times in the Bible, also occurs on the Moabite Stone (ninth century BCE) and in several ancient Hebrew letters and inscriptions. Vocalized biblical texts do not preserve the actual pronunciation of *YHVH*. Instead, they direct the reader to pronounce the divine name as though it were the frequent epithet *adonai*, meaning “lord.” (It was the misunderstanding of this scribal convention that gave rise to the English form *Jehovah*.) The original pronunciation of *YHVH* is generally reconstructed as “Yahveh” or “Yahweh,” on the basis of early Greek transcriptions. A shorter form, *YH*, generally considered secondary, is found 24 times in the Hebrew scriptures. In proper names, the theophoric element is never written as *-yvh* but as *-yh* or *-yhu*.

The name *YHVH* occurs frequently in the compound *yvh tsv't* (*yahveh tseva'oi*). Usually translated as “lord of hosts,” its exact significance is uncertain. Most likely it means either “creator of the [heavenly] hosts” or “Yahveh is the [armed] host of Israel.” *YHVH* is also sometimes combined with *elohim*, the most common generic word for “god,” in the form *Yahveh Elohim*. The term *elohim* appears some 2,600 times in the Hebrew scriptures, and, although in form the word is plural, it is often construed with a singular verb. Most commonly, *Elohim* refers to the God of Israel and is thus synonymous with or interchangeable with *Yahveh*. Certain writers, in particular the author of the so-called Elohist source of the Pentateuch and the composers of certain Psalms, preferred *Elohim* to *Yahveh* as the proper name of the God of Israel.

Even when *Elohim* refers to the God of Israel, it can be treated as a plural (*Gn.* 20:13). Most frequently, however, the plural references are to gods whose worship by Israelites is condemned by the biblical authors. These are referred to as *elohim aherim* (“other gods”; *Ex.* 20:3, *Dt.* 5:7) and *elohim hadashim* (“new gods”; *Jgs.* 5:8). Similar are expressions in which the plural construction is employed. Examples are *elohei ha-nekhar* (“foreign gods”; *Gn.* 35:2, *Jos.* 24:20) and *elohei nekhar ha-arets* (“foreign gods of the land”; *Dt.* 31:16). It must be noted that the Hebrew writers employ the singular sense of *elohim* even when illicit divinities such as Astarte, Milcom, and Chemosh are meant (*1 Kgs.* 11:5, 11:33).

Because *elohim* is antithetical to *anashim* (“people”; see *Jgs.* 9:13), it can include gradations between the two categories of divinity and humanity. Among these are ghosts (*1 Sm.* 28:13, *Is.* 8:19) and minor divinities (*Gn.* 32:29, 48:15–16). The term can also serve in adjectival expressions of might, power, and the like. Among such examples are *ruah elohim* (“mighty wind”; *Gn.* 1:2), *nesi' elohim* (“great prince”; *Gn.* 23:6), *naftulei elohim* (“violent struggles”; *Gn.* 30:8), *hittat elohim* (“terror”; *Gn.* 35:5), *herdat elohim* (“panic”; *1 Sm.* 14:15), *kis'akha elohim* (“your eternal throne”; *Ps.* 45:7), and *har elohim* (“majestic mountain”; *Ps.* 68:16). In addition, *elohim* can mean “happencstance,” as in *etsba'elohim* (*Ex.* 8:15), and, frequently approximates “nature” in the late book *Ecclesiastes*.

Related etymologically to *elohim* is the shorter form *eloah*, construed solely as a grammatical singular. Most of its occurrences are in the later books of the Hebrew scriptures, although it is found also in the archaic poem in *Deuteronomy* (32:15, 32:17). The word occurs almost exclusively in poetry and never with the definite article. With the exception of two passages in *Daniel* (11:38–39), *eloah*, in contrast to *elohim*, does not refer to foreign divinities but has the virtual status of a proper name for the God of Israel.

Another important scriptural designation of divinity is *el*, whose function corresponds generally to that of *elohim*. The word has numerous cognates in the classical Semitic languages and is attested some 230 times in the Hebrew scriptures in the singular as well as the plural, *elim*. Like *Elohim*, *El* can substitute for *Yahveh* as a proper name for the God of Israel, its most common use (*Nm.* 12:13, 23:8, 23:19; *Is.* 8:8, 8:10). The Hebrew word *el* can take the definite article and appear as *ha-el*, “the god” (*Gn.* 46:3, *Ps.* 85:9). It can also refer to pagan deities in such forms as *el zar* (“strange god”; *Ps.* 44:21, 81:10), *el aher* (“other god”; *Ex.* 34:14), and *el nek-har* (“foreign god”; *Mal.* 2:11, *Ps.* 81:10).

Unlike *elohim*, *el* has clear antecedents in older Semitic languages. Early documents from Ebla (modern-day Tel Mardikh) in central Syria and from Mesopotamia show that the closely related *ilu* was used in Akkadian for “god” as well as for the proper name of a high god. Chronologically closer to first-millennium Israel are the texts from Ugarit in northern Syria, which employ *el* for “god” in general and also for the head of the Canaanite pantheon. *El* was known for wisdom and beneficence as well as for his exploits with sex and alcohol. He was a healer and creator god who was sometimes depicted as a bull. Some biblical passages that mention *el* refer to this god (*Is.* 14:13, *Ez.* 28:2, *Hos.* 12:6).

Because the Yahveh cult appropriated the name of *El* to its own object of worship, we cannot always tell whether an *el* reference in a biblical text is to the Canaanite *El*, to *Yahveh*, to a blend of both, or to another divinity entirely. Among the problematic occurrences is *el ro'i*, “the god who sees me” or “*El* who sees me” (*Gn.* 16:13). The name *El Beth'El* (*Gn.* 31:13) is even more problematic, because a divinity named Beth'el, doubtless the hypostasis of a shrine, was worshipped in Samaria in the eighth century (*Hos.* 10:15, 12:5), in Tyre in the seventh century, and at Elephantine in Egypt in the fifth century. Similar difficulties attend the proper understanding of *el shaddai* (*Gn.* 17:1, 28:3; *Ex.* 6:3), which occurs as well in the form *shaddai* (*Nm.* 24:4, 24:16; *Ez.* 1:24; *Jb.*, *passim*). Earlier attempts to connect *El Shaddai* with the Amorite Bel Shade (“lord of the mountains”) have been disproved. Recently published texts in Aramaic from Deir 'Alla in Jordan refer to *shaddayin*—divinities. Whether this discovery will shed some light on the biblical *el shaddai* remains to be seen. There has been a great deal of scholarly discussion of the name *El 'Elyon* (*Gn.* 14:18; *Ps.* 78:35). It is uncertain whether the name should be rendered “God most high” or “*El* most high” and whether the name itself is a blend of two

originally distinct non-Israelite divinities. Finally, a divinity named El Berit had a temple at Shechem (modern-day Nablus). The name might be translated as “god of the covenant” or “El of the covenant.”

BIBLICAL VIEW OF THE ORIGINS OF THE WORSHIP OF YHVH. The original meaning of the name *YHVH* is unknown to modern scholars. Only one biblical writer, the author of *Exodus* 3:14, attempted an explanation, by relating the name to the verb *hayah* (“be, exist”): “and YHVH said . . . say unto the children of Israel: ‘I am’ hath sent me unto you.”

The biblical writers differ among themselves as to when the worship of Yahveh originated. According to *Genesis* 4, Eve knew God by the name *Yahveh*, and her two sons, Cain and Abel, brought him sacrifices. Verse 26 of that same chapter tells us that in the days of Enosh (Hebrew for “person”), grandson of Adam, the name *Yahveh* began to be invoked. In other words, God was worshiped as soon as there was a human community. In contrast, the author of *Exodus* 6, commonly identified as the Priestly writer (or the P source) denies that Israel’s ancestors knew God by this name (*Ex.* 6:3). Instead, he asserts that Abraham, Isaac, and Jacob knew their God as El Shaddai and that the name *Yahveh* was only first revealed to Moses. Though most scholars regard the P source as one of the latest documents, there is something to be said here for its reliability. It is unlikely that the writer would have originated the claim that the ancestors did not know the proper name of the ancestral god. At the same time, the writer might have wished simply to glorify Moses.

Extrabiblical data have not resolved the question of the origin of Yahveh worship. Similarities in the cultures and languages of first-millennium Israel and third-millennium Ebla, as well as second-millennium Mari, have led some scholars to interpret elements of personal names in texts emanating from these areas as references to Yahveh. These interpretations have not won general acceptance. The same holds for the fragmentary mention of a god called Yv at late second-millennium Ugarit. Perhaps the most promising clue comes from a location named Yhv’ in the Negev or the Sinai desert mentioned in Egyptian sources from the thirteenth and fourteenth centuries BCE. These references lend some support to the Midianite or Kenite hypothesis that makes much of the biblical traditions that Yahveh revealed himself to Moses in Midianite territory (*Ex.* 3) and that the father-in-law of Moses was a Midianite priest (*Ex.* 2) who taught Moses how to administer divine law (*Ex.* 18).

THE HISTORICAL PROBLEM OF ISRAELITE MONOTHEISM. Scholars are in agreement that Judaism was a monotheistic religion by the end of the Babylonian exile (c. 539 BCE). Most also agree that Jewish monotheism was greatly encouraged by the preachings of the preexilic prophets. The Hebrew scriptures in their present form are colored by the belief that Yahveh was the sole legitimate object of Israelite worship from earliest times. In consequence, the biblical depiction of Yahveh worship presents the unusual situation of a people

who seem to have disregarded for centuries what is in retrospect said to have been their official religion. The German scholar Julius Wellhausen ([1885] 1957) argued that the official religion of Israel had been originally polytheistic and that Yahveh had been a national god to whom every Israelite owed allegiance. In this respect, Yahveh did not differ from the Moabite god Chemosh or the Assyrian Ashur. The Bible notes time and time again that Israelites worshiped other gods alongside Yahveh. According to Wellhausen, no one viewed this as problematic until the rise of classical prophecy in the eighth century BCE. Yahveh, proclaimed the prophets, would punish unethical behavior on Israel’s part by bringing foreigners against them. In order to make this threat credible, Yahveh had to grow in power at the expense of all other divinities.

Only with the fall of Judah (in 587/6 BCE), in Wellhausen’s analysis, did the contrite Jewish masses begin to accept that the prophets had been right. The dispersion of Yahveh’s people all over the world proved that Yahveh was a universal God and, finally, the sole God in existence. The exilic prophet “Second Isaiah” was the most articulate representative of this thoroughgoing monotheism. Under the influence of his and similar teachings, the bulk of the Pentateuch was composed, and the early prophetic and historical writings were reshaped. In other words, what the Hebrew scriptures present is largely retrojection of monotheistic beliefs of the exilic and postexilic periods onto true early Israelite religion.

In contrast to Wellhausen, other scholars, such as William F. Albright (1957) and, especially, Yehezkel Kaufmann (1970), argued that monotheism was Mosaic in origin and was Israel’s official religion. These scholars generally accept the Bible’s judgment that much of Israelite attention to other gods was sinful. Kaufmann, however, departs from this consensus. He argues that the prophets, in condemning Israelite idolatry, were in fact polemicizing against vestigial fetishism. The fact that their opposition was more often directed against “idolatry,” the worship of “wood and stone,” rather than against real gods was for Kaufmann highly significant. According to his theory, the monotheistic revolution fomented by Moses had so thoroughly eradicated polytheism from Israel that most Israelites no longer understood the myth, ritual, and magic practiced by their pagan neighbors. Aside from some government-sponsored or -tolerated exceptions, the Israelites were never guilty of more than leftover superstition. To the zealous prophets, however, these venial sins warranted Yahveh’s harshest punishments. The correctness of the prophetic position was demonstrated, at least to the prophets, by Israel’s political defeats.

Israelite monolatry. We have seen that the biblical writers (as well as modern scholars) disagree about the period in which the explicit worship of the one God began. There is no disagreement, however, that the Bible requires that the people Israel serve God exclusively. Various early formulations of God’s demand for exclusive worship connect it with

the exodus from Egypt, an event that, if exaggerated in magnitude, clearly has some historical basis (*Ex.* 20:2–3, *Hos.* 13:4, *Ps.* 81:10–11). According to the Pentateuch, a covenant (*berit*) between God and Israel was concluded through the mediation of Moses at the mountain variously called “Sinai,” “Horeb,” and “the mountain of God.” This covenant bound Israel to Yahveh’s exclusive service and carried with it the obligations that were understood as the Law. (*Ex.* 19–24, 34; *Dt.* 5). An additional covenant to the same effect was made in the plains of Moab (*Dt.* 29–30). *Joshua* 24 describes how Joshua caused his people to conclude a covenant for God’s exclusive worship at Shechem (without reference to any Mosaic precedent). None of these covenant traditions insists that Yahveh is the sole god in existence, yet each maintains that Israel is bound to serve him alone.

Some of the early prophets, such as Amos and Isaiah, do not employ the covenant theme explicitly, but they likewise insist on Yahveh’s demand to be worshiped by Israel to the exclusion of all other gods. That demand is best described as *monolatry*, a form of worship in which only one god is served but the existence of others is not denied. Monolatrous worship is, in theory, compatible with polytheism.

Monolatry was not unknown in the ancient Near East. In the fourteenth century BCE, Akhenaten, King of Egypt, had inaugurated a solar monolatry in which the royal family worshiped the Aton, the sun disk, to the exclusion of Egypt’s traditional gods. Mesopotamian mythology describes the temporary worship of a single god in an emergency. In addition, ancient Near Eastern prayer literature regularly employed monolatrous language. A worshiper would approach various gods in turn with the declaration that each one was the only proper object of worship. Sometimes the suppliant went as far as saying that the other gods were no more than attributes or bodily limbs of the god addressed. Undoubtedly at the moment of utterance, these pious statements were meant sincerely, although their intent was not to invalidate the worship of other gods.

Yet the fact that monolatry was found outside of Israel does not explain why it was deemed so important in Israel. The books of the Bible agree that Israel’s tenure in its own land depended on the exclusive worship of Yahveh. In spite of Yahveh’s reminders tendered by his servants the prophets, the people insisted on worshipping other gods (*2 Kgs.* 17:7–23, *Jer.* 25:3–11), with whom they were supposed to have no relation (*Ex.* 23:32; *Jer.* 7:9). The fall of Samaria in 720 BCE and the fall of Judah in 587/6 BCE were caused, according to the biblical writers, by failure to adhere to the covenant with Yahveh.

The covenant, it must be understood, was integral to the very identity of the Israelites as a political entity. It was the god Yahveh who was credited with bringing out from Egypt those descendants of Egyptian slaves and native dissidents who were to constitute the people Israel. Through Yahveh, this new group was to acquire its own land, independent of the Egypto-Canaanite political system. This granting of land

by Yahveh to his people was also described by the metaphor of *berit*, or “covenant,” and was modeled after the international treaty formulas of the second millennium BCE. In Israelite theory, all the land belonged to Yahveh, who assigned it to his people in terms similar to those found in Hittite suzerainty treaties, in which the “great king” demanded sole allegiance from his clients. In its religious adaptation, the covenant notion meant that Israel was to serve Yahveh alone. The Hittite kings demanded exclusive allegiance because they knew that their clients might turn to other kings. Yahveh’s representatives, who acknowledged the existence of other gods with whom one might be tempted to make a similar covenant (*Ex.* 23:32), demanded analogous exclusive allegiance. In addition, the covenant with Yahveh served as the theological expression of the mundane political union between the Canaanite natives and the outsiders who together made up Israel, a process described in *Joshua* 24. It may be noted that the setting of this chapter is Shechem, the scene of successful and unsuccessful coalitions with Canaanites (see *Gn.* 34 and *Jgs.* 8–9).

God in covenant and history. Because it had emerged in historical circumstances, the covenant metaphor imparted to the Israelite cult a far greater concern with “history” than was found in the other cults of the ancient Near East. The “triumphs of Yahveh” (*Jgs.* 5:11), as they are called in the ancient Song of Deborah, were more focused on human life than were Baal’s victories over death and aridity. It is not that the gods of the other nations were not concerned with history nor that Yahveh was not concerned with nature. Rather, the degree of emphasis was markedly different in Israel in that Israelite writers were more likely to produce tales of Yahveh’s political triumphs than to produce tales of his cosmic ones.

The relative space given in the Bible to God’s “mythical” and “historical” deeds is very instructive. Several poetic passages refer to divine combat with a sea monster in which Yahveh vanquishes his foes in the manner of the Babylonian Marduk, the Canaanite Baal, and the Hittite Iluyankas (*Is.* 27:1, 30:7, 51:9–10; *Hb.* 3:8; *Ps.* 74:13–14, 89:10–11, 93:1–4; *Jb.* 26:10–14). The first eleven chapters of *Genesis* contain accounts of God’s creation of the world by fiat in the manner of the Egyptian Ptah, the expulsion of Adam and Eve from Eden, the descent of the ancient heroes from the fallen divinities, and the great flood. Most of the biblical text, however, concentrates on God’s relation to humanity and, especially, to Israel. The Bible is unique among the preserved literature of the ancient Near East in the extent to which a god is involved in human institutions. Thus although there are references to ritual instructions in Egyptian divine books and Mesopotamian accounts of the divine revelation of exorcisms and incantations, these are the exception. The well-known Code of Hammurabi of Babylon (1792–1750 BCE) contains numerous parallels to biblical law, but it is the king, and not the god of justice, who claims credit for its composition.

The Bible claims divine jurisdiction over all areas of life in a more thorough and consistent manner than do all other extant ancient Near Eastern sources. Although Babylonian legal collections such as Hammurabi's Code or the Laws of Eshnunna, for example, show close parallels to laws in the Pentateuch, the context is different. Thus, Hammurabi claims that the gods had called on him to establish justice and so he, the king, enacted the laws. In contrast, in the Hebrew Bible the claim is made that all laws governing all Israelite institutions and all personal relations were divinely revealed to Moses at Yahveh's sacred mountain. Every human action, even when wickedly intended, such as the sale of Joseph by his brothers, is part of the divine plan (*Gn.* 45:5, 50:19–20). Unlike the Akkadian speaker who could describe actions performed *lā libbi ilāni* ("without divine consent"), the Hebrew could refer only to divine disapproval.

The exclusive worship of Yahveh was the religious expression of the political and social factors that had brought Israel into existence. The demand to serve Yahveh alone came to the fore in the settlement of the land, in the formation of the monarchy under Saul (eleventh century BCE), in the purge of the house of Omri under Jehu (r. 842–815 BCE), in the anti-Assyrianism of Hezekiah (r. 715–686 BCE), and in the expansionism of Josiah (r. 640–609 BCE). It reached its logical conclusion, monotheism, in the exilic preachments of "Second Isaiah" and in the reconstitution of the postexilic community of the fifth century BCE.

The persistence of polytheism. At the same time, a number of factors undermined Yahvistic monolatry from the beginning. First, the people who made up Israel were themselves of diverse origin and could not easily forsake their ancestral gods (see *Jos.* 24). Second, monolatry does not deny the existence of the many divinities. As normality set in, the old gods whose existence had never been denied reasserted themselves; the international interests of the monarchy and of commerce also encouraged tolerance of other gods.

It should also be recalled that polytheism made sense in the ancient world. It was not until long after the Babylonian exile that such concepts as "nature" and "universe," which Greek thinkers formulated, began to make an impact in the Middle East. Israelite worship of gods and goddesses reflects the difficulty that the average person must have had in assuming an underlying unity in what appears to be a collection of diverse forces often opposed one to another.

Many Israelites must have resisted monotheism because of its difficulty in accounting for unwarranted suffering. To be sure, the problem of theodicy had been raised by Mesopotamian thinkers long before the rise of Israel, but because polytheists could always blame divine injustice on rivalry among the gods, the problem never became so pointed as in the late biblical writings *Job* and *Ecclesiastes*. These postexilic works were written by authors who took for granted that Yahveh was the sole god in existence. If that sole God was all-powerful and just at the same time, how could injustice persist? The author of *Job* answered that God was not om-

nipotent. The writer of *Ecclesiastes* answered that injustice was built into the system that God had set in motion.

THEOCRACY. The blending of gods and their characteristics is the salvation of monolatry and surely of monotheism. As increasing numbers of Israelites began to become consistent monolaters and monotheists, a process that took centuries, the figure of Yahveh began to absorb many of the functions and attributes of the older gods. We have seen that Yahveh assumed El's name in addition to that god's reputation for beneficence and wisdom. Yahveh likewise acquired Baal's thunderous voice (*1 Sm.* 2:10), his fructifying abilities (*Hos.* 2:10), and his title of "cloud rider" (*Ps.* 68:5).

The biblical writers did not, however, tolerate Yahveh's absorption of the attributes of Near Eastern goddesses. Instead, they condemned the widespread royal and popular worship of female deities. The mother of the pious king Asa (c. 913–873 BCE) had constructed an image of Asherah, and another representation of this same Canaanite "creator of the gods" stood in Yahveh's Jerusalem Temple until Josiah's time (*2 Kgs.* 21:7). In ancient Israel, Astarte remained popular in her classical form as well as in her Aramean-Mesopotamian incarnation as "queen of heaven" (*Jer.* 7:18, 44:17ff.). The biblical depiction of the popularity of female divinities is corroborated by external evidence. Recent archaeological discoveries at Kuntillet 'Ajrud and Khirbet al-Qum have brought to light Hebrew inscriptions referring to "Yahveh of Teman and his Asherah." It is possible that *asherah* in these inscriptions had become a common noun meaning "consort." Finally, the Jews at Elephantine in the fifth century BCE knew a divinity called Anatyahu, an apparent androgynous blend of Yahveh with the ancient Canaanite goddess Anat.

Despite the popularity of female divinity, or perhaps because of it, biblical monolatry excluded the female presence. With rare exceptions (*Isa.* 42:14; 66:13), the biblical writers personify Yahveh with masculine traits, a reflection of the power structure in Israelite society. The northern kingdom of Israel never had a reigning queen. Athaliah, the only reigning queen of the southern kingdom of Judah (842–837 BCE), had come to power under highly irregular circumstances (*2 Kgs.* 11:1–3). There were some women prophets, among them Miriam, Deborah, Huldah and the anonymous wife of Isaiah (*Isa.* 8:3), but no female priests.

THE RISE OF MONOTHEISM. The present state of the evidence suggests that monolatry arose early in Israel but that monotheism was a late development. Throughout the early first millennium BCE, only a minority of Israelites were consistent in their exclusive worship of Yahveh. To this tenacious minority we are indebted for the henotheistic concept of Yahveh that informs the earlier biblical books. The narratives of *Joshua* 24 and *Genesis* 35 reflect what must have been the majority view: to engage in the cult of Yahveh while images of other gods were present was defiling. Jeremiah assailed his contemporaries for committing crimes and then proceeding to Yahveh's temple and declaring that "we have

been saved" (*Jer.* 7:9–10). Baal worship is among the enumerated crimes. Presumably the priesthood required of all entrants to the sanctuary the declaration that they served Yahveh alone, which at the moment they did, fulfilling the Decalogue's demand that "you shall have no other gods in my presence" (*Ex.* 20:3). The Temple priesthood was generally consistently monolatrous, although royal toleration and active support of other cults would have applied pressure on Yahveh priests to be flexible at times (*2 Kgs.* 1–8).

Some biblical writers took the existence of other gods for granted, though all agreed that Yahveh was superior to the other gods (*Gn.* 1:26, 3:22, 6:2; *Ex.* 12:12, 15:11; *Ps.* 82:1–8). Other writers, such as the prophets Amos, Isaiah, and Jeremiah, spoke of Yahveh as the only proper object of Israelite worship, as the only divinity in control of earthly and heavenly events. Among the prophets, Second Isaiah was the most consistent monotheist, insisting that Yahveh was the sole god in existence (*Is.* 43:10–12, 44:6–8, 45:5–7, 45:18–22, 46:9). In general, the biblical monolaters believed the worship of Yahveh alone to be both an Israelite obligation and privilege. Others might worship their own gods (*Dt.* 4:19; *Mi.* 4:5–6). The monotheists required all peoples to forsake their ancestral gods and to worship Yahveh alone (*2 Kgs.* 5:17–18; *Is.* 44:6–20, 45:22; *Jer.* 10:12–16; *Zep.* 3:9; *Zec.* 14:9).

BIBLICAL IMAGERY OF GOD. Although many verbal images of Yahveh are found in the texts, the Bible in God's name prohibits the physical depiction of all divine images (*Ex.* 20:4, 34:17; *Dt.* 4:15–17, 5:8), even for use in the cult. Clearly, this prohibition was not universally observed (*Jgs.* 17:35). Some verbal divine imagery echoed Israel's roots in the Canaanite past. Yahveh was spoken of as a bull (*Gn.* 49:24; *Is.* 1:24; *Ps.* 132:2, 132:5), a further legacy from the Canaanite El, and was represented sculpturally as a bull or calf (*Ex.* 32:4–5, *1 Kgs.* 12:28, *Hos.* 8:6, *Ps.* 106:20).

According to one theory, no one could see Yahveh and remain alive (*Ex.* 32:23), but there were exceptions (*Ex.* 24:10–11; *Nm.* 12:8; *Is.* 6:1, 6:5). God is often described as humanlike (*Gn.* 1:27, 18:2) and with a face (*Ex.* 33:20), a back (*Ex.* 33:23), arms (*Dt.* 32:40), and legs (*Na.* 1:3, *Zec.* 14:4; in *Exodus* 4:25, *legs* is a euphemism for Yahveh's genitals). As a warrior (*Ex.* 15:3, *Ps.* 24:8), God carries a bow (*Gn.* 9:13), arrows (*1 Sm.* 22:15), and a sword (*Dt.* 32:42). Second Isaiah says that Yahveh is indescribable (*Is.* 40:18, 40:25, 46:5) but dresses him in armor and a helmet (*Is.* 59:17). According to *Daniel* 7:9, God is old and has white hair. Other depictions refer to fire and smoke emanating from Yahveh's mouth and nose (*1 Sm.* 22:15) and to his thunderous voice (*Ex.* 20:18–19, *Ps.* 29:3–9, *Jb.* 40:9), images borrowed from the figure of Baal, the thunder god.

God's kingship. In many passages of the Hebrew scriptures, God is spoken of as king. We may distinguish two basic usages, Yahveh as king of the gods and Yahveh as king of Israel. The first meaning is rare but is attested in the verse "For YHVH is a great god, a great king over all the gods"

(*Ps.* 95:3). More common is the notion of Yahveh's kingship over Israel (*Jgs.* 8:23; *1 Sm.* 8:7; *Is.* 41:21, 45:6) and over the world (*Ps.* 47:3, 93:1, 97:1). The gods of Assyria and Mesopotamia such as Marduk and Ashur were regularly spoken of as kings in relation to their own peoples and to the rest of the world. Like these gods, Yahveh as king was the divine enforcer of justice and equity, guardian of the rights of the defenseless widow and orphan. Like them as well, he controlled the nations of the world and regulated their movements for the benefit of the people to whom he was closest.

God's presence. Though God was generally not visible, he might manifest himself publicly in the *kavod*, a word usually translated "glory" but best rendered "person," or "self." The *kavod* of Yahveh showed Israel that Yahveh was present among them. Often this presence could be invited by cultic procedures (*Lv.* 9:6, 9:23). Frequently the *kavod* of Yahveh is associated with the wilderness tabernacle (*Ex.* 16:7, 16:10, 29:43, 40:34–35) and with the Jerusalem Temple (*1 Kgs.* 8:11; *Ez.* 43:2). Among Yahveh's cultic titles were *melekh ha-kavod* ("the king himself"; *Ps.* 24:7, 24:10) and *el ha-kavod* ("the god himself"; *Ps.* 29:3). Like its Akkadian counterpart *melammu* ("sheen"), the *kavod* of Yahveh is of intense luminosity (*Is.* 60:1–2, *Ez.* 43:2) and is often shielded by a cloud (*Ex.* 24:16, 40:34; *Ez.* 1:27–28). The *kavod* is sometimes spoken of as filling the entire earth (*Nm.* 14:21, *Is.* 6:3, *Ps.* 72:19).

God's transcendence. Yahveh is often described as *qadosh*. Similar terms are used to describe divinities a term Ugaritic, Aramaic Phoenician. Although scholars often ascribe to *qadosh* a basic meaning "set apart," it is best understood as a primary emotive category "holy," in the manner of its antonyms "profane," and "impure God is not bound by time, space, or form, nor by moral or ethical categories" (*2 Sm.* 6:5–8). Yet because God serves as the guarantor of justice (*Jer.* 11:20), his divine justice could be questioned (*Gn.* 18:25, *Jer.* 12:1, and most of *Jb.*) and even denied (*Eccl.* 8:15).

Yahveh is frequently referred to as a jealous god (*Ex.* 20:5, 35:14; *Dt.* 4:24, 5:9, 6:15; *Jos.* 24:19; *Na.* 1:2). In these instances, the term employed is a derivative of the verb root *qn'*. In a Babylonian text, the goddess Sarpanitum is described by the identical term. What is unique to the description of Yahveh is the action that activates Yahveh's jealousy (*qinn'ab*) most often—the worship of other gods. Sometimes Yahveh's jealousy results in unbridled punishment (*Dt.* 4:24, 6:15). At other times, it results in strict retributive justice and would better be translated as "zeal" (*Na.* 1:2–3). At still other times, "passion" or "ardor" would be better choices (*Is.* 9:6; *Zec.* 1:14, 8:2).

God's emotions. At the same time, God is also spoken of as being slow to anger (*Ex.* 34:6, *Nm.* 14:18, *Jl.* 2:13, *Na.* 1:3), forgiving of sin (*Jon.* 4:1), and the receiver of the penitent (*Hos.* 14:2; *Jer.* 3:12, 35:3; *Jl.* 2:12; *Zec.* 1:3; *Mal.* 3:7). The different views of Yahveh reflect not only the temperaments of the individual writers but the vicissitudes of Israel's

history as well. Because Yahveh was so embedded in Israel's political and social life and institutions, the changes in Israel's fortune provoked different aspects of the divine character. Paradoxically, Yahveh is at once the most transcendent god of the ancient Near East and the most human. This is expressed most sharply in the prophetic writings of Hosea and Jeremiah. God's love for Israel is like that of a husband for a wife (*Hos.* 3:11). Unlike God's love, which is constant, Israel's is fickle (*Hos.* 3:1, *Jer.* 2:25). Yet both Hosea and Jeremiah emphasize that God's love will be great enough to overcome Israel's inconstancy and that God's relation to his people is eternal (*Hos.* 2:21, *Jer.* 32:40).

S. DAVID SPERLING (1987 AND 2005)

GOD: GOD IN THE NEW TESTAMENT

The New Testament enunciates no new God and no new doctrine of God. It proclaims that the God and Father of Jesus Christ is the God of Abraham, Isaac, and Jacob, the God of earlier covenants. What the New Testament announces is that this God has acted anew in inaugurating God's final reign and covenant through the career and fate of Jesus of Nazareth.

THE PRE-EASTER JESUS. Jesus inherited the Old Testament Jewish faith in Yahveh, which held that God was the creator of the world (*Mk.* 10:6 and parallel) and the one God who elected Israel as his people and gave them his law (*Mk.* 12:29 and parallels). Moreover, God promised the Israelites final salvation (*Is.* 35, 61). At the same time, the sense in the New Testament that God is now realizing ancient promises and is acting anew (cf. *Mt.* 11:4–5, an indubitably authentic saying of Jesus) gives Jesus' image of God a sense of immediacy.

God was not merely creator some thousands (or billions) of years ago; he is creator now, feeding the birds and clothing the flowers (*Mt.* 6:26–30, *Lk.* 12:24 and Q, the purported common source of *Matthew* and *Luke*). Not only did God give the law through Moses, but God now demands radical obedience in each concrete situation (cf. the antitheses of the sermon on the mount in *Mt.* 5:27–48). Above all, God is now offering in the proclamation and activity of Jesus a foretaste of final salvation. Jesus' announcement of the inbreaking of God's reign (*Mk.* 1:15, *Mt.* 10:7, *Lk.* 9:2, Q) is not an abstract concept detached from Jesus' own word and work. Jesus' word and work are the occasions through which God acts definitively and savingly. The same is true of Jesus' exorcisms: "If I by the Spirit [finger, *Lk.* 11:20] of God cast out demons, then the kingdom [i. e., reign] of God has come upon you" (*Mt.* 12:28, *Lk.* 11:20 Q).

Jesus issues a call, "Follow me" (*Mk.* 1:17, 2:14; cf. *Mt.* 8:22, *Lk.* 9:59, Q), not because he advances any claim for himself as such, but only because in that call, as in his word and work in the world, God is issuing the call to end-time salvation. To confess Jesus (*Mt.* 10:32, *Lk.* 12:8, Q, *Mk.* 8:38) or to deny him before others is to determine one's ultimate fate on the last day—whether it be judgment or salvation. The verdict of the "Son of man" on that day will be determined by whether men and women confess Jesus now. Thus, in Jesus' call God is proleptically active as judge and savior. The Fourth Gospel puts it more thematically: God's salvation and judgment are already meted out here and now in the word of Jesus and people's response to it (*Jn.* 3:18, 5:22–27).

Jesus' conduct. Jesus eats with outcasts, and he defends his conduct by telling the parables of the lost (*Lk.* 15). These parables interpret Jesus' action as God's action in seeking and saving the lost and celebrating with them here and now the joy of the reign of God. Ernst Fuchs points out in *Studies of the Historical Jesus* (Naperville, Ill., 1964) that "Jesus . . . dares to affirm the will of God as though he himself stood in God's place" (p. 21).

God as Abba. Jesus' word and work are God's word and work because Jesus has responded to God's call in complete faith and obedience. This is brought out in the baptism, temptation, transfiguration, and Gethsemane narratives of the synoptists (*Mk.* 1:9–11 and parallels, *Mt.* 4:1–11, *Lk.* 4:1–13, Q, *Mk.* 9:2–8 and parallels, *Mk.* 14:32–42 and parallels), and once again it is thematically treated in the discourses of the Fourth Gospel (e.g., *Jn.* 8:28–29). This relation of call and obedience is summarized in Jesus' intimate address to God as Abba ("father"). This is no new doctrine, for the Old Testament and Judaism knew God as Father (e.g., *Is.* 63:16), nor does it imply a claim to metaphysical identity with the being of God or with an aspect of that being, as in later New Testament traditions. Again, Jesus does not pass the Abba appellation on to others as a way of defining God. Rather, he invites those who have responded in faith to his message of God's salvation to call God "Abba"

with him. "Abba" is a familial mode of address that presupposes a new relationship with God. Because Jesus first made the response and enables others to make the same response, they too may call God "Abba" (cf. the Lukan version of the Lord's Prayer, *Lk.* 11:2).

Jesus' death. The saving activity in word and deed that fills the whole career of Jesus culminates in his journey to Jerusalem in order to make the last offer of salvation or judgment to his people at the very center of their national life. As a prophet, Jesus is convinced that he will be rejected and put to death and that this death will be the culmination of Israel's constant rejection of God's word as known through the prophets: "It cannot be that a prophet should perish away from Jerusalem" (*Lk.* 13:33; cf. the parable of the vineyard, *Mk.* 12:1–9 and parallels). Since it is the culmination of his obedience, his death, like all his other activity, is seen by Jesus as the saving act of God. The most primitive form of the suffering-Son-of-man sayings, namely, "The Son of man will be delivered into the hands of men" (cf. *Mk.* 9:31), if authentic, expresses this by using the divine passive: God will deliver the Son of man to death. It is God's prerogative to inaugurate covenants. Therefore, at the last supper, Jesus speaks of his impending death as a supreme act of service (*Lk.* 22:27; cf. the foot washing in *Jn.* 13:2–15), which inaugurates the final covenant and reign of God (*Lk.* 22:29; cf. *Mk.* 14:24, 25 and parallels). In the references to service, covenant, and kingdom (reign) at the last supper lies the historical basis for the post-Easter message of atonement.

Easter. The Easter experiences created in the disciples the faith that, despite the apparent debacle of the crucifixion, God had vindicated Jesus and taken him into his own eternal presence. The early community expressed this conviction chiefly through testimony about Jesus' resurrection: "God raised Jesus from the dead" (*Rom.* 4:24, 10:9; *1 Thes.* 1:10) or "Christ was raised" (*Rom.* 4:25, 6:9; *1 Cor.* 15:4—a divine passive). After Easter, for the believing community, God is preeminently the God who raised Jesus from the dead. Insofar as there is any specific New Testament definition of God, this is it (e.g., again, *Rom.* 10:9). This results in the ascription of titles of majesty to Jesus. At the resurrection, God made him Lord and Christ (Messiah) (*Acts* 2:36) and even Son of God, originally a royal title (*Rom.* 1:4). Jesus is exalted to a position as close as possible to God, to God's "right hand." That means God continues to act savingly, even after Easter, toward the community and toward the world through the proclamation of Jesus as the Christ. In saving activity, God and Christ become interchangeable subjects: what God does, Christ does at the same time. However, Christ does not replace God. All the titles of majesty declare that Christ is God's agent, not God's surrogate.

THE MESSAGE OF THE POST-EASTER CHURCH. Like Jesus in his pre-Easter life, the early church did not approach Israel with a new doctrine of God. Its message was that God had decisively inaugurated the fulfillment of his promises in the career and fate of Jesus of Nazareth, and above all in his res-

urrection. This is the burden of the sermons in the early chapters of the *Acts of the Apostles*: “Jesus of Nazareth, a man attested to you by God with mighty works and signs which God did through him . . . this Jesus, delivered up according to the definite plan and foreknowledge of God . . . God raised him” (*Acts* 2:22–24).

The Hellenistic-Jewish mission. Members of the Greek-speaking Jewish community, initially led by Stephen (*Acts* 6, 7), first found themselves preaching the Christian message to Greek-speaking non-Jews (*Acts* 11:20). In approaching them, it was found necessary to change tactics. Instead of launching straight in with the Christ event as God’s act of salvation, they had to start further back, with belief in God. Because these non-Jewish Greeks came from a pagan and often polytheistic environment, it was necessary first to establish belief in the one God before speaking about what this God had done in Christ and was now doing salvifically. In other words, the Hellenistic-Jewish Christians needed an apologetic for monotheism, arguments for the existence of the one God, in their mission to non-Jews. They were able to draw upon the apologetic that had earlier been worked out by Greek-speaking Jews in their approach to the pagan world. One of the earliest references to such an apologetic for monotheism is attested to by Paul when he reminds the Thessalonians of his original preaching to them before their conversion to Christianity: “You turned from idols to serve a living and true God” (*1 Thes.* 1:9). Note how this precedes the second part of the message: “and to wait for this Son from heaven, whom he raised from the dead” (*1 Thes.* 1:10). A further example of Pauline apologetic for monotheism, and a claim that creation contains a natural revelation of God and his moral demands, occurs in *Romans* 1:18–32 and 2:14–15. Humanity has, however, frequently rejected this revelation and disobeyed God’s moral demands, and Paul seeks to recall pagans to such knowledge and obedience. He sees a close connection between idolatry and immorality: “They . . . exchanged the glory of the immortal God for images resembling mortal man or birds or animals or reptiles. . . . Therefore God gave them up in the lust of their hearts to impurity” (*Rom.* 1:23–24). Later examples of an apologetic for monotheism are to be found in *Acts* 14:15–17, addressed to an unsophisticated audience, and in *Acts* 17:24–29, addressed to a cultured one.

Pauline theology. Paul’s theology is entirely occasional, that is, it was worked out in response to concrete problems in the Christian communities he knew. The focus of his theology is the death and resurrection of Jesus Christ and its saving consequences. He inherited from the liturgical tradition an understanding of Christ’s death as a sacrifice. It was the blood that inaugurated the new covenant (*1 Cor.* 11:25). Christ was the paschal lamb (*1 Cor.* 5:7). But Paul did not develop these sacrificial images in his reflection on Christ’s death, perhaps because such language tended to drive a wedge between Jesus and the Father, as though the sacrifice was offered in order to propitiate or appease an angry deity.

The language of the (probably pre-Pauline) hymn in *Romans* 3:25–26, especially the word translated in the King James Version as “propitiation” (Gr., *hilastērion*), might be taken in that way. But God is the initiator in the atoning death of Christ (“whom God set forth”), and the word is better translated “expiation,” as in the Revised Standard Version. This means that the crucifixion was an act of God dealing with and removing sin, the barrier between God and humanity, rather than an act of Christ directed toward God. It is an act of God’s reconciling love, directed toward sinful humanity (*Rom.* 5:8). Through it God justifies the ungodly (*Rom.* 4:5). *Reconciliation*, like *expiation*, is a word denoting God’s activity toward us, rather than Christ’s activity toward God. Christ does not reconcile the Father to humanity, as traditional theology has often asserted (see, e.g., article 2 of the 1563 Thirty-nine Articles), rather, “God in Christ was [or, was in Christ] reconciling the world to himself” (*2 Cor.* 5:19). Justification and reconciliation (two slightly different images for the same reality) are expressions of the righteousness of God, a central concept in Paul’s thinking about God. Righteousness is both an attribute and an activity of God; it is God’s action of judging and saving.

A writing on the fringe of the Pauline corpus, not by Paul himself, is the *Letter to the Hebrews*, which interprets the saving act of God in Christ in terms of Christ as the high priest. Once again, this author is careful not to drive a wedge between God and Christ. As high priest, Christ does not offer a sacrifice to God for the purpose of propitiation. Rather, the Son offers his life in perfect obedience to the Father (*Heb.* 10:5–10) in order to make purification for sin. As in Paul, the object of Christ’s deed is not God, but sin.

THE INCARNATION AND THE BEING OF CHRIST. All levels of tradition in the New Testament examined thus far speak of Christ’s relation to God in functional terms. He is commissioned, called, and sent as divine agent. God is present with and in him and active through him. These biblical traditions do not raise the question about Jesus’ personal identity in relation to God. There is no discussion of Jesus’ “divinity” or of his “divine nature” in the earliest sources; these are Greek rather than Hebrew concepts. But given the exalted status of Jesus, which the Christian community believed him to have received at Easter, it was inevitable that the question of Jesus’ identity would eventually be raised, especially in the Greek-speaking world. Such reflection initially employed the concept of the divine wisdom to elucidate the revelatory work of Jesus. Historically, Jesus had appeared as a spokesman for the divine wisdom, using the speech forms of the wisdom tradition as these are seen, for example, in *Proverbs*. The content of Jesus’ wisdom utterances contained an implicit claim that he was wisdom’s last and definitive spokesman; this view is drawn out explicitly in the Q material (*Mt.* 11:25–27, *Lk* 10:21–22, Q). Matthew himself even identifies Jesus with wisdom, although in a functional rather than ontological sense (*Mt.* 11:28–30; cf. *Sir.* 24:29, 51:23–26).

In first-century Judaism, however, the concept of God’s wisdom was advancing beyond the stage of poetical personi-

fictionation of an aspect of God's activity, toward a hypostatization (i.e., an attribution of distinct, concrete existence) of an aspect of the being of God. As such, the wisdom of God was an outflow of his being, through which he created the world, became self-revelatory to humanity, called Israel, gave the law, and came to dwell with Israel's notables, such as Abraham, Moses, and the prophets, but this wisdom was constantly rejected by most of the people. In certain hymns in the New Testament (*Phil.* 2:6–11, *1 Cor.* 8:6, *Col.* 1:15–20, *Heb.* 1:1–3) the career and fate of Jesus are linked to this earlier activity of wisdom (though the term *wisdom* itself is not used); a single, continuous subject covers the preincarnate activity of wisdom and the earthly career of Jesus. The result is that Jesus becomes personally identified with the hypostatized wisdom of God. The agent of creation, revelation, and saving activity finally becomes incarnate in Jesus. But this development occurs only in hymnic materials and at this stage is hardly the subject of theological reflection.

Johannine incarnation Christology. The final step toward an incarnation Christology is taken in the Johannine literature, especially in the Fourth Gospel. This gospel is prefaced by the Logos hymn (*Jn.* 1:1–18). *Logos* (“word”) was used as a synonym for the divine wisdom in the later wisdom literature. In this hymn *logos* is equated with, yet distinguishable from, the being of God: “In the beginning was the word [*logos*] and the word was with God and the word was God” (*Jn.* 1:1), which may be paraphrased as “God is essentially a self-communicating God. This self-communication was a distinct aspect within God's being, related to him, and partaking in his divine being.”

The hymn goes on to speak of the activity of the Logos as the agent of creation, revelation, and redemption and finally states that the Logos became flesh, that is, incarnate (*Jn.* 1:14). There could be no clearer statement of the identity of Jesus of Nazareth with an aspect of the very being of God. In the rest of this gospel, the evangelist sets forth the life of Jesus as the incarnation of the divine wisdom, or Logos. (After *John* 1:14 neither *wisdom* nor *logos* is used in the Fourth Gospel, but imagery from the wisdom/Logos tradition is appropriated, especially in the “I am” sayings.) Jesus speaks as one fully conscious of personal preincarnate existence within the being of God. It is significant, however, that this new “high” Christological language does not replace the “lower” Christology, which speaks in terms of call, commission, and the response of obedience. Apparently John understands his “higher” Christology to be an interpretation of the “lower,” refraining from abandoning the terms in which the pre-Easter Jesus spoke and acted. Much of later traditional church Christology has ignored the presence of these two levels in *John* and has rewritten the earthly life of Jesus exclusively in terms of the “higher” Christology.

Is Jesus God? Only very cautiously and gradually does the New Testament use the predicate *God* for Jesus. First, there are possible examples in some Pauline doxologies (e.g., *Rom.* 9:5), although there are problems of text, punctuation,

and grammar that make it difficult to decide whether in such passages Paul actually does equate Jesus with God. Then the *Letter to the Hebrews* transfers Old Testament passages that speak of Yahveh-Kurios (Lord) to Christos-Kurios (e.g., *Heb.* 1:10). Only the Johannine writings directly and unquestionably predicate the deity of Christ. First, he is the incarnation of the Logos that was God. Then, according to the now generally accepted reading, he is the “only-begotten God” during his incarnate life (*Jn.* 1:18). Finally, Thomas greets the risen Christ as “my Lord and my God” (*Jn.* 20:28). Then *1 John* sums it up by predicating God as the preexistent, incarnate, and exalted one in a summary formula: “in his Son Jesus Christ. This is the true God and eternal life” (*1 Jn.* 5:20). Thus the New Testament can occasionally speak of Jesus as God, but always in a carefully nuanced way: he is not God-as-God-is-in-himself, but the incarnation of that aspect of the being of God which is God-going-out-of-himself-in-self-communication.

The Trinity. There is a triadic structure in the Christian experience of God. Through the power of the Holy Spirit, believers know Jesus Christ as the revelation of God the Father. This experience becomes crystallized in triadic formulas (*2 Cor.* 13:13, *Mt.* 28:19) or in unreflected theological statements (*1 Cor.* 12:4–6). But there is no attempt to work out a doctrine of the Trinity, or to integrate the Old Testament Jewish faith in the oneness of God with the Christian threefold experience. Like the doctrine of the incarnation, this was left to the post-New Testament church.

- Lampe, G. W. H. *God as Spirit: The Bampton Lectures of 1976*. Oxford, 1977. The last work of this major British biblical scholar and theologian. Lampe finds the distinctively biblical view of God in the concept of God as Spirit. Jesus is for him the final human bearer of the Spirit but is not ontologically identical with an aspect of the divine being.
- Martin, Ralph P., and Peter Toon, eds. *Reconciliation: A Study of Paul's Theology*. Atlanta, 1981. Investigates the leading themes of Paul's doctrine of salvation with special concentration on the passages dealing with reconciliation. Martin stresses that atonement is something done by God in Christ for humanity, not by Christ to God.
- Wright, N. T. *Jesus and the Victory of God*. Minneapolis, 1996. A major thesis of this work is that Jesus' preaching of the kingdom of God (eschatology) was not an announcement of the end of history as such, but the inauguration of Israel's renewal, a return from exile, the end of history as Israel has known it. Some other scholars, such as E. P. Sanders and J. P. Meier, have advanced similar views.

REGINALD H. FULLER (1987 AND 2005)

GOD: GOD IN POSTBIBLICAL JUDAISM

Postbiblical Jewish thought concerning God can be divided into four distinct periods: the rabbinic or Talmudic (from the first century BCE to the sixth century CE), the philosophical or theological (represented chiefly by the medieval thinkers), the qabbalistic or mystical, and the modern (from the eighteenth century down to the present). While each of these periods has developed independently of the others, there is still a considerable overlapping of ideas from one period to another. Both the rabbinic and the philosophical approaches have had an influence on the mystical, and all three have served in modern attempts at reconstruction of Jewish theology. These four periods will be discussed in turn.

THE RABBINIC APPROACH. Rabbinic thought as contained in the Talmud and the Midrash is unsystematic in presentation. While there is an abundance of references in these sources to the nature of God and his relationship to man and the world, the statements are general responses to particular stimuli, not precise, theological formulations. It is consequently imprecise to speak of the rabbinic doctrine of God, even though the expression is used by some scholars. The Talmud and Midrash are the record of the teachings of many

hundreds of individuals, each with his own temperament and disposition, as these individuals reflected on God's dealings with the Jewish people. Even in their edited forms, the rabbinic sources constitute more an anthology of diverse views than an official consensus by an assembly of elected or inspired teachers. Nevertheless, on the basic ideas about God there is total agreement. All of the rabbis are committed to the propositions that God is One, creator of heaven and earth; that he wishes all men to pursue justice and righteousness; that he rewards those who obey his will and punishes those who disobey; and that he has chosen the Jewish people from all the nations to give them his most precious gift, the Torah. The debates, discussions, and contradictory statements in rabbinic literature are about the detailed meaning and application of these basic concepts. In this section of the article, then, material is taken from the whole, vast range of rabbinic/Talmudic literature, avoiding unwarranted generalizations. A serious attempt is made to distinguish between sober theological reflection and poetic fancy; between individual opinions and broader and more categorical views; between a kind of rabbinic consensus, even where the topic was never put to the vote, and fiercely debated arguments and sheer contradictions. It is only in the very flexible form that one can speak at all of the rabbinic approach.

From an early period, the tetragrammaton, *YHWH*, was never pronounced by Jews as it is written because it is God's own, special name, too holy to be uttered by human mouth. The name *Adonai* ("my lord") was substituted as a euphemism with regard to which a degree of familiarity was allowed. On the other hand, the rabbinic doctrine of the imitation of God suggests a close point of contact between God and man following the scriptural teaching that man is created in God's image. This doctrine is formulated as follows: "Just as he is merciful, be thou merciful. Just as he is compassionate, be thou compassionate. Just as he feeds the hungry, clothes the naked, and comforts the mourners, do thou these things" (*Sifrei Dt.* 11.22; B.T., *Shab.* 133b, *Sot.* 14a).

The two most frequently found names for God in the Talmud are *Ribbono shel 'olam* ("Lord of the universe"), used when addressing God in the second person, and *ha-Qadosh barukh hu'* ("the Holy One, blessed be he"), used when speaking of God in the third person (B.T., *Ber.* 4a, 7a, and very frequently). The implication of this change of person is that while God can be addressed directly in prayer, his true nature is beyond human comprehension. He is the wholly other, totally distinct from any of his creatures, and of him it is permitted to say only that he is the Holy One.

Nevertheless, there are numerous passages in the Talmud and the Midrash in which human terms are applied to God. The rabbis were as little bothered by the problem of anthropomorphism as the biblical authors, though the more human metaphors, when used of God by the rabbis, are generally qualified implicitly, sometimes explicitly, by the expression *ki-ve-yakhol*, "if it were really possible [to say such a thing]." Occasionally the anthropomorphisms are startling,

as when God is said to have requested Ishmael, the high priest, to bless him, or when it is said that God prays to himself, his prayer being “May it be my will that my quality of mercy prevail over my quality of judgment that I might behave with respect to my children beyond the letter of the law and pardon them” (B.T., *Ber.* 7a).

Other rabbinic names for God were intended to suggest either his distance from man or his nearness. The name *ha-Maqom* (“the place”), defined as “He is the place of the world but the world is not his place” (*Gn. Rab.* 68.9), suggests, if this is the original meaning of the term, God’s nearness. The name *Shamayim* (“heaven,” B.T., *Ber.* 31a, 33b, and frequently) suggests his remoteness. In the rabbinic expression “our father in heaven” (*Yoma* 8.9, *Sot.* 9.15), both ideas are combined. The name *Shekhinah* (*San.* 6.5, and frequently), a feminine form from the root meaning “to dwell,” denotes God’s indwelling presence.

It is incorrect, however, to think of these names as implying the transcendence and immanence of God. Abstract terms of this nature are entirely foreign to rabbinic thinking. The description of God as king is ubiquitous in the rabbinic literature with antecedents in the Bible. This metaphor is also founded on the rabbis’ experiences of earthly rulers. God is the divine king whose laws must be obeyed. When he is stern to punish evildoers, he is said to be seated on his throne of judgment. When he is gracious to pardon, he is said to be seated on his throne of mercy (B.T., *A.Z.* 3b). The rabbis urge man to stand in prayer as if he were in the awesome presence of a king (*Ber.* 5.1), first uttering the king’s praises and then offering him supplications (B.T., *Ber.* 31a). Yet there are numerous instances in which the rabbis declare that God is different from a human king. God obeys his own laws, unlike a human king, who is beyond the law (J.T., *R. ha-Sh.* 3a-b, 57a). God commands man not to steal, and he himself refuses to accept the sacrifice of an animal that has been stolen. To steal food and offer God thanks for the food is to be guilty of blasphemy (B.T., *B.Q.* 94a).

Especially after the dispersal of many Jews from the Holy Land and the destruction of the Temple in 70 CE, the idea, found only sporadically in the Bible, that God shares human suffering, grieving with the victims of oppression, was deepened by the rabbis. Whenever Israel is in exile, they taught, the *Shekhinah* is in exile with them (B.T., *Meg.* 29a). The idea that God is affected by human degradation is applied even to a criminal executed for his crimes. The *Shekhinah* is said to be distressed at such a person’s downfall (*San.* 6.5).

A severe problem for the rabbis was the apparent conflict between the favoritism shown to Israel by God and God’s concern for the whole of humankind. In one Talmudic passage, the ministering angels are made to ask God why he shows special favor to Israel, God replying that it is right for him to do so, since Israel is extraordinarily diligent in worshiping him (B.T., *Ber.* 20b). The ministering angels are a device used by the rabbis to express the problem of theodicy

that they themselves were compelled by their sense of integrity to face. When, in the rabbinic account, the second-century rabbi ‘Aqiva’ ben Yosef is tortured to death by the Romans for teaching the Torah, the ministering angels similarly protest: “Is this the reward for teaching the Torah?” (B.T., *Ber.* 61b). In the same vein, the second-century rabbi Yann’ai declared: “We are unable to understand why the righteous suffer and the wicked prosper” (*Avot* 4.15). Despite such awareness of the illusive nature of any solution to the problem of suffering, there are rabbinic suggestions that such suffering is the outcome of sin or the misdeeds of parents and ancestors. There is also to be found the idea of “sufferings of love,” of God visiting sufferings on a man in order to demonstrate that man’s faith and trust in him come what may.

Both idolatry and dualism were strongly condemned by the rabbis. The twice-daily reading of the *Shema* (“Hear O Israel, the Lord our God, the Lord is One,” *Dt.* 6:4), Israel’s declaration of faith in God’s unity, was introduced at least as early as the first century BCE, probably in order to constantly reject the dualistic ideas prevalent in the Near East. The third-century Palestinian teacher Abbahu, in a polemic evidently directed against both Christian beliefs and dualism, expounded the verse: “I am the first, and I am the last, and beside Me there is no God” (*Is.* 44:6). His interpretation is “‘I am the first,’ for I have no father; ‘and I am the last,’ for I have no son; ‘and beside me there is no God,’ for I have no brother” (*Ex. Rab.* 29.5).

In rabbinic Judaism there is little denial that the legitimate pleasures of the world are God’s gift to man, who must give thanks to God when they are enjoyed. In one passage it is even said that a man will have to give an account to God for his rejection of what he is allowed to enjoy (J.T., *Qid.* 4.12, 66d). Yet the emphasis is on spiritual bliss in the hereafter, when man, as a reward for his efforts in this life, will enjoy the nearness of God forever. Although the first-century teacher Eli’ezer sought to limit to Jews the blissful state of the world to come, his contemporary Yehoshu’a, whose view was later accepted, held that the righteous of all peoples have a share in the world to come (*Tosefta, San.* 13.2). That this bliss consists of the proximity of the righteous to God was given expression by the third-century Babylonian teacher Rav, who said: “In the world to come there is neither eating nor drinking, neither procreation nor business activity, neither hatred nor competition, but the righteous sit with their crowns on their heads and bask in the radiance of the *Shekhinah*” (B.T., *Ber.* 17a).

THE PHILOSOPHICAL APPROACH. The medieval Jewish theologians, influenced by Greek philosophy in its Arabic garb, had as one of their main aims the refinement of the concept of God. Unlike the Talmudic rabbis, the medieval thinkers presented their ideas on God in a systematic way. Pascal’s distinction between the God of Abraham, Isaac, and Jacob and the God of the philosophers generally holds true for the distinction between the rabbinic mode of thinking and that of the medieval theologians. For these theologians,

the doctrine that God is One means not only that there is no multiplicity of gods but that God is unique, utterly beyond all human comprehension, and totally different from his creatures, not only in degree but in kind. Moses Maimonides (Mosheh ben Maimon, 1135/8–1204), the most distinguished of the medieval thinkers and the most influential in subsequent Jewish thought, adapts for his purpose the rabbinic saying (B.T., *Ber.* 33b) that to over praise God is akin to praising a human king for possessing myriads of silver pieces when, in reality, he possesses myriads of gold pieces. Maimonides (*Guide of the Perplexed* 1.59) observes that, in the illustration, the king is not falsely praised for possessing thousands of gold pieces when in reality he has myriads. The distinction is between silver and gold. The very coinage of praise suitable for a human king is entirely inapplicable to God. Only the standard liturgical praises of God are permitted and these only because they are formal and so not a real attempt to describe the divine nature.

The medieval thinkers insisted that all of the anthropomorphic expressions used in the Bible about God must be understood in a nonliteral fashion. Maimonides codified thirteen principles of the Jewish faith, one of which is the belief that God is incorporeal. Anyone who believes that God can assume a corporeal form is a heretic to be read out of the community of believers, and he has no share in the world to come, according to Maimonides in his *Mishneh Torah* (*Repentance* 3.7). In his stricture to this passage in Maimonides, Avraham ben David of Posquières (d. 1198) vehemently refuses to read a believer in God's corporeality out of Judaism. Such a person cannot be dubbed a heretic simply because he is not a philosopher and takes biblical and rabbinic anthropomorphisms literally.

For the medieval thinkers God was both omniscient and omnipotent. A major problem for them was how to reconcile God's foreknowledge, seemingly implied in the doctrine of his omniscience, with human freedom to choose. If God knows beforehand how a man will choose, how can he be free to choose? Unwilling to compromise man's freedom of choice, essential to Judaism, both Avraham ibn Daud in his *Emunah ramah* (ed. S. Weil, Frankfurt, 1852, pp. 93–98) and Levi ben Gershom (Gersonides, 1288–1344) in his *Milhamot ha-Shem* (2.6) could see no solution to the problem and were led to qualify the doctrine of God's foreknowledge. God does know all the possible choices open to man, but he does not know beforehand the particular choice a man will make in a given situation. This qualification does not constitute a denial of God's omniscience. God knows all that can be known, whereas human choice, because it is free, is only possible, and the possible, the contingent, must be uncertain by definition. Such radical qualification failed utterly to convince other thinkers. Hasdai Crescas (1340–1410) felt obliged to conclude that since God does have complete foreknowledge this must, indeed, involve a denial that man is free to choose. For Crescas, man's freedom is an illusion (*Or ha-Shem* 2.4.5). Maimonides had earlier seized both horns

of the dilemma: man is free, and yet God has complete foreknowledge (*Mishneh Torah*, *Repentance* 5.5). This is not an admission of defeat by Maimonides. His view is that for the solution of the problem it would be necessary for humans to grasp the nature of God's knowledge, and, since God's knowledge is not something outside of him but is God himself, such a grasp on the part of humans is quite impossible. In God the Knower, the Knowledge and the Knowing are one.

In addition to their discussions regarding God's nature, the medieval thinkers examined God's activity in the finite world, that is, his role as creator and the scope of his providence. That God is the creator of the universe is accepted as axiomatic by all the medieval thinkers, although Gersonides (*Milhamot ha-Shem* 6) is radical here, too, in accepting the Platonic view of a hylic substance, coeternal with God, upon which God imposes form but does not create. Maimonides (*Guide of the Perplexed* 2.13–15), while at first toying with the Aristotelian idea of the material universe as having the same relation to God as the shadow of a tree to the tree, eventually accepts the traditional Jewish view that God created the world out of nothing. Maimonides' motivation is not only to preserve tradition but to emphasize the otherness of God, whose existence is necessary, whereas that of all created things is contingent. As Maimonides remarks in his *Mishneh Torah*:

The foundation of all foundations and the pillar of wisdom is to know that there is a First Being. He it is who brought all things into being, and all creatures in heaven and earth and in between only enjoy existence by virtue of his true Being. If it could be imagined that he does not exist, nothing else could have existed. But if it could be imagined that no other beings, apart from him, enjoyed existence, he alone would still exist and he could not cease because they have ceased. For all beings need him, but he, blessed be he, does not need them, any of them. Consequently, his true nature is different from the truth regarding the nature of any of them. (*Fundamental Principles of the Torah* 1.1–3)

Like the God of the biblical authors and the rabbis, the God of the medieval thinkers is a caring God whose providence extends over all of his creatures. Both Maimonides (*Guide of the Perplexed* 3.17–18) and Gersonides (*Milhamot ha-Shem* 4) limit, however, God's special providence to humans. For animals there is only a general providence that guarantees the continued existence of animal species, but whether, for instance, this spider catches that fly is not ordained by God but is by pure chance. Yehudah ha-Levi (Judah Halevy, c. 1075–1141) in his *Kuzari* (3.11) refuses to allow chance to play any role in creation: God's special providence extends to animals as well as to humans.

Sa'adyah Gaon (882–942) anticipated Thomas Aquinas's statement that "nothing that implies a contradiction falls under the scope of God's omnipotence" (*Summa theologiae* 1.25.4). Sa'adyah (*Book of Beliefs and Opinions* 2.13) observes that the soul will not praise God for being able

to cause five to be more than ten without adding anything to the former, nor for being able to bring back the day gone by to its original condition. Centuries after Sa'adyah, Yosef Albo (d. 1444) similarly distinguishes that which seems impossible but imaginable from that which is impossible because it cannot be imagined. The latter as a logical impossibility does not fall under the scope of the divine omnipotence (*Book of Principles* 1.22).

THE QABBALISTIC APPROACH. The pre-Qabbalistic tendency in Jewish mysticism is that of the "Riders of the Chariot" which extended over the first ten centuries CE. These adepts would perform certain spiritual exercises and delve deeply in the recesses of the psyche on the mysteries of the merkavah, the divine chariot seen by the prophet Ezekiel (chapter one). The journey of the "Riders" would take them into the Heavenly Halls where God sits on his throne surrounded by the angelic hosts. Some of the descriptions of the visions they saw have come down to modern readers. Often these are so bizarre, such as the account of the Divine Body (*Shiur Komah*), in impossibly immense measurements that they can hardly have been taken literally. In the account of the Four Who Entered Paradise (*Hagigah* 14b), one dies, one goes mad, one becomes an apostate, and only one, Rabbi Akiba, emerges in peace. On the basis of this merkavah tendency, the later Qabbalah became known as "The Work of the Merkavah."

The mystical movement or tendency in Jewish thought known as Qabbalah arose in twelfth-century Provence, reaching its culmination, in Spain, in the Zohar, the greatest classical work of Jewish mystical speculation. The qabbalists accepted the arguments of the philosophers in favor of extreme negation of divine attributes. Yet they felt the need, as mystics, to have a relationship with the God of living religion, not with a cold abstraction. In the theosophical scheme worked out by the qabbalists, a distinction is drawn between God as he is in himself and God in manifestation. God as he is in himself is Ein Sof ("no end," i.e., "the limitless"), the impersonal ground of being who emerges from concealment in order to become manifest in the universe. From Ein Sof there is an emanation of ten *sefirot* ("spheres"; sg., *sefirah*), the powers or potencies of the godhead in manifestation, conceived of as a dynamic organism. Of Ein Sof nothing whatsoever can be said. More extreme than the philosophers in this respect, the qabbalists refuse to allow even negative attributes to be used of Ein Sof, but God in his aspect of manifestation in the *sefirot* can be thought of in terms of positive attributes. The living God of the Bible and of religion is the godhead as manifested in the *sefirot*. Ein Sof, on the other hand, is only hinted at in the Bible since complete silence alone is permissible of this aspect of deity. A later qabbalist went further to hold that, strictly speaking, even to use such a negative term as Ein Sof is improper (see I. S. Ratner, *Le-or ha-Qabbalah*, Tel Aviv, 1961, p. 39, n. 40). When the Zohar does refer obliquely to Ein Sof, the expression used is "No thought can grasp thee at all" (*Tiqqunei Zohar*, second introduction).

The *sefirot* represent various aspects in the life of the godhead, for instance, wisdom, justice, and mercy. These are combined in a very complex order, and through them the worlds beneath, including the finite, material universe, are controlled, the whole order conceived as a great chain of being from the highest to the lowest reaching back to Ein Sof. There is a male principle in the realm of *sefirot* and a female principle, a highly charged mythological concept that opponents of Qabbalah, medieval and modern, considered to be a foreign, verging on the idolatrous, importation into Judaism (see *responsa* of Yitshaq ben Sheshet Perfet, *Rivash*, edited by I. H. Daiches, New York, 1964, no. 157, and S. Rubin, *Heidenthum und Kabbala*, Vienna, 1893). The male principle is represented by the *sefirah* called *Tiferet* ("beauty"), the female principle by the *sefirah* called *Malkhut* ("sovereignty"). The sacred marriage between these two means that there is complete harmony on high, and the divine grace can flow through all creation. But the flow of the divine grace depends upon the deeds of man, since he is marvelously fashioned in God's image. Thus, in the qabbalistic scheme, God has made his purposes depend for their fulfillment on human conduct; in this sense it is not only man who needs God but God who needs man.

The *sefirah* called *Malkhut*, the female element, is also known as the Shekhinah. A rabbinic term in origin (meaning the indwelling of God, from a root meaning "to dwell"), the *shekhinah* comes to denote for the qabbalists a person in the godhead. The rabbinic idea of the exile of the Shekhinah, originally meaning no more than that God is with Israel in its exile, means for the qabbalists that until the advent of the Messiah there is incomplete balance, the female element exiled from the male, and part of God exiled, as it were, from God. The task of restoration, of redeeming the Shekhinah from her exile, is man's task on earth. Again, the rabbinic name "the Holy One, blessed be he" is now a name for *Tiferet*, the male principle. The latter-day qabbalists introduced a mystical formula before the performance of every good deed and religious act in which the worshiper declares: "I do this for the sake of the unification of the Holy One, blessed be he, and his Shekhinah."

In qabbalistic literature produced in the school of Isaac Luria (1534–1572), the mythological elements become even more pronounced. In Lurianic Qabbalah, the process by means of which Ein Sof emerges from concealment is traced back beyond the emergence of the *sefirot*. The first act of Ein Sof (although the qabbalists stress that these divine processes take place beyond time) is one of *tsimtsum* ("withdrawal, contraction"). Ein Sof first "withdraws from himself into himself" in order to leave an "empty space" into which the *sefirot* can emerge in their separateness; the Infinite becomes self-limiting so as to become revealed as a multiplicity of powers. The whole process is conceived of in terms of a flow of the light of Ein Sof and then its recoil, as if the Infinite can only produce limitation and ultimately a finite world by God allowing himself gradually, one might say painfully, to

produce that which is outside of himself. In one version, current in some Lurianic circles but suppressed in others, the purpose of *tsimsum*, producing that which is not God, is for God to purge himself of the evil that is latent in his being (see I. Tishby, *Torat ha-ra' ve-ha-qelippah be-qabbalat ha-Ari*, Jerusalem, 1984). It is not surprising that such an astonishingly unconventional notion came to occupy a very peripheral role in the thinking of the qabbalists.

The eighteenth-century mystical movement of Hasidism, particularly the more speculative branch of the movement known as Habad, tended toward a panentheistic understanding of the idea of *tsimsum*. *Tsimsum* does not really take place, since the Infinite is incapable of suffering limitation, but *tsimsum* represents no more than a screening of the divine light so that finite creatures might appear to enjoy separate existence. The only true reality is God. There is a basic difference between this panentheistic ("all is in God") or acosmic view and that of pantheism ("all is God"). In the pantheistic thought of Barukh Spinoza (1632–1677), God is the name given to the totality of things. God is the universe and the universe is God. In Habad thought, without God there could be no universe, but without the universe God would still be the unchanging same; in fact, God is the unchanging same even after the creation of the universe, since from God's point of view there is no universe. The traditionalist rabbis and communal leaders, the *mitnaggedim* ("opponents"), saw the Hasidic view as rank heresy. For them the verse that states that the whole earth is filled with God's glory (*Is.* 6:3) means only that God's providence extends over all and that his glory can be discerned through its manifestation in the world. Speculative Hasidism understands the verse to mean that there is only God's glory as an ultimate.

In the classic work *Tanya' (Sha'ar ha-yihud ve-ha-emunah I)* by the founder of the Habad school, Shne'ur Zalman of Lyady (1745–1813), God is described as a sun and a shield. The sun's rays are essential to life, but the sun must be screened from view to some extent if creatures on earth are to endure its splendor. In the sun itself, however, the rays are lost in its great light. Similarly, finite creatures can only enjoy existence because the divine light is screened. They are like the rays of the sun separated from the sun itself. Yet, in reality, the analogy is very inexact, says Shne'ur Zalman, since the divine light pervades all. From God's point of view, finite creatures are like the rays of the sun in the sun itself. They enjoy no separate existence at all. The verse "Know this day, and lay it to thy heart, that the Lord, he is God in heaven above and upon the earth beneath, there is none else" (*Dt.* 4:39) is taken by Shne'ur Zalman to mean not only that there are other gods but that there is no ultimate reality apart from God himself. The unity of God, understood by medieval thinkers in the sense of his uniqueness, is here interpreted to mean that there is no real multiplicity of beings but only one true being.

MODERN APPROACHES. Modern Jewish thinkers have been obliged to face the challenges to traditional theism provided

by modern thought. From the Renaissance onward, the emphasis in the West has shifted from a God-centered to a human-centered universe. The inerrancy of the Bible was questioned. The idea of revelation as conveying infallible information about God appeared less convincing. Immanuel Kant and his followers questioned whether human reasoning is capable of proving the existence of God. The rise of modern science tended to favor mechanistic philosophies of existence and, in more recent years, both linguistic philosophy and existentialism, in their different ways, cast suspicion on all metaphysics. Although the Jew did not begin to participate fully in Western society and to assimilate Western patterns of thought until the end of the eighteenth century, modern Jewish thinkers have been influenced by all of these trends in Western thought, compelling them to rethink the traditional views concerning God. The result has been an espousal of differing attitudes toward theism, from a reaffirmation of the traditional to a radical transformation in naturalistic terms. In any event, the vocabulary used since, by both the traditionalists and the nonconformists, is that of modern thought, even when it is used to interpret the tradition.

Among twentieth-century Jewish thinkers, Mordecai M. Kaplan (1881–1983) is the most determined of the naturalists. For Kaplan and his disciples, God is not a supernatural, personal being but the power in the universe that makes for righteousness. Kaplan maintains that people really were referring to this power when they spoke of God, even though, in the prescientific age, they expressed their belief in terms of a supreme being, the creator of the world who exercises care over it. Faith in God does not involve belief in being outside the universe but is an affirmation that the universe itself is so constituted that the pursuit of righteousness will triumph. God is the power that guarantees salvation, in terms not of an otherworldly existence but of the enrichment of the human personality to its highest stage of evolution.

Martin Buber (1878–1965), the best-known of Jewish religious existentialists, stresses, on the contrary, the personal aspect of deity. In Buber's thought, when man has an I-Thou relationship to his fellows and to the world in general, he meets in dialogue the Thou of God. While the medieval thinkers devoted a significant part of their thought to reasoning about God's nature, Buber rejects such speculations as futile, cosmic talk, irrelevant to the life of faith. God cannot be spoken about, but he can be met as a person by persons. Franz Rosenzweig (1886–1929) has a similar existentialist approach. For Rosenzweig there are three elements in the universe: God, the world, and man. Religion, specifically Judaism, binds these three together through the processes of revelation, creation, and redemption.

Avraham Yitshaq Kook (1865–1935), the first chief rabbi of Palestine, is completely traditional in his concept of God but accepts the theory of evolution, which, as a qabbalist, he believed to be in full accord with the qabbalistic view. The whole of the universe is on the move, and man is rising

to ever-greater heights ultimately to meet God. Abraham Joshua Heschel (1907–1972), strongly influenced by Hasidism, stresses the sense of wonder as the way to God. Because the universe is shot through with wonder, it points to the wondrous glory of its maker, who, in the title of Heschel's book, is "God in search of man." Heschel's God shares in man's tribulations. He is the God of the Hebrew prophets, involved intimately in human affairs, not a cold abstraction without power to save.

More than any other event, the Holocaust, in which six million Jews perished, compelled Jewish religious thinkers to examine again the doctrine that God is at work in human history. Efforts of medieval thinkers like Yehudah ha-Levi and Maimonides to account for evil in God's creation were, for many, totally inadequate to explain away the enormity of the catastrophe. Some contemporary thinkers invoke the idea found in the ancient sources that there are times when the face of God is hidden, when God surrenders his universe to chance if not to chaos and conceals himself because humankind has abandoned him. There is a reluctance, however, to explore such ideas, since they appear to condemn those who were destroyed, laying the blame, to some extent, at the door of the victims. The free-will defense has also been invoked by contemporary thinkers, both Jewish (e.g., Avraham Yitshaq Kook, Milton Steinberg) and non-Jewish (e.g., John Hick). For man to be free and exercise his choice in freedom to meet his God, the world must be a place in which naked evil is possible, even though the price might seem too high.

None of these theories has provided contemporary Jewry with an adequate response to the problem of evil. The widespread tendency among believers in God is to rely on faith rather than on reason; man finds it hard to believe in God but harder still to accept a mindless universe. The only Jewish thinker of note who has accepted, in part at least, the "death of God" theology is Richard Rubenstein. The others reaffirm, in their different ways, the traditional picture of God as existing and caring, even though, like Kaplan, their understanding of what this can mean departs from that picture. Orthodox thinkers accept the traditional idea in its totality, including the belief that the Torah, given by God, is the path to eternal life and that, even on earth, God will eventually intervene directly, bringing the Messiah to redeem the Jewish people and the whole of humankind. Thinkers belonging to the Reform movement also accept the idea that human history is moving toward its culmination in the acknowledgment of God with the establishment of God's kingdom; however, they speak not of a personal Messiah but of the dawning of a messianic age.

BIBLIOGRAPHY

There are three works of general Jewish theology in which the Jewish doctrine of God is discussed with full bibliographical ref-

erences for further study. *Jewish Theology Systematically and Historically Considered* (1918) by Kaufmann Kohler, with new material by Joseph L. Blau (New York, 1968), is a pioneering work but now dated and heavily influenced by Protestant thought of the first decades of the twentieth century. *Jewish Theology: A Historical and Systematic Interpretation of Judaism and Its Foundations* by Samuel S. Cohon (Assen, Netherlands, 1971) and my *A Jewish Theology* (New York, 1973) are more adequate in that they consider more recent trends in theological thought. The same applies to my *God, Torah, Israel: Traditionalism without Fundamentalism* (Cincinnati, Ohio, 1990) and to Neil Gillman, *Sacred Fragments: Recovering Theology for the Modern Jew* (Philadelphia and New York, 1990).

On the rabbinic views, *The Old Rabbinic Doctrine of God* by Arthur Marmorstein (1927; reprint, New York, 1968) is a detailed examination of the names of God in rabbinic literature by an expert in this literature. George Foot Moore's *Judaism in the First Centuries of the Christian Era, the Age of Tannaim*, 3 vols. in 2 (1927–1930; reprint, Cambridge, Mass., 1970), contains much information, by a non-Jewish scholar, on early rabbinic discussions of God and his relationship to Israel. *Aspects of Rabbinic Theology* by Solomon Schechter (New York, 1961) is a well-written and scholarly treatment of the subject. There is also a good deal of material in *A Rabbinic Anthology*, edited by C. G. Montefiore and Herbert Loewe (1938; reprint, Philadelphia, 1960), in which a Reform and an Orthodox Jew also debate their differing attitudes to the rabbinic formulations. Occasionally this discussion tends to shade off into apologetics and must be used with a degree of caution.

No work exists devoted specifically to God in medieval Jewish philosophy, but the subject is treated extensively in two histories: *A History of Mediaeval Jewish Philosophy* by Isaac Husik (New York, 1916) and *Philosophies of Judaism: The History of Jewish Philosophy from Biblical Times to Franz Rosenzweig* by Julius Guttman, translated by David W. Silverman (New York, 1964). For Maimonides' thought on the subject, the indispensable work is his *Guide of the Perplexed*, translated with an introduction by Shlomo Pines (Chicago, 1963). On the doctrine of God in the merkavah, qabbalistic, and Hasidic literatures, the essential work is the classic *Major Trends in Jewish Mysticism* by Gershom Scholem (1941; reprint, New York, 1961). Scholem's *Jewish Gnosticism, Merkavah Mysticism, and Talmudic Tradition* (New York, 1965) is an important work on the subject in its title. There is a good deal of material on the personal approach in my *Jewish Mystical Testimonies* (London, 1996).

For useful summaries of modern thinkers on God, three works can be recommended. *Anatomy of Faith* by Milton Steinberg, edited by Arthur A. Cohen (New York, 1960), compares Jewish thought on God with Christian thought. *Modern Philosophies of Judaism* by Jacob B. Agus (New York, 1941) is an excellent examination of the thought of Buber, Rosenzweig, Kaplan, and other modern Jewish thinkers. My *Jewish Thought Today* (New York, 1970) is an annotated anthology with a section on God. *Judaism Faces the Twentieth Century: A Biography of Mordecai M. Kaplan* (Detroit, 1993) is a useful introduction to Kaplan's naturalistic view of God.

LOUIS JACOBS (1987 AND 2005)

GOD: GOD IN POSTBIBLICAL CHRISTIANITY

Both New Testament writers and postbiblical Christians sharply opposed the God of their faith to the many gods of popular religion. In doing so they joined not only Jews but also most thoughtful pagans, who believed in one God beyond the many. Because the reality of the one God was not in doubt, arguments for God's existence in that era were unimportant.

There was, however, during the early centuries of the Christian era a great divide. On one side were those classical religious thinkers who continued to reflect on God in strictly philosophical ways, trusting their reason to suffice. This tradition reached its apex in Neoplatonism. On the other side were those who accepted the authority of Jewish (supplemented later by Christian or Islamic) scriptures, correlating the ideas found there with the fruits of reason. The great Alexandrian Jew Philo, a contemporary of the apostle Paul, gave classical expression to this second approach, which gradually won out in the Mediterranean world.

Justin Martyr provides an early picture of how Christians understood the relation of their doctrine of God to the wider culture. He reports that he sought knowledge of God from philosophy with little success. A Christian then persuaded him that the human mind lacks the power to grasp the truth of God and that one must begin with what God has revealed. Accordingly, Justin turned to the Hebrew scriptures, read now through Christian eyes, and found there what he wanted. His success did not lead him to a total rejection of Greek philosophy, however; he continued to admire Plato, but to avoid attributing Plato's wisdom to human reason, he claimed that Plato had learned from Moses.

The authority of scripture ensured that for Christians as for Jews, the God who sometimes appears as an impersonal deity in the philosophical writings would be understood as personal. On the other hand, under the influence of existing philosophical concepts, biblical ideas came to be set in a new key. For example, God's changelessness, which in the Bible means God's faithfulness and dependability, was generally understood to be God's freedom from transiency and perishing. Subsequently this concept was transformed by some into metaphysical immutability. Likewise, God's everlastingness (beginningless and endless life) was sometimes transformed into a nontemporal eternity.

The matter primarily in dispute was the content of divine activity in relation to humankind, what God had done, was doing, and would do. To be a Christian was to affirm that the God of whom the Hebrew scriptures speak had acted in Jesus for the redemption of the world. This conviction expressed itself in the doctrine of incarnation, and it was this doctrine that most distinguished Christian thought from Jewish and philosophical ideas. Yet even incarnation could find various points of contact in the wider religious context, and these analogies were used by some commentators to understand and interpret it. On the one hand, God was known to have spoken through prophets and sibylline oracles; the

theologians of Antioch taught that the Word of God was present to and in Jesus even more fully than in the prophets and oracles. On the other hand, the idea that God sent heavenly messengers, or angels, was widespread; Arius taught that he who was sent to earth as Jesus was not just one angel among others but the one supreme creature through whom all other creatures, including the angels, were made. But the Christian conviction that in Jesus it was God who was incarnate opposed the latter theory, and the former still left God too separate from Jesus to be truly incarnational. Under the leadership of Athanasius the church determined at the Council of Nicaea (325) that what was incarnate in Jesus was truly God, and at the Council of Chalcedon (451) it maintained that while Jesus was fully God, his divinity left his humanity unimpaired.

While the church insisted that what was incarnate was truly God, it did not simply identify what was incarnate with the one whom Jesus called "Father." Instead, following the prologue in the *Gospel of John*, the Word (or Son) who was with God and who was God was the incarnated one. This required a distinction within the one God. Even so, the church lacked a conceptuality that could show how the Word could both be one with God and become incarnate in Jesus without diminution of Jesus' humanity; and so the assertion, unsupported by intelligible conceptuality, became a "mystery." Similarly, the doctrine of the Trinity, which grew out of these debates with the addition of the Holy Spirit, could not be conceptually clarified. Thus faith became assent to mysteries on the basis of the authority of the church.

Although the doctrines of incarnation and Trinity are inescapable and central to Christian theology, their character as mystery reduced their role in shaping early Christian thinking about God. For example, whereas one would expect thinking about God's attributes to be deeply influenced by the gospel accounts of Jesus, such an influence has in fact been uncommon. On the whole, God's attributes were understood much as they were affirmed in Jewish and philosophical thought of the time: God is incorruptible, unsusceptible of harm or decay; God is incorporeal and invisible, a purely spiritual being. An early Christian statement about God's attributes is to be found in the apocryphal *Preaching of Peter*, which describes God as

the invisible, who sees all things,
uncontained, who contains all things,
without needs, of whom all are in need and because of
whom they exist,
incomprehensible, eternal, imperishable,
unmade, who made all by the word of his power.

In the Middle Platonism of the second century there was a strong tendency to emphasize the radical difference of God from the world, and so the incomprehensibility of God, just mentioned in the *Preaching of Peter*, was accented. This note was strong among the Gnostics, but it became prominent also among Christian writers who were increasingly willing to draw consistent consequences from the idea that God was

incomprehensible. For example, Clement of Alexandria wrote that God cannot properly be called “one or the good or the one itself or Father or God or Demiurge or Lord” (*Stromateis* 5.82.1).

The patristic writer Origen made still more explicit the tension between the increasingly negative theology, which the church assimilated largely from the surrounding culture, and the positive language of scripture. Earlier, in arguing against anthropomorphic myths of the gods, Christians had denied that God feels fear or anger or sexual passion and had sometimes generalized this to speak of the divine *apatheia*; Origen systematized this doctrine and drew the conclusion that all passages describing divine emotions such as joy or grief must be read allegorically.

In a late homily on *Ezekiel*, Origen seems to have reversed his position on this point, explicitly denying that the Father is impassible. But the weight of his influence, along with the general logic of the idea of metaphysical immutability, carried the day. The idea that God the Father could have feelings such as pity was called “patripassianism,” and it has been generally regarded as unacceptable at least until the late twentieth century, when Dietrich Bonhoeffer, Jürgen Moltmann, Kazoh Kitamori, and many others, including process theologians generally, began to emphasize God’s suffering.

Although there was broad consensus that all things derive from God, there were alternative images of the relationship between God and the world. One image emphasized creation as an external act of will. The world is envisaged as coming into being by divine fiat out of nothing. Another image, which envisioned the world as the outworking of the dynamism of the divine life, found its clearest expression in Plotinus’s doctrine of emanation. Insofar as this image implied that the world was made of divine substance, it was rejected by the church, but some of its language remained influential. A third image was that of participation, wherein God is seen as perfect being, and creatures are thought to exist as they participate in this being in a creaturely way. This image was supported especially by God’s self-revelation to Moses. God is understood to have said: “I am who I am. . . . Thus shalt thou say to the children of Israel: He Who Is, hath sent me to you.” A fourth image was that of inclusion, according to which God is the “uncontained, who contains all things” (*Preaching of Peter*). This follows from the words attributed to Paul in *Acts*: “In God we live and move and have our being” (17:28).

The Platonic influence on developing Christian beliefs encouraged a correlation between the human intellect and God. Thus Gnosticism held that knowledge of God is superior to faith, and this idea was taken over also by some of the more orthodox Christians. A related concept held that the human soul or mind possessed a kinship with God that was lacking to the body. Such ideas encouraged intellectualistic mysticism and bodily asceticism. The Christian struggle to overcome this dualism can be traced from the fourth-century Cappadocians through the fourteenth-century Greek-

speaking church. It required both the denial that God is of the order of thought or idea and the rejection of a further development in the thought of Plotinus, which located God as the One beyond thought who could be reached only through thought. At the same time it required the clarification of how human beings could have real communion with God by grace.

Basil of Caesarea made a distinction between the essence or substance of God, which is radically and eternally inaccessible, and the divine energies. These energies, he taught, are God’s actual working in the world and are, therefore, fully God and wholly uncreated. Basil associated these energies especially with the Holy Spirit. “Through him the ascent of the emotions, the deification of the weak, the fulfillment of that which is in progress is accomplished. It is he who, shining brightly in those who are being purified of all uncleanness, makes them spiritual persons through communion with himself” (*On the Holy Spirit* 9.23).

The writings of Pseudo-Dionysius (Dionysius the Areopagite) shared much with the Neoplatonism of Plotinus. They served later in the West to encourage a Plotinian form of mysticism. But in the East, where their influence has been pervasive and their orthodoxy unquestioned, they have provided the basis for a Christian spirituality that overcomes a Platonic dualism.

These writings reaffirm the total inaccessibility of the divine essence while stressing the divine energies, powers, or processions. Created beings participate in the divine energy in the way proper to each. Thus the movement of God into the world of creatures enables the creatures to rise toward God. In this process both positive and negative theology are needed. Positive theology finds symbols for God everywhere in the created world. Negative theology points out that these are indeed symbols and that there is no name for God’s essence. In neither process is there any priority of the intellectual over the physical.

In the eighth century, John of Damascus, the most authoritative theologian of the Eastern church, included these elements in his exposition *The Orthodox Faith*, thus ensuring their continued role. This role was most important in monastic practice, which sought to realize the presence of the Holy Spirit. Symeon, called the New Theologian, gave expression to this practice in the early part of the eleventh century. He wrote of the experience of the uncreated light that is neither sensory nor intellectual. This light illumines the human heart, judging, purifying, and forgiving. It is the foretaste of the Parousia.

This current of Eastern spirituality came to its fullest expression in Gregory Palamas in the fourteenth century. He wrote: “Illumination or divine and deifying grace is not the essence but the energy of God” (*Theophanes*, in *Patrologia Graeca* 150.932d). Essence and energy are the two modes of the one divine existence.

This basic structure of Eastern thought of God was the context also for the defense of icons. The Iconoclasts held

that the use of icons in worship was idolatrous because it assumed that the icons shared the substance of God. The victorious defenders thought of divine energies as imparted to the icons without any loss of their creatureliness, while the divine substance remained radically transcendent and unknowable.

The impact of Platonic philosophy in Western thought of God took a different turn chiefly because of Augustine of Hippo. Augustine made fully explicit the theological issues raised for the Christian by dominant philosophical ideas. For example, the church taught the doctrine of creation of the world out of nothing. This seemed to imply that God first was alone and then, subsequently, created the world. But this notion of a temporal sequence of events in the divine life seemed in conflict with the perfection of God. If there was good reason to create a world, why would God delay? In any case, would this sequence not necessarily imply a change in God from precreating to creating? And would not the existence of the world introduce something new into the divine omniscience?

Augustine undertook to reconcile the doctrines of creation and immutability by radical reflection on time. Time, he held, is a function of the mutable, created order. It has, therefore, no reality for God. For humans there is past, present, and future; but from the perspective of eternity, the contents of time exist timelessly. This became standard theological teaching, often ignored in the rhetoric of the church, but rarely directly denied before the twentieth century.

Unlike the author of the pseudo-Dionysian writings, Augustine understood the essence of God to be all that which is common to the persons of the Trinity. God is truth itself, which is at once goodness itself. As the sun is the source of light by which one's eyes see the visible world, so God is the source of illumination of the mind by which it sees eternal truths. And just as it is possible, though difficult, to see the sun itself, so also it is possible, though difficult, to contemplate God.

Truth, according to Augustine, draws the mind to itself, but the mind is distracted by the sinful will, which directs itself toward inferior things. What is known is not different, therefore, from natural knowledge, but because of sin natural knowledge is always distorted. Hence the mind cannot attain to truth apart from the healing of the will. This is the work of grace through Jesus Christ, in whom God accepted humiliation in order to overcome human pride.

This basic pattern, reflective of Plato's influence, dominated early medieval thought of God. It came into conflict with thinking affected by a new, firsthand encounter with the writings of Aristotle, which were mediated to Christian theologians in the West chiefly through Islamic Spain. The Aristotelian influence in theology was long viewed with suspicion, but eventually it gained a strong foothold in Western Christianity through the acceptance of Thomas Aquinas, who, as the most authoritative teacher of the Roman Catholic Church, synthesized aspects of Aristotle with much of the Augustinian tradition.

Thomas found in Aristotle an achievement of natural reason that moved from sense experience to the demonstration of the existence of God. This he called natural theology. He recognized that reason based on sense experience cannot arrive at all the truths taught by the church; so he affirmed also that there are truths attainable only by revelation. In addition he saw that much that the philosopher can attain by reason is also revealed so that all may know.

The Augustinian tradition argues that knowledge of God's existence is already implicitly given in thought. Anselm's formulation of the ontological argument is the most thoroughgoing expression of this tendency. Thomas, on the other hand, seeks to lead the mind by inference from what is known through the senses to the affirmation of God as the supreme cause of the world. The emphasis in Thomas's idea of God shifts, accordingly, from that of the illuminator of the mind to the cause of the existence and motion of all creaturely things.

The Thomistic argument that has best stood the test of time is the argument that proceeds from the contingency of all creaturely things to a necessary existent. By itself, an infinite series of contingent causes cannot explain the actual existence of anything. This dependence of contingent being on necessary being is closely related to Thomas's most original metaphysical work, his analysis of *esse*, or the act of being in its distinction from essence. The broad outlines of this argument already existed in the patristic consideration of God's self-revelation to Moses interpreted as "He Who Is." But whereas Augustine understood it to mean that God is he who never changes, Thomas taught that God is *ipsum esse*, being itself, that is, the act of being. This is pure act, free from all potency, apart from which there can be nothing at all. As pure act it is necessary existence, that on which all contingent existence wholly depends. French neo-Thomists in the twentieth century, such as Étienne Gilson, highlighted these features of Thomas's thought, which had been partly obscured in the interim.

Being itself is radically different from any creaturely being, and because one's ideas are formed in the creaturely world, one cannot speak of God univocally. Nevertheless, the language about God is not merely equivocal. There is justification in using analogies that move from creaturely effect to divine cause, attributing to the supreme cause the perfect form of the excellences found in the effects.

Thomas thought of God not simply as *ipsum esse* but as *ipsum esse subsistens*, that is, as the one who is being itself. The unity of the idea of being itself with the idea of the supreme being has been characteristic of the Thomistic tradition. However, Meister Eckhart, the great fourteenth-century mystic, distinguished God as supreme being from godhead as being itself, and he sought the latter in the depths of his own being. Through this distinction and his experiential realization of being, Eckhart provided a Western Christian analog for the thought and practice of Hindus and Bud-

dhists, who had long distinguished the transpersonal ultimate from the personal God.

Thomas subordinated the divine will to the divine wisdom. That is, God wills what is good. In this doctrine, his thought followed that of the church fathers, including Augustine. God remains for Thomas, as for them, the One, the True, and the Good. But there were others for whom this Platonic way of thinking ceased to be convincing, for whom there were no truth and goodness existing in themselves and attracting the human mind and will; they asserted that God is much more the efficient cause of natural motion, that God is free agent, bound to nothing, and, in short, that God is almighty will, determining thereby what is true and good. This voluntaristic emphasis is associated with the rise of medieval nominalism, influenced especially by William of Ockham. Nominalism is the doctrine that universals are names given to certain things. These universals have no existence in themselves. Furthermore, because there is an element of arbitrariness in how things are named, human choice and decision are accented instead of discernment of what is objectively there for the mind to discover. This doctrine entails the theory that God alone chooses what to require of human beings and what to do for them. What God has chosen cannot be learned by human reason; it can only be revealed by God.

This voluntaristic theology prepared a context for the Protestant Reformation. With the reformers the emphasis was not on philosophical limitations to human knowledge of God but on the radical corruption of the human mind by sin. This impairment does not eradicate all knowledge of God, but it does lead to distortion of every human effort to say who God is. For knowledge of God one is totally dependent on God's gracious and redeeming act in Jesus Christ.

In Calvin's systematic formulation, for example, God's reality is fully manifest objectively in the order of nature; but because of sin those who have tried to interpret nature by reason have been led astray. The truth of God's objective manifestation in nature is properly grasped only through scripture. But, once again, although the truth about God is perfectly clear in scripture, the sinful mind distorts that as well. Hence scripture is properly understood only through the illumination of the Holy Spirit, bestowed by God as God pleases and not according to human merit.

The problem of theodicy is present wherever God is affirmed to be both omnipotent and good, because to deny sin and evil would contradict both scripture and experience. The problem is heightened when, as among Calvinists, God's election is emphasized to be independent of human desert. For the voluntaristic tradition, however, the answer is also given: What is good is finally determined by the divine will. The human mind has no independent access to criteria by which to judge the goodness of God.

Most theologians, however, have attempted to mitigate the starkness of this answer. Calvin himself attempted to

demonstrate that the reprobate fully deserves damnation, and he attempted also to display the justice and mercy of what God has chosen to do as humanly intelligible. Others have argued more systematically that any alternative ordering of things would reduce the goodness of the world; usually the necessity or inevitability of evil in a world where there are free creatures has been emphasized. Although the phrase has not been popular, because it seems to minimize sin and evil, most theodicy has undertaken finally to show, in Leibniz's words, that this is "the best of all possible worlds."

During the Renaissance a new wave of Platonic influence gave rise to the Hermetic tradition, which emphasized the mathematical character of the world, the power of movement immanent in things, and the interrelatedness of human thought with these things. The divine was perceived as indwelling power rather than as transcendent will. The voluntaristic tradition had earlier separated revelation from the support of reason and encouraged an authoritarian spirit; the Hermetic tradition, too, separated reason from revelation, but encouraged instead a critique of hierarchical structures in church and society. Together they paved the way for modern philosophy in the seventeenth century, whereupon there ended definitively the unity of theology and philosophy that had dominated Western thought for more than a thousand years.

The early development of modern science was chiefly in the Hermetic context. But partly for theological reasons, René Descartes and Robert Boyle argued for a mechanical nature of passive objects to which the human mind is essentially alien. This left the sovereign will of God as the source of all order. Newton vacillated between these two worldviews, but eventually he gave his great prestige to the mechanical alternative, and this came to be known as the Newtonian worldview.

The church meanwhile kept alive older modes of thinking of God. Many of the theological debates, such as the Socinian, Arminian, Wesleyan, Universalist, and Unitarian objections to strict Calvinism, paid little attention to the issues raised by modern science. Their concern was to recover the emphasis on human freedom and to make more intelligible the idea of God's love for all people.

Nevertheless, the Newtonian, or mechanical, worldview came to be accepted as the only legitimate one in a scientific age. When the church expressed its faith in ways that were not consistent with this worldview, it became increasingly ghettoized in relation to the intellectual community. Among the intelligentsia thought of God accommodated itself rapidly to the new vision, and popular thought gradually followed. God was conceived, accordingly, as sovereign will, the omnipotent creator and lawgiver. As lawgiver God imposed laws on nature whose mathematical character physicists were disclosing. Parallel to physical laws were moral laws imposed upon human beings. Because human beings are free, these laws functioned more like those of the state, except for the omniscience and omnipotence of the lawgiver. Thus, it was

held, people can disobey, but their disobedience is punished—in part in this life, but fully and appropriately in the next.

This developing idea of God was fully personal in the sense that God was conceived to be a supreme mind and will. But human relations to God were mediated through impersonal laws. The term *deist* was applied to this position; originally synonymous with *theist*, it came later to imply the lack of any immediacy of inwardness of relationship. Deism pictured God as the maker of the machine, which then runs according to the principles built into it.

In the eighteenth century the chief issue was whether God, having established natural laws, ever acted contrary to them. All agreed that God was supernatural. The issue was whether God caused supernatural events in the created world, that is, whether miracles occurred. Orthodox Christians held that the biblical accounts of miracles were true, whereas the Deists held that natural law was perfect and that therefore God did not violate it.

The eighteenth century witnessed also the rise of religious skepticism. There had been skeptics all along, but their numbers and prestige were greatly increased during the Renaissance, as well as by the multiple divisions of Christianity and accompanying religious wars following the Reformation. Also, the increasing autonomy and success of natural science suggested that scientific explanation is sufficient by itself and does not require metaphysical and theological grounding. By the end of the eighteenth century belief in God had become radically problematic. The philosophy of David Hume brought the skeptical spirit to expression in ways that continue to influence contemporary thought. By insisting that causality must be an empirically observable relationship, Hume undercut every argument that begins with the world or with aspects of the world and reasons that there must be a cause that transcends the world.

Reflection about God on the European continent in the nineteenth and early twentieth centuries was shaped by the critical philosophy of Immanuel Kant. Influenced by Hume, Kant saw that empirical evidence alone could not ultimately serve as a sufficient ground for the Newtonian worldview. This perception led him to ground that worldview in necessary structures of thought wherein Newtonian space and time, as well as causality, are ways in which the mind necessarily orders phenomena.

Kant's conclusion was by no means atheistic. Even in relation to the exercise of theoretical reason, the idea of God has a beneficial effect, though it must not be introduced as an explanatory principle. More important, Kant points out that in addition to the sphere of theoretical reason there is another sphere of practical reason, which deals with how people should act. In this sphere, too, the fundamental moral principle is independent of theology. People should act always according to maxims that they can will to be universal principles. For example, if one cannot will that people in

general lie, cheat, or steal whenever it is to their personal advantage to do so, then one ought not to lie, cheat, or steal for one's own advantage. This principle—the “categorical imperative”—holds whether or not God exists.

But Kant also affirmed that it would be fitting if the will that conforms to this imperative were happy. Indeed, the *summum bonum*, that whose realization all must desire, is the union of virtue and happiness. Such a state is not attained in this life, but one has the right to posit that it is not an illusion, that is, that this life is not the whole, and that in the larger sphere the *summum bonum* may be realized. This argument assumes that God exists as the guarantor of ultimate fittingness.

Although few have followed the exact way in which Kant correlated God with ethics, many have agreed that belief in God belongs with ethics rather than with science. Later in the nineteenth century Albrecht Ritschl was to found a neo-Kantian school, which interpreted theology as statements about values rather than about facts. God is that which is supremely valuable, not a being about whose existence it is suitable to argue.

Kant's philosophy opened up a particular idea of God of which he did not approve. Kant had given an elaborate account of the *a priori* structures of experience and thought, specifying that these structures apply to thought or mind as such; they are not accounts of contingent features of particular minds, but rather “transcendentals,” and individual minds exist by participation in them. Mind as such—in German, *Geist*—has a reality of its own, transcending that of individuals. In developments subsequent to Kant much nineteenth-century German theology associated *Geist* with God.

The most influential thinker who made this association was Hegel, who believed that the structure of *Geist* was not static, as Kant thought, but dynamic. Hegel studied this dynamism in the process of thinking as such and also traced it through the great cultures of universal history. He saw it as directed toward a final completion or realization, which he called absolute *Geist*. This Hegelian effort to discern the working of *Geist* in the whole of human cultural and intellectual history has since been characteristic of such theologians as Ernst Troeltsch and Wolfhart Pannenberg.

Kant's philosophy can also be used to support the idea of a religious *a priori*. Theologians can argue that just as space, time, and causality are *a priori* structures of experience, so also is the sense of the divine. Friedrich Schleiermacher held that in all people there is to be found a “feeling of absolute dependence,” and he built his theology around this feeling. Later, Nathan Söderblom and Rudolf Otto identified the feeling of the holy or the numinous as the essentially religious element in experience. Paul Tillich subsequently spoke of “ultimate concern.”

This approach to the divine leaves somewhat ambiguous the reality of God as such. Its normal rhetoric implies that there is One on whom all are absolutely dependent, that

there is One who is numinous, or that everyone's ultimate concern is correlated with that which in truth concerns them ultimately. In this way it crosses beyond the boundaries of strict Kantian thought. Even within the Kantian framework, it follows that because one cannot but experience the world in this way, the question of truth or falsity is irrelevant. In some such way as this there has been a widespread tendency in twentieth-century theology to avoid the need for arguments for the objective reality of God, without relapsing into subjectivism or giving up realistic language about God.

In the twentieth century an important segment of Roman Catholic Thomistic thought followed Kant in still another way by taking the "transcendental turn." Transcendental Thomists, such as Karl Rahner and Bernard Lonergan, probe with Kant within the human mind for the conditions of all thought and knowledge. But unlike Kant they discover not the categorical requirements for the Newtonian worldview but the horizon of being as such, which is God.

In the English-speaking world, in spite of Hume's skepticism on the matter, William Paley's arguments from the order of nature to a transcendent creator were convincing to many, and for many, therefore, Charles Darwin's theory of evolution generated a major crisis of faith. If one thinks of the world as having come into being with something like its present order, it is indeed difficult not to posit a supremely intelligent and powerful creator. But if one supposes that the complex forms of life now to be observed were produced by chance and necessity out of much simpler forms, the role of such a creator declines, eventually to the vanishing point. Hence Darwinism appeared to be a profound threat to theism, and out of the controversy was born fundamentalism as a self-conscious movement, holding to the literal accuracy of biblical teaching against dominant scientific and historical study. Its teaching, of course, had roots in the whole of conservative Protestant history, especially Calvinist, but its defensive stance against science was new.

Those who wished to accept the evolutionary perspective while remaining theists were compelled to reconceive the way God works in the world. Such thinkers, instead of conceiving of God deistically as one who produced the world, gave it its laws, and left it to run its course, found it possible to imagine God as working with creatures in the development of new patterns of order. To do so, however, required the introduction of the notion of purpose into evolution. Debate continues as to whether this modification is justifiable. Thus Teilhard de Chardin argued that the whole evolutionary process moves toward a final destiny, an Omega Point. Jacques Monod replied that science has now established that chance and necessity reign supreme. Yet Monod seems to attribute intelligent purpose to human beings and even to other animals. There is in fact considerable evidence that purposive behavior is an important factor in the evolutionary process, and defenders of theism can argue from it that God is the source of this purposiveness.

The most influential theologian of the twentieth century, Karl Barth, was shaped in much of his thought by Kant's critical philosophy, but he rejected all adaptations of the doctrine of God to philosophical requirements. He denied, more radically than the Protestant reformers, that God can be known by human reason. Humankind is entirely dependent, Barth maintained, on God's self-revelation, who is Jesus Christ. This revelation is known only in the scriptural witness to him. Central to what is revealed of God is radical, sovereign, dynamic freedom. Humans can lay no claims on God and make no judgments about how God will act except as they lay hold on the divine promises and the divine self-disclosure. In Germany this radically Christocentric theology provided a rallying point against compromise with the quasi-religious claims of Nazism.

Barth strove mightily to let his thought of God be shaped by scripture through and through. He wished to avoid dependence on the philosophical ideas that had been so influential throughout Christian history. He also wanted to avoid reaction against uncongenial or hostile modes of thought in contemporary society. His intellectual honesty and openness commanded the respect of many modernists, despite their discomfort with his conclusions; his radical faithfulness to scripture commanded the respect of many fundamentalists, despite his refusal to endorse their teachings about biblical inerrancy and despite his rejection of their quarrel with modern science and philosophy. In the English-speaking world, aided by the popularity of the supportive writings of Emil Brunner, Barth provided an alternative to modernism and fundamentalism, thus making possible an ecumenical center for theological discussion from the 1930s into the 1960s.

The dominance of a positivistically inclined linguistic analysis in English-language philosophy raised problems for the English-speaking Barthian consensus, as illustrated by the work of a North American student of Barth, Paul Van Buren, who called for a nontheistic interpretation of Barth's theology. Meanwhile opposition to Christian teaching about God continued, inherited from nineteenth-century skeptics and also from those who had found belief in God oppressive: Ludwig Feuerbach, who complained that humanity treated its own goodness as something alien, and projected this as "God"; Friedrich Nietzsche, who thought that human beings could not assert their own freedom until they "killed" God. Barth's reassertion of God as free and sovereign will did little to respond to these challenges, and the work of Thomas Altizer renewed this challenge in the mid-1960s. The "death-of-God" theology contributed further to weakening Barth's influence.

The appearance soon after World War II of the writings of Dietrich Bonhoeffer from a Nazi jail struck a responsive chord in those already uncomfortable with Barth's theology. The ideas sketched in these writings indicate a quite different way of thinking of God. "Only a powerless God," Bonhoeffer wrote, "can help." It is the Crucified One rather than the

all-determining Lord who can speak to suffering humanity “come of age.” Bonhoeffer thus helped gain a hearing for a current of thought that directly challenged God’s impassibility and affirmed patripassianism. This position had been formulated philosophically in the United States by Alfred North Whitehead and was systematically developed by Charles Hartshorne; it was forcefully expressed theologically in Germany by Jürgen Moltmann.

Although few have followed Bonhoeffer’s rhetoric of divine powerlessness, there has been considerable new reflection on the nature of God’s power. Whitehead held that God’s power is persuasive rather than coercive. That this was true with respect to human beings had long been taught—for example, by Augustine. But in Whitehead’s view, to exist at all is to have some measure of self-determination. Hence God’s relation to all creatures is persuasive. Wolfhart Pannenberg argues that God is to be thought of as the Power of the Future. God is not now extant as one being alongside others making up the given reality, but rather that which will be all in all. Pannenberg argues that all creative realization in the present comes into being from this divine future. Hence God remains all-determinative, but the mode of this determination is quite different from that against which people have protested for the sake of human freedom. Instead it is God’s determination of the present that makes humanity free.

The association of God with the future, building on the eschatological language of the New Testament, has had other supporters. Whereas for Pannenberg it has ontological meaning, for J.-B. Metz and Jürgen Moltmann it is associated with a “political theology,” which locates salvation primarily in the public historical realm. It is also central to the “liberation theology” of Rubem Alves, Gustavo Gutierrez, Juan Segundo, and other Latin Americans. These German and Latin American theologians argue that God’s will is not expressed in the present structures of society or in some romanticized past, but rather in the promise of something quite different. Hence, the overwhelming tendency of religion to justify and even sanctify existing patterns, or to encourage nostalgia for a lost paradise, is opposed by the prophetic challenge in view of the hoped-for future.

Among these theologians, the image of God has been more important than the concept. Indeed, recognition of the difference between image and concept and of the great importance of image has played a large role in recent thought about God. Blacks in the United States, led by James H. Cone, have pointed out that God has been imaged as white. The fact that theological concepts about God make the notion of skin color absurd has not reduced the power of this image. Blacks then need to image God as black to claim their human and religious identity. They can go on to say that the biblical witness to God’s self-identification with the poor and oppressed gives special justification to this image. Black theology has also provided stimulus for fuller indigenization of images of God in many non-Western cultures.

Similarly, although theologians have insisted that God is beyond gender, feminists have had no difficulty showing that the Christian image of God is overwhelmingly male: Whereas God’s whiteness is clearly not biblical and is rightly rejected in the name of the Bible, God’s maleness is biblical. Hence the denial of maleness to God requires a radical approach to scripture. Furthermore, the characteristics attributed to God by even those theologians who have rejected anthropomorphism have usually been stereotypically masculine ideals: omnipotence, impassibility, self-sufficiency. Feminists challenge this whole theological tradition. They divide between those, such as Mary Daly, who believe that the Christian God is inherently and necessarily patriarchal, and hence incompatible with women’s liberation, and those, such as Rosemary Ruether and Letty Russell, who believe that the Christian deity is a liberator who can free humankind also from patriarchalism.

For a century now there has been a slow decline of the mechanistic worldview. Because the rise of that worldview had so marked an impact on Christian thinking about God, its decline would seem to be important as well. However, the change in theology has not been dramatic. Because of Kant’s influence, theology in central Europe has been largely separated from questions of worldview. The effect of Barth’s theology has been to reinforce this separation. Ironically, the separation has led to the continued acceptance of the mechanistic worldview by some theologians despite its loss of prestige among physicists. Rudolf Bultmann, for example, accepted this worldview unquestioningly and argued from it with respect to what is credible to modern people.

Nevertheless, others, such as Karl Heim, worked to adapt Christian theology to new developments in science; this approach was especially common in the French- and English-language worlds. Scientific developments abounded. After the controversy over evolution, more fundamental challenges to mechanism came from physics with the rise of quantum theory. Newtonian laws gave way to statistical probabilities, and self-contained atoms were replaced by fields. Substances gave way to events. But the lack of a fully articulated, generally accepted new worldview, correlated with the whole range of the sciences, has reduced the impact on theology of the decay of the older worldview. Meanwhile there has emerged largely outside the churches a popular religious culture that correlates religious beliefs with what it takes to be the new science.

The most impressive effort to propose a conceptually rigorous worldview or cosmology appropriate to postmechanistic science is that of Whitehead. Whitehead also spelled out what he saw as the implications of this new cosmology for belief in God. Because the new cosmology replaces atomism with a field of interrelated events, it calls for understanding God as also fully interrelated with the world. God is not a cosmic lawgiver but an intimate participant in every event. Similarly, every event enters forever into the inner life of God.

Whitehead's ideas have been systematically modified, developed, and defended by Charles Hartshorne. In light of the new ways of thinking of God Hartshorne reformulated classical arguments for God's existence, including the ontological argument, and he called his theism neoclassical. This neoclassical theism is a pan-entheism based on a doctrine of God as dipolar, absolute in essence but relational in actuality. Hartshorne's thought has played a central role in the emergence of "process theology."

Another context for Christian reflection on God in recent times is dialogue with representatives of other religious traditions. These dialogues intensify the question whether the Christian God is also worshiped in other traditions. In relation to Jews and Muslims, who share much scripture with Christians, there has rarely been serious doubt. It has also been usual missional strategy in countries previously unacquainted with these scriptures to use terms already present in their languages to speak of the Christian God. It has been widely assumed that, whatever the misunderstanding or distortion, every people has some notion of the one true God who is revealed in the Bible.

Such dialogue also usually leads to greater appreciation of the faith of the dialogue partner and increases the sense that the one true God is known also by the partner. This perception results in an effort to distinguish God from Christian ideas and images of God, so that Christians may respect ideas and images quite different from those to which they have been accustomed. H. Richard Niebuhr has provided a confessional model for dialogue in which the partners tell their story to one another in ways that celebrate the understanding to which their own story has brought them, without disparaging or closing themselves off from what others have learned from their own very different histories.

Reflection on the deep differences between dialogue partners can also lead to the conclusion that the reality of which the partner speaks is different from the biblical God. Meister Eckhart's distinction of godhead from God, Paul Tillich's language about being itself as the God beyond the God of theism, and Whitehead's distinction of creativity from God offer bases for fresh reflection on the relation of the mystical ultimate in Indian and Chinese religions to the Christian God.

The diversity of interests that lead to reflection on God witnesses to the continuing importance of the topic. It also produces great confusion. It is not clear that different statements using the word *God* have, any longer, a common topic. In the Christian context, however, one can almost always understand that, despite all the diversity of concepts and imagery, *God* refers to what Christians worship and trust. Further—with a few exceptions, such as Edgar S. Brightman and William James—God is associated with perfection. Part of the confusion lies in the changing ideal. Whereas for many centuries it seemed self-evident to most Christians that the perfect must be all-determining, affected by nothing external to itself, timeless, and completely self-

sufficient, that supposition is no longer so evident today. Much of the debate about God is a debate about what people most admire and most desire to emulate.

GOD: GOD IN ISLAM

The Qurʾān, Islam's holy scripture, states, "Verily, the religion of God (Allāh) is Islam" (3:19). According to medieval Muslim lexicographers, there are twenty to thirty opinions on the origin, etymology, and meaning of the term *Allāh*.

Some say that it should be read as a proper name, as in the English “God.” Others claim that it is a contraction of *al-ilāh*, meaning “The God” or “The Divinity.” Medieval Muslim manuscripts from North Africa and Islamic Spain often use *al-Ilāh* as a synonym for *Allāh*. Modern philologists relate the term to the Hebrew *El* or *Elohim*, used in the Bible. In Arabic, the verb *alaha* means, “he worshiped, served, or adored.” In this sense, *Allāh* could be translated as “the One who is worshiped or adored.” Similarly, the past participle *ma’lūh*, taken from the same root as *Allāh*, is a synonym of *ma’būd*, “worshiped” or “adored.” In the Qur’ān, the terms *ilāh* (“god” or “divinity”) and *ilāha* (“goddess”) are often used in contrast with *Allāh*, the former representing false gods or false objects of worship when compared with the One True God.

Every *sūrah* of the Qur’ān but one begins with the phrase *Bismillāh al-Rahmān al-Rahīm* (By the name of Allāh, the Beneficent, the Merciful). This phrase, known as the *basmalah*, is also used for oaths and at the beginning of important or sacred acts. Islamic prayers and supplications often begin with the expression *Allāhumma*, which is understood as meaning “Oh God!” (*yā Allāh*). The doubled letter *mīm* in this expression stands for the suppressed vocative particle *Yā* (Oh). Such uses of the term *Allāh* recall the practices of pre-Islamic Arabia, where *Allāh* was called upon as the creator god, the god of the heavens, the bringer of rain, and Lord of the Ka’bah in Mecca. Although this rather remote divinity was personified by the pagan Arabs, he was unique among other Arabian gods because images were not made of him. According to Toshihiko Isutzu, a Japanese scholar of Islam, *Allāh* was seldom worshiped as part of a cult in pre-Islamic Arabia. Instead, he was the object of what Isutzu called “temporary monotheism,” the last recourse of prayer when all the other gods had failed (Isutzu, 1980, p. 101).

The Qur’ān provides evidence for Isutzu’s conclusions. In certain passages it rebukes the pagan Meccans for asking the Prophet Muḥammad, “Who is *al-Rahmān*?” when he invoked this “name” of God (25:60). Implied in the Qur’ān’s rebuke of the Meccans is the idea that *Allāh* and many of his attributes were already known to those who denied Muḥammad’s message (29:65). In this view, the Qur’ān introduced the new term *al-Rahmān* (the Beneficent) into Arabia, but it did not introduce a new god. Rather, the Qur’ān brought the Arabian sky and creator god closer to human experience by stressing that *Allāh* was both transcendent and immanently near: “And when my servants question you concerning me, I am truly near. I answer the prayer of the supplicant when he calls on me. So let them heed my call and believe in me, so that they might be guided rightly” (2:186).

THE QUR’ANIC DOCTRINE OF DIVINE UNITY. The Qur’ān uses a variety of arguments to demonstrate that knowledge of God as the creator of all things makes all other ideas of divinity superfluous. If *Allāh* created everything in the universe, then the lesser gods and powers worshiped by human beings must be created as well, and hence are not truly di-

vine. Theologically, the religion of Islam replaced the pagan *Allāh* with a divinity of greater complexity. God in Islam is more than just a name; *Allāh* is both a theological concept and an active deity that creates and maintains the universe. Both immanent and transcendent, the full nature of God appears as a paradox to the human mind. *Allāh* is the One True God, as in the Greek phrase *ho theos* (The God). However, the oneness of God is not self-evident, nor is it self-evident that God is the ultimate cause of all things. The secondary causes and contingent realities of things in the world veil the nature of God from human understanding. The Qur’ān acknowledges this paradox by equating belief in God with “belief in the unseen” (2:3). Because the full reality of God is not self-evident, a book of revelation is needed to educate human beings about the existence and nature of divinity.

The intellectual quest for the understanding of God is depicted mythologically in the Qur’ān by the story of Abraham, who progressed from worshiping the stars, the moon, and the sun to acknowledging that *Allāh* is the sole cause of heavenly phenomena (6:75–79). However, simply understanding that God is the Cause of Causes only solves part of the divine mystery. There is still the problem of knowing how God, as the transcendent Truth (*al-Ḥaqq*, 22:6), may be discerned in the vast multiplicity of created things and events. This key problem of Islamic theology is expressed in the following poem by the sixteenth-century Moroccan Ṣūfī ‘Abdallāh al-Ghazwānī (d. 1528) of Marrakech:

Oh, he who is one of all! Oh, he for whom all is one!
Mortal beings count you by number, oh one. You appear
in the all such that one cannot be hidden, And you disappear
in the all such that one cannot be seen. (al-Ghazwani, folio 5)

This paradox of divine unity was not only a problem for Ṣūfīs. It also appears in Shī‘ī Islam, as in the following statement of Imām ‘Alī (d. 661):

To know God is to know his oneness. To say that God is one has four meanings: two of them are false and two are correct. As for the two false meanings, one is that a person should say “God is one” and be thinking of number and counting. This is false because that which has no second cannot enter into the category of number. Do you not see that those who say that God is the third of a trinity fall into this infidelity? Another meaning is to say, “So-and-so is one of his people,” namely, a species of this genus or a member of this species. This meaning is also false when applied to God, because it implies likening something to God, whereas God is above all likeness. As to the two meanings that are correct when applied to God, one is that it should be said that “God is one” in the sense that there is no likeness to him among things. Another is to say that “God is one” in the sense that there is no multiplicity or division conceivable in Him, neither outwardly, nor in the mind, nor in the imagination. God alone possesses such a unity. (Tabatabai, 1979, pp. 127–128)

Theologically, the Qur’ān is an extended argument for the existence of the One God. As a revelation both from *Allāh*

and about Allāh, it guides humanity toward a single, absolute Truth that transcends the world: “Say: He is Allāh the Only; Allāh the Indivisible; He gives not birth, nor is He begotten, and He is, in Himself, not dependent on anything” (112:1–4). These verses summarize the Qur’anic definition of *tawhīd*, the Islamic doctrine of divine unity. Most simply, *tawhīd* means that God is one, unique, and not divisible into hypostatic entities or incarnated manifestations. He gives birth to no “son” or demiurge, nor is he begotten from another, for he is independent of his creation: “Your Lord is utterly independent, All-Engendering. If he wills, he can expel you and replace you with others, just as he multiplied you from the seed of others” (5:133). Along with this strictly monotheistic image of God, the Qur’ān also provides a more monistic image of a deity that is immanent in the world of creation: “He is the First and the Last, the Outward and the Inward; He is the Knower of every thing” (57:3). This complementary focus on the immanence of God implies that a full understanding of divine unity must somehow include the transcendence of number. This is the paradox addressed by al-Ghazwānī and Imām ‘Alī above, and the attempt to resolve it delineates the conceptual limits of theological inquiry in Islam.

As an aid in understanding the complexity of *tawhīd*, the Qur’ān uses ninety-nine terms that convey various aspects of the divine nature. These terms are referred to as the “Excellent Names of Allāh” (77:180) and are tokens of God’s presence in the world. Many of the divine names are incorporated into Muslim personal names, such as ‘Abd al-Raḥmān (Slave of the Beneficent), ‘Abd al-Jabbār (Slave of the Overpowering), or ‘Abd al-‘Azīz (Slave of the Glorious). The fact that such names describe attributes of human beings is another reminder of God’s immanence. With the exception of the supreme name Allāh and the Arabic neologism *al-Raḥmān*, which refers to the divine beneficence that creates and maintains the universe, all of the other divine names may be shared by both God and human beings. However, this sharing of attributes should not lead a person to believe that he or she is divine or that the sharing of attributes puts any limitation on God’s transcendent nature. Such attitudes lead to the sin of *shirk*, associating things with God, or relying on contingent, created entities as if they were divine in themselves. *Shirk* is a major sin in Islam because it is the basis of *kufṛ*, literally “covering up” or denying the truth of God and of the Islamic religion.

DIVINE POWER. A constant concern of Islamic theology has been to maintain God’s absolute power and agency. Divine agency is expressed in the Qur’ān by the name *al-Qadīr* (The All-Powerful or All-Potent), and by verses such as, “When [Allāh] decrees a matter, he merely says to it ‘Be!’ and it is” (2:117), or “You do not will, unless Allāh wills” (76:30). The desire to maintain the limitlessness of divine power was particularly important in theological discussions of free will and human agency. One of the earliest theological schools in Islam was the *Jabrīyah* (literally, “Compulsionists”), who conceived of power as a limited quantity and felt that any

amount of choice or agency delegated to human beings reduced the amount of power available to God. This zero-sum approach led to a theology of fatalism and predestination, which was exploited by the Umayyad caliphs (r. 662–750) to justify their rule.

The Umayyads used the doctrine of predestination to claim that their opponents were unbelievers. Since God predetermined the affairs of the world, God’s will was that the Umayyads should rule over Islam. To reject the Umayyads was thus to reject God’s will, and the rejection of God’s will is unbelief. This put their political opponents in a difficult theological situation. To say that the Umayyads were unfit to rule implied either that God’s will was imperfect or that God created evil by creating corrupt rulers. The easiest way out of this dilemma was to cede the power of moral choice to human beings by saying that God creates good but humans create evil. This position is clearly supported by the Qur’ān: “Whatever good befalls you, it is from Allāh, and whatever evil befalls you it is from yourself” (4:79). Blaming human beings for their own faults and weaknesses prevents God from being accused of willing injustice.

The moral separation of God from the actions of created beings characterized the second theological school of Islam, the *Qadarīyah* (literally, “Determinists”), whose name refers to the power (*qudrāh*) of human beings to partially determine their own fate. Just as the theology of predeterminism was used to justify the status quo, *Qadarīyah* theology was often advocated by opponents of the status quo and was combined with a strong moral imperative to oppose injustice. *Qadarīyah* tenets form the basis of *Shī‘ī* theology, which stresses the responsibility to fight against injustice and the freedom to choose the *Shī‘ī imām* as the rightful ruler of the Muslims. *Qadarīyah* doctrines make for good moral theology. After all, how could a just God punish human beings for their actions if they were not free to choose them? The theological choice between Islam and polytheism or the moral choice between good and evil would have no significance if a person’s actions were predetermined. If a Muslim judge cannot punish a person for a crime that he or she was forced to commit, how could God do such a thing?

DIVINE EXCEPTIONALISM AND DIVINE JUSTICE. The most influential proponents of *Qadarīyah* theology were the *Mu‘tazilah* (literally, “Withdrawers”), who called themselves The People of Divine Justice and Unity (*Ahl al-‘Adl wa al-Tawhīd*). *Mu‘tazilism* was prominent in Islam for approximately four hundred years and has recently resurfaced as one of the theological positions of Islamic liberalism. From 833 to 850, it was the official theology of the Abbasid caliphate (750–1258) and had a significant influence on Shiism. As a movement of theological rationalism, it attracted the attention of Western scholars of Islam, who mistakenly believed that it foreshadowed the doctrines of the European Enlightenment. The *Mu‘tazilah* believed in a doctrine of extreme exceptionalism with regard to God. One of their fundamental beliefs was that divine unity could be expressed only in

terms of divine simplicity. According to this understanding, the statement “There is no god but Allāh” meant that nothing but God is equal to God or is even a part of God, including God’s own actions and attributes. The attributes of God cannot be eternal because only God-in-himself is eternal. Thus, the “names” of God mentioned in the Qur’ān are not attributes. They are only metaphors, figures of speech, or created modes of divine action. The Mu’tazilah accused those who believed in divine attributes of falling into anthropomorphism (the belief that God has human attributes) or corporealism (the belief that God’s attributes are corporeal entities that exist within Him).

For the Mu’tazilah, knowledge of God’s unity is based on reason, which is a responsibility imposed by God on all human beings. This knowledge depends on four types of evidence: dialectical reason, the Qur’ān, the *sunnah* of the Prophet Muḥammad, and the consensus of the Muslim community. Of these, reason is the most important. This is because the validity of scripture, tradition, and consensus are based on the rational knowledge that God exists, that he is truthful, and that he is just. The existence of God can be proven by the argument from contingency. Experience tells us that we cannot live forever and that we are limited in our powers and abilities. Thus, we are contingent beings: we must depend on something outside of ourselves for our creation and support. This noncontingent, necessary being is God, who is unlike us in every way. Because God is exalted above all forms of resemblance, statements in the Qur’ān such as “What prevents you from prostrating yourself before what I have created with my two hands?” (38:75) can only be metaphorical. The “hands” of God must stand for something other than real hands, such as God’s ability to create and maintain the world. Metaphors such as these should be understood as partial and approximate descriptions of a divine reality that is ultimately indescribable.

The Mu’tazilite principle of divine justice was derived directly from their view of divine agency and was based on two premises: (1) God desires good for human beings; thus, he does not will or create evil. (2) God provides guidance for human beings in the form of divine revelation; thus, he does not want people to go astray. According to these premises, it would be absurd to believe that God’s voluntarism would lead him to predestine people to commit sinful acts. If God punished people for acts that they performed against their will, he would deny the justice that is his nature. Whatever God wills is objectively good, and his justice can be proved by reasoned arguments. Reason demonstrates that the *sharī‘ah*, the Law of God, is good for humanity. God’s justice, expressed in the *sharī‘ah*, is like a rope thrown to a drowning man. God provides the opportunity for salvation, but it is up to the human being to accept it or reject it.

The Mu’tazilah believed that divine revelation, as the embodiment of God’s law, was a created entity. For them, the Qur’anic reference to a “Glorious Qur’ān on a Preserved Tablet” (85:21–22) meant that God created the Qur’ān as

a model or template of divine scripture before the creation of the world. The Qur’ān that was revealed to the Prophet Muḥammad was a copy of this preexistent Qur’ān. The Mu’tazilite doctrine of the created Qur’ān was similar to the Jewish doctrine of the preexistent Torah. In Judaism, the Torah, as the source of divine law, is both preexistent and created: God created his law before he created the world. The Qur’ān also had to be created before the world because the world was created in conformity with the law, as is expressed in the Qur’anic concept of “God’s Way” (*Sunnat Allāh*, 48:23).

Sunnī Muslims rejected the doctrine of the created Qur’ān. In the first century of Islam, ‘Abdallāh ibn ‘Abbās (d. 687), a cousin of the Prophet Muḥammad, asserted that God’s speech was uncreated and coeternal with God. According to this doctrine, the Qur’ān was also uncreated and eternal because it contained the word of God. Aḥmad ibn Ḥanbal (d. 855), a staunch opponent of the Mu’tazilah, claimed that the word of God is equivalent to God’s knowledge. Since the Qur’ān is part of God’s knowledge, the words and letters that are found in the Qur’ān must be regarded as the word of God. Because the word of God is uncreated, the Qur’ān must also be uncreated. Ibn Ḥanbal realized that the doctrine of the created Qur’ān contained a potential theological problem. If the Qur’ān were created, this might be construed to mean that the text of the Qur’ān was fixed in historical time; thus, its relevance would be limited primarily to the era in which it was revealed. This would imply that certain Qur’anic injunctions might be superseded if the social or historical conditions that gave rise to them changed. However, an uncreated Qur’ān, not being fixed in historical time, would have no such limitations. Since it was coeternal with God’s knowledge, it would be truly universal. Being free of the limitations of culture and history, its injunctions would be valid for all peoples and all times.

DIVINE DETERMINISM. Until the modern revival of the teachings of Ibn Ḥanbal, the most important Sunnī theology of divine voluntarism was Ash‘arism. Named after Abū al-Ḥasan al-Ash‘arī (d. 935), Ash‘arite theology sought to recuperate an unrestricted sense of divine agency by promoting a new theory of predestination and a view of the universe that denied the empirical understanding of cause and effect. For the Ash‘arites, all power belongs to God. If God granted people the power of free choice as the Mu’tazilah believed, this would mean that God relinquished some of his power to determine the fate of his creatures. It was absurd to imagine that an all-powerful God would give up his power for any reason. For the Mu’tazilah, God endowed people with choice because human beings, alone among God’s creatures, possessed reason. Since God endowed people with reason, he could not prevent them from using this gift to make their own decisions. For the Ash‘arites, it was absurd to consider anything impossible for God, even if it appeared to be illogical. If God’s power were truly infinite, then even theoretical limitations on divine power were unacceptable.

According to Ash'arism, the Qur'anic verse "[God is the] doer of what he wills" (11:109) means that God is the creator of everything, including the actions of human beings. Al-Ash'arī distinguished between "necessary" and "acquired" actions. Necessary actions, such as shivering from a fever or trembling with emotion, are involuntary. Acquired actions, such as walking, thinking, and making moral choices, are voluntary. In both cases God is the creator and the agent of all human acts; the human being only "acquires" the capacity to carry them out. This is the meaning of the Qur'anic statement "God created you and that which you do" (37:96). A person's acquired capacity (*kasb*) is created by God at the time of the act itself. The human being acquires the capacity to either do or not do an action, like the "yes" or "no" binary switches on a computer chip. However, even these limited choices are not really one's to make. "Acquiring the power to do something" only means acquiring the capacity to do what God has already created one to do. The human being cannot produce anything he was not predestined to make. For Ash'arism, to say that God is all-powerful is to say that human beings are essentially powerless.

The critics of Ash'arism responded that this was merely a reconfiguration of the outmoded doctrines of the Jabrīyah, who believed that human beings had no freedom of choice whatsoever. The philosopher Ibn Rushd (Averroës) of Córdoba (d. 1198) rejected Ash'arite theology as illogical. If both the ability to act in a certain way and the act itself are created by God, then, to all intents and purposes, the human being is compelled to behave in only one way. If the acquisition of an act created by God enables a person neither to "own" the act nor to create it, the act cannot really be described as a "power" possessed by the human being. It would therefore be unjust for a person to be judged by God for committing a sin that did not, in reality, "belong" to him. Despite such inconsistencies, Ash'arite theology became dominant in Sunnī Islam because it provided a relatively simple solution to the problems of divine power and divine knowledge. By basing their arguments on Qur'anic concepts, the Ash'arites could create a Qur'an-based theology more successfully than their opponents could. Mu'tazilite theology also resorted to the Qur'an, but its emphasis on the use of human reasoning in attaining knowledge of God led to the criticism that revelation was either unnecessary or was reserved for those who were unable to think for themselves. Ash'arite theologians also stressed the importance of reason. However, they considered divine revelation and prophetic tradition to be more essential because they provided the guidance necessary for reason to function properly. The Ash'arites saw themselves as taking a middle path between reason and revelation. According to the great Ash'arite theologian Abū Hāmid al-Ghazālī (d. 1111), revelation is understood through tradition, but its underlying truth is understood through reason.

The Ash'arite theology of divine determinism operated in an atomistic and occasionalistic universe in which nothing was truly real except God. According to the Ash'arite theory

of atomism, the universe is divided into unbounded particles of matter, quality, space, and time. The related theory of occasionalism asserts that every action or event may be broken down into a series of discrete moments, which are completely independent of each other. Such moments are joined together solely through the agency of God's will. No logical continuity or order connects a series of events. To Ash'arite theologians, the act of hitting a ball with a polo mallet was not perceived as a single motion. Instead, swinging the mallet and striking the ball were seen as a series of separate events, in which the mallet is brought closer and closer to the ball, until it finally strikes it. This illusory view of reality can be compared to a strip of movie film, in which what appears to be a single action is in reality a series of images of different events, which only seem to be continuous because of the speed at which they pass through the projector. In Ash'arite occasionalism, objects, actions, and events exist only for a single moment. They appear to have continuity only because they are re-created by God in a series of instantaneous creations. This view of reality rejects the notion of "nature" or even of a natural order. Everything is possible for God, who can change reality at any time. No limitations of divine power are allowed to exist.

Ash'arite occasionalism accepted neither the reality of continuity nor the law of cause and effect. Instead, the regularity of natural occurrences was explained by "habit" or "custom" (*'ādah*), which God may change at any time. A miracle was simply a paranormal event (*kharq al-'ādah*), literally, a "ripping" of the fabric of custom. A miracle seems impossible because it goes against normal expectations. However, from the point of view of Ash'arism, a miracle is essentially normal. Because God creates and re-creates everything at every moment in time, all creation is a miracle. What we think of as a "miracle" is simply an example of God changing his *sunnah*, his customary way of doing things. Šūfīs adopted this concept of paranormality to explain their own doctrine of the miracles of saints. Most Šūfīs were proponents of Ash'arite theology, and most Ash'arite theologians accepted Sufism as a legitimate expression of Islam. The Ash'arite doctrines of divine voluntarism, divine omniscience, predestination, and occasionalism can all be seen in the following verses, taken from an ode by the Spanish Šūfī Abū Madyan (d. 1198). The reference to the Arabic letters *kāf* and *nūn* in the poem recalls the divine command *Kun!* ("Be!"), through which God continually brings things into existence (Qur'an, 2:117):

All praise is yours! There is no granting what you forbid,
And no forbidding what you abundantly bestow.

Your will is preordained and your judgment is piercing,
Your knowledge encompasses the seven heavens and the Earth.

Your command subsists between the [letters] *Kaf* and
Nun, [And is executed] more swiftly and easily than the
blink of an eye.

When you say, "Be!" what you say has already been, And
your enunciation of it is never repeated.

You were, and nothing was before you; you were, and
nothing was Other than you, yet you remain when
mortal beings die.

You determined the fate of creatures before creating them,
And what you determined was a predestined command.
(Cornell, 1996, p. 150)

CREATIVITY AND INTENTIONALITY. Abū al-Ḥasan al-Māturīdī (d. 944) of Samarkand, a contemporary of al-Ashʿarī, developed a theology that split the difference between the Ashʿarite doctrine of divine determinism and the Muʿtazilite doctrine of reasoned choice. Although his ideas are often taken as a critique of Ashʿarism, they were developed independently. Maturidism became influential under the Ottoman Empire (1342–1924), and today it is accepted as a variant of Ashʿarism. The most important difference between the two theologies lies in the balance between divine voluntarism and human agency. According to al-Māturīdī, actions are shared between God and the human being. When an action is attributed to God, it is called “creation” (*khalq*), and when an action is attributed to a person, it is called “acquisition” (*kasb*). God’s actions are essentially creative. They include miracles and other phenomena that the human mind cannot fully comprehend. God also creates the potential for human actions, but human beings are responsible for what they actually do. By being responsible, they “acquire” the act for themselves. Reward or punishment is the moral consequence of a person’s intention (*nīyah*) to act in a certain way. Since Maturidism separated intentions from actual behaviors, it was better able than Ashʿarism to account for apparent paradoxes of the divine will, such as when an otherwise good person inexplicably commits a crime.

Another contribution of Maturidism was a theory of knowledge that balanced the dictates of reason and revelation. Al-Māturīdī was highly critical of blind traditionalism. This was particularly important with respect to notions about God, because the Qurʾān admonishes believers not to blindly follow their forefathers (43:23). Knowledge is of three types: knowledge from the senses, knowledge from testimony, and knowledge from reason. Knowledge from the senses includes knowledge from experience. One who denies the truth of empirical knowledge is unreasonable because he denies what he observes with his own eyes. Knowledge from testimony is what we would today call “history.” This includes the testimony of the Qurʾān and the *sunnah*. Such testimony is believable because God stands behind the teachings of the prophets. However, the most important type of knowledge is from reason. Reason is the critical faculty by which we assess empirical and historical forms of knowledge. Reason enables us to understand the divine wisdom in creation. Without submitting the testimony of the prophets to reason and experience, the human being falls into traditionalism. Without submitting empirical knowledge to reason and revelation, the human being falls into materialism (*illḥād*), which medieval Muslims likened to atheism.

THE ONE IN THE ALL. Today’s limits of Islamic theology are marked by Wahhabism and Sufism. The elimination of the

falsafa tradition of Islamic philosophy by the end of the thirteenth century and the decline of formal Sunnī theology during the Ottoman Empire led to the legalistic fideism that dominates Sunnī theology today. Most of what is left of these traditions has been subsumed into Shiism, as represented by the writings of Mullā Ṣadrā of Shiraz (d. 1641). Wahabbism, which was founded in the eighteenth century by Muḥammad ibn ʿAbd al-Wahhāb (d. 1787), goes beyond normal Sunnī fideism by advocating an extreme form of traditionalism. Its approach to divine unity relies on a literal reading of Qurʾān and *ḥadīth* that avoids rational speculation on the nature of God and his attributes. It also avoids the interpretation of ambiguities in the Qurʾān and even denies the metaphorical nature of certain Qurʾānic verses. Instead, Aḥmad ibn Ḥanbal’s theological formula of *bilā kayf* (literally, “without how”) is employed to assert that God has “hands unlike other hands,” or “a face unlike other faces.” Questions left unanswered by traditional sources are not to be investigated at all. The Wahhābī abandonment of rational interpretation has led their critics to accuse them of theological simple-mindedness and of anthropomorphizing God and his attributes.

Ṣūfī theology stands at the opposite pole from Wahhabism in that it does not reject hermeneutical inquiry. It confronts the paradox of divine transcendence and divine immanence by recognizing that the concept of divine unity must allow for the transcendence of number. Ṣūfī theology has been neglected in modern scholarship, especially in the Islamic world. In part, this has been the result of a Western emphasis on the concept of mysticism, which tends to overlook the use of reasoned arguments in Ṣūfī treatises and focuses instead on “ineffable” spiritual experiences. The identification of Sufism with mysticism has, in turn, affected the image of Sufism in Muslim countries, where it is often dismissed as nonrational or inauthentic. In particular, it is accused of incorporating ideas from Hinduism or Buddhism into Islam. In premodern Islam, however, Ṣūfī theology was the subject of lively debates, and the onus was on the opponents of Sufism to prove why this tradition was not authentic, rather than the other way around.

Abū al-Qāsim al-Junayd (d. 910) of Baghdad was one of the founders of Ṣūfī theology. Like other Sunnī theologians, he sought to combine Qurʾān and *ḥadīth* with a reasoned approach to interpretation. Unlike non-Ṣūfī theologians, however, he accepted mystical experience as epistemologically equivalent to reason. When combined with reason and revelation, mystical experience, which was known as “unveiling” (*kashf*), led to a direct knowledge of God (*maʿrifāh*) that was superior to the intellectual knowledge (*ilm*) of the theologians. The Ṣūfī reliance on mystical perception, however, did not mean that they ignored other approaches to theology. On the contrary, Ṣūfī treatises are full of discussions of theological issues. Al-Junayd was the founder of the “Baghdad school” of Sufism, which set the standards for Ṣūfī thought and practice. Maʿrūf al-Karkhī

(d. 816), a close associate of Shī'ī Imām 'Alī al-Riḍā (d. 818), was an important forerunner of this tradition. Thus, it may be no coincidence that both Sufism and Shiism shared an interest in the paradoxical nature of divine unity.

For al-Junayd, the creedal pillar of *tawhīd* meant “singling out the eternal from that which is created in time” (Abdel-Kader, 1976, p. 70). A later Ṣūfī, 'Alī al-Ḥujwīrī (d. after 1072), glossed this definition in the following way: “You must not regard the eternal as a locus of phenomena, or phenomena as a locus of the eternal. You must know that God is eternal and that you are phenomenal, and that nothing of your genus is connected with him, and that nothing of his attributes is mingled in you, and that there is no homogeneity between the eternal and the phenomenal” (al-Ḥujwīrī, 1976, p. 281). Understood this way, there is nothing distinctively “Ṣūfī” about al-Junayd's definition. It even earned the approval of the Ḥanbalī theologian Ibn Taymīyah (d. 1328), who was one of the most influential opponents of the Ṣūfīs.

However, another possible interpretation of al-Junayd's definition is more problematical. “Singling out” the eternal from that which is created might be understood to mean that God could be found, or at least identified, within his creation. Al-Ḥujwīrī alludes to this when he warns: “When the eternal is believed to descend into phenomena, or phenomena to be attached to the eternal, no proof remains of the eternity of God and the origination of the universe; this leads to materialism. In all the actions of phenomena, there are proofs of unification and evidences of the divine omnipotence and signs, which establish the eternity of God, but men are too heedless to desire only him or to be content only with keeping him in remembrance. Ḥusayn ibn Mansur [al-Ḥallāj, d. 922] said: ‘The first step in *tawhīd* is the annihilation of separation’” (al-Ḥujwīrī, 1976, p. 281).

Muḥammad “Muhyiddin” ibn al-'Arabī (d. 1240), arguably the most influential Ṣūfī theologian, agreed more with al-Ḥallāj's statement than with al-Ḥujwīrī's warning. Many of Ibn al-'Arabī's writings discuss the issues of separating the eternal from the temporal and finding the one in the many. In the chapter on Noah in *Fuṣūṣ al-Ḥikam (Ring-Settings of Wisdom)*, he summarizes the theological paradox of divine unity in the following poem:

If you speak of transcendence, you are restricted. If you speak of immanence, you are limited.

If you speak of both matters, you are complete. You are an Imam and a master of spiritual knowledge.

He who speaks of joining is a polytheist. He who speaks of separating affirms unity.

Beware of immanence if you are a dualist! Beware of transcendence if you are a Unitarian!

You are not he; yet, you are he and you see him in The essences of things both boundless and limited! (Ibn al-'Arabī, 1980, p. 70)

For Ibn al-'Arabī, divine immanence means that God can be “found” in worldly phenomena. In Arabic, the verb “to

find” is *wajada*. The experience of finding is *wijdān*. Most works on Sufism translate *wijdān* as “ecstasy.” This obscures the theological importance of the term for Ibn al-'Arabī. One “finds” ecstasy in *wijdān* because he or she perceives, or “finds” God in the essences of things. Ibn al-'Arabī extends the metaphor of “finding” to all of existence, which in Arabic is denoted by the term *wujūd*. Existence is where the perceptive believer “finds” God. In other words, the world is a theater for the manifestation of the Absolute. Before creation, while possible things are in a state of nonexistence, God is the only existent. At their creation, things “acquire” existence, much as human beings “acquire” moral responsibility in Ash'arite theology. The Qur'an states: “We did not create the heavens and the Earth and all that is between them but in Truth” (15:85). For Ibn al-'Arabī, this verse holds the key to the paradox of divine unity. Things and their effects “find” their way into physical existence through the divine names: “Since the effects belong to the divine names, and the name is the named, there is nothing in existence but God” (Ibn al-'Arabī, 2002, p. 138).

In *al-Fūṭuḥāt al-Makkīyah (Meccan Revelations)*, Ibn al-'Arabī states that no theological subject is more resistant to human reason than the transcendence of number. Because numbers are usually conceived as serial integers and are believed to bestow qualities on the things they designate, it is difficult to understand how the many are dependent on the one. Commenting on the anti-Trinitarian verse of the Qur'an: “They disbelieve who say ‘Verily, Allāh is the third of three’” (5:73), Ibn al-'Arabī notes that the person who says “Allāh is the fourth of three” is not an unbeliever. If God were the third of three, he would be of the same genus (*jins*) as the other two. This is the theological sin of *shirk*, associating partners with God. However, as the “fourth of three,” God would not be of the same genus as the three, so he is not one of them. Therefore, God is one for any group or plurality, but without becoming one of its kind: “He is the fourth of three, so he is one; the fifth of four, so he is one; and so on indefinitely” (Ibn al-'Arabī, 2002, p. 137).

Ibn al-'Arabī explains this theological principle in terms of algebra or set theory. Medieval Muslims called algebra *al-jabr wa al-muqābalah* (literally, “determination and juxtaposition”). God is the fourth of three as in the algebraic expression $(x + y + z) a$. The letter *a* is part of the expression because it is juxtaposed with the terms in parentheses, but it is not part of the set $(x + y + z)$. In the same way, Allāh can be “found” in the expression of his creation, but he is not part of the same set, or genus. This principle is also a key to the paradox of divine unity because it demonstrates how God can be transcendently separate and immanently involved with his creation at the same time. “This is what is called Allāh,” observes Ibn al-'Arabī. God is the existence manifest in the forms associated with the sites of his manifestation, but he is not of their kind. In his essence, he is Necessary Being, whereas created possibilities are “necessary nonexistence” in their essences eternally (Ibn al-'Arabī, 2002, p. 136).

GOD: AFRICAN SUPREME BEINGS

African supreme beings are spiritual beings or divinities who are as varied as the peoples of sub-Saharan Africa, the world's second largest continent after Asia. Belief in a supreme being is universal among most of the over sixty peoples of Africa. Supreme beings carry a distinct and unique quality in African cosmology as creators with all other supreme attributes in the theocentric universe. The nature, characters, and attributes of the African supreme being reflect indigenous religious orthodoxy prior to the introduction of, and in spite of, the influence of Christianity and Islam, and these qualities reflect the continuing diversity of the African peoples' traditional sociopolitical structures and languages within the current modern nation-states. The African supreme being is usually associated symbolically with the varieties of indigenous cultures of the peoples. The indigenous concepts and conceptions of most African supreme beings have been retained by the adherents of the religions that were introduced into Africa in the ritual practices and the translations of the sacred texts (Bible and Qurʾān) of those religious traditions.

BASIC COMMON VIEWS. The diversity of cultural forms and linguistic differences of Africans, notwithstanding the relationships of African supreme beings to the created order (including the human, spiritual, and other entities), reveal to a great extent a certain uniformity and similarity in the nature, attributes, and powers of the supreme beings.

Mythologies: creation and existence. The different groups of Africa have developed myths around their supreme beings' transcendence and immanence. Africans' perceptions towards supreme beings, though varying from one people to the other, express certain basic patterns that reflect African social organization and hierarchical structures, including relationships between elders and youths and humans' interconnections with natural phenomena. The three interrelated elemental dimensions—the sky, the earth, and the underworld (beneath the earth)—are believed to be peopled by different categories of spiritual and physical beings, and all are connected in certain relational ways to the supreme being.

Most mythic narratives of African peoples hold the supreme being responsible for the creation of their universe, including the earth and sky, human beings, and spiritual beings. In some sense, cosmogenic and cosmological myths serve the social and political functions in the diverse tradi-

tional political groups of African communities, particularly the ways in which different ethnic groups came into existence. Most of the myths affirm that the supreme being delegated to lesser spiritual beings the responsibility of creating the local universes of Africa, and the supreme being is always credited with the creation and allotting of what each community considers to be the essence of human beings (including destiny and predestination). Thus, the entire creation is held to be dependent upon the supreme being, who is acknowledged to be at the apex of the cosmic structure. This is the general notion on which rests the concept of an intermediary in African religion, which is also reflected in African social and political setting. Many of the myths are handed down through many generations. They are often told in traditional language by priests of indigenous religious traditions and by elders.

Names: ancient and descriptive. The names of African supreme beings reflect the different African language groups. Within some nation states there are more than 250 languages, as in Nigeria, within others more than one hundred, as in Tanzania, and within some others more than forty, as in Kenya. Most of these names are encoded in etymologies which describe the qualities and functions of such supreme beings. Generally, the names used for the supreme being of every African people are classifiable into two groups: the ancient or primary local names, and the descriptive or secondary names. Ancient or primary names are those that are generally used by older and elderly members of the communities. Examples are Olódùmarè of the Yoruba of Nigeria and Mulungu of the Bantu-speaking peoples of East Africa. Ancient names express the inexplicable nature, character, essence, and attributes of a being who is an almighty, all-powerful, ever-present creator, and who is supreme in all senses of supremacy. The unknowable character of gods' names illustrates power and secrecy beyond human imagination or conception. Although the meanings of the ancient names are not easily explained by common sense or etymological interpretation, due to nonusage over a long period of time, descriptive names have etymologies that express the perceived knowledge and living experiences of peoples in their mundane situations. Furthermore, the etymologies of the descriptive names divulge intrinsic and functional meanings and functional spatial locations which identify supreme beings with the nature of such locations.

The names of the supreme being generally reflect the nature of African universe and sociopolitical structure, and they describe the people's perception of their conditioned environment and the polarity of the supreme being. The names describe the benevolence and activities of the supreme being on the people's life experiences. Both the ancient and descriptive names of the supreme being, however, express an intrinsic reality of the supreme being. It is important to note that each African people also have local names, from which one is adopted for common use by the general public.

Attributes: being and expression. There is a close relationship between the conception of the traditional claims of

historic religions and those of Africans concerning the attributes of the supreme being. The conceptions of African supreme beings are similar to those of most Western and Eastern religions with regards to Godly characteristics, which include omnipotence, omniscience, omnipresence, transcendence, immanence, benevolence, and so on. These attributes express a complex relationship between the supreme being and other entities, human and nonhuman, animate and inanimate, visible and invisible, material, and spiritual. However, the degrees by which each African people express their supreme being differ in intensity and quality, and these are expressed in the indigenous names which each African group gives their supreme being. Some supreme beings, and particularly divinities who serve as intermediaries of supreme beings, also exhibit certain human negative behavioral attributes such as anger and fury. These attributes are manifested in such natural occurrences as thunder, storm, wind, whirlwind, thick cloud, running streams, beaming oceans, and so on.

Relationship to spiritual and human beings and other cosmic entities. Cosmogenic and cosmological myths detail different levels of relationship between a supreme being and other entities. The relationship with other spiritual beings or deities is expressed in stories about the creation and maintenance of the universe. These deities in most cases play the role of intermediaries between the supreme being and human beings. As guardian agents of morality, they function to maintain an ontological equilibrium on behalf of the supreme being. Thus, in ritual practices, these spiritual beings who populate the physical universe are popular and influential among human beings but are limited in power. Some of the deities bear the ritual sacrifices to the supreme being as sacred meals of appeasement and restoration. The supreme being has a close relationship with natural phenomena such as trees, oceans and seas, mountains and hills, the sun and moon, rainbows, and so on. Nature and the natural as well as physical locations of these phenomena are generally noted to have an effect on the people's conception and description of the supreme being. Natural phenomena provide avenues for hierophanic appearances (manifestation of the divine) by the deities who manifest aspects of the supreme beings. Some natural phenomena also serve as altars on which sacred meals are displayed as sacrifices for the deities to feed on, and they possibly carry some of the sacrifices to the supreme being. Africans' attitude to natural phenomena and their recognition of the deities as intermediaries between them and the supreme being have strongly influenced the derogatory description of African religious traditions as polytheism and fetishism by early anthropologists as well as missionaries.

The moral aspect of the relationship of the supreme being to the African universe reveals the polarity of the being who is essentially good, and yet whose works of creation directly or indirectly lead to misfortunes, chaos, and crises. The polarity is often explained by the concepts of free will and determinism, by which the supreme being operates in the

theocentric universe. This idea is variously expressed in African mythologies that the supreme being creates certain spiritual beings and deities to whom he delegates responsibility for creating other universal entities, including human beings.

In African cosmology, the relationship of the supreme being to human beings is crucial because it has moral implications for human and universal harmony. This is a continual relationship in the interminable process of creation, particularly as it provides for reincarnation, which depends upon the quality of life which an individual person lives as a human being in the universe. As in some Eastern religions, a person who lives a worthy life on earth is accepted into ancestral status, and a person who lives a degenerate life reincarnates into a lesser being such as an animal and plant. Africans do not hold their supreme beings directly responsible for imperfection in creation, but they do attribute fault and imperfection in creation to the deities who are involved in the process. African myths attempt to justify deities on the grounds that each represents an aspect of the supreme being, and as such they only serve to check human excesses, bring order to chaos, and maintain an ontological equilibrium in the universe, which has been desecrated by human beings. Thus, human beings are liable for their actions and must accept responsibility for the consequences of the choices they make in their lives.

Anthropomorphic descriptions. The African supreme being is described in anthropomorphic terms which reflect to great extent human biological and social functions such as fatherhood and motherhood, and human physical and domestic activities and cares. In all, the role of the supreme being is conceived as encompassing both masculine and feminine roles in a gendered African universe. Most African myths reveal that the African supreme being, after the first order of creation, either retreated or traveled to the high heavens where he resides. Such retreat or withdrawal is claimed to be a consequence of human beings' misbehavior or disobedience. It can be argued that, contrary to the unduly negative assessments of Western writers, the withdrawal of the supreme being does not indicate that Africans hold their supreme being as distant and unreachable, for they always acknowledge him, not only through the intermediaries but directly as well.

SUPREME BEINGS IN LOCAL GEOGRAPHICAL CONTEXTS. The supreme beings selected here for specific discussion do not represent the totality of the conceptions and imaginations of the numerous African groups; instead, they have been chosen because of the popularity that has been accorded them in academic study and scholarly writings and analysis. Secondly, most of them represent large populations of people who have regarded themselves as kingdoms, especially before the colonial partitioning efforts that led to the current modern states. The supreme beings that are discussed here are selected from various parts of Africa—East, West, Central, and southern Africa—where indigenous cultures still flourish as regards the notion of indigenous African supreme beings:

Amma, Nyame, Ngewo, Olódùmarè, Osanobwa, Chukwu, Kwoth, Mulungu, Nzambi, Nhialic, Ndjambi, Ngai, and uNkulunkulu.

Amma. Amma is the supreme being of the Dogon people of Mali. The Dogon attributed the creation of everything in the world, including human beings, earth, stars and so on to Amma, the supreme being. However, the myth of these creations is complex and profound. The myth "serves to demonstrate the rich system of correspondences between the natural order, the social realm, and personal life" (Sproul 1979, p. 49).

According to Dogon mythology, Amma created the heavens and the earth. The creation is envisaged in several stages with the use of sacred "word" by Amma. The first stage was the creation of nature, the second was an attempt to redeem human beings. The third creation included the sacred granary (including the world order of creation) and the rum which is a primary method of communication and symbolic of verbal language and culture. Amma exists in the shape of an oval egg with four collarbones joined together to form four quarters. These quarters contain the four elements of earth, air, fire, and water.

The creation of human beings, summarized by James Thayer, came when Amma placed a seed within himself and spoke seven creative words which caused the seed to vibrate and to extend itself into the image of man. Amma produced a set of male and female twins by dividing the egg into a double placenta that he placed in each of the twins. The twins emanated directly from Amma, and are thus his children. Yurugu, the male twin, due to impatience, broke through the placenta in need of a female. Yurugu did this to replicate Amma's creation. As the placenta tore away, a piece of it became the earth. Yurugu could not find a mate and instead mated with the earth, thereby defiling the earth, which was actually his mother. Amma tried to restore the creation. He made another male twin, Nommo, and then created four other spirits from Nommo. These were the ancestors of the Dogon. Nommo and the ancestors came down to earth on an ark. The ark was filled with those materials that they would need for proper restoration and successful abode in the world. There came light and rain that would purify the earth. It was through Nommo and the ancestors that human beings, animals, and plants were created. The four other Nommo spirits who were created by Amma gave birth to the four divisions of the Dogon and to their social life. Amma transformed Yurugu into an animal, known as "pale fox," that wanders the earth in search of his female counterpart. The diviners use the signs of the "pale fox" that are left on the earth to interpret important events in the life of the Dogon people.

The effect of Yurugu's "incestuous behavior" resulted in darkness, sterility, and death. This was balanced, however, by partial restoration by Nommo who produced light, rain and fertility. Yurugu personifies the night and all those places that are uninhabitable, including dry lands.

Other sets of creation first invented by Amma included the sun and the moon, made through the process of pottery. Dogon myth states that the sun is a pot raised to white heat and surrounded by a spiral of red copper with eight turns. The moon is the same shape, but the copper is white. The moon was heated one quarter at a time. Amma “took a lump of clay, squeezed it in his hand and flung it from him just as he did with the stars. The clay spread and fell on the north, which is the top, and from there stretched out to the south, which is the bottom, of the world, . . . the earth lies flat, but the north is at the top. It extends east and west with separate members like a foetus in the womb. . . . Its sexual organ is an anthill, and its clitoris a termite hill. Amma being lonely and desirous of intercourse with this creature, approached it. That was the occasion of the first breach of the order of the universe” (Sproul, 1979, 50–51).

However, the termite hill did not allow the passage, and intercourse could not take place. But Amma is all-powerful. He cut down the termite hill and had intercourse with the excised earth. Subsequent intercourse with his earth-wife was easy. Water, the divine seed, was able to enter the womb of the earth, allowing a normal reproductive cycle that resulted in the birth of twins, two beings. The two beings were green in color, half human beings and half serpents who were called Nummo, two homogenous products of Amma, of divine essence like himself. These beings also produced the pair which were present in all water. The pair became the source of all human actions.

Nyame (Onyankopon, Onyame). Nyame is the most common and the principal name for the supreme deity of the Akan people of Ghana. The variations of this name among the Ga of Ghana are Nyonmo, Nyama, and Nyam, which have the same basic connotation and meaning. Other common names among the Akan that are related in etymological interpretation are Nyankopon and Onyankopon. *Nyame* derives from two Akan words, *nya*, meaning “to get,” and *me*, meaning “to be full” or “to be satisfied.” *Nyame* is thus interpreted to mean “if you possess or get him, you are satisfied.” That is, Nyame can be interpreted as the god of fullness or god of satisfaction. The name is also said to be derivable from the root word *nyam*, which can mean “shining,” “brightness,” or “glory.” In the Akans’ worldview, all of these are attributes of the supreme being, but how the idea of the supreme being itself originated is unknown.

The Akan do not possess any systematic account of the process of creation of the universe. There is, however, a strong belief indicated in variants of myths that the creation is credited solely to the supreme being, whatever name it is called. Various accounts specify that the sky was created first, followed by the earth, rivers, waters, plants, and trees. After this came the creation of the first man, called Okane, and the first woman, called Kyeiwaa, as one myth tells. Okane and Kyeiwaa live in a cave. Nyame teaches the couple the names of all things he creates. In all the accounts, Nyame is acknowledged as the author, the creator of all things, hence

his praise name Odomankoma and his title Borebore, which means “excavator,” “hewer,” “carver,” “creator,” “originator,” “inventor,” or “architect.” The next stage is the creation of the animals. Nyame orders and provides a structure in the hierarchies for and utilities of the human, animal, and plant species. Nyame is also said to have some divinities who are called his children because they derive their essential origin from him. There are many proverbs, songs, and other oratures which support the Akans’ belief in Nyame as the creator and author of all that exists, including those essential aspects of human life. In *The Akan Doctrine of God*, J. B. Danquah records a stanza from the Akan songs (which are usually played with a talking drum) that praises Nyame as the creator: “Odomankoma, / He created the Thing, / Hewer-out Creator, / He created the Thing, / What did he create? / He created Order, / He created Knowledge, / He created Death, / As its quintessence!” (Danquah, 1944, p. 70).

Ngewo. Ngewo is the name for the supreme being of the Mende people of Sierra Leone in West Africa. The derivative of the name Ngewo is vague. The probable etymology claims that the name derives from Ngele-woo, a combination of *ngele* (sky) and *woo* (long ago), which suggests “in the sky, from long ago.” Another name for the supreme being among the Mende is Leve, which is said to be the much older name that is used almost exclusively by very old people. Leve means “the giver of chicken” or “high one.”

As in some other African communities, Ngewo, the supreme being of the Mende is claimed to be the creator of the universe. The Mende conceive of Ngewo in masculine terms, that is, they regard him as their father. He is also described as being “high up,” and at the same time ubiquitous. As the controller of the universe, whose ultimate authority is affirmed, the Mende attribute their well-being, victory over their enemies, retribution, and defense to Ngewo.

In their book *The Springs of Mende Belief and Conduct* (1968), William T. Harris and Harry Sawyerr present the myth of the creative power and activities of Ngewo. The myth tells of a long ago when Ngewo made the earth and all things in it, after which he made a man and a woman. The myth of the creation of the animals that populate the world is a fascinating one. It is claimed that before Ngewo was called by that name, he was once a very big or great spirit, living in a cave that had a door. His power and authority was so immense that all he said would come to pass. There came a day when he said to himself, “I have all this power, why don’t I use it? I have lived alone for a long time with no one to talk to and no one to play with.” He went to the entrance of the cave and said, “I want all kinds of animals to live with me in this cave.” The animals came in pairs. He closed the door of the cave. After some time he called the animals together and gave them the rules that would continue to guide them, the violation of which would lead them to a terrible consequence. The first item of the law was on food. He said, “I will give you anything you want, food and everything else,

but you must not touch my own food.” The spirit looked at himself, the animals, and the cave, and he said “This cave is too small.” As he turned himself around, the cave became very, very big. The animals became happy as their food also increased to the size of the room. Also, the spirit was happy as he had neighbors to talk to and play with.

The spirit and the animals usually had a very intimate rapport. The animals usually came to greet him. One day, one of the animals came to greet him. As the animal was approaching him, it smelled some sweet-smelling food, saw the food and took some and ate it. The spirit is very knowledgeable, very strict about his rules, and powerful. The animal mysteriously found itself in front of the spirit. The spirit then said, “What brought you here? You have violated my law.” The spirit threw the animal from the cave and said, “You! From now on, your name is cow.” Later another animal also ate the food and was thrown out. This animal the spirit named monkey. This continued until all the animals were given different names and were thrown out of the cave. This was the genesis of why and how all animals and men wander around the world to look for this sweet-smelling food.

The first man and woman who were created by the great spirit usually referred to him as Maada-le (“He is grandfather”). One day Ngewo addressed the two, saying, “Everything you ask me for, if you want it, you shall have it.” Whenever they needed anything, including food, they went to him requesting, “*Maada*, give us this, or *Maada*, give us that.” As he gave it, he would say, “*In ngee*” (Yes, take it.). However, Ngewo saw their constant coming and requesting from him as wearisome and troubling. This made him decide to leave them. He said to himself, “If I stay near these people they will wear me with their requests; I will make another living place for myself far above them.” The people went to sleep one night. They woke up the next morning and looked about, but could not see him. As they lifted up their heads, they saw him Ngawongo waa, (spread out very big) which forms another possible etymology of the word for Ngewo, the supreme being.

The spirit decided to go up far above men and animals, where he is sitting, watching to see who will eat his food. This spirit was later called Ngewo. Although this myth does not reveal the beginning of human beings, the Mende hold Ngewo as their creator and controller of their universe. They pray to him. They regard ancestors as intermediaries between them and the supreme being.

Olódùmarè and Ọlórùn. Olódùmarè is the supreme god of the Yoruba people, a highly urbanized society with large city-state kingdoms in southwestern Nigeria. The origin of the name has been difficult to decipher through etymologies, but Yoruba mythology and conception of this being describe the supreme being as almighty, the first being, and the creator of the world. Olódùmarè is the ancient name of the Yoruba supreme being. The other name that is commonly used and which etymologically identifies the supreme being with the creation and ownership of the universe and

close relationship with the sky is Ọlórùn (one who owns or resides in the sky).

Although Olódùmarè is the creator, he works through hundreds of *òrìṣà* (divinities or deities)—some myths say 201, some say 401, and some say 601. These *òrìṣà* are said to share of the essence of Olódùmarè. After creating the *òrìṣà*, Olódùmarè delegates some *òrìṣà* to create certain aspects of the universe and some to maintain the universe. This networking by Olódùmarè through the *òrìṣà* stabilizes the social and psychological spaces of the human life. Each *òrìṣà* has a different elemental province. Prominent among the *òrìṣà* who were delegated to create are Ọbàtáálá, Ọrúnmilá, Odùduwà, Ọṣun, and Ọguń. There are others who manifest aspects of Olódùmarè in the maintenance of morality and orderliness in the world. Èṣù is regarded as the neutral force who supervises sacrifices; that is, the sacrifices that are prescribed to clients through divination. Èṣù carries the sacrifices to *Olódùmarè*.

To create the world, Olódùmarè supplies some dry soil, a five-toed hen, and a chameleon. Olódùmarè gives the dry soil to Ọbàtáálá to drop on the primordial watery surface in the world. The five-toed hen then spreads the soil on the watery surface. Another version of the myth states that Odùduwà has to complete the creation of the earth because Ọbàtáálá gets drunk on the way to the world. The five-toed hen does the work. The chameleon tests and confirms the habitability of the now-solid space, and the report pleases Olódùmarè. Ọbàtáálá is also assigned to mold the human being with clay, and Olódùmarè breathes life into the figure. Ọrúnmilá is the deputy of Olódùmarè on matters of knowledge and wisdom, which are understood in Yorubá mythology to be intertwined with the concept of destiny. Destiny is said to be enclosed in the “inner spiritual head,” which is molded by another divinity called Àjàlá. Every human being is given or chooses from the many molded heads when coming from heaven. In these heads are contained all that a human being will experience in life. This further illustrates the Yoruba concept of free will and determinism, which holds that God is not responsible for human calamities. Olódùmarè also commands sacrifices to alleviate human sufferings. The way that the interactions of human beings with Olódùmarè and deities are explained is that the deities that are involved in the processes of controlling human beings moderate the activities of human beings in the world. The ordering of sacrifices by Olódùmarè and his deities, and the performance or nonperformance of the sacrifices by human beings, explains the resolution of the complexities and paradoxes of human responsibility in the cosmos. The relationship of Olódùmarè to human beings is a continuous one, as a well-lived life qualifies a human being to enter into the ancestral world.

The nature, character, and emotions of Olódùmarè are manifested through such divinities as Ọguń, Sańgó, Ọṣun, Ọya, and several others. The divinities express the fury and anger of Olódùmarè, as Sańgó does when he draws on thun-

der and lightning. They also give provision, providence, and protection, as the people demonstrate in thanksgiving with votive offerings in times of plenty and bountiful harvest, and in their prayers and petitions in times of adversity and need.

Osanobwa, or Osanobua. Osanobwa, or Osanobua, is the name of the supreme being of the Edo people of western Nigeria. The name is a contraction of four components: *Osa*, meaning “the source of all beings”; *N’o*, meaning “who” or “which”; *B*, meaning “carries” or “sustains”; and *Wa* or *Uwa*, meaning “the world” or “the universe.” Taken together, the name means “the source of all beings who carries and sustains the whole world or universe.” To the Edo people, their god is the creator of the world and the absolute sustainer.

The creation account of the Edo people states that Osanobwa commissions two divinities who share some part of his essence as the “source being” to perform the creation of the earth. Osanobwa is commissioned to create human beings and to continue to control the house or the township, whereas Osanoha is delegated to create animals of the bush and to rule over the place. Osanoha soon becomes jealous of Osanobwa and plans to destroy his work. He builds a house and stores all kinds of diseases therein. When the creations of Osanobwa, men and women, come from heaven down to earth, Osanoha causes a downpour of rain. The people look for shelter from the rain, and the only available place they find is the house built by Osanoha in which diseases are concealed. Unaware of the consequences (unfortunately for them), the people take shelter in the “disease” house of Osanoha, and this is how people carried various diseases into the world. This myth traces the origin of humans and animals to the supreme being as the source being.

Chukwu, or Chineke (Igbo of eastern Nigeria). Chukwu is the supreme being of the Igbo people in the eastern Nigeria. He is also called Chineke. The two names are commonly and interchangeably used in all parts of Igboland, although it is asserted that the names stem from different areas. Etymologically, *chi* in Igbo language can mean “source being” or “the source of being.” It can also mean “spirit.” Both *Chineke* and *Chukwu* are composed of *chi*, which has been accepted as the generic word for god; *Chineke* is *Chi* + *na* + *eke*, the “source being” + “that/who” + “creates,” and *Chukwu* is *Chi* + *Ukwu*, the “source being” + “great,” “im-mense,” or “superlative.” *Chukwu*, then, means “the great source being.” Obasi is another, ancient name of the supreme being of the Igbo, but it is no longer in common use.

Chukwu is said to live away in the depths of the sky, but he is not really so distant, as he takes much interest in the affairs of human being. He is the creator and organizer of the universe. The Igbo people do not have any systematic account of the creation of the world, though the Igbo myth of creation states that Chukwu created the nature deities such as Anyanwu (Sun), Igwe or Amadioha (Sky), Ala (Earth), and so on. These deities are considered to be essential descendant powers of Chukwu; for instance, Anyanwu

(Sun) is considered to be the son of emanation of Chukwu. Deities serve as messengers of Chukwu and usually are delegated to supervise different parts of the universe. The deities serve as the mediators between Chukwu and human beings. Chukwu creates a human spirit and gives him a *chi* (spirit that creates), which determines and dispenses the destiny of a person and protects and guards him. Chukwu controls the material world, offers the world new crops, and organizes the universe through the deities. For instance, it is Igwe who comes in the form of rain to fertilize Ala, his wife, to produce crops for human beings. Igwe also manifests the power and anger of Chukwu in thunderbolts and lightning to discover and punish undetected criminals.

It is important to note that there exist personal, family, and public altars of the supreme being among the Igbo, in contrast to most other African societies. People offer direct and regular sacrifices to Chukwu, as well as to deities in his behalf. Chukwu has several cult symbols, such as a tree planted in front of one’s house. At the base of this tree is left broken pots and plates. P. Amaury Talbot succinctly describes the shrine of Chukwu thus: “The most common symbol of Chukwu is *Ogbu*, cotton, or *Awba* (or *chi*) tree, or sapling or a post, some four to six inches high, usually accompanied by round or flat stones, and a pot or pots, containing water and sometimes yellowwood, eggs, phallic chalk-cones round stones and palm-wine” (Talbot, 1926, p. 41).

Mulungu (Bantu and Sudanese of East Africa). Mulungu is the chief god of most Bantu-speaking peoples of East Africa: the Yao and Zimba of Malawi and Mozambique, the Kamba of Kenya, and the Gogo of Tanzania all recognize Mulungu as their supreme being. Also, the Swahili-speaking peoples of East and Central Africa use *Mungu* as the name of the supreme being. Variations of this name are *Muungu*, *Mungu*, *Murungu*, and *Mvungu*. *Mulungu* and its variations are claimed to be found in more than forty Bantu languages. It is said that *Mumbi*, which derives from a verb meaning “to create” or “to bring into existence,” is an old name among the Bantu. These variations, which supposedly are due to different intonations by the several peoples, could be seen as insignificant in terms of the meanings and conceptions of the supreme being. *Mulungu* is a word of unknown origin, but it indicates the almighty and ever-present creator.

Mulungu is strongly associated with celestial phenomena, as the sky is said to be his abode, the thunder his voice, and the lightning his power. He rewards the good and punishes the wicked. As an instrument of displeasure and punishment, he uses drought. The common myth revolving around Mulungu relates to the creation of the world, the origins of death, the separation of heaven and earth, and the origin of man. Like most African creation myths, the Yao myth states that only Mulungu and the animals existed in the beginning. There was a day when chameleon, one of the animals, was fishing. He suddenly found in his net a pair of human beings, whom he referred to as unknown. He took the man and the woman to Mulungu, who instructed him

(the chameleon) to take them out of the trap and put them down on the earth to grow. This was the first pair of human beings. Mulungu commanded the chameleon to raise the people and teach them the things they would begin to do including the ability to create fire. However, these human beings could not control the fire, and it raged across the earth and drove Mulungu away into the heavens through the rope which Spider spun for Mulungu. Mulungu still interacts with human being in their day-to-day affairs, however, particularly when human beings violate moral order. Mulungu is by nature benevolent. Although no formal cult is made for Mulungu and prayers are rarely directed to him, he is ruler and judge, omnipotent and omnipresent. Prayers are directed to lesser spirits who dwell on the earth to solicit and ensure their benevolence.

Nzambi. Nzambi (whose nickname is Mpungu) is the supreme being of the Bakongo people, a native tribe of the lower Congo River area. According to the Bakongo, Nzambi is the creator of men and all other things, including traditional medicine, which the people believe was given to the first inhabitants at the time of creation and passed on from generation to generation. The medicine is to be used for good, as expressed in their common saying that “if he had not given us our fetishes (*sic*), we should all be dead long ago.” Nzambi is the sovereign master. He is inaccessible and unapproachable. He is believed by the people to have placed human beings here on earth, and he can take them away. As the creator, he is involved in the birth of every child.

Nzambi is invisible and very powerful. He watches a human being, searches him or her out everywhere, and takes him or her away, inexorably, whether young or old. Among the laws of the Bakongo are *nkondo mi Nzambi* (God’s prohibitions), the violation of which constitutes a *sumu ku Nzambi* (sin against Nzambi), and an ordinary sanction of this is a *lufwa lumbi* (bad death). Thus, at the moral level, Nzambi is responsible for punishing violators of his prohibitions.

Nhialic. Nhialic, otherwise known as Jok (“spirit” or “power”) is the supreme god of the Dinka people, a group numbering nearly four million in the southern Sudan region. Nhialic, which means “that which is above [in the sky],” is regarded as the greatest of the powerful and unseen superhuman forces and powers. He is referred to as creator and father. He is the giver of rain from the sky, where he resides. He is also described as the first ancestor of the people.

According to the Dinka myth of creation, Nhialic created the first people, whom he placed in a world of darkness. Nhialic was originally close to human beings, for the earth and the sky were very close to each other. Human beings could ascend to Nhialic freely by climbing a rope that connected them. Nhialic gave Garang and Abuk, the first humans, all the things that they wanted. Nhialic, however, gave instructions on how they should conduct themselves, including how much they could eat, where they could go, and the nature of human interpersonal relationships.

But one day, Abuk, the first woman, took a pestle to pound millet. Unfortunately, as she raised up the pestle she struck Nhialic, who then withdrew from the people by cutting the rope that connected him with them. This is what caused the separation of heaven and earth, and it marked the end of the golden age of Nhialic’s direct protection of man, thus introducing work, suffering, and death.

Another version of Dinka myth states that the separation of heaven and earth was caused by Nhialic’s refusal to yield to Aruu (Dawn), one of the ancestors, to make an opening in the world for people to see, so Aruu split the world in two with an ax, and the sky and the earth were divided to allow light to appear.

The influence of Nhialic on human lives is immense and noticeable, always affecting them for good or ill. Nhialic dispenses punishment to the wicked. Life and health are thought of as gifts attributable to Nhialic. The Dinka, who are mostly hunters, fishers, and subsistence farmers, make regular votive offerings to Nhialic in appreciation for recovery from illness, relief from famine, and success in hunting.

Kwoth. Kwoth, the supreme being of the Nuer of Republic of Sudan, is the concept on which the people’s religion and worldview is centered. The etymology of Kwoth is taken from such actions as “blowing the embers of a fire; blowing into the uterus of a cow, while a *tulchan* is propped up before it, to make it give milk; the blowing out of air by the *bulyak* or puff fish . . . to blow on fire, to blow the nose, etc.” (Evans-Pritchard, 1967, pp. 134–135). Evans-Pritchard claims that the Nuer conceive of Kwoth as being a pure spirit, a creative spirit. Basically, he is identified as Kwoth *nhial*, or *Kwoth a nhial*, meaning the spirit of the heavens or the spirit (who is) in the heavens. As the creator of material and nonmaterial entities, including custom and tradition, Kwoth is the first cause who provides the final explanation as an expression of ultimate rationality. That is, the meanings and origins of all that exist in the world are traced to him. Kwoth is both remote and far. He is both within and above the world. Although his exact nature is difficult to explain, he is said to be ubiquitous, and this is explained from the point of view of wind or air being present everywhere. He is commonly addressed as *gwandong*, a word that has been translated as “grandfather” or “ancestor,” but which literally means “old father.”

Kwoth plays a part in social and personal life. He judges human conduct, sanctioning right conduct and condemning wrong behaviors. Kwoth does this by rewarding a “righteous” person—one who does not violate the taboos of the land—with the good things of life. On the other hand, those who violate the taboos are inflicted with sickness. The gravity of the sickness is said to be the consequence of the seriousness of the taboo on the social order.

It is noted, as Evans-Pritchard remarks (1956, pp. 48–49), that the influence of Christianity and Islam on the Nuer does not affect their conception and perception of

Kwoth. The Nuer hold the view that Kwoth is the same supreme being as the Christian and Muslim God, only called by different names and communicated with in different manners. But the Nuer have a different attitude toward Kwoth when compared with believers in the Christian and Muslim God. They regard Kwoth as their father and friend, even though he punishes human beings.

The Nuer offer both public and private prayers. Apart from the corporate expression of belief in the reality of this supreme being, particularly in ritual prayers, individual dependence on God is expressed in spontaneous prayers, sometimes spoken aloud and sometimes unspoken. Evans-Pritchard's perception of the people's dependence on Kwoth is that of an "intimate, personal, relationship between man and God. This is apparent . . . in their habit of making short supplications at any time. This is a very noticeable trait of Nuer piety." (Evans-Pritchard, 1956, p. 317).

Ndjambi. Ndjambi is the supreme being of the Herero of the Bantu tribe of southwest Africa. He is also known as Karunga by the Ovambo, the neighboring tribe of the Herero. Ndjambi is said to reside in heaven. He is principally regarded as the giver of rain, and his voice is claimed to be clearly heard at the rising of the clouds. There is a great reverence for the name *Ndjambi*, which is not expected to be uttered. His most striking attribute is kindness, and human successes, achievements, and blessings are attributed to him. However, the worship of Ndjambi is not given any cultic form.

Ngai. Ngai, sometimes written as Mogai, is regarded as the supreme being, the Creator, and the giver of all things to the Kikuyu, iGikuyu, Masaai, and Kamba peoples of the Kenya Highlands of East Africa. Ngai's abode is the sky, but his special dwelling place on earth is Mount Kenya, called Kere-Nyaga (mountain of brightness). People face the mount whenever they pray, asking their ancestors for any kind of help. He also visits several places on earth where he makes a temporarily abode. These places are regarded as resting places of Ngai whenever he comes to carry out a "general inspection" among his people. During such inspection tours, he brings blessings and punishment to people, according to their behavior.

Unlike the supreme being of many other African communities, Ngai is approached with prayers and sacrifices that are traditionally offered to him on those special places where he is said to dwell. Certain big and large trees, which are regarded as sacred, are often chosen as places of prayer and sacrifice to Ngai. There are also four sacred mountains at the four cardinal directions of Kenya. Prayers and sacrifices are offered, particularly in moments of communal crisis and disaster, such as drought and epidemic, and for communal needs, such as planting, harvesting, and rites of passage. Prayers are usually accompanied by offering and animal sacrifice. Home-brewed beer and milk are offered to Ngai. These are consumed by the elders, prepubescent children,

and postmenopausal women who attend the sacrifice, and a portion is burned on the fire for Ngai.

Ngai is invoked by chiefs or elders on behalf of the community or, in extreme cases, for personal need or distress. Ngai is approached only after lesser spiritual powers, including the ancestors, have been tried and found wanting. This level of relationship reflects the traditional social and political hierarchical structure and pattern of the Kikuyu society when societal problems or disputes are being resolved.

uNkulunkulu. The development of uNkulunkulu as a supreme deity among the Zulu people, a large ethnic group in South Africa, is shrouded in mystery. The name *uNkulunkulu*, from the Zulu language, is a contraction of words in which a superlative adjective is repeated: *uNkulunkulu* translates as "great, great one" or "old, old one." However, from what one can infer from the Zulu traditional myth on the development of the name, uNkulunkulu appears as a mystical figure. He is also called *Mvelinqangi*, meaning "the first outcomer." The Zulu regard Mvelinqangi as the ancestor of all. Although one oral tradition identifies uNkulunkulu with uThlanga, who is at the same time a man and a woman, the most common myth among the people holds that he is the first man. This myth suggests that uNkulunkulu appears from, or is created by, the breaking off of reeds, or that he comes out of, or breaks off from, a bed of reeds.

uNkulunkulu is "the first outcomer" human being, "the first man," and "the ancestor of all," and all humans are said to be derived from him. His status as the supreme deity and creator among the Zulu may have been occasioned by the influence of Christian missionaries' search for an equivalent of their biblical God; otherwise, uNkulunkulu is merely an early ancestral figure of the Zulu. However, there have been no known descendants from oral histories, narratives, and communal or corporate rituals from which uNkulunkulu could be traced. The Zulu believe that uNkulunkulu is the creator of human beings, that he gives them their social institutions such as marriage and chieftainship, and that he gives them spirits, diviners who would reveal the hidden things of the past and future, and doctors who would treat various diseases among the people.

WORSHIP. Although there is universality of belief in a supreme being among most African peoples, it is correctly asserted that there is no formal worship accorded the being and no organized cults or great temples built for him in most African communities. However, most popular myths about the supreme being express that he is a reality to many people. Most of the myths state that the sky is his dwelling place, which was once much nearer to the earth. Generally speaking, the worship of the supreme being is done through his many intermediaries, who bear aspects of his nature and characters.

Because the supreme being of most African communities is claimed to have his abode or seat in the sky, individual

Names of Notable Supreme Beings in Africa			
Names of Supreme Being(s)	Meanings/Identity	Peoples	Location(s)
Morimo	Creator	Ndebele	Botswana
Naawum	Heaven; Creator of the world; Ultimate cause of everything that happens	Tallensi	Burkina Faso
Imana	Maker of all things	Hutu	Burundi
Kalumba		Luba	Congo
*Mulungu (Muungu, Murungu)	Supreme Deity, Judge, Ruler; Creator, god of storms and rain, formless	Bantu-speaking	East Africa
Mawu, Nyame, Onyankopon	Supreme Deity	Karimojong	Ethiopia
Nyonmo, Nyama, Nyam	Creator	Ewe, Fon	Ghana
Odomankoma	That which is uninterrupted, infinitely and exclusively full of grace." His capacity as creator is called <i>Odomankoma</i>	Ga	Ghana
Nana Buluku	Great Ancient Deity, Creator	Akan and Ga	Ghana
*Nyame, Onyankopon, Onyame	The great being of fullness or of satisfaction; the bright, glorious God of the heaven and earth who is before and gave all things	Ewe-speaking people of Ghana; Fon of Dahomey	Ghana and Dahomey
*Ngai	Creator, Giver of all things	Akan	Ghana, Ivory Coast, Twi and Ashanti
Molimo (Modimo)	Light, Protector, Father	Kikuyu (Gikuyu), Masaai, and Kamba peoples of Kenya highlands of East Africa	Kenya
Nzambi	The Sovereign Master, unapproachable, sustainer of the universe and human beings	Basuto	Lesotho
*Amma	Supreme god	Bakongo	Lower Congo River area
Mulungu		Dogon	Mali
Ndjambi, Karunga,	Heavenly Being	Swazi	Mozambique
Soko	Great or Supreme Deity that resides in heaven	Herero (Bantu)	Namibia (South-West Africa)
Aondo	The great unknown above, or the power above (sky/heaven) that creates and rules all things	Nupe	Nigeria
Temearau	She who creates and sustains all things	Tiv	Nigeria
Ọbasẹ wà odeen		Ijo	Nigeria
Abasi Ibom	Creator, Greatest God who lives above the earth, governor of all	Yakurr	Nigeria (Cross River State)
Osanobwa, Osanobua	Creator and absolute sustainer of the universe	Ibibio	Nigeria (East)
*Olodumare; Olorun	Almighty Being; Owner of heaven	Edo	Nigeria (Mid-west)
Chukwu, Chineke	Great Spirit that creates	Yoruba	Nigeria (West)
Akongo	Supreme spirit, the creator of the universe, the moulder of human beings like a potter; Beginner, Unending, Almighty, Inexplicable	Igbo	Nigeria (East)
Unkulunkulu, Mwali (Mwari)		Ngombe	Republic of Congo
Imana	Maker of all things, creator		Rhodesia (Zimbabwe)
Ngewo, Leve	Creator, Eternal one who rules from the above. Leve is used by old people. This suggests that Leve is an ancient name of their Supreme Being.	Tusi	Rwanda
Meketa, Yataa	One who was in existence long ago before anyone met him or before he was revealed to men; the great one. Meketa is the ancient name, not used in everyday language	Mende	Sierra Leone
(continued)		Kono	Sierra Leone

TABLE 1.

Names of Notable Supreme Beings in Africa (continued)			
Names of Supreme Being(s)	Meanings/Identity	Peoples	Location(s)
*uNkulunkulu	Great, Great One, Old, Old One; Ancient of days, creator of all things, ancestor of men	Zulu	South Africa
Kalunga	Supreme Spirit	Ovambo	South Africa
*Kwoth	Creator, Spirit of the sky	Nuer	Sudan
*Nhialic, or Jok (Juok, Juong),	Creator, father	Dinka	Sudan (Southern Sudan)
Mkulumncandi, Umkhulumncandi			Swaziland
Engai		Arusha	Tanzania
Katonda	Greater of all things in existence, creator and moulder of human beings	Baganda	Uganda
Adronga	Creator, Spirit in the sky and in the stream	Lugbara	Uganda and Belgian Congo
Dondari		Fulani	West Africa
Muluku (Vidye Muluku)	Great Lord, first ancestor	Baluba	Zaire
Chiuta, Lesa, Mulungu, Nyambe	The Great One of the bow (rainbow), Controller, Organiser	Tumbuka	Zambia
Bumba		Bashongo	Zambia
Leza	First Cause, creator of all, heat and cold, famine and disease, Moulder, Constructor	Tonga	Zambia, Tanzania, Upper Congo

and communal prayers are offered to him facing the sky or a special place considered to possess his divine presence—usually “high up.” Generally, no temples are built or priests specifically initiated to serve in the worship of the supreme being. Ubiquitous in nature, no permanent settlement is constructed for him, nor is he localized. Thus, to the Africans, the sky is the face of God. However, among the Ashanti of Ghana there are temples of Nyame where priests serve as attendants, and the Dogon have group altars for Amma, at which the village chief officiates. A few other African peoples have cults for their supreme beings where they organize special and communal ceremonies. At crucial moments and times of crisis when deities or ancestors who serve as intermediaries fail, appeal is made to the supreme being, who is regarded as the highest authority. Certain symbols are also used to depict the characters of God and to express the people’s need for such symbolic intervention at moments of need.

EARLY STUDIES AND CONTEMPORARY APPROPRIATION/ADOPTION. Much has been documented and cited of the impressions of explorers, anthropologists, and Christian missionaries of Africans’ conceptions and perceptions of their supreme beings. Notable among early non-African commentators and writers on African religions include David Livingstone (1813–1873), Henry M. Stanley (1841–1904), Emil Ludwig, and Leo Frobenius (1873–1938). Their works represent the wide range of misconceptions about African religious worldviews, particularly the idea of the supreme being. These misconceptions later formed the basis for, and were

propagated in, the scholarly works of Sir James Frazer (1854–1941), Émile Durkheim (1858–1917), and Lucien Lévy-Bruhl (1857–1939). The effect of the misconceptions on early African converts to Christianity were immense, for the Africans internalized the obnoxious labels of *paganism* and *heathenism*. The labeling came from Christian evangelists who demonized aspects of African indigenous cultures and practices (e.g., food and fruit items, music and drums, dress and dressing patterns, indigenous rites of passage) that were associated and connected with the Africans’ ideas, beliefs, and worship, particularly regarding the worship of a supreme being.

Sir Samuel Baker, in his lecture to the Ethnological Society of London in 1866 (as cited in Eric O. Ayisi’s *An Introduction to the Study of African Culture*), said that “without any exception, they [the Northern Nilotes, and indeed Africans in general] are without a belief in a supreme being. Neither have they any form of worship nor idolatry nor is the darkness of their minds enlightened by even a ray of superstition” (Ayisi, 1980, p. 72). Leo Frobenius, in *The Voice of Africa* (1913) made a similar submission, while giving credence to Islamic civilization in Africa: “Before the introduction of a genuine faith and a higher standard of culture by the Arabs, the natives had neither political organization, nor, strictly spoken, any religion, nor any industrial development” (p. 1f). The often and popularly cited questions of Emil Ludwig (cited by Edward Geoffrey Parrinder in *African Traditional Religion*) strongly expressed the same negative impres-

sion when he exclaimed “How can the untutored African conceive of God? How can this be? Deity is a philosophical concept which savages are incapable of forming” (Parrinder, 1962, p. 9).

However, African indigenous scholars and a few non-African scholars of African religions who have taken painstaking steps to study African traditional religion have challenged the misleading and erroneous assertions of the early scholars. The symposium *African Ideas of God* was an excellent exploration and breakthrough exercise that established the fact that most African peoples have had a belief in a supreme being as part of their worldview and religious praxis. Since 1950, when the symposium was published into a volume, many books and several articles have been written by African authors in support of the African belief in a spiritual being. Most prominent among these scholars are E. Bolaji Idowu, John S. Mbiti, Edward Geoffrey Parrinder, J. Omosade Awolalu and P. Adelumo Dopamu, and Jacob K. Olupona. They observed that long before their contact with Europeans and Arabs, Africans had developed a variety of distinct social institutions, political structures, cultures, and languages that were a product of their indigenous religious worldview, which had its basis in the belief in a supreme being. Understandably, however, the uncodified form of religious doctrines as well as the practical expression of religious life of the Africans (which developed from the respect and humility with which African sociopolitical and civil life is built) did not allow the early observers to objectively assess Africans’ perception of the supreme being.

Conversion to Christianity and Islam, and the civilizing and proselytizing effects of this conversion, contributed to the demonizing process of African concepts of the supreme being, though it also strongly supported the view that Africans had, and still have, a belief in one supreme being, as can be seen in indigenous translations of the Bible and the Holy Qur’ān. These sacred texts use any or all of the indigenous names of African supreme beings described earlier as ancient or descriptive. For instance, among the Yoruba people of Nigeria, the Bible uses the word “Olórun” for God, “Olúwa” for Lord, and “Olódùmarè” for Almighty; the Yoruba version of the Qur’ān uses “Olórun” for Allah, and Olórun is found in day-to-day usage. Despite the deep-rooted seating of Islam among the Swahili people, Mulungu and its dialectal variations (Murungu, Mluku, Mulunguo, Muunguo) are used, and the indigenous names for the supreme being are mostly used instead of Allah. Mulungu is also adopted as the Christian equivalent for God.

With the emergence of the group of independent churches in Africa, there has been a heightened level of appropriation and adoption of indigenous belief systems and Christian tradition. The reason for this is that these churches operate within the indigenous worldview and religious sensibility, using indigenous languages that are full of metaphors and colors that appeal to people’s imagination and sensitivity.

Scholars’ use of the incorrect nomenclature to describe and define African supreme beings can be seen as a consequence of a lack of adequate knowledge of Africans’ worldviews and languages. Early scholars had described these supreme beings as *deus absconditus* (withdrawn god) and *deus otiosus* (lazy god), both of which leave the world of human beings after creating the world. Polytheism—another term used by early Western scholars and early scholars on African religious traditions—is obvious in African religion, but it does not erode the position of the supreme being or African belief in it, because the supreme being is regarded as the finality of their life in thought and expression. Most African peoples regard their supreme being as the source being, creator, preserver, sustainer, and chief—as a sort of creative energy, the first ancestor who supervises all human and spiritual affairs and who operates a systematic structure. The supreme being is associated with lesser deities, ancestors, spirits, human beings, and natural phenomena. He involves all in the creation, maintenance, and administration of the universe. The African supreme being’s association with other spiritual beings, human beings, and natural phenomena, and his involving them in the maintenance and administration of the universe, provides a complexity in the comparative analysis of the definitions and attributes of the African supreme being with the Christian-Muslim God. While Africans have a strong conception of the supreme being, they use a different definition and different attributes, which are directed toward finding meanings to, and explanations of, events, and toward seeking control over human affairs. The processes through which explanation, prediction, and control of human affairs are sought and achieved are explained by the practical involvement of human beings and spiritual agents responsible to the supreme being, who has the ultimate control of the universe.

The current shift in African beliefs and religious conceptions about the supreme being shows the dynamic nature, resilience, and integrative capability of African religion and culture to adapt, adopt, and appropriate other traditions. This ability is found both within and outside Africa, in places like Europe and many parts of the Americas, such as Cuba and Brazil, where African religious traditions have made inroads and are flourishing.
