Sacred space SACRED SPACE

A sacred space is any place recognized for its ability to direct the mind and body to holy matters. The basis for this power varies considerably. Sometimes spaces act like reliquaries—enclosures that mark the deposit of a saint’s remains, or the site of an unusual event such as a vision or manifestation of divine power, or the place where a holy person preached or lived. Alternatively, sacred spaces are often built environments that seek to shape human consciousness toward states of worship or mindfulness. For example, Father Paul Matthias Dobberstein, an immigrant Catholic priest, constructed the Grotto of the Redemption in West Bend, Iowa (a and b), as well as seven other shrines and grottos in the midwestern United States, as spaces meant to awe and fascinate, but also to claim attention for the purpose of reflection and devotion. The beauty

the priest admired in stone was dedicated to the spiritual beauty of Mary. Sacred space is therefore in many instances intended as an aesthetic shaping of consciousness as an act of adoration, an attempt to segregate the worshiper from other forms of life for the sake of cultivating a special dedication to a saint or deity. To that end, many sacred spaces are grand in scale and expensively appointed, particularly those associated with mass pilgrimage, such as the Buddhist temple district of Ayutthya, Bangkok (c); the many cathedrals and public churches of Europe (d); or the Ka’bah (e), the central pilgrimage site among the world’s Muslims, who go there to visit the site where Muḥammad established

the priest admired in stone was dedicated to the spiritual beauty of Mary. Sacred space is therefore in many instances intended as an aesthetic shaping of consciousness as an act of adoration, an attempt to segregate the worshiper from other forms of life for the sake of cultivating a special dedication to a saint or deity. To that end, many sacred spaces are grand in scale and expensively appointed, particularly those associated with mass pilgrimage, such as the Buddhist temple district of Ayutthya, Bangkok (c); the many cathedrals and public churches of Europe (d); or the Ka’bah (e), the central pilgrimage site among the world’s Muslims, who go there to visit the site where Muḥammad established

the faith, a site believed to have been first consecrated by Abraham, and even by Adam. And when they are not at Mecca, Muslims pray each day in its direction, which is registered in every mosque's *mihrāb* (f), the niche in the wall that indicates the *qiblah*, Mecca's direction, and the place where the *imām* stands to address the assembled company of the prayerful. Although the ancient temple is completely gone, Jews visit the last trace of the installation, the wall in Jerusalem (g), for prayer and devotion.

While many Protestants might feel uneasy about the idea of "sacred space" in their practice, the pride they take in building and maintaining their church buildings (h) suggests an enduring commitment to a place set apart, even if its sacredness consists more in the public statement the building makes. In addition to this, however, the interior space fashions a gathering site where the faithful experience a sense of community, which for many Protestants is the primary locus of the sacred. The material architecture, in other words, provides a shell in which the

human architecture of ordered bodies performs the communal event of sacred assembly.

In addition to being built, sacred space is also found in the natural state of trees, rivers, mountains, canyons, or the ocean. The Ganges is the dominant symbol of Hindu piety and is the daily site of ablutions, prayer, burial, and offerings (i). Tree shrines are also a familiar part of Hindu practice. The holy is not understood to be limited to one place or object, but pervades the entire locale, every aspect of the natural and built environment. But the divine may be addressed at one site, marked by a tree or sculpture or image, like the sacred tree reproduced here (j), a station along the road where passersby stop to pray or make an offering or simply to remember the goodness of the deity honored there.

In other instances, sacred spaces are constructed from local materials, which allow for an international religious

tradition to assume indigenous roots. The elaborate reed construction of a compound (k) at Djourbel, Senegal, was built by the followers of a local Sūfi holy man, Serigne Omar Sy, from the same material used to make the pens that write the word of God. Serigne Sy explained that the reed appeared to him in a dream and asked to be honored. Like Father Dobberstein's grotto in Iowa, the reed compound proceeded as a labor of love, in which followers of the Sūfi *marabout* joined to bring the dream to realization.

Still other sacred spaces are designed to recall the natural state of their site or components, as in the Zen rock garden (l) at Ryōanji in Kyoto, Japan. The Japanese Zen aesthetic seeks to amplify the peculiar characteristics of objects such as trees, bushes, rocks, or streams by carefully cultivating their natural setting. By surrounding the rock garden with walls and raking the pebbles into long rows that caress the contours of island-like boulders, the garden evokes a kind of microcosm. Absorbed in meditation, Zen practitioners may experience many levels of reality in a stillness that undermines the mind-body and

human nature dualities that Buddhists believe condemn human beings to suffering and illusion. There is no intrinsic or autonomous power in this space. Its elements may be changed, but when they are, it is in accord with an aesthetic sensibility that recognizes the power of forms to serve as suggestive prompts to meditation.

A final source for sacred space is appropriation: the adoption of a nonreligious form of built environment for sacred purposes. This occurs in modern urban societies with great frequency when small congregations or charismatic religious leaders acquire an abandoned store and convert it to a church or temple (**m**). Given the expense of building anew, storefront churches are an affordable alternative. But convenience is not all they are about as sacred spaces. They offer congregants a space of their own that they modify to suit their practical purposes but also to act as public signage. And the appropriated spaces situate the sacred not in elaborate, dedicated structures, but in small, adapted environments that do not lose in most instances their connection to the surrounding secular world. Many storefront Christian and Spiritual-

ist churches in the United States operate ministries of outreach among the downtrodden and those who suffer from alcohol and drug abuse, broken homes, joblessness, poor health, and chronic poverty. While they might long for wealth, health, and homes in the suburbs, those who belong to or are served by storefront churches often find in them a supportive community organized around charismatic preachers and healers whose churches are outposts in a brutal and dangerous landscape. The sacred is not the space itself, but what happens there.

DAVID MORGAN (2005)

E

CONTINUED

ETERNITY is the condition or attribute of divine life by which it relates with equal immediacy and potency to all times. The notion emerges at the point of contact of three distinct religious concerns. The oldest of these is the question of the state of life after death, especially in light of the continuing presence of the dead among the living as acknowledged in the various forms of the cult of the dead. A later-developing speculative concern is the question about divine creation, especially when creative power is seen as the production in a divine mind of a world of ideas, a *logos* or paradigm made present in this world as in an image. Finally, there is the concern with contemplative or mystical experience, especially when regarded as a way of partaking of the divine life within the conditions of present existence. Reflection on these themes converges upon the notion of a dimension of life that is “vertically” related to the “horizontal” flowing of time, that transcends time without being apart from it.

Because eternity touches each and every time, it is easily confused with the closely related concept of what “always was, is, and will be,” or, in a word, the everlasting. But in its own proper concept, the eternal only “is”; only in the present tense can it be said to be or act in any way. Exempted from all having-been and going-to-be, eternity is familiarly defined as timelessness, in distinction from the everlasting (sometimes also called the sempiternal). The everlasting antecedes and outlasts everything that begins and ends in time, but because it is just as much given over to being partly past, partly future as are things that come to be and perish, it is therefore just as much in time. Eternity, on the other hand, does not transcend finite spans of time extensively, but intensively. It draws the multiplicity of times into a unity no longer mediated by relations of precedence and posteriority and therefore, at least in this specific sense, no longer timelike.

Yet it oversimplifies to call eternity timelessness. Though eternity excludes pastness and futurity, it remains correct to speak of it as presence, which after all is one of the three fundamental determinations of time. In the Platonic tradition, which gave the concept its classical development and passed it on through Muslim and Christian theology

to modern European philosophy, the present tense retains its temporal sense in affirmations concerning eternity. In this way the Western notion of eternity differs from some Buddhist accounts of *nirvāṇa*, into which not just pastness and futurity but presence as well are dissolved. Platonic eternity by contrast is a paradigmatic presence, and the present in time is its partial but authentic image.

The present is called the “now.” Latin metaphysics spoke therefore of eternity as *nunc stans*, a “standing now,” and of time as *nunc fluens*, a “flowing now.” Since the now of time, which is always experienced as having a certain duration, converges under logical analysis toward the limiting concept of the instantaneous, the dimensionless moment of transition, the problem arises whether the eternal Now is itself a kind of frozen instant, a durationless simplicity about which no experiences of life in time are instructive. Remarkably, the single feature most vividly affirmed of eternity by its classic expositors is that it is life, and not just life but divine life, “a god, manifesting himself as he is,” as the third-century CE Neoplatonist mystic Plotinus says in one place (see the following). How does one incorporate a religious discourse in which eternity is divine life into the stark conceptual analyses of pure metaphysics, which seem to lead to a static, almost mathematical abstraction?

The synthesis of logical, psychological, and theological analyses into a rigorous conception of eternity is proprietary to the Platonic philosophical tradition, and is in many ways the single-handed achievement of Plotinus. There are rather complete analogies to the concept in some of the Upaniṣads in India, but in Asia one finds in the main only partial parallels; the metaphysical cake that is the complex Western idea is there cut apart in different ways, so to speak. Pending the outcome of more penetrating philosophical study than the Asian texts have so far received from Western translators and historians, the story of eternity remains at present the story of the Plotinian synthesis, its sources and its influences. The discussion that follows reflects this situation. It reviews, in decreasing detail (1) the classic Platonic conception of eternity as Plotinus understands it, (2) the place of this conception in its own, mainly European, spiritual history, and (3) those points in Indian and Asian philosophy where search for analogous intuitions most plausibly might begin.

PLATONIC ETERNITY IN PLOTINUS. In the Platonic tradition, eternity and time are regularly considered together. They make up in fact a single topic, in the old literary sense of the Greek term *topos* (“place”), where it refers to a particular place in a canonical text. The discussion of eternity invariably proceeds among Platonists as a meditation on the place in the *Timaeus* of Plato where eternity is described as “abiding in unity” and time as an “eternal image of eternity, moving according to number” (37d). At a minimum, this passage imposes the idea that eternity and time are in some respect comparable to one another. But Neoplatonism makes a stronger claim for a vision of eternity and time as extremes of a continuum. Life itself, the interior life of the soul, brid-

ges the gap according to Plotinus, and this makes possible an account of the experience of eternity itself.

In some ways it is an extremely familiar experience. Consider reading a book that one finds completely compelling, that draws one along in apparently inexhaustible attentiveness and interest. Hours can pass unregistered; it can be shocking to discover how much time has passed, and how meaningless that fact seems compared with the inner composure and vividness of the interval. Any activity that is intensely self-collected, full of purposiveness and power, can generate this effect—not just intellectual but also aesthetic, even physical activity such as dancing or athletics.

Experiences of this kind are a threshold for the pure experience of eternity, contemplation. It is important to notice that they are not without duration, indeed they are rich in inner activity and movement. One experiences something like time in them, but a time that arises more than passes, that gives rather than takes. An inexhaustible power seems to well up within oneself. When, as is inevitable, the spell is broken, one speaks of having fallen away from that power, not of the power itself having lapsed.

Plotinus calls this power the life of the Mind, and in order to express its inexhaustibility says that it is infinite, limitless. In earlier Greek philosophy, to be infinite was to be indefinite, without form or intelligibility, wholly a negative condition. Plotinus too portrays the intelligible world of Platonic Ideas as finite, formally and structurally. But grasped within the living Mind that is its origin and substrate, it is limitlessly vivacious, a world “boiling with life” (6.7.12). The living and dynamic quality of eternal Mind is as central a theme in Plotinus as its simplicity and composure, and is expressed in a remarkable passage where he says that “its nature is to become other in every way,” accomplished in a “wandering” (*planē*, as of the planets) within itself that is like a ceaseless adventure on the “plain of truth” (6.7.13).

For the soul that awakens to this presence of mind, the experience is like a homecoming, a coming into oneself rather than a journey to another self or state of existence. The old Platonic image of this movement as an *anamnēsis*, an unforgetting, depended on the Orphic mythical theme of the preexistence of the soul and was therefore easily understood to be a recollection from elsewhere and elsewhere, so to speak. But in Plotinus *anamnēsis* is altogether what it is in Augustine also, an interior conversion of the soul completed in contemplative immediacy—conversion both in the sense of a turning, from distracting cares to tranquil insight, and of a transformation, from the condition of life that is soul to that of pure intellectual apprehension or Mind.

Because the condition of the life of the soul is time, humans fall away from presence of mind in a recurrent downward movement that makes one’s encounter with eternity multiple and episodic. Yet, “if you look attentively at it again, you will find it as it was” (3.7.5). In that contemplation one will be one’s self again, self-possessed and self-contained,

puzzled by the vulnerability to scatteredness and confusion into which the soul falls in time. A traditional term for the self-possession of eternal life is *stasis*, still used in English, and especially in the familiar complaint that the eternity of Greek metaphysics is “static.” This is a fundamental misunderstanding.

Stasis means “staying, standing rather than falling, holding together rather than lapsing into dispersion.” One can get the sense of eternal stasis best from the English word *homeostasis*, as used in biology to name the dynamic composure that the very diverse movements of metabolism and organic activity maintain within a living system. The simplicity and unity of eternal life is that of a homeostasis, a self-enveloping completion that is at the same time the space for an unlimited enjoyment of activity, purpose, and power.

“Hence,” Plotinus writes, “eternity is a majestic thing, and thought declares it identical with the god.” He goes on: “Eternity could be well described as a god proclaiming and manifesting himself as he is, that is, as being which is unshakeable and self-identical and always as it is, and firmly grounded in life.” From this follows the definition: Eternity is “life that is here and now endless because it is total and expends nothing of itself” (3.7.5).

Familiar in the Latin West through the paraphrase of Boethius, “interminabilis vitae tota simul et perfecta possessio” (“the all-at-once total and perfect possession of endless life,” *The Consolation of Philosophy* 5.6), the Plotinian experience of eternity marks the divine life as a presence and opens the route of human approach to this life through contemplative mysticism.

HISTORICAL BACKGROUND AND CONSEQUENCE. The Greek term that translates as “eternity” in Plato and Plotinus is *aiōn*, and this has given many students of the history of the notion pause. *Aiōn* survives in English in the Latinized spelling *aeon*, and here retains much of its original meaning. *Aiōn* means “life, span of life, lifetime; epoch, aeon.” While it never suggests duration simply on the level of measure or standard interval, even the Homeric places where it comes closest to meaning “inner life force” include strongly the suggestion of power to perdure, of life reaching out to take up its proper span of time. It seems a very timelike term, not only because of its connotation of span or duration, but because beginning, middle, and end belong so much to the kind of totality or completion it expresses still in English.

The term first occurs in surviving fragments of early Greek philosophy in the fifth-century BCE writer Heraclitus, in the gnome “*Aiōn* is a child playing a board game; the kingly power is a child’s” (Heraclitus, B52). The translation “eternity” is clearly inadmissible; those translators who instead supply “time” have good cause. Heraclitus’s theme is the spontaneity and immanence of the laws or patterns manifest in the give-and-take of natural processes; the intelligibility of constant change is not outside nature like a god, but the cosmos is in and by itself an “Everliving Fire, flaring up

by measure, dying down by measure” (B30). Under the control of this ruling image, *aiōn* again means a form of completion embracing birth and death and the process that weaves them together.

It is not at all clear to what degree Plato distinguishes between the adjectival form *aiōnios*, “eternal,” and another term *aiidios*, “everlasting.” Because in fact he inclines to the (false) etymology that takes *aiōn* from *aei ōn*, “always being,” he gives place to the very confusion the Neoplatonists are most concerned to prevent. In the very text in *Timaeus* that becomes decisive, he says of *aiōn* that “its nature is everlasting [*aiidios*]” (37d).

Among consequences of this situation is a protracted controversy among the Hellenistic Platonists of the centuries around the beginning of the common era concerning what is called “the eternity of the world.” The question was whether, as Aristotle argues in the *Metaphysics* (12.6), the world is everlasting and has no beginning in time or whether, as *Timaeus* would suggest if its mythical form were given substantive import, the world began to be at some definite time. Alexandrian Jewish and later Christian Platonists tended to join the argument on the latter side, partly through their effort to coordinate the story in *Timaeus* with that of *Genesis*. It should be clear that once the rigorous nontemporal concept of eternity had been established, it was a mistake to call this question the question of the “eternity” of the world, but only Augustine (*Confessions* 11) diagnoses the category mistake with full philosophical precision.

The antecedents of the Neoplatonic conception of eternity lie not in the lexicography of the term’s classical philosophical usage, but in the associations it takes on through the constant interaction of Platonic image and argument with popular religious consciousness. This includes first of all the concern with immortality and afterlife, the context for talk of the eternal life of the soul. Because this concern is profoundly rooted in the archaic, mythological sensibility and its experience of the structure that Mircea Eliade has called “eternal return,” it made available the notion of another time, a transcending and divine time that could intersect with mundane time, embedding life in a dimension that surpasses birth and death. The eternity that can be abstracted from this archaic experience is an eternal past more than the eternal present of the proper concept; fundamental imaginative possibilities were appropriated from this origin. The mediating religious context was in large measure the emergence of the mystery religions in the Greco-Roman world, among them the mysteries of baptism and of table blessing central to Christianity.

Aiōn in the New Testament is principally an apocalyptic term, qualified as “this aeon” as against “the aeon to come” (synoptic Gospels, Paul). It shares with the rest of the apocalyptic scenario a Persian, Zoroastrian background, and in a few Pauline or deutero-Pauline places (e.g., *Col.* 1:26, *Eph.* 3:9) seems to be personified in the sense of an equation of Aion with Zurwān, an equation that sets the stage for the

florid multiplication of such personified aions in the gnostic literature of the second century CE. Though there has been speculation that this kind of connection between Mediterranean and Near Eastern symbolism contributed to the emergence of the novel Neoplatonic sense of *aiōn*, it seems preferable to portray this as a digression.

A richer question is whether “eternal life” in the *Gospel of John* is consonant with the radical Platonic idea, or already on common ground with it. The predominance of present-tense statements by the glorified Son in that text (“Before Abraham was, I am,” *Jn.* 8:58, et al.), its transformation of apocalyptic into realized eschatology, and its eucharist of epiphany and participation (“He who eats my flesh and drinks my blood abides in me, and I in him,” *Jn.* 6:56) made it possible for Christian Neoplatonism of the Augustinian type to embrace the strict nontemporal eternity without sensing any violence in its interpretation of scripture.

The story of the appropriation of Plotinian contemplative mysticism by later Christian and Muslim theology defeats summary. Suffice it to say that the Neoplatonic system was adapted to biblical monotheism with considerable penetration and accuracy, especially by Augustine and the Latin tradition through Boethius and Bonaventure, by the apophatic tradition from Dionysius the Areopagite through John Scottus Eriugena to Meister Eckhart, and by Sūfī philosophy. The close connection between the theoretical role of eternity as an attribute or name of God and its experiential richness as an element of contemplative spirituality remained characteristic of these traditions.

A certain purely logical interest in the eternity/time contrast, detectable already in Boethius (responding more to Porphyry than Plotinus) and Thomas Aquinas, was amplified by the new mathematical spirit of the metaphysics of the seventeenth century, resulting in the reduction of eternal presence to a kind of schematic simplicity illustrated particularly clearly in the system of Spinoza. The effect was to dissociate the speculative notion from its experiential basis, producing in the end the degraded conception of eternity as lifeless stasis or logical tenselessness that has been the target of complaint in historicist, existentialist, and process theologues of the past century.

ETERNITY IN NON-WESTERN THOUGHT. It is a commonplace that the religious themes of afterlife, divine creation, and the nature of the soul are drawn together in different patterns by non-Western traditions. The Buddha is represented as holding that speculation on none of these furthers one toward enlightenment. It is no surprise to find that a concept like eternity, which emerges at the intersection of these themes in Platonism and then becomes influential precisely through its adaptability to biblical theology, does not always have strict analogies in other religious discourse.

The exegetical and hermeneutical complications that derive from this situation have not always been registered in the translations of non-Western sources. Only some prelimi-

nary pointers about other treatments of eternity are here appropriate.

The striking parallels that are being discovered between Neoplatonism and Vedānta philosophy appear to hold also in the case of eternity. The Sanskrit *nitya* can be translated “eternity” with some confidence already in Upaniṣads, especially at the point where “immortality,” *amṛta*, is pressed beyond the popular image of outliving death, or life after death, to the radical notion of *mokṣa*, “liberation,” deliverance from the cycle of birth and death itself. The fundamental conception in the Upaniṣads that the authentic self, the *ātman*, gathered into its own interior unity from the levels of psychic life, is one with *brahman*, the universal spirit, is developed in ways that regularly parallel the account of the authentic self on the level of the *Nous*, or divine Mind, in Plotinus. It is less clear, however, whether the eternal present, self-consolidated beyond all passage through birth and death, is to be found in the Vedas.

Buddhism presents a much more complex situation. The negative assessment of timelike continuity and the rejection of substantiality and causality that are frequent in Buddhist philosophy lead to descriptions of enlightenment that often have a Platonic ring. In Buddhism, the parallels are particularly pronounced in the meditative traditions that emphasize “sudden enlightenment,” where the unconditioned and spontaneous quality of transcendental insight (Skt., *prajñā*) is stressed. In the Mahāyāna Pure Land tradition, the paradisaical Sukhāvātī (“land of bliss”) of the Buddha Amitābha is sometimes developed in ways reminiscent of the Platonic world of ideal presences, pervaded by divine mentality. If there is an authentic parallel here to the notion of eternity, this will have to be tested by careful analysis of the account of temporal presence itself, for it is this that is ascribed to eternity by Platonism, and in turn made the image of eternity and mark of authentic being for life in time. In those radical portrayals of *nirvāṇa* as release from all forms of temporal conditioning, not just pastness and futurity, but presence itself sometimes seems to be denied of awakened mind.

A focal problem in the search for analogy to eternity in Chinese thought is the proper account of the first line of the *Dao de jing*, often translated, “The Dao that can be spoken is not the eternal Dao [*chang dao*].” “Eternal” may overtranslate *chang*; the core meaning is closer to “steadfast,” “constant,” “abiding.” The parallel seems strongest to *aiōn* at the stage it had reached in Heraclitus. It needs study whether the idealization found in the Vedānta or late Platonic pattern is appropriate for interpretation of this text.

Special wariness should be reserved for the use of the phrase “eternal life” in describing prephilosophical doctrines of immortality and afterlife, or “eternal return” for the transcendental relation of divine life to mundane in the experience of cyclical time that is fundamental in myth-using cultures. Most commonly what is meant by “eternal” in this context is “perpetual” or “everlasting.” Whether the primordial time of beginnings, the transcendent past of divine cre-

ative action, is a predecessor of the eternal present is a separate question that needs careful consideration. While the proper notion of eternity may be very near the surface in Egypt, it is much less likely to exist in the preliterate cultures for which the cycle of death and rebirth is a naturalistic image more than a philosophical idealization.

BIBLIOGRAPHY

The concept of eternity is still most accessible from primary sources, notably the treatise "On Eternity and Time" of Plotinus, *Enneads* 3.7.45, in *Plotinus*, translated by A. Hilary Armstrong, "Loeb Classical Library," vol. 3 (Cambridge, Mass., 1966), and book 11 of the *Confessions* of Augustine, for which there are many suitable editions. An instructive summary of the concept in the full technical development it received in medieval theology can be found in the article by Adolf Darlap and Joseph de Finance, "Eternity," in *Sacramentum Mundi*, edited by Karl Rahner (New York, 1968), vol. 2. Mircea Eliade's *Cosmos and History: The Myth of Eternal Return* (New York, 1954) remains a standard introduction to the role of a transcending divine time in the religious experience of myth-using cultures. A very helpful account of eternity is incorporated into a sketch of the history of the idea of immortality in the ancient Near East and Christian Europe by John S. Dunne, *The City of the Gods* (Notre Dame, Ind., 1978). The classic exposition of the interior experience of eternity in Western mysticism is Bonaventure's "The Soul's Journey into God," in *Bonaventure*, edited and translated by Ewert Cousins (New York, 1978). For eternity in Indian thought, the edition of *The Principal Upaniṣads* by Sarvepalli Radhakrishnan (New York, 1953) is especially useful, both for its extensive introduction and its very rich annotations, which include frequent citation of Western parallels.

PETER MANCHESTER (1987)
Revised Bibliography

ETHICAL CULTURE, a movement dedicated to the ethical improvement of society and the ethical growth of the individual, was inaugurated with the founding of the New York Society for Ethical Culture in May 1876 by Felix Adler and a group of his Jewish supporters. Adler was the son of Rabbi Samuel Adler of New York's Temple Emanu-El, and he was expected to succeed his father in this cathedral pulpit of American Reform Judaism. But having been exposed in German universities to nineteenth-century science, Kantian philosophy, and historical criticism of religion, he came to reject theism and the finality of Jewish theology even in its most liberal form. His new faith consisted of a passionate belief in the inviolability and power of the moral law and the duty to apply it to society, especially to the problems of industrialization, urbanization, and the working poor.

What initially began as a Sunday lecture movement, somewhat patterned after the Independent Church movement and free religious societies such as those of O. B. Frothingham, grew under Adler's leadership to become a vital organization spearheading social reforms and social reconstruction. Adler's personal magnetism drew a membership of well more than one thousand to the society by the early 1880s, mostly but not exclusively people of Jewish origin. He also attracted ethically idealistic and socially committed people of liberal Christian background whom he helped groom to be leaders of other Ethical Culture societies. The Ethical Culture movement took on a national flavor as Adler's apprentices organized new societies in other cities: William M. Salter, Chicago, 1883; S. Burns Weston, Philadelphia, 1885; Walter L. Sheldon, Saint Louis, 1886. The American societies federated as a national organization in 1889, the American Ethical Union, and over the years, new societies springing up in urban and suburban areas across the country (Brooklyn, Westchester County, Washington, Baltimore, Pittsburgh, Los Angeles, Cleveland, Essex County, N.J.) were added to its roster. By 1930, membership in American Ethical Culture societies numbered about thirty-five hundred, and by the mid-1980s, membership in the more than twenty societies totaled approximately five thousand. (The largest society remains the New York branch, at about one thousand.)

Ethical Culture became truly international in scope in the 1890s. The London Ethical Society had been founded in 1886, with such distinguished thinkers participating as Bernard Bosanquet, Edward Caird, and Leslie Stephen, and British interest had been spurred when Stanton Coit, another Adler apprentice, arrived in 1887 and led London's South Place Chapel into the Ethical Culture movement. Coit subsequently created a British Ethical Union in 1896. The movement reached Germany, where a society was founded in Berlin in 1892, and societies also appeared in France, Austria, Italy, Switzerland, and Japan in this new decade. The various societies, each with its own nuanced organizational goals and ethical approaches, were in contact and quite cognizant of each other's activities. At a Zurich meeting in 1896

they created an international confederation, the International Ethical Union, which kept member organizations in touch with each other and which also convened world congresses devoted to specific themes, such as those in London (1908) and the Hague (1912). In the wake of World War II the union became moribund, but in 1952 humanist organizations joined with Ethical Culture societies led by the American Ethical Union to found the International Humanist and Ethical Union with member groups in North and Latin America, Europe, Africa, Asia, and Australia.

Whether or not Ethical Culture is judged a religion depends on one's definition of *religion* and one's inclination either to use or not use the word to designate an ethical humanist posture. Felix Adler did regard Ethical Culture to be a religion and in his later years tried to work out a metaphysic to express it. Still, he adamantly insisted that Ethical Culture embraced all in ethical fellowship regardless of diverse approaches and different names given to the quest for meaning in life. This openness has clearly persisted to this day. Nonetheless, the societies do assume the guise of a religious organization to some extent. (In the United States, many are incorporated as "religious and educational" institutions in their respective states.) A weekly meeting is usually held on Sunday morning or evening (in Germany, during the weekdays), consisting of music, an inspirational reading, and a major address on a topical issue, usually with an eye to its ethical implications. There are no symbols or ritual acts, although the English societies tend to be a bit more ceremonial. Ethical leaders officiate at life-cycle events such as marriage and funerals; they come individually from a variety of social and intellectual backgrounds and may have previous religious affiliations. There is no Ethical Culture seminary, but each prospective leader undertakes a personally tailored training program administered by the Leadership Training Committee of the American Ethical Union.

No established Ethical Culture ideology exists, although general principles certainly have been articulated. To a large extent, Adler's early motto, "Not the creed, but the deed," still serves as the unifying theoretical orientation of Ethical Culture, although with a deepened and richer meaning than Adler himself provided. Members are free to believe what they wish on all issues, including religion, but they generally subscribe to the following ideals: (1) the intrinsic worth of each human being, (2) the importance of seeking ethical principles as a guide to all aspects of life, and (3) the need to work for the material and spiritual betterment of society and humanity.

This last commitment to applied social ethics rather than to any theoretical formulation of an ethical approach has been the quintessential characteristic of Ethical Culture from its inception. In this regard, the Ethical Culture movement, particularly in the United States, has been quite successful, far beyond its limited membership. Its leaders in the first four to five decades—Adler, Salter, Weston, Coit, John L. Elliott, Alfred Martin, David Muzzey, Henry Newman,

Algernon D. Black, among others—were actively involved in most of the progressive causes of social welfare and reform. They and their societies were pioneers in the areas of education for young and old, tenement reforms, settlement work, legal aid societies, boys' clubs, good government clubs, and visiting nursing associations. Many of their ventures—free kindergarten (1877), district visiting nursing (1877), the Neighborhood Guild (1886), the Bureau of Justice (1888), the Arts High School (1913)—served as models for similar undertakings by urban communities. In more recent decades, Ethical Culture, while not a leader as it once was, has nevertheless been involved with significant programs supporting liberal social causes, such as prison reform, drug rehabilitation, the right to abortion. The movement has also sponsored journals of popular and scholarly nature to reflect on the ethical domain as it relates to public policy and philosophy: *Ethical Record* (1888); *International Journal of Ethics* (1890); *Ethical Addresses* (1895); *The Standard* (1914); *Ethical Outlook* (1956); *Ethical Forum* (1965).

BIBLIOGRAPHY

The most comprehensive one-volume history of Ethical Culture is Howard B. Radest's *Toward Common Ground: The Story of the Ethical Societies in the United States* (New York, 1969), which deals with the origins and evolution of the movement through the 1960s. Although written by an insider, the book is not unwilling to take a critical look at the movement and its leaders. My book *From Reform Judaism to Ethical Culture: The Religious Evolution of Felix Adler* (Cincinnati, 1979) gives a detailed institutional history of the founding of the New York Society for Ethical Culture and forwards a careful analysis of Adler's early ideological postures. Important evaluations of the meaning of Ethical Culture can be found in Horace L. Friess's *Felix Adler and Ethical Culture* (New York, 1981), which traces the development of Adler's own thinking on the subject, from initial conceptions to mature reformulations. Robert S. Guttchen's *Felix Adler* (New York, 1974) analyzes Adler's concept of human worth, which remains vital to Ethical Culture's own self-understanding. Another important analysis of Ethical Culture has been made by David S. Muzzey in *Ethics as a Religion*, 2d ed. (New York, 1967). A second-generation leader in the movement, and distinguished professor of American history, Muzzey argues for the religious nature of Ethical Culture. The book contains a brief, useful epilogue on the founding of the movement by Adler.

ETHIOPIAN CHURCH. The Ethiopian or Abyssinian church, on the Horn of Africa, is one of the five so-called

monophysite Christian churches that reject the Council of Chalcedon (451) and its formula of faith. The church does not call itself monophysite but rather Tāwahedo (Unionite; also spelled Tewahedo), a word expressing the union in Christ of the human and divine natures, to distinguish itself from the Eastern Orthodox churches, which accept the formulas accepted at Chalcedon. For the Tāwahedo Orthodox Church of Ethiopia, both Nestorius and Eutyches are heretics. Although formally under the jurisdiction of the Coptic church of Alexandria until 1950, the Ethiopian Orthodox church has managed to retain its indigenous language, literature, art, and music. It expects its faithful to practice circumcision, observe the food prescriptions set forth in the Hebrew scriptures (Old Testament), and honor Saturday as the Sabbath. The church has its own liturgy, including an horologion that contains the daily offices (initially for each of the twenty-four hours of the day), a missal of over fourteen anaphoras, the Deggwā (an antiphony for each day of the year), doxologies (various collections of *nagś* hymns), and homilies in honor of the angels, saints, and martyrs. The most innovative aspect of this church is the provision in the Deggwā for the chanting of *qenē* (poetic hymns) in the liturgy. There are several types of *qenē* varying in number of lines from two to eleven, which one of the clergy usually improvises during the service in keeping with the spirit of *Psalms* 149:1, "Sing unto the Lord a new song."

Until the Ethiopian revolution of 1974, the Ethiopian Orthodox Church (the population of which was at least sixteen million in the early twenty-first century, according to the World Council of Churches) had been a national church defended by the political leader of the country. The monarch's reign had to be legitimized by the church at a religious ceremony where the new king swore allegiance to the church and committed himself to defend the Christian kingdom.

EARLY HISTORY. Historians disagree in assigning a date to the introduction of Christianity into Ethiopia, depending upon which Ethiopian king they think first adopted the faith. The conversion of the monarch, however, is a poor indication of the date of that introduction because not only was he by no means among the country's first converts, but also because until about 960, the monarchy changed hands so frequently that the ruler was not as consistently Christian as were certain segments of the population. We should also be wary of using the local tradition that the Ethiopian eunuch Qinqis (*Acts* 8:26–39) was martyred teaching Christianity in Ethiopia as evidence of the country's conversion. However, we do know that Adulis, the famous port of Ethiopia, and Aksum, the capital, were frequented by Christian traders from the Hellenistic world since the early history of Christianity. Some of these settled there, forming Christian communities and attracting to their religion those with whom they interacted daily.

Ethiopia officially joined the Christian world when Frumentius was consecrated its first bishop by Athanasius of Alexandria in about 347. The contemporary historian Rufinus

(*Ecclesiastical History* 1.9) tells us how this came about. A certain ship was attacked while calling on one of the Ethiopian ports. Of the voyagers, only two Syrian boys from Tyre (modern-day south Lebanon), Frumentius and Aedesius, escaped death. The boys were taken to the palace, where the king made Frumentius his secretary and Aedesius his cup-bearer. Frumentius used his influence in the palace to facilitate the building of an oratory by the Christians in the city. This center was also used as a school where children, even those from non-Christian families, came to receive religious instruction. As soon as the two foreigners received their freedom, Frumentius went to Alexandria to ask the archbishop there to consecrate a bishop for the Christians in Ethiopia. Athanasius thereupon chose Frumentius to be the bishop of Aksum. Rufinus says that he received this story "from the mouth of Aedesius himself," who became a priest in Tyre. Even though Rufinus, like some other historians, calls the country India, there is no doubt that the story deals with Ethiopia. A letter from the Arian emperor, Constantius II (r. 337–361), to the rulers of Ethiopia, Ezana (ʿĒzānā) and Sazana, concerning Frumentius is extant in Athanasius's *Apology to Constantine* (*Patrologia Graeca*, ed. by J.-P. Migne, 25. 636–637). From Ezana's rule to the middle of the twentieth century, the head of the Ethiopian church remained a Copt. It was only in the twentieth century that an Ethiopian, Bäsleyos (1951–1970), was consecrated patriarch. It must be noted, however, that the Coptic metropolitan was in charge primarily of spiritual and theological matters. The administration of other church affairs was the responsibility of a native official with the title of 'aqqābē sa'āt and subsequently *echagē*.

MEDIEVAL PERIOD. The Ethiopian church took many significant steps forward between the fourth and the seventh century. It vigorously translated a great deal of Christian literature from Greek. This included the Old Testament from the Septuagint and the New Testament from the Lucianic recension (the Greek Bible revised by Lucian of Antioch, d. 312) used in the Syrian church. The Ethiopian Bible of eighty-one books includes the *Book of Jubilees* and the *Book of Enoch*, two books that have been preserved in their entirety only in Ethiopic. The *Synodicon* (a collection of canon law), the *Didascalia Apostolorum* (a church order), the *Testament of Our Lord*, and the *Qalēmentos* (an apocalyptic writing ascribed to Clement of Rome) are also part of the Ethiopian canonical scriptures. The number of churches and monasteries also grew quickly. Traveling through Ethiopian territories in the sixth century, a Greek monk, Cosmas Indicopleustes, was impressed to see churches everywhere.

It has been suggested that the *Rule of Pachomius* and the theological writings of the Fathers in the *Qērelos* (including writings from Cyril of Alexandria, Epiphanius, et al.) were brought to Ethiopia by the so-called Nine Saints who came from the Hellenistic or Mediterranean world, including Egypt, in the sixth or seventh century. But any of the many travelers and anchorites (such as Abbā Yoḥannes Kamā) who came to Ethiopia much earlier than the Nine Saints might

have brought them along with several other works. Our historical knowledge about the Nine Saints is not firmly based even though they are highly revered in the church as the founders of monasticism in Ethiopia.

Unfortunately for the faithful, the young church suffered encroachment and harassment by Islam, starting in the eighth century. Locally, too, a vassal queen of one of the provinces, Gudit, revolted and devastated the Christian civilization, paving the way for another dynasty, the Zāgwē (1137–1270).

The Zāgwē kings were more interested in religion than in politics. Many of them were priests as well as rulers, and the last four of the dynasty are, in fact, among the saints of the church. The building of the several rock-hewn churches in Lāstā (central Ethiopia) is ascribed to them. The so-called Solomonic dynasty, which was to overthrow them, would boast of its alleged descentance from Solomon of Israel, while the Zāgwē attempted to reproduce the holy places in their own land, calling their capital Roha (after Edessa), their river Yordanos (after Jordan), and so on.

In 1270 the clergy, led by Takla Hāymānot, the founder of the Monastery of Dabra Libanos (in Shewa), and Iyyasus Moʿa, the founder of the Monastery of Ḥayq Estifānos (in Amhara), collaborated with Yekunno Amlāk to overthrow the Zāgwē and to found the Solomonic dynasty. Although the Solomonic kings did not always observe the church's teaching, it was nonetheless during this period that indigenous religious literature flourished, and Christianity spread into the south and west through the efforts of the monks of Dabra Libanos of Shewa, the twelve *neburāna ed*, chosen by the metropolitan according to the number of the apostles.

RELIGIOUS CONTROVERSIES. Late in the medieval period and afterward, religious controversies arose because of objections by some to the tradition of undue reverence for the Cross, icons of the Madonna and Child, and the king. We hear of these disputes during the reign of Yāqbeʿa Ṣeyon (r. 1285–1294), and they appear again in the days of Sayfa Arʿada (r. 1344–1372). The controversies became serious during the reign of Zarʿa Yāʿeqob (1434–1468), when an anchorite, Estifānos, succeeded in attracting to his teaching of rejection of the tradition many monks who, like him, refused to be shaken by the dreadful persecution that ensued. Another controversy, this time involving the Coptic church also, centered around the Sabbath observance of Saturday in addition to Sunday. Several monasteries, led by the monk Ēwoṣtātēwos (d. 1369), successfully defied the decree of the king and the Coptic metropolitan that sought to abolish the practice of observing the first Sabbath (Saturday). But the most serious controversy dealt with the concept of the unity and trinity of God. The church taught that each being in the Trinity (three suns with one light) has a form or image, *malkeʿ*, which must look like that of a human because humans were created in God's image (*Gen.* 1:27). The heretics, followers of Zamikāʿel, while admitting that God has an image, refused to define a form, quoting *John* 1:18—"No

one has seen God." They also maintained a different theology of the unity and trinity of God (one sun with three attributes—disc, light, and heat). Another dispute developed when some monasteries objected to the use of the Deggwā in the liturgy; this intricate collection of antiphony hymns recommends dancing while chanting during service (*Ps.* 150:4). The number of canonical books and the inclusion of the pseudepigrapha and the pseudoapostolic writings in the canon were also challenged.

RELIGIOUS CIVIL WAR OF THE SIXTEENTH CENTURY. The chronic skirmishes between the Christians and the Muslims in Ethiopia took a different form in the sixteenth century when the latter, led by Imām Ahmad ibn Ibrāhīm al-Ghāzī (or Ahmad Grāñ), sought and received help from the Turks. By this time also the astounding wealth of the individual churches in solid gold, silver, and precious clothes had become an irresistible booty and the *grāñ* sacked the monasteries and burned the churches of the empire for about fifteen years (1527–1542). The Christians turned to Portugal for help. The army of the imām collapsed when he was killed in early 1543. But it was about this time that the Cushitic people the Galla, who call themselves Oromo, migrated into Ethiopia en masse, destroying a great part of the Christian heritage that had escaped the *grāñ*'s devastation.

THE JESUITS' ENTERPRISE. The Portuguese came to help the church in its war against Islam with the assumption that the lost flock, the church of Ethiopia, would come back to the Roman Catholic Church. The Ethiopians, however, were never ready to abandon their faith. The pressure of the Jesuits, however, which started with missionaries sent by Pope Julius III (1487–1555), continued until the seventeenth century, when they succeeded in converting Emperor Suseneyos (r. 1607–1632) to Catholicism. In 1626 a Catholic patriarch, Alphonsus Mendez, came from Rome, and the emperor issued a decree that his subjects should follow his own example. However, the sweeping change that Mendez attempted to introduce into the age-old religious traditions of the nation met with stiff resistance. Led by the monastic leaders, tens of thousands of the faithful were martyred. The Catholic missionaries were finally asked to leave, and the emperor was assassinated, even though he had abdicated the throne to his son Fāsīladas (r. 1632–1667). Fāsīladas was magnanimous with the Jesuits despite the fact that they had attempted to overthrow him by courting one of his brothers.

Even though the Jesuits left, the controversy stemming from their theology of the two natures of Christ continues to the present, taking a local character and creating schism in the Ethiopian church. Overtly, this controversy is centered on the theological significance of *qebʿat*, *unction* (*Acts* 10:38), and *bakwr*, *first-born* (*Rom.* 8:29), when applied to Christ the Messiah, the only Son of God. But those who raised these questions were clearly attempting to show the monophysites the implication of a theology of one nature in Christ, by drawing their attention to the distinct presence of the human nature in him and its inferior position vis-à-vis

his divinity. For one group, the Kārroch, or Tāwahedo (the Unionists of Tegrāy), whose position the church has held officially since 1878, *unction* means the union of divinity with humanity: Christ, who is the ointment and the anointed, became the natural Son of God in his humanity through this union. For the Qebatoch (unctionists of Gonder and Gojam), *unction* means that Christ in his humanity became the natural Son of God through the unction of the Holy Spirit: God the Father is the anointer, the Son the anointed, and the Holy Spirit the ointment. The third group, the Ṣaggioch (adoptionists of Shewa), who are accused of tending toward Catholicism, believe that Christ in his humanity became the Son of God by grace through the unction of the Holy Spirit either in Mary's womb at the Annunciation or at the baptism. They call the occasion when he became the Son of God by grace a third birth for Christ, in relation to the eternal birth from the Father and the temporal birth from Mary, hence the heresy of the three births condemned at the Council of Boru Meda in Welo (central Ethiopia) in 1878. The Ṣaggioch vehemently oppose the notion that Christ became the natural Son of God in his humanity. They are, however, in the minority.

THE CHURCH OUTSIDE AFRICA. Designed to express its spiritual message and to perform the services in the local culture, the Ethiopian church is strictly local and national. In its history it has not engaged in any missionary activities beyond the frontiers that political leaders claimed to be territories of their ancestors. King Kālēb's expedition to Najrān (southern Arabia) in about 525, to rescue the Christians from the persecution of a Jewish ruler and to reorganize the Christian communities there, may not be considered sustained activity by the church outside Ethiopia. Even the Ethiopian churches in the Holy Land could not be exceptions to this historical fact, since they were built to serve Ethiopian nationals who visited the holy places in Palestine and Egypt. Ethiopian monastic communities have lived in Jerusalem since the Middle Ages, and they were Ethiopia's main window to the outside world. In modern times, there were also Ethiopian churches in the former British Somaliland, Kenya, and the Sudan, but they too were serving Ethiopian nationals, refugees who fled the 1936 to 1941 Italian occupation of Ethiopia.

In the 1950s the Ethiopian church was faced with a most unusual challenge. The local church was called upon to respond to the need for cultural and racial identity of the oppressed black people in Africa and the Americas. Churches with the term *Abyssinian* as part of their name started to emerge in these continents. Although the historical link between the Ethiopian church and these churches is lacking, and the Ethiopian church was not economically, educationally, and politically up to the challenge, delegates consisting of clergy were sent from Ethiopia to East Africa (still under British rule), the Caribbean region, and North America. The inevitable problems were how to attract the middle class to an African church and how to adapt the culturally alien church services to English-speaking communities in Africa and the Americas, not to mention the question of rebaptism.

The compromise reached was to retain some parts of the liturgy in Ge'ez and conduct the rest in English. This compromise was not only unsatisfactory to both the church authorities and congregations, but it also meant training the clergy, Ethiopians and non-Ethiopians alike, in Ge'ez and English. In spite of several problems, the church is gaining strength, especially in the West Indies and the Caribbean (e.g., Jamaica, Guyana, Trinidad, and Tobago). The number of the faithful in the United States (New York, Washington, D.C., and Los Angeles) grew because of the influx of Ethiopian refugees fleeing the military Marxist repression that started with the overthrow of the monarchy in 1974.

In 1987 Ethiopia officially became the People's Democratic Republic of Ethiopia, but a rebel movement later overthrew the government and with it centuries of Amharic rule. Eritrea declared its independence from Ethiopia following a UN-sponsored referendum in 1993, and the Orthodox Church of Eritrea broke away from the Ethiopian Church. In 1991 the patriarch of Ethiopia, Abune Merkorios, accused of collaboration with the communist authorities, was removed by the Holy Synod. Merkorios was replaced by Abune Paulos in 1992. Paulos is recognized as the patriarch by the Holy Synod of the Ethiopian Orthodox Tāwahedo Church inside Ethiopia. Merkorios went into exile in Kenya and is upheld as patriarch by the Holy Synod in Exile. Efforts continue to avert a permanent schism of the church.

BIBLIOGRAPHY

For the history of both the church and the country, Jean Doresse's *Ethiopia* (London, 1959) is a good introduction even though it lacks annotation to the sources. Carlo Conti Rossini's *Storia d'Etiopia*, vol. 1, *Dalle origini all'avvento della dinastia Salomonide* (Bergamo, Italy, 1928), remains the standard reference for the early history. Unfortunately, however, this book too has neither adequate annotation to sources nor a bibliography. An index for it has been prepared by Edward Ullendorff in *Rassegna di studi etiopici* 18 (1962): 97–141.

The only book that examines many aspects of the Ethiopian Bible is Edward Ullendorff's *Ethiopia and the Bible* (London, 1968). This book also contains an excellent bibliography. See also Roger W. Cowley's *The Traditional Interpretation of the Apocalypse of St. John in the Ethiopian Orthodox Church* (Cambridge, U.K., 1983). The introduction to this work offers more than the title suggests. The history of Ge'ez (Ethiopic) literature has been ably surveyed in Enrico Cerulli's *La letteratura etiopica*, 3d ed. (Florence, Italy, 1968). Ernst Hammerschmidt's *Studies in the Ethiopic Anaphoras* (Berlin, 1961) summarizes the different studies of the anaphoras in one small volume. For an English version of the anaphoras themselves, see Marcos Daoud and Marsie Hazen's *The Liturgy of the Ethiopian Church* (Cairo, 1959). The most comprehensive study thus far on *genē* hymns is Anton Schall's *Zur äthiopischen Verskunst* (Wiesbaden, Germany, 1961).

The period of the Zāgwē dynasty and the rock-hewn churches of Lästā are well treated in Georg Gerster's *Churches in Rock* (London, 1970), with many large and impressive photo-

graphs and an adequate bibliography. The history of the church from the beginning of the Solomonic dynasty to the Islamic invasion of the sixteenth century has been uniquely treated in Tadesse Tamrat's *Church and State in Ethiopia, 1270–1527* (Oxford, 1972). Francisco Alvarez's *Narrative of the Portuguese Embassy to Abyssinia during the Years 1520–1527*, translated by Lord Stanley of Alderley (London, 1881), is a rare description of church and secular life immediately before the war with the *grāññ*. The translation was revised by C. F. Beckingham and G. W. B. Huntingford and published under the title *The Prester John of the Indies*, 2 vols. (Cambridge, U.K., 1961).

Some of the sources for the religious controversies of the late medieval period were edited and translated in Enrico Cerulli's *Il libro etiopico dei miracoli di Maria e le sue fonti nelle letterature del medio evo latino* (Rome, 1943) and *Scritti teologici etiopici dei secoli XVI–XVII*, 2 vols., "Studi e testi," no. 198 (Rome, 1958).

The unique source for the destruction of the churches by the forces of the *grāññ* in the sixteenth century is Futūḥ al-Ḥabashah, composed by 'Arab Faqīh, the chronicler of the imām, edited and translated in René Basset's *Histoire de la conquête de l'Abyssinie (seizième siècle) par Chihab ed-Din Ahmed ben 'Abd el-Qāder surnommé Arab-Faqih*, 2 vols. (Paris, 1898–1901). The Portuguese, too, have left invaluable though sometimes exaggerated and conflicting reports of the campaign. See *The Portuguese Expedition to Abyssinia in 1541–1543, as Narrated by Castanhoso, with Some Letters, the Short Account of Bermudez, and Certain Extracts from Correa* (London, 1902).

The best work on the religious controversies that started in the seventeenth century is Friedrich Heyer's *Die Kirche Äthiopiens: Eine Bestandsaufnahme* (Berlin and New York, 1971). The history of the religious controversy caused particularly by the Portuguese has been ably and succinctly presented in Germa Beshah and Merid Wolde Aregay's *The Question of the Union of the Churches in Luso-Ethiopian Relations (1500–1632)* (Lisbon, 1964). See also Donald Crumme's *Priests and Politicians: Protestant and Catholic Missions in Orthodox Ethiopia, 1830–1868* (Oxford, 1972). The book has an excellent bibliography with useful comments on some of the works.

Questions about the church that are of interest to Western Christians are answered in *The Teaching of the Abyssinian Church as Set forth by the Doctors of the Same*, translated from Amharic, the vernacular of Ethiopia, by A. F. Matthew (London, 1936). See also Harry Middleton Hyatt's *The Church of Abyssinia* (London, 1928). This work describes in detail the religious practices of the church.

Kirsten Pedersen's *The History of the Ethiopian Community in the Holy Land from the Time of Emperor Tewodros II till 1974* (Jerusalem, 1983) is a result of several years of study of the original and secondary sources on the subject. The minor mistakes pertaining to modern history of Ethiopia do not in any way minimize the usefulness of this work. The major English sources on all aspects of the church are surveyed in Jon Bonk's *An Annotated and Classified Bibliography of English Literature Pertaining to the Ethiopian Orthodox Church* (Metuchen, N.J., 1984).

GETACHEW HAILE (1987)

ETHNOASTRONOMY. This article is limited to discussion of the ethnoastronomies of native South America because of their primary importance in the development of this area of study.

PATTERNS. In the ethnographic literature on indigenous South American Indian populations, there is a considerable body of evidence attesting to the importance of ethnoastronomical beliefs. These beliefs, expressed with varying degrees of emphasis in mythology and ritual, bear witness to long-standing traditions of astronomical observations undertaken for a variety of purposes, ranging from the construction of precise calendar systems to the production of symbols and metaphors for expressing enduring relationships that characterize interactions between men and women, social groups, humans and animals, and so forth. While there are no universally shared astronomical symbols, several recurrent thematic patterns emerge from a comparative study of the ways in which different groupings of celestial bodies are interrelated in the mythology and ritualism of the Andean and Tropical Forest (Amazonian and Orinocoan) religious traditions.

Sun and Moon. A clear expression of the notion of the thematic patterning of relations in an astronomical mode is found in a number of origin myths, especially those in which the origin of humans is thought to have occurred virtually simultaneously with their separation into different—but complementary—kinship or social categories (e.g., siblings, spouses, clans, or moieties). The Apinagé of the Araguaya River of Brazil hold that Sun created the two moieties and localized one (the Kolti moiety) in his own northern half of the circular villages while leaving the other (the Kolre) with his sister, Moon, in the south. The Apinagé held ceremonies directed to Sun during the planting and harvesting periods, while they invoked Moon to help the crops mature (Nimuendajú, 1967, p. 164). The pairing of Sun and Moon as, respectively, brother and sister is also found among the Tapirapé (Wagley, 1940, p. 256) and the Conibo (*Handbook of South American Indians*, 1948, p. 595; hereafter referred to as *H. S. A. I.*). Among the Chiriguano (*H. S. A. I.*, 1948, pp. 483–484), the Kogi (Reichel-Dolmatoff, 1982, p. 178), and the Inca, Sun and Moon are simultaneously brother and sister and husband and wife. For the Xerente, who once occupied several villages southeast of the Apinagé along the Tocantins River, Sun and Moon are "companions" (i. e., neither siblings nor spouses), although each is associated with one of the two moieties. Sun, who is referred to by all Xerente regardless of their moiety affiliation as "Our Creator," communicated with the Siptato moiety through a group of intermediaries, including Venus, Jupiter, the Belt of Orion, and κ Orionis; the intermediaries between Moon and the people of the Sdakra moiety are Mars, Carrion Vultures, and Seven Stars (probably the Pleiades; Nimuendajú, 1942, pp. 84–85). Through the association of Sun and Moon with linked pairs of complementary, yet often asymmetric and hierarchical, social categories (e.g., husband and wife, brother and sister, and the moieties), astronomical phenomena are made to participate in the process of classifying human soci-

ety on the basis of fundamental dichotomies and processes (e.g., alliance and reproduction) that occur throughout the natural world. The relations between Sun and Moon serve as the “charter” for cosmic and social order throughout the succession of the generations. Yet just as inevitably as social order is established and maintained within each society by rules governing relations among different groups of people, the rules are forever being broken and the right order of things momentarily threatened. The inevitability of disorder arising from the violation of rules and prohibitions has its celestial reminder in the spots besmirching the face of the full moon. Throughout the mythological traditions of the tropical forest, the spots on the moon are commonly associated with incestuous relations, especially between brothers and sisters. In a typical example of this theme, the Záparoan-speaking tribes of the Marañón, Napo, and Pastaza rivers say that Moon was formerly a man who, in the dark of night, had sexual intercourse with his sister. In order to identify her lover, the girl one night smeared his face with *genipa* (a blue-black vegetable dye). Out of shame, the man went away to the sky and became the moon, his *genipa*-covered face being reexposed to the Záparo every month (*H. S. A. I.*, 1948, p. 649; cf. Roth, 1908–1909, p. 255; Wagley, 1940, p. 256). Asocial (incestuous) sexual relations may generally be compared with unproductive sexual encounters, which are everywhere signaled by menstruation. Among the contemporary Quechua of the Peruvian highlands, Sun (Inti) is male and Moon (Killa) is female; menses is referred to as *killa chayamushan* (“moon coming, or arriving”). Sun and Moon are also often associated with brightly colored birds or with the plumage of such birds. For example, the Trumai and the Paresí (*H. S. A. I.*, 1948, pp. 348, 360) say that Sun is a ball or headdress of red parrot feathers, while they identify Moon as a collection of yellow feathers. In the Záparo myth discussed above, the wife of the incestuous man who became the moon was herself simultaneously transformed into a night bird. And in a congeries of these various bird images and relations, the Tapirapé of central Brazil, west of the Araguaya River, say that Moon was the sister of Sun and that the latter wears a headdress of red parrot feathers. Sun is said to have slapped Moon’s face with his *genipa*-covered hand because of her sexual misbehavior. Moon was married to a culture hero who divided all birds into two groups. Among the Tapirapé, the two men’s moities are subdivided into three age grades, each of which carries the name of a bird (Wagley, 1940, p. 256).

The Milky Way. Aside from the sun and the moon, one other celestial phenomenon is important throughout the ethnoastronomies of South America: the Milky Way. The Milky Way serves as a means for organizing and orienting the celestial sphere in the spatial, temporal, and mythological dimensions. The Quechua-speakers of the Peruvian Andes refer to the Milky Way as a river (*mayu*) composed of two branches. The branches originate in the north within the cosmic sea that encircles the earth. Water is taken into the Milky Way, and the two branches separate, flowing away from each

other toward the south, where they collide in the heavens near the Southern Cross. The foam (*posuqu*) stirred up by their collision is seen in the bright clouds of the southern Milky Way from the Southern Triangle to the False Cross in Carina. The two branches of the celestial river alternately rise, pass through the zenith, and set; one branch, when it stands in the zenith, passes from the northeast to the southwest, while the other branch passes from the northwest through the zenith to the southeast (Urton, 1981, pp. 54–63). The Barasana, a Tucanoan-speaking group on the Vaupés River in Colombia, conceive of the Milky Way as divided into two “star paths”; one, called New Path, is oriented southeast-northwest, while the other, Old Path, is oriented northeast-southwest. New Path and Old Path are the sites of most of the constellations recognized by the Barasana (Hugh-Jones, 1982, p. 182). For the Desána, another Tucanoan-speaking group of the Vaupés region, the Milky Way, as a single construct, is likened to a river, a trail in the forest, an immense cortege of people, a cast-off snake skin, and a fertilizing stream of semen. In a dualistic image focusing on its cyclical, alternating axes, the Milky Way is imagined as two huge snakes: the starry, luminous part is a rainbow boa, a male principle; the dark part is an anaconda, a female principle. The shifting of the Milky Way, seen as a swinging motion made by the two snakes, punctuates the cycle of fertilizing forces emanating from the sky (Reichel-Dolmatoff, 1982, pp. 170–171). Using metaphors of human sexuality that recall the menstrual cycle of the moon, the Barasana, like the Desána, conceive of the Milky Way as participating in a cycle of fertilizing forces. The connection between the principle of fertility, the Milky Way, and the flow of menses is occasioned by the comparison of the menstrual and seasonal cycles. The rainy season is the menstrual period of the sky, which is personified by Woman Shaman, a creator who has a gourd of wax identified with the Pleiades, which are called Star Thing and are the principal aspect of the New Path of the Milky Way. The gourd is Woman Shaman’s vagina; the wax, her menstrual blood; and the melting of the wax, her menstrual period, which is compared, as an internal, rejuvenating “skin change,” to the rainy season, which begins in the Vaupés in April, as the stars of the Pleiades set. In Barasana cosmology, the internal skin change of Woman Shaman, associated with Star Thing (the gourd of melting wax), is contrasted with the external skin change of the constellation called Caterpillar Jaguar (Scorpius), which stands opposed to, and alternates with, Star Thing (Hugh-Jones, 1982, pp. 196–197).

Bright-star and dark-cloud constellations. Data from the Barasana and Desána introduce a final and far more complex recurrent theme, one that forms perhaps the core of ethnoastronomical symbolism among South American Indian societies. This theme concerns groups of interrelated metaphorical images built up out of animals, anthropomorphic beings, and constellations stretched along the bright path or paths of the Milky Way. The theme of animals and humans as constellations concerns a group of celestial phenomena lo-

cated principally along, or within, the path of the Milky Way. In order to understand many of the references discussed below, it is necessary to see the Milky Way as visually composed of two distinct but interconnected elements: first, it appears in its overall form as a wide, bright band of stars; and second, it contains several dark spots and streaks formed by fixed clouds of interstellar dust that cut through the central path. Both of these galactic phenomena, the bright band of stars against the dark background of the night sky and the dark clouds cutting through the bright path of stars, are recognized as named celestial constructs in South American ethnoastronomical traditions. When viewed as a path, the Milky Way is often considered to be a road along which animals, humans, and spirits move. The Indians of Guiana refer to the Milky Way as both the “path of the tapir” and the path that is walked upon by a group of people bearing white clay, the type used for making pottery (Roth, 1908–1909, p. 260). The Chiriguano (*H. S. A. I.*, 1948, p. 483) know the Milky Way as the “path of the rhea”; they identify the head of the rhea either with the Southern Cross or with the Coalsack, the dark spot at the foot of the Southern Cross. The Amahuaca say that the Milky Way is the trail or path of the sun, formed when a jaguar dragged a manatee across the sky. For the Trumai, the Milky Way is like a drum containing animals; it is the road to the afterworld and the abode of jaguars (*H. S. A. I.*, 1948, p. 348). Finally, the Tapirapé see in the Milky Way the “path of the shamans,” by which shamans travel to the sky to visit celestial bodies (Wagley, 1940, p. 257). That many of the characters who move along the celestial path (or river) are animals reinforces the observation that the most common identifications of the dark clouds that cut through the Milky Way are with animals, birds, or fish. As mentioned earlier, among the Quechua of the central Andes, the Milky Way is seen as two interconnected branches of a river. Within the river, in the southern skies, are several animals, each identified as one of the dark clouds (*yana phuyu*); these include a snake, a toad, a tinamou, a mother llama with her baby, and a fox that pursues the llamas (Urton, 1981, p. 170). The pursuit of a herbivore by a carnivore, as in the pursuit of the llamas by the fox, is a common element in the South American ethnoastronomical symbolism of the dark spots. Within the tropical forest, however, the carnivore is most often a jaguar rather than a fox. For instance, the Paresí and Conibo see a jaguar pursuing a deer in some dark spots in the southern Milky Way (*H. S. A. I.*, 1948, pp. 360, 595). Certain tribes of Guiana see, in the same general area, a tapir being chased by a dog, which in turn is pursued by a jaguar (Roth, 1908–1909, p. 260). The Tukuna locate the bodies of a jaguar and an anteater in dark clouds in the southern skies near the constellation of Centaurus; the two animals are locked in a nightly struggle, although in a Tukuna myth that describes a similar fight the anteater defeats the jaguar, rips open his stomach, and sucks out his liver (Nimuendajú, 1952, p. 143). The Campa say that a dark streak near Antares (in the constellation of Scorpius) is a digging stick and that the Coalsack below the South-

ern Cross is a bees’ nest (Weiss, 1972, p. 160). The Múra, however, see in the Coalsack a manatee carrying a fisherman on its back (*H. S. A. I.*, 1948, p. 265). As is clear from the illustrations above, the identification of the dark clouds of the Milky Way with animals is a widely shared feature in South American Indian ethnoastronomies. Although the specific animals vary from tradition to tradition (as one would expect, given that the various ethnoastronomical data derive from societies in widely differing environmental settings), it is reasonable to suppose that the animals may be identified and interrelated according to similar classificatory principles and symbolic interests as one moves from one society to the next. That this may be so, in at least one respect, is suggested by the fact that the ethnographic literature contains several references to the belief that there is a conceived (if not perceived) relationship between an animal’s reproductive cycle and the first appearance of that animal’s celestial counterpart in the early morning skies (Urton, 1981, pp. 176–189). In addition, there are suggestions that the rising of the celestial representation of an animal or bird serves as an indication that the season to hunt the terrestrial version of that same animal or bird has arrived (Roth, 1908–1909, p. 261). These data suggest that in the process of establishing local calendar systems there is considered to be a temporal correlation between the appearance of a particular dark-cloud animal and the biological periodicity of, or the cycles of human activity in the exploitation of, its terrestrial counterpart.

CLASSIFICATION AND SYMBOLISM. Such a purely calendrical interpretation of the significance of the animals located in the dark spots of the Milky Way should be augmented by two other considerations, one classificatory, the other symbolic. In relation to the former, the animals of the Milky Way may represent those forms considered to be classificatorily “prototypical,” the most representative members of particular classes of animals. Alternatively, they may represent “marked” animals, ones that do not fit comfortably into a single class but that rather bridge two or more classes. That one or the other of these considerations may be significant in Quechua astronomy is suggested by the fact that the sequence of animals that stretches along, and within, the Milky Way includes a reptile (snake), an amphibian (toad), a bird (tinamou), a herbivorous mammal (llama), and a carnivorous mammal (fox). The classificatory significance of these life forms would therefore rest not only on the particular characteristics of each individual animal in turn but also on the relations between and among the various types as they are projected into the sky in a particular sequence (i.e., from a reptile to a mammal). Another classificatory factor that may be important throughout the various ethnoastronomical traditions is a consideration of the color of the animals in question. That is, many of the animals have either a dull, dark coloring (e.g., fox, deer, anteater), or else they are spotted or mottled (e.g., tinamou, toad, anaconda, rainbow boa, jaguar). The dark spots along the “body” of the Milky Way recall the dark or mottled coloring of the terrestrial animals.

In this regard, there may also be a conceptual similarity between the dark spots of the Milky Way and the spots on the moon. The latter, as mentioned earlier, are typically associated with asocial (e.g., incestuous) relationships.

Mythic oppositions. The symbolic significance of the dark-cloud animals will vary considerably from one ethnoastronomical tradition to another and can be understood only on the basis of a careful consideration of the particular characteristics of the celestial animals as they are portrayed in the mythology of each culture. In considering the mythological descriptions of celestial phenomena, however, it is essential first to turn to the material referring to those constellations that are composed of clusters or groupings of stars, since the mythological data for stellar constellations are more abundant, and explicit, than those for the dark spots of the Milky Way. The principal stellar constellations recognized in South American ethnoastronomies are, for the most part, also located near or within the Milky Way; these include the Pleiades, the Hyades, the Belt (and Sword) of Orion, Scorpius, the Southern Cross, and α and β Centauri. By far the richest ethnoastronomical material concerns the Pleiades, a small cluster of some six to ten stars (visible with the naked eye) in the constellation of Taurus. The Pleiades are referred to in a variety of ways, many of which emphasize the visual appearance of this cluster of stars as a group or “bunch” of things. In the tropical forest, the Pleiades are variously referred to as bees, wasps, a handful of flour spilled on the ground, parrots, white down, a bunch of flowers, and so forth (Lévi-Strauss, 1969, p. 222). Claude Lévi-Strauss pointed out an important principle in Tropical Forest ethnoastronomies when he argued that the Pleiades are typically classed together with, while at the same time opposed to, the nearby constellation of the Belt and Sword of Orion. The latter is referred to as a tortoise shell, a bird, a stick, and a leg (or a one-legged man; Lévi-Strauss, 1969, pp. 222–223; cf. Reichel-Dolmatoff, 1982, pp. 173–174). Lévi-Strauss’s argument is that the Pleiades and Orion are diachronically associated, since they rise within a few days of each other, but that they are synchronically opposed, since the Pleiades represent, or are in the category of, the continuous, whereas Orion is in that of the discontinuous. For the Pleiades and Orion, respectively, he notes that “we have names that boil down to collective terms describing a chance distribution of . . . related elements: and on the other, analytical terms describing a systematic arrangement of clearly individualized elements” (Lévi-Strauss, 1969, pp. 222–223; cf. 1973, pp. 268–270). Throughout South America, it can be shown that the Pleiades are contrasted in various ways with other nearby star groupings (e.g., Orion and the Hyades), whereas, on another level, they are grouped together with these same nearby stars and contrasted with other constellations (e.g., Coma Berenices, Corvus, Scorpius, the Southern Cross, and α and β Centauri). These two groupings of stars are contrasted or deemed complementary in terms of their symbolic characteristics, and they are coincidental or alternating in terms of the phasing of the dates of their rising and setting

(cf. Hugh-Jones, 1982; Zuidema, 1982; Wilbert, 1975). The questions to be addressed with regard to these observations are “On what bases are the Pleiades contrasted with other, nearby constellations?” and “On what bases are the Pleiades grouped together with these nearby constellations and contrasted with another, more distant group of constellations?” I suggest that the first question may be approached primarily through a consideration of the mythological data referring to social relations and social organization, whereas the second question can best be addressed on the basis of data referring to meteorological, seasonal, and, ultimately, economic concerns. As for the contrast between the Pleiades, the Hyades, and Orion, there are several myths that mention these three constellations in related mythological contexts. For instance, among certain Carib-speaking tribes there are myths of a woman (the Pleiades) who cuts off her husband’s leg (Orion’s Belt and Sword) and runs away with a tapir (the Hyades; Jara and Magaña, 1983, p. 125; cf. Roth, 1908–1909, p. 262). The Amahuaca of eastern Peru say that the V-shaped Hyades represent the jaw of a caiman that bit off the leg of a man who mistook it for a canoe; the leg is seen in the Pleiades, while Orion’s Belt and Sword represent the man’s brother holding the lance with which he killed the caiman (cf. Reichel-Dolmatoff, 1982, pp. 173–174). The Campa see in the Pleiades a Campa man and his family; the man’s brother-in-law is the Belt and Sword of Orion. They also say that Orion is a Campa man who is being pursued by a warrior wasp and has received an arrow in his leg (Weiss, 1972, p. 160). The various myths that deal with the Pleiades, the Hyades, and Orion are centered on animals and people (or their body parts) who are related by ties of blood or, more commonly, marriage. In many cases, there are also characters present who are implicated in the violation of these kinship and marriage ties (e.g., the tapir who seduces and runs away with a man’s wife). In this regard, it should be recalled that among the Xerente, who practice moiety exogamy, the belt of Orion and k Orionis are related to one moiety, while Seven Stars (the Pleiades?) are related to the other (Nimuen-dajú, 1942, pp. 25, 85). In addition to the “local” contrast between the Pleiades and the neighboring constellations of the Hyades and Orion, there are several references to the contrast between the Pleiades and constellations farther removed. In Barasana cosmology, the Pleiades (Star Thing) are associated with the dry season and opposed to Scorpius (Caterpillar Jaguar), which is associated with the wet season (Hugh-Jones, 1982, p. 197). The Pleiades and Scorpius are similarly opposed, and each is related to either the dry or the wet season, or to planting or harvest, in the cosmology of the Quechua (Urton, 1981, pp. 122–125) and the Chiriguano (*H. S. A. I.*, 1948, p. 483). Similar examples of the opposition of the Pleiades to other constellations (e.g., Corvus and Coma Berenices) appear in the timing of fishing cycles (Lévi-Strauss, 1978, pp. 36–40), honey availability (Lévi-Strauss, 1973, pp. 57–58, 268–272, 282–285), or both fishing cycles and honey availability (Lévi-Strauss, 1973, p. 114). The evening rising and setting of the Pleiades (which occur at differ-

ent times of the year) are associated by the Barasana and the Desána with the fruiting periods of trees (Hugh-Jones, 1982, p. 190; Reichel-Dolmatoff, 1982, p. 173). R. Tom Zuidema has shown that the critical dates in the Inca calendar system, a system that coordinated political, ritual, and agricultural events throughout the year, were determined by the times of the rising, setting, and the upper and lower culminations of the Pleiades in opposition to the Southern Cross and α and β Centauri. In Inca and contemporary Quechua astronomy, the Pleiades represent (among other things) a storehouse; the Southern Cross is important, as it stands just above the dark-cloud constellation of the tinamou; and α and β Centauri are the eyes of the dark-cloud constellation of the llama (Zuidema, 1982, pp. 221–224; Urton, 1981, pp. 181–188).

Mythic similarities. While particular contrasts between (1) the Pleiades, the Hyades, and Orion and (2) the Southern Cross, α and β Centauri, Corvus, Coma Berenices, and Scorpius vary over different parts of South America, the temporal relations between the two groups of constellations represent essentially similar seasonal oppositions regardless of which particular members of the two sets are contrasted. In terms of their celestial locations, the constellations in group 1 are located between right ascension three to six hours, while those of group 2 are between right ascension twelve to sixteen hours. Therefore, the members of one group will rise as the members of the other set. This temporal opposition, and its attendant symbolic and mythological associations, is one other important feature shared by the ethnoastronomies of South American Indians. Although the various Indian tribes of South America are situated in extremely diverse environmental regions, from the dense tropical forests of the Amazon and Orinoco basins to the high Andean mountains along the western side of the continent, there are a number of similarities in the ethnoastronomical traditions of these various groups. One source of similarities may lie in the fact that these cultures are all located within the tropics (see Aveni, 1981): the Amazon River is roughly coincident with the line of the equator. But beyond the similarities that are encountered in the observational phenomena viewed by these cultures, there are perhaps more fundamental similarities in the way in which the celestial bodies are described and interrelated in their mythological and religious traditions. There are fundamental principles that give meaning and coherence to ethnoastronomical beliefs concerning the sun and the moon, the Milky Way, and the two types of constellations. These are the same conceptual foundations that ground the various religious traditions. These basic premises revolve around relations between and among men and women, humans and animals, and beings on earth and those in the sky.

BIBLIOGRAPHY

For excellent discussions of naked-eye observational astronomy in the Americas, see Anthony F. Aveni's *Skywatchers* (Austin, Tex., 2001), and Stephen M. Fabian's *Patterns in the Sky: An Introduction to Ethnoastronomy* (Prospect Heights, Ill.,

2001). Separate ethnographic descriptions, many of which include ethnoastronomical material for a variety of Tropical Forest tribes, can be found in *The Tropical Forest Tribes*, vol. 3 of the *Handbook of South American Indians*, edited by Julian H. Steward (Washington, D.C., 1948). Collections of Tropical Forest Indian myths are included in the following three books by the French anthropologist Claude Lévi-Strauss: *The Raw and the Cooked* (New York, 1969), *From Honey to Ashes* (New York, 1973), and *The Origin of Table Manners* (New York, 1978), all translated by John Weightman and Doreen Weightman. An excellent resource for Amazonian and Andean mythological and cosmological traditions is Lawrence E. Sullivan's, *Icanchu's Drum: An Orientation to Meaning in South American Religions* (New York and London, 1988). The ethnoastronomies of various tribes in northeastern South America are described in Fabiola Jara and Edmundo Magaña's "Astronomy of the Coastal Caribs of Surinam," *L'homme* 23 (1983): 111–133; Walter E. Roth's "An Inquiry into the Animism and Folklore of the Guiana Indians," in the *Thirtieth Annual Report of the Bureau of American Ethnology* (Washington, D.C., 1908–1909); and Johannes Wilbert's "Eschatology in a Participatory Universe: Destinies of the Soul among the Warao Indians of Venezuela," in *Death and the Afterlife in Pre-Columbian America*, edited by Elizabeth P. Benson (Washington, D.C., 1975). Ethnoastronomies of the Indians of the Colombian rain forest are discussed in Stephen Hugh-Jones's "The Pleiades and Scorpius in Barasana Cosmology" and in Gerardo Reichel-Dolmatoff's "Astronomical Models of Social Behavior among Some Indians of Colombia," both of which can be found in *Ethnoastronomy and Archaeoastronomy in the American Tropics*, edited by Anthony F. Aveni and Gary Urton (New York, 1982). The ethnoastronomies of Tropical Forest tribes in eastern Peru are discussed in Gerald Weiss's "Campa Cosmology," *Ethnology* 11 (April 1972): 157–172 and in Peter Roe's *The Cosmic Zygote: Cosmology in the Amazon Basin* (New Brunswick, N.J., 1982). Some of the best descriptions of the astronomy and cosmology of the tribes of the southern Amazon basin are to be found in three works by Curt Nimuendajú: *The Sherente*, translated by Robert H. Lowie (Los Angeles, 1942); *The Tukuana*, translated by William D. Hohenthal, edited by Robert H. Lowie (Berkeley, Calif., 1952); and *The Apinayé*, translated by Robert H. Lowie, edited by John M. Cooper and Robert H. Lowie (Oosterhout, The Netherlands, 1967). Additional valuable discussions of southern Amazonian ethnoastronomy are to be found in Charles Wagley's "World View of the Tapirape Indians," *Journal of American Folklore* 53 (1940): 252–260 and Stephen M. Fabian, *Space-Time of the Bororo of Brazil* (Gainesville, Fla., 1992). For descriptions and analyses of Inca and contemporary Quechua ethnoastronomy, see R. Tom Zuidema's article "Catachillay: The Role of the Pleiades and of the Southern Cross and α and β Centauri in the Calendar of the Incas," in *Ethnoastronomy and Archaeoastronomy in the American Tropics*, mentioned above; and my book, *At the Crossroads of the Earth and the Sky: An Andean Cosmology* (Austin, Tex., 1981). For an example of astronomic configurations in the religious life of hunters, see Otto Zerries's "Sternbilder als Ausdruck Jägerischer Geisteshaltung in Südamerika," *Paideuma* 5 (1952): 220–235.

GARY URTON (1987 AND 2005)

ETHNOLOGY SEE ANTHROPOLOGY, ETHNOLOGY, AND RELIGION

ETHOLOGY OF RELIGION. Human ethology is the biological study of human behavior. It emphasizes the notion that both the behavior of humankind and its physiological basis have evolved phylogenetically and should be studied as an aspect of evolution. Ethology overlaps other disciplines such as sociobiology, behavioral ecology, evolutionary psychology, human anthropology, and even consciousness studies, which in part employ similar strategies of research.

HISTORY OF ETHOLOGY. The historical roots of ethology can be traced to Charles Darwin's theory of evolution. In his book *The Expression of the Emotions in Man and Animals* (1872) Darwin recognized that the role of instinct is just as important for the survival of the species as the adaptation of morphological structures in the course of their phylogenetic histories. During the following decades, however, the Darwinian approach continued to be disregarded. Instead, a scientific school with roots in psychology dominated the study of animal and human behavior. This behaviorism was based on the premise that psychology should be regarded as the science of behavior, rather than the science of mental life. Proceeding from the assumption that behavior is a product of learning, American behaviorists focused on the study of observable behavior and the ascertainable or contrived circumstances of its occurrence. As a result, behaviorists were successful in all kinds of research with regard to general laws of learning, but failed to take evolutionary approaches into account. Until the 1970s most behaviorists and sociologists were convinced that the behavior of humans and animals was mainly a product of their environment and education.

Within the scientific climate at that time, anthropology and the study of religions developed approaches of cultural relativism that considered human culture as phenomena upon which the biological heritage had no influence. This opinion first came into question when the experienced historian of religions Karl Meuli (1891–1968) was able to prove that religions as distinct from one another as the religions of ancient Greece, imperial Rome, recent arctic hunter-gatherers, and probably even prehistoric hunters, shared similar ritual customs. This observation was unintelligible from an environmental point of view. In spite of the prevailing paradigm, Meuli concluded that these similar manifestations of sacrificial practices must originate in an innate behavior pattern acquired during human evolution.

From a biological standpoint, the final impulses for the revision of the extremely environmentally oriented approaches came from zoologists like Konrad Lorenz (1903–1989) and Nikolaas Tinbergen (1907–1988). During the 1940s and 1950s, Tinbergen and Lorenz focused on the investigation of instinctive behavior in the animal's natural habitat, its meaning seen from an evolutionary point of view,

and its physiological and genetic foundation. At the same time they assumed that similar action patterns had been developed to serve as social signals or releasers for appropriate behavior, not only among animal species but among humans as well. As a result, the study of human ethology attempted to apply ethological methods and the evolutionary perspective to psychological, sociological and, finally, even religious phenomena.

During the following decades the German zoologist Irenäus Eibl-Eibesfeldt (1928–) and others contributed to this new discipline by studying expressive movements with signal functions. These behavior patterns are usually incorporated into more complex behavioral events for which the term *ritual* was introduced by Julian Huxley (1887–1975). As for the origin of behavioral patterns, a distinction can be made between phylogenetically evolved, culturally acquired, and individually invented signals. The criteria of homology are applicable to phylogenetically acquired, as well as to culturally acquired, signals. Expressive behavior and ritual behavior both serve the function of communication. As far as religions are concerned, two important remarks have to be taken into account: first, expressive behavior does not necessarily mean that a message is consciously intended; second, originally functional acts can change their function from goal-directed acts into symbolic acts, so that, in the end, even elaborate displays mainly serve the function of social bonding.

STRATEGIES OF INTERACTION. Darwin had already pointed out that a number of facial and bodily expressions are inherent to humankind. Evidence could be derived from studying the expressive behavior of those born blind and deaf, who were deprived of visual and auditory knowledge regarding the facial expressions of their fellow humans and who, nevertheless, exhibited the usual patterns of smiling, laughing, and crying. Besides such ontogenetic studies, cross-cultural documentation of human behavior and primate comparison confirm the assumption that certain human behavior patterns are the result of phylogenetic adaptations.

Eibl-Eibesfeldt's cross-cultural documentation contains many examples of universals in human behavior, which of course only occur in a very generalized form and may vary considerably from culture to culture. The display of the genitals, for example, originates in the sexual behavior of primates, in which erection of the penis expresses not only a willingness for sexual intercourse but also masculine power and vigor. Contrarily, the display of the female breasts is supposed to have an appeasing effect, while the act of raising the arm and showing the palm of one's hand is usually taken as a gesture of defense. All these gestures serve as signals that safely trigger certain responses from the recipient and are universally understood, even if not acted out but manifested in objects of art. The phallic sculpture, therefore, must be understood as a threatening object warding off enemies or evil forces. Phallic figures and signs are frequently used in a religious context to mark tribal territory or serve as a protec-

tive guardian of a house or temple. A similar gesture can be observed in patterns of female behavior. The obscene display of the vulva provokes a fear reaction and demonstrates superiority and dominance. At the same time, this threatening gesture of the female is combined with an encouragement for sexual intercourse, having an appeasing effect on the possible aggressor. As a result, the obscene female idols, amulets, and pendants that frequently occur in various cultures and religions can be understood as bearers of might, with the capability of protecting the owner from harm.

Unfortunately, ethological signs and figures are sometimes difficult to decipher or to encode. As human ethology has been able to prove, these behavioral signals are often portrayed in a devious manner. This form of communication media developed its own traditions, and the manner in which an object is portrayed will probably modify during history. Pictures will change into signs after several generations, signs into mere patterns. In human ethology, art history, the history of religions, and related fields of research, scholars have analyzed the historical development of symbols and patterns in pagan art and have achieved remarkable results. For example, Otto König's documentation of the patterns on the boats of Mediterranean fishermen exemplifies the change of the image of the protective "staring eye" from representation into an abstract symbol, and Karl von den Steinen (1855–1929) was able to explain the meaning of Marquesan tattoos by tracing them back to former portrayals of the skulls of the deceased.

Not only expressive behavior, but also the more complex rituals, serve the function of communication. In ritual, acts are fused into longer sequences that support strategies of social interaction. A functional equivalent of these ritualized sequences of action is language, where verbalized behavior takes the place of expressive gesture.

Ritualized human behavior as observed in greeting rituals and feasts usually displays a certain structure characterized by three successive stages: the opening phase, the phase of interaction, and the phase of parting. Each of these three phases is characterized by a set of verbal and nonverbal behavior patterns that not only correlates with a specific functional aspect of the phase, but also appears in repetition to deliver the same message through different channels and in different forms.

TOWARD AN ETHOLOGY (ANTHROPOLOGY) OF RELIGION.

Any behavior pattern is adaptive in the sense that it contributes to the reproductive success or to the survival of the individual, the group, or the species. In that sense, as the historian of ancient religions Walter Burkert (1931–) points out, well-adapted religious activities promote the success of a culture. He refers explicitly to the results of human ethology when tracing rituals and other activities within the scope of religious behavior to their supposed biological origins. Several basic elements of religious practice and thought, and, in particular, sacrifice, have to be seen as being inherited from

the animal world, where they may contribute to the survival of the individual or the group in dangerous situations.

The anthropologist Marvin Harris (1927–2001) raises the question of whether or not religious behavior should be understood as the result of the adaptation of a culture to its specific ecological niche. For example, Harris describes the Aztec religion, with its focus on human sacrifice and religious cannibalism. Because population growth and the depleted condition of the natural fauna led to a lack of animal foods, it is assumed that the Aztecs pursued a strategy of religious cannibalism to achieve the necessary amount of proteins, vitamins, and minerals. Their religious beliefs, therefore, reflected the importance of a high-protein diet and the lack of natural resources in their habitat. The occurrence of rites of passage, especially seen in male initiation, can also be traced to biological roots. A low-protein diet makes prolonged nursing a necessity. This, however, results in a postpartum sex taboo that leads to polygyny. The resulting mother-child households, together with prolonged nursing, lead to an intensive bonding between mother and child and, finally, to cross-sex identification. Severe male initiation ceremonies that include circumcision or other forms of ritual torture and mind control are then required to break the prepubescent identity in order to allow for later identification with fathers and other males.

A different concern with issues of function and structure shaped the work of the anthropologist Roy Rappaport (1926–1997). As Rappaport points out, ritual and language have coevolved, with ritual providing a necessary counteraction to language-created problems that may otherwise lead to social disorder and violence. Ritual contains self-referential messages that supply information about the size, density, or strength of the group, and similarly serve the purpose of competition by supplying information about the social status and psychophysical characteristics of the participants. By participating in ritual, in which invariable words and actions recur, men and women assume wider commitments—the so-called ultimate sacred postulates—which are forged at a deeper level of the psyche. Even if these postulates are ideally untestable and have no immediate consequences, they cannot be questioned and hold a key position in the governing hierarchy of ideas. Rituals, therefore, as religion's main components, form the concepts that people consider to be religious, and therefore they have been central in the adaptation of the human species as part of a larger ecological whole.

While Burkert, Rappaport, and Harris mostly refer to the adaptive values of religious behavior and thought, the Indologist Frits Staal focuses on the analysis of ritual and mantra by adopting an ethological approach in order to explain the origin of religion. Far from sharing the common scholarly opinion that ritual is a symbolic representation of what people believe, he emphasizes that rituals have to be understood without reference to their supposed religious background. Staal's careful investigation and documentation of

Vedic rituals result in the statement that rituals are pure activity without any meaning or goal, in which only faultless execution in accordance with the rules counts. Staal draws the conclusion that the origins of religion lie deep in inborn behavior patterns. Religions, which do not necessarily have doctrines and beliefs, originate in ritualization as observed in animal behavior. Only later does ritual become religious in the Western and monotheistic sense of the word, when provided with a religious interpretation that includes doctrine and the belief in an afterlife.

For the anthropologist Weston La Barre (1911–1996) religion is the result of the adaptation of human beings to their ecological niche and is shaped by both biological and cultural evolution. In particular, human biology with neoteny (i.e., the persistence of larval features in adult animals) and the resulting need for domestication leads to psychological responses that establish the basis for the capacity and the propensity for magic and religion in men. Belief in God, therefore, is the result of male-fantasized omnipotence as acquired by being locked into a lifelong phallic paranoid state. When vatic personalities, such as priests and their more primitive counterparts, shamans, speak with the voice of God, it is nothing but an expression of the self, deprived of its psychosexual maturity.

According to La Barre, religion first emerged when an early shaman, as depicted in the Stone Age cave of Les Trois Frères, proclaimed to have magic power over game and, after his death, became the supernatural helper of later shamans and, finally, the master of animals. Shaped by Paleolithic belief, shamans persisted as gods into protohistoric and historic times, where they were transformed to suit the needs of an agricultural society. In discovering the human nature of their gods, the Greeks resecularized their nature deities into mere heroes, while the Hebrews sacralized their patriarchal sheikhs and shamans into a moral and spiritual god, who, due to the influence of Greek crisis cults, developed into the Christian God.

Although ethological approaches to the study of religions have helped to gain insight into the ways multiple cultural systems are related to the biology of the human species, heavy criticism has been heaped upon an approach that is accused of being materialistic and nonhistoric—and of working with unnecessary complex and nonverifiable models of social dynamics. The assumed structural parallels of religions with biology, consciousness studies, and linguistics suggest a scientific character that aims at a natural truth underlying conventional scholarly results. As the anthropologist and scholar of religions Benson Saler (1930–) points out, the reference to universals existing in all cultures leads to definitions of universal categories that are so vague and abstract they are nearly useless and, furthermore, contradict the archaeological and anthropological records. The stress on universals, therefore, runs the risk of deflecting attention from the characteristics of a given religion that make it a solitary system of conceptions and deeds acquired throughout the course of

history. According to the historians Carlo Ginzburg (1939–) and Jean-Pierre Vernant (1914–), the specific history of a society and its religion shapes the spiritual universe of a people and modifies certain psychological attitudes, which have retroactive effects on religious behavior and thought.

Anthropological approaches stressing the results of ethological research are undoubtedly of great value as starting points for new and interesting inquiries, but in abandoning the historical method such approaches partially miss the goal of ethology. Because the emphasis of ethology has been based on the notion that the behavior of humans and its manifestations in religion have evolved throughout history, ethological inquiry must consider the historical circumstances under which the custom in question developed. To make matters perfectly clear, the theory of evolution has made biology into a historical science. Methodologically speaking, the descriptive techniques used by both ethologists and historians of religions are now fairly sophisticated, and they should be put to use by scholars surveying the religious behavior of closely defined groups. Comparative studies can be a fertile source of ideas and data if they avoid the implication that one group of people is just like another, and instead provide principles whose applicability to the religion under question can be assessed. Finally, the basic scientific issues of ethological research have to be taken into account, as there are questions of causation, ontogeny, function, and evolution (history). It would be desirable to include not only ethological theory and terminology, but also ethological method, especially in small-scale research. Such an approach would surely lead to remarkable results in future research.

ETRUSCAN RELIGION. Between the beginning of the eighth century BCE and the end of the fifth century BCE, Etruria was the dominant power in central Italy. The Etruscans had built up profitable commercial relations with the Phoenicians and the Greeks, established on the island of Pithecusa (modern Ischia) in Campania, then on the mainland in the town of Cumae around 750 BCE. This wealth and these relations allowed them to develop a much more advanced level of civilization than other peoples of the region. One indication of this is that Rome was under the rule of Etruscan kings between 616 and 509 BCE. Yet it is not this image of a military and political power that the Romans retained concerning their northern neighbors; as the historian Livy remarked at the time of Emperor Augustus, they were "the people most dedicated to matters of religion" (Livy 5.1.6). Thus the Romans saw the Etruscans' intense religious nature as their distinctive characteristic.

SOURCES OF INFORMATION ON THE ETRUSCAN RELIGION. This appreciative judgment concerning Etruscan religion might appear surprising in that the Etruscan religion seems

to be simply a rather ordinary polytheism with gods like those in the Greek or Roman pantheon. This is the picture that comes through from the majority of the existing sources.

These sources are restricted. Apart from divination, a subject this article will return to, Greek and Latin writers give few details, and Etruscan literature that could provide this information has not survived. As for Etruscan inscriptions, they make a limited contribution. The majority are epitaphs, which yield only the name of the deceased, while the votive plaques placed in temples reveal only the name of the divinity to which they were dedicated. Admittedly, some longer documentary sources are available, which could be of greater interest concerning the subject, but the continued inability to understand the language means that they are only partially understood. This is the case with the two longest extant Etruscan texts: the Capua Tile, a terra-cotta plaque bearing three hundred legible words, and the Liber Linteus (Linen book) of Zagreb, a text of twelve hundred words. The story of the latter's survival is amazing. It was written in ink, as was the practice in ancient Italy, on a linen cloth that was taken to Egypt, where it was cut into strips and used as the wrapping for a mummy now preserved at the Zagreb Museum. These texts are both ritual calendars, in any case.

Some archaeological finds exist. Even with these, however, what can be deduced remains limited. The results of excavations of many Etruscan temples are known, and they confirm the statement of the Roman architect Vitruvius that the Etruscans were responsible for the spread of the "Tuscan temple" that, in contrast to the Greek temple from which it took its inspiration, was raised on a high podium, dominating the town the god protected. However, it is impossible to be certain that, as Latin authors claim, the main city temples were dedicated to triads (groups of three gods). Only certain temples at Veii (Portonaccio), Orvieto (Belvedere), or Marzabotto (temple C) demonstrate evidence of a triple structure. It is not impossible that the idea of triadic temples was inferred from the Roman Capitol built by the Etruscan kings (the Tarquins), where Jupiter was flanked by two goddesses, Juno and Minerva.

There remains an extensive amount of iconography on tomb or vase paintings, statues, stone and terracotta reliefs, and engravings on bronze mirrors. From its beginnings, however, Etruscan art was suffused with Hellenic influence. Often, Etruscan documents portray scenes from Greek mythology. Nonetheless, this has one advantage: these Etruscan documents provide the names of the gods corresponding to their Greek equivalents, using the process of interpretation that consists of identifying a Greek god with the local god whose functions are most similar.

THE ETRUSCAN PANTHEON. In this way, scholars have some idea of the Etruscan pantheon. It included a heavenly chief god, analogous to the Greek Zeus or the Latin Jupiter, whom they called Tin or Tinia, which means "the shining day" (like the names Zeus and Jupiter). Just as with the Greek Zeus, this god is portrayed as a majestic bearded figure armed with

thunderbolts. This Tinia is associated with a female consort, Uni, identified with the Greek Hera or the Latin Juno (whose name is perhaps related). Other female divinities are known, sometimes with names of Greek origin, such as Pher-sipnai, who is the Etruscan equivalent of the Greek Persephone. She appears enthroned at the side of her husband Aita (an Etruscan transcription of the Greek god of the underworld, Hades) in paintings on the tomb of the Orcus at Tarquinia and the Golini tomb at Orvieto. Another underworld divinity, Vei, has a purely Etruscan name, however. This name, which must be part of the name of the town of Veii, remains obscure. This is not the case with another indigenous underworld goddess, Culsu, who is depicted on the sarcophagus of Hasti Afunei at Chiusi as placed at the entrance of the underworld. She is its guardian, and the Etruscan word *culs*, meaning "gate," derives from her name. The indigenous name Lasa is given to a series of minor female deities with various names who appear to be associated with more important goddesses, such as Achavisur, Alpanu, and Zipna, and who can be seen on mirrors assisting Turan, the goddess of love, the equivalent of Aphrodite, in getting dressed. The Etruscans also recognized a powerful chthonic goddess, Cel ati; the two parts of her name mean "earth" and "mother." She is a "Mother Earth," analogous to the Greek Demeter and the Latin Terra Mater. Mention should also be made of Menerva, derived from the Latin Minerva, goddess of the intellect (*mens*).

Among the male gods is a god of water, Nethuns, and a god of the forest, Selvans, corresponding, respectively, to the Latin equivalents Neptune and Silvanus. Other gods with Latin equivalents include Satre, corresponding to Saturn; Velchans, corresponding to Vulcan (Volcanus); Vetis, corresponding to Jupiter of the night and the underworld, Vediovis. On the other hand, Apulu, a Greek name, is the god Apollo, whom the Etruscans adopted under this name along with his myths. The *Apollo of Veii* statue from the end of the sixth century BCE in the temple of Portonaccio shows him fighting with Hercules in the episode of the capture of the Cerynian hind. Yet many other gods have local names. Several are the equivalents of figures in the Greek pantheon, including Turms, portrayed as the messenger of the gods Hermes; Sethlans as the blacksmith god Hephaistos; Usil as the sun god Helios, with rays coming from his head; and Fuluns as the god of the wine, Dionysos (and sometimes given the epithet Pachie, a transcription of the name Bacchus). However, several gods had no Greek equivalents. This is the case with Suris, who seems to have been an infernal and war god, like the mysterious Pater Soranus of Mount Soracte in Capena, in the territory of the Sabines, to which the name seems related.

This list shows Greek religious influence. Certain gods, such as Apollo, were borrowed from the Greeks, whereas on another level the success of the hero Hercules, whom they called Herclé, is noteworthy. A large number of statues and statuettes, evidence of his cult, have been found in Etruria.

One should also be aware of the deities with Latin or Italic equivalents, including Nethuns, Selvans, Velchans, Vetis, Menerva, and certainly Uni and Satre, who bear names that may be explained as derived from Italic forms (and not the other way around). This shows that the Etruscan religion was formed in the same mold as the religions of the other peoples of the peninsula in prehistoric Italy at the end of the second and the beginning of the first millennium BCE.

THE PERSISTENT ORIGINALITY OF THE ETRUSCAN RELIGION: THE VISION OF THE UNDERWORLD. This does not, however, mean that the Etruscan religion is not original. Leaving aside divination, Etruria made its mark on what it borrowed from others. This can be seen most obviously in their portrayal of the underworld, where Greek influence is evident. The sacred books dealing with these matters were called the Books of Acheron, after the underworld river in Greek mythology, from which the Etruscans took the infernal boatman Charon. But Charon, who is called Charun, appeared on tomb paintings brandishing a huge hammer with which he made ready to strike those who were about to die, an element not found in the Greek original. More generally, the Etruscans created an entire demonology that was perhaps inspired by certain Greek pieces (such as the depiction of the underworld by Polygnotus in the Cnidian Lesche at Delphi) but that, starting from the first paintings, such as the Tomb of the Blue Demons at Tarquinia from the fifth century BCE, certainly underwent considerable development. Another male demon is Tuchulcha, depicted with a hooked beak and pointed ears with two snakes rising on his head. Female demons also exist. They are often depicted on funerary urns to indicate that the person shown alongside is going to die. In particular, the female demon Vanth is a winged woman, bare-breasted or even completely naked, brandishing a torch, sometimes with snakes, at other times with a roll of parchment on which the fate of the deceased was written.

ETRUSCAN WOMEN AND RELIGION. It is true that the Etruscans were original in one aspect in which their civilization differed from those of Greece and Rome; that is, the accepted position of women in society. The Etruscan woman enjoyed much greater freedom than her Greek and Roman sisters. She can be seen lying alongside her husband on the same banqueting couch. This would have been unthinkable in Greece, where the banquet was an entirely male affair and only prostitutes were present, with lawful wives remaining in the *gynaeceum*. One might therefore expect that Etruscan women would occupy a privileged religious position.

However, this is not apparent in the evidence. Women are more often found in classical roles without particularly high status, such as mourners who, on the fifth-century BCE funerary reliefs at Chiusi, are seen weeping at the scene of the laying out of the dead. Maybe there were female priestesses, but the only definite instance involves a bacchante, who is depicted lying on the lid of a fine marble sarcophagus at Tarquinia holding a thyrsus and a vase with handles with a doe beside her. This woman appears in a religious role on the fringes of the official religion of the city.

However, the restricted role played by women in what the sources reveal concerning Etruscan religion need not be at variance with real life. Even if Etruscan women had more rights than Greek or Roman women, one must be careful not to overrate their social role. One should not take at face value what Greek and Latin writers say about Etruscan women. As peoples who had been the Etruscans' enemies, they were inclined to be critical of them. Thus, the liberty, at least in a relative sense, that the Etruscans allowed their women might be taken by these writers as loose living. They also tended to exaggerate everything they said about them, stating that they gave themselves shamelessly to lovemaking with anyone at all during banquets. The same exaggeration occurred in the religious sphere. Whereas Roman tradition holds that Tanaquil, the wife of L. Tarquinius Priscus, was an expert in divination and interpreted the omens from which her husband and the young Servius Tullius benefited, this is more a matter of Roman imagination than Etruscan reality. The haruspices known from the epigraphic or literary sources are exclusively men.

PROPHETS OF THE ETRUSCAN RELIGION AND THE *ETRUSCA DISCIPLINA*. Even so, there is one sphere in which the Etruscans developed their own myths, and these reveal what is truly original about Etruscan religion and why the Romans considered them the most religious of peoples. They had created what the Romans called *Etrusca disciplina*, using the Latin word *disciplina* to mean a "science." In their case it is a religious science centered around divination and rituals. The Etruscans did not view this *Etrusca disciplina* as the work of human beings. It was the result of a revelation given by gods to human beings at the beginning of their national history. This revelation, committed to writing, was the basis for the Etruscan religious sacred books.

Several competing traditions existed. The most famous was from Tarquinia. According to this version, the *Etrusca disciplina* was owed to a divine child called Tages. As a newborn, he was discovered by a plowman on the outskirts of the town. He had obviously been born from the earth, and no sooner had he been born than he began to speak and issue a revelation. He set out the basic principles of religious science, which those present eagerly committed to writing. Then he disappeared as mysteriously as he had appeared.

The story seems ridiculous, and Cicero, who relates it in his treatise *On Divination*, is openly contemptuous. As a good Roman he did not believe the gods could intervene directly in human affairs and rejected mythology as puerile stories. But the legend may be analyzed in terms of standard motifs. There is the autochthonous myth, in which a being is described as earthborn, produced like a plant. This is how the Athenians described their origins. This motif is coupled with the combination of old man and infant, fusing in one person the physical characteristics of infancy and the wisdom of old age. These are standard legendary motifs; what is interesting is that, in the Etruscan case, they are not used for the tale of a hero or the story of the origin of a people but to

establish the founding myth of the national religious science. This proves its importance to the Etruscans.

THE HARUSPICES. The revelation issued by Tages (or by Ve-goia) gave rise to an entire sacred literature, the "Etruscan books," which set out the substance of the national religious science that Latin writers frequently describe. This means that, for once, scholars are relatively well informed. These books were the mark of the specialists of the Etruscan discipline, the haruspices. These haruspices—whose name originally applied to one of their specialities, the inspection of the liver of sacrificial victims, but then took on a more general meaning—could be recognized by their distinctive dress. They wore a tapering, pointed hat. Sometimes this hat is seen on sarcophagi on top of a kind of folded sheet, which is in fact a linen book (like the one from the Zagreb mummy). This was the particular mark of the haruspex of the dead, who carried out his duties wearing this headgear while consulting his books.

These haruspices, at least in Etruria, were high-ranking individuals. Thus Cicero tells that one of his Etruscan friends, Caecina, was an expert in the national religious science and belonged to one of the most important Tuscan aristocratic families. Haruspices considered the Etruscan discipline as their exclusive possession and handed down the books from one generation to the next, fathers taking care to instruct their sons in their use. This instruction was deadly serious, conveying the scientific aspect, at least to ancient eyes, of the Etruscan discipline. Etruscan haruspicy, concerned with ritual or even with divination, did not allow itself to be guided by what the Greeks called *mania*, the god entering the body and soul of the person acting as the intermediary between the gods and human beings. Etruscan haruspicy studied the phenomena set before it with the help of the classifications laid down in its books. This required seriousness, the exact opposite of the trances of soothsayers possessed by divine inspiration. A famous fifth-century BCE mirror from Vulci shows Calchas, the soothsayer of the Greek army at Troy, as an Etruscan haruspex examining the liver of a victim. He is bent over the organ, which he is studying carefully, looking at the slightest variations in shape, texture, and color. It is quite correct to talk of a science, the term for the rigorous deductive method based upon detailed observation by which the haruspex formed his opinions. The Etruscan discipline even involved experimental science. Far from becoming a closed corpus, fixed once and for all by the initial revelation of Tages, Etruscan sacred literature was enhanced by observations of haruspices of later times. Cicero says they noted in their books new phenomena they observed and thus managed to enlarge upon the basic principles contained in the religious literature handed down to them.

THE SACRED BOOKS OF THE ETRUSCAN RELIGION. According to Cicero, Etruscan religious literature was divided into three kinds of books: the books of thunderbolts, the books of haruspicy, and the books of rituals. The extensive role of divination is clear, since the first two categories were dedicat-

ed to it. The *libri fulgurales* dealt with divination by thunderbolt and lightning, or brontoscapy; and the *libri haruspicini* with divination by inspecting the livers of sacrificial animals, or hepatoscapy; whereas in the *libri rituales* certain other kinds of divination are also considered, such as omens.

The books of thunderbolts. The Etruscans were not the first to be interested in thunderbolts; the phenomenon has always seemed to be of divine origin. In observing them, the haruspices demonstrated their analytical abilities. Seneca, in his *Natural Questions*, and Pliny the Elder, in his *Natural History*, drawing on Etruscan sources, show the fine distinctions the Etruscans made, establishing minute, generally complex classifications, distinguishing thunderbolts by their color, their shape, and the effect they had when they hit the ground. This theory of thunderbolts gave rise to a vision of the way the world worked. The Etruscans maintained that the principal god Tinia had three kinds of thunderbolts. The first, the most benevolent, was used to issue warnings; he used this on his own authority. The effects of the second were more serious; it brought only misfortune. However, the god could only hurl this on the advice of a council of twelve deities, six gods and six goddesses. The third left nothing untouched and changed the way the world was organized. Tinia only used this on the instructions of mysterious divinities—masters of destiny—gods said to be hidden or superior, whose names, numbers, and gender remained unknown.

The Etruscans did not consider the workings of the world the result of the whims of a god, however, even the chief god Tinia. Even he was subject to a destiny more powerful than he. This idea was developed in certain *libri rituales*, the books called *fatales*, concerning *fatum* (destiny). For the Etruscans the history of the world did not unfold by chance but was divided into a certain number of *saecula* (a period of varying length, calculated according to the lifespan of the longest living individual of a particular generation, so *saecula* could consist of 123 or 119 years). Each nation was entitled to a given number of *saecula*, ten in the case of the Etruscans, after which it would disappear, its destiny fulfilled.

The Books of Haruspicy. The *libri haruspicini* dealt with another classical kind of divination, hepatoscapy, which was particularly well known among the ancient peoples of the Middle East and based upon the study of the livers of animals offered to the gods in the central cult ceremony, the bloody sacrifice. Scholars are relatively well informed on Etruscan hepatoscapy. In 1877, in a field near Piacenza in Emilia, a bronze model liver was discovered. Subsequently known as the Liver of Piacenza, it had a box diagram on its surface, each section marked with the name of a god. This model liver was used to teach young haruspices. Thus they learned a particular interpretative grid, which they then used as a gauge for the actual livers they examined. If they found a particular feature in one of the boxes in the diagnostic diagram, they knew the god named in that box had sent this sign and needed to be placated.

The Liver of Piacenza allows still further understanding of the Etruscan religious system. The apparently unsystematic arrangement of boxes on the surface of the liver is in fact amenable to a certain organization. The two halves of the organ are separated by the anatomical division, the *incisura umbilicalis*. The right side, which literary sources call the *pars familiaris*, with neatly arranged square boxes, contains the heavenly gods, such as Tinia, who are relatively benign. In contrast, the left side, which sources describe as *pars hostilis*, arranged in a circle, has the names of infernal gods, such as Vetis, or unsettling gods, such as Satre or Selvans. Above all, the circumference of the organ has a series of sixteen boxes in a band around the object. This ties in with a detail known from elsewhere: Etruscan haruspices divided the vault of heaven into sixteen sectors according to the cardinal points, beginning from the quadrant going from north to west.

This allows an understanding of the theoretical basis of Etruscan hepatoscapy. By reproducing the sky with the abodes of the gods who live there, the liver is a microcosm reflecting the macrocosm of the universe, whose workings the gods oversee. It logically follows that the gods imprint in the microcosm signs that correspond to their actions in the macrocosm. And it is not a matter of indifference that these signs are passed down to the human race using the liver of a sacrificial animal.

According to a thorough analysis of the portion given to the human beings and the portion given to the gods in Greece by Jean-Pierre Vernant and Marcel Detienne and a group of their pupils, published in *La cuisine du sacrifice* in Paris in 1979, the liver reverts to the gods, to whom it is conveyed, when burned upon the altar. Considered by the ancients as the life center of the animal, it reverts by right to the immortal gods, masters of the life of every living creature. Yet if, as this work has emphasized, the Greek sacrifice in this way stresses the difference between the gods and human beings, in the Etruscan sacrifice it was their association, the exchange effected between them, that was considered crucial. The Etruscan sacrifice was defined by ancient authors as consultative: the consultation, involving the examination of the liver by the haruspex, was considered a fundamental part of the ceremony. What mattered to the Etruscans above all was the examination performed on the liver by the haruspex. The organ became the place of exchange between human beings and the gods, and the divinatory signs the gods placed there were their responses to the offering made.

The books of rituals. The third category of books, the books of rituals, is not a single whole. These books discuss divination as regards omens and destiny, the subject of the subcategory *libri fatales*. Nevertheless, rituals are also a significant subject for a religion that regarded the exact performance of ceremonies of vital importance, the slightest error potentially provoking the anger of the gods and leading to disaster. Many Etruscan rituals were brought to Rome. The foundation rite that Romulus is said to have followed when he founded Rome in 753 BCE is universally considered of

Etruscan origin. Romulus invited specialists from Etruria, who explained to him how to draw the sacred boundary of the city, the *pomerium*, by digging the *sulcus primigenius*, the first furrow, with the help of a plow pulled by a white bull and a white cow.

These books also describe other rituals. The subcategory called the Books of Acheron describes certain sacrifices offered for the dead, who it was believed were thus able to become actual gods, called *dei animales*, where *animales* means “created from a soul” (*anima* means “soul” in Latin). The process was simply ritual: it was sufficient to sacrifice certain animals and offer their blood to certain deities. This may seem childish; however, compared to the specifically Roman religion, which said nothing concerning human prospects after death, the Etruscan religion had an infinitely richer view of the future of human beings in the afterlife.

ROME AND ETRUSCAN HARUSPICY. Far from disappearing after the Roman conquest between 396 BCE, the date of the fall of the first Etruscan city, Veii, and 264 BCE, when the last remaining independent city, Volsinii, fell, this aspect of Etruscan religion continued to exist in a world that had now become a Roman one. The Romans were impressed by the practical benefits of the Etruscan discipline.

An ancient state could not be secular. One of its most important tasks was to ensure good relations between the city and the gods. If human beings were to blame for some misdeed or some oversight on their part, what was called the *pax deorum* (peace of the gods)—that is, the harmonious state of relations between the gods and the city—was broken. The gods showed their anger, which risked turning into the worst of disasters, visible in terms of events that indicated a break in the natural order of things, omens, and the outbreak of the supernatural in the normal course of existence. Faced with such signs, it was vital that the city understand what it had done wrong and what action should be taken. Confronted by such divine signs, Roman religion, in terms of its national heritage, was powerless. Faced with disasters, such as earthquakes or epidemics, heavenly signs, such as comets or hailstorms, or even mere curious happenings, such as the birth of a hermaphrodite child or a sheep with two heads, it was necessary to consult the Etruscan haruspices, who would discover in their books what needed to be done.

Rome was not slow to employ the skills of Etruscan specialists in matters of rituals and divination. Probably from the time they had completed the conquest, the Senate organized the Order of Sixty Haruspices, drawn from young nobles of various Etruscan cities, who could be consulted as soon as some event seemed to require the use of the Etruscan discipline.

THE SPREAD OF HARUSPICY IN THE ROMAN EMPIRE. In these circumstances the integration of Etruria into the Roman sphere, far from signaling the disappearance of the Etruscan discipline, enabled new expansion. Individuals also took advantage of the knowledge of the Etruscan soothsayers for their own personal needs. Some important people had

their own haruspex in their retinue: Spurinna, Caesar’s haruspex, unsuccessfully warned him of the danger on the Ides of March. Many generals were accompanied by a haruspex, and subsequent emperors had their own specialized staff for Etruscan divination.

These were important figures. Spurinna belonged to one of the most important Etruscan aristocratic families, and an imperial haruspex like Umbricius Melior, who in turn served Galba, Otho, and Vespasian, was important enough for the town of Tarentum to be honored by his patronage. Yet not all haruspices were such highfliers. Many were poor scoundrels trading on public gullibility. Cato, in his treatise on agriculture, warned the steward of the ideal farm he described to be wary of the haruspices who roamed the countryside. A number of Latin authors, including Cicero, the comic playwright Plautus, and the philosopher-poet Lucretius, denounced low-grade haruspices as nothing more than charlatans. This did not prevent them from flourishing; inscriptions indicate their presence throughout the Roman Empire.

HARUSPICES AND THE DEFENSE OF TRADITIONAL ROMAN RELIGION. Henceforth the Etruscan religious tradition no longer seemed like a foreign body differing from the national Roman tradition, the *mos maiorum*, as the Romans called their ancestral traditions. Etruscan religion was fully integrated into the heart of Roman religion and had an officially recognized place. It even seemed to be a key element. For Emperor Claudius, who reorganized the ancient collegium of sixty haruspices in 47 CE, it represented the the most distinguished part of traditional Roman religion.

Claudius justified his actions by the need to combat “foreign superstitions,” namely all those religious systems not part of traditional Greco-Roman paganism, including the developing Christian religion. The old Etruscan tradition was called upon to play its part in the defense of the *mos maiorum*, and the place held by haruspicy in the religious functions of the Roman *res publica* meant that at times haruspices were effectively in the forefront of the struggle against the Christians. Thus, the Great Persecution of Diocletian, decreed in 303 CE, the gravest crisis the young religion had faced, was embarked upon following an incident, reported by the Christian writer Lactantius, in which haruspices played a key part. Lactantius stated that Christian slaves present at the celebration of an imperial sacrifice disrupted it, causing the anger of the gods. Consequently Diocletian decided to persecute the Christians.

DEVELOPMENT OF ETRUSCAN RELIGIOUS TRADITION UNDER THE EMPIRE. It would be misleading, however, to see in the attitude of the haruspices toward new religions, and particularly in their hostility to Christianity, nothing more than narrow-minded conservatism. On the contrary, it is notable that the knowledge of the development of Etruscan beliefs during this period demonstrates the haruspices’ adaptability to contemporary expectations—including, if need be, features borrowed from their rivals. An amazing text, pre-

served in the Byzantine lexicon the *Suda*, presents a supposedly Etruscan account of creation, which is simply a copy of the biblical story in *Genesis*. As noted, the Etruscan discipline was not closed and inward-looking. The scant evidence of its later condition shows that it evolved and adopted ideas that would have originally been totally alien in the early days, such as the idea of the world being created by God. The Etruscan tradition contained within it an ability to adapt, which other forms of Greco-Roman religion did not possess.

ETRUSCAN RELIGION AND THE DEFENSE OF ROMAN PAGANISM.

The main explanation of the genuine revival enjoyed by the Etruscan religious tradition in the late days of the Roman Empire is that, compared to other religions, it appeared firmly rooted in the most authentic Roman tradition. In an age when, as that great defender of traditional Roman religion in fourth-century Rome, the senator Symmachus, remarked, all religions were considered of equal value in approaching the ineffable mystery of God, the Etruscan tradition retained an enormous advantage over the others. It seemed to be from Italy and thus something with which the Romans should urgently reconnect. This is stated in a letter from a pagan priest, Longinianus, to Augustine, who had asked him about his beliefs. This has been preserved in the letters of the bishop of Hippo. In the letter, Longinianus outlined a theory of revelation, explaining that every part of the world has its own particular prophet and that for Italy this prophet had been Tages, the child-prophet of Tarquinia, to whom the Romans should turn back as a matter of urgency. Here is the trump card of the Etruscan religious tradition: it could put forward prophetic figures, like those required in Judeo-Christian traditions, and it was based upon sacred books setting out the teachings of these prophets. With Tages and the sacred Etruscan books as part of their national heritage, the Romans had no need of the Bible or of a prophet born in a remote corner of Judaea.

These aspects of Etruscan religious tradition ensured that it played a part in the task of defending ancient religion, which occupied philosophers at the end of paganism. A Roman writer of the second half of the third century, Cornelius Labeo, put it forward in his writings, notably in a treatise in which he described the doctrine of the transformation of the souls of the dead into gods, as mentioned in the Books of Acheron. His works have not survived, but they had some influence because this Etruscan doctrine is one of the pagan doctrines concerning the afterlife that Christian writers felt it necessary to attack.

Nonetheless this intellectual volte-face was unable to prevent the imminent disappearance of the last vestiges of the Etruscan religion. These vestiges were closely bound to traditional Roman religion, and they were even, because of the place given to haruspicy in the official religion, bound up with the position of the ancestral religion in the workings of the *res publica*. As soon as the Empire abandoned these religious practices and, with the edicts of Theodosius in 391 and 392 CE, banned public celebration of the pagan cult, the old

Etruscan tradition, which was too directly bound up with the official cult, was doomed to die out. Whereas one can hear echoes in Proclus, the "last pagan" who ran the school of philosophy at Athens between 430 and 485 CE, and even later in the work of John the Lydian, who in the time of Justinian was interested in the ancient religious customs of Etruria in that last outpost of Rome, Byzantium, they were nothing more than nostalgia for a past long gone.

General Works on Etruscan Religion

Dumézil, Georges. "La religion des Étrusques." In *La religion romaine archaïque*, pp. 593–600. Paris, 1966. Mainly based upon literary sources.

Gaultier, Françoise, and Dominique Briquel, eds. *Les Étrusques, les plus religieux des hommes: Actes du colloque international Galeries nationales du Grand Palais, 17–18–19 November 1992*. XXes rencontres de l'École du Louve. Paris, 1997. Completely in French with contributions by the leading Etruscologists, the proceedings of a conference dealing with research on the Etruscan religion. Extensive bibliography.

Grenier, Albert. *Les religions étrusque et romaine*. Series Mana, vol. 3. Paris, 1948. Good description of Greek and Latin sources.

Jannot, Jean-René. *Devins, dieux, et démons: Regards sur la religion de l'Étrurie antique*. Paris, 1998. Well-informed survey with extensive iconography.

Maggiani, Adriano, and Erika Simon. "Il pensiero scientifico e religioso." In *Gli Etruschi: Una nuova immagine*, edited by Mauro Cristofani et al., pp. 139–168. Florence, 1984. Brief discussion but well informed, with a good iconography.

Pfiffig, Ambros Josef. *Religio Etrusca*. Graz, Austria, 1975. In German, a complete work with an analysis of archaeological and iconographical data.

Capua Tile and Linen Book of Zagreb

Cristofani, Mauro. *Tabula Capuana, un calendario festivo di età arcaica*. Florence, 1995. Work by one of the greatest Etruscologists, dealing with the meaning of the Capua Tile.

Pallottino, Massimo. "Il contenuto della mummia di Zagabria." *Studi Etruschi* 11 (1937): 203–237. Reprinted in *Saggi di antichità*, vol. 2, *Documenti per la storia della civiltà etrusca*, pp. 547–588. Rome, 1979. An old article but one of the best introductions to the contents of the Linen Book of Zagreb.

Etruscan Temples

Banti, Luisa. "Il culto del cosiddetto 'tempio di Apollo' a Veii e il problema delle triadi etrusco-italiche." *Studi Etruschi* 17 (1943): 187–201. An old article but helpful on the subject of triads.

Colonna, Giovanni. "Tarquinio Prisco e il tempio di Giove Capitolino." *Parola del Passato* 36 (1981): 41–59. On the exceptional nature of the temple of Jupiter Capitolinus in Rome.

Colonna, Giovanni, ed. *Santuari d'Etruria*. Milan, 1985. Catalog of an exhibition in Arezzo in 1985 with a survey of the main Etruscan temple excavations and the corpus of archaeological data.

Prayon, Friedhelm. "Deorum sedes: Sull'orientamento dei templi etrusco-italici." In *Miscellanea etrusca e italica in onore di*

Massimo Pallottino, pp. 1285–1295. *Archeologia Classica* 43. Rome, 1991. On the orientation of Etruscan temples.

Studies on Etruscan Gods

Ackerman, Hans Christoph, and Jean-Robert Gisler, eds. *Lexicon Iconographicon Mythologiae Classicae*. 8 vols. Zurich, 1981–1997. Articles dedicated to the various Etruscan divinities. Two index volumes were published in 1999.

Berti, Fede, ed. *Dioniso, culti, e mistero*. Comacchio, Italy, 1991. Proceedings of a conference dealing with the Dionysiac cult, notably in Etruria.

Capdeville, Gérard. “*Velchans (?)” In *Volcanus, recherches comparatistes sur les origines du culte de Vulcain*, pp. 289–409. Rome, 1995. In the context of a study of the Roman god Vulcan, introduction of data on the Etruscan Velchans that shows it is not possible to draw any firm conclusions.

Rallo, Antonia. *Lasa, iconografia e esegesi*. Florence, 1974. Study on the Etruscan Lasa, regarded as the equivalent of Greek nymphs.

Etruscan Demonology

Krauskopf, Ingrid. *Todesdämonen und Totengötter im vorhellenischen Etrurien, Kontinuität und Wandel*. Florence, 1987. Study of the different Etruscan demons and their origins (predates the discovery of the Tomb of the Blue Demons in Tarquinia).

Roncagli, Francesco. “Iconographie funéraire et topographie de l’au-delà en Étrurie.” In *Les Étrusques, les plus religieux des hommes*, pp. 37–54. Paris, 1997. Study of the Tomb of the Blue Demons.

Ruyt, Franz de. *Charun, démon étrusque de la mort*. Rome, 1934. Complete iconographical study of the Etruscan Charun.

Etruscan Women

Amann, Petra. *Die Etruskerin, Geschlechterverhältnis und Stellung der Frau im frühen Etrurien (9.–5. Jh. v. Chr.)*. Vienna, 2000. Comprehensive study, well documented archaeologically, on the position of women in Etruscan society in the archaic period.

Rallo, Antonia, ed. *Le donne in Etruria*. Rome, 1989. Collection devoted to the place of women in Etruscan society.

Etruscan Discipline

Bouché-Leclercq, Auguste. *Histoire de la divination dans l’antiquité*. 4 vols. New York, 1975; reprint, Grenoble, France, 2003. Survey of divination practices in the world of classical antiquity. Good analysis of types of divination.

Thulin, Carl Olof. *Die etruskische Disciplin*. 2 vols. Göteborg, Sweden, 1906–1909. Old but fundamental work.

Weinstock, Stefan. “*Libri fulgurales*.” In *Papers of the British School at Rome*, vol. 19, pp. 122–153. London, 1951.

Attitude of Greek and Latin Authors to Etruscan Divination

Guillaumont, François. *Philosophe et augure: Recherches sur la théorie cicéronienne de la divination*. Brussels, 1984. Attitude of Cicero to Etruscan divination.

Guittard, Charles. *La divination dans le monde étrusco-italique*. In *Suppléments à Caesarodunum*, vol. 1, Suppl. 52. Tours, 1985.

Guittard, Charles. *La divination dans le monde étrusco-italique*. In *Suppléments à Caesarodunum*, vol. 2, Suppl. 54. Tours, 1986.

Guittard, Charles. *La divination dans le monde étrusco-italique*. In *Suppléments à Caesarodunum*, vol. 3, Suppl. 56. Tours, 1986.

Guittard, Charles. *La divination dans le monde étrusco-italique*. In *Suppléments à Caesarodunum*, vol. 4, *Les auteurs du Siècle d’Auguste et l’Etrusca disciplina*, part I, Suppl. 61. Tours, 1991.

Guittard, Charles. *La divination dans le monde étrusco-italique*. In *Suppléments à Caesarodunum*, vol. 5, *Les auteurs du Siècle d’Auguste et l’Etrusca disciplina*, part II, Suppl. 63. Tours, 1993.

Guittard, Charles. *La divination dans le monde étrusco-italique*. In *Suppléments à Caesarodunum*, vol. 6, *Les écrivains et l’Etrusca disciplina de Claude à Trajan*, Suppl. 64. Tours, 1995.

Guittard, Charles. *La divination dans le monde étrusco-italique*. In *Suppléments à Caesarodunum*, vol. 7, *Les écrivains du IIe siècle et l’Etrusca disciplina*, Suppl. 65. Tours, 1996.

Guittard, Charles. *La divination dans le monde étrusco-italique*. In *Suppléments à Caesarodunum*, vol. 8, *Les écrivains du troisième siècle et l’Etrusca disciplina*, Suppl. 66. Tours, 1999.

Guittard volumes present a systematic investigation of the attitude of Greek and Latin authors to Etruscan divination, with articles by different contributors.

The Liver of Piacenza

Maggiani, Adriano. “Qualche osservazione sul fegato di Piacenza.” *Studi Etruschi* 50 (1982): 53–88. Fundamental study with new readings of inscriptions.

Meer, L. Bouke van der. *The Bronze Liver of Piacenza: Analysis of a Polytheistic Structure*. Amsterdam, 1987. Analysis of the evidence according to principles different from those adopted by Maggiani.

Omens and Gods Formed from a Soul

Bloch, Raymond. *Les prodiges dans l’Antiquité classique: Grèce, Étrurie, et Rome*. Paris, 1963.

Briquel, Dominique. “Regards étrusques sur l’au-delà.” In *La mort, les morts, et l’au-delà dans le monde romain*, edited by François Hinard, pp. 263–277. Caen, France, 1985.

Haruspices in Republican Rome

MacBain, Bruce. *Prodigy and Expiation: A Study in Religion and Politics in Republican Rome*. Brussels, 1982. Fundamental work on the official haruspicy in Rome during the Republic.

Rawson, Elizabeth. “Caesar and the *Etrusca Disciplina*.” *Journal of Roman Studies* 68 (1978): 132–152.

Position of Haruspicy in Imperial Rome

Briquel, Dominique. *Chrétiens et haruspices: La religion étrusque, dernier rempart du paganisme romain*. Paris, 1997. Relations between those ancient Romans representing traditional Etruscan religion and Christians.

Mastandrea, Paolo. *Un neoplatonico latino, Cornelio Labeone*. Leiden, 1979. Role of Cornelius Labeo in the revival of Etruscan discipline.

Montero, Santiago. *Política y adivinación en el Bajo Imperio Romano: Emperadores y hariuspices*. Brussels, 1991. Systematic examination of evidence regarding late haruspicy.

DOMINIQUE BRIQUEL (2005)
Translated from French by Paul Ellis

EUCHARIST. The Eucharist, also known as the Mass, Communion service, Lord’s Supper, and Divine Liturgy,

among other names, is the central act of Christian worship, practiced by almost all denominations of Christians. Though varying in form from the very austere to the very elaborate, the Eucharist has as its essential elements the breaking and sharing of bread and the pouring and sharing of wine (in some Protestant churches, unfermented grape juice) among the worshipers in commemoration of the actions of Jesus Christ on the eve of his death.

The word *eucharist* is taken from the Greek *eucharistia*, which means “thanksgiving” or “gratitude” and which was used by the early Christians for the Hebrew *berakbah*, meaning “a blessing” such as a table grace. When Christians adopted the word from the Greek into other languages, the meaning was narrowed to the specific designation of the ritual of the bread and wine.

HISTORY. The ritual attributed to Jesus by the writers of the New Testament is portrayed as a Jewish Passover seder meal in which Jesus reinterprets the symbolism of the traditional celebration (Paul in *1 Cor.* 11:23–26, *Mk.* 14:22–25, *Mt.* 26:26–29, and *Lk.* 22:14–20). Passover commemorates the liberation of the Hebrews from slavery in Egypt, which was the first step in their becoming a people in covenant with God. It is celebrated to this day by a lengthy ceremonial meal with prescribed foods, in which the story of the deliverance is symbolically reenacted (see *Ex.* 12:1–28). Selecting from the many symbolic foods customary in his time, Jesus takes only the unleavened bread (the bread of emergency or affliction) and the wine. The tradition of the early witnesses is that Jesus asks the traditional questions about the meaning of the ritual and answers, first about the bread he is breaking, “This is my body, broken for you,” and then about the wine, “This is my blood, the blood of the covenant, which is to be poured out for many.” It is clear that Jesus refers to his death and is interpreting the significance of that death in terms of the symbolism of the Exodus story and the Passover ritual. He invites the disciples to repeat the action frequently and thus enter into his death and the outcome of that death. By placing his death in the context of Passover, Jesus interprets it as a liberation bringing his followers into community as one people in covenant with God (see *1 Cor.* 11:17–34).

In the earliest Christian times, Eucharist was celebrated rather spontaneously as part of an ordinary meal for which the local followers of Jesus were gathered in his name in a private home. By the second century it is clear that there were strong efforts to regulate it under the authority and supervision of the local church leaders known as bishops. By the fourth century, Eucharist was celebrated with great pomp and ceremony in public buildings, and the meal was no longer in evidence. At that time, solemn processions emphasized the role of a clergy arrayed in special vestments. The form of the celebration included several readings from the Bible, prayers, chants, a homily, and the great prayer of thanksgiving, in the course of which the words and actions of Jesus at his farewell supper were recited, followed by the distribution of the consecrated bread and wine to the participants.

The Orthodox and other Eastern churches retained this general format with some variations. The liturgy of the Western churches, however, went through a long period of accretion and elaboration of secondary symbolism which obscured the meaning of the action and tended to leave the congregation passive spectators of what the clergy were doing. During the Middle Ages there also emerged the private Mass, a Eucharist celebrated by a priest without a congregation of worshipers present.

The sixteenth-century reformers took action to strip away all accretions and elements that did not seem to be in accord with the text of the Bible. Zwingli and Calvin were more radical in this than Luther. The Roman Catholic church also instituted extensive reforms of the rite in the sixteenth century, leaving a uniform pattern later known as the Tridentine Mass. This, however, was very substantially revised after the Second Vatican Council (1962–1965), allowing more spontaneity and congregational participation as well as offering more variety.

THEOLOGY. Eucharist is understood by all Christians to commemorate the saving death and resurrection of Jesus, and to mediate communion with God and community among the worshipers. Beyond this basic concept, the theology of the Eucharist varies very widely among the Christian denominations and has often been a cause of bitter dispute between them.

Both Orthodox and Roman Catholic Christians understand the presence of Christ very concretely, taking seriously the so-called words of institution, “This is my body . . . this is my blood.” However, the Orthodox insist that while there is an actual change in the bread and wine that justifies these words, the manner of the change is a mystery not to be analyzed or explained rationally. Since medieval times Catholic Christians have attempted to give an intellectually satisfying explanation, focusing on the notion of a transubstantiation of bread and wine. While the eucharistic theology of the various Protestant churches varies widely, they are united in finding a theology of transubstantiation not in harmony with their interpretation of scripture.

The meaning and effect of the Eucharist have also been discussed in Catholic theology under the term *real presence*. This emphasizes that the presence of Christ mediated by the bread and wine is prior to the faith of the congregation. Protestant theology has generally rejected the term *real presence* as one liable to superstitious interpretation.

Orthodox and Catholic Christians also agree on an interpretation of the Eucharist in terms of sacrifice; that is, a renewed offering by Christ himself of his immolation in death. Again, there have been determined efforts in the Catholic theological tradition to give intellectually satisfying explanations of this, while Orthodox theology tends to tolerate a variety of explanations at the same time as it insists on fidelity to the words of the liturgy itself. Protestants believe the theology of sacrifice lacks biblical foundation and doctrinal

nal validity, and prefer to emphasize the role of the Eucharist as a memorial.

It is paradoxical that the Eucharist is the sacrament of unity for Christians yet is a sign and cause of disunity among denominations. In general denominations exclude others from their eucharistic table, usually on account of theological differences. Contemporary initiatives reflect attempts to reconcile some of these differences and to experiment cautiously with “intercommunion” among the churches. Such initiatives appear to be far more extensive among laity than in the official legislation of the churches.

BIBLIOGRAPHY

The texts of the eucharistic celebrations of the various Western churches are given in *Liturgies of the Western Church*, selected and introduced by Bard Thompson (1961; reprint, Philadelphia, 1980). An account of the Orthodox Divine Liturgy and its theology is given in Alexander Schmemmann's *Introduction to Liturgical Theology* (London, 1966). A description of the early Christians' Eucharist and eucharistic theology, with identification of sources, is presented in *The Eucharist of the Early Christians*, by Willy Rordorf and others (New York, 1978). More specifically concerned with the theology of the Eucharist are Joseph M. Powers's *Eucharistic Theology* (New York, 1967), from a Catholic perspective, and Geoffrey Wainwright's *Eucharist and Eschatology* (1971; reprint, New York, 1981), from a Protestant, particularly a Methodist, perspective. A discussion of the social implications of eucharistic celebration can be found in my book, *The Eucharist and the Hunger of the World* (New York, 1976).

MONIKA K. HELLWIG (1987)

EUCLID (c. 300 BCE) was a Greek mathematician. Plato described mathematics as a discipline that turns one's gaze from the Becoming of the sensible world to the Being of the intelligible. The great value of mathematics is to prepare the mind for the apprehension of pure ideas. After Plato's death, geometry flourished among his students. One of the few details known about Euclid's life is that he studied under Plato's followers. Subsequently he founded the great school of mathematics at Alexandria, Egypt. He wrote on mathematics, optics, and astronomy.

Euclid's *Elements* is the most influential work in all of mathematics. Though other “Elements” were produced before Euclid, his work organized and completed that of his predecessors, who are now known chiefly by reference. As the letters (Gr., *stoikheia*; “elements”) of the alphabet are to language, so are the *Elements* to mathematics, wrote the Neoplatonist Proclus in the fifth century CE. The analogy is apt. In thirteen books Euclid goes from the most elementary definitions and assumptions about points, lines, and angles all the way to the geometry of solids, and he includes a theory of the proportions of magnitudes, number theory, and geomet-

ric algebra. His procedure epitomized the axiomatic-deductive method and became a paradigm for philosophical and scientific reasoning. The greatest works in the history of astronomy imitate the *Elements*: Ptolemy's *Almagest* (c. 150 CE), Copernicus's *De revolutionibus* (1543), and Newton's *Principia* (1686). There is no greater example of Euclid's influence in philosophy than Spinoza's *Ethics* (1675), which scrupulously reproduced Euclid's method of definitions, axioms, and propositions.

The *Elements* became the elementary introduction to mathematics in Hellenistic civilization. Translated into Arabic in the ninth century and into Latin in the thirteenth, it became the foundation of Islamic, medieval, and Renaissance mathematics. It standardized the body of mathematical knowledge well into the twentieth century. The *Elements* was not translated into Sanskrit until the 1720s, though there is evidence of some prior knowledge. The Chinese may have known Euclid in the thirteenth century, but it did not affect the development of their mathematics until 1607, when the Jesuit Matteo Ricci produced a highly praised translation of the first six books of the *Elements* as part of the Jesuit missionary strategy in China. The use of the *Elements* as the textbook of mathematics over millennia is the source of the often repeated claim that, second only to the Bible, the *Elements* is the most widely circulated book in human history.

Euclid's religious significance can be seen in two ways. First, Euclid fulfilled the value Plato saw in mathematics. Euclid's masterpiece remains the enduring testament of the human capacity to construct a transparently intelligible system of relations grounded in logic and capable of extension to the physical world, though not derived from it. He demonstrates with lucid brevity how reason can successfully operate with purely intelligible objects such as points, lines, and triangles, and discover new and unforeseen truths with them. Such exercise frees the mind from the appearances of the senses and initiates it into an intellectual realm that Plato referred to as the realm of Being. In Neoplatonism such exercise had a paramount spiritual value. Augustine of Hippo, in his *Soliloquies* (386), written the year before his baptism, esteemed mathematics as a preparation for the soul's ascent to God. The mind perceives necessary truths first in mathematics and is then prepared to pursue eternal, divine truth. Having tasted the sweetness and splendor of truth in mathematics and the liberal arts, the mind actively seeks the divine. A millennium later, the Christian mystic Nicholas of Cusa wrote in his *Of Learned Ignorance* (1440) that the most fitting approach to knowledge of divine things is through symbols. Therefore he uses mathematical images because of their “indestructible certitude” (bk. 1, chap. 11).

Second, Euclid's geometry implicitly defined the nature of space for Western civilizations up to the nineteenth century. That “a straight line is drawn between two points,” Euclid's first postulate, is also a statement about the space that makes it possible. Conceptions of space have religious repercussions because they involve matters of orientation. Isaac

Newton (1642–1727) reified Euclidean space in his physics. He identified absolute space and absolute time, which together constitute the ultimate frame of reference for cosmic phenomena, with God’s ubiquity and eternity. Euclid’s fifth postulate stipulated the conditions under which straight lines intersect, and, by implication, when they are parallel. To his continuing credit, Euclid presented the conditions as assumptions. For millennia mathematicians tried unsuccessfully to prove them. But, because Euclid’s postulates were only assumptions, other conditions were possible. Thus in the nineteenth century Nikolai Lobachevskii, Farkas Bolyai, and G. F. B. Riemann were inspired to develop non-Euclidean geometries. These were crucial to Einstein’s theories of special and general relativity (1905, 1913) and, hence, to the present cosmology, wherein a straight line cannot be drawn between two points. The conclusion that space and time are inseparable in the mathematical and physical theories of the nineteenth and twentieth centuries owes its existence to the force of the Euclidean tradition.

BIBLIOGRAPHY

The classic English translation of the *Elements* is Thomas L. Heath’s *The Thirteen Books of Euclid’s Elements*, 2d ed. (New York, 1956). It includes an introduction to Euclid’s place in the history of mathematics and a thorough commentary on the text. A more recent account of Euclid and his achievement, as well as the history of the *Elements*, with comprehensive bibliographies, is found in Ivor Bulmer-Thomas’s “Euclid” and John Murdoch’s “Euclid: Transmission of the *Elements*,” in the *Dictionary of Scientific Biography* (New York, 1970–1980). A discussion of the historical and philosophical antecedents to Euclid and how his methods incorporate Platonic and Aristotelian developments in the philosophy of mathematics is provided in Edward A. Maziarz and Thomas Greenwood’s *Greek Mathematical Philosophy* (New York, 1968). The importance of mathematics in the education of the philosopher is addressed in Werner Jaeger’s *Paideia: The Ideals of Greek Culture*, 3 vols., translated by Gilbert Highet (Oxford, 1939–1944).

MICHAEL A. KERZE (1987)
Revised Bibliography

EUGENICS. The term *eugenics*, from the Greek meaning “good birth,” was coined by British scientist Francis Galton (1822–1911). As Galton defined it in *Essays in Eugenics* (1909), eugenics is “the study of agencies under social control which may improve or impair the racial qualities of future generations” (p. 81). Eugenics seeks to improve the human gene pool by encouraging reproduction among “de-

sirable” members of society (positive eugenics) and by discouraging reproduction among the “undesirable” (negative eugenics).

THE ORIGINS OF EUGENICS. Influenced by his cousin Charles Darwin’s theory of evolution by natural selection, Galton researched the ancestry of eminent men in Great Britain and believed that the characteristics that led to their success—especially disposition and cognitive ability—were inherited. Environment might have had some influence, but for Galton heredity was central to an individual’s traits and personality.

In addition to believing that talent and character could be inherited, Galton recognized that society was interfering with natural selection. Though evolution by Darwinian natural selection had produced humanity, developed society was drastically altering its course. In nature, natural selection eliminated the weak and the sick, allowing only the swift and strong to survive. In civilized societies, however, weak and “feeble-minded” persons were cared for and provided for through charities, government programs, and religious groups, so that natural selection was no longer operating on humanity. Galton believed that if nothing were done, society would suffer the deleterious effects of having “fit” traits diluted by “unfit” traits.

Consequently, Galton believed that civilized human society ought to take control of its own breeding practices by encouraging eugenic behavior that promoted the future health of society. He suggested that, much as farmers breed only the best livestock, humans should promote reproduction among only the best of the human stock. Only then would the human race be able to maintain its level of civilization and prevent the regression of humanity toward greater feeble-mindedness and greater physical weakness. Galton’s solution to the problem was to encourage individuals in the upper classes—whose success Galton attributed to inherited traits—to have more children.

After 1900, when the work of the Austrian monk Gregor Mendel (1822–1884) was rediscovered, the true impact of heredity permeated both the scientific community and society, and eugenics seemed to gain momentum. In his experiments with pea plants, Mendel had shown how individual characteristics such as pea color and plant height were inherited according to a regular pattern. Eugenicists applied Mendel’s results to human trait inheritance, assuming that intelligence, attitude, and other complex human behaviors were the result of a clear-cut pattern of inheritance. Examining an individual’s pedigree, then, could yield powerful clues about what traits that individual’s offspring might inherit.

Building on this apparently solid scientific foundation, eugenic scientists in both the United Kingdom and the United States attempted to persuade governments and society to embrace eugenic measures. Established in 1910 by Charles Davenport (1866–1944), the Eugenics Records Office in Cold Spring Harbor, New York, served as the central clear-

inghouse for family pedigree information and eugenic research in the United States. Davenport and his colleague Harry H. Laughlin (1880–1943), superintendent of the Eugenics Records Office, developed pedigree surveys and trained fieldworkers to gather family pedigree information for hundreds of individuals. Based on their examination of such pedigrees, Davenport and Laughlin became convinced that the nation's gene pool faced threats on two fronts. Internally, "feeble-minded" individuals were outbreeding the graduates of Ivy League universities, lowering the overall intelligence of the gene pool. Externally, waves of new immigrants from eastern and southern Europe threatened to overtake the Anglo-Saxon stock in the United States. Both problems were "dysgenic" because they caused a decline in the quality breeding population, so urgent action was required to prevent the further deterioration of society.

In dealing with the dysgenic effects of immigration, the Eugenics Records Office was influential in convincing the U.S. Congress to pass restrictive new laws. Psychologist Henry H. Goddard (1886–1957) had performed intelligence tests on immigrants at Ellis Island that seemed to support the eugenic argument that immigrants were of lower intelligence than native stock. Using Goddard's research as well as his own, Laughlin testified before Congress that the waves of immigrants from southern and eastern Europe were diluting the "purity" of older American immigrant populations from northern Europe, as well as costing taxpayers millions of dollars in social services. Heavily influenced by the eugenicists' arguments, Congress passed the Immigration Act of 1924, which set immigration quotas based on the 1890 census. Consequently, immigrants of "eugenic" stock from northern and western Europe were admitted in larger numbers than the "dysgenic" stock from southern and eastern Europe.

In addition to its work with the U.S. Congress, the Eugenics Records Office provided model sterilization laws for states trying to implement "negative" eugenic measures. Scientists and fieldworkers from the Eugenics Records Office offered expert testimony in sterilization and institutionalization cases for those who had been diagnosed with a range of inherited "defects," such as alcoholism, pauperism, criminality, feeble-mindedness, and insanity. Yet even before the coordinated efforts by the Eugenics Records Office, states began passing eugenic sterilization laws, beginning with Indiana in 1907. Other states soon followed, including California in 1909. In 1913 and 1917, amendments to the California law expanded the state's power to involuntarily sterilize the "feeble-minded," certain prisoners, and criminals with more than three convictions.

In 1927, the U.S. Supreme Court heard an appeal by a seventeen-year-old woman from Virginia named Carrie Buck. Buck, along with her mother Emma, had been labeled "feeble-minded" and placed under the care of the Virginia Colony for Epileptics and Feeble-minded. After the unmarried Carrie Buck gave birth to a baby girl who was diagnosed as "feeble-minded" at eight months of age, the superintendent

of the institution ordered her sterilization under a new Virginia law. The case was appealed to the Supreme Court, who, having heard testimony in favor of sterilization from eugenic experts including Laughlin, ruled that the state of Virginia did indeed have the constitutional right to involuntarily sterilize Carrie Buck. In the majority opinion (*Buck v. Bell* 274 U.S. 200, 1927), Justice Oliver Wendell Holmes argued that the public good demanded that action be taken to sterilize Carrie Buck, because "three generations of imbeciles are enough."

The Supreme Court ruling in *Buck v. Bell* allowed states to continue forcibly sterilizing and institutionalizing those deemed unfit for reproduction. California had involuntarily sterilized nearly twenty thousand individuals by the time its sterilization law was overturned in 1951, more than had been sterilized in any other state. All told, over sixty thousand people in thirty-three states were sterilized for a variety of inherited "defects."

In Germany, the eugenics movement (*Rassenhygiene*) gained momentum as the Nazis rose to power and passed forced sterilization laws beginning in 1933. Nazi scientists and politicians approvingly cited the American experiment with eugenics, particularly in California, in their arguments for broader powers in determining who should be sterilized. When the horrors of the Nazi regime's racial hygiene program were fully revealed, eugenics programs in the United States and elsewhere were largely discredited. Some have argued, however, that though state-sponsored eugenics is now roundly condemned, eugenic attitudes persist in less overt forms.

RELIGION AND EUGENICS. Galton recognized the potential power of eugenic ideals and the necessary conditions for their acceptance. He wrote in 1909 in his *Memories of My Life*, "I take Eugenics very seriously, feeling that its principles ought to become one of the dominant motives in a civilized nation, much as if they were one of its religious tenets" (p. 322). The success of eugenics lay not only in its ability to present pertinent information in support of eugenics, but also in its ability to influence one's entire way of living. Thus, the eugenicists appealed not only to the science behind their efforts but also to religious sensibilities by providing an ultimate explanation for an individual's existence: responsibility to the future of the gene pool. Eugenics required an attitude of individual submission, an ethical orientation toward the greater good. To many scientists who argued for eugenic measures, religion motivated ethical behavior better than any other social phenomenon. Hence, eugenicists went to great lengths in analyzing and appropriating religion for eugenic ends.

Davenport grounded religious belief on the apparent science of eugenics in a lecture he delivered in 1916, "Eugenics as a Religion." Noting that every proper religion has its own statement of belief, Davenport proceeded to announce a twelve-point creed to serve as the basis for the new religion of eugenics. For Davenport, believing in eugenics meant believing that one is the "trustee" of one's genetic material; that

one believes in the power of pedigree over environment; that one should have four to six offspring; that immigration should be limited to weed out the “socially unfit”; and that one is responsible ultimately to the race. Davenport’s eugenic religion required that one be responsible both to one’s genetic past and to society’s genetic future. Along with Davenport’s creed, the American Eugenics Society provided *A Eugenics Catechism* (1926) in question-and-answer form. The catechism assured readers that eugenics was not antagonistic to the Bible, for eugenics was concerned with the well-being of the totality of humanity. The catechism also promised immortality through one’s genetic inheritance, passed on from generation to generation.

Likewise, Paul Popenoe and Roswell Johnson’s *Applied Eugenics* (1933) gave immortality a firm grounding in scientific knowledge. In a passage describing the long line of human descent, Popenoe and Johnson argue that one’s genetic makeup is immortal because genes, as the factors that determine who one is, can be passed on to innumerable generations. The authors argue that immortality is no longer merely hope but a real possibility. Even as the body dies, the genes that contain the information to produce the body live on in one’s offspring. Popenoe and Johnson conclude, “To the eugenicist, life everlasting is something more than a figure of speech or a theological concept—it is as much a reality as the beat of a heart, the growth of muscles, or the activity of the mind” (p. 41). Popenoe and Johnson go so far as to argue that one passes on one’s soul from generation to generation by the propagation of the genetic material; religion has but speculated about the nature of the soul and its immortality, but eugenic science has proven their relationship. According to eugenics, then, an individual passes on his or her very soul to his or her offspring. As Davenport had argued in his creed, the proper attitude is one of submission to the greater good of society and to the precious inheritance of genetic material.

Popenoe and Johnson devote an entire chapter to the subject of eugenics and its relationship to religion. Interestingly, Popenoe and Johnson begin by asserting that “natural selection favors the altruistic and ethical individual because he is more likely to leave children to carry on his endowment and his attitude” than the merely selfish, shortsighted individual. As Galton had first observed, modern society has interfered with the operation of Darwinian natural selection. But unlike Galton, Popenoe and Johnson see the problem not only in society’s failure to eliminate the weak and unintelligent, but also in its failure to rid itself of selfish and shortsighted individuals. They argue that selfishness creates problems for eugenicists since eugenics is based on placing the good of the race ahead of the good of the individual. Thus, the eugenics movement requires a structure for encouraging altruism and selflessness, a structure provided by religion.

For Popenoe and Johnson, science can offer religion a solid basis for ethics, one amenable to eugenic ideals, as well as present a rational explanation for the immortality of the soul. Religion need not retreat from the field of ethics; in-

stead, religion should reexamine its ethical groundings. Dogmatic moral injunctions are no longer tenable in a eugenic world. Popenoe and Johnson conclude that the success of eugenics depends on the individual placing the present and future good of humanity above the good of the individual. Though many societal organizations foster selfless giving, the church is the most effective at encouraging altruism. Religion and the church can be a driving force behind eugenic change if they will but base their ethical systems on a science.

The “Report and Program of the Eugenics Society of the United States of America” (1925) pointed to the central role that religion had played in fostering both dysgenic and eugenic attitudes. Still, the society wondered whether the social value of religion could be used to further eugenic ends. No doubt, religion influenced dysgenic behavior by encouraging charity and providing social services. But like Popenoe and Johnson, both of whom sat on the Eugenics Society’s advisory council, the society recognized religion’s potential to influence individual behavior toward eugenic ends. The Eugenics Society concluded that if further research showed that religion were in fact primarily dysgenic, then eugenics had to devise a means of using religion’s moral authority while altering its message.

One way in which the Eugenics Society encouraged religious engagement with eugenic principles was by sponsoring a sermon contest for clergy. Submissions were judged according to their ability to present eugenic ideals in clear and coherent fashion. Most did so by interpreting religious teachings in light of eugenic ideals. One sermon claimed that the Bible was a book of eugenics because it chronicled the lineages of important leaders and prophets. Jesus was seen as the product of the highest religious and moral stock of priestly and prophetic individuals. Another sermon claimed it a sin to bring feeble-minded and diseased children into the world. Finally, one sermon argued that Jesus endorsed eugenics in saying that it would have been better if Judas had never been born (*Mt.* 26:24; *Mk.* 14:21). In this view, eugenics could be a crucial tool in bringing about the ordered society of which Jesus seemingly spoke.

Because marriage was an important focus of eugenic measures, some clergy took the initiative to aid the eugenic movement by enforcing a version of “negative” eugenics. In 1912, W. T. Sumner, the dean of the Episcopal Cathedral of Chicago, announced that he would not marry couples who failed to produce a physician’s certificate of good health, a move endorsed by two hundred clergy. The hope was that the clergy would aid eugenicists by preventing unprofitable unions that would pass on undesirable traits.

Eugenic scientists embraced religious language even as they critiqued the dysgenic impact of various religions. Still, they recognized religion’s unequalled social power in influencing individual behavior and in urging action. Even as they criticized the dysgenic effects of unconditional religious charity and threatened to take over the entire field of ethics, eu-

genicists urged religion to incorporate scientific analyses into its ethical systems and embrace eugenic ideals.

EUGENICS IN RECENT HISTORY. Interest in the history of the eugenics movement has increased markedly since the 1980s as new genetic technologies have been developed and as the Human Genome Project has completed the map of human DNA. Prenatal screening for genetic disorders, along with the legalization of abortion in the United States and the United Kingdom, has increased the debate over the social consequences of genetic knowledge. Debates have swirled around the proper use of such new technologies and the social consequences of their availability. Key concerns include the difference between notions of treatment versus notions of improvement. For example, if it becomes possible, should the genes for Tay-Sachs disease or cystic fibrosis be removed from the gene pool? Would such action constitute eugenic improvement or disease prevention?

The history of eugenics has also been invoked in debates surrounding the connection between intelligence and race. Richard J. Herrnstein and Charles Murray's *The Bell Curve* (1994) worries about the dysgenic effects of variable breeding rates because, the authors argue, racial groups with lower intelligence levels are reproducing at a higher rate than races with higher IQs. Critics of *The Bell Curve* assert a more environmental explanation for variations in intelligence and argue that genetics are not decisive in determining an individual's intelligence.

Other scholars have maintained that the use of new genetic technologies tends to support existing social hierarchies and vested economic interests. They worry that economic interests will determine for whom and for what purpose genetic technologies will be used, which will in turn reinforce social stratification as those unable to afford genetic enhancements are left behind. If the means for enhancement are available, some argue, parents will demand that such technology be used. In this case, consumer demand, not government control, will drive a new eugenics based on the desire for "designer babies." Though they recognize the eugenic dangers, a number of theologians and ethicists have endorsed certain forms of genetic research because of their potential to relieve human suffering. For them, the promise of healing offered by genetic therapies outweighs the concerns over the misuse of new technologies and new therapies.

EUHEMERUS AND EUHEMERISM. Euhemerus, a Greek (c. 340–260 BCE), achieved fame as the result of an imaginative story he wrote that speaks, in a certain fashion, about the origins of divinities. After his death, Euhemerus's name became identified with a special, widely discussed and disputed way of interpreting religion. Euhemerism had an impact for many centuries. Even today, no one dealing with the history of scholarship of religion will leave Euhemerus unmentioned. Very little is known about Euhemerus himself. What is known is precisely what tradition has made him: the originator of *euhemerism*, an elucidation of religion that explains the gods as elevated images of historical individuals whose acts were beneficial to those around them.

The term *euhemerism* came to refer to a method of empirical explanation applied to the accounts of gods found in sacred traditions. Indeed, Aristotle, the first great Greek thinker with an empirical sense of inquiry, was part of the generation that preceded Euhemerus. There is no reason to believe that Euhemerus was an empiricist or that he shared Aristotle's analytical views concerning traditional religion. Euhemerus's turn of mind went elsewhere. In Euhemerus's

day, well before Strabo (c. 63 BCE–c. 24 CE), geography was far from the accurate discipline it would become. Traveling, however, was a most attractive topic, and travel stories were told everywhere, from China to the shores of the Mediterranean. Euhemerus achieved renown in his own time as the teller of a travel story.

The title of a novelette Euhemerus wrote has come down to us as *Hiera Anagraphē*, a title that is usually rendered as “Treatise on Sacred Matters.” It is not known whether this title was given by Euhemerus himself or by someone later, nor is it known whether this title renders Euhemerus’s own intentions. In fact, a real impediment to modern access to Euhemerus is the fact that no version of the text he wrote exists. (The understanding of *hiera* as “sacred” might be misleading; one might just as well translate the title as “treatise on religious matters.”) All that exists are summaries of much later date. The two most extensive writings about Euhemerus come from the Christian apologist Lactantius (c. 260–340 CE) and, earlier, Diodorus Siculus (died after 21 BCE), who wrote a world history and is one of our best sources for the history of antiquity.

Hiera Anagraphē tells of a voyage to an island in the east called Panchaia, from which—according to the story—on clear days India could be seen. On this island stood a golden pillar with a golden engraving on it. The pillar recounted the life of Zeus, and also of the rulers of Panchaia before him: his father, Kronos, and his grandfather, Ouranos. Zeus, according to this story, traveled through the world, and wherever he went the worship of the gods became established. But Zeus and the kings before him were rulers who bestowed benefits on the inhabitants of Panchaia. The people came to worship them as gods. In other words, Zeus, his father, and his grandfather were royal rulers who were made gods because of their acts on behalf of human beings.

What Euhemerus wrote differs considerably from older, didactic traditions, such as that of Xenophanes of Colophon (sixth century BCE), who is known for his emphasis on the difference between gods and men: “But the mortals think that the gods are born and dress, speak and look just like they themselves do,” (Diels and Kranz, 1934, fragment 14), and “there is only one single God, the supreme among gods and people, unlike the people both in appearance and in thought,” (Diels and Kranz, 1934, fragment 23).

Euhemerus wrote as a storyteller. Storytelling can be a way of conveying the sacred, of speaking about the sacred, which we find in virtually all places and all times. Yet Euhemerus’s narrative came to be viewed as an early attempt to find some rational basis of religion, and its author came to be seen as a sort of rationalist explainer. From the time of the early church fathers on, certain trends in Western thought caused theologians and other scholars to approach Euhemerus as if he were a critic or debunker of the gods. Nevertheless, euhemerism lost little of its prestige. The French scholar Abbé Banier (1673–1741) used it eagerly in his work *La mythologie et les fables expliqués par l’histoire* (My-

thology and fables explained by history). From the age of the Enlightenment onward, scholars, among them many a classicist, looked upon Euhemerus as a debunker whose work represented a rational critique of religion. This element of “desacralization” was admired by some and regretted by others—but both sides of that argument were missing the boat. Few of Euhemerus’s contemporaries were likely to have felt Euhemerus as a critical force. Greek religion was imparted primarily in storytelling.

The classical historian Truesdell S. Brown quite rightly stressed a simple fact many of his peers had overlooked: the Greek gods were unlike the God of the Bible (and of the Qur’an, the holy book of the third Abrahamic tradition). Brown emphasized that the entire known Greek religious heritage consists in stories (that is, myths), whereas the vast majority of biblical writings, apart from notable exceptions like the *Psalms*, present themselves neither as unmythical, or as history. Moreover, the Greeks did not have “holy scripture” or “church dogma.”

The Germanist and historian of religions Jan de Vries was more in keeping with certain of his colleagues when he called Euhemerus “a clear example of the triviality to which the fourth century sank in explaining the gods.” Joseph Fontenrose, a classicist, by contrast, lauded Euhemerus for his “rationalism” and for the position that mere people are at the root of divinity. These positions of De Vries and Fontenrose nicely exemplify those disagreements regarding Euhemerus wherein both sides miss the point that matters by missing the storytelling structure of the religion of the Greeks.

Augustine of Hippo (354–430) accomplished a fateful reunderstanding of Euhemerus (as did many of the early Christian thinkers). Augustine was familiar with Euhemerus’s ideas, and for him they only indicate that the “pagans” themselves were of the opinion that their gods were mere people. Moreover, Augustine was convinced that those individuals who were elevated to divinity gained that status as a result of their stupendous evil—and this inversion, we can see, is precisely the opposite of what Euhemerus said. This *Euhemerismus inversus* of the early Christians had great persistence. Since the nineteenth century (when most missionary societies were established), many a missionary has held the opinion that “pagan” gods are demons. This opinion is an offshoot of those early Christian theologies.

Among more “secular” scholars, it is remarkable that a number have taken Euhemerus very seriously as a rationalist, and some have even developed theories that resemble his supposed rational reductionism. The theory of “animism” proposed by E. B. Tylor (1832–1917) lingers to this day—for example, in the writings of journalists who need a shorthand label (“animist”) to identify the religions of peoples in remote parts of the world, peoples who once would have been called “savage,” “pagan,” or “primitive.” Tylor’s theory concerns the origin of religion and displays a mechanical cause-and-effect rationalism, which many thought they saw (and liked) in Euhemerus.

Turning away from rationalizing and theorizing about the origins of religion, one can confront the fact of the extraordinary importance of storytelling. The medieval world, Christianized as it was, told stories and performed plays in which Jesus, Joseph, and Mary, and of course the devil, spoke with one another. And, of course, there were songs. And institutions or authorities did not condemn storytelling and songs.

It remains true that most of the time in most of the world the myths of each religious tradition have been *stories*. Certainly in Greece and in antiquity in general, doctrines of “faith” were inconceivable. The sloppy habit of equating *religion* with *faith* is a modern deviation, a by-product of Christian church history; *faith* cannot be translated, for example, into the languages of classical India or China.

Kees W. Bolle (2005)

EUSEBIUS (c. 260/70–c. 339), a Christian bishop of Caesarea in Palestine from 314, was a leading early Christian historian, exegete, and apologist. A disciple of Pamphilus at Caesarea, Eusebius wrote a life of his master and called himself “of Pamphilus.” He traced his intellectual descent to Origen, and with Pamphilus wrote a defense of Origen against the theological and personal criticisms current during the persecution of 303–313. Little is known of Eusebius’s early life, but it seems clear that he wrote his *Historia ecclesiastica*

(History of the church) at Caesarea during the persecution, possibly though not certainly after composing at a slightly earlier date a first draft of it as well as a first draft of his *Chronicon* (Chronicle). At the end of the persecution, in spite of occasional slanders concerning apostasy spread by his enemies, he became bishop of Caesarea. During this time he continued to update his *Historia* and composed other significant works, such as the *Demonstratio evangelica* and *Praeparatio evangelica*. He gradually became involved in the Arian controversy; his defense of a traditional subordinationist Christology partly resembling Origen’s was criticized by many fellow bishops. Indeed, a synod held at Antioch in 324 or 325 condemned him and a few others, though he was given the right of later appeal. At the synod held at Nicaea Eusebius set forth the local creed of Caesarea but accepted the Alexandrian term *homoousios* (“of the same substance”), which transformed the creed’s meaning. Thereafter he helped drive the pro-Nicene bishop Eustathius out of Antioch, acted as a judge when Athanasius was brought before several synods, and attacked Marcellus of Ancyra as a Sabellian. At the celebration of Constantine’s thirtieth anniversary Eusebius delivered a panegyric on the emperor and his divinely inspired deeds. Similar themes appear in his *Life of Constantine*, written after 337. Eusebius died before the synod of Antioch in 341.

Eusebius is known less for his deeds than for his multitudinous writings, some of which are lost. Constant revision and the transfer of materials from one work to another make his development as a writer difficult to assess. He was an exegete, an apologist, a historian, and a panegyrist, but his various roles cannot be completely separated.

As exegete he followed the example of Origen in his textual criticism and made some use of the latter’s works in his commentaries on *Isaiah* and *Psalms*. In addition, he produced “canons” for finding gospel parallels and wrote an introduction to theology (*General Elementary Introduction*, of which parts survive in his *Eclogae propheticae*). Biblical exegesis recurs throughout the *Demonstratio*, primarily in regard to Old Testament prophecies of Christ and the church.

Eusebius’s apologetic is implicit throughout the *Historia* and explicit in the *Praeparatio* (sages and seers anticipated Christianity, although inadequately), the treatise *Against Hierocles* (Christ superior to Apollonius of Tyana, a first-century wonder-worker), and the twenty-five lost books against the Neoplatonist philosopher Porphyry, who had written against Christians and criticized Origen. A treatise that survived only in a Syriac version is titled *On the Theophany*; it combines materials from other books.

As historian, Eusebius is best known for his ten books on the history of the church from its divine origin to Constantine’s defeat of the pagan emperor Licinius in 324. The work does not discuss the later conflicts over Arianism, Melitianism, and Donatism, or the synods of 324 and 325. A late edition deletes Eusebius’s expectation that Constantine’s son Crispus would be the emperor’s heir; the deletion must have

been made after Crispus's execution in 326. The main sources of the *Historia* lay in the church archives and libraries at Caesarea and Jerusalem, where there was no documentation for the churches of the West or for many churches of the East. Eusebius seems to have known little about the church of Antioch and had the good sense to refuse translation there in about 330. His strong emphasis on Alexandrian Christianity results from his love for the school of Origen.

Eusebius's panegyrics usually start from his own experiences. Thus his work *The Martyrs of Palestine* (two editions) was based largely on his own acquaintance with the persecution in 303–313; he visited Egypt perhaps in 312, where he witnessed mass executions of Christians. He praised also other martyrs (especially of Gaul), the benefactors who rebuilt the ruined church at Tyre, and above all the emperor Constantine as the divinely appointed champion of Christianity.

It may be that Eusebius's major contribution was as librarian or bibliographer. To him is owed the collections of Origen's letters and the stories of "ancient martyrdoms." The *Chronicon*, *Historia*, *Praeparatio*, and *Demonstratio* are essentially collections of collections or even source books without very full annotation. In other words, his materials may be more important than what he did with them. Although one has to watch for deletions, misconceptions, and other errors, Eusebius does not usually falsify his materials, but his changing attitudes have left strange juxtapositions in the text of the *Historia*.

He was conciliatory toward pagan philosophy and politics but hostile toward pagan religion, in which he could see a main cause of the Great Persecution. In this regard he was aligned with Origen, but he underestimated the ultimate force of the newer Alexandrian theology and its preference for orthodoxy over the harmony that Eusebius, like Constantine, had supported. During his lifetime he enjoyed good fortune. He was in imperial favor at least during his last decade, and by 340 his opponent Eustathius was dead, Athanasius in exile, and Marcellus about to be deposed. The question of his supposed Arianism has agitated historians of doctrine for centuries, but it cannot be answered without greater knowledge of the theology of the early fourth century.

His place in the history of Christian learning and literature was high during his lifetime and continued so for centuries. Those who wrote the history of the Eastern church in the fifth and sixth centuries invariably referred to his work as basic and irrefutable. Less innovative or skilled in philosophy than Origen, he was more concerned with tradition, and this concern led him to an exegesis often more sober and literal. It was this concern, also, that led to his search for early Christian documents. Perhaps he succeeded to the headship of Origen's school at Caesarea. It is possible that the lost life of Eusebius by his successor Acacius resembled the panegyric that a disciple, probably Gregory Thaumaturgus, addressed to Origen. If so, there must have been significant differences. A disciple of Eusebius would have insisted on the importance

of history, not philosophical theology, as the key to exegesis and apologetics.

BIBLIOGRAPHY

Most of Eusebius's works have been critically edited by Ivar A. Heikel and others in *Eusebius Werke: Die griechischen christlichen Schriftsteller der ersten drei Jahrhunderte* (Berlin, 1902–1975). Most important in this collection is the three-volume *Kirchengeschichte*, edited by Eduard Schwartz (Leipzig, 1908). Other texts can be located through Johannes Quasten's *Patrology*, vol. 3 (Utrecht and Westminster, Md., 1960), pp. 309–345. Quasten also takes note of the modern literature. Important secondary sources include Glenn F. Chesnut's *The First Christian Histories* (Paris, 1977), Pierre Nautin's *Origène: Sa vie et son œuvre* (Paris, 1977), Robert M. Grant's *Eusebius as Church Historian* (Oxford, 1980), and Timothy D. Barnes's *Constantine and Eusebius* (Cambridge, Mass., and London, 1981).

ROBERT M. GRANT (1987)

EUTYCHES (c. 378–454), was the archimandrite and founder of the monophysite heresy. Eutyches was born in Constantinople and was archimandrite of a monastery near there. As sponsor of the eunuch Chrysaphius, Eutyches was very influential in the imperial court. Chrysaphius was one of the more powerful counselors of the emperor Theodosius II.

Eutyches was the originator of an extreme form of monophysitism that came to be called Eutychianism. In reaction to the separationist Christology of Nestorius (who accepted two distinct natures in Christ), Eutyches concluded that there was in Christ a single nature. When Theodoret of Cyrhus wrote the *Eranistes* against Eutyches' opinions, Flavian, the patriarch of Constantinople (446–449), sent Eutyches to the Council of Constantinople (448) for judgment.

Eutyches appeared at the council but refused to accept the existence of two natures in Christ and was on that account condemned and deposed. Flavian's successor on the throne of Constantinople, Cyril, was, however, sympathetic to Eutyches' teaching, which corresponded to the general framework of the teaching of the Alexandrian school, rather than that of the Antiochene school. Because Cyril assumed that Flavian was a representative of the Antiochene school, he opposed the measures taken against Eutyches. Cyril promoted the convocation of a synod that later became known as the Robber Synod (449), which restored Eutyches and condemned and deposed Eusebius of Dorylaeum—who also opposed the heresy of Nestorius—as well as Flavian. Despite this, and on account of the loss of imperial favor because of the death of Theodosius II (450), Eutyches was expelled from his monastery. The new emperors, Pulcheria and her consort Marcian, convoked an ecumenical council at Chalcedon in 451, which denounced the Robber Synod, excommunicated Dioscorus (patriarch of Alexandria who had presided over the synod), restored the expelled bishops, and con-

demned Nestorianism, as well as Eutyches along with his teachings.

Eutyches believed that after the union of the divine and the human in Christ, there were no longer two natures but one, and this one nature was a mingling of the two. After this blending, only the divine nature remained, because the human nature was absorbed by the divine. The Council of Chalcedon, by contrast, affirmed that within Christ there are united, without confusion or division, two natures that are wholly God and wholly human.

C. Frend's *The Rise of the Monophysite Movement* (Cambridge, U.K., 1979), which includes sources and a bibliography.

THEODORE ZISSIS (1987)

Translated from Greek by Philip M. McGhee

EVAGRIOS OF PONTUS (345–399), also known as Evagrios Pontikos; Greek theologian and mystic. Evagrios was surnamed Pontikos because he was a native of Pontus, in Asia Minor. He was born to a prosperous, educated family. His father was a *chorepiskopos*, a bishop, of an area adjacent to the family estates of Basil of Caesarea. Evagrios studied under Basil, who ordained him a reader. When Basil died in 379, Evagrios became a disciple of Gregory of Nazianzus, who ordained him deacon and took him under his aegis. Under the Cappadocian fathers, Evagrios became a skilled theologian. Directly or indirectly influenced by the thought of Origen and Gregory of Nyssa, he viewed Hellenism as an enrichment rather than as a corruption of Christianity.

When Gregory of Nazianzus moved to Constantinople as patriarch, Evagrios was invited along. There he participated in the deliberations of the Council of Constantinople (381), which brought the Arian controversy to an end and established the Nicene Creed in its final form. The young deacon impressed many in the council with his brilliant mind and skillful debating.

When Evagrios fell in love with a married woman, he decided to leave the capital and seek peace and salvation in the monastic life. He traveled to centers of monasticism in Egypt and Palestine, where he was the guest of Melania, the Roman aristocrat who ran a hospice on the Mount of Olives for Christian pilgrims. He also became acquainted with Rufinus, who had founded a monastery near the Mount of Olives. Later he moved to Egypt, where he spent two years in the mountains of Nitria and fourteen in the nearby Desert of the Cells (a settlement where six hundred anchorites lived). In Egypt, he came under the influence of the Macarii monks, known as the Makroi Adelphoi (Long Brothers), champions of Origenism. Early in his life among the Egv-

tian monks he encountered their hostility. They did not like "the cultured Greek living in their midst." Still the Desert Fathers exerted a significant influence on Evagrios's spirituality. He was to live among these monks until his death.

Evagrios was a prolific author of theological and ascetic essays, biblical commentaries, and letters. Some of his writings survive in the original Greek but most have survived only in Syriac, Armenian, or Latin translations. His writings reveal his indebtedness to Origen, the Desert and the Cappadocian fathers (Gregory of Nyssa in particular), and his concern with mystical and ascetic theology.

Among some fourteen authentic works by Evagrios is a trilogy: the *Praktikos*, the *Gnostikos*, and the *Kefalaia gnostika*. The first is a comprehensive exposition of his ascetic philosophy in short chapters intended for simple monks; the second is a continuation of the *Praktikos* for educated monks; and the third, the most important, known also as the *Problemata gnostika*, develops his cosmological, anthropological, and philosophical thought. It is here that Origen's influence on Evagrios is most apparent. This work was used for Evagrios's condemnation by the Second Council of Constantinople (553). Evagrios's most important essay, known as "Chapters on Prayer," is preserved in its original Greek under the name of Nilus of Ancyra.

Evagrios is acknowledged as an important spiritual influence on Christian spirituality and Islamic Sufism. He influenced Maximos the Confessor, Dionysius the Areopagite, and John of Klimakos (John Climacus) and became the forerunner of the hesychasts of later Byzantium. Through Rufinus and John Cassian, Evagrios's ascetic and mystical theology influenced John Scottus Eriugena as well as Bernard of Clairvaux and other Cistercian mystics.

DEMETRIOS J. CONSTANTELOS (1987)

EVANGELICAL AND FUNDAMENTAL CHRISTIANITY. The term *evangelicalism* usually refers to a largely Protestant movement that emphasizes:

- (1) the Bible as authoritative and reliable;
- (2) eternal salvation as possible only by regeneration (being “born again”), involving personal trust in Christ and in his atoning work;
- (3) a spiritually transformed life marked by moral conduct and personal devotion, such as Bible reading and prayer; and
- (4) zeal for evangelism and missions.

Among Lutherans the term *evangelical* has long had a more general usage, roughly equivalent to *Protestant*, and some neo-orthodox theologians have used the term in its broad sense of “gospel believer.” In the Spanish-speaking world, the term *evangélico* roughly parallels the Lutheran usage, referring in general to non-Catholic Christian groups of any stripe, although historically most *evangélicos* have in fact been evangelicals as more narrowly defined above. In the English-speaking world, evangelical designates a distinct movement that emerged from the religious awakenings of the eighteenth century and that by the early nineteenth century had taken clear shape in the United States, in England and the British Empire, and in many mission fields.

Fundamentalism is a subspecies of evangelicalism. The term originated in the United States in 1920 and referred to evangelicals who considered it a chief Christian duty to combat uncompromisingly “modernist” theology and certain secularizing cultural trends. Organized militancy was the feature that most clearly distinguished fundamentalists from other evangelicals. Fundamentalism originated as primarily an American phenomenon, although it has British and British Empire counterparts, is paralleled by some militant groups in other traditions, and has been exported worldwide through missions.

Whereas *fundamentalism* and *fundamentalist* continue to be useful terms for historians, they are less useful as terms descriptive of any particular group, in part because the term has become so pejorative in Western culture that only the extreme right wing of evangelicalism would welcome being labeled as such. In addition, the distinction between fundamentalist and evangelical is not always an easy one to make, and what can be said of fundamentalists can often be said, at least in part, of some (even most) evangelicals. Nevertheless, the term is applied with some usefulness to the more theologically and culturally conservative wing of evangelicalism, although the precise parameters of that wing are open to conjecture.

The two characteristics by which fundamentalists are most easily recognized represent both an engagement with Western culture and a rejection of it. Fundamentalists challenge Western culture in an organized, militant battle over secularizing cultural trends even as they appropriate the latest

advances in technology and technique in an evangelistic struggle for human hearts. In an attempt to nurture their constituents, especially their children, within their own subculture, fundamentalists withdraw from Western culture into communities and institutions of their own creation that often parallel the communities and institutions of secular culture. Both evangelicalism and fundamentalism are complex coalitions reflecting the convergences of a number of traditions.

EMERGENCE OF EVANGELICALISM. Although evangelicalism is largely an Anglo-American phenomenon, its origins give it ties with European Protestantism. The central evangelical doctrines, especially the sole authority of the Bible and the necessity of personal trust in Christ, reflect Reformation teachings. Seventeenth-century Puritanism solidly implanted these emphases in a part of the British Protestant psyche, especially in the North American colonies. In the eighteenth century this heritage merged with parallel trends in continental pietism. The influence of the Moravians on John Wesley (1703–1791) best exemplifies this convergence. Wesley’s Methodist movement in the mid-eighteenth century was part of a wider series of awakenings and Pietist renewal movements appearing in Protestant countries from the late seventeenth century through much of the nineteenth century. In England the awakenings were manifested in Methodism, in evangelical renewals among nonconformists, and in the rise of a notable evangelical party in the Church of England. By the mid-nineteenth century, evangelicalism was the most typical form of Protestantism in Great Britain.

In the United States, evangelicalism was even more influential. Evangelical religion had fewer well-established competitors than in the Old World. The rise of the United States as a new nation and the rise of evangelicalism coincided, so the religion often assumed a quasi-official status. Evangelical emphasis on voluntary acceptance of Christianity also was well matched to American ideas of individual freedom.

The character of American evangelicalism began to take shape during the Great Awakening of the eighteenth century. This movement, really a series of revivals throughout the middle decades of the century, brought together several movements. These included New England Puritanism, continental Pietism, revivalist Presbyterianism, Baptist anti-establishment democratic impulses, the Calvinist revivalism of the Englishman George Whitefield (1714–1770), and Methodism (which surpassed all the others after the Revolutionary era). During the first half of the nineteenth century, evangelicalism developed a strong populist base and became by far the most common form of Protestantism in the United States. Evangelicalism had many denominational varieties but tended to blend Calvinist and Methodist theologies, to emphasize conversion experiences evidenced by lives freed from barroom vices, to vigorously promote revivals and missions, and to view the church as a voluntary association of believers founded on the authority of the Bible alone.

By the early nineteenth century evangelicals in Great Britain and the United States had established a formidable network of nonsectarian “voluntary societies” to promote their causes. Of these the various missionary societies, founded around the beginning of the century, were the most prominent, providing, together with denominational agencies, the home support for the most massive worldwide missionary effort ever seen. Home missionary endeavors were comparably vigorous, supported by a host of agencies for promoting evangelism, founding Sunday schools, distributing Bibles and religious tracts, establishing schools and colleges, and bringing the gospel to various needy groups. Revivalism spearheaded such efforts, exemplified best in the extensive campaigns of Charles Finney (1792–1875) both in the United States and in England. These mission and evangelistic efforts were accompanied by campaigns, organized by voluntary societies, for charity and social reform. On both sides of the Atlantic evangelicals played leading roles in combating slavery; in Great Britain, especially under the leadership of William Wilberforce (1759–1833), they were influential in bringing about its abolition throughout the empire. Evangelicals promoted other reforms, including Sabbatarian and temperance legislation, prison reform, and the establishment of private charities. Such reforming spirit was usually part of a postmillennial vision of steady spiritual and moral progress leading to a millennial age of the triumph of the gospel throughout the world, after which Christ himself would return. When linked in the popular mind with notions of the progress achievable through science, the focus brought by romanticism to the possibilities inherent in individuals, and the manifest destiny of the Anglo-Saxon race on the North American continent, this evangelical vision lent itself to a triumphalist view of what could be achieved by Americans in the New World. The downside of this heady brew of evangelicalism and patriotism was at times a nativist impulse that fed both racism and anti-Catholicism.

THE LOSS OF CULTURAL DOMINANCE. In the latter half of the nineteenth century, the vigorous evangelicalism that had grown so successfully in the early industrial era found itself in a new world. The concentrated new industrialism and the massively crowded cities tended to overwhelm the individualistic and voluntaristic evangelical programs. Conceptions of dominating the culture became more difficult to maintain. Evangelicals accordingly increasingly stressed those aspects of their message that involved personal commitment to Christ and personal holiness rather than social programs, although aspirations to be a major moral influence on the culture never entirely disappeared. The evangelicalism of Dwight L. Moody (1837–1899) exemplified this trend. Moody, like Finney before him, had great successes in both the United States and Great Britain. He omitted entirely, however, Finney’s postmillennial emphasis on social reform, stressing instead the importance of rescuing the perishing from the sinking ship that was the condemned world. This increasing sense of evangelical alienation from Anglo-American culture was reflected in Moody’s premillennialism and in the growth

of premillennialism among most of the newer evangelical movements of the day. Premillennialists looked to the second coming of Christ as the only cure for the world’s social and political woes. New emphasis on personal holiness, notably exemplified in the rise of the Keswick holiness movement in Britain after 1875, reflected similar tendencies. Keswick teaching, which spread widely among American evangelical and later fundamentalist followers of Moody, stressed personal victory over sin, personal witnessing about the gospel, and support of missions as chief among Christian duties. Keswick was only one of several new holiness movements that flourished among evangelicals in the mid- and late nineteenth century. Most of these movements had generic ties with Methodism and Wesley’s teachings concerning Christian perfection. Some holiness groups, most notably the Salvation Army, founded in England in 1865, combined their evangelism with extensive charitable work among the needy. Others among an emerging number of holiness denominations emphasized more the personal experience of being filled by the Holy Spirit. Such emphasis in heightened forms was apparent in the rise in the United States after 1900 of Pentecostalism, which also brought separate denominations and almost exclusive emphasis on intense personal spiritual experience. By the early twentieth century, evangelicalism was thus subdivided into a variety of camps on questions of personal holiness and the nature of spiritual experience.

Equally important during this same era, from the later decades of the nineteenth century to World War I, was that evangelicals found themselves in a new world intellectually. Darwinism became the focal symbol of a many-faceted revolution in assumptions dominating the culture. Some of the early debates over Darwinism left an impression, damaging to evangelicalism, that modern science and biblical Christianity were inherently opposed. A deeper issue, however, was a broader revolution in conceptions of reality and truth. Rather than seeing truth as fixed and absolute, Western people were more and more viewing it as a changing function of human cultural evolution. Religion, in such a view, was not absolute truth revealed by the deity but the record of developing human conceptions about God and morality. Such conceptions were devastating when applied to the Bible, which in the higher criticism of the late nineteenth century often was regarded as simply the record of Hebrew religious experience.

The widespread evangelical consensus was shaken to its foundations. The absolute authority of the Bible as the source of the doctrine of salvation was widely questioned, even within the churches. Moral absolutes based on Scripture were also questioned; again the questioning was often from within the churches. The result was a profound split in most of the denominations that had been at the center of the mid-nineteenth-century evangelical alliance. Liberals, sometimes called “modernists” in the early twentieth century, adjusted Christian doctrine to fit the temper of the times. God’s revelation of his kingdom was not so much in startling

supernatural interventions as in working through the best in the natural processes of the growth of civilization and morality. Essentially, Christianity was not so much a doctrine of eternal salvation for another world as a divine revelation of a humane way of life for this world. Sometimes liberals advocated a “social gospel,” based on the progressive politics of the early twentieth century, to replace the individualism of older evangelicalism’s conceptions of salvation. Many traditionalist evangelicals, on the other hand, resisted these trends toward more naturalistic, relativistic, and modern conceptions of the heart of the gospel, continuing rather to preach traditional evangelical doctrine of a miraculous Bible whose revelation centered on describing the means of divine rescue from sin, death, and hell.

THE RISE OF FUNDAMENTALISM. Fundamentalism arose in this context. It combined an organized militant defense of most traditional evangelical doctrines with some of the revivalist evangelical innovations of the nineteenth century. The most important of these innovations, eventually accepted by most fundamentalists, was the elaborate system of biblical interpretation known as *dispensationalism*. Dispensationalism was a version of the premillennialism popularized among revivalists in the late nineteenth century. Originated in England especially by the Plymouth Brethren leader John Nelson Darby (1800–1882), dispensationalism was developed and promoted in the United States principally by Bible teacher associates of Moody, such as Reuben A. Torrey (1856–1928), James M. Gray (1851–1935), and C. I. Scofield (1843–1921), editor of the famous dispensationalist *Scofield Reference Bible*, published in 1909.

Dispensationalism is a systematic scheme for interpreting all of history on the basis of the Bible, following the principle of “literal where possible”; biblical prophecies, especially, are taken to refer to real historical events. This approach yields a rather detailed account of all human history, which is divided into seven dispensations, or eras, of differing relationships between God and humanity (such as the Dispensation of Innocence in Eden or the Dispensation of Law, from Moses to Christ). The last of these eras is the millennium, which will be preceded by the personal return of Jesus, the secret “rapture” of believers who are to “meet him in the air,” a seven-year period of wars among those who remain on earth (resulting in the victory of Christ), the conversion of the Jews, and the establishment of a kingdom in Jerusalem, where Jesus will reign for exactly one thousand years before the Last Judgment. Such exact interpretations of prophecy committed dispensationalists firmly to a view of the Bible as divinely inspired and without error in any detail. The “inerrancy” of Scripture in scientific and historical detail accordingly became the key test of faith for fundamentalists. This doctrine, while not entirely novel in the history of the church, was also given a new and especially forceful articulation by nondispensationalist Presbyterian traditionalists at Princeton Theological Seminary, especially Benjamin B. Warfield (1851–1921), who for a time was allied with dis-

pensationalists in battles against liberal theology and higher criticism of the Bible.

The other major innovation widely accepted by fundamentalists was the Keswick holiness teaching. The same groups of Bible teachers who taught dispensationalism widely promoted Keswick doctrine as well. These leaders established regular summer Bible conferences and, more important, founded a network of Bible institutes for training lay workers in evangelism. These institutes, together with local churches and agencies directly promoting revivalism, such as those of Billy Sunday (1862–1935), provided the principal institutional base for fundamentalism.

Fundamentalism was also a mood as much as a set of doctrines and institutions. It was a mood of militancy in opposition to modernist theology and to some of the relativistic cultural changes that modernism embraced. This militancy provided the basis for a wider antimodernist coalition that emerged as a distinct movement in the United States during the 1920s. The immediate occasion for the appearance of fundamentalism was the sense of cultural crisis that gripped the United States after World War I. Reflecting this mood, fundamentalism gave focus to the anxieties of Protestant traditionalists. This focus was directed first of all against the modernists in major denominations, most notably the major Baptist and Presbyterian churches in the northern United States. Especially in the years from 1920 to 1925, fundamentalists led major efforts to expel such liberals from their denominations, but these efforts met with little success. The other focus was American culture itself. The United States seemed to many evangelicals to have lost its Christian and biblical moorings. World War I precipitated this sense of alarm, for the war sped up a revolution in morals that, despite the rearguard action of Prohibition legislation, replaced Victorian evangelical standards with the public morals of the Jazz Age. The international crisis also generated fears of social upheaval at home, particularly alarm about the rise of bolshevism and atheism in the United States during the “red scare” of 1919 and 1920. Many Protestants also remained concerned about the social and moral impact of the immense immigration of the preceding half century and were antagonistic to the spread of Roman Catholic influences.

Fundamentalists saw all these factors as signs of the end of a Bible-based civilization in the United States. Their chief social anxieties, however, centered on the question of evolution. During the war, extreme propaganda had convinced most Americans that Germany, the homeland of the Reformation, had lapsed into barbarism. The same thing might happen in the United States. The “will to power” philosophy of Friedrich Nietzsche (1844–1900), said the propagandists, had destroyed German morals. Fundamentalists contended that this was an evolutionary philosophy and that evolutionary and relativistic ideas had long been incorporated into German theology, now taught by liberals in America’s churches. Under the leadership of William Jennings Bryan (1860–1925), fundamentalists campaigned to bring the

United States back to the Bible by banning the teaching of biological evolution in public schools. This crusade brought organized fundamentalism into the American South, where homegrown Protestant antimodernist tendencies had been strong since the Civil War. The fundamentalist antievolution campaign reached its peak in the 1925 trial of John Scopes (1900–1970) in Dayton, Tennessee, for teaching biological evolution in a high school. At the highly publicized proceedings, Bryan debated the lawyer Clarence Darrow (1857–1938) concerning the authenticity of biblical miracles. Bryan was ridiculed in the world press, and his death shortly after the trial signaled the beginning of a decline of early fundamentalist efforts to control American culture. During the late 1920s the strength of fundamentalist efforts to purge major northern denominations also declined dramatically. During this era organized fundamentalism had some branches in Canada and some relatively small counterparts in Great Britain.

In the United States, fundamentalism was only the prominent fighting edge of the larger evangelical movement. During the decades from 1925 to 1945 the public press paid less attention to fundamentalist complaints, but the movement itself was regrouping rather than retreating. During this time fundamentalism developed a firmer institutional base, especially in independent local churches and in some smaller denominations, although considerable numbers of fundamentalists remained in major denominations. The revivalist heritage of the movement was especially apparent in this era, as it turned its strongest efforts toward winning the United States through evangelization. In addition to traditional means for evangelization, fundamentalists developed effective radio ministries. Particularly prominent was Charles E. Fuller's (1887–1968) *Old-Fashioned Revival Hour*, which by 1942 had a larger audience than any other radio program in the United States.

Fundamentalist evangelicals also founded new sorts of ministries, such as Youth for Christ, begun in 1942, which soon had hundreds of chapters across the country. Bible institutes, such as Moody Bible Institute in Chicago and the Bible Institute of Los Angeles, remained important centers for the movement, training and sending out evangelists and missionaries, conducting Bible conferences, establishing effective radio ministries, and publishing many books and periodicals.

THE NEW EVANGELICALS. A sharp tension was developing in the fundamentalist-evangelical movement that survived the controversies of the 1920s. This tension led eventually to a deep split between “fundamentalists” and “evangelicals.” The fundamentalists kept in the forefront the militancy that had characterized the movement in the 1920s. Furthermore, they followed the logic of their military metaphors by adding ecclesiastical separatism as a test of true commitment. This separatist stance sometimes also reflected the influence of dispensationalism, which taught that the Bible prophesied the decline and apostasy of the major churches during the present era.

Another element in the generation that had been raised on the fundamentalist controversies of the 1920s sought to bring the movement back toward a broader evangelicalism. Without rejecting entirely their fundamentalist heritage, they nonetheless softened the militancy and often moved away from dispensationalism. Repudiating separatism as a test of the faith, they especially emphasized positive evangelism. By the early 1940s a distinct movement with these emphases was apparent, signaled by the founding of the National Association of Evangelicals (NAE) in 1942. In contrast to the smaller, militantly separatist American Council of Christian Churches, founded in 1941 by the fundamentalist Carl McIntire (1906–2002), the NAE included Pentecostal and holiness denominations as well as individual members who remained in major American denominations.

Following World War II, some younger leaders, notably Harold John Ockenga (1905–1985), Carl F. H. Henry (1913–2003), and Edward J. Carnell (1919–1967), organized a “neoevangelical” movement with the explicit purpose of moderating and broadening fundamentalist evangelicalism. Joined by Fuller, they organized the Fuller Theological Seminary in Pasadena, California, in 1947. Their efforts were vastly aided by the emergence of Billy Graham as America's leading evangelist after 1949. This group in 1956 also founded *Christianity Today* to provide a solid periodical base for the movement.

The final break in the fundamentalist-evangelical movement came with Graham's New York crusade in 1957. Graham accepted the cooperation of some prominent liberal church leaders. Separatist fundamentalists such as Bob Jones Sr. (1883–1968), founder of Bob Jones University; John R. Rice (1895–1980), editor of the influential *Sword of the Lord*; and McIntire anathematized Graham and the neoevangelicals as traitors from within. Neoevangelicals in turn soon ceased altogether to call themselves fundamentalists, preferring the designation “evangelical.”

In the meantime, Graham's crusade in Great Britain in 1954 set off a small flurry of ecclesiastical debate known as the “fundamentalist controversy” in England. This designation confused the terminological issue, since in England the friends of Graham, rather than just his more conservative enemies, were called fundamentalists. (British parlance of the era often lacked the distinction between fundamentalist and evangelical that developed in the United States after the late 1950s.) In any case conservative evangelicalism remained a factor in British church life, especially in the evangelical party in the Church of England. Influenced considerably by the long-standing university ministry of the Inter-Varsity Fellowship, and less a product of the sensational promotional competitions that characterized American revivalism, British evangelicalism was often more sophisticated and less militant than its American counterparts and played an important role in the intellectual leadership of the international movement. Throughout the English-speaking world there are also counterparts to the more strictly fundamentalist, holiness, and Pentecostal groups found in the United States.

THE REEMERGENCE OF EVANGELICALISM IN THE PUBLIC EYE. Evangelicalism was indeed a widespread international phenomenon, even if its Anglo-American manifestations provided its most focused identity as a distinct movement. The Pietist varieties of worldwide Protestantism were scarcely distinguishable from Anglo-American evangelicalism. Moreover, nearly two centuries of massive missionary efforts had planted evangelical communities in most of the nations of the world. The sense of identity of an international evangelicalism was evidenced in world conferences, notably the 1966 World Congress on Evangelism in Berlin and the 1974 International Congress on World Evangelization in Lausanne, Switzerland. Such gatherings were initially organized primarily by Anglo-American friends of Graham, but they also marked the emergence among evangelicals of significant voices and leadership from developing nations. The Lausanne congress, for instance, included over two thousand participants from 150 countries. Traditional evangelical emphases on the reliability and authority of Scripture and on the urgency for world evangelization were apparent, but so was emphasis on the necessity of social and political concern for aiding the poor and victims of injustice.

In the United States, in the meantime, evangelicalism reemerged on the public scene with renewed vigor. During the 1970s the American media suddenly discovered that evangelicalism was a major force in American life. Evangelicalism had in fact been growing steadily for many years, so the numbers of evangelicals had grown to at least forty or fifty million, whereas other Protestants and Roman Catholics were declining in numbers. Once evangelicals were discovered, they became conspicuous in the media, boasting many sports and entertainment stars. Being “born again” suddenly became a political asset, evidenced in 1976 by the victorious presidential campaign of Jimmy Carter, and evangelicalism was reckoned as a powerful if mysterious political force.

The discovery of evangelicalism reflected not only real growth and change in the movement but also the power of a concept. Numerous strands in American religious life were now viewed as part of a more or less unified “evangelicalism.” Such a perception was at once helpful and deceptive. It was helpful in pointing to a large phenomenon: Christians who shared fundamental evangelical beliefs. It was deceptive, however, in its implication that their movement was more unified than it actually was. Certainly evangelicalism as a movement that could claim forty or fifty million adherents was much larger than the consciously organized evangelical movement that had grown out of fundamentalist evangelicalism and that was led by associates of Graham. For instance, black evangelicals, including most of black Protestantism, had little to do with that fundamentalist evangelicalism, even though most of their beliefs and emphases were closely parallel. The same was true, but to a lesser degree, of much of the Southern Baptist Convention, the largest of American evangelical groups. Most holiness de-

nominations and evangelical Methodists were only tangentially related to the organized fundamentalist evangelical movement. So also were most Pentecostals and charismatics, who sponsored some of the largest television ministries and set the tone for much of the evangelical resurgence. Peace churches were generally evangelical in doctrine but preserved a heritage distinct from fundamentalist evangelicalism. Confessional denominations, such as the Missouri Synod Lutheran and the Christian Reformed Church, were close allies of evangelicals but always kept enough distance to preserve distinct doctrinal heritages.

Many evangelicals were in major American denominations, such as Baptist, Presbyterian, Methodist, Disciples of Christ, or Episcopal, but might be as much shaped by the distinctiveness of their denomination’s history as by a conscious evangelical identity. Others in such denominations might identify closely with the doctrines and emphases of a parachurch evangelistic agency, such as Campus Crusade, founded by Bill Bright in 1951. Such variety within evangelicalism, compounded by many denominational and regional differences, suggests that generalization about the movement is hazardous.

Such hazards are especially great concerning evangelicals’ political stances. Whereas one important strand of nineteenth-century American evangelicalism was politically progressive and reformist, in the twentieth century most fundamentalist evangelicals and other white evangelicals were politically conservative. After the 1960s, however, more variety reappeared, especially among spokespersons of the sort who hold conferences and issue declarations. Evangelical voices have been heard across the spectrum of political options, although most of the evangelical constituency is at least moderately conservative.

THE CONTINUING IMPACT OF FUNDAMENTALIST EVANGELICALS. Most hard-line fundamentalists went their separate ways after about 1950, reorganizing themselves loosely in a number of fellowships or smaller denominations. The largest fellowship was the Baptist Bible Fellowship, founded by fundamentalists who split with the volatile Texas fundamentalist F. Frank Norris. By the early 1980s this fellowship claimed to represent two to three million members. During this era some local fundamentalist pastors built huge churches, claiming both membership and Sunday school attendance of over ten thousand each by the 1970s. Prominent among these were Jack Hyles’s First Baptist Church of Hammond, Indiana, Lee Roberson’s Highland Park Baptist Church in Chattanooga, Tennessee, and Jerry Falwell’s Thomas Road Baptist Church in Lynchburg, Virginia. Typically, such ministries were structured as small, individually run empires, including branch chapels, a college, publications, radio and television broadcasts, missionary work, and specialized ministries. The total number of members of strictly separatist fundamentalist churches in the United States by 1980 was perhaps around five million, although the number of evangelicals leaning toward fundamentalism was probably much

greater. Moreover, such militant fundamentalism spread throughout the English-speaking world, and active missions carried its doctrines to every nation where Christian missions were permitted.

Soul winning and church growth are the fundamentalist's first concerns, as they are for most evangelicals. In addition, extreme militancy against theological liberalism led many fundamentalists to emphasize separation even from other evangelicals, especially neoevangelicals, charismatics, and members of large groups, such as the Southern Baptist Convention. The question of separation also divided fundamentalists among themselves. Some fundamentalist leaders, especially those associated with Bob Jones University, advocated "second-degree separation"—that is, separation even from fellow fundamentalists who are not strict fundamentalists. In the 1970s, for instance, Bob Jones III attacked the noted fundamentalist evangelist Rice for publishing materials by Southern Baptists in his widely read paper the *Sword of the Lord*.

Most fundamentalists are militant dispensationalists, usually claiming that the signs of the times indicate that within a few years the dramatic events surrounding the return of Christ will bring the present era to a violent end. The dispensationalist heritage has made most fundamentalist evangelicals sympathetic to the state of Israel, whose existence as a nation is viewed as the fulfillment of prophecy and a key trigger of end-time events. Dispensationalists also take literally the biblical promises of blessing to countries that support Israel. This sympathy by large numbers of evangelicals has had a considerable impact on American foreign policy. During the 1970s, dispensationalist prophetic views attracted wide interest, as indicated by the popularity of Hal Lindsey's book *The Late Great Planet Earth* (1970), of which some ten million copies were printed during the decade. The graphic dispensationalist vision for the end times continued to attract interest far beyond the fundamentalist or even evangelical communities. The pastor and author Tim LaHaye's *Left Behind* series of novels, essentially a fictionalization of the events described earlier by Lindsey and any number of dispensational prophecy teachers, became phenomenal best-sellers in the 1990s and early 2000s. The books regularly debuted at number one on the *New York Times* best-seller list, and over forty million copies (fifty million counting the graphic novels and children's versions) had been sold by 2003.

Until the later 1970s most separatist fundamentalists were not active politically. Some prominent fundamentalist leaders, such as McIntire and Billy James Hargis, were in the forefront of anticommunist crusades during the decades following World War II, but such activists probably did not represent the majority of the movement. Fundamentalists emerged as a considerable force in American political life with the formation of the Moral Majority in 1979. This political coalition of fundamentalists and some other political conservatives was led by Falwell and benefited from his large

television ministry. Some strict fundamentalists condemned such efforts because they involved cooperation with Roman Catholics, Orthodox Jews, neoevangelicals, and other alleged apostates.

Nonetheless, the Moral Majority brought together several long-standing fundamentalist concerns with political issues of the time. Most evangelicals and almost all fundamentalists, for instance, had long held conservative views on the role of women, on the family, and on questions related to sexuality. Sparked by the legalization of abortion in 1973, the women's movement and the proposed Equal Rights Amendment, legislation proposing increased rights for homosexuals, and general permissiveness, many fundamentalist and conservative evangelicals expressed alarm. The Moral Majority focused such sentiments and organized them politically. Reaching a constituency well beyond fundamentalists and fundamentalist evangelicals, its program included endorsement of American conservative political ideals: smaller government, larger military, patriotism, and freedom for businesses. Fundamentalists, supported by the Moral Majority, also successfully revived the antievolution crusade, introducing legislation into a number of states that would require the teaching of fundamentalist "creation science" (arguments that the earth is no more than ten thousand years old) whenever biological evolution is taught in public schools.

Perhaps the closest parallel to such late-twentieth-century American political fundamentalism was the militant Protestantism in Northern Ireland led by Ian Paisley. Paisley, an avowed fundamentalist with connections to American leaders such as Jones and McIntire, mixed conservative Protestantism with aggressive political anti-Catholicism. The long history of the Irish conflict, however, has given Irish fundamentalism a character more violent than its American counterparts. A far more genteel political action movement with some evangelical leadership was England's Festival of Light, an organization prominent in the 1970s and 1980s in its efforts to maintain public decency, particularly in matters concerning sexuality. In general, evangelicalism in Great Britain was less political and less confrontational than in the United States, put relatively more emphasis on evangelism and missions, operated more through traditional denominations, and was a much less influential force in the culture at large.

In the United States the organized political coalitions of the Christian Right had their greatest influence in the period from 1980 to 1994. Contributors to the Republican electoral victory of Ronald Reagan in 1980, they were nonetheless frustrated by the mainstream positions of Reagan on cultural issues. In 1988 the television evangelist Pat Robertson entered the Republican presidential primaries and gained considerable early attention by mobilizing approximately 10 percent of the Republican vote in the states where he ran. Robertson's Christian Coalition reached its greatest strength in the 1990s, when conservative Christians were instrumental in electing a strongly Republican House of Representa-

tives led by the outspoken Speaker of the House, Newt Gingrich. Despite these advances, conservative Christians continued to find most of their political goals frustrated. Perhaps most important, the Christian Coalition marked the consolidation of a culturally conservative wing of evangelicalism solidly entrenched in the Republican Party. By the 1990s, conservative politics were taken for granted in many of the largest evangelical and fundamentalist churches and organizations, although there were always exceptions.

A high-water mark for fundamentalist-leaning evangelicals in church life was the 1990s, when they completed a long campaign to take over control of the central agencies and theological seminaries of the Southern Baptist Convention, the nation's largest Protestant denomination, essentially winning the kind of denominational battle they had been losing since the early twentieth century. Although some Southern Baptist leaders resisted following the lead of what they considered "Yankee-based evangelicalism," they now found themselves fighting over issues such as inerrancy, battles that had been fought among fundamentalists and evangelicals in the North and the West several decades previous. In response to losing control of key institutions, Southern Baptist moderates took advantage of the decentralized Baptist polity to form their own organizations.

The influence of Pentecostal and charismatic models of church life is another key development within Western evangelicalism after 1970. If fundamentalist militancy set the tone for much of evangelicalism in the era from the 1920s through the 1960s, the charismatic and Pentecostal churches set the tone after that. This is especially true in styles of worship and methods of ministry. The 1960s created an atmosphere in which visionary evangelical pastors began experimenting with new ways of reaching out to the broader culture. Many churches initially developed during this period became megachurches, pulling in thousands every Sunday and spawning virtual denominations of like-minded churches around the country and the world. Churches such as Calvary Chapel and the Vineyard in southern California or Willow Creek in the suburbs of Chicago, whereas conservative theologians managed to engage the mainstream of American culture and influenced countless other evangelical churches in the process. By 2003, for example, there were over 825 Calvary Chapels in the United States with another 210 around the world. Over 7,200 churches around the world were at least loosely affiliated with Willow Creek. Typically, these churches use contemporary or Pentecostal styles of worship, highly value lay leadership and small group ministries, and are led by low-key but charismatic and visionary individuals who often have little to no advanced training. Willow Creek has pioneered "seeker" oriented services that use drama, contemporary music, video, and sermons focused on common life problems to attract people who might be alienated by more traditional service styles. With churches like these leading the way, the number of evangelicals in the United States, although difficult to pinpoint with accuracy,

remains high. Polls conducted in the late 1990s reveal that, whereas 13 percent of the U.S. population self-identify as either fundamentalist or evangelical, 33 percent of the U.S. population are members of or attend conservative Protestant denominations that theologically, at least, fall within the evangelical camp.

In addition, evangelicalism in all its forms became one of the West's leading cultural exports as North American missions came to dominate the world missionary movement. By the end of the twentieth century, as liberal Christians either lost the missionary impulse or transferred it to social welfare agencies, such as the Peace Corps, evangelicals took over the missionary enterprise. Fundamentalists and evangelicals founded "faith missions" by the score in the late nineteenth century and early twentieth century. These agencies, modeled on J. Hudson Taylor's (1832–1905) influential China Inland Mission (1865), refused to pay salaries or to raise funds in any overt fashion. Influenced by Keswick piety, which promoted slogans such as "Let go and let God," the new missions professed to rely solely on God to supply recruits and the necessary funds. After enduring some difficult times, they learned to supplement faith in God with aggressive publicity within the evangelical community. By mid-century many of these agencies had high profiles in the evangelical community and routinely attracted some of the most committed evangelical young people. By the end of the twentieth century, roughly 90 percent of American foreign missionaries were evangelical. American missionary efforts helped spark the huge growth of evangelical Protestantism in Latin America and Africa. Aided largely by the massive growth of Pentecostal and charismatic churches, whose adherents number in the hundreds of millions worldwide, most of worldwide Protestantism developed a distinctly evangelical character.

EVANGELIZATION SEE MISSIONS, ARTICLE ON MISSIONARY ACTIVITY

EVANS, ARTHUR (1851–1941) was an English archaeologist who excavated the ruins of Knossos in Crete, center of an early civilization he called Minoan. Son of Sir John Evans, a wealthy Victorian polymath and active amateur archaeologist, Arthur Evans began his work in 1899 at Knossos, which established his fame and for which he was knighted in 1911. Seeking evidence for an early system of writing, Evans uncovered an inscribed clay tablet in his first week of excavation and soon amassed a large archive written in two syllabic scripts now known as Linear A and Linear B. (The latter was deciphered as an early form of Greek by Michael Ventris and John Chadwick in 1952.) The treasures of the palace at Knossos, which Evans named for the legendary King Minos, included many objects that he interpreted as possessing religious significance. In the palace, a building of

great size and complex plan, images of bulls' horns, the motif of the double ax, and depictions of young men and women performing acrobatic feats with bulls furnished attractive parallels with Greek legend: *labrus* means "ax," so that *labyrinthos* suggests "the place of the ax," to which, according to legend, seven young men and seven young women were sent from Athens each year to encounter the Minotaur. Evans interpreted the double ax as symbolizing, or marking the presence of, the Cretan Zeus, a deity of quite different type from the Indo-European sky god of the same name with whom he became identified. The Cretan Zeus died and was reborn in an annual cycle. Also important in Minoan religion was the association of trees and pillars as cult objects, a theme Evans discussed in works published in 1900, in the earliest days of the excavation, and in 1931.

Evans faced the usual difficulties of interpreting religious objects in the absence of verbal evidence. (The Linear B tablets, which proved to be records of tribute paid and other stocktaking records, have added very little.) In the manner of his day, Evans was an evolutionist and comparatist, and he drew heavily on the folklore and practice of other cultures. Evaluations of his interpretations vary, but in the field of Greek religion, as in other branches of classical studies, his importance rests on the abundance of material he excavated and assiduously published.

BIBLIOGRAPHY

Evans's views on Minoan-Mycenaean religion are to be found in *The Mycenaean Tree and Pillar Cult and Its Mediterranean Relations* (London, 1901) and *The Earlier Religion of Greece in the Light of Cretan Discoveries* (London, 1931); the latter was Evans's Frazer Lecture for 1931 at the University of Cambridge. The full account of the Knossos excavation is contained in *The Palace of Minos*, 4 vols. in 6 (London, 1921–1935).

A. W. H. ADKINS (1987)
Revised Bibliography

EVANS-PRITCHARD, E. E. (1902–1973), was an English anthropologist. Edward Evan Evans-Pritchard was the son of a clergyman of the Church of England. He took a degree in history at the University of Oxford and in 1927 a doctorate in anthropology at the University of London, where he was supervised by C. G. Seligman. His thesis was based on field research undertaken from 1926 to 1930 among the Azande of the Sudan. He carried out research among the Nuer, another Sudanese people, intermittently between 1930 and 1935 and also for brief periods among the Anuak, the Luo, and other East African peoples. During

World War II he worked at intervals, when free from military service, among the bedouin of Cyrenaica. In 1944 he joined the Roman Catholic church. He taught at the University of London, Fuad I University in Cairo, Cambridge University, and finally Oxford, where in 1946 he succeeded A. R. Radcliffe-Brown as professor of social anthropology. He retired in 1970, was knighted in 1971, and died in Oxford in September 1973.

Evans-Pritchard's work in religion is unique. It is based on brilliant, sensitive, and meticulous field research, on his mastery of languages (he was fluent in Arabic, Zande, and Nuer), and on his deep knowledge and understanding of the work of his predecessors, in particular those sociologists (Durkheim et al.) associated with *L'année sociologique*. Most of his writings on religion fall into one of four main categories: works on the Azande, the Nuer, the Sanusi, and comparative and theoretical topics.

Each piece of Evans-Pritchard's research and writing is based on certain central problems in anthropology, although never limited to them in a narrow sense. His work among the Azande, a cluster of kingdoms of the southwestern Sudan, led to the publication of *Witchcraft, Oracles, and Magic among the Azande* (1937), perhaps the outstanding work of anthropology published in this century. It is concerned essentially with questions asked, although hardly answered in any convincing manner, by Lucien Lévy-Bruhl in his writings on "primitive" and "scientific" modes of thought. The questions as to whether there are differences between these two modes of thought and, if so, what they are and how they might function in social contexts are basic to anthropology, and Evans-Pritchard's discussion of them has changed the nature of anthropological inquiry. He writes about Zande notions of magic, witchcraft, and divination, that is, their notions of natural and supernatural causation and interference in people's everyday lives. He shows that Zande ideas are rational and systematic; given certain premises of knowledge they are closed and self-perpetuating, and they are not held in isolation but are consistent with forms of authority and power found in Zande society. This is essentially a study of rationality and corrects all earlier views about the "irrationality" of so-called primitive peoples. Later Evans-Pritchard published an immense number of Zande texts, in both Zande and English, with commentaries. This work is probably the greatest single corpus of the myths and tales of an African culture that has yet been published and confirms one of his strongest beliefs: that "primitive" texts are not quaint "folkloristic" stories but are as worthy of careful analysis as those of literate cultures.

Evans-Pritchard's *Nuer Religion* (1956) is the final volume of a trilogy on the Nuer of the southern Sudan (the others are *The Nuer*, 1940, and *Kinship and Marriage among the Nuer*, 1951). In this book he presents Nuer religious thought and ritual as a system of theology that has a subtlety and profundity comparable to those of literate cultures. Here he takes up another basic problem raised by Lévy-Bruhl, that

of “mystical participation” between human beings and what in ethnocentric terms are called the supernatural and the natural. This problem is examined within the context of a series of related aspects of Nuer religion: conceptions of God, spirits, the soul, and ghosts; symbolism; sin and sacrifice; and priesthood and prophecy. Because of Evans-Pritchard’s great skill in unfolding the complexity of Nuer religious thought, never since has it been possible for scholars of comparative religion to dismiss a nonliterate religion as “primitive” or as a form of “animism.” Throughout this work, as in that on the Azande, Evans-Pritchard stresses what he considered to be the central problem of anthropology, that of translation—not the simple problem of translation of words and phrases in a narrow linguistic sense, but the far more complex question of translation of one culture’s experience into the terms of another’s.

Evans-Pritchard’s other “ethnographic” work on religion is rather different, taking as its basic problem the relationship between prophets (a topic raised earlier in his work on the Nuer) and forms of religious and political authority as exemplified in the history of the Muslim Sanusi order in Cyrenaica (*The Sanusi of Cyrenaica*, 1951). Here he was able to use written records as well as his own field research, and he produces a model account of religious history and change.

Evans-Pritchard’s last achievement in the study of religion is his many critical writings on the history of the anthropology of religion, of which the best known is *Theories of Primitive Religion* (1965). It is a superb and sophisticated study of the relations between thought, ideology, and society.

The influence of E. E. Evans-Pritchard’s writings in the anthropological study of religion has been immense. There has been little later analysis made of modes of thought, systems of causation, witch beliefs, sacrifice, notions of sin, and ritual symbolism that has not been influenced by, if not based upon, his work. In addition, much recent research on the philosophy of knowledge has leaned heavily on his book on the Azande. Evans-Pritchard’s influence upon younger anthropologists has been great. The anthropological, historical, and comparative study of religions owes more to him than to any other anthropologist.

BIBLIOGRAPHY

The main works of Evans-Pritchard are cited in the article. The most insightful view of his work, in the form of an obituary, is by T. O. Beidelman, “Sir Edward Evan Evans-Pritchard, 1902–1973: An Appreciation,” *Anthropos* 69 (1974): 553–567. Beidelman is also the editor of *A Bibliography of the Writings of E. E. Evans-Pritchard* (London, 1974). Mary Douglas’s *Edward Evans-Pritchard* (New York, 1980) is a fuller but rather uneven account.

JOHN MIDDLETON (1987)
Revised Bibliography

EVE, or, in Hebrew, *Havvah*; the first woman in the creation narratives of the Hebrew Bible, according to which she was formed from one of the ribs of Adam, the first man (*Gn.* 2:21–23). In this account the creator god wished for Adam to have a mate and so brought all the beasts of the fold and birds of the sky before him to see what he would call each one (*Gn.* 2:19). However, among these creatures the man found no one to be his companion (*Gn.* 2:20). Accordingly, this episode is not solely an etiology of the primal naming of all creatures by the male ancestor of the human race but an account of how this man (*ish*) found no helpmeet until a woman was formed from one of his ribs, whom he named “woman” (*ishshah*; *Gn.* 2:23). This account is juxtaposed with a comment that serves etiologically to establish the social institution of marriage wherein a male leaves his father and mother and cleaves to his wife so that they become “one flesh” together (*Gn.* 2:24). The matrimonial union is thus a reunion of a primordial situation when the woman was, literally and figuratively, flesh of man’s flesh.

Such a version of the origin of the woman, as a special creation from Adam’s body, stands in marked contrast to the creation tradition found in *Genesis* 1:27b, where there is a hint that the primordial person (*adam*) was in fact an androgyne. Alternatively, this latter half-verse may have been concerned with correcting a tradition of an originally lone male by the statement that both male and female were simultaneously created as the first “Adam.”

This mythic image of a male as the source of all human life (*Gn.* 2:21–22) reflects a male fantasy of self-sufficiency. The subsequent narrative introduces a more realistic perspective. Thus, after the woman has succumbed to the wiles of the snake, eaten of the tree of the knowledge of good and evil, and shared it with her husband, she is acknowledged as a source of new life—albeit with negative overtones, since the narrative stresses the punishment of pain that must be borne by Adam’s mate and all her female descendants during pregnancy and childbirth. In token of her role as human genetrix, the man gave to the woman a new name: she was thenceforth called Eve—“for she was the mother of all life” (*Gn.* 2:19).

This new name, *Eve* (Heb., *Havvah*), is in fact a pun on the noun for “life” (Heb., *hay*), since both *havvah* and *hay* allude to old Semitic words (in Aramaic, Phoenician, and Arabic) for “serpent,” as the ancient rabbis noted. Another intriguing cross-cultural pun should be recalled, insofar as it may also underlie the key motifs of the biblical narrative. Thus, in a Sumerian myth it is told that when Enki had a pain in his rib, Ninhursaga caused Nin-ti (“woman of the rib”) to be created from him. Strikingly, the Sumerian logogram *ti* (in the goddess’s name) stands for both “rib” and “life.”

According to one rabbinic *midrash*, Eve was taken from the thirteenth rib of Adam’s right side after Lilith, his first wife, had left him (*Pirqei de-Rabbi Eli’ ezer* 20). Other legends emphasize Eve’s susceptibility to guile and persuasion. Christian traditions use the episode of Eve to encourage the

submission of women to their husbands (cf. *2 Cor.* 11:3, *1 Tm.* 2:22–25). Several church fathers typologically compared Eve with Mary, the “new Eve” and mother of Jesus: the sinfulness and disobedience of the former were specifically contrasted with the latter. The temptation motif and the banishment of Eve and Adam are frequently found in medieval Jewish and Christian illuminated manuscripts and in Persian iconography. The theme is also found in medieval morality plays and in the apocalyptic tract *Life of Adam and Eve*.

MICHAEL FISHBANE (1987)

EVIL. If there is one human experience ruled by myth, it is certainly that of evil. One can understand why: the two major forms of this experience—moral evil and physical evil—both contain an enigmatic element in whose shadows the difference between them tends to vanish.

On the one hand, it is only at the conclusion of a thoroughgoing critique of mythical representations that moral evil could be conceived of as the product of a free act involving human responsibility alone. Social blame, interiorized as guilt, is in fact a response to an existential quality that was initially represented as a stain infecting the human heart as if from outside. And even when this quasi-magical representation of a contamination by an external or superior power is replaced by the feeling of a sin of which we are the authors, we can feel that we have been seduced by overwhelming powers. Moreover, each of us finds evil already present in the world; no one initiates evil but everyone has the feeling of belonging to a history of evil more ancient than any individual evil act. This strange experience of passivity, which is at the very heart of evildoing, makes us feel ourselves to be the victims in the very act that makes us guilty.

On the other hand, it is also only at the conclusion of a comparable critique of mythical representations that physical evil is recognized as the effect of natural causes of a physical, biological, and even social nature: sickness, which often takes the form of great epidemics ravaging entire populations, simultaneously attacks each person in the very depths of his existence by making him suffer and is spontaneously experienced as an aggression, at once external and internal, coming from maleficent powers that are easily confused with those that seduce the human heart and persuade it to do evil.

Moreover, the sort of fate that seems to lead the sick and aging to the threshold of death tends to make mortality the very emblem of the human condition. From this, it is easy to take the next step and consider suffering and death as punishments. Do not guilt and mortality constitute the same enigma?

The persistence of mythical representations of evil can be explained by a third phenomenon, namely the extraordinary way in which guilt and suffering remain intertwined with a stage of development in which the human mind believes it has freed itself from the realm of mythical representations. To declare someone guilty is to declare that person deserving of punishment. And punishment is, in its turn, a suffering, both physical and moral, inflicted by someone other than the guilty party. Punishment, as suffering, therefore bridges the gap between the evil committed and the evil suffered. This same boundary is crossed in the other direction by the fact that a major cause of suffering lies in the violence that human beings exercise on one another. In fact, to do evil is always, directly or indirectly, to make someone else suffer. This mutual overlapping of evil done and evil suffered prevents the two major forms of evil from ever being entirely separate and, in particular, from ever being entirely stripped of their enigmatic character. An essential opaqueness in the human condition is therefore bound up with the experience of evil, which is continually carried back to its darkness, its obscurity, by the exercise of violence, always unjust, and of punishment, even when it is held to be just.

This invincible connection of moral evil and physical evil is expressed on the level of language in the specific “language game” designated by the general term *lamentation*. Lamentation, indeed, is not confined to the moanings rising up from the abyss of suffering, announcing the coming of death. It encompasses the guilty and the victims, for the guilty suffer twice over, first by blame, which states their unworthiness, and then by punishment, which holds them under the reign of violence. With lamentation, the experience of evil becomes heard. The cry becomes a voice, the voice of the undivided enigma of evil. Lamentation forms a bridge between the evil committed or suffered and the myth. And indeed it connects suffering to language only by joining a question to its moaning. “Why evil?” “Why do children die?” “Why me?” In turning itself into a question, lamentation itself appeals to myth.

MYTHS OF EVIL. How does myth reply to the enigma of evil? It provides the first explanatory schema available to humanity. Myth replies to “why?” with “because”—which claims to fulfill the request for sense that is the mediation of lamentation. We shall discuss, in conclusion, why this claim is doomed to fail. But first we must discuss the power of myth.

Before stressing the fantastic, legendary, and even delirious side of myths, three features must be noted that define myth, at least provisionally, as an appropriate response to the “why?” that rises up from lamentation. The first characteristic of myth is to state an order indivisibly uniting ethos and

cosmos. By encompassing in a single configuration celestial and terrestrial phenomena, inanimate and animate nature, seasons and festivals, labors and days, myth offers a privileged framework of thought within which to link together moral evil and physical evil, guilt and mortality, violence and punishment: in short, a framework that preserves, in its answer, the unity of the enigma of evil as a question.

Next, the ambivalence of the sacred, as Rudolf Otto describes it, confers upon myth the power of taking on both the dark and the luminous sides of human existence. Many myths point to a primordial sphere of existence that can be said to be beyond good and evil. Finally, myth incorporates our fragmentary experience of evil within great narratives of origin, as Mircea Eliade has stressed in his many works on this topic. By recounting how the world began, myth recounts how the human condition reached the wretched and miserable form that we know it to take. Theogony, cosmogony, and anthropogenesis therefore form a single narrative chain that scans the “great time” of origin. Order, ambivalence, and omnitemporality are thus the major features of myth, owing to which the mythical explanation can claim to provide an all-encompassing framework for evil.

This is all we can say about myth in general, however, without running the risk of applying to one precise category of myth characters belonging solely to another. This is not to imply that we must cease to speak of myth in general: the case of myths of evil is exemplary in this respect. It appears, in fact, that myth, considered as a type of discourse, draws a certain unity from the place it assumes in a hierarchy of levels of discourse that can be organized according to stages of increasing rationality. Myth constitutes in this regard the lowest level, coming before wisdom and gnosis, which leads to the threshold of the rationalizing theodicies of philosophy and theology. One must be aware, however, that the ordering principle thus alleged is the offshoot of a certain idea of reason that was, in the West, born with philosophy itself. A purely comparativist approach could never assume unreservedly this “prejudice of reason.” On the other hand, if we bracket it completely—and doubtless this must be the case in a purely descriptive history of religions—then we expose ourselves to the inverse danger, which is that the universe of myths will splinter into an infinite number of parts.

It is precisely this feature that prevails in the case of myths of evil when we bracket, at least for a while, the question of the place of myth in an ordered series of levels of discourse. Order, ambivalence, and omnitemporality then appear only as inconsequential abstract and formal elements in relation to the explanatory schemas that mythical thought has produced throughout space and time. Nowhere else as much as in the area of the explanation of evil does myth reveal itself to be this vast field of experimentation, which is unfolded in the literature of the ancient Near East, India, and the Far East. In this immense laboratory everything occurs as if there were no conceivable solution that had not been tried at one point or another as a reply to the enigma

of evil. It is precisely here that the myth forms the great matrix in which are rooted the sapiential, Gnostic, and properly speculative modes of the great discourse proffered by humankind in the space opened up by lamentation between the cry and utter silence. In this sense, myth remains the schema for all subsequent speculation. The question then arises whether, outside any hierarchical order of discourses, this great phantasmagoria of evil lends itself to some typology that will not do violence to its proliferating diversity.

A prudent reply is needed to this methodological question: on the one hand, myths of evil lend themselves to classification by virtue of their narrative character, mentioned above as the third general feature of the mythical universe. Narratives of origin are presented as dramas recounting how evil began; it is therefore possible to apply a structural analysis to them that reduces them to a relatively limited number of ideal types, in Max Weber’s sense—that is, of paradigms constructed by comparative science midway between the clearly transcendental *a priori* and empirical proliferation. The ideal types are those of an exemplary story, organizing segments of action, characters, fortunate and unfortunate events, as in the great epics that take place in our time, after the beginning.

The proliferation of myths can thus be mastered to a relative degree by a typology of dramatic paradigms. On the other hand, individual myths contain so many inconsistent elements, which convey a desperate attempt to explain the unexplainable in order to give an account of what is inscrutable, that they prove to be in large part hostile to all classification. At the most they present “family resemblances” that cause a number of overlaps between types of myth. There is no myth that, in some way or other, does not coincide with another myth. In this way we are prevented from working out a table of the strict play of differences and combinations among myths. In *The Symbolism of Evil*, I proposed a typology limited to the ancient Near East and to archaic Greece, that is, to the cultural memory of the European. (I shall discuss below a vaster typology that will take into account Indian and Buddhist mythology.)

The ancient Near East and Archaic Greece. The restricted typology of *The Symbolism of Evil* verifies the two opposing characteristics mentioned above. On the one hand, the attempt to classify myths in terms of a limited number of paradigms is relatively successful; on the other, the overlapping that occurs shows that every paradigm implies in some aspect or another a very different paradigm.

For a static analysis of the myths of evil, the myths of the cultural sphere considered can be divided fairly easily into four great paradigms.

1. In the myths of chaos, illustrated most strikingly by the Sumerian-Akkadian theogonic myths but also by the Homeric and Hesiodic theogonies, the origin of evil that strikes humans is included within the larger narrative of the final victory of order over chaos in the common genesis of the

gods, the cosmos, and humanity. The great creation epic, *Enuma elish*, makes the appearance of man the final act in a drama that begins with the generation of the gods. One can truly speak in this connection of an epical ontogenesis to describe this sort of total narrative. As regards evil in particular, it is noteworthy that chaos precedes order and that the principle of evil is coextensive here with the generation of the divine. The poem does not hesitate to characterize as evil the hates, the plotting, and the murders that mark not only the primitive struggles among the most ancient gods but also the victory of the younger gods—Marduk, for example, in the Babylonian version of the myth.

Evil therefore precedes humankind, who finds it already present and merely continues it. Evil, in other words, belongs to the very origin of all things; it is what has been overcome in setting up the world as it now is, but it, too, contributed to this state of affairs. This is why order is precarious and its genesis must continually be reenacted by cultic rites. If, in this family of myths, the fall is mentioned, it is never in the sense of the unprecedented emergence of an evil that would be simply “human, all too human,” but as an episode in the drama of creation. In the same way, the failure of the quest for immortality, recounted in the famous *Epic of Gilgamesh*, is tied up with the jealousy of the gods, who trace out the boundary between the sphere of mortals and that of immortals by an act of violence placed beyond good and evil.

2. An evil god and a tragic vision of existence are depicted in the second paradigm of evil in European culture. Here, evil is in a way shared by humankind and gods. It calls, on the one hand, for a figure with the stature of a hero, possessing higher qualities than ordinary men but who commits a grave error, which can be said to be neither the effect of mere ignorance, in the Socratic sense, nor the result of a deliberately bad choice, in the Hebraic sense. Moreover, the overwhelming error that precipitates his fall is deplored by the tragic chorus and by the hero himself as a blindness that has crept over him as a result of the jealousy of the gods; thus the hubris of the tragic hero is at once the cause and the effect of the wickedness belonging to the plane of the divinities. Aeschylus's *Prometheus Bound* is the frightening document of this tragic theology and this tragic anthropology in which the hero in a sense cooperates in a loss, the origin of which is superhuman. It is important to note that the tragic myth produced a spectacle, rather than a speculation, a spectacle that makes the spectators participate in the tragic drama through the catharsis of the emotions of terror and pity.

3. The third type is illustrated by Archaic Orphic myths, which are continued in Platonism and Neoplatonism. This can be termed the myth of the exiled soul, imprisoned in a foreign body. It assumes a radical distinction between a soul, akin to the gods, and a body, perceived as a prison or a tomb. Life itself appears as a punishment, possibly for some fault committed in a previous life. Evil is therefore identified with incarnation itself and even, in certain Far Eastern mythologies, with reincarnation. The model of the body-as-prison,

extended by that of the repetition of reincarnations, is further darkened by the model of infernal punishment, as if life in the body were the image of hell. Life is then a death, which calls for a death that will be true life. Only through purification, at once ethical, ritual, and meditative, can the soul be delivered from this quagmire of bodily existence, which itself mirrors hell. In a sense, this myth alone can properly be termed a myth of the fall, for the incarnation itself marks the loss of an infinitely superior condition and so a loss of height, of altitude, which is precisely what the word *fall* signifies.

4. Compared with these three paradigms, the biblical myth of paradise lost differs in three ways. First, the Adamic myth is purely anthropological, excluding any drama of creation in which evil would originally be included: creation is good, very good; humankind alone initiates evil, although tempted, to be sure, by the serpent (an important feature discussed below); but the serpent too is a creature. Next, evil is clearly ethical, in the sense that it results from an act of disobedience. It therefore cannot be a matter of hubris, which like disobedience would represent a blindness sent down by jealous gods, although “Second Isaiah” does not hesitate, after the difficulties of exile, to make his confession in the form of God's own self-presentation, as in prophesy: “I form light and create darkness, I make weal and create war, I am the Lord, who does all these things” (*Is.* 45:7). Finally, evil is not the result of the fall of the soul into a body; it consists of a gap, a deviation of humankind as a whole, of the flesh, which is unaware of the body-soul dualism.

The Adamic myth is therefore anthropological in the strongest sense of the term, to the extent that Adam is Man, neither a Titan nor a captive soul but the ancestor of all humankind, of the same nature as all the generations springing from him. If the Adamic myth nevertheless deserves the title of myth, this is inasmuch as the narrative in which it consists is incommensurate to the historical time in which the exemplary adventure of the people of Israel takes place. The myth elevates to the level of exemplary and universal history the penitential experience of one particular people, the Jewish people. All the later speculations about the supernatural perfection of Adam before the Fall are adventitious interpretations that profoundly alter the original meaning; they tend to make Adam a superior being and so foreign to our own condition. Hence the confusion over the idea of the Fall.

The intention of the Adamic myth is to separate the origin of evil from that of good, in other words, to posit a radical origin of evil distinct from the more primordial origin of the goodness of all created things; humanity commences evil but does not commence creation. However, it is in the form of a story that the myth accounts for this catastrophe at the heart of the goodness of creation; the passage from innocence to sin is narrated as something that took place. That is why the explanation given here of the origin of evil is not yet elevated to the plane of speculation, as will later happen with the dogma of original sin, but remains an etiological myth involving legendary characters and fabulous events.

With respect to its structure, the myth takes on the form of a twofold conflict: on the one hand, that between the central figure, Adam, and the Adversary, represented by the serpent, who will later become the Devil, and on the other hand, that between the two halves of a split figure, Adam and Eve. From this complex configuration the Adamic myth receives an enigmatic depth, the second pair adding a subtle psychological dimension and an internal density that would not have been attained by the confrontation between Man and his Other alone. In this way the myth universalizes the penitential experience of the Jewish people, but the concrete universal that it forges remains caught up in the gangue of the narrative and the symbolic.

The protohistorical myth is the only vehicle for a speculation akin to sapiential literature. In order to state the discordance between a creation that is fundamentally good and a historical condition that is already bad, the myth has no other resources than to concentrate the origin of evil in a single instant, in a leap, even if it stretches out this instant in a drama that takes time, introduces a series of events, and involves several characters. In this way the myth reflects in its very structure, in which the concentrated instant and the extended drama confront one another, the structure of the phenomenon of evil as such, which at one and the same time commences with each evil act and continues an immemorial tradition.

The etiological character of the myth is further reinforced by the narrative of the maledictions that ensue, following the initial act of disobedience: every human dimension—language, work, institutions, sexuality—is stamped with the twofold mark of being destined for the good and inclined toward evil. The power of naming all beings is so deeply perverted that we no longer recognize it except in reference to the division of speech into different tongues. Work ceases to be a sort of peaceful gardening and becomes hard labor that places man in a hostile relation to nature. The nakedness of innocence is replaced by the shame that casts the shadow of concealment over all aspects of communication. The pain of childbirth tarnishes the joy of procreation; death itself is afflicted by the malediction of the awareness of its immanence. In short, what the myth recounts is how it happened that human beings are obliged to suffer the rule of hardship as we know it in our present condition. The myth's "method" is always the same: stretching out in the time of a narrated drama the paradoxical—because simultaneous—aspects of the present human condition.

This is the restricted typology that we can construct in the limited sphere of the archaic state of the European. Before attempting to move into other cultural spheres, it is important to do justice to the contrary aspect stressed above concerning the level of the typology of myths of evil: the paradigms, we said, are not simply distinct from one another in the sense of Weberian ideal types but they overlap with one another to such an extent that we can discover in each one some aspect that lends it a family resemblance to the others.

The danger of the structural approach we have followed up to now lies in giving an exaggerated cohesiveness to narratives of origin that also possess a composite, paradoxical, even extravagant character, well suited to the heuristic function of myth, when myth is considered as a thought experiment that unfolds in the region of the collective imagination. This is why the static analysis of myths, governed by the search for and the description of ideal types, must be completed by the addition of a dynamic approach to myths, attentive to the internal discordances that make them overlap in places and in this way outline a vast narrative and symbolic cycle.

If we take the Adamic myth as a point of reference, we find in it the muted echo of all the others and vice versa. We can therefore speak of a tragic aspect in the Adamic myth, expressed in the deep and shadowy psychology of temptation. There is a sort of fatalistic side of the ethical confession of sins. But there is also an irreducible remainder of the theogonic combat, which can be seen in the figure of the serpent and in other biblical figures related to the primordial chaos. What is more, the essentially ethical affirmation of God's saintliness can never entirely rid us of the suspicion that God is somehow beyond good and evil and that for this very reason he sends evil as well as good.

This is why later speculation will continually return to what is at once an unthinkable and an invincible possibility, namely that the deity has a dark and terrible side, in which something of the tragic vision and also something of the myth of chaos is preserved and even reaffirmed. If this admission shows itself to be so persistent it is precisely because the human experience of evil itself contains the admission that, in positing the existence of evil, humankind discovers the other side of evil, namely that it has always existed, in a paradoxical exteriority that, as stated above, relates sin to suffering within the undivided mystery of iniquity. The acknowledgment of a nonhuman source of evil is what continually gives new life to theogony and to tragedy alongside an ethical vision of the world.

The same thing should be said with respect to the typological distance between the Adamic myth and the myth of the exiled soul. It is not by sheer chance that, under the influence of Platonism and of Neoplatonism, the Adamic myth has almost fused with the myth of the Fall. There was most likely in the original myth a tendency that led it to confuse the quasi-external character of evil as already present with the body, understood as the sole root of evil. In the same way, the Babylonian exile provided the model of banishment, which continues with that of the expulsion from the garden of paradise. The symbols of captivity and of exodus that underlie the Adamic myth thus lend themselves to contamination by the symbolism, coming from another source, of a fallen "soul." Elevating the figure of Adam above the condition of ordinary mortals doubtless facilitated the reinterpretation of the myth of disobedience in terms of a myth of the Fall: when Adam is represented as a sort of superman endowed with all knowledge, beatitude, and immortality, his

degradation could be represented in no other way than as a fall.

This play of overlappings could be considered from the perspective of each of the four myths that structure the symbolic imagination in the Western world: there is no myth of chaos that, at one moment or another, does not include the confession of sins by a repentant sinner; there is no tragic myth that does not admit the deep fault tied to a hubris for which humankind recognizes itself to be guilty. And would the fall of the soul be such a misfortune if humankind did not contribute to it at least through consent?

Hindu and Buddhist mythologies. The division into four great paradigms that we apply to the vast—although restricted—domain of Semitic archaism and Hellenic archaism, which, together, structure the cultural memory of the West, itself constitutes only a restricted typology. What happens when Westerners attempt to extend their vision to a wider field? Does the typology offer the same features of relative order and of multiple overlappings when we try to pass from the restricted form to a generalized form? For anyone who undertakes the perilous task of incorporating into his or her own vision the universes of thought that entertain complex relations of distance and proximity with one's own cultural memory, two warnings should be taken into consideration: first, it is senseless to seek to be exhaustive; there is no Archimedes point from which one could attempt to raise the totality of mythical universes. We must always confine ourselves to limited incursions into the regions that we intuitively suspect will contain treasures likely to enrich our cultural memory, and from this results the unavoidably selective nature of the itinerary of these incursions.

Second, we must give up the hope of any simple taxonomy, such as a distribution into monisms, dualisms, and mixed forms of these. These distinctions are practically useless on the mythical level itself, assuming they have a less debatable validity on the level of more speculative discourse. The two examples we have chosen, Hindu mythology and Buddhist mythology, taking into account the first warning, also raise issues related to the second warning: Hindu mythology perhaps more than Buddhist mythology confronts us with a profusion of explanatory frameworks requiring a taxonomical refinement that challenges any classificatory principle. Buddhist mythology, perhaps more than Hindu mythology, shows us how the same "solution" can oscillate among several planes of expression, from the level of legend and folklore to that of a metaphysical speculation. This profusion and this variation of levels constitute fearsome challenges for any attempt at typology.

If we admit that theodicy is not restricted to monotheism but forms the touchstone of all religions, when the existential need to explain suffering and moral evil is brought to the level of language, then we can seek and find theodicies in all of them. If, moreover, we admit that Vedantic Hinduism, in which the problem of evil is dismissed rather than resolved by a refined speculation on the relation between suf-

fering and ignorance, is not the same as all systems placed under the vast heading of Hinduism, we can, following Wendy Doniger O'Flaherty in *The Origins of Evil in Hindu Mythology* (Berkeley, 1976), class the expression of theodicies on the clearly mythological level as Puranic Hinduism. These figurative and narrative theodicies lend themselves to a certain classification of different conceptual attitudes toward evil, a classification that struggles with the proliferation of myths to the point of succumbing under their weight.

O'Flaherty, our guide through this labyrinth, observes that four characters can assume the role of the villain in the drama: mortals, fate, demons, and gods. The first type of myth, which recalls the Adamic myth, seems surprising if one considers the doctrine of *karman*, according to which our present experience is the direct result of the good or bad actions of previous existences to be the Indian solution to the problem of evil. Neither gods nor demons are then to blame, and even blame itself is obliterated by the recognition of an eternal cycle in which everything is justified and finds its recompense. The paradox lies in the fact that the feeling generated by rumination on past faults opens the way for all sorts of speculation on the moral responsibility of humankind for the origin of evil, nuanced by the attitude that human beings are always as much victim as guilty party (as we see in the myths of the loss of a golden age).

After all, the very doctrine of *karman* posits that the links in the endless chain of evil are our desires and our sins; Buddhism takes this as its starting point. The paradox, however, is reversed when a primordial fall is evoked; then it is fate rather than humankind that is to blame. This forms a second cycle of myths, where we see God or a god create evil as a positive element in the universe, whether he acts as a willing or unwilling instrument of fate or whether he himself decides that evil must come to be. Logical thought tends to see a contradiction here between being constrained or deciding freely to create an ambivalent universe; Hindu thought, however, moves effortlessly between what ultimately appears to be two variants of a *dharma* that abolishes the distinction between what is and what ought to be.

The opposite is no less true: it is because a doctrine like that of *karman* proves to be emotionally unsatisfactory in certain ways while remaining valid in the eyes of the wise that mythology continually reworks the variants, producing new divergences. It is then not surprising that mythical speculation turns toward gods and demons. Myths placing guilt on the shoulders of gods or demons proliferate, all the more so as ethical and cosmic dualism, illustrated in its purest and most coherent form by Manichaeism, was never victorious in India: the ambiguous nature of the demons, and even of the gods, served to thwart this clear and radical distinction. India preferred to struggle with the paradox of superhuman entities, which are almost all of the same nature and which are distinguished and opposed to another only by their combat. Those who always win are gods, but because their adversaries are never really eliminated, the kinship of the gods and the demons always resurfaces.

Here the guide we have chosen to follow remarks with irony that as a consequence of these reversals the gods reputed to be good are more wicked than we might expect and that the demons reputed to be evil prove to be good demons. This gives rise to a reflection on the demonic as such, in which power overrides benevolence, thus verifying the extent to which myths operate as depth probes sounding the ambivalence of the human condition itself, while on the surface they seem to operate as explanations. By recounting our origins, where we come from, myths describe in a symbolic way what we are: the paradox of the good demon and that of the evil god are not merely playful fantasies but the privileged means of unraveling the tangled skein of passions belonging to the human heart. When the myth tells, for example, how the gods corrupted the demons, something is said about the hidden perversity of the “higher” part of ourselves. When the myth recounts the birth of death, it touches the secret thread of our fright in the face of death, a fright that in fact closely links together evil and death and confronts death as a personified demon.

The fact that myths are indifferent to logical coherence is attested to by another cycle of myths, characteristic of *bhakti* spirituality, where we see a god create evil (for example, a fallacious heresy) for the good of humanity, a lesser malediction freeing a graver one. The cycle is then complete: submitted to this stringent economy, humankind is carried back to the problem of its own evil, as in the theory of *karman*. This cycle, however, is considerably vaster than that of the restricted typology with which we began. It is also more loosely knit. And it is truly in the mythic theodicies of India that we see verified the notion suggested at the beginning of this article, namely that the mythical world is an immense laboratory in which all imaginable solutions are tried.

This acceptance of multiplicity by the same culture confirms one of the conclusions arrived at by our restricted typology (restricted to the archaic Semitic and Greek worlds)—namely, that in every myth, owing to its own incoherence, we discover a sketch in miniature that another myth will develop on a much larger scale. The feature that has not received sufficient attention, however, has to do with the difference in level that allows us to go beyond a lower truth (for example, the struggle between gods and demons or the corruption of demons and mortals by the gods) by means of a higher truth (for example, *karman*), which, far from eliminating the prior truth, confirms it in its subordinate place. This is what Buddhism forcefully demonstrates.

Buddhism poses a singular problem for any careful investigation, not only with respect to the multitude of mythical figures of evil, but also to the oscillation between different levels of discourse. On the one hand, indeed, no religion has gone so far toward a speculation stripped of any narrative or figurative element on behalf of a doctrine of inner illumination. On the other hand, Buddhism seldom appears in a form completely cut off from popular beliefs and from their characteristic demonology, especially in the cultural uni-

verses previously shaped by Hinduism. What is more, Buddhism has generated within its own midst, if not a new demonology, at least a mythical figure of evil, Māra, somewhat comparable to Satan in late Judaism and in early Christianity. Buddhism reinforces in this respect the hypothesis according to which one can speak of the origin of evil only by way of myths. At the same time it appears to constitute a counterexample to this hypothesis, because mythology seems at first to be so incompatible with the purified form of spirituality characteristic of Buddhism. It is, to be sure, in the Pali canon and not in the Mahāyāna documents that T. O. Ling, in his *Buddhism and the Mythology of Evil* (London, 1962), finds the most striking illustration of this phenomenon, which at first sight seems paradoxical.

To begin with, one must admit that a wide gap exists between pure Buddhist doctrine and popular mythologies concerning the origin of evil. The latter are characterized basically by the radically external nature they attribute to demonic powers, represented as threatening, terrifying, devouring creatures. In addition, as is not the case in Iranian dualism, these demons form a swarm in which it is difficult to distinguish the forces of evil from the forces of good. Finally, the principal resource of humans in defending themselves against these external forces is an action itself turned toward the outside, whether this is a propitiatory sacrifice, an invocation addressed to higher powers or the manipulation of hostile forces through magical actions, or even the constraint that is supposed to be exerted on the gods by self-mortification.

On the other hand, if, following T. R. V. Murti in *The Central Philosophy of Buddhism* (London, 1955), we take as our criterion for Buddhism the “philosophical” section of the canon, that is the Abhidhamma Pitaka and, more precisely, Buddhaghosa’s *Visuddhimagga* (Path of Purification), which in the Theravāda school is at once its conclusion and compendium, then we are correct in speaking of a Buddhism without mythology, as Ling does. The thinking behind this radical position is easy to understand. In the first place, the doctrine is entirely directed toward the purely mental conditions of the evils of existence. These conditions are analyzed, catalogued, and hierarchized with the most extraordinary care; they are also submitted to an exploration of the “dependent origination” of the lines of interdependence, which allows the sources of evil to be tracked down in their deepest hiding places. What the analysis exposes are not external forces but, basically, ignorance, which itself results from false views of the world, generated in their turn by an overestimation of the self. Popular demonologies are precisely the crudest sort of expression of these false points of view.

The second reason for incompatibility with mythology is that the analysis itself, in certain schools, is confined to scholasticism, due to the subtlety of its distinctions and derivations, and is placed in the service of a wisdom aimed at establishing a state of emptiness, a void. This state is entirely separate from the familiar realities of everyday existence and

wholly unrelated to the fantastic creatures produced by desire and, even more so, by fear. Demons vanish along with all external reality as a result of the purifying meditation that deserves the name of enlightenment.

And yet, it is not simply a matter of making concessions to popular beliefs if the Pali canon assigns a place in its teachings to the Evil One and gives him the name of Māra. This entity can be termed mythical due to his resemblance to the demons of popular belief and, more precisely, due to his personification of original evil. Ling confirms here the earlier analysis of Ernst W. Windisch in *Māra und Buddha* (Leipzig, 1895). According to both of them, this figure is finally not foreign to the central core of Buddhism to the extent that it is part of the very experience of the Buddha's enlightenment, as a force that threatens, attacks, and seeks to distract the individual from contemplation—a force that the wise person must address, confront, and finally conquer.

Specialists in this field argue whether this confrontation with the threat of distraction is characteristic only of the first stage in the spiritual adventure or whether it is present up to the end; they argue whether the proliferation of legends that attribute to this figure of evil the status of a demon result from subsequent contamination by the surrounding demonologies or whether they develop a mythical core inherent in the pure doctrine. The essential point is that the figure of Māra in its barest signification is the product of Buddhism. Ignorance driven out by knowledge; shadows dissipated by that enlightenment, are experienced as an inner adversity that is spontaneously personified in the figure of an adversary. As is not the case in popular demonology, however, Māra is personified by a single figure, symbolizing the internal enemy, namely the adversary of meditation.

If Buddhism seems to confirm in such a paradoxical fashion the thesis that one can speak only in mythical terms of the origin of evil, this is because the source of evil, however much it may be interiorized, retains a certain hostile nature that calls for a figurative approximation in terms of externality. Expressed in external terms, the myth gives a symbolic expression to the interior experience of evil.

BEYOND MYTH? Myth, however, is not alone in using language to deal with the enigma of evil. I mentioned above that there exists a hierarchy of different levels of discourse within which myth takes its place. We can go beyond myth in two directions, that of theodicy and that of wisdom. These two paths often intersect but they conform to two distinct series of requirements.

The path of theodicy. Theodicy replies to a demand for rational coherence. This requirement stems from lamentation itself, inasmuch as it carries within it an interrogation: "Why? Why must my child die? Why must there be suffering and death? How long, O Lord?" But it also stems from myth itself, inasmuch as it brings the reply of a vaster and more ancient order than the miserable condition of humankind. This reply, however, suffers at once from an excess and from

a defect: an excess resulting from a proliferation that staggers the imagination (the mythical world, Lévi-Strauss observes, is a world that is too full); its defect is due to the mutual incompatibility of myths, to their internal contradictions, and, finally, to their narrative form itself: to tell a story is not to explain. Rationalization has taken a number of different forms: in India, this involves the grand speculations on *karman*, on the degrees of being, on the order of things placed beyond good and evil. In Buddhism, this concerns speculation on the tie between ignorance and suffering and, above all, on the tie between wisdom, which I shall discuss below, and suffering. In Greece, myth was surpassed by philosophy, which essentially separates the question of origin in the sense of foundation from the question of the beginning in the sense of theogonies and genealogies. By virtue of this fundamental clarification, Plato prefers to say that God is the cause of good alone rather than to say, along with myth, that the gods are bad or that they are beyond good and evil.

In the Christian sphere, rationalization takes place within theology, mainly at the time of the confrontation with gnosis, which is still no more than a rationalized myth, and in connection with an overall hellenization of speculation. In this regard, the doctrine of original sin in Augustine offers at once the features of an antignosis as a result of what its conceptual framework borrows from Neoplatonism (being, nothingness, substance, etc.) and the features of a quasi gnosis, and hence of a rationalized myth, due to the way it mixes together the legal model of individual guilt and a biological model of contamination at birth and of hereditary transmission. This is why such rationalization was continued beyond this quasi gnosis in onto-theologies to which we owe the theodicies as such, in Leibniz and, finally, in Hegel. To these theodicies we owe, if not a solution to the enigma of evil, at least the transformation of the enigma into a problem, namely whether or not we can maintain the following three propositions at once: God is all-powerful. God is absolutely good. Evil exists. This is not the place, however, to weigh the success or failure of rational theodicies.

The path of Wisdom. Assuming that a coherent reply could be given to the enigma that has been raised in this way to the level of a rational problem, there could still be no exclusive means for explaining it. The question of evil, indeed, is not simply "Why does evil exist?" but also "Why is evil greater than humans can bear?" and, along with this, "Why this particular evil? Why must my child die? Why me?" The question is also posed, then, to wisdom.

It is Wisdom's task first to develop an argument on the basis of this personal and intimate question that myth does not treat, since it invokes an order that does not concern individual suffering. Wisdom thus forces myth to shift levels. It must not simply tell of the origin in such a way as to explain how the human condition reached its present miserable state; it must also justify the distribution of good and evil to every individual. Myth recounts a story, Wisdom argues. It is in this sense that we see the *Book of Job* question explana-

tion in terms of retribution in the name of the just man who suffers. If the *Book of Job* occupies a primary place in world literature, it does so first because it is a classic of Wisdom's argumentative mode. But it is so because of the enigmatic and even perhaps deliberately ambiguous character of its conclusion. The final theophany gives no direct reply to Job's personal suffering, and speculation must be made in more than one direction. The vision of a creator whose designs are unfathomable may suggest either consolation that has to be deferred until the eschaton, or that Job's complaint is displaced, even set aside, in the eyes of God, the master of good and evil, or that perhaps the complaint has to stand one of the purificatory tests to which Wisdom, itself grafted on a certain *docta ignorantia*, must submit so that Job can love God "for nought" in response to Satan's wager at the beginning of the tale.

This final suggestion reveals the second function of Wisdom, which is no longer to develop arguments or even to accuse God but to transform, practically and emotionally, the nature of the desire that is at the base of the request for explanation. To transform desire practically means to leave behind the question of origins, toward which myth stubbornly carries speculative thought, and to substitute for it the question of the future and the end of evil. For practice, evil is simply what should not but does exist, hence what must be combated. This practical attitude concerns principally that immense share of suffering resulting from violence, that is, from the evil that humans inflict on their fellows. To transform desire emotionally is to give up any consolation, at least for oneself, by giving up the complaint itself. It is perhaps at this point that Job's wisdom coincides with that of Buddhism. Whatever can be said of this meeting of two such remote traditions of wisdom, it is only at this point that myth can be surpassed. But it is not easy to give up the question "why?" to which myth attempts—and fails—to reply.

Revised Bibliography

EVOLA, JULIUS. Giulio Cesare Andrea Evola (Julius; 1898–1974) was a cultural, religious-historical, philosophical, esoteric, and political author. Evola was born in Rome, most likely to Sicilian aristocracy, and was raised Catholic. He came under the early spiritual influence of Arthur Rimbaud (1854–1891), Friedrich Nietzsche (1844–1900), Carlo Michelstaedter (1887–1910), and Otto Weininger (1880–1903). After returning from service in World War I, Evola experienced an existential crisis, which almost ended in suicide. According to his own statement, he was rescued by a sentence from the Buddhist Pali canon. Psychological experiments under the influence of ether led Evola to a transcendental experience of his self (Ego), which transformed him completely. He experienced his self as all-comprising and identical with the highest spiritual power in the universe. During this time he became friends with the futurist Giovanni Papini (1881–1956), who interested Evola in the Eastern wisdom teachings and the mystic Meister Eckhart (c. 1260–1328), whose extreme clarity always remained a model for Evola. Evola was also well acquainted with the futurist theorist and author Filippo Tommaso Marinetti (1876–1944), who might even have introduced him to Benito Mussolini.

Soon, however, Evola turned towards Dadaism and became friends with its main proponent, Tristan Tzara (1896–1963). Due to the quality of his paintings, poetry, and writings on the theory of modern art, Evola is considered the main representative of Italian Dadaism. He saw art as flowing from a "higher consciousness." All of Evola's work is incidentally characterized by his effort to elevate mere human existence to a supramundane level and to concentrate on transcendental principles. This concentration is marked, however, by a militantly active aspect, which drove the contemplative into the background.

In 1922 Evola abandoned his artistic activities, and in the same year, when he was just twenty-four, he completed a translation of the *Dao de jing*, influenced by idealist philosophy; he completely revised this translation in 1959. Evola dedicated himself subsequently to the construction of his own philosophical system, which he called "magical ideal-

ism,” after Novalis (Friedrich von Hardenberg, 1772–1801). Based upon German idealism (mainly Friedrich Schelling, J. G. Fichte, and Novalis) and complemented by his own transcendent “ego experiences,” as well as teachings from the Far East, Evola eventually formulated the notion of an “absolute self,” related to the idea of the Hindu *ātman*. He postulated the “absolute self” as being free from all spiritual or material constraints, wherein freedom, power, and realization form a unity.

In 1926 Evola abandoned his extensive philosophical studies because he was searching for an actual breakthrough to transcendent “initiatic” levels. He had already formed close contacts with Ultra, an independent theosophical group in Rome, through which he got to know the most important Italian scholar of Asian religions, Giuseppe Tucci (1894–1984). He also came into contact with Tantrism, which he studied intensively, drawn by its practical emphasis and promise of direct transcendental experiences. Evola soon entered into correspondence with John Woodroffe (Arthur Avalon; 1865–1936), who had brought Kuṇḍalinī Yoga and Tantrism to the West. Evola’s *L’Uomo come Potenza* (Man as power, 1925) followed. Although still having a strong Western philosophical tendency, this work was based on Woodroffe’s research and translations from Sanskrit sources, and it thus became the first work to make Tantrism known in Italy.

At that time, through René Guénon (1886–1951), Evola received his first exposure to Integral Tradition, according to which all fundamental religions and cultures are said to arise out of a primordial tradition of transcendent origin. From 1927 to 1929, he led the magical-initiatory Group of Ur, in which both esotericists and representatives of general Italian spiritual life, including Emilio Servadio (1904–1995), the “father of Italian psychoanalysis,” participated anonymously. The goal was complete human self-transformation and integration into transcendental regions by way of an experimental path, which Evola called *initiation*; the Daoist *wei wu wei* (nonintentional doing) was a precondition for effective magical actions. The group’s magazine published, besides its own reports, first Italian translations of the ancient Mithraic *Apathanathismos*, as well as excerpts from Avalon’s texts, the Buddhist Pali canon, the biography of the Tibetan Mi la ras pa, the Chinese *Tract of the Golden Flower*, and an article by the French Orientalist Paul Masson-Oursel (1882–1956). After the Group of Ur disbanded, Evola founded the political and literary journal *La Torre*, which published, among others, an article by Paul Tillich (1886–1965) about the demonic and several excerpts from writings by Johann Jakob Bachofen (1815–1887). However, because of its uncompromising positions, *La Torre* had to cease publication at the behest of Mussolini after only ten issues.

Evola’s acquaintance with the then most important Italian philosophers, Benedetto Croce (1866–1952) and Giovanni Gentile (1875–1944), led to a collaboration on the *En-*

ciclopedia Italiana. In the 1930s Evola busied himself intensely with alchemy, a critical analysis of the then prevailing esoteric groups, and the myth of the Holy Grail. His underlying traditional philosophy did not see historical-cultural development as advancement, but rather as decay, a view that reflected Indian and ancient teachings on the cosmic cycles, at the “gloomy” end of which, known as the *kaliyuga*, people live today.

At the same time, Evola traveled throughout Europe to meet with representatives of political views that corresponded to his own sacral-holistic, antiliberalist, and antidemocratic ideas, including the revolutionary conservative Edgar Julius Jung (1894–1934), who was later murdered by the Nazis, the Catholic monarchist Karl Anton Prinz Rohan (1898–1975), and the founder of Romania’s Iron Guard, Corneliu Codreanu (1899–1938). During his visit to Romania in 1937, Evola met Mircea Eliade (1907–1986), who belonged to the Iron Guard. Evola and Eliade had corresponded since the second half of the 1920s, but only several of Evola’s and none of Eliade’s letters have survived because Evola destroyed letters he received after answering them. Evola wrote five contributions for the German cultural journal *Antaios*, published by Ernst Jünger (1895–1998) and Eliade between 1960 and 1970. Evola’s influence on Eliade is undeniable, even if Eliade cannot be regarded as belonging to the Integral Tradition school of thought. The parallels to Evola are particularly evident in Eliade’s early alchemic works. After World War II, Evola introduced Eliade to Italian publishers and translated some of his works. Evola was also acquainted with Angelo Brelich (1913–1977), who published two articles (one about Jupiter and the Roman idea of state) in 1937 and 1940 in *Diorama Filosofico*, Evola’s cultural supplement to the *Regime Fascista* magazine. The article on Jupiter and Rome testifies to Evola’s great interest in Roman religion, which formed the spiritual foundation of the *Imperium Romanum*, which Evola hoped to see reestablished. Letters from Evola preserved in the archives of the great historian of religion Raffaele Pettazzoni (1883–1959) and the mythologist Karl Kerényi (1897–1973) show that he was also in contact with them.

Before and during World War II, Evola concentrated intensely on Buddhism, which he described as a path to spiritual freedom that maintained its validity even in modern times. Evola almost exclusively referred to the Pali canon, and he pointed out that the historical Buddha was a member of the warrior caste. Evola rejected the widespread teaching of modern Mahāyāna Buddhism, which sets peacefulness and universal love in the foreground, instead of clear initiatory knowledge through asceticism and exercise. Nevertheless, Anagarika Govinda (1898–1985), who was the first Westerner to receive the title of lama, praised Evola’s work.

In 1940 Evola wrote an article for the magazine *Asiatica*, published by Tucci. This work was later continued in the subsequent renowned journal *East and West*, which Tucci also managed. Another well-known Orientalist with whom

Evola had been closely connected since his youth was Pio Filippini-Ronconi (b. 1920) who taught at the University of Naples. A close friendship on the basis of common esoteric interests connected Evola with the Egyptologist Boris de Rachewitz (1926–1997). He was also well acquainted with the historian and researcher of ancient Roman religion, Franz Altheim (1898–1976).

Evola's ambivalent attitude towards fascism, which he hoped would lead Italy back to a heathen-sacral *Imperium Romanum*, but which lacked any transcendent basis, led him closer to National Socialism, and in particular to the *Schutzstaffeln* (SS), which he considered a fighting spiritual order, at least in the beginning. However, by 1938 he was denounced as a "reactionary Roman and visionary" in an SS document, which led to an order that Evola's behavior was to be observed. Starting in the mid-1930s, Evola was heavily involved with questions of race, and he hoped that official recognition and influence would result from this work. After all, Mussolini had expressed positive thoughts about Evola's theses of "spiritual" racism, with which he wanted to oppose the "material-biologic" racism of Hitler's Germany. When American troops marched into Rome in 1944, Evola fled to Vienna, where he suffered a severe spinal injury in a bomb attack in 1945. He was confined to a wheelchair for the rest of his life.

After spending three years in hospitals and sanatoriums, Evola returned to Rome in 1948. In 1951 he was accused of being a "spiritual instigator" of secret neo-fascist terror groups and arrested. Following six months of investigative lockup, he was acquitted. Evola's political tendencies changed thereafter more and more into what he called "apolitia," by which he meant a firm spiritual-political position far above daily politics. He also became more heavily involved with Zen Buddhism, which he made widely known in Italy, especially after he began publishing other Zen Buddhist authors. In his last years of life he translated the first volume of *Essays in Zen Buddhism* by D.T. Suzuki, for which he also wrote the introduction. The other two volumes of these *Essays* appeared later on in the book series *Orizzonti dello spirito*, which Evola had founded and for which he selected works from Avalon, Eliade, Tucci, Scholem, and Lu K'uan Yu, among others.

Evola's efforts in popularizing Asian religions helped improve the European image of Asia at a time when a positive view of Asia was not customary. However, his quest was not scientific, although he remained as true to original sources as was possible at the time. For him, as in the case of his esoteric writings, his work in comparative religion was more about revealing paths that could extract modern humans from rampant materialism and lead them to spiritual freedom. Therefore, Evola's religious-historical works examine only selected aspects corresponding to this quest, and they are unsuitable as surveys. This can be seen most clearly in Evola's handling of Hinduism, where he highlighted only the warrior and ascetic aspects of the *Bhagavadgītā*. The

same is true for Islam. Despite this intentional one-sidedness, his books are still appreciated in Orientalist circles, and such experts as Jean Varenne, Filippini-Ronconi, or Silvio Vietta have written forewords to new editions of his works. Academic circles have become increasingly interested in Evola, as evidenced by the numerous books, essays, conference proceedings, and dissertations written about him, and the many translations of his writings.

Although he was never a party member, Evola's involvement with fascism, National Socialism, and racism continues to make him an extremely controversial figure. Controversy has also resulted from the numerous anti-Semitic comments that he made, mainly in the fascist daily press, and from the introduction he wrote in 1937 for the Italian version of the forged *Protocols of the Elders of Zion*. Evola saw in Judaism the modern materialist and economic dominance that he fought against, although he highly valued Orthodox and qabbalistic Judaism.

Evola passed away in 1974. He had expressly refused a Catholic burial, and his ashes were scattered in a crevasse of Monte Rosa.

BIBLIOGRAPHY

Evola's writings comprise more than twenty books, approximately one hundred important essays, and some one thousand newspaper and journal articles, of which practically all have been published in various volumes and collected works. Evola was also an extraordinarily industrious translator. The most readily available bibliography, although not the most recent, is Renato del Ponte, "Julius Evola: Una bibliografia 1920–1994," in *Futuro Presente* 6 (1995): 28–70. The definitive editions of Evola's books are published by Gianfranco de Turrís, the head of the Fondazione Julius Evola in Rome, in the *Opere di Julius Evola* series with Edizioni Mediterranee in Rome. His religious-historical works include *La Tradizione Ermetica: Nei suoi Simboli, nella sua Dottrina e nella sua "Arte Regia"* (Bari, Italy, 1931), which describes alchemy as a spiritual discipline on the basis of numerous original sources; this book was used and valued by C. G. Jung, and it was translated by E. E. Rehmus as *The Hermetic Tradition: Symbols and Teachings of the Royal Art* (Rochester, Vt., 1995). *Rivolta contro il mondo moderno* (Milan, 1934), which is considered Evola's main work, gives an overview of his general weltanschauung, which is based on Guénon's Integral Tradition. This work was positively evaluated by both Mircea Eliade and Ananda K. Coomaraswamy, the latter publishing a chapter in 1940 in English. This entire work was translated by Guido Stucco as *Revolt against the Modern World: Politics, Religion, and Social Order of the Kali Yuga* (Rochester, Vt., 1995). Evola's *La Dottrina del Risveglio* (Bari, Italy, 1943), translated by H. E. Musson as *The Doctrine of Awakening: The Attainment of Self-Mastery according to the Earliest Buddhist Texts* (London, 1951; reprint, Rochester, Vt., 1996), describes ancient Buddhism as an initiatory path. *Lo Yoga della Potenza* (Milan, 1949), translated by Guido Stucco as *The Yoga of Power: Tantra, Shakti, and the Secret Way* (Rochester, Vt., 1992), is a complete revision of Evola's first Tantra book, *L'uomo come potenza*, and is much more based on Avalon's writings than the original *L'uomo*

come potenza, which had a strong Western philosophical bent. *Metafisica del Sesso* (Rome, 1958), translated as *The Metaphysics of Sex* (New York, 1983), describes the connections between religion, esotericism, and sexuality, whereby Evola sees sex as the only remaining force that lets modern humans perceive transcendental planes. Evola's autobiography, *Il Cammino del Cinabro* (Milan, 1963), largely ignores his private life and is useful mostly as an annotated autobiography.

Periodicals that published Evola's works include *Ur* (Rome, 1927–1928) and *Krur* (Rome, 1929), both of which were reprinted in Rome in heavily revised three-volume editions in 1955 and 1971 under the title *Introduzione alla Magia quale Scienza dell'Io*. An English edition of the first 1927 volume is available as *Introduction into Magic* (Rochester, Vt., 2000).

Studi Evoliani, published by Gianfranco de Turrís, was inaugurated in 1998; though an erratic sequence, it contains extensive essays on Evola. Despite the many books, articles, and dissertations written about Evola, many aspects of his life and work remain unexplored due to the great variety of special fields involved, and there is still no comprehensive biography about him. The following are recommended.

Bonvecchio, Claudio, Richard Drake, Joscelyn Godwin, et al. *Julius Evola: un pensiero per la fine del millennio*. Rome, 2001. A volume of lectures held in Milan in 1998 on the occasion of Evola's 100th birthday.

Boutin, Christophe. *Politique et tradition: Julius Evola dans le siècle (1898–1974)*. Paris, 1992. The most comprehensive work on Evola to date, it mainly discusses his political influence.

Consolato, Sandro. *Julius Evola e il Buddhismo*. Borzano, Italy, 1995. A sympathetic work explaining Evola's approach to Buddhism.

del Ponte, Renato. *Evola e il magico "Gruppo di Ur"*. Borzano, Italy, 1994. A work that tries to shed light on the historical and personal background of the Group of Ur.

de Turrís, Gianfranco, ed. *Testimonianze su Evola*. Rome, 1973; rev. ed., 1985. Various authors' personal memories of Evola written in honour of his seventy-fifth birthday.

di Dario, Beniamino M. *La via romana al Divino: Julius Evola e la religione romana*. Padua, Italy, 2001. Discusses Evola's perceptions of Roman religion, with heathen sacrality and the imperial idea as central themes.

di Vona, Piero. *Evola, Guénon, di Giorgio*. Borzano, Italy, 1993. The author, a Spinoza specialist at the University of Naples, describes the complex relationships between René Guénon and his two Italian disciples, Evola and di Giorgio.

Fraquelli, Marco. *Il filosofo proibito: Tradizione e reazione nell'opera di Julius Evola*. Milan, 1994. Discusses Evola's danger for democracy and the value of enlightenment.

Germinario, Francesco. *Razza del Sangue, razza dello Spirito: Julius Evola, l'antisemitismo, e il nazionalsocialismo, 1930–1943*. Turin, Italy, 2001. A critical but well-documented work on Evola's racist and anti-Semitic writings.

Guyot-Jeannin, Arnaud, ed. *Julius Evola*. Lausanne, Switzerland, 1997. A collection exploring various aspects of Evola; includes an interesting appendix with various documentary opinions on Evola.

Hansen, H. T. "Julius Evola's Political Endeavors." Preface to *Men among the Ruins: Post-War Reflections of a Radical Tradi-*

tionalist by Julius Evola, pp. 1–104. Rochester, Vt., 2001. Currently the most comprehensive English-language work on Evola; it strives to uncover Evola's most important intellectual sources.

Rossi, Marco. "Julius Evola and the Independent Theosophical Association of Rome." *Theosophical History* 6, no. 3 (1996–1997): 107–114.

Sheehan, Thomas. "Diventare Dio: Julius Evola and the Metaphysics of Fascism." *Stanford Italian Review* 6, nos. 1–2 (1986): 279–292. A critical survey of Evola's political ideas.

Spineto, Natale. "Mircea Eliade and Traditionalism." *ARIES* 1, no. 1 (2001): 62–87. A well-documented study about Eliade, which mainly shows how he integrated the influences of traditionalist authors, Evola included, without being a traditionalist himself.

EVOLUTIONARY ETHICS

EVOLUTION: THE CONTROVERSY WITH CREATIONISM

Perhaps no topic evokes a greater visceral reaction among both scientific and religious communities than that of the treatment of Darwinian evolution in Western society. On the one hand, scientists realize that this model of how the observed complexity of the living world likely arose seems, at this point in its history, almost self-evident. On the other hand, the media attention engendered by the vocal elements in opposition, whether motivated by creationism or intelligent design, pushes the churchgoing public to think that evolution (and by extension all of science) and religion are "at war." This caricature of the relationship is not only misleading but also mistaken. Ian Barbour, in his seminal work "Religion and Science" (1997) has shown convincingly that the warfare or conflict mode is one of four archetypes for the relationship between science and religion. In fact, the conflict mode represents the reaction of the extremes in both fields. In order to understand the true nature of this conversation as well as the specific positions taken by Darwinists and creationists, it is necessary to review both the science and the history of biological evolution.

DARWIN AND HIS TIMES. It is important to place Charles Darwin within the framework of both the English society of the nineteenth century and the scientific culture of western Europe and the United States during that time. Darwin was a product of the British intellectual class in every sense of the word. His father and his grandfather were both physicians. In addition, Erasmus Darwin, his paternal grandfather, was among those naturalists (now called biologists) who, at the end of the eighteenth century, challenged the notion that

species were “fixed,” that they existed in the same form in which they were originally created. Thus the concept of species changing over time was a part of Charles Darwin’s personal history.

Darwin’s voyage on the HMS *Beagle* from 1831 to 1836 became the means by which the Cambridge-educated student cemented his interest in biology and severed his path toward the theological training to which he seemed destined. He returned to England with his notebooks full of observations but with the ideas that would become his major work still unformed. By 1838 his interaction with the London society of naturalists resulted in the first formulations of his model.

After the voyage, Darwin did not leave England again. His marriage to Emma Wedgwood in 1839 and their life together at Down House in Kent were the stage for the remainder of his life. From that place, in the setting of a country squire and consummate Victorian intellectual, Darwin published the works through which he is known.

At Down House, perhaps taking one of his famous meditative strolls along the Sandwalk, Darwin decided to publish his book *On the Origin of Species by Means of Natural Selection*. His work on this had been ongoing since his return to England on the *Beagle*. The final stimulus to publication was a paper by Alfred Wallace, a young naturalist working in the Far East. The similarity of their conclusions led Darwin to finally complete his book for release in November 1859. *Origin of Species* was released in a total of six editions, all overseen by Darwin. The sixth, published in 1872, was his last. Darwin died in 1882.

THE DARWINIAN MODEL. Darwin’s great contribution was to provide a physical explanation for the observed complexity of the living world. Rather than assume that all things were created in the form in which they now occur (preformationism), he posited that everything arose by descent with modification from a common ancestor. The driving force of this, he proposed, was natural selection. His choice of terms for this force was not accidental. In fact, he was referring by comparison to the commonly understood agricultural practices of his day, by which desired traits of plants or animals were selected artificially by breeding. He argued that, in a similar fashion, favorable traits are selected in the natural world and that this selection results in the complexity of species.

John Maynard Smith put forward a convenient statement of the Darwinian model in 1991:

1. Population of entities (units of evolution) exist with three properties: (a) multiplication (one can give rise to two), (b) variation (not all entities are alike), and (c) heredity (like usually begets like during multiplication).
2. Differences between entities influence the likelihood of surviving and reproducing. That is, the differences influence their fitness.
3. The population changes over time (evolves) in the presence of selective forces.

4. The entities come to possess traits that increase their fitness. (Smith, 1991, p. 27)

It is important to note the emphasis on reproductive fitness in this model. When Darwin used the term *fitness* in *Origin of Species*, he meant it in this sense. That is, those traits that increase the likelihood of the organism reproducing are defined as making the organism more fit. In trying to clarify his meaning about this in subsequent editions, Darwin eventually came to rely on a phrase penned by Herbert Spencer, his contemporary and one of the great figures of Victorian England. In chapter three of the sixth edition of *Origin of Species*, Darwin wrote: “I have called this principle, by which each slight variation, if useful, is preserved, by the term Natural Selection, in order to mark its relation to man’s power of selection. But the expression often used by Mr. Herbert Spencer, of the Survival of the Fittest, is more accurate, and is sometimes equally convenient” (1872, p. 32).

The image of “nature red in tooth and claw,” to use Alfred, Lord Tennyson’s oft-quoted line (*In Memoriam*, 1850, verse LVI), comes from a misreading of this epithet from Spencer. Nonetheless, it is true that Darwin’s model does propose that some individuals are less reproductively fit than others and that this will inevitably entail the die-off of species. It is from this consequence of his model that the theodicy problem arises. Darwin was keenly aware of the theological impact of his own physical interpretations. He wrote in an 1860 letter to the American naturalist Asa Gray that he had trouble reconciling a loving God with some of what he observed in nature. In particular, referencing a species of wasp who lays her eggs in the living body of a caterpillar, whose flesh is then used as nourishment for the wasp’s offspring, Darwin wrote, “I cannot persuade myself that a beneficent and omnipotent God would have designedly created the *Ichneumonidae* with the express intention of their feeding within the living bodies of Caterpillars, or that a cat should play with mice” (Darwin, 1860).

This theological challenge became a part of the catalyst that led to the reaction against the Darwinian model in a minority of Christian communities in the United States. The larger issue, as discussed below, is that of the completely materialistic interpretation of nature that scientific descendants of Darwin make, especially in the modern era.

THE MODERN SYNTHESIS: NEO-DARWINISM AND TWENTIETH-CENTURY BIOLOGY. The decade from 1859 to 1869 saw three scientific achievements that, nearly one hundred years later, were intimately related in the modern paradigms of biology. The first was the publication of Darwin’s masterwork in November 1859. During this time Gregor Mendel, an Augustinian monk working in Brün (now Brno), Austria, developed a quantitative understanding of inheritance. He presented his work to the Brün Academy of Sciences in 1868 and published it in the academy’s journal a year later. In 1869 Johann Fredrich Miescher, a Swiss chemist working at the time in Tübingen, isolated a substance from white

blood cells found on used bandages. He named this material nuclein. It is now known as DNA.

In the nineteenth century, no one had any idea that these three events were related in any way. Certainly both Mendel and Miescher, as active scientists, were aware of Darwin's work and the implications of his model. However, virtually no scientist of the day even read Mendel's paper or appreciated the shift it signaled. In addition, no one could foresee that the genes whose behavior Mendel described and whose variants were the selectable traits Darwin's model relied upon would be found to be sequences of nitrogenous bases making up the structure of Miescher's nuclein.

In 1942 Julian Huxley, the grandson of Thomas Huxley, Darwin's champion, published *Evolution: The Modern Synthesis*. Huxley proposed that the Darwinian model, which had been relatively neglected by biologists (although popular with social scientists), could now be "rescued" by linking it with Mendelian genetics. Mendel of course had been rediscovered at the beginning of the twentieth century, when his experiments were repeated and shown to coincide with the behavior of cells as observed by more powerful microscopes than were available in the 1860s. The power of genetics was evident in the impressive data produced with model organisms such as the fruit fly. In addition, the field of biochemistry added to this new formulation with a search for what the chemical nature of the gene might be.

The search culminated in 1942 with the discovery by Oswald Avery and his colleagues that DNA was indeed the genetic material. Although it took another ten years for this idea to be accepted completely, the stage was now set for a full statement of what has come to be called the neo-Darwinian synthesis. This formulation includes the following features:

- Genes: information in the form of the linear array of bases that make up the DNA molecules of chromosomes.
- The traits of an organism (phenotype): direct expression of the information found in the genes (genotype).
- Variations: result of subtle differences in this information (changes in base pairs).
- Changes in genes: mutational events that occur in a "random" way. Random here means that it is not possible to predict which nitrogenous base changes within the DNA. However, the nature of the change is predictable, given the mutagenic stimulus.
- A population of entities: will have variations in traits that are the result of mutational events (genetic drift).

In this new world of biology, the variant genes are acted upon by natural selection. Variants with a greater likelihood of allowing the organism to reproduce and pass these traits on to the next generation have a positive selective advantage and are said to be more fit.

ENCOUNTERS BETWEEN EVOLUTION AND THEOLOGY. Immediately after the publication of Darwin's book there was

a theological reaction within the Abrahamic religions, mainly the Protestant Christian denominations. At first glance it would seem that the problem was with the challenge to the *Genesis* account of creation. However, it must be understood that the fixity of species had also been assumed by science as well. After all, the eighteenth-century Swedish naturalist Carl von Linné (Carolus Linnaeus), whose taxonomic classification system is still used in the early twenty-first century, assumed that the species he was describing in his work had existed in their present forms since the beginning. Even in Darwin's day this was the predominant model for many biologists, although challenges had already been mounted before 1859. Therefore, while this issue was a problem for theology, it was also a problem for many scientists as well.

A larger theological issue concerned the explanation itself. Darwin consciously wrote his book with earlier models in mind, especially the natural theology of William Paley. In 1802 the Reverend Paley published his view of the origin of life's complexity in a volume called *Natural Theology; or, Evidences for the Existence and Attributes of the Deity, Collected from the Appearances of Nature*. In this book Paley presented his famous watch and watchmaker metaphor. This theistic use of nature ultimately led the modern evolutionary biologist Richard Dawkins to title his challenge to theism *The Blind Watchmaker* (1986).

Darwin, in response to Paley's model of an interventionist God creating all things at the beginning, offered instead a naturalistic and materialistic explanation: descent with modification from a common ancestor through the nonsupernatural force of natural selection. While this model does not assume the absence of a God, it certainly does not invoke God's action in any direct way in its presentation. Darwin was not unaware of the effect his model had among theologians and religious communities. In fact, in the second edition of *Origin of Species* he added the following statement, somewhat in his own defense:

I see no reason why the views given in this volume should shock the religious feelings of any one. It is satisfactory, as showing how transient such impressions are, to remember that the greatest discovery ever made by man, namely, the law of the attraction of gravity, was also attacked by Leibnitz, "as subversive of natural, and inferentially of revealed, religion." (p. 239)

Darwin's view of the transience of the problem is certainly touching in light of the debate that still seems to rage in some circles over his "volume." Nonetheless, in this short and somewhat disingenuous statement he was attempting to make the case for two ideas: the need for science to be seen as not in contradistinction to religion, and the need for theology-religion to take into account the latest scientific advances.

In spite of Darwin's position that there was no threat to religion, the interpreters of his model had other ideas. Thomas Huxley, one of Darwin's chief defenders, saw the evolutionary model as something that went beyond the biol-

ogy it described. He called for the development of a social philosophy, akin to and as a substitute for religion, based on the Darwinian principles. For Huxley, the highest goals and values of humanity could be seen as the continuing evolution of the human species. Herbert Spencer also used Darwinian principals to develop a philosophical and political framework but wanted to apply the survival of the fittest model to the evolution of social systems. Finally, Francis Galton, Darwin's first cousin, used the model to advocate for the purposeful direction of the evolution of humans, a process he called eugenics.

Among theologians of the time there were some who tried to cling to the strict interpretative view of creation as described in *Genesis*, which was not at odds with the model of many naturalists of the day. Others took the new model to heart and attempted to make theological sense out of this new view of the living world. Those theologians who embraced the new idea were already, in some sense, committed to a new kind of biblical criticism that was beginning to supplant literalism among some of the more liberal Christian thinkers. This movement, rather than Darwinian evolution per se, gave rise to the fundamentalists.

THE FUNDAMENTALISTS. It is commonly assumed that antievolutionism is synonymous with Christian fundamentalism. While many Christians who identify with fundamentalism are antievolutionist, the origins of this strain of Christian thought did not include this tenet. When the General Assembly of the Presbyterian Church met in 1910 to approve those beliefs that would be considered fundamental to being a Christian, the following five were adopted:

1. the inerrancy of the Scriptures in their original documents;
2. the deity of Jesus Christ, including the virgin birth;
3. substitutionary atonement;
4. the physical resurrection of Christ;
5. the miracle-working power of Jesus Christ.

Nowhere in this list is there any reference to Darwinian evolution. In fact some of the theologians involved in the formulation of these basic tenets accepted evolution although they were still believing Christians. Thus, at its very foundations, fundamentalism was not antievolution.

How is it then that the modern understanding of a fundamentalist includes this anti-Darwinian posture? Certainly over the years since the establishment of these basic tenets of belief as essential some things have changed. The first fundamental is the inerrancy of Scripture. As originally argued, this tenet was directed against the liberal Protestant theologians who were coming to rely more and more on historical methods of criticism in biblical hermeneutics. The reaction was not against the scientific enterprise itself. The first fundamental deals with the divine authority of Scripture, juxtaposed against the view that these writings were but the historical works of humans. The intent was to defend the purity

of the teaching against internal disagreement within the Christian community, as opposed to direct challenges from science.

The move from this position to one that espouses the literal meaning of *Genesis* as a description of how creation actually took place is a matter of only a few steps. In the face of the growing social movement of secular humanism, itself a spin-off of the scientific enterprise, it is not surprising that some elements of the fundamentalist community began to react against the Darwinian model itself. What developed from this reaction is the theological stance called biblical creationism, which rejects the scientific models completely and relies upon Scripture as the sole source for understanding how the natural world arose.

SCIENTIFIC CREATIONISM. A visit to the Institute for Creation Research (ICR) in the foothills east of San Diego, California, is quite instructive. It is clear that this is a facility that celebrates rather than rejects science. The founding members, such as Duane Guish (biochemistry) and Henry Morris (geology) are trained in science, not theology. One is surrounded by evidence that scientific instruments and techniques are employed in their work. And yet their interpretation of their investigations is given one and only one direction: scientific support of the creation story as given in the *Book of Genesis*.

The ICR founder and president, John Morris, posted the following introduction to their mission on the institute's website:

Our world, our church, our schools, our society, need the truth of creation more than ever. We see the wrong thinking of evolution having produced devastating results in every realm. Our passion at the Institute for Creation Research is to see science return to its rightful God-glorifying position, and see creation recognized as a strength by the body of Christ; supporting Scripture, answering questions, satisfying doubts and removing road blocks to the Gospel. The Institute for Creation Research Graduate School exists to train students in scientific research and teaching skills, preparing effective warriors for the faith.

Morris and others see themselves as scientists whose duty is to correct the errors of the recent past and allow science to resume its "correct" relationship with religion as support for the truths revealed in Scripture. They are not theologians, nor do they pretend to any theological insights whatsoever. Their focus is on the instruments and methods of science and how these can be brought to bear on the questions related to the natural world as seen through the words of *Genesis*. They apply the term *young earth creationism* to their view of the world, and they support six principles:

1. *Creatio ex nihilo* by divine action, without any subsequent development. Everything was created as it exists now.
2. Mutation and natural selection cannot explain the subsequent development of all living things. This is a rejec-

tion of the idea that gradual change (variations) can confer selective advantages that lead to new species.

3. Speciation does not occur. That is, changes happen within a species (within a “kind” in their usage), but new species do not develop from preexisting species.
4. There is no descent from a common ancestor. With respect to human origins in particular, this rejects the notion that humans and other primates have an ancestral link.
5. The geology of the earth is a result of catastrophism rather than evolution. In particular, much of what is seen can be explained by positing a great flood, as described in *Genesis*.
6. The earth is less than ten thousand years old.

All of these principles—especially the last one, with its rejection of all modern dating techniques as inherently flawed—put the scientific creationists in complete disagreement with any natural scientists and with most mainstream theologians. This then raises one of the principle ironies of scientific creationism. Its proponents embrace the methodology of science but reject the standard interpretation of those results. To say that their science is influenced by their religious belief is perhaps self-evident from the conclusions they draw. However, a careful reading of their literature reveals that they take themselves to be scientists and that their argument is with what they view as the incorrect interpretations of the data. This of course leads them into dangerous waters, both scientifically and theologically. For instance, the young earth creationists cannot deny the geological data that leads to the 4.5-billion-year age of the earth. Rather, they argue that God created the earth to have the “appearance” of age, when in reality it is only ten thousand years old. In *Finding Darwin’s God* (1999) Kenneth Miller, a Brown University cellular biologist, argues that this is incorrect from the standpoints of both science and theology. He writes that their rejection of evolution leads them to characterize God as a “schemer, trickster, even a charlatan” (Miller, 1999, p. 80).

In the end, the controversy is not really between science and faith but between one kind of science and another. True, creation science assumes that the *Genesis* story is the literal description of the origin of the natural world. However, it contends that science would also agree with this if only it sharpened its interpretive powers and admitted the errors of the Darwinian model.

INTELLIGENT DESIGN. The controversy between creationism and evolution has spilled over into society, mainly in the form of debates about what should or should not be included in the educational curriculum taught in elementary and secondary schools. The classic case of the so-called Scopes monkey trial in 1925 was just the beginning of these questions. Even into the twenty-first century, school boards are constantly beset with requests to include “both sides” of the story in any curriculum discussing the origins and subsequent development of the natural world. As such, even the word *evo-*

lution becomes suspect as soon as such deliberations are opened. The antiscientific and, perhaps, anti-intellectual position of biblical literalism can usually be set aside as not appropriate to be taught in the same course of study as the methods of science. Even scientific creationism, with its appeal to those very methods, cannot make the cut as “science” in most school board meetings or courtrooms. However, the new contender for attention is neither of these, but rather the intelligent design movement. Intelligent design is best understood as the contention that the living world has features that can only be explained by the action of an intelligent designer. For instance, Michael Behe, in *Darwin’s Black Box* (1996), argues that there are examples of cellular function that could not have arisen as the result of gradual mutational change under the pressure of natural selection. He calls such features “irreducibly complex” and gives a list of six examples from his understanding of the biochemistry of living systems. Of course, his position eventually devolves into a “god of the gaps” argument. In this sense, as soon as an explanation for what appears to be irreducibly complex is presented with a naturalistic basis, his designer disappears from the scene. However, this is not the only issue at stake in this discussion. William Dembski, in *Intelligent Design* (1999) and *No Free Lunch* (2002), takes aim at the philosophical underpinnings of the modern scientific method. He proposes the concept of “specified complexity” to describe features of living systems that infer design. At issue for Dembski is not so much the god of the gaps problem, but rather what he believes to be an insufficiency within the scientific enterprise itself. He argues that science by definition is opaque to the idea of purpose or design. This goes back to the original Aristotelian-Thomistic uses of teleology as the fourth or final cause of a thing. The problem here is that the philosophical assumptions of modern science derive from those post-Cartesian thinkers who rejected teleological explanations as a part of their methodology. On the one hand, this allowed for a more objective approach to understanding nature, opening the way for the experimentalists. On the other hand, the philosophical analogy imbedded in Aquinas’s fifth way of understanding God, the so-called argument from design, seemed no longer valid. Dembski and the intelligent design movement push for a fundamental shift in the philosophy of science. In this way they are distinct from the scientific creationists. They are modern scientists in every sense of the word. However, they would argue that a model of origin and complexification for the living world must include a recognition of purpose, and through this a sense that some features require the action of a designer. Therefore these features would be characterized as specified or irreducible complexity. There is no challenge to current science from the notion of irreducible complexity in itself, in the sense that the properties of complex systems are not explainable as the sum of the parts. This is, in fact, the hallmark of the move to networks and complexity analysis in biology. However, when this complexity is seen to be “specified” by a designer with intent, the issue is joined. The need for a designer then leads to the

question of who this designer might be and necessarily becomes a theological problem, not a scientific one. Most commentators prefer to see intelligent design as just another form of scientific creationism. However, a closer reading of advocates such as Behe and Dembski reveals some distinct differences. Those most closely associated with the scientific arguments for intelligent design are not in any sense rejecting evidence for the age of the earth or other features of the geological record. The scientific creationists accept the methodology of science as given, with its reductionism in place, but have a different interpretation of the data based of course on their view of the *Genesis* description. Nonetheless, both movements fall within the same anti-Darwinian camp. As such, the conversations that concern curriculum focus on the inclusion of intelligent design rather than scientific creationism in the science classroom.

THEISTIC EVOLUTION. Given the fireworks surrounding the media reporting of creationism-evolution discussions, it is no wonder that the general public, and indeed a fair portion of the scientific community, believe it is one or the other; one is either a Darwinian or a Christian. However, for the majority of both theologians and scientists, the truth lies in between these two artificial extremes.

To see this middle position clearly, it is necessary to understand the nature of the scientific enterprise and its self-imposed limits. Science restricts its investigations to the collection of data and the building of physical models of explanation for natural phenomena. It is never the function of science to say that certain data prove or disprove the existence of God. However, it is natural for a scientist, once having derived a model such as Darwin's, to speculate on its meaning beyond the data itself. While this is normal, the scientist is at that point engaging in philosophy or even theology. The confusion arises when a particular scientist or scientific commentator attempts to make the data apply directly to the philosophical point. Thus Daniel Dennett, in *Darwin's Dangerous Idea* (1995), argued that Darwinian evolution "proves" that God does not exist.

The result of this confusion has been the polarized view that many have of these issues. A more reasonable understanding of the possible positions is in John Haught's *God after Darwin* (2000) and Michael Ruse's *Can a Darwinian Be a Christian?* (2001). Theistic evolution is not one position but rather a group of related positions. Theistic evolution accepts the facts leading up to and supporting the Darwinian model and concludes that this model is the most likely explanation for those facts. However, theistic evolution also accepts the idea of divine action in all of creation and sees the Darwinian model as one way in which divine action might have operated.

For the theistic evolutionist there is no inconsistency in this stance. It is a combination of scientific understanding and faith. Haught, as a theologian, argues that theology must respond to the facts of evolution with introspection. The theodicy issue that Darwin saw as a part of his model must be

encountered, Haught proposes, with a full acceptance of the evolutionary history of the world.

CONCLUSION. Modern biology relies upon the neo-Darwinian model as a central paradigm of the discipline. While modifications are proposed to the structure of the model, nothing appears in the early twenty-first century to be a rejection of the model in the sense that the scientific creationists wish to see. As a result, the so-called controversy between science and theology that this represents must be thought of as a conversation waiting to be explored.

EVOLUTION: EVOLUTIONISM

Evolutionism is a term commonly employed to designate a number of similar, usually nineteenth-century anthropological theories that attempt to account for the genesis and development of religion. Although the term *evolutionism* could be used to describe a collection of theologians such as Pierre Teilhard De Chardin (1881–1955) and others belonging to the school of theistic evolution, this article will focus strictly on the uses of the term within the development of anthropological science.

Evolutionist theories of religion's origin hold in common a presupposed "psychic unity of mankind"; that is, they assume that all human groups are possessed of a more or less common developmental pattern (though the shape of this pattern differs from theorist to theorist) and that therefore significant clues as to how religion originated—and in turn as to what religion essentially is—can be detected through a study of the religious lives of the world's "primitive" peoples. If evolutionist assumptions are correct, it should follow that commonalities displayed among groups at each level of development will reveal, when set in diachronic order, a necessary "psychic history" of the human race.

INFLUENCES ON EVOLUTIONIST THOUGHT. Evolutionist anthropological theories represent one manifestation of the nineteenth century's enthusiasm for developmental schemata that find their bases in what might loosely be called a philosophy of history. This philosophy of history declares that human development is rectilinear and progressive and that the mind tends necessarily toward greater and greater rationality and complexity. The idea of progress, especially in its component notion that history is unidirectional and proceeds by way of identifiable stages, is older certainly than the beginning of the nineteenth century. Indeed, one may speculate that there is a nascent "evolutionism" at work already in the Pauline formulation that, with the appearance of Christ, an age of grace supplanted and rendered obsolete an earlier age of law. (To trace "scientific" evolutionism's origins to the beginnings of Christian historiography provides some insight regarding the apologetic purposes that evolutionist thinking seems always to serve.) But for convenience one may point to the philosophical work of G. W. F. Hegel (1770–1831) as having planted the seed that led, by the nineteenth century's close, to the full flowering of the evolutionist creed

among those who considered themselves the first truly scientific investigators of the phenomenon of humans.

In his *Phenomenology of Spirit* (1807), Hegel launched a revolution in thinking about the human past. Put simply, the Hegelian system declares that history (by which Hegel and his followers mean the history of the world as a whole) reveals the progressive manifestation of *Geist* (spirit) in the world: a process that leads eventually to spirit's self-actualization and to human self-understanding. History, according to Hegel, propels itself forward through a dynamic process, within which each successive age "resolves and synthesizes" the antagonisms of earlier eras. Each historical period therefore not only results from what has gone before, but also in some sense contains within itself the self-understanding of earlier eras. Locating anthropological evolutionism's foundation in Hegelian philosophy may therefore help one comprehend what amounts to a "genetic obsession" on the parts of the participants in the debates that raged during the late nineteenth century, debates that had as their crux a question concerning what constitutes the essential—that is, the originary—form of religious consciousness. To identify this originary form would be to uncover an essential element of human beings, for it was generally held among evolutionist theorists that religious belief was the distinguishing characteristic setting the human apart from the animal. This endeavor may seem odd given much of the later history of scientific anthropology, but it makes sense when placed within the context of a fledgling scientific discipline that had not yet weaned itself of philosophical anthropology.

More directly influential than Hegelian philosophy upon the development of scientific anthropological evolutionism, however, is the work of Herbert Spencer (1820–1903), the English polymath and, with the Frenchman Auguste Comte (1798–1957), cofounder of the discipline of sociology. Even before Charles Darwin's *On the Origin of Species by Means of Natural Selection* (1859) revolutionized biological science, Spencer had landed on evolution as the principle that accounts for all change, whether inorganic, organic, or mental (if one may so characterize the quality that separates the development of human societies and individuals from mere organic growth). In his essay "Progress: Its Law and Cause" (1857), Spencer first gave voice to what may be called the essential element of anthropological evolutionist dogma:

The advance from the simple to the complex, through a process of successive differentiations, is seen . . . in the evolution of Humanity, whether contemplated in the civilized individual, or in the aggregate of races; it is seen in the evolution of Society in respect alike of its political, its religious, and its economical organization; and it is seen in the evolution of all those endless concrete and abstract products of human activity. (Spencer, 1914, p. 35)

Having thus laid the theoretical groundwork for his never-to-be-completed "natural history of society," Spencer never-

theless managed to construct the first systematic sociology of religion in English, one of the tasks undertaken in his three-volume *Principles of Sociology* (1876–1896). In this work he identifies the origin of religion (which, Spencer says, supplanted an aboriginal atheism) in what he perceives to be the universal practice among primitive peoples of worshipping the ghosts of their ancestors. He then goes on to trace the further evolution of religious consciousness through polytheism and monotheism. According to Spencer, religion culminates in agnosticism—a metaphysical position girded by the “positivist” epistemological principles that are the earmarks of the scientific age and of the scientific historiography, epitomized in Spencerian sociology—that helps to inaugurate this new era of human development. That Spencer considered agnosticism a genuinely religious position bears noting insofar as one may be tempted to see the work of Spencer and other evolutionists as antagonistic toward religion. It is nearer the case to say that at least some of these thinkers sought, among other agendas, to defend what they found to be the “spiritual maturity” of the age of science to which they belonged.

TYLOR AND HIS CRITICS. Among theorists of religion, E. B. Tylor (1832–1917) perhaps best deserves to be called an “evolutionist.” Tylor’s work, more than that of any other scholar, invites one to identify evolutionism with British “armchair” anthropology of the late nineteenth century. Influences on Tylor include Spencer (whose “ghost theory” of the origin of religion closely resembles the animistic hypothesis forwarded by Tylor) and F. Max Müller (1823–1900), the German-English philologist whose etymological investigations helped inspire Tylor’s researches into the *Urgrund* (primeval ground of being) of religious consciousness.

Before proceeding to a description of the theory of religion’s origin advanced by Tylor, one should note what is perhaps the most significant characteristic of Tylor’s (and indeed of other evolutionist theorists’) manner of thinking about religion. It goes without saying that “religion” is, for these writers, at root one thing. But beyond this it is worth emphasizing that in this framework religion is essentially of an intellectual or cognitive kind. Evolutionist theories of religious development proffer histories of religions within which religion is single-mindedly construed as belief; the affective dimensions of religious experience are simply elided or are written off as so much superstructure.

This intellectualist approach to anthropological research is clearly seen in Tylor’s famous “minimum definition of Religion” as “belief in Spiritual Beings.” Tylor’s intellectualism—and that of his contemporaries—has been harshly derided and largely superseded by twentieth-century anthropologists. And yet this at least ought to be said in its favor: for all their concern to distinguish between modern, Western rationality and the “primitive” mentality of “savage” or “low” races, it is yet the case that the nineteenth-century initiators of anthropological discourse were the first Europeans to conceive of the human race as a single entity; they were

the first, that is, to accord to “savages” human minds. Though they were termed “primitive,” the religions of “low races” were recognized as religions. (It is clearly a part of Tylor’s purpose to put the lie to what he considered the slanderous reports of missionaries and adventurers concerning the godlessness of the tribal peoples they encountered.) Moreover, in so doing, the evolutionists—who, through their examinations of “primitive” people, hoped to uncover keys to human nature per se—helped overturn the privileged position of the European scientific observer, no matter how far such an outcome may have been from their intention. Certainly the work of Tylor and others, especially James G. Frazer (1854–1941), was instrumental in revolutionizing classical studies and thus in altering forever the picture of antiquity, and hence of the West’s own intellectual heritage.

Tylor’s name has come to be identified with the term *animism* or, as he also called it, “the doctrine of souls.” He first proposed this as the most rudimentary stage of religious belief in a paper titled “The Religion of Savages,” published in the *Fortnightly Review* in 1866. Tylor’s monumental influence upon succeeding generations of students of religion can be measured by the fact that, although Tylor’s theory of religion’s origin has long since been discredited, the term *animism* is still widely used to describe the religious beliefs of those peoples who have as yet resisted conversion to one or another of the “great” missionary religions. In articulating the concept and the conceptual basis of animism, however, Tylor did not mean to describe an obsolescent form of religious consciousness but rather to identify the constant center or core of religious belief. The following passage, extracted from Tylor’s masterwork *Primitive Culture* (1871), both points up the universality of animistic belief and identifies the conceptual maneuver responsible for engendering the animistic hypothesis:

At the lowest levels of culture of which we have clear knowledge, the notion of a ghost-soul animating man while in the body, and appearing in dream and vision out of the body, is found deeply ingrained. . . . Among races within the limits of savagery, the general doctrine of souls is found worked out with remarkable breadth and consistency. The souls of animals are recognized by a natural extension from the theory of human souls; the souls of trees and plants follow in some vague partial way; and the souls of inanimate objects expand the general category to its extremest boundary. . . . Far on into civilization, men still act as though in some half-meant way they believed in souls or ghosts of objects. (Quoted in Waardenburg, 1973, pp. 216–217)

Tylor’s doctrine of “survivals”—that is, his claim that, although they may over the course of time lose much or even most of their original meanings, elements of the primitive worldview perdure within and continue to exercise influence upon the mindsets of more advanced cultures—is also hinted at in the foregoing passage. For Tylor, as for perhaps the latest of his heritors, Sigmund Freud (1856–1939), the child

is truly father to the man. Both of these thinkers depended, whether consciously or not, upon the Hegelian principle that ontogeny recapitulates phylogeny. For Tylor, as well as decades later for Freud, the investigation of the mental life of primitive races provided insight into the psychic infancy of humankind and so to the inevitable hurdles that must be overcome in order for the human species to achieve psychic adulthood.

Within British anthropological circles, criticism of Tylor's animistic hypothesis came from two corners. The first of Tylor's critics was the Scottish folklorist Andrew Lang (1844–1912). Though Lang's constructive contributions to anthropological science were minimal, he dealt a devastating blow to the notion that animism represented the earliest stage of religious consciousness. In his book *Myth, Ritual, and Religion* (1887), he pointed to the overwhelming evidence of what he termed "high gods" among many of those peoples who until then had been characterized by anthropologists as being too primitive to be able to conceptualize so abstractly as to arrive at any notion resembling that of an omnipotent, creative deity. Though Lang turned his attention toward other interests during the remainder of his career, his critique of Tylor laid the foundation for the massive researches into the topic of "primitive monotheism" that were later conducted by Wilhelm Schmidt (1868–1954).

The second blow to the animistic hypothesis was struck by R. R. Marett (1866–1943), Tylor's disciple, biographer, and successor to the position of reader in social anthropology at Oxford University. In an essay titled "Preanimistic Religion" published in the journal *Folklore* in 1900, Marett, drawing on the ethnographic data compiled in Melanesia by the Anglican missionary R. H. Codrington, advanced the claim that animism had been preceded by a pre-animistic stage of religious consciousness characterized by belief in an impersonal force or power that invests persons and objects, rendering them sacred. Marett, borrowing from the Melanesian vocabulary supplied by Codrington, termed this "electric" force *mana*. In accord with the evolutionist principles outlined earlier, belief in mana possesses, for Marett, both diachronic and ontological priority. One hears an echo of Tylor in Marett's proposition, in the article "Mana" that he contributed to James Hastings's *Encyclopaedia of Religion and Ethics*, that mana and taboo (which Marett conceives of as mana's "negative" complement) together constitute "a minimum definition of the magico-religious"

While neither Lang nor Marett disavowed evolutionist principles, it is worth noting that the criticisms leveled against Tylor by these writers eventually had the effect of helping to undermine the cogency of evolutionist explanations of the origin and development of religion, insofar as the work of each served to invite anthropologists to a closer examination of actual ethnographic data.

FURTHER HISTORY OF EVOLUTIONIST THEORIES. The early twentieth century saw the demise of "armchair" approaches to anthropological research as anthropologists began to con-

duct detailed, long-term studies of tribal peoples within the contexts of these peoples' actual habitats. One effect of this focus on field research was the production, especially during the middle decades of the twentieth century and within the Anglo-American anthropological tradition, of great numbers of immensely detailed monographs on the day-to-day lives of primitive societies. The quest for a comprehensive and systematic natural history of humankind was gradually abandoned.

This abandonment undoubtedly found one of its sources in an awakening to the theoretical inadequacies of the evolutionist approach to human culture. It began to become clear to anthropological researchers that the systematic theoreticians of humankind's development employed, in their search for the unvarying laws underlying what they perceived to be the relentless progress of human societies toward ever more complex and rational forms, a logic that was wholly circular. In the mere designation of some societies as "primitive" and others as "advanced" a host of culturally engendered presuppositions were employed, and a host of significant theoretical questions were begged. Another inadequacy of evolutionist thinking that began forcibly to strike the notice of scholars of religion was the fact that this mode of explanation ignores the trading of cultural elements, which so evidently has always figured importantly in the change, and especially the complexification, of human societies. (It should be noted that few evolutionists adhered strictly to a doctrine of absolute rectilinear evolution. Spencer admitted the possibility that racial differences accounted for the multiple and apparently irreconcilable directions taken by different cultures, and even the archevolutionist Tylor, in his early work, proposed "diffusionist" explanations for the puzzling appearance of "high" cultures among the Indians of Mesoamerica.) This insight alone was responsible for the instigation of what one may loosely term a school of thought regarding the origins and development of religious phenomena: that of the so-called diffusionists.

Twentieth-century anthropological science also saw the interest in religion as an (or the) essential element in the life of human societies fall out of fashion. From the 1920s through the 1960s, many anthropologists, especially those who received training in England or the United States, focused their attention on kinship relations, economic arrangements, and the like—aspects of society, that is, that they considered more tractable to the "hard," objective studies they were intent upon pursuing. (There were of course exceptions to this trend—E. E. Evans-Pritchard [1902–1973] and Raymond Firth [1901–2002] stand as two of the more important—but even these scientists concentrated their efforts on conducting meticulous examinations of the religious lives of particular societies.) It may not be too inaccurate to generalize to the effect that the nineteenth-century obsession with origins (as a concomitant of the grandiose quest to discover the foundational design of human progress) was replaced in the twentieth century, at least among Anglophone anthropologists, by an obsession with "objectivity."

But to generalize in this manner is dangerous insofar as it ignores, first, the continuing influence of evolutionist anthropological theory on continental anthropological science, and second, the powerful, hardly diminishing influence of evolutionist theory upon Western culture generally. Though there is too little space in this brief treatment to do more than mention them, one may list Émile Durkheim (1858–1917) and Lucien Lévy-Bruhl (1857–1939) as among the continental heritors of evolutionist theory. The debate concerning the nature of “primitive” as opposed to “civilized” (or rational) forms of mentation that was refueled by Lévy-Bruhl continues, though in different, structuralist guise, even in the early twenty-first century.

Though his work represents what many consider a dead end in terms of a continuing influence on anthropological thought, James G. Frazer (1854–1941) produced what must count as the single most imposing monument of evolutionist theory, *The Golden Bough* (1890), which in its third edition (1911–1915) ran to twelve volumes. Not only the most prolific of evolutionist theorists, Frazer was also the most doctrinaire, convinced that human culture’s development is governed by unvarying natural laws and that the human race has evolved, mentally and physically, in uniform fashion. Frazer’s temper was utterly intellectualist; his evolutionary scheme, which posits the successive replacement of an aboriginal magical mode of thought by first a religious and then a scientific mode, finds its basis in Frazer’s conviction that human culture’s development is effected as later generations of human beings awaken to the errors and the resultant practical inefficacy of their predecessors’ worldviews. (A reading of *The Golden Bough* prompted Ludwig Wittgenstein’s [1889–1951] trenchant remark to the effect that, when Frazer reports on a primitive European peasant woman pulling a doll from beneath her skirt during a fertility rite, he seems to think that she is making some sort of mistake and actually believes the puppet to be a child.)

The influence of Frazer’s work on later anthropological theory has been negligible, aside perhaps from the significant impact it had on classical studies. Yet Frazer’s *Golden Bough* rates as one of the century’s most celebrated books because of its profound effect on the literary and artistic dimensions of Western culture, and because of its formative influence on psychoanalytic theory, which with Marxism (itself utterly dependent upon evolutionist assumptions regarding history) stands as a ruling ideology of the twentieth century. Though the axioms of the psychoanalytic model for understanding the human mind and its cultural products probably owe more to evolutionist biology and its philosophical antecedents than they do to British anthropological theory, it is nevertheless the case that the work of Freud (especially his late work) drew heavily upon that of Frazer. Frazer’s *Totemism and Exogamy* (1910) was a direct influence upon Freud’s *Totem and Taboo* (1918). The latter, *The Future of an Illusion* (1928), and *Civilization and Its Discontents* (1930) constitute Freud’s contribution to evolutionist theory. Seeking to dem-

onstrate the logical coincidence of the behavior of neurotics with the “obsessional” practices of primitive peoples, Freud aimed to map a theory of culture whose purposes are both descriptive and prophylactic, insofar as (in the manner of clinical psychoanalytic method) to understand past conflicts that live on within an unconscious realm—whence they continue to exert control over human destiny—is to take a sure step toward resolving these conflicts and thereby achieving psychic health or emotional (and by implication political) maturity. It may need no pointing out that Freud identifies the coming of the race’s adulthood with the waning of religious belief.

Freud’s influence on anthropological science during the middle decades of the twentieth century was minimal, but Freudian-based anthropological theory seemed to experience a rejuvenescence in the late twentieth century, as Melford E. Spiro’s *Oedipus in the Trobriands* (1982) demonstrates. As for the medical import of Freud’s program for human destiny, it again is instructive to observe that evolutionist theory has consistently coupled a descriptive aim with an apologetic and heuristic intention. This has remained true of evolutionism from its modern origins in the thought of Hegel and Spencer down through its modern embodiments both in Marxist historiography and political practice and in Freudian theory and psychoanalytic technique.

MODERN PERSPECTIVES: SOCIOBIOLOGY AND EVOLUTIONARY PSYCHOLOGY. The application of the neo-Darwinian model prevalent in modern biology to the evolution of human behaviors and social structures was brought to the fore with the publication of *Sociobiology* by Edward O. Wilson of Harvard in 1975. Wilson’s observations of behavior among the social insects became the focal point of his theoretical approach to understanding the origin and evolution of human institutions. At the heart of this theory is the assumption that human behaviors at both the individual and group levels must confer a reproductive advantage if they are to be preserved over evolutionary time. Furthermore, it is assumed that, in order for selection to take place (in the Darwinian sense), such behaviors must in fact be genetically determined. It is only fair to say that Wilson, contrary to his most vocal critics, is not as strict a reductionist or genetic determinist as this sounds. Nevertheless the use of Darwinian principles for understanding the origins and continued existence of human behaviors flows naturally out of Wilson’s approach.

Religion was not discussed per se in Wilson’s 1975 book. However, in his later book *Consilience* (1998) he devotes an entire chapter to the origins of ethics and religion. He subscribes to the same kind of primitive-origin hypothesis as did Tylor and Frazer. Wilson argues that the development of religious instincts is encoded in the genes and that such genetic material conferred a reproductive survival advantage on those groups who exhibited it. He suggests that tribal religious systems served to unify those groups that employed them, and that such systems spring from the inevitable result of the human brain’s genetic evolution.

The Darwinian approach taken by Wilson and others to understanding the origins of human behavior finds even greater application in the emerging field of evolutionary psychology. Led by Leda Cosmides and John Tooby at the University of California, Santa Barbara, this field attempts to derive Darwinian models for the origins of all human behaviors.

One of the principle tenets of evolutionary psychology is that the current form of the human brain took shape during a period called the environment of evolutionary adaptation, or EEA. While most place this era in the late Pleistocene, the EEA is really thought of as a composite of selective pressures that served the adaptation of humans' present brain structure. It is thought that during this period of evolutionary history those physical components of human brains that resulted in specific behaviors conferring reproductive advantage or fitness were under selective pressure. In this view, the origins of religious impulse would also be accounted for as a product of the EEA.

The physical nature of the religious experience has been investigated by neuroscience. A number of investigators have reported that the religious impulse could be located to the temporal lobe of the brain. In these studies the link to religious feelings and brain structure go hand in hand with the idea that the adaptation of the brain includes the origin of religion per se.

The work of sociobiology and evolutionary psychology has been critiqued by several evolutionary biologists, including Stephen Jay Gould (1941–2002). Their argument is that the research agenda of both fields is entirely too reductionistic and deterministic. Gould in particular took issue with the conclusions of evolutionary psychology, writing that “the chief strategy proposed for identifying adaptation is untestable and therefore unscientific” (quoted in Rose and Rose, 2000, p. 120).

Nonetheless in this modern version of evolutionism one sees the same process as that which motivated Spencer, Tylor, and Frazer in the nineteenth century and the early twentieth century. The motivation to give an anthropological and even materialist explanation for the occurrence of religions persists in the early twenty-first century.

EVOLUTION: EVOLUTIONARY ETHICS

Evolutionary ethics attempts to use the biological theory of evolution as a foundation for ethics. As such, its history is closely linked with the development and popularization of evolutionary theories starting in the nineteenth century. To a large extent, the history of evolutionary ethics is associated with efforts to find alternatives to religion as a foundation for moral law. The growth of industrialism, the establishment of German biblical criticism, and the rise of science all contributed to growing secularism during the middle of the nineteenth century. Like other attempts to extend an understanding of biological evolution to the human situation, evolutionary ethics has been highly controversial. Although various evolutionary ethics were proposed throughout Western countries, its greatest popularity was in the Anglo-American world. The history of evolutionary ethics is divided into three phases, the initial Darwin and Spencer period, an early-twentieth-century period, and a contemporary period.

INITIAL PERIOD: DARWIN AND SPENCER. When Charles Darwin published his *Origin of Species* in 1859, he avoided discussion of human evolution as well as the implications of his theory for an understanding of human society. He was fully aware, however, that others would immediately extend his theory to cover human evolution and that the implications of his work would be discussed. In his *Descent of Man* (1871) Darwin tackled these issues directly. Of central concern to him was the “moral faculty,” the possession of which he considered the most important difference between humans and all other “lower animals.”

Darwin's theory of evolution attempted to understand the origin of contemporary animal and plant life in naturalistic terms, that is, without reference to any supernatural causes. Since humans, according to his theory, were considered to have had a natural origin, Darwin approached the problem of the origin of the moral faculty as he did other physical and mental traits. His general approach in trying to understand the origin of complex traits, such as the human eye, was to depict them as part of a continuum—instead of focusing on their unique or unusual aspects, he depicted them as part of a series. In the case of the eye, for example, he constructed a series of traits starting with simple, light-sensitive cells on the skin of a primitive organism and ended with the highly complex vertebrate eye. This allowed him to illustrate how, over time, a trait could change by small increments from one end of a spectrum to the other, from simple to complex. He used this approach with the moral faculty and claimed that it was the natural development of the intellectual capacity of social animals.

Any social animal, according to Darwin, that attained an intelligence that was close to human intelligence would develop a moral faculty. He explained the moral faculty in the following manner: With increased intelligence, early humans attained the capacity for various sentiments (e.g., courage, sympathy), and these gave advantages to the group. Groups with these sentiments survived better than those without them. Over time, one of these sentiments evolved into a moral sense that helped consolidate the group and gave it increased survival value. Darwin was aware of the ethnographic literature of his day, which suggested that all human groups had sets of ethical beliefs, and he felt that in time people would understand the adaptive value of these beliefs. Darwin did not attempt to justify moral beliefs by reference to their origin. He was primarily concerned with how they came about.

In contrast, Darwin's contemporary Herbert Spencer sought justification for ethical positions. Spencer elaborated an ethical theory that he believed had evolved from nature, and he argued that his system was natural and prescriptive. In his *Social Statics* (1851) Spencer derived a basic principle for ethics: "Every man has freedom to do all that he wills, provided he infringes not the equal freedom of any other man" (p. 121). This principle allowed individuals to seek what gave them pleasure, and in his later *Principles of Ethics* (1879–1893) he elaborated an evolutionary philosophy to explain how seeking pleasure (and avoiding pain) drove the evolutionary process in biology and psychology and was therefore a natural principle on which to base ethics.

Spencer's evolutionary ethics was more Lamarckian than Darwinian. That is, he did not stress the adaptive value of the moral sentiment but rather emphasized the inheritance of acquired characteristics and thought of nature as moving to a predetermined goal. For Spencer, a natural process was moving human evolution toward a state where duty became pleasure, mutual aid replaced competition, and the greatest possible individual freedom existed.

Contemporaries did not always carefully distinguish between Darwin's ideas and those of Spencer. And numerous supporters of evolutionary ethics combined ideas in new and novel combinations. Consequently, evolutionary ethics varied considerably. In the United States, John Fiske emerged as the most energetic supporter of evolutionary ethics. Fiske was an admirer of Spencer, but he believed that evolutionary ideas opened up the path to a new, reborn Christianity. Fiske's religious orientation was somewhat unusual in the evolutionary ethics tradition. Leslie Stephen in England was more Darwinian, and he believed that evolution provided the foundation for an agnostic, liberal morality. Other important supporters of evolutionary ethics were Woods Hutchinson in the United States and Benjamin Kidd in Britain.

Evolutionary ethics had support, but also a number of critics. Two of the period's major evolutionists, Thomas Henry Huxley and Alfred Russel Wallace, were strongly opposed to the position and wrote critical works arguing against it. Huxley, citing David Hume, argued that describing what "is" does not give one the authority to proscribe what "ought" to be (the famous IS/OUGHT distinction). Wallace took a quite different approach in his critique and was drawn to a spiritualist view of moral thought. He rejected both Darwin's and Spencer's positions on ethics and contended that evolutionary biology could not provide a foundation for ethics.

Of greater importance, the philosophic community was nearly unanimous in its rejection of evolutionary ethics. The leading figure at the time in ethics, Henry Sidgwick of Cambridge University, dismissed evolutionary ethics in his major work, *Methods of Ethics* (1874). He wrote that the justification of evolutionary ethics depended upon one of two arguments. The first, going from a description of a moral belief to a belief in its validity, he rejected because he contended that such an argument merely tells about a custom and is of no value to ethics. The second specifies a hypothetical "natural state" of humans and society and goes on to use that state as a foundation for ethics. He rejected it because he felt it was a confused position; any impulse, desire, or tendency can be considered "natural." How can one deem a particular one significantly natural without some prior justification? According to Sidgwick, ethics is a systematic examination of beliefs about what is right or wrong, with the goal of constructing a rational system of moral ideas. From his perspective, evolutionary ethics was not an ethical system but merely a discussion of how ethical systems may have come into being or a discussion of various held beliefs. It was not to be taken seriously as constructive ethics.

In the early part of the twentieth century, Sidgwick's condemnation of evolutionary ethics was repeated and extended by the Cambridge philosopher G. E. Moore. His arguments are the ones most often cited in criticism of evolutionary ethics. In his *Principia Ethica* (1903), Moore rejected evolutionary ethics along with other forms of naturalistic

ethics, all of which he claimed were based on the “naturalistic fallacy.” He meant by this that attempts to explain the “good” by reference to some property were not valid. The “good” is a simple notion that cannot be defined as pleasure or an evolutionary adaptation. Moore’s critique was aimed at more than just evolutionary ethics, and his writings served to redirect ethical writing. American philosophers were no more accepting of evolutionary ethics than the English. William James and John Dewey, both sympathetic to and influenced by evolutionary ideas, rejected evolutionary ethics.

EARLY-TWENTIETH-CENTURY PERIOD. Evolutionary ethics entered a new phase in the early twentieth century due to changes in evolutionary science itself and the extension of evolutionary ideas into a broad worldview. The most outspoken supporter was Julian Huxley, grandson of Thomas Henry Huxley (who had been so critical of the position in the previous century). Julian Huxley is famous for being one of the architects of the Modern Synthesis, the neo-Darwinian theory that stressed Darwin’s original insight that natural selection of small random variations were the central driving force in evolution. The new theory built on the dramatic new genetic understanding of variation as well as careful work in natural history on geographic variation. Huxley played a key role in synthesizing this knowledge and in popularizing it. Equally important, Huxley believed that the new evolutionary theory provided a foundation for a new humanist philosophy that had important implications for social policy and ethical thought. He elaborated on his version of evolutionary ethics in his Romanes Lecture in 1943.

At the heart of Huxley’s argument was his contention that evolution was a progressive process with three different stages: cosmic, biological, and psychosocial. The process of evolution had led to the emergence of humans, the highest and most advanced species, one capable of cultural evolution and ultimately of a sense of moral obligation. To explain the origin of moral obligation, Huxley made reference to psychology, in particular Sigmund Freud’s concept of the superego, an internalized authority that allows one’s sense of guilt to repress aggression and that is the source of one’s senses of “wrong” and of “duty.” Moral obligation evolved over time, as did human ethical standards, the ethics accepted by social groups. Huxley argued that the direction of moral progress was toward greater human fulfillment and the realization of values that had “intrinsic worth” (rather than adaptive worth). Only a society that respected individual rights, stressed education, encouraged responsibility, and promoted the arts could realize those goals.

Huxley’s scientific humanism enjoyed a limited popularity with the general public in the decades after World War II, as did the writings of C. H. Waddington, who argued along similar lines in his 1960 book *The Ethical Animal*. Waddington departed from Huxley, however, in emphasizing that the “good” in evolutionary ethics had to be viewed in terms of what furthers human evolution. Their version of evolutionary ethics rested on a new and widely accepted the-

ory of evolution, but the old criticisms raised by Sidgwick and Moore remained. Moreover the philosophy community by this time had moved onto other approaches to ethics. Some, like Charles Stevenson, stressed language; others followed A. J. Ayer and his logical positivism, which tended to dismiss ethics as merely expressions of feeling and not having any truth value. None of these newer approaches to ethics accepted evolutionary ethics, and by the 1970s the position had few supporters.

CONTEMPORARY PERIOD: EVOLUTIONARY ETHICS AFTER 1975. With the appearance of Edward O. Wilson’s *Sociobiology* in 1975, a new chapter in the history of evolutionary ethics began. Wilson’s text synthesized research on the Modern Synthesis with population biology and animal behavior. The central argument of the book is that behavior should be regarded as adaptive and can be understood best from an evolutionary perspective, not just animal behavior but human behavior as well. *Sociobiology* had a short section on ethics, and in it Wilson claimed that the time had come for ethics to be removed temporarily from the domain of philosophy and moved into biology. The study of the biological basis of social behavior promised, according to Wilson, to provide a new Darwinian foundation for ethics and for an understanding of social sciences and humanities.

Wilson followed up his suggestion with his Pulitzer Prize-winning book *On Human Nature* (1978), in which he elaborated on his evolutionary understanding of ethics. Unlike Darwin, who had relied on a view of group selection to explain the origin of the moral sentiment, Wilson built on the work of William Hamilton, who argued for understanding “altruistic behavior” as an activity that can promote passage of a greater number of an individual’s genes to the next generation. Hamilton, in a set of classic papers in 1964, showed that an “altruistic act” can have selective value if it leads to the survival and reproduction of near relatives with whom one shares common genes. Because a person shares half of his or her genes with a sibling and an eighth with a cousin, if a person acts in a manner that sacrifices his or her life but that more than doubles the reproductive rate of a sibling, then copies of that person’s genes will increase in the next generation. From an evolutionary perspective, an individual passing on his or her genes is of central value. The individual who passes on genes has a greater impact on the next generation than one who does not. Hamilton’s ideas were popularized by Richard Dawkins in his *The Selfish Gene* (1976), which argues that all supposed selfish acts are ultimately selfish in a genetic sense.

Wilson used Hamilton to explain how an action that “appears” altruistic, that helps another at one’s expense, in the long run can work for its carrier’s “benefit” and therefore have a selective value. But what actions “ought” one take? Here Wilson also utilized the central, modern evolutionary principle, the survival and reproduction of genes. He argued that what promotes survival and reproduction of the gene pool is “good” and what negatively affects it is “bad.” Atomic

warfare, from this perspective, is bad. Wilson in fact derived an entire set of “good” actions and “bad” actions based on their effects on the gene pool. Ultimately, Wilson concluded, science will provide a more powerful mythology than religion, and humans will be able to construct meaningful and moral lives from a totally secular perspective.

Although a few biologists and other intellectuals, particularly evolutionary psychologists, have embraced this new evolutionary ethics, the position has drawn considerable criticism. Philosophers and historians have noted that the new ethics, which draws on evolutionary theory, although up-to-date in its biology, suffers from the same flaws that were first raised by Sidgwick and other early critics. The emphasis on genes and their survival has also raised the question of how deterministic the view is. After all, if people do not have any free will to make decisions, if people are hardwired to act in certain ways, how can one claim that actions are “good?” Wilson has grappled with the issue and argued that genes and culture interact, but that individuals have “tendencies” that predispose them in certain ways. Others see culture as more independent. Richard Alexander, an animal behaviorist, argued that evolutionary analysis can reveal quite a lot about the origin and development of laws and ethical opinions but cannot reveal which ones are “right.” Such views undercut the value of evolutionary ethics, because they underscore its inadequacy of providing a guide for action.

As with the earlier versions of evolutionary ethics, supporters of modern theories of evolutionary ethics have made little headway toward gaining acceptance. Evolutionary ethics has long had an attraction for some. It serves as an essential subject for worldviews based on evolution and has provided a secular foundation for moral beliefs. Unfortunately, it has suffered from a set of serious philosophical flaws, and it has failed to meet the challenges posed by philosophers.

PAUL LAWRENCE FARBER (2005)

EXCOMMUNICATION. *To excommunicate* means “to cut off from communion” or “to exclude from fellowship in a community.” In a Christian setting, the term *excommunication* also applies to exclusion from Holy Communion, or the Eucharist.

Historically, religious practice admitted some form of putting a person outside the community. Any community claims the right to protect itself against nonconforming members who may threaten the common welfare. In a reli-

gious setting this right has often been reinforced by the belief that the sanction affects one's standing before God, inasmuch as it entails being cut off from the community of the saved. In religious traditions in which nonconformity was punishable by death, excommunication was introduced as a mitigation of the death penalty. In medieval Christendom and during the early years of the Reformation, excommunicated persons were turned over to civil authorities, who could inflict the death penalty upon them.

With the shift in modern times to considering religious affiliation a matter of free choice, doubts have been expressed about the meaning and value of excommunication. Although practiced less frequently today, some current examples include the *herem* in Orthodox Judaism, "shunning" among some traditional Christian bodies, withdrawal of membership by congregation-based communities, and "excommunication" as practiced by Mormons, Roman Catholics, and some other mainline Christian churches.

In the Western Christian tradition, excommunication is seen as based on practice reflected in scripture, especially Paul (see, for example, *1 Cor.* 5:1–13, *2 Cor.* 2:5–11, *2 Thes.* 3:14–15). Theoretical justification is taken from the command to bind and loose (*Mt.* 18:15–18). This same passage supplies key elements of procedure, including advance warning and attempts to lead the delinquent to conversion.

Early Christian practice mixed liturgical excommunications, which were part of the nonrepeatable public penitential practices, with disciplinary ones that could culminate in a person being declared anathema. In the thirteenth century Innocent III specified excommunication as a disciplinary penalty distinct from other punishments, characterizing it as specifically medicinal, intended to heal the delinquent. The number of crimes for which excommunication could be incurred increased steadily through the eighteenth century, but a marked reduction in their number began with the reforms of Pius IX in 1869 and continued with the promulgation of the Code of Canon Law in 1917.

As a medicinal, or healing, penalty, excommunication under Roman Catholic law may be incurred only if a serious sin has been committed, or if the person is obstinate in a position after being given formal warnings and time to repent. Reflecting medieval and later developments, some excommunications are automatic (*latae sententiae*), incurred by committing a specified act, such as abortion or physically striking the pope. Other excommunications are imposed (*ferendae sententiae*) after an administrative or judicial investigation. Excommunication must always be lifted as soon as the delinquent repents and seeks peace with the church.

A distinction used to be drawn between major excommunications, which cut a person off from all participation in community life, and minor ones, which prohibited participation in the sacraments, especially the Eucharist. Current canon law has dropped this distinction, although the 1917 code did characterize some excommunicates as *vitandi*, with

whom contact must be completely avoided. Under the 1917 code all others were *tolerati*, and contact with them could be permitted.

An excommunicated person loses basic rights in the church, but not the effects of baptism, which can never be lost. In the revision of the code carried out after Vatican II the effects of excommunication were clarified, and the distinction of *vitandi* and *tolerati* was dropped. Instead, all are treated as *tolerati* so far as the effects are concerned. These depend on whether the excommunication was imposed by a public declaration or sentence of condemnation, or was incurred automatically but without much public notice.

Generally, a person who is excommunicated is denied any role in administering the sacraments, especially the Eucharist. He or she may not receive any of the sacraments or administer sacramentals, such as burials, and is forbidden to exercise any church offices or functions. If the penalty has been declared or imposed by a sentence, any liturgical actions the excommunicate attempts are to be suspended until he or she leaves; the excommunicate loses any offices or other functions in the church; and may make no claim for income or other benefits from the church.

Under the reform of the law, automatic excommunication can be incurred in only six instances, including abortion. It may be imposed for a limited number of other crimes against faith, the Eucharist, or the seal of the confessional in the sacrament of penance. If imposed by a sentence or public declaration, excommunication can be lifted only by a public authority in the church, usually the local diocesan bishop. Otherwise, it can be lifted by a priest during the sacrament of penance, but unlike the 1917 code the revised rules require that in all cases the bishop be contacted afterward for the reconciliation to remain in effect.

EXEGESIS SEE BIBLICAL EXEGESIS; HERMENEUTICS; TAFSĪR

EXILE. Often prompted by historical conditions, the concept of exile appears in various religious traditions as a symbol of separation, alienation, and that which is unredeemed.

IN JUDAISM. With the Babylonian invasion of Judah and the subsequent destruction of the Jerusalem Temple in 587/6 BCE, the concept of exile (Heb., *golah* or *galut*) came to reflect both a historical reality and a communal perception. Forced into exile in Babylonia, members of the upper classes found themselves uprooted from their national and spiritual homeland. Literally, then, the term *exile* came to describe the forced dispersion of the Jewish people and their subjugation under alien rule. Although according to Jewish tradition (*Jer* 29:10) the Babylonian exile was only seventy years in duration, the destruction of the Second Temple in 70 CE and the triumph of Rome caused a national uprootedness that lasted for almost two thousand years. Historically, one can thus maintain that the exile of the Jewish people from the land of Israel began in the sixth century BCE and came to an end in 1948 with the establishment of the state of Israel and the restoration of Jewish political independence.

Metaphorically, however, the term *exile* was and is still used as a symbol of alienation, reflecting the Jews' separation from the land of Israel, from the Torah by which God commanded them to live, from God, and from the non-Jew and the non-Jewish world in general.

To the biblical prophets, exile was a symbol of divine retribution. As Isaiah makes clear (44:9–20), in worshipping other deities, the people of Israel revealed a lack of fidelity to their God and to the covenant that God had established with them. Their punishment, then, was the destruction of their spiritual center, Jerusalem, as well as of the Temple in which sacrifices were offered, and the forced removal of many from the land that had been promised to them. At the same time, however, exile became a symbol of judgment. Those who remained religiously faithful, becoming, in Isaiah's words, God's "suffering servants" (43:10), would reap the rewards of righteousness and ultimately be redeemed.

According to the prophet Ezekiel (14:3ff., 21:31ff.), exile was a trial through which God tested Israel's faithfulness to God and God's teachings. It was also a symbol of Israel's election, with the Babylonians, and later the Romans and all those under whose rule the Jewish people were subjugated, acting as instruments of a divine schema through which, as Isaiah writes, God's "faithful remnant" (27:31ff.) would be redeemed. Exile thus became a metaphor of separation not only from God but also from righteousness. As such, it was associated with a pre-messianic, pre-redemptive era. In exile, as John Bright maintains, one was to purge oneself of sin in order to prepare for the future, to "return," that is, to remember that God, the Creator of the world, chose Israel

to be God's people. Obeying the divine commandments given to them was therefore a way out of exile both historically and spiritually. On a historical level, the Jewish people would be led back to the Land of Israel, with the Temple rebuilt and political independence restored, while on a spiritual level, as Isaiah writes (51:6), the righteous would attain eternal salvation.

Throughout the Middle Ages, the concept of exile gave theological significance to the continued political, social, and economic oppression of the Jewish people. The tenth-century philosopher Sa'adyah Gaon, in his *Book of Beliefs and Opinions*, emphasized the importance of exile as a trial and as a means of purification, while according to an anonymous contemporary, exile, as a divine gift and a "blessing of Abraham," served as a mark of Israel's election. According to this view, exile was not a punishment for sin but an opportunity given by God to bring God's teachings to all of humanity. After fifteen hundred years of Jewish settlement in Spain, characterized by a social, economic, and political integration unknown elsewhere in the medieval world, King Ferdinand and Queen Isabella's edict of expulsion in 1492, left generations of Spanish Jewry feeling doubly exiled. As Jane Gerber notes, the exiles and their descendents viewed Spain as a second Jerusalem. Their expulsion, therefore, "was as keenly lamented as was exile from the Holy Land," leading to "both a new dynamism and a heightened sense of despair."

To many medieval Jewish mystics, exile took on additional significance as a metaphor describing on the divine level what historically had befallen the Jewish people. One finds in the thirteenth-century *Zohar*, for example, the claim that with the destruction of the Second Temple both the Jewish people and the tenth emanation of God, identified as *shekhinah* (God's visible presence in the world), went into exile. Thus, the separation of the Jewish people from the Land of Israel became mirrored in the alienation of God from a part of Godself. This idea is reiterated and broadened in the writings of the sixteenth-century mystic Isaac Luria (1534–1572), in which the exile of the *shekhinah* is said to reflect the exile or "fall" of humanity as a whole into the domination of demonic powers.

Finally, on a psychological level, the concept of exile served to reinforce the national self-consciousness among a people who no longer shared a common culture, language, or land. Exclusion from non-Jewish society, coupled with a Jewish liturgy and calendar that reinforced the notion of the Land of Israel as home, underscored the alien nature of the Jew in the non-Jewish world. After the seventeenth century, however, as European emancipation came to afford growing numbers of Jews the opportunity to participate more fully in non-Jewish society, many began to feel that the Diaspora did not necessarily have to be equated with exile. One sees this most clearly in the writings of nineteenth-century religious reformers who, insisting that Jews were members of a religious community but not of a specific nation, maintained that it was possible for Jews to view any country as home.

Since 1948, it is debatable whether Jews choosing to live outside the state of Israel historically are still in exile. Yet one can argue, as does Arthur Hertzberg in *Being Jewish in America*, that on a psychological level the concept of exile remains a compelling symbol. Hertzberg maintains that even in the United States, where Jews have gained great acceptance and freedom, the Jew continues to be an alien. As an externally and internally imposed sense of self-identification, exile thus reflects the conviction of many Jews that the Diaspora can never truly be seen as “home.”

IN CHRISTIANITY. The metaphor of exile appears in Christianity in two separate ways: first, as that reflecting the historical and spiritual conditions under which the Jewish people have lived since the fall of the Second Temple, and second, as descriptive of life in this world as opposed to life in the kingdom of heaven.

Like their Jewish contemporaries, the Fathers of the early church attached theological significance to the destruction of the Jerusalem Temple in 70 CE. They maintained, however, that its destruction was not caused by sinfulness in general but by one particular sin, namely the rejection by most of the Jewish community in Palestine of Jesus as the Messiah for whom they had been waiting. Thus, the historical exile of the Jewish people was seen to mirror the spiritual exile—or alienation—of the Jews from God. To “return” in the Christian sense came to imply not only repentance but also acknowledgement of Jesus as savior.

In the New Testament *Gospel of John*, one sees that which is usually identified as a more Gnostic understanding of exile. Jesus here identifies himself as one who is “not of the world.” Those who are “of the world,” he says (*Jn.* 17:16), are those who have not acknowledged that he is the Christ (Messiah), sent by his father, the one true God, in order to redeem his people. To be “not of the world,” he continues, is to be with God in the Divine spiritual kingdom, possible even before death. Exile thus functions here as an individual rather than a collective metaphor of alienation or separation from God. Not surprisingly, John’s understanding of “return,” rooted in an individual declaration of faith, is also personal in nature.

IN GNOSTICISM. The concept of exile comes to play a central role in a number of early Gnostic texts. Set within a dualistic framework of spirit versus matter, light versus darkness, goodness versus evil, exile again functions as a symbol of alienation. Here, however, it is not a particular people that are said to be in exile or the nonbeliever per se but the human soul. Belonging to the spiritual realm of light but trapped in the world of matter or darkness, it depends upon the “saving knowledge” of the Gnostic to begin its journey home.

The *Apocryphon of John*, written probably in the late second century CE, the third-century *Gospel of Thomas*, and the fourth-century *Pistis Sophia* are among several Gnostic Christian texts that depict Jesus as having been sent down to earth to impart this saving knowledge to others. Reminding his listeners of their heavenly origin, he tells them that

the soul can be set free only through this insight, or *gnōsis*. To be in exile is to be unredeemed, ignorant of one’s origins and of the nature of the human soul. In these and other texts, knowledge thus becomes the necessary key to salvation.

Yet having attained this knowledge, the Gnostic cannot help but experience life in this world as “alien.” Hans Jonas maintains that this experience serves as the primary symbol not just of Christian Gnosticism but of other forms of gnosticism as well. Life in this world is depicted as a descent into darkness and captivity, a life of exile for which, as the Mandaeans claimed, the only “day of escape” is death. As a metaphor, then, exile takes on personal rather than communal significance, reflecting the experience of the Gnostic who, alienated from and in revolt against the cosmos, longs to return home.

Among the Ismaʿīliyah, an Islamic movement of radical Shiʿah founded in the late third century AH (ninth century CE), one again finds the concept of exile serving as a central symbol of alienation. Here, it is the imam who leads the gnostic away from the world of darkness. Possessing the esoteric knowledge of the soul’s true spiritual birth, the imam offers this knowledge to his disciple as a “salvatory revelation.” Having attained this revelation, the disciple is freed from exile and reborn as a “being of light.”

THE ISHRĀQIYAH. Revealing the influences of Zoroastrianism, Gnosticism, Persian mysticism, and Neoplatonism, the illuminative philosophy of the twelfth-century thinker Shihāb al-Dīn Yahyā Suhrawardī (Shihāb al-Dīn Yahyā ibn Ḥabash ibn Amīrak Abū al-Futūḥ Suhrawardī; AH 549–587/1170–1208 CE) uses exile as a symbol of ignorance of one’s true spiritual nature and of reality in general. “Home,” in the Ishraqī school, is metaphorically identified with the world of light, while exile is described as entrapment within the realm of darkness. In order to journey homeward, the Ishraqīyun need to move beyond rational inquiry to the imaginal world and illumination (*ishraq*). Only then can the souls of the Ishraqīyah attain mystical union with the inner divine presence, experiencing an ecstatic separation from the physical body and an anticipation of death. Thus to journey out of exile is to overcome the separation of the soul from the divine and to become inflamed by what Henry Corbin labels the “divine fire.”

Suhrawardī’s understanding of exile is developed most fully in his *Recital of the Western Exile*, a spiritual autobiography that describes the struggles of the “man of light” to free himself from darkness. Associating ignorance with the West and illumination with the East, Suhrawardī begins his tale with the exile of the soul to the western city of Kairouan. Forgetting his origins and eventually taken captive, the man of light slowly comes to an awareness of his true identity and sets out on the long journey home. Thought at first he is forced to return to the West, he is finally set free. Stripped of the “fettters of matter,” his soul becomes possessed by an angel who helps it return to its celestial condition. Thus

beginning its heavenly ascent, it leaves the world of exile forever.

IN CONTEMPORARY TIBETAN BUDDHISM. Forced to live in exile since 1959, the XIV Dalai Lama, religious and secular head of Tibet, along with well over 100,000 Tibetan refugees, have sought refuge in India, in the Himalayan town of Dharamsala. With the Chinese military annexation of Tibet, the systematic attempt to destroy Tibet's religion, and the massive influx of ethnic Chinese, Tibetan Buddhists have lost their land, temples, monasteries, and most of their religious leaders. Consequently, they also risk losing their identity.

Recognizing the difficulty of returning to Tibet as a free people, the Dalai Lama has created in Dharamsala a Tibetan Government in Exile. In an effort to rebuild the refugees' shattered lives, it features new governmental departments of Education, Rehabilitation, Information, and Security, as well as new Offices of Religious and Economic Affairs. It also features a monastery built in 1968 and a temple built in 1970, leading to what the Dalai Lama has described as a "thriving monastic community of over six thousand strong." The Library of Tibetan Works and Archives opened in Dharamsala in the late 1960s. Housing over forty thousand original Tibetan volumes and involved in published English language and Tibetan books, it has become a world-wide center of Buddhist research and study.

In an effort to preserve the religion and culture of the six million Tibetan Buddhists that he represents, while promoting world peace through nonviolence, the Dalai Lama has devoted himself to building a strong Tibetan community in exile. He also has engaged in dialogue with political and religious leaders throughout the world.

Among them has been a group of rabbis and Jewish scholars first invited to meet with the Dalai Lama in 1989, the same year that he was awarded the Nobel Peace Prize. According to Rodger Kamenetz, "in the Dalai Lama's eyes, and to many of the Tibetans, Jews are survival experts. The idea that Jewish history, with all its traumas, is relevant to another exiled people was inspiring." So was the Jewish observance of home rituals; the preservation and renewal of religious culture and tradition; and most importantly, the Jewish emphasis on remembrance, including the memory of exile.

For over four decades, Tibetan Buddhists have experienced exile as a political and geographical reality. Yet despite the longing of exiled Tibetan Buddhists to return to their home, holy spaces are primarily symbolic in the Buddhist imagination. Since ultimately, they come from an individual's inner spiritual power, they can be transported. Thus Tibet in-and-of-itself is not as central to Tibetan Buddhism as Jerusalem is to Judaism. Nor, for that matter, is the concept of physical exile. Nonetheless, ongoing attempts by the Dalai Lama to free Tibet from Chinese control and to keep Tibetan Buddhism alive, even in exile, have helped differen-

tiate Tibetan Buddhism from other forms of Buddhist belief and practice. So have the efforts by hundreds of resident scholars and monks at the Tibetan Library in Dharamsala to preserve and help translate original Tibetan manuscripts, including rare ones smuggled out of Tibet over the past forty years.

BIBLIOGRAPHY

Excellent summaries of the early historical development of the concept of exile in Judaism can be found in John Bright's *A History of Israel*, 3d ed., (Philadelphia, 1981), and William F. Albright's essay on "The Biblical Period" in *The Jews*, vol. 1, edited by Louis Finkelstein (Philadelphia, 1949), pp. 3–69. For insight into why Spanish Jewry came to feel a sense of being doubly exiled, see Jane Gerber's *The Jews of Spain: A History of the Sephardic Experience* (New York, 1992). For a discussion of the significance of exile in medieval Jewish mysticism, see Gershom Scholem's *Major Trends in Jewish Mysticism* (1941; New York, 1961), especially lectures two, six, and seven. Michael A. Meyer's *The Origins of the Modern Jew* (Detroit, 1967), provides insight into the relationship between European emancipation and the later Jewish reevaluation of exile as a meaningful theological symbol. Finally, Arthur Hertzberg reflects at length on the concept of exile in the American Jewish imagination in his *Being Jewish in America: The Modern Experience* (New York, 1979), and more recently, in his autobiographical *A Jew in America: My Life and a People's Struggle for Identity* (San Francisco, 2002).

The best study of exile as metaphor in Christian and Hellenistic Gnosticism remains Hans Jonas's second revised edition of *The Gnostic Religion* (Boston, 1963). For a comparison between these ideas and those found in the New Testament *Gospel of John*, see James M. Robinson's "Gnosticism and the New Testament," in *Gnosis: Festschrift für Hans Jonas*, edited by Barbara Aland (Göttingen, West Germany, 1978), pp. 125–157. Bernard Lewis's *The Origins of Islamism* (1940; New York, 1975) provides a good overview of this concept among the Isma'iliyah, while Henry Corbin's *En Islam iranien: Aspects spirituels et philosophiques*, vol. 2, (Paris, 1971) and *Spiritual Body and Celestial Earth* (Princeton, 1977) offer cogent accounts of exile as metaphor in Suhrawardī's theosophy of light.

For a lengthy discussion of exile as symbol and reality in contemporary Tibetan Buddhism, see Bstan dzin rgya mtsho, Dalai Lama XIV, *Freedom in Exile: The Autobiography of the Dalai Lama* (New York, 1990). Detailed descriptions of meetings between the Dalai Lama and Jewish leaders can be found in Rodger Kamenetz's *The Jew in the Lotus: A Poet's Rediscovery of Jewish Identity in Buddhist India* (San Francisco, 1994).

ELLEN M. UMANSKY (1987 AND 2005)

EXISTENTIALISM is a type of philosophy difficult to define because it does not have any agreed body of doctrine;

it is rather a way of doing philosophy in which life and thought are closely related to each other. Thus, while some existentialists have been theists and others atheists, they have arrived at their different results by rather similar processes of thought. The existentialist who believes in God does so not as a result of intellectual demonstration—he or she is more likely to say that the attempts to prove God's existence are a waste of time, or even harmful—but on the grounds of passionate inward conviction; likewise the atheistic existentialist rejects God not because of being persuaded by argument but because the very idea of God poses a threat to the freedom and autonomy of the human being, and so to the integrity of humanity. But if such nonrational factors are allowed their say, is it not a departure from philosophy altogether? Perhaps not, if one thinks that reason has become so ambitious that it ceases to perceive its own limitations and so becomes misleading. The all-embracing rational system of Hegel provoked not only Kierkegaard's existentialism but also the skepticism of the left-wing Hegelians and neo-Kantian positivism. The existentialists of the twentieth century emerged about the same time as the logical positivists, and both groups shared doubts about the omniscience of reason. The existentialist would still claim to be a philosopher, in the sense of a thinker, but, in Kierkegaard's expression, an "existing thinker," that is, a thinker who is always involved in the reality being thought about, so that the thinker cannot take up the purely objective attitude of a spectator; also, the thinker is always on the way from one matter to another, so that as long as the thinker exists he or she never has a complete picture. So existentialism stands opposed to all those grand metaphysical systems that profess to give a comprehensive and objective account of all that is. Significantly, Kierkegaard titles two of his most important writings *Philosophical Fragments* and *Concluding Unscientific Postscript*, and these titles implicitly contrast his work with that of philosophers who aim at a comprehensive system.

Though some earlier writers, such as Blaise Pascal (1623–1662), who criticized the theistic proofs and contrasted the God of the philosophers with the living God of Abraham, Isaac, and Jacob, have been seen in retrospect as forerunners of existentialism, the movement belongs essentially to the nineteenth and twentieth centuries. Søren Kierkegaard (1813–1855) is usually regarded as its founder. His philosophy is inextricably entangled with his struggle over what it means to become a Christian. Friedrich Nietzsche (1844–1900) is in many ways at the opposite extreme from Kierkegaard, but his proclamation of the death of God was just as passionate as Kierkegaard's fascination with the God-man paradox. Some Russian thinkers of the same period showed similar existentialist tendencies, notably Fyodor Dostoevsky (1821–1881) and Vladimir Solov'ev (1853–1900). All of these profoundly influenced the existentialists of the twentieth century, among whom may be counted Miguel de Unamuno (1864–1936), Karl Jaspers (1883–1969), Martin Heidegger (1889–1976), and Jean-Paul Sartre (1905–1980), though it should be noted that the term *existentialist* had, in

popular usage, become so widely applied and covered so many differences that most of the philosophers mentioned were unwilling to accept it. The Jewish thinker Martin Buber (1878–1965) had existentialist affinities but criticized the individualism of the typical existentialist. Nevertheless, all the philosophers mentioned above share a number of "family resemblances" that make them existentialists in a broad sense.

It is sometimes suggested that existentialism is a thing of the past, that it was a phenomenon called into being by the specific events of the times in which these thinkers lived but that humanity has now moved into new times with new problems. Up to a point, this may be true. The very fact that the existentialist is an *existing* thinker means that he or she has a concrete relation to the events of his or her own time. Yet there are some characteristics of the human condition that seem to belong to all times or to recur at different times, and some of the insights of the existential philosophers into what it means to be human have a permanent value and are likely to provoke new thought and new investigations in the future.

SOME DISTINGUISHING CHARACTERISTICS. As the name implies, existentialism is a philosophy of existence. It should be noted, however, that the word *existence* is used in a restricted sense. In ordinary speech, one says that stars exist, trees exist, cows exist, men and women exist, and so on of everything that has a place in the spatiotemporal world. The existentialist restricts the term to the human existent. By doing this, there is no intention to suggest that stars, trees, cows and the like are unreal. The existentialist only wants to draw attention to the fact that their being is quite different from the being of a human person. When an existentialist speaks of a human being as "existing," he or she is taking the word in what may be supposed to be the original etymological sense of "standing out." Stars and the like have their being simply by lying around, so to speak. Their nature or essence is already given to them. The human being exists actively, by standing out or emerging through the decisions and acts that make this person the unique being that he or she is. In Sartre's famous definition, *existence* means that the human person begins as nothing, and only afterward does that being become something and form its essence through its chosen policies of action.

Although existentialists use the word *existence* in the sense just explained, it retains something of its traditional meaning. In the history of philosophy, existence (referring to the fact *that* something is) has usually been contrasted with essence (referring to *what* something is or the basic properties of that thing). Philosophies of essence (Platonism is the great example) concentrate attention on the universal properties of things, properties which remain the same in all circumstances and at all times. These universals are amenable to the operations of thinking, so that the essentialist tends to end up as an idealist, holding that thought and reality coincide. The philosopher of existence, on the other hand, concentrates attention on the concrete, individually existing real-

ity, but this has a particularity and contingency that make it much more resistant to the systematizing tendencies of thought, so that, for such a thinker, reality does not conform to thought, and there are always loose ends that refuse to be accommodated in some tidy intellectual construction.

It should be noticed too that the existentialist finds room for dimensions of human existence other than thinking. For several centuries, Western philosophy has been deeply influenced by Descartes's famous pronouncement, "I think, therefore I am." The existentialist would claim that this accords too much preeminence to thinking. Humans are also beings who experience emotion, and these emotions are not just transient inner moods but rather ways of relating to the world and becoming aware of some of its properties that do not reveal themselves to rational observation. Equally important is the will. One learns about the world not just by beholding it and reflecting upon it but rather by acting in it and encountering its resistances.

It follows from this that existentialism is also a philosophy of the subject. Kierkegaard declared that truth is subjectivity. At first sight, this seems a subversive statement, one which might even imply the abolition of truth. But what Kierkegaard meant was that the most important truths of life are not to be achieved by observation and cannot be set down in textbooks to be looked up when required. They are the kind of truths that can be won only through inward and perhaps painful appropriation. The truths of religion are the most obvious case—they cannot be learned from books of theology but only by following the way of faith that is one with the truth and the life (*John* 14:6).

IMPLICATIONS FOR RELIGION. The existentialist recognition of the distinctiveness of human existence as over against the world of nature, together with the claim that the truth of human existence is to be reached by the way of subjectivity, is significant for the philosophy of religion. The tendency in modern times has been to treat the human person as one more natural phenomenon, to be understood objectively through human sciences which model their methods on that of the natural sciences. Existentialists, however, believe that human nature can be understood only from the inside, as it were, through one's own participation in it. The phenomenological analysis of consciousness, developed by Husserl, has been adopted by existentialist philosophers, but long before Husserl similar methods were being used, for instance, by Kierkegaard in *The Concept of Anxiety*.

One obvious result of the application of such methods of inquiry to the human person is the claim that freedom is essential to being human. Decision, conscience, and responsibility are major themes in existentialist writers, in opposition to the determinism or near-determinism characteristic of supposedly scientific views of humanity. Perhaps it would not be going too far to say that freedom is the supreme value among the existentialists. Human existence is said to be "authentic" when the individual freely chooses who and what he or she will become. The freedom to choose and decide

is, of course, never absolute. The human being is finite, inserted at a given position in space and time and therefore subject to all the constraints and influences that operate at that point. Thus one's freedom is always threatened. One may simply reflect the values of one's culture, without ever deciding one's relation to those values, or one may be caught up in the race for money or pleasure, though these may be inimical to the development of one's finest potentialities.

Thus all human existence is lived in the tension between finitude and freedom. This tension can also be expressed as that between freedom (the areas that are still open for choice) and facticity (those elements in existence which are simply given and reduce the area of free decision). It is because of this tension that freedom is always accompanied by anxiety. Existentialists, from Kierkegaard on, have laid great stress on anxiety as a basic emotion or state of mind which illuminates the human condition. In the case of Kierkegaard and other Christian existentialists, the experience of anxiety may predispose toward the life of faith by awakening the need for salvation; but among atheistic existentialists, anxiety points rather to despair, for the inner contradiction in the human being is taken to be incapable of resolution, so that human existence is always on the verge of absurdity. Part of human finitude is the fact that existence will in any case come to an end in death. But here too there are differences in interpretation. Heidegger believes that the fact of death, by closing off the future of existence, makes it possible to achieve a unifying and meaningful pattern in that existence. Sartre, on the other hand, thinks that death, by canceling out all achievement, is the ultimate indication of the absurdity of existence.

The criticism is sometimes made that there is something morbid in the existentialists' preoccupation with anxiety and death, and this criticism also impinges on those Christian theologians who have used these ideas to urge the need for faith and dependence on God. But it should be noted that there is another and more affirmative side to existentialism. Many writers of the school speak also of "transcendence," and by this they do not mean the transcendence of God, as commonly understood in theology, but the transcendence of the human existent moving constantly beyond itself into new situations. Those who stress transcendence believe that the goal of human life is to realize more and more one's authentic possibilities. Whereas the early Heidegger believed that this is to be achieved by human effort, by a steady "resoluteness" in the face of facticity and death, Christian writers such as Gabriel Marcel have thought of human transcendence as a transcendence toward God, and have taught that this is to be achieved not just through human effort but through the assistance of divine grace.

Most existentialists have had a bias toward individualism. This was true of Kierkegaard, who was alarmed by the tendencies toward collectivism in Hegel's philosophy. It is also true of Sartre, who depicts interpersonal relations as essentially frustrating. On the other hand, Marcel claims that a relation to others is essential to an authentic human exist-

tence, while Heidegger sees “being-with-others” as an inescapable dimension of the human being. Critics of existentialism have reckoned its individualism as a defect, on the ground that it prevents the development of a political philosophy, but others have praised the stress on the individual as a defense of human freedom in face of the totalitarian pretensions of the modern state. Nietzsche and Heidegger have both sought to go beyond the biography of the individual to the outlines of a philosophy of history. In this, they oppose the so-called scientific history that seeks to establish objective facts. Nietzsche speaks scornfully of the “antiquarian” type of historian who seeks to reconstruct the past. He prefers the “monumental” historian who goes to some great creative event of the past in order to discover its power and to learn its lessons for the present and future. Heidegger likewise is uninterested in the history that confines itself to the analysis of past events. History, he claims, is oriented to the future. The historian goes to the past only in order to learn about such authentic possibilities of human existence as may be repeatable in the present. This view of history was very influential for Rudolf Bultmann’s existential interpretation of the “saving events” of the New Testament, an interpretation succinctly expressed as “making Christ’s cross one’s own.”

The stress on human freedom together with the bias toward individualism raises the question of the significance of existentialism for ethics. The existentialist has no use for an ethic of law, for the requirement of a universal law ignores the unique individual and conforms everyone to the same pattern. So one finds Kierkegaard defending Abraham’s decision to sacrifice Isaac, for although this meant the “suspension” of ethics, only so could Abraham be true to his own self and be “authentic.” Similarly Nietzsche is found claiming that the “superman” must create his own values to supersede traditional values, while Heidegger claims that what is ordinarily called “conscience” is only the voice of the mediocre values of society and that the true conscience is the deep inward summons of the authentic self. In each case, the value of an action is judged not by its content but by the intensity and freedom with which it is done. Such an ethic is too formless for human society and represents an overreaction against the cramping restraints of legalism. Nevertheless, this extremely permissive ethic has seemed to some Christian thinkers to be compatible with Jesus’ teaching that love rather than law must guide one’s conduct, and it is reflected in the various types of “situation ethics” that flourished for a short time.

Finally, although existentialism turns away from the attempt to formulate any detailed and inclusive metaphysic, its adherents seem to find it impossible to avoid assenting to some ontology or theory of being. Kierkegaard and other Christian existentialists assume (but do not seek to prove) a theistic view of the world as the setting of human existence; Sartre is frankly dualistic in opposing the free but fragile being of humankind (the *pour soi*) to the massive unintelli-

gent being (the *en soi*) of the physical world; there are mystical elements both in Heidegger’s talk of “being” and Jaspers’s of “transcendence.” Existentialist theologians have also found that the reconstruction of Christian theology in terms of human possibilities is inadequate and needs the supplementation of a theistic philosophy.

BIBLIOGRAPHY

An introduction to existentialism is provided in my book *Existentialism* (Baltimore, 1973). Major existentialist texts include Søren Kierkegaard’s *Philosophical Fragments*, translated by David F. Swenson (Princeton, N. J., 1936); Martin Heidegger’s *Being and Time*, translated by me and Edward Robinson (New York, 1962); Jean-Paul Sartre’s *Being and Nothingness*, translated by Hazel E. Barnes (New York, 1956); and Fritz Buri’s *Theology of Existence*, translated by Harold H. Oliver and Gerhard Onder (Greenwood, S.C., 1965).

JOHN MACQUARRIE (1987)
Revised Bibliography

EXORCISM. The English word *exorcism* derives from the Greek *exorkizein*, a compound of *ex* (out) plus *horkizein* (to cause to swear, or to bind by an oath). Whereas in Greek the word sometimes is used simply as a more intensive form of the root, meaning “to adjure,” English derivatives usually designate a “swearing out” of invasive spiritual forces from the body in a formal rite of expulsion. Thus exorcism cannot fully be understood without reference to the concept of spirit possession, the state that it redresses.

The spirits to be exorcised most commonly are conceived either as demons or as restless ghosts. These evil spirits penetrate into the bodies of their victims and completely control, or at least strongly influence, their actions. Possessing spirits may also cause physical illness by interfering with the body’s normal physiological processes or mental illness by affecting the will, intellect, and emotions. Yet in many cultures, spirit possession is diagnosed only retrospectively. That is, the victim often must display abnormal behavior for some time before friends and family diagnose her as pos-

sessed by a spirit. Both cross-culturally and transhistorically, spirit possession afflicts women more often than men. This pattern has been the subject of much discussion among specialists who study the phenomenon.

The forms and prevalence of exorcism within a given culture are intimately related to the question of how the invading spirits are conceived. In certain contexts, possession by neutral or beneficent spirits is highly valued, and in these settings exorcisms are unlikely to be an important constituent of the local culture. Within other religious contexts, however, spirit possession is understood as the work of evil spirits or demons dedicated to the downfall of humanity, and exorcism thus is viewed as a vitally important form of healing. Lastly, many cultures, both historically and worldwide, consider possessing spirits to be the ghosts of the dead. Responses to possession in these cases may involve ambivalent attitudes toward the invading spirit. Communities invariably wish to heal the victim through exorcism but also may feel compassion toward the dead spirit that has invaded the living. Moreover witnesses to exorcisms of ghosts frequently use the occasion to interrogate the spirit about the details of the afterlife.

Exorcisms vary widely. Whereas some rites are purely verbal formulae, many employ objects, gestures, and actions thought to be of particular power against invasive spirits. In some contexts, exorcism may be accomplished simply through the charismatic power of a particularly powerful or righteous individual. Many cultures use dance and music as essential elements of exorcism rituals. In this article, the word *exorcism* may refer either to the procedure itself or to its end result, the liberation from spirits that it accomplishes.

CHRISTIAN EXORCISM. From its origins, Christianity has included a strong belief in spirit possession by demons, understood as primordial forces of evil and followers of the devil. Thus exorcism has a long history within Christianity, particularly (though not exclusively) among Catholics. These traditions continue to the modern day.

In the New Testament. The Greek verb *exorkizein* appears only once in the New Testament, in *Matthew* 26:63, where the high priest “adjures” Jesus to reveal whether he is the Christ. Yet the action of expelling demons frequently does appear in the New Testament canon. Exorcism is among Jesus’ favorite miracles in the Synoptic tradition, comprised of the *Gospels of Mark, Matthew, and Luke*, yet no exorcisms appear in the latest gospel, *John*. The *Acts of the Apostles*, by the same author as the *Gospel of Luke*, also recounts exorcisms by Jesus’ followers after his death and employs the noun *exorkistes* to refer to some Jews who attempt to cast out demons using Jesus’ name (*Lk.* 19:13). Indeed in respect to exorcism, the emerging Jesus Movement was much in accord with developments in other Jewish sects of the period, many of which had begun to place a greater emphasis upon exorcisms and charismatic forms of healing than had been the case in earlier Jewish tradition.

In the earliest gospel, *Mark*, an exorcism is Jesus’ first miracle:

And immediately there was in their synagogue a man with an unclean spirit; and he cried out, “What have you to do with us, Jesus of Nazareth? Have you come to destroy us? I know who you are, the Holy One of God.” But Jesus rebuked him, saying, “Be silent and come out of him!” And the unclean spirit, convulsing him and crying with a loud voice, came out of him. (*Mk.* 1:23–26)

Mark subsequently presents Jesus as famed for his exorcism ability, pairing this miracle with Jesus’ eloquence in preaching as his two main sources of appeal throughout his travels in Galilee (*Mk.* 1:39). Mark’s gospel thus uses exorcism as a way of demonstrating Jesus’ uncanny power as a complement to his teaching: Jesus is shown as battling against malignant spiritual forces both physically and pedagogically.

The most complete account of exorcism is that of the Gerasene demoniac, recounted in all three synoptic gospels (*Mk.* 5:1–20; *Mt.* 8:28–34; *Lk.* 8:26–39). The tale concerns Jesus’ encounter with a man possessed by a multitude of evil spirits. The man was living in the cemetery on the edge of a city—among the tombs of the dead—because his disordered state of mind and superhuman strength rendered him unfit for the society of the living. Jesus interviews the spirits inside the man, which speak through his mouth, and elicits their collective name, Legion. Jesus then commands the spirits to depart from the man but gives them permission to enter into a herd of pigs foraging nearby. The possessed pigs then plunge themselves into the sea and drown, prompting the local herdsmen to flee and tell the story throughout the city. A group of people then come out to Jesus and ask him to leave. The passage reveals much about conceptions of possession and exorcism in this time period, including the disruption of identity and of bodily control characteristic of demoniacs; the importance of learning the demons’ names in order to gain power over them; and Jesus’ charismatic use of a simple verbal command to accomplish the expulsion. However, the conclusion of the tale suggests that Jesus’ action is regarded with considerable fear and ambivalence by the local community.

The Synoptic Gospels report that during his lifetime Jesus empowered his disciples to cast out demons as well. Yet upon occasion this power failed them, as in the case of a dumb and deaf spirit that had entered a child, tormenting him with convulsions. After the disciples proved unable to heal the boy, Jesus successfully completed the task through prayer and fasting (*Mt.* 9:17; *Mt.* 16; *Lk.* 9:40). Jesus’ followers continued to perform exorcisms after his death. The *Acts of the Apostles* describes several cases accomplished through a noteworthy diversity of means. Paul exorcises a slave girl through a verbal rebuke similar to those used by Jesus (*Acts* 16:18), but Peter heals the possessed simply by having them gather in his shadow (*Acts* 5:16). Paul also exorcises spirits through handkerchiefs impregnated with his power of super-

natural healing (*Acts* 19:11–12). Simply invoking the name of Jesus was considered a powerful method of exorcism, one even employed by non-Christians, according to *Acts*. Chapter nineteen describes some Jews in Ephesus who attempt to cast out demons in Jesus' name, though without success.

Late antiquity and the Middle Ages. As in Jesus' own early career, exorcism was an important element in winning new converts for the early generations of the Jesus Movement. The second-century Christian apologist Justin Martyr characterized exorcism as a particularly impressive gift among Christians, noting that any demon, no matter how powerful, became submissive when conjured in Jesus' name. Indeed exorcism became a competitive arena in which Roman Christians claimed triumph over Jewish and pagan rivals, suggesting that their conjurations of demons were more efficacious than any other form of healing. Peter Brown has shown in "The Rise and Function of the Holy Man in Late Antiquity" (1982) that the essential mark of the early Christian holy person was his or her charismatic ability to exorcise, and Christian saints became closely associated with this activity. Thus when a little girl in fourth-century Syria wished to parody a monk in order to entertain her companions, she did so by pretending to exorcise them with all due solemnity.

With the Christian community growing in numbers, the church began to require the exorcism both of adult converts and of infants at baptism. The earliest Catholic baptismal liturgy incorporated exorcisms; one function of godparents, in cases of infant baptism, was to answer for the child when the exorcist asked, "Do you renounce the devil and all his works?" In consequence of this development, by the third century a designated exorcist was required in every Christian community. Documents from this time period make note of a formal order of exorcists that constituted a lowly step on the ecclesiastical hierarchy. The Fourth Council of Carthage in 398 CE is the first surviving text to prescribe the rite of ordination for an exorcist: "When an Exorcist is Ordained: Let him accept from the hand of the priest the little book in which the exorcisms are written, and let the priest say to him, 'Take this and memorize it, and may you have the power of laying on hands upon an energumen, whether baptized or a catechumen'" (Caciola, 2003, p. 229).

As Christianity spread into northern Europe and became a dominant institution in the medieval west, exorcism practices continued to evolve. Whereas the order of exorcists slowly declined in importance and eventually disappeared from view, descriptions of exorcisms performed by saints vastly increased. Medieval hagiographies frequently mention exorcisms performed during their subjects' lifetimes as well as postmortem exorcisms accomplished by the saints' relics or tombs. This development accelerated after the twelfth century, when accounts of demonic possession saw an exponential increase in hagiographical texts. Bernard of Clairvaux (1090–1153 CE), for example, was credited with many personal exorcisms, whereas Hildegard of Bingen (1098–1179

CE) provided detailed advice on how to exorcise a possessed woman in one of her letters. Some of the best surviving accounts of exorcisms during this time period are set at saints' tombs, and certain shrines became known as centers of exorcistic healing. The arm relic of John Gualbert of Florence (999–1073 CE), for example, was famed for its exorcistic properties, and the miracle accounts recorded at his shrine in the later Middle Ages include a number of healings of the possessed. In some cases, families traveled considerable distances for an exorcism of a relative, vowing particular devotion to the saint if he or she provided aid to the possessed at the end of the pilgrimage.

Exorcisms by living saints or their relics were not the only means of casting out demons, however. Medieval people also employed a number of other techniques, often in a somewhat improvisational manner. Friends, family, and religious professionals might try to cast out the demon through prayer and fasting; by showing the demoniac religious paintings; by placing relics or books of Scripture on the victim's head or body; through anointing with holy water, holy oil, or blessed salt; or by giving the demoniac a consecrated Eucharistic wafer.

Medieval popular culture included its own notions of spirit possession and of appropriate remedies as well. Many contemporary texts attest to the northern European belief that demons could invade dead bodies, animate them, and use them for nefarious purposes. In such cases, the preferred solution to the problem was to destroy the corpse as fully as possible. In Mediterranean regions, the spirits that possessed the living were often identified as ghosts rather than as demons. As for cures, the possessed sometimes were immersed in a running body of water as a form of cure. In some areas local men made names for themselves as secular exorcists and healers, each with his own unique formula, rhyming jingles, and other procedures. Thus medieval cultures held diverse notions of spirit possession and exorcism in addition to purely ecclesiastical definitions.

The emergence of a liturgical rite in the fifteenth century. The fifteenth century marked an important turning point in the history of exorcism within the Catholic Church. At this time, as Caciola (2003) has shown, the church began to use formal scripted, liturgical exorcisms, numerous examples of which are preserved in manuscripts. The change likely stemmed from a desire on the part of the Catholic hierarchy to standardize practices of exorcism at a time when the number of reported possessions remained high. In so doing the church also arrogated control over the process of exorcism to the ecclesiastical hierarchy rather than allowing decentralized and improvised practices of exorcism to persist.

Liturgical exorcisms are a species of *clamor*, a family of ritual forms that cry out to God for aid against oppressors. Other examples of this kind of ritual include excommunications, humiliations, and maledictions. These exorcisms also are intimately related to the baptismal liturgy, repeating verbal formulations from the baptismal rite as well as other ele-

ments, such as the blessing of salt and water. A third textual precedent for these rites is Jewish conjurations, particularly the inclusion of exhaustive compendia of the names of God. Indeed liturgical exorcisms are rife with lists of all kinds: those that recount events from the life of Jesus; that call upon the aid of all the saints and the hierarchy of angels; that cast the demon forth from each body part; and that imagine vivid apocalyptic scenarios of demonic defeat and eternal torment. Several manuscripts of exorcism suggest the use of demonic language in order to gain control over the possessing spirit, incorporating brief spells composed of unintelligible words that are said to have been personally composed by the devil. After conjuring the demon in its own language, the exorcist may then proceed to inquire into its precise status, its reason for invading the victim, and its requirements for a successful expulsion. The following quotation from a manuscript held in Munich gives a sense of how a typical liturgical exorcism begins:

Take the head of the possessed person in your left hand and place your right thumb in the possessed person's mouth, saying the following words in both ears: ABRE MONTE ABRYA ABREMONTE CONSACRAMENTARIA SYPAR YPAR YTUMBA OPOTE ALACENT ALAPHIE. Then hold him firmly and say these conjurations: I conjure you, evil spirits, by the terrible name of God Agla. . . . I also conjure you by the great name Pneumaton and by the name Ysiton, that you ascend to the tongue and give me a laugh. If they do not respond, then know that they are mute spirits. The exorcist should diligently discover and require whether it is incubi, or succubi, or even dragons that possesses the obsessed person; whether they are attendants of Pluto, or servants of Satan, or disciples of Astaroth; if they are from the east or the west; from noonday or evening; from the air, earth, water, fire, or whatever kind of spirit. (Caciola, pp. 248–249)

It was believed that once the demon was made to answer questions about itself (either through use of the demonic language or through some other constraint) it would be easier to exorcise.

The liturgy continues with insults to the demon, commands for it to depart, and prayers for divine aid, as well as Bible readings interspersed with lists of body parts, saints, angels, and the names of God. Throughout the rite, the exorcist is frequently directed to make the sign of the cross over the victim or to sprinkle him or her with holy water. The rite usually concludes with a prayer of thanksgiving and a plea for future protection against similar attacks. This basic template was to persist as the basis for the liturgy of exorcism for centuries.

The Reformation and beyond. The Reformation period saw a notable increase in demonological phenomena, most notably the witch hunts that came to a peak in this time period. Whereas the reformers accepted the possibility of demonic possession, they nevertheless opened a vigorous debate over the efficacy of liturgical exorcism as a remedy. Prot-

estant texts satirized the splashing of holy water and frequent crossing of demoniacs performed by Catholic exorcists, deriding them alternately as “superstition,” “empty rituals,” or “magic.” Yet beneath this general atmosphere of rejection lay a diversity of attitudes toward exorcism. Some reformers, like John Calvin (1509–1564) and Ulrich Zwingli (1484–1531), rejected all ritual exorcism; others, however, were less radical in their approaches. Martin Luther (1483–1546), for example, defended the use of traditional rites of exorcism during infant baptisms, deeming them a kind of prayer on behalf of the infant for divine protection. Most Protestant groups eschewed liturgies of exorcism for adults but did not reject simpler forms of exorcism through prayer and fasting, viewing them as acceptable pleas for divine aid against possessing demons.

Among Catholics, belief in the benefits of ritual exorcism continued to flourish unabated. Many elements of the liturgy that was formulated in the fifteenth century were codified in 1614 in the official Roman Ritual. Also during this time period, plural possessions and group exorcisms became a common Catholic form of the phenomenon, usually in a convent setting. The most famous case is the 1634 account of possessed nuns of Loudon studied by Michel de Certeau in *The Possession at Loudon* (1996), but plural possessions also occurred in Spain, Italy, the Low Countries, and France from the mid–sixteenth century through the early seventeenth century.

Some possession cases became closely bound up with the witchcraft persecutions; demonological literature taught that witches could send demons to possess their enemies. The priest of Loudon, Urbain Grandier (1590?–1634), ultimately was convicted of having bewitched the nuns. For this crime, he paid with his life. Likewise the eighteenth-century Puritan witchcraft trials in Salem, Massachusetts, originated with charges that the witches had caused their young accusers to be possessed.

A significant aspect of exorcism in this time period is the degree to which spectacular cases of possession and exorcism entered into public discourse and became causes célèbres. Due to the spread of print technology, for the first time such events could be widely known about and discussed. The publicity provided by pamphlets and broadsides, combined with the fractious confessional politics of the day, made exorcism a vehicle of Catholic polemic against Protestants and Jews. This dynamic was first noted by Daniel Pickering Walker in *Unclean Spirits* (1981). Thus Nicole Obry, a young Catholic woman who became possessed in 1565 and was publicly exorcised in the city of Laon, regaled the vast crowds attending the event in the voice of her possessing demon, which confessed that it was close friends with the Huguenots (preferring them even to the Jews) and that it sustained the greatest torment when young Nicole was given the Eucharist. Here insults to other religious traditions were combined with an endorsement of the Catholic doctrine of transubstantiation.

Nicole's case was widely copied, most notably in the subsequent generation by the famous demoniac Marthe Brossier (1573–16??). Protestant groups were unable to engage in widespread counterpropaganda, however, because they rejected exorcism for the most part. In England, the Protestant minister John Darrell became famed in the 1590s for exorcisms achieved through prayer and fasting, but the accounts of these cases lack the explicitly propagandistic elements of the Catholic cases. In a slightly different polemical vein, a sixteenth-century Catholic exorcist conjured the demons afflicting a group of young Roman girls who had been converted from Judaism. These demons explained their presence as the result of a curse laid upon the girls by their fathers who, angry at the loss of their children, summoned forth demons to possess them.

Exorcism declined in Europe during the eighteenth century, though it never entirely disappeared. Indeed professional exorcists like German Johann Joseph Gassner (1727–1779) continued to appear. Among the educated classes, however, symptoms that traditionally had led to a diagnosis of demonic possession increasingly came to be regarded as indicators of natural pathologies like hysteria, epilepsy, or melancholia. Although naturalistic diagnoses for “possessed behaviors” had been available since the twelfth century, the eighteenth century saw a more definitive shift in favor of medical epistemologies. In consequence exorcism was less frequently indicated as a cure.

The contemporary Christian Churches. Perhaps the best-known modern image of the rite of exorcism derives from the 1973 film *The Exorcist*, based on the 1971 novel of the same title by William Peter Blatty (b. 1928). Though the account is fictionalized, Blatty's story of a demonically possessed little girl was based upon a 1949 case of prolonged exorcism of a young Lutheran boy by a Catholic priest. The film spurred a revival of interest in exorcism in the United States, and Catholic bishops began receiving more and more requests for the procedure. Only a small proportion of such requests were granted because twentieth-century Catholic officials regard genuine demonic possession as an extremely rare phenomenon that is easily confounded with natural mental disturbances. In recognition of this stance, the Vatican in 1999 updated the ritual of exorcism for the first time since 1614, advising consultation with doctors and psychologists in order to rule out organic pathologies; however, the twenty-seven-page exorcism ritual was left largely intact.

Whereas the Catholic hierarchy preaches restraint in regard to exorcism, certain Catholic communities reject this stance along with many other features of the modern church. The most active Catholic exorcists of the late twentieth century belonged to conservative groups that rejected the reforms of the Second Vatican Council (1962–1965), especially the abandonment of the Latin Tridentine Mass. These exorcists contended that the new Mass left the faithful unprotected against demonic attack and believed that as a result of Vatican II, the number of possessions had increased exponentially.

Some modern American Protestant groups have become interested in possession and exorcism as well. The beginnings of modern Pentecostalism in the early twentieth century fostered a broad, interdenominational movement of Christian charismatics who placed direct spiritual interventions at the center of their theology. Some modern charismatics practice exorcism or “deliverance,” as documented by Michael Cuneo in *American Exorcism*. Although deliverances can take many different forms according to the individual practitioner, the majority are simple prayer sessions for the victim's relief. The most extensive deliverances include a clairvoyant discernment of spirits, in which a specialist intuits what type of demon is afflicting the individual: a demon of lust, stubbornness, greed, or other sin. In rare cases, the demon may be identified as an entity of “intergenerational evil,” an inherited demon dedicated to afflicting a particular bloodline; such a diagnosis is particularly likely when the individual requesting deliverance has a family history involving violence or mental illness. More formal rites of deliverance often begin with a binding of the devil, in which the indwelling demon is adjured, in the name of Jesus, to remain calm and desist from thrashing about inside the victim. Next is the prayer phase, which may be accompanied by fasting and a laying on of hands. As with Catholic traditionalists who practice exorcism, Protestant charismatics interested in deliverance tend to be social conservatives opposed to the increasing theological liberalism of the mainline churches.

JUDAISM. Judaism does not have a strongly attested focus on spirit possession and exorcism before the middle of the sixteenth century. At that time belief in possession by reincarnate spirits of the dead began to emerge in the Sephardic Jewish community of Safed in the Galilee. These ideas eventually were disseminated to eastern European Jewish communities, becoming particularly vigorous among eighteenth- and nineteenth-century Hasidic groups. The most familiar term for the possessing spirit, *dybbuk*, came into use only in the late seventeenth century, but it is employed by scholars of Judaism to refer to possession by a ghost even in earlier epochs.

Early history. The earliest account of an exorcism in Jewish tradition is *1 Samuel* 16:14–23. The text recounts how after the spirit of YHWH departed from King Saul, an evil spirit began to torment him. Saul's counselors suggest that music may be able to soothe his affliction, and David is brought to him to play the lyre. The sweet strains of the music succeed in exorcising the spirit from Saul whenever he feels invaded by its presence.

This is the sole account of spirit possession and exorcism in the Hebrew Bible. By the Second Temple period, however, the invasions of demons and forms of spiritual healing had become more prominent within Judaism. These phenomena were central features of the career of Jesus, for instance, as he traveled through the Jewish communities of first-century Palestine. The Qumran texts likewise place significant emphasis upon demonic attacks and human coun-

terattacks, often in the form of protective spells, whereas scattered tales in rabbinic literature recount exorcisms by particularly righteous Jewish teachers.

Surviving bits of material culture testify to the contemporary interest in exorcism as well, particularly a number of bowls inscribed with Aramaic exorcisms that utilize a legalistic language of divorcing the spirit. Josephus (37–c. 100 CE) provides a story about contemporary Jewish exorcism techniques that he ascribes to traditions originating with King Solomon. According to this author, an exorcist named Eleazar gained fame for the efficacy of his cures and even was called upon to demonstrate his prowess before the emperor Vespasian (9–79 CE) along with all his court and army. Eleazar's secret was to draw the demons out from the possessed person's body by employing a certain root, discovered by Solomon, which was encased in a ring. By holding the ring to a demoniac's nose, he allowed that person to inhale the scent of the root, then he extracted the demon from the victim's body through the nostrils.

Accounts of exorcism are rare in medieval Jewish sources, although—as attested in the articles collected by Matt Goldish in *Spirit Possession in Judaism* (2003)—many scholars believe that the practice itself persisted. Medieval Catholic exorcisms include elements drawn from Jewish tradition, such as the use of lists of the names of God and the acronym AGLA (for *Atah Gibbor Le-'olam Adonai*, “You are mighty forever, my Lord”). This interreligious borrowing may suggest that Jewish exorcism traditions remained in common use. An early-sixteenth-century compilation of Jewish magical and exorcism texts, the *Shoshan Yesod ha-'Olam*, testifies to a vigorous tradition of spiritual healing; the book likely incorporates many older traditions that are not attested in surviving earlier literature. The exorcisms here are liturgical in character, involving verbal conjurations of demons and commands to depart. One formula adjures the demon, by the seventy-two names of God, to reveal its own name and parentage, then requires it to depart from the human body and enter into a flask that the exorcist is directed to have handy.

The emergence of dybbuk possession in the sixteenth century. In the sixteenth century spirit possession underwent a significant resurgence and evolution within Jewish thought. Beginning with the case of a young boy in the 1540s, the Galilean village of Safed became the epicenter of a new series of sensational possessions and exorcisms, several of which were associated with the circle of the qabbalist Rabbi Isaac Luria (1534–1572). Not only was possession suddenly a renewed topic of reportage, but the terms in which it was envisioned seem to have shifted. Whereas earlier Jewish attestations of exorcism usually refer to the possessing spirit as a demon, the cases in Safed (which in the early twenty-first century have received sustained treatment from Jeffrey H. Chajes in *Between Worlds* [2003]) constitute the first detailed descriptions of possessing spirits conceived as transmigratory souls of the dead.

Already in the late fourteenth century, Spanish qabbalistic literature had begun to explore the notion of *'ibbur*, “pregnancy,” as a form of spirit possession. The term was used to designate the invasion of a living human being by the transmigrating spirit of a deceased person, thus suggesting the coexistence of two souls within a single body. The sixteenth-century Safedian qabbalists expanded upon this tradition significantly. Although *'ibbur* could involve either benign or maleficent dead spirits, the concern here is with the latter.

The qabbalists explained that the soul of a sinful person might not be permitted to enter into Gehenna directly upon death but instead would wander, disembodied and subject to beatings from angels of destruction. Seeking refuge from the angels, such a spirit would seek to enter into a physical body—either animal or human—for shelter; human bodies could be made vulnerable to such invasion through certain sins. Exorcism of the spirit should ideally be conducted in the presence of witnesses, a *minyan* of ten men. Because the ritual did not follow an invariant form, elements such as extensive suffumigation of the victim with strong incense, the blowing of the *shofar* (ram's horn) into the possessed's ear, and invocation of the names of God were used to force the *dybbuk* to reveal its own name and background. Once the identity of the spirit was established, the exorcist might converse with it, asking questions about its own former life and sins as well as seeking information about the afterlife. The *dybbuk* was often adjured to exit the victim by the big toe, lest the victim choke if it left via the throat. After the departure, the victim was to be given a protective amulet to wear to fend off further spiritual infestations. Texts recounting famous exorcisms served hagiographic functions, glorifying the rabbi who performed a successful expulsion. This is true not only of sixteenth-century Safed but of the later history of the *dybbuk* phenomenon as well.

It is notable that, in cases of *dybbuk* possession, the compassion of rabbinic exorcists was directed not only toward the possessed victim but also toward the possessing spirit. Because the latter was conceived as human, it too merited a degree of concern and healing. Thus even as the exorcist cast the demon out from the body it possessed, he often sought to discover how to help the *dybbuk* achieve *tikkun*, or rectification. If the spirit were permitted to enter Gehenna, it could then find rest and cease tormenting other living beings. This sympathetic feature of Jewish *dybbuk* exorcism could not find a counterpart in earlier Jewish traditions or in Christian traditions, which conceive of the possessing spirits as unredeemable and demonic.

Later developments. The *'ibbur* form of possession appeared in 1575 in Ferrara, Italy, where the spirit possessing a Jewish woman claimed it was the ghost of a recently executed Christian. Scholars are divided as to whether this and subsequent Italian cases resulted from a dissemination of Lurianic notions of possession and exorcism or arose from other contingencies. In the seventeenth century the Italian rabbi

Moses Zacuto (1625–1697) became well known as an exorcist, engaging the topic repeatedly in his correspondence.

By the eighteenth and nineteenth centuries *dybbuk* possession had become common in eastern European Hasidic communities; the term *dybbuk* is first attested in a Yiddish pamphlet published around 1680 in Volhynia. Sholom Anski's (1863–1920) 1910s play *The Dybbuk*; or, *Between Two Worlds*, which is set in a Hasidic context, popularized and romanticized the notion of ghostly possession. Like Blatty's *The Exorcist*, the story ultimately may have influenced the course of the religious phenomenon on the ground. Cases of *dybbuk* possession reminiscent of Anski's narrative have been reported in modern Israel and have begun to be studied by modern folklorists and anthropologists.

COMPETING EXORCISM FORMS IN EGYPT. In modern Islamic Egypt, spirit possession may be managed by one of two means: through Qur'anic healing or participation in a *zār* cult. Islamic demonology is extensive, and the choice of which form of healing to pursue is in part a reflection of how the inhabiting spirit is identified.

Zār. *Zār*, a relatively recent invention dating only to the 1870s, is a form of participatory ritual group healing found in several East African countries. Dominated by women, *zār* cults involve regular meetings at which participants dance to drumming with the goal of entering into individual trance states. Islamic authorities in Egypt often denounce *zār* as a vulgar superstition held by women too ignorant to realize that their actions are un-Islamic. Participants, however, regard the meetings as fully compatible with Islamic tradition.

Strictly speaking, the *zār* cult is not a complete form of exorcism but rather a recurrent form of pacification. The goal of the ceremony is to learn to coexist with the spirit, or *zār* master, by temporarily lessening the intensity of the spirit's hold upon the individual. As documented by Gerda Sengers in *Women and Demons* (2003), the beginning of involvement with *zār* is customarily a private initiation ceremony paid for by the possessed victim and attended by friends, family, and other women who are possessed. After an opening prayer drawn from the Qur'ān, several different drum bands perform in sequence; their purpose is to get the participants dancing and help spur the onset of a trance. The new "*zār* bride," dressed in a long white tunic, is led by the *kudya*, a *zār* specialist who has assisted in the diagnosis of the victim's illness and identification of her invading spirit, or *zār* master. These may be of several kinds, including (among others) Gado, master of the toilet; the atheist *zār* master known as the Red Sultan; the Sultan of the Sea, who affects the brains; and even Christian *zār* masters. (The latter are easily identified because they make their victims desire alcohol, which normally is forbidden to Muslims but allowed to those possessed by Christian *zār* masters at *zār* ceremonies.) *Zār* masters often have negative qualities and cause distress or illness, but they are distinct from the more purely evil Islamic demons and devils known as *jinn* and *shayatin*.

Participants in the *zār* dance not with one another but with their individual *zār* masters. Thus the action, while collective, is not truly communal. After the private *zār* ceremony—sponsored by the family of the new initiate—the initiate will likely join a regular public *zār* group or *hadrah*. The *hadrah* meets regularly, usually on a weekly basis, and each participant contributes funds to pay for the drummers and to support the *kudra*. The repetition of the dance ritual each week keeps the *zār* master quiet within the victim, allowing her to pursue her normal life in all other ways.

Qur'anic healing. Qur'anic healing is a true exorcism that definitively drives out the invasive spirits, which in this case are often *jinn* or *shayatin*, though they can be *zār* masters as well. The healing usually is conducted by a *sheik* who specializes in Qur'anic exorcism on the grounds of a mosque, perhaps in an upstairs room or other chamber; as with *zār* ceremonies, these usually are group meetings with several possessed persons in attendance at once. Participants are segregated by sex, either by some form of barrier or by designating different days of the week for gatherings of men and of women. Nevertheless in Egypt—as in other parts of the world—spirit possession tends to afflict women more often than men. Qur'anic healers consider themselves as a more orthodox alternative to the *zār* cult, which they tend to deride as superstitious, corrupt, and anti-Islamic.

The rite begins with a rapid sequence of prayers, recited either by the *sheik* himself, one of his assistants, or the whole group. As the prayers go on, some of the possessed are likely to become excited and to begin writhing and crying out. At this point the assistants direct their prayers more loudly and forcefully at that individual; they may strike her with a stick while repeatedly shouting at the *jinn* to get out immediately. Eventually the exorcist or his assistant conjures the demon, asking its name, other details of its identity, and its reasons for possessing the victim. One may be possessed by a *jinn* for a variety of offenses, including such sins as hitting a cat. If the demon turns out not to be Muslim, it is given the chance to convert. The spirit is then required to enter into the possessed person's finger and to indicate its presence there by lifting that digit. The exorcist then pricks that finger with a needle, drawing a drop of blood and forcing the spirit out with it. After the rite, the victim is often counseled to adopt a higher level of piety in everyday life by, for example, dressing more modestly or praying more often.

REGIONALISM ON THE INDIAN SUBCONTINENT. The linguistic and cultural diversity of the Indian subcontinent is paralleled by a wide degree of variance in exorcism practices. Certain spirit possession beliefs are widespread in India, such as the frequency with which ghosts as well as demons possess the living; the predominance of women among the possessed; the belief that possession may sometimes be caused by another person's act of sorcery; and the retrospective diagnosis of the onset of possession as occurring at a moment when the victim was alone and felt a sudden fear. Regional variations in possession beliefs—and especially in exorcism

techniques—however, are legion. Indeed even within a single locale there may be several different exorcism techniques in play.

North India: The Balaji temple. The North Indian town of Mehndipur, Rajasthan, is home to the Balaji temple, dedicated to the monkey god Hanumān. The latter deity is an apt choice for a divine exorcist, for he is a heroic figure drawn from the epic *Rāmāyana*, which recounts his devoted service to Rāma during a protracted battle with the Sri Lankan demon Rāvaṇa. The Balaji temple is famed throughout Rajasthan and neighboring states for its successful exorcisms, attracting the possessed from as far away as Delhi. Indeed the Balaji temple has long been a popular pilgrimage destination: it invariably is filled with supplicants come to ask the monkey god for release from possessing spirits of the dead, from demons of the Hindu pantheon, and even sometimes from Muslim *jinn*.

Exorcisms performed at the temple are collective in character. Together caregivers and temple priests intone prayers to Hanumān, with the goal of initiating the victims into an altered state of consciousness or trance (*peshi*). Though the latter often involves convulsions, loud shrieking, and other extreme behaviors, *peshi* is held to be a prerequisite for healing. Victims may return to the temple for several successive days before achieving *peshi*, but once the catharsis of trance is achieved and then exited, the victim is likely to be considered on the road to complete healing. The process may be swift or slow, depending on the number and nature of the possessing spirits. After the exorcism, the newly healed individual may report having received from Hanumān a protective spirit, or *dut*, to help guard against future attacks.

South India. In South India, possession most frequently afflicts new, young brides; the spirit usually (though not invariably) is described as the ghost of a young man. Thus the possession state frequently has a sexual aspect that is explicitly articulated within the local understanding of these events. The ghosts or *peys* that afflict the victims often died unmarried; indeed a common reason for becoming this type of restless, possessing spirit is suicide because of unfulfilled love. These lonely ghosts of the untimely dead may become attracted to a lovely young bride with a still-fresh scent of sexual initiation about her and try to “catch” or possess her, often gaining entry through the woman’s hair. Afterward the spirit becomes jealous and impels the woman to reject the sexual advances of her husband: this act often is the initiating event in a diagnosis of possession.

The exorcism ritual used to cure such afflictions usually involves a controlled, benign counterpossession. Here exorcists are specialists in dance techniques that enable them to enter into a state of trance, during which they incarnate a female deity like Kālī or Ankalaparamēcuvari. The rite is known as “dancing the goddess.” Because these deities are of superior power to the possessing ghost or demon, once the medium has become voluntarily possessed, the incarnate goddess is able to drive out the *pey* through a combination

of supernatural threats and material sacrifices. The negotiation between the two possessed individuals may consume many hours, with the goddess-exorcist demanding that the *pey* leave and hurling insults at it and the ghost attempting to retain hold of the possessed woman and requiring various gifts or sacrifices before agreeing to exit. The exorcists who “dance the goddess” may resort to physical violence against the *pey*, beating the possessed or pulling her hair in order to convince the spirit inside that it must acquiesce and depart. This form of exorcism conceives of the struggle for healing as properly a battle between supernatural beings—the ghost versus the goddess—who nonetheless act through and on human bodies. The long hours of music, the dance, the confrontation between the two possessing personalities, and the ultimate triumph of the goddess-exorcist provides healing for the possessed victim as well as entertainment for the local village.

This counterpossession model of exorcism is supplemented by local practices with a more restricted geographic range. In the South Arcot District of Tamil Nadu, for instance, exorcisms sometimes are conducted by troupes of musicians known as *pampaikkarar*. The exorcism in this instance begins with a singer attempting to lure the possessed woman into a state of trance, after which the ghost who is possessing her may be interviewed. The details of its biography, death story, and the circumstances surrounding its possession of the victim are elicited; indeed the ghost is encouraged to explain its restlessness and its desires. As the music continues into the night, it is not uncommon for bystanders to dance the goddess, thus combining the better-known ritual with the more localized practice.

After the possessing spirit and its grievances have been identified, the musicians negotiate with it, promising a sacrifice in return for its pledge to depart. The spirit is asked to identify the specific lock of the victim’s hair in which it resides; this tress is then tied into a knot over the protestations of the *pey*, which may complain that the action is painful. Afterward the sacrifice, a chicken, is offered, with its severed head being placed in the victim’s mouth. This action shocks and frightens the *pey* and represents the beginnings of the actual expulsion. The possessed is then handed a large stone, said to represent “the weight of the *pey*’s desire,” and is herded toward the nearest tamarind tree. After the possessed person reaches the tree, the rock is laid at its roots, and the knotted lock of hair that contains the spirit is cut from the possessed woman’s head and nailed to the trunk. Following this the exorcism is complete and the victim is considered healed. The culminating actions of the exorcism have been interpreted by Isabelle Nabokov in her article “Expel the Lover, Recover the Wife” (1997) as representing the final “divorce” of the lonely ghost from its victim and its “remarriage” to the tamarind tree, understood as a female entity in Tamil culture. When the *pey*’s desire is given to the tamarind and the *pey* is severed from the woman and united with the tree, the affections of the lonely ghost are thereby redirected to a nonhuman object.

SCHOLARLY INTERPRETATIONS OF EXORCISM. Exorcism has long attracted attention from academics, thus becoming a category of scholarly analysis as well as of religious practice. The comments below identify some major strands in the interpretation of exorcism emanating from within the disciplines of anthropology, psychology, and history. Many of these analyses have tried to address the question of why women predominate in reports of possession and exorcism.

Anthropology. In the late nineteenth century and early twentieth century, the foundational literature of cultural anthropology gave prominent place to divergent cultural conceptualizations of spirits, their capabilities, and human responses to them. This focus was characteristic of the early anthropological approach to so-called “folk” religions, viewed as largely indistinguishable from culture, in contradistinction to “historical” religions, based on scriptural canons and textual precedents. Thus the anthropological literature on spirit possession and exorcism has a long and complex history within the discipline.

A well-known modern anthropological analysis of spirit possession and exorcism is I. M. Lewis’s important 1971 work, *Ecstatic Religion*. Lewis was struck by the frequency with which socially marginal groups, particularly young women, were involuntarily overtaken by spirits, a phenomenon he termed “peripheral possession.” He further noted that, while in a state of possession, the women often gained prestige and were able to act in more assertive ways than was the case in their regular daily lives. Thus they might openly critique their husbands or relatives, shirk household duties, or act in ways deemed immodest or inappropriate for their cultural settings. Lewis suggested that the reason for women’s predominance among the spirit possessed in nearly all cultures is related to a covert desire for status enhancement. Women’s possessing spirits allowed them to articulate resentments and desires that they normally would have had to suppress while simultaneously permitting them to disavow personal responsibility for their transgressive actions. This dynamic only reached its fullest expression, however, in the process of exorcism, which in many cultures takes the form of bargaining with the spirits to depart. The spirit may demand a series of concessions before agreeing to leave, often in the form of material gifts of direct benefit to the possessed woman: a feast, new clothes, or some other special treat.

Many scholars have suggested alternatives to Lewis’s analysis or raised critiques to his approach. Bruce Kapferer, in his 1983 study of exorcism in Sri Lanka, *A Celebration of Demons*, argued that Lewis overvalued individual motivations and self-determination and undervalued broader cultural forces that symbolically align women with the sphere of the demonic and the unclean. Other scholars, including Janice Boddy in her review article “Spirit Possession Revisited” (1994), have called for a reframing of the question that moves “beyond instrumentality” to discuss broader notions of gender, body, and social organization that mitigate a narrowly functionalist view. Others, like Isabelle Nabokov

(1997), have vigorously disputed the notion that exorcism acts to advance the interests of marginal groups, interpreting its symbolism as, rather, a means of asserting the hegemony of dominant cultural values. Nevertheless Lewis’s “social deprivation analysis” remains a dominant influence in anthropological studies of exorcism. Lewis renewed his analysis in a follow-up study published in 1986, *Religion in Context*; this work in turn was reissued in an expanded edition in 1996.

Psychology. The interest of psychologists in possession and exorcism originates with Sigmund Freud, who in the 1920s wrote about the seventeenth-century case of the painter Christopher Haizmann. (A translation of this work is in Brian Levack, *Possession and Exorcism* [1992].) Regarding accounts of Haizmann’s possession as descriptions of a “demonological neurosis,” Freud presented an elaborate interpretation centered on Haizmann’s depression due to the death of a close relative, whom Freud assumes to be Haizmann’s father. The devil, Freud writes, entered into a contract with Haizmann in which he agreed to serve as the painter’s father figure for a term of nine years. Freud argues that the use of the number nine in relation to a span of time reveals Haizmann’s adhesion to a feminine aspect in relation to his father, indeed “a long-repressed phantasy of pregnancy” (nine being the number of months of gestation), combined with a strong castration anxiety (Levack, 1992, p. 90). Haizmann’s eventual release through exorcisms and a pilgrimage to a shrine to the Virgin Mary signal Haizmann’s salutary turn toward another substitute parent, the mother. Through maternal intervention, Haizmann is sufficiently healed to enter into a religious order, thus finding a more appropriate father substitute in these “fathers of the church.”

Nevertheless Freud’s interest in these phenomena set the stage for further psychohistorical and ethnopsychological investigations into possession and exorcism. Understandings of spirit possession as a culturally constructed idiom for expressing repressed or illicit desires, as forms of wish fulfillment, as involving supernatural parent or lover substitutes, or as representative of sexual anxieties and identity disturbances are now a significant component of the scholarly literature. Once again the predominance of young women among the possessed has proven particularly provocative to scholars because the notion of physical penetration by a spirit, often conceived as male, lends itself both to a psychosexual analysis and also potentially to a diagnosis of disturbed gender identity.

Exorcisms have been regarded as having therapeutic value in part because they are couched in the same idiom as the patient’s own expression of neurosis while nonetheless orchestrating the same kind of emotional buildup and catharsis that underlay Freud’s early psychoanalyses. The emphasis upon social reintegration that is central to many exorcism rites has been seen as a cipher for the reintegration of the individual sufferer’s psychic or sexual self: “the expulsion of the masculine and the resumption of an unfragmented conventional sexual identity,” according to Lyndal Roper in

Oedipus and the Devil (Roper, 1994, p. 191). Conversely, the psychological commonplace of “exorcising inner demons” forces a convergence between religious and psychoanalytic idioms. Exorcism and therapy are thereby defined as different terms for the same healing process.

History. Historians have turned their attention to spirit possession and exorcism relatively recently as part of the movement toward cultural history (sometimes called history of mentalities). Whereas the dominant anthropological and psychological interpretations of exorcism focus upon the victim’s experiences and desires, the leading historians working on this problem emphasize the societal power relations deployed in the performance of exorcism. (Indeed Freud’s psychoanalysis of Haizmann has been sharply criticized by Eric Midelfort in his article “Catholic and Lutheran Reactions to Demon Possession in the Late Seventeenth Century” [Levack, 1992] as anachronistic and individually overdetermined, with too little consideration given to the structure of the contextual society.) Thus the focus of historians has been less on the person who is the object of the exorcism and more on the ways practices of exorcism fuel larger social processes. It has been seen then as either a dynamic or a static social force, depending on the context.

An example of exorcism’s potential to propel change is provided by the many scholars who have elucidated its value as a catalyst for conversion. These historians have pointed out how successful public exorcisms can be instrumental in recruiting new believers to the religion of the exorcising group. The rite often seems to have functioned in this way when practiced within a context of intense competition among rival religious systems. As a visible, materially enacted battle with supernatural referents, exorcism easily can become a testing ground for the power of one deity, doctrine, or practice over another. In other cases, however, exorcism may be used to reaffirm a potentially threatened continuity with the past. Thus as noted above the fifteenth-century rise of liturgical exorcism has been shown to be linked to a broader struggle on the part of the Catholic hierarchy to reaffirm its traditional authority at a moment of significant instability and stress. Here innovation in the performance of exorcism acted to reinforce the institutional prerogatives of the Catholic Church.

Perhaps the most elegant historical study of exorcism has been penned by the French social theorist Michel de Certeau. The author’s article “Language Altered: The Sorcerer’s Speech” in *The Writing of History* (1988) focuses on the ways in which early modern exorcists reasserted the hegemony of written traditions by turning to them for neat categorizations of the untidy, real-life possession cases unfolding before them. Certeau begins by noting that a diagnosis of possession was usually applied to a woman soon after she manifested a “disturbance of discourse.” No longer an individual, well-bounded subject, the possessed woman was viewed as displaced from herself. The invading spirit disrupted the continuity of the victim’s selfhood by speaking

through her mouth: her lips and tongue pronounced the spirit’s sentiments and experiences. Thus for Certeau, the speech of the possessed woman was a logical paradox that existed outside normally comprehensible speech patterns. The speaking entity was both male and female, mortal and immortal, powerless and powerful, the victim and the Other.

The processes of exorcism and conjuration of the spirit, Certeau suggests, were a means of resolving this logical paradox by identifying the indwelling spirit. Thus the first goal of an exorcism always was to categorize the speech of the victim as the discourse of a specific, indwelling demon known in advance from exorcistic and demonological literature: Beelzebub, Asmodeus, Leviathan. Through this process, the exorcism transformed the garbled speech of the possessed woman into the recognizable voice of a well-known demon. Naming the demon in turn gave the exorcist power over it: the conjuration could then proceed as a series of conversations between the exorcist and the indwelling demon. Hence the exorcist only can gain mastery by identifying the speech of the victim with a specific demonic name, but in the process the possessed woman’s identity is occluded. Exorcism is an assertion of power, Certeau suggests, insofar as it superimposes traditional categorizations over the creative potential of a paradox. It thus acts as a potent tool of social control.

EXPERIENCE, RELIGIOUS SEE RELIGIOUS EXPERIENCE

EXPIATION SEE ATONEMENT; CONFESSION OF SINS

EXPULSION. Expulsion can be harmful but also beneficial, depending on the purposes toward which it is directed. Associated concepts are alienation, banishment, excommunication, exile, exorcism, expurgation, purification, repentance, scapegoating, defilement, and cleansing. Greeks, Romans, and Indians practiced expulsion as a means of exerting social control over individuals or groups over millennia. Against that cultural background, religious communities adopted and adapted expulsion to their own purposes and provided some of the most dramatic instances of one or another form of expulsion.

The story in the book of *Genesis* in the Hebrew Bible of Yahweh sending Adam and Eve from the Garden of Eden as punishment for their disobedience of his commands is an archetypal story of expulsion that is widely known, particularly in the West. One widespread and persistent interpretation of the story asserts that ever since that momentous expulsion humans have been estranged and alienated from their proper relationship with the divine. Religious communities often seek to provide means to restore the relationship, sometimes through rituals, sometimes through recommended ethical behaviors, sometimes through doctrines said to articulate the proper understanding of the divine-human relationship to which intellectual assent by believers is required.

Further narratives abound in the literature of many other religions indicating that similar experiences occur within their residual memories of the realm of human relations as individuals are estranged from and by other individuals. Humans also experience alienation from themselves and from their feelings and thoughts, sometimes referred to as “self-alienation.” This underscores the necessity to attend to spiritual and psychological dimensions to provide a rounded account of expulsion.

Being alienated from family, friends, communities, organizations, and nations happens as a result of beliefs, actions, and even attitudes that run counter to prevailing norms. Although sometimes voluntary, when for principled reasons a person goes into exile, more often it is a punishment imposed by others. Think of Alexandr Solzhenitsyn, banished by Soviet Union in the 1970s for his books criticiz-

ing communism. In Solzhenitsyn’s case the demise of the communist regime in the early 1990s enabled him to return to his beloved country freed from the dictatorial power that had expelled him.

EXILE. A person can be excommunicated from a community for denying beliefs held to be central to that community or for actions judged unacceptable by the community. In such instances a prescribed path is sometimes offered to enable the excommunicant to return to the community. Instances of such banishment and subsequent restoration are in the histories of such groups as the Amish, the Mennonites, and the Hutterites. Expulsion from such groups is often the penalty for some member becoming too “modernistic” in belief or action. A return is sometimes achieved by the person’s renouncing or recanting her or his offending beliefs or practices. In such instances the power and authority of the community and its traditions is affirmed first by the expulsion and then by its allowing the offender to return on terms the community establishes. Temporary expulsion is a form of ostracizing a person or group for a time of chastisement.

Thus a person can either voluntarily enter into exile to protest a turn of events within a community, often a nation in which a person has held a position of leadership, or one can be banished and thereby become an exile. In the instance of voluntary exile a person makes a principled move aimed at calling attention to, and seeking allies to oppose, whatever is objectionable. In either case, if the situation changes in the community or nation, the person in exile sometimes returns, even triumphantly. A prominent historical instance of this is the case of Martin Luther (1483–1546), who was declared a heretic by the Roman Catholic Church after the Diet of Worms in 1521 and simultaneously was declared an outlaw by the Holy Roman Empire. However, Luther was protected by Prince Frederick the Wise against any move Emperor Charles might have made to enforce the death penalty pronounced against him.

After two years in hiding, Luther returned to Wittenberg, the university city in which he had written his critique of many of the central beliefs and practices of papal Roman Catholicism. That Luther made this return and lived there until his death in 1546 demonstrates that the power and control of both the pope and the Holy Roman emperor were insufficient to make Luther’s expulsion effective. He freely moved about in those Germanic territories in which he lived. His banishment by and from Catholicism had no practical consequences for him in that Luther defied both church and Empire and lived to tell the story. In addition, his actions and thoughts led to the emergence of a new interpretation of Christianity called Protestantism.

BANISHMENT. Expulsion is neither voluntary, as exile sometimes is, nor is there usually any possibility of return, as excommunication sometimes offers. Expulsion is a decision made by people holding power to enforce the judgment against a person or group based on a claim that the larger community will be improved or enhanced by ridding itself

of those objectionable or corrupting people. Such a draconian judgment leaves those expelled without the support of a society or institution. Thus expulsion is synonymous with irreversible banishment. It is one of the cruelest acts that can be perpetrated against humans, for it is a deliberate cutting off of individuals or groups from the social, economic, spiritual, and other resources of the expelling community. It is a sentence of “social death.”

The ideology of expulsion rests upon two bases. First, those who hold sufficient power to impose expulsion typically regard themselves as the sole authentic power center of the institutions over which they rule or within which they hold authority. Any opponents who are perceived to hold views antithetical to those held by the rulers are regarded as threats to the established status quo, and thus as dangerous. This justifies the decisions to rid the institution, the community, or the nation of the purported threat. “Away with them,” is the response. Second, those who impose the expulsion reduce those who are victims in some way or another to either a real or virtual subhuman characterization. This attitude dehumanizes those who thereby become “others” and both allows and legitimizes cruelty and banishment of those “heretics” or infidels. Sometimes such practices are forms of creating a scapegoat, which is the practice of identifying an innocent person, group, or even animal to bear the guilt and blame that rightly belongs to others (cf. *Lv.* 16 in the Hebrew Bible). Scapegoating is the false accusation of an offense that results in the persecution or even murder of those so accused.

One of the most widely known instances of a collective expulsion is that of Jews being driven from Spain in 1492, ironically the date that also marks the voyage of exploration of Christopher Columbus. The notorious Tomás de Torquemada (1420–1498) persuaded King Ferdinand and Queen Isabella to expel the Jews. He argued that the Catholic faith was in peril due to the corrupting presence and influence of the false converts from Judaism (and from Islam as well) who were called *conversos* or, even more insultingly, *marranos*, the Hebrew word for pig. This dogmatic and literalistic perspective insisted on one and only one interpretation of Christianity. It overruled any vestige of Christian charity and forced a major eastward movement of Jews. In the twentieth century the Holocaust perpetrated by Nazi Germany focused its horrendous persecution and extermination upon the Jews in many European countries. The goal was the annihilation of all Jews everywhere. This is quantitatively one of the most radical instances of expulsion and destruction in history.

The powerful residual memory of this expulsion contributed significantly to the idea of Jewish immigration to the “promised land” of Zion. In the nineteenth century some Jewish thinkers, such as Theodor Herzl (1860–1904), developed the ideology of Zionism. The combination of the Holocaust and Zionism propelled the migration of Jews from many nations to Palestine and the creation of the State of Israel in the twentieth century.

PURIFICATION. There are, however, other considerations pertaining to expulsion. The eminent twentieth-century historian of religions Mircea Eliade notes that expulsion is not always a negative or reactive matter, at least in connotation. Rather, he convincingly demonstrates that in many cultures and religious traditions expulsion is a rite of purification incorporated into rituals of regeneration. He observes that “demons, diseases, and sins” are all subject to expulsion by ritual actions and that they are regarded as evils that must be expelled in order for the cleansing to be complete (Eliade, 1959). If one recognizes these “expulsions” as having contemporary analogues, this positive connotation takes on a deeper resonance. For example, in the practice of scientific medicine, prescriptions of certain medicines are precisely meant to expel symptoms and the disease they manifest. Further, certain surgical interventions are designed to remove diseased organs or intrusive growths that are compromising the health of a person’s body.

Confession of sins is a prominent dimension of certain modern religious practices. Confession leads to repentance and, in some traditions, to the requirement that the penitent person engage in certain actions designed to purge the sins that have been confessed. This is a kind of expulsion that is accomplished in the combination of confession and penance.

The idea of demons still awakens deep anxiety and even fear in large numbers of people. “Demon possession” is a diagnosis not confined to persons but also applied to physical places, such as buildings and homes. The depth of this sensitivity gives rise in some traditions to the practice of exorcism. Two definitions of *exorcise* are to expel (an evil spirit) by, or as if by, incantation, command, or prayer; and to free from evil spirits or malign influences. Popular culture bears witness to the power of the ideas of demon possession and exorcism through both the novel and the movie from the 1970s entitled *The Exorcist*. The extraordinary longevity of both book and movie and the remarkable breadth of their popularity demonstrate that demons still occupy a lively place in the contemporary human imagination.

Thus, if diseases, sins, and demons are regarded as realities in the lives of humans from antiquity until the twenty-first century, then means for expelling them—and thereby purifying and regenerating their hosts—will also predictably be of widespread interest and concern. Such instances of expulsion are valued and sought after.

Finally, another form of expulsion is manifest in the act of expurgation that aims to remove or expel objectionable material from a book or magazine or some other word-based medium before it can be published. This, like exorcism, aims to cleanse or purify a text of some kind or other as targeted material. In text-based religious traditions great care is expended by designated guardians who comb earlier editions to identify any items that need expurgation to ensure that new editions of the sacred writings are as accurate and error-free as possible. This practice demonstrates another instance of expelling what is objectionable and unwanted by partici-

pants in a community who are committed to living in conformity with the pure words of their texts.

In the contemporary world, formal religious expulsion, or even expurgation, is comparatively rare, in large measure owing to the heterogeneity of modern societies. People are less confined to participation in only one social, or even religious, grouping. Thus the power of expulsion is reduced to a degree. But informal and powerful instances of ostracizing or banning people still persist in some communities. To the extent that such practices are employed under any circumstances, they serve to demonstrate that expulsion resonates, even in the contemporary world, as a tool of imposing conformity of beliefs, attitudes, and actions.

JAMES B. WIGGINS (2005)

EYE. The eye is one of the most widespread symbols in all religious representation. As the active organ of visual perception, it is closely linked with light. Without light, the eye could neither see nor discern clearly. It is therefore only natural that in most cultures the eye is the symbol of intellectual perception and the discovery of truth. The eye knows because it sees. As early as the fifth century BCE, Democritus thought that certain images exist already in the body and that they emerge from the gaze of certain persons. Pliny the Elder explained that the small image inscribed in the pupil is a sort of miniature soul (*Natural History* 21.12.51). Similarly, the Bambara of West Africa say that the image perceived by the eye is, in fact, the double of the object or being that is seen: "Man's world is his eye." Thus the eye is often considered the mirror of the soul, the body's window, which reveals each person's deep thoughts by means of his gaze. As the mirror of the interior, the eye is the place where the mysterious life of the soul is glimpsed. In seeking to discover the reality behind the physical appearances it perceives, the eye becomes the locus of inner revelation. The expression "His eyes were opened" means that a rational or religious truth has been unveiled.

According to the symbolic conception of man as microcosm, which is found in the most ancient cultures, the eye

is likened to the sun. Like the luminous star, it sees all, shines, and sparkles. Its glances are rays that pierce like arrows. Among the Semang, the Boshiman, and the Fuegians, the sun is the eye of the supreme god. This isomorphism of the eye and the sun reveals moral and religious values according to which all vision introduces clairvoyance, justice, and righteousness. Just as the sun illuminates by projecting its light everywhere, the eye seeks to discover and see everything, even faults and crimes. It thus becomes the emblem of a superior being who punishes and takes vengeance. To be all-seeing is to become omnipotent. Such valorization of the eye sometimes leads to its sacrificial oblation, which results in a supernatural second sight that replaces and sublimates simple, corporeal vision. This second sight is like the inner eye, or the "eye of the heart," so common among mystics who perceive the divine light.

THE EYE AS DIVINE ATTRIBUTE. In Egypt, as in the most ancient cultures of the eastern Mediterranean Basin, the presence of a symbolic eye signifies the power of the supreme divinity to see and know everything. Thus "the eye of Horus" appears on the stela of Memphis, and eyes are engraved on a Cretan ring in the Ashmolean Museum (Oxford University), the symbol of an anonymous divinity who looks at and listens to men. The sacerdotal myths and traditions of ancient Egypt testify that the eye has a solar nature and is the fiery source of light and knowledge. Re, the sun god, is endowed with a burning eye and appears in the form of a rearing cobra with dilated eyes. In the cult of Harmerti, Re and Thoth are the two eyes of Horus, the god of the sky. One Harmerti story relates the struggle between Horus and Seth; Seth pokes out the eye of Horus, who is later cured by Thoth. The healed, healthy eye is the *oudjat* eye that shines in the dark and vanquishes death. *The Book of Going Forth by Day* (17.29ff.) recapitulates that mythical episode in a formula that is said to the dead person by the one playing the role of Thoth: "I restore to the eye the fullness it possessed on the day of the fight between the two adversaries." This means that light and darkness, life and death, are reconciled in the beyond. This *oudjat* eye was painted on the inner sides of the coffin, on each side of the head, and an inscription affirmed that they were hereafter the eyes by which the dead person would see in the afterlife and which would permit him to follow the spectacle of the exterior world while remaining in his tomb. The *oudjat* eye was provided for the dead person "in order that he be animated by it" (Pyramid Texts 578). This is why Horus's eye made an excellent amulet.

At Tell Brak in eastern Syria, the excavation of a sanctuary going back to 2500 BCE has revealed the worship of a divinity with a thousand eyes. In this temple consecrated to Inanna (Ishtar), hundreds of statuettes with multiple eyes have been found, votive offerings or apotropaic images attesting that the eye was the emblem of that all-seeing and omnipresent feminine divinity. Analogous finds have been made at Ur, Lagash, and Mari. Inanna's brother Shamash is the sun god, whose eye sees everything and who knows the most se-

cret thoughts. He can reward or punish deliberately. In Babylon, Shamash was invoked before every divination, for he was the one who wrote the signs in the entrails of sacrificial victims. Without his help, the diviner could not see them.

The Indo-European world attached the same value to the eye as to the sun and to the gods, that is, the quality of being able to see everything. In the *R̥gveda*, the god Sūrya, son of Dyaus, is called “the eye of the sky” (10.37.2) and “the eye of Mithra and of Varuna” (1.115.1, 7.61.1, 10.37.1). He sees from afar and everywhere, and spies on the whole world. Varuṇa, the celestial god, is described as *sahasrāta*, god of a thousand eyes, for he sees everything. According to the hymn of Puruṣa (*R̥gveda* 10.90), the sun was born from the eye of the cosmic giant Puruṣa so that at death, when a man’s soul and body return to the cosmic primordial man, his eye will go back to the sun. It is understandable why, in the *Bhagavadgītā* as well as in certain Upaniṣads, eyes are identified with the two celestial lights, the sun and moon, which are the eyes of Viśvakarman, the divine architect with multiple eyes who ordained everything. The Tamil caste of the Kammalans, who claim to descend from him, have as their main task painting the eyes of divine statues according to a ritual as sacred as that of the *oudjat* eye, the eye of Horus, in Egypt. In Iranian tradition, the sun is also the eye of Ahura Mazda (*Yasna* 1.11), whereas in the tenth *Yasht* of the Avesta, Mithra is called the “master of vast plains who has a thousand ears and ten thousand eyes,” thus assimilating him to the sun.

For the Greeks, the gods “with piercing gaze” saw everything belonging to the past, present, and future in a single, unified vision. This *panopteia* is the very mark of their divinity. Thus there is Kronos, who has four eyes, two in front and two in back; Zeus, whose “vast gaze” pierces through to the most secret things (Hesiod, *Works and Days* 240, 265); Apollo, the solar god, who sees everything (*Iliad* 3.277, *Odyssey* 11.109); and Dionysos, whose Bacchic hymn repeats that he “shines like a star with his eye of fire that darts its rays over the whole earth” (Diodorus of Sicily, 1.11.3). All the Greek gods cast a sovereign and pure gaze on man. The gaze of Athena Glaukopis shines and fascinates; the eye she fixes on her enemies is “a sharp one, an eye of bronze.” When Achilles, driven by rage, tries to kill Agamemnon, Athena seizes him by his hair and forces him to look at her. The hero cries out, “It is terrifying to see the light of your eyes” (*Iliad* 1.200), for the light in her eyes is the light of reason. In Greek poetry, the image of the eye or the pupil is used to mark the quality of a person and the affection one feels for him: “Where is the eye of my beloved Amphiaros, this hero who was both a seer and a valiant warrior?” (Pindar, *Olympian Odes* 6.16.7). The Greek religious experience consisted primarily of a vision. Since Homeric times, an indissoluble relationship has existed between knowing and seeing; knowledge is based on sight, on an optical intuition. In his *Metaphysics*, Aristotle speaks of that joy of seeing, which makes a better basis for knowing than any other perception. The

joy of sensitive contemplation is the climax of the initiation into the great mysteries of Eleusis, the *epopteia*, and the very source of all philosophy, repeats Plato (*Timaeus* 47a). For the knowledge of truth rests on a vision that moves upward from tangible realities to timeless and eternal things: “Holy is the man who has the gods before his eyes” (scholium on Pindar, *Pythian Odes* 4.151b).

The Germanic and Celtic worlds also valued the magical power of the eye. Óðinn (Odin), god of war and magic, is a one-eyed god, for he voluntarily gave an eye in payment to the sorcerer-giant Mímir, or Memory. In return, Óðinn was permitted to drink every day at the spring of knowledge and thus to learn the science of the runes. The loss of an eye is therefore the means of acquiring superior vision and the supernatural powers that flow from it. After the Vanir killed Mímir, Óðinn practiced divination by interrogating the head, which he succeeded in preserving (*Ynglingasaga* 4, 7). This theme of knowledge acquired as a result of blindness—even ocular mutilation—is found elsewhere in other Indo-European traditions. Thus, the Greek diviner Tiresias attains the ability to see the future by becoming blind; Oedipus learns the will of the gods by blinding himself; and the blind king Dhṛtarāṣṭra in the *Mahābhārata* has special powers. Blindness, or voluntary mutilation of the eyes, becomes the sign of the superior sight possessed by the druids and the diviners. Indeed, this quasi-magical power of the eye is found again in Celtic myths. The god Lugh keeps only one eye open. He makes a tour of the enemies’ camp, hopping and singing in an act similar to Óðinn’s during the battle between the Æsir and the Vanir. The same attitude is found in the Celtic hero Cú Chulainn, who, when seized by furor, closes one eye and enlarges the other, or sometimes swallows one eye and places the other on his cheek to frighten his adversary. Many Gallic coins show a hero’s head with an eye disproportionately enlarged.

Other myths also valorize the magical power of the one-eyed person, as if the reduction of vision to a single eye increased the intensity of the gaze. Thus a glance from Medusa’s single eye petrifies anyone who crosses its path, for it is the glance of death that leads to Hades. To overcome it, Perseus must first escape the other two Gorgons and hide the one eye they share between them. He conquers Medusa only by making use of Athena’s mirror, which allows him to see the monster without being seen by her.

THE EVIL EYE AND MAGIC. The belief in the unlucky influence of the evil eye is universal. It rests on a valorization of the gaze reputed to be harmful because the eye is abnormal (eyes of different colors, double pupils, squinting); such a gaze magically reveals the malevolent intention of the soul whose window the eye is. The evil eye, cast for vengeance or out of envy, is an invisible threat against which one must protect oneself with counter-magic, as, for example, in this Babylonian incantation: “Take the eye, attach its feet to a bush in the desert, then take the eye and break it like a pottery vase!” In Egypt it was common practice to bear apotro-

paic names, wear amulets, and recite formulas. In the Roman world, fear of the *fascinum* was constant. Many mosaics have as a central motif a dangerous eye pierced by an arrow, surrounded by animals, and defended by an owl (the bird of evil omen) perched on its eyelid. Against this danger, people resorted to amulets picturing an eye or a phallus. Eyes were even painted on the prows of boats.

Ever since the time of the apostle Paul (*Gal.* 3:1), Christian preachers never ceased to raise their voices, in vain, against the belief in the evil eye. Some rituals of the Greek Orthodox church as found in the *Mikron Euchologion* contain a formula for exorcism against *baskania* (“witchcraft”) similar to that found in certain Babylonian curses. The same belief is found in pre-Islamic Arabia and in the Muslim world. Muḥammad himself recited incantations to preserve his grandson from the evil eye, reviving the formulas that Abraham made use of in order to protect Ishmael and Isaac, the legend says. One Arabic proverb states that “the evil eye empties houses and fills tombs.” The eye frequently occurs in the magical preparations of certain African ethnic groups as well as in the Eastern Orthodox world, where the eyes of the figures in icons were poked out and crushed and then made into a magical powder.

RELIGIOUS AND MYSTICAL VALUES OF THE EYE. The word *eye* recurs 675 times in the Hebrew scriptures (Old Testament) and 137 times in the New Testament; this indicates the richness of its symbolic meanings. It designates, first, the organ of vision fashioned by the creator for the good of man (*Ps.* 94:9, *Prv.* 20:12), for “it is a joy for the eye to see the sun” (*Eccl.* 11:7). But the eye is also a privileged organ of knowledge that scripture always associates with the characteristics of the wise and learned: for example, Balaam, the diviner whose eye is closed to the terrestrial realities that surround him but is open to the hidden and the invisible once he meets the All-Powerful (*Nm.* 23–24). The Targum Yerushalmi makes Balaam a one-eyed seer, thus taking up again the theme of a second sight superior to normal corporeal vision. Symbolically, the eye designates the consciousness of man that Yahveh opens to the knowledge of his law and therefore of good and evil (*Dt.* 29:3, *Is.* 6:10). For Yahveh sees all (*Ps.* 14:2); he is the witnessing God from whom nothing escapes (*Ps.* 139:7–8). This ability to see all is an essential characteristic of his transcendent sovereignty, and the divine eye is the administrator of justice: before it the just man can find grace (*Dt.* 31:29, *Jb.* 11:4). But it is also the paternal eye of Providence, “who turns toward those who fear him” (*Ps.* 33:18), like Nehemiah praying night and day for the people of Israel (*Neh.* 1:6, *Lv.* 16:2, *Nm.* 4:20).

But however great his desire, man may not see God face to face (*Ps.* 42:3), for no one can see Yahveh without dying (*Ex.* 19:21, *Lv.* 16:2, *Nm.* 4:20). Even Moses saw only the back of the glory of God (*Ex.* 33:20–23). If some prophets have had a vision of divine glory, it is in a fugitive and symbolic fashion, through a cloud or in human shape. Thus Zachariah (c. 520 BCE) saw Yahveh put before the high priest

“a single stone decorated with seven eyes,” symbol of God’s vigilant presence in his temple. They are the seven planets, or seven divine eyes that sweep over the earth without resting. Likewise Ezekiel, in his vision of the chariot evoking Yahveh’s throne, sees wheels whose rims are decorated with open eyes (*Ez.* 1:18), signs of Yahveh’s omniscience.

Although, as the apostle John says, “No one has ever seen God” (*1 Jn.* 4:12), Jesus promised the pure in heart that they shall see God (*Mt.* 5:8). This beatitude makes of the eye a symbol of inner purity (*Mt.* 6:22–23); otherwise the eye, as the opportunity for scandal, ought to be plucked out and thrown far away. Early Christian preaching insists on the opposition between the eyes of flesh and those of the spirit; in Paul’s case, physical blinding symbolically preceded the opening of the eyes of the heart (*Acts* 9:18). Furthermore, the function of the Son is to render visible his Father: “Whoever sees me has seen the Father,” says Jesus to Philip (*Jn.* 14:9). But at the end of time, full vision will be given to everyone and “man’s eyes will contemplate the glory of God just as he is” (*1 Jn.* 3:2). Gnosticism especially retains the Pauline theme of “the eye of the heart,” an image already frequent in the writings of the Greek philosophers and the Hebrew rabbis. For the gnostic, “the eye is the inner light to the man of light” (*Gospel of Thomas*, logion 24), and the prototype of the man of light is “the eye of light” (*Sophia of Jesus Christ*).

In numerous philosophical and religious traditions, the inner eye allows access to wisdom. Plotinus explains that the eye of the soul dazzled by the light of understanding is fixed on pure transparency; the soul therefore sees the light found at the interior of his own gaze, and the eye of understanding contemplates the light of *nous* by participating in the very light of this sun-spirit (*Enneads* 5.3[17].28). Recalling that the wise man is he who sees and that the fool is blind, Philo Judaeus explained that formerly the prophets were called “seers” (*1 Sm.* 9:8). For him, wisdom is not only what is obtained by the vision of the inner eye, just as light is perceived by the carnal eye; but wisdom also sees itself, and this is the splendor of God, who, in opening the soul’s eye to wisdom, shows himself to man (*De migratione Abraham* 38).

In Hinduism, the god Śiva is endowed with a third eye, the frontal eye that gives him a unifying vision. His look of fire expresses the pureness of the present without any other temporal dimension, as well as the simultaneity of beings and events, which he reduces to ashes in revelation of the all. Likewise Buddha, the “awakened one,” received inner enlightenment through the celestial eye, which permitted him to see the life of all beings simultaneously and gave him the knowledge of the chain of the fundamental forces of existence as well as its previous forms. This eye of wisdom, *prajñācakṣus*, is found at the limit of unity and multiplicity, of emptiness and creation; it permits the wise man to grasp them simultaneously. The organ of inner vision, it is the very sign of Buddhist wisdom.

But the inner eye is the organ of wisdom only because it is capable of actually experiencing the divine. Every revelation presents itself as a veil that has been pulled back before the gaze of religious man, for whom the beatific vision and the contemplation of God are the very essence of eternal life. The eye of the heart is thus a frequent theme in spiritual and mystical literature. Just as the eye can neither see nor discern its object without light, so the soul cannot contemplate God without the light of faith, which alone opens the eyes of the heart. “Man must therefore become entirely eye”; such is the teaching of the Desert Fathers reiterated by Symeon the New Theologian (*Hymns of the Divine Loves* 45), for the soul’s eye, relieved of carnal passions, can perceive the divine light that opens up on the heavens. Following Origen and his theory of spiritual senses, Gregory of Nyssa, Augustine, Bernard of Clairvaux, and all the Fathers state that it is God who, by opening the heart’s eye, makes one see. Meister Eckhart again picks up this teaching (*Sermons*), and Teresa of Ávila specifies that what we know otherwise than by faith, the soul recognizes at sight, although not by eyesight. Leon Bloy writes in his *Journal* (June 6, 1894) that “we must turn our eyes inward” in order to speak our desire for a vision of truth, for the carnal eye only allows us to see “in enigma and as in a mirror.” The eye of the heart is therefore man seeing God and, at the same time, God looking at man; it is the instrument of enlightenment and inner unification: “We shall find the pearl of the kingdom of heaven inside our hearts if we first purify the eye of our spirit” (Philotheus of Sinai, *Forty Chapters on Spiritual Sobriety* 23).

MICHEL MESLIN (1987)

Translated from French by Kristine Anderson

EZEKIEL (sixth century BCE), or, in Hebrew, Yehezqel, was a Hebrew prophet. A hereditary priest, Ezekiel is known primarily from the biblical book of prophecy named after him that contains first-person reports of revelations made to

him. For example, the opening verse of *Ezekiel* reads: “In the thirtieth year, in the fourth month, on the fifth of the month, when I was among the exiles on the Chebar canal [in the vicinity of the Babylonian city of Nippur], the heavens opened and I saw a divine vision” (a description of God’s majesty borne on the divine “chariot” follows). The time of his prophesying is fixed by some fifteen dates scattered through the book, which, apart from the obscure first one cited above, belong to the era of “our exile”—that is, the exile of King Jehoiachin of Judah, his courtiers, and his administrative staff, in 597 BCE); it may be inferred that Ezekiel was among those deported to Babylon with the king. The dates fall between 593 and 571, all within the reign of the Babylonian king Nebuchadrezzar II (605–562), who is mentioned several times in the book as a world conqueror. No references to events subsequent to the reign of that king are made, nor does the editorial work on the book necessitate assumption of later hands, so that its contents—internally consistent though literarily varied—may be considered the record of a single author’s career. The only personal details given of Ezekiel’s life are his priestly descent and the death of his wife in exile. That the enigmatic “thirtieth year” of the opening verse (cited above) alludes to the prophet’s age at the start of his vocation is an unsupported guess that goes back at least as far as Origen.

Two determinants of the prophet’s outlook stand out in his prophecies: his priesthood and his exile. The former is reflected in his schooling in the full range of Israel’s literary traditions (legal, prophetic, historiographic), his manner of expression (echoing the Priestly writings of the Pentateuch), and his preoccupations (the Temple, God’s holiness, offenses against his worship). The response to exile is reflected in Ezekiel’s anguish and rage at what he perceives as God’s rejection of his apostate people. Ezekiel’s prophecy is characterized by a leaning toward systematization; he propounds doctrines permeated by a severe logic that centers on the injury Israel inflicted on the majesty of God and its reparation rather than on the piteous situation of the people. The *Book of Ezekiel* may be divided into three sections:

- Chapters 1–24 are composed mostly of dooms against Jerusalem that date before its fall in 587/6 BCE. (Chapter 33 is an appendix related to this section.)
- Chapters 34–48 contain prophecies of the restoration of Israel, composed, presumably, after the city’s fall. The first six of these chapters are rhapsodic, the latter nine legislative.
- Chapters 25–32 link the two main divisions in the form of prophecies against Israel’s neighbors, settling accounts with them for their exploitation of, or participation in the collapse of Judah.

No other prophetic book shows so thorough a working through of principles in its arrangement, pointing to the hand of this prophet.

MAIN THEMES OF EZEKIEL’S PROPHECY. The chief burden of Ezekiel’s pre-586 prophecies (chaps. 2–24) was that Jeru-

salem was inevitably doomed to destruction by Nebuchadnezzar. This contradicted the mood both of the exiles and of the homelander, among whom prophets of good tidings were at work (chap. 13). Patriotism, faith in the security offered by God's presence in the Jerusalem Temple, and the encouragement by Egypt of anti-Babylonian forces in Judah combined to rouse the people's hopes, indeed their expectation that subjection to Babylonia was ephemeral; that the exiles would shortly return home; and that resistance to the overlord, supported by Egypt, would be successful. Like Jeremiah, his contemporary in Jerusalem, Ezekiel regarded such hopes as illusory; worse, they revealed spiritual obtuseness in their blindness to the divine purpose realizing itself in Judah's plight. As Jeremiah and Ezekiel saw it, the people's idolatrous infidelity to their covenant with God, reaching back to the beginnings of their history and peaking during the reign of King Manasseh of Judah (*2 Kgs.* 21), had finally outrun God's patience. And alongside apostasy was the corruption of the social order (idolatry and immorality were bound together in the minds of biblical authors): the oppression of the governed by their rulers, the trampling of the poor, the unfortunate, and the aliens by the people at large, until not one righteous person could be found in Jerusalem to stem the onset of God's retributive fury (*Ez.* 22). Another form of infidelity to God that Ezekiel denounced with particular vehemence was the resort of Judah's kings to Egypt for help against Mesopotamian powers (Assyria, Babylonia), instead of trusting in divine protection. These offenses are set out in bills of indictment ending in sentences of doom: God had resolved to abandon his Temple (desecrated by the people) and to deliver his city and land to be ravaged by the Babylonians (chaps. 8–11, 16, 23). In listing the evidences of Jerusalem's guilt and stressing the unavoidability of its fall, Ezekiel sought to disabuse his fellow exiles of their misplaced hopes, turn their minds to consider their evil ways, and lead them to repentance. (Because his dooms are addressed rhetorically to Jerusalem, it has been thought that they were intended to dissuade the Judahite court from pursuing its rebellious policy against Babylonia, but their emphatic unconditionality could hardly serve that end.)

Ezekiel conveyed his messages in deeds as well as words, making much use of dramatic and symbolic acts. He arrayed toy siege works against a representation of Jerusalem drawn on a brick; he lay on his side eating scant siege rations for many days; carrying an exile's pack on his shoulder, he acted out the clandestine flight of the king from the fallen city; he repressed his sighs of mourning for his dead wife to presage the stupefaction of those who would live through the coming carnage (chaps. 4–5, 12, 24)—all these and more. No prophet went to such lengths to impress his audience because none was so convinced of their imperviousness to his message (chaps. 2–3). Still, although at his commissioning he was forewarned of his audience's adamant hostility, in actuality he became the cynosure of exiles in his hometown, Tel Abib: indeed, he complains that they flock to him as to an entertainment but fail to act on his admonitions (chap. 33).

To the exiles he addressed calls for repentance. For their conversion he propounded the doctrine of the eternal availability of divine forgiveness, thus countering the despair that was bound to follow on acceptance of his interpretation of events. For if Israel indeed lay under a generations-long accumulation of guilt—Ezekiel once went so far as to describe Jerusalem as congenitally depraved (*Ez.* 16:3–45)—so overwhelming it caused God to forsake his Temple and his land, what future had they to look forward to? Ezekiel met despair with the twin doctrines of the moral autonomy of each generation—that is, the nonbequeathal of guilt from fathers to sons and God's ever-readiness to accept the penitent wicked. God judges each according to his own ways, not those of his ancestors, and he judges him as he is now, not as he was yesterday. Hence each generation may hope for reconciliation with God, and anyone can unburden himself of a guilty past by renouncing it and turning a new leaf. God does not desire the death of the wicked person but his or her repentance, so that they may live (chaps. 18, 33).

As Jerusalem suffered under the protracted siege that was to end in its fall (in 587/6), Ezekiel began to deliver his oracles against foreign nations; the first is dated in 587, the last in 585 (except for an appendix dated to 571, in chap. 29). Judah's small neighbors, formerly co-rebels with it, abandoned it in the crisis. Some gloated over its fall; Edom seized the occasion to appropriate some of Judah's territory. These countries are denounced for their hubris and their show of contempt toward their downfallen neighbor, and their own ruin is predicted (chaps. 25–28). On the other hand, Egypt, which had encouraged Judah to revolt, is condemned to temporary exile and permanent degradation for having proven to be a "reedy staff" in the hour of need, collapsing when Judah leaned on it (chaps. 29–32). When God punishes his own so ruthlessly, the perfidy and contemptuousness of their neighbors will not be ignored. Some of the most vivid passages in the book occur in these prophecies: a unique list of the Phoenecian trade (Tyre's imports and exports and the nations with which it traded); a mythical depiction of the king of Tyre as the denizen of Paradise, expelled from it for his sin; and a picture of the underworld realm of the dead receiving Pharaoh and his defeated army.

The fall of Jerusalem gave rise to a new concern: the only nation on earth that acknowledged the one true God (however imperfectly) had suffered a crushing defeat on the field and the cream of its population had, for a second time, been deported. However justified these punishments were in terms of Israel's covenant with God, to the world they could only signify the humiliation of Israel's God—or so at least Ezekiel portrayed it in chapter 36. The extreme measures taken to punish Israel for flouting God (in Ezekiel's words, for "profaning God's name") resulted in a still greater "profanation": the nations pointed to the exiles and jeered, "These are the Lord's people and from his land they have come forth!" It followed as an ironbound consequence that God must now vindicate his authority by restoring Israel to its

homeland and so redeem his reputation. This key idea of chapter 36 is the motive of the rhapsodic restoration prophecies of chapters 34–39. All is done for the greater glory of God: Israel's "dry bones" are vivified and the miraculously re-created people are gathered into their land; the former two kingdoms (Israel and Judah) are united under the rule of a new David; the land is blessed with peace and unprecedented fertility. The crowning transformation is in the very nature of the Israelites: their "heart of stone" will be replaced with a "heart of flesh." God's spirit will animate them to observe his laws effortlessly, thus averting forever the recurrence of the terrible cycle of sin, punishment, exile, and profanation of God's name among humans. Moreover, because the restoration of Israel will not be for their sake, but for the sake of God's name (reputation), it will not depend on Israel's taking the initiative to reform itself but will happen at God's initiative. Israel's self-recrimination and remorse over its evil past will follow, not precede, its salvation (chap. 36). To impress his sovereignty finally on the minds of all, God will, after restoring Israel, engineer an attack on them by the barbarian Gog of Magog. Attracted by the prospect of plundering the prospering, undefended cities of Israel, Gog and the armies mustered from the far north under his banner will descend on them, only to be miraculously routed and massacred. Then all will realize that the misfortune that befell Israel was punishment for their sins (not a sign of God's weakness!), and their restoration, a "sanctification of God's name" in the sight of all humankind (chaps. 38–39).

The last major section of the book is legislative and prescriptive: a unique series of revisions of certain Israelite institutions designed to maintain the sanctity of the Temple precinct. The section consists of a vision of the future Temple climaxed by God's return to it (chaps. 41–43:12), and instructions for righting past misconduct in relation to it so that it would never again be abandoned (chaps. 43:13–48).

The future Temple is envisaged as laid out with a well-defined gradation of sacred areas, access to which is rigorously controlled in accordance with grades of personal holiness. The corps of Temple servants is restructured, with a sharp division between priests and nonpriests, the latter being strictly excluded from access to the highest grades of holy space. The role that the future king (archaically entitled "chief") is to play in worship is so defined as to prevent him, a layman, from trespassing on the areas of highest sanctity (as preexilic kings were accustomed to do), while at the same time making allowances for his superior dignity. New periodic sacrifices of purgation are instituted to keep the inevitable contamination of the sanctuary by the natural impurities and inadvertencies of the people from accumulating dangerously. Finally, the land is redistributed among the ingathered population, archaically defined as the twelve tribes, with boundaries derived from the ancient idea of the promised "land of Canaan" rather than from the actual boundaries of the land under the monarchy. The disposition of the tribes is such as to isolate the Temple from contact with the pro-

fane by cordons of sacred personnel surrounding it. God will dwell forever in his holy city, renamed accordingly *YHVH Shammah*, "The Lord is there" (replacing *Yerushalayim*, "Jerusalem").

LATER INFLUENCES. In later times, Ezekiel's justification of the collapse of Israel influenced the revision of the old history of the monarchy (the *Book of Kings*) undertaken under Persian rule embodied in the *Book of Chronicles*. The Chronicler's story of the conduct of the last Judahite kings (from Manasseh on) shows the effect of Ezekiel's doctrines with particular clarity. On the other hand, Ezekiel's rhapsodic descriptions of restoration were far removed from the modest dimensions and achievements of returned exiles. And their mood of repentance (surely owing at least in part to Ezekiel's teachings) kindled in them a resolve to adhere scrupulously to the ancient covenant laws of Moses rather than to Ezekiel's newfangled revisions (which anyway supposed a very different geodemographic reality from that of the postexilic community). Ezekiel had to give way before Moses, and his program was relegated to messianic utopia. His vision of the divine "chariot" (chaps. 7, 10) was to play a decisive role in Jewish mystical experience from Second Temple times onward.

MOSHE GREENBERG (1987)
Revised Bibliography

EZRA (late fifth and early fourth centuries BCE) was known for his restoration of the Law of Moses in the postexilic period and is generally regarded as the founder of Judaism.

LITERARY SOURCES. The account of Ezra's activity is contained in *Ezra* and in *Nehemiah* 8–9. The history covered by *Ezra* is a continuation from *2 Chronicles* and is probably by the same author. It begins with the edict of Cyrus (538 BCE), which permitted the return of exiles from Babylonia to their homeland and the chance to rebuild the Temple. Using some independent sources whose chronology is not clearly understood, the author attempts to trace the history of the Jerusalem community down to the time of Ezra (Heb., 'Ezra'), which begins only in chapter 7. Within chapters 7 to 9 there is a first-person narration by Ezra, often considered to be a separate source, "the memoirs of Ezra," although it cannot easily be separated from its context in 7:1–26 and chapter 10, where Ezra is referred to in the third person. It appears to have been composed after the style of the so-called Nehemiah memoirs.

On the basis of the Greek version (*1 Esd.*) it appears that *Nehemiah* 8 originally followed and was a part of *Ezra*, so that the climax of the history was Ezra's reading of the law book to the Jerusalem community. A later editor who wanted to make the activity of Ezra and Nehemiah appear contemporary transposed this part of the history to its present position. *Nehemiah* 9, the prayer of confession of Ezra, also fits badly as a continuation of chapter 8 and is a later addition. At any rate the biblical portrait of Ezra is not a contemporary record but, in my view, is Hellenistic in date and must be used with caution in any historical reconstruction of the period.

BIBLICAL TRADITION. Ezra's introduction, in *Ezra* 7:1–5, identifies him as a priest and gives him a pedigree back to Aaron. But he is especially known as "the scribe of the law of God." The account indicates that he was given a special commission by the Persian king, Artaxerxes, to promulgate the Law of Moses not only in Judah but in the whole of

Syria-Palestine. He also received considerable monetary support for the cult in Jerusalem. Ezra set out from Babylon with five thousand companions and great treasure and arrived in Jerusalem safely five months later. Shortly after he returned to Jerusalem he discovered that many Jews had intermarried with non-Jews, and after much soul-searching he set about to dissolve all the mixed marriages. In the second year after his arrival, in the seventh month, at Sukkot, Ezra brought forth the Law and read it to the people in a great public ceremony (*Neb.* 8). This is now followed (in *Neb.* 9) by a fast on the twenty-fourth day of the seventh month, in which Ezra leads the people in a great confession of sins and a covenant renewal (*Neb.* 10) by which the people commit themselves to the support of the sanctuary, the observance of the Sabbath, and other laws of the Torah.

There are various layers in the biblical tradition concerning Ezra. The one that identifies Ezra as the scribe who brought the Law to the restored community in Jerusalem is clearly the oldest tradition. Many scholars believe that this tradition reflects the introduction of the Pentateuch into, and its formal acceptance by, the Jewish community in Jerusalem. For this reason the figure of Ezra represents a new era in which the community stands under the Law and its interpreters and becomes, in this view, a religion "of the book," so that it is often regarded as the beginning of Judaism. However, any notion of a radical discontinuity with the religion of the Jews in the late monarchy or exilic periods is quite unwarranted, because the Pentateuch itself embodies much from these periods.

Nevertheless, the mission of Ezra is now seen in the Bible through the eyes of the Chronicler, who considered his presentation of the Law as the climax of his history, and later Judaism did much to further enhance the significance of this event. Already within the biblical account the later levels of the Ezra tradition that portray him as a judge and reformer (*Ezr.* 9–10), or as an intercessor and covenant mediator (*Neb.* 9–10), cast him more and more in the image of a second Moses.

HISTORICAL PROBLEMS. The exact dating of Ezra's activity within the Persian period and especially his relationship to his near contemporary Nehemiah have long been matters of disagreement among scholars. The *Book of Ezra* dates the beginning of Ezra's activity to the seventh year, and Nehemiah to the twentieth year, of Artaxerxes. If these dates refer to the same king, then Ezra would be prior to Nehemiah, as the present biblical tradition suggests. But there is reason to believe that Ezra should be dated to the reign of Artaxerxes II (404–359 BCE) which would put him about 397 BCE, well after Nehemiah. Ezra's return seems to presuppose a revitalized Jerusalem community with protective walls (*Ezr.* 9:9), while Nehemiah seems to know nothing of the large band of exiles that returned with Ezra. It also seems most unlikely that Ezra waited thirteen years after his arrival before promulgating his law if this was his primary commission. Another possibility is to view Ezra as coming during Nehemi-

ah's second term of office, in the thirty-seventh year of Artaxerxes I, but this involves a textual emendation for which there is little justification.

Another area of debate is how to understand the law book that Ezra brought to Jerusalem from the Babylonian exile. Was it a particular part of the Pentateuch, such as the so-called Priestly code, or was it a more complete form of the Torah, much as it is today? And just exactly what was the nature of Ezra's commission from the Persian court and the scope of his authority? The way in which one answers these questions greatly affects one's understanding of the history of the restoration and the development and interpretation of the Pentateuch.

THE APOCALYPSE OF EZRA. Also known as *4 Ezra*, the *Apocalypse of Ezra* is a Jewish work of about 100 CE that presents Ezra (also called Salathiel) as a prophet who experiences dreams and visions of an apocalyptic nature in the thirtieth year after the destruction of Jerusalem. In addition, just like Moses he hears the voice of God speaking from a thornbush and then withdraws from the people for forty days to receive a revelation from God. This revelation includes not only the Law of Moses that had been lost in the destruction of Jerusalem but also the complete twenty-four books of the Hebrew scriptures and seventy secret books for the "wise." Like Moses, Ezra also experienced an assumption to heaven.

How this earlier Ezra the prophet was thought to relate to the later Ezra the scribe is problematic. The common element is Ezra's association with the Law of Moses and his portrayal as a second Moses. This seems to have been carried to the point where in one form of the tradition, Ezra, like Moses, never got back to the land of Palestine. This extracanonical form of the tradition received great elaboration in the medieval period.

EZRA IN JUDAISM, CHRISTIANITY, AND ISLAM. The Jewish *aggadah* regarded Ezra with great honor. He was not just a priest but the high priest and a second Moses. He was especially revered for restoring the Law of Moses, which had been forgotten, and for establishing the regular public reading of the Law. He is also credited with setting up schools for the study of the Law. The law that Ezra brought to the people was not only the written Law of Moses but included the unwritten law as well. In addition, he is also credited with writing parts of *Chronicles* and the *Book of Psalms* and is identified by some as the prophet Malachi.

Following *4 Ezra* early Christian authors regarded Ezra as a prophet who under inspiration recovered all the ancient scriptures that had been destroyed by the Babylonian invasion—not just the Law of Moses. Some extracanonical works

such as *Enoch* are also attributed to his prophetic recollection. Whether there were two Ezras, the prophet and the priest-scribe, or just one was a matter of debate.

The Qur'ān contains only one curious remark about Ezra, that the Jews believed him to be the son of God (*sūrah* 9:30). The basis for this statement is not clear and not reflected in any extant Jewish source.

BIBLIOGRAPHY

The many literary and historical problems associated with Ezra make the literature on this subject enormous and controversial. For the historical reconstructions of the times of Ezra and Nehemiah one should compare the histories of John Bright, *A History of Israel*, 3d ed. (Philadelphia, 1981); Siegfried Herrmann, *Geschichte Israels in alttestamentlicher Zeit*, 2d ed. (Munich, 1973), translated by John Bowden as *A History of Israel in Old Testament Times*, 2d ed. (Philadelphia, 1981); and Peter R. Ackroyd, *Israel under Babylon and Persia* (London, 1970).

For a treatment of Ezra's place in the religion of Israel and especially his relationship to the Law, compare the very influential but somewhat controversial treatment by Yehezkel Kaufmann, *Toledot ha-emunah ha-Yisre'elit*, vol. 4 (Tel Aviv, 1956), translated by Clarence W. Efromson as *History of the Religion of Israel*, vol. 4, *From the Babylonian Captivity to the End of Prophecy* (New York, 1977), with the work of J. G. Vink et al., *The Priestly Code and Seven Other Studies*, "Oudtestamentische Studien," vol. 15 (Leiden, 1969).

Very helpful on matters of literary composition, text, and versions is the commentary by Jacob M. Myers in *Ezra, Nehemiah*, vol. 14 of the Anchor Bible (Garden City, N.Y., 1965).

For a review of recent scholarship and a comprehensive bibliography, see the article "Ezra/Estraschriften" by Magne Saebø, in *Theologische Realenzyklopädie*, vol. 10 (New York, 1982).

JOHN VAN SETERS (1987)
Revised Bibliography

F

FACKENHEIM, EMIL (1916–2003) is best known for his sustained commitment to refashion Judaism in the shadow of the Nazi holocaust. He was born in Halle, Germany, on June 22, 1916. In 1935 he moved to Berlin where he entered the rabbinical program at the *Hochschule für die Wissenschaft des Judentums*; he also began a degree in philosophy at the University of Halle. Fackenheim's academic career in Germany was interrupted by *Kristallnacht* and internment for several months in Sachsenhausen. In the spring of 1940 he fled to Aberdeen, Scotland, and matriculated in a degree program in philosophy at the university. A year later Fackenheim and other refugees were interred in camps and then dispersed throughout the British Empire.

Fackenheim traveled by ship to Canada, spent months in a camp in Sherbrooke, Ontario, and was eventually released, whereupon he went directly to the University of Toronto and was accepted into the doctoral program in philosophy. Fackenheim received his degree in 1945 with a dissertation on medieval Arabic philosophy and its classical antecedents. From 1943 to 1948 he served as rabbi for congregation Anshe Shalom in Hamilton, Ontario. Invited to teach philosophy at the University of Toronto in 1948, he remained there until 1983, when he retired as University Professor. He and his family then immigrated to Israel in 1983. He taught at the Institute for Contemporary Jewry at the Hebrew University of Jerusalem for several years. Fackenheim died in Jerusalem on September 19, 2003.

FACKENHEIM'S 614TH COMMANDMENT. In the postwar period Fackenheim pursued two intellectual interests. First, he began a philosophical examination of faith and reason from Kant (1724–1804) to Kierkegaard (1813–1855), with special attention to Hegel (1770–1831). Second, he explored the role of revelation in modern culture, in particular dealing with Jewish faith, autonomy, the challenge of naturalism and secularism, and the defense of revelation in the thought of Martin Buber (1878–1965) and Franz Rosenzweig (1886–1929).

Until 1966 Fackenheim largely avoided dealing with the Nazi assault on Jews and Judaism and the atrocities of the death camps. On March 26, 1967, at a symposium titled

CLOCKWISE FROM TOP LEFT CORNER. Stone relief of the Buddha's footprints on a pillar at the Great Stupa in Sāñcī, India. [©Adam Woolfit/Corbis]; *Saint Francis Preaching to the Birds* by Giotto di Bondone (c. 1267–1337). S. Francesco, Assisi, Italy. “Jewish Values in the Post–Holocaust Future,” convened by the American Jewish Committee and organized by the editor of its journal *Judaism*, Steven Schwarzschild, Fackenheim first formulated and presented his imperative for authentic Jewish response to the Holocaust, what he called the 614th commandment: “The authentic Jew of today is forbidden to hand Hitler yet another, posthumous victory.” He elaborated the reasoning that led to this imperative and its hermeneutical content in “Jewish Faith and the Holocaust,” which appeared in *Commentary* and, in a slightly different form, in the introduction to his collection of essays, *Quest for Past and Future* (1968). His argument appeared in its most developed form in the third chapter of *God’s Presence in History*, published in 1970 and based on his 1968 Deems Lectures at New York University.

In these central writings, Fackenheim argues that although no intellectual response—historical, political, theological, or psychological—to the evil of Auschwitz is satisfactory, an existential response is necessary. But neither philosophy nor theology is capable of framing what a genuine response should be. One can and must turn to actual lived experience, during and after the event, to grasp how Jews have responded and hence how one ought to respond. Such ongoing Jewish life, Fackenheim claims, can be interpreted as a response to a sense of necessity, and this necessity takes the shape of a duty to oppose all that Nazism sought to accomplish in its hatred of Jews and Judaism and in its rejection of human dignity. Although for secular Jews, such a duty has no ground but is accepted as forceful without one, for believing Jews, the only ground that is possible is the voice of a commanding God. Hence for them, it has the status of a divine command, alongside but not superseding the other, traditional 613 biblical commandments. It is, in his famous formulation, a 614th commandment.

Fackenheim’s route to this imperative of resistance to Nazi purposes capitalized on several crucial insights. One was that after Auschwitz, as he put it, even Hegel would not be a Hegelian, that is, that Auschwitz was a case of evil for evil’s sake and was therefore inassimilable into any prior conceptual system. Even the most systematic philosophic thought was historically situated and was ruptured by the horrors of the death camps. The second was his commitment to existential–dialectical thinking about the human condition and to its hermeneutical character. The third was the recognition that although Auschwitz threatened all prior systems, ways of life, and beliefs, Judaism must and could survive exposure to it. The work of Elie Wiesel (b. 1928) and Wiesel himself, a survivor and a novelist, confirmed this hope and this realization.

TO MEND THE WORLD. In the 1970s Fackenheim’s thought extended the lines of thinking summarized above. On the one hand, he applied this framework to a variety of themes—most notably to the State of Israel, its reestablishment and defense, but also to the belief in God, the relationship between Jews and Christians, and the necessity of struggling

against all attempts to diminish human dignity and the value of human life (see essays collected in his *The Jewish Return Into History* and selections in Morgan [ed.], *The Jewish Thought of Emil Fackenheim*). On the other hand, he turned to important philosophical problems with his existential and hermeneutical argument. The crucial one had to do with the possibility of performing the imperative of resistance or, as one might put it, the possibility of confronting the radical threat of rupture and not giving way to total despair. This was to become the central problem of the book he always took to be his magnum opus, *To Mend the World*, first published in 1982. In the earlier period, culminating in 1970, Fackenheim had argued from the necessity of the commandment or imperative to its possibility, either on Kantian grounds, that duty entails the freedom to perform it, or on Rosenzweigian grounds, that along with the commandments that God grants in an act of grace, he also gives humankind out of the same love the freedom to perform them. By the late 1970s Fackenheim had come to see how both responses failed to respect the victims of the Nazi horrors. In the crucial chapter of *To Mend the World*, he systematically and dialectically explores the agency of evil and its victims, in order to arrive at a moment of lucid understanding that grasps the whole of horror and reacts in opposition to it with surprise, and he confirms this intellectual grasp with an emblematic case of a victim of the atrocities who both sees clearly what she is being subjected to, what the evil is, and senses a duty to oppose it in her life. This episode constitutes an ontological ground of resistance. Judaism, through the idea of a cosmic rupture and a human act that respects and yet opposes it, what is called in the Jewish mystical tradition (*Qabbalah*) *tikkun olam*, provides philosophy with a concept essential to grasp this moment of horrified surprise and recovery from it, the possibility of genuine post-Holocaust life. *To Mend the World* proceeds to apply these lessons in three domains—philosophy, Christianity, and Jewish existence—in each case locating an emblematic case of *tikkun* (mending or repair) that respects the evil of Auschwitz as a total and unqualified rupture and yet finds a route to hope and recovery.

In the last two decades of his life, Fackenheim once more extended the lines of this argument: with a book on the Bible and how it ought to be read by Jews and Christians, together, in a post–Holocaust world (*The Jewish Bible after the Holocaust*, 1990); with a survey of Jewish belief and practice of Jews in the 1980s (*What Is Judaism?*, 1987); and with a number of essays on the State of Israel as a paradigmatically genuine response to the Nazi assault, that is, as a unique blending of religious purposes and secular self-reliance, combining a commitment to a homeland for Jews against the most extreme assault and to its defense.

Fackenheim’s philosophical commitments were deeply immersed in existential and concrete realities, most notably the historicity of philosophical and religious thought, the hermeneutical and situated character of human existence, and the unprecedented evil of Nazis and the death camps.

Auschwitz led him to expose philosophy, culture, and religion unconditionally to historical refutation; yet his deepest yearnings were to find continued hope and to avoid despair, to appreciate the necessity of Jewish life and the defense of human value and dignity. These dispositions, however, were what one might call “rationally defended yearnings” and hence necessities (duties and obligations) only in a deeply contextual sense. In this respect, Fackenheim bears some similarity to the contemporary Anglo-American philosophers such as Charles Taylor, Hilary Putnam, Richard Rorty, and even the French philosopher Emmanuel Levinas (1906–1955), although except for Levinas, the motivation for Fackenheim’s philosophical and theological work was the experience of Auschwitz and not theoretical considerations. In this respect, in the twentieth century, his thought is distinctive and significant and in Jewish life and thought virtually unique.

FA-HSIEN SEE FAXIAN

FAIRIES. *Fay*, the old word for “fairy,” is thought to come from the Latin *fata*, which signifies the Fates, supernatural women who appear beside the cradle of a newborn infant to decide its future. The fairies invited to Sleeping Beauty’s christening are an echo of this belief. During the Middle Ages *fairy* meant the state of enchantment and the land of enchanted beings as well as those who live in it.

Fairies are found under various names in many countries, but they are more typical of Europe and Asia than of the Americas and Africa. To some extent their social organi-

zation reflects the world of humans. In *Irish Fairy and Folk Tales* (1893) the poet William Butler Yeats distinguished between trooping fairies and solitary fairies. The trooping fairies appear in medieval Arthurian legend and romance and are most popular in the literature of Elizabethan England; since that time stories about them have ceased to be written. They are handsome, aristocratic, and beautifully dressed, and they take part in the Fairy Ride. Like their human counterparts, they hunt and hawk, trotting in procession behind their king and queen, who ride white horses decorated with silver bells. Their fairy realm, which is centered on their royal court, is noted for the excellence of its music, dancing, and feasting as well as for the beauty of its women. The Irish Tuatha Dé Danann (“people of the goddess Danu”) are trooping fairies; they are immortal and live in Tír na n’Óg, the Land of Youth.

The nonaristocratic, solitary fairies are described as ugly and often ominous and ill-natured. Some are engaged in trade, like the Irish leprechaun shoemaker, who is quite harmless. A third category of fairy comprises those who live in family groups. They work the land, hold their own markets, and visit human fairs.

Nature fairies are spirits of streams, lakes, and trees. The Russian *rusalki* are water nymphs, who take the form of young maidens. Dryads are tree spirits. So are oak men; hence there is a saying, “Fairy folks are in old oaks.” In England, hawthorn is haunted by the fairies, especially if it grows near fairy hills, and the Gooseberry Wife, in the form of a great hairy caterpillar, stands guard over the fruit bushes.

Tutelary fairies, the family guardians and domestic spirits, look after the fortunes of a particular household. The Scottish MacLeods on the island of Skye were given a fairy flag by their supernatural guardian. Germans call their house spirit *der Kobold* (“gnome”), an unreliable creature whose name survives in the modern *cobalt*. (German miners called this slightly magnetic element after the famous sprite because they found it tiresome and difficult to use.) Danes have their *nis*; the French their *esprit follet*; the Spaniards their *duende*; and the Faeroese Islanders, in the North Atlantic, their *nia-gruisar*.

Russians call their domestic spirits *domovoi*, after *dom* (“house”). Legend says that these creatures were rebellious spirits who opposed God and so were thrown down from heaven, falling on people’s roofs and into their yards. They are amiable and live in the warmth near the hearth. Because it is considered important to please the *domovoi*, peasants leave egg pancakes for him on the threshing floor. When a peasant family moves, they put a piece of bread beside the stove in hopes that the *domovoi* will come with them. In his autobiography *Childhood* (1913), the Russian writer Maxim Gorky describes how his family moved from their house: His grandmother took an old shoe, held it under the stove, and called to the household spirit, asking him to ride in the shoe and bring the family good luck in their new home.

English brownies are also associated with the hearth. They are active at night and do work that the servants have neglected: cleaning and drawing water for the house, tending farm animals, reaping, mowing, threshing, and churning butter. Families can leave food, such as a bowl of cream or little cakes spread with honey for the brownies, but direct gifts, such as money or clothes, will drive the spirit away.

Domestic spirits can be very tiresome. A folktale well known all over Europe tells of a farmer so bothered by the pranks of a boggart (or mischievous brownie) that he decides to move. The family packs their household belongings and loads the cart. As they are leaving, a voice from inside the milk churn says, "Yes, we're moving!" It is the boggart. The family gives up and decides to stay, for what would be the point of moving if the creature was coming too? In other versions of the story the boggart immigrates with the family to the United States.

The most tragic tutelary fairy is the banshee, an Irish and Highland Scottish spirit of death. The word means a woman (*ban*) of the fairy folk (*sídh*, pronounced "shee"). This apparition materializes when someone is about to die. In Scotland the banshee is seen washing the doomed person's graveclothes or bloodstained garmets and can be heard wailing and lamenting, her eyes red with tears. Mélusine, daughter of the fairy Pressina, became the banshee of the house of Lusignan in France. When the family was wiped out and its castle fell to the crown, she appeared, foretelling the deaths of the kings of France.

Some supernatural creatures are closely associated with a particular historical era or geographic area. The gnomes of Europe, for example, were a product of the ancient Hermetic and Neoplatonic doctrine from which medieval medicine and science derived. According to medieval thought, all mortal creatures are a blend of earth, air, fire, and water, and the four elemental beings are gnomes (who inhabit the earth), sylphs (who inhabit the air), salamanders (who inhabit fire), and nereids (who inhabit water). The *Oxford English Dictionary* suggests that the word *gnome* is an elision of the Latin *genomus* ("earth dweller"). Paracelsus (1493–1541), the Swiss physician and alchemist, provides in his *De nymphis* the first description of gnomes as elemental beings of the earth. According to tradition, gnomes live underground and are treasure guardians. Also known as dwarfs, they are skilled metalworkers, supplying medieval knights with armor and weapons that they themselves forge. They are also often associated with mines.

The knockers are said to live in the tin mines of England's Cornwall. They are friendly creatures and will knock on the mine walls to indicate veins of ore. An anti-Semitic legend claims that they were the ghosts of Jews who had been sent to work the mines as a punishment for taking part in the Crucifixion. Richard, earl of Cornwall (1200–1272), is said to have put the Jews to work in the Cornish tin mines, and Robert Hunt, in his *Popular Romances of the West of England* (1865), claims that the tin mines were farmed out to

the Jews in the thirteenth century. But Jewish merchants had very little connection with the tin trade, and no evidence supports these improbable suggestions.

Pixies are another group of fairies belonging to English west-country tradition. They are found in Somerset, Devonshire, and Cornwall. Anna Eliza Bray first brought them to the attention of the public in a series of letters to the poet Robert Southey that were published under the title *The Borders of the Tavy and the Tamar* (1836). The chief characteristic of pixies is that they mislead travelers; as recently as 1961, a woman claimed to have been misled by pixies in a wood near Budleigh Salterton. Local tradition says that pixies are the souls of those who died before Christ was born or of unbaptized children.

Closely related to the pixie and its habit of leading travelers astray is the will-o'-the-wisp (Fr., *le feu follet*; Ger., *das Irrlicht*), also called jack-o'-lantern or *ignis fatuus* ("foolish fire"). This sprite appears in the folklore of many countries and is often an omen of death. In England the will-o'-the-wisp is also identified with the mischievous sprite Puck, or Robin Goodfellow. Traditional legends about this spirit who lures folks to their death in the bog may be an attempt to account for marsh gas, which emanates from rotting organic matter and is ghostly in appearance.

Other malevolent spirits are also linked with the environment. The malicious yarthkins of Lincolnshire, England, another damp area, disappeared when the fens were drained.

The English *goblin*, or *hobgoblin*, is a generic term for evil spirits. It is difficult to distinguish between goblins and imps, however. Originally *imp* referred to an offshoot or a cutting, but in its sense as a supernatural creature it means a small demon, an offshoot of Satan. In England the Puritans thought all fairy creatures were devils, and thus the preacher John Bunyan, in his famous book *Pilgrim's Progress* (1678), numbers the hobgoblin and the "foul fiend" among the forces of evil to be resisted.

Elves reached England from Norse mythology, where they were known as *buldre* folk, closely resembling fairies. The girl elves are very beautiful but they are hollow behind and have long cow's tails. Trolls are another Norse group of supernatural beings. Originally they were thought of as giant ogres, but in later Swedish and Danish tradition they become dwarfs who live in hills and caverns. Like the German dwarfs, they are fine craftsmen and treasure guardians, noted for their stupidity. In the Shetland Islands, north of Scotland, where Scandinavian influence is strong, these beings are called *trows*.

Not all mischievous, supernatural creatures are of ancient origin. The gremlin, a supernatural being who causes trouble for pilots and aircrews, dates from World War I. An explanation for human error, flight fatigue, and high-altitude pressures, the gremlin may originate from the Old English word *gremian* ("to vex").

The relationships that fairies enjoy with human beings has varied considerably. Some can be very helpful; such help-

fulness is said to be how the MacCrimmons, the most distinguished Scottish pipers, learned their skill. As mentioned, guardian spirits look after the families in their care, and brownies do household chores. But they become malevolent if badly treated—or simply disappear. Anybody who spies on them is severely punished.

In folk tradition human beings are sometimes abducted by the fairies. Thomas the Rhymer (Thomas of Erceldoune), the poet and prophet, lived in thirteenth-century England. His tale is told in *The Ballad of True Thomas* and by Sir Walter Scott in *Minstrelsy of the Scottish Border* (1802). Legend says that Thomas received the gift of prophecy from the Queen of Elfland, who loved him and took him away to live with her for seven years.

Stories of fairy brides are common and usually end in tragedy. The lovely creature marries a mortal and imposes some taboo on him. When it is broken, the fairy bride returns to fairyland, deserting her husband and children. Seal-maidens and swan-maidens are usually captured against their will by the theft of their skin or feathers. As soon as they can retrieve the stolen item, they escape.

When a mortal visits fairyland, the result is often equally tragic. The visitor cannot escape and becomes the victim of the supernatural passage of time, whereby one day represents hundreds of years. King Herla was able to return home with his knights, but when they dismounted they crumbled into dust because they had been away for three hundred years.

Although fairies lead independent lives, there are many examples of their dependence on mortals. Narratives tell of midwives summoned to help a fairy in labor and of fairies anxious to possess human children. Stories of the theft of babies continue from the Middle Ages to the present time. Typically the fairies steal an unbaptized child and leave an ugly fairy baby in its place. If the changeling is surprised, it will speak, revealing its true identity; then it can be driven away. Various methods may be used to trick the spirit, such as serving him beer brewed in eggshells. In German tradition the creature would exclaim, "I am as old as the forests of Bohemia, and I've never seen beer brewed in an eggshell before."

These legends conceal much human suffering and cruelty to children. Malformed babies were put over a fire in order to pressure the fairies into returning the supposedly stolen child. Such cases have been recorded as late as the early twentieth century in Ireland. Until recently it was thought that a defect in a child resulted from a defect in the parents. Basically, changelings were sickly, backward, or deformed children. Simple people, unwilling to accept that such a child could be theirs, maintained that the fairies had stolen the real baby and left this wretched thing in its place.

Belief in fairies thus has an aetiologic function: It provides an explanation for mysterious objects and events that are otherwise not understood. The remains of earlier civilizations, which puzzled the uneducated in days gone by, are an-

other obvious example. The ancient Pictish areas of Scotland contain the remains of brochs, round, hill-shaped farmhouses with stone walls and a turf covering. These structures are often referred to as fairy knowes. Burial mounds have also been linked with fairyland. Sudden, disabling illness, such as that caused by a stroke, was traditionally considered to be the result of an elf shot, a wound from one of the flint arrows that are found in low-lying areas, and many Anglo-Saxon charms meant to protect against such attacks have been preserved. Various other illnesses whose origin seemed puzzling centuries ago, such as a slipped disk, rheumatism, and anything that deforms the body, were attributed to invisible blows from the little creatures. Paralysis, skin disease, wasting illnesses such as tuberculosis, and animal disorders such as swine fever and brucellosis have all been blamed on the fairies.

Unusual topographical features are also sometimes attributed to fairies. Those curious, dark green circles that appear on grassy lawns and meadows, often surrounded by a circle of mushrooms, are known as fairy rings, and it is considered very unlucky to damage them in any way. They are in fact caused by *Marasmius oreades*, a type of fungus, but people believe that they are spots where the fairies dance.

Sometimes supernatural origins are attributed to exceptionally large or beautiful objects. There are various stories of a cup stolen from the fairies. The "Luck of Eden Hall" in Cumberland, England, is a lovely green glass goblet, a talisman that was supposed to preserve the Eden family's fortunes. Legend says that the goblet was snatched from the fairies by a servant; if it broke, the family would be destroyed. Eden Hall was pulled down in 1934, but the "Luck" is preserved in the Victoria and Albert Museum in London.

In the thirteenth-century Church of Saint Mary at Frensham in Surrey, England, stands a huge caldron, measuring one yard across. Local tradition says that it was borrowed from the fairies who lived on nearby Borough Hill and was never returned. Probably it was employed in parish feasts and celebrations and then this early usage was forgotten.

Sightings and eyewitness accounts of fairies are common. A striking example was provided by Robert Kirk (1644–1692), a folklorist who became the subject of a fairy tale. Kirk was a Gaelic scholar and a minister of the Scottish church. Evidently his parishioners disapproved of his researches in the supernatural, for when he died and his body was found lying beside a fairy knowe, rumor said that he was living with the fairies inside it. This legend is recorded by Scott in his *Letters on Demonology and Witchcraft* (1830). Kirk's own account of fairy beliefs in the Scottish Highlands, *The Secret Commonwealth of Elves, Fauns and Fairies*, was not published until 1815, long after his death. The brilliant and eccentric English painter and poet William Blake (1757–1827) claimed to have seen a fairy funeral. The body, he said, was laid out on a rose leaf and carried in procession by creatures the size and color of grasshoppers.

In Ireland, places once associated with fairies are pointed out and treated with great respect. To interfere with them is thought to bring bad luck. More than once new roads have been rerouted for such a reason. Recently a fairy bush was cut down in front of a Dutch-owned factory in Limerick. Dutch workmen performed the task because local workers refused. When the works closed not long after and well over a thousand jobs were lost, the disaster was blamed on the removal of the fairy bush.

Traditionally, the fairies dress in green. Green is their color, and even today, many people regard it as unlucky and will not wear it, although they no longer remember the reason.

Various theories have been put forward to explain the origins of the fairies. A British tradition suggests that fairies represent memories of an ancient Stone Age race. When the Celts arrived in England from central Europe in about 500 BCE, the earlier inhabitants were driven back into the hills and hid in caves. They lived underground and were so adept at hiding in the woods that they seemed to be invisible. The popular belief that iron provides protection from the fairies is in line with this view, for the Celts possessed iron weapons, whereas the earlier inhabitants used objects of bronze or stone. The many stories of fairies' borrowings and thefts also lend weight to this theory, for it was thought that these earlier inhabitants borrowed grain and implements, and one can easily imagine a conquered people in hiding, creeping anxiously about to see what they could steal or borrow from their conquerors.

Another view suggests that fairies originated as memories of ancient pagan gods and heroes. They are small in stature because their significance has been reduced. Still another theory sees fairies as personified spirits of nature. Modern supporters of this argument believe that spirits fertilize plants and care for flowers. But this explanation excludes other types of fairy, such as the family guardians and the fairy communities with their elaborate social organization. A fourth suggestion is that the fairies are ghosts. Certainly there are many connections between fairies and the realm of the dead: They live in burial mounds, and many are obviously ghosts and are described as such. None of these theories is entirely adequate, and the answer may well lie in a blend of them all, coupled with the natural desire to find an explanation for puzzling phenomena throughout the world.

Revised Bibliography

FAITH, in probably the best-known definition of it, is "the assurance of things hoped for, the conviction of things not seen." Although this definition itself comes from the Christian scriptures, specifically from the anonymous epistle to the Hebrews in the New Testament, it can, *mutatis mutandis*, be applied across a broad spectrum of religions and religious traditions. Whether or not the term *faith* appears in those traditions is, at least in part, a matter of how various terms are translated into modern Western languages. More importantly, however, *faith* is used, even in Judaism and Christianity (where it has been the most successfully domesticated), to cover an entire cluster of concepts that are related to one another but are by no means identical. If there is truth in the contention that *faith* is the abstract term with which to describe that attitude of the human mind and spirit of which prayer is the concrete expression, then one or more of these concepts may probably be said to play some part in every religious tradition, and in that sense at least, "faith" may likewise be said to appear there. Hence an enumeration

of these discrete concepts, each of them in some way a synonym for *faith*, may serve to provide, if not a logical definition, then at any rate a cumulative description, of it.

FAITH-AS-FAITHFULNESS. In its most fundamental meaning, faith has been defined as faithfulness, and as such, it has been taken as an attribute both of the divine and of believers in the divine. The Latin adjective *pious*, for example, was used in Vergil's *Aeneid* to describe *pious Aeneas* or *pious Achates*, but it also appeared there in such a phrase as *pia numina* to characterize the reciprocal fidelity that the gods manifested in their dealings with human beings; something of both senses, presumably, attached to the word when it became a standard part of the official title of the Roman emperor, most familiarly in the case of Antoninus Pius (r. 138–161 CE). *Pious* went on having both meanings also in postclassical Latin, as the usage of the “Dies Irae” attests. The reciprocity implied in the concept of faith when predicated of human social relations, where (as in the notion of “keeping faith” with someone) “faith” has become almost synonymous with “loyalty,” has carried over likewise into its use for the divine-human relation. Wherever the gods were said to promise something in that relation, *faith* would seem to be an appropriate term for their keeping or fulfilling the promise. Conversely—and much more customarily—it was the appropriate term for the loyalty or “fealty” (that English word is indeed derived, via medieval French, from the Latin *fidelitas*) that the gods in turn rightly expected of mortals. In those religions in which the initiates received a mark on their body as a sign of their special bond with the divine, these marks have often been seen as a pledge and a reminder to those who wore them that they were expected to remain faithful to the terms of that special bond. The consequences of a breach of faith-as-faithfulness formed the basis for practices of discipline, punishment, and in most traditions possible reinstatement, though only after a period of purgation and testing (see “The Community of Faith,” below). Even where the other connotations of “faith” discussed below have appeared to predominate, this emphasis on faith-as-faithfulness, both divine and human, has never been absent, pertaining as it does to the very concept of adhering to the practices, structures, obligations, or beliefs of any particular way of having faith. When it has been divorced from some or all of those other connotations, however, faith-as-faithfulness could all too easily be reduced to the formalism and external propriety that the prophets and critics in many religious traditions have attacked.

FAITH-AS-OBEDIENCE. Faith as faithfulness has expressed itself not only in loyalty but in obedience, yet obedience has meant even more than faithfulness. The precise content of such obedience has varied enormously with the content of what was perceived to have been the divine will or law. Obedience, therefore, carried both liturgical and moral connotations. An imperative to reenact, periodically or once in a lifetime, the acts of the divine model required the obedient and meticulous observance of the demands that those acts had placed upon the believer. Initiation into the faith involved

learning the specific methods of such ritual observance, with rites of passage frequently serving as the occasion for such learning. Where the divine will was conceived of as having laid down rules not only for ritual actions but for ethics, the obedience of faith meant moral behavior in conformity with divine commands; thus in Hinduism, *dharma* as moral law required righteous conduct. Ordinarily there was no explicit antithesis between ethics and ritual action, which together were the content of authentic obedience, often enjoined in the same gnomic saying or story. But the declaration of the prophet Samuel in the Hebrew scriptures, “Has the Lord as great delight in burnt offerings and sacrifices, as in obeying the voice of the Lord? Behold, to obey is better than sacrifice, and to hearken than the fat of rams” (*1 Sm.* 15:22), articulated the awareness, which other religions have shared with Judaism, that faith-as-obedience was above all a compliance with the moral imperative. Presupposed in those words was the belief, central to Judaism, that the moral imperative had been made known in the historical revelation of the word of God to Moses, and through him to the people of Israel. But they have been no less applicable in those religious and philosophical traditions that have emphasized the inner imperative of conscience rather than the outer imperative of law as the norm of ethical action: Here, too, faith has been above all obedience, in Immanuel Kant's formula, “the recognition of all our duties as divine commands.” Even where faith has been defined primarily as trust or as worship or as creed (see below), obedience was inevitably a constitutive element of it.

FAITH AND WORKS. The definition of faith as obedience, and yet as somehow not reducible to obedience, points to the perennial and unavoidable problem of the relation between faith and works. On the one hand, even the most theocentric versions of faith have found themselves obliged to assert, often in self-defense against the charge that they were severing the moral nerve, that they were in fact reinforcing ethics precisely by their emphasis on its vertical dimension: It has been a universal conviction of believers, across religious boundaries, that “faith without works is dead.” On the other hand, those religious systems that have appeared to outsiders, whether critical or friendly, to equate faith and works and to be indifferent to any considerations except the “purely” moral ones prove, upon closer examination, to have been no less sensitive to the dialectic between works and faith. Especially since the Enlightenment, Western critics of traditional supernaturalism have taken Confucianism as the ideal of a religion that eschewed metaphysical subtleties to concentrate on the one thing needful, and they have either criticized traditional Western religions for not conforming to that ideal or reinterpreted them in accordance with it. For in the *Analects* Confucius repeatedly professed ignorance about the mysteries of “Heaven” and avoided discussing the miraculous phenomena in which conventional faith had sought manifestations of supernatural power; even the question of personal immortality did not admit of a clear and definite answer. Rather, he concentrated his attention on works of

piety and of service to others, preferring generosity to greed and virtue to success. All of this Confucius (like many other religious teachers) called “the way,” but it is an unwarranted modern reductionism to see in this attitude a moralistic preoccupation with works alone, at the expense of “faith.” For “Heaven,” which he said had “infused the virtue that is in me,” was the authentic source of the works themselves, as well as the ultimate foundation for the serenity that made the works possible. The faith of Confucius may have been less detailed than that of some teachers in its information about the ontological status of “Heaven” and similar speculative questions, but he knew and expressed a confidence in its providential care as the basis for the works with which he and his disciples were to serve the will of “Heaven.”

FAITH-AS-TRUST. Such a confidence in the providential care of “Heaven” underlies the definition of faith-as-trust. In the classic formulation of Martin Luther, “to ‘have a god’ is nothing else than to trust and believe him with our whole heart,” because “it is the trust and faith of the heart alone that makes both God and an idol” (*Large Catechism*). Many of the conventional metaphors for the divine in various traditions, from “rock” and “mountain” to “mother” or “father,” have served as representations of the conviction that “the trust and faith of the heart” could appropriately be vested in such an object, and that the divine object would prove worthy of human trust. Conventional practices like divination and prayer may likewise be read as expressions of the belief that the divine will—if it could once be known, or perhaps even if it was mysterious and ultimately unknowable—deserved trust. The historic triad of faith, hope, and love (best known from the New Testament, but paralleled elsewhere) has made it necessary for expositors to clarify the distinction between faith and hope as they were both applied to the expectation of future blessings. However, the definition of faith-as-trust has been a way of focusing such expectation on the reliability of divine providence in both prosperity and failure: For good or ill, the ways of the divine will could be counted on, even though the details of their specific intent might not be discernible at any given moment. Such faith-as-trust even in the inscrutable goodness of the divine order presupposed a pattern of divine guidance in the past, which made it safe to conclude that there would be a continuity of such guidance into the future. Historically as well as psychologically, therefore, it is difficult to conceive of faith-as-trust in the absence of such a pattern, be it the outcome of the individual’s own cumulative autobiography or of the history of the community to which the individual has come to belong (or of both). Once established on the basis of this pattern of divine guidance, faith-as-trust has implied that the vicissitudes of the moment could not, or at any rate should not, undermine the confidence that ultimately the object of that trust would be vindicated. As Johann Wolfgang von Goethe said in his autobiography, *Dichtung und Wahrheit*, “Faith is a profound sense of security in regard to both the present and the future; and this assurance springs from confidence.” In the choruses of the Greek tragedians or in the re-

flections of the Muslim mystics or in the discourses of Job, the ambiguities and difficulties of such confidence in the face of concrete reality have served to deepen the understanding of trust and to transform Pollyanna-like optimism into mature faith-as-trust.

FAITH-AS-DEPENDENCE. This combination of mystery and reliability in the divine will, even after that will has made itself known, has introduced into the definition of faith the element of dependence and submission. For if obedience to the divine will was the completion of the circle of faith in the moral realm, dependence on the divine will was the way faith-as-trust affirmed the relation of human weakness to divine power. In those traditions in which the divine has been seen as creator and/or preserver, faith-as-dependence has been, in the first instance, an affirmation of the origin and derivation of humanity and of its world; in those traditions that have tended not to distinguish as sharply between “being” as applied to the divine and as applied to human beings, dependence has been the basis for identifying the locations of both the divine and the human within the “great chain of Being”; in those traditions that have emphasized the recurrence of patterns known to be embedded within the very structure of the cosmos, dependence has made it possible for the community and its individual members to participate, through myth and ritual, in such patterns; and in those traditions that have interpreted human history as the arena in which the will and way of the divine could above all be discerned, dependence has employed the recitation of the decisive events in that history to reinforce the sovereignty of God as the one who was active and knowable within, but always transcendent over, such saving and revelatory events. Thus in Islam (a term that is commonly translated into English as “submission,” but that might perhaps as well be translated as “dependence”), the saying of the Qur’ān, “God causes whom he wills to err, and whom he wills he guides; and you shall assuredly be called to account for your doings,” gave voice to the Prophet’s conviction that the believer must depend on the divine will regardless of circumstances, but that such dependence did not preclude human accountability. In Islam, the Five Pillars of Faith were the specific moral and cultic duties for which every Muslim believer would be held accountable, yet the first two Pillars (the recitation of faith in the oneness of God and the daily prayers) were declarations of the paradoxical affirmation that God was not dependent on creatures or their performance of these duties but would be sovereign regardless. That paradox has been central to the definition of faith-as-dependence in many religious traditions, with theories ranging all the way from thoroughgoing determinism to apparent moralism (for example, to use the terms familiar to the Western tradition, all the way from Calvinism to Pelagianism) as efforts to come to terms with both poles of a dialectical truth.

FAITH-AS-EXPERIENCE. In one way or another, each of these definitions of faith has been derived from faith-as-experience. For even the most transcendent notions of the mystery of the divine will have, by their very act of affirming

the mysteriousness of that mystery, laid claim to an experience in which the individual believer or the community tradition has caught a glimpse of just how mysterious the divine could be. Although mystics and prophets—and, following their lead, historians and philosophers of religion—have often spoken of such experiences in isolation from the continuum of human consciousness, that is not, of course, how they have actually occurred. From the biographies of seers and saints it is obvious that these experiences often came in response and in reaction to specific moments of exaltation or depression, in feverish intensity or in the excitement and release of love and death. That inseparability of faith-as-experience from all the other experiences of life has persuaded some observers of the phenomenon to see it as in fact the sublimation and “supernatural” reinterpretation of an essentially “natural” event. Ludwig Feuerbach, both as historian and as philosopher, penetrated deeply into this aspect of faith-as-experience; and Freudian psychology has been especially successful in explaining religious experience in its relation to the totality and complexity of how the human mind has attempted to cope with all the data of its experience. But in opposition to the reductionism that has frequently been represented as the only acceptable conclusion from this quality of faith-as-experience, the philosophical interpretation of religion, systematized perhaps most effectively by Rudolf Otto, has sought to identify what was distinct about this experience even if it was not separate from other experience. Otto’s formulation, which has since become all but canonical, is “the experience of the Holy.” He called it “a category of interpretation and valuation peculiar to the sphere of religion,” and declared that “there is no religion in which it does not live as the real innermost core, and without it no religion would be worthy of the name.” Yet precisely because faith’s experience of the holy has upon further reflection come to include the recognition of its inherent ineffability, the language of faith has drawn upon other experience—esthetic, moral, intellectual—to be able to speak about the unspeakable at all.

THE COMMUNITY OF FAITH. In the sacred literatures of religious faith, faith-as-experience has often been described in highly individualistic terms: How the poet or prophet has come to know the holy in personal experience has dominated how he or she has described that experience for others, so that they in turn, one at a time, might also come to share in such an experience and duplicate it for themselves. Individualism of that kind underlay, for example, the recurring definition of religion as “what one does with one’s solitariness.” Except for passing moments of intense mystical rapture, however, such individualism has been shown to be illusory. And except for occasional glossolalia, the very language in which the individual has spoken about faith-as-experience has been derived from the history of the community, even when that language has been aimed against the present corruption of the community or when it has been directed toward the founding of a new and purer community. When examined in its total context, moreover, it becomes apparent

that the individualized experience of faith has repeatedly taken place during or after corporate worship: The setting of the private vision has often been the temple itself; or when the vision has come in the solitude of the desert or in the privacy of the soul, it has come as a consequence of participation in the ritual of the temple or as a response to instruction in the lore of the community’s tradition. Just as the distinction between the experience of faith and general human experience has engaged the interest of psychologists of religion, so sociologists of religion have probed the connection (in the formulas of Joachim Wach) between “religion and natural groups,” as well as then the “specifically religious organization of society.” The community of faith, as coextensive with the family or tribe, has conferred its authority on that social organization in marriage, war, and commerce, and has derived its sanctions from it in turn. Then exclusion from the believing community was identical with ostracism from the natural community. But with the more sophisticated identification of the specific nature of faith has come a distinction between the two, often through the emergence of an *ecclesia in ecclesia* as a more precisely delineated community of faith or (using a pejorative word in a nonpejorative sense) a “sect.”

FAITH AND WORSHIP. The community of faith has always been a community of worship; in fact, worship has been far more explicitly a part of its definition than has faith. Western observers of “primitive” societies have sometimes been prevented from recognizing this, either (as in the case of some Christian missionaries) by too particularistic an understanding of worship or (as in the case of some modern anthropologists) by too reductionistic an understanding of ritual. One of the most important scholarly sources for the new and deeper recognition of faith-as-worship has been the investigation of the interrelation between myth and ritual: Myth came to be read as the validation, in the deeds of the ancients or of the gods, of what the ritual now enjoined upon believers; and ritual acquired a new dimension by being understood as not merely outward ceremonial performed *ex opere operato* but as the repetition in the believers’ actions of what the myth recited in words about the divine actions that had made the world and founded the community. Amid an infinite variety of ritual forms and liturgical prescriptions, therefore, worship has defined “faith.” For example, the fourth and last of the Four Noble Truths of Buddhism as formulated by Gautama Buddha himself was the recognition of the methods by which the believer could overcome the inner yearning for pleasure out of which the misery of *dukkha* sprang. Similarly, the eighth and last part of the Eightfold Path of Buddhism consisted in proper meditation, which was inseparable from the first seven. Methodologically, the task of discovering the specifics of the faith expressing itself in a particular worship ritual continues to challenge the ingenuity of historians of religion, as is manifested by their disputes over the meaning of (to cite an example present in several traditions) the ritual of circumcision. Even the widely shared assumption that the ritual antedated the myth, which in turn antedated the theological explanation of both, must be mod-

ified by the repeatedly attested rise of new rituals out of the composition of the myth or after the adoption of the theological doctrine. Yet in the absence of any verifiable statistical data it does seem a safe generalization to suggest that, even more than faith-as-obedience to a moral imperative or commandment, faith-as-worship has defined faith for most of the human race through most of its history. Even the term *orthodoxy*, which has acquired the meaning “right doctrine” in most of the languages where it appears and which carries that meaning also when it is used in a secular sense for political or literary theories, really means “right worship,” as the Russian translation of the word, *pravoslavie* (“the right way to celebrate”), demonstrates.

FAITH-AS-CREDO. Yet *orthodoxy* does mean primarily “right doctrine” now, and one of the definitions of “faith” is “credo” (which is the Latin for “I believe”). Because so much of the history and interpretation of world religions has been the work of Christian thinkers trained in the doctrinal theology of the several Christian churches, early scholarship in “comparative religion” regularly consisted of a review, doctrine by doctrine, of what the various religions were perceived as having taught. As often as not, such reviews were organized according to the schema of categories devised by Thomistic or orthodox Lutheran and Reformed systematic theologians, even, for example, in so sensitive a treatment as Karl Friedrich Nägelsbach’s *Homeric Theology* (1840) and *Post-Homeric Theology* (1857). The artificiality and arbitrariness of imposing these categories from the outside on literary and religious traditions having an integrity of their own led later generations of scholars to employ greater caution in claiming to have discovered “doctrinal” meanings (in the sense in which Christian theology spoke of “doctrines”) in non-Christian religions, even sometimes in postbiblical Judaism. Significantly, however, one outcome of the tensions that have arisen between various of those religions and modern thought (see “Faith and Knowledge” below) has been the development, within the traditions themselves and at the hands of their own faithful devotees, of something very like systematic doctrinal theology, which has included comparative judgments about their relation to other traditions and their “doctrines.” As already suggested, nevertheless, the definition of faith-as-credo has been especially prominent in Western and Christian thought.

In medieval usage, for example, the Latin word *fides* must commonly be translated as “the faith” rather than simply as “faith,” because it referred in the first instance to the content of what was believed (*fides quae creditur*) rather than to the act of believing (*fides qua creditur*), and specifically to one of the orthodox creeds of the church, generally the Apostles’ Creed or the Nicene Creed; once defined, orthodox doctrines were binding *de fide*, by the authority of the faith. To “have faith,” then, meant first of all to “hold the faith” as this had been laid down in the apostolic “deposit of faith” and legislated by church fathers, councils, and popes. And even the repudiation of the medieval system by the Protestant Reformation, a major plank of which was Luther’s elevation of

faith-as-trust over the Roman Catholic faith-as-credo, still retained, and in some ways even intensified, the insistence on right doctrine, a knowledge of which and an assent to which were the necessary presupposition for a correct faith-as-trust.

FAITH AND TRADITION. Acceptance of a “deposit of faith” has implied some notion of tradition as that which has been *traditum*, first “handed down” and then “handed on.” Although the thinkers of the eighteenth-century Enlightenment drew a sharp distinction between “traditionary religion” and “natural religion,” vastly preferring the latter to the former, it was in fact only the former that was to be found in the history of religion; eventually even the “natural religion” of the Enlightenment acquired a certain traditional content and was transmitted from one generation to the next by way of an intellectual tradition. “Traditionary religion,” therefore, has defined itself and its faith on the basis of received tradition. The myth of how holy things have happened; the ritual of how holy acts were to be performed; the rules of conduct by which the faithful were expected to guide their lives; the structure through which the holy community was founded and governed; the doctrine by which the community gave an account of the myth and ritual—all these expressions of faith have been the subject and the content of the holy tradition. In all those religions that have ascribed normative status to a holy book, the question of faith-as-tradition has taken a special form, as they have sought to deal with the question of the relation between the revelation in the book, as given once and for all, and the continuing revelation in the tradition. Reformers in each of those groups have drawn an antithesis between the purity of the original scripture and the accretions of later tradition, which needed to be expunged, while defenders of tradition have posited a continuity between the scripture and the tradition, sometimes by characterizing them as “two sources of revelation” but sometimes by describing the ongoing tradition as the process through which the properly validated authorities had gradually made explicit the content of the faith already implicit in scripture. Thus a twentieth-century Russian Orthodox thinker, Vladimir Lossky, defined tradition as “the life of the Holy Spirit in the Church, communicating to each member of the Body of Christ the faculty of hearing, of receiving, of knowing the Truth in the Light which belongs to it, and not according to the natural light of human reason.” By setting faith into the framework of such a theory of tradition, Lossky and his counterparts in other faiths (who could have used much of the same language, substituting other proper names) have sought to combine the static view of tradition as a “deposit of the faith” in the past with a dynamic view of tradition as “living faith” in the present and future.

FAITH AND KNOWLEDGE. Whether it has been interpreted as a second channel of revelation for faith or as the development of a truth already implicitly present in the original deposit of faith, tradition has been a way of knowing the truth. Faith, therefore, has been taken to be a species of knowledge,

differing from ordinary knowledge by its superior claims: An arcane character, a transcendent content, privileged channels of communication, or divine certainty (or all of the above). So long as such claims remained publicly uncontested, faith could stand as objectively sure, even when subjectively the individual believer might question or doubt it. There is no reason to suppose that such existential questioning and doubting have ever been absent from the experience of faith, and plenty of reason to find evidence of their presence in the artifacts and literary remains of various religious faiths from the past. What has made the situation of religious faith in the present unique, however, is the gravity and the universality of the tension between faith and knowledge. One by one, each of the world faiths has been obliged to confront the competing truth claims not only of other faiths, as it had perhaps done before, but of other forms of knowledge that seemed to render any faith-as-knowledge, regardless of which faith was involved, superfluous or absurd. The identification of faith with accounts of miracles and similar wondrous events that a later generation has found to be, quite literally, incredible has undermined the authority of the faith itself. Orthodox methods of harmonizing away contradictions in the authoritative tradition through allegory or a theory of multiple meanings have not been able to withstand the pressures of the historical method of dealing with the tradition. The discovery or invention of alternate means of dealing with those crises of life and needs of society for which faith had served as the divinely prescribed cure relegated it to a secondary status as a superstitious nostrum still needed only by those who did not know any better. When Immanuel Kant said in his *Critique of Pure Reason* (1781) that he had "found it necessary to deny *knowledge* of God, freedom, and immortality in order to find a place for *faith*," he was speaking for believers in many traditions who have salvaged faith by making it invulnerable to the claims and counterclaims of knowledge; but in so doing, they have also brought into question most of the other functions of faith. At the same time, the very challenge of knowledge to faith has produced a clearer understanding both of faith's relation to other aspects of human experience and of its distinctive meaning and power.

FALL, THE. The concept of the fall appears in myths, traditions, and religions of a great many peoples and presents a number of interrelated themes of primary importance in the history of religious thought. In general, the fall is to be thought of as an accident that arose after the creation or genesis of the world bearing consequences for the present human condition; this accident explains a new situation in the world that is recognized as a decline or degradation when contrasted to the original state of humankind and the cosmos. This fundamental conception of the fall takes different forms in different cultures and religions.

PERSPECTIVES ON MYTHS OF THE FALL. The theme of the fall may be considered from the perspective of (1) historical time and its unfolding; (2) theogony; (3) cosmogony; and (4) anthropogony, which encompasses the creation of humanity and its present condition.

Historical time. Considered temporally, the fall takes place between *Urzeit* and *Endzeit*, between the beginning and the end of creation. Within historical time, it is very close to the beginnings of time conceived as a golden age in contrast to which the fall and its consequences represent a break or degradation. This temporal and historical conception of the fall can be found in various popular traditions as well as myths of the golden age and paradise lost.

Theogony. The theogonic aspect of the fall deals with the degradation of the divine and is found in the numerous myths concerning the origin of the gods, of their victory over chaos, or of the victory of the more recent forces of divinity over older ones. Coextensive with the creation, the fall as presented in theogony implies the identification of evil and chaos on the one hand and of salvation and creation on the other. This conception of the fall is found especially in Sumero-Akkadian theogonic myths that recount the victory of order over preexisting chaos; it is found also in the Egyptian myth of the battle between Seth and Horus. Strictly speaking, these theogonic myths are not true myths of the fall, but two of their recurrent themes justify their inclusion in a typology of myths of the fall. First, they emphasize the ritual celebration of the maintenance of the creation and cosmic order, as in the festival of Akitu in Babylon. Second, they present, through a variety of mythologies, the theme of the degradation of divinity that results from the fall of some por-

tion of the divine substance into matter, body, or darkness. This theme is central to the three most important forms of religious dualism: Orphism, Gnosticism, and Manichaeism.

Cosmogony. From the perspective of cosmogony, the fall is seen as an accident occurring after the genesis of the world that affects cosmic forces and explains the present condition of earth or the universe. Myths that tell of the progressive degradation of the universe and its destruction and recreation in successive cosmic cycles exemplify this cosmogonic view of the fall. The flood is an important example of this type of fall, and numerous myths of the flood are found among religious traditions of the world.

Anthropogony. Anthropogony, however, offers the most important perspective on the fall. From this perspective, the contemporary human condition—a condition of degradation in contrast to that of the golden age of humanity—is explained as the consequence of a fall, a tragic event that bursts into human history. Around this event are clustered those myths and symbols that seek to explain the origins of illness and death and the tragic nature of the human condition after the fall.

From these four perspectives, it is possible to develop a typology through which the myriad myths of the fall in cultures throughout the world become comprehensible. Furthermore, these perspectives illuminate the fundamental aspect of the concept of the fall and the inherent meaning that emerges from these myths: The present human condition is explained by the accident that occurred after creation and ended the golden age.

Myths of the fall clearly show three essential elements: (1) the concept of a golden age in the beginning, (2) the accident that is a break or degradation of original harmony, (3) the explanation of the present human condition. From these three elements, it is possible to trace a historico-phenomenological picture of the traditions dealing with the fall. One final remark needs to be added, however, before proceeding to an analysis of this picture. An understanding of the complexity of the problems related to the concept of the fall must not lose sight of the intimate relationship of this concept with the problem of evil; any conception of the fall has implications concerning the origins of evil, as well as intimations of a possible overcoming of evil through a recovery of the state that existed previous to the fall. Thus a philosophical and ethical dimension is grafted onto, and is coextensive with, the idea of the fall and forms an important part of a hermeneutical approach that tries to come to terms with its relationship to guilt or fault. The scope of this article, however, does not permit an envisage of these other aspects of the fall.

ARCHAIC RELIGIONS AND ORAL TRADITIONS. The myth of an earthly paradise, where humans are immortal, is an integral part of cosmogony and descriptions of the world's beginning in many cultures. That primordial person enjoys a bliss and freedom that it lost as the result of a fall is the dominant theme of this myth, a theme offering many variations.

The Jorai cosmogony of the autochthonous peoples of Indochina gives an idyllic description of original humanity. Living with the god *Oi Adei*, humankind enjoyed a deathless existence in a paradise where one could fly like a bird and talk with plants and animals, where bundles of wicker grew on trees and shovels turned over the earth by themselves. Man had only to feed his tools; but he got drunk and did not do so, and the tools revolted. In the Sre cosmogony of Indochina, humans had no need to work in the earthly paradise, because the god *Ong Ndu* had made them immortal; but when the primordial couple refused the god's command to dive into a well, they were punished for their disobedience by suffering, old age, and death.

The cosmogonies of Bantu speakers from the Mayombe region north of the Kongo River, the cradle of the old Kongo civilization, contain significant stories of the fall. In the Yombe tradition, humankind's golden age was brought to an end by *Nzondo*, a spirit whose magic also created the Zaire River after a flood. *Nzondo* drove people from their original home, dispersing them over the earth and setting in motion the chain of disasters that have since befallen the race.

In a Dogon myth from Mali, heaven and earth were originally very close to each other. But God separated them and made men mortal, after being disturbed by the noise of the women crushing millet. Similarly, in a myth from Cameroon and Burkina Faso (Upper Volta), the vault of heaven was originally within humanity's reach, but when a woman who touched the vault with a load of wood she was carrying on her head asked God to move it out of her way, he moved it so far that he abandoned humankind to death. These myths tell of a paradise lost; but they also stress the theme of God's rejection of a disobedient humankind, of his consigning humanity to death as punishment for a variety of sins, that is, for violating a divine prohibition, for lying or theft, for domestic rivalries, for lack of charity. Death is explained as divine punishment prompted by human disobedience. Similar myths are found among the Diola in Senegal, the Nupe in Nigeria, the Bena Kanioka in Zaire, and the Anyi in the Ivory Coast.

Myths of the fall as fate, though less frequently encountered than those of the fall as punishment, are also significant in sub-Saharan Africa. These myths involve an archetypal badly delivered message—a divine message of immortality that reaches humanity either too late or in abridged or altered form. Here, the original separation of heaven and earth replaces the earthly paradise where God and humans live together; from heaven, God sends messages to people on earth. In a Tsonga myth, a chameleon carries the message of eternal life, while the giant lizard *Galagala* carries the message of death. The lizard, moving faster, arrives first, and humanity so becomes mortal. In a Bete version of the same myth, from the Ivory Coast, the lizard advises the chameleon to walk slowly. Animals are always the messengers in these myths, and the message of mortality always arrives first. Other myths emphasize the change and deterioration of the mes-

sage in the course of its transmission; myths of this sort are found among the Mossi in Burkina Faso, the Ashanti in Ghana, the Kabiye in Togo, and the Kikuyu in Kenya.

In Australia, the Aranda regard their totem ancestors as the heroic forgers of civilizations who gave form to the countryside, who allotted individual lives to humans by creating separate embryos, who lived in a mythical golden age where they were untouched by the woes of contemporary humankind. These totem ancestors were immortal, and those among them who apparently died in battle in fact went to heaven, where they became *tjurungas*, sacred beings who were powerful and creative, traveling to and fro above or below the earth.

Exhausted when they completed their creative work, and seized by an overwhelming lassitude, these mythical ancestors sank into the earth. But before they disappeared they laid down, by some of their actions, the rudiments of death; thus, the first people knew both death and the pains of the human condition. The myth of the magpie Urbura explains the permanence of death. When the first mortal tried to leave his tomb, Urbura struck at him with her claws, thrust a spear through his neck, and nailed him to the ground, establishing forever humanity's mortal condition.

Common to myths of the fall and to nostalgia for a lost golden age is the view that the original human condition was a condition of paradise. Heaven lay close to the earth, and people could go there merely by climbing a mountain, a tree, a ladder, or a vine (Eliade, 1960). Enjoying the friendship of both the gods and the animals—and speaking their language—man enjoyed a life that was immortal, free, spontaneous, and perfectly happy.

That this paradise was lost as the result of the fall is a second commonly held view. Often, the fall is an accident, as in Australia, where myths of the Aranda tribe merely record it. In various African traditions the accident is equated with sleep: The god had asked humans to remain awake through the night to await a message from him, but when it arrived they were asleep. If sleep is understood as a symbol for death, the accident of sleep explains both the precarious human condition and the establishment of death.

The fall may also result from human failings. Once again, the most important documentation is found in sub-Saharan Africa. A Maasai myth known in both Africa and Madagascar tells of a package that humans were given by God but forbidden to open; driven by curiosity, they opened it and let loose sickness and death. The divine prohibition takes other forms in other traditions. In a Pygmy story of central Africa, it is against looking at something; in a story of the Luba in the Democratic Republic of the Congo, it forbids the eating of certain fruits; in a Lozi myth found in the Democratic Republic of the Congo and Malawi, it prohibits the taking of wild game.

Sometimes humanity's fault is best understood anthropologically, as in myths describing theft or lying, or

those that stress lack of charity, or the race's capacity for domestic violence, as in a Chiga myth from Uganda. The curiosity of the primordial couple who aspire to the secrets of the gods is a frequent mythical theme in Africa, where myths of the fall also emphasize the cohesiveness of individual and group (Thomas, 1982, pp. 32–48).

ANCIENT CIVILIZATIONS. Important approaches to the theme of the fall are found in the great civilizations of antiquity. This section examines those myths and traditions found in the civilizations of Egypt, Sumer and Babylonia, ancient India, ancient Iran, and ancient Greece.

Egypt. Egyptian religious thought also shows an awareness of a golden age existing at the beginning. The study of archaic texts has prompted the hypothesis that this age was thought to have had two stages, the first of which was *Urzeit*, primordial time before the creation. The idea of a primordial time is expressed by such formulas as “that did not yet exist” (*nhprt*) or, in the wording of Pyramid Texts 1040 and 1043, “When the heavens did not yet exist . . . there existed neither death nor disorder.” In contrast to this mythic primordial time is the time that follows it, the time of creation and of creator gods such as Re and Osiris (Otto, 1969, pp. 96–99).

Whatever the validity of this hypothesis, the time of creation, the *Schöpfungszeit*, was definitely considered a golden age. A variety of texts make it possible to assert this interpretation with certainty. “Law was established in their time. Justice (Maat) came down from heaven to earth in their age and united herself with those on the earth. There was an abundance on the earth; stomachs were full, and there was no lean year in the Two Lands. Wall did not collapse, thorn did not prick in the time of the primeval Gods” (Kákosy, 1964, p. 206). An inscription from the temple of Idfu speaks in the same way: “There was no sin on the earth. The crocodile did not seize prey, the serpent did not bite in the age of the primeval Gods.” This golden age is depicted in other temple inscriptions and is found again in the Coffin Texts; it is, in fact, a very ancient doctrine in which myths of a golden age and fall are tied to the problem of death.

Three great Egyptian cosmogonies explain the creation of the world. In the Memphis theology, the word of the god Ptah created all things; at Heliopolis, the creation takes place with Re-Atum's separation of heaven and earth; at Hermopolis Magna, the creator is the god Thoth, who fashions an egg from which the sun, organizer of the cosmos, emerges. The Memphis theology makes it clear that, by putting the cosmos, the gods, and the gods' images and cults in place, Ptah established a definitive cosmic order in which Maat, the principle of order, replaced disorder (Pyramid Text 265.1775b).

The myth of the celestial cow, a myth of archaic origin, although known from a text of the New Kingdom, is the most important witness to the Egyptian doctrine of the fall. It tells of insults hurled by humans at the god Re (variously

called “silver-boned Re,” “golden-limbed Re,” “Re of the lapis lazuli hair”) and of Re’s attempt to determine their punishment in a secret council of the gods held in the Nun, or primordial chaos. From his throne, Re glared fixedly at the rebellious humans, as the gods had advised; immediately, his eye became the goddess Hathor, henceforth called Sekhmet, the Powerful; she organized a massacre of the rebels as they fled into the desert. Re, however, preferred to save remaining humankind; ordering that pomegranates be brought to him, he extracted their juice, and at dawn carried the juice to the flooded area of humanity’s impending extermination. There he determined to spare the human race; but he also withdrew to the highest place in heaven, and sat on the back of Nut, the vault of heaven transformed into a cow, assigning to Thoth the role of scribe and the task of civilizing humanity.

The *Book of Going Forth by Day* is another witness to the Egyptian doctrine of the fall. Chapter 17, alluding to Re’s enemies, declares: “I was All when I was in the Nun, and I am Re. . . . When Re first appeared as king of all that he had created, when the uprisings of Shu did not yet exist, he was on the hill that is at Hermopolis and at that time the children of the fall at Hermopolis were delivered over to him.” To this passage, which tells of the revolt against Re, correspond the lines at the beginning of chapter 175, which speak of the disorder created by the children of Nut: “O Thoth, what is to be done with the children of Nut? They have fomented war, they have provoked quarrels, they have caused disorder, they have massacred. . . . They have brought low that which was great in all that I created. Show strength, Thoth, says Atum. . . . Shorten their years, cut off their months. For they have secretly destroyed all that you created.”

From such texts, it is clear that pharaonic Egypt was acquainted very early with a doctrine of a golden age, an age followed by the fall that explains the *Jetztzeit*, the present human condition of death and degradation. Nevertheless, the Egyptian theology that viewed royalty as a divine continuation of Maat, the cosmic and moral order, had a paramount influence on three thousand years of Egyptian history under the pharaohs and the Ptolemies, and although each great historic era ended in a period of disorder, the disorder itself gave rise to the reestablishment of Egyptian society under renewed pharaonic rule. Life and survival were inseparable in Egypt, and the optimism running throughout Egyptian culture is made obvious by the absence of traditions dealing with great cosmic disasters such as the flood.

There was also, however, a darker side to Egyptian thought, one that does relate that evil, incarnate in the god Seth, existed before the creation of humans. Hence some Egyptologists interpret the verses quoted above from chapter 175 of the *Book of Going Forth by Day*, referring to the children of Nut, as an allusion to a quarrel among the gods and evidence of a primordial sin that stood at the origin of the fall.

Sumer and Babylonia. The numerous Mesopotamian traditions dealing with the origins of the gods, the cosmos, and humanity go back to the Sumerian period, well before the third millennium BCE, and become completely intermixed over time with Sumerian, Akkadian, and Babylonian myths. Thus, it is possible to present these traditions coherently by selecting characteristic examples from these three groups of myths.

Samuel Noah Kramer (1981) finds the first document of the Golden Age in the Sumerian story called *Emmer-kai and the Lord of Aratta*. The story speaks of “an earlier time,” before the fall, when humankind lived in peace and harmony, without fear and without rival. During that time, before the creation of snake or scorpion, hyena or lion, wolf or wild dog, all peoples of the universe worshiped the same god, Enlil. But the gods brought about humankind’s fall when Enki cast an evil spell and stole Enlil’s empire.

The creation poem *Enuma elish*, which dates from 1100 BCE but actually goes back to the first Babylonian dynasty at the beginning of the second millennium, relates the genesis of the gods before it describes the genesis of the world or humanity, and shows that strife and murder existed among the gods from the moment of their creation. The younger gods banded together against their mother, Tiamat; they behaved riotously and spread fear throughout the dwelling places on high. The goddess Ea caused the god Apsu—who would himself have murdered the other gods, had his scheme not been betrayed—to fall into a deep sleep, then undressed him to take away his strength, and finally put him to death. The Atrahasis myth, dating from the reign of the Babylonian king Ammisadaqa (1646–1626 BCE), gives another version of these events, in which the gods declared war on Enlil and gathered in arms before his temple for the decisive battle.

In these two myths, evil is coextensive with the first generation of the gods, and disorder begins in the divine world itself when the younger gods kill their mother, Tiamat (who in any case had planned to murder them). From this perspective, the gods are responsible for evil, and order appears among them only with the advent of the god Marduk, the principle of an ordered divine world. Hence, humans simply find evil in the world; they are not the cause of it.

Both the Atrahasis myth and the poem *Enuma elish* show that the gods created humans with the intention of imposing burdensome tasks upon them: food gathering, the building of waterways, dikes, canals, and so forth. In the Atrahasis text, the god Weilu is killed by the other gods, who then mix his flesh and blood with clay to make humankind, upon whom they immediately impose the gods’ “basket” (i.e., workload); in a story dating from the seventeenth century BCE and found in a bilingual text from the reign of King Tiglath-pileser I (1114–1076 BCE), An, Enlil, and Enki kill the Alla gods and from their blood create humankind, which they also charge with tasks previously borne by the gods.

In these texts, and in many others that echo them, it is clear that Mesopotamian thought saw the human condition

as one of total subordination to the gods, who were absolute masters of the world. This dualistic thought presents a humanity fashioned both from the blood of a murdered god and from mere clay, a humanity knowing no primordial fall but only a destiny of submission to the gods and subordination to divine power. The gods reserve a deathless, happy life for themselves, imposing on humanity a precarious existence that ends in death, itself a divine decision. The dead lead only a shadowy existence in the realm of the god Nergal.

Two ancient texts provide Akkadian and Babylonian versions of the Mesopotamian flood. The earlier, dating from the beginning of the third millennium, was found on a Sumerian tablet unearthed in the ruins of Nippur; the other is found in tablet 11 of the *Epic of Gilgamesh*.

The Sumerian tablet describes the creation of the world and humans and the building of the first cities, including Eridu and Shuruppak. The rather fragmentary story of the flood tells of how the gods decided upon a deluge, from which only the pious king Ziusudra was spared. After the disaster, Ziusudra sacrificed an ox and a sheep to the sun god Utu and thereby reconciled the gods and humankind.

In the Babylonian version, from the *Epic of Gilgamesh*, the man saved from the flood was Utanapishtim, to whom the gods gave immortality. After the flood, the quarrel that had divided the gods started up again, and Enlil, the lord of earth and sky who had been the cause of the flood, wanted to destroy its sole survivor; but Ea and Ishtar, protectors of humankind, intervened and Utanapishtim was saved.

In neither version of the flood does the question of human responsibility for the cosmic disaster arise; as in Mesopotamian stories of humanity's creation, the stories of the flood deal only with theogony and with quarrels of the gods. The Atrahasis myth does indicate the gods' motive for the flood—the noise and disturbance produced by the ever-increasing number of humans—but this motive is analogous to that behind the gods' first quarrel. Thus, whatever the reason for the gods' displeasure with humanity, the human failings that appear at the time of the fall are simply part of a divinely ordained chaos. In the final analysis, myths of the fall in Sumerian-Babylonian thought are intimately tied to theogonic and cosmogonic myths in which the fall, like everything else that happens, results from the will of the gods.

Ancient India. In India, which has experienced its past far more through myths than through historical interpretation of actual past events, the most important documents of mythic history are the Purāṇas, or “ancient tales.” One part of the speculations of the *Vāyu Purāṇa* treats the four *yugas*, or ages, of the world. The present age, the fourth *yuga*, is called the *kalīyuga*. The first age, named *kr̥tayuga* or *satīyayuga*, is described in the *Vāyu Purāṇa* as a golden age when Prajapati created all things from a superabundance of light and intelligence.

During this *yuga*, a perfect age that lasted four thousand years (plus an additional four hundred for its dawn and

dusk), all creatures lived in a state of spiritual perfection, doing as they pleased, free from heat and cold, fatigue and suffering, ignorant alike of justice and injustice. Possessing similar forms, their pleasures, their life span, and their ever-youthful bodies ensured a life of abundant happiness, joy, and light, knowing neither classes nor different ways of being. Whatever was sought after by the spirit sprang from the earth, and all enjoyed truth, forbearance, satisfaction, and contentment.

The *Vāyu Purāṇa* does not describe a fall, but simply a decline, from this golden age. The second age, *trētāyuga*, was still, at its beginning, part of the golden age; beings still lived without suffering, joyous and satisfied. With time, however, they became greedy; they laid waste the fruit trees and the honey that had fed them in ease. Afflicted now by wind, heat, and cold, people built houses, then villages and cities. Now too rains came, bringing streams, rivers, and rank vegetation. Humans were divided into four classes: *brāhmaṇa*, *kṣatriya*, *vaiśya*, and *śūdra*; and, because humans no longer fulfilled their duties, the *brāhmaṇas* assigned specific functions to each class. The *brāhmaṇas* were to make sacrifices on behalf of others, to read the Veda, to receive offerings; the *kṣatriyas* were to exercise power, make war, and dispense justice; the *vaiśyas* were to raise livestock or practice agriculture or commerce; the *śūdras* were to practice the various trades. The *brāhmaṇas* likewise introduced and named the four stages of life: first, the quest for knowledge, followed by domestic life, the retreat into the forest, and, finally, renunciation.

It is clear from the *Vāyu Purāṇa* that by the end of the second *yuga* the conditions of humanity and the cosmos were such that the golden age had been lost, the victim not of a fall in the usual sense but of a progressive decline, and of the negative effects of time. As differences appeared among them, humans lost their original vitality, turning to passion, vice, and greed, and ceasing to carry out their duties faithfully. The *Vāyu Purāṇa* emphasizes the role of human responsibility in this cosmic and social decline.

From the sixth century BCE on, the idea of *karman*, specific to Hindu religious thought, was used to explain the decline of the human condition. Linked to the idea of *sāṃsara*, the incessant whirlpool of rebirths, the ethical idea of *karman*, gradually replacing older Vedic ritual notions, placed the human soul under the necessity of being reborn in animal, human, or divine forms. Thus humanity by its actions was made responsible for its decline and for the repercussions of that decline in the cosmos. Holding humankind accountable for his position in the universe, the law of the *karman* became a law of just retribution for actions.

The Indian idea of the flood, of “cosmic disaster,” appears within a cyclical conception of time—a conception analogous to the idea of the *karman* involving the periodic destruction and rebirth of the cosmos. The oldest of numerous Indian versions of a cosmic fall in the form of a flood is that of the *Satapatha Brāhmaṇa* 1.8.1; it presents the story

of Manu, the first man and the survivor of the flood, in a typically Vedic context. Warned of the flood by a fish, Manu takes the fish under his protection and then is saved by it as the waters rise and carry away all other creatures. Left alone, Manu offers the *pāka* sacrifice, and, after a year, a woman—his daughter, called Iḍā, the offering—is born; through her Manu will create his posterity, the renewed humanity.

Ancient Iran. The Avesta preserves ancient Iran's memories of the golden age that existed in the beginning, during the reign of the first king, Yima (*Vendidad* 2.1–20, *Yasna* 9.4–5, *Yashts* 9.9, 13.130, 15.15, 17.29, 19.32). According to *Yasna* 9.4, Yima, the good shepherd, the most glorious of mortals ever born, looked benevolently on all creatures; his reign was one with neither drought nor heat nor cold, when food was always plentiful, and when people and animals lived without want or old age or death. The *Vendidad* (2.7) says that Ahura Mazda brought Yima the two implements symbolizing a prosperous reign, a golden seal and a sword encrusted with gold. Yima also asked for a thousand-year reign of immortality in the world created by the Lord. For three hundred years after the creation, the world filled up with humans and animals; then Yima, advancing in the path of the sun, smote the earth with his seal and pierced it with his sword, and the earth increased in size by a third; he did this again after six hundred winters, and again the earth became a third larger; when he had repeated this act yet again, the earth was enlarged to three times its original surface (*Vendidad* 2.7, 2.8–9, 2.10–11, 2.17–19). Thus ends the story of the paradise of Yima, a paradise that in a Pahlavi text, the *Denkard* 8.1.24, is compared to the highest heaven.

The Avestan text *Yashts* 19.34–38 describes the fall that marked the end of this felicity. When Yima began to take pleasure in false and deceitful speech, the *khvarenah*—the celestial light, the mark of divinity, the sign of the elect and of power—at once abandoned him. He thus lost the three marks of glory associated with the *khvarenah*, the marks of the priest, the warrior, and the agriculturalist-herdsman. Seen in the context of Indo-Iranian thought, the loss of these marks represents the loss of the three great Aryan functions of sovereignty, power, and fecundity. Confounded and distraught, Yima fell to earth and became mortal.

The cause of the fall, the “lie against the truth,” is stressed in *Yashts* 19.34; this lie deprived Yima of his aura of light and delivered him over defenseless to the Evil Spirit, who hounded him with demons and forced him to flee. Yima actually made two mistakes: The first was “the lie and the error,” or *druj*, condemned by the entire Mazdean tradition and still decried in Manichaeism, for Mani taught that lying and deceit constitute the evil that resides in matter and darkness; the second mistake was the offense to God caused by pride (Widengren, 1968, p. 72). Because, in this very ancient myth, Yima is the archetype of the cosmic king who holds sovereignty over the gods and humans, the king of the three functions that correspond to the three classes of society, his fall will mark both the cosmos and the human condition.

Describing Yima's meeting with Ahura Mazda, *Vendidad* 2.21–22 mentions hard winters of bitter cold and heavy snow; in *Bundahishm* 7, there is a story of what appears to be a flood; and al-Mas'ūdī (d. 957) relates how, according to one tradition, the flood came during Yima's time. In the nineteenth century, scholars such as C. P. Tiele, François Lenormant, and A. V. Rydberg saw an allusion to the flood in this evidence; but early in the twentieth century, Nathan Söderblom, in a lengthy discussion of the question, showed that it is impossible to know whether the devastating winters mentioned in these passages were considered part of a real past before they came to symbolize the end of the world later incorporated into Mazdean eschatology. Söderblom leaned toward a strictly eschatological meaning of the myth of the *vara* of Yima and the winter of Mahrkuska; more recently, Geo Widengren has observed that in the few traces of a flood linked to the myth of Yima two different themes have been combined: one of the golden age of Yima, the other of a period when the more fortunate of humankind took refuge in the *vara* because winters threatened their existence (Widengren, 1968, pp. 70–71). Going over the evidence once again, Mary Boyce still finds the narrative of the *vara* of Yima puzzling; but she argues that, because the editing of the *Vendidad* in the Parthian period is comparatively recent, the Avestan story very probably was contaminated by the Mesopotamian and biblical stories of the cosmic flood (Boyce, 1975, pp. 92–96).

Ancient Greece. The term *golden age* (Gr., *chruseon genos*) comes from the ancient Greek world. In *Works and Days*, Hesiod provided the myth of the Golden Age to which later Greek and Latin poets would return again and again, a myth of five races of humans to which correspond five ages of the world: ages of gold, silver, and bronze, of heroes, and, finally, of iron. Created when Kronos reigned in the heavens, the race of gold lived as gods on the earth, perfectly happy and secure, sheltered from all woe, fatigue, pain, or illness. The earth gave forth abundantly all things that people desired, and although this first race of humans was not immortal, its death was a mere going to sleep. This age of paradise, when humans enjoyed the blessing and friendship of the gods, ended with the fall of Kronos; then Zeus made benevolent gods of these first humans.

Plato elaborated on the conditions of this golden age in the *Politics* (271c,d–272a); in that age, he says, the gods were responsible for different parts of the cosmos, and demons served as shepherds for the various species and groups of animals; the earth's climate was always temperate, and everything was designed to serve men, who lived on fruit picked from trees. There were neither cities nor even women or children, because they were reborn from the earth without any memory of earlier lives.

Horace, Vergil, and Ovid later take up this theme, adapting it to the legendary history of Rome; thus Kronos will become Saturn and Latium will have the name Ansonia during the golden age—a time when, according to the Latin

poets, springtime was perpetual, and, because lying and theft did not yet exist, houses had no doors.

Four races will follow that of the golden age. Extremely slow in coming to maturity, the silver race will lose the qualities of life that characterized the previous age. Although created by the Olympian gods, the people of this race could not refrain from foolish excesses, even refusing to sacrifice to the gods, and Zeus buried them, transforming them into the spirits of the underworld. He then created the fearless and warlike race of bronze, a race so given to violence that it destroyed itself and was followed in its turn by the race of heroes, heroes who founded famous cities, fought beneath the walls of Troy and Thebes, and ended their days in the Isles of the Blessed. At last came the present race of humans, the race of iron, whose ephemeral and vulnerable existence is plagued by illness and want.

The myth of the races of humans, which recalls the Indian myth of the four *yugas*, is, like it, a myth of decline rather than fall; like the text of the *Vāyu Purāna*, the Hesiodic text emphasizes progressive degeneration. Gradually humanity loses the virtues and qualities of the primordial period; its strength and endurance diminish, and finally it loses the longevity of the first age. Recent analyses of this myth have also laid stress on the evil pointed out by Hesiod: human pride, the hubris that makes humans refuse to sacrifice to the gods and to defy *dike* ("justice").

In his *Theogony*, Hesiod describes the triumph of an ordered world over chaos and proclaims the sovereign power of Zeus, who imposes himself upon both the universe and the other Olympian gods, to whom he distributes functions and privileges. In *Works and Days*, before recounting the myth of the races of humankind, he tells the story of Pandora, the first woman, created by Zeus's command to bring punishment upon the human race. All the Olympians joined in making this special gift to humans. Zeus sent her to the naive Epimetheus, who was seduced by her beauty and married her.

At pains to stress how humans had originally enjoyed the earth free from troubles, weariness, or illness, Hesiod now relates that Pandora had barely arrived on earth when she was devoured by curiosity to learn the contents of the vase she had brought with her and lifted its lid, thus sending throughout the world all the present and future afflictions and woes of humankind, leaving only hope at the bottom of the vase when she replaced the lid. Henceforth, innumerable miseries will plague humanity, and thus, Hesiod concludes, none can escape the plan of Zeus (*Works and Days* 90–102, 105). In the myth of Pandora, the themes of hubris and fate come together, and the description of the fall shows the fundamental link between divine will and human fate.

Orpheus seems to be a figure of the archaic religious type that, in certain traditions, is thrown back to the earliest time; he stands in sharp contrast to the Olympian gods. Hesiod's theogony and cosmogony oppose an ordered world

upon which Zeus has at last imposed himself to an earlier, primordial chaos; Orphic theogony, on the other hand, presents a primordial Eros, or Protogonos ("firstborn"), or Phanes ("light"), that itself creates night, Ouranos, Kronos, Zeus, and, finally, Dionysos.

Orphic anthropogony, in sources that date from later antiquity, recounts the myth of a Dionysos torn apart and cut to pieces by the Titans, who then divided the dead god among themselves and ate him. Zeus hurled lightning bolts at them as a punishment and killed them; he then created the present race of humans from their ashes. Thus, humans possess both the evil nature of the Titans and the divine nature of Dionysos whom the Titans had assimilated by eating him. The Neoplatonist Proclus talks of three races of humans: the race of gold ruled by Phanes, the god of the beginning of things; the silver race over which Kronos was lord; and the Titanic race, created by Zeus from limbs of Titans whom he had punished for their crime. Plato himself had already referred to this race, Titanic in origin, who likewise refused to obey both laws and parents, refused to abide by oaths, and despised the gods. Both Diodorus Siculus and Firmicus Maternus repeat these basic elements of the Orphic myth; and the dualism of Orphic anthropogony, in which the story of the Titans is presented as an etiological myth accounting for the present human condition, has been further confirmed by the discovery, in 1962, of the fourth-century Dervani Papyrus.

Orphism explains the human condition through the dualistic myth of the exiled soul. Humankind is composed of a divine soul, daughter of heaven, and of an evil, Titanic nature; the tragedy of his condition comes from this mixture, itself the outcome of an earlier, prehuman crime. Evil is the legacy of an event that stands at the origin of the mixed human nature; it originates in the murder of Dionysos, but that murder signifies both the death of the god and the participation of his slayers in his divine nature. The original sin, the sin of the fall, is murder, and with the murder of Dionysos the soul experiences a brutal descent into a body that becomes its prison (see Ricoeur, 1960, pp. 264–279).

The myth of Deukalion and Pyrrha presents the Greek version of the flood, but the fragmentary Greek texts do not give Zeus's reasons for suppressing humankind. However, as Roman mythology disappeared, it absorbed Greek mythology (a phenomenon discussed by Georges Dumézil, *La religion romaine archaïque*, 2d ed., Paris, 1974, pp. 63–75), and it is therefore legitimate to seek Zeus's reasons in Roman mythology, especially in Ovid's *Metamorphoses*, which provides a fuller account of the Greek version of the flood (*Metamorphoses* 1.230, 7.352–356). Taking up the Hesiodic theme of the ages of the world, Ovid emphasizes that humans were progressively perverted by crime and lust. Zeus, before humanity's destruction, visited Lycaon, king of Arcadia, who served him a feast of human flesh; outraged and at the end of his patience, Zeus swept away all creatures, cities, almost the whole of earth itself, in the flood. Only one couple, De-

ukalion and his wife, Pyrrha, were saved, and from them Zeus re-created the race.

WORLD RELIGIONS. Each of the world religions discussed in this section—Gnosticism and Manichaeism, and the three great monotheisms, Judaism, Christianity, and Islam—lend great richness to the concept of the fall.

Gnosticism and Manichaeism. From the second century CE onward, Gnosticism, a religious movement composed of a number of different sects, came to maturity throughout the Mediterranean world and in the Near East. The central element of Gnostic metaphysical speculation is a dualistic doctrine according to which humanity possesses a divine spark that, although originating from on high, has fallen into matter, into body, which holds it prisoner in the lower world. The myth of the fall, therefore, is an integral part of Gnostic teaching. Each Gnostic sect offered salvation through its specific creed and rites of initiation into these dualistic mysteries. These constituted its particular gnosis. Understood only by adherents who were gradually initiated into it, the gnosis brought about an identity of the initiate with the means of his salvation and with divine substance.

Because it claims to possess the most perfect gnosis, Manichaeism holds a special place in the spectrum of gnostic thought. Its founder, Mani (216–276), taught that, as the transmitter of the gnosis, he was the greatest of the prophets and the ultimate revelation, sent by the Holy Spirit, after the trials and failures of his predecessors—most notably Zarathushtra, the Buddha, and Jesus—to establish the church of the end of time, the church of light, and to provide the definitive revelation that would enlighten all people. According to Mani, the soul, a spark detached from divine light and held prisoner by matter, must tear itself away from the darkness of the body in order to return to the realm of light where it had originated.

The Manichaean gnosis offers the clearest conception of the beginning, the middle, and the end, the three divisions of time. In the beginning, there existed two radically opposed natures, darkness and light, eternal and unborn principles. These two natures created two earths, two different realms. The realm of light is located on high, in a city of incomparable beauty, in the house of the Father of Greatness; the breath of the spirit breathes life and light throughout this realm, where all things exude blessing and peace. But beneath this realm, and separated from it by an impregnable border, lies the realm of darkness, the domain of matter and of demons, a realm governed by the Prince of Lies. Obviously, the Manichaean gnosis presents the golden age within a context of radical gnostic dualism.

In other forms of gnosis, dualism appears against a monistic background, because the world on high—everlasting, immutable, and incorruptible—is held to have existed before the lower world. Indeed, many gnostic writings speak of the Pleroma, of the world on high in all its plenitude, emanating from a being that is the source of all things. The gnostic

Pleroma is the union of the Aeons that emanate from the All and constitute, with the First Father, the harmonious universe of peace and light.

The symbol of the fall is omnipresent in gnostic texts; indeed, the precosmic fall of a portion of the divine principle is the underlying reason for the genesis of the cosmos and humanity (Jonas, 1963). In the different metaphysical speculations that explain this fall, it is generally held that the divine principle descended voluntarily, and that guilt came into being as the Aeons turned toward the lower world. Turning toward matter by a burning desire to know it, the soul then sank into it and was swallowed up. Hence, the fall that gave birth to the cosmos also imprisoned the soul in matter.

In Gnostic writings, important groups of symbols suggesting captivity describe the tragic fate of this dualistic, imprisoned soul. One group of symbols suggests pain or danger: violence, fear, and the wounds and bites of animals; another suggests the soul's forgetfulness: torpor, sleep, death, darkness, drunkenness, lack of conscience, ignorance. As a snake's bite causes an infection that debilitates the body, so the poison of darkness causes an infection of the soul that makes it lose awareness of its divine origin. In a frequently used image, the soul falls asleep in matter, and the gnostic message strives to awaken it; hence, gnosticism attaches great importance to its call. Also characteristic of gnostic writings are the images used by Valentinus when describing the behavior of Sophia ("wisdom") after she had fallen into error. The youngest Aeon of the Pleroma, Sophia was the cause of her own fall, through the passion that carried her away—the origin of a fall that brought about the lower world of the Demiurge, who created the material world.

A true religious genius endowed with uncommon imagination, Mani brought together a number of Eastern cosmogonic myths and from them produced a synthesis in which the entire range of dualistic cosmogony, soteriology, and eschatology is included.

In the beginning, Mani taught, the Prince of Darkness, jealous and envious of the Father, hurled a war cry against the realm of light, signaling the beginning of a gigantic cosmic conflict. Primordial Man, the first emanation of the Father, marched against the forces of darkness, but he was wounded and defeated and fell among the archons (cosmic rulers). This was the fall, the moment when the living soul, the divine portion of Primordial Man, was engulfed by darkness; it was also the beginning of the second division of time, the middle, when divinity fell into matter and humanity's mixed nature became fixed. Henceforth, salvation became an imperious necessity. The liberation of Primordial Man from this fallen state is the prototype of the salvation of each soul; and the second emanation of the Father, the Living Spirit (also called the Friend of Light or the Great Architect), extends his right hand to Primordial Man and leads him back to the realm of light. But the fall has permanent consequences, because a part of the light remains captive in the lower realm.

The first moment of middle time, the moment of the fall, is followed by the moment of the creation and the freeing of another part of light, as part of the punishment of the archons. The Living Spirit chained down the archons and cut them to pieces; from their skins he made the vault of heaven, from their bones the mountains, from their flesh and excrement the earth, and from the light taken from them he created the sun, moon, and stars. When a Third Messenger descended from on high in the form of a luminous virgin, the semen of the archons excited by this apparition fell on the earth and produced trees and vegetation. Animals were next created, and finally the first couple was born, the work of demons. This couple was Adam and Eve, creatures of mixed nature whose posterity nonetheless carried with it the greater part of light.

The third moment of middle time is the moment of the messengers of the gnosis, the moment of true and divine hypostasis brought about by the fourth emanation of the Father, Jesus the Splendid, a transcendent, cosmic being, fifth Greatness of the Realm, the life and salvation of humanity. Messengers of the gnosis have followed one after another from Sethel, the son of Adam, to Jesus (here considered as a historical figure), who both announced and sent the final messenger, Mani. Hence, everything was made ready for the third division of time, the end, when all things will become as they had been at the beginning, and the total separation of the realms of darkness and light will be reestablished.

The Eastern myths of the fall brought together by Mani constitute one great myth of the fall and redemption of the divine soul. Each human soul is part of the divine soul that is partly imprisoned in bodies, partly in plants, trees, and earth; in all its imprisoned parts, that divine soul is the soul of the world and the third representation of Jesus, *Jesus patibilis*. In the great Manichaean myth of the fall is found the gnostic myth of the exiled soul; but, in contrast to most gnostic creeds, in Manichaeism the soul is not responsible for its fall and exile in the body, because that exile is a part of a greater, cosmic fall of light. To this cosmic myth of the fall corresponds the cosmic salvation by a gnosis accessible to individual souls in a church that is both the location and the means of individual salvation, a church charged with proclaiming the message of the fall and issuing the call to salvation, as well as awakening human souls and initiating them into the dualistic mysteries.

Judaism. Central to the biblical message is the view that the creation of humankind and the cosmos is the work of a unique and transcendent God who freely willed and effected a creation that also marks the beginning of time.

Two different stories of the creation are given in *Genesis*. The Bible opens with the so-called sacerdotal account of the creation, “the work of six days” (*Gn.* 1:1–31, 2:1–3). In this cosmogony, primordial chaos is replaced by order through the creative power of God’s word. The sacerdotal account emphasizes the transcendence of the creator God and presents his creative activity in an order of ascending importance;

although the creation of the world and of animal and vegetable life are all deemed “good,” the crowning work in the beginning is the creation of humankind.

The second, so-called Yahvistic, creation story (*Gn.* 2:4–25) does not talk of the creation of the earth and sky but rather of a desert made fertile by Yahveh; it stresses God’s action, his fashioning the first man from clay and breathing the breath of life into his nostrils. It is in the Yahvistic story that God plants a garden in Eden, where humans are the creatures of unequalled importance, the rest of creation being made in relation to them. Together, the two stories of creation provide genetic explanations of important aspects of the human condition; in both, humanity occupies a privileged position in creation. The biblical stories stress that humanity is free and not controlled by fate.

In Hebrew, the word *gan*—*paradeisos* in Greek (related to the Iranian *paridaida*)—designates the place where, according to *Genesis* 2:8, God placed humanity. The Yahvistic creation story speaks of an arid land on which Yahveh caused rain to fall, after which he took man and placed him in the garden of Eden, created especially for him. This paradise appears as an oasis in the Oriental desert, although its name is linked by some scholars to the Sumerian word *edin*, for which several Assyrologists read “plain” or “countryside.” The word *paradeisos* adopted by the Greek Bible denotes the pleasure gardens and royal hunting lands of Iran and Asia Minor. For the Greek reader the word suggests a garden of fruits and fruit trees. Certainly the biblical garden is the archetype of all regions of luxuriant vegetation (*Gn.* 13:10, *Is.* 51:3, *Ez.* 31:8).

The text of *Genesis* 2:10–14, which mentions the four rivers flowing out of Eden, is clearly intended to locate the garden symbolically at the center of the cosmos; a story in Mesopotamian mythology also places a divine residence at the source of rivers. The biblical text seeks to establish a relationship between a divine garden and a human earth, thereby emphasizing the marvelous fertility of humanity’s first home. The garden of Eden is also characterized by the presence of two special trees—the tree of life and the tree of the knowledge of good and evil (*Gn.* 2:16–17). The tree of life is part of a larger Mesopotamian group of symbols, known through a number of texts. The tree of the knowledge of good and evil, however, has no parallel in any other ancient text; it is specific to the Yahvistic story of creation and stresses the relationship between life and obedience to God.

Adam and Eve enjoy a life of paradise in the garden, living together in harmony and at peace with the animals, as in Mesopotamian myths of the golden age. Both the Yahvistic and the sacerdotal text stress the privileged situation of humans in Eden—their intimacy with God, their hope of immortality, suggested by the tree of life—and evoke the harmony that exists there, seen in humanity’s relations with the rest of creation and its life of ease. The presence in Eden of the tree of the knowledge of good and evil shows that obedience to God is essential to maintaining this privileged situ-

ation. The biblical text emphasizes considerations that are absent in all other myths of the golden age—considerations of freedom, of moral choice in the face of good and evil. Through a choice of its own, humanity decides its standing before God and at the same time the direction of its destiny.

The testing of humanity in Eden is related to the problem of human freedom. In mythical language, *Genesis* 2–3 describes the situation of humans in the world and in the face of God. The garden of Eden is the place where humanity lives in easy familiarity with God, but it is also the symbolic microcosm where it has been given mastery, and where it enjoys the free use of all other created things; thus the conquest and humanization of the world will become the condition of its vocation. The prohibition against eating from the tree of knowledge belongs to another order, for it deals with the basic human appreciation of the value of earthly things and of the human situation before God (*Gn.* 3:5–6). It will bring about humankind's fall from paradise.

The story of Eden stresses the primordial couple's disobedience to God and their expulsion from the garden, and it emphasizes that they lost the privileged status of Eden for themselves and for their descendants. Thus, their sin is presented as the prototype of that part of human sin that is universal. The essence of hubris is the desire to be like God; when this desire becomes action, the fall takes place and ushers in the woes of humankind. The Yahvistic document asserts both directly and symbolically that human experience of evil had an absolute beginning, a beginning that coincides with the beginning of human history, the history of freedom. Although the first exercise of that freedom resulted in disaster, through it humanity inaugurated the drama of choice that gives particular significance to human life and its relationship to God. Subsequent biblical books and apocryphal texts repeatedly return to these lessons of the fall (*Ez.* 28; *Dt.* 30:15–20; *Prv.* 3:2, 3:22, 6:15, 10:25; *Sir.* 37:3; *Wis.* 1:13–14, 10:1–2).

The editors of chapters 4–11 of *Genesis* saw in the fall of humanity in Eden not only the loss of paradise and the transformation of the human condition but also the source of a whole series of evils that subsequently beset humankind. Thus, at each stage in the rise of civilization and the institutionalization of the social developments that formed human lives in antiquity, the biblical text notes humanity's corruption, variously described as fratricidal war, polygamy, desert warfare, or the division of nations and tongues (*Gn.* 4:8, 4:19, 4:23–24, 11:5–9). Since the fall, evil is born in the hearts of humans and always remains at the heart of history, an inevitable force in human affairs.

The most important biblical event having the characteristics of a universal fall is the flood (*Gn.* 6:5–8:14). The story of Noah in the Bible reinforces elements of the *Epic of Gilgamesh*, but its editors have taken over and reinterpreted Mesopotamian themes in order to transform them into an episode in sacred history and to show the progressive degeneration of humanity that justifies the flood. In both its Yah-

vistic and its sacerdotal forms, the biblical story is very different from the Mesopotamian one. The latter sees in the flood simply the decree of gods annoyed with a despised humanity. In the Bible, the memory of the flood serves as the prototype of God's judgment against a sinful humankind; the human situation as a responsible being is stressed, and humanity is not abandoned to the blows of blind destiny. In this myth of the universal fall, a new alliance is foreseen, in which *Urzeit* leads to *Endzeit*.

Genesis 6:1–4 contains the story of the *benei Elohim* who take the daughters of humans as wives. This unusual text presupposes an oral tradition and possibly other written texts. It appears as a preface to the flood and may be interpreted as further evidence of the sins that will provoke the flood, but it is also the starting point for numerous speculations about the fall of the angels. The rabbinical interpretation has seen in the *benei Elohim*, "the sons of God," angels who sinned with the daughters of humans and were for that reason shut up in the depths of the earth; at the last judgment, they will be thrown into the fire.

Christianity. Allusions to humanity's fall appear throughout the New Testament, although the Gospels speak of it only in *Matthew* 19:4–6, *Mark* 10:6–8, and *John* 3:5 and 8:41–44. It was Paul who was especially interested in the relationship between the fall and sin. In chapters 1–3 of *Romans*, he asserts that no one can escape the domination of sin, and in chapter 7 he gives a lengthy description of the human condition in the earthly paradise, where as yet humans knew neither covetousness nor death, and contrasts this with the actual condition to which they have been reduced by sin and death. He asserts that the actual human condition comes from the first sin, the sin of Adam and Eve in the earthly paradise (*Rom.* 7:13–15); and in *1 Corinthians* 15:21–22, he opposes the first Adam, the author of death, to Christ, the second Adam, the author of life. In general, Paul sees in the story of Eden not only humanity's hereditary punishment of suffering and death but also its hereditary fallen state, a state of sin transmitted to all humankind.

Islam. The Qur'ān demonstrates the importance Islam attaches to the idea of God the creator, the all-powerful. God is the creator (*al-khāliq*), the creator par excellence (*al-khallāq*); all things are created by virtue of the divine resolution that precedes their appearance. The Qur'ān describes a God who creates through his word, a word that is creative, eternal, and ever present (*sūrah*s 11:9 and 41:8–11).

God created humankind and called it *khalīfah*, vicar or viceroy (2:28). Adam, *khalīfat Allāh*, vicar of a God who had placed him at the center of the world, is the preeminent creature, although, made of mud and clay, it owes everything to God (15:26). Many verses of the Qur'ān stress the preeminent dignity of humanity; even the angels must bow down before humankind (2:32), and when the evil angel Iblīs refuses to do so, God damns him and Iblīs falls, followed by other angels (15:26–35, 17:63–67). The continuing work of

creation is also stressed by the Qurʾān; because every person is made by God, the activity of God the creator is permanent.

God put Adam and his wife in the midst of a garden where they could take fruit from the trees, but he forbade them to approach one tree, under pain of falling among sinners (2:33). But the demon made Adam and his wife sin by eating fruit from that tree and thereby caused their expulsion from the place where God had placed them. God said to them, "Leave the garden. You are now enemies one of another, and on earth you will have only brief enjoyment, and brief lives" (2:34). The episodes in the Qurʾān concerning Adam are reminiscent of *Genesis*: his creation out of earth, his title of vicar, his temptation, fall, and expulsion from paradise. Only the episode of Iblīs is not found in the Bible.

Sūrah 7 mentions the story of the fall and punishment (7:21–24). Here it is the demon who suggests that humans break the divine prohibition in order to obtain immortality. After Adam has sinned, God declares that henceforth men born of the first couple will be enemies one of another (2:34, 7:23, 20:21), and the Qurʾān relates the first fratricidal struggle, between two unnamed sons of Adam whom later Muslim authors call Qābīl and Hābīl.

Noah appears in the Qurʾān as a great prophet who opposes unbelievers (11:27–36, 23:23–26). He receives from God the command to build an ark in order to survive the flood; but, contrary to *Genesis*, which stresses the universal character of the flood, the Qurʾān appears to restrict divine punishment to Noah's own people, who had become impious. The Qurʾān treats their punishment as both a warning and a sign.

CONCLUSION. Reflection on the fall is a constant preoccupation of *homo religiosus*. In his "nostalgia for beginnings," he turns instinctively toward a primordial, sacred history, where he finds a golden age that corresponds to what humankind must have been in the beginning. He sees that humanity's present situation no longer corresponds to that of the golden age, and he strives to explain the accident that has taken place and the consequences of that accident, of that break with primordial harmony.

This article has sought to present the theme of the fall as it appears in the religious thought of the greater part of humankind, although it has been necessary to limit the discussion of myths of the fall to those that describe the fall in relation to a supposed golden age—an age that has haunted human memory—and that locates humanity's fall and its present condition between *Urzeit* and *Endzeit*. Most of this article's attention was given to myths of the human fall; but, when pertinent, myths of a cosmic fall, or of the fall of lesser deities, have also been considered.

Nostalgia for the beginning of things is clearly a permanent feature of humankind's collective memory, and representation of a golden age provides the archetype through which that nostalgia is repeatedly expressed. As can be seen by the study of various peoples and cultures, peoples every-

where sought to explain their present condition through the contrast it provides to their supposed primordial condition; in light of that contrast, they have also classified and interpreted their mythical, historical, and symbolic heritage and related these to sacred history.

Revised Bibliography

FALSAFAH. The term *falsafah* is the Arabized loan word from the Greek *philosophia*, "love of wisdom," and hence in its general sense simply means "philosophy." It is, however, also used (as it will be in this account) in a more specific sense as an abbreviation of the expression *al-falsafah al-islāmīyah*, "Islamic philosophy." Similarly, the general Arabic word for "philosophers," *falāsifah* (sg., *faylasūf*), is used more specifically as an abbreviation for the expression *al-falāsifah al-islāmīyūn*, "the Islamic philosophers."

Because for many Muslims, past and present, *falsafah* remains at best doctrinally suspect, the sense in which it will be referred to here as "Islamic" requires clarification. This term, as applied to *falsafah* and *falāsifah*, will first of all be used in a broad cultural sense, for *falsafah* was developed within an Islamic cultural milieu by men whose culture was Islamic. This cultural use of the term *Islamic* is implicit in medieval Arabic usage. Thus, for example, one famous intellectual who condemned some of the *falāsifah* as "infidels" nonetheless referred to them as "Islamic," while another included among the Islamic philosophers the Christians of Baghdad who wrote in Arabic. This latter example calls for a narrowing of the sense in which *Islamic* will be used, however, for in addition to being "Islamic" in the cultural sense, the *falāsifah* were "Islamic" in that they regarded themselves as Muslims, claiming that their conceptions of God and the world were consistent with the Qur'anic view. Most of them attempted to demonstrate the harmony between their respective philosophies and Islamic revelation, and whether such attempts proved convincing or not, they represent a characteristic feature of *falsafah*.

It should be stressed that while the *falāsifah* were theists, they were not theologians. For a proper understanding of *falsafah*, it must be distinguished from *kalām*, Islamic speculative theology. Both disciplines used reason in formulating their respective conceptions of God and his creation, but they differed in approach and motivation. The starting point of *kalām* was revelation. Reason was used in defending the revealed word and in interpreting the natural order in conformity with a Qur'anic view of creation. With *falsafah*, the starting point was reason; the motivation, the quest after "the true nature of things." The *falāsifah* maintained that this quest led them to a demonstrative proof of the existence of a first cause of the universe, which they claimed was identical with the God of the Qur'ān—a claim contested by the Islam-

ic theologians, particularly those who followed the school of *kalām* of al-Ash'arī (d. 935). At issue between *falsafah* and *kalām* was not the question of God's existence; rather, the question was the nature of God.

Another difference between them was historical. *Kalām* antedated *falsafah*; its beginnings are traceable to the period of the Umayyad caliphate (AH 41–132/661–750 CE) and more definitely, to the second half of the eighth century. Moreover, it arose out of religious and political conflicts within Islam. Although subject to foreign influences, particularly Greek thought, *kalām's* modes of argument and perspectives remained to a great extent indigenous. *Falsafah*, on the other hand, was the direct result of a concerted effort to translate Greek science and philosophy into Arabic beginning early in the ninth century. The first Islamic philosopher, al-Kindī, it should be noted, died around 870.

Falsafah was thus rooted in Greek philosophy, or more accurately, Greek philosophy in its translated form. The *falāsifah* regarded themselves not only as guardians of the truths arrived at by the ancient Greek philosophers but also as participants in a continuous quest after truth: As al-Kindī expressed it, the attainment of truth is difficult and requires the cooperative efforts of generations past and present. Thus, the *falāsifah* did not simply accept ideas they received through the translations. They criticized, selected, and rejected; they made distinctions, refined and remolded concepts to formulate their own philosophies. But the conceptual building blocks, so to speak, of these philosophies remained Greek.

THE TRANSLATION MOVEMENT. Although there are indications that some translations of Greek scientific works were made in the period of the Umayyad caliphate, the translation movement properly speaking took place during the caliphate of the Abbasids, who came to power in 750. Translations were undertaken sporadically just after the establishment of Abbasid rule but flourished in the ninth and tenth centuries. The ruler who gave this movement its real impetus was the caliph al-Ma'mūn, who ruled from 813 to 833, and his active sponsorship of the translation of Greek philosophy and science into Arabic was continued by his successors and by families attached to the caliphal court. The *Bayt al-Hikmah* (House of Wisdom), a center for scientific activity and translations that al-Ma'mūn built in Baghdad, symbolized this Abbasid sponsorship of the translation movement.

The motives for this concern with translations were varied. There were practical considerations, such as the need for medical and astronomical knowledge. There was also the probable motive of prestige: The Byzantines could boast of the Greek philosophical and scientific tradition, and the Abbasids likewise wanted to avail themselves of the intellectual treasures of the ancients. This was also a period of intellectual ferment and genuine interest in learning, and scholars were available to undertake the task of translation. In particular, within the Abbasid realm and close to the heart of their empire were the Syriac-speaking people, a culture within a cul-

ture who were themselves partly Hellenized. The utilization of this rich intellectual resource by the intelligent leaders of the Islamic state seemed natural.

Apart from the Syriac-speaking scholars, who were mostly Nestorian and Jacobite Christians, there were scholars in the north Syrian city of Harran who also undertook translations. The Harranians adhered to the Sabian sect, a religion that included star worship but also had a Greek philosophical base. Among the Christian scholars, there were two traditions of scholarship. One was the tradition of the medical and philosophical school of Alexandria; members of this school seem to have moved in the Umayyad period to Antioch and then in the Abbasid period to Harran and finally to Baghdad. The other tradition was that of the medical school and hospital of the Nestorians of Jundīshāpūr in Persia. Originally a camp for Roman captives built in the third century CE by the Sasanid emperor Shāpūr I, Jundīshāpūr became a refuge for Nestorians after the deposition of their patriarch, Nestorius, at the Council of Ephesus in 431. The school flourished in Sasanid times, and although little is known about it in the Umayyad period, it became prominent under the Abbasids as well; from 765 to 870, its Bakhtīshū family provided court physicians for the caliphs.

Among the early translators, mention must be made of Yaḥyā ibn al-Bīṭrīq (d. 830?); Astat (Eustathius), about whom very little is known, but who made a translation of Aristotle's *Metaphysics*, a work known to al-Kindī; and Ibn Na'imah al-Ḥimṣī (d. 835), who translated the very influential if apocryphal *Theology of Aristotle*. The best-known and most influential of the translators was the Nestorian physician and scholar Ḥunayn ibn Isḥāq (d. 873), who was known for his translations of medical works but who was responsible for translating logical and philosophical treatises as well. Unlike earlier and some later scholars, Ḥunayn knew Greek; he followed a system of collating Greek manuscripts before translating and undertook revision of earlier translations from the Syriac. He worked with a team of other translators, who included his son Isḥāq, his nephew Ḥubaysh, and 'Isā ibn Yaḥyā. Among the Harranians the most important translator was Thābit ibn Qurrah (d. 901), who also wrote a commentary on Aristotle's *Physics*. Later translators included Quṣṭā ibn Lūqā (d. 912?), also noted for his treatise *The Difference between Soul and Spirit*, Abū 'Uthmān Sa'īd al-Dimashqī (d. 900), the logician Abū Bishr Mattā (d. 940), Yaḥyā ibn 'Adī (d. 974), Ibn Zur'ah (d. 1008), and Ibn al-Khammār (d. 1020).

The three ancient philosophers who conditioned the rise and development of *falsafah* were Plato, Aristotle, and Plotinus. As with medieval western Europe, Aristotle was the most authoritative figure; his influence lay in the realms of logic, physics, and metaphysics. Plato, whose thought was known largely through the expositions of others, particularly the translated works of the physician Galen, had his greatest influence on the political philosophy of the *falāsifah*. Plotinus was likewise known indirectly, through two main works,

the Neoplatonic *Theology of Aristotle*, a paraphrase of books 4, 5, and 6 of the *Enneads*, and the work based on Proclus known in Arabic as *Fī mahḍ al-khayr* (On the pure good), which was translated into medieval Latin as the *Liber de causis*.

A substantial body of commentary, particularly on Aristotle, was also translated. Thus such commentators as Themistius, Simplicius, and Alexander of Aphrodisias were influential in the development of *falsafah*. There was knowledge of pre-Socratic philosophy and late Stoic philosophy and logic, and the translations also included a body of medical works, particularly those of Galen, and mathematical and scientific works such as Euclid's *Elements* and Ptolemy's *Almagest*.

AL-KINDĪ AND AL-RĀZĪ. The philosophical venture in medieval Islam was pioneered in different ways by two remarkable thinkers, Abū Yūsuf Ya'qūb al-Kindī and the physician-philosopher Abū Bakr al-Rāzī (d. 926). Their philosophies, particularly in their doctrines on the world's creation and the nature of the Creator, differed radically from the thought of the major philosophers who succeeded them. As *falāsifah*, they were atypical; moreover, they differed radically from each other.

Ironically, al-Kindī was atypical because his philosophy conformed with fundamental, generally accepted Muslim beliefs. Thus he argued vigorously and at great length to prove that the world was created ex nihilo and at a finite moment of time in the past relative to the present. He also upheld the doctrine of bodily resurrection. At the same time, his writings were thoroughly philosophical in approach and spirit. "We must not," he insisted, "be ashamed of deeming truth good and of acquiring truth from wherever it comes, even if it comes from races remote from us and nations different from us" (*Rāsa'il al-Kindī al-falsafīyah*, ed. M. A. A. Abū Rīdah, Cairo, 1950, p. 103). Al-Kindī was born around the year 800 in Kufa. Little is known about his education except that he was associated with Christian translators and the caliphs who sponsored the translation movement. He alights on the philosophical scene quite unexpectedly, yet with full confidence, betraying none of the hesitancy of the novice. Like the Islamic philosophers who succeeded him, he was also a physician and a scientist, and the range of his learning was encyclopedic.

Of his numerous writings, only a few treatises, philosophical and scientific, have survived. Fortunately, these include the very important work *On First Philosophy*, a relatively long treatise consisting of four chapters. In the first, al-Kindī offers an introduction to philosophy, which he defines as "knowledge of things in their true nature, to the extent of man's capability." The chapter is also a justification and promotion of its pursuit: Philosophy's ultimate concern, he argues, is the quest after "the True One," the supreme good, the cause of all things.

The chapters that follow constitute a remarkable piece of vigorous, sustained argument. Most of the second chapter

is devoted to proving the creation of the world *ex nihilo* at a distant but finite past. The argument rests on a basic premise, the impossibility of an infinite magnitude. Al-Kindī begins by arguing that an infinite body is impossible. If one supposes the existence of such a body, he maintains, then theoretically it is possible to remove from it a finite part. What remains would also be infinite, but less than the original infinite by the amount of the finite body removed. The consequence would then be the existence of two unequal infinities, amounting, for al-Kindī, to a contradiction. But if a body must be finite, he then tries to show, time and motion must also be finite. The temporal existence of the world could not then go back to infinity; it must have a temporal beginning. Moreover, he argues, creation in time cannot simply mean that a static world (and hence a world outside time) was put into motion at some past finite moment relative to the present. A body by definition, he argues, must be in motion; a static world is a contradiction in terms. Hence not only did the world begin at a finite moment in the past, but it came into being out of nothing.

Having proved the doctrine of creation *ex nihilo* to his own satisfaction, al-Kindī then offers a proof for the existence of God, “the True One,” and an investigation of the nature of this oneness. The Neoplatonic influences on this part of the treatise are very manifest, particularly in al-Kindī’s exposition of the nature of divine oneness. The proof for God’s existence is a causal one, based, however, on the phenomenon of plurality and unity in the world. The proof, given in a short version and a lengthy one, is quite elaborate. The fundamental point al-Kindī makes is that the unity that one experiences in things and that is the cause of plurality does not belong essentially to things; it is a derivative, accidental unity. He then argues that it must derive ultimately from a being who is essentially one and the only being who is essentially one. This is the True One who bestows accidental unities on things. The giver of this unity is the giver of existence.

In this and other treatises, al-Kindī also makes statements about prophecy and the nature of revelation. These are not detailed statements, but the ones concerning prophecy are suggestive of the kind of developed theories encountered later on in the thought of al-Fārābī and Ibn Sīnā (Avicenna). Thus, anticipating Ibn Sīnā, al-Kindī argues that prophetic knowledge is received “instantaneously,” requiring neither intellectual exertion on the part of the prophet nor the disciplines of mathematics and logic. In conformity with generally accepted Islamic belief, al-Kindī maintains that the inimitability of the Qur’ān lies in the excellence of its literary expression, in the way it conveys divine truths directly and succinctly.

Although al-Kindī had followers, notably al-Sarakhsī (d. 899), properly speaking it cannot be said that he founded a school of philosophical thought. The same is true of the major *ḥaylasūf* to succeed him, al-Rāzī. Abū Bakr Zakarīyā’ al-Rāzī (Rhazes), one of the foremost physicians of medieval

times, was born in 865 in the Persian town of Rayy, and he practiced medicine there as well as in Baghdad. Very few of his philosophical works have survived, and consequently, much of his philosophical thought has to be reconstructed from medieval Islamic accounts that are, for the most part, highly critical of his ideas.

In his cosmogony, al-Rāzī was greatly influenced by Plato’s *Timaeus*. The world, he holds, was created at a finite moment in time, but not out of nothing. As with Plato, creation for al-Rāzī means the imposing of order on disorder. He subscribes to the doctrine of the five eternal principles: atomic matter, space, time, the world soul, and the Creator. The atoms, flitting about in disorder, are given order by God at a moment in time. The now-organized atoms allow the world soul to join matter and to become individuated by it, forming individual living beings. Just as this ordering of the atoms, that is, creation, came about at a finite moment of time in the past, the order will cease at a finite moment of time in the future when the five eternal principles revert to their original state. Al-Rāzī offers discussions of atomic matter, absolute space, and absolute time that are scientific in spirit and approach. But when it comes to explaining ultimates, namely, the reason for the world’s creation, he resorts to myth, and his philosophy is noted for its myth of creation.

For al-Rāzī, creation poses two related questions: Why is it that the world was created at one particular moment of time and not at any other, and why was the world created at all? In answering the first, al-Rāzī holds that it is precisely because all the moments of time are similar that God’s choice of one moment rather than another was utterly free. If the moments of time were not similar, then his choice of one moment rather than another would have been determined by “a giver of preponderance” (*murajjih*) outside him. Hence it is because the Creator’s will is utterly free that he arbitrarily chooses one moment for his creation to take place. It is in his answer to the second question that al-Rāzī provides his famous myth.

The world soul became infatuated with matter and sought union with it. To achieve this union, the soul endeavored to give disorganized matter form. Matter, however, resisted this forming activity of the soul, leaving the latter in sorrow. God, being powerful and compassionate, then intervened to help the soul and introduced form, order to the material atoms; in other words, he created the world. In creating humankind, God endowed humans with reason, an emanation of his very essence, so that the soul would awake from its bodily slumber and seek a return to its original eternal existence. This, for al-Rāzī, is salvation. At some finite moment in the future, all people’s souls, awakened by philosophy, will shun their bodies. The individual souls then will reunite with the eternal world soul, and the atoms will resume their chaotic state for eternity.

Salvation, as defined by al-Rāzī, is possible only through philosophy. He thus maintains that there is no need for prophets. All people are capable of pursuing truth through

reason. The fact that many do not pursue this rational course is not due to inability, but to willful choice. He further argues that it would also be unjust for the Creator to favor either one individual or one nation with prophethood. The mistaken belief that God has favored individuals and nations with prophets has caused nothing but strife, so that, al-Rāzī maintains, for the most part wars are caused by religion. If to this is added that al-Rāzī also subscribed to a theory of the transmigration of souls, one can see why his ideas did not find favor within Islam. Nonetheless, he helped the fermentation of philosophical ideas, and the responses to his philosophy constitute a body of intense argument, philosophical and theological.

Apart from the intrinsic interest of their philosophies, both al-Kindī and al-Rāzī showed in their respective ways how philosophizing is possible within medieval Islam, and thus they prepared the ground for the flowering of *falsafah* in medieval Islam.

AL-FĀRĀBĪ AND IBN SĪNĀ. In the tenth and early eleventh centuries, Islamic philosophical thought was dominated by two intellectual giants, al-Fārābī (d. 950) and Ibn Sīnā (d. 1037). Their philosophies have much in common, but remain quite distinct. Al-Fārābī, born shortly after 870 in Transoxania, studied and taught in Baghdad until 942. He studied logic with the Nestorian logician Yuḥannā ibn Haylān (d. 910) and was associated with Abū Bishr Mattā ibn Yūnus, who was another renowned Nestorian logician. He also studied Arabic grammar with Ibn al-Sarrāj (d. 929), a leading grammarian of the period. In 942, for reasons not fully known, he left Baghdad for Syria, and he seems to have lived the remaining years of his life in relative seclusion in Damascus, where he died.

The foremost logician of his time, al-Fārābī wrote commentaries on Aristotle's *Organon* and on other works of Aristotle and other Greek writers. He was medieval Islam's greatest musical theorist and musicologist and is reputed to have been a skilled instrumentalist. He developed a Neoplatonic emanative scheme that greatly influenced the development of emanative systems by his Islamic successors. But perhaps above all else, he was the founder of a Platonic theory of the state that was adopted (with variations) by the major *falsāṣifah* who succeeded him. It should be noted, however, that his philosophical writings pose problems of dating and raise the question of whether they always reflect his real views.

For al-Fārābī, the world is an eternal emanation from God, forming a hierarchically ordered series of existents with the closest to him being the highest in rank. This highest existent is a first intelligence, overflowing directly from God. From it the emanative process continues in the form of dyads: The intelligence undergoes two acts of cognition, an act of knowing God and an act of self-knowledge, from which in turn proceed two existents, a second intelligence and a body—the outermost body of the universe. The second intelligence undergoes a similar act of knowing God and knowing itself, resulting in the emanation of a third intelli-

gence and the sphere of the fixed stars. Successive intelligences repeat this cognitive process, causing the existence of the spheres of the planets, the sun, the moon, and finally, from the last of the intelligences, the Active Intellect, which is this world, the world of generation and corruption.

This entire cosmic order is rational and harmonious, with each sphere governed by an intelligence. Humanity in the world of generation and corruption, endowed with reason and free will, must actualize its potentialities and attain the highest good, happiness. This is achieved when in their way of life people emulate the rational cosmic order, but they can only do this in the society of others. Hence they must strive to form a society that is itself in tune with the rational cosmic order, a hierarchical society ruled by reason, where the various ranks actualize their potentialities in harmony.

In order to achieve this ideal political order, which al-Fārābī refers to as “virtuous,” its first ruler must be both a philosopher and a prophet, an individual who receives the revealed law. Because this law is received from the Active Intellect in the form of images that symbolize universal philosophical knowledge or represent particular examples of it, revelation is the “imitation” of philosophy, a copy of it in images and symbols that the nonphilosopher can understand. Revelation and philosophy are thus in total harmony. Another necessary condition for achieving a virtuous political regime, however, is that the philosopher-ruler must be endowed with exceptional practical powers, for it is necessary to persuade, lead, and educate a majority of citizens incapable of philosophical understanding. In fact, the philosopher-ruler must not address the nonphilosophical majority in philosophical language.

Al-Fārābī's political philosophy is comprehensive, detailed, and subtle. It includes, for example, detailed discussion of the existence of nonvirtuous states, the majority of which he characterizes as “ignorant” because they are led by people who are ignorant of the true nature of happiness. While his view is certainly Platonic in its essentials, one meets in al-Fārābī a tendency toward universalism that is less perceptible in Plato. Thus al-Fārābī does not speak only of the virtuous “city” but also of a desirable nation consisting of virtuous “cities” and of a desirable world consisting of virtuous “nations.” He also maintains that inasmuch as people in different parts of the world differ in language and in their symbols, it is quite possible that the differences among religions are merely differences in symbols, not in what is being symbolized.

It was on the foundations laid by al-Fārābī in logic, metaphysics, and political theory that his successor, the renowned Ibn Sīnā, built his imposing philosophical system. Born in 980 near Bukhara and largely self-taught, Ibn Sīnā was one of medieval Islam's leading physicians, an astronomer, and a scientist. He held positions as court physician, sometimes as vizier as well, in various Persian principalities until his death in 1037.

Of his numerous writings, mostly in Arabic, but some in Persian, two in particular were very influential in Europe, namely, the encyclopedic *Al-qānūn fī al-ṭibb* (Canon of medicine) and his major philosophical work, the voluminous *Al-shifāʾ* (Healing). His writings include short mystical narratives and treatises where the language of symbolism is used. This mysticism, encountered in his writings, is not inconsistent with his “rationalism.” The mystic’s journey to God is the journey of the rational soul to the ultimate source of all reason. God, for Ibn Sīnā, is pure mind (*ʿaql maḥḍ*).

Ibn Sīnā’s philosophical system is “rationalist.” He maintains that in addition to the self-evident first principles of logic, not dependent on one’s sense perception of the external world, there are self-evident intuitive concepts, also not dependent on sense experience. These intuitive concepts include the “existent,” the “thing,” and the “necessary,” the last with its correlates, the “possible” and the “impossible.” A rational consideration of these concepts is sufficient to yield a demonstration of God’s existence. In itself, an “existent” is either necessary or only possible. If it is necessary in itself, Ibn Sīnā then tries to show, it must be the only such existent, devoid of multiplicity and uncaused. If it is only possible in itself, he then argues, it must be necessitated by another existent, the latter by yet another, and so on, forming a chain that must be finite, having as its beginning the existent necessary in itself. Hence each alternative affirms the existent necessary in itself, which is God.

But what does it mean to say that every existent other than God is in itself only possible? This is the distinction on which Ibn Sīnā’s philosophy rests, the distinction between the quiddity or essence of the possible and its existence. From what a thing is, one cannot infer that it exists, because existence is not included in the definition of the possible existent. The quiddity considered in itself excludes not only existence, but unity and plurality, particularity and universality. From this concept of the quiddity considered in itself, Ibn Sīnā develops a theory of universals (where universality is something added to the quiddity as such) that is of intrinsic philosophical interest and one that had great influence on medieval Latin thought.

Although the existent, other than God, is in itself only possible, it is necessitated by another. Ibn Sīnā uses this concept of the possible in itself but necessary through another to transform al-Fārābī’s dyadic emanative scheme into a triadic system. God, the existent necessary in himself, undergoes an eternal act of self-knowledge that necessitates the existence of a first intelligence, an existent in itself only possible, but necessary through another. This intelligence then undergoes three acts of cognition: knowledge of God, knowledge of itself as a necessitated being, and knowledge of itself as a possible being. These three acts produce three other existents respectively: another intelligence, a soul, and a body, the outermost body of the universe. This process is repeated by each successive intellect, giving existence to the various heavenly spheres, each with its soul and intelligence,

until from the last of the celestial intelligences, the Active Intellect, the world of generation and corruption emanates.

The human rational soul, an emanation from the Active Intellect, is immaterial, becomes individuated when it joins the body, and retains its individuality as an immortal soul when it separates from the body after death. Good souls, untarnished by having succumbed in their earthly existence to animal passions, live an eternal life of bliss contemplating the celestial intelligences and God; bad souls live an eternal life of misery, being deprived from such contemplation yet forever seeking it. All theoretical knowledge is received from the Active Intellect. This knowledge consists of primary intelligibles, which are the self-evident logical truths and primitive concepts received by all people without the need of experience and learning. It also consists of the secondary intelligibles (received only by those capable of abstract thought), namely, deductions from the primary intelligible as well as more complex concepts. Normally the reception of these intelligibles from the Active Intellect requires preparatory activities of the soul such as sensation, memory, imagination, and cogitation and the learning processes associated with them. Only the prophets do not require these preparatory activities of the soul; they receive all or most of the secondary intelligibles directly and instantaneously, and this theoretical knowledge is then translated through the prophet’s imaginative faculty into symbols and images that the nonphilosopher can understand. These constitute the revealed word, which is in total harmony with philosophy, and here Ibn Sīnā embraces al-Fārābī’s doctrine that religion is the “imitation” of philosophy.

Ibn Sīnā thus believes in the oneness of God, the prophethood of Muḥammad, and the individual immortality of the soul. His philosophical interpretations of these beliefs, however, were found unacceptable by his chief critic, al-Ghazālī.

AL-GHAZĀLĪ’S CRITIQUE OF THE FALĀSIFĀH. *Falsafah*, as represented by al-Fārābī and Ibn Sīnā, received its most severe rational criticism at the hands of Islam’s great religious thinker, the lawyer, Ashʿarī theologian, and mystic Abū Ḥāmid al-Ghazālī (d. 1111). Tension between *kalām* and *falsafah* had existed prior to al-Ghazālī’s critique of the *falāsifāh*, although it was expressed in reciprocal, but on the whole, muted criticism. Underlying this tension were differences in starting point and ethos, which crystallized in irreconcilable metaphysical outlooks.

Kalām in its Ashʿarī form was atomic in its theory of matter and occasionalist in its interpretation of causal sequences. Accordingly, the temporal and transient conglomerates of atoms forming the physical world were not seen to interact causally with each other in reality. Causal efficacy resided with God; what appear as natural causes and effects are in reality concomitant events created directly by God. The uniform order of nature has no intrinsic necessity but is arbitrarily decreed by the divine will; the divine act is not the outcome of any necessity within the divine nature. Causal

action proceeds only from a living, willing, powerful agent, not as the necessary consequence of an existent's nature or essence. By contrast, al-Fārābī and Ibn Sīnā embraced the Aristotelian theory of matter as potentially infinitely divisible. Moreover, Ibn Sīnā maintains quite explicitly that the world proceeds from God as the necessitated effect of God, the supreme cause of all other existents, and this doctrine seems implicit in al-Fārābī's emanative scheme as well. God, in his essence an eternally active, changeless cause, necessarily produces an eternal effect—the world.

It is the conflict between these two worldviews that al-Ghazālī makes explicit in his attack on philosophy. Between 1091 and 1095, while teaching Islamic law in Baghdad, he made a systematic study of *falsafah*, particularly that of Ibn Sīnā. It should be emphasized that al-Ghazālī was greatly impressed by Ibn Sīnā's logic and wrote a number of works explaining this logic to his fellow theologians and lawyers, urging them to adopt it. He considered this discipline doctrinally neutral, a mere tool of knowledge, nothing more, a view that he expresses in one of the four introductions to his incisive critique of al-Fārābī and Ibn Sīnā, *Tabāfut al-falāsifah* (The incoherence of the philosophers). In these introductions he asserts that his concern is only with those philosophical theories that contravene religious principle and that he will show how, contrary to their own claims, the *falāsifah* have failed to demonstrate such theories. Moreover, he states that in this work he will not adopt any particular doctrinal position, his task being only to refute, and it is true that in the *Tabāfut*, for the sake of arguing against the *falāsifah*, al-Ghazālī sometimes adopts non-Ash'arī views. It can be shown, however, that for the most part the premises underlying his attack on *falsafah* remain Ash'arī.

Al-Ghazālī directs logical arguments against twenty philosophical theories, seventeen of which he regards as heretical innovations and three as utter Islamic unbelief. His method is to present the opponents' position clearly, object to it, raise possible objections to his objection, answer these, and so on, until he is satisfied that the theory in question has been refuted. Thus, before condemning these theories, he strives to show on rational grounds either that they have been unproven or that they are outright inconsistent. The three theories he condemns as utterly irreligious are those of the world's pre-eternity, Ibn Sīnā's theory that God knows the particulars in the world of generation and corruption only in a universal way (which means that he does not know every individual in the terrestrial world), and the doctrine of the soul's individual immortality, which denies bodily resurrection.

The most detailed of his discussions is the first, in which he attacks the theory of the world's pre-eternity. The main thrust of his attack is that such a theory is based on the unproven premise that God's acts proceed by necessity, a premise that, in effect, denies the divine attribute of will. Further, Ibn Sīnā's theory that God knows terrestrial individuals only in a universal way is unproven and contrary to the Qur'anic

pronouncements that God knows all things. The denial of bodily resurrection is also a denial of divine power, al-Ghazālī argues; bodily resurrection is not logically impossible, and what is logically possible is within God's power.

In the Seventeenth Discussion of the *Tabāfut*, al-Ghazālī argues for the possibility of certain kinds of miracles that are rejected as impossible by the *falāsifah*, who base their rejection on a theory of natural, necessary causal connection. Al-Ghazālī first tries to show that this theory is provable neither logically nor empirically—observation shows only concomitance, not necessary causal connection. In this he voices the Ash'arī position that all change is caused directly by God and then suggests another possible causal theory, modifying the philosophers' theory to allow the possibility of the miracles the philosophers reject. In the *Tabāfut*, he declares that both these theories are possible, but in his *Iqtisād fī al-i'tiqād* (Moderation in belief), the theological work that complements the *Tabāfut*, he reaffirms the Ash'arī occasionalist position as the only true one.

Al-Ghazālī's attack on *falsafah* put it on the defensive, more so than it had hitherto been. At the same time, his attack made *falsafah* better known, because in order to refute the *falāsifah*, al-Ghazālī had to explain them to the non-philosophers. In the same way, he legitimized and popularized the study of Ibn Sīnā's logic, and this had the effect of making Greek modes of thinking accessible to the more traditional Muslims. Finally, his criticism evoked replies, the most important of which came from Islamic Spain.

FALSAFAH IN ISLAMIC SPAIN. In the intellectual history of Islamic Spain, or al-Andalus, as the Arabs called it, *falsafah* was a latecomer. A lone Andalusian *ḥakīm*, Ibn Masarraḥ (d. 931), appeared relatively early, but he was a shadowy figure who made no real philosophical impact. The first major Andalusian *ḥakīm* was Ibn Bājjah (Avempace, d. 1138), and he was followed by two major thinkers, Ibn Ṭufayl (d. 1185) and Ibn Rushd (Averroës) (d. 1198), the greatest of the Andalusian *falāsifah*. The late flowering of *falsafah* in Spain was partly due to its geographic remoteness from the centers where the translation movement took place. Scientific and philosophical ideas, however, did travel from the Islamic East to Spain, stimulating a very significant scientific and philosophical movement.

A number of Ibn Bājjah's philosophical treatises have survived, including his *Tadbīr al-mutawahhīd* (Governance of the solitary), a major work in the tradition of al-Fārābī's metaphysical and political thought. It expands on a theme that appears in al-Fārābī almost in passing, namely that of the philosopher in a corrupt political state. Al-Fārābī had stated that such a philosopher should immigrate to a virtuous city, but that if no such city existed at the time, the philosopher would be "a stranger in the world, live poorly in it, death for him being better than life" (al-Fārābī, *Fuṣūl mun-taza'ah*, ed. F. M. Najjār, Beirut, 1971, p. 95). Ibn Bājjah, however, argues that if no virtuous city exists at the time, the philosopher must be isolated from society, associating with

others only to ensure survival, and must be devoted to inner intellectual and moral growth. Ibn Bājjah discusses psychology, epistemology, ethics, and metaphysics as he outlines the path the solitary philosopher must pursue to attain the highest good, the state of union with the Active Intellect. The philosopher's isolation, Ibn Bājjah admits, is "essentially" an evil, because one by nature is a social or political animal. Under the circumstances of the philosopher's having to live in a corrupt political regime, however, such isolation becomes "accidentally" a good.

Most of the writings of Ibn Bājjah's successor, Ibn Ṭufayl, physician, astronomer, and administrator at the court of the Almohad (al-Muwaḥḥid) dynasty then ruling al-Andalus, are lost. The notable exception is his masterly philosophical story, *Ḥayy ibn Yaḡzān*, written as an answer to a friend (real or fictitious) who asks Ibn Ṭufayl to divulge to him the secrets of Ibn Sīnā's mystical philosophy. In the introduction, which includes criticisms of al-Fārābī, al-Ghazālī, and Ibn Bājjah, Ibn Ṭufayl answers, in effect, that because the mystical experience is ineffable, he can only suggest to his friend the sort of thing its pursuit involves by narrating the story of Ḥayy.

Ḥayy ibn Yaḡzān (literally, "the living, son of the awake") is the name of the story's hero. In a lush equatorial island, uninhabited by humans, a baby boy, Ḥayy, comes on the scene. (The author gives two possible explanations for his being there.) A deer that had lost its young discovers the infant, suckles him, and rears him. Ḥayy then undergoes a process of self-education, learning how to clothe himself and fend for himself, but he continues to live with his mother, the deer. She eventually dies, and in his anguish, Ḥayy tries to bring her back to life by dissecting her, only to realize then that his real mother was spirit, not the material body that died. At this point his education takes a reflective turn: Through observation and rational thought, he discovers that every event must have a cause, that an actual infinity of causes is impossible, and hence that there must be one cause of all existents, which is God. He now seeks knowledge of God, and through contemplation, asceticism, and spiritual exercises he achieves his goal: direct experiences of the divine and of the emanative chain of being descending from him. Meanwhile, on a nearby island, a community ruled by the revealed law, which is a replica of philosophical truth, there are two brothers named Salāmān and Absāl (or Āsāl) who have different attitudes toward scriptural language. Salāmān and the rest of the community accept it literally, being incapable of comprehending its inner meaning. Absāl, on the other hand, pursues its inner meaning. Finding no one on the island who understands his quest, he seeks seclusion on a deserted island, which turns out to be Ḥayy's abode. The two meet. Absāl teaches Ḥayy language and discovers that Ḥayy is an unusual philosophical mystic who, unaided, has attained the highest truth, of which Absāl's own religion gives symbolic expression. For his part, Ḥayy recognizes Absāl's religion to be true and believes in its prophet. Both

return to Absāl's island, where Ḥayy endeavors to teach some of its religious citizens the inner meaning of their religion. In this he fails because they are incapable of understanding him. He then adjures them to forget everything he has told them and to continue to take their religion literally. He and Absāl leave for their deserted island to live their mystical existence to the end of their days.

This story, amenable to a variety of interpretations, gives dramatic illustration of two of al-Fārābī's principles: that religion is the "imitation" of philosophy, and that the nonphilosopher ought not be addressed in philosophical language.

It was Ibn Ṭufayl who introduced Ibn Rushd to the Almohad court. Born in 1126 in Cordova, Ibn Rushd was the son and grandson of noted Islamic judges. Trained in medicine, philosophy, and Islamic law, this most Aristotelian of the *falāsifah* was a noted Islamic lawyer and, according to medieval accounts, an authority on Arabic poetry. In 1169 he was appointed judge in Seville and in 1171, chief judge of Cordova. He then became attached to the Almohad court, serving its philosophical ruler Abū Ya'qūb until the latter's death in 1184, and then his son, al-Manṣūr, for another ten years. Largely because of the opposition of conservative religious scholars, as it seems, al-Manṣūr exiled Ibn Rushd in 1194 but reinstated him soon afterward. The philosopher died in the service of this monarch in 1198.

Ibn Rushd is noted in the history of philosophy for his substantial body of commentaries, largely on Aristotle but also on other thinkers. These commentaries had great impact on medieval Latin philosophy as well as the philosophy of the Italian Renaissance. Although Ibn Rushd never set out to formulate a philosophical system of his own, from his commentaries, and perhaps more so from his philosophical reply to al-Ghazālī's criticism of *falsafah*, an Aristotelian philosophical view emerges, informed by Ibn Rushd's individual insights and stamped by his personality. The view is powerful and compelling.

Al-Ghazālī's attack on *falsafah* in his *Tahāfut*, although logically incisive, was theologically motivated. Moreover, his condemnation of al-Fārābī and Ibn Sīnā as "infidels" was a pronouncement in terms of Islamic law. Thus Ibn Rushd's reply to al-Ghazālī encompasses the legal, the theological, and the philosophical. The legal and theological replies are embodied in two main works that are relatively short, namely, the *Faṣl al-maqāl* (Decisive treatise) and the *Kaṣḥf 'an manābij al-adillah* (Expositions of the methods of proof); the philosophical reply to al-Ghazālī's *Tahāfut* is the *Tahāfut al-Tahāfut* (Incoherence of *The Incoherence*), a much larger book.

In the *Faṣl*, Ibn Rushd raises the general question of whether Islamic law commands, allows, or prohibits the study of philosophy. He answers that the law commands its study but that this command is incumbent only on the one class of scholars, the demonstrative class (i.e. scholars who

understand and use Aristotle's demonstrative method in acquiring knowledge), capable of understanding philosophy; nonphilosophers must not pursue it. Ibn Rushd's position is essentially that of al-Fārābī, but it is now couched in Islamic legal language. The *Faṣl* also includes a theory of scriptural interpretation and a defense of the *falāsifah's* three doctrines against al-Ghazālī's charge that they were irreligious. The *Kashf* complements the *Faṣl* but offers more specific criticisms of Ash'arī theological principles.

In the *Tabāfut al-Tabāfut*, Ibn Rushd quotes almost all of al-Ghazālī's *Tabāfut*, commenting on it paragraph by paragraph. Although his main criticisms are directed against al-Ghazālī, at times he criticizes Ibn Sīnā, particularly for his Neoplatonism. Ibn Rushd's *Tabāfut* is a sober work of criticism that tracks down ambiguities, draws distinctions, reformulates positions, corrects misunderstandings, and offers analyses. It reasserts and defends an Aristotelian causal view, arguing incessantly against the Ash'arī conception of divine causality and against their denial of natural causes.

Ibn Rushd's writings on the hereafter, however, pose the question of what he actually believes on this matter. His "technical" discussions of the question of the soul's immortality—whether in his commentaries on Aristotle or in those parts of the *Tabāfut* where he is highly critical of Ibn Sīnā's doctrine of the soul's individual immortality—leave no room for a theory of the soul's individual immortality, to say nothing of a doctrine of bodily resurrection. In the *Kashf*, however, he affirms a doctrine of individual immortality, whether this is confined to the soul or involves bodily resurrection. Again, at the end of the *Tabāfut* (where the discussion is not technical) he seems to affirm a doctrine of bodily resurrection. The indications are that in these conflicting statements he is practicing what he preaches as a follower of al-Fārābī's political thinking. In other words, he is addressing the philosophers philosophically and the nonphilosophers in language they can understand. He also seems to be protecting himself against charges of unbelief.

Falsafah did not end with Ibn Rushd. But the period from al-Kindī to Ibn Rushd witnessed some of its greatest practitioners and established a rich philosophical tradition on which later Islamic thinkers, men of originality and genius, were to build and enrich *falsafah* even more. The majority of these thinkers came from Persia and were in a real sense the spiritual descendants of Ibn Sīnā. But some came from other parts of the Islamic world—Spain and North Africa, for example.

Persia became noted for its mystical philosophy of illumination, *al-ishrāq*. The founder of this tradition was al-Suhrawardī (d. 1191), a contemporary of Ibn Rushd. The basic idea of his philosophy is that reality consists of light of varying degrees of intensity. Light, which for al-Suhrawardī is neither material nor definable, proceeds from the Light of lights (*nūr al-anwār*), God. Its emanation and diffusion at various levels constitute the created world. In this metaphysics of light and illumination, he harks back to the old reli-

gions of Persia. He is also noted for criticizing the Aristotelians for their rejection of the Platonic doctrine of eternal forms. From the thirteenth century onward, al-Suhrawardī was succeeded by a series of Persian philosophers who either adopted his doctrine of *al-ishrāq* or, such as the philosopher-scientist Naṣīr al-Dīn al-Ṭūsī (d. 1274), were greatly influenced by it. Those who adopted it included such leading thinkers as Mīr Dāmād (d. 1631), Mullā Ṣadrā (d. 1640), and the latter's commentator, Sabzawārī (d. 1866), to name but a few.

Of al-Suhrawardī's successors, Mullā Ṣadrā is generally recognized as the most important and most original. Although he adopted al-Suhrawardī's metaphysics of illumination, he disagreed with him on a basic idea concerning the relation of essence to existence. Al-Suhrawardī had argued for the priority of essence over existence. Mullā Ṣadrā maintained the reverse, arguing for the priority and "primacy of existence" (*aṣālat al-wujūd*). By "existence," he meant real existence as distinct from the static concept of existence in the mind. Real existence is grasped intuitively, the act of intuiting it being itself part of the flow of existence. The key idea governing his whole philosophy is that of existence as a dynamic process. This manifests itself in his theories of motion and time. Motion is not simply the rotation of forms over a static substratum, but is inherent in the substratum itself. Similarly, time is not merely the measure of motion: Physical body has an inherent time dimension. There is an ever upward moving process of existence (imperceptible to humans) that is irreversible, a manifestation of God's ceaseless creative impulse.

In Western Islam, philosophical mystical thought attained its heights with two thirteenth-century thinkers, both from Murcia, Spain. The first was the great philosophical mystic Ibn al-'Arabī (d. 1240), noted for his doctrine of the unity of being (*waḥdat al-wujūd*), which exerted a very great influence on Persian mystical thought. The second was Ibn Sab'īn (d. 1270), a mystic-philosopher who expounded a doctrine of the unity of being in terms of Aristotle's concept of form. A much more empirical approach is encountered in the thought of the Tunisian-born historian-philosopher Ibn Khaldūn, one of Islam's most original minds. He served various Islamic rulers as ambassador, envoy, and chief judge. Combining a thorough legal, theological, and philosophical education with firsthand experience in politics, he utilized this background to write his universal history, best noted for its *muqaddimah* ("prolegomena"). It is in this *muqaddimah* that he sets forth his conception of history as a science concerned with the causal explanation for the rise, decline, and fall of civilizations and that he probed the rise and development of social institutions. In doing this, he realized, in effect, a philosophy of history.

Both Ibn Khaldūn and Mullā Ṣadrā in their very different ways are examples of philosophers who broadened the dimensions of *falsafah*. They certainly made advances over the thought of their predecessors. But these were advances

within a rich philosophical tradition whose first foundation stone was laid in the ninth century by al-Kindī.

FALSIFICATION SEE DOUBT AND BELIEF;
LOGICAL POSITIVISM

FALUN GONG. Falun Gong, also known as Falun Dafa, is a Chinese spiritual movement founded in 1992 by

Li Hongzhi (1951–). Although most Western scholars would classify it as a “new religious movement,” Li and his followers understand Falun Gong not as a religion but as a “cultivation system,” based on principles of *qigong* that are widely accepted in China. Falun Gong rapidly became very popular in China, attracting millions of followers in the years immediately after its founding. For complex reasons, Falun Gong soon ran afoul of the Chinese state, and a massive protest in Beijing by Falun Gong practitioners against media censorship at the end of April 1999 led to a harsh crackdown by the Chinese government on the grounds that Falun Gong was a dangerous “heterodox sect.”

QIGONG AND THE QIGONG BOOM. To understand the rise and popularity of Falun Gong, it is essential to understand the rise and popularity of *qigong*. In Chinese, *qi* means “vital breath” or “energy” and refers to a force existing in nature that can be harnessed for a variety of purposes. *Gong* means “skill” or “technique,” and the two characters together mean “the cultivation of *qi* energy.” *Qigong* practice includes a variety of techniques, some stressing physical movement, some stressing meditation or visualization. The goal of practice is self-healing, stress reduction, and the cultivation of super-normal powers.

The practices and principles of *qigong* are drawn from traditional Chinese medicine, folk healing, martial arts, and popular religion, many varieties of which have claimed magical healing powers. These practices did not, however, exist as a coherent whole prior to the Communist revolution of 1949, nor did the notion of *qigong* exist as such. Ironically, given the state's later opposition, *qigong* was created and nurtured by the Chinese government in the 1950s as part of an effort to preserve traditional Chinese medical practices in the face of a massive importation of Western medicine. The goal of those who “invented” *qigong* in the 1950s was to separate pure *qigong* technique from its traditional spiritual underpinnings so as to preserve the scientific benefits of *qigong* while discarding its dangerous and “superstitious” wrappings. The first “consumers” of *qigong* were high-level cadres of the Chinese government, who practiced *qigong* in sanatoria run by the Chinese traditional medical establishment.

After the death of Mao Zedong in 1976, *qigong* became a mass phenomenon in the freer, less politically charged atmosphere of post-Mao China. One important element of this transformation was the emergence of charismatic *qigong* masters who in the late 1970s and early 1980s took *qigong* out of the sanatoria and into the public parks of urban China, where *qigong* was taught to any and all who were interested. As the popularity of *qigong* grew, masters sought larger venues, even renting sports stadiums at the height of the boom and selling tickets to eager followers. The credibility of *qigong* was enhanced by the “discovery” by well-known Chinese scientists that *qi* was a material substance and that the development of supernormal powers based on the mastery of *qi* had a scientific foundation.

Encouraged by the scientific endorsement of the reality of *qi* and *qigong*, the Chinese government lent its support to the *qigong* movement. From a practical point of view, mass practice of *qigong* promised to improve the health of the Chinese people and reduce demands on the health care system at a time when the leadership hoped to economize by shrinking its investment in public health. In addition, after the failure of Mao's Cultural Revolution (1966–1976), the post-Mao Chinese leadership sought legitimacy as much in Chinese nationalism as in Marxism-Leninism, and the government was pleased that many Chinese people were becoming reacquainted with China's traditional culture through their practice of *qigong*, which *qigong* masters linked to China's rich cultural heritage. China's leaders were equally proud to tout *qigong* to the world as China's contribution to modern science—yet another manifestation of post-Mao Chinese nationalism. At the same time, China's leaders sought to regulate *qigong*, and to this end set up the Chinese Qigong Scientific Research Association in April 1986.

Over the course of the 1980s and 1990s, China went wild for *qigong* in what was known as the “*qigong* boom.” Hundreds of millions of people participated, and thousands of articles on *qigong* appeared in official media, as well as in newly created journals and newspapers wholly devoted to *qigong*. Hundreds of *qigong* masters competed for public attention. The most visible symbol of the *qigong* boom was the appearance of nationwide networks of *qigong* practitioners, all of whom were organized around charismatic *qigong* masters, who gave lecture tours, appeared on television, and published and sold books and cassettes. Chinese interest in *qigong* had become a mass movement, which began to take on the character of a new religious movement. Masters, in their explanations of the workings of *qigong*, began to elaborate theories that went beyond the technical aspects of *qigong* practice and the achievement of physical well-being; they linked *qigong* to morality, spirituality, the meaning of life, and the meaning of the universe. In addition, *qigong* practitioners began to fall into trances, experience visions, and suffer “possession,” and a widespread enthusiasm for the pursuit of supernormal powers through *qigong* practice signaled the embrace of *qigong* as a force capable of altering ordinary reality.

LI HONGZHI AND FALUN GONG. Li Hongzhi and Falun Gong emerged as part of the *qigong* boom. Both were initially embraced as part of the movement, and Falun Gong was welcomed into the Qigong Scientific Research Association, which sponsored and helped to organize many of Li's activities between 1992 and 1994. Notable among those activities were fifty-four major lectures given throughout China to a total audience of some twenty thousand. Like other masters, Li published books of his teachings, which achieved such success that he was soon able to offer his lectures free of charge.

Still, if Li Hongzhi and Falun Gong owed their initial success to their kinship with other *qigong* masters and

schools, there was something different about Li Hongzhi. Li condemned other *qigong* schools for their crass materialism, in effect accusing them of fraud. More fundamentally, he reproached the entire *qigong* establishment for an unhealthy obsession with healing and supernormal powers, which came, in his view, at the expense of a deeper spiritual orientation. To Li, Falun Gong was *qigong* taken to a higher plane. Falun Gong, he claimed, could heal illnesses and confer supernormal powers, but the more important objective was to arrive at a physical transformation of the body and a fundamental transformation of one's understanding of the composition of the universe and one's role therein. These transformations were to be effected through Falun Gong practice, which, like other styles of *qigong*, included physical movements, but which also accorded an importance to scripture (i.e., Li Hongzhi's writings). This emphasis on the master's writings was unusual in the context of the *qigong* movement. Unlike other *qigong* schools, Falun Gong also stressed the miraculous, godlike powers of Li Hongzhi (i.e., the ability to assure the health and welfare of all of his followers at all times) in a way that differed from other *qigong* schools.

Li's teachings are an eclectic mixture of Buddhism, Daoism, popular religion, and “scientism.” His theology draws largely on Buddhism, and he calls on followers to sever all “attachments,” be they to meat, alcohol, medicines, material possessions, or other human beings. Practitioners are to be compassionate to all, but such compassion should not engender attachments that detract from salvation. Li frequently evokes the traditional Buddhist concept of karma—the notion, linked to reincarnation, that the merits and demerits of one's present life will be reflected in one's status at the moment of rebirth in a future life. The “scientific” cast of Li Hongzhi's message is reflected in its conception of karma, which in Falun Gong literature has a material basis: karma is a black substance present in the body, which can be transformed by suffering and virtuous practice into a white substance. The transformation, according to Li, occurs at the molecular level and accounts scientifically for the improved health of Falun Gong practitioners. Indeed, the promise of improved health has been the primary attraction of Falun Gong for many practitioners, who consider disease a form of karma to be eliminated through suffering and cultivation. Most Falun Gong practitioners avoid doctors, hospitals, and medication.

Another aspect of Li's teachings concerns world destruction and renewal. He argues that the world has been destroyed and re-created eighty-one times, and that signs indicate that another cycle of world destruction and renewal is imminent. Li drew these ideas from traditional strains of Chinese apocalyptic thinking, found especially in popularized versions of Daoism and Buddhism. Interestingly, Li did not stress this teaching prior to the Chinese government's suppression of Falun Gong.

Li argues furthermore that truth (*zhen*), benevolence (*shan*), and forbearance (*ren*), the three cardinal principles of

Falun Gong practice, are in fact the forces that make up the physical universe. Falun Gong practitioners achieve oneness with cosmic reality in cultivating truth, benevolence, and forbearance in their personal lives. Rather than present scientific arguments to illustrate his contentions, Li claims to have transcended science and thus to understand all of reality from another, higher level. His writings are full of scientific (or parascientific) references (his reflections on the proper understanding of gravity, for example), which his followers take as seriously as the rest of his writings.

Falun Gong practice is simple, albeit time-consuming. The exercises, described in the book *China Falun Gong* (1993), are to be performed on a daily basis if possible, alone or with other practitioners. The more important aspect of Falun Gong practice is the reading and rereading of Li Hongzhi's most important work, *Zhuan Falun* (The revolving wheel of the Buddhist law), first published in Chinese in 1995. This work is held to be the source of all truth; many practitioners report having read it in a single sitting and having experienced an immediate revelation. In China prior to the suppression of Falun Gong, a nationwide network of practice centers brought practitioners together on a regular basis, which allowed for the rapid diffusion of the Falun Gong message to interested parties. The centers offered no worship services, however, and Li Hongzhi forbids anyone to speak in his place; all "teaching" is thus carried out via books or video and audio recordings, or via other materials made available on the Falun Gong websites.

This same basic structure has been copied on a smaller scale outside of China. Many followers exercise daily and meet weekly with other practitioners to read Li Hongzhi's works and to exchange experiences. Large "experience-sharing conferences" are an important part of the North American Falun Gong experience. These are regional events, held on a rotating basis in cities where there are significant numbers of Falun Gong practitioners. Such events add witness statements to the Falun Gong repertoire of exercises and reading of scripture; practitioners deliver prepared statements of their experience before and after coming to know Falun Gong. Li Hongzhi frequently appears at such events, the only occasions at which ordinary members can see the master.

Chinese practitioners in North America are in general highly educated and reasonably wealthy, in part because American and Canadian immigration procedures attempt to filter out the poorly educated and those who are likely to become wards of the state. In China, Falun Gong, like *qigong*, appealed to a broad range of the population—rich and poor, educated and uneducated, powerful and powerless, urban and rural, women and men, as well as members of the Communist Party.

FALUN GONG'S CONFLICT WITH THE CHINESE GOVERNMENT. In his pre-1999 writings, Li Hongzhi appears to be nationalistic and patriotic, but largely apolitical. Nevertheless, while other *qigong* leaders took care to cast their message

in such a way as to avoid conflict with the authorities, Li seems to have worried little about the response his writings might evoke. *Zhuan Falun*, for example, teems with references to spirit possession, the destruction and re-creation of the word, extraterrestrial interference in the affairs of humankind—in short, a host of references unlikely to please Communist authorities.

As a nationwide mass movement organized around a charismatic leader who largely ignored the Chinese Communist Party, Falun Gong represented a potential threat, but as such it was not much different from other *qigong* schools. What distinguished Falun Gong as an organization was its propensity to react quickly and vigorously to perceived slights from the media, a practice that rapidly became "political," since most media outlets in China are little more than mouthpieces for the government. Sources hostile to Falun Gong report more than three hundred such instances, beginning in the summer of 1996, none of which were violent and all of which essentially demanded that "erroneous" information about Falun Gong be corrected. Falun Gong practitioners later likened their protests to those of Mahatma Gandhi in India or Martin Luther King Jr. in the United States. But China has little tradition of civil rights demonstrations, and actions such as surrounding the state-owned and state-run Beijing television station, which Falun Gong practitioners did in May 1998, were perceived as audacious, if not seditious, in the Chinese setting.

Criticism of Falun Gong in the official media suggested that the movement had detractors in high places. Indeed, official opinion about Falun Gong, and about the *qigong* movement in general, was divided. At various points during the *qigong* boom, some critics expressed concern that *qigong* and Falun Gong were little more than a return to "feudal superstition" and that organizations built on such foundations were not to be trusted. It was probably due to such criticisms that Li Hongzhi decided to leave China for the United States in 1996, roughly the same time that Falun Gong "protests" began in China. Subsequently, problems over Falun Gong's continued recognition as an "official" *qigong* organization signaled that the Chinese government was particularly worried about Falun Gong.

The Falun Gong encirclement of Communist Party headquarters in Beijing in 1999 was sparked by a media affair in the neighboring city of Tianjin, and should thus be understood as a continuation of previous protests. The huge demonstration on April 29, 1999, when some ten thousand practitioners surrounded party headquarters at Zhongnanhai, was surely designed to draw the attention of the authorities to the ongoing criticism of Falun Gong in the media. The demonstration may even have been intended to suggest the power of Falun Gong (it was the largest protest China had experienced since the student democracy movement of 1989), and it apparently came as a complete surprise to China's leadership.

If Li Hongzhi expected the Chinese authorities to back down, he must have been sorely disappointed, for the state responded to the demonstration with a fierce campaign against Falun Gong. Laws passed during the summer and fall of 1999 defined Falun Gong as a “heterodox sect” and authorized confiscation of Falun Gong books, recordings, and other paraphernalia. Consistent with their tradition of protest, Falun Gong practitioners—encouraged, one assumes, by the Falun Gong leadership—sought out Chinese authorities at all levels, insisting that Falun Gong was benevolent. The most visible of these Falun Gong protesters were the practitioners who demonstrated in Beijing’s Tiananmen Square, in essence demanding a confrontation with the authorities in China’s central political space. Confrontation ensued, as the state arrested, imprisoned, and tortured tens of thousands of Falun Gong practitioners beginning in the fall of 1999.

After the campaign against Falun Gong, Li Hongzhi’s message began to change. Li largely disappeared from circulation between the spring of 1999 and the fall of 2000. When he reemerged, delivering impromptu addresses at experience-sharing conferences in North America and Europe, he emphasized the apocalyptic aspects of his discourse in ways he had not done prior to April 1999. He began, for example, to depict the suppression of the Falun Gong movement in China as a part of a “final trial,” and he seemed to promise that those who martyred themselves to the cause would receive instant “consummation” or enlightenment, the final completion of their cultivation efforts.

Falun Gong practitioners outside of China began to organize during this period, both to ensure that the truth about Falun Gong and about the suppression reach China, and to bring pressure on Western governments to condemn the actions of the Chinese state. These efforts, particularly those addressed to Western governments, achieved considerable success. However, an important moment in this conflict was the alleged self-immolation of a number of Falun Gong practitioners in Tiananmen Square in late January 2001. Although doubts persist as to the identity of those who set themselves on fire (Falun Gong practitioners insist that the event was staged by Chinese authorities), the incident marked an important public relations victory for the Chinese government within China. Many Chinese who had remained neutral to that point came to share the authorities’ view that Falun Gong was indeed a dangerous heterodox sect. The Chinese authorities succeeded in suppressing Falun Gong, as well as other *qigong* schools, within China, but at great cost in terms of the regime’s international prestige and the loss of money and energy that could have been more usefully invested elsewhere.

DAVID OWNBY (2005)

FAMILY is vitally important to most religious traditions in two closely interconnected ways: Various ritual processes enacted by, to, and for the family help to create and sustain it as well as give it meaning, and it functions as an important symbol of deity. Historically and cross-culturally, family in various forms has (until the late twentieth century in postindustrialized cultures) been so basic to human existence as to be a universal symbol of ultimacy.

DEFINITION. Exactly what constitutes family is not always clear. Some scholars equate family with household, another imprecise construct that variously includes all permanent members such as servants or else excludes unrelated householders. Further confusion results because most anthropologists posit two basic kinds of family: the nuclear family, consisting of mother, father, and unmarried children, and the extended family, typically including mother, father, all unmarried children, and one or more sons with their wives and children. Numerous complicated variations exist, including different polygynous arrangements in which two or more covives live under the same roof. A few domestic groupings, such as those of the Nayar of India, whose men never live with their wives, defy all categories. Nonetheless, family, in some variant, is considered universal.

Also confusing is the fact that all married people simultaneously belong to two different families. Family as seat of

origination stresses ties of blood, whereas family as affiliation emphasizes bonds of marriage. To keep separate these two different kinds of family, some anthropologists designate the first as “kin” and the second as “family.” Kin are those who share common ancestors, as do mother and child (in contrast to mother and father, who do not). Strictly speaking, although family incorporates kin, the reverse is not true because, excepting incestuous marriages, spouses usually are not blood relatives.

Consequently, family is basically a reconciliation of many different opposites: female and male, life and death, ascendants and descendants, kin and affines (relatives by marriage), biology and culture, freedom and servitude, corporation and individuality. The differing ways in which family contains these opposites represent diverse systems of order in which family roles are valued according to accepted local religiocultural belief and custom. Valuation of all members is almost never equal; therefore, family as a whole embodies and symbolizes order of a particular sort—hierarchy.

In its entirety this “natural” order of human relationships, presumed to have evolved out of earlier hominid bands of approximately thirty, has frequently been deified, with members typically reflecting family as experienced in a particular culture. Thus Kwoiam, the warrior hero of Mabuia, an island off New Guinea, lives with his mother, her brother and sister, and his sister’s son in a matrilineal “family” (technically, a kin system) that omits the father. Very different is the Homeric extended patriarchal family of Zeus and Hera, which includes variously begotten offspring. The smaller nuclear family is symbolized in various cultures, as for example the Egyptian Osiris, Isis, and Horus; the holy family of Christianity consisting of Joseph (or God the Father), Mary, and Jesus; and the holy triad of the Yurak Samoyed: Nyebye-haha, the mother deity; Wesako-haha, her spouse; and Nyuhaha, their son. Curious variants appear in the enneads (triple triads) so characteristic of dynastic Egypt.

In its smallest possible configuration (apart from the single individual sometimes defined as family in the post-industrialized West)—as husband and wife—family appears in almost all mythologies. Universally, tales of the *hierogamos* tell of the sacred marriage of Heaven and Earth from whom humanity springs, as illustrated by the Zuni Awitelin-tsita, the fourfold-containing Mother Earth, and Apoyan Ta’Chu, the all-covering Father Sky. Often such etiological stories of how the world came to be tell how one or more of the children produced by the union separate the pair, often forcibly, to form the realms of earth and sky. Such is the case in the Vedic account of Dyaus and Prthivi.

ANCESTORS. Probably no members so fully embody both the ritual and the symbolic significance of the traditional extended family as do ancestors. From the Paleolithic period to the present, many cultures have venerated ancestors to varying degrees, although Herbert Spencer’s theory that ancestor worship stands behind all religious practice has been generally discarded. For example, almost all Native American tribes

believe that spirits of tribal ancestors return to earth to warn, protect, and instruct the living, although only specially trained shamans are capable of seeing them.

Babylonian mythology and artifacts incorporate important motifs of ancestor veneration. The failed attempt of the hero Gilgamesh to escape mortality by visiting his ancestor Utanapishtim, the Babylonian Noah who did escape it, indicates the salvific role hoped for from ancestors. Between the third millennium BCE or earlier, when sacrifices were offered to the departed kings Shulgi and Gudea, and about 2500 BCE, when Grimalsin of the second dynasty of Ur appears to have been deified while still living, two other important themes emerge: Ancestor worship by actual descendants tends to merge with homage paid by a whole people to departed rulers or “fathers.” Thus, in many cultures ancestors function variously as objects of domestic and state devotion, a situation that became pronounced in the Roman Empire. Attribution of divine ancestry has been common for kings, as notably in post-Meiji Restoration Japan, where the emperor was officially proclaimed a direct descendant of the sun goddess Amaterasu Ōmikami. Such ancestry has even been assigned to whole peoples, as repeatedly shown in epic poetry.

So important are the honored ancestors in cultures such as those in China, Japan after Chinese contact (seventh century CE), and areas of Aryan influence, particularly India and Rome, that the traditional family often seems to exist more for their sake than for that of the living. This point indicates one theme present in the traditional family, its orientation toward death. Furthermore, because typically in these cultures ancestors collectively overpower and stifle the individuality now common in the Western world, ancestor veneration also highlights a second important theme: Family as corporate entity strongly opposes the individuality of its members.

Emphasis on ancestors indicates that family is not only the matrix within which an individual enters life but also the means by which he (less commonly she) achieves a kind of immortality. Paradoxically, this denial of death that leads to ancestor veneration makes the family a kind of perpetual cult of the dead enacted by the living.

CHILDREN. In contrast to dead family members, who are almost universally venerated, children are often treated ambivalently. Though desired in the abstract for perpetuating the family, children may be abused or even denied life, as in the ancient classical world. Hippocrates illustrates this point when he asks, “Which children should be raised?” The essentially universal theme of infanticide is clearly present in the biblical stories of Isaac and Moses, who were saved. To this day the practice continues sporadically for girls in parts of India and China, as historically had been the case almost worldwide.

The countertheme of life orientation surfaces most strongly in connection with those newborns elected to sur-

vive. Yet even here the tension of opposites is strained, for only some attain family membership. Commonly thought of as “natural,” family construction is actually often highly artificial.

Birth, mating, and death, the three natural methods of creating, maintaining, and pruning families, are simultaneously both biological and socioreligious events. Successful delivery of a live baby does not guarantee the existence of a new family member. In many cultures, once a child is born (notably, in patriarchal Hellenic Greece or even contemporary China or India), the father must determine whether or not to keep it. Then it must be incorporated into the family. The contemporary Islamic Malays illustrate one variant of this once nearly universal practice: First, the father whispers into the infant’s ear the Islamic call to prayer; next, a specially selected person touches certain objects to the baby’s lips to guard against future lying and gossiping; then, forty-four days later, the father buries the placenta beneath a coconut palm seedling. These and other birth rituals help place the child in its familial and socioreligious context. Thus a new family member is “created” only in the most superficial way by its actual birth. Subsequent actions of family members, often other than the mother, bring the child fully into family life.

As a symbol of deity, the divine child appears in various traditions. Archaeological finds such as vase paintings and figurines depicting infancy themes and rituals place this concept at least as far back as the Neolithic and Chalcolithic periods (c. 7000–3500 BCE) in Old Europe (roughly, southeastern Europe from Czechoslovakia to the Aegean). Motifs of birth and maturing of the infant later took shape mythically and cultically in many variations that recount the passion of the young god of vegetation. Representative is the cult of the infant Dionysos, originally Boeotian and Cretan but subsequently almost universal in Greece, in which the infant Dionysos-Zagreus is dismembered. According to myth, the Titans lured the child with rattles, knucklebones, a top, a ball, and a mirror, then cut him to pieces, cooked him, and devoured him. In some versions he is resurrected by the earth mother, Rhea. This death and resurrection theme, common to the complex of images central to agrarian religion, finds in the child (or alternatively in the seed) an appropriate image of renewal.

Worship of the divine child was originally shared by or even predominantly directed to the mother goddess, as in the case of Ishtar, Astarte, and Cybele, whose son-consorts were of secondary importance. With time, however, the child, originally of either sex as suggested by numerous Sumerian female *Marduks*, ceases to be merely the child or sacrificial consort and becomes more and more an object of veneration in its own right. Christianity epitomizes this process whereby the divine child eclipses its mother.

In a very different form, images of the divine child as divine hero are also common in Native American mythology. This pattern is typified by the Haida story of Shining Heav-

ens. One day a Haida woman was digging on the beach. Hearing a cry from a cockle shell, she uncovered it and found the baby Shining Heavens. She took him home and soon discovered his supernatural power, manifested in his ability to grow up almost immediately. This common motif of the wonder child who grows almost instantly from baby to strong youth or man is also illustrated by the Siouan Young Rabbit and the Algonquian Blood-Clot Boy. Sometimes the child-hero even makes plans in the womb, as do the Iroquoian twins Good Mind and Evil Mind. Such “unnatural” capabilities illustrate the power of godhead to transcend nature.

Such capability is even more apparent in the Vallabha and Caitanya sects of Hinduism, in which worship of the cowherd Kṛṣṇa as the divine child has been popular from at least 900 CE. In the spontaneity of his laughter, pranks, dancing, disobedience, and play, the child Kṛṣṇa symbolizes the unconditional nature of divinity. In such activity, engaged in for no purpose beyond sheer joy, the play of the child metaphorically expresses an aspect of divinity less easily rendered by “adult” personifications.

MOTHERS. So important is a woman’s role as mother in most societies that the biblical Hebrews, for example, insisted that a wife who failed to bear children was obligated to provide her husband with a concubine (*Gen.* 16:2). According to popular Islamic tradition, the main duty of a woman is to obey and serve her husband respectfully; her second duty is to give him male heirs. In traditional China with its strong Confucian ethic, life was meaningless without sons. Without sons, a wife could count on a second wife essentially replacing her.

Theorists assume that the discovery of stockbreeding and planting taught humans about male reproductive capability. That means that for only about twelve thousand of the million years of hominid existence have humans understood paternity and reckoned male as well as female lineage. Thus was the ancient mother-child kin tie challenged by the familial tie. The nineteenth-century belief in mother right, espoused by J. J. Bachofen, Robert Stephen Briffault, Henry Maine, and others, whereby women were thought to have held social and political power during a prepatriarchal era, has long been invalidated; but current scholarship makes indisputable the existence of a practice of prehistoric mother worship in Europe and Asia Minor.

Material evidence in the form of large numbers of “Venus,” often with exaggerated secondary sex characteristics and pregnant bellies, as exemplified by the well-known Venus of Willendorf, firmly roots the idea of divine motherhood in the Upper Paleolithic period in Eurasia (c. 22,000 BCE). By the time of the Neolithic and Chalcolithic periods (c. 7000–3500 BCE) in Old Europe and the Near East, the Great Mother, with her accumulated Paleolithic traits, is well established in the variant forms that generally characterize her in agricultural societies around the world. (In patrilineal totemic and patriarchal nomadic cultures she figures less prominently, as an adjunct to the dominant sky god.) Under various names she appears almost universally wherever agri-

culture develops—as Ishtar (Babylon and Assyria); Astarte (Canaan); Isis (Egypt); Cybele (Phrygia); Rhea, Gaia (pre-Hellenic Greece); Pṛthivī (Vedic India); Di (ancient China); Pachamama (Inca); and so on.

In cultures such as those of Old Europe, pre-Hellenistic Greece, and pre-Vedic India (Harappa, Mohenjo-Daro), which were not dominated by nomadic pastoral peoples, motherhood is typically aligned with a concept seemingly opposed to it—that of virginity. But this belief reflects the archaic notion that birth results from parthenogenesis, an understandable belief for those unaware of the male role. Far from being a moralistic concept, as it subsequently became in patrilineal and patriarchal cultures, it originally reflected an understanding of woman as creator and powerful figure in her own right.

Earth and related vegetal phenomena such as grains are not the only natural elements associated with motherhood. Water, the medium from which humans originally emerge onto land, also functions this way, as with the ancient Mexican goddess of the waters, Chalchiuhtlicue, and the water mother common to the ancient Karelians and other Finno-Ugric peoples. Sometimes, as with the Japanese sun goddess Amaterasu, or the pre-Islamic mother of the heavens Allat, or the Egyptian sky goddess Nut, the traditional association of earth with motherhood and of sky with fatherhood are reversed; consequently, the predominant associations do not always hold, as when the concept “down,” normally affiliated with earth and motherhood, attaches to a male chthonic deity. The variant son-consorts of the mother goddess, such as Adonis and Tammuz, reflect this phenomenon.

Various interconnected processes particularly affect the ways motherhood is represented in divinity and vice versa. Specialization tends to separate qualities originally mixed together in a single great goddess figure into different embodying images, as exemplified by the goddesses of the Homeric pantheon. Artemis and Aphrodite, for example, both lose their original fullness of personality to become mainly associated with the hunt and with erotic love, respectively. In this way motherhood, especially in Western cultures dominated by monotheism, has typically been strictly separated from all other potential and actual attributes of womanhood. Thus hunting, wisdom, sex, and war, all attributes of the undifferentiated goddess, come to appear totally divorced from each other.

A related process polarizes “good” and “bad” qualities into beneficent and terrible goddesses. Such terrible mothers of death and destruction as the Hindu Kālī, the Aztec Tlamatecuhtli, and the Greek Medusa typify this process. Such splitting dichotomizes the originally unified cycle of birth and death, in which Mother Earth gives birth (often quite literally, as in the Greek story of Erichthonius and in the many Native American myths that portray humanity emerging from the womb of the Earth) and later takes back her dead for burial (as in the Pueblo belief that Shipapu, the underworld, is also the womb of the earth goddess, Natya Ha

ʾAtse.) With polarization come goddesses of the underworld realm such as the Greek Persephone and the dread Sumero-Akkadian Ereshkigal, who are separate from beneficent counterparts such as Demeter and Ishtar.

In a variant process the single goddess multiplies, usually into a triad, as in the case of the Scandinavian Norns, the Greek Fates, or the strange *matres* and *matrones* figures from the Celtic and Germanic provinces of the Roman Empire. Such trinitarian representations often involve different stages of motherhood, as in various ubiquitous virgin-mother-crone triads (the Hindu Pārvatī, Durgā, and Umā and the Celtic Macha, Morríghan, and Badhbh, for example).

FATHERS. Next to ancestors and frequently amalgamated with them conceptually, fathers hold the greatest power in traditional patriarchal families, whether or not their fatherhood is biological. This paradox is logical when fatherhood is divided into three categories: The genetic father fertilizes the ovum; the genitor contributes to the child’s growth in the womb, as when the Holy Ghost causes Mary to conceive through her ear; and the social father, known as the *pater*, dominates family life. Whether as genetic father, adoptive father, or maternal uncle, the *pater* supplies the child’s social position.

In a patrifocal extended family the *pater*, as oldest living father in a direct line of descent, firmly heads the family hierarchy. This pattern was thoroughly worked out in the Roman family, where patriarchal power was so complete that, until he died, the father retained limitless authority over unmarried daughters and grown sons and their children. A married daughter customarily joined the household of her husband and so came under the authority of his father. Such extreme paternal power distinguished the Roman father from fathers in other societies in degree, but not in kind.

In contrast to motherhood, which results from pregnancy and childbirth, fatherhood is not immediately self-evident. Nor can fatherhood be as readily represented in images. Development and evolution of the concept are consequently less certain and less easy to follow. Almost everywhere, the most archaic manifestation of divine fatherhood is the “high god” located in the sky. Typically this “father” is originally a creator whose traits include goodness, age (eternity), and remoteness from the world of human affairs. So transcendent is he that he often abdicates his role of creator, handing it over to a successor-demiurge. Consequently, he is seldom revered in cult and may even disappear entirely. Representative examples are the Australian All-Father deities Baiame, worshiped by the Kamilaroi, and Bunjil (of the Kulin tribes); the Andamanese Puluga; numerous African father gods such as Nzambi of the Bantu-speaking peoples and Nyan Kupon of the Tshis. Existence of a sky god of this sort is evident from Neolithic times on and may well go back to Paleolithic times, but hard material evidence to prove it is currently insufficient. Aside from images suggesting the bull-roarers universally associated with father gods, no im-

ages comparable to the Paleolithic Venuses have been discovered.

The fatherhood of such archaic deities is often less specifically biological than creative, as reflected by the terms *Bawai* and *Apap*, applied respectively by the African Chawai and Teso, which convey the fatherhood of God relative to creation. In this sense the supreme being is a “father” whether or not he creates in the well-known *hieros gamos* of Mother Earth and Father Sky or through powers entirely his, as Baiami does.

By contrast, in many less archaic mythological and ritualized conceptions, divine fatherhood is unmistakably biological. Here the archaic mating of Mother Earth and Father Sky, originally an abstract description of creation, becomes far more concrete. The sovereign father is typically eclipsed by his son, as is the Greek Ouranos by Kronos, the Australian Baiami by Grogoragally, the Tiv Awondo by the Sun. Thus, one theme typically connected to divine fatherhood in most mythologies is the generational conflict of fathers and sons. As the archaic father god recedes, the son who replaces him, even as he himself achieves fatherhood, seldom attains the stature of his own progenitor. This is indicated by his characteristic shift from sky god variously to solar or weather god (as when the weather god Zeus replaces Kronos) or agricultural deity (as when the Babylonian Marduk, both a solar and a vegetation deity, eventually supplants the Sumerian great triad of sky gods Anu, Enlil, and Ea), all of which lack the majestic connotations universally ascribed to the sky.

Particularly in the Chalcolithic cultures of the Near East (e.g., Sumer, Babylonia), where worship of the Paleolithic goddess developed strongly into the historic period, this shift is apparent. Here earth as mother, rather than sky as father, typically symbolizes the supreme being, rendering fatherhood a less exalted concept. The god is father solely as fecundator, being more often lover than spouse. Such vegetation gods as Adonis, Tammuz, and their myriad counterparts function this way.

In marked contrast to this biological, often chthonic, fatherhood is the refinement of sky-oriented fatherhood apparent in the monotheistic religions—Judaism, Christianity, and Islam—and in dualistic Zoroastrianism, all of which developed out of patriarchal nomadic herding societies that retained more of the archaic religion than did their matrilineal agricultural counterparts. The biblical Yahveh, for example, is thought to have emerged from the celestial West Semitic deity known as Ya, Yami, or Yahu.

One of the attributes frequently credited to father-gods in almost all patriarchal cultures is that of giving birth: The biblical God creates life without aid from a female deity; Zeus produces Athena from his brow and gestates Dionysos in his thigh; the Scandinavian giant Ymir and the Aboriginal Australian Great Father, Kakora, both give birth from their armpits; and the Egyptian Khepri variously spits and masturbates to produce Shu and Tefnut, respectively.

In ritual, too, fathers often mimic the maternal role. Particularly among various Australian Aboriginal groups, initiation rites for boys, frequently reveal the fathers of a tribe functioning as male mothers, as they ritually mimic menstruation and “giving birth” to the young male initiates. Such sexual crossing over introduces into the concept of fatherhood several conflicting themes. Various, fatherhood is as self-contained as motherhood in its parthenogenetic form; or it projects a “maternal” nurturing quality far different from the remoteness of the archaic sky god; or sometimes it deemphasizes sexual differentiation by blurring, a theme explicit in fertility figures such as Marduk, whose sex changes. These are just some of the ways in which concepts of fatherhood and divine fathers have developed their complexity worldwide.

SIBLINGS. Symbolically, relationships between siblings are almost as central to religion and mythology as those between parents and children. This is partly because brothers and sisters are frequently also spouses, like Zeus and Hera, especially in creation myths, making the theme of incest a common universal mythologem. Almost universally, cross twins (those of opposite sex) are believed to have been the first humans from whom all others descend.

The first couple of the ancient Egyptian ennead were the twins Shu and Tefnut; the second were the brother and sister Geb and Nut, the father and mother of the Osirian gods. The Vedic twins Yama and Yami and the Norse Ask and Embla functioned similarly.

Some idea of the possible meanings of sibling “marriage,” whether of twins or not, is evident from the Japanese myth of Amaterasu Ōmikami, the Heaven-Illuminating Goddess, and her brother Susano-o no Mikoto, the Valiant-Swift-Impetuous Hero. The rule of the universe was divided between these two: The realm of light, including heaven and earth, was presided over wisely by the sun goddess, while the ocean and the domain of hidden things was ruled widely by her stormy brother. In consequence of her brother’s evil behavior, Amaterasu hid in a cave, plunging the entire world into darkness. When she emerged, light triumphed over dark, and her brother was banished to a remote region.

Most variants of this rivalry show the siblings as two brothers, often twins, as in the ancient Persian Zoroastrian myth of the twins Ōhrmazd (“light”) and Ahriman (“darkness”) or in the Iroquoian myth of Ioskeha, the creator and preserver, and Tawiskara, the deadly winter god. Unlike the Iroquoian pair, however, the Persian dyad, representing the principles of good and evil, respectively, set the stage for a dualistic system of thought in which both principles are equal.

Often sibling rivalry incorporates the theme of fratricide, as in the case of the Egyptian Seth who kills Osiris or the Greek brothers Ismenos and Kaanthos through whom fratricide was first introduced into the world. This common theme dramatizes the invidious distinction most cultures

make between elder brothers and all other children. An Australian creation myth about two brothers traveling together at the beginning of time vividly dramatizes this distinction. When the elder brother desires a wife, he operates on his sibling, making him into a woman. The younger brother-turned-wife simply continues in the subordinate position he had occupied all along, making clear the equivalent impotence of younger brothers and wives.

All these sibling tales ring changes on certain important familial themes. Battling twins represent identity altering into difference; fighting sisters and brothers depict familial opposition; cohabiting sisters and brothers embody familial unity; and battling brothers symbolize the struggle between equality and hierarchy, as brotherhood gives way to the rights of the elder brother, the patriarch-to-be.

SERVANTS. Of all the traditional family members, none so emphasizes the way family functions as both example and symbol of a hierarchical order as does the servant, the hired or enslaved person contributing to family life and economics in both agrarian and commercial settings. Particularly in its most extreme form, as slavery, servitude emphasizes the hierarchical nature of the traditional family. In ancient Hawaiian culture, for instance, one outcast social group, the *kauwa*, were designated to serve the chiefs and touch them directly. They alone were exempt from the *kapu* ("taboo") that prohibited touching the chiefs on pain of death. Yet these *kauwa* were themselves untouchable: It was not proper to eat with them or sleep close to them. At the death of their masters, they were buried alive, often as sacrificial atonement for *kapu* violations committed by others. While extreme, this example, like others involving Indian untouchable servants, American black slaves, and Middle Eastern eunuchs, clearly embodies the themes of scapegoating, sacrifice, and hierarchy common to families in general.

Certain religious traditions overtly take up the themes implicit in servitude, stressing them as positive rather than negative attributes, as in the cases of Hanuman, the perfect Hindu servant, and Christ, understood as fulfilling the promise of the servant poems of "Second Isaiah." Others simply portray servitude as an institution as natural to divinity as to humanity: In Japanese mythology, for example, the fox functions as the messenger of the god of harvests, Inari, much as Hermes serves the Greek Olympians. Among the Haida of the Northwest Coast, Old-Woman-under-the-Fire serves as messenger of the supernaturals, going between this world and that of the spirits. Servitude, exemplifying a humility appropriate to worshipers, characterizes many traditions; thus the Vedic Hindus feel like slaves in the presence of Varuṇa (*Rgveda* 1.25.1).

BIBLIOGRAPHY

Besides canonical scriptures, the most useful primary texts for students of the family are the ancient religio-legal codes devel-

oped by most literate cultures. Representative is the *Institutes of Hindu Law, or The Ordinances of Menu, according to the Gloss of Culluca; Comprising the Indian System of Duties, Religious and Civil*, translated from the original Sanskrit by William Jones (1794; 2d ed., London, 1876); the ordinances cover a wide range of family-related topics, including divorce, remarriage, status of wives, and the like. An excellent compendium of various issues of concern to contemporary students of family is the Spring 1977 issue of *Daedalus*, which ranges from articles on specific cultures to family policy issues in the United States to the study of the history of the family.

Of the hundreds of recent works on family studies, *Household and Family in Past Time*, edited by Peter Laslett with the assistance of Richard Wall (Cambridge, 1972), is most representative of the controversial demographic approach. In this work Laslett presents his provocative, ground-breaking argument that the nuclear family preceded the industrial revolution and hence was causative rather than resultant. Also representative of the new demographic scholarship on family is Michael Mitterauer and Reinhard Seider's *The European Family: Patriarchy to Partnership from the Middle Ages to the Present* (Chicago, 1977). For those who wish to pursue the historical aspects of family in depth, particularly by looking at small numbers of people in very precisely documented areas, the *Journal of Family History* (Worcester, Mass., 1796-) presents the most recent work.

Among numerous excellent sources of information on the mother goddess, two stand out for their lucidity: E. O. James's *The Cult of the Mother-Goddess: An Archaeological and Documentary Study* (New York, 1959) and Marija Gimbutas's *The Goddesses and Gods of Old Europe, 6500–3500 B.C.: Myths and Cult Images* (Berkeley, Calif., 1982). Somewhat more difficult to trace for lack of early material evidence and fewer books devoted exclusively to the subject is the concept of the father god. Helpful sources include E. O. James's *The Worship of the Sky-God: A Comparative Study in Semitic and Indo-European Religion* (London, 1963); Wilhelm Schmidt's *The Origin and Growth of Religion: Facts and Theories* (1931; New York, 1972), considered by many the *locus classicus* for its topic; and Mircea Eliade's *Patterns in Comparative Religion* (New York, 1958), in which see especially chapter 2, "The Sky and Sky Gods," and chapter 3, "The Sun and Sun-Worship." A helpful discussion of Kṛṣṇa as divine child appears in David Kinsley's *The Sword and the Flute: Kali and Kṛṣṇa, Dark Visions of the Terrible and the Sublime in Hindu Mythology* (Berkeley, 1975). Much useful information on siblings appears in Donald J. Ward's *The Divine Twins: An Indo-European Myth in Germanic Tradition* (Berkeley, Calif., 1968).

New Sources

The *Histoire de la famille*, edited by André Burguière, Christiane Klapisch-Zuber, Marin Segalen and Françoise Zonabend (Paris, 1986), is the basic work of reference. It contains historical chapters on Mediterranean antiquity, European Middle Ages and ancient Asia as well as anthropological surveys on family in today's Western and Eastern world. The three prefaces by an historian such as Georges Duby and two anthropologists such as Claude Lévi-Strauss and Jack Goody are very inspiring from the methodological point of view.

The well-organized bibliographies and the ample indexes are very helpful. Among the classics, N. D. Fustel de Coulanges, *La cité antique* (Paris, 1872) and Edward Westermarck, *A Short History of Marriage* (London, 1926) are still worth reading as well as various essays on society and religion by Talcott Parsons. Philip Ariès, *L'enfant et la vie familiale sous l'ancien régime* (Paris, 1960); J. L. Flandrin, *Familles. Parenté, maison, sexualité dans l'ancienne société* (Paris, 1976); and Lawrence Stone, *The Family, Sex and Marriage in England 1500–1800* (London, 1977) have been innovating historical studies. *The Development of the Family and Marriage in Europe* (Cambridge, U.K., 1983) and *The Oriental, the Ancient and the Primitive. Systems of Marriage and the Family in Pre-industrial Societies of Eurasia* (Cambridge, U.K., 1990) by Jack Goody are provoking comparative surveys of pre-modern family institutions throughout the world who challenge many traditional assumptions.

Günther Kehr, "Familie" in *Handbuch religionswissenschaftlicher Grundbegriffe*, vol. 2, edited by H. Cancik, B. Gladigow and M. Laubscher (Stuttgart, Germany, 1990), pp. 404–414 is one of the very few accounts of the relationship between family and religion, written from the perspective of social scientific studies. Marzio Barbagli, "Famiglia. 1. Sociologia," in *Enciclopedia delle scienze sociali*, vol. 3 (Rome, 1993), is particularly useful for his ample bibliography.

For religions (especially religions of the Book) in the contemporary situations of American families, see the site of the "Religion, Culture, and Family Project," directed by Don Browning at the University of Chicago Divinity School (<http://divinity.uchicago.edu/family/index.html>), which addresses marriage, sex, and family issues from a range of theological, historical, legal, biblical, and cultural perspectives.

KATHRYN ALLEN RABUZZI (1987)
Revised Bibliography

FAMILY, THE. The religious movement that calls itself "the Family" (though it has also been called the Children of God since its inception) began in the 1960s as the ministry of a particular family and the related musical evangelism called Teens for Christ. Positioning itself in radical opposition to the mainstream churches, which it scorned as worldly "churchianity," it rapidly recruited young adults from the 1960s counterculture and spread beyond its origins in the United States to establish communes around the world. Its visibility made it a target both for secularists aligned with the psychotherapy movement and for some conventional Christians who assumed its unusually high levels of member commitment were caused by brainwashing. Thus, members of the Family were the first victims of forcible "deprogramming," and over a period of years fully six hundred of the group's children were seized by authorities, inadvertently traumatized by their captivity, then returned after the legal basis for holding them proved spurious. The Family remains an intriguing challenge for scholars and social scientists, because it claims to be authentically Christian yet rejects the standard denominations' limits on erotic and spiritual communion, practicing a form of free love and professing to

communicate on a regular basis with Jesus and with deceased persons.

ORIGINS. David Brandt Berg, founder of the Family and variously called Moses David or Father David, was the grandson of John Lincoln Brandt, a leader in the Disciples of Christ, and the son of Virginia Brandt Berg, a radio evangelist and faith healer in the Christian and Missionary Alliance, part of the Holiness movement. After serving as a minister of the Christian and Missionary Alliance in Arizona, Father David worked for a decade in the Soul Clinic, a Pentecostal movement. A break with the Soul Clinic and a "Warning Prophecy" channeled by his mother at the end of 1967 delivered Berg and his family to Huntington Beach, near Los Angeles, where they encountered the hippie movement.

A cultural historian might say the Family was an amalgam of the Holiness movement and the hippie movement, both of which stressed intense, intimate spiritual experiences. However, this analysis may be too facile, because not all the new recruits could be described as hippies and much of the religious inspiration came from the personal experiences of Father David rather than merely reflecting his denominational background. For example, from its formative period in California, the Family has always been profoundly millenarian, yet Father David had no connections to Adventism, and his Holiness tradition was not millenarian. Possibly inspired by the quite different millenarian quality of the hippie movement and the revolutionary anarchism of the associated New Left, Father David studied the books of *Daniel* and *Revelation* to develop his own perspective on the imminence of the apocalypse.

Soon Father David's growing movement was staging colorful public protests, marching in red robes while pounding seven-foot staves on the ground in tempo with shouts of "Woe!" or arguing with ministers of conventional churches during their sermons. A few horrified parents sought the aid of Ted Patrick and other deprogrammers to rescue their sons and daughters from the group, thereby giving birth to the American anticult movement. In 1970 Father David flew to Israel for a temporary visit (his subsequent whereabouts were usually secret, but outside the United States), and his followers began moving first into Europe and then across Asia and Latin America. The highly committed membership living in communes and supporting themselves entirely through missionary work and donations reached ten thousand in 1983 and remained at about that level through the remainder of the twentieth century.

THE LAW OF LOVE. After a celibate period during its formation, the Family developed a theology that endorsed giving erotic satisfaction to other people and sharing sexual experiences beyond marriage with the consent of all parties. In 1969, in a tract called "Scriptural, Revolutionary Love-Making," Father David argued that the biblical *Song of Solomon* was sacred instruction for sexual intercourse. From other parts of the Bible (for example, *Matt.* 22:36–40; *Gal.* 5:14, 22–23; *Titus* 1:15) he derived the Law of Love: that

any harmless sexual act can be good if performed in God's love and with the agreement of those people involved. In 1974, while living in Tenerife in the Canary Islands, Father David developed a new method of witnessing for Jesus, called "flirty-fishing" or "Ffing," in which women of the group offered themselves sexually to selected nonmember men as samples of the Lord's love.

Over the next few years this practice spread to many, but by no means all, of the far-flung communes and became a significant part of the group's relationship with the surrounding world (in some geographic areas more than others) before being abandoned in 1987. Some former members claim they were sexually exploited during this period, but their testimonies are somewhat lacking in detail, and the central organization has generally had difficulty imposing policies on the highly dispersed local groups except through example and exhortation. Interviews by social scientists with women who had engaged in flirty-fishing reveal a variety of relationships with the men involved, and many of them seem to have been sincere supporters of the group. By one internal estimate, 200,000 men received flirty-fishing, but only a vanishingly small fraction became committed members afterward.

In the 1990s, strict rules were instituted to limit sexual contact outside the Family and, at times, even outside the particular communal group. Perhaps in compensation for these limitations, insiders were encouraged to share erotically beyond the married dyad. A questionnaire was administered to 1,025 members of the Family in 1997, based on items from the General Social Survey that had earlier been administered to a random sample of American adults. One battery of items inquired about various sexual relationships, including, "What about a married person having sexual relations with someone other than his or her husband or wife?" (Bainbridge, 2002, p. 125). Of American adults, 78 percent said this would always be wrong, compared with only 1 percent of members of the Family.

Ritual, in the conventional sense of the term, is almost completely absent in the Family, except for giving thanks at meals and occasional spontaneous communion experiences within a home (in spontaneous communion somebody will, on impulse, suggest passing a cup of wine with prayers). Ritual's function is taken by various forms of emotional sharing among members, including not only eroticism but also an extensive repertoire of member-created music, a vast internal literature provided by the central organization, and (since the death of Father David in 1994) a remarkable flood of explicit communications that members believe they receive directly from the supernatural.

SPIRITUAL COMMUNICATION. During the years he led the Family, Father David claimed to be in constant communication both with Jesus and with lesser spirit guides. The core leadership who lived with him accepted these claims and fully expected to receive his gift of prophecy after his passing. To their surprise, at first they had difficulty receiving mes-

sages from the spirit world, but prayer, experimentation, and patience eventually prevailed.

In general, established religious organizations discourage their membership from engaging in direct communication with the supernatural, reserving this function either for the priesthood or for ancient prophets of bygone days. The Family, however, encouraged all members to receive prophecies. The 1997 survey of members found that 95 percent "received prophecy, visions, or messages from the spirit world" (Bainbridge, 2002, p. 81). Interviews with members revealed that individuals mean a great variety of things by *prophecy*—all the way from literally seeing and hearing the voice of Jesus or a deceased relative to a vague intuitive sense of communion or guidance.

Members frequently write up the prophetic messages they receive and send them to the central organization, which is called World Services. It publishes selected examples within the group. Some of these messages ostensibly come from recently deceased loved ones, who report they are extremely happy in the afterlife, which grieving believers find quite comforting. Remarkably, other messages have been entire posthumous works of literature attributed to deceased authors of the past, including William Shakespeare, C. S. Lewis, and Sir Walter Scott.

THE END-TIME. The Family believes that the world has entered the end-time, and members frequently compare biblical passages with the latest news, identifying what may be signs and portents of the coming end. Although for a time they speculated about whether the antichrist might possibly establish his world government around 1985 or 1986, they have never confidently set a date, and they do not accept early Adventist traditions that it is possible to deduce the date through close analysis of the Bible. The group's image of the millennium and the paradise to follow is quite detailed, asserting, for example, that the holy city, New Jerusalem, will be a pyramid fifteen hundred miles along each edge. According to the beliefs of the group, all true members and others who sincerely accepted Jesus as their savior will be resurrected in spiritual bodies, enjoying all the pleasures of the flesh but suffering no sin.

For the first quarter century of its existence, the Family expected the consummation of the end-time at any moment. When members first began having children, they did not imagine the children would have the time to grow up. As the years passed, they began educating the children at home rather than enter schools operated by the detested "system." Second-generation adult respondents to the 1997 survey reported, on average, a total of ten years of home schooling but only one year of schooling outside the home, and 63 percent said they had never attended a non-Family school. This survey also revealed that only 3 percent of members have full-time jobs, other than their missionary work with the Family, and thus the overwhelming majority look toward the future not in terms of a secular career but in terms of saving souls in preparation for the end-time.

Over the years the Family has been able to maintain what sociologists call high tension with the surrounding sociocultural environment, living apart from the institutions of secular society and estranged from the conventional churches. It has done so by periodically launching revivals it calls revolutions and by refusing to compromise with the ambient culture. By placing high demands on membership, it sustains commitment but makes it difficult for people to join. The scholars and social scientists who have followed the Family over its history agree that it entered the twenty-first century facing some difficulty in keeping second-generation members as they enter adulthood and in preventing local schisms. The cultural milieu in which it was formed, California of the late 1960s, is long past, but comparable recruitment episodes may arise in one or more of the roughly ninety nations in which the Family's missionaries are seeking to save souls. Thus it is impossible to predict how much longer the Family will be able to sustain its revolutionary ministry.

There is no evidence that members of the Family consider that the continued existence of the sinful world contradicts their millenarian prophecies. Rather, the sin and misery of life on earth prove to them that each person must urgently accept Jesus. They note that the world does end for the thousands of people who die every day, and they stress that each person should not waste a single day further. In their worldwide ministry they tend to measure success in terms of the many people who kneel in prayer with them to let Jesus into their hearts, not in terms of recruits to Family membership. Social scientists have found the Family to be a veritable treasure trove of research challenges, and it will be interesting to see whether historians and theologians also benefit by studying this radical movement over the coming decades.

FANGSHI. The *fangshi* ("specialists in occult prescriptions"), also called "magicians" and "recipe masters," and later known as *daoshi* ("specialists in the Way") were important contributors to the development of religious Daoism. They were experimental philosophers and occult technicians who, in the course of their observations of nature and search for physical immortality, created a body of prescientific knowledge that formed the basis of Chinese medicine, pharmacology, chemistry, astrology, divination, and physiological alchemy. A major part of this knowledge was later incorporated into the Daoist religion.

The origin and precise meaning of the term *fangshi* are far from certain; but they may have developed from the *wu*, shamans or sorcerers who were involved in mediating between the human and spiritual realms from the earliest times in Chinese court and village life. By the second century BCE the term was used to refer to a group of practitioners of various esoteric arts who were generally outside the literati mainstream. These practitioners apparently maintained their own texts and lore and transmitted their knowledge from master to disciple, yet they have never been regarded as constituting a distinct philosophical school. This is perhaps due to the fact that, while early historians respected their arcane skills, they did not hold them in very high regard and only recorded events in which these abilities were used to strive for political power. The *fangshi* were most influential in China during a period of roughly six hundred years beginning in the third century BCE.

While in later times they came from various areas on the periphery of the empire, the *fangshi* were first associated with the coastal states of Qi and Yan (now Shantung), and it is here in about 330 BCE that we hear of them encouraging local rulers to set out to sea in search of the holy immortals (*xian*) who possessed the potions of immortality. Though their exact relationship to the Naturalist school first systematized by Zou Yan (340–270 BCE) remains unclear, we know that they took the ideas of this school as the philosophical basis for their observations of nature and their various experimental techniques. According to this Naturalist philosophy, all phenomena are infused by one of the Five Phases (*wuxing*) of Energy (*qi*), namely, Earth, Fire, Water, Wood, and Metal. Phenomena infused with the same phase of energy influence and resonate with one another, and these phases themselves spontaneously transform according to their own

inherent laws, and so influence all things from the succession of seasons to the succession of dynasties.

When the first emperor of China, Qin Shihuangdi, united the country in 221 BCE, *fangshi* from Qi and Yan flocked to his court. Their influence there is clearly attested to by the historical records. The emperor believed that he had come to power because the energetic phase of water had gained ascendancy in the world, and so he adopted water as the symbol of his reign. He also sent expeditions to search for Penglai, the Isle of the Immortals, and was himself devoted to the quest for immortality.

In the succeeding century and a half, the cult of immortality flourished, and its principal proponents, the *fangshi*, were influential among the ruling elite. Their power reached its zenith under Han Wudi (140–87 BCE), who appointed a number of them court officials when they promised to contact the immortals and to provide him with their secrets of avoiding death. On the advice of these specialists in occult prescriptions, the emperor undertook expeditions both to the eastern seacoast and to the sacred Kunlun mountains in the west in quest of these secrets. He also reinstated ancient sacrifices to the spirits, the most important of which were the *feng* and *shan* sacrifices on Mount Tai. According to the *fangshi*, the *feng* and *shan* sacrifices had last been performed by their patron and ancestor, the Yellow Emperor (Huangdi), who thereupon had achieved immortality. The ultimate failure of these endeavors was discouraging to Emperor Wu, and after his reign the influence of these esoteric masters declined considerably on a national scale.

On the local level, however, the *fangshi* were still powerful at the courts of a number of vassal states. The most notable was the state of Huainan, whose ruler, Liu An, was sponsor and editor of the important philosophical compendium the *Huainanzi*. Liu An died in 122 BCE after his presumed rebellion was discovered by imperial authorities, but according to legend, the *fangshi* gave him and his family a potion of immortality and they all ascended to heaven to live forever. It is interesting to note that rulers of several other vassal states in which the specialists in occult prescriptions were influential during the next two centuries also plotted (unsuccessful) rebellions and that a number of them were associated with Wang Mang, who seized the reins of the empire for fifteen years early in the first century CE.

The surviving records show the *fangshi* to have been involved in a wide range of experiments aimed at lengthening life and avoiding death. Their experimentation with transmuting cinnabar to mercury and gold in the search for the potion of eternal life is regarded as the origin of Chinese alchemy and chemistry. Their creation of various plant and animal compounds for health and longevity is the basis of the long Chinese pharmacological and medical traditions. Their respiratory and gymnastic techniques, methods of dietary hygiene, and various “bedroom arts” are among the earliest examples of physiological alchemy. The *fangshi* were also adept at shamanistic trance and at contacting and influencing spir-

its and demons. Mantic practices were also an important aspect of their tradition. Some of the large cache of medical and divinatory texts excavated at Mawang dui in 1973 are likely representative of *fangshi* writings.

Ultimately a large part of the knowledge and practices of the *fangshi* found their way into the Daoist religion. Their occult practices and philosophies included breath cultivation and a cosmology of the Dao that are also the hallmarks of the famous foundational works of the Daoist religion, *Laozi* and *Zhuang Zi*, as well as some lesser known texts such as “Inward Training” (*Nei-yeh*), a fourth century BCE poetic work included in the *Guan Zi* that contains the oldest extant Chinese discussion of meditation and its results. The *fangshi* maintained their own independent learning centers throughout the Han dynasty and their lore and practices formed the foundations of the organized Daoist religion that coalesced around a few charismatic *fangshi* leaders between 140 and 184 CE. The oldest source of religious Daoism, the *Taiping jing*, is said to have been authored by *fangshi* and was presented to the imperial court by one in 140 CE. They also wrote a collection of now lost subaltern commentaries on the Confucian classics, the *Zhanwei* (“Wei Apochrypha”) that were also transmitted outside government sanctioned circles. Because the rise of Daoism as a religious and political force during the second century CE took place largely outside the purview of the official historians who are our main sources, the precise role of the *fangshi* in the beginnings of the Daoist religion is difficult to clarify. However scholars have been able to identify textual influences between Han dynasty *fangshi* works and the later Shang qing (“Highest Clarity”) and Lingbao (“Numinous Treasure”) Schools of Religious Daoism.

BIBLIOGRAPHY

There are three Western-language sources devoted exclusively to the *fangshi*. Ngo Van Xuyet's *Divination, magie et politique dans la Chine ancienne* (Paris, 1976) contains an accurate translation of all the *fangshi* biographies in the *History of the Latter Han (Hou Han shu)* as well as excellent supporting material including a detailed discussion of the historical context of the biographies and appendices on the various esoteric techniques of the *fangshi*. Kenneth J. DeWoskin has published one article and one book on the *fangshi*. “A Source Guide to the Lives and Techniques of Han and Six Dynasties *Fangshi*,” *Society for the Study of Chinese Religion Bulletin* 9 (1981): 79–105, is a valuable list of biographical sources and makes an important attempt to define the *fangshi* and delineate their activities. Many of the biographies listed in this article, and all of those translated in Ngo's work, are translated by DeWoskin in *Doctors, Diviners, and Magicians of Ancient China: Biographies of Fangshi* (New York, 1983), which also contains a useful introduction. This work is the most comprehensive to date in the West but unfortunately fails to deal with the very thorny problem of the role of the *fangshi* in the rise of the Daoist religion.

Information on the *fangshi* can be found in a number of other works, the most valuable of which is Yu Yingshi's “Life and

Immortality in the Mind of Han China,” *Harvard Journal of Asiatic Studies* 25 (1964–1965): 80–122. Anna K. Seidel’s superb study *La divinisation de Lao-tseu dans le daoïsme des Han* (Paris, 1969) contains some useful information on the *fangshi* and their relationship to the Yellow Emperor and to the Huang-Lao Daoists. The activities of the *fangshi* under Qin Shihuangdi and Emperor Wu of the Han can be found in Burton Watson’s translation of Ssu-ma Qien’s *Shih chi, Records of the Grand Historian of China*, vol. 2 (New York, 1963), pp. 13–69. There are also scattered references to the *fangshi* in Joseph Needham’s *Science and Civilization in China* (Cambridge, U.K., 1956–1976), especially volume 2, which contains an excellent discussion of the school of Naturalists, and volume 5, part 3, which discusses alchemy. Finally there is a detailed discussion of the practices and texts of the *fangshi* along with a meticulous translation of medical writings that likely derived from them in Donald Harper, *Early Chinese Medical Literature: The Mawangdui Medical Manuscripts* (London, 1998).

There are now several excellent sources for the relationship between the *fangshi* and the organized Daoist religion. Solid overviews can be found in two general histories of Daoism, Isabelle Robinet’s *Daoism: Growth of a Religion* (Stanford, 1997) and Livia Kohn’s *Daoism and Chinese Culture* (Boston, 2001). Toshiaki Yamada’s “Longevity Techniques and the Compilation of the *Lingbao wufuxu*” in Kohn’s edited collection *Daoist Meditation and Longevity Techniques* (Ann Arbor, 1989), pp. 99–123, is a superb textual study of the links between this religious Daoist work and the *fangshi*. There are also a number of notable articles in the masterful *Handbook of Daoism* edited by Kohn (Leiden, 2000): Robinet’s “Shangqing–Highest Clarity,” pp. 196–224, an overview of this important Daoist school in which she traces its roots back to the Han dynasty *fangshi*; Yamada’s “The Lingbao School,” pp. 225–255, which demonstrates the influence of the *fangshi* on the development of this second major school of religious Daoism; Fabrizio Pregadio’s “Elixirs and Alchemy,” pp. 165–195, which argues that the roots of inner and outer alchemy can be found in *fangshi* practices and texts; and Mark Csikszentmihalyi’s “Han Cosmology and Mantic Practices,” pp. 53–73, an analysis of the divination practices and texts of the Han dynasty *fangshi* and how they were transmitted. Finally, for a discussion of early Daoist meditation and its origins, see Harold D. Roth, *Original Dao: Inward Training and the Foundations of Daoist Mysticism* (New York, 1999).

HAROLD D. ROTH (1987 AND 2005)

FĀRĀBĪ, AL-. Abū Naṣr Muḥammad ibn Muḥammad ibn Tarkhān ibn Awzalagh al-Fārābī (258–339? AH/870–950? CE) was a Hellenized Muslim-Arabic philosopher (*ḥaylasūfī*), known in the Islamic tradition as the “Second Teacher” (second to Aristotle); in Latin, al-Fārābī was called Avennasar or Alfarabius. His Arabic biographers called him the first great logician; modern scholars have declared him the chief political philosopher of Islam and the founder of Islamic Neoplatonism. More than one hundred works are attributed to him, not all of which have survived.

While the details of his life are unclear, with the historical accuracy of many later biographical accounts suspect, the following reconstruction has a reasonable degree of certainty. Al-Fārābī was of Turkish origin, born in Fārāb in Transoxiana; he studied logic in Abbasid Baghdad under Nestorian Christian scholars Yuḥannā ibn Ḥaylān (d. 910) and the prominent translator of Aristotle into Arabic, Abū Bishr Mattā (d. 940); his most famous student, too, was a Christian, the Jacobite Yaḥyā ibn ‘Adī (d. 974), another important translator and logician. After having crossed the age of seventy, he left for Syria and attached himself to the court of the Shī‘ī ruler, the Hamdanid Sayf al-Dawla; his writings do show some Shī‘ī leanings. After having traveled to Aleppo and Egypt, he finally returned to Damascus, where he died.

There seem to be good reasons why al-Fārābī enjoyed the prestigious stature of the “Second Teacher” after Aristotle, for in the history of Hellenized philosophy in Islam, he is the first system-builder and one with a heightened sense of curricular organization and rigor. Thus the various elements of his philosophical discourses constitute a coherent body of thought in which every identifiable proper part seems to be related to every other. This monumental synthesis was carried out in an Aristotelian manner but supplemented, modified, and controlled by a peculiar brand of Platonism, Neoplatonism, and Islamism. One of his celebrated works, *Iḥsā’ al-‘Ulūm* (Enumeration of the sciences), that was also known to medieval Europe in its Latin translation, contains a comprehensive didactic account of the hierarchical relationship he saw between different kinds of sciences—rational, linguistic, theological, and juridical—and their subdivisions, establishing the precise order in which they should be studied.

It is a testimony to the integrative power of al-Fārābī’s system that in his works different branches of philosophy begin to display inherent interconnections that are both unexpected and, to a good degree, original in their construction. For example, his theory of prophecy, revelation, and religion is inextricably linked to and makes sense only in the fuller context of his logic and philosophy of language on the one hand, and epistemology and metaphysics on the other, and all of this is related to his psychology and philosophy of mind. But then, quite unexpectedly, his discourses on metaphysics are largely to be found not in isolated treatises on this subject, but in his political writings, in particular *al-Madīna al-Fāḍila* (The virtuous city) and *al-Siyāsa al-Madaniyya* (Civil polity). Likewise, he hardly dedicates separated treatises to psychology and philosophy of mind; his discussions on these disciplines are again to be found in his political works. Does it mean that political writings form the core of al-Fārābī’s system? The answer to this question cannot be straightforward.

The complexity arises because al-Fārābī’s system has multiple cores at once, each core having been worked with equally uncompromising forensic diligence. Logic forms one of these cores, where he surpassed Syriac logicians by going

beyond the traditionally limited number of Aristotle's specific logical works they read and commented upon, and pioneering the study of the entire range of Aristotle's logical treatises, a corpus known as the *Organon*, as well as *Rhetorics* and *Poetics*. This is a major event in the history of philosophy. Apart from his epitomes of and commentaries on Aristotle's individual logical texts, al-Fārābī also wrote his own *Kitāb al-Hurūf* (Book of letters) and *Kitāb al-Alfāz al-Musta'mala fi'l-Mantiq* (Book of utterances employed in logic), both of which concern logic and its relationship with language. Given this, these two books can also be considered discourses in linguistic philosophy. Here it would seem that al-Fārābī is trying to reduce all else in his philosophical universe to logical-linguistic problems. And it is this reductionism that makes logic one of the core components of his system.

But on both historical and philosophical grounds, al-Fārābī's discourses on prophecy and religion can legitimately be considered yet another core of his system. For if all true philosophers bear the onus of communicating their philosophy to the masses, as al-Fārābī believes, following Plato; and if attainment of happiness through the establishment of a just civil society is the very aim of philosophy, and—speaking metaphysically and psychology as he does in his *Tahsīl al-Sa'āda* (Attainment of happiness)—human happiness ultimately consists in the soul's assimilation with the "agent intellect" (*al-'aql al-fā' al*), being the supreme and the last in the hierarchy of four intellects that he posits in a Neoplatonic vein; then by virtue of his own doctrine, the ideal philosopher and the true prophet receiving revelation become practically identical. Indeed in the *Tahsīl* al-Fārābī does argue for the real and conceptual identity of the philosopher and the lawgiver (that is, the prophet), and so writing about philosophy and reason—which was al-Fārābī's fundamental trade—was effectively writing about prophecy and religion.

While neither consistent nor neat on this issue, al-Fārābī says repeatedly that true prophet is an ideal philosopher—for true prophecy, like the religion that it generates, is the symbolization and imitation of those very truths that are known demonstratively and discursively to the philosopher. This symbolization of philosophical truths is accomplished by the prophet through his supremely keen imaginative faculty that has *muḥākāh* (mimesis) as one of its functions. By means of *muḥākāh*, the prophet is able to represent objects with the images of other objects and to depict even immaterial realities. In this way philosophical truths, imaginatively symbolized, are communicated to the members of the general public who thereby receive abstract intelligibles from the prophet in a concrete form that they are able to grasp non-philosophically.

Historically too, al-Fārābī's concern with prophecy and religion can be considered a core of his system, with every other element of his thought appearing to be anchored in this concern and reduced to it. For it would seem that he was en-

gaged fundamentally in addressing what happened to be a historical contingency—namely, Islam's encounter with Hellenism. The phenomenon of Islamic religion had become too massive to be ignored by him; he took it seriously and took it upon himself to give it an all-embracing philosophical respectability, while at the same time creating a niche for Hellenistic rational philosophy in an Arabic-Islamic milieu. Indeed, it is al-Fārābī who established the classical tradition of Arabic philosophers' attitude to revelation. It has been observed that his interest in types of rationality, modes of discourse, hierarchy of intellects, imagination, poetics, and the relations between ordinary and philosophical language all reflect that very core concern with revelation.

And yet it is possible to identify many other cores in al-Fārābī's philosophical world, and this only shows the richness, range, intricacy, and coherence of the system he built and the intellectual control that guided this grand task.

BIBLIOGRAPHY

Though highly simplified, Majid Fakhry's monograph, *Al-Fārābī, Founder of Islamic Neoplatonism* (Oxford, 2002), is a good single-volume introduction to different aspects of the philosopher's system. It also has a useful updated bibliography which lists all modern editions of al-Fārābī's texts as well as translations of his texts into modern European languages; also specified are Arabic sources and a selection of secondary works. Ian Netton's *Al-Fārābī and His School* (London, 1992) is a crisply written general work which clarifies many hitherto obscure areas of al-Fārābī's thought.

For al-Fārābī's contributions to the formal aspects of logic, F. W. Zimmerman's introduction in his translations of *Al-Fārābī's Commentary and Short Treatise on Aristotle's De Interpretatione* (London, 1981) is still the most rigorous piece of work in this field, learned and reliable. Readers with specialized interests should also look at the studies of Charles Butterworth, D. M. Dunlop, and Muhsin Mahdi. But for the non-expert, Deborah Black's chapter on al-Fārābī in *Routledge History of Islamic Philosophy*, edited by Seyyed H. Nasr and Oliver Leaman (London, 1996) is another readable, solid, brief but comprehensive survey.

S. NOMANUL HAQ (2005)

FAREL, GUILLAUME (1489–1565), was an early Protestant reformer of western Switzerland. Born in Gap in the Alps of southeastern France of a poor but noble family, Farel studied in Paris and there came under the influence of the Christian humanist Jacques Lefèvre. Through Lefèvre, Farel was introduced to Paul's epistles and to the doctrine of justification by faith alone. Lefèvre and his students left Paris for Meaux, where they had the support of Bishop Briçonnet, a mild reformer and also a student of Lefèvre, and of Marguerite of Navarre. Farel and others were authorized to preach in the surrounding territory. Neither Briçonnet nor Lefèvre saw a need to renounce Catholicism, and Farel's ideas and preaching were soon forbidden as too radical.

After leaving Meaux, Farel became acquainted with most of the leading reformers. In 1526 he settled in Aigle under the control of Bern, taking part in that city's religious reformation, and in 1529 he introduced the Reformation to Neuchâtel. In 1532 he visited the Waldensians and was present at the synod when they adopted the principles of the Protestant Reformation and began their alignment with Reformed Protestantism.

Farel's most significant work for the future of Protestantism took place in Geneva, which he first visited in 1532. Opposition to the Reformation was strong, but Farel persisted under the protection of Bern. Geneva came to a full acceptance of the Reformation on Sunday, May 21, 1536.

Expelled, along with Calvin, in 1538 from Geneva, Farel returned to Neuchâtel and devoted the last twenty-seven years of his life to building up this church. He continued his preaching missions in neighboring territories almost to the time of his death in 1565. It remained for Calvin, whom Farel had compelled to serve the Reformation in Geneva, to make that city the center of Reformed Protestantism.

Farel's primary contribution was that of a preacher and advocate of the Reformation. He was an intense man of passionate conviction and a powerful preacher who commanded the attention of audiences and elicited opposition as well as conviction. He is best known for his work in Geneva and the support he gave to Calvin until the latter's death. As a writer, he left 350 to 400 letters that, together with those of other reformers, played an important part in the Reformation. He was also the author of various polemical and practical tracts. His liturgy, "The Manner Observed in Preaching When the People Are Assembled to Hear the Word of God," was, according to Bard Thompson in his *Liturgies of the Western Church*, the "first manual of evangelical worship in the French language." Farel's best and most important work was *Sommaire: C'est une brieve declaration d'aucuns lieux fort nécessaires a un chacun chrestien pour mettre sa confiance en Dieu et a ayder son prochain*, the first summary of the evangelical faith in the French language. It was published in six editions during Farel's lifetime; the last was corrected and completed in conformity with Calvinist theology.

BIBLIOGRAPHY

Guillaume Farel, 1489–1565: Biographie nouvelle écrite d'après les documents originaux (Paris, 1930) is an outstanding volume published by a committee of Farel scholars with many collaborators. Two English translations of lives of Farel by nineteenth-century biographers are available: Melchior Kirchofer's *The Life of William Farel, the Swiss Reformer* (London, 1837) and Frances A. Bevan's *William Farel*, 5th ed. (London, 1880). An extended account of Farel's work can be found in Philip Schaff's *History of the Christian Church*, vol. 7, *Modern Christianity: The German Reformation and the Swiss Reformation* (1910; reprint, Grand Rapids, Mich., 1974) and in Williston Walker's biography, *John Calvin: The*

Organizer of Reformed Calvinism, 1509–1564 (1906; reprint, New York, 1969).

JOHN H. LEITH (1987)

FASTI (from *fasti dies*, "the divinely authorized days") were the calendars of the ancient Romans. They are the only known form of a graphical representation of all days of the year from the ancient Mediterranean world. By usually displaying twelve columns of the days of the single months, the *fasti* offered the standard pattern for Christian calendars from late antiquity and ultimately for all representations of the Julian and Gregorian calendars. The listing of the days was organized by the recurring letters A to H (for a continuous week of eight days) at the beginning of every entry. The main information concerned the juridical character of the day, especially indicating whether it was *fas* (right) to open processes in front of the Roman praetor or not (*nefas*). The terminologically divine sanction had other consequences, too: The *comitia*, the Roman legislative body of the people, could not meet on *dies nefasti*; and, probably at the beginning of the third century BCE, a special class of *dies comitiales* that could not be used for the opening of legal cases but could be used for the holding of assemblies was established.

The distribution of days in the known late republican calendars was obviously the outcome of different political and juridical practices; at least from the second century BCE onwards the regulation as a whole was attributed to the codifications of the mid-fifth century (Twelve tables). Religious traditions, too, were integrated: *feriae*, a special class of days given to the gods as property (and hence free from every mundane activity) were marked in a particular way; that is, as *dies nefasti* whose violation made piacular sacrifices necessary (marked by the letters *NP* and abbreviations of the festival names). Obviously, the featuring of this type of religious information helped to enhance the legitimacy of the rigid systematization of temporal rules when published from within the college of the pontiffs (*pontifices*, priests), who formed an important body for the development of legal ruling and procedural guidelines during the early and middle republic. An important tradition attributed the publication to Gnaeus Flavius, probably aedile in 304 BCE and scribe of the pontifical college.

Scholars of Roman religion took a particular interest in the list of the *feriae* as transmitted by early imperial *fasti*, and they postulated a regal "calendar of Numa" as its ultimate source (Theodor Mommsen, 1817–1903). Hence, the *fasti* gained the status of the single most important source for early Roman history (Georg Wissowa, 1859–1931). Yet, even if the list contained some very old traditions, it is not possible to read it as a coherent archaic system. A large number of festivals for Mars and the dedications of the former festivals of the full moon, the (*e*)*idus*, point to a complex history.

The legal and political institutions regulated by the *fasti* gradually fell into disuse under the Empire. Two developments, however, gave them high importance as a visual medium. Within the growing interest in a systematic reconstruction of Rome's past during the third and second centuries BCE, the *fasti* were discovered as a medium for a display of historical achievements. When shortly after 179 BCE Marcus Fulvius Nobilior, assisted by the poet Ennius, dedicated a painted calendar to the temple of Hercules and the Muses, the temporal pattern of the year was used to add the dates of the dedications of other temples, usually events caused and financed by successful warfare. Days of iterated disaster, too, could be memorized, thereby rendering the year into a temporal "mnemotope." Additionally, a list of the highest Roman magistrates, including the consuls used in dating ("eponyms"), was added. This practice was frequently imitated, hence the term *fasti* was used for many lists of magistrates. Not infrequently, such lists could be enlarged to short chronicles by the addition of important dated events (e.g., the *Fasti Ostienses*). Whereas the text of the calendar—even if displayed in middle Italian townships—is cautiously restricted to events in the city of Rome, the lists could present (or add) local magistrates and connect local history with the history of the hegemonial city of Rome.

The dictatorship of Caesar, his divinization, and the religious restoration under Augustus witnessed a second development. A new class of *feriae* was born: festivals celebrating imperial victories and dynastic events. Without clear assignation of a divine owner, these days were given the status of *feriae* and meticulously documented in the *fasti*. Suddenly the ordinary medium of temporal coordination, the calendar (recently reformed by C. Iulius Caesar), was an indicator of recent political developments. Within a few years, the fashion of producing calendars in the form of large (and expensive) marble inscriptions spread over Rome and the center of Italy, even reaching to Taormina (Sicily), an area practicing an alternative form of lunar time-reckoning. The earliest known (and fragmentarily transmitted) marble calendar stems from the grove of Dea Dia, the sanctuary of the priest-hoods of the Arval Brethren, reorganized by Octavianus/Augustus around 30 BCE and in particular dedicated to the cult and welfare of Roman emperors. Soon copies were to be found on public places or in the assembly halls of voluntary associations. Probably without larger practical usage (papyrus calendars must have been widespread), such inscriptions demonstrated loyalty to the emperor and his political as well as religious program.

The new interest in the calendar was not restricted to stonemasons. Parallel to the spread of inscribed *fasti*, commentaries on the *fasti* were written. The antiquarian interest of late republican writers like Marcus Terentius Varro (116–27 BCE) in the institution of the Roman year was intensified. Varro, who pursued the initial stage of a political career, entertained vast historical interest, paying particular attention to the history of language and literature. Although philo-

sophical originality is denied to his eclecticism, even his main antiquarian work, the *Antiquitates rerum humanarum et divinarum*, is controlled by an academic-skeptical outlook. Human society (as the title indicates) precedes its religious institutions, and festivals, like the notion of specific gods and their worship, arise under specific and partly reconstructable historical circumstances. These premises are reflected in Varro's etymological dealing with the calendar in his *De lingua Latina* 6.

It is noteworthy that the versified commentary of Publius Ovidius Naso (43 BCE–17 CE) explicitly declared the same interest that could be detected in the temporal pattern of the spread of inscriptional *fasti*. The emperor is shown as an inseparable part of Roman history and religion; his (extra-constitutional) power is naturalized by his integration into the cosmic scheme of the rising and setting of stars that is part of Ovid's poetic project and easily linked to the traditional calendar by the Julian reform. At the same time, the calendrical scheme offers a convenient pattern for a description of Roman ritual, of those festivals and temples that form the visible part of Roman religion. From Varro's *Antiquitates rerum humanarum et divinarum* and Verrius Flaccus's lexicon on the "meaning of words" down to Macrobius's fifth-century *Saturnalia* dialogue, this pattern remained attractive for the historical or nostalgic description of contemporary or past religion. Ovid himself, who finally ended up in exile, stresses the contemporary commemorative and entertaining functioning of urban festivals. Augustus, to whom the first edition (in 4 CE or shortly before) was dedicated, gets his due share of attention and praise. Yet, Ovid deliberately stops his poem by the end of June—that is, before dealing with the dynastically named and festival-laden months of Iulius and Augustus. It is rather in the epic *Metamorphoses* (fifteen books), published a few years later, that Ovid gives a teleological account of universal and Roman history leading down to Caesar's divinization.

Even if the fashion of epigraphic *fasti* was restricted to the early Principate, the graphical form of the *fasti* remained attractive for wall paintings, as well as for luxury book calendars. The Chronograph of 354 CE forms an ensemble of lists and chronicles around the kernel of contemporary *fasti*, still featuring the pagan festivals and dynastic anniversaries of the mid-fourth century. At the same time, processes that de facto and de jure replaced traditional holidays by attributing the characteristics of *feriae* to Christian festivals continued and renewed the *fasti*. The Jewish-Christian week of seven days, already marked in a calendar of Augustan times as the astrological week of the seven planets, replaced the Roman nundinal week of eight days by the second half of the fourth century. Even if it was difficult to graphically insert the complex determination of the festival of Easter into a calendar intended to be in use for a couple of years, the "birthdays" (*dies natales*) of martyrs and other saints, commemorated on the fixed days of the Julian calendar by the Western church, could easily slip into the graphical (and mental) pattern of the Roman calendar.

JOHN SCHEID (1987)

JÖRG RÜPKE (2005)

Translated from French by Matthew J. O'Connell

FASTING, that is, complete or partial abstinence from nourishment, is an almost universal phenomenon within both Eastern and Western cultures. Although fasting has been and continues to be subscribed to for a variety of reasons, the present article deals with it as a phenomenon evoked for religious reasons, that is, by ideals or beliefs that consider it a necessary or advantageous practice leading to the initiation or maintenance of contact with divinity, or some supranatural or transcendent being.

Although the origins of fasting as a moral or religious discipline are obscure, the custom or practice of fasting is attested in many ancient cultures. The fact that it was in some cultures connected with rites of mourning has led some scholars to equate its origins with the custom whereby friends and relatives leave with the dead the food and drink that they (the living) would normally consume, so that the deceased might have nourishment in an afterlife.

Others consider fasting in earlier cultures to have arisen as a result of the discovery that it could induce a state of sus-

ceptibility to visions and dreams and hence give the practitioner direct access to a spiritual world. As such it became for some a discipline creating the proper state necessary for some degree of participation in divinity. It gradually became an integral part of a purity ritual with definite religious intent. In some of the more archaic religions fasting became part of the discipline ensuring both a defense against taboo powers and a means of obtaining *mana*, or sacred power.

Within certain Greco-Roman philosophical schools and religious fellowships (e.g., the Pythagorean), fasting, as one aspect of asceticism, was closely aligned to the belief that humanity had originally experienced a primordial state of perfection that was forfeited by a transgression. Through various ascetic practices such as fasting, poverty, and so forth, the individual could be restored to a state where communication and union with the divine was again made possible. Hence, in various religious traditions a return to a primordial state of innocence or bliss triggered a number of ascetical practices deemed necessary or advantageous in bringing about such return. For such groups the basic underlying assumption was that fasting was in some way conducive to initiating or maintaining contact with some divine power or powers. In some religious groups (for example, Judaism, Christianity, and Islam) fasting gradually became a standard way of expressing devotion and worship to a specific divine being.

Although it is difficult to pinpoint a specific rationale or motivation for an individual's or a group's fasting, in most cultures that ascribe to it at least three motivations are easily discernible: (1) preliminary to or preparatory for an important event or time in an individual's or a people's life; (2) as an act of penitence or purification; or (3) as an act of supplication.

PREPARATORY FASTING. In addition to the basic underlying assumption that fasting is an essential preparation for divine revelation or for some type of communing with the spiritual (what is above or beyond the natural for humans), many cultures believe that fasting is a prelude to important times in a person's life. It purifies or prepares the person (or group) for greater receptivity in communion with the spiritual. In the Greco-Roman mystery religions, for example, fasting was deemed an aid to enlightenment by a deity, and an initiate into most of these religions had to abstain from all or certain specified foods and drink in order to receive knowledge of the mysteries of the specific religion.

Within some of the mystery cults, fasting was incorporated as part of the ritual preparation for the incubation sleep that, by means of dreams, was to provide answers to specific questions and needs of the person. Dreams and visions were viewed as media through which spiritual or divine revelations were made manifest. Philostratus (c. 170–c. 245 CE), for example, presents the view that since the soul was influenced by diet, only by frugal living and the avoidance of meat and drink could the soul receive unconfused dreams (*Life of Apollonius* 2.37). Both Greek philosophers (e.g., Pythagoreans and Neoplatonists) and Hebrew prophets believed that fast-

ing could produce trancelike states through which revelations would occur. Plutarch narrates how the priests of ancient Egypt abstained from meat and wine in order to receive and interpret divine revelations (*Isis and Osiris* 5–6), and Iamblichus tells how the prophetess fasted three days prior to giving an oracle (*Egyptian Mysteries* 3.7).

Among the Eastern traditions Hindu and Jain ascetics fasted while on pilgrimage and in preparation for certain festivals. Within classical Chinese religious practice, *chai*, or ritual fasting, preceded the time of sacrifices. By contrast, later Chinese religious thought, particularly Daoism, taught that “fasting of the heart” (*xinzhai*), rather than bodily fasting, was more beneficial to arriving at “the Way” (*dao*). Confucianism followed the practice of Confucius in approving fasting as preparation for those times set aside for worship of ancestral spirits. Although the Buddha taught moderation rather than excessive fasting, many Buddhist monks and nuns adhered to the custom of eating only one meal per day, in the forenoon, and they were obliged to fast on days of new and full moon. Among modern-day Buddhists it is more common to fast and confess one’s sins four times per month.

Within the Judaic tradition only one day of fasting was imposed by Mosaic law, Yom Kippur, the Day of Atonement (*Lv.* 16:29–34), but four additional days were added after the Babylonian exile (*Zec.* 8:19) to commemorate days on which disasters had occurred. The Hebrew scriptures set fasting within the context of being vigilant in the service of Yahveh (e.g., *Lv.* 16:29ff.; *Jgs.* 20:26), and it was considered important as a preliminary to prophecy (e.g., Moses fasted forty days on Sinai; Elijah fasted forty days as he journeyed to Horeb). Judaism allowed for individual voluntary fasts, and there is evidence that Mondays and Thursdays were set aside by some Jewish communities as special days of fasting. According to Tacitus, fasting had become so characteristic of the Jews of the first century that Augustus could boast that he fasted more seriously than a Jew (*Histories* 5.4).

Although formalized fasting was spoken against in the New Testament (*Mt.* 6:16–6:18), it eventually became the favorite ascetic practice of the desert dwellers and monastic men and women who saw it as a necessary measure to free the soul from worldly attachments and desires. Within the Christian tradition there gradually developed seasonal fasts such as the Lenten one of forty days preparatory to Easter; Rogation Days in spring in supplication for good crops; and Ember Days, days of prayer and fasting during each of the four seasons of the year. There were also weekly fasts on Wednesdays and Fridays and fasts prior to solemn occasions celebrating important moments in people’s lives (e.g., baptism, ordination to priesthood, admission to knighthood, and reception of the Eucharist).

In the Islamic tradition Muslims continue to observe the ninth month, Ramaḍān, as one of rigorous fasting (*ṣawm*), during which days no liquid or food is allowed between dawn and sunset, as stipulated in the Qurʾān (2:180ff.). Some of the stricter Muslim groups fast each

Monday and Thursday, and the Qurʾān recommends fasting as a penance during a pilgrimage, three days going and seven returning (2:193). Ṣūfīs recommend additional fasting for the purpose of communing with the divine, and the Shīʿī Muslims require fasting as one of the ways of commemorating the martyrdom of ʿAlī, the son-in-law of the Prophet, and his two sons.

Basic to the beliefs of many Native American tribes was the view that fasting was efficacious for receiving guidance from the Great Spirit. Generally, a brave was sent off into the wilderness on a fast in quest of such guidance, which was usually revealed through a personal vision. The young man’s vision was often viewed as necessary for his future success in life, indicating a personal relationship between himself and his guardian spirit. Lakota braves, for example, were advised in their search for a vision of Wakantanka, the supreme being, to “walk in remote places, crying to Wakantanka, and neither eat nor drink for four days.” Within many of the tribes there was a period of ritual fasting prior to a boy’s reaching puberty and a girl’s first menstrual period, considered times of growth into adulthood. In New South Wales, Australia, boys had to fast for two days at their *bora* ceremonies. In the Aztec culture the ritual training required of one who aspired to become a sacrificing priest included fasting as one form of abstinence. While fasting was often viewed as a disciplinary measure that would strengthen the body and character of the individual, prolonged fasting and other austerities were also undergone so that the individual might see or hear the guardian spirit who would remain with him or her for life.

FASTING AS PENANCE OR PURIFICATION. Ancient Egyptian and Babylonian customs included ritualized fasting as a form of penance that accompanied other expressions of sorrow for wrongdoing. Like people of later times, these nations viewed fasting as meritorious in atoning for faults and sins and thus turning away the wrath of the gods. In the *Book of Jonah*, for example, the Assyrians are depicted as covered with sackcloth, weeping, fasting, and praying to God for forgiveness (*Jon.* 3:5ff.).

For the Jews, fasting was an outward expression of inner penitence, and on various occasions a general fast was proclaimed as a public recognition of the sin of the people (*1 Sm.* 14:24, *1 Kgs.* 21:9, *Jer.* 36:9). Yom Kippur, the Day of Atonement, is such a day of fasting and praying for forgiveness of sins. But fasting is also viewed as a means of orienting the human spirit to something or someone greater. According to Philo Judaeus (25 BCE–50 CE), the Therapeutae, a group of Jewish contemplatives living in community, fasted as a means of purifying the spirit so that it could turn itself to more spiritual activities such as reading and study (*On the Contemplative Life*). The Essenes, a Jewish group who followed their “righteous teacher” into the wilderness at Qumran (c. 135 BCE–70 CE), in their *Manual of Discipline* prescribed fasting as one of the ways of purification, of preparing for the coming of the “end of days.”

Although fasting as a means of atonement and purification is evident in other traditions, it was among the Christians that fasting became a predominant feature. Already in the first and second centuries it began to appear as one of the many ascetic practices that became widespread in the Middle Ages. With the rapid growth of ascetic movements that incorporated Greek dualism into their thought patterns, fasting became an important means of ridding the body of its attachment to material possessions and pleasures, thus freeing the person for attaining the higher good, the love for and imitation of Christ. The prevailing notion was that whereas food in moderation was a necessary good for maintaining health, abstinence from food was particularly effective in controlling the balance between body and spirit. Like the Pythagoreans with their elaborate taboos on food (sixth to fourth century BCE), the early Christians saw such ascetic practices as fasting, praying, and almsgiving as means of reducing or eliminating the tension between the earthbound body and the divine, spiritual soul. Although it is true that for some individuals or groups fasting became an end in itself rather than a means to an end, most monastic manuals or rules warn the monastics to avoid excessive fasting, which could bring harm to both body and soul. Though the practice of fasting varied in different countries, most Christian manuals of instruction and worship began to regulate more strictly the times for obligatory fasts (cf. *Didachē* 7ff.; Justin Martyr, *1 Apology* 61). But it was with the growth of monastic communities in the fourth century that fasts began to be more universal.

Modern-day Christian denominations display a considerable diversity of opinion and practice in regard to fasting. For most Protestant denominations, except for some of the more evangelically oriented groups, fasting is left to the discretion of the individual. Although within the Roman Catholic and Greek Orthodox churches prescriptions still govern both individual and corporate practices, rigid fasting practices have been abolished. Roman Catholics still practice partial fasting and abstinence from meat on Ash Wednesday and Good Friday. Within the Greek Orthodox church fasting is usually one of the acts of purification preparing one for participation in the liturgical mysteries.

Although Buddhists generally favor restraint in taking food, and many consider fasting a non-Buddhist practice, it is listed as one of the thirteen Buddhist practices that can serve as an aid to leading a happy life, a means of purification (*dhutanga*). Therefore, many Buddhist monks have the custom of eating only one meal a day, often eating only from the alms bowl and declining a second helping. For other Buddhists enlightenment was considered more easily attainable by renunciation of wrong ideas and views rather than by fasting. Within Jainism there is the belief that certain ascetic practices, like fasting, are purificatory in that they can remove the accumulation of *karman* that weighs down the life-monad. Fasting could therefore carry people upward along the path to liberation from *karman*. Within the Islamic

tradition fasting is viewed as one of the “good works,” one of the recognized duties of the devout Muslim, and is considered efficacious in pardoning an individual from all past sins (Tibrīzī, *Mishkāt al-maṣābīh* 7.7.1).

Within some of the Native American tribes, the practice of fasting was considered conducive to purifying the body prior to some great feat or challenge. The Cherokee Indians believed that prior to slaying an eagle the individual had to undergo a long period of prayer and fasting that purified the body, strengthening it for the necessary combat. Siouan-speaking Indians believed that before both hunting and war the body had to be purified through fasting for these noble tasks. Among the Incas, fasting from salt, chili peppers, meat, or *chicha* (beer made from maize) was one of the ways of preparing the body for an important event and also for a public form of penance.

FASTING AS SUPPLICATION. Although it is difficult in many instances to distinguish clearly between fasting as a means of penitence and fasting as a means of supplication, within certain traditions the latter has widespread usage. Within Judaism, for example, fasting was one way of “bending the ear of Yahveh,” of asking God to turn to the Jews in mercy and grant them the favor requested. Ahab, for example, fasted to avert the disaster predicted by Elijah (*1 Kgs.* 21:27–29, cf. *Nm.* 1:4, *2 Chr.* 20:3, *Jer.* 36:9). Because penitence and supplication were often dual motivational forces for fasting within Judaism, fasting emerged as both conciliatory and supplicatory. As in the Christian and Islamic traditions, the Jewish notion of fasting reflected an attitude of interior sorrow and conversion of heart. Within the Christian ascetic circles, fasting was viewed as one of the more meritorious acts, which exorcised demons and demonic temptation from the individual’s consciousness. Therefore, fasting emerged within Christianity as a potent force in calling down God’s mercy and aid in ridding the individual of temptations against “the world, the flesh, and the devil.” Fasting was a means of calling God to the struggling Christians’ side in order to be both strength and encouragement in the battle against sin. In the Qur’ān fasting as supplication to God is considered of merit only if one also abandons false words and deeds. Otherwise, God pays no heed to the supplication (see, e.g., *sūrah* 2:26).

Within other groups fasting was also viewed as meritorious in obtaining rewards from higher powers. In the Intichiuma ceremonies of the tribes in central Australia fasting was practiced to assure an increase in the totem food supply. Young Jain girls fasted as one means of requesting the higher power to give them a good husband and a happy married life. Fasting frequently accompanied or preceded the dance rituals of certain tribes who prayed for a renewal of fertility and a productive harvest from the earth (e.g., the Dakota Sun Dance; the Cheyenne New Life Lodge; the Ponca Sacred Dance, or Mystery Dance).

In summary, from earliest records to contemporary society, fasting has been a common religious practice, serving as

both a prelude to and a means of deepening the experience of transcendence of the material or bodily state. The voluntary abstinence from nourishment has been for many an ideal means of expressing human dependence on a higher power, or a liberation from those things that stifle aspirations toward a “higher” form of existence. Fasting has often served as a sign and symbol of the human conversion toward something beyond the everyday, a turning toward the spiritual, the transcendent, the Great Spirit, God, and so on. In modern times the therapeutic value of fasting has been adopted as a good health practice that has often taken on the aspect of religious ritual.

ROSEMARY RADER (1987)
Revised Bibliography

FATE. Derived from the Latin *fatum* (something spoken, a prophetic declaration, an oracle, a divine determination), the term *fate* denotes the idea that everything in human lives, in society, and in the world itself takes place according to a set, immutable pattern. *Fatalism* is the term for the submission by human beings to fate in resignation. Fate and fatalism should not be confused with the idea of determinism propagated by nineteenth-century philosophical positivism, which was convinced that science was on its way to uncovering that law of all cause and effect relationships in the world. The assumption of determinism was that a complete set of scientific laws was within reach of the human mind, and that all these would reside in the public domain and be transparent to inquiring reason. By contrast, the notion of fate, in whatever variation, language, or shade of meaning it occurs, always retains a basic element of mystery. Fate may be in the hands of some powerful, superhuman being; it may be superior to the gods; it may be accessible to some select individuals. But, in contrast with philosophical determinism, not only is a certain knowledge possible vis-à-vis fate, but so is a certain “negotiation” with, or even a staving off of, fate’s decrees.

There are no religious traditions in which a notion of fate is supreme, exclusive, and all-powerful. Furthermore, the effort to define fate in a universally valid way cannot go much further than the formal lines drawn above. Only in psychological terms can generalizations be added. The more problematic, and at the same time more fascinating, issues arise when one confronts the variety of notions about fate in cultures and historical eras.

PSYCHOLOGICAL OBSERVATIONS. In the intellectual mood of the modern age, it is natural to think of the notion of fate first of all in psychological terms. Some remarks can certainly be made here, although they do not help a great deal in understanding fate in the ways in which it is presented in specific religious contexts.

The idea that fear is a root cause of all religions was already proposed in antiquity, and through the ages thinkers have tried to revive the idea, though with little success. With respect to fate and fatalism, however, the function of a psychological ambivalence in many human situations seems hard to deny. Especially in the case of fatalism—that is, the full surrender to fate—an attitude of defeat is in evidence in the belief that the future is as inevitable and fixed as the past. One’s acts become acts of a higher power, and Sigmund Freud’s observation concerning a death wish as the ultimate motivation may be fully applicable in many instances. Such ambivalence consists of the renunciation of one’s own reason (hence also of one’s own responsibility) and the hypothesis of a rational coherence of events in another order.

Examples of a grisly sort of fatalism became familiar in the twentieth century. During World War II the suicidal Japanese torpedo attacks and the suicides in SS (Schutzstaffel) quarters during Adolf Hitler’s regime occurred in response to a notion of destiny (*Schicksal*) supposedly far be-

yond the value of individual human lives. Well known are the endeavors to inculcate soldiers in the Nazi years in Germany with fatalism—in the dubious certainty that this was an ancient Germanic warrior stance. In the 1980s, religiously inspired suicidal attacks on targets conceived as threats to Islam, especially in the cause of Shi‘ah, became an almost regular feature in the Middle East, and many more suicidal missions have been undertaken in various areas of the Middle East, not only among traditionally different factions within Islam, but particularly against the State of Israel. It is important to look at these phenomena as instances of fatalism. Indeed, there are many phenomena in the present world that have far more than a superficial resemblance to “fatalism.” Wars have devastated the lives of soldiers and civilians in Korea, Vietnam, many African nations, and Iraq, where fatalism came to reign supreme, leaving soldiers and citizens with inner, indeed fatal, devastation, even when they survived. One should not dismiss such matters from an inquiry into “fate,” for one needs the reminder that cults of fate can revive much more easily than one may imagine. An example, if not of fatalism per se, then of tendencies in this direction in the modern West, began after World War II with the wave of astrology in general literature, as a rubric in most newspapers, and, perhaps more basically, as a way of filling up the empty space of an underlying uncertainty.

The cluster of fear, escape from fear, and dismissal of one’s responsibility as a fundamental cause in the formation of certain conceptions of religion and fate is suggested both in the recent past and in ancient civilizations. The fear of rulers, wild animals, foes, disease, and many things under the rubric *nature* has had its influence on the formulation of religious ideas, even in the earliest times. Samuel Noah Kramer translated a few expressive lines from a Sumerian poet who obviously had meditated on some golden age as a time that contrasted with a fateful present. Characteristically, he thought of that age as one without fear:

Once upon a time, there was no snake, There was no scorpion,
There was no hyena, there was no lion, There was no wild dog,
no wolf, There was no fear, no terror,
Man had no rival. (Kramer, 1963, p. 262)

It would be wrong to conclude that the idea of fate could be fully explained as a projection of basic human fears or uncertainties. The most striking fact militating against this explanation is that certain periods and cultures that knew many fears and reasons for fear have little to tell us of fatalism.

EARLIEST EXPRESSION IN AGRICULTURAL CULTURES. There is no evidence of any religiously central preoccupation with fate in cultures preceding the earliest civilizations based on the cultivation of cereals, nor is there any special religiously significant place provided for notions of fate in hunting cultures. One looks in vain for a significant role or clear expression of “fate” in truly archaic or preliterate societies in general. Everything points to the relative comfort of a grain- or rice-producing culture as a minimum condition for a religious articulation concerning fate. At the same time, it seems

obvious that the chance of crop failures by itself does not create a notion or cult of fate.

DIFFUSION OF ASTROLOGY. One complex of a fatalistic type, though certainly not among the earliest ones, has clearly passed beyond the borders of its land of origin and through many different language areas as well, and that is astrology. Two reasons may be given for its spread

First, it is possible to look upon endeavors to relate celestial observations to the course of human destinies as a special modification, under certain historical conditions, of the macrocosmic-microcosmic correspondence that seems to occur with the structure of human religious symbolization everywhere. In a sense, astrology is not an altogether new phenomenon but rather a transplantation within a common matrix when it appears and is diffused in late antiquity, grafted onto existing cosmogonic and cosmological traditions.

Although astronomical calculation had risen to great heights in ancient Babylon, full-blown astrological systems were first produced in the Greek language of the Hellenistic period. Nevertheless, it is important to realize that astronomy in early antiquity was not what would today be called an exact science, distinct from religion and the humanities. Details such as the linkage of the five classical planets plus the sun and the moon to different celestial spheres were accepted in all parts of the world that had any contact with the ancient Middle East. In all probability, this diffusion of ideas began well before the Hellenistic Age. Cosmological ideas among Siberian tribes, as well as architectonic expressions as far east as the Borobudur temple on Java, show the powerful influence of discoveries from the ancient Middle East. This leads to the second reason that astrology passed so easily from one cultural area to others that were on a lower level of civilization than Mesopotamia.

From the outset—from the earliest appearance of astronomical and mathematical tables in Babylon—formulas tracing and predicting the course of the heavenly bodies had never taken the form of a scientific enterprise in isolation. In the ancient Middle East this science was presented together with the invocations of deities—the clay tablets and other writings with astronomical and calendar data frequently show religious symbols at the same time. In Siberian and Mongolian shamanism, the shaman, the person with expert knowledge and experience of the traffic between this world and the other world, travels in his or her ecstatic journey from earth to heaven passing through the heavenly spheres in between, each as a rule represented by notches in the very real pole the shaman ascends; all the while the shaman is narrating to the community’s people, who witness the events, what is happening from heaven to heaven. In India, the Vedic texts make frequent use of calendrical numbers, of months or days in the year, and equate them with ingredients necessary for traditional sacrifices and other rituals.

Thus each religious system did what was natural to it; rather than adding “scientific” information to its body of tra-

ditional lore, each appropriated the new discoveries as further revelations of religious reality and inserted them in the religious tradition as was fitting. That human life was intrinsically and harmoniously related to the cosmos was beyond doubt. The ground was well prepared for the waves of astrological influences that followed. As a result, the line separating astronomy from astrology is not easy to draw in the ancient and classical worlds. Astrology was accepted as a way to gain knowledge of details in the general macro-microcosmic harmony. It became possible to ascertain the relation of a person to the course of the heavenly bodies on the basis of the time of that person's birth and the celestial sign under which the birth had taken place. In principle, it became possible also to alter destiny. It is not difficult to see that astrology functions by and large in the same way in very different religious traditions and cultural areas. In Hinduism, the astrologer's counsel is taken very seriously—for example to determine the appropriate day for a wedding ceremony. In the world of Judaism and Christianity, astrology cannot boast of such integration in the religious tradition. The Greek philosophers were generally critical of astrology, and that tradition continued and was reinforced under the influence of the biblical tradition. Setting store by astrology's expertise was obviously not in harmony with God's supreme judgment and his power over human destiny. Nevertheless, wherever astrology functions, it remains based on the same principles of ancient science, and in that respect we may speak of a certain sameness, a homogeneity in the astrological complex throughout history.

ANCIENT AND CLASSICAL CONCERNS. Wherever there are clear references to fate in religious documents, the expressions demonstrate immediately that one cannot speak of fate as a single concept. The assumptions and inquiries commonly used in logic, psychology, or sociology do not suffice. Within the history of religions, statements should depend on a clear recognition of the intentions shown by the traditions being investigated. It is beyond the scope of this entry to survey all religions, yet a number of different tendencies within their symbolic contexts can be indicated. The following points present some strands and specific meanings of *fate*. Without exaggerating their importance, they do point to "moments," in the sense of elements that are constituents of well-delineated notions of fate.

Fate that is relatively independent within a religious tradition. Not only moderns who consider themselves secularized, and in some manner "objective" in their views of religious traditions, but also the ancients, among them the Greeks and Romans, have had difficulty defining *fate*. The religious documents themselves show ambivalence. The documents show, however, that such ambivalence is not mere intellectual uncertainty but often an intentional compromise of distinct views, each of which is unassailable. In the case of fate, such necessary ambiguity is much easier to fathom than it is in most other symbolic complexes (e.g., sacrifices or forms of worship).

In the *Theogony*, Hesiod (eighth century BCE) collected and tried to classify ancient and even some pre-Homeric traditions. The Moirai, the goddesses of fate, together with some others, are called by Hesiod daughters of Night (*Theogony* 211–225), although he immediately adds that they punish transgressions by both men and the gods (217–222). When Zeus, king of the gods, has firmly established his rule, the role of the Moirai (together with the Horae, that is, the three goddesses Eunomia, Dikē, and Eirene) is that of dispensers of good and evil. In the new context they function as goddesses of fate, and they are also called the honored daughters of Zeus. The ambivalence, therefore, of their descent from Night and also from the supreme god, whose veneration is certainly the major theme of Hesiod's work, cannot be satisfactorily explained as a conflict of different traditions. It is, of course, possible that such supposed separate traditions existed, but then the major problem still remains: how did such very different pedigrees for the representations of fate come about? The ambivalence is no doubt likely to be related to the nature of fate: on the one hand, there exists an origin of darkness, if not of uncanny supreme independence; on the other, the central god cannot be depicted as subordinate to fate but must be seen as, in fact, generating it.

In the famous epics of the classical traditions, we find this view confirmed in detail. Homer (eighth century BCE) presents a series of dramatic scenes in *Iliad* 16 that establish the case of a purposeful ambivalence. Under the guidance of Patroclus, the Danaans win a mighty victory over the Trojans. Patroclus kills several heroes in succession. Then the Trojan warrior Sarpedon attempts to turn the battle and attacks Patroclus, only to meet with death by his opponent's spear. However, before this fight ensues, Zeus looks down on the battlefield. He has good reason to be concerned, for Sarpedon is his son. Zeus asks his wife Hera whether he should remove Sarpedon from the scene of battle and thus preserve his life, or allow him to be killed. Hera answers with a moving argument: Mortals are doomed by fate. At the same time, however, Zeus can do as he pleases, though once he takes action to save his son, every one of the gods might do the same for a son in battle, for each one loves his son. The best thing, she concludes, is to let Sarpedon be killed by Patroclus, then let him be sent back to his homeland in Lycia, where his family and friends can conduct a proper funeral. In this argument, a highpoint in the religion of the Olympians, Zeus remains supreme; yet in perfect harmony with his supremacy, fate is accepted.

The Roman poet Vergil (70–19 BCE) brings fate even closer to the supreme god in the story of Dido and Aeneas in the fourth chapter of the *Aeneid*. Aeneas, who according to Jupiter's plans must go to Italy to lay the foundations of the Roman state, is delayed in his journey by the charms of the love-stricken Dido. Juno, Jupiter's consort, contrives to have the two marry to make the relationship legal. But Venus counsels Juno to inquire into Jupiter's plans. Jupiter, thus

alerted, sends Mercury to Aeneas to remind him of his real goal: to establish rule over Italy. Thematically less subtle than Homer, Vergil leaves no doubt concerning the supremacy over destiny of the king of the gods. Even Venus, known for her truly fateful power, here victimizing Aeneas as much as Dido, is no match for Jupiter's determination of fate.

This purposeful ambivalence has early roots in the classical world. The classicist William Chase Greene, who studied the subject of fate extensively, attributes much to human dependence on nature, expressed in Greece in the figure of Mother Earth, Gaia. Was she, on whom everything depended, identified with fate? Greene touches the heart of the matter in summaries of earlier classicists (notably Jane E. Harrison) and in his own study of texts by explaining that Gaia's way is the way of *Dikē*. *Dikē* (justice, but also judgment or punishment) is a term akin to fate, although the documents do not allow an unambiguous identification. Often the texts also speak of Themis as a goddess; she is "the right tradition" and also "the right dispensation." It is true that she is sometimes identified with Gaia (earth [the Titan goddess Gaia-Themis is the mother of Prometheus]). However, in the myths this goddess is not a supreme deity but rather the guardian of ancient sacred customs when their solidity is shaken.

Comparable to Themis, or right tradition, *dharmā* in Hinduism occurs as a divinity, the god Dharmā. Typically, however, this god is not identified with any supreme deity; rather, he occurs in legends and myths as the embodied reminder of what should be done. In the epic *Mahābhārata*, the hero Yudhiṣṭhira is also known as Dharmarāja. He is the son of the god Dharmā, and his name implies his justness as a ruler. This heroic character has been divinized and enjoys a cult in a number of minor popular traditions in South India. However, the complexity of these cults also involves other divine and divinized characters who play significant roles in myth and ritual. Although *dharmā* (the maintenance of right tradition) and a hero/god are drawn together, this popular tradition also refrains from identifying any notion of fate with a divine power.

Much earlier, in the period of the Vedas and in Brahmanism (from c. 1200 to 600 BCE, but also in later texts), we find the term *ṛta*. It may be rendered as "truth," and in that sense it is commonly used in later times. Nevertheless, its earliest meaning, never completely lost later on, is closer to "cosmic balance." *Ṛta* is the power or function that preserves the world in its proper order. Its kinship to the generic term *fate* is evident, but this case is also preserved in its own mystery. Two deities, Mitra and Varuṇa, are called the guardians of *ṛta* in the Vedic texts, but not its owners. No deity appropriates it, owns it, or is identical with it.

In Greece, the Moirai (fate) personified in three goddesses, are sometimes called by individual names: Clotho, who spins the thread of life; Lachesis, who measures it; and Atropos, who cuts it off. The symbolism of weaving is eloquent: a tapestry of life is created and by itself does not imply

the design of a superior deity. Homer, as we have seen, does not identify Zeus with fate, but he speaks in several places of one single Moira, whose decisions are irrevocable and to whom even the gods are subjected. Moira's inscrutable nature is not evil; indeed, a wholly evil deity does not occur in Homer, unless it be the goddess Atē (the Romans called her Discordia), but her role is not significant within the structure of classical Greek religion.

The act of weaving (not only cloth but also baskets) has been a source of symbolism concerning fate in many times and places. Urðr (Urd) in Old Norse literature is a personification of fate: a female figure, seated at a source under the world tree, determining destiny. Her name is related to the verb *verða*, akin to Latin *vertere* ("to turn," including the turning and twisting of the thread of destiny). Norse mythology has much to say about fate, including the inevitable destruction of the world (Ragnarøk). Conceivably, the sources for this mythology, which for the most part are very late, show a certain obsession with destiny under the impact of changes brought about by Christianity.

In Germanic heroic poetry the role of goddesses of fate is largely played by the valkyries, nine in number. They are servants of Óðinn (Odin), and their name indicates their activity in war. In ancient Norse there are the three *valkyrja*, who are associated respectively with the past, the present, and the future, and whose name refers explicitly to their task of determining who will be slain in battle. According to the sagas, Óðinn will employ the valkyries in the final battle before Ragnarøk. Thus, in the Germanic world, one detects a certain, no doubt purposeful, ambiguity regarding fate: those who determine fate are somehow independent and even beyond the gods, and nevertheless their activity jibes with the supreme god's will.

In Sanskrit literature, the most common word for fate is *daiva*, an adjectival form of *deva* (god). It is "the divine" in a most general sense, for it refers to what is beyond human beings and human ken. A term that took on far greater significance in the sphere of fate in Indian religious history is *karman*, which owes its principal force to the context in which it first occurs in Vedic sacrificial texts. Vedic sacrificial proceedings, the heart of early Indian religious life as we know it from the texts, are acts that by definition could not be in vain; a ritual was an act (*karman*) par excellence. While it is difficult to define the purpose of those acts, this is a modern reader's problem. The texts agree that all power (and in fact everything that one might want to cover with the word *religion*) was concentrated in the act performed, whether by gods or people, the act that could not miss the mark.

In later Vedic texts (the Upaniṣads), in the Indian epics, and in Yoga literature, the term *karman* absorbs the meaning of the manner in which life is determined by previous acts, or acts in a previous existence. In Buddhism, *karman* becomes the term used for the law of causality determining the cycle of *samsāra*, that is, the continuous flow of all finite existences. This meaning of *karman* has become dominant in

virtually all Indian religious tradition. This notion, in spite of its philosophical contexts and subtleties, can obviously be understood as an expression of fate and fatalism. The religious center, however, from which its meaning derives, is not immutable destiny itself, but the access in human existence toward *mokṣa* or *nirvāṇa*; that is, freedom from bondage to the law of *karman*. Notably, certain Indian religious traditions with archaic Indian roots, such as the *bhakti* cults of the south, are relatively unaffected by ideas concerning the law of *karman*. The loving devotion (*bhakti*) to a gracious god or goddess is so central and so strongly supported by ancient local temple traditions as to make theories concerning laws of causality recede in significance.

Fate beyond the gods. In the Mediterranean world in late antiquity, notions of fate did not disappear, yet new views began to prevail, at least in certain circles, and ancient notions began to be understood in a modified way. The new mood is the same as that which provided a ready acceptance of astrological data and Gnosticism. Tyche in Greece and Fortuna in Rome are goddesses who enjoyed worship, though their names do not seem to indicate much more than “chance,” “fortune,” and “good luck.” Fortuna was invoked under several names, for example, Annonaria (referring to her function of providing food), Muliebris (womanhood), Primigenia (she who is first born, the original one), and Virilis (she who is strong and masculine). Her greatest sanctuary was in Praeneste, the oldest part of which was built in approximately 200 BCE. Fortuna came to be identified with Tyche (fate, or chance) and was a tutelary deity of the state in Hellenistic times. Her cult became very popular.

It is true that earlier times had deities of fate whose names did not seem personal in the strict sense of the word. *Moirā* and *daiva* are examples. The Greek term *anankē* may also be mentioned here. *Anankē* does not denote a deity but is a general word for “necessity,” yet necessity of a more than physical nature; it is seen as the antithesis to freedom (and forms an important subject for Plato in, for example, his *Timaeus*). The term *anankē* preserved its mysterious, dreadful meaning throughout Greek history. Rather different, *Moirā* was fate personified from the earliest times, in spite of the clear, abstract etymology of the word. The name *Moirā* is related to a verb of which the participial form *heimarmenē* meant, and continued to mean in later times, “fate” proper. The term *heimarmenē* is a feminine past participle form of a verb meaning “to attribute” or “allot,” and hence the meaning “what has been allotted” seems clear—if it were not for the unexpected feminine form. The relationship to *Moirā* is not transparent. By contrast, the personification in the Hellenistic period of other feminine deities such as Fortuna is quite distinct. Fortuna’s veneration is symptomatic of a certain obsession with chance and fate. Typically, the Roman poet and philosopher Lucretius (c. 96–55 BCE) begins his work *De rerum natura* (The way things are) with an invocation of Venus, the classical goddess of love, who in that capacity is closely associated with chance and fate. It is she who

embodies control over all things, but Lucretius’s poem makes a strong case for chance (and in doing so does not conceal the author’s critique of all established religion).

Specific epithets for several goddesses who enjoyed worship at the time, including Venus, all refer to the same fundamental concern with chance or fate. The epithets for Fortuna all amount to a transparent naming of the mysterious power that determines the course of nature and history. The great classical gods seem to recede to the background. In roughly the same period, and well into the Middle Ages, during the time in which Indian influences extended into Southeast Asia, the god Kāma (“love,” in the sense of erotic love) came to be much celebrated.

Autonomous fate and divinities holding fate in their power. The eventual victory of Christianity over the Hellenistic religions signifies a change in the religious occupation with fate. The idea of “fate” or “chance” as an independent or supreme force in the universe became a major enemy for many Christians. One might even argue that a prevailing mood shifted from one extreme to another. Later Western philosophers, such as Baruch Spinoza (1632–1677) and David Hume (1711–1776), still found it necessary to go to great lengths to refute Lucretius’s rational reflections on chance. Generally, the Abrahamic religions—Judaism, Christianity, and Islam—looked askance at every semblance of a fate that could be ascertained apart from God.

Martin Luther (1483–1546) dismissed all the serious claims of astrology, since it had “neither principle nor proofs” (*Tischreden* 3.2834b, Weimar ed., 1914). The predestination of John Calvin (1509–1564) is often mistaken for a form of determinism or fatalism, but it is in fact something very different, and Calvin took great pains, with all the philosophical means at his disposal, to explain ultimate human destiny as God’s decision, made within the mystery of God’s eternity, inaccessible to the inquiring mind of human beings (*Institutes* 3.21–23, 1559 ed.). In contrast to the biblically rooted religions, it is striking that in Hinduism, which was not affected by these historical religious developments, astrology continued to flourish unabated, integrated into the Hindu religious structures themselves.

Before the emergence of the religion of Israel, there occurred in Mesopotamia eloquent depictions of fate held in a god’s hands. The Akkadian creation epic known as *Enuma elish*, written down about 1000 BCE but much older in origin, tells of the “tablets of fate” given to Marduk, the leading warrior and king of the gods. The presentation of these tablets is the seal of his sovereignty. He may be said to determine fate. At the same time, religious practice in the Middle East was multifarious, and a dogmatic definition of *god* and *fate* is not given. Among the terms for fate are the early Sumerian *me* or *mu* and the Akkadian *shimtu* (pl., *shimatu*). *Shimatu* (destinies) can somehow be manipulated; this is literally true according to the documents. The tablet of destinies (*tup-shimati*) is a cuneiform tablet; it controls the world, and the myths tell us that it could change hands. A lesser god, Anzu,

once stole the tablet, thus endangering the order of the universe. Although the *Enuma elish* has destiny firmly planted in Marduk's power, another text (the *Exaltation of Inanna*) tells of the goddess Inanna hanging the *mes* (destinies) on her head like jewels. On one occasion, Inanna tricked Enki (the Sumerian name of Ea, Marduk's father, who had formerly held fate in his power) into handing over the destinies.

One cannot do justice to the Babylonian notions concerning fate by explaining them, because of the highly developed art of divination, as a central item in a world of magic; divination was not a mere superstition but rather an attempt to understand and control reality (Buccellati, 1982). Furthermore, Mesopotamia never developed a cult of fate. The Mesopotamian notion of fate can perhaps best be seen as parallel to the notion of necessity (*anankē*) in Plato, and there is no reason to oppose the art of gaining knowledge of the laws controlling the universe to Greek philosophy as if the former were more "primitive" than the latter. In any event, a divine autonomy over destiny is a prevailing theme in ancient Mesopotamia, and this certainly differs from Plato's tendency to oppose *anankē* to God's *nous* (mind) that created the world and human beings.

Historical continuations may be difficult to demonstrate in detail, yet in the Middle East the world of Islam seems to have preserved a number of very ancient ideas concerning destiny. These ideas found their way into the text of the Qurʾān. Specific terms are set in human life: sex, happiness, misery, the amount of one's sustenance, and the time of death (a point especially emphasized for soldiers). Qurʾān 9:51 states that nothing will happen to a man but what God has written down for him. Fate in God's hands here seems to come close to determinism, although it is just as likely, as in Calvin's predestination, that it was more of a stimulus to truly trust God. Certainly, as in the ancient Middle East of many centuries earlier, rational lucidity is not the issue. In Islamic teachings, beginning with the Qurʾān, rewards and punishments in this world as well as in the hereafter are far more significant, and their logic is not always immediately evident. In the history of Islam, theologians and lawyers have struggled with problems that have arisen from the text. Unjustly, many outsiders looking at Islam have considered all Muslims fatalists. God, the almighty, is at the same time the compassionate one. The religious "inconsistency" here in the handling of fate is no more conducive to a monolithic conceptualization than representations of fate elsewhere.

In the Hebrew Bible, the tendency is to associate fate with the will of God. Joseph and Daniel are the outstanding examples of dream readers, but their stories make it clear that they can look into the future through their art only under the inspiration of God. A complementary story of a man interested in necromancy who is not presented as a man of God is that of Saul consulting a woman of Endor, who conjures up the ghost of the dead Samuel (*1 Sm.* 28:8–25).

The problem of fate beyond God or gods. The theme of a destiny that is in harmony with a supreme divinity or

ultimately dependent on that divinity's will is widespread and has many variations, yet some periods have also seen inroads on this general rule. The clearest examples come from situations of great intellectual concern and from an overflow of mystical craving. The conception of a god can "dry up," as it were; it can become a pale, rational reflection in the history of a tradition. In the expression of great mystics, such a development can be translated into a frightening reality, a horror that is too great to be endured. It would be overly simple to suggest that the conceptualization of the idea of God causes mysticism, but as a historical factor there is little doubt that it plays a role. In both Jewish and Christian mysticism certain stark phrases and terms, though they certainly do not sum up the whole of the mystic's vision, may be understood in part as reactions to a world of abstract propositions. Among these are the *deus absconditus*; certain metaphorical, not to say euphemistic, names in early Spanish Qabbalah, especially *Ein Sof*; "the dark night of the soul" of John of the Cross (1542–1591); and "the abyss of the deity" of Johannes Tauler (1300–1361). In the history of Buddhism, the tenacious process of negation in the meditations of Nāgārjuna (second century CE) may also serve as an example. In all these cases traditional concepts are forced to yield to a higher reality, a vision the tradition supposedly intended but had not disclosed hitherto. In the history of Islamic mysticism such use and interpretation of and reaction to traditional concepts have often led to open conflict and to the seer's condemnation and execution, as in the famous case of al-Ḥallāj (d. 922).

There is a compelling reason to relate these trends in heterogeneous forms of mysticism to the subject of fate: in all instances something higher and more powerful than what tradition allowed or was capable of understanding is posited as absolute. The term *fate* falls short of this highest element, which is often called ineffable. And yet, in intellectual circles that are not (or not necessarily) inclined toward mysticism, the desire to point to and name the power beyond what the tradition tolerates does occur. The Christian theologian Paul Tillich spoke of a "God who is Being itself," who as such would transcend "God who is a being." Tillich intended this idea as a bulwark against any fatefulness of the sort that he thought threatened Greek religion in the form of a fate above Zeus, and he made his case with the help of the mystic vocabulary concerning God as ground and abyss of every being. In late antiquity, Gnostic doctrines of salvation show patterns that bear striking resemblances to a fate beyond God. The traditional image of God is rejected as in fact inferior to the real God, who is truly supreme, and who is the source of salvation. The person's self is instructed to consider itself ultimately as alien to the world as is the real, truly transcendent God. Thus, here also, something is posited beyond that which the tradition had declared supreme, and this something higher is that which really determines the world.

OTHER THEMES OF FATE. What follows are points pertaining to some pronounced "moments" in expressions of fate.

Greece and Rome. Practical, down-to-earth ways of handling fate occur nowhere so markedly as in ancient Roman religion. “Signs” are read to interpret the uncertainties of life, signs that are very common, such as sneezes or twitches of the eyelids, or signs that are completely beyond human reach, such as celestial phenomena or the flights of birds. Messages (*omina*) can be deduced from all such signs. As a rule, one has already set out on an enterprise, and then the signs are observed, and precisely this custom preserves a practical human freedom. There seems to have existed a great certainty that the interpretations were of use to the actions undertaken. The Roman situation differs considerably from that of the Greeks, who exhibit a much more encompassing interest in the drama of the future. The Greek oracles, such as the renowned oracle at Delphi, did not provide “yes” or “no” answers to an inquiry; rather, each oracular event was itself a mystery in need of interpretation. All major trends in Greece show a good deal of respect for the nature of fate, and nothing that might resemble a trivialization. Quite strikingly, Plato, in his last work, *Laus*, conceives a heavy penalty for those who are of the opinion that the gods can be caused to change their minds (10.909a). From the perspective not only of the Greeks, but of most traditions with explicit concerns for fate, the Roman customs may perhaps seem trivial.

China. The practicality in conceptions of fate in China differs markedly from ancient Roman customs. On a wider scale of comparison, the religions of China seem generally much less concerned with theory and very much down-to-earth. This difference is visible in expressions touching on fate and fatalism. Typically, the philosopher Wang Chong (probably first century CE) compared the significance of a person to that of a flea or louse in the folds of the garment of the universe. In neo-Daoist literature, expressions with a fatalistic ring occasionally occur. The *Liezi*, written in the third century CE, contains a dialogue between Effort and Fate. At a moment when Fate seems all-powerful, Fate’s reply to the question of whether the way things are is indeed under its control is surprising: “Since I am called Fate, how can I have control? . . . All things come naturally and of themselves. How should I know anything about them?” (6.1a). Dao, the Way, shows its force in preventing Fate itself from reaching sovereignty. In Confucian tradition, strict fatalism is difficult to detect. In ordinary life, however, Confucian scholars have, as a rule, declined to instruct anyone who did not give them the respect they deserved, thereby leaving unwise decision-makers to their own “fate.” This practical “fatalism” is clearly only a by-product; it does not tell us much about the essentials of Confucius and Confucianism.

Iran. The singular place of ancient Iran in the general history of religions is also reflected in ideas concerning fate. Zoroastrianism conceived of a set period of duration for the world. In the end, the forces of good would triumph over those of evil. Human life has its significance on the stage of this world drama. Both good and evil ultimately follow the course of destiny. In later Zoroastrian orthodoxy, fate was

often identified with time; a system approaching determinism developed. In effect, all power of Ahriman or Angra Mainyu (the evil spirit), as well as of Ohrmazd, or Ahura Mazda (the wise lord), was thus dissipated. This later period is commonly referred to as Zurvanism, after Zurwān, in whom Infinite Time is personalized and mythologized. (Zurvanites were the predominant sect in Iran in the third century BCE.) The identification of fate and time has no prototype in other or earlier Iranian religion. One later text, known as the *Epistle of Tonsar* (probably from the end of the sixth century BCE) condemns both people who trust exclusively in their own efforts and people who entrust themselves exclusively to fate. Manichaeism was strongly affected by Zoroastrian thought in its ideas about time, fate, good, and evil. In its turn, Manichaeism influenced the teachings of Gnostic and Christian traditions, in particular from the third to the seventh centuries.

Zurwān (time) is a late development from the ancient Iranian tradition of the Avesta. The great original opponents, Ohrmazd and Ahriman, were the two antipodes of heaven, Ohrmazd being the absolute good one, and Ahriman the absolute evil one. In Avesta mythology, all gods and people will eventually participate in a final battle between the two parties, but the good will triumph. When in the course of time the religion of the Avesta became the established religion, new transformations occurred. One such transformation amounts to the “heresy” of Zurwān (Puhvel, 1987). What is most striking is that Zurwān is transformed into the father of both Ahura Mazda and Ahriman, which would seem to justify the designation of “heresy.”

The travel of destinies. A subject that does not always get the attention it deserves is the movement of ideas over wide areas, often as a result of conquest. The death of Alexander in 323 BCE is normally seen as the beginning of the Hellenistic Age. Not only did Greek become the major language of communication from Egypt to Rome, in a manner of speaking “Greek” also became the language of the world—in the sense that a world of ideas, of communication, opened up and endured for a long time. Eventually both the Islamic East and the Christian West came to lean on Greek ideas. And without the rediscovery of the Greek thinkers—a rediscovery made by the Islamic world—history might have taken a very different course. The Renaissance, for example, would have been unthinkable.

The end of the Hellenistic Age is generally set at 31 BCE, with the end of the Roman Republic and the ascension of Emperor Augustus (27 BCE). History, especially political history, sets its signposts explicitly, but the flow of ideas is a different matter.

Fate, as we have seen, is a notion that can emerge anywhere. However, it is always the context that gives it its special touch. Traveling ideas can have a great impact. It is striking that during the first several centuries of the common era, ideas touching on fate seem to have traveled frequently and over considerable distances. It was a period in which Greek

philosophical ideas—from Aristotle and Plato, the Stoics, Epicureans, Skeptics, Cynics—moved from country to country. The influence of Plotinus (third century CE), the greatest of the Neoplatonists, crossed borders—as he himself did. Plotinus eventually settled in Rome, where he taught and was eminent in intellectual life. This was the time of the early Christians, who also had ideas about fate, most of them rejecting it, for it would belittle the almightiness of God. Nevertheless, there was much ongoing discussion of the subject.

When the religion of the Avesta became the established religion (under the Sassanian rulers from the third to the seventh centuries CE), new manifestations occurred. One of these was the “heresy” in which Zurwān becomes the father of Ōhrmazd and Ahriman. This is precisely the “solution” that came to appeal to many further west; for example, in Greece and Rome. Particularly striking in this regard are the references to Zoroaster, especially in Gnostic texts. The tendency to understand time as the all-devourer became an obsession in various circles. In art, time becomes a monster, gruesome to behold.

The world of ideas is endlessly fascinating. Neoplatonism did not merely survive, but flourished. But even though the thought of Plato and Plotinus survived, much of the argument of this period is lost to us. The religious turmoil of that time is no longer easy to fathom. Nevertheless, that turmoil was considerable. Quite rightly, Gregory Shaw begins his book *Theurgy and the Soul: The Neoplatonism of Iamblichus* (1995) with a moving description of the agitation of Greek peasants when the temples that guaranteed their lives and their crops were being ruined.

Fates of nations and empires. National fate should not be left unmentioned, since it cannot be separated from the subject of religion. China’s “mandate of heaven” was interwoven with the religious mandate of kingship. And it was thought to determine China’s, and indeed the entire world’s, lot. We have seen above that Jupiter decided the founding of Rome. In modern history, manifest destiny, the American doctrine that gained great popularity in the nineteenth-century age of nationalism, held that it was the duty and fate of the Anglo-Saxon nations, particularly the United States, to dominate the Western hemisphere. Closely related to manifest destiny is the appeal of the British poet Rudyard Kipling in his poem “The White Man’s Burden” (1899), which calls on the “white man” to persevere through hardships in his heroic efforts to protect, instruct, and lead to a truly civilized existence his “new-caught, sullen peoples / Half devil and half child.” Equally fraught with pseudo-religious pathos is the *Schicksal* verbiage indulged in by the leaders of Nazi Germany.

TENACITY OF NOTIONS OF FATE. The complexity of notions of fate and their varying frames of reference should not prevent us from observing the force of certain underlying ideas over very long periods of time. Faithful to his theistic inheritance, the mathematician Isaac Newton (1642–1727) inter-

preted his astronomical observations and calculations in terms of God’s design. A Japanese religious movement, Tenrikyō (which came about late in the nineteenth century), is in most ways eclectic and has freely borrowed from theistic systems, but its ideas concerning fate are in perfect harmony with prevailing and popular Buddhist ideas of *karman*.

In moments of crisis that hit the individual, the charm of astrology tends to disappear, and earlier ideas of fate re-emerge. This is not altogether surprising, as astrology was never accepted in the dominant Western religious traditions. Everything points to the remarkable religious tenacity of deep-seated convictions touching on fate, destiny, chance, and related problems. Even when certain conservative religious phenomena submerge or change, as for instance when funeral ceremonies are replaced by other means of disposing of the dead, basic assumptions about fate and images of fate seem hard to repress in social and private life. When occupying German authorities forced Jewish professors to step down, students in Amsterdam published in November 1940 a farewell message concluding: “In this heavy trial brought on you, we implore the Almighty to support you, Him in Whose hands your and our destiny lies, and whose decisions rule the course of existence for all of us.” As in the case with other symbolisms, individuals do not make up their own novel ideas about fate. Instead, old ideas dominant in cultures come to the surface from time to time. They may appear new and striking, yet on closer scrutiny they are like irrepressible sounds made when old strings vibrate anew.

KES W. BOLLE (1987 AND 2005)

FATHER DIVINE. The Harlem-based minister known as Father Divine (1879–1965) became famous during the Great Depression for feeding the hungry and drawing thousands of disciples (white as well as black) who venerated him as God on earth. A short, balding man of great energy and charisma, Divine promoted racial integration in his Peace Mission movement at a time when nearly all American congregations were segregated. He summed up his religious crusade for social justice, saying, "If God cannot prepare a heaven here for you, you are not going anywhere."

Born George Baker in Rockville, Maryland, in 1879, Divine grew up in a southern black farm-laborer's family. As

a young man he traveled through the South preaching to poor blacks. Citing *1 Corinthians* 3:16, "the spirit of God dwelleth in you," he declared that all people were godly and so deserved equal rights and dignity. But after several arrests and detention in an insane asylum, Divine left the Jim Crow South and, in 1915, settled in New York City, then emerging as a center of African American culture amid an influx of migrants from the rural South.

In 1919, Baker, calling himself the Reverend M. J. Divine, relocated to Sayville, Long Island. Living with a few followers who pooled their funds, he distributed books on New Thought, such as Robert Collier's multivolume works, *The Book of Life* (1925), *The Secret of Gold* (1927), and *The Life Magnet* (1928), which taught that everyone could achieve earthly success by visualizing positive images and tapping an inner spiritual power. Disciples also strived for unity with God by renouncing carnal temptations such as tobacco, alcohol, drugs, and sexual relations.

As Divine's communal movement continued to prosper after the onset of the Great Depression in late 1929, his free Sunday banquets attracted blacks from Harlem and Newark, plus a growing minority of whites. These interracial gatherings, though, led to "Father's" arrest in 1931 for "disturbing the peace," and he was convicted the following June after a blatantly racist trial. Yet even before the verdict was overturned in January 1933, Divine found his messianic aura enhanced when, three days after sentencing and censuring Divine, the judge suddenly died. Relocating to Harlem, Divine presided over a burgeoning movement called the Peace Mission, which was clustered in northern ghettos but also featured predominantly white branches in California and other states.

Divine's Peace Mission became a melting pot of the discontented. A majority of Divine's followers were poor black women, often widowed or divorced, and generally from the lowest strata of ghetto society. But others, men and women, held well-paying jobs and were highly educated, including a substantial minority of affluent whites who were drawn to Divine out of idealism or spiritual seeking. In New York and New Jersey, states that contained the heart of Divine's support, the following was 85 to 90 percent black. In states farther west the proportion of blacks in the movement often dropped sharply, but almost never fell below a third of the disciples in any Peace Mission center.

Estimates of the total Peace Mission membership during the 1930s varied sharply. At its peak in the mid-1930s, the movement had perhaps ten thousand hard-core followers who believed fervently in Father Divine's divinity, gave their possessions to the Peace Mission, and lived in one of the more than 150 movement centers. This conservative count excludes many ghetto residents who disdained notions of Father Divine's godhood yet admired his leadership as a philanthropist and champion of racial equality.

Divine pioneered in the growing struggle for equal rights and opportunity. He encouraged integration of "light

and dark complected" followers (the words *Negro* and *colored* were forbidden) and used whites as secret emissaries to circumvent restrictive housing covenants and acquire homes, hotels, and beach fronts for his followers in northern white neighborhoods. The Peace Mission proved the vitality of cooperative enterprise by becoming the largest landowner in Harlem and operating businesses with an estimated value of \$15 million. In January 1936 the Peace Mission's "Righteous Government Convention" in Harlem called for the abolition of segregation, lynching, and capital punishment, and also urged an expanded government commitment to end unemployment, poverty, and hunger.

After 1940 the Peace Mission sharply declined in numbers and influence as the return of prosperity lessened its philanthropic appeal, and it evolved from a mass movement to a formal sect featuring a half-dozen incorporated churches. In 1942 Divine left Harlem for Philadelphia, and four years later he announced a "spiritual" marriage to a 21-year-old white disciple, Edna Rose Ritchings, thereafter known as Mother Divine. When Father Divine died in September 1965 after a long illness, disciples were stunned and saddened, but not to the point of mass desertion. He had been largely out of public view for several years, during which time Mother Divine had prepared followers for the day when "Father will not be with us personally."

Since the late 1950s Mother Divine and her secretarial staff have administered the Peace Mission from a 72-acre estate called Woodmont, outside Philadelphia. Although the Peace Mission's membership has dwindled to perhaps a few hundred and most of its properties have been sold off, disciples still save a place for "Father" at their banquet tables. They pay special homage to Woodmont's Shrine to Life, a structure designed by Mother Divine: it surrounds a red marble crypt that holds the body of Father Divine. Followers believe that "Father" did not die, but rather cast off his mortal body in order to rule the universe through his spirit.

SEE ALSO New Thought Movement.

BIBLIOGRAPHY

Two early biographies that emphasize sensational or allegedly scandalous aspects of Father Divine's ministry are John Hoshor, *God in a Rolls-Royce; The Rise of Father Divine: Madman, Menace, or Messiah* (New York, 1936); and Robert A. Parker, *Incredible Messiah: The Deification of Father Divine* (Boston, 1937). Robert Weisbrot's *Father Divine and the Struggle for Racial Equality* (Urbana, Ill., 1983) focuses on Divine's vanguard activism for racial justice; the volume contains an annotated listing of primary and secondary sources for further study (pp. 224–232). Jill Watts's *God, Harlem U.S.A.: The Father Divine Story* (Berkeley and Los Angeles, 1992) sheds new light on Divine's origins and highlights the role of New Thought in his religious leadership.

ROBERT WEISBROT (2005)

FĀṬIMAH BINT MUḤAMMAD (d. 11 AH/633 CE) was the youngest and best-known daughter of the prophet Muḥammad and his first wife Khadijah. His bloodline continues exclusively through her.

BIOGRAPHICAL DETAILS. The sources give Fāṭimah's date of birth as falling between 609 and 614 CE. She is described as having been greatly beloved of Muḥammad, and in turn was completely devoted to him. Her mother Khadijah's death while Fāṭimah was still very young filled her with great grief. She shared her father's travails during his years of persecution in Mecca before the emigration (*hijrah*) to Medina in 622 CE.

Shortly after the *hijrah*, two close associates of the Prophet, Abū Bakr and ʿUmar (who later became the first and second caliph), asked for Fāṭimah's hand in marriage. Muḥammad refused both of them, and instead encouraged his cousin ʿAlī, despite his greatly impoverished circumstances, to propose marriage to his daughter. ʿAlī, at the Prophet's behest, sold his shield and thereby obtained a sum of roughly 480 *dirhams* to offer as the bridal gift. Fāṭimah was between fifteen and twenty-one and ʿAlī twenty-five years of age at the time of marriage. A modest wedding feast was arranged and the couple moved into a home close to the Prophet's residence. They lived in grinding poverty, especially for the first several years of their marriage; the sources depict them as often having very little to eat. To earn a meager living, ʿAlī would draw water from the wells and water other people's lands, and Fāṭimah did all the housework herself, being unable to afford servants. Despite this, Fāṭimah is well-known for her highly charitable disposition, and before her marriage had tended to the *ahl al-Ṣuffāh* (people of the bench), a group of destitute Muslims who took refuge in the Prophet's mosque in Medina.

The two famous sons of Fāṭimah and ʿAlī, al-Ḥasan and al-Ḥusayn, were born within the first four years of their marriage. A third son, Muḥassin (or Muḥsin), was stillborn. Two daughters followed, Umm Kulthūm and Zaynab, who were named after Fāṭimah's elder sisters.

There was apparently friction between Fāṭimah and ʿAlī, and she would complain to her father about the latter's harshness to her. Muḥammad is said to have been distressed by this lack of conjugal harmony and intervened on such occasions to effect a reconciliation between the sparring couple. A serious rift threatened to erupt between the couple when ʿAlī began to actively consider taking a second wife. The Prophet came to the defense of Fāṭimah and forbade ʿAlī from contracting a second marriage unless he were to divorce her first. Muḥammad's affection for his daughter was codified in a *ḥadīth* he uttered on this occasion: "Fāṭimah is a part of me and whoever offends her offends me." ʿAlī was thus dissuaded from taking a second consort. This event is sometimes invoked to point to the Prophet's preference for monogamy over polygamy, in the absence of extenuating circumstances.

Both the Sunnīs and the Shīʿah venerate Fāṭimah greatly as the beloved daughter of the Prophet, through whom his descendants are traced. She is one of the five members of the Prophet's family (*ahl al-bayt*; literally "family of the house [of the Prophet]"), which includes additionally, besides Muḥammad, ʿAlī and their two sons, al-Ḥasan and al-Ḥusayn. The term *ahl al-bayt* is a highly charged term, particularly for the Shīʿah. It occurs in a significant verse in the Qurʾān (33:33), which states, "O People of the House, God wishes only to remove from you uncleanness." To whom precisely *ahl al-bayt* refers has remained unresolved to this day. Many Sunnī commentators have understood this verse to include not only the five members indicated above but also all the Prophet's wives. But Shīʿī commentators, and a number of pro-ʿAlid Sunnī exegetes, have interpreted *ahl al-bayt* as referring only to the five members, and have stressed the Qurʾānically mandated privileged status thereby accruing to them. An "occasion of revelation" is frequently recounted in connection with this verse, which further anchors this circumscribed meaning of *ahl al-bayt*. The sources relate that during an event that has come to be known as *al-mubāḥalah* (mutual adjuration), the Prophet gathered ʿAlī, Fāṭimah, al-Ḥasan, and al-Ḥusayn under a cloak before a Christian delegation from Najrān as a proof of his prophethood, according to one version. "The family of the cloak" (*ahl al-kisāʾ*), as they are referred to after this incident, tends to become conflated with *ahl al-bayt* in Shīʿī exegetical works in particular.

Another *ḥadīth*, known as the *ḥadīth al-thaqalayn* (the Prophet's statement regarding the two weighty [things]), underscores the high status of the *ahl al-bayt* and is recorded in both Sunnī and Shīʿī standard *ḥadīth* compilations. In this report, Muḥammad says, "Indeed, I am leaving behind two weighty [things] among you: the Book of God and my kindred, the *ahl al-bayt*."

The family of the Prophet is greatly revered by both Sunnīs and Shīʿah alike—although among the Shīʿah, allegiance to the *ahl al-bayt* becomes a religious tenet. Both Sunnī and Shīʿī sources attest to the special bond of affection and closeness that existed between Muḥammad and Fāṭimah in particular. She is said to have closely resembled him in appearance and manner. Fāṭimah's usual epithet, *al-Zahrāʾ*, means "the radiant one." It is worthy of note that the most famous and oldest institution of higher learning in the Islamic world, al-Azhar (masculine form of al-Zahrāʾ) in Cairo, Egypt, is named after her. This mosque-university was built in 969 CE by the Ismāʿīlī dynasty from North Africa, known, once again after Fāṭimah, as the Fāṭimids.

Fāṭimah died in 633, about four to six months after her father. ʿAlī prepared her body for burial, and she was laid to rest in the family cemetery of Baqīʿ al-Gharqad in Medina.

THE CULT OF FĀṬIMAH The cult of Fāṭimah grew as the Shīʿah became more confirmed in their oppositional role to the majoritarian Sunnīs. As the former progressively came

to stress over time that legitimate and just leadership of the Muslim polity could only be exercised by a descendant of Fāṭimah and ‘Alī, her status, as the only daughter of the Prophet to produce heirs who lived into adulthood and thus continue his line, grew accordingly. In Shī‘ī sources, Fāṭimah, in addition to al-Zahrā’, is given eight other names: al-Baṭūl (the Chaste/Virgin), al-Ṣiddīqah (the Truthful), al-Ṭāhirah (the Pure), al-Mubārakah (the Blessed), al-Zakīyah (the Pure), al-Raḍīyah (the One Contented [with God’s pleasure]), al-Marḍīyah (One with whom [God is] pleased), al-Muḥaddathah (the One Spoken to [by angels]), and Umm Muḥammad/Umm Abīhā (Mother of Muḥammad/Mother of Her Father). The last epithet invokes the memory of the occulted Twelfth Imām in Imāmī or Twelver Shī‘ī belief, whose name was Muḥammad, like the Prophet of Islam. In this sense, Fāṭimah is the “mother” of her distant descendant, and thus “of her father” who bears the same name.

In Shī‘ī hagiography, the name *Fāṭimah* itself is glossed as “One who was weaned [by God from the Fire];” those who love her will also be saved from it. Fāṭimah is the Pure and Chaste one because she was not subject to the blood of menstruation and parturition on account of having been created from the waters of paradise. The Qur’anic verse (33:33) cited above is taken by the Shī‘ah as a proof-text attesting to Fāṭimah’s *‘ismah*, or “[moral] impeccability” or “sinlessness” (and that of other members of the family of the Prophet as well). Fāṭimah is moreover believed to have been entrusted with a special “scroll,” known as *Maṣḥaf Fāṭimah*, brought to her by Gabriel to console her on the death of her father. The cult of Fāṭimah has been likened to the cult of the Virgin Mary in Roman Catholicism; there are indeed many parallels to be observed. Like Mary, she is virginal, despite being a wife and mother; and she is a tragic yet powerful female figure, eliciting the greatest loyalty from those devoted to her. The Shī‘ah often refer to Fāṭimah as Maryam al-Kubrā (the Greater Mary).

ASMA AFSARUDDIN (2005)

FA-TSANG SEE FAZANG

FAUST. In sixteenth-century Europe, Faust was reviled as a godless man who, as a consequence of making a pact with the Devil, met a gruesome yet appropriate fate. By the nineteenth century, he had become the archetypal Romantic hero; the term *Faustian*, coined by Oswald Spengler (1880–1936), was taken as a positive epithet to describe those tormented, defiant individuals who strive for more than is humanly possible. Whether condemned or condoned, Faust is the protagonist of an enduring story that embodies fundamental religious and philosophical questions about humanity’s place in the universe, the nature of good and evil, and the limitations of human knowledge.

THE HISTORICAL FAUST. Between 1507 and 1540, numerous references appear in German diaries, letters, and records to an unsavory character with the last name of Faust. The picture that emerges is of a fairly well educated man: He may have been the Johann Faust listed in the matriculation records of the University of Heidelberg for 1509, or he may have been the Georg Faust who received a hostile reception at the University of Erfurt. In any event, he traveled extensively, and he was viewed with a mixture of fear and contempt by his contemporaries, who describe him variously as a magician, a necromancer, a charlatan, an astrologer, an alchemist, a braggart, a sodomite, a gourmand, and a drunkard. His evil reputation, enhanced by his boast of having made a pact with the Devil, is confirmed by references to his expulsion from various cities. According to contemporary accounts, Faust died mysteriously. Philipp Melanchthon (1497–1560) says he was strangled by the Devil in a rural inn in Württemberg on the day their pact fell due.

ORIGIN OF THE FAUST LEGEND. The development of the Faust legend began in 1540, shortly after contemporary references to his activities ceased. The legend, a by-product of the Reformation, originated in Lutheran circles as a reaction against Roman Catholicism and Renaissance magic and science. It illustrates the anti-intellectual strain within the Christian tradition that has erupted periodically in campaigns of censorship and denunciations of “forbidden” knowledge. Faust became a convenient symbol of deviant religious, scientific, and philosophical thought. He was identified with several of the most controversial thinkers of the sixteenth century: Paracelsus, Trithemius, and Agrippa.

LITERARY TREATMENT OF THE FAUST LEGEND. The earliest printed collection of Faust stories, known as the *Spies Faustbuch*, was published by Johann Spies at Frankfurt in 1587. Enormously popular, it was reprinted eighteen times in the next ten years. Before the end of the century, translations appeared in English, Dutch, and French. The German text went through several revisions, the last of which, republished frequently in the eighteenth century, was probably known to Goethe.

The basic story presents Faust as a scholar whose intellectual arrogance prompts him to abandon the legitimate study of theology for the forbidden science of magic. In return for a specified number of years of power and knowledge,

Faust sells his soul to the Devil. He performs astonishing magical feats, conjures up the dead, flies over the earth, and eventually captivates the most beautiful woman in the world, Helen of Troy, by whom he has a son. When the pact expires, he is carried off to Hell.

The two most famous literary treatments of the story are Christopher Marlowe's *The Tragical History of Doctor Faustus* (1604) and Goethe's *Faust* (1808, 1832). Marlowe based his play on the English *Faustbook*. His version of the story is in the tradition of morality plays, but he adds the specifically Protestant theme that Faust's damnation was due to his despairing fatalism and his refusal to accept justification by faith.

The first recorded performance of Marlowe's play was in Graz, Austria, by a company of English players. The play became a staple of German puppet theater, where it was seen by both Lessing and Goethe as children. As adults, both used the Faust story in plays of their own. Faust's defiant attempt to transcend the limits of human existence appealed to both men and fit in with the repudiation of Enlightenment rationalism that characterized the *Sturm und Drang* movement to which they belonged.

Only fragments of Lessing's proposed Faust dramas exist, but Goethe's two-part drama is considered the greatest work of Germany's greatest poet. By emphasizing the tragic elements only hinted at in earlier versions and by making them the source of Faust's salvation rather than his damnation, Goethe transformed the story of a venal, vainglorious magician into that of an inspiring, tragic hero. In Goethe's drama, God has the last word in the prologue: Striving and error go hand in hand ("Es irrt der Mensch, solang' er strebt"), but only those who dare to cultivate the divine spark within can hope to be saved ("Ein guter Mensch in seinem dunkel Drange / Ist sich des rechten Weges wohl bewusst").

The Faust story continued to be popular throughout the nineteenth and twentieth centuries. Among the many authors attracted to the legend were Lenau, Klinger, Chamisso, Grillparzer, Heine, de Nerval, Valéry, and Mann. Most of them, however, rejected Goethe's optimistic conclusion and stressed instead the danger inherent in Faust's insatiable thirst for knowledge.

BIBLIOGRAPHY

In *The Sources of the Faust Tradition* (Oxford, 1936), P. M. Palmer and R. P. More discuss the background to the Faust tradition and print many of the sources, together with the English *Faustbook* of 1592, several early Faust dramas and puppet plays, and the fragments of Lessing's Faust dramas. Another important book on the tradition's development is Frank Baron's *Doctor Faustus: From History to Legend* (Munich, 1978). E. M. Butler has made a wide-ranging study of the Faust legend in three books: *The Myth of the Magus* (Cambridge, U.K., 1948), *Ritual Magic* (Cambridge, U.K., 1949), and *The Fortunes of Faust* (Cambridge, U.K., 1952). Geneviève Bianquis surveys the literature in *Faust à travers quatre siècles*, 2d rev. ed. (Aubier, 1955). Lily B. Campbell discusses

Marlowe's *Doctor Faustus* in the context of Reformation theology in "Dr. Faustus: A Case of Conscience," *Publications of the Modern Language Association of America* 67 (March 1952): 219–239.

ALLISON COUDERT (1987)
Revised Bibliography

FAXIAN (fl. 399–418), Chinese Buddhist monk, translator, and the earliest successful Chinese Buddhist pilgrim to India. Faxian's family name was Gong; he was born in Wuyang in Pingyang Prefecture (in Shanxi province). After being fully ordained at the age of twenty, Faxian recognized that the Buddhist monastic rules (the Vinaya) available in China at the time were incomplete and confused and thus vowed to journey to India to search for Vinaya texts. After years of preparation he organized a party of five monks, who left Chang'an in 399 and passed out of China through Qiangui, Zhangye and Dunhuang (all in northwestern China). From Dunhuang they proceeded along the southern marches of the Tarim basin to the central Asian kingdoms of Shan-shan, Agni, and Khotan, where they watched the religious procession of the Buddha's image. From there they traveled to Charkara, crossed the Pamirs and Agzi, and finally arrived at the kingdom of Uḍḍiyāna in North India, via Darada and the Indus River valley. So long and arduous was their journey that it took three years for the Chinese pilgrims to reach North India from China.

Faxian spent a summer retreat in Uḍḍiyāna then traveled to the south, passed through Suvastu, Gandhara, Takṣaśīla (Taxila), and arrived at Puruṣapura. There, three members of the mission decided to return to China. Faxian and the others continued the journey, traveling to Hilo and paying homage to the Buddha's shadow at Nagārharā. They crossed over the Lesser Snow Mountain, where Huijing, one of the three members of the party, died. Faxian then traveled to Lakki, where he had the summer retreat in 403, after which he went on to Mathura via Harana and Uccha. He passed the summer retreat in 404 at Śaṃkāśya. Turning southeastward, he then passed through Kanyakubja (Kanauj), Vaiśākha, the Jetavana grove at Śrāvastī, and the birthplace of the Buddha at the Lumbinī near Kapilavastu on the Indo-Nepal border. From there he traveled eastward

to Rāmagrāma, Kuśinagara, Vaiśālī, and finally arrived at Pāṭaliputra, the capital of Magadha kingdom. After a short stay at the city, Faxian went to the southeast. In Rājagṛha he performed a rite of worship at the top of Gṛdhrakūta. He worshiped the bodhi tree at Bodh Gayā, visited other places nearby, and returned to Pāṭaliputra. From there he went westward, made a pilgrimage to Vārāṇasī, the Mṛgadava, or the Deer Park at Sarnath, and concluded the trip with a visit to Kauśāmbi.

Between the years 405 and 407, Faxian stayed at the Mahāyāna monastery of Pāṭaliputra, concentrating on the study of the Sanskrit language and Buddhist scriptures. From the monastery, he obtained a collection of the widely observed monastic discipline of the Mahāsāṃghika school. He also obtained a condensed version of the monastic rules according to the Sarvāstivāda school along with several other texts, including the *Samyuktābhidharma-bṛdaya Śāstra* in six thousand verses, the *Mahāparinirvāṇa Sūtra* in two thousand five hundred verses, the *Vaipulya-parinirvāṇa Sūtra* in five thousand verses, and the Abhidharma collection of the Mahāsāṃghika school. Although most of these texts seem to have been copied by Faxian himself, at least one was presented to him by a lay Buddhist named Jialuo at the Mahāyāna monastery as a token of appreciation for Faxian's journey to India.

After the completion of his study at Pāṭaliputra, Daozheng, the other remaining member of the mission, declared his intention to stay in India permanently, leaving Faxian alone to complete his mission. In 407 he left Pāṭaliputra for Tāmraliptī via Champa. He remained at Tāmraliptī for two years (408–409), after which he traveled to Sri Lanka. He stayed on the island for two years, made pilgrimages to the holy places, and attended lectures delivered by an Indian monk. He also obtained additional scriptures there, including the Vinaya of the Mahīśāsaka school, the *Dīrghāgama*, the *Samyuktāgama*, and the *Zazang jing*, none of which was available in China. In 411 he embarked on a merchant ship and sailed for home with the Sanskrit manuscripts he had collected during the trip. Ninety days later, after being blown off course by a typhoon, the ship arrived at the kingdom of Yavadvipa (South Sumatra island). The monk remained on the island for five months, then embarked on another ship for Guangzhou (Canton). A month into the voyage another typhoon disrupted the journey. After nearly ninety days the ship landed at a place that the travelers later discovered was Laoshan in Zhangguang prefecture (Shandong Peninsula). The year was 412. Eventually, Faxian went to Jiankang (Nanjing) and began to translate the Sanskrit texts he had collected in India and Sri Lanka. He had traveled to approximately thirty kingdoms in fifteen years, and was the first Chinese Buddhist monk to successfully journey to India and return with Buddhist scriptures.

In 416, Faxian was asked by his colleagues to write an autobiographical account of his journey. The resulting chronicle, known as *Foguo ji* (A record of the Buddhist coun-

tries), is an important historical and religious document for South Asian history and for the Buddhist tradition. Five of Faxian's translations are extant. All of them have been translated jointly by Faxian and Buddhahadra (d. 429), an Indian Buddhist missionary. Two of these translations are of the Vinaya of the Mahāsāṃghika school (T.D. nos. 1425 and 1427), two are Mahāyāna scriptures (T.D. nos. 376 and 745), and one is a Hīnayāna scripture (T.D. no. 7). According to one catalog, a translation bearing the title *Za ebitan xinlun* in thirteen fascicles is also ascribed to him and Buddhahadra, but the book has been lost. Two other Sanskrit texts brought back to China by Faxian have been translated into Chinese by Buddhajīva (T.D. no. 1421) and Guṇabhadra (T.D. no. 99) respectively. Faxian continued to translate until the time of his death in 418 at the Xin Monastery of Jingzhou (in Hubei province). His successful journey to India and his search for an authentic tradition of Buddhism remained a source of inspiration for later generations of Chinese Buddhists.

BIBLIOGRAPHY

The earliest translation of Faxian's autobiographical account is the *Foé Koué Ki, ou Relation des royaumes bouddhiques: Voyages dans la tartarie, dans l'Afghanistan et dans l'Inde*, translated by Jean Pierre Abel Rémusat et al. (Paris, 1836). The French text was translated into English with additional notes by J. W. Laidley under the title *The Pilgrimage of Fa Hian* (Calcutta, 1848). James Legge's translation, *A Record of Buddhist Kingdoms* (1886; reprint, New York, 1965), still stands as a useful reference and is easily available. H. A. Giles's retranslation, *The Travel of Fa-hsien, 399–414 A.D.* (1923; reprint, London, 1959), is good. Li Yung-hsi's version, *A Record of the Buddhist Countries* (Beijing, 1957), is the most recent and readable translation. Faxian's biography in the *Gaoseng zhuan* has been translated by Robert Shih in his *Biographies des moines éminents (Kao seng tchouan) de Houei-kiao* (Louvain, 1968), pp. 108–115. A study of his translations and writing is found in Prabodh Chandra Bagchi's *Le canon bouddhique en Chine*, vol. 1 (Paris, 1927), pp. 347–348.

JAN YÜN-HUA (1987)
Revised Bibliography

FAZANG (643–712), also known as Xianshou; third patriarch and systematizer of the Huayan school, a Chinese Buddhist tradition centered around exegesis of the *Avatamsaka Sūtra*. His surname, Kang, indicates that his family was originally from Samarkand in Central Asia. Fazang was a son of Mi, a high-ranking army officer in the Tang dynasty. When he was sixteen years old he burned off one of his fingers as an offering to the Buddha before an Aśoka stupa in which relics of the Buddha were enshrined. After seeking without success for a satisfactory teacher, he entered Mount Taibei, where he studied Mahāyāna Buddhism in seclusion. Some years later, hearing that his parents were ill, he returned home to Chang'an, where Zhiyan (later reckoned the second Huayan patriarch) was lecturing on the *Huayan jing* (*Mahāvaiṣṭya-buddhagāṇḍavyūha Sūtra*) at the Yunhua Si. Yan Zhaoyin, Fazang's biographer, described the meeting of these two as a "smooth acceptance, like pouring water into a vessel, a harmonious condition compared to mingling milk and water." Subsequent to this encounter, Fazang became Zhiyan's disciple.

In 668, when his master Zhiyan passed away, Fazang was still a layman. When he was twenty-eight, Empress Wu Zetian built a new temple named Taiyuan Si in memory of her mother, Yongguo. It was at this time that Fazang was ordained and became a monk at this temple, probably at the empress's request. In 684, he met Divākara, a monk from middle India, at Xitaiyuan Si and studied Śīlabhadra's and Jñānaprabha's *jiaopan* (classification of Buddhist teachings). The next year he joined with Divākara for the translation of that portion of the *Gaṇḍavyūha* (an independent sūtra comprising the last chapter of the *Huayan jing*) that was missing from Buddhahadra's translation of the text. He also frequently assisted such excellent translators as Devaprajñā, Śīkṣānanda, and Yijing.

Fazang is best known as the systematizer and propagator of Huayan Buddhism; he is said to have given more than thirty lectures on the *Huayan jing*. His principal works are (1) *Huayan jing zhigui* (The essential meaning of the *Huayan jing*; T.D. no. 1871); (2) *Huayan wujiao zhang* (Outline of the Huayan Five Teachings Doctrine; T.D. no. 1866); (3) *Huayan jing tanxuan ji* (Plumbing the profound import of the *Huayan jing*; T.D. no. 1733); (4) *Dasheng qixinlun yiji* (A commentary on the *Awakening of Faith*; T.D. no. 1846); (5) *Panruoxin jing lüeshu* (A brief commentary on the *Prajñāpāramitāhṛdaya Sūtra*; T.D. no. 1712); (6) *Rulengqie xinxuan yi* (The essential meaning of the *Lankāvatāra Sūtra*; T.D. no. 1790); (7) *Fanwan jing pusa jieben shu* (A commentary on the bodhisattva precepts in the *Brahmajāla Sūtra*; T.D. no. 1813); and (8) *Huayan jing chuanji* (On the tradition of study of the *Huayan jing*; T.D. no. 2073).

According to legend, Fazang was a miracle worker who sought merit for the people. One of his miracles allegedly caused both Emperor Zhongzong and his successor Ruizong to receive the *bodhisattva* precepts and provide government support to establish five temples for the propagation of

Huayan Buddhism. When Fazang died in November of 712, the emperor Xuanzong bestowed upon him the honorary title of Hongluqing, director of palace ceremonies.

Fazang is credited with three major advances in Huayan doctrine. The first is his classification of Buddhist teachings in "five grades and ten qualities." Through this classification Fazang tried to show that Huayan Buddhism should be regarded as the acme of Buddhist teachings, superior even to the Faxiang (Yogācāra) school newly imported by Xuanzang. The second achievement is his advocacy of a doctrine known as *sansing tongyiyi* ("the original way of explaining the doctrine of the three kinds of existence"). Using this theory, he insisted that ultimate truth and deluded consciousness are not mutually exclusive and that consequently even deluded consciousness can penetrate into the very root of truth. Fazang's third achievement is his clarification of the ultimate modality of *pratītya-samutpāda* ("dependent origination"). That is to say, Fazang elaborated upon Zhiyan's philosophy of *fajie yuanqi* ("*pratītya-samutpāda* in the True Realm") so as to emphasize that matter was no different from the truth (*lishi wu'ai*). According to Fazang, when seen from the viewpoint of the Buddha, all phenomena not only depend upon each other but also enter into each other infinitely (*shishi wu'ai*).

KIMURA KIYOTAKA (1987)
Revised Bibliography

FEASTING SEE FOOD; SEASONAL CEREMONIES; WORSHIP AND DEVOTIONAL LIFE

FEET are multivalent symbols. In some mythologies the rays of the sun—as depicted, for example, in the figure of the swastika—are likened to feet. C. G. Jung finds the foot frequently phallic in significance; others believe it is sometimes a symbol of the soul, an idea rarely directly substantiated but indirectly confirmed when lameness is taken to symbolize some defect of the spirit, as in the cases of Hephaistos, Wieland the blacksmith, Mani, and Oedipus.

The heel of the foot is both suitable for and vulnerable to attack; it may dispatch a serpent or it may be the locus of a fatal wound (Achilles, Sigurd, and КῚσηα). In the Hebrew scriptures, Jacob grasps Esau's heel in order to defeat him. In Celtic legend, Gwydion masters Arianrhod by grasping her foot.

Feet are also vulnerable because of their contact with the earth. Vital and sacred forces can be drained away through them. For this reason, the Aztec ruler Moctezuma II was carried on the shoulders of noblemen, and members of the royal family in Uganda were carried on the shoulders of men of the Buffalo clan. An emperor of Japan, it is said, would have been deprived of his office had his feet ever touched the earth. The Irish hero Oisín, who had lived in the Land of Youth for three hundred years, could remain young upon revisiting the land of his birth only if he did not touch his feet to the ground.

The foot is also a symbol of humility because it touches and is besmirched by the dust of the earth. Victory and subjection are represented by the conqueror placing his foot on the neck of the vanquished or using him as a footstool. Worshipers all over the ancient world removed their shoes before entering sanctuaries and temples, as Muslims, Hindus, and Jains do today before entering places of worship. Foot washing has commonly served as part of rites of purification.

Foot washing as an act of hospitality was also widespread throughout the ancient world. The Christian ritual of foot washing was derived from this practice, and especially from Jesus' washing his disciples' feet (*Jn.* 13:5). As such, the ritual does not focus on cleansing but on humility, and on the Christian ideals of willing service and penitence.

Footprints of divine or holy figures may symbolize the way to the truth, or the salvation offered by them. Footprints of both Viṣṇu and the Buddha appear all over India. Such physical evidence of the earthly presence of divinity is a way

of picturing what is wholly transcendent. This is probably the intended symbolism in depictions of Christ's ascension, found especially in eleventh-century English art, where only the feet and part of the legs show at the top of the picture. On a carved medieval bench-end from Launcells in Cornwall, the feet of Christ are seen vanishing into clouds while footprints are left on a rock. Similarly, pilgrims to Palestine can see footprints in the Church of the Ascension on the Mount of Olives.

BIBLIOGRAPHY

There is no really adequate discussion of feet as a religious symbol. James G. Frazer in *The Golden Bough*, 3d ed., rev. & enl. (London, 1911–1915), discusses the taboo against touching the feet to the ground, but he focuses on the loss of power and on the earth as the agency of loss rather than on feet. For a more convenient and up-to-date source, see *The New Golden Bough*, the one-volume abridgment by Theodor H. Gaster (New York, 1959). On foot washing, see G. A. Frank Knight's article "Feet-Washing," in the *Encyclopaedia of Religion and Ethics*, edited by James Hastings, vol. 5 (Edinburgh, 1912), which discusses both secular and religious customs in great detail. Concerning Hephaistos and the "magical or shamanic lameness," consult *Hephaistos, ou La légende du magicien* by Marie Delcourt (Paris, 1957).

ELAINE MAGALIS (1987)

FEINSTEIN, MOSHE (1895–1986), was an American Orthodox rabbi and Jewish legal authority. Born to a rabbinical family in Uzda, Belorussia, Feinstein prepared for a career in the rabbinate under the tutelage of his father, David Feinstein, and subsequently as a student in the leading Talmudic academies of that region. Upon his arrival in the United States in 1937, Feinstein became dean of the Talmudic academy Metivta Tiferet Jerusalem in New York, a position that he held until his death. He played a prominent role in both the Union of Orthodox Rabbis and Agudat Yisra'el, the world movement of Orthodox Jewry.

Feinstein enjoyed worldwide recognition by Orthodox rabbis and laity alike as a leading interpreter and decisor of Jewish law. His *responsa* (legal decisions) have been published in a work entitled *Iggerot Mosheh* (Letters of Moshe). Students of Jewish law have enthusiastically hailed the appearance of *Iggerot Mosheh* because it offers a Jewish legal perspective on numerous issues relating to contemporary scientific, technological, and sociological developments. The topics Feinstein covers include heart transplants, autopsies, brain death, experimentation with live human tissue, intrauterine devices, the use of electric blankets and transistor microphones on the Sabbath, adoption, life insurance, labor unions, and sex manuals. Thus, the subject matter of *Iggerot Mosheh* dramatizes Feinstein's concern to use the technical capability of Jewish law to address ongoing changes in social reality.

Moreover, a number of Feinstein's rulings reflect a creative and bold flexibility, particularly in the realm of Jewish

family law. In one controversial decision, Feinstein permitted, with qualification, artificial insemination even from a donor other than the husband. In a series of rulings regarding the status of a marriage solemnized in either a civil or non-Orthodox ceremony, Feinstein permitted the subsequent remarriage of either spouse without the prior granting of a *get*, a Jewish writ of divorce.

It would be inaccurate, however, to characterize Feinstein as a liberal interpreter of Jewish law. A staunchly traditionalist work, the *Iggerot Mosheh* contains numerous rulings of a conservative nature as well. In the final analysis, then, the Jewish legal process as reflected in the *Iggerot Mosheh* demonstrates both receptivity and resistance to changing sociocultural circumstances. Feinstein's profound and encyclopedic grasp of Jewish law and his legal creativity were coupled with an outstanding reputation for personal piety and selflessness. It is because of these qualities that his halakhic rulings are considered authoritative by a wide cross-section of Orthodox Jewry.

Revised Bibliography

FEMININE SACRALITY. Attributing gender to manifestations of sacred power in the world is a long-standing human practice. Such manifestations generally are said to be "feminine" when they function in ways analogous to women's most common modes of physiological or cultural activity. Hence that which contains, as in a womb, is often considered feminine, particularly if the containment can be perceived as gestation (e.g., the gestation of seeds in the earth). That which nurtures by providing food and shelter or spiritual sustenance, as a mother offers milk and refuge to her child, may also be considered feminine. That which changes may be feminine, especially if it changes periodically, as a woman's body changes through its monthly cycle, swells in pregnancy, or replaces childhood smoothness with

the fullness of maturity and later with the flaccidity of old age. Similarly, that which works changes on materials outside itself may be feminine, just as a woman's care changes her infant into a self-sufficient child or a woman's processing changes raw materials into food and clothing.

Feminine symbols and divinities were especially prominent in religious systems of ancient cultures, and they have remained important in certain Asian cultures and among small-scale agricultural and hunting peoples. Although overshadowed in the West for many centuries by male deities and imagery, they have undergone a renaissance in Neopagan, feminist spirituality, and environmentalist movements.

FEMININE SACRALITY IN NATURE. Perhaps the best-known and most frequently cited forms of feminine sacrality are those connected with that portion of the world at large that produces and reproduces itself without human intervention. Many peoples have experienced this "natural" world as a constellation of powers and realities that both limit humans and open human opportunities. Often such powers and realities in nature are perceived as female. In fact, the entire natural realm may be experienced as female; people in modern Western cultures acknowledge such an experience when they speak of "Mother Nature." But the experience of the "feminine" in nature is more commonly restricted to certain sectors.

The earth. "According to [alchemist] Basilus Valentinius, the earth . . . is not a dead body but is inhabited by a spirit that is its life and soul. All created things, minerals included, draw their strength from the earth spirit. This spirit is life, . . . and it gives nourishment to all the living things it shelters in its womb" (Jung, 1968, p. 342). Throughout history many peoples have taught that the earth is a living organism and the source of all other life that inhabits its surface and crevices. As such, it is the ultimate womb and mother of all.

A poet of ancient India celebrated the earth as "the mistress of that which was and shall be" and declared that "the earth is the mother, and I the earth's son." She is the "womb of all," pouring forth milk for her offspring (*Atharvaveda* 12.1.1, 10, 12, 43). A poet of ancient Greece sang to the earth as "mother of all things, feeding upon her soil all that exists" (Homeric *Hymn to Earth*). The Oglala of the upper Great Plains in North America were solemnly taught: "For the Earth is your Grandmother and Mother and she is sacred. Every step that is taken upon her should be as a prayer" (Brown, 1953, pp. 5–6). Thus they prayed, "O you, Grandmother, from whom all things come, and O You, Mother Earth, who bear and nourish all fruits, behold us and listen" (Brown, 1953, p. 133).

When represented iconographically, the earth takes the form of a buxom, mature woman. Hindu temple sculptors have portrayed her in this way when illustrating the story of her rescue by a great boar that dives in pursuit after a demon carries her to the bottom of the ocean; she clings demurely

to the boar's tusk as he rises from the waters. This boar is a form of Viṣṇu, great Lord of cosmic order. The earth also appears beside Viṣṇu in temple images as his consort the goddess Bhū, "She Who Becomes." Buddhist art offers a more revealing portrayal in scenes where the Buddha-to-be calls the earth to witness to his generosity as he strives to repel the attack of Māra, the god of death and desire. Here, the goddess appears as torso only, rising from the ground. The lower portion of her body—her "womb"—must be understood as the earth itself, of which the anthropomorphic torso is just a temporary projection. The earth goddess Gaia of ancient Greece was similarly portrayed as torso only.

The earth's motherhood is often understood quite literally. Across the world, myths have asserted that humans and other beings first emerged from a womb within the earth's depths. Bronislaw Malinowski's famed 1948 Trobriand Island studies found that residents of each village traced their ancestry to a sister and a brother who emerged from a nearby hole in the ground. In West Africa, the Ashanti likewise claimed that their ancestors first came from holes in the earth. Among native peoples of North America, 120 versions of human emergence from the earth have been recorded. The Oglala tell how their people were initially tricked into leaving the earth womb as the result of a conspiracy between Ink-tomi, the trickster Spider, and Anukite, the double-faced Deer Woman. The two enticed the people to the surface with gifts of meat and clothing and a promise of unending plenty. Then winter came, the buffalo grew scarce, and the people could no longer find their way back into the cave womb. In the Southwest the Navajo and Pueblo peoples developed complex emergence myths describing how the people evolved into higher and higher levels of refinement as they ascended through a series of wombs before exiting onto the earth's surface.

How are earth's offspring first engendered? The earth need not have a partner to help her produce her children. The Trobriand myths cited above make no mention of a genitor who fertilizes their great genetrix. According to Malinowski, Trobrianders themselves did not believe that children came through sexual fertilization. Like the earth from which they ascended, Trobriand women received departed ancestral spirits into their wombs and returned these spirits to life as children. Hence both earth and women accomplished a form of parthenogenesis (virgin birth).

In many cultures, however, the earth is paired with a male fecundator, usually Sky Father. Before the known world is created, she and he are a single entity, locked together in a lasting embrace. Then the embrace is broken, and earth and sky separate, allowing light and motion to enter the intervening realm. Sometimes this separation is voluntary, as in the long cosmogonic cycle of the North American Zuni, where Earth Mother pushes Sky Father away after she becomes pregnant. Often, however, the separation is forced. In a version of this myth told by the Arawa tribe of New Zealand, the children of the primeval parents Ranga and Papa

separate their parents because they have grown weary of the darkness. After several fruitless attempts, the son—Tane-mahuta, "father of forests" (a great tree)—shoves them apart. In the Mediterranean world the act becomes still more violent; according to the version retold by the Greek poet Hesiod, the primeval mother and father, Gaia and Ouranos, separate after their son Kronos castrates his father with a sickle.

If the earth is a sacred mother, it follows that the act of tilling her is also potentially an act of violence. The violence implicit in gardening is vividly acknowledged in a myth from the island of Ceram in Indonesia. A pubescent maiden named Hainuwele is slain and dismembered as her people perform a spiral dance. When planted, her body parts yield the yams that are the islanders' chief staple food and gardening product. Because her murder brings death into the world, the violence that brings the yams also costs Hainuwele's people the paradisaical life that they had known before.

Reluctance to violate the earth and seize her products can also be seen in a frequently cited speech by the American Indian prophet Smohalla. Told that his people should become farmers, Smohalla responded: "You ask me to plough the ground. Shall I take a knife and tear my mother's breast? Then when I die she will not take my bosom to rest. You ask me to dig for stone. Shall I dig under her skin for her bones? Then when I die I cannot enter her body to be born again. You ask me to cut grass and make hay and sell it and be rich like white men. But how dare I cut off my mother's hair?" (Mooney, 1896, p. 721).

The cave as earth womb. If humans are children of earth, born from a womb in her depths, the significance of caves in religious belief and practice becomes apparent. Often a people identifies some cave within its ancestral territory as its own place of origin. For example, the Oglala say their ancestors emerged at Wind Cave in the Black Hills of South Dakota. The belief that caves are the original earth wombs may have been responsible for the great cave sanctuaries of Paleolithic times in Europe. Sections that bear splendid paintings of animals and the hunt are all hard to reach and are located at a distance from the entrance. Some scholars have argued that these caverns may have been utilized for another sort of "birthing" from the earth—namely rituals of initiation—such as those that often feature a symbolic "return to the womb." In this case the return would have been literal, as initiates worked their way back into the bowels of the earth from which their ancestors had ascended.

Another sort of return to the earth mother is accomplished when humans encounter death. The land of the dead is often located in a cavern beneath the earth. In the Latin epic *Aeneid*, the hero Aeneas descends to the land of the dead via a cave at Cumae, west of present-day Naples. The Greeks similarly located their Erebus or Tartarus in a subterranean region, as did the Hebrews their She'ol. Muslim texts portray the underworld as the huge fiery crater Jahannam, into which the unrighteous are thrown after judgment. Dante

borrowed from such concepts when he portrayed his Inferno as a fiery pit whose nadir is deep within the earth's bowels.

The classical Mediterranean underworlds described above are not explicitly defined as female. Nor do females alone rule them; in Greek and Roman sources a goddess (Greek, Persephone; Latin, Proserpina) shares the throne of the dead with her consort (Greek, Hades; Latin, Pluto). In ancient Sumeria, however, the netherworld's queen was a lone goddess, the dread widow Ereshkigal. Similarly, the Germanic goddess Hel was her underworld's sole ruler. In Japan the counterpart was the primeval ancestress Izanagi, who became the first being to die (after giving birth to fire). Among the Maori of New Zealand, the ruler of the dead was Hine-nui-te-po (great goddess of darkness), a former dawn maiden who fled in shame to the underworld after learning that her husband was also her father.

Alternatively, a dread female guards the underworld's entrance; she is often less a woman than a female monster. Perhaps the most interesting example is a figure prominent in myth and ritual of the island of Malekula in the archipelago of Vanuatu. Malekulans say the wind blows the released soul across the waters of death. On the farther side, by the underworld's entrance, the soul encounters the monstrous female Le-hev-hev. Before her on the sand is the design of a maze or labyrinth, half of which she erases as the soul approaches. The soul must restore the missing half of the drawing in order to enter the land of the dead. If the soul fails, the guardian devours it. Mastery of this labyrinth thus becomes a central feature of Malekulan initiation rites.

Feminine sacrality and water. Note that the Malekulan myth perceives the journey of death not only as a passage into a female underworld but also as a voyage that crosses water. Water appears often in stories of human descents to and emergences from subterranean regions. The Greek who entered the underworld land of the dead had to cross the river Styx. Called by Hesiod the "awful goddess hated by the other gods," the Styx was a branch of the ocean stream that coiled around the world (*Theogony* 12.775–778). According to Plato, a soul returning to the earth for rebirth had to cross and drink from another river, Lethe, the stream of forgetfulness (*Republic* 10.620). In some regions of rural Europe, even during the twentieth century, the souls of children were said to emerge not only from caves but also from grottoes, pools, and springs. Versions of the Native American emergence myth replace the usual cave of emergence with a lake, or a subterranean flood drives the people to the surface.

Waters are not merely an amniotic presence within the earth womb; in many cosmogonic accounts they also become the very matrix from which the earth is born. Even the resolutely male-centered Judeo-Christian Creation myth acknowledges their presence: in the beginning the spirit of God hovers upon the face of the waters. In the ancient Near East, where this account originated, other stories of the world's origin depict a process of evolution from primeval waters. According to the Babylonian creation epic *Enuma Elish*, waters

alone existed in the beginning. The sweet and potable waters called Apsu that now lie beneath the earth were then commingled with the primal sea Tiamat. As the two lay together, early generations of the gods were born, culminating in the lord Ea. Then Apsu plotted to kill his children, because their clamor disturbed him. But Ea overcame Apsu and established a dwelling place for himself upon Apsu's waters. Thus the first separation of waters occurred. The second followed after Tiamat, angered by the loss of her consort, gave birth to an army of monsters that attacked her divine children. The latter then found a new hero, Ea's son Marduk. Following a ferocious battle, Marduk slew Tiamat and split her body in a second separation of waters. Half of that body was cast upward to become the waters of the sky. A gap in the text prevents an understanding of what became of the other half, but presumably it transformed into rivers and oceans, whereas Ea's dwelling, the land, was extended as homes for other gods were added. Finally, humankind was created to serve the gods in their new shrines.

According to one Hindu version of the cosmogony, the world's source is a giant male who sleeps upon a serpent in primal waters. A lotus or tree grows from his navel; both are symbols of the cosmos. Alternatively, an egg is born from the waters and then breaks apart, its two halves evolving into heaven and earth. In the Finnish epic *Kalevala* a bird lays the cosmic egg on a knee that the Mother of Waters raises to give the bird a place to build her nest.

Waters preceding the earth's birth become even more explicitly amniotic in "earth diver" myths common in Siberia and on the west coast of North America. In a gesture reminiscent of sexual intercourse, a male animal dives beneath the waters to secure a few scrapings of soil that will become the germ of the land. The land is then stretched out from a central point, just as an embryo grows from its navel. Often the diver in such stories is a duck or a turtle. The boar who rescues the earth and takes her as consort in the Hindu story cited earlier is an alternative form of the Siberian earth diver transplanted onto Indian soil.

Just as waters that give birth to the earth or nourish nascent life beneath its surface are often female, so also are waters flowing over the earth's surface. India is the preeminent land of sacred female watercourses; all of its rivers are goddesses, the first of them being Gangā Mātā (Mother Ganges). Female deities guarded rivers in China, above all in the South. Especially prominent in ancient times, they often had dragonlike characteristics. In ancient Mexico all rivers belonged to the goddess Chalchiuhtlicue (jade skirt). The face of the Mediterranean world was dotted by springs, pools, and streams inhabited by water nymphs or dryads. Similar lesser female deities connected to local waters are found across Eurasia. Sometimes, like the little mermaid of Hans Christian Andersen's celebrated folktale, they venture forth on the earth seeking human lovers or husbands. The child born of such a liaison may become a great king or hero.

Mounds, rocks, and mountains. Rivers are not the only manifestation of the feminine upon the earth's surface; any protuberance or extension of the earth may be viewed as a special concentration of the feminine. Mounds are often associated with the feminine sacred and honored as earth navels—places where the earth first rose above the waters. The famous omphalos (navel) at Delphi, where the Pythia sat to receive visions of the future, was such a mound; appropriately, like the mound itself and the earth from which it erupted, the priestess-seer of the oracle was also female. Rocks may also manifest female power. In village shrines of South India small rocks or heaps of stones are icons for the *ammās*, local goddesses who protect the villages. When the goddess Cybele was moved to Rome from her initial home in Anatolia, she traveled in the form of a sacred black stone. Again, a mountain or volcano may be the visible form of a goddess or her dwelling place or birthplace—a good example is the Hawaiian volcano Kilauea, venerated as home of the goddess Pele.

Vegetation. In the varied mythologies of the world, sacred plants and vegetation deities have been both male and female. Nonetheless, plants are conspicuously connected to both the earth and the waters and often linked with female powers. Popular images of a goddess who is a source of life and fertility may show her seated under a tree or clinging to a branch with her hand, or her body becomes the tree's trunk while its branches rise from her shoulders. Female spirits often haunt trees. Herbs too may be female: a hymn of India's *Yajur Veda* exclaims: "O herbs! Oh, you who are mothers! I hail you as goddesses!" (4.2.6). Sacred plants that grow in swamps are often female; India's lotus, closely associated with Lakṣmī, goddess of prosperity, is an excellent example.

Staple food plants too are sometimes manifestations, gifts, or transformations of feminine sacred powers. This concept was mentioned above in the myth of the murdered maiden Hainuwele—the yam is the transformed maiden. In North America a similar story is told about the origin of corn, which many Native Americans revered as Corn Mother. According to one version of Corn Mother's story, the slain goddess was killed and dragged along the ground to fertilize the land where corn would emerge. An alternative version claims the goddess gave the corn and its rites to the husband who pursued her after she ran away from home.

Lady of the animals. Given the central role of the earth and waters in crop production, it is not surprising that forms of feminine sacrality are often prominent among peoples who practice gardening and agriculture. Except for the earth mother, honored widely among all people who depend on her products, important feminine powers are found less often among hunting peoples. Occasionally, however, a goddess appears among the category of deities known as "lords of animals." Such deities control the supply of animals essential to the hunting economy, either by creating them, corralling and releasing them to produce scarcity and abundance, or restoring them to life after they have been slain. One such lady of

animals is the ill-tempered Sedna of Inuit (Eskimo) legends. Deprived of her fingers and drowned by her father, this once-human maiden tends the seals at the bottom of the ocean. Misdeeds of the Eskimo foul her hair, which she cannot comb for lack of fingers. She then becomes angry and withholds the seals, releasing them only after a shaman descends to comb her matted hair. A far more positive figure is the White Buffalo Calf Woman of the Oglala Lakota. Appearing either as a white buffalo or as a beautiful young woman, this deity brought the sacred pipe to the Lakota and taught them how to summon the Great Spirit with it. She is a prototype not only of the buffalo but also of Oglala women, who were initiated at puberty by a rite in which they imitated movements of a buffalo cow.

Darkness, night, and moon. The earth's dark crevices are often perceived as the womb of an awesome feminine power, and by extension darkness of any kind may be perceived as female. Hence night becomes a female deity, often of awesome power—according to the Greek epic *Iliad*, even Zeus, king of the gods, dared not displease Night. Night may replace the waters as preformal matrix in accounts of the birth of the cosmos. An Orphic myth recounts how Night laid a silver egg in the womb of Darkness. Eros, or desire, was born from that egg and set the universe in motion. In most mythologies of the world, however, Night is relegated to the background of dramatic action; her principal luminary, the moon, receives far more attention.

The moon is most simply perceived as a complement to the sun—as spouse, lover, or sibling. As the gentler of the two lights, the moon is often, but not always, the female partner. Myths of marriage between the sun and the moon are legion, as are etiological accounts explaining why they do not travel the sky at the same time. The most common cause of their separation is some kind of falling-out. An African myth reports, for example, that the moon tired of the sun and took a lover after she had borne many children (the stars) with her husband. The sun then divided his possessions with her and drove her and her children away from his home. A similar myth of the Oglala tells how Moon and Sun were assigned to separate realms after the woman Face usurped the Moon's place beside her husband at a banquet.

Perhaps because she is so often a prototypical spouse, or perhaps because her body swells periodically, the moon is closely linked to pregnancy and childbirth. Lunar goddesses often preside over childbirth or protect married women during their childbearing years. Examples include Juno, a powerful goddess of ancient Italy who became queen of the Roman pantheon, and Mama Quilla, sister and wife and second in command to Inti, the sun god of the Inca Empire. In many areas of the world, mothers hold newborn babies up to the light of the moon, believing that this act brings blessings upon the children. Even when portrayed as a masculine power, the moon retains its connection with childbearing; many peoples tell tales of women made pregnant by moonbeams.

The moon is also cyclic, and the connection between lunar and menstrual cycles has often been noted. The Mbuti (Pygmy) peoples of Africa call menstrual blood *matu* (moon maiden), while the Iroquois of North America have maintained that all menstrual periods occur when the moon is new. Both the association with childbearing and this link to the menstrual cycle seem to generate a special bond between the moon and pubescent women. The Ceramese story of Hainuwele—the maiden whose murder results in the first yams (see above)—has a striking variant in which a rape precedes the murder and the murdered maiden becomes the moon. In this version an ugly rash-covered sun man named Tuwale seeks to marry the maiden, here called Rabia. After he passes harsh tests that her parents set to dissuade him, the parents allow the wedding but place a dead pig in the marriage bed instead of their daughter. The angry Tuwale pursues his fleeing bride and claims her so violently that he pounds her into the ground and no one can free her. As she sinks into the earth, she asks her parents to perform a three-day funeral ritual for her, substituting a dead pig for her missing body. On the third night, she says, she will reappear, shining down upon them as a light from heaven.

The myth of Rabia points to a third important aspect of lunar sacrality, its ties to cycles of death and regeneration. The moon constantly dies and is as constantly reborn. Thus the moon may be a source of immortality, or the home of a goddess who possesses some life-sustaining nectar. The Chinese say, for example, that the moon goddess Ch'ang-o was once a woman who stole the elixir of immortality from her husband; she then fled to the moon to escape her husband's anger. Women and children honored this goddess in one of China's three great annual festivals.

Finally, lunar cycles mark off the passage of time and help to weave the tapestry that is human history. The moon is linked to goddesses who determine human fate, such as the Greek Moirai or the Germanic Norns. Like the moon herself, such goddesses are often portrayed as spinners and weavers; two of the Norns spin and twist the thread of life, while the third cuts it off. Lunar goddesses of fate are commonly portrayed in triple form, corresponding to the waxing, full, and waning moon, as well as to past, present, and future or to youth, adulthood, and old age.

Sun and fire. In its journeys through the sky, the sun has also woven human time and cosmic rhythms. The sun may therefore also be a weaver, as in Japanese tales of Amaterasu, one of the rare female solar divinities to become the focus of a significant cult. Amaterasu was the ancestress of Japan's imperial lineage; a priestess from the imperial family still serves her shrine at Ise. According to the chronicles *Kojiki* and *Nihongi*, Amaterasu emerged from the right eye of the primal ancestor Izanami as he cleansed himself in a river after an abortive attempt to rescue his consort Izanagi from the land of the dead. Amaterasu's most famous myth describes how she fled from the earth and hid in a cave, from which she was coaxed by the sight of her own shining reflec-

tion in a mirror. She hid after her obstreperous brother Susano-o polluted her sacred weaving hall by heaving into it a piebald colt skinned backward. One weaving maiden startled by this stabbed her genitals with a shuttle and died (according to one version of the story, Amaterasu herself was this maiden).

Like the sun, fire is usually understood to be a masculine power, but there are some noteworthy exceptions. In the ancient Mediterranean world, the hearth fire was a goddess (Greek, Hestia; Roman, Vesta). In ancient Rome this goddess had a special temple at which a perpetual fire burned. Priestesses who tended this fire had to remain celibate—to lose one's virginity (and hence pollute the vestal fire) brought a penalty of death. The hearth fire was also a goddess among the Ainu people of Japan. This Old Goddess of the Hearth, named Fuji like Japan's most famous volcano, was not only a means of cooking and the source of a family's warmth but also a psychopomp, guiding souls of the dead back to the land of spirits from which they had come. Another apparent connection between the fire of the hearth and volcanic fire is found in one of the many Polynesian tales about the trickster Maui. Maui steals fire for the use of humankind from his ancestress Mahui-ike, who lives in the underworld and hoards the fire in her fingernails. Fire likewise emerges from a tellurian woman's body in the Japanese story (cited above) of the ancestress Izanagi, who dies as she gives birth to her fiery son.

FEMININE SACRALITY IN CULTURE. In his massive study of feminine symbols and divinities titled *The Great Mother* (1963), the Jungian psychologist Erich Neumann points to two fundamental aspects of feminine power that such symbols and divinities manifest. On the one hand, feminine power is source, giving rise to the multiple forms of life, whereas on the other hand it is process, an agent of growth and transformation. Both aspects of the feminine can be recognized in the natural manifestations described in the preceding section. But it is the second, the transformative, that becomes most prominent in the modes of feminine sacrality associated with cultural activities and institutions. For the production of culture itself is a process of transformation: that which comes to humans "raw" from the natural realm is "cooked" and made fit for human consumption.

Feminine sacrality can enter at virtually any point in this transformative process. In rituals of initiation, for example, where initiates must leave one mode of human existence and enter another, the transition may be accomplished by passing them through the womb of a female power. The postulated relationship between this practice and the cave sanctuaries of western Europe were noted above. Both men and women may evoke feminine powers in rituals of this sort, although the ways in which they utilize them are likely to differ.

Gardening, weaving, baking and cooking, and pottery. However, certain transformative processes seem so inherently female that some cultures assign them usually or solely to women. The underlying premise here seems to be

that the women who bear life and nurture it into growth are better attuned than men to the powers that achieve these transformations. Hence they are better qualified to channel such powers.

Gardening is perhaps the simplest example of a process in which women work with a power construed as feminine to capture a segment of the wild natural world and tame it for human appropriation. In some societies only women practice gardening, especially if other activities, such as hunting, give men alternative economic functions. Among the North American Iroquois, for example, not only were women responsible for all practical functions of gardening, but they also summoned and supervised all calendrical rites connected to gardening and “owned” all of the songs with themes related to food crops. Weaving is another transformative skill often located within the special province of women. Celestial powers that mark off time, such as the moon and the sun, are regarded as spinners and weavers of human destiny. The women who shape human destiny on earth by bearing and nurturing children may appropriately be accounted mistresses of spinning and weaving. Indeed, the two processes may influence each other. Thus people of rural Sweden once believed that if a woman who had just finished weaving rode away carrying a stick she had stuck in her web, she would conceive a child of the same sex as the first person or animal she met. If her husband cut her web from its loom quickly and efficiently, his horses would deliver foals with ease. The power of the weaver’s web to alter the world around it also explains the many weaving enchantresses of the world’s folklore.

Cooking and baking also tap the transformative powers characteristic of feminine sacrality and of women. A striking illustration is found in the Navajo Kinaaldá ceremony, which completes a girl’s transition to adulthood after the appearance of her menses. During the ceremony the girl impersonates and becomes Changing Woman, a complex mythical being who empowers all growth and transformation in the cosmos. As a focal act of the long and taxing ritual, the girl and the women who sponsor her prepare an enormous corn cake. It is then baked in a pit in the earth for an entire night, during which time the girl and her helpers must not fall asleep. The cake is cut on the following day, and the girl hands out pieces to guests at the ceremony. Because many aspects of the ceremony test the girl’s ability to function as a woman, it seems appropriate to assume that the cake is also a test. It tests her ability, as representative of Changing Woman, to take the corn that is sacred to the Navajo and change it into food.

The story of Changing Woman’s own Kinaaldá asserts that the cake represents Mother Earth. The cake is, in fact, born of the earth, a product of the corn and the pit in which it is cooked. Transformative powers of cooking and baking are often linked to the earth, for the various pots, cauldrons, and ovens in which these processes are accomplished are made of the clay or iron that constitute the earth’s own sub-

stance. Thus pots, cauldrons, and ovens are doubly feminine, both as extensions of the earth and as sources of nourishment. It is no wonder then that pottery making is sometimes restricted to women, as it is among the Pueblo peoples of North America. Nor is it surprising that pots can substitute for the earth or earth goddesses in myths and rituals. A story of the Dinka in East Africa recounts how the Creator grew the first humans to full size in a pot after he had made them—the pot clearly represents the earth womb. Pots are often used as movable images of goddesses during various rites and festivals of India.

Spiritual transformations. The province of the feminine sacred is not restricted to material transformations. Processes of spiritual growth and transformation may also tap powers perceived as feminine.

Institutions offering spiritual nourishment and the promise of renewed life are often described through feminine metaphors. The Christian Church has been called the mother of Christ’s flock, nourishing his children with her milk. Such maternal imagery is partly an extension of the metaphor in the New Testament *Letter to the Ephesians* (5:23–32) portraying the church as a “wife” of Christ. For Jews, the life-giving bride is not the community itself but the radiant Sabbath that arrives to restore it each week. “Come, my friend, to meet the bride; Let us welcome in the Sabbath” begins the sixteenth-century song *Lecha Dodi* by Solomon Alkabetz, still sung at Friday evening Sabbath services. Nor is this concept of the Sabbath bride merely a literary image; during medieval times in Europe, Jewish qabbalists dressed in their best clothes on the Sabbath eve and went to the fields to welcome the incoming beloved.

Alternatively, the knowledge, insight, or wisdom that brings spiritual maturation may be assigned feminine gender and portrayed iconographically by female images. In Hindu India the goddess Sarasvatī is the patron of knowledge, honored especially by scholars and students. For Buddhists of the Mahāyāna tradition, also Indian in origin, the term for liberating insight (*prajñā*) was likewise feminine; its ultimate form *prajñāpāramitā* (perfection of wisdom) is called the “Mother of Buddhas” and is represented iconographically as a goddess. In writings of Hellenistic Judaism and of Greek Orthodox Christianity, Sophia, saving Wisdom, was at times identified as the female aspect of an androgynous God.

The compassionate figure who intervenes to aid the needy struggler for salvation may likewise be female. The bodhisattva Kuan-yin of Pure Land Buddhist sects in China is an especially interesting example, because her prototype, the Indian Avalokiteśvara, was male. This personification of the Mahāyāna virtue of compassion came to escort the faithful to paradise at the hour of death. But he or she also offered other, lesser, varieties of salvation by extinguishing fires, stilling waves, calming storms, freeing those condemned to prison or slavery or execution, disarming enemies, blinding demons, even bringing healthy babies to imploring women. Roman Catholic and Eastern Orthodox Christians are famil-

iar with the compassionate intervening female in the form of the Virgin Mary.

THE TERRIBLE SIDE OF THE FEMININE SACRED. Concepts of the earth as feminine power also include a more daunting aspect. The power who brings forth life also reabsorbs it into herself as the dread goddess who rules the subterranean land of the dead. Moreover, the terrible aspect of certain female deities is not merely a product of association with the bowels of a feminine earth; rather it is the other side of the processes of growth and transformation that so many female deities represent. Life and growth inevitably entail death and decay, while misdirected spiritual striving readily deteriorates into madness.

Perhaps the most infamous of the deadly goddesses is Kālī, the awesome Black Goddess of India, born from the wrath of her demon-slaying mother Durgā. Kālī's teeth are fangs; her tongue lolls out of her devouring mouth like that of a wild dog or tiger. One of her many hands brandishes an upraised sword, another lifts a bowl of blood made from the sliced-off cap of a human skull. Kālī wears a necklace of human heads and a skirt of lopped-off human arms; sometimes she stands, squats, or dances on the corpse of her consort, the great Lord Śiva. Kālī is time and death, but also life, and may be adored as a loving mother. She is also the illusion inherent in life's pleasures, so affirming her for what she is can sustain her worshiper on a liberating path.

Still more gruesome than Kālī was a trio that reflected the horrors implicit in the Aztec cult of war and human sacrifice. To recognize their role as the terrible side of the same process that generates life, one must understand the Aztec presuppositions that human sacrifice was necessary to replenish the swiftly waning vitality of the cosmos and that war was also essential to provide victims for the sacrifice. Coatlicue (snake skirt) was mother to the war god Huitzilopochtli. She wears a skirt of writhing snakes, from which she derives her name; her hands are the heads of serpents; her feet have the claws of a predatory bird. She is headless and twin spurts of blood gush from her neck into the mouths of waiting rattlesnakes. Closely related to Coatlicue is Cihuacoatl (snake woman), said to "preside over and personify the collective hunger of the gods for human victims" (Brundage, 1979, p. 170). She was also sometimes called the war god's mother, for she incited the wars over which Huitzilopochtli presided. In Aztec iconography the lower jaw of Cihuacoatl's gaping mouth is that of a bare human skeleton. Her clothes and body are the chalky white of a heap of bleached bones. She prowls at night, braying and screaming insanely; on her back is the knife of sacrifice, swaddled like an Aztec baby. The knife is a transformation of the third terrible goddess, Itzpa-patol (obsidian knife butterfly). This knife is one of the fragments into which this goddess shattered after antagonistic gods cast her into a fire. She wears a skirt fringed with knives and has the wings and tail of a bird; similarly, her hands and feet have a predatory bird's sharp talons.

Cihuacoatl sometimes was said to change into a beautiful young woman. She would seduce men, who withered and died after they had intercourse with her. She has counterparts in the sirens and seducers recurring in folk songs and legends throughout the world—the seduction that lures men to death or madness is a common characteristic of the awful feminine sacred. Dreadful female powers may also be patrons of witches, like Hekate, the triple-headed goddess of ancient Greece. In the dark of the night, Hekate prowled the world with a pack of bitches, hunting souls to take to her friend Persephone, queen of the dead.

FEMININE SACRALITY IN WOMEN. This same ambiguity of response to feminine sacralty—the recognition that it holds both constructive and destructive potential—is found in conceptions of the sacralty of ordinary women. Women themselves have been viewed as repositories of creative and transformative power throughout human history and within a wide variety of cultural contexts. This concept is inherent in the belief that women are better attuned than men to transformative procedures, such as weaving and cooking. The next section explores further this concept of feminine powers linking women to other aspects of the cosmos. This section examines two different ways in which women's sacralty has been imagined.

According to one prominent conception, women are sacred under specific physiological circumstances: sacred power resides in the condition rather than in the woman. For example, menstruation and childbirth often render a woman taboo and dangerous, because she produces blood, an extremely potent substance. Pregnancy may likewise bring danger: in rural Taiwan a pregnant woman is a threat to brides and children. Virginitly evokes purity, and virgins may be essential to certain ritual roles, such as cutting the sacred tree during the Lakota sun dance or tending the vestal fire in ancient Rome. Menopause may endow women with magical or healing powers; hence older women are subject to accusations of witchcraft but are also often solicited for special ritual functions.

A different conception of women's sacralty perceives women as repositories of a single power that they manifest and channel throughout their lives. But this power becomes alternatively beneficent or destructive depending on whether or not it is properly disciplined. For example, all women of Tamil Nadu in South India are understood to be vehicles for *śakti*, a natural energy essential to all action and prosperity. A married woman who controls her *śakti* via faithfulness to her husband is extremely auspicious. Considered a living incarnation of Lakṣmī, the goddess of good fortune, she blesses her family not only while she is alive but even after her death. More capricious but still beneficent is the virgin female who is not yet married—her *śakti* is an unrealized potential. Negative and potentially dangerous figures are widows, unmarried mothers, barren women, and women who die in pregnancy and childbirth. The awesome power of a disciplined *śakti* is most dramatically displayed in the Tamil epic

Cilappatikāram. The faithful wife Kannagi, widowed by miscarried justice, destroys not only the king responsible for her suffering but also his capital city Madurai. No matter how conceived, women's sacrality is often said to be prior to powers that men hold or channel. A myth acknowledging this priority has been recorded in regions of the world as disparate as Africa, Australia, and Tierra del Fuego. Once upon a time, it asserts, women had control of the sacred symbols and rituals. One day, however, the men stole these symbols and rituals (according to some versions, because women were abusing their power). An Australian version of the story points to the counterbalancing reserve of sacrality that compensates the women for their loss. When the Djanggawul sisters realize what has happened, they say: "We know everything. We have really lost nothing, for we remember it all, and we can let them have that small part. For aren't we still sacred, even if we have lost the bags? Haven't we still our uteri?" (Berndt, 1953, pp. 40–41).

FEMININE SACRALITY AS UNIFYING POWER WITH MULTIPLE MANIFESTATIONS. While surveying the wide variety of forms through which feminine sacrality has been manifested, it is important to remember that the powers called "sacred" and "feminine" are not always related to these forms in the same way. People who speak of the earth as their sacred mother sometimes intend this statement quite literally: the earth itself is the awesome power that sustains them. But they may also refer to a generative and transformative power that resides within the earth. The same is true of other manifestations. The moon may be a deity, discrete and specific to the ever-changing orb that paces the night sky. Or a deity may show herself or himself through the moon. This distinction between manifestation and power is reflected in the common assertion that the moon—or mountain, cave, or spring—is the deity's "home." Such an assertion leaves open the possibility that the deity will have another home, or possibly many homes—that is to say, the power that is the deity may have many modes of manifestation. In fact, many of the great goddesses not explored in this article represent powers of birth, transformation, and death that show themselves in many different ways. The celebrated goddesses of the ancient Near East were all multiple-mode deities of this order. The Egyptian Isis, for example, was the deified throne, which in turn extended and concentrated the power of the earth. But she was also known as the "mother of stars," or Night, and her tears produced the Nile's annual and fructifying flood. She could bring life out of death—and did so when she awoke her dead husband Osiris and secured from him the child Horus. Yet she was also death, as is shown by her title "queen of the west"—west being the direction of the underworld. Isis even became the compassionate savior who bestows wisdom and immortality upon the faithful when the Greeks and Romans converted her cult into a mystery religion. Changing Woman of the Navajo, Durgā of India—even the Virgin Mary of Christianity—all are feminine powers with multiple modes of expression.

In some cases even the deity herself is understood to be a form of some more abstract energy that she shares with other manifestations. South India's multiple goddesses—Durgā, her extension Kālī, the many village "mothers"—are all modes of *śakti*, which, as demonstrated, is also manifested in ordinary women and in all forces of increase and prosperity. This inherently female energy may in turn be located within some overarching schema that juxtaposes it against a complementary energy identified as male. The Chinese concept of yin and yang is a classic example: yin predominates in everything that is dark, shaded, cool, wet, waning, bending, earthy, and female; whereas yang is bright, hot, dry, waxing, stubborn, aggressive, heavenly, and male. Despite the high level of abstraction that has generated these concepts, one recognizes in yin several components that have been associated with feminine sacrality in many eras and cultures: the earth, the dark, the waters, the changing, and the dying.

More frequently the concept of a common power remains unarticulated; only the network of symbols clustered together in myth or ritual reveals the presumption that they somehow share a common essence. Earth/waters/moon/women/root crops is one such cluster, often found in horticultural societies, that links together the sources and manifestations of growth and transformation. But the complex need not be the same in all cultures. The ethnographer Joseph Bastien (2001) has studied a complex in Andean Bolivia that clusters women, river, wind, and rats—all powers sharing the capacity to flow or erode, and therefore bring about change.

CONTEMPORARY FEMININE SACRALITY. Many beliefs and customs cited above have faded as the people who have carried them slip under the influence of modern secular culture. Some, however, have gained new prominence as the result of twentieth-century movements grounded in political or countercultural protest. During the later years of British colonial rule in India, for example, nationalists striving to rouse Hindus to resistance did so by evoking ancient images of land-linked goddesses and *śakti*. India was a goddess, they taught, a once-generous and loving mother currently battered and starved by oppressive rulers. Nonetheless, *śakti* newly awakening in the world could empower Mother India's progeny to free her and restore her. One by-product of such rhetoric has been a revival of Hindu interest in female deities, female symbols, and holy women.

In English-speaking countries of the Western world, renewed interest in female sacred imagery has been largely a product of three separate but intertwined movements: contemporary paganism, especially the several strands of Wicca ("wise one"; also called "the Craft"); the closely related "feminist spirituality" movement; and the environmental or "green" movement. The first documented coven of the movement called Wicca began meeting in England in 1948 under the leadership of occult enthusiast Gerald Gardner. Gardner claimed he was reviving pre-Christian ritual traditions that had been preserved in secret over the centuries by

lineages of practitioners who, during the Middle Ages, had been burned as witches. Intended to bring worldly benefit and healing, these ancient rituals drew on sacred powers grounded in the natural realm. Central to these were a horned god and an awesome goddess said to have been worshiped since Paleolithic times, as well as assignment of priestly roles to women. Portrayals of the goddess reflected ideas current in popular and academic literature of the time. She manifested in three modes (maiden, mother, and crone), was immanent in all nature, and had special links to earth and moon, fertility and transformation. Certain Wiccan traditions emerging after Gardener's further emphasized roles of both the goddess and of women—so-called Dianic Wiccans honor the goddess alone and initiate only women into their covens.

The feminist spirituality movement is an offshoot of a critique of patriarchy in religion that began among woman theologians in the late 1960s and the 1970s. Although some feminist theologians chose to work for change within traditional religious frameworks, others aligned themselves with Wiccans in embracing feminine symbols and constructions of deity. Proponents of feminist spirituality seek to empower women, to help them draw on their own strengths and value their own bodies, and to turn women's energies toward working for a more humane and sustainable world. In doing so they have drawn on many ideas and images described in this essay: images of female deity immanent in the world and natural processes; mythic images of divine maidens, mothers, and crones that reveal different modes of female potentiality; and positive values placed on transformation, nurture, and interdependence.

Many contemporary pagans and proponents of feminist spirituality strongly support environmental movements, asserting that their beliefs promote reverence for nature and resistance to earth's exploitation. An important link between these groups and environmentalists has been the "Gaia hypothesis," first published in *Gaia: A New Look at Life on Earth* (1979) by the scientific writer James Lovelock. Lovelock argues that earth and the natural environment should be viewed as a single massive organism, which he calls Gaia, the ancient Greek name for the goddess Earth. To Lovelock, the image of earth as goddess is a metaphor meant to change attitudes toward the matrix in which humans live. Neopagans and spiritual feminists sometimes interpret his image more literally, however.

But this need not be the case, for precise nuances of belief within such movements vary widely. Goddesses may be understood literally as powerful sacred beings external to humans, as powers of growth and transformation surging within the world and humans, and as metaphors for human potentiality. Some groups honor the Wiccan threefold goddess and address her by Celtic or classic names; some may study and call upon female figures from all the world's mythologies; or some may say that, in the end, all goddesses are one. All assert that imageries of feminine sacrality affirm life, con-

nection, the female body, sexuality, and change; that they aid in dealing with death; that they promote creativity and respect for nature; and that they counteract exploitation not only of nature but also throughout human society.

BIBLIOGRAPHY

A path-breaking comparative study of female sacrality still of value is the Jungian psychologist Erich Neumann's *The Great Mother*, 2d ed., translated by Ralph Manheim (New York, 1963; reprint, Princeton, N.J., 1972). Especially valuable are its many photographic plates. Neumann's data are embedded in a controversial theory of the evolution of human consciousness, and readers using his work must remain critically alert. Many fine studies of goddesses and goddess mythology supplement Neumann's work. Useful essay collections are James J. Preston, ed., *Mother Worship* (Chapel Hill, N.C., 1982); Carl Olson, ed., *The Book of the Goddess, Past and Present* (New York, 1983); and John Stratton Hawley and Donna M. Wulff, eds., *Devī: Goddesses of India* (Berkeley, Calif., 1996). Valuable single-author works are Lotte Motz, *The Faces of the Goddess* (New York and Oxford, 1997); David R. Kinsley, *The Goddesses' Mirror* (Albany, N.Y., 1989); and Kinsley, *Hindu Goddesses* (Berkeley, Calif., 1986).

Mircea Eliade's *Patterns in Comparative Religion*, translated by Rosemary Sheed (New York, 1958), cites many valuable examples of earth, waters, moon, vegetation, and gardening symbolisms; his *Birth and Rebirth* (London, 1958), issued in the United States as *Rites and Symbols of Initiation* (New York, 1958; reprint, New York, 1975), offers significant insight into the role of feminine symbolism in initiation. Charles H. Long's *Alpha: The Myths of Creation* (New York, 1963) furnishes fine examples of world parent, earth diver, and emergence myths. For a helpful survey of the latter in North America, see also Erminie Wheeler-Vogelin and Remedios W. Moore's "The Emergence Myth in North America," in *Studies in Folklore*, edited by W. Edson Richmond, pp. 69–91 (Bloomington, Ind., 1957). Sam D. Gill's *Mother Earth: An American Story* (Chicago, 1987) challenges the idea that Mother Earth is an ancient Native American conceptualization. See also C. G. Jung, *Psychology and Alchemy*, vol. 12 of *Collected Works* (Princeton, N.J., 1968), and Bronislaw Malinowski, *Magic, Science, and Religion* (Garden City, N.Y., 1948).

A valuable resource for the study of goddesses who produce food crops from their bodies is Gudmund Hatt's "The Corn Mother in America and Indonesia," *Anthropos* 46 (1951): 853–914. The original collection of variations on the Hainuwele motif is Adolf E. Jensen's *Hainuwele* (Frankfurt am Main, 1939). Although highly specialized, Steven G. Darian's *The Ganges in Myth and History* (Honolulu, Hawai'i, 1978) and Edward H. Shafer's *The Divine Woman* (Berkeley, Calif., 1973) furnish interesting views of water-related female deities in India and China; see also Diana L. Eck's "Gangā: The Goddess Ganges in Hindu Sacred Geography" in Hawley and Wulff (1996), cited above.

A good twentieth-century study of Indian village goddesses is Richard Brubaker, *The Ambivalent Mistress: A Study of South Indian Village Goddesses and Their Religious Meaning* (Ph.D. diss., University of Chicago, 1978, microform). For the White Buffalo Calf Woman of the Oglala, see Black Elk, *The Sacred Pipe*, edited by Joseph Epes Brown (Norman, Okla., 1953); a broader survey of female powers among the Oglala is Marla N. Powers's *Oglala Women* (Chicago, 1986). See also James Mooney, *The Ghost Dance Religion and the Sioux Outbreak of 1890*, Annual Report of the Bureau of American Ethnography, 14: 2 (Washington, D.C., 1896).

Materials on the transformative powers manifested through women's cultural activities remain sparse. But see K. R. V. Wikman's *Die Magie des Webens und des Webstuhls im Schwedischen Volksglauben* (Turku, Finland, 1920). The original source on the Navajo puberty ritual for girls is Charlotte Johnson Frisbee's *Kinaaldá* (Middletown, Conn., 1967). Neumann's *The Great Mother* (see above) is a comprehensive source on the role of feminine powers in spiritual transformations. But see also Joanna R. Macy's "Perfection of Wisdom," in *Beyond Androcentrism*, edited by Rita M. Gross, pp. 315–334 (Missoula, Mont., 1977); the same volume includes an intriguing essay on the transformative powers of Sedna, the Inuit mistress of animals.

A readable account of the goddess Kālī is Kinsley's *The Sword and the Flute* (Berkeley, Calif., 1975); Burr C. Brundage offers a compact and fascinating sketch of the terrifying Aztec goddesses in *The Fifth Sun* (Austin, Tex., 1979). For the monster Le-hev-hev, see John W. Layard's *Stone Men of Malekula* (London, 1942).

For the sacrality of women's physiological states, see Rita M. Gross's *Exclusion and Participation: The Role of Women in Aboriginal Australian Religion* (Ph.D. diss., University of Chicago, 1975, microform). A summary of Gross's principal argument is in *Unspoken Worlds*, edited by Nancy A. Falk and Rita M. Gross, 3d ed., pp. 301–310 (Belmont, Calif., 2001). The same volume includes Joseph W. Bastien's "Rosinta, Rats, and the River," pp. 243–252, on the women/river/wind complex of the Bolivian Kallawayá, and Inés M. Talamantes's "The Presence of Isanaklesh," pp. 290–301, with materials on the Apache Isanaklesh, a counterpart of the Navajo Changing Woman. Carolyn Niethammer's *Daughters of the Earth* (New York, 1977) offers examples of responses to menstruation, childbirth, and postmenopausal women among Native Americans. Emily M. Ahern's "The Power and Pollution of Chinese Women," in *Women in Chinese Society*, edited by Margery Wolf and Roxanne Witke (Stanford, Calif., 1975), also documents perceptions of menstruation and childbirth. Excellent information on the concept of *śakti* is in Susan S. Wadley, ed., *The Powers of Tamil Women* (Syracuse, N.Y., 1980). For the myth of Australian women's prior power, see Ronald M. Berndt, *Djanggawul* (New York, 1953).

Two essays by Nancy A. Falk address the contemporary resurgence of feminine sacrality among Hindus: "Śakti Ascending," in *Religion in Modern India*, edited by Robert D. Baird, pp. 298–334 (New Delhi, 1995), and "Mata, Land, and Line," in *Invoking Goddesses*, edited by Nilima Chitgopekar, pp. 140–164 (New Delhi, 2002). See also Ronald M. Berndt, *Djanggawul* (New York, 1953). Materials on Wicca

and feminist spirituality are legion. A meticulous reconstruction of Wiccan history and antecedents in Britain is in Ronald Hutton's *The Triumph of the Moon* (Oxford, 1999); an American counterpart of broader reach is Margot Adler's *Drawing down the Moon*, 2d ed. (Boston, 1986). Perhaps the most famed writing from within Wicca is the San Francisco priestess Starhawk's *The Spiral Dance* (San Francisco, 1979). For a Wiccan approach to deity, see Monica Sjöö and Barbara Mor, *The Great Cosmic Mother* (San Francisco, 1987). Carol Christ's essay "Why Women Need the Goddess" was of major importance in launching the feminist spirituality movement; it is easiest to find in Carol P. Christ and Judith Plaskow's anthology, *Womanspirit Rising* (San Francisco, 1992). A good example of more recent writing on Wicca-linked feminist spirituality is Melissa Raphael, *Theology and Embodiment* (Sheffield, U.K., 1996). For an approach by feminists working within the Christian tradition, see Charlotte Caron, *To Make and Make Again* (New York, 1993). James Lovelock first published his Gaia hypothesis in *Gaia: A New Look at Life on Earth* (Oxford, 1979).

FEMINISM, GENDER STUDIES, AND RELIGION
FRENCH FEMINISTS ON RELIGION

FEMINISM: FEMINISM, GENDER STUDIES, AND RELIGION

Very few academic fields have remained untouched by the emergence of feminist and gender theory as critical tools for reflecting on, and challenging, the legitimacy of regnant epistemologies. The study of religions is no exception, although it has been slower than other fields to incorporate the insights of contemporary feminist and gender discourses. This entry provides a brief survey of the development of feminism and gender theory and their place within the field of religious studies, and also discusses their critique of traditional methodologies and concepts within the context of the (predominantly Western) study of religious traditions.

FEMINISM AND GENDER STUDIES: AN OVERVIEW. As with many terms, defining *feminism* presents an immediate difficulty, as it suggests a homogeneity that is belied both by the history of its development and the diversity of its articulations and forms. The multiplicity of feminisms that together constitute feminism—whether early suffrage campaigns, discursive analyses of gender hierarchies, or lesbian activism, for example—indicates subtle differences of emphasis and context. Most feminisms are concerned, nonetheless, with promoting political and theoretical programs that address the secondary status of women. In this entry, the term *feminism* will be deployed to refer to a broad set of common themes and concepts, however differently expressed, that articulate a critical analysis of gender relations at meta-theoretical and empirical levels. Feminist theory, as the intellectual conduit of a diversity of feminisms, engages with an array of con-

cerns, all of which reflect an accumulated fund of knowledge and experience that is situated in an ongoing teleological and etioloical analysis of gender inequalities and identities in all social and cultural arenas. The possibility of conceptual and political transformation is thus at the heart of feminist practices, theories, and methodologies.

It is common to discuss the development of feminism in terms of the three main “waves.” First wave feminism, from the mid-1850s to the publication of Simone de Beauvoir’s ground-breaking book *The Second Sex* in 1949, was characterized by materialist debates and political activism concerning universal suffrage, women’s rights to self-determination, access to higher education, and ownership of property. Second wave feminism refers to the reemergence of feminist political activism and literature in the late 1960s. It was largely defined by its liberal agenda; its vision of female solidarity; political interventions in the spheres of reproduction and sexuality, employment, and cultural representation; and theorization of patriarchy. It was during the second wave that feminist theory emerged as a field of cultural critique and began to make its presence felt in a wide variety of academic disciplines. These decades saw the establishment of a large number of women’s studies departments, an innovation that sought to address the absence of women in the androcentric intellectual history of most academic fields by developing women-focused syllabi and research programs.

While many of the concerns of the second wave continue to be important, feminist activity in the late twentieth and early twenty-first centuries is referred to as third wave feminism, or *post-feminism*. It marks both a self-reflexive turn and a mature phase in feminist theorizing as it seeks to critique the previously hegemonic assumptions of the second wave. This stage registers a shift in the common preoccupations that have informed many of the debates between feminists. Most notably, third-wave feminists have moved away from the denunciation of gender inequalities towards the theorization of discursive, dialogic constructions of gender. In addition, influenced by poststructural, postcolonial, and queer theories of identity formation, third wave feminists advocate the rejection of oversimplistic and essentialist descriptions of female and male identity. This includes a sustained examination of hegemonic representations of masculinity, and a more nuanced understanding of the often significant differences between men and women in the contexts of class, ethnicity, sexuality, and economic status. In academic circles, the focus has shifted from women’s studies to gender studies.

FEMINIST THEORY, GENDER THEORY, AND THE STUDY OF RELIGIONS. The emergence of the feminist study of religious traditions has paralleled the three-wave pattern of feminism’s development. Much pioneering feminist scholarship in the 1960s and 1970s was concerned with mapping women’s lives and experiences within religious traditions in order to render them analytically visible. In addition, feminist scholars challenged the androcentrism of the field’s epistemological foundations and outlined alternative methodologies. The

early emphasis on women contributed to the tendency of methodological and epistemological evaluation by feminist scholars to be rather narrowly focused. While it was crucial for identifying the unique place of female expression within religious traditions, it was marginalized in broader methodological debates. Feminist scholars therefore developed multiple critiques of the history of religious studies and, from the 1980s onwards, gender theory was increasingly applied not only to the analysis of religious phenomena but also to the disciplinary paradigms that sought to understand them. Feminist and gender theory began to be articulated in terms of offering the possibility of a paradigm shift, one that would generate conceptual change and renewal within the discipline and provide a necessary corrective to its androcentric foundations (see King, 1995, pp. 1–38). Accordingly, gender-critical scholarship has since been conceived of as a supplementary discourse.

For Jacques Derrida, a supplement is something “added on,” seemingly deliberately, to a prior term in order to address an omission within it, although it appears to be exterior and secondary to the primary term it supplements. Derrida, however, argues against the metaphysical logic that places the supplement in a secondary or derivative position. He suggests that if the supplement is necessary to compensate for the absence it reveals in a prior term, then it is not so much an external extra as a necessary constituent of the term it supplements: “The *supplément* is neither a plus nor a minus, neither an outside nor the complement of an inside, neither accident nor essence” (Derrida, 1981, p. 43). An example of supplementarity that provides a useful parallel for understanding the role of feminist and gender theory in the study of religions is the emergence of the field of “women’s history.” As Joan Scott has argued, “there is a troubling ambiguity inherent in the project of women’s history for it is at once an innocuous supplement to, and a radical replacement for, established history” (Scott, 1991, p. 49). As the study of women is added to the discipline of history it also occasions its rewriting. Gender theory, applied to the study of religions, similarly attends to the exclusion of female and non-elite male perspectives at the level of data gathering and analysis, and, further, queries the epistemological and conceptual formulations that enable such exclusion in the first place. Feminist interventions have thus insisted on the implementation of a series of critical adjustments to traditional concepts and theories in the study of religion’s methodological paradigms.

FEMINIST AND GENDER THEORY: TRANSFORMING METHODOLOGIES. June O’Connor, in her influential article “The Epistemological Significance of Feminist Research in Religion” (1995), usefully summarizes the epistemological framework of feminist and gender theory in the context of the study of religions. She identifies five moments that define the contours of feminist research (p. 46):

1. Application of a hermeneutics of suspicion that recognizes the androcentric content and context of sources;

2. Attention to the retrieval of the religious history of women, alongside other marginalized groups;
3. Critique and transformation of established concepts, particularly universal and androcentric notions of human subjectivity;
4. Rejection of exclusionary modes of scholarship;
5. Self-reflexive scrutiny of assumptions and ideological commitments in order to avoid the assertion of new orthodoxies.

These steps constitute the basis for the critical transformation, by feminist discourses, of the epistemological grounds of the study of religions, a task that has been taken up vigorously.

Feminist scholars have identified central androcentric biases in the formulation of core disciplinary questions that were, historically, defined from the perspective of predominantly white, educated men. It is for this reason that feminists have been quick to criticize the textual bias of traditional studies for unthinkingly replicating elite, male perspectives and rendering the participation of women in religious traditions as either invisible, or as defined only in androcentric terms. Moreover, categories like *homo religiosus* and the insider/outsider debates have been censured for further enacting the marginalization of women. Rosalind Shaw argues, for example, that the *homo religiosus*, as representative of a religious collective, is generally “undifferentiated by gender, race, class or age, or defined explicitly as male” (1995, p. 67). The insider/outsider formulation also falls down on its failure to account for the “outsider” status of women within their own religious traditions. From the perspective of feminist analyses then, the main consequence of biased, androcentric scholarship has been the production of distorted, partial scholarly accounts that contain serious deficiencies at the basic level of data-collection and interpretation, as well as in the subsequent development of theoretical paradigms (see Gross, 1974, p. 7).

Randi Warne points out, however, that the partiality of traditional epistemological models is not solved by simply adding the study of women to existing scholarship: “Women were not simply ‘omitted’ through a[n] . . . act of scholarly absent-mindedness; women were excluded from . . . scholarship, as from ‘significant’ subject matter, as from positions of authority and power, when the basic ideas, definitions, principles and facts were being formulated” (2001, p. 150). A key feminist strategy for confronting gender bias has thus been to revisit traditional methodological debates and to propose critical adjustments to their fundamental premises. Grace Jantzen, for example, in her book *Becoming Divine* (1998), has argued that the traditional philosophy of religion, and Western thought more generally, has wielded theoretical categories that are considered neutral—for example, rationality, objectivity, truth, and God—but which are undeniably biased towards male values, authorizing masculine master-discourses at the expense of female perspectives. A

first step in confronting this bias and correcting its glaring lacunae has been to undertake what Jantzen calls “a radical deconstruction of both religion and secularism to make evident their unacknowledged dependence on alterities of race, gender, and sexuality” (Jantzen, 1998, p. 2). Subsequently, Jantzen seeks to develop alternative epistemologies that celebrate difference, acknowledge the subjective basis of knowledge production, and promote a variety of new models from a feminist perspective, including an emphasis on metaphors of natality and human flourishing as foundational principles.

Feminists have also challenged the conceptual assumptions of the phenomenology of religion, particularly its claim to undertake disinterested observation of religious phenomena and to replicate scientific empiricism at the methodological level. Given the feminist critique of the androcentric nature of the traditional study of religions, the claim of methodological disinterestedness is both demonstrably false and theoretically naive. Although the attempt to justify such a methodology on the grounds of the autonomy of disciplinary boundaries is understandable, feminism’s meta-theoretical orientation suggests, instead, a fluidity of critical perspectives and the benefits of multidisciplinary.

Related to the rejection of “disinterested” research and the rigid policing of disciplinary boundaries has been the development, by feminist scholars of religion, of a cooperative relationship with feminist theology. There are two main reasons for this: firstly, feminist theology, with its emphasis on the primacy of female experience for assessing the validity of religious doctrines and authority, offers both an academic method and a social vision with regard to the position of women within religious traditions; secondly, the hermeneutic orientations of many feminist theologians provide a promising and well-trodden pathway for the analysis and critique of patriarchal religious symbols, narratives, and discourses. Importantly, the affiliation with feminist theology has occurred at a time when many scholars of religious studies have made a concerted effort to delineate between their own nonconfessional, secular approach and the confessional stance of Christian theology. As feminist scholars of religion have sought to make connections with feminist theologians, they have called into question both the clarity of disciplinary boundaries and the purportedly secular orientation of religious studies.

Some scholars of religion have criticized the tendency of feminist scholars to reduce religious phenomena to their interrelation with cultural forms such as gender and class. Feminists have replied to the charge of reductionism by arguing that the acknowledgment of the social and political constitution of religious phenomena is a vital frame of reference for adequately theorizing difference in religious contexts. As Shaw has noted:

Attempting to understand a woman’s experience of religion in terms of (not just “in the context of”) her position within a male-dominated religious tradition is reductionist only if we have severed “religion” from

“power” in the first place. On the contrary, it would be a “reduction”—in the rather different sense of a diminished and distorted representation of her experience—to bracket off “male dominance” and “gender asymmetry” as a mere biographical backdrop to, but not really part of, the experiences which she calls “religious.” (Shaw, 1995, p. 70)

Feminism and gender studies offer innovative epistemological tools for scholarly reflection on the processes and politics of academic knowledge production, as well as for the understanding of religious phenomena. They insist on conceptual transformation in order to account for the fluid, heterogeneous, and polymorphic dimensions of religious expressions, and further maintain that the topography of religious studies must be mapped within a cultural arena that accounts for, and acknowledges, the contradictions and contexts that attend cultural symbolizations. The breadth and depth of feminist scholarship in the study of religions holds out the promise of a much-needed paradigm shift, one that is slowly, but surely, being realized.

BIBLIOGRAPHY

- Anderson, Pamela Sue. *A Feminist Philosophy of Religion: The Rationality and Myths of Religious Belief*. Oxford, 1998. Anderson queries traditional empirical realist accounts of theistic belief in the philosophy of religion and offers an analysis of the theoretical devices that exclude women. She develops a revisionist program using feminist frameworks and epistemologies that challenge traditional assumptions of sex and gender, and seeks to broaden the fundamental propositions of the philosophy of religion.
- Anderson, Pamela Sue, and Beverley Clack, eds. *Feminist Philosophy of Religion: Critical Readings*. London and New York, 2003. The first collection of key readings on the feminist philosophy of religion. It offers an introductory overview of the different types of feminist philosophies of religion, and considers some of the important religious concepts that are addressed by poststructuralist and psychoanalytical approaches. It includes essays from leading thinkers in the field, including Grace Jantzen, Alison Jasper, and Janet Martin Soskice.
- Butler, Judith P. *Gender Trouble: Feminism and the Subversion of Identity*. London and New York, 1990; reprint, 1999. A now classic study of gender theory and one of the most influential books in the field. It addresses the limits of French feminist theory for interrogating gender ontologies, proposing instead to understand gender construction in terms of parody and performativity. In the 1999 tenth-anniversary edition, Butler addresses the critical response to her original arguments and the ways her thinking has been adjusted as a result. Although its language is dense and often difficult, it is ultimately rewarding and is compulsory reading for anyone working with gender theory.
- Butler, Judith P., and Joan W. Scott, eds. *Feminists Theorize the Political*. New York and London, 1992. A rich collection of work by leading feminist scholars that addresses the relevance of poststructuralism to feminist politics. It affirms the importance of feminist theorizing for the transformation of gender relations and understandings and provides a useful overview of contemporary feminist debates operating at the meta-theoretical level.
- Castelli, Elizabeth A., and Rosamond C. Rodman, eds. *Women, Gender, Religion: A Reader*. New York and Basingstoke, U.K., 2001. This interdisciplinary and multitransnational volume highlights the contributions that different disciplinary approaches offer feminist and gender-theoretical studies of religion. It demonstrates the theoretical richness of contemporary debates in the field and includes contributions from Mieke Bal, Donna J. Haraway, Nancy Jay, Patricia Jeffery, Aihwa Ong, Oyèrónké Oyèwùmí, and Judith Plaskow, among others. A useful reader for the classroom.
- Derrida, Jacques. *Positions*. Translated by Alan Bass. London, 1981.
- Flax, Jane. *Thinking Fragments: Psychoanalysis, Feminism, and Postmodernism in the Contemporary West*. Berkeley, Los Angeles, and Oxford, 1990. Flax offers a wide-ranging and careful critique of psychoanalytic, feminist, and postmodern theory, examining the relations between them and evaluating the ways in which each set of theories succeeds in coming to terms with the crises of truth, knowledge, self, and power in contemporary Western culture. An essential text for thinking through the role of theory in humanities research.
- Franzmann, Majella. *Women and Religion*. New York and Oxford, 2000. *Women and Religion* is aimed at undergraduate students of religious studies and is an accessible and serious introduction to the process of studying and listening to women’s accounts of their own religious experiences. It discusses women’s roles, positions, and experiences within five religious traditions: Buddhism, Christianity, Islam, Hinduism, and Judaism. The topics that are covered include the widespread marginalization of women in the context of mainstream religious texts, rituals, and codes of law; women’s experiences within less orthodox religious contexts; women’s independent forms of religious expression; and women’s creative reimaginings of older forms of religion.
- Garry, Ann, and Marilyn Pearsall, eds. *Women, Knowledge, and Reality: Explorations in Feminist Philosophy*. 2d ed. London and New York, 1996. A broadly useful collection of twenty-five essays by well-known feminist scholars that addresses key issues in feminist philosophizing, including epistemology, metaphysics, mind-body dichotomies, gender and language, gender and race, and postmodern perspectives. It also offers a window into some of the most prominent controversies in feminist theory and philosophy.
- Gross, Rita M., ed. *Beyond Androcentrism: New Essays on Women and Religion*. Missoula, Mont., 1974. A classic collection of essays dealing with methodological issues in the study of women and religion.
- Jantzen, Grace. *Becoming Divine: Towards a Feminist Philosophy of Religion*. Manchester, U.K., 1998. A compelling and groundbreaking revision of the field of the philosophy of religion. Jantzen proposes a lucid and timely critique of the core preoccupations and epistemological assumptions of the field and sketches alternative philosophical models based on ideas

about gender, desire, community, and justice. Drawing on the critical thought of key continental thinkers like Derrida and Luce Irigaray, she further proposes an imaginative concept of the divine that challenges traditional dualistic thought and emphasizes process and becoming as a model of divinity. A substantial, solidly argued, and scholarly book, not aimed at beginners.

- Juschka, Darlene M., ed. *Feminism in the Study of Religion: A Reader*. London and New York, 2001. A useful anthology of the feminist theories that have been influential in the development of the feminist study of religion. The selected readings provide a wide range of perspectives and include the work of religious studies scholars, as well as scholars from other disciplines, such as Nancy Chodorow and Judith Butler. The book shows how debates about feminism within the study of religion have been influenced by broader theoretical discussions and offers an excellent overview of the range and breadth of feminist theorizing.
- King, Ursula, ed. *Religion and Gender*. Oxford and Cambridge, Mass., 1995. The standard textbook for the field of gender theory and the study of religion. The book brings together an international group of scholars, provides a systematic overview of the new theoretical and critical perspectives that gender theory offers religious studies and offers a comprehensive discussion of important methodological and hermeneutical issues. King's introduction provides a thorough and systematic outline of key developments and interventions in the field.
- King, Ursula, and Tina Beattie, eds. *Gender, Religion, and Diversity: Cross-Cultural Perspectives*. London and New York, 2004. An essential collection of twenty articles that provides a timely follow-up to King's well-received volume *Religion and Gender*. It is particularly useful for its assessment of the impact of postcolonial, queer, and gay and lesbian theories on feminist theory in the study of religions. Contributors include Melissa Raphael, Rita M. Gross, Morny Joy, and Diane Treacy-Cole. A key volume for advanced undergraduate and postgraduate teaching.
- Morgan, Sue. "Feminist Approaches." In *Approaches to the Study of Religions*, edited by Peter Connolly, pp. 42–72. London and New York, 1999. A comprehensive overview of the history and context of feminist approaches to the study of religions, including a helpful discussion of the relationship of these approaches to feminist theology.
- O'Connor, June. "The Epistemological Significance of Feminist Research in Religion." In *Religion and Gender*, edited by Ursula King, pp. 45–63. Oxford and Cambridge, Mass., 1995.

SIAN HAWTHORNE (2005)

FEMINISM: FRENCH FEMINISTS ON RELIGION

French feminism, understood here to refer to a variety of feminisms of sexual difference that have evolved in France since 1968, has become increasingly influential in religious studies in the late twentieth century and the early twenty-first century. While the term *French feminism* has been criticized widely as a construct of Anglophone academic feminists—a construct that ignores the majority of movements for women's rights in France—it has nevertheless become entrenched in common parlance in the English-speaking world, and the "French feminist" movement is widely understood to include such theorists as Hélène Cixous, Catherine Clément, Luce Irigaray, Julia Kristeva, and Monique Wittig. Unlike many Anglo-American feminists, these French thinkers are less concerned with liberal projects such as equal rights for women than with articulating the problematic of sexual difference that they perceive as fundamental to all forms of cultural expression in the West. The "French feminists," while representing diverse perspectives on this problematic, can be seen to be engaged in an ongoing conversation based on a set of shared premises that each adopts or critiques to varying degrees.

Although all of the French feminists are at least somewhat critical of the work of the French psychoanalytic theorist Jacques Lacan, most are influenced by his theories of subject formation and gender construction (the notable exception to this being Monique Wittig, who rejects psychoanalytic feminism as inherently apolitical). Central to much French feminist theory is the Lacanian view that the subject is linguistically constructed and that the earliest forays into language position the subject within an Oedipal, paternal order (governed by what Lacan calls the "Law of the Father" and symbolized by the phallus). Further, the French feminists tend to follow Lacan in seeing both gender and sexuality

as effects of the sociolinguistic foundations of subjectivity. Where most differ from Lacan is in their view that the “phallogocentric” Law of the Father is not the only possible social order and that feminist interventions in the linguistic and symbolic structures of both Western and non-Western cultures might open a path to a new, postpatriarchal world.

Additionally most of the French feminist theorists are influenced by the deconstructive literary-critical methodology and the philosophical thought of Jacques Derrida—although again not without reservations. Of particular significance is Derrida’s strategy of examining texts for the hidden meanings that both supplement and challenge any explicit signification as well as his claim that the Western philosophical and theological traditions have organized reality into opposing and hierarchically ordered binaries (e.g., presence/absence, good/evil, spirit/body, writing/speech), with man/woman serving as the paradigmatic example. Derrida’s notion of *différance*, an unending play of differing and deferring that both underlies and disrupts the “logocentric” production of univocal meaning, is also useful, as is his view that “woman” is the privileged site of *différance* (although this latter notion is also seen as somewhat problematic).

Beginning from their various understandings of these two thinkers then—and further influenced by such figures as Ferdinand de Saussure, Louis Althusser, Emmanuel Levinas, Roland Barthes, and Claude Lévi-Strauss—the French feminists have articulated a profoundly important body of philosophical and critical thought about the role of sexual difference in the Western tradition, and their work has many implications for the study of religion. The religious discourses of the West emerge as key instances of the “phallogocentrism” of Western thought (that is, of the central role occupied by the phallus and the written word), with the Jewish and Christian Father-God appearing as a symbol with even more power than those marshaled by the state to found a repressive model of subjectivity. The exclusive maleness of the Trinitarian divinity—God conceived as Father, Son, and Holy Spirit—is seen as paradigmatic of the “logic of the same” that the French feminists, and many other French theorists of the late twentieth century and early twenty-first century, trace from Plato through Hegel. This model of God comes under censure both for its eclipsing of the central importance of the mother in the process of (re)producing life and for its underwriting of a patriarchal model of the subject that reduces the feminine to the inferior “other” of the masculine. However, French feminist religious thought is as noteworthy for its constructive impulses as for its critique of established religions and is characterized, especially in later works, by attempts to imagine new ways of being religious that would allow the repressed feminine to find expression.

In this context French feminists have explored such areas of interest as the necessity for honoring (and sacralizing) mother-daughter genealogies; the relationship between divinity and subjectivity; the affinity of women for mysticism; the nature of Jewish and Christian notions of defile-

ment and sin; and the resources offered to Western feminists by non-Western religious traditions. What follows below is merely a suggestion, in somewhat arbitrary order, of the ways these themes find expression in the work of the French feminists, based primarily on the ways in which their work has been taken up by feminist scholars of religion. Further it should be noted that many aspects of French feminist theory that have no direct bearing on religion have found such wide acceptance in religious studies that the French feminists, especially Julia Kristeva and Luce Irigaray, are frequently referenced in feminist religious scholarship.

MATERNITY AND MOTHER-DAUGHTER GENEALOGIES. The issue of the erasure of mothers and daughters from the religious traditions of the West—and the necessity for reworking those traditions in ways that allow maternity to emerge as sacred in its own right—has generated much comment from the French feminists, and their thought in this area has in turn sparked much interest from feminist scholars of religion. In her 1987 “Stabat Mater” and *In the Beginning Was Love*, for example, Julia Kristeva offered a psychoanalytic reading of maternity intended to undermine what she saw as the phallogocentrism of Lacan’s theory of subject formation, a reading that has implications for patriarchal understandings of Christianity as well. In questioning the primacy accorded to the father by Lacan, Kristeva also challenges the appropriation of the Virgin Mary within the Catholic and Orthodox traditions, arguing that that appropriation erases the bodily nature of motherhood and domesticates maternity within a patriarchal order. For Kristeva, the bond between mother and infant is the precursor of the infant’s ability to relate to an Other, so that maternal love is the necessary condition of Christian agape.

Although Luce Irigaray too is very much influenced by psychoanalytic methods, she tends to approach her discussion of motherhood genealogically, sifting through the myths of the Western tradition for lost images of sacred mothers and daughters. In such essays as “The Forgotten Mystery of Female Ancestry” (1994), for example, she explores the story of Demeter and Persephone for what it has to tell the modern world about the ways the mother-daughter relationship, seen by Irigaray as the paradigmatic relationship between women, has been co-opted and subverted by patriarchy and argues that the re-sacralization of such relationships is essential to establishing social justice for women. This approach has not been uniformly welcomed by feminist scholars of religion, many of whom see it as yet another attempt to reclaim or reimagine goddess traditions that fail to intervene effectively in the male-centeredness of the Western religious traditions. Alternatively then in “When the Gods Are Born” (1991), Irigaray turns to Friedrich Nietzsche to show how the maternal function is appropriated both by the Greek gods Apollo and Dionysos, with whom Nietzsche was so fascinated, and by Nietzsche himself in his quest for a revaluation of all values. Behind this metaphorization of motherhood, Irigaray claims, lies a betrayal of the

body that is all too often repeated in Christian thinking about embodiment, although in her view it need not be.

SUBJECTIVITY AND DIVINITY. In *Speculum of the Other Woman* (1985) Irigaray examined psychoanalytic and philosophical theories of subjectivity to mount a critique of what she saw as the implicit masculinity of the Western subject. Although she paid little attention in that text to religion, her argument that Freudian and Platonic conceptions of knowledge function to render true sexual difference invisible was quickly taken up by feminist scholars of religion who saw in it a valuable resource for intervening in the patriarchal legacy of the Christian and Jewish traditions. In a subsequent and widely cited essay, “Divine Women” in *Sexes and Genealogies* (1993), Irigaray returned to this theme to assert the importance for women of a feminine conception of divinity. Borrowing from Ludwig Feuerbach’s claim that God is the idealized expression of “man’s” potential, Irigaray suggested that the Father-God of Christianity could only perform this function for men and that women need a feminine divine to ground the specifically feminine mode of subjectivity that she envisions.

In spite of her many theoretical differences from Irigaray, Monique Wittig implicitly follows this same line of reasoning in her radical lesbian interventions in the mythic and religious imagery of the West. Wittig rejects the psychoanalytic foundations of Irigaray’s project, and yet she too wants to reimagine divinity in a feminine mode, as is clear in such novels as *Les Guérillères* (1971), in which, for example, the Eve of the *Genesis* creation myth emerges as a superhuman solar goddess who willingly eats the forbidden fruit to gain divine knowledge, and *The Lesbian Body* (1975), in which the biblical *Song of Solomon* is reworked as a hymn of divinized love for another woman. In both of these texts Wittig creatively appropriates masculine gods from a wide range of religious traditions of the world to recast them as goddesses who then function as idealized images of the power of women to free themselves from masculine oppression and to become autonomous subjects in their own right.

WOMEN AND MYSTICISM. The importance of mystical religious experience as an expression of repressed elements of Western culture has long been a favorite theme of Catherine Clément. For Clément, who is strongly influenced by Lacanian psychoanalytic theory, every culture necessarily excludes from representation certain aspects of its own experience, and Western culture, with its demand for rationality, tends to exclude the nonrational. Because women have historically been excluded from full participation in society, they have borne the burden of representing these excluded, nonrepresentable elements. In *The Newly Born Woman* (co-written with Hélène Cixous, 1986) it is primarily the witch and the hysteric who capture Clément’s attention in this context, but in such later books as *Syncope: The Philosophy of Rapture* (1994) and *The Feminine and the Sacred* (cowritten with Julia Kristeva, 2001), Clément increasingly offers Asian mystics, especially practitioners of Tantric and other

forms of Yoga, as examples of the marginal figures who haunt and destabilize the masculine social order but do not have the power to overturn it. For Clément, these figures represent a privileged relationship to the sacred, outside of the confines of any form of organized religion.

Irigaray too has expressed interest in female mystical experience; indeed the essay “La Mystérique” in *Speculum* was one of her first interrogations of religious experience. In this essay she argued that mysticism was properly feminine because of its preference for embodied modes of knowledge over reason. She also suggested that in Christianity the relationship of mystic to God is essentially specular—that is, that the mystic attempts to obliterate her own imperfect identity in order to mirror divine perfection. In this way, for Irigaray, the role of the female mystic echoes the role of women in patriarchal society, where women are expected to mirror men’s selves to them to sustain the masculine illusion of self-sufficiency. Since *I Love to You* (1996), however, Irigaray has increasingly turned her attention to Yoga and to a lyrical appreciation of the importance, especially for women, of cultivating the breath, which she sees as having the power to undo such binaries as inside/outside, matter/spirit, and the like. In *Between East and West: From Singularity to Community* (2002) she offers her most extended consideration of the discipline of Yoga, contrasting it with Christian mysticism and suggesting that it might provide a key to rethinking the patriarchal religious traditions of the West.

DEFILEMENT AND SIN. Kristeva is widely known, both within and outside the context of religious studies, for her theorization of abjection—the quality of repulsiveness that haunts human experience of bodily fluids, seen as waste products with the power to defile whomever they touch. First elaborated in her *Powers of Horror: An Essay on Abjection* (1982), Kristeva’s interest in the abject is clearly related to her interest in the effacement of the maternal body in Western culture; as she sees it, the mother’s body must be abjected, or cast away, if the subject is to enter into the symbolic order of language. To the great interest of many scholars of religion, Kristeva has developed some of the religious implications of this theory in her psychoanalytic reading of the Levitical prohibitions in *Powers of Horror* and in the later “Reading the Bible” in *New Maladies of the Soul* (1995) and has linked the sacrificial logic of Judaism and Christianity with the primal matricide that she sees, pace Sigmund Freud, as underlying both culture and the individual subject.

Hélène Cixous’s approach to the problem of sin is intimately bound up with her notion of *écriture féminine*, a feminine practice of writing that reaches beyond what she sees as a masculine fear of otherness to enable new modes of relationship between self and other. For Cixous, writing is, or has the potential to become, a process that instantiates both the feminine (otherwise lost in the patriarchal order of Western culture) and God. This is so because writing participates in what Cixous calls the feminine economy, in which the self gives with no thought of return. To illustrate this notion,

Cixous has at several points taken up the *Genesis* creation story, reworking it so that it reveals the feminine economy underlying Eve's eating of the apple. For Cixous, that is, Eve eats the apple not in spite of the prohibition against doing so but precisely because of that prohibition; in choosing the pleasure of taking the fruit into herself over obedience to divine law, Eve enacts the economy that risks the loss of self to open the self up to the other. Eve is also exemplary of Cixous's notion, articulated in "Grace and Innocence: Heinrich von Kleist" (1991), that the only innocence worth having is a second innocence that comes after knowledge and guilt, after paradise is lost. For Cixous, in other words, the possibility of relationship with the other is of paramount importance, and the law that punishes Eve for pursuing that possibility is itself the source of "sin."

NON-WESTERN RESOURCES. As suggested above, several of the French feminists are especially noteworthy for their interest in what they see as the resources offered by non-Western religious traditions. In *Les Guérillères* and *The Lesbian Body*, for example, Wittig has mined Hindu and Buddhist mythologies as well as those of ancient Africa and Mesoamerica both for potentially feminist forms of religious worship and for goddesses, such as Kālī and the Aztec solar goddess Cihuacoatl, who represent the fierce, self-sustaining qualities of women, qualities that would help bring into being the radical lesbian culture that Wittig envisioned. As is the case when she invokes various figures from Judaism and Christianity, she freely appropriates from Asian traditions to suit her own purposes rather than to shed any light on those traditions as they are practiced.

Clément's consideration of non-Western traditions is arguably more respectful, although she has been criticized by some scholars for being overly romantic in her appreciation of those traditions. As noted above, *Syncope* reveals a fascination with Tantra and other forms of Yoga, practices that produce moments of rapture that, for Clément, are among the deepest expressions of both the sacred and the feminine. In the novel *Theo's Odyssey* (1999) too she explores such diverse traditions as Hinduism, Zen Buddhism, and African tribal religions to show what she sees as the healing power of ecstatic experience, a power linked in the narrative of the novel to being able both to mourn and to recapture the lost feminine.

It is in the work of Irigaray, perhaps, that the most dramatic turning to the East emerges. In such texts as "Practical Teachings: Love—Between Passion and Civility" in *I Love to You*, *The Age of the Breath* (1999), and *Between East and West*, Irigaray elaborates the value of Yogic discipline, specifically cultivation of the breath, for feminist religious practice. Here the breath is seen as paradigmatic of what Irigaray refers to as the "sensible transcendental," that is, the breath is both transcendent (of each individual's limitations) and immanent (in the body). Thus learning to practice the art of breathing offers a path out of the binaries of self/other, body/spirit, immanent/transcendent that haunt Western thought and underlie the repression of the feminine and the oppression of women.

FRENCH FEMINISM AND RELIGION: THE POSSIBILITIES. In its multifaceted approach to the problematic of sexual difference, French feminist thought is clearly a valuable resource for the study of religion. Indeed many of the themes sketched out above have yet to be extensively mined by feminist scholars of religion, and the work of only two of the thinkers discussed—Irigaray and Kristeva—has found wide acceptance in religious studies. Clearly though Clément, Cixous, and Wittig also have much to offer in the domain of religious thought, and it is certain that a further investigation of their work will shed light on the place of women in the patriarchal religious traditions of the West.

BIBLIOGRAPHY

- Cixous, Hélène. *Coming to Writing and Other Essays*. Edited by Deborah Jenson, translated by Sarah Cornell et al. Cambridge, Mass., 1991. This volume includes essays in which Cixous articulates her fascination with God, links the divine with the feminine and with writing, and explores the *Genesis* myth of Eve and the apple.
- Cixous, Hélène. "Grace and Innocence: Heinrich von Kleist." In *Readings: The Poetics of Blanchot, Joyce, Kafka, Kleist, Lispector, and Tsvetayeva*. Edited and translated by Verena Andermatt Conley. Minneapolis, 1991. This essay explores the dramatic work of Kleist as a pretext for raising questions about the nature of grace and innocence in political as well as theological contexts.
- Cixous, Hélène, and Catherine Clément. *The Newly Born Woman*. Translated by Betsy Wing. Minneapolis, 1986. This is the first major work of both authors to be translated into English, and it introduces themes that are essential to understanding their subsequent writings.
- Clément, Catherine. *Syncope: The Philosophy of Rapture*. Translated by Sally O'Driscoll and Deirdre M. Mahoney. Minneapolis, 1994. Throughout the essays of this collection, Clément draws on the mystical elements of both Western and Eastern religious traditions to elaborate her affinity for the kinds of nonrational experiences often repressed in Western culture.
- Clément, Catherine. *Theo's Odyssey*. Translated by Steve Cox and Ros Schwartz. New York, 1999.
- Clément, Catherine, and Julia Kristeva. *The Feminine and the Sacred*. Translated by Jane Marie Todd. New York, 2001. This volume consists of a collection of e-mailed and faxed letters in which Clément and Kristeva explore the relationship between women and the sacred and consider whether there exists a specifically feminine form of the sacred.
- Duchen, Clare. *Feminism in France: From May '68 to Mitterand*. London, 1986. This book offers a comprehensive overview of the development and intellectual context of French feminism.
- Grosz, Elizabeth. *Sexual Subversions: Three French Feminists*. Sydney, 1989. Although not concerned solely with religious themes, this book is a helpful introduction to the work of Julia Kristeva, Luce Irigaray, and Michèle Le Dœuff and elaborates themes that bear on their religious thought.
- Irigaray, Luce. *Speculum of the Other Woman*. Translated by Gillian C. Gill. Ithaca, N.Y., 1985. This is Irigaray's first major

- work to be translated into English, and its deconstructive critique of what she calls the “phallogocentrism” of Western thought lays the groundwork for her subsequent writings.
- Irigaray, Luce. “When the Gods Are Born.” In *Marine Lover of Friedrich Nietzsche*, pp. 121–190; translated by Gillian C. Gill. New York, 1991. This essay explores the ways Nietzsche’s suppression of the feminine echoes that found in Christianity.
- Irigaray, Luce. *Sexes and Genealogies*. Translated by Gillian C. Gill. New York, 1993. Included here are several important essays exemplifying Irigaray’s early religious thought.
- Irigaray, Luce. “Equal to Whom?” Translated by Robert Mazzola. In *The Essential Difference*, edited by Naomi Schor and Elizabeth Weed, pp. 59–76. Bloomington, Ind., 1994. This often referenced essay represents Irigaray’s response to the feminist theological project of Elisabeth Schüssler Fiorenza.
- Irigaray, Luce. “The Forgotten Mystery of Female Ancestry.” In *Thinking the Difference: For a Peaceful Revolution*, pp. 89–113. New York, 1994. In this essay Irigaray argues for the necessity of resacralizing mother-daughter genealogies.
- Irigaray, Luce. *I Love to You*. Translated by Alison Martin. New York, 1996.
- Irigaray, Luce. *The Age of the Breath*. Rüsselsheim, Germany, 1999. Irigaray develops her emerging emphasis on the sacred power of the breath.
- Irigaray, Luce. *Between East and West: From Singularity to Community*. Translated by Stephen Pluháček. New York, 2002. In this book Irigaray presents a meditation on the importance of the breath in Asian religious disciplines and suggests that the Yogic tradition offers resources for Western feminist religious practice.
- Joy, Morny, Kathleen O’Grady, and Judith L. Poxon, eds. *French Feminists on Religion: A Reader*. London, 2002. This volume consists of a selection of important excerpts from the writings of the French feminists on a variety of religious and theological themes. It includes a foreword by Catherine Clément.
- Joy, Morny, Kathleen O’Grady, and Judith L. Poxon, eds. *Religion in French Feminist Thought: Critical Perspectives*. London, 2003. This volume contains thirteen scholarly essays on aspects of the religious thought of the French feminists. It includes an introductory essay by Luce Irigaray.
- Kim, C. W. Maggie, Susan M. St. Ville, and Susan M. Simonaitis, eds. *Transfigurations: Theology and the French Feminists*. Minneapolis, 1993. This is an important early collection of scholarly papers on the emerging significance of French feminist thought for religious studies.
- Kristeva, Julia. *Powers of Horror: An Essay on Abjection*. Translated by Leon S. Roudiez. New York, 1982. In this early work Kristeva offers an extended exploration of her concept of abjection, a concept that has been influential among feminist scholars in religious studies.
- Kristeva, Julia. *In the Beginning Was Love: Psychoanalysis and Faith*. Translated by Arthur Goldhammer. New York, 1987. As the title suggests, the essays in this volume explore aspects of the relationship between religious belief and psychoanalysis; in “Credence-Credit,” Kristeva links Christian agape with the love between a mother and an infant.
- Kristeva, Julia. “Stabat Mater.” In *Tales of Love*, pp. 234–263. Translated by Leon S. Roudiez. New York, 1987. This widely cited essay offers a poetic and scholarly meditation on motherhood, focusing in particular on the appropriation of the Virgin Mary in the Catholic and Orthodox traditions of Christianity.
- Kristeva, Julia. “Reading the Bible.” In *New Maladies of the Soul*, pp. 115–126. Translated by Ross Guberman. New York, 1995. This essay offers a good example of Kristeva’s psychoanalytic reading of sacred texts. Here she applies her earlier work on abjection to *Leviticus* and demonstrates that the subject in the Hebrew Scriptures can be understood only in relation to the Other.
- Wittig, Monique. *Les Guérillères*. Translated by David Le Vay. New York, 1971. In this early novel Wittig offers her vision of Eve as a heroine who acts alone, without the company of Adam, to win essential knowledge for women. Wittig also invokes a number of warlike solar goddesses from ancient religious traditions around the world.
- Wittig, Monique. *The Lesbian Body*. Translated by David Le Vay. New York, 1975. Although not concerned primarily with religious themes, this novel nevertheless illustrates how Wittig reworks patriarchal religious figurations from a wide variety of traditions in her attempt to construct a lesbian imaginary.
- Wittig, Monique. *The Straight Mind and Other Essays*. Boston, 1992. This is a collection of essays in which Wittig articulates her understanding of feminism and challenges aspects of the projects of other French feminist theorists.

FEMINIST THEOLOGY

This entry consists of the following articles:

AN OVERVIEW
CHRISTIAN FEMINIST THEOLOGY

FEMINIST THEOLOGY: AN OVERVIEW

Theology, as rational exploration of the nature and traits of God or deity, is central to Christianity. While other religions, by definition, include some theological assumptions, exploring the nature of deity does not have the same prestige or importance in any other religion, including the other monotheistic religions. Therefore, it is sometimes claimed that explicit and deliberate attention to theology by adherents of other religions is more an imitation of Christianity than an indigenous pursuit. For Buddhism and other nontheistic religions, the term is especially awkward, and some commentators refuse to use the term even if they wish to do critical and constructive reflections on their traditions. Nevertheless, by extension, many non-Christians do use the term for their own reflective work.

Feminist theology originated among Christians in late 1960s and early 1970s, though Jewish feminist commentators quickly joined the discussion. But while Christian feminist theologians took up questions about the implications of feminism for traditional concepts of deity as a major concern, feminists in many other traditions bracketed the question of language and imagery of deity, claiming that other issues, such as women’s status under religious law, were much more pressing for women.

When discussing feminist theologies other than Christian feminist theology, the term *feminism* is equally problematic. In much of the world, the term has extremely negative connotations; people think it means an anti-men and anti-family movement that imposes Western values on other cultures. (This assessment of feminism tends to be promoted by religious conservatives who do not want women in their traditions to take a critical stance vis-à-vis the tradition.) Therefore, most people avoid the term, even if the work they are doing would qualify as feminist according to the Western use of the term. The term *feminist* implies taking a critical and constructive approach that centers on questions of women's well-being and agency to a religious tradition. Such critical and constructive tasks can involve changing or reinterpreting the tradition when it is found that women's well-being is compromised by traditional teachings and practices. The practice of feminist theology can also involve highlighting aspects of a tradition that have been largely neglected, but that do promote women's well-being. However, scholarship that simply provides more information about women's religious lives without invoking any critical perspectives does not qualify as feminist theology.

Feminist theologies generally take up two separate but interrelated tasks (these same tasks are also major topics in Christian feminist theology). Feminist reflection within a religious tradition is usually first sparked by women's resentment of their secondary and peripheral status in all the world's major religious traditions. This discovery leads to many explorations. The history of the tradition is reexamined to search out forgotten but more inspiring role models for women; sometimes this research leads to the conclusion that the religion actually had feminist values originally, but that these values gradually eroded under the weight of convention and tradition. The scriptures are examined anew to see if the traditional patriarchal interpretations are the only possible interpretations; many feminist interpreters of their scriptures claim that the scriptures do promote women's dignity, equality, and well-being, but that traditionalists have focused on a few passages, often taken out of context, that seem to promote male dominance. Rituals and liturgies are studied to see if they can be practiced in ways that are more inclusive of women. Sometimes this involves advocating the actual presence of women in the ritual spaces that were formerly closed to them. Sometimes it involves changing liturgical language to be gender-neutral and gender-inclusive. Sometimes it involves creating new rituals that meet women's religious needs more adequately. Finally, religious institutions are critiqued. Are women kept out of leadership roles? Is study of their tradition difficult for them? Do the laws and customs favor men over women? Feminists find traditional institutional set-ups quite inadequate if one defines the purpose of religious institutions as promoting the well-being of women equally with that of men.

Such questions are all part of the first agenda for feminist theology—reforming the tradition so that it serves

women's needs more adequately. However, feminist theological reflection does not always take up the second, more comprehensive and challenging task. Is the whole religious worldview implicated in the male dominance of the tradition and in its typical disregard for women's well-being? This question is extremely threatening to many religious people, regardless of their specific religious tradition, because a positive answer would involve rethinking the most fundamental assumptions of the tradition. Nevertheless, some feminist theologians have explored this question. One notable example is the critique of the assumed maleness of the deity, which has been made mainly by Jewish and Christian feminist theologians. Lurking behind the assumed maleness of the deity, some feminist theologians have also found questionable assumptions about the relationship between the deity and the world, as well as about many other basic theological issues. This question has not been raised so thoroughly in other religious traditions, though some feminists have questioned some basic Buddhist assumptions. The *guru* or religious teacher is usually male, raising the question of whether this practice limits Buddhist women in the same way the maleness of the deity is claimed to limit Jewish and Christian women? Would women *gurus* highlight teachings and practices that have been largely downplayed by male *gurus*? How helpful is the strong feminine imagery prevalent in some forms of Buddhism for women?

FEMINIST THEOLOGY IN JUDAISM AND ISLAM. Judaism and Islam are similar to each other in many ways. Both are strictly monotheistic and often use male imagery and language for the deity. Both value religious law over theology and pride themselves on providing a comprehensive overarching way of life for their followers. Both regard the sexes as complementary; each sex has its distinctive sphere, and it is often claimed that these separate spheres are of equal value. Both regard public religious observance as a male preserve and see women's roles as being centered in home and family. Both look extremely male-dominated by standard feminist assessments.

There have been strong women's movements in both traditions, but the movements are quite different, in part because the Jewish feminist movement is quite critical of the tradition, whereas Muslim women's movements often seek to educate women about rights they have under Muslim law that are often not fully observed. These differences are also due to the fact that the Jewish women's movement is centered in North America, where feminism is part of the culture, whereas Muslims must constantly deal with the accusation that any attempts to critique or reform Muslim practices surrounding gender are inappropriate forms of "westernization" and should be resisted.

Jewish feminist theology takes the form of both an attempt to include women in all aspects of traditional Judaism from which they have previously been excluded and an attempt to radically rethink the basic categories of Judaism, such as God, Torah, and Israel. Women have been ordained

as rabbis in all forms of Judaism, except the Orthodox movement. Jewish education for women and girls has grown exponentially since the 1960s, with the result that women insist on participating equally in the synagogue roles for which they are trained, and many women have taken on the obligations of daily prayer that are required only of men. But such egalitarian reforms do not go far enough, according to some Jewish feminists, who argue that Jewish theology must be entirely reconceptualized. For example, in addition to insisting that female imagery and language of deity is appropriate, many wish to challenge traditional images of the deity as a ruler with power over humanity and develop partnership models of the relationship between deity and humanity.

Muslims, both feminist and nonfeminist, insist that Islam improved the status of women over what it had been in pre-Islamic Arabia. Muslims also insist, correctly, that Islam gave women rights that women in Christian and Western countries have obtained only recently, even if these rights may seem inadequate from a contemporary feminist point of view. Many Muslims also insist that the primary problem for women is lack of education, not lack of rights. Women may not know what rights they have under Islamic law, and local customs have often eroded whatever rights they have. Some Muslim feminists have shown that many traditional beliefs about women's inferiority have no basis in genuine Muslim thought. The customs that feminists find most problematic, such as female circumcision, honor killings, and even veiling, have no basis in the Qur'ān, though modest dress is required for both women and men. However, the traditional practices of sexual segregation and the requirement of separate spheres for women and men have not been challenged consistently. Traditional theology and concepts of God have not been subjected to feminist analysis.

FEMINIST THEOLOGY IN HINDUISM AND BUDDHISM. The agenda for feminist theology has been largely determined by its Western and Christian practitioners. Some of their concerns merge well into the Hindu and Buddhist contexts, but others find no parallels in Hinduism and Buddhism. Generally, concerns about male-dominated religious institutions and women's access to prestigious religious practices are central to feminist critiques of these traditions. However, many of the more theological issues involving claims about the deity simply do not translate into Hindu or Buddhist contexts.

Hinduism, an umbrella term for extremely varied religious beliefs and practices in India, is as formally male-dominated as religion could possibly be. However, feminist commentators frequently point out that there are the formal law codes on the one hand, and there is religion as it is actually practiced on the other. In India, the former are usually more stringent than the latter. For example, women should not study the Sanskrit Vedas, but they do; a son is needed to light the parent's funeral pyre, but in the absence of a son, daughters sometimes light the fire. Especially in the twentieth century, most areas formerly closed to women were at

least formally opened to them. Nowadays, Sanskrit learning is largely accessible to women, and some *gūrīs* have transmitted their lineages to women disciples, who now hold positions of the highest religious authority. Additionally, offsetting the male dominance of much public religious practice, Hindu women have always had a rich repertoire of rituals for women led by women. The problem of the male deity does not exist in Hinduism, not because there are no male deities, but because there are also numerous female deities, many of them fierce and strong. Hinduism is largely a theistic religion, but it traditionally includes an almost unlimited number of ways to imagine deity. For all these reasons, as well as a general Asian reluctance to use the term *feminism*, there has been little feminist theology, per se, in the Hindu context, and few organized movements to improve women's status in religion. Nevertheless, women are quietly doing virtually everything religiously in Hinduism, at least in some places.

For Buddhism, the situation is somewhat different. Because of Buddhism's growing popularity in the West, it has encountered more direct feminist critiques and reconstructions. There is also a worldwide Buddhist women's movement. Its agenda is restoring the *bhikkhūnī* (nuns) ordination in places where it has been lost and improving the education and status of nuns everywhere, but it also addresses women's concerns more generally. Buddhist teachings are remarkably gender-neutral and gender-free, probably more so than those of any other religion. That is because all Buddhist teachings point to the ultimate irrelevance of gender and to the fact that, like all phenomena, gender lacks substantial reality and is, in that sense, illusory. Buddhism is also a nontheistic religion, so the problem of the male deity does not exist. The plentiful anthropomorphic imagery found in Mahāyāna and Vajrayāna Buddhism features many prominent and popular female representations, as well as male ones. The problem in Buddhism has been its institutional setup, which historically has been extremely male-dominated and much more favorable to men than to women. Thus, Buddhist feminists primarily point to this internal contradiction within Buddhism rather than suggesting profound changes in its worldview. Regarding institutional reforms, progress in Asia is slow, but things are definitely changing. In North America, which in many ways can take a fresh start, the situation is different. Many of the best-known Western teachers of Buddhism are women, as are about half the senior teachers. However, most of these women teachers do not explicitly deal with feminist issues.

FEMINIST THEOLOGY IN EAST ASIAN RELIGIONS. The major religions of East Asia—Confucianism and Daoism—are religions under stress due to the influence of missionaries and other Western critics of Chinese religion, as well as to the hostility of the Chinese Communist government to religion in any form. Consequently, there has been little feminist analysis or reconceptualization of these religions. A few Western-educated Chinese scholars have compared the teachings of these religions with the claims of modern femi-

nism and have found much room for dialogue between Daoism and feminism, but less consonance between Confucianism and feminism. It remains to be seen if these religions regain their former influence, but Daoism in particular does seem to be making a comeback and is also attracting non-Chinese followers. If they do make a comeback, these religions will also undoubtedly receive more attention from feminist theologians.

CONCLUSION. *Feminist theology* may or may not be an appropriate term for the feminist analysis that is done in non-monotheistic or nontheistic contexts. But it is important to recognize that critical and constructive work regarding gender has been done and is appropriate in those religious contexts. Too often in North American theological and academic studies of religion, the process of Christian theologizing is thoroughly discussed, whereas other religious traditions are presented only as static, completed systems of thought. The term *theology* does acknowledge that all religious traditions are changing and responding to current issues, including those brought about by the various feminist critiques of male-dominated religions and societies.

However, feminist theologies in the various religions are much more complex and nuanced than could be indicated within the limits of this short article. It is also important to note that even though several major religions have been discussed, many others, including all the world's indigenous traditions, have been omitted from this short survey.

BIBLIOGRAPHY

Three anthologies give systematic accounts of feminist theology in various religions: Paula M. Cooney, William R. Eakin, and Jay B. McDaniel, *After Patriarchy: Feminist Transformations of the World Religions* (Maryknoll, N.Y., 1991); Arvind Sharma and Katherine K. Young, *Feminism and World Religions* (Albany, 1999); and Arvind Sharma and Katherine K. Young, *Her Voice, Her Faith: Women Speak on World Religions* (Boulder, Colo., 2003). Two other anthologies have collected religious views on topics important to feminists: Daniel C. Maguire, ed., *Sacred Rights: The Case for Abortion and Contraception in World Religions* (Oxford, 2003), and Patricia Beattie Young, Mary E. Hunt, and Radhika Balakrishnan, eds., *Good Sex: Feminist Perspectives from the World's Religions* (New Brunswick, N.J., 2001). For an overview of feminist issues in the world's religions see Rita M. Gross, *Feminism and Religion: An Introduction* (Boston, 1996). The most important feminist analyses of Judaism include, in the order of their publication, Blu Greenberg, *On Women and Judaism: A View from Tradition* (Philadelphia, 1981); Judith Plaskow, *Standing Again at Sinai: Judaism from a Feminist Perspective* (San Francisco, 1990); and Rachel Adler, *Engendering Judaism: An Inclusive Theology and Ethics* (Boston, 1998). Many books on women and Islam have appeared, but

most of them are descriptive rather than analytical. More analytical discussions include Barbara Freyer Stowasser's *Women in the Qur'an: Traditions and Interpretations* (Oxford, 1994) and Fatima Mernissi's *The Veil and the Male Elite: A Feminist Interpretation of Women's Rights in Islam* (Reading, Mass., 1991). For a gripping autobiographical account, *The Hidden Face of Eve: Women in the Arab World* (Boston, 1980), by the well-known feminist activist Nawal el Saadawi, is recommended. Finally, the anthology *Progressive Muslims: On Justice, Gender, and Pluralism* (Oxford, 2003), edited by Omid Safi, includes a section on gender issues in Islam. Many fine anthropological accounts on Hindu women have appeared, so that earlier generalizations about Hindu women are no longer relevant or appropriate. Nevertheless, there are few explicitly feminist analyses of Hinduism. One of the few such books is Alf Hiltebeitel and Kathleen M. Erndl, *Is the Goddess a Feminist?: The Politics of South Asian Goddesses* (Sheffield, U.K., 2000). The most thorough feminist analysis of Buddhism is Rita M. Gross, *Buddhism after Patriarchy: A Feminist History, Analysis, and Reconstruction of Buddhism* (Albany, 1993). Three anthologies on women and Buddhism also offer useful feminist perspectives: Marianne Dresser, ed., *Buddhist Women on the Edge: Contemporary Perspectives from the Western Frontier* (Berkeley, 1996); Lenore Friedman and Susan Moon, eds., *Being Bodies: Buddhist Women on the Paradox of Embodiment* (Boston, 1997); and Karma Lekshe Tsomo, *Innovative Buddhist Women, Swimming against the Stream* (Richmond, U.K., 2000).

RITA M. GROSS (2005)

FEMINIST THEOLOGY: CHRISTIAN FEMINIST THEOLOGY

Christianity's encounter with feminism might be one of the most significant revolutions ever to happen within the Christian tradition, rivaling the impact of the early councils or the reformation in its implications for the future of Christian belief and practice. Although feminism continues to be marginalized, ignored, or condemned by many Christians, its effects are felt across the whole spectrum of contemporary Christianity.

Feminist theology emerged in the United States during the 1960s when so-called second wave feminism was making an impact on academic ideas as well as on western politics and culture. European feminists have made their own distinctive contribution. In the last forty years, feminist theology has become a global movement representing a wide range of cultural, political, and religious perspectives. The Ecumenical Association of Third-World Theologians (EAT-WOT) has provided a significant forum for the development of feminist theologies in engagement with a wide range of women's concerns and experiences from all five continents.

However, it is also true that women have been doing theology since the early church, and the task of feminist theologians is as much about retrieving the neglected voices of women of the past as it is about formulating new theological symbols and values for the present and the future. *The*

Woman's Bible, a critique of Christianity produced in the 1890s by American suffragist Elizabeth Cady Stanton (1815–1902), is regarded as an important founding moment in Christian feminism. Today, feminist theological reflection includes academic scholarship as well as literature, music, liturgy, and a range of insights drawn from the exploration of women's experiences in many different contexts. Although feminist theology is not simply another form of liberation theology, its challenge to the oppression and exploitation of women gives it a strongly liberationist perspective.

The publication of Valerie Saiving's article in 1960, "The Human Situation: A Feminine View" (Saiving, 1992), has with hindsight been recognized as a key event in the contemporary development of feminist theology. Saiving asked the extent to which Christian concepts of sin (pride, ambition, self-centeredness) are influenced by masculine perspectives so that they do not reflect feminine sins (self-denigration, triviality, lack of focus). Feminist theology thus began to question much of what had gone before, not only in terms of women's place in the church, but more generally in terms of the gendering of theological ideas and in the implicit and explicit privileging of the masculine over the feminine at every level of Christian doctrine and practice.

The encounter between feminism and theology was given added impetus by the Second Vatican Council (1962–1965), which encouraged Roman Catholics to enter into a positive engagement with the non-Catholic world. Pioneers such as Rosemary Radford Ruether, Mary Daly, and Elizabeth Johnson were Catholics working in the initially optimistic climate that followed the council. Daly's 1968 book, *The Church and the Second Sex*, offered a hard-hitting feminist critique of Christian misogyny, but still expressed hope that the church could be transformed. Later editions include disclaimers in which Daly makes clear her subsequent rejection of Christianity as irredeemably patriarchal (Daly, 1985). Daphne Hampson has come to the same conclusion about the impossibility of reconciliation between feminism and the Christian tradition (Hampson, 1996).

Nevertheless, feminist theology brings together academics, activists, and believers from all denominations, men as well as women, who believe that the Christian faith, however problematic, can be transformed and continues to offer a message of hope for the world. While it is impossible to do justice to the full range of feminist theological reflection in a short survey, this is an overview of general trends and significant developments in a field of study that is constantly evolving as new perspectives emerge.

WOMEN'S EXPERIENCE. In 1983, Ruether defined "the critical principle of feminist theology" as "the promotion of the full humanity of women" (Ruether, 1992, p. 18). This definition has inspired a process of theological reflection that begins with women's experience, in recognition of the fact that theology has been almost exclusively informed by the experiences of men. Although theology as a discipline is concerned with reflection upon the nature of God as revealed in scrip-

ture, the natural law, and the prayerful use of human reason (described by St. Anselm as "faith seeking understanding"), feminists point out the extent to which theological knowledge is shaped by the cultural context and bodily specificity of the theologian, including his or her gendered embodiment. Strictly speaking, therefore, the appeal to women's experience need not be seen as an attempt to construct a theory of God from the starting point of woman but rather as a corrective to the androcentrism of existing theological discourse. If Christianity recognizes the ultimate mystery and unspeakability of God, it also believes that it can and, indeed, must speak of God in the language and concepts of human embodiment because it believes that God is supremely and (for some) uniquely and exclusively revealed in the human person of Jesus Christ and in the Bible. If male and female are both made in the image of God (*Gen.* 1:27), then the human understanding of God requires the theological participation of both sexes. To bring women's perspectives into theology is not simply to "add women and stir," but to introduce a catalyst capable of initiating radical transformation.

Nevertheless, the appeal to women's experience has been criticized by some feminists and by some antagonistic to feminism. An early and significant critique came from those who argued that the work of theologians such as Ruether and Daly was premised on the experience of white Western women, and that the category of "woman" did not reflect the plurality and diversity of women's experiences in different contexts. As a result, feminist theology now embraces a wide range of perspectives and methods. In seeking to express both a relationship to and a distance from Western feminism, these diverse theologies use a variety of names, including, among others, womanist theology (arising out of the experiences of black North American women), *dalit* women's theology (which explores the situation of low-caste Christian women in India), concerned African women's theology (primarily focusing on the encounter between African culture, Christianity, and feminism), *minjung* feminist theology (Korean women's theology from the perspective of the poor and the marginalized), and *mujerista* theology (informed by the experiences of Hispanic-American women) (King, 1994). This plurality means that methods and sources extend far beyond those regarded as theological in the strictly academic sense, including, among others, oral traditions, literature, art, biography, and autobiography.

While these theologies are often based on a liberal or liberationist approach, since the early 1990s a growing number of feminist theologians have adopted a postmodernist perspective informed by the deconstructive and poststructuralist approaches of secular feminist theory, and by the work of critical theorists such as Jacques Derrida, Michel Foucault, Luce Irigaray, and Julia Kristeva (Chopp and Davaney, 1997; Kim, St. Ville, and Simonaitis, 1993). From this perspective, the appeal to women's experience is problematized by the recognition that all experience is socially constructed and linguistically mediated, and it is argued that feminist

theology needs to concern itself with the analysis of theological language and symbolism. Although this approach has gained some currency, there has been considerable debate over the extent to which political concerns for justice become marginalized if feminist theology aligns itself too closely with theory at the expense of practice. As Janet Martin Soskice notes, "Feminism in theology may lack the theoretical framework of some of its sister subjects, but its prospect for reaching millions of lives, including those of the world's poorest women, is immense" (Soskice in Soskice and Lipton, 2003, p. 8).

Another critique of the appeal to experience comes from those who argue that theological reflection cannot begin with the individual subject but must take the form of a prayerful encounter with the revelation of God. From this perspective, while it is right to criticize excessive androcentrism as a failing in the theological tradition, the corrective is not to introduce another foundational form of gendered subjectivity but to rediscover the importance of doing theology in a space of communication between human awareness and divine revelation within the context of the Christian community (Martin, 1994). Feminists such as Linda Woodhead and Susan Parsons have raised similar concerns, arguing that feminist theology risks the sacrifice of a vital transcendent perspective of faith and hope in favor of a more modernist and individualistic rhetoric of women's liberation (Woodhead, 1997; Parsons, 2000).

THEOLOGICAL LANGUAGE. Potentially the most challenging aspect of feminist theology is its questioning of Christian concepts of God. At one level, this involves the recognition that theological language is almost exclusively masculine, with God being referred to in concepts associated with fatherhood and maleness, and never with images that evoke maternal feminine characteristics. Although the idea of referring to God as "mother" or "she" is anathema to many modern Christians, theological language was in the past much more fluid in terms of gender, frequently referring to God, Christ, and the Holy Spirit in maternal metaphors and symbols. Feminist theologians whose work is informed by critical theory reject the appeal to inclusive language as masking rather than resolving the problem of androcentrism. They would argue that symbols and language must be deconstructed in order to identify the dynamics of power, dissimulation, and ideological manipulation that are encoded within the structures, values, and relationships of theological narratives.

The critique of masculine theological language also challenges the privileging of the Father-Son relationship between God and Jesus Christ, and the representation of the relationship among the three persons of the Trinity, perceived as masculine. Catherine Mowry LaCugna, in *God for Us*, argues that western theology constructed its doctrine of the Trinity around a hierarchy of relationships that in turn lends justification to social hierarchies based on submission to patriarchal authority figures. She seeks the reclamation of a more interpersonal understanding of the Trinity through

an appeal to pre-Nicene theology, particularly that of the Cappadocians, arguing that the doctrine of the Trinity is practical and has radical social implications (LaCugna, 1992). Elizabeth Johnson, in her influential book *She Who Is*, argues that the mystery of God as Trinity can only be expressed through a rich plurality of images and associations, including both male and female terms (Johnson 1992).

While these constitute feminist refigurings of, rather than departures from, traditional theology, some radical feminist theologians (sometimes referred to in the feminized form as theologians) would associate the Judeo-Christian tradition with the triumph of patriarchal monotheism over the more matriarchal goddess religions. They would advocate the reclamation of goddess worship and symbolism as a resource for women's spirituality. While for some this entails the transformation rather than the rejection of Christianity, including the reclamation of the Virgin Mary as the goddess of the Christian tradition, others would see it as a form of post-Christian feminist spirituality that liberates women from the constraints of patriarchal religion (Baring and Cashford, 1991).

THE BIBLE. Feminist biblical criticism has in its short history exhibited a dynamic and innovative capacity for scriptural interpretation, discovering in the biblical narratives a multifaceted resource for the critique of patriarchy and for the reclamation of women's stories of redemption. Feminist hermeneutics entail the recognition that the meaning of a text depends both upon the context in which it was written and the context in which it is interpreted. To consciously read the Bible as a woman and to resist dominant, androcentric readings is to discover previously unrecognized challenges and meanings. This also involves the acknowledgment that the authors of scripture were male and that the Bible, like every other text, is situated within particular cultural and historical contexts that reflect the perspectives of its authors. The quest for revelation thus becomes a struggle with the text, and a resistance to authoritative readings that justify the subordination or oppression of women. Elisabeth Schüssler Fiorenza pioneered a hermeneutical approach that seeks to reclaim the lives of the women around Jesus and in the early church, arguing that the first Christian communities were radically egalitarian and that women shared roles of discipleship and leadership with their male counterparts (Schüssler Fiorenza, 1994a and 1994b). No less influential is the rhetorical criticism and exegesis of Phyllis Trible, whose readings of the Hebrew scriptures challenge existing orthodoxies, particularly with regard to the construction of sexual hierarchies through an appeal to the story of *Genesis* 2–3 (Trible, 1978).

The participation of women from many different cultural perspectives also brings rich new insights to biblical interpretation (King, 1994, pp. 183–242). The Womanist theologian, Delores Williams, proposes a reading of the story of Hagar in *Genesis* 16–21 as one in which Hagar, the Egyptian slave woman persecuted and sexually exploited in the pa-

triarchal household of Abraham, reflects the experiences of black women in the United States (Williams, 1993). The women disciples of Jesus and those who feature in the Pauline letters have been the focus of extensive feminist study, as have the Pauline injunctions on marriage and on women's behavior in church.

While all feminist biblical criticism is to some extent deconstructive, in recent years there has been a significant shift in some feminist approaches to the Bible, through the adoption of a more theoretical linguistic approach to the study of texts. This includes asking to what extent women in ancient literature are in fact ciphers employed by male writers rather than reliable historical accounts. From this perspective, the attempt to reconstruct women's histories from biblical and early Christian texts becomes a more challenging task than has previously been recognized (Clark, 1998).

EMBODIMENT, SEXUALITY, AND NATURE. The position of the female body in Christian worship, language, and ethics is a central concern of feminist theology (Isherwood and Stuart 1998). Again, the ways in which this is addressed vary widely according to different theological perspectives and contexts. For some, the belief that God became incarnate in Jesus Christ raises a fundamental question about the place of the female body in the doctrine of salvation, summarized in Ruether's question, "Can a male savior save women?" (Ruether, 1992). For Ruether, the answer is dependent upon the recognition that Christ's maleness is a contingency of his humanity, and does not have doctrinal significance. Sarah Coakley analyzes the representation of sexuality and the body in Christian texts to show the ambiguity and inherent instability of theological concepts of gender (Coakley, 2002). Others explore the significance of the Virgin Mary as one who bodily participated in the incarnation in a way that has redemptive significance for the female body (Beattie, 2002).

Related to questions about the masculinity of Christ are questions about the role of the female body in relation to Christian symbols and sacraments. Given the relationship between the shedding of Christ's blood, the doctrine of salvation, and the doctrine of the Eucharist, some women theologians ask what symbolic associations might be discovered between the body of Christ and the body of women in terms of their capacity to nurture, to bleed, and to give new life. From an anthropological perspective, Nancy Jay's work has been influential in exploring the relationship between religious concepts of sacrifice and taboos against women priests associated with fears of menstruation and childbirth (Jay, 1992). Bynum has shown that there was a close association between female embodiment and the body of Christ in medieval women's devotions, based on the belief that the divinity of Christ derived from God the Father, but his humanity derived from the female flesh of his mother (Bynum, 1992).

Another area of widespread concern to feminist theologians is the question of female sexuality, which has almost universally been portrayed in negative terms in Christian writings. While obedient and chaste women modeled on the

Virgin Mary have been seen as worthy exemplars of Christian womanhood, female sexuality associated with Eve, temptation, sin, and death has been viewed with fear and condemnation. Christian feminists seek the celebration of sexuality in general and female sexuality in particular as a God-given dimension of human embodiment. For some, this includes the affirmation of lesbian sexuality and its capacity to express Christian love and friendship between women (Stuart, 1995). For others, the primary concern is the extent to which women and children continue to be victims of sexual violence and abuse, both with regard to the ongoing problem of domestic violence and to the burgeoning problem of the global sex trade (King, 1994, pp. 105–79).

Questions about the theological significance of the female body open into wider concerns regarding Christian attitudes toward nature, given the long-standing association between female embodiment and nature. Women's theologies are thus often deeply influenced by the arguments and ideas of eco-feminism, seeking a way beyond modern attitudes of domination and exploitation in order to rediscover a sense of the goodness of creation and the interdependence of the relationship between humankind and the natural world (McFague, 1993).

At a time when many secular academics regard the whole pursuit of theology as moribund or anachronistic, it is in the field of feminist studies that this discipline continues to develop with vitality and intellectual vigor, exposing the extent to which the practices and methods of Christian scholarship have been intellectually limited by the unacknowledged biases of patriarchy and androcentrism. To say this is not to dismiss the legitimate criticisms that have been made of some feminist arguments, nor is it to deny that feminists too bring their own ideological presuppositions and cultural assumptions to their task. Feminist theologians face complex challenges, not least in accommodating the perspectives of those women who resist some or all of their claims because they still find in traditional forms of Christianity a deep source of meaning and inspiration. The challenge is to sustain a sense of the Christian community as inclusive, interactive, and mutually responsible for the creation of a materially significant culture of redemptive hope, while continuing to work for the transformation of a tradition that is also associated with a long and tragic history of violence, sexual oppression, and abusive power relations, which have been both sanctioned and challenged by the Christian understanding of God.

BIBLIOGRAPHY

- Baring, Anne, and Jules Cashford. *The Myth of the Goddess: Evolution of an Image*. London, 1991. The authors offer an in-depth study of goddess myths and religions that they argue have been repressed or annihilated by Judeo-Christian patriarchal monotheism.
- Beattie, Tina. *God's Mother, Eve's Advocate: A Marian Narrative of Women's Salvation*. London and New York, 2002. Beattie reads the texts of the early church and recent Catholic theology in engagement with Luce Irigaray and other critical theorists, to argue for the symbolic reclamation of Eve and Mary in the Christian story.
- Bynum, Caroline Walker. *Fragmentation and Redemption: Essays on Gender and the Human Body in Medieval Religion*. New York, 1992. Bynum's study of medieval attitudes towards gender and the body in the writings of Christian mystics, saints, and theologians has proved an enduring resource for feminist scholarship.
- Chopp, Rebecca S., and Sheila Greeve Davaney, eds. *Horizons in Feminist Theology: Identity, Tradition, and Norms*. Minneapolis, 1997. Chopp and Davaney bring together a range of feminist theologians in essays that explore the significance of feminist theory for feminist theology. For a debate concerning the relevance and the limitations of this approach, see also Emily R. Neil et al., "Roundtable Discussion: From Generation to Generation. Horizons in Feminist Theology or Reinventing the Wheel?" in *The Journal of Feminist Studies in Religion* 15, no. 1 (1999): 102–138.
- Clark, Elizabeth A. "The Lady Vanishes: Dilemmas of a Feminist Historian after the 'Linguistic Turn'" *Church History* 67, no. 1 (1998): 1–31. Clark's article is informative for those seeking to understand the problematic relationship between poststructuralist and deconstructive approaches to language, and the feminist retrievals of early Christian women's histories.
- Coakley, Sarah. *Powers and Submission: Spirituality, Philosophy, and Gender*. Oxford, and Malden, Mass., 2002. Coakley brings a finely honed feminist sensibility to her reading of the Christian tradition in these wide-ranging essays analyzing western philosophy and theology.
- Daly, Mary. *The Church and the Second Sex*. Boston, 1985. First published in 1968, reissued in 1975 with an autobiographical preface and feminist postchristian introduction, and in 1985 with a new archaic afterword; the various versions of this book offer an insight into one woman's journey from radical Catholic theologian to controversial post-Christian feminist.
- Hampson, Daphne. *After Christianity*. London, 1996. Hampson argues that Christianity is neither true nor moral and must be rejected as a false patriarchal myth to allow for new ways of conceptualizing God that more truthfully reflect the experiences and spiritual ideals of people today.
- Isherwood, Lisa, and Elizabeth Stuart. *Introducing Body Theology*. Sheffield, U.K., 1998. This book provides a good survey of feminist concerns regarding the theological representation of the relationship between the body, sexuality, and spirituality.
- Jay, Nancy. *Throughout Your Generations Forever: Sacrifice, Religion, and Paternity*. Chicago, 1992. Jay's interdisciplinary study of sacrifice leads her to argue that blood sacrifice is a means of establishing and sustaining patriarchal social structures that allow paternal lineage to transcend the maternal relationship established by childbirth and motherhood.
- Johnson, Elizabeth A. *She Who Is: The Mystery of God in Feminist Theological Discourse*. New York, 1992. Johnson offers a feminist re-evaluation of the Christian doctrine of the Trinity in a careful reading of the Catholic tradition and its influential thinkers such as Thomas Aquinas and Karl Rahner.
- Kim, C.W. Maggie, Susan M. St. Ville, and Susan M. Simonaitis, eds. *Transfigurations: Theology & The French Feminists*. Minneapolis, 1993. This edited collection of essays offers a critical engagement with feminist theology from the perspective of French feminism.
- King, Ursula, ed. *Feminist Theology from the Third World: A Reader*. London and Maryknoll, N.Y., 1994. King's selection of feminist theological writings from around the world gives a sense of the range of hopes and struggles that informs Christian women in their engagement with feminism and of the methods and perspectives that shape their work.
- LaCugna, Catherine Mowry. *God for Us: The Trinity and Christian Life*. San Francisco, 1992. LaCugna interprets the doctrine of the Trinity as having far-reaching practical implications for human relationships, through the ways in which theology understands the action of God in the world.
- Martin, Francis. *The Feminist Question: Feminist Theology in the Light of Christian Tradition*. (Edinburgh, 1994). While Martin acknowledges the importance of feminist theology, he is critical of its foundationalism in appealing to the individual experiencing subject as the source of theological knowledge.
- McFague, Sallie. *The Body of God: An Ecological Theology*. Minneapolis, 1993. Using the idea of the universe as a metaphor for the body of God, McFague seeks the transformation of Christian attitudes to the body and creation. Although her work has been criticized by some scholars for its misreading of the Christian tradition, she remains an influential resource for feminist environmental theology.
- Parsons, Susan Frank. "Accounting for Hope: Feminist Theology as Fundamental Theology" in *Challenging Women's Orthodoxies in the Context of Faith*. Aldershot, U.K., 2003. Parsons criticizes the work of some feminist theologians, particularly Ruether and Fiorenza, for a nihilistic tendency in which the hope of the Christian faith in God is negated in favor of a politicized approach that fails to recognize its own collusion in perpetuating modern forms of power and control.
- Ruether, Rosemary Radford. *Sexism and God-Talk: Towards a Feminist Theology*. London, 1992; first published, 1983. One of the pioneering books of feminist theology, Ruether's work, although sometimes criticized for its liberal orientation, remains highly influential for a new generation of feminist scholars.
- Saiving, Valerie. "The Human Situation: A Feminine View," first published 1960. In *Womanspirit Rising: A Feminist Reader in Religion*, edited by Carol P. Christ and Judith Plaskow. San Francisco, 1992. Saiving's essay is widely recognized as a pioneering analysis of the gendering of sin in the Christian tradition.
- Schüssler Fiorenza, Elisabeth. *In Memory of Her: A Feminist Theological Reconstruction of Christian Origins*, second edition,

- first published 1983. London, 1994a. Although her historical interpretation of women in the early Church has been criticized, Schüssler Fiorenza's work remains an important resource for feminist biblical hermeneutics.
- Schüssler Fiorenza, Elisabeth, ed. *Searching the Scriptures*, Volumes 1 and 2. New York and London, 1994b. This two-volume edited collection provides an excellent insight into the methods, approaches, and concerns of feminist biblical scholars.
- Soskice, Janet Martin and Diana Lipton, eds. *Feminism & Theology*. Oxford, 2003. This anthology of writings by Jewish and Christian women reflects the ways in which the encounter between feminism and theology is explored in literature, historical studies, theological reflection, and biblical studies.
- Stuart, Elizabeth. *Just Good Friends: Towards a Lesbian and Gay Theology of Relationships*. London, 1995. Stuart asks what it would mean for the church to accept gays and lesbians as equal in the eyes of God, and what heterosexuals might learn from this acceptance.
- Trible, Phyllis. *God and the Rhetoric of Sexuality*. Minneapolis, 1978. Tribble's acclaimed study of the Hebrew scriptures, including her vastly influential re-reading of the story of *Genesis* 1–3, continues to be an important resource for feminist biblical criticism.
- Trible, Phyllis. *Texts of Terror: Literary-Feminist Readings of Biblical Narratives*. London and Minneapolis, 2003; first published 1984. Tribble analyzes some of the most problematic texts of the Hebrew scriptures in their representation of violence against women and shows how they can be read as a divine protest against rather than an endorsement of such violence.
- Williams, Delores S. *Sisters in the Wilderness: The Challenge of Womanist God-Talk*. Maryknoll, N.Y., 1993. Williams presents a Womanist theology in which she examines the doctrines and values of Christianity from the perspective of black American women's experiences, including their history of slavery and sexual and economic exploitation.
- Woodhead, Linda. "Spiritualising the Sacred: A Critique of Feminist Theology." In *Modern Theology* 13, no. 2. (April 1997). Woodhead offers a critique of feminist theology for failing to represent the true interests of women through its conformity to modern individualistic ideas of spirituality and its neglect of traditional theological methods materially rooted in communal practices of faithfulness and prayer.

TINA BEATTIE (2005)

FÉNELON, FRANÇOIS (1651–1715), was a French philosopher, theologian, and educator, and Roman Catholic archbishop of Cambrai. Born in the Château de Fénelon in Périgord, François de Salignac de la Mothe Fénelon, an aristocrat by birth and upbringing, spent the first years of his education at home. After the death of his father in 1663, he was sent to study with the Jesuits at the University of Cahors; then, in 1665, he went to Paris, where he studied philosophy and theology at the College of Le Plessis. Finally, probably in 1672, he entered the Seminary of Saint-Sulpice to prepare for the priesthood.

Ordained at the age of twenty-four, Fénelon worked in the parish of Saint-Sulpice from 1675 to 1678. In 1678 he became superior of the Convent of New Catholics (a position he held until 1689), where he strengthened the faith of young women recently converted to the Catholic church. In August 1689 Louis XIV chose him to be private tutor to his grandson, the duke of Burgundy, a post Fénelon held until 1699. In 1693 he was elected a member of the French Academy and in 1695 was nominated archbishop of Cambrai. Fénelon spent the final years of his life as a successful administrator and zealous bishop.

Fénelon's writings concern pedagogy, literature, politics, philosophy, and theology. In his *Traité de l'éducation des filles* (1687), for example, foreshadowing Rousseau's *Émile*, one finds his educational philosophy. His literary ability and political ideas are felicitously woven together in his *Les aventures de Télémaque* (1699), a mythological novel written for the instruction of the dauphin. Here allegory dissimulates the real import of his views. Fénelon depicts the confused ideal of a monarchy at once absolute, aristocratic, and urbane, while condemning indirectly the despotic and bellicose reign of Louis XIV. The views expressed in this novel rounded inevitably to his discredit in the eyes of the king and his loss of favor at court.

It is the controversy over quietism, however, that has weighed most heavily on the memory of Fénelon, making it difficult to give an objective assessment of him. His undulating and generous nature had made him adopt the principle of the "dévotion idéale" professed by Madame Guyon (1648–1717), a mystic Fénelon had met and befriended in 1688: The soul, completely absorbed by the love of God, becomes indifferent to everything, even its own life and salvation. Feeling obliged, however, to justify himself before the public, Fénelon formally disowned the excesses and consequences of quietism in his *L'explication des maximes des saints sur la vie intérieure* (1697). Nevertheless, in 1699 the Holy See decided to condemn twenty-three propositions extracted from this book.

Yet, with his aristocratic cast of mind and his poetic makeup, Fénelon exercised a strong influence on his contemporaries and left a mark on the history of spirituality. Original insofar as he adopted a scale of values that was personal to him, he provided a philosophical justification for his attitude toward spiritual matters by establishing as the basis of his spiritual system two notions directly connected with each other: pure love and indifference, the latter being the psychological state in which pure love is born.

Fénelon's life and works witness to the more human and subtle exigencies of French spirituality. He was aware of his own defects yet was too deeply committed to the world to have the courage to deny it. His troubled and sublime spirit needed more the experience of God and less the life of the intellect; more freedom for the soul, more spontaneity, and less dedication to the rewards of piety.

SEE ALSO Quietism.

BIBLIOGRAPHY

There have been numerous editions of Fénelon's *Œuvres complètes*: Paris, 1810; Versailles, 1820–1830; Paris, 1835; Paris, 1851–1852; and Paris, 1854. For general information about Fénelon, the following two biographies are still useful: Paul Janet's *Fénelon* (Paris, 1892) and Élie Carcassonne's *Fénelon* (Paris, 1946). Janet's book has been translated into English and edited, with introduction, notes, and index, by Victor Leuliette as *Fénelon: His Life and Works* (Port Washington, N.Y., 1970). See also Carcassonne's *État présent des travaux sur Fénelon* (Paris, 1939). For informative articles on Fénelon, see A. Largent's "Fénelon," *Dictionnaire de théologie catholique*, vol. 5 (Paris, 1924), and Louis Cognet's "Fénelon," *Dictionnaire de spiritualité ascétique et mystique*, vol. 5 (Paris, 1964).

E. GERHARD CARROLL (1987)

FERGHUS MAC ROICH. Tradition has it that Fergush mac Roich was king of the Ulaidh, or Ulstermen, but was driven from his throne by Conchobhar mac Nessa, the king of Ulster, during the momentous events related by the epic *Táin Bó Cuailnge* (The cattle raid of Cuailnge) and other tales. Fergush went into exile to Cruachain, the court of Ailill and Medhbh of Connacht, and this is why he and his companions were in the Connacht camp when Ailill and Medhbh made their famous incursion into Ulster. An alternative, and probably secondary, explanation for his absence from Ulster is provided by the Old Irish tale *Longes mac nUislienn* (The exile of the sons of Uisliu), which is really the story of the tragic heroine Deirdre: acting on Conchobhar's behalf, Fergush offers to the Sons of Uisliu safe conduct back from their exile in Scotland, and when Conchobhar slays them despite these assurances, Fergush wreaks carnage at Emhain Mhacha, capital of the Ulstermen, before going into exile himself.

Both elements of his name suggest physical power: *Fergush* is a compound word meaning "manly vigor, excellence" and *Roich* (originally disyllabic *Roich*) is the genitive of *ro-ech* ("great horse"). His virility was proverbial and measured in heptads: he ate seven times as much as an ordinary man and had the strength of seven hundred men; his nose, mouth, and penis were seven fingers in length, and his scrotum as large as a sack of flour; finally, he needed seven women to satisfy him when separated from his wife Flidhais, a goddess who ruled over the beasts of the forest. This is reminiscent of the description of Indra in the *Rgveda* (6.46.3) as *sahasramuṣka* ("with the thousand testicles"), an epithet which, as Georges Dumézil remarks, alludes to the *supervirilité* which all peoples freely attribute to warriors and warrior gods (*Heur et malheur du guerrier*, Paris, 1969, p. 64). As late as the nineteenth century the famous Lia Fáil, the standing stone at Tara which in early times was reputed to cry out on contact with the man destined to be king, was known to local people as *bod Fhearghusa* ("the phallus of Fergush"). It is particularly appropriate, therefore, that the much-mated Medhbh, queen

and goddess of sovereignty, whose sexual capacity is a commonplace of the early literature, should have cuckolded her husband Ailill with Fergush, as recounted in *Táin Bó Cuailnge*.

Fergush had a famous sword called Caladhbholg (the Irish counterpart of the Welsh Caledwylch, later to become the Excalibur of Arthurian romance), and with it he lopped off the tops of three hills in the province of Midhe when in the grip of his battle rage. According to T. F. O'Rahilly, this is the lightning sword of the great otherworld deity with whom he identifies Fergush and other mythic-heroic figures (*Early Irish History and Mythology*, Dublin, 1946, p. 68). In several archaic genealogical poems a number of tributary peoples in the province of Munster are assigned descent from Fergush, and it is clear that the substance of the tradition embodied in the Ulster saga of *Táin Bó Cuailnge* was already familiar in the southern province in the early seventh century. The name *Fergush* is borne by several pseudohistorical kings of Emhain Mhacha (the royal center of the province of Ulster), and one of these, Fergush mac Leide, who is the hero of a submarine adventure, is very probably a doublet of Fergush mac Roich.

BIBLIOGRAPHY

Further information on Fergush can be found in Rudolf Thurneysen's *Die irische Helden- und Königsage bis zum siebzehnten Jahrhundert*, 2 vols. (Halle, 1921), the classic study of *Táin Bó Cuailnge*.

PROINSIAS MAC CANA (1987 AND 2005)

FESTIVALS SEE SEASONAL CEREMONIES; WORSHIP AND DEVOTIONAL LIFE

FESTSCHRIFTEN. *Festschrift* or *Festgabe* (plural, *Festschriften*, *Festgaben*) is the German word for a collection of articles written in honor of a scholar or high-ranking person (poet, politician, etc.) on the occasion of an anniversary (birth, award of doctorate, term of service, or death) or other important event, usually written by colleagues, pupils, or friends of the honoree. A list of publications may also be part of a *Festschrift*, as well as unpublished articles by the honored person. In addition, it has become customary to provide a picture of the honoree as the frontispiece of the volume. The first German *Festschriften* were published in the 1840s. Subsequently, the German word was taken over into other languages, although these also developed their own words or expressions for this academic genre: English *Studies in honor of*; French *Mélanges* or *Hommage*; Italian *Studi in onore di* or *Omaggio*; Russian *Sbornik statej*, etc. While *Festschriften* for the anniversaries of such institutions as universities or cities may also contribute to academic discussion, this is not necessarily the case with *Festschriften* for anniversaries of such societies as fire brigades or sports clubs, which be-

came very popular in German-speaking countries. An example of this nonacademic type of commemorative collection would be the Festschrift produced in 1882 for the twentieth anniversary of the *Mitteldeutsche Pferdezucht-Verein* (Central German Horse-Breeding Association).

Hence, the genre of Festschriften is a typical product of nineteenth-century German *Gelehrtenkultur* (culture of the educated), with its peculiar social structure and habits, that took on new characteristics after having been introduced into academic milieus outside Germany and Austria. After World War II, particularly in the 1960s, Festschriften lost much of their former prestige and were often regarded as old-fashioned, but this trend was reversed in the 1990s. Once again it became very fashionable to present Festschriften to older scholars—in fact, to precisely those scholars who had been most opposed to this academic custom when they were students.

FESTSCHRIFTEN AS HISTORICAL SOURCES. The academic merit of this particular genre is an open question. When the historian Theodor Mommsen received a Festschrift on the occasion of his sixtieth birthday in 1877, he said it would take him months to disprove the nonsense that had been said. Because a Festschrift is an occasion to honor rather than critique, to which friends rather than academic enemies are invited to contribute, and because articles are not usually peer-reviewed, these collections are of mixed academic quality. On the other hand, Festschriften gained a status of their own within academic debate as an appropriate tool in order to call attention to the research of a particular person—at times ironically known only through the Festschrift—and to expand on his or her theories, apply them to other fields, or discuss them in a friendly atmosphere. Festschriften are thus important resources for historians of science because they reflect the contemporary discourse on a given subject and the influence of certain theories on subsequent generations of scholars. In addition, from an anthropological perspective Festschriften tell a lot about the “family relations” within the academic community: Who contributes to a given volume and who does not? Although contingencies are involved in the selection of authors, the field of religious studies—particularly in such small academic communities as those of Germany, the Netherlands, or France—can be described and analyzed according to the names of the contributors to Festschriften.

EXAMPLES. Not all major scholars in the broad field of religious studies received Festschriften. In fact, so many lacked a respective volume that the absence of a Festschrift should not be interpreted to their discredit. Eminent scholars in the field who did not receive Festschriften include Johann Jakob Bachofen, Auguste Comte, Henry Corbin, Wilhelm Dilthey, Émile Durkheim, Sir James George Frazer, Jane Ellen Harrison, Lucien Lévy-Bruhl, Bronislaw Malinowski, Robert Ranulph Marett, Marcel Mauss, J. H. Mead, Friedrich Max Müller, Raffaele Pettazoni, Friedrich Schleiermacher, William Ramsey Smith, Nathan Söderblom, Ernst Troeltsch,

Victor Turner, and Joachim Wach. Judging from extant Festschriften, however, one can easily find examples of the characteristics mentioned earlier. A Festschrift tells something about the transition of theories from one generation to another; to name but one example, Robin Horton edited a Festschrift for E. E. Evans-Pritchard (1973). That Festschriften may serve as instruments comparable to conference proceedings for putting themes on the scholarly agenda may be exemplified with Gershom Scholem (1967), Carsten Colpe (1991 and 1994), or Antoine Faivre (2001).

When scholars receive more than one Festschrift on different occasions, a comparison of these collections may illuminate progress or changes of interest in their research. The work and impact of Carl Gustav Jung, for instance, is reflected in the five Festschriften dedicated to him between 1935 and 1975, from his sixtieth to his hundredth birthday. The 1945 Festschrift, published as volume 12 of the *Eranos-Jahrbücher*, may be read as an attempt to cope psychologically with the catastrophe of the Second World War. The preface to the volume, written by O. Fröbe-Kapteyn, spoke of an “archetypal situation of transition between ending and beginning, death and rebirth on all fields.” Explicitly harking back to the “psychological universe” of the “wisdom of the endlessly gifted antiquity,” W. Wili’s *Geleitwort* (foreword) presented Jung’s archetypal theory as a cure for the “epidemic of sadism” that swept over Germany and its concentration camps, as well as the east and Europe, “as apocalyptic riders,” against the “soul-pestilences” of the twentieth century, and against the “terrible force of the neuroses of the politically leading persons.” Other Festschriften listed in the collection below likewise reflect their *Zeitgeist* both with regard to the cultural context and the particular scholarly fashions of the time.

BIBLIOGRAPHY

A Collection of Major Festschriften

The following overview is intended to provide the reader with examples of the characteristics of Festschriften discussed in the article. It focuses on important figures in the history of religion and well-known contemporary scholars. The honorees are listed in alphabetical order.

Carsten Colpe received two Festschriften: Elsas, Christoph, and Hans G. Kippenberg, eds. *Loyalitätskonflikte in der Religionsgeschichte. Festschrift für Carsten Colpe* (Würzburg, Germany, 1991); and Elsas, Christoph et al., eds. *Tradition und Translation. Zum Problem der interkulturellen Übersetzbarkeit religiöser Phänomene. Festschrift für Carsten Colpe zum 65. Geburtstag* (Berlin and New York, 1994). Mircea Eliade’s Festschrift is a rigorous collection of a few articles from a large pool of interested authors: Kitagawa, Joseph M., and Charles H. Long, eds. *Myths and Symbols: Studies in Honor of Mircea Eliade* (Chicago and London, 1969). Edward E. Evans-Pritchard received two Festschriften: Cunnison, Ian, and Wendy James, eds. *Essays in Sudan Ethnography, Presented to Sir Edward Evans-Pritchard* (London, 1972); and

Horton, Robin, and Ruth Finnegan, eds. *Modes of Thought: Essays on Thinking in Western and Non-Western Societies. Collection dedicated to Sir Edward Evans-Pritchard* (London, 1973). The voluminous Festschrift for Antoine Faivre fostered the study of Western esotericism: Caron, Richard, Joscelyn Godwin, Wouter J. Hanegraaff, and Jean-Louis Vieillard-Baron, eds. *Ésotérisme, Gnozes et Imaginaire symbolique. Mélanges offerts à Antoine Faivre* (Leuven, Belgium, 2001). Among the major Festschriften for Sigmund Freud is Alexander, Franz, ed. *Freud in der Gegenwart. Ein Vortragszyklus der Universitäten Frankfurt und Heidelberg zum 100. Geburtstag* (Frankfurt am Main, Germany, 1957). A Festschrift for Friedrich Heiler that clearly reflects his theological agenda was edited by Christel Matthias Schröder: *In Deo omnia unum. Eine Sammlung von Aufsätzen, Friedrich Heiler zum 50. Geburtstag dargebracht* (Munich, Germany, 1942). Karl Hoheisel was also honored with a Festschrift: Hutter, Manfred, et al., eds. *Hairesis. Festschrift für Karl Hoheisel zum 65. Geburtstag* (Münster, Germany, 2002).

William James received two important Festschriften: *Essays, Philosophical and Psychological, in Honor of William James . . . by His Colleagues at Columbia University* (New York, 1908); and Kallen, Horace Meyer, ed. *In Commemoration of William James, 1842–1942* (New York, 1942). The five Festschriften for C. G. Jung are: Alm, Ivar et al., eds. *Die kulturelle Bedeutung der komplexen Psychologie. Festschrift zum 60. Geburtstag von Carl Gustav Jung* (Berlin, 1935); Fröbe-Kapteyn, Olga, ed. *Studien zum Problem des Archetypischen. Festgabe für C. G. Jung zum siebzigsten Geburtstag 26.7.1945* (Zürich, Switzerland, 1945); Fröbe-Kapteyn, Olga, ed. *Aus der Welt der Urbilder. Sonderband für Carl Gustav Jung zum 75. Geburtstag, 26.7.1950* (Zürich, Switzerland, 1950); C.-G.-Jung-Institut Zürich, ed. *Studien zur analytischen Psychologie Carl Gustav Jungs. Festschrift zum 80. Geburtstag von C. G. Jung*, 2 vols. (Zürich, Switzerland, 1955); Dieckmann, Hans, et al., eds. *Aspekte analytischer Psychologie. Zum 100. Geburtstag von Carl Gustav Jung 1875–1975* (Basel, Switzerland, 1975).

Among the important recent Festschriften is one for Hans G. Kippenberg: Luchesi, Brigitte, and Kocku von Stuckrad, eds. *Religion im kulturellen Diskurs. Festschrift für Hans G. Kippenberg zu seinem 65. Geburtstag / Religion in Cultural Discourse. Essays in Honor of Hans G. Kippenberg on the Occasion of His 65th Birthday* (Berlin and New York, 2004); and one for E. Thomas Lawson: Light, Timothy, and Brian C. Wilson, eds. *Religion as a Human Capacity: A Festschrift in Honor of E. Thomas Lawson* (Leiden, Netherlands, 2004). Gerardus van der Leeuw received a Festschrift that reflected a strong theological commitment: Kooiman, W. J., et al., eds. *Pro regno-pro santuario. Een bundle studies en bijdragen bij de 60. verjaardag van Prof. Dr. Gerardus van der Leeuw* (Nijkerk, Netherlands, 1950). Of interest for religious studies is also a Festschrift for Karl Löwith: Braun, Hermann, and Manfred Riedel, eds. *Natur und Geschichte. Karl Löwith zum 70. Geburtstag* (Stuttgart, Germany, 1967); and one for Johann Maier: Merklein, Helmut, et al., eds. *Bibel in jüdischer und christlicher Tradition. Festschrift für Johann Maier zum 60. Geburtstag* (Frankfurt am Main, Germany, 1993). Gustav Mensching's Festschrift was edited by Rudolf Thomas: *Religion und Religionen. Festschrift für Gustav Mensching zu*

seinem 65. Geburtstag, dargebracht von Freunden und Kollegen (Bonn, Germany, 1967).

A typical example of a nineteenth-century Festschrift is that for Theodor Mommsen: *Commentationes philologicae in honorem Theodori Mommseni scripserunt amici* (Berlin, 1877). The Festschriften for Rudolf Otto include Frick, Heinrich, ed. *Rudolf-Otto-Festgruß. Aufsätze eines Kollegenkreises zu Rudolf Ottos 60. Geburtstag* (Gotha, Germany, 1931); Frick, Heinrich, ed. *Rudolf-Otto-Ehrung*, 3 vols. (Berlin, 1940); and Benz, Ernst, ed. *Rudolf Otto's Bedeutung für die Religionswissenschaft und die Theologie heute. Zur 100-Jahrfeier seines Geburtstags, 25.9.1969* (Leiden, Netherlands, 1971). Heinrich Rickert also received a Festschrift: Faust, August, ed. *Festgabe für Heinrich Rickert zum 70. Geburtstag* (Bühl, Germany, 1933). Kurt Rudolph's Festschrift influenced the study of Gnosis and Gnosticism: Preißler, Holger, and Hubert Seiwert, eds. *Gnosisforschung und Religionsgeschichte. Festschrift für Kurt Rudolph zum 65. Geburtstag* (Marburg, Germany, 1994).

An important Festschrift for Gershom Scholem was edited by Ephraim E. Urbach and others: *Studies in Mysticism and Religion, Presented to Gershom G. Scholem on His 70th Birthday by Pupils, Colleagues and Friends*, 2 vols. (Jerusalem, 1967). Georg Simmel was honored with a more personal Festschrift: Gassen, Kurt, and Michael Landmann, eds. *Buch des Dankes an Georg Simmel. Briefe, Erinnerungen, Bibliographie. Zu seinem 100. Geburtstag am 1.3.1958* (Berlin, 1958). Edward B. Tylor received a Festschrift late in his career: Balfour, Henry, et al., eds. *Anthropological Essays Presented to Edward Burnett Tylor in Honour of His 75th Birthday, 2.10.1907*. (Oxford, 1907). Max Weber received several Festschriften: Palyi, Melchior, ed. *Hauptprobleme der Soziologie. Erinnerungsgabe für Max Weber*, 2 vols. (Munich, Germany, 1923); König, René, and Johannes Winckelmann, eds. *Max Weber zum Gedächtnis. Materialien und Dokumente zur Bewertung von Werk und Persönlichkeit* (Cologne, Germany, 1963); and Englisch, Karl et al., eds. *Max Weber Gedächtnisschrift der Ludwig-Maximilians-Universität München zur 100. Wiederkehr seines Geburtstags* (Berlin, 1966).

Reference Works about Festschriften

Leistner, Otto. *Internationale Bibliographie der Festschriften / International bibliography of Festschriften*. Osnabrück, Germany, 1976. This resource provides a German and English index of names and subjects.

For the period after 1983, the *Internationale Jahresbibliographie der Festschriften IJBF / International Annual Bibliography of Festschriften*, published by K. G. Saur in Munich, Germany, is the major reference tool. This interdisciplinary database with information about 20,300 international Festschriften and 450,000 contributions is available on CD-ROM and online through some university networks. About a thousand Festschriften comprising twelve thousand articles are added to the indexed references each year. The *IJBF* focuses on European Festschriften in the area of the humanities.

KOCKU VON STUCKRAD (2005)

FETISHISM. The *Oxford English Dictionary* (1893–1897) defines *fetishism* as the “superstition of which . . . the

characteristic feature” is “an inanimate object worshipped by savages on account of its supposed inherent magical powers, or as being animated by a spirit.” This fetish is distinguished from an idol “in that it is worshipped in its own character, not as the image, symbol, or occasional residence of the deity.” The only problem with this definition is that neither fetishism nor the fetish exists as such. There are indeed material objects believed to be imbued with force or power, the nature of which varies with object and culture, and that are used with the intention of achieving particular ends. Consider the list offered by Mesquitela Lima:

diviners’ implements (i.e., the figurines contained in the diviner’s basket, most of which are carved from any one of a variety of materials); figurines sculpted in clay or in termite secretion; small dried trees or even parts of a tree, such as roots, twigs, leaves, branches, and fruit; coarsely sculpted tree trunks; small dolls clothed in net; miniature musical instruments or miniature agricultural or hunting implements; a large number of figurines carved in wood, bone, or ivory in the shape of human beings, animals or even abstract forms; horns, nails, or claws, or bits of human or animal skin; small tortoise shells; sacred rocks or minerals; crucifixes, medals, or images used in Christian cults; philters or magic substances and medicines. (Lima, 1987, p. 315)

However, these objects and their use by no means constitute a system or the entirety of any culture’s religious practices and beliefs. Moreover Wyatt MacGaffey, in his analysis of Kongo religious practices surrounding what have been considered the exemplary fetish objects known as *minkisi*, has demonstrated the inadequacy of any notion of fetish that entails the personification of material cultic objects. Supplementing Marcel Mauss’s dismissal of the ethnographic significance of “fetishism” as “nothing but an immense misunderstanding between two civilizations, the African and the European” (Mauss, 1905–1906, p. 309), MacGaffey placed the ethnographic data against the characteristic components of the fetish as determined by William Pietz, whose analysis of discourses about fetishism is the standard against which contemporary discussions of this topic take their measure (MacGaffey, 1994a). Pietz delineated the four primary attributes of the fetish as:

1. irreducibly material and not representing an immaterial, elsewhere located spirit,
2. fixing previously heterogeneous elements (e.g., an object and a place) into a novel identity,
3. embodying the problem of the nonuniversality of value, and though separate from the body,
4. functioning at times as though it were in control of it. (MacGaffey 1994a; cf. Pietz 1985, 1987, 1988, 1993)

In his studies MacGaffey finds fundamental disjunctions between Kongo *minkisi* and the fetish so defined.

Consequently this article will focus on how the signifier *fetishism* has come to delineate a discursive space in which

the often misrecognized attempt is made to mediate difference(s) by means of material objects (or persons). Simultaneous epistemic and value crises are often provoked by persistent contact with otherness. An inadequacy of extant categories and a disproportion of ascribed values distinguish this ongoing encounter and are met by both avowal and disavowal of that difference. The threatened party finds the ever-deferred resolution of these dilemmas by displacing the recognition of difference upon an object that in its material opacity embodies even as it screens the ambiguity. Correspondingly, ambivalent affect is directed at, even as significance is affixed to, the object. Thus localized and materialized, otherness can be marked and mastered while the marking individual or group’s identity is rendered the norm. The seemingly incommensurable differences between European and non-European, colonizer and colonized, capitalist and worker, male and female are articulated during contact in terms of oppositions, including religion and nonreligion, science and superstition (the absence of science), rationality and irrationality, spirit and matter, necessity and accident, subject and object, order and chaos, culture and nature, human and animal, public and private.

Since its emergence in the contact zone of European-African encounter, no other signifier in the history of the study of religions has been appropriated by so many secular discourses. This article will follow how fetishism has traversed from mercantile encounter to rationalist anthropology to philosophy to positivist sociology to political economy to sexology to psychoanalysis to aesthetics to postcolonial analysis. During its journey “fetishism” functioned as a camera obscura, projecting an inverted picture of Euro-America upon the screen of a number of persistent others, including the non-Euro-American, the woman, the Jew, and the insane.

THE INVENTION OF FETISHISM. While the term *fetishism* (*fétichisme*) was coined in 1760 by Charles de Brosses in his *Du culte des dieux fétiches* (The cult of the fetish gods), the purported practices and beliefs to which the term referred as well as the family of Portuguese words related to *feiticaria* or witchcraft from which it emerged had long been in circulation. Indeed the philological genealogy of *fetishism* in many ways anticipated the series of oppositions the term would eventually mediate. *Feiticaria* finds its roots in the Latin *facticius* (manufactured), which also had the occasional pejorative connotation of artifice or something factitious (without an original). In medieval Christian discourse such objects were associated with the manufactured amulets, images, and potions employed for witchcraft (as opposed to the talismans, remedies, relics, and other sacramental objects given legitimacy by the church) and, in medieval Portuguese, came to be known as *feitigos*. *Feitigos* were distinguished from *idolos* as witchcraft was from idolatry or more generally as magic was distinguished from those religions—Christianity, Judaism, Islam, and paganism or idolatry—that could found an orderly society. An additional distinction was that *feitigos* were concerned with material bodies rather than souls. In contradistinction to such magical objects, the object of idol

worship was the immaterial demon or false god that the idol represented and who acted upon the soul of the worshiper.

As the Portuguese developed a trade zone along the west coast of Africa from what is now Senegal to Angola, *fetiço* rather than *idolo* came to be the dominant Portuguese ascription of the “religious” practices of the cultures encountered in this series of spaces. As trade grew the related pidgin term *fetisso* became affixed by all involved parties to sacramental objects, traded commodities, political emblems, medical preparations, and women’s ornaments that circulated among the various populations who peopled these areas of cross-cultural exchange. The travel accounts of sixteenth- and seventeenth-century European traders, Protestant Dutch and English as well as Catholic Portuguese and French, frequently referred to material objects held to be endowed by the African populations with magical powers or animated by spirits. Attribution of religious value by Africans to a wide range of material objects was correlated with their apparent inability to recognize the proper value of the commodities involved in trade with the Europeans as well as their inability to maintain proper distinctions between public and private, male and female, animal and human. Ironically the same anecdotes that illustrated the moral depravity of fetishists depicted anarchic polities ruled exclusively by the principle of interest—projecting upon the other the forces and values that shaped European society. Moreover that the Africans were said to arbitrarily associate these *fetissos* with the accomplishment of some desired end appeared to confirm the European assumption of the Africans’ allegedly deficient mental abilities.

By the eighteenth century, as the *fetisso* began its migration from the exclusive reserve of travel literature to the emergent rationalist critique of clericalism and superstition, it was rechristened as the *fétiche* (fetish). The scene shifted from the zone of contact where Europe fashioned itself against its non-European other to the emerging zone where the secular fashioned itself against its religious other. Anecdotes from those travelogues, especially Willem Bosman’s *A New and Accurate Description of the Coast of Guinea* (1704) and its analogy of fetish worship with Roman Catholicism, became illustrations of the irrationality and immoral consequences of ascribing supernatural or teleological qualities to material objects rather than recognizing physical and mechanical causality.

Just after mid-century a new term to describe and generalize fetish worship, *fetishism*, emerged with the publication of Charles de Brosses’s *Cult of the Fetish Gods*. Fetishism would become the zero degree of the Enlightenment taxonomy of its other, religion. Rather than *sui generis*, African fetish worship became only the foremost surviving variant of a variety of worldwide practices relating to cult objects: from the biblical Urim and Thummim to Egyptian obelisks to Native American manitous. Fetishism was distinguished from polytheistic idolatry and provided a deeper wedge for cracking open the theological monopoly on the definition of reli-

gious origins. From the privilege ascribed to theistic belief and the human-divine relation, a discourse emerged in Bernard Fontanelle and David Hume that located the source of religion in faulty epistemology, childlike intellects, imagination, fear, and desire. Where natural causality would be, there were the gods. With de Brosses, a stage of human and religious development that preceded polytheism was recognized. Neither beliefs in invisible beings nor amorphous nature initiated that development, rather the forces behind the gratification of human desires or the realization of human fears lay in supernaturally endowed “material, terrestrial entities”: fetishes (Brosses, 1988, p. 11).

Although in the wake of Brosses’s work the primitivity and primordially of fetishism became a truism, its material and magical dimensions, in contrast to the spiritual and social dimensions of polytheism and the three monotheisms of Christianity, Judaism, and Islam, led to the question whether fetishism indeed represented the original religion or was instead the stage preceding religion. Complicating the theological and philosophical questions over the relationship between the material and the spiritual were the demands of colonialism (and later imperialism). Indigenous religion was a fundamental tool for maintaining control of the colonized. Consequently, as David Chidester argues, “fetish worship” would be characterized as a religion, not as a consequence of “prolonged exposure, increased familiarity, acquired linguistic competence, intercultural dialogue, or participant observation,” but as a result of Europeans achieving political and economic control of the particular region (Chidester, 1996, pp. 16–17). The Europeans did not perceive themselves as supplanting some other legitimate sovereign entity, rather European control was imposed upon an anarchic situation ruled by arbitrariness, irrationality, and desire. On a more fundamental level the distinction between order and disorder represented the distinction between the human, defined as the *zoon politikon* (political animal), and the nonhuman, pictured as the demonic or savage that found its confirmation in the distinction between religion and fetishism since, as Ludwig Feuerbach, drawing upon René Descartes and Thomas Hobbes (and before them John Calvin), asserted in the opening of his *Essence of Christianity*, “Religion has its basis in the essential difference between man and the brute” (Feuerbach, 1989, p. 1).

CONTACT, CONQUEST, AND CRISIS: FETISHISM AND THE HUMAN SCIENCES.

As a consequence of its delineation and appropriation by French philosophes, fetishism disseminated throughout European philosophic discourse. In his *Religion within the Limits of Reason Alone* (1793) Immanuel Kant analogized clericalism to fetishism in order to distinguish between true moral religion and false religion, between autonomy and heteronomy. Such labeling allowed Kant to discredit his opponents, render them “irrational,” without ascribing either evil intent or demonism to them.

Now the man who does make use of actions, as means, which in themselves contain nothing pleasing to God

(i.e., nothing moral), in order to earn thereby immediate divine approval of himself and there with the attainment of his desires, labors under the illusion that he possesses an art of bringing about a supernatural effect through wholly natural means. Such attempts we are wont to entitle sorcery. But (since this term carries with it the attendant concept of commerce with the evil principle, whereas the above mentioned attempt can be conceived to be undertaken, through misunderstanding, with good moral intent) we desire to use in place of it the word fetishism, familiar in other connections. (Kant, 1960, p. 165)

By extending materiality from particular objects to all means, fetishism, or “fetish-faith,” came to extend beyond the borders of Africa to encompass everything in the realm of religion—including, in a clear allusion to Moses Mendelssohn’s *Jerusalem* (1783), the Jews—except for “purely moral” religion (Kant, 1960, p. 181–182).

G. W. F. Hegel, by contrast, limited the extent of fetishism to sub-Saharan Africa, where it came to exemplify the historical development or lack thereof of a continent and its peoples. Fetishism was emblematic of the African character, which

is difficult to comprehend, because it is so totally different from our own culture, and so remote and alien in relation to our own mode of consciousness. We must forget all the categories which are fundamental to our own spiritual life, i.e. the forms under which we normally subsume the data which confront us; the difficulty here is that our customary preconceptions will still inevitably intrude in all our deliberations. (Hegel, 1975, p. 176)

The people characterized by fetishism were outside history and substantial objectivity, outside God and morality; they were ruled by caprice, by the arbitrary rule of the individual projected outward onto a misrecognized natural form. This religion of “sensuous arbitrariness” was the lowest form of religion, immediate religion. If religion it was: “A fetish of this kind has no independent existence as an object of religion, and even less as a work of art. It is merely an artifact which expresses the arbitrary will of its creator, and which always remains in his hands” (Hegel, 1975, pp. 190, 181). This debasement of consciousness mirrored the debasement of social life: fetishism was one with cannibalism and slavery. Fetishism embodied the origin that future development would disavow; it was the threshold moment when humanity separated itself from bare life, from animal nature.

Though Samuel Taylor Coleridge analogized fetishism with vulgar empiricism, the proponent of scientific positivism Auguste Comte would determine it to be the first developmental stage of human intelligence and world history. In his *Course in Positive Philosophy* (1830–1842) Comte posited three universal stages of human development— theology, metaphysics, and science (scientific positivism)—with the first, the age of theology, itself assuming a triadic structure: fetishism, polytheism, monotheism. For Comte, in the stage

of fetishism “primitive man” endows all external objects with agency and therefore rises above sheer animal inertia. While Comte later reevaluated “fetishism,” or rather “pure fetishism,” as a necessary component of his new positivist religion of humanity, his implicitly (r)evolutionary scheme was most influential. While the primacy he ascribed to fetishism as the first religion (evolving from a primal atheism) was asserted by John Lubbock in his *Origin of Civilisation and the Primitive Condition of Man* (1870) and by representatives of the German school of ethnopsychology (*Völkerpsychologie*) among others, its primordial status was contested by animism, animatism, totemism, *Urmonotheismus* (primal monotheism), and other claimants.

In the 1840s Brodier’s work not only influenced Comte’s positivist musings, it was also picked up and excerpted by the young Karl Marx, who was in the midst of an extensive ethnographic reading program that also included other discussions of fetishism by Karl Böttiger and Benjamin Constant. These early studies of what Marx called “the religion of sensuous desire” were soon relocated from the colonial periphery to a metropole itself divided into secular and religious spheres as well as into exploiting capitalist and exploited proletariat classes. Marx began his analysis of value in contemporary capitalism in the first volume of *Capital* with a discussion of the fetishism of commodities: that which was viewed as most primitive came to characterize the seat of civilization, and that which was viewed as the most secular of activities—political economy—was unveiled as the religion of everyday life. In a dialectically materialist appropriation of Feuerbach’s theory of religion, the value borne by the fetishized commodity was the culmination of the alienation and objectification of human labor. In contrast to Marx’s earlier construction, fetishism, as the fetishism of commodities, is directed at “a thing which transcends sensuousness.” With the circulation of commodities, “the definite social relation between men themselves . . . assumes here, for them, the fantastic form of a relation between things” (Marx, 1977, pp. 163, 165). As in the fetishism described in his early readings, Marx analogizes, “The products of the human brain appear as autonomous figures endowed with a life of their own, which enter into relations both with each other and with the human race” (Marx, 1977, p. 165). Even as it expropriates use value from the fetishist other, capital reproduces the misrecognitions that it ascribes to that other.

Just as the fetish had come to figure and facilitate the debasement of social life—whether in the form of slavery according to Hegel or proletarianization for Marx—and of society-sustaining morality, so it became associated with the fears of degeneration that haunted the Europeans of the last decades of the nineteenth century. In a France that was experiencing a decline in both its colonial reach and its European position, the perceived source of the threatening physical and moral debilitation and consequent devirilization and depopulation, of cultural crises of national, sexual, and gender difference, was sexual perversion. The psychiatrist Alfred Binet

(1887) gave the cause of individual and national decay a name: fetishism. Like the people under French colonial domination, French men were seeking the satisfaction of their sensuous desires not by the real (here: “natural” acts of genital sexuality) but by fixing their attention upon objects (or body parts) whose value accrued from some past accidental encounter. Fetishism was characteristic of a perverse predisposition, just as Hegel had suggested that the fetishistic behavior of Africans was inherent to their character. Yet even as the fetish was displaced from the religious to the sexual, Binet felt compelled to analogize different levels of fetishism with those other religious stages with which fetishism had previously been contrasted, polytheism and monotheism. He compared normal love, which is composed of a myriad of fetishistic excitations, with polytheism and fetishism, previously associated with the base of the pyramid of religious forms, in its most singular and perverted form with monotheism, the pinnacle. In a world gone upside down, the civilized were going native. Within four years after the publication of Binet’s 1887 “Le fétichisme dans l’amour” (Fetishism in Love), the authoritative compendia of sexual pathology, Richard Krafft-Ebing’s *Psychopathis Sexualis* declared fetishism the general form of sexual pathology.

Unlike totemism, fetishism came under Sigmund Freud’s scrutiny in his analyses of sexuality and not of the genesis of religion. Instead of the perception of fetishism as the sign of a crisis of difference, the degeneration feared by the French medical community, such a crisis was its source: the little boy’s encounter with sexual difference disrupting his narcissistic enjoyment of an undifferentiated, self-contained world. According to Freud, the discovery that women do not have penises leads the little boy to fear for his own. Fetishistic object choice—a symbolic substitute for the mother’s (nonexistent) penis—is one way by which the boy mediates his desire to elide difference (and its feared causes and consequences) with the actuality of that difference; the mother’s castration is both disavowed and affirmed. With the crisis surmounted, the boy not only assumes a gendered and sexualized identity, he is inserted into the social order.

As psychoanalytic and materialist analyses interpenetrated, most influentially with Walter Benjamin’s criticism of the work of art and the political symbol in which “traces of the fetishist” are at play in the object’s “aura” and “authenticity,” the discourse of fetishism became a prime weapon in the critical armory of cultural studies (Benjamin, 1969, p. 244). With the later admixture of postcolonial analysis to the phantasmagoric study of fetishism, what went around came around. The discourses about the colonized and dominated other, including those about the (non)religion of fetishism, were recognized as themselves fetishistic attempts to mediate the possibly incompatible differences between social and cultural forms. The cultural analyst Homi Bhabha read the racial stereotype in its multiple and contradictory shapes of colonial discourse in terms of fetishism. As extended by Jay Geller and others, such as Anne McClintock, the colonial

stereotype often entailed the Euro-Americans’ discursive fixation upon a part of the other’s body. The fixated-upon body part was often one that had been subjected to some discipline, practice, or technique: the circumcised penis, the bound foot, tattooed skin. This overvalued mark or member uncannily conjoined the natural and the cultural. This ambiguous conjunction of two (culturally) differentiated orders of being contributed to both the fascination and the horror evoked by such body techniques. Further, through such corporeal metonymies, discourses in which historical difference was naturalized as race and in which natural difference was figured by sex combined to construct the ethnic, gender, and sexual identity of the other. These fetishistic constructs provided symbolic substitutes for and objectified representations of the otherness—both the indigenous heterogeneous populations of modern Euro-American society and the different peoples contacted in colonial expansion—which undermined the narcissistic phantasy of Euro-American wholeness, of autonomy and dominance.

In sum, fetishism has come to signify the apotropaically monumentalized negotiations at the internal and external borders of culture. That is, it signifies the stuff that helps one think (or more likely misrecognize) the alienations, ambiguities, and contradictions that make up everyday life.

JAY GELLER (2005)

FEUERBACH, LUDWIG (1804–1872), German humanistic philosopher of religion and influential spokesman for the Young Hegelians. Born into a gifted Bavarian family, Ludwig Andreas Feuerbach studied theology at the University of Heidelberg before transferring to Berlin, where he became an enthusiastic convert to Hegelianism. In 1828 he completed his doctoral work at the University of Erlangen, where he remained as a docent until he was denied tenure, having been identified as the author of the anonymously published book *Thoughts on Death and Immortality*. In it he argued that the Christian doctrine of personal immortality was a form of egoism incompatible with a belief in the Absolute as infinite love. The book was especially offensive because of the sarcastic epigrams about pietistic Christianity appended to the text. Never again was he offered an academic position.

In 1837 Feuerbach married Bertha Löw, and the income from a porcelain factory of which she was part owner

supported him until it went bankrupt in 1860. Although in the early 1830s he contributed to the principal journal of the Young Hegelians, the *Hallische Jahrbücher für deutsche Wissenschaft und Kunst*, he shunned political activity and, except for a brief appearance in the Frankfurt Assembly in 1848, lived in studious seclusion in Bruckberg. He became famous in the early 1840s for his atheistic interpretation of religion in *The Essence of Christianity* (1841), as well as for his attacks on Hegelian philosophy in two monographs, *Vorläufige Thesen zur Reform der Philosophie* and *Grundsätze der Philosophie der Zukunft*, which influenced the young Karl Marx. Although Feuerbach returned again and again to the interpretation of religion, his later writings were relatively ignored. He maintained a prolific correspondence with friends all over Europe and America, and when the porcelain factory went bankrupt, he and his wife were sustained by the generosity of friends. When the social democratic press reported that he had suffered a stroke in 1870, contributions poured in from Europe and the United States. He died in Nuremberg in 1872.

Feuerbach's *Essence of Christianity* can best be understood against the background of his two fundamental criticisms of Hegel's speculative idealism. The first was of Hegel's basic tendency to treat abstract predicates—reason, thought, consciousness, and being—as entities. For example, having established that thought was of the essence of humanity, Hegel then transformed this predicate into a metaphysical entity, a subject. Thus whatever truth there was in Hegel's thought could be appropriated by inverting once again the subject and the predicate, so as to make thinking and consciousness the predicates of existing individuals. The second criticism of Hegel concerned his preoccupation with thought in contrast to the actual sensuous existence of human beings. Hegel, together with classical philosophy generally, believed that the ultimate criteria of the real is its capability of being thought. For Feuerbach, the real is that which offers resistance to the entire sensuous being of the person—to sight, feeling, even love. Consequently, human existence is existence with others—it is communal.

Feuerbach's inversion of Hegel's basic metaphysical vision informs *The Essence of Christianity*. If Hegel regarded nature and history as the self-objectification of the Absolute, Feuerbach regarded God, the Absolute, as the reification of the essential predicates of human existence: reason, feeling, and love. The idea of God is the idea of the species characteristics of humankind involuntarily and unconsciously projected as an object of thought and worship. God is, so to speak, an acoustical illusion of consciousness. Hence the history of religions, of which Christianity is the culmination, is the childlike, collective dream of humanity in which it worships and contemplates its own essential nature. Just as Hegel argued that the Absolute must become reconciled with its alienated objectifications (the finite), so too Feuerbach argued that human well-being depends on the reappropriation of the real content contained in the alienated idea of God. The inner meaning of Christian theology is anthropology.

The first part of *The Essence of Christianity* attempts to show that all the major Christian doctrines—especially those of God and the incarnation—can best be understood as anthropology. The second part is more negative, seeking to establish that Christian theology is full of contradictions if these human predicates are attributed to a single, metaphysical being.

Feuerbach's book is still regarded by many as one of the seminal works of the nineteenth century and the first comprehensive projection theory of religion. Religion is not dismissed merely as superstitious belief, but seen as a necessary stage in the development of human self-consciousness. Moreover, the book is the first systematic attempt to develop a body of principles for interpreting Christian doctrine in its entirety. Christian doctrines are profound insights when taken as anthropological truths, but a mass of contradictions when taken as objective theological propositions.

Feuerbach modified his theory of religion in a small book, *The Essence of Religion* (1845), which in turn was amplified in *Lectures on the Essence of Religion* (1848). In these books he emphasized the role of external nature in the development of the religious consciousness, as well as the causal role played by wishes, needs, instincts, and desires. The basic drive of the self to preserve and develop all its powers (*Egoismus*) is said to be the hidden subjective cause of religion, while nature, falsified by the imagination, is said to be its objective ground.

Feuerbach stated that his first and last thoughts were about religion, and he turned to it once again in *Theogonie*, first published in 1857 and again, with a slightly altered title, in 1866. This work attempts to explain morality, culture, and religion in terms of a basic drive for happiness (*Glückseligkeitstrieb*), with arguments drawn from classical Greek, Hebraic, and early Christian sources. The gods are said to be the reified wishes of humankind. Since all wishes are fraught with a haunting sense of their contingency and possible failure, the imagination seizes upon the idea of a being that is not subject to limitation and death. Although Feuerbach regarded this book as his finest, it has generally been ignored.

BIBLIOGRAPHY

A new critical edition of Feuerbach's works, *Gesammelte Werke*, 20 vols. (Berlin, 1967–), is under the editorship of Werner Schuffenhauer; indispensable for serious scholarship, it contains the textual variations of all editions of Feuerbach's major works. It supplants Wilhelm Bolin and Friedrich Jodl's edition, *Sämtliche Werke*, 10 vols. (Stuttgart, 1903–1911), which was reissued in facsimile in 1960–1964 under the editorship of H.-M. Sass. In the facsimile edition, two more volumes were added. The eleventh contains a photographic facsimile of Feuerbach's inauguration dissertation of 1828 (in Latin), his *Thoughts on Death and Immortality* (1830), and an extensive bibliography of all works on Feuerbach in German between 1833 and 1961. The twelve (double) volumes contain Sass's expanded edition of Bolin's *Se-*

lected Correspondence from and to Ludwig Feuerbach, together with some of Bolin's memoirs.

Six of Feuerbach's works have been translated into English: (1) *Thoughts on Death and Immortality*, translated with introduction and notes by James A. Massey (Berkeley, 1980); (2) *The Essence of Christianity*, the famous translation by George Eliot of the second German edition (New York, 1957); (3) *The Essence of Faith According to Luther*, translated with a brief but suggestive introduction by Melvin Chernoh (New York, 1967); (4) *Principles of the Philosophy of the Future* (Indianapolis, 1966), which contains a long introduction by the translator, Manfred H. Vogel, exploring Feuerbach's philosophy of religion and his relationship to Hegel; (5) *Lectures on the Essence of Religion* (New York, 1967), a translation by Ralph Manheim based on the Bolin-Jodl version of 1908 and not the text Feuerbach himself published; and (6) *The Essence of Religion* (New York, 1873), an abridged edition translated by Alexander Loos, long out of print.

There are four scholarly treatments of Feuerbach in English: Van A. Harvey, *Feuerbach and the Interpretation of Religion*, (Cambridge, 1995); Larry Johnston, *Between Transcendence and Nihilism*, (New York, 1995); Marx W. Wartofsky, *Feuerbach* (New York, 1977); and Charles A. Wilson *Feuerbach and the Search for Otherness*, (New York, 1989). A useful introduction is Eugene Kamenka's *The Philosophy of Ludwig Feuerbach* (New York, 1970). There are many important books about Feuerbach in German. Still indispensable is Simon Rawidowicz's *Ludwig Feuerbachs Philosophie: Ursprung und Schicksal* (1931; reprint, Berlin, 1964). Also recommended is Michael von Gager, *Ludwig Feuerbach. Philosophie und Religionskritik* (Munich and Salzburg, 1970).

VAN A. HARVEY (1987 AND 2005)

FICHTE, JOHANN GOTTLIEB (1762–1814), was a German Idealist philosopher and religious thinker. Usually remembered mainly for his part in the development of German Idealism from Kant to Hegel and for his contribution to the rise of German national consciousness, Fichte is also an important figure in European religious thought at the end of the Enlightenment. Born in Rammenau (Lausitz), he enrolled in the University of Jena as a student of theology when he was eighteen. During his studies and a subsequent period as a private tutor in Zurich, he was apparently unacquainted with Kant's philosophy and seems to have been a determinist who admired Spinoza. Returning to Leipzig in 1790, he began a study of Kant that led to his conversion to Kantian practical philosophy. His fragmentary "Aphorismen über Religion und Deismus," written at this time, reveals his concern with the tension between simple Christian piety and philosophical speculation.

A fateful turn in Fichte's life and career came in 1791, when he traveled to Königsberg to meet Kant. Hoping to attract the master's attention, Fichte set out to write his own letter of introduction in the form of a Kantian-style "critique of revelation." When financial hardship cut short his stay in Königsberg, Fichte asked Kant for a loan to finance his re-

turn to Leipzig but got instead an offer to arrange publication of Fichte's manuscript with Kant's own publisher. Delayed for a time by the Prussian state censor, Fichte's *Attempt at a Critique of All Revelation* made its debut at the Leipzig Easter Fair in 1792 under puzzling circumstances. The publisher, perhaps deliberately, omitted both the author's name and his signed preface. The book was widely assumed to be Kant's long-awaited work on religion and received laudatory reviews in the leading journals. When Kant announced the true authorship, Fichte became an important philosopher virtually overnight. The book appeared in a revised second edition the following year, with Fichte's name on the title page, and in 1794 he was appointed to a chair of philosophy in Jena.

Like Kant's *Religion within the Limits of Reason Alone* (published a year later), Fichte's *Critique of All Revelation* argues that a valid revelation must conform to the moral law, which is purely an internal concern of reason. Fichte maintains that a revelation in external nature is nevertheless possible because some people are so enmeshed in the sensuous that God can advance the moral law only by presenting it in sensuous terms. When Fichte published his own Idealist system in 1794, titled *Wissenschaftslehre* (Science of knowledge), he abandoned his explicit dependence on Kant's philosophy while claiming to remain loyal to its fundamental aims. By giving up the Kantian "thing-in-itself" (*Ding an sich*), Fichte overcomes the duality of theoretical and practical, deriving all knowing from the activity of the transcendental ego (*das Ich*). He thereby inaugurates the transformation of Kant's critical philosophy, which culminates in the absolute Idealism of Schelling and Hegel. Fichte's essay on the divine governance of the world, published in 1798, led to the famous Atheism Controversy, which resulted in the loss of his position in Jena and his move to Berlin. Fichte's religious position at this time could be more accurately described as ethical pantheism than as atheism, for he equated the human inner sense of the moral law with God's governance of the world. Convicted of teaching "atheism," he was dismissed from the University of Jena in 1799.

During the last period of his life in Berlin, Fichte developed his political and economic views in the *Speeches to the German Nation*, while continuing to revise and develop his *Wissenschaftslehre* in lectures and in print. Ironically, the man who lost his position for being an atheist moved in an increasingly mystical and theosophical direction in his later years.

Fichte died in 1814 of a fever caught from his wife, who was nursing victims of an epidemic. His writings exerted a continuing influence not only on philosophers but also on theologians, including Friedrich Schleiermacher. Fichte stands as a Janus figure between the religious rationalism of the Enlightenment, which he embraced in his youth, and the new currents of Idealist and Romantic thought, to which he contributed original impulses.

BIBLIOGRAPHY

Works by Fichte

The standard and most accessible edition of Fichte's works is *Johann Gottlieb Fichte's sämtliche Werke*, 8 vols., edited by J. H. Fichte (1845–1846; reprint, Berlin 1971); the writings on religion make up volume 5. A critical edition is being published as the *J. G. Fichte-Gesamtausgabe der Bayerischen Akademie der Wissenschaften*, edited by Reinhard Lauth and Hans Jacob (Stuttgart, 1964–). I have translated *Versuch einer Kritik aller Offenbarung*, 2d ed. (Königsberg, 1793), as *Attempt at a Critique of All Revelation* (Cambridge, 1978), with an introduction and a bibliography of primary and secondary works.

Works about Fichte

An insightful discussion of Fichte's importance for Christian thought is contained in volume 4 of Emanuel Hirsch's *Geschichte der neuern evangelischen Theologie*, 5 vols. (Gütersloh, 1949). Wolfgang Ritzel traces the development of Fichte's religious thought through his entire career in *Fichtes Religionsphilosophie*, "Forschungen zur Kirchen- und Geistesgeschichte," vol. 5 (Stuttgart, 1956).

GARRETT GREEN (1987)

FICINO, MARSILIO (1433–1499), was the most eminent philosopher of the Renaissance. Ficino employed Neoplatonism, the characteristic form of Renaissance philosophy, as a support for Christianity. Cosimo de' Medici, impressed with Ficino's precocity, gave him the opportunity to learn Greek and presented him with his country house at Florence, the Villa Careggi, where Ficino presided over his "Platonic academy."

Ficino edited the complete works of Plato, translated Plato's *Dialogues*, wrote a commentary on the *Symposium*, and edited and translated various works of Neoplatonists such as Plotinus (the *Enneads*), Proclus, Iamblichus, Porphyry, and Dionysius the Areopagite. He also translated from Greek to Latin various second- and third-century mystical and gnostic texts (*Poimandres*) ascribed to Hermes Trismegistos.

In 1473, after an extended period of melancholy, Ficino became a priest. His own best-known works are *On the Christian Religion* and *Platonic Theology*, the latter an elaborate statement of his Christianized Neoplatonic philosophy. Ficino's "pious philosophy" or "learned religion" presupposed an epistemology of poesy and faith. Divine poetry and allegory serve as a veil for true religion, for the rhapsodic and the mystical express religious truth, which cannot be expressed by simple intellectual formulas. A religious syncretist and universalist, Ficino believed that truth has been transmitted through a long tradition from the ancient philosophers and that wisdom has been revealed in many forms. Plato and the Neoplatonists, he believed, encompassed in their thought all the elements of the "ancient philosophy of the gentiles." Ficino envisioned everything within the cosmos as a great hierarchy of being. The One (God) is the abso-

lute and uncontradicted original essence prior to the plurality of finite things, the ultimate unity of all things. The lesser orders are brought into being by emanations proceeding from the One. The way of ascent to the eternal One moves from bodies, through qualities, souls, and heavenly intelligences, with humanity at the center of this great chain of being, for humans are bound to the world of matter by their bodies and linked to the realm of the spirit by their souls. Humanity is assured of its own divinity, since God is immanent in humans through emanation. Ficino added a Christian patina to this Neoplatonic theodicy by identifying the demiurge, or intermediary, between the One and the subdivided spiritual and material world with the divine Logos, Christ, through whom the world was made and who “became flesh and dwelt among us.” The church through dogma and sacrament keeps its people in touch with the spiritual world. Someday the immortal human soul, freed from the prison house of the body, will enjoy the beatific vision of God without mediation.

All parts of the universe, Ficino taught in his treatise *On Light*, are held together by bonds of sympathetic love. The highest form of love, Platonic love, moves the true lover to love another for the sake of God. This love guides humanity in its choice of good over evil and of the beautiful over the unlovely. Ficino’s close association of goodness and truth with beauty appealed to the aesthetic sense of the Renaissance and influenced literature and art as well as philosophy and theology.

BIBLIOGRAPHY

Ficino’s works have been published as *Opera omnia* (1576), 2 vols. (Turin, 1959), and *Supplementum Ficinianum*, 2 vols., edited by Paul O. Kristeller (Florence, 1937). See also *The Letters of Marsilio Ficino*, 3 vols. (London, 1975–1981). On his thought, the most comprehensive study available in English is Kristeller’s *The Philosophy of Marsilio Ficino* (1943; reprint, Gloucester, Mass., 1964). For a brief introduction to his thought, one may turn to Kristeller’s *Eight Philosophers of the Italian Renaissance* (Stanford, Calif., 1964), pp. 37–53, and *The Renaissance Philosophy of Man*, edited by Ernst Cassirer et al. (Chicago, 1948), pp. 185–212. For the larger picture of Neoplatonism and its influence, see Nesca A. Robb’s *Neoplatonism of the Italian Renaissance* (1935; reprint, New York, 1968).

FICTION: HISTORY OF THE NOVEL

The novel has long been considered a literary form existing apart from religion, even if religion as social and moral fact may enter into the lives of its characters from time to time. The belief that the novel, our term for a lengthy work of fiction in prose, is solely the product of the period currently (if unhappily) labeled “Early Modern” has helped to sustain the belief that the novel is a triumphantly modern and secular form of literature. We dwell on authorship and prose style, but ignore earlier problematic points of development, including the eventual advent of the author as an individual “maker” instead of inspired recipient of divine information (see Finkelberg, 1998); in modern literature departments we rarely pause to inquire into the rise of prose itself as a significant and perhaps intrinsically democratic medium (see Goldhill, 2002).

THE HISTORY OF THE NOVEL AND ITS HISTORIANS.

Claude de Saumaise. The English history of the novel, born in the eighteenth century and placing its conception and birth in that century, flew in the face of another history composed by scholars on the Continent. The noted scholar and political theorist Claude de Saumaise (Claudius Salmasius; 1588–1653) in 1640 proposes a line of transmission in succinct prefatory essays to his edition of the Greek text of Achilles Tatius’s novel, here presented as *Erotikon, sive de Clitophontis et Leukippes Amoribus* (Erotic stories, or the Loves of Kleitophon and Leukippe). In his dedicatory *Praefatio* and the address *Ad Lectorem* (To the reader) Salmasius tacitly picks up a suggestion made by Miguel de Cervantes (1547–1616), when the Spanish novelist’s unnamed frame-narrator of *Don Quixote* describes the finding of the mysterious manuscript written in Arabic by Cide Hamete Benengeli, for which he must find a (Muslim) Arab-speaking translator, although officially there are no such persons left in Spain after the ethnic cleansing of the Catholic kings. (The initial act of censorship is massacre and expulsion.) Salmasius proposes that the novel’s origins lie in the East, “The Persians first affected this kind of amorous literature. . . . You will not find it hard to believe that of old they introduced the beginning [*originem*] of Milesian fables in Asia [i.e., Asia Minor] which they ruled. Certainly they gave to the Arabs the fashion of this same kind of writing and the genius for it. The Arabs then transmitted it to the Spanish. From the Spanish we Gauls in turn took it, and from them indeed it also went elsewhere.”

Salmasius traces a clear line of transmission: antique fiction comes from the Persians into Asia Minor and thence into Greek and Roman writings; modern European prose fiction derives from Arabic fiction already influenced by Persians and Greeks and then transmitted through the Moors to Spain and thence to the rest of Europe.

Pierre-Daniel Huet. A few years after Salmasius succinctly propounded this theory, Bishop Pierre-Daniel Huet (1630–1721) wrote his *Traité de l’origine des romans*. This important work was first published in 1670 as a preface to

Zayde, a novel about an Oriental woman written by a woman, though issued under the name of a male writer (Segrais). Huet's treatise (in the form of a letter to Segrais, a respectable male-male discussion) was soon reprinted and amplified as a book. Huet argues that in composing histories of this kind of writing we have stuck too close to home, "It is neither in Provence nor in Spain, as many believe, that we must hope to find the first beginnings of this agreeable amusement of good idle folk [*cet agréable amusement des honnestes paresseux*]; we must go to seek them in the most distant countries and in the most remote antiquity."

Huet's history makes the novel an arena of cultural anxiety and contestation. By 1674 Nicolas Boileau (1636–1711) was forced to take into account the implications of Huet's *Traité*. Boileau initiated the brilliant strategy of attacking the novel not only as a feminine and effeminating kind of literature, but also as a "bourgeois" form. For Huet, the novel existed before such modern social or literary classifications, springing as it does from the deep past and from diverse sources in folk traditions and various aristocratic cultures. It was an international—one could say "multicultural"—form of literature. The English definers of the novel tradition were trying to wrest the form from Huet and from contamination by the alien. Their strategy entails ignoring Continental fiction almost entirely at least, until after the "rise" of the novels of Daniel Defoe (1660–1731), Samuel Richardson (1689–1761), and Henry Fielding (1707–1754) ensured the establishment of the "new" form as of English growth. Such a story of the novel has been freshly established in Ian Watt's *The Rise of the Novel: Studies in Defoe, Richardson, and Fielding* (1957). In this English-manufactured account, only *Don Quixote* of all Continental works is allowed a place. Unlike Salmasius and Huet, English claimants to the invention of the novel do not see in *Don Quixote* a tribute to the Oriental sources of this literature, but rather a handy repudiation of all Continental forms of novelistic fiction. *Don Quixote* becomes an honorary British fiction, a herald of the realistic and commonsensical novel that remained for the English to invent and perfect. (Too bad for Cervantes that such an account made it necessary to suppress all reference to his last work, *Persiles y Sigismunda*, a prose romance manifesting the devices and tropes that Cervantes is supposed to have killed off.)

Development of the term *novel*. The word *novel* is a relatively modern invention; in the sixteenth and seventeenth centuries the term was in use but functioning much like our term *novella*, referring to a short fiction. A long fiction in prose, like long fictions in poetic narration, was termed a *romance*; the word *romance* indicated simply and basically a work written in the vernacular (one of the romance languages, such as French, Italian, or Spanish) and had no negative significance—save to those who disliked all made-up stories. To this day, Continental languages have stubbornly adhered to the basic terms *il romanzo* (Italian), *le roman* (French), and *der roman* (German). For the English the term

became suspect by the mid-eighteenth century, and the term *history* was more generally employed to describe a full-length work of prose fiction, for example, Fielding's *The History of Tom Jones, a Foundling*. This influenced Continental usage; see, for example, Antoine-François Prévost d'Exiles's (1697–1763) *L'Histoire d'une Grecque moderne*.

ANCIENT NOVELS. We must admit, along with Huet, that the novel in the West has much longer and less certainly "Western" roots. Certain prose fictions by authors writing in Greek and Latin from about the first century BCE to the third century CE continued to influence Western literature both in the Byzantine regions and in Roman Europe. Their influence was renewed in the Age of Print; some of these novels were among the earliest fictional works to be printed, such as *Asinus aureus* (The golden ass) by the second-century author known as Apuleius (c. 124–c. 170), first printed in 1469. Many of these works, rendered familiar to readers of the Renaissance, acted as decided influences on the development of new fictions in the vernacular, including novelists writing in English in the eighteenth century and later. The influence of *Aithiopika*, to take but one example, can be seen not only in the *Arcadia* by Sir Philip Sidney (1554–1586), but also in Cervantes' *Persiles y Sigismunda*, and in Richardson's *Clarissa*.

What were these early Western novels? We must be leery of writing stories of "origins" at least in the sense of finding an exact terminus. We do not know when the first of the Greek stories of love and adventures (such as used to be called "Greek romances") was written. Possibly the earliest of those surviving in full is Chariton of Aphrodisias' (first or second century CE) *Chaïreas and Kallirhoe*, which some wish to date as early as 50 BCE, though others would put it as late as the second century. One piece of literary evidence indicates that there were a number of such novels in existence by the early first century CE. If we accept the standard equation of Petronius the author with Petronius Arbiter, his work on the *Satyricon* was finished by the date of his enforced death in 66 CE. This novel plays with the tropes of the Greek novels: with wandering lovers separated, much roaming from place to place, impediments resulting from offenses committed against the gods, the temporary enslavement of the central characters, a sea journey and shipwreck, and so on. If Petronius is able to treat the material of the novel as well known and to play thus with it, the genre must have been fully established by the mid-first century, though the best of the surviving examples come to us from the second and third centuries.

Latin novels. Only two major novels in Latin have come down to us. Petronius' *Satyricon*, if early in the temporal sequence, is ultrasophisticated and its fragmentary state adds to a sophistication in montage creatively imitated by writers like François Rabelais (1483–1553), Laurence Sterne (1713–1768), and James Joyce (1882–1941). Apuleius' *Metamorphoses* has an ascertained author and a fairly clear date (c. 160 CE). Shorter works in Latin include the late *Ephemeris Belli Troiani* (Diary of the Trojan War), presented

as a found manuscript by an invented narrator “Dictys Cretensis” or “Dictys of Crete” (traditionally, all Cretans are liars). There were many other fictions, now lost; Apuleius wrote a second novel that—sadly—has not come down to us. Apuleius’ extant novel is based on the Greek novel *Onos* (The ass), which was once attributed (wrongly, we now think) to Lucian of Samosata (c. 120–c. 190), who is, however, certainly the author of that fine parodic work of science fiction, known as *Vera Historia* (True story; c. 170 CE).

Greek novels. There are many more extant examples of ancient novels in Greek, including the novella *Chion of Heraklea* (c. 100 CE), which demonstrates that the classical world had already invented epistolary narrative. There are five works of substantial length; one, *Ephesiaka* (The Ephesian story; c. 150 CE) by Xenophon of Ephesus (dates unknown), may be partly a paraphrase. The other four are complete texts (given a few cruxes and some missing sentences): *Chaireas and Kallirhoe* by Chariton; *Kleitophon and Leukippe* (c. 150 CE) by Achilles Tatius; *Daphnis and Chloe* (c. 200 CE) by Longus; and *Aithiopika* (The Ethiopian story) by Heliodorus of Emesa (date uncertain; estimates have ranged from the second to the late fourth century, but it is most tempting to believe it belongs to the period of rule of the African emperor Septimius Severus (r. 193–211 CE). All these have named authors (though whether these are the genuine names of the writers has been challenged) and all are referred to in varying titles, sometimes naming the heroine alone: Achilles’ *Leukippe* and Heliodorus’s *Charikleia*.

The dating of these works is vexed, and we should be warned by the errors of great scholars of the past such as Erwin Rohde (1845–1898) not to put too much faith into our own current temporal schemata. Scholars used to be attracted to the late classical self-definition of the period of the “Second Sophistic,” in which rhetorical play of a kind partly associated with the East (including Alexandria) enjoyed a re-credescence in new works. Plays of ideas and words, an understanding of how to interpret and describe works of visual art, clever and unexpected uses of literary allusions, and a self-conscious stance in relation to the literary tradition—all mark works of the Second Sophistic. These qualities, however, can be found outside the second-century temporal zone.

The term *Second Sophistic* was coined in reference to a presumed “First Sophistic,” the period of the late fifth and early fourth century BCE, in which rhetoricians had flourished in Athens. “Sophists” were repudiated as pseudo-wise and dangerous by Socrates (c. 469–399 BCE) and Plato (c. 428–348 BCE). Sophists, Plato believed, pervert the truth with ingenious twisting of words and undermine aristocracy by the employment of verbal techniques that they could make available to anyone who pays. Proponents of the Second Sophistic consciously reversed Plato, declaring there is value in this *préciosité*.

The Sophists were often foreign to Athens—men such as Gorgias of Leontini, who came to Athens as an ambassador in 427 BCE, or Hippodamos of Miletus (fifth century

BCE), one of the foreigners who brought the scientific spirit of Ionia to the marketplace of Athens. Dangerous if attractive representatives of alien cultures were introducing moral relativism, disrespecting tradition, and undermining the independent city-state, the polis. The democratizing of power through rhetoric probably did herald the end of an idealized enclosed and aristocratically controlled polis. After the polis had been fundamentally altered in the Hellenistic age and then subsumed into the Roman Empire, gentlemen from different regions shared a common educational syllabus, including training in rhetoric. Athens had become a kind of university where wealthy young males from various parts of the Roman Empire could meet, instilling in themselves the Hellenic—or Hellenistic—sense of the beautiful and true. The writers of our novels arose out of this colonial matrix, sharing something of the culture of the center. Yet, they were capable of going beyond the Hellenistic- and Roman-adapted mental world. By and before the second century CE writers and readers were evidently interested in finding ways of understanding and assimilating influences that did not emanate from Rome or Athens as Rome interpreted it. By this time the Hebrew scriptures had become available in the Greek Septuagint to non-Jewish readers. Christianity was becoming a force to be reckoned with, though it was only one of many strange religions. Christian, Jewish, and “pagan” authors sought new narrative forms, visible to us in works like the Apocrypha, the Gospels, and the *Acts*; some recent studies attend to the relation between Christian writings and the early novels (e.g., Thomas, 2003). Christian imagination found expression in a number of works, including the Greek *Poimen* (*The Shepherd of Hermas*), a sometimes novelistic text that once had practically canonical standing). *Recognitiones* (Recognitions; c. 150–250), the Latin Christian novel, has as its narrator Clement, the future second pope; here, he is a young man, who becomes a convert and a member of the circle around Saint Peter (d. c. 64 CE) during the conflict with Simon Magus.

There is at least one Jewish novel, aside from works like *Judith* and *Daniel*. *Joseph and Asenath* perhaps existed in the first century BCE, if rewritten later, so as to convey a Christian perspective. The Egyptian heroine Asenath, based on a personage crisply alluded to in *Genesis* 41:50, is the center of the story. Amusingly, she is at first utterly contemptuous of Joseph (her future husband), seeing him as an alien fortune-teller who (she has heard) lay with his mistress. (She will be converted to Joseph and to Judaism.)

Cultural variety of novelists. One thing is as clear to us as it evidently was to Huet: the authors of the Greek novels were not Hellenes from the mainland of Greece. These authors came from the conquered eastern areas of the Roman Empire. They were Syrians like Lucian and Heliodorus (who came from a town in modern Iraq), or they came from inland Asia Minor like Chariton or from the intellectually and materially rich coastal region, like Xenophon of Ephesus and Longus, who appears to be from the Lesbos he describes. Pe-

tronius alone has the credentials of a man of the center of Italy, a genuine Roman citizen, but Apuleius, in marked contrast, is a North African, a Berber from Numidia who after much travel settles in Carthage.

The same pattern of diverse authorship appears when we consider the novels in Greek that exist only in fragments or in paraphrase. Substantial pieces of a number of these have been found, though the fullest account of some can be gathered only from the paraphrases prepared by Photios (c. 820–891), Patriarch of Constantinople, who composed a sort of reader's diary. Called *Bibliothēke*, it gives a fairly full account of the books he liked including novels, offering not only his opinion of style and substance, but also detailed plot summaries. His commentary and paraphrase gives us a fairly full if muffled rendition of Iamblichos' (second century CE) *Babyloniaka* (The Babylonian story) or Antonius Diogenes' *Apistia hyper Thulen* (Wonders beyond Thule). Exact dates for these works and others surviving in fragments are not known; see the scholarly edition of *Ancient Greek Novels* by Susan Stephens and John J. Winkler (1995).

Photios provides manuscript sources of about six pages' worth each of *Semiramis and Nisus* (a love story set in an exotic past with historical characters, perhaps written as early as 100 BCE) and of *Metiochos and Parthenope* (c. 150 CE), a story surviving in fragmentary papyrus emanating from the Fayum in Egypt. The novels were certainly read in Egypt—but we know from the evidence of expensive mosaic illustrations that a wealthy house owner in Syrian Antioch wanted to surround himself with images from these two novels. Despite disdainful assumptions on the part of some that these early novels could have been perused only by women and the semiliterate, evidence indicates a wide readership, socially and geographically, definitely including wealthy males, that was able to pay not only for full-length manuscript copies, but even for costly artwork illustrating the stories.

Different styles of Greek novels. A strange work that has recently come in its fragmentary way to light is *Phoinikika* (The Phoenician story; first published in 1972) by Lollianos. The discovery of this lively comic novel put an end to our earlier theory that only Latin novelists penned realistic, sexually explicit, and comic works of fiction, whereas the Greek novelists were romantic and sentimental. It is more likely that the authors choosing to write in Latin took up forms and comic styles from works in Greek, and it is probable that works in Latin of a more romantic style are now lost to us. Other works of Greek fiction that have come into view include *Herpyllis*, whose surviving passage deals with a storm at sea, a trope beloved of novelists; *Sesonchosis*, with Egyptian characters and themes; and *Chione*, about a heroine whose name could be translated as "Snow White" (Stephens and Winkler, 1995).

THE DEEP TRADITION: FICTIONS OF BABYLON, SYRIA AND ELSEWHERE. It is apparent from the previously mentioned titles that the Greek novels are interested in dealing with material related to various regions that were not Roman. Nor

should the resort to Babylon, Phoenicia, the Assyria of Ninus, or the Egypt of Pharaoh Sesonchosis be thought of as mere "exoticism." Readers and writers alike came from these regions. A matter capable of future examination is the possible influence on the novel of literatures of even more ancient cultures than those that we customarily mean in referring to "antiquity"—a *passé* label. When Renaissance scholars first seriously published commentaries on these fictional texts, they lacked almost completely any real information (aside from Hebrew scripture and the Apocrypha) about the literature of Babylon, Assyria, and Egypt. Slowly, more is coming come to light.

Consider, for example, the incursion of *Gilgamesh* on our literary studies in the late twentieth century. This epic is not an action-epic like the *Iliad* or *Aeneid*, nor a story of wandering, discovery, loss, and restoration like the *Odyssey* (which, however, can strike one as having some Egyptian strands). *Gilgamesh* begins as an action story but becomes a story of love, death, grief, and loss—of coming to terms with something that will not allow a victory. The central character in his coming to grips with the hard fact of death and bereavement becomes a hero of the interior life. *Gilgamesh* might guard us against rash suppositions about regularly progressive development, of the sort that Friedrich Nietzsche (1844–1900) negatively imagines in *The Birth of Tragedy* (1871), when he propounds an original fall from the Dionysiac perfection of ancient theater to the degenerate rationalism and individualism signaled in Socrates and the works of the ancient novelists, in which a sublime communal experience has been exchanged for individual self-consciousness and emotional self-attention.

Our desire for linear progression leads us to render literary history in a rather simplistic mode: first there was the folktale, then there was the epic, reflecting national and group consciousness shaped by an aristocratic class; then, in a new development (progressive or degenerative, according to taste), the epic action became the story of an unimportant individual, and the action turned inward, toward consciousness and what Johann Christoph Friedrich von Schiller (1759–1805) termed the "sentimental," away from the first "naïve" strength. Poetry gave place to prose, and action to sentiment, as we move (sadly, perhaps) from Homer (eighth century BCE) to Henry James (1843–1916). So attractive is this line of progress or regress that we are unwilling to notice how this plotline can be changed. At any moment, what we call "folk" material can reenter the picture and refresh the narrative—as with the advent of the folk tales of Jacob Grimm (1785–1863) and Wilhelm Grimm (1786–1859). Poetic narrative can reassume the telling elsewhere associated with prose fiction as in *Evgeny Onegin* (1823–1831) by Aleksandr Pushkin (1799–1837).

One text that challenges the paradigm is the Cretan narrative poem *Erotókritos*. This heroic love story is a narrative poem written by a Venetian Cretan Vitzéntzos Kornáros (seventeenth century). Kornáros's work, drawing on the ma-

terial of novels, is also epic and nationalistic, a defense not only of Greek Orthodox personages against the Ottomans, but also of Cretan identity. This novel-based literary work of an individual Renaissance artificer becomes for Cretans their genuine national epic. It folds itself back into folklore and folk motif, with many tellings and popular, even homemade, graphic depictions of the hero and heroine, into at least the twentieth century. *Erotókritos* challenges many of our assumptions, as it seems in so many ways to go “backward”—from novel back to epic and then back to folktale. But our surprised impression of an almost unnatural reversal arises from our adaptation of a linear notion of a “progress” and certain staid, if recent assumptions about absolute divisions between literary culture and popular culture.

Eastern and African influences on the novel. If we question our linear representations of such “histories,” we may be willing to admit into the novel written and not just folkloric “influence” from non-Hellenic sources, as Huet divined. It is tantalizing to know that Babylonians of Chaldea had libraries (destroyed by Sennacherib [c. 704–681]) and that the Assyrians followed suit, with libraries of books in clay tablets open to the public. The Chaldeans invented systems and discovered much mathematical knowledge, including geometrical figures; when the Greeks fell in love with geometry as a training for the mind, they were really imbibing the discoveries of Mesopotamia, as transmitted through the cultures of coastal Asia Minor. Much of what we call “literature” could have followed a similar route.

Punic Carthage had philosophies, a priesthood, and a library—all was wrecked by the invading Romans, save for one useful treatise on agriculture. Yet, it seems hard to believe that so much thought could altogether disappear; and elements of Phoenician and more particularly Carthaginian thought and style may be lurking in a number of texts, invisible to us. By contrast we can now pick out the bright red thread of Egyptian thinking, style, and concerns. Since the late nineteenth century we have possessed a collection of classic Egyptian fiction, and poetic stories like *The Story of Sinuhe* or *The Shipwrecked Sailor* seem strongly related not only to some biblical material, but also to many elements in our own fiction. More saliently visible is the influence of the Egyptian religion. The story of Isis (Isis/Osiris) is everywhere alluded to in the ancient novels, and Isis worship forms an extensive part of Apuleius’ *Metamorphoses*. The other and older central Egyptian religious story, that of the solar boat in its journey through the underworld during the twelve hours of darkness, was elaborated by Egyptian thinkers and artists, so that it becomes the basic story of all ordeals—and of all twelve-step programs.

The Egyptians are strongly attracted to stories of an ordeal (of Isis, or of the solar voyager) that develops through multiple sequent phases. A number of the “Gnostic gospels,” written around the same time as our novel texts, betray decided signs of Egyptian influence, especially in the love of progressions through the twelve stages. Dante Alighieri’s

(1265–1321) *Inferno* and the *Purgatorio* both have an ultimately Egyptian ancestry. Journeying is important to the Egyptian ordeal, loss of self, loneliness in the midst of an unmarked world momentarily completely alien, and the encounter with the monster or the monstrous. Yet, in “classic” Egyptian fiction of the two millennia BCE, redemption seems almost always possible, as does some new negotiation of the relation between authority and its subject, as between divine and human.

When we look at the longest and most sophisticated of our Greek and Latin “early” and “Western” novels, *Metamorphoses* and *Aithiopika*, we can see that the writers are very conscious of the possibilities of multicultural narratives. Different traditions are signaled in the introduction of different kinds of story within the main or frame story. We meet characters of varying national or ethnic identities. People establish relations who have no original familial or even ethnic connection with each other. A young Sicilian woman, once in the power of the Persian Great King, develops a friendship with the Persian queen, and on returning to her native Sicily urges the queen “write to me often.” A chatty young Athenian walks on the banks of the Nile with an elderly Egyptian priest and hears the story of the trials of an Ethiopian family. A blond young Greek male from Attica, sentenced to the harshness of the Roman games in Corinth, is spared and consoled by the ministrations of an Egyptian priest and becomes fully a convert to the Egyptian religion of Isis.

Poetry, drama, folk tale and the novel. Traditional or “classical” Hellenic stories are mixed in with new styles and materials from other sources. As examples of the interweaving of different forms of narrative, we may take Heliodorus’ inclusion of the “Phaidra and Hippolytus” kind of story told by a young and somewhat silly if good-natured Athenian young man who is the Hippolytus of his tale; we can note how his story contrasts with the story about himself told by the dignified Egyptian priest Kalasiris, a story that has some resonance with the early Christian semifictional *The Shepherd of Hermas*. In *Metamorphoses* Apuleius sets within with his hero’s comically painful autobiography a miniature epic-cum-love elegy, the charming and puzzling story of “Eros and Psyche,” and then includes sex stories both grim and ribald, told with a twist, and set in a heavily marked social context, the sort of thing medieval writers were to call *fabliau*. Folk material of magic, ghosts, and werewolves mingles with reference to elegantly written literature, and realistic observation of behavior exchanges places with magical transformation, as in *realismo magico*. We do not here forget the presence of alien and oppressive power. Apuleius strikingly describes the way the brutal soldier piles his weapons on top of his dunnage so as to strike terror in the hearts of the ordinary people. Perhaps Apuleius is the first to employ the word *terror* in such an ideologically critical manner. Certainly, he is aware throughout the entire novel of the accoutrements of power used by an oppressive ruler and daily encountered by the vanquished.

NOVEL AND POLITICAL RESISTANCE. The novels of the first centuries CE reflect a tacit resistance to Roman (or Greco-Roman) domination, a search for an imaginative home free of the oppressive dominion of the present. It may have been prudence that dictated that most of these novelists should give their works a historical setting, in an era safely past, customarily when Persia was the ruler of the world. (Persians could be safely criticized.) The political implications of ancient novels have been underemphasized. This may be because of our own allegiance to Rome and our reluctance to realize that its presence could be felt—not only in Judea but elsewhere—as an unjust weight. We do not customarily hear in school, for instance, about the overt expressions of revulsion against Roman rule, as in 88 BCE when the people of Ephesus, with the assistance of the king of Pontus, Mithradates VI Eupator (120–63 BCE), revolted against the Romans, first overthrowing Roman statues and then massacring the Italians found in the region. (Freedom was short lived; the Romans inevitably exacted a strong penalty.) If analyzed, almost every one of these novels is capable of bearing an interpretation of resistance to imposed power. The theme of resistance is strongest in *Chion of Heraklea*, where the student-hero becomes a tyrannicide. Less overtly, the theme of resistance also becomes clear at the end of Chariton's novel *Chaireas and Kallirhoe*, when Chaireas invites all those of his fellow warriors, hitherto living among the Persians and fighting for the Great King of Persia, to join him in coming to Sicily, here imagined as a land of the free (book 8, cap. 2). The hero is willing to include his former enemies, Egyptian fighting men, as well as the Greeks, but only with their own free will; each person is to be asked individually: "*hina monon tous hekontas parabolomen*" (so that we take up only those who are willing).

Slavery and choice. "Choice" is at the center of the morality pursued or invented by the novels—of all kinds. Aristotle notably gave great weight to choice, but only a few people (educated free males) in his view had the power of real choice. Slaves represent human entities who are not persons and absolutely lack choice. In the novels, however, most of the central characters experience enslavement and degradation—in a sense it is true to say that all the central characters are both rulers and slaves. The characters, however low their circumstances, are never without significance, and never, even in enslavement, without the concept of choice—which is proclaimed and presented through their attention to their own inner lives. This is a monumental, not to say monstrous, departure from the classical ordering of the social world. In the novel the individual matters most. The definition of a set cannot be the ultimate measure of a person. A personage is first of all a person—and not first of all, slave or free, Greek or Egyptian, or even male or female. Barriers between civilized and barbarian are set aside. The identity we now call "racial," the difference between "black" and "white" persons, becomes in *Aithiopika* a gigantic conundrum; the heroine proves to be both "black" and "white." Whether Heliodorus'

Charikleia is Greek or Ethiopian is less important than that she is Charikleia.

Individual life. These novels consistently show the life of the individual as central; the individual casts off, overtly or secretly, the restrictions of familial authority, arranged marriage, and custom. Individuality encompasses an inner life. From this individual inner life spring new apprehensions of morality, new orderings of society, and new religious insights. New perceptions and actions may be deeply spiritual, but the central religion is no longer the religion of the state. Public religious ceremonies indeed figure—often as a means for the lovers to lay eyes on each other—but the most loved deity has intercourse with the individual spirit, as Isis makes herself known to asinine Lucius. Epic must not put the individual at the center; the heroic individual, like an Aeneas, is simply and grandly at the service of his clan or nation, and the enticements of a Dido must be got over. It cannot be possible for Aeneas to have a new revelation as to how to live. In the novels, individuals constantly make new cultural adjustments and experience new revelations.

Women and freedom. Another great change from the traditional Greco-Roman view of things is the installation of the female at the center of the story. Many of the Greek novels were called simply by the name of the heroine: *Kallirhoe*, *Leukippe*, and *Charikleia*.

The story of courtship in the Greek novels sets aside the reality of marriage in most parts of the empire. Traditionally, a good Greek marriage consisted of the union of a young girl of fifteen or so—who had nothing to say in the matter—with a man of about thirty. The two were not equal and were not meant to be so. Love as a practical affection was supposed to grow between a married pair, though given the limitations of the female and her patent inferiority, the role of the erotic was to be limited in marriage; in illegitimate heterosexual connections, the desirable female (slave or freedwoman) was usually a prostitute, well below the male in class, and not officially important. When the Greeks—especially the Athenians—of the classical period wrote about what we recognize as romantic love (e.g., in the *Symposium*), they treat the homosexual connection of an older man (the lover) with a youth (the beloved). (Or, in the poems of Sappho [late seventh century BCE], the pull of an older woman toward a nubile girl.)

As David Konstan points out, the traditional Greek equation of love is always unequal, the relation asymmetrical; thus, the novels make a great leap in boldly imagining courtship between equals. The hero and heroine in any of the new novels are both young and near in age, and each is both lover and beloved. There is no division between agent and patient. The two have chosen to love each other—despite their families. The woman consistently has a choice about what she or even they will do, and both display intelligence and courage (and sometimes dull-wittedness and timidity). This equal couple escapes the confines of family and city, roaming through the world. In the course of their wanderings they

make friends who are by all traditional standards unsuitable (in any case, it is traditionally unsuitable for the woman to have friends outside of home, her *oikos*). The rule of the household, the rule of the polis, and the rule of the empire are all challenged in this representation, which offers a new definition of what freedom might mean.

Hero and heroine together overthrow the “citizen” as an ideal. Love takes them away from convention and into discovery. They are not unguided, for there is a tutelary deity, perhaps several; the deity presiding over many of these novels, however, is a female god: Artemis, Aphrodite, or Isis. (Ephesus, the center of the worship of powerful Artemis, “Diana of the Ephesians,” figures incessantly in the novel as locale and reference.) The novels can be seen as explorations of the relation with the goddess rather than with the god. The goddess endorses freedom, love, experience, and searching. The goddess also implicitly endorses the significance of both the physical life of the body (which must include death) and the life of consciousness. The goddess recurs in modern novels as much as in ancient ones, and may be lurking in surprising haunts; one critic (Brown, 2004) convincingly traces the pattern of Celtic myth and the role of the fierce Celtic mother goddess Mor Rigan in *Mrs. Dalloway* (1922) by Virginia Woolf (1882–1941).

RELIGION AND THE NOVEL IN THE WEST. Unlike tragedy, comedy, or epic, the novel has traditionally been supposed to have arisen without religious affiliation. That view was challenged by some twentieth-century scholars, most notably by Karl Kerényi in *Die Griechisch-Orientalische Romanliteratur in Religionsgeschichtlicher Beleuchtung* (1927) and by Reinhold Merkelbach in *Roman und Mysterium in der Antike* (1962).

Kerényi emphasizes the connection between novelistic and Christian perceptions; the central character(s) of the ancient novel imitates on the human level the trials of a divine being. Merkelbach proposes that the early novels embody and encode a mystery ritual, a sequence of experiences initiated ultimately by the divine power. Merkelbach considers that these Greek and Latin novels present to us and their readers the actual images and practices of the mystery cults and are close to the religions of Demeter and Isis. The characters, like the mystery initiates, undergo tests and trials—being beaten, imprisoned, and even left for dead; they eventually encounter various important figures of consolation and enlightenment, including the shepherd or herdsman and the fisherman. From a near-death or seeming death (*Scheintod*) they are resurrected to new life.

Merkelbach applies his discovery only to the ancient novels, but it can be applied to novels beyond this temporal range. The novel, if we look at the templates suggested by the ancient novels, embodies a sequence of experiences that not only the character, but also the reader follows in a sequence of initiation. These “tropes of the novel” take the reader through a participatory ritual. It is the reader as well as the character who undergoes the shock and excitement of

entering the new, being cut off from past life at an initial critical moment, and crossing a borderland of marsh or muddy margins. The reader vicariously undergoes a kind of baptism, walks the labyrinth, gazes on enigmatic images demanding interpretation and understanding, descends into the abyss, and is resurrected. The hidden pattern of initiatory ritual and enlightenment within each novel makes it possible for us to read novels, which would otherwise fly apart under the pressure of their novelty, becoming abstract kaleidoscopes of words, or mere journalism. The goddess presides over this new life, this metamorphosis and grappling with the phenomenal—*phainomena symbola*, to use a term from the opening of *Aithiopika*.

That the “goddess” presides can be explained in another fashion. Under the sign of the male we have placed the creation of what is abstract and enduring: a philosophy, a law, and a work of art—monuments more lasting than bronze. The sphere of the female is more lowly; women create what is temporary and consumed: cakes, fabric, and babies. The novel is the only form that consistently summons the goddess because it is the form that centrally deals with the sacredness of daily transitory and physical life. It respects the fundamental equality of all human beings and their relation both to the animal and spiritual worlds. The novel never ignores the perishable and transient things such as food, love-making, dreams, conversation, fabric, babies.

Plato opposed the changeable, and even Aristotle saw our love of change as a weakness, but the novel gives over the search for steadfast rest and permanence, celebrating the capacity to change. Every novel could really bear the title of Apuleius’ *Metamorphoses*, because all characters are metamorphosing—Elizabeth Bennet, Anna Karenina, or Gregor Samsa. And all are journeying, through space and time. The title *Journey to the West* could apply to all—the journey to enlightenment is simultaneously a journey toward sunset and the grave.

RELIGION AND THE NOVEL IN THE EAST. Both Chinese and Japanese fiction display qualities and patterns remarkably similar to those found in Western novels. The orderly disorder of birth/death, muddying, eating, contemplating images, plunging into the depths and arising—all these ritual experiences can be found. There is perpetual contestation between the political public male-ordered world and the world of private experience.

The earliest collection of poems in Chinese literature may be read as personal lyrics of love and longing, or as coded references to political affairs. The personal can be set against the ideal of order—even the ideal of political order, so central to Chinese thinking and endorsed by Confucianism. Rebellion is a topic, as in the fourteenth-century *Outlaws of the Marsh*, where we follow the individual lives of bandit-heroes, who dwell on the muddy margins. One of them, Song Jiang, is given three heavenly books by the goddess-like Mystic Queen of the Ninth Heaven, who exhorts him to remember justice and bring peace to the people. In

the sixteenth-century classic known as *Journey to the West*, a complex narrative of a pilgrimage from China to the borders of India to find the original Buddhist scriptures and bring them to China, the heroes are often aided by a divine female, the *bodhisattva* Guanyin, who gave them their assignment. By contrast with the refreshment of her rare presence, monasteries encountered en route seem abodes of greed and inertia, masculinity without heart and without spirit. Spiritual life develops in the lived life. The insertion of Monkey, the famous mischief-making hero, reinstates the body and the life of desire in a story that both supports and questions Buddhism itself, as it also questions the Dao that supplies so many of this narrative's fascinating systems of contrasts and affinities. At the end of the novel, the importance of "sacred text" becomes subtly ironic—the truth is within, so a blank page is as good as any other. This strange ending also suggests that the real story is always about to be—that the religious truth can be encountered only in the experience of seeking it.

In the high flowering of the Chinese novel, the feminine moves to a central place, countering both the worldly orderliness of Confucianism and the sense-rejecting purity of Buddhism. One of the greatest of the world's novels is *Hong Lou Meng* (*Dream of the Red Chamber*, or *Story of the Stone*) by Cao Xueqin (c. 1715–1763). Generations have marveled at and wept over the complex and fated loves of Bao-yu and Dai-yu. Divine discontent has never been more subtly or powerfully revealed in a novel teeming with multifaceted characters and taking time to deal with many developments over half a lifetime. Its only rival in representing the subtleties of consciousness in relation to love and loss is the great Japanese novel *Genji Monogatari* (*The Tale of Genji*), written at the turn of the eleventh century by a woman author called Murasaki Shikibu (late tenth to early eleventh century). In both of these novels, love is at the center, love and the yearning of desire, which is constantly faced by the great fact of Death. In contemplating loss and absence, the soul stirs. Individual life is experienced in a world full of social, financial, and moral complexity, with much bustle and comedy, as well as beautiful and ugly objects; yet, amid the welter of experience the spirit knows an inalienable loneliness, sharpened by the metamorphoses demanded by living. The quest for love can awaken and enlighten the spirit, but is not soothing.

These Eastern novels have extraordinarily fine and subtle endings, endings that dramatically make the reader experience that what is desired cannot be grasped; it is the experience of the desire that educates the soul and continually kills and gives rebirth to the self. The self, too, is something not capable of being fully known, even to the self. These are religious revelations, but they cannot be precisely squared with Dao or Buddhism, however much is to be learned from these. What is most approachable is the feminine deity, the goddess of compassion and of the senses, who makes constant change bearable. There is in both Western and Eastern novels an allusion to something that endorses our eagerness

to live—and not only to live but to satisfy curiosity and to undergo change in ourselves—which means living through perpetual dying (and very dangerous that may be). In living our lives and in reading a novel we pursue a mystery that lies deeper than any plot.

CONCLUSION. The novel is really a religiously developed form. It quietly sets itself in opposition to political and religious conventions and traditions to plunge itself and its reader into a closer apprehension of the sacredness that imbues the individual person and the world. It may at times appear dismissive of what is called religion, or it may appear fascinated by religions, but it is not orthodox and will never yield humbly to orthodox authority—even when an author tries to do so. The novel is secular—secular in the original sense, having to do with the *saeculum*, that is, with *time*. Novels, more than any other form, show the individual dealing with experience in time—including not only biological time, but also a particular social and political era (historical or imaginary). The novel pays heed to the importance of time and space, in which the phenomena of matter manifest themselves. It draws on each reader's bodily and temporal experience; the smell of jasmine or urine, the feeling of spring rain, and the taste of honey are supplied by the reader's sensuous knowledge. The novel exhibits characters living with the biological body amid a welter of detail and necessities (including food and money). To live so realistically is not to be subordinated to things, but to have an arena for spiritual experiment, and the novel displays consciousness itself as a major experiment, in harmony with the expedient that is each individual novel.

MARGARET ANNE DOODY (2005)

FICTION: THE WESTERN NOVEL AND RELIGION

While a foremost contemporary American writer of fiction asserts that “the literary artist, to achieve full effectiveness, must assume a religious state of mind” (Updike, p. 239), there is no denying that the novel is a genre of literary art that rarely takes religion as its obvious and principal theme. Among the more prominent twentieth-century theorists of the novel, one viewed it as “the epic of a world that has been abandoned by God” (Lukács, p. 88), and another considered it the genre in which “the absolute past” of the gods, demigods, and heroes is “contemporized” and “brought low, represented on a plane equal with contemporary life, in an everyday environment, in the low language of contemporaneity” (Bakhtin, p. 21).

Some books that read like novels do overtly take religion as their theme, but they are better described as works of edification—although they may possess grace of style or persuasive power, their inspiration is not artistic but propagandist. A true novel, even in modest categories of this genre, seeks to show the human being in society; any teaching that may be inherent in it, or any moral conclusion it may point to, is secondary to this artistic impulse. The great novelists frequently write on themes that have religious implications, but these are approached indirectly and shown in action or reflection rather than direct admonition. To form any notion of the connection between the novel and religion, we must look below the surface of the work of art, and we must not expect wholehearted assent to any version of orthodoxy.

This is not to set the novel at odds with religion, if we accept the latter word in terms of its derivation as implying the careful consideration of forces, laws, ideas, or ideals that are sufficiently powerful to inspire awe or devotion. The novel seeks to show the human being, confused and fallible, meeting the complexities of life, among which are likely to

be those elements describable as numinous. If, indeed, humans are naturally religious, the novel cannot avoid religion, though its principal theme will continue to be the human being.

Although it is actually an ancient genre (Doody, 1996), the novel in its most recognizable current form developed in the seventeenth century as a successor to the epic, which dealt with humans as heroic beings, and the romance, which was free of any necessity for its characters to obey the broad laws of probability, or for stated causes to bring their usual consequences. Conditioned by the Renaissance and strongly influenced by the Reformation, the modern novel required that a story should be, in broad terms, probable, and its characters believable in terms of common experience. The novel was expected to be a story about what most readers would accept as real life, and as ideas of real life are inseparably associated with what human beings, at any period of history, are inclined to take for granted without much reflection, the novel became a mirror of society, and thus a mirror of the nature of the era for which it was written. Although the novel does not seek to avoid issues that are properly religious, its principal energy in this area is better described as moral.

The morality put forward by Western novelists may be reduced to a number of broad precepts. “God is not mocked: for whatsoever a man soweth, that shall he also reap” (*Gal.* 6:7); “Vengeance is mine, I will repay, saith the Lord” (*Rom.* 12:19); “The dog is turned to his own vomit again; and the sow that was washed to her wallowing in the mire” (*2 Pet.* 2:22); “For if a man think himself to be something, when he is nothing, he deceiveth himself” (*Gal.* 6:3). These are but a few of the more minatory precepts found in the Bible that underlie scores of novels. That these general laws may be seen at work in daily life, in the uttermost variety of circumstances, and that they are psychological truths, makes them natural guides of the novelist, who must be, like any artist, an undeluded observer. The novelist may deal with these grim truths humorously, and some of the most truly religious novels are seen by the world as funny books, but their underlying morality is far from funny.

This encyclopedia treats the history of the novel in a separate entry, but it is useful here to begin with *Don Quixote* (pt. 1, 1605; pt. 2, 1615), by Miguel de Cervantes, often spoken of as the first truly modern novel. Its story is of the fortunes of a Spanish gentleman whose wits have been turned by reading old books of romance and chivalry. He equips himself absurdly as a knight and rides forth in search of adventures, and in a rambling and sometimes coarse and perfunctory tale he is mocked, beaten, and humiliated until, on his deathbed, he understands the folly of his delusion.

The book is often read superficially, or not read at all, by many people who are nevertheless aware of it, as the story is familiar from stage, film, and operatic adaptations, and as the word *quixotic*, meaning “actuated by impracticable ideals of honor,” is in common use. A careful reading of the novel reveals the mainspring of the book’s extraordinary power. It

is the first instance in popular literature of the profoundly religious theme of victory plucked from defeat, which has strong Christian implications. The Don, who is courteous and chivalrous toward those who abuse or mock him, and who is ready to help the distressed and attack tyranny or cruelty at whatever cost to himself, is manifestly a greater person than the dull-witted peasants and cruel nobles who torment and despise him. Many readers love him because his folly is Christlike—his victory is not of this world.

The theme is repeated in countless novels, including a lineage of works in which the quixotic protagonist undergoes a discernible process of “sanctification” that runs counter to the more oft-discussed secularizing tendency of modern literature. Three of the most notable examples are Henry Fielding’s *Joseph Andrews* (1742), Fyodor Dostoevsky’s *The Idiot* (1869), and Graham Greene’s *Monsignor Quixote* (1982), with their respective depictions of Parson Adams, Prince Myshkin, and Father Quixote. In these novels, the modes of living, acting, and speaking as a good-natured man (Adams), a holy fool (Myshkin), or a Roman Catholic priest struggling with faith and doubt (Father Quixote) reflect different aspects of the Christian ideal, though they also call to mind the mad delusion of Cervantes’s hero by virtue of their discrepancy with the predominantly profane or secular currents of the modern West (Ziolkowski, 1991).

Among the greatest literary adaptations of the Quixote theme is Charles Dickens’s *Pickwick Papers*. The titular hero, whom we first meet as a foolish and almost buffoonlike character, is deepened by an unjust imprisonment to a point where he is truly aware of the misery that is part of the society in which he lives. It is of importance to our theme that Mr. Pickwick is dependent on his valet, Sam Weller, as Don Quixote is dependent on his peasant squire, Sancho Panza, for a measure of common sense and practical wisdom that saves him from disaster. Faith, hope, charity, justice, and fortitude are exemplified in the masters, but without the prudence and temperance of the servants they would be lost. A character who possessed all the seven great virtues would never do as the hero of a novel, but when a hero who has most of them is complemented by a helper and server who has what he or she lacks, great and magical fiction may result.

As the mighty virtues appear in numerous, though often disguised, forms in great novels, so also do the capital sins. To provide an equivalent for each suggests a list that inevitably means the exclusion of many others equally cogent. When we think of pride, however, we remember how brilliantly it is deployed in Dickens’s *Domby and Son* (1846); wrath recalls Dostoevsky’s *The Brothers Karamazov* (1880) and Herman Melville’s *Moby Dick* (1851); envy is the main-spring of Honoré de Balzac’s *La cousine Bette* (1846); lust has many exemplars, some of them presenting the vice in a refined form, as in Samuel Richardson’s *Clarissa Harlowe* (1747), and others explicit, as in John Cleland’s *Fanny Hill* (1748–1749); gluttony is a less popular theme, though drunkenness, which might be regarded as one of its forms,

is very common and is explored in Émile Zola’s *L’Assommoir* (1877); avarice is popular, and Balzac’s *Le cousin Pons* (1847) shows it in the guise of the collector’s mania, linked in Sylvain Pons with a greed that exemplifies gluttony in the guise of gourmandise (the gourmet’s refinement of the uglier word); sloth recalls Ivan Goncharov’s *Obломov* (1857), in which that sin is explored to its depth. This list is certainly not meant to be definitive, and the Seven Deadly Sins do not include cruelty, of which Dickens affords many examples, nor stupidity, which Gustave Flaubert displays subtly in *Madame Bovary* (1857), nor snobbery, which, though hardly a sin, is a deep preoccupation of the bourgeois world and has never been more searchingly anatomized than in Marcel Proust’s *À la recherche du temps perdu* (1913–1927). Virtually any attribute, when exaggerated, may become a vice, and in some circumstances vice may take on the color of virtue. This makes heavy work for the moralist but is the delight of the novelist, who thrives on delicate distinctions and on that *enantiodromia*, or tendency of attributes and emotions to run into their opposites, which is familiar in psychology.

The novel has proved effective in depicting what, from the traditional Jewish or Christian perspectives, would be ultimate acts of human evil: rebellion against God through an effort to be God’s equal (cf. the biblical tale of Babel), and the human conversion of life in this world to a hell on earth. The preeminent example of the first theme is Mary Shelley’s *Frankenstein* (1818), which represents the effort of a scientist to, in effect, usurp God’s role as creator and conqueror of death. To affirm the jointly Hellenic and Hebrew roots of this theme, Shelley dubbed her titular protagonist “the Modern Prometheus” and included in her narrative explicit references to the rebellious Satan of John Milton’s *Paradise Lost*. *Frankenstein* crystallized a distinctly Gothic dimension of early nineteenth-century Romanticism, some of whose exponents displayed an irrepressible fascination with medieval legends about the Devil (Mephistopheles) and lore of the demonic. In the twentieth century, in contrast, the theme that emerged of the human-made, terrestrial inferno, where countless innocents suffer and perish, was an immediate outgrowth of historical reality. The theme is thus chiefly exemplified in novels by actual survivors of the pogroms, the “concentration-camp universe,” the gulag, and other forms of genocide that marked the century. Elie Wiesel’s *La Nuit* (1958) and Jerzy Kosinski’s *The Painted Bird* (1965) are among the most haunting novelistic testimonies to the horrors of the Nazi Holocaust, while Aleksandr Solzhenitsyn’s *The First Circle* (1968) and his multivolume *The Gulag Archipelago, 1918–1956: An Experiment in Literary Investigation* (1973–1978) expose unforgettably the infernal dimensions of the Soviet slave-labor camps. As memory is the capacity that is *sine qua non* for any novelist, and perhaps especially for those who record atrocities, the novels of Toni Morrison have represented most poignantly the abomination of human slavery and its psychological and spiritual legacies in America.

When novelists choose churches and churchmen as their theme, they frequently dwell on faults that are undeniable, but paint an ungenerous picture of the whole. This is particularly the case when the sort of religion portrayed is of the evangelistic, nonsacramental kind. In such religion, popular opinion expects that the evangelist or the parson will exemplify in himself the virtues he urges on others; in Sinclair Lewis's term, he is a Professional Good Man. His failure to be wholly good makes diverting reading, for hypocrisy provides livelier fiction than virtue. In Lewis's *Elmer Gantry* (1927), all the shams of vulgar religiosity are exposed, and its appeal to naive and unreflective people held up to ridicule. Set likewise during the first half of the twentieth century, but focusing upon a particular African American family against the bleak backdrop of a racist, segregated America, James Baldwin's *Go Tell It on the Mountain* (1953) presents the deacon Gabriel Grimes as the quintessential religious hypocrite. Having once thought himself divinely promised to father a saintly lineage, Gabriel espouses a harshly moralistic brand of Pentecostalism while mistreating his own family (especially his good stepson John, the novel's central protagonist) and concealing his own past moral lapses, most notably his having fathered another son out of wedlock and then abandoned him and the mother.

A variant depiction of the religious life as it is lived by well-intentioned but not spiritually gifted priests is to be found in the novels of Anthony Trollope. In *The Warden* (1855), the principal character, the Reverend Septimus Harding, is a good man, but timid and weak, and his dilemma when he is accused of holding a sinecure is a choice between Christian precept and the way of the world; obedient to public opinion, he resigns his wardenship. In its sequel, *Barchester Towers* (1857), we meet the warden's son-in-law, Archdeacon Grantly, who dearly longs to succeed his father as bishop, for he is a man of strong worldly ambition; but in the first chapter of the book Grantly must decide whether he desires the bishopric at the cost of his father's life. His decision is made in terms of his faith rather than his ambition. The scene in which he prays for forgiveness at his father's bedside is moving and finely realized. Not a crumb of religiosity or false sentiment is to be found in it. Grantly is no saint, but he is a man of principle.

In the same fine novel we meet the bishop's chaplain, Mr. Slope, who cloaks inordinate ambition under evangelistic piety, and the Reverend Dr. Vesey Stanhope, who draws his salary as a clergyman but lives a fashionable life in Italy, leaving his work to curates. Trollope parades before us a wide variety of clergy, some of whom are saved from moral ignominy by the fact that the Church of England, through its catholicism, separates the priestly function from the man who discharges it (though abuse of this distinction is frowned upon). But such characters as Mr. Harding, the warden; the Reverend Francis Arabin, an exemplar of the scholar-priest and intellectual; and the Reverend Josiah Crawley, in whom his creator combines pride with humility, manliness with

weakness, and acute conscience with bitter prejudice, redeem Trollope's clergy and emphasize his very English, very Victorian conviction that a clergyman is not required to be a saint but should unquestionably be a man of principle and a gentleman. This is a long way from Elmer Gantry, who was neither.

No discussion of this subject can escape some consideration of the part the intellectual and artistic character of the novelist plays in his depiction of religion, and its influence on his characters. All generalizations are suspect, but it may be stated broadly that the temperament that makes a writer a novelist is unlikely to be friendly to orthodoxy, and that the Manichaean struggle between darkness and light is more friendly to the novelist's purpose (the depiction of the human being in society) than is an unwavering adherence to a creed. Inevitably, there are important exceptions. Calvinist predestination is the mainspring of James Hogg's fine *The Private Memoirs and Confessions of a Justified Sinner* (1824). There is no mistaking the Roman Catholic thought behind all the work of James Joyce, Graham Greene, and Anthony Burgess, or the monolithic Russian Orthodoxy that informs the novels of Solzhenitsyn. Likewise the novels of Chaim Potok are thoroughly saturated by the world of Orthodox Judaism in modern urban America, highlighting the tensions between the everyday, worldly Orthodoxy and a more stringent form of Hasidism.

More often, however, the theme of Don Quixote is repeated: the good man or woman exhibits, and is betrayed by, weaknesses, but the forces that oppose him or her—which are more likely to be stupidity, conventionality, and self-seeking than determined evil—succeed in the short view. It is the reader who understands and appreciates the goodness of the hero, and whereas in a work of inferior artistic merit this may simply flatter the reader's ego, in a great novel it may leave readers with a larger vision of life and an appreciation of the weight of religious feeling that they did not have before.

Good novelists manage this by indirect means; the aim of such novelists is not to teach but to entertain, and thus to persuade. Their chief purpose, from which they stray at their peril as artists, is to depict life as they see it, and whatever they touch will be colored by their own temperament. The temperament of the artist is not unwaveringly noble—wholeness of spirit, not perfection, is the artist's aim. Many novelists, of whom Sinclair Lewis may serve as an example, are disappointed idealists, angry with life because it does not conform to the best they can conceive, and their strictures on religion, as on other great themes, are apt to be bitter. The calm observation of Trollope is a rarer gift.

Examples could be cited to the point of weariness, without achieving very much. Let it suffice to say that a turbulent and tormented spirit such as Dostoevsky will not see religion as it is seen by a stronger, more deeply and often more narrowly moral writer such as Tolstoy. Neither exhibits the philosophical, ironic, but finally positive spirit of Thomas

Mann. To look for what is called “real life” in the novels of these and countless others is to search for something definable only in vague terms. Vladimir Nabokov once described a fictional masterpiece as an “original world” that is unlikely to fit the reader’s own world. Serious readers enter such an original world as they encounter any work of art—in search of enlargement and enlightenment. If the novel has this effect, the reader’s concept of “real life” has been changed.

Serious readers, however, are not a majority, nor are serious writers. We must beware of the critical error that tries to define art solely in terms of the best. Below the level of greatness are innumerable novels that cannot be dismissed as having no merit; they may be lesser works of art, or on a level below that, or they may be widely popular and thus, in some measure, influential. The best-seller should not be brushed aside simply because many people like it; its very popularity is a strong clue to what a multitude of people will accept as a depiction of the human being in society, and therefore as an indication of what those people believe society to be. Even more than what these readers believe to be true, popular literature displays what they wish were true, about religion as well as many other things. Thus, having appeared at a time when idealistic discussions of social and economic “globalization” are persistently defied by the realities of international conflicts or tensions that are often rooted in religious differences, Catherine Clément’s international best-seller *Le Voyage de Théo* (1997) tells of a boy taken on a tour of the world’s religions, traveling literally from one continent to the next, and arriving finally at the simple morale that one should be at peace with God, whatever one conceives God to be. In one sense, *Le Voyage de Théo* seeks to exploit the same function that numerous profounder novels have fulfilled in illuminating forms of religious life largely unfamiliar to “mainstream” Western readers. The portrayals of Brahmanic and Buddhist asceticism in Hermann Hesse’s *Siddhartha. Eine indische Dichtung* (1922), and of Chippewa traditions in the novels of Louise Erdrich, are but two examples that come immediately to mind.

What many readers seem to wish is that religion should not obtrude into a novel, either directly or in some awareness of the numinous. Writers who ignore their wish feel the lash of their resentment. Aldous Huxley, who seemed to a large and eager group of readers to be the perfection of the cynicism of the period following World War I, astonished and displeased them when, in 1936, he published *Eyeless in Gaza*, in which the voice of the moralist and explorer of faith that had been earlier evident in *Brave New World* (1932) could no longer be ignored. A similar experience befell Evelyn Waugh, whose works, being both witty and funny (for the two are not interchangeable terms), had secured him a delighted following of readers who, although they knew him to be a Roman Catholic, did not appreciate how determinedly Catholic he was until 1945, when *Brideshead Revisited* demanded that Catholic orthodoxy be taken with the uttermost seriousness. The deathbed repentance of the earl of

Marchmain was ridiculed by those critics who could not bring themselves to believe that it might be true. That the wit, the funnyman, should also be religious was unbearable to multitudes of religious illiterates, many of them critics.

It is significant that when Huxley revealed the quester beneath the cynic he was forty, and that when Waugh forced his readers to face an embarrassing fact he was forty-two. Both men had reached the midpoint in life, when radical psychological change presents problems that can no longer be dismissed or dissembled before the artist’s audience. The lives of virtually all novelists of the serious sort reveal some such alteration in the thrust of their work. If not religion in some readily identifiable form, the religious spirit of awe and a moral conviction asserts itself and shows in the work that is most characteristic.

In fiction on the most popular level, that of the best-seller, religion or the trappings of religion may be used (not necessarily cynically) by an author to induce in readers an impression that they are thinking about and weighing serious problems. The familiar tale of the priest who falls in love lies beneath many plots, an example of which is *The Thorn Birds* (1977), by Colleen McCullough, hailed as admirable and even profound by innumerable readers. The priest cannot deny his love, for to do so would be to reject something necessary to his wholeness. In time, as a cardinal, he receives his unacknowledged son into the priesthood.

There may lie beneath McCullough’s book, and others like it, something that should not be ignored: Christianity has never wholly accepted human sexuality as a potentially noble part of the human makeup. Such books are a protest against that attitude, a demand that religion include sexuality and the distinctively feminine element in the human spirit as it shows itself in both sexes. The conflict between a high feminine spirit and a torturing, wholly masculine morality is finely explored in Nathaniel Hawthorne’s *The Scarlet Letter* (1850); Hester Prynne’s greatness is opposed to the orthodoxy of her secret lover, the Reverend Arthur Dimmesdale, and there can be no doubt which spirit is the more truly religious.

Innumerable books have dealt with this question in a manner that may have been the best possible to their authors but that can only be called slight and, in some cases, cynically frivolous. An early example is *The Monk* (1796), the immensely popular novel by Matthew Gregory Lewis, in which the externals of Catholicism are exploited in a tale of nymphomania, murder, magic, and unappeasable lust. Unquestionably it is lively reading, but its notions of numinosity reach no higher than scenes of the Inquisition and a trumpery pact with the Devil. (For a fine example of the theme of the pact with the Devil, one may turn to Thomas Mann’s *Dr. Faustus*, 1947.) Lewis’s Gothic shocker is mentioned here because it is the forerunner of many such tales in which religion serves indecency in the manner Shakespeare describes as “to have honey a sauce to sugar” (*As You Like It*, 3.3.26–27). But they are popular, and it cannot be denied

that they represent what religion means to many people. Victor Hugo's *Notre-Dame de Paris* (1831) offers an artistically superior example. Eugène Marie-Joseph Sue's *Le Juif errant* (1844–1845) is a lesser work in which the supposed unscrupulous intellectualism of the Jesuits is exploited.

Some reference must be made to the large category of books that make use of the occult as part of the paraphernalia of their stories, employing a romantic Satanism to produce an atmosphere of evil and decadence. Two works of Joris-Karl Huysmans have been admired: *À rebours* (1884), in which Catholicism is embraced as a remedy against a blighting pessimism, and *Là-bas* (1891), in which the hero searches for a consoling faith through the path of black magic. On a lower level of artistic achievement is the long-lived romance by Bram Stoker, *Dracula* (1897), in which the popular theme of vampirism is the mainspring of the action (among today's popularizers of this theme, the foremost is undoubtedly Anne Rice). These books are relevant to any discussion of religion and the novel inasmuch as they are evidence of a yearning in a large reading public for something to balance the apparent spiritual barrenness of the world that has emerged from the industrial, scientific, and technological revolution. That the public responds to the negative spirit of black magic rather than to something more hopeful is not surprising. Where religion loses its force, superstition is quick to supplant it, and it would need a strong new religious impulse or revelation to reverse that movement.

It is not surprising that when religion appears in this class of literature it is usually Catholicism, Orthodoxy, or Jewish mysticism (Qabbalah) that accommodate naive or unevolved religious feeling more sympathetically than Protestantism. The reformed versions of Christianity in their eagerness to banish superstition appear sometimes to have banished any sense of the numinous along with it, and it may be argued that the human being cannot live comfortably without some elements of belief that a stern moralist would class as superstitious. The human psyche cannot relate wholly toward the positive and the light side of life; it must have some balancing element of the dark, the unknown, and the fearful.

It is because of this unrecognized pull toward the numinous in its dark side that it is so difficult, even for a great literary artist, to portray a wholly good and admirable character. Dickens's villains have a power not found in his good men and women, and the great artist usually provides a balance, as he does in *The Old Curiosity Shop* (1841), where the innocent and saintly Little Nell is opposed to the grotesque villainy of the dwarf Quilp. This opposition provides the tension that gives the novel life and would slacken if Nell had things too much her own way. In *The Brothers Karamazov* (1880), Dostoevsky cannot, by his finest art, make the saintly Alyosha as real to us as the man divided between his good and evil, his brother Ivan. Modern human beings are aware of this tension as a demanding element in their own lives and respond to it in fiction.

When Tolstoy wrote *War and Peace* (1868) and *Anna Karenina* (1878), his powerful depiction of this tension made him a literary artist of the highest achievement, yet when he was impelled later to write works determinedly improving in tone, that splendor did not survive. But we must sympathize with Tolstoy's deep conviction that art should be religious in its impulse and make religious feeling at its highest available to a public neither devout nor philosophical. This is a conviction recognizable in many novels of the first rank.

In vast areas of popular literature a defensible, if sometimes crude, morality asserts itself, greatly to the satisfaction of its readers. In Westerns, the Good Guy—and the values he stands for—triumphs over the Bad Guy, who is corrupt, cruel, and frequently cynical in his attitude toward women. For the Bad Guy to win in the struggle would topple the myth of worthiness and decency that readers of Westerns value. The same simple morality informs much science fiction and fantasy literature (e.g., C. S. Lewis's "Space Trilogy" [1938–1945] and his "Chronicles of Narnia" [1950–1956], with their overarching Christian cosmology), and even J. K. Rowling's wildly popular Harry Potter novels of alternate worlds and sorcery.

This is significant. In the words of G. K. Chesterton, "men's basic assumptions and everlasting energies are to be found in penny dreadfuls and halfpenny novelettes" (*Heretics*, 1905). Great numbers of readers of detective stories are, without ever defining their attitude, devoted to the morality of "Vengeance is mine, I will repay, saith the Lord," or the bleaker law of *Exodus* 21:23–24: "If any mischief follow then thou shalt give life for life, eye for eye, tooth for tooth, hand for hand, foot for foot." Who is the instrument of the Lord's vengeance, who brings the murderer or the thief to his just reward? The Great Detective, of course. Be he the cold reasoning-machine Sherlock Holmes; the man of pity, Chesterton's own Father Brown; the high-born, donnish Peter Wimsey, or the immobile, intellectual Nero Wolfe; he—or she, as in the cases, say, of Agatha Christie's Miss Marple or Sara Paretsky's V. I. Warshawski—is always the figure recognizable from medieval religious drama, sometimes called Divine Correction. He or she is the restorer of balance, the dispenser of justice, working on behalf of a higher authority.

The same pattern is observable in the spy story, which is the main rival of the detective novel. However attractive or extenuating may be the temptations that make the spy betray his country, and however plodding, weary, disillusioned, and dowdy the spy-catcher may be, in the end the betrayer of the highest values must be found and brought to some sort of justice. Often the tone is cynical; often the secret service is represented as no more than a game; but behind every game lies the desire to win, and thereby to establish or reaffirm some superiority. What superiority? That of an overriding morality.

How far is morality from religion? To the novelist it sometimes looks like the religion that people profess who wish to ignore God—or keep him behind a veil as being too

grand for common concerns. It may be the religion of people who find an ever-present God embarrassing company, because they are aware that they cannot live always on the heights, and they do not believe that God understands their insufficiencies. But to support a system of morality without some reference to numinous values is uphill work for a philosopher, and beyond the scope of even a highly intelligent general reader.

The novel, at its best, is a work of literary art and a form of entertainment at all levels, concerned with human beings in every aspect of their lives, including, but not necessarily approving, their religious life. That its connection with religion should be, in the main, through morality rather than through faith or revelation should therefore surprise no one. Whatever pinnacles it may achieve in morality or philosophy, its character remains secular.

BIBLIOGRAPHY

Many books of criticism that deal with the novel make passing reference to religious concerns when these are relevant, but not all critics are even-handed in their treatment of religion, and some of them seem almost to be religious illiterates, who either stand in foolish awe of what they have not examined or ignorantly decry it. The reader who wishes to pursue the train of thought suggested in the preceding entry might well reread the novels mentioned, with special attention to their religious implication. The following list confines itself to those critical works cited in the article:

- Bakhtin, M. M. *The Dialogic Imagination: Four Essays*. Edited by Michael Holquist. Translated by Caryl Emerson and Michael Holquist. Austin, Tex., 1981.
- Doody, Margaret Anne. *The True Story of the Novel*. New Brunswick, N.J., 1996.
- Lukács, Georg. *The Theory of the Novel: A Historico-Philosophical Essay on the Forms of Great Epic Literature*. Translated by Anna Bostock. Cambridge, Mass., 1971.
- Updike, John. "Religion and Literature." In *The Religion Factor: An Introduction to How Religion Matters*, edited by William Scott Green and Jacob Neusner. Louisville, Ky., 1996.
- Ziolkowski, Eric. *The Sanctification of Don Quixote: From Hidalgo to Priest*. University Park, Pa., 1991.

ROBERTSON DAVIES (1987)
ERIC ZIOLKOWSKI (2005)

FICTION: LATIN AMERICAN FICTION AND RELIGION

As in most places in the world where different cultures and religions have come together as the result of political conquests, in Latin America, fiction, religion and history are inseparably connected. In *The Invention of America: An Inquiry into the Historical Nature of the New World and the Meaning of History* (1961), Edmundo O'Gorman makes substantiated claims that the New World was already an invention in the European imagination before 1492. Early documents about the conquest and colonization of the Americas tell the story

of such invention and of the theological conflicts caused in Western Christian thought by the encounter of a New World different from the known world of Europe, Asia and Africa. The zeal of evangelization, which accompanied political and economic expansion, resulted in theological schisms within the Church that lasted for centuries, vestiges of which can be seen today in the figure of revolutionary priests such as Camilo Torres and Ernesto Cardenal, Liberation Theology and, in various forms, in nineteenth and twentieth century Latin American literary discourses. Christian theology, Judeo-Christian messianic literature, and medieval legends and myths colored the way Europeans perceived the New World. Even Christopher Columbus, who believed he had arrived in India, also claimed in his fourth diary to have found the entrance to Paradise: a claim that the Postmodern Argentinean writer, Abel Posse, humorously engages in his novel *Los perros del paraíso* (1983). Augusto Roa Bastos, in *Vigilia del Almirante* (1992), and Alejo Carpentier, in *El arpa y la sombra* (1979), return to the figure of Columbus to question foundational truths in the history of the New World.

In an attempt to understand native religions, and as a vehicle for teaching Christian faith, Humanist Christian missionaries in the New World established analogies between indigenous religions and Christianity. Even as late as the eighteenth century the association was made between Christ's Apostle Thomas and Viracocha, the white deity of the Incas, and between Thomas and the Aztec wind god Quetzacoatl. Christian theology, fused with pre-Columbian and African myths, and infused with Erasmus's theological treatises on human liberty, dignity, and pure spirituality (*De libero arbitrio*, 1524), created the conditions for the emergence of messianic movements of different religious and political orders. Some announced an apocalyptic second-coming of Christ colored by indigenous New World and African religions; others longed for political messiahs. Alejo Carpentier's novel *The Kingdom of This World* (1957), and Gabriel García Márquez's *One Hundred Years of Solitude* (*Cien años de soledad*, 1967), find in these religious prophesies a metaphor for a cosmic revolution that, like the Arawak and the Quiché Maya deity Huracán, destroys an old order of things. The already archetypal image in Latin America of the cosmic wind of destruction and creation (*Popol Vuh*), brings together in these two novels the Judeo-Christian story of the Flood, the Christian prophesies of a Judgement Day, as well as the Maya-Quiché stories in the *Popol Vuh* about the gods' destruction of their first creation. In his monumental 1981 novel *The War of the End of the World* (*La guerra del fin del mundo*), Mario Vargas Llosa records the tragic destruction of one such movement in the hinterlands of Bahia, Brazil. The novel is based on Euclides da Cunha's accounts in his 1903 Brazilian Classic *Rebellion in the Backlands* (*Os sertões*), about the war the Republic of Brazil waged against Canudos and its messianic spiritual leader. Both texts are meditations on religious and political fanaticisms in Latin America.

Sixteenth-century political and religious conflicts have attracted the attention of twentieth-century Latin American

writers. The writers often return to the foundational texts of this period in order to explore the conflictive religious thoughts that participate in the formation of Latin American cultures, and the imprints those thoughts left in local memories and in those cultures. Mario Vargas Llosa's novel, *El hablador* (1987) is the story of a modern Peruvian of Jewish and Christian background who becomes involved in the life of an Amazonian tribe. He eventually becomes an itinerant tribal storyteller who blends into the traditional tribal tales he narrates, Western literature and Judeo-Christian myths. The novel is a metaphor for the religious and cultural syncretism that has taken place in Latin America.

An example of the religious exchanges that have attracted writers in Latin America, especially in the second half of the twentieth century, is the apparition in Mexico of the dark-skinned Virgin of Guadalupe in 1531, to an Indian man, Juan Diego. This is the single most important religious event for modern Mexico, as she is a symbol of national identity and religious consciousness. Guadalupe served as an icon for the Mexican war of independence, for the Chicano movements in the 1970s, and for the Zapatista movement in the 1990s. What is of interest for contemporary Mexican writers is the fact that, as Jacques Lafaye points out, the Christian Virgin of Guadalupe appeared at the same site, in *Tepeyac*, where the Aztec mother goddess Tonantzin was worshipped prior to the arrival of the Spanish. Like other contemporary Latin American writers, Mexican fictional literature dwells on the significance of such syncretisms in modern Mexico. Carlos Fuentes's work places a special emphasis on the relationship between pre-Columbian religions and modern Mexico. In his novel, *La región más transparente* (1958), his novella, *Aura* (1964), and in his short story, "Chac Mool," Fuentes explores the duality of a pre-Columbian realm masked by modern Mexican culture. In *Aura*, we find a contemporary Mexican historian, and in "Chac Mool," a modern day collector of pre-Columbian art, both drawn into a mythical Aztec-Maya cyclical time of death and renewal. Fuentes is interested in exploring the religious ambiguities of modern Mexico in relationship to the concepts of death and sacrifice. Based on the Aztec notion that time is a living entity rejuvenated through sacrifice, Fuentes establishes a contrast between the Christian veneration of Christ's sacrifice for the salvation of humanity and the Aztec veneration of sacrificial death as a mode of collective salvation. Syncretism, as a literary trope, can be found in Mexican literature as far back as the seventeenth century when Sor Juana Inés de la Cruz, a Mexican nun and a major writer of the Baroque period, made the association in her play *El divino Narciso* between Christ, the Classical figure of Narcissus—who through metamorphosis transcends his humanity—and the Aztec God of the Seeds, who is reborn after death.

The image of a self-sacrificial crucified Christ and the idea of redemption through death appear frequently in Latin American fiction as a literary trope for social inequality and political injustice. However, the Brazilian writer Clarisse Lis-

pector offers a different metaphor for the *Christi* sacrifice remembered in the Christian rite of the Eucharist. Clarisse's 1964 novel, *The Passion according to G.H.*, represents an allegorical communion between an artist, the writer, and the very origins of life, through the self-sacrificial act of ingesting a roach. Lispector metaphorically associates the ingested insect, which represents a lower but primal form of life in contemporary urban society, with the sacred Egyptian beetle, also a symbol of life and rejuvenation. In another Brazilian Classic, *Grande Sertão: Veredas* (1958), João Guimarães Rosa explores the universal struggle between good and evil, from the syncretic gaze of Christian theology and Asian thought, while at the same time proposing that the act of writing is an alchemical search for a higher truth that can only be intimated through imagination. In *Grande Sertão: Veredas*, the hinterland of Brazil is the stage for the universal battle between good and evil. At the end of the novel, good and evil destroy each other, resulting in a state of nothingness, a *non-ada* that reduces humanity's universal saga to the ritual act of memory, and to a repetitive imaginary act of recovery through fiction. Guimarães Rosa's novel also records, reconstructs, and reinvents a way of thinking in the hinterlands, characterized by the fusion of indigenous, African and Christian religions.

AFRICAN RELIGIONS IN LATIN AMERICAN FICTION. Ritual allows its participants to experience and be a part of the source of creation. In Latin American fiction, writers often turn to the representation of ritual in order to record the importance of African traditions in the development of Latin American cultures. The Cuban writer Alejo Carpentier proposes in *The Kingdom of this World*, that the unwavering faith in the African *loas* in Haitian Vodou is what gave Haitian slaves the will power and spiritual strength to defeat the French and to gain independence. Twentieth-century Caribbean and Brazilian fiction demystify the demonic image that African religions have endured since the sixteenth century, while recording the drama of African gods in an American context, colored by Christian and Classical myths.

Caribbean and Brazilian writers may refer to a given *orisha* or *loa*, with the name of a saint, a religious characteristic or a symbol without referring directly to the deity. For example, terms like *red*, *sun*, *fire* and *double ax*, may refer to the *orisha Shango*, while images of yellow, copper, cinnamon, honey and fresh waters, may refer to *Oshun*. Jorge Amado's title for his novel, *Gabriela, Clove, and Cinnamon*, alerts the reader to the association in the text between Gabriela and the *orixá Oshun*. African languages also survived in the Caribbean and in Brazil due to their ritual importance, and to the fact that ritual words that define religious concepts, like *ashe* or in Cuba *aché*, do not find exact correspondences in Western thought. The presence of these words in Latin American vernacular languages and in fiction, disrupts, but also enriches the dominance of Western traditions in Latin America by slowly inscribing in them different ways of conceiving life, humanity, and the divine.

African religious thought conceives the cosmos as a dynamic play of forces in which human beings are also players; therefore, through a ritual process of give-and-take, sacrifice, divination, and offerings, human beings can control those forces. This is also the dynamic realm of the *orixás*, which the Brazilian writer Jorge Amado represents in his novels, always in the syncretic cultural setting of Salvador, Bahia. In *Donna Flor and Her Two Husbands*, Amado constructs an invisible realm of popular African traditions and beliefs that co-exist in Brazilian society with Christianity in a cultural and religious dynamic interchange. This is a process Fernando Ortiz calls *transculturation* (in Bronislaw Malinowski's introduction to Ortiz's *Cuban Counterpoint, Tobacco and Sugar*, 1940, 1995) to differentiate it from the concept of syncretism.

In Cuba, Lydia Cabrera's work carved out a sacred space in Cuban studies and literature for the religious Afro-Cuban concept of *monte*, meaning jungle, forest, mount, countryside and backyard, as the space where the dynamic forces of the cosmos are at play; where the give-and-take between human beings and natural forces takes place. In her short stories and fables, from *Cuentos negros de Cuba* in 1936 to *Ayapá. Cuentos de Jicotea* in 1971, *monte* is the creole Olympus where the drama of the Afro-Cuban deities takes place, mirroring the strengths and weakness, desires, longings, faith and politics of creole society.

A unique representation of African religions and of a greater African consciousness in the Americas can be found in the 1984 novel by the Colombian writer Manuel Zapata Olivella, *Changó el gran Putas*. The novel turns to sixteenth-century Latin American history in order to reinvent America from the gaze of African thought. Here the history of America, including slavery, is the providential design of *Shango*, the ancestral Yoruba *orisha*-king of Ọyó, lord of lightning, thunder and fire, whose American counterparts in Zapata's novel are the Aztec wind-god Quetzacoatl, and the Supreme Fire-Father Sun, Inti, of the Incas. Zapata's choice for choosing Shango as the Supreme African Patriarch, is based on the historical fact that Shango is one of the most important African deities in the New World (Bascom, *Shango in the New World*, 1972): a cultural African and African American hero and deity, whose strengths and powers are always balanced by his human-like weaknesses.

In order to place the act of writing within an African tradition from which to retell the same, but different, story of the Americas from the gaze of a triethnic writer, Zapata follows the structure of African ritual recitations and Afro-Caribbean rituals. The novel begins with the act of summoning African and Afro-Indo-American ancestors and *orishas*. As we find in Zapata's novel, in Afro-Caribbean rituals Legba, or Elegua in Cuba, lord of the crossroads, doors, roads and the Word, is the first one and the last one to speak in all rituals. From a postmodern perspective the novel questions and breaks away from the strictures of literary genres and Western epistemology, and also resists the hegemony of

Western thought in Latin American literature and history. It also brings together as one Bantu and Yoruba traditions with Haitian Vodou, in which, significantly, Legba is associated with Christ, in order to propose a greater African, Afro-Indo-American consciousness conceived in Zapata's novel from the gaze of African religious thought. Zapata also collapses the conceptual and rhetorical differences between fiction and religion by claiming that he wrote this novel under the spiritual guidance of Ifá: a system of divination of African Yoruba tradition brought to the New World by African slaves that serves as a spiritual guide to those who follow it. In and through Ifá the natural divine forces speak to humans through a system of letters or figures made by the position in which cowrie shells or kola nuts thrown by the priest or *Babalawo* fall on the divining table. Each position forms an *Odu*, or road, of positive or negative outcomes. There are numerous anecdotes with each *Odu* that the *Babalawo* recites as part of the divining process. The anecdotes related to Ifá constitute a sacred oral tradition in Africa. In the Caribbean, the anecdotes of Ifá, and those of a similar divining system known as *Diloggun*, form a written corpus of religious literature (known in Cuba as *Pataki*) that records the survival of an ancestral African consciousness in America. This consciousness is what Zapata defines in his novel as *Muntu*. As in Zapata's novel, the drama of the African deities in Latin American fiction provides a record of African religious traditions, while at the same time recording and retelling the greater story of the Indo-African experience in America.

FICTION: CHINESE FICTION AND RELIGION

This essay examines five genres or subgenres of Chinese fiction, namely the *zhiguai*, *chuanqi*, *bianwen*, vernacular short story, and vernacular novel (premodern and modern). Each genre contains works that have themes or structures with religious dimensions. Readership and religious functions of later fictional works will also be mentioned, although these aspects of early works should not be neglected.

ZHIGUAI. The birth of what is usually rendered as Chinese prose fiction (*xiaoshuo*) remains a subject of debate. In defining Chinese fiction in a strict sense, most literary historians trace its origin to the *zhiguai* (records of anomalies), fictional narratives in classical language, in the Six Dynasties period (220–589 CE). These narratives are characterized by an outlook and context rooted in the supernatural world replete with themes such as immortality, the afterlife, the causal relation between merit and punishment, magic, shamanism, and alchemical theories and procedures. In composing these tales, many authors assumed the serious mission of proving the actual existence of the supernatural. Whether or not they succeeded in convincing their readers, this intent along with the general subject matter constitutes the religious dimensions in *zhiguai* tales. Definitive examples in the genre like the *Soushen ji* (In search of the supernatural) of Gan Bao (fl. 320) all represent this tendency.

Zhiguai narratives with religious dimensions can be divided into the modes of *fangshi* magicians, Daoist, and Bud-

dhist. Some *zhiguai* collections of the Six Dynasties, especially the early ones, were perhaps composed by *fangshi* magicians. They are reminiscences of *fangshi* magicians, diviners, and healers as well as of their erudition and expertise.

Zhiguai anthologies of mainly Buddhist and Daoist origins were apparently put together by those who maintained and practiced the religious faith shown in the works represented. The most explicit are the collections focusing on biographies of Daoist immortals (*xian*) and Buddhist miracle tales. Narratives belonging to the Daoist mode tell of ascension, meditation, and autonomy, all laying claim to the Daoist authority. They emerged predominantly out of the immortality cult and the alchemical practices common to popular Daoism.

Regarding the Buddhist mode, these Buddhist miracle tales are largely of the following three general types: (1) accounts of divine intervention and supernatural power in times of need, usually wielded by Avalokiteśvara (Guanyin); (2) illustrations of piety and sincere belief, often through descriptions of the inexorable workings of the law of karmic retribution; and (3) remarkable deeds of monks or laypeople, serving to demonstrate their high spiritual attainments.

Zhiguai tales stress communication between humans and supernatural beings. Whether it is a man's union with a female deity or a human's sojourn in the immortal territory, the stories invariably embody a state of transcendence for which Daoist practitioners yearn. One of the motifs is communication between the living and the dead. Still many *zhiguai* stories are about retributive phenomena.

CHUANQI. *Chuanqi* (transmission of the extraordinary) as a genre refers to fictional narratives in the classical language, longer than *zhiguai*, that emerged during the Tang dynasty (618–907 CE). Tang *chuanqi* tales were overwhelmed by a curiosity about traffic with the transcendent world of gods, immortals, and numinous beings or with the world beyond the grave. Compared to the Six Dynasties *zhiguai*, what distinguishes Tang *chuanqi* lies not so much in what kinds of supernatural themes are presented in a tale, as in how they are represented. With its particular narrative method and polished style, the concern of *chuanqi* is mainly on human motivations and on the exemplary side of human nature. In other words, the supernatural tends to be less arbitrary and arrogant but more benevolent and accessible in its relationship with humans. Their sympathy lies with those who have withdrawn from the official life or shown a tendency to a religious life.

While half of the *chuanqi* tales are determined by the theme of the supernatural, the other favorite subject is love, which is sometimes amalgamated with religious elements. In terms of depiction of supernatural beings, *chuanqi* brought several innovations. First, supernatural beings could become psychologically complex and sympathetic. The common topoi in *chuanqi* tales include the predestined marriage made in heaven, in which the romance with a nonhuman woman

was particularly suited to the *chuanqi*'s combination of the emotional with the extraordinary. In some tales black magic transforms humans into beasts, including the self-motivated transformation of Daoists and Buddhists. Some tales present the process of alchemical formation as a psychological trial of dangerous experiences. Dragon lore in Tang *chuanqi* highlights human involvement in the dragon family. Some tales are about the predestination or revelation of a person's future, likely because of the belief given by the Buddhist doctrine of karmic retribution. Some tales narrate new kinds of oddity involved in dream phenomena and put into service essentially the Daoist-Buddhist ideas concerning the illusory nature of life and the vanity of striving after worldly gain. A great number of tales provide ideal knight errantry that possesses supernatural and fantastic elements, with the Daoist propensity to having the *xia* (swordsmen) hero or heroine retire from the human world after his or her mission is accomplished. And again many tales tell of communication with ghosts.

Although the *zhiguai* from the Six Dynasties and *chuanqi* from the Tang are the most well known, later collections of *zhiguai* and *chuanqi* are also numerous. Some of them, such as Hong Mai's (1123–1202) *Yijian zhi* (Records of the listener), have been used extensively by historians of Chinese religion as a source book for delineating religious beliefs and ritual practice at that time. In the Qing dynasty (1644–1911) *Liaozhai zhiyi* (Strange tales from make-do studio) by Pu Songling (1640–1715) is the most celebrated collection of supernatural tales in the entire canon in the Chinese tradition, which alone contains almost five hundred stories. It is viewed as the pinnacle of the *zhiguai* and *chuanqi* traditions. *Liaozhai zhiyi* is especially famous for the depiction of female ghosts and fox spirits.

BIANWEN. *Bianwen* (transformation texts) of the Tang dynasty and the Five Dynasties periods (907–960 CE) from the Dunhuang caves are narratives written in semicolloquial Chinese in a prosimetric style. These texts, as a type of storytelling, were performed, intending to represent a miraculous event for the purpose of enlightening the audience with Buddhist teachings. Transformation texts are believed to have been used in combination with visual images for performances in Buddhist temples or in certain ritual services. The performers of these transformations were professional entertainers, and the copyists of the extant manuscripts were mostly lay students studying a largely secular curriculum in schools run by Buddhist monasteries.

Some transformation texts with Buddhist subject matter excel in conjuring vast *mandalas* of fantastic beings, divinities, or demons surrounding the central Buddha and vistas of other worlds. *Bianwen* have their roots in Buddhist literature, though the genre quickly became a secular form of entertainment, adopting Chinese historical and contemporary themes. As an example of the Buddhist influence on Chinese thought and writing, *bianwen* stimulated Chinese fiction with many new forms and themes (prosimetric form, greater

extension, and relinquishment of the claim that verifiable historical facts are being recorded) and provided an immeasurable variety of stories and figures.

VERNACULAR SHORT STORIES. Chinese vernacular fiction has its origins in the professional storytelling of the Song (960–1279) and Yuan (1206–1368) periods. Scholars debate what the precise categories of storytelling are in Song records. There were at least two schools of storytelling, among four or six, related to religious phenomena: first, *xiaoshuo* or short stories that included such supernatural themes as ghosts and marvels, and second, Buddhist scriptural narration, monastic tales, and scriptural parodies. In the Yuan, professional storytelling *xiaoshuo* is divided into eight classes. Of the eight, three are primarily concerned with religious themes: spirits and demons, sorcery, and gods and immortals. All these types of the Song-Yuan storytelling continued to appear in later written stories.

With this background in mind, *huaben* should be considered next. *Huaben*, or the vernacular story, refers to a short story from the Song to the Qing dynasties that is written in the vernacular. Many *huaben* stories dealt with the lives of the middle to lower classes, focusing on down-to-earth concerns like preservation of family or lineage and the quest for worldly success. Some, however, treated Daoist and Buddhist themes, emphasizing the emptiness of mundane glory as well as the happiness of reclusion and transcendence.

The development of vernacular stories can be divided into three periods. In the early period (the Yuan and early Ming dynasties, up to 1450), the themes of these early stories include demons, ghosts, and religion. The demon stories normally tell how a young man encounters an animal spirit or a ghost in the guise of a young girl, makes love to her, discovers his danger, and calls an exorcist, usually a Daoist master, to subdue her.

One distinctive story type of the middle period (mid-Ming dynasty, 1400–1575) pertains to the Buddhist stories. They tell of priests, their deaths, and sometimes their reincarnations, combining themes involving the priesthood with that of karmic causation. The stories are concerned above all with the priest's vow of chastity and the temptations to which he is subjected, but they also possess a certain religious meaning. The stories of the middle period are either Buddhist in inspiration or reveal a down-to-earth morality that inevitably links deeds to punishments.

The stories of the late period (after 1550) were written by literati who often fused Confucian principles with popular religious ideas. Many stories in the "Three Words" (*sanyan*), three forty-piece collections of stories compiled by Feng Menglong (1574–1646), have a strong Buddhist flavor. A representative *sanyan* story has its plot building on Buddhist beliefs, its narrative furnished with Buddhist lore, and its conclusion engaging the mediation of Buddhist deities or the attainment of buddhahood.

Among storywriters of this period, Langxian's stories stress reclusion and religious beliefs. They are devoted to

Daoist themes, such as the attainment of immortality, more than any previous stories. Yet the Daoism of Langxian's works was not a rigid doctrine but one of the sentimental and artistic.

Confucian literati also described religious phenomena in their short stories. Ling Mengchu (1580–1644) in *Paian jingqi* (Slapping the table in amazement) and in *Erke paian jingqi* (Slapping the table in amazement, second collection), two collections of stories commonly known as “Two Slappings” (*erpai*), described many religious people and motifs. These stories are ultimately related to the typical example of the *Shanshu* (morality books).

VERNACULAR NOVELS. *Zhanghui xiaoshuo*, a term that is used for full-length vernacular fiction, from premodern times, is customarily translated as “vernacular novel.” When *novel* is used in the premodern Chinese context, however, it does not imply a secular literary genre. Nor does it necessarily project humans in society as the novel in the Western counterpart.

Lu Xun (1881–1936), in his pioneering *Zhongguo xiaoshuo shilue* (Brief history of Chinese fiction), defines *shenmo xiaoshuo* (novels of gods and demons) as a subgenre with religious or supernatural subject matters. There are over one hundred extant novels in this category. But religious or supernatural elements are not limited to these novels. Any novel without a religious or supernatural element would be rare. The Buddhist imagery and its underlying ideology in Chinese novels are obvious. Among the most important Buddhist motifs in Chinese novels are karmic retribution, rebirth, heavens and hells, miraculous transformations and manifestations, and illusion and dream. In many novels the theme, plot, structure, mode of expression, psychological conflicts, and finale are shaped by Buddhist epistemic-soteriological models, especially by the quest for enlightenment as prescribed by the Chinese Mahāyāna tradition.

Honglou meng (Dream of the red chamber; or, The story of the stone) by Cao Xueqin (1715?–1763 or 1764) is the universally acknowledged masterpiece in the Chinese novel. The relationship between Bao-yu and his cousin, Dai-yu, can be interpreted as the narrative enactment of their karmic reciprocity, origin, and destiny. The novel shows the Buddhist complication of desire, as exemplified by Bao-yu's long journey to the Gates of Emptiness. *The Story of the Stone* deals with important Buddhist images of dreams and mirrors. It also represents the paradox of Mahāyāna Buddhism: only in the world of suffering can one find deliverance. That a full-length novel centers its plot on the protagonist's desire for liberation from his emotional sufferings and on his final determination to become a monk has few precedents. While the affirmation of the Buddhist view of reality is but one side of the novel, its success lies in the author's masterful translation of the mythic and religious into the aesthetic and realistic. *The Story of the Stone* in this light can be read as a book of enlightenment through love.

Besides *The Story of the Stone*, Dong Yue's (1620–1686) *Xiyou bu* (Supplement to journey to the west) manifests Buddhist psychology. In *Jin Ping Mei* (Plum in the golden vase) and *Xingshi yinyuan zhuan* (The bonds of matrimony; or, Marriage destined to awaken the world), the Buddhist vision based on merit-making and karmic retribution is apparent. One type of Buddhist novel is the hagiographical fictional work, such as *Qiantang hu yin Jidian Chanshi yulu* (The recorded sayings of the recluse from Qiantang Lake, the Chan master Crazy Ji; 1569).

Most Chinese novels begin with an account of the initial cosmogony. In these novels this familiar Chinese creation myth is immediately followed by an embodiment of the general patterns in specific mythical-historical processes. This pattern of cosmogony is of Daoist character. Indeed Daoism provides the Chinese novel with a soteriologic and narrative structure. In many novels the heroes (or heroines) usually have divine origins (*chushen*) in heaven or paradise, and because of their own mistakes they are banished to or reborn in the human world to experience suffering, redemption, and self-cultivation (*xiuxing*) and to accumulate merits by rescuing other sentient beings, saving the world, or subduing demons. After they accomplish their mundane missions, they return to their primordial heavenly positions or regain immortality. All works of “fiction of gods and demons” and many other novels share this pattern of development. While *The Story of the Stone* can be read undoubtedly as a profound Buddhist allegory, the same novel can also be read as a Daoist myth in which the male and female protagonists as heavenly immortal beings are banished to the human world to repay their debts of love. After they fulfill their long-cherished wish of falling in love with each other as an experience of the vicissitudes of life, they have no other way but to return to their origins.

In *Shuibu zhuan* (Outlaws of the marsh; or, Water margin) the 108 bandits are 108 stars who are released by accident. They finally vanish in the world because of their redemption and accomplishment. The same sort of Daoist frame of previous origins is present in the Ming novel *Pingyao zhuan* (The quelling of demons), Luo Maodeng's (fl. 1597) *Sanbao taijian xiyang ji tongsu yanyi* (Journey to the western ocean), Li Baichuan's (c. 1720–after 1762) *Lüye xianzong* (Trials of immortals in the green wilds), and Li Ruzhen's (c. 1763–1830) *Jinghua yuan* (Flowers in the mirror) and is used more ironically in Wu Jingzi's (1701–1754) *Rulin waishi* (The scholars). Even for the historical novel *Sanguo yanyi* (Romance of the three kingdoms; c. 1400–1500), its antecedent *Sanguozhi pinghua* (Stories from the records of the three kingdoms; c. 1321–1323) still retains this supernatural episode. In a majority of erotic novels, toward the end the protagonists forgo their practice and attain immortality, centering on the Daoist art of love and pursuit of longevity. Of course one of the best-known Daoist novels is *Fengshen yanyi* (Investiture of the gods). Despite Buddhist influence, this novel exhibits the most explicit Daoist frame-

work and elements by changing a historical novel into a “novel of gods and demons.” The Daoists participate in the transition between the Shang and the Zhou from the beginning to the end. The war between the two Daoist sects in the novel represents a hierarchical struggle in Daoism: the official Daoism and folk Daoism. In fact the wars launched in the human world are envisioned as part of the divine cosmogonic process, that is, the “investiture of the gods.”

Some novels even have the flavor of popular or sectarian religion. Pan Jingruo's *Sanjiao kaimi guizheng yanyi* (The romance of the three teachings clearing up the deluded and returning them to the true way; 1612–1620) reveals the mentality behind morality books, a lay religious movement. The moral motif of the novel was also stimulated by the Religion of the Three Teachings, a syncretic popular religious sect founded by Lin Zhao'en (1517–1598). Liu E's (1857–1909) *Laocan youji* (The travels of Laocan; 1907) intends to show the author's religious vision based on the Taigu school, an esoteric philosophy-turned-religious society with a syncretic creed, that embodied elements from Confucianism, Buddhism, Daoism, and probably even Manichaeism. Episodes in the novel, especially in chapters eight to eleven, which constitute the central part of the twenty-chapter work, were modeled after the Taigu school and its main figures, including a Taigu version of worldly paradise, a religious vision and cosmology of the Taigu school, the transcendental realm of this sectarian movement with its cultivation arts, and its prophetic faith in and eschatological problems with history and Chinese culture as well as its political criticism.

The religious novel par excellence is *Xiyou ji* (Journey to the west; or, Monkey), which is attributed to Wu Cheng'en (c. 1500–1582). Religious themes and rhetoric permeate the entire work. *Journey to the West* contains many references to *yinyang* and five-phases (*wuxing*) terminology, *Yijing* (Classic of change) and alchemical lore, and various other Daoist, Buddhist, and Confucian ideas and practices. For more than three centuries the principal concern of criticism on the novel has been to decipher the allegory by separating the narrative surface into moral, religious, and philosophical meanings. While the novel can be read as a tale of travel and adventure or Confucian rectification of the mind and moral self-cultivation, it can also be read as a religious allegory. The immense appropriation of the teaching from the Three Religions (*sanjiao*) is what makes *Journey to the West* a unique text in the history of the Chinese novel. On the Buddhist side, *Journey to the West* consistently projects a distinctly Buddhist worldview. There are countless allusions to Buddhist concepts and legends structured in the narrative. Although there may be no systematic discourse of one particular Buddhist doctrine in the narrative, certain themes and figures, such as karmic laws, merit making, Buddha's mercy, and the paradoxical connection between mind and buddhahood, do receive consistent development. Viewing the text this way, *Journey to the West* can be read as a story of Buddhist *karma* and redemption or enlightenment.

The story of *Journey to the West* raises a rather perplexing phenomenon, that is, that the narrative provides astonishingly few details traceable to specific Buddhist sources, although its story is built on the historical pilgrimage undertaken by Xuanzang (596–664 CE), one of the most famous Buddhist personalities in Chinese history. It is rather noteworthy how extensively the Daoist themes and rhetoric appear in every part of the work. In the novel Daoist elements function not merely as means of providing commentary on incidents and characters in the narrative but often as an aid to disclose the true nature of the fellow pilgrims, to help characterize their essential relationships, and to evolve the narrative action itself. Moreover *Journey to the West* on the whole presents a complete process of internal alchemical cultivation, both the cultivation of nature (*xinggong*) and cultivation of life (*minggong*), including various stages in a proper sequence. Besides the Buddhist notion of salvation or enlightenment and the neo-Confucian rectification of the mind, the author now adds immortality as the distinctive goal of the pilgrimage.

Religious functions. Many authors, editors, and publishers of novels intended their works to be read as religious scriptures, and many readers accepted this claim. In this light *Journey to the West* is one of the three most important Daoist texts for adepts to study in their self-cultivation as a modern Quanzhen (Complete Perfection) Daoist asserts. Indeed many Chinese novels serve as religious texts, namely, morality books. Certain novels and morality books were printed together as two parts of the same work, making the former the exemplar and the latter the tenet. Many temples have printed and issued several novels as morality books or religious texts. There are always some messages at the end of these novels encouraging distributing these novels as merit making. Thus the readers, with their shared value and understanding of the devotional intent of the novels, constituted a religious community by disseminating and receiving these devotional novels in the same temples.

Some of these novels were not only devotional in nature but also revelatory as well. They have their origins in a context of religious revelations. At some point of their transmission, the novels may have been associated with a personage or group with techniques of revelation, such as spirit possession, shamanism, and spirit writing. In this case perhaps either the patron deities of the cults revealed the text or the mediums that the deities possessed “delivered” the text in spirit writing of planchette séances (*fujū*). The appendixes at the end of *Dongyou ji* (Journey to the east) reveal that it was obviously an output of the planchette spirit writing. New novels, such as *Dongming baoji* (A precious record of the mysteries of outlying realms), were uttered by the deities through this technique of spirit writing.

The novels that functioned as vehicles for their protagonists' cults can also affirm these cults' existence. Thus it may well be that a proselytizing purpose probably underlies at least some “novels of gods and demons.” For example, *Romance of the Three Kingdoms* has had an enormous impact

on secret societies, and its character Lord Guan (Guan Yu) was deified as a universal god in Chinese religion. With respect to *Journey to the West*, Monkey exerts its influence on folk religion, making the Monkey cult in southeast China and Hong Kong one of the most popular cults. Many popular deities are drawn from *Investiture of the Gods* as well. Sometimes the influence of popular novels has had imprints on the monastic attitude toward the saints or deities. And some novels themselves were even canonized by the Buddhist or Daoist institutions.

Many novels, such as *Plum in the Golden Vase*, provide vivid pictures of Daoist and Buddhist rites. More important the novel has had a closer affinity with religious ritual. The ritual appendix found at the end of *Beiyou ji* (Journey to the north) stipulates the rules of worship. The readership was thus anticipated not to read the novel passively but to actively perform rites in honor of the novel's protagonist, God Perfect Warrior. In Jiangxi province in the early twenty-first century a Daoist ritual called "Breaking the Yellow River Trap" is directly from a battle described in chapter fifty of *Investiture of the Gods*.

Martial arts novels. *Wuxia xiaoshuo* or martial arts novels as a genre of popular fiction emerged in the popular urban press of the 1920s and 1930s and was later produced in the 1950s in Hong Kong and Taiwan (also encompassing the genre's thematic predecessors in earlier literature). In the 1920s and 1930s Huanzhulouzhu (1902–1961), in *Shushan jianxia zhuan* (Swordsmen of the mountains of Shu), narrates amazing tales of flying swordsmen, monsters, and magical combat largely drawn from Buddhist, Daoist, and popular religious fantasies. The "New School" of martial arts novels since the 1950s, represented by Liang Yusheng (Chen Wentong; 1922–), Jin Yong (Zha Liangyong; 1924–), and Gu Long (Xiong Yaohua; 1936–1985), inherits religious fantasies as the central plots and structures. But these novels also explore the religious meanings and truth behind martial arts, especially in Jin Yong's novels.

Modern fiction. Foreign cultural influences are particularly noticeable in fiction by and for the intelligentsia in the wake of the vernacular literature movement and the May Fourth New Culture movement. Influenced by the Enlightenment spirit, most modern Chinese fiction writers maintained an antireligion attitude. Given the Western cultural impact, however, some writers more or less tended to borrow Christianity in their fictional works. To most of the May Fourth writers, such as Lu Xun (1881–1936), Guo Moruo (1892–1978), and Mao Dun (Shen Yanbing; 1896–1981), Christ's teachings and lifestyle epitomize a spiritual force that can guide the individual in his or her pursuit of wholeness. Thus, in the minds of these writers, the individual should not adhere to Christ through religious faith but must follow his teachings in a basically humanistic fashion. Besides, Buddhism also exerted certain influence on modern fiction. As China was devastated by civil wars, foreign encroachment, and internal corruption, authors such as Fei Ming (Feng

Wenbing; 1901–1967) accepted the Buddhist philosophy and acknowledged the imperfectness of this world and the sadness of human life; others like Yu Dafu (1896–1945) were pessimistic romantics, taking refuge in the *nirvāṇa* of love. Among modern Chinese fiction writers, Xu Dishan (1893–1941) had a strong interest in religion, including Buddhism and Christianity. What distinguished Xu Dishan from his contemporaries was his concern with the basic religious experience of charity or love and endeavor, which manifests in nearly all his stories to show its pervasive presence in human lives.

The decades from the 1990s onward saw a revival of interest in folklore and awareness of religion in Chinese fiction. Jia Pingwa (1952–), in his short stories, particularly the collection *Taibai* (1991), demonstrates a return to the classical tale tradition and its fascination in mystical and numinous phenomena, including religious magic. Gao Xingjian (1940–), the 2000 Nobel literature laureate, is more outstanding in this respect in his quest for individual spiritual freedom. In his best-known epic novel *Lingshan* (Soul mountain, 1990), Gao Xingjian makes manifest his sincere pursuit of religious values. Much of *Soul Mountain* explores or imagines a Chinese tradition counter to the orthodoxy and gives a reference to Daoism, which provides a moral baseline and cultural ground. It marks not only the first Chinese winner of the Nobel Prize for literature but also the fading of scorn for religion among most modern Chinese intellectuals and their literature, including fiction.

RICHARD G. WANG (2005)

FICTION: JAPANESE FICTION AND RELIGION

Like its Western counterpart, modern Japanese fiction is predominantly secular. Despite the ostensibly heavy Buddhist overtone in premodern Japanese literature, modern Japanese fiction reflects the rapid westernization and modernization brought on by the Meiji Restoration (1868) and betrays a deliberate break from the premodern when literature was at times used as a vehicle for conveying Buddhist thoughts and teachings. Modern Japanese fiction, in its predominantly introspective mode, can be seen as an extended quest for a god that is not there rather than a testimony of religious faith. Ichirō in Natsume Sōseki's (1867–1916) *The Wayfarer* (*Kōjin*, 1912–1913) is the prime example of the frustrated spiritual quest of a modern intellectual. In a moment of existential angst, he proclaims that the three choices open to him are "religion, suicide, and madness" and proceeds to hover in a state of mental breakdown, knowing in fact that religion as a choice was foreclosed to him. Another character who personifies the futile quest for solace in religion is Sōsuke in Sōseki's *The Gate* (*Mon*, 1910) who, in a moment of intense guilt and spiritual exhaustion, knocks in vain at the closed gate of a Buddhist temple. It is as if the modern ego is told to look somewhere else for spiritual redemption, if such an option exists at all.

To recognize the difficult and elusive relationship between religion and modern Japanese fiction from the onset is not to deny the relevance of a religious quest in writers ranging from Kitamura Tōkoku (1868–1894) to Kunikida

Doppo (1871–1908) in the Meiji era (1868–1912), from Arishima Takeo (1878–1923) to Miyazawa Kenji (1896–1933) in the Taisho era (1912–1926), and from Endo Shūsaku (1923–1996) to Sono Ayako (b. 1931) in the Shōwa (1926–1988) and Heisei (1988–) eras. In the following sections, we will examine some representative works in the different eras and explore the following aspects: the intellectual and spiritual reaction generated by the encounter between a pantheistic mode of religion (Shintoism and the legendary gods in the *Kojiki* [712]) and a monotheistic mode; the interpretation and exploitation of Buddhist imagery and shamanism; and the intersection between religion and modern Japanese fiction.

MEIJI ERA. The Japanese government lifted the ban on Christianity in 1873, and many Meiji writers absorbed the influence of Christianity in various degrees as part of the drive for “Enlightenment and Civilization” (*bunmei kaika*). Among them, Kitamura Tōkoku, Shimazaki Tōson (1872–1943), Kunikida Doppo, and Tayama Katai (1871–1930), all Christian converts in their youth, contributed significantly to the Meiji literary movements of Romanticism and Naturalism. Tōkoku was baptized by Iwamoto Yoshiharu (1863–1942), the founder and editor of *Jogaku Zasshi*, a women’s magazine whose goals and contents were defined by his Christian faith and idealism. While Tōkoku kept his Christian faith throughout his short life, shifting from Presbyterianism to Quakerism, he was soon disenchanted with Iwamoto’s moralistic and utilitarian view of literature and religion. In 1893, along with Tōson, Hoshino Tenchi (1862–1950, also a Christian convert), Hirata Tokuboku (1873–1943), and Togawa Shūkotsu (1870–1939), Tōkoku separated from *Jogaku Zasshi* and founded *Bungakukai*, one of the most influential literary magazines in the Meiji era. *Bungakukai* carried a terse announcement that summed up the break between literature and Christianity: “Literature is literature and religion is religion. *Bungakukai* is made up of a group of people with literary aspirations; they are not necessarily religious adherents. Furthermore, it is not limited to Christians or to Christian beliefs” (Brownstein, 1980, p. 335).

Disappointment with the external trappings of the church led Tōkoku toward a more internal form of Christianity, and his spiritual quest is evident in his essays and poetry. In “Essay on the Inner Life” (*Naibu seimei ron*, 1893), he argues that “The great difference between the cultures of the East and West is that in one there is a religion which preaches life and in the other there is not” (Mathy, 1964, p. 102). Perhaps in reaction to centuries of feudalism marked by an underevaluation of the individual and an overevaluation of society, Tōkoku celebrates love (*rabu*) in “The Pessimistic Poet and Womanhood” (*Ensei shika to josei*, 1892): “Love is the secret to life. Only after love came into being did human society exist” (quoted in Keene, 1987, p. 195). But above all else, Christianity provides Tōkoku with a language for a new poetics. He defines “inspiration” as an aspect of the Divine (*shin*), and, in Tōkoku’s view, as one enters the

Divine, language and self dissolve into a state of the sublime (Brownstein, 1990). Thus, Christianity provides a context and language for Tōkoku and his contemporaries to define spiritual freedom, love, and aesthetic and poetic ideals crucial to Japanese Romanticism.

Kunikida Doppo was a leading voice in Naturalism (*shizen shūgi*, 1906–1910), a literary movement marked by an intense inward search for the individual in the form of the confessional novel (*watakushi shōsetsu*). Unlike Tōson in *Spring* (*Haru*, 1908) and Tayama Katai in *The Quilt* (*Futon*, 1907), who wallow in their own sins and confessions, Doppo considers his role as a poet to be a heaven-sent mission. “I am to be a poet of God,” Doppo declared, and one of his famous poems begins: “Freedom is found in the mountains and forests./ As I recite this verse I feel my blood dance./ Ah, freedom is found in the mountains and forests behind” (1897) (quoted in Keene, p. 231). Like many of his contemporaries, Doppo experienced some ambivalence with his adopted faith, and his works betray not so much the influence of a monotheistic culture as the romantic notion that he is an instrument through which the splendor of God’s creation is conveyed. He says that the aim of his work is “to describe with my pen all that my independent soul has been able to learn, observe, and feel” (1893) (quoted in Keene, p. 233).

Like Tōkoku, Doppo is under the heavy influence of the English Romantic poets, and his fiction is a testimony of the magnificence of nature. “Old Gen” (*Gen-oji*, 1897) captures a Wordsworthian stormy sea, while “Unforgettable People” (*Wasureenu hibito*, 1899) resembles a painted scroll of impressionistic scenery in which human existence is marked by its insignificance and randomness. In his later works, such as “The Bamboo Fence” (*Take no kido*, 1908), Doppo shows a great capacity to understand human suffering and despair.

In the historical context of scientific and social enlightenment and technological advancement after 350 years of feudalism and isolation, the Nietzschean modern man in Sōseki’s fiction remains skeptical of religion, and the rational physician/scientist in Mori Ōgai’s (1862–1922) fiction (e.g. *Kompira*, 1909) doubts yet fears the power of folk religious practices. These texts are moral inquiries into the soul of the modern individual: What becomes of him or her when the whirlwind of change brought on by modernization creates a spiritual vacuum in which old Confucian morality and feudal order are swept away while a new morality and a new faith is not in sight? What happens when the individual commits a grave sin? Unlike Dostoevsky, for whom, according to R. B. Blackmur, “a true rebirth, a great conversion, can come only after a great sin” (quoted in Irving Howe, *Politics and the Novel*, 2d ed. [New York, 1987], pp. 55–56), Sōseki knows no such religious assurances, so he would eliminate his protagonists before they commit a potential crime—for example, Takayanagi in *The Autumn Wind* (*Nowaki*, 1905)—or condemn the sinner to face the dark abyss of his guilt and choose death—for example, Sensei in *Kokoro* (1914).

Izumi Kyōka (1873–1939) explores the religious imagination from a purely aesthetic angle by tabbing into a twilight zone populated by divine beings, ghosts, and monsters in his fiction, including *The Holy Man of Mount Kōya* (*Kōya hirjiri*, 1900). If a religious imagination is marked by an ability to envision a world other than that which one inhabits, then the twilight world in Kyōka's fiction expresses that imagination most eloquently. In "The Taste of Twilight" (*Tasogare no aji*, 1900), Kyōka speaks of a "twilight" aesthetics in which day meets night and engenders a subtle dimension beyond ordinary sensations, an otherworldliness in which modern individuals come in contact with their innermost being and experiences a sense of wonder and mystery.

TAISHŌ ERA. Arishima Takeo received his early education in a mission school, attended Sapporo Agricultural College (founded by the Christian educator William Clark), lodged with Nitobe Inazō (a renowned Japanese Quaker), and became a close friend to a disciple of the samurai-Christian preacher and pacifist Uchimura Kanzō. An intensely spiritual and sincere Bible-reading Protestant Christian, Arishima eventually bent under the puritanical and austere ideals he imposed on his life, and his encounter with the poetry of Walt Whitman made him long for individual liberation and personal independence. *A Certain Woman* (*Aru onna*, 1919) is "an attack on conventional Christians" (Strong, 1978, p. 18) and an exploration of human nature in the raw. True to his Protestant upbringing, Arishima shows a moral imagination that is strictly confined to a puritanical dimension; after the rejection of Christianity, the fate that awaits his heroine is moral and physical degeneration, sin, and death: "She was not a woman any longer, only a nameless, grotesque, animal contorted with suffering" (p. 380). Like the protagonist in *The Descendants of Cain* (*Kain no matsue*, 1917), there is no atonement after the fall.

In the broad canon of Japanese fiction, perhaps Miyazawa Kenji possesses the most creative religious imagination. As Giles Gunn pointed out, if "what typifies religious man's experience of the sacred, of that which he takes to be of the essence of life, is its 'otherness,' its differentiation (though not necessarily alienation) from his own mode of being" (1975, p. 107), then Miyazawa's poetry and tales reveal a special ability to access this "otherness." A devout Buddhist of the Nichiren sect who recites the *Lotus Sūtra* daily, Miyazawa wrote tales (often featuring animals and nature and written in the guise of "children's stories") that are meditations on birth, suffering, sorrow, death, and rebirth. The mysterious "A Stem of Lilies" (*Yomata no yuri*, posthumous) is itself a Buddhist fable, while the description of dying in "The Bears of Nametoko" (*Nametoko no kuma*, posthumous) explores the dimension of "otherness" when death bodies forth in life. Embedded in Miyazawa's tales is poetry whose piercing beauty introduces an epiphanic moment of wonder and amazement, as in the following from "The First Deer Dance" (*Shishi-odori no hajimari*, 1921): "Now the sun's behind its back,/See the leafy alder tree/Like a mirror crack/And shatter in a million lights" (in *Once and Forever*, trans-

lated by John Bester, 1997, p. 54). Miyazawa's indebtedness to Christianity is also evident in the description of a transcendental world in his famous *The Night of the Milky Way Express* (*Gingatsudō no yoru*, posthumous) and the night-hawk's transfiguration and ascension to heaven in "The Nighthawk Star" (*Yodaka no hoshi*, posthumous). Miyazawa also alludes to Japanese folklore, legends, myths, and ethnographical studies to create a cosmology distinguished by its structural beauty and integrity as a profound alternative reality.

SHOWA AND HEISEI ERAS. The atrocity and calamity of the Fifteen Years' War (1931–1945), ending in the nuclear destruction of Hiroshima and Nagasaki, stirred up feelings of guilt, incomprehension, and pain, compelling a whole generation of writers to embark on soul-searching literary journeys to understand what Ibuse Masuji, in "The Crazy Iris" (*Kakit-subata*, 1951), called a "crazy age." The list of Christian writers is substantial, ranging from the famous and prolific Endo Shūsaku, Ariyoshi Sawako (1931–1984), Inoue Hisashi (b. 1934), Miura Ayako (b. 1922), and Sono Ayako, to the serious and contemplative Shimao Toshio (1917–1986) and Shiina Rinzō (1911–1973) (Gessel, 1982, pp. 437–457). Some writers handle religious themes and issues directly in their works, while some refer to Christianity only at an oblique angle. Some texts are hopeful and optimistic (Shiina) while others have a darker shade of sin and guilt (Shimao). Endo Shūsaku is most forthright about his identity as a Catholic author and consistently thematizes Japanese church history in his fiction, earning himself the appellation of the "Graham Greene of the East." Francis Mathy points out that Endo contrasts a pantheistic Japanese world that is "insensitive to God, sin and even to death" to the monotheistic Christian world of the West that affirms the judgment and salvation of a supreme being. In some texts, Christianity is swallowed up or transformed in the metaphorical swamp that is Japan—for example, *Yellow Man* (*Kiuroi hito*, 1955), *Silence* (*Chinmoku*, 1966)—while in others, such as *Wonderful Fool* (*Obakasan*, 1959), Christ-like characters appear to lift others out of the non-Christian mud swamp (Mathy, 1992). Endo's description of Christ in *A Life of Jesus* (*Iesu no shōgai*, 1973) is a sad figure to whom "a yellow man" can relate to, much like the earthy figure of the Virgin Mary in "Fumie," whom illiterate Japanese peasants worship. Despite his tremendous output as a writer on religious themes, many of Endo's works use church history as a pretext for telling exotic tales with the suggestion of a distorted form of Orientalism and are wanting in theological or spiritual depth.

Among Catholic writers in the Shōwa era, Sono Ayako is noteworthy for the spiritual strength, humanity, and sincerity in her work. Sono received seventeen years of Catholic education at the Sacred Heart Girls School and College, and the strength of her faith is revealed in her boldness in creating intelligent, humane, yet fundamentally questioning characters who challenge the certitude of a divine order. In doing so, she posits a world of incertitude in which believers and nonbelievers alike have to struggle to make sense of suffering

and death that often elude understanding. In *Watcher from the Shore* (*Kami no yogoreta te*, 1979–1980), Dr. Nobeji, a gynecologist whose work in artificial insemination, delivery, and abortion forces him to confront life-or-death decisions daily, finds himself struggling to understand the will of God. Without providing comforting answers to moral issues raised in the novel but adhering to a sympathetic treatment of the protagonist's incertitude, Sono forces the reader to reflect upon faith and moral judgment in an imperfect world. Sono's tremendous output in fiction and essays is a continuous quest of the place of humanity in the larger scheme of God.

Among modern Japanese writers, Mishima Yukio (1925–1970) uses various religious thoughts and iconography most lavishly in his stories. Yet the frequent evocation of religion is for the most part a pretext to summon a remote and exotic other world that provides an alien and fantastical setting for the fermentation of his aesthetic theories. The biblical iconography of the Madonna, Sodom and St. Sebastian in *The Confessions of a Mask* (*Kamen no kokuhaku*, 1949) sets up a triadic tension among the purity of spirit, the corruption of flesh, and martyrdom as the ultimate vision of beauty in Mishima's aesthetic world. The references to sacred space in *The Temple of the Golden Pavilion* (*Kinkakuji*, 1956) and the three holy shrines of Kumano in "Acts of Worship" (*Mikumano mode*, 1965) are instances in which famous Buddhist and Shintō sites are borrowed as convenient locales for the protagonists to confront their hopeless search for an ever elusive beauty and the all too nagging presence of their selfishness, desires, and physical ugliness or deterioration. The Buddhist idea of reincarnation, so prominent a plot mechanism in his tetralogy *The Sea of Fertility* (*Hōyū no umi*, 1965–1970), is no more than a device for him to indulge in the longing of eternal youth and a beautiful death, a destiny privileged to his chosen casts of iconic references, ranging from the sailor in *The Sailor who Fell from Grace with the Sea* (*Gogo no eikō*, 1963) to Joan of Arc and St. Sebastian in *The Confessions of a Mask*, and Kiyooki and his reincarnated selves in *The Sea of Fertility*. To his credit, Mishima's references to Christian, Buddhist, and Shintō thoughts and iconography are articulate and serve as points of interest to the student of religious practices and tradition, most impressive of which being the reference to the five signs of angelic decay in his last novel *The Decay of the Angel* (*Tennin gosui*, 1970). Yet the final negation in his last novel of the tenet of suffering and rebirth in Buddhist thought—ideas that underlie the construction of the tetralogy—testifies the nihilistic view of a man who is tired of exploiting popular religious beliefs as an excuse for horror and extravagance, and has left not a trace of serious engagement in a dialogue of literature and religion.

Non-Christian Japanese writers also explore religious imagery for various purposes in their texts. Abe Kōbō's (1924–1993) vision of an apocalypse and a surviving ark of humanity in *The Ark Sakura* (*Hakobune no sakura*, 1984) transforms his fiction into a continuous quest of existential

meaning in a world without God. Enchi Fumiko (1905–1986) explores the world of shamanism and spiritual possession in a number of her novels, including *Masks* (*Onnamen*, 1958) and *A Tale of False Fortunes* (*Namamiko monogatari*, 1965), a theme that ostensibly links her fiction to the phantoms and rituals of the Heian past. However, Enchi's spiritual world is not meant to be a space for philosophical or religious contemplation but a device that effectively ties her to the legacy of the literary past and an excuse to explore the psychology of her female characters. Nakagami Kenji (1946–1992) wades even deeper into the spiritual realm in such novels as *The Immortal* (*Fushi*, 1984) and *Gravity's Capital* (*Jūryoku no miyako*, 1981) by setting his fiction in the sacred spaces of Kumano and linking his texts, linguistically and temporally, to the world of the mythical gods in *Kojiki*. Yet Nakagami uses the spiritual realm fundamentally to create a postmodern space of multiple realities in order to address political and social problems of the discrimination of the *burakumin*. In that sense, religious imagery is a convenient pretext for Abe, Enchi, and Nakagami to examine existential, feminist, and political issues, while their writings remain fundamentally secular.

In the contemporary literary scene, when the novel has to compete with other forms of more readily consumable media stimulation, a few writers continue to grapple with religious and spiritual issues. Kaga Otohiko (b. 1929), a medical doctor who practiced psychiatry and taught psychology, wrote novels and essays about World War II, including *Riding the East Wind: A Novel of War and Peace* (*Ikari no nai fune*, 1982), and death row inmates (*Love and Light on the Brink of Death; Letters from Death Row* [*Shi no fuchi no ai to hikari*, 1992]) as a means to understand humanity and come to terms with his faith. Suga Atsuko (1929–1998) wrote stories and essays that capture the lives of Catholic saints with great persuasion. A simple metaphor in "The Life of St. Katalina" (*Shiena no seijo: sei Katalina den*, 1957) helps to illuminate the connection between Japanese fiction and religion: "Prepare a secret little chamber in your soul, and enter the chamber when it is ready. Find yourself, and find God" (*Suga Atsuko zenshū*, 8: 187). If the quest for divine understanding can be undertaken by way of a quest for the self, then the majority of Japanese fiction, itself a continuous process of introspection and reflection, is very close to a spiritual and religious quest, despite its predominant secular nature.

Religion intersects with modern Japanese fiction in various ways and serves, on the one hand, as a channel for a new poetics, a romantic quest for individual liberation, and moral inquiries, and on the other hand, as a pretext for generating exotic modern tales. There is no master narrative that governs the relationship between religion and modern Japanese fiction, but perhaps the following scene of mass cremation in Ibuse Masuji's *Black Rain* (*Kuroi ame*, 1966), a novel about the aftermath of the atomic bombing of Hiroshima, expresses most eloquently the place of religion in modern

Japanese fiction. As the protagonist Shigematsu wanders among the mounds of dead bodies, the only expression that comes to him, an atheist who survived the atomic bomb and finds himself acting as a surrogate priest to offer prayers for the dead, are words from the Buddhist “Sermon on Mortality”: “Sooner or later, on this day or the morrow, to me or to my neighbor. . . . So shall the rosy cheeks or morning yield to the skull of eventide. One breath from the wind of change, and the bright eyes shall be closed” (*Black Rain*, 1988, p. 277). Religion intersects with modern Japanese fiction most intimately in addressing the spiritual need to understand the mystery and inscrutability of life and death, and a larger force that exists beyond humanity.

BIBLIOGRAPHY

Most criticism that deals with modern Japanese fiction does not touch upon religious issues, so the reader who wishes to make further religious inquiries might prefer to read the works of fiction mentioned with special attention to their religious implications. Those who wish to pursue the study of Christianity and Japanese fiction are advised to read the articles by Brownstein, Mathy, and Gessel quoted in the article. Further adventures in reading will include exploring the works of the list of Japanese Christian authors quoted in the article as well as the following works of fiction: Natsume Sōseki, *Ten Nights of Dream* (*Yume juya*, 1908) (deals with “other worlds”); *And Then* (*Sore kara*, 1909) (a near religious quest of love and beauty by an atheist); Akutagawa Ryūnosuke, “The Man from the West” (*Saihō no hito*, 1927) (an attempt to understand the relevance of Christ); “Death of a Martyr” (*Hōkyōjin no shi*, 1918) (a dramatic account of the life of a saint); Shiga Naoyo, “At Kinoshiki” (*Kinoshiki ni te*, 1917) (a meditation on life and death); *A Dark Night’s Passing* (*An’ya kōro*, 1921–1937) (note especially the divine revelation in nature towards the end of the novel).

Some of the most thought-provoking and valuable studies on religion and literature do not mention Japanese fiction at all but provide important background in exploring modernity, literature, and religion. These include:

Gunn, Giles. *The Interpretation of Otherness: Literature, Religion, and the American Imagination*. New York, 1975.

Keene, Donald. *Dawn to the West: Japanese Literature in the Modern Era*. New York, 1987.

Strong, Kenneth. Introduction to *A Certain Woman*, by Takeo Arishima. Tokyo, 1978.

ANGELA YIU (2005)

FICTION: SOUTHEAST ASIAN FICTION AND RELIGION

The term *Southeast Asia* was coined during World War II to refer to the part of the continent of Asia that lies south of China and east of India. The region can be divided into two sections.

There are the “mainland” states: Myanmar (Burma), Thailand, Laos, Cambodia, and Vietnam. The distinct cultures of these states remain strongly influenced by Theravāda Buddhism and elements of South Asian religious traditions. In addition, Vietnam has been strongly influenced by Chinese culture, including Taoism, Confucianism, and Mahāyāna Buddhism.

Below the latitude of approximately seven degrees north of the equator as marked on the Malay Peninsula are the “island” states of Malaysia, Singapore, Indonesia, Brunei, and the Philippines. Although the cultures of these states also accepted the influence of Hinduism and Buddhism, from the thirteenth century CE onward they were strongly influenced by the spread of Islam. The northern part of the Philippines was converted to Catholicism after 1535.

TRADITIONAL RELIGIOUS NARRATIVES. The traditional narrative literature of both parts of the region can be divided into two levels. There is the mass of folk literature, which varies from one country to another, and often extensively within each country as well. Being oral literature, this is not available to historical inspection. There is also the written literature produced in the various courts and religious centers; records of some of this, but only a small amount, has survived. From the religious perspective, this written literature dealt in different ways with the stories of the past lives of the Buddha, known as the *jataka* tales, and with the two Indian epics, the *Rāmāyaṇa* and the *Mahābhārata*.

Cambodia was the site of the earliest kingdom in Southeast Asia, called Funan (first century CE). As the area developed with a variety of religious influences through the Angkor period, it came to incorporate areas that are now known as Laos, Thailand, and parts of Burma and Vietnam. Around the ninth century the Burmans settled in the area known today as Myanmar, where they came into contact with earlier settlers, the Pyu, whose ancient cities attest to the influence of Hinduism and Buddhism. By the mid-eleventh century

the pagan dynasty was founded, ushering in a golden age of art and the popularization of Theravāda Buddhism, a trend also occurring in Angkor, whose glory would finally be eclipsed in the fourteenth and fifteenth centuries by the Thai kingdom of Ayutthaya, itself destroyed by the Burmese in 1767.

In Myanmar palm leaf manuscripts were used for religious, grammatical, literary, historical, legal, and other major texts. The earliest surviving examples of prose, which date from the twelfth century, took the form of folding paper books that included illustrated scenes from the life of the Buddha and the *jataka* stories. Some similar manuscripts were probably also used in Cambodia, Thailand, and Laos. In Myanmar 8 of the 10 greater *jataka*, and all 537 minor *jataka*, were translated by two monks during the second half of the eighteenth century.

The first recorded prose text in Thailand is the aristocratic Phya Lithai's *Trai Phum* (Sermon on the Three Worlds; 1345). The sermon contains many illustrative stories on Buddhist cosmology; its teachings also served to legitimate the role of the Buddhist king (*cakkavatti*). Although there are no remaining *jataka* tales to be found in island Southeast Asia, the stories are included on the wall sculptures of the great eighth-century central Javanese shrine, the Borobudur, and were presumably common at that time.

Both mainland and island Southeast Asian countries developed their own versions of the two epics. The *Rāmāyaṇa* has its parallels in the Cambodian *Ramakerti*, the Lao *Phra Lak Phra Lam*, and the Thai *Ramakian*. These are not translations but are distinctive retellings of the story that vary in significant ways from the Indian original. For example, Thailand's *Ramakian* includes a remarkable infusion of Buddhist elements.

In Java the earliest surviving narrative poem is the *Kakawin Rāmāyaṇa*, which is considered by later generations to be the first and finest classical Javanese narrative poem. It was probably written during the second half of the ninth century. The whole of the *Mahābhārata* and the *Rāmāyaṇa* was rendered into Old Javanese *parwa* (prose texts), beginning a century later (i.e., after 1000 CE). These texts were later transferred to Bali and preserved there, following the fall of Majapahit, the major inland Javanese kingdom, after 1350.

The stories of the *Rāmāyaṇa* and the *Mahābhārata* were not only read; they were also appreciated by cultivated audiences in the forms of religious architecture, as well as in dance and shadow-puppet theater (*wayang*). Scholars have divided the repertory of the puppet theater into four cycles: (1) those with animistic themes, (2) stories of Arjuna taken from the *Rāmāyaṇa*, (3) stories based on the *Rāmāyaṇa*, and (4) the majority, stories from the *Mahābhārata*.

The earliest prose fiction from Vietnam, *Linh-nam trich quai*, is a collection of fables written in Chinese and dating from the fifteenth century. The collection reveals a mixture

of animistic beliefs and Chinese influence and includes the Daoist theme of mortals forming relationships with immortals. There are also records of storytelling in the vernacular for entertainment at palace gatherings during the Tran dynasty (1225–1400). This Chinese style of literature at the court and in the government bureaucracy was ultimately transformed by an indigenous rich narrative to produce a uniquely Vietnamese style of fiction by the eighteenth and nineteenth centuries, when prose began to acquire more importance as a literary medium.

TRADITIONAL ISLAMIC NARRATIVE LITERATURE. Unlike Java and Bali, all surviving texts in Malay are written in an adaptation of the Arabic script and therefore date from after the coming of Islam to the peninsula. There are still many surviving manuscripts based on the stories from the two Indian epics, but they have all been modified to give them a superficial Muslim flavor. For example, the *Hikayat Seri Rama* (The Story of Seri Rama), last copied before 1590, begins with references to Allah and Adam, the first prophet.

There are five types of Muslim narratives in traditional Malay literature. Some deal with the life of the Prophet Muhammad, from his archetypal existence (*Hikayat Nur Muhammad*), to his life and miracles (*Hikayat Isra' and Mikraj*), and to his death (*Hikayat Nabi Wafat*). Also included in this first category are works that deal with members of the prophet's own family (e.g., the *Hikayat Nabi Mengajar Anaknya Fatimah*, describing the Prophet's instructions on the duties of women, as given to his daughter Fāṭimah). There are further chronicles about the other great prophets of Allāh, such as Joseph, Moses, Solomon, and Zachariah. (A major anthology of these stories is the *Qisas al-Anbiya*.) The stories of the "Companions" of the Prophet Muḥammad include not only his close disciples (*Hikayat Abu Bakar* and *Hikayat al-Mu'minin Umar*), but also his son-in-law, 'Alī, and 'Alī's two sons who were later martyred, Ḥasan and Ḥusayn (e.g., *Hikayat Ali Kahwin*, on the marriage of Ali). This is a strong indication of the importance of Shiite influences in early Malayan Islam. Works in the next category, chronicles of the great warriors of Islam, present some of the great commanders during the time of Muḥammad (*Hikayat Muḥammad Hanifiyah*), but also include Alexander the Great (*Hikayat Iskandar Dzulkarnain*) and the Yemeni warrior Saif al-Lizan (*Hikayat Saif al-Lizan*). The devout men and women whose lives are described are variously ascetics and mystics, kings and judges. The *Hikayat Ibrahim ibn Adham* tells of a king who renounces his throne to devote himself to a life of prayer; the *Hikayat Raja Jumjumah* tells of an evil king who was restored to life by the Prophet Jesus and thereafter committed himself to constant contemplation.

It is important to note that although all these narratives—Hindu, Buddhist, and Muslim—may, from one perspective, be considered imaginative works, they are definitely not considered as "fictional" (in the sense of "untrue") by those who do, or did, believe in the sacred stories they tell.

THE EMERGENCE OF MODERN GENRES. Modern narrative fiction proposes an imagined personal description by a named author of contemporary society and the complexities of psychological description. Such writing was a product of Western influence, which began in the late sixteenth century but made its real impact following the nineteenth century. The consequent vast changes in social and economic structures, and the attendant human problems and situations, were represented to readers through the spread of printing and mass literacy. Such writing often combined with other preexisting factors, including religious literary influences and oral folktale traditions. While much “modern” writing has a secular emphasis, religious themes are also still to be seen in literary works produced throughout the region. Some writings are critical of traditional practices. Others occasionally still use major characters from both of the traditional Indian epics as a device to indirectly criticize political corruption, social inequity, or the loss of traditional values.

THE MAINLAND BUDDHIST STATES. In Burma the first presses were established during the 1800s by Christian missionaries who pioneered a translation and printing of the Bible. British colonial rule began in 1862 and with it the gradual development of modern Burmese prose fiction influenced by British literature. Religious themes, sometimes critical of Buddhism, occur in Myanmar’s modern fiction. Thein Pe Myint’s novel *Tet Hpon-gyi* (Modern Monk; 1937) criticized corruption in the Buddhist Sangha, causing a great uproar among the monks. Zaw-gyi’s memorable short story “Thu maya” (His Spouse, 1960) involves a husband who decides to enter monkhood in order to avoid family responsibilities. Ne Win Myint’s short story “Thadun” (1995) is a political satire based on one of the crucial events in the Buddha’s growth toward Enlightenment. Despite considerable state censorship, Myanmar has a vibrant contemporary literary culture.

Modern fiction appeared in Thailand from the 1880s, written largely by young male aristocrats who had studied abroad. One of the first published short stories was Krom Luang Phichit Prichakon’s popular and controversial “Sanuk nuk” (Fun Thinking; 1885). Set in a famous Bangkok temple, the story describes an imaginary conversation between four young Buddhist monks about their futures and the pragmatic advantages and disadvantages of remaining a monk. Further episodes were banned. With a growing educated middle class, women also became interested in the art of prose fiction. From the 1930s socially concerned fiction with its ethnographic quality became part of the literary landscape that included Thai Buddhist culture. Khammaan Khonkhai’s popular 1978 ethnographic novel *The Teachers of Mad Dog Swamp* reveals the village cycle of Buddhist rituals as a backdrop to the struggles of the protagonist Piya. Having received his university education in Bangkok while living in a *wat* (temple or monastery), Piya returns to the countryside as a young idealistic teacher. He is spurred into action against the politicians and business elite who are illegally logging the area and have lost their sense of Buddhist

morality. Writers of the American era (1965–1973), like Si Dao Ruang (Wanna Thappananon) in “Mother of Waters, Thaokae Bak, and a Dog” (1977) and Sujit Wongthet in “Second Nature” (1967), criticize the commercialization of Buddhist festivals. Si Dao Ruang has a cycle of stories including “Sita Puts Out the Fire” (1984), which relocates characters from the *Rāmāyana* within the modern urban setting of Bangkok.

Laos and Cambodia lag behind the other countries of Southeast Asia in the development of prose fiction. Both countries were colonized in the mid-1800s by the French, who delayed the introduction of printing presses and public education until the early 1900s. In Cambodia traditionalist monks resisted the printing of Khmer script since hand-copied manuscripts were considered sacred. Their objections were overcome by Venerables Chuon Nath (1883–1969) and Huot Tath (1891–1975), who enabled the printing of a variety of Khmer texts. In fact, most of the early fiction writers were educated monks. The journal *Kambuja Suriya* (1926) of the Buddhist Institute, established by the French, was the first to publish modern novels in serialized form.

Early prose writers, such as Rim Kin in *Sophat* (1938) and Nou Kan in *Tun Jhin* (1947), were naturally influenced by Cambodian religion. The cultural milieu for their fiction includes magic, ghosts, sages, Hindu deities, Buddhist monks, and pagoda schools. In her novella *Gu san mitt min drust mitt* (1947), Sou Seth, the first woman writer of modern prose, develops a complex love story in which the male protagonist renounces secular life to become a monk. Nhok Them in *Kulap pailin* (1943) and Kim Hak in *Dik Danle Sap* (1941) make use of the Buddhist themes of impermanence, karma, and self-determination. In *Dik Danle Sap* a corrupt former monk is finally discredited when his moneymaking meditation scam is discovered. Because of the lingering impact of the Pol Pot era (1975–1979) in Cambodia and government control over literature in Laos, both countries are still struggling to establish strong modern literary traditions.

Vietnam. The development of the modern novel and short story in Vietnam began in 1862 with French colonial control. The influence of the Chinese-language based literati slowly waned as the French modernized the Vietnamese language by employing a romanized script, *quoc-ngu*, originally developed by the French Jesuit Alexandre de Rhodes (1591–1660) in 1651. *Quoc-ngu* was popularized by Vietnamese Roman Catholic writers at the end of the eighteenth century. The most famous of these, Paulus Cua (1834–1907), is credited with developing modern Vietnamese prose. Some of the first publications of prose were collections of tales: *Truyen giai buon* (Stories to Dispel Sadness; 1880) and *Truyen giai buon cuon sau* (More Stories to Dispel Sadness; 1885). The popularity of tales continued throughout the modern period, for example, Nguyen Dong Chi’s *Kho tang truyen co tich Viet-nam* (Treasury of Ancient Vietnamese Stories; 1958). Many of these tales show Chinese and Buddhist influence. *Su-tich 18 ong la-han* (Story of the Eighteen Arahats), for ex-

ample, tells of eighteen thieves who renounce their profession, commit suicide, and become arahats (enlightened monks). Other stories relay the deeds of various bodhisattvas including Kuan-yin or are reminiscent of stories in the *Dhammapada*.

With modernization, the spread of education, and a growing middle class, both male and female writers experimenting with prose fiction emerged from all social levels. From the early 1900s until 1975 writers split over the aesthetics of literature as art for society's sake or art for art's sake. After 1975 social realism became the officially stipulated style for literature until the *Doi Moi* (renovation) policy implemented in 1986, which allowed for greater freedom of expression.

The most internationally well-known Buddhist fiction writer and poet of this modern period is Thich Nhat Hanh, a Thien Buddhist monk who was exiled from Vietnam in 1966, having been banned from participating in antiviolence protests. *The Stone Boy and Other Stories* (1996) is a collection of his short fiction that incorporates tales of monks, bodhisattvas, compassion, and loving kindness in the Vietnamese Buddhist tradition. Among the many *Doi Moi* era writers, two should be mentioned. Nguyen Huy Tiep, a master of the psychological tale, is considered by some to be a postmodernist writer because of his narrative approach to storytelling. In *The General Retires and Other Stories* (1992) and his other fiction themes include decadent Confucianism and Buddhism in a society that seems to have lost its moral compass. Duong Thu Huong lyrically explores the spiritual malaise of failed political ideology in many of her novels, including *Novel without a Name* (1995).

Malaysia and Indonesia. Despite sharing a common language, Indonesian/Malay, and a common religion, Islam, the island regions between the British and the Dutch were divided during the early nineteenth century, leading to the development of two distinctly different modern literary traditions. Both of these owe their origins to the rise of popular printing presses. In Malaya and Singapore the presses had strong connections to the Middle East and frequently published translations of Arabic stories. In an increasingly plural society (Malay, Chinese, and Indian) being a Muslim was seen as part of the definition of being a Malay. In the Dutch East Indies the presses belonged to Chinese and Eurasian settlers; after 1908 the colonial government also established its own publishing house, Balai Pustaka, to promote a modernizing and secular literacy. Islam has, therefore, played a more obvious role in Indonesian literature than in Malay.

Hikayat Faridah Hanum (1925), by Syed Sheikh bin Ahmad Al-Hadi (1867–1934), is often considered the first modern Malay novel, even though it is entirely set in the Middle East. A love story, the novel promotes female emancipation and Islamic reformism in general and criticizes more traditional Muslim figures wherever possible. Following the consolidation of prose in the 1950s, Malay literature was caught up into the Islamic revival movement of the 1970s

and a serious prolonged debate about the nature of a “Muslim literature” followed. The main spokesman was Shahnnon Ahmad. Shahnnon highlighted the natural place of Islam at the heart of rural Malay life and the importance of its morality in maintaining a moral society.

For a long time Islam seemed marginal to modern Indonesian fiction. One exception was the pre–World War II author Haji Abdul Malik Karim Amrullah. His first novel *Di bawah lindungan Ka'abah* (Beneath the Protection of the Ka'abah; 1938) tells of a young man forbidden to marry his true love because of local custom, who flees to Mecca and finds refuge there and eventually death. The later novel *Tuan Direktur* (The Director; 1939) contrasts the material values of the businessman with the simple piety of the villager Pak Yasin. After the war *Atheis* (The Atheist; 1949), by Achdiat Karta Mihardja, explores the spiritual struggles of a young West Javanese man, raised in a repressive and superstitious Islam, that arise when he is confronted with the secularism, rationalism, and self-centered life styles of the capital, Jakarta. The debate about a Muslim literature began in Indonesia only in the mid-1980s and had a much greater influence on poetry than on prose. With the continuing increasing importance of Islam in Indonesian public life, however, a new genre has arisen since 1998: Islamic youth literature. These stories focus on the daily lives of young Muslims and are written in an unselfconscious contemporary Indonesian. A major author in this field is Helvy Tiana Rose. In *Segenggam Gumam*, a collection of her essays published in 2003, she argues that an Islamic literature should be written by a pious Muslim, that it should be informed by a serious knowledge of the teachings of the faith, and that it should encourage readers to dedicate themselves to God and the Muslim community.

Philippines. Before Spanish influence, prose narratives in the Philippines consisted largely of origin myths, hero tales, fables, and legends. The native syllabary, possibly influenced by an Indic script, was replaced by the Roman alphabet introduced by the Spaniards in 1565. As the number of Christianized Filipinos grew, old manuscripts on perishable material were left to disintegrate or were destroyed by missionaries “who believed the indigenous pagan culture was the handicraft of the devil himself” (Lumbera and Lumbera, 1982, p. 3). Resistance to the colonizers or isolation from them allowed for some survival of indigenous literary forms during a period when Christianity spread rapidly under the influence of the Spanish friars.

Filipino literature during the 333 years of Spanish rule was “predominantly religious and moral in character and tone” (San Juan, 1974, p. 4). Ladino writers began to compose in mixed Tagalog and Spanish. The power of the Catholic Church grew to such an extent that all literature had to be approved for publication. In 1856 the Permanent Commission of Censors was established, which included four religious members out of a total of nine.

During the late 1800s the *Ilustrados* of the Propaganda movement emerged in response to this repression. One of them, the great novelist José Rizal (1861–1896), whose literary brilliance would continue to inspire writers throughout the modern period, exposed the sexual misdeeds and the political intrigues of the powerful Catholic friars in his *Noli Me Tangere* (1887) and its sequel *El Filibusterismo* (1891). Realizing that their campaign for reform was failing, these reformist writers shifted from Spanish to Tagalog in the hope of reaching a wider audience. Their nationalistic attempts, which did establish the beginning of a self-conscious Filipino literature, would be further frustrated by the American colonization of the area from 1898 to 1945, an age when the short-story genre would fully develop and women would also become accomplished writers.

The cultural landscape of Catholic influence, with its resonant church bells and solemn rituals, forms part of the aesthetic setting for many romantic or socially critical stories and novels during the modern and contemporary periods, from Paz Marquez Benitez's (1894–1983) "Dead Stars" (1925) to Cristina Pantoja Hidalgo's (1944–) "The Painting" (1993). The appetites of the friars who abetted Spanish colonial oppression are a theme taken up by the next generation of socially critical authors now writing in Tagalog. These include Gabriel Beato Francisco (1850–1935), in his trilogy *Fulgencia Galbillo* (1907), *Capitan Bensio* (1907), and *Alfaro* (1909), and Iñigo Ed. Regalado (1888–1976), with his anticlerical and anticolonial discourse in *Madaling-Araw* (1909). In contrast, Faustino Aguilar (1882–1955) focuses on the subjective blindness of Filipino religious belief in his novel *Pinaglahuan* (1907). The popular novelist Lazaro M. Francisco (1898–1980) in his last two novels, *Maganda Pa Ang Daigdig* (1956) and its sequel *Daluyong* (1962), portrays a progressive priest whose humanity illustrates the positive role religion can play in society. The theme of "priest as social reformist" is also expressed in Paulino Lim's political novel *Requiem for a Rebel Priest* (1996).

FICTION: AUSTRALIAN FICTION AND RELIGION

Evidence of indigenous habitation of Australia dates back some forty or fifty thousand years before European settlement. As Mudrooroo (previously Colin Johnson, b. 1939) noted in *The Indigenous Literature of Australia*, Aboriginal oral literature contains accounts of the wanderings of the creative ancestors who shaped the land and people, but the most sacred aspects of these stories were reserved for initiates. As the white Australian governments of the nineteenth and twentieth centuries discouraged Aboriginal communities from following their cultural and religious practices, many sacred secret stories were lost. Other, more public, stories often suffered in translation from Aboriginal languages, their mythological dimensions reduced to the status of fairy tales or simplistic creation stories for children.

INDIGENOUS FICTION AND RELIGION. Aboriginal people were introduced to the Roman alphabet by the British following their landing at Sydney Cove in 1788. Christian missionaries were zealous educators, and their influence has been seen in the "strong current of Christianity" that runs through Aboriginal writing (Mudrooroo, 1997, p. 10). The first acknowledged Aboriginal writer, David Unaipon (1873–

1967), was raised on a Christian mission and wove biblical values and classical allusions into traditional Ngarrindjeri stories in his booklet *Native Legends* (c. 1929). European Australians, including Ronald and Catherine Berndt and T. G. H. Strehlow, compiled major collections of oral Aboriginal literature.

White children were introduced to indigenous characters and mythology by white writers, most notably novelist Patricia Wrightson (b. 1921) in *The Rocks of Honey* (1960) and the Wirrun Trilogy (1977–1981). Although Wrightson tried to dispel the white blindness that denied Aboriginals their human dignity, and although she was scrupulous in her research, indicating where she had invented material, this aspect of her work has since polarized opinion: did it hasten white appreciation of Aboriginal spirituality, or did it obscure the nature of that spirituality?

In 1964, against a background of increasing demands for justice and Aboriginal land rights, Kath Walker (later Oodgeroo Noonuccal, 1920–1993) published a book of poetry, *We Are Going*, now credited as the beginning of a new phase of Aboriginal writing, one which spoke directly to white Australians. Much contemporary Aboriginal writing is concerned with retrieving and reclaiming the past and with establishing individual and communal identity, as demonstrated by the popularity of the autobiographical and biographical forms. The first indigenous novel to be published, *Karobran* (1978) by Monica Clare (1924–1973), was based on the author's experiences growing up in welfare institutions and white foster homes.

The disintegration of Aboriginal community life because of (and despite) white intervention, the physical and emotional illnesses caused by disregard of sacred rituals, the saving power of the old ways, and the critical importance of the land to the health of the community and the individual are all played out in Kim Scott's novel, *True Country* (1993). In his story of Billy, a part-Aboriginal schoolteacher who is posted to a remote settlement in the far north of Australia, Scott (b. 1957) casts an unflinching eye over the corrupt behavior of both whites and Aborigines who ignore the presence of the sacred and refuse to honor their obligations. There is a suggestion that, for Aboriginals and whites alike, Christianity might survive if the concept of God were to change, if God were to be thought of "as a great spirit, a creator spirit, an artist. A creative force behind the world, living in the world, and giving ceremony and the land." "Maybe," Scott's sympathetic white Catholic priest says, "they, we, will end up with a new God here, some sort of major spirit from the Dreaming or whatever, who named everything and us—or should I say the Aborigines?—and created this special relationship. People, creation, the land" (Scott, 1993, p. 221). Billy's own moment of understanding, his acceptance into the Aboriginal spirit community and the true country, comes as he nearly drowns, swallowed by the snake-like river, the Rainbow Serpent, the Aboriginal figure of divinity. In this spiritual rebirth the abiding presence of the

law, the unity of nature and spirit, and the possibility of hope are affirmed.

POSTSETTLEMENT RELIGION AND FICTION. Since the arrival of the Europeans, Christianity has been the dominant religious influence in Australia, although the number of Australians claiming to be Christian declined throughout the twentieth century. In the 2001 census 68 percent of the population claimed Christian affiliation, but church surveys suggest that only around 20 percent of these people attend religious services. The fastest-growing religions in Australia between 1996 and 2001, according to the census, were Buddhism, Hinduism, and Islam, but they accounted for only 3.9 percent of the population. Much of their growth has been the result of immigration from Southeast Asia and the Middle East.

The Australian attitude to Christianity is ambivalent, stemming from the origins of the colony as a penal settlement where the church was expected to enforce good order among the inhabitants. The brutality of the penal system was graphically illustrated in the novel *For the Term of His Natural Life* (1874) by Marcus Clarke (1846–1881). Early writers such as Clarke, Joseph Furphy (1843–1912) and Henry Lawson (1869–1922) had no sympathy for institutionalized Christianity in their fiction, praising instead Christlike behavior among the convicts, settlers, and bushmen who were battling to survive. The concept of mutual support among men became enshrined as a quasi-religious nationalist creed known as mateship, which has been cited as evidence of widespread Australian adherence to Christ's teaching of love for one's neighbor. Attempts by some theologians in the late 1970s and the mid-1980s to use mateship as the foundation of a specifically Australian Christianity failed, however, because the concept is fundamentally secular and is vulnerable to misuse by sexist, racist, and anti-intellectual interests.

Historically, the Christian churches did little to win the minds of Australians. In 1977 Richard Campbell complained of the lack of "a substantial and continuous intellectual tradition" in Australian religion, noting the absence of great theological colleges, the reliance on imported theologians, and the emphasis on vocational training, rather than "intellectual critique of the church's language about God" (p. 179). In the late 1970s, theologians, tired of making do with a derivative European religion, turned to literature and the arts to find ways to address God in the vernacular. Two of the pioneering commentators, Dorothy Green (1915–1991) and Veronica Brady (b. 1929), were practicing literary critics.

Although a body of novels addresses the experience of growing up within a restrictive religious tradition—Catholic, Greek Orthodox, fundamentalist, Jewish—these works have been overlooked in discussions about Australian theology. Also overlooked have been books by internationally oriented novelists such as Morris West (1916–1999), whose Vatican trilogy was published 1959 and 1990, and Colleen McCullough (b. 1937), author of *The Thorn Birds* (1977), and

works of Holocaust and refugee literature, including *Schindler's Ark* (1982) by Thomas Keneally (b. 1935).

Of most interest have been "literary" writers and works set in Australia that have been seen to comment on the nature of God and the individual's relationship with God, the individual's behavior towards others, and the role of nature as an agent of redemption and as a sign of God's presence. At the heart of these works has been the wish to demonstrate the continuing relevance of Christianity, or, at least, to find a way of expressing the sacred within the context of a (post-) Christian culture.

RELATING TO GOD. In 1976 Dorothy Green detected the presence of religion and religious feeling in the work of most important Australian novelists in the nineteenth and twentieth centuries, even "amongst those who would describe themselves as atheist, agnostic or indifferent" (p. 9). She was able to come to such a generous assessment because she was looking for evidence of adherence to the second Great Commandment, that is, "Thou shalt love thy neighbour as thyself" (*Matt.* 12:31).

Had she concentrated exclusively on a literary preoccupation with the nature of God, or even on works that bore witness to the first Great Commandment, "Thou shalt love the Lord thy God with all thy heart, with all thy soul and with all thy mind . . ." (*Matt.* 12:30), the result would have been different, for few Australian writers have been prepared to engage directly with God across a body of work. Green argued for Martin Boyd (1893–1972) as the author who most completely represented the fusion of the two commandments, an author who believed that "the Christian story corresponds with man's experience on earth" (p. 25). Boyd, however, spent most of his adult life in Europe, and although his novels comprising the Langton tetralogy (published between 1952 and 1962) used Australian material, his ongoing influence on Australian theological thinking has been negligible compared with that of Patrick White.

It is Patrick White (1912–1990) whom Christian commentators most often regard as Australia's preeminent religious author, although White wrote (in a letter dated August 15, 1985) that he could not see himself as a "true Christian. My faith is put together out of bits and pieces. I am a *believer*, but not the kind most 'Christians' would accept" (Marr, 1994, p. 604). White did not write novels for the benefit of theologians. Claims, for example, that his novel *Voss*, about an ill-fated desert expedition by a German explorer, represents the archetypal Australian Christian parable of suffering and redemption are at odds with White's own description of *Voss* as a "megalomaniac explorer" with "delusions of divinity" (September 11, 1956, Marr, 1994, p. 107). White does not comfort his readers but challenges them, as he wrote on May 10, 1970: "I suppose what I am increasingly intent on trying to do in my books is to give professed unbelievers glimpses of their own unprofessed faith. I believe most people have a religious faith, but are afraid that by admitting it

they will forfeit their right to be considered intellectuals" (Marr, 1994, p. 363).

While the academy has been unable to deny the intellectual scope of White's writing, some of its members mistrust religious readings of his works. Ambiguity is one of White's strengths and also a reminder that any article on religious themes in literature is entirely subjective. This can be illustrated by a key scene from White's *The Tree of Man* in which the old man, Stan Parker, cornered by a young evangelist who is pressing him as to whether he believes in God, points to a gob of his own spittle "glittering intensely and personally on the ground": "'That is God,' he said" (p. 476). The scene has been read both as proof that Stan has moved to agnostic secularism and as verification that he has achieved illumination.

The most thorough exploration of religious elements in White's novels *The Tree of Man* (1955), *Voss* (1957), *Riders in the Chariot* (1961), and *The Solid Mandala* (1966) can be found in Peter Beatson's *The Eye in the Mandala* (1977). Beatson argues that to make sense of White's work, it is necessary to accept the presence of a Hidden God behind the material world. White's characters, through "their emotional responses and the assumptions of their cultures," try to comprehend the nature of the Hidden God. But although they always fall short of the truth, this is not to say that God is completely remote from his creation: on the contrary, "every encounter in the human and natural worlds is potentially a moment of dialogue between the individual and God. . . . Union with the Hidden God is not achieved in White's novels by withdrawal from the things of the senses, but by acquiescence to all the conditions of the fallen world in which man finds himself" (pp. 9–10).

RELATING TO OTHER PEOPLE. Christ-figures are generally absent in Australian literature, despite the remarkable presence of Mordecai ben Moshe Himmelfarb, Patrick White's Orthodox Jewish post-Holocaust refugee in *Riders in the Chariot*. Blamed for Christ's crucifixion, he is himself "crucified" by his Australian workmates; he dies on Good Friday and is given a Christian burial: White's point is that all men are the same and all faiths are one.

Himmelfarb, like other characters who might evince Christlike attributes, is not complete in himself: he cannot be redeemed until he learns to accept and give love. In Australian literature the way to God is usually not through excessive penance and self-purification, but through loyalty, compassion, and loving kindness. This is seen clearly, for instance, in the fiction of Thea Astley (b. 1925).

Astley is usually depicted as a social satirist, but she was raised a Catholic and has been a consistent critic of the institutional church, most often Catholic, but of any denomination that demands mindless adherence from its followers. In her early books she criticized the church hierarchy for its pomposity and insincerity, implying, as she did in her first novel, *Girl with a Monkey* (1958), that true spiritual experi-

ence was to be had not at a mass rally with an unctuous bishop but with a small group gathered with a Franciscan priest in a community dance hall amidst tropical undergrowth, where humanity and nature come together to partake of the eternal mystery, the transcendent made immanent in the mass. Her later books, including *Vanishing Points* (1992), attack the patriarchal restrictions of church leadership.

The most sympathetic characters in her novella “Inventing the Weather” (in *Vanishing Points*) are three elderly nuns who, against the wishes of the church, are living with and working for a remote Aboriginal community. Above the kitchen sink is a wall plaque that reads: “Where there is no love, put love and there you will find love” (p. 182). In Astley’s fiction love is the paramount virtue. Love is not necessarily found in the church (the pettiness and legalism of the church crushes the vocations of the most humane religious in *The Slow Natives* [1965] and *A Boat Load of Home Folk* [1968]) but is more likely seen in transactions between fallible human beings in acts of kindness. Astley is critical of those who seek individual salvation, removing themselves from the responsibilities of daily life: in her books the divine is found through community.

Despite Astley’s use of Catholic imagery, her critique of religion, and her passionate commitment to issues of social justice, her work has been ignored in discussions about developing an Australian theology. She is not alone in this, however, as the writings of other women, including Elizabeth Jolley (b. 1923), Helen Garner (b. 1942), and Marion Halligan (b. 1940), who also value the practice of *caritas* over individual salvation, are similarly ignored, except by exponents of feminist theology. It would seem that because their work fails to reproduce certain “sacred” stereotypes, they are thought to have nothing to contribute to religion in Australia.

NATURE AND THE SACRED. The first European settlers found themselves in an alien landscape that could not be captured in conventional language and imagery. European expressions of Christianity were similarly inadequate in a place where nature seemed superior—and indifferent—to human beings. The gradual shift over time, in both theology and literature, from depicting the country as hostile wilderness to sacred site is a measure of people’s increasing spiritual at-homeness.

Veronica Brady, in her treatment of Clarke’s *For the Term of His Natural Life*, notes how the novel, “like many substantial works of Australian fiction, echoes the psalms and the prophets of the Old Testament” in its awareness of the sheer power of nature (1981, p. 5). And there is a thread in Australian theology that posits the wilderness, most often figured as the desert, as a place representing humanity’s fall from grace, a place of suffering that may purify the individual pilgrim. More recently, and perhaps under the influence of Aboriginal spirituality, the desert is seen as a repository of the sacred, a site where, freed from the distractions of the everyday, one might encounter God. Reverence has been afforded novels that use a desert setting (White’s *Voss*, Randolph Stow’s *To the Islands* [1958], Thomas Keneally’s *Woman of*

the Inner Sea [1992]), but until Tim Winton (b. 1960) started writing novels set in riverside Perth and coastal Western Australia, little attention was paid to spiritual readings of the moist or settled areas.

It was Winton’s overwhelmingly popular saga, *Cloudstreet* (1991), set between the 1940s and 1960s, that caused theologians to look seriously at the playing out of religious values among suburban families. Commentators such as Michael Goonan have picked up on the way in which Winton likens the house on Cloud Street, the home of two battling families, the Pickles and the Lambs, to the Australian continent, a “vast indoors,” a “big emptiness” that almost paralyzes them “with spaces and surfaces that yield nothing to them” (Winton, p. 41). As Goonan notes, a crucial question underlies the text of *Cloudstreet*: whether it is possible for non-Aboriginal Australians to belong to the land. For Goonan, resolution comes when the key characters follow the advice of the enigmatic Aboriginal man who appears at crucial moments in the story, most often urging them to return to the house at Cloudstreet, not to sell it, impressing upon the Lambs and the Pickles the importance of family. It is as though Winton is opening up the possibility for spiritual healing of white Australians, should they be prepared to acknowledge key aspects of Aboriginal culture and spirituality, the centrality of land and community.

In his tribute to the Western Australian coastline, *Land’s Edge*, Winton has written that “everything that lives is holy and somehow integrated” (p. 50). Other writers might be less forthright in speaking of their beliefs, but, nevertheless, their work can refresh the religious imagination and realize the hope of reconciliation.

ELAINE LINDSAY (2005)

FICTION: OCEANIC FICTION AND RELIGION

Oceania names the lands of the South Central Pacific. It is an area bounded to the west by the east coast of Australia, to the north by Hawai'i, to the east by Easter Island (Rapanui), and to the south by New Zealand (Aotearoa). Spanish explorers had charted Pacific Islands in the early seventeenth century, and James Cook discovered parts of New Zealand in 1769 and both Hawai'i and the east coast of Australia in 1788. However, oral narrative began in Oceania long before there was any contact with European culture.

In Australia two migrant groups existed—one arriving some 70,000 years ago, almost certainly from Indonesia, and the other about 50,000 years ago, most likely from southern China. Modern Aborigines are the descendents of these groups, although precise lines of descent cannot be drawn.

Nor is it known how Aboriginal religious practices derive from the migrants. Yet it is correct to speak of Aboriginal religions, not religion. It was the arrival of the European culture that changed the perception of the indigenous population and made its beliefs and cultures appear more homogeneous than they likely were. The first narratives on the continent take the form of song cycles, which are not well translated by either the term *fiction* or *poetry*.

With the exception of Easter Island, which was reached from South America, the Pacific Islands were settled by Asians. Between two and three thousands years ago, migrants used Melanesia as a base and branched out from there to Fiji and Tahiti. The Hawaiian islands appear to have been settled by Polynesians, who set out from Tahiti about 1,600 years ago. In New Zealand migrants started to arrive some 1,500 years ago from Melanesia, and by 1300 CE a significant Polynesian settlement appears to have been in place. Hawai'i and New Zealand share legends of gods and goddesses that originated in Tahiti. Stories of Maui, who fished for islands, and Tawhaki, who visited the heavens, can be found on many islands. The notions of *mana* and *tabu*—on which so much twentieth-century speculation about religion depends—derive from Polynesia and influence the stories told about the spirit world. Unlike the polytheistic islanders, the Aborigines follow totemic religious practices. Yet, on neither side of the Tasman Sea is it possible to recover a pristine sense of beliefs before European colonization. With the European settlers came Christianity. The first Anglican service in Australia was held in 1788. Not until 1814 did Samuel Marsden (1764–1838) establish a mission in New Zealand, whereas missionaries arrived in Hawai'i in 1820, following a royal decree for the natives to give up paganism. Throughout Oceania, narrative fiction followed only on Christian settlement.

RELIGIOUS NARRATIVE FICTION. A narrative fiction oriented to religious themes began in Australia in 1838 with John Curtis's *Shipwreck of the Stirling Castle*. It turns on the tale of Elisa Fraser, shipwrecked on K'gari (now Fraser Island) in 1836. Mrs. Fraser's faith—like that of the Children of Israel (and like Jesus in the wilderness)—is put to the test. Her story is retold by Patrick White in *A Fringe of Leaves* (1976) but with the female character, Ellen Roxburgh, who has lost her faith in the Christian God and is supported solely by a faith in life itself.

Aboriginal religion appears briefly in James Tucker's *Ralph Rashleigh* (1845?) but is quickly dismissed as infantile, a matter of warriors' ghosts. Tucker's character Rashleigh is aware that the Aborigines regard certain sites as sacred but interprets their awe simply as fear of supernatural beings. About the same time, Charles Rowcraft's novel *The Bush-ranger of Van Dieman's Land* (1846) at least admits—albeit somewhat patronizingly—that the black people have souls. Not until White's *The Tree of Man* (1955) and *Voss* (1957) is there an authentic sense that Aborigines discern a true spirit in the land. Randolph Stow, especially in *To the Islands* (1958), casts Aboriginal spirituality as superior to imported

Christian beliefs. The character Stephen Heriot, a sixty-seven-year-old missionary, loses his faith and with the help of an Aboriginal guide gains a visionary understanding of the Kimberlies. His spirit eventually merges with that of the land.

Returning to the nineteenth century, Christian moralism is strongly felt in the stories of Mary Vidal collected in *Tales for the Bush* (1845). As with Curtis's Elisa Fraser, the perspective is female. However, now decency rather than survival is the pressing concern. Christianity reveals itself mainly in the need to keep the working people honest and the Sabbath holy. A stronger evangelical current is felt in Caroline Leakey's *The Broad Arrow* (1859), which, like *Ralph Rashleigh*, is set in Tasmania. The heroine is sentenced to life imprisonment there, becomes a "fallen woman," and then finally repents. In the mid-twentieth century there is still interest in the Hobart of convict times, although it is characteristic of the times that Hal Porter's novel *The Tilted Cross* (1961) appeals to Christianity for its symbolism rather than for its spiritual discipline. Throughout the nineteenth century and well after, Australia is represented as a dangerous place for inexperienced Europeans, and more often than not, the land punishes their innocence. Thus there are many stories of children lost in the bush, the best known of which remains Marcus Clarke's "Pretty Dick" (1869). The poor boy dies in the unforgiving landscape, but when at story's end the reader is informed "God had taken him home," the narrator's tone is hardly comforting.

A skeptical attitude toward religion, combined with an anticlerical attitude, gain force in the late nineteenth century. Both can be felt in *The Bulletin* in the 1890s, the magazine's heyday. Only among Catholic writers are clerics at all well regarded; elsewhere, it is remembered that the established Church was rarely a friend of the poor. The Victorian era continues to attract contemporary novelists. In *Oscar and Lucinda* (1988), Peter Carey shows an Anglican minister of that time who, like Pascal but with rather less spirit, regards the religious life as a bet on the existence of God. It is more indicative of the late-twentieth than the nineteenth century, however, that when Oscar dies he begs forgiveness for his part in the death of Aborigines.

Two geographical figures largely organize the plane of religious experience in Australian fiction: the island and the desert. Neither is simple. If the island can be a site of suffering (as it is for Curtis and White), it can also be a metaphor for death transfigured by native understanding (as it is for Stow). It can also be a new Eden. So it is in Martin Boyd's *Nuns in Jeopardy* (1940) and Thea Astley's *Girl with a Monkey* (1958). In *Voss* and *To the Islands*, the desert is a metaphor for a spiritual quest, whereas for Kim Scott in *True Country* (1993), the Outback stands for the sacred. In the middle of this plane of religious experience, a variety of figures can be found: White's Stan and Amy Parker in *The Tree of Man* as a new Adam and Eve; a sense of the divine in the landscape in Elizabeth Jolley's *Palomino* (1980), as well as a

folding of the notion of pilgrimage in her *Mr. Scobie's Riddle* (1983); and a discernment of vocation in David Malouf's *Remembering Babylon* (1995).

DENOMINATIONAL AND RELIGIOUS INFLUENCES. Of the Christian denominations, the Catholics have spent most time exploring the institutional dimension of religion in Australia. Thomas Keneally's *Three Cheers for the Paraclete* (1968) is set in a seminary and casts a comic eye on ecclesial politics and theological niceties. In New Zealand, Elizabeth Smither also attends to post-Vatican II perplexities in her story "Sister Felicity and Sister Perpetua" (1994). A novelist of ideas, the Australian Morris West has gone the furthest in Church politics in his "Vatican series": *The Shoes of the Fisherman* (1963), *The Clowns of God* (1981) and *Lazarus* (1990). Gerard Windsor examines an Australian salesman in Ireland hawking religious accessories in his novella *That Fierce Virgin* (1988) and hints at mystical depths older than Christianity. The theme of Catholic childhood, often guilt-ridden, has received ample treatment in twentieth-century Australian fiction. Gerald Murnane's *Tamarisk Row* (1974) and *A Lifetime on Clouds* (1976) represent the strain at its most enduring.

Predominantly Christian since settlement, Australia also has sizable—and growing—numbers of Buddhists and Muslims. Yet, of the non-Christian faiths, only Judaism figures to any extent in Australian fiction. It does so significantly in White's fiction, beginning in *The Living and the Dead* (1941), and then with more force in *Riders in the Chariot* (1961), *The Solid Mandala* (1966) and *The Eye of the Storm* (1973). In *Riders in the Chariot*, Judaism and Christianity are confronted when Mordecai Himmelfarb, maker of bicycle lamps and a Jewish mystic, is crucified on a jacaranda tree in Sydney. Keneally's *Schindler's Ark* (1982) tells the story of Oskar Schindler who risks his life to help Polish Jews. Could a new religion be formed in the New World? Nevil Shute considers the possibility in *Round the Bend* (1951), in which a Malayan aircraft mechanic becomes the leader of a new religious movement. In *The Fortunes of Richard Mahoney* (1930), Henry Handel Richardson shows a grieving hero succumbing to spiritualism, and Kylie Tennant casts a wry eye on Southwell Vaughan-Quilter of the Order of Human Brotherhood in her novel *Ride on Stranger* (1943). Helen Garner's *Cosmo Cosmolino* (1992) treats New Age spirituality in the character of Maxine who shares a house in Carlton, Melbourne, with a fundamentalist, a skeptic, and a visiting angel. Garner is not the only Pacific writer interested in divine messengers: New Zealander Elizabeth Knox has an angel as a central character in her novel *The Vintner's Luck* (1999).

Patrick White saw Puritanism as a flaw in the Australian character. More so than in Australia, though, a strong strain of twentieth-century New Zealand fiction has been a diagnosis of and rebellion against a narrow-minded and unimaginative religious conservatism. It too is identified as Puritanism, although, as for White, the word indicates a belated Victori-

an prudery, loosely regarded as required for progress, rather than the fierce religious impulse of the early New Englanders. Jane Mander is the first to treat the theme in her *The Story of a New Zealand River* (1920), and Frank Sargeson approaches it in his early short stories, "A Good Boy" (1936) and "Good Samaritan" (1936), as well as in the novel *I Saw in My Dream* (1949). Joy Cowley's story "God Loves You, Miss Rosewater" (1978) should also be mentioned for its amused look at puritan sexuality. However, Maurice Gee provides the most pointed critique of the dolorous world, beginning with *In My Father's Den* (1972) and then in his "Plumb trilogy," especially the first volume, *Plumb* (1978).

RELIGIOUS THEMES. Religious themes appear from time to time in other works by New Zealand writers. Sargeson's story "Tod" (1938) poignantly evokes the human need to call on God. Allusions to Maori myths can be found in Witi Ihimaera's *Tangi* (1973), Kerri Hulme's *The Bone People* (1983) and Patricia Grace's *Potiki* (1986). Note should also be made of Apirana Taylor's story "Carving up the Cross" (1990), which examines an artist's thwarted desire to combine Maori and Christian symbols. Michael Brown examines the transmigration of souls in his *The Weaver's Apprentice* (1986), whereas Vincent O'Sullivan observes a French nun who works among the poor in *Believers to the Bright Coast* (1998). As in Australia, a consciousness of a spirit in the land surfaces from time to time. Sargeson's story "Gods Live in Woods" (1943) is an instance, whereas Roderick Finlayson's story "Wi Gets the Gospel" (1937) sympathetically notes the loss of *mana* from the land for Mauris Ihimaera's story "The Greenstone Patu" (1977) identifies a powerful spirit in a *patu* (hand club). Special mention should be made of *Tales of the Tikongs* (1983), stories by the Tongan writer Epeli Hau'ofa that examine the ways in which the Bible has saturated the local culture.

Missionary activity in Hawai'i is the focus of Ruth Eleanor McKee's *The Lord's Anointed* (1934), a novel that stirred up controversy among descendents of the original missionaries. Jonathan and Constance Williams are missionaries who came to the island in 1820; they exist side by side with historical characters and serve to highlight the hardships of daily life. Constance relates in her diary that she feigned her conversion when smitten by Jonathan. *The Return of Lono* (1956) is O. A. Bushnell's historical novel about James Cook's last voyage to Hawai'i. John Forrest, the narrator, is the medium in which tensions between the faith exemplified by William Bligh and enlightened reason embodied in Cook are played out partly, if unknowingly, within himself. Without the slightest trace of original sin, the natives have nonetheless fallen victim to local priestcraft, he thinks. Hawai'i is at once a horrible place, filled with cruel gods and terrible injustices, and a paradise of graceful, generous people, an Eden that is soon to be lost by dint of the very presence of the white man. A clash between ancient Hawaiian spirituality and contemporary values is explored through the character of Mark Hull in John Dominis Holt's novel *Waimea Summer* (1976).

KEVIN HART (2005)

FICTION: AFRICAN FICTION AND RELIGION

Although storytelling is a universal human activity, the term "African fiction" refers to a European genre of storytelling—comprised of secular novels and short stories—that Africans have adopted and adapted to represent continental African realities in the wake of nineteenth- and twentieth-century European colonialism and post-colonialism. The genre will provide a unifying thread throughout the many oral and written traditions in African as well as European languages.

Although an ancient practice in Africa, as witnessed in pharaonic Egypt, writing in African languages began in Muslim and Christian missionary activity, some of which dates back to pre-modern times, as is the case for Ge'ez or Amharic in Ethiopia. Other African languages such as Sesuto, Xhosa, Zulu, and Yoruba, began in nineteenth- and twentieth-century Euro-Christian missionary schools and feature allegorical novels inspired by Bunyan's *Pilgrim's Progress*. But the tension between Euro-Christianity and African tradition is apparent in the Yoruba novels of Fagunwa (Nigeria), such as *The Forest of a Thousand Daemons*, in which references to a Christian God are imposed on Yoruba mythology. Modern Muslim missionary activity gave rise to Arabic script litera-

tures in languages such as Wolof, Swahili, and Hausa. European-language writing in French, English, and Portuguese is a result of modern colonialism.

African writers of fiction use the genre to enter into dialogue with African and European religious traditions alike. Drawing on oral myths, epics and tales, these writers oppose representations of Africa found in European fiction, as well as in European governmental, missionary, and commercial reports. In the process African writers also rewrite and rework oral traditions.

African oral traditions reflect hierarchies of power in ways parallel to European fiction. At the top of the hierarchy are such works as ceremonial ritual religious poems or the great Dogon cosmogonic myth, according to which the universe originates from a single seed. Next are the great chanted epics such as the Malian epic of Sundiata or the Mwindo epic, which feature shamanic heroes, founders of their society. The great oral praise songs for outstanding men and women are formal lyrics that use epic materials. On a more common level are occupational poems, sung to accompany an activity such as farming, fishing, hunting or smithing. Even these lower forms recall religious functions of individuals or callings.

Short narrative tales may use mythic and epic materials more informally to explain the origins of a people, the founding of a dynasty, or the nature of divine beings, as well as phenomena such as the behavior of certain animals or the origins of geographic details. However, the genre is derivative rather than authoritative, drawing on chanted epics and ceremonial ritual religious poems, praise and occupational poetry. The narrative tale has a more realistic bent. A prominent theme is that of the trickster-hero, who succeeds through cleverness rather than through morality. Recalling the Yoruba (Nigeria) god Eshu-Elegba, the hero may be human or an animal such as the hare (source of the African American Br'er Rabbit), the hyena or the spider. In such tales, might or cleverness makes right and the outcome is not always moral. Shorter forms that one finds frequently used in African fiction are proverbs ("the palm oil with which words are eaten"), epigrams and riddles.

Written African fiction draws on this tradition in many ways in terms of characters, themes, motifs, and formal structures. In terms of religion, most significant is a "vitalist" ontology according to which being is a dynamic vital force that pervades everything much like a fluid as opposed to a collection of static, discrete entities. Hence Western distinctions between human, animal and divine, or the living and the dead do not necessarily apply. Because of vital force human beings have totemic relationships with animals with which they share the force of being. For example, the epic hero Sundiata draws totemically on the power of the buffalo through his mother, Sogolon, and on the power of the lion, which bears a totemic relationship with his male ancestors. In this way, departed ancestors exercise their force through the living.

In the epic, such ontology is portrayed in an unproblematic synthesis with Islam. For example, Sundiata's male ancestors trace their lineage back to Bilali Bounama, a servant of the Prophet Muhammad.

A second religiously important structure that pervades African literature, as Mohammadou Kane has observed, is the initiatory journey, usually presented in three stages: a hero leaves home as a child, goes on a series of adventures and returns as an adult. The epic of Sundiata is an example. The young Sundiata, who after a long period of lameness stands up to walk, must go into exile and face a series of trials, which he overcomes. Then he returns home to found the empire of Mali. This outcome is never in doubt from the day that Sundiata's father sacrifices a red bull and lets its blood soak into the ground. Yet, all is seen as in the hands of the "Almighty." As the family griot, Gnankouman Doua, observes, "The Almighty has his mysteries . . . The silk-cotton tree emerges from a tiny seed" (Kane, p. 16).

That such traditional African elements are portrayed in an unproblematic synthesis with Islam is a witness to the fact of the gradual infiltration of Islam, which was adapted by various groups of society, usually merchants first, then the ruling classes, and finally the people at large. Works such as *Sundiata* reveal ways in which ruling classes gradually combined Islamic and pre-Islamic elements to build the foundation of their power. A similar approach may be seen in the European Renaissance when the French *rex christianissimus* traced his lineage to Hector; the Catholic Hapsburg emperors, and to Jason and the Golden Fleece.

One also finds a relatively syncretistic harmony in autobiographical works such as the Guinean Camara Laye's *The Dark Child* or the Nigerian Wole Soyinka's *Ake*. Although not syncretistic, African language allegorical novels in the tradition of Bunyan's *Pilgrim's Progress* are pre-modern in that they assume a classic religious orthodoxy.

Modern and post-modern African fiction tends to portray fault lines and conflict such as in the Nigerian Fagunwa's Yoruba novel mentioned above or the Kenyan Ngugi wa Thiongo's biting satirical Gikuyu, *Devil on the Cross*.

Eschewing heroes, African fiction, like its European models, foregrounds main characters in what Northrop Frye (*Anatomy of Criticism*) calls the "low mimetic" and "ironic modes." Frye defines these modes not according to the morality of the main character but rather according to his or her "power of action" (Frye, p. 33). As opposed to a Sundiata, who is invincible, the "low mimetic" mode represents characters less powerful than other people or their environment. Characters in the "ironic mode" are inferior to the reader in either power or intelligence, and often the brunt of comedy.

The question of power is particularly pertinent to Africans, for whom colonialism created new and problematic conflicts between the ideal, moral, and practical aspects of religious experience, calling into question the traditional hierarchies and values implied in the oral tradition. For the

most part, African fiction in which religion is a significant theme works out issues of colonial and post-colonial (dis)empowerment, and features not only inter-religious tensions but also conflicts between religion and secular forces often imperfectly understood. On the one hand is a traditional religious mentality according to which religion accounts for an approach to visible and invisible reality that does not observe the Western distinction between natural and supernatural. As Robin Horton observes in *Patterns of Thought in Africa and the West*, such traditional religion provided ways to explain, control and predict events in the visible universe as well as establish communion with an invisible being or beings. On the other hand is a purely secular mentality according to which events unfold due to impersonal political, social, and psychological forces unleashed by the European conquest and occupation.

Novels leading up to African independences in the 1960s underscore such tensions, but retain a faith in a possible future for the continent and for the world. In the Senegalese Cheikh Hamidou Kane's *Ambiguous Adventure* the lure of European technology causes the complicity between Islam and traditional political power to break down. In another time the royal and spiritually gifted Samba Diallo may have been left to pursue a path of spiritual greatness in the hands of his Šūfī spiritual director Tierno or become a kind of priest/king. His family decides instead to tear him away from the ascetic discipline of renunciation and send him to Europe on a kind of "initiatory journey" to learn how "better to join wood to wood" (Kane, p. 29), so as to bring his people into the modern world. The experiment fails, however. Once in Europe Samba Diallo decides to study philosophy, and on his return home is killed by his spiritual director. This death, however, brings Samba Diallo into a Šūfī mystical communion with God. Even though Samba Diallo's death marks the failure of his initiation into the ways of secular Europe, this death may also be considered an extreme form of world renunciation, in which the young man's spiritual vocation is fulfilled.

Although renunciation of this world has always been commonplace in mystical traditions, the split between a European technological material world and Islamic spirituality reflects a limited orientalist view of Islam that overlooks medieval Muslim scientific and technological advances and prowess. It also plays into theses of Negritude that try to rehabilitate orientalist dichotomies in calling for a "universal civilization" that combines spiritual, intuitive and rhythmical "Black" culture in harmony with nature, on the one hand, with analytic and technological "White" culture, on the other.

In works such as the novel *God's Bits of Wood* and the short-story collection *Tribal Scars*, the Senegalese writer Ousmane Sembène eschews the sentimentality of Negritude. Mystical Islam is portrayed as ineffective and its clergy accused of complicity with colonial rule and patriarchal exploitation of women. For Sembène, the only way out of the colo-

nial impasse is through a Marxist-inspired collective political action of the working classes. In *God's Bits of Wood*, it is only in a railroad workers strike that dignity is regained. For example, learning to act collectively without hatred, the brutish, stammering Tiémoko is released to sing the epic of Sundiata. Formerly sacred royal power is now in the hands of secular working people.

While French West African fiction is presented in the terms of concepts of universal pretensions such as Islam, Marxism and Negritude, the novels of the Nigerian Chinua Achebe (*Things Fall Apart*, *Arrow of God*) and the Cameroonian Mongo Beti (*The Poor Christ of Bomba*, *King Lazarus*) and Ferdinand Oyono (*Houseboy*, *Old Man and the Medal*) are more local in scope, in that theirs is a context of forest people such as the Ibo, who live in loose federations or small chiefdoms. These novels denounce the abuses not so much of Christianity as the Christian mission enterprise, which is seen as a source of European violence and conquest. Behind the missionaries come the merchants and the military. Church, hospital, schools and prisons are seen as European institutions in complicity with one another. In *Things Fall Apart*, the missionary prepares the way for the colonial administrator. In *The Poor Christ of Bomba*, the R. P. Drumont who cannot manage to reform the sexual mores of his converts sadly realizes that his efforts result in softening up his "faithful" for exploitation in the colonial labor force.

In these novels Christian conversion is seen to be based on misunderstandings and to yield ludicrous harmful results. King Lazarus converts on his deathbed only to get well and have to face a diplomatic crisis, as he must now choose only one among his many wives. In *Old Man and the Medal*, Meka, who has converted to Christianity and given up his lands to the Catholic mission, embarks on what turns out to be a mock initiatory journey from his community to the administrative center of the Whites. He finds himself standing in the middle of a stadium in a chalk-drawn circle under the hot sun, in ill-fitting shoes and having a strong urge to urinate as he waits for the French colonial administrator to pin a medal on him for his contributions to the community. In such a time of trial only the memory of the pain he endured at his circumcision gives him the courage to withstand heat and burning pain. The true meaning of this medal is revealed when later, Meka is brutally beaten and thrown into jail by the police, who do not recognize him. Here too he resorts to his totemic relations with panthers to muster up the necessary strength.

In both cases, the caricatural evocation of traditional religion is tragi-comic, revealing the comical ineffectiveness of the tradition in the new setting of colonialism. On his return home, Meka is chastened and cynical about his Christian faith and relation with the whites. But his "initiation" leaves him with little new knowledge except for a relief to be back among the grasses and animals of his home. Here unlike the West African novels, there is no faith in an overarching scheme of things. There is also an unremitting satirical criti-

cism implied of African traditions. The indulgent humor of the narrator, who laughs with as well as at the characters, leaves the reader with the conviction of the inherent dignity and resilience of African people.

In all of these works the narrative voice often plays against sliding conceptions of the distinction between the secular and the sacred. In *Things Fall Apart* and in *Houseboy*, child converts whom Christians believe that God has touched are in fact fleeing abusive fathers. In Achebe's novels the fact that Europeans trample sacred forests and kill sacred animals with impunity is taken to be a sign of divine intervention. In fiction such as this, even where there is an implied criticism of African tradition, the overriding message is that the abuse of European colonialism must stop, so that Africans may regroup and take charge of their own fate.

Post-colonial fiction is marked by a turn toward an African audience to address African problems. The multiple consciousness of several sides to a story is taken to new heights with a dialogical representation of reality from an even more complex, pluralistic perspective. Fama, the last of the royal line of Doumbouya in the Ivorian Ahmadou Kourouma's *Suns of Independence* also sets off on a tripartite journey. He leaves the capital for a funeral in Togobala, a seedy village that is all that remains of his family's ancient capital, and he returns home only to be thrown into prison. This tripartite structure, inspired by the initiatory journey is a failure, but can be seen from three equally valid perspectives. The Doumbouya decadence is (1) an eschatological sign of Muslim last days; (2) the result of disrespect for the ancient fetishes; (3) or a secular working out of post-colonial corruption. But no matter how the sequence of events is explained, there is an overriding angry irony at the corruption of contemporary society. Kourouma's novel, *Allah n'est pas obligé*, is even angrier, as he portrays an Africa sinking deeper into crisis under the eyes of an indifferent God. The latter is among what Lilyan Kesteloot calls novels of chaos, novels written in despair of a spectacle of an Africa racked by such corruption, famine and genocide that it seems to be without a God. One bears in mind the Rwanda writers' project, in which several African writers such as Boubacar Boris Diop (Senegal) or Véronique Tadjo (Ivory Coast) committed themselves to write about the genocide in that country. One can also contrast Ngugi wa Thiong'o's *Devil on the Cross*, which brutally satirizes Christianity, to his earlier novels such as *The River Between*, which portrays the protagonist Waiyake (Kenya) as a Christ figure.

A dialogical pluralism similar to Kourouma's may be found in the Nigerian Buchi Emecheta's *Joys of Motherhood*. In this book the protagonist, Nnu Ego, lives out a miserable existence that may be seen as the result of a combination of traditional patriarchy and European colonial exploitation which leave women particularly vulnerable. On the other hand, Nnu Ego's sorry fate may be consistently explained down to its smallest details as the unremitting curse of her *chi*, who in a previous life was forced to be buried alive at her husband's funeral.

Dialogical pluralism of Kourouma and Emecheta is but an extreme example of the tendency of African fiction to call into question constructions, not only of Christianity and Islam, but also of anthropological accounts of local religions. Through devices of irony and comedy the main characters belong yet do not belong to European and African religious traditions. In this respect, one should mention V. Y. Mudimbe's *Entre les Eaux*, in which the priest, Pierre Landu fails to bring together Christianity and Marxism. He is an example of what Wim van Binsbergen calls "Central African clerical intellectualism," an intellectualism of a certain category of Catholic clerics who have little to do with traditional African religion.

Other fiction of the 1970s, 1980s, and 1990s continues this trend toward pluralism, emphasizing intrareligious more than interreligious difference, especially with reference to Islam. In response to Islamic fundamentalism, postmodern fiction from Northern Africa (always a cross-roads of many cultures and religions) reaches back to Islamic traditional means of interpretation in the *hadith* to reveal the suppressed voices of the religion. Novelists such as the Moroccans Driss Chraïbi (*La Mère du Printemps*), and Fatima Mernissi (*Le Harem politique*), the Algerian Assia Djebar (*Loïn de la Médine*), and the Egyptian Nawal El Sadaawi (*God Dies by the Nile*) question Islamic patriarchy and oppose such concepts as *jihad* (holy war, but also self-discipline) and *itjihād* (interpretation).

The Somali novelist Nuruddin Farah goes even further than most of the fiction writers here. In *Maps* he criticizes not Islamic practices or traditions but the internal morality of the religion itself and its nefarious effects on Somali society, although he falls more into the main line in his *Close Sesame*, which emphasizes the gap between ideal Islam and the way it is played out in society.

One sees a similar process in South Africa, where a novel such as Rayda Jacob's *Confessions of a Gambler* portrays a freer, postmodern Islam in the person of the protagonist, an emancipated Capetonian Islamic woman who gambles. Writers such as Zoë Wicomb (*You Can't Get Lost in Cape Town*; and *David's Story*) and Zakes Mda (*The Madonna of Excelsior*), on the other hand, criticize hypocrisy of the abusive Christianity brought by the Dutch Calvinist settlers. These settlers claim South Africa as a land promised to them by God, and are portrayed in Afrikaner novels such as André Brink's *A Dry White Season*.

GEORGE JOSEPH (2005)

FICTION: NATIVE AMERICAN FICTION AND RELIGION

Given the many geographical, cultural, and spiritual differences among indigenous peoples in North America, compiling a historical narrative of religious themes in American Indian fiction is a complicated enterprise. Native groups do share common traditions of oral storytelling and episodes of contact with waves of colonizing Europeans. Themes that manifest themselves in this fiction include colonialism and

postcolonialism, identity and alienation, the loss of land, relocation, memory, healing, religious freedom, the repatriation of sacred objects and skeletal remains, experience with missionaries and boarding schools, cultural continuity, and community building. Native authors are politically and historically conscious, and, in a very real sense, their characters are struggling to survive in the modern world.

Native spirituality encompasses many traditions of belief, from Laguna creation stories to Ojibwa trickster tales, from the Sun Dance to the Ghost Dance, from puberty ceremonies to vision quests to peyote ceremonies at the Native American Church. Native religions embody worldviews without explicit creeds and principles. Vine Deloria Jr. defines tribal religions as “complexes of attitudes, beliefs, and practices fine-tuned to harmonize with the lands on which the people live” (1994, p. 70). “Every factor of human experience is seen in a religious light as part of the meaning of life,” Deloria continues (p. 195). This further complicates the analysis of religious themes in American Indian literature, for spirituality pervades every aspect of the work. Further, works of fiction in English by Indian authors are inherently postcontact narratives and thus also address experiences with Christianity. As Kimberly Blaeser notes, much of Native literature compares Native beliefs to Christianity, rhetorically critiques Christianity, or focuses on the Christian/Native religious conflict (1994, p. 16). For many peoples, becoming Christian did not mean giving up tribal beliefs and customs. Often, the most favorable aspects of each religion have been combined in a syncretic or hybrid manner, and sometimes these religious variations cause irreparable rifts in communities and families. Since the 1970s, however, there has been a resurgence of traditional tribal practices.

THE ROOTS OF STORYTELLING. That American Indians are competent storytellers is no surprise: entire histories and mythologies have long been passed on through story. Prayers, chants, and songs performed during ceremonies are also part of this tradition. LaVonne Ruoff writes, “Because sacred oral literature is so closely interwoven into the fabric of traditional Indian religious life, it is difficult to distinguish between literature and religion” (1990, pp. 141–142). Oral storytelling provides not only pleasure to an audience, but it often passes on knowledge, history, culture, and rules for living. Stories teach “abstract notions of behavior, cosmology, and ways of seeing or thinking about things” (Beck et al., 1995, p. 59). In Pueblo culture, explains writer Leslie Marmon Silko, no distinctions are made “between types of story—historical, sacred, plain gossip” (1996, p. 53). There are as many oral traditions as there are indigenous groups. Pomo author Greg Sarris points out that “it is as impossible to generalize about ‘oral discourse’ as it is about ‘culture’” (1993, p. 47). “Storytelling is a communal act,” writes Joseph Epes Brown (2001, p. 54). As it is the nature of oral tradition to take audience and circumstance into account for each telling, the storyteller can appeal to changing pities and fears—and incorporate contemporary elements.

In his essay “The Native Voice in American Literature,” Kiowa writer N. Scott Momaday writes that the “unconditional belief in the efficacy of language” resides “at the heart of the American Indian oral tradition” (1997, p. 15). Creek scholar Craig Womack concurs: “Native artistry is not pure aesthetics, or art for art’s sake: as often as not Indian writers are trying to *invoke* as much as *evoke*. The idea behind ceremonial chant is that language, spoken in the appropriate ritual contexts, will actually cause a change in the physical universe” (1999, pp. 16–17). The same can be said for contemporary American Indian writing. With the introduction of the written word, storytelling was transformed, but orality was never abandoned. Oral tradition continues to inform Native expression, whether in poetry or the European form of the novel.

EARLY AMERICAN INDIAN FICTION. In many ways, Native novelists have followed the trends of Euro-American literature. In the late 1800s when Anglo- and African American women took up the sentimental plot, often for political purposes, Native women did the same. Three examples are S. Alice Callahan’s *Wynema: A Child of the Forest* (1891), Zitkala-Sa’s *American Indian Stories* (1921), and Mourning Dove’s *Co-ge-wea* (1927), all of which address the “Indian problem.” Other important early writers include John Joseph Mathews, an Osage writer whose novels include *Wah’kon-tah: The Osage and the White Man’s Road* (1932) and *Sundown* (1934), and Lakota author Ella Cara Deloria, whose novel *Waterlily* was written in 1944 (but not published until 1988). In general, early Native authors were concerned with Euro-American contact, missionaries, and loss of land and language and culture. At the same time, they were working against the mainstream notion that their people would indeed become extinct.

The first known published work of fiction by a Native woman is *Wynema* by Callahan, a mixed-blood Muscogee (or Creek). Written in 1891 for a non-Native audience, the book was out of print until 1997. Like much early Native fiction, *Wynema* addresses the impact of colonization and missionization. Unfortunately, Callahan does not provide much description of traditional Creek culture (and, in fact, never mentions the word *Creek* in the text), a move that Susan Bernardin describes as an effort to write “a generic Indian story” that is “putatively pantribal” (2001, p. 4). However, Womack faults Callahan for “purposefully, not accidentally, misrepresenting culture” (1999, p. 115). He calls *Wynema* “a document of Christian supremacism and assimilation” (1999, p. 107). Callahan’s most detailed ethnographic passage describes the green corn ceremony, which is practiced in this community even after the adoption of Christianity. There is also a funeral scene that combines Creek and Christian rituals. But, for the most part, Creek culture is completely negated by Methodism. The novel follows Wynema Harjo, a full-blood Muscogee woman who befriends Genevieve Weir, a Methodist teacher from Alabama, the place from which the Muscogees were removed on the Trail of Tears in 1830. Genevieve eventually marries the

local Methodist minister, Gerald Keithly, while Wynema marries Genevieve's brother Robin. In many ways, Genevieve is the novel's heroine, for it is she who must overcome stereotypes and develop as a character. Although Genevieve begins as a model Indian reformer, Gerald points out that acculturation is reciprocal. *Wynema's* domestic plot is infused with social commentary from the two young women, who often combine suffragist concerns with Indian affairs. At the end of the novel, Callahan shifts her focus from the plots at hand to a wider view of current events in Indian Country. The final two chapters give voice to Lakota rebels and Chikena, a sole survivor of the massacre of Wounded Knee in 1890. When a missionary tells one of the rebels, "Place yourselves in a submissive attitude and the government will protect you," he replies, "peace is not the watchword of the oppressed" (Callahan, 1997, pp. 80, 82). The reader is left with a vision of this very recent horrific carnage at the hands of the U. S. government and a critical voice on the doctrine of Christian submission.

D'Arcy McNickle's novel *The Surrounded* appeared in 1936 and was reprinted in the 1970s. Like other works of this era, *The Surrounded* is told in the mode of social realism. As McNickle explains in an epigraph, the title for the book is taken from the name of his Montana setting, *Sniél-emen*, or "Mountains of the Surrounded," referring to the proximity of the settlers. The story follows the homecoming of Archilde Leon, a mixed-blood whose mother Catherine is Salish and father Max is Spanish. While his mother practices mostly traditional Salish religion, which includes public confession and whipping, Archilde's father is Catholic. Enacting modes of oral tradition, McNickle recounts three versions of how the Salish compelled the Jesuit missionaries to come to them. Father Grepilloux, who is characterized as a good-hearted man, tells Max Leon, "It was inevitable that a new age would come" (McNickle, 1994, p. 108). Archilde has learned the Catholic traditions and plays violin at the church. His nephews attend the mission school. In a crucial scene, Archilde recalls seeing a cross in the sky while at boarding school (p. 103). When he notices that a bird does not recognize the cross as a "sign" from God, Archilde begins to question the authority of the Catholic Church. After having a series of dreams, Archilde's mother renounces her baptism. In her dreaming, Catherine goes to white heaven, but there are no Indians there. She goes to Indian heaven, but they will not accept baptized Indians. Although the novel ends with uncertainty, Archilde's own doubts about Christianity remain constant. As Laird Christensen points out, McNickle's novel questions Christianity's impact on the "cosmology, values, and economy" of this Salish community. In particular, the "Christian concept of eternal judgment [acts] as a wedge that forces the Salish out of traditional patterns of relating to family, society, and ultimately the more-than-human world" (1999, pp. 2–3). McNickle's second novel, *Wind from an Enemy Sky*, was published in 1978.

THE NATIVE AMERICAN RENAISSANCE. The beginning of what Kenneth Lincoln has called the Native American Re-

naissance is marked by the 1968 publication of *House Made of Dawn*, for which N. Scott Momaday won the Pulitzer Prize in 1969. Momaday's novel begins with Abel's return home to his grandfather in Walatawa, New Mexico, after serving in the Korean War. Abel's grandfather Francisco is a tribal elder and a sacristan of the Catholic Church in this Pueblo. Soon after Abel's return, which coincides with the Feast of Santiago, he sleeps with Mrs. Angela Grace St. John, a white woman who comes to Walatawa for its healing waters, and he murders the albino man who is to represent the figure of Santiago during the festivities. The novel follows Abel to Los Angeles, where seven years later he lies in a ditch with broken hands. During a vision quest of sorts, he thinks about his childhood and his time in the city, which includes sermons by Reverend Tosamah, a Native preacher whose grandmother attended the last Kiowa Sun Dance. Abel once again returns home, and his grandfather dies seven days later. After preparing Francisco's body in the traditional way, Abel goes to town to inform the priest, then joins the Jemez dawn runners on the mesa.

Many critics have discussed the religious strains in *House Made of Dawn*. Kenneth Lincoln, for example, has argued that the murder of the albino is a reversal of the biblical murder of Abel. Harold S. McAllister contends that Angela St. John represents the Virgin Mary and shows Abel "the way to salvation" (1974, p. 115). Not all critics focus on the Catholicism in the novel, however. Robert Nelson focuses on the role of place in Abel's healing process, a relationship inherent to Pueblo spirituality. Susan Scarberry-Garcia discusses "Abel's illness in relation to Navajo theories of disease and his restoration in light of both Navajo song texts and Navajo, Kiowa, and Pueblo ritual patterns" (1990, p. 86). Bernard Hirsch describes Reverend Tosamah, a Priest of the Sun and Coyote figure, as "a priest whose saving message, because he has divorced his religion from his everyday life, has an ironic as well as a revelatory dimension" (1983, p. 319). Momaday's fiction also includes *The Ancient Child* (1989).

Leslie Marmon Silko's *Ceremony* (1977) offers a more overt affirmation of Pueblo mythology over Christian dogma. Incorporating traditions of oral culture, Silko begins *Ceremony* with a poem about Thought-Woman, who in Laguna cosmology created the world. The novel traces World War II veteran Tayo as he returns to his home in Laguna Pueblo. Like Momaday's Abel, Tayo is alienated and in need of healing. He feels responsible for the death of his cousin Rocky during the war. Because he cursed the rain that made Rocky's injury worse, Tayo is certain to have caused the drought that plagues Laguna. Suffering from postwar trauma, Tayo participates in a healing ceremony arranged by his grandmother. When Ku'oosh, the local shaman, cannot heal him, Tayo is taken to Gallup to see Betonie, a Navajo who uses a hybrid method of healing. In the mountains, Tayo encounters Ts'eh, a seemingly mythical woman reminiscent of Yellow Woman, who helps Tayo recover his uncle's lost cattle.

Silko's novel focuses on the necessity of achieving balance in the world, of remembering the stories and knowing one's place in them, and of recognizing the relationships between all things, as Robert Nelson proposes. Much *Ceremony* scholarship focuses on aspects of Native spirituality—healing rituals, medicine wheels, witchery, star maps, and the function Ts'eh (see Lincoln, 1983, and Mitchell, 1979). Some critics have focused on the religious syncretism or hybridity in the novel (see Gianferrari, 1999). Jace Weaver points to the importance of community as religious practice in the novel—and that “Tayo is able to achieve wholeness only in re-membering himself in the collective” (1997, p. 134). That sense of community, of working toward communal values, is an outward manifestation of traditional beliefs. One of Silko's short stories, “The Man to Send Rainclouds” (1981), also takes up the conflict between Christianity and Laguna spirituality. Silko's other novels include *Almanac of the Dead* (1991) and *Gardens in the Dunes* (1999).

Other novels published in the 1970s include James Welch's *Winter in the Blood* (1974) and *The Death of Jim Loney* (1979), and Gerald Vizenor's *Darkness in Saint Louis Bearheart* (1978).

THE 1980S AND BEYOND. The 1980s saw a proliferation of American Indian novelists, Louise Erdrich included. Erdrich's first novel *Love Medicine* (1984, revised in 1993)—and later *The Beet Queen* (1986), *Tracks* (1988), *Tales of Burning Love* (1990), *The Bingo Palace* (1994), *The Antelope Wife* (1998), *The Last Report of the Miracles at Little No Horse* (2001), and *The Master Butcher's Singing Club* (2002)—follow certain Ojibwa, German, and mixed-blood families in North Dakota from historical times to the present. Throughout these novels, Erdrich also chronicles the relationship between the Ojibwa and the missionary Jesuits near the fictional town of Argus. *Love Medicine* is told through the voices of multiple narrators and spans fifty years, 1934 to 1984. The novel begins “the morning before Easter Sunday” when June Morrissey decides to walk home from Williston, North Dakota (1993, p. 1). A blizzard unexpectedly begins, and June dies in the snow: “June walked over it like water and came home” (p. 7).

Louis Owens has called June “the feminine Christ-figure resurrected as trickster” (1992, p. 196). Kimberly Blaeser agrees: “By intermingling the symbolism from both religions in June's story, Erdrich seems to challenge not only the exclusiveness of religious myths, but also the exclusive nature of religious ideas themselves” (1994, p. 28). During the remainder of the novel, the community works on coming to terms with June's death. Among the numerous plot lines is Marie Lazarre's experience with Sister Leopolda at the Sacred Heart Convent in 1934. Marie's back is scalded and her hand stabbed by Sister Leopolda, who is trying to save young Marie from the “Dark One.” “Christ has marked me,” Marie says ironically (p. 60). Marie describes the sisters as *windigos*, half-starved creatures from Chippewa lore, again in a combination of religious imagery (see Jaskoski, 2000). Sister

Leopolda is in fact Pauline Puyat, Marie's own mother, which is revealed in *Tracks*. Traditional Ojibwa religion does not go unscathed, however. The love medicine of the title, which Lipsha Morrissey creates to reunite Marie and Nector Kashpaw, ends up choking Nector to death. When Nector Kashpaw had once yelled his prayers at Mass, Lipsha agreed that “God's being going deaf” for years, or that maybe Chippewas “just don't speak its language” (pp. 235–236). Critic Dennis Walsh discusses this “spiritual failure of Catholicism” in the novel (2001, p. 125). Two later chapters also carry enormous religious significance. In “Crown of Thorns,” alcoholism is just that for Gordie Kashpaw. In “Resurrection,” Marie reclaims her Ojibwa spirituality by speaking the language and preparing to pass down Nector's ceremonial pipe to Lipsha. In *Love Medicine*, Erdrich enacts what Patricia Riley calls “mythological synergy,” a move beyond religious syncretism that offers a counternarrative to the story of the vanishing Indian and ensures the survival of her mixed-blood characters (2000, p. 14). Erdrich certainly questions the beneficence of Catholicism throughout her work. In a 2001 interview, Erdrich explains, “Missionary work is essentially tragic. Those who enter the field from the religious side often do so out of love, and out of love they destroy the essence of the people they love.”

Like many contemporary Native novels, Greg Sarris's *Grand Avenue: A Novel in Stories* (1994) takes place off the reservation, which for Sarris is Santa Rosa, California, where families of Pomo descent have relocated. The Pomos have created an “in-town reservation” (Sarris, 1994, p. 198). By transporting traditional ceremonies and familial ties to the city, Sarris offers a different type of narrative. He highlights the traditional as a reclaiming of what has been lost to missionizing and time. Sarris's focus on community and the need for healing in a displaced locale makes *Grand Avenue* what Jace Weaver calls a “communitist” text. The character Nellie Copaz (based on Mabel McKay, a renowned Pomo basketweaver and medicine woman who helped raise Sarris) demonstrates the delicate balance between surviving in the city and preserving tradition. Nellie is the firmest believer in communal values and is sought in times of illness. The two strongest cultural practices in this novel are traditional basketmaking and healing, which are both performed by Nellie.

In the chapter “Waiting for the Green Frog” Nellie recalls hearing the singing frog near her shed on ancestral land. The frog is not specific to tribal lands, for he follows Nellie wherever she moves, including Santa Rosa. Mary Mackie argues that “the green frogs serve as predictors of change, foretellers of a new healer, and the continuance of Pomo culture” (2001, p. 216). Nellie's medical instruments are a combination of the traditional and the modern: “the old canoe basket, the flint piece, a tobacco pipe from a mail order catalog, and a cocoon rattle” (Sarris, 1994, p. 78). When Nellie teaches young Alice Goode how to make baskets, she is performing an act of healing. Nellie also tells Alice how and where to collect the materials, making connections to geo-

graphical and ancestral space. Although Alice is often quiet during these lessons, Nellie tells stories. In the last scene, Alice is visited by the green frog, signaling her future as a healer. Even in the direst of circumstances, Sarris imagines the continuity of Pomo traditions. Sarris's second novel, *Watermelon Nights*, which follows many of the same families, was published in 1998.

American Indian fiction has grown dramatically in recent decades. Novels published in the 1980s include Paula Gunn Allen's *The Woman Who Owned the Shadows* (1983), Janet Campbell Hale's *The Jailing of Cecilia Capture* (1985), James Welch's *Fools Crow* (1986), Michael Dorris's *A Yellow Raft in Blue Water* (1987), and Anna Lee Walters's *Ghost Singer* (1988). Novels of the 1990s include James Welch's *The Indian Lawyer* (1990); Linda Hogan's *Mean Spirit* (1990), *Solar Storms* (1995), and *Power* (1998); Gerald Vizenor's *Dead Voices* (1992); Louis Owens's *The Sharpest Sight* (1992) and *Bone Game* (1994); Ray Young Bear's *Black Eagle Child* (1992) and *Remnants of the First Earth* (1996); Betty Louise Bell's *Faces in the Moon* (1994); Susan Power's *Grass Dancer* (1994); Adrian C. Louis's *Skins* (1995); Sherman Alexie's *Reservation Blues* (1995) and *Indian Killer* (1996); and Diane Glancy's *Pushing the Bear* (1996). Novels of the first decade of the twenty-first century include James Welch's *The Heartsong of Charging Elk* (2000), LeAnne Howe's *Shell Shaker* (2001), and Adrian C. Louis's *Bone and Juice* (2001). Short story collections include Anna Lee Walters's *Sun Is Not Merciful* (1985); Adrian Louis's *Wild Indians and Other Creatures* (1992); Sherman Alexie's *Lone Ranger and Tonto Fistfight in Heaven* (1993), *The Toughest Indian in the World* (2000), and *Ten Little Indians* (2003); N. Scott Momaday's *In the Bear's House* (1999); and Susan Power's *Roofwalker* (2003).

Laura Furlan Szanto (2005)

FIDES. The Roman goddess Fides is the personification of an idea that in itself is secular: the idea of "confidence" (*fides*) and, especially (in a more derivative sense of *fides*), the "good faith" or "trustworthiness" that inspires confidence. Fides made her appearance in the Roman pantheon in the third century CE, about 250, when a temple was dedicated to her by A. Atilius Calatinus. This temple stood on the Capitol, directly next to the temple of Jupiter. But there must have been an earlier sanctuary of Fides (tradition says the cult was established by Numa, the second king of Rome), and the temple built by Calatinus was probably erected on the same site.

The site of the temple of Fides, next to that of Jupiter, is indicative of her origin, for everything points to her having emerged from the supreme deity by a process of hypostatization. In this light, it is easy to understand why Jupiter is guarantor, not only with Fides but also with *Dius Fidius*, of the observance of oaths and compacts (*federala*). In fact, *Dius Fidius*, as "patron of good faith," is a first, archaic hypostatization of Jupiter. He is the god of oaths taken *sub divo*, that is, "in the open air." His temple, open to the sky, was located on the Quirinal, where it was situated on the *Capitolium vetus* ("old Capitol," or place of headship), next to the *sacellum Iovis, Iunonis, Minervae* ("chapel of Jupiter, Juno, Minerva"). Fides, for her part, appears in the wake of Jupiter Capitolinus. Her powers are broader and more flexible than those of *Dius Fidius* and include in particular the guaranteeing both of secrets and of the virtue (the interior disposition) of trustworthiness.

The goddess was honored by a special ritual: Each year some *flamines* (priests) journeyed to her temple in solemn fashion, riding in a covered cart. The sacrificing priest—the *flamen* of Jupiter—celebrated the cult with his right hand wrapped in a piece of white material. The right hand was shielded in this way because it was considered as consecrated when used to swear fidelity. For this reason it was liable to the wrath of heaven if the fidelity was violated. Mucius Scaevola, who lost his right hand after swearing a false oath, is a mythical illustration of this belief. The rite of the veiled

hand is also attested in Umbria in connection with the god *Fisu Sakio*, who closely resembles *Dius Fidius*. At Rome, too, it was the *fidius* aspect of Jupiter that was honored in this way in the person of Fides.

The temple of Fides stood on the *area Capitolina* (the level top of the Capitoline Hill), probably right against its southern edge. Its importance was considerable, because the goddess was patroness of all agreements entered into with a gesture of the right hand. From her commanding position, visible from many points in Rome, she also stood as guarantor of political accords and economic contracts; she encouraged the trustworthiness of citizens toward one another as well as that of the Roman people toward other nations. Her religious function was to procure confidence, credit, and hence often, albeit indirectly, wealth for her trustworthy disciples. (Her temple stood immediately next to that of Ops, a goddess of fertility and plenty.)

The cult of the goddess Fides, suspended during a good part of the first century BCE, was probably restored by the emperor Augustus. Treaties and military documents were posted on the wall of her temple at least until the end of the first century CE. The many representations of Fides on coins minted after that date show that her influence extended well beyond the first century of the common era.

GÉRARD FREYBURGER (1987)

Translated from French by Matthew J. O'Connell
Revised Bibliography

FILARET OF MOSCOW (1782–1867) was a metropolitan of Moscow and Russian Orthodox church leader.

Filaret was born into the clerical “caste.” He became a monk in 1808 and was ordained a priest in the following year. By 1812 he was rector of the Saint Petersburg Theological Academy. He became archbishop of Moscow (1821), then metropolitan of Moscow (1826); he served in the latter office until he died. Meanwhile Filaret had become a member of the Holy Synod (1819), the governing body of the Russian Orthodox church. Whether active participant or (from 1842) estranged consultant, he was to dominate its work for almost half a century. In the process he was able to demonstrate that the church need not be as subservient to the state as successive lay procurators-general of the synod expected it to be.

Filaret was barred from participation in the deliberations of the synod after 1842 largely because of the ban imposed on a privately circulated translation of the Old Testament. This translation was held suspect for two reasons: It was made from the Hebrew, rather than the Septuagint (considered normative by the Orthodox church), and it was made into modern Russian. Filaret had early been a proponent of exactly such a translation, and he had participated in the Russian Bible Society’s work on the New Testament and *Psalms* (published 1818–1823). This work, discouraged after 1824, was not resumed until 1858. The publication of a complete (and, until the late twentieth century, standard) Russian translation of the Bible was begun in the year after Filaret’s death. But it was associated with his name.

Filaret also supported the pioneer translation into Russian of patristic literature. This translation had an impact far beyond the boundaries of those academic centers in which it was undertaken. The freshly uncovered wisdom of the Fathers was to inform and transmute the thought, even the piety, of the Russian church and to rescue it from its previous “Babylonian captivity” to Western theological patterns. Filaret himself was prominent among the beneficiaries of this rescue operation.

Filaret gave much thought to the reform of theological schooling and stressed that Russian Orthodox scholarship should “develop its own models in the true spirit of the apostolic church.” He produced a standard text, *Longer Catechism* (1823, revised 1839), to help the clergy with its work. Of more lasting importance were his carefully considered sermons, which mark him as an exceptionally subtle theologian, always willing to have his personal and profound experience tempered by Orthodox tradition.

Filaret’s posthumous publications include a vast range of memoranda, opinions, and correspondence. They show him to have been a statesman as well as a hierarch of the church. They also demonstrate his curious mixture of determined liberalism with cautious conservatism. He was ill at ease with “democratic principles.” But whatever his limitations in the secular sphere, he reinvigorated the Russian church at every level of its life and, in the fullest sense, reoriented it.

BIBLIOGRAPHY

A rich Russian-language bibliography is provided in Georgii V. Florovskii’s *Puti russkogo bogosloviia* (Paris, 1937). Among Filaret’s variously collected works should be mentioned his sermons: *Slova i rechi*, 7th ed., 5 vols. (Moscow, 1873–1885). Some of these appeared in English translation as *Select Sermons by the Late Metropolitan of Moscow, Philaret* (London, 1873). Others appeared in French, notably those translated by A. Serpinet as *Choix de sermons et discours de son Eminence Mgr Philarète*, 3 vols. (Paris, 1866). Less revealing is Filaret’s *Longer Catechism*, translated by R. W. Blackmore in *The Doctrine of the Russian Church* (1845; Willits, Calif., 1973). No full-length study of Filaret has appeared in English aside from R. L. Nichol’s dissertation on him, “Metropolitan Filaret of Moscow and the Awakening of Orthodoxy” (University of Washington, 1972).

SERGEI HACKEL (1987)

FILLMORE, CHARLES AND MYRTLE. Myrtle (Mary Caroline) Page Fillmore (1845–1931) and Charles Sherlock Fillmore (1854–1948), a married couple, were the founders of Unity, the largest and most distinctly Christian movement in the New Thought tradition. They are the most notable students of New Thought’s founder, Emma Curtis Hopkins (1849–1925). From its inception, Charles Fillmore was the leader of the movement and the primary force in the development of Unity’s theological system and institutional structures. Although less visible than her husband, Myrtle Fillmore was equally important to the emergence and early expansion of the movement, with the healing of her tuberculosis in 1888 precipitating the movement’s founding.

Myrtle was born in Pagetown, Ohio, the eighth of nine children. Her parents were prominent members of the local Methodist Episcopal Church. Unity biographical literature describes her as “not robust” and at times “seriously ill,” but also “active and enthusiastic.” Before entering college, she worked briefly as a newspaper writer. In 1868, after a year of study at Oberlin College, she was licensed as a teacher and began a career as a teacher in Clinton, Missouri. In an effort to maintain her fragile health, a result of suffering from both tuberculosis and malaria, in 1874 she relocated to Denison, Texas, where she established a private school.

Charles was born on a Chippewa reservation near Saint Cloud, Minnesota, the oldest of two sons. He had little contact with his father, who separated from the family when he was seven. Charles remained close to his mother until her death in 1931. Although his mother was a devout Episcopalian, she and her sons seldom attended church services. At the age of ten, Charles suffered a severe hip injury, which disabled him for two years and resulted in permanent damage to his right leg. As a result of his physical challenges and the necessity of finding employment to support the household, Charles’s formal education ended when he was fourteen, although he did receive tutoring throughout his teens from Caroline Taylor, a graduate of Oberlin College. His studies

with Taylor included readings in philosophy and theology. In 1874 Charles left Saint Cloud for the frontier town of Caddo in what is now Oklahoma. Shortly after his arrival he moved to Denison and took a job with the Missouri, Kansas, and Texas Railroad.

Myrtle and Charles met in Denison in 1876 and were married in Clinton, Missouri, in 1881. From 1881 to 1884, the Fillmores resided in Pueblo, Colorado, where Charles Fillmore was a real-estate partner with Charles Small, the husband of Alethea Brooks Small (1848–1906), who later played an important role in the founding of Divine Science. Following opportunities in the West's volatile real-estate market, the Fillmores moved to Omaha, Nebraska, and after a brief residency there they moved to Kansas City, Missouri. It was there that they founded Unity in 1889.

Before beginning their religious work, the couple had pursued livelihoods common to persons living in the nineteenth-century Midwest. Myrtle had been a teacher, and prior to his real estate career, Charles had held jobs as a printer's assistant, railroad freight inspector, mule-team driver, insurance salesperson, and assayer. They were active in the temperance movement, attended Methodist and Episcopal churches, and were exposed to Spiritualism and perhaps Theosophy. They had three sons—Lowell (1882–1975), Rickert (1884–1965), and Royal (1889–1923), each of whom was active in the Unity movement, with Lowell succeeding his father as president of Unity School of Christianity.

In 1886, at the same time the Kansas City real-estate market was beginning to decline, Myrtle experienced a flare-up of her tuberculosis. Seeking relief, she and Charles attended a lecture by E. B. Weeks, a mental healer from Chicago. Charles was not impressed with the lecture, but Myrtle was, specifically by Weeks's statement, "I am a child of God and therefore I do not inherit sickness." Using the statement as a healing affirmation and applying other mental healing techniques, Myrtle recovered, pronouncing herself healed in 1888. During this time, she also began to pray with others, who reported healings as a result. Myrtle's healing and her assistance in the healings of others awakened Charles's interest, and he began to practice mental healing rituals himself. His health improved and denominational histories report that his hip became stronger and his right leg began to lengthen.

As a result of their healings, the Fillmores became interested in the emerging mental healing movement, which was then identified as "Christian Science" (used in a generic sense) but would, by the turn of the century, be called New Thought, to distinguish it from the religion of Mary Baker Eddy (1821–1910). Their interest brought them into contact with Emma Curtis Hopkins, with whom they studied in Chicago and through correspondence from Kansas City. The Fillmores were ordained by Hopkins as ministers in 1891. Hopkins was the single most important influence on the Fillmores' religious development prior to their founding

of Unity. Her impact is evident in the Fillmores' teachings (especially Charles's idealistic theology) and the organizational strategies they used in the early years of the Unity movement.

In 1889 (the year Unity recognizes as its founding), the Fillmores embarked on their first organizational endeavor, the publication of *Modern Thought*, a periodical "devoted to the spiritualization of humanity from an independent standpoint." The following year, Myrtle's healing talents led to the formation of a prayer ministry, the Society of Silent Help (later renamed Silent Unity). The success of *Modern Thought* (later absorbed into *Unity* magazine) and the Society of Silent Help served as the impetus for the emergence of Unity as a denomination.

Unity histories report that the couple did not desire to establish a religion, but in 1903 they formed a religious organization, the Unity Society of Practical Christianity, and they were members of the first group of ordained Unity ministers in 1906 (W. G. Haseltine, the president of the board of the Unity Society, performed the ordination). In 1914, they incorporated Unity School of Christianity, which continues to the present as the movement's most representative institution.

Myrtle's role in the leadership of Unity began to decline as the movement became more institutionalized. She left the office of editor of Unity's children's magazine, *Wee Wisdom*, in 1907, and in 1916 she relinquished her post as director of Silent Unity. In her later years her primary activities consisted of correspondence with Unity followers and assistance to Charles. Myrtle died in 1931, the year of the couple's fiftieth wedding anniversary.

In 1933 Charles married Cora Dedrick, who had been his secretary. He gradually relinquished control of the movement to his sons, especially Lowell, who succeeded him as president of Unity School. Charles and Cora traveled extensively, and he spent considerable time in California. He continued to lecture and write until the last few years of his life. His thirteen books are still printed and distributed by Unity School.

FILM AND RELIGION. While the academic study of “film and religion” as a subfield within religious studies has only come of age since the late 1980s, the connection between film and religion is as old as film itself. As film theorist André Bazin once put it, “The cinema has always been interested in God” (Bazin, 1997, p. 61). Indeed, if one accepts the now-standard origin of cinema to begin with the Lumière brothers’ first public screening for a paying audience in December 1895, then the first decade of cinema saw at least a half dozen filmed versions of the life and passion of Jesus Christ, including those made by the inventors of film themselves, Thomas Edison and Louis Lumière. The figure of Jesus Christ has continued to be a popular topic for film and a touchstone for cinematic controversy throughout the twentieth century, with such directors as Sidney Olcott, D. W. Griffith, Cecil B. DeMille, George Stevens, Pier Paolo Pasolini, Norman Jewison, Martin Scorsese, and Mel Gibson offering various theological perspectives. Jesus is not the only religious figure to appear on screen, however, and religious issues, practices, characters, and conflicts are presented on a frequent basis in films around the world. The first half of this entry will thus offer a global survey of examples of films since the mid-1980s that deal with matters of interest to religious studies.

It is not only the content of film that connects film and religion, for as a number of critics have observed, one can find religious interests and implications in the formal style of film, as well as in the cinematic experience of viewing film. As another early film critic and director, Jean Epstein, once said, “I would even go so far as to say that the cinema is polytheistic and theogonic” (Abel, 1988, p. 317). Film, and the experience of viewing film, may be religious in and of itself, creating its own gods, goddesses, and myths, and film does not merely represent or reflect an already established religion. So, while not mutually exclusive categories, film studies and religion studies can be usefully divided into three key approaches, and the second half of this entry will examine the various scholarly responses to the connections between film and religion: religion in film, religion as film, and the cinematic experience and ritual.

RELIGIONS AND CINEMAS AROUND THE WORLD. While an all-inclusive list would be impossible to include here, there are a number of international filmmakers since 1985 (approximately since the entry on film was written for the first edition of *The Encyclopedia of Religion*) who have dealt with religious issues in myriad ways. Many films in world cinema that touch on religious themes often do so by presenting reli-

gion in conflict. The most common conflicts arise when older religious values are challenged by the social, political, economic, and religious realities of modern life, especially in a postcolonial environment. There is conflict when, due to modern life and the aftereffects of colonialism, religious people from differing traditions are placed side by side and forced to get along (or not). And conflict arises when individual gender, sexual, and ethnic identities meet socioreligious identities. This list is in no way comprehensive, but is intended to display the number of directions that the study of film and religion can go in without treading across the same territory of previous studies. There is little or no critical literature from a religious studies standpoint in English on the films mentioned in this entry, and these films are mentioned precisely for this reason, to show the breadth of possible subject matter for religious studies scholars interested in film.

East Asian cinema has seen the development of several movements since the 1970s, as filmmakers have experimented with new styles and modes of production. In the wake of Akira Kurosawa and Yasujiro Ozu, Japan has continued to be a prominent producer of films dealing with key religious themes. Toshihiro Tenma’s *Kyosono Tanjo* (Many happy returns, 1993) explores new religious movements in Japan; Hirokazu Koreeda’s *Maborosi* (1995) utilizes a “Zen aesthetic”; and two films produced in 1989 examine the life of the Zen Buddhist tea master Rikyu: Kei Kumai’s *Sen no Rikyu* and Hiroshi Teshigahara’s *Rikyu*. Also vibrant in Japan is the work of anime writers and directors, including Hayao Miyazaki’s *Princess Mononoke* (1997) and *Spirited Away* (2001), Hideaki Anno’s two *Neon Genesis Evangelion* films (1997), and Katsuhiro Ôtomo’s *Akira* (1988). Ôtomo also wrote the screenplay for *Metropolis* (2001), directed by Taro Rin. A number of Korean directors have infused Buddhism into their films, including Bae Yong-gyun in *Why Has the Bodhidharma Left for the East?* (1989), Im Kwon-Taek in *Sopyonje* (1993) and *Come Come Come Upward* (1989), and Chang Sonu in *Passage to Buddha* (1993).

China’s New Cinema movement has had a huge impact on the international film scene since the mid-1980s, occasionally incorporating Daoist and Confucian elements. Daoist issues arise in Chinese director Chen Kaige’s *King of the Children* (1987), while critiques of Confucian ethics are seen in Zhang Yimou’s *Ju Dou* (1990). In Bangladesh, Tareque Masud’s *Matir Moina* (The clay bird, 2002) tells the story of the emergence of the nation of Bangladesh, offering a sympathetic yet critical look at Islam in the midst of the move toward political independence.

Notable films with religious interests from New Zealand include the work of Jane Campion: *Angel at My Table* (1990), *The Piano* (1993), and *Holy Smoke* (1999). Cross-cultural conflicts between Maoris, whites, and others get taken up in Lee Tamahori’s *Once Were Warriors* (1994) and Gregor Nicholas’s *Broken English* (1996). In Australia, films such as Nicholas Parsons’s *Dead Heart* (1996) and Tracey Moffatt’s *Nice Coloured Girls* (1987) deal with Christian-

Aboriginal cultural conflicts. From another standpoint, David MacDougall's ethnographic films of Aboriginal culture, such as *Transfer of Power* (1986), offer intriguing examinations of cultural differences, and MacDougall has been prolifically thinking through the issues of visual representation in his films and writings.

South Asian cinema, because of its enormity (Mumbai's yearly production dwarfs Hollywood's) and because mythological themes are so intertwined in Indian cultures, is almost impossible to classify. Indian film history is steeped in mythological themes and stories of Hindu saints, and today's *masala* films often incorporate many of these narratives, weaving them into song and dance routines, domestic drama, and action-adventure sequences. Some films with themes of interest to the religious studies scholar might include the *Mahābhārata* retelling in Arjun Sagnani's *Agni Varsha* (2002), the postcolonial religion/cricket epic *Lagaan* (2001) by Ashutosh Gowariker, and the Muslim-Hindu religious conflicts dealt with in Kamal Haasan's *Hey Ram* (2000), Khalid Mohamed's *Fiza* (2000), and Deepa Mehta's *Earth* (1998). Films about the Indian diaspora and consequent cross-cultural challenges figure prominently in newer Indian films; important among these are the story of a wedding in Sooraj R. Barjatya's *Hum Aapke Hain Koun* (Who am I to you? 1994) and Subhash Ghai's coming of age story, *Pardes* (Abroad, 1997). And apart from Western filmmakers looking at Tibetan Buddhism, including Jean-Jacques Annaud's *Seven Years in Tibet* (1997) and Martin Scorsese's *Kundun* (1997), former Tibetan monk Khyentse Norbu made *The Cup* (1999), a prime film for teaching religious studies, as it deconstructs an exoticizing gaze.

The most productive site in western Asia for film production is Iran, where the films of Abbas Kiarostami (e.g., *A Taste of Cherry* [1997], *The Wind Will Carry Us* [1999]); Mohsen Makhmalbaf (e.g., *A Moment of Innocence* [1996], *The Gabbah* [1996], *The Silence* [1998]); Majid Majidi (e.g., *Children of Heaven* [1997], *The Color of Paradise* [1999]); and Jafar Panahi (e.g., *The Mirror* [1997], *The Circle* [2000]), among others, all reflect everyday life in postrevolutionary Iran. Faced with heavy censorship, Iranian filmmakers have continued to produce some of the most critically acclaimed films in the world. While the religious studies scholar may wish to see more explicit images of Islam, there are a number of ways to read these highly allegorical films that point toward a Persian-Islamic worldview. And while Islam may not always be present, these films are peopled with Muslims, and it is crucial, as always, not to confuse an essentialist term like *Islam* for the people who actually practice the religion.

Toward the Mediterranean, films from Israel have shown the conflicts between gender and religion (as in Amos Gitai's *Kadosh* [1999]), sexuality and religion (as in Sandi Simcha Dubowski's *Trembling Before G-d* [2001]), and between the orthodox and the secular, with a good dose of Qabbalah (as in Yossi Somer's *The Dybbuk of the Holy Apple*

Field [1998]). In Palestine, Elia Suleiman's *Divine Intervention* (2001) portrays conflicts through the mixing of theology and politics.

The continent of Africa has experienced a strong increase in film production since the 1970s, with films confronting postcolonial situations that pit the traditional against the modern; in sub-Saharan Africa this often includes the conflict between Christianity and indigenous beliefs and practice. Egypt is the "Hollywood of the Arab World" and has garnered the attention of the international film world, especially since Youssef Chahine's *Destiny*, a film set in twelfth-century Islamic Andalusia, was nominated for the Golden Palm at the Cannes Film Festival in 1997. Other Egyptian standouts dealing with religious-political conflicts include Daoud Abdel Sayed's *Land of Fear* (1999) and Atef Hetata's *Closed Doors* (1999).

Elsewhere in Africa, examples of the modern-traditional debate with reference to Islamic, Christian, and indigenous religions include Drissa Toure's *Haramuya* (1995) and Dani Kouyaté's *Keita: Heritage of the Griot* (1994), both from Burkina Faso; Amadou Thior's *Almodou* (2000) from Senegal; Nouri Bouzid's *Beznness* (1992) from Tunisia; and Saddiq Balewa's *Kasarmu Ce* (The land is ours, 1994) from Nigeria. Perhaps the best-known and most prolific filmmaker in Africa is Ousmane Sembene from Senegal, whose many films include *Guelwaar* (1992), which offers a critique of interreligious conflict. Like Sembene, director Med Hondo of Mauritania self-consciously makes films that offer an alternative aesthetic to that of Western filmmaking; one example is *Sarraounia* (1986), about a warrior-queen who leads her people in the challenges posed by the colonizing French. In western Africa, there has been a boom in film production through new, inexpensive video technologies that are used to produce "videofilms" that have a mass appeal, many of which are produced by Pentecostal religious groups. The African diaspora is the topic of many films produced in and out of Africa, and can be seen, for example, in such films as Julie Dash's *Daughters of the Dust* (1991), Felix de Rooy's *Desire* (1984), and Haile Gerima's many films, especially *Sankofa* (1993), as well as a number of Latin American films discussed below.

In southeastern Europe, in the midst of decades of political upheaval, film production has been strong. Of particular note is Milcho Manchevski's *Before the Rain* (1994), which tells of Orthodox Christian and Muslim communities and their conflicts in the former Yugoslavia. Romany/Gypsy cultures are seen in a number of productions, including the great Bosnian director Emir Kusturica's *Time of the Gypsies* (1989) and Tony Gatlif's *Latcho Drom* (1993) and *Gadjá Dilo* (1997), the former created without any dialogue, only music and movement.

The works of western European directors have been well-traversed by religion scholars, and are only mentioned in passing here. In many ways inspired by former countrymen Carl Theodor Dreyer and Søren Kierkegaard, Danish

filmmaking has consistently returned to existentially religious themes. Such films include Thomas Vinterberg's *Celebration* (1998), Roy Andersson's *Songs from the Second Floor* (2000), and the works of Lars von Trier, especially *The Kingdom* (1994, 1997), *Breaking the Waves* (1996), and *Dancer in the Dark* (2000). In Poland, the late Krzysztof Kieslowski's religiously inspired films include the *Three Colors* trilogy (1993–1994), *Decalogue* (1988), and the posthumous project eventually directed by Thomas Tykwer, *Heaven* (2002). In Spain, Julio Medem shies away from depicting religion explicitly, yet his style evokes a mystical aura in ways akin to the magic seen through early film theory, especially in *Tierra* (1996), *Lovers of the Arctic Circle* (1998), and *Sex and Lucia* (2001). And Pedro Almodóvar, as a descendant of Luis Buñuel's surrealism and Roman Catholic satire, continues to utilize critical, yet not unsympathetic, portrayals of nuns and the institution of the church in such films as *Matador* (1986), *Live Flesh* (1997), and *All about My Mother* (1999). A number of French films through the 1990s updated the existentialist quest for meaning in life, notably Benoît Jacquot's *School of Flesh* (1998) and Danièle Dubroux's *Diary of a Seducer* (1996), while the cross-cultural clashes of suburban Paris are seen in Mathieu Kassovitz's *Hate* (1995).

Themes of religion in Central and South America have tended to be critical of Roman Catholicism, or have delved into the hybrid religions of Afro-Catholic mixings. Cuba has been a fertile site for film production since the 1959 revolution, with Santerian practices showing up, for example, in Gloria Rolando's *Oggún* (1991), Tomás Gutiérrez Alea's *Guantamamera* (1994), and Humberto Solás's *Honey for Oshun* (2001). Films from Mexico include critiques of Roman Catholicism in Carlos Carrera's *Crime of Father Amaro* (2002) and Nicolás Echevarría's *Cabeza de Vaca* (1991). In Brazil, Tania Cypriano's documentary *Odô já! Life with AIDS* (1997) portrays the importance of Candomblé in education about AIDS, and her short, *Ex-Voto* (1990), is a devotional expression to the patron saint of Brazil. One of the masters of Brazilian Cinema Novo is filmmaker Nelson Pereira dos Santos, whose many films include *Jubiata* (1987), which deals with interracial, interclass issues with a strong dose of Afro-Brazilian religious practice. Vodoun is probably the most slighted religion in the history of film, but can be seen in a somewhat objective light in Maya Deren's posthumously produced documentary *Divine Horsemen* (1985) and Alberto Venzago's documentary *Mounted by the Gods* (2000).

Independent filmmakers in the United States continue to weave religious themes into their works, often improvising on ancient myths and mythic structures, and examining the ways narratives construct the communal and personal identities of Americans. Of note in this regard are the films of Jim Jarmusch (e.g., *Dead Man* [1995], *Ghost Dog* [1999]); Hal Hartley (e.g., *Henry Fool* [1997], *The Book of Life* [1998], *No Such Thing* [2001]); and John Sayles (e.g., *City of Hope* [1991], *Lone Star* [1996], *Limbo* [1999]). The annual Sundance Film Festival gives evidence to the continued presence

of religious interests among young filmmakers, and religious matters have been taken up, for example, in Sarah Rogacki's debut, *Rhythm of the Saints* (2002); Jonathan Kesselman's comedy, *The Hebrew Hammer* (2002); Larry Fessenden's mythic *Wendigo* (2001); and Greg Watkins's relationship comedy, *A Sign from God* (2000). Intriguing insights into the spirituality of rave culture can be seen in Greg Harrison's *Groove* (2000) and Jon Reiss's documentary, *Better Living through Circuitry* (1999).

In Canada, Egyptian-born director Atom Egoyan, whose films include *Calendar* (1993), *Exotica* (1994), *The Sweet Hereafter* (1997), and *Ararat* (2002), continually plays with the ambiguous relation between historical time and memory—specifically in reference to loss, tragedy, and the possibilities of redemption—in ways inherent to the medium of film. The mature works of David Cronenberg, including *Crash* (1996), *eXistenZ* (1999), and *Spider* (2002), deal with issues of identity and relationships in ways that probe the depths of what it is to be human, developing existential questions in a postmodern age.

SCHOLARLY APPROACHES TO FILM AND RELIGION. There are three key scholarly approaches to the relationship between film and religion. The first might be called “religion in film,” a way of analyzing the religious dimensions of film by focusing primarily on its narrative content. “Film as religion” is the second key approach, and is based on formal parallels between the aesthetic styles of film and religious practices. Finally, there is an interest in “cinematic experience and ritual,” where a focus on spectatorship and its relation to ritual takes precedence. These categories often overlap in individual studies, and are charted here for heuristic reasons. The key question that divides these approaches seems to revolve around the location of meaning: Is religious meaning found in the subject matter of the film, in the aesthetic form of the film, or in the experience of viewing the film?

Religion in film. Whether a film plot is based on a messiah, a saint, a bodhisattva, a pilgrimage, a reenactment of a sacred text, or whether religious performances are displayed in documentary film, religion shows up in film on a regular basis. This way of thinking about the relation between film and religion seems to be the most apparent to the textual and narrative bias of most religious studies, and it has therefore become the most prominent method of examining the relationship. As with so much of the study of religion itself, a vast majority of these studies have been based in Christian theology and display a Euro-American outlook.

P. Adams Sitney's contribution to the 1987 *Encyclopedia of Religion* (“Cinema and Religion”) came along at the end of what might be called the first wave of religion-in-film criticism, a loose canon of publications roughly extending from the 1960s to the late 1980s. Book-length studies during this period typically offered broad approaches, and they often worked from the standpoint of existential theology: film could be religiously instructive because it taught about the human condition, providing stories and images that

struggled for meaning. John R. May should be credited as the key person in the development of the interdisciplinary field—especially for amassing and publishing the work of other scholars interested in the topic—as a legitimate focus of study within religious studies.

As most of the publications in this first wave made clear, the connection between film and religion was primarily to be found in European cinema, particularly in the work of directors such as Pier Paolo Pasolini, Carl Theodor Dreyer, Robert Bresson, and Ingmar Bergman (Japanese directors Yasujiro Ozu and Akira Kurosawa were the two key non-Westerners). Relevant U.S. productions included work by D. W. Griffith and Cecil B. DeMille in the early years of cinema, with Alfred Hitchcock adding a few flourishes mid-century, and George Lucas, Stanley Kubrick, and Martin Scorsese providing a religious flavor to film in the 1960s to 1990s. During this period, religion-in-film scholars tended to shy away from popular films, choosing instead to focus on what would later be called “art house” films. This probably does not reflect an elitist attitude on the part of this first wave of scholars so much as it reflects the struggle they faced in getting others in the academy take their work seriously. After all, who could argue against the seriousness with which Bergman or Kurosawa portrayed religious matters?

The study of film and religion became solidified through the decade of the 1990s, as evidenced by the upsurge of publications in the field, the establishment of a program unit on film and religion within the American Academy of Religion, and the launch of the online *Journal of Religion and Film*. In many ways reacting to the earlier paradigm that found film and religion only in “serious” art house films, the 1990s witnessed the next wave of film and religion criticism, which self-consciously took popular Hollywood film as its primary focus. Biblical scholars and theologians began to take a second look at popular culture, and found a wealth of resources in film, particularly in popular film. Christian theologians reworked Reinhold Niebuhr’s and Paul Tillich’s thoughts on the relation between Christianity and culture, and decided that there must be an engagement with culture, with film being one of the cultural expressions par excellence in modern life. The prevalence of the ideas of Tillich and Niebuhr in film and religion studies, a half-century after their writing, attest to these theologians’ keen insights in relating religion and culture, though it probably also attests to the need for new theories of culture, since the culture of the first half of the twentieth century looks less and less like that of the twenty-first.

This second wave is also marked by a number of explicitly Christian theological studies, in contrast to the tendency to use existentially universal language evident in many of the first-wave publications. Studies through the 1990s include the relation of film to Christian, and occasionally Jewish, understandings of the Bible; the relation of film to doctrines of Christian theology; and a plethora of works on Christ figures in film. While there are a variety of interests indicated

in these works, they can be seen collectively through their examination of popular film, by their chiefly Christian theological orientation, and ultimately by the ways they see religion in film, paying scant attention to the specificities of the medium or the role of spectatorship.

Since the mid-1990s there have been several attempts at historicizing, categorizing, and hence legitimizing the sub-field. One of the more influential and useful schemas for the approach to religion in film is found in Joel W. Martin and Conrad E. Ostwalt’s edited volume *Screening the Sacred* (1995). In the introduction, Martin lays out three ways of viewing film from a religious studies standpoint: theological criticism, mythological criticism, and ideological criticism. Not meant to be exclusive categories, Martin points toward a “future” synthesis of these modes, implying that such a synthesis has not yet occurred. A wide variety of films can be included under the three categories, yet the actual studies within the book itself all primarily function from the understanding that religious meaning is found within the film story or characters. Following on these categories, in *Film as Religion* (2003) John Lyden rightly notes that most film and religion studies are either too theological or too ideological: the former remains bound by presuppositions as to what constitutes “religion” (i.e., Christianity), and the latter tends to be so focused on critiquing the power structures that it neglects some of the more positive understandings of religion. Lyden goes on to develop a more nuanced approach that draws heavily on the myth and ritual theories of Clifford Geertz, supplemented by the theories of Wendy Doniger and Jonathan Z. Smith. By investigating “religion as film,” Lyden’s work crosses over into the second category of film and religion approaches.

Religion as film. Early film theorists, chiefly because of the visual prominence of silent film, emphatically stressed formalist understandings of cinema. They argued about the psychological and social effects that the medium of film has on its audience due to its rearranging of “normal” space and time through cinematography, *mise-en-scène*, and editing. In the 1920s in France, film theorists (in particular, Louis Delluc, Jean Epstein, and Léon Moussinac) developed the idea of *photogenie*, the cinematic transformation of reality through the technological properties inherent in the form of film itself. Because of its emphasis on the formal properties of filmmaking, much of this early film theory did not depend on narrative film, and indeed often triumphed nonlinear, nonnarrative films. Thus, through the camera’s ability to slow down or speed up “real time,” or to juxtapose images in ways that display new relations, or to zoom in on particular segments of visual reality, the world itself is reconfigured and viewers are given a brand new outlook, a new “world-view.” Representation became a means for knowledge, “revealing” the truth of the world in an altogether new form. And even though debates eventually emerged between the realists and antirealists in film theory, both arguments have implications for a religious view of film form.

From a religious studies perspective, what is interesting about film's capacity to rearrange the "world-as-it-is" is the frequent use of religious language to justify the theory. Epstein has already been quoted as seeing the theogonic properties of cinema, and others spoke of cinema as "revelation," as "magic," and as a "miracle." Recapping many of these ideas in her book *Savage Theory* (2000), Rachel Moore argues that early film theorists and filmmakers (especially Walter Benjamin, Sergei Eisenstein, Vachel Lindsay, Siegfried Kracauer, and Bazin) saw in film a potential re-enchantment of a modern world that had lost language's expressive ability (explicated in Ferdinand de Saussure's account of the arbitrariness of the sign) and that experienced a general mode of alienation due to industrialized, modern life. In the early 1960s, avant-garde filmmaker Stan Brakhage would continue this language, expressing the religious possibilities of film form in his quasi-manifesto "Metaphors on Vision" (1963). For Brakhage, film artists are "essentially preoccupied by and deal imagistically with—birth, sex, death, and the search for God" (Mast, Cohen, and Braudy, 1992, p. 72).

Later, director and screenwriter Paul Schrader's 1972 *Transcendental Style in Film* examined the "aesthetics of sparseness" in the films of Ozu, Bresson, and Dreyer. Even though these directors had differing religious backgrounds, Schrader sees them each using a filmic style that emerges through pared-down filmmaking techniques, including austere cinematography, unexpressive acting, and light-handed editing. Thus, the properties specific to filmmaking itself allow access to the transcendental; a long take of a close-up of an expressionless face, no matter whose face it is, can evoke an experience of transcendence.

From another angle, the religious dimension to film form and style can also be seen in relation to the contemplative emphasis of various religious traditions, and here film becomes a new medium in a long list of visual media, from icons to yantras to *thangka* paintings, designed to facilitate meditation. Francisca Cho, for example, discusses the relation of Korean Buddhist films to a "cultic mode" of viewing heavily dependent on the aesthetic choices made in the making of film (see Cho in Plate and Jasper, 1999). And as with each of the examples given here regarding "film as religion," Cho's cultic mode of viewing film implicitly suggests that meaning cannot simply be found in the film form, for there must also be an audience that views the edited juxtapositions, the austere lighting, or the slow movement of actors.

The cinematic experience and ritual. Apart from the formal style, the plot, and the characters of film, there is also the cinematic experience—the reception of film—which is a critical point of interrogation for the scholar of religion. While theorists of film and religion continually mention the importance of audience reception, very little work has been done in this area. Scholars often theorize about the effect of editing, for example, but seldom do they do any ethnographic work to find out how audiences actually do react. More complicated still would be a study that gauged the responses

to a particular film in varying locations, times, and cultures, thereby reorienting the location of the meaning of film to the cinematic event.

The religious implications of film reception are most obvious when the experience is understood and analyzed in terms of ritual; this is not to say that every screening of every film is a ritual, for that would make both terms meaningless, but that the cinematic experience can become a ritual. We can see this when viewers perform *pūja* (devotional offerings) before screenings of mythological films in South Asian theaters; when young people in the United States, wearing specific clothes, line up for a "midnight mass" on Saturday night to watch *The Rocky Horror Picture Show* again and again; or when films are televised, and family and friends in North America gather in living rooms to watch the annual broadcast of *It's a Wonderful Life* at Christmas, *King of Kings* at Easter, or *The Wizard of Oz* in July. In these ritualized performances, the religious content of the film is beside the point. Rather, what is crucial is the way these activities occur at special "set apart" times (often in seasonal cycles) and in special places (whether the living room of the family home or in the film theater) in which there is an emphasis on a communal experience and on the aesthetics of seeing and listening (and usually eating as well), and on interacting with other viewers and with the film. Whatever else a ritual is, it certainly aims to be an activity that promotes attentiveness and sensual focus, and film form enables just that.

In this approach to the relation of film and religion, social-scientific approaches become prominent, and such newer fields as media studies and cultural studies offer useful methodologies. Nonetheless, communications and media studies, even when discussing the ritual dimensions of audiovisual media, usually neglect film and spend most of their time evaluating audience reception of television shows and news media. The work of Stewart Hoover, Lynn Schofield Clark, and Eric Rothenbuhler, among others, has offered interesting studies on the ritualized reception of media (mostly television and news media), analyzing many of the parallels between ritual and media, and the methods of these scholars can be useful to film and religion studies. Perhaps the most vital new field that provides a "third term" in linking film and religion is that of visual-culture studies, which combines the formalist interests typical of the humanities with the reception interests typical of the social sciences. Inherent is also an interest in the cross-cultural dimensions to visuality, to see the cinematic experience located within particular cultures, at particular times, paying attention also to the gendered, ethnic, sexual, and religious differences of the activity of seeing. Thus, visual culture offers a way to think through all three of the approaches to film and religion listed here.

CONCLUSIONS AND FUTURES. The subfield of film and religion has gradually gained acceptance in religious studies, and prominent theorists of religion now regularly incorporate discussion of films into their analyses of myth, ritual, and other aspects of religion. Alongside this development are

newer modes of religious inquiry that utilize material and visual artifacts as primary evidence, rather than “illustration,” of religious belief and practice. As part of a broader movement within religious studies that is increasingly paying attention to visual- and material-culture studies (and concomitantly emphasizing religious practice rather than merely belief), film and religion studies can continue to play a vital role in the shaping of religious studies and not merely be an appendage to the discipline. Along these lines there are two key directions that the field is beginning to take (and will likely keep elaborating on). First, film and religion studies is moving beyond the Christian-Hollywood matrix and displaying the varieties of global religious experiences and traditions as mediated through film. Second, religious approaches to film are helping to point out the constructed nature of vision by making links between visual representation and the creation of socioreligious worlds with all their attendant myths, ideologies, and practices.

Because postmodern, postcolonial life consists of multicultural and interreligious encounters on a regular basis, there is an obvious need to branch out beyond the Hollywood centrism evident in a majority of film-and-religion studies in the past. Films made outside of Hollywood do not conform to the same aesthetic standards that capitalist, industrial film relies upon, and by looking at films made in South America, Africa, and Asia, for example, and through attention to film form and reception, the student of film and religion begins to see the ways other worlds are visually constructed, not excluding religious worlds.

In so doing, the religious studies scholar may begin to develop what might be called an “ethics of vision” that is attentive to the differences in cultures, races, classes, genders, sexualities, and a host of other identity factors. Seeing is an activity that humans learn how to do; it is not an innate ability. Among other factors, this sensual activity is shaped by visual technologies such as film, television, video games, and the Internet, as well as ever more powerful telescopes and microscopes. Thus, by moving beyond the search for religious characters in film, scholars can look at the larger religious questions involved in the social construction of reality through visual terms.

Finally, as Sitney ended his 1987 *Encyclopedia of Religion* entry with a nod to avant-garde film, so will this entry. There remains much promise for religious studies in the avant-garde films of Stan Brakhage, Maya Deren, Kenneth Anger, and Hollis Frampton, among others, and it should not be too easily overlooked. While there is often a strong religious content, albeit obscure, in avant-garde works, there is a religious dimension to the formal style of these films that is perhaps more important. Sitney’s own study of the avant-garde, *Visionary Film* (2002), is now in its third edition, and his analysis highlights many engaging relations between film and religion. While avant-garde films remain difficult to watch, they nonetheless help to point out the constructed nature of vision itself. As Brakhage put it in “Metaphors on Vi-

sion”: “Suppose the Vision of the saint and the artist to be an increased ability to see—vision” (Mast, Cohen, Braudy, 1992, p. 71).

BIBLIOGRAPHY

Early film theorists considered issues of religion on a regular basis.

For a good critical study of early film theory and the quasi-religious language that the theorists used see Rachel O. Moore, *Savage Theory: Cinema as Modern Magic* (Durham, N.C., 2000). Useful anthologies on film theory include Richard Abel, ed., *French Film Theory and Criticism: A History/Anthology, 1907–1939*, 2 vols. (Princeton, 1988) and, more broadly, Gerald Mast, Marshall Cohen, and Leo Braudy, eds., *Film Theory and Criticism: Introductory Readings*, 4th ed. (New York and Oxford, 1992) and Bill Nichols’s *Movies and Methods*, 2 vols. (Berkeley, 1976–1985). See also André Bazin’s article “Cinema and Theology” in *Bazin at Work: Major Essays & Reviews from the Forties & Fifties*, edited by Bert Cardullo and translated by Cardullo and Alain Piette (New York, 1997), pp. 61–72.

There have been few studies of religion and film outside Christianity and outside European and North American productions. Occasional articles in edited collections, such as John May’s *New Image of Religious Film* (Kansas City, Mo., 1997) and several of the chapters in S. Brent Plate and David Jasper’s *Imag(in)ing Otherness: Filmic Visions of Living Together* (Atlanta and Oxford, 1999), as well as Plate’s *Representing Religion in World Cinema: Filmmaking, Mythmaking, and Culture Making* (New York, 2003), deal with non-Christian, non-Hollywood films. *The Journal of Religion and Film*, available from <http://cid.unomaha.edu/~wwwjrf>, has also published a number of articles dealing with world cinema.

Significant among the first wave of “religion in film” studies dealing with broad, existentially religious themes are Neil Hurley’s *Theology through Film* (New York, 1970), Ernest Ferlita and John May’s *Film Odyssey: The Art of Film as Search for Meaning* (New York, 1976), and Ronald Holloway’s *Beyond the Image: Approaches to the Religious Dimension in the Cinema* (Geneva, 1977). Some of the second wave of studies that turned toward popular film yet retained a broad understanding of religion can be seen in Joel Martin and Conrad Ostwalt’s edited *Screening the Sacred: Religion, Myth, and Ideology in Popular American Film* (Boulder, Colo., 1995) and Margaret Miles’s *Seeing and Believing: Religion and Values in the Movies* (Boston, 1996). The second wave also includes many works dealing explicitly with Christian theology, including Clive Marsh and Gaye Ortiz’s edited *Explorations in Theology and Film: Movies and Meaning* (Malden, Mass., 1998), and an overabundance of books dealing specifically with images of Jesus and “Christ figures” on screen, including Roy Kinnard and Tim Davis’s *Divine Images: A History of Jesus on the Screen* (New York, 1992), Lloyd Baugh’s *Imaging the Divine: Jesus and Christ-Figures in Film* (Kansas City, Mo., 1997), and Christopher Deacy’s *Screen Christologies: Redemption and the Medium of Film* (Cardiff, UK, 2001). There are also many works dealing with relations of the Bible to film, such

as Robert Jewett's *Saint Paul at the Movies: The Apostle's Dialogue with American Culture* (Louisville, Ky., 1993), Bernard Brandon Scott's *Hollywood Dreams and Biblical Stories* (Minneapolis, 1994), George Aichele and Richard Walsh's edited *Screening Scripture: Intertextual Connections between Scripture and Film* (Harrisburg, Pa., 2002), and Erin Runions's *How Hysterical: Identification and Resistance in the Bible and Film* (New York, 2003). For an updated theory (beyond Tillich and Niebuhr) of the relations of Christianity to culture, see Kathryn Tanner's *Theories of Culture: A New Agenda for Theology* (Minneapolis, 1997).

For overviews of some of the studies dealing with religion in film, see chapter 1 of John C. Lyden's *Film as Religion: Myths, Morals, and Rituals* (New York, 2003) and Steve Nolan's "The Books of the Films" in *Literature and Theology* 12, no. 1 (1998): 1–15.

Studies focusing on "religion as film" come from a variety of perspectives, including Lyden's religious studies orientation in *Film as Religion*. For a film studies perspective see Paul Schrader's *Transcendental Style in Film: Ozu, Bresson, Dreyer* (Berkeley, 1972) and P. Adams Sitney's *Visionary Film: The American Avant-Garde, 1943–2000*, 3d ed. (Oxford, 2002). Many of the early film theorists took this approach as well; see the sources listed above.

Scholarly work relating the "cinematic experience" to religion and ritual is still in its early stages, but see, for example, the work coming out of the social sciences, such as Patrick Kinkade and Michael Katovich's essay "Toward a Sociology of Cult Films: Reading *Rocky Horror*" in *Sociological Quarterly* 33, no. 2 (1992): 191–209. Paul Nathanson's *Over the Rainbow: The Wizard of Oz as a Secular Myth of America* (Albany, N.Y., 1991) and several of the articles in Plate's *Representing Religion in World Cinema* deal with the religious reception of films. Film and religion are usefully brought together by the use of such third terms as cultural studies, media studies, or visual culture. From a media studies perspective, see Eric Rothenbuhler's *Ritual Communication: From Everyday Conversation to Mediated Ceremony* (Thousand Oaks, Calif., 1998) and Stewart Hoover and Lynn Schofield Clark's edited *Practicing Religion in the Age of Media: Explorations in Media, Religion, and Culture* (New York, 2002). David Morgan, while not dealing with moving images, nonetheless develops useful methods for seeing the relations between religion and visual culture, particularly in his *Visual Piety: A History and Theory of Popular Religious Images* (Berkeley, 1998).

S. BRENT PLATE (2005)

FINNISH RELIGIONS. The scope of what is covered by the phrase Finnish religion(s) varies according to the different meanings of Finn, Finnish, and Finland geographically, linguistically, and historically.

Finland is, with Iceland, the world's most northerly country. Its location on the Gulf Stream allows for the economic diversity that supports its population, which has been quite small throughout history and totaled around 5.2 million in 2004.

Despite the fact that Finland is less Arctic than parallel territories in Russia, Canada, and the United States, being

only partly under permafrost, the north is crucial in the religions of the Sami (ca. 8,000 in Finland) and Finns, the two indigenous peoples of Northern Europe. The Latin word *fenni*, first found in Tacitus's *Germania* (98 CE), comes from Germanic speakers who defined their northern and eastern neighbors as Finns. Tacitus describes barbarian people somewhere in the northeastern Baltic region, living "in unparalleled squalor and poverty." As the nomadic *fenni* lifestyle differed from that of the Germanic peoples, who lived a more settled existence, the term *Finn* might have referred to the way of life these people followed. Thus, the word *fenni* may have encompassed the ancestors of both Finnish and Sami speakers, who shared a common "Lapp" nomadic way of life. Old Norse sagas and chronicles by Saxo Grammaticus and Adam von Bremen make a distinction between two types of Finns, those who were settled down and the nomads known as *Scridfinni*.

The word *Finn* (Finnish, *suomalainen*) means citizen of Finland, an independent country since 1917. Despite joining the European Union in 1995, increased international activity, and a trend toward multiculturalism, Finland today is more monocultural than a century ago; the 2004 census reveals a population that is over 90 percent Finnish (*suomi*), around 6 percent Swedish, and 0.5 percent Russian. Finland has older immigrant populations, such as Rom, Tatar Moslems, and Jews, and since the 1990s approximately 100,000 immigrants speaking more than 100 languages have arrived.

Recent development have brought new diversity to the religious life of Finland, which now has a population of around 20,000 Muslims, but the general picture has remained as monotonous as in other Nordic countries, with Evangelical Lutheranism serving as the state church and "ethnoreligion." Loyalty to the established church is characteristic of Finnish civil religion; the five main revivalist movements have remained within the Lutheran Church. Despite a certain loosening of the situation following the freedom of religion law of 2002, the position of the Evangelical Lutheran Church, to which around 85 percent of Finns belong, is strong. The position of the Orthodox Church of Finland, which is an independent national church with four bishops, is stronger than its 1.2 percent membership would suggest, due to Finland's long history of Karelian roots.

Historically, the concept of *Finland* is newer and less complicated than that of the *Finn*. From the Middle Ages, Finland (proper) was one of the three to seven provinces of the Kingdom of Sweden. It became a state in 1809 when, as a Grand Duchy of the Russian Empire, it was granted autonomy, with Helsinki as the new capital. This autonomy favored nation-building ambitions that had been impossible during Finland's long history of Swedish control. The resultant nineteenth-century nation-building process was fed by Finland's notion of the uniqueness of its history, by the celebration of the epics in the *Kalevala*, and by nationalist identification with the Finnish (*suomi*) language.

A new Finnish self-esteem expressed by the historian Yrjö Koskinen (1830–1903) was based on the notion of language as the property shared by Finnish-related peoples in Russia; Finland, Koskinen wrote, stepped “into the light of history quite late because of the country’s extremely peripheral location beside the sea of the Russian peoples.” Identification with national roots was strengthened by research. Matthias Alexander Castrén’s fieldwork among the Finno-Ugric peoples during the 1840s became the cornerstone of Finno-Ugristics. At the same time, a scientific study of the paradigmatic forms of Finnish religion was initiated.

Castrén’s fieldwork stressed Finnish nationalism over Finno-Ugric identity. Castrén returned from his second expedition in 1849, after Lönnrot published his longer version of the *Kalevala*, the (*New*) *Kalevala*, which became recognized as the only proper version of the Finnish epic. It soon replaced the (*Old*) *Kalevala* of 1835, which in 1841 had been translated into Swedish by Castrén. The influence of Romanticism and a surge of nationalism inspired by the French Revolution of 1848 led to a completely new interpretation of the *Kalevala*.

The *Old Kalevala* had been compiled by Lönnrot as a compendium of Finnish myths and was intended to replace and expand upon the *Mythologia Fennica* (1789) of Christfried Ganander. The *New Kalevala* was declared to be the sacred history of the Finns, in a foreshadowing of the later Finnicized National Romanticism. A new historical interpretation of the *Kalevala* projected on to it a linear conception of time tied to the development of Christianity. In this rereading, *Kalevala*’s history began with biblical creation and ended with the voluntary death of its hero, Väinämöinen, after he had been humiliated by the son of Marjatta, the Virgin Mary—the son being none other than Jesus Christ, who now replaced the old hero. Thus, the pre-Christian Finnish worldview was displaced by the faith of the new era. In spite of the consequent linear structure of the epic, the shamanic, cyclic worldview of the rune singers, with its circulation of life and death, is found in the single runes of the *Kalevala* and in the oral poetry that inspired it.

In the new conceptualization of the *Kalevala*, the frightening land of Pohjola, the Northern Land, became the Underworld. In the preface of the *New Kalevala* by Lönnrot, its plot was explained as the war between “us,” the Finns and the Karelians, and “them” in the North, the Lapps in Pohjola. This war of two related peoples filled the social need for a narrative of the heroic Finnish past, following the model of the Viking Age war epic. The war culminated in the robbery of the Sampo from Pohjola, from out of the hands of the evil Lapps. The singing competition of two shamans, Väinämöinen and Joukahainen, was reinterpreted as the battle between “our” *noita* who, of course, was mightier than that of the Lapps. The theory was even advanced that the Sami (Lapps) had no epic poetry, and that Anders Fjellner’s narrative *The Son of the Sun’s Courting Journey to the Land of the Giants* (1849) was inauthentic. Research in the 1990s

has shown that this theory is false; there is indeed a Sami style of epic shamanic *juoigat*.

The profound changes in the interpretation of the *Kalevala* are related to Romantic nationalist ambitions, which got the upper hand in Lönnrot’s work. Lönnrot himself played an active role in the process of transforming the *Kalevala* into a nationalist symbol. For the new Finnish political establishment, the *Kalevala* became the symbol of a Finnish national religion, expressed in paintings, music, solemn national holidays, and so on.

The discipline of folklore was established under the sway of this nationalistic spirit, and did not achieve true academic acceptance until the 1960s. Uno Harva (formerly Holmberg), Martti Haavio, and Lauri Honko are the three Finnish scholars who did the most to establish comparative religion as a serious field of study in Finnish universities. Harva and Haavio both had broad expertise on Finnish folk belief and traditional oral genres. As Honko wrote in Haavio’s 1973 obituary: “Folkloristics and comparative religion were always intertwined in Martti Haavio’s scholarly work” (*Temenos* 9, p. 148). Harva, Haavio, Honko, and others emphasize the power of words in Finnish religion, at first recognized by Domenico Comparetti, an Italian scholar of the *Kalevala*. The general perspective of the Finnish phenomenology of religion school is regionally Finnish—or Finno-Ugric. Broad phenomenological comparisons over space and time are made between Finnish words and Finno-Ugric myths; at the same time, parallels are drawn with elements of other religious systems, placing Finnish myths into the framework of global religious traditions.

Finnish cosmology includes elements typical of the symbolic structures shared by northern cultures in general. The region inhabited by humans was regarded as an island surrounded by a stream. Above earth stood the mighty vault of the heavens, the celestial sphere around the Polar Star as its cosmic column, surrounded by Orion, the Great Bear, and Perseus. The cosmic mountain is located in the center of the universe, and is its pillar. The cosmos was divided into three zones: the upper world, the human middle world, and the underworld. This tripartite structure of the universe is one of the oldest north Eurasian folk beliefs. The role of the shaman is to act as a mediator between the three levels of the universe. The kingdom of the dead (Finnish, *Tuonela*) is sometimes thought of as being in the Northern (Pohjola) village, with its iron gate and powerful female figures, such as Louhi, mistress of Pohjola. Another conception is that of the nether world, with its underworld inhabitants (*manalaise*), or *vainajat*, the spirits of the ancestors.

SOURCE MATERIALS. The first evidence concerning Finnish religions is archaeological, such as the graves indicating ancestor worship and the approximately one hundred pictograph fields dating from between 4500 and 500 BCE. A new interpretation of these pictographs is provided by Juha Pentikäinen and Timo Miettinen in their *Pyhän merkkejä kivessä* (2002); the joint study of an archaeologist and a scholar of

religion, this book deciphers the hidden messages painted or carved on rocks, and analyzes them in relation to shamanic systems of thought and oral poetry.

Mythologia Fennica, published in 1785 by Christfried Ganander, Vicar of Rantsila (1741–1790), was the pioneering study of comparative mythology in Finland. It consisted of a dictionary of Finnish and Lapp sacred and historical vocabulary, accompanied by oral poetry transcriptions and mythology texts. Typically enough, it was concerned with the mythology of both the Finns and the Lapps.

Fragments of Lappish Mythology, published by Lars Levi Laestadius (1800–1861), is a reconstruction of folk beliefs. An important distinction is made between the religious and cultural knowledge of the average person (today defined as collective tradition) and the esoteric secret wisdom of the experts, called *noaidis* (“shamans”) in Sami. Laestadius strongly criticizes the nature mythology of Carl Axel Gottlund, a contemporary scholar who did his fieldwork among the Forest Finns throughout Scandinavia.

FINNO-UGRIC RELIGIONS

This entry consists of the following articles:

AN OVERVIEW
HISTORY OF STUDY

FINNO-UGRIC RELIGIONS: AN OVERVIEW

The Finno-Ugric peoples constitute a family of scattered nations and populations in northern Eurasia in an area that reaches from northernmost Scandinavia and Finland to western Siberia and from the Volga-Kama Basin to Hungary. They speak approximately thirty cognate languages, which, with four Samoyed languages, form the Uralic family of languages. It is mainly the linguistic affinity that links these peoples and cultures; the cultural and religious affinities between them are more difficult to ascertain, spanning as they do considerable geographical distance from each other and over 5,000 years of only partly shared history through which each of them had contacts with different peoples. An “original” Finno-Ugric religion postulated by various scholars thus remains hypothetical, but the religious beliefs and practices of the Finno-Ugric peoples have provided an interesting case for comparative methodology in the history of religions, or rather regional phenomenology of religion masterly covered by experts on Finno-Ugric religions.

GENEALOGY OF LANGUAGES, PEOPLES, AND CULTURES.

Theories of linguistic descent are usually based on the concept of a protolanguage and its subsequent differentiation. The real development, however, probably consisted of complex processes of multiple integration into and differentiation from cognate languages, with the interpenetration of noncognate languages in a given region also playing a role. According to the generally accepted chronology, the Uralic protolanguage began to split up into Finno-Ugric and Samoyed protolanguages around 4000 BCE. In the twenty-first century the Samoyed languages are spoken by some thirty-five thousand people living on the shores of the Arctic Ocean and along the banks of rivers flowing into it between the Taymyr and Kanin Peninsulas. The early Uralic and Finno-Ugric settlements were presumably located in the south, somewhere between the Ural Mountains and the middle reaches of the Volga River. After the differentiation of the Ugric branch around 3000 BCE, and its subsequent division into the Ob-Ugric (Khanty and Mansi in the north) and into a more southerly ethnos that later became the Hungarian branch, the rest of the Finno-Ugrians either stayed near the Volga and developed into the Mari (Cheremis) and Mordvin peoples of today or moved to the north or the northwest. The northern group, the Permian settlement, persisted over two millennia and became divided only a little over one thousand years ago into the Komi (Zyrians), living in the region between the upper reaches of the western Dvina, the Kama, and the Pechora Rivers; and the Udmurts (Votiaks), living between the Kama and Vyatka Rivers. The northwestern group reached the eastern shores of the Baltic Sea, became intermingled with the former inhabitants in contemporary Finland and Scandinavia, and linguistically

developed into what we now know as Sami (Lapps), Finns, Karelians, Ingrians, Votes, Veps, Estonians, and Livonians. The development was far from unilinear and regular, as is shown by contemporary linguistic groups within the Ugric branch range from fourteen million Hungarians to small populations of Mansi (Voguls) and Khanty (Ostiaks) in the northern Ural Mountains and along the Ob River. Similarly, among five million Finns and one million Estonians traces of almost extinct Votes and Livonians have been found. The most recent censuses and maps on the numbers and distribution of the Finno-Ugric peoples indicate radical changes that have taken place in the former Soviet Union and Russia, where most Finno-Ugric people are at least bilingual, as well as among the five almost extinct Sami languages out of nine to ten altogether.

Finno-Ugrians once inhabited most of northeast Europe. It was relatively late that the Slavic expansion changed the picture from the medieval era, and in Siberia from the sixteenth century onward. Another impact was made by the Turco-Tatar tribes and by the Bulgar empire in the Middle Ages, which particularly affected the culture of the southeastern Mari and Udmurts. Western influence was strongest in the Baltic sphere, where early loanwords were adopted from the Baltic- and Germanic-speaking people from the third to the first millennium BCE. Some remote groups of Finno-Ugrians were able to preserve their autochthonous religious traditions fairly late, even until the nineteenth and early twentieth centuries, because the discipline of Eastern Christianity was rather ineffective or permissive and more tolerant toward folk belief than in western Finland, for instance, where Western Christianity, such as Roman Catholicism from the medieval era onward and, later, Lutheranism, abolished sacred groves (Finnish *hiisi*) and several other archaic expressions of religious phenomena that had survived in the Russian Orthodox east (eastern Finland, Karelia, and Ingria) the southeastern Finno-Ugrians the traditions of their Islamic neighbors left marks on the folk religion.

Since the history of Christian missions and crusades is fairly long—the first signs and words from Eastern Christianity in Finland are from around 800 CE and Catholic crusades began in the twelfth century among the western Finns and in the fourteenth century among the Komi, for example—and trade relations with Christianized cultures existed much earlier, it must be assumed that the survival of early folk belief, myth, and ritual among the Finno-Ugrians is partly an example of the coexistence of great and little traditions; that is, Eastern and Western Christianity or Islam versus ethnic religions. The same people who were devout Christians could also perform ancient rites and hold beliefs that did not necessarily contradict Christian doctrine because they were so skillfully adapted and integrated into each other. Indigenous religion began to adopt Christian elements before formal missionizing took place, and long after it had established its position as the official religion, the Christian religion found itself in a symbiosis with pagan belief and custom, at least at the level of folk religiosity.

METHODS OF COMPARISON. The development of and variation in the religions of the Finno-Ugrians must be seen as an interplay of phenomenological, ecological, and historical aspects. At the phenomenological level the question asked by Lauri Honko, for example, is: Are there any typically Finno-Ugric contributions to the phenomenology of religious universals? The answer is: The wide natural-geographical and cultural-historical scale, ranging from mobile hunting and fishing communities in the Arctic north to stable farming and cattle-breeding societies in the south and from remote pockets of religious tradition to the crossroads of Byzantine and Roman influence, permits one to examine the relative importance of linguistic continuity in cultural variation. To reconstruct a true proto-Finno-Ugric religion may be impossible, as the religious systems have changed so many times, but some structural or systematic elements may be discerned, irrespective of whether they belong to a vertical tradition. There are similarities in cosmological belief, in the system of spirits, and in ancestor worship that may not occur as frequently among non-Finno-Ugrians. From the phenomenological point of view, however, dissimilarities may turn out to be as important as similarities, and in the area of language we must remember the existence of the superstrate and substrate area of traditions; that is, the language of a population may change while the traditional content is retained. Under Slavic linguistic form we may find substrata of Finno-Ugric tradition, especially in the north of Russia.

Ecological comparisons may help to explain similarities that are not based on historical contact and interaction between cultures. Ecological comparison often turns out to be regional: Similar trends become discernible among all or most cultures in a given zone, regardless of linguistic affinities. There are different “ecologies” to be observed: those that are based on the natural environment, those that are dependent on the sociocultural development or stage of development in the societies to be compared, and those that refer to the morphology of the religious tradition itself. Finno-Ugric material provides interesting points of departure for attempts to understand the extent to which physical environment, the stage of societal development, and the morphology of the tradition may interact with each other or with linguistic or regional factors.

The third and most common level of comparison has been the historical one. Most recent findings on rock art, pictographs, and petroglyphs in Russia, Karelia, the Kola Peninsula, and Finland have revealed new materials found from the territories occupied by the Finno-Ugric populations or their genetic or maybe even linguistic ancestors. This means that early historical sources and archaeological findings in the field of Finno-Ugric religion are more abundant and illuminating than suggested by Honko in the first edition of this entry. Although the testimonial value of these sources may be rather scanty and problematic, they should be carefully studied in the long chain starting from the archaeology of the petrified language on rock, painted by red clay or carved

with hammer by a Neolithic man, regardless of the language he spoke. Comparison may be made of the shamanic paraphernalia (e.g., *sejd* and other anthro- and zoomorphic stones, drums, dress, and so on) found in the shamans' graves, such as in Karelia (Elk Island on Lake Onega) and northern Finland (Kuusamo).

Tradition-historical analysis shows how the historical assumptions may be based on the evidence of relatively late documents of oral tradition. The assumption usually is unidirectional: One people has borrowed beliefs or rituals from another. Interaction in cultural contact or dissimilar functions of similar traits (or similar functions of dissimilar traits) in different tradition systems are rarely discussed. In spite of this, interesting evidence of early historically connected strata in Finno-Ugric religious tradition has been detected, as for instance in the case of bear killing and the bear feast of the Ob-Ugrians, Karelians, and Sami. There are also phenomena that can only be explained historically, such as the revival of dirge ceremonies in Russian and Karelian areas because of the sufferings caused by World War II.

MORPHOLOGY. One way to organize the Finno-Ugric religious traditions is by the occupations of hunting and fishing, cattle breeding and nomadism, and agriculture and subordinate handicraft industries. These forms of subsistence do not normally occur alone, however, but in various combinations. It is the skillful combination of many different sources of livelihood and the calendar cycle based on these that characterizes most Finno-Ugric groups and their religious tradition. Three calendar systems basically contribute to the formation of the cycle: the calendars of nature, of human work, and of the church (saints' days and so on). The cycle requires new roles of the individual and the re-creating of different social worlds of the community; specialists exist, but the division of labor rarely allows specialists of one domain only. The calendrical cycle expressed by calendar rites is crucial for the cohesion of society and its communal economic activity.

Another important organizing factor of ritual life is the human life cycle from birth to death and the accompanying rites of passage. Through these it is possible to express and legitimize changes of social status and reinforce the prevailing social structure. The early Finno-Ugric communities do not seem to have developed elaborate ceremonies of initiation—even the shamanic initiation did not involve large audiences—but the idea of initiation can be seen in small rituals such as the wrapping of a newborn child in his or her father's sweaty shirt, bringing "tooth money" to the new child (Karelia), dressing the bride, guiding the deceased to their relatives in the otherworld, and so on. Weddings and funerals, along with feasts of the agricultural year, comprise the most developed ritual dramas.

Religion of hunters and fishermen. True hunting communities have survived longest in the Arctic and sub-Arctic zones, but traces of their mythology and religious rites continue to survive in various combined economies where hunting or fishing has played a subsidiary role. Finno-Ugric

materials demonstrate a special sensitivity to and knowledge of nature. In the world of the hunter, who generally works alone, animals, plants, and rocks possess a character of their own and must be addressed properly. The hunter sees himself as an interloper on someone else's territory; the animals and features of the forest communicate promises, warnings, and threats. It is not enough for the hunter to know about the best fishing and hunting places and seasons. He must also know about the being who rules over the forest and its inhabitants, the forest master or mistress; he must understand the ways of the "lord of the animals," who determines the movement and fate of all the living creatures in the forest, and of the special guardian spirits that watch over particular animal species. The territorial aspect is also important, in that different formations of nature possess their own local spirits. No less important is the annual cycle, especially the beginning and the end of a season, which later on came to be marked by Christian saints' days. The Lapp way of life meant an annual cycle: The Sami were called the People of the Eight Seasons (after Ernst Manker's 1975 book) because they patterned their lives after their knowledge of the resources of the environment on the annual migration of the wild deer and elk; the spawning and mating cycles of the salmon, trout, and other fish, ptarmigan, swan, goose and other birds; the harvest season for berry picking; and so on.

The most venerated animal in their Arctic and sub-Arctic territories was the bear, seen by the Sami and Ob-Ugrians as their totemic ancestor and as the son of the sky god Num torem. Several myths that recount either the marriage between the first bear and a human girl or the heavenly origin of the bear and its descent to earth and relate how it was slain and returned home to the celestial father after special ceremonies seem to be of common Finno-Ugric origin. These myths were recited in bear ceremonies, during both the killing and the feast itself, events that abound in dramatic and verbal elements. The Ob-Ugric Khanty and Mansi still perform the complex bear ceremony lasting seven days—with each day pertaining to one of the seven stars in the Great Bear constellation—which has been developed into actual theater performances; hundreds of ritual and semiprofane plays and dances are performed during the feast. The totemic element is apparent in the Ob-Ugric moiety system, which consists of the *mós* (the heavenly people, who are hunters and eaters of raw meat) and the *por* (the underground people, who are wizards and eaters of cooked meat); these phratries observe different norms concerning bear hunting. Although the bear is the object of rites and veneration among most of the northern peoples of Asia and America, there are few ritual dramas comparable to the bear ceremonies of the Ob-Ugrians, Finns, and Sami. Even during the course of the more normal hunting of game, the verbal component—prayers, spells, and songs—is well developed among the Finno-Ugrians. The spirits are usually designated by compounds such as "forest-man," "forest-father," or "forest-master." The system of "fathers" and/or "mothers" of territories, places, buildings, and so on was common.

Religion of cattle breeders and nomads. Cattle breeding is an important subsidiary means of livelihood especially among the Finno-Ugrians of the north, where agriculture is constantly threatened by the climate. The religious profile of cattle breeders is not as clear-cut as that of the hunters and farmers; it also appears in symbiosis with the beliefs of those who practice agriculture. As a means of subsistence, nomadism is also subsidiary, not only to agriculture, but also to hunting. When the flocks of wild reindeer grew thin, the Arctic hunters of both Fennoscandia and the Kanin Peninsula developed reindeer herding, which in some places, such as Sweden, led to full domestication and a dairy economy. Only the reindeer was capable of finding its food even under the snow, and it soon became an indispensable draft and slaughter animal. Another area for wide-scale herding was the Hungarian plains, where the swampy land was unsuitable for farming but provided excellent pasture.

The yearly cycle of the cattle breeder is roughly divided into two halves: the indoor period and the outdoor period; only in Hungary is there some outdoor herding all year round. In the winter horses and cows are under the rule of the owner/cattle breeder and his or her supranormal counterpart, the stable or cowhouse spirit. In the summer the herdsman, often an employee, takes over and the supranormal guardianship is transferred to the forest spirit or other spirits in the landscape. The cattle owner and herdsman observe many rituals, which tend to accumulate at the beginning and the end of a season; minor prayers and offerings that relate to such events as imminent danger or bad weather are also performed during the season.

In the Balto-Finnic areas Saint George's Day (April 23) marks the sending of the cattle to pasture; the ritual has to be performed even if it was too cold for outdoor herding. The animals were encircled by people who walk around the flock carrying an icon of Saint George, an ax, burning coal, gunpowder, churchyard dirt, quicksilver, a hymnal, and a bear's tooth, among other items. Magic signs were drawn on the animals, doorposts, or the cattle's intended route. Food offerings were brought to the forest spirit, and an egg was thrown over the flock. The cattle owner asked the herdsman, the victorious dragon-slayer Saint George, and the forest mistress to join forces to protect the cattle against bears, wolves, and other dangers.

In October the cattle were taken indoors; the autumnal season was brought to an end by slaughtering a sheep or cow around Michaelmas (September 29) or All Saints' Day (November 1). This was the first "New Year" festival, during which dead relatives visited one's home, and, in northern Karelia, the myth of the slaying of the Great Ox was sung. Many southern Finno-Ugric peoples combine their cattle breeding cult with summer feasts and offerings organized primarily as part of the agricultural cycle. In long prayers presented on these occasions cow luck, horse luck, and so on is asked from many gods of the sky and the earth.

Religion of farmers. The society and religion of hunters and cattle breeders is competitive; among the latter, especially, the rites are directed against fellows and neighbors. Even if the principle of "limited good" (one's success means another's loss and vice versa, because the sum of good is constant) is valid in agriculture, the atmosphere is clearly more social and collective than in cattle husbandry. This social atmosphere is clearly expressed in the great rural ritual feasts of the southern Finno-Ugric peoples: the Mordvins, the Mari, and the Udmurts. The traditions of the last two groups derive to a large extent from their Turco-Tatar neighbors, whereas the Mordvins have adopted more from the Russians; regardless, all three have used Finno-Ugric and other traditions of their particular region in creating their agricultural cycles. A broad social approach, in which success is sought not only for the individual or his family, but also for the whole village or a larger population, especially the poor and disabled, prevails in the long prayer recitations performed in connection with animal and food offerings to dozens of gods and spirits. A Mari prayer from the Kazan area lists what is valued in the following order: family, cattle, corn, bees, money, long life, and great happiness. Another value often stressed in prayer is "harmony"; that is, avoidance of quarrels and disruptive feelings, which is seen as a condition to be met before addressing the gods.

The central mythologems of the farmer are the earth and the sky. These parts of the cosmos or their personifications alternately are manifest in the prayers and rites. Earth is above all the female progenitor, Mother Earth; as such, she is sometimes represented as the generic Corn Mother, and sometimes as the mother or guardian of a particular kind of grain or field. The sky god is closely associated with rain, wind, and other types of storms. Thought of as male, he begets the earth. The myth of *Hieros gamos*, the matrimony of heaven and earth, has been preserved in epic poetry and in connection with rainmaking rituals of the Balto-Finnic area. Importance is also attached to the patron saints of agriculture, among whom Elijah and the Saints Peter and Nicholas are the most central. Various feasts may be observed during midsummer, the period of growth, when the working routines are laid still and the crops are at the mercy of the weather, insects, forest animals, and other natural factors. The Finno-Ugric farmer's worldview is oriented toward peace and harmony, every kind of growth and fertility, personal health, social good, and avoidance of misfortune. The farmer enumerates all the gods to avoid offending any of them and bows to them all; a Mari or Udmurt bows "upward," sacrificing a white animal to the sky, and "downward," sacrificing a black animal to the ancestors, thus placing himself in the middle of a three-storied universe.

Cosmology. Two well-known myths of the origin of the world are found among Finno-Ugric peoples, those of the earth diver and of the world egg. In the diver myth, God orders the Devil (originally a water bird) to bring earth from the bottom of the primeval sea; on the third attempt, he suc-

ceeds but tries to hide some of the earth in his mouth. When God scatters sand and the earth begins to grow, the deceit is unmasked; from the earth found in the cheek of the Devil the mountains and hills are formed. The myth is known from the Ob River to Finland and to the Mordvins in the Volga area. The eastern Finnish variant contains an interesting introduction: God stands on a golden statue in the sea and orders his reflection in the water to rise; this reflection becomes the Devil. The global distribution of the world-egg myth is equatorial, but its northernmost occurrence is found in Finland and Estonia. A water bird or an eagle makes a nest on the knee of the creator (Väinämöinen), who is floating in the sea. It lays an egg, which rolls into the water, and pieces of it become the earth, the sky, the moon, and the stars. Myths concerning the creation of humans are found in various forms among the Mansi, Volga Finns, and Karelians; the Karelian version typifies the basic scenario: A hummock rises from the sea, a tree stump on it splits open, and the first human couple steps forth.

Cosmogonic myths function as powerful protomyths: The origin of any phenomenon must be linked to the central cosmographic symbols, and various etiological continuations to these basic myths are therefore abundant. According to the cosmography of the Finno-Ugrians, a stream encircles the world, which is covered by the canopy of the heavens, the central point of which is the North Star (the “nail of the sky” on which the sky rotates); this star is sometimes associated with the world pole that supports the sky. A world tree—often the tree of life—and a world mountain rise at the center of the universe; there is a world omphalos deep in the center of the earth and a corresponding abyss of the sea that swallows ships. On the backs of three fish rest the foundations of the earth; the movements of these fish cause floods and earthquakes. Another possible cause of the destruction of the world is that the world pole collapses and the heavens—sometimes described as being seven- or nine-storied—tumble down.

Much of this symbolism is well known in other parts of the world, but some details may be exclusively Finno-Ugric. An example is the belief that the sun, moon, and stars are found on the branches of the world tree, usually a great oak. Cosmographic symbols also occur frequently in contexts outside the rituals, in folk poetry.

SANCTUARIES AND OFFERINGS. The home sanctuary of the Udmurts is called the *kuala*. It is a small log cabin in the corner of a square building formation that constitutes the house. In the back corner of the *kuala* is a shelf, on which are branches of deciduous trees and conifers, and above them is a *vorsud*, an empty box with a lid. This is a family shrine for weekly offerings, but if the master of the house is the head of a large family, children may come from afar on certain days to worship here. A new *kuala* can only be founded with earth and ashes from the father's *kuala*. It is believed that in former times the *vorsud* was not empty but contained effigies of spirits. This tradition still continues among Finno-Ugric

peoples. Juha Pentikäinen's field research in North Eurasia (1989-2003) includes several examples on shamanic practices of the mobile Ob-Ugric hunters who still carry their spirit effigies in a special sleigh when migrating.

Another Udmurt sanctuary is the *lud*—a fenced-off area in an isolated place in the woods. In the middle is a table for offerings that are made by the family to dispel diseases, to mark calendric observances, and so on. In addition, there are fenced-off sanctuaries for the offerings of the village; these sanctuaries are sometimes situated near the cornfields. Somewhat similar arrangements are found among the Volga Finns (the *keremet* of the ancestors) and in the Balto-Finnic area where, when slash-and-burn agriculture spread into virgin land and distances grew between pioneering families, village groves were replaced by sacrificial stones (with gouged cups on the surface) and sacred family trees near the dwellings.

Among the nomadic, reindeer-breeding and fishing Sami, the *seita* was a place for sacrifices; it was a cave, a tree stump, or a stone, often clearly visible because of its peculiar (natural) shape, usually chosen near difficult places along a reindeer trail or at some good fishing spot. Offerings were made to enhance the safety of reindeer, good fishing, and so on. Many a sanctuary was only temporary, used for one or two offerings only, and founded mainly to mark a good hunting or fishing ground and to guarantee future luck by giving the first piece of game to the gods.

SHAMANS AND OTHER MEDIATORS. Religious professionalism manifested as priesthood is rare among the Finno-Ugrians. The cults and rites discussed earlier were conducted by those in occupational roles, in some instances as head of a family or working team. Ancestor worship as the predominant cultic form tends to support this kind of arrangement as well. A division of labor took place so that washing and dressing the body as well as lamenting throughout mortuary ceremonies is female work, but shamanic visits to lift up bodies from graves, for example, usually belong to the male ritual repertoire of the shamanic society. Religious performance then becomes part and parcel of working routines and role performance in general.

There is, however, one important exception: the *noita* (shaman or sage). Since *noita* is spoken only in Finnish, Sami, and Mansi, the word is hardly Finno-Ugric. According to scholarly opinions, expressed by Vilmos Diószegi, Honko, Mihály Hoppál, and so on, the early stratum of Finno-Ugric religion must have contained shamanism, although pure shamanism has been documented only in the far north among the Sami and Samoyeds. Indirect evidence supporting this hypothesis is based on the form of similar oral traditions and officiants (from the Finnish *tietäjä* to the Hungarian *talós*), who experience a kind of “verbal ecstasy” and display comparable shamanic symbols in their outfits. Although scholars argue that the Finno-Ugric shamans were many things, including diviners, healers, priests, and experts in various technical skills, it may not be proper to deal with all divine or priestly roles as expressions of shamanism. Rather, there were

different types of experts among different Finno-Ugric peoples who held the highest authority on crisis rites and defended the society against malevolent forces by exercising counter-magic and performing rites of propitiation. Their interpretation became the guideline in times of uncertainty.

Cult priests like the Udmurt *tuno* or the Mari *kart* have accordingly been dealt with as representations of relatively late specialization under the impact of foreign culture, whereas the designation for shaman that is found from Finland (Finnish *noita*; northern Sami *noaidi*) to the Ob River (Mansi *najt*) speaks for a more original stratum (the term has many interesting parallels in these languages). Ancient Finnish folk poetry, Hungarian fairy tales, and other such material have been interpreted as carriers of shamanic motifs, and even if some assumptions prove faulty, the general picture has been regarded as likely to persist. Although the old Scandinavian *saga* and *Edda* traditions also include a similar stratum, other European parallels should be considered. Sami drum and jojk singing is a clear parallel to Siberian and Ob-Ugric shamanhood. Even though no drums have been found from the Finns, the fact remains that until the late nineteenth and early twentieth centuries the Finnish and Karelian *tietäjät* still fulfilled many functions and used many techniques and expressions in his charms and vocabulary reminiscent of shamanic practices and folklore in Siberia.

To balance the picture, Honko introduces the female counterpart of the *tietäjä*, the lamenter (Finnish *itkijä*), who with her ecstatic performance was able to set the entire audience at a funeral or a memorial feast in the socially proper mood and prepared a catharsis from uncertainty and grief for her community. Lamenting was customary in the rites of departure (conscriptio, weddings, and funerals) and the lamenter became a kind of psychopomp who with her intensive empathy and metaphorical language guided the helpless object of the rite. This tradition lived with the indirect support of the Russian Orthodox Church much longer than most traditions discussed earlier and is still practiced in certain parts of Soviet Karelia.

BIBLIOGRAPHY

A comprehensive presentation of Finno-Ugric mythology by Uno Holmberg (later, Harva) can be found in *The Mythology of All Races*, vol. 4 (1927; reprint, New York, 1964). Many monographs on the religion of the Finno-Ugric peoples have been published in the series *Folklore Fellows' Communications* (Helsinki, 1910–). More recent works are Ivar Paulson's "Die Religionen der finnischen Völker," in *Die Religionen Nordeurasiens und der amerikanischen Arktis*, edited by Paulson, Åke Hultkrantz, and Karl Jettmar, pp. 145–303 (Stuttgart, 1962), and "Religionen der finnisch-ugrischen Völker," in *Handbuch der Religionsgeschichte*, written by Honko, edited

by Jes Peter Asmussen and Jørgen Laessøe, vol. 1, pp. 173–224 (Göttingen, Germany, 1971). Honko, with Senni Timonen, Keith Bosley, and Michael Branch, published an assembly of Finno-Ugric ritual texts in their original languages and in translation, with commentaries, in *The Great Bear: Folk Poetry in the Finno-Ugric Languages* (Helsinki, 1993). *Komi Mythology* by Nikolay Konakov and others is the first volume in the *Encyclopaedia of Uralic Mythology*, edited by Siikala, Napolskih, and Hoppal, and will include compendia on various Finno-Ugric religions dating the classical series "Suomen suvun uskonnot" (Religions of the Finno-Ugric Peoples) by Kaarle Krohn, Holmberg (Harva), and K. F. Karjalainen. For further reading on Estonian folk religion, see Ivar Paulson's *The Old Estonian Folk Religion* (Bloomington, Ind., 1971). Additional references to basic Finno-Ugric sources can be found in respective entries of this dictionary, as well as in the bibliographies of the above-cited works and the *Wörterbuch der Mythologie* series (Stuttgart, 1965).

FINNO-UGRIC RELIGIONS: HISTORY OF STUDY

The ways of life and customs of peoples inhabiting the northern regions of Europe concerned even the earliest historiographers, such as Herodotus (c. 484–between 430 and 420 BCE) and Tacitus (c. 55–120 CE). Nevertheless, the first genuinely valid data regarding peoples of the Finno-Ugric language family can be found only much later, in the works of writers living from the fifteenth to seventeenth centuries: Mathias de Miechow, Sigismundus Herberstein, Olaus Magnus (1490–1557), Michael Agricola (1508–1557), Alessandro Guagnino, Nicolaes Witsen (1641–1717), Johannes Schefferus (1621–1679), Nicolaie Spataru (1663–1708), and Adam Olearius (1603–1671), among others. The information conveyed by these writers in their religious, geographical, ethnographical, or historical texts has proved to be a valuable contribution not only to social history and ethnography, but to the history of their religion(s) as well.

FOUNDATIONS OF EIGHTEENTH-CENTURY STUDY. The eighteenth century was a time of great journeys and discoveries as well as the publication of travel literature based on eyewitness accounts on respective areas. At this time the peoples of northern Eurasia and Siberia among others became objects of genuine scientific interest. Several authors of travel accounts, namely Y. E. Ides, D. G. Messerschmidt, P. J. Strahlenberg, Johann Georg Gmelin (1709–1755), and J. G. Georgi, made interesting observations not only about the languages of northern Eurasian peoples, but also about their customs and religious cults. These writings also established the basis for the eventual recognition of Finno-Ugric as a language family. Two German scholars, Johann Eberhard Fischer (1697–1771), who was a member of the Russian tsar's academy, and August Ludwig von Schlözer (1735–1809) played especially important roles in this discovery by summa-

rizing in their scholarly works the available information concerning Finno-Ugric peoples: Fischer in *Sibirische Geschichte* (1768) and von Schlözer in *Allgemeine Nordische Geschichte* (1771). In Hungary Finno-Ugric comparative linguistic research was initiated by the study *Demonstratio: Idioma Ungarorum et Lapponum idem esse* (Proof that the languages of the Hungarians and the Lapps are the same; 1770), by Janos Sajnovics (1733–1785), and the study *Affinitas linguae Hungaricae cum linguis fennicae originis* (Relationship of the Hungarian language to languages of Finnic origin; 1779), by Samuel Gyarmathi (1751–1830).

The first Finno-Ugric studies were thus written simultaneously with, and not independently of, respective studies in Indo-European comparative linguistics. Progress in Finno-Ugric studies was slower than that of Indo-European studies because of the more remote distance between peoples themselves as well as scholars studying them. In the same way as the three Finno-Ugric peoples of Europe—Finns, Estonians, and Hungarians, who later on became the only ones to be able to found the national states where Finno-Ugric languages are in majority—lived far from one another, so their scholars also lived in scientific isolation without knowing too much about each other's scientific works and results.

Nevertheless, both the Finns and the Hungarians were able to complete their first mythologies in the last decades of the eighteenth century. In Finland, Henrik Gabriel Porthan (1739–1804), learned professor of rhetorics at Turku Academy, was familiar with theories on Finno-Ugric peoples in Germany. He advocated the publication of Erik Christian Lencquist's doctoral dissertation, *De superstitione veterum Fennorum theoretica et practica* (Superstition in belief and practice among the ancient Finns; 1782), which was based on data collected from people. Another Finnish scholar, Christfried Ganander (1741–1790), a Lutheran pastor in Rantsila, northern Ostrobothnia, created a network of over one hundred ministers and officials around Finland while gathering data for his huge Finnish-Swedish dictionary—until 1997 available in three facsimile volumes only—and Finnish mythology (*Mythologia Fennica*, 1789). The latter is a kind of Finnish-Lappish comparative mythology since it provides an alphabetical listing of Finnish and Lappish (Sami) mythological terms and concepts with historical and other information related to entries. The work is a valuable source of the original runic poems of the eighteenth century and the foundation of the comparative mythology school in Finland. Since it worked as Elias Lönnrot's (1802–1884) model for his further collecting of poems in the field, it was the primary basis for the whole creation of the idea of the Finnish epics. Typically enough, the first editions of the Finnish-Karelian epics compiled by Lönnrot carried the title *The Mythology of the Finnish People edited by Old Poems* before the book was finally named as the *Kalevala* in 1835, with a geographical reference to a mythical dwelling place of Kaleva's gigantic sons—in Lönnrot's thinking, Kaleva was the king of Finland.

Hungarian mythology was introduced in Europe by Daniel Cornides (1732–1787), who lectured on ancient Hungarian religion at the University of Göttingen in 1785. Basing his arguments on medieval chronicles, he compared the remains of ancient pagan Hungarian religion with elements of the ancient Jewish, Greek, and Scythian religions. Later on, in his short study *Commentatio de religione veterum Hungarorum* (Comments on the ancient religion of the Hungarians; 1791), he compared ancient Hungarian religion to Persian religion.

NINETEENTH-CENTURY NATIONAL MYTHOLOGIES. During the first decades of the nineteenth century there was a romantic interest in folk tradition many parts of Europe, especially in Germany. Under stimuli of Indo-European comparative linguistics and mythological research, the collection of folk poetry and the exploration of narrative folk traditions began. Two seminal works of the period were published in 1835. The first was *Deutsche Mythologie* by Jacob Grimm (1785–1863), which subsequently served as a model for reconstructing mythologies of several peoples, among them the Finns, the Estonians, the Sami, and the Hungarians. The other, the *Kalevala* by Lönnrot, contributed to the study of Finnish mythology by compiling folk poetry on the basis of epic songs. In accordance with its initial names, this (Old) *Kalevala* with thirty-two songs was the mythology of the Finns on the basis of the epic poems. Its second, enlarged edition published in 1849 contained almost a double amount of verses, 50 songs with 22,759 lines in all. After Grimm's speech in 1845 at the Academy of Berlin, the (New) *Kalevala* was now offered by Lönnrot as the national epic of the Finns, not as their mythology any more, but as the sacred history of the new nation. The European readers at large only became acquainted with the (New) *Kalevala* through its German translation published in 1852.

The discovery that the Finns, a people small in number, had produced heroic epic poetry comparable with the Homeric epics profoundly impressed the scholars of other Finno-Ugric nations as well. Encouraged by Lönnrot as early as the 1840s, Reinhold Kreutzwald (1803–1882) began collecting Estonian narratives and epic songs about Kalevi-poeg, a gigantic folk hero of exceptional strength. While the first prototext of about twelve thousand lines was completed by 1853, the reconstructed epic itself, *Kalevi poeg: Üks ennemuistene Eesti jut: Kaheskümnes laulus* (Kalevi-poeg: An ancient Estonian legend in twenty songs), was published considerably later (in 1862), in Estonian, even though it appeared in Finland. Meanwhile, Kreutzwald worked on reconstructing Estonian national mythology and published the study "Über den Charakter der estnischen Mythologie" in the journal *Verhandlungen der Gelehrten Estnischen Gesellschaft zu Dorpat* (1850).

The romantic quest for Pan-Finnish identity, to find related peoples and an ancient, common land of origin (where the forebears of related peoples had lived together), prompted scholars of the mid-nineteenth century to undertake long

journeys of exploration. For example, Matthias Alexander Castrén (1813–1852) collected valuable material during his repeated Siberian travels and described his research in *Reiseerinnerungen aus den Jahren 1838–1844: Nordische Reisen und Forschungen* (Travel recollections, 1838–1844: Nordic travel and research; 1833). Castrén's lectures on Altaic (i.e., Finnic) mythology, given during the last years of his life, were published in translation from Swedish under the title *Vorlesungen über die finnische Mythologie* (1853).

Meanwhile, Castrén's Hungarian contemporary Antal Reguly (1819–1859) went on a research trip among the Ob-Ugrians and presented the results of his research in *Ethno-graphisch-geographische Karte des nördlichen Ural-gebietes* (Ethno-geographical map of the northern Ural region; 1846). Only some two decades later did Pál Hunfalvy (1810–1891), one of the founders of Finno-Ugric comparative linguistics, publish Reguly's collection, which contained valuable folk literature—primarily texts of Mansi (Vogul) heroic epics—in *A vogul föld és nép* (The Vogul land and its people; 1864).

For the sake of proper chronology, one must mention here the first comprehensive collection of Hungarian mythology, *Magyar Mythologia* (1854), published during the romantic era of reform after the Hungarian revolt against Austria (1848–1849). Its author, Arnold Ipolyi (1823–1886), a learned Roman Catholic bishop, collected folk tales, legends, and folk beliefs of the region. At the same time he was intimately familiar with the contemporary scholarly literature dealing with comparative mythology. As he pointed out, his work was greatly influenced by the mythological studies of Jakob Grimm, Georg Friedrich Creuzer (1771–1858), and Joseph von Görres (1776–1848), but he also quoted the Finnish studies by Lencquist, Ganander, and Castrén. Ipolyi's study, more than five hundred pages long, is a genuine comparative-mythological survey, though its assertions should today be looked on from a critical distance. A few years later, Ferenc Kállay (1790–1861) compiled another work, though more modest, about the religion of the pre-Christian Hungarians (*A pogány magyarok vallása*, 1861), in which he described the major figures of ancient Hungarian mythology.

For the one-thousandth anniversary of the Magyar conquest of Hungary, Kabos Kandra (1843–1905) prepared the third edition of *Magyar Mythologia* (1897). Although Kandra was in a position to build on the findings of contemporary Finno-Ugric linguistics, his work is basically the last romantic attempt at reconstructing the system of Hungarian mythology. While the most important text among the materials used for purposes of comparison is the *Kalevala*, the *Mythologia* also depends on quotations from the studies and text collections of Bernát Munkácsi (1860–1937). Munkácsi's fieldwork among the Udmurt (Votyaks) and Mansi (Voguls) took place in the second half of the 1880s. He published his own and Antal Reguly's findings in four thick volumes, with copious notes on mythology, titled *Vogul Nép-*

költési Gyűjtemény (Vogul folklore collection; 1892–1902). He also published studies on comparative mythology in Hungarian and German.

While there are early and finely detailed descriptions concerning the ancient religion of the Sami, for example, Ioannus Schefferus's *Lapponica . . . de origine, superstitione, sacris magicis* (1673), the first real reconstruction and description of Sami mythology (*Lappisk Mythologi, Eventyr og Folkesagn*) was published in Christiania (later Oslo) as late as 1871 by Jens Andreas Friis (1821–1896). Lars Levi Laestadius's *Fragments on Lappish Mythology* were written earlier in 1840–1845, but remained unpublished until the 1990s.

As the national self-awareness of the ethnic minorities of tsarist Russia began to increase during the last decades of the nineteenth century, collecting texts of folklore also started among them. One should mention Serafim Patkanov (1856–1888), who did research among the southern groups of Khanty (Ostyaks), and Ivan Nikolaevich Smirnov (1856–1904), a professor of the University of Kazan, Russia, who collected valuable materials among the Finno-Ugric peoples of Perm and along the Volga. Smirnov published several books on his findings concerning the Cheremis (Mari), Votyak (Udmurt), and Komi Permyak: *Cheremisy* (1889), *Votiaki* (1890), and *Permiaki* (1891), respectively. Several chapters in these volumes are devoted to the gods and religious customs of the Finno-Ugric peoples living by the Volga, and they serve as useful source material for comparative research.

EARLY TWENTIETH-CENTURY COMPARATIVE RESEARCH.

Around the turn of the twentieth century, Finno-Ugric studies became strengthened by scientifically planned fieldwork. For the most part it was carried out by well-trained linguists, who in the process of their fieldwork also recorded materials valuable for folklorists and students of mythology. In this context one should mention the Hungarian József Pápay (1873–1931) as well as the Finns Heikki Paasonen (1869–1919), Yrjö Wichmann (1868–1932), Kai Donner (1888–1935), and Artturi Kannisto (1874–1943). Their authentic text collections made it possible to reconstruct the belief systems of certain Finno-Ugric peoples and consequently to prepare comprehensive comparative studies. Since, unlike research on Indo-European mythology, Finno-Ugric comparative mythological research is based almost entirely on folkloric material, it was logical to study it in this context and to describe the mythology of particular peoples as accurately as the circumstances would allow.

In 1908 Kaarle Krohn (1863–1933), the first professor of folklore at the University of Helsinki, and Aladár Bán (1871–1960), a Hungarian scholar, jointly published *A finnugor népek pogány istentisztelete* (Pre-Christian god worship of the Finno-Ugric peoples) in Hungarian; with Bán's supplement, this work essentially became the first Finno-Ugric study of comparative religion. The book is based on *Suomen suvun pakanallinen jumalanpalvelus* (The heathen worship of Finnish tribe; 1894), which included posthumously pub-

lished lectures of Julius Krohn (1835–1888), Kaarle Krohn's father, who was a docent at the University of Helsinki in 1884. In the first chapter, the history of research, the sources, and the scholarly literature are reviewed, and in subsequent chapters sacred places of sacrifice, sacred images, activities of shamans, and actual sacrificial rituals are discussed. What renders this volume valuable even today is its rich use of contemporary Russian scientific literature that is now not readily available.

The second major summary of the religious beliefs of the Finno-Ugric peoples, *Die Religion der Jugra-Völker* (The religion of the Ob-Ugrians; 1922–1927), a three-volume study, was written by Kustaa Fredrik Karjalainen (1871–1919). This monumental work based on the complete literature available at the time was combined with the author's original field research at the turn of the twentieth century. It remains the most detailed overview of the religious beliefs of the Finno-Ugric peoples to date. At the end of the 1920s, Uno Holmberg (later Harva, 1882–1949) published yet another summary, "Finno-Ugric Mythology," in the fourth volume of *The Mythology of All Races* (1927). Here, Holmberg methodically reviews beliefs in the soul, the cult of the dead, hunting magic, and veneration of nature spirits (spirits of stones, water, forest, and fire), of home spirits, of the lord of the sky, and of heroes revered as gods. He devotes a separate chapter to the description of sacrifices and the examination of questions concerning shamanism he found to be characteristic of the Finno-Ugric peoples.

STUDY ON FINNO-UGRIC RELIGIONS DURING THE SOVIET ERA. During the two generations of researchers from World War I and the October 1917 Revolution until the brief period of openness in the spirit of glasnost and perestroika under Mikhail Gorbachov's era at the end of the 1980s, most Finno-Ugric territories inside the borders of the Soviet Union remained closed from scholars living in Finland. Studies on Finno-Ugric languages and religions, however, continued; the rich archival materials gathered by the scholars on the nineteenth and early twentieth centuries were now carefully analyzed and published as linguistically transcribed collections in the *Memoirs and Journals of the Finno-Ugric Society in Finland* (founded in 1883) by experts on respective Finno-Ugric languages.

The topic of religion, labelled the opium of the people by Karl Marx (1818–1883), was taboo in the Communist empire of the Soviet Union. In spite of this, research on religion to a certain extent went on under the umbrella of Soviet ethnography. In 1931 there appeared in the Soviet Union, where most Finno-Ugric peoples lived, a collection of texts about the religious beliefs of the Soviet peoples (*Religioznye verovaniia narodov SSSR*). The sole value of this two-volume collection is that it quotes passages from older Russian publications. In the 1930s particularly, and for many decades following its publication, the monopoly of Marxist critiques of religion practically halted all religio-scientific and mythological research in the Soviet Union.

As far as the position of the Finno-Ugric peoples and the research on their cultures and religions in particular are concerned, World War II meant radical changes to the period between the two world wars. Estonia was annexed (formally as a republic) to the Soviet Union until 1991, and Hungary, although still independent, was occupied by Soviet troops as a part of the Eastern block, which divided Europe during the Cold War. Throughout the Cold War, several prominent scholars escaped from Eastern Europe to conduct their research on Finno-Ugric themes in western Europe and in the United States. Gradually, the Finno-Ugric territories inside the Soviet Union became targets for fieldwork organized by Estonian and Hungarian universities and academic research institutes.

Encyclopedic handbooks began to be published elsewhere, and summaries of research appeared every ten years or so. Of these, the overview written by Ivar Paulson (1922–1966), an Estonian emigrant scholar of religion in Sweden, should be mentioned. It provides a phenomenological synthesis of the religions of northern Eurasian hunting nations and uses the new ethnographic and archaeological data. Paulson's study was published in the third volume of *Die Religion der Menschheit* (1962). A second modern overview, written by Lauri Honko, was published in the first volume of *Das Handbuch der Religionsgeschichte* (1971). In its shortened English version titled "Finno-Ugric Religion," written for the *Encyclopaedia Britannica* (1974), Honko made this kind of observation: "Today there is general agreement that a hypothetical reconstruction representing the 'original religion' of a single language family is virtually impossible."

The second volume of the encyclopedic undertaking of Soviet researchers on myths of the peoples of the world (*Mify narodov mira*, 1982) includes an entry by V. Ia. Petrukhin and E. A. Helimski, who do not even attempt to provide a comprehensive picture, but instead discuss the mythologies of different peoples separately. This is in accordance with the notion that Finno-Ugric languages are distantly related, as are their folklore and religions. Despite the difficulties on editing folkloric texts constituting the basic sources, a few exceptional monographs have been produced that, though not aiming at a reconstruction of the whole system, nevertheless enable us to engage in comparative studies of certain topics. These topics include, for example, lower-order spirits, totemism, and the cult of idols (Haekel, 1946), hunting rituals and the bear cult (Edsman, 1957), and concepts of the soul of the northern Eurasian peoples (Paulson, 1958).

LATE TWENTIETH-CENTURY RUSSIAN RESEARCH TRENDS. In the latter part of the twentieth century, some new results were gained in certain areas, especially in the Soviet Union as a result of an effort to involve other sciences in comparative mythological research and thus to revive its methodological tools. Soviet researchers turned to archaeology, which is "materialistic," and to the cataloging of decorative art objects, which were seen as products of the mythological consciousness of ancient peoples. A characteristic monograph of

these times is S. V. Ivanov's work about the folk arts of the peoples of Siberia. This book reviews museum collections assembled around the turn of the twentieth century (*Materialy po izobrazitel'nomu iskusstvu narodov Sibiri XIX-nachalo XX. V.*, 1954). This study, which contains both Finno-Ugric and other material, becomes especially interesting when read with the study by Dmitrii K. Zelenin (1878–1954) of Siberian idol cults and beliefs in spirits (*Le culte des idoles en Sibirie*, 1952).

Russian archaeologists have been able to contribute most significantly to the reconstruction of ancient beliefs, and thus of Finno-Ugric mythology, by interpreting the highly diverse physical evidence. A few of the valuable works containing such analyses are Vanda Moshinskai's *Drevniaia skulptura Urala i Zapadnoi Sibiri* (Ancient sculptures of the Ural and western Siberia; 1976); Leonilla A. Golubeva's *Zoomorfnye ukrasheniia finno-ugrov* (Finno-Ugric zoomorphic decorative art; 1979); and Liubov S. Gribova's *The Animal Style as One of the Components of Social-Ideological System of Totemism and Stage in the Development of Fine Arts* (1980).

Soviet archaeologists can be credited with the discovery of another important source group: petroglyphs, or rock art. During the last decades, remains of rock art have been extensively uncovered (mostly in the form of engravings) in northern Eurasia. In this discovery Aleksandr P. Okladnikov (1908–1981) had a particularly outstanding role; with his coworkers he has published a series of monographs that contain more than ten thousand Siberian rock drawings and include valuable notes on the history of religions. His major contribution to Finno-Ugric research, written with A. I. Martinov, is *Sokrovishcha tomskikh pisamits* (Treasures of petroglyphs around Tomsk; 1972).

Aleksandr Zolotarev (1907–1943) began his research in the 1930s, under the influence of Marxist conceptions of ancient history and society, but his study of the mythology of ancient society, *Rodovoi stroi i pervobytnaia mifologiya* (Tribal system and ancient mythology; 1964), could be published only after his death. In this study, Zolotarev bases his arguments on a large body of source materials and shows that the dualistic cosmological myths and the dualistic societies of Siberian peoples reflected one another; basically, this recognition resembles Georges Dumézil's position. Zolotarev arranged his materials within a firm theoretical framework. Because of his recognition of the system of dual oppositions, he can be considered a forerunner of structuralism, though his work remains unknown to the West.

COMPARATIVE FINNO-UGRIC MYTHOLOGY AND SHAMANHOOD RESEARCH TRADITIONS. The introduction by Soviet scholars of structuralist and semiotic methods to mythological analyses at the beginning of the 1970s proved to be a methodological turning point. These scholars were independent of the West European (primarily French) structuralists in that they formed their own theories, basing them on their structuralist predecessors—for example, Roman Jakobson (1896–1982), Ol'ga Freidenberg (1910–1954), Vladimir

Propp (1895–1970), and Mikhail Bakhtin (1895–1975). Their most important contention was that mythology is explicable as a system of signs and that it is one of the texts or codes of a culture (Ivanov and Toporov, 1973; Meletinsky, 1973). In his description of the Finno-Ugric mythological system, Mihály Hoppál employs this method. The hierarchy of the gods is described with the aid of dual oppositions functioning as distinctive features (Hoppál, 1976), and consequently mythological structures clarified through semantic characteristics are compared more accurately than before (Toporov, 1974).

Another current trend is related to comparative mythology emphasized by such Finnish scholars of phenomenology of religion and folk belief in the Finno-Ugric context as Martti Haavio, Lauri Honko, and Juha Pentikäinen. The research is related to the fact that in studying certain topics, scholars have moved outside the narrow Finno-Ugric confines and are analyzing particular topics within a wider Uralian or even Eurasian context, as in, for example, the investigation of the question of a supposed ancient Eurasian mother cult, bear and other expressions of animal ceremonialism, as well as shamanism in a Finno-Ugric, Arctic, and comparative context. Pentikäinen's *Kalevala Mythology* (1999) emphasizes the significance of shamanic poetry as the basis of the epical singing. Instead of shamanism, a concept of shamanhood (Russian *samanstvo*) has been introduced by him since he believes that shamanism is not a dogmatic religion, but rather a way of life.

The examination of shamanism has an especially old tradition among Hungarian scholars. Géza Róheim (1891–1953), the founder of psychoanalytic anthropology, devoted an interesting chapter to the question of Ob-Ugrian shamanism in *Hungarian and Vogul Mythology* (1954). Another study of this subject was written by Vilmos Diószegi (1923–1972), who explored the residues of shamanism in Hungarian folklore in *A sámánhit emlékei a magyar népi műveltségben* (1958). Two further studies on the question of Siberian shamanism have been published: *The Rite Technique of the Siberian Shaman* (1978), by Anna-Leena Siikala, and *Obriad i fol'klor v sibirskom shamanizme* (Ritual and folklore in Siberian shamanism; 1984), by Elena S. Novik, who analyzes the syntagmatic structure of shamanic ritual and of narrative folklore.

In summary one could say that, because Finno-Ugric peoples are generally not numerous, and because most of them have constituted ethnic minorities within the Soviet Union and Russia, their search for common roots and mythology, expressed in the language of folklore, has been one way of establishing their own identity and of buttressing their national self-consciousness. Finno-Ugric mythology and folklore will remain as areas of interest for many years to come. Apart from sociopolitical considerations, naturally, the strictly scientific-philological aspects are no less compelling, a fact that renders the prospect of comparative Finno-Ugric mythological research in the future exceptionally inter-

esting in terms of methodology as well, precisely because of the still insufficiently clarified relations among Finno-Ugric peoples, because of their divergent lines of cultural progress and because of their varied relations with neighboring peoples.

FIRE. In early stages of civilization, humans learned to create fire by striking flint, drilling wood, and focusing solar rays. Myths attributed this wondrous, crucial acquisition to the daring of a culture hero, theft from a primordial bird or animal, burglary of heaven and obstinate gods who withheld it, emanation from the vagina of an old woman, or sometimes the outright gift of a divine being. Recognized as ambiguously creative and destructive, life-giving and life-taking, fire appeared in multiple mysteries of transmutation: of environs from cold, dark, and dangerous to warm, light, and secure; of food from raw to cooked; of substance from putrid to pure; of fields from sterile brush to fertile earth; of earth from ore to metal; of human bodies from disease to health; of spirits from profane to sacred; and of speech from babble to wisdom. Fire was identified in animals, plants, earth, air, and water. The human body contained its own fires of digestion, sexuality, and wrath, with fires in the blood, breath, semen, mind, heart, and spleen.

As the alchemist liberated secret interior fires from certain minerals, so with fire the smith accelerated nature's process by cooking and molding minerals into precious goods. Fire was appropriated by the shaman in the sweat lodge, by the *yogin* meditating as a fifth fire between four others, by the Australian aboriginal novice symbolically roasted and purified over a pit-fire, by the hero whose fury incinerated enemy warriors. In ancient India the hearth was said to be a womb and a householder was not born until he and his wife established sacrificial fires. Chinese esoteric alchemists spurned the smelting fire of the exoteric alchemist because a quest for immortality demanded the superior fire in the mind. Certain Native American tribes believed their ritual

fires regenerated the sun and their new fires rekindled the new year. In modern Scandinavia some farmers of the old school still drilled new fire by hand to cure sick cows. Many religious traditions, ancient and contemporary, foresee a celestial or cosmic fire that will destroy the world, as it has in the past.

Fire has been adopted as a metaphor—for some, the only metaphor—of sublime, ineffable, transformative experiences in the spiritual quests of specialists of the sacred, and in works by mystics, philosophers, and writers as disparate as Richard of Saint-Victor, Dante Alighieri, and Blaise Pascal. Understanding across times and cultures responds to an early fourteenth-century voice, that of Richard Rolle de Hampole: "when settled in devotion . . . my soul is set on fire." Western ascetics and saints gained renown as living flames, like legendary salamanders with miraculous immunity to fire, while different traditions of Asia produced similar handlers of fire, and walkers on fire, who demonstrated superhuman status in kinship and seeming unity with the powerful element.

The cultic dimensions of fire are varied and countless. Some societies chose to center tradition on domestic hearths and community fire altars, with extensive links to sacred oral or written texts, while others held fire in supporting mythic and ritual roles. The discussion that follows must of necessity be selective and illustrative, not comprehensive.

ANCIENT INDIA AND IRAN AND SUBSEQUENT TRADITIONS. The oldest and most coherent body of myths, rituals, and symbols of fire is found in the Vedas of ancient India and the remnant Avestan and Pahlavi texts of ancient Iran. There are parallels in both domestic and community cults of fire, and between Indic *soma* and Iranian *haoma* (Indo-Iranian **saumā*), both essential offerings to deities poured into sacrificial fires. These, along with other key names and rituals, indicate an Indo-Iranian tradition of fire maintained by nomadic pastoralists in West Asia several centuries before and after 2000 BCE. Oral mythologies and ritual references collected in the *Rgveda* and *Atharvaveda* from around 1400 to 1000 BCE include some 200 hymns addressed to the god of fire, Agni. The opening verse of the *Rgveda* addresses him as Purohita, a hearth deity who is domestic priest within every household as well as priest for all the gods. In other Vedic *Samhitās* such as the *Yajurveda*, there appeared elaborate ritual schedules based on the identity of fire and the household-sacrificer. Subsequent Brāhmaṇa texts explored the nature and function of this fire cult, which remained a focus for both household and expanded cooperative ritual programs. The tenth book of the *Śatapatha Brāhmaṇa* is *Agni Rahasya*, the "mystery of the fire altar," an esoteric text that set a precedent for philosophical speculations in the Upaniṣads.

In turn, by around 700 BCE these Upaniṣads generated a new worldview for Vedic Hinduism. Each of the two earliest contains the same teaching on *samsāra* (transmigration). After death, one not released from rebirths returns from the moon and passes through five sacrificial fires, the fourth

being a man who offers his semen into a woman; the fruit of this fifth sacrifice is a new embryo. In the same period compendia of manuals known as *sūtras* systematized schedules of cooperative (*Śrauta*) and then domestic (*Gṛhya*) fire sacrifices that have lasted to the present time. Also in this pivotal era various techniques of asceticism grew into prominence, including the production of inner heat (*tapas*) by means of various austerities. Cosmic-human bodily correspondences were explored in yet another way with these new expressions of fire and heat.

As the god Agni himself is a cosmic triad, so there should be three fires set in every household, and still in India today there are *āhitāgnis*, secluded maintainers of Agni in their houses as *āhavanīya* (offering fire), *gārhapatya* (preparatory fire), and *dakṣināgni* (protective southern fire). The *agnihotra*, morning and evening offerings of hot milk, comprise the basic domestic sacrifice. These now-rare three-fire sacrificers are eligible, as in ancient Vedic practice, to advance to the sacrifice of *soma* and then selected other *śrauta* rituals. The *yajamāna* (sacrificer) carries a terra-cotta bowl of fire in identification with Agni and with another Vedic god, Prajāpati, as world-creator. Solemn rituals include the forty-day *paundarikā*, employing seventeen priests with both animal and *soma* offerings in a type of *agnicayana* fire sacrifice reintegrating time and space in a cosmic construction of Agni. Five layers of thousands of bricks shape a gigantic eagle with the *ātman*, the Self, at the center, indicating that the sacrificer and fire are one. A striking feature of these contemporary survivals of ancient practice is the generation of Agni by friction from *araṇis* (male and female wooden drilling sticks). These have a capacity to absorb all three fires into themselves for transport if the *āhitāgni* and *patnī* (wife) must travel away from the house and constant tending of fires.

Confirmation of a belief in the identity of householder and fire is found both in the Vedic cremation ritual, in which the sacrificer or his wife is burned with the three sacrificial fires, literally absorbed by them in *antyeṣṭi*, a “final sacrifice,” and, in another direction, in the vow to become a *saṃnyāsīn*, a renunciator ascetic. *Samnyāsa* calls for the interiorization of fires, ritual deposition of fires in the self, and therefore an end to the external sacrifices that have previously structured life. Since the *saṃnyāsīn*'s breaths are the five cosmic fires, his *agnihotra* becomes the constant offering of *prāṇa* (breath).

Great Vedic fire sacrifices such as the *agnicayana*, *aśvamedha* (royal horse sacrifice), or *rājasūya* (consecration of a king) have not been a prominent feature of Hinduism since the late medieval period, and the god Agni himself has been reduced to minor status since the emergence of the Sanskrit epics and Purāṇas. But the role of fire in Hinduism has never diminished. Life-cycle rites (*saṃskāras*) are an array of ceremonies from conception and birth to cremation, the last still defined by the final offering of the body to Agni Kravyād, consumer of the deceased, on the funeral pyre. *Saṃskāras* depend on ritually kindled fires with domestic

priests or householders themselves reciting either Vedic mantras or Sanskrit verses. As a complement to household worship, which is usually focused on images or symbols of favorite goddesses and gods assembled close to the kitchen hearth, Hindus may go to neighborhood temples and shrines for *devapūjā*, public worship. Inside temples housing a form of Devī, Viṣṇu, Śiva, or another deity, priests conduct on behalf of the visitor a schedule of worship, invariably including *ārati*, the waving of a lighted lamp or burning incense before the sacred image.

There are numerous fire festivals with bonfires, lamps, and fireworks in Hinduism. Dīvālī (Dīpāvalī) is a popular occasion for setting out multitudes of burning lights (*dīpas*) in October–November. In honor of *pitṛs* (ancestors), tiny bamboo boats carry hundreds of burning lamps down the nearest river. Torches are carried in rural communities in circumambulation around the entire village for certain festivals, and passage of all residents under arches of burning straw may be practiced at harvest time. A favorite vow in villages and towns of South India and Sri Lanka is firewalking, at times featuring hundreds of people crossing in single file a thirty-foot-long pit of glowing embers to the sounds of thunderous drums and shrill flutes. At other times a single person, possessed by a deity or the deified dead, may walk on coals, “play” with fire, dance with burning skewers, swallow burning charcoal, or hold burning camphor on the palm of the hand, all as demonstrations of divine power and grace. Devotion to a fierce goddess such as Pattini, Draupadī, Mārīamma, Poleramma, or some other manifestation of Amma (Mother) is thereby tested, and the unscathed devotee gains the goddess's protection against epidemic diseases and other misfortunes. Firewalking is performed by Fiji Island migrant Hindus in the South Pacific, by Buddhist as well as Hindu devotees of the popular god Kataragama (Skanda) in Sri Lanka, and by Shi'ī Muslims in South Asia, particularly during the annual festival of Muḥarram.

This sketch of South Asia over four millennia may be paralleled in greater Iran, where spiritual identifications of humans with fire occur on similar levels: individual, family-household, village, and in the case of kingship rituals, state. However, by comparison with India's still enduring oral traditions and Vedic-Hindu historical continuity in ritual, evidence for ancient Iranian cults of fire is limited first by a break in oral traditions and loss of much of the early written record, then by dispersal of Zoroastrians themselves during the medieval advance of Islam. What survives, however, indicates the centrality of the household hearth (*ātash dādghāh*), along with extended community (*ātash ādarān*) and royal or primary fires (*ātash bahrām*) and sacrifices similar to the pattern of Vedic Indo-Aryans to the east. A cosmic five-fire worldview, again as in India, complemented this basic triad, all based on a system of correspondences between natural fire and ritual fire. Among several major differences, however, was the emergence in Iran of permanent temples, “houses of a fire” enthroned on raised pedestals, perhaps under the in-

fluence of surrounding temple-building cultures of urban West Asia. Although fireplaces have been excavated in Bactria and Margiana (northern Afghanistan and southern Turkmenistan), in sites in the path of Indo-Iranian migrations from around 2500 to 1500 BCE, other than traces of ephedra (possibly *haoma*) there is little evidence regarding the beliefs and rituals of those who used them. It was not until the fourth century BCE that Achaemenid rulers of greater Iran erected temples of perpetual fire. Barely surviving two millennia of political and religious warfare, temples with fire in metal containers still serve today as spiritual centers for remnant Zoroastrians in Iran and for Parsis in western India who maintain eight *bahrām* fires.

Fire emerged as the basic symbol of Zoroastrianism, the religion that developed in the first half of the first millennium BCE, probably from the teachings of Zarathushtra in the *Gāthās*. The ancient Indo-Iranian deities were submerged into a cult of one “Wise Lord,” Ahura Mazda, although they resurfaced as his entities or qualities in a set of six *Amesha Spentas* (Beneficent immortals). Most prominent among them is Asha, the equivalent of Vedic *ṛta* (cosmic order). Asha, a quality of Ahura Mazda—at one point recognized as an independent deity, Asha Vahishta—symbolizes truth and justice, and was represented by fire. The sun and light are visible forms of Ahura Mazda, but above all he is fire. An ethical dualism presented a clear opposition in which the symbols of *asha*—fire, light, purity, and goodness—are on the side of Ahura Mazda against *druj* (the lie), associated with darkness, impurity, and evil. In meditation, personal piety, and sacrifice (*yasna*, Avestan parallel to Vedic *yajña*) a worshiper relates to fire and participates in this cosmic, but also immediately human conflict. The offering into fires of sacrificial animals, particularly their fat, and of pressed *haoma* juice was suppressed by Zarathushtra, but these age-old rituals resurfaced in a later period. Among Parsis today only *haoma* is sacrificed. A symbolic libation of fat occurs only in funerals.

Aside from permanent fire temples, other features distinguish the Iranian fire cult from its Vedic-Hindu counterpart. The sovereign Vedic god Varuṇa governs *ṛta* (cosmic order), while in the case of Varuṇa’s Avestan complement, Ahura Mazda, *asha* is itself the representation of fire. In Iran, disposal of the dead was not by cremation, as in India, but rather by exposure, as seen with the famous stone towers still used today by Parsis in India. Fire burns nearby, but birds and beasts of prey are allowed to clean flesh from bone, thus protecting sacred fire from the pollution of death. Even human breath is polluting, and mouth-veils are worn by sacrificing, fire-tending priests, the only persons who may approach the altars.

Regarding fire, yet another distinction from Indo-Aryan tradition pertains to time. Vedic sacrifices reveal a cyclic pattern, as in the Rājasūya sacrifice used to consecrate kings, in which one performance, when completed, is immediately followed by preparations for another. The Purāṇas contin-

ued this model with the *pralaya* principle, based on an endless repetition of dissolutions and re-creations of the cosmos, destructions being total incineration by one or another form of Agni. Zoroastrianism, on the other hand, introduced a sense of final time and divine judgment, with eschatological fire expected on the last day in a one-time cataclysm. In historic time, judgment occurs routinely, as in ordeals by fire to test veracity and loyalty, but the day of final judgment awaits the future after resolution of the conflict of *asha* and *druj*, the light of truth and darkness of the lie, in favor of Ahura Mazda and his eternal flame.

THE ANCIENT MEDITERRANEAN. A fire altar (*bomos*) in a sacred precinct (*temenos*) was an essential feature of ancient religious practice for Greeks. The cult depended, as in India and Iran, on sacrifice to deities with commensal sharing of victims. Hesiod and Homer speak of the fat-wrapped thigh-bones of an ox, cuts of meat, and wine offered on the altar fire. Open fire pits opposite a temple entrance were standard, although some older temples had interior hearths. Hestia burned perpetually in her temple at Delphi, as a flame and with no image necessary to represent her. And in every home the hearth was the sacred center, a site of offerings, and a space where none could be violated.

In Hesiod’s *Theogony*, Prometheus deceives and angers Zeus during a sacrifice of ox bones by stealing an ember from the altar and kindling the first fire to burn on earth. The Homeric *Hymn to Demeter* preserves an archaic legend of Eleusinian mysteries, the goddess Demeter’s attempt to deify the boy Demophoon by secretly holding him in the hearth fire at night. That ritual, interrupted by the terrified mother, Metaneira, fails and the boy remains mortal. Again, as in India and Iran, cosmic correspondences exist between fire, breath (*pneuma*, Latin *spiritus*), and mind. The worldview of Heraclitus of Ephesus (c. 540–480 BCE) began with fire, an uncreated, eternal substance, essence of the universe, and medium of creation, associated with logos, mind, reason, and wisdom. The Pythagoreans, Parmenides of Elea, and Empedocles were other philosophers placing elemental fire in prominence.

The bare patch of ground on the Palatine Hill may not be “the hearth of Romulus,” as claimed by today’s tour guides, but ancient Rome did have its dual fire cults of domestic hearth, which received part of the meal before the family dined, and public altar (*ara* or *altaria*) with its own adjoining hearth. Vesta, Roman parallel to Hestia, was in a uniquely round temple without an image, her eternal flame being sufficient representation on what was essentially the hearth of the city, tended—like any domestic hearth—by females, six appointed Vestal Virgins tasked with kindling a new fire by friction every New Year’s Day, March 1. On April 21, Pales, goddess of herders and their animals, was honored through the staging of Parilia, a festival including the racing of men and animals through burning straw, similar to one occurring in India today. The temple of Volcanus stood outside the city walls, a reminder of other fires: the

dangerously destructive one sleeping in the heights of Vesuvius and Aetna, and the summer fires of cropfields and granaries.

Two centuries after Heraclitus, Stoic philosophers, including Zeno, Cleanthes, and others, elaborated Heraclitus's belief in fire as a basic element associated with logos as universal reason and regulative principle. The doctrine of seminal logos (*logos spermatikos*) led to belief in individual beings as immortal sparks from a divine fiery unity, a view adopted with modifications by Jewish, Christian, Gnostic, and other philosophical traditions. In the new Hellenistic culture acquainted with the wider world of Asia, several elements derived from early Upaniṣads (c. 700 BCE) are evident, including the notion of the individual soul, destined eventually to rejoin that original fiery unity, departing this earth for the moon.

ANCIENT ISRAEL, JUDAISM, CHRISTIANITY, AND ISLAM. To a limited extent scriptures of the two biblical traditions and Islam consciously separated the supreme being from the natural phenomenon of fire. And yet all three employed numerous symbols, beliefs, and folklore concerning the element of fire and associated phenomena of light. Only ancient Israel had a cult of fire maintained for animal sacrifices on a temple or open-air altar in the pattern of West Asia and, to a lesser extent, Egypt. With the destruction of the Second Temple in Jerusalem in 70 CE, sacrificial fire—along with the Temple and the altar—became eschatological symbols. Early Christian churches with wooden tables as altars for the symbolic sacrifice known as Eucharist, and Islamic mosques as houses of prayer, like synagogues, had place for discreet lamps but not open fire. The Shabbat lamp and the altar candle still serve as fire in miniature.

To a degree, all three religions were influenced by Zoroastrianism, as is particularly evident in postexilic Judaism and in a widespread belief in opposing angels and demons. Most important were apocalyptic and other eschatological imprints in the notions of a fiery last day of judgment, of hell as a place of flaming torment, and of a God who pursues the unrighteous with punishing fire. On the other hand, all three faiths produced mystics of independent and solitary vision and experience, some associated with sublime expressions of fire, heat, and love.

When Solomon prayed before the bronze altar “fire came down from heaven and consumed the burnt offering and the sacrifice and the glory of the Lord filled the temple” (2 *Chron.* 7:1). In a striking theophany Moses saw the angel of the Lord in the midst of a burning bush that was not consumed (*Exod.* 3:2), and in the flight from Egypt through the wilderness the Lord led the people of Israel in a pillar of cloud by day, a pillar of fire by night (*Exod.* 13:21–22). Believers are protected from destructive fire: “When you walk through fire you shall not be burned, and the flame shall not consume you. For I am the Lord your God” (*Isa.* 43:2). Shadrach, Meshach, and Abednego were not harmed when thrown into a fiery furnace for refusing to worship an image

of gold (*Dan.* 3:1–30). “A chariot of fire and horses of fire” took Elijah “up by a whirlwind into heaven” (2 *Kings* 2:11). “My heart grew hot within me,” says David in Psalm 39.3, “as I meditated, the fire burned; then I spoke with my tongue.”

In the New Testament the sound of a mighty wind accompanied the arrival of the Holy Spirit that appeared to the apostles of Jesus as “tongues of fire, distributed and resting on each one of them” (*Acts* 2:1–4). Peter's second letter instructs that heaven and earth will be burned up on the day of the Lord (3:10), and *Revelation*, the Apocalypse of John, warns sinners of an end “in the lake that burns with fire and brimstone, which is the second death” (21.8). Early Christian desert saints of Egypt such as Abba Joseph of Panephis, continuing the imagery of the Holy Spirit, were witnessed as flaming fires. The third-century church “father,” Origen, foresaw a purification on the last day: Jesus will stand in a fiery river to baptize by fire all who enter paradise.

Fire and light play prominent roles in the extracanonical literature of Judaism and Christianity, and in Gnostic texts, particularly in various apocalypses. Developing traditions of Jewish mysticism and collections of Jewish legend (Haggadah) were significant in this regard. In a Haggadah account of creation it is said that the preexistent Torah was written with black fire on white fire, as she (the Torah) was lying in the lap of God. The *Gospel of Thomas* quotes Jesus as saying, “He who is near me is near the fire” (82), but also “I have come to cast upon earth fire, sword and war” (16), and the *Apocalypse of Peter* reveals the day of God with cataracts of fire, “a fierce fire that shall not be put out and it flows for the judgment of wrath” (4). Given the influence of Iranian traditions, it is not surprising to find parallels to cosmic conflict in the Qumran scroll “The War of the Sons of Light with the Sons of Darkness” and in the Gnostic “Paraphrase of Shem,” with its visions of chaotic fires.

Elijah's chariot of fire, reminiscent of both Vedic and ancient Iranian chariots of fire-sacrificers, and Daniel's vision of “a throne of fiery flames with wheels of burning fire” (7:9) became foundational images of the divine throne-chariot (*merkabah*) for many centuries of mystical texts and schools. Enoch's vision, similar to Daniel's, records a heavenly throne of fire in a blazing mansion, with the Lord speaking to him from streams of fire. He is also given a tour of Hell with its rivers of fire (*I Enoch*). The thirteenth-century Zohar, the seminal text for Qabalah, identifies the ten *sefirot*, primordial numbers and emanations of light and power from the divine unity, a process later believed by qabbalists to include dissemination of sparks from that one source.

Inspirational to generations of Ḥasidim are stories of charismatic *rebbe*s such as Ba'al Shem Tov (c. 1700–1760), known as the BeSHT. Once an overnight guest in his house, awakened at midnight in terror by a great flame rising from the hearth, fainted upon realizing it was the BeSHT. Another Hasidic *rebbe*, the Maggid of Mezeritch (1704–1772), sent

his followers fleeing in panic by appearing suddenly as a being of fire.

The mystics of European Christianity often spoke and wrote of being consumed in ecstasy by *incendium amoris*, “the fire of love.” Saints Augustine of Hippo (354–430), Gregory I (the Great) (c. 540–604), John of the Cross (Juan de la Cruz, 1542–1591), Catherine of Genoa (1447–1510), and Teresa of Ávila (d. 1582), the hermit Richard Rolle de Hampole (c. 1290–1349), and the philosopher Jakob Boehme (1575–1624) all used a language of fire and heat to convey the impact of mystical transformations or unitive states. Rolle speaks for many: “[T]he heart that truly receives the fire of the Holy Ghost is burned wholly and turns as it were into fire; and it leads it into that form that is likeliest to God” (*Incendium amoris*, ch. 17).

In some Greek villages today, devotees of Saint Constantine (the Great) and his mother Saint Helena believe they are protected by the pair when performing a firewalk after sacrificing a bull and sharing the feast of Anestanaria. Brought to the United States by immigrants, this ritual was soon swept into the 1970s New Age practice of firewalking, with its goals of self-realization and experimentation rather than ritual or worship. Today the American firewalking movement holds workshops in scores of states and some universities offer courses on firewalking.

Several times the Qurʾān recounts Moses’ theophany of fire, but most references are warnings to those who reject the truth and deserve horrendous flame and molten brass on the day of judgment. Anecdotes of the Prophet preserved in popular bazaars include such miracles as the moment when Muḥammad halted the sun in its course. A rich hagiographical literature, particularly in association with the Ṣūfīs, details the experiences of *awliyāʾ* (friends) of Allāh, saints, and mystics included in collections from the eleventh and following centuries. Examples of Ṣūfīs handling fire or using a language of fire bring to mind the mystics of Christianity. Ḥasan al-Baṣrī (642–728) caused a “fire-worshipping” Zoroastrian to convert to Islam by thrusting his own hand into a fire and leaving it there unburned. Rābīʾah al-ʿAdawīyah (d. 810), Abū Yazīd al-Bisṭāmī (d. 874), Jalāl al-Dīn Rūmī (d. 1273), and Najm Dāyā Rāzī (thirteenth century) all broke restraints of law, theology and proper behavior to identify Allāh and fire, and at times themselves with both. Union with fire readily lent itself to the contested notion of *fānaʾ*, mystical annihilation. One Ṣūfī complained that he could not sleep because of his fear of hell-fire. Rābīʾah was said to have carried a torch and a pail of water, explaining that she intended to burn Paradise and douse Hell in order to eliminate both hindrances to a pure vision of Allāh. One dark night in Basra she had several visitors. Having no lantern, she blew upon her finger, which then lighted the room until sun-up. In the famous account of his “ascension” according to the Tadhkirat al-Auliyaʾ, Abū Yazīd, founder of the “drunken” school of mystics, spoke from his dark night of the soul: “In my intoxication . . . I melted my body in

every crucible in the fire of jealousy.” And Rūmī, ecstatic poet of Persian odes and originator of the Mevlevi (Mawlawīyah) whirling dervish dance, sang to his divine beloved, Shams al-Dīn: “Face like fire, wine like fire, love afire . . . soul . . . lamenting “Whither shall I flee?” (136.6).

DAVID M. KNIFE (2005)

FIRTH, RAYMOND. Raymond Firth (1901–2002) was born in New Zealand and grew up in a rural area on the edge of Auckland. He attended Auckland Grammar School, where, at the age of fourteen, he found a copy of F. E. Manning's *Old New Zealand*, which, he said, laid a foundation for his interest in the indigenous Polynesian people of New Zealand, the Maori. As a schoolboy he also discovered the *Journal of the Polynesian Society* in the Auckland Public Library, became a reader, and later a contributor. In 1925 he published an article in the journal on a Maori *pa* site, and seventy-six years later, at the age of one hundred, an article by him on Tikopia dreams was published in the same journal.

Growing up in New Zealand, Firth had Maori friends and learned their language, which helped him acquire fluency in the cognate language of Tikopia, where he later carried out anthropological fieldwork. His interest in Maori ritual and belief laid a foundation for his later work on religion in Tikopia.

In 1921 Firth graduated in economics from what was then Auckland University College, and in 1924 he wrote a masters thesis on the kauri gum industry. He arrived at the London School of Economics in 1924 to work towards a doctorate in economics, intending to focus his work on the frozen meat industry in New Zealand. However, he came under the influence of the then professor of social anthropology Bronislaw Malinowski and changed the direction of his work. His thesis, *Primitive Economics of the New Zealand Maori*, was published in 1929.

In 1928 Firth set out for Tikopia, a small Polynesian outlier in the Solomon Islands, where he would carry out his first truly anthropological fieldwork. He would return to the island several times. His publications about Tikopia provide a corpus of work about a small preliterate society that is probably unrivaled, comprising nine books and some one hundred articles. His ethnography of the island, *We, the Tikopia* (1936), has been reprinted many times. It introduces Firth's

analysis of traditional Polynesian religion, which he developed in later publications, including *The Work of the Gods in Tikopia* (1940), *History and Traditions of Tikopia* (1960), *Tikopia Ritual and Belief* (1967), and *Rank and Religion in Tikopia* (1970).

Firth has provided a unique record of traditional Polynesian religious thought and practice. In general, missionization of the Pacific had been successfully carried out on the majority of island groups, beginning in the early 1800s. Therefore, a record of traditional beliefs often remained only in the journals of early missionaries, who regarded as benighted or inferior the religions they were replacing with Christianity. Tikopia escaped the earliest onslaught of missionaries because of its isolation. The Tikopia themselves were also extremely resistant to outside intrusion and successfully kept both missionaries and colonial government at bay until the early 1900s.

The first missionary to settle on the island in the 1920s was not European; he was a man from the Banks Islands working for the Melanesian Mission (Church of England). This man, Pa Pangisi, later married a Tikopia woman, and his more sympathetic view of traditional beliefs probably contributed to the fact that by the time Firth carried out his first fieldwork in Tikopia, fewer than half the inhabitants of the island had converted to Christianity, and only one of the four chiefs had done so. Firth, therefore, had the opportunity to record ritual practices firsthand, and his excellent knowledge of the language allowed him to translate the allusive and complex words of the various rituals.

Firth himself had been brought up a Methodist and taught Sunday school as a young man, but at the London School of Economics his opinions changed to a humanistic rationalism and he regretted the proselytization of Tikopia. In *We, the Tikopia* he wrote, "what justification can be found for this steady pressure to break down the customs of a people against whom the main charge is that their gods are different from ours?" (1936, p. 50). His sympathy and respect for the customs of Tikopia persuaded the chiefs of the island to share their ritual knowledge with him, and they later recalled Firth's distaste for the missionary habit of referring to traditional beliefs and paraphernalia as "things of darkness."

On return visits to the island in 1952 and 1966, Firth was able to record Tikopia's final conversion to Christianity. *Social Change in Tikopia* (1958) records the pragmatic decisions taken by the remaining three pagan chiefs, which led to all non-Christian Tikopia (with the exception of one old woman) converting to Melanesian Mission practice.

After Firth's initial period of fieldwork, he served as acting professor at Sydney University from 1930 to 1932, after which he returned to the London School of Economics, where he became a lecturer (1932–1935), reader (1935), and professor (in 1944). He remained there, with brief interruptions, until his retirement in 1968. While Tikopia remained central to his publications, he also carried out fieldwork in

Malaya and in London, as well as writing more generally on topics of theoretical and anthropological interest. He received many honors during his long and distinguished career: he was knighted in 1973 and appointed Companion, New Zealand Order of Merit, in 2001. In 2002 the British Academy announced it was awarding him the first Leverhulme medal to be given to scholars of exceptional distinction in recognition of his "outstanding and internationally acknowledged contributions to 20th century anthropology." Raymond Firth died in February 2002.

JUDITH MACDONALD (2005)

FISH. Inherent in fish symbolism is the sacred power of the abyss, the reciprocities of life and death. Paleolithic fish figurines have been found with the spiral of creativity carved on one side and the labyrinth of death on the other, evincing the spiritual world of early humankind in which fish represented propagating and perishing, killing and consuming, life renewed and sustained.

In the ancient Near East and the Mediterranean world, fish were associated with the great goddesses, archetypal images of femininity, love, and fertility. Astarte was worshiped in the form of a fish; Atargatis named her son Ichthys, Sacred Fish. In ancient Greece, Rome, and Scandinavia, the goddesses Aphrodite, Venus, and Frigg were assimilated to fish, and on Friday, the day sacred to them, fish were eaten as a way of participating in their fecundity. In many parts of the world—India, Greenland, Samoa, and Brazil—virgins were thought to be made pregnant by the gift of a fish, while a "fishing dance" was a common fertility rite in the women's societies of Africa. The dual nature of the symbol was manifested, and fish were regarded as unclean, wherever the goddess was characterized as libidinous and devouring. Fish gods were venerated as creators and vivifiers among Sumero-Semitic peoples and represented phallic power. An Assyrian seal of about 700 BCE depicts "Fish Gods Fertilizing the Tree of Life." Babylonian seals bear the image of a great fish with a vase from which fish stream.

A ubiquitous food in much of the world, fish are a universal motif of plenty. They are an emblem of abundance and good augury on Buddhist altars and are cited as one of the five boons in the Tantric text *Vāmācāris*.

At ritual meals in the temples of Babylon, fish was the sacred food of the priests. In Judaism, fish was regarded as the food of the blessed in paradise and was eaten at the Sabbath meal. The old Jewish Passover was in the month of Adar, the Fish, and the traditional symbol of the national restoration that is to come with the advent of the Messiah is the great fish on which the righteous will feast. Sabbath utensils and the chalice of benediction are often decorated with images of fish.

Sacred fish occur in Syrian and Iranian myths. Throughout the dynastic period in Egypt, they were regarded as the manifestation or abode of a god. Hapi, father of the gods, was “Lord of the Fishes,” and a fish denoted the phallus of the dismembered god Osiris. An attribute of the sea god Poseidon (or Neptune), fish were associated with lunar power, and when represented with an ax, as in Crete, designated both lunar and solar power. Pisces, the twelfth sign of the Zodiac, is a pair of parallel fishes pointing in opposite directions, symbolizing spiritual and temporal power, the upper and lower worlds, past and future, involution and evolution, the ending of one cycle and the beginning of another. A pair of fishes on Chinese Bronze Age vessels signifies creative power. The Japanese believed that the world was supported by a mighty fish. Among the primitive societies of Oceania, Africa, and North and South America, fish were sacred totemic figures, emblematic of the power of the clan. Peruvian Indians believed that the original fish had engendered all others; they worshiped the species that was caught in the greatest numbers. Sea gods riding on a fish signified freedom; shown on the footprint of the Buddha, a fish meant emancipation from attachment and desire.

A corollary of the fish as blessing is its assimilation to a savior. The alchemical sign for *Salvator mundi* is a fish. The Hindu god Viṣṇu, transformed into a fish by Brahma, recovered the Vedas from the flood, saved humankind, and started a new race. Christ was symbolized by the fish, as seen in carved inscriptions in the catacombs of Rome; in Greek, the initial letters of “Jesus Christ, Son of God, Savior” form the Greek word *ichthys* (“fish”). The depiction of Jesus standing in water confirms the metaphor of a fish drawn from the deep to bring salvation to humanity. The feeding of the multitude by the miraculous multiplication of the loaves and fishes is the prototype of the Eucharist; the fish, like the bread, symbolizes the body of the Lord. The concept of Christ as both sacrificed and sacrificer is inherent in the Mass. Three fish with one head, or three intertwined fish—found in the iconography of ancient Mesopotamia, Egypt, India, and Persia, and even down to modern times—is a universal symbol for unity in trinity, and came to represent Christian baptism. Christ’s disciples and the newly baptized were denoted by the sign of a fish, and a neophyte in fish

garb is depicted on early Christian lamps. In Christian mortuary painting, on pagan sarcophagi, and in representations of Chinese feasts of the dead, fish relate to resurrection and regeneration.

The experience of entering the belly of a whale or big fish, as in the Jonah story, is equated to a religious idea that informed the initiatory mysteries and rituals of death and of rebirth through newfound wisdom. Variants of this transition symbol are found worldwide, from the initiation rites of Oceania, West Africa, Lapland, and Finland to the North American Indian tale of Hiawatha, who was swallowed by the King of Fishes.

Fishing symbolizes both looking for souls and looking into the soul, that is, drawing the treasure of wisdom from the sea of the unknown. The Babylonians considered the sea the source of wisdom, and a mystic fisherman called “Warden of the Fish” is represented on a seal of the second millennium BCE. The mythical hero Ea-Oannes, half man, half fish, rose from the waters to bring culture and wisdom to mankind. The figure evolved into a fish god, Lord of the Deep, whose priests wore fish skins and a fish headdress and whose image was ultimately transmuted into the miter of Christian bishops. The name *Orpheus* derives from a term for “fish,” and one of the figures on an Orphic sacramental bowl of the third or fourth century BCE shows Orpheus as a fisher of men, with a fish and pole at his feet. The Celtic god Nodon was a fisher-god, and the Welsh god Bran the Blessed was called “Fisher of Men.” His counterpart is the Grail King whom Parsifal found fishing as he waited for his deliverer. According to Augustine, Christ’s exhortation “Follow me, and I will make you fishers of men” implied that the world is a sea of fish to be converted. For the tenth-century Sūfī mystic Niffari, the sea of spiritual experience through which the mystic passes on his journey to God is full of strange and frightening fish.

Many forms of sea life embody specific religious symbols. The dolphin was regarded as a divine intermediary between the upper and lower worlds; as a guide to departed souls, he was depicted on Greek vases bearing warriors to the Isles of the Blest. The dolphin as psychopomp, or guide of the souls of the dead, is also represented in Christian art. The octopus was a favorite motif in the ceramic arts of ancient Crete, allied to the spiritual in symbolizing the mystic center and the unfolding of creation. In the Celtic legend of Finn, the hero eats the Salmon of Wisdom, which endows him with the foreknowledge of the gods. The European Stella Maris, or starfish, is a symbol of the Virgin Mary and the Holy Spirit.

Revised Bibliography

FLACIUS, MATTHIAS (1520–1575), known as Matthias Flacius Illyricus, was an Italo-Croatian scholar and polemicist; a creative, fiery theological leader of the late Lutheran Reformation. Born in Albona, Istria, Flacius was trained in the humanist schools of Venice under the influence of his uncle, the Franciscan provincial Baldo Luperino, who was sympathetic to Lutheranism. Flacius studied at Tübingen before moving to Wittenberg, where Luther's intervention in a personal religious crisis confirmed Flacius as his passionately committed disciple. The defeat of Lutheran princes in the Smalcald War ended Flacius's career as a Hebrew instructor at Wittenberg and propelled him into the leadership of the Gnesio-Lutheran party, formed by Luther's more radical disciples in opposition to the imposition of the Augsburg Interim (1548) and the compromise settlement worked out by other Lutheran leaders, the Leipzig Interim (1548). Flacius's historical and liturgical research, as well as his biblical, lay-oriented argumentation, led him to criticize both settlements, attacking the Leipzig Interim as a betrayal of Luther's Reformation. As a private scholar at the center of resistance to both interims, Magdeburg (1548–1557); as a professor and counselor at Jena (1557–1561); and later as a consultant and private scholar in Regensburg, Antwerp, and Strassburg, Flacius provided theological leadership and inspired controversy.

Among his major contributions are his pioneering work in Protestant biblical hermeneutics, which climaxed in *Clavis scripturae sacrae* (1567), and in Protestant historiography, which culminated in his own *Catalogus testium veritatis* (1556) and in the *Magdeburg Centuries*, composed by members of a research team that he helped organize and manage.

According to his modern biographer, Oliver K. Olson, Flacius's theology can be described negatively as a program of "de-hellenization," that is, a turning away from Platonism and Aristotle, and positively as an insistent prophetic witness to correct biblical teaching (*pura doctrina*). That witness led him to fight for the independence of the church from the state and to reject many aspects of medieval ecclesiastical custom and polity. Above all, it led him to defend Luther's doctrine of salvation by God's grace through faith in Christ in controversies with other Protestant theologians, especially his formidable antagonist Philipp Melancthon. These controversies concerned, most importantly, the role of good works in salvation and the role of the human will in conversion. In the controversy over human will Flacius defined original sin as the formal substance of the fallen sinner, who, he argued, is the image of Satan. This position was misinterpreted even by some fellow Gnesio-Lutherans and contributed to his alienation from most of his contemporaries at the end of his life, when agents of leading Lutheran princes prevented him from finding a permanent home.

Flacius's ardent polemics in defense of Luther's message at a time when it was seriously menaced by political and ideological forces contributed much to its preservation, and his intellectual contributions in liturgics, hermeneutics, church history, and dogmatics greatly enriched Protestant orthodoxy.

BIBLIOGRAPHY

Oliver K. Olson provides a superb overview of Flacius's thought and life and a sketch of his two-volume biography, as well as an extensive bibliography, in his essay "Matthias Flacius Illyricus, 1520–1575," in *Shapers of Religious Traditions in Germany, Switzerland, and Poland, 1560–1600*, edited by Jill Raitt (New Haven, Conn., 1981), pp. 1–17. The classic treatment of the subject to date is Wilhelm Preger's *Matthias Flacius Illyricus und seine Zeit*, 2 vols. in 1 (Erlangen, 1859–1861). In addition to Olson's articles and dissertation, contemporary studies of Flacius include Günter Moldaenke's *Schriftverständnis und Schriftdeutung im Zeitalter der Reformation*, vol. 1, *Matthias Flacius Illyricus* (Stuttgart, 1936), and Lauri Haikola's *Gesetz und Evangelium bei Matthias Flacius Illyricus* (Lund, 1952).

ROBERT KOLB (1987)

FLAMEN. The city of Rome presented itself as a community of people and gods, and the institution of the priesthood was necessary to mediate between those two spaces, to interpret the will of the gods and to ensure accuracy in the performance of rites. The *flamines*—etymologically, the "dispens-

ers of the sacred” (Isidorus, *Etymologiae* 7.12.17)—were the *sacerdotes* of a particular deity (Cicero, *De legibus* 2.20). They stood in contrast to the pontiffs, who were learned men and men of law, and to other colleges of priests that acted in the name of the community.

The etymology of the word *flamen* is not clear. Based on the common etymology of the words *flamen* and *brahman* established by Georges Dumézil, Henri Le Bourdellès (1970) pointed out that the term—also recorded in the Messapic and Persian languages—designated the priest as invocator or minister of the word. But the functional duties of the Latin *flamen* and those of the Sanskrit *brahman* are far from similar, and the explanation that the Romans themselves offered for the term, relating it to the band of wool (*filum*) that wrapped around the *flamen*’s cap (Varro, *De lingua Latina* 5.84), has been defended by Jens H. Vanggaard (1988).

The literature speaks of fifteen *flamines*: three major ones (*maiores*) and twelve minor ones (*minores*). Several authors, such as Vanggaard (1988, pp. 105ff) and Domenico Fasciano and Pierre Séguin (1993, pp. 22–23), have challenged the traditional thesis that the *flamines* were the specific priests of a certain deity. Fasciano and Séguin point out that the term *flamen* was applied to the *flamen* of the Arvals (*flamen Arvalium*) and to the priests of the thirty curiae into which archaic Rome was divided (*flamines curiales*), suggesting that the twelve *flamines minores* represented, in some way, certain sectors of the population, while the three *flamines maiores* represented the people as a whole, as the common sacrifices to the goddess *Fides* (a symbol of Rome’s “faith”), mentioned by Livy (1.21.4), would illustrate. Such a thesis would also be supported by the common invocation in the conclusion of a treaty by the college of the *fetiales* (Pol. 3.25.6) and in the formula of the *devotio*, the oath taken by a Roman general vowing his life to the gods of the underworld (Livy 8.9).

The differences between the *flamines maiores* (instituted by King Numa) and the *flamines minores* would be due, according to the traditional interpretation (after Georg Wissowa), to the various levels of importance of the gods each *flamen* served. Thus, the *flamines maiores* were in the service of Jupiter, Mars, and Quirinus, the archaic triad that, according to Dumézil, represented the trifunctional Indo-European ideology of sovereignty, war, and production (with parallels to a similar triad among the Umbrian peoples: Jovius, Mars, and Vofionus). But such an explanation was challenged by Vanggaard (1988, pp. 46ff), for whom this distinction should be understood in terms of social differences along patrician-plebeian lines. He also rejects the possibility that the *flamines minores* could be patricians. Vanggaard has pointed at the relationship between the *flamines* and certain family groups (*gentes*), showing the predominance of the *gens* Cornelia and, in a secondary way, of the Postumius Albinus and the Valerius Flaccus families (Vanggaard, 1988, pp. 70ff).

Of the three *flamines maiores*, we know especially well the duties of the *flamen Dialis* thanks to the taboos (*caerimoniae, castus*) to which he was subject. These were cataloged in the pontifical books at the end of the third century or the first half of the second century BCE, and collected by the poet Aulus Gellius in the second century CE (*Noctes Atticae*, 10.15). One text from the Augustan antiquarian Verrius Flaccus, transmitted by Festus (198–200 L) in the second century CE places the priest of Jupiter at the head of the Roman priestly hierarchy, below the *rex sacrorum* and above the priests of Mars and Quirinus, who also outranked the *pontifex maximus*. The positions of *rex* (who is *potentissimus*) and *flamen Dialis* (said to be the priest of the entire world: “*universi mundi sacerdos*”) represent the two types of sovereignty—warring and priestly—characteristic of Rome’s “magical-religious” horizon. In the republican era, the more “political” figures of the magistrate and the pontiff replaced that pair (Marco Simón, 1996).

The cultic functions of the priest of Jupiter are well known: participating in the *confarreatio* marriage ceremonies (offering the couple the spelt bread that it would share), sacrificing a lamb to Jupiter on the day of the full moon (*Idus*), introducing the yearly wine harvest (*Vinalia*), and participating in the feast of *Lupercalia* on February 15. Together with the other two *flamines maiores* (the *flamen Martialis* and the *flamen Quirinalis*), he partook in the sacrifice to the goddess *Fides*. The *flamen Martialis* supposedly partook of the holiday of the October Horse, and the *flamen Quirinalis* in several rituals—*Quirinalia*, *Robigalia*, *Consualia*, and *Larentalia*.

The restrictions imposed on the *flamen* (*caerimoniae, castus*) defined his position. For the *flamen Dialis*—as for the virgins consecrated to Vesta—every day was holy (*cotidie feriatu*) because he symbolized the “stability” of the city itself. Four types of prescriptions insured that stability (Marco Simón, 1996): (1) restrictions that ensured his basic freedoms, including the prohibition to swear oaths or to wear symbolic constrictions such as rings or knots on his clothes; (2) restrictions aimed at ensuring his constant presence in Rome (*adsiduitas*), such as the prohibition from leaving his bed, which had to be in contact with the soil of the city, for more than three consecutive nights; (3) rules that established the symbolic role of the *flamen Dialis* in his double relationship with Jupiter (of whom he was a living image) and with society as a whole; and (4) restrictions that, because of the third category of rules, aimed at preventing contamination (*pollutio*) of the *flamen Dialis* by animals or any elements associated with the underworld or the world of the dead.

The wife of the *flamen Dialis* (*flaminica Dialis*) formed with him a sacred union that was an example to all Romans; it was unbreakable except by death, and she was under the same restrictions as her husband, according to Aulus Gellius (10.15.26), since she was the symbol for the fertility of Rome. She could not wash or comb her hair on certain dates that were associated with the Salian and Argean rites and with the cleaning of the Vestal temple.

One consequence of the taboos applied to the Jupiter priesthood (which prevented the priest from leaving Rome) was that the flamine had little political appeal in comparison to other priesthoods, such as the augurate or the pontificate, which later served as stepping stones for political gain achieved through war. This led to a relaxation of the rules for the other two *flamines*, to whom, originally, the same restrictions had applied. This explains why the flamine of Jupiter was vacant for seventy-five years after the suicide of Cornelius Merula in 87 BCE (Appian, *Bellum civile* 1.74; Velleius Paterculus, *Historiae Romanae* 2.22.2). Young G. Julius Caesar apparently was nominated for the post in 86 BCE, but he was never installed to it.

Only ten of the names of the twelve *flamines minores* are known. The first four were named after the most prominent gods: the *flamen Carmentalis* (Carmenta is a goddess associated with water and the human birthing process, destiny, and prophecy); the *flamen Volcanalis* (Volcanus is the god of celestial fire); the *flamen Portunalis* (Portunus is god of harbors and entrance ways), and the *flamen Cerialis* (Ceres is the goddess of growth and agriculture). The names of the last six *flamines* are known thanks to Ennius (in Varro, *De lingua Latina* 5.84); they served less eminent deities, associated especially with agriculture. They included the *flamen Volturnalis* (Voltumnus is a deity associated with rivers and the wind); the *flamen Palatualis* (Palatua is probably the goddess of the Palatine and is identified with Pales); the *flamen Furrinalis* (Furrina is a goddess of wells and underground water), and the *flamen Floralis* (Flora is the goddess of the blossoming of wheat and orchards). The *flamen Falacer* was the only one bearing the same name as his god, not the adjective epithet. Finally, there was the *flamen Pomonalis* (Pomona is a goddess that protects orchards). Fasciano and Séguin (1993, pp. 141–146) suggest that the names of the two missing *flamines minores* were the *flamen Neptunalis* (Neptunus is the god of fresh water and humidity) and the *flamen Fontinalis* (Fons, or Fontanus, was the god of springs), whose deities were assimilated into Poseidon and the nymphs during the Hellenization of Roman religion.

In imperial times, the *flamines* were in charge of maintaining the cult of the emperor. The law that defined provincial priesthood in the Narbonensis province suggests that the statutes and prerogatives of the *flamines* were drafted following the model of the *flamen Dialis* (CIL XII 6038). These Augustal, municipal, and provincial *flamines* played an important role, since the imperial cult was a first-rate symbolic element in maintaining the political unity and cohesion of the vast and heterogeneous Roman Empire. The priests of the imperial cult received the title of *flamines* in the Hispanic provinces (Hispania Citerior, Lusitania, and Betica), in Gallia Narbonensis, the Maritime and Cottian Alps, Numidia, and the two Mauritanias (Caesarean and Tingitana), while the title *sacerdotes* (which is characteristic of the Flavian era,) prevails in the inscriptions of the altar of the Temple of the Three Gauls in Lugdunum (Lyons), and in the African

provinces, Sardinia, and the Danubian region (Fishwick, 1987–2002).

FRANCISCO MARCO SIMÓN (2005)

Translated from Spanish by Fernando Feliu-Moggi

FLAVIUS JOSEPHUS SEE JOSEPHUS FLAVIUS

FLIGHT. The image of a human being escaping the bonds of earthly life to float and soar about the skies unencumbered and free appears in religious myths, mystical tracts, ritual dramas, and imaginative expressions around the world, from the most archaic to the most contemporary of cultures. While of course their specific historical circumstances and motivations vary, one still feels that in some ways the imagination of the Paleolithic cave dweller who painted the figure of a man with a bird's head on the walls of the caves at Lascaux is not so different from the imagination that created the ancient Greek story of Icarus yearning to fly to the sun or that of the poets of Vedic India who sang praises of the long-haired ascetic who “flies through the air, looking on all shapes below, the friend to all the gods” (*Rgveda* 10.136.4). Perhaps, too, this imagination is not so different in the end from that which helped lift the Wright brothers into the air above Kitty Hawk.

Accounts of human flight are at times quite dramatic, as in the neo-Hebraic text the *Apocalypse of Moses*, which tells of Moses' ascension into the various heavens, each one inhabited by frightening and dreadful angels who breathe fire

and lightning and whose sweat flows into a mighty burning river. Other tales of flight convey a mood of peacefulness, as in the nineteenth-century accounts of Sister Mary of Jesus Crucified, a Carmelite nun who floated about the yard of her nunnery for hours at a time, sometimes perching softly in the treetops like a bird. Some accounts are quite charming, like the medieval Sanskrit text that tells neophyte yogins that a person trying to master the art of levitation may have some difficulty at first and so will bounce across the ground like a jumping frog, but after increased practice will fly about with ease (see *Yogatattva Upaniṣad* 53–55).

Rituals as well as myths also frequently include references to or enactment of aerial travel. Alchemists and Daoist priests in ancient China, for example, clothed themselves with feathered wings while performing various religious ceremonies so that they might fly about the skies with the immortals. Similarly, at one point in the Vedic Vajapeya rite the priest and the ritual's patron are instructed to climb the sacrificial pillar, at the top of which they spread their arms as if flapping their wings and proclaim, "We have come to the heavens, to the gods we have come! We have become immortal" (*Taittīriya Saṃhitā* 1.7.9). The Vedic ritual system as a whole is often described in ornithological terms. The performance of the Agnicayana (fire ritual), for example, revolves around the construction of an altar in the shape of a bird, suggesting that the ritual transports its oblations to the heavens the way a bird soars through the skies.

DIMENSIONS OF MAGICAL FLIGHT. Scholars have offered a variety of theories regarding the origin and meaning of humanity's fascination with magical flight. Some, such as Arthur Maurice Hocart, an anthropologist, have seen in this theme remnants of an archaic solar worship and reverence for the king (who was felt to be the sun, or the son of the sun), who was always carried about on the shoulders of his subjects and thus "flew" everywhere he went. Others, such as Geo Widengren, a scholar of Near Eastern religions, have seen in myths and rituals involving flight distinct elements of religious ideologies based on divine kingship; the protagonist exemplifying such ideologies (originally the king, but later also a prophet or savior) is said to ascend to the realm of the high god in order to receive the sanction to rule the earthly community below. Some theorists feel that the theme represents elements of initiation and rites of passage: The flight typifies the state of being in which the initiate stands between the old and the new modes of existence. Some psychologists, especially those influenced by the theories of Sigmund Freud, have argued that the desire to fly is really a subliminal desire for sexual power, and that the feelings accompanying such an experience are repressed aspects of sexual arousal. Students of other disciplines in the social sciences maintain that magical flight expresses a person's search for a legitimation of authority over other people, or a wish to be free of personal limitations.

There is no doubt that to fly is to have power, and some theorists have held that the search for power is the central

motivation common to all religious experience and expression. Whether or not this means, however, that themes of magical flight in religious myths and rituals derive from specific modes of power (such as royal prestige, prophetic influence, personal gratification, or existential autonomy) will remain open to debate. The issue is complicated by the fact that many types of persons—sovereigns, saints, visionaries, magicians, priests, ascetics, mystics, lovers, philosophers—have been said to undergo such uplifting experiences. Since the 1950s Mircea Eliade has argued that it would be a mistake to conclude that the mythic theme of magical flight derives from only one source, or that it reflects only one stage in human cultural or personal development. According to Eliade, magical flight and its related symbolism (learning the language of birds, the cultivation of ecstasy, rapturous mystical images, and so on) reflect an experience of abolishing everyday ways of knowing the world, the desire for which is expressed in images of transcendence and freedom. Eliade further maintains that this desire is, in fact, constitutive of humanity itself. If this interpretation is correct, then symbols of magical flight not only derive from a moment in human history but also reveal a structure of human consciousness, an existential dimension to the human imagination that "must be ranked among the specific marks of man" (Eliade, 1960, p. 106).

The point is well taken. Studies in the history of religions have repeatedly emphasized that *Homo sapiens* is *homo symbolicus*, defined in part by the ability to make and be moved by symbols, especially symbols of various extraordinary modes of being. At the start of the twentieth century James G. Frazer and Julius von Negelein, among others, noted that religions from around the world have used the image of the bird to signify the human soul, suggesting that celestial and aerial symbols often represent sublime emotions and spiritual ideals. One might recognize such themes in Augustine's account in his *Confessions* of his experience at Ostia when he and his mother, both radiant with spiritual love, soar up to the heavens from where the celestial bodies shine onto the earth. One finds similar themes in traditional Islamic accounts of Muḥammad's *Mi' rāj*, in which the Prophet ascends through the seven heavens of the vertical cosmos to learn sacred lessons from his predecessors in the prophetic lineage who now live in each heaven and draw near to the throne of Allah. This ascension has become a mythic and poetic paradigm for the practices and ideals of Ṣūfī mysticism. Tales of a person's flight through the skies frequently include an emotional tone of longing to be free of the bonds that tie humanity to the ways of the world. A similar longing perhaps enlivened the imagination of the Hebrew psalmist who sang, "Oh that I had wings like a dove! for then I would fly away and be at rest" (*Ps.* 55:6).

Protagonists who fly through the air do so for more than emotional and mystical reasons. They may assert their ability to rise above the laws of the physical world and thus to gain control over what may be experienced as an oppressive uni-

verse. This may be inferred from the South Asian use of such Sanskrit terms as *kaivalya* (“autonomy”) to describe one of the goals of yogic practice, which is marked by such autonomous acts as flying through the air (see Patañjali’s *Yoga Sūtra*, chap. 4 and its commentaries). Similarly, the Theravāda Buddhist tradition teaches that an adept monk can fly cross-legged through the atmosphere “like a bird in flight” (see *Majjhima Nikāya* 1.33, etc.).

At other times, the world is understood to reflect the beauty and wisdom of the divine plan; to fly about it, then, is to see more of it than is normally possible. This may be part of what the Persian Šūfī Farīd al-Dīn ‘Aṭṭar longed to do when, in his epic poem *The Conference of Birds*, he expresses a wish to fly through the air to all regions of the earth in order “to enjoy all beauties.”

At other times, people may want to fly in order to see into the future (movement through vertical space is often associated with movement through time); to escort dead people to their new lives in the unknown world; to obtain valuable medicinal or cultic knowledge from various spiritual beings; or to locate souls that have become lost in the different layers of the universe. While the religious specialist most adept at such divination is the shaman of north-central Asia, the ecstatic experience characterized by such flights appears throughout the world.

The ability to fly through the air therefore often includes an ethical or normative dimension, for the protagonist who can travel to the future, as well as to other worlds, can see what kinds of lives people on earth can expect to have in other realms after they die. Subsequent to such a flight, the aerial traveler can return to earth to tell people how to act so that they may live in the more comfortable or prestigious afterworlds. Such is the case, for example, in the Zoroastrian tale told in the *Ardā Wirāz Nāmag*, in which the priest Virāf falls into an ecstatic sleep after drinking a cup of *mang* and travels through the heavens and hells that are the respective postmortal homes of the pious and the infidel members of the priestly community. Having gained this knowledge, he then returns to his colleagues on earth and tells them what he has learned so that they can adjust their religious practices accordingly.

TYPES OF MAGICAL FLIGHT. The various scenarios in the world’s myths and rituals involving extraordinary aerial flight are so numerous that one could distinguish any number of forms and interpret their individual meanings in an equal number of ways. To arrive at a universal typology of flight, then, is to generalize in a way that might make even thoroughgoing structuralists somewhat wary. The following schema is intended to be comprehensive, but does not pretend to include all variations.

Autonomous this-worldly flight (levitation). Hagiographies from religious traditions around the world often include depictions of various saints, mediators, devotees, and other exemplary figures who are able at certain times to float

up off the ground without visible assistance and without injury. Sometimes these experiences are intentional and desirable, as is implied in a lesson from the *Yogatattva Upaniṣad* (117): “Thrusting the tongue into the back of the throat and focusing one’s eyes on the spot between the eyebrows, one sits in the posture in which one gains the power to float up into the air.” At other times, these experiences seem to catch the community by surprise, as in a story about Alfonso Liguori, who, while giving a sermon one day, offered himself to an image of the Virgin and, stretching out his arms (like a bird?), floated several feet off the platform, whereupon the two thousand people listening were amazed and filled with admiration. While most traditional hagiographies express wonder at such events, many also include implicit or explicit criticism of people who willingly drift about in the air in front of others, since such behavior is either physically dangerous or distracting to the normal person’s religious concentration or constitutes an arrogant display of spiritual authority. The Šūfī tradition, for example, criticizes those who undertake a magical levitation in order to enact a miracle or gain a vision, for to do so is comparable to making the pilgrimage to Mecca merely for the sake of business or pleasure.

The Bollandists’ *Acta Sanctorum* uses such descriptive terms as *a terra levabatur* (“raised above the surface of the earth”), *corporalite elevatus est* (“he or she was elevated bodily”), and *raptus* (“taken up”) to describe those events in Roman Catholic history in which a person is reported to have floated up off the ground while deep in prayer, during moments of deep emotion, or while performing devotions. Since the classical period in India, Sanskrit texts have used such technical terms as *laghuman* (“lightness”), *utkramaṇa* (“stepping upward”), and *gauravahīnatā* (“gravity destroying”) to describe the power a yogin gains while learning to meditate properly. Islam distinguishes two types of mystics, those who are passively “drawn upward” (*majdhūb*) and those who actively stride (*sālik*) upward through the spheres by their own arduous reflection and effort. But such technical terms, among any number of others from the literatures of the world’s religions, seem too specialized for comparative use. The English and French word *levitation* has been used since the nineteenth century by European hagiographers to describe such events in their respective traditions. While the term seems somewhat clumsy, it might suit the comparatist who has recognized such themes in other religions as well.

Levitations may be intentional or unintentional, repeated or unique, momentary or long-lasting. They may take the person over an extensive geography or they may involve rising just an inch or two above the ground. In any case, the adept remains independent of external assistance and, while he or she may be said to alter the physical laws of the world, never leaves the physical structure of the cosmos.

Although levitations are often depicted as strange and astounding events that arrest people’s attention and thrill the storytellers, they are of themselves rarely if ever soteriologically transformative and do not constitute an ultimately valu-

able experience. Rather, tales of levitation mark the esteem that the particular tradition holds for the central figure, or they serve as a means by which the tradition recognizes those specific practices and attitudes (spiritual integrity, strength of will, loving purity and devotion, self-discipline, obedience to the divine, etc.) that it holds to be most valuable.

Dependent this-worldly flight. To the category of dependent magical flights belong those instances in which a person is lifted up off the ground by a flying animal, spirit, or divine creature of some sort and is escorted through the skies over a wide area of the earth and sometimes at great height. These flights are similar to autonomous levitations in that the protagonists never leave the realm of the atmosphere and thus remain within the worldly cosmos, the realm of human activity and community. They differ from levitations in that the protagonists are dependent on another being or outside agent to bring them into the skies.

Sometimes these flights allow a hero to escape in a horizontal direction and at great speed from a situation of great anxiety or terror, often from death personified. Accordingly, the emotional tone of such stories is fervent and fearful. Folklorists have used the German term *magische Flucht* to describe such a flight from a frightening predicament and have found the theme in cultures all over the world. Eliade has noted that “it is important to distinguish one essential element [in such horizontal high-speed flights]: the desperate effort to be rid of a monstrous presence, to free oneself” (Eliade, 1960, p. 104).

At other times, this-worldly flights escorted by a supernatural being reflect less frightening feelings and signify less anxious situations. Sometimes they bring the central character to a new and highly desirable land or a more satisfying life in a distant earthly paradise. Sometimes they free him or her from the drudgery of daily chores long enough to add new wonder to their understanding of the world. Sometimes they show the character the superiority of his or her religious tradition over another, for to fly over the heads of the followers of another tradition is to be better than they are.

In general, tales of escorted this-worldly flights either express a notion that escape or existential change is possible no matter how bleak things look, or help the members of the religious community reaffirm the worthiness of their tradition and encourage people from other traditions to become part of their own. As such, many tales of an escorted this-worldly flight serve conversion as well as self-affirming functions.

Otherworldly flights (ascensions). A third general category of magical flights involves a protagonist’s journey to dimensions or levels of the sacred cosmos other than the earthly one. These journeys may be solitary and autonomous or they may be guided by supernatural beings. In either case, otherworldly flights, or ascensions, necessarily involve a radical transformation of one’s being, a change in ontological status so powerful that one moves from one mode of existence

to another. This transformation is typically depicted as being of ultimate value and is considered soteriologically efficacious. Such experiences reward specific people for their commitment to religious practices, their transformative state of mind, or their embodiment of respected personality traits. The central axis of these aerial journeys tends to be a vertical one, although there are instances of horizontal travels to other worlds as well. Whereas stories of the *magische Flucht* type of this-worldly flight evoke emotions of release, freedom, safety, or personal power, narratives of ascent evoke emotions arising from the transcendence of this world and a concurrent disjunction with normal reality and personal existential situations. If this-worldly flight gets one out of the grasp of something horrible or above the heads of everybody else in the world, ascension gets one out of the world altogether.

Myths of vertical travel to the heavens above the skies are often associated with the protagonist’s previous or subsequent descent along the same axis to the hells or otherworlds below. Therefore, ascensions, like other religious forms of magical flight, often include divinatory and ethical elements. However, unlike levitations and this-worldly flights (which involve travel across the geographies of the terrestrial world), an ascension takes one beyond the dimensions of human space and history, since vertical movement is often synonymous with movement through, or the abolition of, time. Ascensions are typologically different from levitations and this-worldly flights in that ascensions often include apocalyptic or eschatological themes. Thus, although they appear in other traditions as well, it is in Zoroastrianism, apocalyptic Judaism, Christianity, and Islam that myths of ascension are most prevalent, for it is in these traditions that the end of history is most consistently associated with the ascension of a savior into the vertical heavens above the terrestrial realm.

Figures from the world’s religions who ascend to other worlds—prophets, visionaries, saints, founders, perfected beings, and so on—sometimes return to earth with new power or knowledge that is of soteriological benefit to the community as a whole. Such an ascending and returning mediator might well function, then, as a shaman. In other instances, he or she remains in the sacred world above, never to return. Such a person might then serve as a model for others in their religious practices and attitudes, or as an example of a new and transformed being.

BIBLIOGRAPHY

The best place to begin further reading on flight and flight symbolism is with three works by Mircea Eliade: *Myths, Dreams and Mysteries* (New York, 1960), pp. 99–122; *Patterns in Comparative Religion* (New York, 1958), pp. 102–108; and *Shamanism: Archaic Techniques of Ecstasy*, 2d ed., rev. & enl. (New York, 1964), pp. 190–198, 477–507, and elsewhere. As always, Eliade’s works are useful for their extensive bibliographies as well as their typological insights.

Students interested in the varieties of magical flight (more specifically, varieties of the *magische Flucht* of this essay's typology) in the world's folktales should look to Stith Thompson's *Motif-Index of Folk Literature*, 2d ed., rev. & enl., 6 vols. (Bloomington, Ind., and Helsinki, 1955–1958). Sample motifs include the following: D670, Magic Flight; E372, Soul in Form of Bird; F61, Person Wafted to Sky; F62, Bird Carries Person to or from Upper World; F1021, Extraordinary Flights through the Air. Folklorists would also want to see Antti Aarne's *Verzeichnis der Märchentypen*, translated and enlarged by Stith Thompson as *The Types of the Folk-Tale* (1928; reprint, New York, 1971), entries 313–314, "The Magic Flight," or Aarne's *Die magische Flucht* (Helsinki, 1930).

Those who wish to find traditional accounts of levitations, magical flights, and ascensions in the lives of Christian saints have no better place to turn than the *Acta Sanctorum*, a mammoth collection (64 volumes) of hagiographies edited by the Bollandists in a project that was begun in the seventeenth century by Johannes Bollandus and was carried on by Godefridus Henschenius and subsequent editors from the Society of Jesus in Belgium (Brussels, 1643–1931). A less imposing collection, and one centering exclusively on aerial events in the lives of the saints, is Olivier LeRoy's pedantic yet still somewhat amused *Levitation: An Examination of the Evidence and Explanations* (London, 1928). For accounts of celestial travel, usually by the soul after death, in antiquity, see Josef Kroll's *Die Himmelfahrt der Seele in der Antike* (Cologne, 1931). A recent work that in a way complements LeRoy and Kroll is Ioan P. Culianu's "Le vol magique dans l'antiquité tardive," *Revue de l'histoire des religions* 198 (January–March 1981): 57–66; a short study of instances in late antiquity when people who are supposed to be able to fly fail to do so.

For views of the soul as a bird, see James G. Frazer's *The Golden Bough*, part 2, *Taboo and the Perils of the Soul*, 3d ed., rev. & enl. (London, 1911), or Julius von Negelein's "Seele als Vogel," *Globus* 74 (1901): 357–361, 381–384. Arthur Maurice Hocart's notion that magical flight derives from an ancient solar worship appears in his "Flying through the Air," *Indian Quarterly* (1923): 28–31 (also in *Indian Antiquary* 52 [1923]: 80–82). Readers will find Geo Widengren's ideas on divine kingship and the aerial motif in his *The Ascension of the Apostle and the Heavenly Book (King and Savior III)* (Uppsala, 1950) and *Muhammad, the Apostle of God, and His Ascension* (Uppsala, 1955).

For a study of Zoroastrian notions of ascension, see Martin Haug's *Über das Ardâi Virâfnameh* (Munich, 1879). For a collection and discussion of Jewish, Christian, Gnostic, Greek, Roman, and Persian apocalyptic tales of ascension, see *Apocalypse: The Morphology of a Genre*, edited by John J. Collins, special issue of *Semeia* 14 (1975).

WILLIAM K. MAHONY (1987)
Revised Bibliography

FLOOD, THE. Many peoples relate that floods accompany the end of a world. According to one Egyptian text, the

world will disappear in the Nun, the divine water where the first god was formed (*The Book of Going Forth by Day* 175). For the Aztec and the Maya, the universe goes through several eras, separated from each other by the invasion of waves. India has successive creations, in which everything is abolished by a vast expanse of water; this water then constitutes the ocean from which the next creation will arise (*Mahābhārata* 3.188.80, 3.189.42).

Several tales associate humans with this universal drama. The god Faro of the Bambara holds back the waters that will one day submerge the earth, to make way for the future world; warned of this occurrence, people must arm themselves with objects that will ensure their salvation. Iranian texts evoke the snows and floods that will cover the world at the end of a cosmic millennium; in anticipation of this crisis, Yima brings together a number of men in a hidden domain; they will survive and ensure the rebirth of humanity in the next millennium (*Vendidad* 2.22–41). A famous tale from the *Mahābhārata* makes Manu, the very symbol of man, the sole survivor of the flood; it is he who, through his spiritual austerities, will become the author of the new creation (*Śathapatha Brāhmaṇa* 1.8.1–6; *Mahābhārata* 3.190.2–56; *Bhāgavata Purāna* 8.24).

The most numerous narratives, however, deal with another sort of flood. They are more limited and find the full sense of their meaning in the history of mankind. They constitute one of its major expressions; for mankind, there is an antediluvian and a postdiluvian world.

THE ANTECEDENTS OF THE FLOOD; ITS CAUSES. Blunders sometimes characterize the beginning of a cosmogony, for example, the first union and first births of the Japanese deities Izanagi and Izanami, in the *Kojiki*. In an Indonesian myth, divine patriarchs came down one day from the heavens to the earth that was emerging from the waters. The first of them perched himself on the southern extremity and unbalanced it, so that it was inundated by the waves. The second placed himself at the other extremity as a counterbalance, but it folded up; the northern part plunged into the waves while the middle rose up. It was not until the last two patriarchs settled down in the central region that the earth recovered its flatness and stability.

In an equally awkward way, the gods began several times to create humanity on several occasions; floods are one of the means that they used to destroy the unfortunate results of their initial endeavors. After creating the heavens and the earth in darkness, say the Quechua peoples of South America, the god Viracocha made human beings too big; he turned some into statues and destroyed the rest with a flood. In the *Popol Vuh*, the sacred book of the Maya, formative or progenitor spirits create the first animated mannequins. These lived and procreated, but "this was only a trial, an attempt at humanity." They disappeared in the course of a complex series of events, in a vast inundation (*Popol Vuh* 3–4). Instead of annihilating an imperfect humanity, sometimes the creator god tries to improve it; he eliminates the defective hu-

mans by use of a flood. When everything seemed to be complete, say the Desána of South America, a number of plagues overcame the world, and evil beings ravaged humankind. Seeing the suffering of those he had created, Sun brought on a flood that drowned all the living, and then a fire that burned everything. There were survivors, however, and the god had them brought up.

In most of the myths, the flood occurs after a more complex series of events in which human behavior plays a decisive role, although humans are not necessarily at fault. In one Philippine story, the god of the sky causes a flood to destroy humanity because it was becoming too numerous. In a Mesopotamian myth, the growth of humanity is accompanied by a perturbation that tires out the gods; to destroy it, they unleash several catastrophes, the last of which is a flood (Lambert and Millard, 1969). Usually, however, humans commit some characteristic error. They refuse to give a god what he asks of them, show almost no compassion for the unfortunate, take to evil, or disobey religious and moral laws. In *Genesis*, it is because of the evil in humans that God wished to wipe them out (*Gn.* 6:1–7, 6:17).

THE SURVIVORS. In myths where the flood is supposed to destroy the original, defective humankind, sometimes the latter disappears completely. In other cases, there are one or more survivors.

The existing tales do not state what all the qualities are that earned the survivors this privilege. The more explicit stories, however, attribute particular traits to them. The Greek Deukalion was a son of the god Prometheus (Lucian, *De dea Syria* 12ff.). A close relationship joins Atrahasis or Utanapishtim to the Mesopotamian god of waters, the sage Enki-Ea (*Epic of Gilgamesh*, tablet 11; Lambert and Millard, 1969). Furthermore, they themselves seem to possess an eminent wisdom. The merits of the survivors are more evident elsewhere. Alone among humans, they give the gods what they ask. In Hindu myth, Manu is a great *ṛṣi*. A lengthy practice of asceticism raises him above his fellow mortals; he is able to recognize and save the divine being who, in the form of a fish, requests his protection. The biblical Noah by contrast is the only just man in an evil humanity.

THE POSTDILUVIAN WORLD. It has been seen that when the flood destroys a world and all of humanity, it sometimes precedes the creation of a new universe. It appears to separate two successive eras within a cyclical time. On this point, however, matters are not always clear. Although the Egyptian Nun, into which the world will disappear, is identical to the primordial waters, it is not clear that another world will ever emerge from it. A Carib myth says that humans will one day disappear with the entire universe, which does not seem to leave any hope of a new beginning; a flood that has already taken place to punish human evil simply warns them of the final catastrophe, for which humankind will also be to blame.

What happens when floods are linked more specifically to the fate of mortals? In some cases, the gods, after completely destroying the original human species, create another

one; in other cases, the survivors themselves must ensure the survival of the human race.

This is not always a matter of course. When only one person escapes death, a miracle is needed to provide that person with offspring. In a Jivaroan myth, the solitary man plants a part of his own flesh in the earth; from this a woman is born, with whom he couples. Other South American Indians relate that the woman came from bamboo. After the destruction of the world in Hindu myth, Manu feels the desire for posterity. He gives himself over to ascetic practices and offers a sacrifice. In the year that follows, a woman is born, approaches him, and says, "I am your daughter." He begets upon her the race of his descendants by practicing more spiritual austerities.

Things are less unusual when either a couple or numerous individuals escape death; in this case the conditions of natural procreation are fulfilled. However, it may be observed that the salvation of the survivors is in itself a marvel; in many cases, they owe their survival to divine intervention. In Australian Aboriginal myth, only the ancestors survive the flood: By eliminating their evil descendants, the inundation permits a return to origins, from which humankind will be able to start anew. Many myths attribute qualities to the survivors that set them apart: Their descendants will be the products of a process of selection. In short, even when the present humanity issues from antediluvian mankind, it constitutes a second race.

Thus, in the history of humankind, just as it sometimes happens in the history of the cosmos, a destructive flood precedes a sort of new creation. The story of *Genesis* is a good example; Yahveh repeats to Noah's family the words he had spoken to Adam and Eve: "Be fecund, multiply on the earth and rule it" (*Gn.* 9:1ff.; cf. 1:28). But this new beginning is unique; when on the scale of humanity, there no longer cyclical time. This is evident in the biblical concept: The flood takes place within a linear history that goes from an absolute beginning to a definitive end.

THE POSITION OF POSTDILUVIAN HUMANITY. When the flood is supposed to correct the effects of an initial blunder, it fulfills a positive function and is part of progress. In this case, however, it must be noted that the second race is imperfect; it commits errors and undergoes many vicissitudes. In Quechua myth, the new men ignore Viracocha and do not venerate him. This is why the god causes a fire to fall from the heavens, which burns the earth; only those who beg for mercy are spared. The position such myths ascribe to present-day humanity is similar to that found in the other types of stories.

The flood sometimes appears to be a part of a more general degradation. On the original earth, say the Guaraní of Paraguay, people lived close to the gods. Then incest unleashed a series of events, after which the flood wiped out humanity. A new earth was then created, the land of evil reserved for humans. This pessimistic viewpoint is not

common. More typically the flood follows a period of degradation and puts an end to it.

In all types of the myth, the new humanity exhibits traits that distinguish it from the old. Not only is it civilized, but many tales associate the flood with the origins of civilization itself. Viracocha teaches the rudiments of civilization to the second Quechua race he has just created, and the *Popul Vuh* relates how Maya civilization developed during the second humanity. In a myth of the Desána of Colombia, the sun god sends his daughter among the survivors of the flood to teach them the rules of living. Similarly, after a flood and other catastrophes, in a myth of the Fali of Chad and Sudan, the high god makes an ark descend from the heavens with the rain. This ark contains the symbol of all plant species, of wild and domesticated animals, and of the metals and tools of the smithy. Even in the pessimistic Guaraní myth, the man who survives the flood makes manioc, maize, and sweet potatoes appear.

In other narratives, the culture hero and the being who saves humanity from the flood are one and the same. This dual role appears in stories told among African peoples and among American Indians. In Greek myth, Prometheus is not only the hero who gives fire to humans and teaches them the arts of civilization; it is also he who teaches Deukalion how to escape the flood.

Several peoples undoubtedly knew of the existence of an antediluvian civilization. The Mesopotamians list the kings prior to the cataclysm, while the Hebrews tell the story of those who, compelled to work, have succeeded each other on the earth up to Noah. But in these cases too, the flood is associated with the history of civilization. Ea, the god who saves Utanapishtim, had been the protector of the wise men of old, to whom Utanapishtim himself could be related; Gilgamesh, who met him, transmitted an antediluvian wisdom to humanity. The survivor of the Sumerian flood, Atrahasis, takes "the master craftsmen" with him in his ark. Noah is "the farmer." After the flood, his family receives moral laws: This is when homicide is clearly prohibited, when meat as well as plants are offered as food to humankind, and when the rules of slaughter are prescribed.

In addition, humanity finds itself in a new position vis-à-vis the gods. According to the Guaraní myth, before the flood people lived with the gods on earth; on the second earth, they are alone. For many Australian peoples, the flood coincides with the withdrawal of the "dema deity," who abandons earth for a celestial dwelling. In the biblical tale itself, the flood is the culmination of events that begin with the expulsion of Adam and Eve from Paradise; it follows the murder by Cain and other occurrences. In mentioning these misfortunes Yahveh repents for having created humanity.

The Greek myths make a correlation between this rupture and the origin of civilization. The events that include the flood give rise to both of them. Prior to them, humans received everything that was necessary for their subsistence

from the gods and did not have to work at all. Separated from the gods, they must now toil in order to live, but they have learned the arts that will let them provide for their own needs.

The separation that accompanies the flood is not absolute, however. At the end of the inundation, there is a new sort of relation flourishing between humans and gods. Those who beg mercy of Viracocha while he burns them acknowledge his divinity, whereas before they had neglected him. The procedures of the cult of the *dema* deities are defined after their separation, at the end of the Australian floods. Furthermore, the aurora borealis then becomes a sign for humankind of the *demas*' disposition. The daughter whose birth is brought about by Manu's spiritual austerities bears the name of a ritual offering and also symbolizes it. By committing the act that unleashes the entire process of separation between humans and gods—the unequal allotment of a bovine—Prometheus makes a gesture to which the ritual of the great Greek sacrifices will refer: By bringing fire to mortals he gives them the instrument necessary for the burning of victims. At the end of the flood, his surviving son, Deukalion, celebrates the first sacrifice, and several traditions see in him the founder of cults. When the Mesopotamian flood has ended, Utanapishtim makes a sacrifice whose ritual is described in detail by the myth. Similarly, "Noah built an altar to the Lord, and took of every clean animal and of every clean bird, and offered burnt offerings on the altar" (*Gn.* 8:20). In addition, Yahveh makes an agreement with him that encompasses all of humankind to come, and of which the rainbow will remain a sign visible to the eyes of humans.

THE FORMS OF THE FLOOD AND THE FUNCTION OF THE DILUVIAL WATERS. The flood is not the only catastrophe with which the gods threaten to wipe out humanity. As the Egyptian wise men supposedly told Solon, "Men were destroyed and will be destroyed again in many ways; fire and water were the instruments of the most serious destructions" (Plato, *Timaeus* 22c). In some tales the flood itself is associated with other scourges, especially the burning of the earth. In the epic of Atrahasis it follows a plague and terrible droughts. Nevertheless, the myths return to the image of destruction by water, with particular frequency.

The diluvial waters are not just any water. As has been seen, the water into which the world disappears at the end of its existence coincides with the primordial water. The earth that the Indonesian patriarch unbalanced is an insular earth, located in the original ocean whose waves invade it.

If the flood takes the form of rain, as is often the case, this rain comes from the heavenly waters and can be accompanied by a brutal ascent of underground waters as well. "Nergal tears the beams from the heaven, Ninurta makes it unlock its dams . . . the foundations of the earth are broken like a shattered jar," reads a passage in the *Epic of Gilgamesh*. *Genesis* continues: "All the fountains of the great deep burst forth and the windows of the heavens were opened" (*Gn.* 7:11). The Greek poet Nonnus (early fifth century CE) ex-

presses the same notion. The world is thus submerged by the waters that surround it on all sides. According to some myths, these cosmic waters are the very same primordial waters that were thrown back to the periphery of the universe at the creation.

The diluvial waves thus possess the virtues of water in all their original vigor. It is not only that they can be destructive, as when at the end of the world they reduce everything to a state of original indifferentiation. They are also capable of fulfilling an amniotic function, when a new creation succeeds this annihilation. Perhaps their cathartic nature can be seen in their elimination of the bad elements of the human race. Their generative strength is manifested in the marvelous rebirth and proliferation of a purified humanity. They can, finally, play a role in the immortalization of heroes who have lived through the flood and survived. The brother and sister whose incestuous union provoked the flood of the Guaraní myth went into the water, in animal form, and were deified. The Mesopotamian survivors, Utanapishtim and his wife, also became immortal.

CONCLUSION. The influence peoples have exercised over each other in the course of history is not enough to explain why myths of the flood are present on every continent. In order to account for this, some authors have supposed that everywhere people preserve the memory of distant prehistoric catastrophes that destroyed the universe or vast regions of the earth. Such an explanation strikes this writer as misguided. For it to be pertinent, one would have to be able to explain in similar fashion the other mythic scourges that have imperiled humanity: the burning of the earth, for example, or the rage of a goddess in the form of a lion, as in an Egyptian myth about the destruction of humankind.

By resorting to this type of explanation, one also neglects the very thing that makes the flood so significant: the return of the world to its original state, in the case of cosmic destructions, and, in the case of destructions that have a special impact on humankind, the idea of an original intimacy between humans and gods, the idea of their separation, and, finally, the belief that a relationship unites them despite this separation. Mythic thought uses the narrative to express these basic intuitions and elaborate on them. Commonplace occurrences, such as epidemics, ravishing fires, droughts or floods, the fear of wild animals, furnish it with vehicles for this purpose. Among such vehicles, the symbolic richness of water confers a special status to the image of the flood.

JEAN RUDHARDT (1987)
Translated from French by Erica Meltzer
Revised Bibliography

FLORENSKII, PAVEL (1882–1943/1950s?), was a Russian Orthodox priest and theologian. Florenskii was born in Evlakh, Azerbaijan, in Transcaucasian Russia. His engineer father was Russian, perhaps half-Georgian; his mother was Armenian. Religion did not play more than a cultural role in the Florenskii family. Young Florenskii was a child prodigy during his elementary school years in Tiflis (present-day Tbilisi), Georgia. He was sent to study mathematics at Moscow University, where he also became intensely interested in philosophy. At the university he studied with the famous Sergei Trubetskoi and L. M. Lopatin, falling under their religious influence. At this time, with his friends V. F. Ern and A. V. Elchaninov, who was to become a famous émigré Russian Orthodox priest in Western Europe after the Russian Revolution, Florenskii founded the utopian Christian Brotherhood of Battle, an organization that worked for social reforms in Russia and a new church-state policy that would give freedom to the church along the lines of the theocratic philosophy of the sophiologist Vladimir Solov'ev. Upon graduation from the university, Florenskii gave up a research fellowship in mathematics to enter the Moscow Theological Academy on the advice of his spiritual guide, Bishop Antonii Florensov. After completing his studies at the academy in 1908, Florenskii was elected to the academy's faculty of the history of philosophy. He married Anna Mikhailovna Giatsintova on August 17, 1910, and was ordained a priest of the Russian Orthodox church on April 24, 1911.

As a priest, Florenskii never held a formal pastorate, although he served in one of the chapels at the Saint Sergius Trinity Monastery (at present-day Sergiyev Posad), where the Moscow Theological Academy was located, and he was always eager for pastoral work. His good friend Sergei Bulgakov, who returned to Christianity through Florenskii's ministry and became a famous Russian Orthodox archpriest and theologian, testified in his memoirs to the pastoral zeal of his spiritual guide. So also did the renowned, although very different, philosophers N. O. Lossky and Vasilii Rozanov, who also recovered their religious faith through his ministry, both the latter, however, would come to express serious doubts about their mentor's philosophical vision.

Florenskii wrote only one book of theology, the highly debated and generally considered epoch-making collection of twelve essays on theodicy titled *Stolp i utverzhdienie istiny* (The pillar and bulwark of the truth). Published in 1914 in a special typeface selected especially by the author, the book consists of more than eight hundred pages, with more than four hundred footnotes and commentaries touching upon virtually every area of human study: theology, philosophy, philology, history, mathematics, medicine, art, the various sciences, and even the occult. It is written in the form of intimate letters to a friend which Nikolai Berdiaev, among others, criticized for its pretentious aesthetical and lyrical stylization. The chapters, each introduced by a literary vignette, bear such titles as "Doubt," "Friendship," "Triunity," "Sophia," "The Comforter," "Light of Truth," "Contradiction," "Sin," and "Gehenna."

Stolp i utverzhdienie istiny is not a systematic work. Its controlling intuition is expressed in its opening sentence: "Living religious experience [is] the sole legitimate method for understanding [religious, and certainly Christian] dogma." The author's fundamental claim is that ultimate truth, which is religious, comes from the liturgical, spiritual, and ecclesial experience of the whole person within the community of faith and worship of the Orthodox church; this experience fundamentally is the gracious realization by creatures of the indwelling divine life of the trinitarian godhead: Father, Son, and Holy Spirit. Following such thinkers as Solov'ev, Aleksei Khomiakov, and Ivan Kireevskii, and interpreting the theology of the Eastern Christian church fathers and the liturgical hymnography and iconography of the Orthodox tradition in their light, Florenskii forges a magnificent, and extremely complex, worldview. At the heart of Florenskii's worldview lies the experience of free and joyous communion in truth, love, and beauty. This communion is perfected by all creatures made in the image of the uncreated Trinity of divine persons. The eternal being and life of the Trinity provides the archetypal structure for human existence and fulfillment.

The work that formed the basis for *Stolp i utverzhdienie istiny* was accepted by the Moscow Theological Academy as an orthodox expression of the faith of the Russian church, albeit in highly individualistic and idiosyncratic form, and

Florenskii was granted his doctoral degree after its presentation. However, careful analyses of the finished and published product, accomplished almost exclusively outside of Russia after the Revolution, have questioned the work on virtually every point. Classical Orthodox theologians and scholars such as Vladimir Lossky and Georges Florovsky have rejected it as an expression of church dogmatics, and philosophers such as Nikolai Berdiaev have faulted its philosophical argumentation. So also have philosophical interpreters such as Vasilii Zenkovskii and N. O. Lossky, the latter of whom, as has been seen, was greatly influenced in his return to Christianity by Florenskii. In all cases, however, the brilliance of the gifted thinker, the fundamental correctness of his guiding intuition, and his rejection of a rationalist approach to religious and specifically Christian thinking, indeed, to any truly metaphysical reflections on the ultimate nature of things, have been applauded by all who have had the courage to labor through his prodigious creation.

After the Bolshevik Revolution of 1917 Florenskii was inducted by the regime into scientific service, often embarrassing the new rulers by appearing at scientific conferences and classes in his priestly cassock, wearing the cross. He worked for the Highest State Technical-Artistic Studios and the Commission for the Electrification of Soviet Russia. A member of the Academy of Sciences and editor of the Soviet *Technical Encyclopedia*, he was honored for several important scientific discoveries, one of which had to do with the refining of oil. He also wrote standard textbooks for Soviet schools. At the same time, he preached against the excesses of the regime whose fundamental worldview was contrary to his own. It is believed that Florenskii was imprisoned permanently during the Stalinist terror in 1933. According to Soviet records, he died in 1943, but other sources indicate that he may have survived into the 1950s. In 1956 the Soviet government formally rehabilitated the memory of the man who was called by many critics of his work the "Russian Leonardo da Vinci."

BIBLIOGRAPHY

Pavel Florenskii's major work, *Stolp i utverzhdienie istiny*, was originally published in Moscow in 1914. A limited reprint was made in Berlin in 1929. Translations into French (Lausanne, 1975) and Italian (Milan, 1974) also exist. An English version of the fifth letter on the Holy Spirit, titled "The Comforter," appears in Alexander Schmemmann's *Ultimate Questions: An Anthology of Modern Russian Religious Thought* (New York, 1965). Essays on the life and work of Florenskii may be found in N. O. Lossky's *History of Russian Philosophy* (New York, 1951) and Vasilii V. Zenkovskii's *A History of Russian Philosophy*, translated by George L. Kline (New York, 1953). The only book in English on Florenskii, which contains complete bibliographical information in all languages, is Robert Slesinski's *Pavel Florensky: A Metaphysics of Love* (Crestwood, N. Y., 1984).

THOMAS HOPKO (1987)

FLOWERS. The blossom, or reproductive part, of trees, shrubs, and other flora is known as the flower. This part of a growing plant takes on very special and often sacred meanings in every culture and religion of the world. The symbolism of flowers is often determined by a flower's natural properties: its color and smell, where it grows, and the length of its blooming period. While each kind of flower may be assigned a special meaning, flowers in general symbolize beauty and the transitory nature of life. Flowers are often used to represent the cycle of life and are an important part of rituals and ceremonies that celebrate birth, marriage, death, and the promise of regeneration. Flowers also serve as offerings or as a means of communicating with a deity or other sacred being. They are frequently sacred gifts bestowed as signs of welcome or in celebration of victory. Flowers represent certain deities and are associated with cultural beliefs regarding heaven or the afterlife.

It is not just the bloom of a plant that holds these special meanings. Several different plants may be combined to create a "flower" for sacred purposes. In some societies other parts of a living plant may be referred to as a "flower." In Japan, maple leaves are considered to be flowers even though they are not the bloom of the maple tree. And even sea coral was treated as a flower in nineteenth-century Christianity in the United States and was believed to represent heavenly love. Palms and evergreens are often included in the general category of flowers and are used in sacred contexts.

Flowers are used to teach general religious principles. The Japanese myth *Mr. Butterfly and His Flowers* teaches that all creatures are destined to become Buddhas. In this story a hermit is visited by a number of women who are actually the spirits of the flowers from his garden, which he had left behind in his search for enlightenment. These flowers, as spirits of women, had come to share his Buddhist attainment because flowers too are on the path to enlightenment.

The art of flower arrangement in Japan is called *ikebana* ("living flowers") and has spiritual significance. The word for flower is *hana* and includes blossoms, branches, foliage of trees, as well as individual flowers and grasses. The art of arranging these "flowers" expresses the Buddhist ideals of content, calm, and piety. Religious spirit, restraint, serene disposition, and respect for humankind are qualities the flower arranger must possess as he or she strives to portray the growth cycle of the plant from bud to maturity. The Daoist concepts of *in* (Chin., *yin*: female, passive, earth, moon, darkness, coolness, silence) and *yo* (Chin., *yang*: male, heaven, sun, action, power) must also be combined in the flower arrangement.

The lotus is used in many cultures to stand for the ideal of purity and perfection. The plant grows in muddy water and yet remains pure. The flower itself is most frequently believed to symbolize the oneness of Buddhist instruction and enlightenment.

FLOWERS AND DEITIES. Flowers are connected to the sacred realm through their association with gods and goddesses.

Flora, the Roman goddess of springtime and flowers, brings beauty and fragrance to blossoms, sweetness to honey, and aroma to wine. The Aztec god Xochipilli Cinteotl was one of thirteen day lords. He was the prince of flowers—the god of beauty, love, happiness, and youth. His female twin Xochiquetzal ("flower feather") was also the goddess of love. The Hindu love god, Kāma, is represented riding a parrot with a bow and arrow made of flowers. Ko-no-hana-sa-kurahime ("the lady who causes trees to bloom") is a supernatural being of Japan, a fairy represented by the cherry blossom. The Japanese *tennyo* (like the Indian *devatās*) are female deities of the sky. They play music and scatter flowers and the aroma of celestial perfume. The *tennyo* surround pious Buddhists like angels, they appear as decorations in Buddhist temples, and some have their own shrines. The *tennyo* may be identified with Shintō goddesses. In Zoroastrianism, thirty different species of flowers are associated with the thirty *yazatas*, or deities, that preside over the thirty days of the month.

Flowers may be created through the actions of gods. Almost every culture credits the presence of all forms of life, including flowers, to the sacred realm. The ancient Greek and Roman religions include several tales of creation. Jupiter, wishing to render Hercules immortal, placed him at the breast of the sleeping Juno. Some drops of her milk fell to the earth from which sprang the white lily.

The Muslims consider the rose a sacred plant that had sprung from the drops of perspiration that fell from the Prophet during his heavenly journey. Among the Indian cultures of Latin America the geranium is believed to have grown from drops of Christ's blood that fell as he ran from Satan. And the lily of the valley is called "Our Lady's Tears," because this plant grew from the tears the Virgin Mary shed at the cross of Christ.

Flowers are also associated with the birth or creation of deities. Ancient Egyptian religion described the fixed stars in the heavens as gods or souls, and also as fields of heavenly flowers and plants, believed to be the dwelling place of the blessed dead. It was from these fields of flowers and souls that the gods were created. Ancient Egyptians also believed that the sun was born every day from a blue lotus in the celestial ocean. In Asia the lotus is the flower on which Brahmā alighted when he sprang from the navel of Viṣṇu. From this beginning Brahmā ordered the existence of all worlds.

Flowers and deities together may protect human birth. In China the *bodhisattva* Guanyin is known as "the lady who brings children." Sitting on a lotus flower and holding a child in her arms, she is a goddess of fertility and aids in the treatment of all sickness. Her image is found in most homes. Kishimojin (Hariti) is a female divinity of Japan who was converted by the Buddha. She is the protector of children and women in childbirth. This goddess is portrayed standing with a baby at her breast and holding the flower of happiness.

Important symbolism is attached to flowers through their appearance with a sacred being. Many times this con-

nection arises because of particular characteristics of the flower or the season of the year in which the bloom appears and the relation of this blossoming to the religious calendar of the culture. Artists have depicted the angel Gabriel coming to Mary with a spray of lilies in his hand to announce that she will be the mother of Christ. Many flowers are connected to Mary. These flowers all stand for virginity and purity: the annunciation lily, the flowering almond, the madonna lily, the gillyflower, the snow drop, and the rose. The thorns of the rose allude to the suffering of Mary as the mother of Christ. Christ's crown of thorns is believed to have been formed from the acanthus, bramble, or rose-briar. The hawthorn is also believed to be a symbol of Jesus, because it blooms at Christmastime. Because the Easter lily blooms at Eastertide, it is a symbol of Christ's resurrection.

FLOWERS AND RITUALS. Flowers as a link between humankind and the deities are presented as offerings to the sacred world, as food for the gods, or even as a reward from the gods. Deities may be appeased and worshiped through the singing of hymns, the anointing of images, the use of lights and incense, and through the offering of foods and flowers. In India flowers are said to have dropped from heaven to express the joy of the gods.

The religions of Latin America are a mixture of sixteenth-century Catholicism and native Indian religions. In many areas the seven most important saint's days are celebrated in festivals lasting three days. The first day of the festival is spent renewing flower decorations and offerings for house and church altars. The flowers used on this day, and throughout the year, are important offerings to the saints and to God. The last day of the festival falls on the saint's day as declared in the Roman Catholic calendar.

Among the Sherpas of Nepal, the high gods have achieved salvation and bliss and are utterly fulfilled and self-contained. Following traditional Buddhist beliefs, these gods have obtained enlightenment partly through conquering the delights of the senses. The high gods are unconcerned with humans and must be drawn down to aid humankind through a complex ritual involving sacred offerings. The god is "trapped" or seduced by the various offerings, each designed to appeal to one of the senses. The flower used in this ritual tempts the god to use his sense of smell.

Rites of passage. A rite of passage is a vehicle for transforming an individual, or a group of individuals, from one way of being to another through a series of culturally recognized stages. In most cultures, these transitions are marked or given meaning through the ritual use of flowers.

The earliest evidence for the use of flowers in a rite of passage is connected with a Neanderthal burial in the Shanidar Cave in Iraq. This burial site dates from sixty thousand years ago and reveals that the Neanderthals covered the body of the deceased with at least eight species of flowers.

The association of flowers with rituals of death occurs all over the world. The Greeks and Romans covered the dead

and their graves with flowers. The souls of dying Buddhists in Japan are carried upward on a lotus, and the gravestones in cemeteries may rest on carved lotuses. Lotus leaves are also constructed out of gold or silver paper and are carried at Japanese funerals. Tahitians leave bouquets wrapped in ferns by the body after death and then pour floral perfume over the corpse to ease its passage into the sacred afterlife.

In Zoroastrianism, the "rite of flowers" is performed by two priests; it invokes the blessings of the sacred and includes vows to the deceased. The priests conduct a complicated exchange of flowers accompanied by prayers and gestures. These flower exchanges symbolize the exchange of life between this world and the world after death. The ritual is also concerned with good and evil and the importance of good thoughts, words, and deeds.

Flowers are used in marriage rituals as an expression of fertility, virginity, purity, and to represent the sacred union of the bride and groom. Christian weddings in the United States include flowers for the altar, a bridal bouquet that represents the bride's fertility and the children that will result from the marriage, and flowers for virtually all the ritual participants. A Roman Catholic bride often lays her bridal bouquet at the foot of a statue of the Virgin Mary at the conclusion of the wedding ceremony as a dedication of her virginity to the mother of Christ.

The marriage ceremony of Java is a syncretism of Hinduism, Islam, and folk religion. This ceremony is completed only when the bride and groom exchange the *kembang majang* ("blossoming flowers") that represent their virginity. These "flowers" are large composite plants. The stems are from a banana tree trunk, the "blossom" consists of leaves, and the entire "flower" is wrapped in coconut branches.

Flowers and the afterlife or paradise. Not only are flowers used to express cultural beliefs about the changes in the life cycle, but they are also connected to ideas of life after death and paradise. Chinese Buddhists believe that at the hour of death the Buddha will appear to them, and their souls will be placed in a lotus. The souls will remain there until they are cleansed of all impurities, and then they will go to the Land of Extreme Felicity in the West, a paradise of all delights where showers of blossoms fall to the ground. The Aztec paradise was located above the ninth heaven and was called Xochitlicacan, the "place of flowers." The Huichol Indians of northwest Mexico call their paradise Wirikúta, a land of many flowers and much water. It is there that the ancient ones dwell, the ancestors and deities of the Huichol. These ancestor deities are called *neyeturixa*, from *yeturixa*, a thistle plant that flowers and then becomes the dry burrs found in the everyday world. Through the ingestion of peyote, or the five-petaled "flower," these Indians are able to journey to Wirikúta and to meet and join their ancestors amid the flowers of paradise.

SUPERNATURAL POWERS OF FLOWERS. Flowers are believed to possess powers that arise from their connection to the sa-

cred realm. Greek and Roman religion held the amaranth as a sacred flower and associated it with immortality. In Switzerland it is believed that if this flower is worn on Ascension Day, it will render the wearer invisible. The peony is valued for medicinal properties and is named in celebration of Apollo, who as Paeon healed the wounds received by the gods in the Trojan War.

The Maya Indians of Zinacantan perform an illness-curing ceremony called "he enters in the flowers." This ritual includes visits to the ancestor/deity mountain shrines that surround the city of Zinacantan, as well as a ceremonial circuit of the sacred Roman Catholic churches within the town itself. This ceremonial circuit is called "great vision," referring to the number of gods visited during the ceremony, or "big flower," named for the large number of flowers necessary for the success of the procession. These flowers include not only the blooms of plants but also the sacred tips of evergreen trees. These tips are considered to be natural crosses, and two are erected alongside a permanent wooden cross to form the *calvario*, or calvary. This re-creation of the three crosses present at Christ's crucifixion is necessary for many rituals, including curing ceremonies.

PERFUME, THE ESSENCE OF FLOWERS. Flowers may also be present at sacred times in the form of incense or perfume. The aroma of the blooms is believed to reach into the sacred sphere.

The people of Mayotte in the Comoro Islands have two religious systems that exist side by side. The public and male religion is Islam, while the religion of the private domestic sphere of women is a complex system of possession by spirits. Flowers, and especially the perfume made from them, are used to celebrate the sacred in both realms. The flowers are selected for their fragrance, not for their color or form. The cologne made from these flowers is used to mark and give meaning to several occasions: the onset of puberty in women, rituals of curing, and the anointing of the bride and groom during and after their wedding, as well as of the other major participants in the marriage ceremony. Every household keeps a supply of cologne and generously sprinkles the fragrance on body and clothing on all major holidays and Fridays at the weekly mosque service. Cologne is also offered to the mullahs at family rituals, especially during *mawlid* celebrations of the month of the Prophet's birth. Perfume contacts and pleases the sacred and enables prayers to travel more quickly.

The Zoroastrian Dhup-sarvi ("ceremony of the perfumes") involves the use of fragrant flowers, flower water, and other perfumes. These are passed out to the people, who are assembled to honor the dead, and they symbolize the fragrance and joyful nature of the path that righteous souls take to the afterworld.

The meanings attached to flowers, indeed the definition of *flower* itself, vary from culture to culture. The religious significance of these blooms is a very important part of the defi-

nition of *flower* for most societies. There is power in all life, especially in this form of nature that almost universally stands for beauty, purity, and the transitory nature of life.

BIBLIOGRAPHY

One of the best examples of the nineteenth-century use of flowers by Christians is Andrew Joseph Ambauen's *The Floral Apostles, or, What the Flowers Say to Thinking Man* (Milwaukee, Wis., 1900). The use and meaning of flowers in religious practices, especially the historical development of their role in ritual, is well described by Jacques Duchesne-Guillemin in *Symbols and Values in Zoroastrianism: Their Survival and Renewal* (New York, 1966). For an excellent description of the Nyingmawa (Rñin-ma-pa) sect of Tibetan Buddhist beliefs and practices, see Sherry Ortner's *Sherpas through Their Rituals* (New York, 1978). This book is primarily concerned with the underlying beliefs of hospitality that shape the lives of the Sherpas of Nepal and includes a consideration of flowers and their religious significance. The use of flowers as offerings to Mayan gods and Catholic saints is explored by Evon Z. Vogt in *Zinacantan: A Maya Community in the Highlands of Chiapas* (Cambridge, Mass., 1969). This is an extensive study of the Tzotzil-speaking Indians of Guatemala and includes a thorough description of the importance of flowers in ritual. Clifford Geertz's seminal work *The Religion of Java* (New York, 1960) describes the syncretism of Hindu, Islamic, and folk beliefs that constitute Javanese religion. He includes in this work an excellent consideration of flowers as part of the life-cycle rituals and in other religious celebrations. Michael Lambek presents a fascinating account of the importance of flowers and perfume among the people of Mayotte in the Comoro Islands in his *Human Spirits: A Cultural Account of Trance in Mayotte* (New York, 1981). Flowers and the perfume made from flower petals are essential ingredients for the two religious belief systems among the Mayotte: Islam and a native folk religion that centers around trance and possession by spirits. Barbara G. Myerhoff describes two different types of "flowers" in her consideration of Huichol Indian culture. In her book *Peyote Hunt: The Sacred Journey of the Huichol Indians* (Ithaca, N.Y., 1974), flowers represent the Huichol ancestor/deities in paradise and refer to the peyote, the five-petaled flower that enables the contemporary Huichol to journey to this paradise.

FLOW EXPERIENCE. All major world religions, as well as most sects and tribal cults, are said to produce on occasion, among their faithful, states of ecstasy or altered states of consciousness. Such experiences constitute for many believers one of the main attractions of religion, if not a proof of its ability to mediate the supernatural. In cults and sects such experiences are often induced by chemical substances ingested in ritual contexts; by fasting; by various hypnotic trances, or by what Émile Durkheim called “collective effervescence,” a condition engineered by rhythmic music, dance, and ritual movements.

Remnants of such direct sensory means for inducing altered experiential states can still be found in the major religions. The use of music, chanting, lighting, and scent in liturgy and of fasting and ritual feasting clearly derive from earlier methods for producing ecstasy. But the great religious traditions have become gradually less dependent on sensory means, while at the same time they have developed the ability to induce ecstasy through cognitive disciplines. Prayer, meditation, *satori*, *samādhi*, despite the tremendous variety of cultural differences represented in their settings, are all mechanisms for providing a sense of mystic union with a sacred, transcendent force.

Is the ecstasy reported in religious practices and rituals unique to religion, or is it a species of a broader genus of experiential states? At least since the writings of William James, psychologists have supported the latter hypothesis. It is assumed that there is no qualitative difference between the unusual states of consciousness occasionally experienced in religious contexts and analogous states reported in a variety of secular contexts. The task for the scholar is to describe the experiential state precisely, and to explain why it occurs in the context of religious practice.

Perhaps the state of consciousness that most closely resembles accounts of religious ecstasy is the “flow experience,” so named because many people have used the word *flow* in describing it. This subjective state has been reportedly experienced by creative artists when working, by athletes at the height of competition, by surgeons while performing difficult operations, and by ordinary people in the midst of their most satisfying activities. In other words, states of optimal experience in a wide variety of context, including meditation, prayer, and mystical union, are described in terms of very similar subjective parameters. The subsequent experience is “ecstatic” in that it is characterized by a sense of clarity and enjoyment that stands out from the blurred background of everyday routine.

The flow experience is characterized by the following phenomenological dimensions:

- (1) a narrowing of the focus of consciousness on a clearly delimited stimulus field;
- (2) exclusion from one’s awareness of irrelevant immediate stimuli, memories of past events, and contemplation of the future; hence a focusing on the unfolding present;
- (3) merging of action and awareness, also described as ab-

sence of doubt and critical reflection about one’s current activity;

- (4) awareness of clear goals and unambiguous feedback; so that one knows one’s standing with reference to the goals;
- (5) lack of concern regarding one’s ability to control the situation;
- (6) loss of self-consciousness, which in turn may lead to a sense of transcendence of ego boundaries and of union with a larger, transpersonal system.

When these conditions are present in consciousness, the experience is usually interpreted by the individual as being enjoyable and autotelic (worth seeking for its own sake). Activities available in everyday life form a continuum in terms of their capacity to induce flow. At the lowest level are “microflow” activities such as doodling, pacing, or smoking, which provide fleeting experiences of ordered existence. At the other extreme are “deep flow” activities that provide relatively lasting and totally absorbing experiences, as in creative endeavors, complex symbolic or religious thought, or the heights of physical performance.

Whether an activity is capable of providing flow depends in large part on the kind and degree of challenges (opportunities of action) that it makes available, and on the actor’s skill (capacity to relate to them). When these two are in balance, flow occurs. If challenges overshadow skills, anxiety ensues; if skills are greater than the opportunities for using them, boredom follows. The complexity of a flow experience—or its ability to provide deep flow—is a function of the extent of challenges the activity presents and of the actor’s skills. Games, spectacles, and rituals are structured so as to provide the maximum of flow experience.

Religious action-systems present a wide variety of opportunities for action, ranging from microflow-like repetitive physical rituals (e.g., the spinning of Tibetan prayer wheels) to the purely cognitive sequences of doctrinal exegesis. Religions occasionally are able to transform a person’s entire life activity into a unified action-system with clear and congruent goals. It might be argued, for instance, that the religion of the early Puritans was an all-embracing flow activity that focused the consciousness of believers on the necessity of attaining salvation and prescribed a productive vocation as a means for attaining *certitudo salutis*. In this process Puritanism had to exclude many pleasurable experiences from the consciousness of the faithful, but within the limitations of its goals and rules it provided an all-embracing and enjoyable field of action.

In general, however, flow experiences—religious ones included—are liminal in terms of the dominant patterns of consciousness required by social existence. Prayer, ritual, meditation, or the reading of sacred texts establishes interludes of flow in a stream of consciousness that otherwise tends to be structured either too loosely or too rigidly. These activities are occasionally able to provide concrete experi-

ences of a mode of existence more conducive to the expression of individual potentials than the socially restricted historical reality is capable of doing.

Revised Bibliography

FOGUANGSHAN. Founded in 1967, Foguangshan (Buddha's Light Mountain) had by the beginning of the twenty-first century developed into one of the most influential Buddhist organizations in Taiwan (the Republic of China, ROC) and had opened more than 150 temples in nearly thirty countries around the world. Approximately 1,300 clerics were within the Foguang ranks in 2004, and the order's lay society, known as the Buddha's Light International Association (BLIA), had a membership in the hundreds of thousands. Activities sponsored by Foguangshan and BLIA draw more than three million participants annually.

The order's founder, Master Xingyun, was born in 1927 in Jiangsu province of mainland China. He took his vows

of renunciation at age twelve in Qixia Temple, Nanjing. Ten years later he accompanied the Nationalist army as it retreated to Taiwan. Unlike most monks who had come from the mainland, Master Xingyun did not remain in Taipei (the province's capital), but instead took charge of a small temple in a more rural location and eventually established Foguangshan in Kaohsiung county. For his followers, the master symbolizes the transmission of a revitalized version of traditional Chinese culture from the mainland to Taiwan. He has kept tenuous ties with the mainland through the years, returning to his ancestral temple in 1989 and again in 2000.

Foguangshan is regarded as a leading exponent of Humanistic Buddhism (*renjian fojiao*), by which is meant a re-focusing of daily practice to more directly deal with the challenges of contemporary life. The this-worldly pragmatism that serves as the focal point of Humanistic Buddhism significantly affects Master Xingyun's interpretations of Chan (Jap., Zen) and Pure Land practice. Although a forty-eighth generation holder of the Linji *dharma* scroll, only in recent years has the master encouraged devotees to make formal meditation an important part of their cultivation. Up through the 1980s, he considered Pure Land recitation a more suitable expedient means (Chin., *fangbian*; Skt., *upāya*) to attract lay followers, given their busy lives, low education level, and scant understanding of the *dharma*. Clerics were similarly dissuaded from spending too much time in the Chan hall, for to do so was regarded as contrary to the *bodhi-sattva* spirit of serving all beings, not just attending to one's own liberation. Only in the early 1990s, when many lay Buddhists (and even non-Buddhists) were turning to meditation as a means to relieve stress, did Master Xingyun more actively discuss the value of such practice, backing up his rhetoric by constructing Foguangshan's beautiful Chan hall.

The form of meditation that Master Xingyun considers to be most compatible with Humanistic Buddhism is "active Chan" (*dongzhong chan*). Master Baizhang's maxim "A day without work is a day without food" has been broadened radically so that, rather than only justifying farm work as suitable for monastic life, at Foguangshan it has become a paean exalting industriousness as an essential part of religious practice. "Work is nutrition," exclaims the master, while "the most miserable person in this world is one who does not have any work; the greatest privation in life is the loneliness of boredom." Foguang laity are therefore exhorted to maximize productivity in their occupation as a means to serve society and, through generously contributing the resulting wealth, to support Buddhism. For Foguang clergy, active Chan occurs through vigorously attending to the multitudinous projects initiated by monastery leadership to promote the *dharma*. In the view of Foguang monastics, it is they—and not those clerics who sit in absolute silence for hours on end in some isolated monastery—who practice in such a way as to attain the most profound level of Chan realization.

The Humanistic Buddhist perspective has led Master Xingyun to regard the teachings of the Pure Land school in

a new way as well. Rather than exerting their energies toward being reborn in a pure land in a different dimension of the universe, as is usually advocated by the Pure Land school, people are urged to transform our own immediate world into a Pure Land and thereby personally embody the *bodhisattva* aspiration for universal enlightenment. Master Xingyun pronounces that advances in science, technology, and medicine, as well as the global trend toward democracy and human rights, all foster the conditions of security, peace, and well-being required for cultivation. The notion of humanity's steady progress through history to ever-higher levels of comfort, freedom, ethical consciousness, and rationality is a central feature of the master's philosophy. Master Xingyun believes that radical, confrontational reforms are not an effective method for achieving such progress, since such tactics create too much suffering and remain within dualistic thinking. Instead, he espouses gradual amelioration through each person engaging in a daily regimen of contemplation, meditation, and self-reflection, while simultaneously devoting his or her energy to improving the welfare of others. Hence, Foguangshan periodically leads large-scale campaigns aimed at societal regeneration through moral persuasion and sponsors a variety of civic enterprises, including an orphanage, a medical clinic, several preschools, a high school, and a liberal arts university.

Although improving people's material and societal conditions is seen as essential to establishing a Pure Land on earth, the key to realizing such a utopia nonetheless remains cultivating people's wisdom and compassion through exposure to the *dharma*. Naturally, the master sees Buddhism in general, and Humanistic Buddhism as propounded by Foguangshan in particular, as being at the forefront of this movement. Each Foguang temple is regarded as a miniature Pure Land whose wholesome influence will slowly radiate outward to positively influence its surroundings, until eventually the entire world can be transformed into a realm of bliss.

Master Xingyun asserts that the key to extending such purity—or as he would phrase it, “spreading the Buddha's light,”—is implementing effective educational programs, both for the clergy who guide the process and for the laity who assure its widespread dissemination. Foguangshan is therefore especially well known in Taiwan for its system of monastic colleges and its publishing empire. By 2000, Foguangshan had a dozen seminaries with more than five hundred students enrolled. While most of the students come from within the Foguang ranks, a variety of smaller temples around Taiwan also send their novices to these seminaries for training. Foguangshan's publications include an edition of the Buddhist canon (with punctuation added), a six-volume encyclopedia of Buddhism, and scores of books, cassettes, videos, and CD-ROMs explicating Master Xingyun's version of Humanistic Buddhism. The organization also devotes considerable resources to maintaining its many websites and television station.

Foguang projects are typically undertaken in cooperation with political and corporate leaders. Large-scale Fog-

uang activities in Taiwan, which can attract tens of thousands of participants, often take place at government facilities and have as the guests of honor top political officials, military brass, and business elite. Because of this, Master Xingyun's detractors have saddled him with the pejorative labels of “political monk” and “commercial monk.” The former epithet gained especial salience after the master publicly endorsed one of his disciples in 1996 in the Republic of China's first open election for the presidency and then, later that same year, hosted U.S. vice president Al Gore at a banquet at Hsi Lai Temple (Hacienda Heights, California) for what turned out to be a fund-raiser for the Democratic National Committee. The label “commercial monk” came about not only because of the master's many wealthy devotees, but also due to his penchant to create high-profile, glitzy facilities and events. Foguang headquarters' eight-story-high statue of Amitābha Buddha, its Pure Land Cave (which was modeled on Disney's “It's a Small, Small World”), and its annual New Year's Festival of a Myriad Lights have over the years attracted millions of pilgrims and tourists. Master Xingyun is of the firm opinion that attracting society's elite to Buddhism and providing wholesome entertainment with a Buddhist theme are both effective expedient means for spreading the *dharma*. Nonetheless, partially in response to adverse press concerning his organization's forays into more secular spheres, the master decided in 1997 to henceforth allow only groups of Foguang devotees participating in organized pilgrimages to enter the headquarters' compound. Since that time the general public has been welcome to visit Foguangshan's many branch temples, but the headquarters in Kaohsiung has largely remained off limits.

Master Xingyun and his organization are not only influential in Taiwan, but since the early 1990s have played an increasingly prominent role in providing religious instruction and a sense of cultural identity to overseas Chinese. The beginnings of Foguangshan's globalization are to be traced to the master's visit to the United States in 1976, at which point he recognized the great potential for serving the rapidly expanding Chinese-American population. Twelve years later, the master opened the doors of Hsi Lai Temple, the largest Buddhist monastery in the Western hemisphere. In less than a decade after founding that temple, Foguangshan opened ninety-five overseas branches: twenty-seven in Asia (excluding the sixty temples in the ROC), thirteen in Australia and the Pacific Islands, nineteen in Europe, seven in Africa, five in South and Central America, and twenty-four in North America (nineteen in the United States and five in Canada). By the close of the twentieth century, Master Xingyun had decided to hold off on constructing other centers, so the number of Foguang temples has remained fairly steady since that time. This network is supplemented by the Buddha's Light International Association, which in 2000 had some 110 chapters worldwide.

Foguang temples may be found virtually anywhere a relatively large expatriate population from the ROC has co-

alesced. The reach of BLIA is still farther, extending to areas with even small communities of Taiwan emigrants. The only Chinese Buddhist organization with a comparable overseas network is Ciji Hui, which at the beginning of the third millennium had offices in twenty-eight countries. The two organizations differ from one another in that Foguangshan has stationed clerics, and therefore opened temples, while Ciji Hui has relied upon its impressive array of lay leaders to establish “offices.” Foguangshan’s international network of temples exceeds not only that of other Chinese Buddhist institutions, but is one of the most extensive of any Buddhist group.

Although the vast majority of devotees in Foguang branch temples outside of Taiwan are overseas Chinese Buddhists (with most having emigrated from Taiwan, although small numbers have come from mainland China, Vietnam, and Hong Kong), the organization has also devoted considerable energy to bringing others into its fold. Hsi Lai Temple, Nan Tien Temple (Wollengong, Australia), and Nan Hua Temple (Bronkhorstspuit, South Africa) have been at the forefront of Foguangshan missionary endeavor. Hsi Lai Temple and Nan Tien Temple both maintain BLIA chapters serving several dozen non-Chinese members. Nan Hua Temple has undertaken the ambitious task of establishing a seminary and orphanage. In the early years, at least, Foguangshan’s efforts to attract non-Chinese to its lay membership or monastic corps has had only limited success.

Foguangshan gave formal symbolic imprint to its self-avowed role as leader of the global Buddhist community in 1997, when it sponsored an international Triple Altar Ordination in Bodh Gayā, India (site of the Buddha’s enlightenment). One hundred and fifty novices representing Theravādin, Tibetan, and Mahāyāna lineages flew in from countries around the world to take the three sets of vows. The vast majority of participants were women, a significant fact since neither Theravādin nor Tibetan Buddhism provides women with the opportunity to take the necessary precepts for full ordination as a *bhikṣuṇī* nun. In the following years, Foguangshan sponsored several other ceremonies in which dozens more such women underwent *bhikṣuṇī* ordination. Only time will tell whether this campaign will gain momentum and have a noticeable impact on Theravādin and Tibetan Buddhist communities.

Master Xingyun and Foguangshan remain highly influential in Taiwan, enjoy a significant following among overseas Chinese, and to a more limited extent have influenced non-Chinese Buddhists around the world.

FOLK DANCE SEE DANCE, *ARTICLE ON POPULAR AND FOLK DANCE*

FOLKLORE. Folklorists have been interested in religion as an area of research since the beginnings of the discipline in the nineteenth century, although early folklorists often conceived the beliefs of folk cultures not as religion but as superstition or magic. Many folklore scholars were grounded in scientific rationalism to the extent that they dismissed the beliefs of the folk as ignorant superstition, even if these beliefs were part of systems that functioned in ways similar to organized religion. By the early twentieth century, folklorists and other social scientists recognized the link between religion and folk belief, but condescended toward both. From the positivist perspective of folklore studies as a “historical science,” superstition and religion were both considered pre-scientific. In 1930 Alexander Krappe stated in *The Science of Folklore*: “Superstition, in common parlance, designates the sum of beliefs and practices shared by other people in so far as they differ from our own. What we believe and practice ourselves is, of course, Religion” (p. 203). Krappe implies the dichotomy that later folklorists called folk/elite, with the folk an invention of an intellectual elite who always defined *folk* as inferior because they were construed as rural, isolated, and uneducated.

On the other hand, folklorists were part of a larger intellectual tendency to romanticize the folk, including idealizing certain beliefs and practices associated with folk culture. Folklorists’ attitudes towards the folk were similar to anthropologists’ attitudes toward the primitive. According to George E. Marcus and Michael M. J. Fischer in *Anthropology as Cultural Critique: An Experimental Moment in the Human Sciences* (1986), anthropologists have idealized the primitive since the nineteenth century: “They—primitive man—have retained a respect for nature, and we have lost it . . . they have sustained close, intimate, satisfying communal lives, and we have lost this way of life . . . and they have retained a sense of the sacred in everyday life, and we have lost this [spiritual vision]” (p. 129). Folklorists were similarly nostalgic about the folk and their beliefs, imagining some folk be-

liefs as representing a spiritual connection to nature that civilized people had lost and perceiving the folk as leading more sacred lives than people in modern urban environments. This romanticized construction of folk belief was maintained simultaneously with the opposite academic construction of folk belief as pathological. For instance, in the United States folklorists represented Appalachian people as a folk in ways that sometimes reinforced the stereotype of the irrational superstitious hillbilly and at other times projected the image of the wise old mountain healer who was spiritually close to nature.

SUPERSTITION AND RELIGION. Most folklorists made a distinction between superstition and religion, even when evidence indicated a close connection between beliefs and practices assigned to different categories. The religious orientation and theoretical approach of the researcher were factors in making this distinction, as were issues of race and class. A comparison of the 1920s and 1930s research of white folklorist Newbell Niles Puckett and black folklorist Zora Neale Hurston illustrates the complexity of the cultural representation of folk belief and religion in folklore scholarship. Puckett and Hurston viewed the African American tradition of hoodoo or conjuration in very different ways: Hurston as a religion and Puckett as superstitious behavior. Puckett was still theoretically grounded in the outdated nineteenth-century concept of cultural evolution, while Hurston was trained in the then current school of cultural relativism. Puckett, in his extensive collection *Folk Beliefs of the Southern Negro* (1926), associates superstition with “uncultured and backward classes of society” (p. 6), people who had not advanced up the ladder of cultural evolution as far as the educated elite. He therefore saw such African American folk practices as midwifery as “murderous lore” that “should be replaced by modern scientific knowledge.”

Hurston rejected Puckett’s pathological view and saw hoodoo and conjuration as a systematic religion comparable to Christianity. In a 1929 letter to the poet Langston Hughes quoted by Robert Hemenway in his “Introduction” to Hurston’s *Mules and Men* (1935), Hurston writes “I am convinced that Christianity as practiced is an attenuated form of nature worship” (pp. xix–xx). After citing several Christian rituals that contain nature symbolism, she proclaims, “Sympathetic magic pure and simple. *They have a nerve to laugh at conjure.*” She accepted the spiritual efficacy of hoodoo to the point that she studied with a hoodoo priest and was initiated into the practice and came to believe that conjuration worked in particular instances. She argued against the pathological perspective toward folk belief, but in order to present a more positive picture of African American folk belief, she tended to romanticize black southern folk culture as closer to nature and more spiritual than modern societies. Hurston’s subjective position as an African American ethnographer caused her to see her own culture in a more positive light than Puckett as a white sociologist/folklorist born and brought up in a southern racist society could. Despite their differences, Hurston and Puckett confronted the same prob-

lem that scholars had encountered since the invention of the *folk* in the eighteenth century: how to differentiate folk religion from other forms of religion.

FOLK RELIGION. In his seminal 1974 essay “Toward a Definition of Folk Religion,” Don Yoder points out that “the discovery of folk religion in Europe had come at the time of the eighteenth-century Enlightenment, when rationalist clergy attacked folk ‘superstitions’ in sermons and ministerial periodicals” (p. 3). By the nineteenth century, German scholars had included religion as an important component in the study of *Volkskunde* (folklife), and by 1901 a German Lutheran minister used the term *religiöse Volkskunde* (religious folklife) for the first time. In the twentieth century, European folklorists conducted extensive research on the religious beliefs and practices of folk groups throughout Europe among both Roman Catholics and Protestants. To German and other European scholars, the folk were uneducated peasants living in isolated rural areas, so that folk religion could be differentiated from other forms of religion on the basis of the elite/folk hierarchy: folk religion was simpler, contaminated by superstition, and often at variance with official church dogma. Yoder used this long-standing dichotomy as the basis for his definition of folk religion as “unofficial” and “relatively unorganized” in opposition to official organized religion: “Folk religion is the totality of all those views and practices of religion that exist among the people apart from and alongside the strictly theological and liturgical forms of the official religion” (p. 4).

The same basic dichotomy worked for folklorists and anthropologists as they began to study the religious life of peoples in the New World. Folklorists especially were looking for the equivalent of the European peasant in new environments so that any isolated, rural, and relatively uneducated people were designated folk, and folklorists began to collect such religious expressions as hymns, sermons, customs, and rituals from them. The definition of folk religion as religious practices of peasants persisted well into the twentieth century; William A. Christian Jr., who wrote the entry on “Folk Religion” in the original 1987 edition of *The Encyclopedia of Religion*, directed his attention to “past and present-day sedentary cultivators and pastoralists of Asia, North Africa, southern Europe, and Latin America, and historically to sedentary cultivators in northern Europe and North America as well” (vol. 5, p. 370). His definition of folk as pastoral leads him to conclude that the folk had disappeared from North America and northern Europe as a result of urbanization and industrialization, in contrast to such folklorists as Richard M. Dorson, who answered “yes” to the question posed in the title of his 1970 article, “Is There a Folk in the City?” Many of Dorson’s examples came from European immigrants and southern rural migrants in heavily industrialized Gary, Indiana, so that the peasant idea was still underlying the conceptualization of folk.

Folklorists and anthropologists also conducted field research on religious folklore in both urban and rural areas in

Central and South America, where their theoretical concern was with cultural syncretism. They examined the way native religions merged with official religions. Yoder cites the “example [of] the mélange of African primitivism and Roman Catholicism that is in Haiti called ‘Voodoo,’ or the syncretism between Catholicism and native Indian religious beliefs and practices in Central and South America” (1974, p. 2). The fieldwork of Hurston offers an example of how syncretism also influenced folklore field research in the southern United States, since she recognized the Catholic elements in hoodoo in New Orleans. Anthropologists and folklorists still considered religious folklore in socioeconomic class terms as associated with peasants, although some had migrated to cities bringing their religion with them.

Throughout the history of folklore scholarship on religion, the folk/elite dichotomy has been a basic underlying principle, whether in the study of European peasants, African Americans, Appalachian whites, or people whose religions merge native and European elements. This began to change for some folklorists in the 1960s when they started to study urban and suburban folklore and gradually expanded their research to include educated people of a higher socioeconomic class, recognizing that folklore had adapted to technology so that new genres such as “xerox lore” became the subject of scholarly books. Finally, Alan Dundes could answer the question asked in his 1980 article “Who Are the Folk?” by saying that, in essence, we all are: a folk group is any group with any one linking factor. Once the folk/elite dichotomy had been undermined, folklorists who conducted research on religion were freed to reconceptualize it in non-hierarchical ways.

In 1995, Leonard Norman Primiano, in an important essay entitled “Vernacular Religion and the Search for Method in Religious Folklife,” challenged the assumption of folk as inferior: “Scholars within the discipline have consistently named religious people’s beliefs in residualistic, derogatory ways as ‘folk,’ ‘unofficial,’ or ‘popular’ religion, and have then juxtaposed these terms on a two-tiered model with ‘official’ religion” (p. 38). This implies the existence of a “pure” religion that is “contaminated” by the folk in their everyday religious practices. In order to correct the problems inherent in this hierarchical dichotomy, Primiano suggests a new term and a new theoretical concept: “Vernacular religion is, by definition, religion as it is lived: as human beings encounter, understand, interpret, and practice it” (p. 44). There is no opposition here between folk and elite since all religious practitioners would be included no matter what their socioeconomic class: every individual interprets religion within the context of his or her everyday life (the vernacular dimension of life). Priests, rabbis, prophets, shamans—no matter how high in the hierarchy of their respective religions—would all practice vernacular religion in the sense that they make individual interpretations of religious meaning and practice in everyday circumstances. This approach avoids the condescension of the old elite/folk dichotomy and attempts

to treat religious practices with respect by concentrating on the experiential aspects of religion. Primiano recognizes that *vernacular* contains some of the same pejorative connotations as *folk*, and some folklorists prefer to continue using *folk religion* as the scholarly term, but the theoretical concept of *vernacular religion* has been widely accepted in folklore studies.

FOLKLORISTIC APPROACHES TO THE STUDY OF RELIGION. Concepts of the folk and definitions of folk religion have had a basic influence on theoretical approaches folklorists have used in the study of religion, and as these concepts and definitions have changed, so have the approaches. Since most folklore studies are grounded in field research, the best way to understand theoretical approaches in folklore scholarship is by examining representative individual studies since the early 1900s. In the eighteenth and nineteenth centuries, antiquarians were interested in religious folk customs as survivals of previous savage or barbarian times; they thought collecting the beliefs and customs of peasants could provide an understanding of the past. The concept of cultural evolution that was the basis for the survivalist approach had been discredited by the late nineteenth century, but some anthropologists and folklorists continued to base their interpretations of folk beliefs and religion on it well into the twentieth century. Puckett clung to cultural evolution as an explanation of African American folk beliefs in the 1920s, and Ovidiu Birlia used cultural evolution as the basic approach for his entry on “Folklore” in the 1987 edition of *The Encyclopedia of Religion*. However, for most anthropology and folklore scholars, cultural relativism had replaced cultural evolution by early in the twentieth century. The history of anthropological and folkloristic studies of religion continued to overlap as the new paradigm of cultural relativism developed models that then became dominant influences on the study of religious folklore.

Especially important was the anthropological approach that came to be known as functionalism. Bronislaw Malinowski’s fieldwork among Trobriand Islanders became the basis for the functional explanation of magic belief and related behavior that he articulated in a 1931 essay, “The Role of Magic and Religion.” His “anxiety ritual theory” influenced the anthropological and folkloristic study of a wide range of behaviors, from primitive magic to everyday superstitions to rituals in religious settings. He invited this widespread application by suggesting that such behaviors were found in both primitive and modern life: wherever there is uncertainty in human endeavors, there will be magic and ritual to help relieve the anxiety that arises from that uncertainty. Rituals, whether they are as mundane as not walking under a ladder or as elaborate as Catholic priests blessing fishing fleets, function to give a psychological sense of control over uncertainties in life. The functional approach was grounded in scientific rationalism as a way of explaining what seemed to be irrational behaviors; a functionalist might say that when modern educated people base their actions on “magico-religious” beliefs, their behavior is analogous to primitives. As folklorist Bonnie Blair O’Connor pointed out

in her 1995 book, *Healing Traditions: Alternative Medicines and the Health Professions*, the functionalist approach is implicitly condescending to the people whose beliefs are being studied; “they” are not capable of understanding their own behavior the way “we” educated researchers are. This was a submerged problem as long as the subjects were classified as “primitive” or “folk,” but as the concept of folk expanded beyond rural, isolated, relatively uneducated groups, the issue emerged as politically significant.

In retrospect, present-day scholars can see that condescension toward research subjects was a theoretical problem all along for folklorists, including those conducting research on folk religion in the United States. Most American researchers in folk religion concentrated their field research on fundamentalist Christians in the rural South. These American versions of European peasants were conceived of as the folk, and if a researcher wanted to study the full range of their traditional life, then their religion had to be included—a circular way of defining folk religion, but it went uncontested throughout most of the twentieth century. Despite the fact that there were a range of religions to study in the South, folklorists concentrated on the most conservative fundamentalist and evangelical Christian denominations, undoubtedly because they were large in number but also because they fit preconceived notions about the folk. The very conservatism of their religion made it seem more traditional, and from the educated perspective of the folklorist, fundamentalists were seen as more exotic than mainstream religions that were in many cases closer to the folklorists’ own religious background.

In the 1960s and 1970s, folklorists studying fundamentalist Christian conversion experiences began to use such theoretical approaches as the one Victor Turner described in his 1969 book, *The Ritual Process: Structure and Anti-Structure*. One of the first folklorists to use ritual process theory was William Clements in his 1976 article “Conversion and Communitas”; he identified Turner’s ritual states of “liminality” and “communitas” in the experiences of fundamentalists he interviewed in Arkansas. Clements posits that since “many folk Christians are poor, uneducated, and without social prestige,” their experience of communitas functions “in a compensatory manner” to make up for their lack of “social commodities” (pp. 44–45). Following Clements, Patrick B. Mullen discerned the same ritual pattern in conversion narratives among evangelicals in “Ritual and Sacred Narrative in the Blue Ridge Mountains” (1983), and Jeff Todd Titon applied Turner’s theory to religious expression in *Powerhouse for God: Speech, Chant, and Song in an Appalachian Baptist Church* (1988).

Unfortunately, ritual process theory continued the tendency toward condescension in the study of folk religion by applying it mainly to lesser-educated religious groups. Although folklorists concentrated fieldwork on lower socioeconomic fundamentalist religious groups in the rural South, Turner’s ritual pattern can be seen across a wide spectrum

of religions among various socioeconomic classes and in rural, urban, and suburban contexts. There was also a residual effect of scientific rationalism in this approach in that ritual process suggests social and psychological explanations for religious conversion experiences, rather than considering the possibility that they are spiritual experiences. A valuable corrective to the tendency to condescend toward fundamentalists was the 1988 collection of essays *Diversities of Gifts: Field Studies in Southern Religion*. The editors, Ruel W. Tyson Jr., James L. Peacock, and Daniel W. Patterson, and the contributors self-consciously tried to counter stereotypes by depicting fundamentalist religion as complex beliefs and behaviors in closely observed cultural contexts.

Folklorists theoretically refined the ritual process approach by applying it to contexts that required multiple interpretations, recognizing that *communitas* and liminality have significance beyond their religious meanings. A good example of this is Sabra Webber’s study of the Islamic tradition of Ramaḍān. In “Ramadan Observed” (1984) she synthesizes Turner’s ritual theory with cultural politics, seeing Ramaḍān as a space for the negotiation of religious and political meanings. She bases her study on her own fieldwork in Tunisia and on other ethnographic accounts from North Africa, where Ramaḍān combines elements of ritual and festival. Ramaḍān is a lunar month-long fast in which the breaking of the fast at the end is an important element. Webber sees Ramaḍān as a local liminal event that must be examined within a larger “liminal period in North African and Arab-world history” (p. 187), a publicly recognized awareness of great change between more stable periods. “Ramadan at its most basic . . . has become a paradigm that various political and social groups, as well as individuals, are seeking to use to represent their values” (p. 188). This multivocality complicates the concept of *communitas*: “while at a community level a kind of *communitas* is achieved, at the individual level it provides, for some people, an opportunity for intensification of pious or recreational behavior” (p. 191), and for others an opportunity for coming of age, an expression of Muslim identity in opposition to other religions, a statement of acceptance or rejection of modernity, and even, for some, a declaration of revolution. Webber’s field research indicates an ongoing negotiation by Muslims about the meaning of Ramaḍān. Unlike the research on ritual among fundamentalist Christians, where the interpretation comes from outside observers, Webber’s use of ritual theory incorporates interpretations from within the group, thus avoiding condescension.

Webber’s research is one indication of a broader shift in the study of folk religious behavior from the nineteenth century to the present: a movement away from considering the folk and their beliefs as inferior. Folklorists accepted the underlying elite/folk hierarchy for a very long time, but once that was questioned, resistance to it created an effort to remove pejorative judgments from the documentation and analysis of folk religion. One result of this movement is folk-

lorist David J. Hufford's "experience-centered" theory, which tries to avoid prejudging religious experiences. In a book and a series of articles, Hufford has identified the condescension toward and dismissal of spiritual experiences as a major scholarly problem in folk belief and folk religion studies. He began to formulate his approach to such phenomena in his 1982 book, *The Terror That Comes in the Night: An Experience-Centered Study of Supernatural Assault Traditions*, by researching the cross-cultural "old hag" or "Mara" tradition in which people wake up paralyzed in the night thinking that some supernatural entity is pressing down on their chests. The experience transcends religious difference with reports from Jewish and Christian believers, as well as from Islamic sources, where the experience is related to the *jinn*, an evil or mischievous spirit that visits during the night.

Hufford has also applied his approach to other spiritual phenomena, such as out-of-body experiences and visitations from the dead, in his essay "Beings without Bodies: An Experience-Centered Study of the Belief in Spirits" (1995). His approach to these experiences is grounded in phenomenology: he is critical of preconceived assumptions that explain the behavior in psychological or cultural terms, as, for instance, having Freudian symbolic meaning. Rather, his approach concentrates on the experience itself as reported firsthand by the person involved, opening up the possibility that the experience was an actual contact with another dimension.

Many folklorists who study religion have accepted Hufford's theoretical model as a useful balance to the social construction of reality that might view all such spiritual experiences as "deconstructed 'situated hallucinations,'" a phrase used by Margaret Mills in a 1993 article in which she urges folklorists to strive for a sense of what "feels real" in the lives of the people that they study. On the other hand, Patrick B. Mullen in his 2000 essay, "Belief and the American Folk," points out that researchers can never determine the exact nature of the "core experience" itself, that the experience is always mediated by the person in the act of telling it to the researcher. Mullen argues that folklorists should not just be interested in the core experience but also in the "examination of *narrating*, the process of communicating a supernatural or spiritual experience in a specific cultural context" (p. 137). A folklorist does not have to accept or reject a spiritual experience as real in order to examine the cultural process whereby the experience was communicated to others. This suggests that the performance approach, which has been a major component of folklore studies since the 1960s, still has relevance for the study of the expressive dimension of folk religion today.

PERFORMANCE APPROACHES. Performance theory was part of a 1960s and 1970s paradigm shift in folklore studies that incorporated the contextual analysis of anthropology with the ethnography-of-speaking approach of sociolinguistics and the Kenneth Burke rhetorical approach of literary critical theory in order to examine folklore not as static text but as

part of a dynamic cultural process. The emphasis was on the specific situation in which the folklore was communicated, the performance context. Richard Bauman defined performance in 1992 as "an aesthetically marked and heightened mode of communication, framed in a special way and put on display for an audience" (p. 41). This certainly describes many cultural expressions that occur within a religious context, and although folklorists concentrated on verbal art in secular storytelling at first, it was not long before theoretical principles from the performance approach were being used to interpret narrating in religious contexts.

Kirin Narayan's 1989 book, *Storytellers, Saints, and Scoundrels: Folk Narrative in Hindu Religious Teaching*, is based on field research in India, where she observed and participated in storytelling sessions conducted by a Hindu holy man, Swamiji. Narayan employs performance and other approaches to analyze the way Swamiji uses storytelling to teach people who come to him seeking spiritual guidance. She focuses on eight folk narratives in specific performance situations, taking into account the personality and character of the storyteller and dynamic interactions with his audience in order to explain how religious "truths . . . are made comprehensible and persuasive . . . through the medium of stories" (p. 243). Swamiji's stories communicate general religious principles, "yet by telling a story instead of making a generalizing statement, Swamiji endows these principles with a vital immediacy" (p. 244). Narayan's study of Hindu storytelling has application to storytelling in a wide range of other religious settings.

The performance approach mainly concentrated on narratives, but it has been applied more broadly to sermons, hymns, rituals, and other religious expressions. One of the first studies of religious expression as performance was Bruce Rosenberg's *The Art of the American Folk Preacher* (1970), but he goes back to an earlier model, the oral-formulaic approach, for his primary theoretical focus. In many ways, the oral-formulaic approach of Albert B. Lord and Millman Parry was a precursor of performance theory because of its emphasis on oral performance. In *The Singer of Tales* (1960), Lord formulated the oral-formulaic thesis based on fieldwork he and Parry had conducted on performances by South Slav epic poets that provided the evidence of certain oral formulas that also occur in written poetry. Rosenberg identified similar themes and formulas in improvised oral sermon performances by American preachers. Gerald Davis later argued in *I've Got the Word in Me and I Can Sing It, You Know: A Study of the Performed African American Sermon* (1985) that formulas are indeed part of the African American preacher's performance, but they are culture specific and related to rhythmic patterns that are not the same as those used by epic poets. In both studies, belief is not so much an issue as the artistic dimension of the performance, and this gets at one of the problems that folklorists have faced in using a performance approach to religious expression: such studies contextualize traditional religious communication in terms of the

specific circumstances of performance, but tend to leave out the dimension of belief.

As Diane E. Goldstein states in her 1995 article, "The Secularization of Religious Ethnography and Narrative Competence in a Discourse of Faith," many researchers treat "belief issues as essentially external to the scope of research. The folklorist's concern with verbal artistry provides grist for such an approach in that it often lays stress on 'the verbal' and 'the art' to the neglect of the underlying cognitive aspects of culture" (p. 23). We are reminded of Mills's concern that folklorists are leaving out the felt experiential nature of belief and practice in ethnographic descriptions. Goldstein points out that scholars tend to separate language from religion in order to avoid belief as a factor, and consequently they have not fully understood the cultural meaning of religious experience. She says that the performance approach concentrates on art in a way that leaves out the performer's sense of the divine, thus secularizing religious communication and making the approach inadequate as a means of understanding the cultural process being examined. The term *performance* suggests a metaphor underlying the theory, which prompts Goldstein to ask, "Why would you use the dramatic metaphors of stages and actors if you knew about religious experience?" (p. 29).

Some folklorists respond that no matter how divinely felt the experience itself is, it is communicated from one human to another in social contexts that sometimes require the speaker to engage a listener through artistic means. The specific context of communication must be taken into account; some contexts require performance techniques and others do not. As most performance scholars recognize today, an effective theoretical approach to folk religion would combine performance and culturally based theories. The "keys" that define performance in Bauman's *Verbal Art as Performance* (1977) are culturally relative, so that a specific religious performance situation must be examined within its larger cultural frame, including the role of belief. The researcher needs to be "fluent" in the keys of the particular culture being studied. Goldstein points out that this has not been the case in many performance studies of folk religion, but this is not the result of a flaw in the theory, but in its application.

Goldstein's example from her own fieldwork illustrates the importance of taking the group's beliefs into account when examining communication about religious experience. She compares testimonies by two different women in an evangelical worship service; one seems to the researcher to be more articulate and effective and the other halting and ineffective, but to people in the congregation the inarticulate testimony was deemed more sincere and ultimately more authentic and divinely inspired, at least partially because it was not a smooth performance. Their belief system privileged effect over style: "touching the hearts" of people in the congregation was thought to be a sign of divine inspiration. In Bauman's terms, the competency of performance was not

evaluated on the basis of artistic keys, but on authenticity of belief. Performance theory still seems relevant here: even if the qualities of performance are lacking in one testimony, they are made apparent by the presence of performance keys in the other. The important thing is for the researcher to be familiar with the relationship between aesthetics and belief in the particular religious culture under scrutiny.

CULTURAL STUDIES APPROACHES. Performance approaches to folk religion concentrated so much on the aesthetic dimensions of a specific situation that they neglected larger cultural and ideological issues that informed the performance itself, as J. E. Limon and M. J. Young point out in their 1986 critique of performance studies in general, "Frontiers, Settlements, and Development in Folklore Studies, 1972–1985." Limon and Young also criticized folklorists doing performance studies for their concentration on verbal art and neglect of material culture. These imbalances were partially corrected by the growing influence of cultural studies on folklore scholarship in the 1970s and 1980s.

Folklorists using cultural studies approaches helped fill in the gaps by examining power relations within folk religion contexts, including numerous studies of both oral traditions and material culture. For instance, in the 1993 essay "Multivocality and Vernacular Architecture: The Our Lady of Mount Carmel Grotto in Rosebank, Staten Island," Joseph Sciorra traces the history of a neighborhood grotto built by a group of Italian-American men in New York. He interviewed some of the builders to situate the tradition within local culture, and he also placed his study in the larger context of the history of Catholic grottoes in Europe and elsewhere. His research indicates the social and political reality of the official/unofficial dichotomy in folk religion. This may be an imagined construct, but it was manifested in the exercise of power by local church authorities in an attempt to keep religious activities within the control of the priests after local parishioners started their own neighborhood processions and grottos. The struggle took place over many years, but the folk parishioners were able to maintain the Mount Carmel grotto that still stands today as an attraction for thousands of visitors to an out of the way neighborhood on Staten Island.

A similar study by Suzanne Seriff in 1991, "Homages in Clay: The Figural Ceramics of José Varela," focuses on a Mexican-American folk artist whose clay figures often depict religious themes. Like Sciorra, Seriff's theoretical approach to folk religion is grounded in cultural politics and ethnic identity, focusing on power relationships between dominant and minority cultures. Seriff, Sciorra, and other folklorists concerned with cultural politics see religious and spiritual issues not just in aesthetic terms, but also within ideological contexts. Varela's folk art can be understood best through his "concern for community and his passion for the past as a fortification against the spiritual and cultural isolation of being Mexican in an Anglo-dominated world" (p. 162). Varela worked for low pay at an Anglo-owned brick and tile factory

in a small Texas town; he “surreptitiously” used clay from the factory to create his figures and fired them in the factory kiln. Some of these he gave or sold to friends, and later in life he sold them at markets in San Antonio. He also donated his time to the local Catholic Church in order to build an outdoor grotto to the Virgin of Guadalupe, who “symbolizes the sacred essence of the Mexican community” (pp. 148–149). Varela “has created a productive niche for himself and his fellow Mexicans . . . in part by creatively manipulating the conditions of his own oppression—that is, by transforming the materials of the factory in which he works into familiar and fantastic forms to be circulated . . . among members of his own community” (p. 163). Folklorists often assume the role of advocates for the people they study, and Seriff and Sciorra’s research suggests that they have defined the folk as oppressed and disenfranchised within the context of their religious practices in order to argue for their rights.

FEMINIST APPROACHES. Feminist approaches to folk religion share the political perspective of cultural studies while providing a more specific ideological focus. Seriff and another folklorist, Kay Turner, conducted field research that produced the 1987 essay “‘Giving an Altar’: The Ideology of Reproduction in a St. Joseph’s Day Feast.” “This woman-centered altar tradition provides a splendid case in point for understanding folklore practice and performance through a feminist orientation” (p. 446). Their approach combines performance and feminist concerns by viewing the feast of Saint Joseph as a creative symbolic expression of women’s power of reproduction. The feast “gives dramatic and aesthetic recognition to the sustaining values of nurturance, care, comfort, and support—the birthright of the mother,” but it moves from the religious to the ideological in that “religious belief is specifically wedded with the ideology of reproduction. . . it is through the care and nurturance shown to the Holy Family on this day that the importance of women’s daily caretaking of the earthly family is sacralized” (p. 458). This study indicates how folklorists have gone beyond performance in a narrow aesthetic sense by viewing religious artistic communication within a broader ideological frame including feminist principles, and beyond verbal art to consider foodways and other aspects of material folk culture. Turner expanded the scope of her research in folk religion to include a variety of women’s altars across cultures in *Beautiful Necessity: The Art and Meaning of Women’s Altars* (1999).

Susan Starr Sered uses a similar feminist perspective to examine an entirely different religious group in *Women as Ritual Experts: The Religious Lives of Elderly Jewish Women in Jerusalem* (1992), and the principle of women’s empowerment underlies her research as well. She moves beyond the focus on one genre of religious expression to consider a range of expressions and behaviors including life stories, rituals, nonverbal gestures, and everyday experiences. As in other feminist folklore studies, Sered analyzes women’s religious activities within the context of a dominant patriarchal cul-

ture and identifies strategies whereby these largely illiterate women become experts at rituals that are concerned with maintaining the wellbeing of their families. She traces their empowerment in terms of both gender and age: “The Jerusalem women describe a shift from relative ritual powerlessness when young, to intense ritual respect and involvement in old age and especially widowhood” (p. 138). By focusing on illiterate women, Sered may be reinforcing the old concept of the folk as an oral culture, but this reinforces her feminist ideological perspective by concentrating on a group that is socially marginalized in the modern world.

Like Sered, Elaine J. Lawless began her scholarly research by concentrating on subjugated women within an already marginalized culture in *Handmaidens of the Lord: Pentecostal Women Preachers and Traditional Religion* (1988), but then she switched to more middle-class religious cultures in *Holy Women, Wholly Women: Sharing Ministries of Wholeness through Life Stories and Reciprocal Ethnography* (1993). The development of her research over those years illustrates a broader shift in folk religious studies from rural, relatively uneducated, fundamentalist religions to urban and suburban, educated, “mainstream” religions. In *Handmaidens of the Lord*, Lawless examines the process whereby women in a religion that considered them inferior and submissive to men could become respected preachers and leaders in their congregations. She concentrates on their life stories and sermons using both feminist and performance approaches. She analyzes preaching styles in performance terms, but the keys to performance reveal images directly related to their experiences as women. These stylistic devices then become verbal strategies that work to secure leadership roles for women in the church; specifically, the reproductive images used in women preachers’ sermons are seen as part of a “maternal strategy” to reinforce the role of preacher as “Mother” to the congregation. As with other cultural studies approaches to folk religion, power relationships are the focus within a religious setting.

Lawless used her research in fundamentalist churches to begin to formulate the concept of “reciprocal ethnography” in which the field-worker is obliged to share her research findings with the subject. This collaborative research process requires an ongoing relationship between the folklorist and the person providing information about his or her culture, including discussion between ethnographer and subject on possible scholarly interpretations, and then incorporating the consultant’s response in the final report. This approach is complicated by differences in levels of education, socioeconomic class, and religious belief between researcher and subject. Lawless writes in a 1992 essay, “‘I Was Afraid Someone Like You . . . An Outsider . . . Would Misunderstand’: Negotiating Interpretive Differences Between Ethnographers and Subjects,” that she failed to take her consultants’ responses into account in the published version of *Handmaidens of the Lord*, but she began a dialogue with one of the preachers later. This woman felt that because Lawless

was a religious outsider she had misinterpreted her sermons, and Lawless herself came to believe that the preacher's responses should have been included in the book in order to make the scholarly interpretation fuller and richer.

Holy Women, Wholly Women is a product of reciprocal ethnography, taking into account the detailed responses of the women preachers who were the subjects of the research. However, in this case, the women were closer to Lawless in terms of education and religious beliefs, making the reciprocal process less difficult and the results more collaborative. Lawless uses feminist and performance approaches, but this time with mainstream, more highly educated preachers, again interpreting figurative language in their sermons, especially metaphors of nurturing, as revealing particular views and strategies of women. Differences in class and education have been transcended by gender in her two studies, and in both cases Lawless has situated herself subjectively within the study of religion.

REFLEXIVE ETHNOGRAPHY. Subjectivity has taken on increasing importance in folk religion studies, developing from the earlier "invisible ethnographer" of "objective" research to the visibly foregrounded first-person narrator of reflexive ethnography. David J. Hufford has made the most comprehensive statement of the significance of reflexivity in folklore studies of belief in his 1995 essay, "The Scholarly Voice and the Personal Voice: Reflexivity in Belief Studies." Hufford argues for the necessity of the researcher situating himself or herself subjectively within the ethnographic enterprise, saying that this is especially important in studies of belief and religion because of the need to make clear the influence of the researcher's assumptions on the representation of the religious belief system of an "other." He points out that all too often the "objective" stance masks a position of disbelief in religious ethnography. "A reflexive analysis of our scholarship enables us to distinguish among the beliefs of our informants, our scholarly knowledge, our personal beliefs and our occupational ideology. This permits coherent discourse and various warranted moral actions" (p. 71). Instead of hiding one's own beliefs, the scholar should make them clear, thereby allowing different interpretations, including moral or ideological ones, to be stated directly, rather than implied as subtext.

Reflexivity in religious ethnography also opens up the possibility of fieldwork and analysis by members of the religious group, and this is a growing approach in folk religion studies. The "native" perspective is another position among many subjectivities and is legitimate as long as it is recognized reflexively; no longer can the insider's position be seen as less objective than the outsider's since they are both subjective. A good illustration of this is Nikki Bado-Fralick's *Coming to the Edge of the Circle: A Wiccan Initiation Ritual*, in which she uses her dual perspectives as a Wiccan priestess and as a scholar trained in folklore and religious studies to examine a Wiccan religious ritual. Bado-Fralick frames her study in terms of her subjectivity, allowing her to explore

such ethical problems as dealing with secrecy and to examine processes of identity formation from within. Her research also indicates how folklorists have blurred the line between folk and popular religion, recognizing that both are systems of belief and practice as complex and worthy of study as the more academically privileged mainstream organized religions, and thus resisting the dismissal of such religions often implied in terms such as *New Age*.

Another study of what might be classified as New Age religion is Roseanne Rini's 1997 dissertation, "Elizabeth Kelly: Contemporary Spiritual Teacher and Healer," which was based on extensive interviews with a healer and psychic, Elizabeth Kelly, who was widely respected and consulted by well-educated people in the small college town of Yellow Springs, Ohio. Rini initially contacted the woman healer for personal advice and came to know her as a friend and to consult with her on a regular basis. Their personal relationship gradually expanded to include a researcher/consultant dimension, and Rini was able to gain a greater understanding of Kelly's belief and practice from a perspective that included her roles as scholar and believer. Reflexive ethnography has legitimized this kind of research within one's own religious groups in ways that were unimaginable in the past.

These examples of research in New Age religion illustrate that the scholarship in folk religion has expanded well beyond the old paradigm of the folk as peasant, and these and other examples from folklore scholarship since the early twentieth century indicate that the theoretical approaches have grown from simple survivalism to a complex pluralism of choices. The folk are now conceived as any group of people with any linking factor, although approaches grounded in cultural politics tend to focus on disenfranchised and oppressed minority groups as the folk. Folkloristic approaches to the study of religion have developed along similar lines as the general shifts in postmodern theory, with a special emphasis on performance, cultural studies, and feminism. Underlying all the various definitions and approaches used by folklorists to study religion is the ongoing concern for individual experience within specific everyday situations and broader cultural contexts.

AN OVERVIEW
FOLK BUDDHISM
FOLK JUDAISM
FOLK ISLAM

FOLK RELIGION: AN OVERVIEW

Peasant populations (i.e., sedentary agricultural groups forming part of larger, more complex societies) have probably existed since 6000 BCE in southwestern Asia, since 3100 BCE in Egypt, and since 1500 BCE in southeastern Mexico. Unlike agricultural entrepreneurs who are active economic agents or semisubsistence cultivators practicing ritual exchange and barter, peasants are farmers whose surpluses are redistributed to urban centers by more powerful groups. In practice it is not always easy to decide who actually is or is not a peasant, especially in the case of farmers who hold factory jobs, modern European family farmers, contemporary North American small farmers, or cash crop slash-and-burn cultivators of South America and Africa. For the purposes of this article, this term applies to past and present-day sedentary cultivators and pastoralists of Asia, North Africa, southern Europe, and Latin America, and historically to sedentary cultivators in northern Europe and North America as well.

Because sedentary farming emerged independently at different times and in different parts of the world, taking radically different forms (including short-term fallowing with animal-drawn plows, alpine pastoralism, and permanent cultivation by means of hydraulic systems), the search for an original, universal religion based on agriculture seems doomed to wishful speculation. Attempts nevertheless have been made, concentrating on such notions as matriarchy, Earth Mother goddesses, and moon worship.

Yet peasant societies do, by definition, have features in common that set the requirements and limits on the kinds of religion that will serve their members: (1) peasants depend on a particular ecosystem; (2) most live in similar social environments (household-based, on dispersed farms or in small settlements); and (3) they depend on the larger society for which they produce food. Their religion usually provides them with ways to deal with the local natural and social world, as well as the wider social, economic, and political network of which they are a part.

To manage the ecosystem, peasants, like other people, mark the cycles of nature, day and night, the lunar cycle, the solar year, the life cycles of animals and plants—all hold particular importance for cultivators. Many peasant cultures have rituals and routines for transitions relating to equinoxes, planting, germination, and harvest. And because landscape and climate vary widely, peasants tend to establish locally distinct sacred places, times, and divinities. Whether it is at a spring, cave, mountaintop, riverbank, or a special tree, peasants come to pay homage to their divinities according to the calendar, and in times of crisis to seek solutions to such

major agricultural threats as drought, hail, and insect plagues.

In terms of social relationships, peasant life is characterized by endemic disputes among households over such matters as inheritance, property boundaries, and irrigation; and yet as cultivators, peasants must normally undertake a certain amount of cooperative work with their neighbors (such as harvesting, herding, and maintaining roads and irrigation ditches), as well as provide mutual aid in time of crisis. To a lesser extent, these tensions and dependencies apply also between adjacent settlements, particularly when pasture or water rights are involved. In this context, religious devotion can facilitate the unity of households within a settlement (mutual fealty to a common divinity) and solidarity between settlements (worship at common shrines). On the other hand, religions also provide the source, pretext, or rallying cry for chronic and intractable conflict between settlements. With regard to patterns of authority and division of labor, the role of religion (through divine models of hierarchy, justice, and emotion) appears to be much the same in peasant as in nonpeasant societies.

Because the household is the critical social and economic unit, peasants pay special attention to consecrating the identity of household members at birth, the alliance of household economic units through marriage, and the reorganization of the household at death. In many peasant societies, elaborate care for the souls of deceased household members corresponds to the idea that the social personality of the house or farm endures beyond the lives of any particular inhabitants. Consequently, there are reasons why this relationship of religion and identity should be stronger with peasants than with others.

As a local phenomenon, peasant religion only rarely can be studied well from a distance, or by relying on surveys or written sources (aside from the rare documents of oral testimony). The ways that it consecrates relationships with nature, society, and identity must be lived to be understood. Context is crucial, for it gives meaning, often of a particularly local variety, to religious behavior that might otherwise appear to be universal.

Indeed, for most people, not just peasants, beliefs are more acted out (in the sense of worship or ritual) than they are thought out. Only when challenged are such beliefs formulated or declared by any but the religious specialist or exceptional devotee. Much of the study of religion as lived, therefore, is the study of that which is taken for granted, that which goes without saying. As a result students of peasant religion have adopted some of the methods used by anthropologists in studying tribal societies; they have stayed for extended periods in rural communities, paying special attention to public religious acts, local interpretation, individual biography, and the range of opinion and doubt.

But the religion of peasants does not address only local agricultural and human concerns, for by definition peasants

are only specialists in a wider network of trade and power in which, given the vulnerability of agricultural life, they generally find themselves in a subordinate position. One of the vital tasks of government is to ensure an adequate food supply for its cities; peasant societies are geared for this purpose, for which they are both protected and exploited. Not coincidentally, there is always a major component of religion in peasant society that is held in common with city dwellers and that generally extends to even wider intersocietal or international exchange systems as well. Such religions include divine beings, sacred sites, rituals, and usually church organizations, all of which are common to peasant and nonpeasant alike.

One therefore can no more speak of a radical separateness of peasant religion than one can speak of a radical separateness of peasant society. Peasant religion is an integral part of wider religions, which provides a common frame of reference in the cosmic and ethical sense, a framework that sets the terms for regular social and economic interaction. Indeed, since peasants often do not experience the specifically agricultural features of their religion as something distinctly different or apart, it is usually incorrect to speak of peasant "religion" in any sense other than religiosity, for peasants are almost always Christians, Muslims, Jews, Buddhists, Daoists, or of some other religion that transcends their immediate arena.

The presence in peasant society of religious specialists trained in a broader social context provides a never-ending source of new techniques, ideas, and images, which the peasant society may adapt for specifically local purposes. And much of what anthropologists following Robert Redfield have called the "little tradition" of the peasantry is what survived of a "great tradition" in the countryside long after it was rejected or forgotten by urban theologians and administrators.

Because of the long-term stability of the peasants' physical and social landscape, some aspects of their religions have had a remarkable and perhaps misleading permanence, although the peasants themselves and the greater political and religious systems affecting them have undergone many changes. For example, present-day cult paintings and statues throughout the world contain elements from earlier, now extinct religions; places of veneration are located at the same kinds of sites as earlier devotions; and in many areas, vows and votive offerings have not essentially changed in over two thousand years.

Such apparent permanence, however, is often superficial, masking major changes in attitude and identity. Say that one finds that a given group of peasants who are self-confessed, practicing Muslims also leave offerings to images of cows, contrary to the teachings of the Qur'ān. It would be a distortion to think of them as covert pagans. For empirical studies have broadened the notion of religion to include both what believers profess and what they actually do and feel. Thus Islamic religion, for instance, can only be fully understood as the sum of the religious acts and beliefs of Mus-

lims. Or, put another way, major world religions are, in practice, coalitions or mosaics of widely differing local adaptations that share a common core of beliefs, rituals, and organization.

While peasant religion may be composed of what may appear to be different kinds of elements and survivals from different traditions, in practice these elements usually form an indivisible, functional whole for believers. Where the notion of survivals exists among peasants themselves, it is often the result of church efforts to stigmatize nonapproved behavior as superstitious, or because of the spread of findings of early folklorists bent on unraveling the different strands of peasant religion according to "high" or "low" origin. More recent scholarship has concentrated on seeing how these strands work together as a whole.

A problem facing students of peasant or folk religion has been finding something with which it can be compared. One tack has been to treat it as "popular" religion and to compare it with the prescribed norms of the larger church or doctrine, much as the "little" tradition is compared to the "great." But such comparisons have not always proved fruitful, for they involve comparing two very different things—on the one hand, a religion as lived and, on the other, a set of norms that hardly represents a way of life and that, in fact, may not be lived strictly by any kind of person, peasant or nonpeasant.

A refinement on this method has involved observation of the practical impingement of the institutions of a central religion on the religious life of peasants—the extent to which peasant religion is effectively regulated, updated, and revised from without. For Europe, this has been done through longitudinal studies using field-work, church visitation, and government records.

An alternate approach compares the peasant religion to that of lay nonpeasants in the larger society, as in Clifford Geertz's studies in Java and much of the recent work on China. As yet little is known about urban or nonpeasant lay religiosity, so it is difficult to be sure that the religion of peasants, apart from its attention to the natural landscape, was in a given time and society fundamentally different from that of urban laypersons. At least for some places and times, a distinction between peasant and nonpeasant religiosity has not proved particularly revealing.

For when studied with care and sufficient evidence, peasant religiosity has been found to share many of the characteristics hitherto considered the domain of the "civilized." For instance, peasant religion is not necessarily homogeneous. Even when there is a single religion practiced, there is likely to be a wide range of doubt, opinion, and speculation, whether in a thirteenth-century French village or a twentieth-century Chinese hamlet. Nor is peasant religion particularly fixed or stable. Throughout history peasants have converted, have been converted, or have attempted to convert from one religion to another. And peasants are not

invariably and instinctively religious. There are areas where peasant religious indifference has long been common, and recently entire age and gender groups have been known to abandon religion enthusiastically under militantly atheist governments.

Indeed, radical changes in the world political economy since the mid-nineteenth century have affected the terms in which peasant religion can be studied. Urban and rural industrialization, as well as the growth of the service sector, has brought an increased homogeneity in peasant and urban lifestyles. As a result of socialist, communist, and anarchist movements, active, militant disbelief may be an overt or latent presence in rural areas. Seasonal migrations to the cities, increased visiting in the cities with relatives, peasant participation in the international workforce, and the tremendous growth in literacy, as well as the spread of radio and television, have all helped to diffuse new religious styles and cults more rapidly among the peasantry.

In most places this broadening of horizons has made peasants more aware of their "otherness" in religious matters, so that it is they themselves who internalize behavioral distinctions proposed by the dominant culture. Some scholars refer to this process as "biculturalism": acting in different ways at different levels (the local and the metropolitan), clearly distinguishing between the two, and segregating behavior appropriately.

As a corollary to this bicultural insecurity, there is intense religious and political competition for the allegiance of the peasants whose religion has been devalued or rendered impractical. There exists a global religious competition, in keeping with the global economy in which peasants are now involved, in which the competitors are missionaries, again both religious and political. Among Peru's Altiplano peasantry one finds several lifestyles based on models and aid from American and European religious organizations. Indeed, some of the class/clan factionalism that unitary religions once served to ease is now expressed with rival religions from the wider world.

Yet it is not that peasants must choose only from the great religions; on the contrary, as the anthropologist Eric Wolf pointed out, there have been many instances of peasant religious innovation, through creative imitation or the inspiration of visionaries and prophets. Some have taken the form of millenarian movements, others as radical purification sects. (Some religiously innovative groups, such as the Mormons and the Mennonites, created peasants as much as they were created by them.) And as tribespeople become peasants in African nation-states, new sects and cults spring up that speak to the new conditions, most of which, true to form, are not just local but national or international in scope.

In the context of the nation-state, peasant religion is quite easily politicized. Two overlapping factors are at work. First, human-divine relations serve to consecrate and are thereby tied up with personal identities in the family, village,

and nation. Second, the year-in, year-out give-and-take that characterizes peasant devotions to divine figures accumulate great emotional power. Both the investment of identity and the emotional power are generally located in divinities with relatively bounded territories of grace, presenting a permanent temptation to governments, political parties, and to the churches themselves. And if effective channels of political action are blocked by authoritarian regimes the local religion, its shrines, divine protectors, and priests, can embody the entire peasant way of life. Thus through religion, peasant discontent finds a charismatic expression. By the same token, in the face of all-pervasive regimes such as China during the Cultural Revolution, early modern Spain, or Spanish-occupied Peru, private religious acts and beliefs provide some peasants with a margin of independent identity and action, a buffer against the politicization of private life.

Often peasant religion is mobilized or exploited by non-peasant leaders. In the nineteenth and twentieth centuries, literary romanticists, folklorists, and nationalists alike have seen in local peasant religion a source of indigenous virtue, the survival of an earlier local culture and identity in the face of foreign domination. In Ireland, Brittany, Poland, the Basque country, Greece, Yugoslavia, Armenia, the Baltic states, as well as in many of Europe's colonial empires worldwide, independence and autonomy movements have fed on an exaltation of peasant religion that on a superficial level involves a kind of ruralization of the urban elite. An extreme but symptomatic example is Mohandas Gandhi's religious transformation from lawyer to peasant. In response to this kind of demand, rural gurus and seers circulate from city to city and nation to nation servicing devotees; they also spread their messages by the internet.

This type of idealization represents the obverse of metropolitan religious doctrines that long held much of peasant religiosity to be pagan superstition, an attitude shared by enlightened secularizers as well. For both clergy and sophisticates, peasant religion has represented an "other" against which both orthodoxy and civilization could be measured.

These seemingly contradictory points of view, by their emphasis on tradition, survivals, and stability, all draw attention to peasant religion's past rather than its dynamics of change or its present roles. Idealization and stigmatization both tend to attribute an integrity and homogeneity to this religion that it rarely possesses, and simplify a more complex, perhaps less manageable reality.

BIBLIOGRAPHY

The search for universal features of the religion of cultivators in keeping with the framework theory of religious evolution, as exemplified by the work of James G. Frazer and Wilhelm Schmidt, is reviewed by Mircea Eliade in his *Patterns in Comparative Religion* (New York, 1958).

A persuasive exposition of general characteristics of peasant life from an anthropological viewpoint is provided in Eric Wolf's *Peasants* (Englewood Cliffs, N.J., 1966), following on Robert Redfield's *Peasant Society and Culture* (Chicago, 1956). A model study by Clifford Geertz, *The Religion of Java* (Glencoe, Ill., 1960), compares the religion of peasants with that of merchants and nobles, all under the wide mantle of Islam. For Buddhism, Stanley J. Tambiah in *Buddhism and the Spirit Cults in North-East Thailand* (Cambridge, 1970) shows how in practice the elements of different religious traditions function as a whole in the religion of a village. A number of scholars have produced excellent work on folk religion in China. Thomas DuBois, using primary written and oral sources has made a particularly thorough study of the different religious alternatives on the North China Plain in "The Sacred World of Cang County: Religious Belief, Organization and Practice in Rural North China During the Late Nineteenth and Twentieth Centuries." (Ph.D. diss., University of California in Los Angeles, 2001). For the religion of European peasantry, I describe Catholicism in northern Spain in its relation to the landscape and social relations in *Person and God in a Spanish Valley* (rev. ed. Princeton, N. J., 1989), and Lucy Rushton admirably relates Greek Orthodox theology to personal life in "Religion and Identity in a Rural Greek Community" (Ph.D. diss., University of Sussex, 1983).

Much of the early work on popular religion in Europe is discussed in P. Bolgioni's "Religione Popolare," *Augustinianum* 21 (1981): 7–75, with ample bibliographic notes. Richard F. Gombrich in *Precept and Practice: Traditional Buddhism in the Rural Highlands of Ceylon* (Oxford, 1971) argues against the notion of popular religion, as does Jean-Claude Schmitt in "Religion populaire' et culture folklorique," *Annales: Économies, sociétés, civilisations* 31 (September–October 1976): 941–953. Unusual ethnographic information about peasant religion in the Friuli region of northeast Italy, gathered in the context of diocesan investigations, is provided by Carlo Ginzburg in *I Benandanti: Ricerche sulla stregoneria e culti agrari tra Cinquecento e Seicento* (Turin, 1966), translated by John Tedeschi and Anne C. Tedeschi as *The Night Battles: Witchcraft and Agrarian Cults in the Sixteenth and Seventeenth Centuries* (Baltimore, 1983). Emmanuel Le Roy Ladurie's *Montaillou: The Promised Land of Error* (New York, 1978) describes in detail village Catholicism in the Pyrenees and the villagers' conversion to Cathar beliefs. Similarly rich in detail, although not about a single community, is Keith Thomas's *Religion and the Decline of Magic: Studies in Popular Beliefs in Sixteenth and Seventeenth Century England* (New York, 1971). Campaigns to change peasant religion are described in Eamon Duffy, *The Stripping of the Altars: Traditional Religion in England 1400–1580* (New Haven, Conn., 1992), by the same author in *The Voices of Morebath: Reformation and Rebellion in an English Village* (New Haven, Conn., 2001), and for Peru, in Kenneth Mills, *Idolatry and its Enemies: Colonial Andean Religion and Extirpation, 1640–1750* (Princeton, N.J., 1997). Nancy M. Farris's *Maya Society under Colonial Rule: The Collective Enterprise of Survival* (Princeton, 1984) and Victoria Reifler Bricker's *The Indian Christ, the Indian King: The Historical Substrate of Maya Myth and Ritual* (Austin, Tex., 1981) are historical studies of religious syncretism in the Yucatan,

building on a long line of distinguished ethnographies. Peter Brown, in his elegant *The Cult of the Saints: Its Rise and Function in Latin Christianity* (Chicago, 1981), challenges a radical distinction between peasant and nonpeasant religion in the Mediterranean, as I do in *Local Religion in Sixteenth Century Spain* (Princeton, N.J., 1981).

Peasant millennial movements are studied in *Millennial Dreams in Action*, edited by Sylvia L. Thrupp (New York, 1970). Charles Tilly's *The Vendée* (Cambridge, Mass., 1964) asks important questions about the social and economic roots of a peasant uprising in the name of religion.

WILLIAM A. CHRISTIAN, JR. (1987 AND 2005)

FOLK RELIGION: FOLK BUDDHISM

Religious traditions are, by their very nature, complex. One the one hand, they symbolize the highest aspirations of the human mind and spirit; on the other, they sanctify and give meaning to the most ordinary and commonplace human needs and activities. The complexity of religion and its functions have been analyzed in various ways. There has been a tendency, however, to distinguish between those aspects created by and appropriate to the educated elites, for example, priests and rules, and those that help the uneducated, common folk cope with the uncertainties and exigencies of life. Scholars have sometimes referred to this distinction as obtaining between "great" and "little" traditions or between "elite" and "folk" traditions. It must be kept in mind that these formal distinctions do justice neither to the multiplicity of religious traditions nor to the organic unity that characterizes them, even though such categories may serve a useful function.

"Folk" Buddhism may be understood as a persistent, complex, and syncretic dimension of the Buddhist tradition characterized by beliefs and practices dominated by magical intent and fashioned with the purpose of helping people cope with the uncertainties and exigencies of life. Its varied expressions emerge along the wide spectrum between the normative Buddhist ideal represented quintessentially but not exclusively by the Buddha and the concept of *nirvāṇa*, and the indigenous magical-animistic and shamanistic traditions of the given culture in which Buddhism becomes institutionalized. Consequently, some aspects of folk Buddhism (e.g., the figure of the Buddha, the person of the monk, and the practice of meditation) appear to be closely affiliated with the normative ideals of Buddhism, while others are barely distinguishable from native, non-Buddhist religious forms. Folk Buddhist institutional structures, religious practices and practitioners, and oral and written literatures reflect this variation.

Buddhism has had a folk or popular dimension since its inception. Early Buddhist scriptures challenge the view of a "golden age" of pure monastic practice dedicated to the pursuit of *nirvāṇa* unencumbered and undisturbed by the needs and expectations of a simple, uneducated laity. That the

Buddha and his followers were supported by laypersons for reasons of material gain and magical protection, as well as for spiritual benefit, cannot be denied. Even meditation, the *sine qua non* of monastic practice, was perceived as leading not only to equanimity and enlightenment but also to the acquisition of magical power. The *Mahāvagga* of the Theravāda Vinaya Piṭaka depicts the Buddha not simply as an enlightened teacher, but as a yogin who wins followers through his magic. Moreover, although the source is later commentary, it is significant that the future Buddha, just prior to his enlightenment, was said to have been offered food by a woman who mistook him for a tree deity. In general, Buddhist scriptures readily intermesh doctrinal exposition with magical and animistic figures and elements ranging from *devas* (gods) to *mantras* (sacred utterances).

To be sure, folk Buddhism became a more dominant aspect of Buddhist institutional and cultural life as the religion grew in size and cultural significance throughout Asia. In India, Aśoka's strong support of the Buddhist monastic order in the third century BCE proved to be crucial to its growth and diffusion, and the appropriation of folk elements from different cultures was a means by which Buddhism spread and accommodated itself to the cultures of Asia from at least the beginning of the common era. Indigenous folk religions, therefore, were the major media through which Buddhism became a popular religion not only in India, but in Southeast, Central, and East Asia as well. The fact remains, nevertheless, that the folk element within Buddhism has been a part of the tradition since its inception, and has persisted in different forms to the present.

Folk Buddhism has several different facets that reflect various modes of interaction between normative, doctrinal-institutional Buddhism and native religio-cultural traditions. In some cases, the normative Buddhist tradition made only inconsequential adjustments; in others, Buddhism emerged as a thinly veiled animism. The major ingredient of folk Buddhism is usually referred to as animism or magical-animism, that is, the belief in benevolent and malevolent supernatural powers and the attempt to avoid them or to enlist their aid. These powers range from spirits of the living and the deceased to deities of regional or even national jurisdiction associated with non-Buddhist (e.g., Brahmanic) pantheons. The dialectical relationship between Buddhism and indigenous animism such as the Bon of Tibet led to the parochialization of Buddhism, but also changed the face of those native traditions encountered in Tibet, Korea, Japan, and elsewhere. For example, Shintō, rooted in an autochthonous animism, developed in Japan in competition with the more sophisticated traditions of Chinese Buddhism, just as religious Daoism in China institutionalized, at least in part, in response to Indian Buddhist influence.

The complex nature of folk Buddhism can be analyzed in various ways, but the method should do justice to its common or generic elements as well as the uniqueness of distinctive religio-cultural environments. Folk Buddhism as an es-

entially syncretistic phenomenon can be seen in terms of three types or modes of interaction between Buddhist and non-Buddhist elements: appropriation, adaptation, and transformation. These categories are intended to characterize particular historical instances as well as describe general types. Although they have overlapping qualities, they point to the variety within folk Buddhist belief and practice as well.

APPROPRIATION. In many cases, folk Buddhism merely appropriated and subordinated indigenous symbols, beliefs, and practices with very little change in meaning. This is particularly true in the incorporation of a wide range of supernatural beings and powers into the Buddhist system. Generally speaking, these supernaturals, whether gods or spirits, malevolent or benevolent, were subordinated to the dominant Buddhist symbols and motifs. Most often they played a protective role, standing guard at a sacred Buddhist precinct, be it temple or *maṇḍala*, or functioned in an appropriately subordinate way in relationship to the Buddha. In Sri Lanka, for example, a kind of divine pantheon evolved, a hierarchy of gods and spirits ranging from the most localized guardian spirits of village and field to the suzerainty of regional gods the likes of Skanda and Viṣṇu with the entire structure under the sway of the Buddha. In Tibet the gods of the everyday world (*'jig rten pa*) became protectors of the *dharmā*, obeying the commands of the great teachers. While they are so numerous and indeterminate as to defy a fixed ordering, they generally are divided according to the traditional Indian tripartite cosmology of heaven, earth, and the intermediate realm. In Burma (Myanmar) the indigenous *nat* spirits are incorporated into Burmese Buddhism as *devas*. Thagya Min, for instance, is assimilated into Sakka (the Brahmanic Indra), and resides in Tāvātimsa Heaven as king of the *devas*, but is also said to be ruler of the "thirty-seven *nats*." In Thailand various supernaturals including *devata*, *cao*, and *phī* have a complex relationship to Thai Buddhism involving linkage, hierarchy, and instances of both opposition and complementarity. In Japan, Buddhism absorbed native Japanese deities or *kami*. In many cases the *kami* are taken as manifestations of Buddhas or *bodhisattvas* (the theory of *honjisuijaku*), although a uniform set correspondence did not develop. A similar story can be told for Buddhism in China, Korea, and other parts of Asia. While the specific list of supernaturals appropriated into the Buddhist system varies from culture to culture, these beings represent a hierarchy of powers and suzerainties dependent on, under the authority of, or even in tension with, Buddhist figures, symbols, and motifs.

These supernaturals have been assimilated into the Buddhist cultus as well as into Asian Buddhist worldviews; they are amalgamated into orthodox ritual activity or become a distinct ritual subset. Throughout Buddhist Asia the guardian spirits of a temple precinct, such as the *phī* in Thailand or the *kami* in Japan, may be propitiated prior to an auspicious ceremonial event. In Tibet, Tantric ritual has provided a framework for customary religious practices in which Tibetan deities exist side by side with Indian Buddhist ones.

In Sri Lanka, devout Sinhala Buddhists paying respects to the Buddha at the famous sanctuary of Lankatilleke outside of Kandy will make offerings before images of the Hindu deities enshrined in *devales* around the perimeter of the building. In Thailand, Brahmanic deities (e.g., Viṣṇu) may be invoked during a customary Buddhist ritual, and offerings are made to the guardians of the four quarters as part of the New Year celebration at a Buddhist monastery (*wat*).

Of special significance in folk Buddhism have been the belief in the soul (the existence of which is scarcely maintained in scripture), or spirit element(s), of the individual, and various rituals associated with this belief, especially life-crisis or life-transition rites. The role of Buddhism in the conduct of mortuary and death anniversary rites for the souls of the dead in China, Korea, and Japan is well known. In Japan, the Obon festival celebrated in the seventh month honors the return of the souls of the dead. Graves at Buddhist temples will be cleaned in preparation for the spirits' return, and the household altar (*butsudan*) will be decorated with flowers, lanterns, and offerings of fruit. In Burma, mortuary rituals are performed to prevent the soul of the deceased from remaining in its former haunts and causing trouble. In Thailand, soul-calling (*riag khwan*) rites are performed at life-transition times such as weddings and even as part of ordination into the monkhood.

ADAPTATION. In assimilating indigenous magical-animistic and shamanistic religious beliefs and practices, Buddhism itself has changed. This process of adaptation and parochialization has been part of the Buddhist tradition from its outset: the Buddha as teacher but also miracle-worker, meditation as the vehicle for the attainment of insight and supernatural powers, the monk as *nirvāṇa*-seeker and magician. In the Theravāda traditions of Sri Lanka and Southeast Asia the miraculous power of the Buddha is attested to not only in supernatural feats of magical flight, prognostication, and the like, but also in the cult of Buddha relics and Buddha images that typifies ritual practice in this region. The Mahāyāna and Tantrīyāna traditions elaborated the salvific function of the Buddha through the proliferation of Buddhas and *bodhisattvas*. In China, Dao'an (312–385) popularized Buddhism by promoting Maitreya as a savior Buddha, the god of Tuṣita Heaven, an earthly paradise accessible to all. Huiyuan (334–416) did for Amitābha Buddha and his Pure Land (Sukhāvātī) what Dao'an did for Maitreya and Tuṣita Heaven. Both Maitreyism and Amidism became fundamental to folk Buddhism. In Japan, one of the specific adaptations was the assimilation of popular elements into the figure of the *bodhisattva* Jizō (Skt., Kṣitigarbha), who thereby came to occupy an even more important place than did his Chinese counterpart, Dizang. Not only does Jizō deliver souls from hell, but he also helps women in childbirth and, like Kannon (Chin., Guanyin), another popular savior, is seen as the giver of healthy children and a guide to the Western Paradise of Amida.

The supernormal powers associated with meditation adepts has a close association with shamanism. Monks have

become famous for their skills as alchemists, for their ability to communicate with the spirit world, and for their prognostication of future events, activities that conflict with the Vinaya. The biographies of such Tantric adepts as Padma-sambhava and Mi la ras pa attest to this type of parochialization, and even the lives of the Chan (Zen) patriarchs are not exempt from supernatural hagiographic elaboration. In Sri Lanka, ascetic monks are revered not only for their piety but for their magical prowess as well, and in Thailand a significant cult of monk-saints has developed. Popular magazines attest to their extraordinary deeds, their advice is sought for everything from lottery numbers to military ventures, and their amulets are worn for protection against danger and disease.

TRANSFORMATION. Buddhism appropriated magical-animistic and shamanistic religious forms and adapted its own beliefs and practices to this type of cultural milieu. The degree to which assimilation and adaptation has occurred has led to profound transformations of the tradition. While decisive turns in the development of Buddhism have taken various forms, popular sectarian movements have provided one of the most fruitful contexts for this kind of transmutation. Examples abound throughout Buddhist Asia. In Burma and Thailand messianic Buddhist groups emerged in the modern period centered around charismatic leaders often claiming to be Maitreya Buddha. In China, Buddhist sectarian groups led by "rebel monks" split off from monasteries in the Northern Wei kingdom (386–535) as early as the fifth century. The best known is the White Lotus movement, a complex of rebel eschatologies active from the twelfth to the nineteenth century. Other major sects include the Maitreya, White Cloud, and Lo, or Wuwei. These groups were lay-based, heterodox, and syncretistic, and were often politically militant. The White Lotus sect developed its own texts, a married clergy, hereditary leadership, and by the mid-fourteenth century a full-blown eschatology derived from both the Maitreyan tradition and Manichaeism. By the late sixteenth century the principal deity of the White Lotus groups was a mother goddess. Eventually, by the late nineteenth century, the Buddhist elements were so extenuated that they had become congregational folk religion rather than a distinctive form of folk Buddhism.

In Japan as early as the Heian period (794–1185) holy men (*hijiri*) developed a folk Buddhism outside the orthodox ecclesiastical system. In the tenth and eleventh centuries Amida *hijiri* and Nembutsu *hijiri*, preeminent among whom was Kōya, a layman of the Tendai sect, taught universal salvation through the repetition of the Nembutsu (the formulaic recitation of the name of Amida Buddha). The Nembutsu came to be seen as a powerful form of protection against the spirits of the dead and evil spirits (*goryō*) and a means to release them into Amida's paradise. While the founders of the orthodox Pure Land sects, Hōnen and Shinran, rejected the animistic and magical aspects of the Nembutsu, the attitudes of the common folk did not substantially change. The Amida *mantra* was considered a causally effective means to attain the

Pure Land after death as well as a magical spell for sending evil spirits to Amida. Popular sectarianism has continued to develop into the contemporary period. Some of the so-called new religions (*shinkō shūyūkō*) in Japan represent a unique form of folk Buddhism. Arising in the nineteenth and twentieth centuries in a period of political and social crisis, these religions, which developed around strong, charismatic leaders, are syncretistic and often utilize magical ritual practices. Two of the best known are Rishō Kōseikai and Sōka Gakkai. Both are indebted to the *Lotus Sūtra*-Nichiren tradition. Through its political wing, Sōka Gakkai has become a sometimes militant force in Japanese politics.

The Buddhist encounter with folk religion, which has taken the forms of appropriation, adaptation, and transformation, has not occurred without conflict. In Southeast Asia stories abound of the Buddha's encounter with indigenous supernatural beings who are only eventually subdued and made to vow their allegiance to the *dhamma*. Other heroic figures exemplify a similar pattern. Especially noteworthy is Padmasambhava's propagation of the *dharma* in Tibet. The key to his success, in contrast to the previous failure of the great teacher Śāntirakṣita, was Padmasambhava's magical prowess in subduing the powerful Tibetan deities. Such conflict may be mirrored in Buddhist ritual as well as in myth and legend. In northern Thailand, for example, offerings of buffalo meat to the guardian spirits (*phī*) of Chiang Mai are made as part of the New Year celebration; however, this ritual activity has no formal connection with the elaborate ceremonies occurring at Buddhist sanctuaries in the area.

The practitioners of folk Buddhism likewise present a great diversity. Those most closely tied to the autochthonous animism may be likened to shamans, for they function in a shamanlike manner. They have the power to enter into the realm of the supernaturals, an act often symbolized by magical flight; they may also become possessed by supernatural beings or function as a medium between the supernatural and human realms, and have the knowledge to enlist or ward off their power. In Tibet, *mdos* rituals are performed by wandering lamas (Tib., *bla mas*) or exorcists (*snyags pa*) for protection against dangers, hindrances, injuries, illness, and obstacles caused by evil powers. The person who carries out exorcistic rituals (*gto*) must be an expert in meditating on his *yi dam* or tutelary divinity. The *yamabushi* or mountain ascetics of Japan, while affiliated with the Tendai and Shingon sects, perform exorcisms and function as village magicians. The Chinese shaman (*wu*), who exorcised spirits of evil and illness and danced and chanted to ward off disasters, influenced the popular conception of the charismatic leadership of folk Buddhist sects in China. Often, lay Buddhists are the principal practitioners of the folk traditions, especially because many of the magical practices associated with folk Buddhism are either forbidden or discouraged by the orthodox Vinaya. In the Esoteric schools of Buddhism (e.g., Shingon), as well as in sectarian movements, the differentiation between mainstream beliefs and practices and those of the folk

dimension are more difficult to perceive. Even in the Theravāda countries of Southeast Asia, however, actual monastic custom and practice may be far removed from the strict ideal of monastic discipline, which discourages fortune telling, alchemy, and the like.

The texts of folk Buddhism also reflect the ways in which the normative tradition has appropriated, adapted, and been transformed by indigenous folk religion. An important genre of folk literature is the miraculous tale, often purporting to be an episode from the life of the Buddha or a famous Buddhist figure such as Maudgalyāyana or Vimalakīrti. Included in this literary genre are the Jātakas, which are themselves examples of the appropriation of folktales, mythic accounts of heavens and hells (e.g., *Petavatthu*), legendary elements in chronicles, lives of the saints in various Buddhist traditions, and vernacular collections such as the Chinese *pien-wen* (texts of marvelous events). Other texts, such as the *paritta* (scriptural passages that, when chanted, are said to have apotropaic power) in the Theravāda tradition, function in a magical manner in Buddhist ritual, even though the content reflects the highest ethical and spiritual ideals of the normative tradition. The *Bar do thos grol* (Tibetan *Book of the Dead*), although at the center of the Tantric technique of liberation, certainly incorporates shamanistic elements. Another type of folk Buddhist literature includes those texts specifically related to the practice of astrology, fortune telling, and animistic rituals.

In the final analysis, folk Buddhism should not be seen as a later degeneration of the normative Buddhist ideal. Rather, it is a complex dimension of the tradition, present from its origin, that has provided the tradition with much of its vitality and variation from culture to culture.

BIBLIOGRAPHY

In recent years studies of folk or popular Buddhism have been greatly enhanced by the work of anthropologists, especially those working in Southeast Asia. These descriptive and analytic studies provide an important complement to the work of cultural historians and historians of religion. Notable of mention for the Theravāda Buddhist cultures are the works of Stanley J. Tambiah, in particular his *Buddhism and the Spirit Cults in North-East Thailand* (Cambridge, 1970). While this work is a microstudy, like many anthropologists Tambiah offers a more comprehensive interpretation of the religious system in northeast Thailand. Tambiah's structuralist-functionalist approach contrasts with the social-psychological perspective (as found, for instance, in the

works of Abram Kardiner) of Melford E. Spiro's *Buddhism and Society: A Great Tradition and Its Burmese Vicissitudes*, 2d ed. (Berkeley, Calif., 1982). A dominant theme in anthropological studies is the nature of the interrelationship between the folk or "little" tradition and the "great" tradition. In various ways this theme is addressed in Michael M. Ames's "Magical-Animism and Buddhism: A Structural Analysis of the Sinhalese Religious System," in *Religion in South Asia*, edited by Edward B. Harper (Seattle, 1964), pp. 21–52; Gananath Obeyesekere's "The Great Tradition and the Little in the Perspective of Sinhalese Buddhism," *Journal of Asian Studies* 22 (February 1963): 139–153; Manning Nash's *The Golden Road to Modernity: Village Life in Contemporary Burma* (New York, 1965); and A. Thomas Kirsch's "Complexity in the Thai Religious System: An Interpretation," *Journal of Asian Studies* 36 (February 1977): 241–266. This theme figures in studies of the religious systems in Central and East Asia as well. See, for example, J. H. Kamstra's *Encounter or Syncretism: The Initial Growth of Japanese Buddhism* (Leiden, 1967), Alicia Matsunaga's *The Buddhist Philosophy of Assimilation: The Historical Development of the Honji-Suijaku Theory* (Rutland, Vt., and Tokyo, 1969), and Christoph von Fürer-Haimendorf's *Morals and Merit: A Study of Values and Social Controls in South Asian Societies* (London, 1967).

Popular Buddhist millenarian movements constitute another theme addressed by recent studies of folk Buddhism. For Southeast Asia, E. Michael Mendelson's "The King of the Weaving Mountain," *Journal of the Royal Central Asian Society* 48 (July–October 1961): 229–237, and Charles F. Keyes's "Millennialism, Theravāda Buddhism, and Thai Society," *Journal of Asian Studies* 36 (February 1977): 283–302, are particularly noteworthy. For China, Daniel L. Overmeyer's *Folk Buddhist Religion: Dissenting Sects in Late Traditional China* (Cambridge, Mass., 1976) is definitive.

Studies dealing with folk Buddhism that do not take a particular thematic perspective abound. Francis L. K. Hsu's *Under the Ancestors' Shadow: Chinese Culture and Personality* (New York, 1948) treats Chinese popular religion and the ancestral cult. H. Byron Earhart's *A Religious Study of the Mount Haguro Sect of Shugendō* (Tokyo, 1970) deals with the Shugendō sect, a popular movement combining Esoteric Buddhism with Japanese folk religious beliefs. René de Nebesky-Wojtkowitz's *Oracles and Demons of Tibet: The Cult and Iconography of the Tibetan Protective Deities* (The Hague, 1956) treats popular Tibetan protective deities. For folk Buddhism in Japan, see also Hori Ichirō's *Folk Religion in Japan; Continuity and Change*, edited and translated by Joseph M. Kitagawa and Alan L. Miller (Chicago, 1968).

FOLK RELIGION: FOLK JUDAISM

In the course of its millennial history, biblical and Jewish folk religion has found its expression in beliefs in male and female deities other than God; in angels, devils, demons, ghosts, and spirits; in saints and holy men; in the "evil eye" and other baleful influences; and in rites and practices such as magic, witchcraft, divination, and the use of amulets, charms, and talismans. Manifestations of Jewish folk religion were found from earliest biblical times and continued to appear, until in the nineteenth century it waned in those European countries in which the Jews came under the influence of the Enlightenment. In the Middle Eastern Jewish communities folk religion retained its vitality until 1948, after which the people of these communities were largely transplanted to Israel.

BIBLICAL PERIOD. In a few cases the biblical authors refer to folk beliefs and rites without condemnation. These "naive" references pertain mostly to cosmic origins or to the early history of mankind, the Hebrew patriarchs, and the people of Israel. Thus *Genesis* 6:1–4 clearly reflects a folk belief in the existence of "sons of God"; *Isaiah* 14:12–15, in a rebellious angel who was cast down into the netherworld; and various passages in *Isaiah*, *Psalms*, and *Job*, in sea dragons and other monsters who dared to oppose God. *Terafim*, small household gods taken by Rachel from her father's house (*Gn.* 31:19, 31:30–35), and larger versions of the same kept by Saul's daughter Michal (the wife of David) in her chambers (*1 Sm.* 19:13, 19:16), are clear examples of folk belief.

In sharp contrast to these uncritical mentions of folk religion are the condemnatory references to the popular (as well as institutional) worship of gods other than Yahveh contained in the historical and prophetic writings of the Bible. But these scornful references are, at the same time, also testimonies to the popular worship in Israel of several male and female deities (such as Baal, Kemosh, Milcom, Asherah, Asarte, and the Queen of Heaven) from the time of the Judges to the destruction of Israel and Judah in 722 and 587/6 BCE and even later (see *Jer.* 44:15–19). These biblical data are supplemented by archaeological discoveries of small figurines of goddesses (Asherah, Astarte) in many excavated Israelite homes from the biblical period all over the country.

Demons. With reference to demons the biblical evidence shows a similar duality. On the one hand, there are prohibitions of witchcraft and all trafficking with, or consultation of, demons, ghosts, and spirits, which practices are considered capital sins punishable by death (*Ex.* 22:17, *Dt.* 18:10–12), and historical notes tell of the attempted extermination by royal decree of “those that divined by a ghost or familiar spirit” (*1 Sm.* 28:3). On the other, there is ample testimony to the belief, shared by the Yahvist historians and prophets with the common folk, in the existence of demons and their power to harm people’s bodies and minds (*Gn.* 32:25ff.; *Lv.* 16:10; *Is.* 13:21, 34:14; *1 Sm.* 16:15, 16:23; *1 Kgs.* 22:22–23; *Ps.* 91:5–6). Israelite folk religion seems to have made room for species of demons (*shedim*, *se’irim*), as well as individual demons, for example ‘Az’azel. Most of the latter are known from the religions of the neighboring peoples as gods, thus, for example, Lilith, Mavet (“death”), and Reshef (“pestilence”). From the late biblical and apocryphal literature are known the devil-like demons called Saṭan, Maṣemah, Belial (Beliyya’al), Asmodeus (Ashmed’ai), while both in the New Testament and in rabbinic literature demons are referred to as “unclean” or “evil spirits.” In the three synoptic gospels the prince of demons has the name Beelzebul (Ba’al Zebub). These demons, generic and individual, are all reflections of Jewish folk belief.

Magic and divination. The Bible repeatedly condemns action taken to influence the mysterious forces of nature and the spirits. *Deuteronomy* 18:10–11 decrees, “There shall not be found among you any one that . . . useth divination, a soothsayer, or an enchanter, or a sorcerer, or a charmer, or one that consulteth a ghost or a familiar spirit, or a necromancer.” *Exodus* 22:17 rules explicitly, “Thou shalt not suffer a sorceress to live” (cf. *Lv.* 20:27). Passages such as these indicate that the biblical authors shared with the common people the belief in the reality and efficacy of magic, but, in contrast with the common folk, condemned it as an act of unfaithfulness to God (cf. *Dt.* 18:12–13).

Recognizing the assurance divination provided, biblical legislation, while outlawing it in the form practiced by the Canaanites, supplied a substitute for it in the mantic activity of prophets, whose legitimacy, it states, would be proven by subsequent events (*Dt.* 18:14–22). The people, it seems, turned to the prophets primarily in order to profit from their mantic powers (*1 Sm.* 9:6; *1 Kgs.* 14:1ff., 22:5ff.; *2 Kgs.* 3:11). Divination included the questioning of the Urim and Tummim (*1 Sm.* 23:9–12), consultation of the *terafim* (*Jgs.* 17:5, 18:14; *Hos.* 3:4; *Ez.* 21:26; *Zec.* 10:2), the use of gobbets (*Gn.* 44:5), arrows (*Ez.* 21:26), spoken words (*Gn.* 24:14, *1 Sm.* 14:9–10, cf. v. 12), and the interpretation of the liver (*Ez.* 21:26), stars (*Is.* 47:13, *Jer.* 10:2), and dreams (*1 Sm.* 28:6). The hold diviners had over the people is best illustrated by the story about King Saul: he “cut them off the land,” but when in trouble sought out one of those who remained (*1 Sm.* 28:3–25).

The persistence into the first century BCE of magic as a part of popular religion is attested by *2 Maccabees* 12:40,

which tells about the Jewish warriors who wore under their tunics amulets (*hieromata*) taken from the idols of Yavneh. This practice was condemned by the author because of the pagan derivation of the amulets. On the other hand, in *Tobit*, an apocryphal book of the first century BCE, a method of exorcising a demon from a possessed person with the help of fumigation is described as having been taught by the angel Raphael, that is, as a religiously orthodox act.

TALMUDIC PERIOD. After the Babylonian exile, Jewish folk religion found its expression, partly under the impact of Babylonian, Persian, and, later, Hellenistic influences, in a proliferation of angels, demons (some of whom had figured already in the Bible), evil spirits, the evil eye, and so on, and in practices aiming at the invocation of beneficial superhuman powers and the propitiation of, or protection against, those with evil intentions. While in the Jerusalem (Palestinian) Talmud only three categories of demons (*mazziqim*, *shedim*, and *ruḥot*) are mentioned, demonology is more prominent in the Palestinian midrashim. However, it is the Babylonian Talmud (completed c. 500 CE) that is the richest source for Jewish folk religion in general and demonology in particular.

For Talmudic Judaism the number of demons was legion. Ashmed’ai was their king, while their queen, Iggrat the daughter of Mahalat, went about with a retinue of 180,000 “angels of destruction” (B.T., *Pes.* 112b). The Talmudic sages fought valiantly, not against the popular belief in demons, but against the demons themselves. Thus Ḥanina’ ben Dosa’ and Abbaye succeeded in restricting the activities of Iggrat to certain times and places. Other sages conducted conversations with demons. Most dangerous was the female demon Lilith, who seduced men at night and strangled babes, and who could be kept away only by means of protective charms.

Since both Talmuds and the *midrashim* record the sayings, rulings, and acts of the sages, and not of the common folk, our knowledge of folk religion is largely confined to its reflection in the recorded words and deeds of the rabbis, and it is on them that we must base our conclusions as to the religious beliefs and acts of the simple people. Thus, for example, the Mishnah (*San.* 6.4) and the Jerusalem Talmud (*San.* 6.9, 23c) tell about the leading first century BCE Palestinian sage and head of the Sanhedrin, Shim’on ben Sheṭaḥ, that he had eighty witches hanged in the port city of Ashqelon. Such a report is, of course, evidence of the existence of a belief in witches among both the people and their spiritual leaders.

Occasional references in the Mishnah and Talmud indicate that *kishshuf*, witchcraft, was widespread, especially among women (*Sot.* 9.13, *Avot.* 2.7; B.T., *San.* 67a), despite the fact that it was a capital offense (*San.* 7.4, 7.11; B.T., *San.* 67b), punishable by stoning. Persons accused of witchcraft were frequently brought before the judges, who therefore were required to have a thorough familiarity with the workings of magic (B.T., *San.* 17a). They also had certain

criteria by which they were able to differentiate between witchcraft and mere trickery (B.T., *San.* 67b).

Of several sages it is reported that they themselves practiced and taught magic (B.T., *San.* 67b–68a), as did the daughters of at least one of them (B.T., *Git.* 45a). Some women engaged in faith healing (B.T., *Sot.* 22a, cf. Rashi). One of the pious men of the first century BCE, Honi the Circle Maker, practiced rain magic (*Ta'an.* 3.8). The use of incantations and the recitation of magic formulas for curative purposes was widespread (B.T., *Shab.* 67a).

As for amulets (sg., *qamei'a*), in Talmudic times two kinds were in vogue: those written on and those containing roots and leaves. They were dispensed by physicians to cure ailments, and also used by people for protection against the evil eye and demons, and to make women conceive (*Kel.* 23.1, *Shab.* 6.2; B.T., *Shab.* 61a–b, *Pes.* 111b; J. T., *Shab.* 6, 8b top; *Gn. Rab.* 45; *Nm. Rab.* 12; et al.). (Whether the biblical *duda'im* [mandrakes] found by Reuben in the field were ingested by the sterile Rachel or used by her as an amulet is not clear. See *Gn.* 30:14–15, 30:22–23.) An amulet was usually put around the neck of a child soon after its birth (B.T., *Qid.* 73b), which custom has remained alive until modern times in Middle Eastern Jewish communities. Amulets that had proven their efficacy were allowed to be worn outside the home even on the Sabbath, although on that rest day the carrying of all objects was prohibited (*Shab.* 6.2).

Divination (*nihush*) continued in the Talmudic period as an integral part of popular religion, despite rabbinic prohibition and its punishment by flogging. The influence of Jewish and Babylonian folk religion on the Babylonian amoraim (Talmudic sages of the third to fifth centuries) can be seen in the permission they gave to use *simanim* (signs or omens) in trying to foretell the future. Very popular in Talmudic times was the divinatory use of biblical verses randomly recited by children (B.T., *Hag.* 15a–b, *Hul.* 95b). There were so few people who refrained from practicing some kind of divination that those who did were considered more meritorious than the ministering angels (B.T., *Ned.* 32a).

MIDDLE AGES AND LATER TIMES. The medieval development of Qabbalah constituted a favorable environment for the further proliferation of the belief in demons. Folk belief and the teachings of Qabbalah mutually reinforced each other. The sexual seduction of humans by demons was considered an imminent danger, resulting in the birth of additional demons. Many illnesses were believed to be the result of spirit possession, and consequently the exorcism of spirits (dybbuks) became an important method of popular medicine. While the exorcists seem to have been men only, the persons considered possessed were mostly women. Childlessness—generally considered the wife's "fault"—gave rise to a wide variety of folk cures, including the ingestion of substances of animal origin prohibited by *halakhah* (traditional Jewish law).

Much of medieval Jewish folk religion expressed itself in rites and ceremonies performed at the three major stages

of human life: birth (including circumcision), marriage, and death. On these occasions the demons were believed to be especially aggressive and dangerous, and the protection of the principals as well as the attendants was a major concern that gave rise to numerous folk rites.

Features of folk religion are also present at the celebrations of the official Jewish holy days, despite repeated attempts by rabbinical authorities to suppress them. The Tashlikh rite (the symbolic casting of one's sins into water on Ro'sh ha-Shanah, the Jewish New Year) and the Kaparah (the symbolic transference of one's sins onto a hen or a cock on the eve of Yom Kippur) are two examples of practices that Jewish folk religion introduced into the High Holy Days celebrations over the objection of the rabbis.

Of special interest for the historian of religion is the extent to which Jewish folk religion succeeded in being accepted by the leading Jewish religious authorities, who, by including numerous folk beliefs and customs into their halakhic codes, made them part of official Judaism. The *Shulhan 'arukh*, the law code that governs Jewish traditional life to this day, contains rulings that show that its author, the Sefardi Yosef Karo (1488–1575), and his chief annotator, the Ashkenazi Moshe Isserles (1525–1572), believed in the power of the evil eye to harm a person even in the synagogue, in the efficacy of amulets, in the influence of the stars on human life, in omens, in incantations to subdue demons and dangerous animals, in the magic prevention or cure of illness, in consulting the dead and the demons, and so on.

The veneration of saintly men and, more rarely, women, expressed mainly in visits to their tombs with appropriate offerings in the hope of obtaining various benefits, has been an integral part of Jewish folk religion, especially in Islamic countries, for centuries. Occasionally the same Jewish or Muslim saint has been venerated by both Jews and Muslims.

Although several leading medieval rabbinical authorities (including Moses Maimonides, 1135/8–1204) objected to the use of amulets, charms, and magic remedies, their popularity could not be checked, and after the expulsion of the Jews from Spain in 1492 they spread to eastern Europe. Prepared by rabbis, healers, or holy men for a fee, they were believed to save the wearer or user from all types of harm; to cure his (or her) ailments; to protect him from demons; and to provide good luck, health, and many other kinds of benefits. The amulets, widely used especially in the Middle East down to recent times, whether written on paper or made of silver, brass, tin, or iron, are often decorated with magic triangles and squares, the Magen David (Shield of David), or menorahs. The metal amulets typically have the shape of a circle, a square, a rectangle, a shield, a hand (the most frequent shape), and, rarely, a foot. They are inscribed with divine and angelic names, brief quotations from the Bible, and magic combinations of letters or obscure words. Often the amulet states the name of the person for whom it was prepared and the name of his or her mother.

In the seventeenth and eighteenth centuries in central and eastern Europe a magician who prepared such amulets was called *Ba'al Shem*, that is, "Master of the Name," because he was an expert in the use of holy names for magico-religious purposes. The founder of Hasidism, Yisra'el ben Eli'ezer, known as the Besht (acronym of Ba'al Shem Tov), was, in his early years, such a provider of amulets. The popular belief in the efficacy of amulets was so strong that numerous rabbis openly supported their use and wrote treatises in their defense. While practically all the Hasidic *rebeyim* (as the miracle-working saintly leaders were known) were men, at least occasionally women functioned in the same capacity.

Divination continued to be a widespread practice among the Jews down to modern times. More recent methods resorted to include the lighting of candles, the observation of shadows, opening the Bible at random, casting lots, gazing at a polished surface, incantations, and consulting with the dead. The interpretation of omens developed into a veritable folk science to which frequent references are found in medieval and later rabbinic literature. It also led to a literary genre of its own in Hebrew, *sifrei gorlot*, "books of lots," which contain instructions and rules for the predictive use of names of animals, birds, the twelve tribes, the twelve signs of the Zodiac, cosmic phenomena, the twenty-two letters of the Hebrew alphabet, and so on. These books, which, as a rule, are of southern European or Middle Eastern origin, are the counterpart in the field of divination to the even richer assortment of books on charms and magic remedies, some of which were composed or reprinted as late as the twentieth century.

MODERN PERIOD. The spread of the Haskalah (Jewish Enlightenment) in the nineteenth century resulted in a decline of both Jewish folk religion and Jewish orthodoxy. By the second half of the twentieth century folk religion remained a significant element only in the culture of a diminishing sector of unsecularized ultraconservative Jews. Those of Middle Eastern extraction transplanted into Israel colorful customs connected with the life cycle and the ritual calendar, as well as features such as the Moroccan Maimuna feast that commemorates the death of Maimonides and the veneration of other saints, similar to the long-established Lag ba'Omer festivities at the tomb of the second-century tanna Shim'on bar Yoh'ai in Meron. In Israeli *kibbutzim* and in some circles in the United States, attempts are being made to endow traditional religious ceremonies (such as the Passover Seder) with contemporary religious, social, and political relevance. In the United States, outside Orthodox circles, traditional Jewish folk religion is largely moribund, but the transformation of the synagogue into a "center" of social, educational, cultural, and charitable activities and the proliferation of men's clubs, sisterhoods, youth groups, and *havurot* (egalitarian religious fellowships) can be interpreted as a new departure in the realm of folk Judaism. Manifestations such as these can be taken as indications that folk religion, which has always been a significant aspect of Jewish religious life, is still alive

and can be expected to produce as yet unforeseeable developments.

BIBLIOGRAPHY

There is no single book dealing with the whole field of Jewish folk religion, or even with Jewish folk religion in one particular period. There are, however, numerous studies on specific aspects of Jewish folk religion in each of the major historical periods of Judaism.

Biblical Period

Several of the standard histories of biblical Hebrew religion discuss such elements in it as folk belief, folk custom, and magic. See also Reginald C. Thompson's *Semitic Magic: Its Origins and Development* (London, 1908); Alfred Guillaume's *Prophecy and Divination among the Hebrews and Other Semites* (London, 1938); James G. Frazer's *Folk-Lore in the Old Testament*, 3 vols. (London, 1919); and S. H. Hooke's *The Origins of Early Semitic Ritual* (Oxford, 1938).

Talmudic Period

There is no study on Talmudic folk religion in general, but several books deal with Talmudic magic and other aspects of Talmudic folk belief. See Gideon Brecher's *Das Transcendentale, Magie, und magische Heilarten im Talmud* (Vienna, 1850), mainly of historical interest as a pioneering study; Ludwig Blau's *Das altjüdische Zauberesen* (Strasbourg, 1898), still very valuable; Samuel Daiches's *Babylonian Oil Magic in the Talmud and Later Jewish Literature* (Oxford, 1913); *Sefer harazim*, edited by Mordechai Margalioth (Jerusalem, 1969); and my *Man and Temple in Ancient Jewish Myth and Ritual* (1947; 2d ed., New York, 1967).

Middle Ages and Later Times

The subject most thoroughly researched within the general field of medieval and later Jewish folk religion is magic. See in particular *The Sword of Moses: An Ancient Book of Magic*, edited by Moses Gaster (London, 1896), and Gaster's *Studies and Texts in Folklore, Magic, Medieval Romance, Hebrew Apocrypha, and Samaritan Archaeology*, 3 vols. (1925–1928; reprint, New York, 1971); Hermann Gollancz's *Book of the Key of Solomon*, in Hebrew and English (Oxford, 1914); Joshua Trachtenberg's *Jewish Magic and Superstition* (1939; reprint, New York, 1982); H. J. Zimmels's *Magicians, Theologians and Doctors* (London, 1952).

Special Subjects

Among the books dealing with special subjects within the general field of Jewish folk religion the following should be mentioned: Michael L. Rodkinson's *History of Amulets, Charms, and Talismans* (New York, 1893); Theodore Schrire's *Hebrew Amulets* (London, 1966); reprinted as *Hebrew Magic Amulets* (New York, 1982); Angelo S. Rappoport's *The Folklore of the Jews* (London, 1937); my *On Jewish Folklore* (Detroit, 1983); and Michael Molho's *Usos y costumbres de los Sefardies de Salónica* (Madrid, 1950).

Much material on Jewish folk religion is contained in the journals devoted to Jewish folklore and folk life: *Mitteilungen zur jüdischen Volkskunde* (Berlin, 1898–1929) and *Jahrbuch für*

jüdische Volkskunde (Berlin, 1923–1925), both edited by Max Grunwald; *Edoth: A Quarterly for Folklore and Ethnology* (in Hebrew and English), edited by myself and Joseph J. Rivlin (Jerusalem, 1945–1948); and *Yeda'-'Am*, edited by Yom-Tov Levinsky (Tel Aviv, 1948–).

Revised Bibliography

FOLK RELIGION: FOLK ISLAM

The dichotomy implied by the terminology of “folk” or “little” versus “orthodox” or “high” religious traditions has been challenged in various ways by folklorists, sociologists, and historians of Islam and other world religions. In recent decades folklorists have argued that all religion, at the point of enacted belief, may be considered “vernacular” and “oral.” Yet at the same time, both within and across religious traditions and academic disciplines, debates rage on about the viability of terms like “folk” and “orthodox.” The manifest vitality of abundant local variations on religious practice, and the debates that ensue among believers about their authenticity or permissibility, continue to fuel concern beyond the academic.

South Asia, more particularly India, provides a poignant example. Imtiaz Ahmad in the 1970s and early 1980s produced a series of volumes documenting and arguing the indigenous “Indianness” of South Asian Islamic belief and practice. His ethnographic approach was criticized by the religious historian Francis Robinson for being unduly synchronic and thus missing an overall, gradual trajectory of “Islamicization” (also noted by anthropologist Clifford Geertz) from more localized or “syncretic” practices and beliefs toward “perfection” in the form of closer adherence to a “high” religion as articulated in the entexted and canonized law, *sharī‘ah*. Robinson further argued that the eighteenth-century decline of Muslim states (for example, Mughal in India, Ottoman in southwest Asia and North Africa) itself inspired the major Islamic revival movements active down to the present, which moved the believing community away

from local “folk” practice toward greater orthodoxy even in the face of the weakening of Islamic state institutions. Robinson in turn was engaged by Veena Das and Gail Minault, arguing against an overly monolithic model of religious practice. Though this debate took place in the 1980s, it deserves new attention in the face of Hindu religious nationalism, which like Robinson’s vision of Islam, develops a concept of religious orthodoxy that would reject arguments like those of Imtiaz Ahmad for the indigenous nature of South Asian or other regional Islam(s). Robinson criticized Ahmad as harboring a political motive for arguing the indigenous nature of South Asian Islam, reflected in its abundant vernacular or “folk” practices, with their rapprochement to Hindu devotional forms. Robinson was concerned that Ahmad’s vision of South Asian Islam, arguing for an equilibrium between transnational orthodoxy and local practice, was weak on history. In the ensuing twenty years, however, the emergence of the Hindu right wing in India has made abundantly clear the lethal potential for politicization of essentialist distinctions among religious traditions as well.

More recently, and also with specific reference to South Asian local religious practice, Tony Stewart and Carl Ernst (2003) have mounted a trenchant general criticism of the whole notion of syncretism in religious discourse. They reject the concept of syncretism (a pejorative view of borrowing, mixing, or hybridization across distinct religious traditions) as founded on an untenably essentialist concept of discrete religious traditions in general, for “on examination, every ‘pure’ tradition turns out to contain mixed elements” (p. 586). The idea of the canonical or orthodox, they argue, entails a historically untenable concept of a pristine, clearly bounded, originary or primordial form to which later enactments strive to conform. Local or folk practice and belief are then implicated in a pejorative concept of syncretism or “mixing” to the extent that the local deviates from this timeless and placeless ideal.

While academic debates continue to swirl around critiques of essentialism and relativism in studies of the “folk,” vernacular, or local belief and practice over against the canonical or orthodox, it is fair to say that within believing communities, reform movements operate along parallel lines of debate over the pure and the mixed, the authentic and the “tainted.” Insofar as religious thought is based on a mythic vision of an *illud tempus* in which the terms of human existence were established, whether by act of creation or by prophetic revelation, it is hard to avoid some form of originary or essentialist logic. Folklorists simply grant this sense of the ideal to all believers, holding that all who believe find their beliefs to be legitimate and orthodox. This is not to say, however, that beliefs are not malleable through experience or critique. In religious belief and practice, as for the general notion of tradition held by contemporary folklorists, tradition is not fixed but dynamic, consisting of the creative responses of individuals in communities to the preexisting culture-specific materials of their received knowledge base, in dy-

namic interaction with the emerging conditions of their physical lives. Thus, the same person, over the course of a lifetime, without necessarily experiencing a definitive crisis of faith, may radically change her interpretation of her own spiritual experience: “Mādar Zher,” whom I met as a woman of twenty-eight in Afghanistan in the mid-1970s, attributed an earlier episode of severe psychological distress in her life to the interference of *jinn* who had seen her and become interested in her. Eighteen years later, she attributed the same period of mental illness (*divanegi* in Persian) to stress and at least in part to the stern constraints of *purdah* imposed on her by her husband at that period of her life. Nonetheless, while her idea of the etiology of her illness had changed, both at the time of her illness and more than two decades later she considered that the appropriate cure for such illnesses was religious, through the prayerful intervention of an effective local saint (*pir*). Islam, whether orthodox or mystical, recognizes that human understandings of religious truths are partial and emergent, such that intention (*niyat*) or sincerity is the touchstone of true religion and acceptability to God, over and above the state of knowledge (*‘erfān*) one has attained.

Such an operating principle may in practice, if not in principle, admit of a wide variety of religious views and activities and facilitate a gradualist or accommodationist approach to missionary work, as has been observed in the adjustments to local and preexisting religious beliefs and social practices in the poetry and preaching of Šūfī mystics and other lead missionaries on the frontiers of Islam, from South Asia to sub-Saharan Africa (Eaton, 1974; Horvatic, 1994; Lambek, 1990; Robinson, 1984). Yet even in the absence of an active reform movement, diversity of practice may also be the focus for pejorative group identifications, for religious *blason populaire* and scandalous migratory legends. One example is the “murdered saint” legend, ascribed to at least two local shrines in Afghanistan and Pakistan, respectively, alleging that the local population, hearing that a saint who had arrived in their midst would confer great blessings on the community in which he died and was buried, hastened to secure that benefit to themselves by killing him and building him a shrine. Another story, told as a joke to this author in Pakistan, is that of the “Pashtun *sayyed*,” in which a Pashtun who has come to town advertising himself as a *sayyed* (a descendant of the Prophet, whose prayers and other healing interventions may be regarded as especially efficacious) is asked to bring a witness to his *sayyed* status. The witness he produces says, “Of course I can attest that he’s a *sayyed*, I remember the day he became a *sayyed*.” Thus, the ethnic slur takes the form of casting aspersions on the legitimacy of a Pashtun’s religious status claim. A third, large class of such marginalizing discourses is anticlerical humor and folktales, in which clergy are alleged to be more avaricious, lustful, or stupid than the general run of humanity. The ambidexterous genre of Mullā Naṣr ud-Din jokes (Hodja Nasruddin in Turkish), in which the famous clergyman is a scapegrace, a greedy fool when interacting with those less powerful than himself, and a foolish-wise underdog and trickster when in-

teracting with those more powerful, offers additional rich examples of popular ambivalence toward clerical and other authorities. However tenuously these humorous forms may seem to connect with serious matters of belief and religious practice, they articulate fault lines in both the concept of the ideal community of the *ummah* (the total community of believing Muslims) and the trustworthiness of others’ religious views and practices.

Folk poetry may articulate differential or contested religious identity in more specifically theological terms. Hassan Poladi (1989, p. 134) quotes a folk rhyme in Dari (Afghan Persian) that is both a statement of orthodox Sunnī faith and directed against the Shī‘ah Hazara, who are thought to deny the legitimacy of the first three caliphs who led the community after the Prophet’s death and to see only Alī, the Prophet’s cousin and son-in-law, as his legitimate successor:

Saram khāk-e rāh-e Chahār Sarwar,
‘Omar, Abubakr, ‘Oṣmān wa Ḥaidar,
Abubakr Yār-e Ghār, ‘Omar Mīr-e Durrah-dar
‘Oṣmān Shāh-sawar ast, ‘Ali Faṭḥ-e lashkar ast.
Har ki az in Chahār Yār-e Rāh khilāfa nadānad
Kamtarin-e khers wa khuk wa Yahudān-e Khaybar ast.

My head be in the dust of the path of the four Knights
[the first four caliphs of Islam]
‘Omar, Abu Bakr, ‘Oṣmān and Ḥaidar
Abubakr, Friend of the Cave, the Prince who possesses the pearl,
Oṣmān is the Royal Knight, ‘Ali is the Victorious Warrior
Whosoever denies the caliphate of the Four Friends [of the Way],
He is less than a bear, a pig, or the Jews of Khaybar
[who rejected the Prophet’s revelation].

The Jews of Khaybar are cited as the archetypal recalcitrant skeptics but are nonetheless regarded by Muslims as “People of the Book,” who received a revelation of their own in the legitimate line of prophecy. In a situation of Sunnī-Shī‘ī tension in upland Afghanistan, where Jews were few and far between, the Shī‘ah were portrayed as worse than the Jews for having rejected the worldly successors of the Prophet, but at another time, in urban Herāt, where both Sunnīs and Shī‘ahs coexisted with an ancient Jewish community until the post-1948 migration of that population to Israel, Afghan Sunnīs and Shī‘ahs may agree to portray Jews as trying to sow dissension between otherwise (notionally) solidary Sunnī and Shī‘ī Muslims (Mills, 1990).

Yet in other instances, shared veneration of a religious personage may dramatically cut across sectarian lines, as in the case of the Bengali figure of Satya Pīr, whose Muslim devotees regard him as a somewhat cantankerous saint while his Hindu devotees consider him a god. The competing origin stories for Satya Pīr are copresent and available for comparison by his devotees, as is also the case for Skanda, the deity of the great Kataragama Buddhist shrine in Sri Lanka, who is revered as the Prophet Khizr by Muslims who can visit the mosque located on the site.

Parallel practices may be less obvious to practitioners, as is the case with votive activities distributed across Muslim and Hindu southwest and south Asia. The votive offering called *nāzīr* in Arabo-Persian has a complex history in Shīʿī Iran, apparently connected also with Zoroastrian (pre-Islamic Iranian) practice (Jamzadeh and Mills, 1984). In local women's practice, the votive activity may involve the ritual performance of various kinds of oral narrative from legends of Shīʿī saints (called *rowzeh*) to international folktale variants (Betteridge, 1980; Mills, 1982) and be seen as marginal by clergy and by orthodox-aspiring women alike. Not all Muslim *nāzīr* rituals entail narrative recitations; from the data at hand this seems more common among Shīʿī than Sunnī *nāzīr* offerants. Indian Hindus have parallel practices in votive rituals called *vrāt katha* ("vow stories"), conducted by women as domestic rites or more formally by male Brāhmaṇ priests, which indeed require the ritual performance of origin stories articulating the rite's relationship to the deity addressed (Wadley, 2003). While Muslims and Hindus share certain shrines in South Asia (as do, or did, Muslims and Jews in North Africa; see Ben-Ami, 1983), it is not clear that either the practitioners or the scholars have dwelt on the specific parallels in narrative-based *nāzīr* and *vrāt katha*. Within Islam, the veneration of saints and shrine pilgrimage, a pervasively popular practice that is not limited to women, though often attributed primarily to them as religiously marginal, comes in for criticism from some of the orthodox, specifically as a form of *shirk* (worshiping personages other than God, which violates a basic tenet of the faith), whereas in Hinduism, *vrāt katha* is a staple of worship.

Both *nāzīr* (with or without narrative) and *vrāt katha* also involve a food offering or charity food distribution. In foodways in particular, one can see regional or local practices most closely tied to local ecology. In a wide belt from Anatolia across Central Asia to northern Pakistan, the staple grain is wheat, and wheat products are featured as the blessed elements in ritual meals. In particular, sprouted wheat porridges or fudgelike *halvas* figure in Spring New Year rituals predating Islam on the Iranian plateau but now included as part of Muslim festival cycles from Kurdish Turkey across Iran to Central Asia and the Karakorum. For several of these dishes, wheat must first be ritually sprouted, then dried and ground into flour and cooked to make a naturally sweet (because malted) ritual food called *samanu* or *samanak* in Persian (and by other names, for example, *shoshp* in the Khovar language). In many *nāzīr* rituals outside the context of the Spring New Year, various kinds of wheat bread are the sanctified food, sanctified before it is cooked because the saint is believed to visit and touch wheat flour laid out in advance for the rite if the offerant's petition is acceptable. Among Thai and Javanese Muslims, for whom folk ritual feasts are prominent as part of death memorial ceremonies, and as such also to some extent contested by the orthodoxy, the central ritual food, not surprisingly, is rice (Burr, 1983; Woodward, 1988).

An overview of the vast topic of folk Islam or Muslim vernacular religion can at best offer snapshot views both of actual devotional activities and of articulations of perceived differences in practice and belief within the community, that is, of Islamic folk religion and of Muslim folklore, through which Muslims reflect on being Muslims by alleging practices and beliefs of others that may or may not actually occur. Such differences only partly fall along sectarian lines. Gender and ethnicity also figure in Muslims' perceptions of insider and outsider, orthodox and heterodox, and differences in religious practice within the confessional community that defy the doctrinal ideal of equality before God for all pious believers. Vernacular practice provides scope for personal devotionism, some of it of a highly local nature, for members of the community who may be otherwise marginalized (for example, women, who are not expected or encouraged to be regular mosque attendees in some Muslim communities). Perceptions of solidarity, of difference, or even of apostasy may be cast in absolute and ideal terms, but they also can be observed to vary dramatically at different times and places and to reflect and in part constitute political relationships or rifts that are in turn susceptible to community critique. As with other forms of folklore, vigorously held "folk" beliefs and practices may not be perceived as local or idiosyncratic by their adherents, or, on the contrary, they may indeed be espoused as part of local identity work, as in the case of the many instantly recognizable, locally distinctive, elaborated versions of modest dress for both men and women. Further, this identity work, a staple of folk process, may be viewed as benign, or as antireligious if it divides the community in the face of some perceived external threat. Not only practices but also the interpretations put upon them are emergent in terms of consciousness as ties and schisms among Muslims or between Muslims and non-Muslims wax and wane. Academically speaking, the jury remains out as to the overall and longer-term trajectory of universal Islamization (the goal of Islamic reform movements) versus the elaboration of local practices. From the viewpoint of non-Muslim venues, the globalizing trends of a new orthodoxy appear more influential at present, but on closer inspection, local vernacular (also known as "folk") practices (such as conventions and styles of women's modest dress) appear to thrive, to be invented, reinvented, and often enough, contested, even in diaspora populations.

MARGARET A. MILLS (2005)

FOMHOIRE. The Fomhoire are a hostile supernatural race who warred for control of Ireland against both gods and men. Descriptions of the Fomhoire vary widely in different texts and apparently reflect several distinct traditions. The

Fomhoire are sometimes depicted as misshapen or half-animal in form, disproportionately female in numbers, or having only one leg, one arm, and one eye. In other sources, the Fomhoire resemble and intermarry with the gods, the Tuatha Dé Danann (The Tribes or Peoples of the Goddess Danu). Later Irish and Scottish Gaelic folklore know the *fomhóir* (Scottish Gaelic, *famhair*) as raiders from the sea or marauding giants, and throughout Irish literature the Fomhoire manifest both sea connections and supernatural origins. For example, "the cattle of Tethra"—an early poetic kenning about the Fomhorian king Tethra—refers to the waves, and in an eighth-century tale the people of Tethra dwell in a timeless realm of peace and abundance across the sea. The name Fomhoire is of uncertain derivation, meaning perhaps "undersea people" or "sinister supernatural beings." Suggested etymologies include taking the word as comprising *fó* (under) and an element meaning *sea*. Alternatively, the second element may be related to the *mare* of the English word *nightmare*.

ORIGINS OF THE FOMHOIRE. References to the Fomhoire appear in *Leabhar Gabhála Éireann* (The book of the taking of Ireland), a pseudohistorical compendium of medieval prose and poetry linking pre-Christian Ireland to the chronology of the Hebrew Bible and presenting gods and mythical ancestors of the early Irish as mortals descended from Noah. In this system, the Fomhoire are identified as descendants of Cain or of Noah's unfilial son Ham. Other sources include mythic and epic tales, glossaries, and place-name lore. In *Leabhar Gabhála* the Fomhoire (sometimes in the form of misshapen demons) repeatedly attack Ireland's colonists. After defeating two groups of settlers, they reduce a third, the people of Nemhedh, to one boatload of refugees, who survive to become ancestors of two later groups, the Fir Bholg and the Tuatha Dé Danann.

The Fir Bholg rule Ireland successfully without Fomhorian interference but are eventually dispossessed by the Tuatha Dé Danann. According to *Cath Maige Tuired: The Second Battle of Mag Tuired*, which includes language as early as the ninth century, once established in Ireland, the Tuatha Dé contract a marriage alliance with the Fomhoire and offer kingship to the half-Fomhorian Bres, son of Elatha. However, Bres's reign proves disastrous: He is greedy, self-centered, and oppressive, enforcing demands for tribute from his Fomhorian relatives. When the Tuatha Dé restrain his behavior, he flees to his powerful Fomhorian kin to gather an army. Demands for tribute by Fomhorian kings outside of Ireland (including Tethra, Elatha, and Indech, son of Dé Domnann, who ruled islands off Ireland and Scotland) are reminiscent of Viking control of these peripheral areas and may reflect legends surrounding Viking claims to overlordship.

Lugh, who ultimately leads the Tuatha Dé to victory in the Second Battle of Magh Tuiredh, is the half-Fomhorian product of the marriage alliance between the two peoples. The unsuccessful king Bres (Fomhorian on his father's side) is the product of an acknowledged but less formal union.

The theme of Fomhorian kinship amidst hostilities recurs in epic, recalling widespread traditions in other cultures of ambivalent relations between distinct but intermarrying groups. Lugh's son, the epic hero Cú Chulainn, can only marry the daughter of Forgoll Monach (a nephew of the Fomhorian Tethra) by abducting her against her family's armed opposition.

MYTHICAL STRUGGLES. Theomachy—the mythic struggle between gods and their supernatural opponents—is another theme shaping the relationship between the Fomhoire and the Tuatha Dé Danann. In comparative Indo-European terms, as enemies of the gods, the Fomhoire resemble the Asuras (in relation to the Indic Devas)—often monstrous in form but nonetheless blood relations. The ultimate victory of the Tuatha Dé Danann follows Lugh's single combat with his maternal grandfather, the Fomhorian Balar, who has a baleful eye of monstrous size and power. The contest is famous in the popular folklore of Mayo and Donegal.

Another mythic theme that may influence the role of the Fomhoire in the Second Battle of Magh Tuiredh—especially the conflict between Bres and his Tuatha Dé kin—is the struggle between divine representatives of functional aspects of social order. These functions are identified as: (1) the sacred and sovereign, associated with kingship, priesthood, and magical power; (2) physical, especially martial, force; and (3) fertility and abundance. Each of the three is linked to a social class or stratum (i.e., the priestly class, including the king; the aristocratic warrior class, from which kings may be drawn; and the class of ordinary free landowners or farmers) represented within both human and divine societies. The mythic struggle between representatives of the first two functions and those of the third leads to a resolution in which the powers of all three functions are available to society as a whole, although the nature of that resolution varies. For example, Bres's powers evoke fertility and abundance, his name (“The Beautiful”) becomes a byword for beauty, and he is the husband of the Tuatha Dé goddess Brigh (patroness of domestic animals). When suggesting possible ransoms for his life to Lugh after the Tuatha Dé Danann victory, Bres includes the well-being and growth of crops and herds. Lugh's acceptance of Bres's final offer integrates the power of fertility, bringing the Tuatha Dé perpetual success in plowing, sowing, and reaping.

ELIZABETH A. GRAY (2005)

FON AND EWE RELIGION. The Ewe and Fon, related linguistically and culturally, live along the coast and in the hinterland of Benin (formerly Dahomey), Togo, and eastern Ghana in West Africa. They number some three million; depend on fishing, intensive farming, and crafts (especially weaving); and live mostly in towns and large villages.

Europeans in contact with the Fon of Dahomey late in the seventeenth century left an exotic and exaggerated picture of kings, wealth, women soldiers (“Amazons”), brutal human sacrifice, and slave trading; such a picture has fallen into disrepute. Today the seat of the royal family is still centered in the towns of Abomey and Kana, which differ somewhat in both social organization and religion from the hinterland. The people today are organized into dispersed patrilineal clans in each of which the oldest living man is said to be “between the two worlds” of the living and the dead. There was traditionally a complex hierarchical organization from the compound to village chief to king. The kingdom has now lost its former political prerogatives but still retains many traditional ceremonies required by worship of the royal ancestors.

The Ewe of Togo and Ghana, historically representing the outposts of Fon civilization, share a sense of identity and history of migration (ultimately from Oyo in Nigeria) that is commemorated annually. The northern inland Ewe lack centralized political authority and have localized clans, while the coastal groups (known as Anlo Ewe) have a tradition of weak kingship, dispersed clans, and ancestral shrines that are of central importance in the religious life of the community. In each Ewe lineage there is a carved wooden stool, which is the locus of the cult of the lineage deity. During rituals this stool is the place to which ancestral spirits may temporarily be summoned.

FON. The ancestral cult, believed to be necessary for the perpetuation of the clan, is the focal point of Fon social organization and of much religious activity. Funeral ceremonies for dead adults are concluded three years after their death so that their souls are not lost to the clan. Every decade or so the ancestors are “established,” that is, they are deified as *tovodu* (family gods) by a rite in which a local group head must name all the dead group members from the most recently dead back to the earliest. At this rite an ancestral shrine (*dex-*

oxo) is built. There, the *tovodu* are annually “fed” and honored with dancing and praise songs. The individual who is seen as the human founder of a clan is also a deified ancestor; because of this status, the founder is worshiped by a cult of priests and initiates who do not necessarily belong to that particular clan. Royal clan members, however, may worship only their own ancestral deities and cannot be cult-initiates of “public” pantheons of gods; ancestral worship is their only form of religious affiliation.

More powerful than the *tovodu* are the spirits of those who lived so long ago that their names are no longer known by their descendants: these ancestors, personified by Dambada Hwedo, are important because a “forgotten” ancestor is angry and dangerous. Also in the *tovodu* category are the spirits of twins, of children born after twins, and of malformed and aborted children. These last spirits are considered very powerful as they guard the rivers over which the spirits of the dead must pass to reach the other world. Furthermore, the world of the dead reflects that of the living, with local rank there being established by priority of birth in the land of the living.

The Fon have a number of variant cosmologies, and some disagreement exists concerning the identities of the various deities. Some say that the world was created by one god, Nana Buluku, both male and female, who gave birth to twins named Mawu and Lisa; the first, female, was given command of the night, and the second, male, was associated with the day. Opinion varies as to the identifying characteristics and even the relationship between the twins, whose names are often merged together in everyday speech as though they were a single deity, Mawu-Lisa. In addition to being siblings, Mawu and Lisa are also spouses. Other public gods who represent the forces of nature that affect all humans alike include Sagbata, the earth deity who watches over the fields and waters of the earth and punishes offenders with smallpox, and Sogbo, or Xevioso, the thunder and sea god who sends fertilizing rains but also punishes with his “ax,” the thunderbolt. Under each of these is a pantheon of named deities (*vodu*) ranked according to their birth order, each with differing tasks. Worship of each pantheon of these gods is in the hands of an associated priesthood. None of these three pantheons of deities has universal worship.

No single god is all-powerful, not even Mawu who is the parent of the others and controls life and death. The “writing” of Mawu is called Fa, the destiny of the universe. A highly specialized system of divination (derived from the Yoruba), administered by officials known as *bokono*, permits humans to know what destiny has been decreed for them. Only the divine trickster Legba, who is the youngest son of Mawu, can change a person’s destiny. His worship is universal (unlike that of the other major divinities) and individual, with neither priests nor cult houses. Other forms of divination are practiced, including mirror-gazing and the study of entrails. Finally, most widespread of all forms of divination are magical charms (*gbo*) of many and various kinds. These

are said to be given to humans by Legba and Sagbata, and especially by the *aziza*, small hairy creatures who live in ant-hills and silk-cotton trees (*Eriondendron anfractuosum*).

EWE. The Ewe share many aspects of culture, religion, and art with the Fon and indeed occasionally travel to Benin to obtain shrines and spiritual aid. They share many gods, including Mawu, the remote creator god associated with the sky, and Torgbi-nyigbla, the head of the nature gods (*tro*) associated with war and thunder (and thus with Xevioso). Similar, too, are the practice of Afa divination and the Legba cult, including both *dulegba* and *alegba* (town and individual protective deities). There is, however, ambiguous usage among the Ewe of such key terms as *vodu*, *dulegba*, *tro*, and *dzo* (amulets), which are often confused. Most of these deities come from outside Eweland and each is thought of as a discrete entity; this inconsistent usage probably reflects differences in the history of migration and introduction of the cults.

RELIGIOUS CHANGE. Vast numbers of slaves were taken from the Fon-Ewe coast to the New World and they took many aspects of their religion with them. Syncretized with Catholicism in Haiti, Brazil, Cuba, and Jamaica, Fon and Ewe religions contributed important influences to the formation of many cults in the New World, including Voodoo (*voodoo*) and the cult of Shango, among others.

Christian missionaries have worked among the Fon and Ewe since the mid-nineteenth century. Today the vast majority of people declare themselves to be Christian, although most Ewe are involved in both Christian and traditional religious practices. In the north, reportedly, many rites of passage are now abandoned; traditional funerals, especially in the south, however, are still very important.

MICHELLE GILBERT (1987)
Revised Bibliography

FOOD. Historians of religion and cultural anthropologists face an extraordinarily difficult task when they attempt to analyze food customs on a worldwide basis. Dietary laws, food taboos, and the religious and social environments that have molded them are as varied as humanity itself.

Although there are no universal food customs or food taboos, such things are part of daily life in every society. Societies of every sort have restricted what their members may eat, specified the circumstances in which certain types of nourishment may be taken, and made use of food in religious ritual. Rules and practices regarding food constitute languages that express the values a culture teaches regarding nature, God, the sources of social authority, and the purposes or goals of life. In different religious systems, the same foods—milk, oil, blood, wheat, or rice, for example—may cleanse or defile, signify death or rebirth, give nourishment to gods or convey the power of gods to worshipers, depending on the contexts in which these foods are used.

FOOD TABOOS. Because food is a universal human need, the act of making some foods taboo is particularly revelatory of the values that distinguish one culture from another.

Judaism. No religion has such a complex set of food taboos as Judaism. Jewish dietary law begins with the Torah (also known as the Pentateuch, including the biblical books of *Genesis*, *Exodus*, *Leviticus*, *Numbers*, and *Deuteronomy*), which according to Orthodox Jews was given to Moses on Sinai; modern scholars date the final version of the Torah to the Babylonian exile, after 486 BCE. Since Roman times, rabbis have greatly expanded the food taboos of the Jews through commentary designed to show how the laws of the Torah may be kept.

Oldest among Jewish food taboos is the prohibition on eating blood, which forms part of the covenant between God and Noah in *Genesis* 9. From this prohibition grew the practice of kosher butchering, which emphasizes killing the animal with a quick cut of the neck and draining its blood. Jews also salt and boil meat to remove blood, broil organ meats in which the blood collects, and cook meat very thoroughly to eliminate blood. The taboo on blood and the laws of butchering mean that no animal killed by hunting can be eaten by an observant Jew.

Elaborating on a law repeated three times in the Torah, “Thou shalt not boil a kid in its mother’s milk” (*Exod.* 23:19, 34:26; *Deut.* 14:21), the rabbis developed rules to prevent contact of meat and milk. Observant Jews not only abstain from cheeseburgers and avoid milk for some time after eating meat but also maintain two sets of dishes, pots, and utensils for meat and dairy meals. Restaurants observing *kashrut* (kosher) law limit themselves to serving either meat or dairy

meals. Fish and vegetable oil fall into an intermediate class, known as pareve, that can be consumed with either milk or meat.

The Jewish taboo on pork has become famous because the pig is so popular as a source of protein in Europe and Asia, but Jews also abstain from a long list of animals found in *Leviticus* 11 and further defined by the rabbis. Only animals that have hooves (not claws) but also part the hoof (like cows and sheep, unlike horses) and chew the cud (ruminants, capable of eating grass) can be eaten. These restrictions eliminate such common food animals as rabbits, dogs, bears, horses, and camels as well as pigs, which divide the hoof but do not chew the cud. Predatory birds and swarming insects are also forbidden. Among sea creatures, only fish with fins and scales can be eaten; clams, lobsters, eels, squid, scallops, shark, sturgeon (with their caviar), porpoise, and whale are all forbidden, and swordfish are an object of dispute, since they are scaled only as juveniles.

During the eight days of Passover, the spring holiday commemorating the deliverance of ancient Israel from slavery in Egypt, Jews observe a taboo on leaven, which is ordinarily ubiquitous in bread and other products containing wheat. The observance of Passover can lead to a Jewish family owning a third and fourth set of dishes and pots for meat and dairy during Passover, or even a third kitchen, in order to avoid leaven. Not all prepared foods that are certified by rabbinical boards as kosher are also kosher for Passover, because some kosher foods may have been prepared with or in the presence of leaven. Even wine, which might have been thought to be exempt from laws regarding blood, milk, meat, forbidden animals, and leaven, must be certified as kosher or kosher for Passover depending on rabbinical supervision of the conditions of manufacture.

It should be noted that today, only about 10 percent of Jews keep the kosher laws strictly. Among Conservative, Reform, and Reconstructionist Jews, and among the large numbers unaffiliated with a synagogue, there was a strong movement away from keeping kosher during the nineteenth and twentieth centuries. Recently, a return to modified practice, sometimes called “kosher style,” has gained ground among liberal Jews. Jewish food taboos have undoubtedly had one effect announced in the Torah: they have fostered solidarity among Jews by separating Jews from others, making “a distinction between the clean and the unclean” (*Lev.* 11:47) so that Israel may be “holy” (related to the word for “separate”) as its God is holy.

Hinduism, Jainism, and Buddhism. Although the earliest Sanskrit scriptures indicate that the Aryan ancestors of modern Indians ate beef and sacrificed horses, Hinduism quickly (by about 1000 BCE) developed a taboo on meat for the three upper castes (the Brahmin or priestly, Kshatriya or warrior, and Vaisya or merchant). The cow became particularly sacred, so that only the outcaste or untouchable could work with leather or eat beef, but chicken and fish were also avoided by those who wished to maintain purity. Another

powerful taboo involves saliva; a cook must not taste food during preparation because of the danger that saliva will come in contact with the food. Caste differences entailed general taboos on eating food prepared by someone of a lower caste, so that a demand arose for Brahmins willing to serve as cooks. Unlike in Judaism, where food taboos created solidarity among adherents of the religion, in Hinduism these taboos have emphasized difference. The purpose of abstaining from meat and avoiding impurity for Hindus is to avoid collecting *karma*, the attachment to the world that causes reincarnation after death. The same motive causes many Hindus to abstain from alcohol, although there is no absolute rule in the tradition against it, and ancient texts describe the ritual use of an intoxicating substance called soma, the identity of which is uncertain. Some traditions depict the Hindu god Śiva drinking a mixture of yogurt and *cannabis indica*, an Asian variety of marijuana.

During the sixth century BCE, the movements of Jainism and Buddhism gained adherents in India among those who sought freedom from castes and rituals and a more direct means of escape from reincarnation. Following their teacher Mahāvīra, Jains abstain both from meat and from plants that must be killed to be consumed. Their ideal diet consists of fruit that ripens on the tree and grains that dry of themselves; they avoid root vegetables that must be destroyed in the harvest.

Mahāvīra arose from the warrior caste to reject Brahmin rules, and so did Siddhārtha Gautama, who became known as the Buddha (the one who awoke). Not as strict as the Jains, Buddhists sought a middle way between indulgence and asceticism. The Buddha advised the monks whom he sent to spread his teaching not to allow anyone to kill an animal especially for them, but to eat if the animal had already been killed. In Buddhism the *karma* that binds humans to the wheel of rebirth has nothing to do with divine will, material pollution, or with the influence of matter on spirit, but depends entirely on attitude and can be dispelled by awareness. Buddhists have commonly counted the profession of a butcher as a forbidden means of livelihood, like that of gambler or prostitute, because a butcher causes suffering to sentient beings; yet Buddhism has adapted to many cultures in which meat eating is allowed. Some of the most traditional Buddhists, such as the Theravādan monks of Thailand, who go into the street to beg each day at dawn and eat nothing at all after noon, are not vegetarian. The Chan monks of China have normally followed a vegetarian diet themselves but only recently have begun to preach the virtues of vegetarianism to the laity. Tibet, where Buddhism has dominated for more than a thousand years, has never become vegetarian, although some of its religious leaders have. In Japan, the traditional diet of rice and seafood remained despite Buddhism, although the influence of Buddhist ideals of compassion helped to keep meat eating from gaining much favor until modern times. Although the Buddha forbade intoxication, Buddhists have disagreed as to whether this meant absti-

nence from all alcohol; with the exception of the Theravādan monks of South Asia (Sri Lanka, Burma [Myanmar], Thailand, Vietnam), most Buddhist cultures have not prohibited alcoholic drinks.

Christianity. The New Testament shows that early followers of Jesus struggled with questions of how far to continue Jewish food taboos and whether to compromise with Roman rituals of offering food to their ancestors and their gods. Although *Mark* 7:19 says that Jesus “declared all foods clean,” it seems evident from the story of Peter and the Roman centurion Cornelius in *Acts* 10 that the disciples of Jesus had not begun to eat nonkosher food or to share meals with non-Jews even after taking up their mission of preaching the gospel. An argument between Peter and Paul mentioned in Paul’s letter to the Galatians shows that the question of food taboos seemed very urgent two decades after the crucifixion. *Acts* 15 recalls a letter sent by agreement of the apostles to all non-Jewish Christians, telling them to abstain from blood, from anything strangled rather than butchered quickly, and from food consecrated to Roman ancestors or gods. In the *Book of Revelation*, Christians who have decided to eat at the same table where Roman food offerings were made are consigned to the pit of sulfur created for Satan and his angels. After the Roman Empire became Christian in the fourth century CE, this issue disappeared—until recently, that is, when it has demanded a decision by Christians who have friends or relatives who practice Chinese, Wiccan, Yoruba, or other traditions involving the offering of food to spirits. Except for the Coptic Christians of Egypt, who continue to follow some Jewish laws, and the mild restrictions on meat observed by Roman Catholics and Orthodox Christians during Lent and Advent, most Christians now observe no food taboos, and Christianity remains remarkable for its lack of such rules. In the nineteenth century, Adventists in the United States rediscovered the prohibition of *Acts* 15 on blood and went beyond it to vegetarianism; many Christians, especially Protestant evangelicals, Mormons, and Christian Scientists, adopted a taboo on alcohol; but most Roman Catholic, Eastern Orthodox, and Protestant Christians remained free, in theory, to eat and to drink anything.

Islam. The Qur’ān, the book of revelations to Prophet Muḥammad, explicitly forbids eating animals that have died of themselves, blood, pork, and food over which the name of a god other than Allah has been invoked (*sūrah* 2:173). Islamic slaughtering rules resemble those of Judaism with regard to cutting the neck and drawing the blood, but many Muslims also refuse any meat not killed by a Muslim, since only then can they be assured that an invocation of Allāh has accompanied the slaughter. Though abstinence from alcohol does not appear in the Qur’ān, the traditions (or *ḥadīth*) connecting such abstinence to the prophet Muḥammad are so strong that most Muslims believe that their religion forbids all alcohol, even if (as in Muslim countries like Morocco or Turkey) there are public places in which Muslims drink. Many Muslims avoid mozzarella cheese because of the ren-

net, sometimes derived from the stomachs of pigs, involved in its manufacture.

Chinese traditions. It is part of the genius of China to make use of everything edible, if not as food then as medicine. However, Daoist wisdom does teach the avoidance of some combinations of foods because Daoist cosmology has led people to think that the combinations would be poisonous. Such combinations include garlic and honey, crab and persimmon, dog meat and green beans, and mackerel and plums.

Indigenous (or primal) traditions. Religions that remain limited to particular ethnic groups and places do not tend to develop general food taboos, such as the Jewish ban on pork or the Hindu reverence for the cow, which apply in all times and all places. Food taboos in these religions focus on specific times during which certain foods may not be eaten or specific people who may not eat certain foods. Even cannibalism, the strongest candidate for a universal food taboo, may be allowed or even encouraged or required at certain times; among the Hua of New Guinea, funerals involve children eating the parent of the same sex to recycle the limited supply of life force, or *nu*. Before death, Hua adults transmit *nu* to children by rubbing them with spit or other bodily secretions.

FOOD IN SYMBOL, MYTH, AND RITUAL. In some religious traditions, a particular food may stand for the whole identity of the group. The Hopi of southwestern North America say that their first act upon emerging into this world was to choose the short blue corn that expresses the hard but enduring life of their people. Since the purpose of Hopi ritual is to continue a cycle in which cloudlike ancestors (called *katsinas*) come from the mountains to nourish corn, which feeds the Hopi who eventually die and return to the mountains, the Hopi have sometimes said that "We are corn." Similarly, the Lakota of the northern Plains sometimes describe themselves as the descendants of "buffalo people" who emerged from under the Black Hills and gradually became human, never losing their kinship with the primary animal they hunted. This identification of food and people is not necessarily limited to small nations. Each year in Japan, the first planting of rice by the emperor, who is the living embodiment of Ninigo-no-mikoto, the god of the mature rice plant, is photographed for newspapers. When a bad harvest and World Trade Organization pressure caused the Japanese government to lower barriers against imported rice in 1993, the action caused a reaction that went beyond economics to the spiritual, and imported rice is still considered inferior and unclean by many Japanese.

Myths often associate death with the gift of food. The inhabitants of Ceram, an island in the Indonesian archipelago, tell the story of a quasi-divine young girl whose body produced tubers after it was cut up and buried. Among the Iroquois of northern New York, one variant of the creation story describes a girl who fell from the sky, then died and produced beans from her fingers and toes, squash from her

stomach, corn from her breasts, and tobacco from her forehead. In Tongan mythology, Eel was condemned to death for allegedly causing the pregnancy of a virgin who shared his Samoan bathing pool. Villagers who planted Eel's severed head, as he had requested, testified that the coconut tree first appeared on that spot. Another Polynesian myth affirms that the breadfruit tree emerged from the plot where a woman buried the head of her husband.

As religions develop more philosophical perspectives, they distance themselves from myth, but food retains symbolic meanings and important roles in ritual and in healing.

Judaism. The story of Eden implicates a fruit in the beginning of death and of agricultural work (through the curse on Adam). According to *Genesis*, people were vegetarians in Eden but became carnivorous in the aftermath of the Flood; the offering of blood to God in the Temple remained as testimony that animal life still belonged to the creator. Jewish practice included a sacrificial lamb at Passover until the Temple was destroyed by the Romans. Even now, elements of the Passover include a bone to stand for the lamb and other elements such as an egg, salt water, and green herbs that point to a festival of rebirth with foods appropriate to the spring. Foods celebrated in Jewish stories include the manna, said to resemble coriander seed, that fell from heaven each day to feed Israel during its wandering in the wilderness and the cakes brought by ravens to feed the prophet Elijah when he fled into the desert from the wrath of Jezebel. According to Orthodox Jews, the coming of the Messiah will include the return of manna from heaven and a great banquet.

Daily Jewish practice includes a ritual blessing over bread and wine performed at home. On the Sabbath, it is a *mitzvah* (religious duty or good deed) to drink wine and to eat meat. Synagogue services now also commonly include a blessing and sharing of bread and wine. Holidays involve symbolic foods such as the *matzoh* (unleavened bread) of Passover and the round loaves of bread and apples with honey that are eaten to promote continuity and good fortune at the New Year.

Hinduism and Buddhism. Temple worship among Hindus involves large quantities of food because every statue of a god must be fed three times a day and bathed, not only in water but also in substances such as milk, sesame oil, coconut water, grain, and clarified butter. The bathing of a god with milk, oil, and colorful spices can make a striking visual impression. The primary duty of most temple priests is not to instruct but to perform this washing and feeding with correct prayer; people come to observe and to offer their own prayers as these ceremonies proceed, or they visit the gods at other times and make food offerings of their own. Food offerings include rice, curds, clarified butter, oil, many kinds of vegetables and fruits, almonds and other nuts, betel leaves, and combinations of spices including turmeric, salt, and pepper. Among Vaisnavites (worshippers of Viṣṇu and his avatars, such as Kṛṣṇa and Rāma), food offered to the gods is commonly shared by all worshippers under the name of *prasāda*,

which may be taken home from the temple and eaten. Śaivites (worshippers of Śiva and his wife Parvati) consume only what has washed the *linga* and *yoni* statues that are his primary symbols, leaving the food offerings to the priests. On festivals (which often entail fasting), Hindus may bring large quantities of *prasāda* home and subsist on it for some days.

At home and in other areas outside the temples, Hindus hire Brahmin priests to perform fire sacrifices that also involve food. At a wedding or at the *brahmacharya* ritual that marks a son's beginning study of the scriptures, the priest will offer clarified butter, rice, and other foods in a fire while chanting appropriate prayers. In the temple, offerings of food enable worshippers to seek protection and favor from the gods, but in fire sacrifices, the food becomes fuel in the same economy of energy that created the gods and the universe itself; this cosmic energy is released by the fire and directed by the priest to the purpose for which he performs the ritual.

Although Buddhists do not hire priests for Brahmin rituals or bathe the Buddha's statues in food, they continue to leave offerings of fruit before these images. Food offered to the Buddha is not eaten by devotees but thrown away in compassion to animals or (in some cases, if there are large amounts) given to beggars. The tradition that the Buddha himself lived and taught as a beggar remains important in the Theravādan tradition that prevails in South Asia, where Thai monks usually receive food or flowers, not money, in the begging bowls they bring to the streets each morning.

Both Hindus and Buddhists sometimes use violations of food taboos as spiritual practices. For example, the *sannyasi*, or renunciates, of India always eat leftover (or symbolically leftover) food, violating the Hindu taboo on saliva; some yogis go so far to teach and to experience the reality of reincarnation as to eat their own excrement. Hindu ritual purification may entail eating a mixture of the cow's five products, which are milk, ghee (clarified butter), curds, urine, and dung. Tibetan Buddhists may remind themselves of emptiness and insubstantiality by drinking from cups made of the skulls of monks. Among those who practice the Tantric traditions of Hinduism and Buddhism, eating meat and drinking alcohol sometimes form part of secret rituals meant to teach that all things eventually contribute to deliverance.

Christianity. Building upon the blessing of bread and wine from Jewish mealtime, Sabbath, and Passover rituals, Christians have often made the sharing of bread and wine during Communion (or Eucharist) into the center of their ritual lives. During the Middle Ages, Roman Catholic theology defined this ritual meal as the miracle of transubstantiation, during which bread and wine are miraculously transformed into the actual body and blood of Jesus of Nazareth, who is the incarnation of God; Thomas Aquinas taught that the substance of Christ's body is then concealed under the appearance of bread and wine by another miracle in order to prevent disgust among the communicants. Although Protestants later rejected this doctrine, it still prevails among

Catholics. One famous convert to Catholicism, the English writer Evelyn Waugh, was said to have converted because only Catholics offered the opportunity to "eat God."

Few symbolic foods are used by Christians today, but the Easter egg and its chocolate and candy variants are widely recognized; as in the Passover meal, the egg indicates the primordial roots of Easter in spring festivals of rebirth. Ethnic groups like the Italians, many of whom seek a meal of twelve types of seafood on Christmas Eve, often associate particular foods with Christian holidays. Some Protestants in the United States have substituted grape juice, which was invented for this purpose by a Methodist named Welch, for sacramental wine in many churches. Meanwhile, Protestants have made a virtual sacrament of coffee, with after-worship coffee hours following services at most churches. The coffeepot has become the unofficial symbol of Alcoholics Anonymous, a nondenominational spiritual group that grew from the Protestant ethos.

Chinese traditions. Daoist cosmology, and the traditional Chinese wisdom that precedes formal Daoism, sees all foods (and all things in the world) as composites of yin (dark, moist, soft, bland, feminine) and yang (bright, dry, hard, spicy, masculine), which in turn express the basic force of *qi* (breath, spirit) that inheres in all things. For Chinese tradition, every meal has symbolic and medical aspects, and every food establishes a direct and definable connection between the eater and the forces that move the stars. A typical Chinese menu seeks to balance yin and yang, cooling and heating properties, and so to have many ingredients offered in small portions over many courses. Folk traditions associate many symbolic foods, such as round cakes called mooncakes at the New Year, with holidays. Daily ancestor worship, the central practice of Chinese religion, involves offering food by placing it before tablets containing the names of ancestors, sometimes accompanied by pictures. Failure to perform this duty, which can only be done by the eldest son, will result in ancestors becoming hungry ghosts who cause disharmony in the home. For about three thousand years before 1911, the emperor of China offered animal sacrifice to the imperial ancestor and to the heavenly beings at least three times a year, on the Altar of Heaven at the capital; this ritual, which was also performed at times of crisis, was held to keep both the natural world and the nation in harmony.

Islam. Islam stands out among religions by involving no food or drink in its ordinary services of worship. Eating plays an important ritual and social role in the fasting month of Ramadān, when each day ends at sunset with an *iftar* meal that breaks the fast; these meals traditionally begin with figs, following the example of the Prophet. In Muslim countries like Egypt, *iftar* meals stretch into the night and create a festive atmosphere during the month. One of the main holidays of Islam, the 'Īd al-Aḏḥā during the month of pilgrimage to Mecca, involves the sharing of food because each Muslim household is obligated to sacrifice a goat, sheep, ram, cow, or camel and distribute one-third of the meat to the poor.

In the United States, where many Muslims and others do not enjoy eating goat, it has sometimes been difficult to arrange for this meat to be used. The Muslim vision of Paradise involves both food and drink: the Qurʾān often pictures those in Paradise enjoying “fountains” and “fruits, any that they may select,” with “flesh of fowls, any that they may desire” (*Sūrah* 56:18–21).

Yoruba (Vodou, Santeria, Condomble) traditions.

The West African religion of the Yoruba and Fon peoples, native to such modern nations as Nigeria, Cameroon, Benin, and Dahomey, has spread through slavery and immigration throughout the Americas, becoming known as vodou in Haiti and Louisiana, as Santería in Cuba, and as Condomble in Brazil, bringing its own symbolic and ritual uses of food while integrating Christian elements into its African heritage. Here food is offered to the gods so that they descend into the community performing the ritual, taking possession of some participants and inducing trance, while communicating with and healing others. Each deity has favored foods and drinks and animals of sacrifice. For example, Elegba, the god of the crossroads who is invoked to begin any service, favors palm oil, fruits, nuts, roasted corn, and yams; he is drawn to the sacrifice of roosters and male goats; Oya, goddess of storms and cemeteries, enjoys red wine and purple grapes, eggplant and rice and beans; hens and female goats are sacrificed to her. Shango, companion of Oya, is a former human, a deified ruler of the Yoruba who has become the god of lightning and retribution; he is called upon with plantains, green bananas, and bitter kola nuts, and enjoys rum; rams and red roosters are sacrificed to him. The list of *orishas* (or *loa*, divinities) runs to the dozens, each with a set of preferences in food, drink, and sacrificial animal.

FOOD AND SACRIFICE. There is a vast body of literature on the origins and meaning of sacrifice and the role it has played in human history. With relation to food, farmers have often sacrificed the first fruits of the harvest, while shepherds have sacrificed the firstborn of each female in their flocks. Ancient Israelite tradition continued these sacrifices and added the substitution of a sacrifice or monetary gift for a firstborn son. Animals sacrificed at the Jerusalem Temple included bullocks, rams, lambs, pigeons, and doves; other foods included cooked and uncooked dough, prepared with oil and salt, and wine poured like blood at the foot of the altar.

After the destruction of the Jerusalem Temple, Jews gave up on sacrifice, but the Jewish and Gentile followers of Jesus, faced with the need to understand the crucifixion, gradually transmuted the traditional blessings of bread and wine into a sacrificial meal. Not only were the bread and wine understood as transubstantiated into the body and blood of Jesus, and hence of God, but the act of offering the bread and wine was held to have the effects of a sacrifice, releasing power that could gain favor for the living and shorten the punishment of souls in purgatory. Although the most dramatic examples of purely sacrificial worship—for example, the priests who did nothing but offer the sacrifice of the

Mass in private—have been eliminated by reformers, Roman Catholics today still buy Mass Cards and give money so that Jesus may again be offered to God the Father, under the appearances of bread and wine, for the intentions of those who make the donations.
