Medical University of South Carolina
Charleston

# How to use *Nursing2012 Drug Handbook*®

The best-selling nursing drug guide for more than 30 years, *Nursing Drug Handbook* is meticulously reviewed and updated annually by pharmacists and nurses to include the most current, relevant information that practicing nurses and students need to know to administer medications safely in any health care setting. As in previous editions, *Nursing2012 Drug Handbook* emphasizes nursing and safety aspects of drug administration without attempting to replace detailed pharmacology texts. Only the most essential information is included, and helpful graphic symbols, logos, and highlighting draw special attention to critical details that can't be overlooked. Refreshingly redesigned, this 32nd edition ensures easy readability and even quicker access to content that busy nurses need on the go, with larger type and a brand-new alphabetically arranged format.

## New to this edition

In this enhanced 32nd edition, look for these exciting new changes:

- Alphabetical format—complete generic drug entries (monographs) arranged A to Z, with tabbed pages for quick retrieval of information
- Thoroughly updated text with over 1,025 generic and 3,300 brand names listed, 823 comprehensive drug monographs, and 26 generic drugs newly approved by the FDA—over 3,000 clinical changes in all
- New introductory chapter covering safe drug administration—includes communication and education improvements, the use of technologies, and additional strategies to reduce drug errors
- 3 new safety-related appendices addressing best practices to avoid or prevent drug errors, pediatric drugs commonly involved in drug errors, and elder care medication tips
- Fresh, appealing design with larger type, crisper headings, highlighted backgrounds (for generic drug headings and I.V. information), and easy-to-spot logos and icons (such as black box warnings and alerts)
- Expanded color Photoguide insert, with actual-sized images of 398 tablets and capsules.

## Introductory chapters

Chapter 1, "Drug actions, interactions, and reactions," explains how drugs work in the body. It provides a general overview of drug properties (absorption, distribution, metabolism, and excretion) and other significant factors affecting drug action (including protein binding, patient's age, underlying disease, dosage form, and route and timing of administration). Also discussed are drug interactions, adverse reactions, and toxic reactions. Chapter 2, "Drug therapy across the lifespan," discusses the danger associated with indiscriminant use of drugs during pregnancy and breast-feeding and the special precautions women should take when medications are necessary. This chapter also covers the unique challenges of giving drugs to children and elderly patients and offers practical suggestions on how to minimize problems with these special populations. Chapter 3, "Safe drug administration," explores the ongoing involvement of governmental and nongovernmental organizations weighing in on drug safety issues and the necessary measures nurses must take to prevent medication errors from occurring.

Chapter 4, "Selected drug classifications," summarizes the indications, actions, and contraindications and cautions of more than 60 drug classes represented in *Nursing2012 Drug Handbook*. Generic drugs within each class are also listed, allowing nurses to quickly identify and compare similar drugs when patients can't tolerate or don't respond to a particular drug.

## Drug monographs

Each generic drug monograph in *Nursing2012 Drug Handbook* includes the most pertinent clinical information nurses must know to administer medications safely, monitor for potential interactions and adverse effects, implement necessary care measures, and provide appropriate patient teaching. Entries are arranged alphabetically, with the generic drug name prominently displayed—along with its "tall man"

lettering (if applicable), pronunciation, corresponding brand (or trade) names, therapeutic class, pharmacologic class, and pregnancy risk category—on a shaded background for quick and easy identification. Banners or symbols to identify new FDA-approved drugs, drugs that warrant a special safety alert, or drugs that appear in the color photoguide are also included in this highlighted area.

Specific information for each drug is then systematically organized under the headings below. Special icons and logos may be used throughout, as warranted, to point out the drug's safety concerns. For example, a clinical alert logo (  ) provides important advice about life-threatening effects associated with the drug or its administration; a black box warning (**Black Box Warning**) represents a specific warning issued by the FDA. (See *Anatomy of a monograph*, on the inside book cover, for a visual guide to the various symbols that may appear within a drug entry.)

### Available forms

This section lists the preparations available for each drug (for example, tablets, capsules, solutions for injection) and specifies available dosage forms and strengths. Dosage strengths specifically available in Canada are designated with a dagger (†). Preparations that may be obtained over the counter, without a prescription, are marked with an open diamond (◊).

### Indications & dosages

General dosage information for adults and children is found in this section. Dosage instructions reflect current trends in therapeutics and can't be considered absolute or universal. For individual patients, dosage instructions must be considered in light of the patient's condition.

Indications and dosages that aren't approved by the FDA are followed by a closed diamond (♦). It should be noted that only evidence-based off-label uses are included in this edition. An "Adjust-a-dose" logo appearing within this section indicates the need for a special dosage adjustment for certain patients, such as elderly patients or those with renal or hepatic impairment.

### Administration

Here, readers will find guidelines for safely administering drugs by all applicable routes, including P.O., I.V., I.M., subcutaneous, ophthalmic, inhalational, topical, rectal, vaginal, transdermal, and buccal. A special screened background highlights I.V. administration guidelines (including specific instructions on how to reconstitute, mix, and store I.V. medications) and potential I.V. incompatibilities.

### Action

This section succinctly describes the mechanism of action—that is, how the drug provides its therapeutic effect. For example, although all antihypertensives lower blood pressure, they don't all do so by the same process. Also included, in table form, are the onset, peak (described in terms of effect or peak blood level), and duration of drug action for each route of administration, if data are available or applicable. Values listed are for patients with normal renal function unless otherwise specified. The drug's half-life is also provided when known.

### Adverse reactions

In this section, adverse reactions to each drug are listed according to body system. The most common adverse reactions (those experienced by at least 10% of people taking the drug in clinical trials) appear in *italic* type; less common reactions (1% to 9%) are in roman type; life-threatening reactions appear in ***bold italic*** type; and reactions that are common and life-threatening are in **BOLD CAPITAL LETTERS**.

### Interactions

Within this section, readers can find each drug's confirmed, clinically significant interactions with other drugs (additive effects, potentiated effects, and antagonistic effects); herbs; foods; beverages; and lifestyle behaviors (such as alcohol use, sun exposure, or smoking). Interactions with a rapid onset are highlighted in color; interactions with a delayed onset are in bold type.

Drug interactions are listed under the drug that's adversely affected. For example, because magnesium trisilicate, an antacid ingredient, interacts with tetracycline to decrease tetracycline's absorption, this interaction is listed under tetracycline. To check on the possible effects of using two or more drugs simultaneously, refer to the interaction section for each drug.

### Effects on lab test results

This section lists increased and decreased levels, counts, and other values in laboratory test results, which may be caused by the drug's systemic effects. It also indicates false-positive, false-negative, and otherwise altered results of laboratory tests a drug may cause.

### Contraindications & cautions

This section outlines any conditions or special circumstances (such as diseases, pregnancy, breast-feeding) in which use of the drug is undesirable or for which the drug should be given with caution. When applicable, specific signs and symptoms of drug overdose are listed as the last bulleted item under this heading and highlighted by a special logo (⚠ ***Overdose S&S:***) for easy identification.

### Nursing considerations

Within this section, readers will find practical information on patient monitoring techniques and suggestions for the prevention and treatment of adverse reactions. Helpful tips on promoting patient comfort and the proper way to prepare, administer, and store medications are also included.

### Patient teaching

Concise guidelines for explaining the drug's purpose, encouraging compliance, ensuring proper use and storage, and preventing or minimizing adverse reactions are included in this section.

## Appendices and other helpful aids

*Nursing2012 Drug Handbook* includes 17 appendices that provide nurses and students with hands-on access to a wealth of supportive data and clinical information. Three new appendices have been introduced in this edition to address important safety issues: "Avoiding common drug errors: Best practices and prevention," "Pediatric drugs commonly involved in drug errors," and "Elder care medication tips." And a final appendix, "Additional new drugs: Indications and dosages," covers brand-new FDA-approved drugs that couldn't be included in time for publication of this edition.

A handy visual "Quick guide to special symbols, logos, and highlighted terms" and "Guide to abbreviations" immediately follow this "How to use" piece.

## Photoguide to tablets and capsules

To enhance patient safety and help make drug identification easier, *Nursing2012 Drug Handbook* offers a 32-page full-color photoguide to the most commonly prescribed tablets and capsules. Shown in actual size, the drugs are arranged alphabetically by generic name for quick reference, along with their most common dosage strengths. Below the name of each drug is a cross-reference to where information on the drug can be found in the book. Brand names of drugs that appear in the photoguide are shown in text with a special capsule symbol (💊). Page references to the drug photos appear in boldface type in the index (for example, **C12**).

Photos for certain brands were provided by the following companies for use in this book: Forest Pharmaceuticals, Inc. (Campral); Novartis Pharmaceuticals (Enablex); Sepracor, Inc. (Lunesta); Teva Pharmaceuticals (Azilect); Bayer Healthcare Pharmaceuticals (Nexavar); and Pfizer (Sutent).

Photos of the following drugs were provided by Jeff Sigler, © SFI Medical Publishing, Inc.: Aciphex, Actos, Aricept, Clozaril, Dexilant, Diovan HCT, Effient, Flomax, Lyrica, Nexium, Plavix, Pristiq, Seroquel, Topamax, TriCor, Valtrex, Vytorin, and Zyprexa.

## Online Toolkit

A Toolkit containing a wide array of drug-related materials that practicing nurses and students can use on the job and for study—covering safety issues, pharmacology, drug therapy guidelines, patient populations, and a host of other drug-related areas—can be found online at **NDHnow.com.** Included

are patient teaching sheets for more than 225 of the most commonly prescribed drugs, a dosage calculator, drug safety and administration videos, pharmacology animations, English-Spanish translator, audio drug pronunciation guide, a 325-question NCLEX-style test, and access to CE tests. Monthly drug updates and news, drug warnings, and patient teaching information can also be accessed through this site.

# Quick guide to special symbols, logos, and highlighted terms

The following symbols or highlighted features appear throughout drug monographs and select appendices in this edition.

| Special symbols and logos | Usage or meaning |
|---|---|
| ✱ NEW DRUG | New FDA-approved drug |
| SAFETY ALERT! | Drug that presents a heightened avoidable danger |
| buPROPion | "Tall man" lettering for FDA-designated generic drug names prone to mix-ups |
| ➤ | Indication for drug |
| ✱ NEW INDICATION: | New indication for drug |
| Adjust-a-dose: | Dosage adjustment needed for certain populations |
| Alert: | Clinical alert |
| † | Available in Canada |
| ◇ | Over-the-counter (OTC) |
| ♦ | Off-label use |
| | Appears in Photoguide |
| * | Liquid contains alcohol |
| • Look alike–sound alike | Drugs with easily confused names |
| Black Box Warning | FDA black box warning |
| Overdose S&S: | Overdose signs & symptoms |
| **Highlighted reactions** | |
| *common* | Common reaction |
| uncommon | Uncommon reaction |
| ***life-threatening*** | Life-threatening reaction |
| COMMON AND LIFE-THREATENING | Common and life-threatening reaction |
| **Highlighted interactions** | |
| *rapid onset* | Causes interaction with rapid onset |
| ***delayed onset*** | Causes interaction with delayed onset |

# Guide to abbreviations

| | |
|---|---|
| ACE | angiotensin-converting enzyme |
| ADH | antidiuretic hormone |
| ADHD | attention deficit hyperactivity disorder |
| AIDS | acquired immunodeficiency syndrome |
| ALT | alanine transaminase |
| ANA | antinuclear antibody |
| AST | aspartate transaminase |
| AV | atrioventricular |
| b.i.d. | twice daily |
| BPH | benign prostatic hypertrophy |
| BSA | body surface area |
| BUN | blood urea nitrogen |
| cAMP | cyclic 3′, 5′ adenosine monophosphate |
| CBC | complete blood count |
| CK | creatine kinase |
| CMV | cytomegalovirus |
| CNS | central nervous system |
| COPD | chronic obstructive pulmonary disease |
| CSF | cerebrospinal fluid |
| CV | cardiovascular |
| $D_5W$ | dextrose 5% in water |
| DEHP | di(2-ethylhexyl)phthalate |
| DIC | disseminated intravascular coagulation |
| dl | deciliter |
| DNA | deoxyribonucleic acid |
| ECG | electrocardiogram |
| EEG | electroencephalogram |
| EENT | eyes, ears, nose, throat |
| FDA | Food and Drug Administration |
| g | gram |
| G | gauge |
| GABA | gamma-aminobutyric acid |
| GFR | glomerular filtration rate |
| GGT | gamma-glutamyltransferase |
| GI | gastrointestinal |
| gtt | drops |
| GU | genitourinary |
| G6PD | glucose-6-phosphate dehydrogenase |
| $H_1$ | $histamine_1$ |
| $H_2$ | $histamine_2$ |
| HDL | high-density lipoprotein |
| HIV | human immunodeficiency virus |
| HMG-CoA | 3-hydroxy-3-methylglutaryl coenzyme A |
| I.D. | intradermal |
| I.M. | intramuscular |
| INR | International Normalized Ratio |
| IPPB | intermittent positive-pressure breathing |
| I.V. | intravenous |
| kg | kilogram |
| L | liter |
| lb | pound |
| LDH | lactate dehydrogenase |
| LDL | low-density lipoprotein |
| M | molar |
| $m^2$ | square meter |
| MAO | monoamine oxidase |
| mcg | microgram |
| mEq | milliequivalent |
| mg | milligram |
| MI | myocardial infarction |
| min | minute |

| | |
|---|---|
| ml | milliliter |
| $mm^3$ | cubic millimeter |
| mo | month |
| MS | multiple sclerosis |
| msec | millisecond |
| NNRI | non-nucleoside reverse transcriptase inhibitor |
| NSAID | nonsteroidal anti-inflammatory drug |
| OTC | over-the-counter |
| oz | ounce |
| PABA | para-aminobenzoic acid |
| PCA | patient-controlled analgesia |
| P.O. | by mouth |
| P.R. | by rectum |
| p.r.n. | as needed |
| PT | prothrombin time |
| PTT | partial thromboplastin time |
| PVC | premature ventricular contraction |
| q.i.d. | four times daily |
| RBC | red blood cell |
| RDA | recommended daily allowance |
| REM | rapid eye movement |
| RNA | ribonucleic acid |
| RSV | respiratory syncytial virus |
| SA | sinoatrial |
| Subcut. | subcutaneous |
| sec | second |
| SIADH | syndrome of inappropriate antidiuretic hormone |
| S.L. | sublingual |
| SSNRI | selective serotonin and norepinephrine reuptake inhibitor |
| SSRI | selective serotonin reuptake inhibitor |
| $T_3$ | triiodothyronine |
| $T_4$ | thyroxine |
| t.i.d. | three times daily |
| tsp | teaspoon |
| USP | United States Pharmacopeia |
| UTI | urinary tract infection |
| WBC | white blood cell |
| wk | week |

# 1

# Drug actions, interactions, and reactions

Any drug a patient takes causes a series of physical and chemical events in his body. The first event, when a drug combines with cellular drug receptors, is the drug action. What happens next is the drug effect. Depending on the type of cellular drug receptors affected by a given drug, an effect can be local, systemic, or both. A systemic drug effect can follow a local effect. For example, when you apply a drug to the skin, it causes a local effect. But transdermal absorption of that drug can then produce a systemic effect. A local effect can also follow systemic absorption. For example, the peptic ulcer drug cimetidine produces a local effect after it's swallowed by blocking histamine receptors in the stomach's parietal cells. Diphenhydramine, on the other hand, causes a systemic effect by blocking histamine receptors throughout the body.

## Drug properties

Drug absorption, distribution, metabolism, and excretion make up a drug's pharmacokinetics. These parts also describe a drug's onset of action, peak level, duration of action, and bioavailability.

### Absorption

Before a drug can act in the body, it must be absorbed into the bloodstream—usually after oral administration, the most common route. Before an oral drug can be absorbed, it must disintegrate into particles small enough to dissolve in gastric juices. Only after dissolving can the drug be absorbed. Most absorption of orally given drugs occurs in the small intestine because the mucosal villi provide extensive surface area. Once absorbed and circulated in the bloodstream, the drug is bioavailable, or ready to produce a drug effect. The speed of absorption and whether absorption is complete or partial depend on the drug's effects, dosage form, administration route, interactions with other substances in the GI tract, and various patient characteristics. Oral solutions and elixirs bypass the need for disintegration and dissolution and are usually absorbed faster. Some tablets have enteric coatings to prevent disintegration in the acidic environment of the stomach; others have coatings of varying thickness that simply delay release of the drug.

Drugs given I.M. must first be absorbed through the muscle into the bloodstream. Rectal suppositories must dissolve to be absorbed through the rectal mucosa. Drugs given I.V. are injected directly into the bloodstream and are bioavailable completely and immediately.

### Distribution

After absorption, a drug moves from the bloodstream into the fluids and tissues in the body, a movement known as distribution. All of the area to which a drug is distributed is known as volume of distribution. Individual patient variations can change the amount of drug distributed throughout the body. For example, in an edematous patient, a given dose must be distributed to a larger volume than in a nonedematous patient. Occasionally, a dose is increased to account for this difference. In this case, the dose should be decreased after the edema is corrected. Conversely, a dose given to a dehydrated patient must be decreased to allow for its distribution to a much smaller volume. Patients who are very obese may present another problem when considering drug distribution. Some drugs—such as digoxin, gentamicin, and tobramycin—aren't well-distributed to fatty tissue. Sometimes, doses based on actual body weight may lead to overdose and serious toxicity. In these cases, doses must be based on lean body weight, or adjusted body weight, which may be estimated from actuarial tables that give average weight range for height.

### Metabolism

Most drugs are metabolized in the liver. Hepatic diseases may affect the liver's metabolic functions and may increase or decrease a drug's usual metabolism. Closely

monitor all patients with hepatic disease for drug effect and toxicity.

The rate at which a drug is metabolized varies from person to person. Some patients metabolize drugs so quickly that the drug levels in their blood and tissues prove therapeutically inadequate. In other patients, the rate of metabolism is so slow that ordinary doses can produce toxicity.

## Excretion

The body eliminates drugs by metabolism (usually hepatic) and excretion (usually renal). Drug excretion is the movement of a drug or its metabolites from the tissues back into circulation and from the circulation into the organs of excretion, where they're removed from the body. Most drugs are excreted by the kidneys, but some can be eliminated through the lungs, exocrine glands (sweat, salivary, or mammary), liver, skin, and intestinal tract. Drugs also may be removed artificially by direct mechanical intervention, such as peritoneal dialysis or hemodialysis.

## Other modifying factors

One important factor influencing a drug's action and effect is its tendency to bind to plasma proteins, especially albumin, and other tissue components. Because only a free, unbound drug can act in the body, protein binding greatly influences the amount and duration of effect. Malnutrition, renal failure, and the presence of other protein-bound drugs can influence protein binding. When protein binding changes, the drug dose may need to be changed also.

The patient's age is another important factor. Elderly patients usually have decreased hepatic function, less muscle mass, diminished renal function, and lower albumin levels. These patients need lower doses and sometimes longer dosage intervals to avoid toxicity. Neonates have underdeveloped metabolic enzyme systems and inadequate renal function, so they need highly individualized dosages and careful monitoring.

Underlying disease also may affect drug action and effect. For example, acidosis may cause insulin resistance. Genetic diseases, such as G6PD deficiency and hepatic porphyria, may turn drugs into toxins, with serious consequences. Patients with G6PD deficiency may develop hemolytic anemia when given certain drugs, such as sulfonamides. A genetically susceptible patient can develop acute porphyria if given a barbiturate. A patient with a highly active hepatic enzyme system, such as a rapid acetylator, can develop hepatitis when treated with isoniazid because of the quick intrahepatic buildup of a toxic metabolite.

## Drug administration issues

How a drug is given can also influence a drug's action in the body. The dosage form of a drug is important. Some tablets and capsules are too large to be easily swallowed by sick patients. An oral solution may be substituted, but it will produce higher drug levels than a tablet because the liquid is more easily and completely absorbed. When a potentially toxic drug (such as digoxin) is given, its increased absorption can cause toxicity. Sometimes a change in dosage form also requires a change in dosage.

Routes of administration aren't interchangeable. For example, diazepam is readily absorbed P.O. but is slowly and erratically absorbed I.M. On the other hand, gentamicin must be given parenterally because oral administration results in drug levels too low for systemic infections.

Improper storage can alter a drug's potency. Store most drugs in tight containers protected from direct sunlight and extremes in temperature and humidity that can cause them to deteriorate. Some drugs require special storage conditions, such as refrigeration. Caution patients not to store drugs in a bathroom because of the constantly changing environment.

The timing of drug administration can be important. Sometimes, giving an oral drug during or shortly after a meal decreases the amount of drug absorbed. In most drugs, this isn't significant and may even be desirable with irritating drugs such as aspirin. But penicillins and tetracyclines shouldn't be taken at mealtimes because certain foods can inactivate them. If in doubt about the effect of food on a certain drug, check with a pharmacist.

Consider the patient's age, height, and weight. The prescriber will need this information when calculating the dosage for many drugs. Record all information accurately on the patient's chart. The chart should also include all current laboratory data, especially renal and liver function studies, so the prescriber can adjust the dosage as needed.

Watch for metabolic changes and physiologic changes (depressed respiratory function, acidosis, or alkalosis) that might alter drug effect.

Know the patient's medical history. Whenever possible, obtain a comprehensive family history from the patient or his family. Ask about past reactions to drugs, possible genetic traits that might affect drug response, and the current use of other prescription, OTC, and illicit drugs, herbal remedies, and vitamin supplements. Multiple drug therapies can cause serious and fatal drug interactions and dramatically change many drugs' effects.

## Drug interactions

A drug interaction occurs when a drug given with or shortly after another drug alters the effect of either or both drugs. Usually the effect of one drug is increased or decreased. For instance, one drug may inhibit or stimulate the metabolism or excretion of the other or free it for further action by releasing the drug from protein-binding sites.

Combination therapy is based on drug interaction. One drug may be given to complement the effects of another. Probenecid, which blocks the excretion of penicillin, is sometimes given with penicillin to maintain an adequate level of penicillin for a longer time. In many cases, two drugs with similar actions are given together precisely because of the additive effect. For instance, acetaminophen and codeine are commonly given in combination because together they provide greater pain relief than if either is given alone.

Drug interactions are sometimes used to prevent or antagonize certain adverse reactions. The diuretics hydrochlorothiazide and spironolactone are often given together because the former is potassium-depleting and the latter potassium-sparing.

Not all drug interactions are beneficial: many drugs interact and decrease efficacy or increase toxicity. An example of decreased efficacy occurs when a tetracycline is given with drugs or foods that contain calcium or magnesium (such as antacids or milk). These bind with tetracycline in the GI tract and cause inadequate drug absorption. An example of increased toxicity can be seen in a patient taking a diuretic and lithium. The diuretic may increase the lithium level, causing lithium toxicity. This drug effect is known as *antagonism*. Avoid drug combinations that produce these effects, if possible.

Sometimes drug interactions occur after a drug, which may inhibit or increase the metabolism of another drug, has been discontinued. After the drug is discontinued, the other drug's levels may increase or decrease.

## Adverse reactions

Drugs cause adverse *effects*; patients have adverse *reactions.* An adverse reaction may be tolerated to obtain a therapeutic effect, or it may be hazardous and unacceptable. Some adverse reactions subside with continued use. For example, the drowsiness caused by paroxetine and the orthostatic hypotension caused by prazosin usually subside after several days when the patient develops tolerance. But many adverse reactions are dosage related and lessen or disappear only if the dosage is reduced. Most adverse reactions aren't therapeutically desirable, but a few can be put to clinical use. An outstanding example of this is the drowsiness caused by diphenhydramine, which makes it useful as a mild sedative.

Drug hypersensitivity, or drug allergy, is the result of an antigen–antibody immune reaction that occurs in the body when a drug is given to a susceptible patient. Signs and symptoms of a drug allergy may include rash, itching, angioedema, and shortness of breath. One of the most dangerous of all drug hypersensitivities is penicillin allergy. In its most severe form, penicillin anaphylaxis can rapidly become fatal.

Rarely, idiosyncratic reactions occur. These reactions are highly unpredictable and unusual. One of the best-known idiosyncratic adverse reactions is aplastic

anemia caused by the antibiotic chloramphenicol. This reaction may appear in only 1 of 24,000 patients, but when it does occur, it can be fatal. A more common idiosyncratic reaction is extreme sensitivity to very low doses of a drug or insensitivity to higher-than-normal doses.

To deal with adverse reactions correctly, you need to be alert to even minor changes in the patient's clinical status. Such minor changes may be an early warning of pending toxicity. Listen to the patient's complaints about his reactions to a drug, and consider each objectively. You may be able to reduce adverse reactions in several ways. Obviously, dosage reduction can help. But, in many cases, so does a simple rescheduling of the dose. For example, pseudoephedrine may produce stimulation that will be no problem if it's given early in the day. Similarly, drowsiness from antihistamines or tranquilizers can be less important if these drugs are given at bedtime. Most important, your patient needs to be told which adverse reactions to expect so that he won't become worried or even stop taking the drug on his own. Always advise the patient to report adverse reactions to the prescriber immediately.

Your ability to recognize signs and symptoms of drug allergies or serious idiosyncratic reactions may save your patient's life. Ask each patient about the drugs he's taking currently or has taken in the past and whether he experienced any unusual reactions from taking them. If a patient claims to be allergic to a drug, ask him to tell you exactly what happens when he takes it. He may be calling a harmless adverse reaction, such as upset stomach, an allergic reaction, or he may have a true tendency toward anaphylaxis. In either case, you and the prescriber need to know this. Of course, you must record and report clinical changes throughout the patient's course of treatment. If you suspect a severe adverse reaction, withhold the drug until you can check with the pharmacist and the prescriber.

## Toxic reactions

Chronic drug toxicities are usually caused by the cumulative effect and resulting buildup of the drug in the body. These effects may be extensions of the desired therapeutic effect. For example, normal doses of glyburide normalize the glucose level, but higher doses can produce hypoglycemia.

Drug toxicities occur when a drug level rises as a result of impaired metabolism or excretion. For example, hepatic dysfunction impairs the metabolism of theophylline, raising its levels. Similarly, renal dysfunction may cause digoxin toxicity because this drug is eliminated from the body by the kidneys. Of course, excessive dosage can cause toxic levels also. For instance, tinnitus is usually a sign that the safe dose of aspirin has been exceeded.

Most drug toxicities are predictable, dosage-related, and reversible upon dosage adjustment. So, monitor patients carefully for physiologic changes that might alter drug effect. Watch especially for hepatic and renal impairment. Warn the patient about signs of pending toxicity, and tell him what to do if a toxic reaction occurs. Also, make sure to emphasize the importance of taking a drug exactly as prescribed. Warn the patient that serious problems could arise if he changes the dose or schedule or stops taking the drug without his prescriber's knowledge.

# 2

# Drug therapy across the lifespan

Drug therapy is a fact of life for millions of people of all ages, and certain aspects of a patient's life, such as age, growth, and development, can affect drug therapy.

## Drugs and pregnancy

Drug administration during pregnancy has been a source of serious medical concern and controversy since the thalidomide tragedy of the late 1950s, when thousands of malformed infants were born after their mothers were given this mild sedative–hypnotic while pregnant. To identify drugs that may cause such teratogenic effects, preclinical drug studies always include tests on pregnant laboratory animals. These studies may reveal gross teratogenicity but don't establish absolute safety. This is because different animal species react to drugs in different ways. Consequently, animal studies can't reveal all possible teratogenic effects in humans. For example, the preliminary studies on thalidomide gave no warning of teratogenic effects, and it was subsequently released for general use in Europe.

What about the placental barrier? Once thought to protect the fetus from drug effects, the placenta isn't much of a barrier at all. Almost every drug a pregnant woman takes crosses the placenta and enters the fetal circulation, except for drugs with exceptionally large molecular structure, such as heparin, the injectable anticoagulant. By this standard, heparin could be used in a pregnant woman without fear of harming the fetus, but even heparin carries a warning for cautious use during pregnancy. Conversely, just because a drug crosses the placenta doesn't necessarily mean it's harmful to the fetus. The relative risk to the fetus is expressed by the drug's pregnancy risk category.

Actually, only one factor—stage of fetal development—seems clearly related to greater risk during pregnancy. During the first and third trimesters of pregnancy, the fetus is especially vulnerable to damage from maternal use of drugs. During these times, give *all* drugs with extreme caution.

Organogenesis—when fetal organs differentiate—occurs in the first trimester. This is the most sensitive period for drug-induced fetal malformation. Withhold all drugs except those in category A or B during this time, unless this would jeopardize the mother's health. Strongly advise your patient to avoid *all* self-prescribed drugs during early pregnancy.

Fetal sensitivity to drugs is also of special concern during the last trimester. At birth, when separated from his mother, the neonate must rely on his own metabolism to eliminate any remaining drug. Because his detoxifying systems aren't fully developed, any residual drug may take a long time to be metabolized, and thus may induce prolonged toxic reactions. For this reason, discourage pregnant patients from taking drugs except when absolutely necessary and advised by their prescriber during the last 3 months of pregnancy.

Of course, in many circumstances, pregnant women must continue to take certain drugs. For example, a woman with a seizure disorder that is well-controlled with an anticonvulsant should keep taking the drug during pregnancy. Similarly, a pregnant woman with a bacterial infection must receive antibiotics. In such cases, the potential risk to the fetus is outweighed by the mother's medical needs.

Complying with these general guidelines can prevent indiscriminate and harmful use of drugs in pregnancy:

- Before a drug is prescribed for a woman of childbearing age, ask the date of her last menstrual period and whether she may be pregnant. If a drug is a known teratogen (for example, isotretinoin), some manufacturers may recommend special precautions to ensure that the drug isn't given to a woman of childbearing age until pregnancy is ruled out and that contraceptives are used throughout the course of therapy.

- Caution a pregnant woman to avoid all drugs except those essential to maintain her pregnancy or health—especially during the first and third trimesters.
- Topical drugs are subject to the same warning against use during pregnancy. Many topically applied drugs can be absorbed in large enough amounts to be harmful to the fetus.
- When a pregnant woman needs a drug, use the safest drug in the lowest possible dose to minimize harm to the fetus.
- Instruct a pregnant woman to check with her prescriber before taking any drug.

## Drugs and breast-feeding

Most drugs a breast-feeding mother takes appear in breast milk. Drug levels in breast milk tend to be high when drug levels in maternal blood are high, especially right after each dose. Advise the mother to breast-feed *before* taking each drug dose, not *after*. Also, in general, drugs with short half-lives are preferred because they peak quickly and are then eliminated and are less likely to be excreted in breast milk.

A mother who wants to breast-feed usually may continue to do so with her prescriber's advice. However, breast-feeding should be temporarily interrupted and replaced with bottle-feeding when the mother must take tetracycline, chloramphenicol, a sulfonamide (during the first 2 weeks postpartum), an oral anticoagulant, a drug that contains iodine, or an antineoplastic.

Caution the breast-feeding patient to protect her infant by not taking drugs indiscriminately. Instruct the mother to first check with her prescriber to be sure she's taking the safest drug at the lowest dose. Also instruct her to give her prescriber a list of all drugs and herbs she's currently taking.

## Drug therapy in children

Providing drug therapy to infants, children, and adolescents is challenging. Physiologic differences between children and adults, including those in vital organ maturity and body composition, significantly influence a drug's effectiveness.

### Physiologic changes affecting drug action

A child's absorption, distribution (including drug binding to plasma proteins), metabolism, and excretion processes undergo profound changes that affect drug dosage. To ensure optimal drug effect and minimal toxicity, consider these factors when giving drugs to a child.

#### *Absorption*

Drug absorption in children depends on the form of the drug, its physical properties, simultaneous ingestion of other drugs or food, physiologic changes, and concurrent disease.

The pH of neonatal gastric fluid is neutral or slightly acidic; it becomes more acidic as the infant matures, which affects drug absorption. For example, nafcillin and penicillin G are better absorbed in an infant than in an adult because of low gastric acidity.

Various infant formulas or milk products may increase gastric pH and impede absorption of acidic drugs. If possible, give a child oral drugs on an empty stomach.

Gastric emptying time and transit time through the small intestine—which takes longer in children than in adults—can affect absorption. Also, intestinal hypermotility (as occurs in patients with diarrhea) can diminish the drug's absorption.

A child's comparatively thin epidermis allows increased absorption of topical drugs.

#### *Distribution*

As with absorption, changes in body weight and physiology during childhood can significantly influence a drug's distribution and effects. In a premature infant, body fluid makes up about 85% of total body weight; in a full-term infant, it makes up 55% to 70%; in an adult, 50% to 55%. Extracellular fluid (mostly blood) constitutes 40% of a neonate's body weight, compared with 20% in an adult. Intracellular fluid remains fairly constant throughout life and has little effect on drug dosage.

Extracellular fluid volume influences a water-soluble drug's concentration and effect because most drugs travel through

extracellular fluid to reach their receptors. Compared with adults, distribution area in children is proportionately greater because their fluid-to-solid body weight proportion is larger.

Because the proportion of fat to lean body mass increases with age, the distribution of fat-soluble drugs is more limited in children than in adults. As a result, a drug's fat or water solubility affects the dosage for a child.

### *Plasma protein binding*

A decrease in albumin level or intermolecular attraction between drug and plasma protein causes many drugs to be less bound to plasma proteins in infants than in adults.

Strongly protein-bound drugs may displace endogenous compounds, such as bilirubin or free fatty acids. Displacement of bound bilirubin can increase unbound bilirubin, which can lead to increased risk of kernicterus at normal bilirubin levels. Conversely, an endogenous compound may displace a weakly bound drug.

Because only an unbound (free) drug has a pharmacologic effect, a change in ratio of a protein-bound to an unbound active drug can greatly influence its effect.

Several diseases and disorders, such as nephrotic syndrome and malnutrition, can decrease plasma protein and increase the level of an unbound drug, which can either intensify the drug's effect or produce toxicity.

### *Metabolism*

A neonate's ability to metabolize a drug depends on the integrity of the hepatic enzyme system, intrauterine exposure to the drug, and the nature of the drug itself.

Certain metabolic mechanisms are underdeveloped in neonates. Glucuronidation is a metabolic process that renders most drugs more water soluble, facilitating renal excretion. This process isn't developed enough to permit full pediatric doses until the infant is age 1 month. The use of chloramphenicol in a neonate may cause gray baby syndrome because the infant's immature liver can't metabolize the drug and toxic levels accumulate in the blood. Reduce dosage in a neonate and periodically monitor his levels.

Conversely, intrauterine exposure to drugs may induce precocious development of hepatic enzyme mechanisms, increasing the infant's capacity to metabolize potentially harmful substances.

Older children can metabolize some drugs (theophylline, for example) more rapidly than adults. This ability may come from their increased hepatic metabolic activity. Doses larger than those recommended for adults may be required.

Also, more than one drug given to a child simultaneously may change the hepatic metabolism and initiate production of hepatic enzymes. Phenobarbital, for example, accelerates the metabolism of drugs taken with it and causes hepatic enzyme production.

### *Excretion*

Renal excretion of a drug is the net result of glomerular filtration, active tubular secretion, and passive tubular reabsorption. Many drugs are excreted in the urine. The degree of renal development or presence of renal disease can greatly affect a child's dosage requirements because if a child can't excrete a drug renally, the drug may accumulate to toxic levels.

Physiologically, an infant's kidneys differ from an adult's because infants have a high resistance to blood flow and their kidneys receive a smaller proportion of cardiac output. Infants have incomplete glomerular and tubular development and short, incomplete loops of Henle. (A child's GFR reaches an adult value between ages 2½ and 5 months; his tubular secretion rate may reach an adult value between ages 7 and 12 months.) Infants also are less able to concentrate urine or reabsorb certain filtered compounds. The proximal tubules in infants also are less able to secrete organic acids.

Children and adults have diurnal variations in urine pH that correlate with sleep patterns.

## Special administration considerations

Biochemically, a drug displays the same mechanisms of action in all people. But the response to a drug can be affected by a child's age and size, as well as by the

maturity of the target organ. To ensure optimal drug effect and minimal toxicity, consider the following factors when giving drugs to children.

### *Adjusting dosages for children*

When calculating children's dosages, don't use formulas that just modify adult dosages. Base pediatric dosages on either body weight (mg/kg) or body surface area ($mg/m^2$). A child isn't a scaled-down version of an adult.

Reevaluate dosages at regular intervals to ensure needed adjustments as the child develops. Although body surface area provides a useful standard for adults and older children, use the body weight method instead in premature or full-term infants. Don't exceed the maximum adult dosage when calculating amounts per kilogram of body weight (except with certain drugs such as theophylline, if indicated).

Obtain an accurate maternal drug history, including prescription and nonprescription drugs, vitamins, herbs, or other health foods taken during pregnancy. Drugs passed into breast milk can have adverse effects on the breast-feeding infant. Before giving a drug to a breast-feeding mother, investigate its potential effects on the infant.

For example, a sulfonamide given to a breast-feeding mother for a UTI appears in breast milk and may cause kernicterus in an infant with low levels of unconjugated bilirubin. Also, high levels of isoniazid appear in the breast milk of a mother taking this drug. Because this drug is metabolized by the liver, the infant's immature hepatic enzyme mechanisms can't metabolize the drug, and he may develop CNS toxicity.

### *Giving oral drugs*

Remember the following when giving oral drugs to a child:

*If the patient is an infant,* give drugs in liquid form, if possible. For accuracy, measure and give the preparation by oral syringe, never a parenteral syringe. It's very important to remove the syringe cap to keep the infant from aspirating it. Be sure to instruct parents to do the same. Never use a vial or cup. Lift the patient's head to prevent aspiration of the drug, and press down on his chin to prevent choking. You may also place the drug in a nipple and allow the infant to suck the contents.

*If the patient is a toddler,* explain how you're going to give him the drug. If possible, have the parents enlist the child's cooperation. Don't mix the drug with food or call it "candy," even if it has a pleasant taste. Let the child drink a liquid drug from a calibrated medication cup rather than a spoon. It's easier and more accurate. If the preparation is available only in tablet form, crush and mix it with an appropriate buffer, such as jelly or applesauce. (First, verify with the pharmacist that the tablet can be crushed without compromising its effectiveness.)

*If the patient is an older child* who can swallow a tablet or capsule by himself, have him place the drug on the back of his tongue and swallow it with water or nonacidic fruit juice, because milk and milk products may interfere with drug absorption.

### *Giving I.V. infusions*

For I.V. infusions, in infants, use a peripheral vein or a scalp vein in the temporal region. The scalp vein is safe because the needle isn't likely to dislodge. However, the head must be shaved around the site, and the needle and infiltrated fluids may cause temporary disfigurement. For these reasons, scalp veins aren't used as commonly today as they were in the past.

The arms and legs are the most accessible insertion sites, but because patients tend to move about, take these precautions:

- Protect the insertion site to keep the catheter or needle from being dislodged.
- Use a padded arm board to reduce the risk of dislodgment. Remove the arm board during range-of-motion exercises.
- Place the clamp out of the child's reach. If extension tubing is used to allow the child greater mobility, securely tape the connection.
- Explain in simple terms to the child why he must be restrained while asleep, to alleviate anxiety and maintain trust.

During an infusion, monitor flow rates and check the child's condition and insertion site at least every hour. Titrate the flow rate only while the patient is composed;

crying and emotional upset can constrict blood vessels. Flow rate may vary if a pump isn't used. Flow should be adequate because some drugs (calcium, for example) can be irritating at low flow rates. Infants, small children, and children with compromised cardiopulmonary status are especially vulnerable to fluid overload with I.V. drug administration. To prevent this problem and help ensure that a limited amount of fluid is infused in a controlled manner, use a volume-control device in the I.V. tubing and an infusion pump or a syringe. Don't place more than 2 hours of I.V. fluid in the volume-control set at a time.

### *Giving I.M. injections*

I.M. injections are preferred when a drug can't be given by other parenteral routes and rapid absorption is needed.

The vastus lateralis muscle is the preferred injection site in children younger than age 2. The ventrogluteal area or gluteus medius muscle can be used in older children. To select the correct needle size, consider the patient's age, muscle mass, nutritional status, and drug viscosity.

Record and rotate injection sites. Explain to the patient that the injection will hurt but that the drug will help him. Restrain him during the injection, if needed, and comfort him afterward.

### *Giving topical drugs and inhalants*

When you give a child a topical drug or inhalant, consider the following:

Use eardrops warmed to room temperature. Cold drops can cause pain and vertigo. To give drops, turn the patient on his side, with the affected ear up. If he's younger than age 3, pull the pinna down and back; if age 3 or older, pull the pinna up and back.

Avoid using inhalants in young children because it's difficult to get them to cooperate. Before you try to give a drug to an older child through a metered-dose inhaler, explain the inhaler to him. Then have him hold the inhaler upside down and close his lips around the mouthpiece. Have him exhale and pinch his nostrils shut. When he starts to inhale, release one dose of the drug into his mouth. Tell the patient to continue inhaling until his lungs feel full; then he can breathe normally and unpinch his nostrils. Most inhaled drugs aren't useful if the drug remains in the mouth or throat—if you doubt the patient's ability to use the inhalant correctly, don't use it. Such devices as spacers or assist devices may help. Check with a pharmacist, the prescriber, or a respiratory therapist.

Use topical corticosteroids cautiously because prolonged use in children may delay growth. When you apply topical corticosteroids to the diaper area of infants, don't cover the area with plastic or rubber pants, which act as an occlusive dressing and may enhance systemic absorption.

### *Giving parenteral nutrition*

Give I.V. nutrition to patients who can't or won't take adequate food orally and to patients with hypermetabolic conditions who need supplementation. The latter group includes premature infants and children with burns or other major trauma, intractable diarrhea, malabsorption syndromes, GI abnormalities, emotional disorders (such as anorexia nervosa), and congenital abnormalities.

Before giving fat emulsions to infants and children, weigh the potential benefits against any possible risks. Fats—supplied as 10% or 20% emulsions—are given both peripherally and centrally. Their use is limited by the child's ability to metabolize them. For example, an infant or child with a diseased liver can't efficiently metabolize fats.

Some fats, however, must be supplied both to prevent essential fatty acid deficiency and to permit normal growth and development. A minimum of calories (2% to 4%) must be supplied as linoleic acid—an essential fatty acid found in lipids. In infants, fats are essential for normal neurologic development.

Nevertheless, fat solutions may decrease oxygen perfusion and may adversely affect children with pulmonary disease. This risk can be minimized by supplying only the minimum fat needed for essential fatty acid requirements and not the usual intake of 40% to 50% of the child's total calories.

Fatty acids can also displace bilirubin bound to albumin, causing a rise in free,

unconjugated bilirubin and an increased risk of kernicterus. But fat solutions may interfere with some bilirubin assays and cause falsely elevated levels. To avoid this complication, draw a blood sample 4 hours after infusion of the lipid emulsion; or if the emulsion is introduced over 24 hours, be sure the laboratory is aware so they can centrifuge the blood sample before the assay is performed.

## Drug therapy in elderly patients

If you're giving drugs to elderly patients, you'll need to understand the physiologic and pharmacokinetic changes that may affect drug dosage, cause common adverse reactions, or create compliance problems.

### Physiologic changes affecting drug action

As a person ages, gradual physiologic changes occur. Some of these age-related changes may alter the therapeutic and toxic effects of drugs.

#### *Body composition*

Proportions of fat, lean tissue, and water in the body change with age. Total body mass and lean body mass tend to decrease, but the proportion of body fat tends to increase.

Body composition varies from person to person, and these changes in body composition affect the relationship between a drug's concentration and distribution in the body.

For example, a water-soluble drug such as gentamicin isn't distributed to fat. Because there's relatively less lean tissue in an elderly person, more drug remains in the blood. Fat-soluble drugs tend to accumulate in older patients, resulting in prolonged half-lives and more pronounced effects.

#### *Gastrointestinal function*

In elderly patients, decreases in gastric acid secretion and GI motility slow the emptying of stomach contents and movement through the entire intestinal tract. Also, research suggests that elderly patients may have more difficulty absorbing drugs than younger patients. This is an especially significant problem with drugs that have a narrow therapeutic range, such as digoxin, in which any change in absorption can be crucial.

#### *Hepatic function*

The liver's ability to metabolize certain drugs decreases with age. This decrease is caused by diminished blood flow to the liver, which results from an age-related decrease in cardiac output, and from the lessened activity of certain liver enzymes. When an elderly patient takes a sleep medication such as flurazepam, for example, the liver's reduced ability to metabolize the drug and the lipophilic property of the drug can produce a hangover effect the next morning.

Decreased hepatic function may result in more intense drug effects caused by higher levels, longer-lasting drug effects because of prolonged levels, and a greater risk of drug toxicity.

#### *Renal function*

An elderly person's renal function is usually sufficient to eliminate excess body fluid and waste, but the ability to eliminate some drugs may be reduced by 50% or more.

Many drugs commonly used by elderly patients, such as digoxin, are excreted primarily through the kidneys. If the kidneys' ability to excrete the drug is decreased, high blood levels may result. Digoxin toxicity can be relatively common in elderly patients who don't receive a reduced digoxin dosage to accommodate decreased renal function.

Drug dosages can be modified to compensate for age-related decreases in renal function. Aided by results of laboratory tests, such as BUN and creatinine levels, adjust drug dosages so the patient receives therapeutic benefits without the risk of toxicity. It is important to remember that serum creatinine is a function of muscle mass and most elderly people lose muscle mass as they age. An elderly patient can have significant renal impairment even with a serum creatinine level in the normal range. Also, observe the patient for signs and symptoms of toxicity. A patient taking digoxin, for example, may experience anorexia, nausea, vomiting, or confusion.

## Special administration considerations

Aging is usually accompanied by a decline in organ function that can affect drug distribution and clearance. This physiologic decline is likely to be worsened by a disease or a chronic disorder. Together, these factors can significantly increase the risk of adverse reactions and drug toxicity, as well as noncompliance.

### *Adverse reactions*

Compared with younger people, elderly patients experience twice as many adverse drug reactions, mostly from greater drug use, poor compliance, and physiologic changes.

Signs and symptoms of adverse drug reactions—confusion, weakness, agitation, and lethargy—are often mistakenly attributed to senility or disease. If the adverse reaction isn't identified, the patient may continue to receive the drug. He may receive other, unnecessary drugs to treat complications caused by the original drug. This regimen can sometimes result in a pattern of inappropriate and excessive drug use.

Any drug can cause adverse reactions, but most of the serious reactions in the elderly are caused by relatively few drugs. Be particularly alert for toxicities resulting from diuretics, antihypertensives, digoxin, corticosteroids, anticoagulants, sleeping aids, and OTC drugs.

### *Diuretic toxicity*

Because total body water content decreases with age, a normal dosage of a potassium-wasting diuretic, such as hydrochlorothiazide or furosemide, may result in fluid loss and even dehydration in an elderly patient.

These diuretics may deplete a patient's potassium level, making him feel weak, and they may raise blood uric acid and glucose levels, complicating gout and diabetes mellitus.

### *Antihypertensive toxicity*

Many elderly patients experience lightheadedness or fainting when taking antihypertensives, partly in response to atherosclerosis and decreased elasticity of the blood vessels. Antihypertensives can lower blood pressure too rapidly, resulting in insufficient blood flow to the brain, which can cause dizziness, fainting, or even a stroke.

Consequently, dosages of antihypertensives must be carefully individualized. In elderly patients, aggressive treatment of high blood pressure may be harmful. Treatment goals should be reasonable. Blood pressure needs to be reduced more slowly in elderly patients.

### *Digoxin toxicity*

As the body's renal function and rate of excretion decline, the digoxin level in the blood of an elderly patient may increase to the point of causing nausea, vomiting, diarrhea, and, most seriously, cardiac arrhythmias. Monitor the patient's digoxin level and observe him for early signs and symptoms of inotropic toxicity, such as appetite loss, confusion, or depression.

### *Corticosteroid toxicity*

Elderly patients taking a corticosteroid may experience short-term effects, including fluid retention and psychological effects ranging from mild euphoria to acute psychotic reactions. Long-term toxic effects, such as osteoporosis, can be especially severe in elderly patients who have been taking prednisone or related steroidal compounds for months or even years. To prevent serious toxicity, carefully monitor patients on long-term regimens. Observe them for subtle changes in appearance, mood, and mobility; for impaired healing; and for fluid and electrolyte disturbances.

### *Anticoagulant effects*

Elderly patients taking an anticoagulant have an increased risk of bleeding, especially when they take NSAIDs at the same time, which is common. They're also at increased risk of bleeding and bruising because they are more likely to fall. Observe the patient's INR carefully, and monitor him for bruising and other signs of bleeding.

### *Sleeping aid toxicity*

Sedatives and sleeping aids such as flurazepam may cause excessive sedation or drowsiness. Keep in mind that consuming alcohol may increase depressant effects,

even if the sleeping aid was taken the previous evening. Use these drugs sparingly in elderly patients.

***Over-the-counter drug toxicity***

Prolonged ingestion of aspirin, aspirin-containing analgesics, and other OTC NSAIDs (such as ibuprofen, ketoprofen, and naproxen) may cause GI irritation—even ulcers—and gradual blood loss resulting in severe anemia. Prescription NSAIDs may cause similar problems. Both OTC and prescription NSAIDs can cause renal toxicity in older adults. Anemia from prolonged aspirin consumption can affect all age groups, but elderly patients may be less able to compensate because of their already reduced iron stores. These drugs should be used very carefully and at the lowest effective doses.

Laxatives may cause diarrhea in elderly patients, who are extremely sensitive to drugs such as bisacodyl. Long-term oral use of mineral oil as a lubricating laxative may result in lipid pneumonia from aspiration of small residual oil droplets in the patient's mouth.

Antihistamines such as diphenhydramine have anticholinergic effects and can cause confusion and mental status changes. OTC decongestants can have systemic effects, such as hypertension, anxiety, insomnia, and agitation.

***Noncompliance***

Poor compliance can be a problem with patients of any age. Many hospitalizations result from noncompliance with a medical regimen. In elderly patients, factors linked to aging, such as diminished visual acuity, hearing loss, forgetfulness, the need for multiple drug therapy, and socioeconomic factors, can combine to make compliance a special problem. About one-third of elderly patients fail to comply with their prescribed drug therapy. They may fail to take prescribed doses or to follow the correct schedule. They may take drugs prescribed for previous disorders, stop drugs prematurely, or indiscriminately use drugs that are to be taken as needed. Elderly patients may also have multiple prescriptions for the same drug and inadvertently take an overdose.

Review the patient's drug regimen with him. Make sure he understands the dose amount, the time and frequency of doses, and why he's taking the drug. Also, explain in detail if a drug is to be taken with food, with water, or separate from other drugs. To verify the patient's understanding, ask him to repeat the instructions back to you.

Help the patient avoid drug therapy problems by suggesting that he use drug calendars, pill sorters, or other aids to help him comply. Refer him to the prescriber, a pharmacist, or social services if he needs further information or assistance with his drug therapy.

# 3

# Safe drug administration

Medication therapy is the primary intervention for many illnesses. It greatly benefits many patients and yet is involved in many instances of patient harm from either unintended consequences of therapy (adverse drug reactions) or medication-related errors (adverse drug events). Medication errors are a significant cause of patient morbidity and mortality in the United States. In 1999, the Institute of Medicine (IOM) published its first Quality Chasm report "To Err is Human: Building a Safer Health System," which reported that errors related to medication accounted for approximately 1 out of 131 outpatient deaths, 1 out of 854 inpatient deaths, and more than 7,000 deaths annually. Of all sentinel events reviewed since 1995 by The Joint Commission (a nonprofit organization that seeks to improve public health care through the voluntary accreditation of health care institutions), approximately 8% have been attributed to medication errors.

Many governmental and nongovernmental organizations are dedicated to improving the safety of drug administration. One mission of the U.S. Food and Drug Administration (FDA), for example, is to protect the public health by assuring the safety, effectiveness, and security of human drugs, vaccines, and medical devices. The U.S. Pharmacopeia (USP), a nonprofit, nongovernmental, public health organization, sets official public standards for drugs and other health care products manufactured or sold in the United States. It also sets standards for the quality, purity, and strength of food ingredients and dietary supplements.

In 2005, The Patient Safety and Quality Improvement Act authorized the creation of patient safety organizations (PSOs) to improve the quality and safety of U.S. health care delivery. One of these PSOs, the Institute for Safe Medication Practices (ISMP), is a nonprofit organization entirely dedicated to preventing medication errors and using medications safely. In addition, The Joint Commission has established National Patient Safety Goals and standards to improve the safe use of medications in its accredited facilities.

## Causes of medication errors

The National Coordinating Council for Medication Error Reporting and Prevention (http://www.nccmerp.org) defines a medication error as "any preventable event that may cause or lead to inappropriate medication use or patient harm while the medication is in the control of the health care professional, patient, or consumer. Such events may be related to professional practice, health care products, procedures, and systems, including prescribing; order communication; product labeling, packaging, and nomenclature; compounding; dispensing; distribution; administration; education; monitoring; and use."

Medication errors were once thought to be caused by lapses in an individual nurse's practice. Traditionally, teaching nurses to administer drugs safely focused on the individual nurse's practice and the application of the "rights" of safe medication administration. (See *The eight "rights" of medication administration*, page 14.)

Although individual nursing practice is still an extremely important part of safe drug administration, the focus has widened. After medication errors had been systematically studied by numerous organizations who shared data, it became apparent that medication errors are complex events with multiple factors, and are most often caused by failures within systems. As a result of these findings, research has shifted to preventing medication errors by identifying their root causes and then developing and validating evidence-based strategies. Organizational processes, management decisions, inadequate medication administration protocols, staffing shortages, environmental conditions, poor communication, inadequate drug knowledge and resources, and individual mistakes or protocol violations may all contribute to drug errors.

## The medication administration process

Medication errors can occur from medication administration process problems within any one or within more than one of the five stages of the process. Because up to 40% of a nurse's time may be spent in medication administration, and nursing practice intersects multiple stages, nurses may often be involved in medication errors. Here are some of the types of errors that have been reported in each stage.

Stage 1: Ordering and prescribing
- Prescriber orders are incomplete or illegible.
- Contraindicated drugs (such as drugs to which the patient is allergic) are prescribed.
- The prescriber specifies the wrong drug, dose, route, or frequency.
- Drugs are prescribed using inappropriate or inadequate verbal orders.

Stage 2: Transcribing and verifying
- An incorrect drug, dose, route, time, or frequency is transcribed into the medication administration record (MAR) by the pharmacist or nurse.
- Drug verification and documentation in the MAR by the pharmacist or nurse are inadequate.

Stage 3: Dispensing and delivery
- The prescribed drug is filled incorrectly.
- Failure to deliver the right drug to the right place for the right patient occurs.

Stage 4: Administering
- The wrong drug is given to the wrong patient by the nurse or other licensed professional.
- The wrong dose is calculated and given or infused by the nurse or other licensed professional.
- The right drug is incorrectly prepared (such as crushing a drug that shouldn't be crushed) and is given by the nurse or other licensed professional.
- The correct drug is administered by the wrong route (such as an oral drug that is injected I.V.) by the nurse or other licensed professional.
- The correct drug is given at the wrong time or frequency by the nurse or other licensed professional.

Stage 5: Monitoring and reporting
- Monitoring of the patient by the nurse before and after medication administration is inadequate.
- Documentation and reporting of the patient's condition by the nurse before and after medication administration are inadequate.
- Hand-off communication between licensed professionals is inadequate.
- Reporting of medication errors is inadequate.

### *The eight "rights" of medication administration*

Traditionally, nurses have been taught the "five rights" of medication administration. These are broadly stated goals and practices to help individual nurses administer drugs safely.

1. The ***right drug:*** Check the drug label and verify that the drug and form to be given is the drug that was prescribed.
2. The ***right patient:*** Confirm the patient's identity by checking two patient identifiers.
3. The ***right dose:*** Verify that the dose and form to be given is appropriate for the patient, and check the drug label with the prescriber's order.
4. The ***right time:*** Ensure that the drug is administered at the correct time and frequency.
5. The ***right route:*** Verify that the route by which the drug is to be given is specified by the prescriber and is appropriate for the patient.

In addition to the traditional "five rights" of individual practice, best practice researchers have added three additional "rights":

6. The ***right reason:*** Verify that the drug prescribed is appropriate to treat the patient's condition.
7. The ***right response:*** Monitor the patient's response to the drug administered.
8. The ***right documentation:*** Completely and accurately document in the patient's medical record the drug administered, the monitoring of the patient, including his response, and other nursing interventions.

## Elements contributing to safer drug administration

Ensuring the safe delivery of medication involves a system-wide approach, and research has shown that improvements in

communication and education can facilitate the safe delivery of medication.

## Communication improvements

Communication issues have been implicated in approximately 60% of reported medication errors. Communication can be improved in many ways throughout the medication administration process. The traditional nursing process "rights" of safe drug administration are still important components of safe drug administration but even when protocols are followed exactly, some medication errors still occur. For example, a nurse who's exactly following the eight "rights" might administer a drug to which a patient is allergic if his allergy information is incomplete or undocumented or hasn't been communicated effectively. Appropriate communication among all members of the health care team, including nurses, is vitally important.

Many health care facilities have instituted measures to help standardize and organize appropriate communication. One tool commonly used is SBAR (Situation, Background, Assessment, and Recommendation); its purpose is to logically organize information to optimize proper communication among health care providers.

Each institution must have tools and policies in place for the documentation of medication administration. Each prescribed medication order must be clearly written and verbal orders must be used and documented appropriately according to facility policy. Each verbal order should be read back and verified with the prescriber before the drug is administered. The patient's condition must be monitored after each medication is given, and the patient's response and any nursing interventions must be documented appropriately. Clear communication through documentation is essential to safe practice.

The Joint Commission has developed goals and standards regarding medication reconciliation—the process of comparing a patient's medication regimen at every transition in his care (for example, on admission, upon discharge, and between care settings and levels). Medication reconciliation helps ensure that essential information about the patient's medication regimen is communicated to the health care team. Medication reconciliation helps prevent the inadvertent omission of needed medications, prevents medication duplication, and helps identify medications with potentially harmful interactions.

## Education improvements

Lack of knowledge has been implicated in many medication errors; therefore, education about medications is essential to their safe administration. All health care team members involved in the process of medication administration, including the prescriber, pharmacist, and nurse, must have access to accurate information about each drug's indications, appropriate dosing regimen, appropriate route, frequency, possible drug interactions, appropriate monitoring, any cautions, and possible adverse effects. Each facility should have processes in place to educate staff and communicate important drug information.

Governmental and nongovernmental agencies are doing their part toward educating facilities, prescribers, and nurses. In 1995, the FDA established the black box warning system to alert prescribers to drugs with increased risks to patients. These boxed warnings are the strongest labeling requirements for drugs that can have serious reactions. The Joint Commission requires accredited health care facilities to develop a list of abbreviations to avoid in all medication communications. The ISMP maintains a list of high-alert medications that may cause significant patient harm when given. (Each facility should have protocols in place for administering high-alert medications with safeguards built into the process.) The FDA and ISMP have developed a list of drugs with similar names that can be easily confused. Dissimilarities in each drug's name are highlighted with tall letters (so each name has mixed-case letters), making each drug less prone to mix-ups.

### *Patient education*

Patients and their families should be active participants in the patient's care and should understand the patient's plan of care, including the purpose of newly prescribed

medications. The patient and family need to be taught what to watch for, how the patient's condition will be monitored, and what signs and symptoms to report, and to report anything that doesn't seem right, including unfamiliar medications. Before administering a medication, the nurse needs to verify with the patient medication allergies or unusual past reactions to medications.

The following general teaching guidelines will help ensure that the patient receives the maximum therapeutic benefit from his medication regimen and help him avoid adverse reactions, accidental overdose, and harmful changes in effectiveness.

- Instruct the patient to learn the brand name, generic names, and dosages of all drugs and supplements (such as herbs and vitamins) that he's taking.
- Tell the patient to notify the pharmacist and prescriber about everything he takes, including prescription drugs, OTC drugs, and herbal or other supplements, and about any drug allergies.
- Advise the patient to always read the label before taking a drug, to take it exactly as prescribed, and never to share prescription drugs.
- Warn the patient not to change brands of a drug without consulting the prescriber, to avoid harmful changes in effectiveness. For example, certain generic preparations aren't equivalent in effect to brand-name preparations of the same drug.
- Tell the patient to check the expiration date before taking a drug.
- Show the patient how to safely discard drugs that are outdated or no longer needed.
- Caution the patient to keep all drugs safely out of the reach of children and pets.
- Advise the patient to store drugs in their original container, at the proper temperature, and in areas where they won't be exposed to sunlight or excessive heat or humidity. Sunlight, heat, and humidity can cause drug deterioration and reduce a drug's effectiveness.
- Encourage the patient to report adverse or unusual reactions to the prescriber, and teach him proper techniques to monitor his condition (for example, how to obtain a resting heart rate before taking Lanoxin).
- Suggest that the patient have all prescriptions filled at the same pharmacy so that the pharmacist can warn against potentially harmful drug interactions.
- Tell the patient to report his complete medication history to all health care providers he sees, including his dentist.
- Instruct the patient to call the prescriber, poison control center, or pharmacist immediately and to seek immediate medical attention if he or someone else has taken an overdose. The National Poison Control Center phone number is 1-800-222-1222. Tell the patient to keep this and other emergency numbers handy at all times.
- Advise the patient to make sure he has a sufficient supply of drugs when traveling. He should carry them with him in their original containers and not pack them in luggage. Also, recommend that he carry a letter from his prescriber authorizing the use of a drug, especially if the drug is a controlled substance.

## Strategies for reducing error rates

In addition to improvements in communication and education, other strategies that have helped reduce medication administration error rates include:

- providing adequate nurse-to-patient staffing ratios
- designing drug preparation areas as safety zones that promote making correct choices during the medication administration process according to importance, frequency of use, and sequence of use
- improving the medication administration environment (reduce noise to 50 dB, improve lighting to at least 100 foot candles, obtain nonglare computer screens)
- developing and using protocols that reduce distractions for nursing staff directly involved in administering medications
- dispensing medications in unit-dose or unit-of-use packaging
- restricting high-alert drugs and administration routes (limiting their number, variety, and concentration in patient-care areas.) For example, remove all neuromuscular blockers from units where patients aren't normally intubated. Remove highly concentrated electrolytes from unit stock in patient-care units. Remove concentrated

oral opioids from unit stock and dispensing cabinets. Apply additional strong warnings to drug labels. Make sure emergency equipment is always available.
- switching from I.V. to oral or subcutaneous forms as soon as possible
- dispensing I.V. and epidural infusions only from the pharmacy
- labeling all medications both on and off the sterile field
- posting drug information in patient-care units and having drug information available for all health care providers at the point of care; using infusion rate and dosing charts in patient-care areas
- avoiding unapproved abbreviations
- requiring that medication orders be prescribed by metric weight, not by volume (for example in mg/kg not ml)
- establishing protocols and checklists to double-check and document unusual drugs, dosages, or regimens
- always recalculating doses before giving drugs to children or neonates. Make sure that the dose formula is included for calculating the dose. Have a second clinician (preferably a pharmacist) double-check the calculations.
- making sure each patient is monitored appropriately before and after drug administration. Have appropriate monitoring equipment (cardiac monitors, capnography, pulse oximetry) available as needed.

## Using technology to promote safety

Technology is becoming an increasingly important part of providing safer drug administration. The goal of medication administration technology is to enhance individual practice and help build safeguards into the medication administration process.

### Computerized order entry

In computerized physician order entry (CPOE), the prescriber enters the medication orders into a computerized record, thus eliminating errors due to illegible handwriting. Such safeguards as immediate order checking for errors (such as incorrect dosing or routes of administration) and drug interactions, allergy checks, and administration protocols can be built into the system. Orders can be immediately transmitted to the appropriate department and can also be linked to drug information databases. CPOE can be used to monitor how drugs are utilized and provide data for quality improvement. One significant disadvantage of CPOE systems is their high cost.

### Bar codes

Bar-code technology is widely used and was initially developed to help control and track inventory for industry. The use of this technology for safer drug administration, dispensing, inventory control, and drug storage and preparation has been endorsed by the IOM, Joint Commission, Agency for Healthcare Research and Quality, and ISMP. With this technology, the patient wears a bar-code identifier on a wristband; the medication also has a bar code that uses the medication's own unique National Drug Code to identify the name, dose, manufacturer, and type of packaging. The nurse scans the bar code using an optical scanner, verifying the patient's identity and medication. The system supports but does not replace the traditional "rights" of safe medication.

Bar-code systems have been shown to reduce medication errors but they aren't without disadvantages. They don't save time in the medication administration process. Problems with the technology can cause delays in treatment. Wristbands can become unreadable due to wear, and scanners can malfunction. These problems may tempt nurses to develop dangerous shortcuts, such as attaching patients' wristbands to clipboards or giving the patient the medication first and then scanning his wristband. Also, this technology may be expensive to initiate.

### Automated dispensing cabinets

Automated dispensing cabinets (ADCs) are computer-controlled medication distribution systems in the patient-care unit that are used to store, track, and dispense medications. ADCs can provide nurses with near total access to medications needed in their patient-care area and promote the control and security of medications. They electronically track the use of drugs such as controlled substances. They may have

bar-code capabilities for restocking and correct medication selection, and can be programmed to provide safeguards such as drug safety alerts. ADCs can be linked with external databases and billing systems to increase the efficiency of drug dispensing and billing.

### "Smart" pumps

Since 2005, the FDA has received 56,000 reports of adverse events and 500 deaths linked to infusion pumps. Currently, there are initiatives to improve infusion systems and technology. "Smart" I.V. pumps can have such features as programmable drug libraries and dosage limits, perform automatic calculations, and be programmed to signal dosage alerts. They can be integrated with bar-code and CPOE technologies and can be wireless. Smart pumps can help alert nurses when incorrect dosages have been selected or to dosages that may exceed recommended levels.

Smart pumps can't detect all problems with I.V. drug infusions, however. For example, an incorrect drug can be selected from the library database and, with some pumps, it's possible to override safety alerts. Other infusion pump problems include software defects and failure of built-in safety alarms. Some pumps have ambiguous on-screen directions that can lead to dosing errors. The FDA recommends reporting all infusion-related adverse events, planning ahead in case a pump fails, labeling the channels and tubing to prevent errors, checking all settings, and monitoring patients for signs and symptoms of infusion problems. Nurses should perform independent calculation of all doses and infusion rates and not rely solely on the pump. It's essential to double-check each dose calculation. Nurses shouldn't bypass pump alarms, and must verify that the pump is functioning properly before beginning an infusion.

### Other technologies

Using only oral syringes that don't have luer-locks to administer oral or enteral medications helps prevent oral or enteral medications from being administered via the wrong route. (The ISMP has reported cases in which oral medications were drawn into parenteral syringes and inadvertently injected into I.V. lines, resulting in patient deaths.) Utilizing special tubing for epidural medication administration that doesn't have side ports prevents an inadvertent injection of an additional drug into the epidural catheter.

## Reporting medication errors

Clearly, medication errors are a major threat to patient safety. Only by sharing and analyzing data and performing more research can evidence-based quality improvements be developed and validated. Several agencies and organizations provide voluntary reporting systems to study the causes and prevalence of medication errors. The FDA has its Adverse Event Reporting System, which is part of the MedWatch program. The USP maintains MEDMARX (a national database utilized to lower the incidence of hospital medication errors) and the Medication Errors Reporting Program. In addition, the USP works with the ISMP to compile voluntary reports of medication errors. The reports are analyzed by these watchdog agencies, and information is published about their findings. Nurses should be encouraged to report medication errors and "near misses" and to help identify problems within systems.

# 4

# Selected drug classifications

## Alkylating drugs

bendamustine hydrochloride
busulfan
carboplatin
carmustine
chlorambucil
cisplatin
cyclophosphamide
dacarbazine
ifosfamide
lomustine
melphalan
oxaliplatin
temozolomide
thiotepa

### INDICATIONS

➤ **Various tumors, especially those with large volume and slow cell-turnover rate**

### ACTION

Alkylating drugs appear to act independently of a specific cell-cycle phase. They're polyfunctional compounds that can be divided chemically into five groups: nitrogen mustards, ethylene imines, alkyl sulfonates, triazines, and nitrosoureas. These drugs are highly reactive; they primarily target nucleic acids and form links with the nuclei of different molecules. This allows the drugs to cross-link double-stranded DNA and to prevent strands from separating for replication, which may contribute to these drugs' ability to destroy cells.

### ADVERSE REACTIONS

The most common adverse reactions are bone marrow depression, chills, diarrhea, fever, flank pain, hair loss, leukopenia, nausea, redness or pain at the injection site, sore throat, swelling of the feet or lower legs, thrombocytopenia, secondary leukemia, infertility, and vomiting.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs.
- Use cautiously in patients receiving other cell-destroying drugs or radiation therapy.
- In pregnant women, use only when potential benefits to the mother outweigh known risks to the fetus. Breast-feeding women should stop breast-feeding during therapy because drugs are found in breast milk. In children, safety and effectiveness of many alkylating drugs haven't been established. Elderly patients have an increased risk of adverse reactions; monitor these patients closely.

## Alpha blockers (peripherally acting)

doxazosin mesylate
phentolamine mesylate
prazosin hydrochloride
terazosin hydrochloride

### INDICATIONS

➤ **Hypertension, or mild to moderate urinary obstruction in men with BPH**

### ACTION

Selective alpha blockers decrease vascular resistance and increase vein capacity, thereby lowering blood pressure and causing nasal and scleroconjunctival congestion, ptosis, orthostatic and exercise hypotension, mild to moderate miosis, interference with ejaculation, and pink, warm skin. They also relax nonvascular smooth muscle, especially in the prostate capsule, which reduces urinary problems in men with BPH. Because $alpha_1$ blockers don't block $alpha_2$ receptors, they don't cause transmitter overflow.

Nonselective alpha blockers antagonize both $alpha_1$ and $alpha_2$ receptors. Generally, alpha blockade results in tachycardia, palpitations, and increased renin secretion because of abnormally large amounts of norepinephrine (from transmitter overflow) released from adrenergic nerve endings as a result of the blockade of $alpha_1$ and

alpha$_2$ receptors. Norepinephrine's effects are counterproductive to the major uses of nonselective alpha blockers.

### ADVERSE REACTIONS

Alpha blockers may cause severe orthostatic hypotension and syncope, especially with the first few doses, an effect commonly called the "first-dose effect." The most common adverse effects of alpha$_1$ blockade are dizziness, headache, drowsiness, somnolence, and malaise. These drugs also may cause tachycardia, palpitations, fluid retention (from excess renin secretion), nasal and ocular congestion, and aggravation of respiratory tract infection.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with MI, coronary insufficiency, or angina or with hypersensitivity to these drugs or any of their components. Also contraindicated in combination therapy with phosphodiesterase type 5 inhibitors (sildenafil, tadalafil, vardenafil), although tadalafil may be taken with tamsulosin 0.4 mg daily.
- In pregnant or breast-feeding women, use cautiously. In children, the safety and effectiveness of many alpha blockers haven't been established; use cautiously. In elderly patients, hypotensive effects may be more pronounced.

## Alzheimer's disease drugs

donepezil hydrochloride
galantamine hydrobromide
memantine hydrochloride
rivastigmine tartrate

### INDICATIONS

➤ **Treatment of mild to moderate dementia of the Alzheimer's type**

### ACTION

Current theories attribute signs and symptoms of Alzheimer's disease to a deficiency of cholinergic neurotransmission. It's suggested that these drugs improve cholinergic function by increasing acetylcholine through reversible inhibition of its hydrolysis by cholinesterase. Memantine is an N-methyl-D-aspartate (NMDA) receptor antagonist. Persistent activation of the NMDA receptors is thought to contribute to symptoms of Alzheimer's disease. There is no evidence that any of the drugs alter the course of the underlying disease process.

### ADVERSE REACTIONS

Weight loss, diarrhea, anorexia, nausea, vomiting, dizziness, headache, bradyarrhythmias; hypertension and constipation (memantine).

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to any of the drug components.
- May exaggerate neuromuscular blocking effects of succinylcholine-type and similar neuromuscular blocking agents used during anesthesia.
- Use cautiously with concomitant drugs that slow heart rate. There is an increased risk for heart block.
- Use cautiously with NSAIDs because the drug increases gastric acid secretion. There is increased risk of developing ulcers and active or occult GI bleeding.
- Use cautiously in patients with moderate hepatic or renal impairment. The drugs are not recommended in severe hepatic impairment or severe renal impairment (creatinine clearance less than 9 ml/minute).
- Use cautiously in patients with a history of asthma or COPD.

## Aminoglycosides

amikacin sulfate
gentamicin sulfate
neomycin sulfate
tobramycin sulfate

### INDICATIONS

➤ **Septicemia; postoperative, pulmonary, intra-abdominal, and urinary tract infections; skin, soft tissue, bone, and joint infections; aerobic gram-negative bacillary meningitis not susceptible to other antibiotics; serious staphylococcal, *Pseudomonas aeruginosa*, and *Klebsiella* infections; enterococcal infections; nosocomial pneumonia; anaerobic infections involving *Bacteroides fragilis*;**

**tuberculosis; initial empiric therapy in febrile, leukopenic patients**

### ACTION

Aminoglycosides are bactericidal. They bind directly and irreversibly to 30S ribosomal subunits, inhibiting bacterial protein synthesis. They're active against many aerobic gram-negative and some aerobic gram-positive organisms and can be used in combination with other antibiotics for short courses of therapy.

### ADVERSE REACTIONS

Ototoxicity and nephrotoxicity are the most serious complications. Neuromuscular blockade also may occur. Oral forms most commonly cause diarrhea, nausea, and vomiting. Parenteral drugs may cause vein irritation, phlebitis, and sterile abscess.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs.
- Use cautiously in patients with a neuromuscular disorder and in those taking neuromuscular blockades.
- Use at lower dosages in patients with renal impairment.
- In pregnant women, use cautiously. In breast-feeding women, safety hasn't been established. In neonates and premature infants, the half-life of aminoglycosides is prolonged because of immature renal systems. In infants and children, dosage adjustment may be needed. Elderly patients have an increased risk of nephrotoxicity and commonly need a lower dose and longer intervals; they're also susceptible to ototoxicity and superinfection.

## Angiotensin-converting enzyme inhibitors

benazepril hydrochloride
captopril
enalaprilat
enalapril maleate
fosinopril sodium
lisinopril
perindopril erbumine
quinapril hydrochloride
ramipril
trandolapril

### INDICATIONS

➤ **Hypertension, heart failure, left ventricular dysfunction (LVD), MI (with ramipril and lisinopril), and diabetic nephropathy (with captopril)**

### ACTION

ACE inhibitors prevent conversion of angiotensin I to angiotensin II, a potent vasoconstrictor. Besides decreasing vasoconstriction and thus reducing peripheral arterial resistance, inhibiting angiotensin II decreases adrenocortical secretion of aldosterone. This reduces sodium and water retention and extracellular fluid volume. ACE inhibition also causes increased levels of bradykinin, which results in vasodilation. This decreases heart rate and systemic vascular resistance.

### ADVERSE REACTIONS

The most common adverse effects of therapeutic doses are angioedema of the face and limbs, dry cough, dysgeusia, fatigue, headache, hyperkalemia, hypotension, proteinuria, rash, and tachycardia. Severe hypotension may occur at toxic drug levels.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs.
- Use cautiously in patients with impaired renal function or serious autoimmune disease and in those taking other drugs known to decrease WBC count or immune response.
- Women of childbearing potential taking ACE inhibitors should report suspected

pregnancy immediately to prescriber. High risks of fetal morbidity and mortality are linked to ACE inhibitors, especially in the second and third trimesters. Some ACE inhibitors appear in breast milk. To avoid adverse effects in infants, instruct patient to stop breast-feeding during therapy. In children, safety and effectiveness haven't been established; give drug only if potential benefits outweigh risks. Elderly patients may need lower doses because of impaired drug clearance.

## Antacids

aluminum hydroxide
calcium carbonate
magnesium oxide
sodium bicarbonate

### INDICATIONS

➤ **Hyperacidity; hyperphosphatemia (aluminum hydroxide); hypomagnesemia (magnesium oxide); postmenopausal hypocalcemia (calcium carbonate)**

### ACTION

Antacids reduce the total acid load in the GI tract and elevate gastric pH to reduce pepsin activity. They also strengthen the gastric mucosal barrier and increase esophageal sphincter tone.

### ADVERSE REACTIONS

Antacids containing aluminum may cause aluminum intoxication, constipation, hypophosphatemia, intestinal obstruction, and osteomalacia. Antacids containing magnesium may cause diarrhea or hypermagnesemia (in renal failure). Calcium carbonate, magaldrate, magnesium oxide, and sodium bicarbonate may cause constipation, milk-alkali syndrome, or rebound hyperacidity.

### CONTRAINDICATIONS & CAUTIONS

- Calcium carbonate and magnesium oxide are contraindicated in patients with severe renal disease. Sodium bicarbonate is contraindicated in patients with hypertension, renal disease, or edema; patients who are vomiting; patients receiving diuretics or continuous GI suction; and patients on sodium-restricted diets.
- In patients with mild renal impairment, give magnesium oxide cautiously.
- Give aluminum preparations and calcium carbonate cautiously in elderly patients; in those receiving antidiarrheals, antispasmodics, or anticholinergics; and in those with dehydration, fluid restriction, chronic renal disease, or suspected intestinal absorption problems.
- Pregnant women should consult their prescriber before using antacids. Breast-feeding women may take antacids. In infants, serious adverse effects are more likely from changes in fluid and electrolyte balance; monitor them closely. Elderly patients have an increased risk of adverse reactions; monitor them closely; also, give these patients aluminum preparations, calcium carbonate, and magnesium oxide cautiously.

## Antianginals

ranolazine

***Beta blockers***
atenolol
metoprolol
nadolol
propranolol hydrochloride

***Calcium channel blockers***
amlodipine besylate
diltiazem hydrochloride
nicardipine hydrochloride
nifedipine
verapamil hydrochloride

***Nitrates***
isosorbide dinitrate
isosorbide mononitrate
nitroglycerin

### INDICATIONS

➤ **Moderate to severe angina (beta blockers); classic, effort-induced angina and Prinzmetal angina (calcium channel blockers); recurrent angina (long-acting nitrates and topical, transdermal, transmucosal, and oral extended-release nitroglycerin); acute angina (S.L.**

**nitroglycerin and S.L. or chewable isosorbide dinitrate); unstable angina (I.V. nitroglycerin)**

### ACTION

Beta blockers decrease catecholamine-induced increases in heart rate, blood pressure, and myocardial contraction. Calcium channel blockers inhibit the flow of calcium through muscle cells, which dilates coronary arteries and decreases systemic vascular resistance, known as afterload. Nitrates decrease afterload and left ventricular end-diastolic pressure, or preload, and increase blood flow through collateral coronary vessels.

### ADVERSE REACTIONS

Ranolazine may cause dizziness, constipation, and nausea. Beta blockers may cause bradycardia, cough, diarrhea, disturbing dreams, dizziness, dyspnea, fatigue, fever, heart failure, hypotension, lethargy, nausea, peripheral edema, and wheezing. Calcium channel blockers may cause bradycardia, confusion, constipation, depression, diarrhea, dizziness, dyspepsia, edema, elevated liver enzyme levels (transient), fatigue, flushing, headache, hypotension, insomnia, nervousness, and rash. Nitrates may cause flushing, headache, orthostatic hypotension, reflex tachycardia, rash, syncope, and vomiting.

### CONTRAINDICATIONS & CAUTIONS

- Ranolazine is contraindicated in patients taking strong inhibitors of CYP3A or inducers of CYP3A and in those with clinically significant hepatic impairment. Beta blockers are contraindicated in patients hypersensitive to them and in patients with cardiogenic shock, sinus bradycardia, heart block greater than first degree, or bronchial asthma. Calcium channel blockers are contraindicated in patients with severe hypotension or heart block greater than first degree (except with functioning pacemaker). Nitrates are contraindicated in patients with severe anemia, cerebral hemorrhage, head trauma, glaucoma, or hyperthyroidism or in patients using phosphodiesterase type 5 inhibitors (sildenafil, tadalafil, vardenafil).
- Use beta blockers cautiously in patients with nonallergic bronchospastic disorders, diabetes mellitus, or impaired hepatic or renal function. Use calcium channel blockers cautiously in patients with hepatic or renal impairment, bradycardia, heart failure, or cardiogenic shock. Use nitrates cautiously in patients with hypotension or recent MI.
- In pregnant women, use beta blockers cautiously. Recommendations for breast-feeding vary by drug; use beta blockers and calcium channel blockers cautiously. In children, safety and effectiveness haven't been established. Check with prescriber before giving these drugs to children. Elderly patients have an increased risk of adverse reactions; use cautiously.

## Antiarrhythmics

adenosine

***Class IA***
procainamide hydrochloride
quinidine gluconate
quinidine sulfate

***Class IB***
lidocaine hydrochloride

***Class IC***
flecainide acetate
propafenone hydrochloride

***Class II (beta blockers)***
amiodarone hydrochloride
dofetilide
esmolol hydrochloride
ibutilide fumarate
sotalol hydrochloride

***Class IV (calcium channel blocker)***
verapamil hydrochloride

### INDICATIONS

➤ **Atrial and ventricular arrhythmias**

### ACTION

Class I drugs reduce the inward current carried by sodium ions, which stabilizes neuronal cardiac membranes. Class IA

drugs depress phase 0, prolong the action potential, and stabilize cardiac membranes. Class IB drugs depress phase 0, shorten the action potential, and stabilize cardiac membranes. Class IC drugs block the transport of sodium ions, which decreases conduction velocity but not repolarization rate. Class II drugs decrease the heart rate, myocardial contractility, blood pressure, and AV node conduction. Class IV drugs decrease myocardial contractility and oxygen demand by inhibiting calcium ion influx; they also dilate coronary arteries and arterioles.

### ADVERSE REACTIONS

Most antiarrhythmics can aggravate existing arrhythmias or cause new ones. They also may produce CNS disturbances, such as dizziness or fatigue, GI problems, such as nausea, vomiting, or altered bowel elimination; hypersensitivity reactions; and hypotension. Some antiarrhythmics may worsen heart failure. Class II drugs may cause bronchoconstriction.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs.
- Many antiarrhythmics are contraindicated or require cautious use in patients with cardiogenic shock, digitalis toxicity, and second- or third-degree heart block (unless patient has a pacemaker or implantable cardioverter defibrillator).
- In pregnant women, use only if potential benefits to the mother outweigh risks to the fetus. In breast-feeding women, use cautiously; many antiarrhythmics appear in breast milk. In children, monitor closely because they have an increased risk of adverse reactions. In elderly patients, use these drugs cautiously because these patients may exhibit physiologic alterations in CV system.

## Antibiotic antineoplastics

bleomycin sulfate
daunorubicin hydrochloride
doxorubicin hydrochloride
epirubicin hydrochloride
idarubicin hydrochloride
mitomycin

### INDICATIONS

➤ **Various tumors**

### ACTION

Although classified as antibiotics, these drugs destroy cells, thus ruling out their use as antimicrobials alone. They interfere with proliferation of malignant cells in several ways. Their action may be specific to cell-cycle phase, not specific to cell-cycle phase, or both. Some of these drugs act like alkylating drugs or antimetabolites. By binding to or creating complexes with DNA, antibiotic antineoplastics directly or indirectly inhibit DNA, RNA, and protein synthesis.

### ADVERSE REACTIONS

The most common adverse reactions include anxiety, bone marrow depression, chills, confusion, diarrhea, fever, flank or joint pain, hair loss, nausea, redness or pain at the injection site, sore throat, swelling of the feet or lower legs, vomiting, and cardiomyopathy.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs.
- In pregnant women, avoid antineoplastics. Breast-feeding during therapy isn't recommended. In children, safety and effectiveness of some drugs haven't been established; use cautiously. In elderly patients, use cautiously because of their increased risk of adverse reactions.

## Anticholinergics

atropine sulfate
benztropine mesylate
dicyclomine hydrochloride
scopolamine

### INDICATIONS

➤ **Prevention of motion sickness, preoperative reduction of secretions and blockage of cardiac reflexes, adjunct treatment of peptic ulcers and other GI disorders, blockage of cholinomimetic effects of cholinesterase inhibitors or other drugs, and (for benztropine) various spastic conditions, including acute dystonic reactions, muscle rigidity, parkinsonism, and extrapyramidal disorders**

### ACTION

Anticholinergics competitively antagonize the actions of acetylcholine and other cholinergic agonists at muscarinic receptors.

### ADVERSE REACTIONS

Therapeutic doses commonly cause blurred vision, constipation, cycloplegia, decreased sweating or anhidrosis, dry mouth, headache, mydriasis, palpitations, tachycardia, and urinary hesitancy and retention. These reactions usually disappear when therapy stops. Toxicity can cause signs and symptoms resembling psychosis (disorientation, confusion, hallucinations, delusions, anxiety, agitation, and restlessness); dilated, nonreactive pupils; blurred vision; hot, dry, flushed skin; dry mucous membranes; dysphagia; decreased or absent bowel sounds; urine retention; hyperthermia; tachycardia; hypertension; and increased respirations.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs and in those with angle-closure glaucoma, renal or GI obstructive disease, reflux esophagitis, or myasthenia gravis.
- Use cautiously in patients with heart disease, GI infection, open-angle glaucoma, prostatic hypertrophy, hypertension, hyperthyroidism, ulcerative colitis, autonomic neuropathy, or hiatal hernia with reflux esophagitis.
- In pregnant women, safe use hasn't been established. In breast-feeding women, avoid anticholinergics because they may decrease milk production; some may appear in breast milk and cause infant toxicity. In children, safety and effectiveness haven't been established. Patients older than age 40 may be more sensitive to these drugs. In elderly patients, use cautiously and give a reduced dosage, as indicated.

## Anticoagulants

***Coumarin derivative***
warfarin sodium

***Heparin derivative***
heparin sodium

***Low-molecular-weight heparins***
dalteparin sodium
enoxaparin sodium
tinzaparin sodium

***Selective factor Xa inhibitor***
fondaparinux sodium

***Thrombin inhibitors***
argatroban
bivalirudin
desirudin

### INDICATIONS

➤ **Pulmonary emboli, deep vein thrombosis, thrombus, blood clotting, DIC, unstable angina, MI, atrial fibrillation**

### ACTION

Heparin derivatives accelerate formation of an antithrombin III-thrombin complex. It inactivates thrombin and prevents conversion of fibrinogen to fibrin. The coumarin derivative warfarin inhibits vitamin K–dependent activation of clotting factors II, VII, IX, and X, which are formed in the liver. Thrombin inhibitors directly bind to thrombin and inhibit its action. Selective factor Xa inhibitors bind to antithrombin III, which in turn initiates the neutralization of factor Xa.

### ADVERSE REACTIONS

Anticoagulants commonly cause bleeding and may cause hypersensitivity reactions. Warfarin may cause agranulocytosis, alopecia (long-term use), anorexia, dermatitis, fever, nausea, tissue necrosis or gangrene, urticaria, and vomiting. Heparin derivatives may cause thrombocytopenia and may increase liver enzyme levels. Nonhemorrhagic adverse reactions associated with thrombin inhibitors may include back pain, bradycardia, and hypotension.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs or any of their components; in patients with aneurysm, active bleeding, CV hemorrhage, hemorrhagic blood dyscrasias, hemophilia, severe hypertension, pericardial effusions, or pericarditis; and in patients undergoing major surgery, neurosurgery, or ophthalmic surgery.
- Use cautiously in patients with severe diabetes, renal impairment, severe trauma, ulcerations, or vasculitis.
- Most anticoagulants (except warfarin) may be used in pregnancy only if clearly necessary. In pregnant women and those who have just had a threatened or complete spontaneous abortion, warfarin is contraindicated. Women should avoid breast-feeding during therapy. Infants, especially neonates, may be more susceptible to anticoagulants because of vitamin K deficiency. Elderly patients are at greater risk for hemorrhage because of altered hemostatic mechanisms or age-related deterioration of hepatic and renal functions.

## Anticonvulsants

asenapine
carbamazepine
clonazepam
diazepam
fosphenytoin sodium
gabapentin
lacosamide
lamotrigine
levetiracetam
magnesium sulfate
oxcarbazepine
phenobarbital
phenobarbital sodium
phenytoin sodium
phenytoin sodium (extended)
primidone
rufinamide
tiagabine hydrochloride
topiramate
valproate sodium
valproic acid
zonisamide

### INDICATIONS

➤ **Seizure disorders; acute, isolated seizures not caused by seizure disorders; status epilepticus; prevention of seizures after trauma or craniotomy; neuropathic pain**

### ACTION

Anticonvulsants include six classes of drugs: selected hydantoin derivatives, barbiturates, benzodiazepines, succinimides, iminostilbene derivatives (carbamazepine), and carboxylic acid derivatives. Magnesium sulfate is a miscellaneous anticonvulsant. Some hydantoin derivatives and carbamazepine inhibit the spread of seizure activity in the motor cortex. Some barbiturates and succinimides limit seizure activity by increasing the threshold for motor cortex stimuli. Selected benzodiazepines and carboxylic acid derivatives may increase inhibition of GABA in brain neurons. Magnesium sulfate interferes with the release of acetylcholine at the myoneural junction.

### ADVERSE REACTIONS

Anticonvulsants can cause adverse CNS effects, such as ataxia, confusion, somnolence, and tremor. Many anticonvulsants also cause CV disorders, such as arrhythmias and hypotension; GI effects, such as vomiting; and hematologic disorders, such as agranulocytosis, bone marrow depression, leukopenia, and thrombocytopenia. Stevens-Johnson syndrome, other severe rashes, and abnormal liver function test results may occur with certain anticonvulsants.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs.
- Carbamazepine is contraindicated within 14 days of MAO inhibitor use.
- Use cautiously in patients with blood dyscrasias. Also, use barbiturates cautiously in patients with suicidal ideation.
- In pregnant women, therapy usually continues despite the fetal risks caused by some anticonvulsants (barbiturates, phenytoin). In breast-feeding women, the safety of many anticonvulsants hasn't been established. Children, especially young ones, are sensitive to the CNS depression of some anticonvulsants; use cautiously. Elderly patients are sensitive to CNS effects and may require lower doses. Also, some anticonvulsants may take longer to be eliminated because of decreased renal function, and parenteral use is more likely to cause apnea, hypotension, bradycardia, and cardiac arrest.

## Antidepressants, tricyclic

amitriptyline hydrochloride
clomipramine hydrochloride
desipramine hydrochloride
doxepin hydrochloride
imipramine hydrochloride
imipramine pamoate
nortriptyline hydrochloride

### INDICATIONS

➤ **Depression, anxiety (doxepin hydrochloride), obsessive-compulsive disorder (clomipramine), enuresis in children older than age 6 (imipramine), neuropathic pain**

### ACTION

Tricyclic antidepressants may inhibit reuptake of norepinephrine and serotonin in CNS nerve terminals (presynaptic neurons), thus enhancing the concentration and activity of neurotransmitters in the synaptic cleft. Tricyclic antidepressants also exert antihistaminic, sedative, anticholinergic, vasodilatory, and quinidine-like effects.

### ADVERSE REACTIONS

Adverse reactions include anticholinergic effects, orthostatic hypotension, and sedation. The tertiary amines (amitriptyline, doxepin, and imipramine) exert the strongest sedative effects; tolerance usually develops in a few weeks. Amoxapine is most likely to cause seizures, especially with overdose. Tricyclic antidepressants may cause CV effects such as T-wave abnormalities, conduction disturbances, and arrhythmias.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs and in patients with urine retention or angle-closure glaucoma.
- Tricyclic antidepressants are contraindicated within 2 weeks of MAO inhibitor therapy.
- Use cautiously in patients with suicidal tendencies, schizophrenia, paranoia, seizure disorders, CV disease, or impaired hepatic function.
- In pregnant and breast-feeding women, safety hasn't been established; use cautiously. In children younger than age 12, tricyclic antidepressants aren't recommended. Elderly patients are more sensitive to therapeutic and adverse effects; they need lower dosages.

## Antidiabetics

acarbose
glimepiride
glipizide
glyburide
metformin hydrochloride
miglitol
nateglinide
pioglitazone hydrochloride
pramlintide acetate
repaglinide
rosiglitazone maleate
sitagliptin phosphate

### INDICATIONS

➤ **Mild to moderately severe, stable, nonketotic, type 2 diabetes mellitus that can't be controlled by diet alone**

### ACTION

Oral antidiabetics come in several types. Sulfonylureas are sulfonamide derivatives that aren't antibacterial. They lower glucose levels by stimulating insulin release from the pancreas. These drugs work only in the presence of functioning beta cells in the islet tissue of the pancreas. After prolonged administration, they produce hypoglycemia by acting outside of the pancreas, including reduced glucose production by the liver and enhanced peripheral sensitivity to insulin. The latter may result from an increased number of insulin receptors or from changes after insulin binding.

Meglitinides, such as nateglinide and repaglinide, are nonsulfonylurea antidiabetics that stimulate the release of insulin from the pancreas.

Metformin decreases hepatic glucose production, reduces intestinal glucose absorption, and improves insulin sensitivity by increasing peripheral glucose uptake and utilization. With metformin therapy, insulin secretion remains unchanged, and fasting insulin levels and all-day insulin response may decrease.

Alpha-glucosidase inhibitors, such as acarbose and miglitol, delay digestion of carbohydrates, resulting in a smaller rise in glucose levels. Pramlintide, a human amylin analogue, slows the rate at which food leaves the stomach, decreasing postprandial increase in glucose level, and reduces appetite.

Rosiglitazone and pioglitazone are thiazolidinediones, which lower glucose levels by improving insulin sensitivity. These drugs are potent and highly selective agonists for receptors found in insulin-sensitive tissues, such as adipose, skeletal muscle, and liver.

Sitagliptin increases insulin release by inhibiting the enzyme DPP-4.

### ADVERSE REACTIONS

Sulfonylureas cause dose-related reactions that usually respond to decreased dosage: anorexia, headache, heartburn, nausea, paresthesia, vomiting, and weakness. Hypoglycemia may follow excessive dosage, increased exercise, decreased food intake, or alcohol use.

The most serious adverse reaction linked to metformin is lactic acidosis. It's a rare effect and most likely to occur in patients with renal dysfunction. Other reactions to metformin include dermatitis, GI upset, megaloblastic anemia, rash, and unpleasant or metallic taste.

Thiazolidinediones may cause fluid retention leading to or exacerbating heart failure. Alpha-glucosidase inhibitors can cause abdominal pain, diarrhea, and flatulence.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs and in patients with diabetic ketoacidosis with or without coma. Metformin is also contraindicated in patients with renal disease or metabolic acidosis and generally should be avoided in patients with hepatic disease.
- Use sulfonylureas cautiously in patients with renal or hepatic disease. Use metformin cautiously in patients with adrenal or pituitary insufficiency and in debilitated and malnourished patients. Alpha-glucosidase inhibitors should be used cautiously in patients with mild to moderate renal insufficiency. Thiazolidinediones aren't recommended in patients with edema, heart failure, or liver disease.

• In pregnant or breast-feeding women, use is contraindicated. Oral antidiabetics appear in small amounts in breast milk and may cause hypoglycemia in the infant. In children, oral antidiabetics aren't effective in type 1 diabetes mellitus. Elderly patients may be more sensitive to these drugs, usually need lower dosages, and are more likely to develop neurologic symptoms of hypoglycemia; monitor these patients closely. In elderly patients, avoid chlorpropamide use because of its long duration of action.

## Antidiarrheals

bismuth subsalicylate
calcium polycarbophil
diphenoxylate hydrochloride and atropine sulfate
loperamide
octreotide acetate

### INDICATIONS

➤ **Mild, acute, or chronic diarrhea. Octreotide acetate is indicated for certain cancers that cause diarrhea**

### ACTION

Bismuth preparations may have a mild water-binding capacity, may absorb toxins, and provide a protective coating for the intestinal mucosa.

### ADVERSE REACTIONS

Bismuth preparations may cause salicylism (with high doses) or temporary darkening of tongue and stools.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to these drugs.
• Some antidiarrheals may appear in breast milk; check individual drugs for specific recommendations. For children or teenagers recovering from flu or chickenpox, consult prescriber before giving bismuth subsalicylate. For elderly patients, use caution when giving antidiarrheal drugs.

## Antiemetics

aprepitant
dimenhydrinate
dolasetron mesylate
dronabinol
granisetron hydrochloride
meclizine hydrochloride
metoclopramide hydrochloride
ondansetron hydrochloride
palonosetron hydrochloride
prochlorperazine
scopolamine
scopolamine hydrobromide
trimethobenzamide hydrochloride

### INDICATIONS

➤ **Nausea, vomiting, motion sickness, and vertigo**

### ACTION

For antihistamines (dimenhydrinate, meclizine hydrochloride, trimethobenzamide) the mechanism of action is unclear. Phenothiazines (prochlorperazine) work by blocking the dopaminergic receptors in the chemoreceptor trigger zone of the brain. Serotonin-receptor antagonists (dolasetron, granisetron, ondansetron) block serotonin stimulation centrally in the chemoreceptor trigger zone and peripherally in vagal nerve terminals.

### ADVERSE REACTIONS

Antiemetics may cause asthenia, fatigue, dizziness, headache, insomnia, abdominal pain, anorexia, constipation, diarrhea, epigastric discomfort, gastritis, heartburn, nausea, vomiting, neutropenia, hiccups, tinnitus, dehydration, and fever.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to any of the drug components.
• Contraindicated in severe vomiting until etiology of vomiting is established.
• Use cautiously in patients with tartrazine and sulfite sensitivities. Antiemetics may cause allergic type reactions including hives, itching, wheezing, asthma, and anaphylaxis.

## Antifungals

amphotericin B lipid complex
amphotericin B liposomal
anidulafungin
caspofungin acetate
fluconazole
itraconazole
ketoconazole
micafungin sodium
miconazole nitrate
nystatin
posaconazole
terbinafine hydrochloride
voriconazole

### INDICATIONS

➤ **Various fungal infections**

### ACTION

The amphotericin products bind to sterols in the fungal cell membrane, altering permeability and allowing intracellular components to leak out. These drugs usually inhibit fungal growth and multiplication, but if the level is high enough, the drugs can destroy fungi. The azole class of drugs includes fluconazole, itraconazole, ketoconazole, and voriconazole. Fluconazole inhibits fungal cytochrome P450, which weakens fungal cell walls. Itraconazole and voriconazole interfere with fungal wall synthesis by inhibiting ergosterol formation and increasing cell wall permeability and osmotic instability. Ketoconazole interferes with sterol synthesis in fungal cells, damaging cell membranes and increasing permeability. Caspofungin inhibits the synthesis of an integral component of fungal cell walls. Nystatin binds to sterols in fungal cell membranes and alters membrane permeability. Terbinafine inhibits fungal cell growth by inhibiting an enzyme responsible for the manufacture of ergosterol.

### ADVERSE REACTIONS

Fluconazole may cause transient elevations of liver enzymes, alkaline phosphatase and bilirubin levels, dizziness, nausea, vomiting, abdominal pain, diarrhea, rash, headache, hypokalemia, elevated BUN and creatinine levels. Itraconazole adverse reactions include headache and nausea. The most common adverse reactions to ketoconazole are nausea and vomiting. Adverse reactions to voriconazole are uncommon. However, the drug may alter renal function and cause vision changes. Common adverse reactions to caspofungin include paresthesia, tachycardia, anorexia, anemia, pain, myalgia, tachypnea, chills, and sweating. Reactions to nystatin seldom occur, but may include diarrhea, nausea, vomiting, and abdominal pain. Terbinafine may cause abdominal pain, jaundice, diarrhea, flatulence, nausea, anaphylaxis, headache, rash, and vision disturbances.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to any of the drug components.
- Administer I.V. amphotericin under close clinical observation. Acute infusion reactions can occur including fever, shaking chills, hypotension, anorexia, nausea, vomiting, and tachypnea.
- Caspofungin is contraindicated with concomitant use of cyclosporine because of the possibility of elevated liver enzymes.
- The amphotericin drugs aren't interchangeable and are each prescribed differently.

## Antihistamines

cetirizine hydrochloride
chlorpheniramine maleate
desloratadine
diphenhydramine hydrochloride
fexofenadine hydrochloride
levocetirizine
loratadine
promethazine hydrochloride

### INDICATIONS

➤ **Allergic rhinitis, urticaria, pruritus, vertigo, motion sickness, nausea and vomiting, sedation, dyskinesia, parkinsonism**

### ACTION

Antihistamines are structurally related chemicals that compete with histamine for histamine $H_1$-receptor sites on smooth muscle of bronchi, GI tract, and large blood vessels, binding to cellular receptors and

preventing access to and subsequent activity of histamine. They don't directly alter histamine or prevent its release.

### ADVERSE REACTIONS

Most antihistamines cause drowsiness and impaired motor function early in therapy. They also can cause blurred vision, constipation, and dry mouth and throat. Some antihistamines, such as promethazine, may cause cholestatic jaundice, which may be a hypersensitivity reaction, and may predispose patients to photosensitivity. Promethazine may also cause extrapyramidal reactions with high doses.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs and in those with angle-closure glaucoma, stenosing peptic ulcer, pyloroduodenal obstruction, or bladder neck obstruction. Also contraindicated in those taking MAO inhibitors.
- In pregnant women, safe use hasn't been established. During breast-feeding, antihistamines shouldn't be used because many of these drugs appear in breast milk and may cause unusual excitability in the infant. Neonates, especially premature infants, may experience seizures. Children, especially those younger than age 6, may experience paradoxical hyperexcitability with restlessness, insomnia, nervousness, euphoria, tremors, and seizures; give cautiously. Elderly patients usually are more sensitive to the adverse effects of antihistamines, especially dizziness, sedation, hypotension, and urine retention; use cautiously and monitor these patients closely.

## Antihypertensives

***Angiotensin-converting enzyme inhibitors***
benazepril hydrochloride
captopril
enalaprilat
enalapril maleate
fosinopril sodium
lisinopril
perindopril erbumine
quinapril hydrochloride
ramipril
trandolapril

***Angiotensin II receptor blockers***
candesartan cilexetil
eprosartan mesylate
irbesartan
losartan potassium
olmesartan medoxomil
telmisartan
valsartan

***Beta blockers***
atenolol
carvedilol
labetalol hydrochloride
metoprolol succinate
metoprolol tartrate
nadolol
propranolol hydrochloride

***Calcium channel blockers***
amlodipine besylate
diltiazem hydrochloride
felodipine
nicardipine hydrochloride
nifedipine
nisoldipine
verapamil hydrochloride

***Centrally acting alpha blockers (sympatholytics)***
clonidine hydrochloride
guanfacine hydrochloride
methyldopa

***Direct renin inhibitor***
aliskiren

***Peripherally acting alpha blockers***
doxazosin mesylate
prazosin hydrochloride
terazosin hydrochloride

***Vasodilators***
hydralazine hydrochloride
nitroglycerin
nitroprusside sodium

### INDICATIONS
➤ **Essential and secondary hypertension**

### ACTION
For information on the action of ACE inhibitors, alpha blockers, angiotensin II receptor blockers, beta blockers, calcium channel blockers, and diuretics, see their individual drug class entries. Centrally acting sympatholytics stimulate central alpha-adrenergic receptors, reducing cerebral sympathetic outflow, thereby decreasing peripheral vascular resistance and blood pressure. Vasodilators act directly on smooth muscle to reduce blood pressure.

### ADVERSE REACTIONS
Antihypertensives commonly cause orthostatic changes in heart rate, headache, hypotension, nausea, and vomiting. Other reactions vary greatly among different drug types. Centrally acting sympatholytics may cause constipation, depression, dizziness, drowsiness, dry mouth, headache, palpitations, severe rebound hypertension, and sexual dysfunction; methyldopa also may cause aplastic anemia and thrombocytopenia. Vasodilators may cause ECG changes, diarrhea, dizziness, heart failure, palpitations, pruritus, and rash.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to these drugs and in those with hypotension.
- Use cautiously in patients with hepatic or renal dysfunction.
- In pregnant women, use cautiously when potential benefits to the mother outweigh risks to the fetus. Check each drug because some are safe only in the first trimester. In breast-feeding women, use cautiously; some antihypertensives appear in breast milk. In children, safety and effectiveness of many antihypertensives haven't been established; give these drugs cautiously and monitor children closely. Elderly patients are more susceptible to adverse reactions and may need lower maintenance doses; monitor these patients closely.

## Antilipemics
atorvastatin calcium
cholestyramine
colesevelam hydrochloride
ezetimibe
fenofibrate
fluvastatin sodium
gemfibrozil
lovastatin
pitavastatin
pravastatin sodium
rosuvastatin calcium
simvastatin

### INDICATIONS
➤ **Hyperlipidemia, hypercholesterolemia**

### ACTION
Antilipemics lower elevated lipid levels. Bile-sequestering drugs (cholestyramine and colesevelam) lower LDL level by forming insoluble complexes with bile salts, thus triggering cholesterol to leave the bloodstream and other storage areas to make new bile acids. Fibric acid derivatives (gemfibrozil) reduce cholesterol formation, increase sterol excretion, and decrease lipoprotein and triglyceride synthesis. HMG-CoA reductase inhibitors (atorvastatin, fluvastatin, lovastatin, pravastatin, rosuvastatin, simvastatin) interfere with the activity of enzymes that generate cholesterol in the liver. Selective cholesterol absorption inhibitors (ezetimibe) inhibit cholesterol absorption by the small intestine, reducing hepatic cholesterol stores and increasing cholesterol clearance from the blood.

### ADVERSE REACTIONS
Antilipemics commonly cause GI upset. Bile-sequestering drugs may cause bloating, cholelithiasis, constipation, and steatorrhea.

Fibric acid derivatives may cause cholelithiasis and have other GI or CNS effects. Use of gemfibrozil with lovastatin may cause myopathy. HMG-CoA reductase inhibitors may affect liver function or cause rash, pruritus, increased CK levels, rhabdomyolysis, and myopathy.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs. Also, bile-sequestering drugs are contraindicated in patients with complete biliary obstruction. Fibric acid derivatives are contraindicated in patients with primary biliary cirrhosis or significant hepatic or renal dysfunction. HMG-CoA reductase inhibitors and cholesterol absorption inhibitors are contraindicated in patients with active liver disease or persistently elevated transaminase levels.
- Use bile-sequestering drugs cautiously in constipated patients. Use fibric acid derivatives cautiously in patients with peptic ulcer. Use HMG-CoA inhibitors cautiously in patients who consume large amounts of alcohol or who have a history of liver or renal disease.
- In pregnant women, use bile-sequestering drugs and fibric acid derivatives cautiously and avoid using HMG-CoA inhibitors. In breast-feeding women, avoid using fibric acid derivatives and HMG-CoA inhibitors; give bile-sequestering drugs cautiously. In children ages 10 to 17, certain antilipemics have been approved to treat heterozygous familial hypercholesterolemia. Elderly patients have an increased risk of severe constipation; use bile-sequestering drugs cautiously and monitor patients closely.

## Antimetabolite antineoplastics

capecitabine
cytarabine
fludarabine phosphate
fluorouracil
hydroxyurea
mercaptopurine
methotrexate
pemetrexed

### INDICATIONS

➤ **Various tumors and hematologic conditions**

### ACTION

Antimetabolites are structurally similar to naturally occurring metabolites and can be divided into three subcategories: purine, pyrimidine, and folinic acid analogues. Most of these drugs interrupt cell reproduction at a specific phase of the cell cycle. Purine analogues are incorporated into DNA and RNA, interfering with nucleic acid synthesis (by miscoding) and replication. They also may inhibit synthesis of purine bases through pseudofeedback mechanisms. Pyrimidine analogues inhibit enzymes in metabolic pathways that interfere with biosynthesis of uridine and thymine. Folic acid antagonists prevent conversion of folic acid to tetrahydrofolate by inhibiting the enzyme dihydrofolic acid reductase.

### ADVERSE REACTIONS

The most common adverse effects include anxiety, bone marrow depression (anemia, leukopenia, thrombocytopenia), chills, diarrhea, fever, flank or joint pain, hair loss, nausea, redness or pain at injection site, stomatitis, swelling of the feet or lower legs, and vomiting.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs.
- Pregnant women should be informed of the risks to the fetus. Breast-feeding isn't recommended for women taking these drugs. In children, safety and effectiveness

of some drugs haven't been established; use cautiously. Elderly patients have an increased risk of adverse reactions; monitor them closely.

## Antimigraine drugs

almotriptan
eletriptan hydrobromide
frovatriptan succinate
naratriptan hydrochloride
rizatriptan benzoate
sumatriptan succinate
zolmitriptan

### INDICATIONS

➤ **Migraines with or without aura**

### ACTION

The antimigraine drugs are serotonin 5HT-1 agonists. These drugs constrict cranial vessels, inhibit neuropeptide release and reduce transmission in the trigeminal nerve pathway.

### ADVERSE REACTIONS

These drugs have a wide range of adverse reactions. These include tingling, warmth or hot sensations, flushing, nasal discomfort, visual disturbances, parasthesias, dizziness, fatigue, somnolence, chest pain, neck, throat or jaw pain, weakness, dry mouth, dyspepsia, nausea, sweating, and injection site reactions. Intranasal sumatriptan can cause nasal or throat discomfort and taste disturbances.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to any of the drug components.
- Contraindicated in patients with ischemic heart disease, angina, previous MI, uncontrolled hypertension or other significant underlying CV conditions, cerebrovascular disease, peripheral vascular disease, and ischemic bowel disease.

## Antiparkinsonians

amantadine hydrochloride
apomorphine hydrochloride
benztropine mesylate
bromocriptine mesylate
diphenhydramine hydrochloride
entacapone
levodopa and carbidopa
levodopa, carbidopa, and entacapone
pramipexole dihydrochloride
rasagiline mesylate
ropinirole hydrochloride
selegiline hydrochloride
tolcapone

### INDICATIONS

➤ **Signs and symptoms of Parkinson disease and drug-induced extrapyramidal reactions**

### ACTION

Antiparkinsonians include synthetic anticholinergics, dopaminergics, and the antiviral amantadine. Anticholinergics probably prolong the action of dopamine by blocking its reuptake into presynaptic neurons and by suppressing central cholinergic activity. Dopaminergics act in the brain by increasing dopamine availability, thus improving motor function. Entacapone is a reversible inhibitor of peripheral catechol-*O*-methyltransferase (commonly known as COMT), which is responsible for elimination of various catecholamines, including dopamine. Blocking this pathway when giving levodopa and carbidopa should result in higher levels of levodopa, thereby allowing greater dopaminergic stimulation in the CNS and leading to a greater effect in treating parkinsonian symptoms. Amantadine is thought to increase dopamine release in the substantia nigra.

### ADVERSE REACTIONS

Anticholinergics may cause blurred vision, cycloplegia, constipation, decreased sweating or anhidrosis, dry mouth, headache, mydriasis, palpitations, tachycardia, and urinary hesitancy and urine retention. Dopaminergics may cause arrhythmias,

confusion, disturbing dreams, dystonias, hallucinations, headache, muscle cramps, nausea, orthostatic hypotension, and vomiting. Amantadine also causes irritability, insomnia, and livedo reticularis (with prolonged use).

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs.
- Use cautiously in patients with prostatic hyperplasia or tardive dyskinesia and in debilitated patients.
- Neuroleptic malignant-like syndrome involving muscle rigidity, increased body temperature, and mental status changes may occur with abrupt withdrawal of antiparkinsonians.
- In pregnant women, safe use hasn't been established. Antiparkinsonians may appear in breast milk; a decision should be made to stop the drug or stop breast-feeding, taking into account the importance of the drug to the mother. In children, safety and effectiveness haven't been established. Elderly patients have an increased risk for adverse reactions; monitor them closely.

## Antiplatelet drugs

abciximab
cilostazol
clopidogrel bisulfate
dipyridamole
eptifibatide
oprelvekin
ticlopidine hydrochloride
tirofiban hydrochloride

### INDICATIONS

➤ **Reduction of thrombolytic events by reducing platelet aggregation; adjunct to percutaneous catheter intervention, prevention of cardiac ischemic complications, or unstable angina not responding to conventional therapy when percutaneous catheter intervention is planned within 24 hours (abciximab); acute coronary syndrome and percutaneous catheter interventions (eptifibatide); acute coronary syndrome (tirofiban); non-ST-segment elevation acute coronary syndrome and ST-segment elevation MI, recent MI, recent stroke or peripheral vascular disease (clopidogrel and ticlopidine)**

### ACTION

The I.V. drugs abciximab, eptifibatide, and tirofiban antagonize the GPIIb/IIIa receptors located on platelets, which are involved in platelet aggregation. Clopidogrel is an inhibitor of platelet aggregation by inhibiting the binding of adenosine diphosphate (ADP) to its platelet receptor and the subsequent ADP mediated activation of the glycoprotein (GP)IIb/IIIa complex. Ticlopidine inhibits the binding of fibrinogen to platelets.

### ADVERSE REACTIONS

The I.V. drugs can cause serious bleeding, thrombocytopenia, and anaphylaxis. The most common adverse reactions to the oral agents include anaphylaxis, rash, stomach pain, nausea, and headache. Ticlopidine may cause neutropenia and elevated alkaline phosphatase and serum transaminase levels.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to any of the drug components.
- Contraindicated in active bleeding, bleeding disorders, intracranial neoplasm, AV malformation or aneurysm, cerebrovascular accident (within 2 years), recent major surgery or trauma, severe uncontrolled hypertension, or thrombocytopenia.

## Antirheumatics

abatacept
adalimumab
auranofin
gold sodium thiomalate
leflunomide

### INDICATIONS

➤ **Rheumatoid arthritis, ankylosing spondylitis, Crohn disease, psoriatic arthritis**

### ACTION

Inhibits T-cell activation by binding to CD80 and CD86, thereby blocking interaction with CD28. Activated T lymphocytes

are found in the synovium of patients with rheumatoid arthritis. Some drugs bind to tumor necrosis factor (TNF) so it can't bind to a receptor and exert an effect. TNF plays an important role in pathologic inflammation and joint destruction.

### ADVERSE REACTIONS

The most serious adverse reactions include serious infections and malignancies in patients treated with abatacept and adalimumab. The most common adverse reactions include rash, pruritus, hair loss, urticaria, nausea, vomiting, anorexia, flatulence, dyspepsia, anemia, leukopenia, thrombocytopenia, elevated liver enzymes, stomatitis, hypertension, headache, and hematuria. Serious adverse reactions from gold therapy include anaphylactic shock, bradycardia, and angioneurotic edema. The most common adverse reactions from gold therapy include dermatitis, pruritus, and stomatitis.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to any of the drug components.
- Use cautiously in patients receiving two antirheumatics with similar mechanisms of action.
- Use with caution in patients with a history of recurrent infections, COPD, CNS disorders, demyelinating disorders, heart failure, and immunosuppression.

## Antituberculotics

cycloserine
ethambutol hydrochloride
isoniazid
rifabutin
rifampin
rifapentine

### INDICATIONS

➤ **Acute pulmonary and extrapulmonary tuberculosis, acute UTIs**

### ACTION

Inhibits cell wall synthesis in susceptible strains of gram-positive and gram-negative bacteria and if *Mycobacterium tuberculosis* is identified.

### ADVERSE REACTIONS

Adverse reactions primarily affect the GI tract, peripheral nervous system and hepatic system. Isoniazid may precipitate seizures in patients with a seizure disorder and produce optic or peripheral neuritis, as well as elevated liver enzymes. Optic neuritis is the only significant reaction to ethambutol. The most common adverse reactions to rifampin include epigastric pain, nausea, vomiting, flatulence, abdominal cramps, anorexia and diarrhea. Cycloserine can cause seizures, confusion, dizziness, headache, and somnolence.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to any of the drug components.
- Drugs should be discontinued or dosage reduced if patients develop signs of CNS toxicity including convulsions, psychosis, somnolence, depression, confusion, hyperreflexia, headache, tremor, vertigo, paresis, or dysarthria.

## Barbiturates

phenobarbital
phenobarbital sodium

### INDICATIONS

➤ **Sedation, preanesthetic, short-term treatment of insomnia, seizure disorders**

### ACTION

Barbiturates act throughout the CNS, especially in the mesencephalic reticular activating system, which controls the CNS arousal mechanism. The main anticonvulsant actions are reduced nerve transmission and decreased excitability of the nerve cell. Barbiturates decrease presynaptic and postsynaptic membrane excitability by promoting the actions of GABA. They also depress respiration and GI motility and raise the seizure threshold.

### ADVERSE REACTIONS

CNS depression, drowsiness, headache, lethargy, and vertigo are common with barbiturates. After hypnotic doses, a hangover effect, subtle distortion of mood, and impaired judgment and motor skills may

continue for many hours. After dosage reduction or discontinuation, rebound insomnia or increased dreaming or nightmares may occur. Barbiturates cause hyperalgesia in subhypnotic doses. They can also cause paradoxical excitement at low doses, confusion in elderly patients, and hyperactivity in children. High fever, severe headache, stomatitis, conjunctivitis, or rhinitis may precede potentially fatal skin eruptions. Withdrawal symptoms may occur after as little as 2 weeks of uninterrupted therapy.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs and in those with bronchopneumonia, other severe pulmonary insufficiency, or liver dysfunction.
- Use cautiously in patients with blood pressure alterations, pulmonary disease, and CV dysfunction. Use cautiously, if at all, in patients who are depressed or have suicidal tendencies.
- Barbiturates can cause fetal abnormalities; avoid use in pregnant women. Barbiturates appear in breast milk and may result in infant CNS depression; use cautiously. Premature infants are more susceptible to depressant effects of barbiturates because of their immature hepatic metabolism. Children may experience hyperactivity, excitement, or hyperalgesia; use cautiously and monitor closely. Elderly patients may experience hyperactivity, excitement, or hyperalgesia; use cautiously.

## Benzodiazepines

alprazolam
chlordiazepoxide hydrochloride
diazepam
lorazepam
midazolam hydrochloride
oxazepam
temazepam
triazolam

### INDICATIONS

➤ **Seizure disorders (diazepam, midazolam, parenteral lorazepam); anxiety, tension, and insomnia (chlordiazepoxide, diazepam, lorazepam, oxazepam, temazepam, triazolam); conscious sedation or amnesia in surgery (diazepam, lorazepam, midazolam); skeletal muscle spasm and tremor (oral forms of chlordiazepoxide and diazepam); delirium**

### ACTION

Benzodiazepines act selectively on polysynaptic neuronal pathways throughout the CNS. Precise sites and mechanisms of action aren't fully known. However, benzodiazepines enhance or facilitate the action of GABA, an inhibitory neurotransmitter in the CNS. These drugs appear to act at the limbic, thalamic, and hypothalamic levels of the CNS to produce anxiolytic, sedative, hypnotic, skeletal muscle relaxant, and anticonvulsant effects.

### ADVERSE REACTIONS

Therapeutic dose may cause drowsiness, impaired motor function, constipation, diarrhea, vomiting, altered appetite, urinary changes, visual disturbances, and CV irregularities. Toxic dose may cause continuing problems with short-term memory, confusion, severe depression, shakiness, vertigo, slurred speech, staggering, bradycardia, shortness of breath, difficulty breathing, or severe weakness. Prolonged or frequent use of benzodiazepines can cause physical dependency and withdrawal syndrome when drug is stopped.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs, in those with acute angle-closure glaucoma, and in those with depressive neuroses or psychotic reactions in which anxiety isn't prominent.
- Avoid use in patients with suicidal tendencies and patients with a history of drug abuse.
- Use cautiously in patients with chronic pulmonary insufficiency or sleep apnea and in those with hepatic or renal insufficiency.
- In pregnant patients, benzodiazepines increase the risk of congenital malformation if taken in the first trimester. Use during labor may cause neonatal flaccidity. A neonate whose mother took a benzodiazepine during pregnancy may have withdrawal symptoms. In breast-feeding women, benzodiazepines may cause sedation, feeding difficulties, and

weight loss in the infant. In children, use caution; they're especially sensitive to CNS depressant effects. In elderly patients, benzodiazepine elimination may be prolonged; consider a lower dosage.

## Beta blockers

***Beta$_1$ blockers***
atenolol
betaxolol
esmolol hydrochloride
metoprolol tartrate

***Beta$_1$ and beta$_2$ blockers***
carvedilol
labetalol hydrochloride
nadolol
propranolol hydrochloride
sotalol hydrochloride

### INDICATIONS

➤ **Hypertension (most drugs), angina pectoris (atenolol, metoprolol, nadolol, and propranolol), arrhythmias (esmolol, propranolol and sotalol), glaucoma (betaxolol), prevention of MI (atenolol, metoprolol, and propranolol), prevention of recurrent migraine and other vascular headaches (propranolol), pheochromocytomas or essential tremors (selected drugs), heart failure (atenolol, carvedilol, metoprolol)**

### ACTION

Beta blockers compete with beta agonists for available beta receptors; individual drugs differ in their ability to affect beta receptors. Some drugs are nonselective: they block beta$_1$ receptors in cardiac muscle and beta$_2$ receptors in bronchial and vascular smooth muscle. Several drugs are cardioselective and, in lower doses, inhibit mainly beta$_1$ receptors. Some beta blockers have intrinsic sympathomimetic activity and stimulate and block beta receptors, and thereby have less affect on slowing heart rate. Others stabilize cardiac membranes, which affects cardiac action potential.

### ADVERSE REACTIONS

Therapeutic dose may cause bradycardia, dizziness, and fatigue; some may cause other CNS disturbances, such as depression, hallucinations, memory loss, and nightmares. Toxic dose can produce severe hypotension, bradycardia, heart failure, or bronchospasm.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs and in patients with cardiogenic shock, sinus bradycardia, heart block greater than first degree, and bronchial asthma.
- Use cautiously in patients with nonallergic bronchospastic disorders, diabetes mellitus, impaired hepatic or renal function, and congestive heart failure.
- Use caution in discontinuing drug; dose should be tapered. Suddenly stopping can worsen angina or precipitate MI.
- In pregnant women, use cautiously. Drugs appear in breast milk. In children, safety and effectiveness haven't been established; use only if the benefits outweigh the risks. In elderly patients, use cautiously; these patients may need reduced maintenance doses because of increased bioavailability, delayed metabolism, and increased adverse effects.

## Calcium channel blockers

amlodipine besylate
clevidipine butyrate
diltiazem hydrochloride
felodipine
nicardipine hydrochloride
nifedipine
nisoldipine
verapamil hydrochloride

### INDICATIONS

➤ **Prinzmetal variant angina, chronic stable angina, unstable angina, mild-to-moderate hypertension, arrhythmias**

### ACTION

The main physiologic action of calcium channel blockers is to inhibit calcium influx across the slow channels of myocardial and vascular smooth muscle cells. By inhibiting

calcium flow into these cells, calcium channel blockers reduce intracellular calcium levels. This, in turn, dilates coronary arteries, peripheral arteries, and arterioles and slows cardiac conduction.

When used to treat Prinzmetal variant angina, calcium channel blockers inhibit coronary spasm, which then increases oxygen delivery to the heart. Peripheral artery dilation reduces afterload, which decreases myocardial oxygen use. Inhibiting calcium flow into specialized cardiac conduction cells in the SA and AV nodes slows conduction through the heart. Verapamil and diltiazem have the greatest effect on the AV node, which slows the ventricular rate in atrial fibrillation or flutter and converts supraventricular tachycardia to a normal sinus rhythm.

### ADVERSE REACTIONS

Verapamil may cause bradycardia, hypotension, various degrees of heart block, and worsening of heart failure after rapid I.V. delivery. Prolonged oral verapamil therapy may cause constipation. Nifedipine may cause flushing, headache, heartburn, hypotension, lightheadedness, and peripheral edema. The most common adverse reactions with diltiazem are anorexia and nausea; it also may induce bradycardia, heart failure, peripheral edema, and various degrees of heart block.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs and in those with second- or third-degree heart block (except those with a pacemaker) and cardiogenic shock. Use diltiazem and verapamil cautiously in patients with heart failure.
- In pregnant women, use cautiously. Calcium channel blockers may appear in breast milk; instruct patient to stop breast-feeding during therapy. In neonates and infants, adverse hemodynamic effects of parenteral verapamil are possible, but safety and effectiveness of other calcium channel blockers haven't been established; avoid use, if possible. In elderly patients, the half-life of calcium channel blockers may be increased as a result of decreased clearance; use cautiously.

## Cephalosporins

***First generation***
cefadroxil
cefazolin sodium
cephalexin

***Second generation***
cefoxitin sodium
cefprozil
cefuroxime axetil
cefuroxime sodium

***Third generation***
cefdinir
cefotaxime sodium
cefpodoxime proxetil
ceftazidime
ceftrixone sodium

### INDICATIONS

➤ **Infections of the lungs, skin, soft tissue, bones, joints, urinary and respiratory tracts, blood, abdomen, and heart; CNS infections caused by susceptible strains of *Neisseria meningitidis, Haemophilus influenzae,* and *Streptococcus pneumoniae;* meningitis caused by *Escherichia coli* or *Klebsiella;* infections that develop after surgical procedures classified as contaminated or potentially contaminated; penicillinase-producing *N. gonorrhoeae;* otitis media and ampicillin-resistant middle ear infection caused by *H. influenzae***

### ACTION

Cephalosporins are chemically and pharmacologically similar to penicillin; they act by inhibiting bacterial cell wall synthesis, causing rapid cell destruction. Their sites of action are enzymes known as penicillin-binding proteins. The affinity of certain cephalosporins for these proteins in various microorganisms helps explain the differing actions of these drugs. They are bactericidal: they act against many aerobic gram-positive and gram-negative bacteria and some anaerobic bacteria but don't kill fungi or viruses.

First-generation cephalosporins act against many gram-positive cocci, including

penicillinase-producing *Staphylococcus aureus* and *S. epidermidis, S. pneumoniae,* group B streptococci, and group A beta-hemolytic streptococci. Susceptible gram-negative organisms include *Klebsiella pneumoniae, E. coli, Proteus mirabilis,* and *Shigella.*

Second-generation cephalosporins are effective against all organisms attacked by first-generation drugs and have additional activity against *Moraxella catarrhalis, H. influenzae, Enterobacter, Citrobacter, Providencia, Acinetobacter, Serratia,* and *Neisseria. Bacteroides fragilis* are susceptible to cefoxitin.

Third-generation cephalosporins are less active than first- and second-generation drugs against gram-positive bacteria but are more active against gram-negative organisms, including those resistant to first- and second-generation drugs. They have the greatest stability against beta-lactamases produced by gram-negative bacteria. Susceptible gram-negative organisms include *E. coli, Klebsiella, Enterobacter, Providencia, Acinetobacter, Serratia, Proteus, Morganella,* and *Neisseria.* Some third-generation drugs are active against *B. fragilis* and *Pseudomonas.*

### ADVERSE REACTIONS

Many cephalosporins have similar adverse effects. Hypersensitivity reactions range from mild rashes, fever, and eosinophilia to fatal anaphylaxis and are more common in patients with penicillin allergy. Adverse GI reactions include abdominal pain, diarrhea, dyspepsia, glossitis, nausea, tenesmus, and vomiting. Hematologic reactions include positive direct and indirect antiglobulin in Coombs' test, thrombocytopenia or thrombocythemia, transient neutropenia, and reversible leukopenia. Minimal elevation of liver function test results occurs occasionally. Adverse renal effects may occur with any cephalosporin; they are most common in older patients, those with decreased renal function, and those taking other nephrotoxic drugs.

Local venous pain and irritation are common after I.M. injection; these reactions occur more often with higher doses and long-term therapy. Bacterial and fungal superinfections may result from suppression of normal flora.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs.
- Use cautiously in patients with renal or hepatic impairment, history of GI disease, or allergy to penicillins.
- In pregnant women, use cautiously; safety hasn't been definitively established. In breast-feeding women, use cautiously because drugs appear in breast milk. In neonates and infants, half-life is prolonged; use cautiously. Elderly patients are susceptible to superinfection and coagulopathies, commonly have renal impairment, and may need a lower dosage; use cautiously.

## CNS stimulants

armodafinil
doxapram hydrochloride
modafinil
phentermine hydrochloride

### INDICATIONS

➤ **Stimulation of respiration in patients with drug-induced postanesthesia respiratory depression or CNS depression caused by overdose and as temporary measure in acute respiratory insufficiency (doxapram and modafinil); obesity (phentermine); narcolepsy (armodafinil and modafinil)**

### ACTION

Doxapram and modafinil produce respiratory stimulation through the peripheral carotid chemoreceptors. Phentermine is a sympathomimetic amine. The exact mechanism of action in treating obesity isn't established.

### ADVERSE REACTIONS

Phentermine's adverse reactions are related to its stimulatory effect including hypertension, palpitations, tachyarrhythmias, urticaria, constipation, diarrhea, dizziness, excitement, insomnia, tremor, and restlessness.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to any of the drug components.
- Doxapram and modafinil are contraindicated in epilepsy, seizure disorders, mechanical disorders of ventilation such as muscle paresis, flail chest, pneumothorax, asthma, pulmonary fibrosis, head injury, stroke, cerebral edema, uncompensated congestive heart failure, severe coronary disease, and severe hypertension.
- Delay administration of doxapram and modafinil in patients who have received general anesthesia utilizing a volatile agent until the volatile agent has been excreted. This will lessen the chance for arrhythmias including ventricular tachycardia or ventricular fibrillation.
- Administer doxapram and modafinil cautiously in patients taking MAO inhibitors or sympathomimetics because an added pressor effect may occur.
- Administer doxapram and modafinil cautiously in patients taking aminophylline or theophylline because agitation and hyperactivity may occur.
- Phentermine is contraindicated in agitated states, CV disease, history of drug abuse, severe hypertension, hyperthyroidism, glaucoma, and during or within 14 days following use of MAO inhibitors.

## Corticosteroids

beclomethasone dipropionate
betamethasone
budesonide
ciclesonide
dexamethasone
dexamethasone sodium phosphate
fludrocortisone acetate
flunisolide
fluticasone propionate
hydrocortisone
hydrocortisone acetate
hydrocortisone butyrate
hydrocortisone cypionate
hydrocortisone probutate
hydrocortisone sodium succinate
hydrocortisone valerate
methylprednisolone
methylprednisolone acetate
methylprednisolone sodium succinate
prednisolone
prednisolone acetate
prednisolone sodium phosphate
prednisone
triamcinolone

### INDICATIONS

➤ **Hypersensitivity; inflammation, particularly of eye, nose, and respiratory tract; to initiate immunosuppression; replacement therapy in adrenocortical insufficiency, dermatologic diseases, respiratory disorders, rheumatic disorders**

### ACTION

Corticosteroids suppress cell-mediated and humoral immunity by reducing levels of leukocytes, monocytes, and eosinophils; by decreasing immunoglobulin binding to cell-surface receptors; and by inhibiting interleukin synthesis. They reduce inflammation by preventing hydrolytic enzyme release into the cells, preventing plasma exudation, suppressing polymorphonuclear leukocyte migration, and disrupting other inflammatory processes.

### ADVERSE REACTIONS

Systemic corticosteroid therapy may suppress the hypothalamic-pituitary-adrenal

(HPA) axis. Excessive use may cause cushingoid symptoms and various systemic disorders, such as diabetes and osteoporosis. Other effects may include dermatologic disorders, edema, euphoria, fluid and electrolyte imbalances, gastritis or GI irritation, hypertension, immunosuppression, increased appetite, insomnia, psychosis, and weight gain.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs or any of their components and in those with systemic fungal infection.
- Use cautiously in patients with GI ulceration, renal disease, hypertension, osteoporosis, varicella, vaccinia, exanthema, diabetes mellitus, hypothyroidism, thromboembolic disorder, seizures, myasthenia gravis, heart failure, tuberculosis, ocular herpes simplex, hypoalbuminemia, emotional instability, or psychosis.
- In pregnant women, avoid use, if possible, because of risk to the fetus. Women should stop breast-feeding because these drugs appear in breast milk and could cause serious adverse effects in infants. In children, long-term use should be avoided whenever possible because stunted growth may result. Elderly patients may have an increased risk of adverse reactions; monitor them closely.

## Diuretics, loop

bumetanide
ethacrynate sodium
ethacrynic acid
furosemide
torsemide

### INDICATIONS

➤ **Edema from heart failure, hepatic cirrhosis, or nephrotic syndrome; mild-to-moderate hypertension; adjunct treatment in acute pulmonary edema or hypertensive crisis**

### ACTION

Loop diuretics inhibit sodium and chloride reabsorption in the ascending loop of Henle, thus increasing excretion of sodium, chloride, and water. Like thiazide diuretics, loop diuretics increase excretion of potassium. Loop diuretics produce more diuresis and electrolyte loss than thiazide diuretics.

### ADVERSE REACTIONS

Therapeutic dose commonly causes metabolic and electrolyte disturbances, particularly potassium depletion. It also may cause hyperglycemia, hyperuricemia, hypochloremic alkalosis, and hypomagnesemia. Rapid parenteral administration may cause hearing loss (including deafness) and tinnitus. High doses can produce profound diuresis, leading to hypovolemia and CV collapse. Photosensitivity also may occur.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs and in patients with anuria, hepatic coma, or severe electrolyte depletion.
- Use cautiously in patients with severe renal disease. Also use cautiously in patients with severe hypersensitivity to sulfonamides because allergic reaction may occur.
- In pregnant women, use cautiously.

In breast-feeding women, don't use. In neonates, use cautiously; the usual pediatric dose can be used, but dosage intervals should be extended. In elderly patients, use a lower dose, if needed, and monitor patient closely; these patients are more susceptible to drug-induced diuresis.

## Diuretics, potassium-sparing

spironolactone

### INDICATIONS

➤ **Edema from hepatic cirrhosis, nephrotic syndrome, and heart failure; mild or moderate hypertension; diagnosis of primary hyperaldosteronism; metabolic alkalosis produced by thiazide and other kaliuretic diuretics; recurrent calcium nephrolithiasis; lithium-induced polyuria secondary to lithium-induced nephrogenic diabetes insipidus; aid in the treatment of hypokalemia; prophylaxis of hypokalemia in patients taking cardiac glycosides; precocious puberty and female hirsutism; adjunct to treatment of myasthenia gravis and familial periodic paralysis**

### ACTION

Spironolactone competitively inhibits aldosterone at the distal renal tubules, also promoting sodium excretion and potassium retention.

### ADVERSE REACTIONS

Hyperkalemia is the most serious adverse reaction; it could lead to arrhythmias. Other adverse reactions include nausea, vomiting, headache, weakness, fatigue, bowel disturbances, cough, and dyspnea.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to spironolactone, those with a potassium level above 5.5 mEq/L, those taking other potassium-sparing diuretics or potassium supplements, and those with anuria, acute or chronic renal insufficiency, or diabetic nephropathy.
- Use cautiously in patients with severe hepatic insufficiency because electrolyte imbalance may lead to hepatic encephalopathy, and in patients with diabetes, who are at increased risk for hyperkalemia.
- In pregnant women, no controlled studies exist. Women who wish to breast-feed should consult prescriber because drug may appear in breast milk. In children, use cautiously; they're more susceptible to hyperkalemia. In elderly and debilitated patients, observe closely and reduce dosage, if needed; they're more susceptible to drug-induced diuresis and hyperkalemia.

## Diuretics, thiazide and thiazide-like

***Thiazide***
hydrochlorothiazide

***Thiazide-like***
indapamide
metolazone

### INDICATIONS

➤ **Edema from right-sided heart failure, mild-to-moderate left-sided heart failure, or nephrotic syndrome; edema and ascites caused by hepatic cirrhosis; hypertension; diabetes insipidus, particularly nephrogenic diabetes insipidus**

### ACTION

Thiazide and thiazide-like diuretics interfere with sodium transport across the tubules of the cortical diluting segment in the nephron, thereby increasing renal excretion of sodium, chloride, water, potassium, and calcium.

Thiazide diuretics also exert an antihypertensive effect. Although the exact mechanism is unknown, direct arteriolar dilation may be partially responsible. In diabetes insipidus, thiazides cause a paradoxical decrease in urine volume and an increase in renal concentration of urine, possibly because of sodium depletion and decreased plasma volume. This increases water and sodium reabsorption in the kidneys.

### ADVERSE REACTIONS

Therapeutic doses cause electrolyte and metabolic disturbances, most commonly potassium depletion. Other abnormalities include elevated cholesterol levels, hypercalcemia, hyperglycemia, hyperuricemia, hypochloremic alkalosis, hypomagnesemia, and hyponatremia. Photosensitivity also may occur.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs and in those with anuria.
- Use cautiously in patients with severe renal disease, impaired hepatic function, or progressive liver disease.
- In pregnant women, use cautiously. In breast-feeding women, thiazides are contraindicated because they appear in breast milk. In children, safety and effectiveness haven't been established. In elderly patients, reduce dosage, if needed, and monitor patient closely; these patients are more susceptible to drug-induced diuresis.

## Estrogens

esterified estrogens
estradiol
estradiol cypionate
estradiol hemihydrate
estradiol valerate
estrogenic substances, conjugated
estropipate

### INDICATIONS

➤ **Prevention of moderate to severe vasomotor symptoms linked to menopause, such as hot flushes and dizziness; stimulation of vaginal tissue development, cornification, and secretory activity; inhibition of hormone-sensitive cancer growth; female hypogonadism; female castration; primary ovulation failure; ovulation control; prevention of conception**

### ACTION

Estrogens promote the development and maintenance of the female reproductive system and secondary sexual characteristics. They inhibit the release of pituitary gonadotropins and have various metabolic effects, including retention of fluid and electrolytes, retention and deposition in bone of calcium and phosphorus, and mild anabolic activity. Of the six naturally occurring estrogens in humans, estradiol, estrone, and estriol are present in significant quantities.

Estrogens and estrogenic substances given as drugs have effects related to endogenous estrogen's mechanism of action. They can mimic the action of endogenous estrogen when used as replacement therapy and can inhibit ovulation or the growth of certain hormone-sensitive cancers. Conjugated estrogens and estrogenic substances are normally obtained from the urine of pregnant mares. Other estrogens are manufactured synthetically.

### ADVERSE REACTIONS

Acute adverse reactions include abdominal cramps; bloating caused by fluid and electrolyte retention; breast swelling and tenderness; changes in menstrual bleeding patterns, such as spotting and prolongation or absence of bleeding; headache; loss of appetite; loss of libido; nausea; photosensitivity; swollen feet or ankles; and weight gain.

Long-term effects include benign hepatomas, cholestatic jaundice, elevated blood pressure (sometimes into the hypertensive range), endometrial carcinoma (rare), and thromboembolic disease (risk increases greatly with cigarette smoking, especially in women older than age 35).

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in women with thrombophlebitis or thromboembolic disorders, unexplained abnormal genital bleeding, or estrogen-dependent neoplasia.
- Use cautiously in patients with hypertension; metabolic bone disease; migraines; seizures; asthma; cardiac, renal, or hepatic impairment; blood dyscrasia; diabetes; family history of breast cancer; or fibrocystic disease.
- In pregnant or breast-feeding women, use is contraindicated. In adolescents whose bone growth isn't complete, use cautiously because of effects on epiphyseal closure. Postmenopausal women with a history of long-term estrogen use have an increased risk of endometrial cancer and stroke. Postmenopausal women also have increased risk for breast cancer, MI, stroke, and blood clots with long-term use of estrogen plus progestin.

## Fluoroquinolones

ciprofloxacin
gemifloxacin mesylate
levofloxacin
moxifloxacin hydrochloride
ofloxacin

### INDICATIONS

➤ **Bone and joint infection, bacterial bronchitis, endocervical and urethral chlamydial infection, bacterial gastroenteritis, endocervical and urethral gonorrhea, intra-abdominal infection, empiric therapy for febrile neutropenia, pelvic inflammatory disease, bacterial pneumonia, bacterial prostatitis, acute sinusitis, skin and soft tissue infection, typhoid fever, bacterial UTI (prevention**

**and treatment), chancroid, meningococcal carriers, and bacterial septicemia caused by susceptible organisms**

### ACTION

Fluoroquinolones produce a bactericidal effect by inhibiting intracellular DNA topoisomerase II (DNA gyrase), which prevents DNA replication. These enzymes are essential catalysts in the duplication, transcription, and repair of bacterial DNA.

Fluoroquinolones are broad-spectrum, systemic antibacterial drugs active against a wide range of aerobic gram-positive and gram-negative organisms. Gram-positive aerobic bacteria include *Staphylococcus aureus, S. epidermis, S. hemolyticus, S. saprophyticus;* penicillinase- and non–penicillinase-producing staphylococci and some methicillin-resistant strains; *Streptococcus pneumoniae;* group A (beta) hemolytic streptococci *(S. pyogenes);* group B streptococci *(S. agalactiae);* viridans streptococci; groups C, F, and G streptococci and nonenterococcal group D streptococci; *Enterococcus faecalis.* These drugs are active against gram-positive aerobic bacilli including *Corynebacterium* species, *Listeria monocytogenes,* and *Nocardia asteroides.*

Fluoroquinolones are also effective against gram-negative aerobic bacteria including, but not limited to, *Neisseria meningitidis* and most strains of penicillinase- and non–penicillinase-producing *Haemophilus ducreyi, H. influenzae, H. parainfluenzae, Moraxella catarrhalis, N. gonorrhoeae,* and most clinically important *Enterobacteriaceae,* and *Vibrio parahaemolyticus.* Certain fluoroquinolones are active against *Chlamydia trachomatis, Legionella pneumophila, Mycobacterium avium-intracellulare, Mycoplasma hominis, M. pneumoniae,* and *Pseudomonas aeruginosa.*

### ADVERSE REACTIONS

Adverse reactions that are rare but need medical attention include CNS stimulation (acute psychosis, agitation, hallucinations, tremors), hepatotoxicity, hypersensitivity reactions, interstitial nephritis, phlebitis, pseudomembranous colitis, and tendinitis or tendon rupture. Adverse reactions that need no medical attention unless they persist or become intolerable include CNS effects (dizziness, headache, nervousness, drowsiness, insomnia), GI reactions, and photosensitivity.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to fluoroquinolones because serious, possibly fatal, reactions can occur.
- Use cautiously in patients with known or suspected CNS disorders that predispose them to seizures or lower seizure threshold, cerebral ischemia, severe hepatic dysfunction, or renal insufficiency.
- In pregnant women, these drugs cross the placenta and may cause arthropathies. Breast-feeding isn't recommended because these drugs may cause arthropathies in newborns and infants, although it isn't known if all fluoroquinolones appear in breast milk. In children, fluoroquinolones aren't recommended because they can cause joint problems. In elderly patients, reduce dosage, if needed, because these patients are more likely to have reduced renal function.

## Hematopoietic agents

darbepoetin alfa
epoetin alfa

### INDICATIONS

➤ **Anemia associated with chronic renal failure, zidovudine therapy in patients with HIV and cancer patients on chemotherapy; reduce the need for allogeneic blood transfusions in surgical patients (epoetin alpha and related products)**

### ACTION

Epoetin and darbepoetin stimulate RBC production in the bone marrow.

### ADVERSE REACTIONS

Hematopoietic agents may cause fatigue, headache, weakness, chest pain, hypertension, tachycardia, nausea, vomiting, diarrhea, constipation, mucositis, stomatitis, anorexia, myalgias, neutropenic fever, dyspnea, cough, sore throat, alopecia,

rash, urticaria, and stinging at the injection site.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to any of the drug components or human albumin.
- Contraindicated in uncontrolled hypertension.
- Darbepoetin alfa and epoetin alfa shouldn't be used in patients with breast, non–small-cell lung, head and neck, lymphoid, and cervical cancers, or for the treatment of cancers with curative potential.
- Use cautiously in patients with cardiac disease, seizures, and porphyria.

## Histamine$_2$-receptor antagonists

cimetidine
famotidine
ranitidine hydrochloride

### INDICATIONS

➤ **Acute duodenal or gastric ulcer, Zollinger-Ellison syndrome, gastroesophageal reflux**

### ACTION

All $H_2$-receptor antagonists inhibit the action of $H_2$-receptors in gastric parietal cells, reducing gastric acid output and concentration, regardless of stimulants, such as histamine, food, insulin, and caffeine, or basal conditions.

### ADVERSE REACTIONS

$H_2$-receptor antagonists rarely cause adverse reactions. Cardiac arrhythmias, dizziness, fatigue, gynecomastia, headache, mild and transient diarrhea, and thrombocytopenia are possible.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs.
- Use cautiously in patients with impaired renal or hepatic function.
- In pregnant women, use cautiously. In breast-feeding women, $H_2$-receptor antagonists are contraindicated because they may appear in breast milk. In children, safety and effectiveness haven't been established. Elderly patients have increased risk of adverse reactions, particularly those affecting the CNS; use cautiously.

## Immunosuppressants

alefacept
anakinra
azathioprine
basiliximab
certolizumab pegol
cyclosporine
etanercept
glatiramer acetate
infliximab
lymphocyte immune globulin
muromonab-CD3
mycophenolate mofetil
sirolimus
tacrolimus

### INDICATIONS

➤ **Prevention of rejection in organ transplants and in the management of severe rheumatoid arthritis**

### ACTION

The exact mechanism of action is not fully known. Immunosuppressants act by suppressing cell-mediated hypersensitivity reactions and produce various alterations in antibody production, blocking the activity of interleukin, inhibiting helper T cells and suppressor T cells and antagonizing the metabolism of purine, therefore inhibiting ribonucleic acid and deoxyribonucleic acid structure and synthesis.

### ADVERSE REACTIONS

Immunosuppressants may cause albuminuria, hematuria, proteinuria, renal failure, hepatotoxicity, oral *Candida* infections, gingival hyperplasia, tremors, and headache. The most serious reactions include leukopenia, thrombocytopenia, and risk of secondary infection.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to any of the drug components.

● Use cautiously in patients with severe renal disease, severe hepatic disease, or pregnancy.

## Inotropics

digoxin
milrinone

### INDICATIONS

➤ **Heart failure and supraventricular arrhythmias including supraventricular tachycardia, atrial fibrillation, and atrial flutter (digoxin); short-term heart failure and patients awaiting heart transplantation (milrinone)**

### ACTION

The drugs help move calcium into the cells which increases cardiac output by strengthening contractility. Digoxin also acts on the central nervous system to slow heart rate. Milrinone relaxes vascular smooth muscle, decreasing peripheral vascular resistance (afterload) and the amount of blood returning to the heart (preload).

### ADVERSE REACTIONS

Inotropics may cause arrhythmias, nausea, vomiting, diarrhea, headache, fever, mental disturbances, visual changes, and chest pain. Milrinone may cause thrombocytopenia, hypotension, hypokalemia, and elevated liver enzymes.

### CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to any of the drug components.
● Digoxin is contraindicated in ventricular fibrillation.
● Use digoxin cautiously in patients with renal insufficiency because of the potential for digoxin toxicity. Use digoxin cautiously in patients with sinus node disease or AV block because of the potential for advanced heart block.

## Laxatives

***Bulk-forming***
calcium polycarbophil

***Emollient***
docusate calcium
docusate sodium

***Hyperosmolar***
glycerin
lactulose
lubiprostone
magnesium citrate
magnesium hydroxide
magnesium sulfate
sodium phosphates

***Stimulant***
bisacodyl

### INDICATIONS

➤ **Constipation, irritable bowel syndrome, diverticulosis**

### ACTION

Laxatives promote movement of intestinal contents through the colon and rectum in several ways: bulk-forming, emollient, hyperosmolar, and stimulant.

### ADVERSE REACTIONS

All laxatives may cause flatulence, diarrhea, and abdominal disturbances. Bulk-forming laxatives may cause intestinal obstruction, impaction, or (rarely) esophageal obstruction. Emollient laxatives may irritate the throat. Hyperosmolar laxatives may cause fluid and electrolyte imbalances. Stimulant laxatives may cause urine discoloration, malabsorption, and weight loss.

### CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients with GI obstruction or perforation, toxic colitis, megacolon, nausea and vomiting, or acute surgical abdomen.
● Use cautiously in patients with rectal or anal conditions such as rectal bleeding or large hemorrhoids.
● For pregnant women and breast-feeding women, recommendations vary for

individual drugs. Infants and children have an increased risk of fluid and electrolyte disturbances; use cautiously. In elderly patients, dependence is more likely to develop because of age-related changes in GI function. Monitor these patients closely.

## Macrolide anti-infectives

azithromycin
clarithromycin
erythromycin ethylsuccinate
erythromycin lactobionate
erythromycin stearate

### INDICATIONS

➤ **Various common infections**

### ACTION

Inhibit RNA-dependent protein synthesis by acting on a small portion of the 50S ribosomal unit.

### ADVERSE REACTIONS

These drugs may cause nausea, vomiting, diarrhea, abdominal pain, palpitations, chest pain, vaginal candidiasis, nephritis, dizziness, headache, vertigo, somnolence, rash, and photosensitivity.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to any of the drug components.
- Contraindicated in patients with concomitant use of terfenadine, astemizole, or cisapride due to the potential for cardiac arrhythmias. These drugs also have the potential to cause many other drug interactions when given with other drugs; screen carefully.

## Neuromuscular blockers

atracurium besylate
cisatracurium besylate
pancuronium bromide
succinylcholine chloride

### INDICATIONS

➤ **Relax skeletal muscle during surgery to reduce the intensity of muscle spasms in drug- or electrically induced seizures and to manage patients who are fighting mechanical ventilation**

### ACTION

Nondepolarizing blockers (atracurium, cisatracurium, pancuronium) compete with acetylcholine at cholinergic receptor sites on the skeletal muscle membrane. This action blocks acetylcholine's neurotransmitter actions, preventing muscle contraction. Succinylcholine is a depolarizing blocker. This drug isn't inactivated by cholinesterase, thereby preventing repolarization of the motor endplate and causing muscle paralysis.

### ADVERSE REACTIONS

Neuromuscular blockers may cause apnea, hypotension, hypertension, arrhythmias, tachycardia, bronchospasm, excessive bronchial or salivary secretions, and skin reactions.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to any of the drug components.
- The drugs should be used only by personnel skilled in airway management and respiratory support.

## Nonsteroidal anti-inflammatory drugs

aspirin
celecoxib
diclofenac epolamine
diclofenac potassium
diclofenac sodium
diflunisal
etodolac
ibuprofen
indomethacin
indomethacin sodium trihydrate
ketoprofen
ketorolac tromethamine
nabumetone
naproxen
naproxen sodium

### INDICATIONS

➤ **Mild to moderate pain, inflammation, stiffness, swelling, or tenderness caused by headache, arthralgia, myalgia, neuralgia, dysmenorrhea, rheumatoid arthritis,**

**juvenile arthritis, osteoarthritis, or dental or surgical procedures**

### ACTION

The analgesic effect of NSAIDs may result from interference with the prostaglandins involved in pain. Prostaglandins appear to sensitize pain receptors to mechanical stimulation or to other chemical mediators. NSAIDs inhibit synthesis of prostaglandins peripherally and possibly centrally.

Like salicylates, NSAIDs exert an anti-inflammatory effect that may result in part from inhibition of prostaglandin synthesis and release during inflammation. The exact mechanism isn't clear.

### ADVERSE REACTIONS

Adverse reactions chiefly involve the GI tract, particularly erosion of the gastric mucosa. The most common symptoms are abdominal pain, dyspepsia, epigastric distress, heartburn, and nausea. CNS and skin reactions also may occur. Flank pain with other evidence of nephrotoxicity occurs occasionally. Fluid retention may aggravate hypertension or heart failure.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with GI lesions or GI bleeding and in patients hypersensitive to these drugs.
- Use cautiously in patients with heart failure, hypertension, risk of MI, fluid retention, renal insufficiency, or coagulation defects.
- In pregnant women, use cautiously in the first and second trimesters; don't use in the third trimester. For breast-feeding women, NSAIDs aren't recommended. In children younger than age 14, safety of long-term therapy hasn't been established. Patients older than age 60 may be more susceptible to toxic effects of NSAIDs because of decreased renal function.

## Nucleoside reverse transcriptase inhibitors

abacavir sulfate
didanosine
emtricitabine
lamivudine
stavudine
tenofovir disoproxil fumarate
zidovudine

### INDICATIONS

➤ **HIV infection, AIDS, prevention of maternal-fetal HIV transmission, prevention of HIV infection after occupational exposure (as by needle stick) or nonoccupational exposure to blood, genital secretions, or other potentially infectious body fluids of an HIV-infected person when there's substantial risk of transmission**

### ACTION

Nucleoside reverse transcriptase inhibitors (NRTIs) suppress HIV replication by inhibiting HIV DNA polymerase. Competitive inhibition of nucleoside reverse transcriptase inhibits DNA viral replication by chain termination, competitive inhibition of reverse transcriptase, or both.

### ADVERSE REACTIONS

Because of the complexity of HIV infection, it's often difficult to distinguish between disease-related symptoms and adverse drug reactions. The most frequently reported adverse effects of NRTIs are anemia, leukopenia, and neutropenia. Thrombocytopenia is less common. Rare adverse effects of NRTIs are hepatotoxicity, myopathy, and neurotoxicity. Any of these adverse effects requires prompt medical attention.

Adverse effects that don't need medical attention unless they persist or are bothersome include headache, severe insomnia, myalgias, nausea, or hyperpigmentation of nails.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs and patients with moderate to severe hepatic impairment (abacavir) or pancreatitis (didanosine).

● Use cautiously in patients with mild hepatic impairment or risk factors for liver impairment, risk for pancreatitis (didanosine), or compromised bone marrow function (zidovudine).
● In pregnant women, use drug only if benefits outweigh risks. HIV-infected mothers shouldn't breast-feed to reduce the risk of transmitting the virus. It isn't known if NRTIs appear in breast milk. The pharmacokinetic and safety profile of NRTIs is similar in children and adults. NRTIs may be used in children age 3 months and older, but the half-life may be prolonged in neonates. In elderly patients, elimination half-life may be prolonged.

## Opioids

codeine phosphate
codeine sulfate
fentanyl citrate
hydromorphone hydrochloride
meperidine hydrochloride
methadone hydrochloride
morphine sulfate
morphine sulfate and naltrexone
nalbuphine hydrochloride
oxycodone hydrochloride
oxymorphone hydrochloride
pentazocine lactate

### INDICATIONS

➤ **Moderate to severe pain from acute and some chronic disorders; diarrhea; dry, nonproductive cough; management of opioid dependence; anesthesia support; sedation**

### ACTION

Opioids act as agonists at specific opioid-receptor binding sites in the CNS and other tissues, altering the patient's perception of pain.

### ADVERSE REACTIONS

Respiratory and circulatory depression (including orthostatic hypotension) are the major hazards of opioids. Other adverse CNS effects include agitation, coma, depression, dizziness, dysphoria, euphoria, faintness, mental clouding, nervousness, restlessness, sedation, seizures, visual disturbances, and weakness. Adverse GI effects include biliary colic, constipation, nausea, and vomiting. Urine retention or hypersensitivity also may occur. Tolerance to the drug and psychological or physical dependence may follow prolonged therapy.

### CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to these drugs and in those who have recently taken an MAO inhibitor. Also contraindicated in those with acute or severe bronchial asthma or respiratory depression.
● Use cautiously in patients with head injury, increased intracranial or intraocular pressure, hepatic or renal dysfunction, mental illness, emotional disturbances, or drug-seeking behaviors.
● In pregnant or breast-feeding women, use cautiously; codeine, meperidine, methadone, and morphine appear in breast milk. Breast-feeding infants of women taking methadone may develop physical dependence. In children, safety and effectiveness of some opioids haven't been established; use cautiously. Elderly patients may be more sensitive to opioids, and lower doses are usually given.

## Penicillins

***Natural penicillins***
penicillin G benzathine
penicillin G potassium
penicillin G procaine
penicillin G sodium
penicillin V potassium

***Aminopenicillins***
amoxicillin and clavulanate potassium
ampicillin
ampicillin sodium and sulbactam sodium
ampicillin trihydrate

***Extended-spectrum penicillins***
piperacillin sodium and tazobactam sodium
ticarcillin disodium and clavulanate potassium

***Penicillinase-resistant penicillins***
nafcillin sodium

## INDICATIONS

➤ **Streptococcal pneumonia; enterococcal and nonenterococcal group D endocarditis; diphtheria; anthrax; meningitis; tetanus; botulism; actinomycosis; syphilis; relapsing fever; Lyme disease; pneumococcal infections; rheumatic fever; bacterial endocarditis; neonatal group B streptococcal disease; septicemia; gynecologic infections; infections of urinary, respiratory, and GI tracts; infections of skin, soft tissue, bones, and joints**

## ACTION

Penicillins are generally bactericidal. They inhibit synthesis of the bacterial cell wall, causing rapid cell destruction. They're most effective against fast-growing susceptible bacteria. Their sites of action are enzymes known as penicillin-binding proteins (PBPs). The affinity of certain penicillins for PBPs in various microorganisms helps explain the different activities of these drugs.

Susceptible aerobic gram-positive cocci include *Staphylococcus aureus;* nonenterococcal group D streptococci; groups A, B, D, G, H, K, L, and M streptococci; *Streptococcus viridans;* and *Enterococcus* (usually with an aminoglycoside). Susceptible aerobic gram-negative cocci include *Neisseria meningitidis* and non–penicillinase-producing *N. gonorrhoeae.*

Susceptible aerobic gram-positive bacilli include *Corynebacterium, Listeria,* and *Bacillus anthracis.* Susceptible anaerobes include *Peptococcus, Peptostreptococcus, Actinomyces, Clostridium, Fusobacterium, Veillonella,* and non–beta-lactamase–producing strains of *Streptococcus pneumoniae.* Susceptible spirochetes include *Treponema pallidum, T. pertenue, Leptospira, Borrelia recurrentis,* and, possibly, *B. burgdorferi.*

Aminopenicillins have uses against more organisms, including many gram-negative organisms. Like natural penicillins, aminopenicillins are vulnerable to inactivation by penicillinase. Susceptible organisms include *Escherichia coli, Proteus mirabilis, Shigella, Salmonella, S. pneumoniae, N. gonorrhoeae, Haemophilus influenzae, S. aureus, S. epidermidis* (non–penicillinase-producing *Staphylococcus),* and *Listeria monocytogenes.*

Penicillinase-resistant penicillins are semisynthetic penicillins designed to remain stable against hydrolysis by most staphylococcal penicillinases and thus are the drugs of choice against susceptible penicillinase-producing staphylococci. They also act against most organisms susceptible to natural penicillins.

Extended-spectrum penicillins offer a wider range of bactericidal action than the other three classes and usually are given in combination with aminoglycosides. Susceptible strains include *Enterobacter, Klebsiella, Citrobacter, Serratia, Bacteroides fragilis, Pseudomonas aeruginosa, Proteus vulgaris, Providencia rettgeri,* and *Morganella morganii.* These penicillins are also vulnerable to beta-lactamase and penicillinases.

## ADVERSE REACTIONS

With all penicillins, hypersensitivity reactions range from mild rash, fever, and eosinophilia to fatal anaphylaxis. Hematologic reactions include hemolytic anemia, leukopenia, thrombocytopenia, and transient neutropenia. Certain adverse reactions are more common with specific classes. For example, bleeding episodes are usually seen with high doses of extended-spectrum penicillins, whereas GI adverse effects are most common with ampicillin. In patients with renal disease, high doses, especially of penicillin G, irritate the CNS, causing confusion, twitching, lethargy, dysphagia, seizures, and coma. Hepatotoxicity may occur with penicillinase-resistant penicillins, and hyperkalemia and hypernatremia have been reported with extended-spectrum penicillins. Local irritation from parenteral

therapy may be severe enough to warrant administration by subclavian or centrally placed catheter or stopping therapy.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs.
- Use cautiously in patients with history of asthma or drug allergy, mononucleosis, renal impairment, CV diseases, hemorrhagic condition, or electrolyte imbalance.
- In pregnant women, use cautiously. For breast-feeding patients, recommendations vary depending on the drug. For children, dosage recommendations have been established for most penicillins. Elderly patients are susceptible to superinfection and renal impairment, which decreases excretion of penicillins; use cautiously and at a lower dosage.

## Phenothiazines

chlorpromazine hydrochloride
fluphenazine
perphenazine
prochlorperazine maleate
promethazine hydrochloride
thioridazine hydrochloride
thiothixene
trifluoperazine hydrochloride

### INDICATIONS

➤ **Agitated psychotic states, hallucinations, manic-depressive illness, excessive motor and autonomic activity, nausea and vomiting, moderate anxiety, behavioral problems caused by chronic organic mental syndrome, tetanus, acute intermittent porphyria, intractable hiccups, itching, symptomatic rhinitis**

### ACTION

Phenothiazines are believed to function as dopamine antagonists by blocking postsynaptic dopamine receptors in various parts of the CNS. Their antiemetic effects result from blockage of the chemoreceptor trigger zone. They also produce varying degrees of anticholinergic effects and alpha-adrenergic–receptor blocking.

### ADVERSE REACTIONS

Phenothiazines may produce extrapyramidal symptoms, such as dystonic movements, torticollis, oculogyric crises, and parkinsonian symptoms ranging from akathisia during early treatment to tardive dyskinesia after long-term use. A neuroleptic malignant syndrome resembling severe parkinsonism may occur, most often in young men taking fluphenazine.

Other adverse reactions include abdominal pain, agitation, anorexia, arrhythmias, confusion, constipation, dizziness, dry mouth, endocrine effects, fainting, hallucinations, hematologic disorders, local gastric irritation, nausea, orthostatic hypotension with reflex tachycardia, photosensitivity, seizures, skin eruptions, urine retention, visual disturbances, and vomiting.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with CNS depression, bone marrow suppression, heart failure, circulatory collapse, coronary artery or cerebrovascular disorders, subcortical damage, or coma. Also contraindicated in patients receiving spinal and epidural anesthetics and adrenergic blockers.
- Use cautiously in debilitated patients and in those with hepatic, renal, or CV disease; respiratory disorders; hypocalcemia; seizure disorders; suspected brain tumor or intestinal obstruction; glaucoma; and prostatic hyperplasia.
- In pregnant women, use only if clearly necessary; safety hasn't been established. Women shouldn't breast-feed during therapy because most phenothiazines appear in breast milk and directly affect prolactin levels. For children younger than age 12, phenothiazines aren't recommended unless otherwise specified; use cautiously for nausea and vomiting. Acutely ill children, such as those with chickenpox, measles, CNS infections, or dehydration have a greatly increased risk of dystonic reactions. Elderly patients are more sensitive to therapeutic and adverse effects, especially cardiac toxicity, tardive dyskinesia, and other extrapyramidal effects; use cautiously and give reduced doses, adjusting dosage to patient response.

## Progestins

medroxyprogesterone acetate
norethindrone
norethindrone acetate

### INDICATIONS

➤ **Amenorrhea, endometrial hyperplasia, abnormal uterine bleeding, endometriosis**

### ACTION

Progestins transform proliferative endometrium into secretory endometrium.

### ADVERSE REACTIONS

Progestins may cause amenorrhea, breakthrough bleeding, spotting, changes in menstrual flow, breast enlargement and tenderness, alterations in weight, and mood changes.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with impaired liver function or liver disease; known or suspected breast cancer; active deep vein thrombosis, pulmonary embolism, or history of these conditions; active or recent arterial thromboembolic disease; and undiagnosed vaginal bleeding. Also contraindicated in patients hypersensitive to the drug components.
- Use cautiously in patients with depression, epilepsy, migraine headaches, asthma, cardiac dysfunction, or renal dysfunction.
- In pregnant women, use is contraindicated. Use cautiously in breast-feeding women because detectable amounts of progestins have been identified in the breast milk of mothers receiving these drugs. Progestins aren't indicated in children.

## Protease inhibitors

atazanavir sulfate
fosamprenavir calcium
indinavir sulfate
lopinavir and ritonavir
nelfinavir mesylate
ritonavir
saquinavir mesylate
tipranavir

### INDICATIONS

➤ **HIV infection and AIDS**

### ACTION

Protease inhibitors bind to the protease active site and inhibit HIV protease activity. This enzyme is required for the proteolysis of viral polyprotein precursors into individual functional proteins found in infectious HIV. The net effect is formation of noninfectious, immature viral particles.

### ADVERSE REACTIONS

The most common adverse effects, which require immediate medical attention, include kidney stones, pancreatitis, diabetes or hyperglycemia, ketoacidosis, and paresthesia.

Common adverse effects that don't need medical attention unless they persist or are bothersome include generalized weakness, GI disturbances, headache, insomnia, and taste disturbance. Less common adverse effects include dizziness and somnolence.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs or their components and patients taking a drug highly dependent on CYP3A4 for metabolism.
- Use cautiously in patients with impaired hepatic or renal function and those with diabetes mellitus or hemophilia.
- In pregnant women, use drug only if benefits outweigh risks. Contact the pregnancy registry at 1-800-258-4263 or www.apregistry.com to report pregnant women on therapy. HIV-infected mothers shouldn't breast-feed to reduce the risk of transmitting HIV to the infant.

## Proton pump inhibitors

dexlansoprazole
esomeprazole
lansoprazole
omeprazole
pantoprazole
rabeprazole

### INDICATIONS

➤ **Duodenal ulcers, gastric ulcers, erosive esophagitis, and GERD (all proton pump inhibitors); hypersecretory conditions (Zollinger-Ellison syndrome) (lansoprazole, omeprazole, pantoprazole, rabeprazole)**

### ACTION

The drugs reduce stomach acid production by combining with hydrogen, potassium, and adenosine triphosphate in parietal cells of the stomach to block the last step in gastric acid secretion.

### ADVERSE REACTIONS

Proton pump inhibitors may cause abdominal pain, diarrhea, constipation, flatulence, nausea, dry mouth, headache, asthenia, cough, abnormal liver function test results, and hyperglycemia.

### CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to the drug components.

## Selective serotonin reuptake inhibitors

citalopram hydrobromide
escitalopram oxalate
fluoxetine hydrochloride
fluvoxamine maleate
paroxetine hydrochloride
sertraline hydrochloride

### INDICATIONS

➤ **Major depression, obsessive-compulsive disorder, bulimia nervosa, premenstrual dysphoric disorders, panic disorders, post-traumatic stress disorder (sertraline)**

### ACTION

SSRIs selectively inhibit the reuptake of serotonin with little or no effects on other neurotransmitters such as norepinephrine or dopamine, in the CNS.

### ADVERSE REACTIONS

Common adverse effects include headache, tremor, dizziness, sleep disturbances, GI disturbances, and sexual dysfunction. Less common adverse effects include bleeding (ecchymoses, epistaxis), akathisia, breast tenderness or enlargement, extrapyramidal effects, dystonia, fever, hyponatremia, mania or hypomania, palpitations, serotonin syndrome, weight gain or loss, rash, urticaria, or pruritus.

### CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to these drugs or their components.
● Use cautiously in patients with hepatic, renal, or cardiac insufficiency.
● In pregnant women, use drug only if benefits outweigh risks; use of certain SSRIs in the first trimester may cause birth defects. Neonates born to women who took an SSRI during the third trimester may develop complications that warrant prolonged hospitalization, respiratory support, and tube feeding. In breast-feeding women, use isn't recommended. SSRIs appear in breast milk and may cause diarrhea and sleep disturbance in neonates. However, risks and benefits to both the woman and infant must be considered. Children and adolescents may be more susceptible to increased suicidal tendencies when taking SSRIs or other antidepressants. Elderly patients may be more sensitive to the insomniac effects of SSRIs.

## Skeletal muscle relaxants

baclofen
carisoprodol
cyclobenzaprine hydrochloride
dantrolene sodium
tizanidine hydrochloride

### INDICATIONS

➤ **Painful musculoskeletal disorders, spasticity caused by multiple sclerosis**

### ACTION

Baclofen may reduce impulse transmission from the spinal cord to skeletal muscle. Carisoprodol, cyclobenzaprine, and tizanidine's mechanism of action is unclear. Dantrolene acts directly on skeletal muscle to decrease excitation and reduce muscle strength by interfering with intracellular calcium movement.

### ADVERSE REACTIONS

Skeletal muscle relaxants may cause ataxia, confusion, depressed mood, dizziness, drowsiness, dry mouth, hallucinations, headache, hypotension, nervousness, tachycardia, tremor, and vertigo. Baclofen also may cause seizures.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs.
- Use cautiously in patients with impaired renal or hepatic function.
- In pregnant women and breast-feeding women, use only when potential benefits to the patient outweigh risks to the fetus or infant. In children, recommendations vary. Elderly patients have an increased risk of adverse reactions; monitor them carefully.

## Sulfonamides

sulfadiazine
sulfamethoxazole and trimethoprim

### INDICATIONS

➤ **Bacterial infections, nocardiosis, toxoplasmosis, chloroquine-resistant *Plasmodium falciparum* malaria**

### ACTION

Sulfonamides are bacteriostatic. They inhibit biosynthesis of tetrahydrofolic acid, which is needed for bacterial cell growth. They're active against some strains of staphylococci, streptococci, *Nocardia asteroides* and *brasiliensis*, *Clostridium tetani* and *perfringens*, *Bacillus anthracis*, *Escherichia coli*, and *Neisseria gonorrhoeae* and *meningitidis*. Sulfonamides are also active against organisms that cause UTIs, such as *E. coli*, *Proteus mirabilis* and *vulgaris*, *Klebsiella*, *Enterobacter*, and *Staphylococcus aureus*, and genital lesions caused by *Haemophilus ducreyi* (chancroid).

### ADVERSE REACTIONS

Many adverse reactions stem from hypersensitivity, including bronchospasm, conjunctivitis, erythema multiforme, erythema nodosum, exfoliative dermatitis, fever, joint pain, pruritus, leukopenia, Lyell syndrome, photosensitivity, rash, Stevens-Johnson syndrome, and toxic epidermal necrolysis. GI reactions include anorexia, diarrhea, folic acid malabsorption, nausea, pancreatitis, stomatitis, and vomiting. Hematologic reactions include agranulocytosis, granulocytopenia, hypoprothrombinemia, thrombocytopenia, and, in G6PD deficiency, hemolytic anemia. Renal effects usually result from crystalluria caused by precipitation of sulfonamide in renal system.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs.
- Use cautiously in patients with renal or hepatic impairment, bronchial asthma, severe allergy, or G6PD deficiency.
- In pregnant women at term and in breast-feeding women, use is contraindicated; sulfonamides appear in breast milk. In infants younger than age 2 months, sulfonamides are contraindicated unless there's no therapeutic alternative. In children with fragile X chromosome and mental retardation, use cautiously. Elderly patients are susceptible to bacterial and fungal superinfection and have an increased risk of folate deficiency anemia and adverse renal and hematologic effects.

## Tetracyclines

doxycycline
doxycycline hyclate
doxycycline monohydrate
minocycline hydrochloride
tetracycline hydrochloride
tigecycline

### INDICATIONS

➤ **Bacterial, protozoal, rickettsial, and fungal infections**

### ACTION

Tetracyclines are bacteriostatic but may be bactericidal against certain organisms. They bind reversibly to 30S and 50S ribosomal subunits, which inhibits bacterial protein synthesis.

Susceptible gram-positive organisms include *Bacillus anthracis, Actinomyces israelii, Clostridium perfringens* and *tetani, Listeria monocytogenes*, and *Nocardia.*

Susceptible gram-negative organisms include *Neisseria meningitidis, Pasteurella multocida, Legionella pneumophila, Brucella, Vibrio cholerae, Yersinia enterocolitica, Yersinia pestis, Bordetella pertussis, Haemophilus influenzae, H. ducreyi, Campylobacter fetus, Shigella,* and many other common pathogens.

Other susceptible organisms include *Rickettsia akari, typhi, prowazekii*, and *tsutsugamushi; Coxiella burnetii; Chlamydia trachomatis* and *psittaci; Mycoplasma pneumoniae* and *hominis; Leptospira; Treponema pallidum* and *pertenue;* and *Borrelia recurrentis.*

### ADVERSE REACTIONS

The most common adverse effects involve the GI tract and are dose related; they include abdominal discomfort; anorexia; bulky, loose stools; epigastric burning; flatulence; nausea; and vomiting. Superinfections also are common.

Photosensitivity reactions may be severe. Renal failure may be caused by Fanconi syndrome after use of outdated tetracycline. Permanent discoloration of teeth occurs if drug is given during tooth formation in children younger than age 8.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs.
- Use cautiously in patients with renal or hepatic impairment.
- In pregnant or breast-feeding women, use is contraindicated; tetracyclines appear in breast milk. Children younger than age 8 shouldn't take tetracyclines; these drugs can cause permanent tooth discoloration, enamel hypoplasia, and a reversible decrease in bone calcification. Elderly patients may have decreased esophageal motility; use these drugs cautiously, and monitor patients for local irritation from slow passage of oral forms. Elderly patients also are more susceptible to superinfection.

## Thrombolytics

alteplase
drotrecogin alfa
reteplase
tenecteplase
urokinase

### INDICATIONS

➤ **To dissolve a preexisting clot or thrombus, often in acute or emergency situations**

➤ **Acute MI, acute ischemic stroke, pulmonary embolism and peripheral vascular occlusion; restore patency to clotted grafts and I.V. access devices (alteplase); acute MI (reteplase and tenecteplase); pulmonary embolism, coronary artery thrombosis, and catheter clearance (urokinase)**

### ACTION

Thrombolytics convert plasminogen to plasma, which lyse thrombi, fibrinogen and other plasma proteins.

### ADVERSE REACTIONS

The most common with streptokinase are bleeding, allergic responses, reperfusion arrhythmias, hemorrhage, infarct at the site of myocardial necrosis, and temperature elevation. Other adverse reactions common to all are bleeding, allergic reactions, flushing, headache, musculoskeletal pain, nausea, and hypotension.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to any of the drug components.
- Contraindicated in active bleeding, history of stroke, recent intracranial or intraspinal surgery or trauma, intracranial neoplasm, arteriovenous malformation or aneurysm, bleeding diathesis, or severe uncontrolled hypertension.

## Vasopressors

dobutamine hydrochloride
dopamine hydrochloride
ephedrine sulfate
norepinephrine bitartrate
phenylephrine hydrochloride

### INDICATIONS

➤ **Correction of hemodynamic imbalances present in cardiogenic shock due to MI, trauma, septicemia, cardiac surgical procedures, spinal anesthesia, drug reactions, renal failure, and heart failure**

➤ **As vasoconstrictor in regional analgesia and to overcome paroxysmal supraventricular tachycardia (phenylephrine hydrochloride)**

➤ **Stokes-Adams syndrome with complete heart block, narcolepsy, and myasthenia gravis (ephedrine sulfate)**

### ACTION

Dobutamine is a direct-acting inotropic whose primary activity results from stimulation of the beta receptors of the heart while producing mild chronotropic, hypertensive, arrhythmogenic, and vasodilatory effects. Dobutamine increases cardiac output by decreasing peripheral vascular resistance, reducing ventricular filling pressure, and increasing AV node conduction. Dopamine is a natural catecholamine, a precursor to norephinephrine in noradrenergic nerves, and a neurotransmitter in certain areas of the central nervous system. It produces positive chronotropic and inotropic effects on the myocardium, resulting in increased heart rate and cardiac contractility. This is accomplished by directly exerting an agonist action on beta-adrenoreceptors.

### ADVERSE REACTIONS

Adverse reactions to vasopressors may include ventricular arrhythmias, tachycardia, angina, palpitations, cardiac conduction abnormalities, widened QRS complex, bradycardia, hypotension, hypertension, vasoconstriction, headache, anxiety, azotemia, dyspnea, phlebitis, peripheral cyanosis, and gangrene of extremities. Difficult or painful urination can be seen with ephedrine. Less common are hypotension, thrombocytopenia, hypokalemia, nausea, and shortness of breath.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to any of the drug components.
- Contraindicated in patients with pheochromocytoma, uncorrected tachyarrhythmias, or ventricular fibrillation.
- Dobutamine is contraindicated in idiopathic hypertropic subaortic stenosis.
- Before treatment, hypovolemia should be corrected.
- Some vasopressors must be used cautiously in patients with a sulfite allergy, particularly asthmatic patients. Allergic type reactions, including anaphylactic symptoms and severe asthmatic episodes can occur.
- Infusion should be given into a large vein to prevent extravasation into surrounding tissue because this can cause tissue necrosis.
- Patients taking MAO inhibitors or who have been treated with MAO inhibitors 2 to 3 weeks before infusion will require substantially reduced dosage of dopamine.
- Norephinephrine bitartrate shouldn't be used during cyclopropane and halothane anesthesia because of the risk of ventricular tachycardia or fibrillation.
- Use cautiously in elderly patients and in patients with hyperthyroidism, bradycardia, partial heart block, myocardial disease, or severe arteriosclerosis.
- Safety and effectiveness in pediatric patients haven't been established. Phenylephrine can be used to treat hypotension during spinal anesthesia in children.
- Drugs should be given to pregnant women only if clearly indicated.
- Caution should be used when these drugs are administered to breast-feeding women.

## Xanthine derivatives

theophylline

### INDICATIONS

➤ **Asthma and bronchospasm from emphysema and chronic bronchitis**

## ACTION

Xanthine derivatives are structurally related; they directly relax smooth muscle, stimulate the CNS, induce diuresis, increase gastric acid secretion, inhibit uterine contractions, and exert weak inotropic and chronotropic effects on the heart. Of these drugs, theophylline exerts the greatest effect on smooth muscle.

The action of xanthine derivatives isn't completely caused by inhibition of phosphodiesterase. Current data suggest that inhibition of adenosine receptors or unidentified mechanisms may be responsible for therapeutic effects. By relaxing smooth muscle of the respiratory tract, they increase airflow and vital capacity. They also slow onset of diaphragmatic fatigue and stimulate the respiratory center in the CNS.

## ADVERSE REACTIONS

Adverse effects, except for hypersensitivity, are dose related and can be controlled by dosage adjustment. Common reactions include arrhythmias, headache, hypotension, irritability, nausea, palpitations, restlessness, urine retention, and vomiting.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to these drugs.
- Use cautiously in patients with arrhythmias, cardiac or circulatory impairment, cor pulmonale, hepatic or renal disease, active peptic ulcers, hyperthyroidism, or diabetes mellitus.
- In pregnant women, use cautiously. In breast-feeding women, avoid these drugs because they appear in breast milk, and infants may have serious adverse reactions. Small children may have excessive CNS stimulation; monitor them closely. In elderly patients, use cautiously.

# abacavir sulfate

ah-BAK-ah-veer

Ziagen

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Nucleoside reverse transcriptase inhibitor
*Pregnancy risk category C*

## AVAILABLE FORMS

*Oral solution:* 20 mg/ml
*Tablets:* 300 mg

## INDICATIONS & DOSAGES

➤ **HIV-1 infection**

*Adults:* 300 mg P.O. b.i.d. or 600 mg P.O. daily with other antiretrovirals.
*Children ages 3 months to 16 years:* Give 8 mg/kg P.O. b.i.d., up to maximum of 300 mg P.O. b.i.d., with other antiretrovirals.
***Adjust-a-dose:*** In patients with mild hepatic impairment (Child-Pugh score 5 to 6), give 200 mg (oral solution) P.O. b.i.d. Don't use in patients with moderate to severe hepatic impairment.

## ADMINISTRATION

**P.O.**

- Always give drug with other antiretrovirals, never alone.
- Patient may take drug with or without food.

## ACTION

Converted intracellularly to the active metabolite carbovir triphosphate, which inhibits activity of HIV-1 reverse transcriptase, terminating viral DNA growth.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* 1 to 2 hours.

## ADVERSE REACTIONS

**CNS:** fever, headache, insomnia and sleep disorders.
**GI:** *anorexia, diarrhea, nausea, vomiting.*
**Skin:** rash.
**Other:** ***hypersensitivity reaction.***

## INTERACTIONS

**Drug-lifestyle.** *Alcohol use:* May decrease elimination of drug, increasing overall exposure. Monitor alcohol consumption. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase GGT, glucose, and triglyceride levels.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Patients who carry the HLA-B*5701 allele are at high risk for hypersensitivity reactions; patients should be screened prior to beginning therapy. ■

- Contraindicated in patients hypersensitive to drug or its components.
- Contraindicated in patients with moderate to severe hepatic impairment.

**Black Box Warning** Due to increased risk of hepatotoxicity, use cautiously when giving drug to patients at risk for liver disease. Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported with the use of nucleoside analogues alone or in combination, including abacavir and other antiretrovirals. Stop treatment with drug if events occur. ■

- Use cautiously in pregnant women because the effects are unknown. Use during pregnancy only if the potential benefits outweigh the risk. Register pregnant women with the Antiretroviral Pregnancy Registry at 1-800-258-4263.

## NURSING CONSIDERATIONS

- Women are more likely than men to experience lactic acidosis and severe hepatomegaly with steatosis. Obesity and prolonged nucleoside exposure may be risk factors.

**Black Box Warning** Drug can cause fatal hypersensitivity reactions; if patient develops signs or symptoms of hypersensitivity (such as fever, rash, fatigue, nausea, vomiting, diarrhea, or abdominal pain), stop drug and notify prescriber immediately. ■

**Black Box Warning** Don't restart drug after a hypersensitivity reaction because severe signs and symptoms will recur within hours and may include life-threatening hypotension and death. To facilitate reporting of hypersensitivity reactions, register patients

with the Abacavir Hypersensitivity Reaction Registry at 1-800-270-0425. ■
• Because of a high rate of early virologic resistance, triple antiretroviral therapy with abacavir, lamivudine, and tenofovir shouldn't be used as new treatment regimen for naïve or pretreated patients. Monitor patients currently controlled with this combination and those who use this combination in addition to other antiretrovirals, and consider modification of therapy.
• Drug may mildly elevate glucose level.
• ***Look alike–sound alike:*** Don't confuse abacavir with amprenavir.

## PATIENT TEACHING

• Inform patient that drug can cause a life-threatening hypersensitivity reaction. Warn patient who develops signs or symptoms of hypersensitivity (such as fever, rash, severe tiredness, achiness, a generally ill feeling, nausea, vomiting, diarrhea, or stomach pain) to stop taking drug and notify prescriber immediately.
• Include information leaflet about drug with each new prescription and refill. Patient also should receive, and be instructed to carry, a warning card summarizing signs and symptoms of hypersensitivity.
• Inform patient that this drug doesn't cure HIV infection. Tell patient that drug doesn't reduce the risk of transmission of HIV to others through sexual contact or blood contamination and that its long-term effects are unknown.
• Tell patient to take drug exactly as prescribed with or without food.

# abatacept

uh-BAY-tuh-sept

Orencia

*Therapeutic class:* Antiarthritic
*Pharmacologic class:* Immunomodulator
*Pregnancy risk category C*

## AVAILABLE FORMS

*Lyophilized powder for injection:* 250 mg single-use vial (25 mg/ml when reconstituted)

## INDICATIONS & DOSAGES

➤ **To reduce signs and symptoms, induce major clinical response, inhibit disease progression and structural damage, and improve physical function in patients with moderate to severe rheumatoid arthritis whose response to one or more disease-modifying drugs has been inadequate. Used alone or with other disease-modifying drugs (except tumor necrosis factor [TNF] antagonists and anakinra)**

*Adults who weigh more than 100 kg (220 lb):* 1 g I.V. over 30 minutes. Repeat 2 and 4 weeks after initial infusion and then every 4 weeks thereafter.
*Adults who weigh 60 to 100 kg (132 to 220 lb):* 750 mg I.V. over 30 minutes. Repeat 2 and 4 weeks after initial infusion and then every 4 weeks thereafter.
*Adults who weigh less than 60 kg:* 500 mg I.V. over 30 minutes. Repeat 2 and 4 weeks after initial infusion and then every 4 weeks thereafter.

➤ **As monotherapy or with methotrexate to reduce signs and symptoms of moderately to severely active juvenile idiopathic arthritis**

*Children 6 to 17 years weighing less than 75 kg (165 lb):* 10 mg/kg I.V. over 30 minutes. Repeat 2 and 4 weeks after initial infusion and then every 4 weeks thereafter. Maximum dose is 1,000 mg.
*Children 6 to 17 years weighing 75 kg or more:* Utilize adult dosing.

## ADMINISTRATION

**I.V.**

▼ Reconstitute vial with 10 ml of sterile water for injection, using only the silicone-free disposable syringe provided, to yield 25 mg/ml.
▼ Gently swirl contents until completely dissolved. Avoid vigorous shaking.
▼ Vent the vial with a needle to clear away foam.
▼ The solution should be clear and colorless to pale yellow.
▼ Further dilute the solution to 100 ml with normal saline solution. Infuse over 30 minutes using an infusion set and a sterile, nonpyrogenic, low–protein-binding filter.

▼ Store diluted solution at room temperature or refrigerate at 36° to 46° F (2° to 8° C). Complete infusion within 24 hours of reconstituting.
▼ **Incompatibilities:** Don't infuse in the same line with other I.V. drugs.

## ACTION

Inhibits T-cell activation, decreases T-cell proliferation, and inhibits production of TNF-alpha, interferon-gamma, and interleukin-2.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 13 days.

## ADVERSE REACTIONS

**CNS:** *headache,* dizziness.
**CV:** hypertension.
**EENT:** *nasopharyngitis,* rhinitis, sinusitis.
**GI:** *nausea,* diverticulitis, dyspepsia.
**GU:** acute pyelonephritis, UTI.
**Musculoskeletal:** back pain, limb pain.
**Respiratory:** *upper respiratory tract infection,* bronchitis, cough, pneumonia.
**Skin:** cellulitis, rash.
**Other:** *infections,* ***malignancies,*** herpes simplex, influenza, infusion reactions.

## INTERACTIONS

**Drug-drug.** *Anakinra, TNF antagonists:* May increase risk of infection. Don't use together.
*Live-virus vaccines:* May decrease effectiveness of vaccine. Avoid giving vaccines during or for 3 months after abatacept therapy.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or its components.
● Don't use in patients taking a TNF antagonist or anakinra.
● Use cautiously in patients with active infection, history of chronic infections, scheduled elective surgery, or COPD.
● Patients should be screened for viral hepatitis before starting therapy. Antirheumatic treatment may cause reactivation of hepatitis B.
● Patients who test positive for tuberculosis should be treated before receiving drug.

## NURSING CONSIDERATIONS

● Make sure patient has been screened for tuberculosis before giving.
● Monitor patient, especially an older adult, carefully for infections and malignancies.
● If patient develops a severe infection, notify prescriber; therapy may need to be stopped.
● If patient has COPD, watch for worsening.
● Drug may cause serious adverse reactions in a breast-fed infant and may affect his developing immune system.
● Ensure the availability of appropriate supportive measures to treat possible hypersensitivity reactions.

## PATIENT TEACHING

● Instruct patient to have tuberculosis screening before therapy.
● Tell patient to continue taking prescribed arthritis drugs. Caution against taking TNF antagonists, such as Enbrel, Remicade, and Humira, or anakinra.
● Tell patient to avoid exposure to infections.
● Tell patient to immediately report signs and symptoms of infection, swollen face or tongue, and difficulty breathing.
● Tell patient with COPD to report worsening signs and symptoms.
● Advise patient to avoid live-virus vaccines during and for 3 months after therapy.
● Advise woman to consult prescriber if she becomes pregnant or plans to breast-feed.
● Advise patient to contact prescriber before taking any other drugs or herbal supplements.
● Remind patient to contact prescriber before scheduling surgery.

# abciximab

ab-SIX-ah-mab

ReoPro

*Therapeutic class:* Antiplatelet
*Pharmacologic class:* Antiplatelet aggregator
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 2 mg/ml

## INDICATIONS & DOSAGES

➤ **Adjunct to percutaneous coronary intervention (PCI) to prevent acute cardiac ischemic complications**

*Adults:* 0.25 mg/kg as an I.V. bolus given 10 to 60 minutes before start of PCI; then, a continuous I.V. infusion of 0.125 mcg/kg/minute to maximum 10 mcg/minute for 12 hours.

➤ **Unstable angina not responding to conventional medical therapy in patients scheduled for PCI within 24 hours**

*Adults:* 0.25 mg/kg as an I.V. bolus; then an 18- to 24-hour infusion of 10 mcg/minute concluding 1 hour after PCI.

➤ **Before PCI in patients with ST-segment elevation myocardial infarction** ♦

*Adults:* 0.25 mg/kg as an I.V. bolus 10 to 60 minutes before start of PCI; then, a continuous I.V. infusion of 0.125 mcg/kg/minute to maximum of 10 mcg/minute for 12 hours.

## ADMINISTRATION

**I.V.**

▼ Give drug in a separate I.V. line. Don't add other drugs to infusion solution.
▼ Inspect solution for particulate matter before administration. If opaque particles are visible, discard solution and obtain new vial.
▼ For bolus, withdraw needed amount of drug through a low–protein-binding 0.2- or 5-micron syringe filter.
▼ Give bolus 10 to 60 minutes before procedure.
▼ For continuous infusion, filter drug either by withdrawing needed amount of drug through a low–protein-binding 0.2- or 5-micron syringe filter into a syringe or by infusing with a continuous infusion set equipped with a low–protein-binding 0.2 or 0.22-micron in-line filter. Use normal saline solution or $D_5W$.
▼ Infuse at 0.125 mcg/kg/minute (maximum, 10 mcg/minute) for 12 hours via a continuous infusion pump.
▼ Discard unused portion after 12-hour infusion.
▼ **Incompatibilities:** None reported.

## ACTION

Binds to the glycoprotein IIb/IIIa (GPIIb/IIIa) receptor of human platelets and inhibits platelet aggregation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | 48 hr |

*Half-life:* 10 to 30 minutes.

## ADVERSE REACTIONS

**CNS:** confusion, headache, pain.
**CV:** *hypotension*, ***bradycardia,*** *chest pain,* peripheral edema.
**GI:** *nausea,* abdominal pain, vomiting.
**Hematologic:** ***bleeding, thrombocytopenia,*** anemia.
**Musculoskeletal:** *back pain.*

## INTERACTIONS

**Drug-drug.** *Antiplatelet drugs, dipyridamole, heparin, NSAIDs, other anticoagulants, thrombolytics, ticlopidine:* May increase risk of bleeding. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

• May decrease hemoglobin level.
• May increase WBC count. May decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug, its ingredients, or murine proteins.
• Contraindicated in those with active internal bleeding, significant GI or GU bleeding within 6 weeks, stroke within past 2 years, or significant residual neurologic deficit, bleeding diathesis, thrombocytopenia (platelet count lower than 100,000/$mm^3$), major surgery or trauma

within 6 weeks, intracranial neoplasm, intracranial arteriovenous malformation, intracranial aneurysm, severe uncontrolled hypertension, or history of vasculitis.
• Contraindicated when oral anticoagulants have been given within past 7 days unless PT is 1.2 times control or less, or when I.V. dextran is used before or during PCI.
• Use with caution in patients at increased risk for bleeding, including those who weigh less than 75 kg (165 lb) or who are older than age 65, those who have a history of GI disease, and those who are receiving thrombolytics. Conditions that increase patient's risk of bleeding include PCI within 12 hours of onset of symptoms for acute MI, prolonged PCI (lasting longer than 70 minutes), or failed PCI. Heparin use may also increase the risk of bleeding.

### NURSING CONSIDERATIONS
• The risk of bleeding is reduced by using low-dose, weight-adjusted heparin, early sheath removal, and careful maintenance of access site immobility.
• Drug is intended for use with aspirin and heparin; review and monitor other drugs patient is taking.
***Alert:*** Keep epinephrine, dopamine, theophylline, antihistamines, and corticosteroids readily available in case of anaphylaxis.
• Monitor patient closely for bleeding at the arterial access site used for cardiac catheterization and internal bleeding involving the GI or GU tract or retroperitoneal sites.
• Institute bleeding precautions. Keep patient on bed rest for 6 to 8 hours after sheath removal or end of drug infusion, whichever is later. Minimize arterial and venous punctures, I.M. injections, urinary catheters, nasogastric tubes, automatic blood pressure cuffs, and nasotracheal intubation; avoid, if possible.
• During infusion, remove sheath only after heparin has been stopped and its effects largely reversed.
• Before treatment, obtain platelet count, PT, ACT, and activated PTT.
• Monitor platelet count closely. Obtain levels 2 to 4 hours after bolus dose, and 24 hours after bolus dose or before discharge, whichever is first.
• Anticipate stopping drug and giving platelets for severe bleeding or thrombocytopenia.
• ***Look alike–sound alike:*** Don't confuse abciximab with infliximab.

### PATIENT TEACHING
• Explain use and administration of drug to patient and family.
• Instruct patient to report adverse reactions immediately.

**SAFETY ALERT!**

## acamprosate calcium
a-kam-PRO-sate

Campral✔

*Therapeutic class:* Alcohol deterrent
*Pharmacologic class:* Synthetic amino acid neurotransmitter analog
*Pregnancy risk category C*

### AVAILABLE FORMS
*Tablets (delayed-release):* 333 mg

### INDICATIONS & DOSAGES
➤ **Adjunct to management of alcohol abstinence**
*Adults:* 666 mg P.O. t.i.d.
***Adjust-a-dose:*** In patients with creatinine clearance of 30 to 50 ml/minute, give 333 mg t.i.d. Do not use in patients with severe renal impairment (creatinine clearance 30 ml/min or less).

### ADMINISTRATION
**P.O.**
• Don't crush or break tablets.
• Give drug without regard for food.

### ACTION
Restores the balance of neuronal excitation and inhibition, probably by interacting with glutamate and gamma-aminobutyric acid neurotransmitter systems, thus reducing alcohol dependence.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3–8 hr | Unknown |

*Half-life:* 20 to 33 hours.

## ADVERSE REACTIONS

**CNS:** abnormal thinking, amnesia, anxiety, asthenia, depression, dizziness, headache, insomnia, paresthesia, somnolence, ***suicidal thoughts,*** syncope, tremor, pain.
**CV:** hypertension, palpitations, peripheral edema, vasodilation.
**EENT:** abnormal vision, pharyngitis, rhinitis.
**GI:** abdominal pain, anorexia, constipation, *diarrhea*, dry mouth, dyspepsia, flatulence, increased appetite, nausea, taste disturbance, vomiting.
**GU:** impotence.
**Metabolic:** weight gain.
**Musculoskeletal:** arthralgia, back pain, chest pain, myalgia.
**Respiratory:** bronchitis, dyspnea, increased cough.
**Skin:** increased sweating, pruritus, rash.
**Other:** accidental injury, chills, decreased libido, flulike symptoms, infection.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, bilirubin, blood glucose, and uric acid levels. May decrease hemoglobin level and hematocrit.
- May decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients allergic to drug or its components and in those whose creatinine clearance is 30 ml/minute or less.
- Use cautiously in pregnant or breast-feeding women, elderly patients, patients with moderate renal impairment, and patients with a history of depression and suicidal thoughts or attempts.

***Overdose S&S:*** Diarrhea, hypercalcemia in chronic overdose.

## NURSING CONSIDERATIONS

- Use only after the patient successfully becomes abstinent from drinking.
- Drug doesn't eliminate or reduce withdrawal symptoms.
- Monitor patient for development of depression or suicidal thoughts.
- Drug doesn't cause alcohol aversion or a disulfiram-like reaction if used with alcohol.

## PATIENT TEACHING

- Tell patient to continue the alcohol abstinence program, including counseling and support.
- Advise patient to notify his prescriber if he develops depression, anxiety, thoughts of suicide, or severe diarrhea.
- Caution patient's family or caregiver to watch for signs of depression or suicidal ideation.
- Tell patient that drug may be taken without regard to meals, but that taking it with meals may help him remember it.
- Tell patient not to crush, break, or chew the tablets but to swallow them whole.
- Advise women to use effective contraception while taking this drug. Tell patient to contact her prescriber if she becomes pregnant or plans to become pregnant.
- Explain that this drug may impair judgment, thinking, or motor skills. Urge patient to use caution when driving or performing hazardous activities until drug's effects are known.
- Tell patient to continue taking acamprosate and to contact his prescriber if he resumes drinking alcohol.

**SAFETY ALERT!**

# acarbose

a-KAR-boz

Precose

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Alpha-glucosidase inhibitor
*Pregnancy risk category B*

## AVAILABLE FORMS

*Tablets:* 25 mg, 50 mg, 100 mg

## INDICATIONS & DOSAGES

➤ **Adjunct to diet and exercise or with a sulfonylurea, metformin or insulin, to lower glucose level in patients with type 2 diabetes**

*Adults:* Individualized. Initially, 25 mg P.O. t.i.d. with first bite of each main meal. Adjust dosage every 4 to 8 weeks, based on 1-hour postprandial glucose level and

tolerance. Maintenance dosage is 50 to 100 mg P.O. t.i.d.

***Adjust-a-dose:*** For patients who weigh less than 60 kg (132 lb), don't exceed 50 mg P.O. t.i.d. For patients who weigh more than 60 kg, don't exceed 100 mg P.O. t.i.d.

## ADMINISTRATION

**P.O.**

- Give dose with first bite of each main meal.

## ACTION

Delays digestion of carbohydrates, resulting in a smaller increase in glucose level after meals.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | 2–4 hr |

*Half-life:* 2 hours.

## ADVERSE REACTIONS

**GI:** *abdominal pain, diarrhea, flatulence.*

## INTERACTIONS

**Drug-drug.** *Calcium channel blockers, corticosteroids, estrogens, fosphenytoin, hormonal contraceptives, isoniazid, nicotinic acid, phenothiazine, phenytoin, sympathomimetics, thiazides and other diuretics, thyroid products:* May lead to loss of glucose control or cause hypoglycemia when withdrawn. Monitor glucose level. *Digestive enzyme preparations containing carbohydrate-splitting enzymes (such as amylase, pancreatin), intestinal adsorbents (such as activated charcoal):* May reduce effect of acarbose. Avoid using together. *Digoxin:* May reduce digoxin level. Monitor digoxin level.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT and AST levels.

May decrease calcium, vitamin $B_6$, and hemoglobin and hematocrit.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with diabetic ketoacidosis, cirrhosis, inflammatory bowel disease, colonic ulceration, renal impairment, partial intestinal obstruction, predisposition to intestinal obstruction, chronic intestinal disease with marked disorder of digestion or absorption, or conditions that may deteriorate because of increased intestinal gas formation.
- Contraindicated in pregnant or breast-feeding women and those with creatinine level greater than 2 mg/dl.
- Use cautiously in patients receiving a sulfonylurea or insulin.
- Safety and effectiveness of drug haven't been established in children.

***Overdose S&S:*** Transient increases in flatulence, diarrhea, and abdominal discomfort.

## NURSING CONSIDERATIONS

- Closely monitor patients receiving a sulfonylurea or insulin; drug may increase risk of hypoglycemia. If hypoglycemia occurs, give oral glucose (dextrose). Severe hypoglycemia may require I.V. glucose infusion or glucagon administration. Because dosage adjustments may be needed to prevent further hypoglycemia, report hypoglycemia and treatment required to prescriber.
- Insulin therapy may be needed during increased stress (infection, fever, surgery, or trauma). Monitor patient closely for hyperglycemia.
- Monitor patient's 1-hour postprandial glucose level to determine therapeutic effectiveness of drug and to identify appropriate dose. Report hyperglycemia to prescriber. Thereafter, measure glycosylated hemoglobin level every 3 months.
- Monitor transaminase level every 3 months in first year of therapy and periodically thereafter in patients receiving more than 50 mg t.i.d. Report abnormalities; dosage adjustment or drug withdrawal may be needed.

## PATIENT TEACHING

- Tell patient to take drug daily with first bite of each of three main meals.
- Explain that therapy relieves symptoms but doesn't cure disease.
- Stress importance of adhering to therapeutic regimen, specific diet, weight reduction, exercise, and hygiene programs. Show patient how to monitor glucose level and to recognize and treat hyperglycemia.

- Teach patient taking a sulfonylurea how to recognize hypoglycemia. Advise treating symptoms with a form of dextrose rather than with a product containing table sugar.
- Urge patient to wear or carry medical identification at all times.
- Advise patient that adverse reactions usually occur in the first few weeks of therapy and diminish over time.

## acetaminophen (APAP, paracetamol)

a-seet-a-MIN-a-fen

Abenol† ◇, Acephen ◇, ACET† ◇, Aminofen ◇, Apap ◇, Apra ◇, Aspirin Free Anacin ◇, Atasol† ◇, Cetafen ◇, Ed-Apap Chidren's ◇, ElixSure ◇, FeverAll ◇, Genapap ◇, Genebs ◇, Infantaire ◇, Mapap ◇, Masaphen ◇, Neopap ◇, Nortemp Children's Pain and Fever ◇, Pediatrix† ◇, Q-Pap ◇, Quick Melts ◇, Silapap ◇, Tylenol ◇, UN-Aspirin ◇, Valorin ◇

*Tablets:* 160 mg ◇, 325 mg ◇, 500 mg ◇, 650 mg ◇
*Tablets (chewable):* 80 mg ◇, 160 mg ◇, 500 mg ◇
*Tablets (dispersible):* 80 mg ◇

### INDICATIONS & DOSAGES

➤ **Mild pain or fever**

***P.O.***

*Adults:* 325 to 650 mg P.O. every 4 to 6 hours. Or, two extended-release caplets P.O. every 8 hours. Maximum, 4 g daily. For long-term therapy, don't exceed 2.6 g daily unless prescribed and monitored closely by health care provider.
*Children older than age 12:* 650 mg P.O. every 4 to 6 hours p.r.n.
*Children age 12:* 640 mg P.O. every 4 to 6 hours p.r.n.
*Children age 11 weighing 33 to 43 kg (72 to 95 lb):* 480 mg P.O. every 4 to 6 hours p.r.n.
*Children ages 9 to 10 weighing 27 to 32 kg (60 to 71 lb):* 400 mg P.O. every 4 to 6 hours p.r.n.
*Children ages 6 to 8 weighing 22 to 26.8 kg (48 to 59 lb):* 320 mg P.O. every 4 to 6 hours p.r.n.
*Children ages 4 to 5 weighing 16 to 21 kg (36 to 47 lb):* 240 mg P.O. every 4 to 6 hours p.r.n.
*Children ages 2 to 3 weighing 11 to 15.9 kg (24 to 35 lb):* 160 mg P.O. every 4 to 6 hours p.r.n.

➤ **Mild pain or fever ♦**

*Children ages 12 to 23 months weighing 8 to 10.5 kg (18 to 23 lb):* 120 mg P.O. every 4 to 6 hours p.r.n.
*Children ages 4 to 11 months weighing 5.5 to 7.7 kg (12 to 17 lb):* 80 mg P.O. every 4 to 6 hours p.r.n.
*Children up to age 3 months weighing 2.7 to 5 kg (6 to 11 lb):* 40 mg P.O. every 4 to 6 hours p.r.n. Or, 10 to 15 mg/kg/dose every 4 hours p.r.n. Don't exceed five doses in 24 hours.

***Rectal***

*Adults and children older than age 12:* 650 mg P.R. every 4 to 6 hours p.r.n. Maximum, 4 g daily. For long-term therapy, don't exceed 2.6 g daily unless prescribed and monitored closely by health care provider.
*Children ages 6 to 12:* 325 mg P.R. every 4 to 6 hours p.r.n. Maximum dose is 1,950 mg in 24 hours.

*Children ages 3 to 6:* 120 mg P.R. every 4 to 6 hours p.r.n. Maximum dose is 720 mg in 24 hours.
*Children ages 1 to 3:* 80 mg P.R. every 4 hours p.r.n. Maximum dose is 480 mg in 24 hours.
*Children ages 3 months to 11 months:* 80 mg P.R. every 6 hours p.r.n.

## ADMINISTRATION

**P.O.**
- Use liquid form for children and patients who have difficulty swallowing.
- Give drug without regard for food.
- Dispersible tablet should be allowed to dissolve in the mouth or chewed before swallowing.

**Rectal**
- If suppository is too soft, refrigerate for 15 minutes or run under cold water in wrapper.

## ACTION

Thought to produce analgesia by inhibiting prostaglandin and other substances that sensitize pain receptors. Drug may relieve fever through central action in the hypothalamic heat-regulating center.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., P.R. | Unknown | ½–2 hr | 3–4 hr |

*Half-life:* 1 to 4 hours.

## ADVERSE REACTIONS

**Hematologic:** hemolytic anemia, ***leukopenia, neutropenia, pancytopenia.***
**Hepatic:** jaundice.
**Metabolic:** ***hypoglycemia.***
**Skin:** rash, urticaria.

## INTERACTIONS

**Drug-drug.** *Barbiturates, carbamazepine, hydantoins, rifampin, sulfinpyrazone:* High doses or long-term use of these drugs may reduce therapeutic effects and enhance hepatotoxic effects of acetaminophen. Avoid using together.
*Lamotrigine:* May decrease lamotrigine level. Monitor patient for therapeutic effects.
*Warfarin:* May increase hypoprothrombinemic effects with long-term use with high doses of acetaminophen. Monitor INR closely.
*Zidovudine:* May decrease zidovudine effect. Monitor patient closely.
**Drug-herb.** *Watercress:* May inhibit oxidative metabolism of acetaminophen. Discourage use together.
**Drug-food.** *Caffeine:* May enhance analgesic effects of acetaminophen. Products may combine caffeine and acetaminophen for therapeutic advantage.
**Drug-lifestyle.** *Alcohol use:* May increase risk of hepatic damage. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May decrease glucose and hemoglobin levels and hematocrit.
- May decrease neutrophil, WBC, RBC, and platelet counts.
- May cause false-positive test result for urinary 5-hydroxyindoleacetic acid. May falsely decrease glucose level in home monitoring systems.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with any type of liver disease and in patients with long-term alcohol use because therapeutic doses cause hepatotoxicity in these patients. Chronic alcoholics shouldn't take more than 2 g of acetaminophen every 24 hours.

***Overdose S&S:*** Stage 1 (up to 24 hours)—abdominal pain, diaphoresis, nausea, vomiting, malaise, pallor; stage 2 (24 to 36 hours)—right upper quadrant pain, elevated liver function test results and PT; stage 3 (72 to 96 hours)—hepatic failure, encephalopathy, coma.

## NURSING CONSIDERATIONS

***Alert:*** Many OTC and prescription products contain acetaminophen; be aware of this when calculating total daily dose.
- In children, don't exceed five doses in 24 hours.

## PATIENT TEACHING

- Tell parents to consult prescriber before giving drug to children younger than age 2.
- Advise parents that drug is only for short-term use; urge them to consult prescriber if

giving to children for longer than 5 days or adults for longer than 10 days.
***Alert:*** Advise patient or caregiver that many OTC products contain acetaminophen and should be counted when calculating total daily dose.
• Tell patient not to use for marked fever (temperature higher than 103.1° F [39.5° C]), fever persisting longer than 3 days, or recurrent fever unless directed by prescriber.
***Alert:*** Warn patient that high doses or unsupervised long-term use can cause liver damage. Excessive alcohol use may increase the risk of liver damage. Caution long-term alcoholics to limit drug to 2 g/day or less.
• Tell breast-feeding women that drug appears in breast milk in low levels (less than 1% of dose). Drug may be used safely if therapy is short-term and doesn't exceed recommended doses.

## acetaZOLAMIDE

ah-set-a-ZOLE-ah-mide

Acetazolam†, Diamox

## acetazolamide sodium

*Therapeutic class:* Diuretic
*Pharmacologic class:* Carbonic anhydrase inhibitor
*Pregnancy risk category C*

### AVAILABLE FORMS

**acetazolamide**
*Capsules (extended-release):* 500 mg
*Tablets:* 125 mg, 250 mg
**acetazolamide sodium**
*Powder for injection:* 500-mg vial

### INDICATIONS & DOSAGES

➤ **Secondary glaucoma; preoperative treatment of acute angle-closure glaucoma**
*Adults:* 250 mg P.O. every 4 hours or 250 mg P.O. b.i.d. for short-term therapy. In acute cases, 500 mg P.O.; then 125 to 250 mg P.O. every 4 hours. To rapidly lower intraocular pressure (IOP), initially, 500 mg I.V.; may repeat in 2 to 4 hours, if needed, followed by 125 to 250 mg P.O. every 4 to 6 hours.

➤ **Chronic open-angle glaucoma**
*Adults:* 250 mg to 1 g P.O. daily in divided doses q.i.d., or 500 mg extended-release P.O. b.i.d.

➤ **To prevent or treat acute mountain sickness (high-altitude sickness)**
*Adults and children age 12 and older:* 500 mg to 1 g (regular or extended-release) P.O. daily in divided doses every 12 hours. Start 24 to 48 hours before ascent and continue for 48 hours while at high altitude. When rapid ascent is required, start with 1,000 mg P.O. daily.

➤ **Adjunct for epilepsy and myoclonic, refractory, generalized tonic-clonic, absence, or mixed seizures**
*Adults:* 8 to 30 mg/kg P.O. daily in divided doses; 375 mg to 1 g daily is ideal. If given with other anticonvulsants, start at 250 mg P.O. once daily, and increase to 375 mg to 1 g daily.

➤ **Edema caused by heart failure; drug-induced edema**
*Adults:* 250 mg to 375 mg (5 mg/kg) P.O. daily in the morning. For best results, use every other day or 2 days on followed by 1 to 2 days off. Or, 250 to 375 mg I.V. once daily for 1 or 2 days, alternating with a day of rest.

### ADMINISTRATION

**P.O.**
• Give drug with food to minimize GI upset.
• Don't crush or open extended-release capsules.
• If patient can't swallow oral form, pharmacist may make a suspension using crushed tablets in a highly flavored syrup, such as cherry, raspberry, or chocolate to mask the bitter flavor. Although concentrations up to 500 mg/5 ml are possible, concentrations of 250 mg/5 ml are more palatable.
• Refrigeration improves palatability but doesn't improve stability. Suspensions are stable for 1 week.

**I.V.**
▼ Reconstitute drug in 500-mg vial with at least 5 ml of sterile water for injection. Use within 12 hours of reconstitution.

▼ Inject 100 to 500 mg/minute into a large vein using a 21G or 23G needle.
▼ Direct I.V. injection is the preferred route.
▼ Intermittent and continuous infusions aren't recommended.
▼ **Incompatibilities:** Multivitamins.

## ACTION

Promotes renal excretion of sodium, potassium, bicarbonate, and water. As anticonvulsant, drug normalizes neuronal discharge. In mountain sickness, drug stimulates ventilation and increases cerebral blood flow. In glaucoma, drug reduces intraocular pressure (IOP).

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 60–90 min | 1–4 hr | 8–12 hr |
| P.O. (extended-release) | 2 hr | 3–6 hr | 18–24 hr |
| I.V. | 2 min | 15 min | 4–5 hr |

*Half-life:* 10 to 15 hours.

## ADVERSE REACTIONS

**CNS:** ***seizures,*** drowsiness, paresthesia, confusion, depression, weakness, ataxia.
**EENT:** transient myopia, hearing dysfunction, tinnitus.
**GI:** nausea, vomiting, anorexia, metallic taste, diarrhea, black tarry stools, constipation.
**GU:** polyuria, hematuria, crystalluria, glycosuria, phosphaturia, renal calculus.
**Hematologic:** ***aplastic anemia, leukopenia, thrombocytopenia,*** hemolytic anemia.
**Metabolic:** hypokalemia, asymptomatic hyperuricemia, hyperchloremic acidosis.
**Skin:** *pain at injection site,* ***Stevens-Johnson syndrome,*** rash, urticaria.
**Other:** sterile abscesses.

## INTERACTIONS

**Drug-drug.** *Amphetamines, anticholinergics, mecamylamine, procainamide, quinidine:* May decrease renal clearance of these drugs, increasing toxicity. Monitor patient for toxicity.
*Cyclosporine:* May increase cyclosporine level, causing nephrotoxicity and neurotoxicity. Monitor patient for toxicity.
*Diflunisal:* May increase acetazolamide adverse effects; may significantly decrease IOP. Use together cautiously.
*Lithium:* May increase lithium excretion, decreasing its effect. Monitor lithium level.
*Methenamine:* May reduce methenamine effect. Avoid using together.
*Primidone:* May decrease serum and urine primidone levels. Monitor patient closely.
**Black Box Warning** *Salicylates:* May cause accumulation and toxicity of acetazolamide, resulting in CNS depression, metabolic acidosis, anorexia, and death. Administer with caution and monitor patient for toxicity. ■
**Drug-lifestyle.** *Sun exposure:* May increase risk of photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

● May increase uric acid level. May decrease potassium and hemoglobin levels and hematocrit.
● May decrease WBC and platelet counts.
● May decrease iodine uptake by the thyroid in hyperthyroid and euthyroid patients. May cause false-positive urine protein test result.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Fatalities have occurred due to severe reactions to sulfonamides, including Stevens-Johnson syndrome, toxic epidermal necrolysis, fulminant hepatic necrosis, agranulocytosis, aplastic anemia, and other blood dyscrasias. If signs and symptoms of hypersensitivity or other serious reaction occur, discontinue drug. ■
● Contraindicated in patients hypersensitive to drug and in those with hyponatremia or hypokalemia, renal or hepatic disease or dysfunction, renal calculi, adrenal gland failure, hyperchloremic acidosis, or severe pulmonary obstruction.
● Contraindicated in those receiving long-term treatment for chronic noncongestive angle-closure glaucoma.
● Use cautiously in patients receiving other diuretics and in those with respiratory acidosis or COPD.
⚠ ***Overdose S&S:*** Electrolyte imbalance, acidotic state, CNS effects.

## NURSING CONSIDERATIONS

**Black Box Warning** Cross-sensitivity between antibacterial sulfonamides and sulfonamide-derivative diuretics such as acetazolamide has been reported. ■

- Monitor fluid intake and output, glucose, and electrolytes, especially potassium, bicarbonate, and chloride. When drug is used in diuretic therapy, consult prescriber and dietitian about providing a high-potassium diet.
- Monitor elderly patients closely because they are especially susceptible to excessive diuresis.
- Weigh patient daily. Rapid or excessive fluid loss may cause weight loss and hypotension.
- Diuretic effect decreases when acidosis occurs but can be reestablished by using intermittent administration schedules.
- Monitor patient for signs of hemolytic anemia (pallor, weakness, and palpitations).
- Drug may increase glucose level and cause glycosuria.
- ***Look alike–sound alike:*** Don't confuse acetazolamide with acetaminophen or acyclovir.

## PATIENT TEACHING

- Tell patient to take oral form with food to minimize GI upset.
- Tell patient not to crush, chew, or open capsules.
- Caution patient not to perform hazardous activities if adverse CNS reactions occur.
- Instruct patient to avoid prolonged exposure to sunlight because drug may cause phototoxicity.
- Instruct patient to notify prescriber of any unusual bleeding, bruising, tingling, or tremors.

# acetylcysteine

a-se-teel-SIS-tay-een

Acetadote

*Therapeutic class:* Mucolytic
*Pharmacologic class:* L-cysteine derivative
*Pregnancy risk category B*

## AVAILABLE FORMS

*Solution:* 10%, 20%
*I.V. injection:* 200 mg/ml

## INDICATIONS & DOSAGES

➤ **Adjunct therapy for abnormal viscid or thickened mucous secretions in patients with pneumonia, bronchitis, bronchiectasis, primary amyloidosis of the lung, tuberculosis, cystic fibrosis, emphysema, atelectasis, pulmonary complications of thoracic surgery, or CV surgery**

*Adults and children:* 1 to 2 ml 10% or 20% solution by direct instillation into trachea as often as every hour. Or, 1 to 10 ml of 20% solution or 2 to 20 ml of 10% solution by nebulization every 2 to 6 hours, p.r.n.

➤ **Acetaminophen toxicity**

*Adults and children:* Initially, 140 mg/kg P.O.; then 70 mg/kg P.O. every 4 hours for 17 doses (total). Or, a loading dose of 150 mg/kg I.V. over 60 minutes; then I.V. maintenance dose of 50 mg/kg infused over 4 hours, followed by 100 mg/kg infused over 16 hours.

➤ **Prevention of contrast media nephrotoxicity ♦**

*Adults:* 600 mg P.O. b.i.d. starting one day before administration of contrast media and continued through the day of administration for a total of 4 doses.

## ADMINISTRATION

**P.O.**

- Dilute oral dose (used for acetaminophen overdose) with cola, fruit juice, or water. Dilute 20% solution to 5% (add 3 ml of diluent to each milliliter of drug). If patient vomits within 1 hour of receiving loading or maintenance dose, repeat dose. Use diluted solution within 1 hour.

• Drug smells strongly of sulfur. Mixing oral form with juice or cola improves its taste.
• Drug delivered through nasogastric tube may be diluted with water.
• Store opened, undiluted oral solution in the refrigerator for up to 96 hours.

**I.V.**
▼ Drug may turn from a colorless liquid to a slight pink or purple color once the stopper is punctured. This color change doesn't affect the drug.
▼ Drug is hyperosmolar and is compatible with $D_5W$, half-normal saline, and sterile water for injection.
▼ Adjust total volume given for patients who weigh less than 40 kg (88 lb) or who are fluid restricted.
▼ For patients who weigh 40 kg or more, dilute loading dose in 200 ml of $D_5W$, second dose in 500 ml, and third dose in 1,000 ml.
▼ For patients who weigh 25 to 40 kg (55 to 88 lb), dilute loading dose in 100 ml, second dose in 250 ml, and third dose in 500 ml.
▼ For patients who weigh 20 kg (44 lb), dilute loading dose in 60 ml, second dose in 140 ml, and third dose in 280 ml.
▼ For patients who weigh 15 kg (33 lb), dilute loading dose in 45 ml, second dose in 105 ml, and third dose in 210 ml.
▼ For patients who weigh 10 kg (22 lb), dilute loading dose in 30 ml, second dose in 70 ml, and third dose in 140 ml.
▼ Reconstituted solution is stable for 24 hours at room temperature.
▼ Vials contain no preservatives; discard after opening.
▼ **Incompatibilities:** Incompatible with rubber and metals, especially iron, copper, and nickel.

**Inhalational**
• Use plastic, glass, stainless steel, or another nonreactive metal when giving by nebulization. Hand-bulb nebulizers aren't recommended because output is too small and particle size too large.
• **Incompatibilities:** Physically or chemically incompatible with inhaled tetracyclines, erythromycin lactobionate, amphotericin B, and ampicillin sodium. If given by aerosol inhalation, nebulize these drugs separately. Iodized oil, trypsin, and hydrogen peroxide are physically incompatible with acetylcysteine; don't add to nebulizer.

## ACTION
Reduces the viscosity of pulmonary secretions by splitting disulfide linkages between mucoprotein molecular complexes. Also, restores liver stores of glutathione to treat acetaminophen toxicity.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.V., inhalation | Unknown | Unknown | Unknown |

*Half-life:* 6¼ hours.

## ADVERSE REACTIONS
**CNS:** abnormal thinking, fever, drowsiness, gait disturbances.
**CV:** chest tightness, flushing, hypertension, hypotension, tachycardia.
**EENT:** *rhinorrhea,* ear pain, eye pain, pharyngitis, throat tightness.
**GI:** *nausea, stomatitis, vomiting.*
**Respiratory:** ***bronchospasm,*** cough, dyspnea, rhonchi.
**Skin:** clamminess, diaphoresis, pruritus, rash, urticaria.
**Other:** ***anaphylactoid reaction, angioedema,*** chills.

## INTERACTIONS
**Drug-drug.** *Activated charcoal:* May limit acetylcysteine's effectiveness. Avoid using activated charcoal before or with acetylcysteine.

## EFFECTS ON LAB TEST RESULTS
None reported.

## CONTRAINDICATIONS & CAUTIONS
• Contraindicated in patients hypersensitive to drug.
• Use cautiously in elderly or debilitated patients with severe respiratory insufficiency. Use I.V. form cautiously in patients with asthma or a history of bronchospasm.

## NURSING CONSIDERATIONS
**Black Box Warning** Solution isn't for I.V. injection.
• Monitor cough type and frequency.

***Alert:*** Monitor patient for bronchospasm, especially if he has asthma.
● Ingestion of more than 150 mg/kg of acetaminophen may cause liver toxicity. Measure acetaminophen level 4 hours after ingestion to determine risk of liver toxicity.
***Alert:*** Drug is used for acetaminophen overdose within 24 hours of ingestion. Start drug immediately; don't wait for results of acetaminophen level. Give within 10 hours of acetaminophen ingestion to minimize hepatic injury.
● If you suspect acetaminophen overdose, obtain baseline AST, ALT, bilirubin, PT, BUN, creatinine, glucose, and electrolyte levels.
***Alert:*** Monitor patient receiving I.V. form for anaphylactoid reactions. If anaphylactoid reaction occurs, stop infusion and treat anaphylaxis. Once anaphylaxis treatment starts, restart infusion. If anaphylactoid symptoms return, stop drug. Contact the Poison Control Center at (800) 222-1222 for more information.
● Facial erythema may occur within 30 to 60 minutes of start of I.V. infusion and usually resolves without stopping infusion.
● When acetaminophen level is below toxic level according to nomogram, stop therapy.
● ***Look alike–sound alike:*** Don't confuse acetylcysteine with acetylcholine.
● The vial stopper doesn't contain natural rubber latex, dry natural rubber, or blends of natural rubber.

## PATIENT TEACHING

● Warn patient that drug may have a foul taste or smell that may be distressing.
● For maximum effect, instruct patient to cough to clear his airway before aerosol administration.

# activated charcoal

Actidose ◇, Actidose-Aqua ◇, Actidose with Sorbitol ◇, CharcoAid ◇, CharcoAid 2000 ◇, Liqui-Char ◇

# charcoal

Charcal Plus DS ◇, CharcoCaps ◇

*Therapeutic class:* Antidote
*Pharmacologic class:* Adsorbent
*Pregnancy risk category C*

## AVAILABLE FORMS

**activated charcoal**
*Granules:* 15 g ◇
*Liquid:* 12.5 g ◇*, 15 g ◇*, 25 g ◇*, 30 g ◇*, 50 g ◇*
*Oral suspension:* 15 g ◇, 30 g ◇
*Powder:* 15 g ◇, 30 g ◇, 40 g ◇, 120 g ◇, 240 g ◇
**charcoal**
*Capsules:* 260 mg ◇
*Tablets:* 250 mg ◇

## INDICATIONS & DOSAGES

➤ **Flatulence, dyspepsia, diarrhea**
*Adults:* 500 to 520 mg (charcoal) P.O. after meals or at first sign of discomfort. Repeat as needed, up to 5 g daily.

➤ **Poisoning**
*Adults and children from 1 to 12 years weighing over 32 kg (71 lbs):* 50 to 60 g P.O. of drug in sorbitol base.
*Children aged 1 to 12 years weighing 16 to 32 kg (38 to 71 lbs):* 25 to 30 g P.O. (sorbitol base).
*Adults and children older than 1 year:* 5 to 60 g P.O. (aqueous base). Dosage should be 10 times by volume the amount of poison ingested, if known. If amount of poison ingested is not known, a dosage of at least 20 to 30 g should be given.

## ADMINISTRATION

**P.O.**
● Give after emesis is complete because activated charcoal absorbs and inactivates ipecac syrup.
● For best effect, give within 30 minutes after poison ingestion.

• Mix powder (most effective form) with tap water to consistency of thick syrup. Add small amount of fruit juice or flavoring to make mix more palatable. Don't mix with ice cream, milk, or sherbet; these decrease adsorptive capacity of activated charcoal.
• Give by large-bore nasogastric tube after lavage, if needed.
• If patient vomits shortly after administration, repeat dose.
• Space doses at least 1 hour apart from other drugs if treatment is for indications other than poisoning.

## ACTION

Adheres to many drugs and chemicals, inhibiting their absorption from the GI tract. Also reduces volume of intestinal gas and relieves related discomfort.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Immediate | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**GI:** *black stools,* ***intestinal obstruction,*** nausea, constipation.

## INTERACTIONS

**Drug-drug.** *Acetaminophen, barbiturates, carbamazepine, digitoxin, digoxin, furosemide, glutethimide, hydantoins, methotrexate, nizatidine, phenothiazines, phenylbutazone, propoxyphene, salicylates, sulfonamides, sulfonylureas, tetracyclines, theophyllines, tricyclic antidepressants, valproic acid:* May reduce absorption of these drugs. Give charcoal at least 2 hours before or 1 hour after other drugs.
*Acetylcysteine, ipecac:* May inactivate these drugs. Give charcoal after vomiting has been induced by ipecac; remove charcoal by nasogastric tube before giving acetylcysteine.
**Drug-food.** *Milk, ice cream, sherbet:* May decrease adsorptive capacity of drug. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

None known.

## NURSING CONSIDERATIONS

• Although there are no known contraindications, drug isn't effective for treating all acute poisonings.
***Alert:*** Drug is commonly used for treating poisoning or overdose with acetaminophen, aspirin, atropine, barbiturates, dextropropoxyphene, digoxin, poisonous mushrooms, oxalic acid, parathion, phenol, phenytoin, propantheline, propoxyphene, strychnine, or tricyclic antidepressants. Check with poison control center for use in other types of poisonings or overdoses.
***Alert:*** Don't aspirate or allow patient to aspirate charcoal powder; this may result in death.
• Follow treatment with stool softener or laxative to prevent constipation unless sorbitol is part of product ingredients. Preparations made with sorbitol have a laxative effect that lessens risk of severe constipation or fecal impaction.
• If preparation with sorbitol is used, maintain patient's fluid and electrolyte needs.
• Don't use charcoal with sorbitol in dehydrated or fructose-intolerant patients or in children younger than age 1.
***Alert:*** Drug is ineffective for poisoning or overdose of cyanide, mineral acids, caustic alkalis, and organic solvents; it's not very effective for overdose of ethanol, lithium, methanol, and iron salts.
• ***Look alike–sound alike:*** Don't confuse Actidose with Actos.

## PATIENT TEACHING

• Explain use and administration of drug to patient (if awake) and family.
• Warn patient that stools will be black until all the charcoal has passed through the body.
• Instruct patient to drink 6 to 8 glasses of liquid per day because drug can cause constipation.
• Advise patient to call prescriber if diarrhea lasts for more than 2 days or is accompanied by fever.

# acyclovir (oral; injection)

ay-SYE-kloe-ver

Zovirax

# acyclovir sodium

Zovirax

*Therapeutic class:* Antiviral
*Pharmacologic class:* Synthetic purine nucleoside
*Pregnancy risk category B*

## AVAILABLE FORMS

*Capsules:* 200 mg
*Injection:* 500 mg/vial, 1 g/vial
*Suspension:* 200 mg/5 ml
*Tablets:* 400 mg, 800 mg

## INDICATIONS & DOSAGES

➤ **First and recurrent episodes of mucocutaneous herpes simplex virus (HSV-1 and HSV-2) infections in immunocompromised patients; severe first episodes of genital herpes in patients who aren't immunocompromised**

*Adults and children age 12 and older:* 5 mg/kg given I.V. over 1 hour every 8 hours for 7 days. Give for 5 to 7 days for severe first episode of genital herpes.
*Children younger than age 12:* Give 10 mg/kg I.V. over 1 hour every 8 hours for 7 days.

➤ **First genital herpes episode**

*Adults:* 200 mg P.O. every 4 hours while awake, five times daily. Continue for 10 days.

➤ **Intermittent therapy for recurrent genital herpes**

*Adults:* 200 mg P.O. every 4 hours while awake, five times daily. Continue for 5 days. Begin therapy at first sign of recurrence.

➤ **Long-term suppressive therapy for recurrent genital herpes**

*Adults:* 400 mg P.O. b.i.d. for up to 12 months. Or, 200 mg P.O. three to five times daily for up to 12 months.

➤ **Varicella zoster infections in immunocompromised patients**

*Adults and children age 12 and older:* 10 mg/kg I.V. over 1 hour every 8 hours for 7 days. Dosage for obese patients is 10 mg/kg based on ideal body weight every 8 hours for 7 days. Don't exceed maximum dosage equivalent of 20 mg/kg every 8 hours.
*Children younger than age 12:* Give 20 mg/kg I.V. over 1 hour every 8 hours for 7 days.

➤ **Varicella (chickenpox) infection in immunocompetent patients**

*Adults and children who weigh more than 40 kg (88 lb):* 800 mg P.O. q.i.d. for 5 days.
*Children age 2 and older, who weigh less than 40 kg:* 20 mg/kg (maximum 800 mg/dose) P.O. q.i.d. for 5 days. Start therapy as soon as symptoms appear.

➤ **Acute herpes zoster infection in immunocompetent patients**

*Adults and children age 12 and older:* 800 mg P.O. every 4 hours five times daily for 7 to 10 days.

➤ **Herpes simplex encephalitis**

*Adults and children age 12 and older:* 10 mg/kg I.V. over 1 hour every 8 hours for 10 days.
*Children ages 3 months to 12 years:* 20 mg/kg I.V. over 1 hour every 8 hours for 10 days.

➤ **Neonatal herpes simplex virus infection**

*Neonates to 3 months old:* 10 mg/kg I.V. over 1 hour every 8 hours for 10 days.

➤ **Prevention of recurrent ocular herpes infection ♦**

*Adults and children age 12 and older:* 600 to 800 mg P.O. daily for 8 to 12 months.

***Adjust-a-dose:*** For patients receiving the I.V. form, if creatinine clearance is 25 to 50 ml/minute, give 100% of dose every 12 hours; if clearance is 10 to 24 ml/minute, give 100% of dose every 24 hours; if clearance is less than 10 ml/minute, give 50% of dose every 24 hours.

For patients receiving the P.O. form, if normal dose is 200 mg every 4 hours five times daily and creatinine clearance is less than 10 ml/minute, give 200 mg P.O. every 12 hours. If normal dose is 400 mg every 12 hours and clearance is less than 10 ml/minute, give 200 mg every 12 hours. If normal dose is 800 mg every 4 hours five times daily and clearance is 10 to 25 ml/minute, give 800 mg every 8 hours; if clearance is less than 10 ml/minute, give 800 mg every 12 hours.

## ADMINISTRATION

**P.O.**

- Give drug without regard for meals, but give with food if stomach irritation occurs.
- Patient should take drug as prescribed, even after he feels better.

**I.V.**

▼ Solutions concentrated at 7 mg/ml or more may cause a higher risk of phlebitis.
▼ Encourage fluid intake because patient must be adequately hydrated during infusion.
▼ Bolus injection, dehydration (decreased urine output), renal disease, and use with other nephrotoxic drugs increase the risk of renal toxicity. Don't give by bolus injection.
▼ Give I.V. infusion over at least 1 hour to prevent renal tubular damage.
▼ Monitor intake and output, especially during the first 2 hours after administration.
***Alert:*** Don't give I.M. or subcutaneously.
▼ **Incompatibilities:** Amifostine, aztreonam, biological or colloidal solutions, cefepime, cisatracurium besylate, diltiazem hydrochloride, dobutamine hydrochloride, dopamine hydrochloride, fludarabine phosphate, foscarnet sodium, gemcitabine hydrochloride, idarubicin hydrochloride, levofloxacin, meperidine hydrochloride, meropenem, morphine sulfate, ondansetron hydrochloride, parabens, piperacillin sodium and tazobactam sodium, sargramostim, tacrolimus, vinorelbine tartrate.

## ACTION

Interferes with DNA synthesis and inhibits viral multiplication.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2½ hr | Unknown |
| I.V. | Immediate | Immediate | Unknown |

*Half-life:* 2 to 3½ hours with normal renal function; up to 19 hours with renal impairment.

## ADVERSE REACTIONS

**CNS:** *headache, malaise,* ***encephalopathic changes (including lethargy, obtundation, tremor, confusion, hallucinations, agitation, seizures, coma).***
**GI:** *nausea, vomiting,* diarrhea.
**GU:** ***acute renal failure,*** hematuria.
**Hematologic:** ***leukopenia, thrombocytopenia,*** thrombocytosis.
**Skin:** *inflammation or phlebitis at injection site,* rash, urticaria.

## INTERACTIONS

**Drug-drug.** *Interferon:* May have synergistic effect. Monitor patient closely.
*Probenecid:* May increase acyclovir level. Monitor patient for possible toxicity.
*Zidovudine:* May cause drowsiness or lethargy. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN and creatinine levels.
- May decrease WBC count. May increase or decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with neurologic problems, renal disease, or dehydration, and in those receiving other nephrotoxic drugs.
- Adequate studies haven't been done in pregnant women; use only if potential benefits outweigh risks to fetus.

***Overdose S&S:*** Agitation, coma, seizures, lethargy, elevated BUN and creatinine levels, renal failure.

## NURSING CONSIDERATIONS

***Alert:*** Long-term acyclovir use may result in nephrotoxicity. In patients with renal disease or dehydration and in those taking other nephrotoxic drugs, monitor renal function.
***Alert:*** If signs and symptoms of extravasation occur, stop I.V. infusion immediately and notify prescriber. Hyaluronidase may need to be injected subcutaneously at extravasation site as an antidote.
- Encephalopathic changes are more likely to occur in patients with neurologic disorders and in those who have had neurologic reactions to cytotoxic drugs.
- ***Look alike–sound alike:*** Don't confuse acyclovir sodium (Zovirax) with acetazolamide sodium (Diamox) vials, which may look alike.
- ***Look alike–sound alike:*** Don't confuse Zovirax with Zyvox.

### PATIENT TEACHING
- Tell patient to take drug as prescribed, even after he feels better.
- Tell patient drug is effective in managing herpes infection but doesn't eliminate or cure it. Warn patient that drug won't prevent spread of infection to others.
- Tell patient to avoid sexual contact while visible lesions are present.
- Teach patient about early signs and symptoms of herpes infection (such as tingling, itching, or pain). Tell him to notify prescriber and get a prescription for drug before the infection fully develops. Early treatment is most effective.

## acyclovir (topical)
ay-SYE-kloe-ver

Zovirax

*Therapeutic class:* Antiviral
*Pharmacologic class:* Nucleoside analogue
*Pregnancy risk category B*

### AVAILABLE FORMS
*Cream:* 5%
*Ointment:* 5%

### INDICATIONS & DOSAGES
➤ **Initial herpes genitalis; limited, non–life-threatening mucocutaneous herpes simplex virus infections in immunocompromised patients**
*Adults and children age 12 and older:* Cover all lesions every 3 hours six times daily for 7 days. Although dose varies depending on total lesion area, use about ½-inch (1.3-cm) ribbon of ointment on each 4-inch (10-cm) square of surface area.
➤ **Recurrent herpes labialis (cold sores)**
*Adults and children age 12 and older:* Apply cream five times daily for 4 days. Start therapy as early as possible after signs and symptoms start.

### ADMINISTRATION
**Topical**
- Apply with finger cot or rubber glove to prevent autoinoculation of other body sites and transmission of infection to others.
- All lesions must be thoroughly covered.
- Drug is for cutaneous use only; don't apply to eye.

### ACTION
Inhibits herpes simplex and varicella zoster viral DNA synthesis by inhibiting viral DNA polymerase action.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS
**Skin:** *mild pain, burning or stinging,* eczema, rash, dryness, pruritus, contact dermatitis, application site reactions.
**Other:** ***angioedema, anaphylaxis.***

### INTERACTIONS
None significant.

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive or chemically intolerant to drug.
- Women with active herpetic lesions near or on breast should avoid breast-feeding.

### NURSING CONSIDERATIONS
- Start therapy as early as possible after signs or symptoms begin.
- Drug isn't a cure for herpes, but it helps improve signs and symptoms.

### PATIENT TEACHING
- Teach patient that virus transmission can occur during treatment.
- Tell patient that there may be some discomfort with application.
- Stress importance of compliance for successful therapy.
- Teach patient that therapy should begin as soon as signs and symptoms appear.
- Tell patient to notify prescriber if adverse reactions occur.
- Instruct patient to store drug in a dry place at 59° to 77° F (15° to 25° C).

# adalimumab

ay-da-LIM-yoo-mab

Humira

*Therapeutic class:* Antiarthritic
*Pharmacologic class:* Tumor necrosis factor (TNF)-alpha blocker
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 20 mg/0.4 ml, 40 mg/0.8 ml as prefilled syringes or pens

## INDICATIONS & DOSAGES

➤ **Rheumatoid arthritis (RA); psoriatic arthritis; ankylosing spondylitis**

*Adults:* 40 mg subcutaneously every other week. Patient may continue to take methotrexate, steroids, NSAIDs, salicylates, analgesics or other disease-modifying antirheumatic drugs (known as DMARDs) during therapy. Patients with RA who aren't also taking methotrexate may have the dose increased to 40 mg weekly, if needed.

➤ **Moderate to severe Crohn's disease when response to conventional therapy is inadequate or when response to infliximab is lost or patient can't tolerate the drug**

*Adults:* Initially, 160 mg subcutaneously on day 1 given as four 40-mg injections in 1 day or as two 40-mg injections per day for 2 consecutive days; then 80 mg 2 weeks later (day 15), followed by a maintenance dose of 40 mg every other week starting at week 4 (day 29).

➤ **To reduce the signs and symptoms of moderately to severely active polyarticular juvenile idiopathic arthritis**

*Children 4 to 17 years who weigh between 15 kg (33 lbs) and less than 30 kg (66 lbs):* 20 mg subcutaneously every other week.
*Children 4 to 17 years who weigh 30 kg or more:* 40 mg subcutaneously every other week.

➤ **Moderate to severe chronic plaque psoriasis**

*Adults:* 80 mg subcutaneously, followed by 40 mg subcutaneously every other week starting one week after the initial dose. Treatment beyond one year has not been studied.

## ADMINISTRATION

**Subcutaneous**

● Inject subcutaneously into abdomen or thigh.

## ACTION

A recombinant human immunoglobulin $G_1$ monoclonal antibody that blocks human TNF-alpha. TNF-alpha participates in normal inflammatory and immune responses and in the inflammation and joint destruction of RA.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Variable | Variable | Unknown |

*Half-life:* 10 to 20 days.

## ADVERSE REACTIONS

**CNS:** headache.
**CV:** ***hemorrhage,*** hypertension.
**EENT:** *sinusitis.*
**GI:** abdominal pain, nausea.
**GU:** hematuria, UTI.
**Hematologic:** ***leukopenia, pancytopenia, thrombocytopenia.***
**Metabolic:** hypercholesterolemia, hyperlipidemia.
**Musculoskeletal:** back pain.
**Respiratory:** *upper respiratory tract infection,* bronchitis.
**Skin:** *rash.*
**Other:** *accidental injury, injection site reactions (erythema, itching, pain, swelling),* ***anaphylaxis, malignancy,*** allergic reactions, flulike syndrome.

## INTERACTIONS

**Drug-drug.** *Anakinra:* May increase risk of serious infections and neutropenia. Don't use together.
*Live-virus vaccines:* No data are available on secondary transmission of infection from live-virus vaccines. Avoid using together.
*Methotrexate:* May decrease clearance of adalimumab. Dosage adjustment isn't necessary.

## EFFECTS ON LAB TEST RESULTS

● May increase alkaline phosphatase and cholesterol levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components, in immunosuppressed patients, and those with an active chronic or localized infection.
- Use cautiously in patients with demyelinating disorders, a history of recurrent infection, those with underlying conditions that predispose them to infections, and those who have lived in areas where tuberculosis and histoplasmosis are endemic, and in the elderly.
- Use cautiously and monitor closely in heart failure patients.
- Don't give to pregnant women unless benefits outweigh risks. Because of the risk of serious adverse reactions, the patient should stop breast-feeding or stop using the drug.

## NURSING CONSIDERATIONS

- Give first dose under supervision of prescriber.

**Black Box Warning** Patient should be evaluated, and treated if necessary, for latent tuberculosis before starting adalimumab therapy. Closely monitor patient for possible development of tuberculosis even if he has tested negative before initiating therapy. ■

**Black Box Warning** Serious infections and sepsis, including tuberculosis and invasive fungal infections, may occur. If patient develops new infection during treatment, monitor him closely and if infection becomes serious, stop drug. ■

- Drug may increase the risk of malignancy. Patients with highly active RA may be at an increased risk for lymphoma.
- If patient develops anaphylaxis, a severe infection, other serious allergic reaction, or evidence of a lupuslike syndrome, stop drug.
- Drug may cause reactivation of hepatitis B virus in chronic carriers.

***Alert:*** The needle cover contains latex and shouldn't be handled by those with latex sensitivity.

## PATIENT TEACHING

- Tell patient to report evidence of tuberculosis or infection.
- Teach patient or caregiver how to give drug.

***Alert:*** Warn patient to seek immediate medical attention for symptoms of blood dyscrasias or infection, including fever, bruising, bleeding, and pallor.

- Tell patient to rotate injection sites and to avoid tender, bruised, red, or hard skin.
- Teach patient to dispose of used vials, needles, and syringes properly and not in the household trash or recyclables.
- Tell patient to refrigerate drug in its original container before use.

# adefovir dipivoxil

ah-DEF-oh-veer

Hepsera

*Therapeutic class:* Antiviral
*Pharmacologic class:* Acyclic nucleotide analogue
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 10 mg

## INDICATIONS & DOSAGES

➤ **Chronic hepatitis B infection**

*Adults and children age 12 and older:* 10 mg P.O. once daily.

***Adjust-a-dose:*** In patients with creatinine clearance of 30 to 49 ml/minute, give 10 mg P.O. every 48 hours. In patients with clearance of 10 to 29 ml/minute, give 10 mg P.O. every 72 hours. In patients receiving hemodialysis, give 10 mg P.O. every 7 days, after dialysis session.

## ADMINISTRATION

**P.O.**

- Give drug without regard for meals.

## ACTION

An acyclic nucleotide analogue that inhibits hepatitis B virus reverse transcription via viral DNA chain termination.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–4 hr | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *asthenia*, fever, headache.

**GI:** abdominal pain, diarrhea, dyspepsia, flatulence, nausea, vomiting.
**GU:** ***renal failure, renal insufficiency,*** *hematuria,* glycosuria.
**Hepatic:** ***hepatic failure,*** hepatomegaly with steatosis.
**Metabolic:** ***lactic acidosis.***
**Skin:** pruritus, rash.

## INTERACTIONS

**Drug-drug.** *Ibuprofen:* May increase adefovir bioavailability. Monitor patient for adverse effects.
*Nephrotoxic drugs (aminoglycosides, cyclosporine, NSAIDs, tacrolimus, vancomycin):* May increase risk of nephrotoxicity. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, amylase, AST, CK, creatinine, and lactate levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to any component of the drug.
- Use cautiously in patients with renal dysfunction, in those receiving nephrotoxic drugs, and in those with known risk factors for hepatic disease.
- In elderly patients, use cautiously because they're more likely to have decreased renal and cardiac function.
- Safety and effectiveness in children younger than age 12 haven't been established.

⚠ ***Overdose S&S:*** GI adverse reactions.

## NURSING CONSIDERATIONS

**Black Box Warning** Due to increased risk of nephrotoxicity, monitor renal function, especially in patients with renal dysfunction or those taking nephrotoxic drugs. ▮

**Black Box Warning** Patients may develop lactic acidosis and severe hepatomegaly with steatosis during treatment. Women, obese patients, and those taking antiretrovirals are at higher risk. Monitor hepatic function. Stop drug, if needed. ▮

**Black Box Warning** Stopping adefovir may cause severe worsening of hepatitis. Monitor hepatic function closely in patients who stop antihepatitis B therapy. ▮

- The ideal length of treatment hasn't been established.

**Black Box Warning** Offer patients HIV antibody testing; drug may promote resistance to antiretrovirals in patients with unrecognized or untreated HIV infection. ▮

- For pregnant women, call the Antiretroviral Pregnancy Registry at 1-800-258-4263 to monitor fetal outcome.

## PATIENT TEACHING

- Inform the patient that drug may be taken without regard to meals.
- Tell patient to immediately report weakness, muscle pain, trouble breathing, stomach pain with nausea and vomiting, dizziness, light-headedness, fast or irregular heartbeat, and feeling cold, especially in arms and legs.
- Warn patient not to stop taking this drug unless directed because it could cause hepatitis to become worse.
- Instruct woman to tell her prescriber if she becomes pregnant or is breast-feeding. It's unknown if drug appears in breast milk. Use cautiously in breast-feeding women.

# adenosine

a-DEN-oh-seen

Adenocard

*Therapeutic class:* Antiarrhythmic
*Pharmacologic class:* Nucleoside
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 3 mg/ml

## INDICATIONS & DOSAGES

➤ **To convert paroxysmal supraventricular tachycardia (PSVT) to sinus rhythm**
*Adults and children who weigh 50 kg (110 lb) or more:* 6 mg I.V. by rapid bolus injection over 1 to 2 seconds. If PSVT isn't eliminated in 1 to 2 minutes, give 12 mg by rapid I.V. push and repeat, if needed.
*Children who weigh less than 50 kg:* Initially, 0.05 to 0.1 mg/kg I.V. by rapid bolus injection followed by a saline flush. If PSVT isn't eliminated in 1 to 2 minutes, give additional bolus injections, increasing the

amount given by 0.05- to 0.1-mg/kg increments, followed by a saline flush. Continue, as needed, until conversion or a maximum single dose of 0.3 mg/kg is given.

## ADMINISTRATION

**I.V.**

▼ Don't give single doses exceeding 12 mg.
▼ In adults, avoid giving drug through a central line because more prolonged asystole may occur.
▼ Give by rapid I.V. injection to ensure drug action.
▼ Give directly into a vein, if possible. When giving through an I.V. line, use the port closest to the patient.
▼ Flush immediately and rapidly with normal saline solution to ensure that drug quickly reaches the systemic circulation.
▼ **Incompatibilities:** Other I.V. drugs.

## ACTION

Naturally occurring nucleoside that acts on the AV node to slow conduction and inhibit reentry pathways. Drug is also useful in treating PSVTs, including those with accessory bypass tracts (Wolff-Parkinson-White syndrome).

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |

*Half-life:* Less than 10 seconds.

## ADVERSE REACTIONS

**CNS:** dizziness, light-headedness, numbness, tingling in arms, headache.
**CV:** chest pressure, *facial flushing.*
**GI:** nausea.
**Respiratory:** *dyspnea, shortness of breath.*

## INTERACTIONS

**Drug-drug.** *Carbamazepine:* May cause high-level heart block. Use together cautiously.
*Digoxin, verapamil:* May cause ventricular fibrillation. Monitor ECG closely.
*Dipyridamole:* May increase adenosine's effects. Adenosine dose may need to be reduced. Use together cautiously.
*Methylxanthines (caffeine, theophylline):* May decrease adenosine's effects. Adenosine dose may need to be increased or patients may not respond to adenosine therapy.
**Drug-herb.** *Guarana:* May decrease patient's response to drug. Monitor patient.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug.
● Contraindicated in those with second- or third-degree heart block or sinus node disease (such as sick sinus syndrome and symptomatic bradycardia), except those with a pacemaker.
● Use cautiously in patients with asthma, emphysema, or bronchitis because bronchoconstriction may occur.

## NURSING CONSIDERATIONS

***Alert:*** By decreasing conduction through the AV node, drug may produce first-, second-, or third-degree heart block. Patients who develop high-level heart block after a single dose shouldn't receive additional doses.
***Alert:*** New arrhythmias, including heart block and transient asystole, may develop; monitor cardiac rhythm and treat as indicated.
● If solution is cold, crystals may form; gently warm solution to room temperature. Don't use solutions that aren't clear.
● Drug lacks preservatives. Discard unused portion. Don't refrigerate.
***Alert:*** Don't confuse adenosine with adenosine phosphate.

## PATIENT TEACHING

● Instruct patient to report adverse reactions promptly.
● Tell patient to report discomfort at I.V. site.
● Inform patient that he may experience flushing or chest pain lasting 1 to 2 minutes.

## albumin 5%
al-BYOO-min

Albumarc, Albuminar-5, Albutein 5%, Buminate 5%, Plasbumin-5

## albumin 20%
Plasbumin-20

## albumin 25%
Albuminar-25, Albutein 25%, Buminate 25%, Plasbumin-25

*Therapeutic class:* Plasma volume expander
*Pharmacologic class:* Blood derivative
*Pregnancy risk category C*

### AVAILABLE FORMS
**albumin 5%**
*Injection:* 50 mg/ml in 50-ml, 250-ml, 500-ml, 1,000-ml vials
**albumin 20%**
*Injection:* 200 mg/ml in 50-ml, 100-ml vials
**albumin 25%**
*Injection:* 250 mg/ml in 20-ml, 50-ml, 100-ml vials

### INDICATIONS & DOSAGES
➤ **Hypovolemic shock**
*Adults:* Initially, 500 to 750 ml of 5% solution by I.V. infusion, repeated every 30 minutes, as needed. As plasma volume approaches normal, rate of infusion of 5% solution shouldn't exceed 2 to 4 ml/minute. Dosage of 20% and 25% solution varies with patient's condition and response. As plasma volume approaches normal, rate of infusion of 25% solution shouldn't exceed 1 ml/minute.
*Children:* 12 to 20 ml of 5% solution/kg by I.V. infusion, repeated in 15 to 30 minutes if response is inadequate.

➤ **Burns**
*Adults:* 25% or 20% solution infused no faster than 2 to 3 ml/minute to maintain plasma albumin concentration at approximately 2.5 plus or minus 0.5 g/100 ml with a plasma oncotic pressure of 20 mm Hg (equal to a total plasma protein concentration of 5.2 g/100 ml). The duration of therapy is determined by the loss of protein from burned areas and in the urine.

➤ **Hypoproteinemia**
*Adults:* 200 to 300 ml of 25% albumin. Dosage varies with patient's condition and response. Usual daily dose is 50 to 75 g. Rate of infusion shouldn't exceed 2 ml/minute.
*Children:* Usual daily dosage is 25 g.

### ADMINISTRATION
**I.V.**
▼ Make sure patient is properly hydrated before infusion.
▼ Minimize waste when preparing and giving drug. This product is expensive, and supply shortages are common.
▼ Albumin 5% is infused undiluted; albumin 20% and 25% may be infused undiluted or diluted with normal saline solution or $D_5W$ injection.
▼ Avoid rapid I.V. infusion in stable patient. Specific rate is based on patient's age, condition, and diagnosis.
▼ Don't give more than 250 g in 48 hours.
▼ Use solution promptly. Discard unused solution.
▼ Make sure solution is a clear amber color. Don't use cloudy or sediment-filled solutions.
▼ Follow storage instructions on bottle. Freezing may cause bottle to break.
▼ **Incompatibilities:** Midazolam, vancomycin, verapamil hydrochloride, amino acid solutions, solutions containing alcohol.

### ACTION
Albumin 5% supplies colloid to the blood and expands plasma volume. Albumin 25% provides intravascular oncotic pressure in a 5:1 ratio, shifting fluid from interstitial spaces to the circulation and slightly increasing plasma protein level.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | <15 min | <15 min | Several hr |

*Half-life:* 15 to 20 days.

### ADVERSE REACTIONS
**CNS:** headache, fever.
**CV:** ***vascular overload after rapid infusion,*** hypotension, tachycardia.
**GI:** nausea, vomiting.

**Respiratory:** altered respiration, ***pulmonary edema.***
**Skin:** urticaria, rash.
**Other:** chills.

## INTERACTIONS

**Drug-drug.** *ACE inhibitors:* May increase risk of atypical reactions, such as flushing and hypotension. Withhold ACE inhibitors 24 hours before giving albumin, if possible.

## EFFECTS ON LAB TEST RESULTS

- May increase albumin level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with severe anemia, pulmonary edema, or cardiac failure.
- Use with extreme caution in patients with hypertension, low cardiac reserve, hypervolemia, pulmonary edema, or hypoalbuminemia with peripheral edema.
- Use cautiously in patients with hepatic or renal failure because of increased protein load.

## NURSING CONSIDERATIONS

***Alert:*** Watch for hemorrhage or shock after surgery or injury. Rapid increase in blood pressure may cause bleeding from sites that aren't apparent at lower pressures.
- Monitor vital signs carefully.
- Watch for signs of vascular overload (heart failure or pulmonary edema).
- Monitor fluid intake and output; protein, electrolyte, and hemoglobin levels; and hematocrit during therapy.

## PATIENT TEACHING

- Explain use and administration to patient and family.
- Tell patient to report adverse reactions promptly.

# albuterol sulfate

al-BYOO-ter-ole

AccuNeb, ProAir HFA, Proventil HFA, Ventolin HFA, VoSpire ER

*Therapeutic class:* Bronchodilator
*Pharmacologic class:* Adrenergic
*Pregnancy risk category C*

## AVAILABLE FORMS

*Inhalation aerosol:* 90 mcg/metered spray
*Solution for inhalation:* 0.083% (2.5 mg/3 ml), 0.5% (5 mg/ml), 0.042% (1.25 mg/3 ml), 0.021% (0.63 mg/3 ml)
*Syrup:* 2 mg/5 ml
*Tablets:* 2 mg, 4 mg
*Tablets (extended-release):* 4 mg, 8 mg

## INDICATIONS & DOSAGES

➤ **To prevent or treat bronchospasm in patients with reversible obstructive airway disease**

***Tablets (extended-release)***
*Adults and children age 12 and older:* 4 to 8 mg P.O. every 12 hours. Maximum, 32 mg daily.
*Children ages 6 to 11:* 4 mg P.O. every 12 hours. Maximum, 24 mg daily.

***Tablets***
*Adults and children age 12 and older:* 2 to 4 mg P.O. t.i.d. or q.i.d. Maximum, 32 mg daily.
*Children ages 6 to 11:* 2 mg P.O. t.i.d. or q.i.d. Maximum, 24 mg daily.

***Solution for inhalation***
*Adults and children age 12 and older:* 2.5 mg t.i.d. or q.i.d. by nebulizer, given over 5 to 15 minutes. To prepare solution, use 0.5 ml of 0.5% solution diluted with 2.5 ml of normal saline solution. Or, use 3 ml of 0.083% solution.
*Children ages 2 to 12 weighing more than 15 kg (33 lb):* 2.5 mg by nebulizer given over 5 to 15 minutes t.i.d. or q.i.d., with subsequent doses adjusted to response. Don't exceed 2.5 mg t.i.d. or q.i.d.
*Children ages 2 to 12 weighing 15 kg or less:* 0.63 mg or 1.25 mg by nebulizer given over 5 to 15 minutes t.i.d. or q.i.d. with subsequent doses adjusted to response. Don't exceed 2.5 mg t.i.d. or q.i.d.

***Syrup***
*Adults and children older than age 14:* 2 to 4 mg (1 to 2 tsp) P.O. t.i.d. or q.i.d. Maximum, 32 mg daily.
*Children ages 6 to 13:* 2 mg (1 tsp) P.O. t.i.d. or q.i.d. Maximum, 24 mg daily.
*Children ages 2 to 5:* Initially, 0.1 mg/kg P.O. t.i.d. Starting dose shouldn't exceed 2 mg (1 tsp) t.i.d. Maximum, 12 mg daily.
***Inhalation aerosol***
*Adults and children age 4 and older:* 1 to 2 inhalations every 4 to 6 hours as needed. Regular use for maintenance therapy to control asthma symptoms isn't recommended.
***Adjust-a-dose:*** For elderly patients and those sensitive to sympathomimetic amines, 2 mg P.O. t.i.d. or q.i.d. as oral tablets or syrup. Maximum, 32 mg daily.
➤ **To prevent exercise-induced bronchospasm**
*Adults and children age 4 and older:* 2 inhalations using the inhalation aerosol 15 minutes before exercise; up to 12 inhalations may be taken in 24 hours.

## ADMINISTRATION

**P.O.**
- When switching patient from regular to extended-release tablets, remember that a regular 2-mg tablet every 6 hours is equivalent to an extended-release 4-mg tablet every 12 hours.
- Give drug whole; don't break or crush extended-release tablets or mix them with food.

**Inhalational**
- If more than 1 inhalation is ordered, wait at least 2 minutes between inhalations.
- Use spacer device to improve drug delivery, if appropriate.
- Shake the inhaler before use.

## ACTION

Relaxes bronchial, uterine, and vascular smooth muscle by stimulating $beta_2$ receptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 15–30 min | 2–3 hr | 4–8 hr |
| P.O. (extended) | Unknown | 6 hr | 12 hr |
| Inhalation | 5–15 min | 30–120 min | 2–6 hr |

*Half-life:* About 4 hours.

## ADVERSE REACTIONS

**CNS:** *tremor, nervousness, headache, hyperactivity,* insomnia, dizziness, weakness, CNS stimulation, malaise.
**CV:** *tachycardia, palpitations,* hypertension.
**EENT:** dry and irritated nose and throat with inhaled form, nasal congestion, epistaxis, hoarseness, conjunctivitis.
**GI:** *nausea, vomiting,* heartburn, anorexia, altered taste, increased appetite.
**Metabolic:** hypokalemia.
**Musculoskeletal:** muscle cramps.
**Respiratory:** ***bronchospasm,*** cough, wheezing, dyspnea, bronchitis, increased sputum.
**Other:** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *CNS stimulants:* May increase CNS stimulation. Avoid using together.
*Digoxin:* May decrease digoxin level. Monitor digoxin level closely.
*MAO inhibitors, tricyclic antidepressants:* May increase adverse CV effects. Monitor patient closely.
*Propranolol and other beta blockers:* May cause mutual antagonism. Monitor patient carefully.

## EFFECTS ON LAB TEST RESULTS

- May decrease potassium level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its ingredients.
- Use cautiously in patients with CV disorders (including coronary insufficiency and hypertension), hyperthyroidism, or diabetes mellitus and in those who are unusually responsive to adrenergics.
- Use extended-release tablets cautiously in patients with GI narrowing.

***Overdose S&S:*** Exaggeration of adverse reactions, seizures, angina, hypotension, hypokalemia, cardiac arrest.

## NURSING CONSIDERATIONS

- Drug may decrease sensitivity of spirometry used for diagnosis of asthma.
- Syrup contains no alcohol or sugar and may be taken by children as young as age 2.

• In children, syrup may rarely cause erythema multiforme or Stevens-Johnson syndrome.
***Alert:*** Patient may use tablets and aerosol together. Monitor these patients closely for signs and symptoms of toxicity.
• ***Look alike–sound alike:*** Don't confuse albuterol with atenolol or Albutein.

### PATIENT TEACHING

• Warn patient about risk of paradoxical bronchospasm and to stop drug immediately if it occurs.
• Teach patient to perform oral inhalation correctly. Give the following instructions for using the MDI:
– Prime before first use, if not used for 2 weeks, or if MDI has been dropped.
– Shake the inhaler.
– Clear nasal passages and throat.
– Breathe out, expelling as much air from lungs as possible.
– Place mouthpiece well into mouth, seal lips around mouthpiece, and inhale deeply as you release a dose from inhaler. Or, hold inhaler about 1 inch (two fingerwidths) from open mouth; inhale while dose is released.
– Hold breath for several seconds, remove mouthpiece, and exhale slowly.
• If prescriber orders more than 1 inhalation, tell patient to wait at least 2 minutes before repeating procedure.
• Tell patient that use of a spacer device may improve drug delivery to lungs.
• If patient is also using a corticosteroid inhaler, instruct him to use the bronchodilator first and then to wait about 5 minutes before using the corticosteroid. This lets the bronchodilator open the air passages for maximal effectiveness of the corticosteroid.
• Tell patient to remove canister and wash inhaler with warm, soapy water at least once a week.
• Advise patient not to use more frequently than prescribed and not to increase dose or frequency without consulting physician.
• Advise patient not to chew or crush extended-release tablets or mix them with food.

## alefacept

ALE-fuh-sept

Amevive

*Therapeutic class:* Antipsoriatic
*Pharmacologic class:* Immunosuppressant
*Pregnancy risk category B*

### AVAILABLE FORMS

*Powder for injection:* 15-mg single-dose vials

### INDICATIONS & DOSAGES

➤ **Moderate to severe chronic plaque psoriasis in candidates for systemic therapy or phototherapy**
*Adults:* 15 mg I.M. once weekly for 12 weeks. Another 12-week course may be given if CD4+ T-lymphocyte count is normal and at least 12 weeks have passed since the previous treatment.
***Adjust-a-dose:*** Withhold dose if CD4+ T-lymphocyte count is below 250 cells/$mm^3$. Stop drug if CD4+ count remains below 250 cells/$mm^3$ for 1 month.

### ADMINISTRATION

**I.M.**
• Reconstitute 15-mg vial of alefacept with 0.6 ml of supplied diluent.
• Rotate I.M. injection sites so that the new injection is given at least 1 inch away from the old site, and not in an area that is bruised, tender, or hard.
• After reconstitution, use product immediately or within 4 hours.

### ACTION

An immunosuppressive protein that interferes with lymphocyte activation and reduces subsets of CD2+ T lymphocytes, which reduces circulating total CD4+ and CD8+ T-lymphocyte counts.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.M. | Unknown | Unknown | Unknown |

*Half-life:* About 11 days.

### ADVERSE REACTIONS

**CNS:** dizziness.

**CV:** coronary artery disorder.
**EENT:** pharyngitis.
**GI:** nausea.
**Hematologic:** **LYMPHOPENIA.**
**Musculoskeletal:** myalgia.
**Respiratory:** cough.
**Skin:** pruritus, *injection site pain, inflammation,* bleeding, edema or mass.
**Other:** ***infection,*** chills, ***malignancy,*** hypersensitivity reaction, accidental injury, antibody formation.

## INTERACTIONS

**Drug-drug.** *Immunosuppressants, phototherapy:* May increase risk of excessive immunosuppression. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

- May decrease CD4+ and CD8+ T-lymphocyte counts.
- May increase AST and ALT levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components, in breast-feeding women, and in patients with HIV, a history of systemic malignancy, or important infection.
- Use cautiously in patients at high risk for malignancy, patients with chronic or recurrent infections, and pregnant women.
- Use cautiously in elderly patients because of their increased rate of infection and malignancies.
- Safety and effectiveness in children haven't been established.

⚠ ***Overdose S&S:*** Chills, headache, arthralgia, sinusitis.

## NURSING CONSIDERATIONS

- Ensure that CD4+ T-lymphocyte count is normal before therapy. Monitor CD4+ T-lymphocyte count weekly for the 12-week course.
- Monitor patient carefully for evidence of infection or malignancy, and stop drug if it appears.
- Because effects on fetal development aren't known, give drug only if clearly needed. Enroll pregnant women receiving alefacept into the Astella Pharma US pregnancy registry at 1-866-AMEVIVE (1-866-263-8483).

## PATIENT TEACHING

- Tell patient about potential adverse reactions.
- Urge patient to report evidence of infection immediately.
- Tell patient that blood tests will be done regularly to monitor WBC counts.
- Tell patient to notify prescriber if she is or could be pregnant within 8 weeks of receiving drug.
- Advise patient to either stop breast-feeding or stop using the drug because of the risk of serious adverse reactions in the infant.

# alendronate sodium

ah-LEN-dro-nate

Fosamax✐, Fosamax Plus D

*Therapeutic class:* Antiosteoporotic
*Pharmacologic class:* Bisphosphonate
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 5 mg, 10 mg, 35 mg, 40 mg, 70 mg, 70 mg plus 2,800 international units vitamin $D_3$, 70 mg plus 5,600 international units vitamin $D_3$
*Oral solution:* 70 mg/75 ml

## INDICATIONS & DOSAGES

➤ **Osteoporosis in postmenopausal women; to increase bone mass in men with osteoporosis**
*Adults:* 10 mg P.O. daily or 70-mg tablet or solution P.O. once weekly.

➤ **Paget disease of bone (osteitis deformans)**
*Adults:* 40 mg P.O. daily for 6 months.

➤ **To prevent osteoporosis in postmenopausal women**
*Adults:* 5 mg P.O. daily or 35-mg tablet P.O. once weekly.

➤ **Glucocorticoid-induced osteoporosis in patients receiving glucocorticoids in a daily dose equivalent to 7.5 mg or more of prednisone and who have low bone mineral density**
*Adults:* 5 mg P.O. daily. For postmenopausal women not receiving estrogen, recommended dose is 10 mg P.O. daily.

➤ **Osteogenesis imperfecta ♦**
*Adults weighing 30 kg (66 lb) or more:* 10 mg P.O. once daily.
*Adults weighing less than 30 kg:* 5 mg P.O. once daily.

## ADMINISTRATION

**P.O.**
- Give drug with 6 to 8 ounces of water at least 30 minutes before patient's first food or drink of the day to facilitate delivery to the stomach.
- Give at least 2 ounces of water after oral solution.
- Don't allow patient to lie down for 30 minutes after taking drug.

## ACTION

Suppresses osteoclast activity on newly formed resorption surfaces, which reduces bone turnover. Bone formation exceeds resorption at remodeling sites, leading to progressive gains in bone mass.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* More than 10 years.

## ADVERSE REACTIONS

**CNS:** headache.
**GI:** abdominal pain, nausea, dyspepsia, constipation, diarrhea, flatulence, acid regurgitation, esophageal ulcer, vomiting, dysphagia, abdominal distention, gastritis, taste perversion.
**Musculoskeletal:** pain.

## INTERACTIONS

**Drug-drug.** *Antacids, calcium supplements, many oral drugs:* May interfere with absorption of alendronate. Instruct patient to wait at least 30 minutes after taking alendronate before taking other drug orally.
*Aspirin , NSAIDs:* May increase risk of upper GI adverse reactions with drug doses greater than 10 mg daily. Monitor patient closely.
*Ranitidine (I.V. form):* May increase availability of alendronate. Reduce dosage as needed.
**Drug-food.** *Any food:* May decrease absorption of drug. Advise patient to take with full glass of water at least 30 minutes before food, beverages, or ingestion of other drugs.

## EFFECTS ON LAB TEST RESULTS

- May decrease calcium and phosphate levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with hypocalcemia, severe renal insufficiency (CrCl less than 35 ml/min), or abnormalities of the esophagus that delay esophageal emptying.

***Alert:*** There may be an increased risk of atypical fractures of the thigh in patients treated with bisphosphonates.
- Contraindicated in patients unable to stand or sit upright for at least 30 minutes.
- Use cautiously in patients with active upper GI problems (dysphagia, symptomatic esophageal diseases, gastritis, duodenitis, ulcers) or mild to moderate renal insufficiency.

***Overdose S&S:*** Hypocalcemia, hypophosphatemia, upset stomach, heartburn, esophagitis, gastritis, ulcer.

## NURSING CONSIDERATIONS

- Correct hypocalcemia and other disturbances of mineral metabolism (such as vitamin D deficiency) before therapy begins.
- When used to treat osteoporosis, disease may be confirmed by findings of low bone mass on diagnostic studies or by history of osteoporotic fracture.
- The recommended daily intake of vitamin D is 400 to 800 international units. Fosamax Plus D provides 400 international units daily when taken once weekly. Patients at risk for vitamin D deficiency, such as those who are chronically ill, who are nursing home bound, who have a GI malabsorption syndrome, or who are older than age 70, may require additional supplementation.
- In Paget disease, drug is indicated for patients with alkaline phosphatase level at least two times upper limit of normal, for those who are symptomatic, and for those at risk for future complications from the disease.
- Monitor patient's calcium and phosphate levels throughout therapy.

• Severe musculoskeletal pain has been associated with biophosphate use and may occur within days, months, or years of start of therapy. When drug is stopped, symptoms may resolve partially or completely.
• ***Look alike–sound alike:*** Don't confuse Fosamax with Flomax.

### PATIENT TEACHING

• Stress importance of taking tablet only with 6 to 8 ounces of water at least 30 minutes before ingesting anything else, including food, beverages, and other drugs. Tell patient that waiting longer than 30 minutes improves absorption.
• Warn patient not to lie down for at least 30 minutes after taking drug to facilitate delivery to stomach and to reduce risk of esophageal irritation.
• Advise patient to report adverse effects immediately, especially chest pain or difficulty swallowing.
• Advise patient to take supplemental calcium and vitamin D if dietary intake is inadequate.
• Tell patient about benefits of weight-bearing exercises in increasing bone mass. If applicable, explain importance of reducing or eliminating cigarette smoking and alcohol use.

## alfuzosin hydrochloride

al-foo-ZOE-sin

Uroxatral✐

*Therapeutic class:* BPH drug
*Pharmacologic class:* Alpha$_1$ blocker
*Pregnancy risk category B*

### AVAILABLE FORMS

*Tablets (extended-release):* 10 mg

### INDICATIONS & DOSAGES

➤ **BPH**

*Men:* 10 mg P.O. immediately after same meal each day.

### ADMINISTRATION

**P.O.**

• Give drug after same meal each day.
• Don't crush tablets.

### ACTION

Selectively blocks alpha receptors in the prostate, which relaxes the smooth muscles in the bladder neck and prostate, improving urine flow and reducing symptoms of BPH.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 8 hr | Unknown |

*Half-life:* 10 hours.

### ADVERSE REACTIONS

**CNS:** dizziness, fatigue, headache, pain.
**EENT:** pharyngitis, sinusitis.
**GI:** abdominal pain, constipation, dyspepsia, nausea.
**GU:** impotence.
**Respiratory:** bronchitis, upper respiratory tract infection.

### INTERACTIONS

**Drug-drug.** *Antihypertensives (diltiazem):* May cause hypotension. Monitor blood pressure and use together cautiously.
*Atenolol:* May cause hypotension and reduce heart rate. Monitor blood pressure and heart rate for these effects.
*Cimetidine:* May increase alfuzosin level. Use together cautiously.
***Potent CYP3A4 inhibitors (itraconazole, ketoconazole, ritonavir):*** May inhibit hepatic metabolism of alfuzosin. Use together is contraindicated.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients with Child-Pugh categories B and C and those hypersensitive to alfuzosin or its ingredients.
• Use cautiously in patients with severe renal insufficiency, congenital or acquired QT-interval prolongation, or symptomatic hypotension and hypotensive responses to other drugs.
⚠ ***Overdose S&S:*** Hypotension.

### NURSING CONSIDERATIONS

• Don't use drug to treat hypertension.
• Asymptomatic orthostatic hypotension may develop within a few hours.

• Symptoms of BPH and prostate cancer are similar; rule out prostate cancer before therapy.
• If angina pectoris develops or worsens, stop drug.
• Current or previous use of an alpha blocker may predispose the patient to intraoperative floppy iris syndrome during cataract surgery.

### PATIENT TEACHING
• Tell patient to take drug just after the same meal each day.
• At start of therapy, warn patient about possible hypotension and explain that it may cause dizziness. Caution patient against performing hazardous activities until he knows how the drug affects him.
• Tell patient to avoid situations in which he could be injured if he became light-headed or fainted.
• Warn patient not to crush or chew the tablets.
• Advise patient planning cataract surgery to alert his ophthalmologist about this drug and current or previous alpha blocker therapy.

## aliskiren hemifumarate
a-LIS-ke-ren

Tekturna

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Renin inhibitor
*Pregnancy risk category C for 1st trimester; D for 2nd and 3rd trimesters*

### AVAILABLE FORMS
*Tablets:* 150 mg, 300 mg

### INDICATIONS & DOSAGES
➤ **Hypertension, alone or with other antihypertensives**
*Adults:* 150 mg P.O. daily; may increase to 300 mg P.O. daily.

### ADMINISTRATION
**P.O.**
• Don't give drug with high-fat meal because this may decrease the drug's effectiveness.

### ACTION
Inhibits conversion of angiotensin I to angiotensin II, decreasing vasoconstriction and lowering blood pressure.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–3 hr | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS
**CNS:** *headache,* dizziness, fatigue, ***seizures.***
**CV:** *hypotension.*
**EENT:** nasopharyngitis.
**GI:** abdominal pain, diarrhea, dyspepsia, gastroesophageal reflux.
**Metabolic:** hyperuricemia, ***hyperkalemia.***
**Musculoskeletal:** back pain.
**Respiratory:** cough, upper respiratory tract infection.
**Skin:** rash.
**Other:** ***angioedema.***

### INTERACTIONS
**Drug-drug.** *Atorvastatin:* May increase aliskiren levels. Use cautiously together.
*Cyclosporine:* May increase aliskiren levels. Avoid concomitant use.
*Ketoconazole:* May significantly increase aliskiren levels. Use cautiously together.
*Irbesartan:* May decrease aliskiren levels. Monitor patient for effectiveness.
*Furosemide:* May reduce furosemide peak levels. Monitor patient for effectiveness.
**Drug-food.** *High fat meals:* May substantially decrease plasma levels of drug. Monitor patient for effectiveness.

### EFFECTS ON LAB TEST RESULTS
• May increase potassium, creatine kinase, BUN, uric acid, and serum creatinine levels.

### CONTRAINDICATIONS & CAUTIONS
• Contraindicated in patients hypersensitive to drug or its components.
**Black Box Warning** Contraindicated in pregnant women. Because of risk of fetal toxicity, stop drug as soon as possible if patient becomes pregnant. ■
• Contraindicated in breast-feeding patients and patients taking cyclosporine.
• Use cautiously in patients with history of angioedema, severe renal dysfunction

(creatinine of 1.7 mg/dl in women and 2 mg/dl in men, or GFR <30 ml/minute), history of dialysis, nephrotic syndrome, or renovascular hypertension.
***Overdose S&S:*** Hypotension.

## NURSING CONSIDERATIONS

- Monitor blood pressure for hypotension, especially if used in combination with other antihypertensives.
- Monitor potassium levels, especially in patients also taking ACE inhibitors.

***Alert:*** Rarely, angioedema may occur at any time during treatment. Supportive measures may include antihistamines, steroids, and epinephrine.

- Monitor renal function. It's unknown how patients with significant renal disorders will respond to the use of this drug.
- Effect of any dose is usually seen within 2 weeks.

## PATIENT TEACHING

- Instruct patient not to take drug with a high-fat meal because this may decrease the drug's effectiveness.
- Instruct patient to monitor blood pressure daily, if possible, and to report low readings, dizziness, and headaches to prescriber.
- Tell patient to immediately report swelling of the face or neck or difficulty breathing.
- Advise patient of need for regular laboratory tests to monitor for adverse effects.

# allopurinol

al-oh-PURE-i-nole

Lopurin, Zyloprim

# allopurinol sodium

Aloprim

*Therapeutic class:* Antigout
*Pharmacologic class:* Xanthine oxidase inhibitor
*Pregnancy risk category C*

## AVAILABLE FORMS

**allopurinol**
*Tablets (scored):* 100 mg, 300 mg
**allopurinol sodium**
*Injection:* 500 mg/30-ml vial

## INDICATIONS & DOSAGES

➤ **Gout or hyperuricemia**
*Adults:* Mild gout, 200 to 300 mg P.O. daily; severe gout with large tophi, 400 to 600 mg P.O. daily. Maximum 800 mg daily. Dosage varies with severity of disease; can be given as single dose or divided, but doses greater than 300 mg should be divided.

➤ **Hyperuricemia caused by malignancies**
*Adults and children older than age 10:* 200 to 400 mg/$m^2$ daily I.V. as a single infusion or in equally divided doses every 6, 8, or 12 hours beginning 24 to 48 hours before initiation of chemotherapy. Maximum 600 mg daily.
*Children age 10 and younger:* Initially, 200 mg/$m^2$ daily I.V. as single infusion or in equally divided doses every 6, 8, or 12 hours beginning 24 to 48 hours before initiation of chemotherapy. Then titrate according to uric acid levels. For children ages 6 to 10, give 300 mg P.O. daily or divided t.i.d.; for children younger than age 6, give 150 mg P.O. daily.

➤ **To prevent acute gout attacks**
*Adults:* 100 mg P.O. daily; increase at weekly intervals by 100 mg without exceeding maximum dose (800 mg) until uric acid falls to 6 mg/dl or less.

➤ **To prevent uric acid nephropathy during cancer chemotherapy**
*Adults:* 600 to 800 mg P.O. daily for 2 to 3 days, with high fluid intake.

➤ **Recurrent calcium oxalate calculi**
*Adults:* 200 to 300 mg P.O. daily in single or divided doses.
***Adjust-a-dose:*** If creatinine clearance is 10 to 20 ml/minute, give 200 mg P.O. or I.V. daily; if clearance is less than 10 ml/minute, give 100 mg P.O. or I.V. daily; if clearance is less than 3 ml/minute, give 100 mg P.O. or I.V. at extended intervals. If patient is receiving hemodialysis, give a 50% supplemental dose after dialysis.

## ADMINISTRATION

**P.O.**
- Give drug with or immediately after meals to minimize GI upset.

**I.V.**
▼ When possible, initiate therapy 24 to 48 hours before the start of chemotherapy known to cause tumor lysis.
▼ Dissolve contents of each 30-ml vial in 25 ml of sterile water for injection.
▼ Dilute solution to desired concentration (no greater than 6 mg/ml) with normal saline solution for injection or $D_5W$.
▼ Store solution at 68° to 77° F (20° to 25° C) and use within 10 hours. Don't use solution if it contains particulates or is discolored.
▼ **Incompatibilities:** Amikacin, amphotericin B, carmustine, cefotaxime, chlorpromazine, cimetidine, clindamycin phosphate, cytarabine, dacarbazine, daunorubicin, diphenhydramine, doxorubicin, doxycycline hyclate, droperidol, floxuridine, gentamicin, haloperidol lactate, hydroxyzine, idarubicin, imipenem and cilastatin sodium, mechlorethamine, meperidine, methylprednisolone sodium succinate, metoclopramide, minocycline, nalbuphine, netilmicin, ondansetron, prochlorperazine edisylate, promethazine, sodium bicarbonate (or solutions containing sodium bicarbonate), streptozocin, tobramycin sulfate, vinorelbine.

## ACTION

Reduces uric acid production by inhibiting xanthine oxidase.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 30–120 hr | 1–2 wk |
| I.V. | Unknown | 30 min | Unknown |

*Half-life:* Allopurinol, 1 to 2 hours; oxypurinol, about 15 hours.

## ADVERSE REACTIONS

**GI:** nausea, diarrhea.
**Musculoskeletal:** acute gout attack.
**Skin:** rash, maculopapular rash.

## INTERACTIONS

**Drug-drug.** *Amoxicillin, ampicillin:* May increase possibility of rash. Avoid using together.
*Anticoagulants:* May increase anticoagulant effect. Dosage may need to be adjusted.
*Antineoplastics:* May increase potential for bone marrow suppression. Monitor patient carefully.
*Azathioprine, mercaptopurine:* May increase levels of these drugs. Concomitant administration of 300 to 600 mg of oral allopurinol per day requires dosage reduction to ⅓ to ¼ of usual dose of azathioprine or mercaptopurine. Make subsequent dosage adjustments based on therapeutic response and appearance of toxic effects.
*Chlorpropamide:* May increase hypoglycemic effect. Avoid using together.
*Ethacrynic acid, thiazide diuretics:* May increase risk of allopurinol toxicity. Reduce allopurinol dosage, and monitor renal function closely.
*Uricosurics:* May have additive effect. May be used to therapeutic advantage.
*Urine-acidifying drugs (ammonium chloride, ascorbic acid, potassium or sodium phosphate):* May increase possibility of kidney stone formation. Monitor patient carefully.
*Xanthines:* May increase theophylline level. Adjust dosage of theophylline as needed.
**Drug-lifestyle.** *Alcohol use:* May increase uric acid level. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, and AST levels.
- May decrease hemoglobin level and hematocrit.
- May increase eosinophil count.
- May decrease granulocyte and platelet counts.
- May increase or decrease WBC count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with idiopathic hemochromatosis.

## NURSING CONSIDERATIONS

- Monitor uric acid level to evaluate drug's effectiveness.
- Monitor fluid intake and output; daily urine output of at least 2 L and maintenance of neutral or slightly alkaline urine are desirable.
- Periodically monitor CBC and hepatic and renal function, especially at start of therapy.

• Optimal benefits may need 2 to 6 weeks of therapy. Because acute gout attacks may occur during this time, concurrent use of colchicine may be prescribed prophylactically.
• Don't restart drug in patients who have a severe reaction.
• ***Look alike–sound alike:*** Don't confuse Zyloprim with ZORprin.

## PATIENT TEACHING

• To minimize GI adverse reactions, tell patient to take drug with or immediately after meals.
• Encourage patient to drink plenty of fluids while taking drug unless otherwise contraindicated.
• Drug may cause drowsiness; tell patient not to drive or perform hazardous tasks requiring mental alertness until CNS effects of drug are known.
• If patient is taking drug for recurrent calcium oxalate stones, advise him also to reduce his dietary intake of animal protein, sodium, refined sugars, oxalate-rich foods, and calcium.
• Tell patient to stop drug at first sign of rash, which may precede severe hypersensitivity or other adverse reactions. Rash is more common in patients taking diuretics and in those with renal disorders. Tell patient to report all adverse reactions.
• Advise patient to avoid alcohol during therapy.
• Teach patient importance of continuing drug even if asymptomatic.

# almotriptan malate

al-moh-TRIP-tan

Axert

*Therapeutic class:* Antimigraine
*Pharmacologic class:* Serotonin 5-$HT_1$ receptor agonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 6.25 mg, 12.5 mg

## INDICATIONS & DOSAGES

➤ **Acute migraine with or without aura**
*Adults and adolescents ages 12 to 17:* 6.25-mg or 12.5-mg tablet P.O., with one additional dose after 2 hours if headache is unresolved or recurs. Maximum, two doses within 24 hours.
***Adjust-a-dose:*** For patients with hepatic or renal impairment, initially 6.25 mg, with maximum daily dose of 12.5 mg.

## ADMINISTRATION

**P.O.**
• Give drug without regard for food.
• Give only one repeat dose within 24 hours, no sooner than 2 hours after first dose.

## ACTION

May act as an agonist at serotonin receptors on extracerebral intracranial blood vessels, which constricts the affected vessels, inhibits neuropeptide release, and reduces pain transmission in the trigeminal pathways.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1–3 hr | 1–3 hr | 3–4 hr |

*Half-life:* 3 to 4 hours.

## ADVERSE REACTIONS

**CNS:** paresthesia, headache, dizziness, somnolence.
**CV:** ***coronary artery vasospasm, transient myocardial ischemia, MI, ventricular tachycardia, ventricular fibrillation.***
**GI:** nausea, dry mouth.

## INTERACTIONS

**Drug-drug.** *MAO inhibitors, verapamil:* May increase almotriptan level. No dose adjustment is necessary.
*CYP3A4 inhibitors such as ketoconazole:* May increase almotriptan level. Monitor patient for potential adverse reaction. May need to reduce dosage.
*Ergot-containing drugs, serotonin 5-$HT_{1B/1D}$ agonists:* May cause additive effects. Avoid using within 24 hours of almotriptan.
*SSRIs:* May cause additive serotonin effects, resulting in weakness, hyperreflexia, or

incoordination. Monitor patient closely if given together.

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug.
- Contraindicated in those with angina pectoris, history of MI, silent ischemia, coronary artery vasospasm, Prinzmetal's variant angina, or other CV disease; uncontrolled hypertension; and hemiplegic or basilar migraine.
- Don't give within 24 hours after treatment with other 5-$HT_{1B/1D}$ agonists or ergot derivatives.
- Use cautiously in patients with renal or hepatic impairment and in those with cataracts because of the potential for corneal opacities.
- Use cautiously in patients with risk factors for coronary artery disease (CAD), such as obesity, diabetes, and family history of CAD.

***Overdose S&S:*** Hypertension, more serious cardiovascular symptoms.

### NURSING CONSIDERATIONS
- Patients with poor renal or hepatic function should receive a reduced dosage.
- Repeat dose after 2 hours, if needed and don't give more than two doses in 24 hours.

***Alert:*** Combining triptans with SSRIs or SSNRIs may cause serotonin syndrome. Signs and symptoms include restlessness, hallucinations, loss of coordination, rapid heartbeat, rapid changes in blood pressure, increased body temperature, overactive reflexes, nausea, vomiting, and diarrhea. Serotonin syndrome occurs more often when starting or increasing the dose of a triptan, SSRI, or SSNRI.

- ***Look alike–sound alike:*** Don't confuse Axert with Antivert.

### PATIENT TEACHING
- Tell patient that drug can be taken with or without food.
- Advise patient to take drug only when he's having a migraine; explain that drug isn't taken on a regular schedule.
- Advise patient to use only one repeat dose within 24 hours, no sooner than 2 hours after first dose.
- Advise patient that other commonly prescribed migraine drugs can interact with almotriptan.
- Advise patient to report chest or throat tightness, pain, or heaviness.
- Teach patient to avoid possible migraine triggers, such as cheese, chocolate, citrus fruits, caffeine, and alcohol.

## alosetron hydrochloride
ah-LOSS-e-tron

Lotronex

*Therapeutic class:* Anti-IBS drug
*Pharmacologic class:* Selective 5-$HT_3$ receptor antagonist
*Pregnancy risk category B*

### AVAILABLE FORMS
*Tablets:* 0.5 mg, 1 mg

### INDICATIONS & DOSAGES
➤ **Severe diarrhea-predominant irritable bowel syndrome (IBS)**
*Women:* 0.5 mg P.O. b.i.d. If, after 4 weeks, drug is well tolerated but doesn't adequately control IBS symptoms, increase to 1 mg b.i.d. After 4 weeks at this dosage, if symptoms aren't controlled, stop drug.

### ADMINISTRATION
**P.O.**
- Give drug without regard for food.

### ACTION
Selectively inhibits 5-$HT_3$ receptors in the GI tract, which blocks neuronal depolarization, resulting in less visceral pain, colonic transit, and GI secretions.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Variable |

*Half-life:* 1½ hours.

### ADVERSE REACTIONS
**CNS:** headache.
**GI:** **CONSTIPATION,** nausea, GI discomfort and pain, abdominal discomfort and pain,

abdominal distention, hemorrhoids, regurgitation, reflux, ***ileus perforation, ischemic colitis, small bowel mesenteric ischemia,*** impaction, obstruction.
**Skin:** rash.

## INTERACTIONS

**Drug-drug.** *CYP1A2 inhibitors (such as cimetidine, quinolones):* May increase alosetron level. Avoid use together.
*CYP3A4 inhibitors (such as ciprofloxacin, clarithromycin, ketoconazole):* May decrease alosetron metabolism. Use cautiously together.
*Hydralazine, isoniazid, and procainamide:* May cause slower metabolism of these drugs because of *N*-acetyltransferase inhibition. Monitor patient for toxicity.

## EFFECTS ON LAB TEST RESULTS

• May increase ALT level.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or any of its components, and in those with a history of or current chronic or severe constipation, sequelae from constipation, severe hepatic impairment, intestinal obstruction, stricture, toxic megacolon, GI perforation, GI adhesions, ischemic colitis, impaired intestinal circulation, thrombophlebitis, or hypercoagulable state.
• Contraindicated in patients with a history of or current Crohn's disease, ulcerative colitis, or diverticulitis and in those who are unable to understand or comply with the Patient-Physician Agreement.
• Don't use drug if predominant symptom is constipation.
• Use cautiously in patients with mild to moderate liver impairment; contraindicated in patients with severe liver impairment.
• Use cautiously in women who are pregnant, breast-feeding, or planning to become pregnant.
• Use in children younger than age 18 hasn't been studied.
***Overdose S&S:*** Inhibited metabolic elimination, reduced elimination of other drugs.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug is only appropriate for women who experience symptoms for at least 6 months, have no anatomic or biochemical GI tract abnormalities, and haven't responded to other therapies.
• Diarrhea-predominant IBS is considered severe if one or more of the following accompanies the diarrhea:
– frequent and severe abdominal pain or discomfort
– frequent bowel urgency or fecal incontinence
– disability or restriction of daily activities.
**Black Box Warning** Patients taking drug have developed ischemic colitis and serious complications of constipation, resulting in death. If patient develops ischemic colitis (acute colitis, rectal bleeding, or sudden worsening of abdominal pain) while taking drug, stop therapy. If patient taking drug develops constipation, stop drug until symptoms subside.
**Black Box Warning** Only providers who are enrolled in the manufacturer's prescribing program should prescribe this drug.
• Drug is approved for use only in women with IBS. This drug isn't indicated for use in men.
• Elderly women may be at greater risk for complications of constipation.

## PATIENT TEACHING

**Black Box Warning** Have patient sign a Patient-Physician Agreement before starting therapy.
• Urge patient to read the Medication Guide before starting drug and each time she refills the prescription.
• Tell patient that this drug won't cure but may alleviate some IBS symptoms.
• Inform patient that most women notice their symptoms improving after about 1 week of therapy, but some may take up to 4 weeks to get relief from abdominal pain, discomfort, and diarrhea. Let patient know that symptoms usually return within 1 week after stopping the drug.
• Advise patient that drug may be taken with or without food.
**Black Box Warning** If constipation or signs of ischemic colitis occur (rectal bleeding, bloody diarrhea, or worsened abdominal

pain or cramping), tell patient to stop the drug and consult prescriber immediately. Therapy can be resumed after the situation is discussed with prescriber and constipation resolves. ■
● Inform patient not to share drug with other people having similar symptoms. This drug hasn't been shown to be safe or effective for men.
● Tell woman to notify the prescriber immediately if she becomes pregnant.

**SAFETY ALERT!**

## alprazolam

al-PRAH-zoe-lam

Apo-Alpraz†, Apo-Alpraz TS†, Niravam, Novo-Alprazol†, Nu-Alpraz†, Xanax✐, Xanax XR

*Therapeutic class:* Anxiolytic
*Pharmacologic class:* Benzodiazepine
*Pregnancy risk category D*
*Controlled substance schedule IV*

### AVAILABLE FORMS

*Oral solution:* 1 mg/ml (concentrate)
*Orally disintegrating tablets (ODTs):* 0.25 mg, 0.5 mg, 1 mg, 2 mg
*Tablets:* 0.25 mg, 0.5 mg, 1 mg, 2 mg
*Tablets (extended-release):* 0.5 mg, 1 mg, 2 mg, 3 mg

### INDICATIONS & DOSAGES

➤ **Anxiety**

*Adults:* Usual first dose, 0.25 to 0.5 mg P.O. t.i.d. Maximum, 4 mg daily in divided doses.
*Elderly patients:* Usual first dose, 0.25 mg P.O. b.i.d. or t.i.d. Maximum, 4 mg daily in divided doses.

➤ **Panic disorders**

*Adults:* 0.5 mg P.O. t.i.d., increased at intervals of 3 to 4 days in increments of no more than 1 mg. Maximum, 10 mg daily in divided doses. If using extended-release tablets, start with 0.5 to 1 mg P.O. once daily. Increase by no more than 1 mg every 3 to 4 days. Maximum daily dose is 10 mg.
***Adjust-a-dose:*** For debilitated patients or those with advanced hepatic disease, usual first dose is 0.25 mg P.O. b.i.d. or t.i.d. Maximum, 4 mg daily in divided doses.

### ADMINISTRATION

**P.O.**

● Don't break or crush extended-release tablets.
● Mix oral solution with liquids or semisolid food, such as water, juices, carbonated beverages, applesauce, and puddings. Use only calibrated dropper provided with this product.
● Use dry hands to remove ODTs from bottle. Discard cotton from inside bottle.
● Discard unused portion if breaking scored ODT.

### ACTION

Unknown. Probably potentiates the effects of GABA, depresses the CNS, and suppresses the spread of seizure activity.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | Unknown |
| P.O. (extended-release) | Unknown | Unknown | Unknown |

*Half-life:* Immediate-release, 12 to 15 hours; extended-release, 11 to 16 hours.

### ADVERSE REACTIONS

**CNS:** *insomnia, irritability, dizziness, headache, anxiety, confusion, drowsiness, light-headedness, sedation, somnolence, difficulty speaking, impaired coordination, memory impairment, fatigue, depression,* ***suicide,*** mental impairment, ataxia, paresthesia, dyskinesia, hypoesthesia, lethargy, vertigo, malaise, tremor, nervousness, restlessness, agitation, nightmare, syncope, akathisia, mania.
**CV:** palpitations, chest pain, hypotension.
**EENT:** allergic rhinitis, *blurred vision, nasal congestion.*
**GI:** *diarrhea, dry mouth, constipation,* nausea, increased or decreased appetite, anorexia, vomiting, dyspepsia, abdominal pain.
**GU:** dysmenorrhea, sexual dysfunction, premenstrual syndrome, difficulty urinating.
**Metabolic:** increased or decreased weight.
**Musculoskeletal:** arthralgia, myalgia, arm or leg pain, back pain, muscle rigidity, muscle cramps, muscle twitch.
**Respiratory:** upper respiratory tract infection, dyspnea, hyperventilation.

**Skin:** pruritus, increased sweating, dermatitis.
**Other:** influenza, injury, emergence of anxiety between doses, dependence, feeling warm, increased or decreased libido.

## INTERACTIONS

**Drug-drug.** *Anticonvulsants, antidepressants, antihistamines, barbiturates, benzodiazepines, general anesthetics, narcotics, phenothiazines:* May increase CNS depressant effects. Avoid using together.
*Azole antifungals (including fluconazole, itraconazole, ketoconazole, miconazole):* May increase and prolong alprazolam level, CNS depression, and psychomotor impairment. Avoid using together.
***Carbamazepine**, propoxyphene:* May induce alprazolam metabolism and may reduce therapeutic effects. May need to increase dose.
*Cimetidine, fluoxetine, fluvoxamine, hormonal contraceptives, nefazodone:* May increase alprazolam level. Use cautiously together, and consider alprazolam dosage reduction.
*Tricyclic antidepressants:* May increase levels of these drugs. Monitor patient closely.
**Drug-herb.** *Kava, valerian root:* May increase sedation. Discourage use together.
*St. John's wort:* May decrease drug level. Discourage use together.
**Drug-food.** *Grapefruit juice:* May increase drug level. Discourage use together.
**Drug-lifestyle.** ***Alcohol use:*** May cause additive CNS effects. Discourage use together.
*Smoking:* May decrease effectiveness of drug. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT and AST levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other benzodiazepines and in those with acute angle-closure glaucoma.
- Use cautiously in patients with hepatic, renal, or pulmonary disease or history of substance abuse.

***Overdose S&S:*** Somnolence, confusion, impaired coordination, diminished reflexes, coma.

## NURSING CONSIDERATIONS

- The optimum duration of therapy is unknown.

***Alert:*** Don't withdraw drug abruptly; withdrawal symptoms, including seizures, may occur. Abuse or addiction is possible.

- Monitor hepatic, renal, and hematopoietic function periodically in patients receiving repeated or prolonged therapy.
- Closely monitor addiction-prone patients.
- ***Look alike–sound alike:*** Don't confuse alprazolam with alprostadil or lorazepam. Don't confuse Xanax with Zantac, Xopenex, or Tenex.

## PATIENT TEACHING

- Warn patient to avoid hazardous activities that require alertness and good coordination until effects of drug are known.
- Tell patient to avoid use of alcohol while taking drug.
- Advise patient that smoking may decrease drug's effectiveness.
- Warn patient not to stop drug abruptly because withdrawal symptoms or seizures may occur.
- Tell patient to swallow extended-release tablets whole.
- Tell patient using ODT to remove it from bottle using dry hands and to immediately place it on his tongue where it will dissolve and can be swallowed with saliva.
- Tell patient taking half a scored ODT to discard the unused half.
- Advise patient to discard the cotton from the bottle of ODTs and keep it tightly sealed to prevent moisture from dissolving the tablets.
- Warn women to avoid use during pregnancy and breast-feeding.

**SAFETY ALERT!**

# alprostadil (injection)

al-PROSS-ta-dil

Prostin VR Pediatric

*Therapeutic class:* Prostaglandin
*Pharmacologic class:* Prostaglandin
*Pregnancy risk category NR*

## AVAILABLE FORMS

*Injection:* 500 mcg/ml

## INDICATIONS & DOSAGES

➤ **Palliative therapy for temporary maintenance of patency of ductus arteriosus until surgery can be performed**

*Neonates:* 0.05 to 0.1 mcg/kg/minute by I.V. infusion. When therapeutic response is achieved, reduce infusion rate to lowest dose that will maintain response. Maximum dose is 0.4 mcg/kg/minute. Or, give drug through umbilical artery catheter placed at ductal opening.

## ADMINISTRATION

**I.V.**

▼ Dilute drug before giving. Prepare fresh solution daily; discard solution after 24 hours.

▼ For infusion, dilute 1 ml of concentrate labeled as containing 500 mcg in normal saline solution or $D_5W$ injection to yield a solution containing 2 to 20 mcg/ml.

▼ When using a device with a volumetric infusion chamber, add appropriate volume of diluent to the chamber; then add 1 ml of alprostadil concentrate.

▼ During dilution, avoid direct contact between concentrate and wall of plastic volumetric infusion chamber because solution may become hazy. If this occurs, discard solution.

▼ Don't use diluents that contain benzyl alcohol. Fatal toxic syndrome may occur.

▼ Drug isn't recommended for direct injection or intermittent infusion. Give by continuous infusion using an infusion pump. Infuse through a large peripheral or central vein or through an umbilical artery catheter placed at the level of the ductus arteriosus. If flushing from peripheral vasodilation occurs, reposition catheter.

▼ Reduce infusion rate if patient develops fever or significant hypotension.

▼ **Incompatibilities:** None reported.

## ACTION

Relaxes smooth muscle of ductus arteriosus.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 20 min | 1–2 hr | Length of infusion |

*Half-life:* About 5 to 10 minutes.

## ADVERSE REACTIONS

**CNS:** *fever*, ***seizures.***
**CV:** *flushing*, ***bradycardia, cardiac arrest,*** edema, hypotension, tachycardia.
**GI:** diarrhea.
**Hematologic:** ***DIC.***
**Metabolic:** hypokalemia.
**Respiratory:** **APNEA.**
**Other:** ***sepsis.***

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

• May decrease potassium level.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in neonates before making differential diagnosis between respiratory distress syndrome and cyanotic heart disease and in those with respiratory distress syndrome.

• Use cautiously in neonates with bleeding tendencies because drug inhibits platelet aggregation.

⚠ ***Overdose S&S:*** Apnea, bradycardia, pyrexia, hypotension, flushing.

## NURSING CONSIDERATIONS

**Black Box Warning** Apnea is most often seen in neonates weighing less than 2 kg (4.5 lb) at birth and usually appears during the first hour of drug infusion. Monitor respiratory status and keep emergency respiratory support available. ■

• In infants with restricted pulmonary blood flow, measure drug's effectiveness by monitoring blood oxygenation. In infants with restricted systemic blood flow, measure

drug's effectiveness by monitoring systemic blood pressure and blood pH.
• Monitor arterial pressure by umbilical artery catheter, auscultation, or Doppler transducer. If arterial pressure falls significantly, slow infusion rate.
• Carefully monitor neonates receiving drug at recommended doses for longer than 120 hours for gastric outlet obstruction and antral hyperplasia.
**Alert:** CV and CNS adverse reactions occur more often in infants weighing less than 2 kg and in those receiving infusions for longer than 48 hours.
**Alert:** Stop infusion immediately if overdose is suspected.
• **Look alike–sound alike:** Don't confuse alprostadil with alprazolam.

### PATIENT TEACHING
• Tell parents why this drug is needed, and explain its use.
• Encourage parents to ask questions and express concerns.

## alprostadil (intracavernosal injection; urogenital suppository)
al-PROSS-ta-dil

Caverject, Caverject Impulse, Edex, Muse

*Therapeutic class:* Erectile dysfunction drug
*Pharmacologic class:* Prostaglandin
*Pregnancy risk category C*

### AVAILABLE FORMS
*Intracavernosal injection:* 5 mcg/ml, 10 mcg/0.5 ml, 10 mcg/ml, 20 mcg/0.5 ml, 20 mcg/ml, 40 mcg/ml after reconstitution
*Urogenital suppository:* 125 mcg, 250 mcg, 500 mcg, 1,000 mcg

### INDICATIONS & DOSAGES
➤ **Erectile dysfunction of vasculogenic, psychogenic, or mixed causes**
***Injection***
*Men:* Dosages are highly individualized; initially, inject 2.5 mcg intracavernosally. If partial response occurs, give second dose of 2.5 mcg; then increase in increments of 5 to 10 mcg until patient achieves erection suitable for intercourse and lasting no longer than 1 hour. If patient doesn't respond to first dose, increase second dose to 7.5 mcg within 1 hour, and then increase further in increments of 5 to 10 mcg until patient achieves suitable erection. Patient must remain in prescriber's office until complete detumescence occurs. Don't repeat procedure for at least 24 hours.
***Urogenital suppository***
*Men:* Initially, 125 to 250 mcg, under supervision of prescriber. Adjust dosage as needed until response is sufficient for sexual intercourse. Maximum of two administrations in 24 hours; maximum dose is 1,000 mcg.
➤ **Erectile dysfunction of neurogenic cause (spinal cord injury)**
*Men:* Dosages are highly individualized; initially, inject 1.25 mcg intracavernosally. If partial response occurs, give second dose of 1.25 mcg. Increase in increments of 2.5 mcg, to dose of 5 mcg; then increase in increments of 5 mcg until patient achieves erection suitable for intercourse and lasting no longer than 1 hour. If patient doesn't respond to first dose, give next higher dose within 1 hour. Patient must remain in prescriber's office until complete detumescence occurs. If there is a response, don't repeat procedure for at least 24 hours.

### ADMINISTRATION
**Injection**
• For intercavernosal injection, teach patient to follow instructions on package insert.
• Store injection at or below room temperature (77° F [25° C]).
• Vial is designed for a single use. Discard vial if injection solution is discolored or contains precipitate.
• Don't shake injection contents of reconstituted vial.
**Urogenital suppository**
• Store unopened urogenital suppositories in refrigerator (36° to 46° F [2° to 8° C]). Urethral suppositories may be kept at room temperature for up to 14 days before use.
• Have patient urinate before inserting suppository because moisture makes it

easier to insert drug in penis and will help dissolve it.

## ACTION

Induces erection by relaxing trabecular smooth muscle and dilating cavernosal arteries. This leads to expansion of lacunar spaces and entrapment of blood by compressing venules against the tunica albuginea, a process referred to as the corporal veno-occlusive mechanism.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Intracavernous | 5–20 min | 5–20 min | 1–6 hr |
| Urogenital | 10 min | 16 min | 1 hr |

*Half-life:* About 5 to 10 minutes.

## ADVERSE REACTIONS

**CNS:** headache, dizziness.
**CV:** hypertension, hypotension.
**EENT:** sinusitis, nasal congestion.
**GU:** *penile pain, urethral burning,* prolonged erection, penile fibrosis, rash or edema, prostatic disorder, pelvic pain, minor bleeding or spotting, testicular pain.
**Musculoskeletal:** back pain.
**Respiratory:** upper respiratory tract infection, cough, rhinitis.
**Skin:** injection site hematoma or ecchymosis.
**Other:** localized trauma or pain, flulike syndrome, accidental injury.

## INTERACTIONS

**Drug-drug.** *Anticoagulants:* May increase risk of bleeding from intracavernosal injection site. Monitor patient closely.
*Cyclosporine:* May decrease cyclosporine level. Monitor cyclosporine level closely.
*Vasoactive drugs:* Safety and effectiveness haven't been studied. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug, in those with conditions predisposing them to priapism (sickle cell anemia or trait, multiple myeloma, leukemia) or penile deformation (angulation, cavernosal fibrosis, Peyronie disease), in men with penile implants or for whom sexual activity is inadvisable or contraindicated, in women or children, and in sexual partners of pregnant women unless condoms are used.
***Overdose S&S:*** Prolonged erection, priapism, hypotension, facial flushing.

## NURSING CONSIDERATIONS

● First dose should be given in clinic. Monitor patient for hypotension and syncope.
● Stop drug in patients who develop penile angulation, cavernosal fibrosis, or Peyronie disease.

## PATIENT TEACHING

● Teach patient how to prepare and give drug before he begins treatment at home. Stress importance of reading and following patient instructions in each package insert. Tell him to store unopened suppositories in refrigerator (36° to 46° F [2° to 8° C]) and store injection at or below room temperature (77° F [25° C]).
● Tell patient not to shake contents of reconstituted vial, and remind him that vial is designed for a single use. Tell him to discard vial if solution is discolored or contains precipitate. Advise him to use solution promptly.
● Instruct patient to urinate before inserting suppository because moisture makes it easier to insert drug in penis and will help dissolve it.
● Review administration and aseptic technique.
● Inform patient that he can expect an erection 5 to 20 minutes after administration, with a preferable duration of no more than 1 hour. If his erection lasts more than 6 hours, tell him to seek medical attention immediately.
● Remind patient to take drug as instructed (generally, no more than three times weekly, with at least 24 hours between each use). Warn him not to change dosage without consulting prescriber.
● Caution patient to use a condom if his sexual partner could be pregnant.
● Review possible adverse reactions. Tell patient to inspect his penis daily and to report redness, swelling, tenderness, curvature, excessive erection (priapism), unusual pain, nodules, or hard tissue.
● Urge patient not to reuse or share needles, syringes, or drug.

• Warn patient that drug doesn't protect against sexually transmitted diseases. Also, caution him that bleeding at injection site can increase risk of transmitting blood-borne diseases to his partner.
• Remind patient to keep regular follow-up appointments so prescriber can evaluate drug effectiveness and safety.

**SAFETY ALERT!**

## alteplase (tissue plasminogen activator, recombinant; t-PA)

al-ti-PLAZE

Activase, Cathflo Activase

*Therapeutic class:* Thrombolytic
*Pharmacologic class:* Enzyme
*Pregnancy risk category C*

### AVAILABLE FORMS

*Cathflo Activase injection:* 2-mg single-patient vials
*Injection:* 50-mg (29 million international units), 100-mg (58 million international units) vials

### INDICATIONS & DOSAGES

➤ **Lysis of thrombi obstructing coronary arteries in acute MI**

***3-hour infusion***

*Adults who weigh 67 kg (147 lb) or more:* 100 mg by I.V. infusion over 3 hours, as follows: 60 mg in first hour, 6 to 10 mg of which is given as a bolus over first 1 to 2 minutes. Then 20 mg/hour infused for 2 hours.
*Adults who weigh less than 67 kg:* 1.25 mg/kg in a similar fashion: 60% in first hour, 10% of which is given as a bolus; then 20% of total dose per hour for 2 hours. Don't exceed total dose of 100 mg.

***Accelerated infusion***

*Adults who weigh more than 67 kg (147 lb):* 100 mg maximum total dose. Give 15 mg I.V. bolus over 1 to 2 minutes, followed by 50 mg infused over the next 30 minutes; then 35 mg infused over the next hour. Don't exceed total dose of 100 mg.
*Adults who weigh 67 kg or less:* 15 mg I.V. bolus over 1 to 2 minutes, followed by 0.75 mg/kg (not to exceed 50 mg) infused over the next 30 minutes; then 0.5 mg/kg (not to exceed 35 mg) infused over the next hour. Don't exceed total dose of 100 mg.

➤ **To manage acute massive pulmonary embolism**

*Adults:* 100 mg by I.V. infusion over 2 hours. Begin heparin at end of infusion when PTT or thrombin time returns to twice normal or less. Don't exceed 100-mg dose. Higher doses may increase risk of intracranial bleeding.

➤ **Acute ischemic stroke**

*Adults:* 0.9 mg/kg by I.V. infusion over 1 hour with 10% of total dose given as an initial I.V. bolus over 1 minute. Maximum total dose is 90 mg.

➤ **To restore function to central venous access devices**

***Cathflo Activase***

*Adults and children older than age 2:* For patients who weigh more than 30 kg (66 lb), instill 2 mg in 2 ml sterile water into catheter. For patients who weigh 10 kg (22 lb) to less than 30 kg, instill 110% of the internal lumen volume of the catheter, not to exceed 2 mg in 2 ml sterile water. After 30 minutes of dwell time, assess catheter function by aspirating blood. If function is restored, aspirate 4 ml to 5 ml of blood to remove drug and residual clot, and gently irrigate the catheter with normal saline solution. If catheter function isn't restored after 120 minutes, instill a second dose.

### ADMINISTRATION

**I.V.**

▼ Immediately before use, reconstitute solution with unpreserved sterile water for injection. Check manufacturer's labeling for specific information.
▼ Don't use 50-mg vial if vacuum isn't present; 100-mg vials don't have a vacuum.
▼ Using an 18G needle, direct stream of sterile water at lyophilized cake. Don't shake.
▼ Slight foaming is common. Let it settle before giving drug. Solution should be colorless or pale yellow.
▼ Drug may be given reconstituted (at 1 mg/ml) or diluted with an equal

volume of normal saline solution or $D_5W$ to yield 0.5 mg/ml.
▼ Give drug using a controlled infusion device.
▼ Discard any unused drug after 8 hours.
***Cathflo Activase***
▼ Assess the cause of catheter dysfunction before using drug. Possible causes of occlusion include catheter malposition, mechanical failure, constriction by a suture, and lipid deposits or drug precipitates in the catheter lumen. Don't try to suction the catheter because you risk damaging the vessel wall or collapsing a soft-walled catheter.
▼ Reconstitute Cathflo Activase with 2.2 ml sterile water to yield 1 mg/ml. Dissolve completely to produce a colorless to pale yellow solution. Don't shake.
▼ Don't use excessive pressure while instilling drug into catheter; doing so could rupture the catheter or expel a clot into circulation.
▼ Solution is stable up to 8 hours at room temperature.
▼ **Incompatibilities:** None reported, but don't mix with other drugs.

## ACTION

Converts plasminogen to plasmin by directly cleaving peptide bonds at two sites, causing fibrinolysis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* Less than 10 minutes.

## ADVERSE REACTIONS

**CNS:** ***cerebral hemorrhage,*** fever.
**CV:** ***arrhythmias,*** hypotension, edema, ***cholesterol embolization, venous thrombosis.***
**GI:** ***bleeding (Cathflo Activase),*** nausea, vomiting.
**GU:** ***bleeding.***
**Hematologic:** ***spontaneous bleeding.***
**Skin:** ecchymosis.
**Other:** ***anaphylaxis, sepsis (Cathflo Activase),*** bleeding at puncture sites, hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Aspirin, clopidogrel, dipyridamole, drugs affecting platelet activity (abciximab), heparin, warfarin anticoagulants:* May increase risk of bleeding. Monitor patient carefully.
*Nitroglycerin:* May decrease alteplase antigen level. Avoid using together. If use together is unavoidable, use the lowest effective dose of nitroglycerin.

## EFFECTS ON LAB TEST RESULTS

● May alter coagulation and fibrinolytic test results.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients with active internal bleeding, intracranial neoplasm, arteriovenous malformation, aneurysm, severe uncontrolled hypertension, or history or current evidence of intracranial hemorrhage, suspicion of subarachnoid hemorrhage, or seizure at onset of stroke when used for acute ischemic stroke.
● Contraindicated in patients with history of stroke, intraspinal or intracranial trauma or surgery within 2 months, or known bleeding diathesis.
● Use cautiously in patients having major surgery within 10 days (when bleeding is difficult to control because of its location); organ biopsy; trauma (including cardiopulmonary resuscitation); GI or GU bleeding; cerebrovascular disease; systolic pressure of 180 mm Hg or higher or diastolic pressure of 110 mm Hg or higher; mitral stenosis, atrial fibrillation, or other conditions that may lead to left heart thrombus; acute pericarditis or subacute bacterial endocarditis; hemostatic defects caused by hepatic or renal impairment; septic thrombophlebitis; or diabetic hemorrhagic retinopathy.
● Use cautiously in patients receiving anticoagulants, in patients age 75 and older, and during pregnancy and the first 10 days postpartum.

## NURSING CONSIDERATIONS

***Alert:*** When used for acute ischemic stroke, give drug within 3 hours after symptoms occur and only when intracranial bleeding has been ruled out.

- Drug may be given to menstruating women.
- To recanalize occluded coronary arteries and to improve heart function, begin treatment as soon as possible after symptoms start.
- Anticoagulant and antiplatelet therapy is commonly started during or after treatment, to decrease risk of another thrombosis.
- Monitor vital signs and neurologic status carefully. Keep patient on strict bed rest.
- Coronary thrombolysis is linked with arrhythmias caused by reperfusion of ischemic myocardium. Such arrhythmias don't differ from those commonly linked with MI. Have antiarrhythmics readily available, and carefully monitor ECG.
- Avoid invasive procedures during thrombolytic therapy. Closely monitor patient for signs of internal bleeding, and frequently check all puncture sites. Bleeding is the most common adverse effect and may occur internally and at external puncture sites.
- If uncontrollable bleeding occurs, stop infusion (and heparin) and notify prescriber.
- Avoid I.M. injections.

### PATIENT TEACHING

- Explain use and administration of drug to patient and family.
- Tell patient to report adverse reactions promptly.

## aluminum hydroxide

a-LOO-mi-num

AlternaGEL ◇, Alu-Cap ◇, Alu-Tab ◇, Amphojel ◇, Dialume ◇

*Therapeutic class:* Antacid
*Pharmacologic class:* Aluminum salt
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules:* 400 mg ◇, 500 mg ◇
*Liquid:* 600 mg/5 ml ◇
*Oral suspension:* 320 mg/5 ml ◇, 450 mg/5 ml ◇, 675 mg/5 ml ◇
*Tablets:* 500 mg ◇, 600 mg ◇

### INDICATIONS & DOSAGES

➤ **Acid indigestion**

*Adults:* 500 to 1,500 mg P.O. three to six times daily between meals and at bedtime. Or, 5 to 10 ml of liquid formulation or 5 to 30 ml of oral suspension between meals and at bedtime or as directed by prescriber.

### ADMINISTRATION

**P.O.**

- Shake suspension well.
- When giving through nasogastric tube, make sure tube is placed correctly and is patent; after instilling drug, flush tube with water to ensure passage to stomach and to clear tube.

### ACTION

Neutralizes acid in GI tract, elevates gastric pH to reduce pepsin activity, strengthens gastric mucosal barrier, and increases esophageal sphincter tone.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Variable | Unknown | 20–180 min |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CNS:** ***encephalopathy.***
**GI:** *constipation,* ***intestinal obstruction.***
**Metabolic:** hypophosphatemia.
**Musculoskeletal:** osteomalacia.

### INTERACTIONS

**Drug-drug.** *Allopurinol, antibiotics (tetracyclines), corticosteroids, diflunisal, digoxin, ethambutol, $H_2$-receptor antagonists, iron salts, isoniazid, penicillamine, phenothiazines, thyroid hormones, ticlopidine:* May decrease effect of these drugs by impairing absorption. Separate doses by 1 to 2 hours.

*Ciprofloxacin, levofloxacin, lomefloxacin, moxifloxacin, norfloxacin, ofloxacin:* May decrease quinolone effect. Give antacid at least 6 hours before or 2 hours after quinolone.

*Enteric-coated drugs:* May be released prematurely in stomach. Separate doses by at least 1 hour.

### EFFECTS ON LAB TEST RESULTS

- May increase gastrin level. May decrease phosphate level.

## CONTRAINDICATIONS & CAUTIONS

- No known contraindications.
- Use cautiously in patients with chronic renal disease.

## NURSING CONSIDERATIONS

- Monitor long-term, high-dose use in patient on restricted sodium intake. Each tablet, capsule, or 5 ml of suspension may contain 2 or 3 mg of sodium. Refer to manufacturer's label for specific sodium content.
- Record amount and consistency of stools. Manage constipation with laxatives or stool softeners; alternate with magnesium-containing antacids (if patient doesn't have renal disease).
- Monitor phosphate level.
- Watch for evidence of hypophosphatemia (anorexia, malaise, and muscle weakness) with prolonged use; also can lead to resorption of calcium and bone demineralization.
- Aluminum hydroxide therapy may interfere with imaging techniques using sodium pertechnetate Tc-99m, and thus impair evaluation of Meckel's diverticulum. It also may interfere with reticuloendothelial imaging of liver, spleen, or bone marrow using technetium-99m sulfur colloid. It may antagonize effect of pentagastrin during gastric acid secretion tests.
- Because drug contains aluminum, it's used in patients with renal failure to help control hyperphosphatemia by binding with phosphate in the GI tract.
- Watch for aluminum toxicity in patients with severe renal impairment (dialysis encephalopathy, osteomalacia). Aluminum isn't well removed by dialysis.

## PATIENT TEACHING

- Instruct patient to shake suspension well and to follow with a small amount of milk or water to facilitate passage.
- Advise patient not to take aluminum hydroxide indiscriminately or to switch antacids without prescriber's advice.
- Urge patient to notify prescriber about signs and symptoms of GI bleeding, such as tarry stools or coffee-ground vomitus.
- Instruct pregnant patient to seek medical advice before taking drug.

# alvimopan

al-VIM-oh-pan

Entereg

*Therapeutic class:* Bowel restorative drug
*Pharmacologic class:* Peripherally acting mu-opioid receptor antagonist
*Pregnancy risk category B*

## AVAILABLE FORMS

*Capsules:* 12 mg

## INDICATIONS & DOSAGES

➤ **Acceleration of recovery after partial large- or small-bowel resection surgery with primary anastomosis**

*Adults:* 12 mg P.O. 30 minutes to 5 hours before surgery, followed by 12 mg P.O. b.i.d. beginning day after surgery, for maximum of 15 doses.

## ADMINISTRATION

**P.O.**

- May be taken with or without food.

## ACTION

Competitively and selectively binds to mu-opioid receptors in GI tract, preventing peripheral effects of opioids on GI motility and secretion and thereby shortening recovery time after surgery.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 2 hr | Unknown |

*Half-life:* 10 to 18 hours.

## ADVERSE REACTIONS

**GI:** constipation, dyspepsia, flatulence.
**GU:** urine retention.
**Hematologic:** anemia.
**Metabolic:** hypokalemia.
**Musculoskeletal:** back pain.

## INTERACTIONS

None.

## EFFECTS ON LAB TEST RESULTS

None.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Alvimopan is available only for short-term (15 doses) use in hospitalized patients. Only hospitals that have registered in and met all of requirements for the Entereg Access Support and Education (E.A.S.E.) program may use alvimopan. ■

- Contraindicated in patients who have taken opioids for more than 7 days immediately before taking this drug. Avoid use in patients with severe renal or hepatic impairment.
- Use cautiously in patients with history of recent opioid use.
- Use in pregnancy only if benefit to mother outweighs risk to fetus. It isn't known if drug appears in breast milk. Use cautiously.

## NURSING CONSIDERATIONS

- Drug is available only to hospitals that enroll in the E.A.S.E. program (1-866-423-6567). Hospitals that enroll must educate staff about limiting use to inpatients for maximum of 15 doses.
- Monitor GI status closely.
- Closely monitor patients with history of opioid use for chronic pain; drug is associated with increased incidence of MI in these patients.
- To avoid increasing sensitivity, take careful drug history to rule out recent opioid use. Signs and symptoms of increased sensitivity include abdominal pain, nausea, vomiting, and diarrhea.

## PATIENT TEACHING

- Tell patient to report previous use of opioids, including week before surgery.
- Instruct patient to report adverse effects, such as diarrhea, abdominal pain, nausea, and vomiting.
- Explain that drug is to be used only while in the hospital, for no more than 7 days after surgery.

# amantadine hydrochloride

a-MAN-ta-deen

*Therapeutic class:* Antiviral
*Pharmacologic class:* Synthetic cyclic primary amine
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 100 mg
*Syrup:* 50 mg/5 ml
*Tablets:* 100 mg

## INDICATIONS & DOSAGES

➤ **Parkinson disease**

*Adults:* Initially, if used as monotherapy, 100 mg P.O. b.i.d. In patients with serious illness or in those already receiving high doses of other antiparkinsonians, begin dose at 100 mg P.O. once daily. Increase to 100 mg b.i.d. if needed after at least 1 week. Some patients may benefit from 400 mg daily in divided doses.

➤ **To prevent or treat symptoms of influenza type A virus and respiratory tract illnesses**

*Children age 13 or older and adults up to age 65:* 200 mg P.O. daily as a single dose or 100 mg P.O. b.i.d.
*Children ages 9 to 12:* 100 mg P.O. b.i.d.
*Children ages 1 to 8:* 4.4 to 8.8 mg/kg P.O. as a total daily dose given once daily or divided equally b.i.d. Maximum daily dose is 150 mg.
*Elderly patients:* 100 mg P.O. once daily in patients older than age 65 with normal renal function.

Begin treatment within 24 to 48 hours after symptoms appear and continue for 24 to 48 hours after symptoms disappear (usually 2 to 7 days). Start prophylaxis as soon as possible after exposure and continue for at least 10 days after exposure. May continue prophylactic treatment up to 90 days for repeated or suspected exposures if influenza vaccine is unavailable. If used with influenza vaccine, continue dose for 2 to 3 weeks until antibody response to vaccine has developed.

***Adjust-a-dose:*** For patients with creatinine clearance of 30 to 50 ml/minute, 200 mg the first day and 100 mg thereafter; if clearance

is 15 to 29 ml/minute, 200 mg the first day and then 100 mg on alternate days; if clearance is less than 15 ml/minute or if patient is receiving hemodialysis, 200 mg every 7 days.

➤ **Drug-induced extrapyramidal reactions**

*Adults:* 100 mg P.O. b.i.d. May increase to 300 mg daily in divided doses.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.

## ACTION

May exert its antiparkinsonian effect by causing the release of dopamine in the substantia nigra. As an antiviral, may prevent release of viral nucleic acid into the host cell, reducing duration of fever and other systemic symptoms.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–4 hr | Unknown |

*Half-life:* About 24 hours; with renal dysfunction, as long as 10 days.

## ADVERSE REACTIONS

**CNS:** *dizziness, insomnia, irritability, lightheadedness,* depression, fatigue, confusion, hallucinations, anxiety, ataxia, headache, nervousness, dream abnormalities, agitation.

**CV:** ***heart failure,*** peripheral edema, orthostatic hypotension.

**EENT:** blurred vision.

**GI:** *nausea,* anorexia, constipation, vomiting, dry mouth.

**Skin:** livedo reticularis.

## INTERACTIONS

**Drug-drug.** *Anticholinergics:* May increase anticholinergic effects. Use together cautiously; reduce dosage of anticholinergic before starting amantadine.

*CNS stimulants:* May increase CNS stimulation. Use together cautiously.

*Co-trimoxazole, quinidine, thiazide diuretics, triamterene:* May increase amantadine level, increasing the risk of toxicity. Use together cautiously.

*Thioridazine:* May worsen Parkinson disease tremor. Monitor patient closely.

**Drug-herb.** *Jimsonweed:* May adversely affect CV function. Discourage use together.

**Drug-lifestyle.** *Alcohol use:* May increase CNS effects, including dizziness, confusion, and orthostatic hypotension. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase CK, BUN, creatinine, alkaline phosphatase, LDH, bilirubin, GGT, AST, and ALT levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in elderly patients and in patients with seizure disorders, heart failure, peripheral edema, hepatic disease, mental illness, eczematoid rash, renal impairment, orthostatic hypotension, and CV disease. Monitor renal and liver function tests.

***Overdose S&S:*** Arrhythmia, hypertension, tachycardia, pulmonary edema, respiratory distress, increased BUN level, decreased creatinine clearance, renal insufficiency, insomnia, anxiety, aggressive behavior, hypertonia, hyperkinesia, tremor, confusion, disorientation, depersonalization, fear, delirium, hallucinations, psychotic reactions, lethargy, somnolence, coma, seizures, hyperthermia.

## NURSING CONSIDERATIONS

- Patients with Parkinson disease who don't respond to anticholinergics may respond to this drug.

***Alert:*** Elderly patients are more susceptible to adverse neurologic effects. Monitor patient for mental status changes.

- Suicidal ideation and attempts may occur in any patient, regardless of psychiatric history.
- Drug can worsen mental problems in patients with a history of psychiatric disorders or substance abuse.
- ***Look alike–sound alike:*** Don't confuse amantadine with rimantadine.

## PATIENT TEACHING

***Alert:*** Tell patient to take drug exactly as prescribed because not doing so may result in serious adverse reactions or death.

- If insomnia occurs, tell patient to take drug several hours before bedtime.
- If patient gets dizzy when he stands up, instruct him not to stand or change positions too quickly.
- Instruct patient to notify prescriber of adverse reactions, especially dizziness, depression, anxiety, nausea, and urine retention.
- Caution patient to avoid activities that require mental alertness until effects of drug are known.
- Encourage patient with Parkinson disease to gradually increase his physical activity as his symptoms improve.
- Advise patient to avoid alcohol while taking drug.

**SAFETY ALERT!**

# ambrisentan

am-bree-SEN-tan

Letairis

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Endothelin-receptor antagonist
*Pregnancy risk category X*

## AVAILABLE FORMS

*Tablets:* 5 mg, 10 mg

## INDICATIONS & DOSAGES

➤ **Pulmonary arterial hypertension in patients with World Health Organization class II (with significant exertion) or III (with mild exertion) symptoms to improve exercise tolerance and decrease rate of clinical worsening**

*Adults:* 5 mg P.O. once daily; may increase to 10 mg P.O. once daily if tolerated.

***Adjust-a-dose:*** Don't start therapy in patients with elevated aminotransferase levels (ALT and AST) of more than three times the upper limit of normal (ULN) at baseline. If ALT elevations during therapy are between three and five times the ULN, remeasure. If confirmed level is in the same range, reduce dose or stop therapy and remeasure every 2 weeks until levels are less than three times ULN. If ALT and AST are between five and eight times the ULN, stop therapy and monitor until the levels are less than three times ULN. Restart therapy with more frequent monitoring. If ALT and AST exceed eight times the ULN, stop therapy and don't restart.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.
- Give drug whole; don't crush or split tablets.

## ACTION

Blocks endothelin-1 receptors on vascular endothelin and smooth muscle. Stimulation of these receptors in smooth muscle cells is associated with vasoconstriction and PAH.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 2 hr | Unknown |

*Half-life:* 9 hours.

## ADVERSE REACTIONS

**CNS:** *headache.*
**CV:** *peripheral edema,* flushing, palpitations.
**EENT:** nasal congestion, sinusitis, nasopharyngitis.
**GI:** abdominal pain, constipation.
**Hematologic:** anemia.
**Hepatic:** hepatic impairment.
**Respiratory:** dyspnea.

## INTERACTIONS

**Drug-drug.** *CYP enzyme inducers, such as carbamazepine, phenobarbital, phenytoin, and rifampin:* May decrease effects of ambrisentan. Use together cautiously.
*CYP enzyme inhibitors, such as atazanavir, clarithromycin, fluvoxamine, fluconazole, indinavir, itraconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, and ticlopidine:* May increase the effects of ambrisentan. Use together cautiously.
*Cyclosporine:* May increase ambrisentan levels. Use together cautiously and monitor patient for increased adverse effects.

## EFFECTS ON LAB TEST RESULTS

**Black Box Warning** May increase AST, ALT, and bilirubin levels. ■

- May decrease hemoglobin level and hematocrit.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or its components.

**Black Box Warning** Contraindicated in pregnant women because it may harm the fetus. ■

**Black Box Warning** Contraindicated in those with moderate to severe hepatic impairment; don't begin therapy in those with elevated baseline ALT and AST levels of more than three times the ULN. ■

● Use cautiously in those with mild hepatic impairment.

● Use cautiously in those with renal impairment; drug hasn't been studied in those with severe renal impairment.

## NURSING CONSIDERATIONS

**Black Box Warning** Because of risk of liver injury and birth defects, ambrisentan is available only through the Letairis Education and Access Program (LEAP). Only registered prescribers and pharmacies may prescribe and dispense ambrisentan and only to patients enrolled in and meeting all the conditions of LEAP (1-866-664-5327). ■

● Treat women of childbearing age only after negative pregnancy tests.

## PATIENT TEACHING

**Black Box Warning** Inform female patient that she'll need to have a pregnancy test done monthly and to report suspected pregnancy to her prescriber immediately. ■

**Black Box Warning** Teach woman of childbearing age to use two reliable birth control methods unless she has had tubal sterilization or has a Copper T 380A intrauterine device (IUD) or an LNg 20 IUD inserted. ■

● Tell patient that monthly blood tests will be done to monitor for adverse effects.

● Advise patient to take the pill whole and not to split, crush, or chew the tablet.

***Alert:*** Teach patient to notify prescriber immediately of signs or symptoms of liver injury, including anorexia, nausea, vomiting, fever, malaise, fatigue, right upper quadrant abdominal discomfort, itching, and jaundice.

● Tell the patient to report edema and weight gain.

● Inform male patients of the potential for decreased sperm count.

# amikacin sulfate

am-i-KAY-sin

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Aminoglycoside
*Pregnancy risk category D*

## AVAILABLE FORMS

*Injection:* 50 mg/ml (pediatric) vial, 250 mg/ml vial, 250 mg/ml disposable syringe

## INDICATIONS & DOSAGES

➤ **Serious infections caused by sensitive strains of *Pseudomonas aeruginosa, Escherichia coli, Proteus, Klebsiella,* or *Staphylococcus***

*Adults and children:* 15 mg/kg/day I.M. or I.V. infusion, in divided doses every 8 to 12 hours for 7 to 10 days.

*Neonates:* Initially, loading dose of 10 mg/kg I.V.; then 7.5 mg/kg every 12 hours for 7 to 10 days.

➤ **Uncomplicated UTI caused by organisms not susceptible to less toxic drugs**

*Adults:* 250 mg I.M. or I.V. b.i.d.

➤ **Active tuberculosis, with other antituberculotics ♦**

*Adults and children age 15 and older:* 15 mg/kg (up to 1 g) I.M. or I.V. once daily five to seven times per week for 2 to 4 months or until culture conversion. Then reduce dose to 15 mg/kg daily given two or three times weekly depending on other drugs in regimen. Patients older than age 59 may receive a reduced dose of 10 mg/kg (up to 750 mg) daily.

*Children younger than age 15:* Give 15 to 30 mg/kg (up to 1 g) I.M. or I.V. once daily or twice weekly.

***Adjust-a-dose:*** For adults with impaired renal function, initially, 7.5 mg/kg I.M. or I.V. Subsequent doses and frequency determined by amikacin levels and renal function studies. For adults receiving hemodialysis, give supplemental doses of 50% to 75% of initial loading dose at end of each dialysis session. Monitor drug levels and adjust dosage accordingly.

## ADMINISTRATION

**I.V.**

▼ Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.

▼ For adults, dilute I.V. drug in 100 to 200 ml of $D_5W$ or normal saline solution. For children, the amount of fluid will depend on the ordered dose.

▼ In adults and children, infuse over 30 to 60 minutes. In infants, infuse over 1 to 2 hours.

▼ After infusion, flush line with normal saline solution or $D_5W$.

▼ **Incompatibilities:** Allopurinol, aminophylline, amphotericin B, ampicillin, azithromycin, bacitracin, cefazolin, ceftazidime, chlorothiazide sodium, cisplatin, heparin sodium, hetastarch in 0.9% sodium chloride, oxacillin, phenytoin, propofol, thiopental, vancomycin, vitamin B complex with C.

**I.M.**

● Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.

● Obtain blood for peak level 1 hour after I.M. injection and 30 minutes to 1 hour after I.V. infusion ends; for trough levels, draw blood just before next dose. Don't collect blood in a heparinized tube; heparin is incompatible with aminoglycosides.

## ACTION

Inhibits protein synthesis by binding directly to the 30S ribosomal subunit; bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | 30 min | 8–12 hr |
| I.M. | Unknown | 1 hr | 8–12 hr |

*Half-life:* Adults, 2 to 3 hours. Patients with severe renal damage, 30 to 86 hours.

## ADVERSE REACTIONS

**CNS:** ***neuromuscular blockade.***
**EENT:** *ototoxicity.*
**GU:** *azotemia,* ***nephrotoxicity,*** increase in urinary excretion of casts.
**Musculoskeletal:** arthralgia.
**Respiratory:** ***apnea.***

## INTERACTIONS

**Drug-drug.** **Black Box Warning** *Acyclovir, amphotericin B, bacitracin, cephalosporins, cidofovir, cisplatin, methoxyflurane, vancomycin, other aminoglycosides:* May increase nephrotoxicity. Use together cautiously, and monitor renal function test results. ■

*Atracurium, pancuronium, rocuronium, vecuronium:* May increase effects of nondepolarizing muscle relaxants, including prolonged respiratory depression. Use together only when necessary, and expect to reduce dosage of nondepolarizing muscle relaxant.

*Dimenhydrinate:* May mask ototoxicity symptoms. Monitor patient's hearing.

*General anesthetics:* May increase neuromuscular blockade. Monitor patient for increased effects.

*Indomethacin:* May increase trough and peak amikacin levels. Monitor amikacin level.

**Black Box Warning** *I.V. loop diuretics such as furosemide:* May increase ototoxicity. Use together cautiously, and monitor patient's hearing. ■

***Parenteral penicillins:*** May inactivate amikacin in vitro. Don't mix.

## EFFECTS ON LAB TEST RESULTS

● May increase BUN, creatinine, nonprotein nitrogen, and urine urea levels.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or other aminoglycosides.

● Use cautiously in patients with impaired renal function or neuromuscular disorders, in neonates and infants, and in elderly patients.

***Overdose S&S:*** Nephrotoxicity, ototoxicity, neurotoxicity.

## NURSING CONSIDERATIONS

**Black Box Warning** Due to increased risk of ototoxicity, evaluate patient's hearing before and during therapy if he'll be receiving the drug for longer than 2 weeks. Notify prescriber if patient has tinnitus, vertigo, or hearing loss. ■

● Weigh patient and review renal function studies before therapy begins.

• Correct dehydration before therapy because of increased risk of toxicity.
• Peak drug levels more than 35 mcg/ml and trough levels more than 10 mcg/ml may be linked to a higher risk of toxicity.
**Black Box Warning** Due to increased risk of nephrotoxicity, monitor renal function: urine output, specific gravity, urinalysis, BUN and creatinine levels, and creatinine clearance. Report to prescriber evidence of declining renal function.
• Watch for signs and symptoms of superinfection (especially of upper respiratory tract), such as continued fever, chills, and increased pulse rate.
**Black Box Warning** Neuromuscular blockage and respiratory paralysis have been reported after aminoglycoside administration. Monitor patient closely.
• Therapy usually continues for 7 to 10 days. If no response occurs after 3 to 5 days, stop therapy and obtain new specimens for culture and sensitivity testing.
• ***Look alike–sound alike:*** Don't confuse amikacin with anakinra.

## PATIENT TEACHING

• Instruct patient to promptly report adverse reactions to prescriber.
• Encourage patient to maintain adequate fluid intake.

# amiloride hydrochloride

a-MILL-oh-ride

Midamor

*Therapeutic class:* Diuretic
*Pharmacologic class:* Potassium-sparing diuretic
*Pregnancy risk category B*

## AVAILABLE FORMS

*Tablets:* 5 mg

## INDICATIONS & DOSAGES

➤ **Hypertension; hypokalemia; edema of heart failure, usually in patients also taking thiazide or other potassium-wasting diuretics**

*Adults:* 5 mg P.O. daily, increased to 10 mg daily if needed. If hypokalemia persists with 10 mg, dosage can be increased to 15 mg, then 20 mg with careful monitoring of electrolyte levels.

## ADMINISTRATION

**P.O.**
• Give drug with food to minimize GI upset.

## ACTION

Inhibits sodium reabsorption and potassium excretion in the distal tubules.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 2 hr | 6–10 hr | 24 hr |

*Half-life:* 6 to 9 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, fatigue, headache, weakness, ***encephalopathy.***
**GI:** abdominal pain, anorexia, appetite changes, constipation, diarrhea, nausea, vomiting.
**GU:** erectile dysfunction.
**Metabolic:** hyperkalemia.
**Musculoskeletal:** muscle cramps.
**Respiratory:** cough, dyspnea.

## INTERACTIONS

**Drug-drug.** *ACE inhibitors, indomethacin, other potassium-sparing diuretics, potassium supplements:* May cause severe hyperkalemia. Avoid use together if possible. Monitor potassium level closely if using together.
*Digoxin:* May decrease digoxin clearance and decrease inotropic effects. Monitor digoxin level.
*Lithium:* May decrease lithium clearance, increasing risk of lithium toxicity. Monitor lithium level.
*NSAIDs:* May decrease diuretic effectiveness. Avoid use together.
**Drug-food.** *Foods high in potassium (such as bananas, oranges), salt substitutes containing potassium:* May cause hyperkalemia. Advise patient to choose diet carefully and to use low-potassium salt substitutes.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN and potassium levels. May decrease pH, hemoglobin, and liver enzyme and sodium levels.
- May decrease neutrophil count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, in those with potassium level greater than 5.5 mEq/L, and in those with anuria, acute or chronic renal insufficiency, or diabetic nephropathy.
- Contraindicated in patients receiving potassium supplementation or other potassium-sparing diuretics, such as spironolactone and triamterene.
- Use cautiously in patients with diabetes mellitus, cardiopulmonary disease, or severe hepatic insufficiency.
- Use cautiously in elderly or debilitated patients.
- Use during pregnancy only if clearly needed. It's not known whether drug appears in breast milk. Consider having patient discontinue either drug or breast-feeding.
- Safety and efficacy in children haven't been established.

## NURSING CONSIDERATIONS

- To prevent nausea, give drug with meals.
- **Black Box Warning** Carefully monitor potassium level because of the risk of hyperkalemia. Monitor potassium level when drug is initiated, when diuretic dosages are adjusted, and during an illness that could affect renal function. Alert prescriber immediately if potassium level exceeds 5.5 mEq/L; expect to stop drug. ■
- Drug may cause severe hyperkalemia after glucose tolerance testing in patients with diabetes; stop drug at least 3 days before testing.
- ***Look alike–sound alike:*** Don't confuse amiloride with amiodarone.

## PATIENT TEACHING

- Instruct patient to take drug with food to minimize GI upset.
- Advise patient to avoid sudden posture changes and to rise slowly to avoid dizziness.
- Caution patient not to perform hazardous activities if adverse CNS reactions occur.
- To prevent serious hyperkalemia, warn patient to avoid eating potassium-rich foods, potassium-containing salt substitutes, and potassium supplements.
- Advise patient to reports signs of hyperkalemia, such as tingling, muscle weakness, muscle cramps, fatigue, and limb paralysis.
- Instruct patient to check with prescriber before taking new prescriptions or OTC drugs.

**SAFETY ALERT!**

### amino acid infusions, crystalline

a-MEE-noh

Aminess, Aminosyn-RF, NephrAmine, RenAmin

*Therapeutic class:* Nutritional supplement
*Pharmacologic class:* Protein substrate
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 250 ml, 500 ml, 1,000 ml, 2,000 ml containing amino acids in various concentrations

**amino acid infusions, crystalline**
*Aminosyn:* 3.5%, 5%, 7%, 8.5%, 10%
*Aminosyn II:* 3.5%, 5%, 7%, 8.5%, 10%, 15%
*Aminosyn-PF:* 7%, 10%
*Aminosyn-RF:* 5.2%
*FreAmine III:* 8.5%, 10%
*Novamine:* 11.4%, 15%
*Premasol:* 6%, 10%
*Travasol:* 5.5%, 8.5%, 10%
*TrophAmine:* 6%, 10%

**amino acid infusions in dextrose**
*Aminosyn II:* 3.5% in 5% dextrose, 3.5% in 25% dextrose, 4.25% in 10% dextrose, 4.25% in 20% dextrose, 4.25% in 25% dextrose, 5% in 25% dextrose
*Travasol:* 2.75% in 5% dextrose, 2.75% in 10% dextrose, 2.75% in 25% dextrose, 4.25% in 5% dextrose, 4.25% in 10% dextrose, 4.25% in 25% dextrose

**amino acid infusions with electrolytes**
*Aminosyn:* 3.5%, 7%, 8.5%
*Aminosyn II:* 3.5%, 7%, 8.5%
*FreAmine III:* 3%, 8.5%
*ProcalAmine:* 3%
*Travasol:* 3.5%, 5.5%, 8.5%

**amino acid infusions with electrolytes in dextrose**
*Aminosyn II:* 3.5% with electrolytes in 5% dextrose, 3.5% with electrolytes in 25% dextrose, 4.25% with electrolytes in 10% dextrose, 4.25% with electrolytes in 20% dextrose, 4.25% with electrolytes in 25% dextrose

**amino acid infusions for hepatic failure**
*HepatAmine:* 8%
*Hepatasol:* 8%

**amino acid infusions for high metabolic stress**
*Aminosyn-HBC:* 7%
*BranchAmin:* 4%
*FreAmine HBC:* 6.9%

**amino acid infusions for renal failure**
*Aminess:* 5.2%
*Aminosyn-RF:* 5.2%
*NephrAmine:* 5.4%
*RenAmin:* 6.5%

### INDICATIONS & DOSAGES

➤ **Total parenteral nutrition (TPN) in patients who can't or won't eat**
*Adults:* 1 to 1.5 g/kg I.V. daily.
*Children weighing more than 10 kg (22 lb):* 20 to 25 g I.V. daily for first 10 kg; then 1 to 1.25 g/kg I.V. daily for each kilogram over 10 kg.
*Children weighing less than 10 kg:* 2 to 4 g/kg I.V. daily.

➤ **Nutritional support in patients with cirrhosis, hepatitis, or hepatic encephalopathy**
*Adults:* 80 to 120 g of amino acids (12 to 18 g of nitrogen) I.V. daily of formulation for hepatic failure.

➤ **Nutritional support in patients with high metabolic stress**
*Adults:* 1.5 g/kg I.V. daily of formulation for high metabolic stress.

➤ **Nutritional support in patients with renal failure**
*Adults:* Aminosyn-RF 300 to 600 ml added to 70% dextrose I.V. daily. NephrAmine 250 to 500 ml added to 70% dextrose I.V. daily. Aminess 400 ml added to 70% dextrose I.V. daily. RenAmin 250 to 500 ml I.V. daily.
*Children:* 0.5 to 1 g/kg/day. Individualize dosage. Maximum recommended dose is 1 g/kg/day.

### ADMINISTRATION

**I.V.**
▼ Infuse amino acids only in I.V. fluids or TPN solution.
▼ Limit peripheral infusions to 2.5% amino acids and 10% dextrose.
▼ Control infusion rate carefully with infusion pump. If infusion rate falls behind,

notify prescriber; don't increase rate to catch up.
▼ Check infusion site often for erythema, inflammation, irritation, tissue sloughing, necrosis, and phlebitis.
▼ **Incompatibilities:** Bleomycin, ganciclovir, and indomethacin. Because of high risk of incompatibility with other substances, add only needed nutritional products.

## ACTION

Provides a substrate for protein synthesis or increases conservation of existing body protein.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** fever.
**CV:** thrombophlebitis, edema, ***thrombosis,*** flushing.
**GI:** nausea.
**GU:** glycosuria, osmotic diuresis.
**Metabolic:** **REBOUND HYPOGLYCEMIA WHEN LONG-TERM INFUSIONS ARE ABRUPTLY STOPPED,** ***hyperosmolar hyperglycemic nonketotic syndrome,*** hyperglycemia, ***metabolic acidosis,*** alkalosis, hypophosphatemia, hyperammonemia, electrolyte imbalances, weight gain.
**Musculoskeletal:** osteoporosis.
**Skin:** tissue sloughing at infusion site from extravasation.
**Other:** ***catheter-related sepsis,*** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Tetracycline:* May reduce protein-sparing effects of infused amino acids because of its antianabolic activity. Monitor patient.

## EFFECTS ON LAB TEST RESULTS

● May increase ammonia and liver enzyme levels. May decrease magnesium, phosphate, and potassium levels. May increase or decrease glucose level.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients with anuria and in those with inborn errors of amino acid metabolism, such as maple syrup urine disease and isovaleric acidemia.
● Standard amino acid formulations are contraindicated in patients with severe renal failure or hepatic disease.
● Use cautiously in children and neonates.
● Use cautiously in patients with renal or hepatic impairment or failure or diabetes.
● Use cautiously in patients with cardiac disease or insufficiency; drug may cause circulatory overload.

## NURSING CONSIDERATIONS

● Patients with fluid restriction may tolerate only 1 to 2 L.
● When diabetic patient receives drug, his insulin requirements may increase.
● Some products contain sulfites. Check contents before giving to patients with sulfite sensitivity.
● Safe and effective use of parenteral nutrition requires knowledge of nutrition and clinical expertise in recognizing and treating complications. Frequent evaluations of patient and laboratory studies are needed.
● Obtain baseline electrolyte, glucose, BUN, calcium, and phosphorus levels before therapy; monitor these levels periodically throughout therapy.
● Check fractional urine for glycosuria every 6 hours initially, and then every 12 to 24 hours in stable patients. Abrupt onset of glycosuria may be an early sign of impending sepsis.
● Assess body temperature every 4 hours; elevation may indicate sepsis or infection.
● Watch for extraordinary electrolyte losses that may occur during nasogastric suction, vomiting, diarrhea, or drainage from GI fistula.
● If patient has chills, fever, or other signs of sepsis, replace I.V. tubing and bottle and send tubing and bottle to the laboratory to be cultured.
● ***Look alike–sound alike:*** Don't confuse Aminosyn with amikacin.

## PATIENT TEACHING

● Explain need for supplement to patient and family, and answer any questions.

● Tell patient to report adverse reactions promptly.

**SAFETY ALERT!**

## amiodarone hydrochloride

am-ee-OH-dah-rohn

Cordarone, Nexterone, Pacerone

*Therapeutic class:* Antiarrhythmic
*Pharmacologic class:* Benzofuran derivative
*Pregnancy risk category D*

### AVAILABLE FORMS

*Injection:* 50 mg/ml*
*Tablets:* 100 mg, 200 mg, 300 mg, 400 mg

### INDICATIONS & DOSAGES

**Black Box Warning** Amiodarone is intended for use only in patients with life-threatening recurrent ventricular fibrillation or recurrent hemodynamically unstable ventricular tachycardia unresponsive to adequate doses of other antiarrhythmics or when alternative drugs can't be tolerated. ■

*Adults:* Give loading dose of 800 to 1,600 mg P.O. daily divided b.i.d. for 1 to 3 weeks until first therapeutic response occurs; then 600 to 800 mg P.O. daily for 1 month, followed by maintenance dose of 200 to 600 mg P.O. daily for 1 month. Then give 400 mg P.O. daily. For patients with severe GI intolerance, give 200 mg P.O. b.i.d.

Or, give loading dose of 150 mg I.V. over 10 minutes (15 mg/minute); then 360 mg I.V. over next 6 hours (1 mg/minute), followed by 540 mg I.V. over next 18 hours (0.5 mg/minute). After first 24 hours, continue with maintenance I.V. infusion of 720 mg/24 hours (0.5 mg/minute).

### ADMINISTRATION

**P.O.**

● Divide oral loading dose into two or three equal doses and give with meals to decrease GI intolerance. Give maintenance dose once daily or divide into two doses, with meals to decrease GI intolerance.

**I.V.**

▼ Give drug I.V. only if continuous ECG and electrophysiologic monitoring are available.
▼ Mix first dose of 150 mg in 100 ml of $D_5W$ solution.
▼ If infusion will last 2 hours or longer, mix solution in glass or polyolefin bottles.
▼ If concentration is 2 mg/ml or more, give drug through a central line. If possible, use a dedicated line.
▼ Use an in-line filter.
▼ Continuously monitor patient's cardiac status. If hypotension occurs, reduce infusion rate.
▼ I.V. amiodarone (except Nexterone) leaches out plasticizers from I.V. tubing and adsorbs to polyvinyl chloride (PVC) tubing, which can adversely affect male reproductive tract development in fetuses, infants, and toddlers when used at concentrations or flow rates outside of recommendations.
▼ **Incompatibilities:** Aminophylline, ampicillin sodium and sulbactam sodium, bivalirudin, cefazolin sodium, ceftazidime, digoxin, furosemide, heparin sodium, imipenem and cilastatin sodium, magnesium sulfate, normal saline solution, piperacillin sodium, piperacillin and tazobactam sodium, quinidine gluconate, sodium bicarbonate, sodium nitroprusside, sodium phosphates.

### ACTION

Effects result from blockade of potassium chloride leading to a prolongation of action potential duration.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Variable | 3–7 hr | Variable |
| I.V. | Unknown | Unknown | Variable |

*Half-life:* 25 to 110 days (usually 40 to 50 days).

### ADVERSE REACTIONS

**CNS:** *fatigue, malaise, tremor,* peripheral neuropathy, ataxia, paresthesia, insomnia, sleep disturbances, headache.
**CV:** *hypotension,* ***bradycardia, arrhythmias, heart failure, heart block, sinus arrest,*** edema.
**EENT:** *asymptomatic corneal microdeposits, visual disturbances,* optic

neuropathy or neuritis resulting in visual impairment, abnormal smell.
**GI:** *nausea, vomiting,* abnormal taste, anorexia, constipation, abdominal pain.
**Hematologic:** ***coagulation abnormalities.***
**Hepatic:** ***hepatic failure,*** hepatic dysfunction.
**Metabolic:** hypothyroidism, hyperthyroidism.
**Respiratory:** ***acute respiratory distress syndrome,*** **SEVERE PULMONARY TOXICITY.**
**Skin:** *photosensitivity,* solar dermatitis, blue-gray skin.

## INTERACTIONS

**Drug-drug.** *Antiarrhythmics:* May reduce hepatic or renal clearance of certain antiarrhythmics, especially flecainide, procainamide, and quinidine. Use of amiodarone with other antiarrhythmics, especially mexiletine, propafenone, disopyramide, and procainamide, may induce torsades de pointes. Avoid using together.
*Azole antifungals, disopyramide, pimozide:* May increase the risk of arrhythmias, including torsades de pointes. Avoid using together.
*Beta blockers, calcium channel blockers:* May potentiate bradycardia, sinus arrest, and AV block; may increase hypotensive effect. Use together cautiously.
*Cimetidine:* May increase amiodarone level. Use together cautiously.
*Cyclosporine:* May increase cyclosporine level, resulting in an increase in the serum creatinine level and renal toxicity. Monitor cyclosporine levels and renal function tests.
***Digoxin:*** May increase digoxin level 70% to 100%. Monitor digoxin level closely and reduce digoxin dosage by half or stop drug completely when starting amiodarone therapy.
***Fentanyl:*** May cause hypotension, bradycardia, and decreased cardiac output. Monitor patient closely.
***Fluoroquinolones:*** May increase risk of arrhythmias, including torsades de pointes. Avoid using together.
*HMG-CoA reductase inhibitors (such as simvastatin):* May cause myopathy or rhabdomyolysis. Monitor patient carefully.
***Macrolide antibiotics (azithromycin, clarithromycin, erythromycin, telithromycin):*** May cause additive or prolongation of the QT interval. Use with caution. Avoid use with telithromycin.
*Methotrexate:* May impair methotrexate metabolism, causing toxicity. Use together cautiously.
*Phenytoin:* May decrease phenytoin metabolism and amiodarone level. Monitor phenytoin level and adjust dosages of drugs if needed.
***Protease inhibitors (amprenavir, atazanavir, indinavir, lopinavir and ritonavir, nelfinavir, ritonavir, and saquinavir):*** May increase the risk of amiodarone toxicity. Use of ritonavir or nelfinavir with amiodarone is contraindicated. Use other protease inhibitors cautiously.
***Quinidine:*** May increase quinidine level, causing life-threatening cardiac arrhythmias. Avoid using together, or monitor quinidine level closely if use together can't be avoided. Adjust quinidine dosage as needed.
*Rifamycins:* May decrease amiodarone level. Monitor patient closely.
*Simvastatin:* May cause myopathy and rhabdomyolysis with concomitant use. Simvastatin dosage shouldn't exceed 20 mg daily.
*Theophylline:* May increase theophylline level and cause toxicity. Monitor theophylline level.
*Warfarin:* May increase anticoagulant response with the potential for serious or fatal bleeding. Decrease warfarin dosage 33% to 50% when starting amiodarone. Monitor patient closely.
**Drug-herb.** *Pennyroyal:* May change rate of formation of toxic metabolites of pennyroyal. Discourage use together.
*St. John's wort:* May decrease amiodarone levels. Discourage use together.
**Drug-food.** *Grapefruit juice:* May inhibit CYP3A4 metabolism of drug in the intestinal mucosa, causing increased levels and risk of toxicity. Discourage use together.
**Drug-lifestyle.** *Sun exposure:* May cause photosensitivity reaction. Advise patient to avoid excessive sunlight exposure and to take precautions while in the sun.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, GGT, reverse $T_3$, and $T_4$ levels. May decrease $T_3$ level.
- May increase total cholesterol and serum lipid levels.
- May increase PT and INR.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or to iodine.
- Contraindicated in those with cardiogenic shock, second- or third-degree AV block, severe SA node disease resulting in bradycardia unless an artificial pacemaker is present, and in those for whom bradycardia has caused syncope.
- Use cautiously in patients receiving other antiarrhythmics.
- Use cautiously in patients with pulmonary, hepatic, or thyroid disease.

***Overdose S&S:*** AV block, bradycardia, hypotension, cardiogenic shock, hepatotoxicity.

## NURSING CONSIDERATIONS

- Be aware of the high risk of adverse reactions.
- Obtain baseline pulmonary, liver, and thyroid function test results and baseline chest X-ray.

**Black Box Warning** Give loading doses in a hospital setting and with continuous ECG monitoring because of the slow onset of antiarrhythmic effect and the risk of life-threatening arrhythmias. ■

**Black Box Warning** Drug may pose life-threatening management problems in patients at risk for sudden death. Use only in patients with life-threatening, recurrent ventricular arrhythmias unresponsive to or intolerant of other antiarrhythmics or alternative drugs. Amiodarone can cause fatal toxicities, including hepatic and pulmonary toxicity. ■

**Black Box Warning** Drug is highly toxic. Watch carefully for pulmonary toxicity. Risk increases in patients receiving doses over 400 mg/day. ■

- Watch for evidence of pneumonitis, exertional dyspnea, nonproductive cough, and pleuritic chest pain. Monitor pulmonary function tests and chest X-ray.
- Monitor liver and thyroid function test results and electrolyte levels, particularly potassium and magnesium.
- Monitor PT and INR if patient takes warfarin and digoxin level if he takes digoxin.
- Instill methylcellulose ophthalmic solution during amiodarone therapy to minimize corneal microdeposits. About 1 to 4 months after starting amiodarone, most patients develop corneal microdeposits, although 10% or less have vision disturbances. Regular ophthalmic examinations are advised.
- Monitor blood pressure and heart rate and rhythm frequently. Perform continuous ECG monitoring when starting or changing dosage. Notify prescriber of significant change in assessment results.
- Safety and efficacy in children haven't been established. Life-threatening gasping syndrome may occur in neonates given I.V. solutions containing benzyl alcohol.
- During or after treatment with I.V. form, patient may be transferred to oral therapy.
- ***Look alike–sound alike:*** Don't confuse amiodarone with amiloride.

## PATIENT TEACHING

- Advise patient to wear sunscreen or protective clothing to prevent sensitivity reaction to the sun. Monitor patient for skin burning or tingling, followed by redness and blistering. Exposed skin may turn blue-gray.
- Advise patient to keep follow-up appointments, including eye exams and blood tests.
- Tell patient to contact prescriber if he has vision changes, weakness, "pins and needles" or numbness, poor coordination, weight change, heat or cold intolerance, or neck swelling.
- Tell patient to take oral drug with food if GI reactions occur.
- Inform patient that adverse effects of drug are more common at high doses and become more frequent with treatment lasting longer than 6 months, but are generally reversible when drug is stopped. Resolution of adverse reactions may take up to 4 months.
- Tell patient not to stop taking this medication without consulting with his prescriber.

# amitriptyline hydrochloride

a-mee-TRIP-ti-leen

*Therapeutic class:* Antidepressant
*Pharmacologic class:* Tricyclic antidepressant
*Pregnancy risk category C*

## AVAILABLE FORMS

**amitriptyline hydrochloride**
*Tablets:* 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg

## INDICATIONS & DOSAGES

➤ **Depression (outpatients)**
*Adults:* Initially, 50 to 100 mg P.O. at bedtime, increasing to 150 mg daily. Maximum, 300 mg daily, if needed. Maintenance, 40 to 100 mg daily.
*Elderly patients and adolescents:* 10 mg P.O. t.i.d. and 20 mg at bedtime daily.

➤ **Depression (hospitalized patients)**
*Adults:* Initially, 100 mg P.O. daily. If necessary, gradually increase to 200 to 300 mg daily. Maintenance dose is 40 to 100 mg daily.

➤ **Postherpetic neuralgia ♦**
*Adults:* 65 to 100 mg P.O. daily for at least 3 weeks.

➤ **Prevention of chronic headache ♦**
*Adults:* 20 to 100 mg P.O. daily.

➤ **Prevention of migraine ♦**
*Adults:* 10 to 300 mg P.O. daily.

➤ **Fibromyalgia ♦**
*Adults:* 10 to 50 mg P.O. at bedtime.

**Black Box Warning** Drug isn't approved for use in children. ■

## ADMINISTRATION

**P.O.**
• Give drug without regard for food.

## ACTION

Unknown. A tricyclic antidepressant that increases the amount of norepinephrine, serotonin, or both in the CNS by blocking their reuptake by the presynaptic neurons.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–12 hr | Unknown |

*Half-life:* Not established, varies widely.

## ADVERSE REACTIONS

**CNS:** ***stroke, seizures, coma,*** ataxia, tremor, peripheral neuropathy, anxiety, insomnia, restlessness, drowsiness, dizziness, weakness, fatigue, headache, extrapyramidal reactions, hallucinations, delusions, disorientation.
**CV:** *orthostatic hypotension, tachycardia,* ***heart block, arrhythmias, MI,*** ECG changes, hypertension, edema.
**EENT:** blurred vision, tinnitus, mydriasis, increased intraocular pressure.
**GI:** *dry mouth,* nausea, vomiting, anorexia, epigastric pain, diarrhea, constipation, paralytic ileus.
**GU:** urine retention, altered libido, impotence.
**Hematologic:** ***agranulocytosis, thrombocytopenia, leukopenia,*** eosinophilia.
**Metabolic:** ***hypoglycemia,*** hyperglycemia.
**Skin:** rash, urticaria, photosensitivity reactions, diaphoresis.
**Other:** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Barbiturates, CNS depressants:* May enhance CNS depression. Avoid using together.
*Cimetidine,* ***fluoxetine, fluvoxamine,*** *hormonal contraceptives,* ***paroxetine, sertraline:*** May increase tricyclic antidepressant level. Monitor drug levels and patient for signs of toxicity.
*Clonidine:* May cause life-threatening hypertension. Avoid using together.
*Epinephrine, norepinephrine:* May increase hypertensive effect. Use together cautiously.
*MAO inhibitors:* May cause severe excitation, hyperpyrexia, or seizures, usually with high doses. Avoid using within 14 days of MAO inhibitor therapy.
***Quinolones:*** May increase the risk of life-threatening arrhythmias. Avoid using together.
**Drug-herb.** *Evening primrose:* May cause additive or synergistic effect, resulting in lower seizure threshold and increasing the risk of seizures. Discourage use together.
*St. John's wort, SAM-e, yohimbe:* May cause serotonin syndrome and decrease amitriptyline level. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May enhance CNS depression. Discourage use together.

*Smoking:* May lower drug level. Watch for lack of effect.
*Sun exposure:* May increase risk of photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase or decrease glucose level.
- May increase eosinophil count and liver function test values. May decrease granulocyte, platelet, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those who have received an MAO inhibitor within the past 14 days.
- Contraindicated during acute recovery phase of MI.
- Use cautiously in patients with history of seizures, urine retention, angle-closure glaucoma, or increased intraocular pressure; in those with hyperthyroidism, CV disease, diabetes, or impaired liver function; and in those receiving thyroid drugs.
- Use cautiously in elderly patients and in patients with suicidal ideation.
- Use cautiously in those receiving electroconvulsive therapy.

***Overdose S&S:*** Cardiac arrhythmias, severe hypotension, seizures, CNS depression, impaired myocardial contractility, confusion, disturbed concentration, transient visual hallucinations, dilated pupils, disorders of ocular motility, agitation, hyperactive reflexes, polyradiculoneuropathy, stupor, drowsiness, muscle rigidity, vomiting, hypothermia.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug may increase the risk of suicidal thinking and behavior in children, adolescents, and young adults with major depressive disorder or other psychiatric disorder. Don't use in children younger than age 12.

- Amitriptyline has strong anticholinergic effects and is one of the most sedating tricyclic antidepressants. Anticholinergic effects have rapid onset even though therapeutic effect is delayed for weeks.
- Elderly patients may have an increased sensitivity to anticholinergic effects of drug; sedating effects of drug may increase the risk of falls in this population.
- If signs or symptoms of psychosis occur or increase, expect prescriber to reduce dosage. Record mood changes. Monitor patient for suicidal tendencies and allow only minimum supply of drug.
- Because patients using tricyclic antidepressants may suffer hypertensive episodes during surgery, stop drug gradually several days before surgery.
- Monitor glucose level.
- Watch for nausea, headache, and malaise after abrupt withdrawal of long-term therapy; these symptoms don't indicate addiction.
- Don't withdraw drug abruptly.
- ***Look alike–sound alike:*** Don't confuse amitriptyline with nortriptyline or aminophylline.

## PATIENT TEACHING

**Black Box Warning** Advise families and caregivers to closely observe patient for increased suicidal thinking and behavior.

- Whenever possible, advise patient to take full dose at bedtime, but warn him of possible morning orthostatic hypotension.
- Tell patient to avoid alcohol during drug therapy.
- Advise patient to consult prescriber before taking other drugs.
- Warn patient to avoid activities that require alertness and good psychomotor coordination until CNS effects of drug are known. Drowsiness and dizziness usually subside after a few weeks.
- Inform patient that dry mouth may be relieved with sugarless hard candy or gum. Saliva substitutes may be useful.
- To prevent photosensitivity reactions, advise patient to use a sunblock, wear protective clothing, and avoid prolonged exposure to strong sunlight.
- Warn patient not to stop drug abruptly.
- Advise patient that it may take as long as 30 days to achieve full therapeutic effect.

# amlodipine besylate

am-LOE-di-peen

Norvasc✐

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Calcium channel blocker
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 2.5 mg, 5 mg, 10 mg

## INDICATIONS & DOSAGES

➤ **Chronic stable angina, vasospastic angina (Prinzmetal's or variant angina)**

*Adults:* Initially, 5 to 10 mg P.O. daily. Most patients need 10 mg daily.
*Elderly patients:* Initially, 5 mg P.O. daily.
***Adjust-a-dose:*** For patients who are small or frail or have hepatic insufficiency, initially, 5 mg P.O. daily.

➤ **Hypertension**

*Adults:* Initially, 5 mg P.O. daily. Dosage adjusted according to patient response and tolerance. Maximum daily dose is 10 mg.
*Children ages 6 to 17:* 2.5 to 5 mg P.O. once daily. Maximum dosage is 5 mg daily.
*Elderly patients:* Initially, 2.5 mg P.O. daily.
***Adjust-a-dose:*** For patients who are small or frail, are taking other antihypertensives, or have hepatic insufficiency, initially, 2.5 mg P.O. daily.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.

## ACTION

Inhibits calcium ion influx across cardiac and smooth-muscle cells, dilates coronary arteries and arterioles, and decreases blood pressure and myocardial oxygen demand.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 6–12 hr | 24 hr |

*Half-life:* 30 to 50 hours.

## ADVERSE REACTIONS

**CNS:** headache, somnolence, fatigue, dizziness, light-headedness, asthenia, paresthesia.
**CV:** *edema,* flushing, palpitations.
**GI:** dyspepsia, nausea, abdominal pain.
**GU:** sexual difficulties.
**Musculoskeletal:** muscle cramps.
**Respiratory:** dyspnea.
**Skin:** rash, pruritus.

## INTERACTIONS

None reported.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients receiving other peripheral vasodilators, especially those with severe aortic stenosis, and in those with heart failure. Because drug is metabolized by the liver, use cautiously and in reduced dosage in patients with severe hepatic disease.

⚠ ***Overdose S&S:*** Hypotension.

## NURSING CONSIDERATIONS

***Alert:*** Monitor patient carefully. Some patients, especially those with severe obstructive coronary artery disease, have developed increased frequency, duration, or severity of angina or acute MI after initiation of calcium channel blocker therapy or at time of dosage increase.

- Monitor blood pressure frequently during initiation of therapy. Because drug-induced vasodilation has a gradual onset, acute hypotension is rare.
- Notify prescriber if signs of heart failure occur, such as swelling of hands and feet or shortness of breath.

***Alert:*** Abrupt withdrawal of drug may increase frequency and duration of chest pain. Taper dose gradually under medical supervision.

- ***Look alike–sound alike:*** Don't confuse amlodipine with amiloride.

## PATIENT TEACHING

- Caution patient to continue taking drug, even when he feels better.
- Tell patient S.L. nitroglycerin may be taken as needed when angina symptoms are acute. If patient continues nitrate therapy

during adjustment of amlodipine dosage, urge continued compliance.

## amoxicillin

a-mox-i-SILL-in

Amox†, Apo-Amoxi†, DisperMox, Moxatag, Novamoxin†, Nu-Amoxi†

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Aminopenicillin
*Pregnancy risk category B*

### AVAILABLE FORMS

*Capsules:* 250 mg, 500 mg
*Oral suspension:* 50 mg/ml (pediatric drops), 125 mg/5 ml, 200 mg/5 ml, 250 mg/5 ml, 400 mg/5 ml (after reconstitution)
*Tablets (chewable):* 125 mg, 200 mg, 250 mg, 400 mg
*Tablets (extended-release):* 775 mg
*Tablets (film-coated):* 500 mg, 875 mg
*Tablets for oral suspension:* 200 mg, 400 mg, 600 mg

### INDICATIONS & DOSAGES

➤ **Mild to moderate infections of the ear, nose, and throat; skin and skin structure; or GU tract**

*Adults and children who weigh 40 kg (88 lb) or more:* 500 mg P.O. every 12 hours or 250 mg P.O. every 8 hours.
*Children older than age 3 months who weigh less than 40 kg:* 25 mg/kg/day P.O. divided every 12 hours or 20 mg/kg/day P.O. divided every 8 hours.
*Neonates and infants up to age 3 months:* Up to 30 mg/kg/day P.O. divided every 12 hours.

➤ **Mild to severe infections of the lower respiratory tract and severe infections of the ear, nose, and throat; skin and skin structure; or GU tract**

*Adults and children who weigh 40 kg or more:* 875 mg P.O. every 12 hours or 500 mg P.O. every 8 hours.
*Children older than age 3 months weighing less than 40 kg:* 45 mg/kg/day P.O. divided every 12 hours or 40 mg/kg/day P.O. divided every 8 hours.

➤ **Pharyngitis, tonsillitis, or both secondary to *Streptococcus pyogenes* infection**

*Adults and children age 12 and older:* 775-mg extended-release tablet P.O. once daily with a meal for 10 days.

➤ **Uncomplicated gonorrhea**

*Adults and children who weigh more than 45 kg (99 lb):* 3 g P.O. with 1 g probenecid given as a single dose.
*Children age 2 and older who weigh less than 45 kg:* 50 mg/kg to a maximum of 3 g P.O. with 25 mg/kg of probenecid, to a maximum of 1 g, as a single dose. Don't give probenecid to children younger than age 2.

➤ **To prevent endocarditis in at-risk patients having dental, oral, or respiratory tract procedures ♦**

*Adults:* 2 g P.O. 30 to 60 minutes before procedure.
*Children:* 50 mg/kg P.O. 30 to 60 minutes before procedure.

➤ ***Helicobacter pylori* eradication to reduce risk of duodenal ulcer recurrence**

*Adults:* Amoxicillin 1 g with lansoprazole 30 mg P.O. every 8 hours for 14 days.

### ADMINISTRATION

**P.O.**

- Before giving, ask patient about allergic reactions to penicillin. A negative history of penicillin allergy is no guarantee against allergic reaction.
- Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
- Give drug with or without food, except for extended-release tablets, which are given with a meal.
- Don't crush or split extended-release tablets.
- For a child, place drops directly on child's tongue for swallowing or add to formula, milk, fruit juice, water, ginger ale, or a cold drink for immediate and complete consumption.
- For a child taking DisperMox, mix one tablet in about 10 ml of water, have the child drink the resulting solution, rinse container with a small amount of water, and have the child drink again to ensure the whole dose is taken. Mix tablet only in water. Don't let

child chew tablets, swallow them whole, or let them dissolve in mouth.
• Store reconstituted oral suspension in refrigerator, if possible. Be sure to check individual product labels for storage information.

## ACTION

Inhibits cell-wall synthesis during bacterial multiplication.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | 6–8 hr |

*Half-life:* 1 to 1½ hours (7½ hours in severe renal impairment).

## ADVERSE REACTIONS

**CNS:** ***seizures,*** lethargy, hallucinations, anxiety, confusion, agitation, depression, dizziness, fatigue, headache.
**GI:** *diarrhea*, *nausea*, ***pseudomembranous colitis,*** vomiting, glossitis, stomatitis, gastritis, enterocolitis, abdominal pain, black hairy tongue.
**GU:** interstitial nephritis, nephropathy, vaginitis.
**Hematologic:** ***agranulocytosis, leukopenia, thrombocytopenia, thrombocytopenic purpura,*** anemia, eosinophilia, hemolytic anemia.
**Other:** ***anaphylaxis,*** hypersensitivity reactions, overgrowth of nonsusceptible organisms.

## INTERACTIONS

**Drug-drug.** *Allopurinol:* May increase risk of rash. Monitor patient for rash.
*Hormonal contraceptives:* May decrease contraceptive effectiveness. Advise use of additional form of contraception during penicillin therapy.
*Probenecid:* May increase levels of amoxicillin and other penicillins. Probenecid may be used for this purpose.
**Drug-herb.** *Khat:* May decrease antimicrobial effect of certain penicillins. Discourage herb use, or tell patient to take drug 2 hours after herb use.

## EFFECTS ON LAB TEST RESULTS

• May decrease hemoglobin level.
• May increase eosinophil count. May decrease granulocyte, platelet, and WBC counts.
• May falsely decrease aminoglycoside level. May alter results of urine glucose tests that use cupric sulfate, such as Benedict's reagent and Clinitest.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or other penicillins.
• Use cautiously in patients with other drug allergies (especially to cephalosporins) because of possible cross-sensitivity.
• Use cautiously in those with mononucleosis because of high risk of maculopapular rash.
⚠ ***Overdose S&S:*** Oliguric renal failure.

## NURSING CONSIDERATIONS

• If large doses are given or if therapy is prolonged, bacterial or fungal superinfection may occur, especially in elderly, debilitated, or immunosuppressed patients.
• *Clostridium difficile*–associated diarrhea, ranging from mild diarrhea to fatal colitis, has been reported with nearly all antibacterial agents, including amoxicillin. Evaluate patient if diarrhea occurs.
• Amoxicillin usually causes fewer cases of diarrhea than ampicillin.
• ***Look alike–sound alike:*** Don't confuse amoxicillin with amoxapine.

## PATIENT TEACHING

• Tell patient to take entire quantity of drug exactly as prescribed, even after he feels better.
• Instruct patient to take drug with or without food, except extended-release tablets, which are taken with a meal.
• Tell patient to swallow extended-release tablets whole and not to chew, crush, or split them.
• Tell patient to notify prescriber if rash, fever, or chills develop. A rash is the most common allergic reaction, especially if allopurinol is also being taken.
• Tell parent to place drops directly on child's tongue for swallowing or add to formula, milk, fruit juice, water, ginger ale, or a cold drink for immediate and complete consumption.

• If child takes DisperMox, tell parent to mix one tablet in about 10 ml of water, to have the child drink the resulting solution, to rinse container with a small amount of water, and to have the child drink again to ensure the whole dose is taken. Parent should mix tablet only in water. Caution parent against allowing child to chew tablets, to swallow them whole, or to let them dissolve in mouth.

## amoxicillin and clavulanate potassium (amoxycillin and clavulanate potassium)

a-mox-i-SILL-in

Aclavulanate†, Apo-Amoxi Clav†, Augmentin, Augmentin XR, Clavulin†, Novo-Clavamoxin†

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Aminopenicillin and beta-lactamase inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS

*Oral suspension:* 125 mg amoxicillin trihydrate and 31.25 mg clavulanic acid/5 ml (after reconstitution); 200 mg amoxicillin trihydrate and 28.5 mg clavulanic acid/5 ml (after reconstitution); 250 mg amoxicillin trihydrate and 62.5 mg clavulanic acid/5 ml (after reconstitution); 400 mg amoxicillin trihydrate and 57 mg clavulanic acid/5 ml (after reconstitution); 600 mg amoxicillin trihydrate and 42.9 mg clavulanic acid/5 ml (after reconstitution)
*Tablets (chewable):* 125 mg amoxicillin trihydrate, 31.25 mg clavulanic acid; 200 mg amoxicillin trihydrate, 28.5 mg clavulanic acid; 250 mg amoxicillin trihydrate, 62.5 mg clavulanic acid; 400 mg amoxicillin trihydrate, 57 mg clavulanic acid
*Tablets (extended-release):* 1,000 mg amoxicillin trihydrate, 62.5 mg clavulanic acid
*Tablets (film-coated):* 250 mg amoxicillin trihydrate, 125 mg clavulanic acid; 500 mg amoxicillin trihydrate, 125 mg clavulanic acid; 875 mg amoxicillin trihydrate, 125 mg clavulanic acid

### INDICATIONS & DOSAGES

➤ **Recurrent or persistent acute otitis media caused by *Streptococcus pneumoniae, Haemophilus influenzae,* or *Moraxella catarrhalis* in patients exposed to antibiotics within the previous 3 months, who are 2 years old or younger or in day care facilities**
*Children age 3 months and older:* 90 mg/kg/day (600 mg amoxicillin/42.9 mg clavulanic acid/5 ml) P.O., based on amoxicillin component, every 12 hours for 10 days.

➤ **Lower respiratory tract infections, otitis media, sinusitis, skin and skin-structure infections, and UTIs caused by susceptible strains of gram-positive and gram-negative organisms**
*Adults and children weighing 40 kg (88 lb) or more:* 250 mg P.O., based on amoxicillin component, every 8 hours; or 500 mg every 12 hours. For more severe infections, 500 mg every 8 hours or 875 mg every 12 hours.
*Children age 3 months and older and weighing less than 40 kg:* 20 to 45 mg/kg P.O., based on amoxicillin component and severity of infection, daily in divided doses every 8 to 12 hours.
*Children younger than age 3 months:* 30 mg/kg/day P.O., based on amoxicillin component of the 125-mg/5-ml oral suspension, in divided doses every 12 hours.
***Adjust-a-dose:*** Don't give the 875-mg tablet to patients with creatinine clearance less than 30 ml/minute. If clearance is 10 to 30 ml/minute, give 250 to 500 mg P.O. every 12 hours. If clearance is less than 10 ml/minute, give 250 to 500 mg P.O. every 24 hours. Give hemodialysis patients 250 to 500 mg P.O. every 24 hours with an additional dose both during and after dialysis.

➤ **Community-acquired pneumonia or acute bacterial sinusitis caused by *H. influenzae, M. catarrhalis, H. parainfluenzae, Klebsiella pneumoniae,* methicillin-susceptible *Staphylococcus aureus,* or *S. pneumoniae* with reduced susceptibility to penicillin**
*Adults and children age 16 and older:* 2,000 mg/125 mg Augmentin XR tablets

every 12 hours for 7 to 10 days for pneumonia; 10 days for sinusitis.
***Adjust-a-dose:*** In patients with creatinine clearance less than 30 ml/minute and patients receiving hemodialysis, don't use Augmentin XR.

## ADMINISTRATION

**P.O.**
- Before giving drug, ask patient about allergic reactions to penicillin. A negative history of penicillin allergy is no guarantee against an allergic reaction.
- Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
- Give drug at the start of a meal to enhance absorption.
- Give drug at least 1 hour before a bacteriostatic antibiotic.
- Avoid use of 250-mg tablet in children weighing less than 40 kg (88 lb). Use chewable form instead.
- After reconstitution, refrigerate the oral suspension; discard after 10 days.

## ACTION

Prevents bacterial cell-wall synthesis during replication. Increases amoxicillin's effectiveness by inactivating beta-lactamases, which destroy amoxicillin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2½ hr | 6–8 hr |
| P.O. (600 mg amoxicillin/ 42.9 mg clavulanic acid) | Unknown | 1–4 hr | Unknown |
| P.O. (Augmentin XR) | Unknown | 1–6 hr | Unknown |

*Half-life:* 1 to 1½ hours. For patients with severe renal impairment, 7½ hours for amoxicillin and 4½ hours for clavulanate.

## ADVERSE REACTIONS

**CNS:** agitation, anxiety, behavioral changes, confusion, dizziness, insomnia.
**GI:** nausea, vomiting, *diarrhea*, indigestion, gastritis, stomatitis, glossitis, black hairy tongue, enterocolitis, ***pseudomembranous colitis,*** mucocutaneous candidiasis, abdominal pain.
**GU:** vaginal candidiasis, vaginitis.
**Hematologic:** anemia, ***thrombocytopenia, thrombocytopenic purpura,*** eosinophilia, ***leukopenia, agranulocytosis.***
**Other:** hypersensitivity reactions, ***anaphylaxis,*** pruritus, rash, urticaria, ***angioedema,*** overgrowth of nonsusceptible organisms, serum sickness–like reaction.

## INTERACTIONS

**Drug-drug.** *Allopurinol:* May increase risk of rash. Monitor patient for rash.
*Hormonal contraceptives:* May decrease hormonal contraceptive effectiveness. Advise use of additional form of contraception during penicillin therapy.
*Methotrexate:* May increase risk of methotrexate toxicity. Monitor methotrexate levels.
*Probenecid:* May increase levels of amoxicillin and other penicillins. Probenecid may be used for this purpose.
*Tetracyclines:* May reduce therapeutic action of penicillins. Avoid coadministration.
**Drug-herb.** *Khat:* May decrease antimicrobial effect of certain penicillins. Discourage khat chewing, or tell patient to take amoxicillin 2 hours after khat chewing.

## EFFECTS ON LAB TEST RESULTS

- May increase eosinophil count.
- May falsely decrease aminoglycoside level. May alter results of urine glucose tests that use cupric sulfate, such as Benedict's reagent and Clinitest.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other penicillins and in those with a history of amoxicillin-related cholestatic jaundice or hepatic dysfunction.
- Augmentin XR is contraindicated in patients receiving hemodialysis and those with creatinine clearance less than 30 ml/minute.
- Use cautiously in patients with other drug allergies (especially to cephalosporins) because of possible cross-sensitivity and in those with mononucleosis because of high risk of maculopapular rash.
- Use cautiously in breast-feeding women; it's unknown if drug appears in breast milk.

- Use cautiously in hepatically impaired patients, and monitor the hepatic function of these patients.
- Don't give ampicillin-class antibiotics to patients with mononucleosis due to high incidence of erythematous rash.

***Overdose S&S:*** Crystalluria, oliguric renal failure, GI symptoms, rash, hyperactivity or drowsiness.

## NURSING CONSIDERATIONS

- Each Augmentin XR tablet contains 29.3 mg (1.27 mEq) of sodium.
- Augmentin XR isn't indicated for treating infections caused by *S. pneumoniae* with penicillin minimum inhibitory concentration, or MIC, of 4 mcg/ml or greater.
- If large doses are given or therapy is prolonged, bacterial or fungal superinfection may occur, especially in elderly, debilitated, or immunosuppressed patients.

***Alert:*** Don't interchange the oral suspensions because of varying clavulanic acid contents.

- 600 mg amoxicillin/42.9 mg clavulanic acid/5 ml is intended only for children ages 3 months to 12 years with persistent or recurrent acute otitis media.

***Alert:*** Both 250- and 500-mg film-coated tablets contain the same amount of clavulanic acid (125 mg). Therefore, two 250-mg tablets aren't equivalent to one 500-mg tablet. Regular tablets aren't equivalent to Augmentin XR.

- This drug combination is particularly useful in clinical settings with a high prevalence of amoxicillin-resistant organisms.
- ***Look alike–sound alike:*** Don't confuse amoxicillin with amoxapine.

## PATIENT TEACHING

- Tell patient to take entire quantity of drug exactly as prescribed, even after feeling better.
- Instruct patient to take drug with food to prevent GI upset. If he's taking the oral suspension, tell him to keep drug refrigerated, to shake it well before taking it, and to discard remaining drug after 10 days.
- Tell patient to call prescriber if a rash occurs because rash is a sign of an allergic reaction.

**SAFETY ALERT!**

# amphotericin B lipid complex

am-foe-TER-i-sin

Abelcet

*Therapeutic class:* Antifungal
*Pharmacologic class:* Polyene antibiotic
*Pregnancy risk category B*

## AVAILABLE FORMS

*Suspension for injection:* 100 mg/20-ml vial

## INDICATIONS & DOSAGES

➤ **Invasive fungal infections, including *Aspergillus* and *Candida* species, in patients refractory to or intolerant of conventional amphotericin B therapy**

**Black Box Warning** Don't use to treat noninvasive forms of fungal disease in patients with normal neutrophil counts. ■

*Adults and children:* 5 mg/kg daily I.V. as a single infusion given at rate of 2.5 mg/kg/hour.

***Adjust-a-dose:*** For patients with creatinine clearance of less than 10 ml/minute, give 5 mg/kg every 24 to 36 hours

## ADMINISTRATION

**I.V.**

▼ To prepare, shake vial gently until there's no yellow sediment. Using aseptic technique, withdraw calculated dose into one or more 20-ml syringes using an 18G needle. More than one vial will be needed.

▼ Attach a 5-micron filter needle to syringe and inject dose into I.V. bag of $D_5W$. Volume of $D_5W$ should be sufficient to yield 1 mg/ml (2 mg/ml for pediatric and cardiovascular patients). One filter needle can be used for up to four vials of amphotericin B lipid complex.

▼ Don't use an in-line filter.

▼ If infusing through an existing I.V. line, flush first with $D_5W$.

▼ Use an infusion pump, and give by continuous infusion at 2.5 mg/kg/hour.

▼ If infusion time exceeds 2 hours, mix contents by shaking infusion bag every 2 hours.

▼ Monitor vital signs closely. Fever, shaking chills, and hypotension may appear within 2 hours of starting infusion. Slowing infusion rate may decrease risk of infusion-related reactions.
▼ If severe respiratory distress occurs, stop infusion, provide supportive therapy for anaphylaxis, and notify prescriber. Don't restart drug.
▼ Reconstituted drug is stable up to 48 hours if refrigerated (36° to 46° F [2° to 8° C]) and up to 6 hours at room temperature.
▼ Discard any unused drug because it contains no preservative.
▼ **Incompatibilities:** Electrolytes, other I.V. drugs, saline solutions.

## ACTION

Binds to sterols of fungal cell membranes, altering cell permeability and causing cell death.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* About 1 week.

## ADVERSE REACTIONS

**CNS:** *fever,* headache, pain.
**CV:** ***cardiac arrest,*** chest pain, hypertension, hypotension.
**GI:** ***GI hemorrhage,*** abdominal pain, diarrhea, nausea, vomiting.
**GU:** ***renal failure.***
**Hematologic:** ***leukopenia, thrombocytopenia,*** anemia.
**Hepatic:** bilirubinemia.
**Metabolic:** hypokalemia.
**Respiratory:** ***respiratory failure,*** dyspnea, respiratory disorder.
**Skin:** rash.
**Other:** **MULTIPLE ORGAN FAILURE,** *chills,* ***sepsis,*** infection.

## INTERACTIONS

**Drug-drug.** *Antineoplastics:* May increase risk of renal toxicity, bronchospasm, and hypotension. Use together cautiously.
*Cardiac glycosides:* May increase risk of digitalis toxicity from amphotericin B–induced hypokalemia. Monitor potassium level closely.
*Clotrimazole, fluconazole, itraconazole, ketoconazole, miconazole:* May counteract effects of amphotericin B by inducing fungal resistance. Monitor patient closely.
*Corticosteroids, corticotropin:* May enhance hypokalemia, which could lead to cardiac toxicity. Monitor electrolyte levels and cardiac function.
*Cyclosporine:* May increase renal toxicity. Monitor renal function test results closely.
*Flucytosine:* May increase risk of flucytosine toxicity from increased cellular uptake or impaired renal excretion. Use together cautiously.
*Leukocyte transfusions:* May increase risk of pulmonary reactions, such as acute dyspnea, tachypnea, hypoxemia, hemoptysis, and interstitial infiltrates. Use together with caution; separate doses as much as possible, and monitor pulmonary function.
*Nephrotoxic drugs (such as aminoglycosides, pentamidine):* May increase risk of renal toxicity. Use together cautiously and monitor renal function closely.
*Skeletal muscle relaxants:* May enhance skeletal muscle relaxant effects of amphotericin B–induced hypokalemia. Monitor potassium level closely.
*Zidovudine:* May increase myelotoxicity and nephrotoxicity. Monitor renal and hematologic function.

## EFFECTS ON LAB TEST RESULTS

● May increase alkaline phosphatase, ALT, AST, bilirubin, BUN, creatinine, GGT, and LDH levels. May decrease hemoglobin and potassium levels.
● May decrease platelet and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to amphotericin B or its components.
● Use cautiously in patients with renal impairment. Adjust dosage based on patient's overall condition. Renal toxicity is more common at higher dosages.
● It's unknown if drug appears in breast milk. Encourage the patient to stop either breast-feeding or treatment.
⚠ ***Overdose S&S:*** Cardiorespiratory arrest.

## NURSING CONSIDERATIONS

***Alert:*** Different amphotericin B preparations aren't interchangeable, so dosages will vary. Confusing the preparations may cause permanent damage or death.

- Hydrate before infusion to reduce risk of nephrotoxicity.
- Monitor creatinine and electrolyte levels (especially magnesium and potassium), liver function, and CBC during therapy.

## PATIENT TEACHING

- Inform patient that he may develop fever, chills, nausea, and vomiting during infusion, but that these symptoms usually subside with subsequent doses.
- Instruct patient to report any redness or pain at infusion site.
- Teach patient to recognize and report to prescriber signs and symptoms of acute hypersensitivity, such as respiratory distress.
- Warn patient that therapy may take several months.
- Tell patient to expect frequent laboratory testing to monitor kidney and liver function.

**SAFETY ALERT!**

# amphotericin B liposomal

am-foe-TER-i-sin

AmBisome

*Therapeutic class:* Antifungal
*Pharmacologic class:* Polyene antibiotic
*Pregnancy risk category B*

## AVAILABLE FORMS

*Powder for injection:* 50-mg vial

## INDICATIONS & DOSAGES

➤ **Empirical therapy for presumed fungal infection in febrile, neutropenic patients**

*Adults and children:* 3 mg/kg I.V. infusion over 2 hours daily.

➤ **Systemic fungal infections caused by *Aspergillus* species, *Candida* species, or *Cryptococcus* species refractory to amphotericin B deoxycholate or in patients for whom renal impairment or unacceptable toxicity precludes use of amphotericin B deoxycholate**

*Adults and children:* 3 to 5 mg/kg I.V. infusion over 2 hours daily.

➤ **Visceral leishmaniasis in immunocompetent patients**

*Adults and children:* 3 mg/kg I.V. infusion over 2 hours daily on days 1 to 5, day 14, and day 21. A repeat course of therapy may be beneficial if initial treatment fails to clear parasites.

➤ **Visceral leishmaniasis in immunocompromised patients**

*Adults and children:* 4 mg/kg I.V. infusion over 2 hours daily on days 1 to 5, day 10, day 17, day 24, day 31, and day 38.

➤ **Cryptococcal meningitis in patients with HIV infection**

*Adults and children:* 6 mg/kg/day I.V. infusion over 2 hours. Reduce infusion time to 1 hour if treatment is well tolerated, and increase infusion time if discomfort occurs.

**Black Box Warning** Don't use to treat noninvasive forms of fungal disease in patients with normal neutrophil counts. ■

***Adjust-a-dose:*** For patients with creatinine clearance of less than 10 ml/minute, give 3 mg/kg I.V. every 24 hours.

## ADMINISTRATION

**I.V.**

▼ Don't reconstitute with bacteriostatic water for injection, and don't allow bacteriostatic product in solution.

▼ Don't reconstitute with saline solution, add saline solution to reconstituted concentration, or mix with other drugs.

▼ Reconstitute each 50-mg vial with 12 ml of sterile water for injection to yield 4 mg/ml. A yellow, translucent suspension will form.

▼ After reconstitution, shake vial vigorously for 30 seconds or until particulate matter disperses.

▼ Dilute to 1 to 2 mg/ml by withdrawing calculated amount of reconstituted solution into a sterile syringe and injecting it through a 5-micron filter into $D_5W$. Use only 1 filter needle per vial. Concentrations of 0.2 to 0.5 mg/ml may provide sufficient volume of infusion for children.

▼ Flush existing I.V. line with $D_5W$ before infusing drug. If this isn't possible, give drug through a separate line.

▼ Use a controlled infusion device and an in-line filter with a mean pore diameter of 1 micron or larger.
▼ Initially, infuse drug over at least 2 hours. If drug is tolerated well, reduce infusion time to 1 hour. If discomfort occurs, increase infusion time.
▼ Store unopened vial at 36° to 46° F (2° to 8° C). Store reconstituted drug for up to 24 hours at 36° to 46° F. Use within 6 hours of dilution with $D_5W$. Don't freeze.
▼ **Incompatibilities:** Other I.V. drugs, saline solutions.

## ACTION

Binds to sterols of fungal cell membranes, altering cell permeability and causing cell death.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* About 4 to 6 days.

## ADVERSE REACTIONS

**CNS:** *fever, anxiety, confusion, headache, insomnia, asthenia, pain.*
**CV:** *chest pain, hypotension, tachycardia,* hypertension, *edema,* flushing.
**EENT:** *epistaxis, rhinitis.*
**GI:** *nausea, vomiting, abdominal pain, diarrhea,* ***GI hemorrhage.***
**GU:** *hematuria,* ***renal failure.***
**Hematologic:** anemia, thrombocytopenia.
**Hepatic:** *bilirubinemia,* ***hepatotoxicity.***
**Metabolic:** *hyperglycemia,* hypernatremia, *hypocalcemia, hypokalemia,* ***hypomagnesemia.***
**Musculoskeletal:** *back pain.*
**Respiratory:** *increased cough, dyspnea,* hypoxia, *pleural effusion, lung disorder,* hyperventilation.
**Skin:** *pruritus, rash,* sweating.
**Other:** *chills, infection,* ***anaphylaxis, sepsis,*** *blood product infusion reaction.*

## INTERACTIONS

**Drug-drug.** *Antineoplastics:* May enhance potential for renal toxicity, bronchospasm, and hypotension. Use together cautiously.
*Cardiac glycosides:* May increase risk of digitalis toxicity caused by amphotericin B–induced hypokalemia. Monitor potassium level closely.
*Clotrimazole, fluconazole, ketoconazole, miconazole:* May induce fungal resistance to amphotericin B. Use together cautiously.
*Corticosteroids, corticotropin:* May increase potassium depletion, which could cause cardiac dysfunction. Monitor electrolyte levels and cardiac function.
*Flucytosine:* May increase flucytosine toxicity by increasing cellular reuptake or impairing renal excretion of flucytosine. Use together cautiously.
*Leukocyte transfusions:* May increase risk of pulmonary reactions, such as acute dyspnea, tachypnea, hypoxemia, hemoptysis, and interstitial infiltrates. Use together cautiously; separate doses as much as possible, and monitor pulmonary function.
*Other nephrotoxic drugs, such as antibiotics and antineoplastics:* May cause additive nephrotoxicity. Use together cautiously; monitor renal function closely.
*Skeletal muscle relaxants:* May enhance effects of skeletal muscle relaxants resulting from amphotericin B–induced hypokalemia. Monitor potassium level.

## EFFECTS ON LAB TEST RESULTS

● May increase alkaline phosphatase, ALT, AST, bilirubin, BUN, creatinine, GGT, glucose, LDH, and sodium levels. May decrease calcium, magnesium, and potassium levels.
● May decrease hemoglobin and platelet count.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or its components.
● Use cautiously in patients with impaired renal function, in elderly patients, and in pregnant women.
● It's unknown if drug appears in breast milk. Because of risk of serious adverse reactions in breast-fed infants, encourage patient to stop either breast-feeding or therapy, taking into account importance of drug.
⚠ ***Overdose S&S:*** Cardiorespiratory arrest.

## NURSING CONSIDERATIONS

- Patients also receiving chemotherapy or bone marrow transplantation are at greater risk for additional adverse reactions, including seizures, arrhythmias, and thrombocytopenia.
- ***Alert:*** Different amphotericin B preparations aren't interchangeable, so dosages will vary. Confusing the preparations may cause permanent damage or death.
- Premedicate patient with antipyretics, antihistamines, antiemetics, or corticosteroids.
- Hydrate before infusion to reduce the risk of nephrotoxicity.
- Monitor BUN, creatinine, and electrolyte levels (particularly magnesium and potassium), liver function, and CBC.
- Watch for signs and symptoms of hypokalemia (ECG changes, muscle weakness, cramping, drowsiness).
- Patients treated with this drug have a lower risk of chills, elevated BUN level, hypokalemia, hypertension, and vomiting than patients treated with conventional amphotericin B.
- Therapy may take several weeks or months.
- Observe patient closely for adverse reactions during infusion. If anaphylaxis occurs, stop infusion immediately, provide supportive therapy, and notify prescriber.

## PATIENT TEACHING

- Teach patient signs and symptoms of hypersensitivity, and stress importance of reporting them immediately.
- Warn patient that therapy may take several months; teach personal hygiene and other measures to prevent spread and recurrence of lesions.
- Instruct patient to report any adverse reactions that occur while receiving drug.
- Tell patient to watch for and report signs and symptoms of low levels of potassium in the blood (muscle weakness, cramping, drowsiness).
- Advise patient that frequent laboratory testing will be needed.

# ampicillin

am-pi-SILL-in

Apo-Ampi†, Nu-Ampi†

# ampicillin sodium

# ampicillin trihydrate

Principen

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Aminopenicillin
*Pregnancy risk category B*

## AVAILABLE FORMS

*Capsules:* 250 mg, 500 mg
*Injection:* 125 mg, 250 mg, 500 mg, 1 g, 2 g
*Oral suspension:* 125 mg/5 ml, 250 mg/5 ml

## INDICATIONS & DOSAGES

➤ **Respiratory tract or skin and skin-structure infections**

*Adults and children who weigh 40 kg (88 lb) or more:* 250 mg P.O. every 6 hours.
*Children who weigh more than 20 kg (44 lb) but less than 40 kg:* 250 mg P.O. every 6 hours. Pediatric dosages shouldn't exceed recommended adult dosages.
*Children who weigh 20 kg (44 lb) or less:* 50 mg/kg/day P.O. in equally divided doses every 6 to 8 hours.

➤ **GI infections or UTIs**

*Adults and children who weigh 20 kg or more:* 500 mg P.O. every 6 hours. For severe infections, larger doses may be needed.
*Children who weigh less than 20 kg:* 50 to 100 mg/kg/day P.O. in equally divided doses every 6 hours.

➤ **Bacterial meningitis or septicemia**

*Adults:* 150 to 200 mg/kg/day I.V. in divided doses every 3 to 4 hours. May be given I.M. after 3 days of I.V. therapy. Maximum recommended daily dose is 14 g.
*Children:* 150 to 200 mg/kg I.V. daily in divided doses every 3 to 4 hours. Give I.V. for 3 days; then give I.M.

➤ **Uncomplicated gonorrhea**

*Adults and children who weigh more than 20 kg:* 3.5 g P.O. with 1 g probenecid given as a single dose.
***Adjust-a-dose:*** In patients with creatinine clearance of 10 to 50 ml/minute, use same

dose but increase dosing interval to 6 to 12 hours; for those with a clearance less than 10 ml/minute, increase dosing interval to 12 to 16 hours I.V.

## ADMINISTRATION

**P.O.**

- Before giving drug, ask patient about allergic reactions to penicillin. A negative history of penicillin allergy is no guarantee against a future allergic reaction.
- Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
- Give drug 1 to 2 hours before or 2 to 3 hours after meals. When given orally, drug may cause GI disturbances. Food may interfere with absorption.
- Give drug I.M. or I.V. if infection is severe or if patient can't take oral dose.

**I.V.**

▼ Before giving drug, ask patient about allergic reactions to penicillin. A negative history of penicillin allergy is no guarantee against a future allergic reaction.

▼ Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.

▼ Give drug I.M. or I.V. only if infection is severe or if patient can't take oral dose.

▼ Give drug intermittently to prevent vein irritation. Change site every 48 hours.

▼ For direct injection, reconstitute with bacteriostatic water for injection. Use 5 ml for 250-mg or 500-mg vials, 7.4 ml for 1-g vials, and 14.8 ml for 2-g vials. Give drug over 10 to 15 minutes to avoid seizures. Don't exceed 100 mg/minute.

▼ For intermittent infusion, dilute in 50 to 100 ml of normal saline solution for injection. Give drug over 15 to 30 minutes.

▼ Use first dilution within 1 hour. Follow manufacturer's directions for stability data when drug is further diluted for I.V. infusion.

▼ **Incompatibilities:** Amikacin, amino acid solutions, chlorpromazine, dextran solutions, dextrose solutions, dopamine, erythromycin lactobionate, 10% fat emulsions, fructose, gentamicin, heparin sodium, hetastarch, hydrocortisone sodium succinate, hydromorphone, kanamycin, lidocaine, lincomycin, polymyxin B, prochlorperazine edisylate, sodium bicarbonate, streptomycin, tobramycin.

**I.M.**

- Before giving drug, ask patient about allergic reactions to penicillin. A negative history of penicillin allergy is no guarantee against a future allergic reaction.
- Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
- Give drug I.M. or I.V. only if infection is severe or if patient can't take oral dose.

## ACTION

Inhibits cell-wall synthesis during bacterial multiplication.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 hr | 6–8 hr |
| I.V. | Immediate | Immediate | Unknown |
| I.M. | Unknown | 1 hr | Unknown |

*Half-life:* 1 to 1½ hours (10 to 24 hours in severe renal impairment).

## ADVERSE REACTIONS

**GI:** *diarrhea, nausea,* ***pseudomembranous colitis,*** abdominal pain, black hairy tongue, enterocolitis, gastritis, glossitis, stomatitis, vomiting.

**Hematologic:** ***leukopenia, thrombocytopenia, thrombocytopenic purpura,*** anemia, eosinophilia, hemolytic anemia, ***agranulocytosis.***

**Other:** hypersensitivity reactions, overgrowth of nonsusceptible organisms.

## INTERACTIONS

**Drug-drug.** *Allopurinol:* May increase risk of rash. Monitor patient for rash.

*$H_2$ antagonists, proton pump inhibitors:* May decrease ampicillin absorption and level. Separate administration times. Monitor patient for continued antibiotic effectiveness.

*Hormonal contraceptives:* May decrease hormonal contraceptive effectiveness. Advise use of another form of contraception during therapy.

*Oral anticoagulants:* May increase risk of bleeding. Monitor PT and INR.

*Probenecid:* May increase levels of ampicillin and other penicillins. Probenecid may be used for this purpose.

### EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level.
- May increase eosinophil count. May decrease granulocyte, platelet, and WBC counts.
- May falsely decrease aminoglycoside level. May alter results of urine glucose tests that use cupric sulfate, such as Benedict reagent and Clinitest.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other penicillins.
- Use cautiously in patients with other drug allergies (especially to cephalosporins) because of possible cross-sensitivity, and in those with mononucleosis because of high risk of maculopapular rash.

### NURSING CONSIDERATIONS

- Monitor sodium level because each gram of ampicillin contains 2.9 mEq of sodium.
- If large doses are given or if therapy is prolonged, bacterial or fungal superinfection may occur, especially in elderly, debilitated, or immunosuppressed patients.
- Watch for signs and symptoms of hypersensitivity, such as erythematous maculopapular rash, urticaria, and anaphylaxis.
- In patients with impaired renal function, decrease dosage.
- In pediatric meningitis, drug may be given with parenteral chloramphenicol for 24 hours, pending cultures.

### PATIENT TEACHING

- Tell patient to take entire quantity of drug exactly as prescribed, even after he feels better.
- Instruct patient to take oral form on an empty stomach 1 hour before or 2 hours after meals.
- Inform patient to notify prescriber if rash, fever, or chills develop. A rash is the most common allergic reaction, especially if allopurinol is also being taken.

## ampicillin sodium and sulbactam sodium

am-pi-SILL-in

Unasyn

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Aminopenicillin and beta-lactamase inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS

*Injection:* Vials and piggyback vials containing 1.5 g (1 g ampicillin sodium with 0.5 g sulbactam sodium), 3 g (2 g ampicillin sodium with 1 g sulbactam sodium)

### INDICATIONS & DOSAGES

➤ **Intra-abdominal, gynecologic, and skin-structure infections caused by susceptible strains**

*Adults:* 1.5 to 3 g I.M. or I.V. every 6 hours. Don't exceed 4 g/day of sulbactam.

*Children age 1 or older weighing 40 kg (88 lb) or more (skin and skin-structure infections only):* 1.5 to 3 g I.V. or I.M. every 6 hours. Don't exceed 4 g/day sulbactam.

*Children age 1 or older weighing less than 40 kg (skin and skin-structure infections only):* 300 mg/kg/day I.V. in divided doses every 6 hours for no longer than 14 days.

➤ **Community-acquired pneumonia** ♦

*Adults:* 3 g I.V. every 12 hours with either azithromycin or a fluoroquinolone for at least 5 days.

***Adjust-a-dose:*** If creatinine clearance in adults is 15 to 29 ml/minute, give 1.5 to 3 g every 12 hours; if clearance is 5 to 14 ml/minute, give 1.5 to 3 g every 24 hours.

### ADMINISTRATION

**I.V.**

▼ Before giving drug, ask patient about allergic reactions to penicillin. A negative history of penicillin allergy is no guarantee against future allergic reaction.

▼ Obtain specimen for culture and sensitivity tests. Begin therapy while awaiting results.

▼ Reconstitute powder with one of these diluents: normal saline solution, sterile

water for injection, $D_5W$, lactated Ringer's injection, M/6 sodium lactate, dextrose 5% in half-normal saline solution for injection, or 10% invert sugar.
▼ After reconstitution, let vials stand for a few minutes so foam can dissipate. Inspect solution for particles.
▼ Give drug at least 1 hour before giving a bacteriostatic antibiotic.
▼ For infusion, dilute in 50 to 100 ml of compatible diluent and infuse over 15 to 30 minutes.
▼ Stability varies with diluent, temperature, and concentration of solution.
▼ **Incompatibilities:** Amikacin, amino acid solutions, amiodarone, amphotericin B, chlorpromazine, ciprofloxacin, dextran solutions, dopamine, erythromycin lactobionate, 10% fat emulsions, fructose, gentamicin, heparin sodium, hetastarch, hydrocortisone sodium succinate, idarubicin, kanamycin, lidocaine, lincomycin, netilmicin, polymyxin B, nicardipine, ondansetron, prochlorperazine edisylate, sargramostim, sodium bicarbonate, streptomycin, tobramycin.

**I.M.**
● Before giving drug, ask patient about allergic reactions to penicillin. A negative history of penicillin allergy is no guarantee against future allergic reaction.
● Obtain specimen for culture and sensitivity tests. Begin therapy while awaiting results.
● For I.M. injection, reconstitute with sterile water for injection or 0.5% or 2% lidocaine hydrochloride injection. Add 3.2 ml to a 1.5-g vial (or 6.4 ml to a 3-g vial) to yield 375 mg/ml. Give deep into muscle.
● I.M. injection may cause pain at injection site.
● In children, don't use I.M. route.

## ACTION

Inhibits cell-wall synthesis during bacterial multiplication.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | 15 min | Unknown |
| I.M. | Unknown | Unknown | Unknown |

*Half-life:* 1 to 1½ hours (10 to 24 in severe renal impairment).

## ADVERSE REACTIONS

**GI:** *diarrhea, nausea,* ***pseudomembranous colitis,*** black hairy tongue, enterocolitis, gastritis, glossitis, stomatitis, vomiting.
**Hematologic:** ***agranulocytosis, leukopenia, thrombocytopenia, thrombocytopenic purpura,*** anemia, eosinophilia.
**Skin:** *pain at injection site.*
**Other:** hypersensitivity reactions, ***anaphylaxis,*** overgrowth of nonsusceptible organisms.

## INTERACTIONS

**Drug-drug.** *Allopurinol:* May increase risk of rash. Monitor patient for rash.
*Hormonal contraceptives:* May decrease hormonal contraceptive effectiveness. Strongly advise use of another contraceptive during therapy.
*Oral anticoagulants:* May increase risk of bleeding. Monitor PT and INR.
*Probenecid:* May increase ampicillin level. Probenecid may be used for this purpose.

## EFFECTS ON LAB TEST RESULTS

● May increase alkaline phosphatase, ALT, AST, bilirubin, BUN, CK, creatinine, GGT, and LDH levels. May decrease hemoglobin level. May transiently decrease conjugated estriol, conjugated estrone, estradiol, and estriol glucuronide levels in pregnant women.
● May increase eosinophil count. May decrease granulocyte, platelet, and WBC counts.
● May alter results of urine glucose tests that use cupric sulfate, such as Benedict's reagent and Clinitest.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or other penicillins.
● Use cautiously in patients with other drug allergies (especially to cephalosporins) because of possible cross-sensitivity, and in those with mononucleosis because of high risk of maculopapular rash.
⚠ ***Overdose S&S:*** Neuromuscular hyperexcitability, seizures.

## NURSING CONSIDERATIONS

- Dosage is expressed as total drug. Each 1.5-g vial contains 1 g ampicillin sodium and 0.5 g sulbactam sodium.
- In patients with impaired renal function, decrease dosage.
- Monitor liver function test results during therapy, especially in patients with impaired liver function.
- If large doses are given or if therapy is prolonged, bacterial or fungal superinfection may occur, especially in elderly, debilitated, or immunosuppressed patients.

## PATIENT TEACHING

- Tell patient to report rash, fever, or chills. A rash is the most common allergic reaction.
- Warn patient that I.M. injection may cause pain at injection site.

# anakinra

ann-ACK-in-rah

Kineret

*Therapeutic class:* Immune response modifier
*Pharmacologic class:* Interleukin-1 receptor antagonist
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 100 mg/0.67 ml in a prefilled glass syringe

## INDICATIONS & DOSAGES

➤ **To reduce signs and symptoms and slow progression of structural damage in moderately to severely active rheumatoid arthritis (RA) after one or more failures with disease-modifying antirheumatic drugs (DMARDs), alone or combined with DMARDs other than tumor necrosis factor (TNF)-blocking drugs**

*Adults:* 100 mg subcutaneously daily at the same time each day.

***Adjust-a-dose:*** For patients with creatinine clearance of less than 30 ml/minute, decrease dosage to 100 mg subcutaneously every other day.

## ADMINISTRATION

**Subcutaneous**

- Inject entire contents of prefilled syringe.
- Store drug in the refrigerator at 35° to 46° F (2° to 8° C). Don't freeze or shake.
- Protect drug from light.

## ACTION

A recombinant, nonglycosylated form of the human interleukin-1 receptor antagonist (IL-1Ra). The level of naturally occurring IL-1Ra in synovium and synovial fluid from patients with RA isn't enough to compete with the elevated level of locally produced IL-1. Anakinra blocks the biologic activity of IL-1 by competitively inhibiting IL-1 from binding to the interleukin-1 type receptor, which is expressed in various tissues and organs.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 3–7 hr | Unknown |

*Half-life:* 4 to 6 hours.

## ADVERSE REACTIONS

**CNS:** *headache.*
**EENT:** sinusitis.
**GI:** abdominal pain, diarrhea, nausea.
**Hematologic:** ***neutropenia.***
**Respiratory:** *upper respiratory tract infection.*
**Skin:** *ecchymosis, injection site reactions (erythema, inflammation, pain).*
**Other:** infection (cellulitis, pneumonia, bone and joint), flulike symptoms.

## INTERACTIONS

**Drug-drug.** *Etanercept, other TNF-blocking drugs:* May increase risk of severe infection. Use together isn't recommended.
*Vaccines:* May decrease effectiveness of vaccines or may increase risk of secondary transmission of infection with live vaccines. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

- May increase eosinophil count. May decrease neutrophil, platelet, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to *Escherichia coli*–derived proteins or any

components of the product, or in patients with active infections.
• Use drug cautiously in immunosuppressed patients, those with a chronic infection, the elderly, and breast-feeding women.
• Safety and effectiveness in patients with juvenile RA haven't been established.

## NURSING CONSIDERATIONS
• Don't start treatment if patient has active infection.
• Obtain neutrophil count before treatment, monthly for the first 3 months of treatment, and then quarterly for up to 1 year.
• Monitor patient for infections and injection site reactions.
• Stop drug if a serious infection develops.
• Monitor patient for possible anaphylactic reaction.
• ***Look alike–sound alike:*** Don't confuse anakinra with amikacin.

## PATIENT TEACHING
• Tell patient to store drug in refrigerator and not to freeze or expose to excessive heat. Advise letting drug come to room temperature before giving dose.
• Teach patient proper dosage, administration, and needle and syringe disposal.
• Urge patient to rotate injection sites.
• Review signs and symptoms of allergic and other adverse reactions, especially signs of serious infections. Urge patient to contact prescriber if they arise.
• Inform patient that injection site reactions are common, usually mild, and typically last 14 to 28 days.
• Tell patient to avoid live-virus vaccines during therapy.

**SAFETY ALERT!**

# anastrozole
an-AHS-troh-zol

Arimidex🖋

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Aromatase inhibitor
*Pregnancy risk category D*

## AVAILABLE FORMS
*Tablets:* 1 mg

## INDICATIONS & DOSAGES
➤ **First-line treatment of postmenopausal women with hormone receptor–positive or hormone receptor–unknown locally advanced or metastatic breast cancer; advanced breast cancer in postmenopausal women with disease progression after tamoxifen therapy; adjunctive treatment of postmenopausal women with hormone receptor–positive early breast cancer**
*Adults:* 1 mg P.O. daily.

## ADMINISTRATION
**P.O.**
• Give drug without regard for meals.

## ACTION
A selective nonsteroidal aromatase inhibitor that significantly lowers estradiol levels, which inhibits breast cancer cell growth in postmenopausal women.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | <24 hr | Unknown | <7 days |

*Half-life:* 50 hours.

## ADVERSE REACTIONS
**CNS:** *headache, asthenia, pain,* dizziness, *depression,* paresthesia, anxiety, *insomnia.*
**CV:** *hot flashes,* ***thromboembolic disease,*** chest pain, *peripheral edema, hypertension, vasodilation.*
**EENT:** *pharyngitis,* cataracts.
**GI:** *nausea, vomiting,* diarrhea, constipation, abdominal pain, anorexia, dry mouth, dyspepsia.
**GU:** vaginal dryness, pelvic pain.

**Metabolic:** weight gain, increased appetite.
**Musculoskeletal:** *bone pain, back pain, arthritis, arthralgia, osteoporosis, fractures.*
**Respiratory:** *dyspnea, increased cough.*
**Skin:** *rash,* sweating.
**Other:** *lymphedema.*

## INTERACTIONS
None significant.

## EFFECTS ON LAB TEST RESULTS
• May increase liver enzyme and cholesterol levels.

## CONTRAINDICATIONS & CAUTIONS
• Don't use in women who are or may be pregnant.
• Use cautiously in breast-feeding women.

## NURSING CONSIDERATIONS
• Give drug under supervision of a prescriber experienced in use of antineoplastics.
• Patients with hormone receptor–negative disease and patients who didn't respond to previous tamoxifen therapy rarely respond to anastrozole.
• For patients with advanced breast cancer, continue anastrozole until tumor progresses.
• Monitor bone mineral density as indicated.
• Use drug only in postmenopausal women.
• Rule out pregnancy before starting drug.

## PATIENT TEACHING
• Instruct patient to report adverse reactions, especially difficulty breathing, chest pain, or skin lesions or blisters.
• Tell patient to take medication at the same time each day.
• Stress need for follow-up care.
• Counsel women about risks of pregnancy during therapy.
• Tell patient that drug lowers estrogen level, which may lead to decreased bone strength and increased risk of fractures.

# anidulafungin
an-ah-DOO-lah-fun-gin

Eraxis

*Therapeutic class:* Antifungal
*Pharmacologic class:* Echinocandin
*Pregnancy risk category C*

## AVAILABLE FORMS
*Powder for injection:* 50 mg/vial, 100 mg/vial with companion diluent

## INDICATIONS & DOSAGES
➤ **Candidemia and other *Candida* infections (intra-abdominal abscess, peritonitis)**
*Adults:* A single 200-mg loading dose given by I.V. infusion at no more than 1.1 mg/minute on day 1; then 100 mg daily for at least 14 days after last positive culture result.
➤ **Esophageal candidiasis**
*Adults:* A single 100-mg loading dose given by I.V. infusion at no more than 1.1 mg/minute on day 1; then 50 mg daily for at least 14 days and for at least 7 days after symptoms resolve.

## ADMINISTRATION
**I.V.**
▼ Obtain specimens for culture and sensitivity tests and baseline laboratory tests before starting therapy.
▼ Reconstitute each 50-mg vial with 15 ml of supplied diluent. Reconstitute each 100-mg vial with 30 ml of supplied diluent.
▼ Further dilute with $D_5W$ or normal saline solution.
▼ Add 50-mg dose (in 15 ml) to 100 ml of $D_5W$ or sodium chloride 0.9% for injection. Resulting volume is 115 ml and concentration is 0.43 mg/ml. Add 100-mg dose (in 30 ml) to 250 ml of $D_5W$ or normal saline solution. Resulting volume is 280 ml and concentration is 0.36 mg/ml. Add 200-mg dose (in 60 ml) to 500 ml of $D_5W$ or normal saline solution. Resulting volume is 560 ml and concentration is 0.36 mg/ml.

▼ Don't infuse at more than 1.1 mg/minute.
▼ Store at room temperature; don't freeze. Use reconstituted solution within 24 hours of preparation.
▼ **Incompatibilities:** Unknown. Only use supplied diluent to reconstitute and $D_5W$ or normal saline solution to further dilute.

## ACTION

Inhibits glucan synthase, which in turn inhibits formation of 1,3-$\beta$-D-glucan, an essential component of fungal cell walls.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | <24 hr | Unknown | Unknown |

*Half-life:* 40 to 50 hours.

## ADVERSE REACTIONS

**CNS:** headache.
**CV:** ***deep vein thrombosis,*** hypotension.
**GI:** nausea, diarrhea.
**Hematologic:** ***leukopenia, neutropenia.***
**Metabolic:** hypokalemia.
**Skin:** rash.

## INTERACTIONS

None reported.

## EFFECTS ON LAB TEST RESULTS

• May increase AST, ALT, alkaline phosphatase, GGT, hepatic enzymes, amylase, lipase, bilirubin, CK, creatinine, urea, calcium, glucose, potassium, and sodium levels. May decrease potassium and magnesium levels.
• May increase PT. May decrease neutrophil and WBC counts. May increase or decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug, other echinocandins, or any component of the drug.
• Use cautiously in patients with liver impairment and in pregnant or breast-feeding women.
• Safe and effective use in children hasn't been established.

## NURSING CONSIDERATIONS

• Use only the supplied diluent to reconstitute powder.
• To avoid histamine-mediated symptoms, such as rash, urticaria, flushing, itching, dyspnea, and hypotension, don't infuse faster than 1.1 mg/minute.
• Monitor patient closely for changes in liver function and blood cell counts during therapy.
• Notify prescriber about signs or symptoms of liver toxicity, such as dark urine, jaundice, abdominal pain, and fatigue.
• Patients with esophageal candidiasis who are HIV positive may need suppressive antifungal therapy after drug to prevent relapse.

## PATIENT TEACHING

• Tell patient to call the nurse if he develops a rash, itching, trouble breathing, or other adverse effects during infusion.
• Explain that blood tests will be needed to monitor the drug's effects.

# antihemophilic factor (AHF Factor VIII)

an-tye-he-mo-FILL-ik

Advate, Alphanate, Helixate FS, Hemofil M, Hyate:C, Koate-DVI, Kogenate FS, Monarc-M, Monoclate-P, Recombinate, ReFacto, Xyntha

*Therapeutic class:* Clotting factor
*Pharmacologic class:* Plasma protein
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* Vials, with diluent; units specified on label

## INDICATIONS & DOSAGES

Drug provides hemostasis in factor VIII deficiency, hemophilia A. Specific dosage depends on patient's weight, severity of hemorrhage, and presence of inhibitors. Mild bleeding episodes require a circulating factor VIII level 20% to 30% of normal; moderate to major bleeding episodes and minor surgery, a level 30% to 50% of normal; severe bleeding or major surgery, a level 80% to 100% of normal. The

following dosages provide guidelines. Refer to specific brand for actual dosage.

➤ **Control and prevention of mild bleeding in patients with hemophilia**

*Adults and children:* 10 international units/kg daily.

➤ **Control and prevention of moderate bleeding and minor surgery in patients with hemophilia**

*Adults and children:* Initially, 15 to 25 international units/kg. If further therapy is required, give a maintenance dose of 10 to 15 international units/kg every 8 to 12 hours.

➤ **Control and prevention of severe bleeding and bleeding near vital organs in patients with hemophilia**

*Adults and children:* Initially, 40 to 50 international units/kg, then 20 to 25 international units/kg every 8 to 12 hours, as needed.

➤ **Major surgery in patients with hemophilia**

*Adults and children:* 50 international units/kg 1 hour before surgery, then repeat as needed 6 to 12 hours after first dose. Maintain circulating factor levels at 30% to 60% of normal for 10 to 14 days after surgery.

## ADMINISTRATION

**I.V.**

▼ Refrigerate concentrate until ready to use.
▼ Warm concentrate and diluent bottles to room temperature before reconstituting.
▼ Follow manufacturer's instructions for reconstituting.
▼ To mix drug, gently roll vial between hands. Don't shake.
▼ Use reconstituted solution within 3 hours.
▼ Filter solution before giving it.
▼ Use plastic syringe; drug may bind to glass syringe.
▼ Take baseline pulse rate before administration.
▼ Give at 2 ml/minute; may be given up to 10 ml/minute, depending on the preparation being used.
▼ If pulse rate increases significantly, reduce flow rate or stop administration.
▼ **Incompatibilities:** Protein precipitants, other I.V. solutions.

## ACTION

Directly replaces deficient clotting factor.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | 1–2 hr | Unknown |

*Half-life:* 10 to 18 hours.

## ADVERSE REACTIONS

**CNS:** headache, somnolence, lethargy, dizziness, tingling, asthenia, *fever*.
**CV:** tightness in chest, ***thrombosis,*** hypotension, tachycardia, angina pectoris.
**GI:** nausea, vomiting, taste changes, constipation, diarrhea, anorexia, gastroenteritis, abdominal pain, taste perversion.
**Hematologic:** ***hemolytic anemia, thrombocytopenia.***
**Hepatic:** ***risk of hepatitis B, risk of hepatitis C.***
**Musculoskeletal:** myalgias, muscle weakness, joint swelling.
**Respiratory:** wheezing, dyspnea, coughing.
**Skin:** ***urticaria,*** stinging at injection site, rash, facial flushing, increased perspiration, acne, pruritus, urticaria.
**Other:** *chills,* hypersensitivity reactions, ***anaphylaxis, risk of HIV infection.***

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

● May decrease hemoglobin level.
● May decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

● For monoclonally prepared drug, contraindicated in patients hypersensitive to drug or murine (mouse) protein.
● For porcine-derived Hyate:C, don't give to patients hypersensitive to pork products.
● Don't use Alphanate in patients with severe von Willebrand's disease (VWD) (type 3) who are undergoing major surgery.
● Use cautiously in neonates, infants, and patients with hepatic disease because of their susceptibility to hepatitis, which may be transmitted in drug.

## NURSING CONSIDERATIONS

● Monitor coagulation studies before therapy.

- Monitor patients with blood types A, B, and AB for possible hemolysis.
- Orange or red urine discoloration may signify a hemolytic reaction.
- Determine if patient has received vaccinations for hepatitis A and B before administering drug. Give vaccines if necessary.
- Don't give drug I.M. or subcutaneously.
- Monitor vital signs regularly.
- Monitor coagulation studies and platelets frequently during therapy.
- Monitor patient for allergic reactions.
- Patient may develop inhibitors to factor VIII, resulting in decreased response to drug.
- Risk of hepatitis must be weighed against risk of patient not receiving drug.
- When using Alphanate for surgical prophylaxis in VWD patients, be aware that the ratio of factor VIII to von Willebrand factor:ristocetin cofactor (VWF:Rco) varies by lot; recalculate the dosage when lot selection is changed.
- Because of manufacturing process, risk of HIV, hepatitis, and West Nile virus transmission is extremely low.

### PATIENT TEACHING

- Explain use and administration of drug to patient and family.
- Advise patient to report adverse reactions promptly.
- Advise patient to carry medical identification.
- Tell patient to notify prescriber if drug begins to seem less effective; a change may signify the development of antibodies.

## anti-inhibitor coagulant complex

Feiba VH, Feiba VH Immuno†

*Therapeutic class:* Clotting factor
*Pharmacologic class:* Plasma protein
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* Number of units of factor VIII correctional activity indicated on label of vial

### INDICATIONS & DOSAGES

➤ **To prevent or control hemorrhagic episodes in some patients with hemophilia A and B in whom inhibitor antibodies to antihemophilic factor have developed; to manage bleeding in patients with acquired hemophilia who have spontaneously acquired inhibitors to factor VIII, XI and XII**

*Adults and children:* Drug controls hemorrhage in hemophilia A patients who have a factor VIII inhibitor level above 10 Bethesda units. Patients with a level of 5 to 10 Bethesda units may receive the drug if they have severe hemorrhage or respond poorly to factor VIII infusion.

*Adults and children:* Dosage is highly individualized and varies among manufacturers. For Feiba VH, give 50 to 100 units/kg I.V. every 6 or 12 hours until patient shows signs of improvement. Maximum daily dose of Feiba VH is 200 units/kg.

➤ **Joint hemorrhage**

*Adults and children:* 50 to 100 units/kg Feiba VH every 12 hours until patient's condition improves.

➤ **Mucous membrane hemorrhage**

*Adults and children:* 50 units/kg Feiba VH every 6 hours, increasing to 100 units/kg every 6 hours if hemorrhage continues. Maximum daily dose, 200 units/kg.

➤ **Soft-tissue hemorrhage**

*Adults and children:* 100 units/kg Feiba VH every 12 hours. Maximum daily dose, 200 units/kg.

➤ **Other severe hemorrhage**

*Adults and children:* 100 units/kg Feiba VH every 12 hours (occasionally, every 6 hours).

### ADMINISTRATION

**I.V.**

***Alert:*** Infusion should not exceed a single dosage of 100 units per kg of body weight and daily doses of 200 units per kg of body weight.

▼ Warm drug and diluent to room temperature before reconstitution. Reconstitute according to manufacturer's directions. Give drug as soon as possible.

▼ Use filter needle provided by manufacturer to withdraw reconstituted solution from vial into syringe; then replace filter needle with a sterile injection needle for administration.

▼ For infusion, use administration set with filter.
▼ Individualize rate of administration based on patient's response. Feiba VH infusion shouldn't exceed 2 units/kg/minute.
▼ Complete Feiba VH infusion within 3 hours.
▼ If flushing, lethargy, headache, transient chest discomfort, or changes in blood pressure or pulse rate develop because of a rapid infusion, stop drug and notify prescriber. These problems usually disappear when infusion stops. Resume at a slower rate.
▼ **Incompatibilities:** Other I.V. drugs or solutions.

## ACTION

May be related to presence of activated factors, which leads to more complete factor X activation with tissue factor, phospholipid, and ionic calcium to extend the coagulation process beyond stages in which factor VIII is needed.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 10–30 min | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CV:** changes in blood pressure, flushing, ***acute MI, thromboembolic events.***
**Hematologic:** ***DIC.***
**Hepatic:** ***risk of hepatitis C infection.***
**Skin:** rash, urticaria.
**Other:** chills, hypersensitivity reactions, ***anaphylaxis, risk of HIV infection.***

## INTERACTIONS

**Drug-drug.** *Antifibrinolytic drugs:* May alter effects of anti-inhibitor coagulant complex. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Thrombotic and thromboembolic events have been reported following infusion, particularly following the administration of high doses and/or in patients with thrombotic risk factors, such as coronary artery disease, liver disease, disseminated intravascular coagulation, postoperative immobilization, elderly patients, and neonates. ■
● Contraindicated in patients hypersensitive to drug, in those with DIC or a normal coagulation mechanism, and in those showing signs of fibrinolysis.
● Don't give to patients with severe latex allergies. Some packaging components (vial closures, needle covers, syringe plungers) contain natural latex proteins.
● Feiba VH is contraindicated in neonates.
● Use cautiously in patients with hepatic disease.

## NURSING CONSIDERATIONS

● Determine if patient has received vaccinations for hepatitis A and B before administering drug. Give vaccines if necessary.
● Keep epinephrine available to treat anaphylaxis. Monitor patient closely for hypersensitivity reactions.
● Monitor vital signs regularly, and report significant changes to prescriber.
● Observe patient closely for signs of thromboembolic events.
● Reassure patient that, because of the manufacturing process, his risk of HIV, hepatitis, or West Nile virus transmission is extremely low.

## PATIENT TEACHING

● Explain use and administration of anti-inhibitor coagulant complex to patient and family.
● Tell patient to report adverse reactions promptly.

# apomorphine hydrochloride

ah-poe-MORE-feen

Apokyn

*Therapeutic class:* Antiparkinsonian
*Pharmacologic class:* Nonergot-derivative dopamine agonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Solution for injection:* 10 mg/ml (contains benzyl alcohol)

## INDICATIONS & DOSAGES

➤ **Intermittent hypomobility, "off" episodes caused by advanced Parkinson disease (given with an antiemetic)**

*Adults:* Initially, give a 0.2-ml subcutaneous test dose. Measure supine and standing blood pressure every 20 minutes for the first hour. If patient tolerates and responds to drug, start with 0.2 ml subcutaneously as needed as outpatient. Separate doses by at least 2 hours. Increase by 0.1 ml every few days, as needed.

If initial 0.2-ml dose is ineffective but tolerated, give 0.4 ml at next "off" period, measuring supine and standing blood pressure every 20 minutes for the first hour. If drug is tolerated, start with 0.3 ml subcutaneously as outpatient. If needed, increase by 0.1 ml every few days.

If patient doesn't tolerate 0.4-ml dose, give 0.3 ml as a test dose at the next "off" period, measuring supine and standing blood pressure every 20 minutes for the first hour. If drug is tolerated, give 0.2 ml as outpatient. Increase by 0.1 ml every few days, as needed; doses higher than 0.4 ml usually aren't tolerated if 0.2 ml is the starting dose.

Maximum recommended dose is usually 0.6 ml as needed. Most patients use drug t.i.d. Experience is limited at more than five times daily or more than 2 ml daily.

***Adjust-a-dose:*** In patients with mild to moderate renal impairment, give test and starting doses of 0.1 ml subcutaneously.

## ADMINISTRATION

**Subcutaneous**

- Give with an antiemetic to avoid severe nausea and vomiting. Start with trimethobenzamide 300 mg P.O. t.i.d. 3 days before starting apomorphine, and continue antiemetic at least 2 months.
- When programming the dosing pen, it's possible to select the appropriate dose even though insufficient drug remains in the pen. To avoid insufficient dosing, track the amount of drug received at each dose and change the cartridge before drug runs out.
- Rotate injection sites and record.

***Alert:*** Drug is for subcutaneous injection only. Avoid I.V. use.

## ACTION

Thought to improve motor function by stimulating dopamine D2 receptors in the brain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | 20 min | 10–60 min | 2 hr |

*Half-life:* About 30 to 60 minutes in patients with normal or impaired renal function.

## ADVERSE REACTIONS

**CNS:** *confusion, dizziness, drowsiness, hallucinations, somnolence,* aggravated Parkinson disease, anxiety, depression, fatigue, headache, insomnia, syncope, weakness.
**CV:** *angina, chest pain, chest pressure, edema, hypotension, orthostatic hypotension,* ***cardiac arrest, heart failure, MI,*** flushing.
**EENT:** *rhinorrhea.*
**GI:** *nausea, vomiting,* constipation, diarrhea.
**GU:** UTI.
**Respiratory:** dyspnea, pneumonia.
**Metabolic:** dehydration.
**Musculoskeletal:** *dyskinesias,* arthralgia, back pain, limb pain.
**Skin:** bruising, injection site reaction, pallor, sweating.
**Other:** *falls, yawning.*

## INTERACTIONS

**Drug-drug.** *Antihypertensives, vasodilators:* May increase risk of hypotension, MI, pneumonia, falls, and joint injury. Use together cautiously.
*Dopamine antagonists, metoclopramide:* May reduce apomorphine's effectiveness. Use together cautiously.
*Drugs that prolong the QTc interval:* May further prolong the QTc interval. Use together cautiously.
*5-$HT_3$ antagonists (alosetron, dolasetron, granisetron, ondansetron, palonosetron):* May cause serious hypotension and loss of consciousness. Don't use together.
**Drug-lifestyle.** *Alcohol use:* May increase risk of sedation and hypotension. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients allergic to apomorphine or its ingredients, including sulfites, and in patients who take 5-$HT_3$ antagonists.
- Use cautiously in patients at risk for prolonged QTc interval, such as those with hypokalemia, hypomagnesemia, bradycardia, or genetic predisposition.
- Use cautiously in patients with CV or cerebrovascular disease and in those with renal or hepatic impairment.

***Overdose S&S:*** Nausea, loss of consciousness, bradycardia, hypotension.

## NURSING CONSIDERATIONS

***Alert:*** The prescribed dose should always be specified in milliliters rather than milligrams to avoid confusion; the dosing pen is marked in milliliters.

- Give test dose in a medically supervised setting to determine tolerability and effect.
- Monitor supine and standing blood pressure every 20 minutes for the first hour after starting doses or dosage changes.

***Alert:*** Monitor patient for drowsiness or sleepiness, which may occur well after treatment starts. Stop drug if patient develops significant daytime sleepiness that interferes with activities of daily living.

- Watch for evidence of coronary or cerebral ischemia, and stop drug if it occurs.
- Adverse effects are more likely in elderly patients, particularly hallucinations, falls, CV events, respiratory problems, and GI effects.

## PATIENT TEACHING

- Tell patient to avoid sudden position changes, especially rising too quickly from lying down. A sudden drop in blood pressure, dizziness, or fainting can occur.
- Urge patient to keep taking the prescribed antiemetic because nausea and vomiting are likely.
- Instruct patient or caregiver to document each dose to make sure enough drug remains in the cartridge to provide a full next dose.
- Tell patient or caregiver to wait at least 2 hours between doses.

***Alert:*** Show patient or caregiver how to read the dosing pen, and make sure he understands that it's marked in milliliters and not milligrams.

- Tell patient or caregiver to rotate injection sites and to wash hands before each injection. Applying ice to the site before and after the injection may reduce soreness, redness, pain, itching, swelling, or bruising at the site.
- Explain that hallucinations (either visual or auditory) may occur, and urge patient or caregiver to report them immediately.
- Explain that headaches may occur and tell patient to notify prescriber if they become severe or don't go away.
- Advise patient to avoid hazardous activities that require alertness until drug effects are known.
- Caution patient to avoid consuming alcohol.

# aprepitant

ah-PRE-pit-ant

Emend

# fosaprepitant dimeglumine

Emend

*Therapeutic class:* Antiemetic
*Pharmacologic class:* Substance P and neurokinin-1 receptor antagonist
*Pregnancy risk category B*

## AVAILABLE FORMS

*Capsules:* 40 mg, 80 mg, 125 mg
*Injection:* 115 mg

## INDICATIONS & DOSAGES

➤ **To prevent nausea and vomiting after highly emetogenic chemotherapy (including cisplatin) and moderately emetogenic chemotherapy, with a 5-$HT_3$ antagonist and a corticosteroid**

*Adults:* On day 1 of chemotherapy, 125 mg P.O. 1 hour before treatment, or 115 mg by I.V. infusion over 15 minutes, given 30 minutes before treatment. On days 2 and 3, give 80 mg P.O. every morning.

➤ **To prevent postoperative nausea and vomiting**

*Adults:* 40 mg P.O. within 3 hours before induction of anesthesia.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.
- Drug may be given with other antiemetics.

**I.V.**

▼ Reconstitute with 5 ml of normal saline solution. Add the saline along the vial wall to prevent foaming. Swirl gently and avoid shaking.

▼ Add entire volume to infusion bag containing 110 ml of saline. Total volume will be 115 ml and final concentration is 1 mg/ml.

▼ Gently invert the bag 2 to 3 times.

▼ Administer over 15 minutes by I.V. infusion.

▼ Final solution is stable for 24 hours at ambient room temperature.

▼ **Incompatibilities:** Any solutions containing divalent cations (e.g., $Ca^{2+}$, $Mg^{2+}$), including Ringer's lactate and Hartmann's solution

## ACTION

Inhibits emesis by selectively antagonizing substance P and neurokinin-1 receptors in the brain; appears to be synergistic with $5\text{-}HT_3$ antagonists and corticosteroids.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 4 hr | Unknown |
| I.V. | Unknown | Less than 30 min | Unknown |

*Half-life:* 9 to 13 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia, fatigue,* dizziness, fever, headache, insomnia.

**CV:** ***bradycardia,*** hypertension, hypotension.

**EENT:** mucous membrane disorder, tinnitus.

**GI:** *anorexia, constipation, diarrhea, nausea,* abdominal pain, epigastric pain, flatulence, gastritis, heartburn, vomiting.

**GU:** UTI.

**Hematologic:** ***neutropenia,*** anemia.

**Respiratory:** *hiccups.*

**Skin:** pruritus, infusion site pain, infusion site induration.

**Other:** dehydration.

## INTERACTIONS

**Drug-drug.** *Alprazolam, midazolam, triazolam:* May increase levels of these drugs. Watch for CNS effects, such as increased sedation. Decrease benzodiazepine dose by 50%.

*Carbamazepine, phenytoin, rifampin, other CYP3A4 inducers:* May decrease aprepitant level. Watch for decreased antiemetic effect.

*Clarithromycin, diltiazem, erythromycin, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, troleandomycin, other CYP3A4 inhibitors:* May increase aprepitant level and risk of toxicity. Use together cautiously.

*Dexamethasone, methylprednisolone:* May increase levels of these drugs and risk of toxicity. Decrease P.O. corticosteroid dose by 50%; decrease I.V. methylprednisolone dose by 25%.

*Diltiazem:* May increase diltiazem level. Monitor heart rate and blood pressure. Avoid using together.

*Docetaxel, etoposide, ifosfamide, imatinib, irinotecan, paclitaxel, vinorelbine, vinblastine, vincristine:* May increase levels and risk of toxicity of these drugs. Use together cautiously.

*Hormonal contraceptives:* May decrease contraceptive effectiveness. Tell women to use additional birth control method during therapy.

*Paroxetine:* May decrease paroxetine and aprepitant effects. Monitor patient for effectiveness.

*Phenytoin:* May decrease phenytoin level. Monitor level carefully. Avoid using together. Increase phenytoin dose as needed during therapy.

*Pimozide:* May increase pimozide level. Avoid using together.

*Tolbutamide:* May decrease tolbutamide effects. Monitor glucose level.

*Warfarin:* May decrease warfarin effectiveness. Monitor INR carefully for 2 weeks after each aprepitant treatment.

**Drug-herb.** *St. John's wort:* May decrease antiemetic effects by inducing CYP3A4. Discourage use together.

**Drug-food.** *Grapefruit juice:* May increase drug level and risk of toxicity. Discourage use together.

### EFFECTS ON LAB TEST RESULTS
- May increase alkaline phosphatase, AST, ALT, BUN, creatinine, glucose, and urine protein levels. May decrease sodium level.
- May increase RBC and WBC counts. May decrease neutrophil count.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to fosaprepitant, aprepitant, or its components.
- Use cautiously in patients receiving chemotherapy drugs metabolized mainly via CYP3A4 and in those with severe hepatic disease.
- Use in pregnant women only when drug's benefits clearly outweigh its risks.
- Don't use in breast-feeding women; it's unknown if drug appears in breast milk.
- Safety and effectiveness haven't been established in children.

***Overdose S&S:*** Drowsiness, headache.

### NURSING CONSIDERATIONS
- Avoid giving drug for more than 3 days per chemotherapy cycle.

***Alert:*** Fosaprepitant is given I.V. on day 1 only of a 3-day regimen.

***Alert:*** Before giving drug, screen patient carefully for possible drug and herb interactions.
- Don't give drug for existing nausea or vomiting.
- Expect to give drug with other antiemetics to treat breakthrough emesis.
- Monitor CBC, liver function test results, and creatinine level periodically during therapy.

### PATIENT TEACHING
- If nausea or vomiting occurs, instruct patient to take breakthrough antiemetics rather than more aprepitant.
- Urge patient to report use of any other drugs or herbs.
- Caution patient against taking drug with grapefruit juice.
- Advise woman who takes a hormonal contraceptive to use an additional form of birth control.
- Tell patient who takes warfarin that PT and INR will be monitored closely for 2 weeks after therapy starts.
- Teach patient to take drug 1 hour before chemotherapy, then daily in the morning or as directed.

## arformoterol tartrate
arr-fohr-MOH-tur-ahl

Brovana

*Therapeutic class:* Bronchodilator
*Pharmacologic class:* Long-acting selective beta$_2$ agonist
*Pregnancy risk category C*

### AVAILABLE FORMS
*Solution for inhalation:* 15 mcg/2-ml vials

### INDICATIONS & DOSAGES
➤ **Long-term maintenance treatment of bronchoconstriction in patients with COPD, including chronic bronchitis and emphysema**

*Adults:* 15 mcg, inhaled b.i.d. (morning and evening) via nebulizer. Maximum dose is 30 mcg daily.

### ADMINISTRATION
**Inhalational**
- Use only the recommended nebulizer and compressor for treatment.
- Don't mix drugs with other drugs or solutions in the nebulizer.
- Store vials in the foil pouches in the refrigerator and use immediately after opening.

### ACTION
Relaxes bronchial and cardiac smooth muscle by acting on beta$_2$-adrenergic receptors; stimulates the enzyme adenyl cyclase, which catalyzes the conversion from ATP to cAMP. This further relaxes bronchial smooth muscle and inhibits release of mediators (like histamine and leukotrienes) from mast cells.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Inhalation | Rapid | 30 min | Unknown |

*Half-life:* 26 hours.

### ADVERSE REACTIONS
**CNS:** *pain.*

**CV:** *chest pain,* ***AV block,*** atrial flutter, ***heart failure, MI, prolonged QT interval, supraventricular tachycardia,*** inverted T wave, peripheral edema.
**EENT:** sinusitis.
**GI:** diarrhea.
**Metabolic:** ***hypoglycemia,*** hypokalemia.
**Musculoskeletal:** back pain, leg cramps.
**Respiratory:** dyspnea, pulmonary or chest congestion, ***bronchospasm.***
**Skin:** rash.
**Other:** hypersensitivity reaction, flu syndrome.

## INTERACTIONS

**Drug-drug.** *Aminophylline, corticosteroids (such as dexamethasone, prednisone), theophylline:* May increase the risk of hypokalemia. Monitor patient's potassium level.
*Beta blockers (such as metoprolol, atenolol):* May decrease effectiveness of arformoterol and increase risk of bronchospasm. Avoid using together, if possible; otherwise, use with extreme caution.
*Non–potassium-sparing diuretics (such as furosemide, hydrochlorothiazide):* May increase the risk of hypokalemia and ECG changes. Use cautiously together and monitor patient's ECG and potassium level.
*Other beta$_2$ adrenergics (such as albuterol, formoterol):* May cause additive effects. Avoid using together.
*QT interval-prolonging drugs (such as MAO inhibitors, tricyclic antidepressants):* May increase risk of ventricular arrhythmias. Use cautiously together.

## EFFECTS ON LAB TEST RESULTS

• May increase PSA levels. May decrease potassium levels. May increase or decrease glucose levels.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug, formoterol, or any other components of this drug.
**Black Box Warning** Safe and effective use of arformoterol in patients with asthma hasn't been established. Arformoterol is contraindicated in patients with asthma who aren't using a long-term asthma control medication. ▮
• Don't use in patients with acutely deteriorating COPD.
• Use cautiously in patients with seizure disorder; thyrotoxicosis; hepatic insufficiency; preexisting cardiovascular disease, including coronary insufficiency, arrhythmias and hypertension; or in those unresponsive to sympathomimetic amines.
⚠ ***Overdose S&S:*** Exaggeration of adverse reactions, hyperglycemia, hypertension, hypotension, metabolic acidosis, cardiac arrest.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug may increase the risk of asthma-related death. ▮
• Drug is twice as potent as formoterol inhaler.
***Alert:*** Make sure patient has a rescue inhaler, such as albuterol, to treat an acute asthma attack or bronchospasm.
***Alert:*** Notify prescriber if patient experiences decreasing control of symptoms or begins using his short-acting beta$_2$ agonist more often.
• If paradoxical bronchospasm occurs, stop drug immediately.
• Monitor blood pressure, pulse, and ECG, as indicated.
• ***Look alike–sound alike:*** Don't confuse Brovana (arformoterol tartrate) with Boniva (ibandronate sodium).

## PATIENT TEACHING

• Tell patient to store vials in the foil pouches in the refrigerator and use immediately after opening.
• Tell patient to use only the recommended nebulizer and compressor for treatment and not to mix drug with other inhaled drugs or solutions.
***Alert:*** Warn patient that drug is for maintenance treatment only and shouldn't be used to stop an asthma attack or bronchospasm. For emergency treatment, use a short-acting rescue inhaler such as albuterol.
• Educate patient using a short-acting bronchodilator on a scheduled basis, to stop scheduled use and use only for rescue therapy.
***Alert:*** Warn patient that serious adverse effects, including death, can occur at higher

than recommended doses and not to take more inhalations than prescribed.
- Tell patient to stop drug immediately and obtain medical help if life-threatening bronchospasm, severe rash, or swelling in throat occurs.
- Inform patient that he may experience palpitations, chest pain, rapid heartbeat, tremors, or nervousness.
- Tell patient not to swallow the inhalation solution.
- Caution patient to notify prescriber if he notices a decrease in symptom control or more frequent use of his rescue inhaler.

**SAFETY ALERT!**

## argatroban

ahr-GAH-troh-ban

*Therapeutic class:* Anticoagulant
*Pharmacologic class:* Direct thrombin inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS

*Injection:* 100 mg/ml

### INDICATIONS & DOSAGES

➤ **To prevent or treat thrombosis in patients with heparin-induced thrombocytopenia**

*Adults without hepatic impairment:* 2 mcg/kg/minute, given as a continuous I.V. infusion; adjust dose until the steady-state activated PTT is 1½ to 3 times the initial baseline value, not to exceed 100 seconds; maximum dose 10 mcg/kg/minute. See current manufacturer's label for recommended doses and infusion rates.

***Adjust-a-dose:*** For patients with moderate hepatic impairment, reduce first dose to 0.5 mcg/kg/minute, given as a continuous infusion. Monitor PTT closely and adjust dosage as needed.

➤ **Anticoagulation in patients with or at risk for heparin-induced thrombocytopenia during percutaneous coronary intervention (PCI)**

*Adults:* 350 mcg/kg I.V. bolus over 3 to 5 minutes. Start a continuous I.V. infusion at 25 mcg/kg/minute. Check activated clotting time (ACT) 5 to 10 minutes after the bolus dose is completed.

***Adjust-a-dose:*** Use the following table to adjust the dosage.

| *Activated clotting time* | *Additional I.V. bolus* | *Continuous I.V. infusion* |
|---|---|---|
| <300 sec | 150 mcg/kg | 30 mcg/kg/min* |
| >450 sec | None needed | 15 mcg/kg/min* |

*Check ACT again after 5 to 10 minutes.

Once a therapeutic ACT (300 to 450 sec) has been achieved, continue this dose for the duration of the procedure. In case of dissection, impending abrupt closure, thrombus formation during the procedure, or inability to achieve or maintain an ACT exceeding 300 seconds, give an additional bolus of 150 mcg/kg and increase infusion rate to 40 mcg/kg/minute. Check ACT again after 5 to 10 minutes.

### ADMINISTRATION

**I.V.**

▼ Before starting therapy, obtain a complete list of patient's prescription and OTC drugs and supplements, including herbs.
▼ Stop all parenteral anticoagulants before giving drug. Giving with antiplatelets, thrombolytics, and other anticoagulants may increase risk of bleeding.
▼ Before starting drug, get results of baseline coagulation tests, platelet count, hemoglobin level, and hematocrit, and report any abnormalities to prescriber.
▼ Dilute in normal saline solution, $D_5W$, or lactated Ringer's injection to a final concentration of 1 mg/ml.
▼ Dilute each 2.5-ml vial 100-fold by mixing it with 250 ml of diluent.
▼ Mix the solution by repeated inversion of the diluent bag for 1 minute.
▼ Don't expose solution to direct sunlight.
▼ Prepared solutions are stable for up to 24 hours at 77° F (25° C).
▼ **Incompatibilities:** Other I.V. drugs.

### ACTION

Reversibly binds to the thrombin-active site and inhibits thrombin-catalyzed or -induced reactions: fibrin formation; coagulation factor V, VIII, and XIII activation; protein C activation; and platelet aggregation. May

inhibit the action of free and clot-associated thrombin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Rapid | 1–3 hr | Duration of infusion |

*Half-life:* 39 to 51 minutes.

## ADVERSE REACTIONS

**CNS:** ***cerebrovascular disorder, hemorrhage,*** fever, pain.
**CV:** ***atrial fibrillation, cardiac arrest,*** hypotension, ***ventricular tachycardia.***
**GI:** abdominal pain, diarrhea, ***GI bleeding,*** nausea, vomiting.
**GU:** abnormal renal function, groin bleeding, *hematuria,* UTI.
**Hematologic:** *anemia.*
**Respiratory:** cough, dyspnea, pneumonia, hemoptysis.
**Other:** allergic reactions, brachial bleeding, infection, ***sepsis.***

## INTERACTIONS

**Drug-drug.** *Antiplatelet drugs (clopidogrel, NSAIDs, salicylates), heparin, thrombolytics:* May increase risk of intracranial bleeding. Avoid using together.
*Oral anticoagulants:* May prolong PT and INR and may increase risk of bleeding. Monitor patient closely.
**Drug-herb.** *Angelica (dong quai), boldo, bromelains, capsicum, chamomile, dandelion, danshen, devil's claw, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, licorice, meadowsweet, onion, passion flower, red clover, willow:* May increase risk of bleeding. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

• May decrease hemoglobin level and hematocrit.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients who have overt major bleeding who are hypersensitive to drug or any of its components.
• Use cautiously in patients with hepatic disease or conditions that increase the risk of hemorrhage, such as severe hypertension.
• Use cautiously in patients who have just had lumbar puncture, spinal anesthesia, or major surgery, especially of the brain, spinal cord, or eye; patients with hematologic conditions causing increased bleeding tendencies, such as congenital or acquired bleeding disorders; and patients with GI ulcers or other lesions.
***Overdose S&S:*** Excessive anticoagulation, with or without bleeding.

## NURSING CONSIDERATIONS

• Check activated PTT 2 hours after giving drug; dose adjustments may be required to get a targeted activated PTT of 1.5 to 3 times the baseline, no longer than 100 seconds. Steady state is achieved 1 to 3 hours after starting drug.
• Draw blood for additional ACT about every 20 to 30 minutes during prolonged PCI.
***Alert:*** Patients can hemorrhage from any site in the body. Any unexplained decrease in hematocrit or blood pressure or any other unexplained symptoms may signify a hemorrhagic event.
• To convert to oral anticoagulant therapy, give warfarin P.O. with argatroban at up to 2 mcg/kg/minute until the INR exceeds 4 on combined therapy. After argatroban is stopped, repeat the INR in 4 to 6 hours. If the repeat INR is less than the desired therapeutic range, resume the I.V. argatroban infusion. Repeat the procedure daily until the desired therapeutic range on warfarin alone is reached.
• Use cautiously in breast-feeding women; it's unknown if drug appears in breast milk.
• ***Look alike–sound alike:*** Don't confuse argatroban with Aggrastat.

## PATIENT TEACHING

• Tell patient that this drug can cause bleeding, and ask him to report any unusual bruising or bleeding (nosebleeds, bleeding gums) or tarry stools to the prescriber immediately.
• Advise patient to avoid activities that carry a risk of injury, and to use a soft toothbrush and an electric razor during therapy.
• Advise patient to consult with prescriber before initiating any herbal therapy; many herbs have anticoagulant, antiplatelet, and fibrinolytic properties.

- Instruct patient to notify prescriber if he has wheezing, trouble breathing, or skin rash.
- Instruct woman who is pregnant, has recently delivered, or is breast-feeding to notify her prescriber.
- Tell patient to notify prescriber if he has GI ulcers or liver disease, or has had recent surgery, radiation treatment, falling episodes, or injury.

## aripiprazole

air-eh-PIP-rah-zole

Abilify✔, Abilify Discmelt

*Therapeutic class:* Antipsychotic
*Pharmacologic class:* Quinolinone derivative
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 9.75 mg/1.3 ml (7.5 mg/ml) single-dose vial
*Oral solution:* 1 mg/ml
*Orally disintegrating tablets (ODTs):* 10 mg, 15 mg
*Tablets:* 2 mg, 5 mg, 10 mg, 15 mg, 20 mg, 30 mg

### INDICATIONS & DOSAGES

➤ **Schizophrenia**

*Adults:* Initially, 10 to 15 mg P.O. daily; increase to maximum daily dose of 30 mg if needed, after at least 2 weeks. Responding patients should be continued on the lowest dosage needed to maintain remission. Patients should be periodically reassessed to determine the need for maintenance treatment.
*Adolescents age 13 to 17:* Initially, 2 mg P.O. daily; increase to 5 mg after 2 days, then to recommended dose of 10 mg in 2 more days. May titrate to maximum daily dose of 30 mg in 5-mg increments. Responding patients should be continued on the lowest dosage needed to maintain remission. Patients should be periodically reassessed to determine the need for maintenance treatment.

➤ **Bipolar mania, including manic and mixed episodes, with or without psychotic features; adjunctive therapy to either lithium or valproate for treatment of manic and mixed episodes associated with bipolar I disorder with or without psychotic features (acute treatment only)**

*Adults:* Initial and target dose is 15 mg P.O. once daily. Dose can be increased to maximum of 30 mg/day based on clinical response. For maintenance, responding patients on monotherapy should be continued on the lowest dose needed to maintain remission. Patients should be periodically reassessed to determine the long-term usefulness of maintenance treatment.
*Children ages 10 to 17:* Initially, 2 mg P.O. daily; increase to 5 mg P.O. daily after 2 days then to recommended dose of 10 mg in two more days. May titrate to maximum daily dose of 30 mg in 5-mg increments every 5 days. For maintenance, responding patients on monotherapy should be continued on the lowest dose needed to maintain remission. Patients should be periodically reassessed to determine the need for maintenance treatment.

➤ **Adjunctive treatment of major depressive disorder**

*Adults:* Initially, 2 to 5 mg P.O. daily. Dose range is 2 to 15 mg/day. Dosage adjustments of up to 5 mg/day should occur gradually, at intervals of no less than 1 week.

➤ **Agitation associated with schizophrenia or bipolar I disorder, mixed or manic**

*Adults:* 5.25 to 15 mg by deep I.M. injection. Recommended dose is 9.75 mg. May give a second dose after 2 hours, if needed. Safety of giving more frequently than every 2 hours or a total daily dose more than 30 mg isn't known. Switch to oral form as soon as possible.

✷ ***NEW INDICATION:*** **Irritability associated with autistic disorder**

*Children ages 6 to 17:* Initially, 2 mg P.O. daily. Increase dosage to 5 mg/day, with subsequent increases to 10 or 15 mg/day if needed. Dosage adjustments of up to 5 mg/day should occur gradually, at intervals of no less than 1 week.

***Adjust-a-dose:*** When using with CYP3A4 inhibitors, such as ketoconazole or clarithromycin, or CYP2D6 inhibitors, such as quinidine, fluoxetine, or paroxetine, give half the aripiprazole dose. When using with

CYP3A4 inducers such as carbamazepine, double the aripiprazole dose. Return to original dosing after the other drugs are stopped.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.
- Substitute the oral solution on a milligram-by-milligram basis for the 5-, 10-, 15-, or 20-mg tablets, up to 25 mg. Give patients taking 30-mg tablets 25 mg of solution.
- Keep ODTs in blister package until ready to use. Use dry hands to carefully peel open the foil backing and remove the tablet. Don't split tablet.
- Store oral solution in refrigerator; it can be used up to 6 months after opening.

**I.M.**

- Inject slowly and deep into the muscle mass.
- Don't give I.V. or subcutaneously.

## ACTION

Thought to exert partial agonist activity at D2 and serotonin 1A receptors and antagonist activity at serotonin 2A receptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3–5 hr | Unknown |
| I.M. | Unknown | 1–3 hr | Unknown |

*Half-life:* About 75 hours in patients with normal metabolism; about 6 days in those who can't metabolize the drug through CYP2D6.

## ADVERSE REACTIONS

**CNS:** *headache, anxiety, insomnia, lightheadedness, somnolence, akathisia,* ***increased suicide risk, neuroleptic malignant syndrome, seizures, suicidal thoughts,*** *extrapyramidal disorder (children),* tremor, asthenia, depression, fatigue, *dizziness,* nervousness, hostility, manic behavior, confusion, abnormal gait, cogwheel rigidity, fever, tardive dyskinesia, *restlessness.*
**CV:** peripheral edema, chest pain, hypertension, tachycardia, orthostatic hypotension, ***bradycardia.***
**EENT:** rhinitis, blurred vision, increased salivation, conjunctivitis, ear pain.
**GI:** *nausea, vomiting, constipation,* anorexia, dry mouth, dyspepsia, diarrhea, abdominal pain, esophageal dysmotility.
**GU:** urinary incontinence.
**Hematologic:** ecchymosis, anemia.
**Metabolic:** *weight gain,* weight loss, hyperglycemia, hypercholesterolemia.
**Musculoskeletal:** neck pain, neck stiffness, muscle cramps.
**Respiratory:** dyspnea, pneumonia, cough.
**Skin:** rash, dry skin, pruritus, sweating, ulcer.
**Other:** flulike syndrome.

## INTERACTIONS

**Drug-drug.** *Antihypertensives:* May enhance antihypertensive effects. Monitor blood pressure.
*Carbamazepine and other CYP3A4 inducers:* May decrease levels and effectiveness of aripiprazole. Double the usual dose of aripiprazole, and monitor the patient closely.
*Ketoconazole and other CYP3A4 inhibitors:* May increase risk of serious toxic effects. Start treatment with half the usual dose of aripiprazole, and monitor patient closely.
*Potential CYP2D6 inhibitors (fluoxetine, paroxetine, quinidine):* May increase levels and toxicity of aripiprazole. Give half the usual dose of aripiprazole.
**Drug-food.** *Grapefruit juice:* May increase drug level. Tell patient not to take drug with grapefruit juice.
**Drug-lifestyle.** *Alcohol use:* May increase CNS effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase CK and glucose levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with CV disease, cerebrovascular disease, or conditions that could predispose the patient to hypotension, such as dehydration or hypovolemia.
- Use cautiously in patients with history of seizures or with conditions that lower the seizure threshold.
- Use cautiously in patients who engage in strenuous exercise, are exposed to extreme heat, take anticholinergics, or are susceptible to dehydration.

• Use cautiously in patients at risk for aspiration pneumonia, such as those with Alzheimer's disease.
• Use cautiously in pregnant and breast-feeding women.
**Black Box Warning** Abilify isn't approved for use in children with depression. ■
**Black Box Warning** Elderly patients with dementia-related psychosis treated with atypical antipsychotics are at an increased risk for death. Abilify isn't approved for the treatment of patients with dementia-related psychosis. ■
***Overdose S&S:*** Somnolence, tremor, vomiting, acidosis, aggression, atrial fibrillation, bradycardia, coma, confusion, seizures, depressed level of consciousness, hypertension, hypokalemia, hypotension, increased AST and blood CK levels, lethargy, loss of consciousness, aspiration pneumonia, prolonged QRS complex, prolonged QT interval, respiratory arrest, status epilepticus, tachycardia.

## NURSING CONSIDERATIONS

***Alert:*** Neuroleptic malignant syndrome may occur. Monitor patient for hyperpyrexia, muscle rigidity, altered mental status, irregular pulse or blood pressure, tachycardia, diaphoresis, and cardiac dysrhythmias.
• If signs and symptoms of neuroleptic malignant syndrome occur, immediately stop drug and notify prescriber.
• Monitor patient for signs and symptoms of tardive dyskinesia. Elderly patients, especially women, are at highest risk of developing this adverse effect.
***Alert:*** Fatal cerebrovascular adverse events (stroke, transient ischemic attack) may occur in elderly patients with dementia. Drug isn't safe or effective in these patients.
**Black Box Warning** Drug may increase the risk of suicidal thinking and behavior in children, adolescents, and young adults ages 18 to 24 during the first 2 months of treatment, especially in those with major depressive or other psychiatric disorder. ■
***Alert:*** Hyperglycemia may occur. Monitor patient with diabetes regularly. Patient with risk factors for diabetes should undergo fasting blood glucose testing at baseline and periodically. Monitor all patients for symptoms of hyperglycemia including increased hunger, thirst, frequent urination, and weakness. Hyperglycemia may resolve when patient stops taking drug.
***Alert:*** Monitor patient for symptoms of metabolic syndrome (significant weight gain and increased body mass index, hypertension, hyperglycemia, hypercholesterolemia, and hypertriglyceridemia).
• Treat patient with the smallest dose for the shortest time and periodically reevaluate for need to continue.
• Give prescriptions only for small quantities of drug, to reduce risk of overdose.
• Don't give I.V. or subcutaneously.

## PATIENT TEACHING

**Black Box Warning** Advise families and caregivers to closely observe patient for clinical worsening, suicidality, or unusual changes in behavior. ■
• Tell patient to use caution while driving or operating hazardous machinery because psychoactive drugs may impair judgment, thinking, or motor skills.
• Tell patient that drug may be taken without regard to meals.
• Advise patients that grapefruit juice may interact with aripiprazole and to limit or avoid its use.
• Advise patient that gradual improvement in symptoms should occur over several weeks rather than immediately.
• Tell patients to avoid alcohol use while taking drug.
• Advise patients to limit strenuous activity while taking drug to avoid dehydration.
• Tell patient to keep ODT in blister package until ready to use. Using dry hands, he should carefully peel open the foil backing and place tablet on the tongue. Tell him not to split tablet.
• Tell patient to store oral solution in refrigerator, and that the solution can be used for up to 6 months after opening.

# armodafinil

are-moe-DAFF-ih-nihl

Nuvigil

*Therapeutic class:* Stimulant
*Pharmacologic class:* CNS stimulant
*Pregnancy risk category C*
*Controlled substance schedule IV*

## AVAILABLE FORMS

*Tablets:* 50 mg, 150 mg, 250 mg

## INDICATIONS & DOSAGES

➤ **To improve wakefulness in patients with excessive sleepiness caused by narcolepsy, obstructive sleep apnea-hypoapnea syndrome (OAHS), or shift-work sleep disorder**

*Adults:* 150 mg to 250 mg P.O. daily in the morning. For OAHS, doses exceeding 150 mg daily may not be more effective. For shift-work disorder, 150 mg P.O. daily, 1 hour before start of shift.

***Adjust-a-dose:*** Reduce dosage in patients with severe hepatic impairment, with or without cirrhosis.

## ADMINISTRATION

**P.O.**

• Give drug consistently with or without food at same time each day. Food may delay effect of drug.

## ACTION

Unknown. May be similar to sympathomimetics, such as amphetamine and methylphenidate. Also may inhibit dopamine reuptake.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 hr | Unknown |

*Half-life:* 15 hours.

## ADVERSE REACTIONS

**CNS:** agitation, anxiety, depression, dizziness, fatigue, *headache,* insomnia, migraine, nervousness, pain, paresthesia, pyrexia, tremor.
**CV:** increased blood pressure, increased pulse, palpitations.
**GI:** abdominal pain, anorexia, constipation, diarrhea, dry mouth, dyspepsia, loose stools, nausea, vomiting.
**Respiratory:** dyspnea.
**Skin:** contact dermatitis, hyperhydrosis, rash, ***Stevens-Johnson syndrome.***
**Other:** allergic reactions, flulike illness, thirst.

## INTERACTIONS

**Drug-drug.** *CNS stimulants (amphetamine, methylphenidate):* May produce additive effects. Use cautiously together.
*Drugs metabolized by CYP2C19 (diazepam, omeprazole, phenytoin, propranolol):* May increase levels of these drugs. Monitor patient and reduce doses as needed.
*Drugs metabolized by CYP3A (cyclosporine, ethinyl estradiol, midazolam, triazolam):* May decrease levels of these drugs. Adjust doses as needed.
*Drugs that induce CYP3A (carbamazepine, phenobarbital, rifampin):* May decrease armodafinil level. Check drug level and adjust dose as needed.
*Drugs that inhibit CYP3A (erythromycin, ketoconazole):* May increase armodafinil level. Monitor patient carefully and decrease dose as needed.
**Drug-food.** *Any food:* May delay onset of action by several hours. Monitor effect and give drug consistently with or without food, at the same time daily.
**Drug-lifestyle.** *Alcohol use:* May counteract armodafinil's effect. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

• May increase GGT and alkaline phosphatase levels.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients younger than age 17.
• Contraindicated in patients hypersensitive to modafinil, armodafinil, or their inactive ingredients.
• Contraindicated with left ventricular hypertrophy and with mitral valve prolapse developed with other CNS stimulants.
• Use cautiously in breast-feeding or elderly patients.

- Use in pregnant patient only when benefit to mother outweighs risk to fetus.
- Use cautiously in those with a history of drug abuse or dependence.

***Alert:*** Use cautiously in patients with a psychiatric illness; drug may increase the risk of mania, delusion, hallucinations, and suicidal ideation.

- Use cautiously in patients with cardiac disease, multiorgan hypersensitivity, or rash, including Stevens-Johnson syndrome and severe hepatic impairment.

***Overdose S&S:*** Excitation or agitation, insomnia, slight or moderate elevations in hemodynamic parameters, restlessness, disorientation, confusion, hallucinations, nausea, diarrhea, tachycardia, bradycardia, hypertension, chest pain.

## NURSING CONSIDERATIONS

- Obtain a thorough medication history to avoid potentially dangerous drug interactions.
- Obtain a complete cardiac history. Monitor patient for increased blood pressure and pulse rate, ECG changes, chest pain, and arrhythmias.
- Monitor patient carefully for evidence of allergic reaction. If rash or other symptoms appear, stop drug immediately, notify prescriber, and monitor carefully.
- Monitor patients for signs and symptoms of misuse or abuse, especially those with a history of drug or stimulant abuse.
- Assess patient for abnormal level of sleepiness. Don't allow patient to engage in dangerous activities, such as driving, until effect of medication is known.
- Patients receiving continuous positive airway pressure therapy for OAHS should continue its use regardless of armodafinil therapy.

## PATIENT TEACHING

***Alert:*** Instruct patient to stop taking drug and notify prescriber if rash, hives, mouth sores, blister, peeling skin, trouble swallowing or breathing, or other symptoms of allergic reaction occur.

- Tell patient not to perform hazardous tasks, such as driving, if he feels excessive sleepiness or until effects of drug are known.
- Tell patient to notify prescriber of all drugs he takes to avoid potentially dangerous drug interactions.
- Tell patient to take drug at the same time, with or without food, every day.
- Advise patient that taking drug with food may delay its effects.
- Urge patient to notify prescriber right away if she becomes pregnant or plans to breast-feed.

# artemether/lumefantrine

art-TEM-mah-ther/loo-meh-FAN-treen

Coartem

*Therapeutic class:* Antimalarial
*Pharmacologic class:* Schizontocide
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* artemether 20 mg and lumefantrine 120 mg

## INDICATIONS & DOSAGES

➤ **Uncomplicated malaria caused by *Plasmodium falciparum***

*Adults and children who weigh 35 kg (77 lb) or more:* Initially, 4 tablets P.O., followed by 4 tablets P.O. in 8 hours, and then 4 tablets P.O. b.i.d. for the next 2 days. Total course is 24 tablets.

*Children who weigh 25 to 34 kg (55 to 75 lb):* Initially, 3 tablets P.O., followed by 3 tablets P.O. in 8 hours, and then 3 tablets b.i.d. on each of the next 2 days. Total course is 18 tablets.

*Children who weigh 15 to 24 kg (33 to 53 lb):* Initially, 2 tablets P.O., followed by 2 tablets in 8 hours, and then 2 tablets b.i.d. on each of the next 2 days. Total course is 12 tablets.

*Children who weigh 5 kg to 14 kg (11 to 31 lb):* Initially, 1 tablet P.O., followed by 1 tablet in 8 hours, and then 1 tablet b.i.d. on each of the next 2 days. Total course is 6 tablets.

## ADMINISTRATION

**P.O.**

- Give drug with food to improve absorption.

• For patients unable to swallow tablets, such as infants and children, tablets may be crushed and mixed with a small amount of water immediately before use. Rinse container with more water and have patient swallow contents. Follow with food.
• If vomiting occurs within 1 to 2 hours of administration, give a repeat dose. If patient vomits repeat dose, give him an alternative antimalarial treatment.

## ACTION

Exerts antimalarial effect by forming a complex with hemin, and inhibiting nucleic and protein synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–8 hr | Unknown |

*Half-life:* About 2 hours (artemether); 3 to 6 days (lumefantrine).

## ADVERSE REACTIONS

**CNS:** agitation, *asthenia*, ataxia, clonus, *dizziness*, *fatigue*, *fever*, fine motor delay, gait disturbance, *headache*, hyperreflexia, hypoesthesia, insomnia, malaise, mood swings, nystagmus, *sleep disorder*, tremor.
**CV:** *palpitations.*
**EENT:** conjunctivitis, ear infection, nasopharyngitis, oral herpes, rhinitis, tinnitus, vertigo.
**GI:** *abdominal pain*, *anorexia*, constipation, diarrhea, dyspepsia, dysphagia, gastroenteritis, *nausea*, peptic ulcer, *vomiting.*
**GU:** hematuria, proteinuria, UTI.
**Hematologic:** anemia.
**Hepatic:** hepatomegaly.
**Musculoskeletal:** *arthralgia*, back pain, *myalgia.*
**Respiratory:** asthma, bronchitis, cough, pharyngolaryngeal pain, pneumonia, respiratory infection.
**Skin:** acrodermatitis, impetigo, pruritus, rash, subcutaneous abscess, urticaria.
**Other:** abscess, *chills*, helminthic infection, hookworm infection, influenza, malaria, **Plasmodium falciparum *infection***, splenomegaly.

## INTERACTIONS

**Drug-drug.** *Amiodarone, antiretrovirals, astemizole, cisapride, CYP2D6 substrates (amitriptyline, clomipramine, flecainide, imipramine), CYP3A4 inhibitors (antidepressants, ketoconazole, macrolides, other imidazole antifungals), disopyramide, fluoroquinolones, halofantrine, pimozide, procainamide, quinidine, quinine, sotalol, terfenadine, ziprasidone:* May further prolong QT interval. Avoid using together.
*Mefloquine:* May decrease effectiveness of artemether/lumefantrine. Administer drug with food to increase absorption.
*Hormonal contraceptives:* May reduce contraceptive effect. Recommend alternative or additional contraception.
**Drug-food.** *Grapefruit juice:* May increase drug level. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

• May increase ALT and AST levels. May decrease potassium level.
• May increase eosinophil count and hematocrit.
• May increase or decrease platelet and granulocyte counts.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components.
• Avoid use in patients with prolonged QT syndrome and in those with hypokalemia, hypomagnesemia, and those taking other drugs that prolong QT interval.
• Use cautiously in patients with severe hepatic or renal impairment.
• Safety and effectiveness in pregnant women haven't been established. Use only if benefit outweighs risk to fetus.
• Give cautiously to breast-feeding women. It isn't known if drug is excreted in breast milk. Use only if benefit outweighs risk to infant.
• Safety and effectiveness in children weighing less than 5 kg (11 lb) haven't been established.

## NURSING CONSIDERATIONS

• Patient with malaria may be averse to food; encourage patient to resume eating as soon as food can be tolerated because food improves drug absorption.

## PATIENT TEACHING

• Instruct patient to take drug with food.

- Advise patient to take a repeat dose if he vomits within 1 hour.
- If child has difficulty swallowing tablets, tell parents to crush and mix tablets with 1 to 2 teaspoons of water in a clean container, administer immediately, then rinse the container and have child swallow the contents. Advise them to give child food or drink, such as milk, formula, pudding, broth, or porridge, after drug is taken.
- Advise patient to notify prescriber if he develops flulike symptoms (chills, fever, headache, and muscle pain) after completing treatment.

## asenapine

a-SEN-uh-peen

Saphris

*Therapeutic class:* Antipsychotic
*Pharmacologic class:* Dopamine and serotonin antagonist
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets (S.L.):* 5 mg, 10 mg

### INDICATIONS & DOSAGES

➤ **Acute schizophrenia**

*Adults:* 5 mg sublingually b.i.d.

➤ **Acute manic or mixed episodes associated with bipolar I disorder as monotherapy or as adjunctive therapy with either lithium or valproate**

*Adults:* For monotherapy, give 10 mg sublingually b.i.d. For adjunctive therapy, give 5 mg P.O. b.i.d. Dosage may be increased to a maximum of 10 mg P.O. b.i.d.

***Adjust-a-dose:*** If adverse effects occur, reduce dosage to 5 mg b.i.d.

### ADMINISTRATION

**P.O.**

- Obtain blood pressure before starting drug and monitor pressure regularly. Watch for orthostatic hypotension.
- Peel back colored tab on tablet pack, gently remove tablet, place under patient's tongue, and allow to dissolve completely.
- Advise patient not to eat or drink for 10 minutes after taking drug.

### ACTION

Unknown. May block dopamine and 5-$HT_2$ receptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| S.L. | Immediate | 1 hr | Unknown |

*Half-life:* 24 hours.

### ADVERSE REACTIONS

**CNS:** *akathisia,* anxiety, depression, dizziness, extrapyramidal symptoms, fatigue, *headache, insomnia,* irritability, *somnolence.*
**CV:** hypertension, ***prolonged QTc interval.***
**EENT:** dry mouth, oral hypoesthesia, salivary hypersecretion, toothache.
**GI:** constipation, dyspepsia, increased appetite, stomach discomfort, taste perversion, vomiting.
**Metabolic:** weight gain.
**Musculoskeletal:** arthralgia, extremity pain.

### INTERACTIONS

**Drug-drug.** *Alpha$_1$ blockers (such as doxazosin, terazosin):* May increase risk of hypotension. Use together cautiously.
*Dextromethorphan, paroxetine:* May increase dextromethorphan and paroxetine levels. Use together cautiously.
*Drugs known to prolong QTc interval (such as amiodarone, gatifloxacin, levofloxacin, moxifloxacin, procainamide, quinidine, sotalol):* May prolong QTc interval, leading to lethal arrhythmias such as torsades de pointes. Avoid use together.
*Fluvoxamine:* May increase asenapine level. Use together cautiously.
**Drug-lifestyle.** *Alcohol use:* May increase CNS effects. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

- May increase glucose, cholesterol, ALT, AST, and prolactin levels.
- May decrease WBC and neutrophil counts.

### CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Elderly patients with dementia-related psychosis treated with atypical or conventional antipsychotics are at increased risk for death.

Antipsychotics aren't approved for the treatment of dementia-related psychosis. ■
**Alert:** Watch for signs and symptoms of neuroleptic malignant syndrome (extrapyramidal effects, hyperthermia, autonomic disturbance), which are rare but can be fatal.
**Alert:** Avoid use in patients with conditions that may increase risk of torsades de pointes and in those taking other drugs that prolong QTc interval.
• It isn't known if drug appears in breast milk. Because of risk of adverse effects, an alternative method of feeding the baby is recommended.
• Safety and efficacy in children haven't been established.
**Overdose S&S:** Hypotension, circulatory collapse.

## NURSING CONSIDERATIONS

• Monitor ECG before and regularly during treatment for prolongation of QTc interval.
• Monitor patient for tardive dyskinesia, which may occur after prolonged use. It may disappear spontaneously or persist for life, despite stopping drug.
• Drug may alter glucose control in diabetics. Monitor glucose levels closely.
• Monitor CBC frequently during first few months of therapy in those with history of leukopenia or neutropenia. If WBC count decreases, monitor patient for signs and symptoms of infection; if infection occurs, discontinue drug in the absence of another cause.
• Obtain blood pressure before starting drug and monitor pressure regularly. Watch for orthostatic hypotension.
• Monitor patient for dysphagia, which can lead to aspiration and aspiration pneumonia.
• Dispense lowest appropriate quantity of drug, to reduce risk of overdose.
• Monitor patient for abnormal body temperature regulation, especially if he exercises, is exposed to extreme heat, takes anticholinergics, or is dehydrated.

## PATIENT TEACHING

• Instruct patient to peel back colored tab on tablet pack, gently remove tablet, place under the tongue, and allow to dissolve completely. Advise patient not to eat or drink for 10 minutes after taking drug.
• Warn patient to avoid activities that require mental alertness, such as operating hazardous machinery or operating a motor vehicle, until drug's effects are known.
• Advise patient to contact prescriber if palpitations or rapid heartbeat occurs.
• Advise patient not to stand up quickly but to get up slowly from a sitting position to avoid dizziness.
• Inform patient that weight gain may occur.
• Warn patient against exposure to extreme heat because drug may impair body's ability to reduce temperature.
• Advise patient to avoid alcohol.

**SAFETY ALERT!**

# asparaginase

a-SPARE-a-gi-nase

Elspar, Kidrolase†

*Therapeutic class:* Antineoplastic
*Pharmacologic class: Escherichia coli*–derived enzyme
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 10,000-international unit vial

## INDICATIONS & DOSAGES

➤ **Acute lymphocytic leukemia with other drugs**

*Adults and children:* 1,000 international units/kg I.V. daily for 10 days beginning on day 22 of regimen, injected over 30 minutes. Or, 6,000 international units/$m^2$ I.M. at intervals specified in protocol.

➤ **Sole induction drug for acute lymphocytic leukemia**

*Adults and children:* 200 international units/kg I.V. daily for 28 days.

## ADMINISTRATION

**I.V.**

▼ Preparing and giving parenteral form of drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.
▼ Reconstitute drug with 5 ml of sterile water for injection or saline solution for injection.

▼ To avoid foaming, don't shake vial vigorously.
▼ Use only clear solution.
▼ Use of a 5-micron filter during infusion removes gelatinous fiberlike particles that occasionally form without reducing drug potency.
▼ Give injection over 30 minutes through a running infusion of normal saline solution or $D_5W$.
▼ Refrigerate unopened dry powder. Reconstituted solution is stable for 8 hours if refrigerated.
▼ If drug touches skin or mucous membranes, wash with a generous amount of water for at least 15 minutes.
▼ **Incompatibilities:** None reported.

**I.M.**
• For I.M. injection, reconstitute with 2 ml normal saline solution to the 10,000–international unit vial. Refrigerate and use within 8 hours.
• Don't give more than 2 ml I.M. at one injection site.
• Don't use cloudy solutions.
• If drug touches skin or mucous membranes, wash with a generous amount of water for at least 15 minutes.

## ACTION

Leads to death of leukemic cells by destroying the essential amino acid asparagine, which is needed for protein synthesis in acute lymphocytic leukemia.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | 23–33 days |
| I.M. | Unknown | 14–24 hr | 23–33 days |

*Half-life:* 8 to 30 hours.

## ADVERSE REACTIONS

**CNS:** agitation, confusion, drowsiness, depression, fatigue, fever, hallucinations, headache, lethargy, somnolence.
**GI:** **HEMORRHAGIC PANCREATITIS,** *anorexia*, *nausea*, *vomiting*, cramps, stomatitis.
**GU:** *azotemia*, ***renal failure,*** glycosuria, polyuria, uric acid nephropathy.
**Hematologic:** *anemia*, ***DIC, hypofibrinogenemia, leukopenia,*** depression of clotting factor synthesis.
**Hepatic:** ***hepatotoxicity.***
**Metabolic:** *hyperglycemia*, hyperammonemia, hyperuricemia, hypocalcemia, weight loss.
**Skin:** *rash, urticaria.*
**Other:** **ANAPHYLAXIS,** chills, hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Methotrexate:* May decrease methotrexate effectiveness. Avoid using together, or give asparaginase after methotrexate.
*Prednisone:* May cause hyperglycemia. Monitor glucose level.
*Vincristine:* May increase neuropathy. Give asparaginase after vincristine, and monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

• May increase alkaline phosphatase, ammonia, AST, ALT, bilirubin, BUN, glucose, and uric acid levels. May decrease calcium, cholesterol, hemoglobin, and serum albumin levels.
• May decrease thyroid function test values and WBC count.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug (unless desensitized) and in those with pancreatitis or history of pancreatitis.
• Use cautiously in patients with hepatic dysfunction.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug should be given in a hospital setting only under the supervision of an experienced physician who is prepared to treat anaphylaxis. ■
• Monitor blood and urine glucose levels before and during therapy. Watch for signs and symptoms of hyperglycemia.
• Start allopurinol before therapy begins to help prevent uric acid nephropathy.
***Alert:*** Risk of hypersensitivity increases with repeated doses. Give 2 international units I.D. before first dose and when 1 week or more has elapsed between doses. Observe site for at least 1 hour for erythema or a wheal, which indicates a positive skin test.
***Alert:*** Patient with negative skin test may still develop an allergic reaction; desensitization may be needed before first treatment

dose and with retreatment. Give 1 international unit I.V. If no reaction occurs, double dose every 10 minutes until total daily dose is given.
• Drug shouldn't be used alone to induce remission unless combination therapy is inappropriate. Drug isn't recommended for maintenance therapy.
• Keep epinephrine, diphenhydramine, and I.V. corticosteroids available for treating anaphylaxis.
• Monitor CBC and bone marrow function tests.
• Obtain amylase and lipase levels to check pancreatic status. If levels are elevated, stop asparaginase.
• Increase patient's fluid intake to help prevent tumor lysis, which can result in uric acid nephropathy.
• Drug may affect clotting factor synthesis and cause hypofibrinogenemia, leading to thrombosis or, more commonly, severe bleeding. Monitor patient and bleeding studies closely.
• Because of vomiting, give fluids parenterally for 24 hours or until oral fluids are tolerated.
• Patient may become hypersensitive to drug derived from cultures of *Escherichia coli*. Erwinia asparaginase, which is derived from cultures of *E. carotovora*, may be used in these patients without causing cross-sensitivity.
• Drug toxicity is more likely to occur in adults than in children.
• There are several protocols for use of this drug.
• ***Look alike–sound alike:*** Don't confuse asparaginase with pegaspargase.

### PATIENT TEACHING

• Tell patient to watch for signs of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell patient to take temperature daily.
• Stress importance of maintaining adequate fluid intake to help prevent hyperuricemia. If adverse GI reactions prevent patient from drinking fluids, tell him to notify prescriber.
• Urge patient to immediately report severe headache, stomach pain with nausea or vomiting, or inability to move a limb.
• Advise patient to report signs of a hypersensitivity reaction, including rash, itching, chills, dizziness, chest tightness, or difficulty breathing.

## aspirin (acetylsalicylic acid, ASA)

ASS-pir-in

Asaphen† ◇, Asatab† ◇, Bayer ◇, Ecotrin ◇, Empirin ◇, Entrophen† ◇, Halfprin ◇, Heartline ◇, Norwich ◇, Novasen† ◇, St Joseph's ◇, ZORprin ◇

*Therapeutic class:* NSAID
*Pharmacologic class:* Salicylate
*Pregnancy risk category D*

### AVAILABLE FORMS

*Suppositories:* 120 mg ◇, 200 mg ◇, 300 mg ◇, 600 mg ◇
*Tablets:* 325 mg ◇, 500 mg ◇
*Tablets (chewable):* 81 mg ◇
*Tablets (controlled-release):* 800 mg
*Tablets (enteric-coated):* 81 mg ◇, 162 mg ◇, 325 mg ◇, 500 mg ◇, 650 mg ◇
*Tablets (extended-release):* 650 mg ◇

### INDICATIONS & DOSAGES

➤ **Rheumatoid arthritis, osteoarthritis, or other polyarthritic or inflammatory conditions**
*Adults:* Initially, 2.4 to 3.6 g P.O. daily in divided doses. Maintenance dosage is 3.6 to 5.4 g P.O. daily in divided doses.
➤ **Juvenile rheumatoid arthritis**
*Children who weigh more than 25 kg (55 lb):* 2.4 to 3.6 g P.O. daily in divided doses.
*Children who weigh 25 kg or less:* 60 to 130 mg/kg daily P.O. in divided doses. Increase by 10 mg/kg daily at no more than weekly intervals. Maintenance dosages usually range from 80 to 100 mg/kg daily; up to 130 mg/kg daily.
➤ **Mild pain or fever**
*Adults and children older than age 12:* 324 to 1,000 mg P.O. or P.R. every 4 hours

p.r.n. Maximum dose is 4,000 mg in 24 hours.
*Children ages 2 to 11:* 10 to 15 mg/kg/dose P.O. or P.R. every 4 hours up to 80 mg/kg daily.

➤ **Suspected acute MI**
*Adults:* Initial dose of 160 mg to 325 mg P.O. as soon as MI is suspected. Continue maintenance dose of 160 mg to 325 mg P.O. daily for 30 days post infarction. After 30 days, consider further therapy for prevention of MI.

➤ **To reduce risk of MI in patients with previous MI, unstable angina, and chronic stable angina pectoris**
*Adults:* 75 to 325 mg P.O. daily.

➤ **Kawasaki syndrome (mucocutaneous lymph node syndrome)** ♦
*Children:* 80 to 100 mg/kg P.O. daily, divided q.i.d. with immune globulin I.V. After the fever subsides, reduce dosage to 1 to 5 mg/kg once daily. Aspirin therapy usually continues for 6 to 8 weeks.

➤ **To reduce risk of recurrent transient ischemic attacks and stroke or death in patients at risk**
*Adults:* 50 to 325 mg P.O. daily.

➤ **Acute ischemic stroke**
*Adults:* 50 to 325 mg P.O. daily, started within 48 hours of stroke onset and continued for up to 2 to 4 weeks.

➤ **Acute pericarditis after MI** ♦
*Adults:* 162 to 325 mg P.O. daily. Higher doses (650 mg P.O. every 4 to 6 hours) may be needed.

➤ **CABG**
*Adults:* 325 mg P.O. daily starting 6 hours postprocedure.

➤ **PTCA**
*Adults:* Initial dose of 325 mg P.O. 2 hours presurgery and then 160 mg to 325 mg P.O. daily.

➤ **Carotid endarterectomy**
*Adults:* 80 mg P.O. daily to 650 mg P.O. twice daily starting presurgery.

## ADMINISTRATION

**P.O.**
- For patient with swallowing difficulties, crush non–enteric-coated aspirin and dissolve in soft food or liquid. Give liquid immediately after mixing because drug will break down rapidly.
- Give drug with food, milk, antacid, or large glass of water to reduce GI effects.
- Give sustained-release or enteric-coated forms whole; don't crush or break these tablets.

**Rectal**
- Refrigerate suppositories.

## ACTION

Thought to produce analgesia and exert its anti-inflammatory effect by inhibiting prostaglandin and other substances that sensitize pain receptors. Drug may relieve fever through central action in the hypothalamic heat-regulating center. In low doses, drug also appears to interfere with clotting by keeping a platelet-aggregating substance from forming.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. (buffered) | 5–30 min | 1–2 hr | 1–4 hr |
| P.O. (enteric-coated) | 5–30 min | Variable | 1–4 hr |
| P.O. (extended-release) | 5–30 min | 1–4 hr | 1–4 hr |
| P.O. (solution) | 5–30 min | 15–40 min | 1–4 hr |
| P.O. (tablet) | 5–30 min | 25–40 min | 1–4 hr |
| P.R. | Unknown | 3–4 hr | Unknown |

*Half-life:* 15 to 20 minutes.

## ADVERSE REACTIONS

**EENT:** *tinnitus, hearing loss.*
**GI:** *nausea,* ***GI bleeding,*** dyspepsia, GI distress, occult bleeding.
**GU:** renal insufficiency.
**Hematologic:** *prolonged bleeding time,* ***leukopenia, thrombocytopenia.***
**Hepatic:** ***hepatitis.***
**Skin:** *rash,* bruising, urticaria.
**Other:** ***angioedema, Reye syndrome,*** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *ACE inhibitors:* May decrease antihypertensive effects. Monitor blood pressure closely.
*Ammonium chloride and other urine acidifiers:* May increase levels of aspirin products. Watch for aspirin toxicity.
*Antacids in high doses and other urine alkalinizers:* May decrease levels of aspirin products. Watch for decreased aspirin effect.

*Anticoagulants:* May increase risk of bleeding. Use with extreme caution if must be used together.
*Beta blockers:* May decrease antihypertensive effect. Avoid long-term aspirin use if patient is taking antihypertensives.
*Corticosteroids:* May enhance salicylate elimination and decrease drug level. Watch for decreased aspirin effect.
***Heparin:*** May increase risk of bleeding. Monitor coagulation studies and patient closely if used together.
*Ibuprofen, other NSAIDs:* May negate the antiplatelet effect of low-dose aspirin therapy. Patients using immediate-release aspirin (not enteric-coated) should take ibuprofen at least 30 minutes after or more than 8 hours before aspirin. Occasional use of ibuprofen is unlikely to have a negative effect.
*Methotrexate:* May increase risk of methotrexate toxicity. Avoid using together.
*Nizatidine:* May increase risk of salicylate toxicity in patients receiving high doses of aspirin. Monitor patient closely.
*Oral antidiabetics:* May increase hypoglycemic effect. Monitor patient closely.
*Probenecid, sulfinpyrazone:* May decrease uricosuric effect. Avoid using together.
*Valproic acid:* May increase valproic acid level. Avoid using together.
**Drug-herb.** *Dong quai, feverfew, ginkgo, horse chestnut, kelpware, red clover:* May increase risk of bleeding. Monitor patient closely for increased effects. Discourage use together.
*White willow:* May increase risk of adverse effects. Discourage use together.
**Drug-food.** *Caffeine:* May increase drug absorption. Watch for increased effects.
**Drug-lifestyle.** *Alcohol use:* May increase risk of GI bleeding. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase liver function test values, blood urea nitrogen, creatinine, and potassium levels.
- May decrease platelet and WBC counts.
- May falsely increase protein-bound iodine level.
- May interfere with urine glucose analysis with Diastix, Chemstrip uG, Clinitest, and Benedict solution; with urinary 5-hydroxyindoleacetic acid and vanillylmandelic acid tests; and with Gerhardt test for urine acetoacetic acid.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with NSAID-induced sensitivity reactions, G6PD deficiency, or bleeding disorders, such as hemophilia, von Willebrand disease, or telangiectasia.
- Use cautiously in patients with GI lesions, impaired renal function, hypoprothrombinemia, vitamin K deficiency, thrombocytopenia, thrombotic thrombocytopenic purpura, or severe hepatic impairment.

***Alert:*** Oral and rectal OTC products containing aspirin and nonaspirin salicylates shouldn't be given to children or teenagers who have or are recovering from chickenpox or flulike symptoms with or without fever because of the risk of Reye syndrome.
***Overdose S&S:*** Severe acid-base and electrolyte disturbance, hyperthermia, dehydration, tinnitus, vertigo, headache, confusion, drowsiness, diaphoresis, hyperventilation, vomiting, diarrhea.

## NURSING CONSIDERATIONS

- For inflammatory conditions, rheumatic fever, and thrombosis, give aspirin on a schedule rather than as needed.
- Because enteric-coated and sustained-release tablets are slowly absorbed, they aren't suitable for rapid relief of acute pain, fever, or inflammation. They cause less GI bleeding and may be better suited for long-term therapy, such as for arthritis.
- For patients who can't tolerate oral drugs, ask prescriber about using aspirin rectal suppositories. Watch for rectal mucosal irritation or bleeding.
- Febrile, dehydrated children can develop toxicity rapidly.
- Monitor elderly patients closely because they may be more susceptible to aspirin's toxic effects.
- Monitor salicylate level. Therapeutic salicylate level for arthritis is 150 to 300 mcg/ml. Tinnitus may occur at levels above 200 mcg/ml, but this isn't a reliable indicator of toxicity, especially in very young patients and those older than age 60. With long-term therapy, severe toxic

effects may occur with levels exceeding 400 mcg/ml.
- During prolonged therapy, assess hematocrit, hemoglobin level, PT, INR, and renal function periodically.
- Drug irreversibly inhibits platelet aggregation. Stop drug 5 to 7 days before elective surgery to allow time for production and release of new platelets.
- Monitor patient for hypersensitivity reactions, such as anaphylaxis and asthma.
- ***Look alike–sound alike:*** Don't confuse aspirin with Asendin or Afrin.

### PATIENT TEACHING
- Tell patient who's allergic to tartrazine to avoid aspirin.
- Advise patient on a low-salt diet that 1 tablet of buffered aspirin contains 553 mg of sodium.
- Advise patient to take drug with food, milk, antacid, or large glass of water to reduce GI reactions.
- Tell patient not to crush or chew sustained-release or enteric-coated forms but to swallow them whole.
- Instruct patient to discard aspirin tablets that have a strong vinegar-like odor.
- Tell patient to consult prescriber if giving drug to children for longer than 5 days or adults for longer than 10 days.
- Advise patient receiving prolonged treatment with large doses of aspirin to watch for small, round, red pinprick spots, bleeding gums, and signs of GI bleeding, and to drink plenty of fluids. Encourage use of a soft-bristled toothbrush.
- Because of the many drug interactions with aspirin, warn patient taking prescription drugs to check with prescriber or pharmacist before taking aspirin or OTC products containing aspirin.
- Ibuprofen can interfere with the antiplatelet effect of low-dose aspirin therapy, negating its effect. Tell patient how to safely use ibuprofen in relation to aspirin therapy.
- Urge pregnant women to avoid aspirin during last trimester of pregnancy unless specifically directed by prescriber.
- Drug is a leading cause of poisoning in children. Caution parents to keep drug out of reach of children. Encourage use of child-resistant containers.

## atazanavir sulfate
ah-TAZ-ah-nah-veer

Reyataz

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Protease inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS
*Capsules:* 100 mg, 150 mg, 200 mg, 300 mg

### INDICATIONS & DOSAGES
➤ **HIV-1 infection, with other antiretrovirals**
*Adults:* Give antiretroviral-experienced patients 300 mg (as one 300-mg capsule or two 150-mg capsules) once daily, plus 100 mg ritonavir once daily with food. Give antiretroviral-naive patients 400 mg (as two 200-mg capsules) once daily with food. When drug is given with efavirenz in antiretroviral-naive patients, give atazanavir 300 mg and ritonavir 100 mg as a single daily dose with food and efavirenz on an empty stomach, preferably at bedtime. Dosage recommendations for efavirenz and atazanavir in treatment-experienced patients haven't been established.
*Adolescents at least age 13 and weighing at least 39 kg (86 lb) who are treatment-naive and unable to tolerate ritonavir:* 400 mg P.O. once daily with food.
*Children and adolescents ages 6 to 18 who are treatment-naive:* Weighing 15 to less than 25 kg (33 to less than 55 lb), give 150 mg P.O. once daily with 80 mg ritonavir; 25 to less than 32 kg (55 to less than 70 lb), give 200 mg P.O. once daily with 100 mg ritonavir; 32 to less than 39 kg (70 to less than 86 lb), give 250 mg P.O. once daily with 100 mg ritonavir; at least 39 kg (86 lb), give 300 mg once daily with 100 mg ritonavir.
*Children and adolescents ages 6 to 18 who are treatment-experienced:* Weighing 25 to less than 32 kg, give 200 mg P.O. once daily with 100 mg ritonavir; 32 to less than 39 kg, give 250 mg P.O. once daily with 100 mg ritonavir; at least 39 kg, give 300 mg P.O. once daily with 100 mg ritonavir.

***Adjust-a-dose:*** In patients with Child-Pugh class B hepatic insufficiency who haven't experienced prior virologic failure, reduce dosage to 300 mg P.O. once daily.

## ADMINISTRATION

**P.O.**

- Give drug with food.
- Give drug to pregnant woman only if potential benefit justifies fetal risk.

## ACTION

Inhibits viral maturation in HIV-1–infected cells, resulting in the formation of immature noninfectious viral particles.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2½ hr | Unknown |

*Half-life:* About 7 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* depression, dizziness, fatigue, fever, insomnia, pain, peripheral neurologic symptoms.
**CV:** prolonged PR interval.
**EENT:** scleral yellowing.
**GI:** *abdominal pain, diarrhea, nausea,* vomiting.
**Hepatic:** hyperbilirubinemia, jaundice.
**Metabolic:** lipodystrophy.
**Musculoskeletal:** arthralgia, back pain.
**Respiratory:** increased cough.
**Skin:** *rash.*

## INTERACTIONS

**Drug-drug.** *Amiodarone, lidocaine (systemic), quinidine, tricyclic antidepressants:* May increase levels of these drugs. Monitor drug levels.
*Antacids, buffered drugs, didanosine:* May decrease atazanavir level. Give atazanavir 2 hours before or 1 hour after these drugs.
*Atorvastatin:* May increase atorvastatin levels, increasing the risk of myopathy and rhabdomyolysis. Use together cautiously.
*Clarithromycin:* May increase clarithromycin level and prolong QTc interval while reducing active metabolite. Avoid using together, except to treat *Mycobacterium avium* complex infection. Decrease clarithromycin by 50% when using together.
*Cyclosporine, sirolimus, tacrolimus:* May increase immunosuppressant level. Monitor immunosuppressant level.
*Diltiazem, felodipine, nicardipine, nifedipine, verapamil:* May increase calcium channel blocker level. Use together cautiously, with close ECG monitoring. Adjust calcium channel blocker dosage as needed. Decrease diltiazem dose by 50%.
*Efavirenz:* May alter atazanavir level. Reduce atazanavir dosage.
*Ergot derivatives, pimozide:* May cause serious or life-threatening reactions. Avoid using together.
*Ethinyl estradiol and norethindrone:* May increase ethinyl estradiol and norethindrone levels. Use cautiously together; give the lowest effective dose of hormonal contraceptive.
*$H_2$-receptor antagonists:* May decrease atazanavir level, reducing therapeutic effect. Separate doses by at least 12 hours.
*Indinavir:* May increase risk of indirect (unconjugated) hyperbilirubinemia. Avoid using together.
*Irinotecan:* May interfere with irinotecan metabolism and increase irinotecan toxicity. Avoid using together.
*Lovastatin, simvastatin:* May cause myopathy and rhabdomyolysis. Avoid using together.
*Midazolam, triazolam:* May cause prolonged or increased sedation or respiratory depression. Avoid using together.
***Proton-pump inhibitors**, rifampin:* May significantly reduce atazanavir level. Avoid using together.
*Rifabutin:* May increase rifabutin level. Reduce rifabutin dose up to 75%.
*Ritonavir:* May increase atazanavir level. Decrease atazanavir dose to 300 mg.
*Saquinavir (soft-gelatin capsules):* May increase saquinavir level. Avoid using together.
*Sildenafil, tadalafil, vardenafil:* May increase levels of these drugs, causing hypotension, visual changes, and priapism. Use together cautiously and reduce sildenafil dose to 25 mg every 48 hours, tadalafil dose to 10 mg every 72 hours, and vardenafil dose to 2.5 mg every 72 hours.

*Tenofovir:* May decrease atazanavir level, causing resistance. Give both drugs with ritonavir.
*Warfarin:* May increase warfarin level, which may cause life-threatening bleeding. Monitor INR.
**Drug-herb.** ***St. John's wort:*** May decrease drug level, reducing therapeutic effect and causing drug resistance. Discourage use together.
**Drug-food.** *Any food:* May increase bioavailability of drug. Tell patient to take drug with food.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, amylase, AST, bilirubin, and lipase levels. May decrease hemoglobin level.
- May decrease neutrophil count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its ingredients.
- Contraindicated in patients taking drugs cleared mainly by CYP3A4 or drugs that can cause serious or life-threatening reactions at high levels (dihydroergotamine, ergonovine, ergotamine, midazolam, methylergonovine, pimozide, triazolam).
- Don't use in patients with Child-Pugh class C hepatic insufficiency.
- Use cautiously in patients with conduction system disease or hepatic impairment.
- Use cautiously in elderly patients because of the increased likelihood of other disease, additional drug therapy, and decreased hepatic, renal, or cardiac function.

***Overdose S&S:*** Asymptomatic bifascicular block, PR interval prolongation, jaundice.

## NURSING CONSIDERATIONS

***Alert:*** Drug may prolong the PR interval.

- Monitor the patient for hyperglycemia and new-onset diabetes or worsened diabetes. Insulin and oral hypoglycemic dosages may need adjustment.
- Monitor a patient with hepatitis B or C for elevated liver enzymes or hepatic decompensation.
- Watch for life-threatening lactic acidosis syndrome and symptomatic hyperlactatemia, especially in women and obese patients.
- If the patient has hemophilia, watch for bleeding.
- Monitor patient for renal colic; drug may cause nephrolithiasis.
- Most patients have an asymptomatic increase in indirect bilirubin, possibly with yellowed skin or sclerae. This hyperbilirubinemia will resolve when therapy stops.
- Although cross-resistance occurs among protease inhibitors, resistance to drug doesn't preclude use of other protease inhibitors.
- Register pregnant women for monitoring of maternal-fetal outcomes by calling the Antiretroviral Pregnancy Registry at 1-800-258-4263.

## PATIENT TEACHING

- Urge patient to take drug with food every day and to take other antiretrovirals as prescribed.
- Explain that drug doesn't cure HIV infection and that the patient may develop opportunistic infections and other complications of HIV disease.
- Caution the patient that drug doesn't reduce the risk of transmitting the HIV virus to others.
- Tell patient that drug may cause altered or increased body fat, central obesity, buffalo hump, peripheral wasting, facial wasting, breast enlargement, and a cushingoid appearance.
- Tell patient to report yellowed skin or eyes, dizziness, or light-headedness.
- Caution patient not to take other prescriptions or OTC or herbal medicines without first consulting his prescriber.

## SAFETY ALERT!

**atenolol**
a-TEN-o-loll

Tenormin

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Beta blocker
*Pregnancy risk category D*

## AVAILABLE FORMS

*Tablets:* 25 mg, 50 mg, 100 mg

## INDICATIONS & DOSAGES

➤ **Hypertension**

*Adults:* Initially, 50 mg P.O. daily alone or in combination with a diuretic as a single dose, increased to 100 mg once daily after 7 to 14 days. Dosages of more than 100 mg daily are unlikely to produce further benefit.

➤ **Angina pectoris**

*Adults:* 50 mg P.O. once daily, increased as needed to 100 mg daily after 7 days for optimal effect. Maximum, 200 mg daily.

➤ **Migraine prophylaxis ♦**

*Adults:* 50 to 200 mg P.O. daily.

***Adjust-a-dose:*** If creatinine clearance is 15 to 35 ml/minute, maximum dose is 50 mg daily; if clearance is below 15 ml/minute, maximum dose is 25 mg daily. Hemodialysis patients need 25 to 50 mg after each dialysis session.

## ADMINISTRATION

**P.O.**

- Check apical pulse before giving drug; if slower than 60 beats/minute, withhold drug and call prescriber.
- Give drug exactly as prescribed, at the same time each day.

## ACTION

Selectively blocks $beta_1$-adrenergic receptors, decreases cardiac output and cardiac oxygen consumption, and depresses renin secretion.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 2–4 hr | 24 hr |

*Half-life:* 6 to 7 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness, fatigue,* lethargy, vertigo, drowsiness, fever.
**CV:** *hypotension,* ***bradycardia, heart failure,*** intermittent claudication.
**GI:** nausea, diarrhea.
**Musculoskeletal:** leg pain.
**Respiratory:** ***bronchospasm,*** dyspnea.
**Skin:** rash.

## INTERACTIONS

**Drug-drug.** *Amiodarone:* May increase risk of bradycardia, AV block, and myocardial depression. Monitor ECG and vital signs.

*Antihypertensives:* May increase hypotensive effect. Use together cautiously.
*Calcium channel blockers, hydralazine, methyldopa:* May cause additive hypotension and bradycardia. Adjust dosage as needed.
*Cardiac glycosides, diltiazem, verapamil:* May cause excessive bradycardia and increased depressant effect on myocardium. Use together cautiously.
*Clonidine:* May exacerbate rebound hypertension if clonidine is withdrawn. Atenolol should be withdrawn before clonidine by several days or added several days after clonidine is stopped.
*Dolasetron:* May decrease clearance of dolasetron and increase risk of toxicity. Monitor patient for toxicity.
*Insulin, oral antidiabetics:* May alter dosage requirements in previously stabilized diabetic patient. Observe patient carefully.
*I.V. lidocaine:* May reduce hepatic metabolism of lidocaine, increasing risk of toxicity. Give bolus doses of lidocaine at a slower rate and monitor lidocaine level closely.
*NSAIDs:* May decrease antihypertensive effects. Monitor blood pressure.
*Prazosin:* May increase the risk of orthostatic hypotension in the early phases of use together. Help patient stand slowly until effects are known.
*Reserpine:* May cause hypotension or marked bradycardia. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, BUN, creatinine, glucose, LDH, potassium, transaminase, and uric acid levels. May decrease glucose level.
- May increase platelet count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with sinus bradycardia, heart block greater than first degree, overt cardiac failure, untreated pheochromocytoma, or cardiogenic shock.
- Use cautiously in patients at risk for heart failure and in those with bronchospastic disease, diabetes, hyperthyroidism, and impaired renal or hepatic function.

***Overdose S&S:*** Lethargy, decreased respiratory drive, wheezing, sinus pause, bradycardia.

## NURSING CONSIDERATIONS

- Monitor patient's blood pressure.
- Monitor hemodialysis patients closely because of hypotension risk.
- Beta blockers may mask tachycardia caused by hyperthyroidism. In patients with suspected thyrotoxicosis, withdraw beta blocker gradually to avoid thyroid storm.
- Drug may mask signs and symptoms of hypoglycemia in diabetic patients.
- Drug may cause changes in exercise tolerance and ECG.

**Black Box Warning** Avoid abrupt discontinuation of therapy. Withdraw drug gradually to avoid serious adverse reactions, such as severe exacerbations of angina, myocardial infarction, and ventricular arrhythmias even in patients treated only for hypertension. ■

- ***Look alike–sound alike:*** Don't confuse atenolol with timolol or albuterol.

## PATIENT TEACHING

- Instruct patient to take drug exactly as prescribed, at the same time every day.
- Caution patient not to stop drug suddenly, but to notify prescriber if unpleasant adverse reactions occur.
- Teach patient how to take his pulse. Tell him to withhold drug and call prescriber if pulse rate is below 60 beats/minute.
- Tell woman of childbearing age to notify prescriber about planned, suspected, or known pregnancy. Drug will need to be stopped.
- Advise breast-feeding mother to contact prescriber; drug isn't recommended for breast-feeding women.

# atomoxetine hydrochloride

at-oh-MOX-ah-teen

Strattera℞

*Therapeutic class:* ADHD drug
*Pharmacologic class:* Selective norepinephrine reuptake inhibitor
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 10 mg, 18 mg, 25 mg, 40 mg, 60 mg, 80 mg, 100 mg

## INDICATIONS & DOSAGES

➤ **Attention deficit hyperactivity disorder (ADHD)**

*Adults, children, and adolescents who weigh more than 70 kg (154 lb):* Initially, 40 mg P.O. daily; increase after at least 3 days to a total of 80 mg/day P.O., as a single dose in the morning or two evenly divided doses in the morning and late afternoon or early evening. After 2 to 4 weeks, increase total dose to a maximum of 100 mg, if needed.

*Children who weigh 70 kg or less:* Initially, 0.5 mg/kg P.O. daily; increase after a minimum of 3 days to a target total daily dose of 1.2 mg/kg P.O. as a single dose in the morning or two evenly divided doses in the morning and late afternoon or early evening. Don't exceed 1.4 mg/kg or 100 mg daily, whichever is less.

***Adjust-a-dose:*** In patients with moderate hepatic impairment, reduce to 50% of the normal dose; in those with severe hepatic impairment, reduce to 25% of the normal dose. Poor metabolizers of CYP2D6 may require a reduced dose. In children who weigh less than 70 kg, adjust dosage to 0.5 mg/kg daily and increase to 1.2 mg/kg daily if symptoms don't improve after 4 weeks and if first dose is tolerated. In children and adults who weigh more than 70 kg, start at 40 mg daily and increase to 80 mg daily if symptoms don't improve after 4 weeks and if first dose is tolerated.

## ADMINISTRATION

**P.O.**

- Give drug without regard for meals.

• Capsules should be swallowed whole and not opened.

## ACTION

May be related to selective inhibition of the presynaptic norepinephrine transporter.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 1–2 hr | Unknown |

*Half-life:* 21½ hours.

## ADVERSE REACTIONS

**CNS:** *headache, insomnia,* dizziness, somnolence, crying, irritability, mood swings, pyrexia, fatigue, sedation, depression, tremor, early-morning awakening, paresthesia, abnormal dreams, sleep disorder.
**CV:** orthostatic hypotension, tachycardia, hypertension, palpitations, hot flashes.
**EENT:** mydriasis.
**GI:** *abdominal pain, constipation,* dyspepsia, *nausea, vomiting, decreased appetite, dry mouth.*
**GU:** urinary retention, urinary hesitation, ejaculatory problems, difficulty in micturition, dysmenorrhea, erectile disturbance, impotence, delayed menses, menstrual disorder, prostatitis.
**Respiratory:** *cough,* upper respiratory tract infection.
**Skin:** *dermatitis, pruritus, increased sweating.*
**Other:** influenza, decreased libido, chills.

## INTERACTIONS

**Drug-drug.** *Albuterol:* May increase CV effects. Use together cautiously.
***MAO inhibitors:*** May cause hyperthermia, rigidity, myoclonus, autonomic instability with possible rapid fluctuations of vital signs, and mental status changes. Avoid use within 2 weeks of MAO inhibitor.
*Pressor agents:* May increase blood pressure. Use together cautiously.
*Strong CYP2D6 inhibitors (paroxetine, fluoxetine, quinidine):* May increase atomoxetine level. Reduce first dose.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to atomoxetine or to components of drug, in those who have taken an MAO inhibitor within the past 2 weeks, and in those with angle-closure glaucoma.
• Use cautiously in patients with hypertension, tachycardia, or CV or cerebrovascular disease, and in pregnant or breast-feeding women.
• Safety and efficacy haven't been established in patients younger than age 6.
***Overdose S&S:*** Somnolence, agitation, hyperactivity, abnormal behavior, GI symptoms, mydriasis, tachycardia, dry mouth, prolonged QT interval, disorientation, hallucinations, seizures.

## NURSING CONSIDERATIONS

• Use drug as part of a total treatment program for ADHD, including psychological, educational, and social intervention.
• Monitor patient for the appearance or worsening of aggressive behavior or hostility, especially when treatment is initiated.
**Black Box Warning** Monitor children and adolescents closely for worsening of condition, agitation, irritability, suicidal thinking or behaviors, and unusual changes in behavior, especially the first few months of therapy or when the dosage is increased or decreased.
• Patients taking drug for extended periods must be reevaluated periodically to determine drug's usefulness.
• Monitor growth during treatment. If growth or weight gain is unsatisfactory, consider interrupting therapy.
***Alert:*** Severe liver injury may occur and progress to liver failure. Notify prescriber of any sign of liver injury: yellowing of the skin or the sclera of the eyes, pruritus, dark urine, upper right-sided tenderness, or unexplained flulike syndrome.
• Monitor blood pressure and pulse at baseline, after each dose increase, and during treatment periodically.
• Monitor for urinary hesitancy or retention and sexual dysfunction.
• Patient can stop drug without tapering off.

## PATIENT TEACHING

**Black Box Warning** Advise parents to call prescriber immediately about unusual behavior or suicidal thoughts. ■

- Tell pregnant women, women planning to become pregnant, and breast-feeding women to consult prescriber before taking atomoxetine.
- Tell patient to use caution when operating a vehicle or machinery until the effects of drug are known.
- Warn male patient to seek prompt medical attention for an erection that lasts more than 4 hours.

# atorvastatin calcium

ah-TOR-va-stah-tin

Lipitor✔

*Therapeutic class:* Antilipemic
*Pharmacologic class:* HMG-CoA reductase inhibitor
*Pregnancy risk category X*

## AVAILABLE FORMS

*Tablets:* 10 mg, 20 mg, 40 mg, 80 mg

## INDICATIONS & DOSAGES

➤ **In patients with clinically evident coronary heart disease, to reduce the risk of nonfatal MI, fatal and nonfatal strokes, angina, heart failure, and revascularization procedures**

*Adults:* Initially, 10 to 20 mg P.O. daily. May increase based on patient response and tolerance; usual dosage, 10 to 80 mg P.O. daily.

➤ **To reduce the risk of MI, stroke, angina, or revascularization procedures in patients with multiple risk factors for CAD but who don't yet have the disease**

*Adults:* 10 to 80 mg P.O. daily.

➤ **To reduce the risk of MI or stroke in patients with type 2 diabetes and multiple risk factors for CAD but who don't yet have the disease**

*Adults:* 10 to 80 mg P.O. daily.

➤ **Adjunct to diet to reduce LDL, total cholesterol, apolipoprotein B, and triglyceride levels and to increase HDL levels in patients with primary hypercholesterolemia (heterozygous familial and nonfamilial) and mixed dyslipidemia (Fredrickson types IIa and IIb); adjunct to diet to reduce triglyceride level (Fredrickson type IV); primary dysbetalipoproteinemia (Fredrickson type III) in patients who don't respond adequately to diet**

*Adults:* Initially, 10 or 20 mg P.O. once daily. Patient who requires a reduction of more than 45% in LDL level may be started at 40 mg once daily. Increase dose, as needed, to maximum of 80 mg daily as single dose. Dosage based on lipid levels drawn within 2 to 4 weeks of starting therapy and after dosage adjustment.

➤ **Alone or as an adjunct to lipid-lowering treatments, such as LDL apheresis, to reduce total and LDL cholesterol in patients with homozygous familial hypercholesterolemia**

*Adults:* 10 to 80 mg P.O. once daily.

➤ **Heterozygous familial hypercholesterolemia**

*Children ages 10 to 17 (girls should be 1 year postmenarche):* Initially, 10 mg P.O. once daily. Adjustment intervals should be at least 4 weeks. Maximum daily dose is 20 mg.

## ADMINISTRATION

**P.O.**

- Give drug without regard for meals.

## ACTION

Inhibits HMG-CoA reductase, an early (and rate-limiting) step in cholesterol biosynthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | Unknown |

*Half-life:* 14 hours.

## ADVERSE REACTIONS

**CNS:** *headache*, asthenia, insomnia.
**CV:** peripheral edema.
**EENT:** pharyngitis, rhinitis, sinusitis.
**GI:** abdominal pain, constipation, diarrhea, dyspepsia, flatulence, nausea.
**GU:** UTI.
**Musculoskeletal:** ***rhabdomyolysis,*** arthritis, arthralgia, myalgia.
**Respiratory:** bronchitis.

**Skin:** rash.
**Other:** allergic reactions, flulike syndrome, infection.

## INTERACTIONS

**Drug-drug.** *Amiodarone:* May increase risk of severe myopathy or rhabdomyolysis. Avoid use together or decrease atorvastatin dose.
*Antacids, cholestyramine, colestipol:* May decrease atorvastatin level. Separate administration times.
***Cyclosporine, diltiazem,*** *fibric acid derivatives,* ***macrolides (azithromycin, clarithromycin, erythromycin, telithromycin), nefazodone,*** *niacin, protease inhibitors, tacrolimus,* ***verapamil:*** May decrease metabolism of HMG-CoA reductase inhibitors, increasing toxicity. Monitor patient for adverse effects and report unexplained muscle pain.
*Digoxin:* May increase digoxin level. Monitor digoxin level and patient for evidence of toxicity.
*Fluconazole, itraconazole, ketoconazole, voriconazole:* May increase atorvastatin level and adverse effects. Avoid using together; or if unavoidable, reduce dose of atorvastatin.
*Hormonal contraceptives:* May increase norethindrone and ethinyl estradiol levels. Consider increased drug levels when selecting an oral contraceptive.
**Drug-herb.** *Eucalyptus, jin bu huan, kava:* May increase risk of hepatotoxicity. Discourage use together.
*Red yeast rice:* May increase risk of adverse reactions because herb contains compounds similar to those in drug. Discourage use together.
**Drug-food.** *Grapefruit juice:* May increase drug levels, increasing risk of adverse reactions. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, and CK levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with active liver disease or unexplained persistent elevations of transaminase levels.
- Contraindicated in pregnant and breast-feeding women and in women of childbearing age.
- Use cautiously in patients with hepatic impairment or heavy alcohol use.
- Withhold or stop drug in patients at risk for renal failure caused by rhabdomyolysis resulting from trauma; in serious, acute conditions that suggest myopathy; and in major surgery, severe acute infection, hypotension, uncontrolled seizures, or severe metabolic, endocrine, or electrolyte disorders.
- Limit use in children to those older than age 9 with homozygous familial hypercholesterolemia.

## NURSING CONSIDERATIONS

- Patient should follow a standard cholesterol-lowering diet before and during therapy.
- Before treatment, assess patient for underlying causes for hypercholesterolemia and obtain a baseline lipid profile. Obtain periodic liver function test results and lipid levels before starting treatment and at 6 and 12 weeks after initiation, or after an increase in dosage and periodically thereafter.
- Watch for signs of myositis.
- ***Look alike–sound alike:*** Don't confuse Lipitor with Levatol.

## PATIENT TEACHING

- Teach patient about proper dietary management, weight control, and exercise. Explain their importance in controlling high fat levels.
- Warn patient to avoid alcohol.
- Tell patient to inform prescriber of adverse reactions, such as muscle pain, malaise, and fever.
- Advise patient that drug can be taken at any time of day, without regard for meals.

***Alert:*** Tell woman to stop drug and notify prescriber immediately if she is or may be pregnant or if she's breast-feeding.

## atovaquone

a-TOE-va-kwon

Mepron

*Therapeutic class:* Antiprotozoal
*Pharmacologic class:* Ubiquinone analogue
*Pregnancy risk category C*

### AVAILABLE FORMS

*Suspension:* 750 mg/5 ml

### INDICATIONS & DOSAGES

➤ **Acute, mild to moderate *Pneumocystis jiroveci (carinii)* pneumonia in patients who can't tolerate trimethoprim/sulfamethoxazole**

*Adults and adolescents ages 13 to 16:* Give 750 mg P.O. b.i.d. with food for 21 days.

➤ **To prevent *P. jiroveci (carinii)* pneumonia in patients who are unable to tolerate trimethoprim/sulfamethoxazole**

*Adults and adolescents ages 13 to 16:* Give 1,500 mg (10 ml) P.O. daily with food.

### ADMINISTRATION

**P.O.**

- Taking with meals enhances absorption.

### ACTION

May interfere with electron transport in protozoal mitochondria, inhibiting enzymes needed to synthesize nucleic acids and adenosine triphosphate.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* 2 to 3 days.

### ADVERSE REACTIONS

**CNS:** *headache, insomnia, fever, pain,* asthenia, anxiety, dizziness.
**CV:** hypotension.
**EENT:** sinusitis, rhinitis.
**GI:** *abdominal pain, nausea, diarrhea, oral candidiasis, vomiting,* constipation, anorexia, dyspepsia, taste perversion.
**Hematologic:** ***neutropenia,*** anemia.
**Metabolic:** ***hypoglycemia,*** hyponatremia.
**Respiratory:** *cough.*
**Skin:** *rash, diaphoresis,* pruritus.

### INTERACTIONS

**Drug-drug.** *Rifabutin, rifampin:* May decrease atovaquone's steady-state level. Avoid using together.
*Zidovudine:* May elevate zidovudine level and lead to toxicity. Monitor closely.

### EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, and AST levels. May decrease glucose, hemoglobin, and sodium levels.
- May decrease neutrophil count.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in breast-feeding patients; it's unknown if drug appears in breast milk.
- Use cautiously with other highly protein-bound drugs; if used together, assess patient for toxicity.

***Overdose S&S:*** Methemoglobinemia, rash.

### NURSING CONSIDERATIONS

***Alert:*** Monitor patient closely during therapy because of risk of pulmonary infection.

### PATIENT TEACHING

- Instruct patient to take drug with meals; food significantly enhances absorption.

## atovaquone and proguanil hydrochloride

a-TOE-va-kwon

Malarone, Malarone Pediatric

*Therapeutic class:* Antimalarial
*Pharmacologic class:* Hydroxynaphthoquinone and biguanide derivative
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets (adult-strength):* 250 mg atovaquone and 100 mg proguanil hydrochloride
*Tablets (pediatric-strength):* 62.5 mg atovaquone and 25 mg proguanil hydrochloride

## INDICATIONS & DOSAGES

➤ **To prevent *Plasmodium falciparum* malaria, including in areas where chloroquine resistance has been reported**

*Adults and children who weigh more than 40 kg (88 lb):* 1 adult-strength tablet P.O. once daily with food or milk, beginning 1 or 2 days before entering a malaria-endemic area. Continue prophylactic treatment during stay and for 7 days after return.

*Children who weigh 31 to 40 kg (68 to 88 lb):* 3 pediatric-strength tablets P.O. once daily with food or milk, beginning 1 or 2 days before entering endemic area. Continue prophylactic treatment during stay and for 7 days after return.

*Children who weigh 21 to 30 kg (46 to 66 lb):* 2 pediatric-strength tablets P.O. once daily with food or milk, beginning 1 or 2 days before entering endemic area. Continue prophylactic treatment during stay and for 7 days after return.

*Children who weigh 11 to 20 kg (24 to 44 lb):* 1 pediatric-strength tablet P.O. daily with food or milk, beginning 1 or 2 days before entering endemic area. Continue prophylactic treatment during stay and for 7 days after return.

***Adjust-a-dose:*** Don't use for malaria prophylaxis in patients with severe renal impairment (creatinine clearance less than 30 ml/minute).

➤ **Acute, uncomplicated *P. falciparum* malaria**

*Adults and children who weigh more than 40 kg (88 lb):* 4 adult-strength tablets P.O. once daily, with food or milk, for 3 consecutive days.

*Children who weigh 31 to 40 kg (68 to 88 lb):* 3 adult-strength tablets P.O. once daily, with food or milk, for 3 consecutive days.

*Children who weigh 21 to 30 kg (46 to 66 lb):* 2 adult-strength tablets P.O. once daily, with food or milk, for 3 consecutive days.

*Children who weigh 11 to 20 kg (24 to 44 lb):* 1 adult-strength tablet P.O. once daily, with food or milk, for 3 consecutive days.

*Children who weigh 9 to 10 kg (20 to 22 lb):* 3 pediatric-strength tablets P.O. once daily, with food or milk, for 3 consecutive days.

*Children who weigh 5 to 8 kg (11 to 18 lb):* 2 pediatric-strength tablets P.O. once daily, with food or milk, for 3 consecutive days.

## ADMINISTRATION

**P.O.**

- Give dose at same time each day, with food or milk.
- If child has difficulty swallowing tablets, parents may crush tablet and mix it in condensed milk.
- Store tablets at controlled room temperature of 59° to 86° F (15° to 30° C).

## ACTION

Thought to interfere with nucleic acid replication in the malarial parasite. Atovaquone selectively inhibits mitochondrial electron transport in the parasite. Cycloguanil, an active metabolite of proguanil hydrochloride, inhibits dihydrofolate reductase. Atovaquone and cycloguanil, an active metabolite of proguanil hydrochloride, are active against the erythrocytic and exoerythrocytic stages of *Plasmodium* species.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* atovaquone: 2 to 3 days in adults; proguanil: 12 to 21 hours in adults and children.

## ADVERSE REACTIONS

**CNS:** *headache,* fever, asthenia, dizziness, dreams, insomnia.

**GI:** *abdominal pain, nausea, vomiting,* diarrhea, anorexia, dyspepsia, gastritis, oral ulcers.

**Respiratory:** cough.

**Skin:** pruritus.

## INTERACTIONS

**Drug-drug.** *Metoclopramide:* May decrease atovaquone bioavailability. Use another antiemetic.

*Rifampin, rifabutin:* May decrease atovaquone level by about 50%. Avoid using together.

*Tetracycline:* May decrease atovaquone level by about 40%. Monitor patient with parasitemia closely.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, and AST levels. May decrease hemoglobin level and hematocrit.
- May decrease WBC count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to atovaquone, proguanil hydrochloride, or any component of the drug.
- Use cautiously in patients with severe renal impairment and in those who are vomiting.
- Use cautiously in elderly patients because they have a greater frequency of decreased renal, hepatic, and cardiac function.
- It isn't known if atovaquone appears in breast milk, but proguanil does in small amounts. Use cautiously in breast-feeding women.
- Safety and effectiveness haven't been established for prevention in children who weigh less than 11 kg or for treatment in children who weigh less than 5 kg.

***Overdose S&S:*** Rash, methemoglobinemia (atovaquone); epigastric discomfort, vomiting, reversible hair loss, scaling of the skin on the palms or soles, reversible aphthous ulceration, hematologic adverse effects (proguanil).

## NURSING CONSIDERATIONS

- Persistent diarrhea or vomiting may decrease drug absorption. Patients with these symptoms may need a different antimalarial.

## PATIENT TEACHING

- Tell patient to take dose at the same time each day with food or milk.
- Tell parents that if child has difficulty swallowing tablets, to crush and mix in condensed milk.
- Tell patient to repeat dose if he vomits within 1 hour.
- Advise patient to notify prescriber if he can't complete the course of therapy as prescribed.
- Instruct patient to supplement preventive malarial with use of protective clothing, bed nets, and insect repellents.

**SAFETY ALERT!**

# atracurium besylate

at-truh-KYOO-ree-um

Tracrium

*Therapeutic class:* Skeletal muscle relaxant
*Pharmacologic class:* Nondepolarizing neuromuscular blocker
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 10 mg/ml

## INDICATIONS & DOSAGES

➤ **Adjunct to general anesthesia to facilitate endotracheal intubation and relax skeletal muscles during surgery or mechanical ventilation**

*Adults and children age 2 or older:* 0.4 to 0.5 mg/kg by I.V. bolus. Give maintenance dose of 0.08 to 0.1 mg/kg within 20 to 45 minutes during prolonged surgery. Give maintenance doses every 15 to 25 minutes in patients receiving balanced anesthesia. For prolonged procedures, use a constant infusion at an initial rate of 9 to 10 mcg/kg/minute; then reduce to 5 to 9 mcg/kg/minute.

*Children ages 1 month to 2 years:* First dose, 0.3 to 0.4 mg/kg I.V. for children under halothane anesthesia. Frequent maintenance doses may be needed.

***Adjust-a-dose:*** In adults, adolescents, children, or infants with significant CV disease or history suggesting a greater risk of histamine release (anaphylactic reaction, asthma), give initial dose of 0.3 to 0.4 mg/kg slowly or in divided doses over 1 minute. In adults receiving enflurane or isoflurane at the same time, reduce initial atracurium dose by 33% (0.25 to 0.35 mg/kg). In adults receiving atracurium following succinylcholine, initial dose is 0.3 to 0.4 mg/kg.

## ADMINISTRATION

**I.V.**

▼ Use drug only under direct supervision by medical staff skilled in using

neuromuscular blockers and maintaining patent airway. Keep available emergency respiratory support (endotracheal equipment, ventilator, oxygen, atropine, edrophonium, neostigmine, and epinephrine).
▼ Give sedatives or general anesthetics before neuromuscular blockers, which don't reduce consciousness or alter pain threshold.
▼ Drug usually is given by rapid I.V. bolus injection but may be given by intermittent infusion or continuous infusion.
▼ Don't give by I.M. injection.
▼ At concentrations of 0.2 mg/ml to 0.5 mg/ml, drug is compatible in $D_5W$, normal saline solution for injection, or dextrose 5% in normal saline solution for injection for 24 hours (at room temperature or refrigerated).
▼ Stable if undiluted for 6 weeks.
▼ Store in refrigerator. Don't freeze. Once removed from refrigeration, use within 14 days, even if re-refrigerated.
▼ **Incompatibilities:** Alkaline solutions (such as barbiturates), lactated Ringer's solution.

## ACTION

Prevents acetylcholine from binding to receptors on motor end plate, thus blocking neuromuscular transmission.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 2 min | 3–5 min | 35–70 min |

*Half-life:* 20 minutes.

## ADVERSE REACTIONS

**CV:** ***bradycardia,*** hypotension, tachycardia.
**Respiratory:** ***prolonged, dose-related apnea, bronchospasm, laryngospasm,*** wheezing, increased bronchial secretions, dyspnea.
**Skin:** *skin flushing*, erythema, pruritus, urticaria, rash.
**Other:** ***anaphylaxis.***

## INTERACTIONS

**Drug-drug.** *Amikacin, gentamicin, neomycin, streptomycin, tobramycin:* May increase the effects of nondepolarizing muscle relaxant including prolonged respiratory depression. Use together cautiously. May reduce nondepolarizing muscle relaxant dose.
*Carbamazepine, phenytoin, theophylline:* May reverse, or cause resistance to, neuromuscular blockade. May need to increase atracurium dose.
*Clindamycin, general anesthetics (enflurane, halothane, isoflurane), kanamycin, polymyxin antibiotics (colistin, polymyxin B sulfate), procainamide, quinidine, quinine, thiazide and loop diuretics, trimethaphan, verapamil:* May enhance neuromuscular blockade, increasing skeletal muscle relaxation and prolonging effect of atracurium. Use together cautiously during and after surgery.
*Corticosteroids:* May cause prolonged weakness. Monitor patient closely.
*Edrophonium, neostigmine, pyridostigmine:* May inhibit drug and reverse neuromuscular block. Monitor patient closely.
*Lithium, magnesium salts, opioid analgesics:* May enhance neuromuscular blockade, increasing skeletal muscle relaxation and possibly causing respiratory paralysis. Reduce atracurium dosage.
*Succinylcholine:* May cause quicker onset of atracurium; may increase depth of neuromuscular blockade. Monitor patient.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug.
● Use cautiously in elderly or debilitated patients and in those with CV disease; severe electrolyte disorder; bronchogenic carcinoma; hepatic, renal, or pulmonary impairment; neuromuscular disease; or myasthenia gravis.
⚠ ***Overdose S&S:*** Hypotension, prolonged neuromuscular blockade.

## NURSING CONSIDERATIONS

● Dosage depends on anesthetic used, individual needs, and response. Recommended dosages must be individually adjusted.
● Resistance may develop in burn patients; increase dosage if needed.
● Give analgesics for pain. Patient may have pain but may be unable to express it.

- Once spontaneous recovery starts, reverse atracurium-induced neuromuscular blockade with an anticholinesterase (such as neostigmine or edrophonium), usually given with an anticholinergic such as atropine. Complete reversal of neuromuscular blockade is usually achieved within 8 to 10 minutes after using an anticholinesterase.
- Monitor respirations and vital signs closely until patient has fully recovered from neuromuscular blockade, as indicated by tests of muscle strength (hand grip, head lift, and ability to cough).
- A nerve stimulator and train-of-four monitoring are recommended to confirm antagonism of neuromuscular blockade and recovery of muscle strength. Make sure spontaneous recovery is evident before attempting reversal with neostigmine.
- Prior use of succinylcholine doesn't prolong duration of action but quickens onset and may deepen neuromuscular blockade.
- Drug contains benzyl alcohol as a preservative.

***Alert:*** Careful dosage calculation is essential. Always verify dosage with another health care professional.

## PATIENT TEACHING

- Explain all events and procedures to patient because he can still hear.

**SAFETY ALERT!**

# atropine sulfate

AT-troe-peen

AtroPen, Sal-Tropine

*Therapeutic class:* Antiarrhythmic
*Pharmacologic class:* Anticholinergic, belladonna alkaloid
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 0.05 mg/ml, 0.1 mg/ml, 0.3 mg/ml, 0.4 mg/ml, 0.5 mg/ml, 0.8 mg/ml, 1 mg/ml
*Prefilled auto-injectors:* 0.5 mg, 1 mg, 2 mg
*Tablets:* 0.4 mg

## INDICATIONS & DOSAGES

➤ **Symptomatic bradycardia, bradyarrhythmia (junctional or escape rhythm)**

*Adults:* Usually 0.5 to 1 mg I.V. push, repeated every 3 to 5 minutes to maximum of 3 mg.
*Children and adolescents:* 0.02 mg/kg I.V., with minimum dose of 0.1 mg and maximum single dose of 0.5 mg in children or 1 mg in adolescents. May repeat dose at 5-minute intervals to a maximum total dose of 1 mg in children or 2 mg in adolescents.

➤ **Antidote for anticholinesterase-insecticide poisoning**

*Adults:* Initially, 1 to 2 mg I.V.; may repeat with 2 mg I.M. or I.V. every 5 to 60 minutes until muscarinic signs and symptoms disappear or signs of atropine toxicity appear. Severe poisoning may require up to 6 mg hourly.
*Children:* 0.05 mg/kg I.V. or I.M. repeated every 10 to 30 minutes until muscarinic signs and symptoms disappear (may be repeated if they reappear) or until atropine toxicity occurs.

➤ **Preoperatively to diminish secretions and block cardiac vagal reflexes**

*Adults and children who weigh 20 kg (44 lb) or more:* 0.4 to 0.6 mg I.V., I.M., or subcutaneously 30 to 60 minutes before anesthesia.
*Children who weigh less than 20 kg:* 0.01 mg/kg I.V., I.M., or subcutaneously up to maximum dose of 0.4 mg 30 to 60 minutes before anesthesia. May repeat every 4 to 6 hours p.r.n.
*Infants who weigh more than 5 kg (11 lb):* 0.03 mg/kg every 4 to 6 hours p.r.n.
*Infants who weigh 5 kg or less:* 0.04 mg/kg every 4 to 6 hours p.r.n.

➤ **Adjunct treatment of peptic ulcer disease; functional GI disorders such as irritable bowel syndrome; salivation and bronchial secretion reduction; CNS conditions such as parkinsonism; ureteral and biliary colic**

*Adults:* 0.4 to 0.6 mg P.O. every 4 to 6 hours p.r.n.
*Children:* 0.01 mg/kg P.O. not to exceed 0.4 mg P.O every 4 to 6 hours p.r.n.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.

**I.V.**

▼ Give into a large vein or into I.V. tubing over at least 1 minute.

▼ Slow delivery may cause slowing of the heart rate.

▼ **Incompatibilities:** Alkalies, bromides, iodides, isoproterenol, methohexital, norepinephrine, pentobarbital sodium, sodium bicarbonate.

**I.M.**

- Document administration site.

**Subcutaneous**

- Auto-injection may be given through clothing.
- Firmly jab tip into outer thigh at 90-degree angle.
- Hold auto-injector in place for at least 10 seconds to allow time for complete administration.
- Make sure needle is visible after removing auto-injector. If needle didn't engage, repeat injection, jabbing more firmly.
- Massage injection site for several seconds after removing auto-injector.
- In very thin or young patients, pinch the skin on the thigh together before injection.

## ACTION

Inhibits acetylcholine at parasympathetic neuroeffector junction, blocking vagal effects on SA and AV nodes, enhancing conduction through AV node and increasing heart rate.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30–120 min | 1–2 hr | 4 hr |
| I.V. | Immediate | 2–4 min | 4 hr |
| I.M. | 5–40 min | 20–60 min | 4 hr |
| Subcut. | Unknown | Unknown | Unknown |

*Half-life:* Initial, 2 hours; second phase, 12½ hours.

## ADVERSE REACTIONS

**CNS:** *headache, restlessness, insomnia, dizziness,* ataxia, disorientation, hallucinations, delirium, excitement, agitation, confusion.

**CV:** ***bradycardia,*** palpitations, tachycardia.

**EENT:** *blurred vision, mydriasis,* photophobia, cycloplegia, increased intraocular pressure.

**GI:** *dry mouth, constipation,* thirst, nausea, vomiting.

**GU:** urine retention, impotence.

**Other:** ***anaphylaxis.***

## INTERACTIONS

**Drug-drug.** *Antacids:* May decrease absorption of oral anticholinergics. Separate doses by at least 1 hour.

*Anticholinergics, drugs with anticholinergic effects (amantadine, antiarrhythmics, antiparkinsonians, glutethimide, meperidine, phenothiazines, tricyclic antidepressants):* May increase anticholinergic effects. Use together cautiously.

*Ketoconazole, levodopa:* May decrease absorption of these drugs. Separate doses by at least 2 hours, and monitor patient for clinical effect.

*Potassium chloride wax-matrix tablets:* May increase risk of mucosal lesions. Use together cautiously.

**Drug-herb.** *Jaborandi tree, pill-bearing spurge:* May decrease effectiveness of drug. Discourage use together.

*Jimsonweed:* May adversely affect CV function. Discourage use together.

*Squaw vine:* Tannic acid may decrease metabolic breakdown of drug. Monitor patient.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Contraindicated in those with acute angle-closure glaucoma, obstructive uropathy, obstructive disease of GI tract, paralytic ileus, toxic megacolon, intestinal atony, unstable CV status in acute hemorrhage, tachycardia, myocardial ischemia, asthma, or myasthenia gravis.
- Use cautiously in patients with Down syndrome because they may be more sensitive to drug.

⚠ ***Overdose S&S:*** Delirium, seizures, coma, tachycardia, fever, mydriasis, decreased

salivation and sweating, urine retention, hypertension, vasodilation, hyperthermia.

## NURSING CONSIDERATIONS

- In adults, avoid doses less than 0.5 mg because of risk of paradoxical bradycardia.
- ***Alert:*** Watch for tachycardia in cardiac patients because it may lead to ventricular fibrillation.
- Many adverse reactions (such as dry mouth and constipation) vary with dose.
- Monitor fluid intake and urine output. Drug causes urine retention and urinary hesitancy.

## PATIENT TEACHING

- Teach patient receiving oral form of drug how to handle distressing anticholinergic effects such as dry mouth.
- Instruct patient to report serious or persistent adverse reactions promptly.
- Tell patient about potential for sensitivity of the eyes to the sun and suggest use of sunglasses.

# auranofin

or-RAIN-oh-fin

Ridaura

*Therapeutic class:* Antiarthritic
*Pharmacologic class:* Gold compound
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 3 mg

## INDICATIONS & DOSAGES

➤ **Rheumatoid arthritis**

*Adults:* 3 mg P.O. b.i.d. or 6 mg P.O. once daily. After 6 months, may increase to 3 mg P.O. t.i.d. If response is inadequate after 3 months of 9 mg/day, stop use.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.

## ACTION

Probably acts by inhibiting sulfhydryl systems, which alters cellular metabolism. May also alter enzyme function and immune response and suppress phagocytic activity.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 hr | Unknown |

*Half-life:* About 26 days.

## ADVERSE REACTIONS

**CNS:** ***seizures,*** confusion, hallucinations.
**EENT:** conjunctivitis.
**GI:** *diarrhea, abdominal pain, nausea, stomatitis,* glossitis, anorexia, metallic taste, dyspepsia, flatulence, constipation, dysgeusia, ulcerative colitis.
**GU:** ***acute renal failure,*** hematuria, nephrotic syndrome, glomerulonephritis.
**Hematologic:** ***aplastic anemia, agranulocytosis, leukopenia,*** *thrombocytopenia,* eosinophilia, anemia.
**Hepatic:** jaundice.
**Skin:** *rash, pruritus, dermatitis,* exfoliative dermatitis, urticaria, erythema, alopecia.

## INTERACTIONS

**Drug-drug.** *Phenytoin:* May increase phenytoin blood levels. Watch for toxicity.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, and AST levels.
- May decrease hemoglobin level and hematocrit.
- May increase eosinophil count.
- May decrease granulocyte, platelet, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with history of severe gold toxicity or toxicity from previous exposure to other heavy metals and in those with necrotizing enterocolitis, pulmonary fibrosis, exfoliative dermatitis, bone marrow aplasia, or severe hematologic disorders.
- Contraindicated in patients with urticaria, eczema, colitis, severe debilitation, hemorrhagic conditions, or systemic lupus erythematosus and in patients who have recently received radiation therapy.
- Manufacturer recommends avoiding use during pregnancy.

• Use cautiously with other drugs that cause blood dyscrasias.
• Use cautiously in patients with rash, history of bone marrow depression, or renal, hepatic, or inflammatory bowel disease.

## NURSING CONSIDERATIONS

**Black Box Warning** Monitor for signs of gold toxicity such as platelet count below 150,000/$mm^3$, fall in hemoglobin granulocyte count less than 1,500/$mm^3$, leukopenia (WBC count less than 4,000/$mm^3$) or eosinophilia over 5%, proteinuria, hematuria, pruritis, rash, stomatitis, or persistent diarrhea. ■

***Alert:*** Monitor patient's urinalysis results monthly. If proteinuria or hematuria is detected, stop drug because it can cause nephrotic syndrome or glomerulonephritis, and notify prescriber.
• Monitor renal and liver function test results.
• Warn women of childbearing potential about risks of drug therapy during pregnancy.

## PATIENT TEACHING

• Encourage patient to take drug as prescribed.
• Tell patient to continue other drug therapies if prescribed.
• Remind patient to see prescriber for monthly platelet counts.
• Suggest that patient have regular urinalysis.
• Tell patient to keep taking drug if mild diarrhea occurs but to immediately report blood in stool. Diarrhea is the most common adverse reaction.
• Advise patient to report rash or other skin problems and to stop drug until reaction subsides. Itching may precede dermatitis; consider itchy skin eruptions during drug therapy to be a reaction until proven otherwise.
• Inform patient that inflammation of the mouth may be preceded by a metallic taste; tell him to notify prescriber if this occurs. Promote careful oral hygiene during therapy.
• Advise patient to report unusual bleeding or bruising.
• Inform patient that beneficial effect may be delayed as long as 3 months. If response is inadequate and maximum dose has been reached, expect prescriber to stop drug.
• Warn patient not to give drug to others. Auranofin is prescribed only for selected patients with rheumatoid arthritis.

**SAFETY ALERT!**

# azacitidine

az-uh-SIT-uh-deen

Vidaza

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Pyrimidine nucleoside analog
*Pregnancy risk category D*

## AVAILABLE FORMS

*Powder for injection:* 100-mg vials

## INDICATIONS & DOSAGES

➤ **Myelodysplastic syndrome, including refractory anemia, refractory anemia with ringed sideroblasts (if patient has neutropenia or thrombocytopenia, or needs transfusions), refractory anemia with excess blasts, refractory anemia with excess blasts in transformation, or chronic myelomonocytic leukemia**

*Adults:* Initially, 75 mg/$m^2$ subcutaneously or I.V. daily for 7 days; repeat cycle every 4 weeks. May increase to 100 mg/$m^2$ if no response after two treatment cycles and nausea and vomiting are the only toxic reactions. Four to six treatment cycles are recommended.

***Adjust-a-dose:*** If bicarbonate level is less than 20 mEq/L, reduce next dose by 50%. If BUN or creatinine levels rise during treatment, delay the next cycle until they are normal; then give 50% of previous dose.

For patients with baseline WBC greater than or equal to $3 \times 10^9$/L, absolute neutrophil count (ANC) greater than or equal to $1.5 \times 10^9$/L, and platelets greater than or equal to $75 \times 10^9$/L, adjust the dose based on nadir counts as follows: If ANC is less than $0.5 \times 10^9$/L and platelets are less than $25 \times 10^9$/L, give 50% of dose. If ANC is 0.5 to $1.5 \times 10^9$/L and platelets are

25 to 50 × $10^9$/L, give 67% of dose. Adjust further dosages during therapy based on hematologic or renal toxicities.

## ADMINISTRATION

**I.V.**

▼ Reconstitute drug with 10 ml of sterile water for injection.
▼ Vigorously shake or roll the vial until powder is dissolved. The resulting solution will be 10 mg/ml.
▼ Use only clear solution.
▼ Withdraw proper dose and mix in a total volume of 50 to 100 ml of normal saline solution or lactated Ringer's solution.
▼ Give the infusion over 10 to 40 minutes. Infusion must be completed within 1 hour of reconstitution.
▼ **Incompatibilities:** Dextrose 5%, hespan, bicarbonate.

**Subcutaneous**

● Dilute using aseptic and hazardous substances techniques.
● Reconstitute with 4 ml sterile water for injection. Invert vial two to three times and gently rotate until a uniform suspension forms. The resulting cloudy suspension will be 25 mg/ml.
● Draw up suspension into syringes for injection (no more than 4 ml per syringe).
● Just before giving drug, resuspend drug by inverting the syringe two to three times and gently rolling between palms for 30 seconds. Divide doses greater than 4 ml into two syringes and inject into two separate sites.
● Give new injections at least 1 inch from previous site, and never into tender, bruised, red, or hardened skin.
● Reconstituted drug is stable 1 hour at room temperature and 8 hours refrigerated (36° to 46° F [2° to 8° C]). After refrigeration, suspension may be allowed to warm for 30 minutes at room temperature.

## ACTION

Causes hypomethylation of DNA and is toxic to abnormal hematopoietic cells in bone marrow. Hypomethylation may restore normal function to genes needed for proliferation and differentiation. Drug has little effect on nonproliferating cells.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |
| Subcut. | Unknown | 30 min | Unknown |

*Half-life:* About 40 minutes after subcutaneous injection; unknown after I.V.

## ADVERSE REACTIONS

**CNS:** *anxiety, depression, dizziness, fatigue, headache, insomnia, malaise, pain, weakness,* hypoesthesia, lethargy, syncope.
**CV:** *cardiac murmur, chest pain, edema,* hypotension, peripheral swelling, tachycardia.
**EENT:** *epistaxis, nasopharyngitis, pharyngitis, rhinorrhea,* nasal congestion, postnasal drip, sinusitis.
**GI:** *abdominal pain and tenderness, anorexia, constipation, decreased appetite, diarrhea, nausea, vomiting,* abdominal distention, dyspepsia, dysphagia, gingival bleeding, hemorrhoids, loose stools, mouth hemorrhage, oral mucosal petechiae, stomatitis, tongue ulceration.
**GU:** dysuria, UTI.
**Hematologic:** *anemia,* **FEBRILE NEUTROPENIA, LEUKOPENIA, NEUTROPENIA, THROMBOCYTOPENIA,** hematoma, postprocedural hemorrhage.
**Metabolic:** *decreased weight.*
**Musculoskeletal:** *arthralgia, back pain, limb pain, myalgia,* muscle cramps.
**Respiratory:** *atelectasis, cough, crackles, dyspnea, rales, rhonchi, pneumonia, upper respiratory tract infection,* pleural effusion, wheezing.
**Skin:** *bruising, contusion, ecchymosis, erythema, increased sweating, injection site reaction, pain, pallor, petechiae, pitting edema, rash, skin lesion,* cellulitis, dry skin, granuloma, night sweats, pigmentation, pruritus at injection site, skin nodules, swelling at injection site, urticaria.
**Other:** *pyrexia, rigors,* herpes simplex, lymphadenopathy.

## INTERACTIONS

None reported.

## EFFECTS ON LAB TEST RESULTS

● May increase BUN and creatinine levels. May decrease bicarbonate and potassium levels.
● May decrease neutrophil, platelet, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to azacitidine or mannitol and in patients with advanced malignant hepatic tumors.
- Use cautiously in patients with hepatic and renal disease.

***Overdose S&S:*** Diarrhea, nausea, vomiting.

## NURSING CONSIDERATIONS

- Check liver function test results and creatinine level before therapy starts.
- Obtain CBC before each cycle or more often.
- Premedicate patient for nausea and vomiting.
- Monitor renal function closely in elderly patients and in renally impaired patients receiving drug because renal impairment may increase toxicity.
- Store unreconstituted vials at room temperature (59° to 86° F [15° to 30° C]).

## PATIENT TEACHING

- Inform patient that blood counts may decrease with febrile neutropenia, thrombocytopenia, and anemia.
- Advise men and women to use birth control during therapy.

# azathioprine

ay-za-THYE-oh-preen

Azasan, Imuran

*Therapeutic class:* Immunosuppressant
*Pharmacologic class:* Purine antagonist
*Pregnancy risk category D*

## AVAILABLE FORMS

*Powder for injection:* 100 mg
*Tablets:* 25 mg, 50 mg, 75 mg, 100 mg

## INDICATIONS & DOSAGES

➤ **Immunosuppression in kidney transplantation**

*Adults:* Initially, 3 to 5 mg/kg P.O. or I.V. daily, usually beginning on day of transplantation. Maintained at 1 to 3 mg/kg daily based on patient response and tolerance.

***Adjust-a-dose:*** Give drug in lower doses to patients with oliguria in the posttransplant period and in those with impaired renal function. In patients receiving allopurinol, decrease azathioprine dose to one-fourth to one-third of the usual dose.

➤ **Severe, refractory rheumatoid arthritis**

*Adults:* Initially, 1 mg/kg P.O. as single dose or divided into two doses. Usual dose is 50 to 100 mg. If patient response isn't satisfactory after 6 to 8 weeks, dosage may be increased by 0.5 mg/kg daily to maximum of 2.5 mg/kg daily at 4-week intervals. Maintenance therapy should be at lowest effective dose. Attempt gradual dose reduction once the patient is stable. Reduce dosage by 0.5 mg/kg (about 25 mg daily) every 4 weeks.

➤ **Multiple sclerosis** ♦

*Adults:* 2 to 3 mg/kg P.O. daily alone or with other immunosuppressants.

## ADMINISTRATION

**P.O.**

- Give drug after meals to minimize adverse GI effects.

**I.V.**

- Use only in patients who can't tolerate oral drugs.
- Reconstitute drug in 100-mg vial with 10 ml of sterile water for injection.
- Inspect for particles before use.
- Give by direct I.V. injection, or further dilute in normal saline solution for injection or $D_5W$ solution and infuse over 30 to 60 minutes.
- **Incompatibilities:** None reported.

## ACTION

May alter antibody production and suppress T-cell effects.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.V. | Unknown | 1 to 2 hr | Unknown |

*Half-life:* About 5 hours.

## ADVERSE REACTIONS

**CNS:** fever.
**GI:** *nausea, vomiting,* anorexia, ***pancreatitis,*** steatorrhea, diarrhea, abdominal pain.
**Hematologic:** **LEUKOPENIA,** ***myelosuppression,*** macrocytic anemia, anemia, ***pancytopenia,*** **THROMBOCYTOPENIA,** ***immunosuppression.***

**Hepatic:** ***hepatotoxicity,*** jaundice.
**Musculoskeletal:** arthralgia, myalgia.
**Skin:** rash, alopecia.
**Other:** *infections,* ***increased risk of neoplasia.***

## INTERACTIONS

**Drug-drug.** *ACE inhibitors:* May cause severe leukopenia. Monitor patient closely.
***Allopurinol:*** May impair inactivation of azathioprine. Avoid using if possible; decrease azathioprine to one-third to one-fourth usual dose.
*Co-trimoxazole and other drugs that interfere with myelopoiesis:* May cause severe leukopenia, especially in renal transplant patients. Use cautiously together.
*Cyclosporine:* May decrease cyclosporine level. Monitor cyclosporine level closely.
*Warfarin:* May decrease action of warfarin. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, and bilirubin levels. May decrease hemoglobin and uric acid levels.
- May decrease platelet, RBC, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in pregnant women.
- Use cautiously in patients with hepatic or renal dysfunction.
- Benefits must be weighed against risk when giving to patient with systemic viral infection, such as chickenpox or herpes zoster.
- Patients with rheumatoid arthritis previously treated with alkylating drugs, such as cyclophosphamide, chlorambucil, or melphalan, may be at risk for tumor development if treated with this drug.

***Overdose S&S:*** Nausea, vomiting, diarrhea, abnormal liver function, leukopenia.

## NURSING CONSIDERATIONS

**Black Box Warning** Chronic immunosuppression with this drug increases the risk of neoplasia. Physicians using this drug should be very familiar with its risks.

- To prevent bleeding, avoid all I.M. injections when platelet count is below $100{,}000/mm^3$.
- Monitor CBC and platelet counts weekly for 1 month and then twice monthly. Notify prescriber if counts drop suddenly or become dangerously low. Drug may need to be temporarily withheld.
- Watch for early signs and symptoms of hepatotoxicity (such as clay-colored stools, dark urine, pruritus, and yellow skin and sclera) and for increased alkaline phosphatase, bilirubin, AST, and ALT levels.
- Therapeutic response usually occurs within 8 weeks. Patients not improved after 12 weeks can be considered refractory to treatment.
- ***Look alike–sound alike:*** Don't confuse azathioprine with Azulfidine. Don't confuse Imuran with Inderal.

## PATIENT TEACHING

- Warn patient to report even mild infections (colds, fever, sore throat, malaise), because drug is a potent immunosuppressant.
- Instruct patient to avoid conception during therapy and for 4 months after therapy stops.
- Warn patient that some hair thinning is possible.
- Tell patient taking drug for refractory rheumatoid arthritis that it may take up to 12 weeks to be effective.
- Advise patient to report unusual bleeding or bruising.
- Tell patient that drug may be taken with food to decrease nausea.
- Advise patient to use soft toothbrush and perform oral care cautiously.

# azelaic acid

aze-eh-LAY-ik

Azelex, Finacea

*Therapeutic class:* Antiacne
*Pharmacologic class:* Dicarboxylic acid
*Pregnancy risk category B*

## AVAILABLE FORMS

*Cream:* 20%
*Gel:* 15%

## INDICATIONS & DOSAGES

➤ **Mild to moderate inflammatory acne vulgaris**

*Adults and children age 12 and older:* Apply thin film of cream (Azelex) and gently but thoroughly massage into affected areas b.i.d., in morning and evening.

➤ **Mild to moderate rosacea**

*Adults:* Apply thin film of gel (Finacea) and gently but thoroughly massage into affected areas b.i.d., in morning and evening.

## ADMINISTRATION

**Topical**

- Wash and pat dry affected areas before applying drug, wear gloves and wash hands well after application.
- Don't apply occlusive dressings or wrappings to affected areas.
- Store drug at 59° to 86° F (15° to 30° C), and protect it from freezing.

## ACTION

May inhibit microbial cellular protein synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* 12 hours.

## ADVERSE REACTIONS

**Skin:** pruritus, *burning, stinging, tingling,* dermatitis, peeling, erythema, edema, acne.
**Other:** allergic reaction.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in pregnant or breast-feeding women.

⚠ ***Overdose S&S:*** Pronounced local irritation.

## NURSING CONSIDERATIONS

- Monitor patient for early signs and symptoms of hypopigmentation, especially patient with dark complexion.
- If sensitivity or severe irritation occurs, notify prescriber, who may stop drug and order appropriate treatment.
- Avoid using occlusive dressings.

## PATIENT TEACHING

- Instruct patient to wash and pat dry affected areas before applying drug and to wash hands well after application. Warn him not to apply occlusive dressings or wrappings to affected areas.
- Warn patient that skin irritation may occur, usually at start of therapy, if drug is applied to broken or inflamed skin, and to notify prescriber if irritation persists.
- Advise patient to keep drug away from mouth, eyes, and other mucous membranes. If contact occurs, tell him to rinse thoroughly with water and to notify prescriber if irritation persists.
- Advise patient to report abnormal changes in skin color.
- Urge patient to use drug for full treatment period. In most patients with inflammatory lesions, improvement occurs in 1 to 2 months.
- Warn patients with rosacea to avoid foods and beverages that may cause flushing, such as spicy foods, hot food or drinks, and alcohol.
- Instruct patient to store drug at 59° to 86° F (15° to 30° C) and protect it from freezing.

## azelastine hydrochloride

ah-ZELL-ass-teen

Optivar

*Therapeutic class:* Antihistamine
*Pharmacologic class:* $H_1$ receptor antagonist
*Pregnancy risk category C*

### AVAILABLE FORMS

*Ophthalmic solution:* 0.05%

### INDICATIONS & DOSAGES

➤ **Pruritus from allergic conjunctivitis**

*Adults and children age 3 and older:* Instill 1 drop into affected eye b.i.d.

### ADMINISTRATION

**Ophthalmic**

- Keep bottle tightly closed when not in use.
- Don't touch tip of dropper to any surface.

### ACTION

Inhibits the release of histamine and other mediators from cells involved in the allergic response.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | 3 min | Unknown | 8 hr |

*Half-life:* 22 hours.

### ADVERSE REACTIONS

**CNS:** *headache,* fatigue.
**EENT:** *bitter taste, transient eye burning or stinging,* conjunctivitis, eye pain, pharyngitis, rhinitis, temporary blurring.
**Respiratory:** ***asthma,*** dyspnea.
**Skin:** pruritus.
**Other:** flulike syndrome.

### INTERACTIONS

None reported.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to any of drug's components.

### NURSING CONSIDERATIONS

- Drug is for ophthalmic use only. Don't inject or give orally.
- Don't use drug for irritation caused by contact lenses.

### PATIENT TEACHING

- Instruct patient not to touch any surface, eyelid, or surrounding areas with tip of dropper.
- Tell patient to keep bottle tightly closed when not in use.
- Advise patient not to wear contact lens if eye is red.
- Warn patient that soft contact lenses may absorb the preservative benzalkonium.
- Instruct patient who wears soft contact lenses and whose eyes aren't red to wait at least 10 minutes after instilling drug before inserting contact lenses.

## azithromycin

ay-zi-thro-MY-sin

Zithromax, Zmax

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Macrolide
*Pregnancy risk category B*

### AVAILABLE FORMS

*Injection:* 500 mg
*Oral suspension (extended-release):* 2 g
*Powder for oral suspension:* 100 mg/5 ml, 200 mg/5 ml; 1,000 mg/packet
*Tablets:* 250 mg, 500 mg, 600 mg

### INDICATIONS & DOSAGES

➤ **Acute bacterial worsening of COPD caused by *Haemophilus influenzae,* *Moraxella catarrhalis,* or *Streptococcus pneumoniae;* uncomplicated skin and skin-structure infections caused by *Staphylococcus aureus, Streptococcus pyogenes,* or *Streptococcus agalactiae;* second-line therapy for pharyngitis or tonsillitis caused by *Staphylococcus pyogenes***

*Adults and adolescents age 16 and older:* Initially, 500 mg P.O. as a single dose on day 1, followed by 250 mg daily on days 2 through 5. Total cumulative dose is 1.5 g.

Or, for worsening COPD, 500 mg P.O. daily for 3 days.

➤ **Community-acquired pneumonia from *Chlamydia pneumoniae, H. influenzae, Mycoplasma pneumoniae,* or *S. pneumoniae;* or caused by *Legionella pneumophila, M. catarrhalis,* or *S. aureus***
*Adults and adolescents age 16 and older:* For mild infections, give 500 mg P.O. as a single dose on day 1; then 250 mg P.O. daily on days 2 through 5. Total dose is 1.5 g. For more severe infections or those caused by *S. aureus*, give 500 mg I.V. as a single daily dose for 2 days; then 500 mg P.O. as a single daily dose to complete a 7- to 10-day course of therapy. Switch from I.V. to P.O. therapy based on patient response.

➤ **Community-acquired pneumonia caused by *C. pneumoniae, H. influenzae, M. pneumoniae, S. pneumoniae***
*Children 6 months and older:* 10 mg/kg oral suspension P.O. (maximum of 500 mg) as a single dose on day 1, followed by 5 mg/kg (maximum of 250 mg) daily on days 2 through 5.

➤ **Single-dose treatment for mild to moderate acute bacterial sinusitis caused by *H. influenzae, M. catarrhalis,* or *S. pneumoniae;* or community-acquired pneumonia caused by *C. pneumoniae, H. influenzae, M. pneumoniae,* or *S. pneumoniae***
*Adults:* 2 g Zmax P.O. as a single dose taken 1 hour before or 2 hours after a meal.

➤ **Acute bacterial sinusitis caused by *H. influenzae, M. catarrhalis,* or *S. pneumoniae***
*Adults:* 500 mg P.O. daily for 3 days.
*Children age 6 months and older:* 10 mg/kg oral suspension P.O. once daily for 3 days.

➤ **Chancroid**
*Adults:* 1 g P.O. as a single dose.

➤ **Nongonococcal urethritis or cervicitis caused by *C. trachomatis***
*Adults and adolescents age 16 and older:* 1 g P.O. as a single dose.

➤ **To prevent disseminated *Mycobacterium avium* complex in patients with advanced HIV infection**
*Adults and adolescents:* 1.2 g P.O. once weekly alone or with rifabutin.
*Infants and children:* 20 mg/kg P.O. (maximum of 1.2 g) weekly or 5 mg/kg (maximum of 250 mg) can be given P.O. daily. Children age 6 and older may also receive 300 mg rifabutin P.O. daily.

➤ ***M. avium* complex in patients with advanced HIV infection**
*Adults:* 600 mg P.O. daily with ethambutol 15 mg/kg daily.

➤ **Urethritis and cervicitis caused by *Neisseria gonorrhoeae***
*Adults:* 2 g P.O. as a single dose.

➤ **Pelvic inflammatory disease caused by *C. trachomatis, N. gonorrhoeae,* or *M. hominis* in patients who need initial I.V. therapy**
*Adults and adolescents age 16 and older:* 500 mg I.V. as a single daily dose for 1 to 2 days; then 250 mg P.O. daily to complete a 7-day course of therapy. Switch from I.V. to P.O. therapy, based on patient response.

➤ **Otitis media**
*Children older than age 6 months:* 30 mg/kg oral suspension P.O. as a single dose; or, 10 mg/kg P.O. once daily for 3 days; or, 10 mg/kg P.O. on day 1 and then 5 mg/kg once daily on days 2 to 5.

➤ **Pharyngitis, tonsillitis**
*Children age 2 and older:* 12 mg/kg oral suspension (maximum 500 mg) P.O. daily for 5 days.

➤ **Traveler's diarrhea ♦**
*Adults:* 1,000 mg P.O. as a single dose.

## ADMINISTRATION

### P.O.

- Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
- Give Zmax 1 hour before or 2 hours after a meal. Tablets and single-dose packets for oral suspension can be taken with or without food. Don't give with antacids.
- Reconstitute suspension packet with 2 ounces (60 ml) water. After taking, rinse glass with additional 2 ounces water and have patient drink it to ensure he has taken entire dose. Packets aren't for children.

### I.V.

▼ Reconstitute drug in 500-mg vial with 4.8 ml of sterile water for injection to yield 100 mg/ml.
▼ Shake well until all drug is dissolved.
▼ Further dilute in 250- or 500-ml normal saline solution, half-normal saline

solution, $D_5W$, or lactated Ringer's solution to yield a final concentration of 1 or 2 mg/ml, respectively.
▼ Infuse a 500-mg dose of azithromycin I.V. over 1 hour or longer. Never give it as a bolus or I.M. injection.
▼ Reconstituted solution and diluted solution are stable for 24 hours when stored below 86° F (30° C). Diluted solution is stable for 7 days when refrigerated at 41° F (5° C).
▼ **Incompatibilities:** Amikacin sulfate, aztreonam, cefotaxime, ceftazidime, ceftriaxone sodium, cefuroxime, ciprofloxacin, clindamycin phosphate, famotidine, fentanyl citrate, furosemide, gentamicin sulfate, imipenem and cilastatin sodium, ketorolac tromethamine, levofloxacin, morphine sulfate, ondansetron hydrochloride, piperacillin and tazobactam sodium, potassium chloride, ticarcillin disodium and clavulanate potassium, tobramycin sulfate.

## ACTION

Binds to the 50S subunit of bacterial ribosomes, blocking protein synthesis; bacteriostatic or bactericidal, depending on concentration.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–5 hr | Unknown |
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* About 3 days.

## ADVERSE REACTIONS

**CNS:** fatigue, headache, somnolence.
**CV:** chest pain, palpitations.
**GI:** *abdominal pain*, anorexia, *diarrhea, nausea, vomiting,* ***pseudomembranous colitis,*** dyspepsia, flatulence, melena.
**GU:** candidiasis, nephritis, vaginitis.
**Hepatic:** cholestatic jaundice.
**Skin:** photosensitivity reactions, rash, pain at injection site, pruritus.
**Other:** ***angioedema.***

## INTERACTIONS

**Drug-drug.** *Antacids containing aluminum and magnesium:* May lower peak azithromycin level (immediate-release form). Separate doses by at least 2 hours.
*Antiarrhythmics (amiodarone, quinidine):* May increase risk of life-threatening arrhythmias, including torsades de pointes. Monitor ECG rhythm carefully.
*Carbamazepine, phenytoin:* May increase levels of these drugs. Monitor drug levels.
*Cyclosporine:* May elevate cyclosporine concentrations with increased risk of nephrotoxicity and neurotoxicity. Monitor cyclosporine levels and renal function.
*Digoxin:* May increase digoxin level. Monitor digoxin level.
*Ergotamine:* May cause acute ergotamine toxicity. Monitor patient closely.
*HMG-CoA reductase inhibitors (atorvastatin, lovastatin):* May increase HMG-CoA reductase inhibitor levels, resulting in severe myopathy or rhabdomyolysis. Consider alternative therapy.
*Nelfinavir:* May increase azithromycin level. Monitor for liver enzyme abnormalities and hearing impairment.
*Pimozide:* May prolong QT interval and cause ventricular tachycardia. Concurrent use is contraindicated.
*Theophylline:* May increase theophylline level. Monitor theophylline level carefully.
*Triazolam:* May decrease triazolam clearance. Monitor patient closely.
*Warfarin:* May increase INR. Monitor INR carefully.
**Drug-food.** *Any food:* May decrease absorption of multidose oral suspension form. Advise patient to take drug on empty stomach.
**Drug-lifestyle.** *Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

● May increase ALT, AST, creatinine, LDH, and bilirubin levels.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to erythromycin or other macrolide or ketolide antibiotics.
● Use cautiously in patients with impaired hepatic function.

## NURSING CONSIDERATIONS

- Monitor patient for superinfection. Drug may cause overgrowth of nonsusceptible bacteria or fungi.
- If patient vomits within 60 minutes of taking Zmax, notify prescriber; additional or different therapy may be needed.

## PATIENT TEACHING

- Tell patient to take drug as prescribed, even after he feels better.
- Advise patient to avoid excessive sunlight and to wear protective clothing and use sunscreen when outside.
- Tell patient to report adverse reactions promptly.

# aztreonam

AZ-tree-oh-nam

Azactam, Cayston

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Monobactam
*Pregnancy risk category B*

## AVAILABLE FORMS

*Inhalation:* 75-mg ampule
*Injection:* 500-mg vials, 1-g vials, 2-g vials

## INDICATIONS & DOSAGES

➤ **UTI; septicemia; infections of lower respiratory tract, skin, and skin structures; intra-abdominal infections, surgical infections, and gynecologic infections caused by susceptible *Escherichia coli, Klebsiella pneumoniae, Proteus mirabilis, Pseudomonas aeruginosa, Enterobacter cloacae, K. oxytoca, Citrobacter* species, and *Serratia marcescens;* respiratory infections caused by *Haemophilus influenzae***

*Adults:* 500 mg to 2 g I.V. or I.M. every 8 to 12 hours. For severe systemic or life-threatening infections, 2 g every 6 to 8 hours. Maximum dose is 8 g daily.
*Children ages 9 months to 15 years:* 30 mg/kg every 6 to 8 hours I.V. Maximum dose is 120 mg/kg/day.
***Adjust-a-dose:*** For adults with a creatinine clearance of 10 to 30 ml/minute, give 1 to 2 g; then give 50% of the usual dose at usual interval. If clearance is less than 10 ml/minute, give 500 mg to 2 g; then give 25% of the usual dose at usual interval. For serious infections, add 12½% of the initial dose to maintenance doses after each hemodialysis session. For adults with alcoholic cirrhosis, decrease dose by 20% to 25%.

✶ ***NEW INDICATION:*** **To improve respiratory symptoms in cystic fibrosis patients with *Pseudomonas aeruginosa* infection**

*Adults and children age 7 and older:* 75 mg inhalation three times a day for 28 days, followed by 28 days off.

## ADMINISTRATION

### Inhalation

- Give bronchodilator before administering aztreonam.
- Give short-acting bronchodilators 15 minutes to 4 hours before each dose or long-acting bronchodilators 30 minutes to 12 hours before each dose.
- Space doses at least 4 hours apart.
- Treatment order for patients on multiple therapies is bronchodilator, mucolytics, then aztreonam.
- Don't reconstitute until ready to give dose.
- Add one ampule of diluent to one amber glass vial of aztreonam. Replace rubber stopper on vial and gently swirl until contents have completely dissolved. Administer immediately.
- Don't use diluent or reconstituted drug if it's cloudy or if there are particles in the solution.
- Use only Altera Nebulizer System to administer drug.
- Never mix with other drugs in nebulizer.
- Administration usually takes 2 to 3 minutes.

### I.V.

▼ Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
▼ For direct injection, reconstitute with 6 to 10 ml of sterile water for injection and immediately shake vial vigorously. Constituted solutions aren't for multiple-dose use. Discard unused solution.
▼ To give a bolus, inject drug over 3 to 5 minutes, directly into I.V. tubing.

▼ For infusion, reconstitute with a compatible I.V. solution to yield 20 mg/ml or less.
▼ Give infusions over 20 minutes to 1 hour.
▼ Give thawed solutions only by I.V. infusion.
▼ **Incompatibilities:** Acyclovir, amphotericin B, ampicillin sodium, azithromycin, chlorpromazine, daunorubicin, ganciclovir, lorazepam, metronidazole, mitomycin, mitoxantrone, nafcillin, prochlorperazine, streptozocin, vancomycin.

**I.M.**
• To prepare I.M. injection, add at least 3 ml of one of the following solutions per gram of aztreonam: sterile water for injection, bacteriostatic water for injection, normal saline solution, or bacteriostatic normal saline solution.
• Give I.M. injections deep into a large muscle, such as the upper outer quadrant of the gluteus maximus or the side of the thigh. Give doses more than 1 g by I.V. route.
***Alert:*** Don't give I.M. injection to children.
• Pain and swelling may occur at injection site.

## ACTION
Inhibits bacterial cell-wall synthesis, ultimately causing cell-wall destruction; bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Immediate | Unknown |
| I.M. | Unknown | <1 hr | Unknown |
| Inhalation | Unknown | 1 hr | Unknown |

*Half-life:* 2 hours.

## ADVERSE REACTIONS
**CNS:** ***seizures,*** confusion, headache, insomnia, *pyrexia*.
**CV:** hypotension, thrombophlebitis, chest discomfort.
**GI:** ***pseudomembranous colitis,*** diarrhea, abdominal pain, nausea, vomiting.
**Hematologic:** ***neutropenia, pancytopenia, thrombocytopenia,*** anemia, leukocytosis, thrombocytosis.
**Respiratory:** bronchospasm, *cough, nasal congestion, sore throat*.
**Skin:** discomfort and swelling at I.M. injection site, rash.
**Other:** hypersensitivity reactions.

## INTERACTIONS
**Drug-drug.** *Aminoglycosides:* May have synergistic nephrotoxic effects. Monitor renal function.
*Cefoxitin, imipenem:* May have antagonistic effect. Avoid using together.
*Furosemide:* May increase aztreonam level. Avoid using together.
*Probenecid:* May increase aztreonam level. Avoid using together.

## EFFECTS ON LAB TEST RESULTS
• May increase ALT, AST, BUN, creatinine, and LDH levels. May decrease hemoglobin level.
• May increase PT, PTT, and INR. May decrease neutrophil and RBC counts. May increase or decrease platelet and WBC counts.
• May cause false-positive Coombs' test result. May alter urine glucose determinations using cupric sulfate (Clinitest or Benedict reagent).

## CONTRAINDICATIONS & CAUTIONS
• Contraindicated in patients hypersensitive to drug or any of its components.
• Use cautiously in elderly patients and in those with impaired renal or hepatic function. Dosage adjustment may be needed. Monitor renal function test results.
• Use during pregnancy only if clearly needed. Because aztreonam is excreted in breast milk, consider advising breast-feeding women to temporarily discontinue breast-feeding.

## NURSING CONSIDERATIONS
• Observe patient for signs and symptoms of superinfection.
***Alert:*** Because drug is ineffective against gram-positive and anaerobic organisms, combine it with other antibiotics for immediate treatment of life-threatening illnesses.
***Alert:*** Patients allergic to penicillins or cephalosporins may not be allergic to this drug. Monitor closely those who have had an immediate hypersensitivity reaction to these antibiotics, especially to ceftazidime.
• Antibiotics may promote overgrowth of nonsusceptible organisms. Monitor patient for signs of superinfection.

• Dosage of Cayston isn't based on weight or adjusted for age.

### PATIENT TEACHING

• Warn patient receiving I.M. drug that pain and swelling may occur at injection site.
• Tell patient to report discomfort at I.V. insertion site.
• Instruct patient to report adverse reactions and signs and symptoms of superinfection promptly.
• Instruct patient or caregiver in proper administration of drug by nebulizer.
• Teach patient or caregiver to use bronchodilator before using Cayston.

## baclofen

BAK-loe-fen

Lioresal Intrathecal

*Therapeutic class:* Skeletal muscle relaxant
*Pharmacologic class:* Gamma-aminobutyric acid (GABA) derivative
*Pregnancy risk category C*

### AVAILABLE FORMS

*Intrathecal injection:* 50 mcg/ml, 500 mcg/ml, 2,000 mcg/ml
*Tablets:* 10 mg, 20 mg

### INDICATIONS & DOSAGES

➤ **Spasticity in multiple sclerosis; spinal cord injury**

*Adults and children age 12 and older:* Initially, 5 mg P.O. t.i.d. for 3 days; then 10 mg t.i.d. for 3 days, 15 mg t.i.d. for 3 days, 20 mg t.i.d. for 3 days. Increase daily dosage, based on response, to maximum of 80 mg.

***Adjust-a-dose:*** For patients with psychiatric or brain disorders and for elderly patients, increase dose gradually.

➤ **To manage severe spasticity in patients who don't respond to or can't tolerate oral baclofen therapy**

*Adults:* For screening phase, after test dose to check responsiveness, give drug via implantable infusion pump. Give test dose of 1 ml of 50-mcg/ml dilution into intrathecal space by barbotage over 1 minute or longer. Significantly decreased severity or frequency of muscle spasm or reduced muscle tone should appear within 4 to 8 hours. If response is inadequate, give second test dose of 75 mcg/1.5 ml 24 hours after the first. If response is still inadequate, give final test dose of 100 mcg/2 ml after 24 hours. Patients unresponsive to the 100-mcg dose shouldn't be considered candidates for implantable pump.

*Children:* Initial test dose is the same as that of adults (50 mcg); for very small children, initial dose is 25 mcg.

*For maintenance therapy:* Adjust first dose based on screening dose that elicited an adequate response. Double this effective dose and give over 24 hours. However, if screening dose effectiveness was maintained for 12 hours or longer, don't double the dose. After the first 24 hours, increase dose slowly as needed and tolerated by 10% to 30% increments at 24-hour intervals in spasticity of spinal cord origin. In children with spasticity of spinal cord origin and adults and children with spasticity of cerebral origin, increase by 5% to 15% increments at 24-hour intervals. During prolonged maintenance therapy, increase daily dose by 10% to 40% in spasticity of spinal cord origin, or increase daily dose by 5% to 15% in spasticity of cerebral origin, if needed; if patient experiences adverse effects, decrease dose by 10% to 20%. Maintenance dosages range from 12 mcg to 2,000 mcg daily, but experience with dosages of more than 1,000 mcg daily is limited. Most patients need 300 mcg to 800 mcg daily.

***Adjust-a-dose:*** For patients with impaired renal function, decrease oral and intrathecal doses.

➤ **Hiccups that are intractable and unresponsive to other therapies**

*Adults:* Initially, 5 to 10 mg P.O. t.i.d. Higher doses (up to 30 mg P.O. t.i.d.) may be needed.

### ADMINISTRATION

**P.O.**

• Give drug with meals or milk to prevent GI distress.

**Intratracheal**

• Do not discontinue abruptly. This can result in high fever, altered mental status,

exaggerated rebound spasticity, and muscle rigidity, which in rare cases, has led to rhabdomyolysis, multiple-organ-system failure, and death.
- Don't give intrathecal injection by I.V., I.M., subcutaneous, or epidural route.
- If patient suddenly requires a large intrathecal dose increase, check for a catheter complication, such as kinking or dislodgment.
- With long-term intrathecal use, about 5% of patients may develop tolerance to drug. In some cases, this may be treated by hospitalizing patient and slowly withdrawing drug over a 2-week period.

## ACTION

Hyperpolarizes fibers to reduce impulse transmission. Appears to reduce transmission of impulses from the spinal cord to skeletal muscle, thus decreasing the frequency and amplitude of muscle spasms in patients with spinal cord lesions.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–3 hr | Unknown |
| Intrathecal | 30 min–1 hr | 4 hr | 4–8 hr |

*Half-life:* 2½ to 4 hours.

## ADVERSE REACTIONS

**CNS:** *drowsiness*, *dizziness*, headache, *weakness*, fatigue, hypotonia, *confusion*, insomnia, ***seizures with intrathecal use.***
**CV:** hypotension.
**EENT:** nasal congestion.
**GI:** *nausea*, constipation.
**GU:** urinary frequency.
**Metabolic:** hyperglycemia, weight gain.
**Musculoskeletal:** muscle rigidity or spasticity, ***rhabdomyolysis,*** muscle weakness.
**Respiratory:** dyspnea.
**Skin:** rash, pruritus, excessive sweating.
**Other:** ***multiple organ-system failure.***

## INTERACTIONS

**Drug-drug.** *CNS depressants:* May increase CNS depression. Avoid using together.
**Drug-lifestyle.** *Alcohol use:* May increase CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, AST, CK, and glucose levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with impaired renal function or seizure disorder or when spasticity is used to maintain motor function.

***Overdose S&S:*** Coma, dizziness, lightheadedness, diminished reflexes, vomiting, hypotonia, increased salivation, drowsiness, vision changes, respiratory depression, seizures.

## NURSING CONSIDERATIONS

***Alert:*** Don't use oral drug to treat muscle spasm caused by rheumatic disorders, cerebral palsy, Parkinson disease, or stroke because drug's effectiveness for these indications hasn't been established.
- Watch for sensitivity reactions, such as fever, skin eruptions, and respiratory distress.
- Expect an increased risk of seizures in patients with seizure disorder.
- The amount of relief determines whether dosage (and drowsiness) can be reduced.
- Don't withdraw drug abruptly after long-term use unless severe adverse reactions demand it; doing so may precipitate seizures, hallucinations, or rebound spasticity.
- ***Look alike–sound alike:*** Don't confuse baclofen with Bactroban.

## PATIENT TEACHING

- Instruct patient to take oral form with meals or milk.
- Tell patient to avoid activities that require alertness until CNS effects of drug are known. Drowsiness usually is transient.
- Tell patient to avoid alcohol and OTC antihistamines while taking drug.
- Advise patient to follow prescriber's orders regarding rest and physical therapy.

# basiliximab

ba-sil-IK-si-mab

Simulect

*Therapeutic class:* Immunosuppressant
*Pharmacologic class:* Monoclonal antibody
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 10-mg, 20-mg vials

## INDICATIONS & DOSAGES

➤ **To prevent acute organ rejection in patients receiving renal transplantation when used as part of an immunosuppressive regimen that includes cyclosporine and corticosteroids**

*Adults and children weighing 35 kg (77 lb) or more:* 20 mg I.V. given within 2 hours before transplant surgery and 20 mg I.V. given 4 days after transplantation.

*Children weighing less than 35 kg:* 10 mg I.V. given within 2 hours before transplant surgery and 10 mg I.V. given 4 days after transplantation.

## ADMINISTRATION

**I.V.**

▼ Reconstitute 10-mg vial with 2.5 ml sterile water for injection. Reconstitute 20-mg vial with 5-ml sterile water for injection. Shake gently to dissolve powder.

▼ Use reconstituted solution immediately.

▼ Dilute reconstituted solution to 25 ml (10-mg vial) or 50 ml (20-mg vial) with normal saline solution or $D_5W$ for infusion.

▼ When mixing solution, invert bag gently to avoid foaming. Don't shake.

▼ Infuse over 20 to 30 minutes.

▼ Drug may be given as a bolus injection, but doing so may cause nausea, vomiting, pain, and local reactions.

▼ Reconstituted solution may be refrigerated at 36° to 46° F (2° to 8° C) for up to 24 hours or kept at room temperature for 4 hours.

▼ **Incompatibilities:** Don't add or infuse other drugs simultaneously through same I.V. line.

## ACTION

Binds specifically to and blocks the interleukin (IL)-2 receptor alpha chain on the surface of activated T lymphocytes, inhibiting IL-2–mediated activation of lymphocytes, a critical pathway in the cellular immune response involved in allograft rejection.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Immediate | Unknown |

*Half-life:* About 7¼ days in adults, 9½ days in children, 9 days in adolescents.

## ADVERSE REACTIONS

**CNS:** *fever, headache, insomnia, tremor,* agitation, anxiety, asthenia, depression, dizziness, hypoesthesia, neuropathy, paresthesia, fatigue.

**CV:** *hypertension, leg or peripheral edema,* ***arrhythmias, heart failure,*** angina pectoris, atrial fibrillation, chest pain, abnormal heart sounds, aggravated hypertension, hypotension, tachycardia, generalized edema.

**EENT:** *pharyngitis, rhinitis,* abnormal vision, cataract, conjunctivitis, sinusitis.

**GI:** *abdominal pain, candidiasis, constipation, diarrhea, dyspepsia, nausea, vomiting,* ***GI hemorrhage,*** esophagitis, enlarged abdomen, flatulence, gastroenteritis, GI disorder, gum hyperplasia, melena, ulcerative stomatitis.

**GU:** *UTI,* abnormal renal function, albuminuria, bladder disorder, dysuria, frequent micturition, genital edema, hematuria, increased nonprotein nitrogen, oliguria, ***renal tubular necrosis,*** ureteral disorder, urine retention, impotence.

**Hematologic:** *anemia,* ***hemorrhage, thrombocytopenia,*** hematoma, polycythemia, purpura, thrombosis.

**Metabolic:** *hypercholesterolemia, hyperglycemia, hyperkalemia, hyperuricemia, hypokalemia, hypophosphatemia,* acidosis, dehydration, ***diabetes mellitus,*** fluid overload, hypercalcemia, hyperlipemia, hypertriglyceridemia, hypocalcemia, ***hypomagnesemia,*** hypoproteinemia, weight gain.

**Musculoskeletal:** arthralgia, arthropathy, back pain, bone fracture, cramps, hernia, leg pain, myalgia.

**Respiratory:** *dyspnea, upper respiratory tract infection,* ***bronchospasm, pulmonary edema,*** abnormal chest sounds, bronchitis, cough, pneumonia, pulmonary disorder.
**Skin:** *acne,* cyst, hypertrichosis, pruritus, rash, skin disorder or ulceration.
**Other:** *surgical wound complications, viral infection,* ***hypersensitivity reactions, sepsis,*** accidental trauma, infection, herpes zoster, herpes simplex.

## INTERACTIONS
None significant.

## EFFECTS ON LAB TEST RESULTS
- May increase calcium, cholesterol, glucose, lipid, and uric acid levels. May decrease hemoglobin, magnesium, phosphorus, and protein levels. May increase or decrease potassium level.
- May increase RBC count. May decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug or its components.

**Black Box Warning** Use cautiously and only under supervision of prescriber qualified and experienced in immunosuppressive therapy and organ transplantation.
- Use cautiously in elderly patients.

## NURSING CONSIDERATIONS
- Severe acute hypersensitivity reactions can occur within 24 hours after administration. Make sure drugs for treating hypersensitivity reactions are readily available; withhold second dose if hypersensitivity reactions occur.
- Check for electrolyte imbalances and acidosis during drug therapy.
- Monitor patient's intake and output, vital signs, hemoglobin level, and hematocrit during therapy.
- Be alert for signs and symptoms of opportunistic infections during drug therapy.

## PATIENT TEACHING
- Inform patient of potential benefits of and risks related to immunosuppressive therapy, including decreased risk of graft loss or acute rejection.
- Advise patient that immunosuppressive therapy increases risk of developing infection. Tell him to report signs and symptoms of infection promptly.
- Inform women of childbearing age to use effective contraception before therapy starts and for 4 months after therapy ends.
- Instruct patient to report adverse effects immediately.
- Explain that drug is used with cyclosporine and corticosteroids.

# beclomethasone dipropionate (inhalation)
be-kloe-METH-a-sone

QVAR 40, QVAR 80

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Glucocorticoid
*Pregnancy risk category C*

## AVAILABLE FORMS
*Oral inhalation aerosol:* 40 mcg/metered spray, 80 mcg/metered spray

## INDICATIONS & DOSAGES
➤ **Chronic asthma**
*Adults and children age 12 and older:* Starting dose, 40 to 80 mcg b.i.d. when previously used bronchodilators alone, or 40 to 160 mcg b.i.d. when previously used inhaled corticosteroids. Maximum, 320 mcg b.i.d.
*Children ages 5 to 11:* 40 mcg b.i.d., up to 80 mcg b.i.d.

## ADMINISTRATION
**Inhalational**
- Prime the inhaler before first use by depressing canister twice into the air.
- Allow 1 minute to elapse between inhalations.

## ACTION
May decrease inflammation by decreasing the number and activity of inflammatory cells, inhibiting bronchoconstrictor mechanisms producing direct smooth-muscle relaxation, and decreasing airway hyperresponsiveness.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Inhalation | 1–4 wk | Unknown | Unknown |

*Half-life:* 2.8 hours.

## ADVERSE REACTIONS

**CNS:** *headache.*
**EENT:** *hoarseness, throat irritation,* fungal infection of throat.
**GI:** *fungal infection of mouth,* dry mouth.
**Musculoskeletal:** back pain.
**Respiratory:** cough, pharyngitis, rhinitis, upper respiratory tract infection, exacerbation of asthma, sinusitis, wheezing.
**Other:** ***angioedema,*** facial edema, hypersensitivity reactions, ***adrenal insufficiency,*** suppression of hypothalamic-pituitary-adrenal function.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its ingredients and in those with status asthmaticus, nonasthmatic bronchial diseases, or asthma controlled by bronchodilators or other noncorticosteroids alone.
- Use cautiously, if at all, in patients with tuberculosis, fungal or bacterial infections, ocular herpes simplex, or systemic viral infections.
- Use cautiously in patients receiving systemic corticosteroid therapy.

## NURSING CONSIDERATIONS

- Check mucous membranes frequently for signs and symptoms of fungal infection.
- During times of stress (trauma, surgery, or infection), systemic corticosteroids may be needed to prevent adrenal insufficiency in previously corticosteroid-dependent patients.
- Periodic measurement of growth and development may be needed during high-dose or prolonged therapy in children.

***Alert:*** Taper oral corticosteroid therapy slowly. Acute adrenal insufficiency and death may occur in patients with asthma who change abruptly from oral corticosteroids to beclomethasone.

## PATIENT TEACHING

- Tell patient to prime the inhaler before first use, or after 10 days of not using it, by depressing canister twice into the air.
- Inform patient that drug doesn't relieve acute asthma attacks.
- Tell patient who needs a bronchodilator to use it several minutes before beclomethasone.
- Instruct patient to carry or wear medical identification indicating his need for supplemental systemic corticosteroids during stress.
- Advise patient to allow 1 minute to elapse between inhalations of drug and to hold his breath for a few seconds to enhance drug action.
- Tell patient it may take up to 4 weeks to feel the full benefit of the drug.
- Tell patient to keep inhaler clean by wiping it weekly with a dry tissue or cloth; don't get it wet.
- Advise patient to prevent oral fungal infections by gargling or rinsing his mouth with water after each use. Caution him not to swallow the water.
- Tell patient to report evidence of corticosteroid withdrawal, including fatigue, weakness, arthralgia, orthostatic hypotension, and dyspnea.
- Instruct patient to store drug at 77° F (25° C). Advise patient to ensure delivery of proper dose by gently warming canister to room temperature before using.

# beclomethasone dipropionate (intranasal)

be-kloe-METH-a-sone

Beconase AQ

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Corticosteroid
*Pregnancy risk category C*

## AVAILABLE FORMS

*Nasal spray:* 42 mcg/metered spray

## INDICATIONS & DOSAGES

➤ **To relieve symptoms of seasonal or perennial rhinitis, to prevent nasal polyp recurrence after surgical removal**

*Adults and children 12 years and older:* 1 or 2 sprays in each nostril b.i.d.

*Children ages 6 to 12:* 2 sprays into each nostril b.i.d.

## ADMINISTRATION

**Intranasal**

- Pump nasal spray six times until a fine mist is produced before first use.
- Shake before use; pump once or twice before first use each day.

## ACTION

May reduce nasal inflammation by inhibiting mediators of inflammation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Intranasal | 5–7 days | 3 wk | Unknown |

*Half-life:* 15 hours.

## ADVERSE REACTIONS

**CNS:** headache, light-headedness.

**EENT:** *mild, transient nasal burning and stinging,* dryness, epistaxis, nasal congestion, nasopharyngeal fungal infections, rhinorrhea, sneezing, watery eyes.

**GI:** nausea.

**Metabolic:** growth velocity reduction in children and adolescents.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with untreated localized infection involving the nasal mucosa.
- Not recommended for children less than 6 years.
- Use cautiously, if at all, in patients with active or quiescent respiratory tract tuberculous infections or untreated fungal, bacterial, or systemic viral or ocular herpes simplex infections.
- Use cautiously in patients who have recently had nasal septal ulcers, nasal surgery, or trauma until wound healing occurs.

## NURSING CONSIDERATIONS

- Observe patient for fungal infections.
- Drug isn't effective for acute exacerbations of rhinitis. Decongestants or antihistamines may be needed.
- Stop drug if no significant symptom improvement occurs after 3 weeks.

## PATIENT TEACHING

- Advise patient or parent to read package insert for instructions on drug use.
- Advise patient to pump nasal spray six times until a fine mist is produced before first use. If nasal spray pump hasn't been used for 7 or more days, it should be reprimed.
- To instill, instruct patient to blow nose to clear nasal passages, shake container, tilt head slightly forward, and insert nozzle into nostril, pointing away from septum. Tell him to hold other nostril closed and inhale gently while spraying, hold breath for a few seconds, and exhale through the mouth. Next, have him shake container and repeat in other nostril.
- Tell patient to pump nasal spray once or twice before first use each day. He should clean the cap and nosepiece of the activator in warm water every day, and then allow them to air-dry.
- Advise patient to use drug regularly, as prescribed, because its effectiveness depends on regular use.
- Explain that unlike decongestants, drug doesn't work right away. Most patients notice improvement within a few days, but some may need 2 to 3 weeks.
- Warn patient not to exceed recommended dosage because of risk of hypothalamic-pituitary-adrenal axis suppression.
- Tell patient to notify prescriber if signs and symptoms don't improve within 3 weeks or if nasal irritation persists.
- Teach patient good nasal and oral hygiene.

## benazepril hydrochloride

ben-A-za-pril

Lotensin✐

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* ACE inhibitor
*Pregnancy risk category D*

### AVAILABLE FORMS

*Tablets:* 5 mg, 10 mg, 20 mg, 40 mg

### INDICATIONS & DOSAGES

➤ **Hypertension**

*Adults:* For patients not receiving a diuretic, 10 mg P.O. daily initially. Adjust dosage as needed and tolerated; usually 20 to 40 mg daily in one or two divided doses. For patients receiving a diuretic, 5 mg P.O. daily initially.
*Children age 6 and older:* 0.2 mg/kg (between 0.1 and 0.6 mg/kg) P.O. daily. Adjust as needed up to 0.6 mg/kg (maximum 40 mg) P.O. daily.

➤ **Nephropathy (nondiabetic)** ♦

*Adults:* 10 to 20 mg P.O. daily.
***Adjust-a-dose:*** If creatinine clearance is below 30 ml/minute, give 5 mg P.O. daily. Daily dose may be adjusted up to 40 mg.

### ADMINISTRATION

**P.O.**

● Request oral suspension for patients who can't swallow tablets.

### ACTION

Inhibits ACE, preventing conversion of angiotensin I to angiotensin II, a potent vasoconstrictor. Less angiotensin II decreases peripheral arterial resistance, decreasing aldosterone secretion, which reduces sodium and water retention and lowers blood pressure. Drug also acts as antihypertensive in patients with low-renin hypertension.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 2–4 hr | 24 hr |

*Half-life:* 10–11 hours.

### ADVERSE REACTIONS

**CNS:** headache, dizziness, drowsiness, fatigue, somnolence.
**CV:** symptomatic hypotension.
**GI:** nausea.
**GU:** impotence.
**Metabolic:** ***hyperkalemia.***
**Musculoskeletal:** arthralgia, arthritis, myalgia.
**Respiratory:** dry, persistent, nonproductive cough.
**Skin:** increased diaphoresis.
**Other:** hypersensitivity reactions, ***angioedema.***

### INTERACTIONS

**Drug-drug.** *Antidiabetics:* May increase risk of hypoglycemia. Monitor patient carefully.
*Azathioprine:* May increase risk of anemia or leukopenia. Monitor hematologic study results if used together.
*Diuretics, other antihypertensives:* May cause excessive hypotension. Stop diuretic or lower dosage of benazepril, as needed.
*Lithium:* May increase lithium level and toxicity. Use together cautiously; monitor lithium level.
*Nesiritide:* May increase risk of hypotension. Monitor blood pressure.
*NSAIDs:* May decrease antihypertensive effects. Monitor blood pressure.
*Potassium-sparing diuretics, potassium supplements:* May cause hyperkalemia. Monitor potassium level and renal function.
**Drug-herb.** *Capsaicin:* May cause cough. Discourage use together.
*Ma huang:* May decrease antihypertensive effects. Discourage use together.
**Drug-food.** *Salt substitutes containing potassium:* May cause hyperkalemia. Monitor potassium level and renal function.

### EFFECTS ON LAB TEST RESULTS

● May increase BUN, creatinine, and potassium levels.

### CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to ACE inhibitors and in those with a history of angioedema regardless of prior ACE inhibitor use.
**Black Box Warning** ACE inhibitors can cause injury and even death to the developing fetus when used during the second and third trimesters. When pregnancy

is detected, discontinue drug as soon as possible. ■
• Use cautiously in patients with impaired hepatic or renal function.
⚠ ***Overdose S&S:*** Hypotension.

## NURSING CONSIDERATIONS

• Monitor patient for hypotension. Excessive hypotension can occur when drug is given with diuretics. If possible, diuretic therapy should be stopped 2 to 3 days before starting benazepril to decrease potential for excessive hypotensive response. If drug doesn't adequately control blood pressure, diuretic may be cautiously reinstituted.
• Although ACE inhibitors reduce blood pressure in all races, they reduce it less in blacks taking the ACE inhibitor alone. Black patients should take drug with a thiazide diuretic for a more favorable response.
• Drug may increase risk of angioedema in black patients.
• Measure blood pressure when drug level is at peak (2 to 6 hours after administration) and at trough (just before a dose) to verify adequate blood pressure control.
• Assess renal and hepatic function before and periodically during therapy. Monitor potassium level.
• ***Look alike–sound alike:*** Don't confuse benazepril with Benadryl or Lotensin with Loniten or lovastatin.

## PATIENT TEACHING

• Instruct patient to avoid salt substitutes because they may contain potassium, which can cause high potassium level in patients taking drug.
• Inform patient that light-headedness can occur, especially during first few days of therapy. Tell him to rise slowly to minimize this effect and to report dizziness to prescriber. If fainting occurs, he should stop drug and call prescriber immediately.
• Warn patient to use caution in hot weather and during exercise. Inadequate fluid intake, vomiting, diarrhea, and excessive perspiration can lead to light-headedness and fainting.
• Advise patient to report signs of infection, such as fever and sore throat. Tell him to call prescriber if he develops easy bruising or bleeding; swelling of tongue, lips, face, eyes, mucous membranes, or extremities; difficulty swallowing or breathing; or hoarseness.
• Tell woman of childbearing age to notify prescriber if she becomes pregnant. Drug will need to be stopped.

# bendamustine hydrochloride

ben-dah-MOO-steen
hy-dro-CHLOR-ide

Treanda

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Mechlorethamine derivative
*Pregnancy risk category D*

## AVAILABLE FORMS

*Lyophilized powder for injection:* 25 mg, 100 mg in single-use vials

## INDICATIONS & DOSAGES

➤ **Chronic lymphocytic leukemia (CLL)**
*Adults:* 100 mg/m$^2$ I.V. over 30 minutes on days 1 and 2 of a 28-day cycle, given up to 6 cycles.
***Adjust-a-dose:*** For patients with grade 4 hematologic toxicity or clinically significant grade 2, 3, or 4 nonhematologic toxicity, delay treatment. Resume treatment when nonhematologic toxicity has improved to grade 1 or absolute neutrophil count is $1 \times 10^9$/L or higher and platelet count is $75 \times 10^9$/L or higher. In those with grade 3 or greater hematologic toxicity, give 50 mg/m$^2$ on days 1 and 2 of each cycle; if grade 3 or greater toxicity recurs, reduce dose to 25 mg/m$^2$ on days 1 and 2 of each cycle. In patients with clinically significant grade 3 nonhematologic toxicity or greater, give 50 mg/m$^2$ on days 1 and 2 of each cycle. Increase dose in subsequent cycles, as tolerated.
➤ **Indolent B-cell non-Hodgkin lymphoma that has progressed during or within 6 months of treatment with rituximab or a rituximab-containing regimen**
*Adults:* 120 mg/m$^2$ I.V. over 60 minutes on days 1 and 2 of a 21-day cycle, given in up to eight cycles.

***Adjust-a-dose:*** For patients with grade 4 hematologic toxicity or clinically significant grade 2, 3, or 4 nonhematologic toxicity, delay treatment. Resume treatment when nonhematologic toxicity has improved to grade 1 or absolute neutrophil count is $1 \times 10^9$/L or higher and platelet count is $75 \times 10^9$/L or higher. In patients with grade 4 or greater hematologic toxicity, reduce dosage to 90 mg/m$^2$ on days 1 and 2 of each cycle; if grade 4 hematologic toxicity recurs, reduce the dose to 60 mg/m$^2$ on days 1 and 2 of each cycle. In patients with grade 3 or greater nonhematologic toxicity, reduce dosage to 90 mg/m$^2$ on days 1 and 2 of each cycle; if grade 3 or greater nonhematologic toxicity recurs, give 60 mg/m$^2$ on days 1 and 2 of each cycle.

## ADMINISTRATION

**I.V.**

▼ Preparation and administration of parenteral form of drug may be mutagenic, teratogenic, or carcinogenic to staff. Follow institutional policy to reduce risks.

▼ Reconstitute powder using sterile water for injection. Add 20 ml to a 100-mg vial. Drug should dissolve within 5 minutes. Inspect vial for particulate matter and discoloration; discard if present.

▼ Reconstituted solutions must be further diluted within 30 minutes using 500 ml of normal saline solution; 500 ml of dextrose 2.5%/sodium chloride 0.45% may also be used. Discard cloudy or discolored solution (solution should be clear and colorless to slightly yellow).

▼ Reconstituted solution is stable for 24 hours when refrigerated, or 3 hours at room temperature.

▼ **Incompatibilities:** Compatibility with solutions other than normal saline and sterile water for injection hasn't been established.

## ACTION

Exact mechanism unknown. Mechlorethamine splits into electrophilic alkyl groups, which covalently bond with electron-rich nucleophilic moieties, possibly leading to cell death.

## PHARMACOKINETICS

**Absorption:** Given I.V.
**Distribution:** About 95% protein-bound in plasma.
**Metabolism:** Primarily through hydrolysis to metabolites with low cytotoxic activity.
**Excretion:** About 90% excreted in feces.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Rapid | 30 minutes | Unknown |

*Half-life:* About 3½ hours.

## ADVERSE REACTIONS

**CNS:** asthenia, *fatigue, chills,* anxiety, depression, *dizziness, headache, insomnia.*
**CV:** hypotension, tachycardia.
**EENT:** nasopharyngitis, sinusitis, nasal, congestion.
**GI:** *nausea, vomiting, diarrhea, abdominal pain, constipation, dyspepsia, gastroesophageal reflux, stomatitis.*
**GU:** *UTI.*
**Hematologic:** **NEUTROPENIA, THROMBOCYTOPENIA,** anemia, **LEUKOPENIA,** lymphopenia.
**Metabolic:** *weight loss, hyperuricemia,* ***tumor lysis syndrome.***
**Musculoskeletal:** arthralgia, *back pain,* bone pain, extremity pain.
**Respiratory:** *cough, dyspnea,* pneumonia, *upper respiratory tract infection,* wheezing.
**Skin:** *rash,* pruritus.
**Other:** *pyrexia, hypersensitivity,* infection, herpes simplex, *herpes zoster,* ***infusion reactions.***

## INTERACTIONS

**Drug-drug.** *CYP1A2 inducers (omeprazole):* May decrease drug levels. Use together cautiously.
*CYP1A2 inhibitors (fluvoxamine, ciprofloxacin):* May increase drug levels. Use together cautiously.
**Drug-lifestyle.** *Smoking:* May decrease drug levels. Discourage smoking.

## EFFECTS ON LAB TEST RESULTS

● May increase uric acid, bilirubin, AST, ALT, and creatinine levels.
● May decrease neutrophil, platelet, RBC, leukocyte, hemoglobin, and lymphocyte counts.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to bendamustine or mannitol.
- Use cautiously in patients with mild to moderate renal impairment or mild hepatic impairment. Avoid use in patients with creatinine clearance less than 40 ml/minute. Avoid use in those with moderate to severe hepatic impairment.
- Don't use in breast-feeding women.
- Safety and efficacy in children haven't been established.

***Overdose S&S:*** QT interval prolongation, sinus tachycardia, ST and T-wave deviations, left anterior fascicular block.

### NURSING CONSIDERATIONS

- Give through a separate I.V. line using an infusion pump.
- Routinely monitor BUN, creatinine and uric acid levels, liver function studies, and complete blood count.
- Monitor closely for signs of allergic reaction, including chills, rash, and pruritus.
- Administer antipyretics, corticosteroids, and antihistamines, as prescribed.
- Monitor for signs of infection (fever, chills, malaise).
- Monitor fluid intake and output closely, and maintain adequate hydration.
- Allopurinol may be necessary during the first 2 weeks of treatment to combat elevated uric acid levels associated with tumor lysis syndrome.

### PATIENT TEACHING

- Advise patient to avoid exposure to people with infections.
- Instruct patient to watch for signs and symptoms of infection (fever, sore throat, malaise) or bleeding.
- Advise patient to report any signs of allergic reaction immediately (rash, facial swelling, or difficulty breathing) during or soon after infusion.
- Caution women of childbearing age to avoid pregnancy throughout treatment and for 3 months after therapy.
- Advise male patients to use reliable contraception during treatment and for 3 months after therapy.
- Advise women to stop breast-feeding during therapy because of toxicity risk to infant.
- Tell patient that drug may cause tiredness and to avoid driving or operating dangerous tools or machinery until the effects of drug are known.
- Advise patient to report nausea, vomiting, or diarrhea.

## benzonatate

ben-ZOE-na-tate

Tessalon

*Therapeutic class:* Antitussive
*Pharmacologic class:* Local anesthetic
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules:* 100 mg, 200 mg

### INDICATIONS & DOSAGES

➤ **Symptomatic relief of cough**

*Adults and children older than age 10:* 100 to 200 mg P.O. t.i.d.; up to 600 mg daily.

### ADMINISTRATION

**P.O.**

- Protect drug from light and moisture.

### ACTION

Chemical relative of tetracaine that suppresses the cough reflex by direct action on the cough center in the medulla and through an anesthetic action on stretch receptors of vagal afferent fibers in the respiratory passages, lungs, and pleura.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 15–20 min | Unknown | 3–8 hr |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CNS:** dizziness, headache, sedation.
**EENT:** nasal congestion, burning sensation in eyes.
**GI:** nausea, constipation, GI upset.
**Other:** chills, hypersensitivity reactions.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or related compounds.
- Use cautiously in patients hypersensitive to PABA anesthetics (procaine, tetracaine) because cross-sensitivity reactions may occur.

***Overdose S&S:*** Restlessness, tremors, clonic seizures, profound CNS depression.

## NURSING CONSIDERATIONS

- Don't use drug when cough is a valuable diagnostic sign or is beneficial (such as after thoracic surgery).
- Monitor cough type and frequency.
- Use with percussion and chest vibration.

## PATIENT TEACHING

- Warn patient not to chew capsules or dissolve in mouth, which produces either local anesthesia that may result in aspiration, or CNS stimulation that may cause restlessness, tremor, and seizures.
- Instruct patient to report adverse reactions.
- Instruct patient to protect drug from light and moisture.
- Tell patient to contact his prescriber if cough lasts longer than 1 week, recurs frequently, or is accompanied by high fever, rash, or severe headache.

# benztropine mesylate

BENZ-troe-peen

Cogentin

*Therapeutic class:* Antiparkinsonian
*Pharmacologic class:* Anticholinergic
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 1 mg/ml in 2-ml ampules
*Tablets:* 0.5 mg, 1 mg, 2 mg

## INDICATIONS & DOSAGES

➤ **Drug-induced extrapyramidal disorders (except tardive dyskinesia)**
*Adults:* 1 to 4 mg P.O. or I.M. once or twice daily.

➤ **Transient extrapyramidal disorders**
*Adults:* 1 to 2 mg P.O. or I.M. two or three times per day. After 1 or 2 weeks, withdraw drug to determine continued need.

➤ **Acute dystonic reaction**
*Adults:* 1 to 2 mg I.V. or I.M.; then 1 to 2 mg P.O. b.i.d. to prevent recurrence.

➤ **Parkinsonism**
*Adults:* 0.5 to 6 mg P.O. or I.M. daily. First dosage is 0.5 mg to 1 mg, increased by 0.5 mg every 5 to 6 days. Adjust dosage to meet individual requirements. Maximum, 6 mg daily.

➤ **Postencephalitic parkinsonism**
*Adults:* 2 mg P.O. or I.M. daily in one or more doses. In highly sensitive patients, therapy may be initiated with 0.5 mg P.O. or I.M. at bedtime, and increased as needed.

## ADMINISTRATION

**P.O.**

- Drug may be given before or after meals depending on patient reaction. If patient is prone to excessive salivation, give drug after meal. If his mouth dries excessively, give drug before meals unless it causes nausea.

**I.V.**

- Reserve I.V. delivery for emergencies, such as acute dystonic reactions.
- The I.V. form is seldom used because no significant difference exists between it and the I.M. form.
- **Incompatibilities:** Haloperidol lactate.

**I.M.**

- Use filtered needle to draw up solution from ampule.

## ACTION

Unknown. May block central cholinergic receptors, helping to balance cholinergic activity in the basal ganglia.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1–2 hr | Unknown | 24 hr |
| I.V., I.M. | 15 min | Unknown | 24 hr |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** confusion, memory impairment, nervousness, depression, disorientation, hallucinations, toxic psychosis.
**CV:** tachycardia.
**EENT:** dilated pupils, blurred vision.

**GI:** *dry mouth, constipation,* nausea, vomiting, paralytic ileus.
**GU:** urine retention, dysuria.
**Musculoskeletal:** muscle weakness.
**Skin:** decreased sweating.

## INTERACTIONS

**Drug-drug.** *Amantadine, phenothiazines, tricyclic antidepressants:* May cause additive anticholinergic adverse reactions, such as confusion and hallucinations. Reduce dosage before giving.
*Cholinergics (donepezil, galantamine, rivastigmine, tacrine):* May antagonize the therapeutic effects of these drugs. If used together, monitor patient for therapeutic effect.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components, in those with angle-closure glaucoma, and in children younger than age 3.
- Drug may produce anhidrosis. Use cautiously in hot weather, in patients with mental disorders, in elderly patients, and in children age 3 and older.
- Use cautiously in patients with prostatic hyperplasia, arrhythmias, or seizure disorders.

***Overdose S&S:*** CNS depression preceded or followed by stimulation; confusion, nervousness, listlessness, intensification of mental symptoms or toxic psychosis (in patients with mental illness being treated with neuroleptic drugs), hallucinations, dizziness, muscle weakness, ataxia, dry mouth, mydriasis, blurred vision, palpitations, tachycardia, hypertension, nausea, vomiting, dysuria, numbness of fingers, dysphagia, allergic reactions, headache, delirium, coma, shock, seizures, respiratory arrest, anhidrosis, hyperthermia, glaucoma, constipation; hot, dry, flushed skin.

## NURSING CONSIDERATIONS

- Monitor vital signs carefully. Watch closely for adverse reactions, especially in elderly or debilitated patients. Call prescriber promptly if adverse reactions occur.
- At certain doses, drug produces atropine-like toxicity, which may aggravate tardive dyskinesia.
- Watch for intermittent constipation and abdominal distention and pain, which may indicate onset of paralytic ileus.
- Monitor elderly patients closely as they are more prone to severe adverse effects.

***Alert:*** Never stop drug abruptly. Reduce dosage gradually.

- ***Look alike–sound alike:*** Don't confuse benztropine with bromocriptine.

## PATIENT TEACHING

- Warn patient to avoid activities that require alertness until CNS effects of drug are known.
- If patient takes a single daily dose, tell him to do so at bedtime.
- Advise patient to report signs and symptoms of urinary hesitancy or urine retention.
- Tell patient to relieve dry mouth with cool drinks, ice chips, sugarless gum, or hard candy.
- Advise patient to limit hot weather activities because drug-induced lack of sweating may cause overheating.

# benzyl alcohol

ben-zill AL-ko-hall

Ulesfia

*Therapeutic class:* Scabicide, pediculicide
*Pharmacologic class:* Topical alcohol
*Pregnancy risk category B*

## AVAILABLE FORMS

*Lotion:* 5%

## INDICATIONS & DOSAGES

➤ **Head lice infestation**

*Adults age 60 and younger and children age 6 months and older:* Apply to hair and scalp until completely saturated. Allow to remain for 10 minutes; then rinse thoroughly with water. Remove dead lice and nits with fine-toothed comb. Repeat treatment after 7 days. For each treatment, administer 4 to 6 oz for hair 0″ to 2″ long, 6 to 8 oz for hair 2″ to 4″ long, 8 to 12 oz for hair 4″ to 8″

long, 12 to 24 oz for hair 8″ to 16″ long, 24 to 32 oz for hair 16″ to 22″ long, and 32 to 48 oz for hair more than 22″ long.

### ADMINISTRATION

**Topical**

- Apply to dry hair and completely cover all of the hair and scalp with lotion. Be sure to apply behind the ears.
- Don't apply to the face or eyes.

### ACTION

Prevents closure of lice respiratory spiracles, thereby causing lice asphyxiation and death.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown

### ADVERSE REACTIONS

**EENT:** ocular irritation.
**Skin:** irritation, anesthesia, hypoesthesia at application site; pain; *pruritus; erythema;* pyoderma.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Safety and efficacy haven't been established in adults older than age 60.
- Use during pregnancy only when clearly necessary. It isn't known if drug appears in breast milk. Patient should either stop breast-feeding or stop drug.
- Safety and efficacy in children younger than age 6 months haven't been established.
- Avoid use in infants younger than age 1 month and in preterm infants with a corrected age of less than 44 weeks. Gasping syndrome may occur.

### NURSING CONSIDERATIONS

- Wash hands after applying drug.
- If lotion comes into contact with eyes, flush immediately with water.

### PATIENT TEACHING

- Warn patient not to swallow drug.
- Instruct patient to wash (in hot water) or dry-clean all recently worn clothing and hats, and recently used bedding and towels.
- Tell patient a fine-tooth comb or special nit comb may be used to remove dead lice and nits.
- Advise patient to wash personal care items, such as brushes, combs, and hair clips, in hot water.
- Instruct patient to wash hands thoroughly after application.
- Stress to patient the importance of reapplying drug 7 days after first application because lotion kills lice but not nits.
- Warn patient to avoid contact with eyes; instruct patient to flush immediately with water if drug gets into eyes.
- Advise patient to notify prescriber if itching, redness, or skin or eye irritation occurs. If skin or eye irritation occurs, tell patient to rinse affected areas with water immediately.

## bepotastine besilate

beh-POT-uh-steen

Bepreve

*Therapeutic class:* Antihistamine (ophthalmic)
*Pharmacologic class:* Histamine$_1$-receptor antagonist
*Pregnancy risk category C*

### AVAILABLE FORMS

*Ophthalmic solution:* 1.5%

### INDICATIONS & DOSAGES

➤ **Itching associated with conjunctivitis**

*Adults and children age 2 and older:* Instill 1 drop into affected eye(s) b.i.d.

### ADMINISTRATION

**Ophthalmic**

- To minimize contamination of dropper tip and solution, avoid touching patient's eyelids or surrounding areas with dropper tip of bottle. Keep bottle tightly closed when not in use.

## ACTION

Inhibits release of histamine from mast cells by blocking histamine$_1$ receptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Unknown | 1–2 hr | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** headache.
**EENT:** eye irritation, *mild taste*, nasopharyngitis.

## INTERACTIONS

None known.

## EFFECTS ON LAB TEST RESULTS

None known.

## CONTRAINDICATIONS & CAUTIONS

- Drug hasn't been studied in pregnant women. Use during pregnancy only if potential benefit justifies risk to fetus.
- It isn't known if drug appears in breast milk. Use cautiously in breast-feeding women.

## NURSING CONSIDERATIONS

- Don't use drug for irritation caused by contact lenses.
- Remove contact lenses before instilling drops because preservative in bepotastine, benzalkonium chloride, may be absorbed by soft contact lenses.

## PATIENT TEACHING

- Advise patient not to use drug while wearing contact lenses. Lenses may be reinserted 10 minutes after administration.
- Instruct patient to avoid wearing contact lenses if eye redness occurs.
- Advise patient to avoid touching eyelids or surrounding areas with dropper tip of bottle, to minimize contamination of dropper tip and solution, and to keep bottle tightly closed when not in use.

# beractant (natural lung surfactant)

ber-AK-tant

Survanta

*Therapeutic class:* Lung surfactant
*Pharmacologic class:* Bovine lung extract
*Pregnancy risk category NR*

## AVAILABLE FORMS

*Suspension for intratracheal instillation:* 25 mg/ml

## INDICATIONS & DOSAGES

➤ **To prevent respiratory distress syndrome (RDS), also known as hyaline membrane disease, in premature neonates weighing 1,250 g (2 lb, 12 ounces) or less at birth, or having symptoms consistent with surfactant deficiency**

*Neonates:* 4 ml/kg intratracheally. Divide each dose into four quarter-doses and give each quarter-dose with infant in a different position to ensure even distribution of drug; between quarter-doses, use a hand-held resuscitation bag at 60 breaths/minute and sufficient oxygen to prevent cyanosis. Give drug as soon as possible, preferably within 15 minutes of birth. Repeat in 6 hours if respiratory distress continues. Give no more than four doses in 48 hours.

➤ **Rescue treatment of RDS in premature infants**

*Neonates:* 4 ml/kg intratracheally; before giving, increase ventilator rate to 60 breaths/minute with an inspiratory time of 0.5 second and a fraction of inspired oxygen of 1. Divide each dose into four quarter-doses and give each quarter-dose with infant in a different position to ensure even distribution of drug; between quarter-doses, continue mechanical ventilation for at least 30 seconds or until stable. Give dose as soon as RDS is confirmed by X-ray, preferably within 8 hours of birth. Repeat in 6 hours if respiratory distress continues. Give no more than four doses in 48 hours.

## ADMINISTRATION

### Inhalational

● Refrigerate at 36° to 46° F (2° to 8° C). Warm before use by allowing drug to stand at room temperature for at least 20 minutes or by holding in hand for at least 8 minutes. Don't use artificial warming methods. Unopened vials that have been warmed to room temperature may be returned to the refrigerator within 24 hours; however, warm and return drug to the refrigerator only once. Vials are for single use only; discard unused drug.

● Beractant doesn't need sonication or reconstitution before use. Inspect contents before giving; make sure color is off-white to light brown and that contents are uniform. If settling occurs, swirl vial gently; don't shake. Some foaming is normal.

● Use a 20G or larger needle to draw up drug; don't use a filter. Give drug using a #5 French end-hole catheter. Premeasure and shorten catheter before use. Fill catheter with beractant and discard excess drug so that only total dose to be given remains in the syringe. Insert catheter into neonate's endotracheal tube; make sure catheter tip protrudes just beyond end of tube above neonate's carina. Don't instill drug into a mainstream bronchus.

● Even distribution of drug is important. Give each dose in four quarter-doses, with each quarter-dose being given over 2 to 3 seconds and with the patient positioned differently after each use. Between giving quarter-doses, remove the catheter and ventilate the patient. Give the first quarter-dose with the patient's head and body inclined slightly downward, and the head turned to the right. Give the second quarter-dose with the head turned to the left. Then, incline the head and body slightly upward with the head turned to the right to give the third quarter-dose. Turn the head to the left for the fourth quarter-dose.

## ACTION

Lowers alveolar surface tension during respiration and stabilizes alveoli against collapse. Drug contains neutral lipids, fatty acids, surfactant-related proteins, and phospholipids that mimic naturally occurring surfactant.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Intratracheal | 30–120 min | Unknown | 2–3 days |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CV:** **TRANSIENT BRADYCARDIA,** hypotension, vasoconstriction.
**Respiratory:** ***apnea, endotracheal tube reflux or blockage, decreased oxygen saturation, hypercapnia, hypocapnia.***
**Skin:** pallor.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

● In infants who weigh less than 600 g (1.5 lb) at birth or more than 1,750 g (4 lb) at birth, use hasn't been studied.

## NURSING CONSIDERATIONS

● Only staff experienced in treating clinically unstable premature neonates, including neonatal intubation and airway management, should give drug.

● Accurate weight determination is essential for proper measurement of dosage.

● Continuously monitor neonate before, during, and after giving beractant. The endotracheal tube may be suctioned before giving drug; allow neonate to stabilize before proceeding with administration.

● Immediately after giving, moist breath sounds and crackles can occur. Don't suction the neonate for 1 hour unless he has other signs or symptoms of airway obstruction.

● Continuous monitoring of ECG and transcutaneous oxygen saturation are essential; frequent arterial blood pressure monitoring and frequent arterial blood gas sampling are highly desirable.

● Transient bradycardia and oxygen desaturation are common after dosing.

***Alert:*** Drug can rapidly affect oxygenation and lung compliance. Peak ventilator inspiratory pressures may need to be adjusted if chest expansion improves substantially after drug administration. Notify prescriber and

adjust immediately as directed because failing to do so may cause lung overdistention and fatal pulmonary air leakage.
• Review manufacturer's audiovisual materials that describe dosage and usage procedures.
• ***Look alike–sound alike:*** Don't confuse Survanta with Sufenta.

### PATIENT TEACHING
• Inform parents of neonate's need for drug, and explain drug action and use.
• Encourage parents to ask questions, and address their concerns.

## besifloxacin
beh-sih-FLOX-ah-sin

Besivance

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Fluoroquinolone antibiotic
*Pregnancy risk category C*

### AVAILABLE FORMS
*Ophthalmic suspension:* 0.6%

### INDICATIONS & DOSAGES
➤ **Conjunctivitis caused by CDC coryneform group G, *Corynebacterium pseudodiphtheriticum, Corynebacterium striatum, Haemophilus influenzae, Moraxella lacunata, Staphylococcus aureus, Staphylococcus epidermidis, Staphylococcus hominis, Staphylococcus lugdunensis, Streptococcus mitis group, Streptococcus oralis, Streptococcus pneumoniae,* and *Streptococcus salivarius***
*Adults and children age 1 and older:* Instill 1 drop into affected eye t.i.d., 4 to 12 hours apart, for 7 days.

### ADMINISTRATION
**Ophthalmic**
• Invert bottle and shake once before use. Remove cap with bottle in inverted position.
***Alert:*** Don't inject into eye or introduce into anterior chamber of eye.

### ACTION
Inhibits DNA gyrase and topoisomerase, preventing cell replication and division.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Unknown | Unknown | Unknown |

*Half-life:* 7 hours.

### ADVERSE REACTIONS
**CNS:** headache.
**EENT:** blurred vision, conjunctival erythema, eye irritation, eye pain, eye pruritus.

### INTERACTIONS
None reported.

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
• Although drug isn't intended for systemic administration, hypersensitivity reactions have been reported with systemic administration of quinolones. Discontinue drug at first sign of allergic reaction or rash.
• Use cautiously in pregnant or breast-feeding women.
• Safety and efficacy in infants younger than age 1 haven't been established.

### NURSING CONSIDERATIONS
• Be aware that prolonged use may lead to growth of resistant organisms.

### PATIENT TEACHING
• Instruct patient to wash his hands before and after instilling the drug.
• Teach patient how to instill drug correctly. Remind him not to touch the tip of the bottle with his hands and not to let the tip touch the eye or surrounding tissue.
• Advise patient to avoid wearing contact lenses if he has signs and symptoms of conjunctivitis while taking the drug.
• Remind patient not to share washcloths or towels with other family members to avoid spreading infection.
• Tell patient to take drug exactly as prescribed for as long as prescribed, even if he's feeling better.
• Instruct patient to stop the drug and notify his prescriber if rash or allergic reaction occurs.

## betamethasone dipropionate

bay-ta-METH-a-sone

Diprolene, Diprolene AF

## betamethasone valerate

Beta-Val, Dermabet, Luxiq, Valnac

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Corticosteroid
*Pregnancy risk category C*

### AVAILABLE FORMS

**betamethasone dipropionate**
*Aerosol:* 0.1%
*Cream:* 0.05%
*Gel:* 0.05%
*Lotion:* 0.05%
*Ointment:* 0.05%
**betamethasone valerate**
*Cream:* 0.05%, 0.1%
*Foam:* 0.12%
*Lotion:* 0.1%
*Ointment:* 0.1%

### INDICATIONS & DOSAGES

➤ **Inflammation and pruritus from corticosteroid-responsive dermatoses**
*Adults and children older than age 12:* Clean area; apply cream, ointment, lotion, aerosol spray, or gel sparingly. Give dipropionate products once daily to b.i.d.; give valerate 0.1% solution b.i.d., or valerate 0.1% cream or ointment once daily to t.i.d. Maximum dosage of augmented betamethasone dipropionate 0.05% ointment, cream, gel, or lotion is 45 g, 50 g, 45 g, or 50 ml per week, respectively. Therapy with augmented formulations shouldn't exceed 2 weeks.

➤ **Inflammation and pruritus from corticosteroid-responsive dermatoses of scalp (valerate only)**
*Adults:* Gently massage small amounts of foam into affected scalp areas b.i.d., morning and evening, until control is achieved. If no improvement is seen in 2 weeks, reassess diagnosis.

### ADMINISTRATION

**Topical**
- Shake well before use and protect from light.
- Gently wash skin before applying. To prevent skin damage, rub in gently, leaving a thin coat. When treating hairy sites, part hair and apply directly to lesions.
- Decrease dosing frequency to once daily following clinical improvement.
- Avoid applying near eyes or mucous membranes or in ear canal, groin area, or armpit.
- Don't dispense foam directly into warm hands because foam will begin to melt upon contact.
- For patients with eczematous dermatitis whose skin may be irritated by adhesive material, hold dressing in place with gauze, elastic bandages, stockings, or stockinette.

***Alert:*** Product is flammable. Avoid fire, flame, or smoking during use. Don't expose to heat.

***Alert:*** Don't use occlusive dressings.
- Continue drug for a few days after lesions clear.

### ACTION

Unclear. Is diffused across cell membranes to form complexes with receptors. Has anti-inflammatory, antipruritic, vasoconstrictive, and antiproliferative activity. Considered a medium-potency to very-high-potency drug (depending on product), according to vasoconstrictive properties.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**GU:** glycosuria with dipropionate.
**Metabolic:** hyperglycemia.
**Skin:** burning, pruritus, irritation, dryness, erythema, folliculitis, striae, acneiform eruptions, perioral dermatitis, hypopigmentation, hypertrichosis, allergic contact dermatitis, secondary infection, maceration, atrophy, miliaria with occlusive dressings.
**Other:** ***hypothalamic-pituitary-adrenal axis suppression,*** Cushing syndrome.

## INTERACTIONS
None significant.

## EFFECTS ON LAB TEST RESULTS
- May increase glucose level.

## CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to corticosteroids.
- Don't use as monotherapy in primary bacterial infections (impetigo, paronychia, erysipelas, cellulitis, angular cheilitis), rosacea, perioral dermatitis, or acne.
- Don't use augmented betamethasone dipropionate 0.05% ointment, betamethasone dipropionate 0.05% gel, cream, and ointment; betamethasone valerate 0.1% ointment on the face, groin, or axilla.
- Use cautiously in pregnant or breast-feeding women.

***Overdose S&S:*** Systemic effects.

## NURSING CONSIDERATIONS
- Drug isn't for ophthalmic use.
- Because of alcohol content of vehicle, gel products may cause mild, transient stinging, especially when used on or near excoriated skin.
- If antifungal or antibiotic combined with corticosteroid fails to provide prompt improvement, stop corticosteroid until infection is controlled.
- Systemic absorption is likely with prolonged or extensive body surface treatment. Watch for symptoms.
- Avoid using plastic pants or tight-fitting diapers on treated areas in young children. Children may absorb larger amounts of drug and be more susceptible to systemic toxicity.

***Alert:*** Diprolene and Diprolene AF may not be replaced with generics because other products have different potencies.

## PATIENT TEACHING
- Teach patient how to apply drug.
- Emphasize that drug is for external use only.
- Tell patient to wash hands after application.
- Tell patient to stop drug and report signs of systemic absorption, skin irritation or ulceration, hypersensitivity, or infection.
- Instruct patient not to use occlusive dressings.
- Discuss personal hygiene measures to reduce chance of infection.

# betaxolol hydrochloride
beh-TAX-oh-lol

Betoptic, Betoptic S

*Therapeutic class:* Antiglaucoma
*Pharmacologic class:* Beta blocker
*Pregnancy risk category C*

## AVAILABLE FORMS
*Ophthalmic solution:* 0.5%
*Ophthalmic suspension:* 0.25%

## INDICATIONS & DOSAGES
➤ **Chronic open-angle glaucoma, ocular hypertension**
*Adults:* Instill 1 or 2 drops of 0.5% solution or 1 drop of 0.25% suspension b.i.d.

## ADMINISTRATION
**Ophthalmic**
- Shake suspension well.
- Apply light finger pressure on lacrimal sac for 1 minute after instilling drug.
- Don't touch tip of dropper to eye or surrounding tissue.

## ACTION
Unknown. Reduces aqueous formation and may increase outflow of aqueous humor.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | 30–60 min | 2 hr | >12 hr |

*Half-life:* Unknown.

## ADVERSE REACTIONS
**CNS:** insomnia, depression, dizziness, headache.
**CV:** ***arrhythmias, heart block, heart failure,*** palpitations.
**EENT:** *eye stinging on instillation causing brief discomfort,* erythema, itching, keratitis, occasional tearing, photophobia.
**Respiratory:** ***bronchospasm, asthma.***

## INTERACTIONS

**Drug-drug.** *Calcium channel blockers:* May cause AV conduction disturbances, ventricular failure, and hypotension if significant systemic absorption occurs. Monitor patient closely.
*Cardiac glycosides:* May cause excessive bradycardia if significant systemic absorption occurs. Patient may need ECG monitoring.
*Dipivefrin, ophthalmic epinephrine:* May produce mydriasis. Use together cautiously.
*Inhaled hydrocarbon anesthetics:* May prolong severe hypotension if significant systemic absorption occurs. Tell anesthesiologist that patient is receiving ophthalmic betaxolol.
*Insulin, oral antidiabetics:* May cause hypoglycemia or hyperglycemia if significant systemic absorption occurs. May need to adjust dosage of antidiabetics.
*Phenothiazines:* May have additive hypotensive effects; may increase risk of adverse effects if significant systemic absorption occurs. Monitor patient closely.
*Prazosin:* May increase risk of orthostatic hypotension in early phases of use together. Help patient stand slowly until effects are known.
*Reserpine:* May cause excessive beta blockade. Monitor patient closely.
*Systemic beta blockers:* May have additive effects. Monitor patient closely.
*Verapamil:* May increase effects of both drugs. Monitor cardiac function closely and decrease dosages as necessary.
**Drug-lifestyle.** *Cocaine use:* May inhibit betaxolol's effects. Tell patient about this interaction.
*Sun exposure:* May cause photophobia. Advise patient to wear sunglasses.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with sinus bradycardia, greater than first-degree AV block, cardiogenic shock, or overt heart failure.
- Use cautiously in patients with restricted pulmonary function, diabetes mellitus, hyperthyroidism, or history of heart failure.

## NURSING CONSIDERATIONS

- Stabilization of intraocular pressure (IOP)–lowering response may take a few weeks. Determine IOP after 4 weeks of treatment.

## PATIENT TEACHING

- Teach patient how to instill drug. Advise him to wash hands before and after instillation and to apply light finger pressure on lacrimal sac for 1 minute after instilling drug. Warn him not to touch tip of dropper to eye or surrounding tissue. Tell him to shake suspension well before instilling.
- Encourage patient to comply with twice-daily regimen.
- Tell patient to remove contact lenses before instilling drug. Lenses may be reinserted about 15 minutes after using drops.
- Advise patient to ease sun sensitivity by wearing sunglasses.

# bethanechol chloride

be-THAN-e-kole

Duvoid, Urecholine

*Therapeutic class:* Urinary stimulant
*Pharmacologic class:* Cholinergic agonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 5 mg, 10 mg, 25 mg, 50 mg

## INDICATIONS & DOSAGES

➤ **Acute postoperative and postpartum nonobstructive (functional) urine retention, neurogenic atony of urinary bladder with urine retention**

*Adults:* 10 to 50 mg P.O. t.i.d. to q.i.d. Determine minimum effective dose by giving 5 or 10 mg and repeating same amount at hourly intervals until satisfactory response or maximum of 50 mg has been given.

➤ **Gastroesophageal reflux disease ♦**

*Adults:* 25 mg P.O. q.i.d.

## ADMINISTRATION

**P.O.**

● Give drug 1 hour before or 2 hours after meals because drug may cause nausea and vomiting if taken soon after eating.

## ACTION

Directly stimulates muscarinic cholinergic receptors, mimicking acetylcholine action, increasing GI tract tone and peristalsis and contraction of the detrusor muscle of the urinary bladder.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30–90 min | 1 hr | 6 hr |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** headache, malaise.
**CV:** ***bradycardia,*** profound hypotension with reflexive tachycardia, flushing.
**EENT:** lacrimation, miosis.
**GI:** *abdominal cramps, diarrhea,* excessive salivation, nausea, belching, borborygmus.
**GU:** urinary urgency.
**Respiratory:** ***bronchoconstriction,*** increased bronchial secretions.
**Skin:** diaphoresis.

## INTERACTIONS

**Drug-drug.** *Anticholinergics, atropine, belladonna alkaloids, procainamide, quinidine:* May reverse cholinergic effects. Observe patient for lack of drug effect.
*Cholinesterase inhibitors (donepezil), cholinergic agonists:* May cause additive effects or increase toxicity. Avoid using together.
*Ganglionic blockers:* May cause critical drop in blood pressure, usually preceded by severe abdominal pain. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

● May increase amylase, lipase, and liver enzyme levels.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or its components and in those with uncertain strength or integrity of bladder wall, mechanical obstruction of GI or urinary tract, hyperthyroidism, peptic ulceration, latent or active bronchial asthma, obstructive pulmonary disease, pronounced bradycardia or hypotension, vasomotor instability, cardiac or coronary artery disease, AV conduction defects, hypertension, seizure disorder, Parkinson disease, spastic GI disturbances, acute inflammatory lesions of the GI tract, peritonitis, or marked vagotonia.
● Use cautiously in pregnant or breast-feeding women.
⚠ ***Overdose S&S:*** Abdominal discomfort, excessive salivation, flushing, hot feeling, sweating, nausea, vomiting.

## NURSING CONSIDERATIONS

● Adverse effects are rare with P.O. use.
● Monitor vital signs frequently, especially respirations. Always have atropine injection available, and be prepared to give 0.6 mg subcutaneously or by slow I.V. push. Provide respiratory support, if needed.
● Monitor patient for orthostatic hypotension.
● Watch closely for adverse reactions that may indicate drug toxicity.

## PATIENT TEACHING

● Tell patient to take drug on an empty stomach and at regular intervals.
● Inform patient that drug is usually effective 30 to 90 minutes after use.

**SAFETY ALERT!**

# bevacizumab

beh-vah-SIZZ-yoo-mab

Avastin

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Monoclonal antibody
*Pregnancy risk category C*

## AVAILABLE FORMS

*Solution:* 25 mg/ml in 4-ml and 16-ml vials

## INDICATIONS & DOSAGES

➤ **First- or second-line treatment, with fluorouracil-based chemotherapy, for metastatic colon or rectal cancer**

*Adults:* If used with bolus irinotecan, fluorouracil, and leucovorin (IFL) regimen, give 5 mg/kg I.V. every 14 days. If used with oxaliplatin, fluorouracil, and leucovorin (known as FOLFOX 4) regimen, give 10 mg/kg I.V. every 14 days. Infusion rate varies by patient tolerance and number of infusions.

➤ **With carboplatin and paclitaxel as first-line treatment of unresectable, locally advanced, recurrent, or metastatic nonsquamous, non–small cell lung cancer**
*Adults:* 15 mg/kg I.V. infusion once every 3 weeks.

➤ **With paclitaxel, for metastatic HER2-negative breast cancer in patients who have not received chemotherapy** ♦
*Adults:* 10 mg/kg I.V. every 14 days.

➤ **With interferon alfa for metastatic renal cell carcinoma; as single agent for progressive glioblastoma following prior therapy**
*Adults:* 10 mg/kg I.V. every 14 days.

## ADMINISTRATION

**I.V.**

▼ Don't freeze or shake vials.
▼ Dilute drug using aseptic technique. Withdraw proper dose and mix in a total volume of 100 ml normal saline solution in an I.V. bag.
▼ Don't give by I.V. push or bolus.
▼ Give the first infusion over 90 minutes and, if tolerated, the second infusion over 60 minutes. Later infusions can be given over 30 minutes if previous infusions were tolerated.
▼ Discard unused portion; drug is preservative-free.
▼ Drug is stable 8 hours if refrigerated at 36° to 46° F (2° to 8° C) and protected from light.
▼ **Incompatibilities:** Dextrose solutions.

## ACTION

A recombinant humanized vascular endothelial growth factor (VEGF) inhibitor.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* About 20 days.

## ADVERSE REACTIONS

**CNS:** *asthenia, dizziness, headache,* abnormal gait, confusion, pain, syncope.
**CV:** **INTRA-ABDOMINAL THROMBOSIS,** *hypertension,* ***thromboembolism, deep vein thrombosis,*** heart failure, hypotension.
**EENT:** *epistaxis,* excess lacrimation, gum bleeding, *taste disorder,* voice alteration.
**GI:** *anorexia, constipation, diarrhea, dyspepsia, flatulence, stomatitis, vomiting,* ***GI hemorrhage,*** abdominal pain, colitis, dry mouth, nausea.
**GU:** ***vaginal hemorrhage,*** *proteinuria,* urinary urgency.
**Hematologic:** ***leukopenia, neutropenia, thrombocytopenia.***
**Metabolic:** *hypokalemia, weight loss,* bilirubinemia.
**Musculoskeletal:** *back pain, myalgia.*
**Respiratory:** **HEMOPTYSIS,** *dyspnea, upper respiratory tract infection.*
**Skin:** *alopecia, dermatitis, discoloration, dry skin, exfoliative dermatitis,* nail disorder, skin ulcer.
**Other:** decreased wound healing, hypersensitivity.

## INTERACTIONS

**Drug-drug.** *Irinotecan:* May increase level of irinotecan metabolite. Monitor patient.

## EFFECTS ON LAB TEST RESULTS

● May increase bilirubin and urine protein levels. May decrease potassium level.
● May decrease neutrophil, platelet, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients with recent hemoptysis or within 28 days after major surgery.
● Use cautiously in patients hypersensitive to drug or its components, in those who need surgery, are taking anticoagulants, or have significant CV disease.
⚠ ***Overdose S&S:*** Headache.

## NURSING CONSIDERATIONS

***Alert:*** Reversible posterior leukoencephalopathy syndrome (RPLS)-associated symptoms (hypertension, headache, visual disturbances, altered mental function, and seizures) may occur 16 hours to 1 year after

starting the drug. Monitor patient closely. If syndrome occurs, stop drug and provide supportive care.
• RPLS can be confirmed only by MRI.
• Hypersensitivity reactions can occur during infusion. Monitor the patient closely.
• In patients who develop nephrotic syndrome, severe hypertension, hypertensive crisis, serious hemorrhage, GI perforation, or wound dehiscence that needs intervention, stop drug.
***Alert:*** Discontinue drug at least 28 days before elective surgery. Don't initiate for at least 28 days after surgery or until wound is fully healed.
***Alert:*** Drug may increase risk of serious arterial thromboembolic events including MI, TIAs, stroke, and angina. Those patients at highest risk are age 65 or older, have a history of arterial thromboembolism, and have taken the drug before. If patient has an arterial thrombotic event, permanently stop drug.
**Black Box Warning** Drug may cause fatal GI perforation. Monitor patient closely. ■
**Black Box Warning** Bevacizumab can result in life-threatening wound dehiscence. Permanently discontinue bevacizumab therapy in patients who experience wound dehiscence that requires medical intervention. ■
**Black Box Warning** Drug increases risk of severe or fatal hemorrhage, hemoptysis, GI bleeding, CNS hemorrhage, and vaginal bleeding. Don't give to patients with serious hemorrhage or recent hemoptysis. ■
• Monitor urinalysis for worsening proteinuria. Patients with 2+ or greater urine dipstick test should undergo 24-hour urine collection. Discontinue use in patients with nephrotic syndrome.
• Monitor patient's blood pressure every 2 to 3 weeks.
• It's unknown whether drug appears in breast milk. Women shouldn't breast-feed during therapy and for about 3 weeks after therapy ends.
• Adverse reactions occur more often in older patients.

## PATIENT TEACHING

• Inform patient about potential adverse reactions.
• Tell patient to report adverse reactions immediately, especially abdominal pain, constipation, and vomiting.
• Advise patient that blood pressure and urinalysis will be monitored during treatment.
• Caution women of childbearing age to avoid pregnancy during treatment.
• Urge patient to alert other health care providers about treatment and to avoid elective surgery during treatment.

# bimatoprost

by-MAT-oh-prost

Latisse, Lumigan

*Therapeutic class:* Antiglaucoma
*Pharmacologic class:* Prostaglandin analogue
*Pregnancy risk category C*

## AVAILABLE FORMS

*Ophthalmic solution:* 0.01%, 0.03%
*Topical solution:* 0.03%

## INDICATIONS & DOSAGES

➤ **Increased intraocular pressure in patients with open-angle glaucoma or ocular hypertension**
*Adults:* Instill 1 drop in conjunctival sac of affected eye once daily in the evening.
➤ **Hypotrichosis of the eyelashes**
*Adults:* Apply 1 drop nightly directly to skin of upper eyelid margin at base of eyelashes with single-use applicator.

## ADMINISTRATION

**Ophthalmic**
• Don't touch tip of dropper to eye or surrounding tissue.
• If more than one ophthalmic drug is being used, give drugs at least 5 minutes apart.
• Store drug in original container between 59° and 77° F (15° and 25° C).
**Topical**
• Before application, ensure face is clean and makeup and contact lenses are removed.
• Use new applicator for each eye, never reuse. Don't use any other brush or applicator.

• Blot excess solution from beyond eyelid margin.

## ACTION

Has ocular hypotensive activity, which selectively mimics the effects of naturally occurring prostaglandins. Drug may also increase outflow of aqueous humor. Mechanism in treating hypotrichosis is unknown.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | 4 hr | 8–12 hr | Unknown |
| Topical | Unknown | Unknown | Unknown |

*Half-life:* 45 minutes.

## ADVERSE REACTIONS

**CNS:** headache, asthenia.
**EENT:** *conjunctival hyperemia, growth of eyelashes, ocular pruritus*, allergic conjunctivitis, asthenopia, blepharitis, cataract, conjunctival edema, eye discharge, tearing, and pain, eyelash darkening, eyelid erythema, foreign body sensation, increase in iris pigmentation, ocular burning, dryness, and irritation, photophobia, superficial punctate keratitis, visual disturbance.
**Respiratory:** *upper respiratory tract infection.*
**Skin:** hirsutism, hyperpigmentation of periocular skin.
**Other:** *infection.*

## INTERACTIONS

*Latanoprost:* May decrease intraocular pressure–lowering effect. Use cautiously with either ophthalmic or topical form.

## EFFECTS ON LAB TEST RESULTS

• May cause abnormal liver function test values.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to bimatoprost, benzalkonium chloride, or other ingredients in product.
• Drug hasn't been approved for use in patients with angle-closure glaucoma or inflammatory or neovascular glaucoma.
• Use cautiously in patients with renal or hepatic impairment.
• Use cautiously in patients with active intraocular inflammation (iritis, uveitis), aphakic patients, pseudophakic patients with torn posterior lens capsule, and patients at risk for macular edema.

## NURSING CONSIDERATIONS

• Temporary or permanent increased pigmentation of iris and eyelid, as well as increased pigmentation and growth of eyelashes, may occur.
• Patient should remove contact lenses before using solution. Lenses may be reinserted 15 minutes after administration.

## PATIENT TEACHING

• Tell patient receiving treatment in only one eye about potential for increased brown pigmentation of iris, eyelid skin darkening, and increased length, thickness, pigmentation, or number of lashes in treated eye.
• Teach patient how to instill drops, and advise him to wash hands before and after instilling solution. Warn him not to touch tip of dropper to eye or surrounding tissue.
• If eye trauma or infection occurs or if eye surgery is needed, tell patient to seek medical advice before continuing to use multidose container.
• Advise patient to immediately report eye inflammation or lid reactions.
• Advise patient to apply light pressure on lacrimal sac for 1 minute after instillation of drops to minimize systemic absorption of drug.
• Tell patient to remove contact lenses before using solution and that lenses may be reinserted 15 minutes after administration.
• Teach patient that Latisse applicators are for single use only. Instruct patient to wash face and remove makeup and contact lenses before applicator use.
• Tell patient that effects of Latisse are gradual in onset and may not be significant for 2 months. Results last only as long as treatment is continued.
• Instruct patient to blot excess solution from beyond eyelid margin.
• If patient is using more than one ophthalmic drug, tell him to apply them at least 5 minutes apart.
• Stress importance of compliance with recommended therapy.

# bisacodyl

bye-suh-KOH-dil

Alophen ◇, Bisac-Evac ◇, Bisa-Lax ◇, Caroid ◇, Codulax† ◇, Correctol ◇, Dulcolax ◇, Ex-Lax Ultra ◇, Feen-a-Mint ◇, Fleet Bisacodyl ◇, Fleet Bisacodyl Enema ◇, Fleet Laxative ◇, Modane ◇, Soflax EX† ◇, The Magic Bullet† ◇, Woman's Laxative† ◇

*Therapeutic class:* Laxative
*Pharmacologic class:* Diphenylmethane derivative
*Pregnancy risk category C*

## AVAILABLE FORMS

*Enema:* 0.33 mg/ml ◇
*Suppositories:* 10 mg ◇
*Tablets (delayed release):* 10 mg ◇
*Tablets (enteric-coated):* 5 mg ◇

## INDICATIONS & DOSAGES

➤ **Chronic constipation; preparation for childbirth, surgery, or rectal or bowel examination**

*Adults and children age 12 and older:* 5 to 15 mg P.O. in evening or before breakfast. Or, 10 mg P.R. for evacuation before examination or surgery.

*Children ages 6 to 11:* 5 mg P.O. or P.R. at bedtime or before breakfast. Oral dose isn't recommended if child can't swallow tablet whole.

## ADMINISTRATION

**P.O.**

- Don't give tablets within 1 hour after taking an antacid or milk.
- Don't crush or split tablets.

**Rectal**

- Insert suppository as high as possible into the rectum, and try to position suppository against the rectal wall. Avoid embedding within fecal material because doing so may delay onset of action.

## ACTION

Unknown. Stimulant laxative that increases peristalsis, probably by direct effect on smooth muscle of the intestine, by irritating the muscle or stimulating the colonic intramural plexus. Drug also promotes fluid accumulation in colon and small intestine.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 6–12 hr | Variable | Variable |
| P.R. | 15–60 min | Variable | Variable |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** dizziness, faintness, muscle weakness with excessive use.
**GI:** *abdominal cramps, burning sensation in rectum with suppositories, nausea, vomiting,* diarrhea with high doses, laxative dependence with long-term or excessive use, protein-losing enteropathy with excessive use.
**Metabolic:** alkalosis, fluid and electrolyte imbalance, hypokalemia.
**Musculoskeletal:** tetany.

## INTERACTIONS

**Drug-drug.** *Antacids:* May cause gastric irritation or dyspepsia from premature dissolution of enteric coating. Separate doses by at least 1 or 2 hours.
**Drug-food.** *Milk:* May cause gastric irritation or dyspepsia from premature dissolution of enteric coating. Don't use within 1 or 2 hours of drinking milk.

## EFFECTS ON LAB TEST RESULTS

- May increase phosphate and sodium levels. May decrease calcium, magnesium, and potassium levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those with rectal bleeding, gastroenteritis, intestinal obstruction, abdominal pain, nausea, vomiting, or other symptoms of appendicitis or acute surgical abdomen.

## NURSING CONSIDERATIONS

- Give drug at times that don't interfere with scheduled activities or sleep. Soft, formed stools are usually produced 15 to 60 minutes after rectal use.
- Before giving for constipation, determine whether patient has adequate fluid intake, exercise, and diet.

• Tablets and suppositories are used together to clean the colon before and after surgery and before barium enema.

### PATIENT TEACHING

• Advise patient to swallow enteric-coated tablet whole to avoid GI irritation. Instruct him not to take within 1 hour of milk or antacid.
• Tell patient that drug is for 1-week treatment only. (Stimulant laxatives are often abused.) Discourage excessive use.
• Advise patient to report adverse effects to prescriber.
• Teach patient about dietary sources of bulk, including bran and other cereals, fresh fruit, and vegetables.
• Tell patient to take drug with a full glass of water or juice.

## bismuth subsalicylate

BIS-mith

Bismatrol ◇, Kaopectate ◇, Kao-Tin ◇, Maalox Total Stomach Relief Liquid ◇, Peptic Relief ◇, Pepto-Bismol ◇, Pink Bismuth ◇

*Therapeutic class:* Antidiarrheal
*Pharmacologic class:* Adsorbent
*Pregnancy risk category C*

### AVAILABLE FORMS

*Caplets:* 262 mg ◇
*Liquid:* 87 mg/5 ml ◇, 87.3 mg/5 ml ◇, 130 mg/15 ml ◇, 175 mg/5 ml ◇, 262 mg/15 ml, 524 mg/15 ml
*Oral suspension:* 525 mg/15 ml
*Tablets (chewable):* 262 mg ◇

### INDICATIONS & DOSAGES

➤ **Mild, nonspecific diarrhea**

*Adults and children age 12 and older:* 30 ml or 2 tablets P.O. every 30 minutes to 1 hour, up to maximum of eight doses and for no longer than 2 days.
*Children ages 9 to 11:* 15 ml every 30 minutes to 1 hour, up to maximum of eight doses and for no longer than 2 days.
*Children ages 6 to 8:* 10 ml P.O. every 30 minutes to 1 hour, up to maximum of eight doses and for no longer than 2 days.
*Children ages 3 to 5:* 5 ml P.O. every 30 minutes to 1 hour, up to maximum of eight doses and for no longer than 2 days.

➤ **Traveler's diarrhea ♦**

*Adults:* 30 ml P.O. every 30 minutes for 8 doses.

### ADMINISTRATION

**P.O.**

• Shake liquid well before administration.
• Have patient chew or dissolve tablets in mouth.

### ACTION

May have antisecretory, antimicrobial, and anti-inflammatory effects against bacterial and viral enteropathogens.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**GI:** temporary darkening of tongue and stools.
**Other:** salicylism with high doses.

### INTERACTIONS

**Drug-drug.** *Aspirin, other salicylates:* May cause salicylate toxicity. Monitor patient.
*Oral anticoagulants, oral antidiabetics:* May increase effects of these drugs after high doses of bismuth subsalicylate. Monitor patient closely.
*Tetracycline:* May decrease tetracycline absorption. Separate doses by at least 2 hours.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to salicylates.
• Use cautiously in patients taking aspirin. Stop therapy if tinnitus occurs.
• Use cautiously in children and in patients with bleeding disorders or salicylate sensitivity.
• Avoid use in children or teenagers who have or who are recovering from influenza or varicella.

• Use cautiously in infants and debilitated patients because of increased risk of constipation with impaction.

## NURSING CONSIDERATIONS

• Avoid use before GI radiologic procedures because drug is radiopaque and may interfere with X-rays.
• Liquid form is preferred for children, to give more accurate dosing.

## PATIENT TEACHING

• Advise patient that drug contains salicylate. Each tablet has 102 mg salicylate. Regular-strength liquid has 130 mg/15 ml. Extra-strength liquid has 230 mg/15 ml.
• Instruct patient to shake liquid before measuring dose and to chew tablets well before swallowing.
• Tell patient to call prescriber if diarrhea lasts longer than 2 days or is accompanied by high fever.
• Advise patient to drink plenty of clear fluids to help prevent dehydration, which may accompany diarrhea.
• Tell patient that tongue and stools may temporarily turn gray-black.
• Urge patient to consult with prescriber before giving drug to children or teenagers during or after recovery from the flu or chickenpox.
• Inform patient that all forms of drug are effective against traveler's diarrhea. Tablets and caplets may be more convenient to carry.
• Tell patient to watch for hives, ringing in the ears, and rectal bleeding.

**SAFETY ALERT!**

# bivalirudin

bye-VAL-ih-roo-din

Angiomax

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Direct thrombin inhibitor
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 250-mg vial

## INDICATIONS & DOSAGES

➤ **Anticoagulation in patients with unstable angina undergoing percutaneous transluminal coronary angioplasty (PTCA); anticoagulation in patients with unstable angina undergoing percutaneous coronary intervention (PCI), with provisional use of a platelet glycoprotein IIb/IIIa inhibitor (GPI)**

*Adults:* 0.75 mg/kg I.V. bolus followed by a continuous infusion of 1.75 mg/kg/hour during the procedure. Check activated clotting time 5 minutes after bolus dose is given. May give additional 0.3 mg/kg bolus dose if needed. Infusion may continue for up to 4 hours after procedure. After 4-hour infusion, may give an additional infusion of 0.2 mg/kg/hour for up to 20 hours, if needed. Use with 300 to 325 mg aspirin.

➤ **Patients undergoing PCI who have or are at risk for heparin-induced thrombocytopenia (HIT) or heparin-induced thrombocytopenia and thrombosis syndrome (HITTS)**

*Adults:* 0.75 mg/kg I.V. bolus, followed by a continuous infusion of 1.75 mg/kg/hour throughout the procedure. Consult prescriber about continuing the infusion after PCI.

***Adjust-a-dose:*** For patients with creatinine clearance of 30 ml/minute or less, decrease infusion rate to 1 mg/kg/hour. For patients on hemodialysis, reduce infusion rate to 0.25 mg/kg/hour. No reduction of bolus dose is needed.

## ADMINISTRATION

**I.V.**

▼ Reconstitute each 250-mg vial with 5 ml of sterile water for injection.
▼ Dilute each reconstituted vial in 50 ml $D_5W$ or normal saline solution to yield a final concentration of 5 mg/ml.
▼ To prepare low-rate infusion, further dilute each reconstituted vial in 500 ml $D_5W$ or normal saline solution to yield a final concentration of 0.5 mg/ml.
▼ Solutions with concentrations of 0.5 to 5 mg/ml are stable at room temperature for 24 hours.
▼ **Incompatibilities:** Alteplase, amiodarone, amphotericin B, chlorpromazine,

diazepam, prochlorperazine, reteplase, streptokinase, vancomycin. *Note:* Compatible with dobutamine at concentrations up to 4 mg/ml, but incompatible at concentration of 12.5 mg/ml.

## ACTION

Binds specifically and rapidly to thrombin to produce an anticoagulant effect.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Rapid | Immediate | 1–2 hr |

*Half-life:* 25 minutes in patients with normal renal function.

## ADVERSE REACTIONS

**CNS:** anxiety, *headache,* insomnia, nervousness, fever, *pain.*
**CV:** ***bradycardia,*** hypertension, *hypotension.*
**GI:** abdominal pain, dyspepsia, *nausea,* vomiting.
**GU:** urine retention.
**Hematologic:** ***severe, spontaneous bleeding (cerebral, retroperitoneal, GU, GI).***
**Musculoskeletal:** *back pain,* pelvic pain.
**Skin:** pain at injection site.

## INTERACTIONS

**Drug-drug.** *GPIIb/IIIa inhibitors, heparin, thrombolytics, warfarin:* May increase risk of hemorrhage. Use together cautiously.
**Drug-herb.** *Angelica (dong quai), boldo, bromelains, capsicum, chamomile, dandelion, danshen, devil's claw, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, licorice, meadowsweet, onion, passion flower, red clover, willow:* May increase risk of bleeding. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those with active major bleeding. Avoid using in patients with unstable angina who aren't undergoing PTCA or PCI or in patients with other acute coronary syndromes.
- Use cautiously in patients with HIT or HITTS and in those with diseases linked to increased risk of bleeding.
- Use cautiously in breast-feeding women; it's unknown if drug appears in breast milk.

## NURSING CONSIDERATIONS

- Monitor coagulation test results, hemoglobin level, and hematocrit before starting therapy and periodically thereafter.
- Circumstances for provisional use of a GPI during PCI include decreased thrombolysis-in-MI, flow; slow reflow; dissection with decreased flow; new or suspected thrombus; persistent residual stenosis; distal embolization; unplanned stent; suboptimal stenting; side-branch closure; abrupt closure; instability; and prolonged ischemia.
- Obtain a complete list of patient's prescription and OTC drugs and supplements, including herbs.

***Alert:*** Hemorrhage can occur at any site in the body. If patient has unexplained decrease in hematocrit, decrease in blood pressure, or other unexplained symptoms, suspect hemorrhage.

- Monitor venipuncture sites for bleeding, hematoma, or inflammation.
- Puncture-site hemorrhage and catheterization-site hematoma may occur in patients age 65 and older more often than in younger patients.
- Don't give drug I.M.

## PATIENT TEACHING

- Advise patient that drug can cause bleeding and tell him to report unusual bruising or bleeding (nosebleeds, bleeding gums) or tarry stools immediately.
- Counsel patient that drug is given with aspirin and caution him to avoid other aspirin-containing drugs or NSAIDs while receiving this drug.
- Advise patient to consult with prescriber before initiating any herbal therapy; many herbs have anticoagulant, antiplatelet, and fibrinolytic properties.
- Advise patient to avoid activities that carry a risk of injury and instruct him to use a soft toothbrush and electric razor while on drug.

**SAFETY ALERT!**

# bleomycin sulfate

blee-oh-MYE-sin

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Cytotoxic glycopeptide antibiotic
*Pregnancy risk category D*

## AVAILABLE FORMS

*Injection:* 15-unit vials, 30-unit vials

## INDICATIONS & DOSAGES

➤ **Squamous cell carcinoma (head, neck, skin, penis, cervix, and vulva), non-Hodgkin lymphoma, testicular carcinoma**

*Adults:* 2 units or less of bleomycin for injection for the first two doses. If no acute reaction occurs, then 10 to 20 units/$m^2$ I.V., I.M., or subcutaneously once or twice weekly to total of 400 units.

➤ **Hodgkin lymphoma**

*Adults:* 2 units or less of bleomycin for injection for the first two doses. If no acute reaction occurs, then 10 to 20 units/$m^2$ I.V., I.M., or subcutaneously one or two times weekly. After 50% response, maintenance dose is 1 unit I.V. or I.M. daily or 5 units I.V. or I.M. weekly. Total cumulative dose is 400 units.

➤ **Malignant pleural effusion**

*Adults:* 60 units given as single-dose bolus intrapleural injection.

➤ **Malignant pericardial effusion** ♦

*Adults:* Dissolve bleomycin 5 to 20 mg in 10 to 20 ml of normal saline and instill via catheter into pericardial space after pericardiocentesis. Clamp catheter for up to 6 hours. Continue drainage of effusion until volume is less than 20 to 30 ml/day. Repeat if needed to reach desired drainage level.

➤ **Malignant peritoneal effusion** ♦

*Adults:* 30 to 60 mg in 100 ml of normal saline administered by intraperitoneal infusion.

➤ **Warts** ♦

*Adults:* Reconstitute with normal saline to 0.5 to 1 unit/ml. Give 0.1 to 2 units intralesionally.

***Adjust-a-dose:*** For patients with creatinine clearance of 40 to 50 ml/minute, give 70% of dose; for creatinine clearance of 30 to 39 ml/minute, give 60% of dose; for creatinine clearance of 20 to 29 ml/minute, give 55% of dose; for creatinine clearance of 10 to 19 ml/minute, give 45% of dose; and for creatinine clearance of 5 to 9 ml/minute, give 40% of dose.

## ADMINISTRATION

**I.V.**

▼ Preparing and giving parenteral form of drug may be mutagenic, teratogenic, and carcinogenic. Follow facility policy to reduce risks.

▼ Drug may adsorb to plastic I.V. bags. For prolonged infusions, use glass containers.

▼ Reconstitute drug with 5 or 10 ml of normal saline solution for injection to equal 3 units/ml solution.

▼ Use reconstituted solution within 24 hours.

▼ Refrigerate unopened vials containing dry powder.

▼ **Incompatibilities:** Amino acids; aminophylline; ascorbic acid injection; cefazolin; diazepam; drugs containing sulfhydryl groups; fluids containing dextrose; furosemide; hydrocortisone; methotrexate; mitomycin; nafcillin; penicillin G; riboflavin; solutions containing divalent and trivalent cations, especially calcium salts and copper; terbutaline sulfate.

**I.M.**

● Dilute 15 unit-vial in 1 to 5 ml or 30 unit-vial in 2 to 10 ml of sterile water for injection, bacteriostatic water for injection, or normal saline solution for injection.
● Monitor injection site for irritation.

**Subcutaneous**

● Dilute 15 unit-vial in 1 to 5 ml or 30 unit-vial in 2 to 10 ml of sterile water for injection, bacteriostatic water for injection, or normal saline solution for injection.
● Monitor injection site for irritation.

**Intrapleural**

● For intrapleural use, dilute 60 units of drug in 50 to 100 ml normal saline solution for injection; give drug through a thoracotomy tube.
● If patient's condition requires sclerosis, instill drug when chest tube drainage is 100 to 300 ml/24 hours; ideally, drainage

should be less than 100 ml. After instillation, clamp thoracotomy tube and move patient from his back to his left then right side for the next 4 hours. Remove clamp and reestablish suction. Amount of time chest tube is left in place after sclerosis depends on patient's condition.
• Don't use adhesive dressings.

## ACTION

May inhibit DNA synthesis and cause scission of single- and double-stranded DNA; also inhibits RNA and protein synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V., subcut. | Unknown | Unknown | Unknown |
| I.M. | Unknown | 30–60 min | Unknown |

*Half-life:* 2 hours.

## ADVERSE REACTIONS

**CNS:** fever.
**GI:** *stomatitis, anorexia, nausea, vomiting,* diarrhea.
**Metabolic:** weight loss, hyperuricemia.
**Respiratory:** PNEUMONITIS, ***pulmonary fibrosis.***
**Skin:** *erythema, hyperpigmentation, acne, rash, striae, skin tenderness, pruritus, reversible alopecia,* hyperkeratosis, nail changes.
**Other:** *chills,* ***anaphylactoid reactions.***

## INTERACTIONS

**Drug-drug.** *Anesthesia:* May increase oxygen requirements. Monitor patient closely.
*Cardiac glycosides:* May decrease digoxin level. Monitor digoxin level closely.
*Fosphenytoin, phenytoin:* May decrease phenytoin and fosphenytoin levels. Monitor drug levels closely.

## EFFECTS ON LAB TEST RESULTS

• May increase uric acid level.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug.
• Use cautiously in patients with renal or pulmonary impairment.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug should be administered under the supervision of a physician experienced in the use of cancer chemotherapeutic agents. ▮
• Obtain pulmonary function tests. If tests show a marked decline, stop drug.
**Black Box Warning** Fatal pulmonary fibrosis may occur, especially when cumulative dose exceeds 400 units. ▮
**Black Box Warning** Monitor lymphoma patient for idiosyncratic reaction (hypotension, confusion, fever, and wheezing) after receiving drug. ▮
***Alert:*** Adverse pulmonary reactions are more common in patients older than age 70. Also, in patients receiving radiation therapy, patients with lung disease, and patients who need oxygen therapy, pulmonary toxic adverse effects may be increased.
• Monitor chest X-ray and listen to lungs regularly.
• Watch for fever, which may be treated with antipyretics. Fever usually occurs within 3 to 6 hours of administration.
***Alert:*** Watch for hypersensitivity reactions, which may be delayed for several hours, especially in patients with lymphoma. (Give test dose of 1 to 2 units before first two doses in these patients. If no reaction occurs, follow regular dosage schedule.)

## PATIENT TEACHING

• Warn patient that hair loss may occur but is usually reversible.
• Tell patient to report adverse reactions promptly and to take infection-control and bleeding precautions.
• For patient who is to receive anesthesia, tell him to inform anesthesiologist that he has taken this drug. High oxygen levels inhaled during surgery may enhance pulmonary toxicity of drug.

**SAFETY ALERT!**

## bortezomib

bore-TEZ-uh-mib

Velcade

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Proteosome inhibitor
*Pregnancy risk category D*

### AVAILABLE FORMS

*Powder for injection:* 3.5 mg

### INDICATIONS & DOSAGES

**➤ Previously untreated multiple myeloma**

*Adults:* 1.3 mg/m$^2$ I.V. over 3 to 5 seconds in combination with oral melphalan and oral prednisone for nine 6-week treatment cycles. In cycles 1–4, bortezomib is given twice weekly (days 1, 4, 8, 11, 22, 25, 29, and 32). In cycles 5–9, bortezomib is given once weekly (days 1, 8, 22, and 29). Separate consecutive doses of drug by at least 72 hours. Prior to initiating any cycle, platelet count should be $70 \times 10^9$/L or greater, ANC should be $1 \times 10^9$/L or greater, and non-hematology toxicities should have resolved to grade 1 or baseline.

***Adjust-a-dose:*** If prolonged grade 4 neutropenia or thrombocytopenia, or thrombocytopenia with bleeding in previous cycle, consider reducing dose by 25% for next cycle. If platelet count less than or equal to $30 \times 10^9$/L or ANC $0.75 \times 10^9$/L or less on a day other than day 1, withhold dose. If several doses in consecutive cycles are withheld due to toxicity, reduce dose by 1 dose level (from 1.3 mg/m$^2$ to 1 mg/m$^2$, or from 1 mg/m$^2$ to 0.7 mg/m$^2$). For grade 3 non-hematological toxicities, withhold drug until symptoms are grade 1 or baseline, then restart with one dose level reduction. If patient has neuropathic pain, peripheral neuropathy, or both, see table.

If patient has moderate to severe hepatic dysfunction with bilirubin level greater than 1.5 to 3 times upper limit of normal, reduce dose of first cycle to 0.7 mg/m$^2$. If patient tolerates this dose, may increase to 1 mg/m$^2$ in subsequent cycles. Based on tolerability, dose may be reduced to 0.5 mg/m$^2$.

**➤ Multiple myeloma or mantle cell lymphoma that still progresses after at least one therapy**

*Adults:* 1.3 mg/m$^2$ by I.V. bolus twice weekly for 2 weeks (days 1, 4, 8, and 11), followed by a 10-day rest period (days 12 through 21). This 3-week period is a treatment cycle. For therapy longer than 8 cycles, may adjust dosage schedule to once weekly for 4 weeks on days 1, 8, 15, and 22, followed by a rest period on days 23 through 35. Separate consecutive doses of drug by at least 72 hours.

***Adjust-a-dose:*** If grade 3 nonhematologic or grade 4 hematologic toxicity (excluding neuropathy) develops, withhold drug. When toxicity has resolved, restart at a 25% reduced dose. If patient has neuropathic pain, peripheral neuropathy, or both, see table.

If patient has moderate to severe hepatic dysfunction with bilirubin level greater than 1.5 to 3 times upper limit of normal, reduce dose of first cycle to 0.7 mg/m$^2$. If patient tolerates this dose, may increase to 1 mg/m$^2$ in subsequent cycles. Based on tolerability, dose may be reduced to 0.5 mg/m$^2$.

| *Severity of neuropathy* | *Dosage* |
|---|---|
| Grade 1 (paresthesias, loss of reflexes, or both) without pain or loss of function | No change. |
| Grade 1 with pain or grade 2 (function altered but not activities of daily living) | Reduce to 1 mg/m$^2$. |
| Grade 2 with pain or grade 3 (interference with activities of daily living) | Hold drug until toxicity resolves; then start at 0.7 mg/m$^2$ once weekly. |
| Grade 4 (permanent sensory loss that interferes with function) | Stop drug. |

### ADMINISTRATION

**I.V.**

▼ Use caution and aseptic technique when preparing and handling drug. Wear gloves and protective clothing to prevent skin contact.

▼ Reconstitute with 3.5 ml of normal saline solution and give by I.V. bolus over 3 to 5 seconds.

▼ Inspect solution prior ro administration. Don't give if discolored or if particles are seen.
▼ Reconstituted drug may be stored up to 3 hours in a syringe at 59° to 86° F (15° to 30° C), but total storage time must not exceed 8 hours.
▼ Store unopened vial at a controlled room temperature, in original packaging, protected from light.
▼ **Incompatibilities:** None reported.

## ACTION

Disrupts intracellular homeostatic mechanisms by inhibiting the 26S proteosome, which regulates intracellular levels of certain proteins, causing cells to die.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 9 to 15 hours.

## ADVERSE REACTIONS

**CNS:** *anxiety, asthenia, dizziness, dysesthesia, fever, headache, insomnia, paresthesia, peripheral neuropathy, rigors.*
**CV:** *edema, hypotension.*
**EENT:** *blurred vision.*
**GI:** *abdominal pain, constipation, decreased appetite, diarrhea, dysgeusia, dyspepsia, nausea, vomiting.*
**Hematologic:** **NEUTROPENIA, THROMBOCYTOPENIA,** *anemia.*
**Musculoskeletal:** *arthralgia, back pain, bone pain, limb pain, muscle cramps, myalgia.*
**Respiratory:** *cough, dyspnea, pneumonia, upper respiratory tract infection.*
**Skin:** *pruritus,* rash.
**Other:** *dehydration, herpes zoster, pyrexia.*

## INTERACTIONS

**Drug-drug.** *Antihypertensives:* May cause hypotension. Monitor patient's blood pressure closely.
*Drugs linked to peripheral neuropathy, such as amiodarone, antivirals, isoniazid, nitrofurantoin, statins:* May worsen neuropathy. Use together cautiously.
*Inhibitors or inducers of CYP3A4:* May increase risk of toxicity or may reduce drug's effects. Monitor patient closely.
*Oral antidiabetics:* May cause hypoglycemia or hyperglycemia. Monitor glucose level closely.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level.
- May increase or decrease glucose level.
- May decrease neutrophil and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to bortezomib, boron, or mannitol.
- Use cautiously in patients with hepatic or renal impairment or with a history of syncope or in those who are dehydrated or receiving other drugs known to cause hypotension.
- Safety and effectiveness haven't been established for pregnant women or children.

***Overdose S&S:*** Symptomatic hypotension, thrombocytopenia.

## NURSING CONSIDERATIONS

- Monitor for evidence of neuropathy, such as a burning sensation, hyperesthesia, hypoesthesia, paresthesia, discomfort, or neuropathic pain.
- Monitor for signs and symptoms of tumor lysis syndrome (hyperuricemia, hyperkalemia, hyperphosphatemia, hypocalcemia, and acute renal failure).
- Watch carefully for adverse effects, especially in the elderly.
- Be sure patient has an order for an antiemetic, antidiarrheal, or both to treat drug-induced nausea, vomiting, or diarrhea.
- Provide fluid and electrolyte replacement to prevent dehydration.
- To manage orthostatic hypotension, adjust antihypertensive dosage, maintain hydration status, and give mineralocorticoids.
- Dialysis may reduce drug level; give after dialysis.

***Alert:*** Because thrombocytopenia is common, monitor patient's CBC and platelet counts carefully during treatment, prior to each dose, and especially on day 11.

## PATIENT TEACHING

- Tell patient to notify prescriber about new or worsening peripheral neuropathy.

- Urge women to use effective contraception and not to breast-feed during treatment.
- Teach patient how to avoid dehydration, and stress the need to tell prescriber about dizziness, light-headedness, or fainting spells.
- Tell patient to use caution when driving or performing other hazardous activities because drug may cause fatigue, dizziness, faintness, light-headedness, and doubled or blurred vision.

## bosentan

bow-SEN-tan

Tracleer

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Endothelin-receptor antagonist
*Pregnancy risk category X*

### AVAILABLE FORMS

*Tablets:* 62.5 mg, 125 mg

### INDICATIONS & DOSAGES

**Black Box Warning** Only prescribers and pharmacies registered with the Tracleer Access Program may prescribe and distribute bosentan. ■

➤ **Pulmonary arterial hypertension in patients with World Health Organization class III (with mild exertion) or IV (at rest) symptoms, to improve exercise ability and decrease rate of clinical worsening**

*Adults:* 62.5 mg P.O. b.i.d. in the morning and evening for 4 weeks. Increase to maintenance dosage of 125 mg P.O. b.i.d. in the morning and evening.

***Adjust-a-dose:*** For patients who develop ALT and AST abnormalities, the dose may need to be decreased or the therapy stopped until ALT and AST levels return to normal. If therapy is resumed, begin with initial dose. Test levels within 3 days; then give using the following table. If liver function abnormalities are accompanied by symptoms of liver injury or if bilirubin level is at least twice the upper limit of normal (ULN), stop treatment and don't restart. In patients who weigh less than 40 kg (88 lb), the initial and maintenance dosage is 62.5 mg b.i.d.

| *ALT and AST levels* | *Treatment and monitoring recommendations* |
|---|---|
| >3 and <5 times upper limit of normal (ULN) | Confirm with repeat test; if confirmed, reduce dose to 62.5 mg b.i.d. or interrupt treatment and retest every 2 wk. Once ALT and AST levels return to pretreatment levels, continue or reintroduce treatment at starting dose. |
| >5 and <8 times ULN | Confirm with repeat test; if confirmed, stop treatment and retest at least every 2 wk. Once levels return to pretreatment levels, consider reintroduction of treatment. |
| >8 times ULN | Stop treatment; don't consider restarting drug. |

### ADMINISTRATION

**P.O.**

- Give drug in morning and evening without regard for meals.

### ACTION

Specific and competitive antagonist for endothelin-1 (ET-1). ET-1 levels are elevated in patients with pulmonary arterial hypertension, suggesting a pathogenic role for ET-1 in this disease.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3–5 hr | Unknown |

*Half-life:* About 5 hours.

### ADVERSE REACTIONS

**CNS:** *headache,* fatigue.
**CV:** edema, flushing, hypotension, palpitations.
**EENT:** *nasopharyngitis.*
**GI:** dyspepsia.
**Hematologic:** *anemia.*
**Hepatic:** HEPATOTOXICITY.
**Skin:** pruritus.
**Other:** leg edema.

### INTERACTIONS

**Drug-drug.** ***Cyclosporine A:*** May increase bosentan level and decrease cyclosporine level. Use together is contraindicated.

*Glyburide:* May increase risk of elevated liver function test values and decrease levels of both drugs. Use together is contraindicated.

*Hormonal contraceptives:* May cause contraceptive failure. Advise use of an additional method of birth control.
*Ketoconazole:* May increase bosentan effect. Watch for adverse effects.
*Rifampin:* May alter bosentan level. Monitor hepatic function weekly for 4 weeks followed by routine monitoring.
*Ritonavir:* May increase risk of bosentan toxicity. Use together is contraindicated.
*Simvastatin, other statins:* May decrease levels of these drugs. Monitor cholesterol levels to assess need to adjust statin dose.
*Tacrolimus:* May increase bosentan levels. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

**Black Box Warning** May increase AST, ALT, and bilirubin levels. ▮
• May decrease hemoglobin level and hematocrit.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug and in those taking cyclosporine A, ritonavir, or glyburide.
**Black Box Warning** Generally avoid using in patients with moderate to severe liver impairment or in those with elevated aminotransferase levels greater than three times the ULN. ▮
**Black Box Warning** Contraindicated in pregnant women. ▮
• Use cautiously in patients with mild liver impairment.
• Because it's unknown whether drug appears in breast milk, drug isn't recommended for breast-feeding women.
• Safety and efficacy in children haven't been established.
⚠ ***Overdose S&S:*** Headache, nausea, vomiting.

## NURSING CONSIDERATIONS

**Black Box Warning** Use of this drug can cause serious liver injury. AST and ALT level elevations may be dose dependent and reversible, so measure these levels before treatment and monthly thereafter, adjusting dosage accordingly. If elevations are accompanied by symptoms of liver injury (nausea, vomiting, fever, abdominal pain, jaundice, or unusual lethargy or fatigue) or if bilirubin level increases by greater than twice the ULN, notify prescriber immediately. ▮
• Fluid retention and heart failure may occur. Patient may require diuretics, fluid management, or hospitalization for decompensating heart failure.
• Monitor hemoglobin level after 1 and 3 months of therapy; then every 3 months.
• Gradually reduce dose before stopping drug.

## PATIENT TEACHING

• Advise patient to take doses in the morning and evening, with or without food.
**Black Box Warning** Warn patient to avoid becoming pregnant while taking this drug. Hormonal contraceptives, including oral, implantable, and injectable methods, may not be effective when used with this drug. Advise patient to use a backup method of contraception. A monthly pregnancy test must be performed. ▮
• Inform male patients of risk of low sperm count.
• Advise patient to have liver function tests and blood counts performed regularly.

# brimonidine tartrate

bri-MOE-ni-deen

Alphagan P

*Therapeutic class:* Antiglaucoma
*Pharmacologic class:* Selective alpha$_2$ agonist
*Pregnancy risk category B*

## AVAILABLE FORMS

*Ophthalmic solution:* 0.1%, 0.15%, 0.2%

## INDICATIONS & DOSAGES

➤ **To reduce intraocular pressure in open-angle glaucoma or ocular hypertension**
*Adults and children age 2 and older:* 1 drop in affected eye t.i.d., about 8 hours apart.

## ADMINISTRATION

**Ophthalmic**
• Don't touch tip of dropper to eye or surrounding tissue.

## ACTION
Reduces aqueous humor production and increases uveoscleral outflow.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Unknown | 30 min–2½ hr | Unknown |

*Half-life:* 2 hours.

## ADVERSE REACTIONS
**CNS:** asthenia, dizziness, headache.
**CV:** hypertension, hypotension.
**EENT:** *allergic conjunctivitis, ocular hyperemia, pruritus,* abnormal vision, allergic reaction, blepharitis, burning, conjunctival edema, hemorrhage, or inflammation, dryness, eyelid edema or erythema, follicular conjunctivitis, foreign body sensation, increased tearing, pain, pharyngitis, photophobia, rhinitis, sinus infection or inflammation, stinging, superficial punctate keratopathy, visual disturbances, visual field defect, vitreous floaters, worsened visual acuity.
**GI:** dyspepsia, oral dryness.
**Respiratory:** bronchitis, cough, dyspnea.
**Skin:** rash.
**Other:** flulike syndrome.

## INTERACTIONS
**Drug-drug.** *Apraclonidine, dorzolamide, pilocarpine, timolol:* May have additive IOP-lowering effects. Use cautiously together.
*Antihypertensives, beta blockers, cardiac glycosides:* May further decrease blood pressure or pulse. Monitor vital signs.
*CNS depressants:* May increase effects. Use cautiously together.
*MAO inhibitors:* May increase effects. Avoid using together.
*Tricyclic antidepressants:* May interfere with brimonidine's effect. Use cautiously together.
**Drug-lifestyle.** *Alcohol use:* May increase CNS-depressant effect. Urge patient to avoid alcohol.

## EFFECTS ON LAB TEST RESULTS
None reported.

## CONTRAINDICATIONS & CAUTIONS
• Contraindicated in patients hypersensitive to drug or benzalkonium chloride and in those taking MAO inhibitors.
• Use cautiously in patients with CV disease, cerebral or coronary insufficiency, hepatic or renal impairment, depression, Raynaud phenomenon, orthostatic hypotension, or thromboangiitis obliterans.

## NURSING CONSIDERATIONS
• Monitor IOP because drug effect may reverse after first month of therapy.

## PATIENT TEACHING
• Tell patient to wait at least 15 minutes after instilling drug before wearing soft contact lenses.
• Caution patient to avoid hazardous activities because of risk of decreased mental alertness, fatigue, or drowsiness.
• Advise patient to avoid alcohol.
• If patient is using more than one ophthalmic drug, tell him to apply them at least 5 minutes apart.

# bromfenac
BROM-fen-ak

Xibrom

*Therapeutic class:* Anti-inflammatory (ophthalmic)
*Pharmacologic class:* NSAID
*Pregnancy risk category C*

## AVAILABLE FORMS
*Ophthalmic solution:* 0.09%

## INDICATIONS & DOSAGES
➤ **Inflammation and pain after cataract surgery**
*Adults:* 1 drop in each eye b.i.d., starting 24 hours after surgery and continuing for 2 weeks.

## ADMINISTRATION
**Ophthalmic**
• Ask patient if he's sensitive to sulfites, aspirin, or other NSAIDs before treatment. Drug contains sulfite, which may cause allergic-type reactions, including anaphylaxis and life-threatening or less severe asthmatic episodes, in patients sensitive to sulfites.

• Begin treatment at least 24 hours after surgery and continue for 2 weeks. Starting treatment less than 24 hours after surgery or giving for longer than 14 days increases risk of ocular adverse effects.
• After giving drop, have patient close his eyes and apply gentle pressure to lacrimal sac for 1 to 2 minutes.

## ACTION

Blocks prostaglandin synthesis by inhibiting cyclooxygenase 1 and 2.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** headache.
**EENT:** abnormal sensation in the eye, burning, conjunctival hyperemia, eye irritation, eye pain, eye pruritus, eye redness, iritis, keratitis, stinging.

## INTERACTIONS

**Drug-drug.** *Drugs that affect coagulation:* May further increase bleeding tendency or prolong bleeding time. Avoid using together, if possible, or monitor patient closely for bleeding.
*Topical corticosteroids:* May delay healing. Avoid using together, if possible, or monitor healing closely.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its ingredients. Drug contains sulfite, which may cause allergic-type reactions, including anaphylaxis and life-threatening or less severe asthmatic episodes in patients sensitive to sulfites.
• Use cautiously in patients with bleeding tendencies, those taking anticoagulants, and those sensitive to aspirin products, phenylacetic acid derivatives, and other NSAIDs.
• Use cautiously in patients who have had complicated or repeat ocular surgeries or those with corneal denervation, corneal epithelial defects, diabetes mellitus, ocular surface diseases (such as dry-eye syndrome), or rheumatoid arthritis because of the increased risk of corneal adverse effects, which may threaten sight.
• Use in pregnant women only if potential benefit justifies risk; avoid use late in pregnancy because NSAIDs may cause premature closure of the ductus arteriosus, a necessary structure of fetal circulation.
• Use cautiously in breast-feeding women.

## NURSING CONSIDERATIONS

• Sulfite sensitivity is more common in patients with asthma than in those without asthma. If patient has asthma, monitor closely.
• If patient takes an anticoagulant, watch closely for increased bleeding.

## PATIENT TEACHING

• Teach patient how to instill the drops.
• Instruct patient to start therapy 24 hours after surgery and to continue for 14 days.
• Tell patient not to use for longer than 2 weeks after surgery or to save unused amount for other conditions.
• Tell patient the signs and symptoms of adverse effects. If bothersome or serious adverse effects occur, advise patient to stop therapy and contact prescriber.
• Tell patient to store drug at room temperature.
• Advise patient not to use while wearing contact lenses.

# bromocriptine mesylate

broe-moe-KRIP-teen

Cycloset, Parlodel

*Therapeutic class:* Antiparkinsonian
*Pharmacologic class:* Dopamine receptor agonist
*Pregnancy risk category B*

## AVAILABLE FORMS

*Capsules:* 5 mg
*Tablets:* 0.8 mg (Cycloset), 2.5 mg (Parlodel)

## INDICATIONS & DOSAGES

➤ **Parkinson disease (not Cycloset)**
*Adults:* 1.25 mg P.O. b.i.d. with meals. Increase dosage by 2.5 mg/day every 14 to 28 days, up to 100 mg daily.

➤ **Amenorrhea and galactorrhea from hyperprolactinemia; hypogonadism, infertility (not Cycloset)**
*Adults and adolescents age 16 and older:* 1.25 to 2.5 mg P.O. daily, increased by 2.5 mg daily at 2- to 7-day intervals until desired effect occurs. Therapeutic daily dose is 2.5 to 15 mg.
*Children ages 11 to 15:* 1.25 to 2.5 mg P.O. daily. May increase as tolerated until therapeutic response is achieved. Range, 2.5 to 10 mg daily in children with prolactin-secreting pituitary adenomas.

➤ **Acromegaly (not Cycloset)**
*Adults:* 1.25 to 2.5 mg P.O. with bedtime snack for 3 days. Another 1.25 to 2.5 mg may be added every 3 to 7 days until therapeutic benefit occurs. Maximum, 100 mg daily.

➤ **Type 2 diabetes mellitus (Cycloset only)**
*Adults:* Initially, 0.8 mg P.O. daily. May increase by 0.8 mg weekly until maximum tolerated dosage of 1.6 to 4.8 mg daily is achieved.

➤ **Traumatic brain injury ♦**
*Adults:* 2.5 mg P.O. daily. Continue long-term if response is adequate.

## ADMINISTRATION

**P.O.**
- Give drug in the evening with food to minimize adverse reactions.
- For treatment of type 2 diabetes mellitus, give Cycloset within 2 hours of patient's waking in the morning.

## ACTION

Inhibits secretion of prolactin and acts as a dopamine-receptor agonist by activating postsynaptic dopamine receptors; improves glycemic control.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 2 hr | 8 hr | 24 hr |

*Half-life:* 15 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness, headache, fatigue,* ***seizures, stroke,*** mania, light-headedness, drowsiness, delusions, hallucinations, nervousness, insomnia, depression.
**CV:** *orthostatic hypotension,* ***acute MI.***
**EENT:** nasal congestion, rhinitis, blurred vision.
**GI:** *nausea, abdominal cramps, constipation,* diarrhea, vomiting, anorexia.
**GU:** urine retention, urinary frequency.
**Skin:** coolness and pallor of fingers and toes.

## INTERACTIONS

**Drug-drug.** *Amitriptyline, haloperidol, imipramine, loxapine, MAO inhibitors, methyldopa, metoclopramide, phenothiazines, reserpine:* May interfere with bromocriptine's effects. Bromocriptine dosage may need to be increased.
*Antihypertensives:* May increase hypotensive effects. Adjust dosage of antihypertensive.
*CYP3A4 inhibitors or inducers:* May increase or decrease circulating levels of Cycloset, respectively. Use together with caution.
*Dopamine receptor agonists (butyrophenones, metocloperamide, phenothiazenes, thioxanthenes):* May diminish effects of Cycloset. Concurrent use isn't recommended.
*Ergot-related drugs:* May increase occurrence of ergot-related adverse effects and reduce effectiveness of these therapies. Don't use ergot agents within 6 hours of Cycloset administration.
*Erythromycin:* May increase bromocriptine level and risk of adverse reactions. Use together cautiously.
*Estrogens, hormonal contraceptives, progestins:* May interfere with effects of bromocriptine. Avoid using together.
*Levodopa:* May have additive effects. Adjust dosage of levodopa, if needed.
**Drug-lifestyle.** *Alcohol use:* May cause disulfiram-like reaction. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, BUN, CK, and uric acid levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to ergot derivatives and in those with uncontrolled hypertension, toxemia of pregnancy, severe ischemic heart disease, hereditary galactose intolerance, lactase deficiency, glucose-galactose malabsorption, or peripheral vascular disease.
- Cycloset is contraindicated in patients with syncopal migraines or severe psychotic disorders and in breast-feeding women.
- Use cautiously in patients with impaired renal or hepatic function and in those with a history of MI with residual arrhythmias.
- Use Cycloset cautiously in patients taking antihypertensive medications.

***Overdose S&S:*** Nausea, vomiting, constipation, diaphoresis, dizziness, pallor, severe hypotension, malaise, confusion, lethargy, drowsiness, delusions, hallucinations, repetitive yawning.

## NURSING CONSIDERATIONS

- For Parkinson disease, bromocriptine usually is given with levodopa or levodopa and carbidopa. The levodopa and carbidopa may need to be reduced.

***Alert:*** Monitor patient for adverse reactions, which occur in 68% of patients, particularly at start of therapy. Most reactions are mild to moderate; nausea is most common. Minimize adverse reactions by gradually adjusting dosages to effective levels. Adverse reactions are more common when drug is used for Parkinson disease.

- Baseline and periodic evaluations of cardiac, hepatic, renal, and hematopoietic function are recommended during prolonged therapy.
- Drug may lead to early postpartum conception. After menses resumes, test for pregnancy every 4 weeks or as soon as a period is missed.
- Cycloset can cause orthostatic hypotension and syncope, particularly at start of therapy or when dosage is increased. Assess orthostatic vital signs before initiation of therapy and periodically thereafter.
- ***Look alike–sound alike:*** Don't confuse bromocriptine with benztropine or brimonidine, or Parlodel with pindolol.

## PATIENT TEACHING

- Instruct patient to take drug with meals.
- Tell patient to take Cycloset within 2 hours of waking in the morning.
- Advise patient to use contraceptive methods during treatment other than oral contraceptives or subdermal implants.
- Instruct patient to avoid dizziness and fainting by rising slowly to an upright position and avoiding sudden position changes.
- Inform patient that it may take 8 weeks or longer for menses to resume and excess production of milk to slow down.
- Advise patient to avoid alcohol while taking drug.
- Advise patients not to operate heavy machinery if somnolence occurs while taking Cycloset.

# budesonide (inhalation)

byoo-DES-oh-nide

Pulmicort Flexhaler, Pulmicort Respules, Pulmicort Turbuhaler†

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Corticosteroid
*Pregnancy risk category B*

## AVAILABLE FORMS

*Dry powder inhaler:* 90 mcg/dose, 180 mcg/dose, 200 mcg/dose†
*Inhalation suspension:* 0.25 mg, 0.5 mg, 1 mg

## INDICATIONS & DOSAGES

➤ **As a preventative in maintenance of asthma**

*All patients:* Use lowest effective dose after stabilizing asthma.

➤ **Turbuhaler**†

*Adults previously taking bronchodilator alone:* Initially, inhaled dose of 200 to 400 mcg b.i.d. to maximum of 400 mcg b.i.d.
*Adults previously taking inhaled corticosteroid:* Initially, inhaled dose of 200 to 400 mcg b.i.d. to maximum of 800 mcg b.i.d.
*Adults previously taking oral corticosteroid:* Initially, inhaled dose of 400 to 800 mcg b.i.d. to maximum of 800 mcg b.i.d.

*Children older than age 6 previously taking bronchodilator alone or inhaled corticosteroid:* Initially, inhaled dose of 200 mcg b.i.d. to maximum of 400 mcg b.i.d.
*Children older than age 6 previously taking oral corticosteroid:* 400 mcg b.i.d., maximum.

➤ **Respules**

*Children ages 1 to 8 previously on bronchodilator alone:* 0.5 mg daily or 0.25 mg b.i.d. suspension via jet nebulizer.
*Children ages 1 to 8 previously on inhaled corticosteroid:* 0.5 mg daily or 0.25 mg b.i.d. suspension via jet nebulizer to maximum dose of 0.5 mg b.i.d.
***Adjust-a-dose:*** Symptomatic children not responding to nonsteroidal therapy may require starting dose of 0.25 mg daily.

➤ **Flexhaler**

*Adults:* Initially, inhaled dose of 360 mcg b.i.d. to maximum 720 mcg b.i.d.
*Children age 6 and older:* Initially, inhaled dose of 180 mcg b.i.d. to maximum 360 mcg b.i.d.

## ADMINISTRATION

### Inhalational

- Give inhalation suspension at regular intervals once a day or b.i.d., as directed.
- Give suspension with a jet nebulizer connected to a compressor with adequate airflow. Make sure that it's equipped with a mouthpiece or suitable face mask.
- Total daily dose may be increased or given as a divided dose to improve control if needed. Titrate dosage downward again after asthma is stabilized.
- When aluminum foil envelope has been opened, the shelf-life of unused ampules is 2 weeks when protected from light.
- Prime inhaler before first use.

## ACTION

Exhibits potent glucocorticoid activity and weak mineralocorticoid activity. Drug inhibits mast cells, macrophages, and mediators (such as leukotrienes) involved in inflammation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Inhalation, powder | 24 hr | 1–2 wk | Unknown |
| Inhalation, Respules | 2–8 days | 4–6 wk | Unknown |

*Half-life:* 2 to 3 hours.

## ADVERSE REACTIONS

**CNS:** *headache*, asthenia, fever, hypertonia, insomnia, pain, syncope.
**EENT:** *sinusitis*, *pharyngitis*, rhinitis, *otitis media*, voice alteration.
**GI:** abdominal pain, dry mouth, dyspepsia, diarrhea, gastroenteritis, nausea, oral candidiasis, taste perversion, vomiting.
**Metabolic:** weight gain.
**Musculoskeletal:** back pain, fractures, myalgia.
**Respiratory:** *respiratory tract infection*, ***bronchospasm,*** increased cough.
**Skin:** ecchymoses.
**Other:** flulike symptoms, hypersensitivity reactions, viral infection.

## INTERACTIONS

**Drug-drug.** *Ketoconazole:* May inhibit metabolism and increase level of budesonide. Monitor patient.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with status asthmaticus or other acute asthma episodes.
- Use cautiously, if at all, in patients with active or inactive tuberculosis, ocular herpes simplex, or untreated systemic fungal, bacterial, viral, or parasitic infections.

## NURSING CONSIDERATIONS

***Alert:*** When transferring from systemic corticosteroid to this drug, use caution and gradually decrease corticosteroid dose to prevent adrenal insufficiency.
- Drug doesn't remove the need for systemic corticosteroid therapy in some situations.
- If bronchospasm occurs after use, stop therapy and treat with a bronchodilator.
- Lung function may improve within 24 hours of starting therapy, but maximum

benefit may not be achieved for 1 to 2 weeks or longer.
• For Pulmicort Respules, lung function improves in 2 to 8 days, but maximum benefit may not be seen for 4 to 6 weeks.
• Watch for *Candida* infections of the mouth or pharynx.
**Alert:** Corticosteroids may increase risk of developing serious or fatal infections in patients exposed to viral illnesses, such as chickenpox or measles.
• In rare cases, inhaled corticosteroids have been linked to increased intraocular pressure and cataract development. Stop drug if local irritation occurs.

## PATIENT TEACHING

• Tell patient that budesonide inhaler isn't a bronchodilator and isn't intended to treat acute episodes of asthma.
• Instruct patient to use the inhaler at regular intervals because effectiveness depends on twice-daily use on a regular basis, by following these instructions:
– Keep Pulmicort Turbuhaler upright (mouthpiece on top) during loading, to provide the correct dose.
– Prime Turbuhaler when using it for the first time. To prime, hold unit upright and turn brown grip fully to the right, then fully to the left until it clicks. Repeat priming.
– Load first dose by holding unit upright and turning brown grip to the right and then to the left until it clicks.
– Turn your head away from the inhaler and breathe out.
– During inhalation, Turbuhaler must be in the upright or horizontal position.
– Don't shake inhaler.
– Place mouthpiece between lips and to inhale forcefully and deeply.
– You may not taste the drug or sense it entering your lungs, but this doesn't mean it isn't effective.
– Don't exhale through the Turbuhaler. If more than one dose is required, repeat steps.
– Rinse your mouth with water and then spit out the water after each dose to decrease the risk of developing oral candidiasis.
– When 20 doses remain in the Turbuhaler, a red mark appears in the indicator window. When red mark reaches the bottom, the unit is empty.
– Don't use Turbuhaler with a spacer device and don't chew or bite the mouthpiece.
– Replace mouthpiece cover after use and always keep it clean and dry.
• Pulmicort Flexhaler must be primed before use. Refer to patient information guide for complete administration instructions.
• Tell patient that improvement in asthma control may be seen within 24 hours, although the maximum benefit may not appear for 1 to 2 weeks. If signs or symptoms worsen during this time, instruct patient to contact prescriber.
• Advise patient to avoid exposure to chickenpox or measles and to contact prescriber if exposure occurs.
• Instruct patient to carry or wear medical identification indicating need for supplementary corticosteroids during periods of stress or an asthma attack.
• Advise patient that unused Respules are good for 2 weeks after the foil envelope has been opened; however, unused Respules should be returned to the envelope to protect them from light.
• Tell patient to read and follow the patient information leaflet contained in the package.

# budesonide (intranasal)

byoo-DES-oh-nide

Rhinocort Aqua

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Corticosteroid
*Pregnancy risk category B*

## AVAILABLE FORMS

*Nasal spray:* 32 mcg/metered spray

## INDICATIONS & DOSAGES

➤ **Symptoms of seasonal or perennial allergic rhinitis**

*Adults and children age 6 and older:* 1 spray in each nostril once daily. Maximum recommended dose for adults and children 12 and older is 4 sprays per nostril once daily (256 mcg daily). Maximum recommended dose for children ages 6 to 12 is 2 sprays per nostril once daily (128 mcg daily).

## ADMINISTRATION

**Intranasal**

- Prime pump by actuating eight times before first use. Reprime pump if not used for 2 or more days. Discard bottle after 120 sprays.
- Shake before each actuation.

## ACTION

May reduce nasal inflammation by inhibiting mediators of inflammation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Intranasal | 10 hr | 2 wk | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**EENT:** epistaxis, nasal irritation, pharyngitis.
**Respiratory:** ***bronchospasm,*** cough.

## INTERACTIONS

**Drug-drug.** *Potent CYP3A4 inhibitors (erythromycin, fluconazole, indinavir, omeprazole, ritonavir):* May significantly increase serum budesonide level. Use cautiously together.
**Drug-food.** *Grapefruit, grapefruit juice:* May significantly increase serum budesonide level. Advise patient to avoid use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those who have had recent septal ulcers, nasal surgery, or nasal trauma until total healing has occurred.
- Contraindicated in those with untreated localized nasal mucosa infections.
- Use cautiously in patients with tuberculous infections, ocular herpes simplex, or untreated fungal, bacterial, or systemic viral infections.

⚠ ***Overdose S&S:*** Hyperadrenocorticism.

## NURSING CONSIDERATIONS

- Systemic effects of corticosteroid therapy may occur if recommended daily dose is exceeded.

## PATIENT TEACHING

- Tell patient to avoid exposure to chickenpox or measles.
- To instill drug, instruct patient to shake container before use, blow nose to clear nasal passages, and tilt head slightly forward and insert nozzle into nostril, pointing away from septum. Tell him to hold other nostril closed and inhale gently while spraying. Next, have him shake container and repeat in other nostril.
- Advise patient not to freeze, break, incinerate, or store canister in extreme heat; contents are under pressure.
- Advise patient to store canister with valve upward.
- Warn patient not to exceed prescribed dosage or use drug for long periods because of risk of hypothalamic-pituitary-adrenal axis suppression.
- Tell patient to notify prescriber if signs or symptoms don't improve or if they worsen in 3 weeks.
- Teach patient good nasal and oral hygiene.
- Tell patient to use drug within 6 months of opening the protective aluminum pouch.
- Instruct patient not to share drug because this could spread infection.

# budesonide (oral)

byoo-DES-oh-nide

Entocort EC

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Glucocorticoid
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 3 mg

## INDICATIONS & DOSAGES

➤ **Mild to moderate active Crohn's disease involving the ileum, ascending colon, or both**

*Adults:* 9 mg P.O. once daily in morning for up to 8 weeks. For recurrent episodes of active Crohn's disease, a repeat 8-week course may be given. Taper to 6 mg P.O. daily for 2 weeks before completely stopping.

➤ **To maintain remission in mild to moderate Crohn's disease that involves the ileum or ascending colon**
*Adults:* 6 mg P.O. daily for up to 3 months. If symptom control is maintained at 3 months, taper dose to stop therapy. Therapy for longer than 3 months doesn't have added benefit.
***Adjust-a-dose:*** In patients with moderate to severe liver disease who have increased signs or symptoms of hypercorticism, reduce dose.

## ADMINISTRATION

**P.O.**
• Give drug whole; don't break or crush capsule.

## ACTION

Significant glucocorticoid effects caused by drug's high affinity for glucocorticoid receptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | ½–10 hr | Unknown |

*Half-life:* About 2 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* dizziness, asthenia, hyperkinesia, paresthesia, tremor, vertigo, fatigue, malaise, agitation, confusion, insomnia, nervousness, somnolence, pain.
**CV:** chest pain, hypertension, palpitations, tachycardia, flushing.
**EENT:** facial edema, ear infection, eye abnormality, abnormal vision, sinusitis.
**GI:** *nausea, diarrhea,* dyspepsia, abdominal pain, flatulence, vomiting, anal disorder, aggravated Crohn's disease, enteritis, epigastric pain, fistula, glossitis, hemorrhoids, intestinal obstruction, tongue edema, tooth disorder, increased appetite.
**GU:** dysuria, micturition frequency, nocturia, intermenstrual bleeding, menstrual disorder, hematuria, pyuria.
**Hematologic:** leukocytosis, anemia.
**Metabolic:** *hypercorticism,* dependent edema, hypokalemia, increased weight.
**Musculoskeletal:** back pain, aggravated arthritis, cramps, arthralgia, myalgia.
**Respiratory:** *respiratory tract infection,* bronchitis, dyspnea.
**Skin:** *acne,* alopecia, dermatitis, eczema, skin disorder, increased sweating.
**Other:** flulike disorder, sleep disorder, candidiasis, viral infection.

## INTERACTIONS

**Drug-drug.** *CYP inhibitors (erythromycin, indinavir, itraconazole, ketoconazole, ritonavir, saquinavir):* May increase effects of budesonide. If use together is unavoidable, reduce budesonide dosage.
**Drug-food.** *Grapefruit juice:* May increase drug effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

• May increase alkaline phosphatase and C-reactive protein levels. May decrease potassium and hemoglobin levels.
• May increase erythrocyte sedimentation rate and WBC count.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug.
• Use cautiously in patients with tuberculosis, hypertension, diabetes mellitus, osteoporosis, peptic ulcer disease, glaucoma, or cataracts; those with a family history of diabetes or glaucoma; and those with any other condition in which glucocorticosteroids may have unwanted effects.
• Glucocorticoids appear in breast milk, and infants may have adverse reactions. Use cautiously in breast-feeding women only if benefits outweigh risks.
⚠ ***Overdose S&S:*** Hypercorticism, adrenal suppression.

## NURSING CONSIDERATIONS

• Reduced liver function affects elimination of this drug; systemic availability of drug may increase in patients with liver cirrhosis.
• Patients undergoing surgery or other stressful situations may need systemic glucocorticoid supplementation in addition to budesonide therapy.
• Carefully monitor patients transferred from systemic glucocorticoid therapy to budesonide for signs and symptoms of corticosteroid withdrawal. Watch for immunosuppression, especially in patients who haven't had diseases, such as chickenpox or measles; these can be fatal in patients

who are immunosuppressed or receiving glucocorticoids.
• Replacement of systemic glucocorticoids with this drug may unmask allergies, such as eczema and rhinitis, which were previously controlled by systemic drug.
• Long-term use of drug may cause hypercorticism and adrenal suppression.

### PATIENT TEACHING
• Tell patient to swallow capsules whole and not to chew or break them.
• Advise patient to avoid grapefruit juice while taking drug.
• Tell patient to notify prescriber immediately if he is exposed to or develops chickenpox or measles.
• Tell patient to keep container tightly closed.

## bumetanide
byoo-MET-a-nide

*Therapeutic class:* Diuretic
*Pharmacologic class:* Loop diuretic
*Pregnancy risk category C*

### AVAILABLE FORMS
*Injection:* 0.25 mg/ml
*Tablets:* 0.5 mg, 1 mg, 2 mg

### INDICATIONS & DOSAGES
➤ **Edema caused by heart failure or hepatic or renal disease**
*Adults:* 0.5 to 2 mg P.O. once daily. If diuretic response isn't adequate, a second or third dose may be given at 4- to 5-hour intervals. Maximum dose is 10 mg daily. May be given parenterally if oral route isn't possible. Usual first dose is 0.5 to 1 mg given I.V. or I.M. If response isn't adequate, a second or third dose may be given at 2- to 3-hour intervals. Maximum, 10 mg daily.

### ADMINISTRATION
**P.O.**
• Give drug with food to minimize GI upset.
• To prevent nocturia, give drug in morning. If second dose is needed, give in early afternoon.

**I.V.**
▼ For direct injection, give drug over 1 to 2 minutes using a 21G or 23G needle.
▼ For intermittent infusion, give diluted drug through an intermittent infusion device or piggyback into an I.V. line containing a free-flowing, compatible solution.
▼ **Incompatibilities:** Dobutamine, fenoldopam, midazolam.

**I.M.**
• Document injection site.

### ACTION
Inhibits sodium and chloride reabsorption in the ascending loop of Henle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30–60 min | 1–2 hr | 4–6 hr |
| I.V. | Within min | 15–30 min | 30–60 min |
| I.M. | 40 min | Unknown | 5–6 hr |

*Half-life:* 1 to 1½ hours.

### ADVERSE REACTIONS
**CNS:** dizziness, headache, vertigo.
**CV:** orthostatic hypotension.
**GU:** oliguria.
**Metabolic:** volume depletion and dehydration, hypokalemia, hypochloremic alkalosis, ***hypomagnesemia,*** asymptomatic hyperuricemia.
**Skin:** rash, pruritus.

### INTERACTIONS
**Drug-drug.** *Aminoglycoside antibiotics:* May increase ototoxicity. Avoid using together if possible.
*Antidiabetics:* May decrease hypoglycemic effects. Monitor glucose level.
*Antihypertensives:* May increase hypotensive effects. Consider dosage adjustment.
*Cardiac glycosides:* May increase risk of digoxin toxicity from bumetanide-induced hypokalemia. Monitor potassium and digoxin levels.
*Chlorothiazide, chlorthalidone, hydrochlorothiazide, indapamide, metolazone:* May cause excessive diuretic response, causing serious electrolyte abnormalities or dehydration. Adjust doses carefully, and monitor patient closely for signs and symptoms of excessive diuretic response.
*Cisplatin:* May increase risk of ototoxicity. Monitor patient closely.

*Lithium:* May decrease lithium clearance, increasing risk of lithium toxicity. Monitor lithium level.
*Neuromuscular blockers:* May prolong neuromuscular blockade. Monitor patient closely.
*NSAIDs, probenecid:* May inhibit diuretic response. Use together cautiously.
*Other potassium-wasting drugs (such as amphotericin B, corticosteroids):* May increase risk of hypokalemia. Use together cautiously.
*Warfarin:* May increase anticoagulant effect. Use together cautiously.
**Drug-herb.** *Dandelion:* May interfere with drug activity. Discourage use together.
*Licorice:* May cause unexpected, rapid potassium loss. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, bilirubin, cholesterol, creatinine, glucose, LDH, and urine urea levels. May decrease calcium, magnesium, potassium, sodium, and chloride levels.
- May decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or sulfonamides (possible cross-sensitivity) and in patients with anuria, hepatic coma, or severe electrolyte depletion.
- Use cautiously in patients with hepatic cirrhosis and ascites, in elderly patients, and in those with decreased renal function.

⚠ ***Overdose S&S:*** Electrolyte depletion, weakness, dizziness, confusion, anorexia, lethargy, vomiting, cramps, dehydration, circulatory collapse, vascular thrombosis and embolism.

## NURSING CONSIDERATIONS

- Safest and most effective dosage schedule is alternate days or 3 or 4 consecutive days with 1 or 2 days off between cycles.
- Monitor fluid intake and output, weight, and electrolyte, BUN, creatinine, and carbon dioxide levels frequently.
- Watch for evidence of hypokalemia, such as muscle weakness and cramps. Instruct patient to report these symptoms.
- Consult prescriber and dietitian about a high-potassium diet. Foods rich in potassium include citrus fruits, tomatoes, bananas, dates, and apricots.
- Monitor glucose level in diabetic patients.
- Monitor uric acid level, especially in patients with history of gout.

**Black Box Warning** Monitor blood pressure and pulse rate during rapid diuresis. Profound water and electrolyte depletion may occur.

- If oliguria or azotemia develops or increases, prescriber may stop drug.
- Drug can be safely used in patients allergic to furosemide; 1 mg of bumetanide equals about 40 mg of furosemide.

## PATIENT TEACHING

- Instruct patient to take drug with food to minimize GI upset.
- Advise patient to take drug in morning to avoid need to urinate at night; if patient needs second dose, have him take it in early afternoon.
- Advise patient to avoid sudden posture changes and to rise slowly to avoid dizziness upon standing quickly.
- Instruct patient to notify prescriber about extreme thirst, muscle weakness, cramps, nausea, or dizziness.
- Instruct patient to weigh himself daily to monitor fluid status.

## SAFETY ALERT!

# buprenorphine

Butrans

# buprenorphine hydrochloride

byoo-pre-NOR-feen

Buprenex, Subutex

*Therapeutic class:* Opioid analgesic
*Pharmacologic class:* Opioid agonist-antagonist, opioid partial agonist
*Pregnancy risk category C*
*Controlled substance schedule III*

## AVAILABLE FORMS

*Injection:* 0.324 mg (equivalent to 0.3 mg base/ml)

*Sublingual tablets:* 2 mg, 8 mg (as base)
*Transdermal patch:* 5 mcg/hr, 10 mcg/hr, 20 mcg/hr

## INDICATIONS & DOSAGES

➤ **Moderate to severe pain**

*Adults and children age 13 and older:* 0.3 mg I.M. or slow I.V. every 6 hours p.r.n., or around the clock; repeat dose (up to 0.3 mg), as needed, 30 to 60 minutes after first dose.

*Children ages 2 to 12:* 2 to 6 mcg/kg I.M. or I.V. every 4 to 6 hours.

***Adjust-a-dose:*** In high-risk patients, such as debilitated or elderly patients, reduce dose by one-half.

✶ ***NEW INDICATION:*** **Moderate to severe chronic pain in patients requiring continuous opioid analgesia for an extended period of time**

*Adults (opioid-naïve):* 5 mcg/hr transdermal patch once every 7 days. To achieve adequate analgesia and minimize adverse effects, consider patient's tolerance, condition, and other medications and titrate dosage to maximum of 20 mcg/hr. Allow minimum of 72 hours between dosage increases.

*Adults (Non-opioid naïve):* Buprenorphine may precipitate withdrawal in patients already on opioids. For conversion from other opioids to buprenorphine, taper patient's current around-the-clock opioids for up to 7 days to no more than morphine 30 mg or equivalent per day before beginning treatment with buprenorphine. Patients may use short-acting analgesics as needed until analgesic efficacy with buprenorphine is attained. For patients whose daily dose was less than morphine 30 mg orally or equivalent, initiate treatment with buprenorphine transdermal patch 5 mcg/hr. For patients whose daily dose was between 30 and 80 mg of morphine equivalents, initiate treatment with buprenorphine transdermal patch 10 mcg/hr. To achieve adequate analgesia with tolerable adverse effects, consider patient's tolerance, condition, and other medications and titrate dose to maximum of 20 mcg/hr transdermal patch once every 7 days. Allow minimum of 72 hours between dosage increases.

***Adjust-a-dose:*** For patients with mild to moderate hepatic impairment, start with buprenorphine dosage of 5 mcg/hr. Thereafter, individually titrate dosage to level that provides adequate analgesia and tolerable adverse effects, under close supervision of prescriber.

➤ **Opioid dependence**

*Adults:* 12 to 16 mg S.L. as a single daily dose.

## ADMINISTRATION

**I.V.**

▼ When mixed in a 1:1 volume ratio, drug is compatible with atropine sulfate, diphenhydramine hydrochloride, droperidol, glycopyrrolate, haloperidol lactate, hydroxyzine hydrochloride, promethazine hydrochloride, scopolamine hydrochloride, $D_5W$, 5% dextrose in normal saline solution, sodium chloride solution, lactated Ringer's solution, and normal saline solution injections.

▼ For direct injection, give slowly over at least 2 minutes into a vein or through tubing of a free-flowing, compatible I.V. solution.

▼ **Incompatibilities:** Diazepam, furosemide, lorazepam.

**I.M.**

● Give drug as deep I.M. injection.

**S.L.**

● Place all the tablets of the dose under the tongue until dissolved; if uncomfortable, patient should take at least two at the same time.

**Transdermal**

**Black Box Warning** Avoid exposing patch or surrounding area to direct external heat source or direct sunlight. Increased temperature may increase amount of drug released, which can result in overdose and death. ■

**Black Box Warning** Transdermal patch is indicated only for moderate to severe chronic pain that requires around-the-clock analgesia for an extended period of time. ■

● Each patch is intended to be worn for 7 days. If patch falls off during 7-day dosing interval, apply new patch to different site.

● Don't use if pouch seal is broken or patch is cut, damaged, or changed in any way. Apply patch to intact skin immediately after opening.

• Appropriate application sites are right or left upper outer arm, upper chest, upper back, or side of the chest only.
• Application site should be hairless; clip hair if needed but don't shave site. If needed, clean selected site with water only and allow to dry completely before applying patch.
• Edges of patch may be taped to the skin if needed.
• After removing patch, fold it in half, seal it in patch-disposal unit, and place it in trash.
• Wait minimum of 3 weeks before applying new patch to same application site.

## ACTION

Unknown. Binds with opioid receptors in the CNS, altering perception of and emotional response to pain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | 2 min | 6 hr |
| I.M. | 15 min | 1 hr | 6 hr |
| S.L. | Unknown | Unknown | Unknown |
| Transdermal | 17 hr | 3–6 days | 7 days |

*Half-life:* 1 to 7 hours; transdermal, 26 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness, sedation, vertigo,* ***increased intracranial pressure,*** asthenia (tablets only), confusion, depression, dreaming, euphoria, fatigue, headache, insomnia (tablets only), nervousness, pain (tablets only), paresthesia, psychosis, slurred speech, weakness.
**CV:** ***bradycardia,*** cyanosis, flushing, hypertension, hypotension, tachycardia, Wenckebach block.
**EENT:** blurred vision, conjunctivitis, diplopia, dry mouth (patch), miosis, rhinitis (tablets only), tinnitus, visual abnormalities.
**GI:** *nausea,* abdominal pain (tablets only), constipation, diarrhea (tablets only), vomiting.
**GU:** urine retention.
**Respiratory:** ***respiratory depression,*** dyspnea, hypoventilation.
**Skin:** application-site rash or erythema (patch), diaphoresis, injection-site reactions, pruritus, sweating (tablets only).
**Other:** back pain (tablets only), chills, infection (tablets only), withdrawal syndrome.

## INTERACTIONS

**Drug-drug.** *Benzodiazepines, CNS depressants, MAO inhibitors, opioids:* May cause additive effects. Use together cautiously.
*Class IA or III antiarrhythmics:* May increase risk of prolonged QT syndrome. Avoid use with transdermal patch.
*CYP3A4 inducers (carbamazepine, phenobarbital, phenytoin, rifampin):* May increase clearance of buprenorphine. Monitor patient for clinical effects of drug.
*CYP3A4 inhibitors (erythromycin, indinavir, ketoconazole, ritonavir, saquinavir):* May decrease clearance of buprenorphine. Monitor patient for increased adverse effects.
*Skeletal muscle relaxants:* May enhance neuromuscular blocking action and increase respiratory depression. Use together cautiously.
**Drug-lifestyle.** *Alcohol or illicit drug use:* May cause additive effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug and during pregnancy or breastfeeding.
**Black Box Warning** Don't exceed dose of one 20-mcg/hr transdermal patch every 7 days due to risk of prolonging QTc interval.
• Use cautiously in elderly or debilitated patients; patients who are opioid dependent; in those undergoing biliary tract surgery and those with biliary tract disease or pancreatitis, and in those with head injury, intracranial lesions, and increased intracranial pressure; severe respiratory, liver, or kidney impairment; CNS depression or coma; those at risk for hypotension and circulatory shock; thyroid irregularities; adrenal insufficiency; and prostatic hypertrophy, urethral stricture, acute alcoholism, delirium tremens, or kyphoscoliosis.
⚠ ***Overdose S&S:*** Respiratory depression, pinpoint pupils, sedation, hypotension, death.

## NURSING CONSIDERATIONS

**Black Box Warning** Buprenorphine has potential for abuse similar to other opioids and is a controlled substance. Patients at risk for opioid abuse include those with personal or family history of substance abuse or mental illness. Assess for risk or abuse before prescribing and monitor patients regularly. ■

- Taper dosage before discontinuing transdermal patch.
- Drug may worsen increased intracranial pressure and mask its signs and symptoms. Carefully monitor patient's pupillary reflexes and level of consciousness.
- Reassess patient's level of pain 15 and 30 minutes after parenteral administration.
- Buprenorphine 0.3 mg is equal to 10 mg of morphine and 75 mg of meperidine in analgesic potency. It has longer duration of action than morphine or meperidine.

***Alert:*** Naloxone won't completely reverse the respiratory depression caused by buprenorphine overdose; an overdose may require mechanical ventilation. Larger-than-usual doses of naloxone (more than 0.4 mg) and doxapram also may be indicated.

- Treat accidental skin exposure by removing exposed clothing and rinsing skin with water.
- Drug may cause constipation. Assess bowel function and need for stool softeners and stimulant laxatives.

***Alert:*** Drug's opioid antagonist properties may cause withdrawal syndrome in opioid-dependent patients.

- If dependence occurs, withdrawal symptoms may appear up to 14 days after drug is stopped.
- ***Look alike–sound alike:*** Don't confuse Buprenex with Bumex or bupropion.

## PATIENT TEACHING

- Caution ambulatory patient about getting out of bed or walking.
- When drug is used after surgery, encourage patient to turn, cough, and breathe deeply to prevent breathing problems.
- Tell patient to place all the tablets of the dose under his tongue until dissolved; if this is uncomfortable, tell him to take at least two at the same time.
- Instruct patient in proper disposal of transdermal system.
- Teach patient proper patch application and advise him to read package instructions.
- Warn patient not to apply heat to patch application site or to cut patch.
- Tell patient and family to report adverse reactions to prescriber immediately.
- Warn patient not to take other long-acting opioids while using transdermal system.

# buPROPion hydrobromide

Aplenzin

# buPROPion hydrochloride

byoo-PROE-pee-on

Wellbutrin, Wellbutrin SR, Wellbutrin XL, Zyban

*Therapeutic class:* Antidepressant
*Pharmacologic class:* Aminoketone
*Pregnancy risk category B*

## AVAILABLE FORMS

**bupropion hydrobromide**
*Tablets (extended-release):* 174 mg, 348 mg, 522 mg
**bupropion hydrochloride**
*Tablets (extended-release):* 150 mg, 300 mg
*Tablets (immediate-release):* 75 mg, 100 mg
*Tablets (sustained-release):* 50 mg, 100 mg, 150 mg, 200 mg

## INDICATIONS & DOSAGES

➤ **Major depressive disorder (Aplenzin only)**

*Adults:* Initially, 174 mg P.O. (equivalent to 150 mg/day bupropion HCl) given as a single daily dose in the morning. If the 174-mg initial dose is adequately tolerated, increase to the 348-mg/day target dose as early as day 4 of dosing. There should be an interval of at least 24 hours between successive doses. The full antidepressant effect may not be evident until after 4 weeks of treatment or longer. Consider increasing dosage to the maximum of 522 mg P.O. daily, given as a single dose, for patients in whom no clinical improvement is noted after several weeks of treatment at 348 mg/day. When switching patients from Wellbutrin,

Wellbutrin SR, or Wellbutrin XL to Aplenzin, give the equivalent total daily dose when possible (522 mg bupropion HBr is equivalent to 450 mg bupropion HCl; 348 mg bupropion HBr is equivalent to 300 mg bupropion HCl; 174 mg bupropion HBr is equivalent to 150 mg bupropion HCl).

***Adjust-a-dose:*** In patients with renal impairment or mild to moderate hepatic impairment, including hepatic cirrhosis, reduced frequency or dose should be considered. In patients with severe hepatic cirrhosis, don't exceed 174 mg every other day.

➤ **Seasonal affective disorder (Wellbutrin XL only)**

*Adults:* Start treatment in autumn before depressive symptoms appear. Initially, 150 mg extended-release P.O. once daily in the morning. After 1 week, increase to 300 mg once daily, if tolerated. Continue 300 mg daily during the autumn and winter and taper to 150 mg daily for 2 weeks before stopping the drug in the early spring.

➤ **Depression**

*Adults:* For immediate-release, initially, 100 mg P.O. b.i.d.; increase after 3 days to 100 mg P.O. t.i.d., if needed. If patient doesn't improve after several weeks of therapy, increase dosage to 150 mg t.i.d. No single dose should exceed 150 mg. Allow at least 6 hours between successive doses. Maximum dose is 450 mg daily. For sustained-release, initially, 150 mg P.O. every morning; increase to target dose of 150 mg P.O. b.i.d., as tolerated, as early as day 4 of dosing. Allow at least 8 hours between successive doses. Maximum dose is 400 mg daily. For extended-release, initially, 150 mg P.O. every morning; increase to target dosage of 300 mg P.O. daily, as tolerated, as early as day 4 of dosing. Allow at least 24 hours between successive doses. Maximum is 450 mg daily.

➤ **Aid to smoking-cessation treatment**

*Adults:* 150 mg Zyban P.O. daily for 3 days; increased to maximum of 300 mg daily in two divided doses at least 8 hours apart. Continue therapy for 7 to 12 weeks. Some patients may need continuous treatment.

***Adjust-a-dose:*** In patients with mild to moderate hepatic cirrhosis or renal impairment, reduce frequency and dose. In patients with severe hepatic cirrhosis, don't exceed 75 mg immediate-release P.O. daily, 100 mg sustained-release P.O. daily, 150 mg (sustained-release) P.O. every other day, or 150 mg extended-release P.O. every other day.

## ADMINISTRATION

**P.O.**

- Don't crush, split, or allow patients to chew tablets.
- When switching patients from regular- or sustained-release tablets to extended-release tablets, give the same total daily dose (when possible) as the once-daily dosage provided.

## ACTION

Unknown. Drug doesn't inhibit MAO, but it weakly inhibits norepinephrine, dopamine, and serotonin reuptake. Noradrenergic or dopaminergic mechanisms, or both, may cause drug's effect.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. (extended-release) | Unknown | 5 hr | Unknown |
| P.O. (immediate-release) | Unknown | 2 hr | Unknown |
| P.O. (sustained-release) | Unknown | 3 hr | Unknown |

*Half-life:* 8 to 24 hours.

## ADVERSE REACTIONS

**CNS:** *abnormal dreams, insomnia, headache, sedation, tremor, agitation, dizziness,* ***seizures, suicidal behavior,*** anxiety, confusion, delusions, euphoria, fever, hostility, impaired concentration, impaired sleep quality, akinesia, akathisia, fatigue, syncope, somnolence.

**CV:** *tachycardia,* ***arrhythmias,*** hypertension, hypotension, palpitations, chest pain.

**EENT:** *blurred vision, rhinitis,* auditory disturbances, epistaxis, pharyngitis, sinusitis, *dry mouth.*

**GI:** *constipation, nausea, vomiting, anorexia, dry mouth,* taste disturbance, dyspepsia, diarrhea, abdominal pain.

**GU:** impotence, menstrual complaints, urinary frequency, urine retention.

**Metabolic:** increased appetite, *weight loss, weight gain.*

**Musculoskeletal:** arthritis, myalgia, arthralgia, muscle spasm or twitch.
**Respiratory:** upper respiratory complaints, increase in coughing.
**Skin:** *excessive sweating*, pruritus, rash, cutaneous temperature disturbance, urticaria.
**Other:** chills, decreased libido, accidental injury, hot flashes.

## INTERACTIONS

**Drug-drug.** *Amantadine, levodopa:* May increase risk of adverse reactions. If used together, give small first doses of bupropion and increase dosage gradually.
*Antidepressants (desipramine, fluoxetine, imipramine, nortriptyline, sertraline), antipsychotics (haloperidol, risperidone, thioridazine), systemic corticosteroids, theophylline:* May lower seizure threshold. Use cautiously together.
*Beta blockers, class IC antiarrhythmics:* May increase levels of these drugs and adverse reactions. Use a reduced dose if used with bupropion.
*Carbamazepine, phenobarbital, phenytoin:* May enhance metabolism of bupropion and decrease its effect. Monitor patient closely.
*CYP2B6 substrates or inhibitors (cyclophosphamide, orphenadrine, thiotepa), efavirenz, fluvoxamine, nelfinavir, norfluoxetine, paroxetine, ritonavir, sertraline:* May increase bupropion activity. Monitor patient for expected therapeutic effects and adverse effects.
***MAO inhibitors:*** May increase the risk of bupropion toxicity. Don't use drugs within 14 days of each other.
*Nicotine replacement agents:* May cause hypertension. Monitor blood pressure.
*Ritonavir:* May increase bupropion level. Monitor patient closely for adverse reactions.
**Drug-lifestyle.** *Alcohol use:* May alter seizure threshold. Discourage use together.
*Sun exposure:* May increase risk of photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase liver function test values.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, in those who have taken MAO inhibitors within previous 14 days, and in those with seizure disorders or history of bulimia or anorexia nervosa because of a higher risk of seizures.
- Contraindicated in patients abruptly stopping use of alcohol or sedatives (including benzodiazepines).
- Don't use with other drugs containing bupropion.

**Black Box Warning** Bupropion isn't approved for use in children.

- Use cautiously in patients with recent history of MI, unstable heart disease, renal or hepatic impairment, a history of seizures, head trauma, or other predisposition to seizures, and in those being treated with drugs that lower seizure threshold.

***Overdose S&S:*** Seizures, ECG changes, hallucinations, loss of consciousness, sinus tachycardia, coma, fever, hypotension, muscle rigidity, rhabdomyolysis, respiratory failure, stupor.

## NURSING CONSIDERATIONS

- Many patients experience a period of increased restlessness, including agitation, insomnia, and anxiety, especially at start of therapy.

***Alert:*** To minimize the risk of seizures, don't exceed maximum recommended dose.

***Alert:*** Patient with major depressive disorder may experience a worsening of depression and suicidal thoughts. Carefully monitor patient for worsening depression or suicidal thoughts, especially at the beginning of therapy and during dosage changes.

**Black Box Warning** Drug may increase the risk of suicidal thinking and behavior in children, adolescents and young adults with major depressive disorder or other psychiatric disorder.

**Black Box Warning** Drug may cause hostility, agitation, and depressed mood.

- Closely monitor patient with history of bipolar disorder. Antidepressants can cause manic episodes during the depressed phase of bipolar disorder. This may be less likely to occur with bupropion than with other antidepressants.

- Begin smoking-cessation treatment while patient is still smoking; about 1 week is needed to achieve steady-state drug levels.
- Stop smoking-cessation treatment if patient hasn't progressed toward abstinence by week 7. Treatment usually lasts up to 12 weeks. Patient can stop taking drug without tapering off.

**Black Box Warning** Zyban isn't indicated for treatment of depression.

- ***Look alike–sound alike:*** Don't confuse bupropion with buspirone or Wellbutrin with Wellcovorin.

## PATIENT TEACHING

**Black Box Warning** Advise families and caregivers to closely observe patient for increased suicidal thinking and behavior and hostility, agitation, and depressed mood.

***Alert:*** Explain that excessive use of alcohol, abrupt withdrawal from alcohol or other sedatives, and addiction to cocaine, opiates, or stimulants during therapy may increase risk of seizures. Seizure risk is also increased in those using OTC stimulants, in anorectics, and in diabetic patients using oral antidiabetics or insulin.

- Tell patient not to chew, crush, or divide tablets.
- Advise patient to consult prescriber before taking other prescription or OTC drugs.
- Advise patient to avoid hazardous activities that require alertness and good psychomotor coordination until effects of drug are known.

***Alert:*** Advise patient that Zyban and Wellbutrin contain the same active ingredient and shouldn't be used together.

- Tell patient that it may take 4 weeks to reach full antidepressant effect.

***Alert:*** Advise patient to report mood swings or suicidal thoughts immediately.

- Inform patient that tablets may have an odor.

# busPIRone hydrochloride

byoo-SPYE-rone

BuSpar✐, Bustab†

*Therapeutic class:* Anxiolytic
*Pharmacologic class:* Azaspirodecanedione derivative
*Pregnancy risk category B*

## AVAILABLE FORMS

*Tablets:* 5 mg, 7.5 mg, 10 mg, 15 mg, 30 mg

## INDICATIONS & DOSAGES

➤ **Anxiety disorders**

*Adults:* Initially, 7.5 mg P.O. b.i.d. Increase dosage by 5 mg daily at 2- to 3-day intervals. Usual maintenance dosage is 20 to 30 mg daily in divided doses. Don't exceed 60 mg daily.

➤ **Traumatic brain injury** ♦

*Adults:* 10 to 60 mg P.O. once daily for 3 or more months.

## ADMINISTRATION

**P.O.**

- Don't give drug with grapefruit juice.
- Give drug at the same times each day, and always with or always without food.

## ACTION

May inhibit neuronal firing and reduce serotonin turnover in cortical, amygdaloid, and septohippocampal tissue.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 40–90 min | Unknown |

*Half-life:* 2 to 3 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness*, *drowsiness*, headache, nervousness, insomnia, light-headedness, fatigue, numbness, excitement, confusion, depression, anger, decreased concentration.
**CV:** tachycardia, nonspecific chest pain.
**EENT:** blurred vision.
**GI:** dry mouth, nausea, diarrhea, abdominal distress.

## INTERACTIONS

**Drug-drug. *Azole antifungals:*** May inhibit first-pass metabolism of buspirone. Monitor

patient closely for adverse effects; adjust dosage as needed.
*CNS depressants:* May increase CNS depression. Use together cautiously.
*Drugs metabolized by CYP3A4 (erythromycin, nefazodone):* May increase buspirone level. Monitor patient; decrease buspirone dosage and adjust carefully.
*MAO inhibitors:* May elevate blood pressure. Avoid using together.
**Drug-food.** *Grapefruit juice:* May increase drug level, increasing adverse effects. Give with liquid other than grapefruit juice.
**Drug-lifestyle.** *Alcohol use:* May increase CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS
None reported.

## CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug and within 14 days of MAO inhibitor therapy.
- Drug isn't recommended for patients with severe hepatic or renal impairment.

***Overdose S&S:*** Nausea, vomiting, dizziness, drowsiness, miosis, gastric distress.

## NURSING CONSIDERATIONS
- Monitor patient closely for adverse CNS reactions. Drug is less sedating than other anxiolytics, but CNS effects may be unpredictable.

***Alert:*** Before starting therapy, don't stop a previous benzodiazepine regimen abruptly because a withdrawal reaction may occur.
- Drug shows no potential for abuse and isn't classified as a controlled substance.
- ***Look alike–sound alike:*** Don't confuse buspirone with bupropion or risperidone.

## PATIENT TEACHING
- Warn patient to avoid hazardous activities that require alertness and good coordination until effects of drug are known.
- Remind patient that drug effects may not be noticeable for several weeks.
- Warn patient not to abruptly stop a benzodiazepine because of risk of withdrawal symptoms.
- Tell patient to avoid use of alcohol during therapy.
- Advise patient to take consistently, that is, always with or always without food.

**SAFETY ALERT!**

# busulfan
byoo-SUL-fan

Busulfex, Myleran

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Alkyl sulfonate
*Pregnancy risk category D*

## AVAILABLE FORMS
*Injection:* 6 mg/ml
*Tablets:* 2 mg

## INDICATIONS & DOSAGES
➤ **Chronic myelocytic (granulocytic) leukemia**
*Adults:* 4 to 8 mg P.O. daily until WBC count falls to 15,000/$mm^3$; stop drug until WBC count rises to 50,000/$mm^3$, and then resume dosage as before. When remission is less than 3 months, may give maintenance therapy of 1 to 3 mg P.O. daily. Or, 0.8 mg/kg I.V. every 6 hours for 4 days (a total of 16 doses). Give cyclophosphamide 60 mg/kg I.V. over 1 hour daily for 2 days beginning 6 hours after the 16th dose of busulfan injection.
*Children:* 0.06 to 0.12 mg/kg daily or 1.8 to 4.6 mg/$m^2$ daily P.O. until WBC count falls to 15,000/$mm^3$; stop drug until WBC count rises to 50,000/$mm^3$ and then resume dosage as before.

## ADMINISTRATION
**P.O.**
- Give drug on an empty stomach to minimize nausea and vomiting.

**I.V.**
▼ Give antiemetic before first dose of busulfan injection and then on a fixed schedule during therapy; give anticonvulsant to prevent seizures.
▼ Follow facility policy when preparing and handling drug. Label as a hazardous drug.
▼ Dilute drug in either $D_5W$ or normal saline solution to at least 0.5 mg/ml.

▼ Use the 5-micron nylon filter to withdraw the calculated volume from the ampule. Then use a new needle to inject the drug into the I.V. bag or syringe.
▼ Invert several times to ensure mixing.
▼ Use a central venous access device.
▼ Flush access device with 5 ml of $D_5W$ or normal saline solution before and after each infusion.
▼ Infuse over 2 hours through a central venous access device using a controlled-infusion device.
▼ Solutions are stable 8 hours at room temperature or 12 hours when diluted in normal saline solution and refrigerated. Infusions must be completed within these times.
▼ **Incompatibilities:** Don't mix or give with other I.V. solutions of unknown compatibility.

## ACTION

Unknown. Thought to cross-link strands of cellular DNA and interfere with RNA transcription, causing an imbalance of growth that leads to cell death. Not specific to cell cycle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1–2 wk | Unknown | Unknown |
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* About 2½ hours.

## ADVERSE REACTIONS

**CNS:** *fever, headache, asthenia, pain, insomnia, anxiety, dizziness, depression,* delirium, agitation, ***encephalopathy,*** *confusion,* hallucination, lethargy, somnolence, ***seizures.***
**CV:** *edema, chest pain, tachycardia, hypertension, hypotension,* ***thrombosis,*** *vasodilation,* ***heart rhythm abnormalities,*** cardiomegaly, ***heart failure, pericardial effusion,*** *tachycardia.*
**EENT:** *rhinitis, epistaxis, pharyngitis,* sinusitis, ear disorder, cataracts, corneal thinning, lens changes.
**GI:** *nausea, stomatitis, vomiting, anorexia, diarrhea, abdominal pain and enlargement, dyspepsia, constipation, dry mouth, rectal disorder,* ***pancreatitis.***
**GU:** dysuria, *oliguria,* hematuria, hemorrhagic cystitis.
**Hematologic:** **GRANULOCYTOPENIA, THROMBOCYTOPENIA, LEUKOPENIA,** *anemia,* **APLASTIC ANEMIA.**
**Hepatic:** *jaundice,* hepatomegaly, *hyperbilirubinemia,* ***hepatic veno-occlusive disease.***
**Metabolic:** ***hypomagnesemia,*** *hyperglycemia, hypokalemia, hypocalcemia, hypervolemia, weight gain, hypophosphatemia,* hyponatremia.
**Musculoskeletal:** *back pain, myalgia, arthralgia.*
**Respiratory:** *lung disorder, cough, dyspnea,* ***irreversible pulmonary fibrosis, alveolar hemorrhage, asthma,*** atelectasis, pleural effusion, hypoxia, hemoptysis.
**Skin:** *inflammation at injection site, rash, pruritus, alopecia,* exfoliative dermatitis, erythema nodosum, acne, skin discoloration, *hyperpigmentation.*
**Other:** Addison-like wasting syndrome, *chills, allergic reaction,* ***infection,*** *hiccup.*

## INTERACTIONS

**Drug-drug.** *Acetaminophen, itraconazole:* May decrease busulfan clearance. Use together cautiously.
*Anticoagulants, aspirin:* May increase risk of bleeding. Avoid using together.
*Cyclophosphamide:* May increase risk of cardiac tamponade in patients with thalassemia. Monitor patient.
*Metronidazole:* May increase busulfan toxicity. Avoid using together.
*Myelosuppressives:* May increase myelosuppression. Monitor patient.
*Other cytotoxic agents causing pulmonary injury:* May cause additive pulmonary toxicity. Avoid using together.
*Phenytoin:* May decrease busulfan level. Monitor busulfan level.
*Thioguanine:* May cause hepatotoxicity, esophageal varices, or portal hypertension. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

● May increase alkaline phosphatase, ALT, bilirubin, BUN, creatinine, and glucose levels. May decrease calcium, hemoglobin, magnesium, phosphorus, potassium, and sodium levels.
● May decrease WBC and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with chronic myelogenous leukemia resistant to drug and in those with chronic lymphocytic or acute leukemia or in the blastic crisis of chronic myelogenous leukemia.
- Use cautiously in patients recently given other myelosuppressives or radiation treatment and in those with depressed neutrophil or platelet count.
- Use cautiously in patients with history of head trauma or seizures and in those receiving other drugs that lower the seizure threshold because high-dose therapy has been linked to seizures.

***Overdose S&S:*** GI toxicity with diarrhea, mucositis, nausea, vomiting, bone marrow depression, pancytopenia.

## NURSING CONSIDERATIONS

**Black Box Warning** Do not use busulfan unless a diagnosis of CML has been adequately established. ■

**Black Box Warning** Reduce or discontinue the dosage if unusual depression of bone marrow function occurs. ■

**Black Box Warning** Malignant tumors and acute leukemias have been reported in patients who have received busulfan therapy. ■

- Therapeutic effects are commonly accompanied by toxicity.
- To prevent bleeding, avoid all I.M. injections when platelet count is less than 50,000/mm$^3$.
- Monitor patient response (increased appetite and sense of well-being, decreased total WBC count, reduced size of spleen), which usually begins in 1 to 2 weeks.
- Monitor for jaundice and liver function abnormalities in patients receiving high-dose busulfan.
- Anticipate possible blood transfusion during treatment because of cumulative anemia. Patients may receive injections of RBC colony-stimulating factor to promote RBC production and decrease the need for blood transfusions.

***Alert:*** Pulmonary fibrosis may occur as late as 8 months to 10 years after therapy. (Average length of therapy is 4 years.)

## PATIENT TEACHING

- Advise patient to watch for signs of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell patient to take temperature daily.
- Instruct patient to report signs and symptoms of toxicity so dosage can be adjusted. Persistent cough and progressive labored breathing with liquid in the lungs, suggestive of pneumonia, may be caused by drug toxicity.
- Advise patient to report signs of sudden weakness, anorexia, melanoderma, nausea and vomiting, unusual fatigue, and weight loss.
- Instruct patient to avoid OTC products containing aspirin and NSAIDs.
- Inform patient that drug may cause skin darkening.
- Advise woman of childbearing age to avoid becoming pregnant during therapy. Recommend that she consult prescriber before becoming pregnant.
- Advise patient not to breast-feed during therapy because of risk of toxicity to infant.
- Instruct patient to take drug on empty stomach to decrease nausea and vomiting.
- Because of risk of impotence and sterility, advise men who want to father a child about sperm banking before therapy.

**SAFETY ALERT!**

# butorphanol tartrate

byoo-TOR-fa-nole

Stadol

*Therapeutic class:* Opioid analgesic
*Pharmacologic class:* Opioid agonist-antagonist, opioid partial agonist
*Pregnancy risk category C*
*Controlled substance schedule IV*

## AVAILABLE FORMS

*Injection:* 1 mg/ml, 2 mg/ml
*Nasal spray:* 10 mg/ml (1 mg/spray)

## INDICATIONS & DOSAGES

➤ **Moderate to severe pain**

*Adults:* 1 to 4 mg I.M. every 3 to 4 hours p.r.n., or around the clock. Not to exceed

4 mg per dose. Or, 0.5 to 2 mg I.V. every 3 to 4 hours p.r.n., or around the clock. Or, 1 mg by nasal spray every 3 to 4 hours (1 spray in one nostril); repeat in 60 to 90 minutes if pain relief is inadequate. For severe pain, 2 mg (1 spray in each nostril) every 3 to 4 hours.

***Adjust-a-dose:*** For patients with renal or hepatic impairment, increase dosage interval to 6 to 8 hours. For elderly patients, give 1 mg I.M. or 0.5 mg I.V.; wait 6 hours before repeating dose. For nasal use, 1 mg (1 spray in one nostril). May give another 1 mg in 1.5 to 2 hours. Wait 6 hours before repeating sequence.

➤ **Labor for patients at full term; early labor (without signs of fetal distress)**

*Adults:* 1 or 2 mg I.V. or I.M.; repeat after 4 hours as needed. Don't give dose less than 4 hours before anticipated delivery.

➤ **Preoperative anesthesia or preanesthesia**

*Adults:* 2 mg I.M. 60 to 90 minutes before surgery.

➤ **Adjunct to balanced anesthesia**

*Adults:* 2 mg I.V. shortly before induction, or 0.5 to 1 mg I.V. in increments during anesthesia.

*Elderly patients:* One-half usual dose at twice the interval for I.V. use.

## ADMINISTRATION

**I.V.**

▼ Compatible solutions include $D_5W$ and normal saline solutions.

▼ Give by direct injection into a vein or into the tubing of a free-flowing I.V. solution.

▼ **Incompatibilities:** Dimenhydrinate, pentobarbital sodium.

**I.M.**

● Give drug I.M.; don't give subcutaneously.

**Intranasal**

● Watch for nasal congestion with nasal spray use.

## ACTION

May bind with opioid receptors in the CNS, altering perception of and emotional response to pain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 1 min | 4–5 min | 2–4 hr |
| I.M. | 10–30 min | 30–60 min | 3–4 hr |
| Nasal | 15 min | 1–2 hr | 2½–5 hr |

*Half-life:* About 2 to 9¼ hours.

## ADVERSE REACTIONS

**CNS:** *dizziness, insomnia, somnolence,* anxiety, asthenia, confusion, euphoria, headache, lethargy, nervousness, paresthesia, tremor.

**CV:** flushing, palpitations, vasodilation.

**EENT:** *nasal congestion,* blurred vision, nasal irritation, pharingitis, sinus congestion, sinusitis, rhinitis, tinnitus.

**GI:** *nausea, unpleasant taste, vomiting,* anorexia, constipation, dry mouth, stomach pain.

**Respiratory:** bronchitis, cough, dyspnea, upper respiratory tract infection.

**Skin:** clamminess, excessive diaphoresis, puritis.

**Other:** sensation of heat.

## INTERACTIONS

**Drug-drug.** *CNS depressants:* May cause additive effects. Use together cautiously.

**Drug-lifestyle.** *Alcohol use:* May cause additive effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or to preservative, benzethonium chloride, and in those with opioid addiction; may cause withdrawal syndrome.

● Use cautiously in patients with head injury, increased intracranial pressure, acute MI, ventricular dysfunction, coronary insufficiency, respiratory disease or depression, and renal or hepatic dysfunction.

● Use cautiously in patients who have recently received repeated doses of opioid analgesic.

⚠ ***Overdose S&S:*** Respiratory depression, CNS depression, CV insufficiency, coma, death.

## NURSING CONSIDERATIONS

- Reassess patient's level of pain 15 and 30 minutes after administration.
- Respiratory depression apparently doesn't increase with larger dosage.
- Drug may cause constipation. Assess bowel function and need for stool softener and stimulant laxatives.
- Psychological and physical addiction may occur.
- Periodically monitor postoperative vital signs and bladder function. Because drug decreases both rate and depth of respirations, monitor arterial oxygen saturation to help assess respiratory depression.
- ***Look alike–sound alike:*** Don't confuse Stadol with sotalol.

## PATIENT TEACHING

- Caution ambulatory patient about getting out of bed or walking. Warn outpatient to avoid driving and other hazardous activities that require mental alertness until it's clear how the drug affects the CNS.
- Teach patient how to take and store nasal spray.
- Instruct patient to avoid alcohol during therapy.

# calcitonin salmon

kal-si-TOE-nin

Fortical, Miacalcin

*Therapeutic class:* Antiosteoporotic
*Pharmacologic class:* Polypeptide hormone
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 200 units/ml in 2-ml ampules
*Nasal spray:* 200 units/activation

## INDICATIONS & DOSAGES

➤ **Paget disease of bone (osteitis deformans)**

*Adults:* Initially, 100 units daily I.M. or subcutaneously. Maintenance dosage is 50 to 100 units daily every other day or three times weekly.

➤ **Hypercalcemia**

*Adults:* 4 units/kg every 12 hours I.M. or subcutaneously. If response is inadequate after 1 or 2 days, increase dosage to 8 units/kg every 12 hours. If response remains unsatisfactory after 2 additional days, increase dosage to maximum of 8 units/kg every 6 hours.

➤ **Postmenopausal osteoporosis**

*Adults:* 200 units (one activation) daily intranasally, alternating nostrils daily. Or, 100 units I.M. or subcutaneously every other day. Patient should receive adequate vitamin D and calcium supplements (1.5 g calcium carbonate and 400 units of vitamin D) daily.

## ADMINISTRATION

**I.M.**

- I.M. route is preferred if volume of dose exceeds 2 ml.
- Use freshly reconstituted solution within 2 hours.
- Give drug at bedtime, when possible, to minimize nausea and vomiting.

**Intranasal**

- Alternate nostrils daily.
- Give drug at bedtime, when possible, to minimize nausea and vomiting.

**Subcutaneous**

- Use freshly reconstituted solution within 2 hours.
- Give drug at bedtime, when possible, to minimize nausea and vomiting.
- Alternate injection sites.

## ACTION

Decreases osteoclastic activity by inhibiting osteocytic osteolysis; decreases mineral release and matrix or collagen breakdown in bone.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.M., Subcut. | 15 min | 4 hr | 8–24 hr |
| Intranasal | Rapid | 30 min | 1 hr |

*Half-life:* 43 to 60 minutes.

## ADVERSE REACTIONS

**CNS:** headache, weakness, dizziness, paresthesia.
**CV:** chest pressure, *facial flushing.*
**EENT:** eye pain, *nasal congestion, rhinitis.*

**GI:** *transient nausea,* unusual taste, diarrhea, anorexia, *vomiting,* epigastric discomfort, abdominal pain.
**GU:** *increased urinary frequency,* nocturia.
**Respiratory:** shortness of breath.
**Skin:** rash, pruritus of ear lobes, *inflammation at injection site.*
**Other:** hypersensitivity reactions, ***anaphylaxis,*** edema of feet, chills, tender palms and soles.

## INTERACTIONS

**Drug-drug.** *Bisphosphonates:* Prior use of bisphosphonates in patients with Paget disease may reduce the antiresorptive response to nasal spray. Monitor patient.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.

***Overdose S&S:*** Nausea, vomiting.

## NURSING CONSIDERATIONS

- Skin test is usually done in patients with suspected drug sensitivity before therapy.

***Alert:*** Systemic allergic reactions are possible because hormone is protein. Keep epinephrine nearby.

***Alert:*** Observe patient for signs of hypocalcemic tetany during therapy (muscle twitching, tetanic spasms, and seizures when hypocalcemia is severe).

- Monitor calcium level closely. Watch for symptoms of hypercalcemia relapse: bone pain, renal calculi, polyuria, anorexia, nausea, vomiting, thirst, constipation, lethargy, bradycardia, muscle hypotonicity, pathologic fracture, psychosis, and coma.
- Periodic examinations of urine sediment are recommended.
- Monitor periodic alkaline phosphatase and 24-hour urine hydroxyproline levels to evaluate drug effect.
- In Paget disease, maximum reductions of alkaline phosphatase and urinary hydroxyproline excretion may take 6 to 24 months of continuous treatment.
- In patients with good first response to drug who have a relapse, expect to evaluate antibody response to the hormone protein.
- If symptoms have been relieved after 6 months, treatment may be stopped until symptoms or radiologic signs recur.
- Refrigerate drug at 36° to 46° F (2° to 8° C).
- ***Look alike–sound alike:*** Don't confuse calcitonin with calcifediol or calcitriol.

## PATIENT TEACHING

- When drug is given for postmenopausal osteoporosis, remind patient to take adequate calcium and vitamin D supplements.
- Show home care patient and family member how to give drug. Tell them to do so at bedtime if only one dose is needed daily. If nasal spray is prescribed, tell patient to alternate nostrils daily.
- Advise patient to notify prescriber if significant nasal irritation or evidence of an allergic response occurs.
- Inform patient that facial flushing and warmth occur in 20% to 30% of patients within minutes of injection and usually last about 1 hour.
- Tell patient that nausea and vomiting may occur at the onset of therapy.
- Tell patient to inform prescriber promptly if signs and symptoms of hypercalcemia occur. Inform patient that, if drug loses its hypocalcemic activity, other drugs or increased dosages won't help.

# calcitriol (1,25-dihydroxycholecalciferol)

kal-SIH-trye-ol

Calcijex, Rocaltrol

*Therapeutic class:* Antihypocalcemic
*Pharmacologic class:* Vitamin D analogue
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 0.25 mcg, 0.5 mcg
*Injection:* 1 mcg/ml, 2 mcg/ml
*Oral solution:* 1 mcg/ml

## INDICATIONS & DOSAGES

➤ **Hypocalcemia in patients undergoing long-term dialysis**

*Adults:* Initially, 0.25 mcg P.O. daily. Increase by 0.25 mcg daily at 4- to 8-week intervals. Maintenance P.O. dosage is 0.25 mcg every other day up to 1 mcg daily. Or usual I.V. dosage is 1 to 2 mcg I.V. three times weekly. Increase dose by 0.5 to 1 mcg at 2- to 4-week intervals.

➤ **Hypoparathyroidism, pseudohypoparathyroidism**

*Adults and children age 6 and older:* Initially, 0.25 mcg P.O. daily in the morning. Dosage may be increased at 2- to 4-week intervals. Maintenance dosage is 0.25 to 2 mcg P.O. daily.

➤ **Hypoparathyroidism**

*Children ages 1 to 5:* Give 0.25 to 0.75 mcg P.O. daily.

➤ **To manage secondary hyperparathyroidism and resulting metabolic bone disease in predialysis patients (with creatinine clearance of 15 to 55 ml/minute)**

*Adults and children age 3 and older:* Initially, 0.25 mcg P.O. daily. Dosage may be increased to 0.5 mcg/day if needed.

*Children younger than age 3:* Initially, 0.01 to 0.015 mcg/kg P.O. daily.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.
- Don't give with magnesium-containing antacids.

**I.V.**

▼ For hypocalcemia in patient undergoing hemodialysis, give drug by rapid injection through catheter at end of hemodialysis session.

▼ **Incompatibilities:** None reported.

## ACTION

Stimulates calcium absorption from the GI tract and promotes movement of calcium from bone to blood.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 2–6 hr | 3–6 hr | 3–5 days |
| I.V. | Immediate | Unknown | 3–5 days |

*Half-life:* 5 to 8 hours.

## ADVERSE REACTIONS

**CNS:** headache, somnolence, weakness, irritability.

**CV:** hypertension, ***arrhythmias.***

**EENT:** conjunctivitis, photophobia, rhinorrhea, nephrocalcinosis.

**GI:** nausea, vomiting, constipation, polydipsia, ***pancreatitis,*** metallic taste, dry mouth, anorexia.

**GU:** polyuria, nocturia, nephrocalcinosis.

**Metabolic:** weight loss.

**Musculoskeletal:** bone and muscle pain.

**Skin:** pruritus.

**Other:** hyperthermia, decreased libido.

## INTERACTIONS

**Drug-drug.** *Cardiac glycosides:* May increase risk of arrhythmias. Use together cautiously.

*Cholestyramine, colestipol, excessive use of mineral oil:* May decrease absorption of oral vitamin D analogues. Avoid using together.

*Corticosteroids:* May counteract vitamin D analogue effects. Avoid using together.

*Magnesium-containing antacids:* May cause hypermagnesemia, especially in patients with chronic renal failure. Avoid using together.

*Phenytoin, phenobarbital:* May inhibit calcitriol synthesis. Dose may need to be increased.

*Thiazides:* May cause hypercalcemia. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with hypercalcemia or vitamin D toxicity. Withhold all preparations containing vitamin D.
- Use cautiously in patients receiving cardiac glycosides and in those with sarcoidosis or hyperparathyroidism.

***Overdose S&S:*** Hypercalcemia, hyperphosphatemia, weakness, headache, anorexia, nausea, vomiting, stomach cramps, dizziness.

## NURSING CONSIDERATIONS

- Effective therapy is dependent on adequate calcium intake.
- Monitor calcium level; this level times the phosphate level shouldn't exceed 70. During dose adjustment, determine calcium level twice weekly. If hypercalcemia occurs, stop

drug and notify prescriber but resume after calcium level returns to normal. Patient should receive adequate daily intake of calcium. Observe for hypocalcemia, bone pain, and weakness before and during therapy.
- Monitor phosphorous level, especially in hypoparathyroid patients and dialysis patients.
- Reduce dose as parathyroid hormone levels decrease in response to therapy.
- The symptoms of vitamin D intoxication include headache, somnolence, weakness, irritability, hypertension, arrhythmias, conjunctivitis, photophobia, rhinorrhea, nausea, vomiting, constipation, polydipsia, pancreatitis, metallic taste, dry mouth, anorexia, nephrocalcinosis, polyuria, nocturia, weight loss, bone and muscle pain, pruritus, hyperthermia, and decreased libido.
- Protect drug from heat and light.
- ***Look alike–sound alike:*** Don't confuse calcitriol with calcifediol or calcitonin.

### PATIENT TEACHING

- Tell patient to immediately report early symptoms of vitamin D intoxication: weakness, nausea, vomiting, dry mouth, constipation, muscle or bone pain, or metallic taste.
- Instruct patient to adhere to diet and calcium supplementation and to avoid unapproved OTC drugs and antacids that contain magnesium.

***Alert:*** Tell patient that drug is the most potent form of vitamin D available and shouldn't be taken by anyone else.

## calcium acetate
Eliphos, PhosLo Gelcaps

## calcium chloride

## calcium citrate ◇
Citracal ◇, Citracal Liquitab ◇

## calcium glubionate
Calciquid

## calcium gluconate

## calcium lactate ◇

## calcium phosphate, dibasic ◇

## calcium phosphate, tribasic
Posture ◇

*Therapeutic class:* Calcium supplement
*Pharmacologic class:* Calcium salts
*Pregnancy risk category NR; C (PhosLo)*

### AVAILABLE FORMS

**calcium acetate**
Contains 253 mg or 12.7 mEq of elemental calcium/g
*Capsules:* 333.5 mg, 667 mg
*Gelcaps:* 667 mg
*Tablets:* 667 mg

**calcium chloride**
Contains 270 mg or 13.5 mEq of elemental calcium/g
*Injection:* 10% solution in 10-ml ampules, vials, and syringes

**calcium citrate**
Contains 211 mg or 10.6 mEq of elemental calcium/g
*Tablets:* 250 mg, 950 mg ◇
*Tablets (effervescent):* 500 mg of elemental calcium ◇

**calcium glubionate**
Contains 64 mg or 3.2 mEq elemental calcium/g
*Syrup:* 1.8 g/5 ml

**calcium gluconate**
Contains 90 mg or 4.5 mEq of elemental calcium/g
*Injection:* 10% solution in 10-ml ampules and vials, 10-ml or 50-ml vials
*Powder for oral suspension:* 346.7 elemental calcium/15 ml
*Tablets:* 500 mg ◇, 650 mg ◇, 1 g ◇

**calcium lactate**
Contains 130 mg or 6.5 mEq of elemental calcium/g
*Capsules:* 500 mg (96 mg elemental calcium)
*Tablets:* 100 mg, 650 mg (84.5 mg elemental calcium)

**calcium phosphate, dibasic**
Contains 230 mg or 11.5 mEq of elemental calcium/g
*Tablets:* 500 mg ◇

**calcium phosphate, tribasic**
Contains 400 mg or 20 mEq of elemental calcium/g
*Tablets:* 600 mg ◇

## INDICATIONS & DOSAGES

➤ **Hypocalcemic emergency**
*Adults:* 7 mEq to 14 mEq calcium I.V. May give as a 10% calcium gluconate solution, 2% to 10% calcium chloride solution.
*Children:* 1 mEq to 7 mEq calcium I.V.
*Infants:* Up to 1 mEq calcium I.V.

➤ **Hypocalcemic tetany**
*Adults:* 4.5 mEq to 16 mEq calcium I.V. Repeat until tetany is controlled.
*Children:* 0.5 to 0.7 mEq/kg calcium I.V. t.i.d. to q.i.d. until tetany is controlled.
*Neonates:* 2.4 mEq/kg calcium I.V. daily in divided doses.

➤ **Adjunctive treatment of magnesium intoxication**
*Adults:* Initially, 7 mEq I.V. Base subsequent doses on patient's response.

➤ **During exchange transfusions**
*Adults:* 1.35 mEq I.V. with each 100 ml citrated blood.
*Neonates:* 0.45 mEq I.V. after each 100 ml citrated blood.

➤ **Hyperphosphatemia**
*Adults:* 1,334 to 2,000 mg P.O. calcium acetate or 2 to 5.2 g calcium ion t.i.d. with meals. Most dialysis patients need 3 to 4 tablets with each meal.

➤ **Dietary supplement**
*Adults:* 500 mg to 2 g P.O. daily.

➤ **Hyperkalemia with secondary cardiac toxicity**
*Adults:* 2.25 mEq to 14 mEq I.V. Repeat dose after 1 to 2 minutes, if needed.

## ADMINISTRATION

**P.O.**
- Give drug with a full glass of water.
- Give 1 to 1½ hours after meals if GI upset occurs.

**I.V.**
▼ Calcium salts are not interchangeable; verify preparation before use.
▼ Give calcium chloride only by I.V. route. When adding to parenteral solutions that contain other additives (especially phosphorus or phosphate), watch for precipitate. Use an in-line filter.
▼ When giving calcium gluconate as injection, give only by I.V. route.
▼ Monitor ECG when giving calcium I.V. Stop drug and notify prescriber if patient complains of discomfort.
▼ Extravasation may cause severe necrosis and tissue sloughing. Calcium gluconate is less irritating to veins and tissues than calcium chloride.

**Direct injection**
▼ Don't use scalp veins in children.
▼ Warm solution to body temperature before giving it.
▼ For calcium chloride, give at 1 ml/minute (1.5 mEq/minute); for calcium gluconate, 2 ml/minute.
▼ Give slowly through a small needle into a large vein or through an I.V. line containing a free-flowing, compatible solution.
▼ After injection, keep patient recumbent for 15 minutes.

**Intermittent infusion**
▼ Infuse diluted solution through an I.V. line containing a compatible solution.
▼ For calcium gluconate, don't exceed 200 mg/minute.
▼ **Incompatibilities:** Drug will precipitate if given with sodium bicarbonate or other alkaline drugs. Calcium chloride: amphotericin B, chlorpheniramine, dobutamine. Calcium gluconate: amphotericin B, dobutamine, fluconazole, indomethacin sodium trihydrate, methylprednisolone sodium succinate, prochlorperazine edisylate.

**I.M.**
- Use I.M. calcium gluconate only in emergencies when no I.V. route is available because of irritation of tissue by calcium salts.
- Give I.M. in gluteal muscle in adults and in side of the thigh in infants.

## ACTION

Replaces calcium and maintains calcium level.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |
| I.V., I.M. | Immediate | Immediate | 30 min–2 hr |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** tingling sensations, sense of oppression or heat waves with I.V. use, syncope with rapid I.V. use.
**CV:** ***bradycardia, arrhythmias, cardiac arrest with rapid I.V. use,*** mild drop in blood pressure, vasodilation.
**GI:** *constipation,* irritation, chalky taste, ***hemorrhage,*** nausea, vomiting, thirst, abdominal pain.
**GU:** polyuria, renal calculi.
**Metabolic:** hypercalcemia.
**Skin:** local reactions, including burning, necrosis, tissue sloughing, cellulitis, soft-tissue calcification with I.M. use.

## INTERACTIONS

**Drug-drug.** *Atenolol, tetracyclines:* May decrease bioavailability of these drugs and calcium when oral preparations are taken together. Separate dosing times.
*Cardiac glycosides:* May increase digoxin toxicity. Give calcium cautiously, if at all, to digitalized patients.
*Ciprofloxacin, levofloxacin, lomefloxacin, moxifloxacin, norfloxacin, ofloxacin:* May decrease effects of quinolone. Give calcium carbonate at least 6 hours before or 2 hours after quinolone.
*Fosphenytoin, phenytoin:* Use together may decrease absorption of both drugs. Avoid using together, or monitor levels carefully.
*Sodium polystyrene sulfonate:* May cause metabolic acidosis in patients with renal disease and a reduction of the resin's binding of potassium. Separate drugs by several hours.
*Thiazide diuretics:* May cause hypercalcemia. Avoid using together.
*Verapamil:* May reduce effects and toxicity of verapamil. Monitor patient closely.
**Drug-food.** *Foods containing oxalic acid (rhubarb, spinach), phytic acid (bran, whole-grain cereals), phosphorus (dairy products, milk):* May interfere with calcium absorption. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase calcium level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in cancer patients with bone metastases and in those with ventricular fibrillation, hypercalcemia, hypophosphatemia, or renal calculi.

***Overdose S&S:*** Hypercalcemia, confusion, delirium, stupor, coma.

## NURSING CONSIDERATIONS

- Use all calcium products with extreme caution in digitalized patients and patients with sarcoidosis and renal or cardiac disease. Use calcium chloride cautiously in patients with cor pulmonale, respiratory acidosis, or respiratory failure.

***Alert:*** Double-check that you are giving the correct form of calcium; resuscitation cart may contain both calcium gluconate and calcium chloride.

- Monitor calcium levels frequently. Maintain calcium level of 9 to 10.4 mg/dl. Don't allow level to exceed 12 mg/dl. Hypercalcemia may result after large doses in chronic renal failure. Report abnormalities.
- Signs and symptoms of severe hypercalcemia may include stupor, confusion, delirium, and coma. Signs and symptoms of mild hypercalcemia may include anorexia, nausea, and vomiting.
- ***Look alike–sound alike:*** Don't confuse calcium with calcitriol, calcium gluconate with calcium glubionate, or calcium chloride with calcium gluconate.

## PATIENT TEACHING

- Tell patient to take oral calcium 1 to 1½ hours after meals if GI upset occurs.
- Tell patient to take oral calcium with a full glass of water.
- Tell patient to report anorexia, nausea, vomiting, constipation, abdominal pain, dry mouth, thirst, or polyuria.
- Warn patient that, in the meal before he takes calcium, he shouldn't have rhubarb, spinach, bran and whole-grain cereals, or dairy products; these foods may interfere with calcium absorption.
- Inform patient that some products may contain phenylalanine or tartrazine.

## calcium carbonate

KAL-see-um

Alka-Mints ◇, Cal-Carb Forte ◇, Calci-Chew ◇, Calci-Mix ◇, Calel-D ◇, Cal-Gest ◇, Caltrate ◇, Chooz ◇, Dicarbosil ◇, Equilet ◇, Maalox Antacid Caplets ◇, Nephro-Calci ◇, Oscal ◇, Oysco ◇, Oyst-Cal ◇, Rolaids ◇, Surpass ◇, Titralac ◇, Trial ◇, Tums ◇

*Therapeutic class:* Antacid
*Pharmacologic class:* Calcium salt
*Pregnancy risk category C*

### AVAILABLE FORMS

Calcium carbonate contains 40% calcium; 20 mEq calcium per gram.
*Capsules:* 1,250 mg ◇
*Chewing gum:* 300 mg ◇, 450 mg ◇, 500 mg/piece ◇
*Lozenges:* 600 mg ◇
*Oral suspension:* 1,250 mg/5 ml
*Tablets:* 500 mg ◇, 600 mg ◇, 650 mg ◇, 1,000 mg ◇, 1,250 mg ◇, 1,500 mg ◇
*Tablets (chewable):* 350 mg ◇, 400 mg ◇, 420 mg ◇, 500 mg ◇, 750 mg ◇, 850 mg ◇, 1,000 mg ◇, 1,177 mg ◇, 1,250 mg ◇

### INDICATIONS & DOSAGES

➤ **Acid indigestion, calcium supplement**
*Adults:* 350 mg to 1.5 g P.O. or two pieces of chewing gum 1 hour after meals and at bedtime, as needed.

### ADMINISTRATION

**P.O.**
• Shake suspension well before administration.

### ACTION

Reduces total acid load in GI tract, elevates gastric pH to reduce pepsin activity, strengthens gastric mucosal barrier, and increases esophageal sphincter tone.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 20 min | Unknown | 20–180 min |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CNS:** headache, irritability, weakness.
**GI:** *nausea*, constipation, flatulence, rebound hyperacidity.

### INTERACTIONS

**Drug-drug.** *Antibiotics (tetracyclines), hydantoins, iron salts, isoniazid, salicylates:* May decrease effect of these drugs because may impair absorption. Separate doses by 2 hours.
*Ciprofloxacin, levofloxacin, lomefloxacin, moxifloxacin, norfloxacin, ofloxacin:* May decrease quinolone effects. Give antacid at least 6 hours before or 2 hours after quinolone.
*Enteric-coated drugs:* May be released prematurely in stomach. Separate doses by at least 1 hour.
*Proton pump inhibitors:* May decrease calcium absorption. Monitor patient for clinical response; larger calcium doses may be needed.
**Drug-food.** *Milk, other foods high in vitamin D:* May cause milk-alkali syndrome (headache, confusion, distaste for food, nausea, vomiting, hypercalcemia, hypercalciuria). Discourage use together.

### EFFECTS ON LAB TEST RESULTS

• May decrease phosphate level.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients with ventricular fibrillation or hypercalcemia.
• Use cautiously, if at all, if patient takes a cardiac glycoside or has sarcoidosis or renal or cardiac disease.

### NURSING CONSIDERATIONS

• Record amount and consistency of stools. Manage constipation with laxatives or stool softeners.
• Monitor calcium level, especially in patients with mild renal impairment.
• Watch for evidence of hypercalcemia (nausea, vomiting, headache, confusion, and anorexia).

### PATIENT TEACHING

• Advise patient not to take calcium carbonate indiscriminately or to switch antacids without prescriber's advice.

- Tell patient who takes chewable tablets to chew thoroughly before swallowing and to follow with a glass of water.
- Tell patient who uses suspension form to shake well and take with a small amount of water to facilitate passage.
- Urge patient to notify prescriber about signs and symptoms of GI bleeding, such as tarry stools, or coffee-ground vomitus.

## calcium polycarbophil

KAL-see-um

Equalactin ◇, FiberCon ◇, Fiber-Lax ◇, Konsyl Fiber ◇

*Therapeutic class:* Laxative
*Pharmacologic class:* Hydrophilic drug
*Pregnancy risk category A*

### AVAILABLE FORMS

*Tablets:* 500 mg ◇, 625 mg ◇
*Tablets (chewable):* 500 mg ◇

### INDICATIONS & DOSAGES

➤ **Constipation**

*Adults and children older than age 12:* 2 tablets (1,000 to 1,250 mg) P.O. once daily to q.i.d., p.r.n. Maximum, 5 g in 24 hours.
*Children ages 7 to 12:* 1 tablet (500 to 625 mg) P.O. once daily to t.i.d., p.r.n. Maximum, 2 g in 24 hours.

### ADMINISTRATION

**P.O.**

- Equalactin tablets should be chewed thoroughly before swallowing and followed by an 8-ounce glass of water with each dose.
- When drug is used as an antidiarrheal, don't give with glass of water.

### ACTION

Absorbs water and expands to increase bulk and moisture content of stools. The increased bulk encourages peristalsis and bowel movement. As an antidiarrheal, drug absorbs free fecal water, thereby producing formed stools.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 12–24 hr | 3 days | Variable |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**GI:** ***intestinal obstruction,*** abdominal fullness and increased flatus.
**Other:** laxative dependence with long-term or excessive use.

### INTERACTIONS

**Drug-drug.** *Tetracyclines:* May impair tetracycline absorption. Give antibiotic 2 hours before or 1 hour after calcium.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with signs or symptoms of GI obstruction or those with swallowing difficulty.

### NURSING CONSIDERATIONS

- Before giving drug for constipation, determine whether patient has adequate fluid intake, exercise, and diet.
- In children younger than age 6, use must be directed by prescriber.

***Alert:*** Rectal bleeding or failure to respond to therapy may indicate need for surgery.

### PATIENT TEACHING

- Full benefit of drug may take 1 to 3 days.
- Advise patient to chew Equalactin tablets thoroughly before swallowing and to drink an 8-ounce glass of water with each dose. When drug is used as an antidiarrheal, tell patient not to drink the glass of water.
- Advise patient to seek medical attention if he experiences vomiting, chest pain, or difficulty breathing or swallowing after taking medication.
- Teach patient about dietary sources of fiber, including bran and other cereals, fresh fruit, and vegetables.
- For severe diarrhea, advise patient to repeat dose every 30 minutes, but not to exceed maximum daily dose. Tell patient not to use for longer than 2 days, unless directed by a prescriber.

# calfactant

kal-FAK-tant

Infasurf

*Therapeutic class:* Lung surfactant
*Pharmacologic class:* Bovine lung extract
*Pregnancy risk category NR*

## AVAILABLE FORMS

*Intratracheal suspension:* 35 mg phospholipids and 0.65 mg proteins/ml; 6-ml vial

## INDICATIONS & DOSAGES

➤ **To prevent respiratory distress syndrome (RDS) in premature infants younger than 29 weeks' gestational age at high risk for RDS; to treat infants younger than 72 hours of age, who develop RDS (confirmed by clinical and radiologic findings) and need an endotracheal tube (ETT)**

*Neonates:* 3 ml/kg of body weight at birth intratracheally, given in two aliquots of 1.5 ml/kg each, every 12 hours for a total of up to three doses.

## ADMINISTRATION

**Inhalational**

- Suspension settles during storage. Gentle swirling or agitation of the vial is commonly needed for redispersion. Don't shake vial. Visible flecks in the suspension and foaming at the surface are normal.
- Withdraw dose into a syringe from single-use vial using a 20G or larger needle; avoid excessive foaming.
- Give through a side-port adapter into the ETT. Make sure two medical staff are present while giving dose. Give dose in two aliquots of 1.5 ml/kg each. Place infant on one side after first aliquot and other side after second aliquot. Give while ventilation is continued over 20 to 30 breaths for each aliquot, with small bursts timed only during the inspiratory cycles. Evaluate respiratory status and reposition infant between each aliquot.
- Enter each single-use vial only once; discard unused material.
- Unopened, unused vials that have warmed to room temperature can be rerefrigerated within 24 hours for future use. Avoid repeated warming to room temperature.
- Store drug at 36° to 46° F (2° to 8° C). It isn't necessary to warm drug before use.

## ACTION

Modifies alveolar surface tension, which stabilizes the alveoli.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Intratracheal | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CV: BRADYCARDIA.**
**Respiratory: AIRWAY OBSTRUCTION, APNEA,** *cyanosis,* ***hypoventilation.***
**Other:** ***reflux of drug into ETT, dislodgment of ETT.***

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- None known.

***Overdose S&S:*** Hypoxia (from overloading lungs with isotonic solution).

## NURSING CONSIDERATIONS

- Give drug under supervision of medical staff experienced in the acute care of neonates with respiratory failure who need intubation.

***Alert:*** Drug intended only for intratracheal use; to prevent RDS, give to infant as soon as possible after birth, preferably within 30 minutes.

- Monitor patient for reflux of drug into ETT, cyanosis, bradycardia, or airway obstruction during the procedure. If these occur, stop drug and take appropriate measures to stabilize infant. After infant is stable, resume drug with appropriate monitoring.
- After giving drug, carefully monitor infant so that oxygen therapy and ventilatory support can be modified in response

to improvements in oxygenation and lung compliance.

### PATIENT TEACHING

- Explain to parents the function of drug in preventing and treating RDS.
- Notify parents that, although infant may improve rapidly after treatment, he may continue to need intubation and mechanical ventilation.
- Notify parents of possible adverse effects of drug, including bradycardia, reflux into ETT, airway obstruction, cyanosis, dislodgment of ETT, and hypoventilation.
- Reassure parents that infant will be carefully monitored.

## canakinumab

kan-ah-KIN-yoo-mab

Ilaris

*Therapeutic class:* Anti-autoimmune agent
*Pharmacologic class:* Monoclonal antibody
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 180-mg single-use vial

### INDICATIONS & DOSAGES

➤ **Cryopyrin-associated periodic syndromes (familial cold autoinflammatory syndrome and Muckle-Wells syndrome)**
*Adults and children age 4 and older weighing more than 40 kg (88 lb):* 150 mg subcutaneously every 8 weeks.
*Adults and children age 4 and older weighing 15 to 40 kg (33 to 88 lb):* 2 mg/kg subcutaneously every 8 weeks; may increase dosage to 3 mg/kg in children weighing 15 to 40 kg who have an inadequate response.

### ADMINISTRATION

**Subcutaneous**

- Refrigerate unopened vial at 36° to 46° F (2° to 8° C) and protect from light. After reconstitution, vial should be protected from light and may be kept at room temperature if used within 60 minutes of reconstitution.
- Using aseptic technique, reconstitute each vial by slowly injecting 1 ml preservative-free sterile water for injection with 1-ml syringe and an 18G × 2-inch needle. Swirl vial slowly at an angle of about 45 degrees for about 1 minute and allow to stand for 5 minutes. Then gently turn vial upside down and back again 10 times. Avoid touching rubber stopper with your fingers. Allow to stand for about 15 minutes at room temperature to obtain a clear solution. Don't shake. Tap side of vial to remove any residual liquid from stopper. Slight foaming of product upon reconstitution isn't unusual.
- Solution should be free from particles and colorless to slightly yellow-brown. Don't use if solution is distinctly brown or contains particles.

### ACTION

Blocks interleukin (IL)-1B and neutralizes its activity selectively at IL-1 receptors, thereby decreasing inflammation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 2–7 days | Unknown |

*Half-life:* 26 days.

### ADVERSE REACTIONS

**CNS:** *headache, vertigo.*
**EENT:** *nasopharyngitis, pharyngitis, rhinitis.*
**GI:** *diarrhea, gastroenteritis, nausea.*
**Musculoskeletal:** *musculoskeletal pain.*
**Respiratory:** *bronchitis.*
**Other:** *influenza,* injection-site reactions, *weight gain.*

### INTERACTIONS

**Drug-drug.** *CYP450 substrates (such as omeprazole, phenytoin, and warfarin):* May alter canakinumab drug concentration. Monitor patient closely.
*Live vaccines:* May transmit infection. Avoid use together.
*Tumor necrosis factor inhibitors, other IL-1 blockers:* May increase risk of serious infection, including reactivation of latent tuberculosis (TB). Avoid use together.

### EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Use cautiously in patients with infection, history of recurring infection, or underlying conditions that increase risk of infection.
- Use in pregnant women only if benefit to mother outweighs risk to fetus. It isn't known if drug appears in breast milk. Use cautiously in breast-feeding women.

## NURSING CONSIDERATIONS

- Test patient for latent TB before starting therapy; if patient tests positive, treat TB before initiating therapy.
- Drug may increase risk of malignancies. Monitor patient closely.
- Monitor patient for signs and symptoms of infection (fever, body aches, cough, sore throat).

## PATIENT TEACHING

- Advise patient to practice infection-prevention measures.
- Instruct patient to report signs and symptoms of infection (fever, body aches, cough, sore throat).
- Advise women to report pregnancy, possible pregnancy, or plans to become pregnant to their health care provider.
- Tell patient to avoid live vaccines while taking this drug.

# candesartan cilexetil

kan-dah-SAR-tan

Atacand

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Angiotensin II receptor antagonist
*Pregnancy risk category C in 1st trimester; D in 2nd and 3rd trimesters*

## AVAILABLE FORMS

*Tablets:* 4 mg, 8 mg, 16 mg, 32 mg

## INDICATIONS & DOSAGES

➤ **Hypertension (used alone or with other antihypertensives)**

*Adults:* Initially, 16 mg P.O. once daily when used alone; usual range is 8 to 32 mg P.O. daily as a single dose or divided b.i.d.

✶ ***NEW INDICATION:*** **Pediatric hypertension (used alone or with other antihypertensives)**

*Children ages 6 to younger than 17:* Initially for patients weighing more than 50 kg (110 lb), 16 mg P.O. once daily. May increase to 32 mg P.O. as single dose or divided doses as needed. Initially for patients weighing less than 50 kg, 4 to 8 mg P.O. once daily. May increase to 16 mg P.O. as single dose or divided doses as needed.

*Children ages 1 to younger than 6:* Initially, 0.20 mg/kg P.O. once daily. Dosage range is 0.05 to 0.4 mg/kg P.O. as single dose or divided doses.

➤ **Heart failure (New York Heart Association class II to IV)**

*Adults:* Initially, 4 mg P.O. once daily. Double the dose about every 2 weeks as tolerated to a target dose of 32 mg once daily.

***Adjust-a-dose:*** If patient takes a diuretic, consider a lower starting dose.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.
- Tablets may be made into suspension by pharmacist for patients unable to swallow pills.
- Suspension may be stored unopened at room temperature for 100 days.
- Shake suspension well before each use.
- Use suspension within 30 days of opening bottle.

## ACTION

Inhibits vasoconstrictive action of angiotensin II by blocking angiotensin II receptor on the surface of vascular smooth muscle and other tissue cells.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3–4 hr | 24 hr |

*Half-life:* 9 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, fatigue, headache.
**CV:** chest pain, peripheral edema.
**EENT:** pharyngitis, rhinitis, sinusitis.
**GI:** abdominal pain, diarrhea, nausea, vomiting.
**GU:** albuminuria.

**Musculoskeletal:** arthralgia, back pain.
**Respiratory:** coughing, bronchitis, upper respiratory tract infection.
**Other:** ***angioedema.***

### INTERACTIONS

**Drug-drug.** *Lithium:* May increase lithium concentration. Monitor lithium levels closely.
*Potassium-sparing diuretics, potassium supplements:* May cause hyperkalemia. Monitor patient closely.
**Drug-herb.** *Ma huang:* May decrease antihypertensive effects. Discourage use together.
**Drug-food.** *Salt substitutes containing potassium:* May cause hyperkalemia. Monitor patient closely.

### EFFECTS ON LAB TEST RESULTS

- May increase potassium, BUN, and serum creatinine levels.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components, in children with glomerular filtration rate of less than 30 ml/min/1.73 $m^2$, and in children younger than age 1.

**Black Box Warning** Contraindicated in pregnant patients, especially in the second and third trimesters. ▮

- Use cautiously in patients whose renal function depends on the renin-angiotensin-aldosterone system (such as patients with heart failure) because of risk of oliguria and progressive azotemia with acute renal failure or death.
- Use cautiously in patients who are volume or salt depleted because they could develop symptoms of hypotension. Start therapy with a lower dosage range, and monitor blood pressure carefully.

⚠ ***Overdose S&S:*** Symptomatic hypotension.

### NURSING CONSIDERATIONS

**Black Box Warning** Drugs such as candesartan that act directly on the renin-angiotensin system can cause fetal and neonatal illness and death when given to pregnant women. If pregnancy is detected, discontinue candesartan as soon as possible. ▮

- If hypotension occurs after a dose of candesartan, place patient in the supine position and, if needed, give an I.V. infusion of normal saline solution.
- Most of drug's antihypertensive effect occurs within 2 weeks. Maximal effect may take 4 to 6 weeks. Diuretic may be added if blood pressure isn't controlled by drug alone.
- Carefully monitor elderly patients and those with renal disease for therapeutic response and adverse reactions.

### PATIENT TEACHING

- Inform women of childbearing age of the consequences of second and third trimester exposure to drug. Prescriber should be notified immediately if pregnancy is suspected.
- Advise breast-feeding women of the risk of adverse effects on the infant and the need to stop either breast-feeding or drug.
- Instruct patient to store drug at room temperature and to keep container tightly sealed.
- Inform patient to report adverse reactions without delay.
- Tell patient that drug may be taken without regard to meals.

### SAFETY ALERT!

## capecitabine

kap-ah-SEAT-ah-been

Xeloda

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Pyrimidine analogue
*Pregnancy risk category D*

### AVAILABLE FORMS

*Tablets:* 150 mg, 500 mg

### INDICATIONS & DOSAGES

➤ **With docetaxel or alone, metastatic breast cancer resistant to both paclitaxel and an anthracycline-containing chemotherapy regimen or resistant to paclitaxel in patients for whom further anthracycline therapy isn't indicated; first-line treatment of metastatic colorectal cancer when fluoropyrimidine therapy**

**alone is preferred; Duke stage C colon cancer after complete resection of primary tumor when fluoropyrimidine alone is preferred**
*Adults:* 2,500 mg/m$^2$ daily P.O., in two divided doses, about 12 hours apart and after a meal, for 2 weeks, followed by a 1-week rest period; repeat every 3 weeks. Adjuvant treatment in patients with Duke C colon cancer is recommended for a total of eight cycles (24 weeks).
***Adjust-a-dose:*** Follow National Cancer Institute of Canada (NCIC) common toxicity criteria when adjusting dosage. Toxicity criteria relate to degrees of severity of diarrhea, nausea, vomiting, stomatitis, and hand-and-foot syndrome. Refer to drug package insert for specific toxicity definitions. NCIC grade 1: Maintain dose level. NCIC grade 2: At first appearance, stop treatment until resolved to grade 0 to 1; then restart at 100% of starting dose for next cycle. At second appearance, stop treatment until resolved to grade 0 to 1 and use 75% of starting dose for next cycle. At third appearance, stop treatment until resolved to grade 0 to 1 and use 50% of starting dose for next cycle. At fourth appearance, stop treatment permanently. NCIC grade 3: At first appearance, stop treatment until resolved to grade 0 to 1 and use 75% of starting dose for next cycle. At second appearance, stop treatment until resolved to grade 0 to 1 and use 50% of starting dose for next cycle. At third appearance, stop treatment permanently. NCIC grade 4: At first appearance, stop treatment permanently or until resolved to grade 0 to 1, and use 50% of starting dose for next cycle. Reduce starting dose for patients with creatinine clearance 30 to 50 ml/minute to 75% of the starting dose.

## ADMINISTRATION

**P.O.**
- Give drug with water within 30 minutes after breakfast and dinner.

## ACTION

Converted to active 5-fluorouracil (5-FU), which causes cellular injury by interfering with DNA synthesis to inhibit cell division and with RNA processing and protein synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 90–120 min | Unknown |

*Half-life:* About 45 minutes.

## ADVERSE REACTIONS

**CNS:** dizziness, *fatigue,* headache, insomnia, *paresthesia, pyrexia, fever,* lethargy, *peripheral neuropathy, asthenia.*
**CV:** edema, chest pain, ***venous thrombosis.***
**EENT:** *eye irritation,* epistaxis, *increased lacrimation,* rhinorrhea.
**GI:** *diarrhea, nausea, vomiting, stomatitis, abdominal pain, constipation, anorexia, dyspepsia,* taste perversion.
**Hematologic:** NEUTROPENIA, ***thrombocytopenia,*** *anemia,* ***lymphopenia.***
**Metabolic:** dehydration.
**Musculoskeletal:** myalgia, limb pain, *back pain.*
**Respiratory:** *dyspnea.*
**Skin:** *hand-foot syndrome, dermatitis,* nail disorder, alopecia, *rash.*

## INTERACTIONS

**Drug-drug.** *Antacids containing aluminum hydroxide and magnesium hydroxide:* May increase exposure to capecitabine and its metabolites. Monitor patient.
*Leucovorin:* May increase cytotoxic effects of 5-FU with enhanced toxicity. Monitor patient carefully.
*Phenytoin:* May increase toxicity or phenytoin effect. Monitor phenytoin level.
**Black Box Warning** *Warfarin:* May decrease clearance of warfarin and increase risk of bleeding. Monitor PT and INR. ■

## EFFECTS ON LAB TEST RESULTS

- May increase bilirubin level. May decrease hemoglobin level.
- May decrease neutrophil, platelet, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to 5-FU, patients with known dihydropyrimidine dehydrogenase deficiency, and in those with severe renal impairment.
- Use cautiously in elderly patients and those with history of coronary artery disease, mild to moderate hepatic dysfunction from liver metastases, hyperbilirubinemia,

and renal insufficiency. Also, use cautiously in patients also taking warfarin.
***Overdose S&S:*** Nausea, vomiting, diarrhea, GI irritation and bleeding, bone marrow depression.

## NURSING CONSIDERATIONS

- Patients older than age 80 may have a greater risk of adverse GI effects.
- Assess patient for severe diarrhea, and notify prescriber if it occurs. Give fluid and electrolyte replacement if patient becomes dehydrated. Drug may need to be immediately interrupted until diarrhea resolves or becomes less intense.
- Monitor patient for hand-foot syndrome (numbness, paresthesia, painless or painful swelling, erythema, desquamation, blistering, and severe pain of hands or feet), hyperbilirubinemia, and severe nausea. Drug therapy must be immediately adjusted. Hand-foot syndrome is staged from 1 to 4; drug may be stopped if severe or recurrent episodes occur.
- Hyperbilirubinemia may require stopping drug.

**Black Box Warning** Frequently monitor the INR and PT of patients also taking capecitabine and oral coumarin-derivative anticoagulant therapy; adjust anticoagulant dose accordingly. ■
***Alert:*** Monitor patient carefully for toxicity, which may be managed by symptomatic treatment, dose interruptions, and dosage adjustments.

## PATIENT TEACHING

- Tell patient how to take drug. Drug is usually taken for 14 days, followed by 7-day rest period (no drug), as a 21-day cycle. Prescriber determines number of treatment cycles.
- Instruct patient to take drug with water within 30 minutes after breakfast and dinner.
- If a combination of tablets is prescribed, teach patient importance of correctly identifying the tablets to avoid possible dosing error.
- For missed doses, instruct patient not to take the missed dose and not to double the next one. Instead, he should continue with regular dosing schedule and check with prescriber.
- Instruct patient to inform prescriber if he's taking folic acid.
- Inform patient and caregiver about expected adverse effects of drug, especially nausea, vomiting, diarrhea, and hand-foot syndrome (pain, swelling, or redness of hands or feet). Tell him that patient-specific dose adaptations during therapy are expected and needed.

***Alert:*** Instruct patient to stop taking drug and contact prescriber immediately if he develops diarrhea (more than four bowel movements daily or diarrhea at night), vomiting (two to five episodes in 24 hours), nausea, appetite loss or decrease in amount of food eaten each day, stomatitis (pain, redness, swelling or sores in mouth), hand-foot syndrome, temperature of 100.5° F (38° C) or higher, or other evidence of infection.

- Tell patient that most adverse effects improve within 2 to 3 days after stopping drug. If patient doesn't improve, tell him to contact prescriber.
- Advise women of childbearing age to avoid becoming pregnant during therapy.
- Advise breast-feeding women to stop breast-feeding during therapy.

# captopril

KAP-toe-pril

Capoten

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* ACE inhibitor
*Pregnancy risk category C; D in 2nd and 3rd trimesters*

## AVAILABLE FORMS

*Tablets:* 12.5 mg, 25 mg, 50 mg, 100 mg

## INDICATIONS & DOSAGES

➤ **Hypertension**

*Adults:* Initially, 25 mg P.O. b.i.d. or t.i.d. If dosage doesn't control blood pressure satisfactorily in 1 or 2 weeks, increase it to 50 mg b.i.d. or t.i.d. If that dosage doesn't control blood pressure satisfactorily after another 1 or 2 weeks, expect to add

a diuretic. If patient needs further blood pressure reduction, dosage may be raised to 150 mg t.i.d. while continuing diuretic. Maximum daily dose is 450 mg.

➤ **Diabetic nephropathy**

*Adults:* 25 mg P.O. t.i.d.

➤ **Heart failure**

*Adults:* Initially, 25 mg P.O. t.i.d. Patients with normal or low blood pressure who have been vigorously treated with diuretics and who may be hyponatremic or hypovolemic may start with 6.25 or 12.5 mg P.O. t.i.d.; starting dosage may be adjusted over several days. Gradually increase dosage to 50 mg P.O. t.i.d.; once patient reaches this dosage, delay further dosage increases for at least 2 weeks. Maximum dosage is 450 mg daily.

*Elderly patients:* Initially, 6.25 mg P.O. b.i.d. Increase gradually as needed.

➤ **Left ventricular dysfunction after acute MI**

*Adults:* Start therapy as early as 3 days after MI with 6.25 mg P.O. for one dose, followed by 12.5 mg P.O. t.i.d. Increase over several days to 25 mg P.O. t.i.d.; then increase to 50 mg P.O. t.i.d. over several weeks.

➤ **Raynaud phenomenon ♦**

*Adults:* 12.5 mg P.O. b.i.d.; gradually increase to 25 mg t.i.d.

## ADMINISTRATION

**P.O.**

● Give 1 hour before meals to enhance drug absorption.

## ACTION

Inhibits ACE, preventing conversion of angiotensin I to angiotensin II, a potent vasoconstrictor. Less angiotensin II decreases peripheral arterial resistance, decreasing aldosterone secretion, which reduces sodium and water retention and lowers blood pressure.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 15–60 min | 60–90 min | 6–12 hr |

*Half-life:* Less than 2 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, fainting, headache, malaise, fatigue, fever.

**CV:** tachycardia, hypotension, angina pectoris.

**GI:** abdominal pain, anorexia, constipation, diarrhea, dry mouth, dysgeusia, nausea, vomiting.

**Hematologic:** ***leukopenia, agranulocytosis, thrombocytopenia, pancytopenia,*** anemia.

**Metabolic:** hyperkalemia.

**Respiratory:** *dry, persistent, nonproductive cough,* dyspnea.

**Skin:** *urticarial rash, maculopapular rash,* pruritus, alopecia.

**Other:** ***angioedema.***

## INTERACTIONS

**Drug-drug.** *Antacids:* May decrease captopril effect. Separate dosage times.

*Diuretics, other antihypertensives:* May cause excessive hypotension. May need to stop diuretic or reduce captopril dosage.

*Insulin, oral antidiabetics:* May cause hypoglycemia when captopril therapy is started. Monitor patient closely.

*Lithium:* May increase lithium level; symptoms of toxicity possible. Monitor patient closely.

*NSAIDs:* May reduce antihypertensive effect. Monitor blood pressure.

*Potassium-sparing diuretics, potassium supplements:* May cause hyperkalemia. Avoid using together unless hypokalemia is confirmed.

**Drug-herb.** *Black catechu:* May cause additional hypotensive effect. Discourage use together.

*Capsaicin:* May worsen cough. Discourage use together.

**Drug-food.** *Salt substitutes containing potassium:* May cause hyperkalemia. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

● May increase alkaline phosphatase, bilirubin, and potassium levels. May decrease hemoglobin level and hematocrit.

● May decrease granulocyte, platelet, RBC, and WBC counts.

● May cause false-positive urine acetone test results.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or other ACE inhibitors.

**Black Box Warning** Use during pregnancy can cause injury and death to the developing fetus. When pregnancy is detected, stop drug as soon as possible. ■

- Use cautiously in patients with impaired renal function or serious autoimmune disease, especially systemic lupus erythematosus, and in those who have been exposed to other drugs that affect WBC counts or immune response.

⚠ ***Overdose S&S:*** Hypotension.

## NURSING CONSIDERATIONS

- Monitor patient's blood pressure and pulse rate frequently.

***Alert:*** Elderly patients may be more sensitive to drug's hypotensive effects.

- Assess patient for signs of angioedema.
- Drug causes the most frequent occurrence of cough, compared with other ACE inhibitors.
- In patients with impaired renal function or collagen vascular disease, monitor WBC and differential counts before starting treatment, every 2 weeks for the first 3 months of therapy, and periodically thereafter.
- ***Look alike–sound alike:*** Don't confuse captopril with Capitrol.

## PATIENT TEACHING

- Instruct patient to take drug 1 hour before meals; food in the GI tract may reduce absorption.
- Inform patient that light-headedness is possible, especially during first few days of therapy. Tell him to rise slowly to minimize this effect and to report occurrence to prescriber. If fainting occurs, he should stop drug and call prescriber immediately.
- Tell patient to use caution in hot weather and during exercise. Lack of fluids, vomiting, diarrhea, and excessive perspiration can lead to light-headedness and syncope.
- Advise patient to report signs and symptoms of infection, such as fever and sore throat.
- Tell women to notify prescriber if pregnancy occurs. Drug will need to be stopped.
- Urge patient to promptly report swelling of the face, lips, or mouth; or difficulty breathing.

# carbachol (intraocular)

KAHR-buh-kawl

Miostat

# carbachol (topical)

*Therapeutic class:* Miotic
*Pharmacologic class:* Direct-acting parasympathomimetic
*Pregnancy risk category C*

## AVAILABLE FORMS

*Intraocular injection:* 0.01%
*Topical ophthalmic solution:* 1.5%, 2.25%, 3%

## INDICATIONS & DOSAGES

➤ **To produce pupillary miosis in ocular surgery**

*Adults:* Before or after securing sutures, 0.5 ml (intraocular form) instilled gently into anterior chamber.

➤ **To reduce intraocular pressure in the treatment of glaucoma**

*Adults:* 1 or 2 drops (topical form) instilled every 4 to 8 hours, up to three times daily.

## ADMINISTRATION

### Ophthalmic

- Don't touch tip of dropper to eye or surrounding tissue.
- Apply light finger pressure on lacrimal sac for 1 minute after instilling drug to minimize systemic absorption.

## ACTION

A cholinergic that causes contraction of the sphincter muscles of the iris, resulting in miosis. Also produces ciliary spasm, deepening of the anterior chamber, and vasodilation of conjunctival vessels of the outflow tract.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Intraocular | Seconds | 2–5 min | 24–48 hr |
| Ophthalmic (topical) | 10–20 min | Unknown | 4–8 hr |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CV:** ***cardiac arrhythmia,*** flushing, hypotension, syncope.
**EENT:** *transient stinging and burning,* bullous keratopathy, ciliary and conjunctival injection, conjunctival vasodilation, corneal clouding, eye and brow pain, iritis, retinal detachment, salivation, spasm of eye accommodation.
**GI:** diarrhea, epigastric distress, GI cramps, vomiting.
**GU:** frequent urge to urinate, tightness in bladder.
**Respiratory:** ***asthma.***
**Other:** diaphoresis.

## INTERACTIONS

**Drug-drug.** *Pilocarpine:* May cause additive effects. Use together cautiously.
*Topical NSAIDs:* May inactivate carbachol. Monitor patient for clinical effect.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with conditions in which cholinergic effects, such as constriction, are undesirable (acute iritis, some forms of secondary glaucoma, pupillary block glaucoma, or acute inflammatory disease of the anterior chamber).
- Use cautiously in patients with acute heart failure, bronchial asthma, peptic ulcer, hyperthyroidism, GI spasm, Parkinson disease, and urinary tract obstruction.

## NURSING CONSIDERATIONS

- In case of toxicity, give atropine parenterally.
- Drug is used in open-angle glaucoma, especially when patients are resistant or allergic to pilocarpine hydrochloride or nitrate.

***Alert:*** Patients with hazel or brown irises may need stronger solutions or more frequent instillation because eye pigment may absorb drug.

- If tolerance to drug develops, prescriber may switch to another miotic for a short time.
- ***Look alike–sound alike:*** Don't confuse Isopto Carbachol with Isopto Carpine.

## PATIENT TEACHING

- Teach patient how to instill drug. Advise him to wash hands before and after instillation and to apply light finger pressure on lacrimal sac for 1 minute after drops are instilled. Warn him not to exceed recommended dosage.
- Warn patient to avoid hazardous activities, such as operating machinery or driving, until temporary blurring subsides. Reassure patient that blurred vision usually diminishes with prolonged use.
- Tell glaucoma patient that long-term use may be needed. Stress compliance. Tell him to remain under medical supervision for periodic tests of intraocular pressure.
- Warn patient to use caution during night driving and while performing other hazardous activities in reduced light.

# carbamazepine

kar-ba-MAZ-e-peen

Carbatrol, Epitol, Equetro, Novo-Carbamaz†, Tegretol, Tegretol CR†, Tegretol-XR, Teril

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* Iminostilbene derivative
*Pregnancy risk category D*

## AVAILABLE FORMS

*Capsules (extended-release):* 100 mg, 200 mg, 300 mg
*Oral suspension:* 100 mg/5 ml
*Tablets:* 200 mg
*Tablets (chewable):* 100 mg
*Tablets (extended-release):* 100 mg, 200 mg, 400 mg

## INDICATIONS & DOSAGES

➤ **Generalized tonic-clonic and complex partial seizures, mixed seizure patterns (except Carbatrol and Equetro)**
*Adults and children older than age 12:* Initially, 200 mg P.O. b.i.d. (conventional or extended-release tablets), or 100 mg P.O. q.i.d. of suspension with meals. May

be increased weekly by 200 mg P.O. daily in divided doses at 12-hour intervals for extended-release tablets or 6- to 8-hour intervals for conventional tablets or suspension, adjusted to minimum effective level. Maximum, 1,000 mg daily in children ages 12 to 15, and 1,200 mg daily in patients older than age 15. Usual maintenance dosage is 800 to 1,200 mg daily.

*Children ages 6 to 12:* Initially, 100 mg P.O. b.i.d. (conventional or extended-release tablets) or 50 mg of suspension P.O. q.i.d. with meals, increased at weekly intervals by up to 100 mg P.O. divided in three to four doses daily (divided b.i.d. for extended-release form). Maximum, 1,000 mg daily. Usual maintenance dosage is 400 to 800 mg daily; or, 20 to 30 mg/kg in divided doses three to four times daily.

*Children younger than age 6:* 10 to 20 mg/kg in two to three divided doses (conventional tablets) or four divided doses (suspension). Maximum dosage is 35 mg/kg in 24 hours.

➤ **Epilepsy (Carbatrol only)**

*Adults and children older than age 12:* 200 mg P.O. b.i.d. Increase at weekly intervals by adding up to 200 mg daily until optimal response is obtained. Dosage shouldn't exceed 1,000 mg daily in children ages 12 to 15 and 1,200 mg daily in patients older than age 15. Usual effective maintenance level is 800 to 1,200 mg daily.

➤ **Acute manic and mixed episodes associated with bipolar I disorder (Equetro only)**

*Adults:* Initially, 200 mg Equetro P.O. b.i.d. Increase by 200 mg daily to achieve therapeutic response. Doses higher than 1,600 mg daily haven't been studied.

➤ **Trigeminal neuralgia (except Carbatrol and Equetro)**

*Adults:* Initially, 100 mg P.O. b.i.d. (conventional or extended-release tablets) or 50 mg of suspension q.i.d. with meals, increased by 100 mg every 12 hours for tablets or 50 mg of suspension q.i.d. until pain is relieved. Maximum, 1,200 mg daily. Maintenance dosage is usually 200 to 400 mg P.O. b.i.d.

➤ **Trigeminal neuralgia (Carbatrol only)**

*Adults:* Initially, 200-mg capsule P.O. daily. Daily dosage may be increased by up to 200 mg/day every 12 hours, only as needed to achieve freedom from pain. Don't exceed 1,200 mg daily.

➤ **Borderline personality disorder ♦**

*Adults:* Initially, 400 mg P.O. daily in two divided doses (tablets, ER tablets, ER capsules) or four divided doses (oral suspension). May increase dosage in increments of 200 mg/day. Maximum dosage is 1,600 mg/day.

➤ **Alcohol withdrawal ♦**

*Adults:* 600 to 1,200 mg P.O. on day 1, tapered to 0 mg over 5 to 10 days.

## ADMINISTRATION

**P.O.**

- Shake oral suspension well before measuring dose.
- Contents of extended-release capsules may be sprinkled over applesauce if patient has difficulty swallowing capsules. Capsules and tablets shouldn't be crushed or chewed, unless labeled as chewable form.
- When giving by nasogastric tube, mix dose with an equal volume of water, normal saline solution, or $D_5W$. Flush tube with 100 ml of diluent after giving dose.
- Don't crush or split extended-release form or give broken or chipped tablets.

## ACTION

Thought to stabilize neuronal membranes and limit seizure activity by either increasing efflux or decreasing influx of sodium ions across cell membranes in the motor cortex during generation of nerve impulses.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1½–12 hr | Unknown |
| P.O. (extended-release) | Unknown | 4–8 hr | Unknown |

*Half-life:* 25 to 65 hours with single dose; 8 to 29 hours with long-term use.

## ADVERSE REACTIONS

**CNS:** *ataxia, dizziness, drowsiness, somnolence, vertigo,* ***worsening of seizures,*** confusion, fatigue, fever, headache, syncope, *pain,* depression including ***suicidal ideation,*** speech disorder.

**CV:** ***arrhythmias, AV block, heart failure,*** aggravation of coronary artery disease, hypertension, hypotension.

**EENT:** blurred vision, conjunctivitis, diplopia, dry pharynx, nystagmus.
**GI:** *nausea, vomiting,* abdominal pain, anorexia, *diarrhea,* dry mouth, *dyspepsia,* glossitis, stomatitis.
**GU:** albuminuria, glycosuria, impotence, urinary frequency, urine retention.
**Hematologic:** ***agranulocytosis, aplastic anemia, thrombocytopenia,*** eosinophilia, leukocytosis.
**Hepatic:** ***hepatitis.***
**Metabolic:** hyponatremia, SIADH.
**Respiratory:** pulmonary hypersensitivity.
**Skin:** ***erythema multiforme, Stevens-Johnson syndrome,*** excessive diaphoresis, *rash,* urticaria, pruritus.
**Other:** chills.

## INTERACTIONS

**Drug-drug.** *Atracurium, cisatracurium, pancuronium, rocuronium, vecuronium:* May decrease the effects of nondepolarizing muscle relaxant, causing it to be less effective. May need to increase the dose of the nondepolarizing muscle relaxant.
*Cimetidine, danazol, diltiazem, fluoxetine, fluvoxamine, isoniazid, macrolides, propoxyphene, valproic acid, verapamil:* May increase carbamazepine level. Use together cautiously.
*Clarithromycin, erythromycin, troleandomycin:* May inhibit metabolism of carbamazepine, increasing carbamazepine level and risk of toxicity. Avoid using together.
*Doxycycline, felbamate, haloperidol, hormonal contraceptives, phenytoin, theophylline, tiagabine, topiramate, valproate, warfarin:* May decrease levels of these drugs. Watch for decreased effect.
***Lamotrigine:*** May decrease lamotrigine level and increase carbamazepine level. Monitor patient for clinical effects and toxicity.
*Lithium:* May increase CNS toxicity of lithium. Avoid using together.
***MAO inhibitors:*** May increase depressant and anticholinergic effects. Avoid using together.
***Nefazodone:*** May increase carbamazepine levels and toxicity while reducing nefazodone levels and therapeutic benefits. Use together is contraindicated.
*Phenobarbital, phenytoin, primidone:* May decrease carbamazepine level. Watch for decreased effect.
**Drug-herb.** *Plantains (psyllium seed):* May inhibit GI absorption of drug. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN level. May decrease hemoglobin level and hematocrit.
- May increase liver function test values and eosinophil and WBC counts. May decrease thyroid function test values and granulocyte and platelet counts.
- May cause false pregnancy test results.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to this drug or tricyclic antidepressants and in those with a history of bone marrow suppression; also contraindicated in those who have taken an MAO inhibitor within 14 days.
- Use cautiously in patients with mixed seizure disorders because they may experience an increased risk of seizures. Also, use with caution in patients with hepatic dysfunction.

***Overdose S&S:*** Conduction disorders, hypotension or hypertension, impairment of consciousness, irregular breathing, respiratory depression, tachycardia, shock, seizures, adiadochokinesia, ataxia, athetoid movements, ballism, dizziness, drowsiness, dysmetria, motor restlessness, muscular twitching, mydriasis, nystagmus, opisthotonos, psychomotor disturbances, tremor; hyperreflexia followed by anuria or oliguria, hyporeflexia, nausea and vomiting, urine retention.

## NURSING CONSIDERATIONS

***Alert:*** Patients of Asian ancestry should get a genetic blood test to identify their risk for rare, but serious skin reactions (toxic epidermal necrolysis, Stevens-Johnson syndrome). Screen for HLA-B*1502 allele before starting treatment with carbamazepine.
- Watch for worsening of seizures, especially in patients with mixed seizure disorders, including atypical absence seizures.

**Alert:** Closely monitor all patients taking or starting antiepileptic drugs for changes in behavior indicating worsening of suicidal thoughts or behavior or depression. Symptoms such as anxiety, agitation, hostility, mania, and hypomania may be precursors to emerging suicidality.
• Obtain baseline determinations of urinalysis, BUN and iron levels, liver function, CBC, and platelet and reticulocyte counts. Monitor these values periodically thereafter. **Black Box Warning** Aplastic anemia and agranulocytosis have been reported in association with carbamazepine therapy. Obtain complete pretreatment hematologic testing as a baseline. If patient in the course of treatment exhibits low or decreased WBC or platelet counts, monitor patient closely. Consider discontinuing drug if evidence of significant bone marrow depression develops. ■
• Never stop drug suddenly when treating seizures. Notify prescriber immediately if adverse reactions occur.
• Adverse reactions may be minimized by gradually increasing dosage.
• Therapeutic level is 4 to 12 mcg/ml. Monitor level and effects closely. Ask patient when last dose was taken to better evaluate drug level.
• When managing seizures, take appropriate precautions.
**Alert:** Watch for signs of anorexia or subtle appetite changes, which may indicate excessive drug level.
• **Look alike–sound alike:** Don't confuse Tegretol or Tegretol-XR with Topamax, Toprol-XL, or Toradol. Don't confuse Carbatrol with carvedilol.

## PATIENT TEACHING

• Instruct patient to take drug with food to minimize GI distress. Tell patient taking suspension form to shake container well before measuring dose.
• Tell patient not to crush or chew extended-release form and not to take broken or chipped tablets.
• Tell patient that Tegretol-XR tablet coating may appear in stool because it isn't absorbed.
• Advise patient to keep tablets in the original container and to keep the container tightly closed and away from moisture. Some formulations may harden when exposed to excessive moisture, so that less is available in the body, decreasing seizure control.
• Inform patient that when drug is used for trigeminal neuralgia, an attempt to decrease dosage or withdraw drug is usually made every 3 months.
• Advise patient to notify prescriber immediately if fever, sore throat, mouth ulcers, or easy bruising or bleeding occurs.
• Tell patient that drug may cause mild to moderate dizziness and drowsiness when first taken. Advise him to avoid hazardous activities until effects disappear, usually within 3 to 4 days.
• Advise patient that periodic eye examinations are recommended.
• Advise women of risks to fetus if pregnancy occurs while taking carbamazepine.
• Advise women that breast-feeding isn't recommended during therapy.

**SAFETY ALERT!**

# carboplatin

KAR-bo-pla-tin

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Platinum coordination compound
*Pregnancy risk category D*

## AVAILABLE FORMS

*Aqueous solution for injection:* 10 mg/ml, 50 mg/5 ml, 150 mg/15 ml, 450 mg/45 ml, 600 mg/60 ml
*Lyophilized powder for injection:* 50-mg, 150-mg, 450-mg vials

## INDICATIONS & DOSAGES

➤ **Advanced ovarian cancer**
*Adults:* 360 mg/m$^2$ I.V. on day 1 every 4 weeks. Or, 300 mg/m$^2$ on day 1 every 4 weeks for six cycles when used with other chemotherapy drugs. Or, use the Calvert formula to calculate initial dosage:

$$\text{Total dose (mg)} = (\text{target AUC}) \times (\text{GFR} + 25)$$

where target AUC (area under the curve) is usually 4 to 6 mg/ml and GFR (glomerular filtration rate) is measured in ml/minute.

Doses shouldn't be repeated until platelet count exceeds 100,000/$mm^3$ and neutrophil count exceeds 2,000/$mm^3$. Subsequent doses are based on blood counts: If platelets are greater than 100,000/$mm^3$ and neutrophils are greater than 2,000/$mm^3$, give 125% of dose. If platelets are 50,000/$mm^3$ to 100,000/$mm^3$ and neutrophils are 500/$mm^3$ to 2,000/$mm^3$, keep same dose. If platelets are less than 50,000/$mm^3$ and neutrophils are less than 500/$mm^3$, give 75% of dose.

***Adjust-a-dose:*** If creatinine clearance is 41 to 59 ml/minute, first dose is 250 mg/$m^2$. If creatinine clearance is 16 to 40 ml/minute, first dose is 200 mg/$m^2$. Drug isn't recommended for patients with creatinine clearance of 15 ml/minute or less.

➤ **Brain tumors** ♦

*Children age 3 and older:* 175 mg/$m^2$ I.V. once weekly for 4 weeks, followed by 2-week rest period.

➤ **Solid tumors** ♦

*Children age 3 and older:* 300 to 600 mg/$m^2$ I.V. every 4 weeks.

## ADMINISTRATION

**I.V.**

**Black Box Warning** Anaphylaxis may occur within minutes of administration. Keep epinephrine, corticosteroids, and antihistamines available when giving carboplatin. ■

▼ Preparing and giving parenteral form of drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.

▼ Don't use aluminum needles or I.V. administration sets because drug may precipitate or lose potency.

▼ For premixed aqueous solution of 10 mg/ml, dilute for infusion with normal saline solution or $D_5W$ to a concentration as low as 0.5 mg/ml.

▼ For vials of lyophilized powder, reconstitute with sterile water for injection, $D_5W$, or normal saline. For 50-mg vial, use 5 ml solution; for 150-mg vial, use 15 ml solution; for 450-mg vial, use 45 ml solution to yield a concentration of 10 mg/ml.

▼ Give drug by continuous or intermittent infusion over at least 15 minutes.

▼ Store unopened vials at room temperature. Protect from light.

▼ Once reconstituted and diluted as directed, drug is stable at room temperature for 8 hours.

▼ Because drug contains no preservatives, discard after 8 hours.

▼ **Incompatibilities:** Amphotericin B cholesteryl sulfate complex, fluorouracil, mesna, sodium bicarbonate.

## ACTION

May cross-link strands of cellular DNA and interfere with RNA transcription, causing an imbalance of growth that leads to cell death. Not specific to cell cycle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 5 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, confusion, ***stroke,*** peripheral neuropathy, **CENTRAL NEUROTOXICITY,** *pain, asthenia.*

**CV:** ***heart failure, embolism.***

**EENT:** ototoxicity.

**GI:** *abdominal pain,* constipation, diarrhea, *nausea, vomiting,* mucositis, change in taste, stomatitis.

**Hematologic:** **THROMBOCYTOPENIA,** ***leukopenia,*** **NEUTROPENIA,** anemia, **BONE MARROW SUPPRESSION,** ***bleeding.***

**Skin:** *alopecia.*

**Other:** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Aspirin, NSAIDs:* May increase risk of bleeding. Avoid using together.

*Bone marrow suppressants, including radiation therapy:* May increase hematologic toxicity. Monitor CBC with differential closely.

*Nephrotoxic drugs, especially aminoglycosides and amphotericin B:* May enhance nephrotoxicity of carboplatin. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

● May increase alkaline phosphatase, AST, BUN, and creatinine levels. May decrease electrolyte and hemoglobin levels and hematocrit.

• May decrease neutrophil, platelet, RBC, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients with severe bone marrow suppression or bleeding or with history of hypersensitivity to cisplatin, platinum-containing compounds, or mannitol.

***Overdose S&S:*** Bone marrow suppression, hepatotoxicity.

## NURSING CONSIDERATIONS

**Black Box Warning** Carboplatin should be administered under the supervision of a physician experienced in the use of chemotherapeutic agents.

• Determine electrolyte, creatinine, and BUN levels; CBC; platelet count; and creatinine clearance before first infusion and before each course of treatment.

***Alert:*** When using the Calvert formula, the total dose is calculated in mg, not $mg/m^2$.

• Monitor CBC and platelet count frequently during therapy and, when indicated, until recovery. Lowest WBC and platelet counts usually occur by day 21. Levels usually return to baseline by day 28. Don't repeat unless platelet count exceeds $100{,}000/mm^3$.

**Black Box Warning** Bone marrow suppression is dose related and may be severe, resulting in infection or bleeding.

**Black Box Warning** Vomiting is another frequent drug-related side effect.

• Bone marrow suppression may be more severe in patients with creatinine clearance below 60 ml/minute; adjust dosage.

***Alert:*** Carefully check ordered dose against laboratory test results. Only one increase in dosage is recommended. Subsequent doses shouldn't exceed 125% of starting dose.

• Therapeutic effects are commonly accompanied by toxicity.

• Drug has less nephrotoxicity and neurotoxicity than cisplatin, but it causes more severe myelosuppression.

• To prevent bleeding, avoid all I.M. injections when platelet count is below $50{,}000/mm^3$.

• Monitor vital signs during infusion.

• Give antiemetic to reduce nausea and vomiting.

**Black Box Warning** Anemia may be cumulative and require transfusion support.

• Patients older than age 65 are at greater risk for neurotoxicity.

• ***Look alike–sound alike:*** Don't confuse carboplatin with cisplatin.

## PATIENT TEACHING

• Advise patient of most common adverse reactions: nausea, vomiting, bone marrow suppression, anemia, and reduction in blood platelets.

• Advise patient to watch for signs of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell patient to take temperature daily.

• Instruct patient to avoid OTC products containing aspirin and NSAIDs.

• Advise women to stop breast-feeding during therapy because of risk of toxicity to infant.

• Because of risk of sterility and menstruation cessation, counsel both men and women of childbearing age before starting therapy. Also recommend that women consult prescriber before becoming pregnant.

# carboprost tromethamine

KAR-boe-prost

Hemabate

*Therapeutic class:* Oxytocic
*Pharmacologic class:* Prostaglandin
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 250 mcg/ml

## INDICATIONS & DOSAGES

➤ **To terminate pregnancy between weeks 13 and 20 of gestation**

*Adults:* Initially, 250 mcg deep I.M. Give subsequent doses of 250 mcg at intervals of 1½ to 3½ hours, depending on uterine response. Dosage may be increased in increments to 500 mcg if contractility is inadequate after several 250-mcg doses. Total

dose shouldn't exceed 12 mg or continuous administration for more than 2 days.

➤ **Postpartum hemorrhage from uterine atony not managed by conventional methods**

*Adults:* 250 mcg by deep I.M. injection. Repeat doses every 15 to 90 minutes as needed. Maximum total dose is 2 mg.

## ADMINISTRATION

**I.M.**

- Only trained personnel in a hospital setting should give drug.
- Give deep in the muscle using a tuberculin syringe.

## ACTION

Produces strong, prompt contractions of uterine smooth muscle, possibly mediated by calcium and cAMP.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.M. | Unknown | 15–60 min | 24 hr |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *fever*, headache, anxiety, paresthesia, syncope, weakness.
**CV:** ***arrhythmias,*** chest pain, flushing.
**EENT:** blurred vision, eye pain.
**GI:** *vomiting, diarrhea, nausea.*
**GU:** ***uterine rupture,*** endometritis, uterine or vaginal pain.
**Musculoskeletal:** backache, leg cramps.
**Respiratory:** coughing, wheezing.
**Skin:** rash, diaphoresis.
**Other:** breast tenderness, chills, hot flashes.

## INTERACTIONS

**Drug-drug.** *Other oxytocics:* May increase action. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with acute pelvic inflammatory disease or active cardiac, pulmonary, renal, or hepatic disease.
- Use cautiously in patients with history of asthma, hypotension, hypertension, anemia, jaundice, or diabetes; and those with seizure disorders, previous uterine surgery, or CV, adrenal, renal, or hepatic disease.

## NURSING CONSIDERATIONS

- Unlike other prostaglandin abortifacients, drug is given by I.M. injection. Injectable form avoids risk of expelling vaginal suppositories if patient has profuse vaginal bleeding.
- Pretreating and giving with antiemetics and antidiarrheals decreases the risk of common GI effects.

## PATIENT TEACHING

- Explain use and administration of drug to patient and family.
- Instruct patient to report adverse reactions promptly.

✳ *NEW DRUG*

# carglumic acid

kar-GLOO-mik as-id

Carbaglu

*Therapeutic class:* Antihyperammonemic
*Pharmacologic class:* Ammonia detoxicant
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 200 mg

## INDICATIONS & DOSAGES

➤ **Acute or chronic hyperammonemia in patients with *N*-acetylglutamate synthetase (NAGS) deficiency**

*Adults and children:* Initially, 100 to 250 mg/kg/day P.O., divided into two to four doses, immediately before meals. Round each dose to nearest 100 mg. Titrate dosage according to ammonia level and symptoms.

## ADMINISTRATION

**P.O.**

- Give drug immediately before meals or feedings.
- Don't crush tablets or allow patient to swallow them whole.
- For oral administration in adults, disperse each 200-mg tablet in minimum of 2.5 ml water and give immediately. Rinse mixing

container with additional water and have patient swallow contents immediately.
• For oral administration in children, mix each 200-mg tablet in 2.5 ml water. Draw up appropriate volume of dispersion in oral syringe and administer immediately.
• For administration through nasogastric (NG) tube, mix each 200-mg tablet with minimum of 2.5 ml water and shake gently to quickly disperse. Administer dispersion immediately, then flush NG tube with additional water to clear it.
• Before opening container, store refrigerated at 36° to 46° F (2° to 8° C). After opening, don't refrigerate and don't store above 86° F (30° C).

## ACTION

Acts as a replacement for *N*-acetylglutamate in patients with NAGS deficiency, by activating the enzyme carbamoyl phosphate synthetase 1.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3 hr | Unknown |

*Half-life:* 5.6 hours.

## ADVERSE REACTIONS

**CNS:** asthenia, *fever*, *headache*, somnolence.
**EENT:** *ear infections*, *nasopharyngitis*, *tonsillitis.*
**GI:** *abdominal pain*, anorexia, *diarrhea*, taste perversion, *vomiting.*
**Hematologic:** *anemia.*
**Metabolic:** weight loss.
**Respiratory:** influenza, pneumonia.
**Skin:** rash, hyperhidrosis.
**Other:** *infection.*

## INTERACTIONS

None reported.

## EFFECTS ON LAB TEST RESULTS

• May decrease hemoglobin level.

## CONTRAINDICATIONS & CAUTIONS

• Because of risk of irreversible neurologic damage and death from untreated NAGS deficiency, women with NAGS deficiency must receive drug during pregnancy.
• It isn't known if drug appears in breast milk. Women shouldn't breast-feed while taking drug.
⚠ ***Overdose S&S:*** Tachycardia, profuse sweating, increased bronchial secretion, fever, restlessness.

C

## NURSING CONSIDERATIONS

• Treatment should be initiated by prescriber experienced in metabolic disorders.
• Drug should be administered with other ammonia-lowering drugs.
• A high-calorie, protein-restricted diet is recommended when ammonia levels are acutely elevated. Protein intake can be unrestricted when ammonia levels return to normal.
• Monitor neurologic status, ammonia level, and clinical response regularly throughout treatment.

## PATIENT TEACHING

• Instruct patient to date tablet container after opening and to discard container 1 month after first opening.
• Warn patient not to swallow tablets whole or to crush them.
• Advise patient that regular blood testing will be necessary during therapy.
• Teach patient importance of following high-calorie, protein-restricted diet when ammonia levels are high.
• Advise patient to report vomiting, abdominal pain, fever, sore throat, ear pain, diarrhea, or headache.

# carisoprodol

kar-eye-soe-PROE-dol

Soma✐

*Therapeutic class:* Skeletal muscle relaxant
*Pharmacologic class:* Carbamate derivative
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 250 mg, 350 mg

## INDICATIONS & DOSAGES

➤ **Adjunctive treatment for acute, painful musculoskeletal conditions**

*Adults:* 250 mg to 350 mg P.O. t.i.d. and at bedtime for a maximum of 2 to 3 weeks.

## ADMINISTRATION

**P.O.**

- Give drug with food or milk if GI upset occurs.

## ACTION

May modify central perception of pain without modifying pain reflexes. Muscle relaxant effects may be related to sedative properties.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | ½ hr | 1½–2 hr | 4–6 hr |

*Half-life:* 2 hours for carisoprodol, 10 hours for active metabolite.

## ADVERSE REACTIONS

**CNS:** *drowsiness, dizziness,* vertigo, ataxia, tremor, agitation, irritability, headache, depressive reactions, fever, insomnia, syncope.

**CV:** *orthostatic hypotension,* tachycardia, facial flushing.

**GI:** nausea, vomiting, epigastric distress, hiccups.

**Respiratory:** ***asthmatic episodes,*** hiccups.

**Skin:** ***erythema multiforme,*** pruritus, rash.

**Other:** ***angioedema, anaphylaxis.***

## INTERACTIONS

**Drug-drug.** *CNS depressants:* May increase CNS depression. Avoid using together.

*CYP2C19 inducers (such as rifampin):* May increase active metabolite (meprobamate) exposure and decrease available carisoprodol. Use cautiously together.

*CYP2C19 inhibitors (such as fluvoxamine, omeprazole):* May decrease metabolism of carisoprodol to meprobamate, increasing exposure to carisoprodol. Use cautiously together.

*Meprobamate:* May increase meprobamate level. Avoid use together.

**Drug-herb.** *St. Johns wort:* May increase active metabolite (meprobamate) exposure and decrease available carisoprodol. Use cautiously together.

**Drug-lifestyle.** *Alcohol use:* May increase CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase eosinophil count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to related compounds (such as meprobamate) and in those with intermittent porphyria.
- Use cautiously in patients with impaired hepatic or renal function.
- Safety and effectiveness in adults older than 65 and children younger than age 16 haven't been established.

***Overdose S&S:*** Stupor, coma, seizures, shock, respiratory depression, drowsiness, dizziness, headache, diplopia, nystagmus, delirium, dystonia, muscular incoordination.

## NURSING CONSIDERATIONS

***Alert:*** Watch for idiosyncratic reactions after first to fourth doses (weakness, ataxia, visual and speech difficulties, fever, skin eruptions, and mental changes) and for severe reactions, including bronchospasm, hypotension, and anaphylactic shock. After unusual reactions, withhold dose and notify prescriber immediately.

- Record amount of relief to help prescriber determine whether dosage can be reduced.
- Don't stop drug abruptly, which may cause mild withdrawal effects, such as insomnia, headache, nausea, or abdominal cramps.
- Drug may be habit forming.

## PATIENT TEACHING

- Warn patient to avoid activities that require alertness until CNS effects of drug are known. Drowsiness is transient.
- Advise patient to avoid combining drug with alcohol or other CNS depressants.
- Tell patient to ask prescriber before using OTC cold or hay fever remedies.
- Instruct patient to follow prescriber's orders regarding rest and physical therapy.
- Advise patient to avoid sudden changes in posture if dizziness occurs.
- Tell patient to take drug with food or milk if GI upset occurs.

**SAFETY ALERT!**

## carmustine (BCNU)

kar-MUS-teen

BiCNU, Gliadel Wafer

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Nitrosourea
*Pregnancy risk category D*

### AVAILABLE FORMS

*Injection:* 100-mg vial (lyophilized), with a 3-ml vial of absolute alcohol supplied as a diluent
*Wafer:* 7.7 mg, for intracavitary use

### INDICATIONS & DOSAGES

➤ **Brain tumor, Hodgkin lymphoma, malignant lymphoma, multiple myeloma**
*Adults:* 150 to 200 mg/m$^2$ I.V. by slow infusion every 6 weeks; may be divided into daily injections of 75 to 100 mg/m$^2$ on 2 successive days; repeat dose every 6 weeks if platelet count is greater than 100,000/mm$^3$ and WBC count is greater than 4,000/mm$^3$.
***Adjust-a-dose:*** Dosage is reduced by 30% when WBC nadir is 2,000 to 2,999/mm$^3$ and platelet nadir is 25,000 to 74,999/mm$^3$. Dosage is reduced by 50% when WBC nadir is less than 2,000/mm$^3$ and platelet nadir is less than 25,000/mm$^3$.

➤ **Adjunct to surgery to prolong survival in patients with recurrent glioblastoma multiforme for whom surgical resection is indicated**
*Adults:* 8 wafers placed in the resection cavity if size and shape of cavity allow. If 8 wafers can't be accommodated, use maximum number of wafers allowed. Or, 150 to 200 mg/m$^2$ I.V. by slow infusion as single dose, repeated every 6 to 8 weeks.

➤ **Adjunct to surgery and radiation in patients with newly diagnosed high-grade malignant glioma**
*Adults:* 8 wafers placed in the resection cavity if size and shape of cavity allow. If 8 wafers can't be accommodated, use maximum number of wafers allowed.

### ADMINISTRATION

**I.V.**

▼ Preparing and giving parenteral form of drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks. Wear gloves when handling any form of drug.
▼ Prepare drug only in glass containers. Solution is unstable in plastic I.V. bags.
▼ If powder liquefies or appears oily, discard because decomposition has occurred.
▼ To reconstitute, dissolve 100 mg of drug in 3 ml of absolute alcohol provided by manufacturer.
▼ Dilute solution with 27 ml of sterile water for injection. Resulting solution contains 3.3 mg of carmustine/ml in 10% alcohol.
▼ For infusion, dilute in normal saline solution or $D_5W$.
▼ Don't mix with other drugs during administration.
▼ Give at least 250 ml over 1 to 2 hours.
▼ To reduce pain on infusion, dilute further or slow infusion rate.
▼ Solution may be stored in refrigerator for 24 hours or at room temperature for 8 hours. It may decompose at temperatures above 80° F (27° C). Protect from light.
▼ **Incompatibilities:** Sodium bicarbonate.

**Intracavitary**

● Unopened foil pouches of wafer may be kept at room temperature for a maximum of 6 hours.
● Wafers broken in half may be used; however, discard wafers broken into more than two pieces.

### ACTION

Inhibits enzymatic reactions involved with DNA synthesis, cross-links strands of cellular DNA, and interferes with RNA transcription, causing an imbalance of growth that leads to cell death. Not specific to cell cycle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V., intracavitary | Unknown | Unknown | Unknown |

*Half-life:* 15 to 30 minutes.

## ADVERSE REACTIONS

**(I.V. and intracavitary wafer)**
**CNS:** ataxia, ***brain edema, seizures.***
**EENT:** visual disturbances.
**GI:** *nausea, vomiting,* anorexia, diarrhea, dysphagia, ***GI hemorrhage.***
**GU:** ***nephrotoxicity,*** renal impairment.
**Hematologic:** ***cumulative bone marrow suppression, leukopenia, thrombocytopenia, acute leukemia or bone marrow dysplasia,*** anemia, ***hemorrhage.***
**Hepatic:** ***hepatotoxicity.***
**Metabolic:** hyperglycemia, ***hypokalemia,*** hyponatremia.
**Respiratory:** ***pulmonary fibrosis.***
**Other:** *intense pain at infusion site from venous spasm.*
**(Intracavitary wafer only)**
**CNS:** *headache, hemiplegia, confusion, aphasia, depression, somnolence, speech disorder, amnesia,* **INTRACRANIAL HYPERTENSION,** personality disorder, anxiety, facial paralysis, neuropathy, hypoesthesia, abnormal thinking, abnormal gait, hallucinations, insomnia, incoordination, hypokinesia, pain.
**CV:** deep vein thrombophlebitis, ***hemorrhage,*** chest pain.
**GI:** *constipation,* abdominal pain.
**GU:** UTI, urinary incontinence.
**Musculoskeletal:** back pain, myasthenia.
**Respiratory:** ***pulmonary embolus,*** dyspnea, pneumonia.
**Skin:** *rash,* facial edema, abscess.
**Other:** fever, allergic reaction, accidental injury, abnormal healing.

## INTERACTIONS

**Drug-drug.** ***Cimetidine:*** May increase carmustine's bone marrow toxicity. Avoid using together.
*Digoxin, phenytoin:* May decrease levels of these drugs. Monitor patient.
*Myelosuppressives:* May increase myelosuppression. Monitor patient.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, AST, bilirubin, hemoglobin, and urine urea levels.
- May decrease platelet and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.

## NURSING CONSIDERATIONS

**Black Box Warning** Carmustine for injection should be administered under the supervision of a physician experienced in the use of cancer chemotherapeutic agents.
**Black Box Warning** Bone marrow suppression, notably thrombocytopenia and leukopenia, is the most common and severe of the toxic effects.
**Black Box Warning** Pulmonary toxicity appears to be dose related. Patients receiving greater than 1,400 mg/m$^2$ cumulative dose are at higher risk. Pulmonary toxicity can occur years after treatment and can result in death, particularly in patients treated in childhood.
- Obtain pulmonary function tests before and during therapy.

**Black Box Warning** Bone marrow suppression is delayed with carmustine. Blood counts should be monitored weekly for at least 6 weeks after a dose and drug shouldn't be given more often than every 6 weeks.
- Give antiemetic before drug to reduce nausea.
- If drug touches skin, wash off thoroughly. Avoid contact with skin because drug will stain skin brown.
- Perform liver, renal function, and pulmonary function tests periodically.
- Monitor CBC with differential. The absolute neutrophil count may be used to better calculate the patient's immunosuppressive state.
- Monitor uric acid level. To prevent hyperuricemia with resulting uric acid nephropathy, allopurinol may be used with adequate hydration.
- Therapeutic levels are commonly toxic.
- Acute leukemia or bone marrow dysplasia may occur after long-term use.
- To prevent bleeding, avoid using I.M. when platelet count is less than 50,000/mm$^3$.
- Anticipate blood transfusions during treatment because of cumulative anemia.

## PATIENT TEACHING

- Advise patient about common adverse reactions to drug.
- Tell patient to watch for signs and symptoms of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell him to take temperature daily.
- Instruct patient to avoid OTC products containing aspirin and NSAIDs.
- Advise women to stop breast-feeding during therapy because of possible risk of toxicity to infant.
- Caution woman of childbearing age to avoid becoming pregnant during therapy. Recommend that she consult prescriber before becoming pregnant.

# carteolol hydrochloride

KAR-tee-oh-lol

Ocupress

*Therapeutic class:* Antiglaucoma
*Pharmacologic class:* Nonselective beta blocker
*Pregnancy risk category C*

## AVAILABLE FORMS

*Ophthalmic solution:* 1%

## INDICATIONS & DOSAGES

➤ **Chronic open-angle glaucoma, intraocular hypertension**

*Adults:* One drop into conjunctival sac of each affected eye b.i.d.

## ADMINISTRATION

**Ophthalmic**

- Don't touch tip of dropper to eye or surrounding tissue.
- Apply light finger pressure on lacrimal sac for 1 minute after instilling to minimize systemic absorption.
- If more than one ophthalmic drug is being used, give at least 10 minutes apart.

## ACTION

Exact mechanism unknown. Reduces intraocular pressure by decreasing aqueous humor production.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Unknown | 2 hr | 12 hr |

*Half-life:* Unknown.

C

## ADVERSE REACTIONS

**CNS:** asthenia, dizziness, headache, insomnia.
**CV:** ***arrhythmias, bradycardia,*** hypotension, palpitations.
**EENT:** *burning, conjunctival hyperemia, edema, ocular tearing, transient eye irritation,* abnormal corneal staining, blepharoconjunctivitis, blurred and cloudy vision, corneal sensitivity, decreased night vision, photophobia, ptosis, sinusitis.
**GI:** constipation, diarrhea, nausea, taste perversion, vomiting.
**Respiratory:** ***bronchospasm,*** dyspnea.

## INTERACTIONS

**Drug-drug.** *Aminophylline, theophylline:* May act antagonistically, reducing the effects of one or both drugs. May reduce elimination of theophylline. Monitor theophylline levels and patient closely.
*Catecholamine-depleting drugs such as reserpine, oral beta blockers:* May cause additive effects and development of hypotension or bradycardia. Monitor patient closely; monitor vital signs.
*Clonidine:* May cause significant increase in blood pressure when either drug is started or stopped. Monitor blood pressure if used together.
*Epinephrine:* May cause an initial hypertensive episode followed by bradycardia. Stop beta blocker 3 days before anticipated epinephrine use. Monitor patient closely.
*Glucagon:* May decrease the effect of glucagon. Monitor for therapeutic effect; consider oral glucose supplement if appropriate.
*Insulin:* May mask symptoms of hypoglycemia as a result of beta blockade (such as tachycardia). Use together cautiously in patients with diabetes.
*Prazosin:* May increase risk of orthostatic hypotension in early phases of use together. Assist patient to stand slowly until effects are known.

*Verapamil:* May increase effects of both drugs. Monitor cardiac function closely and decrease dosages as necessary.
**Drug-lifestyle.** *Sun exposure:* May cause photophobia. Advise patient to wear sunglasses.

## EFFECTS ON LAB TEST RESULTS
None reported.

## CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug or its components and in those with bronchial asthma, severe COPD, sinus bradycardia, second- or third-degree AV block, overt cardiac failure, or cardiogenic shock.
- Use cautiously in patients hypersensitive to other beta blockers; in those with nonallergic bronchospastic disease, diabetes mellitus, hyperthyroidism, or decreased pulmonary function; and in breast-feeding women.

***Overdose S&S:*** Bradycardia, bronchospasm, heart failure, hypotension.

## NURSING CONSIDERATIONS
- Monitor vital signs.

***Alert:*** Stop drug at first sign of cardiac failure, and notify prescriber.

## PATIENT TEACHING
- If patient is using more than one topical ophthalmic drug, tell him to apply them at least 5 minutes apart.
- Teach patient how to instill drops. Advise him to wash hands before and after instillation, and warn him not to touch tip of dropper to eye or surrounding tissue.
- Advise patient to apply light finger pressure on lacrimal sac for 1 minute after drug instillation to minimize systemic absorption.
- Tell patient to remove contact lenses before instilling drug.
- Instruct patient to keep bottle tightly closed when not in use and to protect it from light.
- Tell patient that drug is a beta blocker and, although given topically, may be absorbed systemically, causing adverse effects. Advise patient to monitor heart rate and blood pressure closely, to report slow heart rate to prescriber, and, if signs or symptoms of serious adverse reactions or hypersensitivity occur, to stop drug and notify prescriber immediately.
- Stress importance of compliance with recommended therapy.
- Advise patient to ease sun sensitivity by wearing sunglasses.

# carvedilol
kar-VAH-da-lol

Coreg

# carvedilol phosphate
Coreg CR

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Alpha-nonselective beta blocker
*Pregnancy risk category C*

## AVAILABLE FORMS
*Capsules (extended-release):* 10 mg, 20 mg, 40 mg, 80 mg
*Tablets:* 3.125 mg, 6.25 mg, 12.5 mg, 25 mg

## INDICATIONS & DOSAGES
➤ **Hypertension**
*Adults:* Dosage highly individualized. Initially, 6.25 mg P.O. b.i.d. Measure standing blood pressure 1 hour after first dose. If tolerated, continue dosage for 7 to 14 days. May increase to 12.5 mg P.O. b.i.d. for 7 to 14 days, following same blood pressure monitoring protocol as before. Maximum dose is 25 mg P.O. b.i.d. as tolerated. May be switched to extended-release capsule after controlled on immediate-release tablets.

➤ **Left ventricular dysfunction after MI**
*Adults:* Dosage individualized. Start therapy after patient is hemodynamically stable and fluid retention has been minimized. Initially, 6.25 mg P.O. b.i.d. Increase after 3 to 10 days to 12.5 mg b.i.d., then again to a target dose of 25 mg b.i.d. Or start with 3.25 mg b.i.d., or adjust dosage slower if indicated. May be switched to extended-release capsule after controlled on immediate-release tablets.

➤ **Mild to severe heart failure**
*Adults:* Dosage highly individualized. Initially, 3.125 mg P.O. b.i.d. for 2 weeks; if tolerated, may increase to 6.25 mg P.O. b.i.d. Dosage may be doubled every 2 weeks, as tolerated. Maximum dose for patients who weigh less than 85 kg (187 lb) is 25 mg P.O. b.i.d.; for those weighing more than 85 kg, dose is 50 mg P.O. b.i.d. May be switched to extended-release capsule after controlled on immediate-release tablets.
***Adjust-a-dose:*** In patient with pulse rate below 55 beats/minute, reduce dosage.
➤ **Chronic, stable angina ♦**
*Adults:* 12.5 to 50 mg P.O. b.i.d. May be switched to extended-release capsule after controlled on immediate-release tablets.
➤ **Idiopathic cardiomyopathy ♦**
*Adults:* Initially, 2.5 mg P.O. once daily. May increase dosage as tolerated up to 75 mg/day.

## ADMINISTRATION

**P.O.**
- Give drug with food.
- Capsules may be opened, mixed in cool applesauce, and taken immediately; don't store.
- Give capsules in the morning.
- Extended-release equivalent of 3.125 mg immediate-release b.i.d. is 10 mg; 6.25 mg immediate-release b.i.d. is 20 mg; 12.5 mg immediate-release b.i.d. is 40 mg; and 25 mg immediate-release b.i.d. is 80 mg. Dosage may be further titrated based on clinical response.

## ACTION

Nonselective beta blocker with alpha-blocking activity.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 1–2 hr | 7–10 hr |
| P.O. (extended-release) | 30 min | 5 hr | Unknown |

*Half-life:* Immediate release: 7 to 10 hours; extended-release: unknown.

## ADVERSE REACTIONS

**CNS:** *asthenia, dizziness, fatigue,* ***stroke,*** pain, headache, malaise, fever, hypesthesia, vertigo, somnolence, depression, insomnia, syncope, paresthesia.
**CV:** *hypotension, postural hypotension,* ***AV block, bradycardia,*** edema, syncope, angina pectoris, peripheral edema, hypovolemia, fluid overload, hypertension, palpitations, chest pain.
**EENT:** abnormal vision, blurred vision, periodontitis.
**GI:** *diarrhea,* vomiting, nausea, melena, periodontitis, abdominal pain, dyspepsia.
**GU:** impotence, abnormal renal function, albuminuria, hematuria, UTI.
**Hematologic:** ***thrombocytopenia,*** purpura.
**Metabolic:** *hyperglycemia, weight gain,* ***hyperkalemia, hypoglycemia,*** weight loss, hypercholesterolemia, hyperuricemia, hyponatremia, glycosuria, diabetes mellitus, gout.
**Musculoskeletal:** arthralgia, muscle cramps.
**Respiratory:** ***lung edema,*** cough, rales.
**Other:** *hypersensitivity reactions.*

## INTERACTIONS

**Drug-drug.** *Amiodarone:* May increase risk of bradycardia, AV block, and myocardial depression. Monitor patient's ECG and vital signs.
*Catecholamine-depleting drugs such as MAO inhibitors, reserpine:* May cause bradycardia or severe hypotension. Monitor patient closely.
*Cimetidine:* May increase bioavailability of carvedilol. Monitor vital signs closely.
*Clonidine:* May increase blood pressure- and heart rate-lowering effects. Monitor vital signs closely.
*Cyclosporine:* May increase cyclosporine level. Monitor cyclosporine level.
*CYP4502D6 inhibitors, such as fluoxetine, paroxetine, propafenone, quinidine:* May increase level of carvedilol. Monitor patient for hypotension and dizziness.
*Digoxin:* May increase digoxin level by about 15% when given together. Monitor digoxin level.
*Diltiazem, verapamil:* May cause isolated conduction disturbances. Monitor patient's heart rhythm and blood pressure.
*Insulin, oral antidiabetics:* May enhance hypoglycemic properties. Monitor glucose level.
*NSAIDs:* May decrease antihypertensive effects. Monitor blood pressure.

*Rifampin:* May reduce carvedilol level by 70%. Monitor vital signs closely.
**Drug-herb.** *Ma huang:* May decrease antihypertensive effects. Discourage use together.
**Drug-food.** *Any food:* May delay rate of absorption of carvedilol with no change in bioavailability. Advise patient to take drug with food to minimize orthostatic effects.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, BUN, cholesterol, creatinine, GGT, nonprotein nitrogen, potassium, triglyceride, sodium, and uric acid levels. May increase or decrease glucose level.
- May decrease PT and platelet count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with New York Heart Association class IV decompensated cardiac failure requiring I.V. inotropic therapy.
- Contraindicated in those with bronchial asthma or related bronchospastic conditions, second- or third-degree AV block, sick sinus syndrome (unless a permanent pacemaker is in place), cardiogenic shock, severe bradycardia, or symptomatic hepatic impairment.
- Use cautiously in hypertensive patients with left-sided heart failure, perioperative patients who receive anesthetics that depress myocardial function (such as cyclopropane and trichloroethylene), and diabetic patients receiving insulin or oral antidiabetics, and in those subject to spontaneous hypoglycemia.
- Use cautiously in patients with thyroid disease (may mask hyperthyroidism; withdrawal may precipitate thyroid storm or exacerbation of hyperthyroidism), pheochromocytoma, Prinzmetal's or variant angina, bronchospastic disease (in those who can't tolerate other antihypertensives), or peripheral vascular disease (may precipitate or aggravate symptoms of arterial insufficiency).
- Use cautiously in breast-feeding women.
- Safety and effectiveness in children younger than age 18 haven't been established.

***Overdose S&S:*** Hypotension, bradycardia, cardiac insufficiency, cardiogenic shock, cardiac arrest, respiratory problems, bronchospasm, vomiting, lapses of consciousness, generalized seizures.

## NURSING CONSIDERATIONS

***Alert:*** Patients who have a history of severe anaphylactic reaction to several allergens may be more reactive to repeated challenge (accidental, diagnostic, or therapeutic). They may be unresponsive to dosages of epinephrine typically used to treat allergic reactions.
- Mild hepatocellular injury may occur during therapy. At first sign of hepatic dysfunction, perform tests for hepatic injury or jaundice; if present, stop drug.
- If drug must be stopped, do so gradually over 1 to 2 weeks, if possible.
- Patient should be stable on maximum immediate-release dose before switching to extended-release form.
- Monitor patient with heart failure for worsened condition, renal dysfunction, or fluid retention; diuretics may need to be increased.
- Monitor diabetic patient closely; drug may mask signs of hypoglycemia, or hyperglycemia may be worsened.
- Observe patient for dizziness or lightheadedness for 1 hour after giving each new dose.
- Monitor elderly patients carefully; drug levels are about 50% higher in elderly patients than in younger patients.

## PATIENT TEACHING

- Tell patient not to interrupt or stop drug without medical approval.
- Inform patient that improvement of heart failure symptoms might take several weeks of drug therapy.
- Advise patient with heart failure to call prescriber if weight gain or shortness of breath occurs.
- Inform patient that he may experience low blood pressure when standing. If dizziness or fainting occurs (rare), advise him to sit or lie down and to notify prescriber if symptoms persist.
- Caution patient against performing hazardous tasks during start of therapy.

- Advise diabetic patient to promptly report changes in glucose level.
- Inform patient who wears contact lenses that his eyes may feel dry.
- Tell patient to take drug with food. Extended-release capsule may be opened and contents mixed with cool applesauce and taken immediately; don't store.
- Advise patient that capsules shouldn't be crushed, chewed, or contents divided.

## caspofungin acetate

KAS-po-fun-gin

Cancidas

*Therapeutic class:* Antifungal
*Pharmacologic class:* Echinocandin
*Pregnancy risk category C*

### AVAILABLE FORMS

*Lyophilized powder for injection:* 50-mg, 70-mg single-use vials

### INDICATIONS & DOSAGES

➤ **Invasive aspergillosis in patients who are refractory to or intolerant of other therapies (amphotericin B, lipid forms of amphotericin B, or itraconazole); candidemia and *Candida*-caused intra-abdominal abscesses, peritonitis, and pleural space infections**

*Adults:* Single 70-mg I.V. loading dose on day 1, followed by 50 mg/day I.V. over about 1 hour. Base treatment duration on severity of patient's underlying disease, recovery from immunosuppression, and clinical response.

*Children age 3 months to 17 years:* Single 70-mg/m$^2$ I.V. loading dose on day 1, followed by 50 mg/m$^2$ daily thereafter. May increase daily maintenance dose to 70 mg/m$^2$. Maximum loading dose and daily maintenance dose shouldn't exceed 70 mg.

➤ **Empirical treatment of presumed fungal infections in febrile, neutropenic patients**

*Adults:* Single 70-mg I.V. loading dose on day 1, followed by 50 mg/day I.V. over 1 hour thereafter. Continue empirical therapy until neutropenia resolves. If fungal infection is confirmed, treat for a minimum of 14 days and continue therapy for at least 7 days after neutropenia and symptoms resolve. May increase daily dose to 70 mg if the 50-mg dose is well tolerated but clinical response is suboptimal.

*Children age 3 months to 17 years:* Single 70-mg/m$^2$ I.V. loading dose on day 1, followed by 50 mg/m$^2$ daily thereafter. May increase daily maintenance dose to 70 mg/m$^2$. Maximum loading dose and daily maintenance dose shouldn't exceed 70 mg.

➤ **Esophageal candidiasis**

*Adults:* 50 mg I.V. daily over 1 hour for 7 to 14 days after symptoms resolve.

*Children age 3 months to 17 years:* Single 70-mg/m$^2$ I.V. loading dose on day 1, followed by 50 mg/m$^2$ daily thereafter. May increase daily maintenance dose to 70 mg/m$^2$. Maximum loading dose and daily maintenance dose shouldn't exceed 70 mg.

***Adjust-a-dose:*** For patients with Child-Pugh score 7 to 9, after initial 70-mg loading dose (when indicated), give 35 mg/day. Dosage adjustment in patients with Child-Pugh score of more than 9 is unknown.

### ADMINISTRATION

**I.V.**

▼ Let refrigerated vial warm to room temperature.
▼ For patients on fluid restriction, dilute the 35-mg and 50-mg doses in 100 ml normal saline solution. For other patients, dilute 35-mg, 50-mg, and 70-mg doses in 250 ml normal saline solution.
▼ Give drug by slow infusion over about 1 hour.
▼ Monitor site carefully for phlebitis.
▼ Use reconstituted vials within 1 hour or discard.
▼ The final product for infusion (solution in I.V. bag or bottle) can be stored at room temperature for 24 hours or at 36° to 46° F (2° to 8° C) for 48 hours.
▼ **Incompatibilities:** Don't mix or infuse with other drugs or dextrose solutions.

### ACTION

Inhibits synthesis of 1,3-$\beta$-D-glucan, an essential component of the cell wall, in

susceptible *Aspergillus* and *Candida* species. Drug is extensively distributed and has a prolonged half-life.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 9 to 11 hours.

### ADVERSE REACTIONS

**CNS:** *paresthesia, fever, headache.*
**CV:** *tachycardia,* phlebitis, infused vein complications.
**GI:** *anorexia, nausea,* vomiting, *diarrhea,* abdominal pain.
**GU:** proteinuria, hematuria.
**Hematologic:** *anemia,* eosinophilia.
**Metabolic:** hypokalemia.
**Musculoskeletal:** *pain, myalgia.*
**Respiratory:** *tachypnea.*
**Skin:** histamine-mediated symptoms, including rash, facial swelling, pruritus, sensation of warmth.
**Other:** *chills, sweating.*

### INTERACTIONS

**Drug-drug.** *Cyclosporine:* May increase caspofungin level. May increase risk of elevated ALT level; avoid using together unless benefit outweighs risk.
*Inducers of drug clearance or mixed inducer-inhibitors (carbamazepine, dexamethasone, efavirenz, nelfinavir, nevirapine, phenytoin, rifampin):* May reduce caspofungin level. May need to adjust dosage upwards to 70 mg in patients who are clinically unresponsive.
*Tacrolimus:* May reduce tacrolimus level. Monitor tacrolimus level; expect to adjust dosage.

### EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase and liver enzyme levels. May decrease albumin, calcium, hemoglobin, potassium, and protein levels.
- May increase eosinophil count.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Safety and efficacy in neonates and infants younger than 3 months aren't known.
- It's unknown if drug appears in breast milk. Use cautiously in breast-feeding women.

### NURSING CONSIDERATIONS

- Safety information is limited, but drug is well tolerated for therapy lasting longer than 2 weeks.
- Observe patients for histamine-mediated reactions, including rash, facial swelling, pruritus, and a sensation of warmth.

### PATIENT TEACHING

- Instruct patient to report signs and symptoms of phlebitis.
- Instruct patient to immediately report any signs of a hypersensitivity reaction.

## cefadroxil

sef-a-DROX-ill

*Therapeutic class:* Antibiotic
*Pharmacologic class:* First-generation cephalosporin
*Pregnancy risk category B*

### AVAILABLE FORMS

*Capsules:* 500 mg
*Oral suspension:* 125 mg/5 ml, 250 mg/5 ml, 500 mg/5 ml
*Tablets:* 1 g

### INDICATIONS & DOSAGES

➤ **UTIs caused by *Escherichia coli, Proteus mirabilis,* and *Klebsiella* species; skin and soft-tissue infections caused by staphylococci and streptococci; pharyngitis or tonsillitis caused by group A beta-hemolytic streptococci**
*Adults:* 1 to 2 g P.O. daily, depending on infection being treated. Usually given once daily or in two divided doses.
*Children:* 30 mg/kg P.O. daily in two divided doses every 12 hours.
***Adjust-a-dose:*** In patients with renal impairment, give first dose of 1 g. Reduce additional doses based on creatinine clearance. If clearance is 25 to 50 ml/minute, give 500 mg P.O. every 12 hours. If clearance is 10 to 25 ml/minute, give 500 mg P.O. every 24 hours; if clearance is less than

10 ml/minute, give 500 mg P.O. every 36 hours.

### ADMINISTRATION

**P.O.**

- Before administration, ask patient if he's allergic to penicillins or cephalosporins.
- Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
- Give drug with food or milk to lessen GI discomfort.

### ACTION

Inhibits cell-wall synthesis, promoting osmotic instability; usually bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | Unknown |

*Half-life:* About 1 to 2 hours.

### ADVERSE REACTIONS

**CNS:** ***seizures,*** fever.
**GI:** ***pseudomembranous colitis,*** glossitis, abdominal cramps.
**GU:** genital pruritus, candidiasis, vaginitis, renal dysfunction.
**Hematologic:** ***transient neutropenia, leukopenia, agranulocytosis, thrombocytopenia,*** anemia, eosinophilia.
**Skin:** *maculopapular and erythematous rashes,* urticaria.
**Other:** ***anaphylaxis, angioedema,*** hypersensitivity reactions.

### INTERACTIONS

**Drug-drug.** *Aminoglycosides:* May increase risk of nephrotoxicity. Avoid using together.
*Probenecid:* May inhibit excretion and increase cefadroxil level. Use together cautiously.

### EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, bilirubin, GGT, and LDH levels. May decrease hemoglobin level.
- May increase eosinophil count. May decrease granulocyte, neutrophil, platelet, and WBC counts.
- May falsely increase serum or urine creatinine level in tests using Jaffe reaction. May cause false-positive results of Coombs' test and urine glucose tests that use cupric sulfate, such as Benedict's reagent and Clinitest.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other cephalosporins.
- Use cautiously in patients with a history of sensitivity to penicillin and in breast-feeding women.
- Use cautiously in patients with impaired renal function; adjust dosage as needed.

### NURSING CONSIDERATIONS

- If creatinine clearance is less than 50 ml/minute, lengthen dosage interval so drug doesn't accumulate. Monitor renal function in patients with renal dysfunction.
- If large doses are given, therapy is prolonged, or patient is high risk, monitor patient for superinfection.
- ***Look alike–sound alike:*** Don't confuse drug with other cephalosporins that sound alike.

### PATIENT TEACHING

- Instruct patient to take drug with food or milk to lessen GI discomfort.
- Tell patient to take entire amount of drug exactly as prescribed, even after he feels better.
- Advise patient to notify prescriber if rash develops or if signs and symptoms of superinfection appear, such as recurring fever, chills, and malaise.

## cefazolin sodium

sef-AH-zoe-lin

Ancef, Kefzol

*Therapeutic class:* Antibiotic
*Pharmacologic class:* First-generation cephalosporin
*Pregnancy risk category B*

### AVAILABLE FORMS

*Infusion:* 500 mg/50-ml bag, 1 g/50-ml bag
*Injection (parenteral):* 500 mg, 1 g, 5 g, 10 g, 20 g

## INDICATIONS & DOSAGES

➤ **Perioperative prevention in contaminated surgery**

*Adults:* 1 g I.M. or I.V. 30 to 60 minutes before surgery; then 0.5 to 1 g I.M. or I.V. every 6 to 8 hours for 24 hours. In operations lasting longer than 2 hours, give another 0.5- to 1-g dose I.M. or I.V. intraoperatively. Continue treatment for 3 to 5 days if life-threatening infection is likely.

➤ **Infections of respiratory, biliary, and GU tracts; skin, soft-tissue, bone, and joint infections; septicemia; endocarditis caused by *Escherichia coli, Enterobacteriaceae,* gonococci, *Haemophilus influenzae, Klebsiella* species, *Proteus mirabilis, Staphylococcus aureus, Streptococcus pneumoniae,* and group A beta-hemolytic streptococci**

*Adults:* 250 to 500 mg I.M. or I.V. every 8 hours for mild infections or 500 mg to 1.5 g I.M. or I.V. every 6 to 8 hours for moderate to severe or life-threatening infections. Maximum 12 g/day in life-threatening situations.

*Children older than age 1 month:* 25 to 50 mg/kg/day I.M. or I.V. in three or four divided doses. In severe infections, dose may be increased to 100 mg/kg/day.

***Adjust-a-dose:*** For patients with creatinine clearance of 35 to 54 ml/minute, give full dose every 8 hours; if clearance is 11 to 34 ml/minute, give 50% of usual dose every 12 hours; if clearance is below 10 ml/minute, give 50% of usual dose every 18 to 24 hours.

## ADMINISTRATION

**I.V.**

▼ Before giving first dose, obtain specimen for culture and sensitivity tests. Begin therapy while awaiting results.

▼ Before giving drug, ask patient if he's allergic to penicillins or cephalosporins.

▼ Give commercially available frozen solutions in $D_5W$ only by intermittent or continuous I.V. infusion.

▼ Reconstitute drug with sterile water, bacteriostatic water, or normal saline solution as follows: Add 2 ml to 500-mg vial or 2.5 ml to 1-g vial, yielding 225 mg/ml or 330 mg/ml, respectively.

▼ Shake well until dissolved.

▼ For direct injection, further dilute with 5 ml of sterile water for injection.

▼ Inject into a large vein or into the tubing of a free-flowing I.V. solution over 3 to 5 minutes.

▼ For intermittent infusion, add reconstituted drug to 50 to 100 ml of compatible solution or use premixed solution.

▼ If I.V. therapy lasts longer than 3 days, alternate injection sites. Use of small I.V. needles in larger available veins may be preferable.

▼ Reconstituted drug is stable 24 hours at room temperature or 10 days refrigerated.

▼ **Incompatibilities:** Aminoglycosides, amiodarone, amobarbital, ascorbic acid injection, bleomycin, calcium gluconate, cimetidine, colistimethate, hydrocortisone, idarubicin, lidocaine, norepinephrine, oxytetracycline, pentobarbital sodium, polymyxin B, ranitidine, tetracycline, theophylline, vitamin B complex with C.

**I.M.**

● Before giving first dose, obtain specimen for culture and sensitivity tests. Begin therapy while awaiting results.

● After reconstitution, inject drug I.M. without further dilution. This drug isn't as painful as other cephalosporins. Give injection deep into a large muscle.

## ACTION

Inhibits cell-wall synthesis, promoting osmotic instability; usually bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |
| I.M. | Unknown | 1–2 hr | Unknown |

*Half-life:* About 1 to 2 hours.

## ADVERSE REACTIONS

**CV:** *phlebitis, thrombophlebitis with I.V. injection.*

**GI:** *diarrhea,* ***pseudomembranous colitis,*** anorexia, glossitis, dyspepsia, abdominal cramps, anal pruritus, oral candidiasis.

**GU:** genital pruritus, candidiasis, vaginitis.

**Hematologic:** ***neutropenia, leukopenia, thrombocytopenia,*** eosinophilia.

**Skin:** *maculopapular and erythematous rashes, urticaria, pruritus, pain, induration, sterile abscesses, tissue sloughing at injection site,* ***Stevens-Johnson syndrome.***

**Other:** ***anaphylaxis,*** hypersensitivity reactions, drug fever.

## INTERACTIONS

**Drug-drug.** *Aminoglycosides:* May increase risk of nephrotoxicity. Avoid using together.
*Anticoagulants:* May increase anticoagulant effects. Monitor PT and INR.
*Probenecid:* May inhibit excretion and increase cefazolin level. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, bilirubin, GGT, and LDH levels.
- May increase eosinophil count. May decrease neutrophil, platelet, and WBC counts.
- May falsely increase serum or urine creatinine level in tests using Jaffe reaction. May cause false-positive results of Coombs' test and urine glucose tests that use cupric sulfate, such as Benedict's reagent and Clinitest.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other cephalosporins.
- Use cautiously in patients hypersensitive to penicillin because of the possibility of cross-sensitivity with other beta-lactam antibiotics.
- Use cautiously in breast-feeding women and in patients with a history of colitis or renal insufficiency.

***Overdose S&S:*** Pain, inflammation, and phlebitis at injection site; dizziness, paresthesia, headache, seizures; elevated creatinine, BUN, liver enzymes, and bilirubin levels; positive Coombs' test; thrombocytosis, thrombocytopenia, eosinophilia, leukopenia; prolonged PT.

## NURSING CONSIDERATIONS

- If creatinine clearance falls below 55 ml/minute, adjust dosage.
- If large doses are given, therapy is prolonged, or patient is at high risk, monitor patient for signs and symptoms of superinfection.
- ***Look alike–sound alike:*** Don't confuse drug with other cephalosporins that sound alike.

## PATIENT TEACHING

- Instruct patient to report adverse reactions promptly.
- Tell patient to report discomfort at I.V. injection site.
- Advise patient to notify prescriber if a rash develops or if signs and symptoms of superinfection appear, such as recurring fever, chills, and malaise.

# cefdinir

sef-DIN-er

Omnicef

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Third-generation cephalosporin
*Pregnancy risk category B*

## AVAILABLE FORMS

*Capsules:* 300 mg
*Suspension:* 125 mg/5 ml, 250 mg/5 ml

## INDICATIONS & DOSAGES

➤ **Mild to moderate infections caused by susceptible strains of microorganisms in community-acquired pneumonia, acute worsening of chronic bronchitis, acute maxillary sinusitis, acute bacterial otitis media, and uncomplicated skin and skin-structure infections**

*Adults and children age 13 and older:* 300 mg P.O. every 12 hours or 600 mg P.O. every 24 hours for 10 days. Give every 12 hours for pneumonia and skin infections.
*Children ages 6 months to 12 years:* 7 mg/kg P.O. every 12 hours or 14 mg/kg P.O. every 24 hours for 10 days, up to maximum dose of 600 mg daily. Give every 12 hours for skin infections.

➤ **Pharyngitis, tonsillitis**

*Adults and children age 13 and older:* 300 mg P.O. every 12 hours for 5 to 10 days or 600 mg P.O. every 24 hours for 10 days.
*Children ages 6 months to 12 years:* 7 mg/kg P.O. every 12 hours for 5 to 10 days; or 14 mg/kg P.O. every 24 hours for 10 days.

***Adjust-a-dose:*** If creatinine clearance is less than 30 ml/minute, reduce dosage to 300 mg P.O. once daily for adults and 7 mg/kg up to 300 mg P.O. once daily for children. In patients receiving long-term hemodialysis, give 300 mg or 7 mg/kg P.O. at end of each dialysis session and then every other day.

## ADMINISTRATION

**P.O.**

- Before administration, ask patient if he's allergic to penicillins or cephalosporins.
- Give antacids and iron supplements 2 hours before or after a dose of cefdinir.
- Give drug without regard for meals.

## ACTION

Inhibits cell-wall synthesis, promoting osmotic instability; usually bactericidal. Some microorganisms resistant to penicillins and cephalosporins are susceptible to cefdinir. Active against a broad range of gram-positive and gram-negative aerobic microorganisms.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–4 hr | Unknown |

*Half-life:* 1¾ hours.

## ADVERSE REACTIONS

**CNS:** headache.
**GI:** *diarrhea,* ***pseudomembranous colitis,*** abdominal pain, nausea.
**GU:** vaginitis, increased urine proteins, WBCs, and RBCs.
**Other:** hypersensitivity reactions, ***anaphylaxis.***

## INTERACTIONS

**Drug-drug.** *Aminoglycosides:* May increase risk of nephrotoxicity. Avoid using together.
*Antacids containing aluminum and magnesium, iron supplements, multivitamins containing iron:* May decrease rate of absorption and bioavailability of cefdinir. Give such preparations 2 hours before or after cefdinir.
*Probenecid:* May inhibit renal excretion of cefdinir. Monitor patient for adverse reactions.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, GGT, and LDH levels. May decrease bicarbonate levels.
- May increase eosinophil, lymphocyte, and platelet counts.
- May falsely increase serum or urine creatinine level in tests using Jaffe reaction. May cause false-positive results of Coombs' test and urine glucose tests that use cupric sulfate, such as Benedict's reagent and Clinitest.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other cephalosporins.
- Use cautiously in patients hypersensitive to penicillin because of the possibility of cross-sensitivity with other beta-lactam antibiotics.
- Use cautiously in patients with history of colitis or renal insufficiency.

## NURSING CONSIDERATIONS

- Prolonged drug treatment may result in emergence and overgrowth of resistant organisms. Monitor patient for signs and symptoms of superinfection.
- Pseudomembranous colitis has been reported with cefdinir and should be considered in patients with diarrhea after antibiotic therapy and in those with history of colitis.
- ***Look alike–sound alike:*** Don't confuse drug with other cephalosporins that sound alike.

## PATIENT TEACHING

- Instruct patient to take antacids and iron supplements 2 hours before or after a dose of cefdinir.
- Inform diabetic patient that each teaspoon of suspension contains 2.86 g of sucrose.
- Tell patient that drug may be taken without regard to meals.
- Tell patient to take drug as prescribed, even after he feels better.
- Advise patient to report severe diarrhea or diarrhea with abdominal pain.
- Tell patient to report adverse reactions or signs and symptoms of superinfection promptly.

## cefepime hydrochloride

SEF-ah-peem

Maxipime

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Fourth-generation cephalosporin
*Pregnancy risk category B*

### AVAILABLE FORMS

*Injection:* 500-mg vial, 1-g/100-ml piggyback bottle, 1-g ADD-Vantage vial, 1-g vial, 2-g/100-ml piggyback bottle, 2-g ADD-Vantage vial, 2-g vial

### INDICATIONS & DOSAGES

➤ **Mild to moderate UTI caused by *Escherichia coli, Klebsiella pneumoniae,* or *Proteus mirabilis,* including concurrent bacteremia with these microorganisms**

*Adults and children age 16 and older:* 0.5 to 1 g I.M. or I.V. over 30 minutes every 12 hours for 7 to 10 days. Use I.M. only for *E. coli* infection when I.M. route is considered more appropriate route of administration.

➤ **Severe UTI, including pyelonephritis, caused by *E. coli* or *K. pneumoniae***

*Adults and children age 16 and older:* 2 g I.V. over 30 minutes every 12 hours for 10 days.

➤ **Moderate to severe pneumonia caused by *Streptococcus pneumoniae, Pseudomonas aeruginosa, K. pneumoniae,* or *Enterobacter* species**

*Adults and children age 16 and older:* 1 to 2 g I.V. over 30 minutes every 12 hours for 10 days.

➤ **Moderate to severe skin infection, uncomplicated skin infection, and skin-structure infection caused by *Streptococcus pyogenes* or methicillin-susceptible strains of *Staphylococcus aureus***

*Adults and children age 16 and older:* 2 g I.V. over 30 minutes every 12 hours for 10 days.

➤ **Complicated intra-abdominal infection caused by *E. coli,* viridans group streptococci, *P. aeruginosa, K. pneumoniae, Enterobacter* species, or *Bacteroides fragilis***

*Adults and children age 16 and older:* 2 g I.V. over 30 minutes every 12 hours for 7 to 10 days. Give with metronidazole.

➤ **Empirical therapy for febrile neutropenia**

*Adults and children age 16 and older:* 2 g I.V. every 8 hours for 7 days or until neutropenia resolves.

➤ **Uncomplicated and complicated UTI (including pyelonephritis), uncomplicated skin and skin-structure infection, pneumonia, empirical therapy for febrile neutropenic children**

*Children ages 2 months to 16 years who weigh up to 40 kg (88 lb):* 50 mg/kg/dose I.V. over 30 minutes every 12 hours for 10 days. For febrile neutropenia, give 50 mg/kg every 8 hours for 7 days or until neutropenia resolves. For UTI, treat for 7 to 10 days. Don't exceed 2 g/dose.

***Adjust-a-dose:*** Adjust dosage based on creatinine clearance, as shown in the table. For patients receiving hemodialysis, about 68% of drug is removed after a 3-hour dialysis session. Cefepime dosage for patients receiving hemodialysis is1 g on day 1, followed by 500 mg every 24 hours for treatment of all infections except febrile neutropenia. For patients with febrile neutropenia, give 1 g every 24 hours. Give cefepime after hemodialysis and at the same time each day. For patients receiving continuous ambulatory peritoneal dialysis, give normal dose every 48 hours.

**Dosage adjustments for renal impairment**

| | *If normal dosage would be* | | | |
|---|---|---|---|---|
| ***Creatinine clearance (ml/min)*** | ***500 mg every 12 hr*** | ***1 g every 12 hr*** | ***2 g every 12 hr*** | ***2 g every 8 hr*** |
| 30–60 | 500 mg every 24 hr | 1 g every 24 hr | 2 g every 24 hr | 2 g every 12 hr |
| 11–29 | 500 mg every 24 hr | 500 mg every 24 hr | 1 g every 24 hr | 2 g every 24 hr |
| <11 | 250 mg every 24 hr | 250 mg every 24 hr | 500 mg every 24 hr | 1 g every 24 hr |

## ADMINISTRATION

**I.V.**

▼ Before giving drug, ask patient if he's allergic to penicillins or cephalosporins.
▼ Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
▼ Follow manufacturer's guidelines closely when reconstituting drug. They vary with concentration of drug ordered and how drug is packaged (piggyback vial, ADD-Vantage vial, or regular vial).
▼ The type of diluent varies with the product used. Use only solutions recommended by the manufacturer.
▼ Give intermittent I.V. infusion with a Y-type administration and compatible solutions.
▼ Stop the main I.V. fluid while infusing.
▼ Infuse over about 30 minutes.
▼ **Incompatibilities:** Aminophylline, amphotericin B, amphotericin B cholesteryl sulfate complex, ciprofloxacin, gentamicin, metronidazole, tobramycin, vancomycin.

**I.M.**

● Before giving drug, ask patient if he's allergic to penicillins or cephalosporins.
● Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
● Reconstitute drug using sterile water for injection, normal saline solution for injection, $D_5W$ injection, 0.5% or 1% lidocaine hydrochloride, or bacteriostatic water for injection with parabens or benzyl alcohol. Follow manufacturer's guidelines for quantity of diluent to use.
● Inspect solution for particulate matter before use. The powder and its solutions tend to darken, depending on storage conditions. If stored as recommended, potency isn't adversely affected.
● Pain may occur at injection site.

## ACTION

Inhibits bacterial cell-wall synthesis, promotes osmotic instability, and destroys bacteria.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V., I.M. | 30 min | 1–2 hr | Unknown |

*Half-life:* Adults: 2 to 2½ hours. Children: 1½ to 2 hours.

## ADVERSE REACTIONS

**CNS:** fever, headache.
**CV:** phlebitis.
**GI:** diarrhea, nausea, vomiting.
**Skin:** rash, pruritus.
**Other:** ***anaphylaxis,*** pain, inflammation, hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Aminoglycosides:* May increase risk of nephrotoxicity. Monitor renal function closely.
*Potent diuretics:* May increase risk of nephrotoxicity. Monitor renal function closely.
*Probenecid:* May inhibit renal excretion of cefepime. Monitor patient for adverse reactions.

## EFFECTS ON LAB TEST RESULTS

● May increase ALT and AST levels. May decrease phosphorus level.
● May increase eosinophil count. May alter PT and PTT.
● May falsely increase serum or urine creatinine level in tests using Jaffe reaction. May cause false-positive results of Coombs' test and urine glucose tests that use cupric sulfate, such as Benedict's reagent and Clinitest.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug, cephalosporins, beta-lactam antibiotics, or penicillins.
● Use cautiously in patients hypersensitive to penicillin because of possibility of cross-sensitivity with other beta-lactam antibiotics.
● Use cautiously in breast-feeding women and in patients with history of colitis or renal insufficiency.
***Overdose S&S:*** Encephalopathy, myoclonus, seizures, neuromuscular excitability.

## NURSING CONSIDERATIONS

● Monitor patient for superinfection. Drug may cause overgrowth of nonsusceptible bacteria or fungi.
● Drug may reduce PT activity. Patients at risk include those with renal or hepatic impairment or poor nutrition and those

receiving prolonged therapy. Monitor PT and INR in these patients. Give vitamin K, as indicated.
• ***Look alike–sound alike:*** Don't confuse drug with other cephalosporins that sound alike.

### PATIENT TEACHING
• Warn patient receiving drug I.M. that pain may occur at injection site.
• Advise patient to notify prescriber if a rash develops or if signs and symptoms of superinfection appear, such as recurring fever, chills, and malaise.
• Instruct patient to report adverse reactions promptly.

## cefotaxime sodium
sef-oh-TAKS-eem

Claforan

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Third-generation cephalosporin
*Pregnancy risk category B*

### AVAILABLE FORMS
*Infusion:* 1-g, 2-g premixed package
*Injection:* 500-mg, 1-g, 2-g vials

### INDICATIONS & DOSAGES
➤ **Perioperative prevention in contaminated surgery**
*Adults:* 1 g I.M. or I.V. 30 to 90 minutes before surgery. In patients undergoing bowel surgery, provide preoperative mechanical bowel cleansing and give a nonabsorbable anti-infective, such as neomycin. In patients undergoing cesarean delivery, give 1 g I.M. or I.V. as soon as the umbilical cord is clamped; then 1 g I.M. or I.V. 6 and 12 hours later.
➤ **Uncomplicated gonorrhea caused by penicillinase-producing strains or non–penicillinase-producing strains of *Neisseria gonorrhoeae***
*Adults and adolescents:* 500 mg I.M. as a single dose.
➤ **Rectal gonorrhea**
*Men:* 1 g I.M. as a single dose.
*Women:* 500 mg I.M. as a single dose.

➤ **Serious infection of the lower respiratory and urinary tract, CNS, skin, bone, and joints; gynecologic and intra-abdominal infection; bacteremia; septicemia caused by susceptible microorganisms, such as streptococci (including *Streptococcus pneumoniae* and *S. pyogenes, Staphylococcus aureus* [penicillinase- and non–penicillinase-producing] and *S. epidermidis), Escherichia coli, Klebsiella, Haemophilus influenzae, Serratia marcescens,* and species of *Pseudomonas* (including *P. aeruginosa*), *Enterobacter, Proteus,* and *Peptostreptococcus***
*Adults and children who weigh 50 kg (110 lb) or more:* 1 to 2 g I.V. or I.M. every 6 to 8 hours. Up to 12 g daily can be given for life-threatening infections.
*Children ages 1 month to 12 years who weigh less than 50 kg (110 lb):* 50 to 180 mg/kg/day I.M. or I.V. in four to six divided doses.
*Neonates ages 1 to 4 weeks:* 50 mg/kg I.V. every 8 hours.
*Neonates to age 1 week:* 50 mg/kg I.V. every 12 hours.
***Adjust-a-dose:*** For patients with creatinine clearance of 10 to 50 ml/minute, give doses every 12 to 24 hours. For patients with creatinine clearance of less than 10 ml/minute, give doses every 24 hours. For patients receiving hemodialysis, give 1 g supplement after dialysis. For patients receiving continuous ambulatory peritoneal dialysis, give 0.5 to 1 g every 24 hours.

### ADMINISTRATION
**I.V.**
▼ Before giving drug, ask patient if he's allergic to penicillins or cephalosporins.
▼ Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
▼ For direct injection, reconstitute drug in 500-mg, 1-g, or 2-g vials with 10 ml of sterile water for injection. Solutions containing 1 g/14 ml are isotonic.
▼ Inject drug over 3 to 5 minutes into a large vein or into the tubing of a free-flowing I.V. solution.

▼ For infusion, reconstitute drug in infusion vials with 50 to 100 ml of $D_5W$ or normal saline solution.
▼ Interrupt flow of primary I.V. solution, and infuse this drug over 20 to 30 minutes.
▼ **Incompatibilities:** Allopurinol, aminoglycosides, aminophylline, azithromycin, doxapram, filgrastim, fluconazole, hetastarch, pentamidine isethionate, sodium bicarbonate injection, vancomycin.

**I.M.**
• Before giving drug, ask patient if he's allergic to penicillins or cephalosporins.
• Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
• For doses of 2 g, divide the dose and give at different sites.
• Inject deep into a large muscle, such as the gluteus maximus or the side of the thigh.

## ACTION
Inhibits cell-wall synthesis, promoting osmotic instability; usually bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |
| I.M. | Unknown | 30 min | Unknown |

*Half-life:* 1 to 2 hours.

## ADVERSE REACTIONS
**CNS:** fever, headache.
**CV:** *phlebitis, thrombophlebitis.*
**GI:** *diarrhea,* ***pseudomembranous colitis,*** nausea, vomiting.
**Hematologic:** ***agranulocytosis, thrombocytopenia, transient neutropenia,*** eosinophilia, hemolytic anemia.
**Skin:** *maculopapular and erythematous rashes, urticaria, pain, induration, sterile abscesses, temperature elevation, tissue sloughing at I.M. injection site.*
**Other:** ***anaphylaxis,*** hypersensitivity reactions, serum sickness.

## INTERACTIONS
**Drug-drug.** *Aminoglycosides:* May increase risk of nephrotoxicity. Monitor patient's renal function tests.
*Probenecid:* May inhibit excretion and increase cefotaxime. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS
• May increase alkaline phosphatase, ALT, AST, bilirubin, GGT, and LDH levels. May decrease hemoglobin level.
• May increase eosinophil count. May decrease granulocyte, neutrophil, and platelet counts.
• May cause positive Coombs' test results.

## CONTRAINDICATIONS & CAUTIONS
• Contraindicated in patients hypersensitive to drug or other cephalosporins.
• Use cautiously in patients hypersensitive to penicillin because of possibility of cross-sensitivity with other beta-lactam antibiotics.
• Use cautiously in breast-feeding women and in patients with history of colitis or renal insufficiency.
***Overdose S&S:*** Elevated BUN and creatinine levels.

## NURSING CONSIDERATIONS
• If large doses are given, therapy is prolonged, or patient is at high risk, monitor patient for superinfection.
• ***Look alike–sound alike:*** Don't confuse drug with other cephalosporins that sound alike.

## PATIENT TEACHING
• Tell patient to report adverse reactions and signs and symptoms of superinfection promptly.
• Instruct patient to report discomfort at I.V. insertion site.

## cefoxitin sodium
se-FOX-i-tin

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Second-generation cephalosporin
*Pregnancy risk category B*

## AVAILABLE FORMS
*Infusion:* 1 g, 2 g in 50-ml or 100-ml container
*Injection:* 1 g, 2 g

## INDICATIONS & DOSAGES

➤ **Serious infection of the respiratory and GU tracts; skin, soft-tissue, bone, or joint infection; bloodstream or intra-abdominal infection caused by susceptible organisms (such as *Escherichia coli* and other coliform bacteria, penicillinase- and non–penicillinase-producing *Staphylococcus aureus, S. epidermidis,* streptococci, *Klebsiella, Haemophilus influenzae,* and *Bacteroides,* including *B. fragilis*)**

*Adults:* 1 to 2 g I.V. or I.M. every 6 to 8 hours for uncomplicated infections. Up to 12 g daily may be used in life-threatening infections.

*Children older than age 3 months:* 80 to 160 mg/kg daily I.V. or I.M., given in four to six equally divided doses. Maximum daily dose is 12 g.

➤ **Perioperative prevention**

*Adults:* 2 g I.M. or I.V. 30 to 60 minutes before surgery; then 2 g I.M. or I.V. every 6 hours for up to 24 hours. For patients undergoing cesarean section, give 2 g I.V. as soon as the umbilical cord is clamped; may give additional 2-g doses 4 and 8 hours after initial dose.

*Children age 3 months and older:* 30 to 40 mg/kg I.M. or I.V. 30 to 60 minutes before surgery; then 30 to 40 mg/kg every 6 hours for up to 24 hours.

➤ **Uncomplicated gonorrhea ♦**

*Adults:* 2 g I.M. with 1 g probenecid P.O. as a single dose. Give probenecid within 30 minutes before cefoxitin dose.

***Adjust-a-dose:*** For patients with creatinine clearance of 30 to 50 ml/minute, 1 to 2 g every 8 to 12 hours; if clearance is 10 to 29 ml/minute, 1 to 2 g every 12 to 24 hours; if clearance is 5 to 9 ml/minute, 0.5 to 1 g every 12 to 24 hours; and if clearance is less than 5 ml/minute, 0.5 to 1 g every 24 to 48 hours. For patients receiving hemodialysis, give a loading dose of 1 to 2 g after each hemodialysis session; then give the maintenance dose based on creatinine level. For patients receiving continuous ambulatory peritoneal dialysis, give 1 g every 24 hours.

## ADMINISTRATION

**I.V.**

▼ Before giving drug, ask patient if he's allergic to penicillins or cephalosporins.

▼ Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.

▼ Reconstitute 1 g with at least 10 ml of sterile water for injection and 2 g with 10 to 20 ml of sterile water for injection. Solutions of $D_5W$ and normal saline solution for injection also may be used.

▼ For direct injection, give drug over 3 to 5 minutes into a large vein or into the tubing of a free-flowing I.V. solution.

▼ For intermittent infusion, add reconstituted drug to 50 or 100 ml of $D_5W$ or normal saline solution for injection.

▼ Interrupt flow of primary solution during infusion.

▼ Assess site often to detect evidence of thrombophlebitis.

▼ **Incompatibilities:** Aminoglycosides, filgrastim, hetastarch, pentamidine isethionate, ranitidine.

**I.M.**

● Before giving drug, ask patient if he's allergic to penicillins or cephalosporins.

● Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.

● Reconstitute each 1 g of drug with 2 ml of sterile water for injection or 0.5% or 1% lidocaine hydrochloride (without epinephrine) to minimize pain. Inject deep into a large muscle, such as the gluteus maximus or the lateral aspect of the thigh.

● After reconstitution, drug may be stored for 24 hours (6 hours for non-ADD-Vantage vials) at room temperature or 1 week under refrigeration.

## ACTION

Inhibits cell-wall synthesis, promoting osmotic instability; usually bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |
| I.M. | Unknown | 20–30 min | Unknown |

*Half-life:* About ½ to 1 hours.

## ADVERSE REACTIONS

**CNS:** fever.
**CV:** *phlebitis, thrombophlebitis,* hypotension.
**GI:** *diarrhea,* ***pseudomembranous colitis,*** nausea, vomiting.
**GU:** ***acute renal failure.***
**Hematologic:** ***thrombocytopenia, transient neutropenia,*** eosinophilia, hemolytic anemia, anemia.
**Respiratory:** dyspnea.
**Skin:** *maculopapular and erythematous rashes, urticaria, pain, induration, sterile abscesses, tissue sloughing at injection site,* exfoliative dermatitis.
**Other:** ***anaphylaxis,*** hypersensitivity reactions, serum sickness.

## INTERACTIONS

**Drug-drug.** *Aminoglycosides:* May increase risk of nephrotoxicity. Monitor patient's renal function tests.
*Probenecid:* May inhibit excretion and increase cefoxitin level. Probenecid may be used for this effect.
*Warfarin:* May increase anticoagulation. Monitor prothrombin times and adjust warfarin dosage as needed.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, bilirubin, and LDH levels. May decrease hemoglobin level.
- May increase eosinophil count. May decrease neutrophil and platelet counts.
- May falsely increase serum or urine creatinine level in tests using Jaffe reaction. May cause false-positive results of Coombs' test and urine glucose tests that use cupric sulfate, such as Benedict's reagent and Clinitest.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other cephalosporins.
- Use cautiously in patients hypersensitive to penicillin because of possibility of cross-sensitivity with other beta-lactam antibiotics.
- Use cautiously in breast-feeding women and in patients with history of colitis or renal insufficiency.

## NURSING CONSIDERATIONS

***Alert:*** The premixed frozen product is for I.V. use only.
- If large doses are given, therapy is prolonged, or patient is at high risk, monitor patient for signs and symptoms of superinfection.
- ***Look alike–sound alike:*** Don't confuse drug with other cephalosporins that sound alike.

## PATIENT TEACHING

- Tell patient to report adverse reactions and signs and symptoms of superinfection promptly.
- Instruct patient to report discomfort at I.V. site.
- Advise patient to notify prescriber about loose stools or diarrhea.

# cefpodoxime proxetil

SEF-pod-OX-eem

Vantin

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Third-generation cephalosporin
*Pregnancy risk category B*

## AVAILABLE FORMS

*Oral suspension:* 50 mg/5 ml or 100 mg/5 ml in 50-, 75-, or 100-ml bottles
*Tablets (film-coated):* 100 mg, 200 mg

## INDICATIONS & DOSAGES

➤ **Acute community-acquired pneumonia caused by strains of *Haemophilus influenzae* or *Streptococcus pneumoniae***
*Adults and children age 12 and older:* 200 mg P.O. every 12 hours for 14 days.

➤ **Acute bacterial worsening of chronic bronchitis caused by *S. pneumoniae* or *H. influenzae* (strains that don't produce beta-lactamase only), or *Moraxella catarrhalis***
*Adults and children age 12 and older:* 200 mg P.O. every 12 hours for 10 days.

➤ **Uncomplicated gonorrhea in men and women; rectal gonococcal infections in women**

*Adults and children age 12 and older:* 200 mg P.O. as a single dose.

➤ **Uncomplicated skin and skin-structure infections caused by *Staphylococcus aureus* or *S. pyogenes***

*Adults and children age 12 and older:* 400 mg P.O. every 12 hours for 7 to 14 days.

➤ **Acute otitis media caused by *S. pneumoniae* (penicillin-susceptible strains only), *S. pyogenes*, *H. influenzae*, or *M. catarrhalis***

*Children age 2 months to 12 years:* 5 mg/kg P.O. every 12 hours for 5 days. Don't exceed 200 mg per dose.

➤ **Pharyngitis or tonsillitis caused by *S. pyogenes***

*Adults:* 100 mg P.O. every 12 hours for 5 to 10 days.

*Children ages 2 months to 12 years:* 5 mg/kg P.O. every 12 hours for 5 to 10 days. Don't exceed 100 mg per dose.

➤ **Uncomplicated UTIs caused by *Escherichia coli*, *Klebsiella pneumoniae*, *Proteus mirabilis*, or *Staphylococcus saprophyticus***

*Adults:* 100 mg P.O. every 12 hours for 7 days.

➤ **Mild to moderate acute maxillary sinusitis caused by *H. influenzae*, *S. pneumoniae*, or *M. catarrhalis***

*Adults and adolescents age 12 and older:* 200 mg P.O. every 12 hours for 10 days.

*Children ages 2 months to 12 years:* 5 mg/kg P.O. every 12 hours for 10 days; maximum is 200 mg/dose.

***Adjust-a-dose:*** For patients with creatinine clearance less than 30 ml/minute, increase dosage interval to every 24 hours. Give to dialysis patients three times weekly after dialysis.

## ADMINISTRATION

**P.O.**

- Before administration, ask patient if he's allergic to penicillins or cephalosporins.
- Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
- Give drug with food to enhance absorption. Shake suspension well before using.
- Store suspension in the refrigerator (36° to 46° F [2° to 8° C]). Discard unused portion after 14 days.

## ACTION

Inhibits cell-wall synthesis, promoting osmotic instability; usually bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–3 hr | Unknown |

*Half-life:* 2 to 3 hours.

## ADVERSE REACTIONS

**CNS:** headache.
**GI:** *diarrhea*, ***pseudomembranous colitis,*** nausea, vomiting, abdominal pain.
**GU:** vaginal fungal infections.
**Skin:** rash.
**Other:** ***anaphylaxis,*** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Aminoglycosides:* May increase risk of nephrotoxicity. Monitor renal function tests closely.

*Antacids, $H_2$-receptor antagonists:* May decrease absorption of cefpodoxime. Avoid using together.

*Probenecid:* May decrease excretion of cefpodoxime. Monitor patient for toxicity.

**Drug-food.** *Any food:* May increase absorption. Give tablets with food to enhance absorption. Oral suspension may be given without regard to food.

## EFFECTS ON LAB TEST RESULTS

- May falsely increase serum or urine creatinine level in tests using Jaffe reaction. May cause false-positive results of Coombs' test and urine glucose tests that use cupric sulfate, such as Benedict's reagent and Clinitest.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other cephalosporins.
- Use cautiously in patients with a history of penicillin hypersensitivity because of risk of cross-sensitivity.
- Use cautiously in patients receiving nephrotoxic drugs because other cephalosporins have been shown to have nephrotoxic potential.
- Use cautiously in breast-feeding women because drug appears in breast milk.

## NURSING CONSIDERATIONS

- Monitor renal function and compare with baseline.
- Monitor patient for superinfection. Drug may cause overgrowth of nonsusceptible bacteria or fungi.
- ***Look alike–sound alike:*** Don't confuse drug with other cephalosporins that sound alike.

## PATIENT TEACHING

- Tell patient to take drug as prescribed, even after he feels better.
- Instruct patient to take drug with food. If patient is using suspension, tell him to shake container before measuring dose and to keep container refrigerated.
- Tell patient to call prescriber if rash or signs and symptoms of superinfection occur.
- Instruct patient to notify prescriber about loose stools or diarrhea.

# cefprozil

sef-PRO-zil

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Second-generation cephalosporin
*Pregnancy risk category B*

## AVAILABLE FORMS

*Oral suspension:* 125 mg/5 ml, 250 mg/5 ml
*Tablets:* 250 mg, 500 mg

## INDICATIONS & DOSAGES

➤ **Pharyngitis or tonsillitis caused by *Streptococcus pyogenes***
*Adults and children age 13 and older:* 500 mg P.O. daily for at least 10 days.
*Children age 2 to 12:* 7.5 mg/kg P.O. every 12 hours for 10 days. Don't exceed adult dose.

➤ **Otitis media caused by *Streptococcus pneumoniae, Haemophilus influenzae,* and *Moraxella catarrhalis***
*Infants and children ages 6 months to 12 years:* 15 mg/kg P.O. every 12 hours for 10 days.

➤ **Secondary bacterial infections of acute bronchitis and acute bacterial worsening of chronic bronchitis caused by *S. pneumoniae, H. influenzae,* and *M. catarrhalis***
*Adults and children age 13 and older:* 500 mg P.O. every 12 hours for 10 days.

➤ **Uncomplicated skin and skin-structure infections caused by *Staphylococcus aureus* and *S. pyogenes***
*Adults and children age 13 and older:* 250 or 500 mg P.O. every 12 hours or 500 mg daily for 10 days.
*Children age 2 to 12:* 20 mg/kg P.O. every 24 hours. Don't exceed adult dose.

➤ **Acute sinusitis caused by *S. pneumoniae, H. influenzae* (beta-lactamase–positive and –negative strains), and *M. catarrhalis* (including strains that produce beta-lactamase)**
*Adults and children age 13 and older:* 250 mg P.O. every 12 hours for 10 days; for moderate to severe infection, 500 mg P.O. every 12 hours for 10 days.
*Children ages 6 months to 12 years:* 7.5 mg/kg P.O. every 12 hours for 10 days; for moderate to severe infections, 15 mg/kg P.O. every 12 hours for 10 days.

***Adjust-a-dose:*** If creatinine clearance is less than 30 ml/minute, give 50% of standard dose at standard intervals. If patient is receiving dialysis, give dose after hemodialysis is completed; drug is removed by hemodialysis.

## ADMINISTRATION

**P.O.**

- Obtain specimen for culture and sensitivity tests before giving first dose. Start therapy while awaiting results.
- Before giving, ask patient if he's allergic to penicillins or cephalosporins.
- Shake suspension well before using.

## ACTION

Inhibits cell-wall synthesis, promoting osmotic instability; usually bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1½ hr | Unknown |

*Half-life:* 1¼ hours in patients with normal renal function; 2 hours in patients with impaired hepatic function; and 5¼ to 6 hours in patients with end-stage renal disease.

## ADVERSE REACTIONS

**CNS:** dizziness.
**GI:** diarrhea, nausea, vomiting, abdominal pain.
**GU:** genital pruritus, vaginitis.
**Hematologic:** eosinophilia.
**Skin:** diaper rash.
**Other:** ***anaphylaxis,*** superinfection, hypersensitivity reactions, serum sickness.

## INTERACTIONS

**Drug-drug.** *Aminoglycosides:* May increase risk of nephrotoxicity. Monitor renal function tests closely.
*Probenecid:* May inhibit excretion and increase cefprozil level. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, bilirubin, BUN, creatinine, and LDH levels.
- May increase eosinophil count. May decrease platelet and WBC counts.
- May falsely increase serum or urine creatinine level in tests using Jaffe reaction. May cause false-positive results of Coombs' test and urine glucose tests that use cupric sulfate, such as Benedict's reagent and Clinitest.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other cephalosporins.
- Use cautiously in patients hypersensitive to penicillin because of possibility of cross-sensitivity with other beta-lactam antibiotics.
- Use cautiously in breast-feeding women and in patients with history of colitis and renal insufficiency.

## NURSING CONSIDERATIONS

- Monitor renal function and liver function test results.
- Monitor patient for superinfection. May cause overgrowth of nonsusceptible bacteria or fungi.
- ***Look alike–sound alike:*** Don't confuse drug with other cephalosporins that sound alike.

## PATIENT TEACHING

- Advise patient to take drug as prescribed, even after he feels better.
- Tell patient to shake suspension well before measuring dose.
- Inform patient or parent that oral suspension is bubble gum–flavored to improve palatability and promote compliance in children. Tell him to refrigerate reconstituted suspension and to discard unused drug after 14 days.
- Instruct patient to notify prescriber if rash or signs and symptoms of superinfection occur.

# ceftazidime

sef-TAZ-i-deem

Fortaz, Tazicef

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Third-generation cephalosporin
*Pregnancy risk category B*

## AVAILABLE FORMS

*Infusion:* 1 g, 2 g in 50-ml and 100-ml vials (premixed)
*Injection (with arginine):* 500 mg, 1 g, 2 g
*Injection (with sodium carbonate):* 500 mg, 1 g, 2 g

## INDICATIONS & DOSAGES

➤ **Serious UTI and lower respiratory tract infection; skin, gynecologic, intra-abdominal, bone and joint, and CNS infection; bacteremia; and septicemia caused by susceptible microorganisms, such as streptococci (including *Streptococcus pneumoniae* and *S. pyogenes*), penicillinase- and non–penicillinase-producing *Staphylococcus aureus, Escherichia coli, Klebsiella, Proteus, Enterobacter, Haemophilus influenzae, Pseudomonas,* and some strains of *Bacteroides***

*Adults and children age 12 and older:* 1 to 2 g I.V. or I.M. every 8 to 12 hours; up to 6 g daily in life-threatening infections.
*Children ages 1 month to 12 years:* 30 to 50 mg/kg I.V. every 8 hours. Maximum

dose is 6 g/day. Use sodium carbonate formulation.
*Neonates up to age 4 weeks:* 30 mg/kg I.V. every 12 hours. Use sodium carbonate formulation.

➤ **Uncomplicated UTI**
*Adults:* 250 mg I.V. or I.M. every 12 hours.

➤ **Complicated UTI**
*Adults and children age 12 and older:* 500 mg to 1 g I.V. or I.M. every 8 to 12 hours.

➤ **Uncomplicated pneumonia**
*Adults and children age 12 and older:* 500 mg to 1 g I.V. or I.M. every 8 hours.

➤ **Lung infections caused by *Pseudomonas* in patients with cystic fibrosis with healthy renal function**
*Adults and children age 12 and older:* 30 to 50 mg/kg I.V. every 8 hours. Maximum dose is 6 g/day.

***Adjust-a-dose:*** If creatinine clearance is 31 to 50 ml/minute, give 1 g every 12 hours; if clearance is 16 to 30 ml/minute, give 1 g every 24 hours; if clearance is 6 to 15 ml/minute, give 500 mg every 24 hours; if clearance is less than 5 ml/minute, give 500 mg every 48 hours. Ceftazidime is removed by hemodialysis; give a loading dose of 1 g, followed by 1 g after each hemodialysis period.

## ADMINISTRATION

**I.V.**
▼ Before administration, ask patient if he's allergic to penicillins or cephalosporins.
▼ Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
▼ Each brand of drug includes specific instructions for reconstitution. Read and follow them carefully.
▼ To reconstitute solution that contains sodium carbonate, add 5 ml sterile water for injection to a 500-mg vial, or add 10 ml to a 1-g or 2-g vial. Shake well to dissolve drug. Because carbon dioxide is released during dissolution, positive pressure will develop in vial.
▼ To reconstitute solution that contains arginine, use 10 ml of sterile water for injection. This product won't release gas bubbles.
▼ Infuse drug over 15 to 30 minutes.
▼ **Incompatibilities:** Aminoglycosides, aminophylline, amiodarone, amphotericin B cholesteryl sulfate complex, azithromycin, clarithromycin, fluconazole, idarubicin, midazolam, pentamidine isethionate, ranitidine hydrochloride, sargramostim, sodium bicarbonate solutions, vancomycin.

**I.M.**
• Before administration, ask patient if he's allergic to penicillins or cephalosporins.
• Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
• Inject deep into a large muscle, such as the gluteus maximus or the side of the thigh.

## ACTION

Inhibits cell-wall synthesis, promoting osmotic instability; usually bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |
| I.M. | Unknown | 1 hr | Unknown |

*Half-life:* 1½ to 2 hours.

## ADVERSE REACTIONS

**CNS:** ***seizures.***
**CV:** *phlebitis, thrombophlebitis.*
**GI:** ***pseudomembranous colitis,*** nausea, vomiting, diarrhea, abdominal cramps.
**Hematologic:** ***agranulocytosis, leukopenia, thrombocytopenia,*** eosinophilia, thrombocytosis, hemolytic anemia.
**Skin:** *maculopapular and erythematous rashes, urticaria, pain, induration, sterile abscesses, tissue sloughing at injection site.*
**Other:** ***anaphylaxis,*** hypersensitivity reactions, serum sickness.

## INTERACTIONS

**Drug-drug.** *Aminoglycosides:* May cause additive or synergistic effect against some strains of *Pseudomonas aeruginosa* and *Enterobacteriaceae;* may increase risk of nephrotoxicity. Monitor patient for effects and monitor renal function.
*Chloramphenicol:* May cause antagonistic effect. Avoid using together.

### EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, bilirubin, and LDH levels. May decrease hemoglobin level.
- May increase eosinophil count. May decrease granulocyte and WBC counts. May increase or decrease platelet count.
- May falsely increase serum or urine creatinine level in tests using Jaffe reaction. May cause false-positive results of Coombs' test and urine glucose tests that use cupric sulfate, such as Benedict's reagent and Clinitest.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other cephalosporins.
- Use cautiously in patients hypersensitive to penicillin because of possibility of cross-sensitivity with other beta-lactam antibiotics.
- Use cautiously in breast-feeding women and in patients with history of colitis or renal insufficiency.

***Overdose S&S:*** Seizures, encephalopathy, asterixis, neuromuscular excitability, coma (in patients with renal failure).

### NURSING CONSIDERATIONS

- If large doses are given, therapy is prolonged, or patient is at high risk, monitor patient for signs and symptoms of superinfection.

***Alert:*** Drug contains either sodium carbonate (Fortaz or Tazicef) or arginine to facilitate dissolution of drug. Safety and effectiveness of solutions containing arginine in children younger than age 12 haven't been established.

- ***Look alike–sound alike:*** Don't confuse drug with other cephalosporins that sound alike.

### PATIENT TEACHING

- Tell patient to report adverse reactions or signs and symptoms of superinfection promptly.
- Instruct patient to report discomfort at I.V. insertion site.
- Advise patient to notify prescriber about loose stools or diarrhea.

## ceftriaxone sodium

sef-try-AX-ohn

Rocephin

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Third-generation cephalosporin
*Pregnancy risk category B*

C

### AVAILABLE FORMS

*Infusion:* 1 g, 2-g piggyback; 1 g, 2 g/50 ml premixed
*Injection:* 250 mg, 500 mg, 1 g, 2 g

### INDICATIONS & DOSAGES

➤ **Uncomplicated gonococcal vulvovaginitis**

*Adults:* 125 mg I.M. as a single dose, plus azithromycin 1 g P.O. as a single dose or doxycycline 100 mg P.O. b.i.d. for 7 days.

➤ **UTI; lower respiratory tract, gynecologic, bone or joint, intra-abdominal, skin, or skin structure infection; septicemia**

*Adults and children older than age 12 years:* 1 to 2 g I.M. or I.V. daily or in equally divided doses every 12 hours. Total daily dose shouldn't exceed 4 g.
*Children age 12 and younger:* 50 to 75 mg/kg I.M. or I.V., not to exceed 2 g/day, given in divided doses every 12 hours or given once daily.

➤ **Meningitis**

*Adults:* 1 to 2 g I.M. or I.V. once daily or in equally divided doses twice daily for 4 to 14 days.

➤ **Perioperative prevention**

*Adults:* 1 g I.V. as a single dose 30 minutes to 2 hours before surgery.

➤ **Acute bacterial otitis media**

*Adults:* 1 to 2 g I.M. or I.V. once daily or in equally divided doses twice daily for 4 to 14 days.
*Children:* 50 mg/kg I.M. as a single dose. Don't exceed 1 g.

### ADMINISTRATION

**I.V.**

▼ Before giving drug, ask patient if he's allergic to penicillins or cephalosporins.

▼ Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
▼ Reconstitute drug with sterile water for injection, normal saline solution for injection, $D_5W$, or a combination of normal saline solution and dextrose injection and other compatible solutions.
▼ Add 2.4 ml of diluent to the 250-mg vial, 4.8 ml to the 500-mg vial, 9.6 ml to the 1-g vial, and 19.2 ml to the 2-g vial. All reconstituted solutions average 100 mg/ml. For intermittent infusion, dilute further to achieve desired concentration, and give over 30 minutes.
▼ Diluted I.V. preparation is stable for 48 hours at room temperature or 10 days if refrigerated.
***Alert:*** Don't mix or coadminister ceftriaxone with calcium-containing I.V. solutions, including parenteral nutrition. This includes the use of different infusion lines at different sites. Don't administer within 48 hours of each other in any patient.
▼ **Incompatibilities:** Aminoglycosides, aminophylline, amphotericin B cholesteryl sulfate complex, azithromycin, calcium, clindamycin phosphate, filgrastim, fluconazole, gentamicin, labetalol, linezolid, metronidazole, pentamidine isethionate, theophylline, vancomycin, vinorelbine tartrate.

**I.M.**
● Before giving drug, ask patient if he's allergic to penicillins or cephalosporins.
● Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
● Inject deep into a large muscle, such as the gluteus maximus or the lateral aspect of the thigh.

## ACTION
Inhibits cell-wall synthesis, promoting osmotic instability; usually bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |
| I.M. | Unknown | 1½–4 hr | Unknown |

*Half-life:* 5½ to 11 hours.

## ADVERSE REACTIONS
**GI:** ***pseudomembranous colitis,*** diarrhea.
**Hematologic:** eosinophilia, thrombocytosis, ***leukopenia.***
**Skin:** pain, induration, tenderness at injection site, *rash.*
**Other:** hypersensitivity reactions, serum sickness, ***anaphylaxis.***

## INTERACTIONS
**Drug-drug.** *Aminoglycosides:* May cause synergistic effect against some strains of *P. aeruginosa* and *Enterobacteriaceae* species. Monitor patient.
*Probenecid:* High doses (1 or 2 g daily) may enhance hepatic clearance of ceftriaxone and shorten its half-life. Avoid using together.

## EFFECTS ON LAB TEST RESULTS
● May increase alkaline phosphatase, ALT, AST, bilirubin, BUN, and LDH levels.
● May increase eosinophil and platelet counts. May decrease WBC count.
● May falsely increase serum or urine creatinine level in tests using Jaffe reaction. May cause false-positive results of Coombs' test and urine glucose tests that use cupric sulfate, such as Benedict's reagent and Clinitest.

## CONTRAINDICATIONS & CAUTIONS
● Contraindicated in patients hypersensitive to drug or other cephalosporins.
● Use cautiously in patients hypersensitive to penicillin because of possibility of cross-sensitivity with other beta-lactam antibiotics.
● Use cautiously in breast-feeding women and in patients with history of colitis and renal insufficiency.

## NURSING CONSIDERATIONS
● If large doses are given, therapy is prolonged, or patient is at high risk, monitor patient for signs and symptoms of superinfection.
● Monitor PT and INR in patients with impaired vitamin K synthesis or low vitamin K stores. Vitamin K therapy may be needed.
● Drug is commonly used in home antibiotic programs for outpatient treatment of serious infections, such as osteomyelitis and community-acquired pneumonia.

• ***Look alike–sound alike:*** Don't confuse drug with other cephalosporins that sound alike.

### PATIENT TEACHING

• Tell patient to report adverse reactions promptly.
• Instruct patient to report discomfort at I.V. insertion site.
• Teach patient and family receiving home care how to prepare and give drug.
• If home care patient is diabetic and is testing his urine for glucose, tell him drug may affect results of cupric sulfate tests; he should use an enzymatic test instead.
• Tell patient to notify prescriber about loose stools or diarrhea.

## cefuroxime axetil

se-fyoor-OX-eem

Ceftin

## cefuroxime sodium

Zinacef

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Second-generation cephalosporin
*Pregnancy risk category B*

### AVAILABLE FORMS

**cefuroxime axetil**
*Suspension:* 125 mg/5 ml, 250 mg/5 ml
*Tablets:* 125 mg, 250 mg, 500 mg
**cefuroxime sodium**
*Infusion:* 750-mg, 1.5-g vials, infusion packs, and ADD-Vantage vials
*Injection:* 750 mg, 1.5 g

### INDICATIONS & DOSAGES

➤ **Serious lower respiratory tract infection, UTI, skin or skin-structure infections, bone or joint infection, septicemia, meningitis, and gonorrhea**
*Adults and children age 13 and older:* 750 mg to 1.5 g cefuroxime sodium I.V. or I.M. every 8 hours for 5 to 10 days. For life-threatening infections and infections caused by less susceptible organisms, 1.5 g I.V. or I.M. every 6 hours; for bacterial meningitis, up to 3 g I.V. every 8 hours.
*Children age 3 months to 12 years:* 50 to 100 mg/kg/day cefuroxime sodium I.V. or I.M. in equally divided doses every 6 to 8 hours. Use higher dosage of 100 mg/kg/day, not to exceed maximum adult dosage, for more severe or serious infections. For bacterial meningitis, 200 to 240 mg/kg/day cefuroxime sodium I.V. in divided doses every 6 to 8 hours.

➤ **Perioperative prevention**
*Adults:* 1.5 g I.V. 30 to 60 minutes before surgery; in lengthy operations, 750 mg I.V. or I.M. every 8 hours. For open-heart surgery, 1.5 g I.V. at induction of anesthesia and then every 12 hours for a total dose of 6 g.

➤ **Bacterial exacerbations of chronic bronchitis or secondary bacterial infection of acute bronchitis**
*Adults and children age 13 and older:* 250 or 500 mg P.O. b.i.d. for 10 days (chronic bronchitis) or 5 to 10 days (acute bronchitis).

➤ **Acute bacterial maxillary sinusitis**
*Adults and children age 13 and older:* 250 mg P.O. b.i.d. for 10 days.
*Children ages 3 months to 12 years:* 250 mg b.i.d. for 10 days. For children who can't swallow tablets whole, 30 mg/kg/day oral suspension divided b.i.d. for 10 days.

➤ **Pharyngitis and tonsillitis**
*Adults and children age 13 and older:* 250 mg P.O. b.i.d. for 10 days.
*Children ages 3 months to 12 years:* 125 mg P.O. b.i.d. for 10 days. For children who can't swallow tablets whole, give 20 mg/kg daily of oral suspension divided b.i.d. for 10 days. Maximum daily dose for suspension is 500 mg.

➤ **Otitis media**
*Children ages 3 months to 12 years:* 250 mg P.O. b.i.d. for 10 days. For children who can't swallow tablets whole, give 30 mg/kg/day of oral suspension divided b.i.d. for 10 days. Maximum daily dose for suspension is 1,000 mg.

➤ **Uncomplicated skin and skin structure infection**
*Adults and children age 13 and older:* 250 or 500 mg P.O. b.i.d. for 10 days.

➤ **Uncomplicated UTI**
*Adults:* 250 mg P.O. b.i.d. for 7 to 10 days.

➤ **Uncomplicated gonorrhea**
*Adults:* 1,000 mg P.O. as a single dose. Or, 1.5 g I.M. with 1 g probenecid P.O. for one dose. Or, 1 g P.O. as a single dose.
➤ **Early Lyme disease**
*Adults and children age 13 and older:* 500 mg P.O. b.i.d. for 20 days.
➤ **Impetigo**
*Children ages 3 months to 12 years:* 30 mg/kg/day of oral suspension divided b.i.d. for 10 days. Maximum daily dose, 1,000 mg.
***Adjust-a-dose:*** In adults with creatinine clearance of 10 to 20 ml/minute, give 750 mg I.V. or I.M. every 12 hours; if clearance is less than 10 ml/min, give 750 mg I.V. or I.M. every 24 hours. Give patients on hemodialysis an additional dose after hemodialysis.

## ADMINISTRATION

**P.O.**
• Before giving drug, ask patient if he's allergic to penicillins or cephalosporins.
• Obtain specimen for culture and sensitivity tests before giving first dose. Therapy may begin while awaiting results.
• Give tablets without regard for meals; give oral suspension with food.
• Crush tablets, if absolutely necessary, for patients who can't swallow tablets. Tablets may be dissolved in small amounts of apple, orange, or grape juice or chocolate milk. However, the drug has a bitter taste that is difficult to mask, even with food.

**I.V.**
▼ Before giving drug, ask patient if he's allergic to penicillins or cephalosporins.
▼ Obtain specimen for culture and sensitivity tests before giving first dose. Therapy may begin while awaiting results.
▼ Reconstitute each 750-mg vial with 8 ml and each 1.5-g vial with 16 ml of sterile water for injection.
▼ Withdraw entire contents of vial for a dose.
▼ For direct injection, inject over 3 to 5 minutes into a large vein or into the tubing of a free-flowing I.V. solution.
▼ For intermittent infusion, add reconstituted drug to 100 ml $D_5W$, normal saline solution for injection, or other compatible I.V. solution.
▼ Infuse over 15 to 60 minutes.
▼ **Incompatibilities:** Aminoglycosides, azithromycin, ciprofloxacin, cisatracurium, clarithromycin, cyclophosphamide, doxapram, filgrastim, fluconazole, gentamicin, midazolam, ranitidine, sodium bicarbonate injection, vancomycin, vinorelbine tartrate.

**I.M.**
• Before giving drug, ask patient if he's allergic to penicillins or cephalosporins.
• Obtain specimen for culture and sensitivity tests before giving first dose. Therapy may begin while awaiting results.
• Inject deep into a large muscle, such as the gluteus maximus or the side of the thigh.

## ACTION

Inhibits cell-wall synthesis, promoting osmotic instability; usually bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 15–60 min | Unknown |
| I.V. | Immediate | Immediate | Unknown |
| I.M. | Unknown | 2 hr | Unknown |

*Half-life:* 1 to 2 hours.

## ADVERSE REACTIONS

**CV:** *phlebitis, thrombophlebitis.*
**GI:** *diarrhea,* ***pseudomembranous colitis,*** nausea, anorexia, vomiting.
**Hematologic:** *hemolytic anemia,* ***thrombocytopenia, transient neutropenia,*** eosinophilia.
**Skin:** *maculopapular and erythematous rashes, urticaria, pain, induration, sterile abscesses, temperature elevation, tissue sloughing at I.M. injection site.*
**Other:** ***anaphylaxis,*** hypersensitivity reactions, serum sickness.

## INTERACTIONS

**Drug-drug.** *Aminoglycosides:* May cause synergistic activity against some organisms; may increase nephrotoxicity. Monitor patient's renal function closely.
*Loop diuretics:* May increase risk of adverse renal reactions. Monitor renal function test results closely.
*Probenecid:* May inhibit excretion and increase cefuroxime level. Probenecid may be used for this effect.

**Drug-food.** *Any food:* May increase absorption. Give oral suspension with food. Tablets may be given without regard to meals.

### EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, bilirubin, and LDH levels. May decrease hemoglobin level and hematocrit.
- May increase PT and INR and eosinophil count. May decrease neutrophil and platelet counts.
- May falsely increase serum or urine creatinine level in tests using Jaffe reaction. May cause false-positive results of Coombs' test and urine glucose tests that use cupric sulfate, such as Benedict's reagent and Clinitest.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other cephalosporins.
- Use cautiously in patients hypersensitive to penicillin because of possibility of cross-sensitivity with other beta-lactam antibiotics.
- Use cautiously in breast-feeding women and in patients with history of colitis or renal insufficiency.

### NURSING CONSIDERATIONS

***Alert:*** Tablets and suspension aren't bioequivalent and can't be substituted milligram-for-milligram.

- Monitor patient for signs and symptoms of superinfection.
- ***Look alike–sound alike:*** Don't confuse drug with other cephalosporins that sound alike.

### PATIENT TEACHING

- Tell patient to take drug as prescribed, even after he feels better.
- If patient has difficulty swallowing tablets, show him how to dissolve or crush tablets, but warn him that the bitter taste is hard to mask, even with food.
- Tell parent to shake suspension well before measuring dose. Suspension may be stored at room temperature or refrigerated, but must be discarded after 10 days.
- Instruct caregiver to give oral suspension with food.
- Instruct patient to notify prescriber about rash, loose stools, diarrhea, or evidence of superinfection.
- Advise patient receiving drug I.V. to report discomfort at I.V. insertion site.

C

## celecoxib

sell-ah-COCKS-ib

Celebrex✐

*Therapeutic class:* NSAID
*Pharmacologic class:* Cyclooxygenase-2 (COX-2) inhibitor
*Pregnancy risk category C; D in 3rd trimester*

### AVAILABLE FORMS

*Capsules:* 50 mg, 100 mg, 200 mg, 400 mg

### INDICATIONS & DOSAGES

➤ **To relieve signs and symptoms of osteoarthritis**
*Adults:* 200 mg P.O. daily as a single dose or divided equally b.i.d.

➤ **To relieve signs and symptoms of rheumatoid arthritis**
*Adults:* 100 to 200 mg P.O. b.i.d.

➤ **To relieve signs and symptoms of ankylosing spondylitis**
*Adults:* 200 mg P.O. once daily or divided b.i.d. If no response after 6 weeks, may increase dose to 400 mg daily. If no response after 6 more weeks, consider other treatment.

➤ **To relieve signs and symptoms of juvenile rheumatoid arthritis**
*Children age 2 and older who weigh 10 to 25 kg (22 to 55 lb):* 50 mg P.O. b.i.d.
*Children age 2 and older who weigh more than 25 kg:* 100 mg P.O. b.i.d.

➤ **Adjunctive treatment for familial adenomatous polyposis to reduce the number of adenomatous colorectal polyps**
*Adults:* 400 mg P.O. b.i.d. with food, for up to 6 months.
***Adjust-a-dose:*** For elderly patients, start at lowest dosage.

➤ **Acute pain and primary dysmenorrhea**
*Adults:* 400 mg P.O., initially, followed by another 200-mg dose if needed. On

subsequent days, 200 mg P.O. b.i.d. as needed.

***Adjust-a-dose:*** For elderly patients and those who weigh less than 50 kg (110 lb), start at lowest dosage. For patients with Child-Pugh class B hepatic impairment, reduce dosage by about 50%. For patients who are poor metabolizers of CYP2C9, start treatment at half the lowest recommended dose.

## ADMINISTRATION

**P.O.**

- Drug can be given without regard to meals, but food may decrease GI upset.

## ACTION

Thought to inhibit prostaglandin synthesis, impeding COX-2, to produce anti-inflammatory, analgesic, and antipyretic effects.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3 hr | Unknown |

*Half-life:* 11 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* dizziness, insomnia.
**CV:** hypertension, peripheral edema.
**EENT:** pharyngitis, rhinitis, sinusitis.
**GI:** abdominal pain, diarrhea, dyspepsia, flatulence, GI reflux, nausea.
**Metabolic:** hyperchloremia.
**Musculoskeletal:** back pain.
**Respiratory:** dyspnea, upper respiratory tract infection.
**Skin:** ***erythema multiforme, exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis,*** rash.
**Other:** accidental injury.

## INTERACTIONS

**Drug-drug.** *ACE inhibitors, angiotensin II antagonists:* May decrease antihypertensive effects. Monitor patient's blood pressure.
*Antacids containing aluminum or magnesium:* May decrease celecoxib level. Separate doses.
*Aspirin:* May increase risk of ulcers; low aspirin dosages can be used safely to reduce the risk of CV events. Monitor patient for signs and symptoms of GI bleeding.
*Fluconazole:* May increase celecoxib level. Reduce dosage of celecoxib to minimal effective dose.
*Furosemide, thiazides:* May reduce sodium excretion caused by diuretics, leading to sodium retention. Monitor patient for swelling and increased blood pressure.
*Lithium:* May increase lithium level. Monitor lithium level closely during treatment.
*Warfarin:* May increase PT and bleeding complications. Monitor PT and INR, and check for signs and symptoms of bleeding.
**Drug-herb.** *Dong quai, feverfew, garlic, ginger, horse chestnut, red clover:* May increase risk of bleeding. Discourage use together.
*White willow:* Herb and drug contain similar components. Discourage use together.
**Drug-lifestyle.** *Long-term alcohol use, smoking:* May cause GI irritation or bleeding. Check for signs and symptoms of bleeding.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, BUN, creatinine, and chloride levels.
- May decrease phosphate level.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Contraindicated for the treatment of perioperative pain after CABG surgery.

- Contraindicated in patients hypersensitive to drug, sulfonamides, aspirin, or other NSAIDs.
- Contraindicated in those with severe hepatic impairment.
- Avoid use in the third trimester of pregnancy and with any dose of a non-aspirin NSAID.
- Use cautiously in patients with history of ulcers or GI bleeding, advanced renal disease, dehydration, anemia, symptomatic liver disease, hypertension, edema, heart failure, or asthma, and in poor CYP2C9 metabolizers.
- Use cautiously in elderly or debilitated patients.

***Overdose S&S:*** Lethargy, drowsiness, nausea, vomiting, epigastric pain, GI bleeding, hypertension, acute renal failure, respiratory depression, coma, anaphylaxis.

## NURSING CONSIDERATIONS

***Alert:*** Patients allergic to or with a history of anaphylactic reactions to sulfonamides, aspirin, or other NSAIDs may be allergic to this drug.

**Black Box Warning** NSAIDs cause an increased risk of serious GI adverse events, including bleeding, ulceration, and perforation of the stomach or intestines, which can be fatal. Elderly patients are at greater risk. ■

- Patient with history of ulcers or GI bleeding is at higher risk for GI bleeding while taking NSAIDs such as celecoxib. Other risk factors for GI bleeding include treatment with corticosteroids or anticoagulants, longer duration of NSAID treatment, smoking, alcoholism, older age, and poor overall health.
- Although drug may be used with low aspirin dosages, the combination may increase risk of GI bleeding.
- Watch for signs and symptoms of overt and occult bleeding.

**Black Box Warning** NSAIDs may increase the risk of serious thrombotic events, MI, or stroke. The risk may be greater with longer use or in patients with CV disease or risk factors for CV disease. ■

- Drug can cause fluid retention; monitor patient with hypertension, edema, or heart failure.
- Assess patient for CV risk factors before therapy.
- Drug may be hepatotoxic; watch for signs and symptoms of liver toxicity.
- Before starting drug therapy, rehydrate dehydrated patient.
- Monitor patient's renal function; renal insufficiency is possible in patients with preexisting renal disease. Long-term administration may cause renal papillary necrosis and other renal injury.
- ***Look alike–sound alike:*** Don't confuse Celebrex with Cerebyx or Celexa.

## PATIENT TEACHING

- Tell patient to report history of allergic reactions to sulfonamides, aspirin, or other NSAIDs before therapy.
- Instruct patient to promptly report signs of GI bleeding, such as blood in vomit, urine, or stool; or black, tarry stools.

***Alert:*** Advise patient to immediately report rash, unexplained weight gain, or swelling.

- Tell woman to notify prescriber if she becomes pregnant or is planning to become pregnant during drug therapy.
- Instruct patient to take drug with food if stomach upset occurs.
- Tell patient that drug may harm the liver. Advise patient to stop therapy and notify prescriber immediately if he experiences signs and symptoms of liver toxicity, including nausea, fatigue, lethargy, itching, yellowing of skin or eyes, right upper quadrant tenderness, and flulike syndrome.
- Inform patient that it may take several days before he feels consistent pain relief.
- Advise patient that using OTC NSAIDs with celecoxib may increase the risk of GI toxicity.

# cephalexin

sef-a-LEX-in

Apo-Cephalex†, Keflex, Novo-Lexin†, Nu-Cephalex†

*Therapeutic class:* Antibiotic
*Pharmacologic class:* First-generation cephalosporin
*Pregnancy risk category B*

## AVAILABLE FORMS

*Capsules:* 250 mg, 500 mg, 750 mg
*Oral suspension:* 125 mg/5 ml, 250 mg/5 ml
*Tablets:* 250 mg, 500 mg

## INDICATIONS & DOSAGES

➤ **Respiratory tract, GI tract, skin, soft-tissue, bone, and joint infections and otitis media caused by *Escherichia coli* and other coliform bacteria, group A beta-hemolytic streptococci, *Klebsiella* species, *Proteus mirabilis, Streptococcus pneumoniae,* and staphylococci**

*Adults:* 250 mg to 1 g P.O. every 6 hours or 500 mg every 12 hours. Maximum 4 g daily.
*Children:* 25 to 50 mg/kg/day P.O. in two to four equally divided doses. In severe infections, dose can be doubled. Don't exceed recommended adult dosage.

***Adjust-a-dose:*** For patients with impaired renal function, safe dosage may be lower than that usually recommended.

## ADMINISTRATION

**P.O.**

- Before giving, ask patient if he's allergic to penicillins or cephalosporins.
- Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
- To prepare oral suspension, add required amount of water to powder in two portions. Shake well after each addition. After mixing, store in refrigerator. Mixture will remain stable for 14 days. Keep tightly closed and shake well before using.
- Give drug with food or milk to lessen GI discomfort.

## ACTION

Inhibits cell-wall synthesis, promoting osmotic instability; usually bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Unknown |

*Half-life:* 30 minutes to 1 hour.

## ADVERSE REACTIONS

**CNS:** dizziness, headache, fatigue, agitation, confusion, hallucinations.
**GI:** *anorexia, diarrhea,* ***pseudomembranous colitis,*** gastritis, glossitis, dyspepsia, abdominal pain, anal pruritus, tenesmus, oral candidiasis.
**GU:** genital pruritus, candidiasis, vaginitis, interstitial nephritis.
**Hematologic:** ***neutropenia, thrombocytopenia,*** eosinophilia, anemia.
**Musculoskeletal:** arthritis, arthralgia, joint pain.
**Skin:** *maculopapular and erythematous rashes, urticaria.*
**Other:** ***anaphylaxis,*** hypersensitivity reactions, serum sickness.

## INTERACTIONS

**Drug-drug.** *Aminoglycosides:* May increase risk of nephrotoxicity. Avoid using together.
*Probenecid:* May increase cephalosporin level. Use probenecid for this effect.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, bilirubin, and LDH levels. May decrease hemoglobin level.
- May increase eosinophil count. May decrease neutrophil and platelet counts.
- May falsely increase serum or urine creatinine level in tests using Jaffe reaction. May cause false-positive results of Coombs' test and urine glucose tests that use cupric sulfate, such as Benedict's reagent and Clinitest.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to cephalosporins.
- Use cautiously in patients hypersensitive to penicillin because of possibility of cross-sensitivity with other beta-lactam antibiotics.
- Use cautiously in breast-feeding women and in patients with history of colitis or renal insufficiency.

***Overdose S&S:*** Nausea, vomiting, epigastric distress, diarrhea, hematuria.

## NURSING CONSIDERATIONS

- If large doses are given or if therapy is prolonged, monitor patient for superinfection, especially if patient is high risk.
- Treat group A beta-hemolytic streptococcal infections for a minimum of 10 days.
- ***Look alike–sound alike:*** Don't confuse drug with other cephalosporins that sound alike.

## PATIENT TEACHING

- Tell patient to take drug exactly as prescribed, even after he feels better.
- Instruct patient to take drug with food or milk to lessen GI discomfort. If patient is taking suspension form, instruct him to shake container well before measuring dose and to store in refrigerator.
- Tell patient to notify prescriber if rash or signs and symptoms of superinfection develop.

## certolizumab pegol

SERT-oh-LIZ-u-mahb PEGH-ol

Cimzia

*Therapeutic class:* Immune response modifier
*Pharmacologic class:* Tumor necrosis factor blocker
*Pregnancy risk category B*

### AVAILABLE FORMS

*Lyophilized powder for injection:* 200 mg
*Prefilled syringe:* 200 mg/ml

### INDICATIONS & DOSAGES

➤ **Crohn's disease when response to conventional therapy is inadequate**

*Adults:* Initially, 400 mg subcutaneously (given as two injections of 200 mg each), then at 2 weeks and 4 weeks followed by a maintenance dose of 400 mg subcutaneously every 4 weeks, if adequate response.

➤ **Rheumatoid arthritis**

*Adults:* Initially and at weeks 2 and 4, 400 mg subcutaneously (given as two injections of 200 mg each), followed by maintenance dose of 200 mg every other week or 400 mg every 4 weeks.

### ADMINISTRATION

**Subcutaneous**

● Each 400-mg dose requires two vials. Reconstitute each vial with 1 ml of sterile water for injection, using a 20-G needle. Gently swirl the vial without shaking. May take up to 30 minutes to fully reconstitute. Inspect vial for particulate matter and discoloration, and discard if present.
● Draw up each vial in its own syringe, switch each 20-G needle to a 23-G needle. Inject prepared or prefilled syringes into separate sites in the abdomen or thigh.
● Reconstituted drug is stable for 2 hours at room temperature or for up to 24 hours if refrigerated.
● Give at room temperature.

### ACTION

Selectively neutralizes TNF$\alpha$, a proinflammatory cytokine responsible for stimulating the production of inflammatory mediators.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 54–171 hr | Unknown |

*Half-life:* 14 days.

### ADVERSE REACTIONS

**CNS:** anxiety, bipolar disorder, suicide attempt.
**CV:** angina pectoris, arrhythmias, heart failure, hypertensive heart disease, myocardial infarction, pericardial effusion and pericarditis, vasculitis.
**EENT:** optic neuritis, retinal hemorrhage, uveitis.
**GI:** abdominal pain.
**GU:** urinary tract infection.
**Hematologic:** anemia, ***leukopenia,*** lymphadenopathy, ***pancytopenia,*** thrombophilia.
**Hepatic:** elevated liver enzymes, hepatitis.
**Musculoskeletal:** arthralgia, extremity pain.
**Respiratory:** *upper respiratory tract infection.*
**Skin:** alopecia, dermatitis, peripheral edema, erythema nodosum, urticaria, injection site pain and erythema.
**Other:** ***tuberculosis and opportunistic infection, Stevens-Johnson syndrome, toxic epidermal necrolysis and erythema multiforme.***

### INTERACTIONS

**Drug-drug.** *Abatacept, anakinra, natalizumab, rituximab:* May increase risk of serious infection and neutropenia. Avoid using together.
*Live vaccines:* May cause infection. Avoid using together.

### EFFECTS ON LAB TEST RESULTS

● May falsely elevate PTT.

### CONTRAINDICATIONS & CAUTIONS

● Use cautiously in patients with known hypersensitivity to other TNF blockers and those with underlying conditions that may increase the risk of infections.
● Use cautiously in those with a history of recurrent infections or concomitant immunosuppressive therapy, or in those who have resided in regions where tuberculosis

and histoplasmosis are endemic. Avoid use in patients with active infections.
• Use cautiously in patients with a history of central nervous system demyelinating disorder, hematologic disorders, or heart failure.

## NURSING CONSIDERATIONS

**Black Box Warning** Monitor patient for signs and symptoms of tuberculosis, invasive fungal infection, and other opportunistic infections during and after treatment. Discontinue treatment if serious infection develops. Fatal infections have occurred. ■
• Before initiating therapy, evaluate patient for tuberculosis risk factors and test for latent tuberculosis infection.
• Before therapy, consider antituberculosis therapy in patients with past history of latent or active tuberculosis when adequate treatment can't be confirmed.
• Before therapy, evaluate patients at risk for hepatitis B virus (HBV) infection and test for previous HBV infection.
• Use during pregnancy only when benefits to mother outweigh the risks to fetus.
• It isn't known whether drug appears in breast milk. Advise stopping breast-feeding during therapy.
**Black Box Warning** Certolizumab isn't indicated for use in children. ■
• Use cautiously in elderly patients because of increased risk for infection.

## PATIENT TEACHING

**Black Box Warning** Teach patient to seek prompt medical attention if persistent fever, cough, shortness of breath, or fatigue develops. ■
• Advise patient to seek immediate medical attention for signs and symptoms of infection or for unusual bruising or bleeding.
• Instruct patient to seek immediate medical attention if any symptoms of severe allergic reaction develop.
• Tell patient to report signs and symptoms of heart failure.
• Show patient how to self-administer prefilled syringes and how to properly dispose of needles and syringes.

# cetirizine hydrochloride

se-TEER-i-zeen

Zyrtec ◇

*Therapeutic class:* Antihistamine
*Pharmacologic class:* Piperazine derivative
*Pregnancy risk category B*

## AVAILABLE FORMS

*Capsules:* 10 mg
*Syrup:* 5 mg/5 ml ◇
*Tablets:* 5 mg ◇, 10 mg ◇
*Tablets (chewable):* 5 mg ◇, 10 mg ◇

## INDICATIONS & DOSAGES

➤ **Seasonal allergic rhinitis**
*Adults and children age 6 and older:* 5 to 10 mg P.O. once daily.
*Children ages 2 to 5:* 2.5 mg P.O. once daily. Maximum daily dose is 5 mg.
➤ **Perennial allergic rhinitis, chronic urticaria**
*Adults and children age 6 and older:* 5 to 10 mg P.O. once daily.
*Children ages 6 months to 5 years:* 2.5 mg P.O. once daily; in children ages 1 to 5, increase to maximum of 5 mg daily. Children ages 12 to 23 months should receive the 5-mg dose as two divided doses.
***Adjust-a-dose:*** For adults and children age 6 and older receiving hemodialysis, those with hepatic impairment, and those with creatinine clearance less than 31 ml/minute, give 5 mg P.O. daily. Don't use in children younger than age 6 with renal or hepatic impairment.

## ADMINISTRATION

**P.O.**
• Give drug without regard for food.

## ACTION

A long-acting, nonsedating antihistamine that selectively inhibits peripheral $H_1$ receptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 60 min | 24 hr |

*Half-life:* About 8 hours.

### ADVERSE REACTIONS
**CNS:** *somnolence,* fatigue, dizziness, headache.
**EENT:** pharyngitis.
**GI:** dry mouth, nausea, vomiting, abdominal distress.

### INTERACTIONS
**Drug-drug.** *CNS depressants:* May cause additive effect. Monitor patient closely for excessive sedation or other adverse effects. *Theophylline:* May decrease cetirizine clearance. Monitor patient closely.
**Drug-lifestyle.** *Alcohol use:* May cause additive effects. Discourage use together.

### EFFECTS ON LAB TEST RESULTS
• May prevent, reduce, or mask positive result in diagnostic skin test.

### CONTRAINDICATIONS & CAUTIONS
• Contraindicated in patients hypersensitive to drug or to hydroxyzine and in breast-feeding women.
• Use cautiously in patients with renal or hepatic impairment.
⚠ ***Overdose S&S:*** Somnolence; initial restlessness and irritability, then drowsiness.

### NURSING CONSIDERATIONS
• Stop drug 4 days before diagnostic skin testing because antihistamines can prevent, reduce, or mask positive skin test response.
• ***Look alike–sound alike:*** Don't confuse Zyrtec with Zyprexa or Zantac.

### PATIENT TEACHING
• Warn patient not to perform hazardous activities until CNS effects of drug are known. Somnolence is a common adverse reaction.
• Advise patient not to use alcohol or other CNS depressants while taking drug.
• Inform patient that sugarless gum, hard candy, or ice chips may relieve dry mouth.

## cetrorelix acetate
set-ROH-re-lix

Cetrotide

*Therapeutic class:* Infertility drug
*Pharmacologic class:* Gonadotropin-releasing hormone (GnRH) antagonist
*Pregnancy risk category X*

C

### AVAILABLE FORMS
*Powder for injection:* 0.25 mg, 3 mg

### INDICATIONS & DOSAGES
➤ **To inhibit premature luteinizing hormone (LH) surges in women undergoing controlled ovarian stimulation**
*Women:* 3 mg subcutaneously once during early to middle follicular phase, given when estradiol level indicates an appropriate stimulation response, usually on stimulation day 7 (range, days 5 to 9). If human chorionic gonadotropin (hCG) hasn't been given within 4 days after injection, give drug 0.25 mg subcutaneously once daily until the day of hCG administration. Or, give 0.25-mg multiple-dose regimen subcutaneously on stimulation day 5 (morning or evening) or day 6 (morning), and continue once daily until the day of hCG administration.

### ADMINISTRATION
**Subcutaneous**
• Store 3-mg form at room temperature (77° F [25° C]) and 0.25-mg form in refrigerator (36° to 46° F [2° to 8° C]). Keep packaged tray in outer carton to protect it from light.
• Follow proper administration technique, as follows. Wash hands thoroughly with soap and water. Flip off plastic cover of vial and wipe top with an alcohol swab. Attach needle with yellow mark to prefilled syringe. Push needle through rubber stopper of vial and slowly inject liquid into vial. Leave syringe in place and gently swirl (don't shake) vial until solution is clear and without residue. Draw liquid from vial into syringe. If necessary, invert vial and pull needle back as far as needed to withdraw entire contents of vial. Detach needle with

yellow mark from syringe and replace it with needle with gray mark. Invert syringe and push plunger until all air bubbles are gone.
• Choose an injection site on lower abdomen, preferably around, but staying at least 1 inch away from, the navel. If giving a multiple-dose (0.25-mg) regimen, choose a different site each day to minimize local irritation. Clean site with alcohol swab and gently pinch a skinfold surrounding injection site. Insert needle completely into skin at about a 45-degree angle and, after needle has been inserted completely, release grasp of skin. Gently pull back plunger of syringe to check for correct positioning of needle. If no blood appears, inject entire solution.

## ACTION
Competes with natural GnRH for binding to membrane receptors on pituitary cells, which controls the release of LH and follicle-stimulating hormone.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | 1–2 hr | 1–2 hr | >4 days |

*Half-life:* 62.8 hours (single 3-mg dose); 5 hours (single 0.25-mg dose); 20.6 hours (multiple 0.25-mg doses).

## ADVERSE REACTIONS
**CNS:** headache.
**GI:** nausea.
**GU:** ***ovarian hyperstimulation syndrome.***

## INTERACTIONS
None reported.

## EFFECTS ON LAB TEST RESULTS
• May increase alkaline phosphatase, ALT, AST, and GGT levels.

## CONTRAINDICATIONS & CAUTIONS
• Contraindicated in patients hypersensitive to drug, extrinsic peptide hormones, mannitol, GnRH, or GnRH analogues.
• Contraindicated in patients with severe renal impairment.
• Contraindicated in pregnant and breast-feeding women, and in patients age 65 or older.

## NURSING CONSIDERATIONS
***Alert:*** Carefully monitor for hypersensitivity reaction after the first injection.
• Rule out pregnancy before starting treatment.
• Prescriber should be experienced in fertility treatment.
• Adjust dose according to patient response.
• When ultrasound shows enough follicles of adequate size, give hCG to induce ovulation and maturation of oocytes.
• To reduce the risk of ovarian hyperstimulation syndrome, don't give hCG if ovaries show an excessive response to treatment.

## PATIENT TEACHING
• Instruct patient to store 3-mg form at room temperature (77° F [25° C]) and 0.25-mg form in refrigerator (36° to 46° F [2° to 8° C]). Tell patient to protect drug from light by storing it in outer carton and to keep product away from children.
• Tell patient to report any adverse effects that become bothersome.
• Teach patient the importance of following the regimen exactly as prescribed to achieve best results.
• If blood appears when patient pulls back on plunger, tell her to withdraw needle and gently press an alcohol swab onto injection site. Explain that she'll need to discard syringe and drug vial and repeat procedure using a new pack.
• Urge patient to use a syringe and needle only once and then to dispose of them properly, in a medical waste container, if available.

**SAFETY ALERT!**

# cetuximab
seh-TUX-eh-mab

Erbitux

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Monoclonal antibody
*Pregnancy risk category C*

## AVAILABLE FORMS
*Injection:* 2 mg/ml in 50-ml vial

## INDICATIONS & DOSAGES

➤ **Squamous cell carcinoma of the head and neck**

*Adults:* A loading dose of 400 mg/m$^2$ I.V. over 2 hours (maximum rate, 10 mg/minute) followed by weekly maintenance dose of 250 mg/m$^2$ I.V. over 1 hour. If used with radiation therapy, begin drug 1 week before radiation course and continue for the duration (6 or 7 weeks). If used as monotherapy for recurrent or metastatic disease after failure of platinum-based therapy, continue until disease progresses or unacceptable toxicity occurs.

➤ **Epidermal growth factor–expressing metastatic colorectal cancer, alone in patients after failure of both irinotecan-based and oxaliplatin-based chemotherapy, as monotherapy in patients intolerant of ironotecan-based chemotherapy, or with irinotecan in patients refractory to irinotecan-based chemotherapy**

*Adults:* Loading dose, 400 mg/m$^2$ I.V. over 2 hours (maximum, 10 mg/minute), alone or with irinotecan. Maintenance dosage, 250 mg/m$^2$ I.V. weekly over 1 hour (maximum, 10 mg/minute).

***Adjust-a-dose:*** If patient develops a grade 1 or 2 infusion reaction, permanently reduce infusion rate by 50%. If patient develops a grade 3 or 4 infusion reaction, stop drug immediately and permanently. If patient develops a severe acneiform rash, follow these guidelines:

- After first occurrence, delay infusion 1 to 2 weeks. If patient improves, continue at 250 mg/m$^2$. If patient doesn't improve, stop drug.
- After second occurrence, delay infusion 1 to 2 weeks. If patient improves, reduce dose to 200 mg/m$^2$. If patient doesn't improve, stop drug.
- After third occurrence, delay infusion 1 to 2 weeks. If patient improves, reduce dose to 150 mg/m$^2$. If patient doesn't improve, stop drug.
- After fourth occurrence, stop drug.

## ADMINISTRATION

**I.V.**

▼ Solution should be clear and colorless and may contain a small amount of particulates.

▼ Don't shake or dilute.

▼ Drug can be given by infusion pump or syringe pump, piggybacked into the patient's infusion line. Don't give drug by I.V. push or bolus.

▼ Give drug through a low–protein-binding 0.22-micrometer in-line filter.

▼ Flush line with normal saline solution at the end of the infusion.

▼ Store vials at 36° to 46° F (2° to 8° C). Don't freeze.

▼ Solution in infusion container is stable up to 12 hours at 36° to 46° F (2° to 8° C) and up to 8 hours at 68° to 77° F (20° to 25° C).

▼ **Incompatibilities:** Don't dilute with other solutions.

## ACTION

An epidermal growth factor receptor (EGFR) antagonist that binds to the EGFR on normal and tumor cells, inhibiting epidermal growth factor from binding, which interrupts cell growth, induces cell death, and decreases growth factor production.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 4¾ days.

## ADVERSE REACTIONS

**CNS:** *asthenia, depression, fever, headache, insomnia, pain.*
**CV:** *edema,* ***cardiopulmonary arrest.***
**EENT:** *conjunctivitis.*
**GI:** *abdominal pain, anorexia, constipation, diarrhea, dyspepsia, dysphagia, mucositis, nausea, stomatitis, vomiting, xerostomia.*
**GU:** ***acute renal failure.***
**Hematologic:** *anemia,* **LEUKOPENIA.**
**Metabolic:** *dehydration,* **HYPOMAGNESEMIA,** weight loss.
**Musculoskeletal:** *back pain.*
**Respiratory:** *cough, dyspnea,* ***pulmonary embolus.***
**Skin:** *alopecia, maculopapular rash, nail disorder, pruritus, radiation dermatitis, acneiform rash.*
**Other:** ***anaphylactoid reaction,*** *chills, infection,* infusion reaction, ***sepsis.***

## INTERACTIONS

**Drug-lifestyle.** *Sun exposure:* May worsen skin reactions. Advise patient to avoid excessive sun exposure.

## EFFECTS ON LAB TEST RESULTS

• May decrease magnesium, calcium, and potassium levels.

## CONTRAINDICATIONS & CAUTIONS

• Use cautiously in patients hypersensitive to drug, its components, or murine proteins. If used with radiation, use cautiously in patients with a history of coronary artery disease, arrhythmias, and heart failure.

## NURSING CONSIDERATIONS

• Premedicate with $H_1$ antagonist such as diphenhydramine 50 mg I.V. 30 to 60 minutes prior to first dose.

**Black Box Warning** Severe infusion reactions, including acute airway obstruction, urticaria, and hypotension, may occur, usually with the first infusion. If a severe infusion reaction occurs, stop drug immediately and give symptomatic treatment. ■

• Keep epinephrine, corticosteroids, I.V. antihistamines, bronchodilators, and oxygen available for severe infusion reactions.

• Manage mild to moderate infusion reactions by decreasing infusion rate and premedicating with an antihistamine for subsequent infusions.

• Monitor patient for infusion reactions for 1 hour after infusion ends.

• Assess patient for acute onset or worsening of pulmonary symptoms. If interstitial lung disease is confirmed, stop drug.

• Monitor patient for skin toxicity, which starts most often during first 2 weeks of therapy. Treat with topical and oral antibiotics.

**Black Box Warning** In patients also receiving radiation therapy, closely monitor electrolytes, especially magnesium, potassium, and calcium, during and after therapy. Cardiopulmonary arrest has occurred. ■

• It's unknown if drug appears in breast milk. Women shouldn't breast-feed until 60 days after last dose.

## PATIENT TEACHING

• Tell patient to promptly report adverse reactions.

• Inform patient that skin reactions may occur, typically during the first 2 weeks of treatment.

• Advise patient to avoid prolonged or unprotected sun exposure during and 2 months after treatment.

# cevimeline hydrochloride

seh-vih-MEH-leen

Evoxac

*Therapeutic class:* Cholinergic agonist
*Pharmacologic class:* Cholinergic agonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 30 mg

## INDICATIONS & DOSAGES

➤ **Dry mouth in patients with Sjögren syndrome**

*Adults:* 30 mg P.O. t.i.d.

## ADMINISTRATION

**P.O.**

• Give drug without regard for food.

• Encourage fluids.

## ACTION

Stimulates the muscarinic receptors of the exocrine glands (salivary, sweat) and increases GI and urinary smooth muscle tone.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1½–2 hr | Unknown |

*Half-life:* 4 to 6 hours.

## ADVERSE REACTIONS

**CNS:** *headache*, anxiety, depression, fever, dizziness, fatigue, hypoesthesia, insomnia, migraine, pain, tremor, vertigo.

**CV:** chest pain, palpitations, peripheral edema.

**EENT:** *rhinitis*, *sinusitis*, abnormal vision, conjunctivitis, earache, epistaxis, eye infection, eye pain, otitis media, pharyngitis, xerophthalmia, eye abnormality.

**GI:** *diarrhea, nausea,* abdominal pain, anorexia, constipation, dry mouth, eructation, excessive salivation, flatulence, gastroesophageal reflux, salivary gland enlargement and pain, salivary calculi, ulcerative stomatitis, vomiting, dyspepsia, increased amylase.
**GU:** cystitis, candidiasis, UTI, vaginitis.
**Hematologic:** anemia.
**Musculoskeletal:** arthralgia, back pain, hypertonia, hyporeflexia, leg cramps, myalgia, rigors, skeletal pain.
**Respiratory:** *upper respiratory tract infection,* bronchitis, pneumonia, coughing, hiccups.
**Skin:** *excessive sweating,* rash, pruritus, skin disorder, erythematous rash.
**Other:** fungal infections, flulike symptoms, injury, hot flushes, tooth disorder, toothache, postoperative pain, allergic reaction, infection, abscess.

## INTERACTIONS

**Drug-drug.** *Antimuscarinics:* May cause antagonistic effects. Monitor patient for effectiveness.
*Beta blockers:* May cause conduction disturbances. Use together cautiously.
*CYP inhibitors:* May inhibit metabolism of cevimeline. Monitor patient closely.
*Parasympathomimetics:* May have additive effects. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

• May increase amylase level. May decrease hemoglobin level.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug and in those for whom miosis is undesirable (as in those who have acute iritis or angle-closure glaucoma).
• Contraindicated in patients with uncontrolled asthma.
• Use cautiously in patients with significant CV disease, controlled asthma, chronic bronchitis, or COPD and in those with a history of kidney stones or gallstones.
***Overdose S&S:*** CV depression, bronchoconstriction.

## NURSING CONSIDERATIONS

• Monitor patients with a history of asthma, COPD, or chronic bronchitis for an increase in signs or symptoms, such as wheezing, increased sputum production, or cough.
• Monitor patients with a history of cardiac disease for changes in heart rate or increased frequency, severity, or duration of angina.
• Monitor elderly patients closely because they have an increased risk of impaired renal, hepatic, and cardiac function.

## PATIENT TEACHING

• Advise patient not to interrupt or stop treatment without consulting prescriber.
• Tell patient that sweating is a common adverse effect. Urge adequate fluid intake to prevent dehydration.
• Inform patient that drug may cause visual disturbances that can impair driving ability, especially at night.

**SAFETY ALERT!**

# chloral hydrate

KLOR-al HYE-drate

Aquachloral, Somnote

*Therapeutic class:* Hypnotic
*Pharmacologic class:* CNS depressant
*Pregnancy risk category C*
*Controlled substance schedule IV*

## AVAILABLE FORMS

*Capsules:* 500 mg
*Suppositories:* 325 mg, 500 mg, 650 mg
*Syrup:* 500 mg/5 ml

## INDICATIONS & DOSAGES

➤ **Sedation**
*Adults:* 250 mg P.O. or P.R. t.i.d. after meals. Maximum single or daily dose is 2 g.
*Children:* 8 mg/kg P.O. t.i.d. Maximum dosage is 500 mg t.i.d.

➤ **Insomnia**
*Adults:* 500 mg to 1 g P.O. or 0.65 to 1.3 g P.R. 15 to 30 minutes before bedtime. Maximum daily dose is 2 g.
*Children:* 50 mg/kg P.O. or 325 mg/18 kg P.R. 15 to 30 minutes before bedtime. Maximum single dose is 1 g.

➤ **Preoperatively to produce sedation and relieve anxiety**
*Adults:* 500 mg to 1 g P.O. 30 minutes before surgery.
➤ **Alcohol withdrawal**
*Adults:* 500 mg to 1 g P.O. or P.R. every 6 hours p.r.n. Maximum single or daily dose is 2 g.
➤ **Premedication for EEG**
*Children:* 20 to 25 mg/kg P.O. or P.R. up to 500 mg/single dose. May give divided doses.

## ADMINISTRATION

**P.O.**
- Give drug after meals.
- Give capsule with full glass of water or juice, and have patient swallow capsule whole.
- To minimize unpleasant taste and stomach irritation, dilute syrup or give with liquid such as ½ glass water, fruit juice, or ginger ale.
- Store capsules or liquid in dark container.

**Rectal**
- Refrigerate suppositories at least 2 hours before intended use.
- Store suppositories in refrigerator.

## ACTION

Unknown. Sedative effects may be caused by drug's main metabolite, trichloroethanol.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30 min | Unknown | 4–8 hr |
| P.R. | Unknown | Unknown | 4–8 hr |

*Half-life:* 8 to 10 hours for trichloroethanol.

## ADVERSE REACTIONS

**CNS:** drowsiness, nightmares, dizziness, ataxia, paradoxical excitement, hangover, somnolence, disorientation, delirium, lightheadedness, hallucinations, confusion, somnambulism, vertigo, malaise, physical and psychological dependence.
**GI:** *nausea, vomiting, diarrhea,* flatulence.
**Hematologic:** eosinophilia, ***leukopenia.***
**Other:** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *CNS depressants including opioid analgesics:* May cause excessive CNS depression or vasodilation reaction. Use together cautiously.
*Furosemide I.V:* May cause sweating, flushes, variable blood pressure, nausea, and uneasiness. Use together cautiously or use a different hypnotic drug.
*Oral anticoagulants:* May increase risk of bleeding. Monitor patient closely.
*Phenytoin:* May decrease phenytoin level. Monitor patient closely.
**Drug-lifestyle.** *Alcohol use:* May react synergistically, increasing CNS depression or, rarely, may produce a disulfiram-like reaction. Strongly discourage alcohol use with these drugs.

## EFFECTS ON LAB TEST RESULTS

- May increase eosinophil count.
- May decrease WBC count.
- May cause false-positive results in urine glucose tests that use cupric sulfate, such as Benedict's reagent, and in phentolamine tests.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with hepatic or renal impairment.
- Oral administration is contraindicated in patients with gastric disorders.

***Alert:*** Do not use when less potentially dangerous agents would be effective.
- Use with caution in patients with severe cardiac disease.
- Use cautiously in patients with mental depression, suicidal tendencies, or history of drug abuse.
- Some products may contain tartrazine; use cautiously in patients with aspirin sensitivity.

***Overdose S&S:*** Miosis, areflexia, muscle flaccidity, coma, hypothermia, respiratory depression, hypotension, cardiac arrhythmia, vomiting, esophageal stricture, gastric necrosis and perforation, GI bleeding, hepatic and renal failure.

## NURSING CONSIDERATIONS

***Alert:*** Note two strengths of oral liquid form. Double-check dose, especially when giving to children. Fatal overdoses have occurred.
- Take precautions to prevent hoarding or overdosing by patients who are depressed,

suicidal, or drug dependent or who have history of drug abuse.
- Long-term use isn't recommended; drug loses its effectiveness in promoting sleep after 14 days of continued use. Long-term use may cause drug dependence, and patient may experience withdrawal symptoms if drug is suddenly stopped.
- Monitor BUN level; large doses may raise BUN level.
- Don't give drug for 48 hours before fluorometric test.

### PATIENT TEACHING
- Instruct patient to take capsule with a full glass of water or juice and to swallow capsule whole.
- Tell patient to avoid alcohol during drug therapy.
- Caution patient to avoid performing activities that require mental alertness or physical coordination.
- Advise patient to store drug in dark container and to store suppositories in refrigerator.

**SAFETY ALERT!**

## chlorambucil
klor-AM-byoo-sill

Leukeran

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Nitrogen mustard
*Pregnancy risk category D*

### AVAILABLE FORMS
*Tablets:* 2 mg

### INDICATIONS & DOSAGES
➤ **Chronic lymphocytic leukemia; malignant lymphomas, including lymphosarcoma, giant follicular lymphoma, and Hodgkin lymphoma**
*Adults:* For initiation of therapy or for short courses of treatment, give 0.1 to 0.2 mg/kg P.O. daily for 3 to 6 weeks (usually 4 to 10 mg daily). Maintenance dosage shouldn't exceed 0.1 mg/kg/day and may be as low as 0.03 mg/kg/day. Adjust dosage according to patient response; reduce when WBC count falls abruptly. For pulse dosage, give initial single dose of 0.4 mg/kg. Then give doses at biweekly or monthly intervals, increasing by 0.1-mg/kg increments until lymphocytosis is controlled or toxicity occurs.
***Adjust-a-dose:*** Reduce first dose if given within 4 weeks after a full course of radiation therapy or myelosuppressive drugs, or if pretreatment leukocyte or platelet counts are depressed from bone marrow disease. For patients with severe renal impairment, adjust dosage as follows: If creatinine clearance is 10 to 50 ml/minute, give 75% of usual dose; if creatinine clearance is less than 10 ml/minute, give 50% of usual dose; for patients receiving hemodialysis or peritoneal dialysis, give 50% of usual dose (no supplemental dosing is needed).

### ADMINISTRATION
**P.O.**
- Chlorambucil is considered a cytotoxic agent. Follow safe-handling procedures when preparing, administering, or dispensing it.
- For initial therapy and short courses of therapy, give entire daily dose at one time.
- Give drug on empty stomach, 1 hour before or 2 hours after meals.

### ACTION
Cross-links strands of cellular DNA and interferes with RNA transcription, causing an imbalance of growth that leads to cell death. Not specific to cell cycle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Unknown |

*Half-life:* 2 hours for parent compound; 2½ hours for phenylacetic acid metabolite.

### ADVERSE REACTIONS
**CNS:** tremors, muscle twitching, myoclonia, confusion, agitation, ataxia, flaccid paresis, hallucinations, **SEIZURES,** peripheral neuropathy.
**GU:** sterile cystitis, infertility.
**Hematologic: BONE MARROW SUPPRESSION, LEUKOPENIA, NEUTROPENIA, THROMBOCYTOPENIA, PANCYTOPENIA,** anemia.
**Hepatic: HEPATOTOXICITY,** jaundice.
**Respiratory: PULMONARY FIBROSIS,** interstitial pneumonia.

**Skin:** urticaria, angioneurotic edema, skin hypersensitivity.
**Other:** fever, **SECONDARY MALIGNANCIES.**

## INTERACTIONS
None reported.

## EFFECTS ON LAB TEST RESULTS
- May increase alkaline phosphatase, AST, and blood and urine uric acid levels. May decrease hemoglobin level. May decrease granulocyte, neutrophil, platelet, RBC, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients with hypersensitivity or resistance to previous therapy. Patients hypersensitive to other alkylating drugs may also be hypersensitive to this drug.
- Use cautiously in patients with history of head trauma or seizures and in patients receiving other drugs that lower the seizure threshold.
- Use cautiously within 4 weeks of a full course of radiation or chemotherapy.

***Overdose S&S:*** Reversible pancytopenia, neurologic toxicity ranging from agitation and ataxia to multiple generalized tonic-clonic seizures.

## NURSING CONSIDERATIONS
**Black Box Warning** Chlorambucil can severely suppress bone marrow function. It is a carcinogen in humans and is probably mutagenic and teratogenic in humans. It also produces human infertility. ■
- Monitor CBC with differential.
- Monitor patient for neutropenia, which may not appear until after the third week of treatment. The absolute neutrophil count (ANC) may continue to decrease for up to 10 days after treatment ends.
- Use the ANC to calculate the patient's immunosuppression.
- Monitor uric acid level. To prevent hyperuricemia with resulting uric acid nephropathy, allopurinol may be used with adequate hydration.
- If WBC count falls below 2,000/mm$^3$ or granulocyte count falls below 1,000/mm$^3$, follow institutional policy for infection control in immunocompromised patients. Patients may receive injections of WBC colony-stimulating factor to increase WBC count recovery.
- Therapeutic effects are frequently accompanied by toxicity.
- To prevent bleeding, avoid all I.M. injections when platelet count is below 50,000/mm$^3$.
- Anticipate blood transfusions during treatment because of cumulative anemia. Patient may receive injections of RBC colony-stimulating factor to promote RBC production and decrease need for blood transfusions.
- ***Look alike–sound alike:*** Don't confuse Leukeran with Alkeran.

## PATIENT TEACHING
- Advise patient to watch for signs of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell patient to take temperature daily.
- Instruct patient to avoid OTC products containing aspirin and NSAIDs.
- Advise women to stop breast-feeding during therapy because of risk of toxicity to infant.
- Advise women of childbearing age to avoid becoming pregnant during therapy and to notify prescriber immediately if pregnancy is suspected.

# chloramphenicol sodium succinate
klor-am-FEN-i-kole

Pentamycetin†

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Dichloroacetic acid derivative
*Pregnancy risk category C*

## AVAILABLE FORMS
*Injection:* 1-g vial

## INDICATIONS & DOSAGES
➤ ***Haemophilus influenzae*** **meningitis, acute *Salmonella typhi* infection, and meningitis, bacteremia, or other severe**

**infections caused by sensitive *Salmonella* species, rickettsia, lymphogranuloma, psittacosis, or various sensitive gram-negative organisms**

*Adults:* 50 to 100 mg/kg I.V. daily, divided every 6 hours. Maximum dose is 100 mg/kg daily.

*Full-term infants older than age 2 weeks with normal metabolic processes:* Up to 50 mg/kg I.V. daily, divided every 6 hours. May use up to 100 mg/kg/day in four divided doses for meningitis.

*Premature infants, neonates age 2 weeks and younger, and children and infants with immature metabolic processes:* 25 mg/kg I.V. once daily.

***Adjust-a-dose:*** For patients with renal or hepatic impairment, excessive blood levels may result from administration of the recommended dose. Determine drug blood concentration at appropriate intervals and adjust dosage accordingly.

## ADMINISTRATION

### I.V.

▼ Reconstitute 1-g vial of powder for injection with 10 ml of sterile water for injection to yield 100 mg/ml.
▼ Give slowly over at least 1 minute.
▼ Check injection site daily for phlebitis and irritation.
▼ Solution is stable for 30 days at room temperature, but you should refrigerate it.
▼ Don't use cloudy solution.
▼ Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
▼ **Incompatibilities:** Chlorpromazine, fluconazole, glycopyrrolate, hydroxyzine, metoclopramide, polymyxin B sulfate, prochlorperazine, promethazine, vancomycin.

## ACTION

Inhibits bacterial protein synthesis by binding to the 50S subunit of the ribosome; bacteriostatic.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | 1–3 hr | Unknown |

*Half-life:* 1½ to 4½ hours.

## ADVERSE REACTIONS

**CNS:** confusion, delirium, headache, mild depression, optic and peripheral neuritis with prolonged therapy.
**EENT:** decreased visual acuity, optic neuritis in patients with cystic fibrosis.
**GI:** diarrhea, enterocolitis, glossitis, nausea, vomiting, stomatitis.
**Hematologic:** ***aplastic anemia, granulocytopenia, hypoplastic anemia, pancytopenia, thrombocytopenia.***
**Hepatic:** jaundice.
**Other:** ***anaphylaxis, gray syndrome in neonates,*** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Anticoagulants, barbiturates, hydantoins, iron salts, sulfonylureas:* May increase levels of these drugs. Monitor patient for toxicity.

*Penicillins:* May have synergistic or antagonistic effects. Monitor patient for change in effectiveness.

*Rifampin:* May reduce chloramphenicol level. Monitor patient for changes in effectiveness.

*Vitamin $B_{12}$:* May decrease response of vitamin $B_{12}$ in patients with pernicious anemia. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

● May decrease hemoglobin level.
● May decrease granulocyte and platelet counts.
● May falsely elevate urine PABA levels if given during a bentiromide test for pancreatic function. May cause false-positive results in urine glucose tests that use cupric sulfate (Clinitest).

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug.
**Black Box Warning** Drug has been reported to cause aplastic anemia and other serious and fatal blood dyscrasias. Use for serious infections only. To facilitate appropriate studies and observation during therapy, it's best if patients are hospitalized. ■
● Use cautiously in patients with impaired hepatic or renal function, acute intermittent porphyria, and G6PD deficiency.

• Use cautiously in those taking other drugs that cause bone marrow suppression or blood disorders.
**Alert:** Use cautiously in premature infants and neonates because potentially fatal gray syndrome may occur. Symptoms include abdominal distention, gray cyanosis, vasomotor collapse, respiratory distress, and death within a few hours of symptom onset.
• Drug may be toxic to fetus. Give during pregnancy only if potential benefit justifies potential risk to fetus. Consider advising breast-feeding women to temporarily discontinue breast-feeding.

## NURSING CONSIDERATIONS

• Obtain drug level measurement; maintain peak level of 10 to 20 mcg/ml and trough level of 5 to 10 mcg/ml.
• Monitor CBC, iron level, and platelet and reticulocyte counts before and every 2 days during therapy. Stop drug and notify prescriber immediately if anemia, reticulocytopenia, leukopenia, or thrombocytopenia develops.
• Monitor patient for signs and symptoms of superinfection.

## PATIENT TEACHING

• Instruct patient to notify prescriber if adverse reactions occur, especially nausea, vomiting, diarrhea, fever, confusion, sore throat, or mouth sores.
• Tell patient receiving drug I.V. to report discomfort at I.V. insertion site.
• Instruct patient to report signs and symptoms of superinfection.

**SAFETY ALERT!**

# chlordiazepoxide hydrochloride

klor-dye-az-e-POX-ide

Librium

*Therapeutic class:* Anxiolytic
*Pharmacologic class:* Benzodiazepine
*Pregnancy risk category D*
*Controlled substance schedule IV*

## AVAILABLE FORMS

*Capsules:* 5 mg, 10 mg, 25 mg

## INDICATIONS & DOSAGES

➤ **Mild to moderate anxiety**
*Adults:* 5 to 10 mg P.O. t.i.d. or q.i.d.
*Children older than age 6:* 5 mg P.O. b.i.d. to q.i.d. Maximum, 10 mg P.O. b.i.d. or t.i.d.
➤ **Severe anxiety**
*Adults:* 20 to 25 mg P.O. t.i.d. or q.i.d.
➤ **Withdrawal symptoms of acute alcoholism**
*Adults:* 50 to 100 mg P.O. Repeat as needed, up to 300 mg daily.
➤ **Preoperative apprehension and anxiety**
*Adults:* 5 to 10 mg P.O. t.i.d. or q.i.d. on day before surgery.
**Adjust-a-dose:** In elderly or debilitated patients give 5 mg P.O. b.i.d. to q.i.d. Use the smallest effective dose to prevent oversedation or ataxia.

## ADMINISTRATION

**P.O.**
**Alert:** 5-mg and 25-mg capsules may look similar in color through the packaging. Verify contents and read label carefully.

## ACTION

A benzodiazepine that may potentiate the effects of GABA, depress the CNS, and suppress the spread of seizure activity.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | ½–4 hr | Unknown |

*Half-life:* 5 to 30 hours.

## ADVERSE REACTIONS

**CNS:** *drowsiness, lethargy,* ataxia, confusion, extrapyramidal reactions, minor changes in EEG patterns.
**CV:** edema.
**GI:** nausea, constipation.
**GU:** menstrual irregularities.
**Hematologic:** ***agranulocytosis.***
**Hepatic:** jaundice.
**Skin:** *swelling and pain at injection site,* skin eruptions.
**Other:** altered libido.

## INTERACTIONS

**Drug-drug.** *Cimetidine:* May decrease chlordiazepoxide clearance and increase risk of adverse reactions. Monitor patient carefully.

*CNS depressants:* May increase CNS depression. Use together cautiously.
*Digoxin:* May increase digoxin level and risk of toxicity. Monitor patient and digoxin level closely.
*Disulfiram:* May decrease clearance and increase half-life of chlordiazepoxide. Monitor patient for enhanced effects. Consider dosage adjustment.
*Fluconazole, itraconazole, ketoconazole, miconazole:* May increase and prolong chlordiazepoxide levels, CNS depression, and psychomotor impairment. Avoid using together.
*Levodopa:* May decrease control of parkinsonian symptoms in patients with Parkinson disease. Use together cautiously.
**Drug-herb.** *Kava:* May increase sedation. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May cause additive CNS effects. Discourage use together.
*Smoking:* May decrease effectiveness of drug. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

- May increase liver function test values. May decrease granulocyte count.
- May cause a false-positive pregnancy test result. May alter urinary 17-ketosteroid (Zimmerman reaction), urine alkaloid (Frings thin-layer chromatography method), and urinary glucose determinations (with Chemstrip uG and Diastix).

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in pregnant women, especially in first trimester.
- Use cautiously in elderly patients and in patients with mental depression, history of substance abuse, porphyria, or hepatic or renal disease.

***Overdose S&S:*** Somnolence, confusion, coma, diminished reflexes.

## NURSING CONSIDERATIONS

- In patients receiving repeated or prolonged therapy, monitor hepatic, renal, and hematopoietic function periodically.
- Watch for paradoxical reaction in psychiatric patients and hyperactive, aggressive children.

***Alert:*** Use of this drug may lead to abuse and addiction. Don't withdraw drug abruptly after long-term use because withdrawal symptoms may occur.
- ***Look alike–sound alike:*** Don't confuse Librium with Librax.

## PATIENT TEACHING

- Warn patient to avoid hazardous activities that require alertness and coordination until effects of drug are known.
- Tell patient to avoid use of alcohol while taking drug.
- Notify patient that smoking may decrease drug's effectiveness.
- Warn patient drug may cause psychological and physical dependence. Tell patient not to increase dose or abruptly stop the drug because withdrawal symptoms may occur.
- Warn women to avoid use during pregnancy.

# chloroquine phosphate

KLO-ro-kwin

Aralen

*Therapeutic class:* Antimalarial
*Pharmacologic class:* Aminoquinoline
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 250 mg (equivalent to 150 mg base), 500 mg (equivalent to 300 mg base)

## INDICATIONS & DOSAGES

**Black Box Warning** Prescribers should be completely familiar with this drug before prescribing. ■

➤ **Acute malarial attacks caused by *Plasmodium vivax, P. malariae, P. ovale,* and susceptible strains of *P. falciparum***
*Adults:* Initially, 600 mg base P.O.; then 300 mg base at 6, 24, and 48 hours.
*Children:* Initially, 10 mg/kg base P.O.; then 5 mg/kg base at 6, 24, and 48 hours. Don't exceed adult dose.

➤ **To prevent malaria**
*Adults:* 300 mg base P.O. once weekly on the same day each week, for 1 to 2 weeks before entering a malaria-endemic area

and continued for 8 weeks after leaving the area. If treatment begins after exposure, give 600 mg base P.O. initially, in two divided doses 6 hours apart, followed by the usual dosing regimen.
*Children:* 5 mg/kg base P.O. once weekly on the same day each week, for 1 to 2 weeks before entering a malaria-endemic area and continued for 4 to 8 weeks after leaving the area. Don't exceed 300 mg. If treatment begins after exposure, give 10 mg/kg base P.O. initially, in two divided doses 6 hours apart, followed by the usual dosing regimen.
➤ **Extraintestinal amebiasis**
*Adults:* 600 mg base P.O. once daily for 2 days; then 300 mg base daily for 2 to 3 weeks. Treatment is usually combined with an intestinal amebicide.

## ADMINISTRATION

**P.O.**
***Alert:*** Drug dosage may be discussed in "mg" or "mg base"; be aware of the difference.
• To improve compliance when drug is used for prevention, advise patient to take drug immediately before or after a meal on the same day each week.

## ACTION

May bind to and alter the properties of DNA in susceptible parasites.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–3 hr | Unknown |

*Half-life:* 1 to 2 months.

## ADVERSE REACTIONS

**CNS:** ***seizures,*** mild and transient headache, psychic stimulation, neuropathy.
**CV:** hypotension, ECG changes.
**EENT:** blurred vision, difficulty in focusing, reversible corneal changes, typically irreversible, sometimes progressive or delayed retinal changes such as narrowing of arterioles, macular lesions, pallor of optic disk, optic atrophy, patchy retinal pigmentation, typically leading to blindness, ototoxicity, nerve deafness, vertigo, tinnitus.
**GI:** anorexia, abdominal cramps, diarrhea, nausea, vomiting.
**Hematologic:** ***agranulocytosis, aplastic anemia, thrombocytopenia,*** hemolytic anemia.
**Skin:** pruritus, lichen planus eruptions, skin and mucosal pigmentary changes, pleomorphic skin eruptions.

## INTERACTIONS

**Drug-drug.** *Aluminum salts (kaolin), magnesium:* May decrease GI absorption. Separate dose times.
*Cimetidine:* May decrease hepatic metabolism of chloroquine. Monitor patient for toxicity.
**Drug-lifestyle.** *Sun exposure:* May worsen drug-induced dermatoses. Advise patient to avoid excessive sun exposure.

## EFFECTS ON LAB TEST RESULTS

• May decrease hemoglobin level.
• May decrease granulocyte and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug and in those with retinal or visual field changes or porphyria.
• Use cautiously in patients with severe GI, neurologic, or blood disorders; hepatic disease or alcoholism; or G6PD deficiency or psoriasis.
***Overdose S&S:*** Headache, drowsiness, visual disturbances, nausea, vomiting, cardiovascular collapse, seizures, sudden and early respiratory and cardiac arrest; atrial standstill, nodal rhythm, prolonged intraventricular conduction time, progressive bradycardia leading to ventricular fibrillation or arrest.

## NURSING CONSIDERATIONS

• Ensure that baseline and periodic ophthalmic examinations are performed. Check periodically for ocular muscle weakness after long-term use.
• Make sure patient is tested with an audiometer before, during, and after therapy, especially if therapy is long-term.
• Monitor CBC and liver function studies periodically during long-term therapy. If a severe blood disorder—not caused by the disease—develops, drug may need to be stopped.

**Alert:** Monitor patient for overdose, which can quickly lead to toxic symptoms. Children are extremely susceptible to toxicity; avoid long-term treatment.

### PATIENT TEACHING

- To improve compliance when using drug for prevention, advise patient to take drug immediately before or after a meal on the same day each week.
- Instruct patient to avoid excessive sun exposure to prevent worsening of drug-induced dermatoses.
- Tell patient to report adverse reactions promptly, especially blurred vision, increased sensitivity to light, tinnitus, hearing loss, or muscle weakness.
- Instruct patient to keep drug out of reach of children. Overdose may be fatal.

## chlorpheniramine maleate

klor-fen-IR-a-meen

Aller-Chlor ◇*, Allergy ◇, Chlo-Amine ◇, Chlor-Trimeton Allergy 8 Hour ◇, Chlor-Trimeton Allergy 12 Hour ◇, Pediox-S, QDALL AR

*Therapeutic class:* Antihistamine
*Pharmacologic class:* Alkylamine
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules (sustained-release)* ◇*:* 8 mg, 12 mg
*Suspension:* 4 mg/5 ml
*Syrup* ◇*:* 2 mg/5 ml*
*Tablets* ◇*:* 4 mg
*Tablets (chewable)* ◇*:* 2 mg
*Tablets (extended-release)* ◇*:* 8 mg, 12 mg, 16 mg

### INDICATIONS & DOSAGES

➤ **Allergic rhinitis**

*Adults and children age 12 and older:* 4 mg P.O. every 4 to 6 hours, not to exceed 24 mg daily. Or, 8 to 12 mg timed-release P.O. every 8 to 12 hours, not to exceed 24 mg daily. Or, 16 mg timed-release P.O. once daily.

*Children ages 6 to 12:* 2 mg P.O. every 4 to 6 hours, not to exceed 12 mg daily. Or, 8 mg timed-release P.O. at bedtime.

### ADMINISTRATION

**P.O.**

- May be given without regard for food.
- Give extended-release tablets whole and not crushed or divided.
- Measure and give syrup or suspension using dosing syringe, dosing spoon, or dosing cup.

### ACTION

Competes with histamine for $H_1$-receptor sites on effector cells. Drug prevents, but doesn't reverse, histamine-mediated responses.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 15–60 min | 2–6 hr | 24 hr |

*Half-life:* Adults with normal renal and hepatic function, 12 to 43 hours; children with normal renal and hepatic function, 9½ to 13 hours; chronic renal failure on hemodialysis, 11½ to 13¾ days.

### ADVERSE REACTIONS

**CNS:** *drowsiness, stimulation,* sedation, excitability in children.
**CV:** hypotension, palpitations, weak pulse.
**GI:** *dry mouth,* epigastric distress.
**GU:** urine retention.
**Respiratory:** thick bronchial secretions.
**Skin:** rash, urticaria, pallor.

### INTERACTIONS

**Drug-drug.** *CNS depressants:* May increase sedation. Use together cautiously.
*MAO inhibitors:* May increase anticholinergic effects. Avoid using together.
**Drug-lifestyle.** *Alcohol use:* May increase CNS depression. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

- May prevent, reduce, or mask positive result in diagnostic skin test.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients having acute asthmatic attacks and in those with angle-closure glaucoma, symptomatic prostatic hyperplasia, pyloroduodenal obstruction, or bladder neck obstruction.

● Contraindicated in breast-feeding women and in patients taking MAO inhibitors.
● Use cautiously in elderly patients and in those with increased intraocular pressure, hyperthyroidism, hypertension, bronchial asthma, urine retention, prostatic hyperplasia, stenosing peptic ulcerations, and CV, liver, or renal disease.
⚠ ***Overdose S&S:*** CNS depression or stimulation, tinnitus, blurred vision, dizziness, ataxia, hypotension, dry mouth, fixed dilated pupils, flushing, hypothermia, GI symptoms.

## NURSING CONSIDERATIONS

● Stop drug 4 days before diagnostic skin testing because antihistamines can prevent, reduce, or mask positive skin test response.

## PATIENT TEACHING

● Warn patient to avoid alcohol and hazardous activities that require alertness until CNS effects of drug are known.
● Inform patient that sugarless gum, hard candy, or ice chips may relieve dry mouth.
● Instruct patient to notify prescriber if tolerance develops because a different antihistamine may need to be prescribed.
● Advise patient that extended-release tablets should be swallowed whole and not crushed, chewed, or divided.
● Advise patient or caregiver to measure and give oral syrup or suspension by dosing syringe, dosing spoon, or dosing cup for accuracy.

# chlorproMAZINE hydrochloride

klor-PROE-ma-zeen

*Therapeutic class:* Antipsychotic
*Pharmacologic class:* Phenothiazine
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 25 mg/ml
*Tablets:* 10 mg, 25 mg, 50 mg, 100 mg, 200 mg

## INDICATIONS & DOSAGES

➤ **Psychosis, mania**

*Adults and children older than age 12:* For hospitalized patients with acute disease, 25 mg I.M.; may give an additional 25 to 50 mg I.M. in 1 hour if needed. Increase over several days to 400 mg every 4 to 6 hours. Switch to oral therapy as soon as possible. Or, 25 mg P.O. t.i.d. initially; then gradually increase to 400 mg daily in divided doses. For outpatients, 30 to 75 mg daily in two to four divided doses. Increase dosage by 20 to 50 mg twice weekly until symptoms are controlled.

➤ **Nausea and vomiting**

*Adults and children older than age 12:* 10 to 25 mg P.O. every 4 to 6 hours, p.r.n. Or, 25 mg I.M. initially. If no hypotension occurs, 25 to 50 mg I.M. every 3 to 4 hours may be given, p.r.n., until vomiting stops.
*Children age 6 months to 12 years:* 0.55 mg/kg P.O. every 4 to 6 hours or I.M. every 6 to 8 hours. Maximum I.M. dose in children younger than age 5 or who weigh less than 23 kg (50 lb) is 40 mg. Maximum I.M. dose in children ages 5 to 12 or who weigh 23 to 45 kg (50 to 100 lb) is 75 mg.

➤ **Acute intermittent porphyria, intractable hiccups**

*Adults and children older than age 12:* 25 to 50 mg P.O. t.i.d. or q.i.d. If symptoms persist for 2 to 3 days, 25 to 50 mg I.M. For hiccups, if symptoms still persist, 25 to 50 mg diluted in 500 to 1,000 ml of normal saline solution and infused slowly with patient in supine position.

➤ **Tetanus**

*Adults and children older than age 12:* 25 to 50 mg I.V. or I.M. t.i.d. or q.i.d.
*Children age 6 months to 12 years:* 0.55 mg/kg I.M. or I.V. every 6 to 8 hours. Maximum parenteral dosage in children who weigh less than 23 kg (50 lb) is 40 mg daily; for children who weigh 23 to 45 kg (50 to 100 lb), 75 mg, except in severe cases. If giving I.V., dilute to 1 mg/ml with normal saline and give at a rate of 0.5 mg/minute.

➤ **Behavioral disorders; hyperactivity**

*Children older than 6 months to 12 years:* For outpatients: 0.55 mg/kg P.O. every 4 to 6 hours or I.M. every 6 to 8 hours, as needed. For hospitalized patients, start with low oral doses and increase gradually. In severe behavior disorders, 50 to 100 mg P.O. daily or, in older children, 200 mg/day or more P.O. may be necessary. There is

little evidence that improvement in severely disturbed mentally retarded patients is enhanced by doses beyond 500 mg/day. In hospitalized patients age 5 or younger or weighing less than 23 kg (50 lb), don't exceed 40 mg/day I.M. In children ages 5 to 12 weighing 23 to 45 kg (50 to 100 lb), don't exceed 75 mg/day I.M., except in unmanageable cases.

➤ **Surgery**

*Adults and children older than age 12:* Preoperatively, 25 to 50 mg P.O. 2 to 3 hours before surgery or 12.5 to 25 mg I.M. 1 to 2 hours before surgery; during surgery, 12.5 mg I.M., repeated in 30 minutes, if needed, or fractional 2-mg doses I.V. at 2-minute intervals to maximum dose of 25 mg.

*Children age 6 months to 12 years:* Preoperatively, 0.55 mg/kg P.O. 2 to 3 hours before surgery or I.M. 1 to 2 hours before surgery. During surgery, 0.25 mg/kg I.M., repeated in 30 minutes if needed, or fractional 1-mg doses I.V. at 2-minute intervals to maximum of 0.25 mg/kg. May repeat fractional I.V. regimen in 30 minutes if needed.

*Elderly patients:* Lower dosages are sufficient; dosage increments should be more gradual than in adults.

## ADMINISTRATION

**P.O.**

● Give drug without regard to food.

**I.V.**

▼ Wear gloves when preparing solutions and avoid contact with skin and clothing. Parenteral forms can cause contact dermatitis.

▼ Drug is compatible with most common I.V. solutions, including $D_5W$, Ringer's injection, lactated Ringer's injection, and normal saline solution for injection.

▼ For direct injection, dilute with normal saline solution for injection and give into a large vein or through the tubing of a free-flowing I.V. solution.

▼ Don't exceed 1 mg/minute for adults or 0.5 mg/minute for children.

▼ For intermittent infusion, dilute with 50 or 100 ml of a compatible solution.

▼ Infuse over 30 minutes.

▼ **Incompatibilities:** Aminophylline, amphotericin B, ampicillin, chloramphenicol sodium succinate, chlorothiazide, cimetidine, dimenhydrinate, furosemide, heparin sodium, linezolid, melphalan, methohexital, paclitaxel, penicillin, pentobarbital, phenobarbital, solutions with a pH of 4 to 5, thiopental.

**I.M.**

● Wear gloves when preparing solutions and avoid contact with skin and clothing. Parenteral forms can cause contact dermatitis.

● Slight yellowing of injection is common and doesn't affect potency. Discard markedly discolored solutions.

● Monitor blood pressure before and after I.M. administration; keep patient supine for 1 hour afterward and have him get up slowly.

● Give deep I.M. only in upper outer quadrant of buttocks. Consider giving injection by Z-track method. Massage slowly afterward to prevent sterile abscess. Injection stings. Rotate injection sites.

## ACTION

A piperidine phenothiazine that may block postsynaptic dopamine receptors in the brain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30–60 min | Unknown | 4–6 hr |
| P.O. (extended) | 30–60 min | Unknown | 10–12 hr |
| I.V., I.M. | Unknown | Unknown | Unknown |

*Half-life:* 20 to 24 hours.

## ADVERSE REACTIONS

**CNS:** *extrapyramidal reactions, sedation, tardive dyskinesia, pseudoparkinsonism,* ***neuroleptic malignant syndrome, seizures,*** dizziness, drowsiness.

**CV:** *orthostatic hypotension,* tachycardia, quinidine-like ECG effects.

**EENT:** ocular changes, blurred vision, nasal congestion.

**GI:** *dry mouth, constipation,* nausea.

**GU:** *urine retention,* menstrual irregularities, inhibited ejaculation, priapism.

**Hematologic:** ***leukopenia, agranulocytosis, aplastic anemia, thrombocytopenia,*** eosinophilia, hemolytic anemia.

**Hepatic:** jaundice.

**Skin:** *mild photosensitivity reactions, pain at I.M. injection site,* allergic reactions, sterile abscess, skin pigmentation changes.
**Other:** gynecomastia, lactation, galactorrhea.

## INTERACTIONS

**Drug-drug.** *Antacids:* May inhibit absorption of oral phenothiazines. Separate antacid and phenothiazine doses by at least 2 hours.
*Anticholinergics such as tricyclic antidepressants, antiparkinsonians:* May increase anticholinergic activity, aggravated parkinsonian symptoms. Use together cautiously.
*Anticonvulsants:* May lower seizure threshold. Monitor patient closely.
*Barbiturates, lithium:* May decrease phenothiazine effect. Monitor patient.
*Centrally acting antihypertensives:* May decrease antihypertensive effect. Monitor blood pressure.
*CNS depressants:* May increase CNS depression. Use together cautiously.
*Electroconvulsive therapy, insulin:* May cause severe reactions. Monitor patient closely.
*Lithium:* May increase neurologic effects. Monitor patient closely.
*Meperidine:* May cause excessive sedation and hypotension. Don't use together.
*Propranolol:* May increase levels of both propranolol and chlorpromazine. Monitor patient closely.
*Warfarin:* May decrease effect of oral anticoagulants. Monitor PT and INR.
**Drug-herb.** *St. John's wort:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.
**Drug-lifestyle.** *Alcohol use:* May increase CNS depression, particularly psychomotor skills. Strongly discourage alcohol use.
*Sun exposure:* May increase risk of photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level and hematocrit.
- May increase liver function test values and eosinophil count. May decrease granulocyte, platelet, and WBC counts.
- May cause false-positive results for urinary porphyrin, urobilinogen, amylase, and 5-hydroxyindoleacetic acid tests and for urine pregnancy tests that use human chorionic gonadotropin.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug; in those with CNS depression, bone marrow suppression, or subcortical damage, and in those in coma.
- Use cautiously in elderly or debilitated patients and in patients with hepatic or renal disease, severe CV disease (may suddenly decrease blood pressure), respiratory disorders, hypocalcemia, glaucoma, or prostatic hyperplasia. Also use cautiously in those exposed to extreme heat or cold (including antipyretic therapy) or organophosphate insecticides.
- Use cautiously in acutely ill or dehydrated children.

***Overdose S&S:*** CNS depression, somnolence, coma, hypotension, extrapyramidal symptoms, agitation, restlessness, seizures, fever, dry mouth, ileus, ECG changes, cardiac arrhythmias.

## NURSING CONSIDERATIONS

- Obtain baseline blood pressure measurements before therapy, and monitor regularly. Watch for orthostatic hypotension, especially with parenteral administration.
- Monitor patient for tardive dyskinesia, which may occur after prolonged use. It may not appear until months or years later and may disappear spontaneously or persist for life, despite stopping drug.
- After abrupt withdrawal of long-term therapy, gastritis, nausea, vomiting, dizziness, or tremor may occur.

***Alert:*** Watch for evidence of neuroleptic malignant syndrome (extrapyramidal effects, hyperthermia, autonomic disturbance), which is rare but usually fatal. It may not be related to length of drug use or type of neuroleptic; more than 60% of affected patients are men.
- If jaundice, symptoms of blood dyscrasia (fever, sore throat, infection, cellulitis, weakness), or persistent extrapyramidal reactions (longer than a few hours) develop, or if such reactions occur in children or pregnant women, withhold dose and notify prescriber.

• Don't withdraw drug abruptly unless required by severe adverse reactions.
***Alert:*** Elderly patients with dementia-related psychosis treated with atypical or conventional antipsychotics are at increased risk for death. Antipsychotics aren't approved for the treatment of dementia-related psychosis.
• ***Look alike–sound alike:*** Don't confuse chlorpromazine with clomipramine or with chlorpropamide, a hypoglycemic.

### PATIENT TEACHING

• Warn patient to avoid activities that require alertness or good coordination until effects of drug are known. Drowsiness and dizziness usually subside after first few weeks.
• Tell patient to avoid alcohol while taking drug.
• Have patient report signs of urine retention or constipation.
• Tell patient to use sunblock and to wear protective clothing to avoid oversensitivity to the sun. This drug is more likely to cause sun sensitivity than other drugs in its class.
• Tell patient to relieve dry mouth with sugarless gum or hard candy.
• Advise patient receiving drug by any method other than by mouth to remain lying down for 1 hour afterward and to rise slowly.

## cholestyramine

koe-LESS-tir-a-meen

Locholest, Locholest Light, Prevalite, Questran, Questran Light

*Therapeutic class:* Antilipemic
*Pharmacologic class:* Bile acid sequestrant
*Pregnancy risk category C*

### AVAILABLE FORMS

*Powder:* 378-g cans, 9-g single-dose packets; each scoop of powder or single-dose packet contains 4 g of cholestyramine resin

### INDICATIONS & DOSAGES

➤ **Primary hyperlipidemia or pruritus caused by partial bile obstruction, adjunct for reduction of increased cholesterol level in patients with primary hypercholesterolemia**
*Adults:* 4 g once or twice daily. Maintenance dose is 8 to 16 g daily divided into two doses. Maximum daily dose is 24 g.
*Children:* 240 mg/kg daily in two to three divided doses, not to exceed 8 g/day.

### ADMINISTRATION

**P.O.**
• Mix thoroughly with 60 to 180 ml of water or other noncarbonated beverage.
• Give drug with a meal.
• Give other drugs 1 hour before or at least 4 hours after cholestyramine to avoid impeding absorption.

### ACTION

Binds bile acids in the intestinal tract, impeding their absorption and causing their elimination in feces. In response to this bile acid depletion, LDL cholesterol levels decrease as the liver uses LDL cholesterol to replenish reduced bile acid stores.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | 2–4 wk |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CNS:** *dizziness, headache, vertigo,* anxiety, fatigue, insomnia, syncope, tinnitus.
**GI:** *abdominal discomfort, constipation, fecal impaction, nausea,* anorexia, diarrhea, flatulence, ***GI bleeding,*** hemorrhoids, steatorrhea, vomiting.
**GU:** dysuria, hematuria.
**Hematologic:** anemia, bleeding tendencies, ecchymoses.
**Metabolic:** hyperchloremic acidosis.
**Musculoskeletal:** backache, muscle and joint pains, osteoporosis.
**Skin:** *rash,* irritation of skin, tongue, and perianal area.
**Other:** *vitamin A, D, E, and K deficiencies from decreased absorption.*

### INTERACTIONS

**Drug-drug.** *Acetaminophen, beta blockers, cardiac glycosides, corticosteroids, estrogens, fat-soluble vitamins (A, D, E, and K), iron preparations, niacin, penicillin G,*

*phenobarbital, progestins, tetracycline, thiazide diuretics, thyroid hormones, warfarin and other coumarin derivatives:* May decrease absorption of these drugs. Give other drugs 1 hour before or 4 to 6 hours after cholestyramine.

### EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase and triglyceride levels. May decrease hemoglobin level and hematocrit.
- May increase PT.
- May cause abnormal results in cholecystography that uses iopanoic acid because iopanoic acid is also bound by cholestyramine.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to bile-acid sequestering resins and in those with complete biliary obstruction.
- Use cautiously in patients predisposed to constipation and in those with conditions aggravated by constipation, such as severe, symptomatic coronary artery disease.

***Overdose S&S:*** GI tract obstruction.

### NURSING CONSIDERATIONS

- Monitor cholesterol and triglyceride levels regularly during therapy.
- Monitor levels of cardiac glycosides in patients receiving cardiac glycosides and cholestyramine together. If cholestyramine therapy is stopped, adjust dosage of cardiac glycosides, if necessary, to avoid toxicity.
- Monitor bowel habits. Encourage a diet high in fiber and fluids. If severe constipation develops, decrease dosage, add a stool softener, or stop drug.
- Watch for hyperchloremic acidosis with long-term use or very high doses.
- Long-term use may lead to deficiencies of vitamins A, D, E, and K, and folic acid.
- For patients with phenylketonuria, light form contains 28.1 mg of phenylalanine per 6.4-g dose.
- ***Look alike–sound alike:*** Don't confuse Questran with Quarzan.

### PATIENT TEACHING

***Alert:*** Tell patient never to take drug in its dry form because it may irritate the esophagus or cause severe constipation.

- Tell patient to prepare drug in a large glass containing water, milk, or juice (especially pulpy fruit juice). Tell him to sprinkle powder on the surface of the beverage, let the mixture stand for a few minutes, and then stir thoroughly. Discourage mixing with carbonated beverages because of excessive foaming. After drinking preparation, patient should swirl a small additional amount of liquid in the same glass and then drink again to make sure he has taken the entire dose.
- Tell patient to avoid sipping or holding the suspension in the mouth because drug may damage tooth surfaces. Advise patient to maintain good oral hygiene.
- Advise patient to take at mealtime, if possible.
- Advise patient to take all other drugs at least 1 hour before or 4 to 6 hours after cholestyramine to avoid blocking their absorption.
- Teach patient about proper dietary management of fats. When appropriate, recommend weight control, exercise, and smoking cessation programs.
- Tell patient that drug may deplete body stores of vitamins A, D, E, and K, and folic acid. Patient should discuss need for supplements with prescriber.

## ciclesonide (inhalation)

si-CLEH-son-ide

Alvesco

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Corticosteroid
*Pregnancy risk category C*

### AVAILABLE FORMS

*Oral inhalation aerosol:* 80 mcg, 160 mcg

### INDICATIONS & DOSAGES

➤ **Preventative during asthma maintenance**

*Adults and children age 12 and older who were previously taking bronchodilators alone:* Initially, inhaled dose of 80 mcg b.i.d. to maximum of 160 mcg b.i.d.

*Adults and children age 12 and older who were previously taking inhaled*

*corticosteroids:* Initially, 80 mcg b.i.d. to maximum of 320 mcg b.i.d.
*Adults and children age 12 and older who were previously taking oral corticosteroids:* 320 mcg b.i.d.

## ADMINISTRATION

**Inhalational**

- Patient should rinse mouth after inhalation.

## ACTION

May decrease inflammation by inhibiting macrophages, eosinophils, and mediators such as leukotrienes involved in the asthmatic response.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Inhalation | Unknown | 1 hour | Unknown |

*Half-life of drug and its active metabolite:* Less than an hour and 6 to 7 hours, respectively.

## ADVERSE REACTIONS

**CNS:** *headache,* back pain.
**EENT:** *nasopharyngitis,* sinusitis, pharyngolaryngeal pain, upper respiratory tract infection, nasal congestion.
**Musculoskeletal:** arthralgia, pain in the extremities.

## INTERACTIONS

**Drug-drug.** *Ketoconazole, other inhibitors of cytochrome P450:* May increase ciclesonide level and adverse effects. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated as primary treatment of status asthmaticus or other acute asthmatic episodes, and in patients hypersensitive to drug or its components.
- Use cautiously, if at all, in patients with active or quiescent respiratory tuberculosis infection; untreated systemic fungal, bacterial, viral, or parasitic infections; or ocular herpes simplex.
- Use cautiously in pregnant and breast-feeding women.

## NURSING CONSIDERATIONS

***Alert:*** Don't use for acute bronchospasm or acute asthma.

- Assess patient for bone loss during long-term use.
- Watch for evidence of localized mouth infections, glaucoma, cataracts, and immunosuppression.
- Closely monitor children for growth suppression.
- Use drug only if benefits to mother justify risks to fetus. If a woman takes a corticosteroid during pregnancy, monitor neonate for hypoadrenalism.

## PATIENT TEACHING

- Inform patient that drug isn't indicated for the relief of acute bronchospasm.
- Instruct patient to rinse his mouth with water and spit out after inhalation.
- Advise patient to use drug at regular intervals, as directed.
- Inform patient that therapeutic results may take several weeks.
- Warn patient to avoid exposure to chickenpox, measles, or other infections, and if exposed to consult prescriber immediately.
- Instruct patient to contact prescriber if symptoms don't improve after 4 weeks of treatment or if condition worsens.
- Advise parents of child receiving long-term therapy that child should have periodic growth measurements.

# ciclesonide (intranasal)

si-CLEH-son-ide

Omnaris

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Nonhalogenated glucocorticoid
*Pregnancy risk category C*

## AVAILABLE FORMS

*Nasal spray:* 50 mcg/metered spray

## INDICATIONS & DOSAGES

➤ **Symptoms of perennial allergic rhinitis**

*Adults and children age 12 and older:* 2 sprays in each nostril once daily (200 mcg/day).

➤ **Symptoms of seasonal allergic rhinitis**
*Adults and children age 6 and older:* 2 sprays in each nostril once daily (200 mcg/day).

## ADMINISTRATION

**Intranasal**

• Before first use, gently shake container, then prime by spraying eight times. If not used for 4 consecutive days, gently shake and reprime with 1 spray or until a fine mist appears.

## ACTION

Hydrolyzed by the nasal mucosa to a biologically active metabolite with anti-inflammatory properties.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Intranasal | 1–2 days | 1–5 wk | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** headache.
**EENT:** epistaxis, nasopharyngitis, ear pain, nasal discomfort.
**Metabolic:** growth retardation.

## INTERACTIONS

**Drug-drug.** *Delavirdine:* May increase serum ciclesonide level. Use with caution. *Protease inhibitors (ritonavir):* May increase serum level and effects of ciclesonide. Use lowest effective ciclesonide dosage and monitor patient closely for Cushing syndrome.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to the drug or its components.
• Contraindicated in patients who have had recent nasal septal ulcers, nasal surgery, or nasal trauma until healing has occurred.
• Use cautiously in patients who have changed from systemic to inhaled corticosteroids; renal insufficiency, steroid withdrawal (pain, lassitude, depression) or acute worsening of symptoms may occur.
• Use cautiously in immunosuppressed patients or in those with wounds; corticosteroids suppress the immune system.
• Use cautiously in children; may cause a decline in growth rate.
• Use cautiously in breast-feeding women.
⚠ ***Overdose S&S:*** Hyperadrenocorticism.

## NURSING CONSIDERATIONS

• Monitor infants born to mothers using drug during pregnancy for hypoadrenalism.
• Monitor patients who are switched from systemic to inhaled corticosteroids for worsening of symptoms and other side effects of withdrawal.
• Monitor children for decline in growth rate; potential to regain growth after drug is stopped hasn't been studied.
• Monitor patient for nasal side effects.

## PATIENT TEACHING

• Teach patient how to use the spray properly. Refer patient to package insert.
• Instruct patient to contact his prescriber if he has no relief from symptoms after 1 week.
• Advise patient to use drug around the same time every day, as directed.
• Warn patient to avoid exposure to people with infections, such as chickenpox or measles; corticosteroids have immunosuppressant effects.
• Tell patient to discard the bottle after 120 actuations following initial priming or 4 months after removal from foil pouch, whichever occurs first.

# cidofovir

sye-DOE-fo-veer

Vistide

*Therapeutic class:* Antiviral
*Pharmacologic class:* Nucleotide analogue
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 75 mg/ml in 5-ml vial

## INDICATIONS & DOSAGES

**Black Box Warning** Cidofovir is indicated only for the treatment of cytomegalovirus (CMV) retinitis in patients with AIDS. ▮

➤ **CMV retinitis in patients with AIDS**
*Adults:* Initially, 5 mg/kg I.V. infused over 1 hour once weekly for 2 consecutive weeks; then maintenance dose of 5 mg/kg I.V. infused over 1 hour once every 2 weeks. Give probenecid and prehydration with normal saline solution I.V. simultaneously to reduce risk of nephrotoxicity.
***Adjust-a-dose:*** For patients with creatinine level of 0.3 to 0.4 mg/dl above baseline, reduce dosage to 3 mg/kg at same rate and frequency. If creatinine level reaches 0.5 mg/dl or more above baseline, or patient develops 3+ or higher proteinuria, stop drug.

## ADMINISTRATION

### I.V.

**Black Box Warning** Drug has mutagenic effects; prepare it in a class II laminar flow biological safety cabinet and wear surgical gloves and a closed-front surgical gown with knit cuffs. ▮
▼ If drug contacts skin, wash and flush thoroughly with water.
▼ Place excess drug and all materials used to prepare and give it in a leak-proof, puncture-proof container.
▼ Let drug reach room temperature before use.
▼ Using a syringe, withdraw prescribed dose and add to an I.V. bag containing 100 ml of normal saline solution.
▼ Infuse over 1 hour using an infusion pump.
▼ Because of the risk of nephrotoxicity, don't exceed recommended dosages or frequency or rate of infusion.
▼ Discard any partially used vials.
▼ Give within 24 hours of preparing. Admixture may be refrigerated at 36° to 46° F (2° to 8° C) for up to 24 hours.
**Black Box Warning** Due to increased risk of nephrotoxicity, give 1 L normal saline solution I.V. over 1- to 2-hour period, immediately before giving drug. Also give probenecid with each cidofovir infusion. ▮
▼ Compatibility of admixture with Ringer's, lactated Ringer's, and bacteriostatic solutions hasn't been evaluated.
▼ **Incompatibilities:** Other drugs or supplements.

## ACTION

Suppresses CMV replication by selective inhibition of viral DNA synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *asthenia, fever, headache,* ***seizures,*** abnormal gait, amnesia, anxiety, confusion, depression, dizziness, hallucinations, insomnia, neuropathy, paresthesia, somnolence, malaise.
**CV:** hypotension, orthostatic hypotension, pallor, syncope, tachycardia, vasodilation.
**EENT:** *ocular hypotony,* abnormal vision, amblyopia, conjunctivitis, eye disorders, iritis, pharyngitis, retinal detachment, rhinitis, sinusitis, uveitis.
**GI:** *abdominal pain, anorexia, diarrhea, nausea, vomiting,* aphthous stomatitis, colitis, constipation, dry mouth, dyspepsia, dysphagia, flatulence, gastritis, melena, mouth ulcers, oral candidiasis, rectal disorders, stomatitis, taste perversion, tongue discoloration.
**GU:** *proteinuria,* ***nephrotoxicity,*** glycosuria, hematuria, urinary incontinence, UTI.
**Hematologic:** *anemia,* ***neutropenia, thrombocytopenia.***
**Hepatic:** hepatomegaly.
**Metabolic:** fluid imbalance, hyperglycemia, hyperlipemia, hypocalcemia, hypokalemia, weight loss.
**Musculoskeletal:** arthralgia, myalgia, myasthenia, pain in back, chest, or neck.
**Respiratory:** *dyspnea,* asthma, bronchitis, coughing, hiccups, increased sputum, lung disorders, pneumonia.
**Skin:** *alopecia, rash,* acne, dry skin, pruritus, skin discoloration, sweating, urticaria.
**Other:** *chills, infections,* ***sarcoma, sepsis,*** allergic reactions, facial edema, herpes simplex.

## INTERACTIONS

**Drug-drug.** **Black Box Warning** *Nephrotoxic drugs (such as aminoglycosides, amphotericin B, foscarnet, I.V. pentamidine):* May increase nephrotoxicity. Avoid using together. ▮

### EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, BUN, creatinine, LDH, and urine protein levels. May decrease bicarbonate and hemoglobin levels.
- May decrease neutrophil and platelet counts.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, probenecid, and other sulfa drugs.

**Black Box Warning** Renal failure has occurred with as few as one or two doses of cidofovir. Contraindicated in patients receiving other drugs with nephrotoxic potential (stop such drugs at least 7 days before starting cidofovir therapy) and in those with creatinine level exceeding 1.5 mg/dl, creatinine clearance of 55 ml/minute or less, or urine protein level of 100 mg/dl or more (equivalent to 2+ proteinuria or more). ■

- Use within 1 month of placement of a ganciclovir ocular implant may cause profound hypotony.
- Safety and effectiveness in children haven't been established.
- Use cautiously in patients with renal impairment. Monitor renal function tests and patient's fluid balance.

### NURSING CONSIDERATIONS

**Black Box Warning** Safety and effectiveness of drug haven't been established for treating other CMV infections, congenital or neonatal CMV disease, or CMV disease in patients not infected with HIV. ■

**Black Box Warning** Due to increased risk of nephrotoxicity and bone marrow suppression, monitor creatinine and urine protein levels and WBC counts with differential before each dose. ■

- Drug may cause Fanconi syndrome and decreased bicarbonate level with renal tubular damage. Monitor patient closely.
- Drug may cause granulocytopenia.
- Stop zidovudine therapy or reduce dosage by 50% on the days when cidofovir is given; probenecid reduces metabolic clearance of zidovudine.

### PATIENT TEACHING

- Inform patient that drug doesn't cure CMV retinitis and that regular ophthalmologic examinations are needed.
- Alert patient taking zidovudine that he'll need to obtain dosage guidelines on days cidofovir is given.
- Tell patient that close monitoring of kidney function will be needed and that abnormalities may require a change in therapy.
- Stress importance of completing a full course of probenecid with each cidofovir dose. Tell patient to take probenecid after a meal to decrease nausea.
- Patients with AIDS should use effective contraception, especially during and for 1 month after treatment.
- Advise men to practice barrier contraception during and for 3 months after treatment.

## cilostazol

sill-AHS-tah-zoll

Pletal

*Therapeutic class:* Antiplatelet
*Pharmacologic class:* Quinolone phosphodiesterase inhibitor
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 50 mg, 100 mg

### INDICATIONS & DOSAGES

➤ **To reduce symptoms of intermittent claudication**

*Adults:* 100 mg P.O. b.i.d., at least 30 minutes before or 2 hours after breakfast and dinner.

***Adjust-a-dose:*** Decrease dose to 50 mg P.O. b.i.d. when giving with drugs that may interact to cause an increase in cilostazol level.

### ADMINISTRATION

**P.O.**

- Give drug at least 30 minutes before or 2 hours after breakfast and dinner.
- Don't give drug with grapefruit juice.

## ACTION

Thought to inhibit the enzyme phosphodiesterase III, thus inhibiting platelet aggregation and causing vasodilation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–4 hr | Unknown |

*Half-life:* 11 to 13 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness*, *headache*, vertigo.
**CV:** *palpitations*, peripheral edema, tachycardia.
**EENT:** *pharyngitis*, *rhinitis*.
**GI:** *abnormal stools*, *diarrhea*, abdominal pain, dyspepsia, flatulence, nausea.
**Hematologic:** bleeding.
**Musculoskeletal:** back pain, myalgia.
**Respiratory:** increased cough.
**Other:** *infection*.

## INTERACTIONS

**Drug-drug.** *Diltiazem:* May increase cilostazol level. Reduce cilostazol dosage to 50 mg b.i.d.
*Erythromycin, other macrolides:* May increase level of cilostazol and its metabolites. Reduce cilostazol dosage to 50 mg b.i.d.
*Omeprazole:* May increase level of cilostazol metabolite. Reduce cilostazol dosage to 50 mg b.i.d.
*Strong inhibitors of CYP3A4 (such as fluconazole, fluoxetine, fluvoxamine, itraconazole, ketoconazole, miconazole, nefazodone, sertraline):* May increase level of cilostazol and its metabolites. Reduce cilostazol dosage to 50 mg b.i.d.
**Drug-food.** *Grapefruit juice:* May increase drug level. Discourage use together.
**Drug-herb.** *Ginkgo biloba:* May prolong bleeding time. Discourage use together.
**Drug-lifestyle.** *Smoking:* May decrease drug exposure. Discourage smoking.

## EFFECTS ON LAB TEST RESULTS

- May reduce triglyceride levels. May increase HDL level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.

**Black Box Warning** Contraindicated in patients with heart failure of any severity.

- Contraindicated in patients with hemostatic disorders or active bleeding, such as bleeding peptic ulcer and intracranial bleeding.
- Use cautiously in patients with severe underlying heart disease; also use cautiously with other drugs having antiplatelet activity.
- Use cautiously in patients with severe renal impairment (creatinine clearance less than 25 ml/minute) and in those with moderate to severe hepatic impairment.

***Overdose S&S:*** Severe headache, diarrhea, hypotension, tachycardia, cardiac arrhythmias.

## NURSING CONSIDERATIONS

- Beneficial effects may not be seen for up to 12 weeks after therapy starts.

**Black Box Warning** Cilostazol and similar drugs that inhibit the enzyme phosphodiesterase decrease the likelihood of survival in patients with class III and IV heart failure.

***Alert:*** CV risk is unknown in patients who use drug on long-term basis and in those with severe underlying heart disease.

- Dosage can be reduced or stopped without such rebound effects as platelet hyperaggregation.

## PATIENT TEACHING

- Instruct patient to take drug on an empty stomach, at least 30 minutes before or 2 hours after breakfast and dinner.
- Tell patient that beneficial effect of drug on cramping pain isn't likely to be noticed for 2 to 4 weeks and that it may take as long as 12 weeks.
- Advise patient to avoid drinking grapefruit juice during drug therapy.
- Inform patient that CV risk is unknown in patients who use drug on a long-term basis and in those with severe underlying heart disease.
- Tell patient that drug may cause dizziness. Caution patient not to drive or perform other activities that require alertness until response to drug is known.

## cimetidine
sye-MET-i-deen

Acid Reducer 200 ◇, Tagamet, Tagamet HB ◇

## cimetidine hydrochloride
Tagamet

*Therapeutic class:* Antiulcer
*Pharmacologic class:* $H_2$ receptor antagonist
*Pregnancy risk category B*

### AVAILABLE FORMS
*Injection:* 300 mg/2 ml, 300 mg in 50 ml normal saline solution, 300 mg/2 ml ADD-Vantage vial
*Oral liquid:* 300 mg/5 ml*
*Tablets:* 200 mg ◇, 300 mg, 400 mg, 800 mg

### INDICATIONS & DOSAGES
➤ **Short-term treatment of duodenal ulcer; maintenance therapy**
*Adults and children age 16 and older:* 800 mg P.O. at bedtime. Or, 400 mg P.O. b.i.d. or 300 mg q.i.d. (with meals and at bedtime). Or, 200 mg t.i.d. with a 400-mg bedtime dose. Treatment lasts 4 to 6 weeks unless endoscopy shows healing. For maintenance therapy, 400 mg at bedtime. For parenteral therapy, 300 mg diluted to 20 ml total volume with normal saline solution or other compatible I.V. solution by I.V. push over at least 5 minutes every 6 to 8 hours; or 300 mg diluted in 50 ml $D_5W$ or other compatible I.V. solution by I.V. infusion over 15 to 20 minutes every 6 to 8 hours; or 300 mg I.M. every 6 to 8 hours (no dilution needed). To increase dosage, give 300-mg doses more frequently to maximum of 2,400 mg daily, as needed. Or, 900 mg/day (37.5 mg/hour) I.V. diluted in 100 to 1,000 ml of compatible solution by continuous I.V. infusion.

➤ **Active benign gastric ulceration**
*Adults:* 800 mg P.O. at bedtime or 300 mg P.O. q.i.d. (with meals and at bedtime) for up to 8 weeks.

➤ **Pathologic hypersecretory conditions, such as Zollinger-Ellison syndrome, systemic mastocytosis, and multiple endocrine adenomas**
*Adults and children age 16 and older:* 300 mg P.O. q.i.d. with meals and at bedtime; adjusted to patient needs. Maximum oral amount, 2,400 mg daily.

For parenteral therapy, 300 mg diluted to 20 ml with normal saline solution or other compatible I.V. solution by I.V. push over at least 5 minutes every 6 to 8 hours; or 300 mg diluted in 50 ml $D_5W$ or other compatible I.V. solution by I.V. infusion over 15 to 20 minutes every 6 to 8 hours. Increase parenteral dosage by giving 300-mg doses more frequently to maximum of 2,400 mg daily, as needed.

➤ **Gastroesophageal reflux disease with erosive esophagitis**
*Adults:* 800 mg P.O. b.i.d. or 400 mg q.i.d. before meals and at bedtime for up to 12 weeks.

***Adjust-a-dose:*** In patients with renal impairment, decrease dosage to 300 mg P.O. or I.V. every 12 hours, increasing frequency to every 8 hours with caution. A renally impaired patient who also has liver dysfunction may require even further dose reduction.

➤ **Heartburn**
*Adults and children age 12 and older:* 200 mg Tagamet HB P.O. with water as symptoms occur, or as directed, up to b.i.d. For prevention, 200 mg right before or up to 30 minutes before eating food or drinking beverages that cause heartburn. Maximum, 400 mg daily. Drug shouldn't be taken daily for longer than 2 weeks.

### ADMINISTRATION
**P.O.**
• Give dose at end of hemodialysis.

**I.V.**
▼ Dilute I.V. solutions with normal saline solution, $D_5W$, dextrose 10% in water (and combinations of these), lactated Ringer's solution, or 5% sodium bicarbonate injection.
▼ For direct injection, give over 5 minutes. Rapid I.V. injection may result in arrhythmias and hypotension.
▼ For intermittent infusion, give drug over at least 30 minutes to minimize risk of adverse cardiac effects.

▼ For continuous infusion, if giving a total volume of 250 ml over 24 hours or less, use an infusion pump.
▼ Give dose at end of hemodialysis.
▼ **Incompatibilities:** Allopurinol, amphotericin B, barbiturates, cefazolin, cefepime, chlorpromazine, combination atropine sulfate and pentobarbital sodium, indomethacin sodium trihydrate, pentobarbital sodium, secobarbital, warfarin. Don't dilute with sterile water for injection.

**I.M.**
- I.M. injection may be given undiluted.
- Give dose at end of hemodialysis.

## ACTION

Competitively inhibits action of histamine on the $H_2$ receptor sites of parietal cells, decreasing gastric acid secretion.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | ¼–3 hr | 45–90 min | 4–5 hr |
| I.V. | ¼–3 hr | Immediate | 4–5 hr |
| I.M. | ¼–3 hr | Unknown | 4–5 hr |

*Half-life:* 2 hours.

## ADVERSE REACTIONS

**CNS:** confusion, dizziness, hallucinations, headache, peripheral neuropathy, somnolence.
**GI:** mild and transient diarrhea.
**GU:** impotence.
**Musculoskeletal:** arthralgia, muscle pain.
**Other:** mild gynecomastia if used longer than 1 month, hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Antacids:* May interfere with cimetidine absorption. Separate doses by at least 1 hour, if possible.
***Carmustine:*** May enhance the bone marrow suppression effects of carmustine. Avoid use together.
*Digoxin, fluconazole, indomethacin, iron salts, ketoconazole, tetracycline:* May decrease drug absorption. Separate doses by at least 2 hours.
*Fosphenytoin, phenytoin, some benzodiazepines, theophylline, warfarin:* May inhibit hepatic microsomal enzyme metabolism of these drugs. Monitor drug level.
*I.V. lidocaine:* May decrease clearance of lidocaine, increasing the risk of toxicity. Consider using a different $H_2$ antagonist, if possible. Monitor lidocaine level closely.
*Metoprolol, propranolol, timolol:* May increase the effects of beta-blocker. Consider another $H_2$ agonist or decrease the dose of beta-blocker.
*Procainamide:* May increase procainamide level. Avoid this combination, if possible. Monitor procainamide level closely and adjust the dose as necessary.
**Drug-herb.** *Guarana:* May increase caffeine level or prolong caffeine half-life. Monitor patient.
*Pennyroyal:* May change rate at which herb's toxic metabolites form. Monitor patient.
*Yerba maté:* May decrease clearance of herb's methylxanthines and cause toxicity. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May increase blood alcohol level. Discourage use together.
*Smoking:* May decrease drug's ability to inhibit nocturnal gastric secretion. Urge patient to quit smoking.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, and creatinine levels.
- May antagonize pentagastrin's effect during gastric acid secretion tests. May cause false-negative results in skin tests using allergen extracts. May impair interpretation of Hemoccult and Gastroccult test results on gastric content aspirate because of FD&C blue dye number 2 used in tablets.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in elderly or debilitated patients because they may be more susceptible to drug-induced confusion.

⚠ ***Overdose S&S:*** Mental deterioration, unresponsiveness, death.

## NURSING CONSIDERATIONS

- Assess patient for abdominal pain. Note blood in emesis, stool, or gastric aspirate.
- Identify tablet strength when obtaining a drug history.

• Schedule dose at end of hemodialysis treatment because hemodialysis reduces drug levels. Adjust dosage for patients with renal impairment.
• Wait at least 15 minutes after giving tablet before drawing sample for Hemoccult or Gastroccult test, and follow test manufacturer's instructions closely.
• Treatment of gastric ulcer isn't as effective as treatment of duodenal ulcer.
• ***Look alike–sound alike:*** Don't confuse cimetidine with simethicone.

## PATIENT TEACHING

• Remind patient taking drug once daily to take it at bedtime and to take multiple daily doses with meals.
• Instruct patient taking Tagamet HB not to exceed recommended dosage and not to take daily for longer than 14 days.
• Warn patient receiving drug I.M. that injection may be painful.
• Urge patient to avoid cigarette smoking because it may increase gastric acid secretion and worsen disease.
• Advise patient to report abdominal pain, blood in stools or emesis, black tarry stools, and coffee-ground emesis.
• Tell patient to check with prescriber or pharmacist before taking other drugs.

# cinacalcet hydrochloride

sin-ah-KAL-set

Sensipar

*Therapeutic class:* Hyperparathyroidism drug
*Pharmacologic class:* Calcimimetic
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 30 mg, 60 mg, 90 mg

## INDICATIONS & DOSAGES

➤ **Secondary hyperparathyroidism in patients with chronic kidney disease undergoing dialysis**

*Adults:* Initially, 30 mg P.O. once daily; adjust no more than every 2 to 4 weeks through sequential doses of 60 mg, 90 mg, 120 mg, and 180 mg P.O. once daily to reach target range of 150 to 300 picograms (pg)/ml for intact parathyroid hormone (PTH).

➤ **Hypercalcemia in patients with parathyroid carcinoma**

*Adults:* Initially, 30 mg P.O. b.i.d.; adjust every 2 to 4 weeks through sequential doses of 30 mg, 60 mg, and 90 mg P.O. b.i.d., and 90 mg P.O. t.i.d. or q.i.d. daily if needed to normalize calcium level.

## ADMINISTRATION

**P.O.**

• Don't break or crush tablets; give them whole, with food or shortly after a meal.

## ACTION

Increases sensitivity of calcium-sensing receptor to extracellular calcium, letting calcium be absorbed despite decreased PTH.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–6 hr | Unknown |

*Half-life:* Terminal half-life, 30 to 40 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness*, asthenia, ***seizures.***
**CV:** chest pain, hypertension.
**GI:** *diarrhea*, *nausea*, *vomiting*, anorexia.
**Metabolic:** *hypocalcemia.*
**Musculoskeletal:** *myalgia.*
**Other:** access infection.

## INTERACTIONS

**Drug-drug.** *Amitriptyline:* Amitriptyline and nortriptyline exposure increases by 20% in patients who are CYP2D6 extensive metabolizers. Avoid using together, if possible.
*Drugs metabolized mainly by CYP2D6 with a narrow therapeutic index (such as flecainide, thioridazine, most tricyclic antidepressants, vinblastine):* May strongly inhibit CYP2D6, decreasing metabolism and increasing levels of these drugs. Adjust dosage of other drugs, as needed.
*Drugs that strongly inhibit CYP3A4 (such as erythromycin, itraconazole, ketoconazole):* May increase cinacalcet level. Use together cautiously, monitoring PTH and calcium level closely and adjusting cinacalcet dosage, as needed.

### EFFECTS ON LAB TEST RESULTS

- May decrease calcium, phosphorus, and testosterone levels.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in patients with calcium level less than 8.4 mg/dl.
- Use cautiously in patients with history of seizures and in those with moderate to severe hepatic impairment.

***Overdose S&S:*** Hypocalcemia.

### NURSING CONSIDERATIONS

***Alert:*** Monitor calcium level closely, especially if patient has a history of seizures, because decreased calcium level lowers seizure threshold.

- Patients with moderate to severe hepatic impairment may need dosage adjustment based on PTH and calcium level. Monitor these patients closely.
- Give drug alone or with vitamin D sterols, phosphate binders, or both.
- Measure calcium level within 1 week after starting therapy or adjusting dosage. After maintenance dose is established, measure calcium level monthly for patients with chronic kidney disease receiving dialysis and every 2 months for those with parathyroid carcinoma.
- Watch carefully for evidence of hypocalcemia: paresthesias, myalgias, cramping, tetany, and seizures.
- If calcium level is 7.5 to 8.4 mg/dl or patient develops symptoms of hypocalcemia, give calcium-containing phosphate binders, vitamin D sterols, or both, to raise calcium level. If calcium level is below 7.5 mg/dl or hypocalcemia symptoms persist and the vitamin D dose can't be increased, withhold drug until calcium level reaches 8.0 mg/dl, hypocalcemia symptoms resolve, or both. Resume therapy with the next lowest dose.
- Measure intact PTH level 1 to 4 weeks after therapy starts or dosage changes. After the maintenance dose is established, monitor PTH level every 1 to 3 months. Levels in patients with chronic kidney disease receiving dialysis should be 150 to 300 pg/ml.
- Adynamic bone disease may develop if intact PTH levels are suppressed below 100 pg/ml. If this occurs, notify prescriber. The dosage of cinacalcet or vitamin D sterols may need to be reduced or stopped.

***Alert:*** Don't use drug in patients with chronic kidney disease who aren't receiving dialysis because they have an increased risk of hypocalcemia.

### PATIENT TEACHING

- Tell patient not to divide tablets but to take them whole, with food or shortly after a meal.
- Advise patient to report to prescriber adverse reactions and signs of hypocalcemia, which include paresthesias, muscle weakness, muscle cramping, and muscle spasm.

## ciprofloxacin

si-proe-FLOX-a-sin

Cipro✐, Cipro I.V., Cipro XR, Proquin XR

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Fluoroquinolone
*Pregnancy risk category C*

### AVAILABLE FORMS

*Infusion (premixed):* 200 mg in 100 ml $D_5W$, 400 mg in 200 ml $D_5W$
*Injection:* 200 mg, 400 mg
*Suspension (oral):* 250 mg/5 ml (5%), 500 mg/5 ml (10%)
*Tablets (extended-release, film-coated):* 500 mg, 1,000 mg
*Tablets (film-coated):* 100 mg, 250 mg, 500 mg, 750 mg

### INDICATIONS & DOSAGES

➤ **Complicated intra-abdominal infection**

*Adults:* 500 mg P.O. or 400 mg I.V. every 12 hours for 7 to 14 days. Give with metronidazole.

➤ **Severe or complicated bone or joint infection, severe respiratory tract infection, severe skin or skin-structure infection**

*Adults:* 750 mg P.O. every 12 hours or 400 mg I.V. every 8 hours.

➤ **Severe or complicated UTI; mild to moderate bone or joint infection; mild to moderate respiratory infection; mild**

**to moderate skin or skin-structure infection; infectious diarrhea; typhoid fever**
*Adults:* 500 mg P.O. or 400 mg I.V. every 12 hours. Or, 1,000 mg extended-release tablets P.O. every 24 hours.

➤ **Complicated UTI or pyelonephritis**
*Adults:* 500 mg P.O. every 12 hours for 7 to 14 days.
*Children age 1 to 17:* 6 to 10 mg/kg I.V. every 8 hours for 10 to 21 days. Maximum I.V. dose, 400 mg. Or, 10 to 20 mg/kg P.O. every 12 hours. Maximum P.O. dose, 750 mg. Don't exceed maximum dose, even in patients who weigh more than 51 kg (112 lb).

➤ **Nosocomial pneumonia**
*Adults:* 400 mg I.V. every 8 hours for 10 to 14 days.

➤ **Mild to moderate UTI**
*Adults:* 250 mg P.O. or 200 mg I.V. every 12 hours for 7 to 14 days.

➤ **Uncomplicated UTI**
*Adults:* 500 mg extended-release tablet P.O. once daily for 3 days.

➤ **Chronic bacterial prostatitis**
*Adults:* 500 mg P.O. every 12 hours or 400 mg I.V. every 12 hours for 28 days.

➤ **Mild to moderate acute sinusitis**
*Adults:* 500 mg P.O. or 400 mg I.V. every 12 hours for 10 days.

➤ **Empirical therapy in febrile neutropenic patients**
*Adults:* 400 mg I.V. every 8 hours used with piperacillin 50 mg/kg I.V. every 4 hours (not to exceed 24 g/day of piperacillin).

➤ **Inhalation anthrax (postexposure)**
*Adults:* 400 mg I.V. every 12 hours initially until susceptibility test results are known; then 500 mg P.O. b.i.d. Give drug with one or two additional antimicrobials. Switch to oral therapy when appropriate. Treat for 60 days (I.V. and P.O. combined).
*Children:* 10 mg/kg I.V. every 12 hours; then 15 mg/kg P.O. every 12 hours. Don't exceed 800 mg/day I.V. or 1,000 mg/day P.O. Give drug with one or two additional antimicrobials. Switch to oral therapy when appropriate. Treat for 60 days (I.V. and P.O. combined).

➤ **Anthrax prophylaxis ♦**
*Adults with zoonotic cutaneous anthrax without head or neck involvement:* 500 mg P.O. b.i.d. for 7 to 10 days.
*Adults with inhalational, GI, or oropharyngeal/cutaneous anthrax with systemic, edematous, or head or neck involvement:* 400 mg I.V. every 12 hours; switch to 500 mg P.O. b.i.d. for a total of 60 days.
*Children with inhalational/systemic/cutaneous anthrax:* 10 to 15 mg/kg I.V. every 12 hours (maximum, 800 mg/day). Convert to 10 to 15 mg/kg P.O. every 12 hours (maximum, 1 g/day) when clinically indicated. Duration of therapy is 60 days.

➤ **Plague ♦**
*Adults:* 400 mg I.V. twice daily. Treat for 7 days after last known or suspected exposure or until exposure has been excluded. Continue treatment for 10 to 14 days.
*Children:* 10 to 15 mg/kg I.V. twice daily. Treat for 7 days after last known or suspected exposure or until exposure has been excluded. Continue treatment for 10 to 14 days.

➤ **Traveler's diarrhea ♦**
*Adults:* 500 mg P.O. b.i.d. for 3 days.

***Adjust-a-dose:*** For patients with a creatinine clearance of 30 to 50 ml/minute, give 250 to 500 mg P.O. every 12 hours or the usual I.V. dose; if clearance is 5 to 29 ml/minute, give 250 to 500 mg P.O. every 18 hours or 200 to 400 mg I.V. every 18 to 24 hours. If patient is receiving hemodialysis, give 250 to 500 mg P.O. every 24 hours after dialysis.

➤ **Tularemia ♦**
*Adults:* 400 mg I.V. twice daily for 10 days.
*Children:* 15 mg/kg I.V. twice daily (maximum, 1 g/day) for 10 days.

## ADMINISTRATION

**P.O.**
- Cipro XR, Proquin XR, and immediate-release oral forms aren't interchangeable.
- Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
- To avoid decreasing the effects of ciprofloxacin, separate dosage of certain drugs by up to 6 hours. Food doesn't affect absorption but may delay peak levels.
- Caffeine should be avoided during therapy with this drug because of potential for increased caffeine effects.
- Give drug with plenty of fluids to reduce risk of urine crystals.

• Don't crush or split the extended-release tablets.

**I.V.**

▼ Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.

▼ Dilute drug to 1 to 2 mg/ml using $D_5W$ or normal saline solution for injection.

▼ If giving drug through a Y-type set, stop the other I.V. solution while infusing.

▼ Infuse over 1 hour into a large vein to minimize discomfort and vein irritation.

▼ **Incompatibilities:** Aminophylline, ampicillin-sulbactam, azithromycin, cefepime, clindamycin phosphate, dexamethasone sodium phosphate, furosemide, heparin sodium, methylprednisolone sodium succinate, phenytoin sodium.

## ACTION

Inhibits bacterial DNA synthesis, mainly by blocking DNA gyrase; bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 30–120 min | Unknown |
| P.O. (extended-release) | Unknown | 1–4 hr | Unknown |
| I.V. | Unknown | Immediate | Unknown |

*Half-life:* 4 hours; Cipro XR, 6 hours in adults with normal renal function.

## ADVERSE REACTIONS

**CNS:** ***seizures,*** confusion, headache, restlessness.

**GI:** ***pseudomembranous colitis,*** *diarrhea, nausea,* vomiting.

**GU:** crystalluria, interstitial nephritis.

**Hematologic:** ***leukopenia, neutropenia, thrombocytopenia,*** eosinophilia.

**Musculoskeletal:** tendon rupture.

**Skin:** *rash,* ***Stevens-Johnson syndrome, toxic epidermal necrolysis.***

**Other:** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Aluminum hydroxide, aluminum-magnesium hydroxide, calcium carbonate, didanosine (chewable tablets, buffered tablets, or pediatric powder for oral solution), magnesium hydroxide, products containing zinc:* May decrease ciprofloxacin absorption and effects. Give ciprofloxacin 2 hours before or 6 hours after these drugs.

*Cyclosporine:* May increase risk for cyclosporine toxicity. Monitor cyclosporine level.

*Iron salts:* May decrease absorption of ciprofloxacin, reducing anti-infective response. Give at least 2 hours apart.

*NSAIDs:* May increase risk of CNS stimulation. Monitor patient closely.

*Probenecid:* May elevate level of ciprofloxacin. Monitor patient for toxicity.

**Black Box Warning** *Steroids:* May increase risk of tendinitis and tendon rupture. ■

*Sucralfate:* May decrease ciprofloxacin absorption, reducing anti-infective response. If use together can't be avoided, give at least 6 hours apart.

*Theophylline:* May increase theophylline level and prolong theophylline half-life. Monitor level of theophylline and watch for adverse effects.

*Tizanidine:* Increases tizanidine levels, causing low blood pressure, somnolence, dizziness, and slowed psychomotor skills. Avoid using together.

*Warfarin:* May increase anticoagulant effects. Monitor PT and INR closely.

**Drug-herb.** *Dong quai, St. John's wort:* May cause photosensitivity. Advise patient to avoid excessive sunlight exposure.

*Yerba maté:* May decrease clearance of herb's methylxanthines and cause toxicity. Discourage use together.

**Drug-food.** *Caffeine:* May increase effect of caffeine. Monitor patient closely.

*Dairy products, other foods:* May delay peak drug levels. Advise patient to take drug on an empty stomach.

*Orange juice fortified with calcium:* May decrease GI absorption of drug, reducing its effects. Discourage use together.

**Drug-lifestyle.** *Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

• May increase alkaline phosphatase, ALT, AST, bilirubin, BUN, creatinine, LDH, and GGT levels.

• May increase eosinophil count. May decrease WBC, neutrophil, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients sensitive to fluoroquinolones.
- Use cautiously in patients with CNS disorders, such as severe cerebral arteriosclerosis or seizure disorders, and in those at risk for seizures. Drug may cause CNS stimulation.

**Black Box Warning** Drug is associated with increased risk of tendinitis and tendon rupture, especially in patients older than age 60 and those with heart, kidney, or lung transplants. ■

## NURSING CONSIDERATIONS

- Monitor patient's intake and output and observe patient for signs of crystalluria.

**Black Box Warning** Tendon rupture may occur in patients receiving quinolones. If pain or inflammation occurs or if patient ruptures a tendon, stop drug. ■

- Long-term therapy may result in overgrowth of organisms resistant to drug.
- Cutaneous anthrax patients with signs of systemic involvement, extensive edema, or lesions on the head or neck need I.V. therapy and a multidrug approach.
- Additional antimicrobials for anthrax multidrug regimens can include rifampin, vancomycin, penicillin, ampicillin, chloramphenicol, imipenem, clindamycin, and clarithromycin.
- Steroids may be used as adjunctive therapy for anthrax patients with severe edema and for meningitis.
- Follow current Centers for Disease Control and Prevention (CDC) recommendations for anthrax.
- Pregnant women and immunocompromised patients should receive the usual doses and regimens for anthrax.

## PATIENT TEACHING

- Tell patient to take drug as prescribed, even after he feels better.
- Advise patient to drink plenty of fluids to reduce risk of urine crystals.
- Advise patient not to crush, split, or chew the extended-release tablets.
- Warn patient to avoid hazardous tasks that require alertness, such as driving, until effects of drug are known.
- Instruct patient to avoid caffeine while taking drug because of potential for increased caffeine effects.
- Advise patient that hypersensitivity reactions may occur even after first dose. If a rash or other allergic reaction occurs, tell him to stop drug immediately and notify prescriber.
- Tell patient that tendon rupture can occur with drug and to notify prescriber if he experiences pain or inflammation.
- Tell patient to avoid excessive sunlight or artificial ultraviolet light during therapy.
- Because drug appears in breast milk, advise women to stop breast-feeding during treatment or to consider treatment with another drug.

# ciprofloxacin hydrochloride

si-proe-FLOX-a-sin

Ciloxan

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Fluoroquinolone
*Pregnancy risk category C*

## AVAILABLE FORMS

*Ophthalmic ointment:* 0.3% (base)
*Ophthalmic solution:* 0.3% (base)

## INDICATIONS & DOSAGES

➤ **Corneal ulcers caused by *Pseudomonas aeruginosa, Staphylococcus aureus, S. epidermidis, Streptococcus pneumoniae,* and possibly *Serratia marcescens* and *Streptococcus viridans***

*Adults and children older than age 1:* Give 2 drops in affected eye every 15 minutes for first 6 hours; then 2 drops every 30 minutes for remainder of first day. On the second day, 2 drops hourly. On days 3 to 14, 2 drops every 4 hours. Treatment may be continued after day 14 if reepithelialization hasn't occurred.

➤ **Bacterial conjunctivitis caused by *Haemophilus influenzae, S. aureus, S. epidermidis,* and possibly *S. pneumoniae***

*Adults and children older than age 1:* Give 1 or 2 drops into conjunctival sac of affected eye every 2 hours while awake for first

2 days. Then, 1 or 2 drops every 4 hours while awake for next 5 days.
*Adults and children older than age 2:* ½-inch ribbon into the conjunctival sac t.i.d. for the first 2 days, then ½-inch ribbon b.i.d. for the next 5 days.

## ADMINISTRATION

**Ophthalmic**

- Apply light finger pressure on lacrimal sac for 1 minute after drops are instilled.

## ACTION

Inhibits bacterial DNA gyrase, an enzyme needed for bacterial replication.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Unknown | Unknown | Unknown |

*Half-life:* 3 to 5 hours.

## ADVERSE REACTIONS

**EENT:** *local burning or discomfort, white crystalline precipitate in superficial portion of corneal defect in patients with corneal ulcers,* allergic reactions, conjunctival hyperemia, foreign body sensation, itching.
**GI:** bad or bitter taste in mouth.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other fluoroquinolones.
- It's unknown if drug appears in breast milk after application to eye; however, drug given systemically appears in breast milk. Use cautiously in breast-feeding women.

## NURSING CONSIDERATIONS

***Alert:*** Stop drug at first sign of hypersensitivity, such as rash, and notify prescriber. Serious hypersensitivity reactions, including anaphylaxis, may occur in patients receiving systemic drug.
- A topical overdose may be flushed from eyes with warm tap water.
- If corneal epithelium is still compromised after 14 days of treatment, continue therapy.
- Institute appropriate therapy if superinfection occurs. Prolonged use may result in overgrowth of nonsusceptible organisms, including fungi.
- ***Look alike–sound alike:*** Don't confuse Ciloxan with Cytoxan.

## PATIENT TEACHING

- Tell patient to clean eye area of excessive discharge before instilling.
- Teach patient how to instill drops or apply ointment. Advise him to wash hands before and after using drug and not to touch tip of dropper to eye or surrounding tissues.
- Instruct patient to apply light finger pressure on lacrimal sac for 1 minute after drops are instilled.
- Advise patient that drug may cause temporary blurring of vision or stinging after administration. If these symptoms become pronounced or worsen, contact prescriber.
- Tell patient to avoid wearing contacts while treating bacterial conjunctivitis. If approved by prescriber, tell patient to wait at least 15 minutes after instilling drops before inserting contact lenses.
- Tell patient not to share drug, washcloths, or towels with family members and to notify prescriber if anyone develops same signs or symptoms.
- Stress importance of compliance with recommended therapy.

**SAFETY ALERT!**

# cisatracurium besylate

sis-ah-trah-KYOO-ee-hum

Nimbex

*Therapeutic class:* Skeletal muscle relaxant
*Pharmacologic class:* Nondepolarizing neuromuscular blocker
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 2 mg/ml, 10 mg/ml

## INDICATIONS & DOSAGES

➤ **Adjunct to general anesthesia to facilitate endotracheal intubation and relax skeletal muscles during surgery**

*Adults:* First dose of 0.15 mg/kg I.V.; then maintenance dosages of 0.03 mg/kg I.V. every 40 to 50 minutes p.r.n. Or, first dose of 0.2 mg/kg I.V.; then maintenance dosages of 0.03 mg/kg I.V. every 50 to 60 minutes p.r.n. Or, after first dose, give a maintenance infusion at 3 mcg/kg/minute and reduce to 1 to 2 mcg/kg/minute as needed.
*Children ages 2 to 12:* 0.1 to 0.15 mg/kg I.V. over 5 to 10 seconds. After first dose, give a maintenance infusion of 3 mcg/kg/minute, then reduce to 1 to 2 mcg/kg/minute as needed.
***Adjust-a-dose:*** During coronary artery bypass surgery with induced hypothermia, reduce infusion rate by 50%.
➤ **To maintain neuromuscular blockade during mechanical ventilation in intensive care unit (ICU)**
*Adults:* Principles for infusion in operating room apply to use in ICU. After first dose, give 3 mcg/kg/minute by I.V. infusion. Range, 0.5 to 5 mcg/kg/minute.
***Adjust-a-dose:*** In patients with neuromuscular disease, such as myasthenia gravis or Eaton-Lambert syndrome, don't exceed 0.02 mg/kg. Patients with burns may need increased amount.

## ADMINISTRATION

### I.V.

▼ Drug is colorless to slightly yellow or green-yellow. Inspect vials for particulates and discoloration before use. Don't use unclear solutions or those with visible particulates.
▼ The 20-ml vial is intended for use only in the ICU.
▼ Use only under direct supervision of medical staff skilled in using neuromuscular blockers and maintaining airway patency. Don't give drug unless resources for intubation, mechanical ventilation, and oxygen therapy are within reach.
▼ Keep refrigerated; don't freeze. Use drug within 21 days after removing from refrigeration.
▼ Use drug within 24 hours when diluted to a concentration of 0.1 mg/ml in $D_5W$, normal saline solution, or 5% dextrose and normal saline solution.
▼ **Incompatibilities:** Acyclovir, alkaline solutions with pH higher than 8.5, aminophylline, amphotericin B, amphotericin B cholesteryl sulfate complex, ampicillin, ampicillin sodium and sulbactam sodium, cefazolin, cefoperazone, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, cefuroxime, diazepam, furosemide, ganciclovir, heparin sodium, ketorolac, lactated Ringer's injection, methylprednisolone sodium succinate, piperacillin, piperacillin sodium and tazobactam sodium, propofol, sodium bicarbonate, sodium nitroprusside, thiopental sodium, ticarcillin disodium and clavulanate potassium, trimethoprim, and sulfamethoxazole.

## ACTION

Binds to cholinergic receptors on the motor end plate, antagonizing acetylcholine and blocking neuromuscular transmission.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 1–2 min | 2–5 min | 25–44 min |

*Half-life:* 22 to 29 minutes; about 3 hours for laudanosine.

## ADVERSE REACTIONS

**CV:** ***bradycardia,*** hypotension, flushing.
**Respiratory:** ***bronchospasm, prolonged apnea.***
**Skin:** rash.

## INTERACTIONS

**Drug-drug.** *Aminoglycosides, bacitracin, clindamycin, colistimethate sodium, colistin, lithium, local anesthetics, magnesium salts, polymyxins, procainamide, quinidine, quinine, tetracyclines:* May enhance neuromuscular blocking action of cisatracurium. Use together cautiously.
*Carbamazepine, phenytoin:* May decrease the effects of cisatracurium. May need to increase cisatracurium dose.
*Enflurane or isoflurane given with nitrous oxide or oxygen:* May prolong cisatracurium duration of action. Patient may need less frequent maintenance doses, lower maintenance doses, or reduced infusion rate of cisatracurium.
*Succinylcholine:* May shorten time to onset of maximal neuromuscular block. Monitor patient.

## EFFECTS ON LAB TEST RESULTS
None reported.

## CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients who are hypersensitive to drug, to other bis-benzylisoquinolinium drugs, or to benzyl alcohol (found in 10-ml vial).
- Use cautiously in pregnant or breast-feeding women.

***Overdose S&S:*** Prolonged neuromuscular blockade.

## NURSING CONSIDERATIONS
- Drug isn't recommended for rapid-sequence endotracheal intubation because of its intermediate onset.
- Dosage requirements vary widely among patients.

***Alert:*** Drug has no known effect on consciousness, pain threshold, or cerebration. To avoid patient distress, don't induce neuromuscular block before unconsciousness.
- Monitor neuromuscular function with nerve stimulator during drug administration. If stimulation doesn't elicit a response, stop infusion until response returns.
- To avoid inaccurate dosing, perform neuromuscular monitoring on a nonparetic arm or leg in patients with hemiparesis or paraparesis.
- Monitor acid-base balance and electrolyte levels. Abnormalities may potentiate or antagonize the action of cisatracurium.
- Monitor patient for malignant hyperthermia.
- Give analgesics, if indicated. Patient can feel pain but can't indicate its presence.

***Alert:*** Careful dosage calculation is essential. Always verify dosage with another health care professional.

## PATIENT TEACHING
- Explain purpose of drug.
- Assure patient that monitoring will be continuous.
- Explain all procedures and events because patient can still hear.

**SAFETY ALERT!**

# cisplatin (CDDP)
SIS-pla-tin

Platinol

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Platinum coordination complex
*Pregnancy risk category D*

C

## AVAILABLE FORMS
*Injection:* 1 mg/ml

## INDICATIONS & DOSAGES
➤ **Adjunctive therapy in metastatic testicular cancer**
*Adults:* 20 mg/m$^2$ I.V. daily for 5 days. Repeat every 3 weeks for three cycles.

➤ **Adjunctive therapy in metastatic ovarian cancer**
*Adults:* 100 mg/m$^2$ I.V.; repeat every 4 weeks. Or, 75 to 100 mg/m$^2$ I.V. once every 4 weeks with cyclophosphamide.

➤ **Advanced bladder cancer**
*Adults:* 50 to 70 mg/m$^2$ I.V. every 3 to 4 weeks. Give 50 mg/m$^2$ every 4 weeks in patients who have received other antineoplastics or radiation therapy.

## ADMINISTRATION
**I.V.**
▼ Preparing and giving parenteral form of drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.
▼ Hydrate patient with normal saline solution for 8 to 12 hours before giving drug. Maintain urine output of at least 100 ml/hour for 4 consecutive hours before therapy and for 24 hours after therapy.
**Black Box Warning** Anaphylactic-type reactions may occur within minutes of administration. Have emergency equipment available. ■
▼ Infusions are most stable in solutions containing chloride (such as normal or half-normal saline solution and 0.22% sodium chloride). Don't use $D_5W$ alone.
▼ Further dilute with dextrose 5% in 0.3% sodium chloride injection or dextrose 5%

in half-normal saline solution for injection with 37.5 g mannitol added.
▼ Administer over 6 to 8 hours.
▼ Solutions are stable for 20 hours at room temperature. Don't refrigerate.
▼ **Incompatibilities:** Aluminum administration sets, amifostine, amphotericin B cholesteryl sulfate complex, cefepime, $D_5W$, etoposide with mannitol and potassium chloride, fluorouracil, mesna, 0.1% sodium chloride solution, paclitaxel, piperacillin sodium with tazobactam sodium, sodium bicarbonate, sodium bisulfate, sodium thiosulfate, solutions with a chloride content less than 2%, thiotepa.

## ACTION

May cross-link strands of cellular DNA and interfere with RNA transcription, causing an imbalance of growth that leads to cell death. Not specific to cell cycle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Several days |

*Half-life:* Initial phase, 25 to 79 minutes; terminal phase, 58 to 78 hours.

## ADVERSE REACTIONS

**CNS:** *peripheral neuritis,* ***seizures.***
**EENT:** *tinnitus, hearing loss.*
**GI:** anorexia, diarrhea, loss of taste, *nausea, vomiting.*
**GU:** **PROLONGED RENAL TOXICITY WITH REPEATED COURSES OF THERAPY.**
**Hematologic:** **MYELOSUPPRESSION,** ***leukopenia, thrombocytopenia,*** anemia.
**Metabolic:** ***hypomagnesemia, hypokalemia, hypocalcemia.***
**Other:** ***anaphylactoid reaction.***

## INTERACTIONS

**Drug-drug.** *Aminoglycosides:* May increase nephrotoxicity. Carefully monitor renal function study results.
*Aminoglycosides, bumetanide, ethacrynic acid, furosemide, torsemide:* May increase ototoxicity. Avoid using together, if possible.
*Aspirin, NSAIDs:* May increase risk of bleeding. Avoid using together.
*Fosphenytoin, phenytoin:* May decrease phenytoin and fosphenytoin levels. Monitor levels.
*Myelosuppressives:* May increase myelosuppression. Monitor patient.

## EFFECTS ON LAB TEST RESULTS

• May increase uric acid level. May decrease calcium, hemoglobin, magnesium, phosphate, potassium, and sodium levels.
• May decrease platelet and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or other platinum-containing compounds and in those with severe renal disease, hearing impairment, or myelosuppression.
• Use cautiously in patients previously treated with radiation or cytotoxic drugs and in those with peripheral neuropathies; also use cautiously with other ototoxic and nephrotoxic drugs.
***Overdose S&S:*** Renal failure, liver failure, deafness, ocular toxicity, significant myelosuppression, intractable nausea and vomiting, neuritis, death.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug should be administered under the supervision of a physician experienced in the use of cancer chemotherapeutic agents.
**Black Box Warning** Be careful to avoid overdose. Doses greater than 100 $mg/m^2$ per cycle every 3 to 4 weeks are rare. Confirm that dose is total dose per cycle, not daily dose.
• Monitor CBC, electrolyte levels (especially potassium and magnesium), platelet count, and renal function studies before initial and subsequent doses.
**Black Box Warning** Ototoxicity may be more pronounced in children and is manifested by tinnitus or loss of high frequency hearing and occasionally, deafness.
• To detect hearing loss, obtain audiometry tests before initial and subsequent doses.
• Prehydration and mannitol diuresis may significantly reduce renal toxicity and ototoxicity.
• Therapeutic effects are frequently accompanied by toxicity.
• Patients may experience vomiting 3 to 5 days after treatment, requiring prolonged antiemetic treatment. Monitor intake and

output. Continue I.V. hydration until patient can tolerate adequate oral intake.
**Black Box Warning** Renal toxicity is cumulative; don't give next dose until renal function returns to normal. ■
• Don't repeat dose unless platelet count exceeds 100,000/$mm^3$, WBC count exceeds 4,000/$mm^3$, creatinine level is below 1.5 mg/dl, creatinine clearance is 50 ml/minute or more, and BUN level is below 25 mg/dl.
• To prevent bleeding, avoid all I.M. injections when platelet count is less than 50,000/$mm^3$.
• Anticipate need for blood transfusions during treatment because of cumulative anemia.
**Black Box Warning** Immediately give epinephrine, corticosteroids, or antihistamines for anaphylactoid reactions. ■
• Safety of drug in children hasn't been established.
• ***Look alike–sound alike:*** Don't confuse cisplatin with carboplatin; they aren't interchangeable.

## PATIENT TEACHING

• Advise patient to watch for signs and symptoms of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell patient to take temperature daily.
• Tell patient to immediately report ringing in the ears or numbness in hands or feet.
• Instruct patient to avoid OTC products containing aspirin.
• Advise women to stop breast-feeding during therapy because of risk of toxicity to infant.
• Advise women of childbearing age to consult prescriber before becoming pregnant.

# citalopram hydrobromide

si-TAL-oh-pram

Celexa🖋

*Therapeutic class:* Antidepressant
*Pharmacologic class:* SSRI
*Pregnancy risk category C*

## AVAILABLE FORMS

*Solution:* 10 mg/5 ml
*Tablets:* 10 mg, 20 mg, 40 mg
*Tablets (orally disintegrating):* 40 mg

## INDICATIONS & DOSAGES

C

➤ **Depression**
*Adults:* Initially, 20 mg P.O. once daily, increasing to 40 mg daily after no less than 1 week. Maximum recommended dose is 60 mg daily.
*Elderly patients:* 20 mg daily P.O. with adjustment to 40 mg daily only for unresponsive patients.
***Adjust-a-dose:*** For patients with hepatic impairment, use 20 mg daily P.O. with adjustment to 40 mg daily only for unresponsive patients.
➤ **Premenstrual disorders** ♦
*Adults:* Intermittent dosing consists of initiating treatment on the estimated day of ovulation. Give 5 mg P.O. Each day increase dose by 5 mg to a maximum dose of 30 mg P.O. daily until first day of menstruation. On first day of menstruation, reduce dose to 20 mg P.O. daily. On second day, reduce dose to 10 mg P.O. daily. No drug is given from menstruation day 3 until estimated ovulation begins.
➤ **Obsessive-compulsive disorder** ♦
*Adults:* Initially, 20 mg P.O. daily, titrated to a target dose of 40 to 60 mg P.O. daily. Typical maximum dosage is 80 mg/day. Significant improvement is generally seen 4 to 6 weeks after the start of therapy.

## ADMINISTRATION

**P.O.**
• Allow orally disintegrating tablet (ODT) to dissolve on the patient's tongue, then be swallowed, with or without water.
• Don't cut, break, or crush ODTs.
• Give drug without regard for food.

## ACTION

Probably linked to potentiation of serotonergic activity in the CNS resulting from inhibition of neuronal reuptake of serotonin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 4 hr | Unknown |

*Half-life:* 35 hours.

## ADVERSE REACTIONS

**CNS:** *somnolence, insomnia,* ***suicide attempt,*** anxiety, agitation, dizziness, paresthesia, migraine, impaired concentration, amnesia, depression, apathy, tremor, confusion, fatigue, fever.
**CV:** tachycardia, orthostatic hypotension, hypotension.
**EENT:** rhinitis, sinusitis, abnormal accommodation.
**GI:** *dry mouth, nausea,* diarrhea, anorexia, dyspepsia, vomiting, abdominal pain, taste perversion, increased saliva, flatulence, increased appetite.
**GU:** dysmenorrhea, amenorrhea, ejaculation disorder, impotence, anorgasmia, polyuria.
**Metabolic:** decreased or increased weight.
**Musculoskeletal:** arthralgia, myalgia.
**Respiratory:** upper respiratory tract infection, coughing.
**Skin:** rash, pruritus.
**Other:** *increased sweating,* yawning, decreased libido.

## INTERACTIONS

**Drug-drug.** *Amphetamines, buspirone, dextromethorphan, dihydroergotamine, meperidine, other SSRIs or SSNRIs (duloxetine, venlafaxine),* ***tramadol****, trazodone, tricyclic antidepressants, tryptophan:* May increase the risk of serotonin syndrome. Avoid other drugs that increase the availability of serotonin in the CNS; monitor patient closely if used together.
*Carbamazepine:* May increase citalopram clearance. Monitor patient for effects.
*CNS drugs:* May cause additive effects. Use together cautiously.
*Drugs that affect coagulation (such as aspirin, NSAIDs):* May increase bleeding risk. Monitor patient closely.
*Drugs that inhibit cytochrome P-450 isoenzymes 3A4 and 2C19:* May cause decreased clearance of citalopram. Monitor patient for increased adverse effects.
*Imipramine, other tricyclic antidepressants:* May increase level of imipramine metabolite desipramine by about 50%. Use together cautiously.
*Lithium:* May enhance serotonergic effect of citalopram. Use together cautiously, and monitor lithium level.
*MAO inhibitors (phenelzine, selegiline, tranylcypromine):* May cause serotonin syndrome or signs and symptoms resembling neuroleptic malignant syndrome. Avoid using within 14 days of MAO inhibitor therapy.
*Sumatriptan:* May cause weakness, hyperreflexia, and incoordination. Monitor patient closely.
**Drug-herb.** *St. John's wort:* May increase the risk of serotonin syndrome. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May increase CNS effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its inactive components, within 14 days of MAO inhibitor therapy, and in patients taking pimozide.
- Use cautiously in patients with history of mania, seizures, suicidal thoughts, or hepatic or renal impairment.
- Use in third trimester of pregnancy may be linked to neonatal complications at birth. Consider the risk versus benefit of treatment during this time.

**Black Box Warning** Safety and efficacy of drug haven't been established in children. ■

***Overdose S&S:*** Dizziness, sweating, nausea, vomiting, tremor, somnolence, sinus tachycardia, amnesia, confusion, coma, seizures, hyperventilation, cyanosis, rhabdomyolysis, ECG changes.

## NURSING CONSIDERATIONS

- Although drug hasn't been shown to impair psychomotor performance, any psychoactive drug has the potential to impair judgment, thinking, or motor skills.
- The possibility of a suicide attempt is inherent in depression and may persist until significant remission occurs. Closely supervise high-risk patients at start of drug therapy. Reduce risk of overdose by limiting amount of drug available per refill.

**Black Box Warning** Drug may increase the risk of suicidal thinking and behavior in children, adolescents, and young adults with major depressive disorder or other psychiatric disorders. ■

- At least 14 days should elapse between MAO inhibitor therapy and citalopram therapy.

***Alert:*** Combining triptans with an SSRI or an SSNRI may cause serotonin syndrome or neuroleptic malignant syndrome–like reactions. Signs and symptoms of serotonin syndrome may include restlessness, hallucinations, loss of coordination, fast heartbeat, rapid changes in blood pressure, increased body temperature, overactive reflexes, nausea, vomiting, and diarrhea. Serotonin syndrome may be more likely to occur when starting or increasing the dose of triptan, SSRI, or SNRI.

- ***Look alike–sound alike:*** Don't confuse Celexa with Celebrex or Cerebyx.

## PATIENT TEACHING

**Black Box Warning** Advise families and caregivers to closely observe patient for increased suicidal thinking and behavior. ■

- Caution patient against use of MAO inhibitors while taking citalopram.
- Inform patient that, although improvement may take 1 to 4 weeks, he should continue therapy as prescribed.
- Advise patient not to stop drug abruptly.
- Tell patient that drug may be taken in the morning or evening without regard to meals. If drowsiness occurs, he should take drug in evening.
- Tell patient to allow orally disintegrating tablet to dissolve on his tongue then swallow, with or without water. Tell him not to cut, crush, or chew.
- Instruct patient to exercise caution when driving or operating hazardous machinery; drug may impair judgment, thinking, and motor skills.
- Advise patient to consult prescriber before taking other prescription or OTC drugs.
- Advise women of childbearing age to consult prescriber before breast-feeding.
- Warn patient to avoid alcohol during drug therapy.
- Instruct women of childbearing age to use contraceptives during drug therapy and to notify prescriber immediately if pregnancy is suspected.

# clarithromycin

klar-ITH-ro-my-sin

Biaxin✐, Biaxin XL✐

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Macrolide
*Pregnancy risk category C*

C

## AVAILABLE FORMS

*Suspension:* 125 mg/5 ml, 250 mg/5 ml
*Tablets (extended-release):* 500 mg, 1,000 mg
*Tablets (film-coated):* 250 mg, 500 mg

## INDICATIONS & DOSAGES

➤ **Pharyngitis or tonsillitis caused by *Streptococcus pyogenes***

*Adults:* 250 mg P.O. every 12 hours for 10 days.
*Children:* 15 mg/kg/day P.O. divided every 12 hours for 10 days.

➤ **Acute maxillary sinusitis caused by *S. pneumoniae, Haemophilus influenzae,* or *Moraxella catarrhalis***

*Adults:* 500 mg P.O. every 12 hours for 14 days. Or, if using extended-release form, give two 500-mg tablets or one 1,000-mg tablet P.O. daily for 14 days.
*Children:* 15 mg/kg/day P.O. divided every 12 hours for 10 days.

➤ **Acute worsening of chronic bronchitis caused by *M. catarrhalis, S. pneumoniae;* community-acquired pneumonia caused by *H. influenzae, S. pneumoniae, Mycoplasma pneumoniae,* or *Chlamydia pneumoniae***

*Adults:* 250 mg P.O. every 12 hours for 7 days (*H. influenzae*) or 7 to 14 days (other bacteria).

➤ **Acute worsening of chronic bronchitis caused by *H. influenzae* or *H. parainfluenzae***

*Adults:* 500 mg P.O. every 12 hours for 7 days *(H. parainfluenzae)* or 7 to 14 days *(H. influenzae).*

➤ **Acute worsening of chronic bronchitis caused by *M. catarrhalis, S. pneumoniae, H. parainfluenzae,* or *H. influenzae***

*Adults:* Two 500-mg or one 1,000-mg of the extended-release tablets P.O. daily for 7 days.

➤ **Mild to moderate community-acquired pneumonia, caused by *H. influenzae, H. parainfluenzae, M. catarrhalis, S. pneumoniae, C. pneumoniae,* or *M. pneumoniae***
*Adults:* 250 mg P.O. b.i.d. for 7 to 14 days. Or, two 500-mg or one 1,000-mg extended-release tablet P.O. daily for 7 days.
➤ **Community-acquired pneumonia caused by *S. pneumoniae, C. pneumoniae,* and *M. pneumoniae***
*Children:* 15 mg/kg/day P.O. divided every 12 hours for 10 days.
➤ **Uncomplicated skin and skin-structure infections caused by *Staphylococcus aureus* or *S. pyogenes***
*Adults:* 250 mg P.O. every 12 hours for 7 to 14 days.
*Children:* 15 mg/kg/day P.O. divided every 12 hours for 10 days.
➤ **Acute otitis media**
*Children:* 7.5 mg/kg/day P.O. divided every 12 hours for 10 days.
➤ **To prevent and treat disseminated infection caused by *Mycobacterium avium* complex**
*Adults:* 500 mg P.O. b.i.d.
*Children age 20 months and older:* 7.5 mg/kg P.O. b.i.d., up to 500 mg b.i.d.
➤ ***Helicobacter pylori,* to reduce risk of duodenal ulcer recurrence**
*Adults:* 500 mg clarithromycin with 30 mg lansoprazole and 1 g amoxicillin, all given every 12 hours for 10 to 14 days. Or, 500 mg clarithromycin with 20 mg omeprazole and 1 g amoxicillin, all given every 12 hours for 10 days. Or, two-drug regimen with 500 mg clarithromycin every 8 hours and 40 mg omeprazole once daily for 14 days. Continue omeprazole for 14 additional days.
***Adjust-a-dose:*** In patients with creatinine clearance less than 30 ml/minute, cut dose in half or double frequency interval.

## ADMINISTRATION

**P.O.**
- Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
- Give drug with or without food.
- Don't refrigerate the suspension form; discard unused portion after 14 days.

## ACTION

Binds to the 50S subunit of bacterial ribosomes, blocking protein synthesis; bacteriostatic or bactericidal, depending on concentration.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–4 hr | Unknown |
| P.O. (extended) | Unknown | 5–6 hr | Unknown |

*Half-life:* 5 to 7 hours.

## ADVERSE REACTIONS

**CNS:** headache.
**GI:** ***pseudomembranous colitis,*** abdominal pain or discomfort, diarrhea, nausea, taste perversion, vomiting (in children).
**Hematologic:** coagulation abnormalities.
**Skin:** rash (in children).

## INTERACTIONS

**Drug-drug.** *Alprazolam, midazolam, triazolam:* May decrease clearance of these drugs, causing adverse reactions. Use together cautiously.
*Carbamazepine, phenytoin:* May inhibit metabolism of these drugs, increasing serum levels and risk of toxicity. Avoid using together.
*Cyclosporine:* May increase cyclosporine levels. Monitor cyclosporine level.
*Digoxin:* May increase digoxin level. Monitor patient for digoxin toxicity.
*Dihydroergotamine, ergotamine:* May cause acute ergot toxicity. Avoid using together.
*Fluconazole:* May increase clarithromycin level. Monitor patient closely.
*HMG-CoA reductase inhibitors:* May increase levels of these drugs; may rarely cause rhabdomyolysis. Use together cautiously.
*Other drugs that prolong the QTc interval (amiodarone, antipsychotics, disopyramide, fluoroquinolones, procainamide, quinidine, sotalol, tricyclic antidepressants):* May have additive effects. Monitor ECG for QTc interval prolongation. Avoid using together if possible.
*Pimozide:* May cause torsades de pointes. Use together is contraindicated.
***Rifamycin:*** May decrease therapeutic effects of macrolide while increasing adverse effects of rifamycin. Monitor patient.

*Ritonavir:* May increase level of clarithromycin. May need to reduce clarithromycin dosage in renally impaired patients.
*Sildenafil:* May prolong absorption of sildenafil. May need to reduce sildenafil dosage.
*Theophylline:* May increase theophylline level. Monitor drug level.
*Warfarin:* May increase PT and INR. Monitor PT and INR carefully.
*Zidovudine:* May alter zidovudine level. Monitor patient closely.
**Drug-food. *Grapefruit juice:*** May inhibit metabolism, increasing adverse effects. Don't take with grapefruit juice.

### EFFECTS ON LAB TEST RESULTS
- May increase BUN level.
- May increase PT and INR.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to clarithromycin, erythromycin, or other macrolides and in those receiving pimozide or other drugs that prolong QT interval or cause cardiac arrhythmias.
- Use cautiously in patients with hepatic or renal impairment.
- Safety and efficacy in children younger than age 6 months haven't been established.
- Use during pregnancy only if potential benefit justifies potential risk to fetus.

### NURSING CONSIDERATIONS
***Alert:*** The safety and effectiveness of the extended-release form haven't been established for treating other infections for which the original form has been approved.
- Monitor patient for superinfection. Drug may cause overgrowth of nonsusceptible bacteria or fungi.
- Giving clarithromycin with a drug metabolized by CYP3A may increase drug levels and prolong therapeutic and adverse effects.

### PATIENT TEACHING
- Tell patient to take drug as prescribed, even after he feels better.
- Advise patient to report persistent adverse reactions.
- Inform patient that drug may be taken with or without food.
- Tell patient not to refrigerate the suspension form, but to discard unused portion after 14 days.

C

## clevidipine butyrate
cle-VIH-deh-peen

Cleviprex

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Dihydropyridine calcium channel blocker
*Pregnancy risk category C*

### AVAILABLE FORMS
*Injection:* 0.5 mg/ml in 50- and 100-ml single-use vials

### INDICATIONS & DOSAGES
➤ **To lower blood pressure when oral therapy isn't feasible or desirable**
*Adults:* Begin infusion at 1 to 2 mg/hour and titrate by doubling the dose every 90 seconds. When blood pressure approaches goal, titrate every 5 to 10 minutes at less than double the dose. Maximum dose is 16 mg/hour. Drug isn't recommended for use beyond 72 hours.

### ADMINISTRATION
**I.V.**
▼ Maintain aseptic technique when handling solution. Drug can support growth of microorganisms; don't use if solution might be contaminated.
▼ Invert vial several times to mix emulsion before use.
▼ Inspect solution and discard if particulate matter or discoloration is present before use. Don't dilute.
▼ Use a continuous infusion pump to regulate flow.
▼ Discard unused portion within 4 hours.
▼ **Incompatibilities:** Don't administer drug in same I.V. line with other medications.

### ACTION
Inhibits calcium ion influx across cardiac and smooth-muscle cells, decreasing contractility and oxygen demand. Dilates

coronary arteries and arterioles, decreasing systemic vascular resistance.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 2–4 min | Unknown | 5–15 min |

*Half-life:* 15 minutes; metabolite, 9 hours.

### ADVERSE REACTIONS
**CNS:** headache.
**CV:** *atrial fibrillation.*
**GI:** *nausea*, vomiting.

### INTERACTIONS
None reported.

### EFFECTS ON LAB TEST RESULTS
• May increase bilirubin, AST, and ALT levels.

### CONTRAINDICATIONS & CAUTIONS
• Contraindicated in patients hypersensitive to soy beans, soy products, eggs, or egg products.
• Contraindicated in those with defective lipid metabolism or severe aortic stenosis.
• Use cautiously in patients with heart failure.
• Use during pregnancy only if the potential benefit justifies the potential risk to the fetus. It's not known if drug appears in breast milk. Advise patient to stop breast-feeding during therapy.
• Safety and efficacy in children younger than age 18 haven't been established
***Overdose S&S:*** Hypotension, reflex tachycardia.

### NURSING CONSIDERATIONS
• Monitor blood pressure and heart rate continuously, especially when starting drug and during dosage adjustments.
• Drug may exacerbate heart failure; monitor patient closely.
• Titrate dose slowly; rapid titration may cause hypotension and reflex tachycardia. If either occurs, decrease clevidipine dosage.
• Monitor patient who received prolonged infusion for rebound hypertension for at least 8 hours after infusion is stopped if no other antihypertensive is prescribed.
• Because drug contains lipids, restrict lipid intake in those with lipid metabolism disorders.
• Drug isn't a beta blocker; if given with beta blocker, gradually reduce beta blocker dosage to avoid withdrawal symptoms.

### PATIENT TEACHING
• Tell patient to report adverse reactions promptly.
• Advise patient to seek medical attention immediately if signs and symptoms of hypertensive emergency occur (visual changes, neurologic symptoms, heart failure).

## clindamycin hydrochloride
klin-da-MYE-sin

Cleocin Hcl, Dalacin C†

## clindamycin palmitate hydrochloride
Cleocin Pediatric, Dalacin C Flavored Granules†

## clindamycin phosphate
Cleocin Phosphate, Dalacin C Phosphate Sterile Solution†

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Lincomycin derivative
*Pregnancy risk category B*

### AVAILABLE FORMS
**clindamycin hydrochloride**
*Capsules:* 75 mg, 150 mg, 300 mg
**clindamycin palmitate hydrochloride**
*Granules for oral solution:* 75 mg/5 ml
**clindamycin phosphate**
*Injectable infusion (in $D_5W$):* 300 mg (50 ml), 600 mg (50 ml), 900 mg (50 ml)
*Injection:* 150-mg base/ml, 300-mg base/2 ml, 600-mg base/4 ml, 900-mg base/6 ml

### INDICATIONS & DOSAGES
➤ **Infections caused by sensitive staphylococci, streptococci, pneumococci, *Bacteroides, Fusobacterium, Clostridium perfringens*, and other sensitive aerobic and anaerobic organisms**
*Adults:* 150 to 450 mg P.O. every 6 hours; or 300 to 600 mg I.M. or I.V. every 6, 8, or 12 hours. In more severe infections, dosage

may be increased to 1,200 to 2,700 mg/day I.M. or I.V. in two, three, or four doses. In life-threatening infections, dosages as high as 4,800 mg daily can be given.
*Children ages 1 month to 16 years:* 20 to 40 mg/kg/day I.M. or I.V. in three or four equal doses. In beta-hemolytic streptococcal infections, treatment should continue for at least 10 days.
*Neonates younger than age 1 month:* 15 to 20 mg/kg/day I.M. or I.V. in three to four equal doses.

➤ **Pelvic inflammatory disease**
*Adults and adolescents:* 900 mg I.V. every 8 hours, with gentamicin. Continue at least 48 hours after symptoms improve; then switch to oral clindamycin 450 mg q.i.d. for total of 10 to 14 days or doxycycline 100 mg P.O. every 12 hours for total of 10 to 14 days.

## ADMINISTRATION

**P.O.**
- Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
- Give capsule form with a full glass of water to prevent esophageal irritation.
- Don't refrigerate reconstituted oral solution because it will thicken. Drug is stable for 2 weeks at room temperature.

**I.V.**
- ▼ Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
- ▼ Never give undiluted as a bolus.
- ▼ For infusion, dilute each 300 mg in 50 ml solution and give over 10 to 60 minutes at no more than 30 mg/minute.
- ▼ Check site daily for phlebitis and irritation.
- ▼ Drug may contain benzyl alcohol. Benzyl alcohol has been associated with a fatal gasping syndrome in premature infants.
- ▼ **Incompatibilities:** Allopurinol, aminophylline, ampicillin, azithromycin, barbiturates, calcium gluconate, cefazolin, ceftriaxone, ciprofloxacin hydrochloride, doxapram, filgrastim, fluconazole, gentamicin sulfate, idarubicin, magnesium sulfate, phenytoin sodium, ranitidine, rubber closures such as those on I.V. tubing, tobramycin sulfate.

**I.M.**
- Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
- Inject deep into muscle. Rotate sites. Don't exceed 600 mg per injection.

## ACTION

Inhibits bacterial protein synthesis by binding to the 50S subunit of the ribosome.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 45–60 min | Unknown |
| I.V. | Immediate | Immediate | Unknown |
| I.M. | Unknown | 3 hr | Unknown |

*Half-life:* 2½ to 3 hours.

## ADVERSE REACTIONS

**CV:** thrombophlebitis.
**GI:** *nausea,* ***pseudomembranous colitis,*** abdominal pain, diarrhea, vomiting.
**Hematologic:** ***thrombocytopenia, transient leukopenia,*** eosinophilia.
**Hepatic:** jaundice.
**Skin:** maculopapular rash, urticaria.
**Other:** ***anaphylaxis.***

## INTERACTIONS

**Drug-drug.** *Erythromycin:* May block access of clindamycin to its site of action. Avoid using together.
*Kaolin:* May decrease absorption of oral clindamycin. Separate dosage times.
*Neuromuscular blockers:* May increase neuromuscular blockade. Monitor patient closely.
*Paclitaxel:* May increase paclitaxel effects. Observe patient for toxicity.
**Drug-food.** *Diet foods with sodium cyclamate:* May decrease drug level. Discourage patient from eating these foods.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, AST, and bilirubin levels.
- May increase eosinophil count. May decrease platelet and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or lincomycin.

• Clindamycin use may result in overgrowth of nonsusceptible organisms, particularly yeasts. Monitor patient for sign of superinfection.
• Use cautiously in neonates and patients with renal or hepatic disease, asthma, history of GI disease, or significant allergies.
**Black Box Warning** Clindamycin therapy has been associated with severe, possibly fatal, colitis; its use should be reserved for serious infections. ■

## NURSING CONSIDERATIONS

• I.M. injection may raise CK level in response to muscle irritation.
• Monitor renal, hepatic, and hematopoietic functions during prolonged therapy.
• Observe patient for signs and symptoms of superinfection.
***Alert:*** Don't give opioid antidiarrheals to treat drug-induced diarrhea; they may prolong and worsen this condition.
**Black Box Warning** Diarrhea, colitis, and pseudomembranous colitis have developed up to several weeks following cessation of drug therapy. ■
• Drug doesn't penetrate blood-brain barrier.

## PATIENT TEACHING

• Advise patient to take capsule form with a full glass of water to prevent esophageal irritation.
• Warn patient that I.M. injection may be painful.
• Tell patient to report discomfort at I.V. insertion site.
• Instruct patient to notify prescriber of adverse reactions (especially diarrhea). Warn him not to treat diarrhea himself because drug may cause life-threatening colitis.

# clindamycin phosphate

klin-da-MYE-sin

Cleocin, Cleocin T, Clindagel, ClindaMax, Clindasol†, Clindesse, Clindets, Dalacin†, Evoclin

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Lincomycin derivative
*Pregnancy risk category B*

## AVAILABLE FORMS

*Foam:* 1%
*Gel:* 1%
*Lotion:* 1%
*Pledget:* 1%*
*Topical solution:* 1%*
*Vaginal cream:* 2%
*Vaginal suppositories:* 100 mg

## INDICATIONS & DOSAGES

➤ **Inflammatory acne vulgaris**
*Adults and children age 12 and older:* Apply to skin b.i.d., morning and evening, or once daily if using Clindagel or Evoclin.
➤ **Bacterial vaginosis**
*Adults:* 1 applicatorful vaginally at bedtime for 3 to 7 days in nonpregnant women or 7 days in pregnant women, or 1 suppository vaginally at bedtime for 3 days, or 1 applicatorful of Clindesse vaginally as a single dose.
➤ **Rosacea ♦**
*Adults:* Apply once or twice daily for 12 weeks.

## ADMINISTRATION

**Topical**
• Wash area with warm water and soap, rinse, pat dry, and wait 30 minutes after washing or shaving to apply.
• Avoid excessive washing of affected area.
• Apply to entire area, but avoid contact with eyes, nose, mouth, and other mucous membranes.
**Vaginal**
• Make sure patient knows how to use applicators that come with drug.
• Tell patient to remove pledgets from foil before use.

• Advise patient to use pledgets only once and then discard. Also, more than 1 pledget may be used per application.

## ACTION

Bacteriostatic or bactericidal based on drug level and susceptibility of organism; suppresses growth of susceptible organisms in sebaceous glands by blocking protein synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical, vaginal | Unknown | Unknown | Unknown |

*Half-life:* 1½ to 2½ hours for topical and vaginal cream; 11 hours for vaginal suppositories.

## ADVERSE REACTIONS

**CNS:** *headache.*
**EENT:** pharyngitis.
**GI:** abdominal pain, bloody diarrhea, colitis including, ***pseudomembranous colitis,*** constipation, diarrhea, GI upset.
**GU:** *Candida albicans overgrowth, cervicitis, vaginitis, vulvar irritation,* UTI, vaginal discharge, vaginal moniliasis.
**Skin:** *dryness, redness,* burning, contact dermatitis, irritation, rash, pruritus, swelling.

## INTERACTIONS

**Drug-drug.** *Erythromycin:* May antagonize clindamycin's effect. Separate doses.
*Isotretinoin:* May cause cumulative dryness, resulting in excessive skin irritation. Use together cautiously.
*Neuromuscular blockers:* May increase action of neuromuscular blocker. Use together cautiously.
**Drug-lifestyle.** *Abrasive or medicated soaps or cleansers, acne products, or other preparations containing peeling drugs (benzoyl peroxide, resorcinol, salicylic acid, sulfur, tretinoin), alcohol-containing products (aftershave, cosmetics, perfumed toiletries, shaving creams or lotions), astringent soaps or cosmetics, medicated cosmetics or cover-ups:* May cause cumulative dryness, resulting in excessive skin irritation. Urge caution.

## EFFECTS ON LAB TEST RESULTS

• May increase liver enzyme levels.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to clindamycin or lincomycin and in those with history of ulcerative colitis, regional enteritis, or antibiotic-related colitis.

## NURSING CONSIDERATIONS

• For treating acne, drug may be used with tretinoin or benzoyl peroxide, as well as systemic antibiotics.
• Drug can cause excessive dryness.
• Topical solution and pledgets contain alcohol base, which may irritate eyes.
• Monitor elderly patients for systemic effects.

## PATIENT TEACHING

• Tell patient to wash area with warm water and soap, rinse, pat dry, and wait 30 minutes after washing or shaving to apply.
• Warn patient to avoid excessive washing of area. Tell patient to cover entire affected area but to avoid contact with eyes, nose, mouth, and other mucous membranes.
• Instruct patient to use other prescribed acne medicines at a different time.
• Tell patient to use only as prescribed.
• Instruct patient to dab, not roll, applicator-tipped bottle. If tip becomes dry, patient should invert bottle and depress tip several times to moisten.
• Warn patient not to smoke while applying topical solution.
• For vaginal treatment, instruct patient how to use vaginal applicators.
• Advise patient that the vaginal form contains mineral oil, which can weaken latex or rubber products, such as condoms and diaphragms, and that she should use another form of birth control during and within 3 days of therapy.
• Advise patient to avoid sexual intercourse during vaginal treatment.
• Advise patient to avoid use of tampons or douches during vaginal treatment.
• Instruct patient to notify prescriber immediately if abdominal pain or diarrhea occurs. Inform patient that an antidiarrheal may worsen condition and should only be used as directed by prescriber.
• Tell patient to remove pledgets from foil before use.

- Advise patient to use pledgets only once and then discard. Also, more than 1 pledget may be used per application.
- Advise patient to complete entire course of therapy.

## clobetasol propionate

kloe-BAY-ta-sol

Clobex, Cormax, Embeline, Embeline E, Olux, Olux-E, Temovate, Temovate E

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Corticosteroid
*Pregnancy risk category C*

### AVAILABLE FORMS

*Cream:* 0.05%
*Foam:* 0.05%*
*Gel:* 0.05%
*Lotion:* 0.05%
*Ointment:* 0.05%
*Scalp application:* 0.05%*
*Shampoo:* 0.05%*
*Solution:* 0.05%*
*Spray:* 0.05%*

### INDICATIONS & DOSAGES

➤ **Inflammation and pruritus from corticosteroid-responsive dermatoses; short-term topical treatment of mild to moderate plaque-type psoriasis of non-scalp regions, excluding the face and intertriginous areas**

*Adults:* Apply thin layer of Clobex lotion to affected skin areas b.i.d., morning and evening, for maximum of 14 days. For lesions of moderate to severe plaque psoriasis that haven't improved sufficiently, continue treatment for up to 2 more weeks, as long as 10% or less of the body surface area is affected. Total dose shouldn't exceed 50 g (50 ml) of spray or lotion weekly.

➤ **Inflammation and pruritus from corticosteroid-responsive dermatoses; short-term topical treatment of mild to moderate plaque-type psoriasis of non-scalp regions, excluding the face and intertriginous areas**

*Adults and children age 12 and older:* Apply thin layer to affected skin areas b.i.d., morning and evening, for maximum of 14 days. Total dose shouldn't exceed 50 g of foam, cream, or ointment or 50 ml of lotion or solution weekly.

➤ **Inflammation and pruritus of moderate to severe corticosteroid-responsive dermatoses of the scalp**

*Adults:* Apply to the affected scalp area b.i.d., morning and evening. Gently massage into affected scalp area until the foam disappears. Repeat until entire affected scalp area is treated. Limit treatment to 14 days, with no more than 50 g of foam weekly.

➤ **Moderate to severe scalp psoriasis**

*Adults:* Apply Clobex shampoo to affected areas of dry scalp in thin film once daily. Leave in place for 15 minutes before lathering and rinsing. Limit treatment to 4 consecutive weeks.

### ADMINISTRATION

**Topical**

- Gently wash skin before applying. To prevent skin damage, rub medication in gently and completely. When treating hairy sites, part hair and apply directly to lesions.
- Avoid applying near eyes or mucous membranes or in ear canal.

***Alert:*** Don't use occlusive dressings or bandages. Don't cover or wrap treated areas unless directed by prescriber.

### ACTION

Unclear. Diffuses across cell membranes to form complexes with receptors, showing anti-inflammatory, antipruritic, vasoconstrictive, and antiproliferative activity. Considered a very-high-potency to high-potency drug, according to vasoconstrictive properties.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**GU:** glycosuria.
**Metabolic:** hyperglycemia.
**Skin:** burning, pruritus, irritation, dryness, erythema, folliculitis, perioral dermatitis, allergic contact dermatitis, hypopigmentation, hypertrichosis, acneiform eruptions, skin atrophy, telangiectasia.

**Other:** ***hypothalamic-pituitary-adrenal axis suppression,*** Cushing syndrome, finger numbness.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

- May increase glucose level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to corticosteroids and in those with primary scalp infections.
- Don't use as monotherapy for primary bacterial infections (impetigo, paronychia, erysipelas, cellulitis, angular cheilitis, erythrasma), rosacea, perioral dermatitis, or acne.
- Don't use very high-potency or high-potency agents on the face, groin, or axilla areas.
- Drug isn't for ophthalmic use.
- Use cautiously in children and in pregnant or breast-feeding women.

⚠ ***Overdose S&S:*** Systemic effects.

## NURSING CONSIDERATIONS

- If antifungal or antibiotic combined with corticosteroid fails to provide prompt improvement, stop corticosteroid until infection is controlled.
- Stop drug and notify prescriber if skin infection, striae, or atrophy occurs.
- Hypothalamic-pituitary-adrenal axis suppression occurs at doses as low as 2 g daily.

## PATIENT TEACHING

- Teach patient how to apply drug and to avoid contact with eyes.
- Tell patient to wash hands after application.
- Tell patient to stop drug and report signs of systemic absorption, skin irritation or ulceration, hypersensitivity, or infection.
- Warn patient to use drug for no longer than 14 consecutive days.
- Tell patient using the foam to invert can and dispense a small amount of Olux foam (up to a golfball–size dollop) into the cap of the can, onto a saucer or other cool surface, or directly on the lesion, taking care to avoid contact with the eyes. Dispensing directly onto hands isn't recommended because the foam will melt immediately upon contact with warm skin. Tell him to move hair away from affected area of scalp so that foam can be applied to each affected area.
- Tell patient using foam that contents are flammable and under pressure, so he should avoid smoking during and immediately after application and keep can away from flames. Also tell him not to puncture or incinerate container.

# clomiPHENE citrate

KLOE-mi-feen

Clomid, Serophene

*Therapeutic class:* Ovulation stimulant
*Pharmacologic class:* Chlorotrianisene derivative
*Pregnancy risk category X*

## AVAILABLE FORMS

*Tablets:* 50 mg

## INDICATIONS & DOSAGES

➤ **To induce ovulation**

*Women:* 50 mg P.O. daily for 5 days, starting on day 5 of menstrual cycle (first day of menstrual flow is day 1) if bleeding occurs, or at any time if patient hasn't had recent uterine bleeding. If ovulation doesn't occur, may increase dose to 100 mg P.O. daily for 5 days as soon as 30 days after previous course. Repeat until conception occurs or until three courses of therapy are completed.

## ADMINISTRATION

**P.O.**

- Protect drug from heat, light, and excessive humidity.
- Give drug without regard for food.

## ACTION

Appears to stimulate release of follicle-stimulating hormone, luteinizing hormone, and pituitary gonadotropins, resulting in maturation of the ovarian follicle, ovulation, and development of the corpus luteum.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* 5 days.

## ADVERSE REACTIONS
**CNS:** headache.
**EENT:** blurred vision, diplopia, scotoma, photophobia.
**GI:** nausea, vomiting, bloating, distention.
**GU:** *ovarian enlargement,* urinary frequency and polyuria, abnormal uterine bleeding, ovarian cyst that regresses spontaneously when drug is stopped.
**Metabolic:** weight gain.
**Skin:** reversible alopecia, urticaria, rash, dermatitis.
**Other:** *hot flashes, breast discomfort.*

## INTERACTIONS
None significant.

## EFFECTS ON LAB TEST RESULTS
None reported.

## CONTRAINDICATIONS & CAUTIONS
• Contraindicated in pregnant women and in those with undiagnosed abnormal genital bleeding, ovarian cyst not related to polycystic ovarian syndrome, hepatic disease or dysfunction, uncontrolled thyroid or adrenal dysfunction, or organic intracranial lesion (such as a pituitary tumor).
***Overdose S&S:*** Nausea; vomiting; vasomotor flushes; visual blurring, spots, or flashes; scotomata; ovarian enlargement with pelvic or abdominal pain.

## NURSING CONSIDERATIONS
• Monitor patient closely because of potentially serious adverse reactions.
• Long-term cyclic therapy isn't recommended.
• ***Look alike–sound alike:*** Don't confuse clomiphene with clomipramine or clonidine. Don't confuse Serophene with Sarafem.

## PATIENT TEACHING
• Tell patient about the risk of multiple births, which increases with higher doses.
• Teach patient to take and chart basal body temperature to ascertain if ovulation has occurred.
• Reinforce importance of compliance with drug regimen.
• Reassure patient that ovulation typically occurs after first course of therapy. If pregnancy doesn't occur, therapy may be repeated twice.
• Advise patient to stop drug and contact prescriber immediately if pregnancy is suspected because drug may have teratogenic effect.
***Alert:*** Advise patient to stop drug and contact prescriber immediately if abdominal symptoms or pain occur; these symptoms may indicate ovarian enlargement or ovarian cyst. Also, tell patient to immediately notify prescriber if signs and symptoms of impending visual toxicity occur, such as blurred vision, double vision, vision defect in one part of the eye (scotoma), or sensitivity to the sun.
• Warn patient to avoid hazardous activities, such as driving or operating machinery, until CNS effects are known. Drug may cause dizziness and visual disturbances.

# clomiPRAMINE hydrochloride
kloe-MI-pra-meen

Anafranil

*Therapeutic class:* Antidepressant
*Pharmacologic class:* Tricyclic antidepressant (TCA)
*Pregnancy risk category C*

## AVAILABLE FORMS
*Capsules:* 25 mg, 50 mg, 75 mg

## INDICATIONS & DOSAGES
➤ **Obsessive-compulsive disorder**
*Adults:* Initially, 25 mg P.O. daily with meals, gradually increased to 100 mg daily in divided doses during first 2 weeks. Thereafter, increase to maximum dose of 250 mg daily in divided doses with meals, as needed. After adjustment, give total daily dose at bedtime.
*Children age 10 and older and adolescents:* Initially, 25 mg P.O. daily with meals, gradually increased over first 2 weeks to daily maximum of 3 mg/kg or 100 mg P.O. in divided doses, whichever is smaller.

Maximum daily dose is 3 mg/kg or 200 mg, whichever is smaller; give at bedtime after adjustment. Reassess and adjust dosage periodically.

➤ **Panic disorder ♦**

*Adults:* Initially, 10 mg P.O. daily and increased to a maximum dosage of 150 mg P.O. daily.

## ADMINISTRATION

**P.O.**

● Give drug without regard for food.

## ACTION

Unknown. Inhibits reuptake of serotonin and norepinephrine at the presynaptic neuron.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–6 hr | Unknown |

*Half-life:* Parent compound, 32 hours; active metabolite, 69 hours.

## ADVERSE REACTIONS

**CNS:** *somnolence, tremor, dizziness, headache, insomnia, nervousness, myoclonus, fatigue,* ***seizures,*** EEG changes.
**CV:** orthostatic hypotension, palpitations, tachycardia.
**EENT:** *pharyngitis, rhinitis, visual changes.*
**GI:** *dry mouth, constipation, nausea, dyspepsia, increased appetite, anorexia, abdominal pain,* diarrhea.
**GU:** *urinary hesitancy,* UTI, *dysmenorrhea, ejaculation failure, impotence.*
**Hematologic:** purpura.
**Metabolic:** *weight gain.*
**Musculoskeletal:** *myalgia.*
**Respiratory:** bronchospasm, coughing, dyspnea.
**Skin:** *diaphoresis,* rash, pruritus, dry skin.
**Other:** *altered libido.*

## INTERACTIONS

**Drug-drug.** *Barbiturates:* May decrease TCA level. Watch for decreased antidepressant effect.
*Cimetidine,* ***fluoxetine, fluvoxamine, paroxetine, sertraline:*** May increase TCA level. Monitor drug level and patient for signs of toxicity.
*Clonidine:* May cause life-threatening hypertension. Avoid using together.
*CNS depressants:* May enhance CNS depression. Avoid using together.
*Epinephrine, norepinephrine:* May increase hypertensive effect. Use together cautiously.
*MAO inhibitors:* May cause hyperpyretic crisis, seizures, coma, or death. Avoid using within 14 days of MAO inhibitor therapy.
***Quinolones:*** May increase the risk of life-threatening arrhythmias. Avoid using together.
**Drug-herb.** *Evening primrose oil:* May cause additive or synergistic effect, resulting in lower seizure threshold and increasing the risk of seizure. Discourage use together.
*St. John's wort, SAM-e, yohimbe:* May cause serotonin syndrome. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May enhance CNS depression. Discourage use together.
*Sun exposure:* May increase risk of photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or other tricyclic antidepressants, in those who have taken MAO inhibitors within previous 14 days, and in patients in acute recovery period after MI.
● Use cautiously in patients with history of seizure disorders or with brain damage of varying cause; in patients receiving other seizure threshold–lowering drugs; in patients at risk for suicide; in patients with history of urine retention or angle-closure glaucoma, increased intraocular pressure, CV disease, impaired hepatic or renal function, or hyperthyroidism; in patients with tumors of the adrenal medulla; in patients receiving thyroid drug or electroconvulsive therapy; and in those undergoing elective surgery.
**Black Box Warning** Clomipramine isn't approved for use in children except for those with obsessive compulsive disorder. ■
⚠ ***Overdose S&S:*** Cardiac arrhythmias, severe hypotension, seizures, CNS

depression, coma, ECG changes, drowsiness, stupor, ataxia, restlessness, agitation, delirium, severe perspiration, hyperactive reflexes, muscle rigidity, athetoid and choreiform movements, tachycardia, congestive heart failure, cardiac arrest, respiratory depression, cyanosis, shock, vomiting, hyperpyrexia, mydriasis, oliguria or anuria.

## NURSING CONSIDERATIONS

- Monitor mood and watch for suicidal tendencies. Allow patient to have only the minimum amount of drug.

**Black Box Warning** Drug may increase risk of suicidal thinking and behavior in children, adolescents, and young adults ages 18 to 24 during the first 2 months of treatment, especially in those with major depressive disorder or other psychiatric disorder. ■

- Don't withdraw drug abruptly.
- Because patients may suffer hypertensive episodes during surgery, stop drug gradually several days before surgery.
- Relieve dry mouth with sugarless candy or gum. Saliva substitutes may be needed.
- ***Look alike–sound alike:*** Don't confuse clomipramine with chlorpromazine or clomiphene, or Anafranil with enalapril, nafarelin, or alfentanil.

## PATIENT TEACHING

- Warn patient to avoid hazardous activities requiring alertness and good coordination, especially during adjustment. Daytime sedation and dizziness may occur.
- Tell patient to avoid alcohol during drug therapy.
- Warn patient not to stop drug suddenly.
- Advise patient to use sunblock, wear protective clothing, and avoid prolonged exposure to strong sunlight to prevent oversensitivity to the sun.

**Black Box Warning** Advise family members and caregivers to closely observe patient for increased suicidal thinking and behavior. ■

**SAFETY ALERT!**

# clonazepam

kloe-NAZ-e-pam

Klonopin℞

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* Benzodiazepine
*Pregnancy risk category D*
*Controlled substance schedule IV*

## AVAILABLE FORMS

*Tablets:* 0.5 mg, 1 mg, 2 mg
*Tablets (orally disintegrating):* 0.125 mg, 0.25 mg, 0.5 mg, 1 mg, 2 mg

## INDICATIONS & DOSAGES

➤ **Lennox-Gastaut syndrome, atypical absence seizures, akinetic and myoclonic seizures**

*Adults:* Initially, no more than 1.5 mg P.O. daily in three divided doses. May be increased by 0.5 to 1 mg every 3 days until seizures are controlled. If given in unequal doses, give largest dose at bedtime. Maximum recommended daily dose is 20 mg.
*Children up to age 10 or 30 kg (66 lb):* Initially, 0.01 to 0.03 mg/kg P.O. daily (not to exceed 0.05 mg/kg daily) in two or three divided doses. Increase by 0.25 to 0.5 mg every third day to maximum maintenance dose of 0.1 to 0.2 mg/kg daily, as needed.

➤ **Panic disorder**

*Adults:* Initially, 0.25 mg P.O. b.i.d.; increase to target dose of 1 mg daily after 3 days. Some patients may benefit from dosages up to maximum of 4 mg daily. To achieve 4 mg daily, increase dosage in increments of 0.125 to 0.25 mg b.i.d. every 3 days, as tolerated, until panic disorder is controlled. Taper drug with decrease of 0.125 mg b.i.d. every 3 days until drug is stopped.

➤ **Restless legs syndrome** ♦

*Adults:* 0.5 to 2 mg P.O. 30 minutes before bedtime.

## ADMINISTRATION

**P.O.**

- Peel back the foil of the orally disintegrating tablet (ODT) pouch carefully. Don't push ODT through foil.

• Give ODT to patient with or without water.

## ACTION

Unknown. Probably acts by facilitating the effects of the inhibitory neurotransmitter GABA.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | Unknown |

*Half-life:* 18 to 50 hours.

## ADVERSE REACTIONS

**CNS:** *drowsiness*, agitation, *ataxia*, *behavioral disturbances*, confusion, depression, slurred speech, tremor.
**CV:** palpitations.
**EENT:** abnormal eye movements, nystagmus.
**GI:** anorexia, change in appetite, constipation, diarrhea, gastritis, nausea, sore gums.
**GU:** dysuria, enuresis, nocturia, urine retention.
**Hematologic:** ***leukopenia, thrombocytopenia,*** eosinophilia.
**Respiratory:** ***respiratory depression,*** chest congestion, shortness of breath.
**Skin:** rash.

## INTERACTIONS

**Drug-drug.** *Carbamazepine, phenobarbital, phenytoin:* May lower clonazepam levels. Monitor patient closely.
*CNS depressants:* May increase CNS depression. Avoid using together.
*Fluconazole, itraconazole, ketoconazole, miconazole:* May increase and prolong drug levels, CNS depression, and psychomotor impairment. Avoid using together.
**Drug-herb.** *St. John's wort:* May increase hepatic metabolism, resulting in decreased drug effects. Adjust clonazepam dosage as needed.
**Drug-lifestyle.** *Alcohol use:* May cause additive CNS effects. Discourage use together.
*Smoking:* May increase clearance of clonazepam. Monitor patient for decreased drug effects.

## EFFECTS ON LAB TEST RESULTS

• May increase liver function test values and eosinophil count. May decrease platelet and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to benzodiazepines and in those with significant hepatic disease or acute angle-closure glaucoma.
• Use cautiously in patients with mixed-type seizures because drug may cause generalized tonic-clonic seizures.
• Use cautiously in children and in patients with chronic respiratory disease, open-angle glaucoma, or a history of drug or alcohol addiction.
• Use cautiously in elderly patients. Drug may accumulate due to potential decrease in hepatic and renal function.
***Overdose S&S:*** Somnolence, confusion, coma, impaired coordination, diminished reflexes.

## NURSING CONSIDERATIONS

***Alert:*** Closely monitor all patients for changes in behavior that may indicate worsening of suicidal thoughts or behavior or depression.
• Don't stop drug abruptly because this may worsen seizures. Call prescriber at once if adverse reactions develop.
• Assess elderly patient's response closely. Elderly patients are more sensitive to drug's CNS effects.
• Monitor patient for oversedation.
• Monitor CBC and liver function tests.
• Withdrawal symptoms are similar to those of barbiturates.
• To reduce inconvenience of somnolence when drug is used for panic disorder, giving one dose at bedtime may be desirable.

## PATIENT TEACHING

• Advise patient to avoid driving and other hazardous activities that require mental alertness until drug's CNS effects are known.
• Instruct parent to monitor child's school performance because drug may interfere with attentiveness.
• Warn patient and parents not to stop drug abruptly because seizures may occur.
• Advise patient that drug isn't for use during pregnancy or breast-feeding.
• Tell patients to open pouch of ODTs and peel back the foil. He shouldn't push the tablet *through* the foil.

● Tell patient to use dry hands when removing the ODT.
● Tell patient that ODTs can be taken with or without water.

## clonidine hydrochloride

KLOE-ni-deen

Catapres, Catapres-TTS, Dixarit†, Duraclon, Jenloga

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Centrally acting alpha agonist
*Pregnancy risk category C*

### AVAILABLE FORMS

*Transdermal:* TTS-1 (releases 0.1 mg/24 hours), TTS-2 (releases 0.2 mg/24 hours), TTS-3 (releases 0.3 mg/24 hours)
*Injection for epidural use:* 100 mcg/ml
*Injection for epidural use, concentrate:* 500 mcg/ml
*Suspension (extended-release):* 0.09 mg/ml
*Tablets:* 0.025 mg†, 0.1 mg, 0.2 mg, 0.3 mg
*Tablets (extended-release):* 0.17 mg, 0.26 mg
*Tablets (modified-release):* 0.1 mg

### INDICATIONS & DOSAGES

➤ **Essential and renal hypertension**
*Adults and children age 12 and older:* Initially, 0.1 mg P.O. b.i.d.; then increased by 0.1 to 0.2 mg daily on a weekly basis. Usual range is 0.2 to 0.6 mg daily in divided doses; infrequently, dosages as high as 2.4 mg daily are used. Or, initially, 0.17 mg P.O. extended-release tablet or solution daily; then increase by 0.09 mg/day on weekly basis as needed. Usual dosage range is 0.17 to 0.52 mg daily. Or, initially, 0.1 mg P.O. modified-release at bedtime *for adults only*. May increase by 0.1 mg/day at weekly intervals to maximum of 0.6 mg/day divided into morning and bedtime doses.

Or, apply transdermal patch once every 7 days, starting with 0.1-mg system and adjusted with another 0.1-mg or larger system.

➤ **Severe cancer pain that is unresponsive to epidural or spinal opiate analgesia or other more conventional methods of analgesia**
*Adults:* Initially, 30 mcg/hour by continuous epidural infusion. Experience with rates greater than 40 mcg/hour is limited.
*Children:* Initially, 0.5 mcg/kg/hour by epidural infusion. Dosage should be cautiously adjusted, based on response.

➤ **Pheochromocytoma diagnosis ♦**
*Adults:* 0.3 mg P.O. for a single dose.

➤ **Growth hormone stimulation test ♦**
*Adults:* 200 mcg or 0.15 mg/$m^2$ P.O. as a single dose.

➤ **Vasomotor symptoms of menopause ♦**
*Adults:* 0.05 to 0.4 mg P.O. b.i.d. or 0.1-mg/24-hour patch applied once every 7 days.

➤ **Ulcerative colitis ♦**
*Adults:* 0.3 mg P.O. t.i.d. for 6 weeks.

➤ **Opiate dependence ♦**
*Adults:* Initially, 0.005 or 0.006 mg/kg test dose, followed by 0.017 mg/kg P.O. daily in three or four divided doses for 10 days. Or, initially, 0.1 mg P.O. three times daily, with dosage adjusted by 0.1 to 0.2 mg daily. Dosage range is 0.3 to 1.2 mg P.O. daily. Stop drug gradually. Follow protocols.

➤ **Symptom suppression during methadone withdrawal ♦**
*Adults:* 0.2 mg P.O. three to four times daily for 2 to 3 weeks. Primary dose and dosage titration should be individualized.

➤ **Smoking cessation ♦**
*Adults:* Initially, 0.1 mg P.O. b.i.d., beginning on or shortly before the day of smoking cessation. Increase dosage every 7 days by 0.1 mg daily, if needed. Or, 0.2-mg/24-hour transdermal patch applied every 7 days. Therapy should begin on or shortly before the day of smoking cessation. Increase dosage by 0.1 mg/24 hours at weekly intervals, if needed.

➤ **Attention deficit hyperactivity disorder ♦**
*Children:* Initially, 0.05 mg P.O. at bedtime. May increase dosage cautiously over 2 to 4 weeks. Maintenance dosage is 0.05 to 0.4 mg P.O. daily.

### ADMINISTRATION

**P.O.**
● Give last dose immediately before bedtime.
● Reduce dosage gradually over 2 to 4 days before discontinuing.

• Modified-release tablets (Jenloga) are for adult use only.

**Transdermal**

• Apply patch to nonhairy area of intact skin on upper arm or torso.

**Epidural**

***Alert:*** The injection form is for epidural use only.

**Black Box Warning** The injection form concentrate containing 500 mcg/ml must be diluted in normal saline injection before use to yield 100 mcg/ml.

## ACTION

Unknown. Thought to stimulate alpha$_2$ receptors and inhibit the central vasomotor centers, decreasing sympathetic outflow to the heart, kidneys, and peripheral vasculature, and lowering peripheral vascular resistance, blood pressure, and heart rate.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30–60 min | 2–4 hr | 12–24 hr |
| Transdermal | 2–3 days | 2–3 days | 7–8 days |
| Epidural | Unknown | 30–60 min | Unknown |

*Half-life:* 6 to 20 hours.

## ADVERSE REACTIONS

**CNS:** *drowsiness, dizziness, sedation, weakness,* fatigue, malaise, agitation, depression.

**CV:** ***bradycardia, severe rebound hypertension,*** orthostatic hypotension.

**GI:** *constipation, dry mouth,* nausea, vomiting, anorexia.

**GU:** urine retention, impotence.

**Metabolic:** weight gain.

**Skin:** *pruritus, dermatitis with transdermal patch,* rash.

**Other:** loss of libido.

## INTERACTIONS

**Drug-drug.** *Amitriptyline, amoxapine, clomipramine, desipramine, doxepin, imipramine, nortriptyline, protriptyline, trimipramine:* May cause loss of blood pressure control with life-threatening elevations in blood pressure. Avoid using together.

***Beta blockers:*** May cause life-threatening hypertension. Closely monitor blood pressure.

*CNS depressants:* May increase CNS depression. Use together cautiously.

*Digoxin, verapamil:* May cause AV block and severe hypotension. Monitor BP and ECG.

*Diuretics, other antihypertensives:* May increase hypotensive effect. Monitor patient closely.

*Levodopa:* May reduce effectiveness of levodopa. Monitor patient.

*MAO inhibitors, prazosin:* May decrease antihypertensive effect. Use together cautiously.

*Propranolol, other beta blockers:* May cause paradoxical hypertensive response. Monitor patient carefully.

**Drug-herb.** *Capsaicum:* May reduce antihypertensive effectiveness. Discourage use together.

*Ma huang:* May decrease antihypertensive effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

• May decrease urinary excretion of vanillylmandelic acid and catecholamines. May cause a weakly positive Coombs' test result.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug.

• Transdermal form is contraindicated in patients hypersensitive to any component of the adhesive layer of transdermal system.

• Epidural form is contraindicated in patients receiving anticoagulant therapy, in those with bleeding diathesis, in those with an injection site infection, and in those who are hemodynamically unstable or have severe CV disease.

• Use cautiously in patients with severe coronary insufficiency, conduction disturbances, recent MI, cerebrovascular disease, chronic renal failure, or impaired liver function.

***Overdose S&S:*** Early hypertension, then hypotension; bradycardia; respiratory and CNS depression.

## NURSING CONSIDERATIONS

• Drug may be given to lower blood pressure rapidly in some hypertensive emergencies.

• Monitor blood pressure and pulse rate frequently. Dosage is usually adjusted to patient's blood pressure and tolerance.

• Elderly patients may be more sensitive than younger ones to drug's hypotensive effects.
• Observe patient for tolerance to drug's therapeutic effects, which may require increased dosage.
• Noticeable antihypertensive effects of transdermal clonidine may take 2 to 3 days. Oral antihypertensive therapy may have to be continued in the interim.
***Alert:*** Remove transdermal patch before defibrillation to prevent arcing.
• Stop drug gradually by reducing dosage over 2 to 4 days to avoid rapid rise in blood pressure, agitation, headache, and tremor. When stopping therapy in patients receiving both clonidine and a beta blocker, gradually withdraw the beta blocker several days before gradually stopping clonidine to minimize adverse reactions.
• Don't stop drug before surgery.
• When drug is given epidurally, carefully monitor infusion pump, and inspect catheter tubing for obstruction or dislodgment.
**Black Box Warning** Epidural clonidine isn't recommended for obstetric, postpartum, or perioperative pain management due to the risk of hemodynamic instability. ■
• ***Look alike–sound alike:*** Don't confuse clonidine with quinidine or clomiphene; or Catapres with Cetapred or Combipres.

## PATIENT TEACHING

• Instruct patient to take drug exactly as prescribed.
• Advise patient that stopping drug abruptly may cause severe rebound high blood pressure. Tell him dosage must be reduced gradually over 2 to 4 days, as instructed by prescriber.
• Tell patient to take the last dose immediately before bedtime.
• Reassure patient that the transdermal patch usually remains attached despite showering and other routine daily activities. Instruct him on the use of the adhesive overlay to provide additional skin adherence, if needed. Also tell him to place patch at a different site each week.
• Caution patient that drug may cause drowsiness but that this adverse effect usually diminishes over 4 to 6 weeks.
• Inform patient that dizziness upon standing can be minimized by rising slowly from a sitting or lying position and avoiding sudden position changes.
• Advise patients that, if they are scheduled for an MRI, they should alert the facility that they are wearing a transdermal patch.

# clopidogrel bisulfate

cloe-PID-oh-grel

Plavix

*Therapeutic class:* Antiplatelet
*Pharmacologic class:* Inhibitor of adenosine diphosphate-induced platelet aggregation
*Pregnancy risk category B*

## AVAILABLE FORMS

*Tablets:* 75 mg, 300 mg

## INDICATIONS & DOSAGES

➤ **To reduce thrombotic events in patients with atherosclerosis documented by recent stroke, MI, or peripheral arterial disease**
*Adults:* 75 mg P.O. daily.
➤ **To reduce thrombotic events in patients with acute coronary syndrome (unstable angina and non–Q-wave MI), including those receiving drugs and those having percutaneous coronary intervention (with or without stent) or coronary artery bypass graft**
*Adults:* Initially, a single 300-mg P.O. loading dose; then 75 mg P.O. once daily. Start and continue aspirin (75 to 325 mg once daily) with clopidogrel.
➤ **ST-segment elevation acute MI**
*Adults:* 75 mg P.O. once daily, with aspirin, with or without thrombolytics. A 300-mg loading dose is optional.
➤ **Loading-dose regimen in patients undergoing coronary stent placement ♦**
*Adults:* 150 to 600 mg P.O., followed by 75 or 150 mg P.O. daily.

## ADMINISTRATION

**P.O.**
• Give drug without regard to meals.

## ACTION

Inhibits the binding of adenosine diphosphate (ADP) to its platelet receptor, impeding ADP-mediated activation and subsequent platelet aggregation, and irreversibly modifies the platelet ADP receptor.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 2 hr | Unknown | 5 days |

*Half-life:* 8 hours.

## ADVERSE REACTIONS

**CNS:** confusion, ***fatal intracranial bleeding,*** hallucinations.
**CV:** hypotension.
**EENT:** epistaxis, rhinitis, taste disorder.
**GI:** ***hemorrhage,*** abdominal pain, constipation, diarrhea, dyspepsia, gastritis, ulcers.
**GU:** UTI, hematuria.
**Hematologic:** purpura.
**Musculoskeletal:** arthralgia, myalgia, arthritis.
**Respiratory:** bronchospasm, interstitial pneumonitis, respiratory tract bleeding.
**Skin:** *rash,* pruritus, bruising, eczema, erythema multiforme, urticaria, ***Stevens-Johnson syndrome, toxic epidermal necrolysis.***
**Other:** flulike syndrome, ***angioedema, anaphylaxis,*** serum sickness.

## INTERACTIONS

**Drug-drug.** *Aspirin, NSAIDs:* May increase risk of GI bleeding. Monitor patient.
***Salicylates:*** May increase the risk of serious bleeding in patients with TIA or ischemic stroke. Avoid use together.
*Warfarin:* May increase risk of bleeding. Use together cautiously.
**Drug-herb.** *Red clover:* May increase risk of bleeding. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those with pathologic bleeding (such as peptic ulcer or intracranial hemorrhage).
- Use cautiously in patients at risk for increased bleeding from trauma, surgery, or other pathologic conditions and in those with renal or hepatic impairment.

***Overdose S&S:*** Prolonged bleeding time, bleeding complications.

C

## NURSING CONSIDERATIONS

**Black Box Warning** Drug effectiveness depends on the drug's activation to an active metabolite by the cytochrome P450 system, principally CYP2C19. Patients who are poor metabolizers exhibit higher cardiovascular event rates following acute coronary syndrome or percutaneous coronary intervention than patients with normal CYP2C19 function. Tests are available to assess a patient's CYP2C19 genotype. Consider alternative treatment for patients identified as poor metabolizers. ■

- Platelet aggregation won't return to normal for at least 5 days after drug has been stopped.

***Alert:*** Drug may cause fatal thrombotic thrombocytopenic purpura (thrombocytopenia, hemolytic anemia, neurologic findings, renal dysfunction, and fever) that requires urgent treatment, including plasmapheresis.

- ***Look alike–sound alike:*** Don't confuse Plavix with Paxil.

## PATIENT TEACHING

- Advise patient it may take longer than usual to stop bleeding. Tell him to refrain from activities in which trauma and bleeding may occur, and encourage him to wear a seat belt when in a car.
- Instruct patient to notify prescriber if unusual bleeding or bruising occurs.
- Tell patient to inform all health care providers, including dentists, before undergoing procedures or starting new drug therapy, that he is taking drug.
- Inform patient that drug may be taken without regard to meals.

# clotrimazole

kloe-TRIM-a-zole

Canesten†, Clotrimaderm†, Cruex ◇, Gyne-Lotrimin ◇, Lotrimin, Lotrimin AF ◇, Mycelex, Mycelex-7 ◇, Trivagizole 3 ◇

*Therapeutic class:* Antifungal
*Pharmacologic class:* Imidazole derivative
*Pregnancy risk category B; C (for lozenges)*

## AVAILABLE FORMS

*Combination pack:* Vaginal tablets 100 mg and vulvar cream 1% ◇, vaginal tablets 200 mg and vulvar cream 1% ◇
*Topical cream:* 1%
*Topical lotion:* 1%
*Topical solution:* 1%
*Troches (lozenges):* 10 mg
*Vaginal cream:* 1% ◇, 2% ◇
*Vaginal suppositories:* 100 mg ◇, 200 mg ◇

## INDICATIONS & DOSAGES

➤ **Superficial fungal infections (tinea corporis, tinea cruris, tinea pedis, tinea versicolor, candidiasis)**

*Adults and children age 2 and older:* Apply thin film and massage into affected and surrounding area, morning and evening, for 2 to 4 weeks. If improvement doesn't occur after 4 weeks, reevaluate patient.

➤ **Vulvovaginal candidiasis**

*Adults and children age 12 and older:* One 100-mg vaginal suppository inserted daily at bedtime for 7 consecutive days. Or, one 200-mg vaginal suppository at bedtime for 3 days. Or, 1 applicatorful of vaginal cream daily at bedtime for 3 days (2%) or 7 days (1%).

➤ **Oropharyngeal candidiasis**

*Adults and children age 3 and older:* Dissolve lozenge in mouth over 15 to 30 minutes five times daily for 14 consecutive days.

➤ **To prevent oropharyngeal candidiasis in patients immunocompromised by chemotherapy, radiotherapy, or corticosteroid therapy in the treatment of leukemia, solid tumors, or renal transplantation**

*Adults:* Dissolve lozenge in mouth over 15 to 30 minutes t.i.d. for duration of chemotherapy or until corticosteroid is reduced to maintenance levels.

## ADMINISTRATION

**P.O.**

- Lozenges should dissolve in mouth and not be chewed, for full benefit.

**Topical**

- Clean and dry area before applying drug.
- Don't use occlusive wrappings or dressings.

**Vaginal**

- Insert suppository high into vagina.
- Applicators for cream and some suppositories are disposable. If not disposable, wash with soap and warm water immediately after use. Rinse thoroughly and dry.

## ACTION

Fungistatic or fungicidal, depending on level. Alters fungal cell-wall permeability and produces osmotic instability.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | 3 hr |
| Topical, vaginal | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**GI:** lower abdominal cramps, nausea and vomiting with lozenges.
**GU:** *mild vaginal burning or irritation,* urinary frequency.
**Skin:** *erythema,* blistering, burning, edema, general irritation, peeling, pruritus, skin fissures, stinging, urticaria.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

- May increase liver enzyme levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Contraindicated for ophthalmic use.

## NURSING CONSIDERATIONS

- Consult prescriber before using topical preparations in children younger than age 2. Don't use troches in children younger than age 3; don't use vaginal preparations in children younger than age 12.
- Watch for irritation or sensitivity; stop if irritation occurs, and notify prescriber.
- Improvement usually occurs within 1 week; if no improvement is seen within 4 weeks, review diagnosis.

## PATIENT TEACHING

- Reassure patient that hypopigmentation from tinea versicolor will resolve gradually.
- Warn patient not to use occlusive wrappings or dressings.
- Warn patient to avoid contact with eyes.
- Caution patient that frequent or persistent yeast infections may suggest a more serious medical problem.
- Tell patient to refrain from sexual intercourse during vaginal treatment.
- Warn patient that topical preparation may stain clothing.
- Tell patient that using a sanitary napkin protects clothing when using vaginal preparation.
- Stress need to continue use of vaginal preparations, as prescribed, even if menstruation begins.
- Tell patient with athlete's foot to change shoes and cotton socks daily and to dry between the toes after bathing.
- Tell patient to allow lozenges to dissolve in mouth and not to chew, for full benefit.
- Stress need to continue treatment for full course and to notify prescriber if no improvement occurs after 4 weeks.

**SAFETY ALERT!**

# clozapine

KLOE-za-peen

Clozaril✐, FazaClo

*Therapeutic class:* Antipsychotic
*Pharmacologic class:* Dibenzapine derivative
*Pregnancy risk category B*

## AVAILABLE FORMS

*Orally disintegrating tablets (ODTs):* 12.5 mg, 25 mg, 100 mg
*Tablets:* 12.5 mg, 25 mg, 50 mg, 100 mg, 200 mg

## INDICATIONS & DOSAGES

➤ **Schizophrenia in severely ill patients unresponsive to other therapies; to reduce risk of recurrent suicidal behavior in schizophrenia or schizoaffective disorders**

*Adults:* Initially, 12.5 mg P.O. once daily or b.i.d. If using the ODT, cut in half and discard the unused half. Adjust dose upward by 25 to 50 mg daily (if tolerated) to 300 to 450 mg daily by end of 2 weeks. Individual dosage is based on clinical response, patient tolerance, and adverse reactions. Subsequent dosage shouldn't be increased more than once or twice weekly and shouldn't exceed 50- to 100-mg increments. Many patients respond to dosages of 200 to 600 mg daily, but some may need as much as 900 mg daily. Don't exceed 900 mg daily.

## ADMINISTRATION

**P.O.**

- Peel the foil from the ODT blister and gently remove the tablet immediately before giving.
- Give ODT with or without water.

## ACTION

Unknown. Binds selectively to dopaminergic receptors in the CNS and may interfere with adrenergic, cholinergic, histaminergic, and serotonergic receptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2½ hr | 4–12 hr |

*Half-life:* Proportional to dose; may range from 8 to 12 hours.

## ADVERSE REACTIONS

**CNS:** *drowsiness, sedation, dizziness, vertigo, headache,* ***seizures,*** syncope, tremor, disturbed sleep or nightmares, restlessness, hypokinesia or akinesia, agitation, rigidity, akathisia, confusion, fatigue, insomnia, hyperkinesia, weakness, lethargy, ataxia, slurred speech, depression, myoclonus, anxiety, fever.
**CV:** *tachycardia,* ***cardiomyopathy, myocarditis, pulmonary embolism, cardiac arrest,*** hypotension, hypertension, chest pain, ECG changes, orthostatic hypotension.
**EENT:** visual disturbances.
**GI:** *constipation, excessive salivation,* dry mouth, nausea, vomiting, heartburn, diarrhea.
**GU:** urinary frequency or urgency, urine retention, incontinence, abnormal ejaculation.
**Hematologic:** ***leukopenia, agranulocytosis, granulocytopenia,*** eosinophilia.
**Metabolic:** *hyperglycemia,* weight gain, hypercholesterolemia, hypertriglyceridemia.
**Musculoskeletal:** muscle pain or spasm, muscle weakness.
**Respiratory:** ***respiratory arrest.***
**Skin:** rash, diaphoresis.

## INTERACTIONS

**Drug-drug.** *Anticholinergics:* May potentiate anticholinergic effects of clozapine. Use together cautiously.
*Antihypertensives:* May potentiate hypotensive effects. Monitor blood pressure.
**Black Box Warning** *Benzodiazepines, other psychotropic drugs:* May increase risk of sedation and CV and respiratory arrest. Use together cautiously. ■
*Bone marrow suppressants:* May increase bone marrow toxicity. Avoid using together.
***Citalopram,*** *fluoroquinolones,* ***fluoxetine, fluvoxamine,*** *paroxetine,* ***sertraline:*** May increase clozapine levels and toxicity. Adjust clozapine dose as needed.
*Digoxin, other highly protein-bound drugs, warfarin:* May increase levels of these drugs. Monitor patient closely for adverse reactions.
*Phenytoin:* May decrease clozapine level and cause breakthrough psychosis. Monitor patient for psychosis and adjust clozapine dosage.
*Psychoactive drugs:* May cause additive effects. Use together cautiously.
*Ritonavir:* May increase clozapine levels and toxicity. Avoid using together.
**Drug-herb.** *St. John's wort:* May decrease drug level. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May increase CNS depression. Discourage use together.
*Smoking:* May decrease drug level. Urge patient to quit smoking. Monitor patient for effectiveness and adjust dosage.

## EFFECTS ON LAB TEST RESULTS

- May increase glucose, cholesterol, and triglyceride levels.
- May increase eosinophil count. May decrease granulocyte and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with uncontrolled epilepsy, history of clozapine-induced agranulocytosis, WBC count below 3,500/mm$^3$, severe CNS depression or coma, paralytic ileus, and myelosuppressive disorders.
- Contraindicated in patients taking other drugs that suppress bone marrow function.
- Use cautiously in patients with prostatic hyperplasia or angle-closure glaucoma because drug has potent anticholinergic effects.

⚠ ***Overdose S&S:*** Altered state of consciousness, drowsiness, delirium, coma, tachycardia, hypotension, respiratory depression or failure, hypersalivation, aspiration pneumonia, cardiac arrhythmias, seizures.

## NURSING CONSIDERATIONS

- ODTs contain phenylalanine.

**Black Box Warning** Drug carries significant risk of agranulocytosis. If possible, give patient at least two trials of standard antipsychotic before starting clozapine. Obtain baseline WBC and differential counts before clozapine therapy. Baseline WBC count must be at least 3,500/mm$^3$ and baseline antineutrophil cytoplasmic

antibody (ANCA) at least 2,000/mm$^3$. Monitor WBC and ANCA values weekly for at least 4 weeks after stopping drug, regardless of how often you were monitoring when therapy stopped. ■

• During the first 6 months of therapy, monitor patient weekly and dispense no more than a 1-week supply of drug. If acceptable WBC and ANCA values [WBC 3,500/mm$^3$ or higher and ANCA 2,000/mm$^3$ or higher] are maintained during the first 6 months of continuous therapy, reduce monitoring to every other week. After 6 months of every-other-week monitoring without interruption by leukopenia, reduce frequency of monitoring WBC and ANCA to monthly.

• If WBC count drops below 3,500/mm$^3$ after therapy begins or if it drops substantially from baseline, monitor patient closely for signs and symptoms of infection. If WBC count is 3,000 to 3,500/mm$^3$ and granulocyte count is above 1,500/mm$^3$, perform WBC and differential count twice weekly. If WBC count drops to 2,000/mm$^3$ to 3,000/mm$^3$ or granulocyte count drops to 1,000/mm$^3$ to 1,500/mm$^3$, interrupt therapy and notify prescriber. Monitor WBC and differential daily until WBC exceeds 3,000/mm$^3$ and ANCA exceeds 1,500/mm$^3$, and monitor patient for signs and symptoms of infection. Continue monitoring WBC and differential counts twice weekly until WBC count exceeds 3,500/mm$^3$ and ANCA exceeds 2,000/mm$^3$. Then, restart therapy with weekly monitoring for 1 year before returning to the usual monitoring schedule of every 2 weeks for 6 months and then every 4 weeks.

• If WBC count drops below 2,000/mm$^3$ and granulocyte count drops below 1,000/mm$^3$, patient may need protective isolation. Bone marrow aspiration may be needed to assess bone marrow function. Future clozapine therapy is contraindicated in these patients.

**Black Box Warning** Drug increases the risk of fatal myocarditis, especially during, but not limited to, the first month of therapy. In patients in whom myocarditis is suspected (unexplained fatigue, dyspnea, tachypnea, chest pain, tachycardia, fever, palpitations, and other signs or symptoms of heart failure or ECG abnormalities, such as ST-T wave abnormalities or arrhythmias), stop therapy immediately and don't restart. ■

***Alert:*** Drug may cause hyperglycemia. Monitor patients with diabetes regularly. In patients with risk factors for diabetes, obtain fasting blood glucose test results at baseline and periodically.

***Alert:*** Monitor patient for metabolic syndrome, including significant weight gain and increased body mass index, hypertension, hyperglycemia, hypercholesterolemia, and hypertriglyceridemia.

• Monitor patient for signs and symptoms of cardiomyopathy.

**Black Box Warning** Orthostatic hypotension, with or without syncope, can occur. Rarely, collapse can be profound and be accompanied by respiratory or cardiac arrest. Orthostatic hypotension is more likely to occur during initial titration with rapid dose escalation. In patients who have had even a brief interval off clozapine (2 or more days since the last dose), start treatment with 12.5 mg once or twice daily. ■

**Black Box Warning** Seizures may occur, especially in patients receiving high doses. ■

• Some patients experience transient fever with temperature higher than 100.4° F (38° C), especially in the first 3 weeks of therapy. Monitor these patients closely.

**Black Box Warning** Drug isn't indicated for use in elderly patients with dementia-related psychoses because of an increased risk for death from CV disease or infection. ■

• After abrupt withdrawal of long-term therapy, abrupt recurrence of psychosis is possible.

• If therapy must be stopped, withdraw drug gradually over 1 or 2 weeks. If changes in patient's medical condition (including development of leukopenia) require that drug be stopped immediately, monitor patient closely for recurrence of psychosis.

• If therapy is reinstated in patients withdrawn from drug, follow usual guidelines for dosage increase. Reexposure of patient to drug may increase severity and risk of adverse reactions. If therapy was stopped because WBC counts were below 2,000/mm$^3$ or granulocyte counts were below 1,000/mm$^3$, don't restart.

● ***Look alike–sound alike:*** Don't confuse clozapine with clonidine, clofazimine, or Klonopin.

## PATIENT TEACHING

● Tell patient about need for weekly blood tests to check for blood-cell deficiency. Advise him to report flulike symptoms, fever, sore throat, lethargy, malaise, or other signs of infection.
● Warn patient to avoid hazardous activities that require alertness and good coordination while taking drug.
● Tell patient to check with prescriber before taking alcohol or OTC drugs.
● Advise patient that smoking may decrease drug effectiveness.
● Tell patient to rise slowly to avoid dizziness.
● Tell patient to keep ODTs in the blister package until he is ready to take them.
● Inform patient that ice chips or sugarless candy or gum may help relieve dry mouth.

**SAFETY ALERT!**

# codeine phosphate

koe-DEEN

# codeine sulfate

*Therapeutic class:* Opioid analgesic
*Pharmacologic class:* Opioid
*Pregnancy risk category C*
*Controlled substance schedule II*

## AVAILABLE FORMS

**codeine phosphate**
*Injection:* 15 mg/ml, 30 mg/ml, 60 mg/ml†
*Oral solution:* 15 mg/5 ml
*Tablets:* 15 mg†, 30 mg†
**codeine sulfate**
*Tablets:* 15 mg, 30 mg, 60 mg

## INDICATIONS & DOSAGES

➤ **Mild to moderate pain**
*Adults:* 15 to 60 mg P.O. or 15 to 60 mg (phosphate) subcutaneously, I.M., or I.V. every 4 to 6 hours p.r.n.
*Children older than age 1:* 0.5 mg/kg P.O., subcutaneously, or I.M. every 4 to 6 hours p.r.n. Don't give I.V. in children.

## ADMINISTRATION

**P.O.**
● Give drug with milk or meals to avoid GI upset.
**I.V.**
▼ Don't give discolored solution.
▼ Give drug by direct injection into a large vein. Give very slowly.
▼ **Incompatibilities:** Aminophylline, ammonium chloride, amobarbital, bromides, chlorothiazide, heparin, iodides, pentobarbital, phenobarbital, phenytoin, salts of heavy metals, sodium bicarbonate, sodium iodide, thiopental.
**I.M.**
● Document injection site.
**Subcutaneous**
● Assess injection site for local irritation, pain, and induration.

## ACTION

May bind with opioid receptors in the CNS, altering perception of and emotional response to pain. Also suppresses the cough reflex by direct action on the cough center in the medulla.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30–45 min | 1–2 hr | 4–6 hr |
| I.V. | Immediate | Immediate | 4–6 hr |
| I.M. | 10–30 min | 30–60 min | 4–6 hr |
| Subcut. | 10–30 min | Unknown | 4–6 hr |

*Half-life:* 2½ to 4 hours.

## ADVERSE REACTIONS

**CNS:** *clouded sensorium, sedation,* dizziness, euphoria, light-headedness, physical dependence.
**CV:** ***bradycardia,*** flushing, hypotension.
**GI:** *constipation,* dry mouth, ileus, nausea, vomiting.
**GU:** urine retention.
**Respiratory:** ***respiratory depression.***
**Skin:** *diaphoresis,* pruritus.

## INTERACTIONS

**Drug-drug.** *CNS depressants, general anesthetics, hypnotics, MAO inhibitors, other opioid analgesics, sedatives, tranquilizers, tricyclic antidepressants:* May cause additive effects. Use together cautiously; monitor patient response.

**Drug-lifestyle.** *Alcohol use:* May cause additive effects. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

- May increase amylase and lipase levels.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- I.V. use contraindicated in children.
- Use cautiously in elderly or debilitated patients and in those with head injury, increased intracranial pressure, increased CSF pressure, hepatic or renal disease, hypothyroidism, Addison disease, acute alcoholism, seizures, severe CNS depression, bronchial asthma, COPD, respiratory depression, and shock.
- Don't administer drug during labor when delivery of a premature infant is anticipated.

***Alert:*** Breast-feeding mothers may put their infants at increased risk of morphine overdose if the mother is an ultra-rapid codeine metabolizer.

***Overdose S&S:*** CNS depression, respiratory depression, apnea, flaccid skeletal muscles, bradycardia, hypotension, circulatory collapse, death.

### NURSING CONSIDERATIONS

- Reassess patient's level of pain at least 15 and 30 minutes after use.
- Codeine and aspirin or acetaminophen are commonly prescribed together to provide enhanced pain relief.
- For full analgesic effect, give drug before patient has intense pain.
- Drug is an antitussive and shouldn't be used when cough is a valuable diagnostic sign or is beneficial (as after thoracic surgery).
- Monitor cough type and frequency.
- Monitor respiratory and circulatory status.
- Opioids may cause constipation. Assess bowel function and need for stool softeners and stimulant laxatives.
- Codeine may delay gastric emptying, increase biliary tract pressure from contraction of the sphincter of Oddi, and interfere with hepatobiliary imaging studies.
- ***Look alike–sound alike:*** Don't confuse codeine with Cardene, Lodine, or Cordran.

### PATIENT TEACHING

- Advise patient that GI distress caused by taking drug P.O. can be eased by taking drug with milk or meals.
- Instruct patient to ask for or to take drug before pain is intense.
- Caution ambulatory patient about getting out of bed or walking. Warn outpatient to avoid driving and other hazardous activities that require mental alertness until drug's effects on the CNS are known.
- Advise patient to avoid alcohol during therapy.
- Warn breast-feeding woman to watch for increased sleepiness, difficulty breast-feeding, or breathing, or limpness of infant. Tell her to immediately seek medical attention if this occurs.

## colchicine

KOL-chih-seen

Colcrys

*Therapeutic class:* Antigout
*Pharmacologic class: Colchicum autumnale* alkaloid
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 0.6 mg

### INDICATIONS & DOSAGES

✷ ***NEW INDICATION:*** **Prevention of gout flares**

*Adults:* 0.6 mg P.O. once or twice daily. Maximum daily dose is 1.2 mg.

➤ **Gout flares**

*Adults:* 1.2 mg P.O. at first sign of a flare, followed by 0.6 mg 1 hour later; maximum dosage is 1.8 mg over a 1-hour period.

➤ **Familial Mediterranean fever (FMF)**

*Adults:* 1.2 to 2.4 mg P.O. daily; may increase by 0.3 mg/day to maximum daily dosage given once daily or b.i.d.

*Adolescents older than age 12:* 1.2 to 1.8 mg P.O. once daily or in two divided doses.

*Children ages 6 to 12:* 0.9 to 1.8 mg P.O. once daily or in two divided doses.

*Children ages 4 to 6:* 0.3 to 1.8 mg P.O. once daily or in two divided doses.

***Adjust-a-dose:*** For patients with creatinine clearance of less than 30 ml/minute, repeat treatment for gout flares no more than once every 2 weeks; for FMF, initially 0.3 mg/day, carefully increasing dosage as needed.

➤ **Acute pericarditis ♦**

*Adults:* Initial loading dose of 1 to 2 mg P.O. daily, followed by maintenance dose of 0.5 to 1 mg P.O. daily for at least 3 months.

➤ **Recurrent pericarditis ♦**

*Adults:* Initial loading dose of 1 to 3 mg P.O. daily, followed by maintenance dose of 0.5 to 2 mg P.O. daily for at least 6 months.

## ADMINISTRATION

**P.O.**

- Give drug with or without food.

## ACTION

Exact mechanism of action is not fully known; thought to involve a reduction in lactic acid produced by leukocytes, reducing uric acid deposits and phagocytosis, thereby decreasing the inflammatory process.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 hr | Unknown |

*Half-life:* 27 to 31 hours.

## ADVERSE REACTIONS

**CNS:** fatigue, headache.
**EENT:** pharyngolaryngeal pain.
**GI:** *diarrhea, nausea, vomiting.*
**Hematologic:** aplastic anemia, granulocytopenia, leukopenia, pancytopenia, thrombocytopenia.
**Other:** gout.

## INTERACTIONS

**Drug-drug.** *Acidifying agents:* May inhibit action of colchicine. Avoid use together.
*Alkalinizing agents:* May increase action of colchicine. Avoid use together.
*CNS depressants, sympathomimetics (such as phenylephrine):* May increase sensitivity to these drugs. Monitor patient closely and adjust dosage as needed.
*Digoxin, HMG-CoA reductase inhibitors (such as atorvastatin, simvastatin):* May increase risk of myopathy or rhabdomyolysis. Avoid use together. If co-administration can't be avoided, monitor patient carefully. Discontinue colchicine if signs or symptoms occur.
*Moderate CYP3A4 inhibitors (such as amprenavir, aprepitant, diltiazem, erythromycin, fluconazole, fosamprenavir, verapamil), P-gp inhibitors (such as cyclosporine, ranolazine), strong CYP3A4 inhibitors (such as atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin):* May increase colchicine level, increasing the risk of toxic effects. Reduce colchicine dose, if alternative treatment isn't available.
**Drug-food.** *Grapefruit juice:* May increase drug level. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase AST, ALT, and CK levels.
- May decrease hemoglobin and hematocrit levels.
- May decrease leukocyte, granulocyte, and platelet counts.
- May cause false-positive results when urine is tested for RBCs or hemoglobin.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with renal or hepatic impairment who are taking P-gp or strong CYP3A4 inhibitors.
- Use only during pregnancy if benefit to patient outweighs risk to fetus.
- Drug appears in breast milk; patient shouldn't breast-feed while taking drug.

⚠ ***Overdose S&S:*** Abdominal pain, nausea, vomiting, diarrhea, hypovolemia, multiorgan failure, death.

## NURSING CONSIDERATIONS

- Safety and efficacy of repeat treatment for gout flares haven't been established.
- Drug isn't an analgesic and shouldn't be used to treat pain from other causes.
- Obtain baseline laboratory studies, including CBC, before starting therapy and periodically thereafter; watch for myelosuppression, leukopenia, granulocytopenia, thrombocytopenia, pancytopenia, and aplastic anemia.
- Monitor patient who has used drug for a prolonged period for neuromuscular toxicity and rhabdomyolysis.

• When used for gout prophylaxis, colchicine must be given with allopurinol or a uricosuric drug (such as probenecid) to decrease serum uric acid level. However, colchicine should be started before the other agent because a sudden change in uric acid level may cause a gout attack.

### PATIENT TEACHING

• Tell patient that drug can be taken without regard to food.
• Advise female patient not to breast-feed and to use an alternative method for feeding the baby.
• Advise patient to report muscle pain or weakness, tingling or numbness in fingers or toes, unusual bleeding or bruising, increased infections, weakness, tiredness, severe diarrhea or vomiting, or cyanosis.

## colesevelam hydrochloride

koe-leh-SEVE-eh-lam

WelChol

*Therapeutic class:* Antilipemic
*Pharmacologic class:* Bile acid sequestrant
*Pregnancy risk category B*

### AVAILABLE FORMS

*Oral suspension:* 1.875-g, 3.75-g packets
*Tablets:* 625 mg

### INDICATIONS & DOSAGES

➤ **Adjunct to diet and exercise, either alone or with an HMG-CoA reductase inhibitor, to reduce elevated LDL cholesterol in patients with primary hypercholesterolemia (Fredrickson type IIa)**

*Adults:* 3 tablets (1,875 mg) P.O. b.i.d. or 6 tablets (3,750 mg) once daily. Or, one 1.875-g packet P.O. b.i.d. or one 3.75-g packet P.O. once daily.

*Children ages 10 to 17:* One 1.875-g packet P.O. b.i.d. with meals or one 3.75-g packet P.O. once daily with a meal.

➤ **Adjunct to diet and exercise to improve glycemic control in type 2 diabetes mellitus**

*Adults:* 3 tablets (1,875 mg) P.O. b.i.d. or 6 tablets (3,750 mg) P.O. once daily. Or, one 1.875-g packet P.O. b.i.d. or one 3.75-g packet P.O. once daily.

### ADMINISTRATION

**P.O.**

• Give drug with a meal and plenty of fluids.
• Store tablets at room temperature and protect them from moisture.
• Empty entire contents of one packet into glass and add 4 to 8 ounces of water. Stir well and give immediately.

### ACTION

Binds bile acids in the intestinal tract, impeding their absorption and causing their elimination in feces. In response to this bile acid depletion, LDL cholesterol levels decrease as the liver uses LDL cholesterol to replenish reduced bile acid stores.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 wk | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CNS:** *headache*, asthenia, pain.
**EENT:** pharyngitis, rhinitis, sinusitis.
**GI:** *constipation*, *flatulence*, abdominal pain, diarrhea, dyspepsia, nausea.
**Musculoskeletal:** back pain, myalgia.
**Respiratory:** increased cough.
**Other:** *infection*, accidental injury, flulike syndrome.

### INTERACTIONS

*Glyburide:* May decrease glyburide level. Administer glyburide at least 4 hours prior to colesevelam.
*Hormonal contraceptives containing ethinyl estradiol and norethindrone:* May decrease levels of these contraceptives. Administer hormonal contraceptive at least 4 hours prior to colesevelam.
*Phenytoin:* May decrease phenytoin level and increase seizure activity. Administer phenytoin 4 hours prior to colesevelam and monitor phenytoin level.
*Thyroid hormones:* Coadministration may increase thyroid-stimulating hormone level. Administer thyroid hormone replacement 4 hours prior to colesevelam.
*Warfarin:* May decrease INR. Monitor INR and patient closely.

## EFFECTS ON LAB TEST RESULTS

● May increase triglyceride levels.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or any of its components, in patients with triglyceride levels greater than 500 mg/dl, and in patients with bowel obstruction.
● Contraindicated for glymemic control in patients with type I diabetes and for the treatment of diabetic ketoacidosis.
● Use cautiously in patients susceptible to vitamin K or fat-soluble vitamin deficiencies and in patients with swallowing disorders, severe GI motility disorders, or major GI tract surgery.
● Use cautiously in patients with triglyceride levels greater than 300 mg/dl.
⚠ ***Overdose S&S:*** Severe local GI reactions, especially constipation.

## NURSING CONSIDERATIONS

● Before starting drug, assess patient for underlying causes of hypercholesterolemia, such as poorly controlled diabetes, hypothyroidism, nephrotic syndrome, dysproteinemias, obstructive liver disease, other drug therapy, and alcoholism.
● Monitor patient's bowel habits. If severe constipation develops, decrease dosage, add a stool softener, or stop drug.
● Monitor the effects of patient's other drugs to identify drug interactions.
● Monitor INR and total and LDL cholesterol and triglyceride levels periodically during therapy.
● Use only when clearly needed in breast-feeding women because it's not known if drug appears in breast milk.

## PATIENT TEACHING

● Instruct patient to take drug with a meal and plenty of fluids.
● Teach patient to monitor bowel habits. Encourage a diet high in fiber and fluids. Instruct patient to notify prescriber promptly if severe constipation develops.
● Encourage patient to follow prescribed diet, exercise, and monitoring of cholesterol and triglyceride levels.
● Tell patient to notify prescriber if she's pregnant or breast-feeding.

✳ ***NEW DRUG***

# collagenase *Clostridium histolyticum*

kuh-LAJ-eh-nase
klos-TRID-ee-um
hiss-toe-LIH-teh-kum

Xiaflex

*Therapeutic class:* Anticollagen drug
*Pharmacologic class:* Enzyme
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 0.9-mg single-use vial

## INDICATIONS & DOSAGES

➤ **Dupuytren's contracture with palpable cord**

*Adults:* 0.58 mg injected into palpable cord with contracture of metacarpophalangeal (MP) joint or proximal interphalangeal (PIP) joint. May repeat up to three times per cord at 4-week intervals.

## ADMINISTRATION

**Intradermal**

● Reconstitute drug, supplied as a lyophilized powder, with provided diluent before use.
● Before use, remove vial containing lyophilized powder and vial containing diluent for reconstitution from refrigerator and allow both vials to stand at room temperature for at least 15 minutes and no longer than 60 minutes.
● After removal of flip-off cap from each vial and while using aseptic technique, swab rubber stopper and surrounding surface of vial containing drug and vial containing diluent for reconstitution with sterile alcohol (don't use other antiseptics).
● Use only supplied diluent for reconstitution; diluent contains calcium, which is required for activity of drug. Using 1-ml syringe that contains 0.01-ml graduations with 27-gauge, ½-inch needle (not supplied), withdraw volume of diluent needed. Inject diluent slowly into sides of vial containing lyophilized powder. Don't invert vial or shake solution. Slowly swirl solution to ensure that all of lyophilized powder has gone into solution.

• Administration of local anesthetic before injection isn't recommended because it may interfere with proper placement of injection.

## ACTION

Hydrolyzes collagen disrupting Dupuytren's cord.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Intralesional | Immediate | Not applicable | Not applicable |

*Half-life:* Not applicable.

## ADVERSE REACTIONS

**CV:** *peripheral edema.*
**Hematologic:** *lymphadenopathy,* lymph node pain.
**Musculoskeletal:** axillary pain, *extremity pain.*
**Skin:** *ecchymosis,* erythema, *injection-site reactions (hemorrhage, swelling, tenderness),* laceration, *pruritus.*
**Other:** *contusion.*

## INTERACTIONS

**Drug-drug.** *Anticoagulants (clopidogrel, enoxaparin, heparin, warfarin):* May increase risk of injection-site hemorrhage. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

• It isn't known if drug appears in breast milk. Use cautiously in breast-feeding women.
• Safety and effectiveness in children haven't been established.
⚠ ***Overdose S&S:*** Tendon rupture.

## NURSING CONSIDERATIONS

• Drug should be administered by health care provider experienced in injection procedures of the hand and in treatment of Dupuytren's contracture.
• Finger extension should be performed 24 hours after injection if contracture persists.
• Only one cord should be injected at a time; if other palpable cords with contracture of MP or PIP joint exist, cords may be injected in sequential order.
• Monitor patient for severe allergic reactions (hypotension, respiratory distress, end-organ dysfunction).
• Monitor patient for swelling, bruising, bleeding, or pain at injection site and surrounding tissue.
• Monitor patient for signs and symptoms of tendon rupture (sensory changes in treated finger or trouble bending finger) after swelling decreases.

## PATIENT TEACHING

• Warn patient that tendon rupture, a rare but serious complication, may occur after injection.
• Tell patient that swelling, bruising, bleeding, and pain may occur at injection site and surrounding tissue after injection.
• Advise patient to report signs and symptoms of infection (fever, chills, increased redness or swelling), sensory changes in treated finger (numbness, tingling, increased pain), or difficulty bending finger after swelling decreases.
• Warn patient to avoid manipulating injected cord.
• Instruct patient to avoid flexing or extending fingers of injected hand.
• Tell patient to keep injected hand elevated until bedtime.
• Advise patient to return to health care provider on day after injection for examination of injected finger and for finger-extension procedure, if needed.
• Instruct patient to perform finger flexion and extension exercises daily and to wear splint at bedtime for up to 4 months after finger-extension procedure.
• Advise patient to avoid strenuous activity with injected hand until recommended by prescriber.

# conivaptan hydrochloride

kah-nih-VAP-tan

Vaprisol

*Therapeutic class:* Vasopressin antagonist
*Pharmacologic class:* Arginine vasopressin receptor antagonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 20 mg/4 ml
*Injection (premixed):* 0.2 mg/ml in 100 ml $D_5W$

## INDICATIONS & DOSAGES

➤ **Euvolemic hyponatremia (as from SIADH, hypothyroidism, adrenal insufficiency, pulmonary disorders) and hypervolemic hyponatremia in hospitalized patients**

*Adults:* Loading dose of 20 mg I.V. over 30 minutes; then 20 mg I.V. by continuous infusion over 24 hours for 1 to 3 days. If sodium level isn't rising at desired rate, increase to 40 mg/day by continuous infusion. Don't give for more than 4 days after loading dose.

***Adjust-a-dose:*** If sodium level rises more than 12 mEq/L in 24 hours, stop infusion. If hyponatremia persists or recurs and the patient has had no adverse neurologic effects from the rapid rise in sodium level, restart infusion at a reduced dose. If patient develops hypotension or hypovolemia, stop infusion. Monitor vital signs and volume status often. If hyponatremia persists once the patient is no longer hypotensive and volume returns to normal, restart infusion at a reduced dose.

## ADMINISTRATION

**I.V.**

▼ Dilute only with $D_5W$. For the loading dose, add 20 mg to 100 ml of $D_5W$. Gently invert bag to ensure complete mixing. Infuse over 30 minutes. For continuous infusion, add 40 mg to 250 ml of $D_5W$. Gently invert bag to ensure complete mixing. Infuse over 24 hours.

▼ Give via a large vein, and change infusion site every 24 hours.

▼ Solution is stable for 24 hours at room temperature.

▼ Protect premixed solution from light until ready to use.

▼ **Incompatibilities:** Lactated Ringer's solution, normal saline solution. Don't mix or infuse with other I.V. drugs.

## ACTION

Increases free water eliminated by kidneys, inhibiting inappropriate or excessive arginine vasopressin (antidiuretic hormone) secretion. Typically, this causes increased net fluid loss, increased urine output, and decreased urine osmolality.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | 2–4 hr | 12 hr |

*Half-life:* 5 hours.

## ADVERSE REACTIONS

**CNS:** *headache*, confusion, fever, insomnia.
**CV:** atrial fibrillation, hypertension, hypotension, orthostatic hypotension.
**EENT:** pharyngolaryngeal pain.
**GI:** constipation, diarrhea, dry mouth, nausea, oral candidiasis, *vomiting.*
**GU:** frequency, hematuria, polyuria, UTI.
**Hematologic:** anemia.
**Metabolic:** ***hypoglycemia,*** hypokalemia, dehydration, hyperglycemia, ***hypomagnesemia,*** hyponatremia.
**Respiratory:** pneumonia.
**Skin:** erythema.
**Other:** *infusion site reactions, thirst.*

## INTERACTIONS

**Drug-drug.** *Amlodipine:* May increase amlodipine level and half-life. Monitor blood pressure.
*Digoxin:* May increase digoxin level. Monitor patient, and adjust digoxin dose, as needed.
*Midazolam:* May increase midazolam level. Monitor patient for respiratory depression and hypotension.
*Potent CYP3A4 inhibitors (clarithromycin, indinavir, itraconazole, ketoconazole, ritonavir):* May seriously increase levels and toxic effects. Use together is contraindicated.

*Simvastatin:* May increase simvastatin level. Monitor patient for signs of rhabdomyolysis, including muscle pain, weakness, and tenderness.

### EFFECTS ON LAB TEST RESULTS

• May decrease potassium, magnesium, sodium, and hemoglobin levels and hematocrit. May increase or decrease blood glucose level.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients with hypovolemic hyponatremia; patients hypersensitive to drug or its components, corn, or corn products; and those taking potent CYP3A4 inhibitors, such as clarithromycin, indinavir, itraconazole, ketoconazole, or ritonavir.
• Use cautiously in hyponatremic patients with underlying heart failure and patients with hepatic or renal impairment.
⚠ ***Overdose S&S:*** Hypotension, thirst.

### NURSING CONSIDERATIONS

• Monitor sodium level and neurologic status regularly during therapy.
***Alert:*** Rapid correction of sodium level may cause osmotic demyelination syndrome. Monitor patient's sodium level and volume status.
• Drug may cause significant infusion site reactions, even with proper dilution and administration. Rotate infusion site every 24 hours to reduce risk of reaction.

### PATIENT TEACHING

• Inform patient that he may experience low blood pressure when standing. If he feels dizzy or faint, advise him to sit or lie down.
• Advise patient to promptly report signs and symptoms of hypoglycemia, such as feeling shaky, nervous, tired, sweaty, cold, hungry, confused, irritable, or impatient.
• Emphasize the importance of reporting an unusually fast heartbeat or weakness.
• Tell patient that analgesics and moist heating pads can be used to treat pain and inflammation at the infusion site.
• Inform patient that the infusion will be given for a maximum of 4 days after the loading dose.

## crotamiton

kroe-TAM-ih-tuhn

Eurax

*Therapeutic class:* Scabicide, pediculicide
*Pharmacologic class:* Scabicide
*Pregnancy risk category C*

C

### AVAILABLE FORMS

*Cream:* 10%
*Lotion:* 10%

### INDICATIONS & DOSAGES

➤ **Parasitic infestation (scabies)**

*Adults:* Scrub entire body with soap and water. Remove scales or crusts. Then apply thin layer of cream over entire body, from chin down (with special attention to skinfolds, creases, interdigital spaces, and genital area). Apply second coat in 24 hours. Change clothing and bed linen the next morning. Wait another 48 hours; then wash off. If retreatment is needed, use an alternative regimen.

➤ **Itching**

*Adults:* Apply locally, massaging gently into affected area until completely absorbed; repeat p.r.n.

### ADMINISTRATION

**Topical**

• Shake product well before each use.
• Don't apply to face, eyes, mucous membranes, or urethral opening.
• If accidental contact with eyes occurs, flush with water and notify prescriber.

### ACTION

Scabicidal and antipruritic actions; mechanism unknown.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**Skin:** *irritation,* allergic skin sensitivity.

### INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS
● None reported.

## CONTRAINDICATIONS & CAUTIONS
● Contraindicated in patients hypersensitive to drug or its components and in those whose skin is raw or inflamed.

## NURSING CONSIDERATIONS
● Estimate amount of cream needed per application; most patients tend to overuse scabicides. For most adults, a single tube of cream is enough for two applications.
● Don't apply drug to acutely inflamed or raw, weeping areas.
● Apply topical corticosteroids, as prescribed, if dermatitis develops from scratching.
● Make sure hospitalized patients are placed in isolation, with special linen-handling precautions, until treatment is completed.
● Treat sexual contacts simultaneously.
● ***Look alike–sound alike:*** Don't confuse Eurax with Serax or Urex.

## PATIENT TEACHING
● Tell patient or family member to shake product well before each use.
● Teach patient or family member how to apply drug. Tell patient not to apply to face, eyes, mucous membranes, or urethral opening. If accidental contact with eyes occurs, tell patient to flush with water and notify prescriber.
● Tell patient to stop using drug, wash it off skin, and notify prescriber immediately if skin irritation or hypersensitivity develops.
● Instruct patient to change all clothing and bed linens the next day and to launder them in hot cycle of washing machine or dry clean them.
● Instruct patient to reapply drug if it's washed off during treatment time.
● Tell patient to warn other family members and sexual contacts about infestation.
● Reassure patient that although itching may continue for several weeks, it will stop; continued itching doesn't indicate that therapy is ineffective.

# cyclobenzaprine hydrochloride

sye-kloe-BEN-za-preen

Amrix, Flexeril

*Therapeutic class:* Skeletal muscle relaxant
*Pharmacologic class:* Tricyclic antidepressant derivative
*Pregnancy risk category B*

## AVAILABLE FORMS
*Capsules (extended-release):* 15 mg, 30 mg
*Tablets:* 5 mg, 7.5 mg, 10 mg

## INDICATIONS & DOSAGES
➤ **Adjunct to rest and physical therapy to relieve muscle spasm from acute, painful musculoskeletal conditions**
*Adults and children age 15 and older:* 5 mg P.O. t.i.d. Based on response, dose may be increased to 10 mg t.i.d. Don't exceed 60 mg/day. Or, 15 to 30 mg extended-release capsule P.O. once daily. Use for longer than 2 or 3 weeks isn't recommended.
***Adjust-a-dose:*** In elderly patients and in those with mild hepatic impairment, start with 5-mg conventional tablets and adjust slowly upward. Drug isn't recommended in patients with moderate to severe hepatic impairment. Don't use extended-release capsules in the elderly or those with impaired hepatic function.

## ADMINISTRATION
**P.O.**
● Don't split the generic 10-mg tablets because of the high risk of inconsistent doses.
● Give extended-release capsules whole; don't crush or break.

## ACTION
Unknown. Relieves skeletal muscle spasm of local origin without disrupting muscle function.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 4 hr | 12–24 hr |
| P.O. (extended-release) | 1.5 hr | 7–8 hr | Unknown |

*Half-life:* 1 to 3 days; 32 hours for extended-release capsules.

## ADVERSE REACTIONS

**CNS:** *dizziness*, *drowsiness*, ***seizures,*** *headache*, tremor, insomnia, fatigue, asthenia, nervousness, confusion, paresthesia, depression, attention disturbances, dysarthria, ataxia, syncope.
**CV:** ***arrhythmias,*** palpitations, hypotension, tachycardia.
**EENT:** visual disturbances, blurred vision.
**GI:** *dry mouth*, dyspepsia, abnormal taste, constipation, nausea.
**Skin:** rash, pruritus, acne.

## INTERACTIONS

**Drug-drug.** *CNS depressants:* May increase CNS depression. Avoid using together.
*Guanethidine:* May block guanethidine's antihypertensive effect. Monitor patient's blood pressure.
*MAO inhibitors:* May cause hyperpyretic crisis, seizures, and death when MAO inhibitors are used with tricyclic antidepressants; may also occur with cyclobenzaprine. Avoid using within 2 weeks of MAO inhibitor therapy.
*Naproxen:* May increase drowsiness. Make patient aware of this interaction.
*Tramadol:* May increase risk of seizures. Use together cautiously.
**Drug-lifestyle.** *Alcohol use:* May increase CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug; in those with hyperthyroidism, heart block, arrhythmias, conduction disturbances, or heart failure; in those who have received MAO inhibitors within 14 days; and in those in the acute recovery phase of an MI.
- Use cautiously in elderly or debilitated patients and in those with a history of urine retention, acute angle-closure glaucoma, or increased intraocular pressure.
- Safety and effectiveness in children younger than age 15 haven't been established.

***Overdose S&S:*** Drowsiness, tachycardia, tremor, agitation, coma, ataxia, hypertension, slurred speech, confusion, dizziness, nausea, vomiting, hallucinations, cardiac arrest, chest pain, cardiac arrhythmias, ECG changes (changes in QRS axis or width).

## NURSING CONSIDERATIONS

- Drug may cause toxic reactions similar to those of tricyclic antidepressants. Observe same precautions as when giving tricyclic antidepressants.
- Monitor patient for nausea, headache, and malaise, which may occur if drug is stopped abruptly after long-term use.

***Alert:*** Notify prescriber immediately of signs and symptoms of overdose, including cardiac toxicity.

- ***Look alike–sound alike:*** Don't confuse Flexeril with Floxin.

## PATIENT TEACHING

- Advise patient to report urinary hesitancy or urine retention. If constipation is a problem, suggest that patient increase fluid intake and use a stool softener.
- Warn patient to avoid activities that require alertness until CNS effects of drug are known.
- Warn patient not to combine with alcohol or other CNS depressants, including OTC cold or allergy remedies.
- Instruct patient not to split the generic 10-mg tablets because of the high risk of inconsistent doses.

**SAFETY ALERT!**

# cyclophosphamide

sye-kloe-FOSS-fa-mide

Cytoxan, Procytox†

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Nitrogen mustard
*Pregnancy risk category D*

## AVAILABLE FORMS

*Injection:* 500-mg, 1-g, 2-g vials
*Tablets:* 25 mg, 50 mg

## INDICATIONS & DOSAGES

➤ **Breast or ovarian cancer, Hodgkin lymphoma, chronic lymphocytic leukemia, chronic myelocytic leukemia, acute lymphoblastic leukemia, acute myelocytic and monocytic leukemia, neuroblastoma, retinoblastoma, malignant lymphoma, multiple myeloma, mycosis fungoides, sarcoma**

*Adults and children:* Initially for induction, 40 to 50 mg/kg I.V. in divided doses over 2 to 5 days. Or, 10 to 15 mg/kg I.V. every 7 to 10 days, 3 to 5 mg/kg I.V. twice weekly, or 1 to 5 mg/kg P.O. daily, based on patient tolerance.

Adjust subsequent doses according to evidence of antitumor activity or leukopenia.

➤ **Minimal-change nephrotic syndrome**

*Children:* 2.5 to 3 mg/kg P.O. daily for 60 to 90 days.

## ADMINISTRATION

**P.O.**

● Don't give drug at bedtime; infrequent urination during the night may increase possibility of cystitis.

**I.V.**

▼ Preparing and giving parenteral form of drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.

▼ Reconstitute powder using sterile water for injection or bacteriostatic water for injection containing only parabens.

▼ Add 25 ml to 500-mg vial, 50 ml to 1-g vial, or 100 ml to 2-g vial to produce a solution containing 20 mg/ml. Shake vigorously to dissolve. If powder doesn't dissolve completely, let vial stand for a few minutes.

▼ Check reconstituted solution for small particles. Filter solution, if needed.

▼ Give by direct I.V. injection or infusion.

▼ For infusion, further dilute with $D_5W$, dextrose 5% in normal saline solution for injection, dextrose 5% in Ringer's injection, lactated Ringer's injection, sodium lactate injection, or half-normal saline solution for injection.

▼ Reconstituted solution is stable 6 days if refrigerated or 24 hours at room temperature. Use stored solutions cautiously because drug contains no preservatives.

▼ **Incompatibilities:** Amphotericin B cholesteryl sulfate complex.

## ACTION

Cross-links strands of cellular DNA and interferes with RNA transcription, causing an imbalance of growth that leads to cell death. Not specific to cell cycle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |
| I.V. | Unknown | 2–3 hr | Unknown |

*Half-life:* 3 to 12 hours.

## ADVERSE REACTIONS

**CV:** ***cardiotoxicity with very high doses and with doxorubicin.***
**GI:** *nausea and vomiting,* anorexia, stomatitis.
**GU:** **HEMORRHAGIC CYSTITIS,** impaired fertility.
**Hematologic:** **LEUKOPENIA,** ***thrombocytopenia,*** anemia.
**Hepatic:** ***hepatotoxicity.***
**Metabolic:** hyperuricemia, SIADH.
**Respiratory:** ***pulmonary fibrosis with high doses.***
**Skin:** *alopecia.*
**Other:** ***secondary malignant disease, anaphylaxis,*** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Allopurinol, myelosuppressives:* May increase myelosuppression. Monitor patient for toxicity.

*Anticoagulants:* May increase anticoagulant effect. Monitor patient for bleeding.

*Aspirin, NSAIDs:* May increase risk of bleeding. Avoid using together.
*Barbiturates:* May enhance cyclophosphamide toxicity. Monitor patient closely.
*Cardiotoxic drugs:* May increase adverse cardiac effects. Monitor patient for toxicity.
*Chloramphenicol, corticosteroids:* May reduce activity of cyclophosphamide. Use together cautiously.
*Ciprofloxacin:* May decrease antimicrobial effect. Monitor patient for effect.
*Digoxin:* May decrease digoxin level. Monitor level closely.
*Quinolones:* May decrease the antimicrobial effects of quinolones. Monitor patient.
*Succinylcholine:* May prolong neuromuscular blockade. Avoid using together.
*Thiazide diuretics:* May prolong antineoplastic-induced leukopenia. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

- May increase uric acid level. May decrease hemoglobin and pseudocholinesterase levels.
- May decrease platelet, RBC, and WBC counts.
- May suppress positive reaction to *Candida*, mumps, *Trichophyton*, and tuberculin skin test results. May cause a false-positive Papanicolaou test result.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with severe bone marrow suppression.
- Use cautiously in patients with leukopenia, thrombocytopenia, malignant cell infiltration of bone marrow, or hepatic or renal disease and in those who have recently undergone radiation therapy or chemotherapy.

⚠ ***Overdose S&S:*** Infection, myelosuppression, cardiotoxicity.

## NURSING CONSIDERATIONS

- If cystitis occurs, stop drug and notify prescriber. Cystitis can occur months after therapy ends. Mesna may be given to reduce frequency and severity of bladder toxicity. Test urine for blood.
- Adequately hydrate patients before and after dose to decrease risk of cystitis.
- Use caution to ensure correct dose to decrease risk of cardiac toxicity.
- Monitor CBC and renal and liver function test results.
- Monitor patient closely for leukopenia (nadir between days 8 and 15, recovery in 17 to 28 days).
- Monitor uric acid level. To prevent hyperuricemia with resulting uric acid nephropathy, allopurinol may be used with adequate hydration.
- To prevent bleeding, avoid all I.M. injections when platelet count is less than 50,000/$mm^3$.
- Anticipate blood transfusions because of cumulative anemia.
- Therapeutic effects are often accompanied by toxicity.
- In boys, using drug for nephrotic syndrome for more than 60 days increases the incidence of oligospermia and azoospermia. Use for more than 90 days increases the risk of sterility.
- Drug may be used to treat nononcologic disorders, such as lupus, nephritis, and rheumatoid arthritis.

## PATIENT TEACHING

- Warn patient that hair loss is likely to occur but is reversible.
- Advise patient to watch for signs and symptoms of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell patient to take temperature daily.
- Instruct patient to avoid OTC products that contain aspirin.
- To minimize risk of hemorrhagic cystitis, encourage patient to urinate every 1 to 2 hours while awake and to drink at least 3 L of fluid daily.
- If patient is taking tablets, tell him not to take it at bedtime because infrequent urination increases risk of cystitis.
- Advise both men and women to practice contraception during therapy and for 4 months afterward; drug may cause birth defects.
- Advise women to stop breast-feeding during therapy because of risk of toxicity to infant.
- Drug can cause irreversible sterility in both men and women. Before therapy,

counsel patients who are considering parenthood. Also recommend that women consult prescriber before becoming pregnant.

## cycloSERINE

sye-kloe-SER-een

Seromycin

*Therapeutic class:* Antituberculotic
*Pharmacologic class:* Isoxazolidine derivative, d-alanine analogue
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules:* 250 mg

### INDICATIONS & DOSAGES

➤ **Adjunctive treatment for pulmonary or extrapulmonary tuberculosis (TB)**

*Adults:* Initially, 250 mg P.O. every 12 hours for 2 weeks; then adjust dosage to maintain blood concentrations at less than 30 mcg/ml. Dosage shouldn't exceed 1 g daily.

➤ **Acute UTIs**

*Adults:* 250 mg P.O. every 12 hours for 2 weeks.

### ADMINISTRATION

**P.O.**

● Drug is considered a second-line drug in TB treatment and should always be given with other antituberculotics to prevent the development of resistant organisms.

### ACTION

Inhibits cell-wall biosynthesis by interfering with the bacterial use of amino acids; may be bacteriostatic or bactericidal, depending on the drug level attained at the site of infection and the organism's susceptibility.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 4–8 hr | Unknown |

*Half-life:* 10 hours.

### ADVERSE REACTIONS

**CNS:** ***coma, seizures, suicidal behavior,*** drowsiness, somnolence, headache, tremor, dysarthria, vertigo, confusion, loss of memory, psychosis, hyperirritability, paresthesia, paresis, hyperreflexia.

**CV:** ***sudden heart failure.***

**Other:** hypersensitivity reactions (rash, photosensitivity).

### INTERACTIONS

**Drug-drug.** *Ethionamide:* May increase neurotoxic adverse reactions. Monitor patient closely.

*Isoniazid:* May increase risk of CNS toxicity, causing dizziness or drowsiness. Monitor patient closely.

**Drug-lifestyle.** *Alcohol use:* May increase risk of CNS toxicity, causing seizures. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

● May increase transaminase levels.

### CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug, in those who use alcohol excessively, and in those with seizure disorders, depression, severe anxiety, psychosis, or severe renal insufficiency.

● Use cautiously in patients with impaired renal function; reduce dosage in these patients.

⚠ ***Overdose S&S:*** Headache, vertigo, confusion, drowsiness, hyperirritability, paresthesia, dysarthria, psychosis, seizures, coma.

### NURSING CONSIDERATIONS

● Obtain specimen for culture and sensitivity tests before therapy begins and then periodically to detect possible resistance.

● Use to treat UTIs only when better alternatives are contraindicated and susceptibility to cycloserine is confirmed.

● Monitor level periodically, especially in patients receiving high dosages (more than 500 mg daily), because toxic reactions may occur with levels above 30 mcg/ml.

● Watch patient receiving dosages of more than 500 mg daily for signs and symptoms of CNS toxicity, such as seizures, anxiety, and tremor. Giving 200 to 300 mg pyridoxine daily may help prevent neurotoxic effects.

● Monitor results of hematologic tests and renal and liver function tests.

- Observe patient for psychotic symptoms, hallucinations, and suicidal behavior.
- Monitor patient for hypersensitivity reactions, such as allergic dermatitis.
- Give anticonvulsant, tranquilizer, or sedative to relieve adverse reactions.

### PATIENT TEACHING

***Alert:*** Warn patient to avoid alcohol, which may cause serious neurologic reactions.
- Advise patient not to perform hazardous activities if drowsiness occurs.
- Tell patient to report adverse reactions promptly; dosage may need to be adjusted or other drugs prescribed to relieve adverse reactions.

## cycloSPORINE

sye-kloe-SPOR-een

Sandimmune

## cycloSPORINE, modified

Gengraf, Neoral

*Therapeutic class:* Immunosuppressant
*Pharmacologic class:* Immunosuppressive
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules for microemulsion (modified)* *:* 25 mg, 50 mg, 100 mg
*Capsules (nonmodified):* 25 mg, 50 mg, 100 mg
*Injection:* 50 mg/ml
*Oral solution (modified and nonmodified):* 100 mg/ml*

### INDICATIONS & DOSAGES

➤ **To prevent organ rejection in renal, hepatic, or cardiac transplantation**

*Adults and children:* 15 mg/kg P.O. 4 to 12 hours before transplantation and continue daily for 1 to 2 weeks postoperatively. Then reduce dosage by 5% each week to maintenance level of 5 to 10 mg/kg daily. Or, 5 to 6 mg/kg I.V. concentrate 4 to 12 hours before transplantation as a slow I.V. infusion over 2 to 6 hours. Postoperatively, repeat dose daily until patient can tolerate P.O. forms.

For conversion from Sandimmune to Gengraf or Neoral, use same daily dose as previously used for Sandimmune. Monitor blood levels every 4 to 7 days after conversion, and monitor blood pressure and creatinine level every 2 weeks during the first 2 months.

➤ **Severe, active rheumatoid arthritis (RA) that hasn't adequately responded to methotrexate**

*Adults:* 2.5 mg/kg Gengraf or Neoral daily P.O., taken b.i.d. as divided doses. Dosage may be increased by 0.5 to 0.75 mg/kg daily after 8 weeks and again after 12 weeks to a maximum of 4 mg/kg daily. If no response is seen after 16 weeks, stop therapy.

➤ **Psoriasis**

*Adults:* 1.25 mg/kg Gengraf or Neoral daily P.O. b.i.d. for at least 4 weeks. Increase dosage by 0.5 mg/kg daily once every 2 weeks as needed to a maximum of 4 mg/kg daily.

***Adjust-a-dose:*** For patients with adverse effects such as hypertension, creatinine level 30% above pretreatment level, or abnormal CBC count or liver function test results, decrease dosage by 25% to 50%.

### ADMINISTRATION

**P.O.**
- Give Neoral or Gengraf on an empty stomach.
- Measure oral solution doses carefully in an oral syringe. Don't rinse dosing syringe with water. If syringe is cleaned, it must be completely dry before reuse.
- To improve the taste of Sandimmune oral solution, mix it with milk, chocolate milk, or orange juice. Gengraf or Neoral oral solution may be mixed with orange or apple juice (not grapefruit juice); it's less palatable when mixed with milk.
- Use a glass container to mix, and have patient drink at once.

**I.V.**
- ▼ This form is usually reserved for patients who can't tolerate oral drugs.
- ▼ Immediately before use, dilute each milliliter of concentrate in 20 to 100 ml of $D_5W$ or normal saline solution for injection. Give at one-third the oral dose.
- ▼ Infuse over 2 to 6 hours.

▼ Protect diluted drug from light.
▼ **Incompatibilities:** Amphotericin B cholesteryl sulfate complex, magnesium sulfate.

## ACTION

May inhibit proliferation and function of T lymphocytes and inhibit production and release of lymphokines.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 90 min–3 hr | Unknown |
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* Initial phase, about 1 hour; terminal phase, 8½ to 27 hours.

## ADVERSE REACTIONS

**CNS:** *tremor, headache,* confusion, paresthesia, ***seizures.***
**CV:** *hypertension,* flushing.
**EENT:** *gum hyperplasia,* sinusitis.
**GI:** *nausea, vomiting,* diarrhea, abdominal discomfort.
**GU:** **NEPHROTOXICITY.**
**Hematologic:** anemia, ***leukopenia, thrombocytopenia.***
**Hepatic:** ***hepatotoxicity.***
**Metabolic:** hyperglycemia.
**Skin:** *hirsutism,* acne.
**Other:** infections, ***anaphylaxis.***

## INTERACTIONS

**Drug-drug.** *Acyclovir, aminoglycosides, amphotericin B, cimetidine, diclofenac, gentamicin, ketoconazole, melphalan, NSAIDs, ranitidine, sulfamethoxazole and trimethoprim, tacrolimus, tobramycin, vancomycin:* May increase risk of nephrotoxicity. Avoid using together.
*Allopurinol,* ***azole antifungals,*** *bromocriptine,* ***caspofungin,*** *cimetidine, clarithromycin, danazol, diltiazem, erythromycin, imipenem and cilastatin, methylprednisolone, metoclopramide,* ***micafungin,*** *nicardipine, prednisolone, verapamil:* May increase cyclosporine level. Monitor patient for increased toxicity.
*Azathioprine, corticosteroids, cyclophosphamide, verapamil:* May increase immunosuppression. Monitor patient closely.
*Carbamazepine, isoniazid, nafcillin, octreotide,* ***orlistat,*** *phenobarbital,* ***phenytoin, rifabutin, rifampin,*** *ticlopidine:* May decrease immunosuppressant effect from low cyclosporine level. Cyclosporine dosage may need to be increased.
*Digoxin, HMG-CoA reductase inhibitors (such as lovastatin), prednisolone:* May decrease clearance of these drugs. Use together cautiously.
*Mycophenolate mofetil:* May decrease mycophenolate level. Monitor patient closely when cyclosporine is added to or removed from therapy.
*Potassium-sparing diuretics:* May induce hyperkalemia. Monitor patient closely.
*Sirolimus:* May increase sirolimus level. Take sirolimus at least 4 hours after cyclosporine dose. If separating doses isn't possible, monitor patient for increased adverse effects.
*Vaccines:* May decrease immune response. Delay routine immunization.
**Drug-herb.** *Astragalus, echinacea, licorice:* May interfere with drug's effect. Discourage use together.
***St. John's wort:*** May reduce drug level, resulting in transplant failure. Discourage use together.
**Drug-food.** *Alfalfa sprouts:* May interfere with drug's effect. Discourage use together.
*Grapefruit and grapefruit juices:* May increase drug level and cause toxicity. Advise patient to avoid use together.
**Drug-lifestyle.** *Sunlight:* May increase risk of sensitivity to sunlight. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, bilirubin, BUN, creatinine, glucose, and LDL levels. May decrease hemoglobin and magnesium levels.
- May decrease platelet and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or polyoxyethylated castor oil (found in injectable form).
- Contraindicated in patients with RA or psoriasis with abnormal renal function, uncontrolled hypertension, or malignancies (Neoral or Gengraf).

## NURSING CONSIDERATIONS

**Black Box Warning** Only experienced physicians should prescribe this drug.

**Black Box Warning** Psoriasis patients previously treated with psoralen and ultraviolet light A, methotrexate or other immunosuppressive agents, UVB, coal tar, or radiation therapy are at an increased risk for skin malignancies when taking Neoral or Gengraf.

- Drug can cause hepatotoxicity.

**Black Box Warning** Neoral and Gengraf may increase the susceptibility to infection and the development of neoplasia.

***Alert:*** Drugs causing immunosuppression increase the risk of opportunistic infections, including activation of latent viral infections such as BK virus–associated neuropathy, which may lead to serious outcomes, including kidney graft loss.

- Monitor elderly patient for renal impairment and hypertension.

**Black Box Warning** Monitor Sandimmune level at regular intervals. Absorption of oral solution can be erratic.

**Black Box Warning** Neoral and Gengraf have greater bioavailability than Sandimmune. A lower dose of Neoral or Gengraf may be needed to provide blood level similar to that achieved with Sandimmune. Monitor blood level when switching patients between these two brands.

- Gengraf is bioequivalent to and interchangeable with Neoral capsules.

**Black Box Warning** Always give with corticosteroids; however, don't give Sandimmune with other immunosuppressants.

**Black Box Warning** Drug can cause systemic hypertension and nephrotoxicity.

- Use Neoral or Gengraf to treat RA or psoriasis.
- ***Look alike–sound alike:*** Don't confuse cyclosporine with cyclophosphamide or cycloserine. Don't confuse Sandimmune with Sandostatin.

**RA**

- Before starting treatment, measure blood pressure at least twice and obtain two creatinine levels to estimate baseline.
- Evaluate blood pressure and creatinine level every 2 weeks during first 3 months and then monthly if patient is stable.
- Monitor blood pressure and creatinine level after an increase in NSAID dosage or introduction of a new NSAID. Monitor CBC and liver function tests monthly if patient also receives methotrexate.
- If hypertension occurs, decrease dosage of Gengraf or Neoral by 25% to 50%. If hypertension persists, decrease dosage further or control blood pressure with antihypertensives.

**Psoriasis**

- Measure blood pressure at least twice to determine a baseline.
- Evaluate patient for occult infection and tumors initially and throughout treatment.
- Obtain baseline creatinine level (on two occasions), CBC, and BUN, magnesium, uric acid, potassium, and lipid levels.
- Evaluate creatinine and BUN levels every 2 weeks during first 3 months and then monthly thereafter if patient is stable.
- If creatinine level is 25% above pretreatment levels, repeat creatinine level measurement within 2 weeks. If creatinine level stays 25% to 50% above baseline, reduce dosage by 25% to 50%. If creatinine level is ever 50% above baseline, reduce dosage by 25% to 50%. Stop therapy if creatinine level isn't reversed after two dosage modifications.
- Monitor creatinine level after increasing NSAID dose or starting a new NSAID.
- Evaluate blood pressure, CBC, and uric acid, potassium, lipid, and magnesium levels every 2 weeks for the first 3 months and then monthly if patient is stable, or more frequently if a dosage is adjusted.
- If an adverse reaction occurs, reduce dosage by 25% to 50%.
- Improvement in psoriasis takes 12 to 16 weeks of therapy.

## PATIENT TEACHING

- Encourage patient to take drug at same time each day and to be consistent with relation to meals.
- Teach patient how to measure dosage and mask taste of oral solution. Tell him not to take drug with grapefruit juice.
- Instruct patient to fill glass with water after dose and drink it to make sure he consumes all of drug.
- Advise patient to take drug with meals if nausea occurs.

- Advise patient to take Neoral or Gengraf on an empty stomach.
- Tell patient being treated for psoriasis that improvement may not occur until after 12 to 16 weeks of therapy.
- Stress that drug shouldn't be stopped without prescriber's approval.
- Explain to patient the importance of frequent laboratory monitoring while receiving therapy.
- Tell patient to avoid people with infections because drug lowers resistance to infection.
- Advise patient to perform careful oral care and to see a dentist regularly because drug can cause gum disease.
- Advise women to use barrier contraception, not hormonal contraceptives, during therapy. Advise patient of the potential risk during pregnancy and the increased risk of tumors, high blood pressure, and renal problems.
- Warn patient to wear protection in the sun and to avoid excessive sun exposure.

**SAFETY ALERT!**

## cytarabine (ara-C, cytosine arabinoside)

sye-TARE-a-been

Cytosar†, Cytosar-U, DepoCyt, Tarabine PFS

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Pyrimidine analogue
*Pregnancy risk category D*

### AVAILABLE FORMS

*Injection:* 20 mg/ml, 100 mg/ml
*Liposomal injection:* 10 mg/ml
*Powder for injection:* 100-mg, 500-mg, 1-g, 2-g vials

### INDICATIONS & DOSAGES

➤ **Acute nonlymphocytic leukemia**

*Adults and children:* 100 mg/m$^2$ I.V. daily by continuous I.V. infusion or 100 mg/m$^2$ I.V. every 12 hours by rapid I.V. injection or I.V. infusion on days 1 to 7 in a course of therapy or daily until remission is attained.

➤ **Acute lymphocytic leukemia**

Consult literature for current recommendations.

➤ **Meningeal leukemia**

*Adults and children:* Varies from 5 to 75 mg/m$^2$ intrathecally. Frequency varies from once daily for 4 days to once every 4 days. The most frequently used dose is 30 mg/m$^2$ every 4 days until CSF fluid is normal; then one additional dose.

➤ **Lymphomatous meningitis (liposomal)**

*Adults:* For induction, give 50 mg liposomal injection intrathecally every 14 days for two doses (weeks 1 and 3); then, for consolidation therapy, give 50 mg liposomal injection intrathecally every 14 days for three doses (weeks 5, 7, and 9) followed by one additional dose at week 13. Maintenance dose, 50 mg liposomal injection intrathecally every 28 days for four doses (weeks 17, 21, 25, and 29).

***Adjust-a-dose:*** For patients with neurotoxicity, reduce dose to 25 mg. If neurotoxicity persists, stop therapy.

### ADMINISTRATION

**I.V.**

▼ Preparing and giving parenteral drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.
▼ To reduce nausea, give antiemetic before drug. Nausea and vomiting are more likely with large doses given by I.V. push. Dizziness may occur with rapid infusion.
▼ Except for neonates or intrathecal use, reconstitute drug using the provided diluent, which is bacteriostatic water for injection containing benzyl alcohol.
▼ Reconstitute 100-mg vial with 5 ml of diluent, 500-mg or 1 g vials with 10 ml of diluent or 2 g vial with 20 ml of diluent.
▼ Discard cloudy reconstituted solution.
▼ For I.V. infusion, further dilute using normal saline solution for injection or $D_5W$.
▼ Reconstituted solution is stable for 48 hours.
▼ **Incompatibilities:** Allopurinol sodium, amphotericin B cholesteryl sulfate complex, fluorouracil, ganciclovir sodium, heparin sodium, hydrocortisone sodium succinate, insulin, methylprednisolone sodium succinate, nafcillin, oxacillin, penicillin.

**Intrathecal**

**Black Box Warning** Give liposomal form with dexamethasone to help decrease the symptoms of chemical arachnoiditis, which may be life-threatening.

- For intrathecal administration, use preservative-free normal saline solution. Use immediately after reconstitution. Discard unused drug.
- Withdraw intrathecal cytarabine liposomal injection from the vial immediately before administration. It is a single-use vial, doesn't contain any preservative, and should be used within 4 hours of withdrawal from the vial. Discard unused portions of each vial properly.
- Don't use in-line filters when giving intrathecal cytarabine liposomal injection.
- After drug administration by lumbar puncture, instruct patient to lie flat for 1 hour.
- Patients should be observed by the physician for immediate toxic reactions.
- Refrigerate liposomal form at 36° to 46° F (2° to 8° C).

## ACTION

Inhibits DNA synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V., intrathecal | Unknown | Unknown | Unknown |

*Half-life:* Initial, 8 minutes; terminal, 1 to 3 hours; in CSF, 2 hours.

## ADVERSE REACTIONS

**CNS:** ***neurotoxicity,*** malaise, dizziness, headache, cerebellar syndrome, *fever*.
**CV:** *thrombophlebitis*, edema.
**EENT:** conjunctivitis.
**GI:** *nausea*, *vomiting*, *diarrhea*, *anorexia*, *anal ulceration*, abdominal pain, oral ulcers in 5 to 10 days, projectile vomiting, ***bowel necrosis with high doses given by rapid I.V.***
**GU:** urine retention, renal dysfunction.
**Hematologic:** ***leukopenia,*** anemia, reticulocytopenia, ***thrombocytopenia,*** *megaloblastosis.*
**Hepatic:** ***hepatotoxicity,*** jaundice.
**Metabolic:** hyperuricemia.
**Musculoskeletal:** myalgia, bone pain.
**Respiratory:** ***pulmonary edema,*** shortness of breath, pulmonary hypersensitivity.
**Skin:** *rash*, pruritus, alopecia, freckling.
**Other:** flulike syndrome, infection, ***anaphylaxis.***

## INTERACTIONS

**Drug-drug.** *Digoxin, except oral liquid and liquid-filled capsules:* May decrease oral digoxin absorption. Monitor digoxin level closely.
*Flucytosine:* May decrease flucytosine activity. Avoid using together.
*Gentamicin:* May decrease activity against *Klebsiella pneumoniae*. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

- May increase bilirubin, phosphorus, potassium, and uric acid levels. May decrease hemoglobin level.
- May increase megaloblast count. May decrease platelet, RBC, reticulocyte, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and active meningeal infection (liposomal cytarabine).
- Use cautiously in patients with hepatic or renal compromise, gout, or myelosuppression.

***Overdose S&S:*** Irreversible CNS toxicity, death (conventional form); severe chemical arachnoiditis (liposomal form).

## NURSING CONSIDERATIONS

**Black Box Warning** Cytarabine should administered by physicians experienced in cancer chemotherapy. For induction therapy, patients should be treated in a facility with laboratory and supportive resources sufficient to monitor drug tolerance and protect and maintain a patient compromised by drug toxicity. The physician must judge possible benefit to the patient against known toxic effects of cytarabine.

- Monitor fluid intake and output carefully. Maintain high fluid intake and give allopurinol to avoid urate nephropathy in leukemia-induction therapy. Monitor uric acid level.
- Monitor hepatic and renal function studies and CBC.

• Therapy may be modified or stopped if granulocyte count is below 1,000/$mm^3$ or platelet count is below 50,000/$mm^3$.
• Corticosteroid eyedrops help prevent drug-induced conjunctivitis.
• Provide diligent mouth care to help minimize stomatitis.
***Alert:*** Assess patient receiving high doses for neurotoxicity, which may first appear as nystagmus but can progress to ataxia and cerebellar dysfunction.
• To prevent bleeding, avoid all I.M. injections when platelet count is below 50,000/$mm^3$.
• Anticipate blood transfusions because of cumulative anemia. Patient may receive RBC colony-stimulating factors to promote RBC production and decrease need for blood transfusions.
**Black Box Warning** Monitor patient for toxic effects, including bone marrow suppression, nausea, vomiting, diarrhea, oral ulceration and hepatic dysfunction. ■
• In leukopenia, initial WBC count nadir occurs 7 to 9 days after drug is stopped. A second, more severe nadir occurs 15 to 24 days after drug is stopped. In thrombocytopenia, platelet count nadir occurs on days 12 to 15.
***Alert:*** A cytarabine syndrome has been described and is characterized by fever, myalgia, bone pain, occasionally chest pain, maculopapular rash, conjunctivitis, and malaise. It usually occurs 6 to 12 hours following drug administration. Corticosteroids have been shown to be beneficial in the treatment or prevention of this syndrome.
• ***Look alike–sound alike:*** Do not confuse conventional cytarabine with liposomal cytarabine.

## PATIENT TEACHING

• Instruct patient to watch for signs and symptoms of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell patient to take temperature daily.
• Advise patient to report visual changes, blurred vision, or eye pain to prescriber.
• Advise breast-feeding women to stop breast-feeding during therapy because of risk of toxicity to infant.
• Caution women of childbearing age to consult prescriber before becoming pregnant because drug may harm fetus.

**SAFETY ALERT!**

# dacarbazine (DTIC)

da-KAR-ba-zeen

DTIC-Dome

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Triazene
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 100-mg, 200-mg

## INDICATIONS & DOSAGES

➤ **Metastatic malignant melanoma**
*Adults:* 2 to 4.5 mg/kg I.V. daily for 10 days; repeat every 4 weeks as tolerated. Or, 250 mg/$m^2$ I.V. daily for 5 days; repeat every 3 weeks.
➤ **Hodgkin lymphoma**
*Adults:* 150 mg/$m^2$ I.V. daily (with other drugs) for 5 days; repeat every 4 weeks. Or, 375 mg/$m^2$ on first day of combination regimen; repeat every 15 days.

## ADMINISTRATION

**I.V.**
▼ Preparing and giving parenteral drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.
▼ Reconstitute drug using sterile water for injection. Add 9.9 ml to 100-mg vial or 19.7 ml to 200-mg vial to yield a concentration of 10 mg/ml.
▼ For infusion, dilute with up to 250 ml of normal saline solution or $D_5W$.
▼ Infuse over at least 15 to 30 minutes.
▼ To decrease pain at insertion site, dilute drug further or decrease infusion rate.
▼ Watch for irritation and infiltration during infusion; extravasation can cause severe pain, tissue damage, and necrosis. If solution infiltrates, stop immediately, apply ice to area for 24 to 48 hours, and notify prescriber.
▼ Reconstituted solutions in the vial are stable 8 hours at room temperature and

with normal lighting conditions, or up to 3 days if refrigerated.
▼ Solution should be colorless to clear yellow. If solution turns pink, it has decomposed. Discard it.
▼ Diluted solutions are stable 8 hours at room temperature and with normal lighting, or up to 24 hours if refrigerated.
▼ **Incompatibilities:** Allopurinol sodium, cefepime, hydrocortisone sodium succinate, piperacillin with tazobactam.

## ACTION

May cross-link strands of cellular DNA and interfere with RNA and protein synthesis. Not specific to cell cycle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* Initial phase, 19 minutes; terminal phase, 5 hours.

## ADVERSE REACTIONS

**GI:** *anorexia, severe nausea and vomiting,* stomatitis.
**Hematologic:** ***leukopenia, thrombocytopenia.***
**Skin:** alopecia.
**Other:** ***anaphylaxis,*** severe pain with infiltration or a too-concentrated solution, tissue damage.

## INTERACTIONS

**Drug-lifestyle.** *Sun exposure:* May cause photosensitivity reaction, especially during first 2 days of therapy. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

● May increase BUN and liver enzyme levels.
● May decrease platelet, RBC, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug.
**Black Box Warning** Use cautiously because drug may be carcinogenic and teratogenic. ■
● Use cautiously in patients with impaired bone marrow function and those with severe renal or hepatic dysfunction.

## NURSING CONSIDERATIONS

**Black Box Warning** Dacarbazine should be administered under the supervision of a physician experienced in the use of cancer chemotherapeutic agents. ■
**Black Box Warning** The physician must carefully weigh the possibility of therapeutic benefit against the risk of toxicity for each patient. ■
● Give antiemetics before giving this drug. Nausea and vomiting may subside after several doses.
● To prevent bleeding, avoid all I.M. injections when platelet count is below 50,000/$mm^3$.
**Black Box Warning** Hemopoietic depression is the most common toxicity. ■
● Anticipate need for blood transfusions to combat anemia.
● Therapeutic effects commonly occur with toxicity. Monitor CBC and platelet count.
**Black Box Warning** Hepatic necrosis may occur. Monitor liver function tests. ■
● For Hodgkin lymphoma, drug is usually given with bleomycin, vinblastine, and doxorubicin.
● ***Look alike–sound alike:*** Don't confuse dacarbazine with procarbazine.

## PATIENT TEACHING

● Tell patient to watch for evidence of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell him to take temperature daily.
● Tell patient to avoid people with upper respiratory tract infections.
● Instruct patient to avoid OTC products that contain aspirin or NSAIDs.
● Advise patient to avoid sunlight and sunlamps for first 2 days after treatment.
● Reassure patient that fever, malaise, and muscle pain, beginning 7 days after treatment ends and possibly lasting 7 to 21 days, may be treated with mild fever reducers such as acetaminophen.
● Tell patient that restricting food intake for 4 to 6 hours before dose may help to decrease adverse GI effects.
● Reassure patient that hair loss is reversible.
● Advise women to avoid pregnancy and breast-feeding during therapy.

✳ NEW DRUG

## dalfampridine

dal-FAM-prih-deen

Ampyra

*Therapeutic class:* Multiple sclerosis drug
*Pharmacologic class:* Potassium channel blocker
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets (extended-release):* 10 mg

### INDICATIONS & DOSAGES

➤ **To improve walking in patients with multiple sclerosis**

*Adults:* 10 mg P.O. every 12 hours.

### ADMINISTRATION

**P.O.**

- May give with or without food approximately 12 hours apart.
- Give tablets whole; don't divide, crush, dissolve, or allow patient to chew tablets.

### ACTION

Thought to increase conduction of action potentials in demyelinated axons by inhibiting potassium channels.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 3–4 hr | Unknown |

*Half-life:* About 6 hours.

### ADVERSE REACTIONS

**CNS:** asthenia, balance disorder, dizziness, headache, insomnia, multiple sclerosis relapse, paresthesia, ***seizures.***
**EENT:** nasopharyngitis, pharyngolaryngeal pain.
**GI:** constipation, dyspepsia, nausea.
**GU:** *UTI.*
**Musculoskeletal:** back pain.

### INTERACTIONS

None known.

### EFFECTS ON LAB TEST RESULTS

None known.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with moderate or severe renal impairment and in those with history of seizures.
- Use during pregnancy only if benefit outweighs risk to fetus.
- It isn't known if drug appears in breast milk. Because of risk of adverse effects, patient should stop breast-feeding or stop drug.

⚠ ***Overdose S&S:*** Seizures, confusion, tremors, diaphoresis, amnesia.

### NURSING CONSIDERATIONS

- Monitor patient for seizures.
- Monitor renal function before and during therapy.
- Monitor patient's walking for improvement.

### PATIENT TEACHING

- Tell patient to take drug without regard to food.
- Instruct patient to take tablets whole and not to divide, crush, dissolve, or chew them.
- Advise patient to stop drug and seek medical attention if seizures occur.
- Instruct patient not to take more than two tablets in 24 hours.

**SAFETY ALERT!**

## dalteparin sodium

DAHL-tep-ah-rin

Fragmin

*Therapeutic class:* Anticoagulant
*Pharmacologic class:* Low–molecular-weight heparin
*Pregnancy risk category B*

### AVAILABLE FORMS

*Injection:* 2,500 antifactor Xa international units/0.2 ml syringe, 5,000 antifactor Xa international units/0.2 ml syringe, 7,500 antifactor Xa international units/0.3 ml syringe, 10,000 antifactor Xa international units/0.4 ml syringe,10,000 antifactor Xa international units/ml syringe, 10,000 antifactor Xa international units/ml in 9.5-ml multidose vial, 12,500 antifactor Xa international units/0.5 ml syringe, 15,000

antifactor Xa international units/0.6 ml syringe, 18,000 antifactor Xa international units/0.72 ml syringe, 95,000 antifactor Xa international units/3.8-ml multidose vial, 95,000 antifactor Xa international units/9.5-ml multidose vial. Each multidose vial contains 14 mg/ml of benzyl alcohol.

## INDICATIONS & DOSAGES

➤ **To prevent deep vein thrombosis (DVT) in patients undergoing abdominal surgery who are at moderate to high risk for thromboembolic complications**

*Adults:* 2,500 international units subcutaneously daily, starting 1 to 2 hours before surgery and repeated once daily for 5 to 10 days postoperatively. Or, for patients at high risk, give 5,000 international units subcutaneously the evening before surgery, then once daily postoperatively for 5 to 10 days. Or, in patients with malignancy, give 2,500 international units subcutaneously 1 to 2 hours before surgery followed by 2,500 international units subcutaneously 12 hours later, then 5,000 international units subcutaneously once daily for 5 to 10 days postoperatively.

➤ **To prevent DVT in patients undergoing hip replacement surgery**

*Adults:* 2,500 international units subcutaneously within 2 hours before surgery and second dose 2,500 international units subcutaneously in the evening after surgery (at least 6 hours after first dose). Starting on first postoperative day, give 5,000 international units subcutaneously once daily for 5 to 10 days. Or, give 5,000 international units subcutaneously on the evening before surgery; then 5,000 international units subcutaneously once daily starting in the evening of surgery for 5 to 10 days postoperatively.

➤ **Unstable angina; non–Q-wave MI**

*Adults:* 120 international units/kg subcutaneously every 12 hours with aspirin (75 to 165 mg daily) P.O., unless contraindicated. Maximum dose, 10,000 international units. Treatment usually lasts 5 to 8 days.

➤ **To prevent DVT in patients at risk for thromboembolic complications because of severely restricted mobility during acute illness**

*Adults:* 5,000 international units subcutaneously once daily for 12 to 14 days.

➤ **Symptomatic venous thromboembolism in cancer patients**

*Adults:* Initially, 200 international units/kg (maximum, 18,000 international units) subcutaneously daily for 30 days; then 150 international units/kg (maximum, 18,000 international units) subcutaneously daily months 2 through 6.

***Adjust-a-dose:*** In patients with platelet count 50,000 to 100,000/$mm^3$, reduce dose by 2,500 international units until platelet count exceeds 100,000/$mm^3$. In patients with platelet count less than 50,000/$mm^3$, stop drug until platelet count exceeds 50,000/$mm^3$. For patients with creatinine clearance of 30 ml/minute or less, monitor anti-Xa levels to determine appropriate dose. Target anti-Xa range is 0.5 to 1.5 international units/ml. Draw anti-Xa 4 to 6 hours after dose and only after the patient has received three to four doses.

## ADMINISTRATION

### Subcutaneous

- Before giving injection, obtain complete list of all prescribed and OTC medications, and supplements, including herbs.
- Have patient sit or lie supine when giving drug.
- Injection sites include a U-shaped area around the navel, upper outer side of thigh, and upper outer quadrangle of buttock. Rotate sites daily.
- When area around the navel or thigh is used, use thumb and forefinger to lift up a fold of skin while giving injection.
- Give subcutaneous injection deeply, inserting the entire length of needle at a 45- to 90-degree angle.
- After first penetration of the rubber stopper, store multidose vial at room temperature for up to 2 weeks.

## ACTION

Enhances inhibition of factor Xa and thrombin by antithrombin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 4 hr | Unknown |

*Half-life:* 3 to 5 hours.

## ADVERSE REACTIONS

**CNS:** fever.
**GU:** hematuria.
**Hematologic:** ***thrombocytopenia, hemorrhage,*** ecchymoses, bleeding complications.
**Skin:** pruritus, rash, *hematoma at injection site*, injection site pain.
**Other:** ***anaphylaxis.***

## INTERACTIONS

**Drug-drug.** *Antiplatelet drugs (aspirin, NSAIDs, clopidogrel, dipyridamole, ticlodipine), oral anticoagulants, thrombolytics:* May increase risk of bleeding. Use together cautiously.
**Drug-herb.** *Angelica (dong quai), boldo, bromelains, capsicum, chamomile, dandelion, danshen, devil's claw, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, licorice, meadowsweet, onion, passion flower, red clover, willow:* May increase risk of bleeding. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT and AST levels.
- May decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, heparin, or pork products; in those with active major bleeding; and in those with thrombocytopenia and antiplatelet antibodies in presence of drug.
- Contraindicated in patients with unstable angina or non-Q-wave MI who are undergoing regional anesthesia because of an increased risk of bleeding associated with the dose of dalteparin recommended for these indications.
- Use with caution in patients with history of heparin-induced thrombocytopenia and in patients at increased risk for hemorrhage, such as those with severe uncontrolled hypertension, bacterial endocarditis, congenital or acquired bleeding disorders, active ulceration, angiodysplastic GI disease, or hemorrhagic stroke; also use with caution shortly after brain, spinal, or ophthalmic surgery. Monitor vital signs.
- Use with caution in patients with bleeding diathesis, thrombocytopenia, platelet defects, severe hepatic or renal insufficiency, hypertensive or diabetic retinopathy, or recent GI bleeding.

***Overdose S&S:*** Hemorrhagic complications.

## NURSING CONSIDERATIONS

**Black Box Warning** Patients who have received epidural or spinal anesthesia or spinal puncture are at increased risk for developing an epidural or spinal hematoma, which may result in long-term or permanent paralysis. Monitor these patients closely for neurologic impairment.

- DVT is a risk factor in patients who are candidates for therapy, including those older than age 40, those who are obese, those undergoing surgery under general anesthesia lasting longer than 30 minutes, and those who have additional risk factors (such as malignancy or history of DVT or pulmonary embolism).
- Never give drug I.M.
- Don't mix with other injections or infusions unless specific compatibility data support such mixing.
- Multidose vial shouldn't be used in pregnant women because of benzyl alcohol content. Benzyl alcohol has been associated with fatal "gasping syndrome" in premature neonates.

***Alert:*** Drug isn't interchangeable (unit for unit) with unfractionated heparin or other low–molecular-weight heparin.

- Periodic, routine CBC and fecal occult blood tests are recommended during therapy. Patients don't need regular monitoring of PT or activated PTT.
- Monitor patient closely for thrombocytopenia.
- Stop drug if a thromboembolic event occurs despite dalteparin prophylaxis.
- Obtain a complete list of patient's prescription and OTC drugs and supplements, including herbs.

## PATIENT TEACHING

- Instruct patient and family to watch for and report signs of bleeding (bruising and blood in stools).
- Tell patient to avoid OTC drugs containing aspirin or other salicylates unless ordered by prescriber.

- Advise patient to consult with prescriber prior to initiating any herbal therapy; many herbs have anticoagulant, antiplatelet, and fibrinolytic properties.
- Tell patient to use a soft toothbrush and electric razor during treatment.

## dantrolene sodium

DAN-troe-leen

Dantrium, Dantrium Intravenous

*Therapeutic class:* Skeletal muscle relaxant
*Pharmacologic class:* Hydantoin derivative
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules:* 25 mg, 50 mg, 100 mg
*Injection:* 20 mg/vial

### INDICATIONS & DOSAGES

➤ **Spasticity and sequelae from severe chronic disorders, such as multiple sclerosis, cerebral palsy, spinal cord injury, stroke**

*Adults:* 25 mg P.O. daily. Increase by 25-mg increments, up to 100 mg t.i.d. to q.i.d. Maintain each dosage level for 7 days to determine response. Maximum, 400 mg daily.

*Children age 5 and older:* Initially, 0.5 mg/kg P.O. daily for 7 days; then 0.5 mg/kg t.i.d. for 7 days, 1 mg/kg t.i.d. for 7 days, and finally, 2 mg/kg, t.i.d. for 7 days. May increase up to 3 mg/kg b.i.d. to q.i.d. if necessary. Maximum, 100 mg q.i.d.

➤ **To manage malignant hyperthermic crisis**

*Adults and children:* Initially, 1 mg/kg I.V. push. Repeat, as needed, up to cumulative dose of 10 mg/kg.

➤ **To prevent or attenuate malignant hyperthermic crisis in susceptible patients who need surgery**

*Adults and children:* 4 to 8 mg/kg P.O. daily in three or four divided doses for 1 or 2 days before procedure. Give final dose 3 or 4 hours before procedure. Or, 2.5 mg/kg I.V. about 1.25 hours before anesthesia; infuse over 1 hour.

➤ **To prevent recurrence of malignant hyperthermic crisis**

*Adults:* 4 to 8 mg/kg P.O. daily in four divided doses for up to 3 days after hyperthermic crisis.

### ADMINISTRATION

**P.O.**

- Give drug with food or milk.
- Prepare oral suspension for single dose by dissolving capsule contents in juice or other liquid. For multiple doses, use acid vehicle and refrigerate. Use within several days.

**I.V.**

▼ Reconstitute drug by adding 60 ml of sterile water for injection and shaking vial until clear. Don't use a diluent that contains a bacteriostatic drug.
▼ Protect solution from light, and use within 6 hours.
▼ **Incompatibilities:** $D_5W$, normal saline solution, other I.V. drugs mixed in a syringe.

### ACTION

Acts directly on skeletal muscle to decrease excitation and contraction coupling and reduce muscle strength by interfering with intracellular calcium movement.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 5 hr | Unknown |
| I.V. | Unknown | Unknown | 3 hr after infusion |

*Half-life:* P.O., 9 hours; I.V., 4 to 8 hours.

### ADVERSE REACTIONS

**CNS:** *drowsiness, dizziness, malaise, fatigue,* ***seizures,*** headache, lightheadedness, confusion, nervousness, insomnia, fever, depression.
**CV:** tachycardia, blood pressure changes, phlebitis, thrombophlebitis, heart failure.
**EENT:** excessive lacrimation, speech disturbance, diplopia, visual disturbances.
**GI:** anorexia, constipation, cramping, dysphagia, metallic taste, severe diarrhea, ***GI bleeding,*** vomiting.
**GU:** urinary frequency, hematuria, incontinence, nocturia, dysuria, crystalluria, difficult erection, urine retention.
**Hematologic:** ***leukopenia, thrombocytopenia, lymphocytic lymphoma,*** anemia.

**Hepatic:** ***hepatitis.***
**Musculoskeletal:** *muscle weakness,* myalgia, back pain.
**Respiratory:** pleural effusion with pericarditis, ***pulmonary edema.***
**Skin:** eczematous eruption, pruritus, urticaria, abnormal hair growth, diaphoresis, photosensitivity.
**Other:** chills.

## INTERACTIONS

**Drug-drug.** *Clofibrate, warfarin:* May decrease protein binding of dantrolene. Use together cautiously.
*CNS depressants:* May increase CNS depression. Avoid using together.
*Estrogens:* May increase risk of hepatotoxicity. Use together cautiously.
*I.V. verapamil and other calcium channel blockers:* May cause hyperkalemia, ventricular fibrillation, and myocardial depression. Stop verapamil before giving I.V. dantrolene.
*Vecuronium:* May increase neuromuscular blockade effect. Use together cautiously.
**Drug-lifestyle.** *Alcohol use:* May increase CNS depression. Discourage use together.
*Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, alkaline phosphatase, LDH, bilirubin, and BUN levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated for spasms in rheumatic disorders and when spasticity is used to maintain motor function.
- Contraindicated in breast-feeding patients and patients with upper motor neuron disorders or active hepatic disease.

**Black Box Warning** Risk of hepatic injury is increased in women, patients older than age 35, and patients with hepatic disease (such as cirrhosis or hepatitis) or severely impaired cardiac or pulmonary function. ■

***Overdose S&S:*** Muscle weakness, altered level of consciousness, vomiting, diarrhea, crystalluria.

## NURSING CONSIDERATIONS

- Start therapy as soon as malignant hyperthermia reaction is recognized.

**Black Box Warning** Liver damage may occur with short- or long-term use. Use the lowest possible effective dose for each patient. If benefits don't occur within 45 days, stop therapy. ■

**Black Box Warning** Obtain liver function test results at start of therapy. Monitor hepatic function, including AST and ALT, frequently. ■

***Alert:*** Watch for fever, jaundice, severe diarrhea, weakness, and sensitivity reactions, including skin eruptions. Withhold dose and notify prescriber.

- ***Look alike–sound alike:*** Don't confuse Dantrium with Daraprim.

## PATIENT TEACHING

- Instruct patient to take drug with meals or milk in four divided doses.
- Tell patient to eat carefully to avoid choking. Some patients may have trouble swallowing during therapy.
- Warn patient to avoid driving and other hazardous activities until CNS effects of drug are known.
- Advise patient to avoid combining drug with alcohol or other CNS depressants.
- Advise patient to notify prescriber if skin or eyes turn yellow, skin itches, or fever develops.
- Tell patient to avoid photosensitivity reactions by using sunblock and wearing protective clothing, to report abdominal discomfort or GI problems immediately, and to follow prescriber's orders regarding rest and physical therapy.

# daptomycin

dap-toe-MYE-sin

Cubicin

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Cyclic lipopeptide
*Pregnancy risk category B*

## AVAILABLE FORMS

*Powder for injection:* 500-mg vial

## INDICATIONS & DOSAGES

➤ **Bacteremia caused by *Staphylococcus aureus* (including right-sided endocarditis caused by methicillin-susceptible and methicillin-resistant strains)**

*Adults:* 6 mg/kg I.V. over 30 minutes every 24 hours for at least 2 to 6 weeks based on patient response.

➤ **Complicated skin or skin-structure infection (SSSI) caused by susceptible strains of *S. aureus* (including methicillin-resistant strains), *Streptococcus pyogenes, Streptococcus agalactiae, Streptococcus dysgalactiae,* and *Enterococcus faecalis* (vancomycin-susceptible strains only)**

*Adults:* 4 mg/kg I.V. over 30 minutes every 24 hours for 7 to 14 days.

***Adjust-a-dose:*** In patients with SSSI with creatinine clearance less than 30 ml/minute, including those receiving hemodialysis or continuous ambulatory peritoneal dialysis, give 4 mg/kg I.V. every 48 hours. For bacteremic patients with a clearance less than 30 ml/minute, give 6 mg/kg I.V. every 48 hours. When possible, give drug after hemodialysis.

## ADMINISTRATION

**I.V.**

▼ Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.

▼ Reconstitute 500-mg vial with 10 ml of normal saline solution.

▼ Further dilute with normal saline solution.

▼ Infuse over 30 minutes.

▼ Refrigerate vials at 36° to 46° F (2° to 8° C).

▼ Vials are for single use; discard excess.

▼ Reconstituted and diluted solutions are stable 12 hours at room temperature or 48 hours at 36° to 46° F (2° to 8° C).

▼ **Incompatibilities:** Dextrose-containing solutions and other I.V. drugs. If an I.V. line is used for several drugs, flush the line with normal saline solution or lactated Ringer's injection between drugs.

## ACTION

Binds to and depolarizes bacterial membranes to inhibit protein, DNA, and RNA synthesis, thus causing bacterial cell death.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Rapid | <1 hr | Unknown |

*Half-life:* About 8 hours.

## ADVERSE REACTIONS

**CNS:** anxiety, confusion, dizziness, fever, headache, insomnia.
**CV:** ***cardiac failure,*** chest pain, edema, hypertension, hypotension.
**EENT:** sore throat.
**GI:** ***pseudomembranous colitis,*** abdominal pain, constipation, decreased appetite, diarrhea, nausea, vomiting.
**GU:** ***renal failure,*** urinary tract infection.
**Hematologic:** anemia.
**Metabolic:** ***hypoglycemia,*** hyperglycemia, hypokalemia.
**Musculoskeletal:** limb and back pain, myopathy.
**Respiratory:** cough, dyspnea.
**Skin:** cellulitis, injection site reactions, pruritus, rash.
**Other:** fungal infections.

## INTERACTIONS

**Drug-drug.** *HMG-CoA reductase inhibitors:* May increase risk of myopathy. Consider stopping these drugs while giving daptomycin.
*Tobramycin:* May affect levels of both drugs. Use together cautiously.
*Warfarin:* May alter anticoagulant activity. Monitor PT and INR for the first several days of daptomycin therapy.

## EFFECTS ON LAB TEST RESULTS

● May increase alkaline phosphatase and CK levels. May decrease potassium and hemoglobin levels and hematocrit. May increase or decrease glucose level.
● May increase liver function test values.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug.
● Use cautiously in patients with renal insufficiency and those who are older than age 65, pregnant, or breast-feeding.

● Safety and effectiveness haven't been established in patients younger than age 18.

## NURSING CONSIDERATIONS

● Monitor CBC and renal and liver function tests periodically.
***Alert:*** Because drug may increase the risk of myopathy, monitor CK level weekly. If CK level rises, monitor it more often. In patients with myopathy and CK elevation over 1,000 units/L or more than 10 times the upper limit of normal, stop drug. Consider stopping all other drugs linked with myopathy (such as HMG-CoA reductase inhibitors) during therapy.
● Monitor patient for superinfection because drug may cause overgrowth of nonsusceptible organisms.
● Watch for evidence of pseudomembranous colitis and treat accordingly.

## PATIENT TEACHING

● Advise patient to immediately report muscle weakness and infusion site irritation.
● Tell patient to report severe diarrhea, rash, and infection.
● Inform patient about possible adverse reactions.

**SAFETY ALERT!**

# darbepoetin alfa

dar-bah-poe-E-tin

Aranesp

*Therapeutic class:* Colony stimulating factor
*Pharmacologic class:* Recombinant human erythropoietin
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection (with albumin or polysorbate solution):* 25 mcg/ml, 40 mcg/ml, 60 mcg/ml, 100 mcg/ml, 150 mcg/0.75 ml, 200 mcg/ml, 300 mcg/ml, and 500 mcg/ml in single-dose vials
*Prefilled syringe or autoinjector (with albumin or polysorbate solution):* 25 mcg/0.42 ml, 40 mcg/0.4 ml, 60 mcg/0.3 ml, 100 mcg/0.5 ml, 150 mcg/0.3 ml, 200 mcg/0.4 ml, 300 mcg/0.6 ml, and 500 mcg/ml

## INDICATIONS & DOSAGES

➤ **Anemia from chronic renal failure**
*Adults:* 0.45 mcg/kg I.V. or subcutaneously once weekly. The I.V. route is preferred for patients on dialysis. Or, in patients not receiving dialysis, give an initial dose of 0.75 mcg/kg subcutaneously once every 2 weeks. Give the lowest effective dose to gradually increase hemoglobin to a level where blood transfusion isn't necessary. Adjust dose to maintain hemoglobin level within 10 to 12 g/dl. Don't increase dose more often than once a month. In adults and children older than age 1 converting from epoetin alfa, base starting dose on the previous epoetin alfa dose (see table). Don't use as initial treatment of anemia in children with chronic renal failure.

| *Previous epoetin alfa dose (units/wk)* | *Darbepoetin alfa dose (mcg/wk): Adults* | *Darbepoetin alfa dose (mcg/wk): Children* |
|---|---|---|
| <1,500 | 6.25 | Unknown |
| 1,500–2,499 | 6.25 | 6.25 |
| 2,500–4,999 | 12.5 | 10 |
| 5,000–10,999 | 25 | 20 |
| 11,000–17,999 | 40 | 40 |
| 18,000–33,999 | 60 | 60 |
| 34,000–89,999 | 100 | 100 |
| ≥90,000 | 200 | 200 |

Give darbepoetin alfa less often than epoetin alfa. If patient was receiving epoetin alfa two to three times weekly, give darbepoetin alfa once weekly. If patient was receiving epoetin alfa once weekly, give darbepoetin alfa once every 2 weeks.
***Adjust-a-dose:*** If increasing hemoglobin level approaches 12 g/dl, reduce dose by 25%. If hemoglobin level continues to increase, withhold dose until hemoglobin level begins to decrease; then restart therapy at a dose 25% below the previous dose.
If hemoglobin level increases more than 1 g/dl over 2 weeks, decrease dose by 25%.
If hemoglobin level increases less than 1 g/dl over 4 weeks and iron stores are adequate, increase dose by 25% of previous dose. Make further increases at 4-week intervals until target hemoglobin level is reached. Patients who don't need dialysis may need lower maintenance doses.

➤ **Anemia from chemotherapy in patients with nonmyeloid malignancies**
*Adults:* 2.25 mcg/kg subcutaneously once weekly or 500 mcg subcutaneously once every 3 weeks.
***Adjust-a-dose:*** For either dosing schedule, adjust dose to maintain a target hemoglobin below 12 g/dl. Give the lowest effective dose to gradually increase hemoglobin to a level where blood transfusion isn't necessary. If hemoglobin exceeds 12 g/dl, hold drug until hemoglobin drops to 11 g/dl, then resume at 40% of previous dose. If hemoglobin increases more than 1 g/dl in a 2-week period, or when hemoglobin exceeds 11 g/dl, reduce dose by 40%. For patients receiving the drug on a once-a-week schedule, if hemoglobin level increases less than 1 g/dl after 6 weeks of therapy, increase dose up to 4.5 mcg/kg.

If after 8 weeks of therapy there is no response as measured by hemoglobin levels or if transfusions are still required, discontinue drug. Discontinue drug after completion of chemotherapy course.

## ADMINISTRATION

**I.V.**
***Alert:*** The needle cover of the prefilled syringe contains dry natural rubber (a derivative of latex). Assess patient for a history of latex allergy.
▼ Don't shake. Shaking can denature drug.
▼ If drug contains particles or is discolored, don't use.
▼ Give undiluted by I.V. injection.
▼ Single-dose vials contain no preservatives; don't pool unused portions.
▼ Store drug in refrigerator; don't freeze. Protect drug from light.
▼ **Incompatibilities:** Other I.V. drugs or solutions.

**Subcutaneous**
***Alert:*** The needle cover of the prefilled syringe contains dry natural rubber (a derivative of latex). Assess patient for a history of latex allergy.
● Don't give subcutaneously in patients with chronic renal failure on dialysis.
● Don't shake. Shaking can denature drug.
● Store drug in refrigerator; don't freeze. Protect drug from light.

## ACTION

Mimics effects of erythropoietin. Functions as a growth factor and as a differentiating factor, enhancing RBC production.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |
| Subcut. | Slow | 48 hr | Unknown |

*Half-life:* 21 hours (I.V.); 74 hours (subcutaneous).

## ADVERSE REACTIONS

**CNS:** ***seizures,*** *dizziness, fatigue, fever, headache,* asthenia, TIA.
**CV:** **CARDIAC ARREST, CARDIAC ARRHYTHMIA,** *edema, hypertension, hypotension, peripheral edema,* ***acute MI, heart failure, stroke, thrombosis,*** angina, chest pain, vascular access thrombosis.
**GI:** *abdominal pain, constipation, diarrhea, nausea, vomiting,* ***GI hemorrhage.***
**Metabolic:** dehydration.
**Musculoskeletal:** *arthralgia, limb pain, myalgia,* back pain.
**Respiratory:** *cough, dyspnea, upper respiratory tract infection,* ***pulmonary embolism,*** bronchitis, pneumonia.
**Skin:** pruritus, rash.
**Other:** *infection,* ***bacteremia, hemorrhage at access site, peritonitis, sepsis,*** abscess, access infection, fluid overload, flulike symptoms, injection site pain.

## INTERACTIONS

None reported.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or its components and in those with uncontrolled hypertension.
● Safety and efficacy haven't been established in patients with underlying hematologic disease, such as hemolytic anemia, sickle cell anemia, thalassemia, or porphyria. Use with caution.
***Overdose S&S:*** Cardiovascular and thrombotic reactions, polycythemia.

## NURSING CONSIDERATIONS

**Black Box Warning** In patients with renal failure, drug may increase risk of serious

CV events, including death, when target hemoglobin is greater than 12 g/dl. Monitor hemoglobin level weekly until stabilized. Individualize dosage to achieve and maintain hemoglobin level within 10 to 12 g/dl. Rate of hemoglobin increase shouldn't exceed 1 g/dl in 2 weeks. ■

**Black Box Warning** In patients with non-small-cell lung cancer and breast, head and neck, lymphoid, and cervical cancers, there is a risk of tumor growth and shortened survival when hemoglobin levels of 12 g/dl are achieved. Target dosage to achieve hemoglobin level of less than 12 g/dl. Use the lowest dosage needed to avoid RBC transfusions. Use only for treatment of anemia due to concomitant myelosuppressive chemotherapy and discontinue drug following chemotherapy course. ■

- Hemoglobin level may not increase until 2 to 6 weeks after starting therapy.
- If patient has a minimal response or lack of response at recommended dose, check for deficiencies in folic acid, iron, or vitamin $B_{12}$. Other contributing factors include infection, malignancy, and occult blood loss.

***Alert:*** If patient develops a sudden loss of response with severe anemia and low reticulocyte count, withhold drug and test patient for antierythropoietin antibodies. If antibodies are present, stop treatment. Don't switch to another erythropoietic protein because a cross-reaction is possible.

- Control blood pressure and monitor it carefully.
- Monitor renal function and electrolytes in predialysis patients.
- Patients who are marginally dialyzed may need adjustments in dialysis prescriptions.
- Serious allergic reactions, including skin rash and urticaria, may occur. If an anaphylactic reaction occurs, stop the drug and give appropriate therapy.

## PATIENT TEACHING

- Instruct patients on proper administration and use and disposal of needles.
- Advise patient of possible side effects and allergic reactions.
- Inform patient of the need for frequent monitoring of blood pressure and hemoglobin level; stress compliance with his treatment for high blood pressure.
- Instruct patient how to take drug correctly at home, including how to store drug and dispose of supplies properly.

# darifenacin hydrobromide

da-ree-FEN-ah-sin

Enablex

*Therapeutic class:* Antispasmodic
*Pharmacologic class:* Anticholinergic
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets (extended-release):* 7.5 mg, 15 mg

## INDICATIONS & DOSAGES

➤ **Urge incontinence, urgency, and frequency from an overactive bladder**

*Adults:* Initially, 7.5 mg P.O. once daily. After 2 weeks, may increase to 15 mg P.O. once daily if needed.

***Adjust-a-dose:*** If patient has a Child-Pugh score of B or takes a potent CYP3A4 inhibitor, such as clarithromycin, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, don't exceed 7.5 mg P.O. once daily.

## ADMINISTRATION

**P.O.**

- Don't crush tablet; swallow whole.
- Give drug without regard for food.

## ACTION

Relaxes smooth muscle of bladder by antagonizing muscarinic receptors, relieving symptoms of overactive bladder.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 7 hr | Unknown |

*Half-life:* 13 to 19 hours.

## ADVERSE REACTIONS

**CNS:** asthenia, dizziness, pain, headache.
**CV:** hypertension, peripheral edema.
**EENT:** abnormal vision, dry eyes, pharyngitis, rhinitis, sinusitis.
**GI:** *dry mouth, constipation,* abdominal pain, diarrhea, dyspepsia, nausea, vomiting.
**GU:** urinary tract disorder, UTI, vaginitis, urine retention.

**Metabolic:** weight gain.
**Musculoskeletal:** arthralgia, back pain.
**Respiratory:** bronchitis.
**Skin:** dry skin, pruritus, rash.
**Other:** accidental injury, flulike syndrome.

## INTERACTIONS

**Drug-drug.** *Anticholinergics:* May increase anticholinergic effects, such as dry mouth, blurred vision, and constipation. Monitor patient closely.
*Digoxin:* May increase digoxin level. Monitor digoxin level.
*Drugs metabolized by CYP2D6 (such as flecainide, thioridazine, tricyclic antidepressants):* May increase levels of these drugs. Use together cautiously.
*Midazolam:* May increase midazolam level. Monitor patient carefully.
*Potent CYP3A4 inhibitors (such as clarithromycin, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir):* May increase darifenacin level. Maintain dosage no higher than 7.5 mg P.O. daily.
**Drug-lifestyle.** *Hot weather:* May cause heat prostration from decreased sweating. Urge caution.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its ingredients.
- Contraindicated in patients who have or who are at risk for urine retention, gastric retention, or uncontrolled narrow-angle glaucoma.
- Avoid use in patients with a Child-Pugh score of C.
- Use cautiously in patients with bladder outflow or GI obstruction, ulcerative colitis, myasthenia gravis, severe constipation, controlled narrow-angle glaucoma, decreased GI motility, or a Child-Pugh score of B.

⚠ ***Overdose S&S:*** Severe antimuscarinic effects (mydriasis, decreased secretions, ileus, urine retention, tachycardia, altered mental status).

## NURSING CONSIDERATIONS

- Assess bladder function, and monitor drug effects.
- If patient has bladder outlet obstruction, watch for urine retention.
- Assess patient for decreased gastric motility and constipation.
- Use during pregnancy only if maternal benefit outweighs fetal risk.
- It's unknown if drug appears in breast milk.

## PATIENT TEACHING

- Tell patient to swallow tablet whole with plenty of liquid; caution against crushing or chewing tablet.
- Inform patient that drug may be taken with or without food.
- Tell patient to use caution, especially when performing hazardous tasks, until drug effects are known.
- Tell patient to report blurred vision, constipation, and urine retention.
- Discourage use of other drugs that may cause dry mouth, constipation, urine retention, or blurred vision.
- Tell patient that drug decreases sweating, and advise cautious use in hot environments and during strenuous activity.

# darunavir ethanolate

duh-ROO-nah-veer

Prezista

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Protease inhibitor
*Pregnancy risk category B*

## AVAILABLE FORMS

*Tablets:* 75 mg, 150 mg, 300 mg, 400 mg, 600 mg

## INDICATIONS & DOSAGES

➤ **With ritonavir and other antiretrovirals for HIV infection**

*Adults who are treatment-experienced:* 600 mg P.O. b.i.d., given with 100 mg ritonavir P.O. b.i.d. and food.
*Adults who are treatment-naive:* 800 mg (two 400-mg tablets) P.O. once daily, given with ritonavir 100 mg P.O. once daily and food.
*Children age 6 to less than 18:* Don't exceed the recommended dose for

treatment-experienced adults. For those weighing 40 kg (88 lb) or more, give 600 mg P.O. b.i.d. with ritonavir 100 mg b.i.d. and food; for those weighing 30 to less than 40 kg (66 to less than 88 lb), give 450 mg P.O. b.i.d. with ritonavir 60 mg b.i.d. and food; for those weighing 20 to less than 30 kg (44 to less than 66 lb), give 375 mg P.O. b.i.d. with ritonavir 50 mg b.i.d. and food.

## ADMINISTRATION

**P.O.**

- Always give with ritonavir and food.

## ACTION

Binds to the protease-active site and inhibits enzyme activity. This prevents mature viral particles from forming.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2½–4 hr | Unknown |

*Half-life:* About 15 hours when combined with ritonavir.

## ADVERSE REACTIONS

**CNS:** *headache,* asthenia, fatigue.
**GI:** *diarrhea, nausea,* abdominal distention, abdominal pain, anorexia, constipation, dry mouth, dyspepsia, flatulence, vomiting.
**Hematologic:** LEUKOPENIA, ***neutropenia, thrombocytopenia.***
**Hepatic:** ***hepatotoxicity.***
**Metabolic:** diabetes mellitus, hypercholesterolemia, hyperlipidemia, hypernatremia, hyperuricemia, hyponatremia, obesity.
**Musculoskeletal:** myalgia.
**Skin:** ***erythema multiforme, Stevens-Johnson syndrome,*** rash.

## INTERACTIONS

**Drug-drug.** *Amiodarone, bepridil, cyclosporine, felodipine, fluticasone, lidocaine, nicardipine, nifedipine, quinidine, rifabutin, sildenafil, sirolimus, tacrolimus, tadalafil, trazodone, vardenafil:* May increase levels of these drugs, increasing the risk of adverse reactions. Use caution, and monitor patient carefully.
*Atorvastatin, pravastatin:* May increase levels of these drugs. Start at the lowest possible dose, and monitor patient carefully.
*Clarithromycin:* May increase clarithromycin level. Reduce clarithromycin dose in patients with renal impairment.
*CYP3A inducers (carbamazepine, dexamethasone, phenobarbital, phenytoin, rifabutin, rifampin), efavirenz, lopinavir, saquinavir:* May increase darunavir clearance and decrease darunavir level. Avoid using together.
*Ergot derivatives, midazolam, pimozide, terfenadine, triazolam:* May cause life-threatening reactions. Use together is contraindicated.
*Ethinyl estradiol, norethindrone:* May decrease estrogen level. Recommend alternative or additional contraception.
*Itraconazole, ketoconazole:* May increase levels of these drugs and darunavir. Don't exceed 200 mg of itraconazole or ketoconazole daily.
*Lovastatin, simvastatin (HMG-CoA reductase inhibitors):* May increase risk of myopathy, including rhabdomyolysis. Use extreme caution.
*Methadone:* May decrease methadone level. Monitor patient for opioid abstinence syndrome, and consider increasing methadone dosage.
*Rifabutin:* May decrease darunavir level. If used together, give rifabutin as 150 mg every other day.
*SSRIs (paroxetine, sertraline):* May decrease levels of these drugs. Adjust dosage carefully based on antidepressant response.
*Trazodone:* May increase trazodone level and risk of toxicity. Decrease trazodone dosage.
*Warfarin:* May decrease warfarin level. Monitor patient carefully.
**Drug-herb.** *St. John's wort:* May decrease drug level significantly. Discourage use together.
**Drug-food.** *Food:* Increases drug absorption, which is needed for adequate therapeutic effect. Advise patient to take with food.

## EFFECTS ON LAB TEST RESULTS

- May increase AST, ALT, GGT, alkaline phosphatase, bilirubin, pancreatic amylase, pancreatic lipase, cholesterol, triglyceride, and uric acid levels. May decrease albumin, bicarbonate, and calcium levels. May

increase or decrease sodium and glucose levels.
• May decrease WBC, neutrophil, lymphocyte, and platelet counts.

### CONTRAINDICATIONS & CAUTIONS
• Contraindicated in patients hypersensitive to any component of drug and patient taking drugs metabolized by CYP3A (dihydroergotamine, ergonovine, ergotamine, methylergonovine, midazolam, pimozide, triazolam).
• Use cautiously in patients with liver or renal impairment, diabetes mellitus, hemophilia, known sulfonamide allergy, or a history of opportunistic infections.

### NURSING CONSIDERATIONS
***Alert:*** Because of an increased risk of hepatotoxicity, especially in patients with prior hepatic dysfunction, check liver function tests before beginning treatment and periodically thereafter. Discontinue treatment in patients with elevated liver enzyme levels and signs and symptoms of liver dysfunction.
• Make sure patient isn't taking any drugs that are incompatible with darunavir.
• If patient has diabetes, monitor glucose level.
• Risks and benefits of drug in treatment-naïve patients aren't known.

### PATIENT TEACHING
• Explain that many drugs interact with darunavir; advise patient to report all drugs he takes, including OTC products.
***Alert:*** Instruct patient to take darunavir and ritonavir at the same time every day, with food.
• Tell patient that drug doesn't cure HIV infection or AIDS and doesn't reduce the risk of passing HIV to others.
• Explain that opportunistic infections and other complications of HIV infection may still develop.
• If patient misses a dose by more than 6 hours, tell him to wait and take the next dose at the regularly scheduled time. If he remembers within 6 hours, tell him to take the missed dose immediately.

## dasatinib
duh-SAH-tin-nib

Sprycel

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Protein-tyrosine kinase inhibitor
*Pregnancy risk category D*

D

### AVAILABLE FORMS
*Tablets:* 20 mg, 50 mg, 70 mg, 100 mg

### INDICATIONS & DOSAGES
➤ **Accelerated, myeloid, or lymphoid blast-phase chronic myeloid leukemia (CML) with resistance or intolerance to earlier treatment, including imatinib; Philadelphia chromosome–positive acute lymphoblastic leukemia with resistance or intolerance to prior therapy**
*Adults:* 140 mg P.O. once daily. If patient tolerates this dose but fails to respond to treatment, increase to 180 mg P.O. once daily. Continue until disease progresses or intolerable adverse effects occur.
***Adjust-a-dose:*** If patient has hematologic toxicity, consider reducing dose or interrupting or stopping therapy. If patient has severe, nonhematologic toxicity, hold dose until condition resolves; then resume at previous or reduced dose.
➤ **Newly diagnosed Philadelphia chromosome-positive chronic-phase CML or chronic-phase CML resistant or intolerant to previous therapy including imatinib**
*Adults:* 100 mg P.O. daily. May increase to 140 mg daily.
***Adjust-a-dose:*** If patient has hematologic toxicity, consider reducing dosage or interrupting or stopping therapy. If patient has severe, nonhematologic toxicity, hold dose until condition resolves; then resume at previous or reduced dosage.

### ADMINISTRATION
**P.O.**
• Give drug without regard for food.
***Alert:*** Don't crush or cut tablets. If tablet is crushed or broken, wear chemotherapy

gloves to dispose of it. Pregnant women shouldn't handle broken tablets.

## ACTION

Reduces leukemic cell growth by inhibiting a tyrosine kinase enzyme. As a result, bone marrow can resume production of normal RBCs, WBCs, and platelets.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | ½–6 hr | Unknown |

*Half-life:* 3 to 5 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia, chills, dizziness, fatigue, headache, neuropathy,* ***bleeding,*** *pyrexia,* ***seizures,*** anxiety, confusion, depression, insomnia, somnolence, syncope, tremor, vertigo, affect lability.
**CV:** **ARRHYTHMIAS,** *chest pain, edema,* ***cardiac dysfunction, heart failure,*** hypertension, hypotension, pericardial effusion, cardiomegaly, flushing, palpitations, **MI.**
**EENT:** *mucositis, stomatitis,* conjunctivitis, dry eyes, dysgeusia, tinnitus.
**GI:** *abdominal distention and pain, anorexia, constipation, diarrhea, nausea, vomiting,* ***bleeding,*** anal fissure, colitis, dyspepsia, dysphagia, gastritis.
**GU:** ***renal failure,*** urinary frequency.
**Hematologic:** *anemia,* ***febrile neutropenia, pancytopenia, thrombocytopenia.***
**Metabolic:** *weight loss or gain,* hyperuricemia, appetite changes.
**Musculoskeletal:** *arthralgia, myalgia, pain,* inflammation, muscle stiffness, weakness.
**Respiratory:** *cough, dyspnea, upper respiratory tract infection, pleural effusion, pneumonia,* asthma, ***pulmonary edema, pulmonary hypertension,*** lung infiltrates, pneumonitis.
**Skin:** *pruritus, rash,* acne, alopecia, dry skin, nail or pigment disorders, sweating, dermatitis, photosensitivity reactions, urticaria.
**Other:** *infection,* ***tumor lysis syndrome,*** ascites, gynecomastia, herpes infection, *fluid retention.*

## INTERACTIONS

**Drug-drug.** *Antacids:* May decrease dasatinib absorption. Give antacid 2 hours before or 2 hours after dasatinib.
*CYP3A4 inducers (carbamazepine, dexamethasone, phenobarbital, phenytoin, rifampicin):* May decrease dasatinib level. Avoid using together, or increase dasatinib dose in 20-mg increments.
*CYP3A4 inhibitors (atazanavir, clarithromycin, erythromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin):* May increase dasatinib level and toxicity. Avoid using together; if unavoidable, monitor patient closely and consider decreasing dasatinib dose to 20 to 40 mg daily.
*CYP3A4 substrates (cyclosporine, ergot alkaloids, fentanyl, pimozide, quinidine, sirolimus, tacrolimus):* May alter levels of these drugs. Use cautiously together, and monitor patient.
*$H_2$-blockers, proton pump inhibitors:* May decrease dasatinib level because of gastric acid suppression. Avoid using together. Consider antacids as an alternative.
*Simvastatin:* May increase simvastatin level. Monitor patient.
**Drug-herb.** *St. John's wort:* May decrease drug level. Discourage use together.
**Drug-food.** *Grapefruit juice:* May increase dasatinib level. Avoid use together.

## EFFECTS ON LAB TEST RESULTS

- May increase uric acid, bilirubin, creatinine, AST, ALT, CK, and troponin levels. May decrease phosphate and calcium levels.
- May decrease RBC, platelet, and neutrophil counts.

## CONTRAINDICATIONS & CAUTIONS

- Use cautiously in patients receiving antiarrhythmics, antiplatelets, or anticoagulants; patients receiving cumulative high-dose anthracycline therapy; patients with a prolonged QT interval or risk of prolonged QT interval (those with hypokalemia, hypomagnesemia, or current use of drugs that prolong the QT interval); patients with liver impairment; and patients who are lactose intolerant.

***Overdose S&S:*** Severe myelosuppression, bleeding.

## NURSING CONSIDERATIONS

- Monitor CBC weekly for the first 2 months of treatment, then monthly thereafter, or as indicated.
- Correct electrolyte imbalances, especially of potassium and magnesium, before treatment.
- Monitor for fluid retention and heart failure.
- Drug contains lactose.
- Drug may cause fetal harm. Don't use in pregnant women. If used, mother should be warned of potential harm.
- Drug affects older and younger adults similarly, although older adults may be more sensitive to drug's effects.
- It's unknown if drug appears in breast milk; mothers shouldn't breast-feed during treatment.

## PATIENT TEACHING

- Tell patient to take the tablets at about the same time every day.
- Caution patient not to crush or cut the tablets.
- Warn women of childbearing age to use reliable contraception during treatment. Men who take drug should use condoms to avoid impregnating their partners.
- Tell patient to report weight gain, swelling, and shortness of breath.
- Advise patient to notify prescriber immediately about easy or unusual bruising.
- Tell patient to avoid grapefruit juice.

**SAFETY ALERT!**

# DAUNOrubicin citrate liposomal

daw-nah-ROO-buh-sin

DaunoXome

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Anthracycline glycoside antibiotic
*Pregnancy risk category D*

## AVAILABLE FORMS

*Injection:* 2 mg/ml (equivalent to 50 mg daunorubicin base)

## INDICATIONS & DOSAGES

➤ **First-line cytotoxic therapy for advanced HIV-related Kaposi sarcoma**

*Adults:* 40 mg/m$^2$ I.V. over 60 minutes once every 2 weeks. Repeat blood counts before each dose; withhold drug if absolute granulocyte count is less than 750 cells/mm$^3$. Continue treatment until progressive disease becomes evident or until other complications of HIV infection preclude continuation of therapy.

***Adjust-a-dose:*** For patients with impaired hepatic and renal function, if bilirubin level is 1.2 to 3 mg/dl, give three-fourths normal dose; if bilirubin or creatinine level exceeds 3 mg/dl, give one-half normal dose.

## ADMINISTRATION

**I.V.**

- Preparing and giving drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.
- To dilute, withdraw calculated volume of drug from vial and transfer into an equal amount of $D_5W$. Recommended concentration after dilution is 1 mg/ml.
- Use immediately after dilution.
- Don't use an in-line filter.
- Give over 60 minutes.

**Black Box Warning** Back pain, flushing, and chest tightness may develop during first 5 minutes of infusion. These symptoms subside after infusion stops and usually don't recur when drug is infused more slowly.

- Monitor I.V. site closely; watch for irritation and infiltration, which can cause tissue damage and necrosis. If it occurs, stop infusion, apply ice, and notify prescriber.
- If needed, drug may be refrigerated at 36° to 46° F (2° to 8° C) for up to 6 hours.
- **Incompatibilities:** Bacteriostatic agents, other I.V. drugs, saline and other solutions.

## ACTION

Maximizes selectivity of daunorubicin for solid tumors in situ. After penetrating tumor, drug is released over time to exert antineoplastic activity by inhibiting DNA synthesis and DNA-dependent RNA synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 4½ hours.

## ADVERSE REACTIONS

**CNS:** *headache, neuropathy,* depression, dizziness, insomnia, amnesia, anxiety, ataxia, confusion, ***seizures,*** hallucination, tremor, hypertonia, ***meningitis,*** *fatigue,* malaise, emotional lability, abnormal gait, hyperkinesia, somnolence, abnormal thinking, *fever.*
**CV:** chest pain, hypertension, palpitations, ***arrhythmias, pericardial effusion, cardiac arrest,*** angina pectoris, ***pulmonary hypertension,*** flushing, edema, tachycardia, ***MI, heart failure.***
**EENT:** *rhinitis,* stomatitis, sinusitis, abnormal vision, conjunctivitis, tinnitus, eye pain, deafness, earache.
**GI:** taste disturbances, dry mouth, gingival bleeding, *nausea, diarrhea, abdominal pain, vomiting, anorexia,* constipation, ***GI hemorrhage,*** gastritis, dysphagia, stomatitis, increased appetite, melena, hemorrhoids, tenesmus.
**GU:** dysuria, nocturia, polyuria.
**Hematologic:** **NEUTROPENIA, THROMBOCYTOPENIA.**
**Hepatic:** hepatomegaly.
**Metabolic:** dehydration.
**Musculoskeletal:** *rigors, back pain,* arthralgia, myalgia.
**Respiratory:** *cough, dyspnea,* hemoptysis, hiccups, pulmonary infiltration, increased sputum.
**Skin:** alopecia, pruritus, *increased sweating,* dry skin, seborrhea, folliculitis, injection site inflammation.
**Other:** splenomegaly, lymphadenopathy, tooth caries, **ALLERGIC REACTIONS,** flulike symptoms.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

- May decrease neutrophil and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients who have experienced severe hypersensitivity reaction to drug or its components.
- Use cautiously in patients with myelosuppression, cardiac disease, previous radiotherapy encompassing the heart, previous anthracycline use (doxorubicin cumulative dose is 300 mg/m$^2$ or above), or hepatic or renal dysfunction.

***Overdose S&S:*** Increased severity of observed dose limiting toxicities of therapeutic doses, myelosuppression (especially granulocytopenia), fatigue, nausea, vomiting.

## NURSING CONSIDERATIONS

- Drug causes less nausea, vomiting, alopecia, neutropenia, thrombocytopenia, and potentially less cardiotoxicity than conventional daunorubicin.

**Black Box Warning** Give only under supervision of prescriber specializing in chemotherapy. ■

**Black Box Warning** Monitor cardiac function regularly. Assess patient before giving each dose because of risk of cardiac toxicity and heart failure. Cardiac monitoring is especially advised in patients who have received prior anthracyclines, have preexisting cardiac disease, or have had prior radiotherapy encompassing the heart. ■

- Determine left ventricular ejection fraction at total cumulative doses of 320 mg/m$^2$ and every 160 mg/m$^2$ thereafter. Total cumulative doses generally shouldn't exceed 550 mg/m$^2$.

**Black Box Warning** Provide careful hematologic monitoring because severe myelosuppression may occur. ■

- Monitor patient closely for signs and symptoms of opportunistic infection, especially because patients with HIV infection are immunocompromised.

**Black Box Warning** Reduce dosage in patients with impaired hepatic function. ■

- ***Look alike–sound alike:*** Don't confuse daunorubicin citrate liposomal with daunorubicin hydrochloride.

## PATIENT TEACHING

- Inform patient that hair loss may occur but that it's usually reversible.

- Instruct patient to call prescriber if sore throat, fever, or other signs or symptoms of infection occur. Tell patient to avoid exposure to people with infections.
- Advise women to report suspected or confirmed pregnancy during therapy.
- Tell patient to report back pain, flushing, or chest tightness during infusion.

**SAFETY ALERT!**

## DAUNOrubicin hydrochloride

daw-nah-ROO-buh-sin

Cerubidine

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Anthracycline glycoside antibiotic
*Pregnancy risk category D*

### AVAILABLE FORMS

*Injection:* 5 mg/ml
*Powder for injection:* 20-mg vials

### INDICATIONS & DOSAGES

Dosages vary. Check treatment protocol with prescriber.

➤ **To induce remission in acute nonlymphocytic (myelogenous, monocytic, erythroid) leukemia**

*Adults age 60 and older:* In combination, 30 mg/m$^2$ per day I.V. on days 1, 2, and 3 of first course and on days 1 and 2 of subsequent courses with cytarabine infusions.

*Adults younger than age 60:* In combination, 45 mg/m$^2$ per day I.V. on days 1, 2, and 3 of first course and on days 1 and 2 of subsequent courses with cytarabine infusions.

➤ **To induce remission in acute lymphocytic leukemia (with combination therapy)**

*Adults:* 45 mg/m$^2$ per day I.V. on days 1, 2, and 3 of first course.

*Children age 2 and older:* 25 mg/m$^2$ I.V. on day 1 every week for up to 6 weeks, if needed.

*Children younger than age 2 or with body surface area less than 0.5 m$^2$:* Dose based on body weight, not surface area.

***Adjust-a-dose:*** For patients with impaired hepatic and renal function, reduce dosage as follows: If bilirubin level is 1.2 to 3 mg/dl, give three-fourths normal dose; if bilirubin or creatinine level exceeds 3 mg/dl, give half normal dose.

### ADMINISTRATION

**I.V.**

▼ Preparing and giving parenteral drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.
▼ Reconstitute with 4 ml sterile water for injection to yield 5 mg/ml.
▼ Withdraw desired dose into syringe containing 10 to 15 ml of normal saline solution for injection.
▼ Inject as a slow I.V. push over 2 to 3 minutes into tubing of a free-flowing I.V. solution of $D_5W$ or normal saline solution for injection.
**Black Box Warning** Give drug into a rapidly infusing I.V. infusion. Do not give I.M. or subcutaneously. Severe local tissue necrosis will result from extravasation.
▼ If extravasation occurs, stop infusion immediately, apply ice to area for 24 to 48 hours, and notify prescriber. Because drug is a vesicant, extravasation could cause severe tissue necrosis.
▼ If possible, use within 8 hours of preparation. Reconstituted solution is stable 24 hours at room temperature, 48 hours if refrigerated.
▼ **Incompatibilities:** Other I.V. drugs. If mixed with dexamethasone or heparin, drug may precipitate; don't mix together.

### ACTION

May interfere with DNA-dependent RNA synthesis by intercalation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* Initial, 45 minutes; terminal, 18½ hours.

### ADVERSE REACTIONS

**CNS:** fever.
**CV:** **IRREVERSIBLE CARDIOMYOPATHY,** ECG changes.
**GI:** *nausea, vomiting,* diarrhea, abdominal pain, mucositis.
**Hematologic:** ***bone marrow suppression.***
**Metabolic:** hyperuricemia.

**Skin:** *reversible alopecia, severe cellulitis and tissue sloughing with drug extravasation,* rash, darkening or redness of previously irradiated areas, contact dermatitis urticaria.

## INTERACTIONS

**Drug-drug.** *Doxorubicin:* May cause additive cardiotoxicity. Monitor patient for toxicity.
*Hepatotoxic drugs:* May increase risk of additive hepatotoxicity. Monitor hepatic function closely.
*Myelosuppressive drugs:* May increase risk of myelosuppression. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, AST, bilirubin, and uric acid levels. May decrease hemoglobin level and hematocrit.
- May decrease platelet and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to the drug.
- Use cautiously in patients with myelosuppression or impaired cardiac, renal, or hepatic function.

## NURSING CONSIDERATIONS

**Black Box Warning** Only physicians experienced in leukemia chemotherapy should administer drug. The physician and institution must be capable of responding rapidly and completely to severe hemorrhage or overwhelming infection. Adequate laboratory and supportive resources must be available.

- Take preventive measures (including adequate hydration) before starting treatment. Hyperuricemia may result from rapid lysis of leukemic cells. Allopurinol may be ordered.

**Black Box Warning** Myocardial toxicity may occur when total cumulative dosage exceeds 400 to 550 mg/m$^2$ in adults, 300 mg/m$^2$ in children older than 2 years, or 10 mg/kg in children younger than 2 years. This may occur during therapy to several months to years after therapy.

- Perform cardiac function studies, including ECG and ejection fraction, before treatment and then periodically throughout therapy.

***Alert:*** Cumulative adult dosage is limited to 400 to 550 mg/m$^2$ (450 mg/m$^2$ when patient is also receiving or has received cyclophosphamide or radiation therapy to cardiac area).

**Black Box Warning** Reduce dosage in patients with renal or hepatic impairment.

- Monitor CBC and hepatic function tests; monitor ECG every month during therapy.

***Alert:*** If signs of heart failure, cardiomyopathy, or arrhythmia develop, stop drug immediately and notify prescriber.

- Watch for nausea and vomiting, which may last 24 to 48 hours.

**Black Box Warning** Severe myelosuppression occurs when used in therapeutic doses; this may lead to infection or hemorrhage.

- Blood transfusions may be needed to combat anemia.
- ***Look alike–sound alike:*** Reddish color of drug is similar to that of doxorubicin; don't confuse the two.
- Lowest blood counts occur 10 to 14 days after dose.
- ***Look alike–sound alike:*** Don't confuse daunorubicin hydrochloride with daunorubicin citrate liposomal.

## PATIENT TEACHING

- Advise patient to report any pain or burning at site of injection during or after administration.
- Advise patient to watch for signs and symptoms of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools) and to take temperature daily.
- Inform patient that red urine for 1 to 2 days is normal and doesn't indicate the presence of blood in urine.
- Advise patient that hair loss may occur but that it's usually reversible.
- Caution woman of childbearing age to avoid becoming pregnant during therapy. Recommend that she consult prescriber before becoming pregnant.

# deferasirox

deh-fah-RASS-ih-rocks

Exjade

*Therapeutic class:* Chelating agent
*Pharmacologic class:* Heavy metal antagonist
*Pregnancy risk category B*

## AVAILABLE FORMS

*Tablets for oral suspension:* 125 mg, 250 mg, 500 mg

## INDICATIONS & DOSAGES

➤ **Chronic iron overload caused by blood transfusions (transfusional hemosiderosis)**

*Adults and children age 2 and older:* Initially, 20 mg/kg P.O. daily on an empty stomach 30 minutes before eating. Monitor serum ferritin level monthly and adjust dose every 3 to 6 months by 5 or 10 mg/kg based on ferritin trends. Don't exceed 40 mg/kg daily. Consider stopping therapy if serum ferritin level drops below 500 mcg/L.

## ADMINISTRATION

**P.O.**

- Give drug to patient at same time each day, about 30 minutes before he eats.
- Tablets may be dissolved in water, orange juice, or apple juice.

## ACTION

Binds with high affinity to iron, allowing mainly fecal excretion.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1½–4 hr | Unknown |

*Half-life:* 8 to 16 hours.

## ADVERSE REACTIONS

**CNS:** *fever, headache,* dizziness, fatigue.
**EENT:** *nasopharyngitis, pharyngolaryngeal pain,* acute tonsillitis, auditory disturbances, ear infection, pharyngitis, rhinitis, visual disturbances.
**GI:** *abdominal pain, diarrhea, nausea, vomiting.*
**GU:** ***acute renal failure.***
**Hematologic:** ***agranulocytosis, neutropenia, thrombocytopenia.***
**Hepatic:** ***liver toxicity.***
**Musculoskeletal:** back pain, joint pain.
**Respiratory:** *cough,* bronchitis, respiratory tract infection.
**Skin:** rash, urticaria, leukocytoclastic vasculitis.
**Other:** influenza, hypersensitivity reactions, ***(including anaphylaxis and angioedema).***

## INTERACTIONS

**Drug-drug.** *Aluminum-containing antacids:* May decrease iron chelation. Avoid using together.
*Cholestyramine:* May decrease deferasirox level. If drugs must be used together, increase initial deferasirox dosage to 30 mg/kg. Monitor serum ferritin level and clinical response before further dosage adjustment.
*Other iron chelators:* May increase risk of toxic effects. Avoid using together.
**Drug-food.** *Any food:* May decrease drug effects. Give to patient with an empty stomach at least 30 minutes before eating.

## EFFECTS ON LAB TEST RESULTS

- May increase transaminase and creatinine levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to deferasirox or any component of the drug.

**Black Box Warning** Drug may cause hepatic or renal impairment, including failure, or GI hemorrhage, which may be fatal. Risk is higher in elderly patients and in those with high risk of myelodysplastic syndrome (MDS), underlying renal or hepatic impairment, or low platelet count. ■

- Contraindicated in patients with creatinine clearance of less than 40 ml/minute or serum creatinine level greater than age-appropriate two times upper limit of normal, in those with poor performance status and high risk of MDS or advanced malignancies, and in patients with platelet count of less than 50,000/$mm^3$.
- Use cautiously in breast-feeding women and patients with renal impairment, hepatic impairment, hearing loss, or vision disturbances.

***Overdose S&S:*** Hepatitis, nausea, diarrhea.

## NURSING CONSIDERATIONS

**Black Box Warning** Monitor kidney and liver function tests closely. Monitor serum creatinine level or creatinine clearance before initiation of therapy and monthly thereafter; in patients with underlying renal impairment or risk factors for renal impairment, monitor serum creatinine level or creatinine clearance weekly for first month, then monthly. Monitor serum transaminase and bilirubin levels before initiation of therapy, every 2 weeks during first month, and monthly thereafter. ■

- Periodically evaluate patient for proteinuria.
- Test patient's hearing and visual acuity before starting drug and yearly thereafter.
- Monitor patient for rash. If mild or moderate, treatment may continue. If severe, drug may be stopped or dose reduced. Patient also may need corticosteroids.
- Maintain adequate hydration for patients experiencing nausea and vomiting.

## PATIENT TEACHING

- Tell patient to take drug at about the same time each day, on an empty stomach, 30 minutes before eating.
- Caution patient not to chew or swallow tablets.
- Instruct patient to dissolve tablets in water, orange juice, or apple juice; drink the mixture; swirl a small amount of the same liquid in the glass to pick up any remaining drug; and swallow that as well.
- Tell patient not to take aluminum-containing antacids at the same time.
- Inform patient of the need for regular blood tests to evaluate the effectiveness of therapy and detect possible side effects.
- Tell patient to report changes in hearing or vision, rash, abdominal pain, yellowing of skin or eyes, pale stools, or dark urine.
- Urge patient to avoid driving or operating hazardous equipment if he becomes dizzy.

**SAFETY ALERT!**

# degarelix acetate

day-gah-REL-ix

Firmagon

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* GnRH receptor antagonist
*Pregnancy risk category X*

## AVAILABLE FORMS

*Injection:* 80-mg, 120-mg vial

## INDICATIONS & DOSAGES

➤ **Advanced prostate cancer**

*Adult men:* Initially, 240 mg subcutaneously, administered as two 120-mg injections. Maintenance dose is 80 mg subcutaneously every 28 days.

## ADMINISTRATION

**Subcutaneous**

- To minimize exposure, always wear gloves when working with degarelix.
- Give drug within 1 hour of reconstitution.
- For 120-mg initial dose, draw up 3 ml sterile water for injection with a reconstitution needle (21G/2 inch). For 80-mg maintenance dose, draw up 4.2 ml sterile water for injection.
- Inject sterile water for injection slowly into degarelix 120-mg or 80-mg vial. To keep product and syringe sterile, don't remove syringe and needle.
- Keeping vial in an upright position, swirl it very gently until liquid looks clear and has no undissolved powder or particles. If powder adheres to vial over the liquid surface, vial can be tilted slightly to dissolve powder. Avoid shaking, to prevent foam formation. A ring of small air bubbles on surface of liquid is acceptable. The reconstitution procedure may take up to 15 minutes.
- Tilt vial slightly and keep needle in lowest part of vial. Withdraw 3 ml of degarelix 120 mg or 4.2 ml of degarelix 80 mg without turning vial upside down.
- Exchange reconstitution needle with administration needle for deep subcutaneous injection (27G/1¼ inch). Remove any air bubbles.

• Inject 3 ml degarelix 120 mg or 4.2 ml degarelix 80 mg subcutaneously immediately after reconstitution. Grasp skin of abdomen, and elevate subcutaneous tissue. Insert needle deeply at angle of not less than 45 degrees. Gently pull back plunger to check if blood is aspirated. If blood appears in syringe, reconstituted product can no longer be used. Discontinue procedure and discard syringe and needle. Reconstitute new dose.
• Repeat reconstitution procedure for second 120-mg initial dose. Choose different injection site and inject 3 ml.

## ACTION

Reversibly binds to the pituitary GnRH receptors, reducing the release of gonadotropins, and consequently testosterone.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 2 days | 53 days |

*Half-life:* About 53 days.

## ADVERSE REACTIONS

**CNS:** asthenia, dizziness, fatigue, fever, headache, insomnia, nausea.
**CV:** hypertension, *hot flashes.*
**GI:** constipation, diarrhea.
**GU:** erectile dysfunction, UTI, testicular atrophy.
**Metabolic:** *weight gain, increased GGT.*
**Musculoskeletal:** arthralgia, back pain, decrease in bone density.
**Skin:** *injection-site reactions* (including *pain, erythema,* swelling, induration, and nodule formation), night sweats, hyperhidrosis.
**Other:** chills, gynecomastia.

## INTERACTIONS

**Drug-drug.** *Class IA, Class III antiarrhythmics (such as amiodarone, procainamide, quinidine, sotalol):* May prolong QT interval. Avoid use together.

## EFFECTS ON LAB TEST RESULTS

• May increase prostate-specific antigen (PSA), AST, ALT, and GGT levels.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components.
• Use cautiously in patients with congenital long QT syndrome, electrolyte abnormalities, or heart failure and in those taking Class IA or Class III antiarrhythmics.
• Use cautiously in patients with creatinine clearance of less than 50 ml/minute or severe hepatic impairment.

D

## NURSING CONSIDERATIONS

• Monitor QT interval in patients with congenital long QT syndrome, electrolyte abnormalities, or heart failure, and in those taking Class IA or Class III antiarrhythmics.
• Monitor PSA level; if level is elevated, monitor testosterone level.
• Monitor bone density tests periodically.
• Monitor liver function test values.

## PATIENT TEACHING

• Teach injection technique and methods of record-keeping to patient or family if they will be giving drug.
• Emphasize to patient the importance of notifying health care provider of heart problems, such as heart failure, irregular heart rhythm, or salt imbalance, before taking drug.
• Advise patient to inform all health care providers that he's taking drug.

# delavirdine mesylate

dell-ah-VUR-den

Rescriptor

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Nonnucleoside reverse transcriptase inhibitor
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 100 mg, 200 mg

## INDICATIONS & DOSAGES

➤ **HIV-1 infection**

*Adults and adolescents age 16 and older:* 400 mg P.O. t.i.d. with other appropriate antiretrovirals.

**Black Box Warning** Resistant virus emerges rapidly when delavirdine is administered as monotherapy. Always administer with appropriate antiretroviral therapy. ■

## ADMINISTRATION

**P.O.**

- Patient may take drug with or without food.
- For patient with achlorhydria (absence of gastric acid in the stomach), drug should be taken with an acidic beverage, such as orange juice or cranberry juice.
- Patient should separate doses of delavirdine and antacid by at least 1 hour.
- Drug may be dispersed in water before ingestion. Add four 100-mg tablets to at least 3 ounces (90 ml) of water, allow to stand for a few minutes, and stir until a uniform dispersion occurs. Tell patient to drink dispersion promptly, rinse glass, and swallow the rinse to ensure that entire dose is consumed. Don't try to disperse 200-mg tablets because they don't disperse well; take 200-mg tablets intact.

## ACTION

A nonnucleoside reverse transcriptase inhibitor of HIV-1 that binds directly to reverse transcriptase and blocks RNA- and DNA-dependent DNA polymerase activities.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Unknown |

*Half-life:* 5¼ hours.

## ADVERSE REACTIONS

**CNS:** *asthenia, fatigue, headache,* depression, fever, insomnia, pain.
**EENT:** pharyngitis, sinusitis.
**GI:** *nausea,* abdominal cramps, diarrhea, distention or pain, vomiting.
**GU:** epididymitis, hematuria, hemospermia, impotence, metrorrhagia, nocturia, polyuria, proteinuria, renal calculi, renal pain, vaginal candidiasis.
**Respiratory:** bronchitis, cough, upper respiratory tract infection.
**Skin:** *rash.*
**Other:** flulike syndrome.

## INTERACTIONS

**Drug-drug.** *Amphetamines, nonsedating antihistamines, benzodiazepines, calcium channel blockers, clarithromycin, dapsone, ergot alkaloid preparations, indinavir, quinidine, rifabutin, sedative-hypnotics, warfarin:* May increase or prolong therapeutic and adverse effects of these drugs. Avoid using together or, if use together is unavoidable, reduce doses of indinavir and clarithromycin.
*Antacids:* May reduce absorption of delavirdine. Separate doses by at least 1 hour.
*Carbamazepine, phenobarbital, phenytoin:* May decrease delavirdine level. Use together cautiously.
*Clarithromycin, fluoxetine, ketoconazole:* May cause a 50% increase in delavirdine bioavailability. Monitor patient and reduce dose of clarithromycin.
*Didanosine:* May decrease absorption of both drugs by 20%. Separate doses by at least 1 hour.
*$H_2$-receptor antagonists:* May increase gastric pH and reduce absorption of delavirdine. Long-term use together isn't recommended.
*HMG-CoA reductase inhibitors, such as atorvastatin, lovastatin, simvastatin:* May increase levels of these drugs, which increases risk of myopathy, including rhabdomyolysis. Avoid using together.
*Rifabutin, rifampin:* May decrease delavirdine level. May increase rifabutin level by 100%. Avoid using together.
*Saquinavir:* May increase bioavailability of saquinavir fivefold. Monitor AST and ALT levels frequently when used together.
*Sildenafil:* May increase sildenafil level and may increase sildenafil adverse events, including hypotension, visual changes, and priapism. Tell patient not to exceed 25 mg of sildenafil in 48 hours.
**Drug-herb.** *St. John's wort:* May decrease drug level. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, amylase, AST, CK, creatinine, GGT, and lipase levels. May decrease glucose and hemoglobin levels and hematocrit.
- May increase eosinophil count, PT, and PTT. May decrease granulocyte, neutrophil, platelet, RBC, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.

• Use cautiously in patients with impaired hepatic function.

## NURSING CONSIDERATIONS

• Because drug's effects in patients with hepatic or renal impairment haven't been studied, monitor renal and liver function test results carefully.
• Drug-induced diffuse, maculopapular, erythematous, pruritic rash occurs most commonly on upper body and arms of patients with lower CD4 cell counts, usually within first 3 weeks of treatment. Dosage adjustment doesn't seem to affect rash. Treat symptoms with diphenhydramine, hydroxyzine, or topical corticosteroids.
• Drug doesn't reduce risk of transmission of HIV-1.
• Monitor patient's fluid balance and weight.

## PATIENT TEACHING

• Tell patient to stop drug and call prescriber if severe rash or such symptoms as fever, fatigue, headache, nausea, abdominal pain, or cough occur.
• Inform patient that drug doesn't cure HIV-1 infection and that he may continue to acquire illnesses including opportunistic infections related to HIV-1 infection. Therapy hasn't been shown to reduce the risk or frequency of such illnesses. Drug hasn't been shown to reduce transmission of HIV.
• Advise patient to remain under medical supervision when taking drug because the long-term effects aren't known.
• Tell patient to take drug as prescribed and not to alter doses without prescriber's approval. If a dose is missed, tell patient to take the next dose as soon as possible; he shouldn't double the next dose.
• Inform patient that drug may be dispersed in water before ingestion. Add four 100-mg tablets to at least 3 ounces (90 ml) of water, allow to stand for a few minutes, and stir until a uniform dispersion occurs. Tell patient to drink dispersion promptly, rinse glass, and swallow the rinse to ensure that entire dose is consumed.
• Instruct patient to take 200-mg tablets whole; 200-mg tablets don't disperse well in water.
• Tell patient that drug may be taken with or without food.
• Tell patient with achlorhydria to take drug with an acidic beverage, such as orange or cranberry juice.
• Instruct patient to take drug and antacids at least 1 hour apart.
• Advise patient to report use of other prescription or nonprescription drugs, including herbal remedies.
• Advise patient taking sildenafil about an increased risk of sildenafil-related adverse events, including low blood pressure, visual changes, and painful penile erection. Tell him to promptly report any symptoms to his prescriber. Tell patient not to exceed 25 mg of sildenafil in 48 hours.

D

✳ *NEW DRUG*

# denosumab

deh-KNOW-sue-mab

Prolia

*Therapeutic class:* Antiosteoporotic
*Pharmacologic class:* Antiresorptive drug
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 60-mg/ml prefilled syringe, 60-mg/ml single-use vial

## INDICATIONS & DOSAGES

➤ **Postmenopausal osteoporosis in patients at risk for fracture**

*Adults:* 60 mg subcutaneously every 6 months. All patients should receive 1,000 mg of calcium daily and at least 400 units of vitamin D daily.

## ADMINISTRATION

**Subcutaneous**

• Don't use if solution is discolored or cloudy or contains many particles or foreign particulate matter.
• Before administration, drug may be removed from refrigerator and brought to room temperature (up to 77° F [25° C]) by letting stand in original container. This generally takes 15 to 30 minutes. Don't warm drug in any other way. Avoid vigorous shaking of drug.

• Administer via subcutaneous injection in upper arm, upper thigh, or abdomen.

## ACTION

Inhibits osteoclast activity, thereby decreasing bone resorption and increasing bone mass and strength.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 10 days | 4–5 mo |

*Half-life:* About 25 days.

## ADVERSE REACTIONS

**CNS:** asthenia, insomnia, sciatica, vertigo.
**CV:** angina, atrial fibrillation, peripheral edema.
**EENT:** pharyngitis.
**GI:** flatulence, gastroesophageal reflux disease, upper abdominal pain.
**GU:** cystitis.
**Hematologic:** anemia.
**Metabolic:** hypercholesterolemia, ***hypocalcemia.***
**Musculoskeletal:** *back pain,* bone pain, *extremity pain,* musculoskeletal pain, myalgia, spinal osteoarthritis.
**Respiratory:** pneumonia, upper respiratory tract infection.
**Skin:** pruritus, rash.
**Other:** herpes zoster.

## INTERACTIONS

None reported.

## EFFECTS ON LAB TEST RESULTS

• May increase cholesterol level. May decrease calcium level.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients with hypocalcemia.
• Use cautiously in patients with history of hypoparathyroidism, thyroid surgery, parathyroid surgery, malabsorption syndromes, excision of small intestine, or severe renal impairment.
• Use cautiously in patients taking immunosuppressants and in those with an impaired immune system.
• Use during pregnancy only if benefit outweighs risk to fetus. It isn't known if drug appears in breast milk. Because of risk of adverse effects, a decision should be made to discontinue either drug or breastfeeding.

## NURSING CONSIDERATIONS

• Make sure patient has adequate intake of calcium and vitamin D.
• Monitor calcium, vitamin D, magnesium, and phosphorus levels before and during therapy.
• Drug may cause osteonecrosis of the jaw, which can occur spontaneously and is commonly associated with tooth extraction, local infection with delayed healing, or both.
• Consider stopping drug if severe skin reactions occur.
***Alert:*** Needle cap on single-use syringe contains latex; keep away from those with latex allergy.

## PATIENT TEACHING

• Advise patient to have a dental exam before treatment and to follow good oral hygiene practices during therapy.
• Instruct patient that, before dental procedures, she should tell dentist that she is taking drug, and to inform dentist or prescriber if persistent pain or slow healing of mouth or jaw occurs after dental surgery.
• Tell patient to report jaw pain, swelling, or numbness; loose teeth; or dramatic gum loss.
• Advise patient to seek prompt medical care if signs and symptoms of severe infection occur, including cellulitis or skin reactions (such as dermatitis, rash, or eczema).
• Instruct patient with severe renal impairment about signs and symptoms of hypocalcemia and the importance of maintaining normal calcium levels.
• Tell patient to take calcium and vitamin D supplement, as directed by prescriber.
• Advise patient who becomes pregnant during therapy to enroll in Amgen's Pregnancy Surveillance Program at 1-800-772-6436.

# desipramine hydrochloride

dess-IP-ra-meen

Norpramin

*Therapeutic class:* Antidepressant
*Pharmacologic class:* Tricyclic antidepressant (TCA)
*Pregnancy risk category NR*

## AVAILABLE FORMS

*Tablets:* 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg

## INDICATIONS & DOSAGES

➤ **Depression**

*Adults:* 100 to 200 mg P.O. daily in divided doses; increase to maximum of 300 mg daily. Or, give entire dose at bedtime.
*Adolescents and elderly patients:* 25 to 100 mg P.O. daily in divided doses; increase gradually to maximum of 150 mg daily, if needed.

➤ **Postherpetic neuralgia ♦**

*Adults:* Mean dose, 94 to 167 mg P.O. daily for at least 6 weeks.

## ADMINISTRATION

**P.O.**

● Give drug without regard for food.

## ACTION

Unknown. Increases the amount of norepinephrine, serotonin, or both in the CNS by blocking their reuptake by the presynaptic neurons.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 4–6 hr | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *drowsiness, dizziness,* ***seizures,*** excitation, tremor, weakness, confusion, anxiety, restlessness, agitation, headache, nervousness, EEG changes, extrapyramidal reactions.
**CV:** *tachycardia,* orthostatic hypotension, ECG changes, hypertension.
**EENT:** *blurred vision,* tinnitus, mydriasis.
**GI:** *dry mouth,* constipation, nausea, vomiting, anorexia, paralytic ileus.
**GU:** urine retention.
**Metabolic:** ***hypoglycemia,*** hyperglycemia.
**Skin:** rash, urticaria, photosensitivity reactions, diaphoresis, alopecia.
**Other:** ***sudden death in children,*** hypersensitivity reactions.

D

## INTERACTIONS

**Drug-drug.** *Barbiturates, CNS depressants:* May enhance CNS depression. Avoid using together.
*Cimetidine,* ***fluoxetine, fluvoxamine, paroxetine, sertraline:*** May increase desipramine level. Monitor drug levels and patient for signs of toxicity.
*Clonidine:* May cause life-threatening blood pressure elevations. Avoid using together.
*Epinephrine, norepinephrine:* May increase hypertensive effect. Use together cautiously.
*MAO inhibitors:* May cause severe excitation, hyperpyrexia, or seizures, usually with high doses. Avoid using within 14 days of MAO inhibitor therapy.
***Quinolones:*** May increase the risk of life-threatening arrhythmias. Avoid using together.
**Drug-herb.** *Evening primrose oil:* May cause additive or synergistic effect, resulting in lower seizure threshold and increasing the risk of seizure. Discourage use together.
*St. John's wort, SAM-e, yohimbe:* May cause serotonin syndrome. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May enhance CNS depression. Discourage use together.
*Smoking:* May lower drug level. Monitor patient for lack of effect.
*Sun exposure:* May increase risk of photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

● May increase or decrease glucose level.
● May increase liver function test values.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug and in those who have taken MAO inhibitors within previous 14 days.
● Contraindicated during acute recovery phase after MI.

**Black Box Warning** Desipramine isn't approved for use in children. ■
• Use with extreme caution in patients with CV disease; in those with a family history of sudden death, cardiac arrhythmias, or cardiac conduction disturbances; in those with history of urine retention, glaucoma, seizure disorders, or thyroid disease; and in those taking thyroid drug.
***Alert:*** Treatment of patients who require as much as 300 mg desipramine should be initiated in hospitals where access to skilled health care providers and frequent electrocardiograms is available. High doses may cause prolongation of the QRS or QT interval.
***Overdose S&S:*** Cardiac arrhythmias, severe hypotension, seizures, CNS depression, coma, ECG changes, confusion, disturbed concentration, transient visual hallucinations, dilated pupils, agitation, hyperactive reflexes, stupor, drowsiness, muscle rigidity, vomiting, hypothermia, hyperpyrexia.

## NURSING CONSIDERATIONS

***Alert:*** Drug has been shown to lower the seizure threshold. Seizures precede cardiac arrhythmias and death in some patients.
• Monitor patient for nausea, headache, and malaise after abrupt withdrawal of long-term therapy; these symptoms don't indicate addiction.
• Don't withdraw drug abruptly.
• Because patients may suffer hypertensive episodes during surgery, stop drug gradually several days before surgery.
• If signs or symptoms of psychosis occur or increase, notify prescriber. Record mood changes. Monitor patient for suicidal tendencies.
**Black Box Warning** Drug may increase risk of suicidal thinking and behavior in children, adolescents, and young adults ages 18 to 24, especially during the first few months of treatment, especially in those with major depressive disorder or other psychiatric disorder. ■
• Recommend sugarless hard candy or gum to relieve dry mouth. Saliva substitutes may be needed.
***Alert:*** Norpramin may contain tartrazine.
• ***Look alike–sound alike:*** Don't confuse desipramine with disopyramide or imipramine.

## PATIENT TEACHING

**Black Box Warning** Advise families and caregivers to observe patient closely for increased suicidal thinking and behavior. ■
• Advise patient to take full dose at bedtime to avoid daytime sedation; if insomnia occurs, tell him to take drug in the morning.
• Warn patient to avoid hazardous activities that require alertness and good coordination until effects of drug are known. Drowsiness and dizziness usually subside after a few weeks.
• Advise patient to call prescriber if fever and sore throat occur. Blood counts may need to be obtained.
• Tell patient to avoid alcohol during therapy because it may antagonize effects of drug.
• Tell patient to consult prescriber before taking other prescription or OTC drugs.
• Warn patient not to stop drug suddenly.
• To prevent sensitivity to the sun, advise patient to use sunblock, wear protective clothing, and avoid prolonged exposure to strong sunlight.

**SAFETY ALERT!**

# desirudin

deh-SIHR-uh-din

Iprivask

*Therapeutic class:* Anticoagulant
*Pharmacologic class:* Thrombin inhibitor
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 15 mg desirudin lyophilized powder and 0.6 ml mannitol (3%) diluent

## INDICATIONS & DOSAGES

➤ **To prevent deep vein thrombosis in patients undergoing hip replacement surgery**
*Adults:* 15 mg subcutaneously every 12 hours for 9 to 12 days. Give first injection 5 to 15 minutes before surgery, after

induction of regional block anesthesia, if used.

***Adjust-a-dose:*** If creatinine clearance is 31 to 60 ml/minute, give 5 mg subcutaneously every 12 hours. If creatinine clearance is less than 31 ml/minute, give 1.7 mg subcutaneously every 12 hours. Check activated PTT and creatinine daily. If activated PTT exceeds two times control, stop therapy until it's within two times control; then resume at a reduced dose.

## ADMINISTRATION

**Subcutaneous**

- Reconstitute each 15-mg vial with 0.5 ml of provided diluent (mannitol 3%).
- Shake vial gently until powder is dissolved. Once reconstituted, each 0.5 ml contains 15.75 mg of desirudin.
- Inspect vial. If solution contains visible particles, don't use it.
- Use reconstituted solution immediately or store it at room temperature for up to 24 hours protected from light.
- Use a syringe with a ½-inch 26G or 27G needle to withdraw all the reconstituted solution.
- With the patient lying down, inject entire contents of syringe by deep subcutaneous injection. Insert entire length of needle into a skinfold held between thumb and forefinger.
- Rotate sites between the right and left thigh or right and left anterolateral and posterolateral abdominal walls.
- **Incompatibilities:** Don't mix with any other drugs.

## ACTION

Selectively inhibits free and clot-bound thrombin, which prolongs plasma clotting time.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | 30 min | 60–180 min | Unknown |

*Half-life:* 2 to 3 hours.

## ADVERSE REACTIONS

**CNS:** cerebrovascular disorder, dizziness, fever.
**CV:** ***thrombosis,*** deep thrombophlebitis, hypotension.
**EENT:** epistaxis.
**GI:** ***hematemesis,*** nausea, vomiting.
**GU:** hematuria.
**Hematologic:** ***hemorrhage,*** anemia.
**Other:** ***anaphylaxis,*** impaired healing, injection site mass, leg edema, leg pain, wound seeping.

## INTERACTIONS

**Drug-drug.** *Abciximab, acetylsalicylic acid, clopidogrel, dipyridamole, glycoprotein IIb/IIIa antagonists, ketorolac, salicylates, sulfinpyrazone, ticlopidine:* May increase the risk of bleeding. Use together cautiously.
*Anticoagulants, dextran 40, glucocorticoids, thrombolytics:* May increase the risk of bleeding. Avoid using together.
**Drug-herb.** *Alfalfa, angelica (dong quai), anise, boldo, bromelains, capsicum, chamomile, dandelion, danshen, devil's claw, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, licorice, meadowsweet, onion, passion flower, red clover, willow:* May increase the risk of bleeding. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level and hematocrit.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to natural or recombinant hirudins and in patients with active bleeding or irreversible coagulation disorders.
- Use cautiously in patients with a creatinine clearance less than 60 ml/minute; patients undergoing spinal or epidural anesthesia; patients with hepatic insufficiency or injury; patients with GI or pulmonary bleeding within 3 months; patients with severe uncontrolled hypertension, bacterial endocarditis, or a hemostatic disorder; and patients with an increased risk of bleeding, such as those with recent major surgery, organ biopsy, puncture of a noncompressible vessel (within 1 month), intracranial or intraocular bleeding, or hemorrhagic or ischemic stroke.

***Overdose S&S:*** Hemorrhagic complications, excessively high activated PTT values.

## NURSING CONSIDERATIONS

- Don't give this drug I.M.

***Alert:*** If the patient has either an unexplained decline in hematocrit or blood pressure or other unexplained symptoms, consider the possibility of hemorrhage.

- Monitor coagulation tests, hemoglobin level, hematocrit, and renal function throughout therapy.
- Watch venipuncture sites for bleeding, hematoma, or inflammation.

**Black Box Warning** Patients who receive epidural or spinal anesthesia or spinal puncture are at increased risk of an epidural or spinal hematoma, which may result in long-term or permanent paralysis. Monitor these patients closely for neurologic impairment. ■

## PATIENT TEACHING

- Advise patient that this drug can cause bleeding. Stress the need to report unusual bruising or bleeding (nosebleeds, blood in urine, tarry stools) immediately.
- Caution patient not to take any other drugs that increase the risk of bleeding, such as aspirin or NSAIDs, while receiving desirudin.
- Advise patient to consult with prescriber before starting any herbal therapy; many herbs have anticoagulant, antiplatelet, or fibrinolytic properties.
- Advise against activities that risk injury.
- Tell patient to use a soft toothbrush and electric razor during therapy.

# desloratadine

dess-lor-AT-a-deen

Clarinex℞, Clarinex RediTabs

*Therapeutic class:* Antihistamine
*Pharmacologic class:* Piperidine
*Pregnancy risk category C*

## AVAILABLE FORMS

*Syrup:* 0.5 mg/ml
*Tablets:* 5 mg
*Tablets (orally disintegrating):* 2.5 mg, 5 mg

## INDICATIONS & DOSAGES

➤ **Seasonal allergic rhinitis (patients age 2 and older); perennial allergic rhinitis; chronic idiopathic urticaria**

*Adults and children age 12 and older:* 5 mg P.O. tablets or syrup once daily.
*Children ages 6 to 11:* 2.5 mg orally disintegrating tablet (ODT) or syrup P.O. once daily.
*Children ages 12 months to 5 years:* 1.25 mg P.O. once daily.
*Infants ages 6 to 11 months:* 1 mg P.O. once daily.

***Adjust-a-dose:*** In adults with hepatic or renal impairment, start dosage at 5 mg P.O. every other day.

## ADMINISTRATION

**P.O.**

- Give drug without regard for meals.
- Place ODTs on tongue immediately after opening blister pack.
- Give ODTs with or without water.

## ACTION

Long-acting tricyclic antihistamine with selective $H_1$-receptor histamine antagonist activity. It inhibits histamine release from human mast cells in vitro. Drug doesn't cross the blood-brain barrier.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | <1 hr | 3 hr | Up to 24 hr |
| P.O. (orally disintegrating) | <1 hr | 2½–4 hr | Up to 24 hr |

*Half-life:* 27 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* somnolence, fatigue, dizziness.
**EENT:** pharyngitis, dry throat.
**GI:** nausea, dry mouth, dyspepsia.
**GU:** dysmenorrhea.
**Musculoskeletal:** myalgia.

## INTERACTIONS

None reported.

## EFFECTS ON LAB TEST RESULTS

- May prevent, reduce, or mask positive result in diagnostic skin test.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in breast-feeding women and in patients hypersensitive to drug, to any of its components, or to loratadine.
- Use cautiously in elderly patients because of the greater likelihood of decreased hepatic, renal, or cardiac function, and concomitant disease or other drug therapy.

***Overdose S&S:*** Somnolence, increased QTc interval.

## NURSING CONSIDERATIONS

- Stop drug 4 days before diagnostic skin testing because antihistamines can prevent, reduce, or mask positive skin test response.

## PATIENT TEACHING

- Advise patient not to exceed recommended dosage. Higher doses don't increase effectiveness and may cause somnolence.
- Tell patient that drug can be taken without regard to meals.
- Instruct patient to remove ODTs from blister pack and place on tongue immediately to dissolve.
- ODTs may be taken with or without water.
- Tell patient to report adverse effects.

# desmopressin acetate

des-moe-PRESS-in

DDAVP, Minirin, Stimate

*Therapeutic class:* Hemostatic
*Pharmacologic class:* Posterior pituitary hormone
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 4 mcg/ml
*Nasal solution:* 0.1 mg/ml, 1.5 mg/ml
*Tablets:* 0.1 mg, 0.2 mg

## INDICATIONS & DOSAGES

➤ **Nonnephrogenic diabetes insipidus, temporary polyuria, and polydipsia related to pituitary trauma**

*Adults and children older than age 12:* 0.1 to 0.4 ml (10 to 40 mcg) intranasally daily in one to three doses. Most adults need 0.2 ml (20 mcg) daily in two divided doses. Or, give 0.5 to 1 ml (2 to 4 mcg) I.V. or subcutaneously daily, usually in two divided doses.

*Adults and children older than age 4:* Give 0.05 mg P.O. b.i.d.; adjust dosage to patient response. If patient previously received the drug intranasally, begin oral therapy 12 hours after last intranasal dose.

*Children ages 3 months to 12 years:* 0.05 to 0.3 ml (5 to 30 mcg) intranasally daily in one or two doses.

➤ **Hemophilia A and von Willebrand disease**

*Adults and children:* 0.3 mcg/kg diluted in normal saline solution and infused I.V. over 15 to 30 minutes. Repeat dose, if needed, as indicated by laboratory response and patient's condition. If used preoperatively, give 30 minutes prior to the scheduled procedure. Or, 300 mcg (one spray in each nostril) of solution containing 1.5 mcg/ml. Dose of 150 mcg (one spray of solution containing 1.5 mg/ml into a single nostril) may be adequate for patients weighing less than 50 kg (110 lb). Give drug 2 hours before surgery.

➤ **Primary nocturnal enuresis**

*Adults and children age 6 and older:* Initially, 0.2 mg P.O. at bedtime, and adjust dose up to 0.6 mg to achieve desired response.

## ADMINISTRATION

**P.O.**

- Discontinue in patient with acute illness that may result in fluid or electrolyte imbalance.
- Store at controlled room temperature.

**I.V.**

▼ Don't give injection to patients with hemophilia A with factor VIII of up to 5% or with severe von Willebrand disease.
▼ For adults and children who weigh more than 10 kg (22 lb), dilute with 50 ml sterile physiologic saline solution. For children who weigh 10 kg or less, 10 ml of diluent is recommended.
▼ Inspect drug for particulates and discoloration before infusing.
▼ Monitor blood pressure and pulse during infusion.
▼ The comparable antidiuretic dose of the injection is about 1/10 of the intranasal dose.
▼ **Incompatibilities:** None reported.

**Intranasal**
- Ensure nasal passages are intact, clean, and free of obstruction before giving intranasally.
- Nasal spray pump delivers only doses of 10 mcg DDAVP or 150 mcg Stimate. If doses other than those are required, use the nasal tube delivery system or injection.

**Subcutaneous**
- Teach patient to rotate injection sites to prevent tissue damage.

## ACTION

Increases the permeability of renal tubular epithelium to adenosine monophosphate and water, enabling the epithelium to promote reabsorption of water and produce a concentrated urine. Also increases factor VIII activity by releasing endogenous factor VIII from plasma storage sites.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 1–1½ hr | 8–12 hr |
| I.V. | 15–30 min | 1½–2 hr | 4–12 hr |
| Intranasal | 1 hr | 1–5 hr | 8–12 hr |
| Subcut. | Unknown | Unknown | Unknown |

*Half-life:* Oral, 1.5 to 2.5 hours; I.V. and intranasal, 7.8 minutes (initial phase) and 75.5 minutes (terminal phase).

## ADVERSE REACTIONS

**CNS:** headache, ***seizures.***
**CV:** flushing, slight rise in blood pressure.
**EENT:** rhinitis, epistaxis, sore throat.
**GI:** nausea, abdominal cramps.
**GU:** vulvar pain.
**Metabolic:** hyponatremia.
**Respiratory:** cough.
**Skin:** local erythema, swelling, or burning after injection.

## INTERACTIONS

**Drug-drug.** *Carbamazepine, chlorpropamide:* May increase ADH; may increase desmopressin effect. Avoid using together.
*Clofibrate:* May enhance and prolong effects of desmopressin. Monitor patient closely.
*Demeclocycline, epinephrine, heparin, lithium:* May increase risk of adverse effects. Monitor patient closely.
*Pressor agents:* May enhance pressor effects with large doses of desmopressin. Monitor patient closely.
**Drug-lifestyle.** *Alcohol use:* May increase risk of adverse effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May decrease sodium level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with type IIB von Willebrand disease, moderate to severe renal impairment, or hyponatremia.
- Use cautiously in patients with coronary artery insufficiency, hypertensive CV disease, and conditions linked to fluid and electrolyte imbalances, such as cystic fibrosis, because these patients are susceptible to hyponatremia.
- Use cautiously in patients at risk for water intoxication with hyponatremia.
- Use cautiously in breast-feeding women; it's unknown if drug appears in breast milk.

***Overdose S&S:*** Confusion, drowsiness, continuing headache, problems passing urine, rapid weight gain due to fluid retention.

## NURSING CONSIDERATIONS

- Morning and evening doses are adjusted separately for adequate diurnal rhythm of water turnover.
- Intranasal use can cause changes in the nasal mucosa, resulting in erratic, unreliable absorption. Report worsening condition to prescriber, who may recommend injectable DDAVP.
- Restrict fluid intake to reduce risk of water intoxication and sodium depletion, especially in children or elderly patients.

***Alert:*** Overdose may cause oxytocic or vasopressor activity. Withhold drug and notify prescriber. If fluid retention is excessive, give furosemide.
- ***Look alike–sound alike:*** Don't confuse desmopressin with vasopressin.

## PATIENT TEACHING

- Some patients may have trouble measuring and inhaling drug into nostrils. Teach

patient and caregivers correct administration method.
• Instruct patient to clear nasal passages before giving drug.
• Instruct patient to press down four times to prime pump. Tell him to discard the bottle after 25 (150 mcg/spray) or 50 doses (10 mcg/spray), depending on the strength, because the amount left may be less than desired dose.
• Advise patient to report nasal congestion, allergic rhinitis, or upper respiratory tract infection to prescriber; dosage adjustment may be needed.
• Teach patient using subcutaneous drug to rotate injection sites to prevent tissue damage.
• Warn patient to drink only enough water to satisfy thirst.
• Inform patient with hemophilia A or von Willebrand disease that taking desmopressin may prevent hazards of using blood products.
• Advise patient to carry medical identification indicating use of drug.

## desoximetasone

dess-OX-ee-MET-ah-sone

Topicort, Topicort LP

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Corticosteroid
*Pregnancy risk category C*

### AVAILABLE FORMS

*Cream:* 0.05%, 0.25%
*Gel:* 0.05%*
*Ointment:* 0.25%

### INDICATIONS & DOSAGES

➤ **Inflammation from corticosteroid-responsive dermatoses**

*Adults and children:* Clean area; apply a thin film and rub in gently b.i.d.

### ADMINISTRATION

**Topical**

• Gently wash skin before applying. To prevent skin damage, rub in gently, leaving thin coat. When treating hairy sites, part hair and apply directly to lesions.
• Avoid applying near eyes, mucous membranes, or in ear canal.
**Alert:** Do not bandage, cover, or wrap the treated skin area unless ordered.
• Stop drug and notify prescriber if skin infection, striae, or atrophy occur.
• Continue drug for a few days after lesions clear.

### ACTION

Unclear. Diffuses across cell membranes to form complexes with receptors, showing anti-inflammatory, antipruritic, vasoconstrictive, and antiproliferative activity. Considered a high-potency drug (0.25% cream and ointment, 0.05% gel) or medium-potency drug (0.05% cream) according to vasoconstrictive properties.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**GU:** glycosuria.
**Metabolic:** hyperglycemia.
**Skin:** burning, pruritus, irritation, dryness, erythema, folliculitis, hypertrichosis, acneiform eruptions, perioral dermatitis, hypopigmentation, allergic contact dermatitis, *maceration, secondary infection, atrophy, striae, miliaria with occlusive dressings.*
**Other:** ***hypothalamic-pituitary-adrenal axis suppression,*** Cushing syndrome.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

• May increase glucose level.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components.
• Don't use as monotherapy in primary bacterial infections (impetigo, paronychia, erysipelas, cellulitis, angular cheilitis), treatment of rosacea, perioral dermatitis, or acne.
• Don't use very-high-potency or high-potency agents on the face, groin, or axillae.
• Drug isn't for ophthalmic use.

● Use cautiously in children and pregnant or breast-feeding women.
⚠ ***Overdose S&S:*** Systemic effects.

## NURSING CONSIDERATIONS

● If fever develops and occlusive dressing is in place, notify prescriber and remove occlusive dressing.
● If antifungal or antibiotic combined with corticosteroid fails to provide prompt improvement, stop corticosteroid until infection is controlled.
● Systemic absorption is likely with use of occlusive dressings, prolonged treatment, or extensive body surface treatment. Watch for symptoms of HPA axis suppression, Cushing syndrome, hyperglycemia, and glucosuria.
● Avoid using plastic pants or tight-fitting diapers on treated areas in young children. Children may absorb larger amounts of drug and be more susceptible to systemic toxicity.
● Gel contains alcohol and may cause burning or irritation in open lesions.
● ***Look alike–sound alike:*** Don't confuse desoximetasone with dexamethasone.

## PATIENT TEACHING

● Teach patient how to apply drug.
● Tell patient this drug is for external use only and to avoid contact with the eyes.
● If an occlusive dressing is ordered, advise patient to leave it in place for no longer than 12 hours each day and not to use the dressing on infected or weeping lesions.
● Tell patient to stop drug and report signs of systemic absorption, skin irritation or ulceration, hypersensitivity, or infection.

# desvenlafaxine succinate

des-ven-lah-FAX-in

Pristiq℞

*Therapeutic class:* Antidepressant
*Pharmacologic class:* Selective serotonin and selective norepinephrine reuptake inhibitor (SNRI)
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets (extended-release):* 50 mg, 100 mg

## INDICATIONS & DOSAGES

➤ **Major depressive disorder**
*Adults:* 50 mg P.O. once daily.
***Adjust-a-dose:*** For patients with creatinine clearance less than 30 ml/minute, give 50 mg P.O. every other day. Don't give supplemental doses after dialysis. For patients with hepatic impairment, maximum dosage is 100 mg/day.

## ACTION

Thought to stimulate receptors, increasing the release of serotonin and norepinephrine.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 7.5 hr | Unknown |

*Half-life:* About 11 hours.

## ADVERSE REACTIONS

**CNS:** abnormal dreams, anxiety, asthenia, chills, *dizziness*, fatigue, jittery feeling, *headache*, *insomnia*, irritability, paresthesia, somnolence, tremor.
**CV:** hot flashes, hypertension, palpitations, tachycardia.
**EENT:** blurred vision, mydriasis, tinnitus.
**GI:** constipation, *diarrhea*, *dry mouth*, dysgeusia, ***GI bleeding,*** *nausea*, vomiting.
**GU:** proteinuria.
**Metabolic:** *decreased appetite*, weight loss.
**Skin:** *hyperhidrosis*, rash.
**Other:** ***sexual dysfunction,*** yawning.

## INTERACTIONS

**Drug-drug.** *Aspirin, NSAIDs, warfarin, other drugs that affect coagulation:* May increase risk of bleeding. Use together cautiously.
*CNS drugs:* Drug may cause additive effect. Avoid using together.
*CYP3A4 inhibitors (ketoconazole):* May increase desvenlafaxine levels. Use together cautiously.
*Desipramine, other drugs metabolized by CYP2D6:* May increase levels of these drugs. Use together cautiously.
*MAO inhibitors:* May cause serotonin syndrome or signs and symptoms resembling neuroleptic malignant syndrome. Avoid using within 7 days of MAO inhibitor therapy.
*Midazolam, other drugs metabolized by CYP3A4:* May decrease levels of these drugs. Use together cautiously.

*SSRIs, SNRIs:* May increase risk of serotonin syndrome. Monitor patient closely if used together.
*Venlafaxine:* Drug is a major active metabolite of venlafaxine. Avoid using together.
**Drug-lifestyle.** *Alcohol use:* May enhance CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase total cholesterol, LDL, triglyceride, and sodium levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or within 14 days of MAO inhibitor therapy.
- Use cautiously in elderly patients and in patients with renal impairment, diseases or conditions that could affect hemodynamic responses or metabolism, and in those with a history of mania or seizures. Use only in pregnant or breast-feeding women when the benefits outweigh the possible risks to the fetus.

**Black Box Warning** Desvenlafaxine isn't approved for use in children. ■

***Overdose S&S:*** Headache, vomiting, agitation, dizziness, nausea, constipation, diarrhea, dry mouth, paresthesia, tachycardia, change in level of consciousness, mydriasis, seizures, ECG changes.

## NURSING CONSIDERATIONS

**Black Box Warning** Closely monitor patient being treated for depression for signs and symptoms of clinical worsening and suicidal ideation, especially at the beginning of therapy and with dosage adjustments. Symptoms may include agitation, insomnia, anxiety, aggressiveness, or panic attacks. ■

- Carefully monitor blood pressure. Drug may cause dose-related increases in blood pressure.
- Monitor intraocular pressure in patients at risk for angle-closure glaucoma.
- Record mood changes. Monitor patient for suicidal tendencies and allow patient only a minimum supply of the drug.
- Monitor patient for signs and symptoms of bleeding.
- Monitor lipid and sodium levels before and during therapy.

***Alert:*** Don't stop drug abruptly. Withdrawal or discontinuation syndrome may occur if drug is stopped abruptly. Signs and symptoms of withdrawal syndrome include dizziness, nausea, headache, irritability, insomnia, diarrhea, anxiety, fatigue, abnormal dreams, and hyperhidrosis. Taper drug slowly.

- Monitor respiratory status. Drug may cause interstitial lung disease or eosinophilic pneumonia. If patient develops dyspnea, cough, or chest discomfort, discontinue drug.

## PATIENT TEACHING

- Advise a woman of childbearing age to contact prescriber if she becomes pregnant, intends to become pregnant during therapy, or is breast-feeding.

**Black Box Warning** Warn family members to closely monitor patient for signs and symptoms of worsening condition or suicidal ideation. ■

- Tell patient to avoid alcohol and to consult prescriber before taking other prescription or OTC drugs.
- Warn patient to avoid hazardous activities that require alertness and good coordination until effects of drug are known.
- If medication is to be stopped, tell patient to stop drug gradually by tapering the dosage as instructed by prescriber and not to abruptly stop taking drug.
- Tell patient not to divide, crush, chew, or dissolve tablets.

# dexamethasone (ophthalmic)

dex-a-METH-a-sone

Maxidex

# dexamethasone sodium phosphate

*Therapeutic class:* Anti-inflammatory (ophthalmic)
*Pharmacologic class:* Corticosteroid
*Pregnancy risk category C*

## AVAILABLE FORMS

*Ophthalmic solution:* 0.1%
*Ophthalmic suspension:* 0.1%

## INDICATIONS & DOSAGES

➤ **Uveitis; iridocyclitis; inflammatory conditions of eyelids, conjunctiva, cornea, anterior segment of globe; corneal injury from chemical or thermal burns, or penetration of foreign bodies; allergic conjunctivitis; suppression of graft rejection after keratoplasty; acne rosacea**

*Adults and children:* Initially, 1 or 2 drops of solution into conjunctival sac every 1 to 2 hours. Decrease to 1 drop every 4 hours when favorable response is noted. As condition improves, taper to 1 drop t.i.d. or q.i.d. to control symptoms, then, to b.i.d., then once daily. Treatment may extend from a few days to several weeks. Or, give 1 or 2 drops of suspension in the conjunctival sac. In severe disease, drops may be used hourly, being tapered to discontinuation as inflammation subsides. In mild disease, drops may be used up to four to six times daily.

## ADMINISTRATION

### Ophthalmic

- Shake suspension well before use.
- Apply light finger pressure on lacrimal sac for 1 minute after instillation.

## ACTION

Suppresses edema, fibrin deposition, capillary dilation, leukocyte migration, capillary proliferation, and collagen deposition.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**EENT:** burning, stinging, or red eyes, cataracts, corneal ulceration, defects in visual acuity and visual field, discharge, discomfort, dry eyes, foreign body sensation, glaucoma worsening, increased intraocular pressure, increased susceptibility to viral or fungal corneal infection, interference with corneal wound healing, mild blurred vision, optic nerve damage with excessive or long-term use, ocular pain, photophobia, thinning of cornea.

**Other:** adrenal suppression with excessive or long-term use, systemic effects.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its ingredients. Drug contains sulfite.
- Contraindicated in those with ocular tuberculosis or acute superficial herpes simplex (dendritic keratitis), vaccinia, varicella, or other fungal or viral diseases of cornea and conjunctiva; in patients with acute, purulent, untreated infections of eye; and in those who have had uncomplicated removal of superficial corneal foreign body.
- Use cautiously in patients with corneal abrasions that may be infected (especially with herpes).
- Use cautiously in patients with glaucoma (any form) because intraocular pressure may increase. Dosage of glaucoma drugs may need to be increased to compensate.
- Safe use in pregnant and breast-feeding women hasn't been established.

## NURSING CONSIDERATIONS

- Drug isn't for long-term use.
- Watch for corneal ulceration, which may require stopping drug.
- Corneal viral and fungal infections may be worsened by corticosteroid application.
- ***Look alike–sound alike:*** Don't confuse dexamethasone with desoximetasone. Don't confuse Maxidex with Maxzide.

## PATIENT TEACHING

- Tell patient to shake suspension well before use.
- Teach patient how to instill drops. Advise him to wash hands before and after applying solution, and warn him not to touch tip of dropper to eye or surrounding tissue.
- Tell patient to apply light finger pressure on lacrimal sac for 1 minute after instillation.
- Advise patient that he may use eye pad with ointment.
- Warn patient not to use leftover drug for new eye inflammation; doing so may cause serious problems.

**Alert:** Warn patient to call prescriber immediately and to stop drug if visual acuity changes or visual field diminishes.
- Tell patient not to share drug, washcloths, or towels with family members and to notify prescriber if anyone develops same signs or symptoms.
- Stress importance of compliance with recommended therapy.
- Tell patient who wears contact lenses to check with prescriber before using lenses again.

## dexamethasone (oral; injection)

dex-a-METH-a-sone

Dexamethasone Intensol*, Dexpak Taperpak

## dexamethasone sodium phosphate

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Glucocorticoid
*Pregnancy risk category C*

### AVAILABLE FORMS

**dexamethasone**
*Elixir:* 0.5 mg/5 ml*
*Oral concentrate:* 1 mg/ml
*Oral solution:* 0.5 mg/5 ml, 0.5 mg/0.5 ml*
*Tablets:* 0.5 mg, 0.75 mg, 1 mg, 1.5 mg, 2 mg, 4 mg, 6 mg
**dexamethasone sodium phosphate**
*Injection:* 4 mg/ml, 10 mg/ml

### INDICATIONS & DOSAGES

➤ **Cerebral edema**
*Adults:* Initially, 10 mg phosphate I.V.; then 4 mg I.M. every 6 hours until symptoms subside (usually 2 to 4 days); then taper over 5 to 7 days. Oral therapy (1 to 3 mg t.i.d.) should replace I.M. dosing as soon as possible.

➤ **Palliative management of recurrent or inoperable brain tumors**
*Adults:* 2 mg I.M. or I.V. b.i.d. to t.i.d. for maintenance therapy.

➤ **Inflammatory conditions, neoplasias**
*Adults:* 0.75 to 9 mg/day P.O. or 0.5 to 9 mg/day phosphate I.M., depending on size and location of affected area.

➤ **Acute, self-limited allergic disorders, acute exacerbations of chronic allergic disorders**
*Adults:* On day one, give 4 or 8 mg I.M. (using 4 mg/ml preparation). On days two and three, give four 0.75 mg tablets P.O. in two divided doses. On day four, give two 0.75 mg tablets P.O. in two divided doses. On days five and six, give one 0.75 mg tablet P.O. A follow-up visit should take place on day eight.

➤ **Shock**
*Adults:* 20 mg phosphate as single first dose; then 3 mg/kg/24 hours via continuous I.V. infusion. Or, 1 to 6 mg/kg phosphate I.V. as single dose. Or, 40 mg phosphate I.V. every 2 to 6 hours, as needed, continued only until patient is stabilized (usually not longer than 48 to 72 hours).

➤ **Dexamethasone suppression test for Cushing syndrome**
*Adults:* Determine baseline 24-hour urine levels of 17-hydroxycorticosteroids; then, give 0.5 mg P.O. every 6 hours for 48 hours. Repeat 24-hour urine collection to determine 17-hydroxycorticosteroid excretion during second 24 hours of dexamethasone administration. Or, 1 mg P.O. as single dose at 11:00 p.m. with determination of plasma cortisol at 8 a.m. the next morning.

➤ **Adrenocortical insufficiency**
*Children:* 0.02 to 0.3 mg/kg or 0.6 to 9 mg/m$^2$ P.O. daily, in three or four divided doses.

➤ **Tuberculous meningitis**
*Adults:* 8 to 12 mg phosphate I.M. daily; taper over 6 to 8 weeks.

➤ **Acute exacerbation of multiple sclerosis**
*Adults:* 30 mg P.O. daily for 1 week, followed by 4 to 12 mg every other day for 1 month.

### ADMINISTRATION

**P.O.**
- Give oral dose with food when possible. Patient may need measures to prevent GI irritation.

**I.V.**
▼ For direct injection, inject undiluted over at least 1 minute.
▼ For intermittent or continuous infusion, dilute solution according to manufacturer's

instructions and give over prescribed duration.
▼ During continuous infusion, change solution every 24 hours.
▼ **Incompatibilities:** Ciprofloxacin, daunorubicin, diphenhydramine, doxapram, doxorubicin, glycopyrrolate, idarubicin, midazolam, vancomycin.

**I.M.**
● Give I.M. injection deep into gluteal muscle. Rotate injection sites to prevent muscle atrophy. Avoid subcutaneous injection because atrophy and sterile abscesses may occur.

## ACTION

Unclear. Decreases inflammation, mainly by stabilizing leukocyte lysosomal membranes; suppresses immune response; stimulates bone marrow; and influences protein, fat, and carbohydrate metabolism.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1–2 hr | 1–2 hr | 2½ days |
| I.V. | 1 hr | 1 hr | Variable |
| I.M. | 1 hr | 1 hr | 6 days |

*Half-life:* About 1 to 2 days.

## ADVERSE REACTIONS

**CNS:** *euphoria, insomnia,* psychotic behavior, ***pseudotumor cerebri,*** vertigo, headache, paresthesia, ***seizures,*** depression.
**CV:** ***heart failure,*** hypertension, edema, ***arrhythmias,*** thrombophlebitis, ***thromboembolism.***
**EENT:** cataracts, glaucoma.
**GI:** *peptic ulceration,* GI irritation, increased appetite, ***pancreatitis,*** nausea, vomiting.
**GU:** menstrual irregularities, increased urine glucose and calcium levels.
**Metabolic:** hypokalemia, hyperglycemia, carbohydrate intolerance, hypercholesterolemia, hypocalcemia, sodium retention.
**Musculoskeletal:** growth suppression in children, muscle weakness, osteoporosis, tendon rupture, myopathy.
**Skin:** hirsutism, delayed wound healing, acne, various skin eruptions, atrophy at I.M. injection site.
**Other:** cushingoid state, susceptibility to infections, acute adrenal insufficiency after increased stress or abrupt withdrawal after long-term therapy, ***angioedema.***
**After abrupt withdrawal:** rebound inflammation, fatigue, weakness, arthralgia, fever, dizziness, lethargy, fainting, orthostatic hypotension, dyspnea, anorexia, ***hypoglycemia. After prolonged use, sudden withdrawal may be fatal.***

## INTERACTIONS

**Drug-drug.** *Aminoglutethimide:* May cause loss of dexamethasone-induced adrenal suppression. Use together cautiously.
*Antidiabetics, including insulin:* May decrease response. May need dosage adjustment.
*Aspirin, indomethacin, other NSAIDs:* May increase risk of GI distress and bleeding. Use together cautiously.
*Barbiturates, carbamazepine, phenytoin, rifampin:* May decrease corticosteroid effect. Increase corticosteroid dosage.
*Cardiac glycosides:* May increase risk of arrhythmia resulting from hypokalemia. May need dosage adjustment.
*Cyclosporine:* May increase toxicity. Monitor patient closely.
*Ephedrine:* May cause decreased half-life and increased clearance of dexamethasone. Monitor patient.
*Oral anticoagulants:* May alter dosage requirements. Monitor PT and INR closely.
*Potassium-depleting drugs such as thiazide diuretics:* May enhance potassium-wasting effects of dexamethasone. Monitor potassium level.
*Salicylates:* May decrease salicylate level. Monitor patient for lack of salicylate effectiveness.
*Skin-test antigens:* May decrease response. Postpone skin testing until therapy is completed.
*Toxoids, vaccines:* May decrease antibody response and may increase risk of neurologic complications. Avoid using together.
**Drug-lifestyle.** *Alcohol use:* May increase risk of gastric irritation and GI ulceration. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

● May increase cholesterol and glucose levels. May decrease calcium, potassium, $T_3$, and $T_4$ levels.

• May decrease $^{131}I$ uptake and protein-bound iodine levels in thyroid function tests. May cause false-negative results in nitroblue tetrazolium test for systemic bacterial infections. May alter reactions to skin tests.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its ingredients, in those with systemic fungal infections, and in those receiving immunosuppressive doses together with live virus vaccines. I.M. administration is contraindicated in patients with idiopathic thrombocytopenic purpura.
• Use with caution in patient with recent MI.
• Use cautiously in patients with GI ulcer, renal disease, hypertension, osteoporosis, diabetes mellitus, hypothyroidism, cirrhosis, diverticulitis, nonspecific ulcerative colitis, recent intestinal anastomoses, thromboembolic disorders, seizures, myasthenia gravis, heart failure, tuberculosis, active hepatitis, ocular herpes simplex, emotional instability, or psychotic tendencies and in women who are breast-feeding.
• Because some forms contain sulfite preservatives, also use cautiously in patients sensitive to sulfites.

## NURSING CONSIDERATIONS

• Most adverse reactions to corticosteroids are dose- or duration-dependent.
• For better results and less toxicity, give once-daily dose in morning.
• Always adjust to lowest effective dose.
• Monitor patient's weight, blood pressure, and electrolyte levels.
• Monitor patient for cushingoid effects, including moon face, buffalo hump, central obesity, thinning hair, hypertension, and increased susceptibility to infection.
• Watch for depression or psychotic episodes, especially in high-dose therapy.
• Diabetic patient may need increased insulin; monitor glucose levels.
• Drug may mask or worsen infections, including latent amebiasis.
• Elderly patients may be more susceptible to osteoporosis with long-term use.
• Inspect patient's skin for petechiae.
• Gradually reduce dosage after long-term therapy.
• ***Look alike–sound alike:*** Don't confuse dexamethasone with desoximetasone.

## PATIENT TEACHING

• Tell patient not to stop drug abruptly or without prescriber's consent.
• Instruct patient to take drug with food or milk.
• Teach patient signs and symptoms of early adrenal insufficiency: fatigue, muscle weakness, joint pain, fever, anorexia, nausea, shortness of breath, dizziness, and fainting.
• Instruct patient to carry medical identification indicating his need for supplemental systemic glucocorticoids during stress, especially when dosage is decreased. This card should contain prescriber's name, drug name, and dosage of drug.
• Warn patient on long-term therapy about cushingoid effects (moon face, buffalo hump) and the need to notify prescriber about sudden weight gain or swelling.
• Warn patient about easy bruising.
• Advise patient receiving long-term therapy to consider exercise or physical therapy. Tell him to ask prescriber about vitamin D or calcium supplement.
• Instruct patient receiving long-term therapy to have periodic eye examinations.
• Advise patient to avoid exposure to infections (such as measles and chickenpox) and to notify prescriber if such exposure occurs.
• Tell patient to avoid alcohol.

# dexlansoprazole

decks-lan-SOH-prah-zole

Dexilant✐

*Therapeutic class:* Antiulcer
*Pharmacologic class:* Proton pump inhibitor
*Pregnancy risk category B*

## AVAILABLE FORMS

*Capsules:* 30 mg, 60 mg

## INDICATIONS & DOSAGES

➤ **Erosive esophagitis**

*Adults:* Initially, 60 mg P.O. once daily for up to 6 weeks; maintenance dose is 30 mg P.O. once daily for up to 6 months.

➤ **Symptomatic nonerosive gastroesophageal reflux disease (GERD)**
*Adults:* 30 mg P.O. once daily for 4 weeks.
***Adjust-a-dose:*** For patients with moderate hepatic impairment (Child-Pugh Class B), maximum dose is 30 mg P.O. daily.

## ADMINISTRATION

**P.O.**
- Give drug with or without food.
- Capsules should be swallowed whole. Or, they can be opened and the intact granules sprinkled on 1 tablespoon of applesauce and swallowed immediately.

## ACTION

Inhibits proton pump activity by binding to hydrogen-potassium adenosine triphosphatase, located at the secretory surface of the gastric parietal cells, to suppress gastric acid secretion.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 4 hr | Unknown |

*Half-life:* 1 to 2 hours.

## ADVERSE REACTIONS

**GI:** abdominal discomfort, abdominal tenderness, diarrhea, flatulence, nausea, vomiting.
**Respiratory:** upper respiratory tract infection.

## INTERACTIONS

**Drug-drug.** *Atazanavir:* May decrease atazanavir level. Avoid use together.
*Clopidogrel:* May reduce clopidogrel's plasma concentration and clinical effect. Avoid use together.
*Drugs with pH-dependent absorption (amipicillin, digoxin, ketoconazole, iron):* May decrease absorption of these drugs. Use together cautiously.
*Warfarin:* May increase INR and the risk of bleeding. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, and AST levels. May increase creatinine, gastrin, protein, glucose, and potassium levels. May increase or decrease bilirubin level.
- May decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- ***Alert:*** There may be an increased risk of hip, wrist, and spine fractures associated with proton pump inhibitors.
- Use cautiously in patients with suspected gastric malignancy. Response to treatment doesn't eliminate the possibility of malignancy.
- Use in pregnant women only if benefit to the mother outweighs risk to the fetus. It isn't known if drug appears in breast milk; use cautiously in breast-feeding women.
- Safety and efficacy in children haven't been established.

## NURSING CONSIDERATIONS

- Monitor patient periodically for improvement in the signs and symptoms of GERD and erosive esophagitis to assess success of therapy.
- Monitor liver function tests results and glucose and electrolyte levels periodically during therapy.
- Monitor patient for bleeding during therapy.

## PATIENT TEACHING

- Tell patient to report hypersensitivity reactions immediately.
- Urge patient to swallow capsule whole and not to crush, split, or chew it. Capsule may also be opened and its contents sprinkled on applesauce if desired.
- Advise patient that drug can be taken without regard to meals.
- Advise female patient to notify prescriber if she is pregnant, plans to become pregnant, or is breast-feeding.

# dexmethylphenidate hydrochloride

decks-meth-ill-FEN-i-date

Focalin, Focalin XR

*Therapeutic class:* CNS stimulant
*Pharmacologic class:* Methylphenidate derivative
*Pregnancy risk category C*
*Controlled substance schedule II*

## AVAILABLE FORMS

*Capsules (extended-release):* 5 mg, 10 mg, 15 mg, 20 mg
*Tablets:* 2.5 mg, 5 mg, 10 mg

## INDICATIONS & DOSAGES

➤ **Attention deficit hyperactivity disorder (ADHD)**

***Immediate-release tablets***

*Adults and children age 6 and older:* For patients who aren't now taking methylphenidate, initially, 2.5 mg P.O. b.i.d., given at least 4 hours apart. Increase weekly by 2.5 to 5 mg daily, up to a maximum of 20 mg daily in divided doses.

For patients who are now taking methylphenidate, initially give half the current methylphenidate dosage, up to a maximum of 20 mg P.O. daily in divided doses.

***Extended-release capsules***

*Adults:* For patients who aren't now taking dexmethylphenidate or methylphenidate, or who are on stimulants other than methylphenidate, give 10 mg P.O. once daily in the morning. May adjust in weekly increments of 10 mg to a maximum dose of 20 mg daily.

For patients who are now taking methylphenidate, initially give half the total daily dose of methylphenidate. Patients who are now taking the immediate-release form of dexmethylphenidate may be switched to the same daily dose of extended-release form. Maximum daily dose is 20 mg.

*Children ages 6 and older:* For patients who aren't now taking dexmethylphenidate or methylphenidate, or who are on stimulants other than methylphenidate, give 2.5 mg P.O. b.i.d. May adjust in weekly increments of 5 mg to a maximum daily dose of 20 mg.

For patients who are now taking methylphenidate, initially give half the total daily dose of methylphenidate. Patients who are now taking the immediate-release form of dexmethylphenidate may be switched to the same daily dose of extended-release form. Maximum daily dose is 30 mg.

## ADMINISTRATION

**P.O.**

- Capsules may be swallowed whole or the contents sprinkled on a small amount of applesauce and eaten immediately.
- Don't crush or divide the capsule or its contents.

## ACTION

Blocks presynaptic reuptake of norepinephrine and dopamine and increases their release, increasing concentration in the synapse.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. (immediate-release) | Unknown | 1–1½ hr | Unknown |
| P.O. (extended-release) | Unknown | 1–4 hr; 4½–7 hr | Unknown |

*Half-life:* 2 to 3 hours.

## ADVERSE REACTIONS

**CNS:** *headache, anxiety, feeling jittery,* nervousness, insomnia, fever, dizziness.
**CV:** tachycardia.
**GI:** *anorexia, abdominal pain,* nausea, dyspepsia, dry mouth.
**Musculoskeletal:** twitching (motor or vocal tics).
**Other:** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Antacids, acid suppressants:* May alter the release of extended-release form. Avoid using together.
*Anticoagulants, phenobarbital, phenytoin, primidone, tricyclic antidepressants:* May inhibit metabolism of these drugs. May need to decrease dosage of these drugs; monitor drug levels.
*Antihypertensives:* May decrease effectiveness of these drugs. Use together cautiously; monitor blood pressure.

*Clonidine, other centrally acting alpha agonists:* May cause serious adverse effects. Use together cautiously.
*MAO inhibitors:* May increase risk of hypertensive crisis. Using together within 14 days of MAO inhibitor therapy is contraindicated.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to methylphenidate or other components.
- Contraindicated in patients with severe anxiety, tension, or agitation; glaucoma; or motor tics or a family history or diagnosis of Tourette syndrome, or within 14 days of MAO inhibitor therapy.

**Black Box Warning** Use cautiously in patients with a history of substance abuse. Chronic abuse can lead to marked tolerance and psychological dependence. Psychotic episodes can occur. Withdraw patient carefully from abusive use because severe depression can occur.

- Use cautiously in patients with a psychiatric illness, bipolar disorder, depression, or family history of suicide; seizures, hypertension, hyperthyroidism, heart failure, or recent MI.
- Use in pregnant women only if the benefits outweigh the risks; drug may delay skeletal ossification, suppress weight gain, and impair organ development in the fetus.
- Use cautiously in breast-feeding women. It's unknown if drug appears in breast milk.
- Don't use in children or adolescents with structural cardiac abnormalities or other serious heart problems.

***Overdose S&S:*** Agitation, cardiac arrhythmias, confusion, seizures, delirium, dryness of mucous membranes, euphoria, flushing, hallucinations, headache, hyperpyrexia, hyperreflexia, hypertension, muscle twitching, mydriasis, palpitations, sweating, tachycardia, tremors, vomiting.

## NURSING CONSIDERATIONS

- Diagnosis of ADHD must be based on complete history and evaluation of the patient by psychological and educational experts.
- Obtain a detailed patient history, including a family history for mental disorders, family suicide, ventricular arrhythmias, or sudden death.
- Refer patient for psychological, educational, and social support.
- Periodically reevaluate the long-term usefulness of the drug.
- Monitor CBC and differential and platelet counts during prolonged therapy.
- Don't use for severe depression or normal fatigue states.
- Stop treatment or reduce dosage if symptoms worsen or adverse reactions occur.
- Long-term stimulant use may temporarily suppress growth. Monitor children for growth and weight gain. If growth slows or weight gain is lower than expected, stop drug.
- Routinely monitor blood pressure and pulse.
- Monitor patient for signs of drug dependence or abuse.
- If seizures occur, stop drug.

## PATIENT TEACHING

- Stress the importance of taking the correct dose of drug at the same time every day. Report accidental overdose immediately.

***Alert:*** Warn patient the misuse of amphetamines can have serious effects including sudden death.

- Advise patients unable to swallow capsules to empty the contents of the capsule onto a spoonful of applesauce and eat immediately.

***Alert:*** Tell patient not to cut, crush, or chew the contents of the extended-release beaded capsule.

- Advise parents to monitor child for medication abuse or sharing. Also inform parents to watch for increased aggression or hostility and to report worsening behavior.
- Advise parents to monitor child's height and weight and to tell the prescriber if they suspect growth is slowing.
- Caution patient to expect blurred vision or difficulty with accommodation and to exercise caution while performing activities that require a clear visual field. Advise patient to report blurred vision to the prescriber.

## dextroamphetamine sulfate

dex-troe-am-FET-a-meen

Dexedrine*, Dexedrine Spansule, DextroStat, Liquadd

*Therapeutic class:* CNS stimulant
*Pharmacologic class:* Amphetamine
*Pregnancy risk category C*
*Controlled substance schedule II*

### AVAILABLE FORMS

*Capsules (extended-release):* 5 mg, 10 mg, 15 mg
*Oral solution:* 5 mg/5 ml
*Tablets:* 5 mg, 10 mg

### INDICATIONS & DOSAGES

➤ **Narcolepsy**

*Adults:* 5 to 60 mg P.O. daily in divided doses.
*Children age 12 and older:* 10 mg P.O. daily. Increase by 10 mg at weekly intervals, as needed. Give first dose on awakening; additional doses (one or two) given at intervals of 4 to 6 hours.
*Children ages 6 to 12:* 5 mg P.O. daily. Increase by 5 mg at weekly intervals as needed.

➤ **Attention deficit hyperactivity disorder (ADHD)**

*Adults and children age 6 and older:* 5 mg P.O. once daily or b.i.d. Increase by 5 mg at weekly intervals, as needed. It's rarely necessary to exceed 40 mg/day.
*Children ages 3 to 5:* 2.5 mg P.O. daily. Increase by 2.5 mg at weekly intervals, as needed.

### ADMINISTRATION

**P.O.**

- Avoid late evening doses, particularly with extended-release capsules, due to resulting insomnia.
- Certain formulations may contain tartrazine.

### ACTION

Unknown. Probably promotes nerve impulse transmission by releasing stored dopamine and norepinephrine from nerve terminals in the brain. Main sites of activity appear to be the cerebral cortex and the reticular activating system.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30–60 min | 2 hr | 4 hr |
| P.O. (extended) | 60 min | 2 hr | 8 hr |

*Half-life:* 10 to 12 hours.

### ADVERSE REACTIONS

**CNS:** *insomnia, nervousness, restlessness,* tremor, dizziness, headache, chills, overstimulation, dysphoria, euphoria.
**CV:** *tachycardia, palpitations,* ***arrhythmias,*** hypertension.
**GI:** dry mouth, taste perversion, diarrhea, constipation, anorexia, other GI disturbances.
**GU:** impotence.
**Metabolic:** weight loss.
**Skin:** urticaria.
**Other:** increased libido.

### INTERACTIONS

**Drug-drug.** *Acetazolamide, alkalizing drugs, antacids, sodium bicarbonate:* May increase renal reabsorption. Monitor patient for enhanced amphetamine effects.
*Acidifying drugs, ammonium chloride, ascorbic acid:* May decrease level and increase renal clearance of dextroamphetamine. Monitor patient for decreased amphetamine effects.
*Adrenergic blockers:* May inhibit adrenergic blocking effects. Avoid using together.
*Chlorpromazine:* May inhibit central stimulant effects of amphetamines. May use to treat amphetamine poisoning.
*Insulin, oral antidiabetics:* May decrease antidiabetic requirements. Monitor glucose level.
*MAO inhibitors:* May cause severe hypertension or hypertensive crisis. Avoid using within 14 days of MAO inhibitor therapy.
*Meperidine:* May potentiate analgesic effect. Use together cautiously.
*Methenamine:* May increase urinary excretion of amphetamines and reduce effectiveness. Monitor drug effects.
*Norepinephrine:* May enhance adrenergic effect of norepinephrine. Monitor patient.
*Phenobarbital, phenytoin:* May delay absorption of these drugs. Monitor patient closely.

**Drug-food.** *Caffeine:* May increase amphetamine and related amine effects. Urge caution.
*Fruit juice:* May decrease effectiveness of oral solution. Avoid giving together.

## EFFECTS ON LAB TEST RESULTS

- May increase corticosteroid level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to or with idiosyncratic reactions to sympathomimetic amines and in those with hyperthyroidism, moderate to severe hypertension, symptomatic CV disease, glaucoma, advanced arteriosclerosis, or history of drug abuse.
- Use cautiously in agitated patients and patients with motor tics, phonic tics, or Tourette syndrome. Also use cautiously in patients whose underlying condition may be worsened by an increase in blood pressure or heart rate (preexisting hypertension, heart failure, recent MI); patients with a psychiatric illness, bipolar disorder, depression, or family history of suicide; those with a seizure disorder.
- Don't use in children or adolescents with structural cardiac abnormalities or other serious heart problems.

***Overdose S&S:*** Assaultiveness, confusion, hallucinations, hyperreflexia, rapid respiration, restlessness, rhabdomyolysis, tremor, hyperpyrexia, panic states, fatigue, depression, arrhythmias, hypertension, hypotension, circulatory collapse, nausea, vomiting, diarrhea, abdominal cramps, seizures, coma.

## NURSING CONSIDERATIONS

- Obtain a detailed patient history, including a family history for mental disorders, family suicide, ventricular arrhythmias, or sudden death.
- Drug shouldn't be used to prevent fatigue.

**Black Box Warning** Drug has a high abuse potential and may cause dependence. Monitor patient closely. ■

- Monitor for growth retardation in children.
- ***Look alike–sound alike:*** Don't confuse Dexedrine with dextran or Excedrin.

## PATIENT TEACHING

**Black Box Warning** Warn patient the misuse of amphetamines can cause serious CV adverse events including sudden death. ■

- Warn patient to avoid activities that require alertness, a clear visual field, or good coordination until CNS effects of drug are known.
- Tell patient he may get tired as drug effects wear off.
- Ask patient to report signs and symptoms of excessive stimulation.
- Inform parents that children may show increased aggression or hostility and to report worsening of behavior.
- Advise patient to consume caffeine-containing products cautiously.
- Tell patient not to drink fruit juice at same time as oral solution.
- Warn patient with a seizure disorder that drug may decrease seizure threshold. Instruct him to notify prescriber if seizures occur.

# dextromethorphan hydrobromide

dex-troe-meth-OR-fan

AcroTuss 12, Belminil DM† ◇, Buckley's Cough Mixture, Creomulsion ◇, Creo-Terpin ◇*, Delsym ◇, DexAlone ◇, ElixSure Children's Cough, Hold DM ◇, Koffex DM† ◇, Little Colds Cough Formula ◇, PediaCare ◇, Robitussin ◇, Robitussin Pediatric ◇, Scot-Tussin ◇, Simply Cough ◇, Sucrets Cough ◇, Theraflu Thin Strips ◇*, Triaminic ◇*, Trocal ◇, Vicks Formula 44 ◇

*Therapeutic class:* Antitussive
*Pharmacologic class:* Levorphanol derivative
*Pregnancy risk category C*

## AVAILABLE FORMS

*Freezer pops; oral:* 7.5 mg/25 ml ◇
*Gelcaps:* 15 mg ◇, 30 mg ◇
*Liquid (extended-release):* 30 mg/5 ml ◇
*Lozenges:* 5 mg ◇, 7.5 mg ◇, 10 mg ◇

*Solution:* 3.5 mg/5 ml, 5 mg/5 ml ◇*, 7.5 mg/5 ml ◇, 10 mg/5 ml ◇*, 12.5 mg/5ml ◇, 15 mg/5 ml ◇*, 15 mg/15 ml ◇*
*Strips (orally disintegrating):* 7.5 mg ◇*, 15 mg ◇*

## INDICATIONS & DOSAGES

➤ **Nonproductive cough**

*Adults and children age 12 and older:* 10 to 20 mg P.O. every 4 hours, or 30 mg every 6 to 8 hours. Or, 60 mg extended-release liquid b.i.d. Maximum, 120 mg daily. Or, give lozenges, 5 to 15 mg, every 1 to 4 hours, up to 120 mg/day.
*Children ages 6 to 11:* 5 to 10 mg P.O. every 4 hours, or 15 mg every 6 to 8 hours. Or, 30 mg extended-release liquid b.i.d. Maximum, 60 mg daily. Or, give lozenges, 5 to 10 mg, every 1 to 4 hours, up to 60 mg/day. Or, 2 freezer pops every 6 to 8 hours. Don't exceed 4 doses in 24 hours.
*Children ages 2 to 5:* 2.5 to 5 mg P.O. every 4 hours, or 7.5 mg every 6 to 8 hours. Or, 15 mg extended-release liquid b.i.d. Maximum, 30 mg daily. Or, 1 freezer pop every 6 to 8 hours. Don't exceed 4 doses in 24 hours.

## ADMINISTRATION

**P.O.**

- Store at controlled room temperature (59° to 86° F [15° to 30° C]), except for freezer pops.
- Allow orally disintegrating strips to dissolve on the tongue.

## ACTION

Suppresses the cough reflex by direct action on the cough center in the medulla.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | < 30 min | Unknown | 3–6 hr |

*Half-life:* About 11 hours.

## ADVERSE REACTIONS

**CNS:** drowsiness, dizziness.
**GI:** nausea, vomiting, stomach pain.

## INTERACTIONS

**Drug-drug.** ***MAO inhibitors:*** May cause risk of hypotension, coma, hyperpyrexia, and death. Avoid using together.
*Quinidine:* May increase the risk of dextromethorphan adverse effects. Consider decreasing dextromethorphan dose if needed.
*Sibutramine:* Serotonin syndrome may occur. Avoid using together.
**Drug-herb.** *Parsley:* May promote or produce serotonin syndrome. Discourage use together.

D

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients currently taking MAO inhibitors or within 2 weeks of stopping MAO inhibitors.
- Use cautiously in atopic children, sedated or debilitated patients, and patients confined to the supine position.
- Use cautiously in patients sensitive to aspirin or tartrazine dyes.

***Alert:*** Use of OTC cough products is not recommended for neonates and children under 2 years.
***Overdose S&S:*** Altered sensory perception, ataxia, dysphoria, slurred speech; seizures, respiratory depression (in children).

## NURSING CONSIDERATIONS

- Don't use dextromethorphan when cough is a valuable diagnostic sign or is beneficial (such as after thoracic surgery).
- Dextromethorphan 15 to 30 mg is equivalent to codeine 8 to 15 mg as an antitussive.
- Drug produces no analgesia or addiction and little or no CNS depression.
- Use drug with chest percussion and vibration.
- Monitor cough type and frequency.

## PATIENT TEACHING

- Instruct patient to take drug exactly as prescribed and not to exceed recommended doses.
- Tell patient to report adverse reactions.
- Tell patient to contact his health care provider if cough lasts longer than 1 week, recurs frequently, or is accompanied by high fever, rash, or severe headache.

**SAFETY ALERT!**

## dextrose (d-glucose)

DEKS-trohse

*Therapeutic class:* Nutritional supplement
*Pharmacologic class:* Carbohydrate caloric agent
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 3-ml ampule (10%); 10 ml (25%); 25 ml (5%); 50 ml (5% and 50% available in vial, ampule, and Bristoject); 70-ml pin-top vial (70% for additive use only); 100 ml (5%); 150 ml (5%); 250 ml (5%, 10%); 500 ml (5%, 10%, 20%, 30%, 40%, 50%, 60%, 70%); 650 ml (38.5%); 1,000 ml (2.5%, 5%, 10%, 20%, 30%, 40%, 50%, 60%, 70%); 2,000 ml (50%, 70%)

### INDICATIONS & DOSAGES

➤ **Fluid replacement and caloric supplementation in patients who can't maintain adequate oral intake or are restricted from doing so**

*Adults and children:* Dosage depends on fluid and caloric requirements. Use peripheral I.V. infusion of 2.5%, 5%, or 10% solution or central I.V. infusion of 20% solution for minimal fluid needs. Use a 10% to 25% solution to treat acute hypoglycemia in neonate or older infant (2 ml/kg). Use a 50% solution to treat insulin-induced hypoglycemia (20 to 50 ml). Solutions of 10%, 20%, 30%, 40%, 50%, 60%, and 70% are diluted in admixtures, usually amino acid solutions, for total parenteral nutrition (TPN) given through a central vein.

### ADMINISTRATION

**I.V.**

▼ Use central vein to infuse dextrose solutions at concentrations above 10%.
▼ Use infusion pump when giving dextrose solution with amino acids for TPN.
▼ Never infuse concentrated solution rapidly. Rapid infusion may cause hyperglycemia and fluid shift. Maximum infusion rate is 0.8 g/kg/hour.
▼ Check injection site often for irritation, tissue sloughing, necrosis, and phlebitis.

▼ **Incompatibilities:** Ampicillin sodium, cisplatin, diazepam, erythromycin lactobionate, 10% and 25% fat emulsion solutions, phenytoin, procainamide, solutions of 10% thiopental and above, whole blood.

### ACTION

A simple water-soluble sugar that minimizes glyconeogenesis and promotes anabolism in patients whose oral caloric intake is limited.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CNS:** ***unconsciousness in hyperosmolar hyperglycemic nonketotic syndrome,*** fever, confusion.
**CV:** ***worsened hypertension and heart failure with fluid overload in susceptible patients,*** *phlebitis, venous sclerosis,* tissue necrosis with prolonged or concentrated infusions, especially when given peripherally.
**GU:** glycosuria, osmotic diuresis.
**Metabolic:** hypovolemia, hypervolemia, hyperglycemia, dehydration, and hyperosmolarity with rapid infusion of concentrated solution or prolonged infusion, ***hypoglycemia from rebound hyperinsulinemia with rapid termination of long-term infusions.***
**Respiratory:** PULMONARY EDEMA.
**Skin:** sloughing and tissue necrosis if extravasation occurs with concentrated solutions.

### INTERACTIONS

**Drug-drug.** *Corticosteroids:* May cause salt and water retention and increase potassium excretion. Monitor glucose, sodium, and potassium levels.

### EFFECTS ON LAB TEST RESULTS

● May increase or decrease glucose level.

### CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients with allergy to corn or corn products.

- Contraindicated in patients in diabetic coma while glucose level remains excessively high.
- Use of concentrated solutions is contraindicated in patients with intracranial or intraspinal hemorrhage; in dehydrated patients with delirium tremens; and in patients with severe dehydration, anuria, diabetic coma, or glucose-galactose malabsorption syndrome.
- Use cautiously in patients with cardiac or pulmonary disease, hypertension, renal insufficiency, urinary obstruction, or hypovolemia.

## NURSING CONSIDERATIONS

***Alert:*** Never stop hypertonic solutions abruptly. Have dextrose 10% in water available to treat hypoglycemia if rebound hyperinsulinemia occurs.
- Don't give concentrated solutions I.M. or subcutaneously.
- Monitor glucose level carefully. Prolonged therapy with $D_5W$ can cause reduction of pancreatic insulin production and secretion.
- Check vital signs frequently. Report adverse reactions promptly.
- Monitor fluid intake and output and weight carefully. Watch closely for signs and symptoms of fluid overload.
- Monitor patient for signs of mental confusion.

## PATIENT TEACHING

- Explain need for supplement to patient and family, and answer any questions.
- Tell patient to report adverse reactions promptly.

**SAFETY ALERT!**

# diazepam

dye-AZ-e-pam

Diastat*, Diastat Acudial, Diazemuls†, Diazepam Intensol*, Novo-Dipam†, Valium✒, Vivol†

*Therapeutic class:* Anxiolytic
*Pharmacologic class:* Benzodiazepine
*Pregnancy risk category D*
*Controlled substance schedule IV*

D

## AVAILABLE FORMS

*Injection:* 5 mg/ml
*Oral solution:* 5 mg/5 ml, 5 mg/ml*
*Rectal gel twin packs*:* 2.5 mg (pediatric), 10 mg, 20 mg (adult)
*Tablets:* 2 mg, 5 mg, 10 mg

## INDICATIONS & DOSAGES

➤ **Anxiety**

*Adults:* Depending on severity, 2 to 10 mg P.O. b.i.d. to q.i.d. Or, 2 to 10 mg I.M. or I.V. every 3 to 4 hours, p.r.n.
*Children age 6 months and older:* 1 to 2.5 mg P.O. t.i.d. or q.i.d., increase gradually, as needed and tolerated.
*Elderly patients:* Initially, 2 to 2.5 mg once daily or b.i.d.; increase gradually.

➤ **Acute alcohol withdrawal**

*Adults:* 10 mg P.O. t.i.d. or q.i.d. first 24 hours; reduce to 5 mg P.O. t.i.d. or q.i.d., p.r.n. Or, initially, 10 mg I.V. or I.M. Then, 5 to 10 mg I.V. or I.M. every 3 to 4 hours, p.r.n.

➤ **Before endoscopic procedures**

*Adults:* Adjust I.V. dose to desired sedative response (up to 20 mg). Or, 5 to 10 mg I.M. 30 minutes before procedure.

➤ **Muscle spasm**

*Adults:* 2 to 10 mg P.O. b.i.d. to q.i.d. as an adjunct. Or, 5 to 10 mg I.V. or I.M. initially; then 5 to 10 mg I.V. or I.M. every 3 to 4 hours, p.r.n. For tetanus, larger doses up to 20 mg every 2 to 8 hours may be needed.
*Children age 5 and older:* 5 to 10 mg I.V. or I.M. every 3 to 4 hours, p.r.n.
*Children ages 1 month to 5 years:* 1 to 2 mg I.V. or I.M. slowly; repeat every 3 to 4 hours, p.r.n.

➤ **Preoperative sedation**
*Adults:* 10 mg I.M. (preferred) or I.V. before surgery.
➤ **Cardioversion**
*Adults:* 5 to 15 mg I.V. within 5 to 10 minutes before procedure.
➤ **Adjunct treatment for seizure disorders**
*Adults:* 2 to 10 mg P.O. b.i.d. to q.i.d.
*Children age 6 months and older:* 1 to 2.5 mg P.O. t.i.d. or q.i.d. initially; increase as needed and as tolerated.
➤ **Status epilepticus, severe recurrent seizures**
*Adults:* 5 to 10 mg I.V. or I.M. initially. Use I.M. route only if I.V. access is unavailable. Repeat every 10 to 15 minutes, p.r.n., up to maximum dose of 30 mg. Repeat every 2 to 4 hours, if needed.
*Children age 5 and older:* 1 mg I.V. every 2 to 5 minutes up to maximum of 10 mg. Repeat every 2 to 4 hours, p.r.n.
*Children ages 1 month to 5 years:* 0.2 to 0.5 mg I.V. slowly every 2 to 5 minutes up to maximum of 5 mg. Repeat every 2 to 4 hours, p.r.n.
➤ **Patients on stable regimens of antiepileptic drugs who need diazepam intermittently to control bouts of increased seizure activity**
*Adults and children age 12 and older:* 0.2 mg/kg P.R., rounding up to the nearest available dose form. A second dose may be given 4 to 12 hours later.
*Children ages 6 to 11:* 0.3 mg/kg P.R., rounding up to the nearest available dose form. A second dose may be given 4 to 12 hours later.
*Children ages 2 to 5:* 0.5 mg/kg P.R., rounding up to the nearest available dose form. A second dose may be given 4 to 12 hours later.
***Adjust-a-dose:*** For elderly and debilitated patients, reduce dosage to decrease the likelihood of ataxia and oversedation.
➤ **Tetanus**
*Adults:* Initially, 5 to 10 mg I.V. or I.M. then 5 to 10 mg in 3 to 4 hours, p.r.n. Larger doses may be required.
*Children age 5 and older:* 5 to 10 mg I.M. or I.V. repeated every 3 to 4 hours, p.r.n.
*Children age 1 month to younger than 5 years:* 1 to 2 mg I.M. or I.V. slowly repeated every 3 to 4 hours, p.r.n.

## ADMINISTRATION

**P.O.**
● When using oral solution, dilute dose just before giving.

**I.V.**
▼ I.V. route is the more reliable parenteral route; I.M. route isn't recommended because absorption is variable and injection is painful.
▼ Keep emergency resuscitation equipment and oxygen at bedside.
▼ Avoid infusion sets or containers made from polyvinyl chloride.
▼ If possible, inject directly into a large vein. If not, inject slowly through infusion tubing as near to the insertion site as possible. Give at no more than 5 mg/minute. Watch closely for phlebitis at injection site.
▼ Monitor respirations every 5 to 15 minutes and before each dose.
▼ Don't store parenteral solution in plastic syringes.
▼ **Incompatibilities:** All other I.V. drugs, most I.V. solutions.

**I.M.**
● Use the I.M. route if I.V. administration is impossible.

**Rectal**
● Use Diastat rectal gel to treat no more than five episodes per month and no more than one episode every 5 days because tolerance may develop.
***Alert:*** Only caregivers who can distinguish the distinct cluster of seizures or events from the patient's ordinary seizure activity, who have been instructed and can give the treatment competently, who understand which seizures may be treated with Diastat, and who can monitor the clinical response and recognize when immediate professional medical evaluation is needed should give Diastat rectal gel.

## ACTION

A benzodiazepine that probably potentiates the effects of GABA, depresses the CNS, and suppresses the spread of seizure activity.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30 min | 2 hr | 20–80 hr |
| I.V. | 1–5 min | 1–5 min | 15–60 min |
| I.M. | Unknown | 2 hr | Unknown |
| P.R. | Unknown | 90 min | Unknown |

*Half-life:* About 1 to 12 days.

## ADVERSE REACTIONS

**CNS:** *drowsiness,* dysarthria, slurred speech, tremor, transient amnesia, fatigue, ataxia, headache, insomnia, paradoxical anxiety, hallucinations, minor changes in EEG patterns, *pain.*
**CV:** ***CV collapse, bradycardia,*** hypotension.
**EENT:** diplopia, blurred vision, nystagmus.
**GI:** nausea, constipation, diarrhea with rectal form.
**GU:** incontinence, urine retention.
**Hematologic:** ***neutropenia.***
**Hepatic:** jaundice.
**Respiratory:** ***respiratory depression, apnea.***
**Skin:** rash, *phlebitis at injection site.*
**Other:** altered libido, physical or psychological dependence.

## INTERACTIONS

**Drug-drug.** *Cimetidine, disulfiram, fluoxetine, fluvoxamine, hormonal contraceptives, isoniazid, metoprolol, propoxyphene, propranolol, valproic acid:* May decrease clearance of diazepam and increase risk of adverse effects. Monitor patient for excessive sedation and impaired psychomotor function.
*CNS depressants:* May increase CNS depression. Use together cautiously.
*Digoxin:* May increase digoxin level and risk of toxicity. Monitor patient and digoxin level closely.
*Diltiazem:* May increase CNS depression and prolong effects of diazepam. Reduce dose of diazepam.
*Fluconazole, itraconazole, ketoconazole, miconazole:* May increase and prolong diazepam level, CNS depression, and psychomotor impairment. Avoid using together.
*Levodopa:* May decrease levodopa effectiveness. Monitor patient.
*Phenobarbital:* May increase effects of both drugs. Use together cautiously.
*Valproate:* May increase CNS depression. Monitor patient closely.
**Drug-herb.** *Kava:* May increase sedation. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May cause additive CNS effects. Discourage use together.
*Smoking:* May decrease effectiveness of drug. Monitor patient closely.

D

## EFFECTS ON LAB TEST RESULTS

- May increase liver function test values.
- May decrease neutrophil count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or soy protein; in patients experiencing shock, coma, or acute alcohol intoxication (parenteral form); in pregnant women, especially in first trimester; and in infants younger than age 6 months (oral form).
- Diazepam is contraindicated in patients with acute angle-closure glaucoma.
- Use cautiously in patients with liver or renal impairment, depression, history of substance abuse, or chronic open-angle glaucoma. Use cautiously in elderly and debilitated patients.

***Overdose S&S:*** Somnolence, confusion, coma, diminished reflexes.

## NURSING CONSIDERATIONS

- Monitor periodic hepatic, renal, and hematopoietic function studies in patients receiving repeated or prolonged therapy.
- Monitor elderly patients for dizziness, ataxia, mental status changes. Patients are at an increased risk for falls.

***Alert:*** Use of drug may lead to abuse and addiction. Don't withdraw drug abruptly after long-term use; withdrawal symptoms may occur.

- ***Look alike–sound alike:*** Don't confuse diazepam with diazoxide or Ditropan. Don't confuse Valium with Valcyte.

## PATIENT TEACHING

- Warn patient to avoid activities that require alertness and good coordination until effects of drug are known.
- Tell patient to avoid alcohol while taking drug.

- Notify patient that smoking may decrease drug's effectiveness.
- Warn patient not to abruptly stop drug because withdrawal symptoms may occur.
- Warn women to avoid use during pregnancy.
- Instruct patient's caregiver on the proper use of Diastat rectal gel.

## diclofenac epolamine (oral; transdermal)

dye-KLOE-fen-ak

Flector

## diclofenac potassium

Apo-Diclo Rapide†, Cambia, Cataflam, Novo-Difenac-K†, Voltaren Rapide†, Zipsor

## diclofenac sodium

Apo-Diclo†, Novo-Difenac†, Nu-Diclo†, Voltaren, Voltaren-XR, Voltaren SR†

*Therapeutic class:* NSAID
*Pharmacologic class:* NSAID
*Pregnancy risk category B; D in 3rd trimester*

### AVAILABLE FORMS

**diclofenac epolamine**
*Transdermal patch:* 1.3%
**diclofenac potassium**
*Capsules:* 25 mg*
*Powder for solution:* 50 mg/packet
*Tablets:* 50 mg
**diclofenac sodium**
*Tablets (delayed-release):* 25 mg, 50 mg, 75 mg
*Tablets (extended-release):* 100 mg

### INDICATIONS & DOSAGES

➤ **Ankylosing spondylitis**
*Adults:* 25 mg delayed-release diclofenac sodium P.O. q.i.d.; may add another 25-mg dose at bedtime.

➤ **Osteoarthritis**
*Adults:* 50 mg P.O. b.i.d. or t.i.d., or 75 mg P.O. b.i.d. diclofenac potassium or delayed-release diclofenac sodium only. Or, 100 mg P.O. daily extended-release diclofenac sodium only.

➤ **Rheumatoid arthritis**
*Adults:* 50 mg P.O. t.i.d. or q.i.d., or 75 mg P.O. b.i.d. diclofenac potassium or delayed-release diclofenac sodium only. Or, 100 mg P.O. daily or b.i.d. extended-release diclofenac sodium only.

➤ **Analgesia, primary dysmenorrhea**
*Adults:* 50 mg diclofenac potassium P.O. t.i.d. For some patients, the first dose on the first day may be 100 mg, followed by 50 mg for the second and third doses; maximum dose for first day is 200 mg. Don't exceed 150 mg daily after the first day.

➤ **Acute pain due to minor strains, sprains, and contusions**
*Adults:* 1 patch to the most painful area b.i.d.

### ADMINISTRATION

**P.O.**
- Give drug with milk, meals, or antacids.
- Don't crush or break enteric-coated tablets.
- Mix powder in water only. Use no other liquid.
- Mix solution well and have patient drink immediately.
- Powder may be less effective if taken with food.

**Transdermal**
- Do not apply to damaged or non-intact skin.
- Patch should not be worn while bathing or showering.

### ACTION

May inhibit prostaglandin synthesis, to produce anti-inflammatory, analgesic, and antipyretic effects.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. (delayed-release) | 30 min | 2–3 hr | 8 hr |
| P.O. (extended-release) | Unknown | 5–6 hr | Unknown |
| P.O. | 10 min | 1 hr | 8 hr |
| Transdermal | Unknown | 10–20 hr | Unknown |

*Half-life:* 1 to 2 hours; 12 hours for transdermal patch.

### ADVERSE REACTIONS

**CNS: *aseptic meningitis,*** anxiety, depression, dizziness, drowsiness, headache, insomnia, irritability.

**CV:** ***heart failure,*** edema, fluid retention, hypertension.
**EENT:** ***laryngeal edema,*** blurred vision, epistaxis, eye pain, night blindness, reversible hearing loss, swelling of the lips and tongue, tinnitus.
**GI:** abdominal distention, abdominal pain or cramps, ***bleeding,*** constipation, diarrhea, flatulence, indigestion, melena, nausea, peptic ulceration, taste disorder, bloody diarrhea, appetite change, colitis.
**GU:** *nephrotic syndrome,* ***acute renal failure,*** fluid retention, interstitial nephritis, oliguria, papillary necrosis, proteinuria.
**Hepatic:** jaundice, ***hepatitis, hepatotoxicity.***
**Metabolic:** ***hypoglycemia,*** hyperglycemia.
**Musculoskeletal:** back, leg or joint pain.
**Respiratory:** ***asthma.***
**Skin:** ***Stevens-Johnson syndrome,*** allergic purpura, alopecia, bullous eruption, dermatitis, eczema, photosensitivity reactions, pruritus, rash, urticaria.
**Other:** ***anaphylactoid reactions, anaphylaxis, angioedema.***

## INTERACTIONS

**Drug-drug.** *Anticoagulants, including warfarin:* May cause bleeding. Monitor patient closely.
*Aspirin:* May decrease effectiveness of diclofenac and increase GI toxicity. Avoid using together.
*Beta blockers:* May decrease antihypertensive effects. Monitor patient closely.
*Cyclosporine, digoxin, lithium, methotrexate:* May reduce renal clearance of these drugs and increase risk of toxicity. Monitor patient closely.
*Diuretics:* May decrease effectiveness of diuretics. Avoid using together.
*Insulin, oral antidiabetics:* May alter requirements for antidiabetics. Monitor patient closely.
*Potassium-sparing diuretics:* May enhance retention and increase level of potassium. Monitor potassium level.
**Drug-herb.** *Dong quai, feverfew, garlic, ginger, horse chestnut, red clover:* May cause bleeding based on the known effects or components. Discourage use together.
*White willow:* Herb and drug contain similar components. Discourage use together.
**Drug-lifestyle.** *Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, bilirubin, BUN, and creatinine levels.
- May increase or decrease glucose level.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Contraindicated for the treatment of perioperative pain after CABG surgery. ■
- Contraindicated in patients hypersensitive to drug and in those with hepatic porphyria or history of asthma, urticaria, or other allergic reactions after taking aspirin or other NSAIDs. Zipsor is contraindicated in patients hypersensitive to bovine protein.
- Avoid use during late pregnancy or while breast-feeding.
- Use cautiously in patients with history of peptic ulcer disease, hepatic dysfunction, cardiac disease, hypertension, fluid retention, or impaired renal function.

***Overdose S&S:*** Drowsiness, confusion, hypotonia, loss of consciousness, vomiting, aspiration, pneumonitis, increased intracranial pressure.

## NURSING CONSIDERATIONS

- Because NSAIDs impair the synthesis of renal prostaglandins, they can decrease renal blood flow and lead to reversible renal impairment, especially in patients with renal or heart failure or liver dysfunction, in elderly patients, and in those taking diuretics. Monitor these patients closely.
- Liver function test values may increase during therapy. Monitor transaminase, especially ALT, levels periodically in patients undergoing long-term therapy. Make first transaminase measurement no later than 8 weeks after therapy begins.

**Black Box Warning** NSAIDs cause an increased risk of serious GI adverse events including bleeding, ulceration, and perforation of the stomach or intestines, which can be fatal. Elderly patients are at greater risk. ■

**Black Box Warning** NSAIDs may increase the risk of serious thrombotic events, MI, or stroke, which can be fatal. The risk may be

greater with longer use or in patients with CV disease or risk factors for CV disease. ■
***Alert:*** Different formulations of oral diclofenac are not bioequivalent even if the milligram strength is the same.
• Because of their antipyretic and anti-inflammatory actions, NSAIDs may mask the signs and symptoms of infection.
• ***Look alike–sound alike:*** Don't confuse diclofenac with Diflucan.

### PATIENT TEACHING

• Tell patient to take tablets or capsules with milk, meals, or antacids to minimize GI distress.
• Instruct patient not to crush, break, or chew enteric-coated tablets.
• Tell patient to mix powder form of drug well in water only and to drink immediately.
• Advise patient that, if he requires an MRI, to inform the facility that he is wearing a transdermal patch.
• Advise patient not to take this drug with any other diclofenac-containing products (such as Arthrotec).
• Teach patient signs and symptoms of GI bleeding, including blood in vomit, urine, or stool; coffee-ground vomit; and black, tarry stool. Tell him to notify prescriber immediately if any of these occurs.
• Teach patient the signs and symptoms of damage to the liver, including nausea, fatigue, lethargy, itching, yellowed skin or eyes, right upper quadrant tenderness, and flulike symptoms. Tell patient to contact prescriber immediately if these symptoms occur.
• Advise patient to avoid drinking alcohol or taking aspirin during drug therapy.
• Tell patient to wear sunscreen or protective clothing because drug may cause sensitivity to sunlight.
• Warn patient to avoid hazardous activities that require alertness until it is known whether the drug causes CNS symptoms.
• Tell pregnant women to avoid use of drug during last trimester.
• Advise patient that use of OTC NSAIDs and diclofenac may increase the risk of GI toxicity.

## diclofenac epolamine (topical)

dye-KLOE-fen-ak

Flector

## diclofenac sodium

Solaraze, Voltaren

*Therapeutic class:* NSAID
*Pharmacologic class:* NSAID
*Pregnancy risk category B (topical gel); C (topical patch)*

### AVAILABLE FORMS

*Topical gel:* 1%, 3%
*Topical patch:* 1.3%

### INDICATIONS & DOSAGES

➤ **Actinic keratosis (Solaraze only)**
*Adults:* Apply gently to lesion b.i.d. for 60 to 90 days.
➤ **Osteoarthritis (Voltaren only)**
*Adults:* Apply 4 g of gel to affected foot, knee, or ankle q.i.d. Maximum dose of 16 g to any single joint of the lower extremities. Or apply 2 g of gel to affected hand, elbow, or wrist q.i.d. Maximum dose of 8 g to any single joint of the upper extremities. Total dose shouldn't exceed 32 g daily for all affected joints.
➤ **Acute pain due to minor strains, sprains, and contusions**
*Adults:* Apply 1 patch to most painful area b.i.d.

### ADMINISTRATION

**Topical**
• Don't apply to open wounds or broken skin.
• Avoid contact with eyes.
• Use enough gel to cover the lesion; for example, use 0.5 g of gel on a 5 × 5-cm lesion.
• Don't apply Flector Patch to nonintact or damaged skin, including from exudative dermatitis, eczema, infected lesions, burns, or wounds.
• Measure gel using supplied dosing cards in package.
• Wear gloves to gently massage Voltaren into skin of entire joint.

## ACTION

Unknown. May produce anti-inflammatory and analgesic effects by ability to inhibit prostaglandin synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | 4–12 hr | Unknown |

*Half-life:* 1 to 3 hours; 12 hours for patch.

## ADVERSE REACTIONS

**CNS:** *paresthesia,* headache, pain, asthenia, migraine, hypokinesia.
**CV:** chest pain, hypertension.
**EENT:** sinusitis, pharyngitis, rhinitis, conjunctivitis, eye pain.
**GI:** diarrhea, dyspepsia, abdominal pain.
**GU:** hematuria, renal impairment.
**Hepatic:** liver impairment.
**Metabolic:** hypercholesterolemia, hyperglycemia.
**Musculoskeletal:** arthralgia, arthrosis, back pain, myalgia, neck pain.
**Respiratory:** ***asthma,*** dyspnea, pneumonia.
**Skin:** *reaction at application site, contact dermatitis, dry skin, exfoliation, localized pain, pruritus, rash,* localized edema, acne, alopecia, photosensitivity reactions, skin ulcer.
**Other:** ***anaphylaxis,*** *flulike syndrome,* infection, allergic reaction.

## INTERACTIONS

**Drug-drug.** *Oral NSAIDs:* May increase drug effects. Minimize use together.
**Drug-lifestyle.** *Sun exposure:* May increase risk of photosensitivity reactions. Advise patient to avoid excessive sun exposure.

## EFFECTS ON LAB TEST RESULTS

• May increase ALT, AST, cholesterol, creatinine, glucose, and phosphokinase levels.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to diclofenac, benzyl alcohol, polyethylene glycol monomethyl ether 350, or hyaluronic acid.
**Black Box Warning** Contraindicated for perioperative pain for coronary artery bypass graft surgery. ▮
• Avoid use during late pregnancy.
• Use cautiously in patients with the aspirin triad; these patients are usually asthmatics who develop rhinitis, with or without nasal polyps, after taking aspirin or other NSAIDs.
• Use cautiously in patients with active GI bleeding or ulceration and in those with severe renal or hepatic impairment.
• Use cautiously in breast-feeding women; it's unknown if drug appears in breast milk. Patient should either stop breast-feeding or stop treatment, taking into account importance of drug to mother.

## NURSING CONSIDERATIONS

**Black Box Warning** NSAIDs may increase the risk of serious CV thrombotic events. The risk may increase with duration of use. Patients with CV disease or risk factors for CV disease may be at greater risk. ▮
**Black Box Warning** NSAIDs increase the risk of serious GI adverse reactions including bleeding, ulceration, and perforation of the stomach or intestines, which can be fatal. These reactions can occur at any time and without warning. Elderly patients are at greater risk. ▮
• Evaluate patient with signs or symptoms of liver dysfunction or with abnormal liver function test results for development of more severe hepatic reaction while taking drug.
• If clinical signs or symptoms of liver disease develop, or if systemic manifestation (eosinophilia, rash) occur, discontinue drug.
• Safety and effectiveness of sunscreens, cosmetics, or other topical medications used with drug are unknown.
• Complete healing or optimal therapeutic effect may not be seen until 30 days after therapy is complete.
• Reevaluate lesions that don't respond to therapy.
• Because of the risk of premature closure of the ductus arteriosus, avoid drug in late pregnancy.

## PATIENT TEACHING

• Inform patient about risk of skin reactions (rash, itchiness, pain, irritation) at the application site. Urge patient to seek medical attention if adverse reactions persist or worsen.

- Encourage patient to minimize sun exposure during therapy. Explain that sunscreen may be helpful but that the safety of using sunscreen with drug is unknown.
- Tell patient using Solaraze that complete healing or optimal therapeutic effect may not occur for up to 30 days after stopping therapy.
- Caution patient not to apply gel to open wounds or broken skin.
- Instruct patient to avoid contact with eyes.
- Instruct patient not to apply other topical drugs or cosmetics to affected area while using drug, unless directed.
- Advise patient to use only on intact skin unless otherwise directed.
- Inform patient that if Flector Patch begins to peel off, the edges may be taped down. Instruct patient not to wear Flector Patch during bathing or showering. Bathing should take place in between scheduled patch removal and application.
- Tell patient to wash his hands after applying gel unless the hands are the treated area; then don't wash for at least one hour after application.
- Instruct patient not to cover area with clothing for at least 10 minutes after applying gel and to wait at least one hour before showering or bathing.
- Tell women to notify prescriber if pregnant or breast-feeding.

## dicyclomine hydrochloride

dye-SYE-kloe-meen

Bentyl, Bentylol†, Di-Spaz, Formulex†

*Therapeutic class:* Antispasmodic
*Pharmacologic class:* Anticholinergic, antimuscarinic
*Pregnancy risk category B*

### AVAILABLE FORMS

*Capsules:* 10 mg, 20 mg
*Injection:* 10 mg/ml
*Syrup:* 10 mg/5 ml
*Tablets:* 10 mg†, 20 mg

### INDICATIONS & DOSAGES

➤ **Irritable bowel syndrome, other functional GI disorders**

*Adults:* Initially, 20 mg P.O. q.i.d., increased to 40 mg q.i.d. Or, 20 mg I.M. q.i.d. Don't use I.M. form for longer than 1 to 2 days.

### ADMINISTRATION

**P.O.**

- Give drug 30 to 60 minutes before meals and at bedtime. Bedtime dose can be larger; give at least 2 hours after last meal of day.

**I.M.**

***Alert:*** Don't give subcutaneously or I.V.
***Alert:*** The dicyclomine labeling may be misleading. Injection concentration is 10 mg/ml. Carefully calculate appropriate amount of solution for administering correct dose.

### ACTION

Inhibits action of acetylcholine on postganglionic, parasympathetic muscarinic receptors, decreasing GI motility. Drug possesses local anesthetic properties that may be partly responsible for spasmolysis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.M. | Unknown | 1–1½ hr | Unknown |

*Half-life:* Initial, about 2 hours; secondary, 9 to 10 hours.

### ADVERSE REACTIONS

**CNS:** *headache, dizziness*, fever, insomnia, light-headedness, drowsiness, nervousness, confusion, and excitement in elderly patients.
**CV:** *palpitations*, tachycardia.
**EENT:** *blurred vision*, increased intraocular pressure, mydriasis, photophobia.
**GI:** *constipation, dry mouth, thirst*, vomiting, *nausea*, abdominal distention, heartburn, paralytic ileus.
**GU:** *urinary hesitancy or retention*, impotence.
**Skin:** urticaria, decreased sweating or inability to sweat, local irritation.
**Other:** allergic reactions, heat prostration.

### INTERACTIONS

**Drug-drug.** *Amantadine, antihistamines, antiparkinsonians, disopyramide, glutethimide, meperidine, phenothiazines, procainamide, quinidine, tricyclic antidepressants:* May have additive adverse effects. Avoid using together.

*Antacids:* May interfere with dicyclomine absorption. Give dicyclomine at least 1 hour before antacid.

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to anticholinergics and in those with obstructive uropathy, obstructive disease of the GI tract, reflux esophagitis, severe ulcerative colitis, toxic megacolon, myasthenia gravis, unstable CV status in acute hemorrhage, tachycardia secondary to cardiac insufficiency or thyrotoxicosis, or glaucoma.
- Contraindicated in breast-feeding patients and in children younger than age 6 months.
- Use cautiously in patients with autonomic neuropathy, hyperthyroidism, coronary artery disease, arrhythmias, heart failure, hypertension, hiatal hernia, hepatic or renal disease, prostatic hyperplasia, known or suspected GI infection, and ulcerative colitis.
- Use cautiously in patients in hot or humid environments; drug can cause heatstroke.

***Overdose S&S:*** Headache; nausea; vomiting; blurred vision; dilated pupils; hot, dry skin; dry mouth; dysphagia; CNS stimulation; muscle weakness; paralysis.

### NURSING CONSIDERATIONS
- Adjust dosage based on patient's needs and response. Dosages up to 40 mg P.O. q.i.d. have been used in adults, but safety and effectiveness for longer than 2 weeks haven't been established.
- Dicyclomine may have atropine-like adverse reactions.

***Alert:*** Overdose may cause curare-like effects such as respiratory paralysis. Keep emergency equipment available.
- Monitor patient's vital signs and urine output carefully.
- ***Look alike–sound alike:*** Don't confuse dicyclomine with dyclonine or doxycycline; don't confuse Bentyl with Aventyl or Benadryl.

### PATIENT TEACHING
- Tell patient when to take drug, and stress importance of doing so on time and at evenly spaced intervals.
- Advise patient to avoid driving and other hazardous activities if drowsiness, dizziness, or blurred vision occurs; to drink plenty of fluids to help prevent constipation; and to report rash or other skin eruption.

D

## didanosine (ddI, dideoxyinosine)
dye-DAN-oh-seen

Videx, Videx EC

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Nucleoside reverse transcriptase inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS
*Capsules (delayed-release):* 125 mg, 200 mg, 250 mg, 400 mg
*Powder for oral solution (pediatric):* 2 g/4-ounce glass bottle, 4 g/8-ounce glass bottle

### INDICATIONS & DOSAGES
➤ **HIV infection**

*Adults who weigh 60 kg (132 lb) or more:* 400-mg capsule P.O. daily. Or, 200 mg b.i.d. (preferred dosing) or 400 mg P.O. once daily of the pediatric powder for oral solution.
*Adults who weigh 25 to less than 60 kg (55 to less than 132 lb):* 250-mg capsule P.O. daily. Or, 125 mg b.i.d. (preferred dosing) or 250 mg P.O. once daily of the pediatric powder for oral solution.
*Adults who weigh 20 to less than 25 kg (44 to less than 55 lb):* 200-mg capsule P.O. daily. Or, 125 mg b.i.d. (preferred dosing), or 250 mg (pediatric powder for oral solution) P.O. once daily.
*Children older than 8 months:* 120 mg/m$^2$ P.O. b.i.d. of the pediatric powder for oral solution. Or, for children who weigh 60 kg or more, give 400-mg capsule P.O. daily; for children who weigh 25 to less than 60 kg, give 250-mg capsule P.O. daily; for children who weigh 20 to less than 25 kg, give 200-mg capsule P.O. daily.

*Children 2 weeks to 8 months:* 100 mg/m$^2$ P.O. b.i.d. of the pediatric powder for oral solution.

***Adjust-a-dose:*** For dialysis patients who weigh 60 kg (132 lb) or more, 100 mg once daily of the pediatric powder for oral solution. For dialysis patients who weigh less than 60 kg, give 75 mg once daily of the pediatric powder for oral solution. For dialysis patients who weigh 60 kg or more, give 125 mg of Videx EC once daily. Don't use in dialysis patients who weigh less than 60 kg. If creatinine clearance is less than 10 ml/minute, don't give a supplemental dose after hemodialysis for either drug.

In adults who weigh 60 kg or more with creatinine clearance of 30 to 59 ml/minute, give 200-mg capsule once daily; or, 200 mg once daily or 100 mg b.i.d. of the pediatric powder for oral solution. If clearance is 10 to 29 ml/minute, give 125-mg capsule, or 150 mg of the pediatric powder for oral solution once daily. If clearance is less than 10 ml/minute, give 125-mg capsule, or 100 mg of the pediatric powder for oral solution once daily.

In adults who weigh less than 60 kg and have a clearance of 30 to 59 ml/minute, give 125-mg capsule once daily; or, 150 mg once daily or 75 mg b.i.d. of the pediatric powder for oral solution. If clearance is 10 to 29 ml/minute, give 125-mg capsule, or 100 mg of the pediatric powder for oral solution once daily. For clearance less than 10 ml/minute, give 75 mg of the pediatric powder for oral solution once daily; capsule not indicated for these patients.

For adult patients taking tenofovir who weigh 60 kg or more with a creatinine clearance greater than or equal to 60 ml/minute, reduce Videx dose to 250 mg once daily. Avoid concomitant therapy in patients with a creatinine clearance less than 60 ml/minute. For adult patients taking tenofovir who weigh less than 60 kg with a creatinine clearance greater than or equal to 60 ml/minute, reduce Videx dose to 200 mg once daily. Avoid concomitant therapy in patients with a creatinine clearance less than 60 ml/minute.

## ADMINISTRATION

**P.O.**

● Give drug on an empty stomach, at least 30 minutes before or 2 hours after eating; giving drug with meals can decrease absorption by 50%.

***Alert:*** The pediatric powder for oral solution must be prepared by a pharmacist before dispensing. It must be constituted with purified USP water and then diluted with an antacid (Mylanta Double Strength Liquid, Extra Strength Maalox Plus Suspension, or Maalox TC Suspension) to a final concentration of 10 mg/ml. The admixture is stable for 30 days at 36° to 46° F (2° to 8° C). Shake the solution well before measuring dose.

## ACTION

Inhibits the enzyme HIV-RNA–dependent DNA polymerase (reverse transcriptase) and terminates DNA chain growth.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 15–90 min | Unknown |
| P.O., E.C. | Unknown | 2 hr | Unknown |

*Half-life:* 48 minutes.

## ADVERSE REACTIONS

**CNS:** *dizziness, fever, headache, peripheral neuropathy,* ***seizures,*** abnormal thinking, asthenia, pain.
**EENT:** optic neuritis, retinal changes.
**GI:** *abdominal pain, diarrhea, nausea, vomiting,* ***pancreatitis,*** anorexia, dry mouth.
**Hematologic:** ***leukopenia, thrombocytopenia,*** anemia, granulocytosis.
**Hepatic:** ***hepatic failure.***
**Metabolic:** hyperuricemia.
**Musculoskeletal:** myopathy.
**Skin:** alopecia, pruritus, rash.
**Other:** *chills,* ***sarcoma,*** allergic reactions, infection.

## INTERACTIONS

**Drug-drug.** *Amprenavir, delavirdine, indinavir, nelfinavir, ritonavir, saquinavir:* May alter pharmacokinetics of didanosine or these drugs. Separate dosage times.
*Antacids containing magnesium or aluminum hydroxides:* May enhance adverse effects of the antacid component (including diarrhea or constipation) when given with

didanosine tablets or pediatric suspension. Avoid using together.
*Co-trimoxazole, pentamidine, other drugs linked to pancreatitis:* May increase risk of pancreatic toxicity. Use together cautiously; consider temporarily stopping didanosine during administration of these drugs.
*Dapsone, drugs that require gastric acid for adequate absorption, ketoconazole:* May decrease absorption from buffering action. Give these drugs 2 hours before didanosine.
*Fluoroquinolones, tetracyclines:* May decrease absorption from buffering products in didanosine tablets or antacids in pediatric suspension. Separate dosage times by at least 2 hours.
*Itraconazole:* May decrease itraconazole level. Avoid using together.
**Black Box Warning** *Stavudine, other antiretrovirals:* Fatal lactic acidosis has been reported in pregnant women. Use only if potential benefits clearly outweigh potential risks. ■
***Tenofovir:*** May increase didanosine levels and risk of life-threatening adverse effects including lactic acidosis and pancreatitis. Adjust didanosine dosage.
**Drug-herb.** *St. John's wort:* May decrease drug level, decreasing therapeutic effects. Discourage use together.
**Drug-food.** *Any food:* May decrease rate of absorption. Advise patient to take drug on an empty stomach at least 30 minutes before a meal.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, bilirubin, and uric acid levels. May decrease hemoglobin level.
- May decrease granulocyte, platelet, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.

**Black Box Warning** Contraindicated in patients with confirmed pancreatitis. ■
**Black Box Warning** Use cautiously in patients with history of pancreatitis; deaths have occurred. ■
**Black Box Warning** Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported. ■

- Use cautiously in patients with peripheral neuropathy, renal or hepatic impairment, or hyperuricemia. Monitor liver and renal function tests.

⚠ ***Overdose S&S:*** Pancreatitis, peripheral neuropathy, diarrhea, hyperuricemia, hepatic dysfunction.

D

## NURSING CONSIDERATIONS

- Patients with advanced HIV disease or history of peripheral neuropathy may develop numbness, tingling, or pain in the hands and feet resulting in dosage reduction or stopping drug.
- Patients may tolerate a reduced dose of Videx after symptoms of peripheral neuropathy resolve; if symptoms recur, consider permanently stopping drug.
- Because of a high rate of early virologic failure and emergence of resistance, using tenofovir with didanosine and lamivudine isn't recommended as a new treatment regimen for therapy-naïve or -experienced patients with HIV infection. Patients on this regimen should be considered for treatment modification.
- ***Look alike–sound alike:*** Don't confuse drug with other antiretrovirals that use abbreviations for identification.

## PATIENT TEACHING

- Instruct patient to take drug on an empty stomach, 30 minutes before or 2 hours after eating.
- Inform patient that drug doesn't cure HIV infection, that opportunistic infections and other complications of HIV infection may continue to occur, and that transmission of HIV to others through sexual contact or blood contamination is still possible.
- Tell patient to report symptoms of inflammation of the pancreas, such as abdominal pain, nausea, vomiting, diarrhea, or symptoms of peripheral neuropathy.

# diflunisal

dye-FLOO-ni-sal

*Therapeutic class:* NSAID
*Pharmacologic class:* Salicylate; NSAID
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 500 mg

## INDICATIONS & DOSAGES

➤ **Osteoarthritis, rheumatoid arthritis**

*Adults:* 500 to 1,000 mg P.O. daily in two divided doses, usually every 12 hours. Maximum, 1,500 mg daily.

*Children age 12 and older:* 250 to 1,000 mg P.O. daily in two divided doses. Maximum dose is 1,500 mg daily.

➤ **Mild to moderate pain**

*Adults and children age 12 and older:* 1 g P.O., then 500 mg every 8 to 12 hours. A lower dosage of 500 mg P.O., then 250 mg every 8 to 12 hours may be appropriate.

## ADMINISTRATION

**P.O.**

- Give tablets with water, milk, or meals.
- Give drug whole; don't crush or break tablets.

## ACTION

Unknown. Probably related to inhibition of prostaglandin synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 2–3 hr | 8–12 hr |

*Half-life:* 8 to 12 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, fatigue, headache, insomnia, somnolence.
**EENT:** tinnitus.
**GI:** constipation, diarrhea, dyspepsia, flatulence, GI pain, nausea, stomatitis, vomiting.
**GU:** ***interstitial nephritis,*** hematuria, renal impairment.
**Skin:** ***erythema multiforme, Stevens-Johnson syndrome,*** pruritus, rash, sweating.

## INTERACTIONS

**Drug-drug.** *Acetaminophen, hydrochlorothiazide, indomethacin:* May substantially increase levels of these drugs, increasing risk of toxicity. Avoid using together.

*Antacids, aspirin:* May decrease diflunisal level. Monitor patient for reduced therapeutic effect.

*Anticoagulants, thrombolytics:* May enhance effects of these drugs. Use together cautiously.

*Cyclosporine:* May enhance the nephrotoxicity of cyclosporine. Avoid using together.

*Methotrexate:* May enhance the toxicity of methotrexate. Avoid using together.

*Sulindac:* May decrease level of sulindac's metabolite. Monitor patient for reduced effect.

## EFFECTS ON LAB TEST RESULTS

- May falsely elevate salicylate level.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Contraindicated for the treatment of perioperative pain after CABG surgery.

- Contraindicated in patients hypersensitive to drug and in those for whom acute asthmatic attacks, urticaria, or rhinitis are precipitated by aspirin or other NSAIDs. Don't use in patients with severe renal disease.
- Use cautiously in patients with GI bleeding, history of peptic ulcer disease, mild to moderate renal impairment, compromised cardiac function, hypertension, or other conditions predisposing patient to fluid retention.

***Overdose S&S:*** Drowsiness, nausea, vomiting, diarrhea, hyperventilation, tachycardia, diaphoresis, tinnitus, disorientation, stupor, coma, decreased urine output, cardiac arrest.

## NURSING CONSIDERATIONS

**Black Box Warning** NSAIDs may increase the risk of serious thrombotic events, MI or stroke. The risk may be greater with longer use or in patients with CV disease or risk factors for CV disease.

**Black Box Warning** NSAIDs cause an increased risk of serious GI adverse reactions,

including bleeding, ulceration, and perforation of the stomach or intestines, which can be fatal. Elderly patients are at greater risk.

***Alert:*** The Centers for Disease Control and Prevention recommend not giving salicylates to children and teenagers with chickenpox or flulike illness with or without fever because of the link to Reye syndrome.

### PATIENT TEACHING

- Advise patient to take with water, milk, or meals.
- Tell patient that tablets must be swallowed whole.
- Instruct patient to avoid aspirin or acetaminophen while using diflunisal.
- Inform breast-feeding woman that drug appears in breast milk; she should stop either breast-feeding or taking drug.

## difluprednate

die-FLU-pred-nate

Durezol

*Therapeutic class:* Anti-inflammatory (ophthalmic)
*Pharmacologic class:* Corticosteroid
*Pregnancy risk category C*

### AVAILABLE FORMS

*Ophthalmic emulsion:* 0.05%

### INDICATIONS & DOSAGES

➤ **Inflammation and pain associated with ocular surgery**

*Adults:* One drop into the conjunctival sac of the affected eye q.i.d. beginning 24 hours after surgery for 2 weeks, then decrease to b.i.d. for one week, and then taper according to response.

### ADMINISTRATION

**Ophthalmic**

- Shake well before each use.
- Don't touch tip of dropper to any surface, including eye.

### ACTION

May inhibit the release of arachidonic acid, a precursor of inflammatory mediators, such as prostaglandins and leukotrienes.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Rapid | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**EENT:** *anterior chamber cells, anterior chamber flare, blepharitis, ciliary and conjunctival hyperemia, conjunctival edema, corneal edema,* eye inflammation, *eye pain,* iritis, *photophobia, posterior capsule opacification,* punctate keratitis, reduced visual acuity.

### INTERACTIONS

None reported.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with ocular tuberculosis, epithelial herpes simplex keratitis (dendritic keratitis), vaccinia, varicella, or other fungal or viral diseases of ocular structures.
- Use cautiously in patients with glaucoma (any form) because intraocular pressure may increase.
- Use cautiously in patients with a history of herpes simplex; drug may prolong or worsen the condition.

### NURSING CONSIDERATIONS

- Drug isn't intended for long-term use; if used for 10 days or more, monitor intraocular pressure. Watch for ocular bacterial, fungal or viral infections.
- Drug may delay healing after cataract surgery; examine with slit lamp biomicroscopy and, if appropriate, fluorescein staining, if used for more than 28 days.
- Safe use in pregnant women hasn't been established.
- Appearance of drug in breast milk isn't known. Use cautiously in breast-feeding women.
- Safety and efficacy haven't been established in children.

## PATIENT TEACHING

- Teach patient how to instill drops. Advise him to wash his hands before and after applying the drug, and warn him not to touch tip of dropper to eye or surrounding tissue.
- Advise patient to contact prescriber if pain develops or redness, itching, or inflammation worsens.
- Tell patient who wears contact lenses to check with prescriber before using lenses again.
- Advise patient to store drug at room temperature in protective carton away from light, and to keep unused vials in foil pouch.

**SAFETY ALERT!**

# digoxin

di-JOX-in

Lanoxicaps, Lanoxin*, Lanoxin Pediatric, Toloxin†

*Therapeutic class:* Inotrope
*Pharmacologic class:* Cardiac glycoside
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 0.05 mg, 0.1 mg, 0.2 mg
*Elixir*:* 0.05 mg/ml (pediatric)
*Injection*:* 0.05 mg/ml†, 0.1 mg/ml (pediatric), 0.25 mg/ml
*Tablets:* 0.125 mg, 0.25 mg

## INDICATIONS & DOSAGES

➤ **Heart failure, paroxysmal supraventricular tachycardia, atrial fibrillation and flutter**

***Capsules***

*Adults:* For rapid digitalization, give 0.4 to 0.6 mg P.O. initially, followed by 0.1 to 0.3 mg every 6 to 8 hours, as needed and tolerated, for 24 hours. For slow digitalization, give 0.05 to 0.35 mg daily in two divided doses. Therapeutic levels are reached in 7 to 22 days. Maintenance dose is 0.05 to 0.35 mg daily in one or two divided doses.
*Children:* Digitalizing dose is based on child's age and is given in three or more divided doses over the first 24 hours. First dose is 50% of the total dose; subsequent doses are given as 25% of total dose for two doses every 6 to 8 hours as needed and tolerated.
*Children age 10 and older:* For rapid digitalization, give 8 to 12 mcg/kg P.O. over 24 hours, divided as described previously. Maintenance dose is 25% to 35% of total digitalizing dose, given daily as a single dose.
*Children ages 5 to 10:* For rapid digitalization, give 15 to 30 mcg/kg P.O. over 24 hours, divided as described previously. Maintenance dose is 25% to 35% of total digitalizing dose, divided and given in two or three equal portions daily.
*Children ages 2 to 5:* For rapid digitalization, give 25 to 35 mcg/kg P.O. over 24 hours, divided as described previously. Maintenance dose is 25% to 35% of total digitalizing dose, divided and given in two or three equal portions daily.

***Elixir, tablets***

*Adults:* For rapid digitalization, give 0.75 to 1.25 mg P.O. over 24 hours in two or more divided doses every 6 to 8 hours. For slow digitalization, give 0.0625 to 0.5 mg daily. Titrate every 2 weeks as needed. Maintenance dose is 0.0625 to 0.5 mg daily.
*Children age 11 and older:* 10 to 15 mcg/kg P.O. over 24 hours in two or more divided doses every 6 to 8 hours. Maintenance dose is 25% to 35% of total digitalizing dose.
*Children ages 5 to 10:* 20 to 35 mcg/kg P.O. over 24 hours in two or more divided doses every 6 to 8 hours. Maintenance dose is 25% to 35% of total digitalizing dose.
*Children ages 2 to 5:* 30 to 40 mcg/kg P.O. over 24 hours in two or more divided doses every 6 to 8 hours. Maintenance dose is 25% to 35% of total digitalizing dose.
*Infants ages 1 month to 2 years:* 35 to 60 mcg/kg P.O. over 24 hours in two or more divided doses every 6 to 8 hours. Maintenance dose is 25% to 35% of total digitalizing dose.
*Neonates:* 25 to 35 mcg/kg P.O. over 24 hours in two or more divided doses every 6 to 8 hours. Maintenance dose is 25% to 35% of total digitalizing dose.
*Premature infants:* 20 to 30 mcg/kg P.O. over 24 hours in two or more divided doses every 6 to 8 hours. Maintenance dose is 20% to 30% of total digitalizing dose.

***Injection***

*Adults:* For rapid digitalization, give 0.4 to 0.6 mg I.V. initially, followed by 0.1 to 0.3 mg I.V. every 6 to 8 hours, as needed and tolerated, for 24 hours. For slow digitalization, give appropriate daily maintenance dose for 7 to 22 days until therapeutic levels are reached. Maintenance dose is 0.075 to 0.35 mg I.V. daily in one or two divided doses.

*Children:* Digitalizing dose is based on child's age; give in three or more divided doses over the first 24 hours. First dose is 50% of total dose; subsequent doses are given every 6 to 8 hours as needed and tolerated.

*Children age 10 and older:* For rapid digitalization, give 8 to 12 mcg/kg I.V. over 24 hours, divided as described previously. Maintenance dose is 25% to 35% of total digitalizing dose, given daily as a single dose.

*Children ages 5 to 10:* For rapid digitalization, give 15 to 30 mcg/kg I.V. over 24 hours, divided as described previously. Maintenance dose is 25% to 35% of total digitalizing dose, divided and given in two or three equal portions daily.

*Children ages 2 to 5:* For rapid digitalization, give 25 to 35 mcg/kg I.V. over 24 hours, divided as described previously. Maintenance dose is 25% to 35% of total digitalizing dose, divided and given in two or three equal portions daily.

*Infants ages 1 month to 2 years:* For rapid digitalization, give 30 to 50 mcg/kg I.V. over 24 hours, divided as described previously. Maintenance dose is 25% to 35% of total digitalizing dose, divided and given in two or three equal portions daily.

*Neonates:* For rapid digitalization, give 20 to 30 mcg/kg I.V. over 24 hours, divided as described previously. Maintenance dose is 25% to 35% of the total digitalizing dose, divided and given in two or three equal portions daily.

*Premature infants:* For rapid digitalization, give 15 to 25 mcg/kg I.V. over 24 hours, divided as described previously. Maintenance dose is 20% to 30% of the total digitalizing dose, divided and given in two or three equal portions daily.

***Adjust-a-dose:*** For patients with impaired renal function, give smaller loading and maintenance doses; extended dosing intervals may be needed.

## ADMINISTRATION

**P.O.**

● Before giving loading dose, obtain baseline data (heart rate and rhythm, blood pressure, and electrolytes) and ask patient about use of cardiac glycosides within the previous 2 to 3 weeks.

● Before giving drug, take apical-radial pulse for 1 minute. Record and notify prescriber of significant changes (sudden increase or decrease in pulse rate, pulse deficit, irregular beats and, particularly, regularization of a previously irregular rhythm). If these occur, check blood pressure and obtain a 12-lead ECG.

**I.V.**

▼ Before giving loading dose, obtain baseline data (heart rate and rhythm, blood pressure, and electrolytes) and ask patient about use of cardiac glycosides within the previous 2 to 3 weeks.

▼ Before giving drug, take apical-radial pulse for 1 minute. Record and notify prescriber of significant changes (sudden increase or decrease in pulse rate, pulse deficit, irregular beats and, particularly, regularization of a previously irregular rhythm). If these occur, check blood pressure and obtain a 12-lead ECG.

▼ Dilute fourfold with $D_5W$, normal saline solution, or sterile water for injection to reduce the chance of precipitation.

▼ Infuse drug slowly over at least 5 minutes.

▼ Protect solution from light.

▼ **Incompatibilities:** Amiodarone, amphotericin B cholesteryl sulfate complex, dobutamine, doxapram, fluconazole, foscarnet, propofol, remifentanil. Mixing with other drugs isn't recommended.

## ACTION

Inhibits sodium-potassium–activated adenosine triphosphatase, promoting movement of calcium from extracellular to intracellular cytoplasm and strengthening myocardial contraction. Also acts on CNS

to enhance vagal tone, slowing conduction through the SA and AV nodes.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30–120 min | 2–6 hr | 3–4 days |
| I.V. | 5–30 min | 1–4 hr | 3–4 days |

*Half-life:* 30 to 40 hours.

## ADVERSE REACTIONS

**CNS:** *agitation, fatigue, generalized muscle weakness, hallucinations,* dizziness, headache, malaise, paresthesia, stupor, vertigo.
**CV:** ***arrhythmias, heart block.***
**EENT:** blurred vision, diplopia, light flashes, photophobia, yellow-green halos around visual images.
**GI:** *anorexia, nausea,* diarrhea, vomiting.

## INTERACTIONS

**Drug-drug.** *Amiloride:* May decrease digoxin effect and increase renal clearance of digoxin. Monitor patient for altered digoxin effect.
***Amiodarone****, diltiazem, indomethacin, nifedipine,* ***quinidine****,* ***verapamil:*** May increase digoxin level. Monitor patient for toxicity.
*Amphotericin B, carbenicillin, corticosteroids,* ***diuretics (such as chlorthalidone, loop diuretics, metolazone, thiazides)****, ticarcillin:* May cause hypokalemia, predisposing patient to digitalis toxicity. Monitor potassium level.
*Antacids, kaolin-pectin:* May decrease absorption of oral digoxin. Separate doses as much as possible.
***Antibiotics (azole antifungals, macrolides, telithromycin, tetracyclines), propafenone, ritonavir:*** May increase risk of toxicity. Monitor patient for toxicity.
*Anticholinergics:* May increase digoxin absorption of oral digoxin tablets. Monitor drug level and observe for toxicity.
*Beta blockers, calcium channel blockers:* May have additive effects on AV node conduction causing advanced or complete heart block. Use cautiously.
*Cholestyramine, colestipol, metoclopramide:* May decrease absorption of oral digoxin. Monitor patient for decreased digoxin level and effect. Give digoxin 1½ hours before or 2 hours after other drugs.
*Parenteral calcium, thiazides:* May cause hypercalcemia and hypomagnesemia, predisposing patient to digitalis toxicity. Monitor calcium and magnesium levels.
**Drug-herb.** *Betel palm, foxglove, fumitory, goldenseal, hawthorn, lily of the valley, motherwort, rue, shepherd's purse:* May increase cardiac effects. Discourage use together.
*Gossypol, horsetail, licorice, oleander, Siberian ginseng, squill:* May increase toxicity. Monitor patient closely.
*Plantain, St. John's wort:* May decrease effectiveness of drug. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May prolong PR interval or depress ST segment.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with digitalis-induced toxicity, ventricular fibrillation, or ventricular tachycardia unless caused by heart failure.
- Don't use in patients with Wolff-Parkinson-White syndrome unless the conduction accessory pathway has been pharmacologically or surgically disabled.
- Use with extreme caution in elderly patients and in those with acute MI, incomplete AV block, sinus bradycardia, PVCs, chronic constrictive pericarditis, hypertrophic cardiomyopathy, renal insufficiency, severe pulmonary disease, or hypothyroidism.

***Overdose S&S:*** Ventricular tachycardia, ventricular fibrillation, bradycardia, heart block, cardiac arrest, hyperkalemia.

## NURSING CONSIDERATIONS

- Drug-induced arrhythmias may increase the severity of heart failure and hypotension.
- In children, cardiac arrhythmias, including sinus bradycardia, are usually early signs of toxicity.
- Patients with hypothyroidism are extremely sensitive to cardiac glycosides and may need lower doses.

- Loading dose is usually divided over the first 24 hours with about half the loading dose given in the first dose.
- Toxic effects on the heart may be life-threatening and require immediate attention.
- Absorption of digoxin from liquid-filled capsules is superior to absorption from tablets or elixir. Expect dosage reduction of 20% to 25% when changing from tablets or elixir to liquid-filled capsules or parenteral therapy.
- Monitor digoxin level. Therapeutic level ranges from 0.8 to 2 nanogram/ml. Obtain blood for digoxin level at least 6 to 8 hours after last oral dose, preferably just before next scheduled dose.

***Alert:*** Excessively slow pulse rate (60 beats/minute or less) may be a sign of digitalis toxicity. Withhold drug and notify prescriber.

- Monitor potassium level carefully. Take corrective action before hypokalemia occurs. Hyperkalemia may result from digoxin toxicity.
- Reduce drug dose for 1 or 2 days before elective cardioversion. Adjust dosage after cardioversion.
- ***Look alike–sound alike:*** Don't confuse digoxin with doxepin.

## PATIENT TEACHING

- Teach patient and a responsible family member about drug action, dosage regimen, how to take pulse, reportable signs, and follow-up care.
- Tell patient to report pulse less than 60 beats/minute or more than 110 beats/minute, or skipped beats or other rhythm changes.
- Instruct patient to report adverse reactions promptly. Nausea, vomiting, diarrhea, appetite loss, and visual disturbances may be indicators of toxicity.
- Encourage patient to eat a consistent amount of potassium-rich foods.
- Tell patient not to substitute one brand for another.
- Advise patient to avoid the use of herbal drugs or to consult his prescriber before taking one.

# digoxin immune Fab (ovine)

di-JOX-in

Digibind, DigiFab

*Therapeutic class:* Antidote
*Pharmacologic class:* Antibody fragment
*Pregnancy risk category C*

D

## AVAILABLE FORMS

*Injection:* 38-mg vial (Digibind), 40-mg vial (DigiFab)

## INDICATIONS & DOSAGES

➤ **Life-threatening digoxin toxicity**

*Adults and children:* Base dosage on ingested amount or level of digoxin. When calculating amount of antidote, round up to the nearest whole number.

For digoxin tablets, calculate number of antidote vials as follows: multiply ingested amount by 0.8; then divide answer by 0.5. For example, if patient takes 25 tablets of 0.25 mg digoxin, the ingested amount is 6.25 mg. Multiply 6.25 mg by 0.8 and divide answer by 0.5 to obtain 10 vials of antidote.

For digoxin capsules, divide the ingested dose in milligrams by 0.5. For example, if patient takes 50 capsules of 0.2 mg, the ingested amount is 10 mg. Divide 10 mg by 0.5 to obtain 20 vials of antidote.

If digoxin level is known, determine the number of antidote vials as follows: multiply the digoxin level in nanograms per milliliter by patient's weight in kilograms; then divide by 100. For example, if digoxin level is 4 nanograms/ml, and patient weighs 60 kg, multiply together to obtain 240. Divide answer by 100 to obtain 2.4 vials; then round up to 3 vials.

➤ **Acute toxicity or if estimated ingested amount or digoxin level is unknown**

*Adults and children:* Consider giving 10 vials of digoxin immune Fab and observing patient's response. Follow with another 10 vials if indicated. Dosage should be effective in most life-threatening cases in adults and children but may cause volume overload in young children.

## ADMINISTRATION

**I.V.**

▼ Reconstitute drug immediately before use with 4 ml sterile water for injection.
▼ For children or other patients who need small doses, reconstitute 38-mg vial Digibind with 38 ml of normal saline solution to yield 1 mg/ml; reconstitute 40-mg vial DigiFab with 40 ml of normal saline solution to yield 1 mg/ml.
▼ If cardiac arrest seems imminent, drug may be given by direct injection.
▼ For intermittent infusion, further dilute with normal saline solution for injection to an appropriate volume.
▼ Infuse drug over at least 30 minutes through a 0.22-micron membrane filter.
▼ Refrigerate powder for injection. Reconstituted solutions may be refrigerated 4 hours.
▼ **Incompatibilities:** None reported.

## ACTION

Binds molecules of unbound digoxin and digitoxin, making them unavailable for binding at site of action on cells.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 30 min | End of infusion | 15–20 hr |

*Half-life:* 15 to 20 hours.

## ADVERSE REACTIONS

**CV:** ***heart failure, rapid ventricular rate, worsening low cardiac output.***
**Metabolic:** ***hypokalemia.***
**Other:** ***anaphylaxis,*** hypersensitivity reactions.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

● May decrease potassium level.
● May interfere with digitalis immunoassay measurements until drug is cleared from the body (about 48 hours).

## CONTRAINDICATIONS & CAUTIONS

● Use cautiously in patients allergic to sheep proteins, papain (papaya), or the pineapple enzyme bromelain, and in those who have previously received antibodies.

## NURSING CONSIDERATIONS

● In patients allergic to sheep proteins and in those who have previously received antibodies, skin testing is recommended because drug is derived from digoxin-specific antibody fragments obtained from immunized sheep.
● Drug is used for life-threatening overdose in patients with anaphylaxis, severe hypotension, or cardiac arrest and in those with ventricular arrhythmias (such as ventricular tachycardia or fibrillation), progressive bradycardia (such as severe sinus bradycardia), or second- or third-degree AV block not responsive to atropine.
● Heart failure and rapid ventricular rate may result by reversal of cardiac glycoside's therapeutic effects.
● Monitor potassium level closely.
● In most patients, signs of digitalis toxicity disappear within a few hours.
● Continue to monitor renal function carefully and watch for digoxin toxicity in patients with renal failure.

## PATIENT TEACHING

● Explain use and administration of drug to patient and family.
● Instruct patient to report adverse reactions promptly.

# diltiazem hydrochloride

dil-TYE-a-zem

Apo-Diltiaz†, Cardizem✔, Cardizem CD✔, Cardizem LA✔, Cartia XT, Dilacor XR, Dilt-CD, Dilt-XR, Diltzac, Nu-Diltiaz†, Taztia XT, Tiazac, Tiazac XC†

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Calcium channel blocker
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules (extended-release):* 60 mg, 90 mg, 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg
*Injection:* 5 mg/ml in 5-, 10-, 25-ml vials
*Powder for injection:* 25 mg
*Tablets:* 30 mg, 60 mg, 90 mg, 120 mg

*Tablets (extended-release):* 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg

## INDICATIONS & DOSAGES

➤ **To manage Prinzmetal's or variant angina or chronic stable angina pectoris**

*Adults:* 30 mg P.O. q.i.d. before meals and at bedtime. Increase dose gradually to maximum of 360 mg/day divided into three or four doses, as indicated. Or, give 120- or 180-mg extended-release capsule or 180-mg extended-release tablet P.O. once daily. Adjust over a 7- to 14-day period as needed and tolerated up to a maximum dose of 360 mg/day (Cardizem LA), 480 mg/day (Cardizem CD, Cartia XT, Dilacor XR), or 540 mg/day (Tiazac).

➤ **Hypertension**

*Adults:* 180- to 240-mg extended-release capsule P.O. once daily. Adjust dosage based on patient response to a maximum dose of 480 mg/day. Or, 120 to 240 mg P.O. (Cardizem LA) once daily. Dosage can be adjusted about every 2 weeks to a maximum of 540 mg daily.

➤ **Atrial fibrillation or flutter; paroxysmal supraventricular tachycardia**

*Adults:* 0.25 mg/kg I.V. as a bolus injection over 2 minutes. Repeat after 15 minutes if response isn't adequate with a dose of 0.35 mg/kg I.V. over 2 minutes. Follow bolus with continuous I.V. infusion at 5 to 15 mg/hour (for up to 24 hours).

## ADMINISTRATION

**P.O.**

● Don't crush or allow patient to chew extended-release tablets; they should be swallowed whole.

● Tiazac extended-release capsules can be opened and the contents sprinkled onto a spoonful of applesauce. The applesauce must be eaten immediately and without chewing, followed by a glass of cool water.

**I.V.**

▼ For direct injection, you need not dilute the 5 mg/ml injection.

▼ For continuous infusion, add 25 ml of drug to 100 ml solution, 50 ml of drug to 250 ml solution, or 50 ml of drug to 500 ml solution of 5 mg/ml injection to yield 1 mg/ml, 0.83 mg/ml, or 0.45 mg/ml, respectively. Compatible solutions include normal saline solution, $D_5W$, or 5% dextrose and half-normal saline solution.

▼ For direct injection or continuous infusion; give slowly while monitoring ECG and blood pressure continuously.

▼ Don't infuse for longer than 24 hours.

▼ **Incompatibilities:** Acetazolamide, acyclovir, aminophylline, ampicillin, ampicillin sodium and sulbactam sodium, cefoperazone, diazepam, furosemide, heparin, hydrocortisone, insulin, methylprednisolone, nafcillin, phenytoin, rifampin, sodium bicarbonate, thiopental.

## ACTION

A calcium channel blocker that inhibits calcium ion influx across cardiac and smooth-muscle cells, decreasing myocardial contractility and oxygen demand. Drug also dilates coronary arteries and arterioles.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30–60 min | 2–3 hr | 6–8 hr |
| P.O. (extended-release capsule) | 2–3 hr | 10–14 hr | 12–24 hr |
| P.O. (Cardizem LA) | 3–4 hr | 11–18 hr | 6–9 hr |
| I.V. | <3 min | 2–7 min | 1–10 hr |

*Half-life:* 3 to 9 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* dizziness, asthenia, somnolence.

**CV:** *edema,* ***arrhythmias, AV block, bradycardia, heart failure,*** flushing, hypotension, conduction abnormalities, abnormal ECG.

**GI:** nausea, constipation, abdominal discomfort.

**Hepatic:** ***acute hepatic injury.***

**Skin:** rash.

## INTERACTIONS

**Drug-drug.** *Anesthetics:* May increase effects of anesthetics. Monitor patient.

*Atazanavir, cimetidine:* May inhibit diltiazem metabolism, increasing additive AV node conduction slowing. Monitor patient for toxicity.

*Buspirone, quinidine, sirolimus, tacrolimus:* May increase level of these drugs. Monitor drug levels and patient for toxicity.

*Carbamazepine:* May increase level of carbamazepine. Monitor carbamazepine

level, and watch for signs and symptoms of toxicity.
*Cyclosporine:* May increase cyclosporine level. Monitor cyclosporine level with each dosage change.
***Diazepam, midazolam, triazolam:*** May increase CNS depression and prolonged effects of these drugs. Use lower dose of these benzodiazepines.
*Digoxin:* May increase digoxin level. Monitor patient for digoxin toxicity.
*Furosemide:* May form a precipitate when mixed with diltiazem injection. Give through separate I.V. lines.
*HMG-CoA reductase inhibitors (simvastatin):* May increase risk of myopathy, rhabdomyolysis, and kidney failure. Use lower starting and maintenance doses of both agents.
*Lithium:* May reduce lithium levels, causing loss of mania control, and neurotoxic and psychotic symptoms. Monitor patient for signs of neurotoxicity.
*Propranolol, other beta blockers:* May precipitate heart failure or prolong conduction time. Use together cautiously.
*Rifampin:* May lower diltiazem levels significantly. Avoid use together.
*Theophylline:* May enhance action of theophylline, causing intoxication. Monitor theophylline levels.

## EFFECTS ON LAB TEST RESULTS
None reported.

## CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug and in those with sick sinus syndrome or second- or third-degree AV block in the absence of an artificial pacemaker, cardiogenic shock, ventricular tachycardia, systolic blood pressure below 90 mm Hg, acute MI, or pulmonary congestion (documented by X-ray).
- Contraindicated in I.V. form for patients who have atrial fibrillation or flutter with an accessory bypass tract, as in Wolff-Parkinson-White syndrome or short PR interval syndrome.
- Use cautiously in elderly patients and in those with heart failure or impaired hepatic or renal function.

## NURSING CONSIDERATIONS
- Patients controlled on drug alone or with other drugs may be switched to Cardizem LA tablets once a day at the nearest equivalent total daily dose.
- Monitor blood pressure and heart rate when starting therapy and during dosage adjustments.
- Maximal antihypertensive effect may not be seen for 14 days.
- If systolic blood pressure is below 90 mm Hg or heart rate is below 60 beats/minute, withhold dose and notify prescriber.
- ***Look alike–sound alike:*** Don't confuse Tiazac with Ziac.

## PATIENT TEACHING
- Instruct patient to take drug as prescribed, even when he feels better.
- Advise patient to avoid hazardous activities during start of therapy.
- If nitrate therapy is prescribed during dosage adjustment, stress patient compliance. Tell patient that S.L. nitroglycerin may be taken with drug, as needed, when angina symptoms are acute.
- ***Alert:*** Tell patient to swallow extended-release tablets whole, and not to crush or chew them.
- If patient is taking Tiazac extended-release capsules, inform him that these capsules can be opened and the contents sprinkled onto a spoonful of applesauce. He must eat the applesauce immediately and without chewing, and then drink a glass of cool water.

# dimenhyDRINATE
dye-men-HYE-dri-nate

Children's Dramamine ◇*, Dimetabs, Dinate ◇, Dramamine ◇*, Dramamine Liquid ◇*, Dramanate, Dymenate, Gravol† ◇, Nauseatol† ◇, Travel Tabs† ◇, TripTone Caplets ◇

*Therapeutic class:* Antivertigo
*Pharmacologic class:* Anticholinergic
*Pregnancy risk category B*

## AVAILABLE FORMS
*Injection:* 50 mg/ml

*Syrup:* 3 mg/ml†, 12.5 mg/4 ml ◇*, 12.5 mg/5 ml ◇*, 15 mg/5 ml† ◇, 15.62 mg/5 ml
*Tablets:* 50 mg ◇
*Tablets (chewable):* 50 mg ◇

## INDICATIONS & DOSAGES

➤ **To prevent and treat motion sickness**

*Adults and children age 12 and older:* 50 to 100 mg P.O. every 4 to 6 hours; 50 mg I.M., as needed; or 50 mg I.V. diluted in 10 ml normal saline solution for injection, injected over 2 minutes. Maximum, 400 mg daily. For prevention, use drug 30 minutes before motion exposure.
*Children ages 6 to 11:* 25 to 50 mg P.O. every 6 to 8 hours, not to exceed 150 mg in 24 hours. Or, 1.25 mg/kg or 37.5 mg/$m^2$ I.M. or P.O. q.i.d.
*Children ages 2 to 5:* 12.5 to 25 mg P.O. every 6 to 8 hours, not to exceed 75 mg in 24 hours. Or, 1.25 mg/kg or 37.5 mg/$m^2$ I.M. or P.O. q.i.d. Maximum, 300 mg daily.

## ADMINISTRATION

**P.O.**

- May be given without regard for food.
- Give at least 30 minutes before activity or travel.

**I.V.**

▼ Dilute each milliliter (50 mg) of drug with 10 ml sterile water for injection, $D_5W$, or normal saline solution for injection.
▼ Give by direct injection over at least 2 minutes.
▼ Don't give if drug has particulate matter or discoloration.
▼ **Incompatibilities:** Aminophylline, ammonium chloride, amobarbital, butorphanol, chlorpromazine, glycopyrrolate, heparin, hydrocortisone sodium succinate, hydroxyzine hydrochloride, midazolam, pentobarbital sodium, phenobarbital sodium, phenytoin, prochlorperazine edisylate, promazine, promethazine hydrochloride, and thiopental.

**I.M.**

- Inspect drug for particulate matter or discoloration; don't give if present.

## ACTION

May affect neural pathways originating in the labyrinth to inhibit nausea and vomiting.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 15–30 min | Unknown | 3–6 hr |
| I.V. | Immediate | Unknown | 3–6 hr |
| I.M. | 20–30 min | Unknown | 3–6 hr |

*Half-life:* Unknown.

D

## ADVERSE REACTIONS

**CNS:** *drowsiness,* confusion, dizziness, excitation, headache, insomnia, lassitude, nervousness, tingling and weakness of hands, vertigo.
**CV:** hypotension, palpitations, tachycardia.
**EENT:** blurred vision, diplopia, dry respiratory passages, nasal congestion.
**GI:** anorexia, constipation, diarrhea, dry mouth, epigastric distress, nausea, vomiting.
**GU:** urine retention.
**Respiratory:** thickened bronchial secretions, wheezing.
**Skin:** photosensitivity reactions, rash, urticaria.
**Other:** ***anaphylaxis,*** tightness of chest.

## INTERACTIONS

**Drug-drug.** *CNS depressants:* May cause additive CNS depression. Avoid using together.
*Ototoxic drugs:* Dimenhydrinate may mask symptoms of ototoxicity. Use together cautiously.
*Tricyclic antidepressants, other anticholinergics:* May increase anticholinergic activity. Monitor patient.
**Drug-lifestyle.** *Alcohol use:* May cause additive CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May prevent, reduce, or mask diagnostic skin test response. May alter xanthine (caffeine, aminophylline) test results.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in elderly patients, patients receiving ototoxic drugs, and patients with seizures, acute angle-closure glaucoma, or enlarged prostate gland.

⚠ ***Overdose S&S:*** Drowsiness, seizures, coma, respiratory depression.

## NURSING CONSIDERATIONS

- Elderly patients may be more susceptible to adverse CNS effects.
- Undiluted solution irritates veins and may cause sclerosis.
- Stop drug 4 days before diagnostic skin tests to prevent falsifying test response.
- Dramamine may contain tartrazine.

***Alert:*** Drug may mask symptoms of ototoxicity, brain tumor, or intestinal obstruction.

- ***Look alike–sound alike:*** Don't confuse dimenhydrinate with diphenhydramine.

## PATIENT TEACHING

- Advise patient to avoid activities that require alertness until CNS effects of drug are known.
- Instruct patient to report adverse reactions promptly.

# dimercaprol

dye-mer-KAP-rawl

BAL in Oil

*Therapeutic class:* Chelating agent
*Pharmacologic class:* Heavy metal antagonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 100 mg/ml

## INDICATIONS & DOSAGES

➤ **Severe arsenic or gold poisoning**

*Adults and children:* 3 mg/kg deep I.M. every 4 hours for 2 days; then q.i.d. on third day; then b.i.d. for 10 days.

➤ **Mild arsenic or gold poisoning**

*Adults and children:* 2.5 mg/kg deep I.M. q.i.d. for 2 days; then b.i.d. on third day; then once daily for 10 days.

➤ **Mercury poisoning**

*Adults and children:* Initially, 5 mg/kg deep I.M.; then 2.5 mg/kg daily or b.i.d. for 10 days.

➤ **Acute lead encephalopathy or lead level greater than 100 mcg/ml**

*Adults and children:* 4 mg/kg deep I.M.; then every 4 hours with edetate calcium disodium for 2 to 7 days. Use separate sites.

For less-severe poisoning, reduce dose to 3 mg/kg after first dose.

## ADMINISTRATION

### I.M.

***Alert:*** Don't give drug I.V.; give by deep I.M. route only.

- Don't let drug contact skin because it may cause a skin reaction.
- Drug has an unpleasant, garlicky odor.
- Solution with slight sediment is usable.

## ACTION

Forms complexes with heavy metals to create chelates that are renally excreted.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.M. | Unknown | 30–60 min | 4 hr |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *fever*, headache, paresthesia, anxiety.
**CV:** *transient increase in blood pressure, tachycardia.*
**EENT:** blepharospasm, conjunctivitis, lacrimation, rhinorrhea.
**GI:** *nausea, vomiting,* excessive salivation, *abdominal pain, burning sensation in lips, mouth, and throat.*
**Musculoskeletal:** muscle pain or weakness.
**Other:** pain or tightness in throat, chest, or hands.

## INTERACTIONS

**Drug-drug.** *Iron:* May cause toxic metal complex. Take iron 24 hours after last dimercaprol dose.

## EFFECTS ON LAB TEST RESULTS

- May block thyroid uptake of $^{131}I$, decreasing values.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with hepatic dysfunction (except postarsenical jaundice) or iron, cadmium, or selenium poisoning; also contraindicated in those allergic to peanuts.
- Don't use in pregnant women except for life-threatening acute poisoning.
- Use cautiously in patients with hypertension, G6PD deficiency, or oliguria.

***Overdose S&S:*** Vomiting, seizures, stupor.

## NURSING CONSIDERATIONS

- Use antihistamine to prevent or relieve mild adverse reactions.
- Keep urine alkaline to prevent renal damage.

## PATIENT TEACHING

- Explain use and administration of drug to patient and family.
- Instruct patient to report adverse reactions promptly.

# dinoprostone

dye-noe-PROST-ohn

Cervidil, Prepidil, Prostin E2

*Therapeutic class:* Oxytocic
*Pharmacologic class:* Prostaglandin
*Pregnancy risk category C*

## AVAILABLE FORMS

*Endocervical gel:* 0.5 mg/application (2.5-ml syringe)
*Vaginal insert:* 10 mg
*Vaginal suppositories:* 20 mg

## INDICATIONS & DOSAGES

**Black Box Warning** Strictly adhere to recommended dosages. ■

➤ **To terminate second-trimester pregnancy; to evacuate uterine contents in missed abortion, intrauterine fetal death up to 28 weeks' gestation, or benign hydatidiform mole**

*Women:* Insert 20-mg suppository high into posterior vaginal fornix; repeat every 3 to 5 hours until abortion is complete, for a maximum of 2 days.

➤ **To ripen an unfavorable cervix in pregnant woman at or near term**

*Women:* Apply 0.5 mg endocervical gel intravaginally; if cervix remains unfavorable after 6 hours, repeat dose. Don't exceed 1.5 mg (three applications) within 24 hours. Or, place 10-mg vaginal insert transversely in posterior vaginal fornix immediately after removing insert from foil. Take insert out when active labor begins or after 12 hours have passed, whichever occurs first.

## ADMINISTRATION

### Vaginal

- For cervical ripening, have patient lie on her back; use a speculum to examine cervix. Use catheter provided with drug to insert gel into cervical canal just below level of the internal os.
- Bring gel to room temperature just before giving. Don't force warming with water bath, microwave, or other external heat source.
- When giving gel form, don't try to give small amount of drug remaining in catheter.
- Patient should lie down for 15 to 30 minutes after using gel.
- Bring vaginal suppository to room temperature just before giving. Patient should lie down for 10 minutes following vaginal suppository insertion.
- When using the vaginal insert, a small amount of water-soluble jelly may be used to aid insertion. There's no need to warm the vaginal insert before insertion.
- Patient should lie down for 2 hours after using vaginal insert. Remove insert at onset of active labor or 12 hours after insertion.

## ACTION

Produces strong, prompt contractions of uterine smooth muscle, possibly mediated by calcium and cAMP. Also has a local cervical effect in initiating softening, effacement, and dilation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Vaginal (gel) | 15–30 min | Unknown | Unknown |
| Vaginal (insert) | Unknown | Unknown | Unknown |
| Vaginal (suppository) | 10 min | Unknown | 2–6 hr |

*Half-life:* 2½ to 5 minutes.

## ADVERSE REACTIONS

**CNS:** *fever, headache, dizziness,* anxiety, paresthesia, weakness, syncope.
**CV:** ***arrhythmias,*** chest pain.
**EENT:** blurred vision, eye pain.
**GI:** *nausea, vomiting, diarrhea.*
**GU:** vaginal pain, vaginitis, endometritis, ***uterine hyperstimulation, uterine rupture.***
**Musculoskeletal:** *nocturnal leg cramps,* backache, muscle cramps.
**Respiratory:** coughing, dyspnea.
**Skin:** rash, diaphoresis.

**Other:** *shivering, chills,* breast tenderness, hot flashes, ***fetal heart rate abnormality, premature rupture of membranes, fetal depression, fetal acidosis.***

## INTERACTIONS

**Drug-drug.** *Other oxytocics:* May increase action. Avoid using together.
**Drug-lifestyle.** *Alcohol use:* May inhibit effectiveness of drug with high doses. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Gel form contraindicated in patients hypersensitive to prostaglandins or constituents of gel; in those for whom prolonged uterine contractions are undesirable; in those with placenta previa or unexplained vaginal bleeding during pregnancy; and in those for whom vaginal delivery isn't indicated (because of vasa previa or active genital herpes).
- Suppository form contraindicated in patients hypersensitive to drug, in those with acute pelvic inflammatory disease, and in those with active cardiac, pulmonary, renal, or hepatic disease.
- Insert form contraindicated in patients hypersensitive to drug and in those with evidence of fetal distress when delivery isn't imminent, with unexplained vaginal bleeding during pregnancy, or with evidence of marked fetal cephalopelvic disproportion; also contraindicated when oxytocics are contraindicated, when prolonged uterine contraction may be detrimental to fetal safety or uterine integrity, when membranes have ruptured, when patient is already receiving an oxytocic, and when patient is multipara with six or more previous term pregnancies.
- Use gel form cautiously in patients with asthma or history of asthma, renal or hepatic dysfunction, ruptured membranes, glaucoma, or increased intraocular pressure.
- Use suppository form cautiously in patients with asthma, seizure disorders, anemia, diabetes, hypertension or hypotension, jaundice, scarred uterus, cervicitis, acute vaginitis, or CV, renal, or hepatic disease.

***Overdose S&S:*** Uterine hyperstimulation, fetal distress.

## NURSING CONSIDERATIONS

**Black Box Warning** Give drug only in a hospital where critical care and surgical facilities are available. ■

- Treat drug-induced fever with water sponging and increased fluid intake, not with aspirin.
- Check vaginal discharge regularly.
- Abortion should be complete within 30 hours when suppository form is used.

## PATIENT TEACHING

- Explain use and administration of drug to patient and family.
- Instruct patient to report adverse reactions promptly.

## diphenhydrAMINE hydrochloride

dye-fen-HYE-drah-meen

AllerMax ◇*, Altaryl Children's Allergy† ◇, Banophen ◇, Benadryl ◇, Ben-Tann ◇, Children's Pedia Care Nighttime Cough† ◇, Compoz Nighttime SleepAid ◇, Diphen AF ◇, Diphenhist ◇, Dormin ◇, 40 Winks ◇, Genahist ◇, Hydramine Cough ◇*, Midol PM ◇, Nytol ◇, Siladryl ◇*, Silphen ◇*, Simply Sleep ◇, Sleep-eze 3 ◇, Sleepinal ◇, Sleepwell 2-nite ◇, Sominex ◇, Snooze Fast ◇, Triaminic MultiSymptom ◇*, Tusstat*, Twilite ◇

*Therapeutic class:* Antihistamine
*Pharmacologic class:* Ethanolamine
*Pregnancy risk category B*

## AVAILABLE FORMS

*Capsules:* 25 mg ◇, 50 mg ◇
*Elixir:* 12.5 mg/5 ml ◇*
*Injection:* 50 mg/ml
*Strips (orally disintegrating):* 12.5 mg ◇*, 25 mg ◇*
*Syrup:* 12.5 mg/5 ml ◇*
*Tablets:* 25 mg ◇, 50 mg ◇
*Tablets (chewable):* 12.5 mg ◇

## INDICATIONS & DOSAGES

➤ **Rhinitis, allergy symptoms, motion sickness, Parkinson's disease**

*Adults and children age 12 and older:* 25 to 50 mg P.O. every 4 to 6 hours. Maximum, 300 mg P.O. daily. Or, 10 to 50 mg I.V. or deep I.M. Maximum I.V. or I.M. dosage, 400 mg daily.

*Children ages 6 to 11:* 12.5 to 25 mg P.O. every 4 to 6 hours. Maximum dose is 150 mg daily. Or, 5 mg/kg day divided into four doses P.O., deep I.M., or I.V. Maximum dose is 300 mg daily.

*Children ages 2 to 5:* 6.25 mg every 4 to 6 hours. Maximum dose is 37.5 mg daily. Or, 5 mg/kg day divided into four doses P.O., deep I.M., or I.V. Maximum dose is 300 mg daily.

➤ **Nighttime sleep aid**

*Adults:* 50 mg P.O. at bedtime.

➤ **Nonproductive cough**

*Adults and children age 12 and older:* 25 mg (syrup) P.O. every 4 hours. Don't exceed 150 mg daily. Or, 25 to 50 mg (liquid) every 4 hours. Don't exceed 300 mg daily.

*Children ages 6 to 11:* 12.5 mg (syrup) P.O. every 4 hours. Don't exceed 75 mg daily. Or, 12.5 to 25 mg (liquid) every 4 hours. Don't exceed 150 mg daily.

*Children ages 2 to 5:* 6.25 mg (syrup) P.O. every 4 hours. Don't exceed 25 mg daily.

## ADMINISTRATION

**P.O.**

● Give drug with food or milk to reduce GI distress.

**I.V.**

▼ Don't exceed 25 mg/minute.

▼ **Incompatibilities:** Allopurinol, amobarbital, amphotericin B, cefepime, dexamethasone, foscarnet, haloperidol lactate, pentobarbital, phenobarbital, phenytoin, thiopental.

**I.M.**

● Give I.M. injection deep into large muscle.

● Alternate injection sites to prevent irritation.

## ACTION

Competes with histamine for $H_1$-receptor sites. Prevents, but doesn't reverse, histamine-mediated responses, particularly those of the bronchial tubes, GI tract, uterus, and blood vessels. Structurally related to local anesthetics, drug provides local anesthesia and suppresses cough reflex.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 15 min | 1–4 hr | 6–8 hr |
| I.V. | Immediate | 1–4 hr | 6–8 hr |
| I.M. | Unknown | 1–4 hr | 6–8 hr |

*Half-life:* About 2½ to 9½ hours.

## ADVERSE REACTIONS

**CNS:** *drowsiness, sedation, sleepiness, dizziness, incoordination,* ***seizures,*** confusion, insomnia, headache, vertigo, fatigue, restlessness, tremor, nervousness.

**CV:** palpitations, hypotension, tachycardia.

**EENT:** diplopia, blurred vision, nasal congestion, tinnitus.

**GI:** *dry mouth, nausea, epigastric distress,* vomiting, diarrhea, constipation, anorexia.

**GU:** dysuria, urine retention, urinary frequency.

**Hematologic:** ***thrombocytopenia, agranulocytosis,*** hemolytic anemia.

**Respiratory:** *thickening of bronchial secretions.*

**Skin:** urticaria, photosensitivity, rash.

**Other:** ***anaphylactic shock.***

## INTERACTIONS

**Drug-drug.** *CNS depressants:* May increase sedation. Use together cautiously.

*MAO inhibitors:* May increase anticholinergic effects. Avoid using together.

*Other products that contain diphenhydramine (including topical therapy):* May increase risk of adverse reactions. Avoid using together.

**Drug-lifestyle.** *Alcohol use:* May increase CNS depression. Discourage use together.

*Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid extensive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

● May decrease hemoglobin level and hematocrit.

● May decrease granulocyte and platelet counts.

● May prevent, reduce, or mask positive result in diagnostic skin test.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug; newborns; premature neonates; breast-feeding women; patients with angle-closure glaucoma, stenosing peptic ulcer, symptomatic prostatic hyperplasia, bladder neck obstruction, or pyloroduodenal obstruction; and those having an acute asthmatic attack.
- Avoid use in patients taking MAO inhibitors.
- Use with caution in patients with prostatic hyperplasia, asthma, COPD, increased intraocular pressure, hyperthyroidism, CV disease, and hypertension.
- Children younger than age 12 should use drug only as directed by prescriber.

⚠ ***Overdose S&S:*** Dry mouth, fixed or dilated pupils, flushing, GI symptoms.

## NURSING CONSIDERATIONS

- Stop drug 4 days before diagnostic skin testing.
- Injection form is for I.V. or I.M. administration only.
- Dizziness, excessive sedation, syncope, toxicity, paradoxical stimulation, and hypotension are more likely to occur in elderly patients.
- ***Look alike–sound alike:*** Don't confuse diphenhydramine with dimenhydrinate; don't confuse Benadryl with Bentyl or benazepril.

## PATIENT TEACHING

- Warn patient not to take this drug with any other products that contain diphenhydramine (including topical therapy) because of increased adverse reactions.
- Instruct patient to take drug 30 minutes before travel to prevent motion sickness.
- Tell patient to take diphenhydramine with food or milk to reduce GI distress.
- Warn patient to avoid alcohol and hazardous activities that require alertness until CNS effects of drug are known.
- Inform patient that sugarless gum, hard candy, or ice chips may relieve dry mouth.
- Tell patient to notify prescriber if tolerance develops because a different antihistamine may need to be prescribed.
- Drug is in many OTC sleep and cold products. Advise patient to consult prescriber before using these products.
- Warn patient of possible photosensitivity reactions. Advise use of a sunblock.

# diphenoxylate hydrochloride and atropine sulfate

dye-fen-OKS-ul-ate and A-troe-peen

Logen, Lomanate, Lomotil*, Lonox

*Therapeutic class:* Antidiarrheal
*Pharmacologic class:* Opioid
*Pregnancy risk category C*
*Controlled substance schedule V*

## AVAILABLE FORMS

*Liquid:* 2.5 mg/5 ml (with atropine sulfate 0.025 mg/5 ml)*
*Tablets:* 2.5 mg (with atropine sulfate 0.025 mg)

## INDICATIONS & DOSAGES

➤ **Acute, nonspecific diarrhea**

*Adults and children older than age 12:* Initially, 5 mg P.O. q.i.d.; then adjust as needed. Maximum dosage 20 mg/day.
*Children ages 2 to 12:* 0.3 to 0.4 mg/kg liquid form P.O. daily in four divided doses. For maintenance, reduce dose when initial control of symptoms is achieved. Dosage may be reduced by as much as 75%. Maximum dosage 20 mg/day.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.

## ACTION

Probably increases smooth muscle tone in GI tract, inhibits motility and propulsion, and diminishes secretions.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 45–60 min | 3 hr | 3–4 hr |

*Half-life:* Diphenoxylate, 2½ hours; its major metabolite, diphenoxylic acid, 4½ hours; atropine, 2½ hours.

## ADVERSE REACTIONS

**CNS:** *dizziness*, *sedation*, confusion, depression, drowsiness, euphoria, headache, lethargy, malaise, numbness in limbs, restlessness.

**CV:** tachycardia.
**EENT:** blurred vision.
**GI:** *dry mouth,* ***pancreatitis,*** paralytic ileus, abdominal discomfort or distention, anorexia, fluid retention in bowel or megacolon, nausea, swollen gums, vomiting.
**GU:** urine retention.
**Respiratory:** ***respiratory depression.***
**Skin:** dry skin, pruritus, rash.
**Other:** ***anaphylaxis, angioedema,*** possible physical dependence with long-term use.

## INTERACTIONS

**Drug-drug.** *Barbiturates, CNS depressants, opioids, tranquilizers:* May enhance CNS depression. Monitor patient closely.
*MAO inhibitors:* May cause hypertensive crisis. Avoid using together.
**Drug-lifestyle.** *Alcohol use:* May enhance CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in children younger than age 2 and in patients hypersensitive to diphenoxylate or atropine, in those with obstructive jaundice, and with acute diarrhea resulting from poison, organisms that penetrate intestinal mucosa, or antibiotic-induced pseudomembranous enterocolitis.
- Use cautiously in children age 2 and older; in patients with hepatic disease, opioid dependence, or acute ulcerative colitis; and in pregnant women.

***Overdose S&S:*** Dry skin and mucous membranes, mydriasis, restlessness, flushing, hyperthermia, tachycardia, lethargy, coma, hypotonic reflexes, nystagmus, respiratory depression.

## NURSING CONSIDERATIONS

***Alert:*** Monitor fluid and electrolyte balance. Correct fluid and electrolyte disturbances before starting drug. Dehydration, especially in young children, may increase risk of delayed toxicity. Fluid retention in bowel or megacolon may occur with drug use and may mask depletion of extracellular fluid and electrolytes, especially in young children treated for acute gastroenteritis.

- Stop therapy immediately and notify prescriber if abdominal distention or other signs or symptoms of toxic megacolon develop.
- Don't use for antibiotic-induced diarrhea.
- Drug is unlikely to be effective if no response occurs within 48 hours.
- Risk of physical dependence increases with high dosage and long-term use. Atropine sulfate helps discourage abuse.
- Monitor for signs of overdose, which may include restlessness, flushing, hyperthermia, and tachycardia, initially, followed by lethargy, coma, pinpoint pupils, hypotonicity, and respiratory depression.
- ***Look alike–sound alike:*** Don't confuse Lomotil with Lamictal.

## PATIENT TEACHING

- Tell patient not to exceed recommended dosage.
- Warn patient not to use drug to treat acute diarrhea for longer than 2 days and to seek medical attention if diarrhea continues.
- Advise patient to avoid hazardous activities, such as driving, until CNS effects of drug are known.

# dipyridamole

dye-peer-IH-duh-mohl

Persantine

*Therapeutic class:* Antiplatelet
*Pharmacologic class:* Pyrimidine analogue
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 5 mg/ml in 2- and 10-ml vials
*Tablets:* 25 mg, 50 mg, 75 mg

## INDICATIONS & DOSAGES

➤ **To inhibit platelet adhesion in prosthetic heart valves (given together with warfarin)**
*Adults and children older than age 12:* 75 to 100 mg P.O. q.i.d.
➤ **Alternative to exercise in evaluation of coronary artery disease during thallium myocardial perfusion scintigraphy**

*Adults:* 0.57 mg/kg as an I.V. infusion at a constant rate over 4 minutes (0.142 mg/kg/minute).

## ADMINISTRATION

**P.O.**

- If GI distress develops, give drug 1 hour before meals or with meals.

**I.V.**

- For use as a diagnostic drug, dilute in half-normal or normal saline solution or $D_5W$ in at least a 1:2 ratio for a total volume of 20 to 50 ml.
- Inject thallium-201 within 5 minutes after completing the 4-minute dipyridamole infusion.
- Don't mix in same syringe or infusion container with other drugs.
- **Incompatibilities:** Other drugs.

## ACTION

May involve drug's ability to increase adenosine, which is a coronary vasodilator and platelet aggregation inhibitor.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 75 min | Unknown |
| I.V. | Unknown | 2 min | Unknown |

*Half-life:* 1 to 12 hours; alpha half-life of oral form, 40 minutes; beta half-life of oral form, 10 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness, headache.*
**CV:** *angina pectoris, chest pain,* ***ECG abnormalities,*** flushing.
**GI:** *nausea,* abdominal distress, diarrhea, vomiting.
**Skin:** rash, pruritus.

## INTERACTIONS

**Drug-drug.** *Adenosine:* May increase levels and cardiac effects of adenosine. Adjust adenosine dose as needed.
*Cholinesterase inhibitors:* May counteract anticholinesterase effects and aggravate myasthenia gravis. Monitor patient.
*Heparin:* May increase risk of bleeding. Monitor patient closely.
*Theophylline, other xanthine derivatives:* May prevent coronary vasodilation by I.V. dipyridamole, causing a false-negative thallium-imaging result. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

- May increase liver enzyme levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with hypotension and those with severe coronary artery disease.

***Overdose S&S:*** Hypotension, warm feeling, flushes, sweating, restlessness, weakness, dizziness, tachycardia.

## NURSING CONSIDERATIONS

- Observe for adverse reactions, especially with large doses. Monitor blood pressure.
- Observe for signs and symptoms of bleeding; note prolonged bleeding time (especially with large doses or long-term therapy).
- The value of drug as part of an antithrombotic regimen is controversial; its use may not provide significantly better results than aspirin alone.
- Dipyridamole injection may contain tartrazine, which may cause allergic reactions in some patients.
- ***Look alike–sound alike:*** Don't confuse dipyridamole with disopyramide. Don't confuse Persantine with Periactin or Bosentan.

## PATIENT TEACHING

- Instruct patient to take drug exactly as prescribed.
- Tell patient to report adverse reactions promptly.
- Tell patient receiving drug I.V. to report discomfort at insertion site.

# disulfiram

dye-SUL-fi-ram

Antabuse

*Therapeutic class:* Alcohol deterrent
*Pharmacologic class:* Aldehyde dehydrogenase inhibitor
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 250 mg, 500 mg

## INDICATIONS & DOSAGES

➤ **Adjunct to management of alcohol abstinence**

*Adults:* 250 to 500 mg P.O. as single dose in morning for 1 to 2 weeks or in evening if drowsiness occurs. Maintenance dosage is 125 to 500 mg P.O. daily (average 250 mg) until permanent self-control is established. Treatment may continue for months or years.

## ADMINISTRATION

**P.O.**

***Alert:*** Never give until patient has abstained from alcohol for at least 12 hours. He should clearly understand consequences of drug and give permission for its use. Use drug only in patients who are cooperative, well motivated, and receiving supportive psychiatric therapy.

## ACTION

Blocks oxidation of alcohol at the acetaldehyde stage. Excess acetaldehyde produces a highly unpleasant reaction in the presence of even small amounts of alcohol.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1–2 hr | Unknown | 14 days |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** drowsiness, headache, fatigue, delirium, depression, neuritis, peripheral neuritis, polyneuritis, restlessness, psychotic reactions.
**EENT:** optic neuritis.
**GI:** metallic or garlicky aftertaste.
**GU:** impotence.
**Skin:** acneiform or allergic dermatitis, occasional eruptions.
**Other:** ***disulfiram reaction precipitated by alcohol use.***

## INTERACTIONS

**Drug-drug.** *Barbiturates:* May prolong duration of barbiturate effect. Closely monitor patient.
*CNS depressants:* May increase CNS depression. Use together cautiously.
*Coumarin anticoagulants:* May increase anticoagulant effect. Adjust dosage of anticoagulant.
*Isoniazid:* May cause ataxia or marked change in behavior. Avoid using together.
*Metronidazole:* May cause psychotic reaction. Avoid using together.
*Midazolam:* May increase midazolam level. Use together cautiously.
*Paraldehyde:* May cause toxic level of acetaldehyde. Avoid using together.
*Phenytoin:* May increase toxic effect of phenytoin. Monitor phenytoin level closely, and adjust dose as necessary.
*Tricyclic antidepressants, especially amitriptyline:* May cause transient delirium. Closely monitor patient.
**Drug-herb.** *Herbal preparations containing alcohol:* May cause disulfiram reaction. Warn patient against using together. Alcohol reaction may occur as long as 2 weeks after single drug dose.
**Drug-food.** *Caffeine:* May increase elimination half-life of caffeine. Tell patient to watch for effects.
**Drug-lifestyle.** *Alcohol use:* May cause disulfiram reaction including flushing, tachycardia, bronchospasm, sweating, nausea and vomiting, or death. Warn patient not to use products containing alcohol, including back rub preparations, cough syrups, liniments, and shaving lotion, or to drink alcoholic beverages.

## EFFECTS ON LAB TEST RESULTS

- May increase cholesterol level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other thiram derivatives used in pesticides and rubber vulcanization; in those with psychoses, myocardial disease, or coronary occlusion; in those receiving metronidazole, paraldehyde, alcohol, or alcohol-containing products; and in those experiencing alcohol intoxication or who have ingested alcohol in preceding 12 hours.
- Don't give drug during pregnancy.
- Use with caution in patients also receiving phenytoin therapy and in those with diabetes mellitus, hypothyroidism, seizure disorder, cerebral damage, nephritis, or hepatic cirrhosis or insufficiency.

## NURSING CONSIDERATIONS

**Black Box Warning** Never give drug to a patient when in a state of alcohol intoxication, or without his full knowledge. ■

- Perform complete physical examination and laboratory studies, including CBC, SMA-12, and transaminase level, before therapy and repeat regularly.
- Disulfiram reaction may result from alcohol use, with flushing, throbbing headache, dyspnea, nausea, copious vomiting, diaphoresis, thirst, chest pain, palpitations, hyperventilation, hypotension, syncope, anxiety, weakness, blurred vision, confusion, and arthropathy.

***Alert:*** A severe disulfiram reaction can cause respiratory depression, CV collapse, arrhythmias, MI, acute heart failure, seizures, unconsciousness, and death.

- The longer the patient remains on the drug, the more sensitive he becomes to alcohol.
- ***Look alike–sound alike:*** Don't confuse Antabuse with Anturane.

## PATIENT TEACHING

**Black Box Warning** Caution patient's family that drug should never be given to patient without his knowledge; severe reaction or death could result if patient drinks alcohol. ■

- Tell patient to carry medical identification that identifies him as a disulfiram user.
- Mild reactions may occur in sensitive patient with blood alcohol levels of 5 to 10 mg/dl; symptoms are fully developed at 50 mg/dl; unconsciousness typically occurs at 125 to 150 mg/dl level. Reaction may last from 30 minutes to several hours or as long as alcohol remains in blood.
- Reassure patient that drug-induced adverse reactions (unrelated to alcohol use), such as drowsiness, fatigue, impotence, headache, peripheral neuritis, and metallic or garlic taste, subside after about 2 weeks of therapy.
- Advise patient not to drink alcoholic beverages or use products containing alcohol, including topical preparations and mouthwash.
- Have patient verify content of OTC products with pharmacist before use.

**SAFETY ALERT!**

# DOBUTamine hydrochloride

DOE-byoo-ta-meen

*Therapeutic class:* Inotrope
*Pharmacologic class:* Adrenergic, beta$_1$ agonist
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 12.5 mg/ml in 20-ml vials (parenteral)
*Dobutamine in 5% dextrose:* 0.5 mg/ml (125 or 250 mg); 1 mg/ml (250 or 500 mg); 2 mg/ml (500 mg); 4 mg/ml (1,000 mg)

## INDICATIONS & DOSAGES

➤ **Increased cardiac output in short-term treatment of cardiac decompensation caused by depressed contractility, such as during refractory heart failure; adjunctive therapy in cardiac surgery**

*Adults and children:* 0.5 to 1 mcg/kg/minute I.V. infusion, titrating to optimum dosage of 2 to 20 mcg/kg/minute. Usual effective range to increase cardiac output is 2.5 to 10 mcg/kg/minute. Rarely, rates up to 40 mcg/kg/minute may be needed.

## ADMINISTRATION

**I.V.**

▼ Before starting therapy, give a plasma volume expander to correct hypovolemia and a cardiac glycoside.

▼ Dilute concentrate before injecting. Compatible solutions include $D_5W$, $D_{10}W$, half-normal or normal saline solution for injection, lactated Ringer's injection, Isolyte-M with $D_5W$, Normosol-M in $D_5W$, and 20% Osmitrol.

▼ Diluting one vial (250 mg) with 1,000 ml of solution yields 250 mcg/ml. Diluting with 500 ml yields 500 mcg/ml. Diluting with 250 ml yields 1,000 mcg/ml.

▼ Oxidation may slightly discolor admixture. This doesn't indicate a significant loss of potency, provided drug is used within 24 hours of reconstitution.

▼ Give through a central venous catheter or large peripheral vein using an infusion pump.

▼ Titrate rate according to patient's condition. Don't exceed 5 mg/ml.
▼ Infusions lasting up to 72 hours produce no more adverse effects than shorter infusions.
▼ Watch for irritation and infiltration; extravasation can cause tissue damage and necrosis. Change I.V. sites regularly to avoid phlebitis.
▼ Solution remains stable for 24 hours. Don't freeze.
▼ **Incompatibilities:** Acyclovir, alkaline solutions, alteplase, aminophylline, bretylium, bumetanide, calcium chloride, calcium gluconate, cefamandole, cefazolin, cefepime, diazepam, digoxin, ethacrynate, furosemide, heparin, hydrocortisone sodium succinate, indomethacin, insulin, magnesium sulfate, midazolam, penicillin, phenytoin, phytonadione, piperacillin with tazobactam, potassium chloride, sodium bicarbonate, thiopental, verapamil, warfarin. Don't give through same line with other drugs.

## ACTION

Stimulates heart's beta$_1$ receptors to increase myocardial contractility and stroke volume. At therapeutic dosages, drug increases cardiac output by decreasing peripheral vascular resistance, reducing ventricular filling pressure, and facilitating AV node conduction.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 1–2 min | 10 min | <5 min after infusion |

*Half-life:* 2 minutes.

## ADVERSE REACTIONS

**CNS:** headache.
**CV:** *hypertension, increased heart rate,* angina, PVCs, phlebitis, nonspecific chest pain, palpitations, ventricular ectopy, hypotension.
**GI:** nausea, vomiting.
**Respiratory:** ***asthma attack,*** shortness of breath.
**Other:** ***anaphylaxis,*** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Beta blockers:* May antagonize dobutamine effects. Avoid using together.
*Bretylium:* May increase risk of arrhythmias. Monitor ECG.
*General anesthetics:* May have greater risk of ventricular arrhythmias. Monitor ECG closely.
*Guanethidine, oxytocic drugs:* May increase pressor response, causing severe hypertension. Monitor blood pressure closely.
***Tricyclic antidepressants:*** May potentiate pressor response and cause arrhythmias. Use together cautiously.
**Drug-herb.** *Rue:* May increase inotropic potential. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May decrease potassium level.
- May decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those with idiopathic hypertrophic subaortic stenosis.
- Use cautiously in patients with history of hypertension because drug may increase pressor response.
- Use cautiously after acute MI.
- Use cautiously in patients with history of sulfite sensitivity.

***Overdose S&S:*** Anorexia, nausea, vomiting, tremor, anxiety, palpitations, headache, shortness of breath, anginal and nonspecific chest pain, hypertension, tachyarrhythmias, myocardial ischemia, ventricular fibrillation, hypotension.

## NURSING CONSIDERATIONS

***Alert:*** Because drug increases AV node conduction, patients with atrial fibrillation may develop a rapid ventricular rate.
- Continuously monitor ECG, blood pressure, pulmonary artery wedge pressure, cardiac output, and urine output.
- Monitor electrolyte levels. Drug may lower potassium level.
- ***Look alike–sound alike:*** Don't confuse dobutamine with dopamine.

## PATIENT TEACHING

- Tell patient to report adverse reactions promptly, especially labored breathing and drug-induced headache.
- Instruct patient to report discomfort at I.V. insertion site.

**SAFETY ALERT!**

# docetaxel

dohs-eh-TAX-ell

Taxotere

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Taxoid
*Pregnancy risk category D*

## AVAILABLE FORMS

*Injection:* 20 mg, 80 mg, in single-dose vials

## INDICATIONS & DOSAGES

➤ **Locally advanced or metastatic breast cancer after failure of previous chemotherapy**

*Adults:* 60 to 100 mg/m$^2$ I.V. over 1 hour every 3 weeks.

***Adjust-a-dose:*** In patients receiving 100 mg/m$^2$ who experience febrile neutropenia, neutrophil count of less than 500/mm$^3$ for longer than 1 week, severe or cumulative cutaneous reactions, or severe peripheral neuropathy, reduce subsequent dose by 25%, to 75 mg/m$^2$. In patients who continue to experience reactions with decreased dose, either decrease it further to 55 mg/m$^2$ or stop drug.

➤ **Adjuvant postsurgery treatment of operable, node-positive breast cancer**

*Adults:* 75 mg/m$^2$ I.V. as a 1-hour infusion given 1 hour after doxorubicin 50 mg/m$^2$ and cyclophosphamide 500 mg/m$^2$ every 3 weeks for six cycles.

***Adjust-a-dose:*** Patients who experience febrile neutropenia should receive granulocyte colony-stimulating factor (G-CSF) in all subsequent cycles. If febrile neutropenia doesn't resolve, continue G-CSF and reduce docetaxel dose to 60 mg/m$^2$. For patients who experience severe or cumulative cutaneous reactions or moderate neurosensory signs and symptoms, reduce dose to 60 mg/m$^2$. If these reactions persist at the reduced dosage, stop treatment.

➤ **Locally advanced or metastatic non–small-cell lung cancer after failure of previous cisplatin-based chemotherapy**

*Adults:* 75 mg/m$^2$ I.V. over 1 hour every 3 weeks.

***Adjust-a-dose:*** In patients who experience febrile neutropenia, neutrophil count of less than 500/mm$^3$ for longer than 1 week, severe or cumulative cutaneous reactions, or other grade 3 or 4 nonhematologic toxicities, withhold drug until toxicity resolves; then restart at 55 mg/m$^2$. In patients in whom grade 3 peripheral neuropathy or above develops, stop drug.

➤ **With cisplatin, unresectable, locally advanced, or metastatic non–small-cell lung cancer not previously treated with chemotherapy**

*Adults:* 75 mg/m$^2$ docetaxel I.V. over 1 hour, immediately followed by cisplatin 75 mg/m$^2$ I.V. over 30 to 60 minutes every 3 weeks.

***Adjust-a-dose:*** In patients whose lowest platelet count during the previous course of therapy was less than 25,000/mm$^3$, and those with febrile neutropenia or serious nonhematologic toxicities, decrease docetaxel dosage to 65 mg/m$^2$. For patients who require a further dosage reduction, a dosage of 50 mg/m$^2$ is recommended. For cisplatin dosage adjustments, see manufacturers' prescribing information.

➤ **Androgen-independent metastatic prostate cancer, with prednisone**

*Adults:* 75 mg/m$^2$ I.V., as a 1-hour infusion every 3 weeks, given with 5 mg prednisone P.O. b.i.d. continuously. Premedicate with dexamethasone 8 mg P.O. at 12 hours, 3 hours, and 1 hour before docetaxel infusion.

***Adjust-a-dose:*** In patients who experience febrile neutropenia, neutrophil count less than 500/mm$^3$ for more than 1 week, severe or cumulative cutaneous reactions, or moderate neurosensory signs or symptoms, reduce subsequent dose to 60 mg/m$^2$. In patients who continue to experience reactions with the decreased dose, stop treatment.

➤ **Advanced gastric adenocarcinoma, in combination with cisplatin and fluorouracil (5-FU)**

*Adults:* Premedicate with antiemetics and hydration per cisplatin recommendations. Give 75 mg/m$^2$ docetaxel I.V. over 1 hour, followed by cisplatin 75 mg/m$^2$ I.V. over 1 to 3 hours both on day 1 only, then, fluorouracil 750 mg/m$^2$ I.V. daily as a 24-hour continuous infusion for 5 days beginning at

the end of cisplatin infusion. Repeat cycle every 3 weeks.

***Adjust-a-dose:*** Patients who experience febrile neutropenia should receive G-CSF in subsequent cycles. If episode recurs, reduce dose to 60 mg/m$^2$. If subsequent episodes of complicated neutropenia occur, reduce dose to 45 mg/m$^2$. In patients who experience grade 4 thrombocytopenia, reduce dosage to 60 mg/m$^2$. Don't retreat until neutrophils are greater than 1,500/mm$^3$ and platelets are greater than 100,000/mm$^3$. Stop treatment if toxicity persists.

For patients who experience diarrhea, adjust dosage as follows: for first episode of grade 3 diarrhea, reduce 5-FU dose by 20%; for second episode, reduce docetaxel dose by 20%; for first episode of grade 4 diarrhea, reduce docetaxel and 5-FU doses by 20%; for second episode, stop drug.

For patients who experience stomatitis, adjust dosage as follows: For first episode of grade 3, reduce 5-FU dose by 20%; second episode, stop 5-FU in subsequent cycles; third episode, reduce docetaxel dose by 20%. For first episode of grade 4, stop 5-FU in subsequent cycles; second episode, reduce docetaxel dose by 20%.

For patients who experience liver dysfunction, reduce docetaxel dose by 20%. If AST or ALT is greater than five times upper limit of normal (ULN) or alkaline phosphatase is greater than five times ULN, stop treatment.

➤ **Induction treatment of inoperable locally advanced squamous cell cancer of the head and neck (SCCHN), with cisplatin and 5-FU**

*Adults:* 75 mg/m$^2$ I.V. infusion over 1 hour, followed by cisplatin 75 mg/m$^2$ I.V. infusion over 1 hour, on day 1, followed by 5-FU 750 mg/m$^2$ daily as a continuous I.V. infusion for 5 days. Repeat this regimen every 3 weeks for four cycles. After chemotherapy, patients should receive radiotherapy. Premedicate with antiemetics and appropriate hydration before and after giving cisplatin.

***Adjust-a-dose:*** Use the same dosage adjustment schedule as for advanced gastric adenocarcinoma.

➤ **Induction treatment for locally advanced SCCHN with cisplatin and 5-FU before chemoradiotherapy**

*Adults:* 75 mg/m$^2$ I.V. infusion over 1 hour, followed by cisplatin 100 mg/m$^2$ I.V. infusion over 30 minutes to 3 hours on day 1, followed by 5-FU 1,000 mg/m$^2$ daily as a continuous I.V. infusion from day 1 to day 4. Repeat this regimen every 3 weeks for three cycles. After chemotherapy, patients should receive chemoradiotherapy. Premedicate with antiemetics and oral corticosteroids.

***Adjust-a-dose:*** Use the same dosage adjustment schedule as for advanced gastric adenocarcinoma.

## ADMINISTRATION

### I.V.

▼ Wear gloves to prepare and give drug. If solution contacts skin, wash immediately and thoroughly with soap and water. If solution contacts mucous membranes, flush thoroughly with water.

▼ Dilute using supplied diluent. Let drug and diluent stand at room temperature for 5 minutes before mixing. After adding all the diluent to drug vial, gently rotate vial for about 45 seconds. Let solution stand for a few minutes so foam dissipates. All foam need not dissipate before preparing infusion solution.

▼ Prepare infusion solution by withdrawing needed amount of premixed solution from vial and injecting it into 250 ml normal saline solution or $D_5W$ to yield 0.3 to 0.74 mg/ml. Doses of more than 200 mg need a larger volume to stay below 0.74 mg/ml of drug. Mix infusion thoroughly by manual rotation.

▼ Prepare and store infusion solution in bottles (glass or polypropylene) or plastic bags, and give through polyethylene-lined administration sets.

▼ Contact between undiluted concentrate and polyvinyl chloride equipment or devices isn't recommended.

▼ If solution isn't clear or if it contains precipitate, discard.

▼ The first dilution is stable for 8 hours. Use infusion solution within 4 hours.

▼ Infuse over 1 hour.

▼ Store unopened vials between 2° and 25° (36° and 77° F).

▼ Mark all waste materials with CHEMOTHERAPY HAZARD labels.

▼ **Incompatibilities:** None reported.

## ACTION

Promotes formation and stabilization of nonfunctional microtubules. This prevents mitosis and leads to cell death.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Rapid | Unknown | Unknown |

*Half-life:* Alpha phase, 4 minutes; beta phase, 36 minutes; terminal phase, 11 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia*, paresthesia, peripheral neuropathy.
**CV:** *fluid retention, peripheral edema,* ***arrhythmias,*** chest tightness, flushing, hypotension.
**EENT:** altered hearing, tearing.
**GI:** *anorexia, diarrhea, dysphagia, esophagitis, nausea, stomatitis, vomiting.*
**Hematologic:** **FEBRILE NEUTROPENIA, LEUKOPENIA, MYELOSUPPRESSION, NEUTROPENIA, THROMBOCYTOPENIA,** *anemia.*
**Hepatic:** ***hepatotoxicity.***
**Musculoskeletal:** *myalgia*, arthralgia, back pain.
**Respiratory:** dyspnea, ***pulmonary edema.***
**Skin:** *alopecia*, desquamation, skin eruptions, nail pigmentation alterations, nail pain, rash, reaction at injection site.
**Other:** *infection*, chills, drug fever, hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Compounds that induce, inhibit, or are metabolized by CYP3A4, such as cyclosporine, erythromycin, ketoconazole, troleandomycin:* May modify metabolism of docetaxel. Use together cautiously.
***Ketoconazole or other CYP3A4 inhibitors:*** May increase docetaxel level and toxicity, including neutropenia. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, and bilirubin levels. May decrease hemoglobin level.
- May decrease platelet and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients severely hypersensitive to drug or to other forms containing polysorbate 80 and in those with neutrophil count below 1,500/$mm^3$.

**Black Box Warning** Patients with severe hepatic impairment shouldn't receive this drug. Don't give drug to patients with bilirubin levels exceeding ULN, or those with ALT or AST levels above 1½ times ULN and alkaline phosphatase levels above 2½ times ULN. ▮

- Safety and effectiveness in children haven't been established.

***Overdose S&S:*** Severe neutropenia, mild asthenia, cutaneous reactions, mild paresthesia, bone marrow suppression, peripheral neurotoxicity, mucositis.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug should be administered only under the supervision of a physician experienced with antineoplastics. ▮

- Give oral corticosteroid such as dexamethasone 16 mg P.O. (8 mg b.i.d.) daily for 3 days, starting 1 day before docetaxel administration, to reduce risk or severity of fluid retention and hypersensitivity reactions.

**Black Box Warning** Don't give drug to patients with baseline neutrophil count less than 1,500/$mm^3$. ▮

- Bone marrow toxicity is the most frequent and dose-limiting toxicity. Frequent blood count monitoring is needed during therapy.

**Black Box Warning** Monitor patient closely for hypersensitivity reactions, especially during first and second infusions. Severe and even fatal reactions have occurred in patients who have received recommended 3-day dexamethasone premedication. ▮

**Black Box Warning** Fluid retention is dose related and may be severe. Monitor patient closely. ▮

***Alert:*** When indicated, cisplatin dose should follow dose of docetaxel.

- ***Look alike–sound alike:*** Don't confuse Taxotere with Taxol.

## PATIENT TEACHING

- Caution women of childbearing age to avoid pregnancy or breast-feeding during therapy.
- Remind patient that he will need premedication with dexamethasone.

- Advise patient to report any pain or burning at injection site during or after administration.
- Warn patient that hair loss occurs in almost 80% of patients and reverses when treatment stops.
- Tell patient to promptly report sore throat, fever, or unusual bruising or bleeding, as well as signs and symptoms of fluid retention, such as swelling or shortness of breath.

## docusate calcium (dioctyl calcium sulfosuccinate)

DOK-yoo-sayt

DC Softgels ◇, Surfak ◇

## docusate sodium (dioctyl sodium sulfosuccinate)

Colace ◇, Diocto ◇, Dioctyn ◇, D.O.S ◇, D-S-S ◇, Dulcolax Stool Softener ◇, Ex-Lax Stool Softener Caplets ◇, Phillips' Liqui-Gels ◇, Regulax SS ◇, Selax† ◇, Soflax† ◇

*Therapeutic class:* Laxative
*Pharmacologic class:* Surfactant
*Pregnancy risk category C*

### AVAILABLE FORMS

**docusate calcium**
*Capsules:* 240 mg ◇
**docusate sodium**
*Capsules:* 50 mg ◇, 100 mg ◇, 240 mg ◇, 250 mg ◇
*Oral liquid:* 150 mg/15 ml ◇
*Oral solution:* 10 mg/ml ◇, 50 mg/ml ◇
*Rectal suspension:* 283 mg/4 ml ◇
*Syrup:* 20 mg/5 ml, 50 mg/15 ml ◇, 60 mg/15 ml ◇
*Tablets:* 50 mg ◇, 100 mg ◇

### INDICATIONS & DOSAGES

➤ **Stool softener**

*Adults and children older than age 12:* 50 to 300 mg docusate calcium or sodium P.O. daily until bowel movements are normal. Or, give enema. Administer contents of 1 bottle P.R. as a single dose.
*Children ages 2 to 12:* 50 to 150 mg docusate sodium P.O. daily.
*Children younger than age 2:* 25 mg docusate sodium P.O. daily.

### ADMINISTRATION

**P.O.**
- Give liquid (not syrups) in milk, fruit juice, or infant formula to mask bitter taste.
- Store drug at 59° to 86° F (15° to 30° C), and protect liquid from light.

**Rectal**
- Follow instructions accompanying rectal suspension.

### ACTION

Stool softener that reduces surface tension of interfacing liquid contents of the bowel. This detergent activity promotes incorporation of additional liquid into stools, thus forming a softer mass.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1–3 days | Unknown | Unknown |
| P.R. | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**GI:** bitter taste, mild abdominal cramping, diarrhea.
**Other:** laxative dependence with long-term or excessive use.

### INTERACTIONS

**Drug-drug.** *Mineral oil:* May increase mineral oil absorption and cause toxicity and lipid pneumonia. Separate doses.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with intestinal obstruction or signs and symptoms of appendicitis, fecal impaction, or acute surgical abdomen, such as undiagnosed abdominal pain or vomiting.

### NURSING CONSIDERATIONS

- Drug isn't used to treat existing constipation but prevents constipation from developing.

- Before giving drug, determine whether patient has adequate fluid intake, exercise, and diet.
- Drug is laxative of choice for patients who shouldn't strain during defecation, including patients recovering from MI or rectal surgery, those with rectal or anal disease that makes passage of firm stools difficult, and those with postpartum constipation.

### PATIENT TEACHING

- Teach patient about dietary sources of fiber, including bran and other cereals, fresh fruit, and vegetables.
- Instruct patient to use drug only occasionally and not for longer than 1 week without prescriber's knowledge.
- Tell patient to stop drug and notify prescriber if severe cramping occurs.
- Notify patient that it may take from 1 to 3 days to soften stools.

## dofetilide

doe-FE-ti-lyed

Tikosyn

*Therapeutic class:* Antiarrhythmic
*Pharmacologic class:* Antiarrhythmic
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules:* 125 mcg, 250 mcg, 500 mcg

### INDICATIONS & DOSAGES

➤ **To maintain normal sinus rhythm in patients with symptomatic atrial fibrillation or atrial flutter lasting longer than 1 week who have been converted to normal sinus rhythm; to convert atrial fibrillation and atrial flutter to normal sinus rhythm**

*Adults:* Individualized dosage based on creatinine clearance and baseline QTc interval (or QT interval if heart rate is below 60 beats/minute), determined before first dose; usually 500 mcg P.O. b.i.d. for patients with creatinine clearance greater than 60 ml/minute.

***Adjust-a-dose:*** If creatinine clearance is 40 to 60 ml/minute, starting dose is 250 mcg P.O. b.i.d.; if clearance is 20 to 39 ml/minute, starting dose is 125 mcg P.O. b.i.d. Don't use drug at all if clearance is less than 20 ml/minute.

Determine QTc interval 2 to 3 hours after first dose. If QTc interval has increased by more than 15% above baseline or if it's more than 500 msec (550 msec in patients with ventricular conduction abnormalities), adjust dosage as follows: If starting dose based on creatinine clearance was 500 mcg P.O. b.i.d., give 250 mcg P.O. b.i.d. If starting dose based on clearance was 250 mcg b.i.d., give 125 mcg b.i.d. If starting dose based on clearance was 125 mcg b.i.d., give 125 mcg once a day.

Determine QTc interval 2 to 3 hours after each subsequent dose while patient is in hospital. If at any time after second dose the QTc interval exceeds 500 msec (550 msec in patients with ventricular conduction abnormalities), stop drug.

### ADMINISTRATION

**P.O.**

- Give drug without regard for food or antacid administration.
- Don't give drug with grapefruit juice.

### ACTION

Prolongs repolarization without affecting conduction velocity. Drug doesn't affect sodium channels, alpha-adrenergic receptors, or beta-adrenergic receptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–3 hr | Unknown |

*Half-life:* 10 hours.

### ADVERSE REACTIONS

**CNS:** *headache*, ***stroke,*** dizziness, insomnia, anxiety, migraine, cerebral ischemia, asthenia, paresthesia, syncope.
**CV:** *chest pain*, ***ventricular fibrillation, ventricular tachycardia, torsades de pointes, AV block, heart block, bradycardia, cardiac arrest, MI,*** bundle-branch block, angina, atrial fibrillation, hypertension, palpitations, edema.
**GI:** nausea, diarrhea, abdominal pain.
**GU:** UTI.
**Hepatic:** liver damage.
**Musculoskeletal:** back pain, arthralgia, facial paralysis.

**Respiratory:** respiratory tract infection, dyspnea, increased cough.
**Skin:** rash, sweating.
**Other:** ***angioedema,*** flu syndrome, peripheral edema.

## INTERACTIONS

**Drug-drug.** *Antiarrhythmics (classes I and III):* May increase dofetilide level. Withhold other antiarrhythmics for at least three plasma half-lives before giving dofetilide.
*Drugs secreted by renal tubular cationic transport (amiloride, metformin, triamterene):* May increase dofetilide level. Use together cautiously; monitor patient for adverse effects.
*Drugs that prolong QT interval:* May increase risk of QT interval prolongation. Avoid using together.
*Inhibitors of CYP3A4 including amiodarone,* ***azole antifungals****, cannabinoids, diltiazem,* ***macrolides****, nefazodone, norfloxacin, protease inhibitors, quinine, SSRIs, zafirlukast:* May decrease metabolism and increase dofetilide level. Use together cautiously.
***Inhibitors of renal cationic secretion (cimetidine, ketoconazole, megestrol, prochlorperazine, trimethoprim with or without sulfamethoxazole), verapamil:*** May increase dofetilide level. Use together is contraindicated.
*Potassium-depleting diuretics:* May increase risk of hypokalemia or hypomagnesemia. Monitor potassium and magnesium levels.
***Thiazide diuretics:*** May cause hypokalemia and arrhythmias. Use together is contraindicated.
**Drug-food.** *Grapefruit juice:* May decrease hepatic metabolism and increase drug level. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, in those with congenital or acquired long QT interval syndromes or with baseline QTc interval greater than 440 msec (500 msec in patients with ventricular conduction abnormalities), and in those with creatinine clearance less than 20 ml/minute.
- Contraindicated for use with thiazide diuretics, verapamil, and cation transport system inhibitors (cimetidine, ketoconazole, megestrol, prochlorperazine, trimethoprim with or without sulfamethoxazole).
- Use cautiously in patients with severe hepatic impairment.

***Overdose S&S:*** Prolonged QT interval, ventricular fibrillation, torsades de pointes, cardiac arrest.

## NURSING CONSIDERATIONS

**Black Box Warning** When dofetilide is initiated or reinitiated, patients should be hospitalized for a minimum of 3 days in a facility that can provide calculations of creatinine clearance, continuous electrocardiographic monitoring, and cardiac resuscitation. Dofetilide is available only to hospitals and prescribers who have received appropriate dofetilide dosing and treatment initiation education. ■

- Don't discharge patient within 12 hours of conversion to normal sinus rhythm.
- Monitor patient for prolonged diarrhea, sweating, and vomiting. Report these signs to prescriber because electrolyte imbalance may increase potential for arrhythmia development.
- Monitor renal function and QTc interval every 3 months.
- Use of potassium-depleting diuretics may cause hypokalemia and hypomagnesemia, increasing the risk of torsades de pointes. Give dofetilide after potassium level reaches and stays in normal range.
- If patient doesn't convert to normal sinus rhythm within 24 hours of starting dofetilide, consider electrical conversion.
- Before starting dofetilide, stop previous antiarrhythmics while carefully monitoring patient for a minimum of three plasma half-lives. Don't give drug after amiodarone therapy until amiodarone level falls below 0.3 mcg/ml or until amiodarone has been stopped for at least 3 months.
- If dofetilide must be stopped to allow dosing with interacting drugs, allow at least 2 days before starting other drug therapy.

## PATIENT TEACHING

- Tell patient to report any change in OTC or prescription drug use, or supplement or herb use.
- Inform patient that drug can be taken without regard to meals or antacid administration.
- Tell patient to immediately report excessive or prolonged diarrhea, sweating, vomiting, or loss of appetite or thirst.
- Advise patient not to take drug with grapefruit juice.
- Advise patient to use antacids, such as Zantac 75 mg, Pepcid, Prilosec, Axid, or Prevacid, instead of Tagamet HB if needed for ulcers or heartburn.
- Instruct patient to tell prescriber if she becomes pregnant.
- Advise patient not to breast-feed while taking dofetilide because drug appears in breast milk.
- If a dose is missed, tell patient not to double a dose but to skip that dose and take the next regularly scheduled dose.

# dolasetron mesylate

doe-LAZ-e-tron

Anzemet

*Therapeutic class:* Antiemetic
*Pharmacologic class:* Selective serotonin ($5\text{-}HT_3$) receptor antagonist
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 20 mg/ml
*Tablets:* 50 mg, 100 mg

## INDICATIONS & DOSAGES

➤ **To prevent nausea and vomiting from cancer chemotherapy**

*Adults:* 100 mg P.O. given as a single dose 1 hour before chemotherapy. Or, 1.8 mg/kg or a fixed dose of 100 mg as a single I.V. dose given 30 minutes before chemotherapy.
*Children ages 2 to 16:* 1.8 mg/kg P.O. given 1 hour before chemotherapy. Or, 1.8 mg/kg as a single I.V. dose given 30 minutes before chemotherapy. Injectable formulation can be mixed with apple juice and given P.O. Maximum dose is 100 mg.

➤ **To prevent postoperative nausea and vomiting**

*Adults:* 100 mg P.O. within 2 hours before surgery. Or, 12.5 mg as a single I.V. dose about 15 minutes before cessation of anesthesia or as soon as nausea or vomiting presents.
*Children ages 2 to 16:* 1.2 mg/kg P.O. given within 2 hours before surgery, to maximum of 100 mg. Or, 0.35 mg/kg, up to 12.5 mg given as a single I.V. dose about 15 minutes before stopping anesthesia or as soon as nausea or vomiting starts. I.V. form can be mixed with apple juice and given P.O.

➤ **Postoperative nausea and vomiting**

*Adults:* 12.5 mg as a single I.V. dose as soon as nausea or vomiting occurs.
*Children ages 2 to 16:* 0.35 mg/kg, to maximum dosage of 12.5 mg, given as a single I.V. dose as soon as nausea or vomiting occurs.

## ADMINISTRATION

**P.O.**

- Mix injection for oral use in apple or apple-grape juice immediately before giving.
- Injection for oral use is stable in juice for 2 hours at room temperature.

**I.V.**

- ▼ Drug can be injected as rapidly as 100 mg over 30 seconds or diluted in 50 ml of compatible solution and infused over 15 minutes.
- ▼ **Incompatibilities:** Other I.V. drugs.

## ACTION

Blocks the action of serotonin and prevents serotonin from stimulating the vomiting reflex.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 1 hr | 8 hr |
| I.V. | Rapid | 36 min | 7 hr |

*Half-life:* 8 hours.

## ADVERSE REACTIONS

**CNS:** *headache*, dizziness, drowsiness, fatigue, fever.
**CV:** ***arrhythmias,*** ECG changes, edema, hypertension, hypotension, tachycardia.
**GI:** *diarrhea*, abdominal pain, anorexia, constipation, dyspepsia.

**GU:** hematuria, polyuria, urine retention.
**Skin:** pruritus, rash.
**Other:** chills, pain at injection site.

### INTERACTIONS

**Drug-drug.** *Drugs that prolong ECG intervals such as antiarrhythmics:* May increase risk of arrhythmia. Monitor patient closely.
*Drugs that inhibit CYP enzymes such as cimetidine:* May increase level of hydrodolasetron, an active metabolite of dolasetron. Monitor patient for adverse effects.
*Drugs that induce CYP enzymes such as rifampin:* May decrease level of hydrodolasetron, an active metabolite of dolasetron. Monitor patient for decreased effectiveness of antiemetic.

### EFFECTS ON LAB TEST RESULTS

- May increase ALT and AST levels.
- May increase PTT.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.

***Alert:*** Give with caution in patients who have or may develop prolonged cardiac conduction intervals, such as those with electrolyte abnormalities, history of arrhythmia, and cumulative high-dose anthracycline therapy.

- Drug isn't recommended for use in children younger than age 2. Use cautiously in breast-feeding women.

***Overdose S&S:*** Hypotension; dizziness; prolonged PR, QRS, and QTc intervals.

### NURSING CONSIDERATIONS

- Monitor patient for CV complications, such as heart block and tachyarrhythmias.
- ***Look alike–sound alike:*** Don't confuse Anzemet with Aldomet or Avandamet.

### PATIENT TEACHING

- Tell patient about possible adverse effects.
- Instruct patient to mix injection in juice for oral use immediately before giving.
- Tell patient to report nausea or vomiting.

## donepezil hydrochloride

doe-NEP-ah-zill

Aricept✐, Aricept ODT

*Therapeutic class:* Anti-Alzheimer
*Pharmacologic class:* Cholinesterase inhibitor
*Pregnancy risk category C*

D

### AVAILABLE FORMS

*Orally disintegrating tablets (ODTs):* 5 mg, 10 mg
*Tablets:* 5 mg, 10 mg, 23 mg

### INDICATIONS & DOSAGES

➤ **Mild to moderate Alzheimer's dementia**

*Adults:* 5 or 10 mg P.O. once daily.

➤ **Moderate to severe Alzheimer's disease**

*Adults:* Initially, 5 mg P.O. once daily for 4 to 6 weeks; dose may then be increased to 10 mg P.O. once daily. The dose may be increased to 23 mg P.O. once daily after patients have been taking 10 mg daily for 3 months.

➤ **Traumatic brain injury ♦**

*Adults:* 5 to 10 mg P.O. daily through subacute or long-term periods of recovery if response is adequate.

### ADMINISTRATION

**P.O.**

- Allow ODT to dissolve on tongue; then follow with water.
- Give drug at bedtime, without regard for food.

### ACTION

Thought to increase acetylcholine level by inhibiting cholinesterase enzyme, which causes acetylcholine hydrolysis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3–4 hr | Unknown |

*Half-life:* 70 hours.

### ADVERSE REACTIONS

**CNS:** *headache, insomnia,* ***seizures,*** dizziness, fatigue, depression, somnolence, syncope, pain.

**CV:** chest pain, hypertension, atrial fibrillation, hypotension, ***bradycardia, heart block.***
**EENT:** cataract, blurred vision, eye irritation, sore throat.
**GI:** *nausea, diarrhea,* vomiting, anorexia, fecal incontinence, ***GI bleeding.***
**GU:** urinary frequency.
**Metabolic:** weight loss, dehydration.
**Musculoskeletal:** muscle cramps, arthritis, bone fracture.
**Respiratory:** dyspnea, bronchitis.
**Skin:** pruritus, urticaria, diaphoresis, ecchymoses.
**Other:** toothache, influenza, increased libido.

## INTERACTIONS

**Drug-drug.** *Anticholinergics:* May decrease donepezil effects. Avoid using together.
*Anticholinesterases, cholinomimetics:* May have synergistic effect. Monitor patient closely.
*Bethanechol, succinylcholine:* May have additive effects. Monitor patient closely.
*Carbamazepine, dexamethasone, phenobarbital, phenytoin, rifampin:* May increase rate of donepezil elimination. Monitor patient.
*NSAIDs:* May increase gastric acid secretions. Monitor for active or occult GI bleeding.

## EFFECTS ON LAB TEST RESULTS

- May increase CK level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or piperidine derivatives and in breast-feeding women.
- Use cautiously in pregnant women and in patients who take NSAIDs or have CV disease, asthma, obstructive pulmonary disease, urinary outflow impairment, or history of ulcer disease.

***Overdose S&S:*** Severe nausea, vomiting, salivation, sweating, bradycardia, hypotension, respiratory depression, collapse, seizures, increasing muscle weakness.

## NURSING CONSIDERATIONS

- Monitor patient for evidence of active or occult GI bleeding.
- Monitor patient for bradycardia because of potential for vagotonic effects.
- ***Look alike–sound alike:*** Don't confuse Aricept with Ascriptin.

## PATIENT TEACHING

- Stress that drug doesn't alter underlying degenerative disease but can temporarily stabilize or relieve symptoms. Effectiveness depends on taking drug at regular intervals.
- Tell caregiver to give drug just before patient's bedtime.
- ODTs may be taken with or without food. Have patient allow tablet to dissolve on his tongue, then swallow with a sip of water.
- Advise patient and caregiver to report immediately significant adverse effects or changes in overall health status and to inform health care team that patient is taking drug before he receives anesthesia.
- Tell patient to avoid OTC cold or sleep remedies because of risk of increased anticholinergic effects.

**SAFETY ALERT!**

# DOPamine hydrochloride

DOE-pa-meen

*Therapeutic class:* Vasopressor
*Pharmacologic class:* Adrenergic
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 40 mg/ml, 80 mg/ml, 160 mg/ml parenteral concentrate for injection for I.V. infusion; 0.8 mg/ml (200 or 400 mg) in $D_5W$; 1.6 mg/ml (400 or 800 mg) in $D_5W$; 3.2 mg/ml (800 mg) in $D_5W$ parenteral injection for I.V. infusion

## INDICATIONS & DOSAGES

➤ **To treat shock and correct hemodynamic imbalances; to improve perfusion to vital organs; to increase cardiac output; to correct hypotension**
*Adults and children:* Initially, 2 to 5 mcg/kg/minute by I.V. infusion. Titrate dosage to desired hemodynamic or renal response. Increase by 1 to 4 mcg/kg/minute at 10- to

30-minute intervals. In seriously ill patients, start with 5 mcg/kg/minute and increase gradually in increments of 5 to 10 mcg/kg/minute to a rate of 20 to 50 mcg/kg/minute, as needed.
***Adjust-a-dose:*** In patients with occlusive vascular disease, initial dose is 1 mcg/kg/minute or less.

## ADMINISTRATION

**I.V.**
▼ Dilute with $D_5W$, normal saline solution, $D_5W$ in normal saline or 0.45% saline, lactated Ringer's, or $D_5W$ in lactated Ringer's. Mix just before use.
▼ Use a central line or large vein, as in the antecubital fossa, to minimize risk of extravasation.
▼ Use a continuous infusion pump to regulate flow rate. Avoid inadvertent administration of a bolus of the drug.
**Black Box Warning** Watch infusion site carefully for extravasation; if it occurs, stop infusion immediately and call prescriber. To prevent sloughing and necrosis in ischemic areas, you may need to infiltrate area with 5 to 10 mg phentolamine in 10 to 15 ml normal saline solution.
▼ Because solution will deteriorate rapidly, discard after 24 hours or earlier if it's discolored.
▼ **Incompatibilities:** Acyclovir sodium, additives with a dopamine and dextrose solution, alteplase, amphotericin B, cefepime, furosemide, gentamicin, indomethacin sodium trihydrate, iron salts, insulin, oxidizing agents, penicillin G potassium, sodium bicarbonate or other alkaline solutions, thiopental. Don't mix other drugs in I.V. container with dopamine.

## ACTION

Stimulates dopaminergic and alpha and beta receptors of the sympathetic nervous system resulting in a positive inotropic effect and increased cardiac output. Action is dose-related; large doses cause mainly alpha stimulation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 5 min | Unknown | <10 min after infusion |

*Half-life:* 2 minutes.

## ADVERSE REACTIONS

**CNS:** headache, anxiety.
**CV:** *hypotension,* ***ventricular arrhythmias (high doses),*** ectopic beats, tachycardia, angina, palpitations, vasoconstriction.
**GI:** nausea, vomiting.
**Metabolic:** azotemia, hyperglycemia.
**Respiratory:** ***asthmatic episodes,*** dyspnea.
**Skin:** necrosis and tissue sloughing with extravasation, piloerection.
**Other:** ***anaphylactic reactions.***

## INTERACTIONS

**Drug-drug.** *Alpha and beta blockers:* May antagonize dopamine effects. Monitor patient closely.
*Ergot alkaloids:* May cause extremely high blood pressure. Avoid using together.
*Inhaled anesthetics:* May increase risk of arrhythmias or hypertension. Monitor patient closely.
*MAO inhibitors (phenelzine, tranylcypromine):* May cause fever, hypertensive crisis, or severe headache. Avoid using together; if patient received an MAO inhibitor in the past 2 to 3 weeks, initial dopamine dose is less than or equal to 10% of the usual dose.
*Oxytocics:* May cause severe, persistent hypertension. Use together cautiously.
*Phenytoin:* May cause severe hypotension, bradycardia, and cardiac arrest. Monitor patient carefully.
*Tricyclic antidepressants:* May decrease pressor response. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

● May increase catecholamine, glucose, and urine urea levels.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients with uncorrected tachyarrhythmias, pheochromocytoma, or ventricular fibrillation.
● Use cautiously in patients with occlusive vascular disease, cold injuries, diabetic endarteritis, and arterial embolism; in pregnant or breast-feeding women; in those with a history of sulfite sensitivity; and in those taking MAO inhibitors.
⚠ ***Overdose S&S:*** Excessive blood pressure elevation.

## NURSING CONSIDERATIONS

- Most patients receive less than 20 mcg/kg/minute. Doses of 0.5 to 2 mcg/kg/minute mainly stimulate dopamine receptors and dilate the renal vasculature. Doses of 2 to 10 mcg/kg/minute stimulate beta receptors for a positive inotropic effect. Higher doses also stimulate alpha receptors, constricting blood vessels and increasing blood pressure.
- Drug isn't a substitute for blood or fluid volume deficit. If deficit exists, replace fluid before giving vasopressors.
- During infusion, frequently monitor ECG, blood pressure, cardiac output, central venous pressure, pulmonary artery wedge pressure, pulse rate, urine output, and color and temperature of limbs.
- If diastolic pressure rises disproportionately with a significant decrease in pulse pressure, decrease infusion rate, and watch carefully for further evidence of predominant vasoconstrictor activity, unless such an effect is desired.
- Observe patient closely for adverse reactions; dosage may need to be adjusted or drug stopped.
- Check urine output often. If urine flow decreases without hypotension, notify prescriber because dosage may need to be reduced.

***Alert:*** After drug is stopped, watch closely for sudden drop in blood pressure. Taper dosage slowly to evaluate stability of blood pressure.

- Acidosis decreases effectiveness of drug.
- ***Look alike–sound alike:*** Don't confuse dopamine with dobutamine.

## PATIENT TEACHING

- Tell patient to report adverse reactions promptly.
- Instruct patient to report discomfort at I.V. insertion site.

# doripenem

dor-eh-PEN-em

Doribax

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Carbapenem
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 500-mg vial

## INDICATIONS & DOSAGES

➤ **Complicated intra-abdominal infections caused by *Escherichia coli, Klebsiella pneumoniae, Pseudomonas aeruginosa, Bacteroides caccae, B. fragilis, B. thetaiotaomicron, B. uniformis, B. vulgatas, Streptococcus intermedius, S. constellatus,* or *Peptostreptococcus micros***

*Adults:* 500 mg I.V. every 8 hours for 5 to 14 days.

➤ **Complicated urinary tract infections, including pyelonephritis caused by *E. coli, K. pneumoniae, Proteus mirabilis, Pseudomonas aeruginosa, Acinetobacter baumannii***

*Adults:* 500 mg I.V. every 8 hours for 10 days. May be given for 14 days to patient with concurrent bacteremia.

➤ **Hospital-acquired pneumonia ♦**

*Adults:* 500 mg I.V. over 1 to 4 hours every 8 hours for 7 to 14 days.

***Adjust-a-dose:*** In patients with creatinine clearance of 30 to 50 ml/minute, give 250 mg I.V. every 8 hours; with creatinine clearance of more than 10 to less than 30 ml/minute, give 250 mg I.V. every 12 hours.

## ADMINISTRATION

**I.V.**

▼ Assess for history of allergies to beta-lactams (carbapenems, penicillins, cephalosporins).
▼ Obtain specimen for culture and sensitivity tests before beginning treatment.
▼ Dilute drug in single-use vials with 10 ml sterile water for injection or normal saline for injection, shake gently to form a concentration of 50 mg/ml.

▼ Add reconstituted drug to 100 ml normal saline or $D_5W$ for a final concentration of 4.5 mg/ml.
▼ To prepare a 250-mg dose, remove 55 ml of solution from infusion bag.
▼ Inspect solution for particulate matter and discoloration. Solution should be clear to slightly yellow.
▼ Solution prepared with normal saline may be stored at room temperature for 8 hours; $D_5W$, for 4 hours. If refrigerated, solution may be stored for 24 hours.
▼ Give only by infusion over 1 hour.
▼ **Incompatibilities:** Other I.V. drugs.

## ACTION

Inhibits bacterial cell-wall biosynthesis by inactivating multiple penicillin-binding proteins, causing cell death.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Rapid | 1¼ hr | Unknown |

*Half-life:* 1 hour.

## ADVERSE REACTIONS

**CNS:** *headache,* ***seizures.***
**GI:** ***pseudomembranous colitis,*** *diarrhea, nausea.*
**GU:** renal insufficiency, ***renal failure.***
**Hematologic:** *anemia.*
**Respiratory:** interstitial pneumonia.
**Skin:** phlebitis, pruritus, rash, ***Stevens-Johnson syndrome, toxic epidermal necrolysis.***
**Other:** ***anaphylaxis,*** infection.

## INTERACTIONS

**Drug-drug.** *Valproic acid:* May decrease valproic acid level, causing seizures. Monitor valproic acid levels. May need to switch to another antibacterial or anticonvulsant if levels can't be maintained.
*Probenecid:* May increase drug level. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

● May increase ALT, AST, transaminase and other hepatic enzyme levels.
● May decrease RBC count.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug, its components, or other beta-lactams.
● Use caution in those with moderate to severe renal impairment.

## NURSING CONSIDERATIONS

● Monitor patient closely for pseudomembranous colitis, which can occur up to 2 months after drug administration.
● Monitor renal function.
***Alert:*** If allergic reaction occurs, stop drug, use supportive measures and contact the prescriber.
● To report suspected adverse reactions, contact the FDA at 1-800-FDA-1088 or *www.fda.gov/medwatch.*
● Safety and efficacy haven't been established in pregnant or pediatric patients. It's unknown whether drug is excreted in breast milk.

## PATIENT TEACHING

● Tell patient to report any serious adverse effects such as dyspnea, skin reaction, pain at injection site, or diarrhea.
***Alert:*** Severe and life-threatening diarrhea can occur up to 2 months after drug is given; tell patient to report immediately.
● Advise woman to tell prescriber if she's pregnant or breast-feeding.

# dorzolamide hydrochloride

dor-ZOLE-ah-mide

Trusopt

*Therapeutic class:* Antiglaucoma
*Pharmacologic class:* Carbonic anhydrase inhibitor, sulfonamide
*Pregnancy risk category C*

## AVAILABLE FORMS

*Ophthalmic solution:* 2%

## INDICATIONS & DOSAGES

➤ **Increased intraocular pressure (IOP) in patients with ocular hypertension or open-angle glaucoma**
*Adults and children:* One drop into conjunctival sac of each affected eye t.i.d.

## ADMINISTRATION

### Ophthalmic

- Don't touch tip of dropper to eye or surrounding tissue.
- Apply light finger pressure on lacrimal sac for 1 minute after instilling to minimize systemic absorption.
- If more than one ophthalmic drug is being used, give at least 10 minutes apart.

## ACTION

Decreases aqueous humor secretion, presumably by slowing the formation of bicarbonate ions. This reduces sodium and fluid transport, reducing IOP.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | 1–2 hr | 2–3 hr | 8 hr |

*Half-life:* 4 months.

## ADVERSE REACTIONS

**CNS:** asthenia, fatigue, headache.
**EENT:** *blurred vision, dryness, lacrimation, ocular allergic reaction, ocular burning, stinging, and discomfort, photophobia, superficial punctate keratitis,* iridocyclitis.
**GI:** *bitter taste,* nausea.
**GU:** urolithiasis.
**Skin:** rash.

## INTERACTIONS

**Drug-drug.** *Oral carbonic anhydrase inhibitors, salicylates:* May cause additive effects. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in patients hypersensitive to sulfonamides and in those with hepatic or renal impairment.

***Overdose S&S:*** Electrolyte imbalance, acidosis, CNS effects.

## NURSING CONSIDERATIONS

- Normal IOP is 10 to 21 mm Hg.
- Monitor patient who is hypersensitive to sulfonamides carefully. Drug may cause reactions similar to oral sulfonamides.

## PATIENT TEACHING

- Teach patient how to instill drops. Advise him to wash hands before and after instillation, and warn him not to touch tip of dropper to eye or surrounding tissue.
- Tell patient that drug is a sulfonamide and, although it's given topically, it can be absorbed systemically. Advise patient to apply light finger pressure on lacrimal sac for 1 minute after drug instillation to minimize systemic absorption.
- Tell patient to stop drug and notify prescriber immediately if signs or symptoms of serious adverse reactions or hypersensitivity occur, including eye inflammation and eyelid reactions.
- Tell patient not to wear soft contact lenses during therapy.
- Stress importance of compliance with recommended therapy.

# doxapram hydrochloride

DOCKS-a-pram

Dopram

*Therapeutic class:* CNS stimulant
*Pharmacologic class:* Analeptic
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 20 mg/ml (benzyl alcohol 0.9%)

## INDICATIONS & DOSAGES

➤ **Postanesthesia respiratory stimulation**

*Adults:* 0.5 to 1 mg/kg as a single I.V. injection (not to exceed 1.5 mg/kg) or as multiple injections every 5 minutes, total not to exceed 2 mg/kg. Or, 250 mg in 250 ml of normal saline solution or $D_5W$ infused at initial rate of 5 mg/minute I.V. until satisfactory response is achieved. Maintain at 1 to 3 mg/minute. Don't exceed total dose for infusion of 4 mg/kg.

➤ **Drug-induced CNS depression**

*Adults:* For injection, priming dose of 1 to 2 mg/kg I.V., repeated in 5 minutes and again every 1 to 2 hours until patient awakens (and if relapse occurs). Maximum daily dose is 3 g.

For infusion, priming dose of 1 to 2 mg/kg I.V., repeated in 5 minutes and

again in 1 to 2 hours, if needed. If response occurs, give I.V. infusion (1 mg/ml) at 1 to 3 mg/minute until patient awakens. Don't infuse for longer than 2 hours or give more than 3 g/day. May resume I.V. infusion after rest period of 30 minutes to 2 hours, if needed.

➤ **Chronic obstructive pulmonary disease related to acute hypercapnia**

*Adults:* 1 to 2 mg/minute by I.V. infusion using 2 mg/ml solution. Maximum, 3 mg/minute for up to 2 hours.

## ADMINISTRATION

**I.V.**

▼ Drug is compatible with $D_5W$, $D_{10}W$, and normal saline solution.

▼ Give slowly; rapid infusion may cause hemolysis.

▼ Watch for irritation and infiltration; it can cause tissue damage and necrosis.

▼ **Incompatibilities:** Aminophylline, ascorbic acid, cefoperazone, cefotaxime, cefuroxime sodium, dexamethasone sodium phosphate, diazepam, digoxin, dobutamine, folic acid, furosemide, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, ketamine, methylprednisolone sodium succinate, minocycline, sodium bicarbonate, thiopental, ticarcillin disodium.

## ACTION

Not clearly defined. Directly stimulates the central respiratory centers in the medulla and may indirectly act on carotid, aortic, or other peripheral chemoreceptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 20–40 sec | 1–2 min | 5–12 min |

*Half-life:* 2½ to 4 hours.

## ADVERSE REACTIONS

**CNS:** *headache, dizziness,* ***seizures,*** apprehension, disorientation, hyperactivity, bilateral Babinski's signs, paresthesia.

**CV:** *chest pain and tightness, variations in heart rate, hypertension,* ***arrhythmias,*** T-wave depression on ECG, flushing.

**EENT:** ***laryngospasm,*** sneezing.

**GI:** nausea, vomiting, diarrhea.

**GU:** urine retention, bladder stimulation with incontinence, albuminuria.

**Musculoskeletal:** muscle spasms.

**Respiratory:** ***bronchospasm,*** cough, dyspnea, rebound hypoventilation, hiccups.

**Skin:** pruritus, diaphoresis.

## INTERACTIONS

**Drug-drug.** *General anesthetics:* May cause self-limiting arrhythmias. Avoid using doxapram within 10 minutes of an anesthetic that sensitizes the myocardium to catecholamines.

*MAO inhibitors, sympathomimetics:* May increase adverse CV effects. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

● May increase BUN level. May decrease hemoglobin level and hematocrit.

● May decrease erythrocyte, RBC, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients with seizure disorders; head injury; CV disorders; frank, uncompensated heart failure; severe hypertension; stroke; respiratory failure or incompetence secondary to neuromuscular disorders, muscle paresis, flail chest, obstructed airway, pulmonary embolism, pneumothorax, restrictive respiratory disease, acute bronchial asthma, or extreme dyspnea; or hypoxia unrelated to hypercapnia.

● Use cautiously in patients with bronchial asthma, severe tachycardia or arrhythmias, cerebral edema, increased intracranial pressure, hyperthyroidism, pheochromocytoma, or metabolic disorders.

● Don't give drug to children younger than age 12.

⚠ ***Overdose S&S:*** Excessive pressor effect, hypertension, tachycardia, skeletal muscle hyperactivity, enhanced deep tendon reflexes, agitation, confusion, sweating, cough, dyspnea.

## NURSING CONSIDERATIONS

● Drug is used only in surgical or emergency department situations.

● Separate end of anesthetic treatment and start of this drug by at least 10 minutes.

***Alert:*** Establish an adequate airway before giving drug. Prevent patient from aspirating vomitus by placing him on his side.
- Monitor blood pressure, heart rate, deep tendon reflexes, and arterial blood gases before giving drug and every 30 minutes afterward.
- Hold drug and notify prescriber if patient needs mechanical ventilation or shows signs of increased arterial carbon dioxide or oxygen tension.
- ***Look alike–sound alike:*** Don't confuse doxapram with doxorubicin, doxepin, or doxazosin. Don't confuse Dopram with dopamine.

## PATIENT TEACHING
- Inform family and patient about need for drug.
- Answer patient's questions and address his concerns.

# doxazosin mesylate
dox-AY-zo-sin

Cardura✓, Cardura XL

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Alpha blocker
*Pregnancy risk category C*

## AVAILABLE FORMS
*Tablets:* 1 mg, 2 mg, 4 mg, 8 mg
*Tablets (extended-release):* 4 mg, 8 mg

## INDICATIONS & DOSAGES
➤ **Essential hypertension**
*Adults:* Initially, 1 mg P.O. daily; determine effect on standing and supine blood pressure at 2 to 6 hours and 24 hours after dose. May increase at 2-week intervals to 2 mg and, thereafter, 4 mg and 8 mg once daily, if needed. Maximum daily dose is 16 mg, but doses over 4 mg daily increase the risk of adverse reactions. Don't use extended-release formulation to treat hypertension.
➤ **BPH**
*Adults:* Initially, 1 mg P.O. once daily in the morning or evening; may increase at 1- or 2-week intervals to 2 mg and, thereafter, 4 mg and 8 mg once daily, if needed. Or, one 4-mg extended-release tablet once daily with breakfast. May increase to 8 mg at 3- to 4-week intervals.
➤ **Pediatric hypertension ♦**
*Children:* Initially, 1 mg P.O. daily. May increase, as needed, at 2-week intervals to maximum dosage of 4 mg/day.

## ADMINISTRATION
**P.O.**
- Swallow extended-release tablets whole: don't chew, divide, cut, or crush.
- Give extended-release tablet with breakfast.
- Don't give evening dose the night before switching to extended-release from immediate-release formula.

## ACTION
An alpha blocker that acts on the peripheral vasculature to reduce peripheral vascular resistance and produce vasodilation. Drug also decreases smooth muscle tone in the prostate and bladder neck.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1–2 hr | 2–3 hr | 24 hr |

*Half-life:* 19 to 22 hours.

## ADVERSE REACTIONS
**CNS:** *dizziness*, *asthenia*, *headache*, vertigo, somnolence, drowsiness, pain.
**CV:** *orthostatic hypotension*, ***arrhythmias,*** hypotension, edema, palpitations, tachycardia.
**EENT:** rhinitis, pharyngitis, abnormal vision, dry mouth.
**GI:** nausea, vomiting, diarrhea, constipation.
**GU:** erectile dysfunction.
**Hematologic:** ***leukopenia, neutropenia.***
**Musculoskeletal:** arthralgia, myalgia, back pain.
**Respiratory:** dyspnea.
**Skin:** rash, pruritus.

## INTERACTIONS
**Drug-drug.** *Midodrine:* May decrease the effectiveness of midodrine. Monitor patient for therapeutic effect.
**Drug-herb.** *Butcher's broom:* May decrease effect of doxazosin. Discourage use together.

*Ma huang:* May decrease antihypertensive effects. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

- May decrease WBC and neutrophil counts.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and quinazoline derivatives (including prazosin and terazosin).
- Use cautiously in patients with impaired hepatic function.

***Overdose S&S:*** Hypotension.

### NURSING CONSIDERATIONS

- Monitor blood pressure closely.
- If syncope occurs, place patient in a recumbent position and treat supportively. A transient hypotensive response isn't considered a contraindication to continued therapy.
- Initial extended-release dose is 4 mg. If patient stops medication briefly, he should resume at 4-mg dose and titrate back to 8 mg if appropriate.
- Wait 3 to 4 weeks before increasing extended-release dose.
- ***Look alike–sound alike:*** Don't confuse doxazosin with doxapram, doxorubicin, or doxepin. Don't confuse Cardura with Coumadin, K-Dur, Cardene, or Cordarone.

### PATIENT TEACHING

- Instruct patient to take drug exactly as prescribed.

***Alert:*** Advise patient that he is susceptible to a first-dose effect (marked low blood pressure on standing up with dizziness or fainting). This is most common after first dose but also can occur during dosage adjustment or interruption of therapy.

- Advise patient to consult prescriber if dizziness or palpitations are bothersome.
- Advise patient to rise slowly from sitting or lying position.
- Advise patient to avoid driving and other hazardous activities until drug's effects are known.

## doxepin hydrochloride

DOKS-eh-pin

Silenor

*Therapeutic class:* Antidepressant
*Pharmacologic class:* Tricyclic antidepressant (TCA)
*Pregnancy risk category C*

D

### AVAILABLE FORMS

*Capsules:* 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg
*Oral concentrate:* 10 mg/ml
*Tablets:* 3 mg, 6 mg

### INDICATIONS & DOSAGES

➤ **Depression; anxiety**

*Adults:* Initially, 75 mg P.O. daily. Usual dosage range is 75 to 150 mg daily to maximum of 300 mg daily in divided doses. Or, entire maintenance dose may be given once daily. Maximum dosage is 300 mg/day.
*Children age 12 and older:* Initially, 75 mg P.O. daily. Usual dosage range is 75 to 150 mg/day. Maximum dosage is 150 mg/day.

✶ ***NEW INDICATION:*** **Insomnia (Silenor only)**

*Adults:* 6 mg P.O. once daily within 30 minutes of bedtime.

***Adjust-a-dose:*** For elderly patients, give 3 mg P.O. once daily within 30 minutes of bedtime.

### ADMINISTRATION

**P.O.**

- Dilute oral concentrate with 4 ounces (120 ml) of water, milk, or juice (orange, grapefruit, tomato, prune, or pineapple, but not grape); don't mix preparation with carbonated beverages.
- Give at bedtime, if possible, because it may cause drowsiness and dizziness.
- Don't give Silenor within 3 hours of a meal.

### ACTION

Unknown. Increases amount of norepinephrine, serotonin, or both in the CNS by blocking their reuptake by the presynaptic neurons.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 hr | Unknown |

*Half-life:* 6 to 8 hours.

## ADVERSE REACTIONS

**CNS:** *drowsiness, dizziness,* ***seizures,*** confusion, numbness, hallucinations, paresthesia, ataxia, weakness, headache, extrapyramidal reactions.
**CV:** *orthostatic hypotension, tachycardia,* ECG changes.
**EENT:** *blurred vision,* tinnitus.
**GI:** *dry mouth, constipation,* nausea, vomiting, anorexia.
**GU:** urine retention.
**Metabolic:** ***hypoglycemia,*** hyperglycemia.
**Skin:** *diaphoresis,* rash, urticaria, photosensitivity reactions.
**Other:** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Barbiturates, CNS depressants:* May enhance CNS depression. Avoid using together.
*Cimetidine,* ***fluoxetine, fluvoxamine, paroxetine, sertraline:*** May increase doxepin level. Monitor drug levels and patient for signs of toxicity.
*Clonidine:* May cause life-threatening hypertension. Avoid using together.
*Epinephrine, norepinephrine:* May increase hypertensive effect. Use together cautiously.
*MAO inhibitors:* May cause severe excitation, hyperpyrexia, or seizures, usually with high dosage. Avoid using within 14 days of MAO inhibitor therapy.
***Quinolones:*** May increase the risk of life-threatening arrhythmias. Avoid using together.
**Drug-herb.** *Evening primrose oil:* May cause additive or synergistic effect, resulting in lower seizure threshold and increasing the risk of seizure. Discourage use together.
*St. John's wort, SAM-e, yohimbe:* May cause serotonin syndrome. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May enhance CNS depression. Discourage use together.
*Sun exposure:* May increase risk of photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase or decrease glucose level.
- May increase liver function test values.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with glaucoma or tendency toward urine retention; also contraindicated in those who have received an MAO inhibitor within past 14 days and during acute recovery phase of an MI.

**Black Box Warning** Doxepin isn't approved for use in children.

***Overdose S&S:*** Cardiac arrhythmias, severe hypotension, seizures, CNS depression, coma, confusion, disturbed concentration, transient visual hallucinations, dilated pupils, agitation, hyperactive reflexes, stupor, drowsiness, muscle rigidity, vomiting, hypothermia, hyperpyrexia.

## NURSING CONSIDERATIONS

- Don't withdraw drug abruptly.
- Monitor patient for nausea, headache, and malaise after abrupt withdrawal of long-term therapy; these symptoms don't indicate addiction.

***Alert:*** Because hypertensive episodes may occur during surgery in patients receiving drug, stop it gradually several days before surgery.

- If signs or symptoms of psychosis occur or increase, expect prescriber to reduce dosage. Record mood changes. Monitor patient for suicidal tendencies and allow only a minimum supply of drug.

**Black Box Warning** Drug may increase risk of suicidal thinking and behavior in children, adolescents, and young adults ages 18 to 24, especially during the first few months of treatment, especially in those with major depressive disorder or other psychiatric disorder.

- Drug has strong anticholinergic effects and is one of the most sedating TCAs. Adverse anticholinergic effects can occur rapidly.
- Recommend use of sugarless hard candy or gum to relieve dry mouth.
- ***Look alike–sound alike:*** Don't confuse doxepin with doxazosin, digoxin, doxapram, or Doxidan.

## PATIENT TEACHING

- Tell patient to dilute oral concentrate with 4 ounces (120 ml) of water, milk, or juice (orange, grapefruit, tomato, prune, or pineapple, but not grape); preparation shouldn't be mixed with carbonated beverages.

**Black Box Warning** Advise families and caregivers to closely observe patient for increased suicidal thinking and behavior. ■

- Tell patient to take full dose at bedtime whenever he can, but warn him of possible morning dizziness on standing up quickly.
- Tell patient that, to minimize the potential for next day effect, not to take Silenor within 3 hours of a meal.
- Advise patient to consult prescriber before taking other prescription or OTC drugs.
- Warn patient to avoid hazardous activities that require alertness and good psychomotor coordination until effects of drug are known. Drowsiness and dizziness usually subside after a few weeks.
- Tell patient to avoid alcohol during drug therapy.
- Tell patient that maximal effect may not be evident for 2 to 3 weeks.
- Warn patient not to stop drug suddenly.
- To prevent sensitivity to the sun, advise patient to use sunblock, wear protective clothing, and avoid prolonged exposure to strong sunlight.

**SAFETY ALERT!**

# DOXOrubicin hydrochloride

dox-oh-ROO-bi-sin

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Anthracycline glycoside antibiotic
*Pregnancy risk category D*

## AVAILABLE FORMS

*Injection (preservative-free):* 2 mg/ml
*Powder for injection:* 10-mg, 20-mg, 50-mg

## INDICATIONS & DOSAGES

➤ **Bladder, breast, lung, ovarian, stomach, and thyroid cancers; non-Hodgkin lymphoma; Hodgkin lymphoma; acute lymphoblastic and myeloblastic leukemia; Wilms tumor; neuroblastoma; lymphoma; soft tissue and bone sarcomas**

*Adults and children:* 60 to 75 mg/m$^2$ I.V. as single dose every 3 weeks; or when used in combination with other chemotherapy drugs, 40 to 60 mg/m$^2$ I.V. every 21 to 28 days.

***Adjust-a-dose:*** Reduce dosage for patients with myelosuppression or impaired liver function. Elderly patients may need reduced dosages. Be prepared to decrease dosage if bilirubin level rises: Give 50% of dose when bilirubin level is 1.2 to 3 mg/100 ml; 25% when it's 3.1 to 5 mg/100 ml. For patients with creatinine clearance of less than 10 ml/minute, consider reducing dosage to 75% of usual dose.

## ADMINISTRATION

**I.V.**

**Black Box Warning** Never give drug I.M. or subcutaneously. ■

▼ Preparing and giving parenteral drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.

▼ Reconstitute with preservative-free normal saline solution for injection to yield 2 mg/ml; add 5 ml to 10-mg vial, 10 ml to 20-mg vial, or 25 ml to 50-mg vial. Shake vial to dissolve drug.

▼ Don't place I.V. catheter over joints or in limbs with poor venous or lymphatic drainage.

▼ Give by direct injection over at least 3 minutes into the tubing of a free-flowing I.V. solution containing $D_5W$ or normal saline solution for injection.

▼ If vein streaking occurs, slow administration rate. If welts appear, stop drug and notify prescriber.

▼ Some protocols give doxorubicin as a prolonged infusion, which requires central venous access.

**Black Box Warning** If extravasation occurs, stop infusion immediately and notify prescriber. Monitor area closely because extravasation may be progressive. Apply ice to the site for 15 minutes 4 times daily for 3 days. Drug is a strong vesicant and may cause tissue necrosis; two treatments for extravasation include topical dimethyl

sulfoxide and dexrazoxane I.V. Early consultation with a plastic surgeon may be advisable. ■
▼ Refrigerated, reconstituted solution is stable 15 days; at room temperature, it's stable 7 days.
▼ **Incompatibilities:** Allopurinol, aluminum, aminophylline, bacteriostatic diluents, cefepime, dexamethasone sodium phosphate, diazepam, fluorouracil, furosemide, ganciclovir, heparin sodium, hydrocortisone sodium succinate, piperacillin with tazobactam.

## ACTION

May interfere with DNA-dependent RNA synthesis by intercalation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* Initial, 30 minutes; terminal, 16½ hours.

## ADVERSE REACTIONS

**CV:** cardiac depression, ***arrhythmias, acute left ventricular failure, irreversible cardiomyopathy.***
**GI:** *nausea, vomiting,* diarrhea, *stomatitis,* esophagitis, anorexia.
**GU:** transient red urine.
**Hematologic:** ***leukopenia, thrombocytopenia,*** **MYELOSUPPRESSION.**
**Metabolic:** hyperuricemia.
**Skin:** *severe cellulitis and tissue sloughing with drug extravasation,* urticaria, facial flushing, *complete alopecia within 3 to 4 weeks,* hyperpigmentation of nail beds and dermal creases, radiation recall effect.
**Other:** chills, ***anaphylaxis.***

## INTERACTIONS

**Drug-drug.** *Aminophylline, cephalothin, dexamethasone, fluorouracil, heparin, hydrocortisone:* May form a precipitate. Don't mix together.
*Calcium channel blockers:* May increase cardiotoxic effects. Monitor patient's ECG closely.
*Cyclosporine:* May increase doxorubicin concentration. Monitor patient for toxicity.
*Digoxin:* May decrease digoxin level. Monitor digoxin level closely.
*Fosphenytoin, phenytoin:* May decrease level of phenytoin or fosphenytoin. Monitor drug level.
*Paclitaxel:* May decrease doxorubicin clearance. Monitor patient for toxicity.
*Phenobarbital:* May increase doxorubicin clearance. Monitor patient closely.
*Progesterone:* May enhance neutropenia and thrombocytopenia. Monitor patient and laboratory values closely.
*Streptozocin:* May increase and prolong doxorubicin level. Doxorubicin dosage may have to be adjusted.

## EFFECTS ON LAB TEST RESULTS

- May increase uric acid level.
- May decrease platelet and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with a history of sensitivity reactions to drug or its components.
- Contraindicated in patients with marked myelosuppression induced by previous treatment with other antitumor drugs or radiotherapy and in those who have received a lifetime cumulative dose of 550 mg/m$^2$ of doxorubicin or daunorubicin.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug should be administered under the supervision of a physician experienced with cancer chemotherapeutic agents. ■
- Perform cardiac function studies, including ECG and ejection fraction, before treatment and then periodically throughout therapy.
- Take preventive measures, including adequate hydration of the patient, before starting treatment. Rapid lysis of leukemic cells may cause hyperuricemia. Allopurinol may be ordered.
- Premedicate with antiemetic to reduce nausea.
- If skin or mucosal contact occurs, immediately wash with soap and water.

**Black Box Warning** Reduce dosage in patients with hepatic impairment. ■
**Black Box Warning** Severe myelosuppression may occur. ■
- Monitor CBC with differential and hepatic function tests; monitor ECG monthly

during therapy. If WBC count falls below 2,000/mm$^3$ or granulocyte count falls below 1,000/mm$^3$, follow institutional policy for infection control in immunocompromised patients.
• Monitor ECG for changes, such as sinus tachycardia, T-wave flattening, ST-segment depression, and voltage reduction.
• Leukopenia may occur during days 10 to 15, with recovery by day 21.
• If tachycardia develops, stop drug or slow rate of infusion, and notify prescriber.
**Black Box Warning** Myocardial toxicity may occur during therapy or months to years after termination of therapy. ■
***Alert:*** If signs of heart failure develop, stop drug and notify prescriber. Heart failure can often be prevented by limiting cumulative dose to 550 mg/m$^2$ (400 mg/m$^2$ when patient is also receiving or has received cyclophosphamide or radiation therapy to cardiac area).
***Alert:*** Reddish color of drug is similar to that of daunorubicin; don't confuse the two drugs.
• Esophagitis is common in patients who also have received radiation therapy.
***Alert:*** If patient has previously received radiation therapy, he's susceptible to radiation recall effect.
• ***Look alike–sound alike:*** Don't confuse doxorubicin with doxorubicin liposomal.

## PATIENT TEACHING

• Advise patient to report any pain or burning at site of injection during or after administration.
• Advise patient to watch for signs and symptoms of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools) and to take temperature daily.
• Advise patient that orange to red urine for 1 to 2 days is normal and doesn't indicate presence of blood.
• Inform patient that hair loss may occur but that it's usually reversible. Hair may regrow 2 to 5 months after drug is stopped.

**SAFETY ALERT!**

# DOXOrubicin hydrochloride liposomal

dox-oh-ROO-bi-sin

Doxil

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Anthracycline glycoside antibiotic
*Pregnancy risk category D*

D

## AVAILABLE FORMS

*Injection:* 20 mg/10 ml, 50 mg/25 ml

## INDICATIONS & DOSAGES

➤ **Metastatic ovarian carcinoma refractory to both paclitaxel- and platinum-based chemotherapy regimens**
*Women:* 50 mg/m$^2$ I.V. initially at 1 mg/minute once every 4 weeks for minimum of four courses. Continue as long as condition doesn't progress, patient shows no evidence of cardiotoxicity, and patient continues to tolerate treatment. If no infusion-related adverse reactions develop, increase infusion rate to complete administration over 1 hour.
➤ **AIDS-related Kaposi sarcoma refractory to previous combination chemotherapy and in patients intolerant of such therapy**
*Adults:* 20 mg/m$^2$ I.V. over 60 minutes once every 3 weeks. Initial rate should be 1 mg/minute to minimize infusion-related reactions. Continue as long as patient responds satisfactorily and tolerates treatment.
➤ **Multiple myeloma**
*Adults:* 30 mg/m$^2$ I.V. on day 4 following bortezomib which is given at 1.3 mg/m$^2$ bolus on days 1, 4, 8, and 11, every 3 weeks. Initial rate of first dose of doxorubicin hydrochloride liposomal should be 1 mg/minute to minimize infusion-related reactions. If no infusion-related adverse reactions occur, increase infusion rate to complete administration over 1 hour. Treatment may continue for up to 8 cycles, until disease progression or occurrence of unacceptable toxicity.
***Adjust-a-dose:*** For patients with impaired hepatic function, reduce dosage as follows:

If bilirubin level is 1.2 to 3 mg/dl, give half normal dose; if bilirubin level is more than 3 mg/dl, give one-fourth normal dose. Dose modifications may be needed for stomatitis, myelosuppression, and hand-foot syndrome, based on toxicity grade.

## ADMINISTRATION

### I.V.

▼ Don't give I.M. or subcutaneously.
▼ Follow procedures for proper handling and disposal of antineoplastics.
▼ Dilute appropriate dose (maximum, 90 mg) in 250 ml $D_5W$ using aseptic technique.
**Black Box Warning** Carefully check label on I.V. bag before giving drug. Accidentally substituting doxorubicin hydrochloride liposomal for conventional doxorubicin hydrochloride may cause severe adverse reactions. The two products can't be substituted on a milligram-per-milligram basis. ■
▼ Don't use an in-line filter.
▼ Infuse over 60 minutes. Monitor patient carefully during infusion.
**Black Box Warning** Serious, sometimes fatal, allergic infusion reactions can occur. Make sure emergency equipment and medications are available. Acute infusion-related reactions include flushing, shortness of breath, facial swelling, headache, chills, back pain, tightness in chest or throat, and hypotension. They may resolve when infusion rate is slowed, or over several hours to a day when infusion is stopped. ■
▼ If extravasation occurs, stop infusion immediately. Apply ice at the site for about 30 minutes to help alleviate local reaction. Restart infusion in another vein.
▼ Refrigerate diluted solution at 36° to 46° F (2° to 8° C) and give within 24 hours.
▼ **Incompatibilities:** Other I.V. drugs.

## ACTION

Consists of doxorubicin hydrochloride encapsulated in liposomes. Action may involve drug's ability to bind DNA and inhibit nucleic acid synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 5 hours in first phase; 55 hours in second phase with doses of 10 to 20 mg/$m^2$.

## ADVERSE REACTIONS

**CNS:** *asthenia*, paresthesia, headache, somnolence, dizziness, depression, insomnia, anxiety, malaise, emotional lability, fatigue, fever.
**CV:** chest pain, hypotension, tachycardia, peripheral edema, ***cardiomyopathy, heart failure, arrhythmias,*** pericardial effusion.
**EENT:** pharyngitis, rhinitis, conjunctivitis, retinitis, optic neuritis.
**GI:** *nausea, vomiting, constipation, anorexia, diarrhea*, abdominal pain, dyspepsia, oral candidiasis, enlarged abdomen, esophagitis, dysphagia, *stomatitis*, taste perversion, glossitis.
**Hematologic:** **LEUKOPENIA, NEUTROPENIA, THROMBOCYTOPENIA,** *anemia.*
**Hepatic:** hyperbilirubinemia.
**Metabolic:** dehydration, weight loss, hypocalcemia, hyperglycemia.
**Musculoskeletal:** myalgia, back pain.
**Respiratory:** dyspnea, increased cough, pneumonia.
**Skin:** *rash, alopecia*, dry skin, pruritus, skin discoloration, skin disorder, exfoliative dermatitis, sweating, *palmar-plantar erythrodysesthesia.*
**Other:** allergic reaction, chills, *herpes zoster*, infection, infusion-related reactions.

## INTERACTIONS

None reported. However, drug may interact with drugs that interact with conventional form of doxorubicin hydrochloride.

## EFFECTS ON LAB TEST RESULTS

● May increase bilirubin and glucose levels. May decrease calcium and hemoglobin levels.
● May increase PT and INR. May decrease neutrophil, platelet, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to conventional formulation of doxorubicin hydrochloride or any component in the liposomal form.

• Contraindicated in patients with marked myelosuppression and those who have received a lifetime cumulative dose of 550 mg/m$^2$ (400 mg/m$^2$ in patients who have received radiotherapy to the mediastinal area or therapy with other cardiotoxic drugs such as cyclophosphamide).
• Use cautiously in patients who have received other anthracyclines.
***Overdose S&S:*** Leukopenia, mucositis, thrombocytopenia.

## NURSING CONSIDERATIONS

• Consider previous or current therapy with related compounds such as daunorubicin when calculating total dose of drug to be given. Heart failure and cardiomyopathy may occur after stopping therapy.
**Black Box Warning** Cumulative dose over 550 mg/m$^2$ increases risk of cardiotoxicity.
• Give drug to patient with history of CV disease only when benefit outweighs risk to patient.
***Alert:*** Monitor patient for signs and symptoms of palmar-plantar erythrodysesthesia, hematologic toxicity, or stomatitis. These adverse reactions may be managed with dosage delays and adjustments.
**Black Box Warning** Evaluate patient's hepatic function before therapy, and adjust dosage accordingly.
• Drug may increase toxicity of other antineoplastics.
• Closely monitor cardiac function by endomyocardial biopsy, echocardiography, or gated radionuclide scans. If results indicate possible cardiac injury, the benefit of continued therapy must be weighed against the risk of myocardial injury.
**Black Box Warning** Severe myelosuppression may occur.
• Monitor CBC, including platelets, before each dose and frequently throughout therapy. Leukopenia is usually transient. Persistent severe myelosuppression may result in superinfection or hemorrhage. Patient may need granulocyte colony-stimulating factor (or granulocyte-macrophage colony-stimulating factor) to support blood counts.

## PATIENT TEACHING

• Tell patient to notify prescriber if he experiences signs and symptoms of hand-foot syndrome (such as tingling or burning, redness, flaking, bothersome swelling, small blisters, or small sores on palms of hands or soles of feet).
• To reduce the risk of hand-foot syndrome, advise the patient to follow these guidelines at least 1 day before and for 3 to 5 days after treatment:
– Avoid direct sunlight and use sunblock SPF 15 or higher on all exposed skin.
– Wear loose clothing and comfortable, well-ventilated, low-heeled shoes.
– Avoid contact with hot water and take cool, short showers or baths.
– Don't put pressure on your skin. (Avoid kneeling, leaning on your elbows, wearing tight jewelry or undergarments, and chopping hard foods.)
• Advise patient to report signs and symptoms of mouth inflammation (such as painful redness, swelling, or sores in mouth).
• Warn patient to avoid exposure to people with infections. Tell patient to report temperature of 100.5° F (38° C) or higher.
• Tell patient to report nausea, vomiting, tiredness, weakness, rash, or mild hair loss.
• Advise women of childbearing age to avoid pregnancy during therapy.

## doxycycline
dox-i-SYE-kleen

Oracea

## doxycycline calcium
Vibramycin

## doxycycline hyclate
Apo-Doxy†, Atridox, Doryx, Doxy 100, Doxy 200, Doxycin†, Doxytab†, Novo-Doxylin†, Oraxyl, Periostat, Vibramycin, Vibra-Tabs

## doxycycline monohydrate
Monodox, Vibramycin

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Tetracycline
*Pregnancy risk category D*

### AVAILABLE FORMS
**doxycycline**
*Capsules:* 40 mg (30 mg immediate-release and 10 mg delayed-release)
*Injection:* 100 mg/vial
**doxycycline calcium**
*Syrup:* 50 mg/5 ml
**doxycycline hyclate**
*Capsules:* 50 mg, 100 mg
*Capsules (coated pellets):* 75 mg, 100 mg
*Injection:* 100 mg, 200 mg
*Tablets:* 20 mg, 100 mg
**doxycycline monohydrate**
*Capsules:* 50 mg, 100 mg
*Oral suspension:* 25 mg/5 ml
*Tablets:* 50 mg, 75 mg, 100 mg

### INDICATIONS & DOSAGES
➤ **Infections caused by susceptible gram-positive and gram-negative organisms (including *Haemophilus ducreyi, Yersinia pestis,* and *Campylobacter fetus*), *Rickettsiae* species, *Mycoplasma pneumoniae, Chlamydia trachomatis,* and *Borrelia burgdorferi* (Lyme disease); psittacosis; granuloma inguinale**
*Adults and children older than age 8 who weigh at least 45 kg (99 lb):* 100 mg P.O. every 12 hours on first day; then 100 mg P.O. daily as a single dose or divided b.i.d. Or, 200 mg I.V. on first day in one or two infusions; then 100 to 200 mg I.V. daily. Daily doses of 200 mg I.V. can be given as a single dose or divided b.i.d.
*Children older than age 8 who weigh less than 45 kg:* 4.4 mg/kg P.O. or I.V. daily, in divided doses every 12 hours on first day; then 2.2 to 4.4 mg/kg daily given as a single dose or divided b.i.d.

Give I.V. infusion slowly (minimum 1 hour). Infusion must be completed within 12 hours (within 6 hours in lactated Ringer's solution or dextrose 5% in lactated Ringer's solution).

➤ **Gonorrhea in patients allergic to penicillin**
*Adults:* 100 mg P.O. b.i.d. for 7 days. For epididymitis, use for 10 days and give a single dose of ceftriaxone 250 mg I.M.

➤ **Syphilis in patients allergic to penicillin (except Doryx, Monodox)**
*Adults:* 100 mg P.O. b.i.d. for 14 days (early). If more than 1-year duration, 100 mg P.O. daily for 4 weeks.

➤ **Primary or secondary syphilis in patients allergic to penicillin (Doryx, Monodox only)**
*Adults:* 300 mg P.O. daily in divided doses for at least 10 days.

➤ **Uncomplicated urethral, endocervical, or rectal infections caused by *C. trachomatis* or *Ureaplasma urealyticum***
*Adults:* 100 mg P.O. b.i.d. for at least 7 days. For epididymitis, use for 10 days and give a single dose of ceftriaxone 250 mg I.M. if caused by *C. trachomatis*. In those with lymphogranuloma venereum, treat for at least 21 days.

➤ **To prevent malaria**
*Adults:* 100 mg P.O. daily beginning 1 to 2 days before travel to endemic area and continued for 4 weeks after travel.
*Children older than age 8:* Give 2 mg/kg P.O. once daily beginning 1 to 2 days before travel to endemic area and continued for 4 weeks after travel. Don't exceed daily dose of 100 mg.

➤ **Pelvic inflammatory disease ♦**
*Adults:* 100 mg I.V. or P.O. every 12 hours with 2 g cefoxitin I.V. every 6 hours. May stop parenteral doxycycline and cefoxitin after 24 hours and continue with 100 mg doxycycline P.O. every 12 hours for 14 days total.

➤ **Adjunct to other antibiotics for inhalation, GI, and oropharyngeal anthrax**
*Adults:* 100 mg every 12 hours I.V. initially until susceptibility test results are known. Switch to 100 mg P.O. b.i.d. when appropriate. Treat for 60 days total.
*Children older than age 8 who weigh more than 45 kg (99 lb):* 100 mg every 12 hours I.V.; then switch to 100 mg P.O. b.i.d. when appropriate. Treat for 60 days total.
*Children older than age 8 who weigh 45 kg or less:* 2.2 mg/kg every 12 hours I.V.; then switch to 2.2 mg/kg (up to 100 mg) P.O. b.i.d. when appropriate. Treat for 60 days total.
*Children age 8 and younger:* 2.2 mg/kg every 12 hours I.V.; then switch to 2.2 mg/kg (up to 100 mg) P.O. b.i.d. when appropriate. Treat for 60 days total.
➤ **Cutaneous anthrax**
*Adults:* 100 mg P.O. every 12 hours for 60 days.
*Children older than age 8 who weigh more than 45 kg (99 lb):* 100 mg P.O. every 12 hours for 60 days.
*Children older than age 8 who weigh 45 kg or less:* 2.2 mg/kg (up to 100 mg) every 12 hours P.O. for 60 days.
*Children age 8 and younger:* 2.2 mg/kg (up to 100 mg) P.O. every 12 hours for 60 days.
➤ **Adjunct to scaling and root planing to improve attachment and reduce pocket depth in periodontitis**
*Adults:* 20 mg P.O. Periostat b.i.d., more than 1 hour before or 2 hours after the morning and evening meals and after scaling and root planing. Effective for 9 months.
➤ **Inflammatory lesions of rosacea**
*Adults:* 40 mg Oracea P.O. once daily in the morning, 1 hour before or 2 hours after a meal. Give with a full glass of water. Reevaluate treatment after 16 weeks.

## ADMINISTRATION

### P.O.

● Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
**Alert:** Check expiration date. Outdated or deteriorated tetracyclines may cause reversible nephrotoxicity (Fanconi syndrome).
● Give drug with food or milk if stomach upset occurs.
● Increase fluid intake and don't administer tablets or capsules within 1 hour of bedtime because of possible esophageal irritation or ulceration.
● Give Oracea with a full glass of water.
● Tablets may be crushed and mixed with low-fat or chocolate milk, chocolate pudding, or apple juice mixed equally with sugar. Store mixtures in refrigerator (except apple juice mixture, which can be stored at room temperature) and discard after 24 hours.

### I.V.

▼ Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
▼ Reconstitute powder for injection with sterile water for injection. Use 10 ml in 100-mg vial and 20 ml in 200-mg vial. Further dilute solution to a concentration of 0.1 mg/ml to 1 mg/ml; don't infuse solution that contains more than 1 mg/ml.
▼ Don't expose drug to light or heat. Protect it from sunlight during infusion.
▼ Infusion time varies with dose but usually ranges from 1 to 4 hours. Infusion must be completed within 12 hours.
▼ Monitor infusion site for evidence of thrombophlebitis.
▼ Reconstituted injectable solution is stable 72 hours if refrigerated and protected from light.
▼ **Incompatibilities:** Allopurinol; drugs that are unstable in acidic solutions, such as barbiturates; erythromycin lactobionate; heparin; meropenem; nafcillin; penicillin G potassium; piperacillin with tazobactam; riboflavin; and sulfonamides.

## ACTION

May exert bacteriostatic effect by binding to the 30S and possibly 50S ribosomal subunits of microorganisms and inhibiting protein synthesis. May also alter the cytoplasmic membrane of susceptible microorganisms.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1½–4 hr | Unknown |
| I.V. | Immediate | Unknown | Unknown |

*Half-life:* About 1 day after multiple dosing.

## ADVERSE REACTIONS

**CNS:** ***intracranial hypertension.***
**CV:** pericarditis, thrombophlebitis.
**GI:** *diarrhea, epigastric distress, nausea,* anorexia, glossitis, dysphagia, vomiting, oral candidiasis, enterocolitis, anogenital inflammation.
**Hematologic:** ***neutropenia, thrombocytopenia,*** eosinophilia, hemolytic anemia.
**Musculoskeletal:** bone growth retardation in children younger than age 8.
**Skin:** *maculopapular and erythematous rashes, photosensitivity reactions, increased pigmentation, urticaria.*
**Other:** ***anaphylaxis,*** hypersensitivity reactions, superinfection, permanent discoloration of teeth, enamel defects.

## INTERACTIONS

**Drug-drug.** *Antacids and laxatives containing aluminum, magnesium, or calcium, antidiarrheals:* May decrease antibiotic absorption. Give antibiotic 1 hour before or 2 hours after these drugs.
*Carbamazepine, phenobarbital, rifamycins:* May decrease antibiotic effect. Avoid using together.
*Ferrous sulfate and other iron products, zinc:* May decrease antibiotic absorption. Give drug 2 hours before or 3 hours after iron.
*Hormonal contraceptives:* May decrease contraceptive effectiveness and increase risk of breakthrough bleeding. Advise use of a nonhormonal contraceptive.
*Isotretinoin:* May increase risk of pseudotumor cerebri. Avoid using together.
*Methoxyflurane:* May cause nephrotoxicity with tetracyclines. Avoid using together.
*Oral anticoagulants:* May increase anticoagulant effect. Monitor PT and INR, and adjust dosage.
*Penicillins:* May interfere with bactericidal action of penicillins. Avoid using together.
**Drug-lifestyle.** *Alcohol use:* May decrease drug's effect. Discourage use together.
*Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN and liver enzyme levels. May decrease hemoglobin level.
- May increase eosinophil count. May decrease platelet, neutrophil, and WBC counts.
- May falsely elevate fluorometric tests for urine catecholamines. May cause false-negative results in urine glucose tests using glucose oxidase reagent (Diastix or Chemstrip uG). Parenteral form may cause false-positive Clinitest results.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other tetracyclines.
- Use cautiously in patients with impaired renal or hepatic function.
- In a fetus in the last half of gestation or a child younger than age 8, drug may cause permanently discolored teeth, enamel defects, and bone growth retardation.

***Overdose S&S:*** Dizziness, nausea, vomiting.

## NURSING CONSIDERATIONS

- If patient receives large doses or prolonged therapy or if patient is at high risk, watch for signs and symptoms of superinfection. If superinfection occurs, drug should be discontinued and appropriate therapy instituted.
- Cutaneous anthrax with signs of systemic involvement, extensive edema, or lesions on the head or neck requires I.V. therapy and a multidrug approach.
- Ciprofloxacin and doxycycline are first-line therapies for anthrax. If anthrax patient also has meningitis, ciprofloxacin is preferred because of better distribution to the CNS.
- In pregnant women and immunocompromised patients, use the usual dosage schedule for anthrax. In pregnant women, adverse effects on fetal teeth and bones are dose-limited, so drug may be used for 7 to 14 days before the third trimester.
- Check patient's tongue for signs of fungal infection. Emphasize good oral hygiene.
- Photosensitivity reactions may occur within a few minutes to several hours after exposure and may last after therapy ends.
- ***Look alike–sound alike:*** Don't confuse doxycycline, doxylamine, and dicyclomine.

### PATIENT TEACHING

- Tell patient to take entire amount of drug exactly as prescribed, even after he feels better.
- Instruct patient to report adverse reactions promptly. If drug is being given I.V., tell him to report discomfort at I.V. site.
- Advise patient to take oral form of drug with food or milk if stomach upset occurs.
- Advise patient to increase fluid intake and not to take oral tablets or capsules within 1 hour of bedtime because of possible esophageal irritation or ulceration.
- Advise parent giving drug to a child that tablets may be crushed and mixed with low-fat or chocolate milk, chocolate pudding, or apple juice mixed equally with sugar. Tell parent to store mixtures in refrigerator (except apple juice mixture, which can be stored at room temperature) and to discard after 24 hours.
- Warn patient to avoid direct sunlight and ultraviolet light, wear protective clothing, and use sunscreen.
- Tell patient to report signs and symptoms of superinfection to prescriber.
- Tell patient taking Oracea to take drug with a full glass of water.

## dronabinol (delta-9-tetrahydrocannabinol)

droe-NAB-i-nol

Marinol

*Therapeutic class:* Antiemetic
*Pharmacologic class:* Cannabinoid
*Pregnancy risk category C*
*Controlled substance schedule III*

### AVAILABLE FORMS

*Capsules:* 2.5 mg, 5 mg, 10 mg

### INDICATIONS & DOSAGES

➤ **Nausea and vomiting from cancer chemotherapy**

*Adults:* 5 mg/m$^2$ P.O. 1 to 3 hours before chemotherapy session. Then, same dose every 2 to 4 hours after chemotherapy, for total of four to six doses daily. If needed, increase dosage in 2.5-mg/m$^2$ increments to maximum of 15 mg/m$^2$ per dose.

➤ **Anorexia and weight loss in patients with AIDS**

*Adults:* 2.5 mg P.O. b.i.d. before lunch and dinner. If patient can't tolerate it, decrease to 2.5 mg P.O. given as a single dose daily in evening or at bedtime. May gradually increase to maximum of 20 mg daily given in divided doses.

### ADMINISTRATION

**P.O.**

- Give 1 to 3 hours before chemotherapy.
- Store in cool environment, but protect from freezing.

### ACTION

Unknown. A derivative of marijuana.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30–60 min | 2–4 hr | 4–6 hr |

*Half-life:* 1 to 1½ days.

### ADVERSE REACTIONS

**CNS:** *ataxia, dizziness, drowsiness, euphoria, paranoia,* amnesia, asthenia, confusion, depersonalization, hallucinations, muddled thinking, somnolence.
**CV:** orthostatic hypotension, palpitations, tachycardia, vasodilation.
**EENT:** visual disturbances.
**GI:** *abdominal pain, dry mouth, nausea, vomiting,* diarrhea.

### INTERACTIONS

**Drug-drug.** *CNS depressants, psychomimetic substances, sedatives:* May cause additive CNS depression. Avoid using together.
**Drug-lifestyle.** *Alcohol use:* May cause additive CNS depression. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to sesame oil or cannabinoids.
- Use cautiously in the elderly, in pregnant or breast-feeding women, and in those with heart disease, psychiatric illness, or history of drug abuse.

***Overdose S&S:*** Mild—drowsiness, euphoria, heightened sensory awareness, altered time perception, reddened conjunctiva, dry mouth, tachycardia; moderate—memory impairment, depersonalization, mood alteration, urine retention, decreased bowel motility; severe—decreased motor coordination, lethargy, slurred speech, orthostatic hypotension.

## NURSING CONSIDERATIONS

- Expect drug to be prescribed only for patients who haven't responded satisfactorily to other antiemetics.

***Alert:*** Drug is the principal active substance in *Cannabis sativa* (marijuana), which can produce both physiologic and psychological dependence and has a high risk of abuse.

- Monitor patient for hypotension, hypertension, syncope, and tachycardia.
- Monitor patient for worsening signs and symptoms of psychiatric illness.
- CNS effects are intensified at higher dosages.
- Drug effects may persist for days after treatment ends.
- ***Look alike–sound alike:*** Don't confuse dronabinol with droperidol.

## PATIENT TEACHING

- Tell patient that drug may induce unusual changes in mood or other adverse behavioral effects.
- Advise patient against performing activities that require alertness until CNS effects of drug are known.
- Warn caregivers to supervise patient during and immediately after treatment.
- Advise patient to take drug 1 to 3 hours before chemotherapy.

# dronedarone

dro-neh-DAR-rone

Multaq

*Therapeutic class:* Antiarrhythmic
*Pharmacologic class:* Benzofuran derivative
*Pregnancy risk category X*

## AVAILABLE FORMS

*Tablets:* 400 mg

## INDICATIONS & DOSAGES

➤ **To reduce risk of hospitalization in patients with recent episode of paroxysmal or persistent atrial fibrillation or flutter who have cardiovascular risk factors, such as age older than 70, diabetes, hypertension, stroke, left atrial diameter greater than 50 mm, or left ventricular ejection fraction less than 40%, who are in normal sinus rhythm or who will be cardioverted**

*Adults:* 400 mg P.O. b.i.d.

## ADMINISTRATION

**P.O.**

- Give drug with morning and evening meals.
- Don't give grapefruit juice to patient taking this drug.

## ACTION

Unknown. Exhibits properties of all four Vaughan-Williams antiarrhythmic classes; it's unclear which of these is important in producing drug's clinical effects.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3–6 hr | Unknown |

*Half-life:* 13 to 19 hours.

## ADVERSE REACTIONS

**CNS:** asthenia.
**CV:** ***bradycardia, heart failure, QT interval prolongation.***
**GI:** abdominal pain, diarrhea, dyspepsia, nausea, vomiting.
**Skin:** allergic dermatitis, dermatitis, eczema, pruritus, rash.

## INTERACTIONS

**Drug-drug.** *Beta blockers:* May cause bradycardia. Initially, give low dose of beta blocker and increase dosage only after monitoring ECG for tolerance.
*Calcium channel blockers:* May cause additive effects. Reduce initial dosage of calcium channel blocker; increase dosage only after monitoring ECG for tolerance.
*CYP2C9 substrates (losartan, warfarin):* May increase metabolite levels. Monitor patient closely; monitor INR in patient taking warfarin.
*CYP3A inducers (carbamazepine, phenobarbital, phenytoin, rifampin):* May decrease dronedarone level. Use together is contraindicated.
*CYP3A inhibitors (clarithromycin, erythromycin, itraconazole, ketoconazole, ritonavir, voriconazole):* May increase dronedarone level. Use together is contraindicated.
*CYP3A substrates (sirolimus, tacrolimus):* May increase levels of these drugs. Monitor drug levels.
*Digoxin:* May increase digoxin level and electrophysiological effects of dronedarone. Avoid use together; if necessary to use together, decrease digoxin dosage by 50%.
*Drugs that prolong QT interval (Class I and III antiarrhythmics, macrolide antibiotics, phenothiazines, tricyclic antidepressants):* May further increase QT interval, leading to torsades de pointes. Use together is contraindicated.
*Statins:* May increase statin level. Use together cautiously.
**Drug-herb.** *St John's wort:* May decrease drug level. Discourage use together.
**Drug-lifestyle.** *Grapefruit juice:* May increase drug level. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase serum creatinine level.
- May decrease potassium and magnesium levels (in patients taking potassium-depleting diuretics).

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Contraindicated in patients with New York Heart Association Class IV heart failure or Class II to III heart failure with recent decompensation requiring hospitalization or referral to a heart failure clinic. ■

- Contraindicated in second- or third-degree AV block or sick sinus syndrome (unless a functioning pacemaker is in place), bradycardia (less than 50 beats/minute), severe hepatic impairment, QTc interval of 500 ms or greater, or PR interval greater than 280 ms.
- Contraindicated with concomitant use of CYP3A inhibitors and drugs or herbal preparations that prolong QT interval.
- Use cautiously in patients with new or worsening heart failure.
- Use in pregnant women is contraindicated. Women of childbearing age should use effective birth control during therapy.
- It isn't known if drug appears in breast milk. Women should stop breast-feeding before using this drug.

***Overdose S&S:*** QTc interval prolongation.

## NURSING CONSIDERATIONS

- Potassium-depleting diuretics may cause hypokalemia and hypomagnesemia, increasing the risk of torsades de pointes. Initiate dronedarone therapy after potassium and magnesium levels reach and stay within normal range.
- Monitor cardiovascular status, ECG, and QTc interval routinely.
- Monitor renal function and electrolyte levels regularly.

## PATIENT TEACHING

- Instruct patient to take drug with morning and evening meals.
- Warn patient to avoid grapefruit juice.
- Advise patient to report weight gain, dyspnea, fatigue, and peripheral edema, which may indicate worsening heart failure.
- Tell patient to report changes in OTC or prescription drug use, or in supplement or herb use.
- If patient misses a dose, tell patient not to double the dose but to skip that dose and take the next regularly scheduled dose.
- Instruct patient to report slowed heartbeat, diarrhea, nausea, vomiting, abdominal pain, indigestion, fatigue, or rash.
- Advise women of childbearing age to use an effective method of birth control

while taking drug and to notify prescriber if becoming pregnant or thinking of becoming pregnant.
- Advise women not to breast-feed while taking dronedarone because drug may appear in breast milk.

## drospirenone and ethinyl estradiol

droh-SPYE-re-none and ETH-i-nill es-tra-DYE-ole

Yasmin, YAZ

*Therapeutic class:* Contraceptive
*Pharmacologic class:* Estrogenic and progestinic steroids
*Pregnancy risk category X*

### AVAILABLE FORMS

*Tablets:* 3 mg drospirenone and 0.03 mg ethinyl estradiol as 21 yellow tablets and 7 white (inert) tablets (Yasmin); 3 mg drospirenone and 0.02 mg ethinyl estradiol as 24 light pink active tablets and 4 white (inert) tablets (YAZ).

### INDICATIONS & DOSAGES

➤ **Contraception**

*Women:* 1 yellow Yasmin tablet P.O. daily for 21 days beginning on day 1 of menstrual cycle or first Sunday after onset of menstruation. Then 1 white inert tablet P.O. daily on days 22 through 28. Or 1 light pink YAZ tablet P.O. daily for 24 days beginning on day 1 of menstrual cycle or first Sunday after onset of menstruation. Then 1 white inert tablet P.O. daily on days 25 through 28. Begin next and all subsequent 28-day regimens on same day of week that first regimen began, following same schedule. Restart yellow or light pink tablets on next day after last white tablet.

➤ **Premenstrual dysphoric disorder**

*Women:* 1 light pink YAZ tablet P.O. daily for 24 days beginning on day 1 of menstrual cycle or first Sunday after menstruation begins. Then 1 white inert tablet P.O. daily on days 25 through 28. Begin next and all subsequent 28-day regimens on same day of week that first regimen began, following same schedule. Restart light pink tablets on next day after last white tablet.

✶ ***NEW INDICATION:*** **Acne**

*Women:* Follow guidelines of use for timing and initiation of dosing with YAZ. The 28-day dosing regimen consists of 1 active tablet P.O. for 24 consecutive days followed by 1 inert tablet P.O. daily for 4 days. After 28 tablets are taken, new course is started next day.

### ADMINISTRATION

**P.O.**
- Give pill at same time each day.

### ACTION

Reduces chance of conception by inhibiting ovulation, inhibiting sperm progression, and reducing chance of implantation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–3 hr | Unknown |

*Half-life:* drospirenone, 30 hours; ethinyl estradiol, 24 hours.

### ADVERSE REACTIONS

**CNS:** ***cerebral hemorrhage, cerebral thrombosis,*** asthenia, depression, dizziness, emotional lability, headache, migraine, nervousness.
**CV:** ***arterial thromboembolism, mesenteric thrombosis, MI, pulmonary embolism,*** hypertension, thrombophlebitis, fluid retention, edema.
**EENT:** cataracts, steepening of corneal curvature, intolerance to contact lenses, pharyngitis, retinal thrombosis, sinusitis.
**GI:** abdominal pain, abdominal cramping, bloating, changes in appetite, colitis, diarrhea, gastroenteritis, nausea, vomiting, gallbladder disease.
**GU:** amenorrhea, breakthrough bleeding, change in cervical erosion and secretion, change in menstrual flow, cystitis, cystitis-like syndrome, dysmenorrhea, impaired renal function, leukorrhea, menstrual disorder, premenstrual syndrome, spotting, temporary infertility after discontinuing treatment, UTI, vaginal candidiasis, vaginitis.
**Hepatic:** ***Budd-Chiari syndrome, hepatic adenomas,*** cholestatic jaundice, benign liver tumors.

**Metabolic:** reduced glucose tolerance, porphyria, weight change, ***hyperkalemia.***
**Musculoskeletal:** back pain.
**Respiratory:** bronchitis, upper respiratory tract infection.
**Skin:** ***erythema multiforme,*** acne, erythema nodosum, hemorrhagic eruption, hirsutism, loss of scalp hair, melasma, pruritus, rash.
**Other:** changes in libido, breast tenderness, ***hemolytic-uremic syndrome.***

## INTERACTIONS

**Drug-drug.** *ACE inhibitors, aldosterone antagonists, angiotensin II receptor antagonists, NSAIDs, potassium-sparing diuretics:* May increase risk of hyperkalemia. Monitor potassium level.
*Acetaminophen:* May increase level of contraceptive and decrease effectiveness of acetaminophen. Monitor patient for adverse effects. Adjust acetaminophen dose as needed.
*Antibiotics, griseofulvin, penicillins, tetracycline:* May decrease contraceptive effect. Advise patient to use additional method of birth control while taking the antibiotic.
*Ascorbic acid, atorvastatin:* May increase level of contraceptive. Monitor patient for adverse effects.
*Carbamazepine, modafinil, oxcarbazepine, phenobarbital, phenytoin, protease inhibitors:* May increase metabolism of ethinyl estradiol and decrease contraceptive effectiveness. Advise patient to use another method of birth control.
*Clofibrate, morphine, salicylic acid, temazepam:* May decrease levels and increase clearance of these drugs. Monitor patient for effectiveness.
*Cyclosporine, prednisolone, theophylline:* May increase levels of these drugs. Monitor patient for adverse effects and toxicity.
*Phenylbutazone, rifampin:* May decrease contraceptive effectiveness and increase menstrual irregularities. Advise patient to use another method of birth control.
*Troleandomycin:* May increase risk of intrahepatic cholestasis and decrease contraceptive effect. Advise patient to use an alternative method of birth control.
**Drug-herb.** *St. John's wort:* May decrease contraceptive effectiveness and increase breakthrough bleeding. Discourage use together, or advise use of additional method of birth control.
**Drug-lifestyle.** *Smoking:* May increase risk of CV adverse effects. Advise patient to avoid smoking.

D

## EFFECTS ON LAB TEST RESULTS

- May increase potassium, corticoid; factor VII, VIII, IX, and X; prothrombin; thyroid-binding globulin; total circulating sex steroid; total thyroid hormone; triglyceride levels, amylase, GGT, iron-binding capacity, transferrin, prolactin, renin activity, and vitamin A. May decrease antithrombin III level, folate, albumin, zinc, and vitamin $B_{12}$.
- May increase norepinephrine-induced platelet aggregation. May decrease glucose tolerance and free $T_3$ resin uptake.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in women with hepatic dysfunction, tumor, or disease; renal or adrenal insufficiency; thrombophlebitis, thromboembolic disorders, or history of deep vein thrombosis or thromboembolic disorders; cerebrovascular or coronary artery disease; known or suspected breast cancer, endometrial cancer, or other estrogen-dependent neoplasia; abnormal genital bleeding; or cholestatic jaundice of pregnancy or jaundice with other hormonal contraceptive use.
- Contraindicated in women who are or may be pregnant and in women age 65 or older.
- Use cautiously in patients with CV risk factors such as hypertension, hyperlipidemias, obesity, and diabetes.
- Use cautiously in patients with conditions aggravated by fluid retention.

***Overdose S&S:*** Nausea, withdrawal uterine bleeding.

## NURSING CONSIDERATIONS

***Alert:*** The use of contraceptives causes increased risk of MI, thromboembolism, stroke, hepatic neoplasia, gallbladder disease, and hypertension. Risk increases in patients with hypertension, diabetes, hyperlipidemia, and obesity.
**Black Box Warning** Smoking increases the risk of serious CV adverse effects. The risk

increases with age (especially age older than 35 years) and in patients who smoke 15 or more cigarettes daily. ■
• The relationship between the use of hormonal contraceptives and breast and cervical cancers is unclear. Encourage women to schedule a complete gynecologic examination at least yearly and to perform breast self-examinations monthly.
• In patients scheduled to have elective surgery that may increase the risk of thromboembolism, stop contraceptive use from at least 4 weeks before until 2 weeks after surgery. Also stop use during and after prolonged immobilization.
• Because of increased risk of thromboembolism in the postpartum period, don't start contraceptive earlier than 4 to 6 weeks after delivery.
• Stop use and evaluate patient if loss of vision, proptosis, diplopia, papilledema, or retinal vascular lesions occur. Recommend that contact lens wearers be evaluated by an ophthalmologist if visual changes or lens intolerance occurs.
• If patient misses two consecutive periods, she should obtain a negative pregnancy test result before continuing use of contraceptive.
• Immediately stop use if pregnancy is confirmed.
• Closely monitor patient with diabetes. Glucose intolerance may occur.
• Closely monitor patient with hypertension or a history of depression. Stop drug if these events occur.
• In patient at high risk for hyperkalemia and patient taking medications that may increase potassium, check potassium level during the first treatment cycle.
• Stop drug and evaluate patient if persistent, severe headaches occur or if migraines occur or are worsened.
• Evaluate patient for malignancy or pregnancy if she experiences breakthrough bleeding or spotting.
• Closely monitor patient with hyperlipidemias.
• Stop use if jaundice occurs.
• ***Look alike–sound alike:*** Don't confuse YAZ with Yasmin.

## PATIENT TEACHING

• Advise patient to use additional method of birth control during the first 7 days of the first cycle of hormonal contraceptive.
• Inform patient that pills don't protect against sexually transmitted diseases such as HIV.
• Advise patient of the dangers of smoking while taking hormonal contraceptives. Suggest smokers choose a different form of birth control.
• Tell patient to schedule gynecologic examinations yearly and perform breast self-examination monthly.
• Inform patient that spotting, light bleeding, or stomach upset may occur during the first 1 to 3 packs of pills. Tell her to continue taking the pills and to notify her health care provider if these symptoms persist.
• Tell patient to take the pill at the same time each day.
• Tell patient to immediately report sharp chest pain; coughing of blood or sudden shortness of breath; calf pain; crushing chest pain or chest heaviness; sudden severe headache or vomiting; dizziness or fainting; visual or speech disturbances, weakness or numbness in an arm or leg; vision loss; breast lumps; severe stomach pain or tenderness; difficulty sleeping, lack of energy, fatigue, or change in mood; jaundice with fever, fatigue, loss of appetite, dark urine, or light-colored bowel movements.
• Tell patient to notify health care provider if she wears contact lenses and notices a change in vision or has trouble wearing the lenses.
• Tell patient that the risk of pregnancy increases with each active yellow or light pink tablet she forgets to take. Inform patient what to do if she misses pills.
• Tell patient to use an additional method of birth control and to notify health care provider if she isn't sure what to do about missed pills.
• Small amounts of hormonal contraceptives appear in breast milk. Quality and quantity of breast milk may be decreased. Yellow skin and eyes (jaundice) and breast enlargement may occur in breast-fed neonates. Advise breast-feeding women to use alternative method of birth control until infant is completely weaned.

**SAFETY ALERT!**

# drotrecogin alfa (activated)

drow-tra-COH-gin

Xigris

*Therapeutic class:* Antisepsis
*Pharmacologic class:* Recombinant human activated protein C
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection (preservative-free):* 5-mg vial, 20-mg vial

## INDICATIONS & DOSAGES

➤ **To reduce the risk of death in patients with severe sepsis from acute organ dysfunction**

*Adults:* 24 mcg/kg/hour I.V. infusion for a total of 96 hours.

## ADMINISTRATION

**I.V.**

▼ Avoid exposing drug to heat or direct sunlight.
▼ Use aseptic technique during preparation.
▼ Reconstitute 5-mg vial with 2.5 ml or 20-mg vial with 10 ml sterile water for injection. Swirl vial gently until powder is completely dissolved. Don't invert or shake vial.
▼ Use reconstituted solution immediately.
▼ Dilute with sterile normal saline for injection by adding drug to infusion bag. Direct the stream to the side of the bag to avoid agitating solution.
▼ When using an infusion pump, dilute drug to between 100 mcg/ml and 200 mcg/ml.
▼ When using a syringe pump, dilute drug to between 100 mcg/ml and 1,000 mcg/ml.
▼ Gently invert the infusion bag to mix.
▼ Don't transport the infusion bag between locations using a mechanical delivery system.
▼ Inspect solution for particulates and discoloration before giving drug.
▼ If drug is diluted to less than 200 mcg/ml and flow rate is less than 5 ml/hour, prime the infusion set for about 15 minutes at 5 ml/hour.
▼ Give through a dedicated I.V. line or lumen of a multilumen central venous catheter. The only other solutions that can be given through the same line are normal saline solution, lactated Ringer's injection, $D_5W$, or dextrose in saline mixtures.
▼ If the infusion is interrupted, restart at the 24-mcg/kg/hour infusion rate.
▼ Complete infusion within 12 hours after preparing solution.
▼ Store in refrigerator at 35° to 46° F (2° to 8° C). Don't freeze.
▼ If needed, reconstituted vial may be stored at 59° to 86° F (15° to 30° C) for up to 3 hours.
▼ **Incompatibilities:** Other I.V. drugs.

## ACTION

May produce dose-dependent reductions in D-dimer and interleukin (IL)-6. Activated protein C exerts an antithrombotic effect by inhibiting factors Va and VIIIa.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**Hematologic: *hemorrhage.***

## INTERACTIONS

**Drug-drug.** *Drugs that affect hemostasis:* May increase risk of bleeding. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

● May prolong PT and PTT.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or any of its components, those with active internal bleeding, and those who have had hemorrhagic stroke in the past 3 months or intracranial or intraspinal surgery in the past 2 months.
● Contraindicated in patients with severe head trauma, trauma with increased risk of life-threatening bleeding, an epidural catheter, intracranial neoplasm or mass lesion, or cerebral herniation.

***Alert:*** Use only after assessing the risk versus benefit in patients with single organ dysfunction and recent surgery because these patients may not be at a high risk of death.
- Use cautiously in patients taking other drugs that affect hemostasis such as heparin (at least 15 units/kg/hour) and in those with a platelet count less than $30{,}000 \times 10^6$/L (even if the platelet count is increased after transfusions) or an INR greater than 3.
- Use cautiously in patients who have had GI bleeding in the past 6 weeks; thrombolytic therapy in the past 3 days; oral anticoagulants, glycoprotein IIb/IIIa inhibitors, or aspirin (more than 650 mg/day) or other platelet inhibitors in the past week; ischemic stroke in the past 3 months; or intracranial arteriovenous malformation or aneurysm, bleeding diathesis, chronic severe hepatic disease, or any condition in which bleeding poses a significant hazard or would be difficult to manage because of its location.

## NURSING CONSIDERATIONS

***Alert:*** Monitor patient closely for bleeding. If clinically important bleeding occurs, stop infusion immediately.
- Stop drug 2 hours before an invasive surgical procedure. After hemostasis has been achieved, drug may be restarted 12 hours after major invasive procedure or immediately after uncomplicated less invasive procedure.
- Because drug has minimal effect on the PT, this value can be used to monitor the patient's coagulopathy status.

## PATIENT TEACHING

- Inform patient of the potential adverse reactions.
- Instruct patient to promptly report signs of bleeding.
- Advise patient that bleeding may occur for up to 28 days after treatment.

# duloxetine hydrochloride

do-LOCKS-ah-teen

Cymbalta

*Therapeutic class:* Antidepressant
*Pharmacologic class:* SSNRI
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules (delayed-release):* 20 mg, 30 mg, 60 mg

## INDICATIONS & DOSAGES

➤ **Major depressive disorder**
*Adults:* Initially, 20 mg P.O. b.i.d.; then, 60 mg P.O. once daily or divided in two equal doses. Maximum, 60 mg daily.

➤ **Generalized anxiety disorder**
*Adults:* 60 mg P.O. daily. Or, 30 mg P.O. daily for 1 week; then increase to 60 mg P.O. daily. May increase in increments of 30 mg daily to 120 mg P.O. once daily.

➤ **Fibromyalgia**
*Adults:* Initially, 30 mg P.O. once daily for 1 week; increase to 60 mg P.O. once daily after a week. Some patients may respond to the starting dose. Maximum dose is 60 mg/day. Base continued treatment on individual patient response.

➤ **Neuropathic pain related to diabetic peripheral neuropathy**
*Adults:* 60 mg P.O. once daily.

***Adjust-a-dose:*** Duloxetine isn't recommended for patients with end-stage renal disease, severe renal dysfunction, or hepatic dysfunction.

## ADMINISTRATION

**P.O.**
- Give drug whole; don't crush or open capsule.

## ACTION

May inhibit serotonin and norepinephrine reuptake in the CNS.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 6 hr | Unknown |

*Half-life:* 12 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness, fatigue, headache, insomnia, somnolence,* ***suicidal thoughts,*** fever, hypoesthesia, irritability, lethargy, nervousness, nightmares, restlessness, sleep disorder, anxiety, asthenia, tremor.
**CV:** hot flashes, hypertension, increased heart rate.
**EENT:** blurred vision, nasopharyngitis, pharyngolaryngeal pain.
**GI:** *constipation, diarrhea, dry mouth, nausea,* dyspepsia, gastritis, vomiting.
**GU:** abnormal orgasm, abnormally increased frequency of urinating, delayed or dysfunctional ejaculation, dysuria, erectile dysfunction, urinary hesitation.
**Metabolic:** *decreased appetite,* ***hypoglycemia,*** increased appetite, weight gain or loss, hyponatremia.
**Musculoskeletal:** muscle cramps, myalgia.
**Respiratory:** cough.
**Skin:** increased sweating, night sweats, pruritus, rash.
**Other:** decreased libido, rigors.

## INTERACTIONS

**Drug-drug.** *Antiarrhythmics of type 1C (flecainide, propafenone), phenothiazines:* May increase levels of these drugs. Use together cautiously.
*Anticoagulants (such as aspirin, NSAIDs, warfarin):* May increase bleeding risk. Monitor patient closely.
*CNS drugs:* May increase adverse effects. Use together cautiously.
*CYP1A2 inhibitors (cimetidine, fluvoxamine, certain quinolones):* May increase duloxetine level. Avoid using together.
*CYP2D6 inhibitors (fluoxetine, paroxetine, quinidine):* May increase duloxetine level. Use together cautiously.
*Drugs that reduce gastric acidity:* May cause premature breakdown of duloxetine's protective coating and early release of the drug. Monitor patient for effects.
***MAO inhibitors:*** May cause hyperthermia, rigidity, myoclonus, autonomic instability, rapid fluctuations of vital signs, agitation, delirium, and coma. Avoid use within 2 weeks after MAO inhibitor therapy; wait at least 5 days after stopping duloxetine before starting MAO inhibitor.
*Thioridazine:* May prolong the QT interval and increase risk of serious ventricular arrhythmias and sudden death. Avoid using together.
*Tricyclic antidepressants (amitriptyline, nortriptyline, imipramine):* May increase levels of these drugs. Reduce tricyclic antidepressant dose, and monitor drug levels closely.
*Triptans:* May cause serotonin syndrome (restlessness, hallucinations, loss of coordination, fast heartbeat, rapid changes in blood pressure, increased body temperature, hyperreflexia, nausea, vomiting, and diarrhea) or neuroleptic malignant syndrome. Use cautiously and with increased monitoring, especially when starting or increasing dosages.
**Drug-lifestyle.** *Alcohol use:* May increase risk of liver damage. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

• May increase alkaline phosphatase, ALT, AST, bilirubin, and CK levels.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its ingredients, patients taking MAO inhibitors, patients with uncontrolled angle-closure glaucoma, and patients with a creatinine clearance less than 30 ml/minute. Drug isn't recommended for patients with hepatic dysfunction or end-stage renal disease.
**Black Box Warning** Duloxetine isn't approved for use in children. ■
• Use cautiously in patients with a history of mania or seizures, patients who drink substantial amounts of alcohol, patients with hypertension, patients with controlled angle-closure glaucoma, and those with conditions that slow gastric emptying.
***Overdose S&S:*** Coma, hypotension, hypertension, seizures, serotonin syndrome, somnolence, syncope, tachycardia, vomiting.

## NURSING CONSIDERATIONS

• Monitor patient for worsening of depression or suicidal behavior, especially when therapy starts or dosage changes.

**Black Box Warning** Drug may increase risk of suicidal thinking and behavior in children, adolescents, and young adults ages 18 to 24, especially during the first few months of treatment, especially in those with major depressive disorder or other psychiatric disorder. ■

- Treatment of overdose is symptomatic. Don't induce emesis; gastric lavage or activated charcoal may be performed soon after ingestion or if patient is still symptomatic. Because drug undergoes extensive distribution, forced diuresis, dialysis, hemoperfusion, and exchange transfusion aren't useful. Contact a poison control center for information.
- If taken with tricyclic antidepressants, duloxetine metabolism will be prolonged, and patient will need extended monitoring.
- Periodically reassess patient to determine the need for continued therapy.
- Decrease dosage gradually, and watch for symptoms that may arise when drug is stopped, such as dizziness, nausea, headache, paresthesia, vomiting, irritability, and nightmares.
- If intolerable symptoms arise when decreasing or stopping drug, restart at previous dose and decrease even more gradually.
- Monitor blood pressure periodically during treatment.
- Use during the third trimester of pregnancy may cause neonatal complications including respiratory distress, cyanosis, apnea, seizures, vomiting, hypoglycemia, and hyperreflexia, which may require prolonged hospitalization, respiratory support, and tube feeding. Consider potential benefit of drug to the mother versus risks to the fetus.
- Older patients may be more sensitive to drug effects than younger adults.

***Alert:*** Combining triptans with an SSRI or an SSNRI may cause serotonin syndrome or neuroleptic malignant syndrome–like reactions. Signs and symptoms of serotonin syndrome may include restlessness, hallucinations, loss of coordination, fast heartbeat, rapid changes in blood pressure, increased body temperature, overactive reflexes, nausea, vomiting, and diarrhea. Serotonin syndrome may be more likely to occur when starting or increasing the dose of triptan, SSRI, or SSNRI.

## PATIENT TEACHING

**Black Box Warning** Warn families or caregivers to report signs of worsening depression (such as agitation, irritability, insomnia, hostility, impulsivity) and signs of suicidal behavior to prescriber immediately. ■

- Tell patient to consult his prescriber or pharmacist if he plans to take other prescription or OTC drugs or an herbal or other dietary supplement.
- Instruct patient to swallow capsules whole and not to chew, crush, or open them because they have an enteric coating.
- Urge patient to avoid activities that are hazardous or require mental alertness until he knows how the drug affects him.
- Warn against drinking alcohol during therapy.
- If patient takes drug for depression, explain that it may take 1 to 4 weeks to notice an effect.

# dutasteride

doo-TAS-teh-ride

Avodart

*Therapeutic class:* BPH drug
*Pharmacologic class:* 5-alpha-reductase enzyme inhibitor
*Pregnancy risk category X*

## AVAILABLE FORMS

*Capsules:* 0.5 mg

## INDICATIONS & DOSAGES

➤ **To treat and improve the symptoms of BPH, reduce the risk of acute urine retention, and reduce the need for BPH-related surgery**

*Men:* 0.5 mg P.O. once daily. May be given with tamsulosin 0.4 mg P.O. once daily.

➤ **Prostate cancer prevention ♦**

*Men:* 0.5 mg P.O. once daily for up to 7 years.

## ADMINISTRATION

**P.O.**

- Don't crush or break capsules.
- Give drug without regard for food.

**Alert:** Drug is considered a teratogen. Follow safe-handling procedures when preparing, administering, or dispensing drug.

## ACTION

Inhibits conversion of testosterone to dihydrotestosterone, the androgen primarily responsible for the initial development and subsequent enlargement of the prostate gland.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–3 hr | Unknown |

*Half-life:* About 5 weeks.

## ADVERSE REACTIONS

**GU:** impotence, decreased libido, ejaculation disorder.
**Other:** gynecomastia.

## INTERACTIONS

**Drug-drug.** *CYP3A4 inhibitors (such as cimetidine, ciprofloxacin, diltiazem, ketoconazole, ritonavir, verapamil):* May increase dutasteride level. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

- May lower prostate-specific antigen (PSA) level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in women and children and in patients hypersensitive to dutasteride or its ingredients or to other 5-alpha-reductase inhibitors.
- Use cautiously in patients with hepatic disease and in those taking long-term potent cytochrome P-450 inhibitors.

## NURSING CONSIDERATIONS

- Because drug may be absorbed through the skin, women who are or may become pregnant shouldn't handle the drug.
- If contact is made with leaking capsules, wash the contact area immediately with soap and water.
- Carefully monitor patients with a large residual urine volume or severely diminished urine flow, or both, for obstructive uropathy.
- Patients should wait at least 6 months after their last dose before donating blood.
- Establish a new baseline PSA level in men treated for 3 to 6 months and use it to assess potentially cancer-related changes in PSA level.
- To interpret PSA values in men treated for 6 months or more, double the PSA value for comparison with normal values in untreated men.
- Evaluate patients for prostate cancer prior to initiating therapy and periodically thereafter.

## PATIENT TEACHING

- Tell patient to swallow the capsule whole.
- Inform patient that ejaculate volume may decrease but that sexual function should remain normal.
- Teach women who are pregnant or may become pregnant not to handle drug. A male fetus exposed to drug by the mother's swallowing or absorbing the drug through her skin may be born with abnormal sex organs.

**Alert:** Tell patient not to donate blood for at least 6 months after final dose to prevent drug administration to a pregnant female transfusion recipient.

- Tell patient he'll need periodic blood tests to monitor therapeutic effects.

**✶ NEW DRUG**

# ecallantide

ee-KAL-lan-tide

Kalbitor

*Therapeutic class:* Protein inhibitor
*Pharmacologic class:* Human plasma kallikrein inhibitor
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 10-mg/ml vials

## INDICATIONS & DOSAGES

➤ **Acute attacks of hereditary angioedema**

*Adults and adolescents age 16 and older:* 30 mg subcutaneously given as three 10-mg injections; give additional 30-mg dose if attack persists.

## ADMINISTRATION

**Subcutaneous**

- Visually inspect each vial for particulate matter and discoloration before administration. If there is particulate matter or discoloration, don't use vial.
- Using aseptic technique, withdraw 1 ml (10 mg) of ecallantide from vial using large-bore needle. Then change needle on syringe to one suitable for subcutaneous injection (27 gauge).
- Inject subcutaneously into skin of abdomen, thigh, or upper arm.
- Site for each injection may be in same or in different anatomic location (abdomen, thigh, or upper arm); there is no need for site rotation. Separate injection sites by at least 2 inches (5 cm) and avoid anatomic site of attack.

## ACTION

Inhibits kallikrein within the inflammatory pathways, preventing excess bradykinin production.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 2–3 hr | Unknown |

*Half-life:* About 2 hours.

## ADVERSE REACTIONS

**CNS:** *fatigue, fever, headache.*
**EENT:** nasopharyngitis.
**GI:** abdominal pain, *diarrhea, nausea,* vomiting.
**Respiratory:** upper respiratory tract infection.
**Skin:** injection-site reactions, pruritus, rash, urticaria.
**Other:** **ANAPHYLAXIS.**

## INTERACTIONS

None reported.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.

**Black Box Warning** Anaphylaxis has occurred after administration (usually within first hour after dosing). Drug should be administered only by health care provider with medical support available to treat anaphylaxis and hereditary angioedema. Monitor patient closely. ■

- Use during pregnancy only if clearly needed.
- It isn't known if drug appears in breast milk. Use cautiously in breast-feeding women.
- Use cautiously in elderly patients because they may be at increased risk for adverse reactions.

## NURSING CONSIDERATIONS

- Be aware that signs and symptoms of hypersensitivity reactions and acute hereditary angioedema may be very similar.
- Monitor patient closely for signs and symptoms of hypersensitivity reactions (including chest discomfort, flushing, pharyngeal edema, pruritus, rhinorrhea, sneezing, nasal congestion, throat irritation, urticaria, wheezing, and hypotension), especially within first hour after dosing.

## PATIENT TEACHING

- Advise patient to immediately report wheezing, cough, chest tightness, trouble breathing, dizziness, fainting, throat tightness, itchiness, hives, and swelling of tongue or throat.
- Inform patient that drug must be given by health care provider in health care setting, in case serious allergic reaction occurs.

# econazole nitrate

ee-KOE-na-zole

*Therapeutic class:* Antifungal
*Pharmacologic class:* Imidazole derivative
*Pregnancy risk category C*

## AVAILABLE FORMS

*Cream:* 1%

## INDICATIONS & DOSAGES

➤ **Tinea corporis, tinea cruris, tinea pedis, tinea versicolor**

*Adults and children:* Rub into affected areas daily for at least 2 weeks (1 month for tinea pedis).

➤ **Cutaneous candidiasis**
*Adults and children:* Rub into affected areas b.i.d.

## ADMINISTRATION

**Topical**
- Clean and dry affected area before applying.
- Don't use occlusive dressings.
- Drug isn't for ophthalmic use.

## ACTION

Fungistatic, but may be fungicidal depending on level. Appears to alter fungal cell-wall permeability and produce osmotic instability.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**Skin:** burning, erythema, pruritus, stinging.

## INTERACTIONS

**Drug-drug.** *Corticosteroids:* May inhibit antifungal activity against certain organisms. Monitor patient for effect.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.

## NURSING CONSIDERATIONS

- Improvement should be seen after treatment period. If no change is noted, patient should be reevaluated.

## PATIENT TEACHING

- Tell patient to use drug for entire treatment period, even if signs and symptoms improve. Instruct him to notify prescriber if no improvement occurs after 2 weeks in fungal infection on hairless skin (tinea corporis), jock itch, or fungal skin infection (tinea versicolor), or after 4 weeks for athlete's foot.
- Reassure patient that lack of pigmentation from tinea versicolor resolves gradually.
- Tell patient to stop drug and notify prescriber if condition persists or worsens or if irritation occurs.
- Warn patient that drug may stain clothing.
- Tell patient with athlete's foot to change shoes and cotton socks daily and to dry between toes after bathing.
- Tell patient to keep drug out of eyes.

E

**SAFETY ALERT!**

# eculizumab

eck-u-LIZ-uh-mob

Soliris

*Therapeutic class:* Hemolysis inhibitor
*Pharmacologic class:* Monoclonal IgG antibody
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 10 mg/ml in 300-mg single-use vial

## INDICATIONS & DOSAGES

**Black Box Warning** Meningococcal vaccine is required at least 2 weeks before administration of eculizumab.

➤ **Hemolysis in patients with paroxysmal nocturnal hemoglobinuria (PNH)**
*Adults:* 600 mg I.V. every 7 days for 4 weeks, 900 mg 7 days later, then 900 mg every 14 days thereafter.

## ADMINISTRATION

**I.V.**
- Dilute to a final concentration of 5 mg/ml with 0.9% or 0.45% NaCl, $D_5W$ or Ringer's solution (equal volume of diluent to drug volume).
- Don't give as I.V. push or bolus injection.
- Solution should be clear and at room temperature before giving.
- Discard any unused portion left in vial; solution contains no preservatives.
- Reconstituted solution remains stable for 24 hours refrigerated or at room temperature.
- Infuse over 35 minutes. Don't exceed 2 hours total infusion time if infusion is slowed.

▼ Monitor the patient for adverse reactions, including anaphylaxis or hypersensitivity during and 1 hour after infusion.
▼ Store vials in refrigerator and protect from light. Don't freeze or shake.
▼ **Incompatibilities:** Other drugs.

## ACTION

Antibody binds to complement protein C5 to reduce intravascular hemolysis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Unknown | Unknown |

*Half-life:* 272 hours.

## ADVERSE REACTIONS

**CNS:** *headache, fatigue,* fever.
**EENT:** *nasopharyngitis,* sinusitis.
**GI:** *nausea,* constipation.
**Musculoskeletal:** *back pain,* myalgia, pain in arm or leg.
**Hematologic:** anemia.
**Respiratory:** *cough,* respiratory tract infection.
**Other:** ***meningococcal infection/sepsis,*** herpes simplex infection, flulike illness.

## INTERACTIONS

Drug interaction studies haven't been performed.

## EFFECTS ON LAB TEST RESULTS

- May decrease LDH level if hemolysis declines.
- May increase RBC count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patient with unresolved serious *Neisseria meningitidis* infection or in patients who aren't vaccinated against *N meningitidis*.
- Use cautiously in patients with any systemic infection.
- Use during pregnancy only if benefits outweigh risks to fetus.
- Use cautiously in breast-feeding women because drug may appear in breast milk.
- Safety and efficacy in patients younger than age 18 haven't been established.

## NURSING CONSIDERATIONS

**Black Box Warning** Eculizumab increases the risk of meningococcal infections. Give meningococcal vaccine at least 2 weeks before infusing eculizumab; revaccinate according to guidelines. Monitor patient for early signs of meningococcal infections. Evaluate immediately if infection is suspected and treat with antibiotics if necessary. ■

- Give infusion at recommended intervals.
- Monitor the patient for hemolysis after therapy is stopped. Signs of hemolysis include increased LDH levels greater than pretreatment level; greater than 25% absolute decrease in PNH red blood cell clone size within a week; hemoglobin of less than 5 g/dl or a decrease of more than 4 g/dl in less than 7 days; angina; mental status changes; 50% increase in serum creatinine; or thrombosis.
- Watch for hemolysis for 8 weeks after stopping drug.
- If hemolysis occurs, treatment may include blood transfusion, anticoagulation, corticosteroids, or restarting eculizumab.

## PATIENT TEACHING

- Tell patient that meningococcal vaccine is required at least 2 weeks before eculizumab infusion; revaccination may also be required, according to guidelines.

***Alert:*** Advise patient that vaccination won't prevent all meningococcal infection and to report moderate to severe headache accompanied by nausea or vomiting, fever, or stiff neck or back.

- Advise patient to report high fever, fever with rash, confusion, severe muscle aches with flulike symptoms, and sensitivity to light.
- Tell patient he will need periodic blood tests during treatment and continued monitoring for at least 8 weeks after therapy is stopped.
- Advise patient to carry the provided Patient Safety Card at all times and to show the card to any health care provider who treats him.

# edetate calcium disodium

ED-e-tate

Calcium Disodium Versenate

*Therapeutic class:* Chelating agent
*Pharmacologic class:* Heavy metal antagonist
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 200 mg/ml

## INDICATIONS & DOSAGES

➤ **Acute lead encephalopathy or lead levels greater than 70 mcg/dl**

*Adults and children:* Use in conjunction with dimercaprol. Consult published protocols and specialized references for dosage recommendations.

➤ **Lead poisoning without encephalopathy or asymptomatic with lead levels less than 70 mcg/dl**

*Adults and children:* 1 g/m$^2$ I.V. infused over 8 to 12 hours once daily or 1 g/m$^2$ I.M. daily in divided doses spaced 8 to 12 hours apart for 5 days.

## ADMINISTRATION

**I.V.**

▼ Dilute 5-ml ampule with 500 ml or 250 ml of $D_5W$ or normal saline solution for injection to yield 2 mg/ml to 4 mg/ml, respectively.

▼ Infuse half of daily dose over 1 hour and remaining infusion at least 12 hours later. Or, give by slow infusion over at least 8 hours.

▼ **Incompatibilities:** Amphotericin B, dextrose 10% in water, hydralazine hydrochloride, invert sugar 10% in normal saline solution, invert sugar 10% in water, lactated Ringer's solution, Ringer's injection, ⅙ M sodium lactate.

**I.M.**

● Add lidocaine or procaine hydrochloride to I.M. solution to minimize pain. Watch for local reactions.

## ACTION

Forms stable, soluble complexes with metals, particularly lead.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V., I.M. | 1 hr | 24–48 hr | Unknown |

*Half-life:* 20 minutes to 1¼ hours.

## ADVERSE REACTIONS

**CNS:** fever, tremors, headache, paresthesia, malaise, fatigue.
**CV:** hypotension, rhythm irregularities.
**EENT:** histamine-like reactions (including sneezing, congestion, and lacrimation).
**GI:** cheilosis, nausea, vomiting, anorexia, excessive thirst.
**GU:** ***nephrotoxicity with renal tubular necrosis leading to fatal nephrosis,*** proteinuria, hematuria.
**Hematologic:** ***transient bone marrow suppression,*** anemia.
**Metabolic:** zinc deficiency, hypercalcemia.
**Musculoskeletal:** myalgia, arthralgia.
**Skin:** rash.
**Other:** pain at I.M. injection site, chills.

## INTERACTIONS

**Drug-drug.** *Insulin:* May interfere with action of insulin by binding with zinc. Adjust insulin dosage as directed.
*Steroids:* May increase edetate's renal toxicity. Avoid use together. Use mannitol for cerebral edema.

## EFFECTS ON LAB TEST RESULTS

● May increase ALT, AST, and calcium levels. May decrease hemoglobin level and hematocrit.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients with anuria, hepatitis, or acute renal disease.
● Use with caution in patients with mild renal disease. Dosage may be reduced.
⚠ ***Overdose S&S:*** Zinc deficiency.

## NURSING CONSIDERATIONS

**Black Box Warning** Because rapid I.V. use may increase intracranial pressure, especially in children, I.M. route may be preferred for lead encephalopathy. I.V. infusion is still recommended whenever possible. Avoid rapid infusion and never exceed recommended daily dosage. ■
● Monitor fluid intake and output, urinalysis, BUN level, and ECG daily.

● To avoid toxicity, use with dimercaprol; don't mix in same syringe.
● ***Look alike–sound alike:*** Don't confuse edetate calcium disodium with edetate disodium. Both drugs may be abbreviated EDTA; clarify drug order with prescriber.

### PATIENT TEACHING
● Explain use of drug to patient and family.
● Tell patients with lead encephalopathy to avoid excess fluids.

## efavirenz
eff-ah-VYE-renz

Sustiva

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Nonnucleoside reverse transcriptase inhibitor
*Pregnancy risk category D*

### AVAILABLE FORMS
*Capsules:* 50 mg, 100 mg, 200 mg
*Tablets:* 600 mg

### INDICATIONS & DOSAGES
➤ **HIV-1 infection, with a protease inhibitor or nucleoside analogue reverse transcriptase inhibitors**
*Adults and children age 3 and older who weigh 40 kg (88 lb) or more:* 600 mg (three 200-mg capsules or one 600-mg tablet) P.O. once daily on an empty stomach, preferably at bedtime.
*Children age 3 and older who weigh 32.5 to less than 40 kg (72 to less than 88 lb):* 400 mg P.O. once daily on an empty stomach, preferably at bedtime.
*Children age 3 and older who weigh 25 to less than 32.5 kg (55 to less than 72 lb):* 350 mg P.O. once daily on an empty stomach, preferably at bedtime.
*Children age 3 and older who weigh 20 to less than 25 kg (44 to less than 55 lb):* 300 mg P.O. once daily on an empty stomach, preferably at bedtime.
*Children age 3 and older who weigh 15 to less than 20 kg (33 to less than 44 lb):* 250 mg P.O. once daily on an empty stomach, preferably at bedtime.
*Children age 3 and older who weigh 10 to less than 15 kg (22 to less than 33 lb):* 200 mg P.O. once daily on an empty stomach, preferably at bedtime.
***Adjust-a-dose:*** For adults also taking voriconazole, increase voriconazole maintenance dose to 400 mg every 12 hours and decrease efavirenz capsules to 300 mg once daily.

### ADMINISTRATION
**P.O.**
● Give drug at bedtime to decrease CNS adverse effects.

### ACTION
Inhibits the transcription of HIV-1 RNA to DNA, a critical step in the viral replication process, suppressing viral replication.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3–5 hr | Unknown |

*Half-life:* 40 to 76 hours.

### ADVERSE REACTIONS
**CNS:** *dizziness*, abnormal dreams or thinking, agitation, amnesia, confusion, depersonalization, *depression*, euphoria, fever, fatigue, hallucinations, headache, hypoesthesia, impaired concentration, insomnia, nervousness, somnolence.
**GI:** *diarrhea*, *nausea*, abdominal pain, anorexia, dyspepsia, vomiting.
**Skin:** *rash*, ***erythema multiforme, Stevens-Johnson syndrome, toxic epidermal necrolysis,*** increased sweating, pruritus.

### INTERACTIONS
**Drug-drug.** *Amprenavir, clarithromycin, indinavir, lopinavir:* May decrease levels of these drugs. Consider alternative therapy or dosage adjustment.
*Atorvastatin, calcium channel blockers, itraconozole, pravastatin, rifampin, simvastatin:* May decrease levels of these drugs. Dosage adjustments may be necessary.
*Bepridil, ergot derivatives, midazolam, pimozide, triazolam:* May inhibit metabolism of these drugs and cause serious or life-threatening adverse events (such as arrhythmias, prolonged sedation, or respiratory depression). Avoid using together.

*Drugs that induce the cytochrome P-450 enzyme system (such as phenobarbital phenytoin, rifampin):* May result in lower drug levels of efavirenz. Avoid using together.
*Estrogens, ritonavir:* May increase drug levels. Monitor patient.
*Hormonal contraceptives:* May increase ethinyl estradiol level. Advise use of a reliable method of barrier contraception in addition to use of hormonal contraceptives.
*Psychoactive drugs:* May cause additive CNS effects. Avoid using together.
*Rifabutin:* May decrease rifabutin level. Increase daily rifabutin dosage by 50%. Consider doubling rifabutin dosage when rifabutin is given two or three times per week.
*Ritonavir:* May increase levels of both drugs. Monitor patient and liver function closely.
*Saquinavir:* May decrease saquinavir level and efavirenz exposure to the body. Don't use with saquinavir as sole protease inhibitor.
*Voriconazole (in standard doses):* Decreases voriconazole levels significantly, while efavirenz levels significantly increase. Avoid using together unless doses of each are adjusted.
*Warfarin:* May increase or decrease level and effects of warfarin. Monitor INR.
**Drug-herb.** *St. John's wort:* May decrease drug level. Discourage use together.
**Drug-food.** *High-fat meals:* May increase absorption of drug. Instruct patient to maintain a proper low-fat diet.
**Drug-lifestyle.** *Alcohol use:* May enhance CNS effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, and cholesterol levels.
- May cause false-positive urine cannabinoid test results.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those taking bepridil, midazolam, pimozide, triazolam, or ergot derivatives.
- Use cautiously in patients with hepatic impairment and in those receiving hepatotoxic drugs. Monitor liver function test results in patients with history of hepatitis B or C and in those taking ritonavir.

***Overdose S&S:*** Increased nervous system symptoms, involuntary muscle contractions.

## NURSING CONSIDERATIONS

- Monitor cholesterol level.

***Alert:*** Drug shouldn't be used as monotherapy or added on as a single drug to a regimen failing because of viral resistance.

- Using drug with ritonavir may increase liver enzyme levels and adverse effects (such as dizziness, nausea, paresthesia).
- Pregnancy must be ruled out before starting therapy in women of childbearing age.
- Children may be more prone to adverse reactions, especially diarrhea, nausea, vomiting, and rash.

## PATIENT TEACHING

- Instruct patient to take drug with water, preferably at bedtime and on an empty stomach.
- Inform patient about need for scheduled blood tests to monitor liver function and cholesterol level.
- Tell patient to use a barrier contraceptive with a hormonal contraceptive and to notify prescriber immediately if pregnancy is suspected; drug is a known risk to the fetus.
- Inform patient that drug doesn't cure HIV infection, that opportunistic infections and other complications of HIV infection may continue to occur, and that transmission of HIV to others through sexual contact or blood contamination is still possible.
- Instruct patient to take drug at the same time daily and always with other antiretrovirals.
- Tell patient to take drug exactly as prescribed and not to stop it without medical approval. Also instruct patient to report adverse reactions.
- Inform patient that rash is the most common adverse effect. Tell patient to report rash immediately because it may be serious in rare cases.
- Advise patient to report use of other drugs.

• Advise patient that dizziness, difficulty sleeping or concentrating, drowsiness, or unusual dreams may occur during the first few days of therapy. Reassure him that these symptoms typically resolve after 2 to 4 weeks and may be less problematic if drug is taken at bedtime.
• Tell patient to avoid alcohol, driving, or operating machinery until the drug's effects are known.

## eletriptan hydrobromide

ell-ah-TRIP-tan

Relpax

*Therapeutic class:* Antimigraine
*Pharmacologic class:* Serotonin 5-$HT_1$ receptor agonist
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 20 mg, 40 mg

### INDICATIONS & DOSAGES

➤ **Acute migraine with or without aura**

*Adults:* 20 to 40 mg P.O. at first migraine symptom. If headache recurs, dose may be repeated at least 2 hours later to a maximum of 80 mg daily.

### ADMINISTRATION

**P.O.**

• Give drug without regard for food.
• Give drug whole; don't crush or break tablet.
• Give drug with a full glass of water.
• If headache returns after first dose, give a second dose after 2 hours. Don't give more than 80 mg in 24 hours.

### ACTION

Binds to 5-$HT_1$ receptors and may constrict intracranial blood vessels and inhibit proinflammatory neuropeptide release.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | ½ hr | 1½–2 hr | Unknown |

*Half-life:* About 4 hours.

### ADVERSE REACTIONS

**CNS:** *asthenia*, dizziness, headache, hypertonia, hypesthesia, pain, paresthesia, somnolence, vertigo.
**CV:** chest tightness, pain, and pressure, flushing, palpitations.
**EENT:** pharyngitis.
**GI:** abdominal pain, discomfort or cramps, dry mouth, dyspepsia, dysphagia, nausea.
**Musculoskeletal:** back pain.
**Skin:** increased sweating.
**Other:** chills.

### INTERACTIONS

**Drug-drug.** *CYP3A4 inhibitors (such as clarithromycin, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, troleandomycin):* May decrease eletriptan metabolism. Avoid use within 72 hours of these drugs.
*Ergotamine-containing or ergot-type drugs (such as dihydroergotamine or methysergide), other triptans:* May prolong vasospastic reactions. Avoid use within 24 hours of these drugs.
*SSRIs:* May increase the risk of serotonin syndrome (weakness, hyperreflexia, and incoordination). If used together, observe patient closely.

### EFFECTS ON LAB TEST RESULTS

None known.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components and in those with severe hepatic impairment; ischemic heart disease, such as angina pectoris, a history of MI, or silent ischemia; coronary artery vasospasm, including Prinzmetal's variant angina; and other significant CV conditions.
• Contraindicated in patients with cerebrovascular syndromes, such as stroke or transient ischemic attack; peripheral vascular disease, including ischemic bowel disease; uncontrolled hypertension; or hemiplegic or basilar migraine.
• Contraindicated within 24 hours of another 5-$HT_1$ agonist, drugs containing ergotamine, or ergot-type drug.
• Contraindicated in patients with risk factors for coronary artery disease (CAD), such as hypertension, hypercholesterolemia,

smoking, obesity, diabetes, strong family history of CAD, postmenopausal women, or men older than age 40, unless patient is free from cardiac disease. Monitor patient closely after first dose.
- Safety of treating more than three migraine headaches in 30 days hasn't been established.

***Overdose S&S:*** Hypertension, more serious cardiovascular reactions.

### NURSING CONSIDERATIONS
- Drug isn't intended for migraine prevention.

***Alert:*** Combining a triptan with an SSRI or an SSNRI may cause serotonin syndrome. Signs and symptoms may include restlessness, hallucinations, loss of coordination, fast heartbeat, rapid changes in blood pressure, increased body temperature, hyperreflexia, nausea, vomiting, and diarrhea. Serotonin syndrome may be more likely to occur when starting or increasing the dose of a triptan, SSRI, or SSNRI.
- Use drug only when patient has a clear diagnosis of migraine. If the first use produces no response, reconsider the migraine diagnosis.

***Alert:*** Serious cardiac events including acute MI, arrhythmias, and death occur rarely within a few hours after use of 5-$HT_1$ agonists.
- Ophthalmologic effects may occur with long-term use.
- Older patients may develop higher blood pressure than younger patients after taking drug.

### PATIENT TEACHING
- Instruct patient to take dose at the first sign of a migraine headache. If the headache comes back after the first dose, he may take a second dose after 2 hours. Caution patient not to take more than 80 mg in 24 hours.
- Warn patient to avoid driving and operating machinery if he feels dizzy or fatigued after taking the drug.
- Tell patient to immediately report pain, tightness, heaviness, or pressure in the chest, throat, neck, or jaw.
- Tell patient to swallow tablet whole and not to split, crush, or chew.
- Instruct patient to take each dose with a full glass of water.

## eltrombopag
ell-trom-BOW-pag

Promacta

*Therapeutic class:* Hematopoietic
*Pharmacologic class:* Thrombopoietin receptor agonist
*Pregnancy risk category C*

E

### AVAILABLE FORMS
*Tablets:* 25 mg, 50 mg, 75 mg

### INDICATIONS & DOSAGES
**Black Box Warning** Only prescribers enrolled in the Promacta Cares program may prescribe eltrombopag.

➤ **Thrombocytopenia associated with chronic immune thrombocytopenic purpura when response to corticosteroids, immunoglobulins, or splenectomy is inadequate**

*Adults:* Initially, 50 mg P.O. once daily. Adjust dosage as necessary to achieve and maintain platelet count at $50 \times 10^9$/L or greater; maximum dosage is 75 mg daily.
*Adjust-a-dose:* For patients of East Asian descent and those with moderate or severe hepatic impairment, reduce dosage to 25 mg P.O. once daily. For patients with platelet count less than 50,000/$mm^3$ after at least 2 weeks of therapy, increase daily dosage by 25 mg to maximum dosage of 75 mg daily. For platelet count of 200,000 to 400,000/$mm^3$, decrease daily dosage by 25 mg. For platelet count greater than 400,000/$mm^3$, stop drug and monitor platelet count twice weekly. Restart therapy at 25 mg less than the daily dosage when platelet count is less than 150,000/$mm^3$. When platelet count is greater than 400,000/$mm^3$ after 2 weeks at lowest dosage, permanently discontinue drug.

### ADMINISTRATION
**P.O.**
- Give drug on an empty stomach either 1 hour before or 2 hours after a meal.

• Allow a 4-hour interval between eltrombopag administration and the administration of other medications or supplements containing iron, calcium, aluminum, magnesium, selenium, and zinc.

## ACTION

Interacts with the transmembrane of human thrombopoietin receptors, inducing proliferation and differentiation of megakaryocytes from progenitor cells in bone marrow.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–6 hr | Unknown |

*Half-life:* 21 to 32 hours.

## ADVERSE REACTIONS

**CNS:** paresthesia.
**EENT:** cataract, conjunctival hemorrhage.
**GI:** dyspepsia, nausea, vomiting.
**GU:** menorrhagia.
**Hematologic:** thrombocytopenia.
**Musculoskeletal:** myalgia.
**Skin:** ecchymosis.

## INTERACTIONS

**Drug-drug.** *Acetaminophen, NSAIDS, opioids:* May increase levels of these drugs. Use together cautiously.
*Aluminum, calcium, iron, magnesium, selenium, zinc, other polyvalent cations:* May reduce eltrombopag absorption. Avoid using within 4 hours of each other.
*CYP1A2 inhibitors (ciprofloxacin, fluvoxamine):* May increase eltrombopag level. Use together cautiously.
*Substrates of OATPlB1 (atorvastatin, benzylpenicillin, fluvastatin, methotrexate, nateglinide, pravastatin, repaglinide, rifampin, rosuvastatin):* May increase levels of these drugs. Reduce drug dosages.
**Drug-food.** *Dairy products:* May reduce eltrombopag absorption. Advise patient to avoid dairy products within 4 hours of administration.
**Drug-lifestyle.** *Smoking:* May alter drug level. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

• May increase ALT and AST levels and platelet count.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Drug may cause hepatotoxicity. Use cautiously in patients with hepatic disease. ■
• Drug may cause collagen fiber deposition in bone marrow. Obtain a CBC before treatment and then monthly. Discontinue drug if morphologic blood cell abnormalities or cytopenias develop.
• Effects of eltrombopag on pregnant women are unknown. Use cautiously during pregnancy only if the benefit to the mother outweighs the risk to the fetus.
• Safety and efficacy in children younger than age 10 haven't been established.
***Overdose S&S:*** Increased platelet count, increased AST and ALT levels, rash, bradycardia, fatigue.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug is available only through a restricted distribution program called Promacta Cares. Only prescribers, pharmacies, and patients registered with the program are able to prescribe, dispense, and receive the drug. To enroll, call l-877-9-PROMACTA. ■
**Black Box Warning** Enroll pregnant patients in the Promacta pregnancy registry at 1-888-825-5249. ■
**Black Box Warning** Monitor CBC, platelet count, and peripheral blood smear before therapy, weekly during dosage adjustments, and then monthly. Monitor weekly for 4 weeks after therapy ends. ■
**Black Box Warning** Drug may cause hepatotoxicity. Monitor liver function test results before therapy, every 2 weeks during dosage adjustment, and then monthly. If bilirubin level is elevated, fractionation should be performed. If abnormal values are detected, repeat tests within 3 to 5 days until the abnormality resolves, stabilizes, or returns to baseline levels. Discontinue drug if ALT levels are three times or more the upper limit of normal and are progressive, persistent for 4 weeks or more, or accompanied by increased direct bilirubin or clinical symptoms of liver injury. ■
***Alert:*** In patients with thrombocytopenia due to chronic liver disease, drug has been associated with an increased risk of portal venous thrombosis with platelet counts

greater than 200,000/mm$^3$. Drug isn't indicated for these patients.
- Patient should have a baseline eye examination before, and regularly during therapy to monitor for cataract formation or worsening.
- Drug may increase the risk of hematologic malignancies.

### PATIENT TEACHING
- Advise patient to avoid situations and medications that increase the risk of bleeding.
- Instruct patient to avoid foods, mineral supplements, and antacids containing iron, calcium, aluminum, magnesium, selenium, and zinc within 4 hours of taking drug.
- Advise patient to immediately report yellowing of the skin or whites of the eyes, unusual darkening of urine, unusual tiredness, or right upper stomach pain.
- Warn patient that, after stopping drug, the risk of bleeding may be worse than before therapy, especially if patient is taking anticoagulants or antiplatelet drugs.

## emtricitabine
em-tra-SYE-tah-ben

Emtriva

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Nucleoside reverse transcriptase inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS
*Capsules:* 200 mg
*Oral solution:* 10 mg/ml

### INDICATIONS & DOSAGES
➤ **HIV-1 infection, with other antiretrovirals**
*Adults:* One 200-mg capsule or 240 mg (24 ml) oral solution P.O. once daily.
*Children ages 3 months to 17 years:* For children who weigh more than 33 kg (73 lb) and can swallow intact capsules, give one 200-mg capsule P.O. once daily. Otherwise, give 6 mg/kg, up to a maximum dose of 240 mg (24 ml) oral solution once daily.
*Children younger than age 3 months:* 3 mg/kg oral solution P.O. once daily.

***Adjust-a-dose:*** In adults with creatinine clearance of 30 to 49 ml/minute, give one 200-mg capsule every 48 hours or 120 mg oral solution every 24 hours; if clearance is 15 to 29 ml/minute, give one 200-mg capsule every 72 hours or 80 mg oral solution every 24 hours; if clearance is less than 15 ml/minute or patient is receiving dialysis, give one 200-mg capsule every 96 hours or 60 mg oral solution every 24 hours. Give dose after dialysis session. In children with renal insufficiency, consider a dose reduction and increased dosing interval.

**Black Box Warning** Emtricitabine isn't indicated for the treatment of chronic hepatitis B virus (HBV) infection; safety and efficacy of drug haven't been established in patients coinfected with HBV and HIV.

### ADMINISTRATION
**P.O.**
- Give drug with or without food.
- Refrigerate oral solution; if stored at room temperature, use within 3 months.

### ACTION
Inhibits replication of HIV by blocking viral DNA synthesis and inhibits reverse transcriptase by acting as an alternative for the enzyme's substrate, deoxycytidine triphosphate.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | Unknown |

*Half-life:* About 10 hours.

### ADVERSE REACTIONS
**CNS:** *abnormal dreams, asthenia, dizziness, headache, insomnia, depression, fatigue,* neuritis, paresthesia, peripheral neuropathy.
**EENT:** *rhinitis.*
**GI:** *abdominal pain, diarrhea, nausea,* dyspepsia, vomiting.
**Hepatic:** ***hepatotoxicity.***
**Musculoskeletal:** arthralgia, myalgia.
**Respiratory:** *increased cough.*
**Skin:** *allergic skin reaction, discoloration, maculopapular rash, pruritus, urticarial and purpuric lesions, vesiculobullous rash.*

## INTERACTIONS
None reported.

## EFFECTS ON LAB TEST RESULTS
- May increase ALT, amylase, AST, bilirubin, CK, lipase, glucose, and triglyceride levels.
- May decrease neutrophil count.

## CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug or its ingredients.
- In elderly patients, use cautiously because of the potential for other diseases and drug therapies and for decreased hepatic, renal, or cardiac function.
- Use cautiously in patients with impaired renal function.

**Black Box Warning** Lactic acidosis and severe hepatomegaly, including fatal cases, have been reported. ■

## NURSING CONSIDERATIONS
- Test all patients for HBV before starting drug.

**Black Box Warning** Hepatitis B may worsen after emtricitabine therapy stops. Patients with both HIV and HBV need close clinical and laboratory follow-up for several months or longer after stopping drug. ■
- Like other antiretrovirals, emtricitabine may cause changes or increases in body fat, including central obesity, buffalo hump, peripheral wasting, facial wasting, breast enlargement, and a cushingoid appearance.
- Use drug only if clearly needed in pregnant women.

## PATIENT TEACHING
- Remind patient that anti-HIV medicine must be taken for life.
- Inform patient that drug doesn't cure HIV infection, that opportunistic infections and other complications of HIV infection may continue to occur, and that transmission of HIV to others through sexual contact or blood contamination is still possible.
- Explain possible adverse reactions, including lactic acidosis, hepatotoxicity, and changes or increases in body fat.
- Tell woman to notify prescriber immediately if she is or could be pregnant.
- Inform patient the drug may be taken with or without food.
- Tell patient to refrigerate oral solution but if stored at room temperature, to use within 3 months.

# enalaprilat
eh-NAH-leh-prel-at

# enalapril maleate
Vasotec®

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* ACE inhibitor
*Pregnancy risk category C; D in 2nd and 3rd trimesters*

## AVAILABLE FORMS
**enalaprilat**
*Injection:* 1.25 mg/ml
**enalapril maleate**
*Tablets:* 2.5 mg, 5 mg, 10 mg, 20 mg

## INDICATIONS & DOSAGES
➤ **Hypertension**
*Adults:* In patients not taking diuretics, initially, 5 mg P.O. once daily; then adjusted based on response. Usual dosage range is 10 to 40 mg daily as a single dose or two divided doses. Or, 1.25 mg I.V. infusion over 5 minutes every 6 hours.
*Children ages 2 months to 16 years:* 0.08 mg/kg (up to 5 mg) P.O. once daily; dosage should be adjusted as needed up to 0.58 mg/kg (maximum 40 mg). Don't use if creatinine clearance is less than 30 ml/minute.
***Adjust-a-dose:*** If patient is taking diuretics or creatinine clearance is 30 ml/minute or less, initially, 2.5 mg P.O. once daily. Or, 0.625 mg I.V. over 5 minutes, and repeat in 1 hour, if needed; then 1.25 mg I.V. every 6 hours.
➤ **To convert from I.V. therapy to oral therapy in patients receiving diuretics**
*Adults:* Initially, 2.5 mg P.O. once daily; if patient was receiving 0.625 mg I.V. every 6 hours, then 2.5 mg P.O. once daily. Adjust dosage based on response.
➤ **To convert from oral therapy to I.V. therapy**
*Adults:* 1.25 mg I.V. over 5 minutes every 6 hours.

***Adjust-a-dose:*** If creatinine level is more than 1.6 mg/dl or sodium level below 130 mEq/L, initially, 2.5 mg P.O. daily and adjust slowly.

➤ **To manage symptomatic heart failure**

*Adults:* Initially, 2.5 mg P.O. daily or b.i.d., increased gradually over several weeks. Maintenance is 5 to 20 mg daily in two divided doses. Maximum daily dose is 40 mg in two divided doses.

➤ **Asymptomatic left ventricular dysfunction**

*Adults:* Initially, 2.5 mg P.O. b.i.d. Increase as tolerated to target daily dose of 20 mg P.O. in divided doses.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.
- Request oral suspension for patient who has difficulty swallowing.

**I.V.**

▼ Compatible solutions include $D_5W$, normal saline solution for injection, dextrose 5% in lactated Ringer's injection, dextrose 5% in normal saline solution for injection, and Isolyte E.

▼ Inject drug slowly over at least 5 minutes, or dilute in 50 ml of a compatible solution and infuse over 15 minutes.

▼ **Incompatibilities:** Amphotericin B, cefepime hydrochloride, phenytoin sodium.

## ACTION

May inhibit ACE, preventing conversion of angiotensin I to angiotensin II, a potent vasoconstrictor. Less angiotensin II decreases peripheral arterial resistance, decreasing aldosterone secretion, reducing sodium and water retention, and lowering blood pressure.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 4–6 hr | 24 hr |
| I.V. | 15 min | 1–4 hr | 6 hr |

*Half-life:* 12 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia*, headache, dizziness, fatigue, vertigo, syncope.
**CV:** hypotension, chest pain, angina pectoris.
**GI:** diarrhea, nausea, abdominal pain, vomiting.
**GU:** decreased renal function (in patients with bilateral renal artery stenosis or heart failure).
**Hematologic:** bone marrow depression.
**Respiratory:** *dry, persistent, tickling, nonproductive cough*, dyspnea.
**Skin:** rash.
**Other:** ***angioedema.***

## INTERACTIONS

**Drug-drug.** *Azathioprine:* May increase risk of anemia or leukopenia. Monitor hematologic study results if used together.
*Diuretics:* May excessively reduce blood pressure. Use together cautiously.
*Insulin, oral antidiabetics:* May cause hypoglycemia, especially at start of enalapril therapy. Monitor patient closely.
*Lithium:* May cause lithium toxicity. Monitor lithium level.
*NSAIDs:* May reduce antihypertensive effect. Monitor blood pressure.
*Potassium-sparing diuretics, potassium supplements:* May cause hyperkalemia. Avoid using together unless hypokalemia is confirmed.
**Drug-herb.** *Capsaicin:* May cause cough. Discourage use together.
*Ma huang:* May decrease antihypertensive effects. Discourage use together.
**Drug-food.** *Salt substitutes containing potassium:* May cause hyperkalemia. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

- May increase bilirubin, BUN, creatinine, and potassium levels. May decrease sodium and hemoglobin levels and hematocrit.
- May increase liver function test values.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with a history of angioedema related to previous treatment with an ACE inhibitor.

**Black Box Warning** Use during pregnancy can cause injury and death to the developing fetus. When pregnancy is detected, stop drug as soon as possible.

● Use cautiously in renally impaired patients or those with aortic stenosis or hypertrophic cardiomyopathy.
⚠ ***Overdose S&S:*** Hypotension.

### NURSING CONSIDERATIONS
● Closely monitor blood pressure response to drug.
● ***Look alike–sound alike:*** Similar packaging and labeling of enalaprilat injection and pancuronium, a neuromuscular-blocking drug, could result in a fatal medication error. Check all labels carefully.
● Monitor CBC with differential counts before and during therapy.
● Diabetic patients, those with impaired renal function or heart failure, and those receiving drugs that can increase potassium level may develop hyperkalemia. Monitor potassium intake and potassium level.
● ***Look alike–sound alike:*** Don't confuse enalapril with Anafranil or Eldepryl.

### PATIENT TEACHING
● Instruct patient to report breathing difficulty or swelling of face, eyes, lips, or tongue. Swelling of the face and throat (including swelling of the larynx) may occur, especially after first dose.
● Advise patient to report signs of infection, such as fever and sore throat.
● Inform patient that light-headedness can occur, especially during first few days of therapy. Tell him to rise slowly to minimize this effect and to notify prescriber if symptoms develop. If he faints, he should stop taking drug and call prescriber immediately.
● Tell patient to use caution in hot weather and during exercise. Inadequate fluid intake, vomiting, diarrhea, and excessive perspiration can lead to light-headedness and fainting.
● Advise patient to avoid salt substitutes; these products may contain potassium, which can cause high potassium levels in patients taking this drug.
● Tell women of childbearing age to notify prescriber if pregnancy occurs. Drug will need to be stopped.

## enfuvirtide
en-foo-VEER-tide

Fuzeon

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Fusion inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS
*Powder for injection:* 108-mg single-use vials (90 mg/ml after reconstitution)

### INDICATIONS & DOSAGES
➤ **To help control HIV-1 infection, with other antiretrovirals, in patients who have continued HIV-1 replication despite antiretroviral therapy**
*Adults:* 90 mg subcutaneously b.i.d., injected into the upper arm, anterior thigh, or abdomen.
*Children ages 6 to 16:* Give 2 mg/kg subcutaneously b.i.d.; maximum 90 mg per dose.

### ADMINISTRATION
**Subcutaneous**
● Reconstitute vial with 1.1 ml sterile water for injection. Tap vial for 10 seconds and then gently roll to prevent foaming. Let drug stand for up to 45 minutes to ensure reconstitution. Or, gently roll vial between hands until product is completely dissolved. Then draw up correct dose and inject drug.
● If you won't be using drug immediately after reconstitution, refrigerate in original vial and use within 24 hours. Don't inject drug until it's at room temperature.
● Vial is for single use; discard unused portion.
● Rotate injection sites. Don't inject into the same site for two consecutive doses, and don't inject into moles, scar tissue, bruises, or the navel.
● Store unreconstituted vials at room temperature.

### ACTION
Interferes with entry of HIV-1 into cells by inhibiting fusion of HIV-1 to cell membranes.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 4–8 hr | Unknown |

*Half-life:* 4 hours.

## ADVERSE REACTIONS

**CNS:** *fatigue, insomnia,* anxiety, asthenia, depression, peripheral neuropathy.
**EENT:** conjunctivitis, sinusitis, taste disturbance.
**GI:** *diarrhea, nausea,* ***pancreatitis,*** abdominal pain, constipation.
**Metabolic:** anorexia, weight decrease.
**Musculoskeletal:** myalgia.
**Respiratory:** ***bacterial pneumonia,*** cough.
**Skin:** *injection site reactions,* pruritus, skin papilloma.
**Other:** herpes simplex, influenza, influenza-like illness, lymphadenopathy.

## INTERACTIONS

None reported.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, amylase, AST, CK, GGT, lipase, and triglyceride levels. May decrease hemoglobin level.
- May decrease eosinophil count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those not infected with HIV.
- Use in pregnant women only if clearly needed. Pregnant women can be registered in the Antiretroviral Pregnancy Registry by calling 1-800-258-4263.
- Safety and effectiveness haven't been established in children younger than age 6.

## NURSING CONSIDERATIONS

- Injection site reactions (pain, discomfort, induration, erythema, pruritus, nodules, cysts, ecchymosis) are common and may require analgesics or rest.

***Alert:*** Monitor patient closely for evidence of bacterial pneumonia. Patients at high risk include those with a low initial CD4 count or high initial viral load, those who use I.V. drugs or smoke, and those with history of lung disease.

- Hypersensitivity may occur with the first dose or later doses. If symptoms occur, stop drug.

## PATIENT TEACHING

- Teach patient how to prepare and give drug and how to safely dispose of used needles and syringes.
- Tell patient to rotate injection sites and to watch for cellulitis or local infection.
- Urge patient to immediately report evidence of pneumonia, such as cough with fever, rapid breathing, or shortness of breath.
- Tell patient to stop taking drug and seek medical attention if evidence of hypersensitivity develops, such as rash, fever, nausea, vomiting, chills, rigors, and hypotension.
- Teach patient that drug doesn't cure HIV infection and that it must be taken with other antiretrovirals.
- Tell patient to inform prescriber if she's pregnant, plans to become pregnant, or is breast-feeding while taking this drug. Because HIV could be transmitted to the infant, HIV-infected mothers shouldn't breast-feed.
- Tell patient that drug may affect his ability to drive or operate machinery.
- Tell patient that information on self-administration is available by calling 1-877-4FUZEON or at www.fuzeon.com.

**SAFETY ALERT!**

# enoxaparin sodium

en-OCKS-a-par-in

Lovenox

*Therapeutic class:* Anticoagulant
*Pharmacologic class:* Low–molecular-weight heparin
*Pregnancy risk category B*

## AVAILABLE FORMS

*Syringes (graduated prefilled):* 60 mg/0.6 ml, 80 mg/0.8 ml, 100 mg/ml, 120 mg/0.8 ml, 150 mg/ml
*Syringes (prefilled):* 30 mg/0.3 ml, 40 mg/0.4 ml
*Vial (multidose):* 300 mg/3 ml (contains 15 mg/ml of benzyl alcohol)

## INDICATIONS & DOSAGES

➤ **To prevent pulmonary embolism and deep vein thrombosis (DVT) after hip or knee replacement surgery**

*Adults:* 30 mg subcutaneously every 12 hours for 7 to 10 days. Treatment for up to 14 days has been well tolerated. Give initial dose between 12 and 24 hours postoperatively, as long as hemostasis has been established. Continue treatment during postoperative period until risk of DVT has diminished. Hip replacement patients may receive 40 mg subcutaneously given 12 hours preoperatively. After initial phase of therapy, hip replacement patients should continue with 40 mg subcutaneously daily for 3 weeks.

➤ **To prevent pulmonary embolism and DVT after abdominal surgery**

*Adults:* 40 mg subcutaneously daily with initial dose 2 hours before surgery. Give subsequent dose, as long as hemostasis has been established, 24 hours after initial preoperative dose and continue once daily for 7 to 10 days. Treatment for up to 12 days has been well tolerated. Continue treatment during postoperative period until risk of DVT has diminished.

➤ **To prevent pulmonary embolism and DVT in patients with acute illness who are at increased risk because of decreased mobility**

*Adults:* 40 mg once daily subcutaneously for 6 to 11 days. Treatment for up to 14 days has been well tolerated.

***Adjust-a-dose:*** In patients with creatinine clearance less than 30 ml/minute receiving drug as prophylaxis after abdominal surgery or hip or knee replacement surgery, and in medical patients for prophylaxis during acute illness, give 30 mg subcutaneously once daily.

➤ **To prevent ischemic complications of unstable angina and non–Q-wave MI with oral aspirin therapy**

*Adults:* 1 mg/kg subcutaneously every 12 hours until clinical stabilization (minimum 2 days) with aspirin 100 to 325 mg P.O. once daily. Usual duration of treatment is 2 to 8 days.

➤ **Acute ST-segment elevation MI**

*Adults younger than age 75:* 30 mg single I.V. bolus plus 1 mg/kg subcutaneously followed by 1 mg/kg subcutaneously every 12 hours (maximum of 100 mg for the first two doses only) with aspirin (75 to 325 mg P.O. once daily). When given with a thrombolytic, give enoxaparin from 15 minutes before to 30 minutes after the start of fibrinolytic therapy. For patients with percutaneous coronary intervention (PCI), if the last subcutaneous dose was given less than 8 hours before balloon inflation, no additional dose is needed. If the last dose was given more than 8 hours before balloon inflation, give 0.3 mg/kg I.V. bolus.

*Adults age 75 and older:* Don't use an initial I.V. bolus. Give 0.75 mg/kg subcutaneously every 12 hours (maximum 75 mg for the first two doses only).

***Adjust-a-dose:*** In adults younger than age 75 with severe renal impairment, 30 mg single I.V. bolus plus 1 mg/kg subcutaneously followed by 1 mg/kg subcutaneously once daily. In adults age 75 and older with severe renal impairment, 1 mg/kg subcutaneously once daily with no initial bolus.

➤ **Inpatient treatment of acute DVT with and without pulmonary embolism when given with warfarin sodium**

*Adults:* 1 mg/kg subcutaneously every 12 hours. Or, 1.5 mg/kg subcutaneously once daily (at same time daily) for 5 to 7 days until therapeutic oral anticoagulant effect (INR 2 to 3) is achieved. Warfarin sodium therapy is usually started within 72 hours of enoxaparin injection.

➤ **Outpatient treatment of acute DVT without pulmonary embolism when given with warfarin sodium**

*Adults:* 1 mg/kg subcutaneously every 12 hours for 5 to 7 days until therapeutic oral anticoagulant effect (INR 2 to 3) is achieved. Warfarin sodium therapy usually is started within 72 hours of enoxaparin injection.

***Adjust-a-dose:*** In patients with creatinine clearance less than 30 ml/minute receiving drug for acute DVT or prophylaxis of ischemic complications of unstable angina and non–Q-wave MI, give 1 mg/kg subcutaneously once daily.

## ADMINISTRATION

**I.V.**

▼ Use multidose vial.

▼ Flush I.V. access with sufficient amount of saline or dextrose solution before and following I.V. bolus administration.

▼ **Incompatibilities:** Don't mix with other I.V. drugs.

**Subcutaneous**

● With patient lying down, give by deep subcutaneous injection, alternating doses between left and right anterolateral and posterolateral abdominal walls.

● Don't massage after subcutaneous injection. Watch for signs of bleeding at site. Rotate sites and keep record.

## ACTION

Accelerates formation of antithrombin III–thrombin complex and deactivates thrombin, preventing conversion of fibrinogen to fibrin. Drug has a higher antifactor-Xa-to-antifactor-IIa activity ratio than heparin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 4 hr | Unknown |

*Half-life:* 4½ hours after a single dose; 7 hours after repeated dosing.

## ADVERSE REACTIONS

**CNS:** confusion, fever, pain.

**CV:** edema, peripheral edema.

**GI:** nausea, diarrhea.

**Hematologic:** ***thrombocytopenia, hemorrhage,*** ecchymoses, bleeding complications, hypochromic anemia.

**Skin:** irritation, pain, hematoma, and erythema at injection site, *rash, urticaria.*

**Other:** ***angioedema, anaphylaxis.***

## INTERACTIONS

**Drug-drug.** *Anticoagulants, antiplatelet drugs, NSAIDs:* May increase risk of bleeding. Use together cautiously. Monitor PT and INR.

*SSRIs:* May increase risk of severe bleeding. Monitor PT, INR, and patient. Adjust therapy as needed.

**Drug-herb.** *Angelica (dong quai), boldo, bromelains, capsicum, chamomile, dandelion, danshen, devil's claw, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, licorice, meadowsweet, onion, passion flower, red clover, willow:* May increase risk of bleeding. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

● May increase ALT and AST levels. May decrease hemoglobin level.

● May decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug, heparin, or pork products; in those with active major bleeding; and in those with thrombocytopenia and antiplatelet antibodies in presence of drug.

● Use cautiously in patients with history of heparin-induced thrombocytopenia, aneurysms, cerebrovascular hemorrhage, spinal or epidural punctures (as with anesthesia), uncontrolled hypertension, or threatened abortion.

● Use cautiously in elderly patients and in those with conditions that place them at increased risk for hemorrhage, such as bacterial endocarditis, congenital or acquired bleeding disorders, ulcer disease, angiodysplastic GI disease, hemorrhagic stroke, or recent spinal, eye, or brain surgery.

● Use cautiously in patients with prosthetic heart valves, with regional or lumbar block anesthesia, blood dyscrasias, recent childbirth, pericarditis or pericardial effusion, renal insufficiency, or severe CNS trauma.

⚠ ***Overdose S&S:*** Hemorrhagic complications.

## NURSING CONSIDERATIONS

● It's important to achieve hemostasis at the puncture site after PCI. The vascular access sheath for instrumentation should remain in place for 6 hours after a dose if manual compression method is used; give next dose no sooner than 6 to 8 hours after sheath removal. Monitor vital signs and site for hematoma and bleeding.

● Monitor pregnant women closely. Warn pregnant women and women of childbearing age about the potential risk of therapy to her and the fetus.

● Multidose vial shouldn't be used in pregnant women because of benzyl alcohol content.

• Monitor anti-Xa levels in pregnant women with mechanical heart valves.
**Black Box Warning** Patients who receive epidural or spinal anesthesia or spinal puncture during therapy are at increased risk for developing an epidural or spinal hematoma, which may result in long-term or permanent paralysis. Monitor these patients closely for neurologic impairment. ■
• Draw blood to establish baseline coagulation parameters before therapy.
• Never give drug I.M.
***Alert:*** Don't try to expel the air bubble from the 30- or 40-mg prefilled syringes. This may lead to loss of drug and an incorrect dose.
• Avoid I.M. injections of other drugs to prevent or minimize hematoma.
• Monitor platelet counts regularly. Patients with normal coagulation won't need close monitoring of PT or PTT.
• Regularly inspect patient for bleeding gums, bruises on arms or legs, petechiae, nosebleeds, melena, tarry stools, hematuria, hematemesis.
• To treat severe overdose, give protamine sulfate (a heparin antagonist) by slow I.V. infusion at concentration of 1% to equal dose of drug injected.
***Alert:*** Drug isn't interchangeable with heparin or other low–molecular-weight heparins.

## PATIENT TEACHING

• Instruct patient and family to watch for signs of bleeding or abnormal bruising and to notify prescriber immediately if any occur.
• Tell patient to avoid OTC drugs containing aspirin or other salicylates unless ordered by prescriber.
• Advise patient to consult with prescriber before initiating any herbal therapy; many herbs have anticoagulant, antiplatelet, or fibrinolytic properties.

# entacapone

en-tah-KAP-own

Comtan

*Therapeutic class:* Antiparkinsonian
*Pharmacologic class:* Catechol-O-methyltransferase (COMT) inhibitor
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 200 mg

## INDICATIONS & DOSAGES

➤ **Adjunct to levodopa and carbidopa for treatment of idiopathic Parkinson disease in patients with signs and symptoms of end-of-dose wearing off**
*Adults:* 200 mg P.O. with each dose of levodopa and carbidopa, up to eight times daily. Maximum, 1,600 mg daily. May need to reduce daily levodopa dose or extend the interval between doses to optimize patient's response.

## ADMINISTRATION

**P.O.**
• Give drug with immediate- or sustained-release levodopa and carbidopa.
• Give drug without regard for food.

## ACTION

A reversible COMT inhibitor given with levodopa and carbidopa. The combination is thought to cause higher levels of levodopa and optimal control of parkinsonian symptoms.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 1 hr | 6 hr |

*Half-life:* About ½ to ¾ hour for first phase and about 2½ hours for second phase.

## ADVERSE REACTIONS

**CNS:** *dyskinesia*, *hyperkinesia*, hypokinesia, dizziness, anxiety, somnolence, agitation, fatigue, asthenia, hallucinations.
**GI:** *nausea*, *diarrhea*, abdominal pain, constipation, vomiting, dry mouth, dyspepsia, flatulence, gastritis, taste perversion.
**GU:** *urine discoloration.*
**Hematologic:** purpura.

**Musculoskeletal:** back pain.
**Respiratory:** dyspnea.
**Skin:** sweating.
**Other:** bacterial infection.

## INTERACTIONS

**Drug-drug.** *Ampicillin, chloramphenicol, cholestyramine, erythromycin, probenecid:* May block biliary excretion, resulting in higher levels of entacapone. Use together cautiously.
*CNS depressants:* May cause additive effect. Use together cautiously.
*Drugs metabolized by COMT (dobutamine, dopamine, epinephrine, isoetharine, isoproterenol, norepinephrine):* May cause higher levels of these drugs, resulting in increased heart rate, changes in blood pressure, or arrhythmias. Use together cautiously.
*Nonselective MAO inhibitors (such as phenelzine, tranylcypromine):* May inhibit normal catecholamine metabolism. Avoid using together.
**Drug-lifestyle.** *Alcohol use:* May cause additive CNS effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with hepatic impairment, biliary obstruction, or orthostatic hypotension.

⚠ ***Overdose S&S:*** Abdominal pain, loose stools.

## NURSING CONSIDERATIONS

- Use drug only with levodopa and carbidopa; no antiparkinsonian effects occur when drug is given as monotherapy.
- Levodopa and carbidopa dosage requirements are usually lower when drug is given with entacapone; lower levodopa and carbidopa dose or increase dosing interval to avoid adverse effects.
- Drug may cause or worsen dyskinesia, even if levodopa dose is lowered.
- Hallucinations may occur or worsen during therapy with this drug.
- Monitor blood pressure closely, and watch for orthostatic hypotension.
- Diarrhea most often begins within 4 to 12 weeks of starting therapy but may begin as early as 1 week or as late as many months after starting treatment.
- Drug may discolor urine.
- Rarely, rhabdomyolysis has occurred with drug use.
- Rapid withdrawal or abrupt reduction in dose could lead to signs and symptoms of Parkinson disease; it may also lead to hyperpyrexia and confusion, a group of symptoms resembling neuroleptic malignant syndrome. Stop drug gradually, and monitor patient closely. Adjust other dopaminergic treatments, as needed.

## PATIENT TEACHING

- Instruct patient not to crush or break tablet and to take it at same time as levodopa and carbidopa.
- Warn patient to avoid hazardous activities until CNS effects of drug are known.
- Advise patient to avoid alcohol during treatment.
- Instruct patient to use caution when standing after a prolonged period of sitting or lying down because dizziness may occur. This effect is more common during initial therapy.
- Warn patient that hallucinations, increased difficulty with voluntary movements, nausea, and diarrhea could occur.
- Inform patient that drug may turn urine brownish orange.
- Advise patient to notify prescriber about planned, suspected, or known pregnancy, and to notify prescriber if she's breastfeeding.

# entecavir

en-TEK-ah-veer

Baraclude

*Therapeutic class:* Antiviral
*Pharmacologic class:* Guanosine nucleoside analogue
*Pregnancy risk category C*

## AVAILABLE FORMS

*Oral solution:* 0.05 mg/ml
*Tablets:* 0.5 mg, 1 mg

## INDICATIONS & DOSAGES

➤ **Chronic hepatitis B virus (HBV) infection in patients with active viral replication and either persistently increased aminotransferase levels or histologically active disease**

*Adults and adolescents age 16 and older who have had no previous nucleoside treatment:* 0.5 mg P.O. once daily at least 2 hours before or after a meal.

***Adjust-a-dose:*** If creatinine clearance is 30 to 49 ml/minute, give 0.25 mg P.O. once daily. If clearance is 10 to less than 30 ml/minute, give 0.15 mg P.O. once daily. If clearance is less than 10 ml/minute or patient is undergoing hemodialysis or continuous ambulatory peritoneal dialysis, give 0.05 mg P.O. once daily.

*Adults and adolescents age 16 and older who have a history of viremia and are taking lamivudine or have resistance mutations:* 1 mg P.O. once daily at least 2 hours before or after a meal.

***Adjust-a-dose:*** If creatinine clearance is 30 to 49 ml/minute, give 0.5 mg P.O. once daily. If clearance is 10 to less than 30 ml/minute, give 0.3 mg P.O. once daily. If clearance is less than 10 ml/minute or patient is undergoing hemodialysis or continuous ambulatory peritoneal dialysis, give 0.1 mg P.O. once daily.

## ADMINISTRATION

**P.O.**

- Drug should be taken on an empty stomach at least 2 hours before or after a meal to increase absorption.

## ACTION

Inhibits HBV polymerase and reduces viral DNA levels.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | ½–1½ hr | Unknown |

*Half-life:* About 5 or 6 days.

## ADVERSE REACTIONS

**CNS:** dizziness, fatigue, headache.
**GI:** diarrhea, dyspepsia, nausea.
**GU:** glycosuria, hematuria.
**Hepatic:** hepatomegaly.
**Metabolic:** ***lactic acidosis.***

## INTERACTIONS

**Drug-drug.** *Cyclosporine, tacrolimus:* May further decrease renal function. Monitor renal function carefully.

*Drugs that reduce renal function or compete for active tubular secretion:* May increase level of either drug. Monitor renal function, and watch for adverse effects.

**Drug-food.** *All foods:* Delays absorption and decreases drug level. Give drug at least 2 hours before or after a meal.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, amylase, AST, blood glucose, creatinine, lipase, and total bilirubin levels.
- May decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.

**Black Box Warning** Don't use in patients coinfected with HIV/HBV who aren't also receiving highly active antiretroviral therapy. ■

- Use cautiously in patients with renal impairment and in patients who have had a liver transplant.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug may cause life-threatening lactic acidosis and severe hepatomegaly with steatosis. ■

**Black Box Warning** HBV infection may worsen severely after therapy stops. Monitor hepatic function for several months in patients who stop therapy. If appropriate, start therapy for HBV infection. ■

- Use cautiously in pregnant women only if maternal benefit outweighs fetal risk. For monitoring of fetal outcome data, call the pregnancy registry at 1-800-258-4263.
- It's unknown if drug appears in breast milk. Avoid use in breast-feeding women.
- In elderly patients, adjust dosage for age-related decrease in renal function.

## PATIENT TEACHING

- Tell patient to take drug on an empty stomach at least 2 hours before or after a meal.
- Caution against mixing or diluting oral solution with any other substance. Teach proper use of dosing spoon.

- Tell patient to report to prescriber any new adverse effects from this drug and any new drugs he's taking.
- Explain that drug doesn't reduce the risk of HBV transmission to others.
- Teach patient the signs and symptoms of lactic acidosis, such as muscle pain, weakness, dyspnea, GI distress, cold hands and feet, dizziness, or fast or irregular heartbeat.
- Teach patient the signs and symptoms of hepatotoxicity, such as jaundice, dark urine, light-colored stool, loss of appetite, nausea, and stomach pain.
- Warn patient not to stop drug abruptly.

**SAFETY ALERT!**

## ephedrine sulfate

e-FED-rin

*Therapeutic class:* Vasopressor
*Pharmacologic class:* Adrenergic
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules:* 25 mg
*Injection:* 50 mg/ml

### INDICATIONS & DOSAGES

➤ **Hypotension**

*Adults:* 5 to 25 mg I.V., p.r.n., to maximum of 150 mg/24 hours. Or, 25 to 50 mg I.M. or subcutaneously.
*Children:* 0.5 mg/kg or 16.7 mg/$m^2$ subcutaneously or I.M. every 4 to 6 hours.

➤ **Bronchodilation**

*Adults and children older than age 12:* 12.5 to 25 mg P.O. every 4 hours, as needed, not to exceed 150 mg in 24 hours.
*Children:* 0.5 mg/kg or 16.7 mg/$m^2$ subcutaneously or I.M. every 4 to 6 hours.

### ADMINISTRATION

**P.O.**

- Give last dose of the day at least 2 hours before bedtime to prevent insomnia.

**I.V.**

▼ Drug is compatible with most common solutions.
▼ Give slowly by direct injection.
▼ If needed, repeat in 5 to 10 minutes.
▼ **Incompatibilities:** Fructose 10% in normal saline solution; hydrocortisone sodium succinate; Ionosol B, D-CM, and D solutions; pentobarbital sodium; phenobarbital sodium; thiopental.

**I.M.**

- Don't use solution with particulate matter or discoloration.
- Document injection site.

**Subcutaneous**

- Don't use solution with particulate matter or discoloration.
- Document injection site.

### ACTION

Relaxes bronchial smooth muscle by stimulating $beta_2$ receptors; also stimulates alpha and beta receptors and is a direct- and indirect-acting sympathomimetic.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 15–60 min | Unknown | 3–5 hr |
| I.V. | 5 min | Unknown | 60 min |
| I.M., Subcut. | 10–20 min | Unknown | 30–60 min |

*Half-life:* 3 to 6 hours.

### ADVERSE REACTIONS

**CNS:** *insomnia, nervousness,* ***cerebral hemorrhage,*** dizziness, headache, muscle weakness, euphoria, confusion, delirium, tremor.
**CV:** *palpitations,* ***arrhythmias,*** tachycardia, hypertension, precordial pain.
**EENT:** dry nose and throat.
**GI:** nausea, vomiting, anorexia.
**GU:** urine retention, painful urination from visceral sphincter spasm.
**Skin:** diaphoresis.

### INTERACTIONS

**Drug-drug.** *Acetazolamide:* May increase ephedrine level. Monitor patient for toxicity.
*Alpha blockers:* May reduce vasopressor response. Monitor patient closely.
*Antihypertensives:* May decrease effects. Monitor blood pressure.
*Beta blockers:* May block the effects of ephedrine. Monitor patient closely.
*Cardiac glycosides, general anesthetics (halogenated hydrocarbons):* May increase risk of ventricular arrhythmias. Monitor ECG closely.

*Guanethidine:* May decrease pressor effects of ephedrine. Monitor patient closely.
*MAO inhibitors (phenelzine, tranylcypromine):* May cause severe headache, hypertension, fever, and hypertensive crisis. Avoid using together.
*Methyldopa, reserpine:* May inhibit ephedrine effects. Use together cautiously.
*Oxytocics:* May cause severe hypertension. Avoid using together.
*Tricyclic antidepressants:* May decrease pressor response. Monitor patient closely.

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to ephedrine and other sympathomimetics and in those with porphyria, severe coronary artery disease, arrhythmias, angle-closure glaucoma, psychoneurosis, angina pectoris, substantial organic heart disease, or CV disease.
- Contraindicated in those receiving MAO inhibitors or general anesthesia with cyclopropane or halothane.
- Use with caution in elderly patients and in those with hypertension, hyperthyroidism, nervous or excitable states, diabetes, or prostatic hyperplasia.

***Overdose S&S:*** Seizures, nausea, vomiting, chills, cyanosis, irritability, nervousness, fever, suicidal behavior, tachycardia, dilated pupils, blurred vision, opisthotonos, spasms, pulmonary edema, gasping respirations, coma, respiratory failure, hypertension followed by hypotension and anuria.

### NURSING CONSIDERATIONS
***Alert:*** Hypoxia, hypercapnia, and acidosis must be identified and corrected before or during therapy because they may reduce effectiveness or increase adverse reactions.
- Drug isn't a substitute for blood or fluid volume replenishment. Volume deficit must be corrected before giving vasopressors.
- Effectiveness decreases after 2 to 3 weeks as tolerance develops. Prescriber may increase dosage. Drug isn't addictive.
- ***Look alike–sound alike:*** Don't confuse ephedrine with epinephrine.

### PATIENT TEACHING
- Tell patient taking oral form of drug at home to take last dose of day at least 2 hours before bedtime to prevent insomnia.
- Warn patient not to take OTC drugs or herbs that contain ephedrine without consulting prescriber.

## epinastine hydrochloride
ep-ih-NAS-teen

Elestat

*Therapeutic class:* Antihistamine
*Pharmacologic class:* $H_1$ receptor antagonist and mast cell stabilizer
*Pregnancy risk category C*

### AVAILABLE FORMS
*Ophthalmic solution:* 0.05%

### INDICATIONS & DOSAGES
➤ **To prevent pruritus from allergic conjunctivitis**
*Adults and children age 3 and older:* Instill 1 drop into each eye b.i.d. Continue treatment as long as allergen is present, even if symptoms resolve.

### ADMINISTRATION
**Ophthalmic**
- Drug is for ophthalmic use only. Don't inject or give orally.
- Keep bottle tightly closed when not in use.
- Don't touch tip of dropper to any surface.

### ACTION
Inhibits release of mediators from cells involved in hypersensitivity reactions, temporarily preventing pruritus.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Immediate | Unknown | 8 hr |

*Half-life:* About 12 hours.

### ADVERSE REACTIONS
**CNS:** headache.
**EENT:** *cold symptoms*, burning eyes, hyperemia, increased lymph nodes near eyes, pharyngitis, pruritus, rhinitis, sinusitis.

**Respiratory:** increased cough, *upper respiratory tract infection.*

## INTERACTIONS
None reported.

## EFFECTS ON LAB TEST RESULTS
None reported.

## CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug or its components.
- Contraindicated for irritation related to contact lenses.
- Use cautiously in pregnant or breast-feeding women.
- Safety and effectiveness haven't been established in children younger than age 3.

## NURSING CONSIDERATIONS
- Monitor patient for signs and symptoms of infection.
- Soft contact lenses may absorb the preservative benzalkonium.

## PATIENT TEACHING
- Teach patient proper instillation technique. Instruct him not to touch any surface, eyelid, or surrounding areas with tip of dropper.
- Caution patient not to use drops to treat contact lens–related eye irritation and not to wear contact lenses if eyes are red.
- Warn patient that soft contact lenses may absorb the preservative benzalkonium.
- Advise patient to report adverse reactions to drug.
- Tell patient to keep bottle tightly closed when not in use.
- Instruct patient who wears soft contact lenses and whose eyes aren't red to wait at least 10 minutes after instilling drug before inserting contact lenses.

**SAFETY ALERT!**

# epinephrine (adrenaline)
ep-i-NEF-rin

Primatene Mist ◇*

# epinephrine hydrochloride
Adrenalin Chloride, EpiPen, EpiPen Jr, microNefrin ◇, Nephron ◇, S2 ◇

*Therapeutic class:* Vasopressor
*Pharmacologic class:* Adrenergic
*Pregnancy risk category C*

## AVAILABLE FORMS
*Aerosol inhaler:* 220 mcg ◇
*Injection:* 0.1 mg/ml (1:10,000), 0.5 mg/ml (1:2,000), 1 mg/ml (1:1,000) parenteral
*Nebulizer inhaler:* 1% (1:100) ◇, 1.125% ◇

## INDICATIONS & DOSAGES
➤ **Bronchospasm, hypersensitivity reactions, anaphylaxis**
*Adults:* 0.2 to 1 mg of 1:1,000 solution I.M. or subcutaneously. Repeat every 10 to 15 minutes as needed. Or, 0.1 to 0.25 mg of 1:10,000 solution I.V. slowly over 5 to 10 minutes. May repeat every 5 to 15 minutes as needed, or follow with a continuous I.V. infusion, starting at 1 mcg/minute and increasing to 4 mcg/minute, as needed. Or, 0.3 mg I.M. or subcutaneously with autoinjector into outer aspect of thigh, through clothing if necessary. Repeat as needed.
*Infants and children:* 0.01 mg/kg (10 mcg) of 1:1,000 solution subcutaneously; repeat every 4 hours, as needed. Maximum single dose shouldn't exceed 0.5 mg. Or, 0.3 mg of 1:10,000 solution I.V. Repeat every 15 minutes for three or four doses p.r.n. Or, 0.15 mg by autoinjector if patient weighs 15 to 29 kg (33 to 64 lb) or 0.3 mg by autoinjector if patient weighs 30 kg (66 lb) or more, I.M. or subcutaneously, into outer aspect of thigh, through clothing if necessary. Repeat p.r.n.
*Neonates:* 0.01 mg/kg of 1:1,000 solution subcutaneously.
➤ **Hemostasis**
*Adults:* 1:50,000 to 1:1,000, sprayed or applied topically.

➤ **Acute asthma attacks**
*Adults and children age 4 and older:* One inhalation, repeated once if needed after at least 1 minute; don't give subsequent doses for at least 3 hours. Or, 1 to 3 deep inhalations using a hand-bulb nebulizer containing 1% (1:100) solution of epinephrine repeated every 3 hours, as needed.
➤ **To restore cardiac rhythm in cardiac arrest ♦**
*Adults:* 0.5 to 1 mg I.V., repeated every 3 to 5 minutes, if needed.
*Children:* 0.01 mg/kg (0.1 ml/kg of 1:10,000 injection) I.V. or intraosseous push every 3 to 5 minutes. First endotracheal dose is 0.1 mg/kg (0.1 ml/kg of a 1:1,000 injection) diluted in 1 to 2 ml of half-normal or normal saline solution. Give subsequent I.V. or intratracheal doses 0.1 (0.1 ml/kg of a 1:1,000 injection), repeated every 3 to 5 minutes, if needed.

## ADMINISTRATION

**I.V.**
▼ Keep solution in light-resistant container, and don't remove before use.
▼ Just before use, mix with $D_5W$, normal saline solution for injection, lactated Ringer's injection, or combinations of dextrose in saline solution.
▼ Monitor blood pressure, heart rate, and ECG when therapy starts and frequently thereafter.
▼ Discard solution if it's discolored or contains precipitate or after 24 hours.
▼ Don't give autoinjectors I.V.
▼ **Incompatibilities:** Aminophylline; ampicillin sodium; furosemide; hyaluronidase; Ionosol D-CM, PSL, and T solutions with $D_5W$; mephentermine; thiopental sodium. Compatible with most other I.V. solutions. Rapidly destroyed by alkalies or oxidizing drugs, including halogens, nitrates, nitrites, permanganates, sodium bicarbonate, and salts of easily reducible metals, such as iron, copper, and zinc. Don't mix with alkaline solutions.

**I.M.**
● Avoid I.M. use of parenteral suspension into buttocks. Gas gangrene may occur because drug reduces oxygen tension of the tissues, encouraging growth of contaminating organisms.
● Massage site after I.M. injection to counteract vasoconstriction. Repeated local injection can cause necrosis at injection site.
● Don't give if solution is discolored or contains precipitate.
● Don't give autoinjectors I.V.

**Subcutaneous**
● Don't refrigerate; protect from light.
● Don't give if solution is discolored or contains precipitate.
● Don't give autoinjectors I.V.
● Preferred route. Don't inject too deeply and enter muscle.

**Inhalational**
● Teach patient to perform oral inhalation correctly. See "Patient teaching" for complete instructions.
● Epinephrine 1:100 will turn from pink to brown if exposed to air, light, heat, alkalies, and some metals. Don't use solution that's discolored or has a precipitate.

## ACTION

Relaxes bronchial smooth muscle by stimulating $beta_2$ receptors and alpha and beta receptors in the sympathetic nervous system.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | 5 min | Short |
| I.M. | Variable | Unknown | 1–4 hr |
| Subcut. | 5–15 min | 30 min | 1–4 hr |
| Inhalation | 1–5 min | Unknown | 1–3 hr |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *drowsiness, headache, nervousness, tremor,* ***cerebral hemorrhage, stroke,*** vertigo, pain, disorientation, agitation, fear, dizziness, weakness.
**CV:** *palpitations,* ***ventricular fibrillation, shock,*** widened pulse pressure, hypertension, tachycardia, anginal pain, altered ECG (including a decreased T-wave amplitude).
**GI:** *nausea, vomiting.*
**Respiratory:** dyspnea.
**Skin:** urticaria, hemorrhage at injection site, pallor.
**Other:** tissue necrosis.

## INTERACTIONS

**Drug-drug.** *Alpha blockers:* May cause hypotension from unopposed beta-adrenergic effects. Avoid using together.

*Antihistamines, thyroid hormones:* When given with sympathomimetics, may cause severe adverse cardiac effects. Avoid using together.
*Cardiac glycosides, general anesthetics (halogenated hydrocarbons):* May increase risk of ventricular arrhythmias. Monitor ECG closely.
*Carteolol, nadolol, penbutolol, pindolol, propranolol, timolol:* May cause hypertension followed by bradycardia. Stop beta blocker 3 days before starting epinephrine.
*Doxapram, methylphenidate:* May enhance CNS stimulation or pressor effects. Monitor patient closely.
*Ergot alkaloids:* May decrease vasoconstrictor activity. Monitor patient closely.
*Guanadrel, guanethidine:* May enhance pressor effects of epinephrine. Monitor patient closely.
*Levodopa:* May enhance risk of arrhythmias. Monitor ECG closely.
*MAO inhibitors:* May increase risk of hypertensive crisis. Monitor blood pressure closely.
*Tricyclic antidepressants:* May potentiate the pressor response and cause arrhythmias. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN, glucose, and lactic acid levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with angle-closure glaucoma, shock (other than anaphylactic shock), organic brain damage, heart failure, cardiac dilation, arrhythmias, coronary insufficiency, or cerebral arteriosclerosis.
- Contraindicated in patients receiving general anesthesia with halogenated hydrocarbons or cyclopropane and in patients in labor (may delay second stage).
- Commercial products containing sulfites contraindicated in patients with sulfite allergies, except when epinephrine is being used to treat serious allergic reactions or other emergency situations.
- Contraindicated for use in fingers, toes, ears, nose, or genitalia when used with local anesthetic.
- Use cautiously in patients with long-standing bronchial asthma or emphysema who have developed degenerative heart disease.
- Use cautiously in elderly patients and in those with hyperthyroidism, CV disease, hypertension, psychoneurosis, and diabetes.

***Overdose S&S:*** Precordial distress, vomiting, headache, dyspnea, hypertension, peripheral vascular constriction, pulmonary edema, cerebral hemorrhage.

E

## NURSING CONSIDERATIONS

- In patients with Parkinson disease, drug increases rigidity and tremor.
- Drug interferes with tests for urinary catecholamines.
- Note that 1 mg equals 1 ml of 1:1,000 solution or 10 ml of 1:10,000 solution.
- Epinephrine is drug of choice in emergency treatment of acute anaphylactic reactions.
- Observe patient closely for adverse reactions. Notify prescriber if adverse reactions develop; adjusting dosage or stopping drug may be necessary.
- If blood pressure increases sharply, give rapid-acting vasodilators, such as nitrates and alpha blockers, to counteract the marked pressor effect of large doses.
- Drug is rapidly destroyed by oxidizing products, such as iodine, chromates, nitrites, oxygen, and salts of easily reducible metals (such as iron).
- When treating patient with reactions caused by other drugs given I.M. or subcutaneously, inject this drug into the site where the other drug was given to minimize further absorption.
- ***Look alike–sound alike:*** Don't confuse epinephrine with ephedrine or norepinephrine.

## PATIENT TEACHING

- Teach patient to perform oral inhalation correctly. Give the following instructions for using a metered-dose inhaler:
  – Shake canister.
  – Clear nasal passages and throat.
  – Breathe out, expelling as much air from lungs as possible.
  – Place mouthpiece well into mouth, and inhale deeply as you release dose from

inhaler. Or, hold inhaler about 1 inch (two fingerwidths) from open mouth, and inhale while releasing dose.
– Hold breath for several seconds, remove mouthpiece, and exhale slowly.
• If more than one inhalation is prescribed, advise patient to wait at least 2 minutes before repeating procedure.
• Tell patient that use of a spacer device may improve drug delivery to lungs.
• If patient is also using a corticosteroid inhaler, instruct him to use the bronchodilator first and then to wait about 5 minutes before using the corticosteroid. This lets the bronchodilator open the air passages for maximal effectiveness.
• Instruct patient to remove canister and wash inhaler with warm, soapy water at least once weekly.
• If patient has acute hypersensitivity reactions (such as to bee stings), you may need to teach him to self-inject drug.
• Instruct patient in autoinjector use.
• Tell patient to give autoinjector in outer thigh and not into the buttock.
• Caution patient or caregiver to only give two sequential doses unless under direct medical supervision. Patient should seek immediate medical care for acute hypersensitivity reactions.

**SAFETY ALERT!**

## epirubicin hydrochloride

ep-uh-ROO-bi-sin

Ellence

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Anthracycline glycoside antibiotic
*Pregnancy risk category D*

### AVAILABLE FORMS

*Injection:* 2 mg/ml
*Powder for injection:* 50 mg, 200 mg

### INDICATIONS & DOSAGES

➤ **Adjuvant therapy in patients with evidence of axillary node tumor involvement after resection of primary breast cancer**

*Adults:* 100 to 120 mg/m$^2$ I.V. infusion over 3 to 5 minutes through a free-flowing I.V. solution on day 1 of each cycle, or divided equally in two doses on days 1 and 8 of each cycle; cycle repeated every 3 to 4 weeks for six cycles; used with regimens containing cyclophosphamide and fluorouracil.

Dosage modification after first cycle is based on toxicity. For patients with platelet count nadir below 50,000/mm$^3$, absolute neutrophil count (ANC) below 250/mm$^3$, neutropenic fever, or grade 3 or 4 nonhematologic toxicity, reduce day 1 dose in subsequent cycles to 75% of day 1 dose given in current cycle. Delay day 1 therapy in subsequent cycles until platelet count is at least 100,000/mm$^3$, ANC is at least 1,500/mm$^3$, and nonhematologic toxicities recover to grade 1.

For patients receiving divided doses (days 1 and 8), day 8 dose should be 75% of day 1 dose if platelet count is 75,000 to 100,000/mm$^3$ and ANC is 1,000 to 1,499/mm$^3$. If day 8 platelet count is below 75,000/mm$^3$, ANC is below 1,000/mm$^3$, or grade 3 or 4 nonhematologic toxicity has occurred, omit day 8 dose.

***Adjust-a-dose:*** For patients with bone marrow dysfunction (heavily pretreated patients, patients with bone marrow depression, or those with neoplastic bone marrow infiltration), start at lower doses of 75 to 90 mg/m$^2$.

**Black Box Warning** For patients with hepatic dysfunction, if bilirubin is 1.2 to 3 mg/dl or AST is two to four times upper limit of normal, give half recommended starting dose. If bilirubin level is above 3 mg/dl or AST is more than four times upper limit of normal, give one-fourth recommended starting dose. ■

For patients with severe renal dysfunction (creatinine level over 5 mg/dl), consider lower doses.

### ADMINISTRATION

**I.V.**

▼ Wear protective clothing (goggles, gown, disposable gloves) when handling drug, which is a vesicant.

**Black Box Warning** Never give drug I.M. or subcutaneously. Always give I.V. through free-flowing normal saline solution or $D_5W$ over 3 to 20 minutes

depending on dosage and volume of infusion solution. ▮

**Black Box Warning** Avoid veins over joints or in limbs with compromised venous or lymphatic drainage. ▮

▼ Avoid repeated injection into the same vein.

▼ Facial flushing and erythematous streaking along vein may indicate overly rapid delivery.

**Black Box Warning** If burning or stinging occurs, stop infusion immediately and restart in another vein. ▮

▼ After vial has been penetrated, discard unused solution after 24 hours.

▼ **Incompatibilities:** Fluorouracil, heparin, ifosfamide with mesna, other I.V. drugs.

## ACTION

May form a complex with DNA by getting between nucleotide base pairs, inhibiting DNA, RNA, and protein synthesis; DNA cleavage occurs, resulting in cytocidal activity. Drug may also interfere with replication and transcription of DNA and may generate cytotoxic free radicals.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 31 to 35 hours.

## ADVERSE REACTIONS

**CNS:** *lethargy,* fever.
**CV:** ***cardiomyopathy, heart failure,*** hot flashes.
**EENT:** *conjunctivitis, keratitis.*
**GI:** *nausea, vomiting, diarrhea,* anorexia, *mucositis.*
**GU:** *amenorrhea,* red urine.
**Hematologic:** **LEUKOPENIA, NEUTROPENIA, *febrile neutropenia,*** *anemia,* **THROMBOCYTOPENIA.**
**Skin:** *alopecia,* rash, itch, skin changes, local toxicity.
**Other:** *infection.*

## INTERACTIONS

**Drug-drug.** *Calcium channel blockers, other cardioactive compounds:* May increase risk of heart failure. Monitor cardiac function closely.

*Cimetidine:* May increase epirubicin level by 50%. Avoid using together.
*Cytotoxic drugs:* May cause additive toxicities (especially hematologic and GI). Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level.
- May decrease neutrophil, platelet, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, other anthracyclines, or anthracenediones, and in patients with baseline neutrophil counts below 1,500/mm$^3$, severe myocardial insufficiency, recent MI, serious arrhythmias, or severe hepatic dysfunction.
- Contraindicated in patients who have had previous treatment with anthracyclines to total cumulative doses.
- Use cautiously in patients with active or dormant cardiac disease, previous or current radiotherapy to mediastinal and pericardial areas, or previous therapy with other anthracyclines or anthracenediones.
- Use cautiously in patients receiving other cardiotoxic drugs.

***Overdose S&S:*** Bone marrow aplasia, grade 4 mucositis, GI bleeding, hyperthermia, multiple organ failure, lactic acidosis, increased LDH level, anuria, death.

## NURSING CONSIDERATIONS

**Black Box Warning** Give drug under supervision of prescriber experienced in cancer chemotherapy. ▮

- Don't handle drug if you are pregnant.
- For patients taking 120 mg/m$^2$, give prophylactic co-trimoxazole or fluoroquinolones.
- Give antiemetic before drug to reduce nausea and vomiting.
- Before therapy, obtain total bilirubin, AST, and creatinine levels; CBC including ANC; and left ventricular ejection fraction (LVEF).
- Monitor LVEF regularly during therapy. Stop drug at first sign of impaired cardiac function. Early signs of cardiac toxicity include sinus tachycardia, ECG abnormalities, tachyarrhythmias, bradycardia, AV block, and bundle-branch block.

**Black Box Warning** Delayed cardiac toxicity may occur 2 to 3 months after treatment ends; indications include reduced LVEF and signs and symptoms of heart failure (tachycardia, dyspnea, pulmonary edema, dependent edema, hepatomegaly, ascites, pleural effusion, and gallop rhythm). Delayed cardiac toxicity depends on cumulative dose of epirubicin. Don't exceed cumulative dose of 900 mg/m$^2$. ■

**Black Box Warning** Severe myelosuppression may occur. ■

- Obtain total and differential WBC, CBC, platelet counts, and liver function tests before and during each cycle of therapy.
- WBC nadir is usually reached 10 to 14 days after drug administration, and returns to normal by day 21.
- Monitor uric acid, potassium, calcium phosphate, and creatinine levels immediately after initial chemotherapy administration in patients susceptible to tumor lysis syndrome. Hydration, urine alkalinization, and prophylaxis with allopurinol may prevent hyperuricemia and minimize potential complications of tumor lysis syndrome.
- Drug may enhance the effects of radiation therapy or cause an inflammatory cell reaction at irradiation site. Monitor patient closely.

**Black Box Warning** Secondary AML has been reported in patients with breast cancer treated with anthracyclines including epirubicin. ■

## PATIENT TEACHING

- Advise patient to report any pain or burning at site of injection during or after administration.
- Advise patient to report nausea, vomiting, mouth inflammation, dehydration, fever, evidence of infection, or symptoms of heart failure (rapid heart beat, labored breathing, swelling).
- Tell patient that urine will be reddish pink for 1 to 2 days after treatment.
- Inform patient of risk of heart damage and treatment-related leukemia with use of drug.
- Advise men to use effective contraception during treatment.
- Advise women that irreversible, premature menopause may occur.
- Tell patient that hair usually regrows within 2 to 3 months after therapy stops.

# eplerenone

ep-LER-eh-nown

Inspra

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Selective aldosterone receptor antagonist
*Pregnancy risk category B*

## AVAILABLE FORMS

*Tablets:* 25 mg, 50 mg

## INDICATIONS & DOSAGES

➤ **Hypertension**

*Adults:* 50 mg P.O. once daily. If response is inadequate after 4 weeks, increase dosage to 50 mg P.O. b.i.d. Maximum daily dose, 100 mg.

***Adjust-a-dose:*** In patients taking weak CYP3A4 inhibitors (erythromycin, fluconazole, saquinavir, verapamil), reduce eplerenone starting dose to 25 mg P.O. once daily.

➤ **Heart failure after an MI**

*Adults:* Initially, 25 mg P.O. once daily. Increase within 4 weeks, as tolerated and according to potassium level, to 50 mg P.O. once daily.

***Adjust-a-dose:*** If potassium level is less than 5 mEq/L, increase dosage from 25 mg every other day to 25 mg daily; or increase dosage from 25 mg daily to 50 mg daily. If potassium level is 5 to 5.4 mEq/L, don't adjust dosage. If potassium level is 5.5 to 5.9 mEq/L, decrease dosage from 50 mg daily to 25 mg daily; or decrease dosage from 25 mg daily to 25 mg every other day; or if dosage was 25 mg every other day, withhold drug. If potassium level is greater than 6 mEq/L, withhold drug. May restart drug at 25 mg every other day when potassium level is less than 5.5 mEq/L. In patients taking weak CYP3A4 inhibitors (erythromycin, fluconazole, saquinavir, verapamil), reduce eplerenone starting dose to 25 mg P.O. once daily.

## ADMINISTRATION

**P.O.**

● Give drug without regard for meals.

## ACTION

Binds to mineralocorticoid receptors and blocks aldosterone, which increases blood pressure through induction of sodium reabsorption and possibly other mechanisms.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 90 min | Unknown |

*Half-life:* 4 to 6 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, fatigue.
**GI:** diarrhea, abdominal pain.
**GU:** albuminuria, abnormal vaginal bleeding.
**Metabolic:** ***hyperkalemia.***
**Respiratory:** cough.
**Other:** flulike syndrome, gynecomastia.

## INTERACTIONS

**Drug-drug.** *ACE inhibitors, angiotensin II receptor antagonists:* May increase risk of hyperkalemia. Use together cautiously.
***Azole antifungals (itraconazole, ketoconazole), macrolides (clarithromycin), nefazodone, protease inhibitors (nelfinavir, ritonavir):*** Inhibits the CYP3A4 metabolism of eplerenone. Use together is contraindicated.
*Lithium:* May increase risk of lithium toxicity. Monitor lithium level.
*NSAIDs:* May reduce the antihypertensive effect and cause severe hyperkalemia in patients with impaired renal function. Monitor blood pressure and potassium level.
***Potassium supplements, potassium-sparing diuretics (amiloride, spironolactone, triamterene):*** May increase risk of hyperkalemia and sometimes-fatal arrhythmias. Use together is contraindicated.
*Weak CYP3A4 inhibitors (erythromycin, fluconazole, saquinavir, verapamil):* May increase eplerenone level. Reduce eplerenone starting dose to 25 mg P.O. once daily.
**Drug-herb.** *St. John's wort:* May decrease eplerenone level over time. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

● May increase ALT, BUN, cholesterol, creatinine, GGT, potassium, triglyceride, and uric acid levels. May decrease sodium level.

## CONTRAINDICATIONS & CAUTIONS

● When used for hypertension, contraindicated in patients with type 2 diabetes with microalbuminuria, creatinine level greater than 2 mg/dl in men or greater than 1.8 mg/dl in women, or creatinine clearance less than 50 ml/minute and in patients taking potassium supplements or potassium-sparing diuretics (amiloride, spironolactone, or triamterene).
● Contraindicated in patients with potassium level greater than 5.5 mEq/ml or creatinine clearance 30 ml/minute or less and in patients taking strong CYP3A4 inhibitors, such as ketoconazole, clarithromycin, ritonavir, nelfinavir, nefazodone, or itraconazole.
● Use cautiously in patient with mild to moderate hepatic impairment.
● Use in pregnant women only if the potential benefits justify the potential risk to the fetus. Use cautiously in breast-feeding women; it's unknown if drug appears in breast milk.
***Overdose S&S:*** Hypotension, hyperkalemia.

## NURSING CONSIDERATIONS

● Drug may be used alone or with other antihypertensives.
● Full therapeutic effect of the drug occurs in 4 weeks.
● In patients with heart failure, measure potassium level at baseline, within the first week, at 1 month after starting therapy, and periodically thereafter.
● Monitor patient for signs and symptoms of hyperkalemia.
● ***Look alike–sound alike:*** Don't confuse Inspra with Spiriva.

## PATIENT TEACHING

● Inform patient that drug may be taken with or without food.
● Advise patient to avoid potassium supplements and salt substitutes during treatment.
● Tell patient to report adverse reactions.

**SAFETY ALERT!**

## epoetin alfa (erythropoietin)

e-poe-E-tin

Epogen, Eprex†, Procrit

*Therapeutic class:* Colony stimulating factor
*Pharmacologic class:* Recombinant human erythropoietin
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 2,000 units/ml, 3,000 units/ml, 4,000 units/ml, 10,000 units/ml, 20,000 units/ml, 40,000 units/ml

### INDICATIONS & DOSAGES

➤ **Anemia caused by chronic renal failure**

*Adults:* Dosage is individualized. Starting dose is 50 to 100 units/kg subcutaneously or I.V. three times weekly. I.V. route is preferred for patients receiving hemodialysis. Maintenance dosage is highly individualized. Give the lowest effective dose to gradually increase hemoglobin to a level where blood transfusion isn't necessary.
*Infants and children ages 1 month and older who are on dialysis or 3 months and older who aren't on dialysis:* Initially, 50 units/kg I.V. or subcutaneously three times weekly. I.V. route is preferred for patients receiving hemodialysis. Maintenance dosage is highly individualized to keep hemoglobin level within target range. Give the lowest effective dose to gradually increase hemoglobin to a level where blood transfusion isn't necessary.
***Adjust-a-dose:*** Reduce dosage by 25% when target hemoglobin level approaches 12 g/dl or if it rises more than 1 g/dl in any 2-week period. If hemoglobin level continues to increase, hold dose until hemoglobin level begins to decrease; then restart at 25% below previous dose. Increase dosage by 25% if hemoglobin level is less than 10 g/dl and hasn't increased by 1 g/dl after 4 weeks or hemoglobin level falls below 10 g/dl.

➤ **Anemia from zidovudine therapy (less than or equal to 4,200 mg/week) in HIV-infected patients**

*Adults:* Initially, 100 units/kg I.V. or subcutaneously three times weekly for 8 weeks or until target hemoglobin level is reached. If response isn't satisfactory after 8 weeks, increase dosage by 50 to 100 units/kg I.V. or subcutaneously three times weekly. Evaluate response every 4 to 8 weeks thereafter; further increase dosage in increments of 50 to 100 units/kg three times weekly, up to maximum of 300 units/kg I.V. or subcutaneously three times weekly. Give the lowest effective dose to gradually increase hemoglobin to a level where blood transfusion isn't necessary.

➤ **Anemia from chemotherapy**

*Adults:* Don't initiate therapy if hemoglobin level is 10 g/dl or higher. Initially, 150 units/kg subcutaneously three times weekly. If response isn't satisfactory after 4 weeks, increase dosage up to 300 units/kg subcutaneously three times weekly. Or, 40,000 units subcutaneously once weekly. If hemoglobin level hasn't increased by at least 1 g/dl (in the absence of RBC transfusion), increase dose to 60,000 units weekly. Give the lowest effective dose to gradually increase hemoglobin to a level where blood transfusion isn't necessary. Discontinue drug after 8 weeks if no response, as measured by hemoglobin level or if tranfusions are still required.
*Children ages 5 to 18:* 600 units/kg (maximum 40,000 units) I.V. once weekly. If hemoglobin level hasn't increased by at least 1 g/dl (in the absence of RBC transfusion), increase dosage to 900 units/kg I.V. (maximum, 60,000 units). Discontinue drug after 8 weeks if no response, as measured by hemoglobin level or if transfusions are still required.
***Adjust-a-dose:*** Withhold drug if hemoglobin level exceeds 12 g/dl. Reduce dose by 25% and resume therapy when hemoglobin level is less than 11 g/dl. If hemoglobin level increases by more than 1 g/dl in any 2-week period, reduce dose by 25%.

➤ **Reduce need for allogenic blood transfusion in anemic patients scheduled to have elective, noncardiac, nonvascular surgery**

*Adults:* 300 units/kg daily subcutaneously daily for 10 days before surgery, on day of surgery, and for 4 days after surgery. Or,

600 units/kg subcutaneously in once-weekly doses (21, 14, and 7 days before surgery), plus a fourth dose on day of surgery.

## ADMINISTRATION

**I.V.**

▼ Store solution in refrigerator and protect from light.
▼ Don't shake.
▼ Give by direct injection without dilution.
▼ If patient is having dialysis, drug may be given into venous return line after dialysis session. To keep drug from adhering to tubing, inject drug with blood still in the line. Then flush with normal saline solution.
▼ Single-dose vials contain no preservatives. Discard unused portion.
***Alert:*** Multidose vials contain benzyl alcohol, which has been associated with sometimes fatal neurologic and other complications in premature infants.
▼ **Incompatibilities:** Other I.V. drugs.

**Subcutaneous**

● Store solution in refrigerator and protect from light.
● Don't shake.
● Don't use if solution is discolored or has particulate matter.
● Give in upper arm, abdomen, mid-thigh or outer buttocks.
● Single use vial without preservative may be admixed in a syringe with bacteriostatic sodium chloride 0.9% injection with benzyl alcohol 0.9% (bacteriostatic saline) at a 1:1 ratio to provide local anesthetic.
● Rotate injection sites and document.

## ACTION

Mimics effects of erythropoietin. Functions as a growth factor and as a differentiating factor, enhancing RBC production.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |
| Subcut. | Unknown | 5–24 hr | Unknown |

*Half-life:* 4 to 13 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia, dizziness, fatigue, headache, paresthesia, pyrexia,* ***seizures.***
**CV:** *edema, hypertension,* increased clotting of arteriovenous grafts.
**EENT:** *pharyngitis.*
**GI:** *abdominal pain and constipation (in children), diarrhea, nausea, vomiting.*
**Metabolic:** ***hyperkalemia,*** hyperphosphatemia, hyperuricemia.
**Musculoskeletal:** *arthralgia.*
**Respiratory:** *cough, shortness of breath, upper respiratory infection.*
**Skin:** *injection site reactions, rash,* urticaria.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

● May increase BUN, creatinine, phosphate, potassium, and uric acid levels.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to products derived from mammal cells or albumin (human) and in those with uncontrolled hypertension.
● Use cautiously in breast-feeding women.
***Overdose S&S:*** Cardiovascular events.

## NURSING CONSIDERATIONS

**Black Box Warning** In patients with renal failure, drug may increase risk of serious CV events, including death, when target hemoglobin is greater than 12 g/dl. Monitor hemoglobin level weekly until stabilized. Individualize dosing to achieve and maintain hemoglobin level within 10 to 12 g/dl. Rate of hemoglobin increase shouldn't exceed 1 g/dl in 2 weeks. ▮
● Before starting therapy, evaluate patient's iron status. Patient should receive adequate iron supplementation beginning no later than when epoetin alfa treatment starts and continuing throughout therapy. Patient also may need vitamin $B_{12}$ and folic acid.
● Monitor blood pressure before therapy. Most patients with chronic renal failure have hypertension. Blood pressure may increase, especially when hematocrit increases in the early part of therapy.
**Black Box Warning** In patients with non-small-cell lung cancer and breast, head and neck, lymphoid, and cervical cancers, there is a risk of tumor growth and shortened survival when hemoglobin levels of 12 g/dl are achieved. Target dosage to

achieve hemoglobin level of less than 12 g/dl. Use the lowest dosage needed to avoid RBC transfusions. Use only for treatment of anemia due to concomitant myelosuppressive chemotherapy and discontinue drug following chemotherapy course. ■
• Institute diet restrictions or drug therapy to control blood pressure.
• Monitor hemoglobin level twice weekly until it stabilizes in the target range (10 to 12 g/dl for most patients) and maintenance dose is established, then continue to monitor at regular intervals. Resume twice weekly testing following any dosage adjustments.
• When used in HIV-infected adults, dosage recommendations are for those with endogenous erythropoietin levels of 500 units/L or less and cumulative zidovudine doses of 4.2 g/week or less.
• Monitor blood counts; elevated hematocrit may cause excessive clotting.
• Patient may need additional heparin to prevent clotting during dialysis treatments. **Black Box Warning** Due to increased risk of deep vein thrombosis, consider prophylaxis. ■
***Alert:*** Evaluate patient who experiences a lack or loss of effect for pure red cell aplasia.
• ***Look alike–sound alike:*** Don't confuse Epogen with Neupogen.

## PATIENT TEACHING

• Inform patient that pain or discomfort in limbs (long bones) and pelvis, and coldness and sweating may occur after injection (usually within 2 hours). Symptoms may last for 12 hours and then disappear.
• Advise patient to avoid driving or operating heavy machinery at start of therapy. There may be a relationship between too-rapid increase in hematocrit and seizures.
• Tell patient to monitor blood pressure at home and to adhere to dietary restrictions.
• Advise women that they may resume menstruating after therapy and to consider the need for contraception.

# eprosartan mesylate

ep-row-SAR-tan

Teveten

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Angiotensin II receptor antagonist
*Pregnancy risk category C; D in 2nd and 3rd trimesters*

## AVAILABLE FORMS

*Tablets:* 400 mg, 600 mg

## INDICATIONS & DOSAGES

➤ **Hypertension (alone or with other antihypertensives)**
*Adults:* Initially, 600 mg P.O. daily. Dosage ranges from 400 to 800 mg daily, given as single daily dose or two divided doses.

## ADMINISTRATION

**P.O.**
• Give drug without regard for meals.

## ACTION

An angiotensin II receptor antagonist that reduces blood pressure by blocking the vasoconstrictor and aldosterone-secreting effects of angiotensin II. Drug selectively blocks the binding of angiotensin II to its receptor sites found in many tissues, such as vascular smooth muscle and the adrenal gland.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1–2 hr | 1–3 hr | 24 hr |

*Half-life:* 5 to 9 hours.

## ADVERSE REACTIONS

**CNS:** depression, fatigue, headache, dizziness.
**CV:** chest pain, dependent edema.
**EENT:** pharyngitis, rhinitis, sinusitis.
**GI:** abdominal pain, dyspepsia, diarrhea.
**GU:** UTI.
**Hematologic:** ***neutropenia.***
**Musculoskeletal:** arthralgia, myalgia.
**Respiratory:** cough, upper respiratory tract infection, bronchitis.
**Other:** injury, viral infection.

## INTERACTIONS

**Drug-drug.** *NSAIDs:* May decrease antihypertensive effects. Monitor blood pressure.
**Drug-herb.** *Ma huang:* May decrease antihypertensive effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN and triglyceride levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to eprosartan or its components.
- Use cautiously in patients with renal artery stenosis; in patients with an activated renin-angiotensin system, such as volume- or salt-depleted patients; and in patients whose renal function may depend on the renin-angiotensin-aldosterone system, such as those with severe heart failure.
- Safety and effectiveness in children haven't been established.

**Black Box Warning** Use during pregnancy can cause injury and death to the developing fetus. When pregnancy is detected, stop drug as soon as possible. ■

## NURSING CONSIDERATIONS

- Correct hypovolemia and hyponatremia before starting therapy to reduce risk of symptomatic hypotension.
- Monitor blood pressure closely for 2 hours at start of treatment. If hypotension occurs, place patient in a supine position and, if needed, give an I.V. infusion of normal saline solution.
- A transient episode of hypotension isn't a contraindication to continued treatment. Drug may be restarted once patient's blood pressure has stabilized.
- Drug may be used alone or with other antihypertensives, such as diuretics and calcium channel blockers. Maximal blood pressure response may take 2 or 3 weeks.
- Monitor patient for facial or lip swelling because angioedema has occurred with other angiotensin II antagonists.
- Closely observe infants exposed to eprosartan in utero for hypotension, oliguria, and hyperkalemia.

## PATIENT TEACHING

- Advise women of childbearing age to use a reliable form of contraception and to notify prescriber immediately if pregnancy is suspected. Treatment may need to be stopped under medical supervision.
- Advise patient to report facial or lip swelling and signs and symptoms of infection, such as fever and sore throat.
- Tell patient to notify prescriber before taking OTC medication to treat a dry cough.
- Inform patient that drug may be taken without regard to meals.
- Advise breast-feeding women to stop either therapy or breast-feeding because of potential for adverse reactions in infant.

E

# eptifibatide

ep-tiff-IB-ah-tide

Integrilin

*Therapeutic class:* Antiplatelet
*Pharmacologic class:* Glycoprotein IIb/IIIa (GPIIb/IIIa) inhibitor
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 10-ml (2 mg/ml), 100-ml (0.75 mg/ml and 2 mg/ml) vials

## INDICATIONS & DOSAGES

➤ **Acute coronary syndrome (unstable angina or non–ST-segment elevation MI) in patients receiving drug therapy and in those having a percutaneous coronary intervention (PCI)**

*Adults:* 180 mcg/kg I.V. bolus as soon as possible after diagnosis, followed by a continuous I.V. infusion at a rate of 2 mcg/kg/minute until hospital discharge or start of coronary artery bypass graft (CABG) surgery, for up to 72 hours. If patient is having a PCI, continue infusion until hospital discharge or for 18 to 24 hours after the procedure, whichever comes first, for up to 96 hours.

***Adjust-a-dose:*** If creatinine clearance is less than 50 ml/minute or creatinine level is greater than 2 mg/dl, give 180 mcg/kg I.V. bolus as soon as possible after diagnosis, followed by a continuous I.V. infusion at

1 mcg/kg/minute. Patients with this creatinine clearance who weigh more than 121 kg should receive a bolus not to exceed 22.6 mg, followed by a maximum infusion rate of 7.5 mg/hour.

➤ **PCI**

*Adults:* 180 mcg/kg I.V. bolus given just before the procedure, immediately followed by an infusion of 2 mcg/kg/minute and a second I.V. bolus of 180 mcg/kg given 10 minutes after the first bolus. Continue infusion until hospital discharge or for 18 to 24 hours, whichever comes first; the minimum duration of infusion is 12 hours.

***Adjust-a-dose:*** If creatinine clearance is less than 50 ml/minute or creatinine level is greater than 2 mg/dl, give 180 mcg/kg I.V. bolus just before the procedure, immediately followed by a continuous I.V. infusion at 1 mcg/kg/minute and a second bolus of 180 mcg/kg given 10 minutes after the first bolus.

## ADMINISTRATION

**I.V.**

▼ Inspect solution for particles before use; if they appear, drug may not be sterile. Discard it.

▼ Protect drug from light before giving.

▼ Drug may be given in same line with normal saline solution, $D_5W$, alteplase, atropine, dobutamine, heparin, lidocaine, meperidine, metoprolol, midazolam, morphine, nitroglycerin, or verapamil. Main infusion may also contain up to 60 mEq/L of potassium chloride.

▼ For I.V. push, withdraw bolus dose from 10-ml vial into a syringe and give over 1 or 2 minutes.

▼ For infusion, give undiluted drug directly from 100-ml vial using an infusion pump.

▼ If patient needs thrombolytics, stop infusion.

▼ Refrigerate vials at 36° to 46° F (2° to 8° C). Store vials at room temperature for no longer than 2 months; afterward, discard them.

▼ **Incompatibilities:** Furosemide.

## ACTION

Reversibly binds to the GP IIb/IIIa receptor on human platelets and inhibits platelet aggregation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | 4–6 hr |

*Half-life:* 2½ hours.

## ADVERSE REACTIONS

**CV:** hypotension.
**GU:** hematuria.
**Hematologic:** *bleeding*, ***thrombocytopenia.***
**Other:** bleeding at femoral artery access site.

## INTERACTIONS

**Drug-drug.** *Clopidogrel, dipyridamole, NSAIDs, oral anticoagulants (warfarin), thrombolytics, ticlopidine:* May increase risk of bleeding. Monitor patient closely for signs of bleeding.

*Other inhibitors of platelet receptor IIb/IIIa:* May cause serious bleeding. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

● May decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or its ingredients and in those with history of bleeding diathesis or evidence of active abnormal bleeding within previous 30 days; severe hypertension (systolic blood pressure higher than 200 mm Hg or diastolic blood pressure higher than 110 mm Hg) not adequately controlled with antihypertensives; major surgery within previous 6 weeks; history of stroke within 30 days or history of hemorrhagic stroke; current or planned use of another parenteral GP IIb/IIIa inhibitor; or platelet count less than 100,000/$mm^3$.

● Contraindicated in patients with creatinine level 4 mg/dl or higher and in patients dependent on renal dialysis.

● Use cautiously in patients at increased risk for bleeding, in those with platelet count less than 150,000/$mm^3$, in those with hemorrhagic retinopathy, and in those weighing more than 143 kg (315 lb).

## NURSING CONSIDERATIONS

- Drug is intended for use with heparin and aspirin.
- At least 4 hours before hospital discharge, stop this drug and heparin and achieve sheath hemostasis by standard compressive techniques.
- Remove sheath during infusion only after heparin has been stopped and its effects largely reversed.
- If patient is to have a CABG, stop infusion before surgery.
- Minimize use of arterial and venous punctures, I.M. injections, urinary catheters, and nasotracheal and nasogastric tubes.
- When obtaining I.V. access, avoid use of noncompressible sites (such as subclavian or jugular veins).
- Monitor patient for bleeding.
- ***Alert:*** If patient's platelet count is less than 100,000/$mm^3$, stop this drug and heparin.
- Perform baseline laboratory tests before start of drug therapy; also determine hemoglobin level, hematocrit, PT, INR, activated PTT, platelet count, and creatinine level.

## PATIENT TEACHING

- Explain that drug is a blood thinner used to prevent chest pain and heart attack.
- Explain that benefits of drug far outweigh risk of serious bleeding.
- Tell patient to report to prescriber chest discomfort or other adverse effects immediately.

**SAFETY ALERT!**

# erlotinib

ur-LOE-tih-nib

Tarceva

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Epidermal growth factor receptor inhibitor
*Pregnancy risk category D*

## AVAILABLE FORMS

*Tablets:* 25 mg, 100 mg, 150 mg

## INDICATIONS & DOSAGES

➤ **With gemcitabine, first-line treatment of locally advanced, unresectable, or metastatic pancreatic cancer**

*Adults:* 100 mg P.O. once daily taken at least 1 hour before or 2 hours after meals. Continue until disease progresses or intolerable toxicity occurs.

✶ ***NEW INDICATION:*** **Initial maintenance therapy for locally advanced or metastatic non–small cell lung cancer in patients whose disease hasn't progressed after four cycles of platinum-based, first-line chemotherapy**

*Adults:* 150 mg P.O. once daily at least 1 hour before or 2 hours after meals. Continue until disease progresses or intolerable toxicity occurs.

➤ **Locally advanced or metastatic non–small cell lung cancer after failure of at least one chemotherapy regimen**

*Adults:* 150 mg P.O. once daily taken at least 1 hour before or 2 hours after meals. Continue until disease progresses or intolerable toxicity occurs.

***Adjust-a-dose:*** In patients with severe skin reactions or severe diarrhea refractory to loperamide, reduce dose in 50-mg decrements or stop therapy.

In patients with severe hepatic impairment (AST greater than three times upper limit of normal) reduce initial dose to 75 mg/day and gradually increase as tolerated.

## ADMINISTRATION

**P.O.**

- Give drug 1 hour before or 2 hours after a meal.

## ACTION

Probably inhibits tyrosine kinase activity in epidermal growth factor receptors, which are expressed on the surface of normal and cancer cells. Is particularly selective for human epidermal growth factor receptor 1.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 4 hr | Unknown |

*Half-life:* About 36 hours.

## ADVERSE REACTIONS

**CNS:** *fatigue.*
**EENT:** *conjunctivitis, keratoconjunctivitis sicca.*
**GI:** *abdominal pain, anorexia, diarrhea, nausea, stomatitis, vomiting.*
**Respiratory:** *cough, dyspnea,* ***pulmonary toxicity.***
**Skin:** *dry skin, pruritus, rash.*
**Other:** *infection.*

## INTERACTIONS

**Drug-drug.** *Antacids, $H_2$-receptor antagonists, proton pump inhibitors:* May reduce bioavailability of drug. Separate doses by several hours.
*Anticoagulants, such as warfarin:* May increase risk of bleeding. Monitor PT and INR.
*CYP3A4 inducers, such as carbamazepine, phenobarbital, phenytoin, rifabutin, rifampin:* May increase erlotinib metabolism. Increase erlotinib dosage, as needed.
*Strong CYP3A4 inhibitors, such as atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, troleandomycin, voriconazole:* May decrease erlotinib metabolism. Use together cautiously, and consider reducing erlotinib dosage.
**Drug-food.** *Any food:* May increase bioavailability of drug. Give drug 1 hour before or 2 hours after meals.
*Grapefruit or grapefruit juice:* May increase drug level. Avoid use together.
**Drug-herb.** *St. John's wort:* May increase drug metabolism. Drug dosage may need to be increased. Discourage use together.
**Drug-lifestyle.** *Cigarette smoking:* May decrease drug level. Encourage smoking cessation.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, and bilirubin levels.
- May increase INR and PT.

## CONTRAINDICATIONS & CAUTIONS

- Use cautiously in patients with pulmonary disease or liver impairment. Also use cautiously in patients who have received or are receiving chemotherapy because it may worsen adverse pulmonary effects.
- Use cautiously in patients receiving other antiangiogenic agents, corticosteroids, NSAIDs, or taxane-based chemotherapy, and in those with a history of peptic ulcer disease because of increased risk of GI perforation.

## NURSING CONSIDERATIONS

- Monitor renal and liver function tests periodically during therapy.
- ***Alert:*** GI perforation with fatalities have been reported. Permanently discontinue drug if GI perforation occurs.
- ***Alert:*** Rarely, serious interstitial lung disease may occur. If patient develops dyspnea, cough, and fever, notify prescriber. Therapy may need to be interrupted or stopped.
- Monitor patient for severe diarrhea, and give loperamide if needed.
- Monitor patient for eye ulcers, bullous blistering, and exfoliative skin conditions.
- Women shouldn't breast-feed while taking this drug.
- Drug has been used off label to treat squamous cell head and neck cancer.

## PATIENT TEACHING

- ***Alert:*** Tell patient to immediately report new or worsened cough, shortness of breath, eye irritation, or severe or persistent diarrhea, nausea, anorexia, or vomiting.
- Instruct patient to take drug 1 hour before or 2 hours after food.
- Advise women to avoid pregnancy while taking this drug and for 2 weeks after treatment ends. Drug can harm fetus.
- Explain the likelihood of serious interactions with other drugs and herbal supplements and the need to tell prescriber about any change in drugs and supplements taken.
- Counsel patient about smoking cessation, as smoking may decrease drug level and effectiveness.

## ertapenem sodium

er-tah-PEN-em

Invanz

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Carbapenem
*Pregnancy risk category B*

### AVAILABLE FORMS

*Injection:* 1 g

### INDICATIONS & DOSAGES

➤ **Complicated intra-abdominal infection caused by *Escherichia coli, Clostridium clostridiforme, Eubacterium lentum, Peptostreptococcus* species, *Bacteroides fragilis, B. distasonis, B. ovatus, B. thetaiotaomicron,* or *B. uniformis***

*Adults and children age 13 and older:* 1 g I.V. or I.M. once daily for 5 to 14 days.

*Infants and children ages 3 months to 13 years:* 15 mg/kg I.V. or I.M. every 12 hours for 5 to 14 days. Don't exceed 1 g daily.

➤ **Complicated skin or skin-structure infection including diabetic foot infections without osteomyelitis caused by *Staphylococcus aureus* (methicillin-susceptible strains), *Streptococcus agalactiae, S. pyogenes, Escherichia coli, Klebsiella pneumoniae, Proteus mirabilis, Bacteroides fragilis, Peptostreptococcus* species, *Porphyromonas asaccharolytica,* or *Prevotella bivia***

*Adults and children age 13 and older:* 1 g I.V. or I.M. once daily for 7 to 14 days. Diabetic foot infections may need up to 28 days of treatment.

*Infants and children ages 3 months to 13 years:* 15 mg/kg I.V. or I.M. every 12 hours for 7 to 14 days. Don't exceed 1 g daily.

➤ **Community-acquired pneumonia from *S. pneumoniae* (penicillin-susceptible strains), *Haemophilus influenzae* (beta-lactamase–negative strains), or *Moraxella catarrhalis;* complicated UTI including pyelonephritis caused by *E. coli* or *K. pneumoniae***

*Adults and children age 13 and older:* 1 g I.V. or I.M. once daily for 10 to 14 days. If patient improves after at least 3 days of treatment, use appropriate oral therapy to complete the full course of therapy.

*Infants and children ages 3 months to 13 years:* 15 mg/kg I.V. or I.M. every 12 hours for 10 to 14 days. Don't exceed 1 g daily. If patient improves after at least 3 days of treatment, use appropriate oral therapy to complete the full course of therapy.

➤ **Acute pelvic infection, including postpartum endomyometritis, septic abortion, and postsurgical gynecologic infections caused by *S. agalactiae, E. coli, B. fragilis, P. asaccharolytica, Peptostreptococcus* species, or *P. bivia***

*Adults and children age 13 and older:* 1 g I.V. or I.M. once daily for 3 to 10 days.

*Infants and children ages 3 months to 13 years:* 15 mg/kg I.V. or I.M. every 12 hours for 3 to 10 days. Don't exceed 1 g daily.

***Adjust-a-dose:*** In adult patients with creatinine clearance of 30 ml/minute or less, give 500 mg/day. In hemodialysis patients receiving daily 500-mg dose less than 6 hours before hemodialysis, give supplementary 150-mg dose afterward. In hemodialysis patients receiving dose 6 hours or more before hemodialysis, no supplementary dose is needed.

➤ **Prevention of surgical site infection after elective colorectal surgery**

*Adults:* 1 g I.V. 1 hour before surgical incision.

### ADMINISTRATION

**I.V.**

▼ Obtain specimens for culture and sensitivity testing before giving. Begin therapy while awaiting results.

▼ Before giving first dose, check for previous hypersensitivity to penicillin, cephalosporin, beta-lactam, or local amide-type anesthetics.

▼ Reconstitute 1-g vial with 10 ml of sterile water for injection, normal saline solution for injection, or bacteriostatic water for injection.

▼ Shake well to dissolve, and then immediately transfer contents to 50 ml of normal saline solution.

▼ Infuse over 30 minutes.

▼ Complete the infusion within 6 hours of reconstitution or refrigerate for up to 24 hours. Infuse within 4 hours once removed from refrigeration. Don't freeze.
▼ **Incompatibilities:** Diluents containing dextrose (alpha-D-glucose), other I.V. drugs.

**I.M.**
- Obtain specimens for culture and sensitivity testing before giving. Begin therapy while awaiting results.
- Before giving first dose, check for previous hypersensitivity to penicillin, cephalosporin, beta-lactam, or local amide-type anesthetics.
- Reconstitute 1-g vial with 3.2 ml of 1% lidocaine hydrochloride injection (without epinephrine). Shake vial thoroughly to form solution. Immediately withdraw the contents of the vial and give by deep I.M. injection into a large muscle, such as the gluteal muscles or lateral part of the thigh. Use the reconstituted I.M. solution within 1 hour after preparation. Don't give reconstituted solution I.V.

## ACTION

Inhibits cell-wall synthesis through penicillin-binding proteins.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | 30 min | 24 hr |
| I.M. | Unknown | 2 hr | 24 hr |

*Half-life:* 4 hours.

## ADVERSE REACTIONS

**CNS:** altered mental status, anxiety, asthenia, dizziness, fatigue, fever, headache, insomnia.
**CV:** chest pain, edema, hypertension, hypotension, infused vein complication, phlebitis, swelling, tachycardia, thrombophlebitis.
**EENT:** pharyngitis.
**GI:** *diarrhea,* abdominal pain, acid regurgitation, constipation, dyspepsia, nausea, oral candidiasis, vomiting.
**GU:** renal dysfunction, vaginitis.
**Hematologic:** ***leukopenia, neutropenia, thrombocytopenia,*** anemia, coagulation abnormalities, eosinophilia, ***thrombocytosis.***
**Hepatic:** jaundice.
**Metabolic:** ***hyperkalemia, hypokalemia,*** hyperglycemia.
**Musculoskeletal:** leg pain.
**Respiratory:** cough, dyspnea, rales, ***respiratory distress,*** rhonchi.
**Skin:** erythema, extravasation, infusion site pain and redness, pruritus, rash.
**Other:** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Probenecid:* May reduce renal clearance and may increase half-life. Don't give together with probenecid to extend half-life.
*Valproic acid:* May decrease valproic acid levels, leading to loss of seizure control. Monitor valproic acid levels, and observe patient for signs of seizure activity.

## EFFECTS ON LAB TEST RESULTS

- May increase albumin, ALT, alkaline phosphatase, AST, bilirubin, creatinine, glucose, and potassium levels. May decrease hemoglobin level and hematocrit.
- May increase eosinophil count, PT, and urinary RBC or urine WBC counts. May decrease segmented neutrophil and serum WBC counts. May increase or decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to any component of the drug or to other drugs in the same class and in patients who have had anaphylactic reactions to beta-lactams. I.M. use is contraindicated in patients hypersensitive to local anesthetics of the amide type (because of drug's diluent, lidocaine hydrochloride).
- Use cautiously in patients with CNS disorders, compromised renal function, or both, as seizures may occur in these patients.

***Overdose S&S:*** Nausea, diarrhea, dizziness.

## NURSING CONSIDERATIONS

- If patient has diarrhea during therapy, notify prescriber and collect stool specimen for culture to rule out pseudomembranous colitis.
- Vomiting occurs more frequently in children than adults. Monitor children closely

for signs and symptoms of dehydration and electrolyte imbalance.
• If allergic reaction occurs, stop drug immediately.
• Anaphylactic reactions require immediate emergency treatment with epinephrine, oxygen, I.V. steroids, and airway management.
• Anticonvulsants may continue in patients with seizure disorders. If focal tremors, myoclonus, or seizures occur, notify prescriber. Drug may need to be decreased or stopped.
• Monitor renal, hepatic, and hematopoietic function during prolonged therapy.
• Methicillin-resistant staphylococci and *Enterococcus* species are resistant to drug.
• ***Look alike–sound alike:*** Don't confuse Invanz with Avinza.

### PATIENT TEACHING
• Tell patient about adverse reactions.
• Tell patient to alert nurse if discomfort occurs at injection site.

## erythromycin (ophthalmic)
er-ith-roe-MYE-sin

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Macrolide
*Pregnancy risk category B*

### AVAILABLE FORMS
*Ophthalmic ointment:* 0.5%

### INDICATIONS & DOSAGES
➤ **Acute and chronic conjunctivitis, other eye infections**
*Adults and children:* Apply a ribbon of ointment about 1 cm long directly to infected eye up to six times daily, depending on severity of infection.
➤ **To prevent ophthalmia neonatorum caused by *Neisseria gonorrhoeae* or *Chlamydia trachomatis***
*Neonates:* Apply a ribbon of ointment about 1 cm long in lower conjunctival sac of each eye shortly after birth.

### ADMINISTRATION
**Ophthalmic**
• Don't use for infection unless causative organism has been identified.
• To prevent ophthalmia neonatorum, apply ointment no later than 1 hour after birth. Use drug in neonates born either vaginally or by cesarean birth. Gently massage eyelids for 1 minute to spread ointment. Use new tube for each neonate.

### ACTION
Inhibits protein synthesis; usually bacteriostatic, but may be bactericidal in high concentrations or against highly susceptible organisms.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS
**EENT:** blurred vision, itching and burning eyes, slowed corneal wound healing.
**Skin:** dermatitis, urticaria.
**Other:** overgrowth of nonsusceptible organisms with long-term use.

### INTERACTIONS
None significant.

### EFFECTS ON LAB TEST RESULTS
• May interfere with fluorometric determinations of urine catecholamines.

### CONTRAINDICATIONS & CAUTIONS
• Contraindicated in patients hypersensitive to drug.
• Use cautiously in breast-feeding women.

### NURSING CONSIDERATIONS
• Use drug only when sensitivity studies show it's effective against infecting organisms; don't use in infections of unknown cause.
• Store drug at room temperature in tightly closed, light-resistant container.

### PATIENT TEACHING
• Tell patient to clean eye area of excessive discharge before application.
• Teach patient how to apply drug. Advise him to wash hands before and after applying ointment, and warn him not to touch tip of applicator to eye or surrounding tissue.
• Tell patient that vision may be blurred for a few minutes after applying ointment.

Instruct patient to keep eyes closed for 1 to 2 minutes after applying drug.
• Advise patient to watch for and report signs and symptoms of sensitivity (itching lids, redness, swelling, or constant burning).
• Tell patient not to share drug, washcloths, or towels with family members and to notify prescriber if anyone develops same signs or symptoms.
• Stress importance of compliance with recommended therapy.

## erythromycin (topical)

er-ith-roe-MYE-sin

Akne-mycin, Ery-Sol†, Erythra-Derm, Erythro-Statin

*Therapeutic class:* Antiacne
*Pharmacologic class:* Macrolide
*Pregnancy risk category C (topical solution); B (other topical preparations)*

### AVAILABLE FORMS

*Ointment:* 2%
*Pledgets:* 2%
*Topical gel:* 2%
*Topical solution:* 2%*

### INDICATIONS & DOSAGES

➤ **Inflammatory acne vulgaris**

*Adults and children:* Apply to affected areas b.i.d., morning and evening. If no improvement in 6 to 8 weeks, discontinue drug; prescriber should re-evaluate treatment.

### ADMINISTRATION

**Topical**

• Wash, rinse, and dry affected areas before application.
• Use pledget once, and then discard.
• Wash hands after each application.

### ACTION

Usually bacteriostatic, but may be bactericidal in high concentrations or against highly susceptible organisms. Disrupts protein synthesis in susceptible bacteria.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**GI:** ***pseudomembranous colitis.***
**Skin:** *burning, dryness, pruritus,* erythema, irritation, oily skin, peeling, sensitivity reactions.

### INTERACTIONS

**Drug-drug.** *Clindamycin:* May antagonize clindamycin's effect. Avoid using together.
*Isotretinoin:* May cause cumulative dryness, resulting in excessive skin irritation. Use together cautiously.
**Drug-lifestyle.** *Abrasive or medicated soaps or cleansers, acne products, or other preparations containing peeling drugs (benzoyl peroxide, resorcinol, salicylic acid, sulfur, tretinoin), alcohol-containing products (aftershave, cosmetics, perfumed toiletries, shaving creams or lotions), astringent soaps or cosmetics, medicated cosmetics or cover-ups:* May cause cumulative dryness, resulting in excessive skin irritation. Urge caution.

### EFFECTS ON LAB TEST RESULTS

• May interfere with fluorometric determinations of urine catecholamines.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components.
• Safety and efficacy in children haven't been established.

### NURSING CONSIDERATIONS

• Prolonged use may be needed when treating acne vulgaris, which may result in overgrowth of nonsusceptible organisms.

### PATIENT TEACHING

• Advise patient to wash, rinse, and dry face thoroughly before each use.
• Advise patient to avoid use near eyes, nose, mouth, or other mucous membranes.
• Tell patient to wash hands after each application.
• Tell patient to stop using drug and notify prescriber if no improvement occurs or if condition worsens in 3 to 12 weeks.
• Advise patient not to share towels or washcloths.
• Instruct patient to use each pledget once, then discard.

• Caution patient to keep drug away from heat and open flame.

## erythromycin base
er-ith-roe-MYE-sin

*Capsules (delayed-release):* 250 mg
*Tablets (enteric-coated):* 250 mg, 333 mg, 500 mg
*Tablets (filmtabs):* 250 mg, 500 mg
**erythromycin ethylsuccinate**
*Oral suspension:* 100 mg/2.5 ml, 200 mg/5 ml, 400 mg/5 ml
*Tablets:* 400 mg
*Powder for oral suspension:* 200 mg/5 ml, 400 mg/5 ml
**erythromycin lactobionate**
*Injection:* 500-mg, 1-g vials
**erythromycin stearate**
*Tablets (film-coated):* 250 mg, 500 mg

### INDICATIONS & DOSAGES
➤ **Acute pelvic inflammatory disease caused by *Neisseria gonorrhoeae***
*Adults:* 500 mg I.V. every 6 hours for 3 days; then 500 mg P.O. every 12 hours or 333 mg P.O. every 8 hours for 7 days.
➤ **Intestinal amebiasis caused by *Entamoeba histolytica***
*Adults:* 250 mg P.O. q.i.d. or 333 mg P.O. every 8 hours, or 500 mg delayed-release tablets P.O. every 12 hours for 10 to 14 days. Or, 400 mg P.O. as ethylsuccinate q.i.d. for 10 to 14 days.
*Children:* 30 to 50 mg/kg P.O. daily, in divided doses, for 10 to 14 days.
➤ **To prevent rheumatic fever recurrence in patients allergic to penicillin and sulfonamides**
*Adults:* 250 mg base or stearate P.O. b.i.d.; or, 400 mg ethylsuccinate P.O. b.i.d.
➤ **Mild to moderately severe respiratory tract, skin, or soft-tissue infection from sensitive group A beta-hemolytic streptococci, *Streptococcus pneumoniae, Mycoplasma pneumoniae, Corynebacterium diphtheriae,* or *Bordetella pertussis***
*Adults:* 250 to 500 mg base or stearate P.O. every 6 hours; or 400 to 800 mg ethylsuccinate P.O. every 6 hours; or 15 to 20 mg/kg I.V. daily, as continuous infusion or in divided doses every 6 hours for 10 days (3 weeks for *Mycoplasma* species infection). Maximum dosage is 4 g/day.
*Children:* 30 to 50 mg/kg P.O. daily, in divided doses every 6 hours; or 15 to 20 mg/kg I.V. daily, in divided doses every 4 to 6 hours for 10 days (3 weeks for *Mycoplasma* species infection).
➤ ***Listeria monocytogenes* infection**
*Adults:* 250 mg P.O. every 6 hours or 500 mg P.O. every 12 hours.
➤ **Nongonococcal urethritis caused by *Ureaplasma urealyticum***
*Adults:* 500 mg P.O. every 6 hours or 666 mg P.O. every 8 hours for at least 7 days.
➤ **Legionnaires' disease**
*Adults:* 1 to 4 g P.O. daily in divided doses for 10 to 14 days alone or with rifampin. I.V. route may be used initially in severe cases.
➤ **Uncomplicated urethral, endocervical, or rectal infection caused by *Chlamydia trachomatis,* when tetracyclines are contraindicated**
*Adults:* 500 mg base P.O. q.i.d. for at least 7 days, or 666 mg P.O. every 8 hours for at least 7 days, or 250 mg P.O. q.i.d. for 14 days if patient can't tolerate higher doses.
➤ **Urogenital *C. trachomatis* infection during pregnancy**
*Adults:* 500 mg base or stearate P.O. q.i.d. for at least 7 days or 250 mg base or stearate

or 400 mg ethylsuccinate P.O. q.i.d. for at least 14 days.

➤ **Pneumonia in infants caused by *C. trachomatis***

*Infants:* 50 mg/kg/day base or stearate P.O. in four divided doses for 21 days, or 15 to 20 mg/kg/day lactobionate I.V. as a continuous infusion or in four divided doses.

➤ **Chancroid caused by *Haemophilus ducreyi* ♦**

*Adults:* 500 mg base P.O. t.i.d. to q.i.d. for 7 days.

➤ **Pertussis**

*Adults:* 40 to 50 mg/kg/day P.O. in divided doses for 5 to 14 days.

➤ **Preoperative prophylaxis for elective colorectal surgery**

*Adults:* Two 500-mg tablets, three 333-mg tablets, or four 250-mg tablets P.O. at 1 p.m., 2 p.m., and 11 p.m. on preoperative day 1 before 8 a.m. surgery.

➤ **Primary syphilis**

*Adults:* 30 to 40 g P.O. in divided doses for 10 to 15 days.

## ADMINISTRATION

**P.O.**

- Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
- When giving suspension, note the concentration.
- Give drug with full glass of water 2 hours before or 2 hours after meals for best absorption.
- Give drug with food if GI upset occurs. Don't give drug with fruit juice. Make sure patient doesn't swallow chewable tablets whole.
- Coated tablets or encapsulated pellets cause less GI upset, so they may be better tolerated by patients who have trouble tolerating drug.

**I.V.**

▼ Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.

▼ Reconstitute drug according to manufacturer's directions.

▼ Dilute each 250 mg in at least 100 ml of normal saline solution.

▼ Infuse over 1 hour.

▼ **Incompatibilities:** Ascorbic acid injection, colistimethate, dextrose 2.5% in half-strength Ringer's lactate, dextrose 5% in lactated Ringer's solution, dextrose 5% in normal saline solution, dextrose 5% in Normosol-M, dextrose 10% in water, $D_5W$, furosemide, heparin sodium, linezolid, metoclopramide, Normosol-R, Ringer's injection, vitamin B complex with C.

## ACTION

Inhibits bacterial protein synthesis by binding to the 50S subunit of the ribosome. Bacteriostatic or bactericidal, depending on concentration.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1½ hr | Unknown |
| I.V. | Immediate | 1½ hr | Unknown |

*Half-life:* 1½ hours.

## ADVERSE REACTIONS

**CNS:** fever.

**CV:** *vein irritation or thrombophlebitis after I.V. injection,* ***ventricular arrhythmias.***

**GI:** ***pseudomembranous colitis,*** *abdominal pain and cramping, diarrhea, nausea, vomiting.*

**Hepatic:** hepatocellular or cholestatic hepatitis.

**Skin:** eczema, rash, urticaria.

**Other:** ***anaphylaxis,*** overgrowth of nonsusceptible bacteria or fungi.

## INTERACTIONS

**Drug-drug.** *Antihistamines (astemizole, terfenadine):* May cause fatal cardiac arrhythmias when used together. Don't use together.

*Carbamazepine:* May inhibit metabolism of carbamazepine, increasing blood level and risk of toxicity. Avoid using together.

*Clindamycin, lincomycin:* May be antagonistic. Avoid using together.

*Cyclosporine:* May increase cyclosporine level. Monitor drug level.

***Digoxin:*** May increase digoxin level. Monitor patient for digoxin toxicity.

*Disopyramide:* May increase disopyramide level, which may cause arrhythmias and prolonged QT intervals. Monitor ECG.

*Ergot alkaloids:* May cause acute ergot toxicity with severe peripheral vasospasm and dysesthesias. Monitor carefully.
*HMG-CoA reductase inhibitors (lovastatin, simvastatin):* May increase concentrations of HMG-CoA reductase inhibitors; rhabdomyolysis has occurred rarely. Monitor CK and serum transaminase levels.
*Midazolam, triazolam:* May increase effects of these drugs. Monitor patient closely.
*Oral anticoagulants:* May increase anticoagulant effect. Monitor PT and INR closely.
***Fluoroquinolones**, other drugs that prolong the QTc interval (amiodarone, antipsychotics, procainamide, quinidine, sotalol, tricyclic antidepressants):* May have additive effects. Monitor ECG for QTc interval prolongation. Avoid using together, if possible.
***Rifamycins (rifabutin, rifampin, rifapentine):*** May decrease therapeutic effects of erythromycin while increasing adverse effects of rifamycin. Monitor patient.
*Strong CYP3A inhibitors (such as diltiazem, verapamil, troleandomycin):* May increase the risk of sudden death from cardiac causes. Don't use together.
*Theophylline:* May decrease erythromycin level and increase theophylline toxicity. Use together cautiously.
**Drug-herb.** *Pill-bearing spurge:* May inhibit CYP3A enzymes, affecting drug metabolism. Urge caution.
**Drug-food.** ***Food, grapefruit juice:*** Food can delay absorption; grapefruit juice may inhibit drug's metabolism. Don't give within 2 hours of a meal; caution patient to avoid grapefruit juice during therapy.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, and bilirubin levels.
- May interfere with fluorometric determination of urine catecholamines and with colorimetric assays.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in those hypersensitive to drug or other macrolides.
- Use erythromycin salts cautiously in patients with impaired hepatic function.
- Drug appears in breast milk. Use cautiously in breast-feeding women.
- Don't use drug to treat neurosyphilis.

## NURSING CONSIDERATIONS

- Monitor patient for superinfection. Drug may cause overgrowth of nonsusceptible bacteria or fungi.
- Monitor hepatic function. Drug may cause hepatotoxicity.

## PATIENT TEACHING

- Tell patient to take drug as prescribed, even after he feels better.
- Instruct patient to take oral form of drug with full glass of water 2 hours before or 2 hours after meals for best absorption.
- Drug may be taken with food if GI upset occurs. Tell patient not to take drug with fruit juice or to swallow the chewable tablets whole.
- Instruct patient to report adverse reactions, especially nausea, abdominal pain, vomiting, and fever.

# escitalopram oxalate

ess-si-TAL-oh-pram

Lexapro✔

*Therapeutic class:* Antidepressant
*Pharmacologic class:* SSRI
*Pregnancy risk category C*

## AVAILABLE FORMS

*Oral solution:* 5 mg/5 ml
*Tablets:* 5 mg, 10 mg, 20 mg

## INDICATIONS & DOSAGES

➤ **Treatment and maintenance therapy for patients with major depressive disorder**
*Adults and adolescents:* Initially, 10 mg P.O. once daily, increasing to 20 mg if needed after at least 1 week.
➤ **Generalized anxiety disorder**
*Adults:* Initially, 10 mg P.O. once daily, increasing to 20 mg if needed after at least 1 week.
➤ **Posttraumatic stress disorder (PTSD) ♦**
*Adults:* 10 mg P.O. once daily. Increase to 20 mg once daily after 4 weeks. Consider tapering, over 2 weeks to 1 month, after 6 to 12 months in patients with acute PTSD, after 12 to 24 months in patients with

chronic PTSD who have had an excellent response to therapy, and after at least 24 months or longer in patients with chronic PTSD and residual symptoms.
***Adjust-a-dose:*** For elderly patients and those with hepatic impairment, 10 mg P.O. daily, initially and as maintenance dosages. In pregnant patients, consider tapering dosage in the third trimester.

## ADMINISTRATION

**P.O.**
- Give drug without regard for food.

## ACTION

Action may be linked to increase of serotonergic activity in the CNS from inhibition of neuronal reuptake of serotonin. Drug is closely related to citalopram, which may be the active component.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 5 hr | Unknown |

*Half-life:* 27 to 32 hours.

## ADVERSE REACTIONS

**CNS:** ***suicidal behavior,*** fever, insomnia, dizziness, somnolence, paresthesia, lightheadedness, migraine, tremor, vertigo, abnormal dreams, irritability, impaired concentration, fatigue, lethargy.
**CV:** palpitations, hypertension, flushing, chest pain.
**EENT:** rhinitis, sinusitis, blurred vision, tinnitus, earache.
**GI:** *nausea*, diarrhea, constipation, indigestion, abdominal pain, vomiting, increased or decreased appetite, dry mouth, flatulence, heartburn, cramps, gastroesophageal reflux.
**GU:** ejaculation disorder, impotence, anorgasmia, menstrual cramps, UTI, urinary frequency.
**Metabolic:** weight gain or loss, hyponatremia.
**Musculoskeletal:** arthralgia, myalgia, muscle cramps, pain in arms or legs.
**Respiratory:** bronchitis, cough.
**Skin:** rash, increased sweating.
**Other:** decreased libido, yawning, flulike symptoms.

## INTERACTIONS

**Drug-drug.** *Antiparkinsonians (such as rasagiline, selegiline):* May cause serotonin syndrome. Avoid use together.
*Aspirin, NSAIDs, other drugs known to affect coagulation:* May increase the risk of bleeding. Use together cautiously.
*Carbamazepine:* May increase escitalopram clearance. Monitor patient for expected antidepressant effect and adjust dose as needed.
*Cimetidine:* May increase escitalopram level. Monitor patient for increased adverse reactions to escitalopram.
*Citalopram:* May cause additive effects. Using together is contraindicated.
*CNS drugs:* May cause additive effects. Use together cautiously.
*Desipramine, other drugs metabolized by CYP2D6:* May increase levels of these drugs. Use together cautiously.
*Lithium:* May enhance serotonergic effect of escitalopram. Use together cautiously, and monitor lithium level.
***MAO inhibitors:*** May cause fatal serotonin syndrome or signs and symptoms resembling neuroleptic malignant syndrome. Avoid using within 14 days of MAO inhibitor therapy.
*Triptans:* May increase serotonergic effects, leading to weakness, hyperreflexia, incoordination, rapid changes in blood pressure, nausea, and diarrhea. Use together cautiously, especially at the start of therapy or at dosage increases.
***Tramadol:*** May cause serotonin syndrome. Monitor patient closely.
**Drug-herb.** *St. John's wort:* May cause serotonin syndrome. Use with caution.
**Drug-lifestyle.** *Alcohol use:* May increase CNS effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients taking pimozide, MAO inhibitors, or within 14 days of MAO inhibitor therapy and in those hypersensitive to escitalopram, citalopram, or any of its inactive ingredients.

**Black Box Warning** Escitalopram isn't approved for use in children. ■

• Use cautiously in patients with a history of mania, seizure disorders, suicidal thoughts, or renal or hepatic impairment.
• Use cautiously in patients with diseases that produce altered metabolism or hemodynamic responses.
• Use with caution in elderly patients because they may have greater sensitivity to drug.
• Use in third trimester of pregnancy may cause complications at birth. Consider the risk versus benefit of treatment during this time.
• Drug appears in breast milk. Patient should either stop breast-feeding or stop taking drug.
***Overdose S&S:*** Seizures, coma, dizziness, ECG changes, hypotension, insomnia, nausea, sinus tachycardia, somnolence, vomiting, acute renal failure.

## NURSING CONSIDERATIONS

• Closely monitor patients at high risk of suicide.
**Black Box Warning** Drug may increase risk of suicidal thinking and behavior in children, adolescents, and young adults ages 18 to 24, especially during the first few months of treatment, especially in those with major depressive disorder or other psychiatric disorder. ■
• ***Look alike–sound alike:*** Don't confuse escitalopram with estazolam.
• Evaluate patient for history of drug abuse and observe for signs of misuse or abuse.
• Periodically reassess patient to determine need for maintenance treatment and appropriate dosing.
***Alert:*** Combining triptans with an SSRI or an SSNRI may cause serotonin syndrome or neuroleptic malignant syndrome–like reactions. Signs and symptoms of serotonin syndrome may include restlessness, hallucinations, loss of coordination, fast heart beat, rapid changes in blood pressure, increased body temperature, overactive reflexes, nausea, vomiting, and diarrhea. Serotonin syndrome may be more likely to occur when starting or increasing the dose of triptan, SSRI, or SSNRI.

## PATIENT TEACHING

• Inform patient that symptoms should improve gradually over several weeks, rather than immediately.
• Tell patient that although improvement may occur within 1 to 4 weeks, he should continue drug as prescribed.
**Black Box Warning** Caution patient and patient's family to report signs of worsening depression (such as agitation, irritability, insomnia, hostility, impulsivity) and signs of suicidal behavior to prescriber immediately. ■
• Tell patient to use caution while driving or operating hazardous machinery because of drug's potential to impair judgment, thinking, and motor skills.
• Advise patient to consult health care provider before taking other prescription or OTC drugs.
• Tell patient that drug may be taken in the morning or evening without regard to meals.
• Encourage patient to avoid alcohol while taking drug.
• Tell women to notify health care provider if pregnant or breast-feeding.

**SAFETY ALERT!**

# esmolol hydrochloride

ESS-moe-lol

Brevibloc

*Therapeutic class:* Antiarrhythmic
*Pharmacologic class:* Selective beta blocker
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 10 mg/ml in 10-ml vials, 20 mg/ml in 5-ml vials
*Premixed bags in sodium chloride:* 10 mg/ml in 100-ml bags; 20 mg/ml in 100-ml bags

## INDICATIONS & DOSAGES

➤ **Supraventricular tachycardia; postoperative tachycardia or hypertension; noncompensatory sinus tachycardias**
*Adults:* 500 mcg/kg/minute as loading dose by I.V. infusion over 1 minute; then 4-minute maintenance infusion of

50 mcg/kg/minute. If adequate response doesn't occur within 5 minutes, repeat loading dose and follow with maintenance infusion of 100 mcg/kg/minute for 4 minutes. Repeat loading dose and increase maintenance infusion by increments of 50 mcg/kg/minute. Maximum maintenance infusion for tachycardia is 200 mcg/kg/minute.

➤ **Intraoperative tachycardia or hypertension**

*Adults:* For intraoperative treatment of tachycardia or hypertension, 80 mg (about 1 mg/kg) I.V. bolus over 30 seconds; then 150 mcg/kg/minute I.V. infusion, if needed. Titrate infusion rate, as needed, to maximum of 300 mcg/kg/minute.

➤ **Hypertensive emergency** ♦

*Children ages 1 to 17:* 100 to 500 mcg/kg/minute by I.V. infusion.

## ADMINISTRATION

**I.V.**

▼ Don't dilute 10-mg/ml single-dose, ready-to-use vials.

▼ Give with an infusion-control device rather than by I.V. push.

▼ If concentration exceeds 10 mg/ml, give drug through a central line.

▼ Don't use for longer than 48 hours. Watch infusion site carefully for signs of extravasation; if they occur, stop infusion immediately and call prescriber.

▼ **Incompatibilities:** Amphotericin B cholesteryl sulfate complex, diazepam, furosemide, procainamide, sodium bicarbonate 5%, thiopental sodium, warfarin sodium.

## ACTION

A class II antiarrhythmic and ultra–short-acting selective beta blocker that decreases heart rate, contractility, and blood pressure.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | 30 min | 30 min after infusion |

*Half-life:* About 9 minutes.

## ADVERSE REACTIONS

**CNS:** anxiety, depression, dizziness, somnolence, headache, agitation, fatigue, confusion.

**CV:** *hypotension*, peripheral ischemia.

**GI:** nausea, vomiting.

**Skin:** inflammation or induration at infusion site.

## INTERACTIONS

**Drug-drug.** *Digoxin:* May increase digoxin level by 10% to 20%. Monitor digoxin level.

*Morphine:* May increase esmolol level. Adjust esmolol dosage carefully.

*Prazosin:* May increase risk of orthostatic hypotension. Help patient to stand slowly until effects are known.

*Reserpine, other catecholamine-depleting drugs:* May increase bradycardia and hypotension. Adjust esmolol dosage carefully.

*Succinylcholine:* May prolong neuromuscular blockade. Monitor patient closely.

*Verapamil:* May increase the effects of both drugs. Monitor cardiac function closely and decrease dosages as necessary.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients with sinus bradycardia, second- or third-degree heart block, cardiogenic shock, or overt heart failure.

● Use cautiously in patients with renal impairment, diabetes, or bronchospasm.

***Overdose S&S:*** Bradycardia, hypotension, loss of consciousness, cardiac arrest, pulseless electrical activity.

## NURSING CONSIDERATIONS

● Dosage for postoperative treatment of tachycardia and hypertension is same as for supraventricular tachycardia.

***Alert:*** Monitor ECG and blood pressure continuously during infusion. Nearly half of patients will develop hypotension. Diaphoresis and dizziness may accompany hypotension. Monitor patient closely, especially if he had low blood pressure before treatment.

● Hypotension can usually be reversed within 30 minutes by decreasing the dose or, if needed, by stopping the infusion. Notify prescriber if this becomes necessary.

● If a local reaction develops at the infusion site, change to another site. Avoid using butterfly needles.

• When patient's heart rate becomes stable, replace drug with an alternative antiarrhythmic, such as propranolol, digoxin, or verapamil. Reduce infusion rate by half, 30 minutes after the first dose of the new drug. Monitor patient response and, if heart rate is controlled for 1 hour after administration of the second dose of the replacement drug, stop esmolol infusion.

### PATIENT TEACHING

• Instruct patient to report adverse reactions promptly.
• Tell patient to report discomfort at I.V. site.

## esomeprazole magnesium

ess-oh-ME-pray-zol

Nexium✔

## esomeprazole sodium

Nexium I.V.

*Therapeutic class:* Antiulcer
*Pharmacologic class:* Proton pump inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS

**esomeprazole magnesium**
*Capsules (delayed-release):* 20 mg, 40 mg
*Powder for suspension (delayed-release):* 10 mg, 20 mg, 40 mg
**esomeprazole sodium**
*Powder for injection:* 20 mg, 40 mg single-use vials

### INDICATIONS & DOSAGES

➤ **Gastroesophageal reflux disease (GERD); to heal erosive esophagitis**
*Adults:* 20 or 40 mg P.O. daily for 4 to 8 weeks. Maintenance dose for healing erosive esophagitis is 20 mg P.O. for up to 6 months.
*Children and adolescents age 12 to 17:* For GERD only, 20 or 40 mg P.O. once daily for up to 8 weeks.
*Children age 1 to 11:* For GERD only, 10 mg P.O. once daily for up to 8 weeks.

➤ **Symptomatic GERD**
*Adults:* 20 mg P.O. daily for 4 weeks. If symptoms are unresolved, may continue treatment for 4 more weeks.

➤ **Short-term therapy (up to 10 days) of GERD in patients with a history of erosive esophagitis who are unable to take drug orally**
*Adult:* Reconstitute 20 or 40 mg with 5 ml of $D_5W$, normal saline solution, or lactated Ringer's injection and give by I.V. bolus over 3 minutes. Or, further dilute to a total volume of 50 ml and give I.V. over 10 to 30 minutes. Switch patient to oral therapy as soon as he can tolerate it.

➤ **To heal erosive esophagitis**
*Children age 1 to 11 who weigh less than 20 kg (44 lb):* 10 mg P.O. once daily for up to 8 weeks.
*Children age 1 to 11 who weigh 20 kg or more:* 10 or 20 mg P.O. once daily for up to 8 weeks.

➤ **To reduce the risk of gastric ulcers in patients receiving continuous NSAID therapy**
*Adults:* 20 or 40 mg P.O. once daily for up to 6 months.

➤ **Long-term treatment of pathological hypersecretory conditions, including Zollinger-Ellison syndrome**
*Adults:* 40 mg P.O. b.i.d. Adjust dosage based on patient response.

➤ **To eliminate *Helicobacter pylori***
*Adults:* 40 mg esomeprazole magnesium P.O. daily, 1,000 mg amoxicillin P.O. b.i.d., and 500 mg clarithromycin P.O. b.i.d., given together for 10 days to reduce duodenal ulcer recurrence.
***Adjust-a-dose:*** For patient with severe hepatic failure, maximum daily dose is 20 mg.

### ADMINISTRATION

**P.O.**
• Give drug at least 1 hour before meals. If patient has difficulty swallowing the capsule, contents of the capsule can be emptied and mixed with 1 tablespoon of applesauce and swallowed (without chewing the enteric-coated pellets).
• If giving capsule via nasogastric (NG) tube, open capsule and empty the granules into a 60-ml syringe. Mix with 50 ml of water. Replace the plunger and shake vigorously for 15 seconds. Flush NG tube with additional water after use. Don't give if pellets have dissolved or disintegrated.

● For oral suspension, mix contents of packet with 1 tablespoon of water, and then let it sit for 2 to 3 minutes to thicken. Stir the suspension and drink within 30 minutes.
● To give oral suspension via NG tube, add 15 ml of water to a syringe, then add contents of packet. Shake syringe and leave for 2 to 3 minutes to thicken. Shake syringe again and inject through NG or gastric tube within 30 minutes.

**I.V.**
▼ Flush I.V. line with $D_5W$, normal saline solution, or lactated Ringer's injection before and after administration.
▼ Use reconstituted solution within 12 hours.
▼ Use admixture diluted with $D_5W$ within 6 hours.
▼ If diluted with normal saline solution or lactated Ringer's injection, use within 12 hours.
▼ Store reconstituted solution and admixture at room temperature.
▼ **Incompatibilities:** Other I.V. drugs.

## ACTION

Reduces gastric acid secretion and decreases gastric acidity.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1½ hr | 13–17 hr |
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 1 to 1½ hours.

## ADVERSE REACTIONS

**CNS:** headache, dizziness.
**GI:** abdominal pain, constipation, diarrhea, dry mouth, flatulence, nausea, vomiting.
**Respiratory:** sinusitis, respiratory infection.
**Skin:** pruritus.

## INTERACTIONS

**Drug-drug.** *Amoxicillin, clarithromycin:* May increase levels of esomeprazole. Monitor patient for toxicity.
*Azole antifungals (such as voriconazole):* May significantly increase esomeprazole level. Adjust dosage in patients receiving higher doses.
*Azole antifungals (such as itraconazole, ketoconazole):* May decrease bioavailability of antifungal. Avoid use together.
*Clopidogrel:* May decrease antiplatelet activity. Use cautiously together.
*Diazepam:* May decrease clearance of diazepam. Monitor patient for diazepam toxicity.
*Drugs metabolized by CYP2C19:* May alter clearance of esomeprazole, especially in elderly patients or patients with hepatic insufficiency. Monitor patient for toxicity.
*Iron salts:* May interfere with absorption of iron due to decreased gastric acid. Monitor effectiveness of iron therapy.
*Warfarin:* May prolong PT and INR, causing abnormal bleeding. Monitor the patient and his PT and INR.
**Drug-food.** *Any food:* May reduce drug level. Advise patient to take drug 1 hour before food.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or components of esomeprazole or omeprazole (a drug similar to this one).
***Alert:*** There may be an increased risk of hip, wrist, and spine fractures associated with proton pump inhibitors.
● Use cautiously in patients with hepatic insufficiency and in pregnant or breast-feeding women. It's unknown if this drug appears in breast milk, but omeprazole does.
● Use cautiously in patients receiving continuous NSAID therapy who are at increased risk for gastric ulcers (those age 60 and older and those with a history of gastric ulcers).
***Overdose S&S:*** Blurred vision, confusion, diaphoresis, drowsiness, flushing, headache, nausea, tachycardia.

## NURSING CONSIDERATIONS

● Antacids can be used while taking drug, unless otherwise directed by prescriber.
● Monitor patient for rash or signs and symptoms of hypersensitivity. Monitor GI symptoms for improvement or worsening. Monitor liver function tests, especially in patients with preexisting hepatic disease.
***Alert:*** Amoxicillin may trigger anaphylaxis in patients with a history of penicillin hypersensitivity.

- Long-term therapy may cause atrophic gastritis.
- ***Look alike–sound alike:*** Don't confuse Nexium with Nexavar.

### PATIENT TEACHING

- Instruct patient to take drug exactly as prescribed.
- Tell patient to take drug at least 1 hour before a meal.
- Advise patient that antacids can be used while taking drug unless otherwise directed by prescriber.
- Warn patient not to chew or crush drug pellets because this inactivates the drug.
- If patient has difficulty swallowing capsule, tell him to mix contents of capsule with 1 tablespoon of soft applesauce and swallow immediately.
- Advise patient to store capsules at room temperature in a tight container.
- Tell patient to inform prescriber of worsening signs and symptoms or pain.
- Instruct patient to alert prescriber if rash or other signs and symptoms of allergy occur.

## esterified estrogens

ESS-tehr-eh-fide ESS-troe-jenz

Menest, Neo-Estrone†

*Therapeutic class:* Estrogen
*Pharmacologic class:* Estrogen
*Pregnancy risk category X*

### AVAILABLE FORMS

*Tablets (film-coated):* 0.3 mg, 0.625 mg, 1.25 mg, 2.5 mg

### INDICATIONS & DOSAGES

➤ **Inoperable progressing prostate cancer**
*Men:* 1.25 to 2.5 mg P.O. t.i.d.

➤ **Palliative treatment for metastatic breast cancer**
*Men and postmenopausal women:* 10 mg P.O. t.i.d. for 3 or more months.

➤ **Hypogonadism**
*Women:* 2.5 to 7.5 mg daily in divided doses in cycles of 20 days on, 10 days off.

➤ **Castration, primary ovarian failure**
*Women:* 1.25 mg daily in cycles of 3 weeks on, 1 week off. Adjust for symptoms. Can be given continuously.

➤ **Vasomotor menopausal symptoms**
*Women:* 1.25 mg P.O. daily in cycles of 3 weeks on, 1 week off. Dosage may be increased to 2.5 to 3.75 mg P.O. daily, if needed.

➤ **Moderate to severe menopausal vulvar and vaginal atrophy**
*Women:* 0.3 to 1.25 mg or more P.O. daily in cycles of 3 weeks on, 1 week off.

### ADMINISTRATION

**P.O.**
- Use lowest effective dose needed for specific indication.

### ACTION

Mimics the actions of endogenous estrogens; increases synthesis of DNA, RNA, and protein in responsive tissues; reduces release of follicle-stimulating and luteinizing hormones from pituitary gland.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CNS:** headache, dizziness, chorea, depression, ***stroke, seizures.***
**CV:** thrombophlebitis, ***thromboembolism,*** hypertension, *edema*, ***pulmonary embolism, MI.***
**EENT:** worsening myopia or astigmatism, intolerance of contact lenses.
**GI:** *nausea,* vomiting, abdominal cramps, bloating, anorexia, increased appetite, ***pancreatitis,*** increased risk of gallbladder disease.
**GU:** breakthrough bleeding, altered menstrual flow, dysmenorrhea, amenorrhea, ***increased risk of endometrial cancer,*** cervical erosion, altered cervical secretions, enlargement of uterine fibromas, vaginal candidiasis, testicular atrophy, impotence.
**Hepatic:** cholestatic jaundice, ***hepatic adenoma.***
**Metabolic:** hypercalcemia, weight changes, hypertriglyceridemia.

**Skin:** melasma, rash, hirsutism or hair loss, erythema nodosum, dermatitis.
**Other:** *breast tenderness, enlargement, or secretion;, gynecomastia;,* ***increased risk of breast cancer.***

## INTERACTIONS

**Drug-drug.** *Carbamazepine, fosphenytoin, phenobarbital, phenytoin, rifampin:* May decrease effectiveness of estrogen therapy. Monitor patient closely.
*Clarithromycin, erythromycin, itraconazole, ketoconazole, ritonavir:* May increase estrogen plasma levels and side effects. Monitor patient.
*Corticosteroids:* May enhance effects. Monitor patient closely.
*Cyclosporine:* May increase risk of toxicity. Use together with caution, and monitor cyclosporine level frequently.
*Dantrolene, hepatotoxic drugs:* May increase risk of hepatotoxicity. Monitor liver function closely.
*Oral anticoagulants:* May decrease anticoagulant effects. Adjust dosage if needed. Monitor PT and INR.
*Tamoxifen:* May interfere with tamoxifen effectiveness. Avoid using together.
**Drug-herb.** *St. John's wort:* May decrease effects of drug. Discourage use together.
**Drug-food.** *Caffeine:* May increase caffeine level. Urge caution.
*Grapefruit, grapefruit juice:* May increase risk of adverse effects. Discourage use together.
**Drug-lifestyle.** *Smoking:* May increase risk of CV effects. If smoking continues, may need another form of therapy.

## EFFECTS ON LAB TEST RESULTS

- May increase calcium, thyroid-binding globulin, serum triglyceride, serum phospholipid, and clotting factor VII, VIII, IX, and X levels.
- May increase norepinephrine-induced platelet aggregation and PT.
- May reduce metyrapone test results and cause impaired glucose tolerance.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in pregnant women, in patients hypersensitive to drug, and in patients with breast cancer (except metastatic disease), estrogen-dependent neoplasia, active thrombophlebitis, thromboembolic disorders, undiagnosed abnormal genital bleeding, or history of thromboembolic disease.
- Use cautiously in patients with history of hypertension, mental depression, cardiac or renal dysfunction, liver impairment, gallbladder disease, bone disease, migraine, seizures, or diabetes.

## NURSING CONSIDERATIONS

- When used for vasomotor symptoms in menstruating women, cyclic administration is started on day 5 of bleeding.
- When given cyclically for short-term use, administration should be cyclic and attempts to discontinue or taper the medication should be made at 3- to 6-month intervals.
- Make sure patient has thorough physical examination before starting estrogen therapy. Patients receiving long-term therapy should have annual examinations. Periodically monitor body weight, blood pressure, lipid levels, and hepatic function.
- Notify pathologist about patient's estrogen therapy when sending specimens to laboratory for evaluation.

***Alert:*** Because of risk of thromboembolism, stop therapy at least 1 month before procedures that cause prolonged immobilization or increased risk of thromboembolism, such as knee or hip surgery.

**Black Box Warning** Estrogens have been reported to increase the risk of endometrial carcinoma.

**Black Box Warning** Estrogens should not be used during pregnancy.

- Glucose tolerance may be impaired. Monitor glucose level closely in patients with diabetes.

## PATIENT TEACHING

- Tell patient to read package insert describing estrogen's adverse effects; also, give patient verbal explanation.
- Emphasize importance of regular physical examinations. Postmenopausal women who use estrogen replacement for longer than 5 years to treat menopausal symptoms may be at increased risk for endometrial cancer. This risk is reduced by using cyclic rather

than continuous therapy and the lowest possible estrogen dosage. Adding progestins to the regimen decreases risk of endometrial hyperplasia, but it's unknown whether progestins affect risk of endometrial cancer.

***Alert:*** Warn patient to immediately report abdominal pain; pain, numbness, or stiffness in legs or buttocks; pressure or pain in chest or shortness of breath; severe headaches; visual disturbances, such as blind spots, flashing lights, or blurriness; vaginal bleeding or discharge; breast lumps; swelling of hands or feet; yellow skin or sclera; dark urine; or light-colored stools.

- Tell diabetic patient to report elevated glucose level so that antidiabetic dosage can be adjusted.
- Explain to woman receiving cyclic therapy for postmenopausal symptoms that she may experience withdrawal bleeding during week off drug. Tell her to report unusual vaginal bleeding.
- Teach woman to perform routine breast self-examination.
- Advise woman of childbearing age to consult prescriber before taking drug and to advise prescriber immediately if she becomes pregnant.
- Teach patient methods to decrease risk of blood clots.
- Encourage patient to stop smoking or reduce number of cigarettes smoked because of the risk of CV complications.

### AVAILABLE FORMS

**estradiol**
*Spray, topical solution:* 1.53 mg
*Tablets (micronized):* 0.5 mg, 1 mg, 1.5 mg, 2 mg
*Transdermal:* 0.014 mg/24 hours, 0.025 mg/24 hours, 0.0375 mg/24 hours, 0.05 mg/24 hours, 0.06 mg/24 hours, 0.075 mg/24 hours, 0.1 mg/24 hours
*Vaginal cream (in nonliquefying base):* 0.1 mg/g
*Vaginal ring (extended-release):* 0.0075 mg/24 hours
**estradiol acetate**
*Tablets:* 0.45 mg, 0.9 mg, 1.8 mg
*Vaginal ring:* 0.05 mg/24 hours; 0.1 mg/24 hours
**estradiol cypionate**
*Injection (in oil):* 5 mg/ml
**estradiol gel**
*Transdermal gel:* 0.06% (1.25 g/metered dose), 0.1% (in 0.25-, 0.5-, and 1-g single-dose packets)
**estradiol hemihydrate**
*Topical emulsion:* 0.25%
*Vaginal tablets:* 10 mcg, 25 mcg
**estradiol valerate**
*Injection (in oil):* 10 mg/ml, 20 mg/ml, 40 mg/ml

### INDICATIONS & DOSAGES

➤ **Vasomotor menopausal symptoms, female hypogonadism, female castration, primary ovarian failure**
*Women:* 1 to 2 mg P.O. estradiol daily. Or, for vasomotor symptoms, 1 to 5 mg cypionate I.M. once every 3 to 4 weeks; for female hypogonadism, 1.5 to 2 mg cypionate I.M. once every month.
***Transdermal patch***
*Women:* Apply patch according to manufacturer's instructions. Alora, Estraderm,

Vivelle, and Vivelle-Dot are applied twice weekly. Climara and Menostar are applied once a week. Apply to clean, dry area of the trunk. Adjust dose, if necessary, after the first 2 or 3 weeks of therapy; then every 3 to 6 months as needed. Rotate application sites weekly with an interval of at least 1 week between particular sites used. Adjust dosage as needed.

➤ **Postmenopausal urogenital symptoms**

*Women:* One ring inserted into the upper third of the vagina. Ring is kept in place for 3 months.

➤ **Vulvar and vaginal atrophy**

*Women:* 0.05 mg/24 hours Estraderm applied twice weekly in a cyclic regimen. Or, 0.05 mg/24 hours Climara applied weekly in a cyclic regimen. Or, 2 to 4 g vaginal applications of cream daily for 1 to 2 weeks. When vaginal mucosa is restored, maintenance dose is 1 g one to three times weekly in a cyclic regimen. If using Vagifem for atrophic vaginitis, give 1 tablet vaginally once daily for 2 weeks. Maintenance dose is 1 tablet inserted vaginally twice weekly. Or, 10 to 20 mg valerate I.M. every 4 weeks as needed. Or, 1 to 5 mg estradiol cypionate I.M. once every 3 to 4 weeks. Or, 0.05 to 0.1 mg daily by vaginal ring. Replace vaginal ring every 3 months.

➤ **Moderate to severe vasomotor symptoms, as well as vulvar and vaginal atrophy associated with menopause**

*Women:* 1.25 g EstroGel applied once daily to skin in a thin layer from wrist to shoulder of one upper extremity.

➤ **Palliative treatment of advanced, inoperable breast cancer**

*Men and postmenopausal women:* 10 mg P.O. estradiol t.i.d. for 3 months.

➤ **Palliative treatment of advanced, inoperable prostate cancer**

*Men:* 30 mg valerate I.M. every 1 to 2 weeks, or 1 to 2 mg P.O. estradiol t.i.d.

➤ **To prevent postmenopausal osteoporosis**

*Women:* Place a 6.5-$cm^2$ (0.025 mg/24 hours) Climara patch once weekly on clean, dry skin of lower abdomen or upper quadrant of buttock. Or, place a 3.25-$cm^2$ (0.014 mg/24 hours) Menostar patch once weekly to clean, dry area of the lower abdomen. Or, place a 0.5 mg/24 hours Estraderm patch twice weekly in a cyclic regimen in women with an intact uterus. In women with a hysterectomy, apply one Estraderm patch twice weekly in a continuous regimen. For each system, press firmly in place for about 10 seconds; ensure complete contact, especially around edges. Or, 0.025-mg/24 hours Vivelle, Vivelle-Dot, or Alora system applied to a clean, dry area of the trunk twice weekly. Or, 0.5 mg P.O. daily for 23 days, followed by 5 days without drug.

➤ **Moderate to severe vasomotor symptoms from menopause**

*Women:* Apply contents of two 1.74-g foil pouches (total 3.48 g) of Estrasorb daily. Or, Divigel 0.1% at dose of 0.25, 0.5, or 1 g/day. Start with Divigel 0.25 g daily and adjust dose based on individual patient response. Or, 1 pump per day of Elestrin applied to the upper arm. Or, Evamist 1 spray per day initially; may adjust dose based on clinical response. Or, 0.05 to 0.1 mg daily by vaginal ring. Replace vaginal ring every 3 months.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food. If stomach upset occurs, give with food.
- Don't give drug with grapefruit juice.
- Store at controlled room temperature.

**I.M.**

- To give I.M. injection, make sure drug is well dispersed by rolling vial between palms. Inject deep into large muscle. Rotate injection sites to prevent muscle atrophy. Never give drug I.V.

**Transdermal**

- Open each pouch of Estrasorb individually and use contents of one pouch for each leg. Rub emulsion into thigh and calf for 3 minutes until thoroughly absorbed; rub emulsion remaining on hands onto the buttocks. Allow areas to dry before covering with clothing. Wash hands with soap and water to remove excess drug.
- Apply Elestrin once daily to the upper arm.
- Apply EstroGel over the entire area of one arm.
- Apply Evamist each morning to adjacent, non-overlapping areas on the inner surface

of the forearm, starting near the elbow. Allow to dry for 2 minutes and do not wash the site for 30 minutes.
• Apply Divigel once daily on skin of either right or left upper thigh. Application surface area should be about 5 by 7 inches (about the size of two palm prints). Apply entire contents of a unit dose packet each day. To avoid potential skin irritation, apply Divigel to right or left upper thigh on alternating days. Don't apply Divigel on face, breasts, or irritated skin, or in or around the vagina. After application, allow gel to dry before dressing. Don't wash application site within 1 hour after applying Divigel. Avoid contact of gel with eyes. Wash hands after application.
• Apply transdermal patch to clean, dry, hairless, intact skin on abdomen or buttock. Don't apply to breasts, waistline, or other areas where clothing can loosen patch. When applying, ensure thorough contact between patch and skin, especially around edges, and hold in place for about 10 seconds. Apply patch immediately after opening and removing protective cover. Rotate application sites.

**Vaginal**
• Using the applicator, insert Vagifem as far into vagina as it can comfortably go, without using force.
• Remove vaginal ring from its pouch. Squeeze sides together and insert ring into vagina where comfortable.

## ACTION

Increases synthesis of DNA, RNA, and protein in responsive tissues; reduces release of follicle-stimulating and luteinizing hormones from the pituitary gland.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.M., vaginal | Unknown | Unknown | Unknown |
| Transdermal (Estrasorb) | Immediate | Unknown | Unknown |
| Transdermal gel (EstroGel) | Immediate | 1 hr | 24–36 hr |

*Half-life:* Alora transdermal patch, 1.75 ± 2.87 hours; Vivelle transdermal patch, 4.4 ± 2.3 hours; Vivelle-Dot transdermal patch, 5.9 to 7.7 hours; other forms, unknown.

## ADVERSE REACTIONS

**CNS:** ***stroke,*** *headache,* dizziness, chorea, depression, ***seizures,*** insomnia (Vagifem).
**CV:** thrombophlebitis, ***thromboembolism,*** hypertension, *edema*, ***pulmonary embolism (PE), MI.***
**EENT:** worsening myopia or astigmatism, intolerance of contact lenses, sinusitis (Vagifem).
**GI:** *nausea,* vomiting, abdominal cramps, bloating, increased appetite, ***pancreatitis,*** anorexia, gallbladder disease, dyspepsia (Vagifem).
**GU:** breakthrough bleeding, altered menstrual flow, dysmenorrhea, amenorrhea, ***increased risk of endometrial cancer,*** cervical erosion, abnormal Pap smear, altered cervical secretions, enlargement of uterine fibromas, vaginal candidiasis in women, testicular atrophy, impotence in men, genital pruritus, hematuria, vaginal discomfort, vaginitis (Vagifem).
**Hepatic:** cholestatic jaundice, ***hepatic adenoma.***
**Metabolic:** weight changes, hypothyroidism, hypercalcemia (in patients with breast cancer and bone metastases).
**Respiratory:** *upper respiratory tract infection,* allergy, bronchitis (Vagifem).
**Skin:** melasma, urticaria, erythema nodosum, dermatitis, hair loss, pruritus.
**Other:** *gynecomastia,* ***increased risk of breast cancer,*** hot flashes, pain (Vagifem), *breast tenderness, enlargement, or secretion,* flulike syndrome.

## INTERACTIONS

**Drug-drug.** *Carbamazepine, fosphenytoin, phenobarbital, phenytoin, rifampin:* May decrease effectiveness of estrogen therapy. Monitor patient closely.
*Clarithromycin, erythromycin, itraconazole, ketoconazole, ritonavir:* May increase estrogen plasma levels and side effects. Monitor patient.
*Corticosteroids:* May enhance effects of corticosteroids. Monitor patient closely.
*Cyclosporine:* May increase risk of toxicity. Use together with caution, and monitor cyclosporine level frequently.
*Dantrolene, other hepatotoxic drugs:* May increase risk of hepatotoxicity. Monitor liver function closely.

*Oral anticoagulants:* May decrease anticoagulant effect. Dosage adjustments may be needed. Monitor PT and INR.
*Tamoxifen:* May interfere with tamoxifen effectiveness. Avoid using together.
**Drug-herb.** *Black cohosh:* May increase drug's adverse effects. Discourage use together.
*Saw palmetto:* May negate drug's effects. Discourage use together.
*St. John's wort:* May decrease effects of drug. Discourage use together.
**Drug-food.** *Caffeine:* May increase caffeine level. Advise patient to avoid or minimize use of caffeine.
*Grapefruit juice:* May elevate drug level. Tell patient to take drug with liquid other than grapefruit juice.
**Drug-lifestyle.** *Smoking:* May increase risk of adverse CV effects. If smoking continues, may need another therapy.
*Sunscreen use:* May increase absorption of Estrasorb. Tell patient to separate application times.

## EFFECTS ON LAB TEST RESULTS

- May increase clotting factor VII, VIII, IX, and X; total $T_4$; thyroid-binding globulin; liver function test; and triglyceride levels.
- May increase norepinephrine-induced platelet aggregation and PT.
- May decrease metyrapone test results.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in pregnant patients and patients with thrombophlebitis or thromboembolic disorders, estrogen-dependent neoplasia, breast or reproductive organ cancer (except for palliative treatment), undiagnosed abnormal genital bleeding, or history of thrombophlebitis or thromboembolic disorders linked to previous estrogen use (except for palliative treatment of breast and prostate cancer).
- Contraindicated in patients with liver dysfunction or disease.
- Use cautiously in patients with cerebrovascular or coronary artery disease, asthma, bone disease, migraine, seizures, or cardiac or renal dysfunction.
- Use cautiously in women who have a strong family history (grandmother, mother, sister) of breast cancer, breast nodules, fibrocystic breasts, or abnormal mammogram findings.

***Alert:*** Postmenopausal women ages 50 to 79 who are taking estrogen and progestin have an increased risk of MI, stroke, invasive breast cancer, PE, and thrombosis. Postmenopausal women age 65 or older also have an increased risk of dementia.
***Overdose S&S:*** Nausea, vomiting, withdrawal uterine bleeding.

## NURSING CONSIDERATIONS

- Ensure that patient has physical examination before starting therapy. Patients receiving long-term therapy should have yearly examinations. Monitor lipid levels, blood pressure, body weight, and hepatic function.
- Ask patient about allergies, especially to foods and plants. Estradiol is available as an aqueous solution or as a solution in peanut oil; estradiol cypionate, as a solution in cottonseed oil; estradiol valerate, as a solution in castor oil or sesame oil.

**Black Box Warning** Estrogen increases the risk of endometrial cancer. Use adequate diagnostic measures, including endometrial sampling when indicated, to rule out malignancy in all cases of undiagnosed persistent or recurring abnormal vaginal bleeding. ■

**Black Box Warning** Do not use estrogens with or without progestins to prevent cardiovascular disease or dementia. ■

- When estrogen is prescribed for a postmenopausal woman with a uterus, also initiate a progestin to reduce the risk of endometrial cancer.

***Alert:*** EstroGel contains alcohol. Avoid fire, flame, or smoking until area dries in 2 to 5 minutes.

- In women also taking oral estrogen, treatment with the Estraderm transdermal patch can begin 1 week after withdrawal of oral therapy, or sooner if menopausal symptoms appear before the end of the week.
- Transdermal systems may be used continually rather than cyclically. Other alternative regimens are 1 to 5 mg cypionate I.M. every 3 to 4 weeks and 10 to 20 mg (valerate) I.M. every 4 weeks, as needed.
- Instruct patients using Vagifem who have severely atrophic vaginal mucosa to be careful when inserting the applicator. After

gynecologic surgery, tell patient to use any vaginal applicator cautiously and only if clearly indicated.
• The prescriber should assess the patient's need to continue estradiol therapy. Make attempts to stop or taper at 3- to 6-month intervals.
• Because of risk of thromboembolism, stop therapy at least 1 month before high-risk procedures or those that cause prolonged immobilization, such as knee or hip surgery.
• Glucose tolerance may be impaired. Monitor glucose level closely in patients with diabetes.
• Notify pathologist about estrogen therapy when sending specimens to laboratory for evaluation.
• Estrace 2 mg micronized tablets contain tartrazine.

## PATIENT TEACHING

• Tell patient to read package insert describing estrogen's adverse effects and give verbal explanation.
***Alert:*** Advise patient not to allow contact between children and Evamist application site. Accidental exposure may cause premature puberty in children. If contact occurs, immediately wash child's skin with soap and water.
• Emphasize importance of regular physical examinations. Postmenopausal women who use estrogen replacement for longer than 5 years may be at increased risk for endometrial cancer. Risk is reduced by using cyclic rather than continuous therapy and the lowest possible dosages of estrogen. Adding progestins to the regimen decreases risk of endometrial hyperplasia; however, it isn't known whether progestins affect risk of endometrial cancer. No increased risk of breast cancer has been reported.
• Teach woman how to use cream. She should wash vaginal area with soap and water before applying and insert cream high into the vagina (about two-thirds the length of the applicator). She should take drug at bedtime, or lie flat for 30 minutes after instillation to minimize drug loss.
• Tell patient using topical emulsion not to apply it with sunscreen.
• Tell patient to use transdermal system correctly, to rotate sites, to avoid breasts and waistline, and to reapply patch if it falls off.
• Teach patient using transdermal gel (EstroGel) to apply in a thin layer on one arm and allow to dry before smoking, getting near flames, dressing, or touching the arm. Recommend bathing before application to maintain full dosage.
• Tell patient that estradiol gel should never be applied directly to the breast.
• Tell patient to insert Vagifem by the applicator as far into vagina as it can comfortably go, without using force.
***Alert:*** Warn patient to immediately report abdominal pain, pressure or pain in chest, shortness of breath, severe headaches, visual disturbances, vaginal bleeding or discharge, breast lumps, swelling of hands or feet, yellow skin or sclera, dark urine, light-colored stools, and pain, numbness, or stiffness in legs or buttocks.
• Explain to patient receiving cyclic therapy for postmenopausal symptoms that withdrawal bleeding may occur during week off drug. Tell her to report unusual vaginal bleeding.
• Tell diabetic patient to report elevated glucose level so that antidiabetic dosage can be adjusted.
• Teach woman how to perform routine breast self-examination.
• Teach patient methods to decrease risk of blood clots.
• Advise woman not to become pregnant during estrogen therapy.
• Advise woman of childbearing age to consult prescriber before taking drug and to advise prescriber immediately if she becomes pregnant.
• Encourage patient to stop or reduce smoking because of the risk of CV complications.
• Advise patient not to allow pets to lick or touch Evamist application site. If signs of illness occur, patient should contact pet's veterinarian.

# estradiol and norethindrone acetate transdermal system

ess-tra-DYE-ole and nor-ETH-in-drone

CombiPatch

*Therapeutic class:* Estrogen
*Pharmacologic class:* Estrogen and progestin
*Pregnancy risk category X*

## AVAILABLE FORMS

*Transdermal:* 9-cm$^2$ system releasing 0.05 mg estradiol and 0.14 mg norethindrone acetate daily; 16-cm$^2$ system releasing 0.05 mg estradiol and 0.25 mg norethindrone acetate daily

## INDICATIONS & DOSAGES

➤ **Moderate to severe vasomotor symptoms from menopause; vulval and vaginal atrophy; hypoestrogenemia from hypogonadism, castration, or primary ovarian failure in women with intact uterus**

***Continuous combined regimen***

*Women:* Wear 9-cm$^2$ patch continuously on lower abdomen. Replace system twice weekly during 28-day cycle. May increase to 16-cm$^2$ patch.

***Continuous sequential regimen***

*Women:* For use in sequential regimen with an estradiol transdermal system (such as Alora, Estraderm, Vivelle), wear 0.05-mg estradiol transdermal patch for first 14 days of 28-day cycle; replace system twice weekly. Wear 9-cm$^2$ patch system on lower abdomen for rest of 28-day cycle; replace system twice weekly. May increase to 16-cm$^2$ patch as needed.

## ADMINISTRATION

**Transdermal**

- Apply patch system to a smooth (fold-free), clean, dry, nonirritated area of skin on lower abdomen, avoiding the waistline. Rotate application sites, with an interval of at least 1 week between applications to same site.
- Don't apply patch on or near breasts.
- Avoid applying to areas that may get prolonged sun exposure.
- Reapply patch, if needed, to another area of lower abdomen. If patch fails to adhere, replace with a new one.

## ACTION

A matrix transdermal system in which estradiol and norethindrone are released continuously. Estrogen replacement therapy can reduce menopausal symptoms and release of follicle-stimulating and luteinizing hormones in postmenopausal women.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Transdermal | 12–24 hr | Unknown | 3–4 days |

*Half-life:* 2 to 23 hours (estradiol); 6 to 8 hours (norethindrone).

## ADVERSE REACTIONS

**CNS:** *asthenia*, ***stroke,*** depression, insomnia, nervousness, dizziness, *headache*, *pain.*
**CV:** ***thromboembolism,*** thrombophlebitis, hypertension, *edema*, ***pulmonary embolism, MI.***
**EENT:** pharyngitis, *rhinitis*, *sinusitis*, retinal vascular thrombosis, intolerance to contact lenses.
**GI:** *abdominal pain*, *diarrhea*, dyspepsia, changes in appetite, flatulence, *nausea*, constipation, gallbladder disease.
**GU:** *dysmenorrhea*, *leukorrhea*, *menstrual disorder*, suspicious Papanicolaou smears, *vaginitis*, menorrhagia, ***vaginal hemorrhage.***
**Hepatic:** cholestatic jaundice.
**Metabolic:** weight changes, hypercalcemia, hypertriglyceridemia.
**Musculoskeletal:** arthralgia, *back pain.*
**Respiratory:** *respiratory disorder*, bronchitis.
**Skin:** application site reactions, acne, melasma, chloasma.
**Other:** *accidental injury*, *flulike syndrome*, *breast pain*, tooth disorder, peripheral edema, breast enlargement, infection, changes in libido.

## INTERACTIONS

**Drug-drug.** *Carbamazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *rifampin:* May decrease estrogen therapy effectiveness. Monitor patient closely.
*Clarithromycin*, *erythromycin*, *itraconazole*, *ketoconazole*, *ritonavir:* May increase

estrogen plasma levels and side effects. Monitor patient.
*Corticosteroids:* May enhance effects of corticosteroids. Monitor patient closely.
*Cyclosporine:* May increase risk of toxicity. Use together with caution; monitor cyclosporine level frequently.
*Dantrolene, hepatotoxic drugs:* May increase risk of hepatotoxicity. Monitor liver function closely.
*Oral anticoagulants:* May decrease effect of anticoagulant. May need to adjust dose. Monitor PT and INR.
*Tamoxifen:* May interfere with tamoxifen effectiveness. Avoid using together.
**Drug-herb.** *Black cohosh:* May increase adverse effects of drug. Discourage use together.
*Saw palmetto:* May cause antiestrogenic effects. Discourage use together.
*St. John's wort:* May decrease effects of drug. Discourage use together.
**Drug-food.** *Caffeine:* May increase caffeine level. Advise patient to avoid or minimize use of caffeine.
*Grapefruit juice:* May elevate estrogen level. Advise patient to take with liquid other than grapefruit juice.
**Drug-lifestyle.** *Smoking:* May increase risk of adverse CV effects. If smoking continues, may need alternative therapy.

## EFFECTS ON LAB TEST RESULTS

- May increase $T_3$ and $T_4$, HDL, and triglyceride levels. May decrease LDL levels.
- May increase fibrinogen activity and platelet count. May decrease $T_3$ resin uptake. May alter activated PTT, INR, and platelet aggregation times.
- May reduce metyrapone test values. May alter glucose tolerance test results.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in women hypersensitive to estrogen, progestin, or any component of the patch; in pregnant patients; and in patients with known or suspected breast cancer, known or suspected estrogen-dependent neoplasia, undiagnosed abnormal genital bleeding, active thrombophlebitis, thromboembolic disorders, or stroke.
- Use cautiously in breast-feeding women and in patients with impaired liver function, asthma, epilepsy, migraine, or cardiac or renal dysfunction.

## NURSING CONSIDERATIONS

**Black Box Warning** Do not use estrogens, with or without progestins, to prevent cardiovascular disease or dementia. ▮
**Black Box Warning** Postmenopausal women treated for 5 years have an increased risk of MI, stroke, invasive breast cancer, pulmonary emboli and deep vein thrombosis. ▮
- Women not receiving continuous estrogen or combined estrogen and progestin therapy may start therapy at any time.
- Women receiving continuous hormone replacement therapy should complete the current cycle before starting therapy. Women commonly have withdrawal bleeding at completion of cycle; first day of withdrawal bleeding is appropriate time to start therapy.
- Store patches in refrigerator before dispensing. Patient may then store patches at room temperature for up to 6 months, or the expiration date, whichever comes first.
- Reevaluate therapy at 3- to 6-month intervals.
- A combined estrogen and progestin regimen is indicated for a woman with an intact uterus. Progestins taken with estrogen significantly reduce, but don't eliminate, risk of endometrial cancer linked to use of estrogen alone.
- Because of risk of thromboembolism, stop therapy at least 4 to 6 weeks before surgery associated with an increased risk of thromboembolism, or during periods of prolonged immobilization.
- Blood pressure increases have been linked to estrogen use. Monitor patient's blood pressure regularly.
- Treatment of postmenopausal symptoms usually starts during menopausal stage when vasomotor symptoms occur.
- Monitor glucose level closely in patients with diabetes.

***Alert:*** Don't interchange CombiPatch with other estrogen patches. Verify therapy before application.

## PATIENT TEACHING

- Teach woman how to apply patch properly. She should wear only one patch at any time during therapy. Tell her to apply patch immediately after opening protective cover.
- Tell patient an oil-based cream or lotion may help remove adhesive from the skin after patch has been removed and the area allowed to dry for 15 minutes.
- Advise woman not to use patch if she's pregnant or plans to become pregnant.
- Urge woman of childbearing age to consult prescriber before applying patch and to advise prescriber immediately if she becomes pregnant.
- Instruct patient that the continuous combined regimen may lead to irregular bleeding, particularly in the first 6 months, but that it usually decreases with time, and often stops completely.
- Tell patient that, for the continuous sequential regimen, monthly withdrawal bleeding is common.
- Advise patient to alert prescriber and remove patch at first sign of clotting disorders (thrombophlebitis, cerebrovascular disorders, and pulmonary embolism).
- Instruct patient to stop using patch and call prescriber about any loss of vision, sudden onset of protrusion of the eyeball (proptosis), double vision, or migraine.
- Encourage patient to stop or reduce smoking because of the risk of CV complications.
- Tell patient to perform monthly self breast exams and to have annual gynecologic and breast examinations by a health care provider.
- Advise patient not to store patches where extreme temperatures can occur.
- Tell patient undergoing an MRI to alert facility that she's using a transdermal patch.

✳ NEW DRUG

# estradiol valerate and estradiol valerate/dienogest

ess-tra-DYE-ole VAL-er-ate and dye-EN-oh-jest

Natazia

*Therapeutic class:* Estrogen
*Pharmacologic class:* Estrogen and progestin
*Pregnancy risk category X*

## AVAILABLE FORMS

*Tablets:* 28-day blister pack containing two 3-mg estradiol valerate, five 2-mg estradiol valerate with 2-mg dienogest, seventeen 2-mg estradiol valerate with 3-mg dienogest, two 1-mg estradiol valerate, and two inert tablets

## INDICATIONS & DOSAGES

➤ **Contraception**

*Women:* 1 tablet P.O. daily beginning on first day of menstrual cycle as directed on blister pack at same time each day. When changing from another combination hormonal contraceptive, begin on first day of withdrawal bleeding. When changing from combination hormonal vaginal ring or transdermal patch, begin on day vaginal ring or transdermal patch is removed. When changing from progestin-only, begin next day. When changing from implant contraceptive or intrauterine system, begin day of implant or intrauterine system removal. When changing from injection contraceptive, begin day next injection is due.

## ADMINISTRATION

**P.O.**

- Give at same time each day; don't delay by more than 12 hours.
- Tablets must be given in order indicated on blister pack.

## ACTION

Prevents pregnancy by suppressing ovulation. May also cause changes in endometrium and cervical mucus, inhibiting sperm penetration and reducing likelihood of implantation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3 hr (estradiol); 1½ hr (dienogest) | Unknown |

*Half-life:* 14 hours (estradiol); 11 hours (dienogest).

## ADVERSE REACTIONS

**CNS:** depression, *headache.*
**CV:** **MI, DEEP VEIN THROMBOSIS (DVT),** hypertension.
**GI:** nausea, vomiting.
**GU:** amenorrhea, irregular uterine bleeding, metrorrhagia, oligomenorrhea, ***uterine leiomyoma, ruptured ovarian cyst.***
**Metabolic:** weight gain, hyperglycemia.
**Skin:** acne.
**Other:** breast pain, tenderness, or discomfort.

## INTERACTIONS

**Drug-drug.** *Antibiotics:* May reduce contraceptive effectiveness. Advise use of back-up contraception during therapy.
*HIV protease inhibitors:* May either increase or decrease estrogen and progesterone levels. Use together cautiously and monitor patient for effectiveness of hormone treatment.
*Lamotrigine:* May decrease lamotrigine serum level, reducing seizure control. Adjust lamotrigine dosage as necessary.
*Strong CYP3A4 inducers (such as barbiturates, carbamazepine, phenytoin, rifampin):* May reduce contraceptive effectiveness or increase breakthrough bleeding. An alternative method of birth control should be used.
*Strong and moderate inhibitors of CYP3A4 (such as cimetidine, erythromycin, ketoconazole, selective serotonin reuptake inhibitors, verapamil):* May increase levels of hormones. Avoid use together. If drugs must be used together, monitor patient for adverse effects.
*Thyroid hormone:* May increase serum concentration of thyroid-binding globulin, leading to decreased effectiveness of thyroid replacement therapy. Monitor patient; thyroid hormone dosage may need adjustment.
**Drug-herb.** *St John's wort:* May reduce contraceptive effectiveness or increase breakthrough bleeding. Recommend alternative method of birth control.
**Drug-food.** *Grapefruit juice:* May increase levels of hormones. Avoid use together.
**Drug-lifestyle.** **Black Box Warning** *Smoking:* Increases risk of medical problems, such as stroke, emboli, or heart disease. Recommend smoking cessation. ■

## EFFECTS ON LAB TEST RESULTS

- May increase thyroid-binding globulin, glucose, cholesterol, and lipid levels.
- May increase coagulation factors.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in pregnant patients and in those with benign or malignant liver tumors; liver disease; breast cancer or history of breast cancer; undiagnosed abnormal genital bleeding; headaches with focal neurologic symptoms or migraine headaches with or without aura if older than age 35; diabetes with vascular disease; uncontrolled hypertension; hypertension with vascular disease; inherited or acquired hypercoagulopathies; thrombogenic valvular or thrombogenic rhythm disease of heart, such as endocarditis or atrial fibrillation; coronary artery disease; cerebrovascular disease; DVT; or current or past pulmonary embolism.

**Black Box Warning** Contraindicated in women who smoke and who are older than age 35. ■

- Use cautiously in women with CV disease risk factors, history of cholestasis, history of well-controlled hypertension, prediabetes or well-controlled diabetes, history of hyperlipidemia, new-onset headaches, history of bleeding irregularities, history of emotional disorders, angioedema, or chloasma.
- Safety and efficacy in women with body mass index greater than 30 kg/m$^2$ haven't been evaluated.
- Drug hasn't been studied in postmenopausal women and isn't indicated in this population.
- When possible, breast-feeding women should use other forms of contraception while breast-feeding because estrogen may reduce milk production and small amount of drug is present in breast milk.

● Safety and efficacy in women of reproductive age have been established. Use of this product before menarche isn't indicated.
***Overdose S&S:*** Nausea, withdrawal bleeding.

## NURSING CONSIDERATIONS

● Start drug no earlier than 4 weeks after delivery in women who aren't breast-feeding. Risk of postpartum venous thrombotic event (VTE) decreases and ovulation risk increases after third postpartum week.
● Ensure that oral contraceptives aren't given to pregnant women. Evaluate reported amenorrhea.
● Monitor blood pressure; elevations are possible in nonhypertensive women.
● Monitor coagulation factors as appropriate.
● Monitor glucose and cholesterol levels regularly, especially in women who are prediabetic and in those with history of elevated lipid levels.
● Monitor women for headache. New-onset headaches may require discontinuing oral contraceptives.
● Carefully monitor women with history of depression for recurrence or exacerbation.
● Stop drug if arterial or deep VTE occurs. Highest risk of VTE is during first year of contraceptive use. If feasible, stop tablets at least 4 weeks before and for 2 weeks after major surgery.
● Oral contraceptives are associated with increased risk of thrombotic and hemorrhagic strokes, especially in women older than age 35, in those with hypertension, and in smokers. Stop drug if unexplained vision loss, proptosis, diplopia, papilledema, or retinal vascular changes occur. Evaluate retinal vein thrombosis immediately.
● Risk of drug causing breast cancer or cervical or endometrial cancer is controversial and uncertain. As a precaution, women should have regular Papanicolaou tests, breast examinations, and mammograms.
● Discontinue drug if jaundice develops. Women who take oral contraceptives are at slightly higher risk for developing liver tumors and gallstones. Monitor patient for skin color changes and pain in upper right quadrant.

## PATIENT TEACHING

● Teach patient to take tablet once daily and not to skip doses or delay taking tablet by more than 12 hours. Advise patient that tablets should be taken in the order marked on each pack.
● Instruct patient to read package insert for information on missed tablets or to contact her pharmacist or prescriber and that back-up contraception must be used.
● Tell patient starting drug for first time to begin taking tablets on day 1 of her period and to use back-up contraceptive method for first 9 days
● Instruct patient that spotting or light bleeding is normal at first.
● Advise patient that she may feel nauseous, especially during first few months, but that this symptom usually disappears and she shouldn't stop taking tablets. Tell patient to report to prescriber if nausea doesn't resolve.
● Warn patient to start drug no earlier than 4 weeks after giving birth.
● Advise patient to notify prescriber if she is pregnant before taking drug.
● Tell patient that breast-feeding while taking tablets isn't recommended because milk production may be reduced and small amounts of drug appear in breast milk.
● Inform patient taking tablets that blood tests may be needed to check blood glucose and cholesterol levels and how her blood is clotting and that her blood pressure may also be checked.
● Tell patient to inform prescriber of all prescription, over-the-counter, and herbal supplements she is taking.
● Advise patient, if appropriate, to quit smoking before taking drug.
**Black Box Warning** Advise patient who smokes that she is at increased risk for serious CV events from combination oral contraceptive use. Risk increases with age, especially after age 35, and with number of cigarettes smoked. ■
● Inform patient that contraceptive use doesn't protect against HIV infection or other sexually transmitted diseases.
● Tell patient a missed period may occur but that pregnancy should be ruled out if she misses two or more consecutive menstrual cycles.

● Warn patient to call prescriber immediately if she experiences persistent leg pain; sudden shortness of breath; sudden blindness (partial or complete); severe chest pain; sudden, severe headache; weakness or numbness in an arm or leg; trouble speaking; or yellowing of skin or eyes.
● Advise patient with tendency to chloasma to avoid sun exposure and ultraviolet radiation.
● Advise patient to stop smoking while taking oral contraceptive because of increased risk of stroke and other thromboembolic events.

## estrogens, conjugated (estrogenic substances, conjugated; oestrogens, conjugated)

ESS-troe-jenz

Cenestin, C.E.S.†, Enjuvia, Premarin🖋, Premarin Intravenous

*Therapeutic class:* Estrogen
*Pharmacologic class:* Estrogen
*Pregnancy risk category X*

### AVAILABLE FORMS

*Injection:* 25 mg/5 ml
*Tablets:* 0.3 mg, 0.45 mg, 0.625 mg, 0.9 mg, 1.25 mg
*Vaginal cream:* 0.625 mg/g

### INDICATIONS & DOSAGES

➤ **Abnormal uterine bleeding (hormonal imbalance)**
*Adults:* 25 mg I.V. (preferred) or I.M. Repeat dose in 6 to 12 hours, if necessary.
➤ **Vulvar or vaginal atrophy**
*Adults:* 0.5 to 2 g cream intravaginally once daily in cycles of 3 weeks on, 1 week off.
➤ **Castration and primary ovarian failure**
*Adults:* Initially, 1.25 mg Premarin P.O. daily in cycles of 3 weeks on, 1 week off. Adjust dose as needed.
➤ **Female hypogonadism**
*Adults:* 0.3 to 0.625 mg Premarin P.O. daily, given cyclically 3 weeks on, 1 week off.
➤ **Moderate to severe vasomotor symptoms with or without moderate to severe symptoms of vulvar and vaginal atrophy associated with menopause**
*Adults:* Initially, 0.3 mg Premarin or Enjuvia P.O. daily. Premarin may also be given cyclically 25 days on, 5 days off. Adjust dosage based on patient response.
➤ **Moderate to severe vasomotor symptoms from menopause**
*Adults:* 0.45 mg Cenestin P.O. daily. Adjust dose based on patient response.
➤ **Moderate to severe symptoms of vulvar and vaginal atrophy from menopause**
*Adults:* 0.3 mg Cenestin P.O. daily.
➤ **To prevent osteoporosis**
*Adults:* 0.3 mg Premarin P.O. daily, or cyclically, 25 days on, 5 days off. Adjust dose based on response of bone mineral density testing.
➤ **Palliative treatment of inoperable prostatic cancer**
*Adults:* 1.25 to 2.5 mg Premarin P.O. t.i.d.
➤ **Palliative treatment of breast cancer**
*Adults:* 10 mg Premarin P.O. t.i.d. for at least 3 months.

### ADMINISTRATION

**P.O.**
● Give drug at same time each day.

**I.V.**
▼ Refrigerate before reconstituting.
▼ Reconstitute only with diluent provided. Agitate gently after adding diluent.
▼ Drug is compatible with normal saline, dextrose, or invert sugar solutions.
▼ Use reconstituted solution within a few hours, if possible. Reconstituted solution is stable under refrigeration for 60 days. Don't use if solution darkens or precipitates.
▼ Give direct injection slowly to avoid flushing reaction.
▼ **Incompatibilities:** Acidic solutions, ascorbic acid, protein hydrolysate.

**I.M.**
● Reconstitute only with diluent provided. Agitate gently after adding diluent.
● Inject deep into large muscle. Rotate injection sites to prevent muscle atrophy.

**Vaginal**
● Wash the vaginal area with soap and water, insert about two-thirds the length of the applicator into the vagina, and release

drug. Give drug at bedtime or when the patient will lie flat for 30 minutes after use to minimize drug loss.

## ACTION

Increases synthesis of DNA, RNA, and protein in responsive tissues. Also reduces release of follicle-stimulating and luteinizing hormones from the pituitary gland.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.V., I.M., vaginal | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** headache, dizziness, chorea, depression, ***stroke, seizures.***
**CV:** flushing with rapid I.V. administration, thrombophlebitis, ***thromboembolism,*** hypertension, *edema,* ***pulmonary embolism, MI.***
**EENT:** worsening myopia or astigmatism, intolerance of contact lenses.
**GI:** *nausea,* vomiting, abdominal cramps, bloating, anorexia, increased appetite, ***pancreatitis,*** gallbladder disease.
**GU:** breakthrough bleeding, altered menstrual flow, dysmenorrhea, amenorrhea, ***increased risk of endometrial cancer,*** cervical erosion, altered cervical secretions, enlargement of uterine fibromas, vaginal candidiasis, testicular atrophy, impotence.
**Hepatic:** cholestatic jaundice, ***hepatic adenoma.***
**Metabolic:** weight changes, hypercalcemia, hypertriglyceridemia.
**Skin:** melasma, chloasma, urticaria, hirsutism or hair loss, erythema nodosum, dermatitis.
**Other:** *breast tenderness, enlargement, or secretion, gynecomastia,* ***increased risk of breast cancer,*** changes in libido.

## INTERACTIONS

**Drug-drug.** *Carbamazepine, fosphenytoin, phenobarbital, phenytoin, rifampin:* May decrease effectiveness of estrogen therapy. Monitor patient closely.
*Corticosteroids:* May enhance corticosteroid effects. Monitor patient closely.
*Cyclosporine:* May increase risk of toxicity. Use together with caution, and monitor cyclosporine level frequently.
*Dantrolene, other hepatotoxic drugs:* May increase risk of hepatotoxicity. Monitor liver function closely.
*Itraconazole, ketoconazole, macrolide antibiotics, ritonavir:* May increase estrogen plasma levels and side effects. Monitor patient.
*Oral anticoagulants:* May decrease anticoagulant effects. May need to adjust dosage. Monitor PT and INR.
*Tamoxifen:* May interfere with tamoxifen effectiveness. Avoid using together.
*Thyroid hormones:* May increase serum thyroxine-binding globulin levels, which may increase thyroid hormone requirements.
**Drug-herb.** *Black cohosh:* May increase adverse effects of drug. Discourage use together.
*Red clover:* May interfere with hormonal therapies. Discourage use together.
*Saw palmetto:* May have antiestrogenic effects. Discourage use together.
*St. John's wort:* May decrease effects of drug. Discourage use together.
**Drug-food.** *Caffeine:* May increase caffeine level. Advise caution.
*Grapefruit juice:* May increase concentration of estrogen. Avoid using together.
**Drug-lifestyle.** *Smoking:* May increase risk of adverse CV effects. If smoking continues, recommend nonhormonal contraception.

## EFFECTS ON LAB TEST RESULTS

- May increase clotting factor VII, VIII, IX, and X; total $T_4$; phospholipid; thyroid-binding globulin; and triglyceride levels.
- May increase norepinephrine-induced platelet aggregation and PT.
- May cause a false-positive metyrapone test result.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Contraindicated in pregnant patients.

- Contraindicated in patients with thrombophlebitis, thromboembolic disorders, estrogen-dependent neoplasia, breast or reproductive cancer (except for palliative

treatment), or undiagnosed abnormal genital bleeding.
• Use cautiously in patients with cerebrovascular or coronary artery disease, asthma, bone disease, migraine, seizures, or cardiac, hepatic, or renal dysfunction.
• Use cautiously in women who have a strong family history (mother, grandmother, sister) of breast or genital tract cancer, breast nodules, fibrocystic breasts, or abnormal mammogram findings.
***Overdose S&S:*** Nausea, vomiting, breast tenderness, abdominal pain, drowsiness or fatigue, withdrawal uterine bleeding.

## NURSING CONSIDERATIONS

• Make sure patient has thorough physical exam before starting therapy, and patients receiving long-term therapy should have yearly exams. Periodically monitor lipid levels, blood pressure, body weight, and hepatic function.
• Rapid treatment of dysfunctional uterine bleeding or reduction of surgical bleeding usually requires delivery by I.V. or I.M. route.
**Black Box Warning** Don't use to prevent CV disease. In postmenopausal women receiving therapy for more than 5 years, drugs may increase risks of MI, stroke, invasive breast cancer, pulmonary emboli, and deep vein thrombosis. Use the lowest effective doses for the shortest time, considering the benefits and risks. ■
**Black Box Warning** In postmenopausal women receiving therapy for more than 5 years, drug may increase risk of endometrial cancer. Cyclic therapy and the lowest possible dose reduces risk. Adding progestins decreases risk of endometrial hyperplasia, but it's unknown whether they affect risk of endometrial cancer. ■
**Black Box Warning** In postmenopausal women 65 years of age or older during 4 years of treatment with conjugated estrogens plus medroxyprogesterone acetate, drug may increase the risk of dementia. ■
• When used solely for the treatment of vulval and vaginal atrophy, consider topical products.
• Notify pathologist about estrogen therapy when sending specimens to laboratory for evaluation.
• Because of thromboembolism risk, stop therapy at least 1 month before procedures that prolong immobilization or raise the risk of thromboembolism, such as knee or hip surgery.
• Glucose tolerance may be impaired. Monitor glucose level closely in patients with diabetes.
• Re-evaluate need for therapy at 3- to 6-month intervals.
• ***Look alike–sound alike:*** Don't confuse Premarin with Primaxin, Provera, or Remeron.

## PATIENT TEACHING

• Tell patient to read package insert describing estrogen's adverse effects and to explain them back to you.
• Emphasize importance of regular physical exams.
• Teach woman how to use vaginal cream. Tell patient to wash the vaginal area with soap and water, insert about two-thirds the length of the applicator into the vagina, and release drug. Tell her to use drug at bedtime or to lie flat for 30 minutes after use to minimize drug loss.
• Explain to patient that cyclic therapy for postmenopausal symptoms may cause withdrawal bleeding during week off drug. Tell her to report unusual vaginal bleeding.
***Alert:*** Warn patient to immediately report abdominal pain; pain, numbness, or stiffness in legs or buttocks; pressure or pain in chest; shortness of breath; severe headaches; visual disturbances, such as blind spots, flashing lights, or blurriness; vaginal bleeding or discharge; breast lumps; swelling of hands or feet; yellow skin or sclera; dark urine; and light-colored stools.
• Tell diabetic patient to report elevated glucose level so that antidiabetic dosage can be adjusted.
• Teach woman how to perform routine breast self-examination.
• Advise woman not to become pregnant during estrogen therapy.
• Advise woman of childbearing age to consult prescriber before taking drug and to advise prescriber immediately if she becomes pregnant.
• Encourage patient to stop smoking or reduce number of cigarettes smoked because of the risk of CV complications.

● Tell patient using drug for osteoporosis prevention to ensure adequate intake of calcium and vitamin D.
● Inform patient that vaginal cream has been reported to weaken latex condoms and to use an alternative method of birth control.

## estropipate (piperazine estrone sulfate)

ess-troe-PIH-pate

Ogen, Ortho-Est

*Therapeutic class:* Estrogen
*Pharmacologic class:* Estrogen
*Pregnancy risk category X*

### AVAILABLE FORMS

*Tablets:* 0.75 mg, 1.5 mg, 3 mg, 6 mg
*Vaginal cream:* 1.5 mg/g

### INDICATIONS & DOSAGES

➤ **Vulval and vaginal atrophy**
*Women:* 0.75 to 6 mg P.O. daily, 3 weeks on and 1 week off; or 2 to 4 g vaginal cream daily.

➤ **Primary ovarian failure, female castration, female hypogonadism**
*Women:* 1.5 to 9 mg P.O. daily for first 3 weeks; then a rest period of 8 to 10 days. If bleeding doesn't occur by end of rest period, cycle is repeated.

➤ **Moderate to severe vasomotor menopausal symptoms**
*Women:* 0.75 to 6 mg P.O. daily in cyclic method, 3 weeks on and 1 week off. Can be given continuously.

➤ **To prevent osteoporosis**
*Women:* 0.75 mg P.O. daily for 25 consecutive days of a 31-day cycle, followed by 6 days without drug. Repeat regimen as indicated.

### ADMINISTRATION

**P.O.**
● Give drug with meals to minimize GI upset.

**Vaginal**
● Wash vaginal area with soap and water and then insert vaginal cream high into vagina (about two-thirds the length of applicator). Use drug at bedtime or when patient is able to lie flat for 30 minutes after application to minimize drug loss.

### ACTION

Increases synthesis of DNA, RNA, and proteins in responsive tissues; reduces follicle-stimulating and luteinizing hormones.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., vaginal | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CNS:** depression, headache, dizziness, migraine, ***seizures, stroke.***
**CV:** *edema,* thrombophlebitis, hypertension, ***pulmonary embolism (PE), MI, thromboembolism.***
**EENT:** steepening of corneal curvature, intolerance to contact lenses.
**GI:** nausea, vomiting, gallbladder disease, abdominal cramps, bloating.
**GU:** increased size of uterine fibromas, ***endometrial cancer,*** vaginal candidiasis, cystitis-like syndrome, dysmenorrhea, amenorrhea, breakthrough bleeding, condition resembling premenstrual syndrome.
**Hepatic:** cholestatic jaundice, ***hepatic adenoma.***
**Metabolic:** weight changes, hypercalcemia, hypertriglyceridemia.
**Skin:** hemorrhagic eruption, erythema nodosum, ***erythema multiforme,*** hirsutism or hair loss, melasma.
**Other:** breast engorgement or enlargement, ***breast cancer,*** breast tenderness, changes in libido.

### INTERACTIONS

**Drug-drug.** *Carbamazepine, fosphenytoin, phenobarbital, phenytoin, rifampin:* May decrease estrogen effect. Monitor patient closely.
*Clarithromycin, erythromycin, itraconazole, ketoconazole, ritonavir:* May increase estrogen plasma levels and side effects. Monitor patient.
*Corticosteroids:* May enhance corticosteroid effect. Monitor patient closely.
*Cyclosporine:* May increase risk of toxicity. Use together with caution; frequently monitor cyclosporine level.

*Dantrolene, other hepatotoxic drugs:* May increase risk of hepatotoxicity. Monitor liver function closely.
*Oral anticoagulants:* May decrease anticoagulant effect. Dosage adjustments may be needed. Monitor PT and INR.
*Tamoxifen:* May interfere with tamoxifen effect. Avoid using together.
**Drug-herb.** *Black cohosh:* May increase adverse effects of estrogen. Discourage use together.
*Red clover:* May interfere with hormonal therapies. Discourage use together.
*Saw palmetto:* May have antiestrogenic effect. Discourage use together.
*St. John's wort:* May decrease estrogen effect. Discourage use together.
**Drug-food.** *Caffeine:* May increase caffeine level. Advise caution.
**Drug-lifestyle.** *Smoking:* May increase risk of adverse CV effects. If smoking continues, may need alternative therapy.

## EFFECTS ON LAB TEST RESULTS

- May increase clotting factor VII, VIII, IX, and X; total $T_4$; phospholipid; thyroid-binding globulin; and triglyceride levels.
- May increase norepinephrine-induced platelet aggregation and PT.
- May reduce metyrapone test results.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Contraindicated during pregnancy or during the immediate postpartum period.

- Contraindicated in patients with active thrombophlebitis; thromboembolic disorders; estrogen-dependent neoplasia; undiagnosed genital bleeding; and breast, reproductive organ, or genital cancer.
- Use cautiously in patients with cerebrovascular or coronary artery disease; asthma; mental depression; bone disease; migraine; seizures; or cardiac, hepatic, or renal dysfunction.
- Use cautiously in women who have a family history (mother, grandmother, sister) of breast or genital tract cancer, breast nodules, fibrocystic breasts, or abnormal mammogram findings.

***Overdose S&S:*** Nausea, vomiting, withdrawal uterine bleeding.

## NURSING CONSIDERATIONS

- Make sure patient has thorough physical examination before starting estrogen therapy. Patients receiving long-term therapy should have examinations yearly. Periodically monitor lipid levels, blood pressure, body weight, and hepatic function.

**Black Box Warning** Estrogens and progestins shouldn't be used to prevent CV disease. The Women's Health Initiative study reported increased risks of MI, stroke, invasive breast cancer, PE, and deep vein thrombosis in postmenopausal women during 5 years of combination therapy. Because of these risks, estrogens and progestins should be prescribed at the lowest effective doses and for the shortest duration consistent with treatment goals and risks for the individual woman.

**Black Box Warning** Estrogens may increase the risk of endometrial cancer in postmenopausal women.

- When used to treat hypogonadism, duration of therapy needed to produce withdrawal bleeding depends on patient's endometrial response to drug. If satisfactory withdrawal bleeding doesn't occur, an oral progestin is added to the regimen. Explain to patient that, despite return of withdrawal bleeding, pregnancy can't occur because she doesn't ovulate.
- Because of risk of thromboembolism, stop therapy at least 1 month before procedures that prolong immobilization or raise the risk of thromboembolism, such as knee or hip surgery.
- Glucose tolerance may be impaired. Monitor glucose level closely in patients with diabetes.

## PATIENT TEACHING

- Tell patient to read package insert describing estrogen's adverse effects; also, explain effects verbally.
- Teach woman how to use vaginal cream. Patient should wash the vaginal area with soap and water and then insert vaginal cream high into the vagina (about two-thirds the length of the applicator). Tell her to use drug at bedtime or to lie flat for 30 minutes after application to minimize drug loss.
- Tell diabetic patient to report elevated glucose level to prescriber.

• Stress importance of regular physical examinations. Postmenopausal women who use estrogen replacement for longer than 5 years may have increased risk of endometrial cancer. Using cyclic therapy and lowest possible estrogen dosage reduces risk. Adding progestins to regimen decreases risk of endometrial hyperplasia; however, it isn't known whether progestins affect risk of endometrial cancer.
***Alert:*** Warn patient to immediately report abdominal pain; pain, stiffness, or numbness in legs or buttocks; pressure or pain in chest; shortness of breath; severe headaches; visual disturbances, such as blind spots or flashing lights; vaginal bleeding or discharge; breast lumps; swelling of hands or feet; yellow skin or sclera; dark urine; and light-colored stools.
• Teach woman how to perform routine breast self-examination.
• Advise woman not to become pregnant while on estrogen therapy.
• Encourage patient to stop or reduce smoking because of the risk of CV complications.
• Advise woman of childbearing age to consult prescriber before taking drug and to tell prescriber immediately if she becomes pregnant.
• Teach patient at risk for osteoporosis about the importance of adequate calcium and vitamin D intake.

**SAFETY ALERT!**

# eszopiclone

ess-ZOP-ah-klone

Lunesta

*Therapeutic class:* Hypnotic
*Pharmacologic class:* Pyrrolopyrazine derivative
*Pregnancy risk category C*
*Controlled substance schedule IV*

## AVAILABLE FORMS

*Tablets:* 1 mg, 2 mg, 3 mg

## INDICATIONS & DOSAGES

➤ **Insomnia**

*Adults:* 2 mg P.O. immediately before bedtime. Increase to 3 mg as needed.
*Elderly patients having trouble falling asleep:* 1 mg P.O. immediately before bedtime. Increase to 2 mg as needed.
*Elderly patients having trouble staying asleep:* 2 mg P.O. immediately before bedtime.
***Adjust-a-dose:*** In patients with severe hepatic impairment, start with 1 mg P.O. In patients who also take a potent CYP3A4 inhibitor, start with 1 mg and increase to 2 mg as needed.

## ADMINISTRATION

**P.O.**

• Avoid giving drug after a high-fat meal.
• Give drug immediately before bedtime because drug may cause dizziness or lightheadedness.
• Patient must swallow tablet whole.

## ACTION

Probably interacts with GABA receptors at binding sites close or connected to benzodiazepine receptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 1 hr | Unknown |

*Half-life:* 6 hours.

## ADVERSE REACTIONS

**CNS:** abnormal dreams, anxiety, complex sleep-related behavior, confusion, decreased libido, depression, dizziness, hallucinations, *headache*, nervousness, pain, *somnolence*, neuralgia.
**EENT:** *unpleasant taste.*
**GI:** diarrhea, dry mouth, dyspepsia, nausea, vomiting.
**GU:** dysmenorrhea, UTI.
**Respiratory:** *respiratory tract infection.*
**Skin:** pruritus, rash.
**Other:** ***anaphylaxis, angioedema,*** accidental injury, gynecomastia, viral infection.

## INTERACTIONS

**Drug-drug.** *CNS depressants:* May have additive CNS effects. Adjust dosage of either drug as needed.
*CYP3A4 inhibitors (clarithromycin, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, troleandomycin):* May decrease eszopiclone elimination, increasing the risk of toxicity. Use together cautiously.

*Olanzapine:* May impair cognitive function or memory. Use together cautiously.
*Rifampicin:* May decrease eszopiclone activity. Don't use together.
**Drug-food.** *High-fat meals:* May decrease drug absorption and effects. Discourage high-fat meals with or just before taking drug.
**Drug-lifestyle.** *Alcohol use:* May decrease psychomotor ability. Discourage use together.

## EFFECTS ON LAB TEST RESULTS
None reported.

## CONTRAINDICATIONS & CAUTIONS
- Use cautiously in elderly and debilitated patients, and in patients with diseases or conditions that could affect metabolism or hemodynamic responses. Also use cautiously in patients with compromised respiratory function, severe hepatic impairment, or signs and symptoms of depression.

***Overdose S&S:*** CNS depression.

## NURSING CONSIDERATIONS
***Alert:*** Anaphylaxis and angioedema may occur as early as the first dose; monitor the patient closely.
- Evaluate patient for physical and psychiatric disorders before treatment.
- Use the lowest effective dose.

***Alert:*** Give drug immediately before patient goes to bed or after patient has gone to bed and has trouble falling asleep.
- Use only for short periods (for example, 7 to 10 days). If patient still has trouble sleeping, check for other psychological disorders.
- Monitor patient for changes in behavior, including those that suggest depression or suicidal thinking.

## PATIENT TEACHING
***Alert:*** Warn patient that drug may cause allergic reactions, facial swelling, and complex sleep-related behaviors, such as driving, eating, and making phone calls while asleep. Advise patient to report these adverse effects.
- Urge patient to take drug immediately before going to bed because drug may cause dizziness or light-headedness.
- Caution patient not to take drug unless he can get a full night's sleep.
- Advise patient to avoid taking drug after a high-fat meal.
- Tell patient to avoid activities that require mental alertness until the drug's effects are known.
- Tell patient to swallow tablet whole.
- Advise patient to avoid alcohol while taking drug.
- Urge patient to immediately report changes in behavior and thinking.
- Warn patient not to stop drug abruptly or change dose without consulting the prescriber.
- Inform patient that tolerance or dependence may develop if drug is taken for a prolonged period.

E

# etanercept
ee-tan-ER-sept

Enbrel

*Therapeutic class:* Antiarthritic
*Pharmacologic class:* Tumor necrosis factor (TNF) blocker
*Pregnancy risk category B*

## AVAILABLE FORMS
*Injection:* 25-mg multiuse vial
*Prefilled syringe:* 25 mg/0.5 ml, 50 mg/ml

## INDICATIONS & DOSAGES
➤ **To reduce signs and symptoms of moderately to severely active polyarticular-course juvenile rheumatoid arthritis (RA) in patients whose response to one or more disease-modifying antirheumatic drugs has been inadequate**
*Children ages 2 to 17:* 0.8 mg/kg subcutaneously weekly (maximum 50 mg/week). For children weighing 63 kg (138 lb) or more, give weekly dose using the prefilled syringe. For children weighing 31 to 62 kg (68 to 136 lb), give total weekly dose as two subcutaneous injections, either on the same day or 3 or 4 days apart using the multiuse vial. For children weighing less than 31 kg (68 lb), give weekly dose as single subcutaneous injection using the correct volume from the multiuse vial. Glucocorticoids,

NSAIDs, or analgesics may be continued during treatment. Use with methotrexate hasn't been studied in pediatric patients.

➤ **RA, psoriatic arthritis, ankylosing spondylitis**

*Adults:* 50 mg subcutaneously once weekly using the 50-mg/ml single-use prefilled syringe. Methotrexate, glucocorticoids, salicylates, NSAIDs, or analgesics may be continued during treatment.

➤ **Chronic moderate to severe plaque psoriasis in patients who are candidates for systemic therapy or phototherapy**

*Adults:* 50 mg subcutaneously twice weekly, 3 to 4 days apart for 3 months. Then, reduce dose to 50 mg subcutaneously once weekly. Give dose using 50-mg/ml single-use prefilled syringes.

## ADMINISTRATION

**Subcutaneous**

- Give 50-mg dose as one subcutaneous injection using a 50-mg/ml single-use prefilled syringe or as two 25-mg subcutaneous injections using multiuse vial. Give the two 25-mg injections on the same day or 3 to 4 days apart.
- Store prefilled syringe at 36° to 46° F (2° to 8° C), but let it reach room temperature (15 to 30 minutes) before use.
- Reconstitute multiple-use vial aseptically with 1 ml of supplied sterile bacteriostatic water for injection (0.9% benzyl alcohol). Use a 25G needle rather than the supplied vial adapter if the vial will be used for multiple doses. Don't filter reconstituted solution when preparing or giving drug. Inject diluent slowly into vial. Refrigerate in vial for up to 14 days at 36° to 46° F (2° to 8° C).
- Minimize foaming by gently swirling during dissolution rather than shaking. Dissolution takes less than 10 minutes.
- Don't use solution if it's discolored or cloudy, or if it contains particulate matter.
- Separate injection sites by at least 1 inch, rotate regularly, and never use areas where skin is tender, bruised, red, or hard. Use sites on the thigh, abdomen, and upper arm.

***Alert:*** Needle covers of diluent syringe and prefilled syringe contain latex and shouldn't be handled by persons sensitive to latex.

- **Incompatibilities:** Don't add other drugs or diluents to solution.

## ACTION

Binds specifically to TNF and blocks its action with cell surface TNF receptors, reducing inflammatory and immune responses found in RA.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 72 hr | Unknown |

*Half-life:* About 5 days.

## ADVERSE REACTIONS

**CNS:** *headache,* asthenia, dizziness.
**CV:** peripheral edema.
**EENT:** *rhinitis,* pharyngitis, sinusitis, mouth ulcers.
**GI:** abdominal pain, dyspepsia, nausea, vomiting.
**Respiratory:** *upper respiratory tract infections,* cough, respiratory disorder.
**Skin:** *injection site reaction,* rash, alopecia.
**Other:** *infections,* ***malignancies.***

## INTERACTIONS

**Drug-drug.** *Anakinra:* Increased rate of serious infection when used together. Use together cautiously.
*Cyclophosphamide:* May increase risk of solid malignancies. Concurrent use not recommended.
*Sulfasalazine:* May cause decreased neutrophil count. Monitor patient carefully.
*Vaccines:* May affect normal immune response. Postpone live-virus vaccine until therapy stops.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components, in those with sepsis, and in those receiving a live vaccine.
- Drug isn't indicated for use in children younger than age 2.
- Use cautiously in patients with underlying diseases that predispose them to infection, such as diabetes, heart failure, or history of active or chronic infections. Also use cautiously in RA patients with preexisting or recent onset of demyelinating disorders,

including multiple sclerosis, myelitis, and optic neuritis.

### NURSING CONSIDERATIONS

- Methotrexate, glucocorticoids, salicylates, NSAIDs, or analgesics may be continued during treatment in adults.

**Black Box Warning** Anti-TNF therapies that include drug may affect defenses against infection. If serious infection occurs, stop therapy and notify prescriber. ■

**Black Box Warning** Infections including bacterial sepsis and tuberculosis have been reported. Evaluate patient's risk factors and test for latent tuberculosis. Begin treatment for latent tuberculosis prior to therapy with etanercept. ■

***Alert:*** Don't give live vaccines during therapy.

- If possible, bring patients with juvenile RA up-to-date with all immunizations before starting treatment.

***Alert:*** Histoplasmosis, coccidioidomycosis, blastomycosis, and other opportunistic infections may develop with use of this drug.

- Use of this drug may increase the risk of lymphoma.

### PATIENT TEACHING

- If patient will be self-administering drug, advise him about mixing and injection techniques, including rotation of injection sites.
- Instruct patient to use puncture-resistant container for disposal of needles and syringes.
- Tell patient that injection site reactions generally occur within first month of therapy and decrease thereafter.
- Inform patient of importance of avoiding live vaccine administration during therapy.
- Stress importance of alerting other health care providers of etanercept use.
- Instruct patient to promptly report signs and symptoms of infection to prescriber, including persistent fever, cough, shortness of breath or fatigue.
- Advise women to stop breast-feeding during therapy.

## ethacrynate sodium

eth-uh-KRIH-nayt

Edecrin Sodium

## ethacrynic acid

Edecrin

*Therapeutic class:* Diuretic
*Pharmacologic class:* Loop diuretic
*Pregnancy risk category B*

E

### AVAILABLE FORMS

**ethacrynate sodium**
*Injection:* 50 mg/vial
**ethacrynic acid**
*Tablets:* 25 mg

### INDICATIONS & DOSAGES

➤ **Acute pulmonary edema**

*Adults:* 50 mg or 0.5 to 1 mg/kg I.V. Usually only one dose is needed, although a second dose may be needed.

➤ **Edema**

*Adults:* 50 to 200 mg P.O. daily. May increase to 200 mg b.i.d. for desired effect.
*Children age 13 months and older:* First dose is 25 mg P.O., increase cautiously by 25 mg daily until desired effect is achieved. Dosage for infants hasn't been established.
***Adjust-a-dose:*** If added to an existing diuretic regimen, first dose is 25 mg and dosage adjustments are made in 25-mg increments.

### ADMINISTRATION

**P.O.**

- Give drug in morning to prevent nocturia.

**I.V.**

- Add to vial 50 ml of $D_5W$ or normal saline solution.
- Don't use cloudy or opalescent solution.
- Give over several minutes through tubing of running infusion.
- If more than one I.V. dose is needed, use a new injection site to avoid thrombophlebitis.
- Discard unused solution after 24 hours.
- **Incompatibilities:** Hydralazine, Normosol-M, procainamide, ranitidine, reserpine, solutions or drugs with pH

below 5, tolazoline, triflupromazine, whole blood, and its derivatives.

## ACTION

Potent loop diuretic; inhibits sodium and chloride reabsorption at the proximal and distal tubules and the ascending loop of Henle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30 min | 2 hr | 6–8 hr |
| I.V. | 5 min | 15–30 min | 2 hr |

## ADVERSE REACTIONS

**CNS:** malaise, confusion, fatigue, vertigo, headache, nervousness, fever.
**CV:** orthostatic hypotension.
**EENT:** transient or permanent deafness with over-rapid I.V. injection, blurred vision, tinnitus, hearing loss.
**GI:** cramping, diarrhea, anorexia, nausea, vomiting, ***GI bleeding, pancreatitis.***
**GU:** oliguria, hematuria, nocturia, polyuria, frequent urination.
**Hematologic:** ***agranulocytosis, neutropenia, thrombocytopenia,*** azotemia.
**Metabolic:** asymptomatic hyperuricemia, hypokalemia, hypochloremic alkalosis, fluid and electrolyte imbalances, including dilutional hyponatremia, hypocalcemia and hypomagnesemia, hyperglycemia and impaired glucose tolerance, volume depletion and dehydration.
**Skin:** rash.
**Other:** chills.

## INTERACTIONS

**Drug-drug.** *Aminoglycoside antibiotics:* May increase ototoxic adverse reactions of both drugs. Use together cautiously.
*Antidiabetics:* May decrease hypoglycemic effects. Monitor glucose level.
*Antihypertensives:* May increase risk of hypotension. Use together cautiously.
*Cardiac glycosides:* May increase risk of digoxin toxicity from ethacrynate-induced hypokalemia. Monitor potassium and digoxin levels.
*Chlorothiazide, chlorthalidone, hydrochlorothiazide, indapamide, metolazone:* May cause excessive diuretic response, causing serious electrolyte abnormalities or dehydration. Adjust doses carefully, and monitor patient closely for signs and symptoms of excessive diuretic response.
*Cisplatin:* May increase risk of ototoxicity. Avoid using together.
*Lithium:* May decrease lithium clearance, increasing risk of lithium toxicity. Monitor lithium level.
*Neuromuscular blockers:* May enhance neuromuscular blockade. Monitor patient closely.
*NSAIDs:* May decrease diuretic effect. Use together cautiously.
*Other potassium-wasting drugs (amphotericin B, corticosteroids):* May increase risk of hypocalcemia. Use together cautiously.
*Probenecid:* May decrease diuretic effect. Avoid using together.
*Warfarin:* May increase anticoagulant effect. Use together cautiously.
**Drug-herb.** *Dandelion:* May interfere with diuretic activity. Discourage use together.
*Licorice:* May cause unexpected rapid potassium loss. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase glucose and uric acid levels. May decrease calcium, magnesium, potassium, and sodium levels.
- May decrease granulocyte, neutrophil, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in infants, patients hypersensitive to drug, and patients with anuria.

**Black Box Warning** Drug is potent diuretic and can cause severe diuresis with water and electrolyte depletion. Monitor patient closely.

- Use cautiously in patients with electrolyte abnormalities or hepatic impairment.

***Overdose S&S:*** Dehydration, electrolyte depletion.

## NURSING CONSIDERATIONS

- Monitor fluid intake and output, weight, blood pressure, and electrolyte levels.
- Watch for signs of hypokalemia, such as muscle weakness and cramps.
- Monitor glucose level in diabetic patients.
- Consult prescriber and dietitian about providing a high-potassium diet. Foods rich in potassium include citrus fruits, tomatoes,

bananas, dates, and apricots. Potassium chloride and sodium supplements may be needed.
- Dosage may be on an alternate daily schedule or more prolonged periods of diuretic therapy may be interspersed with rest periods. Intermittent dosage schedule allows time to correct electrolyte imbalance and may provide a more efficient diuretic response.
- Drug may increase risk of gastric hemorrhage caused by steroid treatment.
- Monitor elderly patients, who are especially susceptible to excessive diuresis.
- Monitor uric acid level, especially in patients with history of gout.

***Alert:*** If patient develops severe diarrhea, stop drug. Patient shouldn't receive drug again after diarrhea has resolved.

## PATIENT TEACHING

- Instruct patient to take drug with food to minimize GI upset.
- Advise patient to take drug in morning to avoid need to urinate at night; if patient needs second dose, have him take it in early afternoon.
- Advise patient to avoid sudden posture changes and to rise slowly to avoid dizziness upon standing quickly.
- Tell patient to notify prescriber about muscle weakness, cramps, nausea, diarrhea, or dizziness.
- Caution patient not to perform hazardous activities if drug causes drowsiness.
- Advise diabetic patient to closely monitor glucose level.

# ethambutol hydrochloride

e-THAM-byoo-tole

Etibi†, Myambutol

*Therapeutic class:* Antituberculotic
*Pharmacologic class:* Synthetic antituberculotic
*Pregnancy risk category B*

## AVAILABLE FORMS

*Tablets:* 100 mg, 400 mg

## INDICATIONS & DOSAGES

**➤ Adjunctive treatment for pulmonary tuberculosis**

*Adults and children older than age 13:* In patients who haven't received prior antituberculotic therapy, 15 mg/kg P.O. daily as a single dose once every 24 hours, combined with other antituberculotics. For retreatment, 25 mg/kg P.O. every 24 hours as a single dose for 60 days (or until bacteriologic smears and cultures become negative) with at least one other antituberculotic; after 60 days, decrease to 15 mg/kg/day as a single dose every 24 hours.

## ADMINISTRATION

**P.O.**
- Always give drug with other antituberculotics to prevent development of resistant organisms.
- Giving drug with food doesn't significantly alter absorption.
- Administer on a once-every-24-hour basis only.

## ACTION

May inhibit synthesis of one or more metabolites of susceptible bacteria, changing cell metabolism during cell division; bacteriostatic.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–4 hr | Unknown |

*Half-life:* About 3½ hours.

## ADVERSE REACTIONS

**CNS:** dizziness, fever, hallucinations, headache, malaise, mental confusion, peripheral neuritis.
**EENT:** optic neuritis, irreversible blindness.
**GI:** abdominal pain, anorexia, GI upset, nausea, vomiting.
**Hematologic:** ***thrombocytopenia, leukopenia, neutropenia.***
**Metabolic:** hyperuricemia.
**Musculoskeletal:** joint pain.
**Skin:** ***toxic epidermal necrolysis,*** dermatitis, pruritus.
**Other:** ***anaphylactoid reactions,*** precipitation of acute gout.

## INTERACTIONS

**Drug-drug.** *Aluminum salts:* May delay and reduce absorption of ethambutol. Separate doses by several hours.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, bilirubin, and uric acid levels. May decrease glucose level.
- May decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in children younger than age 13, patients hypersensitive to drug, and patients with optic neuritis.
- Use cautiously in patients with impaired renal function, cataracts, recurrent eye inflammation, gout, or diabetic retinopathy.

## NURSING CONSIDERATIONS

- Perform visual acuity and color discrimination tests before and during therapy.
- Ensure that any changes in vision don't result from an underlying condition.
- Obtain AST and ALT levels before therapy, and monitor these levels every 3 to 4 weeks.
- In patients with impaired renal function, base dosage on drug level.
- Monitor uric acid level; observe patient for signs and symptoms of gout.

## PATIENT TEACHING

- Reassure patient that visual disturbances usually disappear several weeks to months after drug is stopped. Inflammation of the optic nerve is related to dosage and duration of treatment.
- Inform patient that drug is given with other antituberculotics.
- Stress importance of compliance with drug therapy.
- Advise patient to report adverse reactions to prescriber.

*Tablets:* ethinyl estradiol 20 mcg and norethindrone acetate 1 mg (Junel 21 day 1/20, Loestrin 21 1/20, Microgestin 1/20); ethinyl estradiol 30 mcg and norethindrone acetate 1.5 mg (Junel 21 day 1.5/30, Loestrin 21 1.5/30, Microgestin 1.5/30)

**ethinyl estradiol and norgestimate**
*Tablets:* ethinyl estradiol 35 mcg and norgestimate 0.25 mg (MonoNessa, Ortho-Cyclen, Sprintec)

**ethinyl estradiol and norgestrel**
*Tablets:* ethinyl estradiol 30 mcg and norgestrel 0.3 mg (Cryselle, Lo/Ovral, Lo-Ogestrel); ethinyl estradiol 50 mcg and norgestrel 0.5 mg (Ogestrel)

**ethinyl estradiol, norethindrone acetate, and ferrous fumarate**
*Tablets:* ethinyl estradiol 20 mcg, norethindrone acetate 1 mg, and ferrous fumarate 75 mg (Loestrin Fe 1/20, Loestrin 24 Fe, Microgesin Fe 1/20); ethinyl estradiol 30 mcg, norethindrone acetate 1.5 mg, and ferrous fumarate 75 mg (Loestrin Fe 1.5/30, Microgesin Fe 1.5/30)

*Chewable tablets:* norethindrone 0.4 mg/ethinyl estradiol 35 mcg; inactive tablets contain ferrous fumarate 75 mg

**mestranol and norethindrone**

*Tablets:* mestranol 50 mcg and norethindrone 1 mg (Necon 1/50, Norinyl 1 + 50, Ortho-Novum 1/50-28)

***biphasic hormonal contraceptives* ethinyl estradiol and desogestrel**

*Tablets:* ethinyl estradiol 20 mcg and desogestrel 0.15 mg (21 days), then inert tablets (2 days), then ethinyl estradiol 10 mcg (5 days) (Kariva, Mircette)

**ethinyl estradiol and levonorgestrel**

*Tablets:* ethinyl estradiol 0.02 mg and levonorgestrel 0.1 mg (84 days), then ethinyl estradiol 0.01 mg (7 days) (Lo Seasonique); ethinyl estradiol 30 mcg and levonorgestrel 0.15 mg (84 days), then ethinyl estradiol 10 mcg (7 days) (Seasonique)

**ethinyl estradiol and norethindrone**

*Tablets:* ethinyl estradiol 35 mcg and norethindrone 0.5 mg (10 days); ethinyl estradiol 35 mcg and norethindrone 1 mg (11 days) (Necon 10/11)

***triphasic hormonal contraceptives* ethinyl estradiol and desogestrel**

*Tablets:* 0.1 mg desogestrel with 25 mcg ethinyl estradiol (7 tablets); 0.125 mg desogestrel with 25 mcg ethinyl estradiol (7 tablets); 0.15 mg desogestrel with 25 mcg ethinyl estradiol (7 tablets) (Cyclessa, Velivet)

**ethinyl estradiol and levonorgestrel**

*Tablets:* ethinyl estradiol 30 mcg and levonorgestrel 0.05 mg (6 days); ethinyl estradiol 40 mcg and levonorgestrel 0.075 mg (5 days); ethinyl estradiol 30 mcg and levonorgestrel 0.125 mg (10 days) (Enpresse, Trivora-28)

**ethinyl estradiol and norethindrone**

*Tablets:* ethinyl estradiol 35 mcg and norethindrone 0.5 mg (7 days); ethinyl estradiol 35 mcg and norethindrone 1 mg (9 days); ethinyl estradiol 35 mcg and norethindrone 0.5 mg (5 days) (Tri-Norinyl); ethinyl estradiol 35 mcg and norethindrone 0.5 mg (7 days); ethinyl estradiol 35 mcg and norethindrone 0.75 mg (7 days); ethinyl estradiol 35 mcg and norethindrone 1 mg (7 days) (Necon 7/7/7, Nortrel 7/7/7, Ortho-Novum 7/7/7)

**ethinyl estradiol and norgestimate**

*Tablets:* ethinyl estradiol 25 mcg and norgestimate 0.18 mg (7 days); ethinyl estradiol 25 mcg and norgestimate 0.215 mg (7 days); ethinyl estradiol 25 mcg and norgestimate 0.25 mg (7 days) (Ortho Tri-Cyclen Lo); ethinyl estradiol 35 mcg and norgestimate 0.18 mg (7 days); ethinyl estradiol 35 mcg and norgestimate 0.215 mg (7 days); ethinyl estradiol 35 mcg and norgestimate 0.25 mg (7 days) (Ortho Tri-Cyclen, TriSprintec)

**ethinyl estradiol, norethindrone acetate, and ferrous fumarate**

*Tablets:* ethinyl estradiol 20 mcg and norethindrone acetate 1 mg (5 days); ethinyl estradiol 30 mcg and norethindrone acetate 1 mg (7 days); ethinyl estradiol 35 mcg and norethindrone acetate 1 mg (9 days); and 75-mg ferrous fumarate tablets (7 days) (Estrostep Fe)

## INDICATIONS & DOSAGES

### ➤ Contraception

***Monophasic hormonal contraceptives***

*Women:* 1 tablet P.O. daily beginning on first day of menstrual cycle or first Sunday after menstrual cycle begins. With 20- and 21-tablet package, new cycle begins 7 days after last tablet taken. With 28-tablet package, dosage is 1 tablet daily without interruption; extra tablets taken on days 22 to 28 are placebos or contain iron. Or, for Seasonale, 1 pink tablet P.O. daily beginning on first Sunday after menstrual cycle begins, for 84 consecutive days, followed by 7 days of white (inert) tablets. Or, for Lybrel, 1 tablet P.O. daily beginning on the first day of menstrual cycle. When changing from 21-day or 28-day combination oral contraceptive, begin on first day of withdrawal bleeding, at the latest 7 days after last active tablet. When changing from progestin-only pill begin the next day. When changing from implant contraceptive, begin the day of implant removal. When changing from injection contraceptive, begin the day when next injection is due.

***Biphasic hormonal contraceptives***

*Women:* 1 color tablet P.O. daily for 10 days; then next color tablet for 11 days. With 21-tablet packages, new cycle begins 7 days after last tablet taken. With 28-tablet

packages, dosage is 1 tablet daily without interruption. Or, for Seasonique, 1 light blue-green tablet P.O. once daily for 84 consecutive days followed by 1 yellow tablet for 7 consecutive days; then repeat cycle.

***Triphasic hormonal contraceptives***

*Women:* 1 tablet P.O. daily in the sequence specified by the brand. With 21-tablet packages, new dosing cycle begins 7 days after last tablet taken. With 28-tablet packages, dosage is 1 tablet daily without interruption.

➤ **Moderate acne vulgaris in women age 15 and older who have no known contraindications to hormonal contraceptive therapy, who want oral contraception for at least 6 months, who have reached menarche, and who are unresponsive to topical antiacne drugs**

*Women age 15 and older:* 1 tablet Ortho Tri-Cyclen or Estrostep P.O. daily (21 tablets contain active ingredients and 7 are inert).

## ADMINISTRATION

**P.O.**

- Give drug at the same time each day; give at night to reduce nausea and headaches.
- Chewable tablet may be swallowed whole or chewed and followed with a full glass of liquid.

## ACTION

Inhibit ovulation and may prevent transport of the ovum (if ovulation should occur) through the fallopian tubes.

Estrogen suppresses follicle-stimulating hormone, blocking follicular development and ovulation.

Progestin suppresses luteinizing hormone so that ovulation can't occur even if the follicle develops; it also thickens cervical mucus, interfering with sperm migration, and prevents implantation of the fertilized ovum.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 hours (ethinyl estradiol) 0.5 to 4 hr (varies by progestin) | Unknown |

*Half-life:* 6 to 20 hours (ethinyl estradiol); 5 to 45 hours (varies by progestin).

## ADVERSE REACTIONS

**CNS:** *headache, dizziness,* depression, lethargy, migraine, ***stroke, cerebral hemorrhage.***

**CV:** ***thromboembolism,*** hypertension, edema, ***pulmonary embolism, MI.***

**EENT:** worsening myopia or astigmatism, intolerance of contact lenses, exophthalmos, diplopia.

**GI:** *nausea,* vomiting, abdominal cramps, bloating, anorexia, changes in appetite, gallbladder disease, ***pancreatitis.***

**GU:** *breakthrough bleeding, spotting,* granulomatous colitis, dysmenorrhea, amenorrhea, cervical erosion or abnormal secretions, enlargement of uterine fibromas, vaginal candidiasis.

**Hepatic:** cholestatic jaundice, ***liver tumors, gallbladder disease.***

**Metabolic:** weight change, additive insulin resistance in diabetics.

**Skin:** rash, acne, ***erythema multiforme,*** melasma, hirsutism.

**Other:** breast tenderness, enlargement, or secretion, ***anaphylaxis, hemolytic uremic syndrome.***

## INTERACTIONS

**Drug-drug.** *Anti-infectives (chloramphenicol, fluconazole, griseofulvin, neomycin, nitrofurantoin, penicillins, sulfonamides, tetracyclines):* May decrease contraceptive effect. Advise patient to use another method of contraception.

*Atorvastatin:* May increase norethindrone and ethinyl estradiol levels. Monitor patient for adverse effects.

*Benzodiazepines:* May decrease or increase benzodiazepine levels. Adjust dosage, if necessary.

*Beta blockers:* May increase beta blocker level. Dosage adjustment may be necessary.

*Carbamazepine, fosphenytoin, phenobarbital, phenytoin, rifampin:* May decrease estrogen effect. Use together cautiously.

*Corticosteroids:* May enhance corticosteroid effect. Monitor patient closely.

*Insulin, sulfonylureas:* Glucose intolerance may decrease antidiabetic effects. Monitor these effects.

*Nonnucleoside reverse transcriptase inhibitors, protease inhibitors:* May decrease

hormonal contraceptive effect. Avoid using together, if possible.
*Oral anticoagulants:* May decrease anticoagulant effect. Dosage adjustments may be needed. Monitor PT and INR.
*Tamoxifen:* May inhibit tamoxifen effect. Avoid using together.
**Drug-herb.** *Black cohosh:* May increase adverse effects of estrogen. Discourage use together.
*Red clover:* May interfere with drug. Discourage use together.
*Saw palmetto:* May have antiestrogenic effect. Discourage use together.
*St. John's wort:* May decrease drug effect because of increased hepatic metabolism. Discourage use together, or advise patient to use an additional method of contraception.
**Drug-food.** *Caffeine:* May increase caffeine level. Urge caution.
*Grapefruit juice:* May increase estrogen level. Advise patient to take with liquid other than grapefruit juice.
**Drug-lifestyle.** *Smoking:* May increase risk of adverse CV effects. If smoking continues, may need alternative therapy.

## EFFECTS ON LAB TEST RESULTS

- May increase clotting factor II, VII, VIII, IX, X; fibrinogen; phospholipid; plasminogen; thyroid-binding globulin; total $T_4$; and triglyceride levels.
- May increase norepinephrine-induced platelet aggregation and PT.
- May reduce metyrapone test results. May cause false-positive result in nitroblue tetrazolium test.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with thromboembolic disorders, cerebrovascular or coronary artery disease, diplopia or ocular lesions arising from ophthalmic vascular disease, classic migraine, MI, known or suspected breast cancer, known or suspected estrogen-dependent neoplasia, benign or malignant liver tumors, active liver disease or history of cholestatic jaundice with pregnancy or previous use of hormonal contraceptives, and undiagnosed abnormal vaginal bleeding.
- Contraindicated in women who are or may be pregnant or breast-feeding.
- Use cautiously in patients with hyperlipidemia, hypertension, migraines, seizure disorders, asthma, or cardiac, renal, or hepatic insufficiency, bleeding irregularities, gallbladder disease, ocular disease, diabetes, and emotional disorders.

***Overdose S&S:*** Nausea, withdrawal uterine bleeding.

## NURSING CONSIDERATIONS

**Black Box Warning** Cigarette smoking increases the risk of serious cardiovascular side effects from oral contraceptives. This risk increases with age and with heavy smoking (at least 15 cigarettes daily) and is quite marked in women older than 35 years. Women who use oral contraceptives should not smoke.

- Triphasic hormonal contraceptives may cause fewer adverse reactions, such as breakthrough bleeding and spotting.
- The Centers for Disease Control and Prevention reports that use of hormonal contraceptives may decrease risk of ovarian and endometrial cancers and doesn't seem to increase risk of breast cancer. However, the FDA reports that some studies suggest that hormonal contraceptives may be linked to an increase in cervical cancer.
- Monitor lipid levels, blood pressure, body weight, and hepatic function.

***Alert:*** Many hormonal contraceptives share similar names. Make sure to check the hormone strength for verification.

- Estrogens and progestins may alter glucose tolerance, thus changing dosage requirements for antidiabetics. Monitor glucose level.
- Stop hormonal contraceptives for a few weeks before adrenal function tests.
- Stop hormonal contraceptive and notify prescriber if patient develops granulomatous colitis.
- Stop drug at least 1 week before surgery to decrease risk of thromboembolism. Tell patient to use an alternative method of birth control.
- Women who are nonlactating mothers or those who have had second-trimester abortion must wait 28 days before starting oral contraception.

● In case of first-trimester abortion, patient may start Lybrel immediately without additional contraceptive method.

### PATIENT TEACHING

● Tell patient to take tablets at same time each day; nighttime doses may reduce nausea and headaches.
● Advise patient to use additional method of birth control, such as condom or diaphragm with spermicide, for first week of first cycle.
● Tell patient that missing doses in midcycle greatly increases likelihood of pregnancy.
● Tell patient that missing a dose may cause spotting or light bleeding.
● Tell patient that hormonal contraceptives don't protect against HIV or other sexually transmitted diseases.
● Tell patient using Seasonale that there will be four planned menses per year, but spotting or bleeding between menses may occur.
● If 1 pill is missed, tell patient to take it as soon as possible (2 pills if remembered on the next day) and then to continue regular schedule. Advise an additional method of contraception for remainder of cycle. If 2 consecutive pills are missed, tell patient to take 2 pills a day for next 2 days and then resume regular schedule. Advise an additional method of contraception for the next 7 days or preferably for the remainder of cycle. If 2 consecutive pills are missed in the 3rd or 4th week or if patient misses 3 consecutive pills, tell patient to contact prescriber for instructions.
● Warn patient of common adverse effects, such as headache, nausea, dizziness, breast tenderness, spotting, and breakthrough bleeding, which usually diminish after 3 to 6 months.
● Instruct patient to weigh herself at least twice a week and to report any sudden weight gain or swelling to prescriber.
● Warn patient to avoid exposure to ultraviolet light or prolonged exposure to sunlight.
***Alert:*** Warn patient to immediately report abdominal pain; numbness, stiffness, or pain in legs or buttocks; pressure or pain in chest; shortness of breath; severe headache; visual disturbances, such as blind spots, blurriness, or flashing lights; undiagnosed vaginal bleeding or discharge; two consecutive missed menstrual periods; lumps in the breast; swelling of hands or feet; or severe pain in the abdomen (tumor rupture in liver).
● Advise patient of increased risks created by simultaneous use of cigarettes and hormonal contraceptives.
● If one menstrual period is missed and tablets have been taken on schedule, tell patient to continue taking them. If two consecutive menstrual periods are missed, tell patient to stop drug and have pregnancy test. Progestins may cause birth defects if taken early in pregnancy.
● Tell patient to chew chewable tablet and follow with a full glass of liquid or swallow whole.
● Advise patient not to take same drug for longer than 12 months without consulting prescriber. Stress importance of Papanicolaou tests and annual gynecologic examinations.
● Advise patient to check with prescriber about how soon pregnancy may be attempted after hormonal therapy is stopped. Many prescribers recommend that women not become pregnant within 2 months after stopping drug.
● Warn patient of possible delay in achieving pregnancy when drug is stopped.
● Teach women how to perform routine breast self-examination.
● Teach patient methods to decrease risk of thromboembolism.
● Advise patient taking hormonal contraceptives to use additional form of birth control during concurrent treatment with certain antibiotics.
● Advise patient that hormonal contraceptives may change the fit of contact lenses.

## etodolac

ee-toe-DOE-lak

*Therapeutic class:* NSAID
*Pharmacologic class:* NSAID
*Pregnancy risk category C; D in 3rd trimester*

### AVAILABLE FORMS

*Capsules:* 200 mg, 300 mg
*Tablets:* 400 mg, 500 mg

*Tablets (extended-release):* 400 mg, 500 mg, 600 mg

## INDICATIONS & DOSAGES

➤ **Acute pain**

*Adults:* 200 to 400 mg P.O. every 6 to 8 hours p.r.n., not to exceed 1,200 mg daily.

➤ **Short- and long-term management of osteoarthritis and rheumatoid arthritis**

*Adults:* 600 to 1,000 mg P.O. daily, divided into two or three doses. Maximum daily dose is 1,200 mg. For extended-release tablets, 400 to 1,000 mg P.O. daily. Maximum daily dose is 1,200 mg.

➤ **Juvenile rheumatoid arthritis**

*Children ages 6 to 16:* 400 mg (extended-release) P.O. once daily if weight is 20 to 30 kg (40 to 66 lb); 600 mg (extended-release) P.O. once daily if weight is 31 to 45 kg (68 to 99 lb); 800 mg (extended-release) P.O. once daily if weight is 46 to 60 kg (101 to 132 lb); or 1,000 mg P.O. once daily if weight exceeds 60 kg.

## ADMINISTRATION

**P.O.**

• Give drug with milk or meals to minimize GI discomfort.

## ACTION

Unknown. Produces anti-inflammatory, analgesic, and antipyretic effects, possibly by inhibiting prostaglandin synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30 min | 1–2 hr | 4–12 hr |
| P.O. (extended-release) | Unknown | 3–12 hr | 6–12 hr |

*Half-life:* 7¼ hours.

## ADVERSE REACTIONS

**CNS:** asthenia, malaise, dizziness, depression, drowsiness, nervousness, insomnia, syncope, fever.

**CV:** hypertension, ***heart failure,*** flushing, palpitations, edema, fluid retention.

**EENT:** blurred vision, tinnitus, photophobia.

**GI:** *dyspepsia,* flatulence, abdominal pain, diarrhea, nausea, constipation, gastritis, melena, vomiting, anorexia, ***peptic ulceration with or without GI bleeding or perforation,*** ulcerative stomatitis, thirst, dry mouth.

**GU:** dysuria, urinary frequency, ***renal failure.***

**Hematologic:** anemia, ***leukopenia,*** hemolytic anemia.

**Hepatic:** ***hepatitis.***

**Metabolic:** weight gain.

**Respiratory:** ***asthma.***

**Skin:** pruritus, rash, cutaneous vasculitis, ***Stevens-Johnson syndrome.***

**Other:** chills.

## INTERACTIONS

**Drug-drug.** *Antacids:* May decrease etodolac's peak level. Watch for decreased effect of etodolac.

*Aspirin:* May decrease protein-binding of etodolac without altering its clearance. May increase GI toxicity. Avoid using together.

*Beta blockers, diuretics:* May blunt effects of these drugs. Monitor patient closely.

*Cyclosporine:* May increase risk of nephrotoxicity. Avoid using together.

*Digoxin, lithium, methotrexate:* May impair elimination of these drugs, increasing risk of toxicity. Monitor drug levels.

*Phenylbutazone:* May increase etodolac level. Avoid using together.

*Phenytoin:* May increase phenytoin level. Monitor patient for toxicity.

*Warfarin:* May decrease the protein binding of warfarin but doesn't change its clearance. Although no dosage adjustment is needed, monitor INR closely and watch for bleeding.

**Drug-herb.** *Dong quai, feverfew, garlic, ginger, horse chestnut, red clover:* May increase risk of bleeding. Discourage use together.

*White willow:* Herb and drug contain similar components. Discourage use together.

**Drug-lifestyle.** *Alcohol use:* May increase risk of adverse effects. Discourage use together.

*Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

• May increase BUN and creatinine. May decrease uric acid and hemoglobin levels and hematocrit.

• May decrease WBC count.

• May cause a false-positive test result for urine bilirubin, possibly from phenolic metabolites and ketone bodies.

### CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Contraindicated for the treatment of perioperative pain after CABG surgery.

• Contraindicated in patients hypersensitive to drug and in those with history of aspirin- or NSAID-induced asthma, rhinitis, urticaria, or other allergic reactions.

• Use cautiously in elderly patients and in patients with history of renal or hepatic impairment, preexisting asthma, or GI bleeding, ulceration, and perforation.

***Overdose S&S:*** Lethargy, drowsiness, nausea, vomiting, epigastric pain, GI bleeding, coma, hypertension, acute renal failure, respiratory depression, anaphylaxis.

### NURSING CONSIDERATIONS

• Because NSAIDs impair the synthesis of renal prostaglandins, they can decrease renal blood flow and lead to reversible renal impairment, especially in patients with renal or heart failure or liver dysfunction, in elderly patients, and in those taking diuretics. Monitor these patients closely.

**Black Box Warning** NSAIDs cause an increased risk of serious GI adverse events including bleeding, ulceration, and perforation of the stomach or intestines, which can be fatal. Elderly patients are at greater risk.

**Black Box Warning** NSAIDs may increase the risk of serious thrombotic events, MI, or stroke, which can be fatal. The risk may be greater with longer use or in patients with CV disease or risk factors for CV disease.

### PATIENT TEACHING

• Tell patient to take drug with milk or meals to minimize GI discomfort.

• Teach patient signs and symptoms of GI bleeding, including blood in vomit, urine, or stool; coffee-ground vomit; and black, tarry stool. Tell him to notify prescriber immediately if any of these occurs.

• Advise patient to avoid consuming alcohol or aspirin while taking drug.

• Warn patient to avoid hazardous activities that require alertness until harmful CNS effects of drug are known.

• Teach patient signs and symptoms of liver damage, including nausea, fatigue, lethargy, itching, yellowed skin or eyes, right upper quadrant tenderness, and flulike symptoms. Tell him to contact prescriber immediately if any of these symptoms occurs.

• Advise patient to use a sunblock, wear protective clothing, and avoid prolonged exposure to sunlight because of possible sensitivity to sunlight.

• Tell pregnant women to avoid use of drug during last trimester.

• Advise patient that use of OTC NSAIDs and etodolac may increase the risk of GI toxicity.

## etonogestrel and ethinyl estradiol vaginal ring

e-toe-noe-JES-trel and ETH-i-nill

NuvaRing

*Therapeutic class:* Contraceptive
*Pharmacologic class:* Estrogenic and progestinic steroids
*Pregnancy risk category X*

### AVAILABLE FORMS

*Vaginal ring:* Delivers 0.12 mg etonogestrel and 0.015 mg ethinyl estradiol daily

### INDICATIONS & DOSAGES

➤ **Contraception**

*Women:* Insert one ring into the vagina and leave in place for 3 weeks. Insert new ring 1 week after the previous ring is removed.

### ADMINISTRATION

**Vaginal**

• In women who did not use hormonal contraception during the previous month, therapy should be initiated on the first day of the menstrual cycle. A woman using a combination oral contraceptive may switch to NuvaRing on any day, but at the latest on the day following the usual hormone-free interval.

• Leave ring in place continuously for a full 3 weeks to maintain effect. It's then

removed for 1 week. During this time, withdrawal bleeding occurs (usually starting 2 or 3 days after removal). Insert a new ring inserted 1 week after removal of the previous one, regardless of whether patient is still menstruating.

## ACTION

Suppresses gonadotropins, which inhibits ovulation, increases the viscosity of cervical mucus (decreasing the ability of sperm to enter the uterus), and alters the endometrial lining (reducing potential for implantation).

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Vaginal | Immediate | 200 hr (etonogestrel) 60 hr (ethinyl estradiol) | Unknown |

*Half-life:* etonogestrel, 29 hours; ethinyl estradiol, 45 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* emotional lability, ***cerebral thrombosis, cerebral hemorrhage.***
**CV:** hypertension, ***thromboembolic events, MI.***
**EENT:** *sinusitis,* changes in corneal curvature, intolerance to contact lenses.
**GI:** *nausea.*
**GU:** *vaginitis, leukorrhea,* device-related events (for example, foreign body sensation, coital difficulties, device expulsion), vaginal discomfort, breakthrough bleeding.
**Hematologic:** ***coagulation abnormalities.***
**Hepatic:** ***hepatic adenomas,*** benign liver tumors, cholestatic jaundice.
**Metabolic:** weight gain.
**Respiratory:** *upper respiratory tract infection.*
**Skin:** melasma.

## INTERACTIONS

**Drug-drug.** *Acetaminophen:* May decrease acetaminophen level and increase ethinyl estradiol level. Monitor patient for effects.
*Ampicillin, barbiturates, carbamazepine, felbamate, griseofulvin, oxcarbazepine, phenylbutazone, phenytoin, rifampin, tetracyclines, topiramate:* May decrease contraceptive effect and increase risk of pregnancy, breakthrough bleeding, or both. Tell patient to use an additional form of contraception while taking these drugs.
*Ascorbic acid, atorvastatin, itraconazole:* May increase ethinyl estradiol level. Monitor patient for adverse effects.
*Clofibric acid, morphine, salicylic acid, temazepam:* May increase clearance of these drugs. Monitor patient for effectiveness.
*Cyclosporine, prednisolone, theophylline:* May increase levels of these drugs. Monitor levels if appropriate and adjust dosage.
*HIV protease inhibitors:* May affect contraceptive effect. Refer to the specific protease inhibitor drug literature. May need to use a backup method of contraception.
*Miconazole (oil-based vaginal capsule):* May increase serum concentrations of etonogestrel and ethinyl estradiol. Monitor patient for adverse effects.
**Drug-herb.** *St. John's wort:* May reduce drug effectiveness and increase the risk of breakthrough bleeding and pregnancy. Discourage use together.
**Drug-lifestyle.** *Smoking:* May increase risk of serious CV adverse effects, especially in those older than age 35 who smoke 15 or more cigarettes daily. Urge patient to avoid smoking.

## EFFECTS ON LAB TEST RESULTS

- May increase clotting factor VII, VIII, IX, and X; prothrombin; thyroid-binding globulin (leading to increased circulating total thyroid hormone levels); sex hormone–binding globulin (and other binding proteins); and triglyceride levels. May decrease antithrombin III and folate levels.
- May increase norepinephrine-induced platelet aggregation. May decrease $T_3$ resin uptake.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to any component of drug, patients who are or may be pregnant, patients older than age 35 who smoke 15 or more cigarettes daily, and patients with thrombophlebitis, thromboembolic disorder, history of deep vein thrombophlebitis, cerebral vascular or coronary artery disease (current or previous), valvular heart disease with complications, severe hypertension, diabetes with vascular complications, headache with focal neurologic symptoms, major surgery with

prolonged immobilization, known or suspected cancer of the endometrium or breast, estrogen-dependent neoplasia, abnormal undiagnosed genital bleeding, jaundice related to pregnancy or previous use of hormonal contraceptive, active liver disease, or benign or malignant hepatic tumors.
• Use cautiously in patients with hypertension, hyperlipidemias, obesity, or diabetes.
• Use cautiously in patients with conditions that could be aggravated by fluid retention, and in patients with a history of depression.

## NURSING CONSIDERATIONS

***Alert:*** Drug may increase the risk of MI, thromboembolism, stroke, hepatic neoplasia, and gallbladder disease.

**Black Box Warning** Cigarette smoking increases the risk of serious adverse cardiac effects. The risk increases with age and in patients who smoke 15 or more cigarettes daily. ■
• Stop drug at least 4 weeks before and for 2 weeks after procedures that may increase the risk of thromboembolism, and during and after prolonged immobilization.
• Stop drug and notify prescriber if patient develops unexplained partial or complete loss of vision, proptosis, diplopia, papilledema, retinal vascular lesions, migraines, depression, or jaundice.
• Monitor blood pressure closely if patient has hypertension or renal disease.
• Rule out pregnancy if woman hasn't adhered to the prescribed regimen and a period is missed, if prescribed regimen has been adhered to and two periods are missed, or if the patient has retained the ring for longer than 4 weeks.

## PATIENT TEACHING

• Stress importance of having regular annual physical examinations to check for adverse effects or developing contraindications.
• Tell patient that drug doesn't protect against HIV and other sexually transmitted diseases.
• Advise patient not to smoke while using contraceptive.
• Tell patient to use backup method until ring has been used continuously for 7 days. Tell patient not to use diaphragm if backup method of birth control is needed.
• Tell patient who wears contact lenses to contact an ophthalmologist if vision or lens tolerance changes.
• Advise patient to follow manufacturer's instructions for use if switching from different form of hormonal contraceptive.
• Tell patient to insert ring into vagina (using fingers) and keep it in place continuously for 3 weeks to maintain effect, saving foil package for later disposal. Explain that it is then removed for 1 full week and that, during this time, withdrawal bleeding occurs (usually starting 2 or 3 days after removal). Tell patient to insert new ring 1 week after removing previous one, regardless of menstrual bleeding. Tell patient to reseal ring in the package after removing it from vagina.
• Advise patient that, if the ring is removed or expelled (such as while removing a tampon, straining, or moving bowels), it should be washed with cool to lukewarm (not hot) water and reinserted immediately. Stress that contraceptive effect may be compromised if the ring stays out for longer than 3 hours and that she should use a backup method of contraception until the newly reinserted ring is used continuously for 7 days.
• Tell patient that there's no danger of the vaginal ring being pushed too far up in the vagina or getting lost.

**SAFETY ALERT!**

# etoposide (VP-16-213)

e-toe-POE-side

# etoposide phosphate

Etopophos

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Podophyllotoxin derivative
*Pregnancy risk category D*

## AVAILABLE FORMS

**etoposide**
*Capsules:* 50 mg
*Injection:* 20 mg/ml in 5-, 12.5-, and 25-ml vials

**etoposide phosphate**
*Injection:* 119.3-mg vials equivalent to 100 mg etoposide

## INDICATIONS & DOSAGES

➤ **Refractory testicular cancer in combination with other chemotherapeutic agents**
*Adults:* 50 to 100 mg/m$^2$ daily I.V. on 5 consecutive days every 3 to 4 weeks. Or, 100 mg/m$^2$ daily I.V. on days 1, 3, and 5 every 3 to 4 weeks for three or four courses of therapy.

➤ **Small-cell carcinoma of the lung in combination with other chemotherapeutic agents**
*Adults:* 35 mg/m$^2$ daily I.V. for 4 days. Or, 50 mg/m$^2$ daily I.V. for 5 days. P.O. dose is two times I.V. dose, rounded to nearest 50 mg.

***Adjust-a-dose:*** For patients with creatinine clearance of 15 to 50 ml/minute, reduce dose by 25%.

## ADMINISTRATION

**P.O.**
- Give drug without regard for food.
- Don't give drug with grapefruit juice.

**I.V.**
▼ Preparing and giving parenteral drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.
▼ For etoposide infusion, dilute to 0.2 or 0.4 mg/ml in either $D_5W$ or normal saline solution. Higher concentrations may crystallize.
▼ Give etoposide by slow infusion over at least 30 minutes to prevent severe hypotension.
▼ For etoposide phosphate, give without further dilution or dilute to as low as 0.1 mg/ml in either $D_5W$ or normal saline solution.
▼ Give etoposide phosphate over 5 to 210 minutes.
▼ Check blood pressure every 15 minutes during infusion. Hypotension may occur if infusion is too rapid. If systolic pressure falls below 90 mm Hg, stop infusion and notify prescriber.
▼ Etoposide diluted to 0.2 mg/ml is stable 96 hours at room temperature in plastic or glass, unprotected from light; at 0.4 mg/ml, it's stable 24 hours under same conditions. Diluted etoposide phosphate solution is stable for same times at room temperature or 24 hours refrigerated.
▼ **Incompatibilities:** Cefepime hydrochloride, filgrastim, gallium nitrate, idarubicin.

## ACTION

Inhibits topoisomerase II enzyme, causing inability to repair DNA strand breaks, which leads to cell death. Cell cycle specific to $G_2$ portion of cell cycle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.V. | Unknown | Unknown | Unknown |

*Half-life:* Initial phase, ½ to 2 hours; terminal phase, 5¼ hours.

## ADVERSE REACTIONS

**CNS:** peripheral neuropathy.
**CV:** hypotension.
**GI:** *anorexia, diarrhea, nausea, vomiting,* abdominal pain, stomatitis, *mucositis.*
**Hematologic:** **LEUKOPENIA, NEUTROPENIA, THROMBOCYTOPENIA,** *anemia,* ***myelosuppression.***
**Hepatic:** ***hepatotoxicity.***
**Skin:** *reversible alopecia,* rash.
**Other:** ***anaphylaxis,*** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** ***Cyclosporine:*** May increase etoposide level and toxicity. Monitor CBC and adjust etoposide dose.
*Phosphatase inhibitors:* May decrease etoposide effectiveness. Monitor drug effects.
*Warfarin:* May further prolong PT. Monitor PT and INR closely.
**Drug-food.** *Grapefruit juice:* May reduce etoposide concentrations. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level.
- May decrease neutrophil, platelet, RBC, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.

• Use cautiously in patients who have had cytotoxic or radiation therapy and in those with hepatic impairment.

## NURSING CONSIDERATIONS

**Black Box Warning** Give drug under the supervision of a physician experienced in the use of cancer chemotherapy. ▮

• Obtain baseline blood pressure before starting therapy.
• Anticipate need for antiemetics.
• Have diphenhydramine, hydrocortisone, epinephrine, and emergency equipment available to establish an airway in case anaphylaxis occurs.
• Store capsules in refrigerator.

**Black Box Warning** Monitor CBC. Watch for evidence of bone marrow suppression. ▮

• Observe patient's mouth for signs of ulceration.
• To prevent bleeding, avoid all I.M. injections when platelet count is below 50,000/$mm^3$.
• Etoposide phosphate dose is expressed as etoposide equivalents; 119.3 mg of etoposide phosphate is equivalent to 100 mg of etoposide.

## PATIENT TEACHING

• Tell patient to watch for signs and symptoms of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell patient to take temperature daily.
• Inform patient of need for frequent blood pressure readings during I.V. administration.
• Caution women of childbearing age to avoid pregnancy and breast-feeding during therapy.

# etravirine

eh-trah-VIGH-reen

Intelence

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Antiviral
*Pregnancy risk category B*

## AVAILABLE FORMS

*Tablets:* 100 mg

## INDICATIONS & DOSAGES

➤ **HIV-1 in patients who have had previous treatment and have replication of HIV-1 strains resistant to an NNRTI and other antiretrovirals**

*Adults:* 200 mg P.O. b.i.d. after meals. Given with other antiretrovirals.

## ADMINISTRATION

**P.O.**

• Give drug after meal.
• If patient can't swallow tablets, disperse tablets in a glass of water. Stir the dispersion well and have the patient drink immediately. Rinse the glass with water several times and have patient swallow each rinse completely.

## ACTION

Binds to reverse transcriptase, an enzyme that replicates HIV.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2.5–4 hours | Unknown |

*Half-life:* About 41 hours.

## ADVERSE REACTIONS

**CNS:** abnormal dreams, amnesia, anxiety, confusion, disorientation, fatigue, headache, hypoesthesia, insomnia, paresthesia, peripheral neuropathy, ***seizures,*** sluggishness, syncope, tremors.
**CV:** angina, ***atrial fibrillation,*** hypertension, ***MI.***
**EENT:** blurred vision, vertigo.
**GI:** abdominal distension, abdominal pain, anorexia, constipation, diarrhea, dry mouth, flatulence, gastritis, gastroesophageal reflux disease, hematemesis, *nausea*, ***pancreatitis,*** retching, stomatitis, vomiting.
**GU:** ***renal failure.***
**Hepatic:** ***hepatitis,*** hepatomegaly, increased liver enzyme levels.
**Hematologic:** anemia, hemolytic anemia.
**Metabolic:** ***diabetes,*** dyslipidemia.
**Respiratory:** ***bronchospasm,*** dyspnea.
**Skin:** *rash.*
**Other:** facial wasting, fat redistribution or accumulation, gynecomastia, hypersensitivity, immune reconstitution syndrome.

## INTERACTIONS

**Drug-drug.** *Amiodarone, bepridil, disopyramide, flecainide, lidocaine, mexiletine,*

*propafenone, quinidine:* May decrease levels of these drugs. Use caution, and monitor patient closely.
*Amprenavir and ritonavir:* May increase amprenavir level. Avoid use together.
*Atazanavir and ritonavir:* May decrease atazanavir level and increase etravirine level. Avoid use together.
*Atorvastatin, lovastatin, simvastatin:* May decrease levels of these drugs. Adjust dosage, if needed.
*Clarithromycin:* May decrease clarithromycin level and increase etravirine level. Consider using azithromycin for treating *Mycobacterium avium* complex.
*CYP3A4 inhibitors (such as itraconazole, ketoconazole):* May decrease levels of these drugs. Adjust dosage, if needed.
*CYP450 inducers (such as carbamazepine, phenobarbital, phenytoin):* May decrease etravirine level. Avoid use together.
*Delavirdine:* May increase etravirine level. Avoid use together.
*Dexamethasone:* May decrease etravirine level. Avoid use together.
*Diazepam:* May increase diazepam level. Reduce diazepam dose, as needed.
*Efavirenz, nevirapine:* May decrease etravirine level. Avoid use together.
*Fluconazole, posaconazole:* May increase etravirine level. Use together cautiously.
*Fluvastatin:* May increase fluvastatin level. Adjust dosage, if needed.
*Immunosuppressants (such as cyclosporine, sirolimus, tacrolimus):* May decrease levels of these drugs. Use together cautiously, and monitor patient closely.
*Lopinavir and ritonavir:* May increase etravirine level. Use together cautiously.
*Methadone:* May cause withdrawal symptoms. Monitor patient, and consider increasing methadone dosage.
*Phosphodiesterase-5 inhibitors (sildenafil, tadalafil, vardenafil):* May decrease effectiveness of these drugs. Adjust dosage, as needed.
*Protease inhibitors (such as atazanavir, fosamprenavir, indinavir, nelfinavir):* May alter protease inhibitor level if given without ritonavir. Avoid use together unless given with low-dose ritonavir.
*Rifabutin:* May decrease etravirine and rifabutin levels. If etravirine isn't given with a protease inhibitor and ritonavir, give rifabutin 300 mg daily. If etravirine is given with darunavir and ritonavir or with raquinavir and ritonavir, avoid rifabutin.
*Rifampin, rifapentine:* May decrease etravirine level. Avoid use together.
*Ritonavir:* May decrease etravirine level. Avoid use together.
*Ritonavir and tipranavir:* May decrease etravirine level. Avoid use together.
*Warfarin:* May increase warfarin level. Monitor INR closely, and adjust warfarin dosage if needed.
**Drug-herb.** *St. John's wort:* May decrease etravirine level. Avoid use together.

## EFFECTS ON LAB TEST RESULTS

- May increase amylase, lipase, creatinine, total cholesterol, LDL, triglyceride, AST, ALT, and glucose levels. May decrease hemoglobin level.
- May decrease RBC, neutrophil, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to etravirine or its components.
- Use cautiously in elderly patients and patients with hepatic impairment or hepatitis B or C.
- Pregnant women should take etravirine only if potential benefits to mother outweigh risks to fetus.
- Pregnant women who take etravirine should be enrolled in the Antiretroviral Pregnancy Registry, which monitors maternal-fetal outcomes, by calling 1-800-258-4263.

## NURSING CONSIDERATIONS

***Alert:*** Etravirine may interact with many drugs. Review patient's complete drug regimen.
- If patient can't swallow the tablet whole, dissolve it in water and have patient drink it immediately. To make sure patient receives entire dose, refill the glass several times and have patient drink.

***Alert:*** Monitor patient closely for skin reactions. Fatalities have occurred due to toxic epidermal necrolysis and hypersensitivity reactions that may be accompanied by

hepatic failure. Discontinue drug if severe skin or hypersensitivity reactions develop.
• Monitor patient for signs of fat redistribution, including central obesity, buffalo hump, peripheral wasting, breast enlargement, and cushingoid appearance.
• Notify prescriber if signs, symptoms, or laboratory abnormalities suggest pancreatitis. Monitor amylase and lipase levels.
• Monitor patient's CBC, platelet count, and renal and liver function studies. Report abnormalities.

## PATIENT TEACHING

• Advise patient to take etravirine after a meal.
• Warn patient to tell prescriber about any other prescription drugs, over-the-counter drugs, and herbal supplements he takes.
• Advise patient to report adverse effects to prescriber.
• Inform patient that drug doesn't cure HIV infection, that opportunistic infections and other complications of HIV infection may still occur, and that HIV may still be transmitted to others through sexual contact or blood contamination.
• Advise patient to take drug as prescribed and not to alter dose or stop drug without medical approval.
• If patient misses a dose, tell him to take it as soon as possible and then return to his normal schedule. Advise patient not to double the dose.
• Tell patient that routine blood tests will be needed to assess how he is tolerating drug therapy.

**SAFETY ALERT!**

# everolimus

eh-ver-OH-lih-mus

Afinitor, Zortress

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Kinase inhibitor
*Pregnancy risk category D*

## AVAILABLE FORMS

*Tablets (Afinitor):* 5 mg, 10 mg
*Tablets (Zortress):* 0.25 mg, 0.5 mg, 0.75 mg

## INDICATIONS & DOSAGES

➤ **Advanced renal cell carcinoma after treatment with sunitinib or sorafenib fails**

*Adults:* 10 mg P.O. once daily.
***Adjust-a-dose:*** For severe or intolerable adverse effects, reduce dosage to 5 mg P.O. daily or interrupt therapy. For moderate hepatic impairment (Child-Pugh Class B), reduce dosage to 5 mg P.O. daily.

✶ ***NEW INDICATION:*** **Prevention of kidney transplant rejection in patients at low to moderate immunologic risk (Zortress only)**

*Adults:* Initially, 0.75 mg P.O. twice daily with cyclosporine as soon as possible after transplantation. Dosage adjustments may be made at 4- to 5-day intervals based on patient response and clinical situation.
***Adjust-a-dose:*** In patients with moderate hepatic impairment, give half the recommended initial daily dose and monitor blood concentrations.

## ADMINISTRATION

**P.O.**
• Give drug at same time each day with or without food.
• Have patient swallow tablets whole with a glass of water. Tablets shouldn't be chewed or crushed.
• Patient should avoid grapefruit or grapefruit juice while taking drug.

## ACTION

Binds to an intracellular protein, thereby inhibiting mammalian target rapamycin (mTOR), a kinase. Inhibiting mTOR reduces cancer cell proliferation, angiogenesis, and glucose uptake.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | Unknown |

*Half-life:* 30 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia*, dizziness, *dysgeusia*, *headache*, insomnia, paresthesia, *fever*, *fatigue.*
**CV:** chest pain, heart failure, hypertension, tachycardia.
**EENT:** conjunctivitis, eyelid edema, *epistaxis*, *mucosal inflammation*,

nasopharyngitis, pharyngolaryngeal pain, rhinorrhea, sinusitis.
**GI:** abdominal pain, *anorexia, diarrhea,* dry mouth, dysphagia, hemorrhoids, *nausea, stomatitis, vomiting.*
**GU:** renal failure, UTI.
**Hematologic:** ***hemorrhage.***
**Metabolic:** exacerbation of diabetes mellitus, weight loss.
**Musculoskeletal:** *extremity pain,* jaw pain.
**Respiratory:** bronchitis, *cough, dyspnea,* pleural effusion, pneumonia, **PNEUMONITIS.**
**Skin:** acneiform dermatitis, *dry skin,* erythema, hand-foot syndrome, nail disorder, *pruritus,* onychoclasis, *rash,* skin lesion.
**Other:** chills, *peripheral edema.*

## INTERACTIONS

**Drug-drug.** **Black Box Warning** *Cyclosporine:* Increased nephrotoxicity can occur with standard cyclosporine dosing in combination with everolimus. Decrease cyclosporine dosage and monitor serum cyclosporine and everolimus levels. ▮ *Strong CYP3A4 inducers (carbamazepine, dexamethasone, phenobarbital, phenytoin, rifabutin, rifampin):* May decrease everolimus level. Avoid using together; if drugs must be used together, increase everolimus dosage at 5 mg-increments up 20 mg daily. *Strong or moderate CYP3A4 inhibitors (such as amprenavir, aprepitant, atazanavir, clarithromycin, delavirdine, diltiazem, erythromycin, fluconazole, fosamprenavir, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, verapamil, and voriconazole) and P-gp inhibitors (such as amiodarone, atorvastatin, and spironolactone):* May increase everolimus level. Avoid using together.
**Drug-herb.** *St. John's wort:* May alter drug level. Discourage use together.
**Drug-food.** *Grapefruit, grapefruit juice:* May increase drug level. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase creatinine, cholesterol, triglyceride, and glucose levels.
- May decrease hemoglobin level and lymphocyte, neutrophil, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, its components, other rapamycin derivatives, or sirolimus (Zortress only).
- Avoid use in patients with severe hepatic impairment or severe infection.
- Avoid use in pregnant women because of potential hazards to fetus.
- It isn't known if drug appears in breast milk. Women shouldn't breast-feed while taking drug.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug should only be prescribed by providers experienced in immunosuppressive therapy and management of transplant patients. ▮
- Don't crush tablets. Avoid direct contact with skin or mucous membranes. If contact occurs, wash area thoroughly.

**Black Box Warning** Drug increases risk of infection and malignancies, such as lymphoma and skin cancer, due to immunosuppression. ▮
- Monitor patient for signs of infection (fever, chills, sore throat, fatigue).

**Black Box Warning** There is an increased risk of arterial and venous renal thrombosis leading to graft loss, usually in first 30 days after transplant. ▮
- Monitor renal function studies and CBC before and during therapy.
- Avoid mouthwash containing alcohol or peroxide in patients who develop mouth ulcers, stomatitis, or oral mucositis.
- Monitor respiratory status for signs and symptoms of noninfectious pneumonitis (hypoxia, pleural effusion, cough, dyspnea). For severe cases, discontinue therapy and administer corticosteroids.

## PATIENT TEACHING

- Advise women of childbearing age to use an effective method of contraception during therapy and for 8 weeks after therapy ends.
- Tell patient to swallow the tablets whole with a full glass of water.
- Advise patient to notify his health care provider if he experiences mouth ulcers, fever, shortness of breath, cough, rash,

headache, loss of appetite, nausea, vomiting, diarrhea, swelling of the extremities or face, weakness, tiredness, or nosebleeds.
• Tell patient not to receive live vaccines and to avoid close contact with anyone who has received a live vaccine.

**SAFETY ALERT!**

## exemestane

ecks-eh-MES-tayn

Aromasin

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Aromatase inhibitor
*Pregnancy risk category D*

### AVAILABLE FORMS

*Tablets:* 25 mg

### INDICATIONS & DOSAGES

➤ **Advanced breast cancer in postmenopausal women whose disease has progressed after treatment with tamoxifen**

*Adults:* 25 mg P.O. once daily after food.

➤ **Early-stage breast cancer in patients who have taken tamoxifen for 2 to 3 years**

*Adults:* 25 mg P.O. once daily after food to complete a 5-year course, unless cancer recurs or is found in the other breast.

### ADMINISTRATION

**P.O.**

• Give drug after a meal.

### ACTION

A highly protein-bound, irreversible, steroidal aromatase inactivator that reduces circulating estrogen levels, which decreases cell growth in estrogen-dependent breast cancer.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | 24 hr |

*Half-life:* About 24 hours.

### ADVERSE REACTIONS

**CNS:** *fatigue, insomnia, pain, depression,* anxiety, dizziness, headache, paresthesia, generalized weakness, asthenia, confusion, hypoesthesia, fever.
**CV:** *hot flashes,* hypertension, edema, chest pain.
**EENT:** sinusitis, rhinitis, pharyngitis.
**GI:** *nausea,* vomiting, abdominal pain, anorexia, constipation, diarrhea, increased appetite, dyspepsia.
**GU:** UTI.
**Hematologic:** ***lymphopenia.***
**Musculoskeletal:** *arthralgia,* pathologic fractures, arthritis, back pain, skeletal pain.
**Respiratory:** *dyspnea,* bronchitis, cough, upper respiratory tract infection.
**Skin:** *increased sweating, alopecia,* itching, dermatitis, rash.
**Other:** infection, flulike syndrome, lymphedema.

### INTERACTIONS

**Drug-drug.** *Drugs containing estrogen:* May interfere with exemestane's action. Avoid using together.
*Potent CYP3A4 inducers, such as phenytoin and rifampicin:* May increase the metabolism of exemestane, decreasing level. Increase exemestane dosage to 50 mg daily.
**Drug-herb.** *St. John's wort:* May decrease effectiveness of drug. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

• May increase bilirubin, alkaline phosphatase, and creatinine levels.
• May decrease lymphocyte count.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components.

### NURSING CONSIDERATIONS

• Use drug only in postmenopausal women. Pregnancy must be ruled out before starting drug therapy.
• Patients with advanced disease should continue treatment until tumor progression is apparent.

### PATIENT TEACHING

• Tell patient to take drug after a meal.
• Stress the importance of maintaining healthy bones by staying active, eating

foods containing calcium and vitamin D, minimizing alcohol consumption, and quitting smoking.
• Advise patient to report adverse effects, especially fever or swelling of arms or legs.

**SAFETY ALERT!**

# exenatide

eks-EHN-uh-tyde

Byetta

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Incretin mimetic
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 5 mcg/dose in 1.2-ml prefilled pen (60 doses); 10 mcg/dose in 2.4-ml prefilled pen (60 doses)

## INDICATIONS & DOSAGES

➤ **Adjunct to diet and exercise to improve glycemic control in patients with type 2 diabetes**

*Adults:* 5 mcg subcutaneously b.i.d. within 60 minutes before morning and evening meals. If needed, increase to 10 mcg b.i.d. after 1 month.

***Adjust-a-dose:*** Use caution when escalating doses from 5 to 10 mcg in patients with moderate renal impairment (creatinine clearance of 50 to 80 ml/minute). Drug isn't recommended for patients with end-stage renal disease or severe renal impairment (creatinine clearance of less than 30 ml/minute).

## ADMINISTRATION

**Subcutaneously**

• Drug comes in two strengths; check cartridge carefully before use.
• Give as a subcutaneous injection in the thigh, abdomen, or upper arm.
• Before first use, store drug in refrigerator at 36° to 46° F (2° to 8° C). After first use, drug can be kept at temperature up to 77° F (25° C). Don't freeze, and don't use drug if it has been frozen. Protect drug from light. Discard pen 30 days after first use, even if some drug remains.

## ACTION

Reduces fasting and postprandial glucose levels in type 2 diabetes by stimulating insulin production in response to elevated glucose levels, inhibiting glucagon release after meals, and slowing gastric emptying.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 2 hr | Unknown |

*Half-life:* 2½ hours.

## ADVERSE REACTIONS

**CNS:** dizziness, headache, jittery feeling, weakness.
**GI:** anorexia, *diarrhea*, dyspepsia, *nausea*, ***pancreatitis,*** *vomiting*, reflux.
**Metabolic:** ***hypoglycemia.***
**Skin:** excessive sweating, pruritis, urticaria, rash.
**Other:** hypersensitivity reactions, injection site reaction, ***angioedema, anaphylaxis.***

## INTERACTIONS

**Drug-drug.** *Acetaminophen:* May decrease acetaminophen concentration. Give acetaminophen at least 1 hour before or 4 hours after exenatide injection.
*Digoxin, lisinopril, lovastatin:* May decrease concentrations of these drugs. Monitor patient.
*Drugs that are rapidly absorbed:* May slow gastric emptying and reduce absorption of some oral drugs. Separate administration by 1 hour.
*Oral drugs that need to maintain a threshold concentration to maintain effectiveness (antibiotics, hormonal contraceptives):* May reduce rate and extent of absorption of these drugs. Give these drugs at least 1 hour before giving exenatide.
*Sulfonylureas:* May increase the risk of hypoglycemia. Reduce sulfonylurea dose as needed, and monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components.
• Don't use in patients with type 1 diabetes or diabetic ketoacidosis.

- Don't use in patients with end-stage renal disease, creatinine clearance less than 30 ml/minute, or severe GI disease (including gastroparesis).
- Use cautiously in pregnant or breast-feeding women, and in patients with renal transplant.

***Overdose S&S:*** Severe nausea, severe vomiting, hypoglycemia.

### NURSING CONSIDERATIONS

- Assess GI and renal function before and during treatment.

***Alert:*** Drug-related nausea, vomiting, and diarrhea resulting in dehydration have led to increased serum creatinine levels and acute renal failure.

- Monitor glucose level regularly and glycosylated hemoglobin level periodically.

***Alert:*** Stop drug if pancreatitis is suspected. Initiate appropriate treatment and monitor patient carefully. Byetta should not be readministered.

- ***Look alike–sound alike:*** Don't confuse exenatide with ezetimibe.

### PATIENT TEACHING

- Explain the risks of drug.
- Review proper use and storage of dosage pen, particularly the one-time setup for each new pen.
- Inform patient that prefilled pen doesn't include a needle; explain which needle length and gauge is appropriate.
- Instruct patient to inject drug in the thigh, abdomen, or upper arm within 60 minutes before morning and evening meals. Caution against injecting drug after a meal.
- Advise patient that drug may decrease appetite, food intake, and body weight, and that these changes don't warrant a change in dosage.
- Advise patient to seek immediate medical care if unexplained, persistent, severe abdominal pain, with or without vomiting, occurs.
- Review steps for managing hypoglycemia, especially if patient takes a sulfonylurea.
- Inform patient of potential risk of worsening renal function and signs and symptoms of renal dysfunction.
- Stress importance of proper storage (refrigerated), infection prevention, and timing of exenatide dose in relation to other oral drugs.
- Tell patient that if a dose is missed, resume treatment as prescribed with the next scheduled dose.

## ezetimibe

ee-ZET-ah-mibe

Zetia✐

*Therapeutic class:* Antilipemic
*Pharmacologic class:* Selective cholesterol absorption inhibitor
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 10 mg

### INDICATIONS & DOSAGES

➤ **Adjunct to diet and exercise to reduce total-cholesterol (C), LDL-C, and apolipoprotein B (Apo B) levels in patients with primary hypercholesterolemia, alone or combined with HMG-CoA reductase inhibitors (statins) or bile acid sequestrants; adjunct to other lipid-lowering drugs (combined with atorvastatin or simvastatin) in patients with homozygous familial hypercholesterolemia; adjunct to diet in patients with homozygous sitosterolemia to reduce sitosterol and campesterol levels; adjunct to fenofibrate and diet to reduce total-C, LDL-C, Apo B, and non–HDL-C levels in patients with mixed hyperlipidemia**

*Adults and children age 10 and older:* 10 mg P.O. daily.

### ADMINISTRATION

**P.O.**

- Give drug without regard for meals.

### ACTION

Inhibits absorption of cholesterol by the small intestine, unlike other drugs used for cholesterol reduction; causes reduced hepatic cholesterol stores and increased cholesterol clearance from the blood.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 4–12 hr | Unknown |

*Half-life:* 22 hours.

### ADVERSE REACTIONS
**CNS:** dizziness, fatigue, headache.
**CV:** chest pain.
**EENT:** pharyngitis, sinusitis.
**GI:** abdominal pain, diarrhea.
**Musculoskeletal:** arthralgia, back pain, myalgia.
**Respiratory:** *upper respiratory tract infection*, cough.
**Other:** viral infection.

### INTERACTIONS
**Drug-drug.** *Bile acid sequestrant (cholestyramine):* May decrease ezetimibe level. Give ezetimibe at least 2 hours before or 4 hours after cholestyramine.
*Cyclosporine, fenofibrate:* May increase ezetimibe level. Monitor patient for adverse reactions.
*Fibrates:* May increase excretion of cholesterol into the gallbladder bile. Avoid using together.

### EFFECTS ON LAB TEST RESULTS
- May increase liver function test values.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients allergic to any component of the drug.
- Contraindicated with HMG-CoA reductase inhibitor in pregnant or breast-feeding women and in patients with active hepatic disease or unexplained increased transaminase level.
- Use cautiously in elderly patients.

### NURSING CONSIDERATIONS
- Before starting treatment, assess patient for underlying causes of dyslipidemia.
- Obtain baseline triglyceride and total, LDL, and HDL cholesterol levels.
- Using drug with an HMG-CoA reductase inhibitor significantly decreases total and LDL cholesterol, apolipoprotein B, and triglyceride levels and (except with pravastatin) increases HDL cholesterol level more than use of an HMG-CoA reductase inhibitor alone. Check liver function test values when therapy starts and thereafter according to the HMG-CoA reductase inhibitor manufacturer's recommendations.
- Patient should maintain a cholesterol-lowering diet during treatment.

### PATIENT TEACHING
- Emphasize importance of following a cholesterol-lowering diet during drug therapy.
- Tell patient he may take drug without regard for meals.
- Advise patient to notify prescriber of unexplained muscle pain, weakness, or tenderness.
- Urge patient to tell his prescriber about any herbal or dietary supplements he's taking.
- Advise patient to visit his prescriber for routine follow-ups and blood tests.
- Tell woman to notify prescriber if she becomes pregnant.

## factor IX complex
Bebulin VH, Profilnine SD, Proplex T

## factor IX (human)
AlphaNine SD, Mononine

## factor IX (recombinant)
BeneFIX

*Therapeutic class:* Clotting factor
*Pharmacologic class:* Plasma protein
*Pregnancy risk category C*

### AVAILABLE FORMS
*Injection:* Vials, with diluent; International units specified on label

### INDICATIONS & DOSAGES
➤ **Factor IX deficiency (also called hemophilia B or Christmas disease), anticoagulant overdosage; factor VII deficiency (Proplex T only)**
*Adults and children:* To calculate international units of factor IX needed, use the following equations:

***Human product***

$$1 \text{ international unit/kg} \times \text{body weight in kg} \times \text{percentage of desired increase of factor IX level}$$

***Recombinant product***

| | | | | |
|---|---|---|---|---|
| 1.2 international unit/kg | × | body weight in kg | × | percentage of desired increase of factor IX level |

***Proplex T***

| | | | | |
|---|---|---|---|---|
| 0.5 international unit/kg | × | body weight in kg | × | percentage of desired increase of factor VII level |

Infusion rates vary with product and patient comfort. Dosage is highly individualized, depending on degree of deficiency, level of factor VII or IX desired, patient weight, and severity of bleeding.

## ADMINISTRATION

**I.V.**

▼ Warm to room temperature before reconstituting.
▼ Reconstitute each vial of lyophilized drug with sterile water for injection according to manufacturer's directions.
▼ Don't shake, refrigerate, or mix with other solutions.
▼ Use factor IX (human) within 3 hours after reconstitution. Factor IX complex is stable 12 hours after reconstitution, although delivery should start within 3 hours of reconstitution.
▼ Filter drug before giving.
▼ The rate of administration varies between each product; infuse slowly at suggested rate of 2 to 3 ml/minute and adapt to patient response.
▼ Avoid rapid infusion. If tingling sensation, fever, chills, or headache develop, decrease flow rate and notify prescriber.
▼ Store away from heat.
▼ **Incompatibilities:** All I.V. drugs and solutions, except normal saline solution.

## ACTION

Directly replaces deficient clotting factor.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | 10–30 min | Unknown |

*Half-life:* 20 to 25 hours.

## ADVERSE REACTIONS

**CNS:** headache, *transient fever, chills,* somnolence.
**CV:** ***thromboembolic reactions, MI, pulmonary embolism,*** changes in blood pressure, *flushing.*
**GI:** nausea, vomiting, altered taste.
**Hematologic:** ***DIC.***
**Hepatic:** Hepatitis B or C.
**Skin:** urticaria, injection-site reaction.
**Other:** *tingling,* ***anaphylaxis.***

F

## INTERACTIONS

**Drug-drug.** *Aminocaproic acid:* May increase risk of thrombosis. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to murine (mouse) protein (Mononine) or hamster protein (BeneFIX).
● Use cautiously in neonates and infants because of susceptibility to hepatitis, which may be transmitted with factor.

## NURSING CONSIDERATIONS

● Determine if patient has been vaccinated against hepatitis A and B. If necessary, give hepatitis A and B vaccines before giving factor.
● Observe patient for allergic reactions and monitor vital signs regularly.
● Observe patient closely for signs and symptoms of thromboembolic events.
● Risk of hepatitis must be weighed against risk of not receiving drug.

## PATIENT TEACHING

● Explain use and administration of factor to patient and family.
● Tell patient to report adverse reactions promptly and to stop using drug if they occur.
● Advise patient to report chest tightness, wheezing, respiratory distress, cough, or low blood pressure.
● Tell patient that risk of HIV, hepatitis, or West Nile virus transmission is extremely low because of manufacturing process.

# famciclovir

fam-SYE-kloe-vir

Famvir

*Therapeutic class:* Antiviral
*Pharmacologic class:* Synthetic acyclic guanine derivative
*Pregnancy risk category B*

## AVAILABLE FORMS

*Tablets:* 125 mg, 250 mg, 500 mg

## INDICATIONS & DOSAGES

➤ **Acute herpes zoster infection (shingles)**

*Adults:* 500 mg P.O. every 8 hours for 7 days.

***Adjust-a-dose:*** For patients with creatinine clearance of 40 to 59 ml/minute, give 500 mg P.O. every 12 hours; if clearance is 20 to 39 ml/minute, give 500 mg P.O. every 24 hours; if clearance is less than 20 ml/minute, give 250 mg P.O. every 24 hours. For hemodialysis patients, give 250 mg P.O. after each hemodialysis session.

➤ **Recurrent genital herpes**

*Adults:* 1,000 mg P.O. b.i.d. for a single day. Begin therapy at the first sign or symptom.

***Adjust-a-dose:*** For patients with creatinine clearance of 40 to 59 ml/minute, give 500 mg every 12 hours for 1 day; for clearance of 20 to 39 ml/minute, give 500 mg P.O. as a single dose; if clearance is less than 20 ml/minute, give 250 mg as a single dose. For hemodialysis patient, give 250 mg single dose following dialysis session.

➤ **Suppression of recurrent genital herpes**

*Adults:* 250 mg P.O. b.i.d. for up to 1 year.

***Adjust-a-dose:*** For patients with creatinine clearance of 20 to 39 ml/minute, give 125 mg P.O. every 12 hours; if clearance is less than 20 ml/minute, give 125 mg P.O. every 24 hours. For hemodialysis patients, give 125 mg P.O. after each hemodialysis session.

➤ **Recurrent mucocutaneous herpes simplex infections in HIV-infected patients**

*Adults:* 500 mg P.O. b.i.d. for 7 days.

***Adjust-a-dose:*** For patients with creatinine clearance of 20 to 39 ml/minute, give 500 mg P.O. every 24 hours; if clearance is less than 20 ml/minute, give 250 mg P.O. every 24 hours. For hemodialysis patients, give 250 mg P.O. after each hemodialysis session.

➤ **Recurrent herpes labialis (cold sores)**

*Adults:* 1,500 mg P.O. for one dose. Give at the first sign or symptom of cold sore.

***Adjust-a-dose:*** For patients with creatinine clearance of 40 to 59 ml/minute, give 750 mg as a single dose; for clearance of 20 to 39 ml/minute, give 500 mg P.O. as a single dose; if clearance is less than 20 ml/minute, give 250 mg as a single dose. For hemodialysis patient, give 250 mg single dose following dialysis session.

## ADMINISTRATION

**P.O.**

- Give drug without regard for meals.

## ACTION

A guanosine nucleoside that is converted to penciclovir, which enters viral cells and inhibits DNA polymerase and viral DNA synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Unknown |

*Half-life:* 2 to 3 hours.

## ADVERSE REACTIONS

**CNS:** *headache*, fatigue, dizziness, paresthesia, somnolence.
**GI:** *nausea*, abdominal pain, diarrhea, vomiting.
**Skin:** pruritus.
**Other:** zoster-related signs, symptoms, and complications.

## INTERACTIONS

**Drug-drug.** *Probenecid:* May increase level of penciclovir, the active metabolite of famciclovir. Monitor patient for increased adverse reactions.

## EFFECTS ON LAB TEST RESULTS

- None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with renal or hepatic impairment.

## NURSING CONSIDERATIONS

- In patients with renal or hepatic impairment, adjust dosage as needed.
- Monitor renal and liver function tests.

## PATIENT TEACHING

- Inform patient that drug doesn't cure genital herpes but can decrease the length and severity of symptoms.
- Teach patient how to avoid spreading infection to others.
- Urge patient to recognize the early signs and symptoms of herpes infection, such as tingling, itching, and pain, and to report them. Therapy is more effective if started within 48 hours of rash onset.

# famotidine

fa-MOE-ti-deen

Pepcid🖋, Pepcid AC ◇

*Therapeutic class:* Antiulcer
*Pharmacologic class:* $H_2$ receptor antagonist
*Pregnancy risk category B*

## AVAILABLE FORMS

*Gelcaps:* 10 mg ◇
*Injection:* 10 mg/ml
*Powder for oral suspension:* 40 mg/5 ml after reconstitution
*Premixed injection:* 20 mg/50 ml in normal saline solution
*Tablets:* 10 mg ◇, 20 mg ◇, 40 mg
*Tablets (chewable):* 10 mg ◇, 20 mg ◇

## INDICATIONS & DOSAGES

➤ **Short-term treatment for duodenal ulcer**

*Adults:* For acute therapy, 40 mg P.O. once daily at bedtime or 20 mg P.O. b.i.d. Healing usually occurs within 4 weeks. For maintenance therapy, 20 mg P.O. once daily at bedtime.

➤ **Short-term treatment for benign gastric ulcer**

*Adults:* 40 mg P.O. daily at bedtime or 20 mg P.O. b.i.d. for 8 weeks.
*Children ages 1 to 16:* 0.5 mg/kg/day P.O. at bedtime or divided b.i.d., up to 40 mg daily.

➤ **Pathologic hypersecretory conditions (such as Zollinger-Ellison syndrome)**

*Adults:* 20 mg P.O. every 6 hours, up to 160 mg every 6 hours.

➤ **Hospitalized patients who can't take oral drug or who have intractable ulcers or hypersecretory conditions**

*Adults:* 20 mg I.V. every 12 hours.

➤ **Gastroesophageal reflux disease (GERD)**

*Adults:* 20 mg P.O. b.i.d. for up to 6 weeks. For esophagitis caused by GERD, 20 to 40 mg b.i.d. for up to 12 weeks.
*Children ages 1 to 16:* 1 mg/kg/day P.O. divided twice daily up to 40 mg b.i.d.
*Children age 3 months to younger than 1 year:* 0.5 mg/kg/dose oral suspension b.i.d. for up to 8 weeks.
*Children younger than age 3 months:* 0.5 mg/kg/dose oral suspension once daily for up to 8 weeks.

➤ **To prevent or treat heartburn**

*Adults:* 10 mg Pepcid AC P.O. 1 hour before meals to prevent symptoms, or 10 mg Pepcid AC P.O. with water when symptoms occur. Maximum daily dose is 20 mg. Drug shouldn't be taken daily for longer than 2 weeks.

***Adjust-a-dose:*** For patients with creatinine clearance below 50 ml/minute, give half the dose, or increase dosing interval to every 36 to 48 hours.

## ADMINISTRATION

**P.O.**

- Reconstitute and shake oral suspension before use.
- Store reconstituted oral suspension below 86° F (30° C). Discard after 30 days.

**I.V.**

▼ Compatible solutions include sterile water for injection, normal saline solution for injection, $D_5W$ or dextrose 10% in water for injection, 5% sodium bicarbonate injection, and lactated Ringer's injection. Drug also can be added to total parenteral nutrition solutions.

▼ For direct injection, dilute 2 ml (20 mg) with compatible solution to a total volume of either 5 or 10 ml.
▼ Inject over at least 2 minutes.
▼ For intermittent infusion, dilute 20 mg (2 ml) in 100-ml compatible solution. The premixed 50-ml solution doesn't need further dilution.
▼ Infuse over 15 to 30 minutes.
▼ After dilution, solution is stable 48 hours at 36° to 46° F (2° to 8° C).
▼ **Incompatibilities:** Amphotericin B cholesterol complex, azithromycin, cefepime, piperacillin with tazobactam.

## ACTION

Competitively inhibits action of histamine on the $H_2$ receptor sites of parietal cells, decreasing gastric acid secretion.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 1–3 hr | 12 hr |
| I.V. | 1 hr | 1–4 hr | 12 hr |

*Half-life:* 2½ to 3½ hours.

## ADVERSE REACTIONS

**CNS:** *headache*, dizziness, fever, malaise, paresthesia, vertigo.
**CV:** flushing, palpitations.
**EENT:** orbital edema, tinnitus.
**GI:** anorexia, constipation, diarrhea, dry mouth, taste perversion.
**Musculoskeletal:** bone and muscle pain.
**Skin:** acne, dry skin.
**Other:** transient irritation at I.V. site.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

• May increase BUN, creatinine, and liver enzyme levels.
• May cause false-negative results in skin tests using allergen extracts. May antagonize pentagastrin in gastric acid secretion tests.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug.

## NURSING CONSIDERATIONS

• Assess patient for abdominal pain.
• Look for blood in emesis, stool, or gastric aspirate.

## PATIENT TEACHING

• Instruct patient in proper use of OTC product, if appropriate.
• Warn patient with phenylketonuria that Pepcid AC chewable tablets contain phenylalanine.
• Tell patient to take prescription drug with a snack, if desired.
• Advise patient to limit use of prescription drug to no longer than 8 weeks, unless ordered by prescriber, and OTC drug to no longer than 2 weeks.
• With prescriber's knowledge, let patient take antacids together, especially at beginning of therapy when pain is severe.
• Urge patient to avoid cigarette smoking because it may increase gastric acid secretion and worsen disease.
• Advise patient to report abdominal pain, blood in stools or vomit, black tarry stools, or coffee-ground emesis.

**SAFETY ALERT!**

# fat emulsions

Intralipid 20%, Intralipid 30%, Liposyn II 10%, Liposyn II 20%, Liposyn III 10%, Liposyn III 20%, Liposyn III 30%

*Therapeutic class:* Nutritional supplement
*Pharmacologic class:* Lipids
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 50 ml (20%), 100 ml (10%, 20%), 200 ml (10%, 20%), 250 ml (20%), 500 ml (10%, 20%, 30%)

## INDICATIONS & DOSAGES

**Black Box Warning** Death in preterm infants after infusion of I.V. fat emulsions have occurred. Adhere strictly to the recommended total daily dose. Hourly I.V. infusion rate should not exceed 1 g/kg in 4 hours. ■

➤ **Adjunct to total parenteral nutrition (TPN) to provide adequate source of calories**

*Adults:* 1 ml/minute I.V. for 15 to 30 minutes (10% emulsion) or 0.5 ml/minute I.V. for 15 to 30 minutes (20% emulsion). If no adverse reactions occur, increase rate to deliver 250 ml (20% Liposyn) or 500 ml (10% Liposyn; 10% or 20% Intralipid) over the first day; don't give more than 2.5 g/kg (10%) or 3 g/kg (20%) daily. For 30% Liposyn III, initial infusion rate is the equivalent of 0.1 g fat/minute for the first 15 to 30 minutes. If no adverse reactions occur, increase infusion rate to equivalent of 0.2 g fat/minute. The admixture shouldn't contain more than 330 ml of Liposyn III 30% on first day of therapy. If patient has no adverse reactions, increase dose the next day. Daily dosage shouldn't exceed 2.5 g of fat/kg of body weight.

*Children:* 0.1 ml/minute for 10 to 15 minutes (10% emulsion) or 0.05 ml/minute I.V. for 10 to 15 minutes (20% emulsion). If no adverse reactions occur, increase rate to deliver 1 g/kg over 4 hours; don't give more than 3 g/kg daily. For 30% Liposyn, initial infusion rate is no more than 0.01 g fat/minute for the first 10 to 15 minutes. If no adverse reactions occur, change rate to permit infusion of 0.1 g fat/kg/hour. Daily dosage shouldn't exceed 3 g of fat/kg of body weight. Fat emulsion supplies 60% of daily caloric intake; protein-carbohydrate TPN should supply remaining 40%.

*Premature infants:* Begin at 0.5 g fat/kg/24 hours (2.5 ml Intralipid 20%, 1.7 ml Liposyn III 30%) and may be increased in relation to the infant's ability to eliminate fat. Maximum recommended dosage is 3 g fat/kg/24 hours.

➤ **Fatty acid deficiency**

*Adults and children:* 8% to 10% of total caloric intake I.V.

## ADMINISTRATION

**I.V.**

▼ Don't use if it separates or becomes oily.

▼ Drug may be mixed in same container with amino acids, dextrose, electrolytes, vitamins, and other nutrients.

▼ Because lipids support bacterial and fungal growth, change all tubing before each infusion, and check infusion site daily.

▼ Use an infusion pump to regulate rate. Rapid infusion may cause fluid or fat overload.

▼ Refrigeration isn't needed unless part of an admixture.

▼ **Incompatibilities:** Acyclovir, albumin, amikacin, aminophylline, amphotericin B, ampicillin sodium, ascorbic acid injection, calcium chloride, calcium gluconate, cyclosporine, dopamine, doxorubicin, doxycycline, droperidol, fluorouracil, ganciclovir, gentamicin, haloperidol, heparin sodium, hydromorphone hydrochloride (HCl), iron dextran, levorphanol tartrate, lorazepam, magnesium chloride, methyldopate HCl, midazolam HCl, minocycline HCl, morphine sulfate, nalbuphine HCl, ondansetron HCl, penicillin G, pentobarbital sodium, phenobarbital sodium, phenytoin sodium, potassium chloride, potassium phosphates, ranitidine HCl, sodium bicarbonate, sodium chloride solution, sodium phosphates, vitamin B complex.

## ACTION

Provides neutral triglycerides, predominantly unsaturated fatty acids; acts as a source of calories and prevents fatty acid deficiency. When substituted for dextrose as a source of calories, fat emulsions decrease carbon dioxide production.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**Early reactions**

**CNS:** headache, sleepiness, dizziness, fever.

**CV:** chest and back pains, flushing.

**EENT:** pressure over eyes.

**GI:** nausea, vomiting.

**Hematologic:** hypercoagulability.

**Respiratory:** dyspnea, cyanosis.

**Skin:** diaphoresis, irritation at infusion site.

**Other:** hypersensitivity reactions.

**Delayed reactions**
**CNS:** ***focal seizures,*** fever.
**Hematologic:** ***thrombocytopenia, leukopenia,*** leukocytosis.
**Hepatic:** hepatomegaly.
**Other:** splenomegaly.

### INTERACTIONS
None significant.

### EFFECTS ON LAB TEST RESULTS
- May increase bilirubin, lipid, and liver enzyme levels.
- May decrease platelet count. May increase or decrease WBC count.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients with severe egg allergies, hyperlipidemia, lipid nephrosis, or acute pancreatitis with hyperlipidemia.
- Use cautiously in patients with severe hepatic or pulmonary disease, anemia, or blood coagulation disorders including thrombocytopenia, and in patients at risk for fat embolism.
- Use cautiously in jaundiced or premature infants.

### NURSING CONSIDERATIONS
- Watch for adverse reactions, especially during first half of infusion.
- Monitor lipid levels closely when patient is receiving fat emulsion therapy. Lipemia must clear between doses.
- Monitor hepatic function carefully in long-term therapy.
- Check platelet count frequently in neonates.

**Black Box Warning** Carefully monitor triglyceride levels and free fatty acids in infants, especially premature and jaundiced infants.

- Available products differ mainly by their fatty acid components.

### PATIENT TEACHING
- Explain need for fat emulsion therapy, and answer any questions.
- Tell patient to report adverse reactions promptly.

## febuxostat
feh-BUCKS-oh-stat

Uloric

*Therapeutic class:* Antigout
*Pharmacologic class:* Xanthine oxidase inhibitor
*Pregnancy risk category C*

### AVAILABLE FORMS
*Tablets:* 40 mg, 80 mg

### INDICATIONS & DOSAGES
➤ **Hyperuricemia associated with gout**
*Adults:* 40 mg P.O. daily. May increase dosage to 80 mg after 2 weeks if uric acid level remains above 6 mg/dl.

### ADMINISTRATION
**P.O.**
- Give drug without regard to food or antacid use.

### ACTION
Reduces uric acid production by inhibiting xanthine oxidase.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 1–1½ hr | Unknown |

*Half-life:* 5 to 8 hours.

### ADVERSE REACTIONS
**GI:** nausea.
**Hepatic:** liver function abnormalities.
**Musculoskeletal:** arthralgia.
**Skin:** rash.

### INTERACTIONS
**Drug-drug.** *Azathioprine, mercaptopurine, theophylline:* May increase levels of these drugs, leading to toxicity. Use together is contraindicated.

### EFFECTS ON LAB TEST RESULTS
- May increase alkaline phosphatase, AST, and ALT levels.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug or its components and in those

taking azathioprine, mercaptopurine, or theophylline.
• Use cautiously in patients with severe hepatic impairment (Child-Pugh Class C) or renal impairment (creatinine clearance less than 30 ml/minute).
• Use during pregnancy only if benefit to the mother outweighs risk to the fetus. It isn't known if drug appears in breast milk; use cautiously in breast-feeding women.
• Safety and efficacy in children haven't been established.

## NURSING CONSIDERATIONS

• Acute gouty attacks may occur during first 6 weeks of therapy; colchicine or another anti-inflammatory may be added prophylactically and drug should be continued.
• Monitor hepatic function at 2 months and 4 months after starting therapy and periodically thereafter.
• Monitor uric acid level.
• Patient taking drug may be at risk for thromboembolic events, such as MI and stroke. Monitor patient closely.

## PATIENT TEACHING

• Warn patient about the risk of gout flares and the importance of taking a nonsteroidal anti-inflammatory drug or colchicine during the first 6 weeks of treatment.
• Instruct women of childbearing age to notify prescriber if pregnant or breast-feeding or planning a pregnancy during therapy.
• Inform patient that drug may increase the risk of MI or stroke. Advise him to report rash, chest pain, dyspnea, or neurologic symptoms of a stroke.

# felodipine

fell-OH-di-peen

Renedil†

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Calcium channel blocker
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets (extended-release):* 2.5 mg, 5 mg, 10 mg

## INDICATIONS & DOSAGES

➤ **Hypertension**

*Adults:* Initially, 5 mg P.O. daily. Adjust dosage based on patient response, usually at intervals not less than 2 weeks. Usual dose is 2.5 to 10 mg daily; maximum dosage is 10 mg daily.
*Elderly patients:* 2.5 mg P.O. daily; adjust dosage as for adults. Maximum dosage is 10 mg daily.
***Adjust-a-dose:*** For patients with impaired hepatic function, 2.5 mg P.O. daily; adjust dosage as for adults. Maximum daily dose is 10 mg.

➤ **Pediatric hypertension**

*Children ages 1 to 17:* 2.5 mg P.O. once daily.

## ADMINISTRATION

**P.O.**
• Give drug whole; don't crush or cut tablets.
• Give drug without food or with a light meal.
• Don't give drug with grapefruit juice.

## ACTION

Unknown. A dihydropyridine-derivative calcium channel blocker that prevents entry of calcium ions into vascular smooth muscle and cardiac cells; shows some selectivity for smooth muscle compared with cardiac muscle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 2–5 hr | 2½–5 hr | 24 hr |

*Half-life:* 11 to 16 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* dizziness, paresthesia, asthenia.
**CV:** *peripheral edema,* chest pain, palpitations, flushing.
**EENT:** rhinorrhea, pharyngitis.
**GI:** abdominal pain, nausea, constipation, diarrhea.
**Musculoskeletal:** muscle cramps, back pain.
**Respiratory:** upper respiratory tract infection, cough.
**Skin:** rash.

## INTERACTIONS

**Drug-drug.** *Anticonvulsants:* May decrease felodipine level. Avoid using together.
*CYP3A4 inhibitors such as azole antifungals, cimetidine, erythromycin:* May decrease clearance of felodipine. Reduce doses of felodipine; monitor patient for toxicity.
*Metoprolol:* May alter pharmacokinetics of metoprolol. Monitor patient for adverse reactions.
*NSAIDs:* May decrease antihypertensive effects. Monitor blood pressure.
*Tacrolimus:* May increase tacrolimus level. Monitor patient closely.
*Theophylline:* May slightly decrease theophylline level. Monitor patient response closely.
**Drug-herb.** *Ma huang:* May decrease antihypertensive effects. Discourage use together.
**Drug-food.** *Grapefruit, lime:* May increase drug level and adverse effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with heart failure, particularly those receiving beta blockers, and in patients with impaired hepatic function.

⚠ *Overdose S&S:* Peripheral vasodilation, hypotension, bradycardia.

## NURSING CONSIDERATIONS

- Monitor blood pressure for response.
- Monitor patient for peripheral edema, which appears to be both dose- and age-related. It's more common in patients taking higher doses, especially those older than age 60.

## PATIENT TEACHING

- Tell patient to swallow tablets whole and not to crush or chew them.
- Tell patient to take drug without food or with a light meal.
- Advise patient not to take drug with grapefruit juice.
- Advise patient to continue taking drug even when he feels better, to watch his diet, and to check with prescriber or pharmacist before taking other drugs, including OTC drugs, nutritional supplements, or herbal remedies.
- Advise patient to observe good oral hygiene and to see a dentist regularly; use of drug may cause mild gum problems.

# fenofibrate

fee-no-FYE-brate

Antara, Fenoglide, Lipofen, TriCor®, Triglide

*Therapeutic class:* Antilipemic
*Pharmacologic class:* Fibric acid derivative
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules (delayed-release):* 45 mg, 135 mg
*Capsules:* 50 mg, 100 mg, 150 mg
*Capsules (micronized):* 43 mg, 67 mg, 130 mg, 134 mg, 200 mg
*Tablets:* 40 mg, 48 mg, 50 mg, 54 mg, 107 mg, 120 mg, 145 mg, 160 mg

## INDICATIONS & DOSAGES

➤ **Hypertriglyceridemia (Fredrickson types IV and V hyperlipidemia) in patients who don't respond adequately to diet alone**

*Adults:* For Antara, initial dose is 43 to 130 mg P.O. daily. Maximum dose, 130 mg daily. For Lipofen, initial dose is 50 to 150 mg daily. Maximum dose, 150 mg daily. For TriCor, initial dose is 48 to 145 mg daily. Maximum dose, 145 mg daily. For Triglide, initial dose is 50 to 160 mg daily. Maximum dose, 160 mg daily. For Fenoglide the initial dose is 40 to 120 mg/day. For all forms, adjust dose based on patient response and repeat lipid determinations every 4 to 8 weeks.

➤ **Primary hypercholesterolemia or mixed dyslipidemia (Fredrickson types IIa and IIb) in patients who don't respond adequately to diet alone**

*Adults:* For Antara, initial dose is 130 mg P.O. daily. For Lipofen, initial dose is

150 mg daily. For TriCor, initial dose is 145 mg daily. For Triglide, initial dose is 160 mg daily. For Fenoglide the initial dose is 120 mg/day. May reduce dose if lipid levels fall significantly below the target range.

➤ **Hyperuricemia ♦**

*Adults:* 200 mg/day (micronized formulation) P.O. for up to 12 months or 100 mg t.i.d. for 6 weeks.

***Adjust-a-dose:*** If creatinine clearance is less than 50 ml/minute or in elderly patients, initially 43 mg daily for Antara, 50 mg daily for Lipofen, 48 mg daily for TriCor, 50 mg daily for Triglide, or 40 mg/day for Fenoglide. Increase only after evaluating effects on renal function and triglyceride level at this dose.

## ADMINISTRATION

**P.O.**

● Give Lipofen capsules with food to enhance absorption; give other preparations without regard for food.

## ACTION

May lower triglyceride levels by inhibiting triglyceride synthesis with less very–low-density lipoproteins released into circulation. Drug may also stimulate breakdown of triglyceride-rich protein.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 6–8 hr | Unknown |

*Half-life:* 20 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness, headache,* asthenia, fatigue, insomnia, localized pain, paresthesia.

**CV:** ***arrhythmias.***

**EENT:** blurred vision, conjunctivitis, earache, eye discomfort, eye floaters, rhinitis, sinusitis.

**GI:** abdominal pain, constipation, diarrhea, dyspepsia, eructation, flatulence, increased appetite, nausea, vomiting.

**GU:** polyuria, vaginitis.

**Musculoskeletal:** arthralgia.

**Respiratory:** cough.

**Skin:** pruritus, rash.

**Other:** *infection,* decreased libido, flulike syndrome, hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Bile-acid sequestrants:* May bind and inhibit absorption of fenofibrate. Give drug 1 hour before or 4 to 6 hours after bile-acid sequestrants.

*Coumarin-type anticoagulants:* May potentiate anticoagulant effect, prolonging PT and INR. Monitor PT and INR closely. May need to reduce anticoagulant dosage.

*Cyclosporine, immunosuppressants, nephrotoxic drugs:* May induce renal dysfunction that may affect fenofibrate elimination. Use together cautiously.

*HMG-CoA reductase inhibitors:* May increase risk of adverse musculoskeletal effects. Avoid using together, unless potential benefit outweighs risk.

**Drug-food.** *Any food:* May increase capsule absorption. Advise patient to take capsule with meals.

**Drug-lifestyle.** *Alcohol use:* May increase triglyceride levels. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

● May increase ALT, AST, BUN, CK, and creatinine levels. May decrease uric acid and hemoglobin levels and hematocrit.

● May decrease WBC count.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug and in those with gallbladder disease, hepatic dysfunction, primary biliary cirrhosis, severe renal dysfunction, or unexplained persistent liver function abnormalities.

● Use cautiously in patients with a history of pancreatitis.

## NURSING CONSIDERATIONS

● Obtain baseline lipid levels and liver function test results before therapy, and monitor liver function periodically during therapy. Stop drug if enzyme levels persist above three times normal.

● Watch for signs and symptoms of pancreatitis, myositis, rhabdomyolysis, cholelithiasis, and renal failure. Monitor patient for muscle pain, tenderness, or weakness, especially with malaise or fever.

● If an adequate response isn't obtained after 2 months of treatment with maximum daily dose, stop therapy.

• Drug lowers uric acid level by increasing uric acid excretion in patients with or without hyperuricemia.
• Beta blockers, estrogens, and thiazide diuretics may increase triglyceride levels; evaluate need for continued use of these drugs.
• Hemoglobin level, hematocrit, and WBC count may decrease when therapy starts but will stabilize with long-term administration.

## PATIENT TEACHING

• Inform patient that drug therapy doesn't reduce need for following a triglyceride-lowering diet.
• Advise patient to promptly report unexplained muscle weakness, pain, or tenderness, especially with malaise or fever.
• Tell patient to take capsules with meals for best drug absorption.
• Advise patient to continue weight control measures, including diet and exercise, and to limit alcohol before therapy.
• Instruct patient who is also taking a bile-acid resin to take fenofibrate 1 hour before or 4 to 6 hours after resin.
• Advise patient about risk of tumor growth.
• Tell breast-feeding women to either stop breast-feeding or stop taking drug.

**SAFETY ALERT!**

# fentanyl citrate

FEN-ta-nil

Onsolis, Sublimaze

# fentanyl transdermal system

Duragesic-12, Duragesic-25, Duragesic-50, Duragesic-75, Duragesic-100

# fentanyl transmucosal

Actiq, Fentora

*Therapeutic class:* Opioid analgesic
*Pharmacologic class:* Opioid agonist
*Pregnancy risk category C*
*Controlled substance schedule II*

## AVAILABLE FORMS

*Injection:* 50 mcg/ml
*Transdermal system:* Patches that release 12.5 mcg, 25 mcg, 50 mcg, 75 mcg, or 100 mcg of drug per hour
*Transmucosal (buccal tablet):* 100 mcg, 200 mcg, 300 mcg, 400 mcg, 600 mcg, 800 mcg, 1,200 mcg
*Transmucosal (lozenge):* 200 mcg, 400 mcg, 600 mcg, 800 mcg, 1,200 mcg, 1,600 mcg

## INDICATIONS & DOSAGES

➤ **Adjunct to general anesthetic**
*Adults:* For low-dose therapy, 2 mcg/kg I.V. For moderate-dose therapy, 2 to 20 mcg/kg I.V.; then 25 to 100 mcg I.V. or I.M. p.r.n. For high-dose therapy, 20 to 50 mcg/kg I.V.; then 25 mcg to one-half initial loading dose I.V. p.r.n.

➤ **Adjunct to regional anesthesia**
*Adults:* 50 to 100 mcg I.M. or slowly I.V. over 1 to 2 minutes p.r.n.

➤ **To induce and maintain anesthesia**
*Children ages 2 to 12:* 2 to 3 mcg/kg I.V.

➤ **Postoperative pain, restlessness, tachypnea, and emergence delirium**
*Adults:* 50 to 100 mcg I.M. every 1 to 2 hours p.r.n.

➤ **Preoperative medication**
*Adults:* 50 to 100 mcg I.M. 30 to 60 minutes before surgery.

➤ **To manage persistent, moderate to severe chronic pain in opioid-tolerant patients who require around-the-clock opioid analgesics for an extended time**
*Adults and children age 2 and older:* When converting to Duragesic, base the first dose on the daily dose, potency, and characteristics of the current opioid therapy; the reliability of the relative potency estimates used to calculate the needed dose; the degree of opioid tolerance; and the patient's condition. Each patch may be worn for 72 hours, although some adult patients may need a patch to be applied every 48 hours during the first dosage period. May increase dose 3 days after the first dose, then every 6 days thereafter.
***Adjust-a-dose:*** For elderly, cachectic, or debilitated patients, start transdermal system doses at no higher than 25 mcg/hr unless these patients are already tolerating around-the-clock opioid at a dose and potency comparable to fentanyl 25 mcg/hr transdermal system.

➤ **To manage breakthrough cancer pain in patients already receiving and tolerating an opioid**

*Adults:* 200 mcg Actiq initially; may give second dose 15 minutes after completing the first (30 minutes after first lozenge placed in mouth). Maximum dose is 2 lozenges per breakthrough episode. If several episodes of breakthrough pain requiring 2 lozenges occur, dose may be increased to the next available strength. After a successful dosage has been reached, patient should limit use to no more than 4 lozenges daily.

Or, initially 100 mcg buccal tablet between the upper cheek and gum. May repeat same dose once per breakthrough episode after at least 30 minutes. Adjust in 100-mcg increments. Doses above 400 mcg can be increased by 200 mcg. Generally, dosage should be increased when patient requires more than one dose per breakthrough episode. Once a successful maintenance dose has been established, reevaluate if patient experiences more than four breakthrough episodes per day.

➤ **Switching from Actiq to Fentora to manage breakthrough cancer pain in opioid-tolerant patients**

*Adults:* If current Actiq dose is 200 to 400 mcg, start with 100 mcg Fentora; if current Actiq dose is 600 to 800 mcg, use 200 mcg Fentora; if current Actiq dose is 1,200 to 1,600 mcg, use 400 mcg Fentora. Actiq and Fentora aren't bioequivalent.

***Adjust-a-dose:*** For patients with renal or hepatic impairment, use lowest possible dose.

## ADMINISTRATION

**I.V.**

▼ Only those trained to give I.V. anesthetics and manage adverse effects should give this form.

▼ Keep opioid antagonist (naloxone) and resuscitation equipment available.

▼ I.V. form often used with droperidol to produce neuroleptanalgesia.

▼ Inject slowly over 1 to 2 minutes.

▼ **Incompatibilities:** Azithromycin, fluorouracil, lidocaine, methohexital, pentobarbital sodium, phenytoin, thiopental.

**I.M.**

● Document administration site.

**Transdermal**

● Dosage equivalent charts are available to calculate the fentanyl transdermal dose based on the daily morphine intake; for example, for every 90 mg of oral morphine or 15 mg of I.M. morphine per 24 hours, 25 mcg/hour of transdermal fentanyl is needed.

● Clip hair at application site but don't use a razor, which may irritate skin. Wash area with clear water, if needed, but not with soaps, oils, lotions, alcohol, or other substances that may irritate skin or prevent adhesion. Dry area completely before application.

● Remove transdermal system from package just before applying, hold in place for 30 seconds, and be sure edges of patch stick to skin.

● Don't cut or otherwise alter transdermal patch before applying.

● Place transdermal patch on the upper back for a child or patient who's cognitively impaired to reduce the chance the patch will be removed and placed in the mouth.

● Heat from fever or heating pads, electric blankets, heat lamps, hot tubs, or water beds may increase transdermal delivery and cause toxicity.

**Transmucosal**

● Remove foil just before giving.

● For Actiq: Place lozenge between patient's cheek and gum and allow to dissolve over about 15 to 20 minutes; it must not be bitten, sucked, or chewed. Lozenge may be moved from one side to the other using the stick. Discard stick in the trash after use or, if any drug matrix remains on the stick, place under hot running tap water until dissolved. Or, place in child-resistant container provided and discard as for schedule II drugs.

● For buccal tablet: Place tablet between patient's cheek and gum and leave there until disintegrated, usually 14 to 25 minutes. Tablet shouldn't be sucked, chewed, or swallowed; this results in lower plasma concentrations. After 30 minutes, if remnants from tablet remain, they may be swallowed with a glass of water.

## ACTION

Unknown. Binds with opioid receptors in the CNS, altering perception of and emotional response to pain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 1–2 min | 3–5 min | 30–60 min |
| I.M. | 7–15 min | 20–30 min | 1–2 hr |
| Transdermal | 12–24 hr | 1–3 days | Variable |
| Transmucosal | 5–15 min | 20–30 min | Unknown |

*Half-life:* 3½ hours after parenteral use; 5 to 15 hours after transmucosal use; 18 hours after transdermal use.

## ADVERSE REACTIONS

**CNS:** *asthenia, clouded sensorium, confusion, euphoria, sedation, somnolence,* ***seizures,*** anxiety, depression, dizziness, hallucinations, headache, nervousness.
**CV:** ***arrhythmias,*** chest pain, hypertension, hypotension.
**EENT:** pharyngitis.
**GI:** *constipation,* abdominal pain, anorexia, diarrhea, dyspepsia, dry mouth, ileus, nausea, vomiting.
**GU:** urine retention.
**Musculoskeletal:** skeletal muscle rigidity (dose-related).
**Respiratory:** ***apnea, hypoventilation, respiratory depression,*** dyspnea, cough.
**Skin:** *diaphoresis, pruritus,* erythema at application site (transdermal).
**Other:** physical dependence.

## INTERACTIONS

**Drug-drug.** *Amiodarone:* May cause hypotension, bradycardia, and decreased cardiac output. Monitor patient closely.
*CNS depressants, general anesthetics, hypnotics, MAO inhibitors, other opioid analgesics, sedatives, tricyclic antidepressants:* May cause additive effects. Use together cautiously. Reduce dosages of these drugs and reduce fentanyl dose by one-fourth to one-third.
*CYP3A4 inducers (carbamazepine, phenytoin, rifampin):* May decrease analgesic effects. Monitor patient for adequate pain relief.
**Black Box Warning** *CYP3A4 inhibitors (such as cyclosporine, itraconazole, ketoconazole):* May increase fentanyl level and cause fatal respiratory depression. Carefully monitor patient and adjust fentanyl dosage as needed. ■
*Diazepam:* May cause CV depression when given with high doses of fentanyl. Monitor patient closely.
*Droperidol:* May cause hypotension and decrease pulmonary arterial pressure. Use together cautiously.
***Protease inhibitors:*** May increase fentanyl levels and adverse effects. Monitor patient closely for respiratory depression.
**Drug-lifestyle.** *Alcohol use:* May cause additive effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase amylase and lipase levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients intolerant to drug.

**Black Box Warning** Transdermal form contraindicated in patients hypersensitive to adhesives, those who are opioid-naive, those who need postoperative pain management, and those with acute, mild, or intermittent pain that can be managed with nonopioids. Don't use in patients with increased intracranial pressure, head injury, impaired consciousness, or coma. ■

**Black Box Warning** Transmucosal forms contraindicated in those who need acute or postoperative pain management. ■

- Fentora contraindicated in patients with mucositis more severe than grade 1.
- Use with caution in patients with brain tumors, COPD, decreased respiratory reserve, potentially compromised respirations, hepatic or renal disease, or cardiac bradyarrhythmias.
- Use with caution in elderly or debilitated patients.

***Overdose S&S:*** CNS depression, respiratory depression, apnea, flaccid skeletal muscles, bradycardia, hypotension, circulatory collapse.

## NURSING CONSIDERATIONS

- For better analgesic effect, give drug before patient has intense pain.

***Alert:*** High doses can produce muscle rigidity, which can be reversed with neuromuscular blockers; however, patient must be artificially ventilated.

• Monitor circulatory and respiratory status and urinary function carefully. Drug may cause respiratory depression, hypotension, urine retention, nausea, vomiting, ileus, or altered level of consciousness, no matter how it's given.
• Periodically monitor postoperative vital signs and bladder function. Because drug decreases both rate and depth of respirations, monitoring of arterial oxygen saturation ($SaO_2$) may help assess respiratory depression. Immediately report respiratory rate below 12 breaths/minute, decreased respiratory volume, or decreased $SaO_2$.
• Drug may cause constipation. Assess bowel function and need for stool softeners and stimulant laxatives.
**Black Box Warning** Fentanyl is an opioid agonist and schedule II controlled substance with potential for abuse. Be alert for signs of misuse, abuse, or diversion. ▮
**Transdermal form**
***Alert:*** Transdermal drug levels peak between 24 and 72 hours after initial application and dose increases. Monitor patients for life-threatening hypoventilation, especially during these times.
• Fentanyl patches should be used only in patients age 2 or older who are opioid-tolerant, who have chronic moderate to severe pain poorly controlled by other drugs, and who need a total daily opioid dose at least equivalent to the 25-mcg/hour fentanyl patch.
• When converting a patient from another opioid, determine the initial fentanyl dosage with great care; overestimating the dosage could be dangerous or fatal.
• Identify all daily drugs, particularly CYP3A4 inhibitors, which may increase fentanyl levels.
• Monitor patients closely, and provide immediate care for evidence of overdose, such as slow or shallow breathing, a slow heartbeat, severe sleepiness, cold and clammy skin, trouble walking and talking, and feeling faint, dizzy, or confused.
• Give patients detailed instructions for using fentanyl patches correctly and safely.
• Make dosage adjustments gradually in patient using the transdermal system. Reaching steady-state level of a new dosage may take up to 6 days; delay dosage adjustment until after at least two applications.
• Monitor patient who develops adverse reactions to the transdermal system for at least 12 hours after removal. Drug level drops gradually and may take as long as 17 hours to decline by 50%.
• Most patients experience good control of pain for 3 days while wearing the transdermal system, but a few may need a new application after 48 hours.
• Because the drug level rises for the first 24 hours after application, analgesic effect can't be evaluated on the first day. Make sure patient has adequate supplemental analgesic to prevent breakthrough pain.
• When reducing opioid therapy or switching to a different analgesic, withdraw the transdermal system gradually. Because the drug level drops gradually after removal, give half the equianalgesic dose of the new analgesic 12 to 18 hours after removal.
**Transmucosal form**
**Black Box Warning** Transmucosal forms are used only to manage breakthrough cancer pain in patients who are already receiving and tolerating opioids. ▮
**Black Box Warning** Transmucosal forms aren't bioequivalent and can't be substituted on a microgram-per-microgram basis. ▮
• ***Look alike–sound alike:*** Don't confuse fentanyl with alfentanil.

## PATIENT TEACHING

• When drug is used for pain control, instruct patient to request drug before pain becomes intense.
***Alert:*** Inform family members only the patient should be activating the Ionsys system for pain control to decrease the risk of fatal respiratory depression.
• When drug is used after surgery, encourage patient to turn, cough, and breathe deeply to prevent lung problems.
• Instruct patient to avoid hazardous activities until CNS effects subside.
• Tell home care patient to avoid drinking alcohol or taking other CNS-type drugs because additive effects can occur.
• Advise patient not to stop drug abruptly.
• Teach patient about proper application of transdermal patch. Tell patient to clip hair at application site but not to use a razor,

which may irritate skin. Wash area with clear water, if needed, but not with soaps, oils, lotions, alcohol, or other substances that may irritate skin or prevent adhesion. Dry area completely before application.
- Tell patient to remove transdermal system from package just before applying, hold in place for 30 seconds, and be sure the edges of patch stick to skin.

***Alert:*** Teach patient not to alter the transdermal patch (such as by cutting it) before applying.
- Advise parent or caregiver to place transdermal patch on the upper back for a child or a patient who's cognitively impaired, to reduce the chance the patch will be removed and placed in the mouth.
- Teach patient to dispose of the transdermal patch by folding it so the adhesive side adheres to itself and then flushing it down the toilet.
- Tell patient that, if another patch is needed after 48 to 72 hours, he should apply it to a different skin site.
- Tell patient that pain relief with the patch may not occur for several hours after the patch is applied. Oral, immediate-release opioids may be needed for initial pain relief.
- Inform patient that heat from fever or environment, such as from heating pads, electric blankets, heat lamps, hot tubs, or water beds, may increase transdermal delivery and cause toxicity requiring dosage adjustment. Instruct patient to notify prescriber if fever occurs or if he'll be spending time in a hot climate.
- Instruct patient that, if he requires an MRI, to inform the facility that he is wearing a transdermal patch.

**Black Box Warning** Warn patient and patient's family that the amount of drug in one transmucosal tablet can be fatal to a child. Keep well secured and out of children's reach. ■

# ferrous fumarate

FAIR-us

Euro-Fer† ◇, Feostat ◇, Ferrate† ◇, Hemocyte ◇, Ircon ◇, Neo-Fer† ◇, Nephro-Fer ◇, Palafer† ◇

*Therapeutic class:* Iron supplement
*Pharmacologic class:* Hematinic
*Pregnancy risk category A*

## AVAILABLE FORMS

Each 100 mg of ferrous fumarate provides 33 mg of elemental iron.
*Tablets:* 90 mg ◇, 200 mg ◇, 300 mg† ◇, 324 mg ◇, 325 mg ◇, 350 mg ◇
*Tablets (chewable):* 100 mg ◇

## INDICATIONS & DOSAGES

➤ **Iron deficiency**

*Adults:* One tablet P.O. daily between meals or as directed by prescriber. Or, 100-mg chewable tablet P.O. once daily to q.i.d.

➤ **As a supplement during pregnancy**

*Women:* 30 mg elemental iron P.O. daily.

## ADMINISTRATION

**P.O.**
- Between-meal doses are preferable. Drug can be given with some foods, although absorption may be decreased.
- Give tablets with juice (preferably orange juice) or water but not with milk or antacids.
- Don't crush tablets.

## ACTION

Provides elemental iron, an essential component in the formation of hemoglobin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 4 days | 7–10 days | 2–4 mo |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**GI:** *nausea*, vomiting, *constipation*, diarrhea, *black stools*, GI irritation.
**Other:** temporarily stained teeth from suspension and drops.

## INTERACTIONS

**Drug-drug.** *Antacids, cholestyramine resin, $H_2$ antagonists, proton pump inhibitors:*

May decrease iron absorption. Separate doses by at least 2 hours.
*Chloramphenicol:* May delay response to iron therapy. Monitor patient.
*Fluoroquinolones, penicillamine, tetracyclines:* May decrease GI absorption of these drugs, possibly causing decreased levels or effect. Separate doses by 2 to 4 hours.
*Levodopa, methyldopa:* May decrease absorption and effectiveness of levodopa and methyldopa. Watch for decreased effect of these drugs.
*L-thyroxine:* May decrease L-thyroxine absorption. Separate doses by at least 2 hours. Monitor thyroid function.
*Mycophenolate mofetil:* May decrease absorption of mycophenolate. Avoid simultaneous administration.
*Penicillamine:* May decrease absorption and effect of penicillamine. Separate doses by 2 hours.
*Vitamin C:* May increase iron absorption. Use together for therapeutic effect.
**Drug-herb.** *Black cohosh, chamomile, feverfew, gossypol, hawthorn, nettle, plantain, St. John's wort:* May decrease iron absorption. Discourage use together.
*Oregano:* May decrease iron absorption. Tell patient to separate ingestion of herb from ingestion of food containing iron or iron supplement by at least 2 hours.
**Drug-food.** *Cereals, cheese, coffee, eggs, milk, tea, whole-grain breads, yogurt:* May decrease iron absorption. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May yield false-positive guaiac test results. May decrease uptake of technetium-99m and interfere with skeletal imaging.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with primary hemochromatosis or hemosiderosis, hemolytic anemia (unless patient also has iron deficiency anemia), peptic ulcer disease, regional enteritis, or ulcerative colitis.
- Contraindicated in those receiving repeated blood transfusions.
- Use cautiously on long-term basis.

***Overdose S&S:*** Lethargy, nausea, vomiting, abdominal pain, tarry stools, weak rapid pulse, hypotension, diminished tissue perfusion, metabolic acidosis, fever, leukocytosis, hyperglycemia, dyspnea, coma, diffuse vascular congestion, pulmonary edema, shock, seizures, anuria, death.

## NURSING CONSIDERATIONS

- GI upset may be related to dose.
- Enteric-coated products reduce GI upset but also reduce amount of iron absorbed.
- Check for constipation; record color and amount of stools.

***Alert:*** Oral iron may turn stools black. Although this unabsorbed iron is harmless, it could mask presence of melena.

- Monitor hemoglobin level, hematocrit, and reticulocyte count during therapy.
- Combination products such as Ferro-Sequels contain stool softeners, which help prevent constipation—a common adverse reaction.

## PATIENT TEACHING

**Black Box Warning** Inform parents that as few as 5 or 6 tablets of a high-potency form can cause fatal poisoning in children. Tell parents to keep all iron-containing products out of the reach of children and to immediately call prescriber or poison control center if an accidental overdose occurs.

- Tell patient to take tablets with juice (preferably orange juice) or water but not with milk or antacids.
- Tell patient to take suspension with straw and place drops at back of throat to avoid staining teeth.
- Caution patient not to crush tablets.
- Advise patient not to substitute one iron salt for another; the amount of elemental iron may vary.
- Advise patient to report constipation and change in stool color or consistency.

# ferrous gluconate

FAIR-us

Fergon ◇, Fertinic†, Novo-ferrogluc† ◇

*Therapeutic class:* Iron supplement
*Pharmacologic class:* Hematinic
*Pregnancy risk category A*

## AVAILABLE FORMS

Each 100 mg of ferrous gluconate provides 11.6 mg of elemental iron.
*Tablets:* 225 mg ◇, 324 mg ◇, 325 mg ◇

## INDICATIONS & DOSAGES

➤ **Iron deficiency**
*Adults:* 100 to 200 mg P.O. elemental iron daily in three divided doses.
*Adolescent boys up to age 18:* 120 mg/day P.O.
*Menstruating adolescent girls ages 12 to 18:* 60 to 120 mg/day P.O.
*Preadolescent school-age children:* 60 mg/kg/day P.O.
*Infants and children:* 3 mg/kg P.O. daily in three divided doses.

➤ **As a supplement during pregnancy**
*Adults:* 15 to 30 mg elemental iron P.O. daily during last two trimesters.

## ADMINISTRATION

**P.O.**
● Between-meal doses are preferable. Drug can be given with some foods, although absorption may be decreased.
● Give tablets with juice (preferably orange juice) or water but not with milk or antacids.

## ACTION

Provides elemental iron, an essential component in the formation of hemoglobin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 4 days | 7–10 days | 2–4 mo |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**GI:** *nausea*, vomiting, *constipation*, diarrhea, *black stools*, GI irritation.

## INTERACTIONS

**Drug-drug.** *Antacids, cholestyramine resin, $H_2$ antagonists, proton pump inhibitors:* May decrease iron absorption. Separate doses by at least 2 hours.
*Chloramphenicol:* Delays response to iron therapy. Monitor patient.
*Fluoroquinolones, penicillamine, tetracyclines:* May decrease GI absorption of these drugs, possibly causing decreased level or effect. Separate doses by 2 to 4 hours.
*Levodopa, methyldopa:* May decrease levodopa and methyldopa absorption and effect. Watch for decreased effect of these drugs.
*L-thyroxine:* May decrease L-thyroxine absorption. Separate doses by at least 2 hours. Monitor thyroid function.
*Mycophenolate mofetil:* May decrease absorption of mycophenolate. Avoid simultaneous administration.
*Penicillamine:* May decrease absorption and effect of penicillamine. Separate doses by 2 hours.
*Vitamin C:* May increase iron absorption. Use together for therapeutic effect.
**Drug-herb.** *Black cohosh, chamomile, feverfew, gossypol, hawthorn, nettle, plantain, St. John's wort:* May decrease iron absorption. Discourage use together.
*Oregano:* May decrease iron absorption. Tell patient to separate ingestion of herb from ingestion of food containing iron or iron supplement by at least 2 hours.
**Drug-food.** *Cereals, cheese, coffee, eggs, milk, tea, whole-grain breads, yogurt:* May decrease iron absorption. Discourage using together.

## EFFECTS ON LAB TEST RESULTS

● May yield false-positive guaiac test results. May decrease uptake of technetium-99m and interfere with skeletal imaging.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients with peptic ulceration, regional enteritis, ulcerative colitis, hemosiderosis, primary hemochromatosis, or hemolytic anemia (unless patient also has iron deficiency anemia) and in those receiving repeated blood transfusions.
● Use cautiously on long-term basis.

***Overdose S&S:*** Lethargy, nausea, vomiting, abdominal pain, tarry stools, weak rapid pulse, hypotension, diminished tissue perfusion, metabolic acidosis, fever, leukocytosis, hyperglycemia, dyspnea, coma, diffuse vascular congestion, pulmonary edema, shock, seizures, anuria, death.

## NURSING CONSIDERATIONS

- GI upset may be related to dose.
- Enteric-coated products reduce GI upset but also reduce amount of iron absorbed.
- Check for constipation; record color and amount of stools.

***Alert:*** Oral iron may turn stools black. Although this unabsorbed iron is harmless, it could mask melena.

- Monitor hemoglobin level, hematocrit, and reticulocyte count during therapy.

## PATIENT TEACHING

- Tell patient to take tablets with juice (preferably orange juice) or water, but not with milk or antacids.
- Caution patient not to substitute one iron salt for another because the amounts of elemental iron vary.
- Advise patient to report constipation and change in stool color or consistency.

# ferrous sulfate

FAIR-us

Feosol ◇*, Fer-Gen-Sol ◇*, Fer-In-Sol ◇*, FeroSul

# ferrous sulfate, dried

Feosol ◇, Feratab ◇, Novo-ferrosulfate† ◇, Slow FE ◇, Slow Release Iron

*Therapeutic class:* Iron supplement
*Pharmacologic class:* Hematinic
*Pregnancy risk category A*

## AVAILABLE FORMS

Each 100 mg of ferrous sulfate provides 20 mg of elemental iron, about 30 mg of elemental iron in ferrous sulfate dried products.
*Caplets (extended-release)* ◇*:* 160 mg (dried)
*Capsules:* 190 mg (dried)
*Drops* ◇*:* 125 mg/ml
*Elixir* ◇*:* 220 mg/5 ml ◇*
*Liquid* ◇*:* 150 mg/5 ml†, 300 mg/5 ml
*Tablets* ◇*:* 195 mg, 200 mg (dried), 300 mg (dried), 325 mg
*Tablets (slow-release)* ◇*:* 160 mg (dried)

## INDICATIONS & DOSAGES

➤ **Iron deficiency**
*Adults:* One tablet P.O. b.i.d. to t.i.d. Or, 5 ml (300 mg) P.O. t.i.d. between meals.
*Children age 12 and older:* 5 ml (300 mg) P.O. t.i.d. between meals.
*Children age 4 and younger:* 0.6 ml (75 mg ferrous sulfate) P.O. daily or as prescribed.

## ADMINISTRATION

**P.O.**

- Between-meal doses are preferable. Drug can be given with some foods, although absorption may be decreased.
- Give tablets with juice (preferably orange juice) or water, but not with milk or antacids.
- Don't crush extended-release form.

## ACTION

Provides elemental iron, an essential component in the formation of hemoglobin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 4 days | 7–10 days | 2–4 mo |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**GI:** *nausea, constipation, black stools,* diarrhea, GI discomfort.
**Other:** temporarily stained teeth from liquid forms.

## INTERACTIONS

**Drug-drug.** *Antacids, cholestyramine resin, $H_2$ antagonists, proton pump inhibitors:* May decrease iron absorption. Separate doses if possible.
*Chloramphenicol:* May delay response to iron therapy. Monitor patient.
*Fluoroquinolones, penicillamine, tetracyclines:* May decrease GI absorption of these drugs, possibly resulting in decreased levels or effect. Separate doses by 2 to 4 hours.

*Levodopa, methyldopa:* May decrease absorption and effect of levodopa and methyldopa. Watch for decreased effect of these drugs.
*L-thyroxine:* May decrease L-thyroxine absorption. Separate doses by at least 2 hours. Monitor thyroid function.
*Mycophenolate mofetil:* May decrease absorption of mycophenolate. Avoid simultaneous administration.
*Penicillamine:* May decrease absorption and effect of penicillamine. Separate doses by 2 hours.
*Vitamin C:* May increase iron absorption. Use together for therapeutic effect.
**Drug-herb.** *Black cohosh, chamomile, feverfew, gossypol, hawthorn, nettle, plantain, St. John's wort:* May decrease iron absorption. Discourage use together.
*Oregano:* May decrease iron absorption. Tell patient to separate ingestion of herb from ingestion of food containing iron or iron supplement by at least 2 hours.
**Drug-food.** *Cereals, cheese, coffee, eggs, milk, tea, whole-grain breads, yogurt:* May decrease iron absorption. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

- May yield false-positive guaiac test results. May decrease uptake of technetium-99m and interfere with skeletal imaging.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with hemosiderosis, primary hemochromatosis, hemolytic anemia (unless patient also has iron deficiency anemia), peptic ulceration, ulcerative colitis, or regional enteritis and in those receiving repeated blood transfusions.
- Use cautiously on long-term basis.

***Overdose S&S:*** Abdominal pain, coma, diminished tissue perfusion, dyspnea, fever, hyperglycemia, hypotension, lethargy, leukocytosis, metabolic acidosis, nausea, tarry stools, vomiting, weak rapid pulse, anuria, seizures, pulmonary edema, shock, diffuse vascular congestion, death.

### NURSING CONSIDERATIONS

- GI upset may be related to dose.
- Enteric-coated products reduce GI upset but also reduce amount of iron absorbed.

***Alert:*** Oral iron may turn stools black. Although this unabsorbed iron is harmless, it could mask melena.
- Monitor hemoglobin level, hematocrit, and reticulocyte count during therapy.
- ***Look alike–sound alike:*** Don't confuse different iron salts; elemental content may vary.

### PATIENT TEACHING

- Tell patient to take tablets with juice (preferably orange juice) or water, but not with milk or antacids.
- Instruct patient not to crush or chew extended-release form.
- Caution patient not to substitute one iron salt for another because amounts of elemental iron vary.
- Advise patient to report constipation and change in stool color or consistency.

## fesoterodine fumarate

fezz-oh-TER-ah-deen

Toviaz

*Therapeutic class:* Antispasmodic
*Pharmacologic class:* Muscarinic receptor antagonist
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets (extended-release):* 4 mg, 8 mg

### INDICATIONS & DOSAGES

➤ **Urge incontinence, urgency, and frequency from overactive bladder**
*Adults:* 4 mg P.O. once daily; increase to 8 mg if needed.
***Adjust-a-dose:*** Don't exceed 4 mg in patients with severe renal insufficiency and in those taking CYP3A4 inhibitors.

### ADMINISTRATION

**P.O.**
- Give drug with or without food.
- Don't divide or crush tablets. Give with water and have patient swallow whole.

### ACTION

Antagonizes muscarinic (M3) receptors, increasing bladder capacity and decreasing unstable detrusor contractions.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 5 hr | Unknown |

*Half-life:* 7 hours.

### ADVERSE REACTIONS
**CNS:** insomnia.
**CV:** peripheral edema.
**EENT:** dry eyes.
**GI:** *dry mouth*, constipation, dyspepsia, nausea, abdominal pain.
**GU:** UTI, dysuria, urine retention.
**Musculoskeletal:** back pain.
**Respiratory:** upper respiratory tract infection, dry throat, cough.
**Skin:** rash.

### INTERACTIONS
**Drug-drug.** *Anticholinergics, antimuscarinics:* May increase risk of anticholinergic effects (such as constipation, blurred vision, urine retention). Use together cautiously.
*Strong CYP3A4 inhibitors (such as clarithromycin, itraconazole, ketoconazole):* May increase fesoterodine concentrations. Avoid use together.
**Drug-lifestyle.** *Alcohol use:* May cause additive CNS depression. Discourage use together.

### EFFECTS ON LAB TEST RESULTS
None known.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients with hypersensitivity to drug or its components and in those with urine retention, gastric retention, or uncontrolled narrow-angle glaucoma.
- Avoid use in patients with severe hepatic impairment.
- Use cautiously in patients with bladder outlet obstruction, decreased GI motility, myasthenia gravis, or controlled narrow-angle glaucoma.
- Use in pregnant women only if benefit to the mother outweighs risk to the fetus. It isn't known if drug appears in breast milk. Women shouldn't breast-feed while taking drug.

***Overdose S&S:*** Confusion, blurred vision, tachycardia, constipation, dry mouth, light-headedness, difficulty starting and continuing urination, urinary incontinence.

### NURSING CONSIDERATIONS
- Give drug without regard to food.
- Monitor patient for urinary symptoms and adverse reactions.

### PATIENT TEACHING
- Warn patient to avoid hot environments because drug may decrease sweating, causing severe heat illness.
- Advise patient to avoid driving, operating machinery, and other dangerous activities until drug's effects are known.
- Tell patient to avoid alcohol as it may cause drowsiness.
- Tell patient to report stomach or intestinal problems, constipation, difficulty emptying the bladder, weak urine stream, glaucoma, kidney or liver problems, or myasthenia gravis.
- Instruct woman of childbearing age to consult prescriber if she's pregnant, trying to become pregnant, or is breast-feeding.
- Tell patient to take drug with water and to swallow tablet whole. Tell him not to chew, crush, or divide tablet.

## fexofenadine hydrochloride
fecks-oh-FEN-a-deen

Allegra🖋, Allegra ODT

*Therapeutic class:* Antihistamine
*Pharmacologic class:* Piperidine
*Pregnancy risk category C*

### AVAILABLE FORMS
*Oral suspension:* 30 mg/5 ml
*Tablets:* 30 mg, 60 mg, 180 mg
*Tablets (orally disintegrating):* 30 mg

### INDICATIONS & DOSAGES
➤ **Seasonal allergic rhinitis**
*Adults and children age 12 and older:* 60 mg P.O. b.i.d. or 180 mg P.O. once daily.
*Children ages 2 to 11:* 30 mg P.O. b.i.d. either as a tablet or 5 ml oral suspension.
➤ **Chronic idiopathic urticaria**
*Adults and children age 12 and older:* 60 mg P.O. b.i.d. or 180 mg P.O. once daily.

*Children ages 2 to 11:* 30 mg P.O. b.i.d. either as a tablet or 5 ml oral suspension.
*Children ages 6 months to younger than 2 years:* 15 mg (2.5 ml) P.O. b.i.d.
***Adjust-a-dose:*** For patients with impaired renal function or a need for dialysis, give adults and children age 12 and older 60 mg daily, children ages 2 to 11, 30 mg daily, and children ages 6 months to 2 years, 15 mg daily.

## ADMINISTRATION

**P.O.**
- Don't give antacid within 2 hours of this drug.
- Give orally disintegrating tablets (ODTs) to patient with an empty stomach. Allow ODT to disintegrate on the patient's tongue; and it may be swallowed with or without water.
- Don't remove ODT from blister package until time of administration.

## ACTION

A long-acting nonsedating antihistamine that selectively inhibits peripheral $H_1$ receptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 3 hr | 14 hr |

*Half-life:* 14½ hours.

## ADVERSE REACTIONS

**CNS:** fatigue, drowsiness, fever, *headache.*
**EENT:** otitis media.
**GI:** nausea, dyspepsia, vomiting.
**GU:** dysmenorrhea.
**Musculoskeletal:** back pain.
**Respiratory:** cough, rhinorrhea, upper respiratory tract infection.
**Other:** viral infection.

## INTERACTIONS

**Drug-drug.** *Aluminum or magnesium antacids:* May decrease fexofenadine level. Separate dosage times.
*Erythromycin, ketoconazole:* May increase fexofenadine level. Monitor patient for side effects.
**Drug-food.** *Apple juice, grapefruit juice, orange juice:* May decrease drug effects. Patients should take drug with liquid other than these juices.
**Drug-lifestyle.** *Alcohol use:* May increase CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May prevent, reduce, or mask positive result in diagnostic skin test.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in patients with impaired renal function.

***Overdose S&S:*** Dizziness, drowsiness, dry mouth.

## NURSING CONSIDERATIONS

- Stop drug 4 days before patient undergoes diagnostic skin tests because drug can prevent, reduce, or mask positive skin test response.
- It's unknown if drug appears in breast milk; use caution when using drug in breast-feeding women.

## PATIENT TEACHING

- Instruct patient or parent not to exceed prescribed dosage and to use drug only when needed.
- Warn patient to avoid alcohol and hazardous activities that require alertness until CNS effects of drug are known. Explain that drug may cause drowsiness.
- Tell patient not to take antacids within 2 hours of this drug.
- Advise patient with dry mouth to try sugarless gum, hard candy, or ice chips.
- Tell parents to keep the oral suspension in a cool, dry place, tightly closed, and to shake well before using.
- Instruct patient to let ODT disintegrate on the tongue then swallow with or without water.
- Tell patient ODT should be taken on an empty stomach.
- Tell patient to keep ODT in original blister package until time of use.

**SAFETY ALERT!**

## filgrastim (G-CSF; granulocyte-colony stimulating factor)

fill-GRASS-tim

Neupogen

*Therapeutic class:* Colony stimulating factor
*Pharmacologic class:* Hematopoietic
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 300 mcg/ml in 1-ml and 1.6-ml vials, 300 mcg/0.5 ml in 0.5-ml and 0.8-ml prefilled syringes

### INDICATIONS & DOSAGES

➤ **To decrease risk of infection in patients with nonmyeloid malignant disease receiving myelosuppressive antineoplastics**

*Adults and children:* 5 mcg/kg daily I.V. (as continuous or intermittent infusion), subcutaneous infusion, or subcutaneously as a single dose given no sooner than 24 hours after cytotoxic chemotherapy. Doses may be increased in increments of 5 mcg/kg for each chemotherapy cycle depending on duration and severity of the nadir of absolute neutrophil count (ANC). Administer daily for up to 2 weeks.

➤ **To decrease risk of infection in patients with nonmyeloid malignant disease receiving myelosuppressive antineoplastics followed by bone marrow transplantation**

*Adults and children:* 10 mcg/kg daily I.V. infusion of 4 or 24 hours or as continuous 24-hour subcutaneous infusion at least 24 hours after cytotoxic chemotherapy and bone marrow infusion. Adjust subsequent dosages based on neutrophil response.

***Adjust-a-dose:*** For patients with ANC over 1,000/$mm^3$ for 3 consecutive days, reduce dosage to 5 mcg/kg daily; if ANC remains over 1,000/$mm^3$ for 3 more consecutive days, stop drug. If ANC decreases to below 1,000/$mm^3$, resume therapy at 5 mcg/kg daily.

➤ **Congenital neutropenia**

*Adults:* 6 mcg/kg subcutaneously b.i.d. Adjust dosage based on patient response.

***Adjust-a-dose:*** For patients with an ANC persistently above 10,000/$mm^3$, reduce dosage, as directed.

➤ **Idiopathic or cyclic neutropenia**

*Adults:* 5 mcg/kg subcutaneously daily. Adjust dosage based on patient response.

➤ **Peripheral blood progenitor cell collection and therapy in cancer patients**

*Adults:* 10 mcg/kg subcutaneously (as bolus or continuous infusion) daily. Give 4 days before leukapheresis and continue until last leukapheresis.

***Adjust-a-dose:*** Patients with WBC count over 100,000/$mm^3$ may need dosage adjustment.

➤ **Neutropenic fever ♦**

*Adults:* 5 mcg/kg subcutaneously daily 24 to 72 hours after administration of myelotoxic chemotherapeutic agents. Continue until ANC is at least 2 to 3 $\times 10^9$/L.

### ADMINISTRATION

**I.V.**

▼ Dilute in 50 to 100 ml of $D_5W$. Dilution to less than 5 mcg/ml isn't recommended.
▼ Don't dilute with normal saline solution.
▼ If drug yield is 5 to 15 mcg/ml, add albumin at 2 mg/ml (0.2%) to minimize binding of drug to plastic containers or tubing.
▼ Give by intermittent infusion over 15 to 60 minutes or by continuous infusion over 24 hours.
▼ **Incompatibilities:** Amphotericin B, cefepime, cefonicid, cefotaxime, cefoxitin, ceftizoxime, ceftriaxone, cefuroxime, clindamycin, dactinomycin, etoposide, fluorouracil, furosemide, heparin sodium, mannitol, methylprednisolone sodium succinate, metronidazole, mitomycin, piperacillin, prochlorperazine edisylate, sodium solutions, thiotepa.

**Subcutaneous**

● Rotate administration sites and record.

### ACTION

Binds cell receptors to stimulate proliferation, differentiation, commitment, and end-cell function of neutrophils.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 5–60 min | 24 hr | 1–7 days |
| Subcut. | 5–60 min | 2–8 hr | 1–7 days |

*Half-life:* 3½ hours.

## ADVERSE REACTIONS

**CNS:** *fever*, headache, weakness, *fatigue.*
**CV:** ***MI, arrhythmias,*** chest pain, hypotension.
**GI:** *nausea*, *vomiting*, *diarrhea*, *mucositis*, stomatitis, constipation.
**Hematologic:** ***thrombocytopenia,*** leukocytosis, **NEUTROPENIC FEVER.**
**Metabolic:** hyperuricemia.
**Musculoskeletal:** *bone pain.*
**Respiratory:** dyspnea, cough.
**Skin:** *alopecia*, rash, cutaneous vasculitis.
**Other:** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Chemotherapeutic drugs:* Rapidly dividing myeloid cells may be sensitive to cytotoxic drugs. Don't use within 24 hours before or after a dose of one of these drugs.
*Lithium:* May potentiate release of neutrophils, causing a greater increase in WBC count than expected. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, creatinine, LDH, and uric acid levels.
- May increase WBC count. May decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components or to proteins derived from *Escherichia coli*.
- Use cautiously in breast-feeding women.

⚠ ***Overdose S&S:*** Excessive leukocytosis.

## NURSING CONSIDERATIONS

- Obtain baseline CBC and platelet count before therapy.
- Once a dose is withdrawn, don't reuse vial. Discard unused portion. Vials are for single-dose use and contain no preservatives.
- Obtain CBC and platelet count two to three times weekly during therapy. Patients who receive drug also may receive high doses of chemotherapy, which may increase risk of toxicities.
- A transiently increased neutrophil count is common 1 or 2 days after therapy starts. Give daily for up to 2 weeks or until ANC has returned to 10,000/mm$^3$ after the expected chemotherapy-induced neutrophil nadir.
- ***Look alike–sound alike:*** Don't confuse Neupogen with Epogen or Neumega.

## PATIENT TEACHING

- If patient will give drug, teach him how to do so and how to dispose of used needles, syringes, drug containers, and unused medicine.

***Alert:*** Rarely, splenic rupture may occur. Advise patient to immediately report upper left abdominal or shoulder tip pain.

- Instruct patient to report persistent or serious adverse reactions promptly.

# finasteride

fin-AS-teh-ride

Propecia, Proscar

*Therapeutic class:* BPH drug
*Pharmacologic class:* 5-alpha-reductase enzyme inhibitor
*Pregnancy risk category X*

## AVAILABLE FORMS

*Tablets:* 1 mg, 5 mg

## INDICATIONS & DOSAGES

➤ **To improve symptoms of BPH and reduce risk of acute urine retention and need for surgery, including transurethral resection of prostate and prostatectomy**
*Men:* 5 mg P.O. Proscar daily.

➤ **With doxazosin, to reduce the risk of BPH symptom progression (Proscar)**
*Men:* 5 mg P.O. daily.

➤ **Male pattern hair loss (androgenetic alopecia) in men only**
*Men:* 1 mg P.O. Propecia daily.

➤ **Women with polycystic ovary syndrome hirsutism ♦**
*Adults:* 2.5 to 5 mg P.O. daily.

➤ **Prostate cancer prevention ♦**
*Men:* 5 mg P.O. once daily for up to 7 years.

### ADMINISTRATION

**P.O.**

- Give drug without regard for food.

***Alert:*** Drug is a potential teratogen. Follow safe handling procedures when preparing, administering, or dispensing drug.

### ACTION

Inhibits conversion of testosterone to dihydrotestosterone (DHT), the androgen primarily responsible for the initial development and subsequent enlargement of the prostate gland. In male pattern baldness, the scalp contains miniaturized hair follicles and increased DHT level; drug decreases scalp DHT level in such cases.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | 24 hr |

*Half-life:* 6 hours; 8 hours in elderly patients.

### ADVERSE REACTIONS

**CNS:** dizziness, asthenia, headache.
**CV:** hypotension, *orthostatic hypotension.*
**GU:** *impotence,* decreased volume of ejaculate, decreased libido.
**Other:** gynecomastia.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

- May decrease prostate-specific antigen (PSA) level.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or to other 5-alpha-reductase inhibitors, such as dutasteride. Although drug isn't used in women or children, manufacturer indicates pregnancy as a contraindication.
- Use cautiously in patients with liver dysfunction.

### NURSING CONSIDERATIONS

- Before therapy, evaluate patient for conditions that mimic BPH, including hypotonic bladder, prostate cancer, infection, or stricture.
- Carefully monitor patients who have a large residual urine volume or severely diminished urine flow.
- Sustained increase in PSA level could indicate noncompliance with therapy.
- A minimum of 6 months of therapy may be needed for treatment of BPH.

### PATIENT TEACHING

- Tell patient that drug may be taken with or without meals.
- Warn woman who is or may become pregnant not to handle crushed tablets because of risk of adverse effects on male fetus.
- Inform patient that signs of improvement may require at least 3 months of daily use when drug is used to treat hair loss or at least 6 months when taken for BPH.
- Reassure patient that drug may decrease volume of ejaculate without impairing normal sexual function.
- Instruct patient to report breast changes, such as lumps, pain, or nipple discharge.

## flecainide acetate

FLEH-kay-nighd

Tambocor

*Therapeutic class:* Antiarrhythmic
*Pharmacologic class:* Benzamide derivative
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 50 mg, 100 mg, 150 mg

### INDICATIONS & DOSAGES

➤ **Prevention of paroxysmal supraventricular tachycardia, including AV nodal reentrant tachycardia and AV reentrant tachycardia or paroxysmal atrial fibrillation or flutter in patients without structural heart disease; life-threatening ventricular arrhythmias such as sustained ventricular tachycardia**

*Adults:* For paroxysmal supraventricular tachycardia, 50 mg P.O. every 12 hours. Increase in increments of 50 mg b.i.d. every 4 days. Maximum dose is 300 mg/day. For life-threatening ventricular arrhythmias, 100 mg P.O. every 12 hours. Increase in increments of 50 mg b.i.d. every 4 days until

desired effect occurs. Maximum dose for most patients is 400 mg/day.
***Adjust-a-dose:*** If creatinine clearance is 35 ml/minute or less, first dose is 100 mg P.O. once daily or 50 mg P.O. b.i.d.

## ADMINISTRATION

**P.O.**
- Give drug exactly as prescribed.
- Give drug without regard for food.

## ACTION

A class IC antiarrhythmic that decreases excitability, conduction velocity, and automaticity by slowing atrial, AV node, His-Purkinje system, and intraventricular conduction; prolongs refractory periods in these tissues.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–3 hr | Unknown |

*Half-life:* 12 to 27 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness, headache, lightheadedness, syncope,* fatigue, fever, tremor, anxiety, insomnia, depression, malaise, paresthesia, ataxia, vertigo, asthenia.
**CV:** ***new or worsened arrhythmias, heart failure, cardiac arrest,*** chest pain, palpitations, edema, flushing.
**EENT:** *blurred vision and other visual disturbances,* eye pain, eye irritation.
**GI:** nausea, constipation, abdominal pain, dyspepsia, vomiting, diarrhea, anorexia.
**Respiratory:** *dyspnea.*
**Skin:** rash.

## INTERACTIONS

**Drug-drug.** *Amiodarone, cimetidine, CYP2D6 inhibitors (clozapine, quinidine):* May increase level of flecainide. Watch for toxicity. In the presence of amiodarone, reduce usual flecainide dose by 50% and monitor the patient for adverse effects.
*Digoxin:* May increase digoxin level by 15% to 25%. Monitor digoxin level.
*Disopyramide, verapamil:* May increase negative inotropic properties. Avoid using together.
*Propranolol, other beta blockers:* May increase flecainide and propranolol levels by 20% to 30%. Watch for propranolol and flecainide toxicity.
***Ritonavir:*** May significantly increase flecainide levels and toxicity. Use together is contraindicated.
*Urine-acidifying and urine-alkalinizing drugs:* May cause extremes of urine pH, which may alter flecainide excretion. Monitor patient for flecainide toxicity or decreased effectiveness.
**Drug-lifestyle.** *Smoking:* May decrease flecainide level. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with second- or third-degree AV block or right bundle-branch block with a left hemiblock (in the absence of an artificial pacemaker), recent MI, or cardiogenic shock, and in patients taking ritonavir.

**Black Box Warning** Patients who received flecainide for atrial fibrillation or flutter had increased risk of ventricular tachycardia and ventricular fibrillation. Its use for these conditions isn't recommended. ■

- Use cautiously in patients with heart failure, cardiomyopathy, severe renal or hepatic disease, prolonged QT interval, sick sinus syndrome, or blood dyscrasia.

## NURSING CONSIDERATIONS

**Black Box Warning** When used to prevent ventricular arrhythmias, reserve drug for patients with documented life-threatening arrhythmias. For patients with sustained ventricular tachycardia, initiate therapy in the hospital and monitor rhythm. ■

**Black Box Warning** Patients treated with flecainide for atrial flutter have a 1:1 atrioventricular conduction due to slowing of the atrial rate. A paradoxical increase in the ventricular rate may occur. Concomitant negative chronotropic therapy with digoxin or beta blockers may lower the risk of this complication. ■

- Check that pacing threshold was determined 1 week before and after starting therapy in a patient with a pacemaker; flecainide can alter endocardial pacing thresholds.

• Correct hypokalemia or hyperkalemia before giving flecainide because these electrolyte disturbances may alter drug's effect.
• Monitor ECG rhythm for proarrhythmic effects.
• Most patients can be adequately maintained on an every-12-hours dosing schedule, but some need to receive flecainide every 8 hours.
• Monitor flecainide level, especially if patient has renal or heart failure. Therapeutic flecainide levels range from 0.2 to 1 mcg/ml. Risk of adverse effects increases when trough blood level exceeds 1 mcg/ml.

### PATIENT TEACHING

• Stress importance of taking drug exactly as prescribed.
• Instruct patient to report adverse reactions promptly and to limit fluid and sodium intake to minimize fluid retention.

## fluconazole

floo-KON-a-zole

Diflucan✐

*Therapeutic class:* Antifungal
*Pharmacologic class:* Bis-triazole derivative
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 200 mg/100 ml, 400 mg/200 ml
*Powder for oral suspension:* 10 mg/ml, 40 mg/ml
*Tablets:* 50 mg, 100 mg, 150 mg, 200 mg

### INDICATIONS & DOSAGES

➤ **Oropharyngeal candidiasis**
*Adults:* 200 mg P.O. or I.V. on first day, then 100 mg once daily for at least 2 weeks.
*Children:* 6 mg/kg P.O. or I.V. on first day, then 3 mg/kg daily for 2 weeks.

➤ **Esophageal candidiasis**
*Adults:* 200 mg P.O. or I.V. on first day, then 100 mg once daily. Up to 400 mg daily has been used, depending on patient's condition and tolerance of treatment. Patients should receive drug for at least 3 weeks and for 2 weeks after symptoms resolve.
*Children:* 6 mg/kg P.O. or I.V. on first day, then 3 mg/kg daily for at least 3 weeks and for at least 2 weeks after symptoms resolve. Maximum daily dose 12 mg/kg.

➤ **Vulvovaginal candidiasis**
*Adults:* 150 mg P.O. for one dose only.

➤ **Systemic candidiasis**
*Adults:* 400 mg P.O. or I.V. on first day, then 200 mg once daily for at least 4 weeks and for 2 weeks after symptoms resolve. Doses up to 400 mg/day may be used.
*Children:* 6 to 12 mg/kg/day P.O. or I.V.

➤ **Cryptococcal meningitis**
*Adults:* 400 mg P.O. or I.V. on first day, then 200 mg once daily for 10 to 12 weeks after CSF culture result is negative. Doses up to 400 mg/day may be used.
*Children:* 12 mg/kg/day P.O. or I.V. on first day, then 6 mg/kg/day for 10 to 12 weeks after CSF culture result is negative.

➤ **To prevent candidiasis in bone marrow transplant and cancer patients**
