*Adults:* 400 mg P.O. or I.V. once daily. Start treatment several days before anticipated agranulocytosis, and continue for 7 days after neutrophil count exceeds 1,000/$mm^3$.

➤ **To suppress relapse of cryptococcal meningitis in patients with AIDS**
*Adults:* 200 mg P.O. or I.V. daily.
*Children:* 6 mg/kg/day P.O. or I.V. once daily.

***Adjust-a-dose:*** If creatinine clearance is less than 50 ml/minute and patient isn't receiving dialysis, reduce dosage by 50%. Patients receiving regular hemodialysis treatment should receive usual dose after each dialysis session.

### ADMINISTRATION

**P.O.**
• Give drug without regard for food.
• Add 24 ml of distilled or purified water to the bottle and shake oral suspension well before giving.

**I.V.**
▼ To ensure product sterility, don't remove protective wrap from I.V. bag until just before use.
▼ The plastic container may show some opacity from moisture absorbed during sterilization. This doesn't affect drug and diminishes over time.

▼ To prevent air embolism, don't connect in series with other infusions.
▼ Use an infusion pump.
▼ Give by continuous infusion at no more than 200 mg/hour.
▼ **Incompatibilities:** Amphotericin B, amphotericin B cholesteryl sulfate complex, ampicillin sodium, calcium gluconate, cefotaxime sodium, ceftazidime, ceftriaxone, cefuroxime sodium, chloramphenicol sodium succinate, clindamycin phosphate, co-trimoxazole, diazepam, digoxin, erythromycin lactobionate, furosemide, haloperidol lactate, hydroxyzine hydrochloride, imipenem and cilastatin sodium, pentamidine, piperacillin sodium, ticarcillin disodium, trimethoprim-sulfamethoxazole. Don't add other drugs to I.V. bag.

## ACTION

Inhibits fungal cytochrome P-450 (responsible for fungal sterol synthesis); weakens fungal cell walls.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | 30 hr |
| I.V. | Immediate | Immediate | Unknown |

*Half-life:* 20 to 50 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* dizziness.
**GI:** nausea, vomiting, abdominal pain, diarrhea, dyspepsia, taste perversion.
**Hematologic:** ***leukopenia, thrombocytopenia.***
**Skin:** rash.
**Other:** ***anaphylaxis.***

## INTERACTIONS

**Drug-drug.** *Alprazolam, chlordiazepoxide, clonazepam, clorazepate, diazepam, estazolam, flurazepam, midazolam, quazepam, triazolam:* May increase and prolong levels of these drugs, CNS depression, and psychomotor impairment. Avoid using together.
*Cimetidine:* May decrease fluconazole level. Monitor patient's response to fluconazole.
*Cyclosporine, phenytoin, theophylline:* May increase levels of these drugs. Monitor cyclosporine, phenytoin, and theophylline levels.
*HMG-CoA reductase inhibitors (atorvastatin, fluvastatin, lovastatin, pravastatin, simvastatin):* May increase levels and adverse effects of these drugs. Avoid using together or reduce dosage of HMG-CoA reductase inhibitor.
*Isoniazid, oral sulfonylureas, phenytoin, rifampin, valproic acid:* May increase hepatic transaminase level. Monitor liver function test results closely.
*Oral sulfonylureas (such as glipizide, glyburide):* May increase levels of these drugs. Monitor patient for enhanced hypoglycemic effect.
*Proton pump inhibitors:* May decrease fluconazole effect. Give fluconazole 2 hours or more before proton pump inhibitors.
*Rifampin:* May enhance fluconazole metabolism. Monitor patient for lack of response to fluconazole.
*Tacrolimus:* May increase tacrolimus level and nephrotoxicity. Monitor patient carefully.
*Warfarin:* May increase risk of bleeding. Monitor PT and INR.
*Zidovudine:* May increase zidovudine activity. Monitor patient closely.
*Zolpidem:* May increase therapeutic effects of zolpidem. Monitor patient closely. A decrease in dosage may be needed.

## EFFECTS ON LAB TEST RESULTS

● May increase alkaline phosphatase, ALT, AST, bilirubin, and GGT levels.
● May decrease platelet and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug and breast-feeding patients.
● Use cautiously in patients hypersensitive to other antifungal azole compounds.
***Overdose S&S:*** Hallucinations, paranoid behavior.

## NURSING CONSIDERATIONS

● Serious hepatotoxicity has occurred in patients with underlying medical conditions.
● If patient develops mild rash, monitor him closely. Stop drug if lesions progress.
● Likelihood of adverse reactions may be greater in HIV-infected patients.

### PATIENT TEACHING

- Tell patient to take drug as directed, even after he feels better.
- Instruct patient to report adverse reactions promptly.

**SAFETY ALERT!**

## fludarabine phosphate

floo-DAR-a-been

Fludara, Oforta

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Purine analogue
*Pregnancy risk category D*

### AVAILABLE FORMS

*Liquid for injection:* 50 mg/2 ml
*Powder for injection:* 50 mg
*Tablets:* 10 mg

### INDICATIONS & DOSAGES

➤ **B-cell chronic lymphocytic leukemia in patients with no or inadequate response to at least one standard alkylating drug regimen**

*Adults:* 25 mg/m$^2$ I.V. daily over 30 minutes for 5 consecutive days. Repeat cycle every 28 days. For oral dosing, give 40 mg/m$^2$ P.O. daily for 5 consecutive days; repeat cycle every 28 days.

***Adjust-a-dose:*** In patients with creatinine clearance of 30 to 70 ml/minute, decrease dose by 20%. Don't use drug in patients with clearance less than 30 ml/minute.

### ADMINISTRATION

**P.O.**

- Give with or without food.
- Don't break or crush tablets; have patient swallow tablets whole with water.

**I.V.**

▼ Preparing and giving parenteral drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.
▼ To prepare, add 2 ml of sterile water for injection to the vial. If using powder for injection, dissolution should occur within 15 seconds.
▼ Each milliliter contains 25 mg of drug.
▼ Dilute further in 100 or 125 ml of $D_5W$ or normal saline solution for injection.
▼ Use within 8 hours of reconstitution.
▼ Store drug in refrigerator at 36° to 46° F (2° to 8° C).
▼ **Incompatibilities:** Acyclovir sodium, amphotericin B, chlorpromazine, daunorubicin, ganciclovir, hydroxyzine hydrochloride, prochlorperazine edisylate.

### ACTION

Unknown. After conversion to its active metabolite, drug interferes with DNA synthesis by inhibiting DNA polymerase alpha, ribonucleotide reductase, and DNA primase.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.V. | Unknown | Unknown | Unknown |

*Half-life:* About 10 hours.

### ADVERSE REACTIONS

**CNS:** *fatigue, malaise, weakness, paresthesia,* peripheral neuropathy, ***stroke,*** headache, sleep disorder, depression, cerebellar syndrome, ***transient ischemic attack,*** agitation, *confusion, fever,* ***coma,*** *pain.*
**CV:** *edema,* angina, phlebitis, ***arrhythmias, heart failure, MI,*** supraventricular tachycardia, ***deep vein thrombosis, aneurysm, hemorrhage.***
**EENT:** *visual disturbances,* hearing loss, delayed blindness, sinusitis, pharyngitis, epistaxis.
**GI:** *nausea, vomiting, diarrhea,* constipation, *anorexia,* stomatitis, ***GI bleeding,*** esophagitis, mucositis.
**GU:** dysuria, *UTI,* urinary hesitancy, proteinuria, hematuria, ***renal failure.***
**Hematologic:** hemolytic anemia, **MYELOSUPPRESSION.**
**Hepatic:** ***liver failure,*** cholelithiasis.
**Metabolic:** hypocalcemia, hyperkalemia, hyperglycemia, dehydration, hyperuricemia, hyperphosphatemia.
**Musculoskeletal:** *myalgia.*
**Respiratory:** *cough, pneumonia, dyspnea, upper respiratory tract infection,* allergic pneumonitis, hemoptysis, hypoxia, bronchitis.
**Skin:** *rash,* pruritus, alopecia, seborrhea, diaphoresis.

**Other:** *chills,* ***tumor lysis syndrome,*** **INFECTION,** ***anaphylaxis.***

## INTERACTIONS

**Drug-drug.** *Cytarabine:* May decrease metabolism of subsequently given fludarabine and inhibition of fludarabine activity. Monitor patient closely.
*Myelosuppressives:* May increase toxicity. Avoid using together, if possible.
**Black Box Warning** *Pentostatin:* May increase risk of pulmonary toxicity, which can be fatal. Avoid using together. ■

## EFFECTS ON LAB TEST RESULTS

- May increase glucose, phosphate, potassium, and uric acid levels.
- May decrease calcium and hemoglobin levels. May decrease platelet, RBC, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those with creatinine clearance less than 30 ml/minute.
- Use cautiously in patients with renal insufficiency.

***Overdose S&S:*** Delayed blindness, coma, thrombocytopenia, neutropenia, death.

## NURSING CONSIDERATIONS

**Black Box Warning** Administer under the supervision of a physician experienced in the use of antineoplastic therapy. ■
**Black Box Warning** Higher than recommended doses are associated with severe neurologic toxicity, including blindness, coma, and death. ■
***Alert:*** Monitor patient closely and expect modified dosage based on toxicity. Most toxic effects are dose dependent. Advanced age, renal insufficiency, and bone marrow impairment may predispose patients to increased or excessive toxicity.
**Black Box Warning** Careful hematologic monitoring is needed, especially of neutrophil and platelet counts. Bone marrow suppression can be severe. ■
**Black Box Warning** Monitor patient for development of hemolytic anemia. ■
- To prevent bleeding, avoid all I.M. injections when platelet count is below 50,000/$mm^3$.
- Give blood transfusions because of cumulative anemia. Patients should be given irradiated blood only, to minimize transfusion-associated graft-versus-host disease.
- Hyperuricemia, hypocalcemia, hyperkalemia, and renal failure may result from rapid lysis of tumor cells. Take preventative measures against tumor lysis syndrome, such as I.V. hydration, alkalinization of urine, and treatment with allopurinol as appropriate.
- Avoid vaccination with live vaccines during and after treatment.
- ***Look alike–sound alike:*** Don't confuse fludarabine with floxuridine, fluorouracil, or flucytosine.

## PATIENT TEACHING

- Instruct patient to watch for signs and symptoms of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell patient to take temperature daily.
- Advise women to consult prescriber before becoming pregnant.
- Caution women to stop breast-feeding during therapy because of risk of toxicity to infant.
- Tell patient not to chew or break tablets but to swallow tablets whole with water.

# fludrocortisone acetate

floo-droe-KOR-ti-sone

*Therapeutic class:* Mineralocorticoid
*Pharmacologic class:* Mineralocorticoid
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 0.1 mg

## INDICATIONS & DOSAGES

➤ **Salt-losing adrenogenital syndrome**
*Adults:* 0.1 to 0.2 mg P.O. daily.
➤ **Addison disease (adrenocortical insufficiency)**
*Adults:* 0.1 mg P.O. daily. Usual dosage range is 0.1 mg three times weekly to 0.2 mg daily. Decrease dosage to 0.05 mg daily if transient hypertension develops as a result of drug therapy.

➤ **Orthostatic hypotension ♦**
*Adults:* 0.1 to 0.4 mg P.O. daily in patients with diabetes; 0.05 to 0.2 mg daily in patients with orthostatic hypotension as a result of levodopa therapy.

## ADMINISTRATION

**P.O.**
- Continually monitor patients for signs that dosage adjustment is needed, such as remissions or exacerbations of the disease, and stress (surgery, infection, trauma).
- Store at room temperature and avoid excessive heat.

## ACTION

Increases sodium resorption and potassium and hydrogen secretion at the distal convoluted tubules of nephrons.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Variable | 2 hr | 1–2 days |

*Half-life:* 18 to 36 hours (biological).

## ADVERSE REACTIONS

**CNS:** ***convulsions, increased intracranial pressure with papilledema (pseudotumor cerebri),*** vertigo, headache, severe mental disturbances, insomnia.
**CV:** ***heart failure,*** hypertension, cardiac hypertrophy, edema, syncope.
**EENT:** cataracts, glaucoma, increased intraocular pressure, exophthalmos.
**GI:** ***peptic ulcer with possible perforation and hemorrhage, pancreatitis,*** abdominal distension, ulcerative esophagitis.
**Hematologic:** bruising.
**Metabolic:** *sodium and water retention,* hypokalemia, hyperglycemia.
**Musculoskeletal:** muscle weakness.
**Skin:** diaphoresis, urticaria, allergic rash, impaired wound healing, acne.
**Other:** ***anaphylaxis.***

## INTERACTIONS

**Drug-drug.** *Anabolic steroids, estrogen:* May increase fludrocortisone levels. Monitor patient for adverse effects and increased edema.
*Barbiturates, carbamazepine, fosphenytoin, phenytoin, rifampin:* May increase clearance of fludrocortisone acetate. Monitor patient for possible diminished effect of corticosteroid. Corticosteroid dosage may need to be increased.
*Digoxin:* May increase the risk of digoxin toxicity associated with hypokalemia. Monitor potassium and digoxin levels.
*Potassium-depleting drugs such as amphotericin B, thiazide diuretics:* May enhance potassium-wasting effects of fludrocortisone. Monitor potassium level. Use potassium supplements as needed.
*Salicylates:* May decrease salicylate effectiveness. Coadministration also may increase the ulcerogenic effects of each. Monitor patient for decreased effect and for ulcers.
**Drug-food.** *Sodium-containing drugs or foods:* May increase blood pressure. Advise patient of need for sodium intake adjustment.

## EFFECTS ON LAB TEST RESULTS

- May decrease potassium level.
- May affect the nitroblue tetrazolium test for bacterial infection and produce false-negative results.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with systemic fungal infections.
- Use cautiously in patients with hypothyroidism, recent MI, cirrhosis, ocular herpes simplex, emotional instability, psychotic tendencies, diverticulitis, fresh intestinal anastomoses, active or latent peptic ulcer, renal insufficiency, hypertension, osteoporosis, myasthenia gravis, active hepatitis, active tuberculosis, or nonspecific ulcerative colitis. Also use cautiously in breast-feeding women.
- Patients shouldn't be vaccinated against smallpox while taking drug.

***Overdose S&S:*** Hypertension, edema, hypokalemia, excessive weight gain, increased heart size.

## NURSING CONSIDERATIONS

- Drug is used with cortisone or hydrocortisone in adrenal insufficiency.
- Perform glucose tolerance tests only if needed because addisonian patients tend to develop severe hypoglycemia within 3 hours of the test.

***Alert:*** Monitor patient's blood pressure and electrolyte levels. If hypertension occurs, notify prescriber and expect dosage to be decreased by 50%.
- Weigh patient daily; notify prescriber about sudden weight gain.
- Unless contraindicated, give low-sodium diet that's high in potassium and protein. Potassium supplements may be needed.
- Drug may cause adverse effects similar to those of glucocorticoids.

## PATIENT TEACHING

- Tell patient to notify prescriber if low blood pressure, weakness, cramping, or palpitations worsen, or if changes in mental status occur.
- Warn patient that mild swelling is common.
- Caution patient to avoid exposure to infections (such as chickenpox or measles) and to notify prescriber if such exposure occurs.

# flumazenil

floo-MAZ-eh-nill

Romazicon

*Therapeutic class:* Antidote
*Pharmacologic class:* Benzodiazepine antagonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 0.1 mg/ml in 5-ml and 10-ml multiple-dose vials

## INDICATIONS & DOSAGES

➤ **Complete or partial reversal of sedative effects of benzodiazepines after anesthesia or conscious sedation**

*Adults:* Initially, 0.2 mg I.V. over 15 seconds. If patient doesn't reach desired level of consciousness after 45 seconds, repeat dose. Repeat at 1-minute intervals, if needed, until cumulative dose of 1 mg has been given (first dose plus four more doses). Most patients respond after 0.6 to 1 mg of drug. In case of resedation, dosage may be repeated after 20 minutes, but never give more than 1 mg at any one time or exceed 3 mg in any 1 hour.

*Children age 1 year and older:* 0.01 mg/kg (up to 0.2 mg) I.V. over 15 seconds. If patient doesn't reach desired level of consciousness after 45 seconds, repeat dose. Repeat at 1-minute intervals, if needed, until cumulative dose of 0.05 mg/kg or 1 mg, whichever is lower, has been given (first dose plus four more doses).

➤ **Suspected benzodiazepine overdose**

*Adults:* Initially, 0.2 mg I.V. over 30 seconds. If patient doesn't reach desired level of consciousness after 30 seconds, give 0.3 mg over 30 seconds. If patient still doesn't respond adequately, give 0.5 mg over 30 seconds. Repeat 0.5-mg doses, as needed, at 1-minute intervals until cumulative dose of 3 mg has been given. Most patients with benzodiazepine overdose respond to cumulative doses between 1 and 3 mg; rarely, patients who respond partially after 3 mg may need additional doses, up to 5 mg total. If patient doesn't respond in 5 minutes after receiving 5 mg, sedation is unlikely to be caused by benzodiazepines. In case of resedation, dosage may be repeated after 20 minutes, but never give more than 1 mg at any one time or exceed 3 mg in any 1 hour.

## ADMINISTRATION

**I.V.**
- ▼ Store drug in vial until use.
- ▼ Make sure airway is secure and patent.
- ▼ Compatible solutions include $D_5W$, lactated Ringer's injection, and normal saline solution.
- ▼ To minimize pain at injection site, inject drug over 15 to 30 seconds into large vein through free-flowing solution.
- ▼ Monitor patient for signs of extravasation.
- ▼ Drug is stable in a syringe for 24 hours.
- ▼ **Incompatibilities:** None reported.

## ACTION

Competitively inhibits the actions of benzodiazepines on the GABA-benzodiazepine receptor complex.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 1–2 min | 6–10 min | Variable |

*Half-life:* 54 minutes.

## ADVERSE REACTIONS

**CNS:** *dizziness, abnormal or blurred vision, headache,* ***seizures,*** agitation, emotional lability, tremor, insomnia.
**CV:** ***arrhythmias,*** cutaneous vasodilation, palpitations.
**GI:** *nausea, vomiting.*
**Respiratory:** dyspnea, hyperventilation.
**Skin:** *diaphoresis.*
**Other:** *pain at injection site.*

## INTERACTIONS

**Drug-drug.** *Antidepressants, drugs that may cause seizures or arrhythmias:* May increase risk of seizures or arrhythmias. Don't use flumazenil when overdose involves more than one drug, especially when seizures (from any cause) are likely.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to flumazenil or benzodiazepines, in those with evidence of serious tricyclic antidepressant overdose, and in those who have received benzodiazepines to treat a potentially life-threatening condition, such as status epilepticus.
• Use cautiously in patients with head injury, psychiatric disorders, or alcohol dependence.
• Use cautiously in patients at high risk for developing seizures and in those who have recently received multiple doses of a parenteral benzodiazepine, who display signs of seizure activity, or who may be at risk for benzodiazepine dependence, such as intensive care unit patients.
⚠ ***Overdose S&S:*** Anxiety, agitation, increased muscle tone, hyperesthesia, seizures.

## NURSING CONSIDERATIONS

• Monitor patient closely for resedation that may occur after reversal of benzodiazepine effects; drug's duration of action is the shortest of all benzodiazepines. Length of monitoring period depends on specific drug being reversed. Monitor patient closely after doses of long-acting benzodiazepines, such as diazepam, or after high doses of short-acting benzodiazepines, such as 10 mg of midazolam. In most cases, severe resedation is unlikely in patients who fail to show signs of resedation 2 hours after a 1-mg dose.
**Black Box Warning** Monitor patients for seizures, especially those who have been on benzodiazepines for long-term sedation or in overdose cases where patients are showing signs of serious cyclic antidepressant overdose. ■

## PATIENT TEACHING

• Warn patient not to perform hazardous activities within 24 hours of procedure because of resedation risk.
• Tell patient to avoid alcohol, CNS depressants, and OTC drugs for 24 hours.
• Give family necessary instructions or provide patient with written instructions. Patient won't recall information given after the procedure; drug doesn't reverse amnesic effects of benzodiazepines.

# flunisolide (inhalation)

floo-NISS-oh-lide

Nasarel, Rhinalar†

# flunisolide hemihydrate

AeroSpan HFA

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Glucocorticoid
*Pregnancy risk category C*

## AVAILABLE FORMS

**flunisolide**
*Nasal solution:* 25 mcg/metered spray
**flunisolide hemihydrate**
*Oral inhalant in a hydrofluoroalkane (HFA) inhaler:* 80 mcg/metered dose

## INDICATIONS & DOSAGES

➤ **Chronic asthma**
*Adults and children age 12 and older:* 2 inhalations (160 mcg) with HFA inhaler b.i.d. Don't exceed 320 mcg twice daily.
*Children ages 6 to 11:* 1 inhalation (80 mcg) with HFA inhaler b.i.d. Don't exceed 160 mcg twice daily.

➤ **Seasonal or perennial rhinitis**
*Adults and adolescents older than age 14:* 2 sprays (50 mcg) in each nostril b.i.d. May be increased to t.i.d., as needed. Maximum dose is 8 sprays in each nostril daily (400 mcg).
*Children ages 6 to 14:* 1 spray (25 mcg) in each nostril t.i.d. or 2 sprays (50 mcg) in each nostril b.i.d. Maximum dose is 4 sprays in each nostril daily (200 mcg).

## ADMINISTRATION

**Inhalational**
- For best results, the canister should be at room temperature before use.
- Allow 1 minute between doses.

**Intranasal**
- Before the first use, prime the nasal spray by pushing down on the pump 5 or 6 times until a fine mist appears.

## ACTION

A corticosteroid that may decrease inflammation of asthma by inhibiting macrophages, T-cells, eosinophils, and mediators such as leukotrienes, while reducing the number of mast cells within the airway.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Inhalation (nasal) | < 3 wk | Unknown | Unknown |
| Inhalation (oral) | 1–4 wk | Unknown | Unknown |

*Half-life:* About 1¾ hours.

## ADVERSE REACTIONS

**CNS:** *headache,* dizziness, fever, irritability, nervousness.
**CV:** chest pain, edema, palpitations.
**EENT:** *nasal congestion, sore throat,* altered taste, hoarseness, nasal burning or stinging, nasal irritation, nasopharyngeal fungal infections, throat irritation.
**GI:** *diarrhea, nausea, unpleasant taste, upset stomach, vomiting,* abdominal pain, decreased appetite, dry mouth.
**Respiratory:** *cold symptoms, upper respiratory tract infection.*
**Skin:** pruritus, rash.
**Other:** *influenza.*

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with status asthmaticus or respiratory tract infections.
- Drug isn't recommended in patients with nonasthmatic bronchial diseases or with asthma controlled by bronchodilator or other noncorticosteroid alone.

## NURSING CONSIDERATIONS

**Black Box Warning** All patients with asthma should have routine tests of adrenal cortical function, including measurement of early morning resting cortisol levels to establish a baseline in the event of an emergency. ■

**Black Box Warning** There is an increased risk of death due to adrenal insufficiency in patients transferred from systematically active corticosteriods to flunisolide inhaler. Monitor patient carefully. ■

**Black Box Warning** Withdraw drug slowly in patients who have received long-term oral corticosteroid therapy. ■

**Black Box Warning** After withdrawing systemic corticosteroids, patient may need supplemental systemic corticosteroids if stress (trauma, surgery, or infection) causes adrenal insufficiency. ■

- Store drug at room temperature.
- ***Look alike–sound alike:*** Don't confuse flunisolide with fluocinonide.
- Stop nasal spray after 3 weeks if symptoms don't improve.

## PATIENT TEACHING

**Oral inhalant**
- Warn patient that drug doesn't relieve acute asthma attacks.

***Alert:*** Instruct patient to immediately contact prescriber if asthma episodes unresponsive to bronchodilators occur during treatment.
- Advise patient to ensure delivery of proper dose by gently warming the canister to room temperature before using. Some patients carry the canister in a pocket to keep it warm.

- Tell patient who also uses a bronchodilator to use it several minutes before beginning flunisolide treatment.
- Instruct patient to begin inhaling immediately before activating the canister to get the full dose.
- Instruct patient to allow 1 minute to elapse before repeating inhalations and to hold his breath for a few seconds to enhance drug action.
- Teach patient to keep inhaler clean and unobstructed. The HFA inhaler doesn't need cleaning during normal use.
- Teach patient to check mucous membranes frequently for signs and symptoms of fungal infection.
- Advise patient to prevent oral fungal infections by gargling or rinsing mouth with water after each inhaler use. Caution him not to swallow the water.
- Warn patient to avoid exposure to chickenpox or measles. If exposed, contact prescriber immediately.
- Advise parents of a child receiving long-term therapy that the child should have periodic growth measurements and be checked for evidence of hypothalamic-pituitary-adrenal axis suppression.

**Nasal spray**

- Tell patient to prime the nasal inhaler (5 to 6 sprays) before first use and after long periods of no use.
- Advise patient to clear nasal passageways before use.
- Patient should follow manufacturer's instructions for use and cleaning. Tell him to discard open containers after 3 months.
- Advise patient that therapeutic results may take several weeks.

## flunisolide (intranasal)

floo-NISS-oh-lide

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Corticosteroid
*Pregnancy risk category C*

### AVAILABLE FORMS

*Nasal spray:* 25 mcg/spray, 29 mcg/spray

### INDICATIONS & DOSAGES

**➤ Symptoms of seasonal or perennial rhinitis**

*Adults and children age 15 and older:* Starting dose is 2 sprays in each nostril b.i.d. If needed, dosage may be increased to 2 sprays in each nostril t.i.d. Maximum total daily dose is 8 sprays in each nostril per day.
*Children ages 6 to 14:* Starting dose is 1 spray in each nostril t.i.d. or 2 sprays in each nostril b.i.d. Maximum total daily dose is 4 sprays in each nostril per day.

F

### ADMINISTRATION

**Intranasal**

- Shake well before each use.
- Before first use, prime the nasal spray by pushing down on the pump five or six times until a fine mist appears. If the pump hasn't been used for 5 days or more, the spray must be primed again.

### ACTION

Exact mechanism unknown. Decreases nasal inflammation, mainly by stabilizing leukocyte lysosomal membranes.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Intranasal | Unknown | Unknown | Unknown |

*Half-life:* 1 to 2 hours.

### ADVERSE REACTIONS

**CNS:** dizziness, headache.
**EENT:** *mild, transient nasal burning and stinging,* epistaxis, nasal dryness, nasal congestion, pharyngitis, sneezing, watery eyes.
**GI:** nausea, vomiting.
**Respiratory:** cough.
**Other:** *aftertaste,* hypersensitivity reaction, loss of taste and smell.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with untreated localized infection involving nasal mucosa.

● Use cautiously, if at all, in patients with active or quiescent respiratory tract tuberculous infections or untreated fungal, bacterial, or systemic viral or ocular herpes simplex infections.
● Use cautiously in patients who have recently had nasal septal ulcers, nasal surgery, or nasal trauma.

### NURSING CONSIDERATIONS
● Drug isn't effective for acute exacerbations of rhinitis. Decongestants or antihistamines may be needed.
● ***Look alike–sound alike:*** Don't confuse flunisolide with fluocinonide, fluticasone, or Flumadine.

### PATIENT TEACHING
● Tell patient to avoid exposure to chickenpox or measles.
● Advise patient or parent to read package instructions for drug use.
● Instruct patient to shake container before use, blow nose to clear nasal passages, tilt head slightly forward, and insert nozzle into nostril, pointing away from septum. Tell him to hold other nostril closed and inhale gently while spraying. Have him repeat procedure in other nostril. Tell him to clean nosepiece with warm water daily.
● Explain that drug doesn't work right away. Most patients notice improvement within a few days, but some may need 2 to 3 weeks.
● Advise patient to use drug regularly, as prescribed.
● Warn patient not to exceed recommended dosage to avoid hypothalamic-pituitary-adrenal axis suppression.
● Tell patient to stop drug and notify prescriber if signs and symptoms don't diminish in 3 weeks or if nasal irritation persists.

## fluocinolone acetonide
floo-oh-SIN-oh-lone

Capex, Derma-Smoothe/FS, Synalar

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Corticosteroid
*Pregnancy risk category C*

### AVAILABLE FORMS
*Cream:* 0.01%, 0.025%
*Oil:* 0.01%
*Ointment:* 0.025%
*Shampoo:* 0.01%
*Topical solution:* 0.01%

### INDICATIONS & DOSAGES
➤ **Inflammation from corticosteroid-responsive dermatoses**
*Adults and children:* Clean area; apply product sparingly t.i.d. to q.i.d.
➤ **Atopic dermatitis**
*Adults:* Apply thin film of topical oil t.i.d.
*Children 3 months and older:* Apply thin film of topical oil b.i.d. for maximum of 4 weeks. Avoid face and diaper area.
➤ **Scalp psoriasis**
*Adults:* Wet or dampen hair and scalp thoroughly. Apply a thin film of topical oil and massage into scalp. Cover with supplied shower cap overnight or for a minimum of 4 hours before washing thoroughly with regular shampoo and then rinsing thoroughly with water.
➤ **Seborrheic dermatitis of the scalp**
*Adults:* Apply no more than 30 ml of 0.01% shampoo to the scalp once daily, lather, and rinse thoroughly with water after 5 minutes.

### ADMINISTRATION
**Topical**
● Gently wash skin before applying. To prevent skin damage, rub in gently, leaving a thin coat. When treating hairy sites, part hair and apply directly to lesions.
● Avoid application near eyes or mucous membranes; in armpits, groin, or rectal area; or in ear canal if eardrum is perforated.
● Do not use occlusive dressing unless ordered.

• For patients with eczematous dermatitis whose skin may be irritated by adhesive material, hold dressing in place with gauze, elastic bandages, stockings, or stockinette.
• Change dressing as prescribed. Stop drug and notify prescriber if skin infection, striae, or atrophy occur.
• Shake shampoo well prior to use.

## ACTION

Unclear. Is diffused across cell membranes to form complexes with receptors. Shows anti-inflammatory, antipruritic, vasoconstrictive, and antiproliferative activity. Considered a medium-potency to low-potency drug, according to vasoconstrictive properties.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**GU:** glycosuria.
**Metabolic:** hyperglycemia.
**Skin:** burning, pruritus, irritation, dryness, erythema, folliculitis, hypertrichosis, hypopigmentation, acneiform eruptions, perioral dermatitis, allergic contact dermatitis, *maceration, secondary infection, atrophy, striae, miliaria with occlusive dressings.*
**Other:** ***hypothalamic-pituitary-adrenal axis suppression,*** Cushing syndrome.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

• May increase glucose level.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components.
• Don't use as monotherapy in primary bacterial infections (impetigo, paronychia, erysipelas, cellulitis, angular cheilitis), treatment of rosacea, perioral dermatitis, or acne.
• Drug isn't for ophthalmic use.
• Use cautiously in patients with peanut sensitivity.
• Use cautiously in pregnant or breast-feeding women.
***Overdose S&S:*** Systemic effects.

## NURSING CONSIDERATIONS

• If an occlusive dressing has been applied and a fever develops, notify prescriber and remove dressing.
• If antifungal or antibiotic combined with corticosteroid fails to provide prompt improvement, stop corticosteroid until infection is controlled.
• Systemic absorption is likely with use of occlusive dressings, prolonged treatment, or extensive body surface treatment. Watch for symptoms, such as hyperglycemia, glycosuria, hypothalamic-pituitary-adrenal axis suppression, or Cushing syndrome.
• Avoid using plastic pants or tight-fitting diapers on treated areas in young children. Children may absorb larger amounts of drug and be more susceptible to systemic toxicity.
***Alert:*** Body oil and scalp oil formulations contain peanut oil.
• ***Look alike–sound alike:*** Don't confuse fluocinolone with fluocinonide or fluticasone.

## PATIENT TEACHING

• Teach patient or family how to apply drug using gloves or sterile applicator.
• Tell patient to wash hands after application.
• If an occlusive dressing is used, advise patient to leave it in place for no longer than 12 hours each day and not to use dressing on infected or weeping lesions.
• Tell patient to stop using solution and notify prescriber if he develops signs of systemic absorption, skin irritation or ulceration, hypersensitivity, or infection.
• Advise patient using the shampoo not to bandage, cover, or wrap the treated scalp area unless directed.

# fluocinonide

floo-oh-SIN-oh-nide

Lidex, Lidex-E, Vanos

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Corticosteroid
*Pregnancy risk category C*

## AVAILABLE FORMS

*Cream:* 0.05%, 0.1%
*Gel:* 0.05%

*Ointment:* 0.05%
*Topical solution:* 0.05%

## INDICATIONS & DOSAGES

➤ **Inflammation from corticosteroid-responsive dermatoses**

*Adults and children:* Clean area; apply cream, gel, ointment, or topical solution sparingly b.i.d. to q.i.d. In children, use lowest dosage that promotes healing. If using Vanos 0.1% cream in adults and children age 12 and older, apply a thin layer once or twice daily for up to 2 weeks. Don't use more than 60 g/week.

## ADMINISTRATION

**Topical**

- Gently wash skin before applying. To prevent skin damage, rub in gently, leaving a thin coat. When treating hairy sites, part hair and apply directly to lesion.
- Avoid applying near eyes or mucous membranes or in ear canal.
- Occlusive dressings may be used in severe or resistant dermatoses.
- For patients with eczematous dermatitis whose skin may be irritated by adhesive material, hold dressing in place with gauze, elastic bandages, stockings, or stockinette.
- Change dressing as prescribed. Stop drug and notify prescriber if skin infection, striae, or atrophy occur.
- Continue treatment for a few days after lesions clear.

## ACTION

Unclear. Diffuses across cell membranes to form complexes with cytoplasmic receptors, showing anti-inflammatory, antipruritic, vasoconstrictive, and antiproliferative activity. Considered a high-potency drug, according to vasoconstrictive properties.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**GU:** glycosuria.
**Metabolic:** hyperglycemia.
**Skin:** burning, pruritus, irritation, dryness, erythema, folliculitis, hypertrichosis, hypopigmentation, acneiform eruptions, perioral dermatitis, allergic contact dermatitis, *maceration, secondary infection, atrophy, striae, miliaria with occlusive dressings.*
**Other:** ***hypothalamic-pituitary-adrenal axis suppression,*** Cushing syndrome.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

- May increase glucose level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Don't use as monotherapy in primary bacterial infections (impetigo, paronychia, erysipelas, cellulitis, angular cheilitis), treatment of rosacea, perioral dermatitis, or acne.
- Don't use very-high-potency or high-potency agents on the face, groin, or armpits.
- Drug isn't for ophthalmic use.
- Use cautiously in pregnant or breast-feeding women.

⚠ ***Overdose S&S:*** Systemic effects.

## NURSING CONSIDERATIONS

- If an occlusive dressing has been applied and a fever develops, notify prescriber and remove dressing.
- If antifungal or antibiotic combined with corticosteroid fails to provide prompt improvement, stop corticosteroid until infection is controlled.
- Systemic absorption is likely with use of occlusive dressings, prolonged treatment, or extensive body surface treatment. Watch for such symptoms as hyperglycemia, glycosuria, and hypothalamic-pituitary-adrenal axis suppression.
- Avoid using plastic pants or tight-fitting diapers on treated areas in young children. Children may absorb larger amounts of drug and be more susceptible to systemic toxicity.
- ***Look alike–sound alike:*** Don't confuse fluocinonide with fluocinolone or fluticasone.

## PATIENT TEACHING

- Teach patient and family how to apply drug using careful hand washing and gloves or sterile applicator.

- If an occlusive dressing is ordered, advise patient to leave it in place no more than 12 hours each day and not to use the dressing on infected or weeping lesions.
- Tell patient to stop drug and report signs of systemic absorption, skin irritation or ulceration, hypersensitivity, or infection.

## fluorometholone

flur-oh-METH-oh-lone

FML, FML Forte, FML S.O.P.

## fluorometholone acetate

Flarex

*Therapeutic class:* Anti-inflammatory (ophthalmic)
*Pharmacologic class:* Corticosteroid
*Pregnancy risk category C*

### AVAILABLE FORMS

**fluorometholone**
*Ophthalmic ointment:* 0.1%
*Ophthalmic suspension:* 0.1%, 0.25%
**fluorometholone acetate**
*Ophthalmic suspension:* 0.1%

### INDICATIONS & DOSAGES

➤ **Inflammatory and allergic conditions of cornea, conjunctiva, sclera, anterior uvea**

*Adults and children older than age 2 (acetate form not for use in children of any age):* 1 drop b.i.d. to q.i.d. or ½ inch ointment one to three times daily. For first 24 to 48 hours, may increase dosing frequency to every 4 hours. For fluorometholone acetate, 1 to 2 drops q.i.d.; may give 2 drops every 2 hours during the initial 24 to 48 hours of treatment.

### ADMINISTRATION

**Ophthalmic**

- Shake suspension well before use.
- Apply light finger pressure on lacrimal sac for 1 minute after instillation.
- Wait at least 10 minutes before giving any other eye preparations.

### ACTION

Suppresses edema, fibrin deposition, capillary dilation, leukocyte migration, capillary proliferation, and collagen deposition.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**EENT:** increased intraocular pressure (IOP), thinning of cornea, interference with corneal wound healing, corneal ulceration, increased susceptibility to viral or fungal corneal infections, glaucoma worsening, discharge, discomfort, ocular pain, foreign body sensation, cataracts, decreased visual acuity, diminished visual field, optic nerve damage with excessive or long-term use.
**Other:** systemic effects, adrenal suppression with excessive or long-term use.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with vaccinia, varicella, acute superficial herpes simplex (dendritic keratitis), other fungal or viral eye diseases, ocular tuberculosis, or acute, purulent, untreated eye infections.
- Use cautiously in patients with corneal abrasions that may be contaminated (especially with herpes).
- Safety and effectiveness of fluorometholone in children younger than age 2 haven't been established. Fluorometholone acetate not for use in children of any age.

### NURSING CONSIDERATIONS

- Treatment may last from a few days to several weeks, but avoid long-term use. Monitor IOP.
- Drug is less likely to increase IOP with extended use than other ophthalmic anti-inflammatories (except medrysone).
- In chronic conditions, withdraw treatment by gradually decreasing frequency of applications.

## PATIENT TEACHING

- Tell patient to shake container well before use.
- Teach patient how to instill drops or apply ointment. Advise him to wash hands before and after using either form, and warn him not to touch tip of dropper or tube to eye or surrounding tissue.
- Advise patient to apply light finger pressure on lacrimal sac for 1 minute after instillation.
- Tell patient not to use any other eye preparation for at least 10 minutes.
- Urge patient to call prescriber immediately and to stop drug if visual acuity decreases or visual field diminishes.
- Tell patient not to share drug, washcloths, or towels with family members and to notify prescriber if anyone develops same signs or symptoms.
- Warn patient not to use leftover drug for new eye inflammation; it may cause serious problems.
- Advise patient to consult prescriber if condition doesn't improve after 2 days. Don't stop treatment prematurely.
- Tell patient to store drug in tightly covered, light-resistant container.

**SAFETY ALERT!**

# fluorouracil (5-fluorouracil, 5-FU)

flure-oh-YOOR-a-sill

Carac, Efudex, Fluoroplex

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Pyrimidine analogue
*Pregnancy risk category D (injection); X (topical form)*

## AVAILABLE FORMS

*Cream:* 0.5%, 1%, 5%
*Injection:* 50 mg/ml
*Topical solution:* 2%, 5%

## INDICATIONS & DOSAGES

➤ **Colon, rectal, breast, stomach, and pancreatic cancers**

*Adults:* Initially, 12 mg/kg I.V. daily for 4 days (daily dose shouldn't exceed 800 mg); if no toxicity, give 6 mg/kg on days 6, 8, 10, and 12; then give a single weekly maintenance dose of 10 to 15 mg/kg I.V. begun after toxicity (if any) from first course has subsided. (Recommended dosages are based on actual body weight unless patient is obese or retaining fluid.)

➤ **Multiple actinic (solar) keratoses**

*Adults:* Apply Carac cream once daily for up to 4 weeks. Or, apply Efudex or Fluoroplex cream or topical solution b.i.d. for 2 to 6 weeks.

➤ **Superficial basal cell carcinoma**

*Adults:* Apply 5% Efudex cream or topical solution b.i.d. usually for 3 to 6 weeks; maximum, 12 weeks.

## ADMINISTRATION

**I.V.**

- Preparing and giving parenteral drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.
- To reduce nausea, give antiemetic before fluorouracil.
- Don't use cloudy solution. If crystals form, redissolve by warming.
- Drug may be given by direct injection without dilution.
- For infusion, dilute drug with $D_5W$, sterile water for injection, or normal saline solution for injection.
- For continuous infusion, use plastic I.V. containers. Solution is more stable in plastic than in glass bottles.
- Don't refrigerate. Protect drug from sunlight.
- Discard unused portion of vial after 1 hour.
- **Incompatibilities:** Aldesleukin, amphotericin B cholesterol complex, carboplatin, cisplatin, cytarabine, diazepam, doxorubicin, droperidol, epirubicin, fentanyl citrate, filgrastim, gallium nitrate, leucovorin calcium, metoclopramide, morphine sulfate, ondansetron, topotecan, vinorelbine tartrate.

**Topical**

- Apply topical form cautiously near patient's eyes, nose, and mouth.
- Avoid occlusive dressings with topical form because they increase risk of inflammatory reactions in adjacent normal skin.

• Apply topical form with nonmetal applicator or suitable gloves. Wash hands immediately after handling topical form.
• The 1% topical strength is used on patient's face. Higher strengths, such as 5%, are used for thicker skinned areas or resistant lesions, such as superficial basal cell carcinoma.

## ACTION

May interfere with DNA and RNA synthesis, leading to a thymine deficiency that provokes unbalanced growth and death of the cell.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V., topical | Unknown | Unknown | Unknown |

*Half-life:* 20 minutes.

## ADVERSE REACTIONS

**CNS:** acute cerebellar syndrome, confusion, disorientation, euphoria, ataxia, headache, *weakness, malaise.*
**CV:** ***myocardial ischemia,*** angina, thrombophlebitis.
**EENT:** epistaxis, photophobia, lacrimation, lacrimal duct stenosis, nystagmus, visual changes, eye irritation.
**GI:** *stomatitis, GI ulcer, nausea, vomiting, diarrhea, anorexia,* ***GI bleeding.***
**Hematologic:** ***leukopenia, thrombocytopenia, agranulocytosis,*** *anemia.*
**Skin:** *dermatitis, erythema, scaling, pruritus,* nail changes, pigmented palmar creases, erythematous contact dermatitis, desquamative rash of hands and feet, hand-foot syndrome with long-term use, photosensitivity reactions, *reversible alopecia, pain, burning,* soreness, suppuration, *swelling, dryness, erosion with topical use.*
**Other:** ***anaphylaxis.***

## INTERACTIONS

**Drug-drug.** *Leucovorin calcium:* May increase cytotoxicity and toxicity of fluorouracil. Monitor patient closely.
**Drug-lifestyle.** *Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

• May increase alkaline phosphatase, AST, ALT, bilirubin, 5-hydroxyindoleacetic acid (in urine), and LDH levels. May decrease hemoglobin and plasma albumin levels.
• May decrease granulocyte, platelet, RBC, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug and in those with bone marrow suppression (WBC counts of 5,000/$mm^3$ or less or platelet counts of 100,000/$mm^3$ or less) or potentially serious infections.
• Contraindicated in patients in a poor nutritional state and those who have had major surgery within previous month.
• Topical formulations contraindicated in pregnant women.
• Use cautiously in patients who have received high-dose pelvic radiation or alkylating drugs and in those with impaired hepatic or renal function or widespread neoplastic infiltration of bone marrow.
***Overdose S&S:*** Nausea, vomiting, diarrhea, GI ulceration and bleeding, bone marrow depression (thrombocytopenia, leukopenia, agranulocytosis).

## NURSING CONSIDERATIONS

**Black Box Warning** I.V. drug should be administered under the supervision of a physician experienced in cancer chemotherapy.
**Black Box Warning** Patient should be hospitalized at least during the initial course of I.V. drug therapy.
• Ingestion and systemic absorption of topical form may cause leukopenia, thrombocytopenia, stomatitis, diarrhea, or GI ulceration, bleeding, and hemorrhage. Application to large ulcerated areas may cause systemic toxicity.
• Watch for stomatitis or diarrhea (signs of toxicity). Consider using topical oral anesthetic to soothe lesions. Stop drug and notify prescriber if diarrhea occurs.
• Encourage diligent oral hygiene to prevent superinfection of denuded mucosa.
• Monitor WBC and platelet counts. WBC counts with differential are recommended before each dose. Watch for ecchymoses, petechiae, easy bruising, and anemia.
• Monitor fluid intake and output, CBC, and renal and hepatic function tests.

• Long-term use may cause erythematous, desquamative rash of the hands and feet, which may be treated with pyridoxine 50 to 150 mg P.O. daily for 5 to 7 days.
• Dermatologic adverse effects are reversible when drug is stopped.
• To prevent bleeding, avoid I.M. injections when platelet count is below 50,000/$mm^3$.
• Anticipate blood transfusions because of cumulative anemia.
***Alert:*** Toxicity may be delayed for 1 to 3 weeks.
• The WBC count nadir occurs 9 to 14 days after first dose; the platelet count nadir occurs in 7 to 14 days.
***Alert:*** Drug may be ordered as "5-fluorouracil" or "5-FU." The numeral "5" is part of the drug name and shouldn't be confused with dosage units.
• ***Look alike–sound alike:*** Don't confuse fluorouracil with floxuridine, fludarabine, or flucytosine.

## PATIENT TEACHING

• Warn patient that hair loss may occur but is reversible.
• Caution patient to avoid prolonged exposure to sunlight or ultraviolet light when topical form is used.
• Tell patient to use highly protective sunblock to avoid inflammatory skin irritation.
• Warn patient that topically treated area may be unsightly during therapy and for several weeks afterward. Complete healing may take 1 or 2 months.
• Caution women of childbearing age to consult prescriber before becoming pregnant.
• Advise women to stop breast-feeding during therapy because of risk of toxicity to infant.

# fluoxetine hydrochloride

floo-OX-e-teen

Prozac✒, Prozac Weekly✒, Sarafem✒

*Therapeutic class:* Antidepressant
*Pharmacologic class:* SSRI
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules (delayed-release):* 90 mg
*Capsules (pulvules):* 10 mg, 20 mg, 40 mg
*Oral solution:* 20 mg/5 ml
*Tablets:* 10 mg, 15 mg, 20 mg

## INDICATIONS & DOSAGES

➤ **Depression, obsessive-compulsive disorder (OCD) (excluding Sarafem)**
*Adults:* Initially, 20 mg P.O. in the morning; increase dosage based on patient response. Maximum daily dose is 80 mg.
*Children ages 7 to 17 (OCD):* 10 mg P.O. daily. After 2 weeks, increase to 20 mg daily. Dosage is 20 to 60 mg daily.
*Children ages 8 to 18 (depression):* 10 mg P.O. once daily for 1 week; then increase to 20 mg daily.

➤ **Maintenance therapy for depression (excluding Sarafem) in stabilized patients (not for newly diagnosed depression)**
*Adults:* 90 mg Prozac Weekly P.O. once weekly. Start once-weekly doses 7 days after the last daily dose of Prozac 20 mg.

➤ **Short-term and long-term treatment of bulimia nervosa (excluding Sarafem)**
*Adults:* 60 mg P.O. daily in the morning.

➤ **Short-term treatment of panic disorder with or without agoraphobia**
*Adults:* 10 mg P.O. once daily for 1 week; then increase dose as needed to 20 mg daily. Maximum daily dose is 60 mg.

➤ **Depressive episodes associated with bipolar I disorder (with olanzapine)**
*Adults:* 20 mg P.O. with 5 mg P.O. olanzapine once daily in the evening. Dosage adjustments can be made based on efficacy and tolerability within ranges of fluoxetine 20 to 50 mg and olanzapine 5 to 12.5 mg.

➤ **Treatment-resistant depression**
*Adults:* 20 mg P.O. with 5 mg P.O. olanzapine once daily in the evening. Dosage adjustments can be made based on efficacy and tolerability within ranges of fluoxetine 20 to 50 mg and olanzapine 5 to 20 mg.

➤ **Posttraumatic stress disorder (PTSD) ♦**
*Adults, children, and adolescents:* 10 to 20 mg P.O. daily. Evaluate response every 1 to 2 weeks. Average target daily dose is 20 to 50 mg (20 mg in older adults). Maximum target dose is 80 mg/day. Recommended therapy duration is 6 to 12 months for acute PTSD, 12 to 24 months for chronic PTSD with excellent response, and at least

24 months for chronic PTSD with residual symptoms. Tapering dosage over 2 weeks to 1 month is recommended.

➤ **Premenstrual dysphoric disorder**
*Adults:* 20 mg Sarafem P.O. daily continuously (every day of the menstrual cycle) or intermittently (daily dose starting 14 days before the anticipated onset of menstruation through the first full day of menses and repeating with each new cycle). Maximum daily dose is 80 mg P.O.

➤ **Raynaud phenomenon ♦**
*Adults:* 20 to 60 mg P.O. daily.

➤ **Borderline personality disorder ♦**
*Adults:* 20 to 80 mg P.O. daily. A reasonable trial period for treatment is at least 12 weeks.

***Adjust-a-dose:*** For patients with renal or hepatic impairment and those taking several drugs at the same time, reduce dose or increase dosing interval.

## ADMINISTRATION

**P.O.**
- Give drug without regard for food.
- Avoid giving drug in the afternoon, whenever possible, because doing so commonly causes nervousness and insomnia.
- Delayed-release capsules must be swallowed whole; don't crush or open.

## ACTION

Thought to be linked to drug's inhibition of CNS neuronal uptake of serotonin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 6–8 hr | Unknown |

*Half-life:* Fluoxetine, 2 to 3 days; norfluoxetine, 7 to 9 days.

## ADVERSE REACTIONS

**CNS:** *nervousness, somnolence, anxiety, insomnia, headache, drowsiness, tremor, dizziness, asthenia,* ***suicidal behavior,*** fatigue, fever.
**CV:** palpitations, hot flashes.
**EENT:** nasal congestion, pharyngitis, sinusitis.
**GI:** *nausea, diarrhea, dry mouth, anorexia,* dyspepsia, constipation, abdominal pain, vomiting, flatulence, increased appetite.
**GU:** sexual dysfunction.
**Metabolic:** weight loss.
**Musculoskeletal:** muscle pain.
**Respiratory:** upper respiratory tract infection, cough, ***respiratory distress.***
**Skin:** *rash,* pruritus, diaphoresis.
**Other:** flulike syndrome.

## INTERACTIONS

**Drug-drug.** *Amphetamines, buspirone, dextromethorphan, dihydroergotamine, lithium salts, meperidine, other SSRIs or SSNRIs (duloxetine, venlafaxine),* ***tramadol,*** *trazodone, tricyclic antidepressants, tryptophan:* May increase the risk of serotonin syndrome. Avoid combinations of drugs that increase the availability of serotonin in the CNS; monitor patient closely if used together.
*Benzodiazepines, lithium, tricyclic antidepressants:* May increase CNS effects. Monitor patient closely.
*Beta blockers, carbamazepine, flecainide, vinblastine:* May increase levels of these drugs. Monitor drug levels and monitor patient for adverse reactions.
*Cyproheptadine:* May reverse or decrease fluoxetine effect. Monitor patient closely.
*Dextromethorphan:* May cause unusual side effects such as visual hallucinations. Advise use of cough suppressant that doesn't contain dextromethorphan while taking fluoxetine.
*Highly protein-bound drugs:* May increase level of fluoxetine or other highly protein-bound drugs. Monitor patient closely.
*Insulin, oral antidiabetics:* May alter glucose level and antidiabetic requirements. Adjust dosage.
*MAO inhibitors (phenelzine, selegiline, tranylcypromine):* May cause serotonin syndrome and signs and symptoms resembling neuroleptic malignant syndrome. Avoid using at the same time and for at least 5 weeks after stopping.
*Phenytoin:* May increase phenytoin level and risk of toxicity. Monitor phenytoin level and adjust dosage.
*Thioridazine:* May increase thioridazine level, increasing risk of serious ventricular arrhythmias and sudden death. Avoid using at the same time and for at least 5 weeks after stopping.
*Triptans:* May cause weakness, hyperreflexia, incoordination, rapid changes

in blood pressure, nausea, and diarrhea. Monitor patient closely, especially at the start of treatment and when dosage increases.
*Warfarin:* May increase risk for bleeding. Monitor PT and INR.
**Drug-herb.** *St. John's wort:* May increase sedative and hypnotic effects; may cause serotonin syndrome. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May increase CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those taking MAO inhibitors within 14 days of starting therapy. MAO inhibitors shouldn't be started within 5 weeks of stopping fluoxetine. Avoid using thioridazine with fluoxetine or within 5 weeks after stopping fluoxetine.
- Use cautiously in patients at high risk for suicide and in those with history of diabetes mellitus, seizures, mania, or hepatic, renal, or CV disease.
- Use in third trimester of pregnancy may be associated with neonatal complications at birth. Consider the risk versus benefit of treatment during this time.

**Black Box Warning** Fluoxetine is approved for use in children with major depressive disorder and obsessive-compulsive disorder. Sarafem isn't approved for use in children. ■

***Overdose S&S:*** Nausea, seizures, somnolence, tachycardia, vomiting, coma, delirium, ECG abnormalities, hypotension, mania, neuroleptic malignant syndrome–like reactions, pyrexia, stupor, syncope.

## NURSING CONSIDERATIONS

- Use antihistamines or topical corticosteroids to treat rashes or pruritus.
- Watch for weight change during therapy, particularly in underweight or bulimic patients.
- Record mood changes. Watch for suicidal tendencies.

**Black Box Warning** Drug may increase the risk of suicidal thinking and behavior in children, adolescents, and young adults with major depressive disorder or other psychiatric disorder. ■

- Drug has a long half-life; monitor patient for adverse effects for up to 2 weeks after drug is stopped.

***Alert:*** Combining triptans with an SSRI or an SSNRI may cause serotonin syndrome or neuroleptic malignant syndrome–like reactions. Signs and symptoms of serotonin syndrome may include restlessness, hallucinations, loss of coordination, fast heartbeat, rapid changes in blood pressure, increased body temperature, overactive reflexes, nausea, vomiting, and diarrhea. Serotonin syndrome may be more likely to occur when starting or increasing the dose of triptan, SSRI, or SSNRI.

- When discontinuing drug, taper dosage over 2 weeks to 1 month to avoid withdrawal syndrome.
- ***Look alike–sound alike:*** Don't confuse fluoxetine with fluvoxamine or fluvastatin. Don't confuse Prozac with Proscar, Prilosec, or ProSom.

## PATIENT TEACHING

- Tell patient to avoid taking drug in the afternoon whenever possible because doing so commonly causes nervousness and insomnia.
- Drug may cause dizziness or drowsiness. Warn patient to avoid driving and other hazardous activities that require alertness and good psychomotor coordination until effects of drug are known.
- Tell patient to consult prescriber before taking other prescription or OTC drugs.
- Advise patient that full therapeutic effect may not be seen for 4 weeks or longer.

**Black Box Warning** Advise families and caregivers to carefully observe patient for worsening suicidal thinking or behavior. ■

# fluphenazine decanoate

floo-FEN-a-zeen

Modecate†, Modecate Concentrate†

# fluphenazine hydrochloride

*Therapeutic class:* Antipsychotic
*Pharmacologic class:* Phenothiazine
*Pregnancy risk category C*

## AVAILABLE FORMS

**fluphenazine decanoate**
*Depot injection:* 25 mg/ml*
**fluphenazine hydrochloride**
*Elixir:* 2.5 mg/5 ml*, 5 mg/ml
*I.M. injection:* 2.5 mg/ml, 25 mg/ml
*Oral concentrate:* 5 mg/ml*
*Tablets:* 1 mg, 2.5 mg, 5 mg, 10 mg

## INDICATIONS & DOSAGES

➤ **Psychotic disorders**

*Adults:* Initially, 2.5 to 10 mg fluphenazine hydrochloride P.O. daily in divided doses every 6 to 8 hours; may increase cautiously to 20 mg. Maximum daily dose is 40 mg. Maintenance dose is 1 to 5 mg P.O. daily. I.M. doses are one-third to one-half of P.O. doses. Usual I.M. dose is 1.25 mg. Give more than 10 mg daily with caution.

Or, 12.5 to 25 mg of fluphenazine decanoate I.M. or subcutaneously every 1 to 6 weeks; maintenance dose is 25 to 100 mg, as needed.

*Elderly patients:* 1 to 2.5 mg fluphenazine hydrochloride P.O. daily.

## ADMINISTRATION

**P.O.**

- Oral liquid forms can cause contact dermatitis. Wear gloves when preparing solutions, and avoid contact with skin and clothing.
- Protect drug from light. Slight yellowing of concentrate is common and doesn't affect potency. Discard markedly discolored solutions.
- Dilute liquid concentrate with water, fruit juice, milk, or semisolid food just before administration.

**I.M.**

- Parenteral forms can cause contact dermatitis. Wear gloves when preparing solutions, and avoid contact with skin and clothing.
- Protect drug from light. Slight yellowing of injection is common and doesn't affect potency. Discard markedly discolored solutions.
- For long-acting form (decanoate), which is an oil preparation, use a dry needle of at least 21G.

**Subcutaneous**

- Long-acting form (decanoate) is indicated for subcutaneous administration.
- Use a dry needle of at least 21G.

## ACTION

A piperazine phenothiazine that probably blocks postsynaptic dopamine receptors in the brain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | <1 hr | 30 min | 6–8 hr |
| I.M. (decanoate) | 24–72 hr | Unknown | 1–6 wk |
| I.M. (hydrochloride) | <1 hr | 90–120 min | 6–8 hr |
| Subcut. | Unknown | Unknown | Unknown |

*Half-life:* Hydrochloride, 15 hours; decanoate, 7 to 10 days.

## ADVERSE REACTIONS

**CNS:** *extrapyramidal reactions, tardive dyskinesia, pseudoparkinsonism,* ***seizures, neuroleptic malignant syndrome,*** sedation, EEG changes, drowsiness, dizziness.
**CV:** orthostatic hypotension, tachycardia, ECG changes.
**EENT:** *blurred vision,* ocular changes, nasal congestion.
**GI:** *dry mouth, constipation,* increased appetite.
**GU:** *urine retention,* dark urine, menstrual irregularities, inhibited ejaculation.
**Hematologic:** ***leukopenia, agranulocytosis, aplastic anemia, thrombocytopenia,*** eosinophilia, hemolytic anemia.
**Hepatic:** cholestatic jaundice.
**Metabolic:** weight gain.
**Skin:** *mild photosensitivity reactions,* allergic reactions.
**Other:** gynecomastia, galactorrhea.

## INTERACTIONS

**Drug-drug.** *Antacids:* May inhibit absorption of oral phenothiazines. Separate antacid and phenothiazine doses by at least 2 hours.
*Anticholinergics:* May increase anticholinergic effects. Use together cautiously.
*Barbiturates, lithium:* May decrease phenothiazine effect and increase neurologic adverse effects. Monitor patient.
*Centrally acting antihypertensives:* May decrease antihypertensive effect. Monitor blood pressure.
*CNS depressants:* May increase CNS depression. Use together cautiously.
**Drug-herb.** *St. John's wort:* May increase risk of photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.
**Drug-lifestyle.** ***Alcohol use:*** May increase CNS depression, especially that involving psychomotor skills. Strongly discourage alcohol use.
*Sun exposure:* May increase risk of photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase liver function test values. May decrease hemoglobin level and hematocrit.
- May increase eosinophil count. May decrease granulocyte, platelet, and WBC counts.
- May cause false-positive results for amylase, 5-hydroxyindoleacetic acid, urinary porphyrin, and urobilinogen tests and for urine pregnancy tests that use human chorionic gonadotropin.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with coma, CNS depression, bone marrow suppression or other blood dyscrasia, subcortical damage, or liver damage.
- Use cautiously in elderly or debilitated patients and in those with pheochromocytoma, severe CV disease (may cause sudden drop in blood pressure), peptic ulcer, respiratory disorder, hypocalcemia, seizure disorder (may lower seizure threshold), severe reactions to insulin or electroconvulsive therapy, mitral insufficiency, glaucoma, or prostatic hyperplasia.
- Use cautiously in those exposed to extreme heat or cold (including antipyretic therapy) or phosphorus insecticides.
- Use parenteral form cautiously in patients who have asthma or are allergic to sulfites.

***Overdose S&S:*** Stupor, coma, seizures in children.

## NURSING CONSIDERATIONS

- Monitor patient for tardive dyskinesia, which may occur after prolonged use. It may not appear until months or years later and may disappear spontaneously or persist for life, despite ending drug.

***Alert:*** Watch for signs and symptoms of neuroleptic malignant syndrome (extrapyramidal effects, hyperthermia, autonomic disturbance), which is rare but often fatal. It may not be related to length of drug use or type of neuroleptic; more than 60% of affected patients are men.

- Withhold dose and notify prescriber if patient, especially child or pregnant woman, develops signs or symptoms of blood dyscrasia (fever, sore throat, infection, cellulitis, weakness) or extrapyramidal reactions persisting longer than a few hours.

***Alert:*** Elderly patients with dementia-related psychosis treated with atypical or conventional antipsychotics are at increased risk for death. Antipsychotics aren't approved for the treatment of dementia-related psychosis.

- Don't withdraw drug abruptly unless serious adverse reactions occur.
- Abrupt withdrawal of long-term therapy may cause gastritis, nausea, vomiting, dizziness, tremor, feeling of warmth or cold, diaphoresis, tachycardia, headache, or insomnia.

## PATIENT TEACHING

- Warn patient to avoid activities that require alertness and good coordination until effects of drug are known. Drowsiness and dizziness usually subside after first few weeks.
- Warn patient to avoid alcohol while taking drug.
- Tell patient to relieve dry mouth with sugarless gum or hard candy.
- Have patient report signs of urine retention or constipation.

- Advise patient to use sunblock and wear protective clothing to avoid sensitivity to the sun.
- Tell patient that drug may discolor urine.

**SAFETY ALERT!**

## flutamide

FLOO-ta-mide

Euflex†

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Nonsteroidal antiandrogen
*Pregnancy risk category D*

### AVAILABLE FORMS

*Capsules:* 125 mg, 250 mg†

### INDICATIONS & DOSAGES

➤ **Metastatic locally confined prostate cancer (stages $B_2$, C, $D_2$), combined with luteinizing hormone–releasing hormone analogues such as leuprolide acetate or goserelin**

*Men:* 250 mg P.O. every 8 hours.

➤ **Hirsutism in women with polycystic ovary syndrome ♦**

*Women:* 125 to 500 mg P.O. daily.

### ADMINISTRATION

**P.O.**

- Drug is a hormonal agent and considered a potential teratogen. Follow safe-handling procedures.
- Give drug with a full glass of water.
- Give drug without regard for food.

### ACTION

Inhibits androgen uptake or prevents binding of androgens in nucleus of cells in target tissues.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 hr | Unknown |

*Half-life:* For steady-state metabolite, about 6½ hours.

### ADVERSE REACTIONS

**CV:** peripheral edema, hypertension, *hot flashes.*
**GI:** *diarrhea, nausea, vomiting,* anorexia.
**GU:** *impotence,* urine discoloration.
**Hematologic:** anemia, ***leukopenia, thrombocytopenia,*** hemolytic anemia.
**Hepatic:** ***hepatic encephalopathy, liver failure.***
**Skin:** rash, photosensitivity reactions.
**Other:** *loss of libido,* gynecomastia.

### INTERACTIONS

**Drug-drug.** *Warfarin:* May increase PT. Monitor PT and INR.
**Drug-lifestyle.** *Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

### EFFECTS ON LAB TEST RESULTS

- May increase BUN, creatinine, hemoglobin, and liver enzyme levels.
- May decrease platelet and WBC counts.
- May alter pituitary-gonadal system tests during therapy and for 12 weeks after.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with severe liver dysfunction.

⚠ ***Overdose S&S:*** Gynecomastia, breast tenderness, increased AST level.

### NURSING CONSIDERATIONS

**Black Box Warning** Drug may cause liver failure. Obtain liver function test before the start of therapy, monthly for the first 4 months of therapy, and at the first signs and symptoms suggesting liver dysfunction (nausea, vomiting, anorexia, fatigue). Immediately stop drug if jaundice occurs or AST level rises above two times upper limit of normal. ■

- Monitor CBC periodically.
- Flutamide must be taken continuously with drug used for medical castration (such as leuprolide) to allow full therapeutic benefit. Leuprolide suppresses testosterone production, whereas flutamide inhibits testosterone action at cellular level; together, they can impair growth of androgen-responsive tumors.

## PATIENT TEACHING

- Advise patient not to stop drug without consulting prescriber.
- Tell patient to take drug with a full glass of water.
- Tell patient drug may be taken without food, but if stomach irritation occurs, to take with food.
- Instruct patient to report adverse reactions promptly, especially dark yellow or brown urine, vomiting, or yellowing of the eyes or skin.

# fluticasone furoate

FLOO-tih-ka-sone

Veramyst

# fluticasone propionate

Flonase, Flovent Diskus, Flovent HFA

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Corticosteroid
*Pregnancy risk category C*

## AVAILABLE FORMS

*Nasal spray (furoate):* 27.5 mcg/spray
*Nasal spray (propionate):* 50 mcg/metered spray
*Oral inhalation aerosol:* 44 mcg, 110 mcg, 220 mcg
*Oral inhalation powder:* 50 mcg, 100 mcg, 250 mcg

## INDICATIONS & DOSAGES

➤ **As preventative in maintenance of chronic asthma in patients requiring oral corticosteroid**

***Flovent Diskus***

*Adults and children ages 12 and older:* In patients previously taking bronchodilators alone, initially, inhaled dose of 100 mcg b.i.d. to maximum of 500 mcg b.i.d.
*Adults and children age 12 and older previously taking inhaled corticosteroids:* Initially, inhaled dose of 100 to 250 mcg b.i.d. to maximum of 500 mcg b.i.d.
*Adults and children ages 12 and older previously taking oral corticosteroids:* Inhaled dose of 500 to 1,000 mcg b.i.d. Maximum dose, 1,000 mcg b.i.d.
*Children ages 4 to 11:* For patients previously on bronchodilators alone or on inhaled corticosteroids, initially, inhaled dose of 50 mcg b.i.d. to maximum of 100 mcg b.i.d.

***Flovent HFA***

*Adults and children age 12 and older:* In those previously taking bronchodilators alone, initially, inhaled dose of 88 mcg b.i.d. to maximum of 440 mcg b.i.d.
*Adults and children age 12 and older previously taking inhaled corticosteroids:* Initially, inhaled dose of 88 to 220 mcg b.i.d. to maximum of 440 mcg b.i.d.
*Adults and children age 12 and older previously taking oral corticosteroids:* Initially, inhaled dose of 440 mcg b.i.d. to maximum of 880 mcg b.i.d.
*Children ages 4 to 11 years:* 88 mcg inhaled b.i.d. regardless of prior therapy.

➤ **Nasal symptoms of seasonal and perennial allergic and nonallergic rhinitis**

***Flonase***

*Adults:* Initially, 2 sprays (100 mcg) in each nostril daily or 1 spray b.i.d. Once symptoms are controlled, decrease to 1 spray in each nostril daily. Or, for seasonal allergic rhinitis, 2 sprays in each nostril once daily, as needed, for symptom control.
*Adolescents and children age 4 and older:* Initially, 1 spray (50 mcg) in each nostril daily. If not responding, increase to 2 sprays in each nostril daily. Once symptoms are controlled, decrease to 1 spray in each nostril daily. Maximum dose is 2 sprays in each nostril daily.

***Veramyst***

*Adults and children age 12 and older:* 110 mcg once daily administered as 2 sprays (27.5 mcg/spray) in each nostril.
*Children ages 2 to 11 years:* 55 mcg once daily administered as 1 spray (27.5 mcg/spray) in each nostril.

## ADMINISTRATION

**Inhalational**

- Prime and shake well before each use.

**Intranasal**

- Prime and shake well before use.

## ACTION

Anti-inflammatory and vasoconstrictor that may decrease inflammation by inhibiting

mast cells, macrophages, and mediators such as leukotrienes.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Inhalation (nasal) | 12 hr | Several days | 1–2 wk |
| Inhalation (oral) | 24 hr | Several days | 1–2 wk |

*Half-life:* 3 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* dizziness, fever, migraine, nervousness.
**EENT:** *pharyngitis,* blood in nasal mucus, cataracts, conjunctivitis, dry eye, dysphonia, epistaxis, eye irritation, hoarseness, laryngitis, nasal burning or irritation, nasal discharge, rhinitis, sinusitis.
**GI:** *oral candidiasis,* abdominal discomfort, abdominal pain, diarrhea, mouth irritation, nausea, viral gastroenteritis, vomiting.
**GU:** UTI.
**Hematologic:** eosinophilia.
**Metabolic:** cushingoid features, growth retardation in children, hyperglycemia, weight gain.
**Musculoskeletal:** aches and pains, disorder or symptoms of neck sprain or strain, joint pain, muscular soreness, osteoporosis.
**Respiratory:** *upper respiratory tract infection,* ***bronchospasm,*** asthma symptoms, bronchitis, chest congestion, cough, dyspnea.
**Skin:** dermatitis, urticaria.
**Other:** ***angioedema,*** influenza, viral infections.

## INTERACTIONS

**Drug-drug.** *Ketoconazole and other cytochrome P-450 3A4 inhibitors:* May increase mean fluticasone level. Use together cautiously.
*Ritonavir:* May cause systemic corticosteroid effects, such as Cushing syndrome and adrenal suppression. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

• May cause an abnormal response to the 6-hour cosyntropin stimulation test in patients taking high doses of fluticasone.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to ingredients in these preparations.
• Contraindicated as primary treatment of patients with status asthmaticus or other acute, intense episodes of asthma.
• Use cautiously in breast-feeding women.
⚠ ***Overdose S&S:*** Hypercorticism.

## NURSING CONSIDERATIONS

• Because of risk of systemic absorption of inhaled corticosteroids, observe patient carefully for evidence of systemic corticosteroid effects.
***Alert:*** Monitor patient, especially postoperatively, during periods of stress or severe asthma attack for evidence of inadequate adrenal response.
***Alert:*** During withdrawal from oral corticosteroids, some patients may experience signs and symptoms of systemically active corticosteroid withdrawal, such as joint or muscle pain, lassitude, and depression, despite maintenance or even improvement of respiratory function. Deaths due to adrenal insufficiency have occurred with transfer from active corticosteroids to fluticasone propionate inhaler.
• For patients starting therapy who are currently receiving oral corticosteroid therapy, reduce dose of prednisone to no more than 2.5 mg/day on a weekly basis, beginning after at least 1 week of therapy with fluticasone.
***Alert:*** As with other inhaled asthma drugs, bronchospasm may occur with an immediate increase in wheezing after a dose. If bronchospasm occurs after a dose of inhalation aerosol, treat immediately with a fast-acting inhaled bronchodilator.

## PATIENT TEACHING

• Tell patient that drug isn't indicated for the relief of acute bronchospasm.
• For proper use of drug and to attain maximal improvement, tell patient to carefully follow the accompanying patient instructions.
• Advise patient to use drug at regular intervals, as directed.
• Instruct patient to contact prescriber if nasal spray doesn't improve condition after 4 days of treatment.
• Instruct patient to immediately contact prescriber if asthma episodes unresponsive to bronchodilators occur during treatment

with fluticasone. During such episodes, patient may need therapy with oral corticosteroids.
- Warn patient to avoid exposure to chickenpox or measles and, if exposed, to consult prescriber immediately.
- Tell patient to carry or wear medical identification indicating that he may need supplementary corticosteroids during stress or a severe asthma attack.

***Alert:*** During periods of stress or a severe asthma attack, instruct patient who has been withdrawn from systemic corticosteroids to resume prescribed oral corticosteroids immediately and to contact prescriber for further instruction.
- Tell patient to prime inhaler with 4 test sprays (away from his face) before first use, shaking well before each spray. Also, prime with 1 spray if inhaler has been dropped or not used for 1 week or longer.
- Advise patient to avoid spraying inhalation aerosol into eyes.
- Instruct patient to shake canister well before using inhalation aerosol.
- Instruct patient to rinse his mouth and spit water out after inhalation.
- Advise patient to store fluticasone powder in a dry place.

**Flonase nasal spray**
- Tell patient to prime the nasal inhaler before first use or after 1 week or longer of nonuse.
- Have patient clear nasal passages before use.
- Advise patient to follow manufacturer's recommendations for use and cleaning.
- Advise patient to use at regular intervals for full benefit.
- Tell patient to contact provider if signs or symptoms don't improve within 4 days or if signs or symptoms worsen.
- Tell patient that the correct amount of spray can't be guaranteed after 120 sprays, even though the bottle may not be completely empty.

## fluticasone propionate

FLOO-ti-ka-sone

Cutivate

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Corticosteroid
*Pregnancy risk category C*

### AVAILABLE FORMS

*Cream:* 0.05%
*Lotion:* 0.05%
*Ointment:* 0.005%

### INDICATIONS & DOSAGES

➤ **Inflammation and pruritus from dermatoses responsive to corticosteroids**

*Adults:* Apply sparingly to affected area b.i.d.; rub in gently and completely.
*Children age 3 months and older:* Apply a thin film of cream (0.05%) to affected areas b.i.d. Rub in gently. Don't use for longer than 4 weeks. If using lotion (0.05%) in adults and children 1 year and older, apply once daily.

➤ **Inflammation and pruritus from atopic dermatitis**

*Children age 3 months and older:* Apply thin film (0.05%) to affected areas once daily or b.i.d. Rub in gently. Don't use for longer than 4 weeks.

### ADMINISTRATION

**Topical**
- Don't use drug with an occlusive dressing or in diaper area.

### ACTION

Unclear. Is diffused across cell membranes to form complexes with cytoplasmic receptors. Shows anti-inflammatory, antipruritic, vasoconstrictive, and antiproliferative activity. Considered a medium-potency drug, according to vasoconstrictive properties.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Rapid | Unknown | 10 hr |

*Half-life:* About 7½ hours.

### ADVERSE REACTIONS

**CNS:** light-headedness.
**GU:** glycosuria.

**Metabolic:** hyperglycemia.
**Skin:** urticaria, burning, hypertrichosis, pruritus, irritation, erythema, hives, dryness.
**Other:** ***hypothalamic-pituitary-adrenal axis suppression,*** Cushing syndrome.

### INTERACTIONS
None significant.

### EFFECTS ON LAB TEST RESULTS
- May increase glucose level.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug or its components.
- Don't use as monotherapy in primary bacterial, viral, fungal, herpetic, or tubercular skin infections; for treatment of rosacea, perioral dermatitis, or acne.
- Drug isn't for ophthalmic use.
- Use cautiously in pregnant or breast-feeding women.

⚠ ***Overdose S&S:*** Systemic effects (including reversible hypothalamic-pituitary-adrenal [HPA] axis suppression, Cushing syndrome, hyperglycemia, glycosuria.)

### NURSING CONSIDERATIONS
- Don't mix drug with other bases or vehicles because doing so may affect potency.
- If adverse reactions occur, prescriber may order less potent drug.
- Stop drug if local irritation or systemic infection, absorption, or hypersensitivity occurs.
- Absorption of corticosteroid is increased when drug is applied to inflamed or damaged skin, eyelids, or scrotal area; it's lowest when applied to intact normal skin, palms of hands, or soles of feet.
- ***Look alike–sound alike:*** Don't confuse fluticasone with fluconazole, fluocinolone, or fluocinonide.

### PATIENT TEACHING
- Teach patient or family member how to apply drug using gloves, sterile applicator, or after careful hand washing.
- Tell patient to wash hands after application.
- Tell patient to avoid prolonged use and contact with eyes. Warn him not to apply to face, in skin creases, or around eyes, genitals, underarms, or rectum.
- Instruct patient to notify prescriber if condition persists or worsens or if burning or irritation develops.

## fluticasone propionate and salmeterol inhalation powder

FLOO-tih-ka-sone and sal-MEE-ter-ol

Advair Diskus 100/50, Advair Diskus 250/50, Advair Diskus 500/50, Advair HFA 45/21, Advair HFA 115/21, Advair HFA 230/21

*Therapeutic class:* Antiasthmatic
*Pharmacologic class:* Corticosteroid, long-acting beta$_2$-adrenergic agonist
*Pregnancy risk category C*

### AVAILABLE FORMS
*Inhalation powder:* 100 mcg fluticasone and 50 mcg salmeterol, 250 mcg fluticasone and 50 mcg salmeterol, 500 mcg fluticasone and 50 mcg salmeterol
*Aerosol spray:* 45 mcg fluticasone propionate and 21 mcg salmeterol, 115 mcg fluticasone propionate and 21 mcg salmeterol, 230 mcg fluticasone propionate and 21 mcg salmeterol

### INDICATIONS & DOSAGES
➤ **Long-term maintenance of asthma**
*Adults and children age 12 and older:* 1 inhalation b.i.d., at least 12 hours apart of Advair Diskus; or 2 inhalations twice daily of Advair HFA. Starting doses are dependent on the patient's current asthma therapy. Maximum dose of Advair Diskus is 1 inhalation of fluticasone 500 mcg/salmeterol 50 mcg b.i.d. Maximum dose of Advair HFA is 2 inhalations of fluticasone 230 mcg/salmeterol 21 mcg b.i.d.
*Children age 12 and older:* 1 inhalation of Advair Diskus b.i.d. about 12 hours apart. Starting doses are based on patient's asthma severity. Or, 2 inhalations of Advair HFA b.i.d. about 12 hours apart. Starting dose is based on patient's current asthma

therapy. Maximum dose for Advair HFA is 2 inhalations of fluticasone 230 mcg/21 mcg salmeterol.
*Children ages 4 to 11 (Advair Diskus):* 1 inhalation of fluticasone 100 mcg/salmeterol 50 mcg b.i.d. about 12 hours apart.
➤ **Maintenance therapy for airflow obstruction in patients with COPD from chronic bronchitis; to reduce exacerbations of COPD in patients with a history of exacerbations**
*Adults:* 1 inhalation of Advair Diskus 250/50 only, b.i.d., about 12 hours apart.

## ADMINISTRATION

### Inhalational

- Prime Advair HFA before first use by releasing 4 test sprays into the air, away from the face, shaking well for 5 seconds before each spray. If inhaler hasn't been used for 4 weeks or has been dropped, prime inhaler again by shaking well before each spray and releasing 2 test sprays into the air.
- Discard Advair HFA canister when counter reads "000."
- After administration, have the patient rinse his mouth without swallowing.

## ACTION

Fluticasone is a synthetic corticosteroid with potent anti-inflammatory activity.

Salmeterol xinafoate, a long-acting beta agonist, relaxes bronchial smooth muscle and inhibits release of mediators.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Inhalation (fluticasone) | Unknown | 1–2 hr | Unknown |
| Inhalation (salmeterol) | Unknown | 5 min | Unknown |

*Half-life:* Fluticasone: 8 hours; salmeterol: 5½ hours.

## ADVERSE REACTIONS

**CNS:** *headache,* compressed nerve syndromes, hypnagogic effects, sleep disorders, tremors, pain.
**CV:** palpitations.
**EENT:** *pharyngitis*, blood in nasal mucosa, congestion, conjunctivitis, dental discomfort and pain, eye redness, hoarseness or dysphonia, keratitis, nasal irritation, rhinorrhea, rhinitis, sinusitis, sneezing, viral eye infections.
**GI:** abdominal pain and discomfort, appendicitis, constipation, diarrhea, gastroenteritis, nausea, oral candidiasis, oral discomfort and pain, oral erythema and rashes, oral ulcerations, unusual taste, vomiting.
**Musculoskeletal:** arthralgia, articular rheumatism, bone and cartilage disorders, muscle pain, muscle stiffness, rigidity, tightness.
**Respiratory:** *upper respiratory tract infection,* bronchitis, cough, lower respiratory tract infections, pneumonia.
**Skin:** disorders of sweat and sebum, infection, skin flakiness, sweating, urticaria.
**Other:** allergic reactions, chest symptoms, fluid retention, viral or bacterial infections.

## INTERACTIONS

**Drug-drug.** *Beta blockers:* Blocked pulmonary effect of salmeterol may produce severe bronchospasm in patients with asthma. Avoid using together. If necessary, use a cardioselective beta blocker cautiously.
*Ketoconazole, other inhibitors of cytochrome P-450:* May increase fluticasone level and adverse effects. Use together cautiously.
*Loop diuretics, thiazide diuretics:* Potassium-wasting diuretics may cause or worsen ECG changes or hypokalemia. Use together cautiously.
*MAO inhibitors, tricyclic antidepressants:* May potentiate the action of salmeterol on the vascular system. Separate doses by 2 weeks.

## EFFECTS ON LAB TEST RESULTS

- May increase liver enzyme levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.

***Alert:*** When treating asthma use only for patients not adequately controlled on other asthma-controller medications.

- Contraindicated as primary treatment of status asthmaticus or other acute asthmatic episodes.
- Use cautiously, if at all, in patients with active or quiescent respiratory tuberculosis infection; untreated systemic fungal,

bacterial, viral, or parasitic infection; or ocular herpes simplex.
• Use cautiously in patients with CV disorders, seizure disorders or thyrotoxicosis; in patients unusually responsive to sympathomimetic amines; and in patients with hepatic impairment.
***Overdose S&S:*** Hypercorticism, angina, arrhythmias, dizziness, dry mouth, fatigue, headache, hypertension, hypotension, insomnia, malaise, muscle cramps, nausea, nervousness, palpitations, seizures, tachycardia, prolonged QTc interval, hypokalemia, hyperglycemia, cardiac arrest, death.

## NURSING CONSIDERATIONS

***Alert:*** Patient shouldn't be switched from systemic corticosteroids to Advair Diskus or Advair HFA because of hypothalamic-pituitary-adrenal axis suppression. Death from adrenal insufficiency can occur. Several months are required for recovery of hypothalamic-pituitary-adrenal function after withdrawal of systemic corticosteroids.
• Don't start therapy during rapidly deteriorating or potentially life-threatening episodes of asthma. Serious acute respiratory events, including fatality, can occur.
• The benefit of Advair 250/50 in treating patients with COPD for more than 6 months is unknown. If drug is used for longer than 6 months, periodically reevaluate patient to assess for benefits or risks of therapy.
• Monitor patient for urticaria, angioedema, rash, bronchospasm, or other signs of hypersensitivity.
• Don't use this drug to stop an asthma attack. Patients should carry an inhaled, short-acting beta$_2$ agonist (such as albuterol) for acute symptoms.
• If drug causes paradoxical bronchospasm, treat immediately with a short-acting inhaled bronchodilator (such as albuterol), and notify prescriber.
**Black Box Warning** Rare, serious asthma episodes or asthma-related deaths have occurred in patients taking salmeterol. Don't use for patients whose asthma is adequately controlled on low or medium-dose inhaled corticosteroids. ■
• Monitor patient for increased use of inhaled short-acting beta$_2$ agonist. The dose of Advair may need to be increased.
• Closely monitor children for growth suppression.

## PATIENT TEACHING

• Instruct patient on proper use of the prescribed inhaler to provide effective treatment.
• Tell patient to avoid exhaling into the dry-powder multidose inhaler, to activate and use the dry-powder multidose inhaler in a level, horizontal position and not to use Advair Diskus with a spacer device.
• Instruct patient to keep the dry-powder multidose inhaler in a dry place, away from direct heat or sunlight, and to avoid washing the mouthpiece or other parts of the device. Patient should discard device 1 month after removal from the moisture-protective overwrap pouch or after every blister has been used, whichever comes first. He shouldn't attempt to take device apart.
• Instruct patient to rinse mouth after inhalation to prevent oral candidiasis.
• Inform patient that improvement may occur within 30 minutes after dose, but the full benefit may not occur for 1 week or more.
• Advise patient not to exceed recommended prescribing dose.
• Instruct patient not to relieve acute symptoms with Advair. Treat acute symptoms with an inhaled short-acting beta$_2$ agonist.
• Instruct patient to report decreasing effects or use of increasing doses of their short-acting inhaled beta$_2$ agonist.
• Tell patient to report palpitations, chest pain, rapid heart rate, tremor, or nervousness.
• Instruct patient to call immediately if exposed to chickenpox or measles.

# fluvastatin sodium

flue-va-STA-tin

Lescol®, Lescol XL

*Therapeutic class:* Antilipemic
*Pharmacologic class:* HMG-CoA reductase inhibitor
*Pregnancy risk category X*

## AVAILABLE FORMS

*Capsules:* 20 mg, 40 mg
*Tablets (extended-release):* 80 mg

## INDICATIONS & DOSAGES

➤ **To reduce LDL and total cholesterol levels in patients with primary hypercholesterolemia (types IIa and IIb); to slow progression of coronary atherosclerosis in patients with coronary artery disease; to reduce elevated triglyceride and apolipoprotein B (apoB) levels in patients with primary hypercholesterolemia and mixed dyslipidemia whose response to dietary restriction and other nonpharmacologic measures has been inadequate**

*Adults:* Initially, 20 to 40 mg P.O. at bedtime, increasing if needed to maximum of 80 mg daily in divided doses or 80 mg Lescol XL P.O. at bedtime.

➤ **Adjunct to diet to reduce LDL, total cholesterol, and apoB levels in pediatric patients with heterozygous familial hypercholesterolemia whose response to dietary restriction hasn't been adequate and for whom the following findings are present: LDL-C remains at 190 mg/dl or more; or LDL-C remains at 160 mg/dl or more and there's a positive family history of premature cardiovascular disease or two or more other cardiovascular disease risk factors are present**

*Adolescent boys and girls (who are at least 1 year postmenarche) ages 9 to 16:* 20 mg P.O. once daily at bedtime. Dosage adjustments may be made at 6-week intervals up to maximum of 40 mg (capsule) P.O. b.i.d. or 80 mg extended-release tablet P.O. once daily.

➤ **To reduce the risk of undergoing coronary revascularization procedures**

*Adults:* In patients who must reduce LDL cholesterol level by at least 25%, initially, 40 mg P.O. once daily or b.i.d.; or one 80-mg extended-release tablet as a single dose in the evening. In patients who must reduce LDL cholesterol level by less than 25%, initially, 20 mg P.O. daily. Dosages range from 20 to 80 mg daily.

## ADMINISTRATION

**P.O.**

- Give drug without regard for meals.
- For once-daily dosage, give immediate-release capsules in the evening.
- Don't crush or break tablets; don't open capsules.

## ACTION

Inhibits HMG-CoA reductase, an early (and rate-limiting) step in the synthetic pathway of cholesterol.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Unknown |

*Half-life:* Less than 1 hour.

## ADVERSE REACTIONS

**CNS:** dizziness, fatigue, headache, insomnia.
**EENT:** pharyngitis, rhinitis, sinusitis.
**GI:** abdominal pain, constipation, diarrhea, dyspepsia, flatulence, nausea, vomiting.
**Hematologic:** ***leukopenia, thrombocytopenia,*** hemolytic anemia.
**Musculoskeletal:** ***rhabdomyolysis,*** arthralgia, back pain, myalgia.
**Respiratory:** *upper respiratory tract infection,* bronchitis, cough.
**Other:** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Cholestyramine, colestipol:* May bind with fluvastatin in the GI tract and decrease absorption. Separate doses by at least 4 hours.
*Cimetidine, omeprazole, ranitidine:* May decrease fluvastatin metabolism. Monitor patient for enhanced effects.
*Cyclosporine and other immunosuppressants, erythromycin, gemfibrozil, niacin:* May increase risk of polymyositis and rhabdomyolysis. Avoid using together.

*Digoxin:* May alter digoxin pharmacokinetics. Monitor digoxin level carefully.
*Fluconazole, itraconazole, ketoconazole:* May increase fluvastatin level and adverse effects. Use cautiously together, or, if given together, reduce dose of fluvastatin.
*Glyburide:* May increase levels of both drugs. Monitor serum glucose and signs and symptoms of toxicity.
*Phenytoin:* May increase phenytoin levels. Monitor phenytoin levels.
*Rifampin:* May enhance fluvastatin metabolism and decrease levels. Monitor patient for lack of effect.
*Warfarin:* May increase anticoagulant effect with bleeding. Monitor PT and INR.
**Drug-herb.** *Eucalyptus, jin bu huan, kava:* May increase risk of hepatotoxicity. Discourage use together.
*Red yeast rice:* May increase risk of adverse reactions because herb contains compounds similar to those in drug. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May increase risk of hepatotoxicity. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, and CK levels. May decrease hemoglobin level and hematocrit.
- May decrease platelet and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with active liver disease or unexplained persistent elevations of transaminase levels; also contraindicated in pregnant and breast-feeding women and in women of childbearing age.
- Use cautiously in patients with severe renal impairment and history of liver disease or heavy alcohol use.

***Overdose S&S:*** GI complaints, elevated AST and ALT levels.

## NURSING CONSIDERATIONS

- Patient should follow a diet restricted in saturated fat and cholesterol during therapy.
- Test liver function at start of therapy, at 12 weeks after start of therapy, 12 weeks after an increase in dose, and then periodically. Stop drug if there is a persistent increase in ALT or AST levels of at least three times the upper limit of normal.
- Watch for signs of myositis.
- ***Look alike–sound alike:*** Don't confuse fluvastatin with fluoxetine.

## PATIENT TEACHING

- Tell patient that drug may be taken without regard for meals; if taken once daily, immediate-release capsules are taken in the evening.
- Advise the patient who is also taking a bile-acid resin such as cholestyramine to take fluvastatin at bedtime, at least 4 hours after taking the resin.
- Teach patient about proper dietary management, weight control, and exercise. Explain their importance in controlling elevated cholesterol and triglyceride levels.
- Warn patient to avoid alcohol.
- Tell patient to notify prescriber of adverse reactions, especially muscle aches and pains.
- Advise patient that it may take up to 4 weeks for the drug to be completely effective.

***Alert:*** Tell woman of childbearing age to stop drug and notify prescriber immediately if she is or may be pregnant or if she's breast-feeding.

# fluvoxamine maleate

floo-VOX-a-meen

Luvox, Luvox CR

*Therapeutic class:* Antidepressant
*Pharmacologic class:* SSRI
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules (extended-release):* 100 mg, 150 mg
*Tablets:* 25 mg, 50 mg, 100 mg

## INDICATIONS & DOSAGES

➤ **Obsessive-compulsive disorder (OCD)**
*Adults:* Initially, 50 mg (tablet) P.O. daily at bedtime; increase by 50 mg every 4 to 7 days. Maximum, 300 mg daily. Give total daily amounts above 100 mg in two divided doses. Or, 100-mg extended-release capsule

P.O. once per day as a single daily dose at bedtime. Increase in 50-mg increments every week, as tolerated, until maximum therapeutic benefit is achieved. Maximum dose is 300 mg/day.
*Children ages 8 to 17:* Initially, 25 mg P.O. daily at bedtime; increase by 25 mg every 4 to 7 days. Maximum, 200 mg daily for children ages 8 to less than 11 and 300 mg daily for children ages 11 to 17. Give total daily amounts over 50 mg in two divided doses.

➤ **Social anxiety disorder (capsules only)**
*Adults:* Initially, 100-mg extended-release capsule P.O. once per day as a single daily dose at bedtime. Increase in 50 mg increments every week, as tolerated, until maximum therapeutic benefit is achieved. Maximum dose is 300 mg/day.

➤ **Bulimia nervosa ♦**
*Adults:* 50 mg P.O. daily. May titrate dosage based on therapeutic response to 200 mg/day for up to 12 weeks.

➤ **Panic disorder ♦**
*Adults:* Initially, 50 mg P.O. daily. Maintain dosage for several days; then gradually increase to 150 mg daily. Further dosage increases up to 300 mg daily may be considered for patients without response after several weeks. Continue treatment for 1 to 2 years after response. When discontinuing drug, slowly taper dosage over 2 to 6 months with close supervision.

➤ **Posttraumatic stress disorder (PTSD) ♦**
*Adults, children, and adolescents:* Initially, 50 mg P.O. daily. Average daily target doses are 50 mg P.O. daily in children and younger adolescents, 100 to 250 mg P.O. daily for adults, and 100 mg P.O. daily for older adults. Maximum dosage is 300 mg/day for adults. Consider tapering dosage after 6 to 12 months in patients with acute PTSD, after 12 to 24 months in patients with chronic PTSD who have had an excellent response to treatment and after at least 24 months in patients with chronic PTSD and residual symptoms. Tapering should take place over 2 weeks to 1 month and over 4 to 12 weeks in patients at risk for relapse.

➤ **Migraine prevention ♦**
*Adults:* 50 mg P.O. at bedtime for 12 weeks.

***Adjust-a-dose:*** In elderly patients and those with hepatic impairment, give lower first dose and adjust dose more slowly. When using Luvox CR capsules, titrate dosage more slowly after initial 100-mg dose.

## ADMINISTRATION

**P.O.**
- Give drug without regard for food.
- Capsules shouldn't be crushed or chewed.
- Give extended-release capsules at bedtime.

## ACTION

Unknown. Selectively inhibits the presynaptic neuronal uptake of serotonin, which may improve OCD.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. (capsules) | Unknown | Unknown | Unknown |
| P.O. (tablets) | Unknown | 3–8 hr | Unknown |

*Half-life:* 15 to 17 hours.

## ADVERSE REACTIONS

**CNS:** *agitation, headache, asthenia, somnolence, insomnia, nervousness, dizziness,* tremor, anxiety, hypertonia, depression, CNS stimulation.
**CV:** palpitations, vasodilation.
**EENT:** amblyopia.
**GI:** *nausea, diarrhea, constipation, dyspepsia, vomiting, dry mouth,* anorexia, flatulence, dysphagia, taste perversion.
**GU:** abnormal ejaculation, urinary frequency, impotence, anorgasmia, urine retention.
**Respiratory:** upper respiratory tract infection, dyspnea.
**Skin:** sweating.
**Other:** tooth disorder, flulike syndrome, chills, decreased libido, yawning.

## INTERACTIONS

**Drug-drug.** *Benzodiazepines, theophylline, warfarin:* May reduce clearance of these drugs. Use together cautiously (except for diazepam, which shouldn't be used with fluvoxamine). Adjust dosage as needed.
*Carbamazepine, clozapine, methadone, metoprolol, propranolol, theophylline, tricyclic antidepressants:* May increase levels of these drugs. Use together cautiously, and monitor patient closely for adverse reactions. Dosage adjustments may be needed.

*Diltiazem:* May cause bradycardia. Monitor heart rate.
*Lithium, tryptophan:* May enhance effects of fluvoxamine. Use together cautiously.
***MAO inhibitors (phenelzine, selegiline, tranylcypromine):*** May cause serotonin syndrome (CNS irritability, shivering, and altered consciousness) or neuroleptic malignant syndrome. Avoid using within 2 weeks of MAO inhibitor.
*Pimozide, thioridazine:* May prolong QTc interval. Avoid using together.
*Sumatriptan:* May cause weakness, hyperreflexia, and incoordination. Monitor patient closely. May cause serotonin syndrome. Avoid using within 2 weeks of MAO inhibitor.
***Tramadol:*** May cause serotonin syndrome. Monitor patient closely.
**Drug-herb.** *St. John's wort:* May increase sedative-hypnotic effects. Avoid use together.
**Drug-lifestyle.** *Alcohol use:* May increase CNS effects. Discourage use together.
*Smoking:* May decrease drug's effectiveness. Urge patient to stop smoking.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or to other phenyl piperazine antidepressants, in those receiving pimozide, alosetron, tizanidine, or thioridazine therapy, and within 2 weeks of MAO inhibitor.
● Use cautiously in patients with hepatic dysfunction, other conditions that may affect hemodynamic responses or metabolism, or history of mania or seizures.
**Black Box Warning** Fluvoxamine tablets aren't approved for use in children, except for those with obsessive-compulsive disorder. Fluvoxamine extended-release capsules shouldn't be used in children. ■
***Overdose S&S:*** Nausea, vomiting, diarrhea, coma, hypokalemia, hypotension, respiratory difficulties, somnolence, tachycardia, ECG abnormalities, seizures, dizziness, liver function disturbances, tremor, increased reflexes.

## NURSING CONSIDERATIONS

● Record mood changes. Monitor patient for suicidal tendencies.
**Black Box Warning** Don't use for the treatment of major depressive disorders in children younger than age 18 because of an increased risk of suicidal behavior. ■
**Black Box Warning** Drug may increase the risk of suicidal thinking and behavior in young adults ages 18 to 24, especially during the first few months of treatment. ■
***Alert:*** Combining an SSRI with a triptan may cause serotonin syndrome or neuroleptic malignant syndrome–like reactions. Signs and symptoms of serotonin syndrome may include restlessness, hallucinations, loss of coordination, fast heartbeat, rapid changes in blood pressure, increased body temperature, hyperreflexia, nausea, vomiting, and diarrhea. Serotonin syndrome is more likely to occur when starting or increasing the dose of a triptan.
● Patients shouldn't stop drug without first consulting prescriber; abruptly stopping drug may cause withdrawal syndrome, including headache, muscle ache, and flulike symptoms.
● ***Look alike–sound alike:*** Don't confuse fluvoxamine with fluoxetine.

## PATIENT TEACHING

**Black Box Warning** Advise families and caregivers to closely observe patient for increased suicidal thinking or behavior. ■
● Warn patient to avoid hazardous activities until CNS effects of drug are known.
● Tell women to notify prescriber about planned, suspected, or known pregnancy.
● Tell patient who develops a rash, hives, or a related allergic reaction to notify prescriber.
● Inform patient that several weeks of therapy may be needed to obtain full therapeutic effect. Once improvement occurs, advise patient not to stop drug until directed by prescriber.
● Suggest that patient keep a diary of changes in mood or behavior. Tell patient to report suicidal thoughts immediately.
● Advise patient to check with prescriber before taking OTC drugs; drug interactions can occur.
● Tell patient drug can be taken with or without food.

## folic acid (vitamin $B_9$)

FOE-lik

Novo-Folacid†

*Therapeutic class:* Vitamin
*Pharmacologic class:* Folic acid derivative
*Pregnancy risk category A*

### AVAILABLE FORMS

*Injection:* 10-ml vials (5 mg/ml with 1.5% benzyl alcohol, 5 mg/ml with 1.5% benzyl alcohol and 0.2% ethylenediaminetetraacetic acid)
*Tablets:* 0.4 mg, 0.8 mg, 1 mg, 5 mg†

### INDICATIONS & DOSAGES

➤ **RDA**

*Adults and children age 14 and older:* 400 mcg.
*Children ages 9 to 13:* 300 mcg.
*Children ages 4 to 8:* 200 mcg.
*Children ages 1 to 3:* 150 mcg.
*Infants ages 7 months to 1 year:* 80 mcg.
*Neonates and infants age 6 months and younger:* 65 mcg.
*Pregnant women:* 600 mcg.
*Breast-feeding women:* 500 mcg.

➤ **Megaloblastic or macrocytic anemia from folic acid or other nutritional deficiency, hepatic disease, alcoholism, intestinal obstruction, or excessive hemolysis**

*Adults and children age 4 and older:* 0.4 to 1 mg P.O., I.V., I.M., or subcutaneously daily. After anemia caused by folic acid deficiency is corrected, proper diet and RDA supplements are needed to prevent recurrence.
*Children younger than age 4:* Up to 0.3 mg P.O., I.V., I.M., or subcutaneously daily.
*Pregnant and breast-feeding women:* 0.8 mg P.O., I.V., I.M., or subcutaneously daily.
*Infants:* 0.1 mg P.O., I.M., I.V., or subcutaneously daily.

### ADMINISTRATION

**P.O.**

● Give drug without regard for food.

**I.V.**

▼ Protect from light and heat; store at room temperature.

**I.M.**

● Don't mix with other drugs in same syringe for I.M. injections.
● Protect drug from light and heat; store at room temperature.

**Subcutaneous**

● Protect drug from light and heat; store at room temperature.

### ACTION

Stimulates normal erythropoiesis and nucleoprotein synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.M., Subcut. | Unknown | 30–60 min | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CNS:** altered sleep pattern, general malaise, difficulty concentrating, confusion, impaired judgment, irritability, hyperactivity.
**GI:** anorexia, nausea, flatulence, bitter taste.
**Respiratory:** ***bronchospasm.***
**Skin:** allergic reactions including rash, pruritus, and erythema.

### INTERACTIONS

**Drug-drug.** *Aminosalicylic acid, chloramphenicol, hormonal contraceptives, methotrexate, sulfasalazine, trimethoprim:* May antagonize folic acid. Watch for decreased folic acid effect. Use together cautiously.
*Phenytoin:* May increase anticonvulsant metabolism, which decreases anticonvulsant level. Monitor phenytoin level closely.

### EFFECTS ON LAB TEST RESULTS

● May decrease serum and RBC folate levels.

### CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients with undiagnosed anemia (it may mask pernicious anemia) and in those with vitamin $B_{12}$ deficiency.

## NURSING CONSIDERATIONS

- The U.S. Public Health Service recommends use of folic acid during pregnancy to decrease fetal neural tube defects. Patients with history of fetal neural tube defects in pregnancy should increase folic acid intake for 1 month before and 3 months after conception.
- Patients with small-bowel resections and intestinal malabsorption may need parenteral administration.
- Most CNS and GI adverse reactions occur at higher doses, such as 15 mg daily for 1 month.
- ***Look alike–sound alike:*** Don't confuse folic acid with folinic acid.

## PATIENT TEACHING

- Teach patient about proper nutrition to prevent recurrence of anemia.
- Stress importance of follow-up visits and laboratory studies.
- Teach patient about foods that contain folic acid: liver, oranges, whole wheat, broccoli, and Brussels sprouts.

**SAFETY ALERT!**

# fondaparinux sodium

fon-dah-PEAR-ah-nucks

Arixtra

*Therapeutic class:* Anticoagulant
*Pharmacologic class:* Activated factor X inhibitor
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 2.5 mg/0.5 ml, 5 mg/0.4 ml, 7.5 mg/0.6 ml, 10 mg/0.8 ml single-dose prefilled syringe

## INDICATIONS & DOSAGES

➤ **To prevent deep vein thrombosis (DVT), which may lead to pulmonary embolism, in patients undergoing surgery for hip fracture, hip replacement, knee replacement, or abdominal surgery**

*Adults who weigh 50 kg (110 lb) or more:* 2.5 mg subcutaneously once daily for 5 to 9 days. Give first dose after hemostasis is established, 6 to 8 hours after surgery. Giving the dose earlier than 6 hours after surgery increases the risk of major bleeding. Patients undergoing hip fracture surgery should receive an extended prophylaxis course of up to 24 additional days; a total of 32 days (perioperative and extended prophylaxis) has been tolerated.

➤ **Acute DVT (with warfarin); acute pulmonary embolism (with warfarin) when treatment is started in the hospital**

*Adults who weigh more than 100 kg (220 lb):* 10 mg subcutaneously daily for 5 to 9 days (drug has been given for up to 26 days) and until INR level is 2 to 3. Begin warfarin therapy as soon as possible, usually within 72 hours.

*Adults who weigh 50 to 100 kg:* 7.5 mg subcutaneously daily for 5 to 9 days (drug has been given for up to 26 days) and until INR level is 2 to 3. Begin warfarin therapy as soon as possible, usually within 72 hours.

*Adults who weigh less than 50 kg:* 5 mg subcutaneously daily for 5 to 9 days (drug has been given for up to 26 days) and until INR level is 2 to 3. Begin warfarin therapy as soon as possible, usually within 72 hours.

## ADMINISTRATION

**Subcutaneous**

- Give subcutaneously only, never I.M. Inspect the single-dose, prefilled syringe for particulate matter and discoloration before giving.
- Give the drug in fatty tissue, rotating injection sites. If the drug has been properly injected, the needle will pull back into the syringe security sleeve and the white safety indicator will appear above the blue upper body. A soft click may be heard or felt when the syringe plunger is fully released. After injection of the syringe contents, the plunger automatically rises while the needle withdraws from the skin and retracts into the security sleeve. Don't recap the needle.
- **Incompatibilities:** Other injections or infusions.

## ACTION

Binds to antithrombin III (AT-III) and potentiates the neutralization of factor Xa by AT-III, which interrupts coagulation and inhibits formation of thrombin and blood clots.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 2–3 hr | Unknown |

*Half-life:* 17 to 21 hours.

## ADVERSE REACTIONS

**CNS:** *fever*, insomnia, dizziness, confusion, headache, pain.
**CV:** hypotension, edema.
**GI:** *nausea*, constipation, vomiting, diarrhea, dyspepsia.
**GU:** UTI, urine retention.
**Hematologic:** ***hemorrhage,*** *anemia,* hematoma, ***postoperative hemorrhage, thrombocytopenia.***
**Metabolic:** hypokalemia.
**Skin:** mild local irritation (injection site bleeding, rash, pruritus), bullous eruption, purpura, rash, increased wound drainage.

## INTERACTIONS

**Drug-drug.** *Drugs that increase risk of bleeding (NSAIDs, platelet inhibitors, anticoagulants):* May increase risk of hemorrhage. Stop these drugs before starting fondaparinux. If use together is unavoidable, monitor patient closely.
**Drug-herb.** *Angelica (dong quai), boldo, bromelains, capsicum, chamomile, dandelion, danshen, devil's claw, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, licorice, meadowsweet, onion, passion flower, red clover, willow:* May increase risk of bleeding. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase AST, ALT, and bilirubin levels. May decrease potassium and hemoglobin levels and hematocrit.
- May decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with creatinine clearance less than 30 ml/minute and in those who are hypersensitive to the drug.
- Contraindicated for prophylaxis in patients who weigh less than 50 kg who are undergoing hip fracture, hip replacement, knee replacement, or abdominal surgery.
- Contraindicated in patients with active major bleeding, bacterial endocarditis, or thrombocytopenia with a positive test result for antiplatelet antibody after taking fondaparinux.
- Use cautiously in patients being treated with platelet inhibitors; in those at increased risk for bleeding, such as congenital or acquired bleeding disorders; in those with active ulcerative and angiodysplastic GI disease; in those with hemorrhagic stroke; and in patients shortly after brain, spinal, or ophthalmologic surgery.
- Use cautiously in elderly patients, in patients with creatinine clearance of 30 to 50 ml/minute, and in those with a history of heparin-induced thrombocytopenia, a bleeding diathesis, uncontrolled arterial hypertension, or a history of recent GI ulceration, diabetic retinopathy, or hemorrhage.

***Alert:*** Use cautiously in latex-sensitive patients; the packaging (needle guard) contains dry natural rubber.

***Overdose S&S:*** Hemorrhagic complications.

## NURSING CONSIDERATIONS

- Don't use interchangeably with heparin, low–molecular-weight heparins, or heparinoids.

***Alert:*** To avoid loss of drug, don't expel air bubble from the syringe.

**Black Box Warning** Patients who receive epidural or spinal anesthesia or spinal puncture are at increased risk for developing an epidural or spinal hematoma, which may result in long-term or permanent paralysis. Monitor these patients closely for neurologic impairment. ■

- Monitor renal function periodically and stop drug in patients who develop unstable renal function or severe renal impairment while receiving therapy.
- Routinely assess patient for signs and symptoms of bleeding, and regularly monitor CBC, platelet count, creatinine level, and stool occult blood test results. Stop use if platelet count is less than 100,000/$mm^3$.
- Anticoagulant effects may last for 2 to 4 days after stopping drug in patients with normal renal function.
- PT and activated PTT aren't suitable monitoring tests to measure drug activity. If coagulation parameters change unexpectedly or patient develops major bleeding, stop drug.

## PATIENT TEACHING

- Tell patient to report signs and symptoms of bleeding.
- Instruct patient to avoid OTC products that contain aspirin or other salicylates.
- Advise patient to consult with prescriber before starting herbal therapy; many herbs have anticoagulant, antiplatelet, or fibrinolytic properties.
- Teach patient the correct technique for subcutaneous use, if needed.

# formoterol fumarate

for-MOH-te-rol

Foradil Aerolizer, Perforomist

*Therapeutic class:* Bronchodilator
*Pharmacologic class:* Selective $beta_2$-adrenergic agonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules for inhalation:* 12 mcg
*Inhalation solution:* 20 mcg/2-ml vial

## INDICATIONS & DOSAGES

➤ **Maintenance treatment and prevention of bronchospasm in patients with reversible obstructive airway disease or nocturnal asthma, who usually require treatment with short-acting inhaled $beta_2$ agonists**

*Adults and children age 5 and older:* One 12-mcg capsule by inhalation via Aerolizer inhaler every 12 hours. Total daily dosage shouldn't exceed 1 capsule b.i.d. (24 mcg/day). If symptoms occur between doses, use a short-acting $beta_2$ agonist for immediate relief.

➤ **To prevent exercise-induced bronchospasm**

*Adults and children age 5 and older:* One 12-mcg capsule by inhalation via Aerolizer inhaler at least 15 minutes before exercise p.r.n. Don't give additional doses within 12 hours of first dose.

➤ **Maintenance treatment of bronchoconstriction in patients with COPD (chronic bronchitis, emphysema)**

*Adults:* One 20-mcg/2 ml vial (Perforomist) by oral inhalation through a jet nebulizer every 12 hours. Maximum dose, 40 mcg/day. Or, one 12-mcg capsule (Foradil) by inhalation via Aerolizer inhaler every 12 hours; total daily dosage shouldn't exceed 24 mcg/day.

## ADMINISTRATION

### Inhalational

**Foradil**

- Give Foradil capsules only by oral inhalation and only with the Aerolizer inhaler. They aren't for oral ingestion. Patient shouldn't exhale into the device. Capsules should remain in the unopened blister until administration time and be removed immediately before use.
- Pierce Foradil capsules only once. In rare instances, the gelatin capsule may break into small pieces and get delivered to the mouth or throat upon inhalation. The Aerolizer contains a screen that should catch any broken pieces before they leave the device. To minimize the possibility of shattering the capsule, strictly follow storage and use instructions.

**Perforomist**

- Give Perforomist inhalational solution through a standard jet nebulizer connected to an air compressor.

## ACTION

Long-acting selective $beta_2$ agonist that causes bronchodilation. It ultimately increases cAMP, leading to relaxation of bronchial smooth muscle and inhibition of mediator release from mast cells.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Inhalation powder | 5 min | 1–3 hr | 12 hr |
| Inhalation solution | 12 min | 1–3 hr | 12 hr |

*Half-life:* 10 hours for Foradil; 7 hours for Perforomist.

## ADVERSE REACTIONS

**CNS:** tremor, dizziness, insomnia, nervousness, headache, fatigue, malaise.
**CV:** ***arrhythmias,*** chest pain, angina, hypertension, hypotension, tachycardia, palpitations.
**EENT:** dry mouth, tonsillitis, dysphonia, nasopharyngitis.
**GI:** nausea, vomiting, diarrhea.

**Metabolic:** ***metabolic acidosis,*** hypokalemia, hyperglycemia.
**Musculoskeletal:** muscle cramps.
**Respiratory:** bronchitis, chest infection, dyspnea.
**Skin:** rash.
**Other:** viral infection.

## INTERACTIONS

**Drug-drug.** *Adrenergics:* May potentiate sympathetic effects of formoterol. Use together cautiously.
*Beta blockers:* May antagonize effects of beta agonists, causing bronchospasm in asthmatic patients. Avoid use except when benefit outweighs risks. Use cardioselective beta blockers with caution to minimize risk of bronchospasm.
*Diuretics, steroids, xanthine derivatives:* May increase hypokalemic effect of formoterol. Use together cautiously.
*MAO inhibitors, tricyclic antidepressants, other drugs that prolong QT interval:* May increase risk of ventricular arrhythmias. Use together cautiously.
*Non–potassium-sparing diuretics, such as loop or thiazide diuretics:* May worsen ECG changes or hypokalemia. Use together cautiously, and monitor patient for toxicity.

## EFFECTS ON LAB TEST RESULTS

• May increase glucose level. May decrease potassium level.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components, or with other long-acting beta$_2$ agonists.
• Use cautiously in patients with CV disease, especially coronary insufficiency, cardiac arrhythmias, and hypertension, and in those who are unusually responsive to sympathomimetic amines.
• Use cautiously in patients with diabetes mellitus because hyperglycemia and ketoacidosis have occurred rarely with the use of beta agonists.
• Use cautiously in patients with seizure disorders or thyrotoxicosis and in breast-feeding women.
• Use for asthma only as additional therapy for patients whose condition is not adequately controlled with other asthma-controller medications.
***Overdose S&S:*** Exaggeration of adverse reactions, hypotension, cardiac arrest.

## NURSING CONSIDERATIONS

• Drug isn't indicated for patients who can control asthma symptoms with just occasional use of inhaled, short-acting beta$_2$ agonists or for treatment of acute bronchospasm requiring immediate reversal with short-acting beta$_2$ agonists or in patients with rapidly deteriorating or significantly worsening asthma.
• Drug may be used along with short-acting beta agonists, inhaled corticosteroids, and theophylline therapy for asthma management.
***Alert:*** Drug isn't a substitute for short-acting beta$_2$ agonists for immediate relief of bronchospasm or as substitute for inhaled or oral corticosteroids.
• Patients using drug twice daily shouldn't take additional doses to prevent exercise-induced bronchospasm.
• For patients formerly using regularly scheduled short-acting beta$_2$ agonists, decrease use of the short-acting drug to an as-needed basis when starting long-acting formoterol.
**Black Box Warning** Drug may increase the risk of asthma-related death. Use only as additional therapy for patients not adequately controlled on low to medium dose of inhaled corticosteroids or in patients whose disease is severe and requires treatment with two maintenance therapies. ■
***Alert:*** As with all beta$_2$ agonists, drug may produce life-threatening paradoxical bronchospasm. If bronchospasm occurs, notify prescriber immediately.
***Alert:*** If patient develops tachycardia, hypertension, or other CV adverse effects, drug may need to be stopped.
• Watch for immediate hypersensitivity reactions, such as anaphylaxis, urticaria, angioedema, rash, and bronchospasm.
• ***Look alike–sound alike:*** Don't confuse Foradil with Toradol.

## PATIENT TEACHING

• Tell patient not to increase the dosage or frequency of use without medical advice.

- Warn patient not to stop or reduce other medication taken for asthma.
- Advise patient that drug isn't to be used for acute asthmatic episodes. Prescriber should give a short-acting beta$_2$ agonist for this use.
- Advise patient to report worsening symptoms, treatment that becomes less effective, or increased use of short-acting beta agonists.
- Tell patient to report nausea, vomiting, shakiness, headache, fast or irregular heart beat, or sleeplessness.
- Tell patient using drug for exercise-induced bronchospasm to take it at least 15 minutes before exercise and to wait 12 hours before taking additional doses.
- Tell patient not to use the Foradil Aerolizer with a spacer device or to exhale or blow into the Aerolizer.
- Advise patient to avoid washing the Aerolizer and to always keep it dry. Each refill contains a new device to replace the old one.
- Tell patient to avoid exposing capsules to moisture and to handle them only with dry hands.
- Advise woman to notify prescriber if she becomes pregnant or is breast-feeding.

## fosamprenavir calcium

foss-am-PREN-ah-ver

Lexiva

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Protease inhibitor
*Pregnancy risk category C*

### AVAILABLE FORMS

*Oral suspension:* 50 mg/ml
*Tablets:* 700 mg

### INDICATIONS & DOSAGES

➤ **HIV infection, with other antiretrovirals**

*Adults:* In patients not previously treated, 1,400 mg P.O. b.i.d. (without ritonavir). Or, 1,400 mg P.O. once daily and ritonavir 200 mg P.O. once daily. Or, 1,400 mg P.O. once daily and ritonavir 100 mg P.O. once daily. Or, 700 mg P.O. b.i.d. and ritonavir 100 mg P.O. b.i.d. In patients previously treated with a protease inhibitor, 700 mg P.O. b.i.d. plus ritonavir 100 mg P.O. b.i.d.
*Children ages 6 and older:* In patients not previously treated, 30 mg/kg oral suspension b.i.d., not to exceed adult dosage of 1,400 mg b.i.d., or 18 mg/kg oral suspension plus ritonavir 3 mg/kg b.i.d., not to exceed adult dosage of fosamprenavir 700 mg plus ritonavir 100 mg b.i.d. In therapy-experienced children age 6 and older, 18 mg/kg oral suspension plus ritonavir 3 mg/kg b.i.d., not to exceed adult dosage of fosamprenavir 700 mg plus ritonavir 100 mg b.i.d. When administered without ritonavir, adult regimen of fosamprenavir 1,400 mg tablets b.i.d. may be used for children weighing at least 47 kg (104 lb). When administered with ritonavir, fosamprenavir tablets may be used for children weighing at least 39 kg (86 lb); ritonavir capsules may be used for children weighing at least 33 kg (73 lb).
*Children ages 2 to 5:* In patients not previously treated, 30 mg/kg oral suspension b.i.d., not to exceed adult dosage of 1,400 mg b.i.d. Don't use in therapy-experienced children in this age-group.
***Adjust-a-dose:*** If the patient has mild hepatic impairment (Child-Pugh score of 5 to 6), reduce dosage to 700 mg P.O. b.i.d. without ritonavir (in therapy-naive patients) or 700 mg b.i.d. plus ritonavir 100 mg once daily (in therapy-naive or protease inhibitor–experienced patients). If the patient has moderate hepatic impairment (Child-Pugh score of 7 to 9), reduce dosage to 700 mg b.i.d. (in therapy-naive patients) without ritonavir or 450 mg b.i.d. plus ritonavir 100 mg once daily (in therapy-naive or protease inhibitor–experienced patients). If the patient has severe hepatic impairment (Child-Pugh score of 10 to 12), reduce dosage to 350 mg b.i.d. without ritonavir (in therapy-naive patients). Don't use in combination with ritonavir.

### ADMINISTRATION

**P.O.**

- Give drug with other antiretrovirals.
- Tablets may be taken with or without food.

• Adults should take oral suspension without food. Children should take oral suspension with food. If patient vomits within 30 minutes after taking medication, dose should be repeated.
• Shake oral suspension before using.

## ACTION

Converts rapidly to amprenavir, which binds to the active site of HIV-1 protease and forms immature noninfectious viral particles.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1½–4 hr | Unknown |

*Half-life:* 7¼ hours.

## ADVERSE REACTIONS

**CNS:** *depression, fatigue, headache, oral paresthesia.*
**CV:** ***MI.***
**GI:** *abdominal pain, diarrhea, nausea, vomiting.*
**Metabolic:** hyperglycemia, hypercholesterolemia.
**Skin:** *rash,* pruritus.

## INTERACTIONS

**Drug-drug.** *Amitriptyline, cyclosporine, imipramine, rapamycin, tacrolimus:* May increase levels of these drugs. Monitor drug levels.
*Antiarrhythmics (amiodarone, systemic lidocaine, quinidine):* May increase antiarrhythmic level. Use together cautiously and monitor antiarrhythmic levels.
*Atorvastatin:* May increase atorvastatin level. Give 20 mg/day or less of atorvastatin and monitor patient carefully. Or, consider other HMG-CoA reductase inhibitors, such as fluvastatin, pravastatin, or rosuvastatin.
*Benzodiazepines (alprazolam, clorazepate, diazepam, flurazepam):* May increase benzodiazepine level. Decrease benzodiazepine dosage as needed.
*Bepridil:* May increase bepridil level, possibly leading to arrhythmias. Use together cautiously.
*Calcium channel blockers (amlodipine, diltiazem, felodipine, isradipine, nifedipine, nicardipine, nimodipine, nisoldipine, verapamil):* May increase calcium channel blocker level. Use together cautiously.
*Carbamazepine, dexamethasone, $H_2$-receptor antagonists, phenobarbital, phenytoin, proton-pump inhibitors:* May decrease amprenavir level. Use together cautiously.
*Delavirdine:* May cause loss of virologic response and resistance to delavirdine. Avoid using together.
*Dihydroergotamine, ergonovine, ergotamine, flecainide, methylergonovine, midazolam, pimozide, propafenone, triazolam:* May cause serious adverse reactions. Avoid using together.
*Efavirenz, nevirapine, saquinavir:* May decrease amprenavir level. Appropriate combination doses haven't been established.
*Efavirenz with ritonavir:* May decrease amprenavir level. Increase ritonavir by 100 mg/day (300 mg total) when giving efavirenz, fosamprenavir, and ritonavir once daily. No change needed in ritonavir when giving efavirenz, fosamprenavir, and ritonavir twice daily.
*Ethinyl estradiol and norethindrone:* May increase ethinyl estradiol and norethindrone levels. Recommend nonhormonal contraception.
*Indinavir, nelfinavir:* May increase amprenavir level. Appropriate combination doses haven't been established.
*Ketoconazole, itraconazole:* May increase ketoconazole and itraconazole levels. Reduce ketoconazole or itraconazole dosage as needed if patient receives more than 400 mg/day. (More than 200 mg/day isn't recommended.).
*Lopinavir with ritonavir:* May decrease amprenavir and lopinavir levels. Appropriate combination doses haven't been established.
*Lovastatin, simvastatin:* May increase risk of myopathy, including rhabdomyolysis. Avoid using together.
*Methadone:* May decrease methadone level. Increase methadone dosage as needed.
*Rifabutin:* May increase rifabutin level. Obtain CBC weekly to watch for neutropenia, and decrease rifabutin dosage by at least half. If patient receives ritonavir, decrease dosage by at least 75% from the usual 300 mg/day. (Maximum, 150 mg every other day or three times weekly.).
*Rifampin:* May decrease amprenavir level and drug effects. Avoid using together.

*Sildenafil, tadalafil, vardenafil:* May increase levels of these drugs. Recommend cautious use of sildenafil at 25 mg every 48 hours, tadalafil at 10 mg every 72 hours, or vardenafil at no more than 2.5 mg every 24 hours. If patient receives ritonavir, advise no more than 2.5 mg vardenafil every 72 hours, and tell patient to report adverse events.
*Warfarin:* May alter warfarin level. Monitor INR.
**Drug-herb.** *St. John's wort:* May cause loss of virologic response and resistance to drug or its class of protease inhibitors. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, glucose, lipase, and triglyceride levels.
- May decrease neutrophil count.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Contraindicated with dihydroergotamine, ergonovine, ergotamine, flecainide, methylergonovine, midazolam, pimozide, propafenone, and triazolam.
- Use cautiously in patients allergic to sulfonamides and those with hepatic impairment or cardiac disease.
- Use in pregnant woman only when benefit to mother justifies risk to fetus.
- Tell woman not to breast-feed during therapy.

⚠ ***Overdose S&S:*** Increased ALT and AST levels.

### NURSING CONSIDERATIONS

- Patients with hepatitis B or C or marked increase in transaminases before treatment may have increased risk of transaminase elevation. Monitor patient closely.
- Monitor cholesterol, triglyceride, lipase, ALT, AST, and glucose levels before starting therapy and periodically throughout treatment.
- Assess and manage lipid disorders as clinically appropriate.
- Ask patient if he's allergic to sulfa drugs.
- Monitor patient with hemophilia for spontaneous bleeding.
- During first treatment, monitor patient for opportunistic infections, such as *Mycobacterium avium* complex, CMV, *Pneumocystis jiroveci (carinii)* pneumonia, and tuberculosis.
- Assess patient for redistribution or accumulation of body fat, as in central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, facial wasting, breast enlargement, and a cushingoid appearance.

### PATIENT TEACHING

- Tell patient that drug doesn't reduce the risk of transmitting HIV to others.
- Inform patient that the drug may reduce the risk of progression to AIDS.
- Explain that fosamprenavir must be used with other antiretrovirals.
- Tell patient not to alter the dose or stop taking drug without consulting prescriber.
- Drug interacts with many other drugs; urge patient to tell prescriber about any prescription, OTC, or herbal medicines he's taking (especially St. John's wort).
- Explain that body fat may redistribute or accumulate.

## foscarnet sodium (PFA, phosphonoformic acid)

foss-CAR-net

Foscavir

*Therapeutic class:* Antiviral
*Pharmacologic class:* Pyrophosphate analogue
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 24 mg/ml in 250- and 500-ml bottles

### INDICATIONS & DOSAGES

**Black Box Warning** Drug is only indicated for use in immunocompromised patients with cytomegalovirus (CMV) retinitis and mucocutaneous acyclovir-resistant herpes simplex virus (HSV) infections. ▮

➤ **CMV retinitis in patients with AIDS**

*Adults:* Initially, for induction, 60 mg/kg I.V. over a minimum of 1 hour every 8 hours

or 90 mg/kg I.V. over 1½ to 2 hours every 12 hours for 2 to 3 weeks, depending on patient response. Follow with a maintenance infusion of 90 to 120 mg/kg over 2 hours daily.

➤ **Acyclovir-resistant HSV infections**

*Adults:* 40 mg/kg I.V. over 1 hour every 8 to 12 hours for 2 to 3 weeks or until healed.

***Adjust-a-dose:*** Adjust dosage when creatinine clearance is less than 1.4 ml/minute/kg. If clearance falls below 0.4 ml/minute/kg, stop drug. Consult manufacturer's package insert for specific dosage adjustments.

## ADMINISTRATION

### I.V.

**Black Box Warning** To minimize renal toxicity, make sure patient is adequately hydrated before and during infusion. ■

▼ Don't exceed the recommended dosage, rate, or frequency of infusion. Doses must be individualized according to patient's renal function.

▼ Drug may be infused via a central or peripheral vein with enough blood flow for rapid distribution and dilution. If infusing into a central vein, don't dilute the commercially available form (24 mg/ml). If infusing into a peripheral vein, dilute to 12 mg/ml with $D_5W$ or normal saline solution to decrease risk of local irritation. Use an infusion pump.

▼ Give induction treatment over 1 to 2 hours, depending on the dose, and maintenance infusions over 2 hours.

▼ **Incompatibilities:** Acyclovir, amphotericin B, co-trimoxazole, dextrose 30%, diazepam, digoxin, diphenhydramine, dobutamine, droperidol, ganciclovir, haloperidol, lactated Ringer's solution, leucovorin, lorazepam, midazolam, pentamidine, phenytoin, prochlorperazine, promethazine, solutions containing calcium (such as total parenteral nutrition), trimetrexate, vancomycin.

## ACTION

Inhibits herpes virus replication in vitro by blocking the pyrophosphate-binding site on DNA polymerases and reverse transcriptases.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Immediate | Unknown |

*Half-life:* 3 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia, dizziness, fatigue, fever, headache, hypoesthesia, malaise, neuropathy, paresthesia,* **SEIZURES,** abnormal coordination, agitation, aggression, amnesia, anxiety, aphasia, ataxia, cerebrovascular disorder, confusion, dementia, depression, EEG abnormalities, generalized spasms, hallucinations, insomnia, meningitis, nervousness, pain, sensory disturbances, somnolence, stupor, tremor.

**CV:** *ECG abnormalities, first-degree AV block, flushing, hypertension, hypotension, palpitations, sinus tachycardia,* chest pain, edema.

**EENT:** conjunctivitis, eye pain, pharyngitis, rhinitis, sinusitis, visual disturbances.

**GI:** *abdominal pain, anorexia, diarrhea, nausea, vomiting,* ***pancreatitis,*** constipation, dysphagia, dry mouth, dyspepsia, flatulence, melena, rectal hemorrhage, taste perversion, ulcerative stomatitis.

**GU:** ***acute renal failure,*** *abnormal renal function,* albuminuria, candidiasis, dysuria, polyuria, urethral disorder, urinary retention, UTI.

**Hematologic:** *anemia,* ***bone marrow suppression, granulocytopenia, leukopenia, thrombocytopenia,*** thrombocytosis.

**Hepatic:** abnormal hepatic function.

**Metabolic:** hyperphosphatemia, *hypocalcemia, hypokalemia,* **HYPOMAGNESEMIA,** *hypophosphatemia, hyponatremia.*

**Musculoskeletal:** arthralgia, back pain, leg cramps, myalgia.

**Respiratory:** ***bronchospasm,*** *cough, dyspnea,* hemoptysis, pneumonitis, ***pneumothorax,*** pulmonary infiltration, ***respiratory insufficiency,*** stridor.

**Skin:** *diaphoresis, rash,* erythematous rash, facial edema, pruritus, seborrhea, skin discoloration, skin ulceration.

**Other:** ***sarcoma, sepsis,*** abscess, bacterial or fungal infections, flulike symptoms, inflammation and pain at infusion site, lymphadenopathy, lymphoma-like disorder, rigors.

### INTERACTIONS

**Drug-drug.** *Nephrotoxic drugs (such as aminoglycosides, amphotericin B):* May increase risk of nephrotoxicity. Avoid using together.
*Pentamidine:* May increase risk of nephrotoxicity; severe hypocalcemia also has been reported. Monitor renal function tests and electrolytes.
*Zidovudine:* May increase risk or severity of anemia. Monitor blood counts.

### EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, bilirubin, creatinine, and phosphate levels. May decrease calcium, hemoglobin, magnesium, phosphate, potassium, and sodium levels.
- May increase platelet count. May decrease granulocyte, platelet, and WBC counts.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.

**Black Box Warning** In patients with abnormal renal function, use cautiously and reduce dosage. Drug is nephrotoxic and can worsen renal impairment. Some degree of nephrotoxicity occurs in most patients. ▮
***Overdose S&S:*** Seizures, renal impairment, paresthesia (limb or perioral), calcium and phosphate electrolyte disturbances.

### NURSING CONSIDERATIONS

***Alert:*** Because drug is highly toxic, which is probably dose-related, always use the lowest effective maintenance dose.
- Monitor creatinine clearance frequently during therapy because of drug's adverse effects on renal function. Obtain a baseline 24-hour creatinine clearance. Monitor level two to three times weekly during induction and at least once every 1 to 2 weeks during maintenance.

**Black Box Warning** Drug can alter electrolyte levels; monitor levels using a schedule similar to that established for creatinine clearance. Assess patient for tetany and seizures caused by abnormal electrolyte levels. ▮
- Monitor patient's hemoglobin level and hematocrit. Anemia occurs in about a third of patients and may be severe enough to require transfusions.
- Drug may cause a dose-related transient decrease in ionized calcium, which may not always show up in patient's laboratory values.

### PATIENT TEACHING

- Explain the importance of adequate hydration throughout therapy.
- Advise patient to report tingling around the mouth, numbness in the arms and legs, and pins-and-needles sensations.
- Tell patient to alert nurse about discomfort at I.V. insertion site.

F

## fosinopril sodium

foh-SIN-oh-pril

Monopril✐

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* ACE inhibitor
*Pregnancy risk category C; D in 2nd and 3rd trimesters*

### AVAILABLE FORMS

*Tablets:* 10 mg, 20 mg, 40 mg

### INDICATIONS & DOSAGES

➤ **Hypertension**
*Adults:* Initially, 10 mg P.O. daily; adjust dosage based on blood pressure response at peak and trough levels. Usual dosage is 20 to 40 mg daily; maximum is 80 mg daily. Dosage may be divided.
*Children who weigh more than 50 kg (110 lb):* Initially, 5 to 10 mg P.O. once daily. Maximum dosage is 40 mg/day.
➤ **Heart failure**
*Adults:* Initially, 10 mg P.O. once daily. Increase dosage over several weeks to a maximum of 40 mg P.O. daily, if needed.
***Adjust-a-dose:*** For patients with moderate to severe renal failure or vigorous diuresis, start with 5 mg P.O. once daily.

### ADMINISTRATION

**P.O.**
- Give drug without regard for meals.

## ACTION

Inhibits ACE, preventing conversion of angiotensin I to angiotensin II, a potent vasoconstrictor. Less angiotensin II decreases peripheral arterial resistance, thus decreasing aldosterone secretion, which reduces sodium and water retention and lowers blood pressure.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 3 hr | 24 hr |

*Half-life:* 11½ hours.

## ADVERSE REACTIONS

**CNS:** *dizziness*, ***stroke,*** headache, fatigue, syncope, paresthesia, sleep disturbance.
**CV:** ***MI,*** chest pain, angina pectoris, rhythm disturbances, palpitations, hypotension, orthostatic hypotension.
**EENT:** tinnitus, sinusitis.
**GI:** ***pancreatitis,*** nausea, vomiting, diarrhea, dry mouth, abdominal distention, abdominal pain, constipation.
**GU:** sexual dysfunction, renal insufficiency.
**Hepatic:** ***hepatitis.***
**Metabolic:** ***hyperkalemia.***
**Musculoskeletal:** arthralgia, musculoskeletal pain, myalgia.
**Respiratory:** *dry, persistent, tickling, nonproductive cough,* ***bronchospasm.***
**Skin:** urticaria, rash, photosensitivity reactions, pruritus.
**Other:** ***angioedema,*** decreased libido, gout.

## INTERACTIONS

**Drug-drug.** *Antacids:* May impair absorption. Separate dosage times by at least 2 hours.
*Azathioprine:* May increase risk of anemia or leukopenia. Monitor hematologic studies if used together.
*Diuretics, other antihypertensives:* May cause excessive hypotension. Stop diuretic or lower fosinopril dosage.
*Lithium:* May increase lithium level and lithium toxicity. Monitor lithium level.
*Nesiritide:* May increase hypotensive effects. Monitor blood pressure.
*NSAIDs:* May decrease antihypertensive effects. Monitor blood pressure.
*Potassium-sparing diuretics, potassium supplements:* May cause risk of hyperkalemia. Monitor patient closely.
**Drug-herb.** *Capsaicin:* May cause cough. Discourage use together.
*Ma huang:* May decrease antihypertensive effects. Discourage use together.
**Drug-food.** *Salt substitutes containing potassium:* May cause hyperkalemia. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN, creatinine, potassium, and hemoglobin levels and hematocrit.
- May increase liver function test values.
- May cause falsely low digoxin level with the Digi-Tab radioimmunoassay kit for digoxin.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other ACE inhibitors and in breast-feeding women.
- Use cautiously in patients with impaired renal or hepatic function.

**Black Box Warning** Use during pregnancy can cause injury and death to the developing fetus. When pregnancy is detected, stop drug as soon as possible. ■

***Overdose S&S:*** Hypotension.

## NURSING CONSIDERATIONS

- Monitor blood pressure for drug effect.
- Although ACE inhibitors reduce blood pressure in all races, they reduce it less in blacks taking the ACE inhibitor alone. Black patients should take drug with a thiazide diuretic for a more favorable response.
- ACE inhibitors appear to cause a higher risk of angioedema in black patients.
- Monitor potassium intake and potassium level. Diabetic patients, those with impaired renal function, and those receiving drugs that can increase potassium level may develop hyperkalemia.
- Other ACE inhibitors may cause agranulocytosis and neutropenia. Monitor CBC with differential counts before therapy and periodically thereafter.
- Assess renal and hepatic function before and periodically throughout therapy.
- ***Look alike–sound alike:*** Don't confuse fosinopril with lisinopril. Don't confuse Monopril with Monurol.

## PATIENT TEACHING

- Tell patient to avoid salt substitutes; these products may contain potassium, which can cause high potassium level in patients taking drug.
- Instruct patient to contact prescriber if light-headedness or fainting occurs.
- Advise patient to report evidence of infection, such as fever and sore throat.
- Instruct patient to call prescriber if he develops easy bruising or bleeding; swelling of tongue, lips, face, eyes, mucous membranes, arms, or legs; difficulty swallowing or breathing; and hoarseness.
- Urge patient to use caution in hot weather and during exercise. Inadequate fluid intake, vomiting, diarrhea, and excessive perspiration can lead to light-headedness and fainting.
- Tell women of childbearing age to notify prescriber if pregnancy occurs. Drug will need to be stopped.

# fosphenytoin sodium

faws-FEN-i-toe-in

Cerebyx

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* Hydantoin derivative
*Pregnancy risk category D*

## AVAILABLE FORMS

*Injection:* 2 ml (150 mg fosphenytoin sodium equivalent to 100 mg phenytoin sodium), 10 ml (750 mg fosphenytoin sodium equivalent to 500 mg phenytoin sodium)

## INDICATIONS & DOSAGES

➤ **Seizures**

*Adults:* 15 to 20 mg phenytoin sodium equivalent (PE)/kg I.V. at 100 to 150 mg PE/minute as loading dose; then 4 to 6 mg PE/kg daily I.V. as maintenance dose.

➤ **To prevent and treat seizures during neurosurgery (nonemergent loading or maintenance dosing)**

*Adults:* Loading dose of 10 to 20 mg PE/kg I.M. or I.V. at infusion rate not exceeding 150 mg PE/minute. Maintenance dose is 4 to 6 mg PE/kg daily I.V. or I.M.

➤ **Short-term substitution for oral phenytoin therapy**

*Adults:* Same total daily dose equivalent as oral phenytoin sodium therapy given as a single daily dose I.M. or I.V. at infusion rate not exceeding 150 mg PE/minute. Some patients may need more frequent dosing.
*Elderly patients:* Phenytoin clearance is decreased slightly in elderly patients; lower or less-frequent dosing may be required.

F

## ADMINISTRATION

**I.V.**

▼ If rapid phenytoin loading is a main goal, this form is preferred.
▼ For status epilepticus, give I.V. rather than I.M. because therapeutic phenytoin level occurs more rapidly.
▼ For infusion, dilute in $D_5W$ or normal saline solution for injection to yield 1.5 to 25 mg PE/ml.
▼ Don't give more than 150 mg PE/minute. For a 50-kg (110-lb) patient, infusion should take 5 to 7 minutes. (Infusion of identical molar dose of phenytoin takes at least 15 minutes, because giving phenytoin I.V. at more than 50 mg/minute causes adverse CV effects.)
▼ Patients receiving 20 mg PE/kg at 150 mg PE/minute typically feel discomfort, usually in the groin. To reduce discomfort, slow or temporarily stop infusion.
▼ Monitor patient's ECG, blood pressure, and respirations continuously during maximum phenytoin level—about 10 to 20 minutes after end of fosphenytoin infusion. Severe CV complications are most common in elderly or gravely ill patients. If needed, decrease rate or stop infusion.
▼ Store drug under refrigeration. Don't store at room temperature longer than 48 hours. Discard vials that develop particulate matter.
▼ **Incompatibilities:** Other I.V. drugs.

**I.M.**

- Depending on dose ordered, may require two separate I.M. injections.
- I.M. administration generates systemic phenytoin levels similar enough to oral phenytoin sodium to allow essentially interchangeable use.

• Store drug under refrigeration. Don't store at room temperature longer than 48 hours. Discard vials that develop particulate matter.

## ACTION

May stabilize neuronal membranes and limit seizure activity either by increasing efflux or decreasing influx of sodium ions across cell membranes in the motor cortex during generation of nerve impulses.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | End of infusion | Unknown |
| I.M. | Unknown | 30 min | Unknown |

*Half-life:* 15 minutes.

## ADVERSE REACTIONS

**CNS:** *ataxia, dizziness, somnolence,* ***brain edema, intracranial hypertension,*** agitation, asthenia, dysarthria, extrapyramidal syndrome, fever, headache, hypesthesia, incoordination, increased or decreased reflexes, nervousness, paresthesia, speech disorders, stupor, thinking abnormalities, tremor, vertigo.
**CV:** hypertension, hypotension, tachycardia, vasodilation.
**EENT:** *nystagmus,* amblyopia, deafness, diplopia, tinnitus.
**GI:** constipation, dry mouth, taste perversion, tongue disorder, vomiting.
**GU:** pelvic pain.
**Metabolic:** hypokalemia.
**Musculoskeletal:** back pain, myasthenia.
**Respiratory:** pneumonia.
**Skin:** *pruritus,* ecchymoses, injection site reaction and pain, rash.
**Other:** accidental injury, chills, facial edema, infection.

## INTERACTIONS

**Drug-drug.** *Amiodarone, chloramphenicol, chlordiazepoxide, cimetidine, diazepam, disulfiram, estrogens, ethosuximide, fluoxetine, $H_2$ antagonists, halothane, isoniazid, methylphenidate, phenothiazines, phenylbutazone, salicylates, succinimides, sulfonamides, tolbutamide, trazodone:* May increase phenytoin level and effect. Use together cautiously.
*Carbamazepine, reserpine:* May decrease phenytoin level. Monitor patient.
*Corticosteroids, doxycycline, estrogens, furosemide, hormonal contraceptives, quinidine, rifampin, theophylline, vitamin D, warfarin:* May decrease effects of these drugs because of increased hepatic metabolism. Monitor patient closely.
*Lithium:* May increase lithium toxicity. Monitor patient's neurologic status closely. Marked neurologic symptoms have been reported despite normal lithium level.
*Phenobarbital, valproate sodium, valproic acid:* May increase or decrease phenytoin level. May increase or decrease levels of these drugs. Monitor patient.
*Tricyclic antidepressants:* May lower seizure threshold and require adjustments in phenytoin dosage. Use together cautiously.
**Drug-lifestyle.** *Alcohol use:* Acute intoxication may increase phenytoin level and effect. Discourage use together.
*Long-term alcohol use:* May decrease phenytoin level. Monitor patient and strongly discourage use together.

## EFFECTS ON LAB TEST RESULTS

• May increase alkaline phosphatase, GGT, and glucose levels. May decrease folate, potassium, and $T_4$ levels.
• May cause falsely low dexamethasone and metyrapone test results.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components, phenytoin, or other hydantoins.
• Contraindicated in those with sinus bradycardia, SA block, second- or third-degree AV block, or Adams-Stokes syndrome.
• Use cautiously in patients with porphyria and in those with history of hypersensitivity to similarly structured drugs, such as barbiturates, oxazolidinediones, and succinimide.
***Alert:*** If patient develops acute hepatotoxicity, discontinue drug and don't readminister.
***Overdose S&S:*** Asystole, bradycardia, cardiac arrest, hypocalcemia, hypotension, lethargy, metabolic acidosis, nausea, syncope, tachycardia, vomiting, death.

## NURSING CONSIDERATIONS

• Most significant drug interactions are those commonly seen with phenytoin.

***Alert:*** Drug should always be prescribed and dispensed in phenytoin sodium equivalent units (PE). Don't make adjustments in the recommended doses when substituting fosphenytoin for phenytoin, and vice versa.
- In status epilepticus, phenytoin may be used instead of fosphenytoin as maintenance, using the appropriate dose.
- Phosphate load provided by fosphenytoin (0.0037 millimole phosphate/mg PE fosphenytoin) must be taken into consideration when treating patients who need phosphate restriction, such as those with severe renal impairment. Monitor laboratory values.
- Asian patients who have tested positive for the allele HLA-B*1502 have a potentially increased risk of serious skin reactions, including Stevens-Johnson syndrome and toxic epidermal necrolysis. Monitor these patients carefully.
- If patient gets exfoliative, purpuric, or bullous rash or signs and symptoms of lupus erythematosus, Stevens-Johnson syndrome, or toxic epidermal necrolysis, stop drug and notify prescriber. If rash is mild (measleslike or scarlatiniform), therapy may resume after rash disappears. If rash recurs when therapy is resumed, further fosphenytoin or phenytoin administration is contraindicated. Document that patient is allergic to drug.
- Stop drug in patients with acute hepatotoxicity.
- After administration, phenytoin levels shouldn't be monitored until conversion to phenytoin is essentially complete—about 2 hours after the end of an I.V. infusion or 4 hours after I.M. administration.
- Interpret total phenytoin levels cautiously in patients with renal or hepatic disease or hypoalbuminemia caused by an increased fraction in unbound phenytoin. It may be more useful to monitor unbound phenytoin levels in these patients. When giving drug I.V., monitor patients with renal and hepatic disease because they are at increased risk for more frequent and severe adverse reactions.
- Monitor glucose level closely in diabetic patients; drug may cause hyperglycemia.
- Abrupt withdrawal of drug may precipitate status epilepticus.
- ***Look alike–sound alike:*** Don't confuse Cerebyx with Cerezyme, Celexa, or Celebrex.

### PATIENT TEACHING
- Warn patient that sensory disturbances may occur with I.V. administration.
- Instruct patient to immediately report adverse reactions, especially rash.
- Warn patient not to stop drug abruptly or adjust dosage without discussing with prescriber.
- Advise women of childbearing age to discuss drug therapy with prescriber if considering pregnancy.
- Advise women of childbearing age that breast-feeding isn't recommended during therapy.

**SAFETY ALERT!**

## fospropofol disodium
fos-PROP-ah-fol

Lusedra

*Therapeutic class:* Hypnotic
*Pharmacologic class:* Sedative-hypnotic
*Pregnancy risk category B*

### AVAILABLE FORMS
*Injection:* 35 mg/ml in 30-ml single-use vials

### INDICATIONS & DOSAGES
➤ **Monitored anesthesia care in patients undergoing diagnostic or therapeutic procedures**
*Adults younger than age 65 classified as American Society of Anesthesiologists (ASA) Physical (P) category 1 or 2:*
Initially, 6.5 mg/kg (maximum, 16.5 ml) I.V., followed by 1.6 mg/kg (maximum, 4 ml) I.V. as needed to achieve adequate sedation. Administer supplemental doses no more frequently than every 4 minutes, when patient is able to respond purposefully to verbal or light tactile stimuli.
***Adjust-a-dose:*** For patients age 65 and older or those with severe systemic disease (ASA P3 or P4), reduce dosage by 75%.

## ADMINISTRATION

**I.V.**

▼ Don't use drug if particulate matter or discoloration is present.
▼ May administer through a free-flowing I.V. line containing $D_5W$, $D_5$ and one-quarter normal saline solution, $D_5$ and half-normal saline solution, normal saline solution, $D_5$ and lactated Ringer's solution, lactated Ringer's solution, half-normal saline solution, and $D_5$ and half-normal saline solution with 20 mEq potassium chloride.
▼ Flush infusion line with normal saline solution before and after administration.
▼ **Incompatibilities:** Other I.V. drugs.

## ACTION

Unknown. Thought to produce hypnosis through positive modulation of GABA, an inhibitory neurotransmitter.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | 2–12 min | Unknown |

*Half-life:* About 1 hour.

## ADVERSE REACTIONS

**CNS:** headache, *paresthesia*, procedural pain.
**CV:** hypotension.
**GI:** nausea, vomiting.
**Respiratory:** HYPOXEMIA, ***respiratory depression.***
**Skin:** *pruritus.*
**Other:** ***unresponsiveness to tactile or painful stimulation.***

## INTERACTIONS

**Drug-drug.** *Benzodiazepines, opioids, sedative-hypnotics, other cardiorespiratory depressants:* May cause additive cardiorespiratory effects. Avoid use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

• Use cautiously in patients with compromised myocardial function, reduced vascular tone, or reduced vascular volume.
• Use only if benefit to mother outweighs risk to fetus.
• Safe use in children hasn't been established
***Overdose S&S:*** Cardiorespiratory depression.

## NURSING CONSIDERATIONS

***Alert:*** Staff trained in administration of general anesthesia and who aren't involved in surgical or diagnostic procedure should give drug and monitor patient closely.
***Alert:*** Have resuscitation equipment available in case of severe respiratory depression.
***Alert:*** Always administer supplemental oxygen while patient is receiving drug.
• Continuously monitor pulse oximetry, ECG, and vital signs during sedation and through the recovery period.
• Assess patient's ability to purposefully respond to verbal or light tactile stimuli.

## PATIENT TEACHING

• Reassure patient that he'll be monitored appropriately during administration.
• Inform patient that burning, tingling, or stinging (usually in perineal area) may occur while drug is being injected and that these sensations are typically mild and resolve quickly without treatment.
• Advise patient to have an escort to take him home after procedure.

# frovatriptan succinate

frow-vah-TRIP-tan

Frova

*Therapeutic class:* Antimigraine
*Pharmacologic class:* Serotonin 5-$HT_1$ receptor agonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 2.5 mg

## INDICATIONS & DOSAGES

➤ **Acute treatment of migraine attacks with or without aura**

*Adults:* 2.5 mg P.O. taken at the first sign of migraine attack. If the headache recurs, a second tablet may be taken at least 2 hours

after the first dose. The total daily dose shouldn't exceed 7.5 mg.

## ADMINISTRATION

### P.O.

- Give drug without regard for food.
- Give drug with a full glass of water.
- If headache returns after first dose, give a second dose after 2 hours. Don't give more than 3 tablets in 24 hours.

## ACTION

May inhibit excessive dilation of extracerebral and intracranial arteries during migraine headaches.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–4 hr | Unknown |

*Half-life:* 26 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, headache, fatigue, paresthesia, insomnia, anxiety, somnolence, dysesthesia, hypoesthesia, hot or cold sensation, pain.
**CV:** ***coronary artery vasospasm, transient myocardial ischemia, MI, ventricular tachycardia, ventricular fibrillation,*** chest pain, palpitations, flushing.
**EENT:** abnormal vision, tinnitus, sinusitis, rhinitis.
**GI:** dry mouth, dyspepsia, vomiting, abdominal pain, diarrhea, nausea.
**Musculoskeletal:** skeletal pain.
**Skin:** increased sweating.

## INTERACTIONS

**Drug-drug.** *5-$HT_1$ agonists:* May cause additive effects. Separate doses by 24 hours.
*Ergotamine-containing or ergot-type drugs (such as dihydroergotamine or methysergide):* May cause prolonged vasospastic reactions. Separate doses by 24 hours.
*SSRIs (such as citalopram, fluoxetine, fluvoxamine, paroxetine, sertraline):* May cause weakness, hyperreflexia, and incoordination. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or any of its components.
- Contraindicated in patients with history or symptoms of ischemic heart disease or coronary artery vasospasm, including Prinzmetal's variant angina; in those with cerebrovascular or peripheral vascular disease, including ischemic bowel disease; in those with uncontrolled hypertension; and in those with hemiplegic or basilar migraine.
- Contraindicated within 24 hours of another triptan, drug containing ergotamine, or ergot-type drug.
- Contraindicated in patients with risk factors for coronary artery disease (CAD), such as hypertension, hypercholesterolemia, smoking, obesity, diabetes, strong family history of CAD, postmenopausal women, or men older than age 40, unless patient is free from cardiac disease. If drug is used in such a patient, monitor patient closely and consider obtaining an ECG after the first dose. Intermittent, long-term users of triptans or those with risk factors should undergo periodic cardiac evaluation while using drug.
- Use cautiously in breast-feeding women. It's unknown if drug appears in breast milk.
- The safety of treating an average of more than four migraine headaches in a 30-day period hasn't been established.

## NURSING CONSIDERATIONS

***Alert:*** Serious cardiac events, including acute MI, life-threatening cardiac arrhythmias, and death may occur within a few hours of taking a triptan.
- Use drug only when patient has a clear diagnosis of migraine. If a patient has no response for the first migraine attack treated with frovatriptan, reconsider the diagnosis of migraine.

***Alert:*** Combining a triptan with an SSRI or an SSNRI may cause serotonin syndrome. Symptoms may include restlessness, hallucinations, loss of coordination, fast heartbeat, rapid changes in blood pressure, increased body temperature, hyperreflexia, nausea, vomiting, and diarrhea. Serotonin syndrome is more likely to occur when

starting or increasing the dose of a triptan, SSRI, or SSNRI.

### PATIENT TEACHING

- Instruct patient to take dose at first sign of migraine headache. If headache comes back after first dose, he may take a second dose after 2 hours. Tell patient not to take more than 3 tablets in 24 hours.
- Caution patient to take extra care or avoid driving and operating machinery if dizziness or fatigue develops after taking drug.
- Stress importance of immediately reporting pain, tightness, heaviness, or pressure in chest, throat, neck, or jaw, or rash or itching after taking drug.
- Instruct the patient not to take drug within 24 hours of taking another serotonin-receptor agonist or ergot-type drug.
- Tell patient dose may be taken with or without food, but to take with a full glass of fluid.

**SAFETY ALERT!**

## fulvestrant

full-VES-trant

Faslodex

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Estrogen antagonist
*Pregnancy risk category D*

### AVAILABLE FORMS

*Injection:* 50 mg/ml in 2.5-ml and 5-ml prefilled syringes

### INDICATIONS & DOSAGES

➤ **Hormone receptor–positive metastatic breast cancer with disease progression after antiestrogen therapy**

*Postmenopausal women:* 500 mg I.M. slowly into buttocks over 1 to 2 minutes as two 5-ml injections, one in each buttock on days 1, 15, 29, and then once monthly thereafter.

***Adjust-a-dose:*** For patients with moderate hepatic impairment (Child-Pugh class B) give 250 mg I.M. as one 5-ml injection on days 1, 15, 29, and then monthly thereafter.

### ADMINISTRATION

**I.M.**

- Drug is a potential teratogen. Follow safe-handling procedures.
- Drug may be warmed before use by storing at room temperature for 1 hour or rolling injection gently in hands.
- Expel gas bubble from syringe before giving.
- When using the 2.5-ml syringes, both must be given to obtain full dose.
- Give slowly into buttocks.

### ACTION

Competitively binds estrogen receptors and downregulates estrogen-receptor protein in human breast cancer cells. It's effective in treating estrogen receptor–positive breast tumors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.M. | Unknown | 7 days | 1 mo |

*Half-life:* About 40 days.

### ADVERSE REACTIONS

**CNS:** *asthenia, headache, pain,* dizziness, insomnia, fever, paresthesia, depression, anxiety.
**CV:** *hot flashes,* chest pain, peripheral edema, *vasodilation.*
**EENT:** *pharyngitis.*
**GI:** *nausea, vomiting, constipation, abdominal pain, diarrhea,* anorexia.
**GU:** UTI.
**Hematologic:** anemia.
**Musculoskeletal:** *bone pain, back pain, pelvic pain,* arthritis.
**Respiratory:** *dyspnea, cough.*
**Skin:** *injection site pain,* rash, sweating.
**Other:** accidental injury, flulike syndrome.

### INTERACTIONS

None reported.

### EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level and hematocrit.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in pregnant women and in patients allergic to drug or any of its components.

● Use cautiously in patients with moderate or severe hepatic impairment.

### NURSING CONSIDERATIONS

● Because drug is given I.M., don't use in patients with bleeding diatheses or thrombocytopenia, or in those taking anticoagulants.
● Make sure woman isn't pregnant before starting drug.

### PATIENT TEACHING

● Caution women to avoid pregnancy and to report suspected pregnancy immediately.
● Inform patient of the most common side effects, including pain at injection site, headache, GI symptoms, back pain, hot flashes, and sore throat.

## furosemide

fur-OH-se-mide

Lasix✐*, Lasix Special†

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Loop diuretic
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 10 mg/ml
*Oral solution:* 10 mg/ml, 40 mg/5 ml
*Tablets:* 20 mg, 40 mg, 80 mg, 500 mg†

### INDICATIONS & DOSAGES

➤ **Acute pulmonary edema**

*Adults:* 40 mg I.V. injected slowly over 1 to 2 minutes; then 80 mg I.V. in 60 to 90 minutes if needed.

➤ **Edema**

*Adults:* 20 to 80 mg P.O. daily in the morning. If response is inadequate, give a second dose, and each succeeding dose, every 6 to 8 hours. Carefully increase dose in 20- to 40-mg increments up to 600 mg daily. Once effective dose is attained, may give once or twice daily. Or, 20 to 40 mg I.V. or I.M., increased by 20 mg 2 hours after previous dose until desired effect achieved.
*Infants and children:* 2 mg/kg P.O. daily, increased by 1 to 2 mg/kg in 6 to 8 hours if needed; carefully adjusted up to 6 mg/kg daily if needed. Or, 1 mg/kg slowly I.V. or I.M. Dosage may be increased by 1 mg/kg 2 hours after previous dose if needed up to 6 mg/kg/day.

➤ **Hypertension**

*Adults:* 40 mg P.O. b.i.d. Dosage adjusted based on response. May be used as adjunct to other antihypertensives if needed.

### ADMINISTRATION

**P.O.**

● To prevent nocturia, give in the morning. Give second dose if ordered in early afternoon, 6 to 8 hours after morning dose.
● Give drug with food to prevent GI upset.
● Store tablets in light-resistant container to prevent discoloration (doesn't affect potency). Refrigerate oral solution to ensure drug stability.

**I.V.**

▼ If discolored yellow, don't use.
▼ For direct injection, give over 1 to 2 minutes.
▼ For infusion, dilute with $D_5W$, normal saline solution, or lactated Ringer's solution.
▼ To avoid ototoxicity, infuse no more than 4 mg/minute.
▼ Use prepared infusion solution within 24 hours.
▼ **Incompatibilities:** Acidic solutions, aminoglycosides, amiodarone, ascorbic acid, azithromycin, bleomycin, buprenorphine, chlorpromazine, ciprofloxacin, diazepam, diltiazem, dobutamine, doxapram, doxorubicin, droperidol, epinephrine, erythromycin, esmolol, filgrastim, fluconazole, fructose 10% in water, gentamicin, hydralazine, idarubicin, invert sugar 10% in electrolyte #2, isoproterenol, levofloxacin, mannitol, meperidine, methocarbamol, metoclopramide, midazolam, milrinone, morphine, netilmicin, norepinephrine, ondansetron, oxytetracycline, prochlorperazine, promethazine, protamine, quinidine, tetracycline, thiamine, vinblastine, vincristine, vitamins B and C.

**I.M.**

● To prevent nocturia, give in the morning. Give second dose if ordered in early afternoon, 6 to 8 hours after morning dose.
● Record administration site.

## ACTION

Inhibits sodium and chloride reabsorption at the proximal and distal tubules and the ascending loop of Henle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 20–60 min | 1–2 hr | 6–8 hr |
| I.V. | Within 5 min | 30 min | 2 hr |
| I.M. | Unknown | 30 min | 2 hr |

*Half-life:* 30 minutes.

## ADVERSE REACTIONS

**CNS:** vertigo, headache, dizziness, paresthesia, weakness, restlessness, fever.
**CV:** orthostatic hypotension, thrombophlebitis with I.V. administration.
**EENT:** transient deafness, blurred or yellowed vision, tinnitus.
**GI:** abdominal discomfort and pain, diarrhea, anorexia, nausea, vomiting, constipation, ***pancreatitis.***
**GU:** azotemia, nocturia, polyuria, frequent urination, oliguria.
**Hematologic:** ***agranulocytosis, aplastic anemia, leukopenia, thrombocytopenia,*** anemia.
**Hepatic:** hepatic dysfunction, jaundice.
**Metabolic:** volume depletion and dehydration, asymptomatic hyperuricemia, impaired glucose tolerance, hypokalemia, hypochloremic alkalosis, hyperglycemia, dilutional hyponatremia, hypocalcemia, hypomagnesemia.
**Musculoskeletal:** muscle spasm.
**Skin:** dermatitis, purpura, photosensitivity reactions, transient pain at I.M. injection site.
**Other:** gout.

## INTERACTIONS

**Drug-drug.** *Aminoglycoside antibiotics, cisplatin:* May increase ototoxicity. Use together cautiously.
*Amphotericin B, corticosteroids, corticotropin, metolazone:* May increase risk of hypokalemia. Monitor potassium level closely.
*Antidiabetics:* May decrease hypoglycemic effects. Monitor glucose level.
*Antihypertensives:* May increase risk of hypotension. Use together cautiously. Decrease antihypertensive dose if needed.
*Cardiac glycosides, neuromuscular blockers:* May increase toxicity of these drugs from furosemide-induced hypokalemia. Monitor potassium level.
*Chlorothiazide, chlorthalidone, hydrochlorothiazide, indapamide, metolazone:* May cause excessive diuretic response, causing serious electrolyte abnormalities or dehydration. Adjust doses carefully, and monitor patient closely for signs and symptoms of excessive diuretic response.
*Ethacrynic acid:* May increase risk of ototoxicity. Avoid using together.
*Lithium:* May decrease lithium excretion, resulting in lithium toxicity. Monitor lithium level.
*NSAIDs:* May inhibit diuretic response. Use together cautiously.
*Phenytoin:* May decrease diuretic effects of furosemide. Use together cautiously.
*Propranolol:* May increase propranolol level. Monitor patient closely.
*Salicylates:* May cause salicylate toxicity. Use together cautiously.
*Sucralfate:* May reduce diuretic and antihypertensive effect. Separate doses by 2 hours.
**Drug-herb.** *Aloe:* May increase drug effect. Discourage use together.
*Dandelion:* May interfere with drug activity. Discourage use together.
*Ginseng:* May decrease drug effect. Discourage use together.
*Licorice:* May cause unexpected rapid potassium loss. Discourage use together.
**Drug-lifestyle.** *Sun exposure:* May increase risk for photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase cholesterol, glucose, BUN, creatinine, and uric acid levels. May decrease calcium, hemoglobin, magnesium, potassium, and sodium levels.
- May decrease granulocyte, platelet, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with anuria.
- Use cautiously in patients with hepatic cirrhosis and in those allergic to sulfonamides. Use during pregnancy only if potential benefits to mother clearly outweigh risks to fetus.

***Overdose S&S:*** Dehydration, blood volume reduction, hypotension, electrolyte imbalance.

## NURSING CONSIDERATIONS

***Alert:*** Monitor weight, blood pressure, and pulse rate routinely with long-term use.

**Black Box Warning** Drug is potent diuretic and can cause severe diuresis with water and electrolyte depletion. Monitor patient closely.

- If oliguria or azotemia develops or increases, drug may need to be stopped.
- Monitor fluid intake and output and electrolyte, BUN, and carbon dioxide levels frequently.
- Watch for signs of hypokalemia, such as muscle weakness and cramps.
- Consult prescriber and dietitian about a high-potassium diet or potassium supplements. Foods rich in potassium include citrus fruits, tomatoes, bananas, dates, and apricots.
- Monitor glucose level in diabetic patients.
- Drug may not be well absorbed orally in patient with severe heart failure. Drug may need to be given I.V. even if patient is taking other oral drugs.
- Monitor uric acid level, especially in patients with a history of gout.
- Monitor elderly patients, who are especially susceptible to excessive diuresis, because circulatory collapse and thromboembolic complications are possible.
- ***Look alike–sound alike:*** Don't confuse furosemide with torsemide or Lasix with Lonox, Lidex, or Luvox.

## PATIENT TEACHING

- Advise patient to take drug with food to prevent GI upset, and to take drug in morning to prevent need to urinate at night. If patient needs second dose, tell him to take it in early afternoon, 6 to 8 hours after morning dose.
- Inform patient of possible need for potassium or magnesium supplements.
- Instruct patient to stand slowly to prevent dizziness and to limit alcohol intake and strenuous exercise in hot weather to avoid worsening dizziness upon standing quickly.
- Advise patient to immediately report ringing in ears, severe abdominal pain, or sore throat and fever; these symptoms may indicate toxicity.

***Alert:*** Discourage patient from storing different types of drugs in the same container, increasing the risk of drug errors. The most popular strengths of this drug and digoxin are white tablets about equal in size.

- Tell patient to check with prescriber or pharmacist before taking OTC drugs.
- Teach patient to avoid direct sunlight and to use protective clothing and a sunblock because of risk of photosensitivity reactions.

G

# gabapentin

gab-ah-PEN-tin

Neurontin✒

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* Gamma-aminobutyric acid (GABA) structural analogue
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 100 mg, 300 mg, 400 mg
*Oral solution:* 250 mg/5 ml
*Tablets:* 100 mg, 300 mg, 400 mg, 600 mg, 800 mg

## INDICATIONS & DOSAGES

➤ **Adjunctive treatment of partial seizures with or without secondary generalization in patients with epilepsy**

*Adults and children older than age 12:* Initially, 300 mg P.O. t.i.d. Increase dosage as needed and tolerated to 1,800 mg daily in divided doses. Dosages up to 3,600 mg daily have been well tolerated.

➤ **Adjunctive treatment to control partial seizures in children**

*Starting dosage, children ages 3 to 12:* 10 to 15 mg/kg daily P.O. in three divided doses, adjusting over 3 days to reach effective dosage.
*Effective dosage, children ages 5 to 12:* 25 to 35 mg/kg daily P.O. in three divided doses.
*Effective dosage, children ages 3 to 4:* 40 mg/kg daily P.O. in three divided doses.

➤ **Postherpetic neuralgia**
*Adults:* 300 mg P.O. once daily on first day, 300 mg b.i.d. on day 2, and 300 mg t.i.d. on day 3. Adjust as needed for pain to a maximum daily dose of 1,800 mg in three divided doses.
***Adjust-a-dose:*** In patients age 12 and older with creatinine clearance of 30 to 59 ml/minute, give 400 to 1,400 mg daily, divided into two doses. For clearance of 15 to 29 ml/minute, give 200 to 700 mg daily in single dose. For clearance less than 15 ml/minute, give 100 to 300 mg daily, in single dose. Reduce daily dose in proportion to creatinine clearance (patients with a clearance of 7.5 ml/minute should receive one-half the daily dose of those with a clearance of 15 ml/minute). For patients receiving hemodialysis, maintenance dose is based on estimates of creatinine clearance. Give supplemental dose of 125 to 350 mg after each 4 hours of hemodialysis.
➤ **Pain from diabetic neuropathy ♦**
*Adults:* 900 mg to 3.6 g P.O. daily in three divided doses.
➤ **Vasomotor symptoms in women with breast cancer and in postmenopausal women ♦**
*Women:* For cancer-related symptoms, 200 to 1,600 mg P.O. once daily to q.i.d. for 4 to 8 weeks. For postmenopausal symptoms, 200 to 2,700 mg P.O. once daily to q.i.d. for up to 12 weeks.

## ADMINISTRATION

**P.O.**
- Give drug without regard for food.
- Refrigerate oral solution.

## ACTION

Unknown. Structurally related to GABA but doesn't interact with GABA receptors, isn't converted into GABA or GABA agonist, doesn't inhibit GABA reuptake, and doesn't prevent degradation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* 5 to 7 hours.

## ADVERSE REACTIONS

**CNS:** *ataxia, dizziness, fatigue, somnolence,* abnormal thinking, amnesia, depression, dysarthria, incoordination, nervousness, tremor.
**CV:** peripheral edema, vasodilation.
**EENT:** amblyopia, diplopia, dry throat, pharyngitis, rhinitis.
**GI:** constipation, dry mouth, dyspepsia, increased appetite, nausea, vomiting.
**GU:** impotence.
**Hematologic:** ***leukopenia.***
**Metabolic:** weight gain.
**Musculoskeletal:** back pain, fractures, myalgia.
**Respiratory:** coughing.
**Skin:** abrasion, pruritus.
**Other:** dental abnormalities.

## INTERACTIONS

**Drug-drug.** *Antacids:* May decrease absorption of gabapentin. Separate dosage times by at least 2 hours.
*Hydrocodone:* May increase gabapentin level and decrease hydrocodone level. Monitor patient for increased adverse effects or loss of clinical effect.

## EFFECTS ON LAB TEST RESULTS

- May decrease WBC count.
- May cause false-positive results with the Ames-N-Multistix SG dipstick test for urine protein when used with other antiepileptics.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- In elderly patients, adjust dosage based on creatinine clearance values due to potentially decreased renal function.

***Overdose S&S:*** Double vision, slurred speech, drowsiness, lethargy, diarrhea.

## NURSING CONSIDERATIONS

- Give first dose at bedtime to minimize drowsiness, dizziness, fatigue, and ataxia.

***Alert:*** Closely monitor all patients taking or starting antiepileptic drugs for changes in behavior indicating worsening of suicidal thoughts or behavior or depression. Symptoms such as anxiety, agitation, hostility, mania, and hypomania may be precursors to emerging suicidality.
- If drug is to be stopped or an alternative drug substituted, do so gradually over at

least 1 week to minimize risk of precipitating seizures.
***Alert:*** Don't suddenly withdraw other anticonvulsants in patients starting gabapentin therapy.
• Routine monitoring of drug levels isn't necessary. Drug doesn't appear to alter levels of other anticonvulsants.
• ***Look alike–sound alike:*** Don't confuse Neurontin with Noroxin.

### PATIENT TEACHING
• Advise patient that drug may be taken without regard for meals.
• Instruct patient to take first dose at bedtime to minimize adverse reactions.
• Tell patient with seizures the maximum time interval between doses shouldn't exceed 12 hours.
• Warn patient to avoid driving and operating heavy machinery until drug's CNS effects are known.
• Advise patient not to stop drug abruptly.
• Advise women to discuss drug therapy with prescriber if considering pregnancy.
• Tell patient to keep oral solution refrigerated.

## galantamine hydrobromide
gah-LAN-tah-meen

Razadyne, Razadyne ER

*Therapeutic class:* Anti-Alzheimer
*Pharmacologic class:* Cholinesterase inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS
*Capsules (extended-release):* 8 mg, 16 mg, 24 mg
*Oral solution:* 4 mg/ml
*Tablets:* 4 mg, 8 mg, 12 mg

### INDICATIONS & DOSAGES
➤ **Mild to moderate Alzheimer's dementia**
*Adults:* Initially, 4 mg b.i.d., preferably with morning and evening meals. If dose is well tolerated after minimum of 4 weeks of therapy, increase dosage to 8 mg b.i.d. A further increase to 12 mg b.i.d. may be attempted, but only after at least 4 weeks of therapy at the previous dosage. Dosage range is 16 to 24 mg daily in two divided doses.

Or, 8 mg extended-release capsule P.O. once daily in the morning with food. Increase to 16 mg P.O. once daily after a minimum of 4 weeks. May further increase to 24 mg once daily after a minimum of 4 weeks, based upon patient response and tolerability.
***Adjust-a-dose:*** For patients with Child-Pugh score of 7 to 9, dosage usually shouldn't exceed 16 mg daily. Drug isn't recommended for patients with Child-Pugh score of 10 to 15. For patients with moderate renal impairment, dosage usually shouldn't exceed 16 mg daily. For patients with creatinine clearance less than 9 ml/minute, drug isn't recommended.

### ADMINISTRATION
**P.O.**
***Alert:*** Give Razadyne tablets twice daily; give Razadyne ER capsules once daily. To avoid dosing errors, verify any prescription that suggests a different dosing schedule.
• Give drug with food and antiemetics, and ensure adequate fluid intake to decrease the risk of nausea and vomiting.
• Use proper technique when dispensing the oral solution with the pipette. Dispense measured amount into a beverage and give to patient right away.

### ACTION
Thought to enhance cholinergic function by increasing acetylcholine level in brain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Unknown |

*Half-life:* About 7 hours.

### ADVERSE REACTIONS
**CNS:** depression, dizziness, headache, tremor, insomnia, somnolence, fatigue, syncope, tremor.
**CV:** ***bradycardia, AV block.***
**EENT:** rhinitis.
**GI:** *diarrhea, nausea, vomiting,* abdominal pain, dyspepsia, anorexia.
**GU:** UTI, hematuria.
**Hematologic:** anemia.
**Metabolic:** weight loss.

## INTERACTIONS

**Drug-drug.** *Amitriptyline, fluoxetine, fluvoxamine, quinidine:* May decrease galantamine clearance. Monitor patient closely.
*Anticholinergics:* May antagonize anticholinergic activity. Monitor patient.
*Cholinergics (such as bethanechol, succinylcholine):* May have synergistic effect. Monitor patient closely. May need to avoid use before procedures using general anesthesia with succinylcholine-type neuromuscular blockers.
*Cimetidine, clarithromycin, erythromycin, ketoconazole, paroxetine:* May increase galantamine bioavailability. Monitor patient closely.
*NSAIDs:* May increase risk of bleeding due to increased gastric acid secretion. Monitor patient for symptoms of active or occult GI bleeding.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in patients with supraventricular cardiac conduction disorders and in those taking other drugs that significantly slow heart rate.
- Use cautiously during or before procedures involving anesthesia using succinylcholine-type or similar neuromuscular blockers.
- Use cautiously in patients with history of peptic ulcer disease and in those taking NSAIDs. Because of the potential for cholinomimetic effects, use cautiously in patients with bladder outflow obstruction, seizures, asthma, or COPD.

***Overdose S&S:*** Muscle weakness, muscle fasciculations, nausea, vomiting, GI cramping, excessive salivation, excessive lacrimation, sweating, bradycardia, hypotension, respiratory depression, syncope, seizures, QT interval prolongation, hallucinations.

## NURSING CONSIDERATIONS

- Drug may cause bradycardia and heart block. Consider all patients at risk for adverse effects on cardiac conduction.

***Alert:*** The original trade name for galantamine, "Reminyl," was changed to "Razadyne" because of name confusion with the antidiabetic Amaryl.

- If drug is stopped for several days or longer, restart at the lowest dose and gradually increase, at 4-week or longer intervals, to the previous dosage level.
- Because of the risk of increased gastric acid secretion, monitor patients closely for symptoms of active or occult GI bleeding, especially those with an increased risk of developing ulcers.

## PATIENT TEACHING

- Advise caregiver to give drug with morning and evening meals (for the conventional form), or only in the morning (for the extended-release form).
- Inform patient that nausea and vomiting are common adverse effects.
- Teach caregiver the proper technique when measuring the oral solution with the pipette. Tell her to place measured amount in a nonalcoholic beverage and have patient drink right away.
- Urge patient or caregiver to report slow heartbeat immediately.
- Advise patient and caregiver that although drug may improve cognitive function, it doesn't alter the underlying disease process.

# ganciclovir (DHPG)

gan-SYE-kloe-vir

Cytovene

*Therapeutic class:* Antiviral
*Pharmacologic class:* Synthetic purine nucleoside analogue of guanine
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 250 mg, 500 mg
*Injection:* 500 mg/vial

## INDICATIONS & DOSAGES

**Black Box Warning** Ganciclovir capsules are indicated only for prevention of CMV disease in patients with advanced HIV infection at risk for CMV disease, for maintenance treatment of CMV retinitis

in immunocompromised patients, and for prevention of CMV disease in solid organ transplant recipients. ■

**Black Box Warning** Ganciclovir I.V. is indicated only for the treatment of CMV retinitis in immunocompromised patients and for the prevention of CMV disease in transplant patients at risk for CMV disease. ■

➤ **CMV retinitis in immunocompromised patients, including those with AIDS and normal renal function**

*Adults:* Induction treatment is 5 mg/kg I.V. every 12 hours for 14 to 21 days. Don't use capsules for induction. Maintenance treatment is 5 mg/kg I.V. daily 7 days per week or 6 mg/kg I.V. daily five times weekly. Or, for maintenance therapy, give 1,000 mg P.O. t.i.d. with food or 500 mg P.O. every 3 hours while awake (six times daily).

➤ **To prevent CMV disease in patients with advanced HIV infection and normal renal function**

*Adults and children age 13 and older:* 1,000 mg P.O. t.i.d. with food.

➤ **To prevent CMV disease in transplant recipients with normal renal function**

*Adults:* 5 mg/kg I.V. (given at a constant rate over 1 hour) every 12 hours for 7 to 14 days; then 5 mg/kg daily 7 days per week or 6 mg/kg daily five times weekly. Duration of therapy depends on degree of immunosuppression.

**Initial I.V. therapy**

| *Creatinine clearance (ml/min)* | *Dose (mg/kg)* | *Interval* |
|---|---|---|
| 50–69 | 2.5 | 12 hr |
| 25–49 | 2.5 | 24 hr |
| 10–24 | 1.25 | 24 hr |
| <10 | 1.25 | 3 times weekly after hemodialysis |

**Maintenance I.V. therapy**

| *Creatinine clearance (ml/min)* | *Dose (mg/kg)* | *Interval* |
|---|---|---|
| 50–69 | 2.5 | 24 hr |
| 25–49 | 1.25 | 24 hr |
| 10–24 | 0.625 | 24 hr |
| <10 | 0.625 | 3 times weekly after hemodialysis |

**P.O. therapy**

| *Creatinine clearance (ml/min)* | *Dose (mg/kg)* | *Interval* |
|---|---|---|
| 50–69 | 1,500 | 24 hr |
| | 500 | 8 hr |
| 25–49 | 1,000 | 24 hr |
| | 500 | 12 hr |
| 10–24 | 500 | 24 hr |
| <10 | 500 | 3 times weekly after hemodialysis |

***Adjust-a-dose:*** Adjust dosage in patients with renal impairment according to the table. If patient is receiving hemodialysis, give dose shortly after session is complete.

G

## ADMINISTRATION

**P.O.**

- Give drug with a meal.
- Don't crush or open capsule.

**I.V.**

▼ To reconstitute, add 10 ml sterile water for injection to 500-mg vial. Shake vial well to dissolve drug.
▼ Further dilute in 50 to 250 ml (usually 100 ml) of compatible I.V. solution.
▼ If fluids are being restricted, dilute to no more than 10 mg/ml.
▼ Don't give as bolus.
▼ Use an infusion pump.
▼ Infuse over at least 1 hour.
▼ Infusing drug too rapidly has toxic effects.
▼ Use caution when preparing solution, which is alkaline.
***Alert:*** Don't give subcutaneously or I.M.
▼ **Incompatibilities:** Aldesleukin, amifostine, aztreonam, cefepime, cytarabine, doxorubicin hydrochloride, fludarabine, foscarnet, ondansetron, other I.V. drugs, paraben (bacteriostatic agent), piperacillin sodium with tazobactam, sargramostim, vinorelbine.

## ACTION

Inhibits binding of deoxyguanosine triphosphate to DNA polymerase, resulting in inhibition of DNA synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–3 hr | Unknown |
| I.V. | Unknown | Immediate | Unknown |

*Half-life:* About 3 hours.

## ADVERSE REACTIONS

**CNS:** *fever,* ***coma, seizures,*** abnormal thinking, agitation, altered dreams, amnesia, anxiety, asthenia, ataxia, confusion, dizziness, headache, somnolence, tremor, neuropathy, paresthesia.
**EENT:** retinal detachment in CMV retinitis patients.
**GI:** *abdominal pain, anorexia, diarrhea, nausea, vomiting,* dry mouth, dyspepsia, flatulence.
**Hematologic:** *anemia,* ***agranulocytosis, leukopenia, thrombocytopenia.***
**Respiratory:** pneumonia.
**Skin:** *rash, sweating,* inflammation, pruritus, pain and phlebitis at injection site.
**Other:** ***sepsis,*** chills, infection.

## INTERACTIONS

**Drug-drug.** *Amphotericin B, cyclosporine, other nephrotoxic drugs:* May increase risk of nephrotoxicity. Monitor renal function.
*Cytotoxic drugs:* May increase toxic effects, especially hematologic effects and stomatitis. Monitor patient closely.
*Imipenem and cilastatin:* May increase seizure activity. Use together only if potential benefits outweigh risks.
*Immunosuppressants (such as azathioprine, corticosteroids, cyclosporine):* May enhance immune and bone marrow suppression. Use together cautiously.
*Probenecid:* May increase ganciclovir level. Monitor patient closely.
***Zidovudine:*** May increase risk of agranulocytosis. Use together cautiously; monitor hematologic function closely.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, creatinine, and GGT levels. May decrease hemoglobin level.
- May decrease granulocyte, neutrophil, platelet, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Contraindicated in patients hypersensitive to drug or acyclovir and in those with an absolute neutrophil count below 500/$mm^3$ or a platelet count below 25,000/$mm^3$.
- Use cautiously and reduce dosage in patients with renal dysfunction. Monitor renal function tests.

**Black Box Warning** Ganciclovir caused aspermatogenesis and was carcinogenic and teratogenic in animal studies.
***Overdose S&S:*** Persistent bone marrow suppression, reversible neutropenia or granulocytopenia, hepatitis, renal toxicity, seizures (all with I.V. form).

## NURSING CONSIDERATIONS

**Black Box Warning** Because of the frequency of agranulocytosis and thrombocytopenia, obtain neutrophil and platelet counts every 2 days during twice-daily doses and at least weekly thereafter.
**Black Box Warning** Ganciclovir capsules are associated with a risk of more rapid rate of CMV retinitis progression. Use capsules as maintenance treatment only in patients for whom this risk is balanced by benefit associated with avoiding daily I.V. infusions.

## PATIENT TEACHING

- Explain importance of drinking plenty of fluids during therapy.
- Instruct patient to report adverse reactions promptly.
- Tell patient to report discomfort at I.V. insertion site.
- Advise patient that drug causes birth defects. Instruct women to use effective birth control; men should use barrier contraception during and for at least 90 days after therapy.
- Tell patient to take capsule with food and to swallow whole. Tell patient not to crush, open, or chew capsule.

# gatifloxacin

ga-ti-FLOKS-a-sin

Zymar, Zymaxid

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Fluoroquinolone
*Pregnancy risk category C*

## AVAILABLE FORMS

*Solution:* 0.3%, 0.5%

## INDICATIONS & DOSAGES

➤ **Bacterial conjunctivitis caused by *Corynebacterium propinguum, Streptococcus mitis, Staphylococcus aureus, Staphylococcus epidermidis, Streptococcus pneumoniae, Haemophilus influenzae***

*Adults and children age 1 and older:* Instill 1 drop into affected eye every 2 hours while patient is awake, up to eight times daily for 2 days. Then instill 1 drop up to q.i.d. for 5 more days.

➤ **Bacterial conjunctivitis caused by *S. mitis, S. aureus, S. epidermidis, S. pneumoniae, H. influenzae***

*Adults and children age 1 and older:* Instill 1 drop Zymaxid into affected eye every 2 hours while patient is awake, up to eight times on day 1. Then instill 1 drop two to four times daily while patient is awake on days 2 to 7.

## ADMINISTRATION

### Ophthalmic

- Apply gentle pressure to the inside corner of the eyelid for 1 to 2 minutes after instilling drop.

## ACTION

Inhibits DNA gyrase and topoisomerase, preventing cell replication and division.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** headache.
**EENT:** *conjunctival irritation, increased lacrimation, keratitis, papillary conjunctivitis,* chemosis, conjunctival hemorrhage, discharge, dry eyes, eye irritation, eyelid edema, pain, red eyes, reduced visual acuity.
**GI:** taste disturbance.

## INTERACTIONS

None reported.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other quinolones.
- Safety and effectiveness in infants less than 1 year have not been established.
- Use cautiously in pregnant or breast-feeding women.

## NURSING CONSIDERATIONS

- Solution isn't for injection subconjunctivally or into the anterior chamber of the eye.
- Systemic drug may cause serious hypersensitivity reactions. If allergic reaction occurs, stop drug and treat symptoms.
- Monitor patient for superinfection.
- Growth of resistant organisms, including fungi, may occur with prolonged use. Monitor patient carefully.

## PATIENT TEACHING

- Urge patient to immediately stop drug and seek medical treatment if evidence of a serious allergic reaction develops, such as itching, rash, swelling of the face or throat, or difficulty breathing.
- Instruct patient to apply gentle pressure to inside corner of eyelid for 1 to 2 minutes after instilling drop.
- Tell patient not to wear contact lenses during treatment.
- Warn patient to avoid touching the applicator tip to anything, including eyes and fingers.
- Teach patient that prolonged use may encourage infections with nonsusceptible bacteria.

**SAFETY ALERT!**

# gemcitabine hydrochloride

jem-SITE-ah-been

Gemzar

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Pyrimidine analogue
*Pregnancy risk category D*

## AVAILABLE FORMS

*Powder for injection:* 200-mg, 1-g vials

## INDICATIONS & DOSAGES

➤ **Locally advanced or metastatic adenocarcinoma of pancreas**

*Adults:* 1,000 mg/m$^2$ I.V. over 30 minutes once weekly for up to 7 weeks, unless

toxicity occurs. Monitor CBC with differential and platelet count before giving each dose.

***Adjust-a-dose:*** If bone marrow suppression is detected, adjust therapy. If absolute granulocyte count (AGC) is 1,000/mm$^3$ or more and platelet count is 100,000/mm$^3$ or more, give full dose. If AGC is 500 to 999/mm$^3$ or platelet count is 50,000 to 99,000/mm$^3$, give 75% of dose. If AGC is below 500/mm$^3$ or platelet count is below 50,000/mm$^3$, withhold dose. Course of 7 weeks is followed by 1 week of rest. Subsequent dosage cycles consist of one infusion weekly for 3 of 4 consecutive weeks. Dosage adjustments for subsequent cycles are based on AGC and platelet count nadirs and degree of nonhematologic toxicity.

➤ **With cisplatin, first-line treatment of inoperable, locally advanced, or metastatic non–small-cell lung cancer**

*Adults:* For 4-week schedule, 1,000 mg/m$^2$ I.V. over 30 minutes on days 1, 8, and 15 of each 28-day cycle. 100 mg/m$^2$ cisplatin on day 1 after gemcitabine infusion.

For 3-week schedule, 1,250 mg/m$^2$ I.V. over 30 minutes on days 1 and 8 of each 21-day cycle. 100 mg/m$^2$ cisplatin on day 1 after gemcitabine infusion.

***Adjust-a-dose:*** If bone marrow suppression is detected, adjust therapy. If absolute granulocyte count (AGC) is 1,000/mm$^3$ or more and platelet count is 100,000/mm$^3$ or more, give full dose. If AGC is 500 to 999/mm$^3$ or platelet count is 50,000 to 99,000/mm$^3$, give 75% of dose. If AGC is below 500/mm$^3$ or platelet count is below 50,000/mm$^3$, withhold dose.

➤ **With carboplatin, for treatment of advanced ovarian cancer that relapsed at least 6 months after platinum-based therapy**

*Adults:* 1,000 mg/m$^2$ I.V. over 30 minutes on days 1 and 8 of each 21-day cycle. Give carboplatin AUC 4 I.V. on day 1 after gemcitabine. Check CBC with differential and platelet count before each dose. The AGC should be 1,500/mm$^3$ or higher and platelet count 100,000/mm$^3$ or higher before each cycle.

***Adjust-a-dose:*** Base adjustment on AGC and platelet count results on day 8 of cycle. If AGC is 1,000 to 1,499/mm$^3$, give 50% of dose. If AGC is below 1,000/mm$^3$ or platelet count is below 75,000/mm$^3$, hold dose. Adjustments for subsequent cycles based on observed toxicities.

➤ **With paclitaxel, first-line therapy for metastatic breast cancer after failure of other adjuvant chemotherapy with an anthracycline**

*Adults:* 1,250 mg/m$^2$ I.V. over 30 minutes on days 1 and 8 of each 21-day cycle, with 175 mg/m$^2$ paclitaxel I.V. as a 3-hour infusion given before gemcitabine dose on day 1 of the cycle. Adjust dosage based on total AGC and platelet counts taken on day 8 of the cycle.

***Adjust-a-dose:*** If AGC is 1,000 to 1,199/mm$^3$ or platelet count is 50,000 to 75,000/mm$^3$, give 75% of dose. If AGC is 700 to 999/mm$^3$ and platelet count is 50,000/mm$^3$ or above, give 50% of dose. If AGC is below 700/mm$^3$ or platelet count is below 50,000/mm$^3$, withhold dose.

## ADMINISTRATION

### I.V.

▼ Preparing and giving parenteral drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.

▼ To prepare solution, add 5 ml of unpreserved normal saline solution for injection to 200-mg vial or 25 ml to 1-g vial. Shake to dissolve.

▼ Resulting concentration is 40 mg/ml; reconstitution at higher concentrations isn't recommended.

▼ If needed, dilute to as little as 0.1 mg/ml by adding normal saline solution for injection.

▼ Make sure solution is clear to light straw-colored and free of particles.

▼ Don't extend infusion time beyond 60 minutes or give drug more often than once weekly; doing so may increase toxicity.

▼ Drug is stable 24 hours at room temperature.

▼ Don't refrigerate reconstituted drug because it may crystallize.

▼ **Incompatibilities:** Acyclovir, amphotericin B, cefoperazone, cefotaxime, furosemide, ganciclovir, imipenem and

cilastatin, irinotecan, methotrexate, methylprednisolone, mitomycin, piperacillin, piperacillin and tazobactam sodium, prochlorperazine, sodium succinate.

## ACTION

Cytotoxic and specific to cell cycle; inhibits DNA synthesis and blocks progression of cells.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* About 2 to 19½ hours.

## ADVERSE REACTIONS

**CNS:** *somnolence, paresthesia, pain, fever.*
**CV:** *edema, peripheral edema.*
**GI:** *stomatitis, nausea, vomiting, constipation, diarrhea.*
**GU:** *proteinuria, hematuria.*
**Hematologic:** *anemia,* ***leukopenia, neutropenia, thrombocytopenia,*** **HEMORRHAGE.**
**Hepatic:** ***hepatotoxicity.***
**Respiratory:** *dyspnea,* ***bronchospasm, pneumonitis.***
**Skin:** *alopecia, rash,* pain at injection site.
**Other:** *flulike syndrome, infection.*

## INTERACTIONS

*Warfarin:* May increase the anticoagulant effect of warfarin. Monitor patient and INR.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, BUN, and creatinine levels. May decrease hemoglobin level.
- May decrease neutrophil, platelet, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in pregnant or breast-feeding women.
- Use cautiously in patients with renal or hepatic impairment.
- Use cautiously when given within 7 days of radiation therapy.
- In children, safety and effectiveness haven't been determined.

***Overdose S&S:*** Myelosuppression, paresthesia, severe rash.

## NURSING CONSIDERATIONS

- Monitor patient closely. Expect dosage modification according to toxicity and degree of myelosuppression. Age, gender, and presence of renal impairment may predispose patient to toxicity.
- Carefully monitor hematologic values, especially of neutrophil and platelet counts.
- Obtain baseline and periodic renal and hepatic laboratory tests.

## PATIENT TEACHING

- Advise patient to watch for evidence of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell patient to take temperature daily.
- Advise patient to promptly report flulike symptoms or breathing problems.
- Tell patient that adverse effects may continue after treatment ends.
- Caution women to avoid pregnancy or breast-feeding during therapy.

G

# gemfibrozil

jem-FI-broe-zil

Lopid✒

*Therapeutic class:* Antilipemic
*Pharmacologic class:* Fibric acid derivative
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 600 mg

## INDICATIONS & DOSAGES

➤ **Types IV and V hyperlipidemia unresponsive to diet and other drugs; to reduce risk of coronary heart disease in patients with type IIb hyperlipidemia who can't tolerate or who are refractory to treatment with bile-acid sequestrants or niacin**

*Adults:* 1,200 mg P.O. daily in two divided doses, 30 minutes before morning and evening meals.

## ADMINISTRATION

**P.O.**

- Give drug 30 minutes before breakfast and dinner.

## ACTION

Inhibits peripheral lipolysis and reduces triglyceride synthesis in the liver; lowers triglyceride levels and increases HDL cholesterol levels.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 2–5 days | 4 wk | Unknown |

*Half-life:* 1¼ hours.

## ADVERSE REACTIONS

**CNS:** fatigue, headache, vertigo.
**CV:** atrial fibrillation.
**GI:** *abdominal and epigastric pain, dyspepsia,* acute appendicitis, constipation, diarrhea, nausea, vomiting.
**Hematologic:** ***leukopenia, thrombocytopenia,*** anemia, eosinophilia.
**Hepatic:** bile duct obstruction.
**Metabolic:** hypokalemia.
**Skin:** dermatitis, eczema, pruritus, rash.

## INTERACTIONS

**Drug-drug.** *Cyclosporine:* May decrease cyclosporine levels. Monitor cyclosporine levels and adjust dose as needed.
*Glyburide:* May increase hypoglycemic effects. Monitor glucose level, and watch for signs of hypoglycemia.
*HMG-CoA reductase inhibitors:* May cause myopathy with rhabdomyolysis. Avoid using together.
*Oral anticoagulants:* May enhance effects of oral anticoagulants. Monitor patient closely.
*Repaglinide:* May increase repaglinide level. Avoid using together if possible. If already taking both drugs, monitor glucose levels and adjust repaglinide dosage.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, and CK levels. May decrease potassium and hemoglobin levels and hematocrit.
- May decrease eosinophil, WBC, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with hepatic or severe renal dysfunction (including primary biliary cirrhosis) or gallbladder disease.

## NURSING CONSIDERATIONS

- Check CBC and test liver function periodically during the first 12 months of therapy.
- If drug has no benefits after 3 months of therapy, stop drug.
- Patient shouldn't take drug together with repaglinide or itraconazole.

## PATIENT TEACHING

- Instruct patient to take drug 30 minutes before breakfast and dinner.
- Teach patient about proper dietary management of cholesterol and triglycerides. When appropriate, recommend weight control, exercise, and smoking cessation programs.
- Because of possible dizziness and blurred vision, advise patient to avoid driving and other hazardous activities until effects of drug are known.
- Tell patient to observe bowel movements and to report evidence of excess fat in feces or other signs of bile duct obstruction.
- Advise patient to report muscle pain to prescriber if occurs during therapy.

# gemifloxacin mesylate

jem-ah-FLOX-a-sin

Factive

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Fluoroquinolone
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 320 mg

## INDICATIONS & DOSAGES

➤ **Acute bacterial worsening of chronic bronchitis caused by *Streptococcus pneumoniae, Haemophilus influenzae, H. parainfluenzae,* or *Moraxella catarrhalis***
*Adults:* 320 mg P.O. once daily for 5 days.
➤ **Mild to moderate community-acquired pneumonia caused by *S. pneumoniae* (including multidrug-resistant strains), *H. influenzae, M. catarrhalis, Mycoplasma pneumoniae, Chlamydia pneumoniae,* or *Klebsiella pneumoniae***
*Adults:* 320 mg P.O. once daily for 7 days.

***Adjust-a-dose:*** If creatinine clearance is 40 ml/minute or less, or if patient receives routine hemodialysis or continuous ambulatory peritoneal dialysis, reduce dosage to 160 mg P.O. once daily.

## ADMINISTRATION

**P.O.**

- Give drug with or without food; however it must be given 2 hours before or 3 hours after an antacid.
- Give plenty of fluids during treatment.

## ACTION

Prevents cell growth by inhibiting DNA gyrase and topoisomerase IV, which interferes with DNA synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | ½–2 hr | Unknown |

*Half-life:* 4 to 12 hours.

## ADVERSE REACTIONS

**CNS:** headache, dizziness.
**GI:** diarrhea, nausea, abdominal pain, vomiting.
**Musculoskeletal:** ruptured tendons.
**Skin:** rash.
**Other:** ***hypersensitivity reactions.***

## INTERACTIONS

**Drug-drug.** *Antacids (magnesium or aluminum), didanosine (chewable tablets, buffered tablets, or pediatric powder for oral solution), ferrous sulfate, multivitamins containing metal cations (such as zinc), sucralfate:* May decrease gemifloxacin level. Give these drugs at least 3 hours before or 2 hours after gemifloxacin.
*Antiarrhythmics of class IA (procainamide, quinidine) or class III (amiodarone, sotalol):* May increase risk of prolonged QTc interval. Avoid using together.
*Antipsychotics, erythromycin, tricyclic antidepressants:* May increase risk of prolonged QTc interval. Use together cautiously.
*Probenecid:* May increase gemifloxacin level. May use with probenecid for this reason.
**Black Box Warning** *Steroids:* May increase risk of tendinitis and tendon rupture. Monitor patient for tendon pain or inflammation.
*Sucralfate:* May decrease gemifloxacin level. Use together cautiously.
*Warfarin:* May increase anticoagulation effect. Monitor PT and INR.
**Drug-lifestyle.** *Sun exposure:* May increase risk of photosensitivity. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, bilirubin, BUN, CK, creatinine, GGT, and potassium levels. May decrease albumin, protein, and sodium levels. May increase or decrease calcium and hemoglobin levels and hematocrit.
- May increase or decrease neutrophil, platelet, and RBC counts.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Drug is associated with increased risk of tendinitis and tendon rupture, especially in patients older than age 60 and those with heart, kidney, or lung transplants.

- Contraindicated in patients hypersensitive to fluoroquinolones, gemifloxacin, or their components.
- Contraindicated in patients with a history of prolonged QTc interval, those with uncorrected electrolyte disorders (such as hypokalemia or hypomagnesemia), and those taking a drug that could prolong the QTc interval.
- Use cautiously in patients with a proarrhythmic condition, epilepsy, or a predisposition to seizures.
- Safety and efficacy haven't been established for children younger than 18.

## NURSING CONSIDERATIONS

- Use drug only for infections caused by susceptible bacteria.

***Alert:*** Don't exceed recommended dosage because this increases the risk of prolonging the QTc interval.

- Mild to moderate maculopapular rash may appear, usually 8 to 10 days after therapy starts. It's more likely in women younger than age 40 and postmenopausal women taking hormone therapy. Stop drug if rash appears.

***Alert:*** Serious, occasionally fatal, hypersensitivity reactions may occur. Stop drug

immediately if hypersensitivity reaction occurs.

**Black Box Warning** Fluoroquinolones may cause tendon rupture, arthropathy, or osteochondrosis; stop drug if patient reports pain or inflammation or ruptures a tendon. ■

- Stop drug if patient has a photosensitivity reaction.
- Fluoroquinolones may cause CNS effects, such as tremors and anxiety. Monitor patient carefully.
- Serious diarrhea may reflect pseudomembranous colitis; drug may need to be stopped.
- Keep patient adequately hydrated to avoid concentration of urine.

## PATIENT TEACHING

- Urge patient to finish full course of treatment, even if symptoms improve.
- Tell patient that drug may be taken with or without food, but that it shouldn't be taken within 3 hours after or 2 hours before an antacid.
- Tell patient to stop drug and seek medical care if evidence of hypersensitivity reaction develops.
- Instruct patient to drink fluids liberally.
- Warn patient against taking OTC drugs or dietary supplements without consulting his prescriber.
- Tell patient to avoid excessive exposure to sunlight or ultraviolet light.
- Urge patient to report pain, inflammation, or rupture of tendons.
- Warn patient to avoid driving or other hazardous activities until effects of drug are known.

# gentamicin sulfate (injection)

jen-ta-MYE-sin

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Aminoglycoside
*Pregnancy risk category D*

## AVAILABLE FORMS

*Injection:* 40 mg/ml (adults), 10 mg/ml (children)

*I.V. infusion (premixed):* 40 mg, 60 mg, 70 mg, 80 mg, 100 mg, 120 mg, in normal saline solution

## INDICATIONS & DOSAGES

➤ **Serious infections caused by sensitive strains of *Pseudomonas aeruginosa, Escherichia coli, Proteus, Klebsiella, Serratia,* or *Staphylococcus***

*Adults:* 3 mg/kg daily in three divided doses I.M. or I.V. infusion every 8 hours. For life-threatening infections, may give up to 5 mg/kg daily in three or four divided doses; reduce dosage to 3 mg/kg daily as soon as patient improves.

*Children:* 2 to 2.5 mg/kg every 8 hours I.M. or by I.V. infusion.

*Neonates older than 1 week and infants:* 2.5 mg/kg every 8 hours I.M. or by I.V. infusion.

*Neonates younger than 1 week and preterm infants:* 2.5 mg/kg every 12 hours I.M. or by I.V. infusion.

***Adjust-a-dose:*** For adults with impaired renal function, doses and frequency are determined by drug level and renal function. To maintain therapeutic levels, adults should receive 1 to 1.7 mg/kg I.M. or by I.V. infusion after each dialysis session, and children should receive 2 to 2.5 mg/kg I.M. or by I.V. infusion after each dialysis session.

## ADMINISTRATION

**I.V.**

▼ Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
▼ For intermittent infusion, dilute with 50 to 200 ml of $D_5W$ or normal saline solution for injection.
▼ Infuse over 30 minutes to 2 hours.
▼ After completing infusion, flush the line with normal saline solution or $D_5W$.
▼ **Incompatibilities:** Allopurinol, amphotericin B, ampicillin, azithromycin, cefazolin, cefepime, cefotaxime, ceftazidime, ceftriaxone sodium, cefuroxime, certain parenteral nutrition formulations, cytarabine, dopamine, fat emulsions, furosemide, heparin, hetastarch, idarubicin, indomethacin sodium trihydrate, nafcillin, propofol, ticarcillin, warfarin.

**I.M.**
• Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
• Obtain blood for peak level 1 hour after I.M. injection or 30 minutes after I.V. infusion finishes; for trough levels, draw blood just before next dose. Don't collect blood in a heparinized tube; heparin is incompatible with aminoglycosides.

## ACTION
Inhibits protein synthesis by binding directly to the 30S ribosomal subunit; bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | 30–90 min | Unknown |
| I.M. | Unknown | 30–90 min | Unknown |

*Half-life:* 2 to 3 hours.

## ADVERSE REACTIONS
**CNS:** ***encephalopathy, seizures,*** fever, headache, lethargy, confusion, dizziness, numbness, peripheral neuropathy, vertigo, ataxia, tingling.
**CV:** hypotension.
**EENT:** *ototoxicity*, blurred vision, tinnitus.
**GI:** vomiting, nausea.
**GU:** ***nephrotoxicity,*** possible increase in urinary excretion of casts.
**Hematologic:** ***agranulocytosis, leukopenia, thrombocytopenia,*** anemia, eosinophilia.
**Musculoskeletal:** muscle twitching, myasthenia gravis–like syndrome.
**Respiratory:** ***apnea.***
**Skin:** rash, urticaria, pruritus, injection site pain.
**Other:** ***anaphylaxis.***

## INTERACTIONS
**Drug-drug.** **Black Box Warning** *Acyclovir, amphotericin B, cephalosporins, cidofovir, cisplatin, methoxyflurane, vancomycin, other aminoglycosides:* May increase ototoxicity and nephrotoxicity. Monitor hearing and renal function test results. ■
*Atracurium, pancuronium, rocuronium, vecuronium:* May increase effects of nondepolarizing muscle relaxants, including prolonged respiratory depression. Use together only when necessary, and expect to reduce dosage of nondepolarizing muscle relaxant.
*Dimenhydrinate:* May mask ototoxicity symptoms. Monitor patient's hearing.
*General anesthetics:* May increase neuromuscular blockade. Monitor patient closely.
*Indomethacin:* May increase peak and trough levels of gentamicin. Monitor gentamicin level.
**Black Box Warning** *I.V. loop diuretics (such as furosemide):* May increase risk of ototoxicity. Monitor patient's hearing. ■
***Parenteral penicillins (such as ampicillin and ticarcillin):*** May inactivate gentamicin in vitro. Don't mix together.

## EFFECTS ON LAB TEST RESULTS
• May increase ALT, AST, bilirubin, BUN, creatinine, LDH, and nonprotein nitrogen levels. May decrease hemoglobin level.
• May increase eosinophil count. May decrease platelet and WBC counts.

## CONTRAINDICATIONS & CAUTIONS
• Contraindicated in patients hypersensitive to drug or other aminoglycosides.
• Use cautiously in neonates, infants, elderly patients, and patients with impaired renal function or neuromuscular disorders.
***Overdose S&S:*** Nephrotoxicity, neurotoxicity, ototoxicity.

## NURSING CONSIDERATIONS
**Black Box Warning** Evaluate patient's hearing before and during therapy. Notify prescriber if patient complains of tinnitus, vertigo, or hearing loss. ■
• Weigh patient and review renal function studies before therapy begins.
***Alert:*** Use preservative-free form when intrathecal route is used adjunctively for serious CNS infections, such as meningitis and ventriculitis.
**Black Box Warning** Maintain peak levels at 4 to 12 mcg/ml and trough levels at 1 to 2 mcg/ml. The maximum peak level is usually 8 mcg/ml, except in patients with cystic fibrosis, who need increased lung penetration. Prolonged peak levels of 10 to 12 mcg/ml or prolonged trough levels greater than 2 mcg/ml may increase risk of toxicity. ■

G

**Black Box Warning** Monitor renal function: urine output, specific gravity, urinalysis, BUN and creatinine levels, and creatinine clearance. Report to prescriber evidence of declining renal function. ▮

- Hemodialysis for 8 hours may remove up to 50% of drug from blood.
- Watch for signs and symptoms of superinfection (especially of upper respiratory tract), such as continued fever, chills, and increased pulse rate.
- Therapy usually continues for 7 to 10 days. If no response occurs in 3 to 5 days, stop therapy and obtain new specimens for culture and sensitivity testing.

### PATIENT TEACHING

- Instruct patient to promptly report adverse reactions, such as dizziness, vertigo, unsteady gait, ringing in the ears, hearing loss, numbness, tingling, or muscle twitching.
- Encourage patient to drink plenty of fluids.
- Warn patient to avoid hazardous activities if adverse CNS reactions occur.

## gentamicin sulfate (ophthalmic)

jen-ta-MYE-sin

Genoptic, Gentak, Ivax†

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Aminoglycoside
*Pregnancy risk category C*

### AVAILABLE FORMS

*Ophthalmic ointment:* 0.3% (base)
*Ophthalmic solution:* 0.3% (base)

### INDICATIONS & DOSAGES

➤ **External ocular infections (conjunctivitis, keratoconjunctivitis, corneal ulcers, blepharitis, blepharoconjunctivitis, meibomianitis, and dacryocystitis) caused by susceptible organisms, especially *Pseudomonas aeruginosa, Proteus, Klebsiella pneumoniae, Escherichia coli,* and other gram-negative organisms**

*Adults and children:* 1 to 2 drops in affected eye every 4 hours. In severe infections, up to 2 drops every hour. Or, apply ointment to lower conjunctival sac b.i.d. or t.i.d.

### ADMINISTRATION

**Ophthalmic**

- Store drug away from heat.
- Apply light finger pressure on lacrimal sac for 1 minute after drops are instilled.
- Wait at least 10 minutes before instilling other eyedrops.

### ACTION

Thought to inhibit protein synthesis; usually bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**EENT:** burning, stinging, or blurred vision with ointment, conjunctival hyperemia, transient irritation from solution, bacterial and fungal corneal ulcers.
**Other:** overgrowth of nonsusceptible organisms with long-term use.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with history of sensitivity to aminoglycosides because cross-sensitivity may occur.

### NURSING CONSIDERATIONS

- Obtain culture before giving drug. Therapy may begin before culture results are known.
- Solution isn't for injection into conjunctiva or anterior chamber of eye.
- If ophthalmic gentamicin is given together with systemic gentamicin, monitor gentamicin level.
- Systemic absorption from excessive use may cause toxicities.

### PATIENT TEACHING

- Tell patient to clean eye area of excessive discharge before instilling drug.

- Teach patient how to instill drops or apply ointment. Advise him to wash hands before and after applying ointment or solution and not to touch tip of dropper or tube to eye or surrounding tissues.
- Instruct patient to apply light finger pressure on lacrimal sac for 1 minute after drops are instilled.
- Tell patient to wait at least 10 minutes before instilling other eyedrops.
- Instruct patient to stop drug and notify prescriber if signs and symptoms of sensitivity (itching lids, swelling, or constant burning) occur.
- Advise patient not to share drug, washcloths, or towels with family members and to notify prescriber if anyone develops same signs or symptoms.
- Tell patient that vision may be blurred for few minutes after application of ointment.

***Alert:*** Stress importance of following recommended therapy. *Pseudomonas* infections can cause complete vision loss within 24 hours if infection isn't controlled.

## gentamicin sulfate (topical)

jen-ta-MYE-sin

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Aminoglycoside
*Pregnancy risk category C*

### AVAILABLE FORMS

*Cream:* 0.1%
*Ointment:* 0.1%

### INDICATIONS & DOSAGES

➤ **To treat or prevent superficial infections and superficial burns of the skin caused by susceptible bacteria**

*Adults and children older than age 1:* Rub in small amount gently three or four times daily, with or without gauze dressing.

### ADMINISTRATION

**Topical**

- Clean affected area and remove crusts of impetigo before applying to increase absorption.
- Wash hands after each application.
- Store drug in cool place.

### ACTION

Exact mechanism unknown. An aminoglycoside that disrupts bacterial protein synthesis by binding to ribosomes. Susceptible bacteria include sensitive strains of streptococci and *Staphylococcus aureus* and gram-negative bacteria including *Pseudomonas aeruginosa, Aerobacter aerogenes, Escherichia coli, Proteus vulgaris,* and *Klebsiella pneumoniae.*

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**Skin:** allergic contact dermatitis, erythema, minor skin irritation, photosensitivity.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those who may have cross-sensitivity with other aminoglycosides, such as neomycin.

### NURSING CONSIDERATIONS

***Alert:*** Avoid use on large skin lesions or over a wide area because of possible systemic toxic effects.
- Restrict use of drug to selected patients; widespread use may lead to resistant organisms.
- Prolonged use may result in overgrowth of nonsusceptible organisms.

### PATIENT TEACHING

- Tell patient to clean affected area and to remove crusts of impetigo before applying to increase absorption.
- Tell patient to wash hands after each application.
- Instruct patient to store drug in cool place.
- Tell patient to stop using drug and notify prescriber immediately if no improvement occurs or if condition worsens.

**SAFETY ALERT!**

# glatiramer acetate

glah-TEER-ah-mer

Copaxone

*Therapeutic class:* MS drug
*Pharmacologic class:* Biologic response modifier
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 20 mg glatiramer acetate and 40 mg mannitol, USP, in a single-use prefilled syringe

## INDICATIONS & DOSAGES

➤ **For first clinical episode and to reduce frequency of relapse in patients with relapsing-remitting multiple sclerosis**
*Adults:* 20 mg subcutaneously daily.

## ADMINISTRATION

**Subcutaneous**

- Give drug only subcutaneously.
- Drug doesn't contain preservatives; discard if solution contains particulate matter.
- Don't try to expel the air bubble from the prefilled syringe. This may lead to loss of drug and an incorrect dose.
- Store drug in refrigerator (36° to 46° F [2° to 8° C]); allow drug to warm to room temperature for 20 minutes before use. If refrigeration is not available, may store at room temperature for up to 1 month.

## ACTION

May modify immune processes responsible for the pathogenesis of multiple sclerosis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *anxiety, asthenia,* abnormal dreams, agitation, confusion, emotional lability, *fever,* migraine, nervousness, *pain,* speech disorder, stupor, syncope, tremor, vertigo.
**CV:** *chest pain, palpitations, vasodilation,* hypertension, tachycardia.
**EENT:** *rhinitis,* ear pain, eye disorder, laryngismus, nystagmus.
**GI:** *diarrhea, nausea, anorexia,* bowel urgency, gastroenteritis, *GI disorder,* oral candidiasis, salivary gland enlargement, ulcerative stomatitis, *vomiting.*
**GU:** *urinary urgency,* ***vaginal hemorrhage,*** abnormal Papanicolaou smear, amenorrhea, *dysmenorrhea,* hematuria, impotence, menorrhagia, *vaginal candidiasis.*
**Hematologic:** *lymphadenopathy,* ecchymosis.
**Metabolic:** weight gain.
**Musculoskeletal:** *arthralgia, back pain, hypertonia,* footdrop, neck pain.
**Respiratory:** *dyspnea, bronchitis,* hyperventilation.
**Skin:** *diaphoresis, injection site reaction, pruritus, rash,* eczema, erythema or hemorrhage, nodule, skin atrophy, urticaria, warts.
**Other:** *flulike syndrome, infection,* bacterial infection, chills, cyst, dental caries, herpes simplex and zoster, *peripheral and facial edema.*

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or mannitol.

## NURSING CONSIDERATIONS

- Immediate postinjection reactions may occur; symptoms include flushing, chest pain, palpitations, anxiety, dyspnea, constriction of the throat, and urticaria. They typically are transient and self-limiting and don't need specific treatment. Onset of postinjection reaction may occur several months after treatment starts, and patients may have more than one episode.
- Patient may experience at least one episode of transient chest pain, which usually begins at least 1 month after treatment starts; it isn't accompanied by other signs or symptoms and doesn't appear to be clinically important.

## PATIENT TEACHING

- Instruct patient how to self-inject drug. Supervise first injection. Injection sites include arms, abdomen, hips, and thighs.
- Explain need for aseptic self-injection techniques and warn patient against reuse of needles and syringes. Periodically review proper disposal of needles, syringes, drug containers, and unused drug.
- Tell patient to notify prescriber about planned, suspected, or known pregnancy.
- Tell women to notify prescriber if breast-feeding.
- Advise patient not to change drug or dosage schedule or to stop drug without medical approval.
- Tell patient to notify prescriber immediately if dizziness, hives, profuse sweating, chest pain, difficulty breathing, or if severe pain occurs after drug injection.

**SAFETY ALERT!**

# glimepiride

glye-MEH-per-ide

Amaryl

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Sulfonylurea
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 1 mg, 2 mg, 4 mg

## INDICATIONS & DOSAGES

➤ **Adjunct to diet and exercise to lower glucose level in patients with type 2 diabetes whose hyperglycemia can't be managed by diet and exercise alone**

*Adults:* Initially, 1 or 2 mg P.O. once daily; usual maintenance dose is 1 to 4 mg P.O. once daily. After reaching 2 mg, dosage is increased in increments not exceeding 2 mg every 1 to 2 weeks, based on patient's glucose level response. Maximum dose is 8 mg daily.

➤ **Adjunct to diet and exercise in conjunction with insulin or metformin therapy in patients with type 2 diabetes whose hyperglycemia can't be managed with the maximum dosage of glimepiride alone**

*Adults:* 8 mg P.O. once daily; used with low-dose insulin. Increase insulin dosage weekly, if needed, based on patient's glucose level response. Or, if patients do not respond adequately to maximum dose of glimepiride, addition of metformin may be considered.

***Adjust-a-dose:*** For patients with renal or hepatic impairment, initially, 1 mg P.O. once daily then adjust to appropriate dosage, if needed.

## ADMINISTRATION

**P.O.**

- Give drug with first meal of the day.

## ACTION

Lowers glucose level, possibly by stimulating release of insulin from functioning pancreatic beta cells, and may lead to increased sensitivity of peripheral tissues to insulin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 2–3 hr | >24 hr |

*Half-life:* 9 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, asthenia, headache.
**EENT:** changes in accommodation.
**GI:** nausea.
**Hematologic:** ***leukopenia,*** hemolytic anemia, ***agranulocytosis, thrombocytopenia, aplastic anemia, pancytopenia.***
**Metabolic:** ***hypoglycemia,*** dilutional hyponatremia.

## INTERACTIONS

**Drug-drug.** *Beta blockers:* May mask symptoms of hypoglycemia. Monitor glucose level.
*Drugs that tend to produce hyperglycemia (such as corticosteroids, estrogens, fosphenytoin, hormonal contraceptives, isoniazid, nicotinic acid, other diuretics, phenothiazines, phenytoin, thyroid products):* May lead to loss of glucose control. Adjust dosage.
*Insulin:* May increase risk of hypoglycemia. Use together cautiously.
*NSAIDs, other drugs that are highly protein-bound (such as beta blockers, chloramphenicol, coumarin, MAO*

*inhibitors, probenecid, sulfonamides):* May increase hypoglycemic action of sulfonylureas such as glimepiride. Monitor glucose level carefully.
***Rifamycins, thiazide diuretics:*** May increase risk of hyperglycemia. Monitor glucose level.
***Salicylates:*** May increase hypoglycemic effects of sulfonylurea. Monitor glucose level.
**Drug-herb.** *Burdock, dandelion, eucalyptus, marshmallow:* May increase drug effects. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May alter glycemic control, most commonly causing hypoglycemia. May also cause disulfiram-like reaction. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, AST, BUN, and creatinine levels. May decrease glucose, hemoglobin, and sodium levels.
- May decrease granulocyte, platelet, RBC, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with diabetic ketoacidosis, which should be treated with insulin.
- Contraindicated in pregnant women or elderly patients and as sole therapy for type 1 diabetes.
- Contraindicated in breast-feeding women because it may cause hypoglycemia in breast-fed infants.
- Use cautiously in debilitated or malnourished patients and in those with adrenal, pituitary, hepatic, or renal insufficiency; these patients are more susceptible to the hypoglycemic action of glucose-lowering drugs.
- Use cautiously with drugs that can cause hypoglycemia.
- Use cautiously in patients allergic to sulfonamides.
- In children, safety and effectiveness haven't been established.

***Overdose S&S:*** Hypoglycemia.

## NURSING CONSIDERATIONS

- Glimepiride and insulin may be used together in patients who lose glucose control after first responding to therapy.
- Monitor fasting glucose level periodically to determine therapeutic response. Also monitor glycosylated hemoglobin level, usually every 3 to 6 months, to precisely assess long-term glycemic control.

***Alert:*** Use of oral hypoglycemics may carry higher risk of CV mortality than use of diet alone or of diet and insulin therapy.

- When changing patient from other sulfonylureas to glimepiride, a transition period isn't needed. Monitor patient carefully for 1 to 2 weeks when changing from longer half-life sulfonylureas, such as chlorpropamide.
- ***Look alike–sound alike:*** Don't confuse glimepiride with glyburide or glipizide. Don't confuse Amaryl with Altace.

## PATIENT TEACHING

- Tell patient to take drug with first meal of the day.
- Make sure patient understands that therapy relieves symptoms but doesn't cure the disease. He should also understand potential risks and advantages of taking drug and of other treatment methods.
- Stress importance of adhering to diet, weight reduction, exercise, and personal hygiene programs. Explain to patient and family how and when to monitor glucose level, and teach recognition of and intervention for signs and symptoms of high and low glucose levels.
- Advise patient to wear or carry medical identification at all times.
- Advise woman to consult prescriber before planning pregnancy. Insulin may be needed during pregnancy and breast-feeding.
- Advise patient to consult prescriber before taking any OTC products.
- Teach patient to carry candy or other simple sugars to treat mild episodes of low glucose level. Patient experiencing severe episode may need hospital treatment.
- Advise patient to avoid alcohol, which lowers glucose level.

**SAFETY ALERT!**

## glipiZIDE

GLIP-i-zide

Glucotrol✔, Glucotrol XL✔

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Sulfonylurea
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets (extended-release):* 2.5 mg, 5 mg, 10 mg
*Tablets (immediate-release):* 5 mg, 10 mg

### INDICATIONS & DOSAGES

➤ **Adjunct to diet to lower glucose level in patients with type 2 (non–insulin-dependent) diabetes**

***Immediate-release tablets***

*Adults:* Initially, 5 mg P.O. daily 30 minutes before breakfast. Maximum once-daily dose is 15 mg. Divide doses of more than 15 mg. Maximum daily dose is 40 mg.

***Adjust-a-dose:*** Initially, for patients older than age 65, give 2.5 mg P.O. daily.

***Extended-release tablets***

*Adults:* Initially, 5 mg P.O. with breakfast daily. Increase by 5 mg every 3 months, depending on level of glycemic control. Maximum daily dose is 20 mg.

***Adjust-a-dose:*** For patients with liver disease, first dose is 2.5 mg P.O. daily.

➤ **To replace insulin therapy**

*Adults:* If insulin dosage is more than 20 units daily, start patient at usual dosage in addition to 50% of insulin. If insulin dosage is less than or equal to 20 units daily, insulin may be stopped when glipizide starts.

### ADMINISTRATION

**P.O.**

- Give immediate-release tablet about 30 minutes before meals.
- Give extended-release tablet with breakfast.
- Don't split or crush extended-release tablets.

### ACTION

Unknown. Probably stimulates insulin release from pancreatic beta cells, reduces glucose output by the liver, and increases peripheral sensitivity to insulin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. (immediate-release) | 15–30 min | 1–3 hr | 24 hr |
| P.O. (extended-release) | 2–3 hr | 6–12 hr | 24 hr |

*Half-life:* 2 to 4 hours.

### ADVERSE REACTIONS

**CNS:** dizziness, drowsiness, headache, syncope, *asthenia*, nervousness, tremor.
**GI:** nausea, dyspepsia, flatulence, constipation, diarrhea.
**GU:** polyuria.
**Hematologic:** ***leukopenia,*** hemolytic anemia, ***agranulocytosis, thrombocytopenia, aplastic anemia.***
**Metabolic:** ***hypoglycemia.***
**Musculoskeletal:** arthralgia, leg cramps.
**Respiratory:** rhinitis.
**Skin:** pruritus, photosensitivity reactions.

### INTERACTIONS

**Drug-drug.** *Amantadine, anabolic steroids, antifungals, chloramphenicol, clofibrate, guanethidine, MAO inhibitors, NSAIDs, probenecid,* ***salicylates,*** *sulfonamides:* May increase hypoglycemic activity. Monitor glucose level.
*Beta blockers:* May prolong hypoglycemic effect and mask symptoms of hypoglycemia. Use together cautiously.
*Corticosteroids, glucagon, phenytoin,* ***rifamycins, thiazide diuretics:*** May decrease hypoglycemic response. Monitor glucose level.
*Oral anticoagulants:* May increase hypoglycemic activity or enhance anticoagulant effect. Monitor glucose level, PT, and INR.
**Drug-herb.** *Burdock, dandelion, eucalyptus, marshmallow:* May increase drug effects. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May alter glycemic control, most commonly causing hypoglycemia. May cause disulfiram-like reaction. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, AST, LDH, BUN, cholesterol, and creatinine

levels. May decrease glucose and hemoglobin levels.
• May decrease granulocyte, platelet, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug and in those with diabetic ketoacidosis with or without coma.
• Contraindicated in pregnant or breast-feeding women and as sole therapy in type 1 diabetes.
• Use cautiously in patients with severe GI narrowing, renal or hepatic disease, in those allergic to sulfonamides, and in debilitated, malnourished, or elderly patients.
***Overdose S&S:*** Hypoglycemia.

## NURSING CONSIDERATIONS

• Some patients may attain effective control on a once-daily regimen, whereas others respond better with divided dosing.
• Patient may switch from immediate-release dose to extended-release tablets at the nearest equivalent total daily dose.
• Glipizide is a second-generation sulfonylurea. The frequency of adverse reactions appears to be lower than with first-generation drugs such as chlorpropamide.
***Alert:*** Use of oral hypoglycemics may carry a higher risk of CV mortality than use of diet alone or of diet and insulin therapy.
• During periods of increased stress, patient may need insulin therapy. Monitor patient closely for hyperglycemia in these situations.
• Patient switching from insulin therapy to an oral antidiabetic should check glucose level at least three times a day before meals. Patient may need hospitalization during transition.
• ***Look alike–sound alike:*** Don't confuse glipizide with glyburide or glimepiride.

## PATIENT TEACHING

• Instruct patient about disease and importance of following therapeutic regimen, adhering to diet, losing weight, getting exercise, following personal hygiene programs, and avoiding infection. Explain how and when to monitor glucose level, and teach recognition of episodes of low and high glucose levels.
• Tell patient to carry candy or other simple sugars to treat mild low-glucose episodes. Patient experiencing severe episode may need hospital treatment.
• Instruct patient not to change drug dosage without prescriber's consent and to report abnormal blood or urine glucose test results.
• Tell patient not to take other drugs, including OTC drugs, without first checking with prescriber.
• Advise patient to wear or carry medical identification at all times.
• Advise women planning pregnancy to first consult prescriber. Insulin may be needed during pregnancy and breast-feeding.
• Advise patient to avoid alcohol, which lowers glucose level.
• Tell patient that he may occasionally notice something in their stool that looks like a tablet and that it's the nonabsorbable shell of the extended-release tablet.

# glucagon

GLOO-ka-gon

GlucaGen Diagnostic Kit, GlucaGen HypoKit, Glucagon Emergency Kit

*Therapeutic class:* Diagnostic agent
*Pharmacologic class:* Antihypoglycemic
*Pregnancy risk category B*

## AVAILABLE FORMS

*Powder for injection:* 1-mg (1-unit) vial

## INDICATIONS & DOSAGES

➤ **Hypoglycemia**

***Glucagon***

*Adults and children who weigh more than 20 kg (44 lb) or older than 6 to 8 years:* 1 mg (1 unit) I.V., I.M., or subcutaneously.
*Children who weigh 20 kg or less:* 0.5 mg (0.5 units) or 20 to 30 mcg/kg I.V., I.M., or subcutaneously; maximum dose 1 mg. May repeat in 15 minutes, if needed. I.V. glucose must be given if patient fails to respond.

***GlucaGen***

*Adults and children (more than 25 kg or older than 6 to 8 years and weight is unknown):* 1 ml I.V., I.M., or subcutaneously.

*Children (less than 25 kg or younger than 6 to 8 years and weight is unknown):* 0.5 ml I.V., I.M., or subcutaneously.

➤ **Diagnostic aid for radiologic examination of the GI tract**

*Adults:* 0.25 to 2 mg I.V. or 1 to 2 mg I.M. before radiologic examination.

## ADMINISTRATION

**I.V.**

▼ Reconstitute drug in 1-unit vial with 1 ml of diluent.

▼ Use only diluent supplied by manufacturer when preparing doses of 2 mg or less. For larger doses, dilute with sterile water for injection.

▼ Unstable hypoglycemic diabetic patients may not respond to glucagon; give dextrose I.V. instead.

▼ Store at room temperature before reconstituting. Avoid freezing and protect from light. After reconstitution, use immediately.

▼ **Incompatibilities:** Sodium chloride solution, solutions with pH 3 to 9.5.

**I.M.**

● Store at room temperature before reconstituting. Avoid freezing and protect from light. After reconstitution, use immediately.

**Subcutaneous**

● Store at room temperature before reconstituting. Avoid freezing and protect from light. After reconstitution, use immediately.

## ACTION

Raises glucose level by promoting catalytic depolymerization of hepatic glycogen to glucose. Relaxes the smooth muscle of the stomach, duodenum, small bowel, and colon.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. (hypoglycemia) | Immediate | 30 min | 60–90 min |
| I.V. (gastric relaxation) | 1 min | 30 min | 9–25 min |
| I.M. | 4–10 min | 13 min | 12–32 min |
| Subcut. | 4–10 min | 20 min | 12–32 min |

*Half-life:* 8 to 18 minutes; 45 minutes (I.M.).

## ADVERSE REACTIONS

**CV:** hypotension.
**GI:** nausea, vomiting.
**Other:** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Anticoagulants:* May enhance anticoagulant effect. Monitor prothrombin activity, and watch for signs of bleeding.

## EFFECTS ON LAB TEST RESULTS

● May decrease potassium level.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug and in those with pheochromocytoma.

● Use cautiously in patients with history of insulinoma or pheochromocytoma.

⚠ ***Overdose S&S:*** Nausea, vomiting, diarrhea, inhibited GI tract motility, increased blood pressure and pulse rate.

## NURSING CONSIDERATIONS

● For hypoglycemia, use drug only in emergency situations.

● Monitor glucose level before, during, and after administration.

***Alert:*** As soon as patient regains consciousness and is able to swallow, give additional carbohydrates orally to prevent secondary hypoglycemic reactions.

## PATIENT TEACHING

● Instruct patient and caregivers how to give glucagon and recognize a low glucose episode.

● Explain importance of calling prescriber immediately in emergencies.

● Teach patient and caregivers how to prevent hypoglycemia.

**SAFETY ALERT!**

## glyBURIDE (glibenclamide)

GLYE-byoor-ide

DiaBeta🖋, Euglucon†, Gen Glybe†, Glynase PresTab

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Sulfonylurea
*Pregnancy risk category B (Glynase); C (DiaBeta)*

## AVAILABLE FORMS

*Tablets:* 1.25 mg, 2.5 mg, 5 mg

*Tablets (micronized):* 1.5 mg, 3 mg, 4.5 mg, 6 mg

## INDICATIONS & DOSAGES

➤ **Adjunct to diet to lower glucose level in patients with type 2 (non–insulin-dependent) diabetes**

***Nonmicronized form***

*Adults:* Initially, 2.5 to 5 mg P.O. once daily with breakfast or first main meal. Adjust to maintenance dose at no more than 2.5-mg increments at weekly intervals. Usual daily maintenance dose is 1.25 to 20 mg, in single dose or divided doses. Maximum daily dose is 20 mg P.O.

***Micronized form***

*Adults:* Initially, 1.5 to 3 mg daily with breakfast or first main meal. Adjust to maintenance dose at no more than 1.5-mg increments at weekly intervals. Usual daily maintenance dose is 0.75 to 12 mg. Dosages exceeding 6 mg daily may have better response with b.i.d. dosing. Maximum dose is 12 mg P.O. daily.

***Adjust-a-dose:*** For elderly patients, patients who are more sensitive to antidiabetics, and for those with adrenal or pituitary insufficiency, start with 1.25 mg daily. When using micronized tablets, patients who are more sensitive to antidiabetics should start with 0.75 mg daily.

➤ **To replace insulin therapy**

*Adults:* If insulin dosage is less than 40 units/day, patient may be switched directly to glyburide when insulin is stopped. If insulin dose is less than 20 units/day, initial dose is 2.5 to 5 mg (1.5 to 3 mg micronized) P.O. daily. If insulin dose is 20 to 40 units/day, initial dose is 5 mg (3 mg micronized) P.O. daily. If insulin dosage is 40 or more units/day, initially, 5 mg (3 mg micronized) P.O. once daily in addition to 50% of insulin dose.

## ADMINISTRATION

**P.O.**

● Give drug with breakfast or first main meal.

## ACTION

Unknown. Probably stimulates insulin release from pancreatic beta cells, reduces glucose output by the liver, and increases peripheral sensitivity to insulin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. (micronized) | 1 hr | 1 hr | 12–24 hr |
| P.O. (nonmicronized) | 2–4 hr | 2–4 hr | 16–24 hr |

*Half-life:* 10 hours.

## ADVERSE REACTIONS

**EENT:** changes in accommodation or blurred vision.
**GI:** nausea, epigastric fullness, heartburn.
**Hematologic:** ***leukopenia,*** hemolytic anemia, ***agranulocytosis, thrombocytopenia, aplastic anemia.***
**Hepatic:** cholestatic jaundice, ***hepatitis.***
**Metabolic:** ***hypoglycemia,*** hyponatremia.
**Musculoskeletal:** arthralgia, myalgia.
**Skin:** rash, pruritus, other allergic reactions.
**Other:** ***angioedema.***

## INTERACTIONS

**Drug-drug.** *Anabolic steroids, chloramphenicol, clofibrate, fluoroquinolones, guanethidine, MAO inhibitors, miconazole, NSAIDs, probenecid, phenylbutazone,* ***salicylates****, sulfonamides:* May increase hypoglycemic activity. Monitor glucose level.

*Beta blockers:* May prolong hypoglycemic effect and mask symptoms of hypoglycemia. Use together cautiously.

*Carbamazepine, corticosteroids, glucagon,* ***rifamycins, thiazide diuretics:*** May decrease hypoglycemic response. Monitor glucose level.

*Oral anticoagulants:* May increase hypoglycemic activity or enhance anticoagulant effect. Monitor glucose level, PT, and INR.

**Drug-herb.** *Burdock, dandelion, eucalyptus, marshmallow:* May increase hypoglycemic effect. Discourage use together.

**Drug-lifestyle.** ***Alcohol use:*** May alter glycemic control, most commonly causing hypoglycemia. May cause disulfiram-like reaction. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

● May increase alkaline phosphatase, AST, ALT, bilirubin, BUN, and cholesterol levels. May decrease glucose, sodium, and hemoglobin levels.

• May decrease granulocyte, platelet, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug and in those with diabetic ketoacidosis with or without coma.
• Contraindicated as sole therapy for type 1 diabetes and in pregnant or breast-feeding women.
• Use cautiously in patients with hepatic or renal impairment; in debilitated, malnourished, or elderly patients; and in patients allergic to sulfonamides.
⚠ ***Overdose S&S:*** Hypoglycemia.

## NURSING CONSIDERATIONS

***Alert:*** Micronized glyburide (Glynase PresTab) contains drug in a smaller particle size and isn't bioequivalent to regular glyburide tablets. In patients who have been taking Glynase or DiaBeta, adjust dosage.
• Although most patients may take drug once daily, those taking more than 10 mg daily may achieve better results with twice-daily dosage.
• Drug is a second-generation sulfonylurea. Adverse effects are less common with second-generation drugs than with first-generation drugs such as chlorpropamide.
***Alert:*** Use of oral hypoglycemics may carry a higher risk of CV mortality than use of diet alone or of diet and insulin therapy.
• During periods of increased stress, such as infection, fever, surgery, or trauma, patient may need insulin therapy. Monitor patient closely for hyperglycemia in these situations.
• Patient switching from insulin therapy to an oral antidiabetic should check glucose level at least three times a day before meals. Patient may need hospitalization during transition.
• ***Look alike–sound alike:*** Don't confuse glyburide with glimepiride or glipizide.

## PATIENT TEACHING

• Teach patient about diabetes and the importance of following therapeutic regimen, adhering to specific diet, losing weight, getting exercise, following personal hygiene programs, and avoiding infection. Explain how and when to monitor glucose level, and teach recognition of and intervention for low and high glucose levels.
• Tell patient not to change drug dosage without prescriber's consent and to report abnormal blood or urine glucose test results.
• Teach patient to carry candy or other simple sugars for mild low-glucose level. Patient experiencing severe episode may need hospital treatment.
• Advise patient not to take other drugs, including OTC drugs, without first checking with prescriber.
• Advise patient to wear or carry medical identification at all times.
***Alert:*** Instruct patient to report episodes of low glucose to prescriber immediately; a severely low glucose level is sometimes fatal in patients receiving as little as 2.5 to 5 mg daily.
• Advise patient to avoid alcohol, which may lower glucose level.

# glycerin

GLI-ser-in

Colace ◇, Fleet Babylax ◇, Sani-Supp ◇

*Therapeutic class:* Laxative
*Pharmacologic class:* Trihydric alcohol
*Pregnancy risk category C*

## AVAILABLE FORMS

*Enema (pediatric):* 4 ml/applicator ◇
*Suppositories:* Adult, children, and infant sizes ◇

## INDICATIONS & DOSAGES

➤ **Constipation**

*Adults and children age 6 and older:* 2 to 3 g as rectal suppository; or 5 to 15 ml as enema.
*Children ages 2 to 6:* 1 to 1.2 g as rectal suppository; or 2 ml as enema.

## ADMINISTRATION

**Rectal**

• Give drug into the rectum as directed. The patient should retain the drug for at least 15 minutes.

## ACTION

Draws water from the tissues into the feces, thus stimulating evacuation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.R. | 15–30 min | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**GI:** *cramping pain*, hyperemia of rectal mucosa, rectal discomfort.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with intestinal obstruction or signs and symptoms of appendicitis, fecal impaction, or acute surgical abdomen, such as undiagnosed abdominal pain or vomiting.

## NURSING CONSIDERATIONS

- Drug is used mainly to reestablish proper toilet habits in laxative-dependent patients.

## PATIENT TEACHING

- Tell patient that drug must be retained for at least 15 minutes and that it usually acts within 1 hour. Entire suppository need not melt to be effective.
- Warn patient about adverse GI reactions.

# gold sodium thiomalate

Aurolate, Myochrysine

*Therapeutic class:* Antiarthritic
*Pharmacologic class:* Gold compound
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 50 mg/ml with benzyl alcohol in 2-ml and 10-ml vials

## INDICATIONS & DOSAGES

➤ **Rheumatoid arthritis**

*Adults:* Initially, 10 mg I.M., followed by 25 mg in 1 week. Then, 25 to 50 mg every week to total dose of 1 g. If condition improves and no toxicity occurs, give 25 to 50 mg every 2 weeks for 2 to 20 weeks; then, 25 to 50 mg every 3 to 4 weeks as maintenance therapy. If relapse occurs, resume injections at weekly intervals. *Children:* Initially, a test dose of 10 mg I.M.; then, 1 mg/kg I.M. weekly, not to exceed 50 mg for a single injection. Follow adult spacing of doses.

## ADMINISTRATION

**I.M.**

- Give drug I.M. only, preferably into gluteal muscle.
- Drug should be pale yellow; don't use if it darkens.
- When injecting gold sodium thiomalate, have patient lie down for 10 to 20 minutes to minimize hypotension.

## ACTION

Probably acts by inhibiting sulfhydryl systems, which alters cellular metabolism. May also alter enzyme function and immune response and suppress phagocytic activity.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.M. | Unknown | 3–6 hr | Unknown |

*Half-life:* 3 to 27 days (single dose); 14 to 40 days (3rd dose); up to 168 days (11th dose).

## ADVERSE REACTIONS

**CNS:** ***seizures,*** confusion, hallucinations.
**CV:** ***bradycardia,*** hypotension.
**EENT:** corneal gold deposition, corneal ulcers.
**GI:** *diarrhea*, *metallic taste*, *stomatitis*, anorexia, abdominal cramps, nausea, vomiting, ulcerative enterocolitis.
**GU:** ***acute renal failure,*** albuminuria, proteinuria, nephrotic syndrome, nephritis, acute tubular necrosis, hematuria.
**Hematologic:** ***thrombocytopenia, aplastic anemia, agranulocytosis, leukopenia,*** eosinophilia, anemia.
**Hepatic:** ***hepatitis,*** jaundice.
**Skin:** *rash*, *dermatitis*, erythema, exfoliative dermatitis, diaphoresis, photosensitivity reaction.
**Other:** ***anaphylaxis, angioedema.***

## INTERACTIONS

**Drug-drug.** *Penicillamine:* May increase risk of serious hematologic and renal reactions. Avoid use together.
**Drug-lifestyle.** *Sun or ultraviolet light exposure:* May cause photosensitivity reaction. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, and AST levels.
- May decrease hemoglobin level and hematocrit.
- May increase eosinophil count.
- May decrease granulocyte, platelet, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with history of severe toxicity from previous exposure to gold or other heavy metals.
- Contraindicated in those who have recently received radiation therapy and in those with hepatitis, exfoliative dermatitis, severe uncontrollable diabetes, renal disease, hepatic dysfunction, uncontrolled heart failure, systemic lupus erythematosus, colitis, Sjögren syndrome, urticaria, eczema, hemorrhagic conditions, or severe hematologic disorders.
- Use cautiously, if at all, in patients with rash, marked hypertension, compromised cerebral or CV circulation, or history of renal or hepatic disease, drug allergies, or blood dyscrasias.

## NURSING CONSIDERATIONS

- Warn women about risks of gold therapy during pregnancy.

**Black Box Warning** Give drug only under constant supervision of prescriber thoroughly familiar with drug's toxicities and benefits.

**Black Box Warning** Monitor for signs of gold toxicity including fall in hemoglobin, leukopenia $<4{,}000$ WBC/mm$^3$, proteinuria, hematuria, pruritus, rash, stomatitis, or persistent diarrhea.

- Analyze urine for protein and sediment changes before each injection.
- Watch for anaphylactoid reaction for 30 minutes after administration.

***Alert:*** Keep dimercaprol available to treat acute toxicity.

- Monitor CBC, including platelet count, before every second injection.
- If adverse reactions are mild, some rheumatologists resume gold therapy after 2 to 3 weeks' rest.
- Monitor platelet counts if patient develops purpura or ecchymoses.

## PATIENT TEACHING

- Inform patient that increased joint pain may occur for 1 to 2 days after injection but usually subsides.
- Advise patient to report rash or skin problems immediately and to stop drug until reaction subsides. Itching may precede skin inflammation; consider itchy skin eruptions during gold therapy to be a reaction until proven otherwise.
- Advise patient to report unusual bleeding or bruising.
- Instruct patient to report a metallic taste. Promote careful oral hygiene.
- Urge patient to avoid sunlight and artificial ultraviolet light, which may cause gray-blue skin pigmentation.
- Tell patient that benefits may not appear for 3 to 4 months.
- Stress need for follow-up care.

# golimumab

go-LIM-myoo-mab

Simponi

*Therapeutic class:* Antiarthritic
*Pharmacologic class:* Tumor necrosis factor (TNF) blocker
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 50 mg/0.5-ml prefilled syringe; 50 mg/0.5-ml prefilled autoinjector

## INDICATIONS & DOSAGES

➤ **Moderate to severe active rheumatoid arthritis in combination with methotrexate; active psoriatic arthritis alone or in**

**combination with methotrexate; active ankylosing spondylitis**
*Adults:* 50 mg subcutaneously monthly.

## ADMINISTRATION

**Subcutaneous**

- Remove drug from refrigerator 30 minutes before administration and allow it to reach room temperature.
- Inspect solution before administration. Don't use solution if discolored or cloudy or if foreign particles are present. Drug is normally colorless to slightly opalescent to light yellow.
- Prefilled syringe and prefilled syringe in autoinjector contain latex. Don't handle if sensitive to latex.
- Rotate injection sites. Don't inject drug into areas where skin is tender, bruised, red, or hard.

## ACTION

Binds to human TNF-alfa to neutralize its activity and inhibit its binding with receptors, thereby reducing the infiltration of inflammatory cells.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 2–6 days | Unknown |

*Half-life:* 2 weeks.

## ADVERSE REACTIONS

**CNS:** dizziness, paresthesia, fever.
**CV:** hypertension.
**EENT:** nasopharyngitis, oral herpes, pharyngitis, rhinitis, sinusitis.
**Respiratory:** bronchitis, upper respiratory tract infection.
**Skin:** *injection-site reactions.*
**Other:** influenza.

## INTERACTIONS

**Drug-drug.** *Abatacept, anakinra:* May increase risk of serious infection. Avoid using together.
*CYP450 substrates (such as cyclosporine, theophylline, warfarin):* May alter levels of these drugs. Monitor patient closely and adjust dosages as needed.
*Live vaccines:* May increase risk of infection. Postpone live-virus vaccine until therapy has ended.

## EFFECTS ON LAB TEST RESULTS

- May increase liver enzyme levels.
- May decrease platelet, WBC, and neutrophil counts.

## CONTRAINDICATIONS & CAUTIONS

- Use cautiously in patients with malignancies; invasive fungal infection; chronic infection (hepatitis B, tuberculosis [TB]); history of recurrent infection, hematologic abnormalities, or heart failure; or preexisting or recent onset of CNS demyelination.
- Use in pregnant women only if benefit outweighs risk to fetus. It isn't known if drug appears in breast milk. Women shouldn't breast-feed while taking drug.
- Safe use in children hasn't been established.

## NURSING CONSIDERATIONS

**Black Box Warning** Monitor patient closely for signs and symptoms of infection before and after treatment. TB, invasive fungal infection, and other opportunistic infections, which are sometimes fatal, may occur in patients receiving golimumab. Stop drug if serious infection or sepsis develops during treatment. ■

**Black Box Warning** Evaluate patient for latent TB with tuberculin skin test before initiating treatment. Treat latent TB before therapy with golimumab. Monitor all patients for active TB during treatment even if initial latent TB test is negative. ■

- Monitor patient for new or worsening heart failure; stop drug if signs and symptoms occur.
- Monitor patient for lymphomas and other malignancies.
- Monitor CBC regularly during therapy.

## PATIENT TEACHING

- Teach patient how to give subcutaneous injection.
- Instruct patient to report signs and symptoms of infection, new or worsening heart failure, or liver or nervous system problems.
- Advise women to report pregnancy, possible pregnancy, or plans to become pregnant.
- Tell patient to avoid live vaccines while taking this drug.

• Advise breast-feeding women to stop breast-feeding during therapy.

**SAFETY ALERT!**

## goserelin acetate

GOE-se-rel-in

Zoladex

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Gonadotropin-releasing hormone analogue
*Pregnancy risk category X (endometriosis and endometrial thinning); D (breast cancer)*

### AVAILABLE FORMS

*Implants:* 3.6 mg, 10.8 mg

### INDICATIONS & DOSAGES

➤ **Endometriosis, including pain relief and lesion reduction**

*Women:* 3.6 mg subcutaneously every 28 days into the anterior abdominal wall below the navel. Maximum length of therapy is 6 months.

➤ **Endometrial thinning before endometrial ablation**

*Women:* 3.6 mg subcutaneously into the anterior abdominal wall below the navel. Give one or two implants, 4 weeks apart.

➤ **Palliative treatment of advanced breast cancer in premenopausal and postmenopausal women**

*Women:* 3.6 mg subcutaneously every 28 days into the anterior abdominal wall below the navel.

➤ **Palliative treatment of advanced prostate cancer**

*Men:* 3.6 mg subcutaneously every 28 days or 10.8 mg subcutaneously every 12 weeks into the anterior abdominal wall below the navel.

### ADMINISTRATION

**Subcutaneous**

• Implant comes in a preloaded syringe. If package is damaged, don't use the syringe. Make sure drug is visible in the translucent chamber of the syringe.
• Give drug into the anterior abdominal wall below the navel using aseptic technique.
• After cleaning area with an alcohol swab and injecting a local anesthetic, stretch patient's skin with one hand while grasping barrel of syringe with the other.
• Insert needle into the subcutaneous fat; then change direction of needle so that it parallels the abdominal wall. Push needle in until hub touches patient's skin; withdraw about 1 cm (this creates a gap for drug to be injected) before depressing plunger completely.
• To avoid need for a new syringe and injection site, don't aspirate after inserting needle. If needle penetrates a blood vessel, blood will appear in the syringe chamber. Withdraw needle, and inject elsewhere with a new syringe.
• Never give by I.V. injection.

### ACTION

A luteinizing hormone–releasing hormone (LH-RH) analogue that acts on the pituitary gland to decrease the release of follicle-stimulating hormone and LH, dramatically lowering sex hormone levels (estrogen in women and testosterone in men).

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Rapid | 30–60 min | Throughout therapy |

*Half-life:* About 4½ hours.

### ADVERSE REACTIONS

**CNS:** lethargy, *pain*, dizziness, *insomnia*, anxiety, *depression*, *headache*, chills, *emotional lability*, ***stroke,*** *asthenia*.
**CV:** edema, ***heart failure, arrhythmias,*** *peripheral edema*, hypertension, ***MI,*** peripheral vascular disorder, chest pain, *hot flashes*.
**GI:** nausea, vomiting, diarrhea, constipation, ulcer, anorexia, abdominal pain.
**GU:** *sexual dysfunction*, *impotence*, *lower urinary tract symptoms*, renal insufficiency, urinary obstruction, *vaginitis*, UTI, *amenorrhea*.
**Hematologic:** anemia.
**Metabolic:** hypercalcemia, hyperglycemia, weight increase, gout.
**Musculoskeletal:** back pain, osteoporosis, decreased bone mineral density.
**Respiratory:** COPD, upper respiratory tract infection.

**Skin:** rash, *diaphoresis, acne, seborrhea,* hirsutism.
**Other:** *changes in breast size, changes in libido, infection,* breast swelling, pain, and tenderness.

## INTERACTIONS
None significant.

## EFFECTS ON LAB TEST RESULTS
• May increase calcium and glucose levels. May decrease hemoglobin level.

## CONTRAINDICATIONS & CAUTIONS
• Contraindicated in patients hypersensitive to LH-RH, LH-RH agonist analogues, or goserelin acetate.
• Contraindicated in pregnant or breast-feeding women and in patients with obstructive uropathy or vertebral metastases.
• The 10.8-mg implant is contraindicated in women because of insufficient data supporting reliable suppression of estradiol.
• Because drug may cause bone density loss in women, use cautiously in patients with risk factors for osteoporosis, such as family history of osteoporosis, chronic alcohol or tobacco abuse, or use of drugs such as corticosteroids or anticonvulsants that affect bone density.

## NURSING CONSIDERATIONS
• Before giving to women, rule out pregnancy.
• When drug is used for prostate cancer, LH-RH analogues such as goserelin may initially worsen symptoms because drug first increases testosterone level. Some patients may temporarily have increased bone pain. Rarely, disease may get worse (spinal cord compression or ureteral obstruction), although the relationship to therapy is uncertain.
• When drug is used for endometrial thinning, if one implant is given, surgery should be performed 4 weeks later; if two implants are given, surgery should be performed 2 to 4 weeks after patient receives second implant.
• May increase risk of diabetes and CV diseases (MI, stroke, and sudden cardiac death) in men being treated for prostate cancer. Monitor patient closely.

## PATIENT TEACHING
• Advise patient to return every 28 days for a new implant. A delay of a couple of days is permissible.
• Tell patient that pain may worsen for first 30 days of treatment.
• Tell women to use a nonhormonal form of contraception during treatment. Caution patient about significant risks to fetus.
• Urge women to call prescriber if menstruation persists or if breakthrough bleeding occurs. Menstruation should stop during treatment.
• Inform women that a delayed return of menstruation may occur after therapy ends. Persistent lack of menstruation is rare.

# granisetron
gran-IZ-e-tron

Granisol, Sancuso

# granisetron hydrochloride
Kytril

*Therapeutic class:* Antiemetic
*Pharmacologic class:* Selective serotonin ($5\text{-}HT_3$) receptor antagonist
*Pregnancy risk category B*

## AVAILABLE FORMS
*Injection:* 0.1 mg/ml in 1-ml single-use vials; 1 mg/ml in 1-ml, single-dose, preservative-free vials and 4-ml multidose vials containing benzyl alcohol
*Oral solution:* 1 mg/5 ml
*Tablets:* 1 mg
*Transdermal patch:* 3.1 mg per 24 hours

## INDICATIONS & DOSAGES
➤ **To prevent nausea and vomiting from emetogenic cancer chemotherapy**
*Adults and children age 2 and older:* 10 mcg/kg I.V. undiluted and given by direct injection over 30 seconds, or diluted and infused over 5 minutes. Start giving at least 30 minutes before chemotherapy. Or, for adults, 1 mg P.O. up to 1 hour before chemotherapy and repeated 12 hours later. Or, for adults, 2 mg P.O. daily given up to 1 hour before chemotherapy. Or, apply a single patch to the upper outer arm 24 to

48 hours before chemotherapy. Remove the patch a minimum of 24 hours after completion of chemotherapy or a maximum of 7 days.

➤ **To prevent nausea and vomiting from radiation, including total body irradiation and fractionated abdominal radiation**

*Adults:* 2 mg P.O. once daily within 1 hour of radiation.

➤ **Postoperative nausea and vomiting**

*Adults:* 1 mg I.V. undiluted and given over 30 seconds. For prevention, give before anesthesia induction or immediately before reversal.

## ADMINISTRATION

**P.O.**

• Store bottle of oral solution in an upright position.

**I.V.**

▼ For direct injection, give drug undiluted over 30 seconds.

▼ For intermittent infusion, dilute with normal saline solution for injection or $D_5W$ to a volume of 20 to 50 ml.

▼ Infuse over 5 minutes, starting within 30 minutes before chemotherapy and only on days chemotherapy is given.

▼ Diluted solutions are stable 24 hours at room temperature.

▼ Don't freeze vials.

▼ Once the multiuse vial is penetrated, use contents within 30 days.

▼ **Incompatibilities:** Other I.V. drugs.

**Transdermal**

• Apply patch to intact, healthy skin.

• Each patch is packed in a pouch and should be applied directly after the pouch has been opened.

• Do not cut the patch into pieces.

## ACTION

May block 5-$HT_3$ in the CNS in the chemoreceptor trigger zone and in the peripheral nervous system on nerve terminals of the vagus nerve.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.V. | Unknown | Unknown | Unknown |
| Transdermal | Unknown | 48 hr | Unknown |

*Half-life:* 5 to 9 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia, headache, fever,* agitation, anxiety, CNS stimulation, dizziness, insomnia, somnolence, *pain.*

**CV:** ***bradycardia,*** hypertension, hypotension.

**GI:** *constipation, nausea, vomiting,* abdominal pain, decreased appetite, diarrhea, dyspepsia, flatulence, taste disorder.

**GU:** oliguria, UTI.

**Hematologic:** *anemia,* ***leukocytosis, leukopenia, thrombocytopenia.***

**Respiratory:** cough, increased sputum.

**Skin:** alopecia, rash, dermatitis.

**Other:** hypersensitivity reactions (***anaphylaxis,*** urticaria, dyspnea, hypotension), infection.

## INTERACTIONS

None known.

## EFFECTS ON LAB TEST RESULTS

• May increase ALT and AST levels. May decrease hemoglobin level and hematocrit. May alter fluid and electrolyte levels with prolonged use.

• May decrease platelet and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug.

***Overdose S&S:*** Headache.

## NURSING CONSIDERATIONS

• Drug regimen is given only on days when chemotherapy is given. Treatment at other times isn't useful.

## PATIENT TEACHING

• Stress importance of taking second dose of oral drug 12 hours after the first for maximum effectiveness.

• Tell patient to report adverse reactions immediately.

# guaifenesin (glyceryl guaiacolate)

gwye-FEN-e-sin

Allfen Jr, Altarussin ◇, Balminil† ◇, Benylin E† ◇, Diabetic Tussin ◇, Ganidin NR, Guiatuss ◇, Humibid ◇, Liquibid, Mucinex ◇, Mucinex Mini-Melts ◇, Naldecon Senior EX ◇, Organidin NR, Robitussin ◇, Scot-Tussin Expectorant ◇, Siltussin ◇

*Therapeutic class:* Expectorant
*Pharmacologic class:* Propanediol derivative
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 200 mg ◇
*Granules:* 50 mg ◇, 100 mg ◇
*Liquid:* 100 mg/5 ml ◇*, 200 mg/5 ml ◇
*Syrup:* 100 mg/5 ml ◇
*Tablets:* 100 mg ◇, 200 mg ◇, 400 mg
*Tablets (extended-release):* 600 mg ◇, 1,200 mg ◇

## INDICATIONS & DOSAGES

➤ **Expectorant**

*Adults and children age 12 and older:* 200 to 400 mg P.O. every 4 hours, or 600 to 1,200 mg extended-release capsules or tablets every 12 hours. Maximum, 2,400 mg daily.
*Children ages 6 to 11:* 100 to 200 mg P.O. every 4 hours. Maximum, 1,200 mg daily.
*Children ages 2 to 5:* 50 to 100 mg (immediate-release) P.O. every 4 hours. Maximum, 600 mg daily.

## ADMINISTRATION

**P.O.**

- Don't break or crush extended-release products.
- Empty entire contents of granule packet on the patient's tongue. Tell patient to swallow without chewing for best taste.

## ACTION

Increases production of respiratory tract fluids to help liquefy and reduce the viscosity of tenacious secretions.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** dizziness, headache.
**GI:** vomiting, nausea.
**Skin:** rash.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

- May interfere with uric acid level determination and with 5-hydroxyindoleacetic acid and vanillylmandelic tests.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.

## NURSING CONSIDERATIONS

- Some liquid formulations contain alcohol.
- Drug is used to liquefy thick, tenacious sputum. Evidence suggests that guaifenesin is effective as an expectorant, but no evidence exists to support its role as an antitussive.
- Monitor cough type and frequency.
- Stop use 48 hours before 5-hydroxyindoleacetic acid and vanillylmandelic tests.
- ***Look alike–sound alike:*** Don't confuse guaifenesin with guanfacine.

## PATIENT TEACHING

- Tell patient to contact his health care provider if cough lasts longer than 1 week, recurs frequently, or is accompanied by high fever, rash, or severe headache.
- Inform patient that drug shouldn't be used for chronic or persistent cough, such as with smoking, asthma, chronic bronchitis, or emphysema.
- Advise patient to take each dose with one glass of water; increasing fluid intake may prove beneficial.
- Tell patient to empty entire contents of granule packet onto the tongue and to swallow without chewing for best taste.
- Encourage deep-breathing exercises.

## guanfacine hydrochloride

GWAHN-fa-seen

Intuniv, Tenex

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Centrally acting antiadrenergic
*Pregnancy risk category B*

### AVAILABLE FORMS

*Tablets:* 1 mg, 2 mg
*Tablets (extended-release):* 1 mg, 2 mg, 3 mg, 4 mg

### INDICATIONS & DOSAGES

➤ **Hypertension**

*Adults:* Initially, 1 mg immediate-release tablet P.O. once daily at bedtime. If response isn't adequate after 3 to 4 weeks, increase dosage to 2 mg daily. Dosage may be further increased to 3 mg P.O. after an additional 3 to 4 weeks.

✷ ***NEW INDICATION:*** **Pediatric hypertension**

*Children age 12 and older:* Initially, 1 mg immediate-release tablet P.O. daily at bedtime. May increase to 2 mg after 3 to 4 weeks as needed.

✷ ***NEW INDICATION:*** **Attention deficit hyperactivity disorder**

*Children age 6 and older:* Extended-release form only. Initially, 1 mg P.O. once daily in a.m. Adjust dosage in increments of 1 mg/week as needed. Dosage range is 1 to 4 mg/day. Or, initially, 0.05 to 0.08 mg/kg P.O. once daily. Adjust dosage up to 0.12 mg/kg. Maximum total dose is 4 mg/day.

### ADMINISTRATION

**P.O.**

- When given with another antihypertensive, give dose at bedtime to reduce somnolence.
- Don't give extended-release tablet with high-fat meal; give with water, milk, or other liquid.
- Don't crush, break, or allow patient to chew extended-release tablets.

### ACTION

Reduces sympathetic outflow from the vasomotor center to the heart and blood vessels, resulting in a decrease in peripheral vascular resistance and a reduction in heart rate.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–4 hr | 24 hr |
| P.O. (extended-release) | Unknown | 4–8 hr | Unknown |

*Half-life:* About 17 hours; for extended-release tablet, about 18 hours.

### ADVERSE REACTIONS

**CNS:** *dizziness, somnolence,* fatigue, headache, insomnia, asthenia.
**CV:** ***bradycardia.***
**GI:** *constipation, dry mouth,* diarrhea, nausea.
**GU:** impotence.
**Skin:** dermatitis, pruritus.

### INTERACTIONS

**Drug-drug.** *CNS depressants:* May increase sedation. Use together cautiously.
*Tricyclic antidepressants:* May inhibit antihypertensive effects. Monitor blood pressure.
**Drug-lifestyle.** *Alcohol:* May increase sedation. Discourage alcohol use.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with severe coronary insufficiency, recent MI, cerebrovascular disease, or chronic renal or hepatic insufficiency.

⚠ ***Overdose S&S:*** Drowsiness, lethargy, bradycardia, hypotension.

### NURSING CONSIDERATIONS

- Monitor blood pressure frequently.
- Risk and severity of adverse reactions increase with higher dosages.
- Drug may be used alone or with a diuretic.
- Rebound hypertension may occur and, if it occurs, will be noticeable within 2 to 4 days after therapy ends.
- Children on long-term treatment require periodic reassessment.

- Don't substitute immediate-release for extended-release or vice versa, or use together.
- Immediate-release form may be used as monotherapy or in combination with other antihypertensives.
- ***Look alike–sound alike:*** Don't confuse guanfacine with guanidine, guaifenesin, or guanabenz. Don't confuse Tenex with Xanax, Entex, or Ten-K.

## PATIENT TEACHING

- Tell patient not to stop therapy abruptly and to follow tapering instructions from provider.
- Advise patient to avoid activities that require alertness before drug's effects are known; drowsiness may occur.
- Warn patient that he may have a lower tolerance to alcohol and other CNS depressants during therapy.
- Caution patient that drug may decrease saliva and contribute to dental caries, periodontal disease, oral candidiasis, and discomfort. Advise patient to have routine dental exams.
- Advise patient not to take extended-release form with a high-fat meal because of increase in drug exposure. Tablet may be taken with water, milk, or other liquid.
- Tell patient not to crush, chew, or break extended-release tablets.

# haloperidol

ha-loe-PER-i-dole

Haldol, Novo-Peridol†

# haloperidol decanoate

Haldol Decanoate, Haloperidol LA†

# haloperidol lactate

Haldol

*Therapeutic class:* Antipsychotic
*Pharmacologic class:* Phenylbutylpiperadine derivative
*Pregnancy risk category C*

## AVAILABLE FORMS

**haloperidol**
*Tablets:* 0.5 mg, 1 mg, 2 mg, 5 mg, 10 mg, 20 mg

**haloperidol decanoate**
*Injection:* 50 mg/ml, 100 mg/ml

**haloperidol lactate**
*Injection:* 5 mg/ml

## INDICATIONS & DOSAGES

➤ **Psychotic disorders**

*Adults and children older than age 12:* Dosage varies for each patient. Initially, 0.5 to 5 mg P.O. b.i.d. or t.i.d. Or, 2 to 5 mg I.M. lactate every 4 to 8 hours, although hourly administration may be needed until control is obtained. Maximum, 100 mg P.O. daily.

*Children ages 3 to 12 who weigh 15 to 40 kg (33 to 88 lb):* Initially, 0.5 mg P.O. daily divided b.i.d. or t.i.d. May increase dose by 0.5 mg at 5- to 7-day intervals, depending on therapeutic response and patient tolerance. Maintenance dose, 0.05 mg/kg to 0.15 mg/kg P.O. daily given in two or three divided doses. Severely disturbed children may need higher doses.

➤ **Chronic psychosis requiring prolonged therapy**

*Adults:* 50 to 100 mg I.M. decanoate every 4 weeks.

➤ **Nonpsychotic behavior disorders**

*Children ages 3 to 12:* 0.05 to 0.075 mg/kg P.O. daily, in two or three divided doses. Maximum, 6 mg daily.

➤ **Tourette syndrome**

*Adults:* Initially, 0.5 to 2 mg P.O. b.i.d., t.i.d., or as needed. Up to about 10 mg/day may be needed.

*Children ages 3 to 12:* 0.05 to 0.075 mg/kg P.O. daily, in two or three divided doses.

*Elderly patients:* 0.5 to 2 mg P.O. b.i.d. or t.i.d.; increase gradually, as needed.

➤ **Hiccups ♦**

*Adults:* 0.5 to 2 mg P.O. daily, b.i.d. or t.i.d. Or, 2.5 to 5 mg I.M. one to three times daily. Or, 5 to 10 mg/day as I.V. or subcutaneous infusion.

➤ **Prevention of chemotherapy-induced nausea and vomiting ♦**

*Adults:* 1 to 2 mg P.O. every 4 to 6 hours given on a set schedule.

***Adjust-a-dose:*** For debilitated patients, initially, 0.5 to 2 mg P.O. b.i.d. or t.i.d.; increase gradually, as needed.

## ADMINISTRATION

**P.O.**

● Protect drug from light. Slight yellowing of concentrate is common and doesn't affect potency. Discard very discolored solutions.
● Dilute oral dose with water or a beverage, such as orange juice, apple juice, tomato juice, or cola, immediately before administration.

**I.V.**

▼ Only the lactate form can be given I.V.
▼ Monitor patient receiving single doses higher than 50 mg or total daily doses greater than 500 mg closely for prolonged QTc interval and torsades de pointes.
▼ Store at controlled room temperature, and protect from light.
▼ **Incompatibilities:** Allopurinol, amphotericin B cholesteryl sulfate complex, benztropine, cefepime, diphenhydramine, fluconazole, foscarnet, heparin, hydromorphone, hydroxyzine, ketorolac, morphine, nitroprusside sodium, piperacillin and tazobactam sodium, sargramostim.

**I.M.**

● Protect drug from light. Slight yellowing of injection is common and doesn't affect potency. Discard very discolored solutions.
● When switching from tablets to decanoate injection, give 10 to 15 times the oral dose once a month (maximum 100 mg).
***Alert:*** Don't give decanoate form I.V.

## ACTION

A butyrophenone that probably exerts antipsychotic effects by blocking postsynaptic dopamine receptors in the brain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3–6 hr | Unknown |
| I.V. | Unknown | Unknown | Unknown |
| I.M. (decanoate) | Unknown | 3–9 days | Unknown |
| I.M. (lactate) | Unknown | 10–20 min | Unknown |

*Half-life:* P.O., 24 hours; I.M., 21 hours.

## ADVERSE REACTIONS

**CNS:** *severe extrapyramidal reactions, tardive dyskinesia,* ***neuroleptic malignant syndrome, seizures,*** sedation, drowsiness, lethargy, headache, insomnia, confusion, vertigo.
**CV:** tachycardia, hypotension, hypertension, ECG changes, ***torsades de pointes,*** with I.V. use.
**EENT:** blurred vision.
**GI:** dry mouth, anorexia, constipation, diarrhea, nausea, vomiting, dyspepsia.
**GU:** urine retention, menstrual irregularities, priapism.
**Hematologic:** ***leukopenia,*** leukocytosis.
**Hepatic:** jaundice.
**Skin:** rash, other skin reactions, diaphoresis.
**Other:** gynecomastia.

## INTERACTIONS

**Drug-drug.** *Anticholinergics:* May increase anticholinergic effects and glaucoma. Use together cautiously.
*Azole antifungals, buspirone, macrolides:* May increase haloperidol level. Monitor patient for increased adverse reactions; haloperidol dose may need to be adjusted.
*Carbamazepine:* May decrease haloperidol level. Monitor patient.
*CNS depressants:* May increase CNS depression. Use together cautiously.
*Lithium:* May cause lethargy and confusion after high doses. Monitor patient.
*Methyldopa:* May cause dementia. Monitor patient closely.
*Rifampin:* May decrease haloperidol level. Monitor patient for clinical effect.
**Drug-lifestyle.** *Alcohol use:* May increase CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

● May increase liver function test values.
● May increase or decrease WBC count.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug and in those with parkinsonism, coma, or CNS depression.
● Use cautiously in elderly and debilitated patients; in patients with history of seizures or EEG abnormalities, severe CV disorders, allergies, glaucoma, or urine retention; and in those taking anticonvulsants, anticoagulants, antiparkinsonians, or lithium.
***Overdose S&S:*** Severe extrapyramidal reactions, hypotension, sedation.

H

## NURSING CONSIDERATIONS

- Monitor patient for tardive dyskinesia, which may occur after prolonged use. It may not appear until months or years later and may disappear spontaneously or persist for life, despite ending drug.

***Alert:*** Watch for signs and symptoms of neuroleptic malignant syndrome (extrapyramidal effects, hyperthermia, autonomic disturbance), which is rare but commonly fatal.

**Black Box Warning** Elderly patients with dementia-related psychosis treated with atypical or conventional antipsychotics are at increased risk for death. Antipsychotics aren't approved for the treatment of dementia-related psychosis. ■

- Don't withdraw drug abruptly unless required by severe adverse reactions.

***Alert:*** Haldol may contain tartrazine.

- ***Look alike–sound alike:*** Don't confuse Haldol with Halcion or Halog.

## PATIENT TEACHING

- Although drug is the least sedating of the antipsychotics, warn patient to avoid activities that require alertness and good coordination until effects of drug are known. Drowsiness and dizziness usually subside after a few weeks.
- Warn patient to avoid alcohol during therapy.
- Tell patient to relieve dry mouth with sugarless gum or hard candy.

**SAFETY ALERT!**

# heparin sodium

HEP-ah-rin

Hepalean†, Heparin Lock Flush Solution (with Tubex), Heparin Sodium Injection, Hep-Lock, Hep-Pak

*Therapeutic class:* Anticoagulant
*Pharmacologic class:* Anticoagulant
*Pregnancy risk category C*

## AVAILABLE FORMS

Products are derived from beef lung or pork intestinal mucosa.

**heparin sodium**
*Carpuject:* 5,000 units/ml
*Premixed I.V. solutions:* 1,000 units in 500 ml of normal saline solution; 2,000 units in 1,000 ml of normal saline solution; 12,500 units in 250 ml of half-normal saline solution; 25,000 units in 250 ml of half-normal saline solution; 25,000 units in 500 ml of half-normal saline solution; 10,000 units in 100 ml of $D_5W$; 12,500 units in 250 ml of $D_5W$; 20,000 units in 500 ml of $D_5W$; 25,000 units in 250 ml $D_5W$; 25,000 units in 500 ml $D_5W$
*Single-dose ampules and vials:* 1,000 units/ml, 5,000 units/ml, 10,000 units/ml, 20,000 units/ml, 40,000 units/ml
*Syringes:* 1,000 units/ml, 2,500 units/ml, 5,000 units/ml, 7,500 units/ml, 10,000 units/ml, 20,000 units/ml
*Unit-dose vials:* 1,000 units/ml, 2,500 units/ml, 5,000 units/ml, 7,500 units/ml, 10,000 units/ml, 20,000 units/ml
*Vials (multidose):* 1,000 units/ml, 2,000 units/ml, 2,500 units/ml, 5,000 units/ml, 10,000 units/ml, 20,000 units/ml, 40,000 units/ml

**heparin sodium flush**
*Syringes:* 1 unit/ml, 10 units/ml, 100 units/ml
*Vials:* 10 units/ml, 100 units/ml

## INDICATIONS & DOSAGES

➤ **Full-dose continuous I.V. infusion therapy for deep vein thrombosis (DVT), MI, pulmonary embolism**

*Adults:* Initially, 5,000 units by I.V. bolus; then 20,000 to 40,000 units/day by I.V. infusion with pump. Titrate hourly rate based on PTT results (every 4 to 6 hours in the early stages of treatment).
*Children:* Initially, 50 units/kg I.V.; then 25 units/kg/hour or 20,000 units/$m^2$ daily by I.V. infusion pump. Titrate dosage based on PTT.

➤ **Full-dose subcutaneous therapy for DVT, MI, pulmonary embolism**

*Adults:* Initially, 5,000 units I.V. bolus and 10,000 to 20,000 units in a concentrated solution subcutaneously; then 8,000 to 10,000 units subcutaneously every 8 hours or 15,000 to 20,000 units in a concentrated solution every 12 hours.

➤ **Full-dose intermittent I.V. therapy for DVT, MI, pulmonary embolism**
*Adults:* Initially, 10,000 units by I.V. bolus; then titrated according to PTT, and 5,000 to 10,000 units I.V. every 4 to 6 hours.
➤ **Fixed low-dose therapy for prevention of venous thrombosis, pulmonary embolism, embolism associated with atrial fibrillation, and postoperative DVT**
*Adults:* 5,000 units subcutaneously every 12 hours. In surgical patients, give first dose 2 hours before procedure; then 5,000 units subcutaneously every 8 to 12 hours for 5 to 7 days or until patient can walk.
➤ **Consumptive coagulopathy (such as disseminated intravascular coagulation)**
*Adults:* 50 to 100 units/kg by I.V. bolus or continuous I.V. infusion every 4 hours.
*Children:* 25 to 50 units/kg by I.V. bolus or continuous I.V. infusion every 4 hours. If no improvement within 4 to 8 hours, stop heparin.
➤ **Open-heart surgery**
*Adults:* For total body perfusion, 150 to 400 units/kg continuous I.V. infusion. Frequently, a dose of 300 units/kg for procedures estimated to last less than 60 minutes, or 400 units/kg for those estimated to last more than 60 minutes, is used.
➤ **Patency maintenance of I.V. indwelling catheters**
*Adults:* 10 to 100 units I.V. flush. Use sufficient volume to fill device. Not intended for therapeutic use.

## ADMINISTRATION

### I.V.

▼ Draw blood to establish baseline coagulation parameters before therapy.
▼ Use an infusion pump to provide maximum safety. Check continuous infusions regularly, even when pumps are in good working order, to ensure correct dosing. Place notice above patient's bed to caution I.V. team or laboratory personnel to apply pressure dressings after taking blood.
▼ During intermittent infusion, always draw blood 30 minutes before next scheduled dose to avoid falsely elevated PTT. Blood for PTT may be drawn 4 hours after continuous I.V. heparin therapy starts. Never draw blood for PTT from the tubing of the heparin infusion or from the infused vein, because falsely elevated PTT will result. Always draw blood from the opposite arm.
▼ Don't skip a dose or try to "catch up" with a solution containing heparin. If solution runs out, restart it as soon as possible, and reschedule bolus dose immediately. Monitor PTT.
▼ Concentrated heparin solutions (more than 100 units/ml) can irritate blood vessels.
▼ Never piggyback other drugs into an infusion line while heparin infusion is running. Never mix another drug and heparin in same syringe when giving a bolus.
▼ **Incompatibilities:** Alteplase; amikacin; amiodarone; amphotericin B cholesteryl; ampicillin sodium; atracurium; caspofungin; chlorpromazine; ciprofloxacin; codeine phosphate; cytarabine; dacarbazine; dantrolene; daunorubicin; dextrose 4.3% in sodium chloride solution 0.18%; diazepam; diltiazem; dobutamine; doxorubicin; doxycycline hyclate; droperidol; ergotamine; erythromycin gluceptate or lactobionate; filgrastim; gentamicin; haloperidol lactate; hydrocortisone sodium succinate; hydroxyzine hydrochloride; idarubicin; kanamycin; labetalol; levofloxacin; levorphanol; meperidine; methadone; methylprednisolone sodium succinate; morphine sulfate; nesiritide; netilmicin; nicardipine; penicillin G potassium; penicillin G sodium; pentazocine lactate; phenytoin sodium; polymyxin B sulfate; prochlorperazine edisylate; promethazine hydrochloride; quinidine gluconate; reteplase; 1/6 M sodium lactate; solutions containing a phosphate buffer, sodium carbonate, or sodium oxalate; streptomycin; sulfamethoxazole and trimethoprim; tobramycin sulfate; trifluoperazine; triflupromazine; vancomycin; vinblastine; warfarin.

### Subcutaneous

● Give low-dose injections sequentially between iliac crests in lower abdomen deep into subcutaneous fat. Inject drug subcutaneously slowly into fat pad.
● Don't massage injection site; watch for signs of bleeding there.

● Alternate sites every 12 hours—right for morning, left for evening. Record location.

## ACTION

Accelerates formation of antithrombin III-thrombin complex and deactivates thrombin, preventing conversion of fibrinogen to fibrin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Unknown | Variable |
| Subcut. | 20–60 min | 2–4 hr | Variable |

*Half-life:* 1 to 2 hours. Half-life is dose-dependent and nonlinear and may be disproportionately prolonged at higher doses.

## ADVERSE REACTIONS

**CNS:** fever.
**EENT:** rhinitis.
**Hematologic:** ***hemorrhage, overly prolonged clotting time, thrombocytopenia, white clot syndrome.***
**Metabolic:** ***hyperkalemia,*** hypoaldosteronism.
**Skin:** irritation, mild pain, hematoma, ulceration, cutaneous or subcutaneous necrosis, pruritus, urticaria.
**Other:** hypersensitivity reactions, including chills, ***anaphylactoid reactions.***

## INTERACTIONS

**Drug-drug.** *Antihistamines, digoxin, quinine, tetracycline:* May interfere with anticoagulant effect of heparin. Monitor patient for therapeutic effect.
*Antiplatelet drugs, salicylates:* May increase anticoagulant effect. Use together cautiously. Monitor coagulation studies and patient closely.
*Cephalosporins, penicillins:* May increase risk of bleeding. Monitor patient closely.
*Nitroglycerin:* May decrease effects of heparin. Monitor patient closely.
*Oral anticoagulants:* May increase additive anticoagulation. Monitor PT, INR, and PTT.
*Thrombolytics:* May increase risk of hemorrhage. Monitor patient closely.
**Drug-herb.** *Angelica (dong quai), boldo, bromelains, capsicum, chamomile, dandelion, danshen, devil's claw, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, licorice, meadowsweet, motherwort, onion, passion flower, red clover, white willow:* May increase risk of bleeding. Discourage herb use.
**Drug-lifestyle.** *Smoking:* May interfere with anticoagulant effect of heparin. Discourage smoking.

## EFFECTS ON LAB TEST RESULTS

● May increase ALT, AST, and potassium levels.
● May increase INR, PT, and PTT. May decrease platelet count.
● Drug may cause false elevations in some tests for thyroxine level.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug. Conditionally contraindicated in patients with active bleeding, blood dyscrasia, or bleeding tendencies, such as hemophilia, thrombocytopenia, or hepatic disease with hypoprothrombinemia; suspected intracranial hemorrhage; suppurative thrombophlebitis; inaccessible ulcerative lesions (especially of GI tract) and open ulcerative wounds; extensive denudation of skin; ascorbic acid deficiency and other conditions that cause increased capillary permeability.
● Conditionally contraindicated during or after brain, eye, or spinal cord surgery; during spinal tap or spinal anesthesia; during continuous tube drainage of stomach or small intestine; and in subacute bacterial endocarditis, shock, advanced renal disease, threatened abortion, or severe hypertension.
● Use cautiously in women during menses or after childbirth and in patients with mild hepatic or renal disease, alcoholism, occupations with high risk of physical injury, or history of allergies, asthma, or GI ulcerations.
● Use cautiously in women older than age 60 because of an increased risk of bleeding.
⚠ ***Overdose S&S:*** Bleeding, nosebleeds, hematuria, tarry stools, easy bruising, petechial formations.

## NURSING CONSIDERATIONS

● Although heparin use is clearly hazardous in certain conditions, its risks and benefits must be evaluated.
● If a woman needs anticoagulation during pregnancy, most prescribers use heparin.

**Alert:** Some commercially available heparin injections contain benzyl alcohol. Avoid using these products in neonates and pregnant women if possible.
- Drug requirements are higher in early phases of thrombogenic diseases and febrile states; they are lower when patient's condition stabilizes.
- Elderly patients should usually start at lower dosage.
- Check order and vial carefully; heparin comes in various concentrations.

**Alert:** USP and international units aren't equivalent for heparin.

**Alert:** Heparin, low–molecular-weight heparins, and danaparoid aren't interchangeable.

**Alert:** Don't change concentrations of infusions unless absolutely necessary. This is a common source of dosage errors.

**Alert:** There is the potential for delayed onset of heparin-induced thrombocytopenia (HIT), a serious antibody-mediated reaction resulting from irreversible aggregation of platelets. HIT may progress to the development of venous and arterial thromboses, a condition referred to as heparin-induced thrombocytopenia and thrombosis (HITT). Thrombotic events may be the initial presentation for HITT, which can occur up to several weeks after stopping heparin therapy. Evaluate patients presenting with thrombocytopenia or thrombosis after stopping heparin for HIT and HITT
- Draw blood for PTT 4 to 6 hours after dose given subcutaneously.
- Avoid I.M. injections of other drugs to prevent or minimize hematoma.
- Measure PTT carefully and regularly. Anticoagulation is present when PTT values are 1½ to 2 times the control values.
- Monitor platelet count regularly. When new thrombosis accompanies thrombocytopenia (white clot syndrome), stop heparin.
- Regularly inspect patient for bleeding gums, bruises on arms or legs, petechiae, nosebleeds, melena, tarry stools, hematuria, and hematemesis.
- Monitor vital signs.

**Alert:** To treat severe overdose, use protamine sulfate (1% solution), a heparin antagonist. Dosage is based on the dose of heparin, its route of administration, and the time since it was given. Generally, 1 to 1.5 mg of protamine per 100 units of heparin is given if only a few minutes have elapsed; 0.5 to 0.75 mg protamine per 100 units heparin, if 30 to 60 minutes have elapsed; and 0.25 to 0.375 mg protamine per 100 units heparin, if 2 hours or more have elapsed. Don't give more than 50 mg protamine in a 10-minute period.
- Abrupt withdrawal may cause increased coagulability; warfarin therapy usually overlaps heparin therapy for continuation of prophylaxis or treatment.
- **Look alike–sound alike:** Don't confuse heparin with Hespan.
- **Look alike–sound alike:** Don't confuse heparin sodium injection 10,000 units/ml and Hep-Lock 10 units/ml.

### PATIENT TEACHING
- Instruct patient and family to watch for signs of bleeding or bruising and to notify prescriber immediately if any occur.
- Tell patient to avoid OTC drugs containing aspirin, other salicylates, or drugs that may interact with heparin unless ordered by prescriber.
- Advise patient to consult with prescriber before starting herbal therapy; many herbs have anticoagulant, antiplatelet, or fibrinolytic properties.

## hepatitis B immune globulin, human (HBIG)

hep-ah-TYE-tis

HepaGam B, HyperHEP B S/D, Nabi-HB

*Therapeutic class:* Prophylactic agent
*Pharmacologic class:* Immune serum
*Pregnancy risk category C*

### AVAILABLE FORMS
*Injection:* 1-ml, 5-ml vials; 0.5-ml neonatal single-dose syringe; 1-ml single-dose syringe

### INDICATIONS & DOSAGES
➤ **Hepatitis B exposure in high-risk patients**

*Adults and children:* 0.06 ml/kg (usual dose is 3 ml to 5 ml) I.M. as soon as possible,

but within 7 days after exposure (within 14 days if sexual exposure). Repeat dose 28 days after exposure if patient doesn't elect to receive the hepatitis B vaccine.
*Neonates born to hepatitis B surface antigen (HBsAg)-positive patients:* 0.5 ml I.M. within 12 hours of birth.

➤ **To prevent hepatitis B recurrence following liver transplantation in HBsAg-positive liver transplant patients (HepaGam B only)**
*Adults:* 20,000 international units I.V. at rate of 2 ml/minute. Give first dose given simultaneously with the grafting of the transplanted liver (anhepatic phase); then daily on days 1 through 7, every 2 weeks from day 14 through 12 weeks, monthly from month 4 onward.
***Adjust-a-dose:*** Adjust dosage in patients who don't reach anti-HBs levels of 500 international units/L within the first week after transplantation. Give 10,000 international units I.V. until target level is reached.

## ADMINISTRATION

**I.M.**
• Inspect for discoloration or particulates. Make sure drug is clear, slightly amber, and moderately viscous.
• Inject into anterolateral thigh or deltoid muscle in older children and adults; inject into anterolateral thigh in neonates and children younger than age 3.

**I.V.**
▼ Give HepaGam B through a separate I.V. line using an I.V. administration set via infusion pump.
▼ During preparation, don't shake vials; avoid foaming.
▼ Set administration rate at 2 ml/minute. Decrease rate of infusion to 1 ml/minute or slower if the patient develops discomfort or infusion-related adverse events, or if there is concern about the speed of infusion.
▼ ***Alert:*** Don't give HyperHEP B or Nabi-HB I.V.

## ACTION

Provides passive immunity to hepatitis B.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.M. | 1–6 days | 3–11 days | 2 mo |
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* Antibodies to HBsAg, 21 days.

## ADVERSE REACTIONS

**CNS (I.V.):** chills, fever, *headache.*
**GI (I.V.):** nausea, vomiting.
**Musculoskeletal (I.V.):** arthralgia, low back pain, *myalgia.*
**Skin:** *pain and tenderness at injection site,* urticaria.
**Other:** ***anaphylaxis, angioedema,*** *cold symptoms or flu,* malaise.

## INTERACTIONS

**Drug-drug.** *Live-virus vaccines:* May interfere with response to live-virus vaccines. Postpone routine immunization for 3 months.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients with history of anaphylactic reactions to immune serum.
• Give to patients with coagulation disorders or thrombocytopenia only if benefit outweighs risk.
• Use cautiously in patients with specific IgA deficiency.

## NURSING CONSIDERATIONS

• Obtain history of allergies and reactions to immunizations. Keep epinephrine 1:1,000 available.
• For postexposure prophylaxis (such as after needlestick or direct contact), give drug with hepatitis B vaccine.
• A vial of HBIG (human) that has been entered should be used within 6 hours. Don't reuse or save for future use.
• The maltose contained in HepaGam B can interfere with some blood glucose monitoring systems, causing falsely elevated readings.
• Antibodies present in HepaGam B may interfere with some serological tests.
• ***Look alike–sound alike:*** This immune globulin provides passive immunity; don't confuse with hepatitis B vaccine. Both

drugs may be given at same time. Don't mix in the same syringe.

### PATIENT TEACHING

- Inform patient that pain and tenderness may occur at injection site.
- Tell patient to report signs and symptoms of hypersensitivity immediately.

## hydrALAZINE hydrochloride

hye-DRAL-a-zeen

Apresoline†, Novo-Hylazin†, Nu-Hydral†

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Peripheral dilator
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 20 mg/ml in 1-ml vial
*Tablets:* 10 mg, 25 mg, 50 mg, 100 mg

### INDICATIONS & DOSAGES

➤ **Hypertension**

*Adults:* Initially, 10 mg P.O. q.i.d.; gradually increase over 2 weeks to 50 mg q.i.d., based on patient tolerance and response. Once stabilized, maintenance dosage can be divided b.i.d. Recommended range is 12.5 to 50 mg b.i.d.
*Children:* Initially, 0.75 mg/kg daily P.O. divided into four doses; gradually increased over 3 to 4 weeks to maximum of 7.5 mg/kg or 200 mg daily. Maximum first P.O. dose is 25 mg.

➤ **Severe essential hypertension**

*Adults:* 20 to 40 mg I.M. or I.V. slowly; repeat as needed. Switch to oral form as soon as possible.

### ADMINISTRATION

**P.O.**

- Give drug with food to increase absorption.

**I.V.**

▼ Give drug slowly and repeat p.r.n., generally every 4 to 6 hours. Hydralazine changes color in most infusion solutions; these color changes don't indicate loss of potency.

▼ Drug is compatible with normal saline, Ringer's, lactated Ringer's, and several other common I.V. solutions.
▼ Replace parenteral therapy with oral therapy as soon as possible.
▼ **Incompatibilities:** Aminophylline, ampicillin sodium, chlorothiazide, $D_5W$, dextrose 10% in lactated Ringer's solution, dextrose 10% in normal saline solution, diazoxide, doxapram, edetate calcium disodium, ethacrynate, fructose 10% in normal saline solution, fructose 10% in water, furosemide, hydrocortisone sodium succinate, mephentermine, metaraminol bitartrate, methohexital, nitroglycerin, phenobarbital sodium, verapamil.

**I.M.**

- Switch to oral form as soon as possible.

### ACTION

Unknown. A direct-acting peripheral vasodilator that relaxes arteriolar smooth muscle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 20–30 min | 1–2 hr | 2–4 hr |
| I.V. | 5–20 min | 10–80 min | 2–6 hr |
| I.M. | 10–30 min | 1 hr | 2–6 hr |

*Half-life:* 3 to 7 hours.

### ADVERSE REACTIONS

**CNS:** *headache,* peripheral neuritis, dizziness.
**CV:** *angina pectoris, palpitations, tachycardia,* orthostatic hypotension, edema, flushing.
**EENT:** nasal congestion.
**GI:** *nausea, vomiting, diarrhea, anorexia,* constipation.
**Hematologic:** ***neutropenia, leukopenia, agranulocytopenia, agranulocytosis, thrombocytopenia with or without purpura.***
**Skin:** rash.
**Other:** *lupuslike syndrome.*

### INTERACTIONS

**Drug-drug.** *Diazoxide, MAO inhibitors:* May cause severe hypotension. Use together cautiously.
*Diuretics, other hypotensive drugs:* May cause excessive hypotension. Dosage adjustment may be needed.

*Indomethacin:* May decrease effects of hydralazine. Monitor blood pressure.
***Metoprolol, propranolol:*** May increase levels and effects of these beta blockers. Monitor patient closely. May need to adjust dosage of either drug.
**Drug-food.** *Any food:* Food may increase drug absorption. Encourage patient to take with food.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level.
- May decrease neutrophil, WBC, granulocyte, platelet, and RBC counts.
- May cause positive ANA titers.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Contraindicated in those with coronary artery disease or mitral valvular rheumatic heart disease.
- Use cautiously in patients with suspected cardiac disease, stroke, or severe renal impairment and in those taking other antihypertensives.

***Overdose S&S:*** Hypotension, tachycardia, headache, flushing.

## NURSING CONSIDERATIONS

- Monitor patient's blood pressure, pulse rate, and body weight frequently. Drug may be given with diuretics and beta blockers to decrease sodium retention and tachycardia and to prevent angina attacks.
- Elderly patients may be more sensitive to drug's hypotensive effects.
- Obtain CBC, lupus erythematosus cell preparation, and antinuclear antibody titer determination before therapy and periodically during long-term therapy.

***Alert:*** Monitor patient closely for signs and symptoms of lupuslike syndrome (sore throat, fever, muscle and joint aches, rash), and notify prescriber immediately if they develop.
- Improve patient compliance by giving drug b.i.d. Check with prescriber.
- ***Look alike–sound alike:*** Don't confuse hydralazine with hydroxyzine.

## PATIENT TEACHING

- Instruct patient to take oral form with meals to increase absorption.
- Inform patient that low blood pressure and dizziness upon standing can be minimized by rising slowly and avoiding sudden position changes.
- Tell woman of childbearing age to notify prescriber if she suspects pregnancy. Drug will need to be stopped.
- Tell patient to notify prescriber of unexplained prolonged general tiredness or fever, muscle or joint aching, or chest pain.

# hydrochlorothiazide

hye-droe-klor-oh-THYE-a-zide

Apo-Hydro†, Microzide, Novo-Hydrazide†, Nu-hydro†, Oretic, Urozide†

*Therapeutic class:* Diuretic
*Pharmacologic class:* Thiazide diuretic
*Pregnancy risk category B*

## AVAILABLE FORMS

*Capsules:* 12.5 mg
*Oral solution:* 50 mg/5 ml
*Tablets:* 12.5 mg, 25 mg, 50 mg

## INDICATIONS & DOSAGES

➤ **Edema**

*Adults:* 25 to 100 mg P.O. daily or intermittently; up to 200 mg initially for several days until nonedematous weight is attained.

➤ **Hypertension**

*Adults:* 12.5 to 50 mg P.O. once daily. Increase or decrease daily dose based on blood pressure.
*Children ages 6 months to 12 years:* 1 to 2 mg/kg P.O. daily in a single dose or two divided doses. The total daily dose shouldn't exceed 37.5 mg for children up to age 2 or 100 mg in children ages 2 to 12.
*Children younger than age 6 months:* Up to 3 mg/kg P.O. daily in two divided doses.
***Adjust-a-dose:*** In patients older than age 65 initially, 12.5 mg daily. Adjust in increments of 12.5 mg, if needed.

## ADMINISTRATION

**P.O.**

- Give drug with food to minimize GI upset.
- To prevent nocturia, give drug in morning. If second dose is needed, give in early afternoon.

## ACTION

Increases sodium and water excretion by inhibiting sodium and chloride reabsorption in distal segment of the nephron.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 2 hr | 4–6 hr | 6–12 hr |

*Half-life:* 5½ to 15 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, vertigo, headache, paresthesia, weakness, restlessness.
**CV:** orthostatic hypotension, allergic myocarditis, vasculitis.
**GI:** ***pancreatitis,*** anorexia, nausea, epigastric distress, vomiting, abdominal pain, diarrhea, constipation.
**GU:** ***renal failure,*** polyuria, frequent urination, interstitial nephritis.
**Hematologic:** ***aplastic anemia, agranulocytosis, leukopenia, thrombocytopenia,*** hemolytic anemia.
**Hepatic:** jaundice.
**Metabolic:** asymptomatic hyperuricemia, hypokalemia, hyperglycemia and impaired glucose tolerance, fluid and electrolyte imbalances, including dilutional hyponatremia and hypochloremia, metabolic alkalosis, hypercalcemia, volume depletion and dehydration.
**Musculoskeletal:** muscle cramps.
**Respiratory:** ***respiratory distress,*** pneumonitis.
**Skin:** dermatitis, photosensitivity reactions, rash, purpura, alopecia.
**Other:** ***anaphylactic reactions,*** hypersensitivity reactions, gout.

## INTERACTIONS

**Drug-drug.** *Amphotericin B, corticosteroids:* May increase risk of hypokalemia. Monitor potassium level closely.
*Antidiabetics:* May decrease hypoglycemic effects. Adjust dosage if needed. Monitor glucose level.
*Antihypertensives:* May have additive antihypertensive effect. Use together cautiously.
*Barbiturates, opioids:* May increase orthostatic hypotensive effect. Monitor patient closely.
*Bumetanide, ethacrynic acid, furosemide, torsemide:* May cause excessive diuretic response, causing serious electrolyte abnormalities or dehydration. Adjust doses carefully, and monitor patient closely for signs and symptoms of excessive diuretic response.
*Cardiac glycosides:* May increase risk of digoxin toxicity from diuretic-induced hypokalemia. Monitor potassium and digoxin levels.
*Cholestyramine, colestipol:* May decrease intestinal absorption of thiazides. Separate doses by 2 hours.
*Diazoxide:* May increase antihypertensive, hyperglycemic, and hyperuricemic effects. Use together cautiously.
*Lithium:* May decrease lithium excretion, increasing risk of lithium toxicity. Monitor lithium level.
*NSAIDs:* May increase risk of renal failure. May decrease diuretic and antihypertensive effects. Monitor renal function and blood pressure.
**Drug-herb.** *Dandelion:* May interfere with diuretic activity. Discourage use together.
*Licorice:* May cause unexpected rapid potassium loss. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May increase orthostatic hypotensive effect. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase glucose, cholesterol, triglyceride, calcium, and uric acid levels. May decrease potassium, sodium, chloride, and hemoglobin levels.
- May decrease granulocyte, WBC, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with anuria and patients hypersensitive to other thiazides or other sulfonamide derivatives.
- Use cautiously in children and in patients with severe renal disease, impaired hepatic function, or progressive hepatic disease.

***Overdose S&S:*** Electrolyte imbalance, dehydration.

## NURSING CONSIDERATIONS

- Monitor fluid intake and output, weight, blood pressure, and electrolyte levels.
- Watch for signs and symptoms of hypokalemia, such as muscle weakness and cramps.
- Drug may be used with potassium-sparing diuretic to prevent potassium loss.
- Consult prescriber and dietitian about a high-potassium diet or potassium supplement. Foods rich in potassium include citrus fruits, tomatoes, bananas, dates, and apricots.
- Monitor creatinine and BUN levels regularly. Cumulative effects of drug may occur with impaired renal function.
- Monitor uric acid level, especially in patients with history of gout.
- Monitor glucose level, especially in diabetic patients.
- Monitor elderly patients, who are especially susceptible to excessive diuresis.
- Stop thiazides and thiazide-like diuretics before parathyroid function tests.
- In patients with hypertension, therapeutic response may be delayed several weeks.

## PATIENT TEACHING

- Instruct patient to take drug with food to minimize GI upset.
- Advise patient to take drug in morning to avoid need to urinate at night; if patient needs second dose, have him take it in early afternoon.
- Advise patient to avoid sudden posture changes and to rise slowly to avoid dizziness upon standing quickly.
- Encourage patient to use a sunblock to prevent photosensitivity reactions.
- Tell patient to check with prescriber or pharmacist before using OTC drugs.

# hydrocortisone (oral; injection; rectal)

hye-droe-KOR-ti-sone

Cortef, Cortenema

## hydrocortisone acetate

Anucort-HC, Anusol-HC, Cortifoam, Proctocort

## hydrocortisone cypionate

## hydrocortisone sodium succinate

A-Hydrocort, Solu-Cortef

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Glucocorticoid
*Pregnancy risk category C*

## AVAILABLE FORMS

**hydrocortisone**
*Enema:* 100 mg/60 ml
*Tablets:* 5 mg, 10 mg, 20 mg
**hydrocortisone acetate**
*Injection:* 25 mg/ml, 50 mg/ml suspension
*Rectal aerosol foam:* 10% aerosol foam (provides 90 mg/application)
*Rectal suppository:* 25 mg, 30 mg
**hydrocortisone cypionate**
*Oral suspension:* 2 mg/ml
**hydrocortisone sodium succinate**
*Injection:* 100-mg vial, 250-mg vial, 500-mg vial, 1,000-mg vial

## INDICATIONS & DOSAGES

➤ **Severe inflammation, adrenal insufficiency**
*Adults:* 20 to 240 mg P.O. daily. Or, initially, 100 to 500 mg succinate I.M. or I.V.; repeat every 2, 4, or 6 hours as needed.
➤ **Shock**
*Adults:* Initially, 50 mg/kg succinate I.V., repeated in 4 hours. Repeat dosage every 24 hours as needed. Or, 0.5 to 2 g every 2 to 6 hours, continued until patient is stabilized (usually not longer than 48 to 72 hours).
➤ **Adjunct treatment for ulcerative colitis and proctitis**
*Adults:* 1 enema (100 mg) P.R. nightly for 21 days. Or, 1 applicatorful (90-mg foam) P.R. daily or b.i.d. for 14 to 21 days. Or,

25 mg rectal suppository b.i.d. for 2 weeks. For severe proctitis, 25 mg P.R. t.i.d. or 50 mg b.i.d.

## ADMINISTRATION

**P.O.**

• Give drug with milk or food when possible. Patient may need another drug to prevent GI irritation.

**I.V.**

▼ Don't use acetate or suspension form for I.V. route.

▼ Reconstitute hydrocortisone sodium succinate with bacteriostatic water or bacteriostatic saline solution before adding to I.V. solutions. For direct injection, inject over 30 seconds to 10 minutes. For infusion, dilute with $D_5W$, normal saline solution, or dextrose 5% in normal saline solution to 1 mg/ml or less.

▼ **Incompatibilities:** Amobarbital, ampicillin sodium, bleomycin, ciprofloxacin, colistimethate, cytarabine, dacarbazine, diazepam, dimenhydrinate, ephedrine, ergotamine, furosemide, heparin sodium, hydralazine, idarubicin, Ionosol B with invert sugar 10%, kanamycin, methylprednisolone sodium succinate, midazolam, nafcillin, pentobarbital sodium, phenobarbital sodium, phenytoin, prochlorperazine edisylate, promethazine hydrochloride, sargramostim, vancomycin, vitamin B complex with C.

**I.M.**

• Inject deep into gluteal muscle. Rotate injection sites to prevent muscle atrophy. Avoid subcutaneous injection because atrophy and sterile abscesses may occur.

• Injectable forms aren't used for alternate-day therapy.

**Rectal**

• Have the patient lie on his left side during administration and for 30 minutes afterward to allow fluid to distribute throughout the left colon. Have patient try to retain the enema for at least 1 hour but preferably all night.

## ACTION

Not clearly defined. Decreases inflammation, mainly by stabilizing leukocyte lysosomal membranes; suppresses immune response; stimulates bone marrow; and influences protein, fat, and carbohydrate metabolism.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.V., I.M., P.R. | Variable | Variable | Variable |

*Half-life:* 8 to 12 hours.

## ADVERSE REACTIONS

**CNS:** *euphoria, insomnia,* psychotic behavior, ***pseudotumor cerebri,*** vertigo, headache, paresthesia, ***seizures.***

**CV:** ***heart failure,*** hypertension, edema, ***arrhythmias,*** thrombophlebitis, ***thromboembolism.***

**EENT:** cataracts, glaucoma.

**GI:** *peptic ulceration,* GI irritation, increased appetite, ***pancreatitis,*** nausea, vomiting.

**GU:** menstrual irregularities, increased urine calcium levels.

**Hematologic:** easy bruising.

**Metabolic:** hypokalemia, hyperglycemia, carbohydrate intolerance, hypercholesterolemia, hypocalcemia.

**Musculoskeletal:** growth suppression in children, muscle weakness, osteoporosis, tendon rupture.

**Skin:** hirsutism, delayed wound healing, acne, skin eruptions.

**Other:** cushingoid state, susceptibility to infections, ***acute adrenal insufficiency after increased stress or abrupt withdrawal after long-term therapy.***

**After abrupt withdrawal:** rebound inflammation, fatigue, weakness, arthralgia, fever, dizziness, lethargy, depression, fainting, orthostatic hypotension, dyspnea, anorexia, ***hypoglycemia. After prolonged use, sudden withdrawal may be fatal.***

## INTERACTIONS

**Drug-drug.** *Aspirin, indomethacin, other NSAIDs:* May increase risk of GI distress and bleeding. Use together cautiously.

*Barbiturates, carbamazepine, fosphenytoin, phenytoin, rifampin:* May decrease corticosteroid effect. Increase corticosteroid dosage.

*Cyclosporine:* May increase toxicity. Monitor patient closely.

*Live attenuated virus vaccines, other toxoids and vaccines:* May decrease

antibody response and increase risk of neurologic complications. Avoid using together.
*Oral anticoagulants:* May alter dosage requirements. Monitor PT and INR closely.
*Potassium-depleting drugs such as thiazide diuretics:* May enhance potassium-wasting effects of hydrocortisone. Monitor potassium level.
*Skin-test antigens:* May decrease response. Postpone skin testing until after therapy.
**Drug-herb.** *Echinacea:* May increase immune-stimulating effects. Discourage use together.
*Ginseng:* May increase immune-modulating response. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase glucose and cholesterol levels. May decrease $T_3$, $T_4$, potassium, and calcium levels.
- May cause decreased $^{131}I$ uptake and protein-bound iodine levels in thyroid function tests. May cause false-negative results in nitroblue tetrazolium test for systemic bacterial infections. May alter reactions to skin tests.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its ingredients, in those with systemic fungal infections, in those receiving immunosuppressive doses together with live virus vaccines, and in premature infants (succinate).
- Use with caution in patient with recent MI.
- Use cautiously in patients with GI ulcer, renal disease, hypertension, osteoporosis, diabetes mellitus, hypothyroidism, cirrhosis, diverticulitis, nonspecific ulcerative colitis, active hepatitis, recent intestinal anastomoses, thromboembolic disorders, seizures, myasthenia gravis, heart failure, tuberculosis, ocular herpes simplex, emotional instability, and psychotic tendencies or in women who are breast-feeding.

## NURSING CONSIDERATIONS

- Determine whether patient is sensitive to other corticosteroids.
- Most adverse reactions to corticosteroids are dose- or duration-dependent.
- For better results and less toxicity, give a once-daily dose in morning.
- ***Alert:*** Salts aren't interchangeable.
- ***Alert:*** Only hydrocortisone sodium succinate can be given I.V.
- Enema may produce same systemic effects as other forms of hydrocortisone. If enema therapy must exceed 21 days, taper off by giving every other night for 2 to 3 weeks.
- High-dose therapy usually isn't continued beyond 48 hours.
- Always adjust to lowest effective dose.
- Monitor patient's weight, blood pressure, and electrolyte level.
- Monitor patient for cushingoid effects, including moon face, buffalo hump, central obesity, thinning hair, hypertension, and increased susceptibility to infection.
- Unless contraindicated, give a low-sodium diet that's high in potassium and protein. Give potassium supplements.
- Drug may mask or worsen infections, including latent amebiasis.
- Stress (fever, trauma, surgery, and emotional problems) may increase adrenal insufficiency. Increase dosage.
- Watch for depression or psychotic episodes, especially during high-dose therapy.
- Inspect patient's skin for petechiae.
- Diabetic patient may need increased insulin; monitor glucose level.
- Periodic measurement of growth and development may be needed during high-dose or prolonged therapy in children.
- Elderly patients may be more susceptible to osteoporosis with prolonged use.
- Gradually reduce dosage after long-term therapy.
- ***Look alike–sound alike:*** Don't confuse Solu-Cortef with Solu-Medrol (methylprednisolone sodium succinate), or hydrocortisone with hydroxychloroquine.

## PATIENT TEACHING

- Tell patient not to stop drug abruptly or without prescriber's consent.
- Instruct patient to take oral form of drug with milk or food.
- Warn patient on long-term therapy about cushingoid effects (moon face, buffalo

hump) and the need to notify prescriber about sudden weight gain or swelling.
- Teach patient signs and symptoms of early adrenal insufficiency: fatigue, muscle weakness, joint pain, fever, anorexia, nausea, shortness of breath, dizziness, and fainting.
- Instruct patient to carry a card with his prescriber's name and name and dosage of drug, indicating his need for supplemental systemic glucocorticoids during stress.
- Warn patient about easy bruising.
- Urge patient receiving long-term therapy to consider exercise or physical therapy. Also, tell him to ask prescriber about vitamin D or calcium supplement.
- Advise patient receiving long-term therapy to have periodic eye examinations.
- Caution patient to avoid exposure to infections (such as chickenpox or measles) and to notify prescriber if such exposure occurs.

### INDICATIONS & DOSAGES

➤ **Inflammation and pruritus from corticosteroid-responsive dermatoses, adjunctive topical management of seborrheic dermatitis of scalp**
*Adults and children:* Clean area; apply cream, gel, lotion, ointment, or topical solution sparingly daily to q.i.d. Spray aerosol onto affected area daily to q.i.d. until acute phase is controlled; then reduce dosage to one to three times weekly as needed. Give children lowest dose that provides positive results.

➤ **Inflammation from proctitis**
*Adults:* 1 applicatorful of rectal foam P.R. daily or b.i.d. for 2 to 3 weeks; then every other day as needed. Give enema once nightly for 21 days or until patient improves;

may use every other night for 2 to 3 months. Insert suppository b.i.d. for 2 weeks.

## ADMINISTRATION

**Topical**

- Gently wash skin before applying. To prevent skin damage, rub in gently, leaving a thin coat. When treating hairy sites, part hair and apply directly to lesions.
- Check individual products for frequency of administration.
- Avoid applying near eyes or mucous membranes or in ear canal; may be safely used on face, groin, armpits, and under breasts.
- Change dressing as prescribed. Stop drug and tell prescriber if skin infection, striae, or atrophy occurs.
- When using aerosol near the face, cover patient's eyes and warn against inhaling spray. Aerosol contains alcohol and may cause irritation or burning when used on open lesions. Don't spray longer than 3 seconds or from closer than 6 inches (15 cm) to avoid freezing tissues. If spray is applied to dry scalp after shampooing, drug doesn't need to be massaged into scalp.
- Continue treatment for a few days after lesions clear.

**Rectal**

- Insert suppositories blunt end first after removing foil wrapper.

## ACTION

Unclear. Diffuses across cell membranes to form complexes with cytoplasmic receptors, showing anti-inflammatory, antipruritic, vasoconstrictive, and antiproliferative activity. Considered a low-potency (hydrocortisone, hydrocortisone acetate) and a medium-potency (hydrocortisone butyrate, hydrocortisone probutate, hydrocortisone valerate) drug, according to vasoconstrictive properties.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical, P.R. | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**Topical**

**GU:** glycosuria.
**Metabolic:** hyperglycemia.
**Skin:** burning, pruritus, irritation, dryness, erythema, folliculitis, hypertrichosis, hypopigmentation, acneiform eruptions, allergic contact dermatitis, *atrophy, maceration, secondary infection, striae, miliaria with occlusive dressings.*
**Other:** ***hypothalamic-pituitary-adrenal axis suppression,*** Cushing syndrome.

**Rectal**

**CNS:** ***seizures, increased intracranial pressure,*** vertigo, headache.
**CV:** hypertension.
**EENT:** cataracts, glaucoma.
**GI:** peptic ulcer, ***pancreatitis,*** abdominal distention.
**GU:** menstrual irregularities.
**Metabolic:** fluid or electrolyte disturbances, decreased carbohydrate tolerance.
**Musculoskeletal:** muscle weakness, osteoporosis, necrosis and fractures in bone.
**Skin:** impaired wound healing, fragile skin, petechiae, erythema, sweating.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

- May increase glucose level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Don't use as monotherapy in primary bacterial infections (impetigo, paronychia, erysipelas, cellulitis, angular cheilitis), treatment of rosacea, perioral dermatitis, or acne.
- Drug isn't for ophthalmic use.
- Use cautiously in pregnant or breast-feeding women.

***Overdose S&S:*** Systemic effects.

## NURSING CONSIDERATIONS

- If an occlusive dressing is applied and a fever develops, notify prescriber and remove dressing.
- If antifungal or antibiotic combined with corticosteroid fails to provide prompt improvement, stop corticosteroid until infection is controlled.
- Systemic absorption is likely with use of occlusive dressings, prolonged treatment, or extensive body surface treatment. Watch

for symptoms, such as hyperglycemia, glycosuria, and hypothalamic-pituitary-adrenal axis suppression.
- Avoid using plastic pants or tight-fitting diapers on treated areas in young children. Children may absorb larger amounts of drug and be more susceptible to systemic toxicity.
- Monitor patient for fluid or electrolyte disturbances (sodium and fluid retention, potassium loss, hypokalemic alkalosis, negative nitrogen balance from catabolism of protein).
- Drug may suppress skin reaction testing.
- ***Look alike–sound alike:*** Don't confuse hydrocortisone with hydroxychloroquine.

### PATIENT TEACHING
- Teach patient or family member how to apply drug.
- Tell patient to wash hands after application.
- If an occlusive dressing is ordered, advise patient to leave it in place for no longer than 12 hours each day and not to use the dressing on infected or weeping lesions.
- Tell patient to stop drug and report signs of systemic absorption, skin irritation or ulceration, hypersensitivity, infection, or lack of improvement.
- Instruct patient to insert suppositories blunt end first after removing foil wrapper.
- For perianal application, instruct patient to place small amount of drug on a tissue and gently rub in.
- Tell patient to disassemble applicator or aerosol cap and clean with warm water after each use.
- Tell patient to stop using this product if condition worsens or if symptoms persist for more than 7 days.

**SAFETY ALERT!**

## hydromorphone hydrochloride (dihydromorphinone hydrochloride)

hye-droe-MOR-fone

Dilaudid, Dilaudid-HP, Exalgo

*Therapeutic class:* Opioid analgesic
*Pharmacologic class:* Opioid
*Pregnancy risk category C*
*Controlled substance schedule II*

H

### AVAILABLE FORMS
*Injection:* 1 mg/ml, 2 mg/ml, 4 mg/ml, 10 mg/ml
*Liquid:* 5 mg/5 ml
*Lyophilized powder for injection:* 10 mg/ml
*Suppositories:* 3 mg†
*Tablets:* 2 mg, 3 mg, 4 mg, 8 mg
*Tablets (extended-release):* 8 mg, 12 mg, 16 mg

### INDICATIONS & DOSAGES
✷ ***NEW INDICATION:*** **Moderate to severe pain in opioid-tolerant patients requiring continuous analgesia for extended period of time**
*Adults currently on immediate-release hydromorphone:* Starting dose of extended-release form is equivalent to total daily dose of immediate-release form. May increase every 3 to 4 days. Maximum dose is 64 mg (extended release form) P.O. once daily.

➤ **Moderate to severe pain**
*Adults:* 2 to 4 mg P.O. every 4 to 6 hours p.r.n. Or, 1 to 4 mg I.M., subcutaneously, or I.V. (slowly over at least 2 to 5 minutes) every 4 to 6 hours p.r.n. Or, 3 mg P.R. suppository every 6 to 8 hours p.r.n. Or, 2.5 to 10 mg oral liquid every 3 to 6 hours p.r.n.
***Adjust-a-dose:*** For elderly patients and those with renal or hepatic impairment, reduce initial starting dose.

### ADMINISTRATION
**P.O.**
- Give drug with food if GI upset occurs.

**Black Box Warning** Patient should swallow extended-release tablets whole; don't break, chew, dissolve, crush, or inject them. ■

**Black Box Warning** Don't give extended-release tablets with other extended-release opioids.

**I.V.**

▼ For infusion, drug may be mixed in $D_5W$, normal saline solution, dextrose 5% in normal saline solution, dextrose 5% in half-normal saline solution, or Ringer's or lactated Ringer's solutions.

▼ Give by direct injection over no less than 2 minutes.

▼ Respiratory depression and hypotension can occur. Give slowly, and monitor patient constantly. Keep resuscitation equipment available.

▼ **Incompatibilities:** Alkalies, amphotericin B cholesteryl complex, ampicillin sodium, bromides, cefazolin, dexamethasone, diazepam, gallium nitrate, haloperidol, heparin sodium, iodides, minocycline, phenobarbital sodium, phenytoin sodium, prochlorperazine edisylate, sargramostim, sodium bicarbonate, sodium phosphate, thiopental.

**I.M.**

● Document administration site.

**Subcutaneous**

● Rotate injection sites to avoid induration with subcutaneous injection.

**Rectal**

● Refrigerate suppositories.

## ACTION

Unknown. Binds with opioid receptors in the CNS, altering perception of and emotional response to pain. Also suppresses the cough reflex by direct action on the cough center in the medulla.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 15–30 min | 30–60 min | 4–5 hr |
| P.O. (extended-release) | 15–30 min | 12–16 hr | 18–24 hr |
| I.V. | 10–15 min | 15–30 min | 2–3 hr |
| I.M. | 15 min | 30–60 min | 4–5 hr |
| Subcut. | 15 min | 30–90 min | 4 hr |
| P.R. | Unknown | Unknown | 4 hr |

*Half-life:* 2½ to 4 hours; P.O. (extended-release), 11 hours.

## ADVERSE REACTIONS

**CNS:** sedation, *somnolence*, clouded sensorium, *dizziness*, euphoria, light-headedness, insomnia, drug withdrawal syndrome (extended-release form), fever, asthenia, *headache*, pain.

**CV:** hypotension, flushing, ***bradycardia,*** chest discomfort, edema.

**EENT:** blurred vision, diplopia, nystagmus.

**GI:** *nausea, vomiting, constipation,* anorexia, weight loss, diarrhea, ileus, dry mouth.

**GU:** urine retention.

**Musculoskeletal:** arthralgia, muscle spasms.

**Respiratory:** ***respiratory depression, bronchospasm.***

**Skin:** diaphoresis, pruritus, hyperhydrosis.

**Other:** induration with repeated subcutaneous injections, physical dependence, pain.

## INTERACTIONS

**Drug-drug.** *Anticholinergics:* May increase risk of urine retention or severe constipation. Use together cautiously.

*CNS depressants, general anesthetics, hypnotics, MAO inhibitors, other opioid analgesics, sedatives, tranquilizers, tricyclic antidepressants:* May cause additive effects. Use together with caution; reduce hydromorphone dose and monitor patient response.

**Drug-lifestyle.** *Alcohol use:* May cause additive effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

● May increase amylase and lipase levels.

● May interfere with hepatobiliary imaging studies because delayed gastric emptying and contraction of sphincter of Oddi may increase biliary tract pressure.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug; in those with intracranial lesions that cause increased intracranial pressure; in those with paralytic ileus, narrowed or obstructed GI tract; and in those with depressed ventilation, such as in status asthmaticus, COPD, cor pulmonale, emphysema, and kyphoscoliosis.

**Black Box Warning** Extended-release form is contraindicated in opioid-naïve patients. It isn't indicated for acute pain or postoperative pain or as a p.r.n. analgesic. Fatal

respiratory depression may occur in patients who aren't opioid-tolerant. Accidental intake, especially in children, can cause fatal hydromorphone overdose. ■
• Use with caution in elderly or debilitated patients and in those with hepatic or renal disease, hypothyroidism, Addison's disease, prostatic hyperplasia, or urethral stricture.
***Overdose S&S:*** Constricted pupils, cold clammy skin, extreme somnolence progressing to stupor or coma, respiratory depression, skeletal muscle flaccidity, bradycardia, hypotension, apnea, cardiac arrest, circulatory collapse, death.

## NURSING CONSIDERATIONS

• Reassess patient's level of pain at least 15 and 30 minutes after administration.
• For better analgesic effect, give drug on a regular schedule, before patient has intense pain.
**Black Box Warning** Dilaudid-HP, a highly concentrated form (10 mg/ml), may be given in smaller volumes to prevent the discomfort of large-volume I.M. or subcutaneous injections. Don't confuse Dilaudid-HP with standard parenteral formulations. Check dosage carefully. ■
• Discontinue all other extended-release opioids before giving extended-release form of hydromorphone.
• Monitor respiratory and circulatory status and bowel function.
• Keep opioid antagonist (naloxone) available.
• Don't use extended-release form within 14 days of stopping MAO inhibitor.
• Discontinue use of extended-release form if stopped for more than 3 days.
• Drug may worsen or mask gallbladder pain.
• Drug is a commonly abused opioid.
• Drug may cause constipation. Assess bowel function and need for stool softeners and stimulant laxatives.
***Alert:*** Cough syrup may contain tartrazine.
• ***Look alike–sound alike:*** Don't confuse hydromorphone with morphine or oxymorphone or Dilaudid with Dilantin.

## PATIENT TEACHING

• Instruct patient to request or take drug before pain becomes intense.
**Black Box Warning** Warn patient that extended-release tablets must be taken whole. Caution patient not to cut, chew, crush, dissolve, or inject them. ■
• Tell patient to store suppositories in refrigerator.
• Advise patient to take drug with food if GI upset occurs.
• When drug is used after surgery, encourage patient to turn, cough, and breathe deeply to avoid lung problems.
• Caution patient about getting out of bed or walking. Warn outpatient to avoid hazardous activities that require mental alertness until drug's CNS effects are known.
• Advise patient to avoid alcohol during therapy.

H

# hydroxychloroquine sulfate

hye-drox-ee-KLOR-oh-kwin

Plaquenil

*Therapeutic class:* Antimalarial
*Pharmacologic class:* Aminoquinoline
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 200 mg (equivalent to 155 mg base)

## INDICATIONS & DOSAGES

**Black Box Warning** Prescribers should be completely familiar with this drug before prescribing. ■

➤ **Suppressive prevention of malaria attacks caused by *Plasmodium vivax, P. malariae, P. ovale,* and susceptible strains of *P. falciparum***
*Adults:* 310 mg base P.O. weekly on the same day each week, beginning 1 to 2 weeks before entering malaria-endemic area and continuing for 4 weeks after leaving area. If not started before exposure, double first dose to 620 mg base in two divided doses 6 hours apart.
*Children:* 5 mg/kg base P.O. weekly on the same day each week, beginning 1 to 2 weeks before entering malaria-endemic

area and continuing for 4 weeks after leaving area. Don't exceed adult dose. If not started before exposure, double first dose to 10 mg/kg base in two divided doses, 6 hours apart.

➤ **Acute malarial attacks**

*Adults:* Initially, 620 mg base P.O., followed by 310 mg base 6 hours after first dose; then 310 mg base daily for 2 days.

*Children:* Initially, 10 mg/kg base P.O.; then 5 mg/kg base at 6 hours, 24 hours, and 48 hours after the first dose.

➤ **Lupus erythematosus**

*Adults:* 310 mg base P.O. daily or b.i.d., continued for several weeks or months, depending on response. For prolonged maintenance dose, 155 to 310 mg base daily.

➤ **Rheumatoid arthritis**

*Adults:* Initially, 310 to 465 mg base P.O. daily. When good response occurs, usually in 4 to 12 weeks, cut dosage in half. If objective improvement doesn't occur within 6 months, discontinue drug.

## ADMINISTRATION

**P.O.**

***Alert:*** Drug dosage may be discussed in "mg" or "mg base"; be aware of the difference.

- To improve compliance when drug is used for prevention, advise patient to take drug immediately before or after a meal on the same day each week.

## ACTION

May bind to and alter the properties of DNA in susceptible organisms.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–4½ hr | Unknown |

*Half-life:* 32 to 50 days.

## ADVERSE REACTIONS

**CNS:** ***seizures,*** irritability, nightmares, ataxia, psychosis, vertigo, dizziness, hypoactive deep tendon reflexes, lassitude, headache.

**CV:** ***cardiomyopathy.***

**EENT:** blurred vision, difficulty in focusing, reversible corneal changes, typically irreversible nystagmus, sometimes progressive or delayed retinal changes such as narrowing of arterioles, macular lesions, pallor of optic disk, optic atrophy.

**GI:** anorexia, abdominal cramps, diarrhea, nausea, vomiting.

**Hematologic:** ***agranulocytosis, leukopenia, thrombocytopenia, hemolysis in patients with G6PD deficiency, aplastic anemia.***

**Metabolic:** weight loss.

**Musculoskeletal:** skeletal muscle weakness.

**Skin:** pruritus, lichen planus eruptions, skin and mucosal pigmentary changes, pleomorphic skin eruptions, worsened psoriasis, alopecia, bleaching of hair.

## INTERACTIONS

**Drug-drug.** *Aluminum salts (kaolin), magnesium:* May decrease GI absorption. Separate dose times.

*Cimetidine:* May decrease hepatic metabolism of hydroxychloroquine. Monitor patient for toxicity.

*Digoxin:* May increase digoxin level. Monitor drug levels; monitor patient for toxicity.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level.
- May decrease granulocyte, WBC, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with retinal or visual field changes or porphyria.
- Contraindicated for long-term therapy for children.
- Use with caution in patients with severe GI, neurologic, or blood disorders.
- Use with caution in patients with hepatic disease or alcoholism because drug concentrates in liver.
- Use with caution in those with G6PD deficiency or psoriasis because drug may worsen these conditions.

***Overdose S&S:*** Headache, drowsiness, visual disturbances, cardiovascular collapse, seizures, sudden and early respiratory and cardiac arrest; atrial standstill, nodal rhythm, prolonged intraventricular conduction time, progressive bradycardia leading to ventricular fibrillation or arrest.

## NURSING CONSIDERATIONS

- Ensure that baseline and periodic ophthalmic examinations are performed. Check periodically for ocular muscle weakness after long-term use.
- Make sure patient is examined with an audiometer before, during, and after therapy, especially if therapy is longterm.
- Monitor CBC and liver function studies periodically during long-term therapy; if severe blood disorder—not caused by disease—develops, drug may need to be stopped.

***Alert:*** Monitor patient for possible overdose, which can quickly lead to toxic signs or symptoms. Children are extremely susceptible to toxicity.

## PATIENT TEACHING

- Advise patient taking drug for prevention to take drug immediately before or after a meal on the same day each week, to improve compliance.
- Instruct patient to report adverse reactions promptly.

**SAFETY ALERT!**

# hydroxyurea

hye-drox-ee-yoor-EE-a

Droxia, Hydrea

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Antimetabolite
*Pregnancy risk category D*

## AVAILABLE FORMS

*Capsules:* 200 mg, 300 mg, 400 mg, 500 mg

## INDICATIONS & DOSAGES

➤ **Melanoma; resistant chronic myelocytic leukemia; recurrent, metastatic, or inoperable ovarian cancer; head and neck cancers**

*Adults:* 80 mg/kg Hydrea P.O. as single dose every 3 days; or 20 to 30 mg/kg P.O. as single daily dose. For carcinoma of head and neck with radiation, give 80 mg/kg as single dose every third day beginning at least 7 days before radiation and continue during and after radiation.

➤ **To reduce frequency of painful crises and need for blood transfusions in adult patients with sickle cell anemia with recurrent moderate to severe painful crises**

*Adults:* 15 mg/kg Droxia P.O. once daily. If blood counts are in acceptable range, dose may be increased by 5 mg/kg daily every 12 weeks until maximum tolerated dose or 35 mg/kg daily has been reached. If blood counts are considered toxic, withhold drug until counts recover. Resume treatment after reducing dose by 2.5 mg/kg daily. Every 12 weeks, drug may then be adjusted up or down in 2.5-mg/kg daily increments until patient is at a stable, nontoxic dose for 24 weeks.

***Adjust-a-dose:*** For patients with creatinine clearance less than 60 ml/minute or end-stage renal disease, initial dose should be 7.5 mg/kg/day. Give dose after dialysis on dialysis days.

➤ **Thrombocytopenia ♦**

*Adults:* 15 to 20 mg/kg P.O. daily. Titrate to maintain platelet count of $400 \times 10^9$/L or less and absolute neutrophil count of greater than 1,000 cells/$mm^3$.

## ADMINISTRATION

**P.O.**

- Wear gloves when handling drug or its container, and wash hands before and after contact with bottle or capsule. If powder from capsule is spilled, wipe up immediately with a damp towel. Dispose of towel in a closed container such as a plastic bag.

## ACTION

May inhibit DNA synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 hr | 24 hr |

*Half-life:* 3 to 4 hours.

## ADVERSE REACTIONS

**CNS:** malaise, fever, drowsiness.
**GI:** *anorexia, nausea, vomiting, diarrhea,* stomatitis, constipation.
**Hematologic:** ***leukopenia, thrombocytopenia,*** *anemia, megaloblastosis,* ***bone marrow suppression.***
**Metabolic:** hyperuricemia, weight gain.

**Skin:** rash, itching, alopecia, cutaneous vasculitic toxicities (including vasculitic ulcerations and gangrene).
**Other:** chills.

## INTERACTIONS

**Drug-drug.** *Cytotoxic drugs, radiation therapy:* May enhance toxicity of hydroxyurea. Use together cautiously.
*Interferon:* May increase the risk of cutaneous vasculitic toxicities, including vasculitic ulcerations and gangrene. Stop drug.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN, creatinine, hepatic enzyme, and uric acid levels. May decrease hemoglobin level.
- May decrease WBC, RBC, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with WBC count less than 2,500/$mm^3$, platelet count less than 100,000/$mm^3$, or severe anemia.
- Use cautiously in patients with renal dysfunction and in the elderly.

***Overdose S&S:*** Acute mucocutaneous toxicity; soreness, violet erythema on palms and soles followed by scaling of hands and feet; severe generalized hyperpigmentation of the skin; stomatitis.

## NURSING CONSIDERATIONS

***Alert:*** Droxia may cause severe, sometimes life-threatening adverse effects. Administer under the supervision of a physician experienced with the use of this medication for the treatment of sickle cell anemia.

***Alert:*** Hydroxyurea is mutagenic, clastogenic, and genotoxic. Secondary leukemias have occurred after long-term use. Carefully consider the potential benefits relative to the undefined risk of developing secondary malignancies.

- Routinely measure BUN, uric acid, liver enzyme, and creatinine levels; monitor blood counts every 2 weeks.
- Acceptable blood counts during dosage adjustment are neutrophil count of 2,500/$mm^3$ or more, platelet count of 95,000/$mm^3$ or more, hemoglobin level more than 5.3 g/dl, and reticulocyte count (if hemoglobin level is below 9 g/dl) at least 95,000/$mm^3$. Toxic levels are neutrophil count less than 2,000/$mm^3$, platelet count less than 80,000/$mm^3$, hemoglobin level less than 4.5 g/dl, and reticulocyte count (if hemoglobin level is below 9 g/dl) less than 80,000/$mm^3$.
- Hydroxyurea may dramatically lower WBC count in 24 to 48 hours.

***Alert:*** Patients who have received or are currently receiving interferon may be at a greater risk for developing cutaneous vasculitic toxicities. Monitor closely.

- Monitor fluid intake and output; keep patient hydrated.
- Allopurinol is used to treat or prevent tumor lysis syndrome.
- To prevent bleeding, avoid all I.M. injections when platelet count is less than 50,000/$mm^3$.
- Give blood transfusions for cumulative anemia.
- Dosage change may be needed after chemotherapy or radiation therapy.
- Auditory and visual hallucinations and hematologic toxicity increase when renal function decreases.
- Drug crosses blood-brain barrier.
- Radiation therapy may increase risk or severity of GI distress or stomatitis.

## PATIENT TEACHING

- Tell patient and caregiver to wear gloves when handling drug or its container and to wash their hands before and after contact with the bottle or capsule. If powder from capsule is spilled, wipe up immediately with a damp towel and dispose of the towel in a closed container such as a plastic bag.
- Tell patient who can't swallow capsules that he may empty contents into water, drink immediately, and rinse mouth with water afterward. Inform patient that some inert material may not dissolve.
- Advise patient to watch for signs and symptoms of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). He also should take his temperature daily.
- Caution women of childbearing age to consult prescriber before becoming pregnant.

## hydrOXYzine hydrochloride

hye-DROX-i-zeen

Atarax†, Vistaril

## hydrOXYzine pamoate

Vistaril

*Therapeutic class:* Anxiolytic
*Pharmacologic class:* Piperazine derivative
*Pregnancy risk category NR*

### AVAILABLE FORMS

**hydroxyzine hydrochloride**
*Capsules:* 10 mg†, 25 mg†, 50 mg†
*Injection:* 25 mg/ml, 50 mg/ml
*Syrup:* 2 mg/ml†, 10 mg/5 ml
*Tablets:* 10 mg, 25 mg, 50 mg
**hydroxyzine pamoate**
*Capsules:* 25 mg, 50 mg
*Oral suspension:* 25 mg/5 ml

### INDICATIONS & DOSAGES

➤ **Anxiety**
*Adults:* 50 to 100 mg P.O. q.i.d. Or, 50 to 100 mg I.M. q.i.d.
*Children age 6 and older:* 50 to 100 mg P.O. daily in divided doses.
*Children younger than age 6:* 50 mg P.O. daily in divided doses.

➤ **Preoperative and postoperative adjunctive therapy for sedation**
*Adults:* 50 to 100 mg P.O. or I.M.
*Children:* 0.6 mg/kg P.O or I.M.

➤ **Pruritus**
*Adults:* 25 mg P.O. or I.M. t.i.d. or q.i.d.
*Children age 6 and older:* 50 to 100 mg P.O. daily in divided doses.
*Children younger than age 6:* 50 mg P.O. daily in divided doses.

### ADMINISTRATION

**P.O.**
- Give drug without regard for meals.
- Shake suspension well before giving.

**I.M.**
- Parenteral form (hydroxyzine hydrochloride) is for I.M. use only, preferably by Z-track injection. Never give drug I.V. or subcutaneously.
- Aspirate I.M. injection carefully to prevent inadvertent I.V. injection. Inject deeply into a large muscle.

### ACTION

Suppresses activity in certain essential regions of the subcortical area of the CNS.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 15–30 min | 2 hr | 4–6 hr |
| I.M. | Unknown | Unknown | 4–6 hr |

*Half-life:* 3 hours.

### ADVERSE REACTIONS

**CNS:** *drowsiness,* involuntary motor activity.
**GI:** *dry mouth,* constipation.
**Skin:** pain at I.M. injection site.
**Other:** hypersensitivity reactions.

### INTERACTIONS

**Drug-drug.** *Anticholinergics:* May cause additive anticholinergic effects. Use together cautiously.
*CNS depressants:* May increase CNS depression. Use together cautiously; dosage adjustments may be needed.
*Epinephrine:* May inhibit and reverse vasopressor effect of epinephrine. Avoid using together.
**Drug-lifestyle.** *Alcohol use:* May increase CNS depression. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

- May cause false increase in urinary 17-hydroxycorticosteroid level.
- May cause false-negative skin allergen tests by reducing or inhibiting the cutaneous response to histamine.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, patients in early pregnancy, and breast-feeding women.
- Use cautiously in elderly patients.

⚠ ***Overdose S&S:*** Hypersedation.

### NURSING CONSIDERATIONS

- If patient takes other CNS drugs, watch for oversedation.
- Elderly patients may be more sensitive to adverse anticholinergic effects; monitor these patients for dizziness, excessive

H

sedation, confusion, hypotension, and syncope.
● ***Look alike–sound alike:*** Don't confuse hydroxyzine with hydroxyurea, Hydrogesic, or hydralazine. Don't confuse Vistaril with Restoril.

## PATIENT TEACHING

● Warn patient to avoid hazardous activities that require alertness and good coordination until effects of drug are known.
● Tell patient to avoid use of alcohol while taking drug.
● Advise patient to use sugarless hard candy or gum to relieve dry mouth.
● Warn women of childbearing age to avoid use during pregnancy and breast-feeding.

# hyoscyamine

hye-AH-ska-meen

Cystospaz, Hyospaz

# hyoscyamine sulfate

Anaspaz, Cystospaz, Cystospaz-M, HyoMax-FT, IB-Stat, Levbid, Levsin*, Levsin Drops*, Levsin SL, Levsinex Timecaps, Mar-Spas, Neosol, NuLev, Symax Duotab, Symax FasTab, Symax SL, Symax SR

*Therapeutic class:* Antispasmodic
*Pharmacologic class:* Belladonna alkaloid, anticholinergic
*Pregnancy risk category C*

## AVAILABLE FORMS

**hyoscyamine**
*Tablets:* 0.15 mg
**hyoscyamine sulfate**
*Capsules (extended-release):* 0.375 mg
*Elixir:* 0.125 mg/5 ml*
*Injection:* 0.5 mg/ml
*Oral spray:* 0.125 mg/ml*
*Oral solution:* 0.125 mg/ml*
*Tablets:* 0.125 mg, 0.15 mg
*Tablets (chewable):* 0.125 mg
*Tablets (extended-release):* 0.375 mg
*Tablets (orally disintegrating):* 0.125 mg, 0.25 mg
*Tablets (S.L.):* 0.125 mg

## INDICATIONS & DOSAGES

➤ **Acute rhinitis, anticholinesterase poisoning, GI disorders, GU disorders (cystitis, renal colic), parkinsonism**

*Adults and children age 12 and older:* For regular and sublingual tablets, usual dosage is 1 to 2 tablets P.O. every 4 hours or as needed, with maximum dosage of 12 tablets in 24 hours. Or, for Mar-Spas orally disintegrating tablets, ½ to 1 tablet P.O. three to four times a day, 30 minutes to 1 hour before meals and at bedtime. Or, for all other disintegrating tablets, usual dosage is 1 to 2 tablets P.O. every 4 hours, with maximum dose of 12 tablets in 24 hours. For extended-release tablets, usual dosage is 1 to 2 tablets P.O. every 12 hours, with maximum dose of 4 tablets in 24 hours. Or, for extended-release and timed-release capsules, usual dosage is 1 to 2 capsules P.O. every 12 hours (dosage may be adjusted to 1 capsule every 8 hours if needed), with maximum dosage of 4 capsules in 24 hours. Or, for oral solution, usual dosage is 1 to 2 ml P.O. every 4 hours or as needed, with maximum dosage of 12 ml in 24 hours. Or, for elixir, usual dosage is 1 to 2 teaspoonfuls P.O. every 4 hours or as needed, with maximum dosage of 12 teaspoonfuls in 24 hours. Or, for oral spray, usual dosage is 1 to 2 ml (1 to 2 sprays) P.O. every 4 hours or as needed, with maximum dosage of 12 ml (12 sprays) in 24 hours.
*Children age 2 to younger than 12:* For regular and sublingual tablets, usual dosage is ½ to 1 tablet P.O. every 4 hours or as needed, with maximum dosage of 6 tablets in 24 hours. Or, for all other disintegrating tablets, usual dosage is ½ to 1 tablet P.O. every 4 hours or as needed, with maximum dosage of 6 tablets in 24 hours. Or, for oral solution, usual dosage is 0.25 to 1 ml P.O. every 4 hours or as needed, with maximum dosage of 6 ml in 24 hours. Elixir dosages are based on body weight: If patient weighs 50 kg (110 lb), usual dosage is 1 tsp (5 ml) every 4 hours or as needed. If patient weighs 40 kg (88 lb), usual dosage is ¾ tsp (3.75 ml) every 4 hours or as needed. If patient weighs 20 kg (44 lb), usual dosage is ½ tsp (2.5 ml) every 4 hours or as needed. If patient weighs 10 kg (22 lb), usual dosage is ¼ tsp (1.25 ml) every 4 hours or as needed.

For elixir, don't exceed 6 teaspoonfuls in 24 hours. Or, for GI disorders, 0.25 to 0.5 mg (0.5 to 1 ml undiluted) administered subcutaneously, I.V., or I.M. Some patients may need only a single dose; others may require doses two, three, or four times a day at 4-hour intervals.

*Children younger than age 2:* Oral solution dosages are based on body weight: If patient weighs 10 kg (22 lb), usual dosage is 8 drops P.O. every 4 hours or as needed, with maximum of 48 drops in 24 hours. If patient weighs 7 kg (15 lb), usual dosage is 6 drops P.O. every 4 hours or as needed, with maximum of 36 drops in 24 hours. If patient weighs 5 kg (11 lb), usual dosage is 5 drops P.O. every 4 hours or as needed, with maximum of 30 drops in 24 hours. If patient weighs 3.4 kg (7.5 lb), usual dosage is 4 drops P.O. every 4 hours or as needed, with maximum of 24 drops in 24 hours.

➤ **Preanesthetic medication**

*Adults and children older than age 2:* 5 mcg (0.005 mg)/kg of body weight given subcutaneously, I.V., or I.M. 30 to 60 minutes before anticipated time of anesthesia induction or when preanesthetic opioid or sedatives are administered.

➤ **To reduce drug-induced bradycardia during surgery**

*Adults and children older than age 2:* Administer I.V. in increments of 0.125 mg (0.25 ml undiluted); repeat as needed.

➤ **Reversal of neuromuscular blockade**

*Adults and children older than age 2:* 0.2 mg (0.4 ml undiluted) given subcutaneously, I.V., or I.M. for every 1 mg neostigmine or equivalent dose of physostigmine or pyridostigmine.

## ADMINISTRATION

**P.O.**

- Give drug 30 minutes to 1 hour before meals and at bedtime. Bedtime dose can be larger; give at least 2 hours after last meal of day.
- Don't crush or split extended-release capsules.
- Extended-release tablets are scored and may be broken to allow for dosage titration. Don't crush or allow patient to chew tablets.
- Hyoscyamine orally disintegrating tablets may be taken with or without water.
- Sublingual tablets are formulated to be placed under the tongue; however, the tablets may be chewed or taken orally.
- Dispense spray in original container with metered sprayer.

**I.V.**

▼ Use when P.O. and S.L. routes aren't possible or when rapid effect is needed.

▼ Injection contains sodium metabisulfite, which may cause allergic reaction in certain people.

▼ **Incompatibilities:** None reported.

**I.M.**

- Injection contains sodium metabisulfite, which may cause allergic reaction in certain people.

**Subcutaneous**

- Injection contains sodium metabisulfite, which may cause allergic reaction in certain people.

**S.L.**

- Hyoscyamine sublingual tablets are formulated for sublingual administration; however, they may be chewed or taken orally.

## ACTION

Blocks acetylcholine action at muscarinic receptors, which decreases GI motility and inhibits gastric acid secretion.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 20–30 min | ½–1 hr | 4–12 hr |
| P.O. (extended) | 20–30 min | 40–90 min | 12 hr |
| I.V. | 2–3 min | 15–30 min | 4 hr |
| I.M., Subcut. | Unknown | 15–30 min | 4–12 hr |
| S.L. | 5–20 min | ½–1 hr | 4 hr |

*Half-life:* Conventional tablets, 2 to 3½ hours; extended-release capsules or tablets, 5 to 6 or 9 hours, respectively; I.M., 12½ hours or longer. Prolonged in patients with renal dysfunction.

## ADVERSE REACTIONS

**CNS:** *confusion or excitement in elderly patients,* fever, headache, insomnia, drowsiness, dizziness, nervousness, weakness, fever (especially in children).

**CV:** *palpitations,* tachycardia.

**EENT:** *blurred vision,* mydriasis, increased intraocular pressure, cycloplegia, photophobia.

**GI:** *constipation, dry mouth, paralytic ileus,* dysphagia, heartburn, loss of taste, nausea, vomiting.
**GU:** *urinary hesitancy, urine retention,* impotence.
**Skin:** urticaria, decreased or lack of sweating.
**Other:** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Amantadine, antihistamines, antiparkinsonians, disopyramide, glutethimide, MAO inhibitors, meperidine, phenothiazines, procainamide, quinidine, tricyclic antidepressants:* May have additive adverse effects. Avoid using together.
*Antacids:* May decrease absorption of oral anticholinergics. Separate doses by 2 or 3 hours.
*Ketoconazole:* May interfere with ketoconazole absorption. Separate doses by 2 or 3 hours.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to anticholinergics and in those with glaucoma, obstructive uropathy, obstructive disease of the GI tract, severe ulcerative colitis, myasthenia gravis, paralytic ileus, intestinal atony, unstable CV status in acute hemorrhage, tachycardia secondary to cardiac insufficiency of thyrotoxicosis, or toxic megacolon.
- Use cautiously in patients with autonomic neuropathy, hyperthyroidism, coronary artery disease, arrhythmias, heart failure, hypertension, hiatal hernia with reflux esophagitis, hepatic or renal disease, known or suspected GI infection, and ulcerative colitis.
- Use cautiously in patients in hot or humid environments; drug can cause heatstroke.
- Use cautiously in children and the elderly because they may be more susceptible to adverse effects. Psychosis has been reported in sensitive individuals receiving anticholinergics.

***Overdose S&S:*** CNS stimulation; blurred vision; dysphagia; dilated pupils; dizziness; dry mouth; headache; hot, dry skin; nausea; vomiting.

## NURSING CONSIDERATIONS

***Alert:*** Overdose may cause curare-like effects, such as respiratory paralysis. Keep emergency equipment available. Drug is dialyzable.
- Monitor patient's vital signs and urine output carefully.
- Monitor patient for CNS signs and symptoms, including confusion, disorientation, short-term memory loss, hallucinations, ataxia, euphoria, fatigue, and agitation. Signs and symptoms usually resolve within 12 to 48 hours after drug is discontinued.
- ***Look alike–sound alike:*** Don't confuse Anaspaz with Anaprox or Antispas.

## PATIENT TEACHING

- Urge patient to take drug as prescribed.
- Caution patient not to crush or chew extended-release tablets.
- Advise patient to avoid driving and other hazardous activities if drowsiness, dizziness, or blurred vision occurs; to drink plenty of fluids to help prevent constipation and heat stroke; and to report rash or other skin eruption.
- Advise patient not to take any new drug or OTC preparation unless directed by prescriber.

# ibandronate sodium

eh-BAN-drow-nate

Boniva

*Therapeutic class:* Antiosteoporotic
*Pharmacologic class:* Bisphosphonate
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 3 mg/3-ml prefilled syringe
*Tablets:* 2.5 mg, 150 mg

## INDICATIONS & DOSAGES

➤ **To treat or prevent postmenopausal osteoporosis**
*Women:* 2.5 mg P.O. daily or 150 mg P.O. once monthly, taken first thing in the morning, with a large glass of plain water,

1 hour before any food or other drugs. Or, for treatment, 3 mg I.V. bolus once every 3 months.

➤ **Bone metastases ♦**

*Adults:* 20 to 50 mg P.O. daily for up to 96 weeks. Or, 20 mg I.V. bolus or 6 mg I.V. infusion over 1 to 2 hours every 3 to 4 weeks for up to 2 years.

## ADMINISTRATION

**P.O.**

- Give drug first thing in the morning 1 hour before eating or drinking and before any other drugs.
- Give drug with plain water only.

**I.V.**

- ▼ Prefilled syringes are for single use only.
- ▼ Give undiluted using needle provided with the syringe.
- ▼ Give by I.V. bolus over 15 to 30 seconds.
- ▼ Don't use if drug is discolored or contains particulate matter.
- ▼ Store at room temperature.
- ▼ **Incompatibilities:** Calcium-containing solutions and other I.V. drugs.

## ACTION

Inhibits bone breakdown and removal to reduce bone loss and increase bone mass.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | ½–2 hr | Unknown |
| I.V. | Rapid | Unknown | Unknown |

*Half-life:* 1½ to 6½ days for the 150-mg dose.

## ADVERSE REACTIONS

**CNS:** asthenia, dizziness, headache, insomnia, nerve root lesion, vertigo.
**CV:** hypertension.
**EENT:** nasopharyngitis, pharyngitis.
**GI:** *dyspepsia,* abdominal pain, constipation, diarrhea, gastritis, nausea, vomiting.
**GU:** cystitis, UTI.
**Musculoskeletal:** *back pain,* arthralgia, arthritis, joint disorder, limb pain, localized osteoarthritis, muscle cramps, myalgia.
**Respiratory:** bronchitis, upper respiratory tract infection, pneumonia.
**Skin:** rash.
**Other:** allergic reaction, infection, influenza, tooth disorder.

## INTERACTIONS

**Drug-drug.** *Aspirin, NSAIDs:* May increase GI irritation. Use together cautiously.

*Products containing aluminum, calcium, magnesium, or iron:* May decrease ibandronate absorption. Give oral ibandronate 1 hour before vitamins, minerals, or antacids.

**Drug-food.** *Food, milk, beverages (except water):* May decrease drug absorption. Give oral drug on an empty stomach with plain water.

**Drug-lifestyle.** *Alcohol use:* May decrease drug absorption and increase risk of esophageal irritation. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase cholesterol level.
- May decrease total alkaline phosphatase level. May interfere with bone-imaging agents.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with uncorrected hypocalcemia. Oral form is contraindicated in those who can't stand or sit upright for 60 minutes.

**Alert:** There may be an increased risk of atypical fractures of the thigh in patients treated with biphosphonates.

- Don't give to patients with severe renal impairment.
- Use cautiously in patients with a history of GI disorders.

**Overdose S&S:** Hypocalcemia, hypophosphatemia, hypomagnesemia.

## NURSING CONSIDERATIONS

- Correct hypocalcemia or other disturbances of bone and mineral metabolism before therapy.
- Make sure patient has adequate intake of calcium and vitamin D.
- Watch for signs or symptoms of esophageal irritation, including dysphagia, painful swallowing, retrosternal pain, and heartburn.
- Monitor patient for bone, joint, and muscle pain, which may be severe and incapacitating and may occur within days,

months, or years of start of therapy. When drug is stopped, symptoms may resolve partially or completely.
- Watch for signs and symptoms of uveitis and scleritis.

***Alert:*** Drug may lead to osteonecrosis, mainly in the jaw. Dental surgery may worsen condition. Consider stopping drug if patient needs a dental procedure.
- Use during pregnancy only if benefit outweighs risk to fetus.
- Use cautiously in breast-feeding women.

## PATIENT TEACHING

- Tell patient receiving I.V. form, if she misses a dose, reschedule the missed dose as soon as possible. Subsequent injections should be rescheduled once every 3 months from that dose. She shouldn't receive more than one dose in a 3-month time frame.
- Tell patient taking monthly dose to take it on same date each month and to wait at least 7 days between doses if she misses a scheduled dose.
- Tell patient taking daily dose not to take a missed dose later in the day. She should skip the missed dose and resume her normal schedule the next day.
- Instruct patient to take oral drug first thing in the morning 1 hour before eating or drinking and before any other drugs, including OTC drugs, such as calcium, antacids, and vitamins.
- Advise patient to swallow drug whole with a full glass of plain water while standing or sitting and to remain upright for at least 1 hour after taking drug.
- Caution patient to take only with plain water.
- Instruct patient not to chew or suck on the tablet.
- Advise patient to take calcium and vitamin D supplements as directed by prescriber.
- Tell patient to report any bone, joint, or muscle pain.
- Advise patient to stop drug and immediately report to prescriber signs and symptoms of esophageal irritation, such as dysphagia, painful swallowing, retrosternal pain, or heartburn.

# ibuprofen

eye-byoo-PROH-fen

Advil ◇, Axum† ◇, Caldolor, Excedrin IB ◇, Ibuprohm, Ibutab ◇, Midol Liquid Gels ◇, Motrin IB, Motrin Migraine Pain, Neoprofen, Novo-Profen†, Pamprin Ibuprofen Formula† ◇, PediaCare Fever ◇

*Therapeutic class:* NSAID
*Pharmacologic class:* NSAID
*Pregnancy risk category D; in 3rd trimester*

## AVAILABLE FORMS

*Capsules:* 200 mg ◇
*Injection:* 400 mg/4-ml, 800 mg/8-ml single-dose vials
*Oral drops:* 40 mg/ml ◇
*Oral suspension:* 100 mg/5 ml ◇
*Tablets:* 100 mg ◇, 200 mg ◇, 400 mg, 600 mg, 800 mg
*Tablets (chewable):* 50 mg ◇, 100 mg ◇

## INDICATIONS & DOSAGES

➤ **Rheumatoid arthritis, osteoarthritis, arthritis**

*Adults:* 300 to 800 mg P.O. t.i.d. or q.i.d. Maximum daily dose is 3.2 g.

➤ **Mild to moderate pain**

*Adults:* 400 mg P.O. every 4 to 6 hours p.r.n. Or, 400 to 800 mg I.V. every 6 hours p.r.n.

➤ **Fever**

*Adults:* 200 to 400 mg P.O. every 4 to 6 hours, for no longer than 3 days. Maximum daily dose is 1.2 g. Or, 400 mg I.V. followed by 400 mg I.V. every 4 to 6 hours or 100 to 200 mg I.V. every 4 hours p.r.n.
*Children ages 6 months to 12 years:* If child's temperature is below 102.5° F (39.2° C), give 5 mg/kg P.O. every 6 to 8 hours. Treat higher temperatures with 10 mg/kg every 6 to 8 hours. Maximum daily dose is 40 mg/kg.

➤ **Clinically significant patent ductus arteriosus**

*Premature infants who weigh between 500 and 1,500 g who are no more than 32 weeks gestational age:* 10 mg/kg I.V. followed by 5 mg/kg I.V. 24 hours later followed by a

third dose of 5 mg/kg I.V. 24 hours after second dose.

➤ **Juvenile arthritis ♦**

*Children:* 30 to 50 mg/kg daily P.O. in three or four divided doses. Maximum daily dose is 2,400 mg/day.

## ADMINISTRATION

**P.O.**

● Give drug with milk or meals.

**I.V.**

▼ Dilute drug with normal saline solution, 5% dextrose, or lactated Ringer's solution. For 400-mg dose, use at least 100 ml of diluent. For 800-mg dose, use at least 200 ml of diluent. Give over at least 30 minutes.

▼ Diluted solutions are stable for 24 hours at room temperature.

▼ Correct dehydration before administering drug.

## ACTION

May inhibit prostaglandin synthesis, to produce anti-inflammatory, analgesic, and antipyretic effects.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Variable | 1–2 hr | 4–6 hr |
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 2 to 4 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, headache, nervousness.
**CV:** edema, fluid retention.
**EENT:** tinnitus.
**GI:** abdominal pain, bloating, constipation, decreased appetite, diarrhea, dyspepsia, epigastric distress, flatulence, heartburn, nausea, *nonnecrotizing enterocolitis,* vomiting.
**GU:** ***acute renal failure,*** azotemia, cystitis, hematuria.
**Hematologic:** ***agranulocytosis, aplastic anemia, leukopenia, neutropenia, pancytopenia, thrombocytopenia,*** anemia, prolonged bleeding time.
**Metabolic:** ***hyperkalemia, hypoglycemia.***
**Skin:** pruritus, rash.

## INTERACTIONS

**Drug-drug.** *Antihypertensives, furosemide, thiazide diuretics:* May decrease the effectiveness of diuretics or antihypertensives. Monitor patient closely.
*Aspirin:* May negate the antiplatelet effect of low-dose aspirin therapy. Advise patient on the appropriate spacing of doses.
*Aspirin, corticosteroids:* May cause adverse GI reactions. Avoid using together.
*Bisphosphonates:* May increase risk of gastric ulceration. Monitor patient for signs of gastric irritation or bleeding.
*Cyclosporine:* May increase nephrotoxicity of both drugs. Avoid using together.
*Digoxin, lithium, oral anticoagulants:* May increase levels or effects of these drugs. Monitor patient toxicity.
*Methotrexate:* May decrease methotrexate clearance and increases toxicity. Use together cautiously.
**Drug-herb.** *Dong quai, feverfew, garlic, ginger, ginkgo biloba, horse chestnut, red clover:* May increase risk of bleeding, based on the known effects of components. Discourage use together.
*White willow:* Herb and drug contain similar components. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May cause adverse GI reactions. Discourage use together.
*Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

● May increase BUN, creatinine, ALT, AST, and potassium levels.
● May decrease glucose and hemoglobin levels and hematocrit.
● May decrease neutrophil, WBC, RBC, platelet, and granulocyte counts.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug and in those with angioedema, syndrome of nasal polyps, or bronchospastic reaction to aspirin or other NSAIDs.
**Black Box Warning** Contraindicated for the treatment of perioperative pain after CABG surgery.
● Contraindicated in pregnant women.
● Use cautiously in elderly patients and in patients with GI disorders, history of peptic ulcer disease, hepatic or renal disease,

cardiac decompensation, hypertension, asthma, or intrinsic coagulation defects.
***Overdose S&S:*** Abdominal pain, nausea, vomiting, lethargy, drowsiness, headache, tinnitus, CNS depression, seizures, hypotension, bradycardia, tachycardia, atrial fibrillation, metabolic acidosis, coma, acute renal failure, hyperkalemia, respiratory depression and failure.

## NURSING CONSIDERATIONS

- Check renal and hepatic function periodically in patients on long-term therapy. Stop drug if abnormalities occur and notify prescriber.
- Because of their antipyretic and anti-inflammatory actions, NSAIDs may mask signs and symptoms of infection.
- Blurred or diminished vision and changes in color vision may occur.
- Full anti-inflammatory effects may take 1 or 2 weeks to develop.

**Black Box Warning** NSAIDs cause an increased risk of serious GI adverse events including bleeding, ulceration, and perforation of the stomach or intestines, which can be fatal. Elderly patients are at greater risk.

- Monitor patients for signs and symptoms of GI ulceration and bleeding.

**Black Box Warning** NSAIDs may increase the risk of serious thrombotic events, MI, or stroke, which can be fatal. The risk may be greater with longer use or in patients with CV disease or risk factors for CV disease.

- If patient consumes three or more alcoholic drinks per day, drug may cause stomach bleeding.

## PATIENT TEACHING

- Tell patient to take with meals or milk to reduce adverse GI reactions.

***Alert:*** Drug is available OTC. Instruct patient not to exceed 1.2 g daily, not to give to children younger than age 12, and not to take for extended periods (longer than 3 days for fever or longer than 10 days for pain) without consulting prescriber.

- Tell patient that full therapeutic effect for arthritis may be delayed for 2 to 4 weeks. Although pain relief occurs at low dosage levels, inflammation doesn't improve at dosages less than 400 mg q.i.d.
- Caution patient that use with aspirin, alcohol, or corticosteroids may increase risk of GI adverse reactions.
- Teach patient to watch for and report to prescriber immediately signs and symptoms of GI bleeding, including blood in vomit, urine, or stool; coffee-ground vomit; and black, tarry stool.
- Tell patient to contact prescriber before using this drug if fluid intake hasn't been adequate or if fluids have been lost as a result of vomiting or diarrhea.
- Warn patient to avoid hazardous activities that require mental alertness until effects on CNS are known.
- Advise patient to wear sunscreen to avoid hypersensitivity to sunlight.

**SAFETY ALERT!**

# ibutilide fumarate

eye-BYOO-ti-lyed

Corvert

*Therapeutic class:* Antiarrhythmic
*Pharmacologic class:* Methanesulfonanilide derivative
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 0.1 mg/ml in 10-ml vials

## INDICATIONS & DOSAGES

➤ **Rapid conversion of recent onset atrial fibrillation or atrial flutter to sinus rhythm**

*Adults who weigh 60 kg (132 lb) or more:* 1 mg I.V. infusion over 10 minutes. May repeat dose if arrhythmia doesn't respond 10 minutes after completing first dose.
*Adults who weigh less than 60 kg:* 0.01 mg/kg I.V. infusion over 10 minutes. May repeat dose if arrhythmia doesn't respond 10 minutes after completing first dose.

## ADMINISTRATION

**I.V.**

▼ Give drug undiluted or diluted in 50 ml of diluent, and add to normal saline solution for injection or $D_5W$ before infusion.

Add contents of 10-ml vial (0.1 mg/ml) to 50-ml infusion bag to form admixture of about 0.017 mg/ml ibutilide. Use drug with polyvinyl chloride plastic bags or polyolefin bags.
▼ Give drug over 10 minutes.
▼ Stop infusion if arrhythmia is terminated or patient develops ventricular tachycardia or marked prolongation of QT or QTc interval. If arrhythmia doesn't respond 10 minutes after infusion ends, may repeat dose.
▼ Admixtures with approved diluents are stable for 24 hours at room temperature; 48 hours if refrigerated.
▼ Don't infuse parenteral products that contain particulate matter or are discolored.
▼ **Incompatibilities:** None reported.

## ACTION

Prolongs action potential in isolated cardiac myocyte and increases atrial and ventricular refractoriness, namely class III electrophysiologic effects.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* Averages about 6 hours.

## ADVERSE REACTIONS

**CNS:** headache.
**CV:** ***sustained polymorphic ventricular tachycardia, AV block, bradycardia, heart failure,*** ventricular extrasystoles, ***nonsustained ventricular tachycardia,*** hypotension, bundle-branch block, hypertension, ***prolonged QT interval,*** palpitations, tachycardia.
**GI:** nausea.

## INTERACTIONS

**Drug-drug.** *Class IA antiarrhythmics (disopyramide, procainamide, quinidine), other class III drugs (amiodarone, sotalol):* May increase potential for prolonged refractoriness. Don't give these drugs for at least five half-lives before and 4 hours after ibutilide dose.
*Digoxin:* Supraventricular arrhythmias may mask cardiotoxicity from excessive digoxin level. Use with caution in patients who may have an increased digoxin therapeutic range.
*$H_1$-receptor antagonist antihistamines, phenothiazines, tetracyclic antidepressants, tricyclic antidepressants, other drugs that prolong QT interval:* May increase risk for proarrhythmia. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Administer drug only when the benefits of maintaining sinus rhythm outweigh the immediate risks of ibutilide administration and the risks of maintenance therapy. ■
● Contraindicated in patients hypersensitive to drug or its components.
● Contraindicated in patients with history of polymorphic ventricular tachycardia. Use not recommended in breast-feeding women.
● Use cautiously in patients with hepatic or renal dysfunction.
● Safety and effectiveness of drug haven't been established in children.
⚠ ***Overdose S&S:*** Ventricular ectopy, ventricular tachycardia, third-degree AV block.

## NURSING CONSIDERATIONS

**Black Box Warning** Only skilled personnel trained in identification and treatment of acute ventricular arrhythmias, particularly polymorphic ventricular tachycardia, should give drug. Cardiac monitor, intracardiac pacing, cardioverter or defibrillator, and drugs to treat sustained ventricular tachycardia must be available. ■
● Before therapy, correct hypokalemia and hypomagnesemia to reduce risk of proarrhythmia.
**Black Box Warning** Patients with atrial fibrillation lasting longer than 2 to 3 days must be adequately anticoagulated, generally over at least 2 weeks. ■
● Monitor ECG continuously during administration and for at least 4 hours afterward or until QTc interval returns to baseline; drug can induce or worsen ventricular arrhythmias. Longer monitoring is required if ECG shows arrhythmia or patient has hepatic insufficiency.
● Don't give class IA or other class III antiarrhythmics with infusion or for 4 hours afterward.

## PATIENT TEACHING

- Tell patient to report adverse reactions promptly.
- Instruct patient to alert nurse of discomfort at injection site.

**SAFETY ALERT!**

# idarubicin hydrochloride

eye-duh-ROO-bi-sin

Idamycin PFS

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Semisynthetic anthracycline
*Pregnancy risk category D*

## AVAILABLE FORMS

*Injection:* 1 mg/ml in 5-, 10-, and 20-ml single-dose vials

## INDICATIONS & DOSAGES

Dosages vary. Check treatment protocol with prescriber.

➤ **Acute myeloid leukemia, including French-American-British classifications M1 through M7, with other approved antileukemic drugs**

*Adults:* 12 mg/m$^2$ daily for 3 days by slow I.V. injection (over 10 to 15 minutes) with 100 mg/m$^2$ daily of cytarabine for 7 days by continuous I.V. infusion. Or, the cytarabine may be given 25-mg/m$^2$ bolus; then 200 mg/m$^2$ daily for 5 days by continuous infusion. A second course may be given, if needed.

***Adjust-a-dose:*** If patient experiences severe mucositis, delay second course of therapy until recovery is complete and reduce dosage by 25%.

**Black Box Warning** Reduce dosage in patients with hepatic or renal impairment. Don't give idarubicin if bilirubin level exceeds 5 mg/dl. ■

## ADMINISTRATION

**I.V.**

▼ Preparing and giving parenteral drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.

▼ Reconstitute to final concentration of 1 mg/ml using normal saline solution for injection without preservatives. Add 5 ml to 5-mg vial, 10 ml to 10-mg vial, or 20 ml to 20-mg vial. Don't use bacteriostatic saline solution. Vial is under negative pressure.

**Black Box Warning** Give drug over 10 to 15 minutes into a free-flowing I.V. infusion of normal saline or $D_5W$ solution running into a large vein. Do not give I.M. or subcutaneously. ■

**Black Box Warning** Drug is a vesicant; tissue necrosis may result. ■

▼ If extravasation occurs, stop infusion immediately and notify prescriber. Treat with intermittent ice packs for ½ hour immediately and then for ½ hour q.i.d. for 4 days.

▼ Reconstituted solutions are stable for 72 hours at 59° to 86° F (15° to 30° C); 7 days if refrigerated and protected from light. Label unused solutions with chemotherapy hazard label.

▼ **Incompatibilities:** Acyclovir sodium, alkaline solutions, allopurinol, ampicillin sodium with sulbactam, cefazolin, cefepime, ceftazidime, clindamycin phosphate, dexamethasone sodium phosphate, etoposide, furosemide, gentamicin, heparin, hydrocortisone sodium succinate, lorazepam, meperidine, methotrexate sodium, piperacillin sodium with tazobactam, sodium bicarbonate, teniposide, vancomycin, vincristine.

## ACTION

Unknown. Probably inhibits nucleic acid synthesis and interacts with the enzyme topoisomerase II. Drug is highly lipophilic, which increases rate of cellular uptake.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Few min | Unknown |

*Half-life:* 20 to 22 hours.

## ADVERSE REACTIONS

**CNS:** *headache, changed mental status,* peripheral neuropathy, ***seizures,*** *fever.*

**CV:** **HEMORRHAGE,** ***heart failure, MI, myocardial insufficiency, arrhythmias, myocardial toxicity,*** atrial fibrillation, chest pain, asymptomatic decline in left ventricular ejection fraction.

**GI:** *nausea, vomiting, cramps, diarrhea, mucositis.*
**GU:** renal dysfunction, red urine.
**Hematologic:** ***myelosuppression.***
**Hepatic:** changes in hepatic function.
**Metabolic:** hyperuricemia.
**Skin:** *alopecia, rash, urticaria, bullous erythrodermatous rash on palms and soles,* urticaria, erythema at previously irradiated sites, tissue necrosis if extravasation occurs.
**Other:** **INFECTION,** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Alkaline solutions, heparin:* These combinations are incompatible. Don't mix idarubicin with other drugs unless specific compatibility data are known.

## EFFECTS ON LAB TEST RESULTS

- May increase uric acid level. May decrease hemoglobin level.
- May decrease WBC, neutrophil, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Use cautiously in patients with bone marrow suppression induced by previous drug therapy or radiotherapy, impaired hepatic or renal function, previous treatment with anthracyclines or cardiotoxic drugs, or a cardiac condition.

***Overdose S&S:*** Severe and prolonged myelosuppression, increased severity of GI toxicity, severe arrhythmia, acute cardiac toxicity, increased incidence of delayed cardiac failure.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug should be given only under the supervision of a physician experienced in the use of cancer chemotherapeutic agents.

**Black Box Warning** Cardiotoxicity is the dose-limiting toxicity of drug. It is more common in those who have received prior anthracyclines or who have pre-existing cardiac disease.

- Cardiovascular side effects occur with greater frequency in older patients.
- Make sure patient is adequately hydrated before treatment. Hyperuricemia may result from rapid lysis of leukemic cells. Allopurinol may be ordered.
- Assess patient for systemic infection and ensure that it's controlled before therapy begins.
- Give antiemetics to prevent or treat nausea and vomiting.
- Monitor hepatic and renal function tests and CBC frequently.
- To prevent bleeding, avoid all I.M. injections when platelet count is below $50{,}000/mm^3$.

**Black Box Warning** Severe myelosuppression may occur.

- Anticipate need for blood transfusions for anemia.
- Notify prescriber if signs or symptoms of heart failure occur.
- ***Look alike–sound alike:*** Don't confuse idarubicin with daunorubicin or doxorubicin.

## PATIENT TEACHING

- Teach patient to recognize signs and symptoms of leakage of drug into surrounding tissue, and tell him to report them if they occur.
- Warn patient to watch for signs and symptoms of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools).
- Advise patient that red urine for several days is normal and doesn't indicate presence of blood.
- Caution woman of childbearing age to avoid becoming pregnant during therapy. Recommend that she consult prescriber before becoming pregnant.

**SAFETY ALERT!**

# ifosfamide

eye-FOSS-fa-mide

Ifex

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Nitrogen mustard
*Pregnancy risk category D*

## AVAILABLE FORMS

*Powder for injection:* 1 g, 3 g

## INDICATIONS & DOSAGES

➤ **Testicular cancer**

*Adults:* 1.2 g/$m^2$ daily I.V. for 5 consecutive days. Repeat treatment every 3 weeks or after patient recovers from hematologic toxicity. Don't repeat doses until WBC count exceeds 4,000/$mm^3$ and platelet count exceeds 100,000/$mm^3$.

***Adjust-a-dose:*** For patients with renal insufficiency, reduce dosage as follows: If glomerular filtration rate (GFR) is 30 to 60 ml/minute, give 75% of usual dose; if GFR is 10 to 30 ml/minute, give 50% of usual dose. Don't give dose if GFR is less than 10 ml/minute. For patients with hepatic dysfunction, consider decreasing dosage to 25% of usual dose if serum AST level is greater than 300 units/L or if bilirubin level is greater than 3 mg/dl.

## ADMINISTRATION

**I.V.**

▼ Preparing and giving drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.

▼ Give a protective drug such as mesna to prevent hemorrhagic cystitis. Ifosfamide and mesna are physically compatible and may be mixed in the same I.V. solution.

▼ Obtain urinalysis before each dose. If microscopic hematuria occurs, notify prescriber. Adjust dosage of mesna, if needed. Adequate fluid intake (2 L daily, either P.O. or I.V.) is essential before, and 72 hours after, therapy.

▼ Reconstitute each gram of drug with 20 ml of diluent to yield a solution of 50 mg/ml. Use sterile water for injection or bacteriostatic water for injection. Solutions may then be further diluted with sterile water, dextrose 2.5% or 5% in water, half-normal or normal saline solution for injection, dextrose 5% and normal saline solution for injection, or lactated Ringer's injection.

▼ Infuse each dose over at least 30 minutes.

▼ Reconstituted solution is stable for 1 week at room temperature or 6 weeks if refrigerated. However, use solution within 6 hours if drug was reconstituted with sterile water without a preservative (such as benzyl alcohol or parabens).

▼ **Incompatibilities:** Cefepime, mesna with epirubicin, methotrexate sodium.

## ACTION

Cross-links strands of cellular DNA and interferes with RNA transcription, causing an imbalance of growth that leads to cell death. Not specific to cell cycle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* About 14 hours.

## ADVERSE REACTIONS

**CNS:** *somnolence, confusion,* hallucinations, depressive psychosis, fever, ***seizures, coma.***

**GI:** *nausea, vomiting.*

**GU:** *hemorrhagic cystitis, hematuria.*

**Hematologic:** **LEUKOPENIA, THROMBOCYTOPENIA, MYELOSUPPRESSION.**

**Skin:** *alopecia.*

**Other:** infection, phlebitis.

## INTERACTIONS

**Drug-drug.** *Anticoagulants, aspirin, NSAIDs:* May increase risk of bleeding. Avoid using together.

*Barbiturates, chloral hydrate, fosphenytoin, phenytoin:* May increase ifosfamide toxicity. Monitor patient closely.

*Corticosteroids:* May inhibit hepatic enzymes, reducing ifosfamide's effect. Monitor patient for increased ifosfamide toxicity if corticosteroid dosage is suddenly reduced or stopped.

*Cyclophosphamide:* May increase risk of cardiac tamponade in patients with thalassemia. Monitor patient closely.

*Myelosuppressives:* May enhance hematologic toxicity. Dosage adjustment may be needed.

## EFFECTS ON LAB TEST RESULTS

- May increase liver enzyme levels.
- May decrease WBC and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with severe bone marrow suppression.
- Use cautiously in patients with renal impairment or compromised bone marrow

reserve as indicated by leukopenia, granulocytopenia, extensive bone marrow metastases, previous radiation therapy, or previous therapy with cytotoxic drugs.

### NURSING CONSIDERATIONS

**Black Box Warning** Drug should be administered under the supervision of a physician experienced in the use of cancer chemotherapeutic agents. ▮

**Black Box Warning** Urotoxic side effects, especially hemorrhagic cystitis, and CNS toxicities, such as confusion and coma, may require cessation of ifosfamide therapy. ▮

**Black Box Warning** Severe myelosuppression has been reported. ▮

- Give antiemetic before drug, to reduce nausea.
- Ensure that patient is adequately hydrated during therapy.
- Don't give drug at bedtime; infrequent urination during the night may increase possibility of cystitis. If cystitis develops, stop drug and notify prescriber.
- Bladder irrigation with normal saline solution may be done to treat cystitis.
- Monitor CBC and renal and liver function tests.
- To prevent bleeding, avoid all I.M. injections when platelet count is less than 50,000/$mm^3$.
- Anticipate blood transfusions because of cumulative anemia.
- Assess patient for mental status changes; dosage may have to be decreased.
- ***Look alike–sound alike:*** Don't confuse ifosfamide with cyclophosphamide.

### PATIENT TEACHING

- Remind patient to urinate frequently to minimize contact of drug and its metabolites with the lining of the bladder.
- Advise patient to watch for signs and symptoms of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell patient to take temperature daily.
- Instruct patient to avoid OTC products that contain aspirin.
- Advise women to stop breast-feeding during therapy because of possible risk of toxicity to infant.
- Caution woman of childbearing age to avoid becoming pregnant during therapy. Recommend that she consult prescriber before becoming pregnant.

## iloperidone

ill-oh-PER-ih-done

Fanapt

*Therapeutic class:* Antipsychotic
*Pharmacologic class:* Dopamine and serotonin antagonist
*Pregnancy risk category C*

I

### AVAILABLE FORMS

*Tablets:* 1 mg, 2 mg, 4 mg, 6 mg, 8 mg, 10 mg, 12 mg

### INDICATIONS & DOSAGES

➤ **Schizophrenia**

*Adults:* Initially, 1 mg P.O. b.i.d. Increase dosage daily as needed according to the following dosing schedule: 2 mg P.O. b.i.d. on day 2; 4 mg P.O. b.i.d. on day 3; 6 mg P.O. b.i.d. on day 4; 8 mg P.O. b.i.d. on day 5; 10 mg P.O. b.i.d. on day 6; 12 mg P.O. b.i.d. on day 7. Maximum dosage is 12 mg P.O. b.i.d.

***Adjust-a-dose:*** For patients taking CYP2D6 inhibitors (fluoxetine, paroxetine) and CYP3A4 inhibitors (clarithromycin, ketoconazole), reduce dosage by half.

### ADMINISTRATION

**P.O.**

- Give drug with or without food.

### ACTION

May antagonize dopamine type 2 and serotonin type 2.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–4 hr | Unknown |

*Half-life:* 18 to 37 hours.

### ADVERSE REACTIONS

**CNS:** aggression, delusion, *dizziness*, extrapyramidal effects, fatigue, lethargy, restlessness, *somnolence*, tremor.
**CV:** hypotension, orthostatic hypotension, palpitations, *tachycardia*.

**EENT:** blurred vision, conjunctivitis, *dry mouth*, nasal congestion, nasopharyngitis.
**GI:** abdominal discomfort, diarrhea, *nausea.*
**GU:** ejaculation failure, erectile dysfunction, urinary incontinence.
**Metabolic:** weight gain, weight loss.
**Musculoskeletal:** arthralgia, muscle spasm, musculoskeletal stiffness, myalgia.
**Respiratory:** dyspnea, upper respiratory tract infection.
**Skin:** rash.

## INTERACTIONS

**Drug-drug.** *Alpha$_1$ blockers:* May enhance antihypertensive effects. Use together cautiously.
*Centrally acting drugs:* May increase CNS effects. Use together cautiously.
*CYP3A4 or CYP2D6 inhibitors (clarithromycin, fluoxetine, ketoconazole, paroxetine):* May increase iloperidone level. Reduce dosage by half.
*Dextromethorphan:* May increase dextromethorphan level. Avoid use together.
*Drugs that prolong QT interval:* May cause lethal arrhythmias. Avoid use together.
**Drug-lifestyle.** *Alcohol:* May increase CNS effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May decrease hematocrit.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Avoid use with other drugs known to prolong QT interval and in elderly patients with dementia-related psychosis.
- Use cautiously in patients with history of stroke, transient ischemic attack, arrhythmia, QT-interval prolongation, diabetes, seizures, orthostatic hypotension, neuroleptic malignant syndrome, tardive dyskinesia, leukopenia, neutropenia, agranulocytosis, suicidal ideation, or priapism.
- Safe use in pregnancy hasn't been established. Use only if benefit to mother outweighs risk to fetus. It isn't known if drug appears in breast milk. Patient shouldn't breast-feed during therapy.

***Overdose S&S:*** Prolonged QT interval, drowsiness, sedation, tachycardia, hypotension.

## NURSING CONSIDERATIONS

**Black Box Warning** Fatal cardiovascular events may occur in elderly patients with dementia. Drug isn't approved for use in patients with dementia-related psychosis. ■

***Alert:*** Obtain baseline blood pressure measurements before starting therapy, and monitor blood pressure regularly. Watch for orthostatic hypotension, especially during first dosage adjustments.

***Alert:*** Watch for evidence of neuroleptic malignant syndrome (hyperthermia, muscle rigidity, altered mental status, and autonomic instability), which is rare but can be fatal.

***Alert:*** Life-threatening hyperglycemia may occur in patients taking atypical antipsychotics. Monitor patients with diabetes regularly. Monitor fasting blood glucose level at drug initiation and periodically during therapy in patients with risk factors for diabetes.

- Monitor patient for tardive dyskinesia, which may occur with prolonged use of drug. If tardive dyskinesia occurs, discontinue drug unless patient's condition warrants continued use.
- Monitor patient for suicidal thinking and behavior.
- Dispense lowest appropriate quantity of drug to reduce the risk of overdose.
- Monitor patient for weight gain.
- Periodically reassess patient to determine continued need for therapy.
- Monitor CBC frequently during the first few months of therapy and discontinue drug if WBC count drops with no other underlying cause.
- Drug may lower seizure threshold in patients with a history of seizures; monitor these patients closely.

## PATIENT TEACHING

- Warn patient to avoid driving and other hazardous activities that require mental alertness until the drug's effects are known.
- Tell patient drug can be taken with or without food.
- Warn patient to rise slowly, avoid hot showers, and use other precautions to avoid fainting when starting therapy.
- Advise patient to avoid becoming overheated or dehydrated.

- Tell women of childbearing age to notify prescriber about planned, suspected, or known pregnancy.
- Advise breast-feeding women not to breast-feed during therapy.
- Instruct patient to report symptoms of dizziness, palpitations, or fainting to prescriber.
- Advise patient to avoid alcohol use while taking drug.
- Tell male patient to seek emergency medical care if an erection lasts more than 4 hours.
- Warn patient and caregiver about the risk of neuroleptic malignant syndrome and advise them to seek emergency medical care if symptoms occur.
- Tell patient to notify prescriber about other prescription or OTC drugs he's taking or plans to take.

## iloprost

EYE-loe-prost

Ventavis

*Therapeutic class:* Pulmonary vasodilator
*Pharmacologic class:* Prostacyclin analogue
*Pregnancy risk category C*

### AVAILABLE FORMS

*Inhalation solution:* 10 mcg/ml, 20 mcg/ml in single-dose ampules

### INDICATIONS & DOSAGES

➤ **Pulmonary arterial hypertension in patients with New York Heart Association (NYHA) Class III or IV symptoms**

*Adults:* Initially, 2.5 mcg inhaled using the I-neb or the Prodose Adaptive Aerosol Delivery (AAD) systems. As tolerated, increase to 5 mcg inhaled six to nine times daily while patient is awake, as needed, but to no more than every 2 hours. Maximum, 5 mcg nine times daily.

***Adjust-a-dose:*** For patients with Child-Pugh class B or C, consider increasing dosing interval to every 3 to 4 hours depending on patient response.

### ADMINISTRATION

**Inhalational**

- Use only I-neb AAD or Prodose AAD delivery devices, per manufacturer's instructions.

### ACTION

Lowers pulmonary arterial pressure by dilating systemic and pulmonary arterial beds. Drug also affects platelet aggregation, although effect in pulmonary hypertension treatment isn't known.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Inhalation | Unknown | Unknown | 30–60 min |

*Half-life:* 20 to 30 minutes.

### ADVERSE REACTIONS

**CNS:** *headache,* insomnia, syncope.
**CV:** *hypotension, vasodilation, chest pain,* ***heart failure, supraventricular tachycardia,*** palpitations, peripheral edema.
**GI:** *nausea,* tongue pain, vomiting.
**GU:** ***renal failure.***
**Musculoskeletal:** *trismus,* back pain, muscle cramps.
**Respiratory:** *cough,* dyspnea, hemoptysis, pneumonia.
**Other:** *flulike syndrome.*

### INTERACTIONS

**Drug-drug.** *Anticoagulants:* May increase risk of bleeding. Monitor patient closely. *Antihypertensives, vasodilators:* May increase effects of these drugs. Monitor patient's blood pressure.

### EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase and GGT levels.

### CONTRAINDICATIONS & CAUTIONS

- No contraindications known. Avoid using in patients whose systolic blood pressure is less than 85 mm Hg.
- Use cautiously in elderly patients, patients with hepatic or renal impairment, and patients with COPD, severe asthma, or acute pulmonary infection.

⚠ ***Overdose S&S:*** Diarrhea, flushing, headache, hypotension, nausea, vomiting.

## NURSING CONSIDERATIONS

- Keep drug away from skin and eyes.
- The 2-ml ampule must be used with the Prodose AAD System and may be used with the I-neb AAD System. The 1-ml ampule must be used only with the I-neb AAD System.
- Take care not to inhale drug while providing treatment.
- Monitor patient's vital signs carefully at start of treatment.
- Watch for syncope.
- If patient develops evidence of pulmonary edema, stop treatment immediately.

## PATIENT TEACHING

- Advise patient to take drug exactly as prescribed and using Prodose AAD or I-neb AAD.
- Urge patient to follow manufacturer's instructions for preparing and inhaling drug.
- Advise patient to keep a backup Prodose AAD or I-neb AAD in case the original malfunctions.
- Tell patient to keep drug away from skin and eyes and to rinse the area immediately if contact occurs.
- Caution patient not to ingest drug solution.
- Inform patient that drug may cause dizziness and fainting. Urge him to stand up slowly from a sitting or lying position and to report to prescriber worsening of symptoms.
- Tell patient to take drug before physical exertion but no more than every 2 hours.
- Tell patient not to expose others, especially pregnant women and infants, to drug.
- Teach patient how to clean equipment and safely dispose of used ampules after each treatment. Caution patient not to save or use leftover solution.

**SAFETY ALERT!**

# imatinib mesylate

eh-MAT-eh-nib

Gleevec

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Protein-tyrosine kinase inhibitor
*Pregnancy risk category D*

## AVAILABLE FORMS

*Tablets:* 100 mg, 400 mg

## INDICATIONS & DOSAGES

➤ **Relapsed or refractory Philadelphia chromosome–positive (Ph+) ALL**
*Adults:* 600 mg P.O. daily.

➤ **Aggressive systemic mastocytosis (ASM) without the D816V c-Kit mutation or with c-Kit mutational status unknown**
*Adults:* 400 mg P.O. daily.
***Adjust-a-dose:*** For patients with ASM associated with eosinophilia, a clonal hematologic disease related to the fusion kinase FIP1L1-PDGFR$\alpha$, initial dose is 100 mg/day. Increase dose from 100 mg to 400 mg/day if no adverse drug reactions and if insufficient response to therapy.

➤ **Hypereosinophilic syndrome (HES) or chronic eosinophilic leukemia (CEL), or both**
*Adults:* 400 mg P.O. daily.
***Adjust-a-dose:*** In HES/CEL patients with demonstrated FIP1L1-PDGFR$\alpha$, fusion kinase, initial dose is 100 mg/day. Increase dose from 100 mg to 400 mg/day if no adverse drug reactions and if insufficient response to therapy.

➤ **Myelodysplastic (MDS) or myeloproliferative (MPD) disease with PDGFR gene rearrangements**
*Adults:* 400 mg P.O. daily.

➤ **Unresectable, recurrent, or metastatic dermatofibrosarcoma protuberans (DFSP)**
*Adults:* 800 mg P.O. daily.

➤ **Chronic myeloid leukemia (CML) in blast crisis, in accelerated phase, or in chronic phase after failure of alfa interferon therapy; newly diagnosed Ph+ chronic-phase CML**

*Adults:* For chronic-phase CML, 400 mg P.O. daily as single dose with a meal and large glass of water. For accelerated-phase CML or blast crisis, 600 mg P.O. daily as single dose with a meal and large glass of water. Continue treatment as long as patient continues to benefit. May increase daily dose to 600 mg P.O. in chronic phase or to 800 mg P.O. (400 mg P.O. b.i.d.) in accelerated phase or blast crisis.
*Children age 2 and older:* For newly diagnosed Ph+ chronic-phase CML only, give 340 mg/m$^2$ daily P.O. Don't exceed 600 mg.

➤ **Kit (CD117)-positive or GI stromal tumors (GISTs) after resection**
*Adults:* 400 mg P.O. daily.

➤ **Kit-positive unresectable or metastatic malignant GISTs**
*Adults:* 400 mg P.O. daily or b.i.d.

➤ **Ph+ chronic-phase CML in patients whose disease has recurred after stem cell transplant or who are resistant to alfa interferon therapy**
*Children age 2 and older:* 260 mg/m$^2$ daily P.O. as a single dose or divided into two doses. Have patient take with meal and large glass of water. May increase dosage to 340 mg/m$^2$ daily.

***Adjust-a-dose:*** For patients with creatinine clearance of 40 to 59 ml/minute, don't exceed 600 mg daily; if creatinine clearance is 20 to 39 ml/minute, don't exceed 400 mg daily; if creatinine clearance is less than 20 ml/minute, don't exceed 100 mg daily. For patients with severe hepatic failure, reduce dosage by 25%. See manufacturer's package insert for full details on dosage adjustment.

## ADMINISTRATION

**P.O.**
- For daily dosing of 800 mg and above, use the 400-mg tablet to reduce exposure to iron.
- For patients unable to swallow tablets, disperse the tablets in water or apple juice (50 ml for 100-mg tablet or 200 ml for 400-mg tablet). Stir and have patient drink immediately.

## ACTION

Inhibits the abnormal tyrosine kinase created by the Philadelphia chromosome abnormality in CML; it inhibits tumor growth of murine myeloid cells and leukemia lines from CML patients in blast crisis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–4 hr | Unknown |

*Half-life:* Within 7 days.

## ADVERSE REACTIONS

**CNS:** **CEREBRAL HEMORRHAGE,** *fatigue, headache, pyrexia, weakness, depression, dizziness, insomnia.*
**CV:** *edema.*
**EENT:** *epistaxis,* nasopharyngitis.
**GI:** **GI HEMORRHAGE,** *abdominal pain, anorexia, constipation, diarrhea, dyspepsia, nausea, vomiting.*
**Hematologic:** **HEMORRHAGE, NEUTROPENIA, THROMBOCYTOPENIA,** *anemia.*
**Metabolic:** *hypokalemia,* weight increase.
**Musculoskeletal:** *arthralgia, myalgia, muscle cramps, musculoskeletal pain.*
**Respiratory:** *cough, dyspnea, pneumonia.*
**Skin:** *petechiae, rash,* pruritus.
**Other:** *night sweats.*

## INTERACTIONS

**Drug-drug.** *Acetaminophen:* May increase risk of hepatic toxicity. Monitor patient closely.
*CYP3A4 inducers (carbamazepine, dexamethasone, phenobarbital, phenytoin, rifampin):* May increase metabolism and decrease imatinib level. Use together cautiously.
*CYP3A4 inhibitors (clarithromycin, erythromycin, itraconazole, ketoconazole):* May decrease metabolism and increase imatinib level. Monitor patient for toxicity.
*Dihydropyridine-calcium channel blockers, certain HMG-CoA reductase inhibitors (simvastatin), cyclosporine, pimozide, triazolo-benzodiazepines:* May increase levels of these drugs. Monitor patient for toxicity, and obtain drug levels, if appropriate.
*Levothyroxine:* May increase levothyroxine clearance, causing increased thyroid stimulating hormone levels and symptoms of

hypothyroidism. Monitor thyroid function.
*Warfarin:* May alter metabolism of warfarin. Avoid using together; use standard heparin or a low–molecular-weight heparin.
**Drug-herb.** *St. John's wort:* May decrease drug effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase creatinine, bilirubin, alkaline phosphatase, AST, and ALT levels. May decrease potassium and hemoglobin levels.
- May decrease neutrophil and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in elderly patients and in those with hepatic impairment.
- Severe congestive heart failure and left ventricular dysfunction have occurred in patients taking imatinib. Use cautiously in patients with cardiac disease or risk factors for cardiac failure.
- Safety and effectiveness in children younger than age 2 haven't been established.

***Overdose S&S:*** Muscle cramps, ascites, elevated creatinine, AST, ALT, and bilirubin levels.

## NURSING CONSIDERATIONS

- Monitor patient closely for possibly severe fluid retention. Elderly patients may have an increased risk of edema.
- Monitor weight daily. Report unexpected, rapid weight gain.
- Monitor CBC weekly for first month; every other week for second month and periodically thereafter.
- Monitor liver function tests carefully because hepatotoxicity (occasionally severe) may occur; decrease dosage as needed.
- May increase dose if no severe adverse reactions or severe non–leukemia-related neutropenia or thrombocytopenia in the following circumstances: disease progression, failure to achieve a satisfactory hematologic response after at least 3 months of treatment, or loss of a previously achieved hematologic response.
- In patients with HES and cardiac involvement, cases of cardiogenic shock/left ventricular dysfunction have been associated with the initiation of imatinib therapy. The condition is reversible with administration of systemic steroids, circulatory support measures, and by temporarily withholding imatinib. Monitor echocardiogram and serum troponin in patients with HES/CEL and in patients with MDS/MPD or ASM associated with high eosinophil levels.
- Grade 3/4 hemorrhage has been reported in patients with newly diagnosed CML and with GIST. GI tumor sites may be the source of GI bleeds in GIST.
- Gastrointestinal perforations, some fatal, have been reported.

## PATIENT TEACHING

- Tell patient to take drug with food and a large glass of water.
- Advise patient unable to swallow tablets to mix them in water or apple juice (50 ml for 100-mg tablet or 200 ml for 400-mg tablet). Tell him to stir and drink immediately.
- Advise patient to report to prescriber any adverse effects, such as fluid retention.
- Advise patient to obtain periodic liver and kidney function tests and blood work to determine blood counts.
- Tell patient to avoid or limit the use of acetaminophen in OTC or prescription products because of potential toxic effects on the liver.

# imipenem and cilastatin sodium

im-ih-PEN-em and sye-luh-STAT-in

Primaxin

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Carbapenem, beta-lactam
*Pregnancy risk category C*

## AVAILABLE FORMS

*Powder for injection:* 250 mg, 500 mg, 750 mg

## INDICATIONS & DOSAGES

➤ **Serious lower respiratory tract, bone, intra-abdominal, gynecologic, joint, skin, and soft-tissue infections; UTIs; endocarditis; and bacterial septicemia, caused by *Acinetobacter, Enterococcus, Staphylococcus, Streptococcus, Escherichia coli, Haemophilus, Klebsiella, Morganella, Proteus, Enterobacter, Pseudomonas aeruginosa,* and *Bacteroides,* including *B. fragilis***

*Adults who weigh more than 70 kg (154 lb):* 250 mg to 1 g by I.V. infusion every 6 to 8 hours. Maximum daily dose is 50 mg/kg/day or 4 g/day, whichever is less.

*Children age 3 months and older (except for CNS infections):* 15 to 25 mg/kg I.V. every 6 hours. Maximum daily dose is 2 to 4 g.

*Infants ages 4 weeks to 3 months who weigh 1.5 kg (3 lb) or more (except for CNS infections):* 25 mg/kg I.V. every 6 hours.

*Neonates ages 1 to 4 weeks who weigh 1.5 kg or more (except for CNS infections):* 25 mg/kg I.V. every 8 hours.

*Neonates younger than age 1 week who weigh 1.5 kg or more (except for CNS infections):* 25 mg/kg I.V. every 12 hours.

➤ **Intra-abdominal, lower respiratory, skin and skin-structure, and gynecologic infections**

*Adults:* 500 to 750 mg I.M. every 12 hours.

***Adjust-a-dose:*** If creatinine clearance is less than 70 ml/minute, adjust dosage and monitor renal function test results. Consult manufacturer's package insert for specific dosage adjustments. For patients on hemodialysis, administer dose after hemodialysis and at 12-hour intervals timed from the end of that dialysis session.

## ADMINISTRATION

**I.V.**

▼ Obtain specimens for culture and sensitivity testing before giving first dose. Begin therapy while awaiting results.

▼ Reconstitute piggyback units with 100 ml of compatible I.V. solution to provide solution containing 2.5 to 5 mg/ml.

▼ When reconstituting powder, shake until the solution is clear. Solutions may be colorless to yellow; variations of color within this range don't affect drug's potency.

▼ After reconstitution, solution is stable for 4 hours at room temperature and for 24 hours when refrigerated.

▼ Don't give by direct I.V. bolus injection.

▼ For adults, give each 250- or 500-mg dose by I.V. infusion over 20 to 30 minutes. Infuse each 750-mg to 1-g dose over 40 to 60 minutes.

▼ For children, infuse doses of 500 mg or less over 15 to 30 minutes. Infuse doses greater than 500 mg over 40 to 60 minutes. If nausea occurs, the infusion may be slowed.

▼ **Incompatibilities:** Allopurinol, antibiotics, amiodarone, amphotericin B cholesteryl complex, azithromycin, dextrose 5% in lactated Ringer's injection, etoposide, fluconazole, gemcitabine, lorazepam, meperidine, midazolam, milrinone, sargramostim, sodium bicarbonate.

**I.M.**

● Obtain specimen culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.

***Alert:*** Don't give I.M. solution by I.V. route.

## ACTION

Inhibits bacterial cell-wall synthesis; enzymatic breakdown of drug in the kidneys causes adequate antibacterial levels of drug in the urine.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |
| I.M. | Unknown | 1–2 hr | Unknown |

*Half-life:* 1 hour after I.V. dose; 2 to 3 hours after I.M. dose.

## ADVERSE REACTIONS

**CNS:** ***seizures,*** dizziness, fever, somnolence.

**CV:** hypotension, thrombophlebitis.

**GI:** ***pseudomembranous colitis,*** diarrhea, nausea, vomiting.

**Hematologic:** ***leukopenia, thrombocytopenia,*** eosinophilia.

**Skin:** injection site pain, pruritus, rash, urticaria.

**Other:** ***anaphylaxis,*** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Beta-lactam antibiotics:* May have antagonistic effect. Avoid using together.
*Ganciclovir:* May cause seizures. Avoid using together.
*Probenecid:* May increase cilastatin level. May be used together for this effect.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN, creatinine, ALT, AST, alkaline phosphatase, bilirubin, and LDH levels.
- May increase eosinophil count. May decrease WBC and platelet counts.
- May interfere with glucose determination by Benedict's solution or Clinitest.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, in those with a history of hypersensitivity to local anesthetics of the amide type, and in those with severe shock or heart block.
- Use cautiously in patients allergic to penicillins or cephalosporins because drug has similar properties.
- Use cautiously in patients with history of seizure disorders, especially if they also have compromised renal function.
- Use cautiously in children younger than age 3 months.

## NURSING CONSIDERATIONS

***Alert:*** Don't use for CNS infections in children because drug increases the risk of seizures.
***Alert:*** If seizures develop and persist despite anticonvulsant therapy, stop drug and notify prescriber.
- For patients receiving hemodialysis, drug is recommended only when benefits outweigh possible risk of seizures.
- Monitor patient for bacterial or fungal superinfections and resistant infections during and after therapy.

## PATIENT TEACHING

- Instruct patient to report adverse reactions promptly.
- Tell patient to report discomfort at I.V. insertion site.
- Urge patient to notify prescriber about loose stools or diarrhea.

# imipramine hydrochloride

im-IP-ra-meen

Novo-pramine†, Tofranil

# imipramine pamoate

Tofranil-PM

*Therapeutic class:* Antidepressant
*Pharmacologic class:* Tricyclic antidepressant (TCA)
*Pregnancy risk category D*

## AVAILABLE FORMS

**imipramine hydrochloride**
*Tablets:* 10 mg, 25 mg, 50 mg
**imipramine pamoate**
*Capsules:* 75 mg, 100 mg, 125 mg, 150 mg

## INDICATIONS & DOSAGES

➤ **Depression**
*Adults:* 75 to 100 mg P.O. daily in divided doses, increased by 25 to 50 mg. Maximum daily dose is 200 mg for outpatients and 300 mg for hospitalized patients. Give entire dose at bedtime.
*Adolescents and elderly patients:* Initially, 30 to 40 mg daily; maximum shouldn't exceed 100 mg daily.
➤ **Childhood enuresis**
*Children age 6 and older:* 25 mg P.O. 1 hour before bedtime. If patient doesn't improve within 1 week, increase dose to 50 mg if child is younger than age 12; increase dose to 75 mg for children age 12 and older. In either case, maximum daily dose is 2.5 mg/kg.
➤ **Chronic tension headaches ♦**
*Adults:* 10 to 25 mg P.O. t.i.d.
➤ **Attention deficit hyperactivity disorder ♦**
*Children and adolescents:* Initially, 1 mg/kg/day titrated to maximum dosage of 4 mg/kg/day or 200 mg/day, whichever is smaller.

## ADMINISTRATION

**P.O.**
- Give drug without regard for food.
- Give full dose at bedtime if possible.

## ACTION

Unknown. Increases norepinephrine, serotonin, or both in the CNS by blocking their reuptake by the presynaptic neurons.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | Unknown |

*Half-life:* 11 to 25 hours.

## ADVERSE REACTIONS

**CNS:** *drowsiness, dizziness,* ***seizures, stroke,*** excitation, tremor, confusion, hallucinations, anxiety, ataxia, paresthesia, nervousness, EEG changes, extrapyramidal reactions.
**CV:** *orthostatic hypotension, tachycardia, ECG changes,* ***MI, arrhythmias, heart block,*** hypertension, ***precipitation of heart failure.***
**EENT:** *blurred vision,* tinnitus, mydriasis.
**GI:** *dry mouth, constipation,* nausea, vomiting, anorexia, paralytic ileus, abdominal cramps.
**GU:** *urine retention.*
**Hematologic:** ***bone marrow depression.***
**Metabolic:** ***hypoglycemia,*** hyperglycemia.
**Skin:** rash, urticaria, photosensitivity reactions, pruritus, diaphoresis.
**Other:** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Barbiturates, CNS depressants:* May enhance CNS depression. Avoid using together.
*Cimetidine,* ***fluoxetine, fluvoxamine, paroxetine, sertraline:*** May increase imipramine level. Monitor drug levels and patient for signs of toxicity.
*Clonidine:* May cause life-threatening hypertension. Avoid using together.
*Epinephrine, norepinephrine:* May increase hypertensive effect. Use together cautiously.
*MAO inhibitors:* May cause hyperpyretic crisis, severe seizures, and death. Avoid using within 14 days of MAO inhibitor therapy.
***Quinolones:*** May increase the risk of life-threatening arrhythmias. Avoid using together.
**Drug-herb.** *Evening primrose oil:* May cause additive or synergistic effect, lowering the seizure threshold and increasing the risk of seizure. Discourage use together.
*St. John's wort, SAM-e, yohimbe:* May cause serotonin syndrome. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May enhance CNS depression. Discourage use together.
*Smoking:* May lower level of drug. Monitor patient for lack of effect.
*Sun exposure:* May increase risk of photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase or decrease glucose level.
- May increase liver function test values.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those receiving MAO inhibitors; also contraindicated during acute recovery phase of MI.
- Use with extreme caution in patients at risk for suicide; in patients with history of urine retention, angle-closure glaucoma, or seizure disorders; in patients with increased intraocular pressure, CV disease, impaired hepatic function, hyperthyroidism, or impaired renal function; and in patients receiving thyroid drugs. Injectable form contains sulfites, which may cause allergic reactions in hypersensitive patients.

**Black Box Warning** Imipramine isn't approved for use in children except for those with nocturnal enuresis.

***Overdose S&S:*** Cardiac arrhythmias, severe hypotension, seizures, CNS depression, coma, ECG changes, drowsiness, stupor, ataxia, restlessness, agitation, hyperactive reflexes, muscle rigidity, athetoid and choreiform movements, tachycardia, congestive heart failure, respiratory depression, cyanosis, shock, vomiting, hyperpyrexia, mydriasis, diaphoresis.

## NURSING CONSIDERATIONS

- Monitor WBCs during therapy and monitor patient for fever and sore throat. Discontinue drug if pathological neutrophil depression occurs.
- Monitor patient for nausea, headache, and malaise after abrupt withdrawal of long-term therapy; these symptoms don't indicate addiction.
- Don't withdraw drug abruptly.

• Because of hypertensive episodes during surgery in patients receiving TCAs, stop drug gradually several days before surgery.
• If signs or symptoms of psychosis occur or increase, expect prescriber to reduce dosage. Record mood changes. Monitor patient for suicidal tendencies, and allow only a minimum supply of drug.
**Black Box Warning** Drug may increase the risk of suicidal thinking and behavior in children, adolescents, and young adults with major depressive disorder or other psychiatric disorder. ■
• To prevent relapse in children receiving drug for enuresis, withdraw drug gradually.
• Recommend sugarless hard candy or gum to relieve dry mouth. Saliva substitutes may be useful.
***Alert:*** Tofranil and Tofranil-PM may contain tartrazine.
• ***Look alike–sound alike:*** Don't confuse imipramine with desipramine.

## PATIENT TEACHING

**Black Box Warning** Advise families and caregivers to closely observe patient for increased suicidal thinking and behavior. ■
• Tell patient to take full dose at bedtime whenever possible, but warn him of possible morning dizziness upon standing up quickly.
• If child is an early-night bed-wetter, tell parents it may be more effective to divide dose and give the first dose earlier in day.
• Tell patient to avoid alcohol while taking this drug.
• Advise patient to consult prescriber before taking other prescription or OTC drugs.
• Warn patient to avoid hazardous activities that require alertness and good coordination until effects of the drug are known. Drowsiness and dizziness usually subside after a few weeks.
• Warn patient not to stop drug suddenly.
• To prevent oversensitivity to the sun, advise patient to use sunblock, wear protective clothing, and avoid prolonged exposure to strong sunlight.

# imiquimod

ih-mih-KWI-mahd

Aldara, Zyclara

*Therapeutic class:* Immunosuppressant (topical)
*Pharmacologic class:* Immune response modifier
*Pregnancy risk category C*

## AVAILABLE FORMS

*Cream:* 3.75%, 5% in single-use packets containing 12.5 mg imiquimod

## INDICATIONS & DOSAGES

➤ **External genital and perianal warts**
*Adults and adolescents age 12 and older:* Apply thin layer of 5% cream to affected area three times weekly before normal sleeping hours and leave on skin for 6 to 10 hours. Continue treatment until genital or perianal warts clear completely or maximum of 16 weeks.
➤ **Typical, nonhyperkeratotic, nonhypertrophic actinic keratoses on the face or scalp in immunocompetent adults**
*Adults:* Wash area with mild soap and water and dry at least 10 minutes. Apply Aldara cream to face or scalp, but not both concurrently, twice weekly at bedtime, and wash off after about 8 hours. Treat for 16 weeks. Or, apply Zyclara 3.75% once daily at bedtime for two 2-week cycles. Separate cycles by 2-week no-treatment period.
➤ **Superficial basal cell carcinoma**
*Adults:* Wash area with mild soap and water and allow to dry thoroughly. Apply a thin layer of 5% cream to the biopsy-confirmed area, including 1 cm of skin surrounding tumor, five times a week at bedtime; wash off after about 8 hours. Treat for 6 weeks.

## ADMINISTRATION

**Topical**
• Wash area with mild soap and water and dry completely before applying cream.
• Discard unused portion of single-use packet.

## ACTION

Has no direct antiviral activity in cell culture. Drug induces mRNA-encoding cytokines including interferon alfa at the treatment site.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* About 20 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, headache.
**Musculoskeletal:** myalgia.
**Skin:** local itching, burning, pain, soreness, erythema, ulceration, edema, erosion, induration, flaking, excoriation.
**Other:** *fungal infection,* flulike symptoms.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Drug isn't recommended for treatment of urethral, intravaginal, cervical, rectal, or intra-anal human papillomavirus disease.
- Safety of drug in breast-feeding women is unknown.

***Overdose S&S:*** Severe local skin reactions.

## NURSING CONSIDERATIONS

- Don't use until genital or perianal tissue is healed from previous drug or surgical treatment.
- Patient usually experiences local skin reactions at site of application or surrounding areas. Use nonocclusive dressings, such as cotton gauze, or cotton undergarments in management of skin reactions. Patient's discomfort or severity of the local skin reaction may require a rest period of several days. Resume treatment once reaction subsides.

***Alert:*** Women with a local inflammatory reaction that causes severe vulvar swelling may be at risk for urinary retention. If symptoms of urinary retention occur, interrup or discontinue drug and monitor patient carefully.

- Drug isn't a cure; new warts may develop during therapy.
- Maximum tumor diameter of superficial basal cell carcinoma should be 2 cm or smaller. Cream may be applied to neck, trunk, or arms and legs (excluding hands and feet).
- Assess treatment site for clearance 12 weeks posttreatment.

## PATIENT TEACHING

- Advise patient that effect of cream on transmission of genital or perianal warts is unknown. New warts may develop during therapy; drug isn't a cure.
- Tell patient to use cream only as directed and to avoid contact with eyes, lips, or nostrils.
- Tell patient to wash hands before and after applying cream.
- Tell patient to wash the area with mild soap and water and dry completely before applying cream.
- Advise patient to apply cream in thin layer over affected area and rub in until cream isn't visible. Advise patient to avoid excessive use of cream. Tell him not to occlude area after applying cream and to wash with mild soap and water 6 to 10 hours after application of cream.
- Advise patient that mild local skin reactions, such as redness, erosion, excoriation, flaking, and swelling at site of application or surrounding areas, are common. Tell him that most skin reactions are mild to moderate. Advise him to report severe skin reactions promptly.
- Instruct uncircumcised man being treated for warts under the foreskin to retract foreskin and clean area daily.
- Advise patient that drug can weaken condoms and vaginal diaphragms and that use together isn't recommended.
- Advise patient to avoid sexual contact while cream is on the skin.
- Advise patient to minimize or avoid exposure to sunlight and other UV light; encourage sunscreen use.
- Tell patient to store drug at temperatures below 86° F (30° C) and to avoid freezing.
- Tell patient to discard partially used packets and not to reuse.

## immune globulin intramuscular (gamma globulin, IG, IGIM)

GamaSTAN S/D

## immune globulin intravenous (IGIV)

Carimune NF, Flebogamma, Gammagard Liquid, Gamunex, Octagam, Privigen

## immune globulin subcutaneous (IGSC, SCIG)

Hizentra, Vivaglobin

*Therapeutic class:* Antibody
*Pharmacologic class:* Immune serum
*Pregnancy risk category C*

### AVAILABLE FORMS

**immune globulin intramuscular**
*Injection:* 15% to 18% in vials and single-dose syringes
**immune globulin intravenous**
*Injection:* 5% in 10-ml, 50-ml, 100-ml, and 200-ml vials (Flebogamma); 5% in 1-g, 2.5-g, 5-g, 10-g single-use bottles (Octagam)
*Injection:* 5% single-use vials
*Injection (preservative-free):* 5%, 10% single use vials
*Powder for injection:* 0.5-g, 3-g, 6-g, 12-g vials (Carimune NF)
**immune globulin subcutaneous**
*Injection:* 16%, 20% single-use vials

### INDICATIONS & DOSAGES

➤ **Primary immunodeficiency (IGIV)**

***Carimune NF***
*Adults and children:* 200 mg/kg I.V. monthly. Start with 0.5 to 1 ml/minute of 3% solution; gradually increase to 2.5 ml/minute after 15 to 30 minutes.

***Flebogamma***
*Adults:* 300 to 600 mg/kg I.V. every 3 to 4 weeks. Infuse at 0.5 mg/kg/minute and increase after 30 minutes to 5 mg/kg/minute.

***Gammagard Liquid***
*Adults:* 300 to 600 mg/kg I.V. every 3 to 4 weeks. Infuse at 0.8 mg/kg/minute and increase every 30 minutes to 8.9 mg/kg/minute.

***GammaSTAN S/D***
*Adults and children:* Initially, 1.3 ml/kg I.M. Maintenance 0.66 ml/kg (at least 100 mg/kg) every 3 to 4 weeks. Maximum single dose of IGIM is 30 to 50 ml in adults and 20 to 30 ml in infants and small children.

***Gamunex***
*Adults:* 300 to 600 mg/kg I.V. every 3 to 4 weeks.

***Hizentra***
*Adults and children:* Initial dose is 1.53 times previous IGIV dose in grams divided by number of weeks between IGIV doses. Multiply dose in grams by 5 to obtain dose in milliliters. Adjust dose based on clinical response and IgG trough levels to goal of 1.3 times trough level before last IGIV treatment. Give by subcutaneous infusion weekly. See package insert for full dosage adjustment guidelines.

***Octagam***
*Adults and children:* 300 to 600 mg/kg I.V. every 3 to 4 weeks. Start infusion at 30 mg/kg/hour for 30 minutes. If no discomfort is experienced, increase rate to 60 mg/kg/hour for 30 minutes. Rate can then be increased to maximum of 200 mg/kg/hour.

***Privigen***
*Adults:* 200 to 800 mg/kg every 3 to 4 weeks. Start infusion at 0.5 mg/kg/minute and increase slowly to 8 mg/kg/minute.

***Vivaglobin***
*Adults and children:* Initial dose is 1.37 times previous IGIV dose divided by number of weeks between IGIV doses. Recommended weekly dose is 100 to 200 mg/kg by subcutaneous infusion. Adjust dosage based on clinical response and serum IgG trough levels. See package insert for full dosage adjustment guidelines.

➤ **Chronic inflammatory demyelinating polyneuropathy**
*Adults:* 2,000 mg/kg I.V. Gamunex in divided doses over 2 to 4 days every 3 weeks. Or, 1,000 mg/kg I.V. over 1 day every 3 weeks or 500 mg/kg I.V. on 2 consecutive days every 3 weeks.

➤ **Idiopathic thrombocytopenic purpura**
***Carimune NF***
*Adults and children:* 400 mg/kg I.V. for 2 to 5 consecutive days, depending on platelet count and immune response.

***Gamunex***
*Adults:* 2,000 mg/kg I.V. in divided doses over 2 days or 400 mg/kg I.V. in 5 doses over 5 days.
***Privigen***
*Adults:* 1,000 mg/kg I.V. for 2 days.
➤ **Pediatric HIV infection (IGIV)**
*Children:* 400 mg/kg I.V. once every 2 to 4 weeks.
➤ **Kawasaki syndrome**
*Children:* 400 mg/kg I.V. daily over 2 hours for 4 consecutive days, or a single dose of 1,000 mg/kg over 10 hours. Start within 10 days of disease onset. Give with aspirin (100 mg/kg P.O. daily through day 14; then 3 to 5 mg/kg P.O. daily for 5 weeks).
➤ **Hepatitis A exposure (IGIM)**
*Adults and children:* 0.02 ml/kg I.M. as soon as possible after exposure. Up to 0.06 ml/kg may be given for prolonged or intense exposure.
➤ **Measles exposure (IGIM)**
*Adults and children:* 0.25 ml/kg I.M. within 6 days after exposure.
➤ **Measles postexposure prophylaxis (IGIM)**
*Immunocompromised children:* 0.5 ml/kg I.M. (maximum 15 ml) immediately after exposure.
➤ **Chickenpox exposure (IGIM)**
*Adults and children:* 0.6 to 1.2 ml/kg I.M. as soon as possible after exposure.
➤ **Rubella exposure in first trimester of pregnancy (IGIM)**
*Women:* 0.55 ml/kg I.M. as soon as possible after exposure (within 72 hours).
➤ **Guillain-Barré syndrome (IGIV) ♦**
*Adults:* 2,000 mg/kg I.V. over 2 to 5 days within 2 to 4 weeks of onset.
*Children:* 2,000 mg/kg I.V. over 2 days within 2 to 4 weeks of onset.
➤ **Severe exacerbation of myasthenia gravis (IGIV) ♦**
*Adults:* 1,000 to 2,000 mg/kg I.V. over 2 to 5 days.

## ADMINISTRATION

**I.M.**
● Give in the anterolateral aspects of the upper thigh and the deltoid muscle of the upper arm. Divide doses larger than 10 ml and inject into several muscle sites to reduce pain and discomfort.
● Give drug soon after reconstitution.
● The gluteal region should not routinely be used. If necessary, only the upper outer quadrant should be used.

**I.V.**
▼ After reconstitution, Carimune NF contains at least 96% IgG; Octagam contains about 50 mg of protein/ml and at least 96% IgG.
▼ Most adverse reactions are related to a rapid infusion rate. If they occur, decrease infusion rate or stop infusion until reaction subsides. Resume infusion at a rate the patient can tolerate.
▼ Store Octagam at 36° to 46° F (2° to 8° C) for 24 months or at no higher than 77° F (25° C) for up to 18 months from the date of manufacture.
**Carimune NF**
▼ Use 15-micron in-line filter when giving. Reconstitute with normal saline solution, $D_5W$, or sterile water. Infusion rate is 0.5 to 1 ml/minute for 3% solution. After 15 to 30 minutes, increase rate to 1.5 to 2.5 ml/minute.
**Gammagard Liquid**
▼ Drug should be at room temperature during administration.
▼ Normal saline solution should not be used as a diluent. If dilution is preferred, $D_5W$ may be used.
▼ The use of an in-line filler is optional.
▼ Begin infusion at 0.5 ml/kg/hour. If tolerated, gradually increase every 30 minutes to 5 ml/kg/hour.
**Gamunex**
▼ Incompatible with saline solutions. Compatible with $D_5W$, if needed.
▼ Infuse I.V. at a rate of 0.01 ml/kg/minute for first 30 minutes. If no problems, rate can be slowly increased to maximum of 0.08 ml/kg/minute.
▼ Store vials at 36° to 46° F (2° to 8° C). During first 18 months from the date of manufacture, store vials for up to 5 months at room temperature not exceeding 77° F (25° C); then vials must be used immediately or discarded. Don't freeze vials.
**Octagam**
▼ Octagam should be at room temperature during infusion. If using an infusion set (not mandatory), the filter size must

be 0.2 to 200 microns. Initially, infuse at 30 mg/kg/hour for the first 30 minutes; if tolerated, infuse at 60 mg/kg/hour for the second 30 minutes; if further tolerated, infuse at 120 mg/kg/hour for the third 30 minutes. If tolerated, infusion can be maintained at less than 200 mg/kg/hour. Adverse reactions usually disappear with slowing or stopping the infusion. For patients at risk for renal dysfunction, reduce infusion time to less than 200 mg/kg/hour.

**Privigen**

▼ If necessary dilute with $D_5W$

▼ Begin infusion at 0.5 mg/kg/min. If well tolerated, may increase gradually to 8 mg/kg/min.

▼ For chronic ITP, maximum infusion rate is 4 mg/kg/min.

▼ Infusion line may be flushed with $D_5W$ or normal saline solution.

▼ **Incompatibilities:** Other I.V. drugs.

**Subcutaneous**

● IGSC is given by subcutaneous infusion.

● Infusion sites include abdomen, thighs, upper arms, and lateral hip.

● Up to four infusion sites may be used at the same time, with at least 2 inches between sites.

● Give up to 15 ml per site with initial infusion. May increase to 20 ml per site after fourth infusion and to maximum of 25 ml per site as tolerated.

● Initially infuse at 15 ml/hour. May increase to maximum of 25 ml/hour per site as tolerated. Total infusion rate for all sites combined must not exceed 50 ml/hour.

● Don't mix with other products.

## ACTION

Provides passive immunity by increasing antibody titer. The primary component is IgG. It's unknown how it works for idiopathic thrombocytopenic purpura.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |
| I.M. | Unknown | 2–5 hr | Unknown |
| Subcut. | Unknown | 2.9 days | Unknown |

*Half-life:* 21 to 24 days in immunocompromised patients.

## ADVERSE REACTIONS

**CNS:** severe headache requiring hospitalization, faintness, fever, *headache*, malaise.

**CV:** chest pain, chest tightness, ***heart failure, MI.***

**GI:** diarrhea, abdominal pain, nausea, vomiting.

**Musculoskeletal:** back pain, arthralgia, hip pain, muscle stiffness at injection site.

**Respiratory:** ***pulmonary embolism, transfusion related acute lung injury,*** dyspnea.

**Skin:** erythema, urticaria, pain, *local infusion-site reactions*, rash.

**Other:** ***anaphylaxis, angioedema,*** chills.

## INTERACTIONS

**Drug-drug.** *Live-virus vaccines:* Length of time to wait before giving live-virus vaccinations varies with dose of immune globulin given. Check the recommendations of the American Academy of Pediatrics.

## EFFECTS ON LAB TEST RESULTS

● May falsely elevate serum glucose level (for IGIV preparations containing maltose, such as Octagam).

● May cause positive Coombs' test.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or its components.

● Hizentra is contraindicated in patients hypersensitive to polysorbate 80, patients with hyperprolinemia, and IgA-deficient patients with antibodies against IgA and history of hypersensitivity.

● Use IGIV cautiously in patients with a history of CV disease or thrombotic episodes.

**Black Box Warning** Use IGIV cautiously in patients with renal dysfunction or a predisposition to renal failure, including patients with preexisting renal insufficiency, diabetes mellitus, volume depletion, sepsis, paraproteinemia, those older than age 65, and those receiving nephrotoxic drugs. Give at minimum concentration and infuse as slowly as practicable. ■

## NURSING CONSIDERATIONS

● Obtain history of allergies and reactions to immunizations. Keep epinephrine 1:1,000 available to treat anaphylaxis.

• IGIV administration may be linked to thrombotic events.
• If patient is at risk for a thrombotic event, make sure infusion concentration is no more than 5% and start infusion rate no faster than 0.5 ml/kg/hour. Advance rate slowly only if well tolerated, to a maximum rate of 4 ml/kg/hour.
• Don't give as prophylaxis against hepatitis A if 6 weeks or more since exposure or onset of symptoms.
• Products made from human plasma may contain infectious agents, such as viruses and, potentially, the Creutzfeldt-Jakob disease agent.

### PATIENT TEACHING

• Explain to patient and family how drug will be given.
• Tell patient that local reactions may occur at injection site. Instruct him to notify prescriber promptly if adverse reactions persist or become severe.
• Inform patient of possible need for therapy more than once monthly to maintain adequate immunoglobulin G levels.

## indapamide

in-DAP-a-mide

Lozide†

*Therapeutic class:* Diuretic
*Pharmacologic class:* Thiazide-like diuretic
*Pregnancy risk category B*

### AVAILABLE FORMS

*Tablets:* 1.25 mg, 2.5 mg

### INDICATIONS & DOSAGES

➤ **Edema of heart failure**

*Adults:* Initially, 2.5 mg P.O. daily in the morning. Increased to 5 mg daily after 1 week, if needed.

➤ **Hypertension**

*Adults:* Initially, 1.25 mg P.O. daily in the morning. Increased to 2.5 mg daily after 4 weeks, if needed. Increased to 5 mg daily after 4 more weeks, if needed. If response is inadequate, a second antihypertensive, given at 50% of the usual starting dose, may be needed.

### ADMINISTRATION

**P.O.**

• Give drug with food to minimize GI upset.
• To prevent nocturia, give drug in the morning.

### ACTION

Enhances excretion of sodium chloride and water by interfering with sodium transport in the distal tubule.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1–2 hr | Within 2 hr | Up to 36 hr |

*Half-life:* About 14 hours.

### ADVERSE REACTIONS

**CNS:** headache, nervousness, dizziness, light-headedness, weakness, vertigo, restlessness, drowsiness, fatigue, anxiety, depression, numbness of limbs, irritability, agitation, lethargy.
**CV:** orthostatic hypotension, palpitations, PVCs, irregular heartbeat, vasculitis, flushing, chest pain, edema.
**EENT:** rhinorrhea, blurred vision, pharyngitis, sinusitis, conjunctivitis.
**GI:** anorexia, nausea, epigastric distress, vomiting, abdominal pain or cramps, diarrhea, constipation.
**GU:** nocturia, polyuria, frequent urination, erectile dysfunction.
**Metabolic:** asymptomatic hyperuricemia, fluid and electrolyte imbalances, including dilutional hyponatremia, hypochloremia, metabolic alkalosis and hypokalemia, weight loss, volume depletion and dehydration, hyperglycemia.
**Musculoskeletal:** muscle cramps and spasms.
**Respiratory:** cough.
**Skin:** rash, pruritus, urticaria.
**Other:** gout, infection.

### INTERACTIONS

**Drug-drug.** *Amphotericin B, corticosteroids:* May increase risk of hypokalemia. Monitor potassium level closely.
*Antidiabetics:* May decrease hypoglycemic effect of sulfonylureas, causing elevated

glucose levels. Adjust dosage, if needed. Monitor glucose level.
*Barbiturates, opioids:* May increase orthostasis. Monitor patient closely.
*Bumetanide, ethacrynic acid, furosemide, torsemide:* May cause excessive diuretic response, causing serious electrolyte abnormalities or dehydration. Adjust doses carefully, and monitor patient closely for signs and symptoms of excessive diuretic response.
*Cardiac glycosides:* May increase risk of digoxin toxicity from indapamide-induced hypokalemia. Monitor potassium and digoxin levels.
*Cholestyramine, colestipol:* May decrease absorption of thiazides. Separate doses by 2 hours.
*Diazoxide:* May increase antihypertensive, hyperglycemic, and hyperuricemic effects. Use together cautiously.
*Lithium:* May decrease lithium clearance that may increase lithium toxicity. Avoid using together.
*NSAIDs:* May increase risk of NSAID-induced renal failure. Monitor patient for signs and symptoms of renal failure.
**Drug-herb.** *Dandelion:* May interfere with drug activity. Discourage use together.
*Licorice:* May cause unexpected rapid potassium loss. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May increase orthostatic hypotensive effect. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN, creatinine, glucose, cholesterol, triglyceride, calcium, and uric acid levels. May decrease potassium, sodium, phosphate, and chloride levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to other sulfonamide-derived drugs and in those with anuria.
- Use cautiously in patients with severe renal disease, impaired hepatic function, or progressive hepatic disease.

***Overdose S&S:*** Nausea, vomiting, GI disorders, weakness, electrolyte imbalance, hypotension, depressed respirations.

## NURSING CONSIDERATIONS

- Monitor fluid intake and output, weight, blood pressure, and electrolyte levels.
- Watch for signs of hypokalemia, such as muscle weakness and cramps. Drug may be used with potassium-sparing diuretic to prevent potassium loss.
- Consult prescriber and dietitian about a high-potassium diet or potassium supplement. Foods rich in potassium include citrus fruits, tomatoes, bananas, dates, and apricots.
- Monitor creatinine and BUN levels regularly. Cumulative effects of drug may occur in patients with impaired renal function.
- Monitor uric acid level, especially in patients with history of gout.
- Monitor glucose level, especially in diabetic patients.
- Monitor elderly patients, who are especially susceptible to excessive diuresis.
- Stop thiazides and thiazide-like diuretics before parathyroid function tests.
- Therapeutic response may be delayed several weeks in hypertensive patients.

## PATIENT TEACHING

- Instruct patient to take drug in morning to prevent need to urinate at night.
- Tell patient to take drug with food to minimize GI upset.
- Advise patient to avoid sudden posture changes and to rise slowly to avoid dizziness upon standing quickly.

# indinavir sulfate

in-DIN-ah-ver

Crixivan

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Protease inhibitor
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 100 mg, 200 mg, 400 mg

## INDICATIONS & DOSAGES

**➤ HIV infection, with other antiretrovirals, when antiretrovirals are warranted**

*Adults:* 800 mg P.O. every 8 hours. Consider reducing indinavir to 600 mg every 8 hours when patient is taking delaviridine 400 mg t.i.d. Reduce indinavir to 600 mg every 8 hours when patient is taking itraconazole 200 mg b.i.d. or ketaconazole. When patient is taking indinavir and rifabutin, decrease rifabutin to one-half the standard dosage and increase indinavir to 1,000 mg every 8 hours.

***Adjust-a-dose:*** For patients with mild to moderate hepatic insufficiency from cirrhosis, reduce dosage to 600 mg P.O. every 8 hours.

## ADMINISTRATION

**P.O.**

- Give drug on an empty stomach with water 1 hour before or 2 hours after a meal. Or, give it with other liquids (such as skim milk, juice, coffee, or tea) or a light meal. A meal high in fat, calories, and protein reduces drug absorption.
- Store capsules in the original container and keep desiccant in the bottle; capsules are sensitive to moisture.

## ACTION

Inhibits HIV protease by binding to the protease-active site and inhibiting activity of the enzyme, preventing cleavage of the viral polyproteins and forming immature noninfectious viral particles.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | <1 hr | Unknown |

*Half-life:* 2 hours.

## ADVERSE REACTIONS

**CNS:** asthenia, dizziness, fatigue, headache, insomnia, malaise, somnolence.
**GI:** *nausea, abdominal pain,* acid regurgitation, anorexia, diarrhea, dry mouth, taste perversion, vomiting.
**GU:** hematuria, nephrolithiasis, dysuria.
**Hematologic:** ***neutropenia, thrombocytopenia,*** anemia.
**Metabolic:** *hyperbilirubinemia,* hyperglycemia.
**Musculoskeletal:** back pain.
**Skin:** pruritus, rash.
**Other:** flank pain.

## INTERACTIONS

**Drug-drug.** *Amprenavir, saquinavir:* May increase levels of these drugs. Dosage adjustments not needed.
*Carbamazepine:* May decrease indinavir exposure to the body. Consider an alternative drug.
*Clarithromycin:* May alter clarithromycin level. Dosage adjustments not needed.
*Delavirdine, itraconazole, ketoconazole:* May increase indinavir level. Consider reducing indinavir to 600 mg every 8 hours.
*Didanosine:* May alter absorption of indinavir. Separate doses by 1 hour and give on an empty stomach.
*Efavirenz, nevirapine:* May decrease indinavir level. Increase indinavir to 1,000 mg every 8 hours.
*HMG-CoA reductase inhibitors:* May increase levels of these drugs and increase risk of myopathy and rhabdomyolysis. Avoid using together.
*Lopinavir and ritonavir combination:* May increase indinavir level. Adjust indinavir dosage to 600 mg b.i.d.
*Nelfinavir:* May increase indinavir level by 50% and nelfinavir by 80%. May need to adjust dosage to indinavir 1,200 mg b.i.d. and nelfinavir 1,250 mg b.i.d. Monitor patient closely.
***Proton-pump inhibitors (lansoprazole, omeprazole, pantoprazole, rabeprazole):*** May reduce the antiviral activity of indinavir. Avoid using together.
***Rifabutin:*** May increase rifabutin level and decrease indinavir level. Give indinavir 1,000 mg every 8 hours and decrease the rifabutin dose to either 150 mg daily or 300 mg two to three times a week.
***Rifampin:*** May decrease indinavir level. Avoid using together.
***Rifapentine:*** May decrease indinavir level. Use with extreme caution, if at all.
*Ritonavir:* May increase indinavir level twofold to fivefold. Adjust dosage to indinavir 400 mg b.i.d. and ritonavir 400 mg b.i.d., or indinavir 800 mg b.i.d. and ritonavir 100 to 200 mg b.i.d.
*Sildenafil, tadalafil, vardenafil:* May increase levels of these drugs and increase

adverse effects (hypotension, visual changes, and priapism). Tell patient not to exceed prescribed dosage. Sildenafil dosage shouldn't exceed 25 mg in a 48-hour period. Tadalafil dosage shouldn't exceed 10 mg in a 72-hour period. Vardenafil dosage shouldn't exceed 2.5 mg in a 24-hour period.

**Drug-herb.** ***St. John's wort:*** May reduce drug level by more than half. Discourage use together.

**Drug-food.** *Grapefruit and grapefruit juice:* May decrease drug level and therapeutic effect. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, bilirubin, amylase, hemoglobin, and glucose levels.
- May decrease neutrophil and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Contraindicated with alfuzosin, alprazolam, amiodarone, dihydroergotamine, ergonovine, ergotamine, methylergonovine, midazolam, sildenafil (when used to treat pulmonary hypertension), triazolam, and pimozide.
- Use cautiously in patients with hepatic insufficiency from cirrhosis.
- Safety and effectiveness in children haven't been established.

***Overdose S&S:*** Nephrolithiasis/urolithiasis, flank pain, hematuria, nausea, vomiting, diarrhea.

## NURSING CONSIDERATIONS

- Drug must be taken at 8-hour intervals.
- Drug may cause nephrolithiasis. If signs and symptoms of nephrolithiasis occur, prescriber may stop drug for 1 to 3 days during acute phases.
- To prevent nephrolithiasis, patient should maintain adequate hydration (at least 48 ounces or 1.5 L of fluids every 24 hours while taking indinavir).

## PATIENT TEACHING

- Tell patient that drug doesn't cure HIV infection and that he may continue to develop opportunistic infections and other complications of HIV infection. Drug hasn't been shown to reduce the risk of HIV transmission.
- Advise patient to use barrier protection during sexual intercourse.
- Caution patient not to adjust dosage or stop therapy without first consulting prescriber.
- Advise patient that if a dose is missed, he should take the next dose at the regularly scheduled time and shouldn't double the dose.
- Instruct patient to take drug on an empty stomach with water 1 hour before or 2 hours after a meal. Or, he may take it with other liquids (such as skim milk, juice, coffee, or tea) or a light meal.
- Instruct patient to store capsules in the original container and to keep desiccant in the bottle; capsules are sensitive to moisture.
- Tell patient to drink at least 48 ounces (1.5 L) of fluid daily.
- Advise women to avoid breast-feeding because drug may appear in breast milk. Also, to prevent transmitting virus to infant, advise HIV-positive women not to breast-feed.

# indomethacin

in-doe-METH-a-sin

Indocin, Indocin SR, Novo-Methacin†, Nu-Indo†, Pro-Indo†

# indomethacin sodium trihydrate

Indocid P.D.A.†, Indocin I.V.

*Therapeutic class:* NSAID
*Pharmacologic class:* NSAID
*Pregnancy risk category B; D in 3rd trimester*

## AVAILABLE FORMS

**indomethacin**
*Capsules:* 25 mg, 50 mg
*Capsules (sustained-release):* 75 mg
*Oral suspension:* 25 mg/5 ml *
*Suppositories:* 50 mg
**indomethacin sodium trihydrate**
*Injection:* 1-mg vials

## INDICATIONS & DOSAGES

➤ **Moderate to severe rheumatoid arthritis or osteoarthritis, ankylosing spondylitis**

*Adults:* 25 mg P.O. b.i.d. or t.i.d. with food or antacids or 25 mg P.R. b.i.d. or t.i.d.; increase daily dose by 25 or 50 mg every 7 days, up to 200 mg daily. Or, 75 mg sustained-release capsules P.O. to start, in morning or at bedtime, followed by 75 mg sustained-release capsules b.i.d. if needed.

➤ **Acute gouty arthritis**

*Adults:* 50 mg P.O. or P.R. t.i.d. Reduce dose as soon as possible; then stop therapy. Don't use sustained-release form.

➤ **Acute painful shoulders (bursitis or tendinitis)**

*Adults:* 75 to 150 mg P.O. or P.R. daily in divided doses t.i.d. or q.i.d. for 7 to 14 days.

➤ **To close a hemodynamically significant patent ductus arteriosus in premature neonates**

*Neonates older than age 7 days:* 0.2 mg/kg I.V.; then two doses of 0.25 mg/kg at 12- to 24-hour intervals.

*Neonates ages 2 to 7 days:* 0.2 mg/kg I.V.; then two doses of 0.2 mg/kg at 12- to 24-hour intervals.

*Neonates younger than 48 hours:* 0.2 mg/kg I.V.; then two doses of 0.1 mg/kg I.V. at 12- to 24-hour intervals.

## ADMINISTRATION

**P.O.**

● Give drug with food, milk, or antacid.

**I.V.**

▼ Reconstitute powder for injection with sterile water or normal saline solution. For each 1-mg vial, add 1 or 2 ml of diluent for a solution containing 1 mg/ml or 0.5 mg/ml, respectively. Give over 20 to 30 minutes.

▼ Use only preservative-free sterile saline solution or sterile water to prepare. Never use diluents containing benzyl alcohol because it has been linked to toxicity in newborns.

▼ Because injection contains no preservatives, reconstitute drug immediately before use and discard unused solution.

▼ If anuria or marked oliguria is evident, withhold administration of second or third scheduled I.V. dose and notify prescriber.

▼ Watch carefully for bleeding and for reduced urine output.

▼ **Incompatibilities:** Amino acid injection, calcium gluconate, cimetidine, dextrose injection, dobutamine, dopamine, gentamicin, levofloxacin, solutions with pH less than 6, tobramycin sulfate, tolazoline.

**Rectal**

● If suppository is too soft, place in refrigerator for 15 minutes or run under cold water in wrapper.

## ACTION

May inhibit prostaglandin synthesis, to produce anti-inflammatory, analgesic, and antipyretic effects.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30 min | 1–4 hr | 4–6 hr |
| I.V. | Immediate | Immediate | 4–6 hr |
| P.R. | Unknown | Unknown | 4–6 hr |

*Half-life:* 4¼ hours.

## ADVERSE REACTIONS

***P.O. and rectal***

**CNS:** *headache*, dizziness, depression, fatigue, somnolence, syncope, vertigo.

**CV:** edema, hypertension.

**EENT:** hearing loss, tinnitus.

**GI:** ***pancreatitis,*** abdominal pain, anorexia, constipation, diarrhea, dyspepsia, ***GI bleeding,*** nausea, peptic ulceration.

**Other:** hypersensitivity reactions.

***I.V.***

**GU:** hematuria, interstitial nephritis, proteinuria.

## INTERACTIONS

**Drug-drug.** *Aminoglycosides, cyclosporine, methotrexate:* May enhance toxicity of these drugs. Avoid using together.

*Anticoagulants:* May cause bleeding. Monitor patient closely.

*Antihypertensives:* May decrease antihypertensive effect. Monitor patient closely.

*Antihypertensives, furosemide, thiazide diuretics:* May impair response to both drugs. Avoid using together, if possible.

*Aspirin:* May decrease level of indomethacin. Avoid using together.

*Aspirin, corticosteroids:* May increase risk of GI toxicity. Avoid using together.

*Bisphosphonates:* May increase risk of gastric ulceration. Monitor patient for symptoms of gastric irritation or GI bleeding.
*Diflunisal, probenecid:* May decrease indomethacin excretion. Watch for increased indomethacin adverse reactions.
*Digoxin:* May prolong half-life of digoxin. Use together cautiously.
*Dipyridamole:* May enhance fluid retention. Avoid using together.
*Lithium:* May increase lithium level. Monitor patient for toxicity.
*Penicillamine:* May increase bioavailability of penicillamine. Monitor patient closely.
*Phenytoin:* May increase phenytoin level. Monitor patient closely.
*Triamterene:* May cause nephrotoxicity. Avoid using together.
**Drug-herb.** *Dong quai, feverfew, garlic, ginger, horse chestnut, red clover:* May cause bleeding. Discourage use together.
*Senna:* May inhibit diarrheal effects. Discourage use together.
*White willow:* Herb and drug contain similar components. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May cause GI toxicity. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase potassium level.
- May decrease hemoglobin level and hematocrit.
- May increase liver function test values.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with a history of aspirin- or NSAID-induced asthma, rhinitis, or urticaria.
- Contraindicated in pregnant or breast-feeding women and in neonates with untreated infection, active bleeding, coagulation defects or thrombocytopenia, congenital heart disease needing patency of the ductus arteriosus, necrotizing enterocolitis, or significant renal impairment.
- Suppositories are contraindicated in patients with history of proctitis or recent rectal bleeding.

**Black Box Warning** Contraindicated for the treatment of perioperative pain after CABG surgery.

- Use cautiously in elderly patients, those with history of GI disease, and those with epilepsy, parkinsonism, hepatic or renal disease, CV disease, infection, and mental illness or depression.

***Overdose S&S:*** Drowsiness, lethargy, confusion, nausea, vomiting, paresthesia, numbness, aggressive behavior, disorientation, seizures, headache, dizziness, GI bleeding.

## NURSING CONSIDERATIONS

- Because of the high risk of adverse effects from long-term use, drug shouldn't be used routinely as an analgesic or antipyretic.
- Sustained-release capsules shouldn't be used for acute gouty arthritis.
- If ductus arteriosus reopens, a second course of one to three doses may be given. If ineffective, surgery may be needed.
- Watch for bleeding in patients receiving anticoagulants, patients with coagulation defects, and neonates.
- Because NSAIDs impair synthesis of renal prostaglandins, they can decrease renal blood flow and lead to reversible renal impairment, especially in patients with renal failure, heart failure, or liver dysfunction; in elderly patients; and in those taking diuretics. Monitor these patients closely.
- Drug causes sodium retention; watch for weight gain (especially in elderly patients) and increased blood pressure in patients with hypertension.
- Monitor patient for rash and respiratory distress, which may indicate a hypersensitivity reaction.
- Because of their antipyretic and anti-inflammatory actions, NSAIDs may mask signs and symptoms of infection.

**Black Box Warning** NSAIDs cause an increased risk of serious GI adverse events including bleeding, ulceration, and perforation of the stomach or intestines, which can be fatal. Elderly patients are at greater risk.

**Black Box Warning** NSAIDs may increase the risk of serious thrombotic events, MI, or stroke, which can be fatal. The risk may be greater with longer use or in patients with CV disease or risk factors for CV disease.

- Monitor patient on long-term oral therapy for toxicity by conducting regular eye

examinations, hearing tests, CBCs, and kidney function tests.

### PATIENT TEACHING

- Tell patient to take oral dose with food, milk, or antacid to prevent GI upset.
- Alert patient that using oral form with aspirin, alcohol, other NSAIDs, or corticosteroids may increase risk of adverse GI reactions.
- Teach patient signs and symptoms of GI bleeding, including blood in vomit, urine, or stool; coffee-ground vomit; and black, tarry stool. Tell him to notify prescriber immediately if any of these occurs.
- Tell patient to immediately report signs or symptoms of cardiac events, such as chest pain, shortness of breath, weakness, and slurred speech.
- Warn patient to avoid hazardous activities that require mental alertness until CNS effects are known.
- Tell patient to notify prescriber immediately if visual or hearing changes occur.

## infliximab

in-FLICKS-ih-mab

Remicade

*Therapeutic class:* Anti-inflammatory
*Pharmacologic class:* Tumor necrosis factor (TNF) blocker
*Pregnancy risk category B*

### AVAILABLE FORMS

*Lyophilized powder for injection:* 100-mg vial

### INDICATIONS & DOSAGES

➤ **Moderately to severely active Crohn's disease; reduction in the number of draining enterocutaneous and rectovaginal fistulas and maintenance of fistula closure in patients with fistulizing Crohn's disease**

*Adults:* 5 mg/kg I.V. infusion over at least 2 hours. Repeat at 2 and 6 weeks, then every 8 weeks thereafter. For patients who respond and then lose their response, consider 10 mg/kg. Patients who don't respond by week 14 are unlikely to respond with continued therapy. In those patients, consider stopping drug.

*Children age 6 to 17:* For Crohn's disease, 5 mg/kg I.V. infusion over at least 2 hours. Repeat at 2 and 6 weeks, then every 8 weeks thereafter.

➤ **Moderately to severely active rheumatoid arthritis**

*Adults:* 3 mg/kg I.V. infusion over at least 2 hours. Repeat at 2 and 6 weeks after first infusion and every 8 weeks thereafter. Dose may be increased up to 10 mg/kg, or doses may be given every 4 weeks if response is inadequate. Use with methotrexate.

➤ **Moderate to severe ulcerative colitis**

*Adults:* Induction dose, 5 mg/kg I.V. over at least 2 hours. Repeat at 2 and 6 weeks, then every 8 weeks thereafter.

➤ **Ankylosing spondylitis**

*Adults:* 5 mg/kg I.V. infusion over at least 2 hours. Repeat at 2 and 6 weeks, then every 6 weeks thereafter.

➤ **Psoriatic arthritis, with or without methotrexate**

*Adults:* 5 mg/kg I.V. infusion over at least 2 hours. Repeat at 2 and 6 weeks after first infusion, then every 8 weeks thereafter.

➤ **Chronic severe plaque psoriasis**

*Adults:* 5 mg/kg I.V. infusion over at least 2 hours. Repeat dose in 2 and 6 weeks, then give 5 mg/kg every 8 weeks thereafter.

### ADMINISTRATION

**I.V.**

▼ Reconstitute with 10 ml sterile water for injection, using syringe with 21G or smaller needle. Don't shake; gently swirl to dissolve powder. Solution should be colorless to light yellow and opalescent. It may also develop a few translucent particles; don't use if other types of particles develop or discoloration occurs.

▼ Dilute total volume of reconstituted drug to 250 ml with normal saline solution for injection. Infusion concentration range is 0.4 to 4 mg/ml.

▼ Use an in-line, sterile, nonpyrogenic, low–protein-binding filter with a pore size less than 1.2 micrometer.

▼ Begin infusion within 3 hours of preparation and give over at least 2 hours.

▼ **Incompatibilities:** Other I.V. drugs.

## ACTION

Binds to human tumor necrosis factor (TNF)-alpha to neutralize its activity and inhibit its binding with receptors, thereby reducing the infiltration of inflammatory cells and TNF-alpha production in inflamed areas of the intestine.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 9½ days.

## ADVERSE REACTIONS

**CNS:** *fatigue, fever, headache,* dizziness, depression, insomnia, malaise, pain, systemic and cutaneous vasculitis.
**CV:** *hypertension,* chest pain, flushing, hypotension, pericardial effusion, tachycardia.
**EENT:** *pharyngitis, rhinitis, sinusitis,* conjunctivitis.
**GI:** *abdominal pain, diarrhea, dyspepsia, nausea,* ***intestinal obstruction,*** constipation, flatulence, oral pain, ulcerative stomatitis, vomiting.
**GU:** *UTI,* dysuria, increased urinary frequency.
**Hematologic:** ***leukopenia, neutropenia, pancytopenia, thrombocytopenia,*** anemia, hematoma.
**Musculoskeletal:** *arthralgia, back pain,* arthritis, myalgia.
**Respiratory:** *coughing, upper respiratory tract infections,* bronchitis, dyspnea, respiratory tract allergic reaction.
**Skin:** *rash,* acne, alopecia, candidiasis, dry skin, eczema, erythema, erythematous rash, increased sweating, maculopapular rash, papular rash, urticaria.
**Other:** abscess, chills, ecchymosis, flulike syndrome, hot flashes, peripheral edema, toothache.

## INTERACTIONS

**Drug-drug.** *TNF blockers (abatacept, anakinra, golimumab, rilonacept):* May increase the risk of serious infections and neutropenia. Avoid using together.
*Vaccines:* May affect normal immune response. Postpone live-virus vaccine until therapy stops.

## EFFECTS ON LAB TEST RESULTS

- May increase liver enzyme level. May decrease hemoglobin level and hematocrit.
- May decrease WBC and platelet counts.
- May cause false-positive antinuclear antibody test result.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to murine proteins or other components of drug. Doses greater than 5 mg/kg are contraindicated in patients with moderate to severe heart failure.
- Use cautiously in elderly patients and in patients with active infection, history of chronic or recurrent infections, a history of hematologic abnormalities, or preexisting or recent onset of CNS demyelinating or seizure disorders; or in those who have lived in regions where histoplasmosis is endemic.

## NURSING CONSIDERATIONS

***Alert:*** Watch for infusion-related reactions, including fever, chills, pruritus, urticaria, dyspnea, hypotension, hypertension, and chest pain during administration and for 2 hours afterward. If an infusion-related reaction occurs, stop drug, notify prescriber, and give acetaminophen, antihistamines, corticosteroids, and epinephrine.
- Give for Crohn's disease and ulcerative colitis only after patient has an inadequate response to conventional therapy.
- Consider stopping treatment in patient who develops significant hematologic abnormalities or CNS adverse reactions.
- Notify prescriber for symptoms of new or worsening heart failure.

***Alert:*** Histoplasmosis, coccidioidomycosis, blastomycosis, and other opportunistic infections may develop with use of this drug.

**Black Box Warning** Watch for development of lymphoma and infection. A patient with chronic Crohn's disease and long-term exposure to immunosuppressants is more likely to develop lymphoma and infection.

- Drug may affect normal immune responses. Patient may develop autoimmune antibodies and lupus-like syndrome; stop drug if this happens. Symptoms should resolve.

**Black Box Warning** Drug may cause disseminated or extrapulmonary tuberculosis and fatal opportunistic infections. ■
**Black Box Warning** Evaluate patient for latent tuberculosis infection with a tuberculin skin test. Treat latent tuberculosis infection before therapy. ■
● ***Look alike–sound alike:*** Don't confuse Remicade with Renacidin.

### PATIENT TEACHING

● Tell patient about infusion-reaction symptoms and adverse effects and the need to report them promptly.
● Advise patient to seek immediate medical attention for signs and symptoms of infection, including persistent fever, cough, shortness of breath, or fatigue; or unusual bleeding or bruising.
● Tell women to stop breast-feeding during therapy.
● Tell patient that before he receives vaccines, he should alert prescriber to therapy.
● Advise parent to get child up-to-date for all vaccines before therapy.

**SAFETY ALERT!**

## insulin (regular)

IN-su-lin

Humulin R ◇, Humulin R Regular U-500 (concentrated), Novolin R ◇, Novolin R PenFill ◇, Novolin R Prefilled ◇

## insulin (lispro)

Humalog

## insulin lispro protamine and insulin lispro

Humalog Mix 75/25, Humalog Mix 50/50

## isophane insulin suspension (NPH)

Humulin N ◇, Novolin N ◇, Novolin N PenFill ◇, Novolin N Prefilled ◇

## isophane insulin suspension and insulin injection combinations

Humulin 70/30 ◇, Novolin 70/30 ◇, Novolin 70/30 PenFill ◇, Novolin 70/30 Prefilled ◇

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Pancreatic hormone
*Pregnancy risk category B*

### AVAILABLE FORMS

*Available without a prescription*
**insulin (regular)**
*Injection (human):* 100 units/ml (Humulin R, Novolin R, Novolin R PenFill, Novolin R Prefilled)
**isophane insulin suspension (NPH)**
*Injection (human):* 100 units/ml (Humulin N, Novolin N, Novolin N PenFill, Novolin N Prefilled)
**isophane insulin suspension and insulin injection combinations**
*Injection (human):* 100 units/ml (Humulin 70/30, Novolin 70/30, Novolin 70/30 PenFill, Novolin 70/30 Prefilled)
*Available by prescription only*
**insulin (regular)**
*Injection (human):* 500 units/ml (Humulin R Regular U-500 [concentrated])
**insulin (lispro)**
*Injection (human):* 100 units/ml (Humalog)
**insulin lispro protamine and insulin lispro**
*Injection (human):* 100 units/ml (Humalog Mix 75/25, Humalog Mix 50/50)

### INDICATIONS & DOSAGES

➤ **Moderate to severe diabetic ketoacidosis or hyperosmolar hyperglycemia**
***regular insulin***
*Adults older than age 20:* Loading dose of 0.15 units/kg I.V. by direct injection, followed by 0.1 unit/kg/hour as a continuous infusion. If glucose level doesn't fall by 50 mg/dl in the first hour, double the insulin infusion rate every hour until glucose level decreases steadily by 50 to 75 mg/dl/hour. Decrease rate of insulin infusion to 0.05 to 0.1 unit/kg/hour when glucose level reaches 250 to 300 mg/dl. Start infusion of $D_5W$ in half-normal saline solution separately

from the insulin infusion when glucose level is 150 to 200 mg/dl in patients with diabetic ketoacidosis or 250 to 300 mg/dl in those with hyperosmolar hyperglycemia. Give dose of insulin subcutaneously 1 to 2 hours before stopping insulin infusion (intermediate-acting insulin is recommended).

*Adults and children age 20 and younger:* Loading dose isn't recommended. Begin therapy at 0.1 unit/kg/hour I.V. infusion. After condition improves, decrease rate of insulin infusion to 0.05 unit/kg/hour. Start infusion of $D_5W$ in half-normal saline solution separately from the insulin infusion when glucose level is 250 mg/dl.

➤ **Mild diabetic ketoacidosis**
***regular insulin***

*Adults older than age 20:* Loading dose of 0.4 to 0.6 unit/kg divided in two equal parts, with half the dose given by direct I.V. injection and half given I.M. or subcutaneously. Subsequent doses can be based on 0.1 unit/kg/hour I.M. or subcutaneously.

➤ **Newly diagnosed diabetes, type 1**
***regular insulin***

*Adults older than age 20:* Individualize therapy. Initially, 0.5 to 1 unit/kg/day subcutaneously as part of a regimen with short-acting and long-acting insulin therapy.

*Adults and children age 20 and younger:* Individualize therapy. Initially, 0.1 to 0.25 unit/kg subcutaneously every 6 to 8 hours for the first 24 hours to determine insulin requirements; then adjust accordingly.

➤ **Control of hyperglycemia with Humalog and longer-acting insulin in patients with type 1 diabetes**

*Adults:* Dosage varies among patients and must be determined by prescriber familiar with patient's metabolic needs, eating habits, and other lifestyle variables. Inject subcutaneously within 15 minutes before or after a meal.

➤ **Control of hyperglycemia with Humalog and sulfonylureas in patients with type 2 diabetes**

*Adults and children older than age 3:* Dosage varies among patients and must be determined by prescriber familiar with patient's metabolic needs, eating habits, and other lifestyle variables. Inject subcutaneously within 15 minutes before or after a meal.

➤ **Hyperkalemia ♦**

*Adults:* 50 ml of dextrose 50% given over 5 minutes, followed by 5 to 10 units of regular insulin by I.V. push.

## ADMINISTRATION

**I.V.**

▼ Give only regular insulin I.V.

▼ Inject directly into vein or into a port close to I.V. access site. Intermittent infusion isn't recommended.

▼ For continuous infusion, dilute drug in normal saline solution and give at prescribed rate.

▼ **Incompatibilities:** Aminophylline, amobarbital, chlorothiazide, cytarabine, digoxin, diltiazem, dobutamine, dopamine, levofloxacin, methylprednisolone sodium succinate, nafcillin, norepinephrine, pentobarbital sodium, phenobarbital sodium, phenytoin sodium, ranitidine, sodium bicarbonate, thiopental.

**Subcutaneous**

- Injection dosage is expressed in USP units. Use only the syringes calibrated for that concentration of insulin.
- To mix insulin suspension, swirl vial gently or rotate between palms or between palm and thigh. Don't shake vigorously, to avoid bubbling and air in syringe.
- Regular insulin may be mixed with NPH insulin in any proportion. When mixing regular insulin with NPH, always draw up regular insulin into syringe first.
- Switching from separate injections to a prepared mixture may alter patient response. When NPH is mixed with regular insulin in the same syringe, give immediately to avoid loss of potency.
- Lispro insulin may be mixed with Humulin N; give within 15 minutes before a meal to prevent a hypoglycemic reaction.
- Don't use insulin that changes color or becomes clumped or granular in appearance.
- Check expiration date on vial before using contents.
- Drug is usually given subcutaneously. To give, pinch a fold of skin with fingers at least 3 inches (7.5 cm) apart and insert needle at a 45- to 90-degree angle.

• Press, don't rub, site after injection. Rotate injection sites to avoid overuse of one area. Diabetic patients may achieve better control if injection site is rotated within same anatomic region.
• Store injectable insulin in cool area. Refrigeration is desirable. Don't freeze.

## ACTION

Increases glucose transport across muscle and fat cell membranes to reduce glucose level. Helps convert glucose to glycogen; triggers amino acid uptake and conversion to protein in muscle cells; stimulates triglyceride formation and inhibits release of free fatty acids from adipose tissue; and stimulates lipoprotein lipase activity, which converts circulating lipoproteins to fatty acids.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. (regular) | Immediate | Unknown | Unknown |
| Subcut. (rapid) | ½–1½ hr | 2–3 hr | 5–7 hr |
| Subcut. (intermediate) | 1–2½ hr | 4–15 hr | 24 hr |
| Subcut. (long-acting) | 4–8 hr | 10–30 hr | 36 hr |

*Half-life:* About 9 minutes after I.V. use.

## ADVERSE REACTIONS

**EENT:** blurred vision.
**GI:** *dry mouth.*
**Metabolic:** ***hypoglycemia,*** hyperglycemia, ***hypomagnesemia,*** hypokalemia.
**Skin:** rash, urticaria, pruritus, swelling, redness, stinging, warmth at injection site.
**Respiratory:** *increased cough, respiratory tract infection,* dyspnea, reduced pulmonary function.
**Other:** *lipoatrophy, lipohypertrophy,* ***anaphylaxis,*** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *ACE inhibitors, anabolic steroids, antidiabetics, calcium, chloroquine, clonidine, disopyramide, fibrates, fluoxetine, guanethidine, lithium,* ***MAO inhibitors****, mebendazole, octreotide, pentamidine, propoxyphene, pyridoxine, salicylates, sulfinpyrazone, sulfonamides, tetracyclines:* May enhance hypoglycemic effects of insulin. Monitor glucose level.
*Acetazolamide, adrenocorticosteroids, albuterol, antiretrovirals, asparaginase, calcitonin, cyclophosphamide, danazol, diazoxide, diltiazem, diuretics, dobutamine, epinephrine, estrogens, ethacrynic acid, hormonal contraceptives containing estrogen, isoniazid, lithium, morphine, niacin, nicotine, phenothiazines, phenytoin, progestogens, somatropin, terbutaline, thyroid hormones:* May diminish insulin response. Monitor glucose level.
*Bronchodilators and other inhaled drugs:* May alter the absorption of inhaled insulin. Consistently time doses of other inhaled drugs with inhaled insulin, and monitor glucose level closely.
*Carteolol, nadolol, pindolol, propranolol, timolol:* May mask symptoms of hypoglycemia as a result of beta blockade (such as tachycardia). May delay recovery from hypoglycemic episodes. Use together cautiously in patients with diabetes.
*Rosiglitazone:* May cause fluid retention that may lead to or worsen heart failure. Monitor patient closely.
**Drug-herb.** *Basil, bay, bee pollen, burdock, ginseng, glucomannan, horehound, marshmallow, myrrh, sage:* May affect glycemic control. Discourage use together, and monitor glucose level carefully.
**Drug-food.** *Unregulated diet:* May cause hyperglycemia or hypoglycemia. Urge caution and monitor patient's diet.
**Drug-lifestyle.** *Alcohol use:* May cause hypoglycemic effect. Discourage use together.
*Marijuana use:* May increase glucose level. Inform patient of this interaction.
*Smoking:* May increase glucose level and decrease response to drug. Monitor glucose level.

## EFFECTS ON LAB TEST RESULTS

• May decrease glucose, magnesium, and potassium levels.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients with history of systemic allergic reaction to pork when porcine-derived products are used or hypersensitivity to any component of preparation.
• Contraindicated during episodes of hypoglycemia.
⚠ ***Overdose S&S:*** Hypoglycemia.

## NURSING CONSIDERATIONS

***Alert:*** Regular insulin is for patients with circulatory collapse, diabetic ketoacidosis, or hyperkalemia. Don't use Humulin R (concentrated) U-500 I.V. Don't use intermediate- or long-acting insulins for coma or other emergencies requiring rapid drug action. Also, ketosis-prone type 1, severely ill, and newly diagnosed diabetic patients with very high glucose levels may need hospitalization and I.V. treatment with regular fast-acting insulin.

***Alert:*** Some patients may develop insulin resistance and need large insulin doses to control symptoms of diabetes. U-500 insulin is available as Humulin R (concentrated) U-500 for such patients. Give pharmacy sufficient notice when requesting refill prescription. Never store U-500 insulin in same area with other insulin preparations because of the risk of severe overdose if accidentally given to the wrong patient.

- Monitor patient for hyperglycemia (rebound, or Somogyi, effect).

## PATIENT TEACHING

- Make sure patient knows that drug relieves symptoms but doesn't cure disease.
- Instruct patient about the disease and importance of following therapeutic regimen, adhering to specific diet, losing weight, getting exercise, following personal hygiene program, and avoiding infection. Emphasize importance of timing injections with eating and of not skipping meals.
- Stress that accuracy of measurement is important, especially with concentrated regular insulin. A magnifying sleeve or dose magnifier may improve accuracy. Show patient and caregivers how to measure and give insulin.
- Advise patient not to change order in which insulins are mixed or model or brand of insulin, syringe, or needle. Be sure patient knows when mixing two insulins to always draw the regular into the syringe first.
- Teach patient that glucose level and urine ketone tests provide essential guides to dosage and success of therapy. It's important for patient to recognize symptoms of high and low glucose levels. Insulin-induced low glucose level is hazardous and may cause brain damage if prolonged; most adverse effects are temporary. Instruct patient on insulin peak times and their importance.
- Instruct patient on proper use of equipment for monitoring glucose level.
- Advise patient not to smoke within 30 minutes after insulin injection because smoking decreases amount of insulin absorbed subcutaneously.
- Advise patient to avoid vigorous exercise immediately after insulin injection, especially of the area where injection was given, because it increases absorption and risk of low glucose episodes.
- Teach patient to avoid alcohol because it lowers glucose level.
- Advise patient to wear or carry medical identification at all times, to carry ample insulin and syringes on trips, to keep carbohydrates (lump of sugar or candy) on hand for emergencies, and to note time zone changes for dosage schedule when traveling.
- Advise woman planning pregnancy to first consult prescriber.
- Advise patient to store injectable insulin at 36° to 46° F (2° to 8° C). Tell him not to freeze or expose vials to excessive heat or sunlight.

**SAFETY ALERT!**

**insulin aspart (rDNA origin) injection**
IN-su-lin AS-part

NovoLog, NovoRapid†

**insulin aspart (rDNA origin) protamine suspension and insulin aspart (rDNA origin) injection**
NovoLog Mix 70/30

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Human insulin analogue
*Pregnancy risk category B*

## AVAILABLE FORMS

*PenFill cartridges:* 3 ml (100 units/ml)
*Prefilled syringes:* 3 ml (100 units/ml)
*Vial:* 10 ml, containing 100 units of insulin aspart per ml (U-100)

## INDICATIONS & DOSAGES

➤ **Control of hyperglycemia in patients with diabetes**

***NovoLog***

*Adults and children age 2 and older:* Dosage is highly individualized. Typical daily insulin requirement is 0.5 to 1 unit/kg/day, divided in a meal-related treatment regimen. About 50% to 70% of dose is provided with NovoLog and the remainder by an intermediate- or long-acting insulin. Give 5 to 10 minutes before start of meal by subcutaneous injection in the abdominal wall, thigh, or upper arm.

*External insulin infusion pumps (adults and children age 4 and older):* Initially, based on the total daily insulin dose of the previous regimen. Usually 50% of the total dose is given as meal-related boluses, and the remainder as basal infusion. Adjust dose if needed.

***NovoLog Mix 70/30***

*Adults:* Dosage is individualized based on the needs of the patient. Doses are usually given twice daily within 15 minutes of meals. Each dose is intended to cover two meals or a meal and a snack.

## ADMINISTRATION

**Subcutaneous**

- Inspect insulin vials before use. NovoLog is a clear, colorless solution. It should not contain particulate matter or be cloudy, viscous, or discolored. NovoLog Mix 70/30 should be uniformly white and cloudy and should not contain particulate matter or be discolored.
- Give NovoLog 5 to 10 minutes before start of meal. Give NovoLog Mix 70/30 up to 15 minutes before start of meal. Because of its rapid onset of action and short duration of action, patients also may need longer-acting insulins to prevent hyperglycemia.
- Let insulin warm to room temperature before giving to minimize discomfort. Give by subcutaneous injection into the abdominal wall, thigh, or upper arm. Rotate sites to minimize lipodystrophies.
- When giving and mixing NovoLog with NPH human insulin, draw up NovoLog into syringe first and give immediately after dose is drawn up.
- Store drug between 36° and 46° F (2° and 8° C). Don't freeze. Don't expose vials to excessive heat or sunlight. Opened vials of NovoLog Mix 70/30 and opened vials and cartridges of NovoLog are stable at room temperature for 28 days. Punctured cartridges of NovoLog Mix 70/30 may be stored at room temperature up to 14 days; don't refrigerate punctured cartridges.

**Subcutaneous**

**External insulin pump**

- Don't dilute or mix insulin aspart with any other insulin when using an external insulin pump.
- Insulin aspart is recommended for use with Disetronic H-TRON plus V100 with Disetronic 3.15 plastic cartridges and Classic or Tender infusion sets, Polyfin or Sof-set infusion sets, and MiniMed Models 505, 506, and 507 with MiniMed 3-ml syringes.
- Replace infusion sets, and choose a new infusion site every 48 hours or less. Insulin may be stored and used in the pump for up to 6 days.
- Discard insulin exposed to temperatures higher than 98.6° F (37° C). The temperature of the insulin may exceed ambient temperature when the pump housing, cover, tubing, or sport case is exposed to sunlight or radiant heat.

**I.V.**

▼ NovoLog may also be given as an I.V. infusion with close medical monitoring of glucose and potassium levels. Using a polypropylene bag, dilute insulin aspart to a concentration of 0.05 to 1 unit/ml in normal saline solution, $D_5W$, or 10% dextrose injection with 40 mEq/L of potassium chloride.

***Alert:*** Don't give 70/30 form I.V. and don't mix it with other insulin products.

## ACTION

Regulates glucose metabolism. It has the same glucose-lowering effect as regular human insulin, but its effect is more rapid and of shorter duration.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Unknown | 3–5 hr |
| Subcut. | 15 min | 1–3 hr | 3–5 hr |
| Subcut. (70/30) | Rapid | 1–4 hr | ≤24 hr |

*Half-life:* 81 minutes.

## ADVERSE REACTIONS

**Metabolic:** ***hypoglycemia,*** hypokalemia.
**Skin:** injection site reactions, lipodystrophy, pruritus, rash.
**Other:** ***allergic reactions.***

## INTERACTIONS

**Drug-drug.** *ACE inhibitors, disopyramide, fibrates, fluoxetine, oral antidiabetics, propoxyphene, salicylates, somatostatin analogue (octreotide), sulfonamide antibiotics:* May enhance the glucose-lowering effect of insulin and may potentiate hypoglycemia. Monitor glucose level, and watch for signs and symptoms of hypoglycemia. May need insulin dose adjustment.
*Beta blockers, clonidine:* May increase or decrease the glucose-lowering effect of insulin and cause hypoglycemia or hyperglycemia. May reduce or mask symptoms of hypoglycemia. Monitor glucose level.
*Corticosteroids, danazol, diuretics, estrogens, isoniazid, niacin, phenothiazine derivatives, progestins (as in hormonal contraceptives), somatropin, sympathomimetics (epinephrine, salbutamol, terbutaline), thyroid hormones:* May decrease the glucose-lowering effect of insulin and cause hyperglycemia. Monitor glucose level. May require insulin dose adjustment.
*Crystalline zinc preparations:* May be incompatible with NovoLog. Don't mix together.
*Guanethidine, reserpine:* May reduce or mask symptoms of hypoglycemia. Monitor glucose level.
*Lithium salts, pentamidine:* May increase or decrease glucose-lowering effect of insulin and may cause hypoglycemia or hyperglycemia. Pentamidine may cause hypoglycemia, sometimes followed by hyperglycemia. Monitor glucose level.
***MAO inhibitors:*** May increase insulin's effects. Monitor patient and glucose level closely.
**Drug-herb.** *Burdock, dandelion, eucalyptus, marshmallow:* May increase drug's effects. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May increase or decrease drug effect, causing hypoglycemia or hyperglycemia. Advise patient to monitor glucose level.
*Exercise:* May alter the need for drug, requiring dose adjustment. Advise patient to report changes in physical activity.
*Marijuana use:* May increase glucose level. Inform patient of this interaction.
*Smoking:* May increase glucose level and decrease response to insulin. Monitor glucose level.

## EFFECTS ON LAB TEST RESULTS

• May increase alkaline phosphatase level. May decrease glucose and potassium levels.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated during episodes of hypoglycemia and in patients hypersensitive to NovoLog or one of its components.
• Use cautiously in patients susceptible to hypoglycemia and hypokalemia, such as those who have autonomic neuropathy or are fasting, taking potassium-lowering drugs, or taking drugs sensitive to potassium level.
***Overdose S&S:*** Hypoglycemia, hypokalemia.

## NURSING CONSIDERATIONS

• The time course of NovoLog action may vary among people or at different times in the same person and depends on the site of injection, blood supply, temperature, and physical activity.
• Adjustments in the dose of NovoLog or of any insulin may be needed with changes in physical activity or meal routine. Insulin requirements also may be altered during emotional disturbances, illness, or other stresses.
• Adjust dose regularly, according to patient's glucose measurements. Monitor glucose level regularly.
• Periodically monitor glycosylated hemoglobin level.
• Assess patient for rash (including pruritus) over whole body, shortness of breath, wheezing, hypotension, rapid pulse,

or sweating, which may signify a generalized allergy to insulin. Severe cases, including anaphylactic reactions, may be life-threatening.
• Patients with renal dysfunction and hepatic impairment may need close glucose monitoring and dose adjustments of NovoLog.
• Observe injection sites for reactions, such as redness, swelling, itching, or burning. These reactions should resolve within a few days to a few weeks.
• Assess patient and notify prescriber for signs and symptoms of hypoglycemia (sweating, shaking, trembling, confusion, headache, irritability, hunger, rapid pulse, nausea) and hyperglycemia (drowsiness, fruity breath odor, frequent urination, thirst).
• Symptoms of hypoglycemia may occur in patients with diabetes, regardless of glucose value.
• Patients with long duration of diabetes, diabetic nerve disease, or intensified diabetes control may have different or less-pronounced early warning symptoms of hypoglycemia; severe hypoglycemia may occur in such patients with virtually no warning.

**For external pump use with NovoLog**

• Monitor patient with an external insulin pump for erythematous, pruritic, or thickened skin at injection site.
***Alert:*** Pump or infusion set malfunctions or insulin degradation can lead to hyperglycemia and ketosis in a short time because there's a subcutaneous depot of fast-acting insulin.
• Teach patient how to properly use the external insulin pump.
• ***Look alike–sound alike:*** Don't confuse NovoLog Mix 70/30 with Novolin 70/30.

## PATIENT TEACHING

• Tell patient not to stop insulin therapy without medical approval.
• Advise patient of the warning signs of low glucose level (shaking, sweating, moodiness, irritability, confusion, or agitation). Tell patient to carry sugar (candy, sugar packets) to counteract low glucose level.
• Instruct patient to roll the cartridge or pen between his palms 10 times before inserting the NovoLog Penfill cartridge into a compatible delivery device or using the NovoLog FlexPen. Then, to turn the device upside down so the glass ball inside the cartridge or pen travels the length of the cartridge and to repeat this rolling and turning technique at least 10 times until the suspension is uniformly white and cloudy.
• Teach patient proper insulin injection technique and importance of timing dose to meals and adhering to meal plans.
• Tell patient to report swelling, redness, and itching at injection site, and instruct patient on the importance of rotating injection sites to avoid lipodystrophies.
• Instruct patient on correct use of injection pen, if indicated.
• Instruct patient to use the same brand of insulin, especially if mixing insulin. Changing brands of insulin may necessitate dosage changes.
• Tell patient not to dilute or mix insulin aspart with any other insulin when using an external insulin pump.
• Instruct patient to monitor glucose level regularly.
• Advise patient to avoid vigorous exercise immediately after insulin injection, especially of the area where injection was given; it causes increased absorption and increased risk of low glucose level.
• Advise patient to store insulin at 36° to 46° F (2° to 8° C), and avoid freezing or excessive heat or sunlight.
• Advise women to notify prescriber about planned, suspected, or known pregnancy.
• Urge patient to carry medical identification at all times.
• Instruct patient about the importance of diet and exercise. Explain long-term complications of diabetes and the importance of yearly eye and foot examinations.

**SAFETY ALERT!**

# insulin detemir (rDNA origin) injection

IN-su-lin DEH-teh-meer

Levemir

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Insulin analogue
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 100 units/ml in 10-ml vials, 3-ml cartridges (PenFill), 3-ml prefilled syringes (InnoLet, FlexPen)

## INDICATIONS & DOSAGES

➤ **Hyperglycemia in patients with diabetes mellitus who need basal (long-acting) insulin**

*Adults and children age 6 and older:* Base dosage on patient response and glucose level. In insulin-naive patients with type 2 diabetes, start with 0.1 to 0.2 units/kg subcutaneously once daily in the evening or 10 units once or twice daily based on glucose level. Patients with type 1 or 2 diabetes already receiving basal-bolus treatment or basal insulin may switch to this drug on a unit-for-unit basis, adjusted to glycemic target.

## ADMINISTRATION

**Subcutaneous**

***Alert:*** Don't give I.V. or I.M.

***Alert:*** Don't mix or dilute with other insulins.

- Give by subcutaneous injection in the thigh, abdominal wall, or upper arm. Rotate injection sites within the same region.
- Store unused insulin detemir between 36° and 46° F (2° and 8° C). Don't freeze. Don't use insulin detemir if it has been frozen.
- After initial use, store vials in a refrigerator, never in a freezer. If refrigeration isn't possible, keep in-use vial unrefrigerated at room temperature, below 86° F (30° C), for up to 42 days. Keep vial as cool as possible, away from direct heat and light.
- After initial use, a cartridge or prefilled syringe may be used for up to 42 days if kept at room temperature, below 86° F (30° C). Don't store in-use cartridges and prefilled syringes in a refrigerator or with the needle in place. Keep all cartridges and prefilled syringes away from direct heat and sunlight. Unopened cartridges and prefilled syringes can be used until the expiration date printed on the label if they're stored in a refrigerator. Keep unused cartridges and prefilled syringes in the carton so they'll stay clean and protected from light.

## ACTION

Regulates glucose metabolism by binding to insulin receptors, facilitating cellular uptake of glucose into muscle and fat, and inhibiting release of glucose from liver.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 6–8 hr | 6–23 hr |

*Half-life:* 5 to 7 hours.

## ADVERSE REACTIONS

**CV:** edema.
**Metabolic:** **HYPOGLYCEMIA,** sodium retention, *weight gain.*
**Skin:** injection site reactions, lipodystrophy, pruritus, rash.
**Other:** ***allergic reactions.***

## INTERACTIONS

**Drug-drug.** *ACE inhibitors, antidiabetic drugs, disopyramide, fibrates, fluoxetine,* ***MAO inhibitors****, octreotide, propoxyphene, salicylates, sulfonamides:* May increase the glucose-lowering effect of insulin and risk of hypoglycemia. Monitor glucose level carefully.

*Beta blockers, clonidine, guanethidine, reserpine:* May decrease or conceal signs of hypoglycemia. Avoid using together, if possible.

*Clonidine, lithium salts:* May increase or decrease glucose-lowering effect of insulin. Monitor glucose level carefully.

*Corticosteroids, danazol, diuretics, estrogens, isoniazid, phenothiazines, progestogens, somatropin, sympathomimetics, thyroid hormones:* May decrease glucose-lowering effect of insulin. Monitor glucose level carefully.

*Other insulins:* May alter the action of one or both insulins if mixed together. Don't mix or dilute insulin detemir with other insulins.
*Pentamidine:* May cause initial hypoglycemia followed by hyperglycemia. Use together cautiously.
**Drug-lifestyle.** *Alcohol use:* May increase or decrease effect of drug. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May decrease glucose level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components. Don't give drug with an insulin infusion pump.
- Use cautiously in patients with hepatic or renal impairment; they may need dosage adjustment.

***Overdose S&S:*** Hypoglycemia.

## NURSING CONSIDERATIONS

- Monitor glucose level routinely in all patients receiving insulin.
- Measure patient's glycosylated hemoglobin level periodically.
- Watch for hyperglycemia, especially if patient's diet or exercise pattern changes.
- Assess patient for signs and symptoms of hypoglycemia. Insulin doses may need adjustment.
- Early warning symptoms of hypoglycemia may be less pronounced in patients who take beta blockers and those with longstanding diabetes, diabetic nerve disease, or intensified diabetes control. Monitor glucose level closely in these patients because severe hypoglycemia could develop before symptoms do.
- Insulin requirements may be altered during illness, emotional disturbance, or stress, or if patient changes his usual meal plan or exercise level.
- Starting dosage, increments of change, and maintenance dosage should be conservative in elderly patients as hypoglycemia may be harder to recognize.

## PATIENT TEACHING

- Teach diabetes management, including glucose monitoring, injection techniques, and continuous rotation of injection sites.

***Alert:*** Urge patient not to mix with any other insulin or solution.

- Instruct patient to use only solution that's clear and colorless, with no visible particles.
- Tell patient to recognize and report signs and symptoms of hyperglycemia, such as nausea, vomiting, drowsiness, flushed dry skin, dry mouth, increased urination, thirst, and loss of appetite.
- Urge patient to check glucose level often to achieve control and avoid hyperglycemia and hypoglycemia.
- Teach patient to recognize and report signs and symptoms of hypoglycemia, such as sweating, dizziness, light-headedness, headache, drowsiness, and irritability.
- Advise patient to carry a quick source of simple sugar, such as hard candy or glucose tablets, in case of hypoglycemia.
- Caution patient not to stop insulin abruptly or change the amount or type of insulin used without consulting prescriber.
- Advise patient to avoid alcohol because it lowers the glucose level.
- Caution women to consult prescriber before trying to become pregnant.
- Tell patient to store unused vials, cartridges, and prefilled syringes in the refrigerator at 36° to 46° F (2° to 8° C).
- After initial use, vials may be refrigerated or stored at room temperature, below 86° F (30° C), away from direct heat and light, for up to 42 days. Cartridges or prefilled syringes may be stored at room temperature, below 86° F (30° C). Tell patient not to store or refrigerate insulin with a needle in place.
- Caution against freezing drug and against using drug that has been frozen.

**SAFETY ALERT!**

## insulin glargine (rDNA origin) injection

IN-su-lin GLAR-gene

Lantus

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Pancreatic hormone
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 100 units/ml in 10-ml vials, 3-ml cartridge (OptiClik), 3-ml disposable insulin device (SoloStar)

### INDICATIONS & DOSAGES

➤ **To manage type 1 (insulin-dependent) diabetes in patients who need basal (long-acting) insulin to control hyperglycemia**

*Adults and children age 6 and older:* Individualize dosage, and give subcutaneously once daily at the same time each day. Maintenance dosage is 2 to 100 units daily.

➤ **To manage type 2 (non–insulin-dependent) diabetes in patients who need basal (long-acting) insulin to control hyperglycemia**

*Adults:* Individualize dosage, and give subcutaneously once daily at the same time each day. If patient is insulin-naive, start with 10 units subcutaneously daily. Adjust dose to patient response. Maintenance dosage is 2 to 100 units daily.

### ADMINISTRATION

**Subcutaneous**

***Alert:*** Don't give I.V. or with an insulin pump.

***Alert:*** Don't mix or dilute with other insulins or solutions.

- Rotate injection sites with each dose.
- Store unopened insulin vials and 3-ml cartridge system in the refrigerator; opened vials may be stored at 86° F (30° C) or less and away from direct heat. Discard opened vials or cartridge system after 28 days whether refrigerated or not. Don't freeze or refrigerate the open, in-use cartridge system if inserted in OptiClik.

### ACTION

Reduces glucose level by stimulating peripheral glucose uptake, especially by skeletal muscle and fat, and by inhibiting hepatic glucose production.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | 1 hr | None | 24 hr |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**Metabolic:** ***hypoglycemia.***
**Skin:** lipodystrophy, pruritus, rash.
**Other:** allergic reactions, pain at injection site.

### INTERACTIONS

**Drug-drug.** *ACE inhibitors, disopyramide, fibrates, fluoxetine,* ***MAO inhibitors****, octreotide, oral antidiabetics, propoxyphene, salicylates, sulfonamide antibiotics:* May cause hypoglycemia and increase insulin effect. Monitor glucose level. May need to adjust dosage of insulin glargine.

*Beta blockers, clonidine:* May mask signs of hypoglycemia and may either increase or reduce insulin's glucose-lowering effect. Avoid using together, if possible. If used together, monitor glucose level carefully.

*Corticosteroids, danazol, diuretics, estrogens, isoniazid, phenothiazines (such as prochlorperazine, promethazine hydrochloride), progestins (such as hormonal contraceptives), somatropin, sympathomimetics (such as albuterol, epinephrine, terbutaline), thyroid hormones:* May reduce the glucose-lowering effect of insulin. Monitor glucose level. May need to adjust dosage of insulin glargine.

*Guanethidine, reserpine:* May mask the signs of hypoglycemia. Avoid using together, if possible. Monitor glucose level carefully.

*Lithium:* May either increase or decrease the glucose-lowering effect of insulin. Monitor glucose level. May require dosage adjustments of insulin glargine.

*Pentamidine:* May cause hypoglycemia, which may be followed by hyperglycemia. Avoid using together, if possible.

**Drug-herb.** *Burdock, dandelion, eucalyptus, marshmallow:* May increase hypoglycemic effects. Discourage use together.

*Licorice root:* May increase dosage requirements of insulin. Discourage use together.
**Drug-lifestyle.** *Alcohol use, emotional stress:* May increase or decrease the glucose-lowering effect of insulin. Advise patient to self-monitor glucose level.

## EFFECTS ON LAB TEST RESULTS

- May decrease glucose level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated during hypoglycemic episodes and in patients hypersensitive to drug or its components.
- Use cautiously in patients with renal or hepatic impairment.

***Overdose S&S:*** Hypoglycemia, severe hypoglycemia (coma, neurologic impairment, seizures).

## NURSING CONSIDERATIONS

- Because of prolonged duration, this isn't the insulin of choice for diabetic ketoacidosis.
- The rate of absorption, onset, and duration of action may be affected by exercise and other variables, such as illness and emotional stress.
- As with any insulin therapy, lipodystrophy may occur at the injection site and delay insulin absorption. Reduce this risk by rotating the injection site with each injection.
- Hypoglycemia is the most common adverse effect of insulin. Early symptoms may be different or less pronounced in patients with long duration of diabetes, diabetic nerve disease, or intensified diabetes control. Monitor glucose level closely in these patients because severe hypoglycemia may result before the patient develops symptoms.
- ***Look alike–sound alike:*** Don't confuse Lantus with Lente.

## PATIENT TEACHING

- Teach proper glucose monitoring, injection techniques, and diabetes management.
- Tell patient to take dose once daily at the same time each day.

***Alert:*** Educate diabetic patients about signs and symptoms of low glucose level, such as fatigue, weakness, confusion, headache, pallor, and profuse sweating.

- Urge patient to wear or carry medical identification at all times.
- Advise patient to treat mild hypoglycemia with oral glucose tablets. Encourage patient to always carry glucose tablets in case of a low-glucose episode.
- Educate patients on the importance of maintaining prescribed diet, and explain that adjustments in drug dosage, meal patterns, and exercise may be needed to regulate glucose.

***Alert:*** Advise patient not to dilute or mix any other insulin or solution with insulin glargine. If the solution is cloudy, urge patient to discard the vial. Use solution only if it's clear and colorless.

***Alert:*** Make any change of insulin cautiously and only under medical supervision. Changes in insulin strength, manufacturer, type (such as regular, NPH, or insulin analogues), species (animal, human), or method of manufacturer (rDNA versus animal source insulin) may require a change in dosage. Oral antidiabetic treatment taken at the same time may need to be adjusted.

- Tell patient to consult prescriber before using OTC medications.
- Inform patient to avoid alcohol, which lowers glucose level.
- Advise patient to avoid vigorous exercise immediately after insulin injection, especially of the area where injection was given; it causes increased absorption and increased risk of low glucose.
- Advise woman planning pregnancy to first consult prescriber.
- Advise patient that if OptiClik device malfunctions, drug may be drawn from the cartridge system into a U-100 syringe and injected.
- Advise patient on proper drug storage: store unopened insulin vials and 3-ml cartridge system in the refrigerator, opened vials may be stored at 86° F (30° C) or less and away from direct heat, discard opened vials or cartridge system after 28 days whether refrigerated or not, and don't freeze or refrigerate the open, in-use cartridge system if inserted in OptiClik.

**SAFETY ALERT!**

# insulin glulisine (rDNA origin) injection

IN-su-lin GLUE-lih-seen

Apidra, Apidra SoloStar

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Human insulin analogue
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 100 units/ml in 10-ml vial, 3-ml cartridge (OptiClik), or 3-ml prefilled pen

## INDICATIONS & DOSAGES

➤ **Diabetes mellitus**

*Adults and children age 4 and older:* Individualize dosage. Give 0.5 to 1 unit/kg/day subcutaneous injection within 15 minutes before a meal. If regimen also includes a longer-acting insulin or basal insulin analogue, give within 20 minutes after meal starts. Or, give drug as continuous subcutaneous infusion using an external infusion pump. Or, drug may be given I.V. under strict medical supervision with close monitoring of blood glucose and potassium levels.

## ADMINISTRATION

**Subcutaneous**

***Alert:*** Drug has a more rapid onset and shorter duration of action than regular human insulin. Give within 15 minutes before or within 20 minutes after the start of a meal.

- Don't mix drug in a syringe with any other insulin except NPH.
- When used in an external subcutaneous infusion pump, don't mix drug with any other insulin or diluent.
- Store unopened vials in the refrigerator and opened vials in the refrigerator or below 77° F (25° C). Use opened vials within 28 days. Infusion bags are stable at room temperature for 48 hours. Protect from direct heat and light.

**I.V.**

▼ Use at a concentration of insulin glulisine 1 unit/ml in infusion systems with the infusion fluid, sterile 0.9% sodium chloride solution, using polyvinyl chloride (PVC) Viaflex infusion bags and PVC tubing (Clearlink system Continu-Flo solution set) with a dedicated infusion line. The use of other bags and tubing hasn't been studied.

## ACTION

Lowers glucose level by increasing peripheral glucose uptake and decreasing hepatic glucose production. When drug is given by subcutaneous injection, onset of action is more rapid and duration of action shorter than those of regular human insulin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Unknown | Unknown |
| Subcut. | 15 min | 55 min | Unknown |

*Half-life:* 13 minutes (I.V.), 42 minutes (subcutaneous).

## ADVERSE REACTIONS

**CNS:** headache, ***seizures.***
**CV:** hypertension, peripheral edema.
**EENT:** *nasopharyngitis.*
**Metabolic:** ***hypoglycemia.***
**Respiratory:** upper respiratory tract infection.
**Skin:** *injection site reactions,* lipodystrophy, pruritus, rash.
**Other:** allergic reactions, ***anaphylaxis,*** insulin antibody production, influenza.

## INTERACTIONS

**Drug-drug.** *ACE inhibitors, disopyramide, fibrates, fluoxetine,* ***MAO inhibitors****, oral antidiabetics, pentoxifylline, propoxyphene, salicylates, sulfonamide antibiotics:* May increase glucose-lowering effects. Monitor glucose level, and watch for evidence of hypoglycemia.

*Beta blockers, clonidine, lithium, pentamidine:* May cause unpredictable response to insulin. Use together cautiously; monitor patient closely.

*Clozapine, corticosteroids, danazol, diazoxide, diuretics, estrogens, glucagons, isoniazid, olanzapine, phenothiazines, progestogens, protease inhibitors, somatropin, sympathomimetics (such as epinephrine, albuterol, and terbutaline), thyroid*

*hormone:* May decrease glucose-lowering effects. Monitor glucose level carefully. **Drug-lifestyle.** *Alcohol:* May potentiate or reduce insulin effects, resulting in either hypoglycemia or hyperglycemia. Discourage alcohol use.

### EFFECTS ON LAB TEST RESULTS

- May decrease glucose level.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated during periods of hypoglycemia and in patients hypersensitive to insulin glulisine or one of its ingredients.
- Use cautiously in patients with impaired renal or hepatic function and in pregnant or breast-feeding women.

***Overdose S&S:*** Hypoglycemia, hypokalemia.

### NURSING CONSIDERATIONS

- Use with a longer-acting or basal insulin analogue.
- Changes in insulin strength, manufacturer, type, or species may cause a need for dosage adjustment.
- Changes in physical activity or usual meal plan may cause a need for dosage adjustment.
- Insulin requirements may be altered during illness, emotional disturbances, or stress.
- Early warning signs of hypoglycemia may be different or less pronounced in patients who take beta blockers, who have had an oral antidiabetic added to the regimen, or who have long-term diabetes or diabetic nerve disease.
- Monitor patient for lipodystrophy at injection site; it may delay insulin absorption.
- Redness, swelling, or itching may occur at injection site.

### PATIENT TEACHING

- Tell patient to take drug within 15 minutes before starting a meal to 20 minutes after starting a meal, depending on regimen.
- Teach patient how to give subcutaneous insulin injections.
- Tell patient not to mix insulin glulisine in a syringe with any insulin other than NPH.
- If patient is mixing insulin glulisine with NPH, tell patient to use U-100 syringes, to draw insulin glulisine into the syringe first, followed by NPH insulin, and to inject the mixture immediately.
- Instruct patient to rotate injection sites to avoid injection-site reactions.
- If patient is using an external infusion pump, teach proper use of the device. Tell patient not to mix insulin glulisine with any other insulin or diluents. Instruct patient to change the infusion set, reservoir with insulin, and infusion site at least every 48 hours.
- Teach patient the signs and symptoms of hypoglycemia (sweating, rapid pulse, trembling, confusion, headache, irritability, and nausea). Advise the patient to treat these symptoms by eating or drinking something containing sugar.
- Instruct the patient to contact a health care provider for possible dosage adjustments if hypoglycemia occurs frequently.
- Show patient how to monitor and log glucose levels to evaluate diabetes control.
- Explain the possible long-term complications of diabetes and the importance of regular preventive therapy. Urge patient to follow prescribed diet and exercise regimen. To further reduce the risk of heart disease, encourage patient to stop smoking and lose weight.
- Instruct patient to carry medical identification showing that he has diabetes.
- Tell patient to store unopened vials in the refrigerator and opened vials in the refrigerator or below 77° F (25° C). Opened vials should be used within 28 days. Protect from direct heat and light.

**SAFETY ALERT!**

## interferon alfa-2b, recombinant (IFN-alpha 2)

in-ter-FEER-on

Intron A

*Therapeutic class:* Antiviral
*Pharmacologic class:* Biologic response modifier
*Pregnancy risk category C*

### AVAILABLE FORMS

*Solution for injection:* 3, 5, and 10 million international units/dose in multidose pens;

10 million international units/vial; 18 and 25 million international units in multidose vials
*Powder for injection:* 10, 18, and 50 million international units/vial with diluent

## INDICATIONS & DOSAGES

➤ **Hairy cell leukemia**
*Adults:* 2 million international units/$m^2$ I.M. or subcutaneously, three times weekly for 6 months or more if patient is responding to treatment.

➤ **Condylomata acuminata (genital or venereal warts)**
*Adults:* 1 million international units for each lesion (maximum five lesions in a single course) intralesionally three times weekly for 3 weeks. Additional course may be given at 12 to 16 weeks.

➤ **AIDS-related Kaposi sarcoma**
*Adults:* 30 million international units/$m^2$ subcutaneously or I.M. three times weekly. Maintain dose unless disease progresses rapidly or intolerance occurs.

➤ **Chronic hepatitis B**
*Adults:* 30 to 35 million international units weekly I.M. or subcutaneously, given as 5 million international units daily or 10 million international units three times weekly for 16 weeks.
*Children ages 1 to 17:* 3 million international units/$m^2$ subcutaneously three times weekly for first week; then increase to 6 million international units/$m^2$ subcutaneously three times weekly (maximum is 10 million international units three times weekly) for total of 16 to 24 weeks.
***Adjust-a-dose:*** If WBC count is less than $1.5 \times 10^9$/L, granulocyte count is less than $0.75 \times 10^9$/L, or platelet count is less than $50 \times 10^9$/L, reduce dose by 50%. Permanently discontinue drug if WBC count is less than $1 \times 10^9$/L, granulocyte count is less than $0.5 \times 10^9$/L, or platelet count is less than $25 \times 10^9$/L.

➤ **Chronic hepatitis C**
*Adults:* 3 million international units I.M. or subcutaneously three times weekly. In patients tolerating therapy with normalization of ALT at 16 weeks of therapy, continue for 18 to 24 months. In patients who haven't normalized the ALT, consider stopping therapy.

➤ **Adjunct to surgical treatment in patients with malignant melanoma who are asymptomatic after surgery but at high risk for systemic recurrence for up to 8 weeks after surgery**
*Adults:* Initially, 20 million international units/$m^2$ by I.V. infusion 5 consecutive days weekly for 4 weeks; then maintenance dose of 10 million international units/$m^2$ subcutaneously three times weekly for 48 weeks. If adverse effects occur, stop therapy until they abate; then resume therapy at 50% of the previous dose. If intolerance persists, stop therapy.

➤ **First treatment of clinically aggressive follicular non-Hodgkin lymphoma with chemotherapy containing anthracycline**
*Adults:* 5 million international units subcutaneously three times weekly for up to 18 months.

## ADMINISTRATION

**I.V.**
▼ Prepare infusion solution immediately before use.
▼ Based on desired dose, reconstitute appropriate vial strength of drug with diluent provided. Withdraw dose and inject into a 100-ml bag of normal saline solution. Final yield of drug shouldn't be less than 10 million international units/100 ml.
▼ Infuse over 20 minutes.
▼ Store solution in refrigerator. Store powder before and after reconstitution in refrigerator. Use within 24 hours.
▼ **Incompatibilities:** Dextrose solutions.

**I.M.**
• Carefully monitor injection sites in patient with thrombocytopenia. Avoid I.M. injections if possible.
• In patients whose platelet count is below 50,000/$mm^3$, give subcutaneously.
• Give drug at bedtime to minimize daytime drowsiness.

**Subcutaneous**
• For condylomata acuminata intralesional injection, use only 10 million-international unit vial because dilution of other strengths for intralesional use results in a hypertonic solution.

• Don't reconstitute drug in 10 million-international unit vial with more than 1 ml of diluent.
• Use tuberculin or similar syringe and 25G to 30G needle.
• Don't inject too deep beneath lesion or too superficially. As many as five lesions can be treated at one time.
• To ease discomfort, give in evening with acetaminophen.

## ACTION

Unknown. May inhibit tumor or viral cell replication and modulate host immune response by enhancing macrophage activity and improving specific lymphocytes' cytotoxicity for target cells.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | 15–60 min | 4 hr |
| I.M., Subcut. | Unknown | 3–12 hr | 16 hr |

*Half-life:* 3½ to 8½ hours.

## ADVERSE REACTIONS

**CNS:** apathy, amnesia, *asthenia*, *depression*, difficulty in thinking or concentrating, *dizziness*, *fatigue*, *insomnia*, paresthesia, *somnolence*, anxiety, lethargy, nervousness, weakness, headache.
**CV:** *chest pain*, ***cyanosis,*** edema, hypotension.
**EENT:** conjunctivitis, earache, rhinorrhea, *sinusitis*, pharyngitis, rhinitis.
**GI:** *anorexia*, *diarrhea*, *dry mouth*, *dyspepsia*, *nausea*, *vomiting*, abdominal pain, constipation, esophagitis, flatulence, stomatitis.
**GU:** decreased libido, impotence.
**Hematologic:** ***leukopenia, thrombocytopenia,*** anemia, ***neutropenia.***
**Hepatic:** ***hepatitis.***
**Respiratory:** *coughing*, *dyspnea.*
**Skin:** *alopecia*, *dryness*, *increased diaphoresis*, *pruritus*, *rash*, dermatitis.
**Other:** *flulike syndrome*, injection site reaction.

## INTERACTIONS

**Drug-drug.** *Aminophylline, theophylline:* May reduce theophylline clearance. Monitor theophylline level.
*CNS depressants:* May increase CNS effects. Avoid using together.
*Live-virus vaccines:* May increase adverse reactions to vaccine or decrease antibody response. Postpone immunization.
*Zidovudine:* May cause synergistic adverse effects (higher risk of neutropenia). Carefully monitor WBC count.

## EFFECTS ON LAB TEST RESULTS

• May increase calcium, phosphate, AST, ALT, LDH, alkaline phosphatase, and fasting glucose levels. May decrease hemoglobin level.
• May increase PT, INR, and PTT. May decrease WBC and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components.
***Alert:*** Combination therapy with ribavirin is contraindicated in pregnant women and in men whose female partners are pregnant.
• Use cautiously in elderly patients and in those with history of CV disease, pulmonary disease, diabetes mellitus, coagulation disorders, renal impairment, and severe myelosuppression.
• Depression and suicidal behavior have been linked to drug use; patients with psychotic disorders, especially depression, shouldn't continue drug treatment.
***Alert:*** Neurotoxicity and cardiotoxicity are more common in elderly patients, especially those with underlying CNS or cardiac impairment.
***Overdose S&S:*** Abnormal liver enzyme levels, renal failure, hemorrhage, MI.

## NURSING CONSIDERATIONS

**Black Box Warning** Alpha interferons cause or aggravate fatal or life-threatening neuropsychiatric, autoimmune, ischemic, and infectious disorders. Monitor patients closely with periodic clinical and laboratory evaluations. Withdraw patients with persistently severe or worsening signs or symptoms of these conditions from therapy. ■
***Alert:*** Not all dosage forms are appropriate for all indications. Read package insert for approved indications before use.
• Ensure patient is well hydrated, especially at beginning of treatment.
• At start of treatment, monitor patient for flulike signs and symptoms, which

tend to diminish with continued therapy. Premedicate patient with acetaminophen to minimize these symptoms.
• Periodically check for adverse CNS reactions, such as decreased mental status and dizziness, during therapy.
• Monitor CBC with differential, platelet count, blood chemistry and electrolyte studies, and liver function tests. Monitor ECG if patient has cardiac disorder or advanced stages of cancer.
• For patients who develop thrombocytopenia, exercise extreme care in performing invasive procedures; inspect injection site and skin frequently for signs and symptoms of bruising; limit frequency of I.M. injections; test urine, emesis fluid, stool, and secretions for occult blood.
• Severe adverse reactions may need dosage reduction to one-half or stoppage of drug until reactions subside.
• Use with blood dyscrasia–causing drugs, bone marrow suppressants, or radiation therapy may increase bone marrow suppression. Dosage reduction may be needed.
• For condylomata acuminata, maximum response usually occurs in 4 to 8 weeks. If results are not satisfactory after 12 to 16 weeks, a second course may be started. Patients with 6 to 10 condylomata may receive a second course of treatment; patients with more than 10 condylomata may receive additional courses.

### PATIENT TEACHING

• Advise patient to avoid contact with persons with viral illness; patient is at increased risk for infection during therapy.
• Advise patient that laboratory tests will be performed before and periodically during therapy.
• Teach patient proper oral hygiene during treatment because bone marrow suppressant effects of interferon may lead to microbial infection, delayed healing, and bleeding gums. Drug also may decrease salivary flow.
• Advise patient to check with prescriber for instructions after missing a dose.
• Stress need to follow prescriber's instructions about taking and recording temperature and how and when to take acetaminophen.
• If patient will give drug to himself, teach him how to prepare injection and to use disposable syringe. Give him information on drug stability.
• Tell patient that drug may cause temporary partial hair loss; hair should return after drug is stopped.
• Advise patient to notify prescriber if signs or symptoms of depression occur.
**Black Box Warning** Because of fetal risk, warn women of childbearing age and male patients with partners of childbearing age who are receiving combination therapy with ribavirin to use two forms of contraception. ■

**SAFETY ALERT!**

## interferon alfacon-1

in-ter-FEER-on

Infergen

*Therapeutic class:* Immune response modifier
*Pharmacologic class:* Biologic response modifier
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 9 mcg/0.3-ml, 15 mcg/0.5-ml vials

### INDICATIONS & DOSAGES

➤ **Chronic hepatitis C viral infection in patients with compensated liver disease**
*Adults:* 9 mcg subcutaneously three times weekly for 24 weeks; for patients who don't respond or who relapse, 15 mcg subcutaneously three times weekly for up to 48 weeks. Allow at least 48 hours between doses.
***Adjust-a-dose:*** For patients intolerant to higher doses, dose may be reduced to 7.5 mcg. Don't give doses below 7.5 mcg because decreased efficacy may result.
✶ ***NEW INDICATION:*** **Chronic hepatitis C viral infection in patients with compensated liver disease (in combination with ribavirin)**
*Adults weighing more than 75 kg (165 lb):* 15 mcg daily subcutaneously with ribavirin 1,200 mg P.O. daily for up to 48 weeks.

*Adults weighing less than 75 kg:* 15 mcg daily subcutaneously with ribavirin 1,000 mg P.O. daily for up to 48 weeks.
***Adjust-a-dose:*** For patients intolerant to starting dose, may decrease to 9 mcg daily, and then to 6 mcg daily as necessary.

## ADMINISTRATION

**Subcutaneous**

- Store drug in refrigerator at 36° to 46° F (2° to 8° C); don't freeze. Injection may be allowed to reach room temperature just before use.
- Avoid vigorous shaking.
- Discard unused portion.

## ACTION

Induces gene-mediated biological responses that include antiviral, antiproliferative, and immunomodulatory effects and cytokine regulation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 24–36 hr | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *amnesia, anxiety, depression, dizziness, emotional lability, headache, insomnia, malaise, nervousness, paresthesia,* ***suicidal ideation,*** agitation, confusion.
**CV:** hypertension, palpitations, tachycardia, *chest pain.*
**EENT:** *pharyngitis, retinal hemorrhages, rhinitis, sinusitis,* conjunctivitis, ear pain, epistaxis, loss of visual acuity or visual field, tinnitus.
**GI:** *abdominal pain, anorexia, diarrhea, dyspepsia, nausea, vomiting,* constipation, decreased saliva, flatulence, hemorrhoids, taste perversion.
**GU:** dysmenorrhea, vaginitis.
**Hematologic:** ***anemia, granulocytopenia, leukopenia, thrombocytopenia,*** ecchymosis, lymphadenopathy, ***lymphocytosis.***
**Metabolic:** hypothyroidism.
**Respiratory:** *congestion, cough, infection,* bronchitis, dyspnea.
**Skin:** *alopecia, erythema at injection site, pruritus, rash,* dry skin.
**Other:** *body pain, flulike symptoms,* hypersensitivity reactions, decreased libido, toothache.

## INTERACTIONS

**Drug-drug.** *Drugs metabolized by cytochrome P-450:* May alter drug levels. Monitor changes in levels of these drugs. *Myelosuppressives:* May cause added hematologic toxicities; use cautiously together. Monitor CBC and therapeutic or toxic level of myelosuppressive.

## EFFECTS ON LAB TEST RESULTS

- May increase triglyceride and TSH levels. May decrease $T_4$ levels.
- May increase PT and INR. May decrease granulocyte, WBC, and platelet counts. May decrease hemoglobin and hematocrit levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to alpha interferons, to *Escherichia coli*–derived products, or to any component of product; and in patients with history of severe psychiatric disorders, autoimmune hepatitis, or decompensated hepatic disease.
- Use with caution in patients with history of cardiac disease and other autoimmune or endocrine disorders, in those with abnormally low peripheral blood cell counts, and in those receiving drugs that cause myelosuppression.
- Use of monotherapy isn't recommended unless patient is intolerant to ribavirin.
- Use of combination therapy in treatment-naïve patients and in patients with human papilloma virus or HIV-1 hasn't been evaluated for safety and efficacy.
- Patients with limited response to prior therapy, Gentotype 1, high viral load, African-American race, or cirrhosis are less likely to benefit from combination therapy.

***Overdose S&S:*** Anorexia, chills, fever, myalgia, elevated liver enzyme levels.

## NURSING CONSIDERATIONS

**Black Box Warning** Alpha interferons may cause or aggravate fatal or life-threatening neuropsychiatric, autoimmune, ischemic, and infectious disorders. Monitor patients closely with periodic clinical and laboratory evaluations. Withdraw patients with persistently severe or worsening signs or symptoms of these conditions from therapy. ■

**Black Box Warning** Use with ribavirin may cause birth defects or fetal death. Female patients and female partners of male patients should avoid pregnancy. ■
**Black Box Warning** Use with ribavirin may cause hemolytic anemia and worsen cardiac disease. ■
• Discontinue ribavirin if interferon alfacon-1 is stopped, even temporarily.
• Obtain the following laboratory tests before therapy, 2 weeks after it starts, and periodically during therapy: CBC with platelet count, and creatinine, albumin, bilirubin, TSH, and $T_4$ levels.
***Alert:*** If hypersensitivity reaction occurs, stop drug immediately and treat. Premedication with acetaminophen or ibuprofen may decrease adverse effects.
• Allow at least 48 hours to elapse between doses.
• Dosages and adverse reactions vary among different subtypes of drug. Don't use different subtypes in a single treatment regimen.

## PATIENT TEACHING

• If drug is to be used at home, instruct patient on appropriate use, dosage, and administration. Give the patient information leaflet available from the manufacturer to the patient. Also teach patient proper disposal procedures for needles, syringes, drug containers, and unused drug.
• Instruct patient not to reuse needles or syringes or reenter vial.
• Urge patient not to use vial that's discolored or contains particulates.
• Tell patient that nonnarcotic analgesics and bedtime administration may be used to prevent or lessen flulike symptoms (headache, fever, malaise, muscle pain) related to therapy.
• Instruct patient to immediately report symptoms of depression.

**SAFETY ALERT!**

# interferon beta-1a

in-ter-FEER-on

Avonex, Rebif

*Therapeutic class:* Antiviral
*Pharmacologic class:* Biologic response modifier
*Pregnancy risk category C*

## AVAILABLE FORMS

**Avonex**
*Lyophilized powder for injection:* 33 mcg (6.6 million international units)
*Prefilled syringe:* 30 mcg (6 million international units)/0.5 ml
**Rebif**
*Parenteral:* 8.8 mcg (2.4 million international units), 22 mcg (6 million international units), and 44 mcg (12 million international units) in prefilled syringe

## INDICATIONS & DOSAGES

➤ **To slow accumulation of physical disability and decrease frequency of clinical worsening in patients with relapsing forms of multiple sclerosis (MS)**
*Adults age 18 and older:* 30 mcg Avonex I.M. once weekly. Or, initially, 8.8 mcg Rebif subcutaneously three times weekly for 2 weeks; then increase dose to 22 mcg three times weekly for another 2 weeks. Then increase to a maintenance dose of 44 mcg subcutaneously three times weekly.
***Adjust-a-dose:*** For Rebif, in patients with leukopenia or elevated liver function test values (ALT greater than five times upper limit of normal), reduce dosage by 20% to 50% until toxicity is resolved. Stop treatment if jaundice or other signs of hepatic injury occur.
➤ **First MS attack if brain magnetic resonance imaging shows abnormalities consistent with MS**
*Adults:* 30 mcg Avonex I.M. once weekly.

## ADMINISTRATION

**Subcutaneous**
• Visually inspect Rebif for particulate matter and discoloration before administration.

- Rotate sites of injection.
- Administer Rebif at same time on same 3 days at least 48 hours apart each week (late afternoon or evening on Monday, Wednesday, and Friday).
- Store Rebif in the refrigerator between 36° and 46° F (2° and 8° C). Don't freeze. Rebif may be stored at or below 77° F (25° C) for up to 30 days if away from heat and light.

**I.M.**

- To reconstitute lyophilized Avonex, inject 1.1 ml of supplied diluent (sterile water for injection) into vial and gently swirl to dissolve drug. Don't shake.
- Use drug as soon as possible; may be used up to 6 hours after being reconstituted if stored at 36° to 46° F (2° to 8° C).
- Rotate sites of injection.
- The Avonex and diluent vials are for single use only; discard unused portions.
- Store Avonex prefilled syringes in the refrigerator at 36° to 46° F (2° to 8° C). Once removed from refrigerator, warm to room temperature (about 30 minutes) and use within 12 hours. Don't use external heat sources, such as hot water, to warm syringe, or expose to high temperatures. Don't freeze. Protect from light.
- After giving each dose, discard any remaining product in the syringe.

## ACTION

Unknown. Interacts with specific cell receptors found on the surface of cells. Binding of these receptors causes the expression of a number of interferon-induced gene products believed to mediate the biological actions of interferon beta-1a.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 16 hr | Unknown |
| I.M. | Unknown | 3–15 hr | Unknown |

*Half-life:* I.M., 10 hours; subcutaneous, 69 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia, dizziness, fatigue, fever, headache, pain, sleep difficulty,* depression, ***seizures, suicidal ideation or attempt, suicidal tendency,*** abnormal coordination, ataxia, hypertonia, malaise, speech disorder, syncope.
**CV:** chest pain, vasodilation.
**EENT:** *abnormal vision, sinusitis,* decreased hearing, otitis media.
**GI:** *abdominal pain, diarrhea, dyspepsia, nausea,* anorexia, dry mouth.
**GU:** increased urinary frequency, ovarian cyst, urinary incontinence, vaginitis.
**Hematologic:** *lymphadenopathy,* ***leukopenia, pancytopenia, thrombocytopenia,*** anemia.
**Hepatic:** abnormal hepatic function, ***autoimmune hepatitis,*** bilirubinemia, hepatic injury, ***hepatitis.***
**Metabolic:** hyperthyroidism, hypothyroidism.
**Musculoskeletal:** *back pain, muscle ache, skeletal pain,* arthralgia, muscle spasm.
**Respiratory:** *upper respiratory tract infection,* dyspnea.
**Skin:** *injection site reaction,* alopecia, ecchymosis at injection site, nevus, urticaria.
**Other:** *chills, flulike syndrome, infection,* hypersensitivity reactions, herpes simplex, herpes zoster, neutralizing antibodies.

## INTERACTIONS

**Drug-drug.** *Myelosuppressants:* May cause added hematologic toxicities; use cautiously together. Monitor CBC.
**Drug-lifestyle.** *Sun exposure:* May cause photosensitivity reactions. Advise patient to take precautions against sun exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase liver enzyme level. May decrease hemoglobin level and hematocrit. May increase or decrease thyroid function test levels.
- May increase eosinophil count. May decrease WBC and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to natural or recombinant interferon beta, human albumin, or other components of drug.
- Use cautiously in patients with depression, seizure disorders, or severe cardiac conditions.
- It's unknown if drug appears in breast milk; a breast-feeding woman must either stop breast-feeding or stop drug.
- Safety and effectiveness of drug in chronic progressive MS or in children

younger than age 18 haven't been established.

## NURSING CONSIDERATIONS

- Monitor patient closely for depression and suicidal ideation. It isn't known if these symptoms are related to the underlying neurologic basis of MS or to the drug.
- Monitor WBC count, platelet count, and blood chemistries, including liver function tests. Rare but severe liver injury, including liver failure, may occur in patients taking Avonex.
- Give analgesics or antipyretics to decrease flulike symptoms.

## PATIENT TEACHING

- Advise patient to read medication guide that comes with drug.
- Teach patient and family member how to reconstitute drug and give I.M.
- Caution patient not to change dosage or schedule of administration. If a dose is missed, tell him to take it as soon as he remembers. He may then resume his regular schedule. Tell patient not to take two injections within 48 hours of each other.
- Show patient how to store drug.
- Inform patient that flulike signs and symptoms, such as fever, fatigue, muscle aches, headache, chills, and joint pain, are not uncommon at start of therapy. Acetaminophen 650 mg P.O. may be taken immediately before injection and for another 24 hours after each injection, to lessen severity of flulike signs and symptoms.
- Advise patient to report depression, suicidal thoughts, or other adverse reactions.
- Instruct patient to keep syringes and needles away from children. Also, instruct him not to reuse needles or syringes and to discard them in a syringe-disposal unit.
- Caution women not to become pregnant during therapy because of the risk of spontaneous abortion. If pregnancy occurs, instruct patient to notify prescriber immediately and to stop drug.
- Advise patient to use sunscreen and avoid sun exposure while taking drug because photosensitivity may occur.
- Tell patient to store Rebif in the refrigerator between 36° to 46° F (2° to 8° C) and not to freeze. Rebif may also be stored at or below 77° F (25° C) for up to 30 days and away from heat and light.

**SAFETY ALERT!**

# interferon beta-1b, recombinant

in-ter-FEER-on

Betaseron, Extavia

*Therapeutic class:* Antiviral
*Pharmacologic class:* Biologic response modifier
*Pregnancy risk category C*

## AVAILABLE FORMS

*Powder for injection:* 9.6 million international units (0.3 mg)

## INDICATIONS & DOSAGES

➤ **To reduce frequency of exacerbations in relapsing forms of multiple sclerosis**

*Adults:* 0.0625 mg subcutaneously every other day for weeks 1 and 2; then 0.125 mg subcutaneously every other day for weeks 3 and 4; then 0.1875 mg subcutaneously every other day for weeks 5 and 6; then 0.25 mg subcutaneously every other day thereafter.

## ADMINISTRATION

### Subcutaneous

- To reconstitute, inject 1.2 ml of supplied diluent (half-normal saline solution for injection) into vial and gently swirl to dissolve drug.
- Reconstituted solution contains 8 million international units (0.25 mg)/ml.
- Don't shake. Discard vial that contains particulates or discolored solution.
- Inject immediately after preparation.
- Rotate injection sites to minimize local reactions and observe site for necrosis.
- Store at room temperature. After reconstitution, if not used immediately, drug may be refrigerated for up to 3 hours.

## ACTION

A naturally occurring antiviral and immunoregulatory drug derived from human fibroblasts. Drug attaches to membrane receptors and causes cellular changes, including increased protein synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 1–8 hr | Unknown |

*Half-life:* 8 minutes to 4¼ hours.

## ADVERSE REACTIONS

**CNS:** depression, anxiety, emotional lability, depersonalization, ***suicidal tendencies,*** confusion, *hypertonia, asthenia, migraine,* ***seizures,*** *headache, pain,* dizziness, malaise, *fever, chills, insomnia.*
**CV:** *chest pain, peripheral edema,* palpitations, hypertension, tachycardia, peripheral vascular disorder.
**EENT:** laryngitis, *sinusitis, conjunctivitis,* abnormal vision.
**GI:** *diarrhea, constipation, abdominal pain, vomiting, dyspepsia.*
**GU:** *menstrual bleeding or spotting, early or delayed menses, fewer days of menstrual flow, menorrhagia, urgency,* impotence, prostate disorder, frequency.
**Hematologic:** **LEUKOPENIA,** *lymphadenopathy.*
**Musculoskeletal:** *myasthenia, arthralgia, myalgia,* leg cramps.
**Respiratory:** dyspnea.
**Skin:** *inflammation, pain, necrosis at injection site, diaphoresis,* alopecia, *rash,* skin disorder.
**Other:** breast pain, *flulike syndrome, pelvic pain,* generalized edema.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT and bilirubin levels.
- May decrease WBC and neutrophil counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to interferon beta, human albumin, or components of drug.
- Use cautiously in women of childbearing age. Evidence is inconclusive about teratogenic effects, but drug may be an abortifacient.

## NURSING CONSIDERATIONS

***Alert:*** Serious liver damage, including hepatic failure requiring transplant, can occur. Monitor liver function at 1, 3, and 6 months after therapy starts and periodically thereafter.
- Monitor patient for signs of depression.
- Monitor CBC.
- Monitor thyroid function tests every 6 months in patients being treated for thyroid disorder.

## PATIENT TEACHING

- Warn woman about dangers to fetus. If pregnancy occurs during therapy, tell her to notify prescriber and stop taking drug.
- Advise patient to read medication guide that comes with drug.
- Teach patient how to perform subcutaneous injections, including solution preparation, aseptic technique, injection site rotation, and equipment disposal. Periodically reevaluate patient's technique.
- Tell patient to take drug at bedtime to minimize mild flulike signs and symptoms that commonly occur.
- Advise patient to report suicidal thoughts or depression.
- Urge patient to immediately report signs or symptoms of tissue death at injection site.
- Advise patient of importance of obtaining routine blood tests.

**SAFETY ALERT!**

# interferon gamma-1b

in-ter-FEER-on

Actimmune

*Therapeutic class:* Immune response modifier
*Pharmacologic class:* Biologic response modifier
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 100 mcg (2 million international units)/0.5-ml vial

## INDICATIONS & DOSAGES

➤ **Chronic granulomatous disease, severe malignant osteopetrosis**

*Adults with body surface area (BSA) greater than 0.5 $m^2$:* Give 50 $mcg/m^2$ (1 million

international units/$m^2$) subcutaneously three times weekly, preferably at bedtime.
*Adults with a BSA 0.5 $m^2$ or less:*
1.5 mcg/kg subcutaneously three times weekly.
***Adjust-a-dose:*** If patient has severe reaction, decrease dosage by 50% or stop drug until reaction subsides.

## ADMINISTRATION

### Subcutaneous

- Discard unused drug. Each vial is for single use only and doesn't contain a preservative.
- Don't mix with other drugs in the same syringe.
- Store in refrigerator before use. Discard unpunctured vials left at room temperature for more than 12 hours.

## ACTION

Interleukin-type lymphokine. Drug has potent phagocyte-activating properties and increases the oxidative metabolism of tissue macrophages.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 7 hr | Unknown |

*Half-life:* 6 hours.

## ADVERSE REACTIONS

**CNS:** *fatigue*, chills, dizziness, *fever, headache.*
**GI:** *diarrhea, nausea, vomiting.*
**Hematologic:** ***neutropenia, thrombocytopenia.***
**Musculoskeletal:** arthralgia, myalgia.
**Skin:** *erythema and tenderness at injection site, rash.*
**Other:** *flulike syndrome.*

## INTERACTIONS

**Drug-drug.** *Myelosuppressants:* May increase myelosuppression. Use together with caution. Monitor patient closely.
*Rotavirus live vaccine:* May increase risk of infection by live vaccine. Don't use together.

## EFFECTS ON LAB TEST RESULTS

- May increase liver enzyme levels.
- May decrease neutrophil and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or to genetically engineered products derived from *Escherichia coli.*
- Use cautiously in patients with cardiac disease, including arrhythmias, ischemia, or heart failure. The flulike syndrome commonly seen with high doses of drug can worsen these conditions.
- Use cautiously in patients with compromised CNS function or seizure disorders. CNS adverse reactions that may occur at high doses of drug can worsen these conditions.

***Overdose S&S:*** Decreased mental status, dizziness, gait disturbance, elevated liver enzyme and triglyceride levels, neutropenia, thrombocytopenia.

## NURSING CONSIDERATIONS

- Administer in the deltoid or anterior thigh muscle.

***Alert:*** The drug's activity is expressed in international units (1 million international units/50 mcg). This is equal to what was previously expressed as units (1.5 million units/50 mcg).

- Premedicate patient with acetaminophen to minimize signs and symptoms at start of therapy; these tend to diminish with continued therapy.
- Before beginning therapy and at 3-month intervals, monitor CBC, platelet count, renal and hepatic function tests, and urinalysis.

## PATIENT TEACHING

- If patient will give drug to himself, teach him how to give it and how to dispose of used needles, syringes, containers, and unused drug.
- Instruct patient how to manage flulike signs and symptoms (fever, fatigue, muscle aches, headache, chills, joint pain) that commonly occur.
- Advise use of acetaminophen.

# ipratropium bromide

ih-pra-TROE-pee-um

Atrovent, Atrovent HFA

*Therapeutic class:* Bronchodilator
*Pharmacologic class:* Anticholinergic
*Pregnancy risk category B*

## AVAILABLE FORMS

*Inhaler:* 17 mcg/metered dose (Atrovent HFA)
*Nasal spray:* 0.03% (21 mcg/metered dose), 0.06% (42 mcg/metered dose)
*Solution (for inhalation):* 0.02% (500 mcg/vial)

## INDICATIONS & DOSAGES

➤ **Bronchospasm in chronic bronchitis and emphysema**

*Adults:* Usually, 2 inhalations q.i.d.; patient may take additional inhalations as needed but shouldn't exceed 12 inhalations in 24 hours. Or, 250 to 500 mcg every 6 to 8 hours via oral nebulizer.

➤ **Rhinorrhea caused by allergic and nonallergic perennial rhinitis**

*Adults and children age 6 and older:* Two 0.03% nasal sprays (42 mcg) per nostril b.i.d. or t.i.d.

➤ **Rhinorrhea caused by the common cold**

*Adults and children age 12 and older:* Two 0.06% nasal sprays (84 mcg) per nostril t.i.d. or q.i.d.
*Children ages 5 to 11:* Two 0.06% nasal sprays (84 mcg) per nostril t.i.d.

➤ **Rhinorrhea caused by seasonal allergic rhinitis**

*Adults and children age 5 and older:* Two 0.03% nasal sprays (84 mcg) per nostril q.i.d. Total dose is 672 mcg/day.

## ADMINISTRATION

### Inhalational

- Shake canister before use, except for HFA aerosol.
- If more than 1 inhalation is ordered, wait at least 2 minutes between inhalations.
- Use spacer device to improve drug delivery, if appropriate.

### Intranasal

- Prime nasal spray before first use and after unused for more than 24 hours.
- Tilt patient's head backward after dose to allow drug to spread to back of nose.

## ACTION

Inhibits vagally mediated reflexes by antagonizing acetylcholine at muscarinic receptors on bronchial smooth muscle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Inhalation | 5–15 min | 1–2 hr | 3–6 hr |

*Half-life:* About 2 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, pain, headache.
**CV:** palpitations, chest pain.
**EENT:** blurred vision, rhinitis, pharyngitis, sinusitis, epistaxis.
**GI:** nausea, GI distress, dry mouth.
**Musculoskeletal:** back pain.
**Respiratory:** *upper respiratory tract infection, bronchitis,* ***bronchospasm,*** cough, dyspnea, increased sputum.
**Skin:** rash.
**Other:** flulike symptoms, hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Anticholinergics:* May increase anticholinergic effects. Avoid using together.
**Drug-herb.** *Jaborandi tree:* May decrease effect of drug. Advise patient to use cautiously.
*Pill-bearing spurge:* May decrease effect of drug. Advise patient to use cautiously.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, atropine, or its derivatives.
- Use cautiously in patients with angle-closure glaucoma, prostatic hyperplasia, or bladder-neck obstruction.
- Safety and effectiveness of nebulization or inhaler in children younger than age 12 haven't been established.

## NURSING CONSIDERATIONS

- If patient uses a face mask for a nebulizer, take care to prevent leakage around the mask because eye pain or temporary blurring of vision may occur.
- Safety and effectiveness of use beyond 4 days in patients with a common cold haven't been established.
- ***Look alike–sound alike:*** Don't confuse Atrovent with Alupent.

## PATIENT TEACHING

- Warn patient that drug isn't effective for treating acute episodes of bronchospasm when rapid response is needed.
- Teach patient to perform oral inhalation correctly. Give the following instructions for using an MDI:
  - Shake canister. The HFA form doesn't need to be shaken.
  - Clear nasal passages and throat.
  - Breathe out, expelling as much air from lungs as possible.
  - Place mouthpiece well into mouth, and inhale deeply as you release dose from inhaler. (Patient should close his eyes.)
  - Hold breath for several seconds, remove mouthpiece, and exhale slowly.
- Inform patient that use of a spacer device with MDI may improve drug delivery to lungs.
- Warn patient to avoid accidentally spraying drug into eyes. Temporary blurring of vision may result.
- If more than 1 inhalation is prescribed, tell patient to wait at least 2 minutes before repeating procedure.
- Instruct patient to remove canister and wash inhaler in warm, soapy water at least once weekly.
- If patient is also using a corticosteroid inhaler, instruct him to use ipratropium first and then to wait about 5 minutes before using the corticosteroid. This lets the bronchodilator open air passages for maximal effectiveness of the corticosteroid.
- Instruct patient to prime nasal spray by pumping seven times before first use or after unused for 1 week. Prime with two pumps after unused for 1 day.
- Instruct patient to sniff deeply after each spray and to breathe out through mouth. Tell him to tilt head backward to allow drug to spread to back of nose.

# irbesartan

er-bah-SAR-tan

Avapro

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Angiotensin II receptor antagonist
*Pregnancy risk category C; D in 2nd and 3rd trimesters*

## AVAILABLE FORMS

*Tablets:* 75 mg, 150 mg, 300 mg

## INDICATIONS & DOSAGES

➤ **Hypertension**

*Adults:* Initially, 150 mg P.O. daily, increased to maximum of 300 mg daily, if needed.

***Adjust-a-dose:*** For volume- and sodium-depleted patients, initially, 75 mg P.O. daily.

➤ **Nephropathy in patients with type 2 diabetes**

*Adults:* Target maintenance dose is 300 mg P.O. once daily.

## ADMINISTRATION

**P.O.**

- Give drug without regard for meals.

## ACTION

Produces antihypertensive effect by competitive antagonist activity at the angiotensin II receptor.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | ½–2 hr | 24 hr |

*Half-life:* 11 to 15 hours.

## ADVERSE REACTIONS

**CNS:** fatigue, anxiety, dizziness, headache.
**CV:** chest pain, edema, tachycardia.
**EENT:** pharyngitis, rhinitis, sinus abnormality.
**GI:** diarrhea, dyspepsia, abdominal pain, nausea, vomiting.
**GU:** UTI.
**Musculoskeletal:** musculoskeletal trauma or pain.

**Respiratory:** upper respiratory tract infection, cough.
**Skin:** rash.

## INTERACTIONS
None reported.

## EFFECTS ON LAB TEST RESULTS
None reported.

## CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in patients with impaired renal function, heart failure, and renal artery stenosis and in breast-feeding women.

**Black Box Warning** Use during pregnancy can cause injury and death to the developing fetus. When pregnancy is detected, stop drug as soon as possible. ■

***Overdose S&S:*** Hypotension, tachycardia, bradycardia.

## NURSING CONSIDERATIONS
- Drug may be given with a diuretic or other antihypertensive, if needed, for control of hypertension.
- Symptomatic hypotension may occur in volume- or sodium-depleted patients (vigorous diuretic use or dialysis). Correct the cause of volume depletion before administration or before a lower dose is used.
- If hypotension occurs, place patient in a supine position and give an I.V. infusion of normal saline solution, if needed. Once blood pressure has stabilized after a transient hypotensive episode, drug may be continued.
- Dizziness and orthostatic hypotension may occur more frequently in patients with type 2 diabetes and renal disease.

## PATIENT TEACHING
- Warn woman of childbearing age of consequences of drug exposure to fetus. Tell her to call prescriber immediately if pregnancy is suspected.
- Tell patient that drug may be taken without regard for food.

**SAFETY ALERT!**

# irinotecan hydrochloride
eh-rin-OH-te-kan

Camptosar

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* DNA topoisomerase inhibitor
*Pregnancy risk category D*

## AVAILABLE FORMS
*Injection:* 20 mg/ml in 2- and 5-ml vials

## INDICATIONS & DOSAGES
➤ **Metastatic carcinoma of the colon or rectum that has recurred or progressed after fluorouracil (5-FU) therapy**
*Adults:* Initially, 125 mg/m$^2$ by I.V. infusion over 90 minutes on days 1, 8, 15, and 22; then 2-week rest period. Thereafter, additional courses of treatment may be repeated every 6 weeks with 4 weeks on and 2 weeks off. Subsequent doses may be adjusted to low of 50 mg/m$^2$ or maximum of 150 mg/m$^2$ in 25- to 50-mg/m$^2$ increments based on patient's tolerance. Or, 350 mg/m$^2$ by I.V. infusion over 90 minutes once every 3 weeks. Additional courses may continue indefinitely in patients who respond favorably and in those whose disease remains stable, provided intolerable toxicity doesn't occur.
***Adjust-a-dose:*** Consider reducing starting dose in patients age 65 and older, in those who have received pelvic or abdominal radiation, or in those who have a performance status of 2 or increased bilirubin level. Give 300 mg/m$^2$ by I.V. infusion over 90 minutes once every 3 weeks. Or, give 100 mg/m$^2$ by I.V. infusion over 90 minutes once weekly.
➤ **First-line therapy for metastatic colorectal cancer with 5-fluorouracil (5-FU) and leucovorin**
***Regimen 1***
*Adults:* 125 mg/m$^2$ I.V. over 90 minutes on days 1, 8, 15, and 22; then leucovorin 20 mg/m$^2$ I.V. bolus on days 1, 8, 15, and 22 and 5-FU 500 mg/m$^2$ I.V. bolus on days 1, 8, 15, and 22. Courses are repeated every 6 weeks.

***Regimen 2***
*Adults:* 180 mg/m$^2$ I.V. over 90 minutes on days 1, 15, and 29; then leucovorin 200 mg/m$^2$ I.V. over 2 hours on days 1, 2, 15, 16, 29, and 30; then 5-FU 400 mg/m$^2$ I.V. bolus on days 1, 2, 15, 16, 29, and 30 and 5-FU 600 mg/m$^2$ I.V. infusion over 22 hours on days 1, 2, 15, 16, 29, and 30.
***Adjust-a-dose:*** See manufacturer's package insert for details on dosage adjustment.

## ADMINISTRATION

**I.V.**
▼ Drug packaged in plastic blister to protect against inadvertent breakage and leakage. Inspect vial for damage and signs of leakage before removing blister.
▼ Wear gloves while handling and preparing infusion solutions. If drug contacts skin, wash thoroughly with soap and water. If drug contacts mucous membranes, flush thoroughly with water.
▼ Dilute drug in $D_5W$ injection (preferred) or normal saline solution for injection before infusion to yield 0.12 to 2.8 mg/ml.
▼ Solution is stable for up to 24 hours at 77° F (25° C) in ambient fluorescent lighting. Solutions diluted in $D_5W$, stored at 36° to 46° F (2° to 8° C), and protected from light are stable for 48 hours. However, because microbial contamination may occur during dilution, use admixture within 24 hours if refrigerated or 6 hours if kept at room temperature. Refrigerating admixtures using normal saline solution isn't recommended because of low and sporadic risk of visible particulate. Don't freeze admixture because drug may precipitate.
▼ Premedicate patient with antiemetic drugs on day of treatment starting at least 30 minutes before giving irinotecan.
▼ Watch for irritation and infiltration; extravasation can cause tissue damage. If extravasation occurs, flush site with sterile water and apply ice. Notify prescriber.
▼ Store vial at 59° to 86° F (15° to 30° C). Protect from light.
▼ **Incompatibilities:** Other I.V. drugs.

## ACTION

Interacts with topoisomerase I, inducing reversible single-strand DNA breaks. Drug binds to the topoisomerase I–DNA complex and prevents religation of these single-strand breaks.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | 1 hr | Unknown |

*Half-life:* About 6 to 12 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia, dizziness, fever, headache, insomnia, pain,* akathisia.
**CV:** *edema, vasodilation,* orthostatic hypotension.
**EENT:** *rhinitis.*
**GI:** **DIARRHEA,** *abdominal cramping, pain, and enlargement, anorexia, constipation, dyspepsia, flatulence, nausea, stomatitis, vomiting.*
**Hematologic:** *anemia,* ***leukopenia, neutropenia, thrombocytopenia.***
**Metabolic:** *dehydration, weight loss.*
**Musculoskeletal:** *back pain.*
**Respiratory:** *dyspnea, increased cough.*
**Skin:** *alopecia, rash, sweating.*
**Other:** *chills, infection.*

## INTERACTIONS

**Drug-drug.** *CYP3A4 enzyme-inducing anticonvulsants (phenytoin, phenobarbital, or carbamazepine), rifampin, rifabutin:* May significantly decrease irinotecan levels. For patients requiring anticonvulsant treatment, consider substituting non–enzyme-inducing anticonvulsants at least 2 weeks before start of irinotecan therapy.
*Dexamethasone:* May increase risk of irinotecan-induced lymphocytopenia. Monitor patient closely.
*Diuretics:* May increase risk of dehydration and electrolyte imbalance. Consider stopping diuretic during active periods of nausea and vomiting.
*Ketoconazole:* May increase irinotecan levels leading to drug toxicity. Stop ketoconazole at least 1 week before starting irinotecan therapy. Ketoconazole is contraindicated during irinotecan therapy.
*Laxatives:* May increase risk of diarrhea. Avoid using together.
*Neuromuscular-blocking agents:* May prolong the neuromuscular-blocking effects of succinylcholine, and the neuromuscular blockade of nondepolarizing drugs may be

antagonized. Monitor patient for prolonged effects of succinylcholine if given together.
*Other antineoplastics:* May cause additive adverse effects, such as myelosuppression and diarrhea. Monitor patient closely.
*Prochlorperazine:* May increase risk of akathisia. Monitor patient closely.
**Drug-herb. *St. John's wort:*** May decrease drug levels by about 40%. Use together is contraindicated.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, AST, and bilirubin levels. May decrease hemoglobin level.
- May decrease WBC and neutrophil counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Safety and effectiveness of drug in children haven't been established.
- Use cautiously in elderly patients.

***Overdose S&S:*** Severe neutropenia, severe diarrhea.

## NURSING CONSIDERATIONS

**Black Box Warning** Administer drug under the supervision of a physician experienced with cancer chemotherapy. ■

**Black Box Warning** Drug may cause severe myelosuppression. ■

- Pelvic or abdominal irradiation may increase risk of severe myelosuppression. Avoid use of drug in patients undergoing irradiation.
- Patients with UGT1A1*28 allele or UGT1A1 7/7 genotype are at increased risk for neutropenia. Patient should be considered for initial minus 1 level dosage adjustment; monitor patient closely.
- If neutropenic fever occurs or if absolute neutrophil count drops below 500/$mm^3$, temporarily stop therapy. Reduce dosage, especially if WBC count is below 2,000/$mm^3$, neutrophil count is below 1,000/$mm^3$, hemoglobin level is below 8 g/dl, or platelet count is below 100,000/$mm^3$.
- A colony-stimulating factor may be helpful in patients with significant neutropenia.
- Monitor WBC count with differential, hemoglobin level, and platelet count before each dose.

**Black Box Warning** Drug can cause severe diarrhea. Treat diarrhea occurring within 24 hours of drug administration with 0.25 to 1 mg atropine I.V., unless contraindicated. Treat late diarrhea (more than 24 hours after irinotecan administration) promptly with loperamide. Monitor patient for dehydration, electrolyte imbalance, or sepsis, and treat appropriately. ■

- Delay subsequent doses until normal bowel function returns for at least 24 hours without antidiarrheal. If grade 2, 3, or 4 late diarrhea occurs, decrease subsequent doses within the current cycle.
- To decrease risk of dehydration, withhold diuretic during treatment and periods of active vomiting or diarrhea.
- ***Look alike–sound alike:*** Don't confuse irinotecan with topotecan.

## PATIENT TEACHING

- Inform patient about risk of diarrhea and methods to treat it; tell him to avoid laxatives.
- Instruct patient to contact prescriber if any of the following occur: diarrhea for the first time during treatment; black or bloody stools; symptoms of dehydration such as light-headedness, dizziness, or faintness; inability to drink fluids due to nausea or vomiting; inability to control diarrhea within 24 hours; or fever or infection.
- Warn patient that hair loss may occur.
- Caution women to avoid pregnancy or breast-feeding during therapy.

# iron dextran

DexFerrum, InFeD, Proferdex

*Therapeutic class:* Iron supplement
*Pharmacologic class:* Hematinic
*Pregnancy risk category C*

## AVAILABLE FORMS

1 ml iron dextran provides 50 mg elemental iron.
*Injection:* 50 mg elemental iron/ml in 1-ml and 2-ml single-dose vials

## INDICATIONS & DOSAGES

➤ **Iron deficiency anemia**

*Adults and children weighing more than 15 kg (33 lb):* I.V. or I.M. test dose is required. (See the package insert.) Total dose may be calculated using dosage table in package insert or by using the following formula:

$$\text{Dose (ml)} = 0.0442\,(\text{desired Hb} - \text{observed Hb}) \times \text{LBW} + (0.26 \times \text{LBW})$$

*Note:* LBW = lean body weight in kg. For males, LBW = 50 kg + 2.3 kg for each inch of patient's height over 5 feet. For females, LBW = 45.5 kg + 2.3 kg for each inch of patient's height over 5 feet.

*Children weighing 5 to 15 kg (11 to 33 lb):* Use dosage table in package insert or calculate dose as follows:

$$\text{Dose (ml)} = 0.0442\,(\text{desired Hb} - \text{observed Hb}) \times \text{weight in kg} + (0.26 \times \text{weight in kg}).$$

***I.V.***

*Adults and children:* Inject 0.5-ml test dose over at least 5 minutes. If no reaction occurs in 1 hour, give remainder of therapeutic I.V. dose. Repeat therapeutic I.V. dose daily. Single daily dose shouldn't exceed 100 mg. Give slowly (1 ml/minute). Don't give drug in the first 4 months of life.

***I.M. (by Z-track method)***

*Adults and children:* Inject 0.5-ml test dose. If no reaction occurs in 1 hour, give remainder of dose. Daily dose ordinarily shouldn't exceed 0.5 ml (25 mg) for infants who weigh less than 5 kg (11 lb); 1 ml (50 mg) for those who weigh less than 10 kg (22 lb); and 2 ml (100 mg) for heavier children and adults. Don't give drug in the first 4 months of life.

➤ **Iron replacement for blood loss**

*Adults:* Replacement iron (in mg) = blood loss (in ml) × hematocrit.

*Note:* This formula is based on the approximation that 1 ml of normocytic, normochromic red cells contains 1 mg of elemental iron.

## ADMINISTRATION

**I.V.**

▼ Check hospital policy before giving I.V.

▼ After completing I.V. dose, flush the vein with 10 ml of normal saline solution.

▼ Patient should rest for 15 to 30 minutes after I.V. administration.

▼ **Incompatibilities:** Other I.V. drugs, parenteral nutrition solutions for I.V. infusion.

**I.M.**

• Inject I.M. deep into upper outer quadrant of buttock—never into the arm or other exposed area—with a 2- to 3-inch 19G or 20G needle.

• Use Z-track method to avoid leakage into subcutaneous tissue and staining of skin.

• After drawing up drug, use a new sterile needle to give injection.

## ACTION

Provides elemental iron, an essential component in the formation of hemoglobin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |
| I.M. | 72 hr | Unknown | 3–4 wk |

*Half-life:* 5 to 20 hours.

## ADVERSE REACTIONS

**CNS:** headache, transitory paresthesia, dizziness, malaise, fever, chills, ***seizures,*** disorientation.

**CV:** chest pain, tachycardia, ***bradycardia,*** *hypotensive reaction, peripheral vascular flushing.*

**GI:** nausea, anorexia, abdominal pain, diarrhea.

**GU:** hematuria.

**Hematologic:** leukocytosis, lymphadenopathy.

**Musculoskeletal:** arthralgia, myalgia.

**Respiratory:** ***bronchospasm,*** dyspnea, wheezing, ***respiratory arrest.***

**Skin:** rash, urticaria, *soreness, inflammation, brown skin discoloration at I.M. injection site, local phlebitis at I.V. injection site,* sterile abscess, necrosis, atrophy.

**Other:** fibrosis, ***anaphylaxis, delayed sensitivity reactions.***

## INTERACTIONS

**Drug-drug.** *Chloramphenicol:* May increase iron level. Monitor patient closely.

### EFFECTS ON LAB TEST RESULTS

• May cause false increase in bilirubin level and false decrease in calcium level. Use of more than 250 mg iron may color the serum brown. Drug may alter measurement of iron level and total iron-binding capacity for up to 3 weeks; I.M. injection may cause dense areas of activity for 1 to 6 days on bone scans using technetium-99m diphosphonate.

### CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Fatal anaphylactic reactions have been reported. Fatal reactions have occurred when the test dose was tolerated. Give only when indications have been clearly established and for iron deficiencies not amenable to oral iron therapy. Keep emergency equipment readily available. ■

• Contraindicated in patients hypersensitive to drug, in those with acute infectious renal disease, and in those with any anemia except iron deficiency anemia.

• Use cautiously in patients who have serious hepatic impairment, rheumatoid arthritis, or other inflammatory diseases because these patients may be at higher risk for certain delays and reactions.

• Use cautiously in patients with history of significant allergies or asthma.

⚠ ***Overdose S&S:*** Hemosiderosis.

### NURSING CONSIDERATIONS

**Black Box Warning** Observe for signs and symptoms of anaphylactic-type reactions with every dose given. Have epinephrine immediately available in event of acute hypersensitivity reaction. ■

• Don't give iron dextran with oral iron preparations.

• I.V. or I.M. injections of iron are advisable only for patients in whom oral administration is impossible or ineffective.

• Monitor hemoglobin level, hematocrit, and reticulocyte count.

• Maximum daily dose should not exceed 2 ml undiluted iron dextran.

### PATIENT TEACHING

• Teach patient signs and symptoms of hypersensitivity and iron toxicity, and tell him to report them to prescriber.

• Inform patient that drug may stain skin.

## iron sucrose injection

Venofer

*Therapeutic class:* Iron supplement
*Pharmacologic class:* Hematinic
*Pregnancy risk category B*

### AVAILABLE FORMS

*Injection:* 20 mg/ml of elemental iron in 5-ml and 10-ml single-dose vials

### INDICATIONS & DOSAGES

➤ **Iron deficiency anemia in patients who are hemodialysis dependent and receiving erythropoietin therapy**

*Adults:* 100 mg (5 ml) of elemental iron I.V. directly in the dialysis line, either by slow injection over 2 to 5 minutes or by infusion over 15 minutes during the dialysis session one to three times a week to a total of 1,000 mg in 10 doses; repeat as needed.

➤ **Iron deficiency anemia in chronic kidney disease patients not on dialysis**

*Adults:* 200 mg by undiluted slow I.V. injection over 2 to 5 minutes on five separate occasions in a 14-day period to a total cumulative dose of 1,000 mg.

➤ **Iron deficiency anemia in peritoneal dialysis-dependent chronic kidney disease patients**

*Adults:* 300 mg I.V. infusion over 90 minutes on two separate occasions 14 days apart, followed by one 400-mg infusion over 2½ hours 14 days later.

### ADMINISTRATION

**I.V.**

▼ Inspect drug for particulate matter and discoloration before giving.

▼ For infusion, dilute 100 mg elemental iron in a maximum of 100 ml normal saline solution immediately before infusion, and infuse over at least 15 minutes. Dilute dose 300 mg or greater in a maximum of 250 ml normal saline solution.

▼ **Incompatibilities:** Other I.V. drugs, parenteral nutrition solutions.

### ACTION

Exogenous source of iron that replenishes depleted body iron stores and is essential for hemoglobin synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Variable |

*Half-life:* 6 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* asthenia, malaise, dizziness, fever.
**CV:** ***heart failure,*** *hypotension,* chest pain, hypertension, fluid retention.
**GI:** *nausea,* vomiting, diarrhea, abdominal pain, taste perversion.
**Metabolic:** gout, hyperglycemia.
**Musculoskeletal:** *leg cramps,* bone and muscle pain.
**Respiratory:** dyspnea, wheezing, pneumonia, cough.
**Skin:** rash, pruritus, injection site reaction.
**Other:** accidental injury, pain, ***sepsis, hypersensitivity reactions.***

## INTERACTIONS

**Drug-drug.** *Oral iron preparations:* May reduce absorption of oral iron preparations. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with hypersensitivity to drug or its components, evidence of iron overload, or anemia not caused by iron deficiency.
- Use cautiously in breast-feeding women.

***Overdose S&S:*** Hypotension, dyspnea, headache, vomiting, nausea, dizziness, joint aches, paresthesia, abdominal pain, muscle pain, edema, cardiovascular collapse.

## NURSING CONSIDERATIONS

***Alert:*** Rare but fatal hypersensitivity reactions, characterized by anaphylactic shock, loss of consciousness, collapse, hypotension, dyspnea, or seizures, may occur. Have epinephrine readily available.
- Mild to moderate hypersensitivity reactions, with wheezing, dyspnea, hypotension, rash, or pruritus, may occur.
- Giving drug by infusion may reduce the risk of hypotension.
- Transferrin saturation level increases rapidly after I.V. administration of drug. Obtain iron level 48 hours after I.V. use.
- Monitor ferritin level, transferrin saturation, hemoglobin level, and hematocrit.
- Withhold dose in patient with signs and symptoms of iron overload.
- Keep dose selection in elderly patients conservative because of decreased hepatic, renal, or cardiac function; other disease; and other drug therapy.

## PATIENT TEACHING

- Instruct patient to notify prescriber if symptoms of overdose or allergic reaction occur.

# isoniazid (INH, isonicotinic acid hydrazide)

eye-soe-NYE-a-zid

Isotamine†

*Therapeutic class:* Antituberculotic
*Pharmacologic class:* Isonicotinic acid hydrazine
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 100 mg/ml
*Oral solution:* 50 mg/5 ml
*Tablets:* 100 mg, 300 mg

## INDICATIONS & DOSAGES

➤ **Actively growing tubercle bacilli**

*Adults and children age 15 and older:* 5 mg/kg daily P.O. or I.M. in a single daily dose, up to 300 mg/day, with other drugs, continued for 6 months to 2 years. For intermittent multiple-drug regimen, 15 mg/kg (up to 900 mg) P.O. or I.M. up to three times a week.
*Infants and children:* 10 to 15 mg/kg daily P.O. or I.M. in a single daily dose, up to 300 mg/day, continued long enough to prevent relapse. Give with at least one other antituberculotic. For intermittent multidrug regimen, 20 to 30 mg/kg (up to 900 mg) P.O. or I.M. two or three times weekly.

➤ **To prevent tubercle bacilli in those exposed to tuberculosis (TB) or those**

**with positive skin test results whose chest X-rays and bacteriologic study results indicate nonprogressive TB**
*Adults:* 300 mg daily P.O. in a single dose, continued for 6 months to 1 year.
*Infants and children:* 10 mg/kg daily P.O. in a single dose, up to 300 mg/day, continued for up to 1 year.

## ADMINISTRATION

**P.O.**
- Always give drug with other antituberculotics to prevent development of resistant organisms.
- Give drug 1 hour before or 2 hours after meals.

**I.M.**
- Solution may crystallize at a low temperature. Warm vial to room temperature before use to redissolve crystals.

## ACTION

May inhibit cell-wall biosynthesis by interfering with lipid and DNA synthesis; bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.M. | Unknown | 1–2 hr | Unknown |

*Half-life:* 1 to 4 hours.

## ADVERSE REACTIONS

**CNS:** *peripheral neuropathy,* ***seizures, toxic encephalopathy,*** memory impairment, toxic psychosis.
**EENT:** optic neuritis and atrophy.
**GI:** epigastric distress, nausea, vomiting.
**Hematologic:** ***agranulocytosis, aplastic anemia, thrombocytopenia,*** eosinophilia, hemolytic anemia, sideroblastic anemia.
**Hepatic:** ***hepatitis,*** bilirubinemia, jaundice.
**Metabolic:** hyperglycemia, hypocalcemia, hypophosphatemia, ***metabolic acidosis.***
**Skin:** irritation at injection site.
**Other:** gynecomastia, hypersensitivity reactions, pyridoxine deficiency, rheumatic and lupuslike syndromes.

## INTERACTIONS

**Drug-drug.** *Antacids and laxatives containing aluminum:* May decrease isoniazid absorption. Give isoniazid at least 1 hour before antacid or laxative.
*Benzodiazepines, such as diazepam, triazolam:* May inhibit metabolic clearance of benzodiazepines that undergo oxidative metabolism, possibly increasing benzodiazepine activity. Monitor patient for adverse reactions.
*Carbamazepine, phenytoin:* May increase levels of these drugs. Monitor drug levels closely.
*Cycloserine:* May increase CNS adverse reactions. Use safety precautions.
*Disulfiram:* May cause neurologic symptoms, including changes in behavior and coordination. Avoid using together.
*Enflurane:* In rapid acetylators of isoniazid, may cause high-output renal failure because of nephrotoxic inorganic fluoride level. Monitor renal function.
*Ketoconazole:* May decrease ketoconazole level. Monitor patient for lack of efficacy.
*Meperidine:* May increase CNS adverse reactions and hypotension. Use safety precautions.
*Oral anticoagulants:* May enhance anticoagulant activity. Monitor PT and INR.
*Phenytoin:* May inhibit phenytoin metabolism and increase phenytoin level. Monitor patient for phenytoin toxicity.
***Rifampin:*** May increase the risk of hepatotoxicity. Monitor liver function tests closely.
**Drug-food.** *Foods containing tyramine (such as aged cheese, beer, and chocolate):* May cause hypertensive crisis. Tell patient to avoid such foods or eat in small quantities.
**Drug-lifestyle.** *Alcohol use:* May increase risk of drug-related hepatitis. Discourage use of alcohol.

## EFFECTS ON LAB TEST RESULTS

- May increase transaminase, glucose, and bilirubin levels. May decrease calcium, phosphate, and hemoglobin levels.
- May increase eosinophil count. May decrease granulocyte and platelet counts.
- May alter result of urine glucose tests that use cupric sulfate method, such as Benedict's reagent and Diastix.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Contraindicated in patients with acute hepatic disease or isoniazid-related liver damage. Severe

and sometimes fatal hepatitis associated with isoniazid therapy may occur even after months of treatment. If signs or symptoms suggest hepatic damage, discontinue isoniazid because a more severe form of liver damage can occur. ■
• Use cautiously in elderly patients, in those with chronic non–isoniazid-related liver disease or chronic alcoholism, in those with seizure disorders (especially if taking phenytoin), and in those with severe renal impairment.
⚠ ***Overdose S&S:*** Nausea, vomiting, dizziness, slurring of speech, blurring of vision, visual hallucinations, respiratory distress, CNS depression progressing from stupor to coma, seizures, severe metabolic acidosis, acetonuria, hyperglycemia.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug's pharmacokinetics vary among patients because drug is metabolized in the liver by genetically controlled acetylation. Fast acetylators metabolize drug up to five times faster than slow acetylators. About 50% of blacks and whites are fast acetylators; more than 80% of Chinese, Japanese, and Inuits are fast acetylators. A report suggests the risk of fatal hepatitis increases in black and Hispanic women and in the postpartum period. ■
• Peripheral neuropathy is more common in patients who are slow acetylators, malnourished, alcoholic, or diabetic. Give pyridoxine to prevent peripheral neuropathy.
**Black Box Warning** Monitor hepatic function closely for changes. Monitor patients older than age 35 monthly and measure hepatic enzyme levels before starting treatment. Elevated liver function study results occur in about 15% of patients; most abnormalities are mild and transient, but some may persist throughout treatment. ■

## PATIENT TEACHING

• Instruct patient to take drug exactly as prescribed; warn against stopping drug without prescriber's consent.
• Advise patient to take drug 1 hour before or 2 hours after meals.
**Black Box Warning** Tell patient to notify prescriber immediately if signs and symptoms of liver impairment occur, such as appetite loss, fatigue, malaise, yellow skin or eye discoloration, and dark urine. ■
• Advise patient to avoid alcoholic beverages while taking drug. Also tell him to avoid certain foods: fish, such as skipjack and tuna, and products containing tyramine, such as aged cheese, beer, and chocolate, because drug has some MAO inhibitor activity.
• Encourage patient to comply fully with treatment, which may take months or years.

# isoproterenol hydrochloride

eye-soe-proe-TER-e-nole

Isuprel

*Therapeutic class:* Bronchodilator
*Pharmacologic class:* Nonselective beta-adrenergic agonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 200 mcg/ml in 1- and 5-ml ampules and 5- and 10-ml vials

## INDICATIONS & DOSAGES

➤ **Bronchospasm during anesthesia**
*Adults:* Dilute 1 ml of a 1:5,000 solution with 10 ml of normal saline or $D_5W$. Give 0.01 to 0.02 mg I.V. and repeat as necessary. Or, give 1:50,000 solution undiluted using same dose.
➤ **Heart block, ventricular arrhythmias**
*Adults:* Initially, 0.02 to 0.06 mg I.V.; then 0.01 to 0.2 mg I.V. or 5 mcg/minute I.V. Or, initially, 0.2 mg I.M.; then 0.02 to 1 mg I.M., as needed.
*Children:* Initial I.V. infusion of 0.1 mcg/kg/minute. Adjust dosage based on patient's response. Usual dosage range is 0.1 to 1 mcg/kg/minute.
➤ **Shock**
*Adults and children:* 0.5 to 5 mcg/minute isoproterenol hydrochloride by continuous I.V. infusion. Usual concentration is 1 mg or 5 ml in 500 ml $D_5W$. Titrate infusion rate according to heart rate, central venous pressure, blood pressure, and urine flow.

## ADMINISTRATION

### I.V.

▼ For infusion, dilute with most common I.V. solutions, but don't use with sodium bicarbonate injection; drug decomposes rapidly in alkaline solutions.
▼ Don't use solution if it's discolored or contains precipitate.
▼ Give by direct injection or I.V. infusion.
▼ For shock, closely monitor blood pressure, central venous pressure, ECG, arterial blood gas measurements, and urine output. Carefully titrate infusion rate according to these measurements. Use a continuous infusion pump to regulate flow rate.
▼ Store at room temperature. Protect from light.
▼ **Incompatibilities:** Alkalies, aminophylline, furosemide, metals, sodium bicarbonate.

## ACTION

Relaxes bronchial smooth muscle by stimulating beta$_2$ receptors. As a cardiac stimulant, acts on beta$_1$ receptors in the heart.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Unknown | < 60 min |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** headache, mild tremor, weakness, dizziness, nervousness, insomnia, anxiety.
**CV:** *palpitations, rapid rise and fall in blood pressure, tachycardia, angina,* ***arrhythmias, cardiac arrest, pulmonary edema.***
**GI:** nausea, vomiting.
**Metabolic:** hyperglycemia.
**Skin:** diaphoresis.
**Other:** swelling of parotid glands with prolonged use.

## INTERACTIONS

**Drug-drug.** *Corticosteroids (I.V.), theophylline:* May cause cardiotoxic effects leading to myocardial necrosis and death. Use together cautiously.
*Epinephrine, other sympathomimetics:* May increase risk of arrhythmias. Use together cautiously. If used together, give at least 4 hours apart.
*Halogenated general anesthetics or cyclopropane:* May increase risk of arrhythmias. Avoid using together.
*Propranolol, other beta blockers:* May block bronchodilating effect of isoproterenol. Monitor patient carefully.

## EFFECTS ON LAB TEST RESULTS

● May increase glucose level.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients with tachycardia or AV block caused by digoxin intoxication, arrhythmias other than those that may respond to drug, angina pectoris, or angle-closure glaucoma.
● Contraindicated when used with general anesthetics with halogenated drugs or cyclopropane.
● Use cautiously in elderly patients and in those with renal or CV disease, coronary insufficiency, diabetes, hyperthyroidism, or history of sensitivity to sympathomimetic amines.
⚠ ***Overdose S&S:*** Hypotension, hypertension, tachycardia, ventricular tachycardia or fibrillation, palpitations, angina, sudden death.

## NURSING CONSIDERATIONS

● Correct volume deficit before giving vasopressors.
***Alert:*** If heart rate exceeds 110 beats/minute during I.V. infusion, notify prescriber. Doses that increase the heart rate to more than 130 beats/minute may induce ventricular arrhythmias.
● Drug may cause a slight increase in systolic blood pressure and a slight to marked decrease in diastolic blood pressure.
● Monitor patient for adverse reactions.
● ***Look alike–sound alike:*** Don't confuse Isuprel with Isordil.

## PATIENT TEACHING

● Tell patient to report chest pain, fluttering in chest, or other adverse reactions.
● Remind patient to report pain at the I.V. injection site.

## isosorbide dinitrate

eye-soe-SOR-bide

Apo-ISDN†, Cedocard SR†, Dilatrate-SR, Isordil Titradose

## isosorbide mononitrate

Apo-ISMN†, ISMO, Monoket

*Therapeutic class:* Antianginal
*Pharmacologic class:* Nitrate
*Pregnancy risk category C; B for mononitrate*

### AVAILABLE FORMS

**isosorbide dinitrate**
*Capsules (sustained-release):* 40 mg
*Tablets:* 5 mg, 10 mg, 20 mg, 30 mg, 40 mg
*Tablets (S.L.):* 2.5 mg, 5 mg
*Tablets (sustained-release):* 40 mg
**isosorbide mononitrate**
*Tablets:* 10 mg, 20 mg
*Tablets (extended-release):* 30 mg, 60 mg, 120 mg

### INDICATIONS & DOSAGES

➤ **Acute anginal attacks (S.L. isosorbide dinitrate only); to prevent situations that may cause anginal attacks**
*Adults:* 2.5 to 5 mg S.L. tablets for prompt relief of angina, repeated every 5 to 10 minutes (maximum of three doses for each 30-minute period). For prevention, 2.5 to 10 mg every 2 to 3 hours. Or, 5 to 40 mg isosorbide dinitrate P.O. b.i.d. or t.i.d. for prevention only (use smallest effective dose). Or, 20 mg ISMO or Monoket b.i.d. with the two doses given 7 hours apart.

### ADMINISTRATION

**P.O.**
- Give patient S.L. tablet at first sign of attack. Tell him to wet tablet with saliva and place under his tongue until absorbed. Dose may be repeated every 10 to 15 minutes for a maximum of three doses.
- Tell patient taking P.O. form of isosorbide dinitrate to swallow oral tablet whole on an empty stomach either 30 minutes before or 1 to 2 hours after meals.
- Store drug in a cool place, in a tightly closed container, and away from light.

### ACTION

Thought to reduce cardiac oxygen demand by decreasing preload and afterload. Drug also may increase blood flow through the collateral coronary vessels.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 15–40 min | Unknown | 4–8 hr |
| P.O. (extended-release) | ½–4 hr | Unknown | 6–12 hr |
| P.O. (S.L.) | 2–5 min | Unknown | 1–4 hr |

*Half-life:* dinitrate P.O., 5 to 6 hours; S.L., 2 hours; mononitrate, about 5 hours.

### ADVERSE REACTIONS

**CNS:** *headache,* dizziness, weakness.
**CV:** *orthostatic hypotension, tachycardia, palpitations, ankle edema, flushing,* fainting.
**EENT:** sublingual burning.
**GI:** nausea, vomiting.
**Skin:** cutaneous vasodilation, rash.

### INTERACTIONS

**Drug-drug.** *Antihypertensives:* May increase hypotensive effects. Monitor patient closely during initial therapy.
*Sildenafil, tadalafil, vardenafil:* May cause life-threatening hypotension. Use of nitrates in any form with these drugs is contraindicated.
**Drug-lifestyle.** *Alcohol use:* May increase hypotension. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

- May falsely reduce value in cholesterol tests using the Zlatkis-Zak color reaction.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with hypersensitivity or idiosyncrasy to nitrates and in those with severe hypotension, angle-closure glaucoma, increased intracranial pressure, shock, or acute MI with low left ventricular filling pressure.
- Use cautiously in patients with blood volume depletion (such as from diuretic therapy) or mild hypotension.

⚠ ***Overdose S&S:*** Venous pooling, decreased cardiac output, hypotension, methemoglobinemia.

## NURSING CONSIDERATIONS

- To prevent tolerance, a nitrate-free interval of 10 to 14 hours per day is recommended. The regimen for isosorbide mononitrate (1 tablet on awakening with the second dose in 7 hours, or 1 extended-release tablet daily) is intended to minimize nitrate tolerance by providing a substantial nitrate-free interval.
- Monitor blood pressure and heart rate and intensity and duration of drug response.
- Drug may cause headaches, especially at beginning of therapy. Dosage may be reduced temporarily, but tolerance usually develops. Treat headache with aspirin or acetaminophen.
- Methemoglobinemia has been seen with nitrates. Symptoms are those of impaired oxygen delivery despite adequate cardiac output and adequate arterial partial pressure of oxygen.
- ***Look alike–sound alike:*** Don't confuse Isordil with Isuprel or Inderal.

## PATIENT TEACHING

- Caution patient to take drug regularly, as prescribed, and to keep it accessible at all times.
- ***Alert:*** Advise patient that stopping drug abruptly may cause spasm of the coronary arteries with increased angina symptoms and potential risk of heart attack.
- Tell patient to take S.L. tablet at first sign of attack. He should wet tablet with saliva and place under his tongue until absorbed; he should sit down and rest. Dose may be repeated every 10 to 15 minutes for a maximum of three doses. If drug doesn't provide relief, tell patient to seek medical help promptly.
- Advise patient who complains of tingling sensation with S.L. drug to try holding tablet in cheek.
- Warn patient not to confuse S.L. with P.O. form.
- Advise patient taking P.O. form of isosorbide dinitrate to take oral tablet on an empty stomach either 30 minutes before or 1 to 2 hours after meals and to swallow oral tablets whole.
- Tell patient to minimize dizziness upon standing up by changing to upright position slowly. Advise him to go up and down stairs carefully and to lie down at first sign of dizziness.
- Caution patient to avoid alcohol because it may worsen low blood pressure effects.
- Advise patient that use of sildenafil, tadalafil, or vardenafil with any nitrate may cause severe low blood pressure. Patient should talk to his prescriber before using these drugs together.
- Instruct patient to store drug in a cool place, in a tightly closed container, and away from light.

# isotretinoin

eye-so-TRET-i-noyn

Amnesteem, Claravis, Sotret

*Therapeutic class:* Antiacne
*Pharmacologic class:* Retinoic acid derivative
*Pregnancy risk category X*

## AVAILABLE FORMS

*Capsules:* 10 mg, 20 mg, 30 mg, 40 mg

## INDICATIONS & DOSAGES

➤ **Severe nodular acne that's unresponsive to conventional therapy**

*Adults and adolescents:* 0.5 to 2 mg/kg P.O. daily in two divided doses with food for 15 to 20 weeks.

## ADMINISTRATION

**P.O.**

- Before use, have patient read patient information and sign accompanying consent form.
- Give drug with or shortly after meals to facilitate absorption.

## ACTION

May normalize keratinization, reversibly decrease size of sebaceous glands, and make sebum less viscous and less likely to plug follicles.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3 hr | Unknown |

*Half-life:* 30 minutes to 39 hours.

## ADVERSE REACTIONS

**CNS:** *pseudotumor cerebri,* depression, ***psychosis, suicidal ideation or attempts, suicide, aggressive and violent behavior,*** emotional instability, headache, fatigue.
**EENT:** *conjunctivitis, epistaxis, drying of mucous membranes, dry nose,* corneal deposits, dry eyes, hearing impairment (sometimes irreversible), decreased night vision, visual disturbances.
**GI:** nonspecific GI symptoms, *nausea, vomiting, abdominal pain, dry mouth,* anorexia, gum bleeding and inflammation, ***acute pancreatitis,*** inflammatory bowel disease.
**Hematologic:** *increased erythrocyte sedimentation rate,* anemia, ***thrombocytosis.***
**Hepatic:** ***hepatitis.***
**Metabolic:** *hypertriglyceridemia,* hyperglycemia.
**Musculoskeletal:** ***rhabdomyolysis,*** skeletal hyperostosis, tendon and ligament calcification, premature epiphyseal closure, decreased bone mineral density and other bone abnormalities, back pain, arthralgia, arthritis, tendinitis.
**Skin:** *cheilitis, cheilosis, fragility, rash, dry skin, facial skin desquamation, petechiae, pruritus, nail brittleness,* thinning of hair, skin infection, peeling of palms and toes, photosensitivity reaction.

## INTERACTIONS

**Drug-drug.** *Corticosteroids:* May increase risk of osteoporosis. Use together cautiously.
*Medicated soaps, cleansers, and coverups; preparations containing alcohol; topical resorcinol peeling agents (benzoyl peroxide):* May have cumulative drying effect. Use together cautiously.
*Micro-dose progesterone hormonal contraceptives ("minipills") that don't contain estrogen:* May decrease effectiveness of contraceptive. Advise patient to use different contraceptive method.
*Phenytoin:* May increase risk of osteomalacia. Use together cautiously.
*Products containing vitamin A, vitamin A:* May increase toxic effects of isotretinoin. Avoid using together.
*Tetracyclines:* May increase risk of pseudotumor cerebri. Avoid using together.
**Drug-food.** *Any food:* May increase absorption of drug. Advise patient to take drug with milk, a meal, or shortly after a meal.
**Drug-lifestyle.** *Alcohol use:* May increase risk of hypertriglyceridemia. Discourage use together.
*Sun exposure:* May increase photosensitivity reaction. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase AST, ALT, alkaline phosphatase, triglyceride, glucose, and uric acid levels.
- May increase platelet count and erythrocyte sedimentation rate.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to parabens (used as preservatives), vitamin A, or other retinoids.

**Black Box Warning** Contraindicated in woman of childbearing potential, unless patient has had two negative pregnancy test results before beginning therapy, will begin drug therapy on second or third day of next menstrual period, and will comply with stringent contraceptive measures for 1 month before therapy, during therapy, and for at least 1 month after therapy. ■

- Use cautiously in patients with a history of mental illness or a family history of psychiatric disorders, asthma, liver disease, diabetes, heart disease, osteoporosis, genetic predisposition for age-related osteoporosis, history of childhood osteoporosis, weak bones, anorexia nervosa, osteomalacia, or other disorders of bone metabolism.

***Overdose S&S:*** Vomiting, facial flushing, abdominal pain, headache, dizziness, ataxia.

## NURSING CONSIDERATIONS

- Patient must have negative results from two urine or serum pregnancy tests; one is performed in the office when the patient is qualified for therapy, the second during the first 5 days of the next normal menstrual period immediately preceding the beginning of therapy. For patients with amenorrhea, the second test should be done at least 11 days after the last unprotected act of sexual intercourse. A pregnancy test must

be repeated every month before the patient receives the prescription.
**Black Box Warning** If pregnancy does occur during treatment, discontinue drug immediately and refer patient to an obstetrician-gynecologist experienced in reproductive toxicity. ■
• Monitor baseline lipid studies, liver function tests, and pregnancy tests before therapy and at monthly intervals.
• Regularly monitor glucose level and CK levels in patients who participate in vigorous physical activity.
• Most adverse reactions occur at doses exceeding 1 mg/kg daily. Reactions are generally reversible when therapy is stopped or dosage is reduced.
***Alert:*** If patient experiences headache, nausea and vomiting, or visual disturbances, screen for papilledema. Signs and symptoms of pseudotumor cerebri require stopping the drug immediately and beginning neurologic interventions promptly.
**Black Box Warning** To minimize the risk of fetal exposure, the drug is only available through a restricted FDA-approved distribution program called iPLEDGE. ■
• A second course of therapy may begin 8 weeks after completion of the first course, if necessary. Improvements may continue after first course is complete.
• Patients may be at increased risk of bone fractures or injury when participating in sports with repetitive impact.
• Spontaneous reports of osteoporosis, osteopenia, bone fractures, and delayed healing of bone fractures have occurred in patients taking drug. To decrease this risk, don't exceed recommended doses and duration.
• ***Look alike–sound alike:*** Don't confuse Accutane with Accupril or Accolate.

## PATIENT TEACHING

**Black Box Warning** Warn woman of childbearing age that, if this drug is used during pregnancy, severe fetal abnormalities may occur. Advise her to either abstain from sex or use two reliable forms of contraception simultaneously for 1 month before, during, and for 1 month after treatment. An isotretinoin medication guide must be given to the patient each time isotretinoin is dispensed, as required by law. ■
• Advise patient to take drug with or shortly after meals to facilitate absorption.
• Tell patient to immediately report visual disturbances and bone, muscle, or joint pain.
• Warn patient that contact lenses may feel uncomfortable during therapy.
• Advise patient not to drive at night until effect on vision is known. Drug may decrease night vision.
• Warn patient against using abrasives, medicated soaps and cleansers, acne preparations containing peeling drugs, and topical products containing alcohol (including cosmetics, aftershave, cologne) because they may cause cumulative irritation or excessive drying of skin.
• Tell patient to avoid prolonged sun exposure and to use sunblock. Drug may have additive effect if used with other drugs that cause photosensitivity reaction.
• Warn patient that transient exacerbations may occur during therapy.
• Warn patient not to donate blood during therapy and for 1 month after stopping drug because drug could harm fetus of a pregnant recipient.
• Tell patient to report adverse reactions immediately, especially depression, suicidal thoughts, persistent headaches, and persistent GI pain.
• Advise patient to read iPLEDGE carefully and to fully understand all information before signing it.

# itraconazole

eye-tra-KON-a-zole

Sporanox

*Therapeutic class:* Antifungal
*Pharmacologic class:* Synthetic triazole
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 100 mg
*Oral solution:* 10 mg/ml

## INDICATIONS & DOSAGES

➤ **Pulmonary and extrapulmonary blastomycosis, nonmeningeal histoplasmosis**

*Adults:* 200 mg P.O. daily; increase as needed and tolerated by 100 mg to maximum of 400 mg daily. Give dosages exceeding 200 mg P.O. daily in two divided doses. Continue treatment for at least 3 months. In life-threatening illness, give a loading dose of 200 mg P.O. t.i.d. for 3 days.

➤ **Aspergillosis**

*Adults:* 200 to 400 mg P.O. daily.

➤ **Onychomycosis of the toenail (with or without fingernail involvement)**

*Adults:* 200 mg P.O. once daily for 12 consecutive weeks.

➤ **Onychomycosis of the fingernail**

*Adults:* 200 mg P.O. b.i.d. for 1 week, followed by 3 weeks drug free. Repeat dosage.

➤ **Oropharyngeal candidiasis**

*Adults:* 200 mg oral solution swished in mouth vigorously and swallowed daily, for 1 to 2 weeks.

➤ **Oropharyngeal candidiasis in patients unresponsive to fluconazole tablets**

*Adults:* 100 mg oral solution swished in mouth vigorously and swallowed b.i.d., for 2 to 4 weeks.

➤ **Esophageal candidiasis**

*Adults:* 100 to 200 mg oral solution swished in mouth vigorously and swallowed daily, for at least 3 weeks. Treatment should continue for 2 weeks after symptoms resolve.

## ADMINISTRATION

**P.O.**

- Before starting therapy, confirm diagnosis of onychomycosis by sending nail specimens for testing.
- Don't interchange capsules and oral solution.

## ACTION

Interferes with fungal cell-wall synthesis by inhibiting ergosterol formation and increasing cell-wall permeability, leading to osmotic instability.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3–4 hr | Unknown |

*Half-life:* 1 to 8¼ hours.

## ADVERSE REACTIONS

**CNS:** *headache,* fever, dizziness, somnolence, fatigue, malaise, asthenia, pain, tremor, abnormal dreams, anxiety, depression.

**CV:** ***heart failure,*** hypertension, edema, orthostatic hypotension.

**EENT:** rhinitis, sinusitis, pharyngitis.

**GI:** *nausea,* vomiting, diarrhea, abdominal pain, anorexia, dyspepsia, flatulence, increased appetite, constipation, gastritis, gastroenteritis, ulcerative stomatitis, gingivitis.

**GU:** albuminuria.

**Hematologic:** ***neutropenia.***

**Hepatic:** ***hepatotoxicity, liver failure,*** impaired hepatic function.

**Metabolic:** hypokalemia, hypertriglyceridemia.

**Musculoskeletal:** myalgia.

**Respiratory:** ***pulmonary edema,*** upper respiratory tract infection.

**Skin:** rash, pruritus.

**Other:** decreased libido, injury, herpes zoster, *hypersensitivity reactions (urticaria,* ***angioedema, Stevens-Johnson syndrome).***

## INTERACTIONS

**Drug-drug.** *Alprazolam, midazolam, triazolam:* May increase and prolong drug levels, CNS depression, and psychomotor impairment. Avoid using together.

*Antacids, carbamazepine, $H_2$-receptor antagonists, isoniazid, phenobarbital,* ***phenytoin,*** *rifabutin, rifampin:* May decrease itraconazole level. Avoid using together.

*Chlordiazepoxide, clonazepam, clorazepate, diazepam, estazolam, flurazepam, quazepam:* May increase and prolong drug levels, CNS depression, and psychomotor impairment. Avoid using together.

*Clarithromycin, erythromycin:* May increase itraconazole levels. Monitor patient for signs of itraconazole toxicity.

*Cyclosporine,* ***digoxin,*** *tacrolimus:* May increase levels of these drugs. Monitor drug levels.

**Black Box Warning** *Dofetilide , pimozide, quinidine:* May increase levels of these drugs by cytochrome P-450 metabolism, causing serious CV events, including torsades de pointes, QT interval prolongation,

ventricular tachycardia, cardiac arrest, and sudden death. Avoid using together. ■
*HMG-CoA reductase inhibitors (atorvastatin, fluvastatin, lovastatin, pravastatin, simvastatin):* May increase levels and adverse effects of these drugs. Avoid using together, or reduce dose of HMG-CoA reductase inhibitor. Don't use itraconazole with lovastatin or simvastatin.
*Indinavir, ritonavir, saquinavir:* May increase levels of these drugs; indinavir and ritonavir may increase itraconazole levels. Monitor patient for toxicity.
*Oral anticoagulants:* May enhance anticoagulant effect. Monitor PT and INR.
*Oral antidiabetics:* May cause hypoglycemia, similar to effect of other antifungals. Monitor glucose level. Avoid using together.
*Phosphodiesterase type 5 (PDE5) inhibitors (sildenafil, tadalafil, vardenafil):* May increase levels of these drugs, increasing adverse effects. Give PDE5 inhibitors with caution and in reduced doses.
**Drug-food.** *Grapefruit and orange juice:* May decrease drug level and therapeutic effect. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, bilirubin, triglyceride, and GGT levels. May decrease potassium level.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Contraindicated in patients hypersensitive to drug or those receiving alprazolam, dofetilide, ergot alkaloids, lovastatin, midazolam, pimozide, quinidine, simvastatin, or triazolam; in those with ventricular dysfunction or a history of heart failure; and in those who are breast-feeding. If signs and symptoms of heart failure occur, stop itraconazole. ■

- Use cautiously in patients with hypochlorhydria; they may not absorb drug readily.
- Use cautiously in HIV-infected patients because hypochlorhydria can accompany HIV infection.
- Use cautiously in patients receiving other highly bound drugs.

## NURSING CONSIDERATIONS

***Alert:*** Capsules and oral solution aren't interchangeable.

- Perform baseline liver function tests and monitor results periodically. In patients with baseline hepatic impairment, give drug only if patient's condition is life threatening. If liver dysfunction occurs during therapy, notify prescriber immediately.

## PATIENT TEACHING

- Teach patient to recognize and report signs and symptoms of liver disease (anorexia, dark urine, pale stools, unusual fatigue, and jaundice).
- Instruct patient not to use oral solution interchangeably with capsules.
- For the oral solution, tell patient to take 10 ml at a time.
- Advise patient to take solution without food and to take capsules with a full meal.
- Urge patient to list the other drugs he's taking for prescriber to avoid drug interactions.
- Advise women of childbearing age that an effective form of contraception must be used during therapy and for two menstrual cycles after stopping therapy with capsules.

**SAFETY ALERT!**

# ixabepilone

ecks-ah-BEH-pill-own

Ixempra

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Microtubule inhibitor
*Pregnancy risk category D*

## AVAILABLE FORMS

*Injection:* 15 mg, 45 mg vials

## INDICATIONS & DOSAGES

➤ **With capecitabine for metastatic or locally advanced breast cancer, after failure of anthracycline and a taxane; or alone for metastatic or locally advanced breast cancer, after failure of anthracycline, taxanes, and capecitabine**
*Adults:* 40 mg/m$^2$ I.V. over 3 hours every 3 weeks. Doses for patients with body

surface area (BSA) greater than 2.2 $m^2$ should be calculated based on 2.2 $m^2$. Premedicate with an $H_1$ antagonist, such as diphenhydramine 50 mg P.O. and an $H_2$ antagonist such as ranitidine 150 to 300 mg 1 hour before ixabepilone infusion.

***Adjust-a-dose:*** If toxicities occur, refer to package insert for adjustments for monotherapy and combination therapy.

In patients with hepatic impairment receiving combination therapy who have an AST or ALT up to 2.5 × ULN or bilirubin up to 1 × ULN, the standard dose may be given. Treatment is contraindicated with higher AST, ALT, or bilirubin levels. Patients with moderate hepatic impairment receiving monotherapy should be started at 20 mg/$m^2$. The dosage in subsequent cycles may be increased to 30 mg/$m^2$ if tolerated. Use in patients with AST or ALT greater than 10 × ULN or bilirubin greater than 2 × ULN isn't recommended. Refer to package insert for additional guidance.

## ADMINISTRATION

### I.V.

▼ Protect drug from light.
▼ Keep refrigerated. Let stand at room temperature for 30 minutes before administration.
▼ The white precipitate in diluent will clear at room temperature.
▼ Drug may be a contact irritant; handle and give with care. Wear gloves and avoid inhaling vapors.
▼ Reconstitute drug before use, using supplied diluent, to a concentration of 15 mg/8 ml or 45 mg/23.5 ml. Gently swirl and invert vial.
▼ Before giving drug, further dilute with lactated Ringer's solution supplied in di(2-ethylhexyl) phthalate (DEHP)–free bags. Final concentration should yield 0.2 mg/ml to 0.6 mg/ml.
▼ Infuse within 6 hours of preparation.
▼ Administer through a 0.2- to 1.2-micron in-line filter, using a DEHP-free administration set.
▼ **Incompatibilities:** Unknown. Don't give with other I.V. drugs.

## ACTION

Causes cell death by inhibiting cell division.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Rapid | 3 hr | 3 wk |

*Half-life:* 52 hours.

## ADVERSE REACTIONS

**CNS:** insomnia, *peripheral neuropathy, headache, fatigue, asthenia,* dizziness, fever, pain.
**CV:** *edema,* chest pain.
**EENT:** increased lacrimation.
**GI:** *anorexia, taste disorder, nausea, vomiting, stomatitis, mucositis, diarrhea, constipation, abdominal pain,* gastroesophageal reflux disease.
**Hematologic:** **FEBRILE NEUTROPENIA, LEUKOPENIA,** anemia, **THROMBOCYTOPENIA.**
**Hepatic:** ***acute hepatic failure,*** jaundice.
**Metabolic:** dehydration, weight loss.
**Musculoskeletal:** *myalgia, arthralgia, skeletal pain.*
**Respiratory:** upper respiratory tract infection, dyspnea, cough.
**Skin:** *alopecia, rash, nail disorder, palmer-plantar erythrodysesthesia disorder,* pruritus, exfoliation, *hyperpigmentation.*
**Other:** hypersensitivity reactions, hot flush.

## INTERACTIONS

**Drug-drug.** *CYP3A4 inducers (such as dexamethasone, phenytoin, carbamazepine, rifampin, rifampicin, rifabutin, or phenobarbital):* May decrease ixabepilone level, causing treatment failure. Avoid using together.
*CYP3A4 inhibitors (such as ketoconazole, itraconazole, clarithromycin, atazanavir, nefazodone, saquinavir, telithromycin, ritonavir, amprenavir, indinavir, nelfinavir, delavirdine, or voriconazole):* May increase ixabepilone level. Avoid using together. If use together is necessary, decrease ixabepilone dose according to manufacturer's instructions.
**Drug-herb.** *St. John's wort:* May decrease drug level. Discourage use together.
**Drug-food.** *Grapefruit juice:* May increase drug level. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

- May increase bilirubin, AST, and ALT levels.
- May decrease neutrophil, WBC, RBC, and platelet counts.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Contraindicated in patients with neutrophil counts less than 1,500 cells/$mm^3$ or platelet count less than 100,000 cells/$mm^3$.

**Black Box Warning** Contraindicated in patients with AST or ALT > 2.5 × ULN or bilirubin > 1 × ULN in combination with capecitabine.

- Use cautiously in patients with cardiac disease.

### NURSING CONSIDERATIONS

- Monitor baseline and periodic CBC and liver enzymes and adjust dose as needed.
- Premedicate with $H_1$ and $H_2$ antagonists 1 hour before infusion to avoid hypersensitivity reaction. If patient experiences a hypersensitivity reaction, also premedicate with corticosteroids.
- Monitor cardiac function. Discontinue drug in those who develop cardiac ischemia or impaired cardiac function.
- In patients with CNS changes, be aware that drug contains dehydrated alcohol.
- Monitor for signs of peripheral neuropathy, hypersensitivity reactions or infections.
- Peripheral neuropathy is generally reversible and should be managed by dose adjustment and delays.
- Drug may cause fetal harm. Tell patient to avoid becoming pregnant.
- Because of drug's potential risk, breast-feeding should be stopped or drug should be stopped.
- Elderly patients have a greater risk of grade 3 or 4 adverse effects when used with capecitabine.

### PATIENT TEACHING

- Tell patient to report numbness or tingling of hands or feet.
- Advise patient to call prescriber for fever above 100.5° F (38° C) or signs of infections such as chills, cough, or pain or burning on urination.
- Advise patient to call prescriber for skin rash, itching, flushing, swelling, difficulty breathing, or chest tightness.
- Tell patient that he will need periodic blood testing during treatment.
- Tell patient not to drink grapefruit juice while taking drug.

***Alert:*** Advise patient that ixabepilone contains alcohol. Avoid dangerous activities such as driving or operating machinery if dizzy or drowsy.

- Caution women of childbearing age to avoid pregnancy and breast-feeding during therapy.

## ketoconazole (oral)

kee-toe-KOE-na-zole

Nizoral

*Therapeutic class:* Antifungal
*Pharmacologic class:* Imidazole derivative
*Pregnancy risk category C*

K

### AVAILABLE FORMS

*Tablets:* 200 mg

### INDICATIONS & DOSAGES

➤ **Systemic candidiasis, chronic mucocutaneous candidiasis, oral candidiasis, candiduria, coccidioidomycosis, blastomycosis, histoplasmosis, chromomycosis, and paracoccidioidomycosis; severe cutaneous dermatophyte infections that are resistant to topical therapy**

*Adults and children who weigh more than 40 kg (88 lb):* Initially, 200 mg P.O. daily in a single dose. Dosage may be increased to 400 mg once daily in patients who don't respond.

*Children age 2 and older:* 3.3 to 6.6 mg/kg P.O. daily in a single dose.

### ADMINISTRATION

**P.O.**

- For patient with achlorhydria, dissolve each tablet in 4 ml aqueous solution of 0.2 N hydrochloric acid and have patient sip solution through a glass or plastic straw. Then have patient drink a glass of water

because drug needs gastric acidity for dissolution and absorption.
• Patient should wait at least 2 hours after dose before taking antacids, anticholinergics, and histamine-2 ($H_2$) blockers.

## ACTION

Interferes with fungal cell-wall synthesis by inhibiting formation of ergosterol and increasing cell-wall permeability that makes the fungus susceptible to osmotic instability.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | Unknown |

*Half-life:* 8 hours.

## ADVERSE REACTIONS

**CNS:** ***suicidal tendencies,*** severe depression.
**GI:** nausea, vomiting, abdominal pain, diarrhea.
**Hematologic:** ***leukopenia, thrombocytopenia.***
**Hepatic:** ***fatal hepatotoxicity.***
**Skin:** pruritus.

## INTERACTIONS

**Drug-drug.** *Antacids, anticholinergics, $H_2$-receptor antagonists:* May decrease absorption of ketoconazole. Wait at least 2 hours after ketoconazole dose before giving these drugs.
*Chlordiazepoxide, clonazepam, clorazepate, diazepam, estazolam, flurazepam, midazolam, quazepam, triazolam:* May increase and prolong levels of these drugs. May cause CNS depression and psychomotor impairment. Avoid using together.
*Cyclosporine, methylprednisolone, tacrolimus:* May increase drug levels. Monitor drug levels, if appropriate.
*Digoxin:* May increase digoxin level. Monitor digoxin level.
*Isoniazid, rifampin:* May increase ketoconazole metabolism. Monitor patient for decreased antifungal effect.
*HMG-CoA reductase inhibitors (atorvastatin, fluvastatin, lovastatin, pravastatin, simvastatin):* May increase levels and adverse effects of these drugs. Avoid using together, or reduce dose of HMG-CoA reductase inhibitor.
*Oral antidiabetics:* May cause hypoglycemia. Monitor glucose level.
*Paclitaxel:* May inhibit metabolism. Use together cautiously.
*Phenytoin:* May alter the metabolism of one or both drugs. Monitor patient for adverse effects.
*Rifampin, isoniazid:* May decrease ketoconazole level. Avoid using together.
*Theophylline:* May decrease theophylline level. Monitor theophylline level.
*Warfarin:* May enhance effects of anticoagulant. Monitor PT and INR and adjust dosage, as needed.
**Drug-herb.** *Yew:* May inhibit drug metabolism. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

• May increase lipid, alkaline phosphatase, ALT, and AST levels. May decrease hemoglobin level.
• May decrease platelet and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or any of its components.
**Black Box Warning** Due to increased risk of hepatotoxicity, use cautiously in patients with hepatic disease and in those taking other hepatotoxic drugs.
• Women taking ketoconazole shouldn't breast-feed.

## NURSING CONSIDERATIONS

***Alert:*** Because of risk of hepatotoxicity, drug shouldn't be used for less serious conditions, such as fungal infections of skin or nails.
**Black Box Warning** Due to increased risk of hepatotoxicity, monitor patient for signs and symptoms of hepatotoxicity, including elevated liver enzyme levels, nausea that doesn't subside, and unusual fatigue, jaundice, dark urine, or pale stool.
• Doses up to 800 mg/day can be used to treat fungal meningitis and intracerebral fungal lesions.
***Alert:*** Drug is a potent inhibitor of the cytochrome P-450 enzyme system. Giving this drug with drugs metabolized by the cytochrome P-450 3A4 enzyme system may lead to increased drug levels, which could increase or prolong therapeutic and adverse effects.

### PATIENT TEACHING

- Instruct patient with achlorhydria to dissolve each tablet in 4 ml aqueous solution of 0.2 N hydrochloric acid, sip mixture through a glass or plastic straw, and then drink a glass of water because drug needs gastric acidity for dissolution and absorption.
- Instruct patient to wait at least 2 hours after dose before taking antacids, anticholinergics, or $H_2$ blockers.
- Make sure patient understands that treatment should continue until all tests indicate that active fungal infection has subsided. If drug is stopped too soon, infection will recur. Minimum treatment for candidiasis is 7 to 14 days; for other systemic fungal infections, 6 months; for resistant dermatophyte infections, at least 4 weeks.
- Reassure patient that nausea is common early in therapy but will subside. To minimize nausea, instruct patient to divide daily amount into two doses or take drug with meals.
- Review signs and symptoms of hepatotoxicity with patient; instruct him to stop drug and notify prescriber if they occur.
- Advise patient to discuss any new drugs or herbal supplements with prescriber.

## ketoconazole (topical)

kee-toe-KOE-na-zole

Extina, Ketoderm†, Ketozole, Nizoral, Nizoral A-D ◇, Xolegel

*Therapeutic class:* Antifungal
*Pharmacologic class:* Imidazole
*Pregnancy risk category C*

### AVAILABLE FORMS

*Cream:* 2%
*Foam:* 2%
*Gel:* 2%
*Shampoo:* 1% ◇, 2%

### INDICATIONS & DOSAGES

➤ **Seborrheic dermatitis in immunocompetent patients**

*Adults and children age 12 and older:* Apply foam to affected area b.i.d. for 4 weeks. Apply gel to affected area once daily for 2 weeks.

➤ **Tinea corporis, tinea cruris, tinea pedis, tinea versicolor from susceptible organisms; seborrheic dermatitis; cutaneous candidiasis**

*Adults:* Cover affected and immediate surrounding areas daily for at least 2 weeks. For seborrheic dermatitis, apply b.i.d. for 4 weeks. Patients with tinea pedis need 6 weeks of treatment.

➤ **Scaling caused by dandruff**

*Adults:* Using shampoo, wet hair, lather, and massage for 1 minute. Rinse hair thoroughly with warm water, then repeat. Leave drug on scalp for 3 minutes, then rinse and dry hair with towel or warm air flow. Shampoo twice weekly for 4 weeks, with at least 3 days between shampoos and then intermittently, as needed, to maintain control.

### ADMINISTRATION

**Topical**

- Don't let drug come in contact with eyes.

### ACTION

Probably inhibits yeast growth by altering the permeability of the cell membrane.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**Skin:** abnormal hair texture, increase in normal hair loss, irritation, pruritus, oiliness, or dryness of hair and scalp with shampoo use, scalp pustules, severe irritation, pruritus, and stinging with cream.

### INTERACTIONS

None known.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in pregnant and breast-feeding women.
- Ketoconazole cream contains sulfites that may cause allergic reactions, including anaphylaxis, in susceptible patients.

## NURSING CONSIDERATIONS

- Most patients show improvement soon after treatment begins.
- Treatment of tinea corporis or tinea cruris should continue for at least 2 weeks to reduce possibility of recurrence.

***Alert:*** Product contains sodium sulfite anhydrous, which may cause severe or life-threatening allergic reactions, including anaphylaxis, in patients with asthma.

## PATIENT TEACHING

- Tell patient to stop drug and notify prescriber if hypersensitivity reaction occurs.
- Advise patient to check with prescriber if condition worsens; drug may have to be stopped and diagnosis reevaluated.
- Tell patient to avoid using shampoo on scalp if skin is broken or inflamed.
- Warn patient that shampoo applied to permanent-waved hair removes curl.
- Warn patient to avoid drug contact with eyes.
- Tell patient to continue drug for intended duration of therapy, even if signs and symptoms improve soon after starting treatment.
- Tell patient not to store drug above room temperature (77° F [25° C]) and to protect from light.

# ketoprofen

kee-toe-PROE-fen

Apo-Keto†

*Therapeutic class:* NSAID
*Pharmacologic class:* NSAID
*Pregnancy risk category B; D in 3rd trimester*

## AVAILABLE FORMS

*Capsules:* 25 mg, 50 mg, 75 mg
*Capsules (extended-release):* 100 mg, 150 mg, 200 mg
*Suppositories:* 50 mg†, 100 mg†
*Tablets (enteric-coated):* 50 mg†, 100 mg†
*Tablets (extended-release):* 200 mg†

## INDICATIONS & DOSAGES

➤ **Rheumatoid arthritis, osteoarthritis**
*Adults:* 75 mg t.i.d. or 50 mg q.i.d., or 200 mg as an extended-release tablet once daily. Maximum dose is 300 mg daily, or 200 mg daily for extended-release capsules. Or, 50 or 100 mg P.R. b.i.d.; or one suppository at bedtime (with oral ketoprofen during the day).

➤ **Mild to moderate pain, dysmenorrhea**
*Adults:* 25 to 50 mg P.O. every 6 to 8 hours p.r.n. Maximum dose is 300 mg daily.

***Adjust-a-dose:*** For patients age 75 and older, reduce dosage. For patients with mildly impaired renal function, maximum daily dose is 150 mg. For patients with glomerular filtration rate of less than 25 ml/minute/1.73 $m^2$, end-stage renal disease, or impaired liver function and serum albumin level less than 3.5 g/dl, maximum daily dose is 100 mg.

## ADMINISTRATION

**P.O.**

- Give drug 30 minutes before or 2 hours after meals with a full glass of water. If adverse GI reactions occur, drug may be given with milk or meals.
- Don't crush delayed-release or extended-release tablets.

**Rectal**

- Rectal suppository replaces oral dose; don't use suppository in addition to tablets or capsules.

## ACTION

Unknown. Produces anti-inflammatory, analgesic, and antipyretic effects, possibly by inhibiting prostaglandin synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. (extended-release) | 2–3 hr | 6–7 hr | Unknown |
| P.O., P.R. | 1–2 hr | 30–120 min | 3–4 hr |

*Half-life:* 2 to 5½ hours for extended-release forms.

## ADVERSE REACTIONS

**CNS:** headache, dizziness, CNS excitation (which includes insomnia, nervousness, and dreams) or CNS depression (which includes somnolence and malaise).
**CV:** peripheral edema.
**EENT:** tinnitus, visual disturbances.
**GI:** *dyspepsia*, abdominal pain, anorexia, constipation, diarrhea, flatulence, nausea, stomatitis, vomiting.

**GU:** ***nephrotoxicity,*** UTI signs and symptoms.
**Skin:** photosensitivity reactions, rash.

## INTERACTIONS

**Drug-drug.** *Aspirin, corticosteroids:* May increase risk of adverse GI reactions. Avoid using together.
*Aspirin, probenecid:* May increase ketoprofen level. Avoid using together.
*Cyclosporine:* May increase nephrotoxicity. Avoid using together.
*Hydrochlorothiazide, other diuretics:* May decrease diuretic effectiveness. Monitor patient for lack of effect.
*Lithium, methotrexate, phenytoin:* May increase levels of these drugs, leading to toxicity. Monitor patient closely.
*Warfarin:* May increase risk of bleeding. Monitor patient closely.
**Drug-herb.** *Dong quai, feverfew, garlic, ginger, horse chestnut, red clover:* May cause bleeding based on the known effects of components. Discourage use together.
*White willow:* Herb and drug contain similar components. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May cause GI toxicity. Discourage use together.
*Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase creatinine, BUN, ALT, and AST levels.
- May increase bleeding time.
- May increase or decrease iron test results.
- May falsely increase bilirubin level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with history of aspirin- or NSAID-induced asthma, urticaria, or other allergic reactions.

**Black Box Warning** Contraindicated for the treatment of perioperative pain after CABG surgery.

- Avoid use during last trimester of pregnancy.
- Drug isn't recommended for children or breast-feeding women.
- Use cautiously in patients with history of peptic ulcer disease, renal dysfunction, hypertension, heart failure, or fluid retention.

***Overdose S&S:*** Lethargy, drowsiness, nausea, vomiting, epigastric pain, respiratory depression, coma, seizures, GI bleeding, hypotension, hypertension, acute renal failure.

## NURSING CONSIDERATIONS

- Don't use sustained-release form for patients in acute pain.
- Because NSAIDs impair synthesis of renal prostaglandins, they can decrease renal blood flow and lead to reversible renal impairment, especially in patients with renal or heart failure or liver dysfunction, in elderly patients, and in those taking diuretics. Monitor these patients closely.
- Check renal and hepatic function every 6 months or as indicated.
- Drug decreases platelet adhesion and aggregation, and can prolong bleeding time about 3 to 4 minutes from baseline.

**Black Box Warning** NSAIDs cause an increased risk of serious GI adverse events including bleeding, ulceration, and perforation of the stomach or intestines, which can be fatal. Elderly patients are at greater risk.

**Black Box Warning** NSAIDs may increase the risk of serious thrombotic events, MI, or stroke, which can be fatal. The risk may be greater with longer use or in patients with CV disease or risk factors for CV disease.

- NSAIDs may mask signs and symptoms of infection because of their antipyretic and anti-inflammatory actions.

## PATIENT TEACHING

***Alert:*** Drug is available without prescription. Instruct patient not to exceed 75 mg daily.

- Tell patient to take drug 30 minutes before or 2 hours after meals with a full glass of water. If adverse GI reactions occur, patient may take drug with milk or meals.
- Tell patient not to crush delayed-release or extended-release tablets.
- Tell patient that full therapeutic effect may be delayed for 2 to 4 weeks.
- Teach patient signs and symptoms of GI bleeding, including blood in vomit, urine, or stool; coffee-ground vomit; and black,

tarry stool. Tell him to notify prescriber immediately if any of these occurs.
• Alert patient that using with aspirin, alcohol, other NSAIDs, or corticosteroids may increase risk of adverse GI reactions.
• Warn patient to avoid hazardous activities that require mental alertness until CNS effects are known.
• Because of possibility of sensitivity to the sun, advise patient to use a sunblock, wear protective clothing, and avoid prolonged exposure to sunlight.
• Instruct patient to report problems with vision or hearing immediately.
• Tell patient to protect drug from direct light and excessive heat and humidity.

## ketorolac tromethamine (ophthalmic)

KEE-toe-role-ak

Acular, Acular PF, Acular LS, Acuvail

*Therapeutic class:* Anti-inflammatory (ophthalmic)
*Pharmacologic class:* NSAID
*Pregnancy risk category C*

### AVAILABLE FORMS

**Acular**
*Ophthalmic solution:* 0.5%
**Acular PF**
*Ophthalmic solution:* 0.5%
**Acular LS**
*Ophthalmic solution:* 0.4%
**Acuvail**
*Ophthalmic solution:* 0.45%

### INDICATIONS & DOSAGES

➤ **Relief from ocular itching caused by seasonal allergic conjunctivitis (Acular)**
*Adults and children age 3 and older:* 1 drop into conjunctival sac in each eye q.i.d.

➤ **Postoperative inflammation in patients who have had cataract extraction (Acular)**
*Adults and children age 3 and older:* 1 drop to affected eye q.i.d. beginning 24 hours after cataract surgery and continuing through first 2 weeks of postoperative period.

➤ **Reduce ocular pain, burning, and stinging after corneal refractive surgery (Acular LS)**
*Adults and children age 3 and older:* 1 drop q.i.d. to affected eye, as needed, for up to 4 days after surgery.

➤ **Reduce pain and photophobia after incisional refractive surgery (Acular PF)**
*Adults and children age 3 and older:* 1 drop q.i.d. to affected eye, as needed, for up to 3 days after surgery.

➤ **Reduce pain and inflammation after cataract surgery (Acuvail)**
*Adults:* 1 drop b.i.d. to affected eye beginning 1 day before surgery, continuing on day of surgery, and through first 2 weeks after surgery.

### ADMINISTRATION

**Ophthalmic**
• Apply light finger pressure on lacrimal sac for 1 minute after instillation.
• Store drug away from heat in a dark, tightly closed container and protect from freezing.

### ACTION

Thought to inhibit the action of cyclooxygenase, an enzyme responsible for prostaglandin synthesis. Prostaglandins mediate the inflammatory response and cause miosis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Unknown | Unknown | Unknown |

*Half-life:* 4 hours.

### ADVERSE REACTIONS

**CNS:** headache (Acular LS).
**EENT:** *transient stinging and burning on instillation*, conjunctival hyperemia, corneal edema, corneal infiltrates, iritis, ocular edema and ocular pain (Acular LS), ocular inflammation (Acular), ocular irritation, ocular pain, superficial keratitis, superficial ocular infections.
**Other:** hypersensitivity reactions.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to components of drug and in those wearing soft contact lenses.
- Use cautiously in patients with bleeding disorders or those hypersensitive to other NSAIDs or aspirin. Use cautiously in breast-feeding women.

## NURSING CONSIDERATIONS

- Acuvail may be used with other topical ophthalmics when given at least 5 minutes apart.
- ***Look alike–sound alike:*** Don't confuse Acular with Acthar.

## PATIENT TEACHING

- Teach patient how to instill drops. Advise him to wash hands before and after instilling solution, and warn him not to touch tip of dropper to eye or surrounding tissue.
- Advise patient to apply light finger pressure on lacrimal sac for 1 minute after instillation.
- Stress importance of compliance with recommended therapy.
- Tell patient not to instill drops while wearing contact lenses.
- Advise patient to report excessive bleeding or bruising to prescriber.
- Remind patient to discard drug when it's no longer needed.

# ketorolac tromethamine (oral; injection)

KEE-toe-role-ak

Sprix, Toradol†

*Therapeutic class:* NSAID
*Pharmacologic class:* NSAID
*Pregnancy risk category C; D in 3rd trimester*

## AVAILABLE FORMS

*Injection:* 15 mg/ml in 1- and 2-ml vials and 1-ml Tubex syringes, 30 mg/ml in 1- and 2-ml single-dose vials, 1- and 2-ml Tubex syringes, and 10-ml multiple-dose vials
*Nasal spray:* 15.75 mg/spray
*Tablets:* 10 mg

## INDICATIONS & DOSAGES

➤ **Short-term management of moderately severe, acute pain for single-dose treatment**

*Adults younger than age 65:* 60 mg I.M. or 30 mg I.V.
*Children ages 2 to 16:* 1 mg/kg I.M. (maximum dose 30 mg) or 0.5 mg/kg I.V. (maximum dose 15 mg).
*Adults age 65 and older:* 30 mg I.M. or 15 mg I.V.
***Adjust-a-dose:*** For renally impaired patients or those who weigh less than 50 kg (110 lb), 30 mg I.M. or 15 mg I.V.

➤ **Short-term management of moderately severe, acute pain for multiple-dose treatment**

*Adults younger than age 65:* 30 mg I.M. or I.V. every 6 hours for maximum of 5 days. Maximum daily dose is 120 mg. Or, 31.5 mg (one 15.75-mg spray in each nostril) every 6 to 8 hours; maximum daily dose is 126 mg.
*Adults age 65 and older:* 15 mg I.M. or I.V. every 6 hours for maximum of 5 days. Maximum daily dose is 60 mg. Or, 15.75 mg (one spray in only one nostril) every 6 to 8 hours; maximum daily dose is 63 mg.
***Adjust-a-dose:*** For renally impaired patients or those who weigh less than 50 kg, 15 mg I.M. or I.V. every 6 hours. Maximum daily dose is 60 mg. Or, 15.75 mg (one spray in only one nostril) every 6 to 8 hours; maximum daily dose is 63 mg.

➤ **Short-term management of moderately severe, acute pain when switching from parenteral to oral administration (oral therapy is indicated only as continuation of parenterally given drug and should never be given without patient first having received parenteral therapy)**

*Adults younger than age 65:* 20 mg P.O. as single dose; then 10 mg P.O. every 4 to 6 hours for maximum of 5 days. Maximum daily dose is 40 mg.
*Adults age 65 and older:* 10 mg P.O. as single dose; then 10 mg P.O. every 4 to 6 hours for maximum of 5 days. Maximum daily dose is 40 mg.
***Adjust-a-dose:*** For renally impaired patients or those who weigh less than 50 kg, give 10 mg P.O. as single dose; then 10 mg P.O.

every 4 to 6 hours. Maximum daily dose is 40 mg.

## ADMINISTRATION

**P.O.**

- Give drug with food if GI upset occurs.

**I.V.**

- ▼ Dilute with normal saline solution, $D_5W$, 5% dextrose and normal saline solution, Ringer's solution, lactated Ringer's solution, or Plasma-Lyte A.
- ▼ Give injection over at least 15 seconds.
- ▼ Protect from light.
- ▼ **Incompatibilities:** Azithromycin; fenoldopam mesylate; haloperidol lactate; nalbuphine; solutions that result in a relatively low pH, such as hydroxyzine, meperidine, morphine sulfate, and prochlorperazine; thiethylperazine.

**I.M.**

- When appropriate, give by deep I.M. injection.
- Patient may feel pain at injection site.
- Put pressure on site for 15 to 30 seconds after injection to minimize local effects.

**Intranasal**

- Discard nasal spray within 24 hours of first dose, even if bottle still contains medication.
- Each 1.7-g bottle contains eight sprays.
- Activate pump before first use by pumping five times.
- Have patient blow his nose before use, sit upright or stand, and tilt his head slightly forward.
- Insert tip into the nostril, point away from the septum, and spray once.

## ACTION

May inhibit prostaglandin synthesis, to produce anti-inflammatory, analgesic, and antipyretic effects.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30–60 min | 30–60 min | 6–8 hr |
| I.V. | Immediate | 1–3 min | 6–8 hr |
| I.M. | 10 min | 30–60 min | 6–8 hr |
| Intranasal | Unknown | ½–2 hr | 6–8 hr |

*Half-life:* 4 to 6 hours.

## ADVERSE REACTIONS

**CNS:** *headache*, dizziness, drowsiness, sedation.

**CV:** ***arrhythmias,*** edema, hypertension, palpitations.

**EENT:** (nasal spray only) increased lacrimation, *nasal discomfort, rhinalgia,* rhinitis, throat irritation.

**GI:** *dyspepsia, GI pain, nausea,* constipation, diarrhea, flatulence, peptic ulceration, stomatitis, vomiting.

**GU:** ***renal failure.***

**Hematologic:** decreased platelet adhesion, prolonged bleeding time, purpura.

**Skin:** diaphoresis, pruritus, rash.

**Other:** pain at injection site.

## INTERACTIONS

**Drug-drug.** *ACE inhibitors, angiotensin II receptor antagonists:* May cause renal impairment, particularly in volume-depleted patients. Avoid using together in volume-depleted patients.

*Anticoagulants:* May increase anticoagulant levels in the blood. Use together with extreme caution and monitor patient closely.

*Antiepileptic (such as carbamazepine, phenytoin):* May increase seizure activity. Use together cautiously.

*Antihypertensives, diuretics:* May decrease effectiveness. Monitor patient closely.

*Lithium:* May increase lithium level. Monitor patient closely.

*Methotrexate:* May decrease methotrexate clearance and increased toxicity. Avoid using together.

*Pentoxifylline:* May increase risk of bleeding. Avoid use together.

***Probenecid:*** May increase level and toxicity of ketorolac. Avoid using together.

***Salicylates:*** May increase the risk of serious ketorolac adverse effects. Avoid using together.

*SSRIs:* May increase risk of GI bleeding. Use together cautiously.

**Drug-herb.** *Dong quai, feverfew, garlic, ginger, horse chestnut, red clover:* May cause bleeding. Discourage use together.

*White willow:* Herb and drug contain similar components. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT and AST levels.
- May increase bleeding time.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Contraindicated in patients hypersensitive to drug and in those with active peptic ulcer disease, recent GI bleeding or perforation, advanced renal impairment, cerebrovascular bleeding, hemorrhagic diathesis, or incomplete hemostasis, women during labor and delivery and while breast-feeding, and those at risk for renal impairment from volume depletion or at risk for bleeding. ■

**Black Box Warning** Contraindicated in children younger than age 2 and in patients with history of peptic ulcer disease or GI bleeding or past allergic reactions to aspirin or other NSAIDs. ■

**Black Box Warning** Nasal spray hasn't been approved for pediatric use. ■

**Black Box Warning** Contraindicated as prophylactic analgesic before major surgery or intraoperatively when hemostasis is critical; and in patients currently receiving aspirin, an NSAID, or probenecid. ■

**Black Box Warning** Contraindicated for treatment of perioperative pain in patients requiring coronary artery bypass graft surgery. ■

**Black Box Warning** Contraindicated in patients currently receiving aspirin or NSAIDs. ■

• Use cautiously in patients who are elderly or have hepatic or renal impairment or cardiac decompensation.

⚠ ***Overdose S&S:*** Abdominal pain, nausea, vomiting, peptic ulcers, GI bleeding, hyperventilation, renal dysfunction, metabolic acidosis, hypertension, lethargy, drowsiness, respiratory depression, coma, anaphylaxis.

## NURSING CONSIDERATIONS

• Correct hypovolemia before giving.

**Black Box Warning** Oral therapy is only indicated as a continuation of I.V./I.M. therapy. The maximum combined duration of parenteral, nasal, and oral therapy is 5 days. ■

• In children age 2 and older, use as a single dose only.

**Black Box Warning** Sprix isn't indicated for use in children or for minor or chronic painful conditions. ■

• Don't give drug epidurally or intrathecally because of alcohol content.

• Carefully observe patients with coagulopathies and those taking anticoagulants. Drug inhibits platelet aggregation and can prolong bleeding time. This effect disappears within 48 hours of stopping drug and doesn't alter platelet count, INR, PTT, or PT.

**Black Box Warning** NSAIDs may increase the risk of serious thrombotic events, MI, or stroke, which can be fatal. The risk may be greater with longer use or in patients with CV disease or risk factors for CV disease. ■

**Black Box Warning** NSAIDs cause an increased risk of serious GI adverse events including bleeding, ulceration, and perforation of the stomach or intestines, which can be fatal. Elderly patients are at greater risk. ■

• Don't give drug concomitantly with other forms of ketorolac or other NSAIDs.

• NSAIDs may mask signs and symptoms of infection because of their antipyretic and anti-inflammatory actions.

## PATIENT TEACHING

• Tell patient to discard nasal spray within 24 hours of the first dose, even if medication remains in the bottle.

• Warn patient using nasal spray that he may experience transient, mild to moderate nasal irritation that lasts for a few minutes and won't worsen with next dose.

• Advise patient to take a sip of water after using nasal spray to decrease throat sensation.

• Teach patient to read package insert and full directions for use of nasal spray bottle.

• Warn patient not to take ketorolac with other NSAIDs.

• Advise patient to maintain adequate fluid intake.

• Advise patient to be alert for signs and symptoms of CV events (chest pain, shortness of breath, weakness, slurred speech) and to seek medical attention immediately if they occur.

• Tell patient to promptly report edema and weight gain.

• Teach patient the warning signs and symptoms of hepatotoxicity (nausea, fatigue, lethargy, pruritus, jaundice, right upper quadrant abdominal tenderness, flulike symptoms) and advise him to stop

drug and seek medical help immediately if they occur.
- Instruct patient to notify prescriber immediately if she is pregnant.
- Warn patient receiving drug I.M. that pain may occur at injection site.
- Teach patient signs and symptoms of GI bleeding, including blood in vomit, urine, or stool; coffee-ground vomit; and black, tarry stool. Tell him to notify prescriber immediately if any of these occurs.
- Tell patient not to take drug for more than 5 days in a row.

## ketotifen fumarate

kee-toe-TYE-fen

Alaway ◇, Zaditor ◇

*Therapeutic class:* Antihistamine (ophthalmic)
*Pharmacologic class:* $H_1$ receptor antagonist and mast cell stabilizer
*Pregnancy risk category C*

### AVAILABLE FORMS

*Ophthalmic solution:* 0.025%

### INDICATIONS & DOSAGES

➤ **To temporarily prevent eye itching from allergic conjunctivitis; or the temporary relief of itchy eyes due to pollen, ragweed, grass, animal hair, and dander**
*Adults and children age 3 and older:* Instill 1 drop in each affected eye every 8 to 12 hours but not more than twice a day.

### ADMINISTRATION

**Ophthalmic**
- Drug is for ophthalmic use only. Don't inject or give orally.
- Close bottle tightly when not in use.
- Don't touch tip of dropper to any surface.

### ACTION

Stabilizes mast cells to inhibit release of mediators involved in hypersensitivity reactions and blocks action of histamine at the $H_1$ receptor, temporarily preventing itching of the eye.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Within min | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CNS:** *headache.*
**EENT:** *conjunctival infection, rhinitis,* burning or stinging of eyes, conjunctivitis, dry eyes, eye discharge, eye pain, eyelid disorder, itching of eyes, keratitis, lacrimation disorder, mydriasis, ocular allergic reactions, ocular rash, pharyngitis, photophobia.
**Other:** flulike syndrome.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to components of drug.
- Contraindicated for irritation related to contact lenses.

### NURSING CONSIDERATIONS

- Soft contact lenses may absorb the preservative benzalkonium. Contact lenses shouldn't be inserted until 10 minutes after drug is instilled.
- To prevent contaminating dropper tip and solution, don't touch eyelids or surrounding areas with dropper tip of bottle.

### PATIENT TEACHING

- Teach patient the proper technique for instilling drops.
- Advise patient not to wear contact lens if eye is red. Warn him not to use drug to treat contact lens–related irritation.
- Instruct patient who wears soft contact lenses and whose eyes aren't red to wait at least 10 minutes after instilling drug before inserting contact lenses.
- Advise patient to report adverse reactions.
- Advise patient to keep bottle tightly closed when not in use.

**SAFETY ALERT!**

# labetalol hydrochloride

la-BET-ah-loll

Trandate

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Alpha and beta blocker
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 5 mg/ml in 20- and 40-ml multiple-dose vials
*Tablets:* 100 mg, 200 mg, 300 mg

## INDICATIONS & DOSAGES

➤ **Hypertension**

*Adults (inpatients):* 200 mg P.O., followed by 200 to 400 mg P.O. in 6 to 12 hours depending on blood pressure response. May increase by 200 mg P.O. b.i.d.
*Adults (outpatients):* 100 mg P.O. b.i.d. with or without a diuretic. If needed, dosage is increased to 200 mg b.i.d. after 2 days. Further increases may be made every 2 to 3 days until optimal response is reached. Usual maintenance dosage is 100 to 400 mg b.i.d. Maximum dose is 2.4 g daily in two divided doses given alone or with a diuretic.

➤ **Severe hypertension, hypertensive emergencies**

*Adults:* 200 mg diluted in 160 ml of $D_5W$, infused at 2 mg/minute I.V. until satisfactory response is obtained; then infusion is stopped. Maximum dose is 300 mg.

Or, give by repeated I.V. injection; initially, 20 mg I.V. slowly over 2 minutes. Repeat injections of 40 to 80 mg every 10 minutes until maximum dose of 300 mg is reached, as needed.

## ADMINISTRATION

**P.O.**

- When switching from I.V. to P.O. form, begin P.O. regimen at 200 mg after blood pressure begins to rise; repeat dose with 200 to 400 mg in 6 to 12 hours. Adjust dosage according to blood pressure response.
- If dizziness occurs, give dose at bedtime or in smaller doses t.i.d.

**I.V.**

- Give by slow, direct I.V. injection over 2 minutes at 10-minute intervals.
- For I.V. infusion, prepare by diluting with $D_5W$ or normal saline solutions; for example, 200 mg of drug to 160 ml $D_5W$ to yield 1 mg/ml.
- Give labetalol infusion with an infusion-control device.
- Monitor blood pressure closely every 5 minutes for 30 minutes; then every 30 minutes for 2 hours. Then, monitor hourly for 6 hours.
- Patient should remain supine for 3 hours after infusion. When given I.V. for hypertensive emergencies, drug produces a rapid, predictable fall in blood pressure within 5 to 10 minutes.
- Store at room temperature. Protect from light.
- **Incompatibilities:** Alkali solutions, amphotericin B, cefoperazone, ceftriaxone, furosemide, heparin, nafcillin, sodium bicarbonate, thiopental, warfarin.

## ACTION

May be related to reduced peripheral vascular resistance, as a result of alpha and beta blockade.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 20 min | 2–4 hr | 8–12 hr |
| I.V. | 2–5 min | 5 min | 2–4 hr |

*Half-life:* About 5½ hours after I.V. use; 6 to 8 hours after P.O. use.

## ADVERSE REACTIONS

**CNS:** *dizziness,* vivid dreams, fatigue, headache, paresthesia, transient scalp tingling, syncope, vertigo, asthenia.
**CV:** *orthostatic hypotension,* ***ventricular arrhythmias.***
**EENT:** nasal congestion.
**GI:** nausea, vomiting.
**GU:** sexual dysfunction, urine retention.
**Respiratory:** ***bronchospasm,*** dyspnea.
**Skin:** rash.

## INTERACTIONS

**Drug-drug.** *Beta agonists:* May blunt bronchodilator effect of these drugs in patients with bronchospasm. May need to increase dosages of these drugs.

L

*Cimetidine:* May enhance labetalol's effect. Use together cautiously.
*Halothane:* May increase hypotensive effect. Monitor blood pressure closely.
*Insulin, oral antidiabetics:* May alter dosage requirements in previously stabilized diabetic patient. Monitor patient closely.
*Nitroglycerin:* May blunt reflex tachycardia produced by nitroglycerin but not the hypotension. Monitor BP if used together.
*NSAIDs:* May decrease antihypertensive effects. Monitor blood pressure.
*Tricyclic antidepressants:* May increase incidence of tremor. Monitor patient for tremor.
**Drug-herb.** *Ma huang:* May decrease antihypertensive effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase transaminase and urea levels.
- May cause false-positive increase of urine free and total catecholamine levels when measured by a nonspecific trihydroxyindole fluorometric method. May cause false-positive test result for amphetamines when screening urine for drugs.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those with bronchial asthma, overt cardiac failure, greater than first-degree heart block, cardiogenic shock, severe bradycardia, and other conditions that may cause severe and prolonged hypotension.
- Use cautiously in patients with heart failure, hepatic failure, chronic bronchitis, emphysema, peripheral vascular disease, and pheochromocytoma.

***Overdose S&S:*** Orthostatic hypotension, bradycardia, heart failure, bronchospasm, seizures.

## NURSING CONSIDERATIONS

- Monitor blood pressure frequently. Drug masks common signs and symptoms of shock.
- In diabetic patients, monitor glucose level closely because beta blockers may mask certain signs and symptoms of hypoglycemia.
- ***Look alike–sound alike:*** Don't confuse Trandate with Trental or Tridrate.

## PATIENT TEACHING

***Alert:*** Tell patient that stopping drug abruptly can worsen chest pain and trigger a heart attack.
- Advise patient that dizziness is the most troublesome adverse reaction and tends to occur in the early stages of treatment, in patients taking diuretics, and with higher dosages. Inform patient that dizziness can be minimized by rising slowly and avoiding sudden position changes.
- Warn patient that occasional, harmless scalp tingling may occur, especially when therapy begins.

# lacosamide

lah-COSS-ah-mide

Vimpat

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* Functionalized amino acid
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 200 mg/20-ml vial
*Oral solution:* 10 mg/ml
*Tablets:* 50 mg, 100 mg, 150 mg, 200 mg

## INDICATIONS & DOSAGES

➤ **Adjunct therapy for partial-onset seizures**

*Adults and adolescents age 17 and older:* Initially, 50 mg P.O. b.i.d.; increase at weekly intervals to a maximum daily dosage of 100 to 200 mg P.O. b.i.d. May administer I.V. at an equivalent daily dosage and frequency when P.O. administration is temporarily not feasible.

***Adjust-a-dose:*** In patients with mild or moderate hepatic impairment or severe renal impairment, maximum recommended daily dosage is 300 mg. Withhold drug in patients with severe hepatic impairment. Dosage supplementation of up to 50% should be considered following a 4-hour hemodialysis treatment.

## ADMINISTRATION

**P.O.**

● Give drug with or without food.

**I.V.**

▼ Reconstitute with normal saline solution, $D_5W$, or lactated Ringer's solution. Discard solution if discolored or if particulate matter is present. Solution is stable for 24 hours at room temperature.

▼ Infuse over 30 to 60 minutes.

▼ Discard unused solution in vial.

▼ **Incompatibilities:** None known.

## ACTION

May selectively enhance slow inactivation of sodium channels, stabilizing hyperexcitable neuronal membranes and inhibiting repetitive neuronal firing.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–4 hr | Unknown |
| I.V. | Unknown | 30–60 min | Unknown |

*Half-life:* Approximately 13 hours.

## ADVERSE REACTIONS

**CNS:** asthenia, ataxia, balance disorder, depression, *dizziness*, fatigue, gait disturbance, *headache*, memory impairment, somnolence, tremor.

**EENT:** blurred vision, *diplopia*, nystagmus, vertigo.

**GI:** diarrhea, *nausea*, vomiting.

**Skin:** pruritus, skin laceration.

**Other:** contusion.

## INTERACTIONS

**Drug-drug.** *Carbamazepine, phenobarbital, phenytoin:* May decrease lacosamide level. Adjust dosage as needed.

**Drug-lifestyle.** *Alcohol use:* May cause additive drowsiness. Don't use together.

## EFFECTS ON LAB TEST RESULTS

● May increase liver function test values.

## CONTRAINDICATIONS & CAUTIONS

● Lacosamide isn't recommended for patients with severe hepatic impairment.

● Use cautiously in patients with known cardiac conduction problems, depression, myocardial ischemia, or heart failure and in those with a history of suicidal thoughts.

● Use lacosamide during pregnancy only if potential benefit to the mother justifies potential risk to the fetus.

● It isn't known if drug appears in breast milk. Patient should either stop breast-feeding or stop drug.

● Safety and efficacy in children younger than age 17 haven't been established.

⚠ ***Overdose S&S:*** Coma.

## NURSING CONSIDERATIONS

● Monitor patient for signs and symptoms of multiorgan hypersensitivity reaction, including fever, rash, eosinophilia, hepatitis, nephritis, lymphadenopathy, and myocarditis. If reaction is suspected, discontinue drug and begin alternative treatment.

● Obtain an ECG in patients with severe cardiac disease or known conduction defects before starting drug.

***Alert:*** Withdraw drug gradually to minimize potential for increased seizure activity.

● Enroll pregnant patients in the UCB AED registry by calling 1-888-537-7734.

● Encourage pregnant patients to enroll in the North American Antiepileptic Drug Pregnancy Registry at 1-888-233-2334. Registry information can also be found at www.aedpregnancyregistry.org.

***Alert:*** Drug may increase risk of suicidal thinking and behavior. Monitor patient closely for worsening depression, suicidal thoughts or behavior, and unusual changes in mood or behavior.

● Closely observe patients with mild to moderate hepatic impairment during dosage titration.

## PATIENT TEACHING

● Inform patient that drug may be taken without regard to meals.

● Tell patient to report mood changes or suicidal thoughts immediately.

● Warn patient to avoid driving and operating heavy machinery until drug's CNS effects are known.

● Advise woman to notify prescriber if she suspects or is considering pregnancy or plans to breast-feed.

● Warn patient not to stop drug abruptly.

● Tell patient to avoid alcohol while taking drug.

● Advise patient to report blurred vision, dizziness, double vision, nausea, uncoordinated movement, or vertigo.

## lactulose

LAK-tyoo-lose

Cephulac, Constulose, Enulose, Kristalose

*Therapeutic class:* Laxative
*Pharmacologic class:* Disaccharide
*Pregnancy risk category B*

### AVAILABLE FORMS

*Packets:* 10 g, 20 g
*Syrup:* 10 g/15 ml

### INDICATIONS & DOSAGES

➤ **Constipation**

*Adults:* 10 to 20 g or 15 to 30 ml P.O. daily, increased to 60 ml/day, if needed.

➤ **To prevent and treat hepatic encephalopathy, including hepatic precoma and coma in patients with severe hepatic disease**

*Adults:* Initially, 20 to 30 g or 30 to 45 ml P.O. t.i.d. or q.i.d., until two or three soft stools are produced daily. Usual dose is 60 to 100 g daily in divided doses. Or, 200 g or 300 ml diluted with 700 ml of water or normal saline solution and given as retention enema P.R. every 4 to 6 hours, as needed.

### ADMINISTRATION

**P.O.**

● To minimize sweet taste, dilute with water or fruit juice or give with food.

**Rectal**

● Prepare enema (not commercially available) by adding 200 g (300 ml) to 700 ml of water or normal saline solution. The diluted solution is given as retention enema for 30 to 60 minutes. Use a rectal balloon.
● If enema isn't retained for at least 30 minutes, repeat dose.

### ACTION

Produces an osmotic effect in colon; resulting distention promotes peristalsis. Also decreases ammonia, probably as a result of bacterial degradation, which lowers the pH of colon contents.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 24–48 hr | Variable | Variable |
| P.R. | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**GI:** *abdominal cramps, belching, diarrhea, flatulence, gaseous distention,* nausea, vomiting.

### INTERACTIONS

**Drug-drug.** *Antacids:* May decrease lactulose effectiveness. Avoid using together.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients on a low-galactose diet.
● Use cautiously in patients with diabetes mellitus.
⚠ ***Overdose S&S:*** Diarrhea, abdominal cramps.

### NURSING CONSIDERATIONS

● Monitor sodium level for hypernatremia, especially when giving in higher doses to treat hepatic encephalopathy.
● Monitor mental status and potassium levels when giving to patients with hepatic encephalopathy.
● Replace fluid loss.
● ***Look alike–sound alike:*** Don't confuse lactulose with lactose.

### PATIENT TEACHING

● Show home care patient how to mix and use drug.
● Inform patient about adverse reactions and tell him to notify prescriber if reactions become bothersome or if diarrhea occurs.
● Instruct patient not to take other laxatives during lactulose therapy.

# lamivudine (3TC)

lam-ah-VEW-den

Epivir, Epivir-HBV, Heptovir†

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Nucleoside reverse transcriptase inhibitor
*Pregnancy risk category C*

## AVAILABLE FORMS

**Epivir**
*Oral solution:* 10 mg/ml
*Tablets:* 150 mg, 300 mg
**Epivir-HBV**
*Oral solution:* 5 mg/ml
*Tablets:* 100 mg

## INDICATIONS & DOSAGES

**Black Box Warning** Epivir tablets and oral solution (used to treat HIV infection) contain a higher dose of the active ingredient than Epivir-HBV tablets and oral solution (used to treat chronic hepatitis B infection). Patient with HIV infection should receive only dosing forms appropriate for HIV treatment.

➤ **HIV infection, with other antiretrovirals**

*Adults and children older than age 16:* Give 300 mg Epivir P.O. once daily or 150 mg P.O. b.i.d.
*Children ages 3 months to 16 years:* 4 mg/kg Epivir solution P.O. b.i.d. Maximum dose is 150 mg b.i.d.
*Children 14 kg (31 lb) or more who can reliably swallow tablets:* Weighing 14 to 21 kg (46 lb), give ½ tablet (75 mg) P.O. b.i.d.; 21 to less than 30 kg (66 lb), give ½ tablet (75 mg) P.O. in morning and 1 tablet (150 mg) P.O. in evening; 30 kg or more, give 150 mg P.O. b.i.d.
***Adjust-a-dose:*** For patients with chronic hepatitis B and creatinine clearance of 30 to 49 ml/minute, give 150 mg Epivir P.O. daily. If clearance is 15 to 29 ml/minute, give 150 mg P.O. on day 1 and then 100 mg daily; if it's 5 to 14 ml/minute, give 150 mg on day 1 and then 50 mg daily; if it's less than 5 ml/minute, give 50 mg on day 1 and then 25 mg daily.

➤ **Chronic hepatitis B with evidence of hepatitis B virus (HBV) replication and active liver inflammation**

*Adults:* 100 mg Epivir-HBV P.O. once daily.
*Children ages 2 to 17 years:* 3 mg/kg Epivir-HBV P.O. once daily, up to a maximum dose of 100 mg daily. Optimum duration of treatment isn't known; safety and effectiveness of treatment beyond 1 year haven't been established.
***Adjust-a-dose:*** For adult patients with chronic hepatitis B and creatinine clearance of 30 to 49 ml/minute, give first dose of 100 mg Epivir-HBV; then give 50 mg P.O. once daily. If clearance is 15 to 29 ml/minute, give first dose of 100 mg; then give 25 mg P.O. once daily. If clearance is 5 to 14 ml/minute, give first dose of 35 mg; then give 15 mg P.O. once daily. If clearance is less than 5 ml/minute, give first dose of 35 mg; then give 10 mg P.O. once daily.
For adults with HIV and creatinine clearance of 30 to 49 ml/minute, give 150 mg P.O. b.i.d. or 300 mg P.O. once daily. If clearance is 15 to 29 ml/minute, give first dose of 150 mg P.O.; then 100 mg P.O. once daily. If clearance is 5 to 14 ml/minute, give first dose of 150 mg P.O.; then 50 mg P.O. once daily. If clearance is less than 5 ml/minute, give first dose of 50 mg P.O.; then 25 mg P.O. once daily.

## ADMINISTRATION

**P.O.**
- Give without regard for food.

## ACTION

A synthetic nucleoside analogue that inhibits HIV and HBV reverse transcription via viral DNA chain termination. RNA- and DNA-dependent DNA polymerase activities.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–3 hr | Unknown |

*Half-life:* 5 to 7 hours.

## ADVERSE REACTIONS

Adverse reactions pertain to the combination therapy of lamivudine and zidovudine.
**CNS:** *dizziness, fatigue, fever, headache, insomnia and other sleep disorders, malaise, neuropathy,* depressive disorders.

**EENT:** *nasal symptoms.*
**GI:** *anorexia, diarrhea, nausea, vomiting,* ***pancreatitis,*** abdominal cramps, abdominal pain, dyspepsia.
**Hematologic:** ***neutropenia, thrombocytopenia,*** anemia.
**Hepatic:** ***hepatotoxicity.***
**Metabolic:** ***lactic acidosis.***
**Musculoskeletal:** *musculoskeletal pain,* arthralgia, myalgia.
**Respiratory:** *cough.*
**Skin:** rash.
**Other:** *chills.*

## INTERACTIONS

**Drug-drug.** *Trimethoprim and sulfamethoxazole:* May increase lamivudine level because of decreased clearance of drug. Monitor patient for toxicity.
*Zalcitabine:* May inhibit activation of both drugs. Avoid using together.
*Zidovudine:* May increase zidovudine level. Monitor patient closely for adverse reactions.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT and bilirubin levels. May decrease hemoglobin level.
- May decrease neutrophil and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported. ▮

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with renal impairment.

***Alert:*** Use drug cautiously, if at all, in children with history of pancreatitis or other significant risk factors for development of pancreatitis.

- The Antiretroviral Pregnancy Registry monitors maternal-fetal outcomes of pregnant women exposed to lamivudine. To register a pregnant woman, call the Antiretroviral Pregnancy Registry at 1-800-258-4263.

## NURSING CONSIDERATIONS

***Alert:*** Stop treatment immediately and notify prescriber if signs, symptoms, or laboratory abnormalities suggest pancreatitis. Monitor amylase level.

***Alert:*** Lactic acidosis and hepatotoxicity have been reported. Notify prescriber if signs of lactic acidosis or hepatotoxicity occurs.

**Black Box Warning** Hepatitis may recur in some patients with chronic HBV when they stop taking drug. ▮

- Safety and effectiveness of Epivir-HBV for longer than 1 year haven't been established; optimum duration of treatment isn't known.

**Black Box Warning** Test patients for HIV before starting treatment and during therapy because form and dosage of lamivudine in Epivir-HBV aren't appropriate for those infected with both HBV and HIV. If lamivudine is given to patients with HBV and HIV, use the higher dosage indicated for HIV therapy as part of an appropriate combination regimen. ▮

- Because of a high rate of early virologic resistance, don't use triple antiretroviral therapy with abacavir or didanosine, lamivudine, and tenofovir as new treatment for never-treated or pretreated patients. Monitor patients currently taking this therapy and those who take it with other antiretrovirals, and consider a different therapy.
- Monitor patient's CBC, platelet count, and renal and liver function studies. Report abnormalities.

## PATIENT TEACHING

- Inform patient that long-term effects of drug aren't known.
- Stress importance of taking drug exactly as prescribed.
- Inform patient that drug doesn't cure HIV infection, that opportunistic infections and other complications of HIV infection may still occur, and that transmission of HIV to others through sexual contact or blood contamination is still possible.
- Teach parents or guardians the signs and symptoms of pancreatitis. Advise them to report signs and symptoms immediately.

## lamotrigine

la-MO-tri-geen

Lamictal, Lamictal CD, Lamictal ODT, Lamictal XR

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* Phenyltriazine
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 25 mg, 100 mg, 150 mg, 200 mg
*Tablets (chewable dispersible):* 2 mg, 5 mg, 25 mg
*Tablets (extended release):* 25 mg, 50 mg, 100 mg, 200 mg, 300 mg
*Tablets (orally disintegrating):* 25 mg, 50 mg, 100 mg, 200 mg

### INDICATIONS & DOSAGES

➤ **Adjunct treatment of partial seizures or primary generalized tonic-clonic seizures caused by epilepsy or generalized seizures of Lennox-Gastaut syndrome**

*Adults and children older than age 12 taking valproate:* 25 mg (immediate-release) P.O. every other day for 2 weeks; then 25 mg P.O. daily for 2 weeks. Continue to increase, as needed, by 25 to 50 mg daily every 1 to 2 weeks until an effective maintenance dosage of 100 to 400 mg daily given in one or two divided doses is reached. When added to valproate alone, the usual daily maintenance dose is 100 to 200 mg. Or, 25 mg (extended-release) P.O. every other day for 2 weeks; then 25 mg P.O. daily for 2 weeks; then 50 mg P.O. daily for 1 week; then 100 mg P.O. daily for 1 week; then 150 mg P.O. daily for 1 week. Daily maintenance dose is 200 to 250 mg.

*Adults and children older than age 12 not taking carbamazepine, phenytoin, phenobarbital, primidone, or valproate:* 25 mg (extended-release) P.O. daily for 2 weeks; then 50 mg P.O. daily for 2 weeks; then 100 mg P.O. daily for 1 week; then 150 mg P.O. daily for 1 week; then 200 mg P.O. daily for 1 week. Daily maintenance dose is 300 to 400 mg.

*Adults and children older than age 12 taking anticonvulsant drugs but not carbamazepine, phenytoin, phenobarbital, primidone, or valproate:* 25 mg (immediate-release) P.O. daily for 1 to 2 weeks; then 50 mg P.O. daily for another 2 weeks. Continue to increase by 50 mg/day every 1 to 2 weeks until an effective maintenance dose is reached. Daily maintenance dose is 225 to 375 mg P.O. daily in two divided doses.

*Adults and children older than age 12 taking carbamazepine, phenytoin, phenobarbital, or primidone but not valproate:* 50 mg (immediate-release) P.O. daily for 2 weeks; then 100 mg P.O. daily in two divided doses for 2 weeks. Increase, as needed, by 100 mg daily every 1 to 2 weeks. Usual maintenance dosage is 300 to 500 mg P.O. daily in two divided doses. Or, 50 mg (extended-release) P.O. daily for 2 weeks; then 100 mg P.O. daily for 2 weeks; then 200 mg P.O. daily for 1 week; then 300 mg P.O. daily for 1 week; then 400 mg P.O. daily for 1 week. Daily maintenance dose is 400 to 600 mg.

*Children ages 2 to 12 weighing 7 to 40 kg (15 to 88 lb) taking valproate:* 0.15 mg/kg P.O. daily in one or two divided doses (rounded down to nearest whole tablet) for 2 weeks, followed by increasing the daily dose with an additional 0.3 mg/kg daily in one or two divided doses for every 1 to 2 weeks. Thereafter, usual maintenance dosage is 1 to 5 mg/kg daily (maximum, 200 mg daily in one to two divided doses).

*Children ages 2 to 12 weighing 7 to 40 kg (15 to 88 lb) taking anticonvulsant drugs but not carbamazepine, phenytoin, phenobarbital, primidone, or valproate:* 0.3 mg/kg (immediate-release) P.O. daily in one or two divided doses (rounded down to the nearest whole tablet) for 2 weeks; then 0.6 mg/kg P.O. daily in two divided doses for another 2 weeks; then increase the daily dose with an additional 0.6 mg/kg P.O. daily in two divided doses every 1 to 2 weeks. Thereafter, usual maintenance dose is 4.5 to 7.5 mg/kg P.O. daily. Maximum dose is 300 mg daily in two divided doses.

*Children ages 2 to 12 weighing 7 to 40 kg (15 to 88 lb) taking carbamazepine, phenytoin, phenobarbital, or primidone but not valproate:* 0.6 mg/kg P.O. daily in two divided doses (rounded down to nearest whole tablet) for 2 weeks; then increase

the daily dose with an additional 1.2 mg/kg daily in two divided doses every 1 to 2 weeks. Usual maintenance dosage is 5 to 15 mg/kg P.O. daily (maximum 400 mg daily in two divided doses).

➤ **To convert patients from therapy with a hepatic enzyme-inducing anticonvulsant alone to lamotrigine therapy**

*Adults and children age 16 and older:* Add lamotrigine (immediate-release) 50 mg P.O. once daily to current drug regimen for 2 weeks, followed by 100 mg P.O. daily in two divided doses for 2 weeks. Then increase daily dosage by 100 mg every 1 to 2 weeks until maintenance dose of 500 mg daily in two divided doses is reached. The concomitant hepatic enzyme-inducing anticonvulsant can then be gradually reduced by 20% decrements weekly for 4 weeks.

***Adjust-a-dose:*** For patients with severe renal impairment, use lower maintenance dosage.

➤ **To convert patients with partial seizures from adjunctive therapy with valproate to therapy with lamotrigine alone**

*Adults and children age 16 and older:* Add lamotrigine (immediate-release) until 200 mg daily is achieved; then gradually decrease valproate to 500 mg daily by decrements of no more than 500 mg daily per week. Maintain these dosages for 1 week, then increase lamotrigine to 300 mg daily while decreasing valproate to 250 mg daily. Maintain these dosages for 1 week, then stop valproate completely while increasing lamotrigine by 100 mg daily every week until a dose of 500 mg daily is reached.

➤ **Bipolar disorder**

*Adults:* Initially, 25 mg (immediate-release) P.O. once daily for 2 weeks; then 50 mg P.O. once daily for 2 weeks. Dosage may then be doubled at weekly intervals, to maintenance dosage of 200 mg daily.

*Adults taking carbamazepine or other hepatic enzyme-inducing drugs without valproate:* Initially, 50 mg (immediate-release) P.O. once daily for 2 weeks; then 100 mg daily in two divided doses for 2 weeks. Dosage is then increased by 100 mg weekly to maintenance dosage of 400 mg daily, given in two divided doses.

*Adults taking valproate:* Initially, 25 mg (immediate-release) P.O. every other day for 2 weeks; then 25 mg P.O. once daily for 2 weeks. Dosage may then be doubled at weekly intervals to maintenance dosage of 100 mg daily.

## ADMINISTRATION

**P.O.**

- Chewable dispersible tablets may be swallowed whole, chewed, or dispersed in water or diluted fruit juice.
- If tablets are chewed, give a small amount of water or diluted fruit juice to aid in swallowing.
- Orally disintegrating tablets should be placed on the tongue and moved around in the mouth.
- Orally disintegrating tablets may be swallowed with or without water and without regard to food.
- Give extended-release tablets once daily with or without food. Patient must swallow tablets whole and must not chew, crush, or divide them.

## ACTION

Unknown. May inhibit release of glutamate and aspartate (excitatory neurotransmitters) in the brain via an action at voltage-sensitive sodium channels.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–5 hr | Unknown |

*Half-life:* 14½ to 70¼ hours, depending on dosage schedule and use of other anticonvulsants.

## ADVERSE REACTIONS

**CNS:** *ataxia, dizziness, headache, somnolence,* ***seizures,*** aggravated reaction, anxiety, concentration disturbance, decreased memory, depression, dysarthria, emotional lability, fever, incoordination, insomnia, irritability, malaise, mind racing, speech disorder, sleep disorder, tremor, vertigo.

**CV:** palpitations.

**EENT:** *blurred vision, diplopia, rhinitis,* nystagmus, pharyngitis, vision abnormality.

**GI:** *nausea, vomiting,* abdominal pain, anorexia, constipation, diarrhea, dry mouth, dyspepsia.

**GU:** amenorrhea, dysmenorrhea, vaginitis.

**Musculoskeletal:** muscle spasm, neck pain.
**Respiratory:** cough, dyspnea.
**Skin:** *rash*, ***Stevens-Johnson syndrome, toxic epidermal necrolysis,*** acne, alopecia, hot flashes, pruritus.
**Other:** chills, flulike syndrome, infection, tooth disorder.

## INTERACTIONS

**Drug-drug.** *Acetaminophen:* May decrease therapeutic effects of lamotrigine. Monitor patient.
***Carbamazepine:*** May decrease effects of lamotrigine while increasing toxicity of carbamazepine. Adjust doses and monitor patient.
*Ethosuximide, oxcarbazepine, phenobarbital, phenytoin, primidone:* May decrease lamotrigine level. Monitor patient closely.
*Folate inhibitors, such as co-trimoxazole and methotrexate:* May have additive effect because lamotrigine inhibits dihydrofolate reductase, an enzyme involved in folic acid synthesis. Monitor patient.
*Hormonal contraceptives containing estrogen, rifampin:* May decrease lamotrigine levels. Adjust dosage. By the end of the "pill-free" week, lamotrigine levels may double.
***Valproate:*** May decrease clearance of lamotrigine, which increases lamotrigine level; also decreases valproate level. Monitor patient for toxicity.
**Drug-lifestyle.** *Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid excessive sun exposure.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in patients with renal, hepatic, or cardiac impairment.

***Overdose S&S:*** Ataxia, nystagmus, increased seizures, decreased level of consciousness, coma, intraventricular conduction delay.

## NURSING CONSIDERATIONS

***Alert:*** Closely monitor all patients taking or starting antiepileptic drugs for changes in behavior indicating worsening of suicidal thoughts or behavior or depression. Symptoms such as anxiety, agitation, hostility, mania, and hypomania may be precursors to emerging suicidality
- Don't stop drug abruptly because this may increase seizure frequency. Instead, taper drug over at least 2 weeks.

**Black Box Warning** Serious rashes requiring hospitalization and discontinuation of treatment have been reported in association with lamotrigine therapy. Stop drug at first sign of rash, unless rash is clearly not drug-related. ■

***Alert:*** Drug may cause aseptic meningitis. Monitor patient for symptoms such as headache, fever, neck stiffness, nausea, vomiting, rash, and photophobia. Discontinue drug if no other cause of meningitis is found.
- Reduce lamotrigine dose if drug is added to a multidrug regimen that includes valproic acid.
- Evaluate patients for changes in seizure activity. Check adjunct anticonvulsant level.
- ***Look alike–sound alike:*** Don't confuse lamotrigine with lamivudine or Lamictal with Lamisil, Ludiomil, labetalol, or Lomotil.

## PATIENT TEACHING

- Inform patient that drug may cause rash. Combination therapy of valproic acid and lamotrigine may cause a serious rash. Tell patient to report rash or signs or symptoms of hypersensitivity promptly to prescriber because they may warrant stopping drug.
- Warn patient not to engage in hazardous activity until drug's CNS effects are known.
- Advise patient or caregiver to immediately report headache, fever, neck stiffness, nausea, vomiting, rash, drowsiness, confusion, or light sensitivity to his health care provider.
- Warn patient that the drug may trigger sensitivity to the sun and to take precautions until tolerance is determined.
- Warn patient not to stop drug abruptly.

***Alert:*** Advise women of childbearing age to discuss drug therapy with prescriber if considering pregnancy. Babies exposed to drug during the first trimester have a greater risk of cleft lip or palate.

• Advise women of childbearing age that breast-feeding isn't recommended during therapy.

## lansoprazole

lanz-AH-pray-zol

Prevacid®, Prevacid SoluTab

*Therapeutic class:* Antiulcer
*Pharmacologic class:* Proton pump inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS

*Capsules (delayed-release):* 15 mg, 30 mg
*Orally disintegrating tablet (ODT) (delayed-release):* 15 mg, 30 mg

### INDICATIONS & DOSAGES

➤ **Short-term treatment of active duodenal ulcer**
*Adults:* 15 mg P.O. daily before eating for 4 weeks.

➤ **Maintenance of healed duodenal ulcers**
*Adults:* 15 mg P.O. daily.

➤ **Short-term treatment of active benign gastric ulcer**
*Adults:* 30 mg P.O. once daily for up to 8 weeks.

➤ **Short-term treatment of erosive esophagitis**
*Adults:* 30 mg P.O. daily before eating for up to 8 weeks. If healing doesn't occur, 8 more weeks of therapy may be given. Maintenance dosage for healing is 15 mg P.O. daily.
*Children ages 12 to 17:* 30 mg P.O. once daily for up to 8 weeks.
*Children ages 1 to 11 who weigh more than 30 kg (66 lb):* 30 mg P.O. once daily for up to 12 weeks. Increase dosage up to 30 mg b.i.d. in patients who remain symptomatic after 2 weeks.
*Children ages 1 to 11 who weigh 30 kg or less:* 15 mg P.O. once daily for up to 12 weeks. Increase dosage up to 30 mg b.i.d. in patients who remain symptomatic after 2 weeks.

➤ **Long-term treatment of pathologic hypersecretory conditions, including Zollinger-Ellison syndrome**
*Adults:* Initially, 60 mg P.O. once daily. Increase dosage, as needed. Give daily amounts above 120 mg in evenly divided doses.

➤ ***Helicobacter pylori* eradication to reduce risk of duodenal ulcer recurrence**
*Adults:* For patients receiving dual therapy, 30 mg P.O. lansoprazole with 1 g P.O. amoxicillin, each given t.i.d. for 14 days. For patients receiving triple therapy, 30 mg P.O. lansoprazole with 1 g P.O. amoxicillin and 500 mg P.O. clarithromycin, all given b.i.d. for 10 to 14 days.

➤ **Short-term treatment of symptomatic gastroesophageal reflux disease**
*Adults:* 15 mg P.O. once daily for up to 8 weeks.
*Children ages 12 to 17:* 15 mg P.O. once daily for up to 8 weeks.
*Children ages 1 to 11 who weigh more than 30 kg (66 lb):* 30 mg P.O. once daily for up to 12 weeks. Dosage can be increased up to 30 mg b.i.d. in patients who remain symptomatic after 2 weeks.
*Children ages 1 to 11 who weigh 30 kg or less:* 15 mg P.O. once daily for up to 12 weeks. Dosage can be increased up to 30 mg b.i.d. in patients who remain symptomatic after 2 weeks.

➤ **NSAID-related ulcer in patients who continue NSAID use**
*Adults:* 30 mg P.O. daily for 8 weeks.

➤ **To reduce risk of NSAID-related ulcer in patients with history of gastric ulcer who need NSAIDs**
*Adults:* 15 mg P.O. daily for up to 12 weeks.

### ADMINISTRATION

**P.O.**
• Give 30 to 60 minutes before a meal.
• Don't crush or allow patient to chew capsules.
• Contents of capsule can be mixed with 40 ml of apple juice in a syringe and given within 3 to 5 minutes via a nasogastric (NG) tube. Flush with additional apple juice to give entire dose and maintain patency of the tube.
• To give ODTs using an oral syringe, dissolve a 15-mg tablet in 4 ml water or a

30-mg tablet in 10 ml water and give within 15 minutes. Refill syringe with about 2 ml (15-mg tablet) or 5 ml (30-mg tablet) of water, shake gently, and give any remaining contents.
• To give ODTs through an NG tube 8 French or larger, dissolve a 15-mg tablet in 4 ml water or a 30-mg tablet in 10 ml water and give within 15 minutes. Refill syringe with about 5 ml of water, shake gently, and flush the NG tube.
• ODTs contain 2.5 mg phenylalanine/15-mg tablet and 5.1 mg phenylalanine/30-mg tablet.

## ACTION

Inhibits proton pump activity by binding to hydrogen-potassium adenosine triphosphates, located at secretory surface of gastric parietal cells; to suppress gastric acid secretions.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1–3 hr | Unknown | 24 hr |

*Half-life:* Less than 2 hours.

## ADVERSE REACTIONS

**GI:** abdominal pain, constipation, diarrhea, nausea.

## INTERACTIONS

**Drug-drug.** *Ampicillin esters, digoxin, iron salts, ketoconazole:* May inhibit absorption of these drugs. Monitor patient closely.
*Atazanavir:* May reduce GI absorption of atazanavir, reducing antiviral activity. Don't use together.
***Clarithromycin:*** May increase lansoprazole levels and adverse effects. Monitor patient.
*Sucralfate:* May cause delayed lansoprazole absorption. Give lansoprazole at least 30 minutes before sucralfate.
*Theophylline:* May mildly increase theophylline clearance. Adjust theophylline dosage when lansoprazole is started or stopped. Use together cautiously.
**Drug-herb.** *Male fern:* May inactivate herb. Discourage use together.
*St. John's wort:* May increase risk of sun sensitivity. Advise patient to avoid excessive sunlight exposure.
**Drug-food.** *Food:* May decrease rate and extent of GI absorption. Advise patient to take before meals.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug.
***Alert:*** There may be an increased risk of hip, wrist, and spine fractures associated with proton pump inhibitors.
• It's unknown if drug appears in breast milk. Breast-feeding women should either stop breast-feeding or stop drug.

## NURSING CONSIDERATIONS

• Patients with severe liver disease may need dosage adjustment, but don't adjust dosage for elderly patients or those with renal insufficiency.
• Just because symptoms respond to therapy, gastric malignancy shouldn't be ruled out.
***Alert:*** Amoxicillin may trigger anaphylaxis in patients with a history of penicillin hypersensitivity.
• ***Look alike–sound alike:*** Don't confuse Prevacid with Pepcid, Prilosec, or Prevpac.

## PATIENT TEACHING

• For best effect, instruct patient to take drug 30 to 60 minutes before eating.
• Tell patient he may mix the capsule's contents with a small amount (about 2 ounces) of apple, cranberry, grape, orange, pineapple, prune, tomato, or vegetable juice. The patient must drink the mixture within 30 minutes. To ensure complete delivery of the dose, the patient should fill the glass two or more times with juice and swallow the contents immediately.
• Contents of capsule can be mixed with 1 tablespoon of applesauce, Ensure, pudding, cottage cheese, yogurt, or strained pears and swallowed immediately. The capsule and granules shouldn't be chewed or crushed.
• Tell patient taking ODTs to allow tablet to dissolve on tongue until all particles can be swallowed.

## lanthanum carbonate

LAN-thah-num

Fosrenol

*Therapeutic class:* Antihyperphosphatemic
*Pharmacologic class:* Non-calcium, non–aluminum phosphate binder
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets (chewable):* 500 mg, 750 mg, 1 g

### INDICATIONS & DOSAGES

➤ **To reduce phosphate level in patients with end-stage renal disease (ESRD)**

*Adults:* Initially, 250 to 500 mg P.O. t.i.d. with meals. Adjust every 2 to 3 weeks by 750 mg daily until reaching desired phosphate level. Reducing phosphate level to less than 6 mg/dl usually requires 1,500 to 3,000 mg daily.

### ADMINISTRATION

**P.O.**

- Give drug with or just after a meal.
- Remind patient to chew tablets completely before swallowing them.

### ACTION

Inhibits phosphate absorption by binding to phosphate released during digestion and forming highly insoluble lanthanum-phosphate complexes.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* 53 hours.

### ADVERSE REACTIONS

**CNS:** *headache.*
**CV:** *hypotension.*
**EENT:** rhinitis.
**GI:** *constipation, diarrhea, nausea, vomiting,* abdominal pain.
**Metabolic:** hypercalcemia.
**Respiratory:** bronchitis.
**Other:** *dialysis graft occlusion or complication.*

### INTERACTIONS

None reported.

### EFFECTS ON LAB TEST RESULTS

- May increase calcium level.

### CONTRAINDICATIONS & CAUTIONS

- No known contraindications.
- Use cautiously in breast-feeding women and patients with acute peptic ulcer, ulcerative colitis, Crohn's disease, or bowel obstruction.

### NURSING CONSIDERATIONS

- Monitor patient for bone pain and skeletal deformities.
- Check serum phosphate levels during dosage adjustment and regularly as needed throughout treatment.
- Drug isn't recommended for children because it's deposited in developing bone, including the growth plate.

### PATIENT TEACHING

- Urge patient to follow a low-phosphorus diet. Assist with meal planning as needed.
- Tell patient to take drug with or immediately after meals.

***Alert:*** Remind patient to chew tablets completely before swallowing them.

- Instruct patient to avoid taking lanthanum within 2 hours of oral drugs known to interact with antacids.
- Explain that the most common side effects are nausea and vomiting and that they tend to subside over time.

## lapatinib

lah-PAH-tih-nihb

Tykerb

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Kinase inhibitor
*Pregnancy risk category D*

### AVAILABLE FORMS

*Tablets:* 250 mg

### INDICATIONS & DOSAGES

➤ **Advanced or metastatic breast cancer with capecitabine when tumors**

**overexpress *HER2* and patient has had prior therapy, including an anthracycline, a taxane, and trastuzumab**
*Adults:* 1,250 mg (5 tablets) P.O. once daily as a single dose on days 1 through 21, with 2,000 mg/m$^2$/day capecitabine given P.O. in two doses 12 hours apart on days 1 to 14. Repeat 21-day cycle.
➤ ***HER2*-positive, hormone receptor–positive metastatic breast cancer in postmenopausal women**
*Adults:* 1,500 mg P.O. once daily with letrozole 2.5 mg once daily.
***Adjust-a-dose:*** In patients with decreased left ventricular ejection fraction (LVEF) that is grade 2 or higher by NCI Common Terminology Criteria for Adverse Events (NCI CTCAE), or LVEF that drops below the institution's lower limit of normal due to treatment, stop drug. After 2 weeks if patient has recovered normal LVEF and is asymptomatic, resume at reduced dose of 1,000 mg/day and monitor LVEF. In patients with severe hepatic impairment (Child-Pugh class C), reduce dose to 750 mg/day. In patients with grade 2 or higher toxicity by NCI CTCAE, withhold drug. Resume normal dose of 1,250 mg/day if initial episode of toxicity improves to grade 1 or lower. If toxicity recurs, resume at 1,000 mg/day.

## ADMINISTRATION

**P.O.**
- Give drug once daily; don't divide doses.
- Give drug 1 hour before or 1 hour after a meal.
- Give capecitabine with or within 30 minutes after food.

## ACTION

Inhibits ErbB-driven tumor cell growth; additive effects may be seen when given together with capecitabine.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Up to 1½ hr | 4 hr | Unknown |

*Half-life:* 14¼ hours; after repeated dosing, 24 hours.

## ADVERSE REACTIONS

**CNS:** *insomnia.*
**CV:** ***decreased LVEF, prolonged QT interval.***
**EENT:** *mucosal inflammation.*
**GI:** *diarrhea, nausea, vomiting, stomatitis, dyspepsia.*
**Hematologic:** *anemia,* **NEUTROPENIA, THROMBOCYTOPENIA.**
**Musculoskeletal:** *arm or leg pain, back pain.*
**Respiratory:** **DYSPNEA.**
**Skin:** *palmar-plantar erythrodysesthesia, rash, dry skin.*

## INTERACTIONS

**Drug-drug.** *Antiarrhythmics, other drugs that prolong QT interval, cumulative high-dose anthracycline therapy:* May prolong QTc interval. Avoid using together.
*CYP2C8 inhibitors, P-glycoprotein substrates:* May increase lapatinib level. Avoid using together.
*Strong CYP3A4 inducers (dexamethasone, phenytoin, carbamazepine, rifampin, rifabutin, rifapentine, phenobarbital):* May significantly decrease lapatinib level. Avoid using together or gradually increase dose of lapatinib, as tolerated, to 4,500 mg/day. If the strong inducer is stopped, adjust lapatinib dose to recommended dose.
*Strong CYP3A4 inhibitors (ketoconazole, itraconazole, clarithromycin, atazanavir, indinavir, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, voriconazole):* May significantly increase lapatinib level. Avoid using together or reduce lapatinib dose to 500 mg/day. If the strong inhibitor is stopped, allow 1 week before increasing lapatinib dose.
**Drug-food.** *All food:* May increase exposure to drug. Advise patient to take at least 1 hour before or 1 hour after a meal.
*Grapefruit:* May increase drug level. Discourage use together.
**Drug-herb.** *St. John's wort:* May significantly decrease drug level. Discourage use together, or gradually increase lapatinib dose as tolerated to 4,500 mg/day.

## EFFECTS ON LAB TEST RESULTS

- May increase total bilirubin, AST, and ALT levels. May decrease hemoglobin level.
- May decrease platelet and neutrophil counts.

## CONTRAINDICATIONS & CAUTIONS

● Use cautiously in patients with left ventricular dysfunction; conditions that may decrease LVEF; severe hepatic impairment; hypokalemia; hypomagnesemia, or diarrhea.
⚠ ***Overdose S&S:*** Diarrhea, vomiting.

## NURSING CONSIDERATIONS

**Black Box Warning** Liver toxicity and deaths have occurred days to several months after start of treatment. Monitor LFTs during treatment and as indicated. ■
● Evaluate LVEF before starting treatment, and monitor during treatment.
● Correct hypokalemia and hypomagnesemia before start of treatment.
● Monitor for excessive diarrhea; give antidiarrheals and correct electrolyte abnormalities, as needed.
● Monitor blood counts for anemia and neutropenia.
● Interstitial lung disease and pneumonitis has occurred in patients during drug therapy. Monitor patient for pulmonary symptoms, including dyspnea, cough, hypoxia, and fever.

## PATIENT TEACHING

● Tell patient to immediately report shortness of breath, palpitations, fatigue, diarrhea, and change in medications or OTC preparations to prescriber.
● Instruct patient not to divide doses but to take drug once daily, regardless of number of tablets per dose, 1 hour before or after a meal.
● Remind patient to take capecitabine only as prescribed.
● Advise patient that he will need routine blood tests to evaluate for adverse effects.

# latanoprost

lah-TAN-oh-prost

Xalatan

*Therapeutic class:* Antiglaucoma
*Pharmacologic class:* Prostaglandin analogue
*Pregnancy risk category C*

## AVAILABLE FORMS

*Ophthalmic solution:* 0.005% (50 mcg/ml)

## INDICATIONS & DOSAGES

➤ **Increased intraocular pressure (IOP) in patients with ocular hypertension or open-angle glaucoma who are intolerant or who had insufficient response to other IOP-lowering medications**
*Adults:* Instill 1 drop in conjunctival sac of each affected eye once daily at bedtime.

## ADMINISTRATION

**Ophthalmic**
● Don't allow tip of dispenser to contact eye or surrounding tissue. Serious damage to eye and subsequent vision loss may be caused by contaminated solutions.
● Apply light finger pressure on lacrimal sac for 1 minute after instilling drug to minimize systemic absorption.
● If more than one ophthalmic drug is being used, give at least 5 minutes apart.

## ACTION

Thought to increase outflow of aqueous humor, thereby lowering IOP.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | 3–4 hr | 8–12 hr | Unknown |

*Half-life:* 3 hours (from aqueous humor).

## ADVERSE REACTIONS

**CV:** angina pectoris.
**EENT:** *blurred vision, burning, foreign body sensation, increased brown pigmentation of the iris, itching, stinging,* conjunctival hyperemia, dry eye, excessive tearing, eye pain, eyelash changes, lid crusting or edema, lid discomfort, photophobia, punctate epithelial keratopathy.
**Musculoskeletal:** muscle, joint, or back pain.
**Respiratory:** upper respiratory tract infection.
**Skin:** allergic skin reaction, rash.
**Other:** cold, flulike syndrome.

## INTERACTIONS

**Drug-drug.** *Eyedrops that contain thimerosal:* May cause precipitation of eyedrops. Give at least 5 minutes apart.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, benzalkonium chloride, or other components of drug.
- Use cautiously in patients with impaired renal or hepatic function.
- Use cautiously in breast-feeding women; it's unknown if drug appears in breast milk.
- Safety and effectiveness of drug in children haven't been established.

***Overdose S&S:*** Ocular irritation, conjunctival or episcleral congestion.

## NURSING CONSIDERATIONS

- Don't give drug while patient is wearing contact lenses.
- Giving drug more frequently than recommended may decrease its IOP-lowering effects; don't exceed once-daily dosing.
- Drug may gradually change eye color, increasing amount of brown pigment in iris. This change in iris color occurs slowly and may not be noticeable for months or years. Increased pigmentation may be permanent.

## PATIENT TEACHING

- Inform patient of risk that iris color may change in treated eye.
- Teach patient how to instill drops, and advise him to wash hands before and after instilling solution. Warn him not to touch tip of dropper to eye or surrounding tissue.
- Advise patient to apply light finger pressure on lacrimal sac for 1 minute after instillation to minimize systemic absorption.
- Instruct patient to report reactions in the eye, especially eye inflammation and lid reactions.
- Tell patient who wears contact lenses to remove them before instilling solution and not to reinsert the lenses until 15 minutes have elapsed.
- If patient is using more than one topical ophthalmic drug, tell him to apply them at least 5 minutes apart.
- If patient develops another eye condition (such as trauma or infection) or needs eye surgery, advise him to contact prescriber about continued use of multidose container.
- Stress importance of compliance with recommended therapy.

**SAFETY ALERT!**

# leflunomide

leh-FLEW-no-mide

Arava

*Therapeutic class:* Antiarthritic
*Pharmacologic class:* Pyrimidine synthesis inhibitor
*Pregnancy risk category X*

## AVAILABLE FORMS

*Tablets:* 10 mg, 20 mg, 100 mg

## INDICATIONS & DOSAGES

➤ **To reduce signs and symptoms of active rheumatoid arthritis; to slow structural damage as shown by erosions and joint space narrowing seen on X-ray; to improve physical function**

*Adults:* 100 mg P.O. every 24 hours for 3 days; then 20 mg (maximum daily dose) P.O. every 24 hours. Dose may be decreased to 10 mg daily if higher dose isn't well tolerated.

***Adjust-a-dose:*** For confirmed ALT elevations between two and three times the upper limit of normal (ULN), reduce dose to 10 mg/day; if elevations persist despite dose reduction or if ALT elevations of greater than three times ULN are present, stop drug and give cholestyramine or charcoal.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.

## ACTION

An immunomodulatory drug that inhibits dihydroorotate dehydrogenase, an enzyme involved in pyrimidine synthesis, and that has antiproliferative activity and anti-inflammatory effects.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 6–12 hr | Unknown |

*Half-life:* 15 to 18 days.

## ADVERSE REACTIONS

**CNS:** anxiety, asthenia, depression, dizziness, fever, headache, insomnia, malaise,

migraine, neuralgia, neuritis, pain, paresthesia, sleep disorder, vertigo.
**CV:** *hypertension,* angina pectoris, chest pain, palpitations, peripheral edema, tachycardia, varicose veins, vasculitis, vasodilation.
**EENT:** blurred vision, cataracts, conjunctivitis, epistaxis, eye disorder, pharyngitis, rhinitis, sinusitis.
**GI:** *diarrhea,* abdominal pain, anorexia, cholelithiasis, colitis, constipation, dry mouth, dyspepsia, enlarged salivary glands, esophagitis, flatulence, gastritis, gastroenteritis, gingivitis, melena, mouth ulcer, nausea, oral candidiasis, stomatitis, taste perversion, vomiting.
**GU:** albuminuria, cystitis, dysuria, hematuria, menstrual disorder, pelvic pain, prostate disorder, urinary frequency, UTI, vaginal candidiasis.
**Hematologic:** anemia.
**Hepatic:** ***hepatotoxicity.***
**Metabolic:** ***diabetes mellitus,*** hyperglycemia, hyperlipidemia, hyperthyroidism, hypokalemia, weight loss.
**Musculoskeletal:** arthralgia, arthrosis, back pain, bone necrosis, bone pain, bursitis, joint disorder, leg cramps, muscle cramps, myalgia, neck pain, synovitis, tendon rupture, tenosynovitis.
**Respiratory:** *respiratory infection,* ***asthma,*** bronchitis, dyspnea, increased cough, lung disorder, pneumonia.
**Skin:** *alopecia, rash,* acne, contact dermatitis, dry skin, eczema, fungal dermatitis, hair discoloration, hematoma, maculopapular rash, nail disorder, pruritus, skin discoloration, skin disorder, skin nodule, skin ulcer, subcutaneous nodule.
**Other:** abscess, allergic reaction, cyst, ecchymoses, flulike syndrome, hernia, herpes simplex, herpes zoster, increased sweating, injury or accident, tooth disorder.

## INTERACTIONS

**Drug-drug.** *Charcoal, cholestyramine:* May decrease leflunomide level. Sometimes used for this effect in overdose.
*Methotrexate, other hepatotoxic drugs:* May increase risk of hepatotoxicity. Monitor liver enzyme levels.
*NSAIDs (diclofenac, ibuprofen):* May increase NSAID level. Monitor patient.
*Rifampin:* May increase active leflunomide metabolite level. Use together cautiously.
*Tolbutamide:* May increase tolbutamide level. Monitor patient.

## EFFECTS ON LAB TEST RESULTS

- May increase AST, ALT, glucose, lipid, and CK levels.
- May decrease potassium level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.

**Black Box Warning** Contraindicated in pregnant women and women of childbearing potential who are not using reliable contraception.

- Drug isn't recommended for patients with evidence of infection with hepatitis B or C viruses, severe immunodeficiency, bone marrow dysplasia, or severe uncontrolled infections; in women who are breastfeeding; in patients younger than age 18; or in men attempting to father a child.

**Black Box Warning** Drug isn't recommended for patients with preexisting liver disease or ALT more than twice the upper limit of normal (ULN).

**Black Box Warning** Use cautiously in patients taking other drugs that can cause liver damage.

- Use cautiously in patients with renal insufficiency.

***Overdose S&S:*** Diarrhea, abdominal pain, leukopenia, anemia, elevated liver function test results.

## NURSING CONSIDERATIONS

- Vaccination with live vaccines isn't recommended. Consider the long half-life of drug when contemplating giving a live vaccine after stopping drug treatment.

***Alert:*** Men planning to father a child should stop drug therapy and follow recommended leflunomide removal protocol (cholestyramine 8 g, P.O. t.i.d. for 11 days). In addition to cholestyramine, verify drug levels are less than 0.02 mg/L by two separate tests at least 14 days apart. If level is greater than 0.02 mg/L, consider additional cholestyramine treatment.

- Risk of malignancy, particularly lymphoproliferative disorders, is increased with use

of some immunosuppressants, including leflunomide.
**Black Box Warning** Liver enzyme levels should be monitored regularly during treatment. If ALT rises to more than twice the ULN, discontinue drug and monitor liver function tests until ALT returns to normal.
***Alert:*** Monitor platelet and WBC counts and hemoglobin level or hematocrit at baseline and monthly for 6 months after starting therapy and every 6 to 8 weeks thereafter.
***Alert:*** Monitor AST, ALT, and serum albumin levels monthly if treatment includes methotrexate or other potential immunosuppressives.
• Stop drug and start cholestyramine or charcoal therapy if bone marrow suppression occurs.
• Watch for overlapping hematologic toxicity when switching to another antirheumatic.
***Alert:*** Rare cases of severe liver injury, including cases with fatal outcome, have occurred during leflunomide therapy. Most cases occur within 6 months of therapy and in a setting of multiple risk factors for hepatotoxicity (liver disease, other hepatotoxins).
• Carefully monitor patient after dose reduction. Because the active metabolite of leflunomide has a prolonged half-life, it may take several weeks for levels to decline.

### PATIENT TEACHING
• Explain need for and frequency of required blood tests and monitoring.
**Black Box Warning** Instruct patient to use birth control during course of treatment and until it's been determined that drug is no longer active.
• Warn patient to immediately notify prescriber if signs or symptoms of pregnancy occur (such as late menstrual periods or breast tenderness).
• Advise women to stop breast-feeding during therapy.
• Instruct patient to immediately report rash or mucous membrane lesions, unusual tiredness, abdominal pain, jaundice, easy bruising, bleeding, fever, recurrent infections, or pallor, which may be warnings of infrequent but serious adverse reactions.
• Inform patient he may continue taking aspirin, other NSAIDs, and low-dose corticosteroids during treatment.
• Inform patient that it may take 4 weeks to begin to see improvement from therapy.

**SAFETY ALERT!**

## letrozole
LE-tro-zol

Femara

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Aromatase inhibitor
*Pregnancy risk category D*

### AVAILABLE FORMS
*Tablets:* 2.5 mg

### INDICATIONS & DOSAGES
➤ **Metastatic breast cancer with disease progression after antiestrogen therapy (such as tamoxifen)**
*Postmenopausal women:* 2.5 mg P.O. as single daily dose.
➤ **First-line treatment of hormone receptor–positive or hormone receptor–unknown, locally advanced, or metastatic breast cancer**
*Postmenopausal women:* 2.5 mg P.O. once daily until tumor progression is evident.
➤ **Adjuvant treatment of hormone-sensitive early breast cancer**
*Postmenopausal women:* 2.5 mg P.O. daily.
➤ **Extended adjuvant treatment of early breast cancer following 5 years of adjuvant tamoxifen therapy**
*Postmenopausal women:* 2.5 mg P.O. once daily for 5 years.

### ADMINISTRATION
**P.O.**
• Drug is a hormonal agent and considered a potential teratogen. Follow safe-handling procedures.
• Give drug without regard for meals.

### ACTION
Inhibits conversion of androgens to estrogens, which decreases tumor mass

or delays progression of tumor growth in some women.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 days | Unknown |

*Half-life:* About 2 days.

## ADVERSE REACTIONS

**CNS:** headache, somnolence, dizziness, fatigue, mood changes.
**CV:** *hot flashes*, ***MI, thromboembolism,*** chest pain, edema, hypertension.
**GI:** *nausea*, vomiting, constipation, diarrhea, abdominal pain, anorexia.
**Metabolic:** hypercholesterolemia, weight gain.
**Musculoskeletal:** *bone pain, limb pain, back pain, arthralgia*, fractures.
**Respiratory:** dyspnea, cough.
**Skin:** rash, pruritus, alopecia, diaphoresis.
**Other:** viral infections, breast pain.

## INTERACTIONS

**Drug-drug.** *Tamoxifen:* May reduce plasma letrozole levels. Give letrozole immediately after tamoxifen course is completed.

## EFFECTS ON LAB TEST RESULTS

- May increase cholesterol level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in patients with severe liver impairment; dosage adjustment isn't needed in those with mild to moderate liver dysfunction.

## NURSING CONSIDERATIONS

- Dosage adjustment isn't needed in patients with creatinine clearance of 10 ml/minute or more.
- Use drug only in postmenopausal women. Rule out pregnancy before starting drug.
- ***Look alike–sound alike:*** Don't confuse Femara with FemHRT.

## PATIENT TEACHING

- Instruct patient to take drug exactly as prescribed.
- Tell patient to take drug with a small glass of water, with or without food.
- Inform patient about potential adverse effects.
- Advise patient to use caution performing tasks that require alertness, coordination, or dexterity, such as driving, until effects are known.

**SAFETY ALERT!**

# leuprolide acetate

loo-PROE-lide

Eligard, Lupron, Lupron Depot, Lupron Depot-Ped, Lupron Depot–3 Month, Lupron Depot–4 Month

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Gonadotropin-releasing hormone analogue
*Pregnancy risk category X*

## AVAILABLE FORMS

*Depot injection:* 3.75 mg, 7.5 mg, 11.25 mg, 15 mg, 22.5 mg, 30 mg, 45 mg
*Injection:* 5 mg/ml in 2.8-ml multiple-dose vials

## INDICATIONS & DOSAGES

➤ **Advanced prostate cancer**

*Adults:* 1 mg subcutaneously daily. Or, 7.5 mg I.M. depot injection monthly. Or, 7.5 mg subcutaneous Eligard once monthly. Or, 22.5 mg I.M. depot injection every 3 months. Or, 22.5 mg subcutaneous Eligard every 3 months. Or, 30 mg I.M. depot injection every 4 months. Or, 30 mg subcutaneous Eligard every 4 months. Or, 45 mg subcutaneous Eligard every 6 months.

➤ **Endometriosis**

*Adults:* 3.75 mg I.M. depot injection as single injection once monthly for up to 6 months. Or, 11.25 mg I.M. every 3 months for up to 6 months.

➤ **Central precocious puberty**

*Children:* Initially, 0.3 mg/kg (minimum 7.5 mg) I.M. depot injection as single injection every 4 weeks. May increase in increments of 3.75 mg every 4 weeks, if needed. Stop drug before girl reaches age 11 or boy reaches age 12.

➤ **Anemia related to uterine fibroids (with iron therapy)**
*Adults:* 3.75 mg I.M. depot injection once monthly for up to 3 consecutive months. Or 11.25 mg I.M. depot injection for 1 dose.

## ADMINISTRATION

• Products have specific mixing and administration instructions. Read manufacturer's directions closely.

**I.M.**

• Never give by I.V. injection.
• Give depot injections under medical supervision.
• Use supplied diluent to reconstitute drug (extra diluent is provided; discard remainder).
• Inject into vial; shake well. Suspension will appear milky. Use immediately.
• Draw 1 ml into a syringe with a 22G needle.
• When preparing Lupron Depot–3 Month 22.5 mg, use a 23G or larger needle. Withdraw 1.5 ml from ampule for the 3-month form.
• When using prefilled dual-chamber syringes, prepare for injection according to manufacturer's instructions.
• Gently shake syringe to form a uniform milky suspension. If particles adhere to stopper, tap syringe against your finger.
• Remove needle guard and advance plunger to expel air from syringe. Inject entire contents I.M. as with a normal injection.

**Subcutaneous**

• For the two-syringe mixing system, connect the syringes and inject the liquid contents according to manufacturer's instructions.
• Mix product by pushing contents back and forth between syringes for about 45 seconds; shaking the syringes won't mix the contents enough.
• Attach the needle provided in the kit and inject subcutaneously.
• Suspension settles very quickly. Remix if settling occurs. Must be given within 30 minutes.
• Never give by I.V. injection.

## ACTION

Stimulates and then inhibits release of follicle-stimulating hormone and luteinizing hormone, which suppresses testosterone and estrogen levels.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.M., Subcut. | Variable | 1–2 mo | 60–90 days |
| Implant | Unknown | 4 hr | 12 mo |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *dizziness, depression, headache, pain,* insomnia, paresthesia, *asthenia.*
**CV:** ***arrhythmias,*** angina, ***MI,*** *peripheral edema, ECG changes,* hypotension, hypertension, murmur, *hot flashes.*
**GI:** *nausea, vomiting,* anorexia, constipation.
**GU:** *impotence, vaginitis,* urinary frequency, hematuria, UTI, *amenorrhea.*
**Hematologic:** anemia.
**Metabolic:** *weight gain or loss.*
**Musculoskeletal:** transient bone pain during first week of treatment, joint disorder, myalgia, neuromuscular disorder, bone loss.
**Respiratory:** dyspnea, sinus congestion, ***pulmonary fibrosis.***
**Skin:** reactions at injection site, dermatitis, acne.
**Other:** gynecomastia, androgen-like effects.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

• May increase albumin, alkaline phosphatase, bilirubin, BUN, calcium, creatinine, glucose, LDH, phosphorus, and uric acid levels. May decrease hemoglobin level.
• May alter results of pituitary-gonadal system tests during therapy and for 12 weeks after.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or other gonadotropin-releasing hormone analogues, in women with undiagnosed vaginal bleeding, and in pregnant or breast-feeding women.

L

- The 30- and 45-mg depot injections are contraindicated in women and children.
- Use cautiously in patients hypersensitive to benzyl alcohol.

### NURSING CONSIDERATIONS

- A fractional dose of drug formulated to give every 3, 4, or 6 months isn't equivalent to same dose of once-a-month formulation.
- After starting treatment for central precocious puberty, monitor patient response every 1 to 2 months with a gonadotropin-releasing hormone stimulation test and sex corticosteroid level determinations. Measure bone age for advancement every 6 to 12 months.

***Alert:*** During first few weeks of treatment for prostate cancer, signs and symptoms of disease may temporarily worsen or additional signs and symptoms may occur (tumor flare).

- May increase risk of diabetes and CV events. Monitor patient closely.

### PATIENT TEACHING

- Before starting child on treatment for central precocious puberty, make sure parents understand importance of continuous therapy.
- Carefully instruct patient who will give himself subcutaneous injection about the proper technique and advise him to use only the syringes provided by manufacturer.
- Advise patient that, if another syringe must be substituted, a low-dose insulin syringe (U-100, 0.5 ml) may be an appropriate choice but that needle gauge should be no smaller than 22G (except when using Lupron Depot–3 Month 22.5 mg).
- Instruct patient to store leuprolide acetate powder (depot) and diluent at room temperature, to refrigerate unopened vials of leuprolide acetate injection, and to protect leuprolide acetate injection from heat and light.
- Inform patient with history of undesirable effects from other endocrine therapies that leuprolide is easier to tolerate.
- Reassure patient that adverse effects disappear after about 1 week. Explain that symptoms of prostate cancer or central precocious puberty may worsen at first.
- Advise women of childbearing age to use a nonhormonal form of contraception during treatment.

## levalbuterol hydrochloride

lev-al-BYOO-ter-ol

Xopenex

## levalbuterol tartrate

Xopenex HFA

*Therapeutic class:* Bronchodilator
*Pharmacologic class:* $Beta_2$ agonist
*Pregnancy risk category C*

### AVAILABLE FORMS

*Inhalation aerosol:* 45 mcg per actuation
*Solution for inhalation:* 0.31 mg, 0.63 mg, or 1.25 mg in 3-ml vials; 1.25 mg/0.5-ml vials (concentrate)

### INDICATIONS & DOSAGES

➤ **To prevent or treat bronchospasm in patients with reversible obstructive airway disease**

*Adults and adolescents age 12 and older:* 0.63 mg given t.i.d. every 6 to 8 hours, by oral inhalation via a nebulizer. Patients with more severe asthma who don't respond adequately to 0.63 mg t.i.d. may benefit from 1.25 mg t.i.d.

*Children ages 6 to 11:* 0.31 mg inhaled t.i.d. by nebulizer. Routine dosage shouldn't exceed 0.63 mg t.i.d.

*Adults and children age 4 and older:* 2 inhalations Xopenex HFA (90 mcg) every 4 to 6 hours. In some patients, 1 inhalation every 4 hours is sufficient.

### ADMINISTRATION

**Inhalational**

- Keep unopened vial in foil pouch. After opened, vial must be used within 2 weeks and protected from light.
- Release four test sprays before first use of inhaler or after unused for more than 3 days.
- Shake canister well before use.
- Use a spacer device to improve inhalation, as appropriate.

## ACTION

Relaxes bronchial smooth muscle by stimulating beta$_2$ receptors; also, inhibits release of mediators from mast cells in the airway.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Inhalation | 5–15 min | 1 hr | 3–4 hr |

*Half-life:* 3¼ to 4 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, migraine, nervousness, pain, tremor, anxiety, asthenia, fever, headache.
**CV:** tachycardia.
**EENT:** *rhinitis*, sinusitis, turbinate edema, pharyngitis.
**GI:** dyspepsia, diarrhea.
**Musculoskeletal:** leg cramps.
**Respiratory:** increased cough, asthma.
**Other:** *viral infection*, flulike syndrome, accidental injury, lymphadenopathy.

## INTERACTIONS

**Drug-drug.** *Beta blockers:* May block pulmonary effect of the drug and cause severe bronchospasm. Avoid using together, if possible. If use together is unavoidable, consider a cardioselective beta blocker, but use cautiously.
*Digoxin:* May decrease digoxin level up to 22%. Monitor digoxin level.
*Loop or thiazide diuretics:* May cause ECG changes and hypokalemia. Use together cautiously.
*MAO inhibitors, tricyclic antidepressants:* May potentiate action of levalbuterol on the vascular system. Avoid using within 2 weeks of MAO inhibitor or tricyclic antidepressant therapy.
*Other short-acting sympathomimetic aerosol bronchodilators, epinephrine:* May increase adrenergic adverse effects. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or to racemic albuterol.
- Use cautiously in patients with CV disorders (especially coronary insufficiency, hypertension, and arrhythmias), seizure disorders, hyperthyroidism, or diabetes mellitus, and in those who are unusually responsive to sympathomimetic amines.

***Overdose S&S:*** Exaggeration of adverse reactions, hypokalemia, seizures, angina, hypertension, hypotension, arrhythmias, muscle cramps, dry mouth, palpitations, nausea, insomnia, cardiac arrest, sudden death.

## NURSING CONSIDERATIONS

***Alert:*** As with other inhaled beta agonists, drug can produce paradoxical bronchospasm or life-threatening CV effects. If this occurs, stop drug immediately and notify prescriber.
- Drug may worsen diabetes mellitus and ketoacidosis.
- Drug may temporarily decrease potassium level, but potassium supplementation is usually unnecessary.
- The compatibility of levalbuterol mixed with other drugs in a nebulizer hasn't been established.

## PATIENT TEACHING

- Warn patient that he may experience worsened breathing. Tell him to stop drug and contact prescriber immediately if this occurs.
- Tell patient not to increase dosage without consulting prescriber.
- Urge patient to seek medical attention immediately if levalbuterol becomes less effective, if signs and symptoms become worse, or if he's using drug more frequently than usual.
- Tell patient that the effects of levalbuterol may last up to 8 hours.
- Tell patient not to double the next dose if he misses one. Tell him to take doses at least 6 hours apart.
- Advise patient to use other inhalations and antiasthmatics only as directed while taking levalbuterol.
- Inform patient that common adverse reactions include palpitations, rapid heart rate, headache, dizziness, tremor, and nervousness.
- Encourage woman to contact prescriber if she becomes pregnant or is breast-feeding.
- Tell patient to keep unopened vials in foil pouch. After the foil pouch is opened, vials

must be used within 2 weeks. Inform patient that vials removed from the pouch, if not used immediately, should be protected from light and excessive heat and used within 1 week.
- Teach patient to use drug correctly when inhaling by nebulizer.
- Instruct patient to breathe as calmly, deeply, and evenly as possible until no more mist is formed in the nebulizer reservoir (5 to 15 minutes).
- Tell patient using the inhaler to release four test sprays into the air away from the face before the first use or if it hasn't been used for more than 3 days.

## levetiracetam

lee-vah-tih-RACE-ah-tam

Keppra, Keppra XR

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* Pyrrolidine derivative
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 500 mg/5 ml single-use vial
*Oral solution:* 100 mg/ml
*Tablets:* 250 mg, 500 mg, 750 mg, 1,000 mg
*Tablets (extended-release):* 500 mg, 750 mg

### INDICATIONS & DOSAGES

➤ **Adjunctive therapy for myoclonic seizures of juvenile myoclonic epilepsy**
*Adults and adolescents age 12 and older:* Initially, 500 mg P.O. b.i.d. Increase by 1,000 mg/day every 2 weeks to daily dose of 3,000 mg.

➤ **Adjunctive therapy for primary generalized tonic-clonic seizures**
*Adults and adolescents age 16 and older:* Initially, 500 mg P.O. b.i.d. Increase dose by 500 mg b.i.d. every 2 weeks to dose of 1,500 mg b.i.d.
*Children ages 6 to 16:* Initially, 10 mg/kg P.O. b.i.d. Increase dose by 10 mg/kg b.i.d. at 2-week intervals to dose of 30 mg/kg b.i.d. For children who weigh more than 20 kg (44 lb), use either tablets or oral solution. For children who weigh 20 kg or less, use the oral solution.

➤ **Adjunctive treatment for partial-onset seizures in patients with epilepsy**
*Adults and adolescents age 16 or older:* Initially, 500 mg P.O. or I.V. b.i.d. Increase dosage by 500 mg b.i.d., as needed, for seizure control at 2-week intervals to maximum of 1,500 mg b.i.d. Or, give extended-release tablets 1,000 mg P.O. daily. May increase in increments of 1,000 mg every 2 weeks to maximum recommended dosage of 3,000 mg P.O. daily.
*Children ages 4 to 16:* Initially, 10 mg/kg P.O. b.i.d. Increase dose by 10 mg/kg b.i.d. at 2-week intervals to recommended dose of 30 mg/kg b.i.d. If patient can't tolerate this dose, reduce it. For children who weigh 20 kg or less, use the oral solution.
***Adjust-a-dose:*** Immediate-release and oral solution: For adults with creatinine clearance of 50 to 80 ml/minute, give 500 to 1,000 mg every 12 hours; if clearance is 30 to 50 ml/minute, give 250 to 750 mg every 12 hours; if clearance is less than 30 ml/minute, give 250 to 500 mg every 12 hours. For dialysis patients, give 500 to 1,000 mg every 24 hours. Give a 250- to 500-mg dose after dialysis.

For extended release tablets, if creatinine clearance is 50 to 80 ml/minute, give 1,000 to 2,000 mg every 24 hours. If clearance is 30 to 50 ml/minute, give 500 to 1,500 mg every 24 hours. If clearance is less than 30 ml/minute, give 500 to 1,000 mg every 24 hours.

### ADMINISTRATION

**P.O.**
- Give drug without regard for food.
- P.O. and I.V. forms are bioequivalent.
- Tablets should be swallowed whole and shouldn't be chewed, broken, or crushed.

**I.V.**
- ▼ Dilute drug before giving.
- ▼ Dilute 500-mg, 1,000-mg, or 1,500-mg dose in 100 ml normal saline, $D_5W$, or lactated Ringer's injection and infuse over 15 minutes.
- ▼ Drug is compatible with diazepam, lorazepam, and valproate sodium for 24 hours at a controlled room temperature.
- ▼ **Incompatibilities:** Unknown with other antiepileptics besides diazepam, lorazepam, and valproate sodium.

## ACTION

May act by inhibiting simultaneous neuronal firing that leads to seizure activity.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.V. | 1 hr | 1 hr | 12 hr |

*Half-life:* About 7 hours in patients with normal renal function.

## ADVERSE REACTIONS

**CNS:** *asthenia, headache, somnolence,* amnesia, anxiety, ataxia, depression, dizziness, emotional lability, hostility, nervousness, paresthesia, pain, vertigo.
**EENT:** diplopia, pharyngitis, rhinitis, sinusitis.
**GI:** anorexia.
**Hematologic:** ***leukopenia, neutropenia.***
**Respiratory:** cough.
**Other:** infection.

## INTERACTIONS

**Drug-drug.** *Antihistamines, benzodiazepines, opioids, other drugs that cause drowsiness, tricyclic antidepressants:* May lead to severe sedation. Avoid using together.
**Drug-lifestyle.** *Alcohol use:* May lead to severe sedation. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May alter liver function test results. May decrease hemoglobin and hematocrit.
- May decrease WBC, RBC, and neutrophil counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in immunocompromised patients, such as those with cancer or HIV infection. Leukopenia and neutropenia have been reported with drug use.
- Use cautiously in patients with history of psychiatric symptoms, especially psychotic symptoms and behaviors.

***Overdose S&S:*** Drowsiness, aggression, agitation, coma, depressed level of consciousness, respiratory depression, somnolence.

## NURSING CONSIDERATIONS

- Use drug only with other anticonvulsants; it's not recommended for monotherapy.
- Seizures can occur if drug is stopped abruptly. Tapering is recommended.
- Monitor patients closely for such adverse reactions as dizziness, which may lead to falls.

***Alert:*** Closely monitor all patients taking or starting antiepileptic drugs for changes in behavior indicating worsening of suicidal thoughts or behavior or depression. Symptoms such as anxiety, agitation, hostility, mania, and hypomania may be precursors to emerging suicidality.

- ***Look alike–sound alike:*** Don't confuse Keppra with Kaletra.

## PATIENT TEACHING

- Warn patient to use extra care when sitting or standing to avoid falling.
- Advise patient to call prescriber and not to stop drug suddenly if adverse reactions occur.
- Tell patient to take with other prescribed seizure drugs.
- For the oral solution, tell patient or parent to use a calibrated measuring device, not a household spoon.
- Warn patient that drug may cause dizziness and somnolence and that he should avoid driving, bike riding, or other hazardous activities until he knows how the drug will affect him.
- Inform patient that drug can be taken with or without food.
- Tell patient not to chew, crush, or break tablets.

L

# levobunolol hydrochloride

LEE-voe-BYOO-no-lahl

AKBeta, Betagan

*Therapeutic class:* Antiglaucoma
*Pharmacologic class:* Nonselective beta blocker
*Pregnancy risk category C*

## AVAILABLE FORMS

*Ophthalmic solution:* 0.25%, 0.5%

## INDICATIONS & DOSAGES

➤ **Chronic open-angle glaucoma, ocular hypertension**

*Adults:* One or two drops once daily (0.5%) or b.i.d. (0.25%).

## ADMINISTRATION

### Ophthalmic

- Don't let tip of dropper touch patient's eye or surrounding tissue.
- Apply light finger pressure on lacrimal sac for 1 minute after instilling drug to minimize systemic absorption.

## ACTION

Thought to reduce formation, and possibly increase outflow, of aqueous humor.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | 1 hr | 2–6 hr | 24 hr |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *syncope,* depression, headache, insomnia.
**CV:** *hypotension,* ***bradycardia, heart failure,*** slight reduction in resting heart rate.
**EENT:** *transient eye stinging and burning,* blepharoconjunctivitis, corneal punctate staining, decreased corneal sensitivity, erythema, itching, keratitis, photophobia, tearing.
**GI:** nausea.
**Respiratory:** ***bronchospasm.***
**Skin:** urticaria.

## INTERACTIONS

**Drug-drug.** *Dipivefrin, epinephrine, systemically administered carbonic anhydrase inhibitors, topical miotics:* May further reduce intraocular pressure (IOP). Use together cautiously.
*Metoprolol, propranolol, other oral beta blockers:* May increase ocular and systemic effects. Use together cautiously.
*Reserpine, other catecholamine-depleting drugs:* May increase hypotensive and bradycardiac effects. Monitor blood pressure and heart rate closely.
**Drug-lifestyle.** *Sun exposure:* May cause photophobia. Advise patient to wear sunglasses.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with bronchial asthma, sinus bradycardia, second- or third-degree AV block, cardiac failure, cardiogenic shock, or history of bronchial asthma or severe COPD.
- Use cautiously in patients with chronic bronchitis, emphysema, diabetes mellitus, hyperthyroidism, or myasthenia gravis.
- Safe use in pregnant or breast-feeding women hasn't been established.

***Overdose S&S:*** Bradycardia, hypotension, bronchospasm, acute heart failure.

## NURSING CONSIDERATIONS

- Normal IOP is 10 to 21 mm Hg.

## PATIENT TEACHING

- Teach patient how to instill drug. Advise him to wash hands before and after instillation and to apply light finger pressure on lacrimal sac for 1 minute after drops are instilled.
- Warn patient not to touch tip of dropper to eye or surrounding tissue.
- Advise elderly patient to report shortness of breath, chest pain, or heart irregularities to prescriber. Drug may be absorbed systemically and produce signs and symptoms of beta blockade.
- Advise patient to carry medical identification at all times during therapy.

# levocetirizine dihydrochloride

LEE-voe-se-TIR-a-zeen

Xyzal

*Therapeutic class:* Antihistamine
*Pharmacologic class:* $H_1$-receptor antagonist
*Pregnancy risk category B*

## AVAILABLE FORMS

*Oral solution:* 2.5 mg/5 ml
*Tablets:* 5 mg

## INDICATIONS & DOSAGES

➤ **Seasonal and perennial allergic rhinitis; uncomplicated skin manifestations of chronic idiopathic urticaria**

*Adults and children age 12 and older:* 5 mg P.O. once daily in the evening.
*Children ages 6 to 11:* 2.5 mg P.O. once daily in the evening.
*Children ages 6 months to 5 years:* 1.25 mg (2.5 ml) P.O. daily in the evening. Don't exceed this dose.
***Adjust-a-dose:*** For patients ages 12 and older with creatinine clearance of 50 to 80 ml/minute, give 2.5 mg P.O. once daily; with creatinine clearance of 30 to 50 ml/minute, give 2.5 mg P.O. every other day; and with creatinine clearance 10 to 30 ml/minute, give 2.5 mg P.O. twice weekly (once every 3 to 4 days).

## ADMINISTRATION

**P.O.**
- Give drug without regard for food.

## ACTION

$H_1$-receptor inhibition creates antihistamine effect, relieving allergy symptoms.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | 24 hr |

*Half-life:* 8 hours.

## ADVERSE REACTIONS

**CNS:** fatigue, pyrexia, somnolence.
**EENT:** dry mouth, epistaxis, nasopharyngitis, pharyngitis.
**Respiratory:** cough.

## INTERACTIONS

**Drug-drug.** *CNS depressants:* May have additive effects when taken together. Avoid using together.
*Ritonavir:* May increase serum concentration and increase half-life of levocetirizine. Use cautiously together.
*Theophylline:* May decrease the clearance of levocetirizine. Use cautiously together.
**Drug-lifestyle.** *Alcohol use:* May have additive effect when taken with levocetirizine. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May prevent, reduce, or mask positive result skin wheal in diagnostic skin test.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or to cetirizine.
- Contraindicated in patients with creatinine clearance less than 10 ml/minute or those undergoing hemodialysis.
- Contraindicated in patients age 6 to 11 with impaired renal function.

***Overdose S&S:*** Drowsiness; initial agitation and restlessness, then drowsiness (in children).

## NURSING CONSIDERATIONS

- Monitor patient's renal function.
- Patient should avoid engaging in hazardous occupations requiring mental alertness and motor coordination, such as operating machinery or driving a motor vehicle.
- Drug is excreted in breast milk; avoid use in nursing mothers.
- Safety and effectiveness in patients younger than age 6 months haven't been established.
- Use drug during pregnancy only if benefits to mother clearly outweigh risk to fetus.

## PATIENT TEACHING

- Warn patient not to perform hazardous tasks or those requiring alertness and coordination until CNS effects are known.
- Advise patient to avoid use of alcohol and other CNS depressants while taking this drug.
- Advise patient not to take more than the recommended dose because of increased risk of somnolence at higher doses.

# levodopa and carbidopa

lee-voe-DOE-pa and kar-bih-DOE-pa

Parcopa, Sinemet✓, Sinemet CR✓

*Therapeutic class:* Antiparkinsonian
*Pharmacologic class:* Decarboxylase inhibitor and dopamine precursor
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 100 mg levodopa with 10 mg carbidopa (Sinemet 10–100), 100 mg levodopa

with 25 mg carbidopa (Sinemet 25–100), 250 mg levodopa with 25 mg carbidopa (Sinemet 25–250)
*Tablets (extended-release):* 200 mg levodopa with 50 mg carbidopa (Sinemet CR), 100 mg levodopa with 25 mg carbidopa
*Tablets (orally disintegrating):* 100 mg levodopa with 10 mg carbidopa, 100 mg levodopa with 25 mg carbidopa, 250 mg levodopa with 25 mg carbidopa

## INDICATIONS & DOSAGES

➤ **Idiopathic Parkinson disease, postencephalitic parkinsonism, and symptomatic parkinsonism resulting from carbon monoxide or manganese intoxication**

*Adults:* 1 tablet of 100 mg levodopa with 25 mg carbidopa P.O. t.i.d.; then increased by 1 tablet daily or every other day, as needed, to maximum daily dose of 8 tablets. May use 250 mg levodopa with 25 mg carbidopa or 100 mg levodopa with 10 mg carbidopa tablets, as directed, to obtain maximal response. Optimum daily dose must be determined by careful adjustment for each patient.

Patients given conventional tablets may receive extended-release tablets; dosage is calculated on current levodopa intake. Extended-release tablets should provide 10% more levodopa daily, increased as needed and as tolerated to 30% more levodopa daily. Give in divided doses at intervals of 4 to 8 hours. Allow at least a 3-day interval between dosage adjustments.

## ADMINISTRATION

**P.O.**

- Give drug with food to decrease GI upset, but avoid giving with high-protein meals, which can impair absorption and reduce effectiveness.
- Don't crush or break extended-release form.
- Give orally disintegrating tablet (ODT) immediately after removing from bottle. Place tablet on patient's tongue, where it will dissolve in seconds and be swallowed with saliva. No additional fluid is needed.

## ACTION

Levodopa, a dopamine precursor, relieves parkinsonian symptoms by being converted to dopamine in the brain. Carbidopa inhibits the decarboxylation of peripheral levodopa, which allows more intact levodopa to travel to the brain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 40–150 min | Unknown |

*Half-life:* 1 to 2 hours.

## ADVERSE REACTIONS

**CNS:** syncope, agitation, bradykinetic episodes, confusion, dementia, ***suicidal tendencies,*** dizziness, dream abnormalities, headache, insomnia, ***neuroleptic malignant syndrome,*** paresthesia, psychotic episodes, somnolence.
**CV:** cardiac irregularities, hypertension, hypotension, orthostatic hypotension, palpitations, phlebitis, ***MI.***
**GI:** anorexia, constipation, dark saliva, duodenal ulcer, diarrhea, dry mouth, dyspepsia, ***GI bleeding,*** taste alterations, vomiting.
**GU:** dark urine, urinary frequency, UTI.
**Hematologic:** ***agranulocytosis,*** hemolytic and nonhemolytic anemia, ***leukopenia, thrombocytopenia.***
**Musculoskeletal:** back pain, muscle cramps, shoulder pain.
**Respiratory:** dyspnea, upper respiratory tract infection.
**Skin:** alopecia, rash, diaphoresis, dark sweat.
**Other:** increased libido, hypersensitivity.

## INTERACTIONS

**Drug-drug.** *Antihypertensives:* May cause additive hypotensive effects. Use together cautiously.
*Iron salts:* May reduce bioavailability of levodopa and carbidopa. Give iron 1 hour before or 2 hours after Sinemet.
*MAO inhibitors:* May cause risk of severe hypertension. Avoid using together.
*Papaverine, phenytoin:* May antagonize antiparkinsonian actions. Avoid using together.
*Phenothiazines, other antipsychotics:* May antagonize antiparkinsonian actions. Use together cautiously.

**Drug-herb.** *Kava:* May decrease action of drug. Discourage kava use altogether. *Octacosanol:* May worsen dyskinesias. Discourage use together.
**Drug-food.** *Foods high in protein:* May decrease levodopa absorption. Don't give levodopa with high-protein foods.

## EFFECTS ON LAB TEST RESULTS

- May increase uric acid, ALT, AST, alkaline phosphatase, LDH, and bilirubin levels. May decrease hemoglobin level and hematocrit.
- May decrease WBC, granulocyte, and platelet counts.
- May falsely increase urinary catecholamine level and serum and urinary uric acid levels in colorimetric tests. May falsely decrease urinary vanillylmandelic acid level. May cause false-positive results in urine ketone tests using sodium nitroprusside reagent and in urinary glucose tests using cupric sulfate reagent. May cause false-negative results in tests using glucose oxidase. May alter results of urine screening tests for phenylketonuria.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with angle-closure glaucoma, melanoma, or undiagnosed skin lesions.
- Contraindicated within 14 days of MAO inhibitor therapy.
- Use cautiously in patients with severe CV, renal, hepatic, endocrine, or pulmonary disorders; history of peptic ulcer; psychiatric illness; MI with residual arrhythmias; bronchial asthma; emphysema; or well-controlled, chronic open-angle glaucoma.

***Overdose S&S:*** Muscle twitching, blepharospasm.

## NURSING CONSIDERATIONS

- If patient takes levodopa, stop drug at least 8 hours before starting levodopa-carbidopa.
- Giving levodopa and carbidopa together typically decreases amount of levodopa needed by 75%, reducing risk of adverse reactions.
- Therapeutic and adverse reactions occur more rapidly with levodopa and carbidopa than with levodopa alone. Observe patient and monitor vital signs, especially while adjusting dosage. Report significant changes.

***Alert:*** Because of risk of precipitating a symptom complex resembling neuroleptic malignant syndrome, observe patient closely if levodopa dosage is reduced abruptly or stopped.

- Hallucinations may require reduction or withdrawal of drug.
- Test patients receiving long-term therapy regularly for diabetes and acromegaly, and periodically for hepatic, renal, and hematopoietic function.

## PATIENT TEACHING

- Tell patient to take drug with food to minimize GI upset; however, high-protein meals can impair absorption and reduce effectiveness.
- Tell patient not to chew or crush extended-release form.
- Warn patient and caregivers not to increase dosage without prescriber's orders.
- Caution patient about possible dizziness when standing up quickly, especially at start of therapy. Tell him to change positions slowly and dangle his legs before getting out of bed. Elastic stockings may control these adverse reactions in some patients.
- Instruct patient to report adverse reactions and therapeutic effects.
- Inform patient that pyridoxine (vitamin $B_6$) doesn't reverse beneficial effects of levodopa and carbidopa. Multivitamins can be taken without reversing levodopa's effects.
- Teach patient to take ODT immediately after taking from bottle and to place on top of tongue. Tablet will dissolve in seconds and will be swallowed with saliva. No additional fluid is needed.

## levodopa, carbidopa, and entacapone

lee-voe-DOE-pa, kar-bih-DOE-pa, and en-ta-KAP-own

Stalevo

*Therapeutic class:* Antiparkinsonian
*Pharmacologic class:* Dopamine precursor, decarboxylase inhibitor, and catecholamine-*O*-methyltransferase (COMT) inhibitor
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets (film-coated):* 50 mg levodopa, 12.5 mg carbidopa, 200 mg entacapone; 75 mg levodopa, 18.75 mg carbidopa, 200 mg entacapone; 100 mg levodopa, 25 mg carbidopa, 200 mg entacapone; 125 mg levodopa, 31.25 mg carbidopa, 200 mg entacapone; 150 mg levodopa, 37.5 mg carbidopa, 200 mg entacapone; 200 mg levodopa, 50 mg carbidopa, 200 mg entacapone

### INDICATIONS & DOSAGES

➤ **Idiopathic Parkinson disease, to replace (with equivalent strengths) levodopa, carbidopa, and entacapone given individually or to replace immediate-release levodopa and carbidopa for a patient who has end-of-dose "wearing off," who's taking a total daily levodopa dose of 600 mg or less and who has no dyskinesia**

*Adults:* 1 tablet P.O.; determine dose and interval by therapeutic response. Maximum, 8 tablets daily.

### ADMINISTRATION

**P.O.**

- Don't cut tablets.
- Give only 1 tablet at each dosing interval.
- Give drug with food to decrease GI upset, but avoid giving with high-protein meal, which can decrease absorption.

### ACTION

Levodopa, a dopamine precursor, relieves parkinsonian symptoms by converting to dopamine in the brain. Carbidopa inhibits the decarboxylation of peripheral levodopa, which allows more intact levodopa to travel to the brain. Entacapone is a reversible COMT inhibitor that increases levodopa level.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1½ hr | Unknown |

*Half-life:* 1½ to 2 hours carbidopa, 1 to 5 hours levodopa, and 1 to 4 hours entacapone.

### ADVERSE REACTIONS

**levodopa and carbidopa**

**CNS:** syncope, agitation, bradykinetic episodes, confusion, dementia, ***suicidal tendencies,*** dizziness, dream abnormalities, headache, insomnia, ***neuroleptic malignant syndrome,*** paresthesia, psychotic episodes, somnolence.
**CV:** cardiac irregularities, hypertension, hypotension, orthostatic hypotension, palpitations, phlebitis, ***MI.***
**GI:** anorexia, constipation, dark saliva, duodenal ulcer, diarrhea, dry mouth, dyspepsia, ***GI bleeding,*** taste alterations, vomiting.
**GU:** dark urine, urinary frequency, UTI.
**Hematologic:** ***agranulocytosis,*** hemolytic and nonhemolytic anemia, ***leukopenia, thrombocytopenia.***
**Musculoskeletal:** back pain, muscle cramps, shoulder pain.
**Respiratory:** dyspnea, upper respiratory tract infection.
**Skin:** alopecia, rash, diaphoresis, dark sweat.
**Other:** increased libido, hypersensitivity.

**entacapone**

**CNS:** *dyskinesia*, *hyperkinesia*, agitation, anxiety, asthenia, dizziness, fatigue, hypokinesia, somnolence.
**GI:** *diarrhea*, *nausea*, abdominal pain, constipation, dry mouth, dyspepsia, flatulence, gastritis, taste perversion, vomiting.
**GU:** *urine discoloration.*
**Musculoskeletal:** back pain.
**Respiratory:** dyspnea.
**Skin:** increased sweating, purpura.
**Other:** bacterial infection.

### INTERACTIONS

**Drug-drug.** *Ampicillin*, *chloramphenicol*, *cholestyramine*, *erythromycin*, *probenecid*,

*rifampicin:* May interfere with entacapone excretion. Use together cautiously.
*Antihypertensives:* May cause orthostatic hypotension. Adjust antihypertensive dosage as needed.
*CNS depressants:* Additive effects. Use together cautiously.
*Dopamine (D2) receptor antagonists such as butyrophenones, iron salts, isoniazid, metoclopramide, phenothiazines, phenytoin, risperidone:* May decrease levodopa, carbidopa, and entacapone effects. Monitor patient for effectiveness.
*Drugs metabolized by COMT, such as alpha-methyldopa, apomorphine, dobutamine, dopamine, epinephrine, isoproterenol, isoetharine, norepinephrine:* May increase heart rate, arrhythmias, and excessive blood pressure changes. Use together cautiously.
*Metoclopramide:* May increase availability of levodopa and carbidopa by increasing gastric emptying. Monitor patient for adverse effects.
*Nonselective MAO inhibitor:* May disrupt catecholamine metabolism. Avoid using together.
*Selegiline:* May cause severe hypotension. Use together cautiously, and monitor blood pressure.
*Tricyclic antidepressants:* May increase risk of hypertension and dyskinesia. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, AST, ALT, LDH, glucose, BUN, and bilirubin levels. May decrease hemoglobin level and hematocrit.
- May decrease platelet and WBC counts.
- May cause false-positive reaction for urinary ketone bodies on a test tape. May cause false-negative result for glucosuria with glucose oxidase testing methods.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its ingredients.

**Alert:** Drug may increase the risk for MI, stroke, and death. Monitor cardiovascular status closely.

- Contraindicated in patients with angle-closure glaucoma, suspicious undiagnosed skin lesions, or a history of melanoma.
- Contraindicated within 2 weeks of MAO inhibitor therapy.
- Use cautiously in patients with past or current psychosis and in patients with severe CV or pulmonary disease; bronchial asthma; biliary obstruction; or renal, hepatic, or endocrine disease.
- Use cautiously in patients with chronic open-angle glaucoma or a history of MI and residual atrial, nodal, or ventricular arrhythmias.

**Overdose S&S:** CNS disturbances, hypotension, tachycardia, rhabdomyolysis, transient renal insufficiency, abdominal pain, loose stools.

## NURSING CONSIDERATIONS

- Certain CNS effects, such as dyskinesia, may occur at lower dosages and sooner with levodopa, carbidopa, and entacapone than with levodopa alone. Dyskinesia may require a reduced dosage.
- During the first adjustment period, monitor patient with CV disease carefully and in a facility equipped to provide intensive cardiac care.
- Neuroleptic malignant syndrome may develop when levodopa and carbidopa are reduced or stopped, especially in patients taking antipsychotic drugs. Watch patient carefully for fever, hyperthermia, muscle rigidity, involuntary movements, altered consciousness, mental status changes, and autonomic dysfunction.
- During extended therapy, periodically monitor hepatic, hematopoietic, CV, and renal function.
- Diarrhea is common; it usually develops 4 to 12 weeks after treatment starts but may appear as early as the first week or as late as many months after treatment starts.

**Alert:** Monitor patient for hallucinations, depression, and suicidal tendencies.

## PATIENT TEACHING

- Advise patient to take drug exactly as prescribed.
- Tell patient to report a "wearing-off" effect, which may occur at the end of the dosing interval.

- Tell patient that urine, sweat, and saliva may turn dark (red, brown, or black) during treatment.
- Advise patient to notify the prescriber if problems making voluntary movements increase.
- Tell patient that diarrhea is common with this treatment.
- Inform patient that hallucinations may occur.
- Urge patient to immediately report depression or suicidal thoughts.
- Explain that he may become dizzy if he rises quickly. Urge patient to use caution when rising.
- Tell patient that a high-protein diet, excessive acidity, and iron salts may reduce the drug's effectiveness.
- Urge patient to avoid hazardous activities until the CNS effects of the drug are known.
- Advise patient to notify prescriber if she becomes pregnant.

## levofloxacin

lee-voe-FLOX-a-sin

Levaquin

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Fluoroquinolone
*Pregnancy risk category C*

### AVAILABLE FORMS

*Infusion (premixed):* 250 mg in 50 ml $D_5W$, 500 mg in 100 ml $D_5W$, 750 mg in 150 ml $D_5W$
*Oral solution:* 25 mg/ml*
*Single-use vials:* 500 mg, 750 mg
*Tablets:* 250 mg, 500 mg, 750 mg

### INDICATIONS & DOSAGES

➤ **Acute bacterial sinusitis caused by susceptible strains of *Streptococcus pneumoniae, Moraxella catarrhalis,* or *Haemophilus influenzae***
*Adults:* 500 mg P.O. or I.V. infusion over 60 minutes every 24 hours for 10 to 14 days or 750 mg P.O. every 24 hours for 5 days.

➤ **Mild to moderate skin and skin-structure infections caused by *Staphylococcus aureus* or *S. pyogenes***
*Adults:* 500 mg P.O. or I.V. infusion over 60 minutes every 24 hours for 7 to 10 days.

➤ **Acute bacterial worsening of chronic bronchitis caused by *S. aureus, S. pneumoniae, M. catarrhalis, H. influenzae,* or *H. parainfluenzae***
*Adults:* 500 mg P.O. or I.V. infusion over 60 minutes every 24 hours for 7 days.

➤ **Community-acquired pneumonia from *S. pneumoniae* (resistant to two or more of the following antibiotics: penicillin, second-generation cephalosporins, macrolides, trimethoprim-sulfamethoxazole, tetracyclines), *S. aureus, M. catarrhalis, H. influenzae, H. parainfluenzae, Klebsiella pneumoniae, Chlamydia pneumoniae, Legionella pneumophila,* or *Mycoplasma pneumoniae***
*Adults:* 500 mg P.O. or I.V. infusion over 60 minutes every 24 hours for 7 to 14 days.

➤ **To prevent inhalation anthrax after confirmed or suspected exposure to *Bacillus anthracis***
*Adults:* 500 mg I.V. infusion or P.O. every 24 hours for 60 days.
*Children age 6 months and older weighing at least 50 kg (110 lb):* 500 mg by slow I.V. infusion every 24 hours for 60 days.
*Children age 6 months and older weighing less than 50 kg (110 lb):* 8 mg/kg (not to exceed 250 mg/dose) by slow I.V. infusion every 12 hours for 60 days.

➤ **Chronic bacterial prostatitis caused by *Escherichia coli, Enterococcus faecalis,* or *Staphylococcus epidermidis***
*Adults:* 500 mg P.O. or I.V. over 60 minutes every 24 hours for 28 days.

***Adjust-a-dose:*** In patients with a creatinine clearance of 20 to 49 ml/minute, give first dose of 500 mg and then 250 mg daily. If clearance is 10 to 19 ml/minute, give first dose of 500 mg and then 250 mg every 48 hours. For patients receiving dialysis or chronic ambulatory peritoneal dialysis, give first dose of 500 mg and then 250 mg every 48 hours. For patients using the 5-day regimen for acute bacterial sinusitis, use the Adjust-a-dose schedule for nosocomial pneumonia.

➤ **Community-acquired pneumonia from *S. pneumoniae* (excluding multidrug-resistant strains), *H. influenzae,***

***H. parainfluenzae, M. pneumoniae,* and *C. pneumoniae***
*Adults:* 750 mg P.O. or I.V. over 90 minutes every 24 hours for 5 days.

➤ **Complicated skin and skin-structure infections caused by methicillin-sensitive *S. aureus, E. faecalis, S. pyogenes,* or *Proteus mirabilis***
*Adults:* 750 mg P.O. or I.V. infusion over 90 minutes every 24 hours for 7 to 14 days.

➤ **Nosocomial pneumonia caused by methicillin-susceptible *S. aureus, Pseudomonas aeruginosa, Serratia marcescens, E. coli, K. pneumoniae, H. influenzae,* or *S. pneumoniae***
*Adults:* 750 mg P.O. or I.V. infusion over 90 minutes every 24 hours for 7 to 14 days.
***Adjust-a-dose:*** If creatinine clearance is 20 to 49 ml/minute, give 750 mg initially and then 750 mg every 48 hours; if clearance is 10 to 19 ml/minute, or patient is receiving hemodialysis or chronic ambulatory peritoneal dialysis, give 750 mg initially and then 500 mg every 48 hours.

➤ **Complicated UTI caused by *E. faecalis, Enterobacter cloacae, E. coli, K. pneumoniae, P. mirabilis,* or *P. aeruginosa;* acute pyelonephritis caused by *E. coli***
*Adults:* 250 mg P.O. or I.V. over 60 minutes every 24 hours for 10 days.
***Adjust-a-dose:*** If creatinine clearance is 10 to 19 ml/minute, increase dosage interval to every 48 hours.

➤ **Complicated UTI caused by *E. coli, K. pneumoniae,* or *P. mirabilis;* acute pyelonephritis caused by *E. coli***
*Adults:* 750 mg P.O. or I.V. over 90 minutes daily for 5 days.
***Adjust-a-dose:*** If creatinine clearance is 20 to 49 ml/minute, increase dosage interval to every 48 hours. If creatinine clearance is 10 to 19 ml/minute or patient is receiving dialysis, give 750 mg P.O. or I.V. initial dose, then 500 mg every 48 hours.

➤ **Mild to moderate uncomplicated UTI caused by *E. coli, K. pneumoniae,* or *S. saprophyticus***
*Adults:* 250 mg P.O. daily for 3 days.

➤ **Traveler's diarrhea ♦**
*Adults:* 500 mg P.O. daily for up to 3 days.

## ADMINISTRATION

### P.O.

- Obtain specimen for culture and sensitivity tests before therapy and as needed to determine if bacterial resistance has occurred.
- Give drug with plenty of fluids.
- Give 2 hours before or 6 hours after antacids, sucralfate, and products containing iron or zinc.
- Give oral solution 1 hour before or 2 hours after a meal.

### I.V.

- Obtain specimen for culture and sensitivity tests before therapy and as needed to determine if bacterial resistance has occurred.
- Give this form only by infusion.
- Dilute drug in single-use vials, according to manufacturer's instructions, with $D_5W$ or normal saline solution for injection to a final concentration of 5 mg/ml.
- Infuse doses of 500 mg or less over 60 minutes and doses of 750 mg over 90 minutes.
- Reconstituted solution should be clear, slightly yellow, and free of particulate matter.
- Reconstituted drug is stable for 72 hours at room temperature, for 14 days when refrigerated in plastic containers, and for 6 months when frozen.
- Thaw at room temperature or in refrigerator.
- **Incompatibilities:** Acyclovir sodium, alprostadil, azithromycin, furosemide, heparin sodium, indomethacin sodium trihydrate, insulin, mannitol 20%, nitroglycerin, propofol, sodium bicarbonate, sodium nitroprusside. The manufacturer recommends not mixing or infusing other drugs with levofloxacin.

## ACTION

Inhibits bacterial DNA gyrase and prevents DNA replication, transcription, repair, and recombination in susceptible bacteria.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.V. | Unknown | 1–2 hr | Unknown |

*Half-life:* About 6 to 8 hours.

## ADVERSE REACTIONS

**CNS:** ***encephalopathy, seizures,*** dizziness, headache, insomnia.
**GI:** ***pseudomembranous colitis,*** abdominal pain, constipation, diarrhea, dyspepsia, nausea, vomiting.
**GU:** vaginitis.
**Hematologic:** ***lymphopenia,*** eosinophilia, hemolytic anemia.
**Metabolic:** ***hypoglycemia.***
**Musculoskeletal:** back pain, tendon rupture.
**Respiratory:** allergic pneumonitis, dyspnea.
**Skin:** ***erythema multiforme, Stevens-Johnson syndrome,*** photosensitivity, pruritus, rash.
**Other:** ***anaphylaxis, multisystem organ failure, hypersensitivity reactions.***

## INTERACTIONS

**Drug-drug.** *Aluminum hydroxide, aluminum–magnesium hydroxide, calcium carbonate, didanosine, magnesium hydroxide, products containing zinc, sucralfate:* May interfere with GI absorption of levofloxacin. Give levofloxacin 2 hours before or 6 hours after these products.
*Antiarrhythmics (Class IA procainamide, quinidine or Class III amiodarone, dofetilide), chlorpromazine, erythromycin, fluconazole, imipramine, ziprasidone:* May increase risk of life-threatening cardiac arrhythmias. Avoid use together.
*Antidiabetics:* May alter glucose level. Monitor glucose level closely.
*Iron salts:* May decrease absorption of levofloxacin, reducing anti-infective response. Separate doses by at least 2 hours.
*NSAIDs:* May increase CNS stimulation. Monitor patient for seizure activity.
**Black Box Warning** *Steroids:* May increase risk of tendinitis and tendon rupture. Monitor patient for tendon pain or inflammation. ■
*Theophylline:* May decrease clearance of theophylline. Monitor theophylline level.
*Warfarin and derivatives:* May increase effect of oral anticoagulant. Monitor PT and INR.
**Drug-herb.** *Dong quai, St. John's wort:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.
**Drug-lifestyle.** *Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May decrease glucose and hemoglobin levels.
- May increase eosinophil count. May decrease WBC count.
- May produce false-positive opioid assay results.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Drug is associated with increased risk of tendinitis and tendon rupture, especially in patients older than age 60 and those with heart, kidney, or lung transplants. ■
- Contraindicated in patients hypersensitive to drug, its components, or other fluoroquinolones.
- Use cautiously in patients with history of seizure disorders or other CNS diseases, such as cerebral arteriosclerosis.
- Use cautiously and with dosage adjustment in patients with renal impairment.
- Safety and efficacy of drug in children younger than age 18 and in pregnant and breast-feeding women haven't been established.

## NURSING CONSIDERATIONS

- If patient experiences symptoms of excessive CNS stimulation (restlessness, tremor, confusion, hallucinations), stop drug and notify prescriber. Begin seizure precautions.
- Patients with acute hypersensitivity reactions may need treatment with epinephrine, oxygen, I.V. fluids, antihistamines, corticosteroids, pressor amines, and airway management.
- Most antibacterials can cause pseudomembranous colitis. If diarrhea occurs, notify prescriber; drug may be stopped.
- Drug may cause an abnormal ECG.

***Alert:*** If *P. aeruginosa* is a confirmed or suspected pathogen, use with a beta-lactam.
- Monitor glucose level and results of renal, hepatic, and blood counts.

## PATIENT TEACHING

- Tell patient to take drug as prescribed, even if signs and symptoms disappear.
- Advise patient to take drug with plenty of fluids and to space antacids, sucralfate, and products containing iron or zinc.
- Tell patient to take oral solution 1 hour before or 2 hours after eating.
- Warn patient to avoid hazardous tasks until adverse effects of drug are known.
- Advise patient to avoid excessive sunlight exposure.
- Instruct patient to stop drug and notify prescriber if rash or other signs or symptoms of hypersensitivity develop.

**Black Box Warning** Tell patient that tendon rupture may occur with drug and to notify prescriber if he experiences pain or inflammation. ■

- Instruct diabetic patient to monitor glucose level and notify prescriber about low-glucose reaction.
- Instruct patient to notify prescriber of loose stools or diarrhea.

# levothyroxine sodium ($T_4$ L-thyroxine sodium)

lee-voe-thye-ROX-een

Eltroxin†, Euthyrox†, Levo-T, Levothroid, Levoxyl🖋, Synthroid🖋, Unithroid

*Therapeutic class:* Thyroid hormone replacement
*Pharmacologic class:* Thyroid hormone
*Pregnancy risk category A*

## AVAILABLE FORMS

*Powder for injection:* 200 mcg, 500 mcg
*Tablets:* 25 mcg, 50 mcg, 75 mcg, 88 mcg, 100 mcg, 112 mcg, 125 mcg, 137 mcg, 150 mcg, 175 mcg, 200 mcg, 300 mcg

## INDICATIONS & DOSAGES

➤ **Thyroid hormone replacement**

*Adults:* For patients younger than age 50 or those older than age 50 who have been recently treated for hyperthyroidism, or have been hypothyroid for a short time, give 1.7 mcg/kg P.O. once daily. Monitor thyroid-stimulating hormone (TSH) levels every 6 to 8 weeks, making dosage adjustments in 12.5- to 25-mcg increments until patient is euthyroid and TSH level normalizes.
*Adults:* For patients age 50 or older or those younger than age 50 with underlying cardiac disease, give 25 to 50 mcg P.O. daily. Adjust dose every 6 to 8 weeks, if needed, until patient is euthyroid and TSH level normalizes.
*Children in whom growth and puberty are complete:* 1.7 mcg/kg P.O. once daily.
*Children older than age 12 in whom growth and puberty are incomplete:* More than 150 mcg or 2 to 3 mcg/kg P.O. daily.
*Children ages 6 to 12:* 100 to 150 mcg or 4 to 5 mcg/kg P.O. daily.
*Children ages 1 to 5:* 75 to 100 mcg or 5 to 6 mcg/kg P.O. daily.
*Children ages 6 months to 1 year:* 50 to 75 mcg or 6 to 8 mcg/kg P.O. daily.
*Children ages 3 to 6 months:* 25 to 50 mcg or 8 to 10 mcg/kg P.O. daily.
*Infants and neonates birth to 3 months:* 10 to 15 mcg/kg P.O. daily. In neonates at risk for cardiac failure, use a lower initial dose (such as 25 mcg daily), and increase every 4 to 6 weeks as needed.
*Elderly patients with underlying cardiovascular disease:* 12.5 to 25 mcg P.O. daily; increase by 12.5 to 25 mcg every 4 to 6 weeks, depending on response.

➤ **Severe, long-standing hypothyroidism**

*Adults:* 12.5 to 25 mcg P.O. daily. Increase in increments of 25 mcg every 2 to 4 weeks as needed.
*Children:* 25 mcg P.O. daily. Increase in increments of 25 mcg every 2 to 4 weeks as needed.

➤ **Hypothyroidism (when rapid onset of effect is critical or when oral route is precluded for long periods of time)**

*Adults and children:* Approximately one-half of previously established oral dosage I.V. or I.M. Maintenance dosage is 50 to 100 mcg/day (0.05 to 0.1 mg/day) I.V. or I.M.

➤ **Myxedema coma or stupor without concomitant severe heart disease**

*Adults and children:* 200 to 500 mcg (0.2 to 0.5 mg) I.V. as solution containing 100 mcg/ml. May give additional 100 to 300 mcg or more on second day. Maintain continued daily administration of lesser

amounts until patient can take daily oral dose.

## ADMINISTRATION

**P.O.**

- Synthroid may contain tartrazine.
- Give drug at same time each day on an empty stomach, preferably ½ to 1 hour before breakfast.
- Give levoxyl with a full glass of water to prevent choking, gagging, and difficulty swallowing.
- If necessary, crush tablet and suspend it in small amount of formula (except soy formula, which may decrease the absorption), breast milk, or water, and give by spoon or dropper. Crushed tablet can also be sprinkled over food, except foods containing large amounts of soybean, fiber, or iron.

**I.V.**

- ▼ Reconstitute by adding 5 ml sodium chloride 0.9% injection only.
- ▼ Shake vial.
- ▼ Use immediately after reconstitution.
- ▼ Discard any unused portion.
- ▼ **Incompatibilities:** Don't mix or give with anything other than sodium chloride 0.9% injection.

**I.M.**

- Reconstitute by adding 5 ml sodium chloride 0.9% injection only.
- Shake vial.
- Use immediately after reconstitution.
- Discard any unused portion.

## ACTION

Not completely defined. Stimulates metabolism of all body tissues by accelerating rate of cellular oxidation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 24 hr | Unknown | Unknown |
| I.V., I.M. | Unknown | Unknown | Unknown |

*Half-life:* 3 to 4 days in hyperthyroidism; 9 to 10 days in hypothyroidism.

## ADVERSE REACTIONS

**CNS:** *nervousness, insomnia, tremor,* headache, fever, fatigue.
**CV:** *tachycardia, palpitations,* ***arrhythmias,*** *angina pectoris,* ***cardiac arrest.***
**GI:** diarrhea, vomiting.
**GU:** menstrual irregularities.
**Metabolic:** weight loss, increased appetite.
**Musculoskeletal:** decreased bone density, muscle weakness.
**Respiratory:** dyspnea.
**Skin:** allergic skin reactions, diaphoresis, hair loss.
**Other:** heat intolerance, impaired fertility.

## INTERACTIONS

**Drug-drug.** *Amiodarone, iodide (including iodine-containing radiographic contrast agents), lithium:* May reduce thyroid hormone secretion. Monitor thyroid function studies if used together.
*Antacids, calcium carbonate, cholestyramine, colestipol, ferrous sulfate, sucralfate:* May impair levothyroxine absorption. Separate doses by 4 to 5 hours.
*Beta blockers:* May reduce beta-blocker effects. Monitor patient.
*Carbamazepine, hydantoins, phenobarbital, rifampin:* May increase hepatic metabolism, resulting in hypothyroidism. Monitor patient.
*Digoxin:* May decrease glycoside effects. Monitor patient for clinical effect.
***Estrogens:*** May decrease thyroid levels. Monitor levels after 12 weeks of therapy and adjust levothyroxine dose as needed.
*Fosphenytoin, phenytoin:* May release free thyroid hormone. Monitor patient for tachycardia.
*Insulin, oral antidiabetics:* May alter glucose level. Monitor glucose level. Dosage adjustments may be needed.
*Ketamine:* May produce marked hypertension and tachycardia. Use together cautiously.
*Selective serotonin reuptake inhibitors:* May increase levothyroxine requirements. Adjust dosage as needed.
*Sympathomimetics such as epinephrine:* May increase risk of coronary insufficiency. Monitor patient closely.
*Theophylline:* May decrease theophylline clearance in hypothyroidism; clearance may return to normal when euthyroid state is achieved. Monitor theophylline level.
*Tricyclic antidepressants, tetracyclic antidepressants:* May increase therapeutic effects and toxicity of both drugs. Monitor patient closely.

***Warfarin:*** May increase anticoagulant effects. Monitor patient for bleeding and check PT and INR closely. Warfarin dosage adjustment may be needed.
**Drug-herb.** *Horseradish:* May cause abnormal thyroid function. Discourage use in patients undergoing thyroid function tests. *Lemon balm:* May have antithyroid effects; may inhibit TSH. Discourage use together.
**Drug-food.** *Cottonseed meal, dietary fiber, soybean flour, walnuts:* May decrease absorption of drug. Dosage adjustments may be needed.

## EFFECTS ON LAB TEST RESULTS

• May decrease thyroid function test results. May alter results of liothyronine, protein-bound iodine, and radioactive $^{131}I$ uptake studies.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug and in those with acute MI uncomplicated by hypothyroidism, untreated subclinical or overt thyrotoxicosis, or uncorrected adrenal insufficiency.
**Black Box Warning** Don't use either alone or with other therapeutic agents for treatment of obesity or for weight loss. ▮
• Use cautiously in elderly patients and in those with angina pectoris, hypertension, other CV disorders, renal insufficiency, or ischemia.
• Use cautiously in patients with diabetes mellitus, diabetes insipidus, or myxedema and during rapid replacement in those with arteriosclerosis.
⚠ ***Overdose S&S:*** Signs and symptoms of hyperthyroidism, confusion, disorientation, cerebral embolism, shock, coma, seizures, death.

## NURSING CONSIDERATIONS

• Patients with diabetes mellitus may need increased antidiabetic doses when starting thyroid hormone replacement.
• Watch for angina, coronary occlusion, or stroke in patients with arteriosclerosis who are receiving rapid replacement.
• In patients with coronary artery disease who must receive thyroid hormone, observe carefully for possible coronary insufficiency.
• Patients with adult hypothyroidism are unusually sensitive to thyroid hormone. Start at lowest dosage, and adjust to higher dosages according to patient's symptoms and laboratory data until euthyroid state is reached.
• When changing from levothyroxine to liothyronine, stop levothyroxine and begin liothyronine. Increase dosage in small increments after residual effects of levothyroxine have disappeared. When changing from liothyronine to levothyroxine, start levothyroxine several days before withdrawing liothyronine to avoid relapse. Drugs aren't interchangeable.
• Long-term therapy causes bone loss in premenopausal and postmenopausal women. Consider a basal bone density measurement, and monitor patient closely for osteoporosis.
• Patients taking levothyroxine who need to have $^{131}I$ uptake studies performed must stop drug 4 weeks before test.
• Patients taking anticoagulants may need their dosage modified and require careful monitoring of coagulation status.
• Dosage may need to be increased in pregnant patients.
• Drug shouldn't be used for infertility (unless associated with hypothyroidism).
**Black Box Warning** Drug should not be used for the treatment of obesity or for weight loss. ▮
• ***Look alike–sound alike:*** Don't confuse levothyroxine with liothyronine or liotrix or Lamictal.

## PATIENT TEACHING

• Teach patient the importance of compliance. Tell him to take drug at same time each day, preferably ½ to 1 hour before breakfast, to maintain constant hormone levels and help prevent insomnia.
• Make sure patient understands that replacement therapy is usually for life. The drug should never be stopped unless directed by prescriber.
• Warn patient (especially elderly patient) to notify prescriber immediately about chest pain, palpitations, sweating, nervousness, shortness of breath, or other signals of overdose or aggravated CV disease.

L

● Tell caregiver of infant or child who can't swallow tablets to crush tablet and suspend in small amount of water and give by spoon or dropper. Crushed tablet can be sprinkled over food, except foods containing large amounts of soybean, fiber, or iron.
● Tell patient using Levoxyl to take pill with plenty of water to avoid choking, gagging, or getting the pill stuck in his throat.
● Advise patient who has achieved stable response not to change brands.
● Tell patient to report unusual bleeding and bruising.
● Advise patient not to take OTC or other prescription drugs without first consulting prescriber.
● Advise patient to report pregnancy to prescriber because dosage may need adjustment.
● Advise patient to protect tablets from light and moisture.

**SAFETY ALERT!**

## lidocaine hydrochloride (lignocaine hydrochloride)

LYE-doe-kane

LidoPen Auto-Injector, Xylocaine, Xylocard†

*Therapeutic class:* Antiarrhythmic
*Pharmacologic class:* Amide derivative
*Pregnancy risk category B*

### AVAILABLE FORMS

*Infusion (premixed):* 0.2% (2 mg/ml), 0.4% (4 mg/ml), 0.8% (8 mg/ml)
*Injection (for direct I.V. use):* 1% (10 mg/ml), 2% (20 mg/ml)
*Injection (for I.M. use):* 300 mg/3 ml automatic injection device
*Injection (for I.V. admixtures):* 4% (40 mg/ml), 10% (100 mg/ml), 20% (200 mg/ml)

### INDICATIONS & DOSAGES

➤ **Ventricular arrhythmias caused by MI, cardiac manipulation, or cardiac glycosides**

*Adults:* 50 to 100 mg (1 to 1.5 mg/kg) by I.V. bolus at 25 to 50 mg/minute. Bolus dose is repeated every 3 to 5 minutes until arrhythmias subside or adverse reactions develop. Don't exceed 300-mg total bolus during a 1-hour period. Simultaneously, constant infusion of 20 to 50 mcg/kg/minute (1 to 4 mg/minute) is begun. If single bolus has been given, smaller bolus dose may be repeated 15 to 20 minutes after start of infusion to maintain therapeutic level.
*Children:* 1 mg/kg by I.V. or intraosseous bolus. If no response, start infusion of 20 to 50 mcg/kg/minute. Give an additional bolus dose of 0.5 to 1 mg/kg if delay of greater than 15 minutes between initial bolus and starting the infusion. Bolus doses shouldn't exceed 3 to 5 mg/kg.
*Elderly patients:* Reduce dosage and rate of infusion by 50%.
***Adjust-a-dose:*** For patients with heart failure, with renal or liver disease, or who weigh less than 50 kg (110 lb), reduce dosage.

### ADMINISTRATION

**I.V.**

▼ Injections (additive syringes and single-use vials) containing 40, 100, or 200 mg/ml are for the preparation of I.V. infusion solutions only and must be diluted before use.
▼ Prepare I.V. infusion by adding 1 g (using 25 ml of 4% or 5 ml of 20% injection) to 1 L of $D_5W$ injection to provide a solution containing 1 mg/ml.
▼ Use a more concentrated solution of up to 8 mg/ml in fluid-restricted patient.
▼ Patients receiving infusions must be on a cardiac monitor and must be attended at all times. Use an infusion control device for giving infusion precisely. Don't exceed 4 mg/minute; faster rate greatly increases risk of toxicity.
▼ Avoid giving injections containing preservatives.
▼ **Incompatibilities:** Amphotericin, ampicillin, cefazolin, ceftriaxone, fentanyl citrate (higher pH brands), methohexital sodium, phenytoin sodium, sodium bicarbonate, thiopental sodium.

**I.M.**

● Give I.M. injections in the deltoid muscle only.
● Drug may cause soreness at injection site.

## ACTION

A class IB antiarrhythmic that decreases the depolarization, automaticity, and excitability in the ventricles during the diastolic phase by direct action on the tissues, especially the Purkinje network.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | 10–20 min |
| I.M. | 5–15 min | 10 min | 2 hr |

*Half-life:* 1½ to 2 hours (may be prolonged in patients with heart failure or hepatic disease).

## ADVERSE REACTIONS

**CNS:** *confusion, tremor, stupor, restlessness, light-headedness,* ***seizures,*** lethargy, somnolence, anxiety, hallucinations, nervousness, paresthesia, muscle twitching.
**CV:** *hypotension,* ***bradycardia, new or worsened arrhythmias, cardiac arrest.***
**EENT:** *tinnitus, blurred or double vision.*
**GI:** vomiting.
**Respiratory:** ***respiratory depression and arrest.***
**Skin:** soreness at injection site.
**Other:** ***anaphylaxis,*** sensation of cold.

## INTERACTIONS

**Drug-drug.** *Atenolol, metoprolol, nadolol, pindolol, propranolol:* May reduce hepatic metabolism of lidocaine, increasing the risk of toxicity. Give bolus doses of lidocaine at a slower rate, and monitor lidocaine level and patient closely.
*Cimetidine:* May decrease clearance of lidocaine, increasing the risk of toxicity. Consider using a different $H_2$ receptor antagonist if possible. Monitor lidocaine level closely.
*Ergot-type oxytocic drugs:* May cause severe, persistent hypertension or stroke. Avoid using together.
*Mexiletine:* May increase pharmacologic effects. Avoid using together.
*Phenytoin, procainamide, propranolol, quinidine:* May increase cardiac depressant effects. Monitor patient closely.
*Succinylcholine:* May prolong neuromuscular blockade. Monitor patient closely.
**Drug-herb.** *Pareira:* May increase the effects of neuromuscular blockade. Discourage use together.
**Drug-lifestyle.** *Smoking:* May increase metabolism of lidocaine. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

- May increase CK levels with I.M. use.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to the amide-type local anesthetics.
- Contraindicated in those with Adams-Stokes syndrome, Wolff-Parkinson-White syndrome, and severe degrees of SA, AV, or intraventricular block in the absence of an artificial pacemaker.
- Use cautiously and at reduced dosages in patients with complete or second-degree heart block or sinus bradycardia, in elderly patients, in those with heart failure or renal or hepatic disease, and in those who weigh less than 50 kg (110 lb).

***Overdose S&S:*** Circulatory depression, change in level of consciousness, seizures, hypoventilation.

## NURSING CONSIDERATIONS

- Monitor isoenzymes when using I.M. drug for suspected MI. A patient who has received I.M. lidocaine will show a sevenfold increase in CK level. Such an increase originates in the skeletal muscle, not the heart.
- Monitor drug level. Therapeutic levels are 2 to 5 mcg/ml.

***Alert:*** Monitor patient for toxicity. In many severely ill patients, seizures may be the first sign of toxicity, but severe reactions are usually preceded by somnolence, confusion, tremors, and paresthesia. If signs of toxicity occur, stop drug at once and notify prescriber. Continuing could lead to seizures and coma. Give oxygen through a nasal cannula if not contraindicated. Keep oxygen and cardiopulmonary resuscitation equipment available.

- Monitor patient's response, especially blood pressure and electrolytes, BUN, and creatinine levels. Notify prescriber promptly if abnormalities develop.
- If arrhythmias worsen or ECG changes (for example, QRS complex widens or PR interval substantially prolongs), stop infusion and notify prescriber.

### PATIENT TEACHING

- For I.M. form, tell patient that drug may cause soreness at injection site. Tell him to report discomfort at the site.
- Tell patient to report adverse reactions promptly because toxicity can occur.

## lindane

LIN-dayn

Hexit†

*Therapeutic class:* Scabicide, pediculicide
*Pharmacologic class:* Ectoparasiticide and ovicide
*Pregnancy risk category C*

### AVAILABLE FORMS

*Lotion:* 1%
*Shampoo:* 1%

### INDICATIONS & DOSAGES

➤ **Parasitic infestation (scabies, pediculosis)**

*Adults and children:* Centers for Disease Control and Prevention recommend not bathing before applying on skin. If patient does bathe, let skin dry and cool thoroughly before using drug. For scabies, apply thin layer of lotion over entire skin surface from the neck down (with special attention to skinfolds, creases, under fingernails, interdigital spaces, and genital area) and rub in thoroughly; for pediculosis, apply thin layer of lotion to hairy areas. After 8 to 12 hours, wash drug off.

Apply shampoo undiluted to dry hair and work into lather for 4 minutes; small amounts of water may increase lathering. Apply 30 ml of shampoo for short hair, 45 ml for medium-length hair, or 60 ml for long hair. Rinse thoroughly and rub dry with towel. Comb with a fine-tooth comb.

*Elderly patients:* May need to reduce dosage because of increased skin absorption.

### ADMINISTRATION

**Topical**

- If patient bathes before application, make sure his skin is dry and cool before applying drug.
- Apply thin layer to cover body only once. Use 1 ounce for children younger than age 6 and 1 to 2 ounces for older children and adults.
- Don't leave drug on for longer than 12 hours; remove drug by washing thoroughly.

### ACTION

May inhibit neuronal membrane function in arthropods, causing neuronal hyperactivity, seizures, and death after penetrating the parasite's exoskeleton.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | 190 min | Unknown | Unknown |

*Half-life:* About 18 hours.

### ADVERSE REACTIONS

**CNS:** ***seizures,*** dizziness.
**Skin:** alopecia, dermatitis, pruritus, urticaria.

### INTERACTIONS

**Drug-drug.** *Drugs that lower the seizure threshold (anticholinesterases, antidepressants, antipsychotics, cyclosporine, chloroquine sulfate, imipenem, isoniazid, methocarbamol, meperidine, mofetil, mycophenolate, penicillins, pyrimethamine, quinolones, tacrolimus, theophylline):* May precipitate seizure activity if used together. Monitor patient if used together.
**Drug-lifestyle.** *Alcohol use:* May lower seizure threshold. Discourage use together.
*Oil-based hair products:* May increase absorption of drug. If oil-based hair products are used, urge patient to wash and dry hair before using drug.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Contraindicated in premature infants and in those with seizure disorders. Use cautiously in infants, children, elderly patients, patients with skin conditions other than lice infestation, and those who weigh less than 50 kg (110 lb); all are at greater risk for CNS toxicity, including seizures and death. ■

• Contraindicated in patients hypersensitive to drug or its components and in those with inflamed skin.
⚠ ***Overdose S&S:*** CNS excitation, seizures.

## NURSING CONSIDERATIONS

**Black Box Warning** Use lindane products only as second-line treatment of lice infestation or in patients who can't tolerate treatment with safer medications. ▮
• Permethrin 1% cream rinse and pyrethrins with piperonyl butoxide are safer than lindane for pubic lice.
• Apply topical corticosteroids or give oral antihistamines, as prescribed, for pruritus.
• Make sure that hospitalized patients are placed in isolation, with special linen-handling precautions, until treatment is completed.
• Intact skin absorbs 6% to 13% of drug. Absorption is increased if applied to face, scalp, axillae, neck, scrotum, or irritated or broken skin.
• Avoid drug contact with eyes.
**Black Box Warning** When used correctly, drug is safe and effective. When overused, it can cause adverse reactions. Don't confuse prolonged itching with reinfestation. ▮
• Treat sexual partners simultaneously.

## PATIENT TEACHING

• Teach patient or family member how to apply drug: Apply thin layer to cover body only once. Use 1 ounce for children younger than age 6 and 1 to 2 ounces for older children and adults. Don't leave drug on for longer than 12 hours; remove drug by washing thoroughly.
• If patient bathes before application, tell him to let skin dry thoroughly and cool before applying drug.
• Instruct patient to put lotion under fingernails after trimming nails short. A toothbrush can be used to apply lotion under fingernails. Tell patient to wrap toothbrush in paper and throw away immediately after use.
• Inform patient that drug can be poisonous when misused. Warn patient not to apply to open areas, acutely inflamed skin, or to face, eyes, mucous membranes, or urethral opening. If accidental contact with eyes occurs, advise patient to flush with water and notify prescriber.
• Tell patient to avoid inhaling vapors.
• Advise family member to wear gloves when applying drug.
• Tell patient to wash drug off skin and to notify prescriber immediately if skin irritation or hypersensitivity develops.
• Discourage repeated use, which can lead to skin irritation, systemic toxicity, or seizures. Advise patient to repeat use only if live lice or nits are found after 1 week.
• Warn patient not to use other creams or oils during treatment because of potential for increased absorption.
• Advise breast-feeding women to avoid a lot of skin-to-skin contact with infant while drug is present. Interrupt breast-feeding with expression and discarding of milk for at least 24 hours following use.
• Instruct patient to change all clothing and bed linens and launder them in hot water or dry clean after drug is washed off body.
• After application for lice infestation, tell patient to use fine-tooth comb or tweezers to remove nits from hairy areas.
• Advise patient to use shampoo form to clean combs or brushes and to wash them thoroughly afterward.
• Warn patient that itching may continue for several weeks after effective treatment, especially for scabies.
• Instruct patient to reapply drug if it's washed off during treatment time.
• Tell patient to warn other family members and sexual partners about infestation.
• Advise patient to use product carefully and follow all directions. Overusing product will cause unwanted side effects. Tell him not to confuse prolonged itching with reinfestation.

L

# linezolid

lih-NEH-zoe-lid

Zyvox

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Oxazolidinone
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 2 mg/ml

*Powder for oral suspension:* 100 mg/5 ml when reconstituted
*Tablet:* 600 mg

## INDICATIONS & DOSAGES

➤ **Vancomycin-resistant *Enterococcus faecium* infections, including those with concurrent bacteremia**
*Adults and children age 12 and older:* 600 mg I.V. or P.O. every 12 hours for 14 to 28 days.
*Neonates age 7 days or older and infants and children through age 11:* 10 mg/kg I.V. or P.O. every 8 hours for 14 to 28 days.
*Neonates younger than age 7 days:* 10 mg/kg I.V. or P.O. every 12 hours for 14 to 28 days. Increase to 10 mg/kg every 8 hours when patient is 7 days old. Consider this dosage increase if neonate has inadequate response.

➤ **Hospital-acquired pneumonia caused by *Staphylococcus aureus* (methicillin-susceptible [MSSA] and methicillin-resistant [MRSA] strains) or *Streptococcus pneumoniae* (including multidrug-resistant strains [MDRSP]); complicated skin and skin-structure infections, including diabetic foot infections without osteomyelitis caused by *S. aureus* (MSSA and MRSA), *S. pyogenes*, or *S. agalactiae*; community-acquired pneumonia caused by *S. pneumoniae* (including MDRSP), including those with concurrent bacteremia, or *S. aureus* (MSSA only)**
*Adults and children age 12 and older:* 600 mg I.V. or P.O. every 12 hours for 10 to 14 days.
*Neonates 7 days or older, infants and children through 11 years:* 10 mg/kg I.V. or P.O. every 8 hours for 10 to 14 days.
*Neonates younger than age 7 days:* 10 mg/kg I.V. or P.O. every 12 hours for 10 to 14 days. Increase to 10 mg/kg every 8 hours when patient is 7 days old. Consider this dosage increase if neonate has inadequate response.

➤ **Uncomplicated skin and skin-structure infections caused by *S. aureus* (MSSA only) or *S. pyogenes***
*Adults:* 400 mg P.O. every 12 hours for 10 to 14 days.
*Children ages 12 to 18:* 600 mg P.O. every 12 hours for 10 to 14 days.
*Children ages 5 to 11:* 10 mg/kg P.O. every 12 hours for 10 to 14 days.
*Neonates age 7 days or older and infants and children younger than age 5:* 10 mg/kg P.O. every 8 hours for 10 to 14 days.
*Neonates younger than age 7 days:* 10 mg/kg P.O. every 12 hours for 10 to 14 days. Increase to 10 mg/kg every 8 hours when patient is 7 days old. Consider this dosage increase if neonate has inadequate response.

## ADMINISTRATION

**P.O.**
- Give tablets and suspension with or without meals.
- Reconstitute suspension according to manufacturer's instructions.
- Store reconstituted suspension at room temperature and use within 21 days.

**I.V.**
▼ Inspect solution for particulate matter and leaks.
▼ Drug is compatible with $D_5W$ injection, normal saline solution for injection, and lactated Ringer's injection.
▼ Don't inject additives into infusion bag. Give other I.V. drugs separately or via a separate I.V. line to avoid incompatibilities. If single I.V. line is used, flush line before and after infusion with a compatible solution.
▼ Infuse over 30 minutes to 2 hours. Don't infuse drug in a series connection.
▼ Store drug at room temperature in its protective overwrap. Solution may turn yellow over time, but this doesn't affect drug's potency.
▼ **Incompatibilities:** Amphotericin B, ceftriaxone sodium, chlorpromazine hydrochloride, diazepam, erythromycin lactobionate, pentamidine isethionate, phenytoin sodium, trimethoprim-sulfamethoxazole.

## ACTION

Prevents bacterial protein synthesis by interfering with DNA translation in the ribosomes. Also prevents formation of a functional 70S ribosomal subunit by binding to a site on the bacterial 50S ribosomal subunit.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Unknown |
| I.V. | Unknown | 30 min | Unknown |

*Half-life:* 6¼ hours.

## ADVERSE REACTIONS

**CNS:** *headache,* dizziness, fever, insomnia.
**GI:** *diarrhea, nausea,* ***pseudomembranous colitis,*** altered taste, constipation, oral candidiasis, tongue discoloration, vomiting.
**GU:** vaginal candidiasis.
**Hematologic:** ***leukopenia, myelosuppression, neutropenia, thrombocytopenia,*** anemia.
**Skin:** rash.
**Other:** fungal infection.

## INTERACTIONS

**Drug-drug.** *Adrenergic drugs (such as dopamine, epinephrine, pseudoephedrine):* May cause hypertension. Monitor blood pressure and heart rate; start continuous infusions of dopamine and epinephrine at lower doses and titrate to response.
*Serotoninergic drugs:* May cause serotonin syndrome, including confusion, delirium, restlessness, tremors, blushing, diaphoresis, and hyperpyrexia. Notify prescriber immediately of signs and symptoms of serotonin syndrome.
**Drug-food.** *Foods and beverages high in tyramine (such as aged cheeses, air-dried meats, red wines, sauerkraut, soy sauce, tap beers):* May increase blood pressure. Provide a list of foods containing tyramine and advise patient that tyramine content of meals shouldn't exceed 100 mg.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, bilirubin, alkaline phosphatase, creatinine, amylase, lipase, and BUN levels. May decrease hemoglobin level.
- May decrease WBC, neutrophil, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.

## NURSING CONSIDERATIONS

- No dosage adjustment is needed when switching from I.V. to P.O. forms.
- ***Alert:*** Nausea and vomiting may be symptoms of lactic acidosis. Monitor patient for unexplained acidosis or low bicarbonate level and notify prescriber immediately if these occur.
- ***Alert:*** Drug may cause thrombocytopenia. In patients at increased risk for bleeding, those with existing thrombocytopenia, those taking other drugs that may cause thrombocytopenia, and those receiving this drug for longer than 14 days, monitor platelet count.
- ***Alert:*** Drug may lead to myelosuppression. Monitor CBC weekly.
- ***Alert:*** Pseudomembranous colitis or superinfection may occur. Consider these diagnoses and take appropriate measures in patients with persistent diarrhea or secondary infections.
- Inappropriate use of antibiotics may lead to development of resistant organisms; carefully consider other drugs before starting therapy, especially in outpatient setting.
- ***Look alike–sound alike:*** Don't confuse Zyvox with Zovirax. Both come in a 400-mg strength.

## PATIENT TEACHING

- Tell patient that tablets and oral suspension may be taken with or without meals.
- Stress importance of completing entire course of therapy, even if patient feels better.
- Tell patient to alert prescriber if he has high blood pressure, is taking cough or cold preparations, or is being treated with SSRIs or other antidepressants.
- Advise patient to avoid large quantities of tyramine-containing foods (such as aged cheeses, soy sauce, tap beers, red wine) during therapy.
- Inform patient with phenylketonuria that each 5 ml of oral suspension contains 20 mg of phenylalanine. Tablets and injection don't contain phenylalanine.

## liothyronine sodium ($T_3$)

lye-oh-THYE-roe-neen

Cytomel, Triostat

*Therapeutic class:* Thyroid hormone replacement
*Pharmacologic class:* Thyroid hormone
*Pregnancy risk category A*

### AVAILABLE FORMS

*Injection:* 10 mcg/ml in 1-ml vials*
*Tablets:* 5 mcg, 25 mcg, 50 mcg

### INDICATIONS & DOSAGES

➤ **Congenital hypothyroidism**

*Children:* 5 mcg P.O. daily; increase by 5 mcg every 3 to 4 days until desired response is achieved.

➤ **Myxedema**

*Adults:* Initially, 5 mcg P.O. daily; increase by 5 to 10 mcg every 1 to 2 weeks until daily dose reaches 25 mcg. Then increase by 5 to 25 mcg daily every 1 to 2 weeks. Maintenance dosage is 50 to 100 mcg daily.

➤ **Myxedema coma, premyxedema coma**

*Adults:* Initially, 10 to 20 mcg I.V. for patients with CV disease; 25 to 50 mcg I.V. for patients who don't have CV disease. Adjust dosage based on patient's condition and response. Switch patient to oral therapy as soon as possible.

➤ **Simple (nontoxic) goiter**

*Adults:* Initially, 5 mcg P.O. daily; may increase by 5 to 10 mcg daily every 1 to 2 weeks, until daily dose reaches 25 mcg. Then increase by 12.5 to 25 mcg daily every 1 to 2 weeks. Usual maintenance dosage is 75 mcg daily.

*Patients older than age 65 and children:* 5 mcg daily; increase by 5 mcg daily every 1 to 2 weeks.

➤ **Thyroid hormone replacement**

*Adults:* Initially, 25 mcg P.O. daily; increase by up to 25 mcg every 1 to 2 weeks until satisfactory response occurs. Usual maintenance dosage is 25 to 75 mcg daily.

➤ **$T_3$ suppression test to differentiate hyperthyroidism from euthyroidism**

*Adults:* 75 to 100 mcg P.O. daily for 7 days.

### ADMINISTRATION

**P.O.**

- When switching from I.V. therapy, discontinue I.V. dose, begin P.O. at a low dose, and increase gradually according to patient response.
- Give drug at same time each day, preferably before breakfast.

**I.V.**

***Alert:*** Don't give I.M. or subcutaneously.
▼ Give repeat doses 4 to 12 hours apart.
▼ To store, refrigerate vials.
▼ When switching to P.O. levothyroxine from I.V. liothyronine, decrease I.V. dose gradually.
▼ **Incompatibilities:** None reported.

### ACTION

Unclear. Enhances oxygen consumption by most tissues of the body; increases the basal metabolic rate and the metabolism of carbohydrates, lipids, and proteins.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–3 days | 3 days |
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* Less than or equal to 2½ days.

### ADVERSE REACTIONS

**CNS:** *nervousness, insomnia, tremor,* headache, fever.
**CV:** *tachycardia,* ***arrhythmias,*** angina, ***cardiac decompensation and collapse, MI.***
**GI:** diarrhea, vomiting.
**GU:** menstrual irregularities.
**Metabolic:** weight loss.
**Musculoskeletal:** accelerated bone maturation in infants and children.
**Skin:** skin reactions, diaphoresis.
**Other:** heat intolerance.

### INTERACTIONS

**Drug-drug.** *Aluminum and magnesium antacids, cholestyramine, colestipol, sucralfate:* May impair liothyronine absorption. Separate doses by 4 to 5 hours.
*Beta blockers:* May reduce beta-blocker effect. Monitor patient for clinical effect.
*Digoxin:* May decrease glycoside effect. Monitor patient for clinical effect.
*Insulin, oral antidiabetics:* First thyroid replacement therapy may increase insulin or oral hypoglycemic requirements. Monitor

glucose level. Dosage adjustments may be needed.
*Ketamine:* May cause hypertension and tachycardia. Use with caution and be prepared to treat hypertension.
*Sympathomimetics such as epinephrine:* May increase risk of coronary insufficiency. Monitor patient closely.
*Theophylline:* May decrease theophylline clearance in hypothyroidism; clearance may return to normal when euthyroid state is achieved. Monitor theophylline level.
*Tricyclic antidepressants:* May enhance both drugs. May cause transient cardiac arrhythmias. Monitor patient.
***Warfarin:*** May increase warfarin effect. Monitor patient for bleeding and check PT and INR closely. Warfarin dosage adjustment may be needed.
**Drug-herb.** *Horseradish:* May cause abnormal thyroid function. Discourage horseradish use in patients undergoing thyroid function tests.
*Lemon balm:* May have antithyroid effects; may inhibit thyroid-stimulating hormone. Discourage use together.
**Drug-food.** *Cottonseed meal, dietary fiber, soybean flour, walnuts:* May decrease absorption of drug. Advise patient that dosage adjustments may be needed.

## EFFECTS ON LAB TEST RESULTS

- May decrease thyroid function test results. May alter results of liothyronine, protein-bound iodine, and radioactive $^{131}I$ uptake studies.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with acute MI uncomplicated by hypothyroidism, untreated thyrotoxicosis, or uncorrected adrenal insufficiency. Also contraindicated with artificial rewarming of patients.
- Use cautiously in elderly patients and in those with angina pectoris, hypertension, other CV disorders, renal insufficiency, or ischemia.
- Use cautiously in patients with diabetes mellitus, diabetes insipidus, or myxedema and during rapid replacement in those with arteriosclerosis.

***Overdose S&S:*** Headache, irritability, nervousness, sweating, arrhythmia (including tachycardia), increased bowel motility, menstrual irregularities, angina and heart failure (possibly induced or aggravated), shock, thyroid storm.

## NURSING CONSIDERATIONS

- Watch for angina, coronary occlusion, or stroke in patients with arteriosclerosis who are receiving rapid replacement. In patients with coronary artery disease who must receive thyroid hormones, watch for possible coronary insufficiency.

***Alert:*** Drug may be used when a rapid-onset or a rapidly reversible drug is desirable, or in patients with impaired peripheral conversion of levothyroxine to liothyronine.

- Long-term therapy causes bone loss in premenopausal and postmenopausal women. Consider a basal bone density measurement, and monitor patient closely for osteoporosis.
- Thyroid hormone replacement requirements are about 25% lower in patients older than age 60 than in young adults.
- Monitor pulse and blood pressure.
- When changing from levothyroxine to this drug, stop levothyroxine and start this drug at a low dosage. Increase dosage in small increments after residual effects of levothyroxine have disappeared. When changing from this drug to levothyroxine, start levothyroxine several days before stopping this drug to avoid relapse.
- Patients who need $^{131}I$ uptake studies done must stop drug 7 to 10 days before test.
- In pregnant patients, dosage may need to be increased.
- ***Look alike–sound alike:*** Don't confuse levothyroxine with liothyronine or liotrix. Don't confuse Cytomel with Cytotec.

## PATIENT TEACHING

- Teach patient importance of compliance. Tell him to take thyroid hormones at same time each day, preferably before breakfast, to maintain constant hormone levels and help prevent insomnia.
- Make sure patient understands that replacement therapy is usually for life. Drug should never be stopped unless directed by prescriber.

- Advise patient who has achieved a stable response not to change brands.
- Warn patient (especially elderly patient) to notify prescriber at once about chest pain, palpitations, sweating, nervousness, or other signals of overdose or aggravated CV disease.
- Tell patient to report unusual bleeding and bruising.
- For diabetic patients, advise them to monitor glucose level closely.
- Tell patient not to take OTC or other prescription medications without first consulting his prescriber.
- Advise woman to report pregnancy to prescriber because dosage may need adjustment.

## liotrix

LYE-oh-trix

Thyrolar

*Therapeutic class:* Thyroid hormone replacement
*Pharmacologic class:* Thyroid hormone
*Pregnancy risk category A*

### AVAILABLE FORMS

*Tablets:* Levothyroxine sodium 12.5 mcg and liothyronine sodium 3.1 mcg (Thyrolar-0.25); levothyroxine sodium 25 mcg and liothyronine sodium 6.25 mcg (Thyrolar-0.5); levothyroxine sodium 50 mcg and liothyronine sodium 12.5 mcg (Thyrolar-1); levothyroxine sodium 100 mcg and liothyronine sodium 25 mcg (Thyrolar-2); levothyroxine sodium 150 mcg and liothyronine sodium 37.5 mcg (Thyrolar-3)

### INDICATIONS & DOSAGES

Dosages are expressed in thyroid equivalents and must be individualized to approximate the deficit in patient's thyroid secretion.

➤ **Hypothyroidism**

*Adults:* Initially, a single daily dose of Thyrolar-0.5. Adjust dosage by 1 tablet of Thyrolar-0.25 at 2- to 3-week intervals. Maintenance dose is 1 tablet of Thyrolar-1 or Thyrolar-2 daily. Readjust dose within the first 4 weeks of therapy after proper clinical and laboratory evaluations of $T_4$ and TSH.

***Adjust-a-dose:*** For elderly patients and patients with long-standing myxedema with cardiovascular impairment, initial dose is 1 tablet of Thyrolar-0.25 daily. Reduce dose if angina occurs.

➤ **Congenital hypothyroidism**

*Children older than age 12:* More than 18.75/75 ($T_3/T_4$) mcg P.O. daily.
*Children ages 6 to 12:* 12.5/50 ($T_3/T_4$) to 18.75/75 mcg ($T_3/T_4$) P.O. daily.
*Children ages 1 to 5:* 9.35/37.5 ($T_3/T_4$) to 12.5/50 ($T_3/T_4$) mcg P.O. daily.
*Children ages 6 to 12 months:* 6.25/25 ($T_3/T_4$) to 9.35/37.5 ($T_3/T_4$) mcg P.O. daily.
*Newborns and infants birth to 6 months:* 3.1/12.5 ($T_3/T_4$) to 6.25/25 ($T_3/T_4$) mcg P.O. daily.

### ADMINISTRATION

**P.O.**

- Give drug at same time each day, preferably before breakfast.

### ACTION

Not clearly defined. Stimulates metabolism of all body tissues by accelerating the rate of cellular oxidation and provides both $T_3$ and $T_4$ to the tissues.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CNS:** *nervousness, insomnia, tremor,* headache.
**CV:** *tachycardia,* ***arrhythmias,*** angina pectoris, ***cardiac decompensation and collapse.***
**GI:** diarrhea, vomiting.
**GU:** menstrual irregularities.
**Metabolic:** weight loss.
**Musculoskeletal:** accelerated rate of bone maturation in infants and children.
**Skin:** allergic skin reactions, diaphoresis.
**Other:** heat intolerance.

### INTERACTIONS

**Drug-drug.** *Beta blockers:* May reduce beta-blocker effect. Monitor patient for clinical effect.

*Cholestyramine, colestipol:* May impair liotrix absorption. Separate doses by 4 to 5 hours.
*Digoxin:* May decrease glycoside effect. Monitor patient for clinical effect.
***Estrogens:*** May decrease thyroid levels. Monitor levels after 12 weeks of therapy and adjust liotrix dose as needed.
*Fosphenytoin, phenytoin:* May release free thyroid hormone. Monitor patient for tachycardia.
*Insulin, oral antidiabetics:* May alter glucose level. Monitor glucose level. Dosage adjustments may be needed.
*Sympathomimetics such as epinephrine:* May increase risk of coronary insufficiency. Monitor patient closely.
*Theophylline:* May decrease theophylline clearance in hypothyroidism; clearance may return to normal when euthyroid state is achieved. Monitor theophylline level.
***Warfarin:*** May increase anticoagulant effects. Monitor patient for bleeding and check PT and INR closely. Warfarin dosage adjustment may be needed.
**Drug-herb.** *Horseradish:* May cause abnormal thyroid function. Discourage horseradish use in patients undergoing thyroid function tests.
*Lemon balm:* May have antithyroid effects; may inhibit thyroid-stimulating hormone. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May decrease thyroid function test results. May alter results of liothyronine, protein-bound iodine, and radioactive $^{131}I$ uptake studies.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with acute MI uncomplicated by hypothyroidism, untreated thyrotoxicosis, or uncorrected adrenal insufficiency.
- Use cautiously in elderly patients and in those with angina pectoris, hypertension, other CV disorders, renal insufficiency, or ischemia.
- Use cautiously in patients with diabetes mellitus, diabetes insipidus, or myxedema and during rapid replacement in those with arteriosclerosis.

***Overdose S&S:*** Hypermetabolic state.

## NURSING CONSIDERATIONS

- Watch for angina, coronary occlusion, or stroke in patients with arteriosclerosis who are receiving rapid replacement.
- In patients with coronary artery disease who must receive thyroid hormones, monitor patient for possible coronary insufficiency. Also watch carefully during surgery because arrhythmias may arise.
- Thyroid hormone replacement requirements are about 25% lower in patients older than age 60 than in young adults.
- Dosage may need to be increased in pregnant patients.
- Monitor pulse and blood pressure.
- Long-term therapy causes bone loss in premenopausal and postmenopausal women. Consider a basal bone density measurement and monitor patient closely for osteoporosis.
- Patients taking liotrix must stop drug 7 to 10 days before undergoing $^{131}I$ uptake studies.

**Black Box Warning** Don't use drug to treat obesity.

- ***Look alike–sound alike:*** Don't confuse Thyrolar with thyroid or Synthroid; don't confuse liotrix with levothyroxine or liothyronine.

## PATIENT TEACHING

- Teach patient importance of compliance. He should take thyroid hormones at same time each day, preferably before breakfast, to maintain constant hormone levels and help prevent insomnia.
- Tell patient that drug should never be stopped unless directed by prescriber.
- Warn patient (especially elderly patient) to notify prescriber immediately about chest pain, palpitations, sweating, nervousness, or other signs of overdose or aggravated CV disease.
- Tell patient to report unusual bleeding and bruising.
- Advise patient not to take other drugs (OTC or prescription) without first consulting his prescriber.
- Advise patient to report pregnancy to prescriber because dosage may need adjustment.

**SAFETY ALERT!**

✳ *NEW DRUG*

# liraglutide

leer-ah-GLOO-tide

Victoza

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Glucagon-like peptide-1 (GLP-1) receptor agonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 0.6 mg, 1.2 mg, 1.8 mg in prefilled syringes

## INDICATIONS & DOSAGES

➤ **As adjunct to diet and exercise to improve glycemic control in patients with type 2 diabetes mellitus**

*Adults:* Initially, 0.6 mg subcutaneously daily; after 1 week, increase dosage to 1.2 mg subcutaneously daily. May increase dosage to 1.8 mg subcutaneously daily if needed to achieve glycemic control.

## ADMINISTRATION

**Subcutaneous**

- Give drug once daily at any time of day, independently of meals. Inject into abdomen, thigh, or upper arm. Injection site and timing can be changed without dosage adjustment.
- Inspect solution before each injection. Use solution only if it is clear, colorless, and contains no particles.
- Before first use, store drug in refrigerator at between 36° and 46° F (2° and 8° C).
- After initial use of liraglutide pen, pen can be stored for 30 days at room temperature (59° to 86° F [15° to 30° C]) or in refrigerator (36° to 46° F). Keep pen cap on when not in use. Discard pen after 30 days.

## ACTION

Stimulates insulin release in the presence of elevated glucose levels by increasing intracellular cAMP.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 8–12 hr | Unknown |

*Half-life:* 13 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, headache.
**CV:** hypertension.
**EENT:** nasopharyngitis, sinusitis.
**GI:** *constipation, diarrhea,* dyspepsia, *nausea, vomiting.*
**GU:** UTI.
**Metabolic:** *hypoglycemia.*
**Musculoskeletal:** back pain.
**Respiratory:** influenza, *upper respiratory tract infection.*
**Skin:** injection site reactions.
**Other:** ***thyroid cancer.***

## INTERACTIONS

**Drug-drug.** *Insulin secretagogues (sulfonylureas):* May increase risk of hypoglycemia. Reduce dosage of insulin secretagogue before beginning drug.
*Oral medications:* May impair absorption of these drugs. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

- May decrease blood glucose level.
- May increase serum bilirubin level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with personal or family history of medullary thyroid carcinoma and in those with multiple endocrine neoplasia syndrome type 2.
- Use cautiously in patients with renal or hepatic impairment and in those with history of pancreatitis.
- Safe use in pregnancy hasn't been established. Use only if benefit outweighs risk to fetus. It isn't known if drug appears in breast milk. Patient should either stop breast-feeding or stop drug.
- Elderly adults may be more sensitive to drug. Use cautiously.

⚠ ***Overdose S&S:*** Nausea, vomiting, hypoglycemia.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug may cause thyroid C-cell tumors, including medullary thyroid cancer. Monitor patient closely. ■

- Monitor patient closely for signs and symptoms of pancreatitis (persistent, severe abdominal pain, which may radiate to the back, and vomiting).

- Drug isn't recommended for first-line therapy in patients who have inadequate glycemic control with diet and exercise.
- Drug isn't a substitute for insulin; it shouldn't be used for treatment of diabetic ketoacidosis or type 1 diabetes mellitus.
- Monitor blood glucose and hemoglobin $A_{1c}$ levels.
- Monitor patient for signs and symptoms of hypoglycemia (tachycardia, palpitations, anxiety, hunger, nausea, diaphoresis, tremors, pallor, restlessness, headache, and speech and motor dysfunction).
- Monitor GI status; drug slows gastric emptying.

### PATIENT TEACHING

- Warn patient that drug may increase risk of thyroid tumor; tell him to report such signs and symptoms as hoarseness, difficulty swallowing, difficulty breathing, or lump in the neck.
- Advise patient to stop taking drug and notify health care provider if he experiences persistent, severe abdominal pain that may radiate to the back and may or may not be accompanied by vomiting.
- Warn patient to avoid sharing pen with another person, even if needle is changed.
- Tell patient that stress, such as fever, trauma, infection, or surgery, may change drug requirements and to seek medical advice promptly.
- Emphasize to patient importance of adhering to a diet and exercise program and monitoring glucose and hemoglobin $A_{1c}$ levels.
- Teach patient how to give subcutaneous injection; instruct patient to rotate sites to prevent injection-site reactions.
- Instruct patient to discard pen after 30 days.

## lisdexamfetamine dimesylate

lis-DEX-am-FET-a-meen

Vyvanse

*Therapeutic class:* CNS stimulant
*Pharmacologic class:* Amphetamine
*Pregnancy risk category C*
*Controlled substance schedule II*

### AVAILABLE FORMS

*Capsules:* 20 mg, 30 mg, 40 mg, 50 mg, 60 mg, 70 mg

### INDICATIONS & DOSAGES

➤ **Attention deficit hyperactivity disorder (ADHD)**

*Adults and children ages 6 to 12:* Initially, 30 mg P.O. once daily in the morning. Increase by 10 or 20 mg at weekly intervals to a maximum of 70 mg daily.

L

### ADMINISTRATION

**P.O.**

- Capsules may be swallowed whole or the contents dissolved in a glass of water and taken immediately.
- Give drug in the morning to prevent insomnia.

### ACTION

May increase the release of norepinephrine and dopamine into extraneural spaces by blocking their reuptake into the presynaptic neuron.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 1 hr | Unknown |

*Half-life:* Less than 1 hour.

### ADVERSE REACTIONS

**CNS:** *headache, insomnia, irritability,* aggressive or hostile behavior, agitation, delusional thinking, dizziness, fever, hallucinations, labile affect, restlessness, somnolence, tic, tremor.
**CV:** ***ventricular hypertrophy,*** increased blood pressure, increased heart rate.
**EENT:** abnormal vision, blurred vision.
**GI:** *abdominal pain, decreased appetite,* dry mouth, nausea, vomiting.

**Metabolic:** slow growth, weight loss.
**Respiratory:** dyspnea.
**Skin:** hyperhidrosis, rash.

## INTERACTIONS

**Drug-drug.** *Adrenergic blockers:* May inhibit adrenergic blocking effects. Avoid using together.
*Antihistamines:* May inhibit sedative effects of antihistamines. Monitor patient.
*Antihypertensives, veratrum alkaloids:* May inhibit antihypertensive effects of these drugs. Avoid using together.
*Chlorpromazine, haloperidol:* May decrease effectiveness of amphetamines. Monitor patient closely.
*Ethosuximide:* May delay absorption of this drug. Monitor patient closely.
*Lithium:* May inhibit anorectic and CNS stimulant effects of amphetamine. Monitor patient closely.
*Tricyclic antidepressants:* May cause adverse CV effects. Avoid using together.
*MAO inhibitors:* May cause severe hypertension or hypertensive crisis. Avoid using within 14 days of MAO inhibitor therapy.
*Meperidine:* May increase the analgesic effect of meperidine. Use together cautiously.
*Norepinephrine:* May increase adrenergic effects of norepinephrine. Monitor patient closely.
*Phenobarbital, phenytoin:* May delay intestinal absorption of these drugs and enhance their anticonvulsant effects. Monitor patient closely.
*Propoxyphene:* May cause fatal seizures if overdose of propoxyphene taken. Don't use together.
*Urine acidifiers (ammonium chloride, sodium acid phosphate), methenamine:* May decrease serum level due to increased renal excretion of amphetamine. Monitor patient for decreased drug effects.
**Drug-food.** *Caffeine:* May increase CNS stimulation. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase corticosteroid level.
- May interfere with urinary steroid test.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to sympathomimetic amines or in those with idiosyncratic reactions to them, in agitated patients, and in those with a history of drug abuse.
- Contraindicated in patients with advanced arteriosclerosis, hyperthyroidism, symptomatic CV disease, structural cardiac abnormalities, moderate to severe hypertension, or glaucoma.
- Contraindicated within 14 days of MAO inhibitor therapy.
- Use cautiously in patients with a history of arrhythmias, MI, stroke, or seizures.
- Use cautiously in patients with preexisting psychosis, bipolar disorder, or aggressive behavior; or Tourette syndrome.

***Overdose S&S:*** Assaultiveness, confusion, hallucinations, hyperpyrexia, hyperreflexia, panic states, rapid respiration, restlessness, rhabdomyolysis, tremor, fatigue, depression, arrhythmias, circulatory collapse, hypertension, hypotension, abdominal cramps, diarrhea, nausea, vomiting, seizures, coma.

## NURSING CONSIDERATIONS

- Diagnosis of ADHD must be based on complete history and evaluation of the child with consultation of psychological, educational, and social resources.
- Give the lowest effective dose in the morning. Afternoon doses may cause insomnia.

**Black Box Warning** Monitor patient for signs of drug dependence or abuse. Misuse may cause sudden death. ■

- Abruptly stopping the drug can cause severe fatigue and depression.
- Monitor patient closely for adverse CV effects, new or worsening behavior (aggression, mania), vision problems, or seizures.
- Monitor blood pressure and pulse routinely.
- Effectiveness of this drug when taken longer than 4 weeks isn't known. Periodically interrupt therapy to determine whether continuation is necessary.
- Growth may be suppressed with long-term stimulant use. Monitor the child for growth and weight gain. Stop treatment if growth is suppressed or if weight gain is lower than expected.
- The drug may trigger Tourette syndrome. Monitor patient, especially at the start of therapy.

● Monitor patient for the appearance or worsening of aggressive behavior or hostility, especially when treatment is initiated.

### PATIENT TEACHING

**Black Box Warning** Warn patient that the misuse of amphetamines can cause serious CV adverse events, including sudden death. ■

● Tell patient or caregiver that drug should be taken in the morning to prevent insomnia.
● Advise patient to swallow capsule whole. If he's unable to do so, the contents may be dissolved in a glass of water and taken immediately. Once dissolved, don't store for later use.
● Tell patient or caregiver that abruptly stopping drug can cause severe fatigue, depression, or general withdrawal reaction.
● Caution patient to avoid activities that require alertness or good psychomotor coordination until CNS effects of drug are known.
● Warn patient with seizure disorder that drug may decrease seizure threshold. Urge him to notify his prescriber if a seizure occurs.
● Instruct patient or caregiver to report palpitations or visual disturbances.
● Tell patient or caregiver to report worsening aggression, hallucinations, delusions, or mania.
● Advise patient to avoid caffeine consumption while taking drug.

## lisinopril

lye-SIN-oh-pril

Prinivil✐, Zestril✐

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* ACE inhibitor
*Pregnancy risk category C; D in 2nd and 3rd trimesters*

### AVAILABLE FORMS

*Tablets:* 2.5 mg, 5 mg, 10 mg, 20 mg, 30 mg, 40 mg

### INDICATIONS & DOSAGES

➤ **Hypertension**

*Adults:* Initially, 10 mg P.O. daily for patients not taking a diuretic. Most patients are well controlled on 20 to 40 mg daily as a single dose. For patients taking a diuretic, initially, 5 mg P.O. daily.

*Children age 6 and older:* Initially, 0.07 mg/kg (up to 5 mg) P.O. once daily. Increase dosage based on patient response and tolerance. Maximum dose, 0.61 mg/kg (don't exceed 40 mg). Don't use in children with a creatinine clearance less than 30 ml/minute.

***Adjust-a-dose:*** In adults, if creatinine clearance is 10 to 30 ml/minute, give 5 mg P.O. daily; if clearance is less than 10 ml/minute, give 2.5 mg P.O. daily.

➤ **Adjunct treatment (with diuretics and cardiac glycosides) for heart failure**

*Adults:* Initially, 5 mg P.O. daily; increased as needed to maximum of 20 mg (40 mg for Zestril) P.O. daily.

***Adjust-a-dose:*** If sodium level is less than 130 mEq/L, serum creatinine greater than 3 mg/dl, or creatinine clearance less than 30 ml/minute, start treatment at 2.5 mg daily.

➤ **Hemodynamically stable patients within 24 hours of acute MI to improve survival**

*Adults:* Initially, 5 mg P.O.; then 5 mg after 24 hours, 10 mg after 48 hours, followed by 10 mg once daily for 6 weeks.

***Adjust-a-dose:*** For patients with systolic blood pressure 120 mm Hg or less when treatment is started or during first 3 days after an infarct, decrease dosage to 2.5 mg P.O. If systolic blood pressure drops to 100 mm Hg or less, reduce daily maintenance dose of 5 mg to 2.5 mg, if needed. If prolonged systolic blood pressure stays under 90 mm Hg for longer than 1 hour, withdraw drug.

### ADMINISTRATION

**P.O.**

● Give drug without regard for food.
● If made into a suspension by pharmacist, shake before each use.

### ACTION

Causes decreased production of angiotensin II and suppression of the renin-angiotensin-aldosterone system.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 7 hr | 24 hr |

*Half-life:* 12 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness,* headache, fatigue, paresthesia.
**CV:** *orthostatic hypotension,* hypotension, chest pain.
**EENT:** *nasal congestion.*
**GI:** *diarrhea,* nausea, dyspepsia.
**GU:** impaired renal function, impotence.
**Metabolic:** ***hyperkalemia.***
**Respiratory:** dyspnea, dry, persistent, tickling, nonproductive cough.
**Skin:** rash.
**Other:** ***angioedema.***

## INTERACTIONS

**Drug-drug.** *Allopurinol:* May cause hypersensitivity reaction. Use together cautiously.
*Azathioprine:* May increase risk of anemia or leukopenia. Monitor hematologic studies if used together.
*Diuretics, thiazide diuretics:* May cause excessive hypotension with diuretics. Monitor blood pressure closely.
*Indomethacin, NSAIDs:* May reduce hypotensive effects of drug. Adjust dose as needed.
*Insulin, oral antidiabetics:* May cause hypoglycemia, especially at start of lisinopril therapy. Monitor glucose level.
*Lithium:* May cause lithium toxicity. Monitor lithium levels.
*Phenothiazines:* May increase hypotensive effects. Monitor blood pressure closely.
*Potassium-sparing diuretics, potassium supplements:* May cause hyperkalemia. Monitor laboratory values.
*Tizanidine:* May cause severe hypotension. Monitor patient.
**Drug-herb.** *Capsaicin:* May cause ACE inhibitor-induced cough. Discourage use together.
*Ma huang:* May decrease antihypertensive effects. Discourage use together.
**Drug-food.** *Potassium-containing salt substitutes:* May cause hyperkalemia. Monitor laboratory values.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN, creatinine, potassium, and bilirubin levels.
- May increase liver function test values.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to ACE inhibitors and in those with a history of angioedema related to previous treatment with ACE inhibitor.

**Black Box Warning** Use during pregnancy can cause injury and death to the developing fetus. When pregnancy is detected, stop drug as soon as possible.

- Use cautiously in patients with impaired renal function; adjust dosage.
- Use cautiously in patients at risk for hyperkalemia and in those with aortic stenosis or hypertrophic cardiomyopathy. The safety and efficacy of lisinopril on blood pressure in children younger than age 6 or in children with GFR less than 30 ml/minute hasn't been established.

***Overdose S&S:*** Hypotension.

## NURSING CONSIDERATIONS

- When using drug in acute MI, give patient the appropriate and standard recommended treatment, such as thrombolytics, aspirin, and beta blockers.
- Although ACE inhibitors reduce blood pressure in all races, blood pressure reduction is less in blacks taking the ACE inhibitor alone. Black patients should take drug with a thiazide diuretic for a more favorable response.
- ACE inhibitors appear to increase risk of angioedema in black patients.
- Monitor blood pressure frequently. If drug doesn't adequately control blood pressure, diuretics may be added.
- Monitor WBC with differential counts before therapy, every 2 weeks for first 3 months of therapy, and periodically thereafter.
- ***Look alike–sound alike:*** Don't confuse lisinopril with fosinopril or Lioresal. Don't confuse Zestril with Zostrix, Zetia, Zebeta, or Zyrtec. Don't confuse Prinivil with Proventil or Prilosec.

## PATIENT TEACHING

***Alert:*** Rarely, facial and throat swelling (including swelling of the larynx) may occur, especially after first dose. Advise patient to report signs or symptoms of breathing problems or swelling of face, eyes, lips, or tongue.

- Inform patient that light-headedness can occur, especially during first few days of therapy. Tell him to rise slowly to minimize this effect and to report symptoms to prescriber. If he faints, advise patient to stop taking drug and call prescriber immediately.
- If unpleasant adverse reactions occur, tell patient not to stop drug suddenly but to notify prescriber.
- Advise patient to report signs and symptoms of infection, such as fever and sore throat.
- Tell women of childbearing age to notify prescriber if pregnancy occurs. Drug will need to be stopped.
- Instruct patient not to use salt substitutes that contain potassium without first consulting prescriber.

# lithium carbonate

LITH-ee-um

Carbolith†, Duralith†, Lithane†, Lithobid

# lithium citrate

Cibalith-S*

*Therapeutic class:* Antimanic
*Pharmacologic class:* Alkali metal
*Pregnancy risk category D*

## AVAILABLE FORMS

**lithium carbonate**
*Capsules:* 150 mg, 300 mg, 600 mg
*Tablets:* 300 mg (300 mg equals 8.12 mEq lithium)
*Tablets (extended-release):* 300 mg, 450 mg
**lithium citrate**
*Syrup (sugarless):* 8 mEq lithium/5 ml; 5 ml lithium citrate liquid contains 8 mEq lithium, equal to 300 mg lithium carbonate

## INDICATIONS & DOSAGES

➤ **To prevent or control mania in bipolar disorder**
*Adults:* 600 mg P.O. t.i.d. Or, 900-mg controlled-release tablets P.O. every 12 hours. Or, 10 ml (lithium 16 mEq) P.O. t.i.d. Increase dosage based on blood levels to achieve optimum dosage. Recommended therapeutic lithium levels are 1 to 1.5 mEq/L for acute mania and 0.6 to 1.2 mEq/L for maintenance therapy.

➤ **Borderline personality disorder** ♦
*Adults:* 900 to 2,400 mg P.O. in three to four divided doses or 900 to 1,800 mg (extended release) P.O. daily in two divided doses, titrated to maintain serum levels of 0.8 to 1 mEq/L.

## ADMINISTRATION

**P.O.**
- Give drug after meals with plenty of water to minimize GI upset.
- Don't crush controlled-release tablets.

## ACTION

Probably alters chemical transmitters in the CNS, possibly by interfering with ionic pump mechanisms in brain cells, and may compete with or replace sodium ions.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 30 min–3 hr | Unknown |

*Half-life:* 18 hours (adolescents) to 36 hours (elderly).

## ADVERSE REACTIONS

**CNS:** *fatigue, lethargy,* ***coma, epileptiform seizures,*** tremors, drowsiness, headache, confusion, restlessness, dizziness, psychomotor retardation, blackouts, EEG changes, worsened organic mental syndrome, impaired speech, ataxia, incoordination.
**CV:** ***arrhythmias, bradycardia,*** reversible ECG changes, ***severe bradycardia,*** hypotension.
**EENT:** tinnitus, blurred vision.
**GI:** *vomiting, anorexia, diarrhea, thirst,* nausea, metallic taste, dry mouth, abdominal pain, flatulence, indigestion.
**GU:** *polyuria,* ***renal toxicity with long-term use,*** glycosuria, decreased creatinine clearance, albuminuria.

**Hematologic:** *leukocytosis with leukocyte count of 14,000 to 18,000/mm$^3$.*
**Metabolic:** transient hyperglycemia, goiter, hypothyroidism, hyponatremia.
**Musculoskeletal:** *muscle weakness.*
**Skin:** pruritus, rash, diminished or absent sensation, drying and thinning of hair, psoriasis, acne, alopecia.
**Other:** ankle and wrist edema.

## INTERACTIONS

**Drug-drug.** *ACE inhibitors:* May increase lithium level. Monitor lithium level; adjust lithium dosage, as needed.
*Aminophylline, sodium bicarbonate, urine alkalinizers:* May increase lithium excretion. Avoid excessive salt, and monitor lithium levels.
*Antiarrhythmics and other drugs that prolong QT interval:* May increase risk of life-threatening arrhythmias. Avoid use together.
*Calcium channel blockers (verapamil):* May decrease lithium levels and may increase risk of neurotoxicity. Use together cautiously.
*Carbamazepine, fluoxetine, methyldopa, NSAIDs, probenecid:* May increase effect of lithium. Monitor patient for lithium toxicity.
*Neuromuscular blockers:* May cause prolonged paralysis or weakness. Monitor patient closely.
*NSAIDs (such as indomethacin):* May increase plasma lithium level. Monitor lithium level closely.
***Thiazide diuretics:*** May increase reabsorption of lithium by kidneys, with possible toxic effect. Use with caution, and monitor lithium and electrolyte levels (especially sodium).
**Drug-food.** *Caffeine:* May decrease lithium level and drug effect. Advise patient who ingests large amounts of caffeine to tell prescriber before stopping caffeine. Adjust lithium dosage, as needed.

## EFFECTS ON LAB TEST RESULTS

- May increase glucose and creatinine and TSH levels. May decrease sodium, $T_3$, $T_4$, and protein-bound iodine levels.
- May increase $^{131}I$ uptake and WBC and neutrophil counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated if therapy can't be closely monitored.
- Avoid using in pregnant patient unless benefits outweigh risks.
- Use with caution in patients receiving neuromuscular blockers and diuretics; in elderly or debilitated patients; and in patients with thyroid disease, seizure disorder, infection, renal or CV disease, severe debilitation or dehydration, or sodium depletion.

***Overdose S&S:*** Diarrhea, vomiting, drowsiness, muscular weakness, lack of coordination, giddiness, ataxia, blurred vision, confusion, tinnitus, large output of dilute urine, slurred speech, loss of consciousness, myoclonic limb movements, agitation, urinary or fecal incontinence, seizures, arrythmias, hypotension, peripheral vascular collapse, coma.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug has a narrow therapeutic margin of safety. Determining drug level is crucial to safe use of drug. Don't use drug in patients who can't have regular tests. Monitor level 8 to 12 hours after first dose, the morning before second dose is given, two or three times weekly for the first month, and then weekly to monthly during maintenance therapy. ■

- When drug level is less than 1.5 mEq/L, adverse reactions are usually mild.
- Monitor baseline ECG, thyroid studies, renal studies, and electrolyte levels.
- Check fluid intake and output, especially when surgery is scheduled.
- Weigh patient daily; check for edema or sudden weight gain.
- Adjust fluid and salt ingestion to compensate if excessive loss occurs from protracted diaphoresis or diarrhea. Under normal conditions, patient fluid intake should be 2½ to 3 L daily, and he should follow a balanced diet with adequate salt intake.
- Check urine specific gravity and report level below 1.005, which may indicate diabetes insipidus.
- Drug alters glucose tolerance in diabetics. Monitor glucose level closely.

• Perform outpatient follow-up of thyroid and renal functions every 6 to 12 months. Palpate thyroid to check for enlargement.
• ***Look alike–sound alike:*** Don't confuse Lithobid with Levbid.

### PATIENT TEACHING

• Tell patient to take drug with plenty of water and after meals to minimize GI upset.
• Explain the importance of having regular blood tests to determine drug levels; even slightly high values can be dangerous.
• Warn patient and caregivers to expect transient nausea, large amounts of urine, thirst, and discomfort during first few days of therapy and to watch for evidence of toxicity.
• Instruct patient to withhold one dose and call prescriber if signs and symptoms of toxicity appear, but not to stop drug abruptly.
• Warn patient to avoid hazardous activities that require alertness and good psychomotor coordination until CNS effects of drug are known.
• Tell patient not to switch brands or take other prescription or OTC drugs without prescriber's guidance.
• Tell patient to wear or carry medical identification at all times.

**SAFETY ALERT!**

## Iomustine (CCNU)

Ioe-MUS-teen

CeeNU

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Nitrosourea
*Pregnancy risk category D*

### AVAILABLE FORMS

*Capsules:* 10 mg, 40 mg, 100 mg

### INDICATIONS & DOSAGES

➤ **Brain tumor, Hodgkin lymphoma**
*Adults and children:* 100 to 130 mg/m$^2$ P.O. as single dose every 6 weeks. Repeat doses shouldn't be given until WBC count exceeds 4,000/mm$^3$ and platelet count is greater than 100,000/mm$^3$.
***Adjust-a-dose:*** Reduce dosage according to degree of bone marrow suppression or when used with other myelosuppressive drugs. Reduce dosage by 30% for WBC count nadir 2,000 to 2,999/mm$^3$ and platelet count nadir 25,000 to 74,999/mm$^3$; by 50% for WBC count nadir less than 2,000/mm$^3$ and platelet count nadir less than 25,000/mm$^3$. Reduce dosage in patients with renal impairment: For creatinine clearance of 10 to 50 ml/minute, give 75% of usual dose; for creatinine clearance of less than 10 ml/minute, give 50% of usual dose.

### ADMINISTRATION

**P.O.**
• Give antiemetic before drug to reduce nausea.
• Give 2 to 4 hours after meals; drug will be more completely absorbed if taken when stomach is empty.
• Store capsules at room temperature. Avoid exposure to moisture, and protect from temperatures greater than 104° F (40° C).

### ACTION

Cross-links strands of cellular DNA and interferes with RNA transcription, causing an imbalance of growth that leads to cell death. Not specific to cell cycle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* 1 to 2 days.

### ADVERSE REACTIONS

**CNS:** disorientation, lethargy, ataxia, dysarthria.
**GI:** *nausea, vomiting,* stomatitis.
**GU:** ***nephrotoxicity,*** progressive azotemia, ***renal failure,*** amenorrhea, azoospermia.
**Hematologic:** *anemia,* **LEUKOPENIA, THROMBOCYTOPENIA, BONE MARROW SUPPRESSION.**
**Hepatic:** ***hepatotoxicity.***
**Skin:** alopecia.
**Other:** ***secondary malignant disease.***

### INTERACTIONS

**Drug-drug.** *Anticoagulants, aspirin, NSAIDs:* May increase risk of bleeding. Avoid using together.
*Myelosuppressives:* May increase myelosuppression. Monitor patient.

### EFFECTS ON LAB TEST RESULTS

- May increase urine urea level. May decrease hemoglobin level.
- May decrease WBC, RBC, and platelet counts.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with decreased platelet, WBC, or RBC counts and in those receiving other myelosuppressives.

### NURSING CONSIDERATIONS

**Black Box Warning** Monitor CBC weekly. Usually not given more often than every 6 weeks; bone marrow toxicity is cumulative and delayed, usually occurring 4 to 6 weeks after drug administration. ■

- Periodically monitor liver function test results.
- To prevent bleeding, avoid all I.M. injections when platelet count is less than $50{,}000/mm^3$.
- Anticipate blood transfusions because of cumulative anemia.
- Therapeutic effects come with toxicity.

**Black Box Warning** Bone marrow suppression, notably thrombocytopenia and leukopenia is the most common and severe of the toxic effects of the drug. ■

### PATIENT TEACHING

- Advise patient to take capsules on an empty stomach, if possible, and to wear gloves when handling capsules.
- Advise patient to watch for signs and symptoms of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell patient to take temperature daily.

***Alert:*** Tell patients that to give the proper dose of lomustine, two or more different types and colors of capsules may be dispensed.

- Instruct patient to avoid OTC products that contain aspirin or NSAIDs.
- Advise women to stop breast-feeding during therapy because of possible risk of toxicity to infant.
- Caution woman of childbearing age to avoid becoming pregnant during therapy. Recommend that she consult prescriber before becoming pregnant.

## loperamide

loe-PER-a-mide

Diar-aid Caplets ◇, Imodium A-D ◇, Imodium A-D EZ chews, K-pec II ◇, Neo-Diaral ◇

*Therapeutic class:* Antidiarrheal
*Pharmacologic class:* Piperidine derivative
*Pregnancy risk category B*

### AVAILABLE FORMS

*Chewable tablets:* 2 mg ◇
*Tablets:* 2 mg ◇
*Capsules:* 2 mg
*Oral liquid:* 1 mg/5 ml ◇, 1 mg/7.5 ml ◇

### INDICATIONS & DOSAGES

➤ **Acute, nonspecific diarrhea**

*Adults and children older than age 12:* Initially, give 4 mg P.O.; then 2 mg after each unformed stool. Maximum, 16 mg daily, unless otherwise directed.
*Children ages 8 to 12:* 2 mg P.O. t.i.d. on first day. Maximum, 6 mg daily. If diarrhea persists, contact prescriber.
*Children ages 6 to younger than 8:* 2 mg P.O. b.i.d. on first day. If diarrhea persists, contact prescriber. Maximum, 4 mg daily.
*Children ages 2 to 5:* 1 mg P.O. t.i.d. on first day. Maximum, 3 mg daily. If diarrhea persists, contact prescriber.

➤ **Chronic diarrhea associated with chronic bowel disease**

*Adults:* Initially, give 4 mg P.O.; then 2 mg after each unformed stool until diarrhea subsides. Adjust dosage to individual response. Maximum dose is 16 mg/day.

➤ **Traveler's diarrhea ♦**

*Adults:* 4 mg P.O. followed by 2 mg after each unformed stool for a maximum of 16 mg/day.

### ADMINISTRATION

**P.O.**

- Use the liquid formulation for children ages 2 to 5.

## ACTION
Inhibits peristalsis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2½–5 hr | 24 hr |

*Half-life:* 9 to 14½ hours.

## ADVERSE REACTIONS
**CNS:** dizziness, drowsiness, fatigue.
**GI:** *constipation*, abdominal pain, distention or discomfort, dry mouth, nausea, vomiting.
**Skin:** hypersensitivity reactions, rash.

## INTERACTIONS
**Drug-drug.** *Saquinavir:* May increase loperamide levels and decrease saquinavir levels. Avoid using together.

## EFFECTS ON LAB TEST RESULTS
None reported.

## CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug and in those who must avoid constipation.
- Contraindicated in patients with bloody diarrhea or diarrhea with fever greater than 101° F (38° C), in breast-feeding women, and in children younger than age 2.
- Use cautiously in patients with hepatic disease.

***Overdose S&S:*** Paralytic ileus, CNS depression.

## NURSING CONSIDERATIONS
- If symptoms don't improve within 48 hours, stop therapy and consider another drug.
- Drug produces antidiarrheal action similar to that of diphenoxylate but without as many adverse CNS effects.

***Alert:*** Monitor children closely for CNS effects; children may be more sensitive to these effects than adults.

- ***Look alike–sound alike:*** Don't confuse Imodium with Ionamin.

## PATIENT TEACHING
- Advise patient not to exceed recommended dosage.
- Tell patient with acute diarrhea to stop drug and seek medical attention if no improvement occurs within 48 hours. In chronic diarrhea, tell patient to notify prescriber and to stop drug if no improvement occurs after taking 16 mg daily for at least 10 days.
- Advise patient with acute colitis to stop drug immediately and notify prescriber about abdominal distention.
- Warn patient to avoid activities that require mental alertness until CNS effects of drug are known.
- Tell patient to report nausea, abdominal pain, or abdominal discomfort.
- Advise patient to relieve dry mouth with ice chips or sugarless gum.

# lopinavir and ritonavir
low-PIN-ah-ver

Kaletra*✔

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Protease inhibitor
*Pregnancy risk category C*

L

## AVAILABLE FORMS
*Capsules:* lopinavir 133.3 mg and ritonavir 33.3 mg
*Tablets:* lopinavir 100 mg and ritonavir 25 mg; lopinavir 200 mg and ritonavir 50 mg
*Solution:* lopinavir 400 mg and ritonavir 100 mg/5 ml (80 mg and 20 mg/ml)*

## INDICATIONS & DOSAGES
➤ **HIV infection, without other antiretrovirals (efavirenz, fosamprenavir, nevirapine, nelfinavir), in treatment-naive adults**
*Adults:* 800 mg lopinavir and 200 mg ritonavir P.O. once daily (patients with less than 3 lopinavir resistance-associated substitutions) or evenly divided b.i.d.
➤ **HIV infection, without other antiretrovirals (efavirenz, fosamprenavir, nevirapine, nelfinavir), in treatment-experienced adults**
*Adults:* 400 mg lopinavir and 100 mg ritonavir P.O. b.i.d.
➤ **HIV infection, with other antiretrovirals (efavirenz, fosamprenavir,**

**nevirapine, nelfinavir), in treatment-naive adults**
*Adults:* 500 mg lopinavir and 125 mg ritonavir (tablets) P.O. b.i.d., or 533 mg lopinavir and 133 mg ritonavir (oral solution) P.O. b.i.d.

➤ **HIV infection, with other antiretrovirals (efavirenz, fosamprenavir, nevirapine, nelfinavir), in treatment-experienced adults who have reduced susceptibility to lopinavir**
*Adults:* 600 mg lopinavir and 150 mg ritonavir (tablets) P.O. b.i.d.

➤ **HIV infection, without other antiretrovirals (efavirenz, fosamprenavir, nevirapine, nelfinavir), in infants**
*Infants age 14 days to 6 months:* 16 mg/kg lopinavir and 4 mg/kg ritonavir (oral solution) P.O. b.i.d. Don't use in conjunction with other antiretrovirals (efavirenz, fosamprenavir, nevirapine, nelfinavir) in children less than age 6 months.

➤ **HIV infection, without other antiretrovirals (efavirenz, fosamprenavir, nevirapine, nelfinavir), in children**
*Children age 6 months to 18 years who weigh 15 to 40 kg (33 to 88 lb):* 10 mg/kg lopinavir and 2.5 mg/kg ritonavir P.O. b.i.d. Don't exceed adult dosage.
*Children age 6 months to 18 years who weigh less than 15 kg:* 12 mg/kg lopinavir and 3 mg/kg ritonavir P.O. b.i.d. Don't exceed adult dosage.

➤ **HIV infection, with other antiretrovirals (efavirenz, fosamprenavir, nevirapine, nelfinavir), in children**
*Children age 6 months to 18 years who weigh 15 to 45 kg (33 to 99 lb):* 11 mg/kg lopinavir and 2.75 mg ritonavir P.O. b.i.d. Don't exceed adult dosage.
*Children age 6 months to 18 years who weigh less than 15 kg:* 13 mg/kg lopinavir and 3.25 mg/kg ritonavir P.O. b.i.d. Don't exceed adult dosage.

## ADMINISTRATION

**P.O.**

***Alert:*** Many drug interactions are possible. Review all drugs patient is taking.
- Give oral solution with food. Give tablets without regard for food.
- Tablets must be swallowed whole; don't crush or divide, and tell patient not to chew.
- Refrigerated drug remains stable until expiration date on package. If stored at room temperature, use drug within 2 months.

## ACTION

Lopinavir is an HIV protease inhibitor, which produces immature, noninfectious viral particles. Ritonavir, also an HIV protease inhibitor, slows lopinavir metabolism, thereby increasing lopinavir level.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 4 hr | 5–6 hr |

*Half-life:* About 6 hours.

## ADVERSE REACTIONS

**CNS:** ***encephalopathy,*** abnormal dreams, abnormal thinking, agitation, amnesia, anxiety, asthenia, ataxia, confusion, depression, dizziness, dyskinesia, emotional lability, fever, headache, hypertonia, insomnia, malaise, nervousness, neuropathy, pain, paresthesia, peripheral neuritis, somnolence, tremors.
**CV:** chest pain, ***deep vein thrombosis,*** edema, hypertension, palpitations, thrombophlebitis, vasculitis.
**EENT:** abnormal vision, eye disorder, otitis media, sinusitis, tinnitus.
**GI:** ***hemorrhagic colitis, pancreatitis,*** *diarrhea, nausea,* abdominal pain, abnormal stools, anorexia, cholecystitis, constipation, dry mouth, dyspepsia, dysphagia, enterocolitis, eructation, esophagitis, fecal incontinence, flatulence, gastritis, gastroenteritis, GI disorder, increased appetite, inflammation of the salivary glands, stomatitis, taste perversion, ulcerative stomatitis, vomiting.
**GU:** abnormal ejaculation, hypogonadism, renal calculus, urine abnormality.
**Hematologic:** ***leukopenia, neutropenia, thrombocytopenia in children,*** anemia.
**Hepatic:** hyperbilirubinemia in children.
**Metabolic:** Cushing's syndrome, dehydration, decreased glucose tolerance, hyperglycemia, hyperuricemia, hyponatremia in children, hypothyroidism, ***lactic acidosis,*** weight loss.
**Musculoskeletal:** arthralgia, arthrosis, back pain, myalgia.

**Respiratory:** bronchitis, dyspnea, lung edema.
**Skin:** acne, alopecia, benign skin neoplasm, dry skin, exfoliative dermatitis, furunculosis, nail disorder, pruritus, rash, skin discoloration, sweating.
**Other:** chills, decreased libido, facial edema, flu syndrome, gynecomastia, lymphadenopathy, viral infection.

## INTERACTIONS

**Drug-drug.** *Amiodarone, bepridil, lidocaine, quinidine:* May increase antiarrhythmic level. Use together cautiously. Monitor levels of these drugs, if possible.
*Amprenavir, efavirenz, nelfinavir, nevirapine:* May decrease lopinavir level. Consider increasing lopinavir-ritonavir combination dose. Don't use a once-daily regimen of lopinavir-ritonavir combination with these drugs.
*Antiarrhythmics (flecainide, propafenone), pimozide:* May increase risk of cardiac arrhythmias. Avoid using together.
*Atorvastatin:* May increase level of this drug. Use lowest possible dose and monitor patient carefully.
*Atovaquone, methadone:* May decrease levels of these drugs. Consider increasing doses of these drugs.
*Carbamazepine, dexamethasone, phenobarbital, phenytoin:* May decrease lopinavir level. Use together cautiously.
*Clarithromycin:* May increase clarithromycin level in patients with renal impairment. Adjust clarithromycin dosage.
*Cyclosporine, rapamycin, tacrolimus:* May increase levels of these drugs. Monitor therapeutic levels.
*Delavirdine:* May increase lopinavir level. Avoid using together.
*Didanosine:* May decrease absorption of didanosine because lopinavir-ritonavir combination is taken with food. Give didanosine 1 hour before or 2 hours after lopinavir-ritonavir combination.
*Disulfiram, metronidazole:* May cause disulfiram-like reaction. Avoid using together.
*Ergot derivatives (dihydroergotamine, ergonovine, ergotamine, methylergonovine):* May increase risk of ergot toxicity characterized by peripheral vasospasm and ischemia. Avoid using together.
*Felodipine, nicardipine, nifedipine:* May increase levels of these drugs. Use together cautiously.
*Hormonal contraceptives (ethinyl estradiol):* May decrease effectiveness of contraceptives. Recommend nonhormonal contraceptives.
*Indinavir, saquinavir:* May increase levels of these drugs. Avoid using together.
*Itraconazole, ketoconazole:* May increase levels of these drugs. Don't give more than 200 mg/day of these drugs.
*Lovastatin, simvastatin:* May increase risk of adverse reactions, such as myopathy, rhabdomyolysis. Avoid using together.
*Midazolam (parenteral), triazolam:* May cause prolonged or increased sedation or respiratory depression. Avoid using together. Don't give with oral midazolam.
*Rifabutin:* May increase rifabutin level. Decrease rifabutin dose by 75%. Monitor patient for adverse effects.
*Rifampin:* May decrease effectiveness of Kaletra. Avoid using together.
*Sildenafil, tadalafil, vardenafil:* May increase level of these drugs and adverse effects, such as hypotension and prolonged erection. Warn patient not to take more than 25 mg of sildenafil in 48 hours, more than 10 mg of tadalafil in 72 hours, or more than 2.5 mg vardenafil in 72 hours.
*Warfarin:* May affect warfarin level. Monitor PT and INR.
**Drug-herb.** *St. John's wort:* Loss of virologic response and possible resistance to drug. Discourage use together.
**Drug-food.** *Any food:* May increase absorption of oral solution. Tell patient to take with food.

## EFFECTS ON LAB TEST RESULTS

- May increase amylase, cholesterol, and triglyceride levels. May decrease hemoglobin level and hematocrit.
- May decrease RBC, WBC, neutrophil, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or any of its components.

● Contraindicated with CYP3A metabolized drugs, including dihydroergotamine, ergonovine, lovastatin, methylergonovine, midazolam, pimozide, rifampin, simvastatin, triazolam, and St. John's wort.
● Use cautiously in patients with a history of pancreatitis or with hepatic impairment, hepatitis B or C, marked elevations in liver enzyme levels, or hemophilia.
● Use cautiously in elderly patients.
● The Antiretroviral Pregnancy Registry monitors maternal-fetal outcomes of pregnant women taking Kaletra. Health care providers are encouraged to enroll women by calling 1-800-258-4263.
***Overdose S&S:*** Alcohol-related toxicity.

## NURSING CONSIDERATIONS

● Don't administer tablets or oral solution as a once-daily dosing regimen when combined with efavirenz, nevirapine, amprenavir, or nelfinavir.
● Avoid once-daily dosing in children younger than age 18.
● Monitor patient for signs of fat redistribution, including central obesity, buffalo hump, peripheral wasting, breast enlargement, and cushingoid appearance.
● Monitor total cholesterol and triglycerides before starting therapy and periodically thereafter.
● Monitor patient for signs and symptoms of pancreatitis (nausea, vomiting, abdominal pain, or increased lipase and amylase values).
● Monitor patient for signs and symptoms of bleeding (hypotension, rapid heart rate).
● ***Look alike–sound alike:*** Don't confuse Kaletra with Keppra.

## PATIENT TEACHING

● Tell patient to take oral solution with food. Tablets may be taken without regard to food.
***Alert:*** Tablets must be swallowed whole; don't crush or divide, and tell patient not to chew.
● Tell patient also taking didanosine to take it 1 hour before or 2 hours after lopinavir-ritonavir combination.
● Advise patient to report side effects to prescriber.
● Tell patient to immediately report severe nausea, vomiting, or abdominal pain.
● Inform patient that drug doesn't cure HIV infection, that opportunistic infections and other complications of HIV infection may still occur, and that transmission of HIV to others through sexual contact or blood contamination remains possible.
● Advise patient taking an erectile dysfunction drug of an increased risk of adverse effects, including low blood pressure, visual changes, and painful erections, and to promptly report any symptoms to his prescriber. Tell him not to take more often than directed.
● Warn patient to tell prescriber about any other prescription or nonprescription medicine that he's taking, including herbal supplements.

# loratadine

lor-AT-a-deen

Alavert ◇, Alavert Children's ◇, Children's Claritin Allergy ◇, Claritin ◇, Claritin Hives Relief ◇, Claritin 24-Hour Allergy ◇, Claritin Liqui-Gels ◇, Claritin RediTabs ◇, Clear-Atadine ◇, Dimetapp Children's Non-Drowsy Allergy ◇, Triaminic Allerchews ◇

*Therapeutic class:* Antihistamine
*Pharmacologic class:* Piperidine
*Pregnancy risk category B*

## AVAILABLE FORMS

*Capsules:* 10 mg ◇
*Syrup:* 1 mg/ml ◇
*Tablets:* 10 mg ◇
*Tablets (chewable):* 5 mg ◇
*Tablets (orally disintegrating):* 5 mg ◇, 10 mg ◇

## INDICATIONS & DOSAGES

➤ **Allergic rhinitis**
*Adults and children age 6 and older:* 10 mg P.O. daily. Or, 5 mg RediTabs every 12 hours.
*Children ages 2 to 5:* 5 mg chewable tablets or syrup P.O. daily.
➤ **Chronic idiopathic urticaria ♦**
*Adults and children age 6 and older:* 10 mg P.O. daily.

*Children ages 2 to 5:* 5 mg P.O. daily.
***Adjust-a-dose:*** In adults and children age 6 and older with hepatic impairment or GFR less than 30 ml/minute, give 10 mg every other day. In children ages 2 to 5 years with hepatic or renal impairment, give 5 mg every other day.

## ADMINISTRATION

**P.O.**
- Give Claritin RediTabs on the tongue, where it disintegrates within a few seconds.
- Give drug with or without water.

## ACTION

Blocks effects of histamine at $H_1$-receptor sites. Drug is a nonsedating antihistamine; its chemical structure prevents entry into the CNS.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 1.3–2.5 hr | 24 hr |

*Half-life:* 8½ hours.

## ADVERSE REACTIONS

**CNS:** *headache,* drowsiness, fatigue, insomnia, nervousness.
**GI:** dry mouth.

## INTERACTIONS

**Drug-drug.** *Cimetidine, ketoconazole, macrolide antibiotics (clarithromycin, erythromycin):* May increase loratadine level. Monitor patient closely.
**Drug-lifestyle.** *Alcohol use:* May increase CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May prevent, reduce, or mask positive result in diagnostic skin test.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with hepatic or renal impairment and in breast-feeding women.

⚠ ***Overdose S&S:*** Somnolence, tachycardia, headache, extrapyramidal reactions, palpitations.

## NURSING CONSIDERATIONS

- Stop drug 4 days before patient undergoes diagnostic skin tests because drug can prevent, reduce, or mask positive skin test response.

## PATIENT TEACHING

- Make sure patient understands to take drug once daily. If symptoms persist or worsen, tell him to contact prescriber.
- Tell patient taking Claritin RediTabs to use tablet immediately after opening individual blister.
- Advise patient taking Claritin RediTabs to place tablet on the tongue, where it disintegrates within a few seconds. It can be swallowed with or without water.
- Warn patient to avoid alcohol and hazardous activities that require alertness until CNS effects of drug are known.
- Tell patient that dry mouth can be relieved with sugarless gum, hard candy, or ice chips.

L

**SAFETY ALERT!**

# lorazepam

lor-AZ-e-pam

Ativan, Lorazepam Intensol, Novo-Lorazem†, Nu-Loraz†

*Therapeutic class:* Anxiolytic
*Pharmacologic class:* Benzodiazepine
*Pregnancy risk category D*
*Controlled substance schedule IV*

## AVAILABLE FORMS

*Injection:* 2 mg/ml, 4 mg/ml
*Oral solution (concentrated):* 2 mg/ml
*Tablets:* 0.5 mg, 1 mg, 2 mg

## INDICATIONS & DOSAGES

➤ **Anxiety**
*Adults:* 2 to 6 mg P.O. daily in divided doses. Maximum, 10 mg daily.
*Elderly patients:* 1 to 2 mg P.O. daily in divided doses. Maximum, 10 mg daily.
➤ **Insomnia from anxiety**
*Adults:* 2 to 4 mg P.O. at bedtime.
➤ **Preoperative sedation**
*Adults:* 2 mg I.V. total or 0.044 mg/kg I.V., whichever is smaller. Larger doses up to

0.05 mg/kg I.V., to total of 4 mg, may be needed. Or, 0.05 mg/kg I.M. 2 hours before procedure. Total dose shouldn't exceed 4 mg.

➤ **Status epilepticus**

*Adults:* 4 mg I.V. If seizures continue or recur after 10 to 15 minutes; then, an additional 4-mg dose may be given. Drug may be given I.M. if I.V. access isn't available.

## ADMINISTRATION

**P.O.**

● Mix oral solution with liquid or semisolid food, such as water, juices, carbonated beverages, applesauce, or pudding.

**I.V.**

▼ Keep emergency resuscitation equipment and oxygen available.

▼ Dilute with an equal volume of sterile water for injection, normal saline solution for injection, or $D_5W$. Give slowly at no more than 2 mg/minute.

▼ Monitor respirations every 5 to 15 minutes and before each I.V. dose.

▼ Contains benzyl alcohol. Avoid use in neonates.

▼ Refrigerate intact vials and protect from light.

▼ **Incompatibilities:** Aldesleukin, aztreonam, buprenorphine, caffeine citrate, floxacillin, foscarnet, idarubicin, imipenem-cilastatin sodium, omeprazole, ondansetron hydrochloride, sargramostim, sufentanil citrate, thiopental.

**I.M.**

● For status epilepticus, drug may be given I.M. if I.V. access isn't available.

● For I.M. use, inject deeply into a muscle. Don't dilute.

● Refrigerate parenteral form to prolong shelf life.

## ACTION

May potentiate the effects of GABA, depress the CNS, and suppress the spread of seizure activity.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 2 hr | 12–24 hr |
| I.V. | 5 min | 60–90 min | 6–8 hr |
| I.M. | 15–30 min | 60–90 min | 6–8 hr |

*Half-life:* 10 to 20 hours.

## ADVERSE REACTIONS

**CNS:** *drowsiness, sedation,* amnesia, insomnia, agitation, dizziness, weakness, unsteadiness, disorientation, depression, headache.

**CV:** hypotension.

**EENT:** visual disturbances, nasal congestion.

**GI:** abdominal discomfort, nausea, change in appetite.

## INTERACTIONS

**Drug-drug.** *CNS depressants:* May increase CNS depression. Use together cautiously.

*Digoxin:* May increase digoxin level and risk of toxicity. Monitor patient and digoxin level closely.

**Drug-herb.** *Kava:* May increase sedation. Discourage use together.

**Drug-lifestyle.** ***Alcohol use:*** May cause additive CNS effects. Discourage use together.

*Smoking:* May decrease drug's effectiveness. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

● May increase liver function test values.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug, other benzodiazepines, or the vehicle used in parenteral dosage form; in patients with acute angle-closure glaucoma; and in pregnant women, especially in the first trimester.

● Use cautiously in patients with pulmonary, renal, or hepatic impairment, or history of substance abuse.

● Use cautiously in elderly, acutely ill, or debilitated patients.

***Overdose S&S:*** Drowsiness, confusion lethargy, ataxia, hypotonia, hypotension, hypnotic state, stage 1 to 3 coma, death.

## NURSING CONSIDERATIONS

● Monitor hepatic, renal, and hematopoietic function periodically in patients receiving repeated or prolonged therapy.

***Alert:*** Use of this drug may lead to abuse and addiction. Don't stop drug abruptly after long-term use because withdrawal symptoms may occur.

● ***Look alike–sound alike:*** Don't confuse lorazepam with alprazolam or clonazepam. Don't confuse Ativan with Atgam.

### PATIENT TEACHING

● When used before surgery, drug causes substantial preoperative amnesia. Patient teaching requires extra care to ensure adequate recall. Provide written materials or inform a family member, if possible.
● Warn patient to avoid hazardous activities that require alertness or good coordination until effects of drug are known.
● Tell patient to avoid use of alcohol while taking drug.
● Notify patient that smoking may decrease drug's effectiveness.
● Warn patient not to stop drug abruptly because withdrawal symptoms may occur.
● Advise women to avoid becoming pregnant while taking drug.

## losartan potassium

low-SAR-tan

Cozaar✔

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Angiotensin II receptor antagonist
*Pregnancy risk category C; D in 2nd and 3rd trimesters*

### AVAILABLE FORMS

*Tablets:* 25 mg, 50 mg, 100 mg

### INDICATIONS & DOSAGES

➤ **Hypertension**
*Adults:* Initially, 50 mg P.O. daily. Maximum daily dose is 100 mg in one or two divided doses.
*Children age 6 and older:* 0.7 mg/kg (up to 50 mg) P.O. daily, adjust as needed up to 1.4 mg/kg/day (maximum 100 mg).
***Adjust-a-dose:*** For adults who are hepatically impaired or intravascularly volume depleted (such as those taking diuretics), initially, 25 mg.

➤ **Nephropathy in type 2 diabetic patients**
*Adults:* 50 mg P.O. once daily. Increase dosage to 100 mg once daily based on blood pressure response.

➤ **To reduce risk of stroke in patients with hypertension and left ventricular hypertrophy**
*Adults:* Initially, 50 mg P.O. once daily. Adjust dosage based on blood pressure response, adding hydrochlorothiazide 12.5 mg once daily, increasing losartan to 100 mg daily, or both. If further adjustments are required, may increase the daily dosage of hydrochlorothiazide to 25 mg.

### ADMINISTRATION

**P.O.**
● Give drug without regard for meals.
● If made into suspension by pharmacist, store in refrigerator and shake well before each use.

### ACTION

Inhibits vasoconstrictive and aldosterone-secreting action of angiotensin II by blocking angiotensin II receptor on the surface of vascular smooth muscle and other tissue cells.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Unknown |

*Half-life:* 2 hours.

### ADVERSE REACTIONS

**Patients with hypertension or left ventricular hypertrophy**
**CNS:** dizziness, asthenia, fatigue, headache, insomnia.
**CV:** edema, chest pain.
**EENT:** nasal congestion, sinusitis, pharyngitis, sinus disorder.
**GI:** abdominal pain, nausea, diarrhea, dyspepsia.
**Musculoskeletal:** muscle cramps, myalgia, back or leg pain.
**Respiratory:** cough, upper respiratory infection.
**Other:** ***angioedema.***
**Patients with nephropathy**
**CNS:** *asthenia, fatigue,* fever, hypesthesia.
**CV:** *chest pain,* hypotension, orthostatic hypotension.
**EENT:** sinusitis, cataract.
**GI:** *diarrhea,* dyspepsia, gastritis.
**GU:** *UTI.*
**Hematologic:** *anemia.*

**Metabolic:** ***hyperkalemia, hypoglycemia,*** weight gain.
**Musculoskeletal:** *back pain,* leg or knee pain, muscle weakness.
**Respiratory:** *cough, bronchitis.*
**Skin:** cellulitis.
**Other:** *flulike syndrome,* ***diabetic vascular disease, angioedema,*** infection, trauma, diabetic neuropathy.

## INTERACTIONS

**Drug-drug.** *Lithium:* May increase lithium level. Monitor lithium level and patient for toxicity.
*NSAIDs:* May decrease antihypertensive effects. Monitor blood pressure.
*Potassium-sparing diuretics, potassium supplements:* May cause hyperkalemia. Monitor patient closely.
**Drug-herb.** *Ma huang:* May decrease antihypertensive effects. Discourage use together.
**Drug-food.** *Salt substitutes containing potassium:* May cause hyperkalemia. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

- May increase liver enzyme or bilirubin levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug. Breast-feeding isn't recommended during losartan therapy.
- Use cautiously in patients with impaired renal or hepatic function.

**Black Box Warning** Drugs that act directly on the renin-angiotensin system (such as losartan) can cause fetal and neonatal morbidity and death when given to women in the second or third trimester of pregnancy. These problems haven't been detected when exposure was limited to the first trimester. If pregnancy is suspected, notify prescriber because drug should be stopped. ■

***Overdose S&S:*** Hypotension, tachycardia, bradycardia.

## NURSING CONSIDERATIONS

- Drug can be used alone or with other antihypertensives.
- If antihypertensive effect is inadequate using once-daily doses, a twice-daily regimen using the same or increased total daily dose may give a more satisfactory response.
- Monitor patient's blood pressure closely to evaluate effectiveness of therapy. When used alone, drug has less of an effect on blood pressure in black patients than in patients of other races.
- Monitor patients who are also taking diuretics for symptomatic hypotension.
- Regularly assess the patient's renal function (via creatinine and BUN levels).
- Patients with severe heart failure whose renal function depends on the angiotensin-aldosterone system may develop acute renal failure during therapy. Closely monitor patient, especially during first few weeks of therapy.
- ***Look alike–sound alike:*** Don't confuse Cozaar with Zocor.

## PATIENT TEACHING

- Tell patient to avoid salt substitutes; these products may contain potassium, which can cause high potassium level in patients taking losartan.
- Inform women of childbearing age about consequences of second and third trimester exposure to drug. Prescriber should be notified immediately if pregnancy is suspected.
- Advise patient to immediately report swelling of face, eyes, lips, or tongue or any breathing difficulty.

# lovastatin (mevinolin)

loe-va-STA-tin

Altoprev, Mevacor

*Therapeutic class:* Antilipemic
*Pharmacologic class:* HMG-CoA reductase inhibitor
*Pregnancy risk category X*

## AVAILABLE FORMS

*Tablets:* 10 mg, 20 mg, 40 mg
*Tablets (extended-release):* 20 mg, 40 mg, 60 mg

## INDICATIONS & DOSAGES

➤ **To prevent and treat coronary heart disease; hyperlipidemia**

*Adults:* Initially, 20 mg P.O. once daily with evening meal. Recommended range is 10 to 80 mg as a single dose or in two divided doses; maximum daily recommended dose is 80 mg.

Or, 20 to 60 mg extended-release tablets P.O. at bedtime.

➤ **Heterozygous familial hypercholesterolemia in adolescents**

*Adolescents ages 10 to 17:* Give 10 to 40 mg daily P.O. with evening meal. Patients requiring reductions in LDL cholesterol level of 20% or more should start with 20 mg daily.

***Adjust-a-dose:*** For patients also taking cyclosporine, give 10 mg P.O. daily, not to exceed 20 mg daily. Avoid use of lovastatin with fibrates or niacin at doses greater than 1 g/day; if combined with either, the dosage of lovastatin shouldn't exceed 20 mg daily. For patients also taking amiodarone or verapamil, the dosage of lovastatin shouldn't exceed 40 mg daily, or 20 mg daily for Altoprev. For elderly patients, diabetic patients, or patients with creatinine clearance less than 30 ml/minute, carefully consider dosage increase greater than 20 mg daily and implement cautiously if necessary. For patients requiring smaller reductions in cholesterol levels, use immediate-release lovastatin.

## ADMINISTRATION

**P.O.**

- Give drug with evening meal, which improves absorption and cholesterol biosynthesis.
- Don't crush, split, or allow patient to chew extended-release tablets.

## ACTION

Inhibits HMG-CoA reductase, an early (and rate-limiting) step in cholesterol biosynthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 hr | Unknown |
| P.O. (extended-release) | Unknown | 14 hr | Unknown |

*Half-life:* 3 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* dizziness, insomnia, peripheral neuropathy.
**EENT:** blurred vision.
**GI:** abdominal pain or cramps, constipation, diarrhea, dyspepsia, flatulence, heartburn, nausea, vomiting.
**Musculoskeletal:** muscle cramps, myalgia, myositis, ***rhabdomyolysis.***
**Skin:** alopecia, rash, pruritus.

## INTERACTIONS

**Drug-drug.** *Amiodarone,* ***verapamil:*** May cause myopathy and rhabdomyolysis. Don't exceed 40 mg lovastatin (or 20 mg Altoprev) daily.

*Azole antifungals,* ***protease inhibitors:*** May cause myopathy and rhabdomyolysis. Avoid using together.

***Cyclosporine:*** May cause severe myopathy and rhabdomyolysis. Don't use together.

*Danazol, gemfibrozil or other fibrates, niacin:* May cause myopathy and rhabdomyolysis. Don't exceed 20 mg lovastatin daily.

***Diltiazem, macrolides (azithromycin, clarithromycin, erythromycin, telithromycin), nefazodone:*** May decrease metabolism of HMG-CoA reductase inhibitor, increasing toxicity. Monitor patient for adverse effects and report unexplained muscle pain.

*Oral anticoagulants:* May increase oral anticoagulant effect. Monitor patient closely.

**Drug-herb.** *Eucalyptus, jin bu huan, kava:* May increase risk of hepatotoxicity. Discourage use together.

*Pectin:* May decrease drug effect. Discourage use together.

*Red yeast rice:* May increase risk of adverse reactions because herb contains compounds similar to those in drug. Discourage use together.

**Drug-food.** *Grapefruit juice:* May increase drug level, increasing risk of adverse effects. Discourage use together.

**Drug-lifestyle.** *Alcohol use:* May increase risk of hepatotoxicity. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, and CK levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with active liver disease or unexplained persistently increased transaminase level.
- Contraindicated in pregnant and breast-feeding women and in women of childbearing age.
- Use cautiously in patients who consume substantial quantities of alcohol or have a history of liver disease.

## NURSING CONSIDERATIONS

- Have patient follow a diet restricted in saturated fat and cholesterol during therapy.
- Obtain liver function test results at the start of therapy, at 6 and 12 weeks after the start of therapy, and when increasing dose; then monitor results periodically.
- Heterozygous familial hypercholesterolemia can be diagnosed in adolescent boys and in girls who are at least 1 year postmenarche and are 10 to 17 years old; if after an adequate trial of diet therapy LDL cholesterol level remains over 189 mg/dl or LDL cholesterol over 160 mg/dl and patient has a positive family history of premature CV disease or two or more other CV disease risk factors.
- ***Look alike–sound alike:*** Don't confuse lovastatin with Lotensin, Leustatin, or Livostin. Don't confuse Mevacor with Mivacron.

## PATIENT TEACHING

- Instruct patient to take drug with the evening meal.
- Teach patient about proper dietary management of cholesterol and triglycerides. When appropriate, recommend weight control, exercise, and smoking cessation programs.
- Advise patient to have periodic eye examinations; related compounds cause cataracts.
- Instruct patient to store tablets at room temperature in a light-resistant container.
- Advise patient to promptly report unexplained muscle pain, tenderness, or weakness, particularly when accompanied by malaise or fever.

***Alert:*** Tell woman to stop drug and notify prescriber immediately if she is or may be pregnant or if she's breast-feeding.

***Alert:*** Advise patient not to crush or chew extended-release tablets.

# loxapine succinate

LOX-a-peen

*Therapeutic class:* Antipsychotic
*Pharmacologic class:* Dibenzapine derivative
*Pregnancy risk category NR*

## AVAILABLE FORMS

*Capsules:* 5 mg, 10 mg, 25 mg, 50 mg

## INDICATIONS & DOSAGES

➤ **Psychotic disorders**

*Adults:* Initially, 10 mg P.O. b.i.d. In severely disturbed patients, up to 50 mg daily may be desirable. Increase dosage fairly rapidly over the first 7 to 10 days until symptoms are controlled. Usual therapeutic and maintenance range is 60 to 100 mg daily.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.

## ACTION

Unknown. Probably exerts antipsychotic effects by blocking postsynaptic dopamine receptors in the brain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30 min | 90 min–3 hr | 12 hr |

*Half-life:* 8 hours.

## ADVERSE REACTIONS

**CNS:** *extrapyramidal reactions, sedation, tardive dyskinesia,* ***neuroleptic malignant syndrome, seizures,*** drowsiness, numbness, confusion, syncope, pseudoparkinsonism, EEG changes, dizziness.
**CV:** orthostatic hypotension, tachycardia, ECG changes, hypertension.
**EENT:** *blurred vision,* nasal congestion.
**GI:** *dry mouth, constipation,* nausea, vomiting, paralytic ileus.
**GU:** *urine retention,* menstrual irregularities.
**Hematologic:** ***leukopenia, agranulocytosis, thrombocytopenia.***
**Hepatic:** jaundice.
**Metabolic:** weight gain.

**Skin:** allergic reactions, rash, pruritus.
**Other:** gynecomastia, galactorrhea.

## INTERACTIONS

**Drug-drug.** *Anticholinergics:* May increase anticholinergic effect. Use together cautiously.
*CNS depressants:* May increase CNS depression. Use together cautiously.
*Epinephrine:* May inhibit vasopressor effect of epinephrine. Avoid using together.
**Drug-lifestyle.** *Alcohol use:* May increase CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase liver function test values. May decrease WBC, granulocyte, and platelet counts.
- May cause false-positive results for urinary porphyrin, urobilinogen, amylase, and 5-hydroxyindoleacetic acid tests and for urine pregnancy tests that use human chorionic gonadotropin.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to dibenzapines, in those in a coma, and in those with severe CNS depression or drug-induced depressed states.
- Use cautiously in patients with seizure disorder, CV disorder, glaucoma, or history of urine retention.

***Overdose S&S:*** Mild depression of the CNS and cardiovascular systems, hypotension, respiratory depression, unconsciousness, extrapyramidal symptoms, seizures, renal failure.

## NURSING CONSIDERATIONS

- Obtain baseline blood pressure measurements before starting therapy and monitor pressure regularly.
- Monitor patient for tardive dyskinesia, which may occur after prolonged use. It may not appear until months or years later and may disappear spontaneously or persist for life, despite ending drug.

***Alert:*** Watch for evidence of neuroleptic malignant syndrome (extrapyramidal effects, hyperthermia, autonomic disturbance), a rare but deadly disorder.

***Alert:*** Elderly patients with dementia-related psychosis treated with atypical or conventional antipsychotics are at increased risk for death. Antipsychotics aren't approved for the treatment of dementia-related psychosis.

## PATIENT TEACHING

- Warn patient to avoid activities that require alertness and good coordination until effects of drug are known. Drowsiness and dizziness usually subside after first few weeks.
- Advise patient to report bruising, fever, or sore throat immediately.
- Tell patient to avoid alcohol while taking drug.
- Advise patient to get up slowly to avoid dizziness upon standing quickly.
- Tell patient to relieve dry mouth with sugarless gum or hard candy.
- Recommend periodic eye examinations.

# lubiprostone

loo-bee-PRAHS-tohn

Amitiza✒

*Therapeutic class:* Laxative
*Pharmacologic class:* Chloride channel activator
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 8 mcg, 24 mcg

## INDICATIONS & DOSAGES

➤ **Chronic idiopathic constipation**
*Adults:* 24 mcg P.O. b.i.d. with food.
➤ **Irritable bowel syndrome with constipation**
*Women 18 years and older:* 8 mcg P.O. b.i.d. with food and water.

## ADMINISTRATION

**P.O.**
- Give drug with food.
- Patient should swallow capsule whole.

## ACTION

Increases intestinal fluid secretion by activating chloride channels, and increases intestinal motility.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Unknown |

*Half-life:* Cannot be reliably calculated.

## ADVERSE REACTIONS

**CNS:** *headache*, anxiety, depression, dizziness, fatigue, insomnia, pyrexia.
**CV:** chest pain, peripheral edema.
**EENT:** nasopharyngitis, pharyngolaryngeal pain, sinusitis.
**GI:** *diarrhea*, *nausea*, abdominal distention, abdominal pain or discomfort, constipation, dry mouth, dyspepsia, flatulence, gastroesophageal reflux disease, loose stools, stomach discomfort, viral gastroenteritis, vomiting.
**GU:** UTI.
**Metabolic:** weight gain.
**Musculoskeletal:** arthralgia, back pain, limb pain, muscle cramps.
**Respiratory:** bronchitis, cough, dyspnea, upper respiratory tract infection.
**Other:** influenza.

## INTERACTIONS

None reported.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those with a history of mechanical GI obstruction.
- Use cautiously in women who are or may become pregnant.

***Overdose S&S:*** Nausea, vomiting, diarrhea, dizziness, headache, abdominal pain, flushing, retching, dyspnea, pallor, stomach discomfort, anorexia, asthenia, chest discomfort, dry mouth, hyperhidrosis, syncope.

## NURSING CONSIDERATIONS

- Patient may experience dyspnea and chest tightness within 1 hour of first dose. Symptoms resolve within 3 hours but may recur with repeat dosing.
- Periodically assess patient's need for continued therapy.
- Monitor patient for diarrhea.
- Don't give drug to a patient with severe diarrhea.
- Safety and effectiveness in children haven't been established.

## PATIENT TEACHING

- Tell patient to take drug with food and to swallow capsule whole. Advise patient not to open or chew capsules.
- Explain to patient he may experience diarrhea; advise him not to take drug if he develops severe diarrhea.
- Advise patient about a proper diet and the need to drink plenty of fluids.

# lymphocyte immune globulin (antithymocyte globulin [equine], ATG, LIG)

LIM-foh-site

Atgam

*Therapeutic class:* Immunosuppressant
*Pharmacologic class:* Immunoglobulin
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 50 mg of equine IgG/ml in 5-ml ampules

## INDICATIONS & DOSAGES

➤ **To prevent acute renal allograft rejection**

*Adults and children:* 15 mg/kg I.V. daily for 14 days; then alternate-day therapy for 14 days. Give first dose within 24 hours of transplantation.

➤ **Acute renal allograft rejection**

*Adults and children:* 10 to 15 mg/kg I.V. daily for 14 days. Additional alternate-day therapy to total of 21 doses can be given. Start therapy when rejection is diagnosed.

➤ **Aplastic anemia**

*Adults:* 10 to 20 mg/kg I.V. daily for 8 to 14 days. Additional alternate-day therapy to total of 21 doses can be given.

## ADMINISTRATION

**I.V.**

▼ Don't use solutions that are older than 12 hours, including actual infusion time.

▼ Dilute concentrated drug for injection before giving. Dilute required dose in 250 to 1,000 ml of half-normal or normal saline solution. Final concentration of drug shouldn't exceed 4 mg/ml.
▼ Allow diluted drug to reach room temperature before infusion.
▼ When adding drug to infusion solution, make sure container is inverted so drug doesn't contact air inside container. Gently rotate or swirl container to mix contents; don't shake because this may cause excessive foaming or denature the drug protein.
▼ Infuse with an in-line filter with a pore size of 0.2 to 1 micron over at least 4 hours (most institutions use 4 to 8 hours) into a vascular shunt, arterial venous fistula, or high-flow central vein.
▼ Refrigerate at 35° to 47° F (2° to 8° C). Concentrate is heat sensitive. Don't freeze.
▼ **Incompatibilities:** Don't dilute with dextrose solutions or those with a low salt concentration because a precipitate may form. Proteins in drug can be denatured by air. Drug is unstable in acidic solutions.

## ACTION

Unknown. Inhibits cell-mediated immune responses either by altering T-cell function or eliminating antigen-reactive T cells.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | 5 days | Unknown |

*Half-life:* About 6 days.

## ADVERSE REACTIONS

**CNS:** ***seizures,*** headache, malaise.
**CV:** *chest pain, hypotension,* edema, iliac vein obstruction, tachycardia, thrombophlebitis.
**EENT:** ***laryngospasm.***
**GI:** *diarrhea, nausea, vomiting,* abdominal distention, epigastric pain, hiccups, stomatitis.
**GU:** renal artery stenosis.
**Hematologic:** **LEUKOPENIA, THROMBOCYTOPENIA,** ***aplastic anemia,*** hemolysis, lymphadenopathy.
**Metabolic:** hyperglycemia.
**Musculoskeletal:** *arthralgia, myalgia.*
**Respiratory:** *dyspnea,* ***pulmonary edema.***
**Skin:** *pruritus, rash, urticaria.*
**Other:** ***anaphylaxis,*** chills, febrile reactions, hypersensitivity reactions, infections, night sweats, serum sickness.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

● May increase liver enzyme and glucose levels. May decrease hemoglobin level.
● May decrease WBC and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug.
● Use cautiously in patients receiving additional immunosuppressive therapy (such as corticosteroids or azathioprine) because of increased risk of infection.

## NURSING CONSIDERATIONS

***Alert:*** Do an I.D. skin test at least 1 hour before first dose. Give an I.D. dose of 0.1 ml of a 1:1,000 lymphocyte immune globulin along with a contralateral normal saline control. Marked local swelling or erythema larger than 10 mm indicates increased risk of severe systemic reaction such as anaphylaxis. Severe reactions to skin test, such as hypotension, tachycardia, dyspnea, generalized rash, or anaphylaxis, usually preclude further use of drug. Anaphylaxis may still occur in patients with negative skin tests.
**Black Box Warning** Drug should only be used by physicians experienced in immunosuppressive therapy in the treatment of renal transplant or aplastic anemia patients. ■
● Monitor patient for hypotension, respiratory distress, and chest, flank, or back pain, which may indicate anaphylaxis or hemolysis.
● Keep airway adjuncts and anaphylaxis drugs at bedside during administration.
● Watch for signs and symptoms of infection, such as fever, sore throat, malaise.

## PATIENT TEACHING

● Instruct patient to report adverse drug reactions promptly, especially signs and symptoms of infection (fever, sore throat, fatigue).

- Tell patient to immediately report discomfort at I.V. insertion site because drug can cause a chemical phlebitis.
- Advise women to avoid pregnancy during therapy.

## magnesium chloride
Slow-Mag ◇

## magnesium sulfate

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* Magnesium salt
*Pregnancy risk category C (chloride injection); A (sulfate injection)*

### AVAILABLE FORMS
**magnesium chloride**
*Injection:* 20% in 50-ml vials
*Tablets (delayed-release):* 64 mg
**magnesium sulfate**
*Injectable solutions:* 10%, 12.5%, 50% in 2-, 5-, 10-, 20-, and 50-ml ampules, vials, and prefilled syringes

### INDICATIONS & DOSAGES
➤ **Mild hypomagnesemia**
*Adults:* 1 g I.V. by piggyback or I.M. every 6 hours for four doses, depending on magnesium level. Or, 3 g P.O. every 6 hours for four doses.
➤ **Symptomatic severe hypomagnesemia, with magnesium 0.8 mEq/L or less**
*Adults:* 5 g I.V. in 1 L of solution over 3 hours. Base subsequent doses on magnesium level.
➤ **Magnesium supplementation**
*Adults:* 64 mg (one tablet) P.O. t.i.d.
➤ **Magnesium supplementation in total parenteral nutrition (TPN)**
*Adults and children:* 8 to 24 mEq I.V. daily added to TPN solution.
*Infants:* 2 to 10 mEq I.V. daily added to TPN solution. Each 2 ml of 50% solution contains 1 g, or 8.12 mEq, magnesium sulfate.
➤ **Seizures associated with epilepsy, glomerulonephritis, or hypothyroidism**
*Adults:* 1 g I.M. or I.V.
➤ **Severe preeclampsia or eclampsia**
*Adults:* 4 to 5 g I.V. in 250 ml of solution. Simultaneously, give up to 10 g I.M. (5 g or 10 ml of the undiluted 50% solution in each buttock.) Base subsequent doses on magnesium level. Do not exceed 30 to 40 g in a 24 hour period.
➤ **Barium poisoning**
*Adults:* 1 to 2 g magnesium sulfate I.V.
➤ **Cerebral edema**
*Adults:* 2.5 g (25 ml of a 10% solution) I.V.

### ADMINISTRATION
**P.O.**
- Give drug with food.
- Store between 20° and 25° C (68° and 77° F).

**I.V.**
▼ Concentration should be 200 mg/ml or less.
▼ Inject bolus dose slowly at a rate of 150 mg/minute or less, or use infusion pump for continuous infusion to avoid respiratory or cardiac arrest. Maximum infusion rate is 150 mg/minute. Rapid drip causes feeling of heat.
▼ For severe hypomagnesemia, watch for respiratory depression and evidence of heart block. Respirations should be better than 16 breaths/minute before giving dose.
▼ **Incompatibilities:** Alcohol (in large amounts), alkali carbonates and bicarbonates, amiodarone, amphotericin B, calcium chloride, calcium gluconate, cefepime, ciprofloxacin, clindamycin, cyclosporine, dobutamine, drotrecogin alfa, heavy metals, hydralazine, hydrocortisone sodium succinate, I.V. fat emulsion 10%, phytonadione, polymyxin B, procaine, quinolones, salicylates, sodium bicarbonate, soluble phosphates, vitamin B complex.

**I.M.**
- Undiluted 50% solutions may be given by deep I.M. injection to adults. Dilute solutions to 20% or less for use in children.

### ACTION
Replaces magnesium and maintains magnesium level; as an anticonvulsant, reduces muscle contractions by interfering with release of acetylcholine at myoneural junction.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 4 hr | 4–6 hr |
| I.V. | Immediate | Unknown | 30 min |
| I.M. | 1 hr | Unknown | 3–4 hr |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** toxicity, *weak or absent deep tendon reflexes,* flaccid paralysis, drowsiness, stupor.
**CV:** slow, weak pulse, ***arrhythmias,*** *hypotension,* ***circulatory collapse,*** flushing.
**GI:** diarrhea.
**Metabolic:** hypocalcemia.
**Respiratory:** ***respiratory paralysis.***
**Skin:** diaphoresis.
**Other:** hypothermia.

## INTERACTIONS

**Drug-drug.** *Alendronate, fluoroquinolones, nitrofurantoin, penicillamine, sodium polystyrene sulfonate, tetracyclines:* May decrease bioavailability with oral magnesium supplements. Separate doses by 2 to 3 hours.
*Cardiac glycosides:* May cause serious cardiac conduction changes. Use together with caution.
*CNS depressants:* May have additive effect. Use together cautiously.
*Neuromuscular blockers:* May cause increased neuromuscular blockage. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

- May increase magnesium level. May decrease calcium level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with myocardial damage or heart block, coma, and in pregnant women in actively progressing labor.
- Use parenteral magnesium with caution in patients with impaired renal function.

⚠ ***Overdose S&S:*** Hypotension, facial flushing, feeling of warmth, thirst, nausea, vomiting, lethargy, dysarthria, drowsiness, diminished deep tendon reflexes, shallow respirations, apnea, coma, cardiac arrest.

## NURSING CONSIDERATIONS

- Keep I.V. calcium available to reverse magnesium intoxication.
- Test knee-jerk and patellar reflexes before each additional dose. If absent, notify prescriber and give no more magnesium until reflexes return; otherwise, patient may develop temporary respiratory failure and need cardiopulmonary resuscitation or I.V. administration of calcium.
- Check magnesium level after repeated doses.
- Monitor fluid intake and output. Output should be 100 ml or more during 4-hour period before dose.
- Monitor renal function.
- After giving to toxemic pregnant woman within 24 hours before delivery, watch neonate for signs and symptoms of magnesium toxicity, including neuromuscular and respiratory depression.
- ***Look alike–sound alike:*** Don't confuse magnesium sulfate with manganese sulfate.

## PATIENT TEACHING

- Explain use and administration of drug to patient and family.
- Tell patient to report adverse effects.

# magnesium citrate (citrate of magnesia)

# magnesium hydroxide (milk of magnesia)

Milk of Magnesia ◇, Milk of Magnesia-Concentrated ◇, Phillips' Milk of Magnesia ◇

# magnesium sulfate ◇ (Epsom salts ◇)

*Therapeutic class:* Laxative
*Pharmacologic class:* Magnesium salt
*Pregnancy risk category B*

## AVAILABLE FORMS

**magnesium citrate**
*Oral solution:* About 168 mEq magnesium/240 ml ◇
**magnesium hydroxide**
*Chewable tablets:* 300 mg, 600 mg
*Oral suspension:* 400 mg/5 ml, 800 mg/5 ml

**magnesium sulfate**
*Granules:* About 40 mEq magnesium/5 g ◊

## INDICATIONS & DOSAGES

➤ **Constipation, to evacuate bowel before surgery**

*Adults and children age 12 and older:* 11 to 25 g magnesium citrate P.O. daily as a single or divided dose. Or, 2.4 to 4.8 g or 30 to 60 ml magnesium hydroxide P.O. (2 to 4 tablespoons at bedtime or upon arising, followed by 8 ounces of liquid) daily as a single dose or divided. Or, 10 to 30 g magnesium sulfate P.O. daily as a single or divided dose.

*Children ages 6 to 11:* 5.5 to 12.5 g magnesium citrate P.O. daily as a single or divided dose. Or, 1.2 to 2.4 g or 15 to 30 ml magnesium hydroxide P.O. (1 to 2 tablespoons, followed by 8 ounces of liquid) daily as a single or divided dose. Or, 5 to 10 g magnesium sulfate P.O. daily as a single or divided dose. Don't use dosage cup.

*Children ages 2 to 5:* 2.7 to 6.25 g magnesium citrate P.O. daily as a single or divided dose. Or, 0.4 to 1.2 g or 5 to 15 ml magnesium hydroxide P.O. (1 to 3 tsp, followed by 8 ounces of liquid) daily as a single or divided dose. Or, 2.5 to 5 g magnesium sulfate P.O. daily as a single or divided dose. Don't use dosage cup.

## ADMINISTRATION

**P.O.**

- Give drug at times that don't interfere with scheduled activities or sleep. Drug produces watery stools in 3 to 6 hours.
- Chill magnesium citrate before use to improve its palatability.
- Shake suspension well; give with a large amount of water when used as laxative. When giving by nasogastric tube, make sure tube is placed properly and is patent. After instilling drug, flush tube with water to ensure passage to stomach and maintain tube patency.

## ACTION

Saline laxative that produces an osmotic effect in the small intestine by drawing water into the intestinal lumen.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30 min–3 hr | Variable | Variable |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**GI:** *abdominal cramping, diarrhea, nausea.*
**Metabolic:** fluid and electrolyte disturbances with daily use.
**Other:** laxative dependence with long-term or excessive use.

## INTERACTIONS

**Drug-drug.** *Oral drugs:* May impair absorption. Separate doses.

## EFFECTS ON LAB TEST RESULTS

- May alter fluid and electrolyte levels with prolonged use.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in pregnant patients about to deliver and in patients with myocardial damage, heart block, fecal impaction, rectal fissures, intestinal obstruction or perforation, renal disease, or signs and symptoms of appendicitis or acute surgical abdomen, such as abdominal pain, nausea, or vomiting.
- Use cautiously in patients with rectal bleeding.

***Overdose S&S:*** Blurred or double vision, coma, dizziness, syncope, drowsiness, increased or decreased urination, bradycardia, dyspnea.

## NURSING CONSIDERATIONS

- Before giving drug for constipation, determine whether patient has adequate fluid intake, exercise, and diet.

***Alert:*** Monitor electrolyte levels during prolonged use. Magnesium may accumulate if patient has renal insufficiency.

- Drug is recommended for short-term use only.
- Magnesium sulfate is more potent than other saline laxatives.

## PATIENT TEACHING

- Teach patient how to use drug.
- Teach patient about dietary sources of fiber, including bran and other cereals, fresh fruit, and vegetables.

● Warn patient that frequent or prolonged use as a laxative may cause dependence.

## magnesium oxide

mag-NEE-see-um

Mag-Ox 400 ◇, Maox ◇, Uro-Mag ◇

*Therapeutic class:* Antacid
*Pharmacologic class:* Magnesium salt
*Pregnancy risk category B*

### AVAILABLE FORMS

*Capsules:* 140 mg ◇
*Tablets:* 400 mg ◇, 420 mg ◇, 500 mg

### INDICATIONS & DOSAGES

➤ **Acid indigestion**

*Adults:* 140 mg P.O. with water or milk after meals and at bedtime.

➤ **Oral replacement therapy in mild hypomagnesemia**

*Adults:* 400 to 840 mg P.O. daily. Monitor magnesium level.

### ADMINISTRATION

**P.O.**

● When used to treat acid indigestion, give with water or milk.

### ACTION

Reduces total acid load in GI tract, elevates gastric pH to reduce pepsin activity, strengthens gastric mucosal barrier, and increases esophageal sphincter tone.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 20 min | Unknown | 20–180 min |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**GI:** *diarrhea*, abdominal pain, nausea.
**Metabolic:** hypermagnesemia.

### INTERACTIONS

**Drug-drug.** *Allopurinol, antibiotics, digoxin, iron salts, penicillamine, phenothiazines:* May decrease effects of these drugs because may impair absorption. Separate doses by 1 to 2 hours.

*Anticoagulants (such as warfarin):* May increase risk of adverse effects. Use together cautiously.
*Bisphosphonates:* May impair absorption of bisphosphonate. When administering both drugs, separate doses by 2 hours.
*Enteric-coated drugs:* May be released prematurely in stomach. Separate doses by at least 1 hour.

### EFFECTS ON LAB TEST RESULTS

● May increase magnesium level.

### CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients with severe renal disease.
● Use cautiously in patients with mild to moderate renal impairment.
⚠ ***Overdose S&S:*** Hypotension, nausea, vomiting, urine retention, bradycardia, vasodilation, ECG changes, hyporeflexia, secondary CNS depression, respiratory changes, coma, cardiac arrest.

### NURSING CONSIDERATIONS

***Alert:*** Monitor magnesium level. With prolonged use and renal impairment, watch for evidence of hypermagnesemia (hypotension, nausea, vomiting, depressed reflexes, respiratory depression, and coma).
● If diarrhea occurs, use a different drug.

### PATIENT TEACHING

● Advise patient not to take drug indiscriminately or to switch antacids without prescriber's advice.
● Urge patient to report signs of GI bleeding, such as tarry stools, or coffee-ground vomitus.

**SAFETY ALERT!**

## magnesium sulfate

mag-NEE-zee-um

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* Mineral; electrolyte
*Pregnancy risk category A*

### AVAILABLE FORMS

*Injection:* 4%, 8%, 10%, 12.5%, 25%, 50%
*Injection solution:* 1% in $D_5W$, 2% in $D_5W$

## INDICATIONS & DOSAGES

➤ **To prevent or control seizures in preeclampsia or eclampsia**

*Women:* Initially, 4 g I.V. in 250 ml $D_5W$ or normal saline and 4 to 5 g deep I.M. into each buttock; then 4 to 5 g deep I.M. into alternate buttock every 4 hours, as needed. Or, 4 g I.V. loading dose; then 1 to 3 g hourly as I.V. infusion. Total dose shouldn't exceed 30 or 40 g daily.

➤ **Hypomagnesemia**

*Adults:* For mild deficiency, 1 g I.M. every 6 hours for four doses; for severe deficiency, 5 g in 1,000 ml $D_5W$ or normal saline solution infused over 3 hours.

➤ **Seizures, hypertension, and encephalopathy with acute nephritis in children**

*Children:* 20 to 40 mg/kg I.M. as needed to control seizures. Dilute the 50% concentration to a 20% solution and give 0.1 to 0.2 ml/kg of the 20% solution.

➤ **To manage life-threatening ventricular arrhythmias, such as sustained ventricular tachycardia or torsades de pointes ♦**

*Adults:* If associated with cardiac arrest, give 1 to 2 g diluted in 10 ml $D_5W$ I.V. or intraosseous over 15 to 20 minutes. If torsades de pointes is intermittent and not associated with cardiac arrest, dilute 1 to 2 g in 50 to 100 ml $D_5W$ and give I.V. over 5 to 60 minutes.

➤ **To manage preterm labor ♦**

*Adults:* 4 to 6 g I.V. over 20 minutes, followed by 2 to 4 g/hour I.V. infusion for 12 to 24 hours, as tolerated, after contractions have stopped.

## ADMINISTRATION

**I.V.**

▼ If necessary, dilute to maximum level of 20%. Infuse no faster than 150 mg/minute (1.5 ml/minute of a 10% solution or 0.75 ml/minute of a 20% solution). Drug is compatible with $D_5W$ and normal saline solution.

▼ Maximum infusion rate is 150 mg/minute. Too-rapid infusion produces uncomfortable feeling of heat.

▼ Monitor vital signs every 15 minutes when giving drug I.V.

▼ **Incompatibilities:** Alkali carbonates and bicarbonates, amiodarone, amphotericin B, calcium gluconate, cefepime, ciprofloxacin, clindamycin, cyclosporine, dobutamine, heavy metals, I.V. fat emulsion 10%, polymyxin B, procaine, salicylates, sodium bicarbonate, soluble phosphates.

**I.M.**

● For adults, give undiluted 50% concentration by deep injection.

● For children, dilute to concentration of 20% or less with $D_5W$ or normal saline for injection.

## ACTION

May decrease acetylcholine released by nerve impulses, but anticonvulsant mechanism is unknown.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 1–2 min | Rapid | 30 min |
| I.M. | 1 hr | Unknown | 3–4 hr |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *depressed reflexes,* drowsiness, flaccid paralysis, hypothermia.

**CV:** *flushing, hypotension,* ***bradycardia, circulatory collapse,*** depressed cardiac function.

**EENT:** diplopia.

**Metabolic:** hypocalcemia.

**Respiratory:** ***respiratory paralysis.***

**Skin:** diaphoresis.

## INTERACTIONS

**Drug-drug.** *Anesthetics, CNS depressants:* May cause additive CNS depression. Use together cautiously.

*Cardiac glycosides:* May worsen arrhythmias. Use together cautiously.

*Neuromuscular blockers:* May cause increased neuromuscular blockade. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

● May increase magnesium level. May decrease calcium level.

## CONTRAINDICATIONS & CAUTIONS

● Parenteral administration contraindicated in patients with heart block or myocardial damage.

- Contraindicated in patients with toxemia of pregnancy during 2 hours preceding delivery.
- Use cautiously in patients with impaired renal function.
- Use cautiously in pregnant women during labor.

***Overdose S&S:*** Disappearance of the patellar reflex, sharp drop in blood pressure, respiratory paralysis.

## NURSING CONSIDERATIONS

- If used to treat seizures, take appropriate seizure precautions.

***Alert:*** Watch for respiratory depression and signs and symptoms of heart block.

- Keep I.V. calcium gluconate available to reverse magnesium intoxication, but use cautiously in digitalized patients because of danger of arrhythmias.
- Check magnesium level after repeated doses.
- Signs of hypermagnesemia begin to appear at levels of 4 mEq/L.
- Effective anticonvulsant level ranges from 2.5 to 7.5 mEq/L.
- Monitor fluid intake and output. Make sure urine output is 100 ml or more in 4-hour period before each dose.
- Observe neonates for signs of magnesium toxicity, including neuromuscular or respiratory depression, when giving I.V. form of drug to toxemic mothers within 24 hours before delivery.
- ***Look alike–sound alike:*** Don't confuse magnesium sulfate with manganese sulfate.

## PATIENT TEACHING

- Inform patient of short-term need for drug and answer any questions and address concerns.
- Review potential adverse reactions and instruct patient to promptly report any occurrences. Reassure patient that, although adverse reactions can occur, vital signs, reflexes, and drug level will be monitored frequently to ensure safety.

# mannitol

MAN-i-tole

Osmitrol

*Therapeutic class:* Diuretic
*Pharmacologic class:* Osmotic diuretic
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 5%, 10%, 15%, 20%, 25%
*Solution for irrigation:* 5 g/100 ml

## INDICATIONS & DOSAGES

➤ **Test dose for marked oliguria or suspected inadequate renal function**

*Adults and children older than age 12:* 200 mg/kg or 12.5 g as a 15% to 20% I.V. solution over 3 to 5 minutes. Response is adequate if 30 to 50 ml of urine/hour is excreted over 2 to 3 hours; if response is inadequate, a second test dose is given. If still no response after second dose, stop drug.

➤ **Oliguria**

*Adults and children older than age 12:* 50 to 100 g I.V. as a 15% to 25% solution over 90 minutes to several hours.

➤ **To prevent oliguria or acute renal failure**

*Adults and children older than age 12:* 50 to 100 g I.V. of a 5% to 25% solution. Determine exact concentration by fluid requirements.

➤ **To reduce intraocular or intracranial pressure or cerebral edema**

*Adults and children older than age 12:* 1.5 to 2 g/kg as a 15%, 20%, or 25% I.V. solution over 30 to 60 minutes. For maximum intraocular pressure reduction before surgery, give 60 to 90 minutes preoperatively.

➤ **Diuresis in drug intoxication**

*Adults and children older than age 12:* 5% to 25% solution continuously up to 200 g I.V., while maintaining 100 to 500 ml urine output/hour and a positive fluid balance.

➤ **Irrigating solution during transurethral surgical procedures**

*Adults:* 2.5% to 5% solution.

## ADMINISTRATION

**I.V.**

▼ Change I.V. administration apparatus every 24 hours.

▼ To redissolve crystallized solution (crystallization occurs at low temperatures or in concentrations higher than 15%), warm bottle or bag in a hot water bath with occasional shaking. Cool to body temperature before giving. Don't use solution with undissolved crystals.

▼ Give as intermittent or continuous infusion at prescribed rate, using an inline filter and an infusion pump. Don't give as direct injection.

▼ Check patency at infusion site before and during administration.

▼ Monitor patient for signs and symptoms of infiltration; if it occurs, watch for inflammation, edema, and necrosis.

▼ **Incompatibilities:** Blood products, cefepime, doxorubicin liposomal, filgrastim, imipenem-cilastatin, meropenem, potassium chloride, sodium chloride, strongly acidic or alkaline solutions.

## ACTION

Increases osmotic pressure of glomerular filtrate, thus inhibiting tubular reabsorption of water and electrolytes. Drug elevates plasma osmolality and increases water flow into extracellular fluid.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 30–60 min | 1 hr | 6–8 hr |

*Half-life:* About 1½ hours.

## ADVERSE REACTIONS

**CNS:** ***seizures,*** dizziness, headache, fever.
**CV:** edema, thrombophlebitis, hypotension, hypertension, ***heart failure,*** tachycardia, angina-like chest pain, vascular overload.
**EENT:** blurred vision, rhinitis.
**GI:** thirst, dry mouth, nausea, vomiting, *diarrhea.*
**GU:** urine retention.
**Metabolic:** dehydration.
**Skin:** local pain, urticaria.
**Other:** chills, thirst.

## INTERACTIONS

**Drug-drug.** *Lithium:* May increase urinary excretion of lithium. Monitor lithium level closely.

## EFFECTS ON LAB TEST RESULTS

● May increase or decrease electrolyte levels.
● May interfere with tests for inorganic phosphorus or ethylene glycol level.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug.
● Contraindicated in patients with anuria; severe pulmonary congestion; frank pulmonary edema; active intracranial bleeding (except during craniotomy); severe dehydration; metabolic edema; previous progressive renal disease or dysfunction after starting drug, including increasing azotemia and oliguria; or previous progressive heart failure or pulmonary congestion after drug.
***Overdose S&S:*** Increased electrolyte excretion, orthostatic tachycardia or hypotension, decreased central venous pressure, impaired neuromuscular function, intestinal dilation and ileus, pulmonary edema or water intoxication if urinary output is inadequate.

## NURSING CONSIDERATIONS

● Monitor vital signs, including central venous pressure and fluid intake and output hourly. Report increasing oliguria. Check weight, renal function, fluid balance, and serum and urine sodium and potassium levels daily.
● In comatose or incontinent patient, use urinary catheter because therapy is based on strict evaluation of fluid intake and output. If patient has urinary catheter, use an hourly urometer collection bag to evaluate output accurately and easily.
● To relieve thirst, give frequent mouth care or fluids.
● Drug is commonly used in chemotherapy regimens to enhance diuresis of renally toxic drugs.
● Don't give electrolyte-free solutions with blood. If blood is given simultaneously, add at least 20 mEq of sodium chloride to each

liter of drug solution to avoid pseudoagglutination.

### PATIENT TEACHING

- Tell patient that he may feel thirsty or have a dry mouth, and emphasize importance of drinking only the amount of fluids ordered.
- Instruct patient to promptly report adverse reactions and discomfort at I.V. site.

## maraviroc

mahr-AY-vih-rok

Selzentry

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* CCR5 co-receptor antagonist
*Pregnancy risk category B*

### AVAILABLE FORMS

*Tablets:* 150 mg, 300 mg

### INDICATIONS & DOSAGES

➤ **Combined with CYP3A4 inhibitors including protease inhibitors (except tipranovir/ritonavir) to treat CCR5-tropic HIV-1 infection with evidence of viral replication or HIV-1 strains resistant to multiple antiretrovirals**
*Adults and children age 16 and older:* 150 mg P.O. b.i.d.

➤ **Combined with nucleoside reverse transcriptase inhibitors, tipranavir/ritonavir, nevirapine, or other drugs that aren't strong CYP3A inhibitors or CYP3A inducers, to treat CCR5-tropic HIV-1 infection with evidence of viral replication or HIV-1 strains resistant to multiple antiretrovirals**
*Adults and children age 16 and older:* 300 mg P.O. b.i.d.

➤ **Combined with CYP3A inducers, to treat CCR5-tropic HIV-1 infection with evidence of viral replication or HIV-1 strains resistant to multiple antiretrovirals**
*Adults and children age 16 and older:* 600 mg P.O. b.i.d.

### ADMINISTRATION

**P.O.**
- Give drug without regard for food.

### ACTION

Blocks viral entry into cells by binding to chemokine receptor 5 co-receptor and preventing the initiation of HIV replication cycle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | ½–4 hr | Unknown |

*Half-life:* 14 to 18 hours.

### ADVERSE REACTIONS

**CNS:** dizziness, paresthesias, sensory abnormalities, peripheral neuropathy, sleep disturbances, depressive disorders, *pyrexia,* pain, disturbances in consciousness, ***stroke.***
**CV:** unstable angina, ***acute cardiac failure,*** coronary artery disease, ***MI,*** myocardial ischemia, vascular hypertensive disorders.
**GI:** abdominal pain, constipation, dyspepsia, stomatitis, appetite disorders.
**GU:** urinary tract signs and symptoms.
**Hepatic:** ***cirrhosis, hepatic failure,*** cholestatic jaundice.
**Musculoskeletal:** muscle pains, joint pain, myositis, osteonecrosis, ***rhabdomyolysis.***
**Respiratory:** *upper respiratory tract infection,* bronchitis, sinusitis, *cough,* pneumonia.
**Skin:** rash, pruritus, dermatitis, eczema, folliculitis, condyloma acuminatum.
**Other:** herpes infection, influenza.

### INTERACTIONS

**Drug-drug.** *CYP3A inhibitors (protease inhibitors except tipranavir/ritonavir), delavirdine, ketoconazole, itraconazole, clarithromycin, nefazodone, telithromycin:* May increase levels of maraviroc. Decrease dose of maraviroc.
*CYP3A inducers (carbamazepine, efavirenz, phenobarbital, phenytoin, rifampin):* May decrease levels of maraviroc. Increase dose of maraviroc.
**Drug-herb.** *St. John's wort:* May decrease levels of maraviroc. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

- May increase AST, ALT, bilirubin, amylase, lipase, and CK levels.
- May decrease absolute neutrophil count.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.

- Use cautiously in patients with preexisting liver dysfunction or patients who are infected with viral hepatitis B or C.
- Use cautiously in patients at risk for CV events, with a history of postural hypotension, or taking another medication known to lower blood pressure.
- Safety and efficacy haven't been established in children younger than age 16.
- Patient shouldn't breast-feed while taking drug because of the potential for HIV transmission and serious drug side effects in infants.
- Pregnant women exposed to drug should be registered in the Antiretroviral Pregnancy Registry 1-800-258-4263.

## NURSING CONSIDERATIONS

- Effectiveness hasn't been established in patients with dual, mixed, or CXCR4–tropic HIV-1 infection.
- Monitor patient closely for signs and symptoms of infection.

**Black Box Warning** Due to increased risk of hepatotoxicity, monitor patient closely. Systemic allergic reaction with pruritic rash, eosinophilia, or elevated IgE may precede hepatotoxicity. Patients with signs or symptoms of hepatitis or allergic reaction should be evaluated immediately. ■

## PATIENT TEACHING

- Instruct patient to promptly report signs or symptoms of hepatitis or allergic reaction (rash, yellow eyes or skins, dark urine, vomiting, and abdominal pain).
- Caution patients that drug doesn't cure HIV infection and that they may still develop HIV-related illness, including opportunistic infections.
- Caution patient that drug doesn't reduce risk of transmission of HIV to others.
- If patient feels dizzy while taking drug, advise him to avoid driving or operating machinery.
- Instruct woman to tell her prescriber if she's pregnant or planning to become pregnant while taking drug.
- Advise patient to take drug every day as prescribed with other antiretrovirals. Tell patient not to change the dose or dosing schedule or stop any antiretroviral without consulting prescriber.

# mebendazole

me-BEN-da-zole

*Therapeutic class:* Anthelmintic
*Pharmacologic class:* Benzimidazole
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets (chewable):* 100 mg

## INDICATIONS & DOSAGES

➤ **Pinworm**

*Adults and children older than age 2:* Give 100 mg P.O. as a single dose; repeat if infestation persists 3 weeks later.

➤ **Roundworm, whipworm, and hookworm**

*Adults and children older than age 2:* Give 100 mg P.O. b.i.d. for 3 days; repeat if infestation persists 3 weeks later.

➤ **Trichinosis ♦**

*Adults:* 200 to 400 mg P.O. t.i.d. for 3 days; then 400 to 500 mg t.i.d. for 10 days.

➤ **Capillariasis ♦**

*Adults and children:* 200 mg P.O. b.i.d. for 20 days.

➤ **Dracunculiasis ♦**

*Adults:* 400 to 800 mg P.O. daily for 6 days.

## ADMINISTRATION

**P.O.**

- Tablets may be chewed, swallowed whole, or crushed and mixed with food.

## ACTION

Selectively and irreversibly inhibits uptake of glucose and other nutrients by susceptible helminths.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–4 hr | Variable |

*Half-life:* 3 to 9 hours.

## ADVERSE REACTIONS

**CNS:** ***seizures,*** fever.
**GI:** transient abdominal pain and diarrhea in massive infestation and during expulsion of worms.
**Skin:** urticaria.

## INTERACTIONS

**Drug-drug.** *Carbamazepine, hydantoin:* May decrease mebendazole level, which may decrease drug's effect. Monitor patient for drug effectiveness.
*Cimetidine:* May increase mebendazole level. Monitor patient for increased adverse effects.

## EFFECTS ON LAB TEST RESULTS

• May increase liver function test values with prolonged use.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug.
• Safe use in pregnant women and children younger than age 2 hasn't been established.
⚠ ***Overdose S&S:*** GI complaints.

## NURSING CONSIDERATIONS

• Give drug to all family members to decrease risk of spreading the infestation.
• No dietary restrictions, laxatives, or enemas are needed.

## PATIENT TEACHING

• Teach patient about personal hygiene, especially good hand-washing technique. Advise him to refrain from preparing food for others.
• To avoid reinfestation, teach patient to wash perianal area daily, change undergarments and bedclothes daily, and wash hands and clean fingernails before meals and after bowel movements.

# mecasermin

meh-KAH-sur-men

Increlex

*Therapeutic class:* Growth factor
*Pharmacologic class:* Human insulin growth factor
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 10 mg/ml*

## INDICATIONS & DOSAGES

➤ **Growth failure in children with severe primary insulin growth factor-1 (IGF-1) deficiency or children with growth-hormone gene deletion who have developed neutralizing antibodies to growth hormone**

*Children age 2 and older:* Initially, 0.04 to 0.08 mg/kg twice daily subcutaneously. If well tolerated for at least one week, may increase by 0.04 mg/kg per dose, to the maximum dose of 0.12 mg/kg given twice daily.

## ADMINISTRATION

**Subcutaneous**

• Reduce dose if hypoglycemia occurs despite adequate food intake.
• Give dose about 20 minutes before or after a meal or snack.
• Hold dose if patient is unable to eat.
• Do not increase dose to make up for 1 or more omitted doses.
• Rotate sites for injection (thigh, abdomen, buttocks, or upper arm). New injections should be given at least 1 inch from previous injection site(s) and never into areas where the skin is tender, bruised, red, or hard or lacks fatty tissue.

## ACTION

Promotes growth because synthetic drug is identical to endogenous insulin-like growth factor-binding protein-3 (IGFBP-3) and IGF-1.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | 1 hr | 2 hr | Unknown |

*Half-life:* About 6 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* dizziness, ***seizures, intracranial hypertension,*** *pain.*
**CV:** murmur.
**EENT:** *tonsillar hypertrophy,* otitis media, papilledema, fluid in middle ear, sensitivity to sound.
**GI:** vomiting.
**GU:** hematuria, ovarian cysts.
**Hematologic:** *iron deficiency anemia,* enlarged thymus, lymphadenopathy.
**Metabolic:** hyperglycemia, ***hypoglycemia,*** lipohypertrophy.
**Musculoskeletal:** *muscle atrophy,* arthralgia, bone pain, scoliosis.

**Skin:** injection-site reaction, bruising.
**Other:** snoring.

## INTERACTIONS
None known.

## EFFECTS ON LAB TEST RESULTS
- May increase AST, LDH, and transaminase levels. May increase or decrease glucose level.

## CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients with closed epiphyses, active or suspected cancer, or allergy to drug or its components. I.V. use is also contraindicated. Don't use in place of growth hormone or for other causes of growth failure.
- Use cautiously in pregnant or breast-feeding women.

***Overdose S&S:*** Hypoglycemia, acromegaly.

## NURSING CONSIDERATIONS
- Make sure patient has had a baseline ophthalmic examination before therapy.
- Monitor glucose level carefully, especially in small children, whose oral intake can be inconsistent.
- Check patient regularly for adenotonsillar enlargement. Ask parent or caregiver if the child has developed snoring, sleep apnea, or reduced hearing.
- Monitor patient for changes typical of acromegaly.
- Monitor child experiencing rapid growth closely for development of a limp, hip or knee pain, or progression of scoliosis (if present).
- Safety and effectiveness in children younger than age 3 are not known.

## PATIENT TEACHING
- Explain that drug must be kept refrigerated and protected from direct light and avoid freezing.
- Tell parent that vials are stable for 30 days after opening if kept refrigerated.
- Warn parent not to use cloudy drug.
- Tell parent to give drug 20 minutes before or after a meal or snack and to withhold dose if the child can't or won't eat.
- Teach parent how to inject drug and dispose of syringes properly.
- Tell parent to inject drug subcutaneously into child's upper arm, upper thigh, stomach area, or buttocks. Caution against injecting it into a muscle or vein.
- To decrease injection site reactions, advise parent to rotate the injection site for each dose.
- Tell parent to regularly monitor the child's glucose level. Review signs and symptoms of hypoglycemia, including dizziness, tiredness, hunger, irritability, sweating, nausea, and a fast or irregular heartbeat.
- Advise parent and child to keep a quick source of sugar (such as orange juice, glucose gel, or candy) readily available in case hypoglycemia occurs.
- Explain that child should avoid hazardous activities while the dose is being adjusted. Hypoglycemia can cause unconsciousness, seizures, or death.
- Advise parent to have the child's tonsils checked regularly and to monitor child for enlarged tonsils and snoring or sleep apnea.
- Tell parent to notify prescriber if child develops nausea and vomiting with headache, hypoglycemic episodes, limping, hip or knee pain, snoring, trouble swallowing, earaches, or breathing problems.

# meclizine hydrochloride (meclozine hydrochloride)
MEK-li-zeen

Antivert, Antivert/25 ◇, Antivert/50, Bonamine†, Bonine ◇, Dramamine Less Drowsy Formula ◇, Meni-D

*Therapeutic class:* Antivertigo
*Pharmacologic class:* Anticholinergic
*Pregnancy risk category B*

## AVAILABLE FORMS
*Capsules:* 25 mg
*Tablets:* 12.5 mg, 25 mg ◇, 50 mg
*Tablets (chewable):* 25 mg ◇

## INDICATIONS & DOSAGES
➤ **Vertigo**

*Adults:* 25 to 100 mg P.O. daily in divided doses. Dosage varies with response.

➤ **Motion sickness**
*Adults and children age 12 and older:* 25 to 50 mg P.O. 1 hour before travel; then daily for duration of trip.

## ADMINISTRATION

**P.O.**
• Chewable tablets may be chewed or swallowed with water.

## ACTION

Unknown. May affect neural pathways originating in the labyrinth to inhibit nausea and vomiting.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | Unknown | 8–24 hr |

*Half-life:* About 6 hours.

## ADVERSE REACTIONS

**CNS:** *drowsiness,* auditory and visual hallucinations, excitation, nervousness, restlessness.
**CV:** hypotension, palpitations, tachycardia.
**EENT:** blurred vision, diplopia, dry nose and throat, tinnitus.
**GI:** anorexia, constipation, diarrhea, dry mouth, nausea, vomiting.
**GU:** urinary frequency, urine retention.
**Skin:** rash, urticaria.

## INTERACTIONS

**Drug-drug.** *CNS depressants:* May increase drowsiness. Use together cautiously.
**Drug-lifestyle.** *Alcohol use:* May increase drowsiness. Avoid use together.

## EFFECTS ON LAB TEST RESULTS

• May prevent, reduce, or mask diagnostic skin test response.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug.
• Use cautiously in patients with asthma, glaucoma, or prostatic hyperplasia.
⚠ ***Overdose S&S:*** Hyperexcitability alternating with drowsiness, seizures, hallucinations, respiratory paralysis.

## NURSING CONSIDERATIONS

• Stop drug 4 days before diagnostic skin tests to avoid interference with test response.
• Drug may mask signs and symptoms of ototoxicity, brain tumor, or intestinal obstruction.
• ***Look alike–sound alike:*** Don't confuse Antivert with Axert. Don't confuse Dramamine Less Drowsy with other Dramamine formulations.

## PATIENT TEACHING

• Advise patient to avoid hazardous activities that require alertness until CNS effects of drug are known.
• Urge patient to report persistent or serious adverse reactions promptly.

# medroxyPROGESTERone acetate

me-DROX-ee-proe-JESS-te-rone

Depo-Provera, Depo-subQ Provera 104, Provera✐

*Therapeutic class:* Estrogen
*Pharmacologic class:* Progestin
*Pregnancy risk category X*

M

## AVAILABLE FORMS

*Tablets:* 2.5 mg, 5 mg, 10 mg
*Injection (suspension):* 104 mg/0.65 ml, 150 mg/ml, 400 mg/ml

## INDICATIONS & DOSAGES

➤ **Abnormal uterine bleeding caused by hormonal imbalance**
*Women:* 5 to 10 mg P.O. daily for 5 to 10 days beginning on day 16 or 21 of menstrual cycle. If patient also has received estrogen, give 10 mg P.O. daily for 10 days beginning on day 16 or 21 of cycle.
➤ **Secondary amenorrhea**
*Women:* 5 to 10 mg P.O. daily for 5 to 10 days. Start at any time during menstrual cycle (usually during latter half of cycle).
➤ **Endometrial hyperplasia**
*Postmenopausal women (intact uterus) receiving conjugated estrogen 0.625 mg:* 5 or 10 mg P.O. daily for 12 to 14 consecutive days per month, beginning day 1 or 16 of cycle.
➤ **Endometrial or renal cancer**
*Adults:* 400 to 1,000 mg I.M. weekly. Dosage may be decreased to 400 mg/month when disease has stabilized.

➤ **Contraception**
*Women:* 150 mg (Depo-Provera) I.M. once every 3 months. Or, 104 mg Depo-subQ Provera subcutaneously once every 3 months.
➤ **Endometriosis**
*Adults:* 104 mg Depo-subQ Provera subcutaneously once every 3 months. Therapy for longer than 2 years isn't recommended.

## ADMINISTRATION

**P.O.**
• Giving this drug immediately before or after a meal increases its bioavailability.
**I.M.**
• Shake vigorously before use.
• Give by deep I.M. injection in the gluteal or deltoid muscle.
• I.M. injection may be painful. Monitor sites for evidence of sterile abscess. Rotate injection sites to prevent muscle atrophy.
**Subcutaneous**
• Shake vigorously before use.
• Give subcutaneous injection into the anterior thigh or abdomen.

## ACTION

Suppresses ovulation, possibly by inhibiting pituitary gonadotropin secretion, thus preventing follicular maturation and causing endometrial thinning.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 2–4 hr | 3–5 days |
| I.M. | Slow | 24 hr | 3–4 mo |
| Subcut. | Unknown | Unknown | Unknown |

*Half-life:* 2¼ to 9 hours P.O., 50 days I.M., 40 days subcutaneous.

## ADVERSE REACTIONS

**CNS:** depression, ***stroke,*** pain, dizziness.
**CV:** thrombophlebitis, ***pulmonary embolism,*** edema, ***thromboembolism,*** syncope.
**EENT:** exophthalmos, diplopia.
**GI:** *bloating, abdominal pain.*
**GU:** *breakthrough bleeding,* dysmenorrhea, *amenorrhea,* cervical erosion, abnormal secretions.
**Hepatic:** cholestatic jaundice.
**Metabolic:** weight changes.
**Musculoskeletal:** loss of bone mineral density.
**Skin:** rash, induration, sterile abscesses, acne, pruritus, melasma, alopecia, hirsutism.
**Other:** breast tenderness, enlargement, or secretion; hot flashes.

## INTERACTIONS

**Drug-drug.** *Aminoglutethimide, carbamazepine, fosphenytoin, phenobarbital, phenytoin, rifampin:* May decrease progestin effects. Monitor patient for diminished therapeutic response. Tell patient to use a nonhormonal contraceptive during therapy with these drugs.
*Anticonvulsants, corticosteroids:* These drugs can also reduce bone mass. Monitor patient.
**Drug-food.** *Caffeine:* May increase caffeine level. Advise caution.
**Drug-lifestyle.** *Smoking:* May increase risk of adverse CV effects. If smoking continues, may need alternative therapy.

## EFFECTS ON LAB TEST RESULTS

• May increase liver function test values, coagulation tests, and prothrombin factors VII, VIII, IX, and X.
• May reduce metyrapone test results. May cause abnormal thyroid function test results.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug and in those with active thromboembolic disorders or history of thromboembolic disorders, cerebrovascular disease, apoplexy, breast cancer, undiagnosed abnormal vaginal bleeding, missed abortion, or hepatic dysfunction; also contraindicated during pregnancy. Tablets are contraindicated in patients with liver dysfunction or known or suspected malignant disease of genital organs.
• Use cautiously in patients with diabetes, seizures, migraine, cardiac or renal disease, asthma, or depression.

## NURSING CONSIDERATIONS

• Drug shouldn't be used as test for pregnancy; it may cause birth defects and masculinization of female fetus.
• Depo-Provera and Depo-subQ Provera may cause a significant loss of bone mineral density.

• Monitor patient for pain, swelling, warmth, or redness in calves; sudden, severe headaches; visual disturbances; numbness in extremities; signs of depression; signs of liver dysfunction (abdominal pain, dark urine, jaundice).

## PATIENT TEACHING

• According to FDA regulations, patient must read package insert explaining possible adverse effects of progestins before receiving first dose. Also, give patient verbal explanation.
**Black Box Warning** Teach patient that this product does not protect against HIV or other sexually transmitted diseases. ■
• Advise patient to take medication with food if GI upset occurs.
***Alert:*** Tell patient to report unusual symptoms immediately and to stop drug and notify prescriber about visual disturbances or migraine.
• Teach women how to perform routine breast self-examination.
• Advise patient to immediately report to prescriber any breast abnormalities, vaginal bleeding, swelling, yellowed skin or eyes, dark urine, clay-colored stools, shortness of breath, chest pain, or pregnancy.
• Advise patient that injection must be given every 3 months to maintain adequate contraceptive effects.
• Tell patient that because this is a long-acting method of birth control, it may take some time for fertility to return after the last injection.
• Tell women to immediately report to prescriber a suspected pregnancy.
• Advise patient that amenorrhea is possible with prolonged use.
• Encourage adequate intake of calcium and vitamin D.

# mefloquine hydrochloride

MEH-flow-kwin

*Therapeutic class:* Antimalarial
*Pharmacologic class:* Quinine derivative
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 250 mg

## INDICATIONS & DOSAGES

➤ **Acute malaria infections caused by mefloquine-sensitive strains of *Plasmodium falciparum* or *P. vivax***

*Adults:* 1,250 mg (5 tablets) P.O. as a single dose with food and at least 8 ounces of water. Patients with *P. vivax* infections should receive further therapy with primaquine or other 8-aminoquinolines to avoid relapse after treatment of the initial infection.
*Children:* 20 to 25 mg/kg P.O. as a single dose with food and at least 8 ounces of water. Maximum dose 1,250 mg. Dosage may be divided into two doses given 6 to 8 hours apart to reduce the incidence and severity of adverse effects. Patients with *P. vivax* infections should receive further therapy with primaquine or other 8-aminoquinolines to avoid relapse after treatment of the initial infection.

➤ **To prevent malaria**

*Adults and children weighing more than 45 kg (99 lb):* 250 mg P.O. once weekly. Prevention therapy should start 1 week before entering endemic area and continue for 4 weeks after returning. If patient returns to an area without malaria after a prolonged stay in an endemic area, prevention therapy should end after three doses.
*Children who weigh 31 to 45 kg (68 to 99 lb):* 187.5 mg (¾ of a 250-mg tablet) P.O. once weekly.
*Children who weigh 21 to 30 kg (46 to 66 lb):* 125 mg (½ of a 250-mg tablet) P.O. once weekly.
*Children who weigh 11 to 20 kg (24 to 44 lb):* 62.5 mg (¼ of a 250-mg tablet) P.O. once weekly.
*Children who weigh 5 to 10 kg (11 to 22 lb):* 5 mg/kg (approximately ⅛ of a 250-mg tablet) P.O. once weekly.

## ADMINISTRATION

**P.O.**

• Because giving quinine and mefloquine together poses a health risk, give mefloquine no sooner than 12 hours after the last dose of quinine or quinidine.
• Patient should avoid taking drug on empty stomach and should always take it with at least 8 ounces of water.

## ACTION

May be caused by drug's ability to form complexes with hemin and to raise intravesicular pH in parasite acid vesicles.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 7–24 hr | Unknown |

*Half-life:* About 21 days.

## ADVERSE REACTIONS

**CNS:** ***seizures, suicidal behavior,*** fever, dizziness, syncope, headache, psychotic changes, hallucinations, confusion, anxiety, fatigue, vertigo, depression, tremor, ataxia, mood changes, panic attacks.
**CV:** chest pain, edema.
**EENT:** tinnitus, visual disturbances.
**GI:** vomiting, *nausea*, loose stools, diarrhea, abdominal discomfort or pain, dyspepsia.
**Hematologic:** ***leukopenia, thrombocytopenia.***
**Musculoskeletal:** myalgia.
**Skin:** rash.
**Other:** chills.

## INTERACTIONS

**Drug-drug.** *Beta blockers, quinidine, quinine:* May cause ECG abnormalities and cardiac arrest. Avoid using together.
*Carbamazepine, phenobarbital, phenytoin, valproic acid:* May decrease drug levels and loss of seizure control at start of mefloquine therapy. Monitor anticonvulsant level.
*Chloroquine, quinine:* May increase risk of seizures and ECG abnormalities. Give mefloquine at least 12 hours after last dose.
*Halofantrine:* May cause fatal prolongation of the QTc interval if given with or subsequent to mefloquine. Do not use together.
*Valproic acid:* May decrease valproic acid level and loss of seizure control at start of mefloquine therapy. Monitor anticonvulsant level.

## EFFECTS ON LAB TEST RESULTS

- May increase transaminase level. May decrease hematocrit.
- May decrease WBC and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to mefloquine or related compounds.
- Contraindicated for prevention of malaria in patients with a history of seizures or an active or recent history of depression, generalized anxiety disorder, psychosis, schizophrenia, or other major psychiatric disorders.
- Use cautiously when treating patients with cardiac disease or seizure disorders.

***Overdose S&S:*** Possibly more pronounced adverse reactions.

## NURSING CONSIDERATIONS

- Patients with *P. vivax* infections are at high risk for relapse because drug doesn't eliminate the hepatic-phase exoerythrocytic parasites. Give follow-up therapy with primaquine.
- Monitor liver function test results periodically.
- If overdose is suspected, induce vomiting or perform gastric lavage because of risk of cardiotoxicity. Mefloquine has produced cardiac reactions similar to quinidine and quinine.

***Alert:*** When drug is used preventively, psychiatric symptoms (acute anxiety, depression, restlessness, confusion) that occur may precede onset of a more serious event. Replace drug with other therapy.

## PATIENT TEACHING

- Advise patient taking drug for prevention to take dose immediately before or after a meal on the same day each week, to improve compliance beginning 1 week before arrival at endemic area.
- Tell patient not to take drug on an empty stomach and always to take it with at least 8 ounces of water.
- Advise patient to use caution when performing activities that require alertness and coordination because dizziness, disturbed sense of balance, and neuropsychiatric reactions may occur.
- Instruct patient taking drug for prevention to stop drug and notify prescriber if signs or symptoms of impending toxicity, such as anxiety, depression, confusion, or restlessness, occur.
- Advise patient undergoing long-term therapy to have periodic ophthalmic exams because drug may cause ocular lesions.

• Advise women of childbearing age to use reliable contraception during treatment.

**SAFETY ALERT!**

## megestrol acetate

me-JESS-trole

Megace, Megace ES, Megace OS†

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Progestin
*Pregnancy risk category D (tablets); X (oral suspension)*

### AVAILABLE FORMS

*Oral suspension:* 40 mg/ml
*Oral suspension (concentrated):* 125 mg/ml
*Tablets:* 20 mg, 40 mg

### INDICATIONS & DOSAGES

➤ **Breast cancer (palliative treatment)**
*Adults:* 40 mg P.O. q.i.d.
➤ **Endometrial cancer (palliative treatment)**
*Adults:* 40 to 320 mg P.O. daily in divided doses.
➤ **Anorexia, cachexia, or unexplained significant weight loss in patients with AIDS**
*Adults:* 800 mg P.O. (20 ml regular oral suspension) or 625 mg P.O. (5 ml concentrated oral suspension) once daily.

### ADMINISTRATION

**P.O.**
• Drug is a hormonal agent and is considered a teratogen. Follow safe-handling procedures.
• Give drug without regard for meals.
• Shake suspension well before pouring.

### ACTION

Inhibits hormone-dependent tumor growth by inhibiting pituitary and adrenal steroidogenesis. Drug may also have direct cytotoxicity; its appetite-stimulating mechanism is unknown.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–5 hr | Unknown |

*Half-life:* About 10 days.

### ADVERSE REACTIONS

**CV:** thrombophlebitis, ***heart failure,*** hypertension, ***thromboembolism.***
**GI:** nausea, vomiting, *diarrhea,* flatulence, constipation, dry mouth, increased appetite.
**GU:** breakthrough menstrual bleeding, impotence, vaginal bleeding or discharge, UTI.
**Metabolic:** hyperglycemia, *weight gain.*
**Musculoskeletal:** carpal tunnel syndrome.
**Respiratory:** ***pulmonary embolism,*** dyspnea.
**Skin:** alopecia, rash.
**Other:** gynecomastia, tumor flare.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

• May increase glucose level.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug.
• Contraindicated in known or suspected pregnancy. Patient shouldn't breast-feed while taking drug.
• Use cautiously in patients with history of thrombophlebitis or thromboembolism.

### NURSING CONSIDERATIONS

• May increase glucose level in diabetic patients.
• Drug isn't intended for prophylactic use to avoid weight loss. Start treatment with megestrol acetate oral suspension only after treatable causes of weight loss are sought and addressed.
• Drug is relatively nontoxic with a low risk of adverse effects.
• Two months is an adequate trial period in patients with cancer.

### PATIENT TEACHING

• Inform patient that therapeutic response isn't immediate. Drug must be taken for at least 2 months to determine effectiveness.
• Tell patient drug may be taken without regard for food.
***Alert:*** Tell patient that the ES oral suspension is more concentrated than the regular oral suspension, so a smaller amount is needed.

• Advise women to stop breast-feeding during therapy because of risk of toxicity to infant.
• Advise women of childbearing age to use an effective form of contraception while receiving drug.

**SAFETY ALERT!**

## melphalan (L-PAM, phenylalanine mustard)

MEL-fa-lan

Alkeran

## melphalan hydrochloride

Alkeran

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Nitrogen mustard
*Pregnancy risk category D*

### AVAILABLE FORMS

*Lyophilized powder for injection:* 50 mg
*Tablets (scored):* 2 mg

### INDICATIONS & DOSAGES

➤ **Multiple myeloma**

*Adults:* Initially, 6 mg P.O. daily for 2 to 3 weeks; then stop drug for up to 4 weeks or until WBC and platelet counts stop dropping and begin to rise again; maintenance dose is 2 mg daily. Or, 10 mg/day for 7 to 10 days, followed by 2 mg/day when WBC is greater than 4,000 cells/$mm^3$ and platelet count is greater than 100,000 cells/$mm^3$; dosage is adjusted to between 1 and 3 mg/day depending on hematologic response. Or, 0.15 mg/kg P.O. daily for 7 days followed by a rest period of at least 14 days; maintenance dose is 0.05 mg/kg/day or less. Or 0.25 mg/kg/day for 4 days (or 0.2 mg/kg/day for 5 days); repeat every 4 to 6 weeks.

Or, give I.V. to patients who can't tolerate oral therapy, 16 mg/$m^2$ given by infusion over 15 to 20 minutes at 2-week intervals for four doses. After patient has recovered from toxicity, give drug at 4-week intervals.

➤ **Nonresectable advanced ovarian cancer**

*Adults:* 0.2 mg/kg P.O. daily for 5 days. Repeat every 4 to 5 weeks, depending on bone marrow recovery.

### ADMINISTRATION

**P.O.**

• Give drug when patient has an empty stomach; food decreases drug absorption.

**I.V.**

**Black Box Warning** Preparing and giving this form may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.

▼ Because drug isn't stable in solution, reconstitute immediately before giving with the 10 ml of sterile diluent supplied by manufacturer. Shake vigorously until solution is clear. The resulting solution will contain 5 mg/ml of melphalan. Immediately dilute required dose in normal saline solution for injection to no more than 0.45 mg/ml. Give infusion over 15 to 20 minutes.

▼ Monitor infusion carefully. Extravasation causes painful inflammation.

▼ Reconstituted product begins to degrade within 30 minutes. After final dilution, nearly 1% of drug degrades every 10 minutes. Administration must be finished within 60 minutes of reconstitution.

▼ Don't refrigerate reconstituted product because precipitate will form.

▼ **Incompatibilities:** Amphotericin B, chlorpromazine, $D_5W$, lactated Ringer's injection. Compatibility with normal saline injection depends on the concentration; don't prepare solutions with a concentration exceeding 0.45 mg/ml.

### ACTION

Cross-links strands of cellular DNA and interferes with RNA transcription, causing an imbalance of growth that leads to cell death. Not specific to cell cycle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.V. | Unknown | Unknown | Unknown |

*Half-life:* 2 hours.

### ADVERSE REACTIONS

**CV:** vasculitis.
**GI:** nausea, vomiting, diarrhea, oral ulceration, stomatitis.
**Hematologic:** ***thrombocytopenia, leukopenia, bone marrow suppression,*** hemolytic anemia.
**Hepatic:** ***hepatotoxicity.***

**Respiratory:** ***pneumonitis, pulmonary fibrosis.***
**Skin:** pruritus, alopecia, urticaria, ulceration at injection site.
**Other:** ***anaphylaxis,*** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug (I.V. melphalan only).** *Anticoagulants, aspirin, NSAIDs:* May increase risk of bleeding. Avoid using together.
*Carmustine:* May decrease threshold for pulmonary toxicity. Use together cautiously.
*Cimetidine:* May decrease melphalan level. Monitor patient closely.
*Cisplatin:* May increase renal impairment, decreasing melphalan clearance. Monitor patient closely.
*Cyclosporine:* May cause severe renal impairment. Monitor renal function closely.
*Interferon alfa:* May increase melphalan elimination. Monitor patient closely.
*Myelosuppressives:* May increase myelosuppression. Monitor patient.
*Vaccines:* May decrease effectiveness of killed-virus vaccines and increase risk of toxicity from live-virus vaccines. Postpone routine immunization for at least 3 months after last dose of melphalan.
**Drug-food.** *Any food:* May decrease oral drug absorption. Advise patient to take drug on an empty stomach.

## EFFECTS ON LAB TEST RESULTS

- May increase urine urea level. May decrease hemoglobin level.
- May decrease RBC, WBC, and platelet counts.
- May cause a false-positive direct Coombs' test.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with disease resistant to drug. Patients hypersensitive to chlorambucil may have cross-sensitivity to this drug.
- Contraindicated in patients with severe leukopenia, thrombocytopenia, or anemia and in those with chronic lymphocytic leukemia.
- Use cautiously in patients receiving radiation and chemotherapy.

***Overdose S&S:*** Vomiting, ulceration of the mouth, diarrhea, GI hemorrhage, bone marrow suppression.

## NURSING CONSIDERATIONS

**Black Box Warning** Administer drug only under the supervision of a physician experienced in the use of cancer chemotherapeutic agents.
**Black Box Warning** Severe bone marrow suppression with resulting bleeding or infection may occur.
**Black Box Warning** Drug is leukemogenic and potentially mutagenic.
**Black Box Warning** Hypersensitivity reactions, including anaphylaxis, have occurred with I.V. form.

- Dosage may need to be reduced in patients with renal impairment.
- Monitor uric acid level and CBC.
- To prevent bleeding, avoid all I.M. injections when platelet count is less than $50{,}000/mm^3$.
- Give blood transfusions for cumulative anemia.
- Anaphylaxis may occur. Keep antihistamines and steroids readily available to give if needed.
- ***Look alike–sound alike:*** Don't confuse melphalan with Mephyton.

## PATIENT TEACHING

- Advise patient to take tablets on empty stomach.
- Advise patient to report pain or redness at I.V. site.
- Advise patient to watch for signs and symptoms of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell patient to take temperature daily.
- Instruct patient to avoid OTC products that contain aspirin or NSAIDs.
- Advise women to stop breast-feeding during therapy because of risk of toxicity to infant.
- Advise women of childbearing age to consult prescriber before becoming pregnant.

# memantine hydrochloride

meh-MAN-teen

Namenda, Namenda XR

*Therapeutic class:* Anti-Alzheimer
*Pharmacologic class:* N-methyl-D-aspartate (NMDA) receptor antagonist
*Pregnancy risk category B*

## AVAILABLE FORMS

*Capsules (extended-release):* 7 mg, 14 mg, 21 mg, 28 mg
*Oral solution:* 2 mg/ml
*Tablets:* 5 mg, 10 mg

## INDICATIONS & DOSAGES

➤ **Moderate to severe Alzheimer's dementia**

*Adults:* Initially, 5 mg P.O. once daily. Increase by 5 mg/day every week until target dose is reached. Maximum, 10 mg P.O. b.i.d. Doses greater than 5 mg should be divided b.i.d.

Or, for extended-release capsules, initial dose is 7 mg P.O. once daily. Increase as tolerated by 7-mg increments each week to target dosage of 28 mg P.O. once daily.

*To convert from immediate-release to extended-release form:* Patients taking immediate-release 10 mg twice daily may switch to extended-release 28 mg once daily the day following the last immediate-release tablet. Patients with severe renal failure taking immediate-release 5 mg twice daily may switch to extended-release 14 mg once daily the day following the last immediate-release tablet.

***Adjust-a-dose:*** Reduce dosage in patients with moderate renal impairment. Drug isn't recommended for patients with severe renal impairment. For extended-release form, no dosage adjustment is recommended for patients with mild to moderate renal impairment; a target dosage of 14 mg/day is recommended for patients with severe renal impairment.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.
- Patients may take capsules intact or capsules may be opened, sprinkled on applesauce, then swallowed. Don't allow patients to divide, chew, or crush capsules.

## ACTION

Antagonizes NMDA receptors, the persistent activation of which seems to increase Alzheimer symptoms.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3–7 hr | Unknown |

*Half-life:* 60 to 80 hours.

## ADVERSE REACTIONS

**CNS:** ***stroke,*** aggressiveness, agitation, anxiety, ataxia, confusion, depression, dizziness, fatigue, hallucinations, headache, hypokinesia, insomnia, pain, somnolence, syncope, transient ischemic attack, vertigo.
**CV:** ***heart failure,*** edema, hypertension.
**EENT:** cataracts, conjunctivitis.
**GI:** anorexia, constipation, diarrhea, nausea, vomiting.
**GU:** incontinence, urinary frequency, UTI.
**Hematologic:** anemia.
**Metabolic:** weight loss.
**Musculoskeletal:** arthralgia, back pain.
**Respiratory:** bronchitis, coughing, dyspnea, flulike symptoms, pneumonia, upper respiratory tract infection.
**Skin:** rash.
**Other:** abnormal gait, falls, injury.

## INTERACTIONS

**Drug-drug.** *Cimetidine, hydrochlorothiazide, quinidine, ranitidine, triamterene:* May alter levels of both drugs. Monitor patient.
*NMDA antagonists (amantadine, dextromethorphan, ketamine):* Combined use unknown. Use together cautiously.
*Urine alkalinizers (carbonic anhydrase inhibitors, sodium bicarbonate):* May decrease memantine clearance. Monitor patient for adverse effects.
**Drug-herb.** *Herbs that alkalinize urine:* May increase drug level and adverse effects. Use together cautiously.
**Drug-food.** *Foods that alkalinize urine:* May increase drug level and adverse effects. Use together cautiously.

**Drug-lifestyle.** *Alcohol use:* May alter drug adherence, decrease its effectiveness, or increase adverse effects. Discourage use together.
*Nicotine:* May alter levels of drug and nicotine. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

• May increase alkaline phosphatase level. May decrease hemoglobin level and hematocrit.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients allergic to drug or its components.
• Contraindicated for mild Alzheimer's disease or other types of dementia.
• Immediate-release form isn't recommended for patients with severe renal impairment.
• Use cautiously in patients with seizures, hepatic impairment, or moderate renal impairment.
• Use cautiously in patients who may have an increased urine pH (from drugs, diet, renal tubular acidosis, or severe UTI, for example).
⚠ ***Overdose S&S:*** Restlessness, psychosis, visual hallucinations, somnolence, stupor, loss of consciousness.

### NURSING CONSIDERATIONS

• In elderly patients, even those with a normal creatinine level, use of this drug may impair renal function. Estimate creatinine clearance; reduce dosage in patients with moderate renal impairment. Don't give drug to patients with severe renal impairment.
• Monitor patient carefully for adverse reactions as he may not be able to recognize changes or communicate effectively.

### PATIENT TEACHING

• Explain that drug doesn't cure Alzheimer's disease but may aid patient to maintain function for a longer period of time.
• Tell patient or caregiver to report adverse effects.
• Urge patient to avoid alcohol during treatment.
• To avoid possible interactions, advise patient not to take herbal or OTC products without consulting prescriber.

## menotropins

men-oh-TROE-pins

Menopur, Repronex

*Therapeutic class:* Ovulation stimulant
*Pharmacologic class:* Gonadotropin
*Pregnancy risk category X*

### AVAILABLE FORMS

*Injection:* 75 international units of luteinizing hormone (LH) and 75 international units of follicle-stimulating hormone (FSH) activity per ampule

### INDICATIONS & DOSAGES

➤ **Assisted reproductive technologies**
*Adults:* Initially, 225 units subcutaneously (Menopur, Repronex) or I.M. (Repronex only) for patients who have received gonadotropin-releasing hormone (GnRH) agonist or antagonist pituitary suppression. Adjust dose based on ultrasound and estradiol levels not more frequently than every 2 days and not to exceed 75 to 150 units Repronex or 150 units Menopur per adjustment. Maximum daily dose is 450 units. Use for maximum of 12 days (Repronex) or 20 days (Menopur). Then, 5,000 to 10,000 units of human chorionic gonadotropin (hCG) after adequate follicular development.

➤ **Infertility with oligo-anovulation (Repronex)**
*Adults:* Initially, 150 units subcutaneously or I.M. daily for 5 days in patients who have received GnRH agonist or antagonist pituitary suppression. Adjust based on response; 75 to 150 units per adjustment and not more frequently than every 2 days. Maximum daily dose is 450 units; don't use for more than 12 days. If patient response is adequate, 5,000 to 10,000 units of hCG. Hold hCG if estradiol level is greater than 2,000 picograms/ml.

### ADMINISTRATION

**I.M.**
• Refrigerate powder or store at room temperature. Protect from light.
• Reconstitute with 1 to 2 ml of sterile normal saline solution for injection. Do not

shake; gently swirl until the solution is clear. Use immediately.
- Rotate injection sites.
- Only Repronex should be given I.M.

**Subcutaneous**
- Refrigerate powder or store at room temperature. Protect from light.
- Reconstitute with 1 to 2 ml of sterile normal saline solution for injection. Do not shake; gently swirl until the solution is clear. Use immediately.
- Use alternating sides of the lower abdomen for subcutaneous administration. Rotate injection sites.

## ACTION

In women who haven't had primary ovarian failure, drug mimics FSH in inducing follicular growth and LH in aiding follicular maturation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.M., subcut. | 9–12 days | 12–18 hr | Unknown |

*Half-life:* Menopur, 11 to 13 hours; Repronex, 54 to 60 hours.

## ADVERSE REACTIONS

**CNS:** ***stroke,*** *headache*, migraine, malaise, fever, dizziness.
**CV:** tachycardia, venous thrombophlebitis, ***arterial occlusion, pulmonary embolism.***
**GI:** *nausea*, vomiting, diarrhea, *abdominal cramps*, bloating.
**GU:** *ovarian enlargement with pain and abdominal distention*, multiple births, ***ovarian hyperstimulation syndrome,*** ovarian cysts, ***ectopic pregnancy,*** menstrual disorder.
**Musculoskeletal:** aches, back pain, joint pains.
**Respiratory:** ***acute respiratory distress syndrome, pulmonary infarction,*** atelectasis, dyspnea, tachypnea, increased cough.
**Skin:** rash, injection-site pain, injection-site reaction.
**Other:** *gynecomastia*, ***anaphylaxis,*** hypersensitivity reactions, injection site reaction, chills, breast tenderness.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with primary ovarian failure, uncontrolled thyroid or adrenal dysfunction, pituitary tumor, abnormal uterine bleeding, uterine fibromas, ovarian cysts or enlargement not due to polycystic ovarian syndrome, sex hormone–dependent tumor of the reproductive tract (Menopur only), or any cause of infertility other than anovulation (Repronex only).
- Contraindicated in pregnant women.

***Overdose S&S:*** Ovarian hyperstimulation.

## NURSING CONSIDERATIONS

- Prescriber should be experienced in fertility treatment.

***Alert:*** Watch for ovarian hyperstimulation syndrome, which may rapidly progress to a life-threatening condition, characterized by dramatic increase in vascular permeability, which causes rapid accumulation of fluid in the peritoneal cavity, thorax, and pericardium. Signs and symptoms are hypovolemia, hemoconcentration, electrolyte imbalance, ascites, hemoperitoneum, pleural effusion, hydrothorax, and thromboembolism. Condition is common and severe if woman becomes pregnant.

## PATIENT TEACHING

- Tell women about possibility of multiple births (which occur about 20% of the time).
- In women being treated for infertility, encourage daily intercourse from day before hCG is given until ovulation occurs.
- Instruct patient to immediately report severe abdominal pain, bloating, swelling of hands or feet, nausea, vomiting, diarrhea, substantial weight gain, or dyspnea.

**SAFETY ALERT!**

# meperidine hydrochloride (pethidine hydrochloride)

me-PER-i-deen

Demerol✒, Pethidine†

*Therapeutic class:* Opioid analgesic
*Pharmacologic class:* Opioid
*Pregnancy risk category B; D if used for prolonged periods or in high doses at term*
*Controlled substance schedule II*

## AVAILABLE FORMS

*Injection:* 25 mg/ml, 50 mg/ml, 75 mg/ml, 100 mg/ml
*Syrup:* 50 mg/5 ml
*Tablets:* 50 mg, 100 mg

## INDICATIONS & DOSAGES

➤ **Moderate to severe pain**

*Adults:* 50 to 150 mg P.O., I.M., or subcutaneously every 3 to 4 hours p.r.n.
*Children:* 1.1 to 1.8 mg/kg P.O., I.M., or subcutaneously every 3 to 4 hours. Maximum, 100 mg every 4 hours p.r.n.
***Adjust-a-dose:*** Reduce meperidine doses by 25% to 50% when administered with phenothiazines and other tranquilizers because they potentiate the action of meperidine. Reduce dosage in elderly patients and in those with hepatic and renal impairment. If creatinine clearance is 10 to 50 ml/minute, give 75% of normal dose. If clearance is less than 10 ml/minute, give 25% to 50% of normal dose.

➤ **Preoperative analgesia**

*Adults:* 50 to 100 mg I.M. or subcutaneously 30 to 90 minutes before surgery.
*Children:* 1 to 2.2 mg/kg I.M. or subcutaneously up to the adult dose 30 to 90 minutes before surgery.
***Adjust-a-dose:*** Reduce dosage in elderly patients and in those with hepatic or renal impairment. If creatinine clearance is 10 to 50 ml/minute, give 75% of normal dose. If clearance is less than 10 ml/minute, give 25% to 50% of normal dose.

➤ **Adjunct to anesthesia**

*Adults:* Repeated slow I.V. injections of fractional doses (10 mg/ml). Or, continuous I.V. infusion of a more dilute solution (1 mg/ml) titrated to patient's needs.

➤ **Obstetric analgesia**

*Adults:* 50 to 100 mg I.M. or subcutaneously when pain becomes regular; repeated at 1- to 3-hour intervals.

## ADMINISTRATION

**P.O.**

● Syrup has local anesthetic effect. Give with full glass of water.

**I.V.**

▼ Keep opioid antagonist (naloxone) available.
▼ Give drug slowly by direct injection.
▼ Drug may also be given by slow continuous infusion. Drug is compatible with most solutions, including $D_5W$, normal saline solution, and Ringer's or lactated Ringer's solutions.
▼ Protect from light and store at room temperature.
▼ **Incompatibilities:** Acyclovir, allopurinol, aminophylline, amobarbital, amphotericin B, cefepime, cefoperazone, doxorubicin liposomal, ephedrine, furosemide, heparin, hydrocortisone sodium succinate, idarubicin, imipenem and cilastatin sodium, methylprednisolone sodium succinate, morphine, pentobarbital, phenobarbital sodium, phenytoin, sodium bicarbonate, sodium iodide, thiopental.

**I.M.**

● Oral dose is less than half as effective as parenteral dose. Give I.M. if possible. When changing from parenteral to oral route, increase dosage.

**Subcutaneous**

● Subcutaneous injection isn't recommended because it's very painful, but it may be suitable for occasional use. Monitor patient for pain at injection site, local tissue irritation, and induration after subcutaneous injection.

## ACTION

Unknown. Binds with opioid receptors in the CNS, altering perception of and emotional response to pain.

M

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 15 min | 60–90 min | 2–4 hr |
| I.V. | 1 min | 5–7 min | 2–4 hr |
| I.M., Subcut. | 10–15 min | 30–50 min | 2–4 hr |

*Half-life:* 2½ to 4 hours.

## ADVERSE REACTIONS

**CNS:** *clouded sensorium, dizziness, euphoria, light-headedness, sedation, somnolence,* ***seizures,*** hallucinations, headache, paradoxical anxiety, physical dependence, syncope, tremor.
**CV:** ***bradycardia, cardiac arrest, shock,*** hypotension, tachycardia.
**GI:** biliary tract spasms, constipation, dry mouth, ileus, *nausea, vomiting.*
**GU:** urine retention.
**Musculoskeletal:** muscle twitching.
**Respiratory:** ***respiratory arrest, respiratory depression.***
**Skin:** *diaphoresis,* pruritus, urticaria.
**Other:** induration, local tissue irritation, pain at injection site, phlebitis after I.V. delivery.

## INTERACTIONS

**Drug-drug.** *Aminophylline, barbiturates, heparin, methicillin, morphine sulfate, phenytoin, sodium bicarbonate, sulfonamides:* Incompatible when mixed in same I.V. container. Avoid using together.
*Chlorpromazine:* May cause excessive sedation and hypotension. Avoid using together.
*Cimetidine:* May increase respiratory and CNS depression. Monitor patient closely.
*CNS depressants, general anesthetics, hypnotics, other opioid analgesics, phenothiazines, sedatives, tricyclic antidepressants:* May cause respiratory depression, hypotension, profound sedation, or coma. Use together with caution; reduce meperidine dosage.
*MAO inhibitors:* May increase CNS excitation or depression that can be severe or fatal. Avoid using together.
*Phenytoin:* May decrease meperidine level. Watch for decreased analgesia.
*Protease inhibitors:* May increase respiratory and CNS depression. Avoid using together.
***Ritonavir:*** May significantly increase level and toxic effects of meperidine. Avoid use together.
**Drug-lifestyle.** *Alcohol use:* May cause additive effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase amylase and lipase levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those who have received MAO inhibitors within past 14 days.
- Avoid use in patients with end-stage renal disease.
- Use with caution in elderly or debilitated patients and in those with increased intracranial pressure, head injury, asthma and other respiratory conditions, supraventricular tachycardias, seizures, acute abdominal conditions, hepatic or renal disease, hypothyroidism, Addison's disease, urethral stricture, and prostatic hyperplasia.

***Overdose S&S:*** Dry mouth, increased muscle activity, tremors, tachycardia, respiratory depression, delirium, hallucinations, tonic/clonic seizures, mydriasis, skeletal muscle flaccidity, circulatory collapse, death.

## NURSING CONSIDERATIONS

- In elderly patients or in those with renal dysfunction, active metabolite may accumulate, causing increased adverse CNS reactions.
- Drug may be used in some patients who are allergic to morphine.
- Reassess patient's level of pain at least 15 and 30 minutes after administration.
- Because drug toxicity frequently appears after several days of treatment, drug isn't recommended for treatment of chronic pain.
- In neonates exposed to drug during labor, monitor respirations. Have resuscitation equipment and naloxone available.
- Monitor respiratory and CV status carefully. Don't give if respirations are below 12 breaths/minute, if respiratory rate or depth is decreased, or if change in pupils is noted.
- If drug is stopped abruptly after long-term use, monitor patient for withdrawal symptoms.

• In postoperative patients, monitor bladder function.
• Monitor bowel function. Patient may need a stimulant laxative and stool softener.
• ***Look alike–sound alike:*** Don't confuse Demerol with Demulen.

## PATIENT TEACHING

• Encourage postoperative patient to turn, cough, deep-breathe, and use an incentive spirometer to prevent lung problems.
• Caution ambulatory patient about getting out of bed or walking. Warn outpatient to avoid driving and other potentially hazardous activities that require mental alertness until drug's CNS effects are known.
• Advise patient to avoid alcohol during therapy.
• Caution patient that drug isn't intended for long-term use.

**SAFETY ALERT!**

# mercaptopurine (6-mercaptopurine, 6-MP)

mer-kap-toe-PYOOR-een

Purinethol

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Purine analogue
*Pregnancy risk category D*

## AVAILABLE FORMS

*Tablets (scored):* 50 mg

## INDICATIONS & DOSAGES

➤ **Acute lymphoblastic leukemia**

*Adults and children:* 2.5 mg/kg P.O. once daily (rounded to nearest 25 mg). May increase to 5 mg/kg daily after 4 weeks if no improvement.

After remission is attained, usual maintenance dose for adults and children is 1.5 to 2.5 mg/kg once daily.

***Adjust-a-dose:*** For patients with creatinine clearance of less than 50 ml/minute, or patients receiving hemodialysis, continuous ambulatory peritoneal dialysis, or continuous renal replacement therapy, give dose every 48 hours.

## ADMINISTRATION

**P.O.**

• Give total daily dosage at one time, calculated to the nearest multiple of 25 mg.
• If giving allopurinol concurrently, reduce dosage of mercaptopurine to one-third to one-fourth of the usual dose.
• Give on an empty stomach.

## ACTION

Inhibits RNA and DNA synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**GI:** nausea, vomiting, anorexia, painful oral ulcers, diarrhea, ***pancreatitis,*** GI ulceration.
**Hematologic:** ***leukopenia, thrombocytopenia,*** *anemia.*
**Hepatic:** *jaundice,* ***hepatotoxicity.***
**Metabolic:** hyperuricemia.
**Skin:** rash, hyperpigmentation.

## INTERACTIONS

**Drug-drug.** ***Allopurinol:*** Slows inactivation of mercaptopurine. Decrease mercaptopurine to 25% or 33% of normal dose.
*Azathioprine:* Increased risk of severe myelosuppression. Avoid giving together.
*Hepatotoxic drugs:* May enhance hepatotoxicity of mercaptopurine. Monitor patient for hepatotoxicity.
*Nondepolarizing neuromuscular blockers:* May antagonize muscle relaxant effect. Notify anesthesiologist that patient is receiving mercaptopurine.
*Sulfamethoxazole/trimethoprim:* May enhance bone marrow suppression. Monitor CBC with differential carefully.
*Warfarin:* May decrease or increase anticoagulant effect. Monitor PT and INR.

## EFFECTS ON LAB TEST RESULTS

• May increase uric acid, transaminase, alkaline phosphatase, and bilirubin levels. May decrease hemoglobin level.
• May decrease WBC, RBC, and platelet counts.

M

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients resistant or hypersensitive to drug.

***Overdose S&S:*** Anorexia, nausea, vomiting, diarrhea, myelosuppression, hepatic dysfunction, gastroenteritis.

## NURSING CONSIDERATIONS

**Black Box Warning** A diagnosis of acute lymphatic leukemia must be established before starting therapy. The supervising physician must be knowledgeable in assessing response to chemotherapy. ■

● Risk of relapse is lower with evening administration than with morning administration.

● Consider modifying dosage after chemotherapy or radiation therapy in patients who have depressed neutrophil or platelet counts or impaired hepatic or renal function.

***Alert:*** Drug may be ordered as "6-mercaptopurine" or as "6-MP." The numeral 6 is part of drug name and doesn't refer to dosage.

● Monitor CBC and transaminase, alkaline phosphatase, and bilirubin levels weekly during induction and monthly during maintenance.

● Leukopenia, thrombocytopenia, or anemia may persist for several days after drug is stopped.

● Watch for signs of bleeding and infection.

● Monitor fluid intake and output. Encourage 3 L fluid intake daily.

***Alert:*** Watch for jaundice, clay-colored stools, and frothy, dark urine. Hepatic dysfunction is reversible when drug is stopped. If right-sided abdominal tenderness occurs, stop drug and notify prescriber.

● Monitor uric acid level. Use allopurinol cautiously.

● To prevent bleeding, avoid all I.M. injections when platelet count is below $100{,}000/mm^3$.

● Anticipate need for blood transfusions because of cumulative anemia.

● GI adverse reactions are less common in children than in adults.

● ***Look alike–sound alike:*** Don't confuse Purinethol and propylthiouracil (PTU). Both are available in 50-mg strengths.

## PATIENT TEACHING

● Instruct patient to watch for signs and symptoms of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell patient to take temperature daily.

● Tell patient to take drug on an empty stomach in the evening.

● Caution women of childbearing age to consult prescriber before becoming pregnant.

● Advise women to stop breast-feeding during therapy because of risk of toxicity to infant.

# meropenem

mare-oh-PEN-em

Merrem IV

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Carbapenem
*Pregnancy risk category B*

## AVAILABLE FORMS

*Powder for injection:* 500 mg, 1 g

## INDICATIONS & DOSAGES

➤ **Complicated skin and skin-structure infections from *Staphylococcus aureus* (beta-lactamase or non-beta-lactamase–producing, methicillin-susceptible isolates only), *Streptococcus pyogenes, S. agalactiae*, viridans group streptococci, *Enterococcus faecalis* (excluding vancomycin-resistant isolates), *Pseudomonas aeruginosa, Escherichia coli, Proteus mirabilis, Bacteroides fragilis,* and *Peptostreptococcus* species**

*Adults and children who weigh more than 50 kg (110 lb):* 500 mg I.V. every 8 hours over 15 to 30 minutes as I.V. infusion.

*Children ages 3 months and older who weigh 50 kg or less:* 10 mg/kg I.V. every 8 hours over 15 to 30 minutes as I.V. infusion or over 3 to 5 minutes as I.V. bolus injection (5 to 20 ml); maximum dose is 500 mg I.V. every 8 hours.

➤ **Complicated appendicitis and peritonitis from viridans group streptococci, *E. coli, Klebsiella pneumoniae, Pseudomonas aeruginosa, B. fragilis,***

***B. thetaiotaomicron*, and *Peptostreptococcus* species**
*Adults and children who weigh more than 50 kg:* 1 g I.V. every 8 hours over 15 to 30 minutes as I.V. infusion or over 3 to 5 minutes as I.V. bolus injection (5 to 20 ml).
*Children ages 3 months and older, who weigh 50 kg or less:* 20 mg/kg I.V. every 8 hours over 15 to 30 minutes as I.V. infusion or over 3 to 5 minutes as I.V. bolus injection (5 to 20 ml); maximum dose is 1 g I.V. every 8 hours.
***Adjust-a-dose:*** For adults with creatinine clearance of 26 to 50 ml/minute, give usual dose every 12 hours. If clearance is 10 to 25 ml/minute, give half usual dose every 12 hours; if clearance is less than 10 ml/minute, give half usual dose every 24 hours.
➤ **Bacterial meningitis from *S. pneumoniae, Haemophilus influenzae,* and *Neisseria meningitidis***
*Children who weigh more than 50 kg:* 2 g I.V. every 8 hours.
*Children ages 3 months and older, who weigh 50 kg or less:* 40 mg/kg I.V. every 8 hours; maximum dose, 2 g I.V. every 8 hours.
➤ **Community-acquired pneumonia** ♦
*Adults:* 500 mg I.V. every 8 hours for at least 5 days in combination with a fluoroquinolone.
➤ **Hospital-acquired pneumonia (uncomplicated)** ♦
*Adults:* 1 g I.V. every 8 hours for 7 to 8 days.

## ADMINISTRATION

### I.V.

▼ Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
***Alert:*** Serious hypersensitivity reactions may occur in patients receiving beta-lactams. Before therapy begins, determine if patient has had previous hypersensitivity reactions to penicillins, cephalosporins, beta-lactams, or other allergens. If an allergic reaction occurs, stop drug and notify prescriber. Serious anaphylactic reactions require emergency treatment.
▼ Use freshly prepared solutions of drug immediately whenever possible. Stability of drug varies with form of drug used (injection vial, infusion vial, or ADD-Vantage container).
▼ For bolus, add 10 ml of sterile water for injection to 500 mg/20-ml vial or 20 ml to 1 g/30-ml vial. Shake to dissolve, and let stand until clear. Give over 3 to 5 minutes.
▼ For infusion, an infusion vial (500 mg/100 ml or 1 g/100 ml) may be directly reconstituted with a compatible infusion fluid. Or, an injection vial may be reconstituted and the resulting solution added to an I.V. container and further diluted with an appropriate infusion fluid. Don't use ADD-Vantage vials for this purpose. Give over 15 to 30 minutes.
▼ For ADD-Vantage vials, constitute only with half-normal saline solution for injection, normal saline solution for injection, or $D_5W$ in 50-, 100-, or 250-ml Abbott ADD-Vantage flexible diluent containers. Follow manufacturer's guidelines closely when using ADD-Vantage vials.
▼ **Incompatibilities:** Other I.V. drugs.

## ACTION

Inhibits cell-wall synthesis in bacteria. Readily penetrates cell wall of most gram-positive and gram-negative bacteria to reach penicillin-binding protein targets.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | 1 hr | Unknown |

*Half-life:* 1 hour.

## ADVERSE REACTIONS

**CNS: *seizures,*** headache.
**CV:** phlebitis, thrombophlebitis.
**GI: *pseudomembranous colitis,*** constipation, diarrhea, glossitis, nausea, vomiting.
**GU:** RBCs in urine.
**Respiratory: *apnea,*** dyspnea, pneumonia.
**Skin:** injection site inflammation, pruritus, rash.
**Other: *anaphylaxis, sepsis,*** hypersensitivity reactions, inflammation.

## INTERACTIONS

**Drug-drug.** *Probenecid:* May decrease renal excretion of meropenem; probenecid competes with meropenem for active tubular secretion, which significantly increases elimination half-life of meropenem and extent of systemic exposure. Avoid using together.

### EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, bilirubin, alkaline phosphatase, LDH, creatinine, and BUN levels. May decrease hemoglobin level and hematocrit.
- May increase eosinophil count. May decrease WBC count. May increase or decrease PT, PTT, and INR, and platelet count.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to components of drug or other drugs in same class and in patients who have had anaphylactic reactions to beta-lactams.
- Use cautiously in elderly patients and in those with a history of seizure disorders or impaired renal function.
- Safety and effectiveness of drug haven't been established for infants younger than age 3 months.
- Use drug cautiously in breast-feeding women; it's unknown if drug appears in breast milk.

***Overdose S&S:*** Exaggerated adverse reactions.

### NURSING CONSIDERATIONS

- In patients with CNS disorders, bacterial meningitis, and compromised renal function, drug may cause seizures and other CNS adverse reactions.
- If seizures occur during therapy, stop infusion and notify prescriber. Dosage adjustment may be needed.
- Monitor patient for signs and symptoms of superinfection. Drug may cause overgrowth of nonsusceptible bacteria or fungi.
- Periodic assessment of organ system functions, including renal, hepatic, and hematopoietic function, is recommended during prolonged therapy.
- Monitor patient's fluid balance and weight carefully.

### PATIENT TEACHING

- Advise women not to breast-feed during therapy.
- Instruct patient to report adverse reactions or signs and symptoms of superinfection.
- Advise patient to report loose stools to prescriber.

## mesalamine

me-SAL-a-meen

Apriso, Asacol, Asacol HD, Canasa, Lialda, Pentasa, Rowasa, sfRowasa

*Therapeutic class:* Anti-inflammatory
*Pharmacologic class:* Salicylate
*Pregnancy risk category B*

### AVAILABLE FORMS

*Capsules (controlled-release):* 250 mg, 375 mg, 500 mg
*Rectal suspension:* 4 g/60 ml
*Suppositories:* 1,000 mg
*Tablets (delayed-release):* 400 mg, 800 mg, 1.2 g

### INDICATIONS & DOSAGES

➤ **Active mild to moderate distal ulcerative colitis, proctitis, or proctosigmoiditis**

*Adults:* Two 400-mg tablets (800 mg) P.O. t.i.d. for total dose of 2.4 g daily for 6 weeks. Or 1 g capsules P.O. q.i.d. for total dose of 4 g up to 8 weeks. Or 1,000 mg suppository P.R., retained in the rectum for 1 to 3 hours or longer, once daily at bedtime. Or 4 g retention enema once daily (preferably at bedtime).

➤ **Remission-induction of active, mild to moderate ulcerative colitis**

***Lialda***

*Adults:* Two to four 1.2 g tablets (2.4 to 4.8 g) P.O. once daily with a meal for up to 8 weeks.

***Pentasa***

*Adults:* Four 250-mg capsules or two 500-mg capsules (1 g) P.O. 4 times daily for a total dose of 4 g for up to 8 weeks.

➤ **Maintenance of remission of ulcerative colitis**

*Adults:* 1.5 g Apriso P.O. once daily in the morning. Or, 1.6 g Asacol daily in divided doses.

### ADMINISTRATION

**P.O.**

- Give Lialda with food.
- Don't administer drug with antacids.
- Don't crush or cut delayed-release or controlled-release forms.

• Intact or partially intact tablets may be seen in stool. Notify prescriber if this occurs repeatedly.

**Rectal**

• Patient should retain rectal dosage form overnight (for about 8 hours). Usual course of therapy for rectal form is 3 to 6 weeks.
• Shake suspension well before each use and remove sheath before inserting into rectum.

## ACTION

An active metabolite of sulfasalazine, drug probably acts topically by inhibiting prostaglandin production in the colon.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., P.R. | Unknown | 3–12 hr | Unknown |

*Half-life:* About 5 to 10 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* dizziness, fever, fatigue, malaise, asthenia.
**CV:** chest pain.
**EENT:** *pharyngitis.*
**GI:** abdominal pain, cramps, discomfort, flatulence, diarrhea, rectal pain, bloating, nausea, *pancolitis,* vomiting, constipation, eructation.
**GU:** interstitial nephritis, nephropathy, ***nephrotoxicity.***
**Musculoskeletal:** arthralgia, myalgia, back pain, hypertonia.
**Respiratory:** wheezing.
**Skin:** itching, rash, urticaria, hair loss.
**Other:** chills, acne.

## INTERACTIONS

**Drug-drug.** *Azathioprine, mercaptopurine:* May cause blood disorders. Monitor blood cell counts and adjust therapy as needed.
*Lactulose:* May impair release of delayed- or extended-release products. Monitor patient closely.
*Warfarin:* May decrease anticoagulation effect. Monitor effectiveness of therapy closely.

## EFFECTS ON LAB TEST RESULTS

• May increase BUN, creatinine, AST, ALT, alkaline phosphatase, LDH, amylase, and lipase levels.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in children and in patients allergic to mesalamine, sulfites (including sulfasalazine), any salicylates, or any component of the preparation.
• Use cautiously in renally impaired, elderly, pregnant, and breast-feeding patients.
⚠ ***Overdose S&S:*** Confusion, diarrhea, headache, hyperventilation, diaphoresis, tinnitus, vertigo, vomiting.

## NURSING CONSIDERATIONS

• Monitor periodic renal function studies in patients on long-term therapy.
• Because the mesalamine rectal suspension contains potassium metabisulfite, it may cause hypersensitivity reactions in patients sensitive to sulfites.
• Absorption of drug may be nephrotoxic.
• ***Look alike–sound alike:*** Don't confuse Asacol with Os-Cal.

## PATIENT TEACHING

• Instruct patient to carefully follow instructions supplied with drug and to swallow tablets whole without crushing or chewing.
• Advise patient to stop drug if fever or rash occurs. Patient intolerant of sulfasalazine may also be hypersensitive to mesalamine.
• Tell patient to remove foil wrapper from suppositories before inserting into rectum.
• Teach patient about proper use of retention enema.
• Tell patient that enema solution may stain bedsheets, clothing, and most floor coverings. Patient should use protective underpads and linens.

**SAFETY ALERT!**

# metformin hydrochloride

met-FORE-min

Fortamet, Glucophage✐, Glucophage XR✐, Glumetza, Riomet

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Biguanide
*Pregnancy risk category B*

## AVAILABLE FORMS

*Oral solution:* 500 mg/5 ml

*Tablets:* 500 mg, 850 mg, 1,000 mg
*Tablets (extended-release):* 500 mg, 750 mg, 1,000 mg

## INDICATIONS & DOSAGES

➤ **Adjunct to diet to lower glucose level in patients with type 2 (non–insulin-dependent) diabetes**

*Adults:* If using regular-release tablets or oral solution, initially 500 mg P.O. b.i.d. given with morning and evening meals, or 850 mg P.O. once daily given with morning meal. When 500-mg dose of regular-release form is used, may increase dosage by 500 mg weekly to maximum dose of 2,500 mg P.O. daily in divided doses. When 850-mg dose of regular-release form is used, may increase dosage by 850 mg every other week to maximum dose of 2,550 mg P.O. daily in divided doses. If using extended-release formulation, start therapy at 500 mg (1000 mg for Glumetza and Fortamet) P.O. once daily with the evening meal. May increase dose weekly in increments of 500 mg daily, up to a maximum dose of 2,000 mg once daily (2500 mg for Fortamet). If higher doses are required, consider a trial of 1000 mg b.i.d. or using the regular-release formulation up to its maximum dose.

*Children ages 10 to 16:* 500 mg P.O. b.i.d. using the regular-release formulation only. Increase dosage in increments of 500 mg weekly up to a maximum of 2,000 mg daily in divided doses.

***Adjust-a-dose:*** For elderly or debilitated patients, dosage should be conservative because of potential decrease in renal function.

➤ **Adjunct to diet and exercise in type 2 diabetes as monotherapy or with a sulfonylurea or insulin (Fortamet)**

*Adults age 17 and older:* Initially, 500 mg P.O. with evening meal for patients on insulin therapy. Increase dosage based on glucose level in increments of 500 mg weekly to a maximum of 2,500 mg daily. Decrease insulin dose by 10% to 25% when fasting blood glucose level is less than 120 mg/dl.

If patient has not responded to four weeks of maximum dose Fortamet monotherapy, consider the gradual addition of an oral sulfonylurea.

***Adjust-a-dose:*** For elderly or debilitated patients, use conservative initial and maintenance dosage because of potential decrease in renal function. Adjust dosage carefully. Don't adjust to maximum dosage.

➤ **Adjunct to diet and exercise in type 2 diabetes as monotherapy or with a sulfonylurea or insulin (Glumetza)**

*Adults:* Initially, 500 mg P.O. once daily in the evening with food for patients on insulin therapy. Increase as needed in weekly increments of 500 mg, to a maximum of 2,000 mg daily. If glycemic control not attained at this dose, give 1,000 mg b.i.d. Decrease insulin dose by 10% to 25% when fasting glucose level is less than 120 mg/dl.

If patient has not responded to four weeks of maximum dose Glumetza monotherapy, consider the gradual addition of an oral sulfonylurea.

***Adjust-a-dose:*** For elderly, malnourished, or debilitated patients, don't adjust to maximum dosage.

➤ **Polycystic ovary syndrome ♦**

*Adults:* 1,500 to 2,000 mg P.O. daily in divided doses as monotherapy or as part of a combination.

## ADMINISTRATION

**P.O.**

- Give drug with meals. Maximum doses may be better tolerated if total dose is divided into t.i.d. dosing and given with meals (immediate-release tablets only).
- Don't cut or crush extended-release tablets.

## ACTION

Decreases hepatic glucose production and intestinal absorption of glucose and improves insulin sensitivity (increases peripheral glucose uptake and use).

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. (conventional) | Unknown | 2–4 hr | Unknown |
| P.O. (extended-release) | Unknown | 4–8 hr | Unknown |
| P.O. (solution) | Unknown | 2½ hr | Unknown |

*Half-life:* About 6 hours.

## ADVERSE REACTIONS

**CNS:** asthenia, headache, dizziness, chills, light-headedness.

**GI:** *diarrhea, nausea, vomiting,* abdominal bloating, *flatulence,* anorexia, taste disorder, abnormal stools, constipation, dyspepsia.
**Hematologic:** megaloblastic anemia.
**Metabolic:** ***lactic acidosis,*** **HYPOGLYCEMIA.**
**Respiratory:** rhinitis, upper respiratory tract infection.
**Other:** accidental injury, *infection.*

## INTERACTIONS

**Drug-drug.** *Beta blockers:* Hypoglycemia may be difficult to recognize in patients using beta-blockers. Monitor patient and blood glucose.
*Calcium channel blockers, corticosteroids, estrogens, fosphenytoin, hormonal contraceptives, isoniazid, nicotinic acid, phenothiazines, phenytoin, sympathomimetics, thiazide and other diuretics, thyroid drugs:* May produce hyperglycemia. Monitor patient's glycemic control. Metformin dosage may need to be increased.
*Cationic drugs (such as amiloride, cimetidine, digoxin, morphine, procainamide, quinidine, quinine, ranitidine, triamterene, trimethoprim, vancomycin):* May compete for common renal tubular transport systems, which may increase metformin level. Monitor glucose level.
*Nifedipine:* May increase metformin level. Monitor patient closely. Metformin dosage may need to be decreased.
*Radiologic contrast dye:* May cause acute renal failure. Withhold metformin at the time of or prior to the procedure and 48 hours after the procedure. Restart drug only after renal function is evaluated and found to be normal.
**Drug-herb.** *Guar gum:* May decrease hypoglycemic effect. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May increase drug effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

• May decrease vitamin $B_{12}$ and hemoglobin levels.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug and in those with hepatic disease or metabolic acidosis.
• Contraindicated in patients with renal disease and in those with a serum creatinine greater than or equal to 1.5 mg/dl (males) or greater than or equal to 1.4 mg/dl (females).
• Contraindicated in patients with acute heart failure requiring pharmacologic intervention and in patients with conditions predisposing to renal dysfunction, CV collapse, MI, hypoxia, and septicemia. Temporarily withhold from patients having radiologic studies involving use of contrast media containing iodine.
**Black Box Warning** Because of risk of lactic acidosis, drug is contraindicated in patients older than age 80, unless creatinine clearance indicates normal renal function.
• Use caution when giving drug to elderly, debilitated, or malnourished patients and to those with adrenal or pituitary insufficiency because of increased risk of hypoglycemia.
***Overdose S&S:*** Hypoglycemia, lactic acidosis.

## NURSING CONSIDERATIONS

• Before therapy begins and at least annually thereafter, assess patient's renal function. If renal impairment is detected, a different antidiabetic may be indicated.
• When switching patients from chlorpropamide to metformin, take care during the first 2 weeks of metformin therapy because the prolonged retention of chlorpropamide increases the risk of hypoglycemia during this time.
• Monitor patient's glucose level regularly to evaluate effectiveness of therapy. Notify prescriber if glucose level increases despite therapy.
• If patient hasn't responded to 4 weeks of therapy with maximum dosage, an oral sulfonylurea can be added while keeping metformin at maximum dosage. If patient still doesn't respond after several months of therapy with both drugs at maximum dosage, prescriber may stop both and start insulin therapy.
• Monitor patient closely during times of increased stress, such as infection, fever, surgery, or trauma. Insulin therapy may be needed in these situations.
**Black Box Warning** Risk of drug-induced lactic acidosis is very low, however when it occurs it is fatal in approximately 50%

M

of cases. Reported cases have occurred primarily in diabetic patients with significant renal insufficiency; in those with other medical or surgical problems; and in those with other drug regimens. Risk increases with degree of renal impairment and patient age. Suspect lactic acidosis in any diabetic patient with metabolic acidosis lacking evidence of ketoacidosis. ■

**Black Box Warning** Stop drug immediately and notify prescriber if patient develops a condition related to hypoxemia or dehydration because of risk of lactic acidosis. ■

• Stop drug temporarily for surgical procedures (except minor procedures that don't restrict intake of food and fluids) and for patients undergoing radiologic studies involving use of contrast media containing iodine. Don't restart drug until patient's oral intake has resumed and renal function has been deemed normal by prescriber and at least 48 hours after contrast media.

• Monitor patient's hematologic status for evidence of megaloblastic anemia. Patients with inadequate vitamin $B_{12}$ or calcium intake or absorption appear to be predisposed to developing subnormal vitamin $B_{12}$ level. These patients should have routine vitamin $B_{12}$ level determinations every 2 to 3 years.

• ***Look alike–sound alike:*** Don't confuse Glucophage with Glucovance or Glucotrol.

## PATIENT TEACHING

• Instruct patient about nature of diabetes and importance of following therapeutic regimen, adhering to specific diet, losing weight, getting exercise, following personal hygiene programs, and avoiding infection. Explain how and when to monitor glucose level. Teach evidence of low and high glucose levels. Explain emergency measures.

**Black Box Warning** Instruct patient to stop drug and immediately notify prescriber about unexplained hyperventilation, muscle pain, malaise, dizziness, light-headedness, unusual sleepiness, unexplained stomach pain, feeling of coldness, slow or irregular heart rate, or other nonspecific symptoms of early lactic acidosis. ■

• Warn patient not to consume excessive alcohol while taking drug.

• Tell patient not to change drug dosage without prescriber's consent. Encourage patient to report abnormal glucose level test results.

***Alert:*** Advise patient not to cut, crush, or chew extended-release tablets; instead, he should swallow them whole.

• Tell patient that inactive ingredients may be eliminated in the stool as a soft mass resembling the original tablet.

• Advise patient not to take other drugs, including OTC drugs, without first checking with prescriber.

• Instruct patient to carry medical identification at all times.

• Tell patient that adverse effects of diarrhea, nausea, and upset stomach generally subside over time.

**SAFETY ALERT!**

# methadone hydrochloride

METH-a-done

Dolophine, Methadose

*Therapeutic class:* Opioid analgesic
*Pharmacologic class:* Opioid agonist
*Pregnancy risk category C*
*Controlled substance schedule II*

## AVAILABLE FORMS

*Dispersible tablets (for methadone maintenance therapy):* 40 mg
*Injection:* 10 mg/ml
*Oral solution:* 5 mg/5 ml, 10 mg/5 ml, 10 mg/ml (concentrate)
*Tablets:* 5 mg, 10 mg

## INDICATIONS & DOSAGES

➤ **Severe pain**

*Adults:* 2.5 to 10 mg P.O., I.M., or subcutaneously every 3 to 4 hours p.r.n.

➤ **Opioid withdrawal syndrome**

*Adults:* Initially, 20 to 30 mg P.O. daily often suppresses withdrawal symptoms (highly individualized; some patients may require a higher dose). Initial dose shouldn't exceed 30 mg. Maintenance dose is 20 to 120 mg P.O. daily. Dosage adjusted, as needed.

***Adjust-a-dose:*** For elderly patients and those with renal or hepatic impairment, reduce initial dose.

## ADMINISTRATION

**P.O.**

• Oral form legally required in maintenance programs. Completely dissolve tablets in ½ cup of orange juice or powdered citrus drink.

• Oral dose is half as potent as injected dose.

**I.M.**

• For parenteral use, I.M. injection is preferred. Rotate injection sites.

**Subcutaneous**

• Monitor patient for pain at injection site, tissue irritation, and induration after injection.

## ACTION

Unknown. Binds with opioid receptors in the CNS, altering perception of and emotional response to pain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30–60 min | 90–120 min | 4–6 hr |
| I.M., Subcut. | 10–20 min | 1–2 hr | 4–5 hr |

*Half-life:* 15 to 25 hours.

## ADVERSE REACTIONS

**CNS:** *clouded sensorium,* hallucinations, *dizziness, light-headedness, sedation, somnolence,* ***seizures,*** agitation, choreic movements, euphoria, headache, insomnia, syncope.

**CV:** ***arrhythmias, bradycardia, prolonged QT interval, cardiac arrest, shock, cardiomyopathy, heart failure,*** flushing, phlebitis, edema, hypotension, palpitations.

**EENT:** visual disturbances.

**GI:** *nausea, vomiting,* abdominal pain, anorexia, biliary tract spasm, constipation, dry mouth, glossitis, ileus.

**GU:** urine retention.

**Metabolic:** hypokalemia, ***hypomagnesemia,*** weight gain.

**Respiratory:** ***respiratory arrest, respiratory depression, pulmonary edema.***

**Skin:** diaphoresis, pruritus, urticaria.

**Other:** decreased libido, induration, pain at injection site, physical dependence, tissue irritation.

## INTERACTIONS

**Drug-drug.** *Ammonium chloride, other urine acidifiers, phenytoin:* May reduce methadone effect. Watch for decreased pain control.

*CNS depressants, general anesthetics, hypnotics, MAO inhibitors, sedatives, tranquilizers, tricyclic antidepressants:* May cause respiratory depression, hypotension, profound sedation, or coma. Use together with caution. Monitor patient response.

***Nonnucleoside reverse transcriptase inhibitors (delavirdine, efavirenz, nevirapine), protease inhibitors (lopinavir and ritonavir, nelfinavir, ritonavir), rifamycins:*** May increase methadone metabolism causing opioid withdrawal symptoms. Monitor patient and adjust dose as needed.

*Protease inhibitors, cimetidine, fluvoxamine:* May increase respiratory and CNS depression. Monitor patient closely.

**Drug-lifestyle.** *Alcohol use:* May cause additive effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

• May increase amylase level.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug.

• Use with caution in elderly or debilitated patients and in those with acute abdominal conditions, severe hepatic or renal impairment, hypothyroidism, Addison's disease, prostatic hyperplasia, urethral stricture, head injury, increased intracranial pressure, asthma, and other respiratory conditions.

**Black Box Warning** Deaths have been reported during initiation of methadone therapy for opioid dependence. Exercise extreme caution when initiating treatment. ■

⚠ ***Overdose S&S:*** Miosis, respiratory depression, somnolence, coma, cool clammy skin, skeletal muscle flaccidity, hypotension, apnea, bradycardia, noncardiac pulmonary edema, death.

## NURSING CONSIDERATIONS

**Black Box Warning** Respiratory depression, QT interval prolongation, and torsades de pointes have been observed during treatment. Be vigilant during treatment initiation and dose titration. ■

• Reassess patient's level of pain at least 15 and 30 minutes after parenteral

M

administration and 30 minutes after oral administration.
**Black Box Warning** When used in opioid withdrawal syndrome, treatment products shall be dispensed only by opioid treatment programs.
• Because Diskets are available in 10-mg doses, they may not be appropriate for initial dosing in many patients.
• An around-the-clock regimen is needed to manage severe, chronic pain.
• Patient treated for opioid withdrawal syndrome usually needs an additional analgesic if pain control is needed.
• Monitor patient closely because drug has cumulative effect; marked sedation can occur after repeated doses.
• Monitor circulatory and respiratory status and bladder and bowel function. Patient may need a stool softener and stimulant laxative.
***Alert:*** Respiratory depressant effects may last longer than analgesic effects. Monitor patient's respiratory status closely.
• When used as an adjunct in the treatment of opioid addiction (maintenance), withdrawal is usually delayed and mild.
***Alert:*** Use caution when dosing. Confusion has occurred between ml and mg doses.
• ***Look alike–sound alike:*** Don't confuse methadone with methylphenidate (Metadate CD, Metadate ER), dexmethylphenidate, and Mephyton.

## PATIENT TEACHING
• Caution ambulatory patient about getting out of bed or walking. Warn outpatient to avoid hazardous activities that require mental alertness until drug's CNS effects are known.
• Instruct patient to increase fluid and fiber in diet, if not contraindicated, to combat constipation.
• Advise patient to avoid alcohol during therapy.
**Black Box Warning** Caution patients not to use CNS depressants during initiation of treatment with methadone.

# methimazole
meth-IM-a-zole

Tapazole

*Therapeutic class:* Antihyperthyroid
*Pharmacologic class:* Thyroid hormone antagonist
*Pregnancy risk category D*

## AVAILABLE FORMS
*Tablets:* 5 mg, 10 mg, 15 mg, 20 mg

## INDICATIONS & DOSAGES
➤ **Hyperthyroidism**
*Adults:* If mild, 15 mg P.O. daily. If moderately severe, 30 to 40 mg daily. If severe, 60 mg daily. Daily amount is divided into three equal doses and given at 8-hour intervals. Maintenance dosage is 5 to 15 mg daily.
*Children:* 0.4 mg/kg P.O. in three divided doses daily given at 8-hour intervals. Maintenance dosage is 0.2 mg/kg in divided doses daily.

## ADMINISTRATION
**P.O.**
• Give drug with meals to minimize adverse GI effects.

## ACTION
Inhibits synthesis of thyroid hormones.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 30–60 min | Unknown |

*Half-life:* 5 to 13 hours.

## ADVERSE REACTIONS
**CNS:** headache, drowsiness, vertigo, paresthesia, neuritis, neuropathies, CNS stimulation, fever.
**CV:** edema.
**GI:** nausea, vomiting, salivary gland enlargement, loss of taste, epigastric distress.
**Hematologic:** ***agranulocytosis, leukopenia, thrombocytopenia, aplastic anemia.***
**Hepatic:** jaundice, hepatic dysfunction, ***hepatitis.***
**Metabolic:** hypothyroidism.
**Musculoskeletal:** arthralgia, myalgia.

**Skin:** rash, urticaria, discoloration, pruritus, erythema nodosum, exfoliative dermatitis, lupuslike syndrome, abnormal hair loss.
**Other:** lymphadenopathy.

## INTERACTIONS

**Drug-drug.** *Aminophylline, theophylline:* May decrease clearance of these drugs. Dosage may need to be adjusted.
*Beta blockers:* Beta-blocker clearance may be enhanced by hyperthyroidism. Dosage of beta blocker may need to be reduced when patient becomes euthyroid.
*Cardiac glycosides:* May increase cardiac glycoside level. Cardiac glycoside dosage may need to be reduced.
*Potassium iodide:* May decrease response to drug. Methimazole dosage may need to be increased.
***Warfarin:*** May alter dosage requirements. Monitor PT, PTT, and INR.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level.
- May decrease granulocyte, WBC, and platelet counts.
- May alter thyroid uptake of $^{123}I$ or $^{131}I$.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in breast-feeding women.
- Use cautiously in pregnant patients.

***Overdose S&S:*** Nausea, vomiting, epigastric distress, headache, fever, joint pain, pruritus, edema, aplastic anemia, agranulocytosis, hepatitis, nephrotic syndrome, exfoliative dermatitis, neuropathies, CNS stimulation or depression.

## NURSING CONSIDERATIONS

- Pregnant women may need less drug as pregnancy progresses. Monitor thyroid function studies closely. Thyroid hormone may be added to regimen. Drug may be stopped during last few weeks of pregnancy.
- Monitor CBC periodically to detect impending leukopenia, thrombocytopenia, and agranulocytosis; also monitor hepatic function. Stop drug if liver abnormality occurs.

***Alert:*** Doses higher than 30 mg daily increase risk of agranulocytosis.

***Alert:*** Patients older than age 40 may have an increased risk of drug-induced agranulocytosis.

- Watch for evidence of hypothyroidism (mental depression, cold intolerance, and hard, nonpitting edema); notify prescriber because patient may need dosage adjustment.

***Alert:*** Stop drug and notify prescriber if severe rash or enlarged cervical lymph nodes develop.

- ***Look alike–sound alike:*** Don't confuse methimazole with mebendazole, methazolamide, metolazone, or metronidazole.

## PATIENT TEACHING

- Tell patient to take drug with meals to reduce adverse GI reactions.
- Warn patient to report fever, sore throat, mouth sores, skin eruptions, anorexia, itching, right upper quadrant pain, or yellow skin or eyes.
- Tell patient to ask prescriber about using iodized salt and eating shellfish because the iodine in these foods may make the drug less effective.
- Warn patient that drug may cause drowsiness; advise patient to use caution when operating machinery or a vehicle.
- Instruct patient to store drug in light-resistant container.
- Teach patient to watch for evidence of hypothyroidism (unexplained weight gain, fatigue, cold intolerance) and to notify prescriber if it arises.
- Tell women not to use drug while breast-feeding.

**SAFETY ALERT!**

## methotrexate (amethopterin, MTX)

meth-oh-TREX-ate

## methotrexate sodium

Methotrexate LPF, Rheumatrex, Trexall

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Folic acid antagonist
*Pregnancy risk category X*

### AVAILABLE FORMS

*Injection:* 25 mg/ml in 2-ml, 4-ml, 8-ml, 10-ml, 20-ml, and 40-ml preservative-free single-use vials; 25 mg/ml in 2-ml and 10-ml vials containing benzyl alcohol
*Lyophilized powder:* 1,000-mg vials, preservative-free; 2.5-mg/ml, 25-mg/ml vials
*Tablets (scored):* 2.5 mg, 5 mg, 7.5 mg, 10 mg, 15 mg

### INDICATIONS & DOSAGES

➤ **Trophoblastic tumors (choriocarcinoma, hydatidiform mole)**
*Adults:* 15 to 30 mg P.O. or I.M. daily for 5 days. Repeat after 1 or more weeks, based on response or toxicity. Number of courses is three to maximum of five.

➤ **Acute lymphocytic leukemia**
*Adults and children:* 3.3 mg/m$^2$ daily P.O., I.V., or I.M. with 60 mg/m$^2$ prednisone daily for 4 to 6 weeks or until remission occurs; then 30 mg/m$^2$ P.O. or I.M. weekly in two divided doses or 2.5 mg/kg I.V. every 14 days.

➤ **Meningeal leukemia**
*Adults and children:* 12 mg/m$^2$ or less (maximum 15 mg) intrathecally every 2 to 5 days until CSF is normal; then one additional dose. Or, for children, use dosages based on age.
*Children age 3 and older:* 12 mg intrathecally every 2 to 5 days.
*Children ages 2 to 3:* 10 mg intrathecally every 2 to 5 days.
*Children ages 1 to 2:* 8 mg intrathecally every 2 to 5 days.
*Children younger than age 1:* 6 mg intrathecally every 2 to 5 days.

➤ **Burkitt lymphoma (stage I, II)**
*Adults:* 10 to 25 mg P.O. daily for 4 to 8 days, with 1-week rest intervals.

➤ **Lymphosarcoma (stage III)**
*Adults:* 0.625 to 2.5 mg/kg daily P.O., I.M., or I.V.

➤ **Osteosarcoma**
*Adults:* Initially, 12 g/m$^2$ I.V. as 4-hour infusion. Give subsequent doses 15 g/m$^2$ I.V. as 4-hour I.V. infusion at postoperative weeks 4, 5, 6, 7, 11, 12, 15, 16, 29, 30, 44, and 45. Give with leucovorin, 15 mg P.O. every 6 hours for 10 doses, beginning 24 hours after start of methotrexate infusion.

➤ **Breast cancer**
*Adults:* 40 mg/m$^2$ I.V. on days 1 and 8 of each cycle, combined with cyclophosphamide and fluorouracil.
***Adjust-a-dose:*** In patients older than age 60, give 30 mg/m$^2$.

➤ **Mycosis fungoides**
*Adults:* 5 to 50 mg P.O. or I.M. once weekly; or 15 to 37.5 mg I.M. twice weekly.

➤ **Psoriasis**
*Adults:* 10 to 25 mg P.O., I.M., or I.V. as single weekly dose; or 2.5 to 5 mg P.O. every 12 hours for three doses weekly. Dosage shouldn't exceed 30 mg per week.

➤ **Rheumatoid arthritis**
*Adults:* Initially, 7.5 mg P.O. weekly, either in single dose or divided as 2.5 mg P.O. every 12 hours for three doses once weekly. Dosage may be gradually increased to maximum of 30 mg weekly.

➤ **Poly-articular course JRA**
*Children and adolescents age 2 to 16:* 10 mg/m$^2$ P.O., or I.M. once weekly. Or, 20 to 30 mg/m$^2$/week I.M. or subcutaneously.

➤ **Head and neck carcinomas**
*Adults:* 40 to 60 mg/m$^2$ I.V. weekly. Response to therapy is limited to 4 months.

### ADMINISTRATION

**P.O.**
- Give drug when patient has an empty stomach.
- Tablets may contain lactose. If needed, give with OTC lactose enzyme supplement.

**I.V.**

▼ Preparing and giving parenteral drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.

▼ Dilution of drug depends on product, and infusion guidelines vary, depending on dose.

▼ Reconstitute 20-mg vial to a concentration no greater than 25 mg/ml. Reconstitute 1-g vial to a concentration of 50 mg/ml.

▼ If giving infusion, dilute total dose in $D_5W$.

▼ Reconstitute solutions without preservatives with normal saline solution or $D_5W$ immediately before use, and discard unused drug.

▼ **Incompatibilities:** Bleomycin, chlorpromazine, droperidol, gemcitabine, idarubicin, ifosfamide, midazolam, nalbuphine, promethazine, propofol.

**I.M.**

● Preparing and giving parenteral drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.

**Intrathecal**

● Preparing and giving parenteral drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.

**Black Box Warning** Use preservative-free form for intrathecal administration. ■

## ACTION

Reversibly binds to dihydrofolate reductase, blocking reduction of folic acid to tetrahydrofolate, a cofactor necessary for purine, protein, and DNA synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | Unknown |
| I.V. | Immediate | Immediate | Unknown |
| I.M. | Unknown | 30 min–1 hr | Unknown |
| Intrathecal | Unknown | Unknown | Unknown |

*Half-life:* For doses below 30 mg/m$^2$, about 3 to 10 hours; for doses of 30 mg/m$^2$ and above, 8 to 15 hours.

## ADVERSE REACTIONS

**CNS:** ***arachnoiditis within hours of intrathecal use, leukoencephalopathy, seizures,*** subacute neurotoxicity possibly beginning a few weeks later, demyelination, malaise, fatigue, dizziness, headache, aphasia, hemiparesis, fever, drowsiness.
**EENT:** pharyngitis, blurred vision.
**GI:** gingivitis, *stomatitis, diarrhea,* abdominal distress, anorexia, GI ulceration and ***bleeding***, enteritis, *nausea, vomiting.*
**GU:** nephropathy, *tubular necrosis,* ***renal failure,*** hematuria, menstrual dysfunction, defective spermatogenesis, infertility, abortion, cystitis.
**Hematologic:** *anemia,* ***leukopenia, thrombocytopenia.***
**Hepatic:** ***acute toxicity, chronic toxicity,*** including cirrhosis and ***hepatic fibrosis***.
**Metabolic:** ***diabetes,*** hyperuricemia.
**Musculoskeletal:** arthralgia, myalgia, osteoporosis in children on long-term therapy.
**Respiratory:** ***pulmonary fibrosis, pulmonary interstitial infiltrates,*** pneumonitis, dry, nonproductive cough.
**Skin:** *urticaria,* pruritus, hyperpigmentation, erythematous rashes, ecchymoses, rash, photosensitivity reactions, alopecia, acne, psoriatic lesions aggravated by exposure to sun.
**Other:** chills, reduced resistance to infection, ***septicemia, sudden death.***

## INTERACTIONS

**Drug-drug.** ***Acitretin:*** May increase the risk of hepatitis. Avoid using together.
*Acyclovir:* Use with intrathecal methotrexate may cause neurologic abnormalities. Monitor patient closely.
*Digoxin:* May decrease digoxin level. Monitor digoxin level closely.
*Folic acid derivatives:* Antagonizes methotrexate effect. Avoid using together, except for leucovorin rescue with high-dose methotrexate therapy.
*Fosphenytoin, phenytoin:* May decrease phenytoin and fosphenytoin levels. Monitor drug levels closely.
*Hepatotoxic drugs:* May increase risk of hepatotoxicity. Monitor patient closely.
***NSAIDs****, phenylbutazone, salicylates:* May increase methotrexate toxicity. Avoid using together.
*Oral antibiotics:* May decrease absorption of methotrexate. Monitor patient closely.
*Penicillins,* ***sulfonamides, trimethoprim:*** May increase methotrexate level. Monitor patient for methotrexate toxicity.

M

*Probenecid:* May impair excretion of methotrexate, causing increased level, effect, and toxicity of methotrexate. Monitor methotrexate level closely and adjust dosage accordingly.
*Procarbazine:* May increase risk of nephrotoxicity. Monitor patient closely.
*Theophylline:* May increase theophylline level. Monitor theophylline level closely.
*Thiopurines:* May increase thiopurine level. Monitor patient closely.
*Vaccines:* May make immunizations ineffective; may cause risk of disseminated infection with live-virus vaccines. Postpone immunization, if possible.
**Drug-food.** *Any food:* May delay absorption and reduce peak level of methotrexate. Instruct patient to take drug on an empty stomach.
**Drug-lifestyle.** *Alcohol use:* May increase hepatotoxicity. Discourage use together.
*Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.
**Black Box Warning** Methotrexate given with radiotherapy may increase the risk of soft tissue necrosis and osteonecrosis. ■

## EFFECTS ON LAB TEST RESULTS

- May increase uric acid level. May decrease hemoglobin level.
- May decrease WBC, RBC, and platelet counts.
- May alter results of laboratory assay for folate, which interferes with detection of folic acid deficiency.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with psoriasis or rheumatoid arthritis who also have alcoholism, alcoholic liver, chronic liver disease, immunodeficiency syndromes, or blood dyscrasias.

**Black Box Warning** When high doses of drug are used to treat osteosarcoma, don't give NSAIDs before or with drug. Use together may elevate and prolong serum methotrexate level, resulting in severe bone marrow suppression, aplastic anemia, and GI toxicity. ■
**Black Box Warning** Contraindicated in pregnancy; do not use in women of childbearing potential unless benefits outweigh risks. ■

- Contraindicated in breast-feeding women.

**Black Box Warning** Use cautiously and at modified dosage in patients with impaired hepatic or renal function, bone marrow suppression, aplasia, leukopenia, thrombocytopenia, or anemia. ■

- Use cautiously in very young, elderly, or debilitated patients and in those with infection, peptic ulceration, or ulcerative colitis.

***Overdose S&S:*** Leukopenia, thrombocytopenia, anemia, pancytopenia, bone marrow suppression, mucositis, stomatitis, oral ulceration, nausea, vomiting, GI ulceration, GI bleeding, sepsis or septic shock, renal failure, aplastic anemia, headache, seizures, acute toxic encephalopathy, cerebellar herniation associated with increased intracranial pressure, death.

## NURSING CONSIDERATIONS

**Black Box Warning** Methotrexate-induced lung disease is a potentially dangerous lesion that may occur at any time during therapy. It isn't always fully reversible. Pulmonary symptoms (especially a dry, nonproductive cough) may require interruption of treatment and careful investigation. ■
**Black Box Warning** Diarrhea and ulcerative stomatitis require interruption of therapy; hemorrhagic enteritis and death from intestinal perforation may occur. ■
**Black Box Warning** Malignant lymphomas may occur in patients receiving low-dose methotrexate. ■
**Black Box Warning** Methotrexate may induce tumor lysis syndrome in patients with rapidly growing tumors. ■
**Black Box Warning** Severe, occasionally fatal skin reactions have been reported following single or multiple doses of methotrexate. Reactions have occurred within days of methotrexate administration. Recovery has been reported with discontinuation of therapy. ■
**Black Box Warning** Potentially fatal opportunistic infections, especially *Pneumocystis carinii* pneumonia, may occur with methotrexate therapy. ■

**Black Box Warning** The high-dose regimens for osteosarcoma require meticulous care. ■

**Alert:** Drug may be given daily or once weekly, depending on the disease. To avoid administration errors, know your patient's dosing schedule.

• Monitor pulmonary function tests periodically and fluid intake and output daily. Encourage fluid intake of 2 to 3 L daily.

• Monitor uric acid level.

• Drug distributes readily into pleural effusions and other third-space compartments, such as ascites, leading to prolonged systemic level and risk of toxicity. Use drug cautiously in these patients.

**Alert:** Alkalinize urine by giving sodium bicarbonate tablets or fluids to prevent precipitation of drug, especially at high doses. Maintain urine pH above 7. If BUN level is 20 to 30 mg/dl or creatinine level is 1.2 to 2 mg/dl, reduce dosage. If BUN level exceeds 30 mg/dl or creatinine level is higher than 2 mg/dl, stop drug and notify prescriber.

**Black Box Warning** Watch for increases in AST, ALT, and alkaline phosphatase levels, which may signal hepatic dysfunction. Periodic liver biopsies are recommended for psoriatic patients who are under long-term treatment. ■

• Watch for signs and symptoms of bleeding (especially GI) and infection.

• To prevent bleeding, avoid all I.M. injections when platelet count is below $50{,}000/mm^3$.

• Give blood transfusions for cumulative anemia. Patient may receive injections of RBC colony-stimulating factors to promote RBC production and decrease need for blood transfusions.

• Leucovorin rescue is needed with doses of more than 100 mg and starts 24 hours after therapy starts. Leucovorin is continued until methotrexate level falls below $5 \times 10^{-8}$ M. Consult specialized references for specific recommendations for leucovorin dosage. Monitor methotrexate level and adjust leucovorin dose.

• The WBC and platelet count nadirs usually occur on day 7.

### PATIENT TEACHING

• Advise patient to watch for signs and symptoms of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell patient to take temperature daily.

**Black Box Warning** Fully inform patient of the risks involved with methotrexate therapy. ■

• Teach and encourage diligent mouth care to reduce risk of superinfection in the mouth.

• Instruct patient how to take leucovorin. Stress the importance of taking as prescribed until instructed by prescriber to stop.

• Tell patient to use highly protective sunblock when exposed to sunlight.

• Warn both men and women to avoid conception during and for at least 12 weeks after therapy because of risk of abortion, birth defects, or fetal death.

• Advise women to stop breast-feeding during therapy.

M

## methoxy polyethylene glycol-epoetin beta

meh-THOCKS-ee paw-lee-ETH-ah-leen GLIGH-call eh-poe-EH-tin BAY-tah

Mircera

*Therapeutic class:* Colony stimulating factor
*Pharmacologic class:* Erythropoietin receptor activator
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 50 mcg/ml, 100 mcg/ml, 200 mcg/ml, 300 mcg/ml, 400 mcg/ml, 600 mcg/ml, 1,000 mcg/ml in single-dose vials
*Prefilled syringe:* 50 mcg/0.3 ml, 75 mcg/0.3 ml, 100 mcg/0.3 ml, 150 mcg/0.3 ml, 200 mcg/0.3 ml, 250 mcg/0.3 ml, 400 mcg/0.6 ml, 600 mcg/0.6 ml, 800 mcg/0.6 ml

### INDICATIONS & DOSAGES

➤ **Anemia caused by chronic renal failure**
*Adults:* 0.6 mcg/kg I.V. (preferred for patient on hemodialysis) or subcutaneously

once every 2 weeks to keep hemoglobin level at 10 to 12 g/dl. When hemoglobin reaches maintenance level, give 1.2 mcg/kg I.V. or subcutaneously once monthly, and adjust as needed. Don't increase dosage more often than once monthly.

If patient is converting from epoetin alfa or darbepoetin, use this dosage table:

| *Previous epoetin alfa dose (units/wk)* | *Previous darbepoetin alfa dose (mcg/wk)* | *Methoxy polyethylene glycol-epoetin beta* | |
|---|---|---|---|
| | | *(mcg/ 2 wk)* | *(mcg/ month)* |
| Less than 8,000 | Less than 40 | 60 | 120 |
| 8,000–16,000 | 40–80 | 100 | 200 |
| More than 16,000 | More than 80 | 180 | 360 |

***Adjust-a-dose:*** If increasing hemoglobin level approaches 12 g/dl, reduce dosage by 25%. If level continues to increase, withhold dose until hemoglobin level begins to decrease; then restart therapy at a dosage 25% below the previous dose. If hemoglobin level increases more than 1 g/dl over 2 weeks, decrease dosage by 25%. If hemoglobin level increases less than 1 g/dl over 4 weeks, increase dosage by 25%. Dosage shouldn't be increased more often than every 4 weeks.

## ADMINISTRATION

**I.V.**

▼ Don't shake drug; doing so may denature it.
▼ Don't give drug if it contains particles or is discolored.
▼ Give drug undiluted.
▼ Don't pool unused portions of drug because it contains no preservatives.
▼ Plunger must be fully depressed in order for the needle guard to activate.
▼ Store drug in original carton, in refrigerator, and protect from light.
▼ **Incompatibilities:** Don't give with other I.V. drugs or solutions.

**Subcutaneous**

• Don't shake drug; doing so may denature it.
• Don't give drug if it contains particles or is discolored.
• Give drug undiluted.
• Don't pool unused portions of drug because it contains no preservatives.
• Plunger must be fully depressed in order for the needle guard to activate.
• Store drug in original carton, in refrigerator, and protect from light.
• Sites for subcutaneous injection include the outer area of the upper arms, the front of the middle thighs, and the abdomen (except for 2-inch area around the navel).

## ACTION

Activates erythropoietin receptors to stimulate erythropoietin production.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |
| Subcut. | Unknown | 72 hr | Unknown |

*Half-life:* 3 to 8 days.

## ADVERSE REACTIONS

**CNS:** headache, ***seizures, stroke.***
**CV:** ***heart failure,*** *hypertension,* hypotension, ***myocardial infarction,*** procedural hypotension.
**EENT:** *nasopharyngitis.*
**GI:** constipation, *diarrhea,* vomiting.
**GU:** urinary tract infection.
**Hematologic:** arteriovenous (AV) fistula site complication, AV fistula thrombosis, ***pure red cell aplasia.***
**Metabolic:** fluid overload.
**Musculoskeletal:** back pain, limb pain, muscle spasms.
**Respiratory:** cough, upper respiratory tract infection.
**Other:** allergic reactions, ***increased risk of death, tumor progression.***

## INTERACTIONS

None reported.

## EFFECTS ON LAB TEST RESULTS

• May increase hemoglobin level.
• May decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components and patients with uncontrolled hypertension.

**Black Box Warning** Contraindicated in patients with anemia caused by cancer chemotherapy. ■
• Use cautiously in patients with history of hypertension and in breast-feeding women.
⚠ ***Overdose S&S:*** Cardiovascular events.

## NURSING CONSIDERATIONS

**Black Box Warning** In patients with renal failure, drug may increase risk of serious CV events, including death, when target hemoglobin level is greater than 12 g/dl. Check hemoglobin level often until it's stabilized. Individualize dosing to achieve and maintain hemoglobin level between 10 and 12 g/dl. ■
• Monitor patient for signs and symptoms of allergic reaction, such as tachycardia, pruritus, and rash.
• Assess ferritin level and transferrin saturation before and during treatment. Provide iron supplement if patient's ferritin level is less than 100 mcg/L or serum transferrin saturation is less than 20%.
• Drug may increase risk of cardiovascular events. Control patient's blood pressure, and monitor it carefully.
• Assess renal function and fluid and electrolyte balance.

## PATIENT TEACHING

• Teach patient how to inject drug and safely dispose of used needles.
• Tell patient how to store drug at home.
• Explain possible side effects and allergic reactions, and urge patient to report them to health care provider immediately.
• Inform patient about the need for frequent monitoring of blood pressure and iron and hemoglobin levels. Urge patient to comply with treatment for hypertension.

**SAFETY ALERT!**

# methyldopa

meth-ill-DOE-pa

Novo-Medopa†, Nu-Medopa†

# methyldopate hydrochloride

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Centrally acting antiadrenergic
*Pregnancy risk category B for P.O.; C for I.V.*

## AVAILABLE FORMS

**methyldopa**
*Tablets:* 250 mg, 500 mg
**methyldopate hydrochloride**
*Injection:* 50 mg/ml

## INDICATIONS & DOSAGES

➤ **Hypertension, hypertensive crisis**
*Adults:* Initially, 250 mg P.O. b.i.d. to t.i.d. in first 48 hours. Increase if needed every 2 days. May give entire daily dose in evening or at bedtime. Adjust dosages if other antihypertensives are added to or deleted from therapy. Adjust dosage at 48-hour intervals. Maintenance dosage is 500 mg to 2 g daily in two to four divided doses. Maximum recommended daily dose is 3 g. Or, 250 to 500 mg I.V. every 6 hours. Maximum dosage is 1 g every 6 hours. Switch to oral antihypertensives as soon as possible.
*Children:* Initially, 10 mg/kg P.O. daily in two to four divided doses; or, 20 to 40 mg/kg I.V. daily in four divided doses. Increase dose daily until desired response occurs. Maximum daily dose is 65 mg/kg or 3 g, whichever is less.

## ADMINISTRATION

**P.O.**
• If unpleasant adverse reactions occur, patient shouldn't suddenly stop taking drug but should notify his prescriber.

**I.V.**
▼ Dilute appropriate dose in 100 ml $D_5W$. Infuse slowly over 30 to 60 minutes.

▼ **Incompatibilities:** Amphotericin B; drugs with poor solubility in acidic media, such as barbiturates and sulfonamides; methohexital; some total parenteral nutrition solutions.

## ACTION

May inhibit the central vasomotor centers, decreasing sympathetic outflow to the heart, kidneys, and peripheral vasculature.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 4–6 hr | Unknown | 12–48 hr |
| I.V. | 4–6 hr | Unknown | 10–16 hr |

*Half-life:* About 2 hours.

## ADVERSE REACTIONS

**CNS:** *decreased mental acuity, sedation, headache,* weakness, dizziness, paresthesia, parkinsonism, involuntary choreoathetoid movements, psychic disturbances, depression, nightmares.
**CV:** *orthostatic hypotension, edema,* ***bradycardia, myocarditis,*** aggravated angina.
**EENT:** *nasal congestion.*
**GI:** *dry mouth,* ***pancreatitis,*** nausea, vomiting, diarrhea, constipation.
**GU:** galactorrhea, dark urine.
**Hematologic:** ***thrombocytopenia, leukopenia, bone marrow depression,*** hemolytic anemia.
**Hepatic:** ***hepatic necrosis, hepatitis.***
**Musculoskeletal:** arthralgia.
**Skin:** rash.
**Other:** drug-induced fever, gynecomastia.

## INTERACTIONS

**Drug-drug.** *Amphetamines, nonselective beta blockers, norepinephrine, phenothiazines, tricyclic antidepressants:* May cause hypertensive effects. Monitor patient closely.
*Anesthetics:* May need lower doses of anesthetics. Use together cautiously.
*Barbiturates:* May decrease actions of methyldopa. Monitor patient closely.
*Ferrous sulfate:* May decrease bioavailability of methyldopa. Separate doses.
*Haloperidol:* May increase antipsychotic effects of haloperidol or cause psychosis. Use together cautiously.
*Levodopa:* May increase hypotensive effects, which may increase adverse CNS reactions. Monitor patient closely.
*Lithium:* May increase lithium level. Watch for increased lithium level and signs and symptoms of toxicity.
*MAO inhibitors:* May cause excessive sympathetic stimulation. Avoid using together.
*Tolbutamide:* May impair metabolism of tolbutamide. Monitor patient for hypoglycemic effect.
**Drug-herb.** *Capsicum:* May reduce antihypertensive effect. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase creatinine level. May decrease hemoglobin level and hematocrit.
- May increase liver function test values. May decrease platelet and WBC counts.
- May interfere with results of urinary uric acid testing, serum creatinine test, and AST test. May cause positive Coombs' test result. May falsely increase urine catecholamine level, interfering with the diagnosis of pheochromocytoma.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with active hepatic disease (such as acute hepatitis) or active cirrhosis.
- Contraindicated in those whose previous methyldopa therapy caused liver problems and in those taking MAO inhibitors.
- Use cautiously in patients with history of impaired hepatic function or sulfite sensitivity and in breast-feeding women.

***Overdose S&S:*** Sedation, acute hypotension, weakness, bradycardia, dizziness, constipation, abdominal distention, flatus, diarrhea, nausea, vomiting.

## NURSING CONSIDERATIONS

- Monitor patient's blood pressure regularly. Elderly patients are more likely to experience hypotension and sedation.
- Occasionally, tolerance may occur, usually between the second and third months of therapy. Adding a diuretic or adjusting dosage may be needed. If patient's response changes significantly, notify prescriber.
- After dialysis, monitor patient for hypertension and notify prescriber, if needed. Patient may need an extra dose of drug.
- Monitor CBC with differential counts before therapy and periodically thereafter.

• Patients who need blood transfusions should have direct and indirect Coombs' tests to prevent crossmatching problems.
• Monitor patient's Coombs' test results. In patients who have received drug for several months, positive reaction to direct Coombs' test indicates hemolytic anemia.
• Report involuntary choreoathetoid movements. Drug may be stopped.

### PATIENT TEACHING

• If unpleasant adverse reactions occur, advise patient not to suddenly stop taking drug but to notify prescriber.
• Instruct patient to report signs and symptoms of infection.
• Tell patient to check his weight daily and to notify prescriber if he gains 2 or more pounds in 1 day or 5 pounds in 1 week. Sodium and water retention may occur but can be relieved with diuretics.
• Warn patient that, particularly at the start of therapy, drug may impair ability to perform tasks that require mental alertness. A once-daily dose at bedtime minimizes daytime drowsiness.
• Inform patient that low blood pressure and dizziness upon rising can be minimized by rising slowly and avoiding sudden position changes and that dry mouth can be relieved by chewing gum or sucking on hard candy or ice chips.
• Tell patient that urine may turn dark if left sitting in toilet bowl or if toilet bowl has been treated with bleach.

## methylergonovine maleate

meth-ill-er-goe-NOE-veen

Methergine

*Therapeutic class:* Oxytocic
*Pharmacologic class:* Ergot alkaloid
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 0.2 mg/ml in 1-ml ampules
*Tablets:* 0.2 mg

### INDICATIONS & DOSAGES

➤ **To prevent and treat postpartum hemorrhage caused by uterine atony or subinvolution**

*Adults:* 0.2 mg I.M. every 2 to 4 hours to a maximum of five doses. For excessive uterine bleeding or other emergencies, 0.2 mg I.V. over 1 minute while monitoring blood pressure and uterine contractions. After first I.M. or I.V. dose, 0.2 mg P.O. every 6 to 8 hours for 2 to 7 days. Decrease dosage if severe cramping occurs.

### ADMINISTRATION

**P.O.**

• Store tablets in tightly closed, light-resistant container. Discard if discolored.

**I.V.**

▼ Don't routinely use this form because of risk of severe hypertension and stroke.
▼ Dilute to 5 ml with normal saline solution, as needed.
▼ Give slowly over at least 1 minute while carefully monitoring blood pressure.
▼ Store solution below 46° F (8° C). Daily stock may be kept at room temperature for 60 to 90 days.
▼ **Incompatibilities:** None reported.

**I.M.**

• Store in refrigerator and protect from light.
• Drug may be given after delivery of the anterior shoulder, after delivery of the placenta, or during the puerperium.

### ACTION

Increases motor activity of the uterus by direct stimulation of the smooth muscle, shortening the third stage of labor, and reducing blood loss.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 5–10 min | 30 min | 3 hr |
| I.V. | Immediate | Unknown | 45 min |
| I.M. | 2–5 min | Unknown | 3 hr |

*Half-life:* 1½ to 12¾ hours.

### ADVERSE REACTIONS

**CNS:** ***seizures, stroke with I.V. use,*** dizziness, headache, hallucinations.
**CV:** hypertension, transient chest pain, palpitations, hypotension, thrombophlebitis.
**EENT:** tinnitus, nasal congestion.
**GI:** *nausea, vomiting,* diarrhea, foul taste.
**GU:** hematuria.
**Musculoskeletal:** leg cramps.
**Respiratory:** dyspnea.
**Skin:** diaphoresis.

## INTERACTIONS

**Drug-drug.** *Clarithromycin, delavirdine, erythromycin, indinavir, itraconazole, ketoconazole, nelfinavir, ritonavir, telithromycin, troleandomycin, voriconazole:* May cause vasospasm, leading to ischemia. Avoid using together.

*Clotrimazole, fluconazole, fluoxetine, fluvoxamine, nefazodone, saquinavir, zileuton:* May increase risk of vasospasm. Use together cautiously.

*Dopamine, ergot alkaloids, I.V. oxytocin, regional anesthetics, vasoconstrictors:* May cause excessive vasoconstriction. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

- May decrease prolactin level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in pregnant patients, in patients sensitive to ergot preparations, and in patients with hypertension or toxemia.
- Use cautiously in patients with sepsis, obliterative vascular disease, or hepatic or renal disease.
- Use cautiously during last stage of labor.

***Overdose S&S:*** Nausea, vomiting, abdominal pain, numbness, tingling of the extremities, rise in blood pressure; in severe cases, followed by hypotension, respiratory depression, hypothermia, seizures, coma.

## NURSING CONSIDERATIONS

- Monitor and record blood pressure, pulse rate, and uterine response; report sudden change in vital signs, frequent periods of uterine relaxation, and character and amount of vaginal bleeding.
- Monitor contractions, which may begin immediately. Contractions may continue for up to 45 minutes after I.V. use or for 3 hours or more after P.O. or I.M. use.
- ***Look alike–sound alike:*** Don't confuse Methergine with terbutaline.

## PATIENT TEACHING

- Explain use of drug to patient and family.
- Instruct patient to report adverse reactions promptly.

# methylnaltrexone bromide

mehth-eel-NAHL-trek-zone

Relistor

*Therapeutic class:* Laxative
*Pharmacologic class:* Peripherally acting $\mu$-opioid receptor antagonist
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 12 mg/0.6 ml single-use vial

## INDICATIONS & DOSAGES

➤ **Opioid-induced constipation in those receiving palliative care for advanced illness when response to laxatives is insufficient**

*Adults weighing less than 38 kg (84 lb):* 0.15 mg/kg subcutaneously every other day, as needed.

*Adults weighing 38 to 61 kg (84 to 134 lb):* 8 mg subcutaneously every other day, as needed.

*Adults weighing 62 to 114 kg (136 to 251 lb):* 12 mg subcutaneously every other day, as needed.

*Adults weighing more than 114 kg (251 lb):* 0.15 mg/kg subcutaneously every other day, as needed.

***Adjust-a-dose:*** If creatinine clearance is less than 30 ml/minute, reduce dose by one-half.

## ADMINISTRATION

**Subcutaneous**

- Administer no more than one dose within 24 hours.
- To determine injection volume for the 0.15 mg/kg dose, multiply patient's weight in pounds by 0.0034 and round up to the nearest 0.1 ml, or multiply patient's weight in kilograms by 0.0075 and round up to the nearest 0.1 ml.
- Store drug at room temperature, away from light.
- After drawn into a syringe as directed, drug is stable at room temperature for 24 hours.
- Give injections subcutaneously into the abdomen, thighs, or upper arms.

## ACTION
Antagonizes GI $\mu$-opioid receptors, preventing opioid-induced slowing of GI motility and transit time.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 30 min | Unknown |

*Half-life:* About 8 hours.

## ADVERSE REACTIONS
**CNS:** *dizziness.*
**GI:** *abdominal pain, flatulence, nausea,* diarrhea.

## INTERACTIONS
None reported.

## EFFECTS ON LAB TEST RESULTS
None reported.

## CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to the drug and in those with known or suspected mechanical GI obstruction.
- Use cautiously in patients with peritoneal catheters.

⚠ ***Overdose S&S:*** Orthostatic hypotension.

## NURSING CONSIDERATIONS
- Drug will relieve opioid-induced constipation without affecting opioid-mediated analgesic effects.
- Don't use in pregnant women unless the benefits outweigh risk to fetus.
- It's unknown whether the drug is excreted in breast milk. Avoid use in breast-feeding women.
- Safety and efficacy in children haven't been established.

## PATIENT TEACHING
- Inform patient that drug may be effective within a few minutes to a few hours after administration.
- Instruct patient to discontinue therapy, and notify prescriber if severe or persistent diarrhea occurs.
- Tell patient that vial is for single-use only; remaining drug should be discarded.
- Advise patient to avoid injecting the drug into areas where the skin is tender, bruised, red, or hard, to avoid areas with scars or stretch marks, and to rotate injection sites.
- Warn patient that no more than one dose should be taken within a 24-hour period.
- Advise women of childbearing age to notify prescriber if pregnancy is desired or if it occurs.

# methylphenidate hydrochloride
meth-ill-FEN-i-date

Concerta✐, Metadate CD, Metadate ER, Methylin, Methylin ER, Ritalin✐, Ritalin LA, Ritalin-SR✐

# methylphenidate transdermal system
Daytrana

*Therapeutic class:* CNS stimulant
*Pharmacologic class:* Piperidine derivative
*Pregnancy risk category NR; C (for Concerta, Daytrana, Metadate CD, Ritalin LA)*
*Controlled substance schedule II*

M

## AVAILABLE FORMS
*Oral solution (Methylin):* 5 mg/5 ml, 10 mg/5 ml
*Tablets (chewable):* 2.5 mg, 5 mg, 10 mg
*Tablets (Ritalin, Methylin):* 5 mg, 10 mg, 20 mg
**Extended-release**
*Capsules (Metadate CD):* 10 mg, 20 mg, 30 mg, 40 mg, 50 mg, 60 mg
*Capsules (Ritalin LA):* 10 mg, 20 mg, 30 mg, 40 mg
*Tablets (Concerta):* 18 mg, 27 mg, 36 mg, 54 mg
*Tablets (Metadate ER, Methylin ER):* 10 mg, 20 mg
**Sustained-release**
*Tablets (Ritalin-SR):* 20 mg
**Transdermal system**
*Patch:* 10 mg, 15 mg, 20 mg, 30 mg

## INDICATIONS & DOSAGES
➤ **Attention deficit hyperactivity disorder (ADHD)**
*Adults:* 10 mg (immediate-release) P.O. b.i.d. or t.i.d. Dosage varies; maximum dosage is 60 mg daily.

*Children age 6 and older:* Initially, 5 mg P.O. b.i.d. immediate-release form before breakfast and lunch, increasing by 5 to 10 mg at weekly intervals, as needed, until an optimum daily dose of 2 mg/kg is reached, not to exceed 60 mg/day. To use Ritalin-SR, Metadate ER, and Methylin ER tablets in place of immediate-release methylphenidate tablets, calculate methylphenidate dosage in 8-hour intervals.

***Concerta***

*Adults ages 18 to 65 not taking methylphenidate, or for patients taking other stimulants:* Initially, 18 or 36 mg P.O. daily. May increase dosage in 18-mg increments at weekly intervals to maximum of 72 mg daily.

*Adolescents age 13 to 17 not currently taking methylphenidate, or for patients taking other stimulants:* 18 mg P.O. extended-release Concerta once daily in the morning. Adjust dosage by 18 mg at weekly intervals to a maximum of 72 mg P.O. once daily in the morning.

*Children age 6 to 12 not currently taking methylphenidate or patients taking stimulants other than methylphenidate:* 18 mg extended-release P.O. once daily every morning. Adjust dosage by 18 mg at weekly intervals to a maximum of 54 mg daily every morning.

*Adolescents and children age 6 and older currently taking methylphenidate:* If previous methylphenidate dosage was 5 mg b.i.d. or t.i.d. give 18 mg P.O. every morning. If previous dosage was 10 mg b.i.d. or t.i.d. give 36 mg P.O. every morning. If previous dosage was 15 mg b.i.d. or t.i.d. give 54 mg P.O. every morning. Maximum conversion daily dose is 54 mg. Once conversion is complete, adjust adolescents age 13 to 17 to maximum dose of 72 mg once daily.

***Metadate CD***

*Adults and children age 6 and older:* Initially, 20 mg P.O. daily before breakfast, increasing by 10 to 20 mg at weekly intervals to a maximum of 60 mg daily.

***Ritalin LA***

*Adults and children age 6 and older:* Initially, 10 to 20 mg P.O. once daily. Increase by 10 mg at weekly intervals to a maximum of 60 mg daily. If previous methylphenidate dosage was 5 mg P.O. b.i.d., give 10 mg P.O. once daily. If previous methylphenidate dosage was 10 mg b.i.d., give 20 mg P.O. once daily. If previous methylphenidate dosage was 15 mg b.i.d., give 30 mg P.O. once daily. If previous methylphenidate dosage was 20 mg b.i.d., give 40 mg P.O. once daily. If previous methylphenidate dosage was 30 mg b.i.d., give 60 mg P.O. once daily.

***Daytrana***

*Adults and children ages 6 to 17:* Initially, apply one 10-mg patch to clean, dry, nonirritated skin on the hip, alternating sites daily. Apply 2 hours before desired effect and remove 9 hours later. Increase dose weekly as needed to a maximum of 30 mg daily. Base final dose and wear time on patient response.

➤ **Narcolepsy**

*Adults:* 10 mg P.O. b.i.d. or t.i.d. immediate-release, 30 to 45 minutes before meals. Dosage varies; maximum dose is 60 mg/day.

*Children age 6 and older:* Initially, 5 mg P.O. b.i.d. (before breakfast and lunch) immediate-release. Increase dosage, if needed, by 5 to 10 mg weekly. Maximum dose is 60 mg. To use Ritalin-SR, Metadate ER, or Methylin ER tablets in place of immediate-release methylphenidate tablets, calculate the dose of methylphenidate in 8-hour intervals.

## ADMINISTRATION

**P.O.**

- Give chewable tablet with at least 8 oz (237 ml) of water.
- Give drug after meals to reduce appetite-suppressant effects; give last daily dose at least 6 hours before bedtime to prevent insomnia.
- Metadate CD or Ritalin LA may be swallowed whole, or the contents of the capsule may be sprinkled onto a small amount of cool applesauce and taken immediately.
- Extended-release and sustained-release tablets (Metadate ER, Methylin ER, Ritalin-SR) must be swallowed whole and never crushed, chewed, or divided.
- Concerta may be taken with or without food and must be swallowed whole. Don't crush, divide, or allow patient to chew Concerta tablets.

**Transdermal**
• Avoid placing the patch on the waistline or where tight clothing may rub it off.

## ACTION

Releases nerve terminal stores of norepinephrine, promoting nerve impulse transmission. At high doses, effects are mediated by dopamine.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. (Methylin, Ritalin) | Unknown | 2 hr | Unknown |
| P.O. (Methylin ER, Ritalin-SR) | Unknown | 5 hr | 8 hr |
| P.O. (Metadate CD) | Unknown | 1½ hr; 4½ hr | Unknown |
| P.O. (Ritalin LA) | Unknown | 1–3 hr; 4–7 hr | Unknown |
| P.O. (Concerta) | Unknown | 6–8 hr | Unknown |
| Transdermal | 2 hr | Variable | 14 hr |

*Half-life:* Conventional, 3 to 6 hours; extended-release (Metadate ER, Methylin ER, Ritalin SR), 3 to 8 hours, (Concerta, Metadate CD, Ritalin LA) 8 to 12 hours; transdermal, 3 to 4 hours.

## ADVERSE REACTIONS

**CNS:** *nervousness, headache, insomnia,* ***seizures,*** tics, dizziness, akathisia, dyskinesia, drowsiness, mood swings.
**CV:** *palpitations, tachycardia,* ***arrhythmias,*** hypertension.
**EENT:** pharyngitis, sinusitis.
**GI:** *nausea, abdominal pain, anorexia, decreased appetite, vomiting.*
**Hematologic:** ***thrombocytopenia, thrombocytopenic purpura, leukopenia,*** anemia.
**Metabolic:** weight loss.
**Respiratory:** cough, upper respiratory tract infection.
**Skin:** *exfoliative dermatitis,* ***erythema multiforme,*** rash, urticaria, application site irritation (redness, swelling, papules).
**Other:** *viral infection.*

## INTERACTIONS

**Drug-drug.** *Anticonvulsants (such as phenobarbital, phenytoin, primidone), SSRIs, tricyclic antidepressants (imipramine, clomipramine, desipramine), warfarin:* May increase levels of these drugs. Monitor patient for adverse reactions and decrease dose of these drugs as needed. Monitor drug levels (or coagulation times if patient is also taking warfarin).
*Centrally acting alpha$_2$ agonists, clonidine:* May cause serious adverse events. Avoid using together.
*Centrally acting antihypertensives:* May decrease antihypertensive effect. Monitor blood pressure.
***MAO inhibitors:*** May cause severe hypertension or hypertensive crisis. Avoid using within 14 days of MAO inhibitor therapy.
**Drug-food.** *Caffeine:* May increase amphetamine and related amine effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

• May decrease hemoglobin level and hematocrit.
• May decrease platelet and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug and in those with glaucoma, motor tics, family history or diagnosis of Tourette syndrome, or history of marked anxiety, tension, or agitation. Also contraindicated within 14 days of MAO inhibitor therapy. Avoid use in patients with structural cardiac abnormalities.
• Because it doesn't dissolve, Concerta isn't recommended in patients with a history of peritonitis or with severe GI narrowing (such as small bowel inflammatory disease, short-gut syndrome caused by adhesions or decreased transit time, cystic fibrosis, chronic intestinal pseudoobstruction, or Meckel diverticulum).
• Use cautiously in patients with a history of emotional disorder, seizures, EEG abnormalities, or hypertension, and in patients whose underlying medical conditions might be compromised by increases in blood pressure or heart rate, such as those with preexisting hypertension, heart failure, recent MI, or hyperthyroidism.
**Black Box Warning** Use cautiously in patients who have a history of drug dependence or alcoholism. Long-term abusive use can lead to tolerance and psychological dependence. Psychotic episodes can occur. Monitor patient for severe depression during drug withdrawal. ■

M

***Overdose S&S:*** Agitation, cardiac arrhythmias, confusion, seizures, coma, delirium, dryness of mucous membranes, euphoria, flushing, hallucinations, headache, hyperpyrexia, hyperreflexia, hypertension, muscle twitching, mydriasis, palpitations, sweating, tachycardia, tremors, vomiting.

## NURSING CONSIDERATIONS

- Chewable tablets contain phenylalanine.
- Don't use drug to prevent fatigue or treat severe depression.
- Drug may trigger Tourette syndrome in children. Monitor patient, especially at start of therapy.
- Observe patient for signs of excessive stimulation. Monitor blood pressure.
- Check CBC, differential, and platelet counts with long-term use, particularly if patient shows signs or symptoms of hematologic toxicity (fever, sore throat, easy bruising).
- Monitor height and weight in children on long-term therapy. Drug may delay growth spurt, but children will attain normal height when drug is stopped.
- Monitor patient for tolerance or psychological dependence.
- ***Look alike–sound alike:*** Don't confuse Ritalin with Rifadin, or Ritalin SR with Ritalin LA.

## PATIENT TEACHING

- Tell patient or caregiver to give last daily dose at least 6 hours before bedtime to prevent insomnia and after meals to reduce appetite-suppressant effects.
- Warn patient against chewing sustained-release tablets.
- Metadate CD or Ritalin LA may be swallowed whole, or the contents of the capsule may be sprinkled onto a small amount of cool applesauce and taken immediately.

***Alert:*** Warn patient to take chewable tablet with at least 8 oz (237 ml) of water. Not using enough water to swallow tablet may cause the tablet to swell and block the throat, causing choking.

- Caution patient to avoid activities that require alertness or good psychomotor coordination until CNS effects of drug are known.
- Warn patient with seizure disorder that drug may decrease seizure threshold. Urge him to notify prescriber if seizure occurs.
- Advise patient to avoid beverages containing caffeine while taking drug.
- Tell parent to apply patch immediately after opening; don't use if pouch seal is broken. Press firmly in place for about 30 seconds using the palm of your hand, being sure there is good contact with the skin, especially around the edges. Once applied correctly, the child may shower, bathe, or swim as usual.
- Inform parent if patch comes off, a new one may be applied on a different site, but the total wear time for that day should be 9 hours. Upon removal, fold patch in half so the sticky sides adhere to itself, then flush down toilet or dispose of in a lidded container.
- If the applied patch is missing, have parent ask the child when or how the patch came off. Teach child that patch shouldn't be shared or removed except by parent or health care provider.
- Encourage parent to use the application chart provided with patch carton to keep track of application and removal.
- Tell parent to remove patch sooner than 9 hours if the child has decreased evening appetite or has difficulty sleeping.
- Tell parent the effects of the patch lasts for several hours after its removal.
- Warn parent and patient to avoid exposing patch to direct external heat sources, such as heating pads, electric blankets, and heated water beds.
- Tell parent to notify prescriber if the child develops bumps, swelling, or blistering at the application site or is experiencing blurred vision or other serious side effects.

## methylPREDNISolone

meth-ill-pred-NISS-oh-lone

Medrol✐, Medrol Dosepak

## methylprednisolone acetate

Depo-Medrol

## methylprednisolone sodium succinate

A-Methapred, Solu-Medrol

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Glucocorticoid
*Pregnancy risk category C*

### AVAILABLE FORMS

**methylprednisolone**
*Tablets:* 2 mg, 4 mg, 8 mg, 16 mg, 24 mg, 32 mg
**methylprednisolone acetate**
*Injection (suspension):* 20 mg/ml, 40 mg/ml, 80 mg/ml
**methylprednisolone sodium succinate**
*Injection:* 40-mg vial, 125-mg vial, 500-mg vial, 1,000-mg vial, 2,000-mg vial

### INDICATIONS & DOSAGES

➤ **Severe inflammation or immunosuppression**
*Adults and children:* 4 to 48 mg P.O. daily. After favorable response is noted, determine maintenance dosage by decreasing dosage until lowest dosage that will maintain adequate clinical response is achieved. Or, 10 to 80 mg acetate I.M. daily, or 10 to 40 mg succinate I.M. or I.V. up to six times daily. Or, 4 to 40 mg acetate into smaller joints or 20 to 80 mg acetate into larger joints. Intralesional use is usually 20 to 60 mg acetate. Repeat intralesional and intra-articular injections every 1 to 5 weeks.
*Children:* Not less than 0.5 mg/kg I.M. every 24 hours.

➤ **Shock**
*Adults:* 100 to 250 mg succinate I.V. every 2 to 6 hours. Or, 30 mg/kg I.V. initially; repeat every 4 to 6 hours as needed. Give over 3 to 15 minutes. Continue therapy for 2 to 3 days or until patient is stable.

### ADMINISTRATION

**P.O.**
● Give drug with milk or food when possible. Critically ill patients may need to take drug with an antacid or $H_2$-receptor antagonist.

**I.V.**
▼ Use only methylprednisolone sodium succinate, never the acetate form.
▼ Reconstitute according to manufacturer's directions using supplied diluent, or use bacteriostatic water for injection with benzyl alcohol.
▼ Compatible solutions include $D_5W$, normal saline solution, and dextrose 5% in normal saline solution.
▼ For direct injection, inject diluted drug into vein or free-flowing compatible I.V. solution over at least 1 minute.
▼ For intermittent or continuous infusion, dilute solution according to manufacturer's instructions and give over prescribed duration. If used for continuous infusion, change solution every 24 hours.
▼ For shock, give massive doses over at least 10 minutes to prevent arrhythmias and circulatory collapse.
▼ Discard reconstituted solution after 48 hours.
▼ **Incompatibilities:** Allopurinol, aminophylline, calcium gluconate, ciprofloxacin, cytarabine, diltiazem, docetaxel, doxapram, etoposide, filgrastim, gemcitabine, glycopyrrolate, nafcillin, ondansetron, paclitaxel, penicillin G sodium, potassium chloride, propofol, sargramostim, vinorelbine, vitamin B complex with C.

**I.M.**
● Give injection deeply into gluteal muscle. Avoid subcutaneous injection because atrophy and sterile abscesses may occur.
● Dermal atrophy may occur with large doses of acetate form. Use several small injections rather than a single large dose, and rotate injection sites.

### ACTION

Not clearly defined. Decreases inflammation, mainly by stabilizing leukocyte lysosomal membranes; suppresses immune response; stimulates bone marrow; and

M

influences protein, fat, and carbohydrate metabolism.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 2–3 hr | 30–36 hr |
| I.V. | Rapid | Immediate | 1 wk |
| I.M. | 6–48 hr | 4–8 days | 4–8 days |
| Intra-articular | Rapid | 7 days | 1–5 wk |

*Half-life:* 18 to 36 hours.

## ADVERSE REACTIONS

**CNS:** *euphoria, insomnia,* psychotic behavior, ***pseudotumor cerebri,*** vertigo, headache, paresthesia, ***seizures.***
**CV:** ***arrhythmias, heart failure,*** hypertension, edema, thrombophlebitis, ***thromboembolism, cardiac arrest, circulatory collapse after rapid use of large I.V. dose.***
**EENT:** cataracts, glaucoma.
**GI:** *peptic ulceration,* GI irritation, increased appetite, ***pancreatitis,*** nausea, vomiting.
**GU:** menstrual irregularities.
**Metabolic:** hypokalemia, hyperglycemia, carbohydrate intolerance, hypercholesterolemia, hypocalcemia.
**Musculoskeletal:** growth suppression in children, muscle weakness, osteoporosis.
**Skin:** hirsutism, delayed wound healing, acne, various skin eruptions.
**Other:** cushingoid state, susceptibility to infections, ***acute adrenal insufficiency after increased stress or abrupt withdrawal after long-term therapy.***
**After abrupt withdrawal (may be fatal after prolonged use):** rebound inflammation, fatigue, weakness, arthralgia, fever, dizziness, lethargy, depression, fainting, orthostatic hypotension, dyspnea, anorexia, ***hypoglycemia.***

## INTERACTIONS

**Drug-drug.** *Aspirin, indomethacin, other NSAIDs:* May increase risk of GI distress and bleeding. Use together cautiously.
*Barbiturates, carbamazepine, phenytoin, rifampin:* May decrease corticosteroid effect. Increase corticosteroid dosage.
*Cyclosporine:* May increase toxicity. Monitor patient closely.
*Ketoconazole and macrolide antibiotics:* May decrease methylprednisolone clearance. Decreased dose may be required.
*Oral anticoagulants:* May alter dosage requirements. Monitor PT and INR closely.
*Potassium-depleting drugs such as thiazide diuretics:* May enhance potassium-wasting effects of methylprednisolone. Monitor potassium level.
*Salicylates:* May decrease salicylate levels. Monitor patient for lack of salicylate effectiveness.
*Skin-test antigens:* May decrease response. Postpone skin testing until after therapy.
*Toxoids, vaccines:* May decrease antibody response and may increase risk of neurologic complications. Avoid using together.
**Drug-herb.** *Echinacea:* May increase immune-stimulating effects. Discourage use together.
*Ginseng:* May increase immune-regulating response. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase glucose and cholesterol levels and urine calcium levels. May decrease $T_3$, $T_4$, potassium, and calcium levels.
- May decrease $^{131}I$ uptake and protein-bound iodine levels in thyroid function tests. May cause false-negative results in nitroblue tetrazolium test for systemic bacterial infections. May alter reactions to skin tests.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its ingredients, in those with systemic fungal infections, in premature infants (acetate and succinate), and in patients receiving immunosuppressive doses together with live virus vaccines.
- Use cautiously in patients with GI ulceration or renal disease, hypertension, osteoporosis, diabetes mellitus, hypothyroidism, cirrhosis, diverticulitis, nonspecific ulcerative colitis, recent intestinal anastomoses, thromboembolic disorders, seizures, active hepatitis, myasthenia gravis, heart failure, tuberculosis, ocular herpes simplex, emotional instability, and psychotic tendencies or in breast-feeding women.

## NURSING CONSIDERATIONS

- Medrol may contain tartrazine. Watch for allergic reaction to tartrazine in patients with sensitivity to aspirin.

- Drug may be used for alternate-day therapy.
- Most adverse reactions to corticosteroids are dose- or duration-dependent. For better results and less toxicity, give a once-daily dose in the morning.

**Alert:** Different salts aren't interchangeable.

**Alert:** Don't give Solu-Medrol intrathecally because severe adverse reactions may occur.

- If immediate onset of action is needed, don't use acetate form.
- Always adjust to lowest effective dose.
- Monitor patient's weight, blood pressure, electrolyte level, and sleep patterns. Euphoria may initially interfere with sleep, but patients typically adjust to therapy in 1 to 3 weeks.
- Monitor patient for cushingoid effects, including moon face, buffalo hump, central obesity, thinning hair, hypertension, and increased susceptibility to infection.
- Measure growth and development periodically in children during high-dose or prolonged treatment.
- Drug may mask or worsen infections, including latent amebiasis.
- Watch for depression or psychotic episodes, especially in high-dose therapy.
- Diabetic patient may need increased insulin; monitor glucose level.
- Watch for an enhanced response to drug in patients with hypothyroidism or cirrhosis.
- Unless contraindicated, give low-sodium diet that's high in potassium and protein. Give potassium supplements as needed.
- Elderly patients may be more susceptible to osteoporosis with prolonged use.
- Taper off dosage after long-term therapy.
- **Look alike–sound alike:** Don't confuse Solu-Medrol with Solu-Cortef or methylprednisolone with medroxyprogesterone.

### PATIENT TEACHING

- Tell patient not to stop drug abruptly or without prescriber's consent.
- Instruct patient to take oral form of drug with milk or food.
- Teach patient signs and symptoms of early adrenal insufficiency: fatigue, muscle weakness, joint pain, fever, anorexia, nausea, shortness of breath, dizziness, and fainting.
- Instruct patient to carry or wear medical identification indicating his need for supplemental systemic glucocorticoids during stress. This card should contain prescriber's name, name of drug, and dosage taken.
- Warn patient on long-term therapy about cushingoid effects (moon face, buffalo hump) and the need to notify prescriber about sudden weight gain or swelling.
- Advise patient receiving long-term therapy to consider exercise or physical therapy. Also, tell patient to ask prescriber about vitamin D or calcium supplement.
- Instruct patient to avoid exposure to infections (such as chickenpox or measles) and to contact prescriber if such exposure occurs.

## methyITESTOSTERone

meth-ill-tes-TOSS-ter-own

Android, Metandren†, Methitest, Testred, Virilon

*Therapeutic class:* Androgen
*Pharmacologic class:* Androgenic anabolic steroid hormone
*Pregnancy risk category X*
*Controlled substance schedule III*

M

### AVAILABLE FORMS

*Capsules:* 10 mg
*Tablets:* 10 mg, 25 mg
*Tablets (buccal):* 10 mg

### INDICATIONS & DOSAGES

➤ **Metastatic breast cancer**
*Women 1 to 5 years after menopause:* 50 to 200 mg P.O. daily.

➤ **Hypogonadism**
*Men:* 10 to 50 mg P.O. daily.

➤ **Postpubertal cryptorchidism**
*Men:* 30 mg P.O. daily.

### ADMINISTRATION

**P.O.**
- Give without regard for food.
- Have patient rinse mouth after buccal tablet dissolves.

### ACTION

Stimulates target tissues to develop normally in androgen-deficient men. May have

some antiestrogen properties, making it useful in treating certain estrogen-dependent breast cancers.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 hr | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** headache, anxiety, depression, paresthesia.
**GI:** irritation of oral mucosa with buccal administration, nausea.
**GU:** oligospermia, decreased ejaculatory volume, priapism, amenorrhea.
**Hematologic:** ***suppression of clotting factors,*** polycythemia.
**Hepatic:** reversible jaundice, ***cholestatic hepatitis.***
**Metabolic:** hypernatremia, ***hyperkalemia,*** hyperphosphatemia, hypercholesterolemia, hypercalcemia.
**Musculoskeletal:** muscle cramps or spasms.
**Skin:** hypersensitivity reactions, acne.
**Other:** androgenic effects in women, altered libido, *hypoestrogenic effects in women*, excessive hormonal effects in men, male pattern baldness.

## INTERACTIONS

**Drug-drug.** ***Cyclosporine:*** May increase cyclosporine toxicity. Monitor cyclosporine levels.
*Hepatotoxic drugs:* May increase risk of hepatotoxicity. Monitor liver function closely.
*Insulin, oral antidiabetics:* May decrease glucose level; may alter dosage requirements. Monitor glucose level in diabetic patients.
*Oral anticoagulants:* May increase sensitivity to oral anticoagulants; may alter dosage requirements. Monitor PT and INR.
*Oxyphenbutazone:* May cause elevated oxyphenbutazone level. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

• May increase sodium, potassium, phosphate, liver enzyme, lipid, and calcium levels. May decrease thyroxine-binding globulin and total $T_4$ levels.
• May increase RBC count and resin uptake of $T_3$ and $T_4$.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in pregnant or breast-feeding women and in men with breast or prostate cancer.
• Use cautiously in elderly patients; patients with cardiac, renal, or hepatic disease; and healthy males with delayed puberty.
***Overdose S&S:*** Nausea, edema.

## NURSING CONSIDERATIONS

• Don't give to women of childbearing age until pregnancy is ruled out.
• In children, obtain X-rays of wrist bones before therapy begins to establish bone maturation level. During treatment, bones may mature more rapidly than they grow in length. Periodically review X-rays to monitor bone maturation.
• Drug is typically used only for intermittent therapy. Because of potential hepatotoxicity, watch closely for jaundice.
• Promptly report evidence of virilization in women, such as deepening of the voice, increased hair growth, acne, or baldness.
• Watch for hypoestrogenic effects in women (flushing, diaphoresis, vaginal bleeding, nervousness, emotional lability, menstrual irregularities, and vaginitis, including itching, dryness, and burning).
• Watch for excessive hormonal effects in men. If patient is prepubertal, watch for premature epiphyseal closure, acne, priapism, growth of body and facial hair, and phallic enlargement. If he's postpubertal, watch for testicular atrophy, oligospermia, decreased ejaculatory volume, impotence, gynecomastia, and epididymitis.
• Unless contraindicated, use with high-calorie, high-protein diet. Give small, frequent meals.
• Periodically check cholesterol, calcium, and hemoglobin levels, hematocrit, and cardiac and liver function test results.
• Check weight regularly. Control edema with sodium restriction or diuretics.
***Alert:*** In breast cancer, therapeutic response usually occurs within 3 months. If disease appears to progress, stop drug.
• Report signs of hypercalcemia. In metastatic breast cancer, hypercalcemia

may indicate progression of bone metastases.
• Evaluate semen every 3 to 4 months, especially in adolescent boys.
***Alert:*** Don't use to enhance athletic performance or physique.
• ***Look alike–sound alike:*** Testosterone and methyltestosterone aren't interchangeable. Don't confuse methyltestosterone with medroxyprogesterone.

### PATIENT TEACHING

• Make sure patient understands importance of using effective contraception during therapy.
• Tell women of childbearing age to report menstrual irregularities and to stop drug while awaiting examination.
• Instruct patient to stop drug immediately and notify prescriber if pregnancy is suspected.
• Tell patient to place buccal tablet in upper or lower buccal pouch between cheek and gum; tablet needs 30 to 60 minutes to dissolve. Tell patient not to eat, drink, chew, or smoke while buccal tablet is in place and not to swallow tablet.
• Instruct patient to change buccal tablet absorption site with each dose to minimize risk of irritation. Advise patient to rinse mouth after using buccal tablet.
• Tell women to immediately report evidence of virilization, such as acne, swelling, weight gain, increased hair growth, hoarseness, clitoral enlargement, decreased breast size, deepening of voice, changes in libido, male pattern baldness, and oily skin or hair.
• Teach patient signs and symptoms of low glucose level (hypoglycemia) and method for checking glucose level; drug enhances hypoglycemia. Instruct patient to report signs or symptoms of hypoglycemia immediately.
• Advise women to wear cotton underwear and to wash after intercourse to decrease risk of vaginitis.

## metoclopramide hydrochloride

met-oh-KLOE-pra-mide

Apo-Metoclop†, Octamide PFS, Reglan

*Therapeutic class:* Antiemetic
*Pharmacologic class:* Dopamine antagonist
*Pregnancy risk category B*

### AVAILABLE FORMS

*Injection:* 5 mg/ml
*Syrup:* 5 mg/5 ml
*Tablets:* 5 mg, 10 mg

### INDICATIONS & DOSAGES

➤ **To prevent or reduce nausea and vomiting from emetogenic cancer chemotherapy**
*Adults:* 1 to 2 mg/kg I.V. 30 minutes before chemotherapy; repeat every 2 hours for two doses, then every 3 hours for three doses.
➤ **To prevent or reduce postoperative nausea and vomiting**
*Adults:* 10 to 20 mg I.M. near end of surgical procedure; repeat every 4 to 6 hours, as needed.
➤ **To facilitate small-bowel intubation, to aid in radiologic examinations**
*Adults and children older than age 14:* 10 mg I.V. as a single dose over 1 to 2 minutes.
*Children ages 6 to 14:* 2.5 to 5 mg I.V. slowly over 1 to 2 minutes.
*Children younger than age 6:* 0.1 mg/kg I.V. slowly over 1 to 2 minutes.
➤ **Delayed gastric emptying secondary to diabetic gastroparesis**
*Adults:* 10 mg P.O. 30 minutes before each meal and at bedtime for mild symptoms. Or, give 10 mg by slow I.V. infusion over 1 to 2 minutes 30 minutes before each meal and at bedtime for up to 10 days for severe symptoms; then P.O. dose may be started and continued for 2 to 8 weeks.
➤ **Gastroesophageal reflux disease**
*Adults:* 10 to 15 mg P.O. q.i.d., as needed, 30 minutes before meals and at bedtime.
***Adjust-a-dose:*** For patients with creatinine clearance below 40 ml/minute, decrease dosage by half.

➤ **Gastroparesis** ♦
*Adults:* 10 to 20 mg P.O. 30 minutes before meals and at bedtime for up to 8 weeks.

## ADMINISTRATION

**P.O.**
● Give drug before each meal and at bedtime.

**I.V.**
▼ Drug is compatible with $D_5W$, normal saline solution for injection, dextrose 5% in half-normal saline solution, Ringer's injection, and lactated Ringer's injection. Normal saline solution is the preferred diluent; drug is most stable in this solution.
▼ Give doses of 10 mg or less by direct injection over 1 to 2 minutes. Dilute doses larger than 10 mg in 50 ml of compatible diluent, and infuse over at least 15 minutes. Monitor blood pressure closely.
▼ No need to protect drug from light if infusion mixture is given within 24 hours. If protected from light and refrigerated, it's stable for 48 hours.
▼ **Incompatibilities:** Allopurinol, ampicillin, amphotericin B, calcium gluconate, cefepime, chloramphenicol sodium succinate, cisplatin, doxorubicin liposomal, erythromycin lactobionate, fluorouracil, furosemide, methotrexate sodium, penicillin G potassium, propofol, sodium bicarbonate.

**I.M.**
● Inspect for particulate matter and discoloration. If either is present, don't use.

## ACTION

Stimulates motility of upper GI tract, increases lower esophageal sphincter tone, and blocks dopamine receptors at the chemoreceptor trigger zone.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30–60 min | 1–2 hr | 1–2 hr |
| I.V. | 1–3 min | Unknown | 1–2 hr |
| I.M. | 10–15 min | Unknown | 1–2 hr |

*Half-life:* 4 to 6 hours.

## ADVERSE REACTIONS

**CNS:** *anxiety, drowsiness, dystonic reactions, fatigue, lassitude, restlessness,* ***neuroleptic malignant syndrome, seizures, suicide ideation,*** akathisia, confusion, depression, dizziness, extrapyramidal symptoms, fever, hallucinations, headache, insomnia, tardive dyskinesia.
**CV:** ***bradycardia, supraventricular tachycardia,*** hypotension, transient hypertension.
**GI:** bowel disorders, diarrhea, nausea.
**GU:** incontinence, urinary frequency.
**Hematologic:** ***agranulocytosis, neutropenia.***
**Skin:** rash, urticaria.
**Other:** loss of libido, prolactin secretion.

## INTERACTIONS

**Drug-drug.** *Anticholinergics, opioid analgesics:* May antagonize GI motility effects of metoclopramide. Use together cautiously.
*CNS depressants:* May cause additive CNS effects. Avoid using together.
*Levodopa:* Levodopa and metoclopramide have opposite effects on dopamine receptors. Avoid using together.
*MAO inhibitors:* May increase release of catecholamines in patients with hypertension. Use together cautiously.
*Phenothiazines:* May increase risk of extrapyramidal effects. Monitor patient closely.
**Drug-lifestyle.** *Alcohol use:* May cause additive CNS effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

● May increase liver function tests, aldosterone and prolactin levels.
● May decrease neutrophil and granulocyte counts.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug and in those with pheochromocytoma, tardive dyskinesia, or seizure disorders.
● Contraindicated in patients for whom stimulation of GI motility might be dangerous (those with hemorrhage, obstruction, or perforation).
**Black Box Warning** Long-term or high-dose drug use has been linked to tardive dyskinesia, even after the drug was stopped, especially in older, female, and diabetic patients. ■

• Use cautiously in patients with history of depression, Parkinson disease, or hypertension.
**Overdose S&S:** Drowsiness, disorientation, extrapyramidal reactions; seizures, lethargy (in infants and children).

## NURSING CONSIDERATIONS
• Monitor bowel sounds.
• Safety and effectiveness of drug haven't been established for therapy lasting longer than 12 weeks.
• Discontinue drug if signs and symptoms of tardive dyskinesia develop. Avoid treatment for longer than 12 weeks except in rare cases in which therapeutic benefit is thought to outweigh risk of tardive dyskinesia.
• Monitor patient for involuntary movements of face, tongue, and extremities, which may indicate tardive dyskinesia.
• Monitor patient for dizziness, headache, or nervousness after metoclopramide is stopped as these may indicate withdrawal.
**Alert:** Use 25 mg diphenhydramine I.V. to counteract extrapyramidal adverse effects from high doses.

## PATIENT TEACHING
• Tell patient to avoid activities that require alertness for 2 hours after doses.
• Urge patient to report persistent or serious adverse reactions promptly.
• Advise patient not to drink alcohol during therapy.

# metolazone
me-TOLE-a-zone

Zaroxolyn

*Therapeutic class:* Diuretic
*Pharmacologic class:* Thiazide-like diuretic
*Pregnancy risk category B*

## AVAILABLE FORMS
*Tablets:* 2.5 mg, 5 mg, 10 mg

## INDICATIONS & DOSAGES
➤ **Edema in heart failure or renal disease**
*Adults:* 5 to 20 mg P.O. once daily.

➤ **Hypertension**
*Adults:* 2.5 to 5 mg P.O. once daily. Base maintenance dosage on blood pressure.

## ADMINISTRATION
**P.O.**
• Give drug without regard for meals.
• To prevent nocturia, give drug in the morning.
**Black Box Warning** Don't interchange Zaroxolyn tablets and other formulations of metolazone that share its slow and incomplete bioavailability.

## ACTION
Increases sodium and water excretion by inhibiting sodium reabsorption in ascending loop of Henle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 2–8 hr | 12–24 hr |

*Half-life:* About 14 hours.

## ADVERSE REACTIONS
**CNS:** *dizziness*, headache, fatigue, vertigo, paresthesia, weakness, restlessness, drowsiness, anxiety, depression, nervousness, blurred vision.
**CV:** orthostatic hypotension, palpitations, vasculitis.
**GI:** ***pancreatitis,*** anorexia, nausea, epigastric distress, vomiting, abdominal pain, diarrhea, constipation, dry mouth.
**GU:** nocturia, polyuria, impotence.
**Hematologic:** ***aplastic anemia, agranulocytosis, leukopenia,*** purpura.
**Hepatic:** jaundice, ***hepatitis.***
**Metabolic:** hyperglycemia and impaired glucose tolerance, fluid and electrolyte imbalances, including hypokalemia, hypomagnesemia, dilutional hyponatremia and hypochloremia, metabolic alkalosis, and hypercalcemia, volume depletion and dehydration.
**Musculoskeletal:** muscle cramps.
**Skin:** dermatitis, photosensitivity reactions, rash, pruritus, urticaria.

## INTERACTIONS
**Drug-drug.** *Amphotericin B, corticosteroids:* May increase risk of hypokalemia. Monitor potassium level closely.

M

*Anticoagulants:* May decrease anticoagulant response. Monitor PT and INR.
*Antidiabetics:* May alter glucose level and require dosage adjustment of antidiabetics. Monitor glucose level.
*Barbiturates, opioids:* May increase orthostatic hypotensive effect. Monitor patient closely.
***Bumetanide, ethacrynic acid, furosemide, torsemide:*** May cause excessive diuretic response, causing serious electrolyte abnormalities or dehydration. Adjust doses carefully, and monitor patient closely for signs and symptoms of excessive diuretic response.
*Cardiac glycosides:* May increase risk of digoxin toxicity from metolazone-induced hypokalemia. Monitor potassium and digoxin levels.
*Cholestyramine, colestipol:* May decrease intestinal absorption of thiazides. Separate doses.
*Diazoxide:* May increase antihypertensive, hyperglycemic, and hyperuricemic effects. Use together cautiously.
*Lithium:* May decrease lithium clearance, increasing risk of lithium toxicity. Monitor lithium level.
*NSAIDs:* May increase risk of renal failure. May decrease diuretic and antihypertensive effects. Monitor renal function and blood pressure.
*Other antihypertensives:* May have additive effects. Use together cautiously.
**Drug-herb.** *Dandelion:* May interfere with diuretic activity. Discourage use together.
*Licorice:* May cause unexpected rapid potassium loss. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May increase orthostatic hypotensive effect. Discourage use together.
*Sun exposure:* May increase risk for photosensitivity reaction. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase glucose, calcium, cholesterol, and triglyceride levels. May decrease potassium, sodium, magnesium, chloride, and hemoglobin levels.
- May decrease granulocyte and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to thiazides or other sulfonamide-derived drugs and in those with anuria, hepatic coma, or precoma.
- Use cautiously in patients with impaired renal or hepatic function.

***Overdose S&S:*** Orthostatic hypotension, dizziness, drowsiness, lethargy, syncope, CNS depression, electrolyte abnormalities, hemoconcentration, depressed respirations, GI irritability and hypermotility.

## NURSING CONSIDERATIONS

- Monitor fluid intake and output, weight, blood pressure, and electrolyte levels.
- Watch for signs and symptoms of hypokalemia, such as muscle weakness and cramps. Drug may be used with potassium-sparing diuretic to prevent potassium loss.
- Consult prescriber and dietitian about a high-potassium diet. Foods rich in potassium include citrus fruits, tomatoes, bananas, dates, and apricots.
- Monitor glucose level, especially in diabetic patients.
- Monitor uric acid level, especially in patients with history of gout.
- Monitor elderly patients, who are especially susceptible to excessive diuresis.
- In hypertensive patients, therapeutic response may be delayed several weeks.
- Monitor blood pressure. If response is inadequate, another antihypertensive may be added.
- Metolazone and furosemide may be used together to enhance diuretic effect.
- Unlike thiazide diuretics, metolazone is effective in patients with decreased renal function.
- Stop thiazides and thiazide-like diuretics before parathyroid function tests.
- ***Look alike–sound alike:*** Don't confuse Zaroxolyn with Zarontin.

## PATIENT TEACHING

- Tell patient to take drug in morning to prevent need to urinate at night.
- Advise patient to avoid sudden posture changes and to rise slowly to avoid effects of dizziness upon standing quickly.
- Instruct patient to use a sunblock to prevent photosensitivity reactions.

## metoprolol succinate

meh-TOH-pruh-lol

Toprol-XL✔

## metoprolol tartrate

Betaloc†, Betaloc Durules†, Lopresor†, Lopresor SR†, Lopressor, Novo-Metoprol†, Nu-Metop†

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Selective beta blocker
*Pregnancy risk category C*

### AVAILABLE FORMS

**metoprolol succinate**
*Tablets (extended-release):* 25 mg, 50 mg, 100 mg, 200 mg
**metoprolol tartrate**
*Injection:* 1 mg/ml in 5-ml ampules
*Tablets:* 25 mg, 50 mg, 100 mg
*Tablets (extended-release):* 100 mg†, 200 mg†

### INDICATIONS & DOSAGES

➤ **Hypertension**
*Adults:* Initially, 50 mg P.O. b.i.d. or 100 mg P.O. once daily; then up to 100 to 400 mg daily in two or three divided doses. Or, 50 to 100 mg of extended-release tablets (tartrate equivalent) once daily. Adjust dosage as needed and tolerated at intervals of not less than 1 week to maximum of 400 mg daily.
*Children ages 6 to 16:* 1 mg/kg P.O. once daily, not to exceed 50 mg P.O. once daily.

➤ **Early intervention in acute MI**
*Adults:* 5 mg metoprolol tartrate I.V. bolus every 2 minutes for three doses. Then, 15 minutes after the last I.V. dose, give 25 to 50 mg P.O. every 6 hours for 48 hours. Maintenance dosage is 100 mg P.O. b.i.d.

➤ **Angina pectoris**
*Adults:* Initially, 100 mg P.O. daily as a single dose or in two equally divided doses; increased at weekly intervals until an adequate response or a pronounced decrease in heart rate is seen. Effects of daily dose beyond 400 mg aren't known. Or, give 100 mg of extended-release tablets (tartrate equivalent) once daily. Adjust dosage as needed and tolerated at intervals of not less than 1 week to maximum of 400 mg daily.

➤ **Stable symptomatic heart failure (New York Heart Association class II) resulting from ischemia, hypertension, or cardiomyopathy**
*Adults:* 25 mg Toprol-XL P.O. once daily for 2 weeks. Double the dose every 2 weeks, as tolerated, to a maximum of 200 mg daily.
***Adjust-a-dose:*** In patients with more severe heart failure, start with 12.5 mg Toprol-XL P.O. once daily for 2 weeks.

### ADMINISTRATION

**P.O.**
● Give drug with or immediately after meal.

**I.V.**
▼ Give drug undiluted by direct injection.
▼ Although best avoided, drug can be mixed with meperidine hydrochloride or morphine sulfate or given with an alteplase infusion at a Y-site connection.
▼ Store drug at room temperature and protect from light. Discard solution if it's discolored or contains particles.
▼ **Incompatibilities:** Amphotericin B.

### ACTION

Unknown. A selective beta blocker that selectively blocks $beta_1$ receptors; decreases cardiac output, peripheral resistance, and cardiac oxygen consumption; and depresses renin secretion.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 15 min | 1 hr | 6–12 hr |
| P.O. (extended-release) | 15 min | 6–12 hr | 24 hr |
| I.V. | 5 min | 20 min | 5–8 hr |

*Half-life:* 3 to 7 hours.

### ADVERSE REACTIONS

**CNS:** *fatigue*, *dizziness*, depression.
**CV:** *hypotension*, ***bradycardia, heart failure, AV block,*** edema.
**GI:** nausea, diarrhea, constipation, heartburn.
**Respiratory:** dyspnea, wheezing.
**Skin:** rash.

### INTERACTIONS

**Drug-drug.** *Amobarbital, butabarbital, butalbital, pentobarbital, phenobarbital, primidone,*

M

*secobarbital:* May reduce metoprolol effect. May need to increase metoprolol dose.
*Cardiac glycosides, diltiazem:* May cause excessive bradycardia and increased depressant effect on myocardium. Use together cautiously.
*Catecholamine-depleting drugs such as MAO inhibitors, reserpine:* May have additive effect. Monitor patient for hypotension and bradycardia.
*Chlorpromazine:* May decrease hepatic clearance. Watch for greater beta-blocking effect.
*Cimetidine:* May increase metoprolol effects. Give another $H_2$ agonist or decrease dose of metoprolol.
*Fluoxetine, paroxetine, propafenone, quinidine:* May increase metoprolol level. Monitor vital signs.
*Hydralazine:* May increase levels and effects of both drugs. Monitor patient closely. May need to adjust dosage.
*Indomethacin, NSAIDs:* May decrease antihypertensive effect. Monitor blood pressure and adjust dosage.
*Insulin, oral antidiabetics:* May alter dosage requirements in previously stabilized diabetic patients. Monitor patient closely.
*I.V. lidocaine:* May reduce hepatic metabolism of lidocaine, increasing risk of toxicity. Give bolus doses of lidocaine at a slower rate, and monitor lidocaine level closely.
*Prazosin:* May increase risk of orthostatic hypotension in the early phases of use together. Assist patient to stand slowly until effects are known.
*Rifampin:* May increase metoprolol metabolism. Watch for decreased effect.
*Terbutaline:* May antagonize bronchodilatory effects of terbutaline. Monitor patient.
*Verapamil:* May increase effects of both drugs. Monitor cardiac function closely, and decrease dosages as needed.
**Drug-herb.** *Ma huang:* May decrease antihypertensive effects. Discourage use together.
**Drug-food.** *Food:* May increase absorption. Encourage patient to take drug with food.

## EFFECTS ON LAB TEST RESULTS

- May increase transaminase, alkaline phosphatase, LDH, and uric acid levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other beta blockers.
- Contraindicated in patients with sinus bradycardia, greater than first-degree heart block, cardiogenic shock, or overt cardiac failure when used to treat hypertension or angina. When used to treat MI, drug is contraindicated in patients with heart rate less than 45 beats/minute, greater than first-degree heart block, PR interval of 0.24 second or longer with first-degree heart block, systolic blood pressure less than 100 mm Hg, or moderate to severe cardiac failure.
- Use cautiously in patients with heart failure, diabetes, or respiratory or hepatic disease.

***Overdose S&S:*** Bradycardia, hypotension, bronchospasm, cardiac failure, cardiac arrest, coma, AV block, nausea, vomiting.

## NURSING CONSIDERATIONS

- Always check patient's apical pulse rate before giving drug. If it's slower than 60 beats/minute, withhold drug and call prescriber immediately.
- In diabetic patients, monitor glucose level closely because drug masks common signs and symptoms of hypoglycemia.
- Monitor blood pressure frequently; drug masks common signs and symptoms of shock.
- Beta blockers may mask tachycardia caused by hyperthyroidism. In patients with suspected thyrotoxicosis, taper off beta blocker to avoid thyroid storm.

**Black Box Warning** When stopping therapy, taper dosage over 1 to 2 weeks. Abrupt discontinuation may cause exacerbations of angina or myocardial infarction. Don't discontinue therapy abruptly even in patients treated only for hypertension. ■

- Beta selectivity is lost at higher doses. Watch for peripheral side effects.
- ***Look alike–sound alike:*** Don't confuse metoprolol with metaproterenol misoprostol, or metolazone. Don't confuse Toprol-XL with Topamax, Tegretol, or Tegretol-XR.

### PATIENT TEACHING

- Instruct patient to take drug exactly as prescribed and with meals.
- Caution patient to avoid driving and other tasks requiring mental alertness until response to therapy has been established.
- Advise patient to inform dentist or prescriber about use of this drug before procedures or surgery.
- Tell patient to alert prescriber if shortness of breath occurs.
- Instruct patient not to stop drug suddenly but to notify prescriber about unpleasant adverse reactions. Inform him that drug must be withdrawn gradually over 1 or 2 weeks.
- Inform patient that use isn't advisable in breast-feeding women.

## metronidazole (oral; injection)

me-troe-NI-da-zole

Flagyl, Flagyl ER, Florazole ER†, Novo-Nidazol†

## metronidazole hydrochloride

Flagyl IV RTU

*Therapeutic class:* Antiprotozoal
*Pharmacologic class:* Nitroimidazole
*Pregnancy risk category B*

### AVAILABLE FORMS

*Capsules:* 375 mg
*Injection:* 500 mg/100 ml in vials or ready-to-use minibags
*Tablets:* 250 mg, 500 mg
*Tablets (extended-release):* 750 mg

### INDICATIONS & DOSAGES

**Black Box Warning** Use metronidazole only for the conditions for which it's indicated. Avoid unnecessary use. ■

➤ **Amebic liver abscess**

*Adults:* 500 to 750 mg P.O. t.i.d. for 5 to 10 days; or 2.4 g P.O. once daily for 1 to 2 days. Or, 500 mg I.V. every 6 hours for 10 days if patient can't tolerate P.O. route.
*Children:* 35 to 50 mg/kg daily in three divided doses for 10 days. Maximum, 750 mg/dose.

➤ **Intestinal amebiasis**

*Adults:* 750 mg P.O. t.i.d. for 5 to 10 days; then treat with a luminal amebicide, such as iodoquinol or paromomycin.
*Children:* 35 to 50 mg/kg daily in three divided doses for 10 days; then treat with a luminal amebicide, such as iodoquinol or paromomycin.

➤ **Trichomoniasis**

*Adults:* 500 mg P.O. b.i.d. for 7 days, or 2 g P.O. in single dose (may give the 2-g dose in two 1-g doses, both on the same day); wait 4 to 6 weeks before repeating course.
*Children:* 5 mg/kg P.O. t.i.d. for 7 days.

➤ **Refractory trichomoniasis**

*Adults:* 500 mg P.O. b.i.d. for 7 days.

➤ **Bacterial infections caused by anaerobic microorganisms**

*Adults:* Loading dose is 15 mg/kg I.V. infused over 1 hour. Maintenance dose is 7.5 mg/kg I.V. or P.O. every 6 hours. Give first maintenance dose 6 hours after loading dose. Maximum dose shouldn't exceed 4 g daily.

➤ **To prevent postoperative infection in contaminated or potentially contaminated colorectal surgery**

*Adults:* Infuse 15 mg/kg I.V. over 30 to 60 minutes and complete about 1 hour before surgery. Then, infuse 7.5 mg/kg I.V. over 30 to 60 minutes at 6 and 12 hours after first dose.

➤ **Bacterial vaginosis**

*Adults:* 750 mg Flagyl ER P.O. daily for 7 days.

➤ ***Clostridium difficile*–associated diarrhea and colitis** ♦

*Adults:* Usually 250 mg P.O. q.i.d. or 500 mg P.O. t.i.d. for 10 days. Or, 500 mg to 750 mg I.V. every 6 to 8 hours when P.O. route isn't practical.
*Children:* 30 to 50 mg/kg/day P.O. given in three to four equally divided doses for 7 to 10 days. Don't exceed adult dose.

➤ **Pelvic inflammatorydisease (PID)** ♦

*Adults:* 500 mg I.V. every 8 hours with ofloxacin or with I.V. levofloxacin. For ambulatory patients, 500 mg P.O. b.i.d. with ofloxacin or levofloxacin for 14 days.

➤ **Bacterial vaginosis** ♦

*Nonpregnant women:* 500 mg P.O. b.i.d. for 7 days; or, 2 g P.O. as a single dose.

*Pregnant women:* 250 mg P.O. t.i.d. or 500 mg P.O. b.i.d. for 7 days.

➤ **Prophylaxis after sexual assault** ♦

*Adults:* 2 g P.O. in a single dose with ceftriaxone and either azithromycin or doxycycline.

## ADMINISTRATION

**P.O.**

● Give drug with food.

**I.V.**

▼ Flagyl IV ready-to-use (RTU) minibags need no preparation.

▼ Don't use aluminum needles or hubs to reconstitute the drug or to transfer reconstituted drug. Equipment that contains aluminum will turn the solution orange; the potency isn't affected.

▼ To reconstitute lyophilized vials, add 4.4 ml of sterile water for injection, bacteriostatic water for injection, sterile normal saline solution for injection, or bacteriostatic normal saline solution for injection. Reconstituted drug contains 100 mg/ml. Add contents of vial to 100 ml of $D_5W$, lactated Ringer's injection, or normal saline solution to yield 5 mg/ml. Neutralize this highly acidic solution by carefully adding 5 mEq sodium bicarbonate to each 500 mg; the carbon dioxide gas that forms may need to be vented.

▼ Infuse drug over at least 1 hour. Don't give by I.V. push.

▼ Don't refrigerate the neutralized diluted solution; precipitation may occur. Refrigerated Flagyl IV RTU may form crystals, which disappear after the solution warms to room temperature.

▼ **Incompatibilities:** Aluminum, amino acid 10%, amoxicillin sodium and clavulanate potassium, amphotericin B, aztreonam, ceftriaxone, dopamine, filgrastim, meropenem, other I.V. drugs, warfarin.

## ACTION

Direct-acting trichomonacide and amebicide that works inside and outside the intestines. It's thought to enter the cells of microorganisms that contain nitroreductase, forming unstable compounds that bind to DNA and inhibit synthesis, causing cell death.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 hr | Unknown |
| I.V. | Immediate | 1 hr | Unknown |

*Half-life:* 6 to 8 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* ***seizures,*** fever, vertigo, ataxia, dizziness, syncope, incoordination, confusion, irritability, depression, weakness, insomnia, peripheral neuropathy.

**CV:** flattened T wave, edema, flushing, thrombophlebitis after I.V. infusion.

**EENT:** rhinitis, sinusitis, pharyngitis.

**GI:** *nausea,* abdominal cramping or pain, stomatitis, epigastric distress, vomiting, anorexia, diarrhea, constipation, proctitis, dry mouth, metallic taste.

**GU:** *vaginitis,* darkened urine, polyuria, dysuria, cystitis, dyspareunia, dryness of vagina and vulva, vaginal candidiasis, genital pruritus.

**Hematologic:** ***transient leukopenia, neutropenia.***

**Musculoskeletal:** transient joint pains.

**Respiratory:** upper respiratory tract infection.

**Skin:** rash.

**Other:** decreased libido, overgrowth of nonsusceptible organisms, especially *Candida*.

## INTERACTIONS

**Drug-drug.** *Busulfan:* May increase busulfan toxicity. Avoid using together.

*Cimetidine:* May increase risk of metronidazole toxicity because of inhibited hepatic metabolism. Monitor for toxicity.

*Disulfiram:* May cause acute psychosis and confusion. Avoid giving metronidazole within 2 weeks of disulfiram.

*Lithium:* May increase lithium level, which may cause toxicity. Monitor lithium level.

*Phenobarbital, phenytoin:* May decrease metronidazole effectiveness; may reduce total phenytoin clearance. Monitor patient.

***Warfarin:*** May increase anticoagulant effects and risk of bleeding. Reduce warfarin as needed.

**Drug-lifestyle.** *Alcohol use:* May cause disulfiram-like reaction, including nausea, vomiting, headache, cramps, and flushing. Warn patient to avoid alcohol during and for 3 days after completing drug therapy.

### EFFECTS ON LAB TEST RESULTS

- May decrease WBC and neutrophil counts.
- May falsely decrease triglyceride and aminotransferase levels.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other nitroimidazole derivatives and in patients in first trimester of pregnancy.

***Alert:*** If drug must be given to a pregnant woman for trichomoniasis, use the 7-day regimen, not the 2-g single-dose regimen. The 2-g dose produces a high level that's more likely to reach fetal circulation.

- Use cautiously in patients with history of blood dyscrasia, CNS disorder, or retinal or visual field changes.
- Use cautiously in patients who take hepatotoxic drugs or have hepatic disease or alcoholism.

***Overdose S&S:*** Nausea, vomiting, ataxia, neurotoxicity.

### NURSING CONSIDERATIONS

- Monitor liver function test results carefully in elderly patients.
- Observe patient for edema, especially if he's receiving corticosteroids; Flagyl IV RTU may cause sodium retention.
- Record number and character of stools when drug is used to treat amebiasis. Give drug only after *Trichomonas vaginalis* infection is confirmed by wet smear or culture or *Entamoeba histolytica* is identified.
- Sexual partners of patients being treated for *T. vaginalis* infection, even if asymptomatic, must also be treated to avoid reinfection.

### PATIENT TEACHING

- Instruct patient to take extended-release tablets at least 1 hour before or 2 hours after meals but to take all other oral forms with food to minimize GI upset.
- Inform patient of need for sexual partners to be treated simultaneously to avoid reinfection.
- Instruct patient in proper hygiene.
- Tell patient to avoid alcohol and alcohol-containing drugs during and for at least 3 days after treatment course.
- Tell patient he may experience a metallic taste and have dark or red-brown urine.
- Tell patient to report to prescriber symptoms of candidal overgrowth.
- Tell patient to report to prescriber immediately any neurologic symptoms (seizures, peripheral neuropathy).

## metronidazole (topical; vaginal)

me-troe-NI-da-zole

MetroCream, MetroGel, MetroGel Vaginal, MetroLotion, Noritate, Rosasol†, Vandazole

*Therapeutic class:* Antibacterial (topical)
*Pharmacologic class:* Nitroimidazole
*Pregnancy risk category B*

### AVAILABLE FORMS

*Topical cream:* 0.75%, 1%
*Topical gel:* 0.75%, 1%
*Topical lotion:* 0.75%
*Vaginal gel:* 0.75%

### INDICATIONS & DOSAGES

➤ **Inflammatory papules and pustules of acne rosacea**

*Adults:* If using a 0.75% preparation, apply thin film to affected area b.i.d., morning and evening. If using a 1% preparation, apply thin film to affected area once daily. After response is seen (usually within 3 weeks), adjust frequency and duration of therapy.

➤ **Bacterial vaginosis**

*Adults:* One applicatorful vaginally daily or b.i.d. for 5 days. For once-daily use, give at bedtime.

### ADMINISTRATION

**Topical**

- Clean area thoroughly before use, and then wait 15 to 20 minutes before applying drug to minimize risk of local irritation. Avoid contact with eyes.

**Vaginal**

- Screw the end of the applicator onto the tube and squeeze slowly. The plunger will stop when the applicator is full.

• Wash plunger and barrel in warm, soapy water and rinse thoroughly. Dry before reassembling.

## ACTION

Unknown. May cause bactericidal effect by interacting with bacterial DNA. Drug is active against many anaerobic gram-negative bacilli, anaerobic gram-positive cocci, *Gardnerella vaginalis*, and *Campylobacter fetus*.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | 8–12 hr | Unknown |
| Vaginal | Unknown | 6–12 hr | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**Topical form**
**EENT:** lacrimation if applied around eyes.
**Skin:** *transient redness, dryness, mild burning, stinging,* contact dermatitis, pruritus, rash.
**Vaginal form**
**GI:** cramps, nausea, loose stools, metallic or bad taste in mouth, pain.
**GU:** *cervicitis, vaginitis,* perineal and vulvovaginal itching, vaginal burning.
**Skin:** *transient redness, dryness, mild burning, stinging.*
**Other:** overgrowth of nonsusceptible organisms.

## INTERACTIONS

**Drug-drug.** *Disulfiram:* May cause disulfiram-like reaction when used with vaginal form of metronidazole. Avoid using together, and wait 2 weeks after stopping disulfiram before starting metronidazole vaginal therapy.
*Lithium:* May increase lithium level. Monitor lithium level.
*Oral anticoagulants:* May increase anticoagulant effect. Monitor patient for adverse reactions.
**Drug-lifestyle.** *Alcohol use:* May cause disulfiram-like reaction when used with vaginal form. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

• May interfere with AST, ALT, LDH, triglyceride, and glucose levels.
• May increase or decrease WBC count.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its ingredients, such as parabens, and other nitroimidazole derivatives.
• Use cautiously in patients with history or evidence of blood dyscrasia and in those with hepatic impairment.
• Use vaginal gel cautiously in patients with history of CNS diseases. Oral form may cause seizures and peripheral neuropathy.
• Use in pregnant and breast-feeding women only if clearly needed.

## NURSING CONSIDERATIONS

• Topical therapy hasn't been linked to the adverse effects observed with parenteral or oral therapy, but some drug may be absorbed after topical use.
• Don't use vaginal gel in patients who have taken disulfiram within past 2 weeks.

## PATIENT TEACHING

• Instruct patient to avoid use of topical gel around eyes.
• Advise patient to clean area thoroughly before use and to wait 15 to 20 minutes after cleaning skin before applying drug to minimize risk of local irritation. Cosmetics may be used after applying drug.
• If local reactions occur, advise patient to apply drug less frequently or stop using it and notify prescriber.
• Advise patient to avoid sexual intercourse while using vaginal preparation.
• Caution patient to avoid alcohol while being treated with vaginal preparation.

# micafungin sodium

mick-a-FUN-gin

Mycamine

*Therapeutic class:* Antifungal
*Pharmacologic class:* Echinocandin
*Pregnancy risk category C*

## AVAILABLE FORMS

*Lyophilized powder for injection:* 50 mg, 100-mg single-use vial

## INDICATIONS & DOSAGES

➤ **Candidemia, acute disseminated candidiasis, and *Candida* peritonitis and abscesses**

*Adults:* 100 mg I.V. daily for 10 to 47 days (mean duration 15 days).

➤ **Esophageal candidiasis**

*Adults:* 150 mg I.V. daily for 10 to 30 days.

➤ **To prevent candidal infection in hematopoietic stem cell transplant recipients**

*Adults:* 50 mg I.V. daily for 6 to 51 days.

## ADMINISTRATION

**I.V.**

▼ Use aseptic technique when preparing drug.

▼ Reconstitute each 50-mg or 100-mg vial with 5 ml of normal saline solution or $D_5W$ for injection. To minimize foaming, dissolve powder by swirling the vial; don't shake it.

▼ Dilute dose in 100 ml of normal saline solution or $D_5W$ for injection.

▼ Flush line with normal saline solution for injection before infusing drug.

▼ Infuse drug over 1 hour.

▼ Reconstituted product and diluted infusion may be stored for up to 24 hours at room temperature.

▼ Protect diluted solution from light.

▼ **Incompatibilities:** Drug may precipitate when mixed with commonly used drugs.

## ACTION

Inhibits synthesis of an essential component of fungal cell walls. Drug is active against *Candida albicans, C. glabrata, C. krusei, C. parapsilosis,* and *C. tropicalis.*

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** headache, insomnia.

**CV:** atrial fibrillation, bradycardia, *cardiac disorders*, hypertension, *hypotension*, tachycardia, *vascular disorders.*

**GI:** abdominal pain, *diarrhea*, nausea, vomiting.

**Hematologic:** ***leukopenia, neutropenia, thrombocytopenia,*** anemia.

**Metabolic:** hypocalcemia, hypokalemia, ***hypomagnesemia,*** hypophosphatemia.

**Skin:** infusion site inflammation, phlebitis, pruritus, rash.

**Other:** pyrexia, rigors.

## INTERACTIONS

**Drug-drug.** *Cyclosporine:* May increase cyclosporine level. Monitor for adverse reactions and decrease cyclosporine dose if needed.

*Itraconazole:* May increase itraconazole level. Monitor for itraconazole toxicity and reduce itraconazole dose if needed.

*Nifedipine:* May increase nifedipine level. Monitor blood pressure, and decrease nifedipine dose if needed.

*Sirolimus:* May increase sirolimus level. Monitor patient for evidence of toxicity, and decrease sirolimus dose if needed.

## EFFECTS ON LAB TEST RESULTS

● May increase alkaline phosphatase, ALT, AST, bilirubin, BUN, creatinine, and LDH levels. May decrease calcium, magnesium, phosphorus, potassium, and hemoglobin levels and hematocrit.

● May decrease neutrophil and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug.

● Use cautiously in patients with severe hepatic disease.

## NURSING CONSIDERATIONS

● Injection site reactions occur more often in patients receiving drug by peripheral I.V.

● To reduce the risk of histamine-mediated reactions, infuse drug over at least 1 hour.

***Alert:*** If patient develops signs of serious hypersensitivity reaction, including shock, stop infusion and notify prescriber.

● Monitor hepatic and renal function during therapy.

● Monitor patient for hemolysis and hemolytic anemia.

● Use drug in pregnant women only if clearly needed.

● It's unknown whether drug appears in breast milk. Use cautiously in breast-feeding women.

### PATIENT TEACHING

- Advise patient to report pain or redness at infusion site.
- Tell patient he'll likely need laboratory tests to monitor his hematologic, renal, and hepatic function.

## miconazole

mi-KON-a-zole

Oravig

## miconazole nitrate

Desenex ◇, Femizol-M ◇, Fungoid Tincture ◇, Lotrimin AF ◇, Micatin ◇, Micozole† ◇, Monistat 1 ◇, Monistat 3 ◇, Monistat 7 ◇, M-Zole 3 ◇, M-Zole 7 ◇, Tetterine† ◇, Ting ◇, Vagistat-1 ◇, Zeasorb-AF ◇

*Therapeutic class:* Antifungal
*Pharmacologic class:* Imidazole
*Pregnancy risk category C*

### AVAILABLE FORMS

*Aerosol powder:* 2% ◇
*Aerosol spray:* 1%, 2% ◇
*Buccal tablets:* 50 mg
*Lotion:* 2% ◇
*Powder:* 2% ◇
*Topical cream:* 2% ◇
*Topical ointment:* 2% ◇
*Topical solution:* 2% ◇
*Vaginal cream:* 2% ◇, 4% ◇
*Vaginal suppositories:* 100 mg ◇, 200 mg ◇, 1,200 mg ◇

### INDICATIONS & DOSAGES

➤ **Tinea corporis, tinea cruris, tinea pedis, cutaneous candidiasis, common dermatophyte infections**

*Adults and children older than age 2:* Apply sparingly b.i.d. for 2 to 4 weeks. Powder or spray can be used liberally over affected area. In children younger than age 2, use only under the direction and supervision of a physician.

➤ **Tinea versicolor**

*Adults and children older than age 2:* Apply sparingly daily for 2 weeks. In children younger than age 2, use only under the direction and supervision of a physician.

➤ **Vulvovaginal candidiasis**

*Adults and children age 12 and older:* One applicatorful or 100-mg Monistat 7 suppository vaginally at bedtime for 7 days; repeat course, if needed. Or, 200-mg Monistat 3 suppository vaginally at bedtime for 3 days. Or, one 1,200-mg suppository vaginally at bedtime for 1 day. Or, apply topical cream sparingly to affected area b.i.d. for 7 days.

✶ ***NEW INDICATION:*** **Oropharyngeal candidiasis**

*Adults:* One buccal tablet to the gum region once daily for 14 consecutive days.

### ADMINISTRATION

**P.O.**

- Instruct patient not to crush, chew, or swallow buccal tablets.

**Topical**

- Don't use occlusive dressings.
- Lotion is preferred in skinfolds.

**Vaginal**

- Suppository is inserted high into vagina with applicator provided.
- Store between 59° and 86° F (15° and 30° C).

### ACTION

Fungicidal; disrupts fungal cell membrane permeability.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 7 hr | Unknown |
| Topical, vaginal | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CNS:** headache.
**GI:** diarrhea, nausea, dysgeusia, upper abdominal pain, vomiting (buccal tablets).
**GU:** pelvic cramps, pruritus, and irritation with vaginal cream, vulvovaginal burning.
**Skin:** allergic contact dermatitis, burning, irritation, maceration, pain, edema.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components. Cross-sensitivity to imidazole antifungals may occur.
- Don't use in children younger than age 2.
- Don't use vaginal preparation during the first trimester of pregnancy.
- Use cautiously in breast-feeding women.

## NURSING CONSIDERATIONS

- Avoid using within 72 hours of certain vaginal and latex products, such as condoms or vaginal contraceptive diaphragms, because drug causes latex breakdown.

## PATIENT TEACHING

- Advise patient that vaginal form of drug is for perineal or vaginal use only and to keep drug out of eyes.
- Caution patient that frequent or persistent yeast infections may suggest a more serious medical problem.
- Tell patient to cautiously insert vaginal form high into the vagina with applicator provided.

***Alert:*** Vaginal preparation shouldn't be used during first trimester of pregnancy. Use vaginal preparation during pregnancy only if recommended by prescriber.

- Tell patient that drug may stain clothing.
- Warn patient to stop drug if sensitivity or chemical irritation occurs.
- Tell patient to use drug for full treatment period prescribed and to notify prescriber if symptoms persist or worsen despite therapy.
- Advise patient to avoid tampons and sexual intercourse during vaginal treatment.
- Instruct patient to apply sparingly in skinfolds and rub in well to prevent skin breakdown.
- Tell patient to store vaginal product between 59° and 86° F (15° and 30° C).
- Tell patient not to crush, chew, or swallow buccal tablets.

**SAFETY ALERT!**

# midazolam hydrochloride

mid-AY-zoh-lam

*Therapeutic class:* Anxiolytic
*Pharmacologic class:* Benzodiazepine
*Pregnancy risk category D*
*Controlled substance schedule IV*

## AVAILABLE FORMS

*Injection:* 1 mg/ml, 5 mg/ml
*Syrup:* 2 mg/ml

## INDICATIONS & DOSAGES

➤ **Preoperative sedation (to induce sleepiness or drowsiness and relieve apprehension)**

*Adults:* 0.07 to 0.08 mg/kg I.M. about 1 hour before surgery.

➤ **Moderate sedation before short diagnostic or endoscopic procedures**

*Adults younger than age 60:* Initially, small dose not to exceed 2.5 mg I.V. given slowly; repeat in 2 minutes p.r.n., in small increments of first dose over at least 2 minutes to achieve desired effect. Total dose of up to 5 mg may be used. Additional doses to maintain desired level of sedation may be given by slow titration in increments of 25% of dose used to first reach the sedative end point.

*Patients age 60 or older and debilitated patients:* 0.5 to 1.5 mg I.V. over at least 2 minutes. Incremental doses shouldn't exceed 1 mg. A total dose of up to 3.5 mg is usually sufficient.

➤ **To induce sleepiness and amnesia and to relieve apprehension before anesthesia or before and during procedures**

***P.O.***

*Children ages 6 to 16 who are cooperative:* 0.25 to 0.5 mg/kg P.O. as a single dose, up to 20 mg.

*Infants and children ages 6 months to 5 years or less cooperative, older children:* 0.25 to 1 mg/kg P.O. as a single dose, up to 20 mg.

***I.V.***

*Children ages 12 to 16:* Initially, no more than 2.5 mg I.V. given slowly; repeat in 2 minutes, if needed, in small increments of first dose over at least 2 minutes to achieve

desired effect. Total dose of up to 10 mg may be used. Additional doses to maintain desired level of sedation may be given by slow titration in increments of 25% of dose used to first reach the sedative end point.
*Children ages 6 to 12:* 0.025 to 0.05 mg/kg I.V. over 2 to 3 minutes. Additional doses may be given in small increments after 2 to 3 minutes. Total dose of up to 0.4 mg/kg, not to exceed 10 mg, may be used.
*Children ages 6 months to 5 years:* 0.05 to 0.1 mg/kg I.V. over 2 to 3 minutes. Additional doses may be given in small increments after 2 to 3 minutes. Total dose of up to 0.6 mg/kg, not to exceed 6 mg, may be used.

***I.M.***

*Children:* 0.1 to 0.15 mg/kg I.M. Use up to 0.5 mg/kg in more anxious patients.
***Adjust-a-dose:*** For obese children, base dose on ideal body weight; high-risk or debilitated children and children receiving other sedatives need lower doses.

➤ **To induce general anesthesia**

*Adults older than age 55:* 0.3 mg/kg I.V. over 20 to 30 seconds if patient hasn't received premedication, or 0.2 mg/kg I.V. over 20 to 30 seconds if patient has received a sedative or opioid premedication. Additional increments of 25% of first dose may be needed to complete induction.
*Adults younger than age 55:* 0.3 to 0.35 mg/kg I.V. over 20 to 30 seconds if patient hasn't received premedication, or 0.25 mg/kg I.V. over 20 to 30 seconds if patient has received a sedative or opioid premedication. Additional increments of 25% of first dose may be needed to complete induction.
***Adjust-a-dose:*** For debilitated patients, initially, 0.2 to 0.25 mg/kg. As little as 0.15 mg/kg may be needed. Reduce doses in elderly patients.

➤ **As continuous infusion to sedate intubated patients in critical care unit**

*Adults:* Initially, 0.01 to 0.05 mg/kg may be given I.V. over several minutes, repeated at 10- to 15-minute intervals until adequate sedation is achieved. To maintain sedation, usual initial infusion rate is 0.02 to 0.1 mg/kg/hour. Higher loading dose or infusion rates may be needed in some patients. Use the lowest effective rate.
*Children:* Initially, 0.05 to 0.2 mg/kg may be given I.V. over 2 to 3 minutes or longer; then continuous infusion at rate of 0.06 to 0.12 mg/kg/hour. Increase or decrease infusion to maintain desired effect.
*Neonates more than 32 weeks' gestational age:* Initially, 0.06 mg/kg/hour. Adjust rate, as needed, using lowest possible rate.
*Neonates less than 32 weeks' gestational age:* Initially, 0.03 mg/kg/hour. Adjust rate, as needed, using lowest possible rate.

## ADMINISTRATION

**P.O.**

● Give drug without regard for food, but don't give with grapefruit juice or grapefruit.

**I.V.**

**Black Box Warning** I.V. midazolam should only be used in hospital or ambulatory-care settings, including physicians' and dental offices, that can provide continuous monitoring of cardiac and respiratory function. Appropriate resuscitative drugs and equipment and personnel trained in their use and skilled in airway management should be ensured. ■

▼ Drug may be mixed in the same syringe with morphine sulfate, meperidine, atropine, or scopolamine.

▼ When mixing infusion, use 5-mg/ml vial and dilute to 0.5 mg/ml with $D_5W$ or normal saline solution.

**Black Box Warning** Give slowly over at least 2 minutes, and wait at least 2 minutes when titrating doses to produce therapeutic effect. ■

**Black Box Warning** Do not administer by rapid injection in the neonatal population. ■

▼ **Incompatibilities:** Albumin, amoxicillin sodium, amphotericin B, ampicillin sodium, bumetanide, butorphanol, ceftazidime, cefuroxime, clonidine, dexamethasone sodium phosphate, dimenhydrinate, dobutamine, foscarnet, fosphenytoin, furosemide, heparin sodium, hydrocortisone, imipenem-cilastatin sodium, lactated Ringer's injection, methotrexate sodium, nafcillin, omeprazole sodium, pentobarbital sodium, perphenazine, prochlorperazine edisylate, ranitidine hydrochloride, sodium bicarbonate, thiopental, some

total parenteral nutrition formulations, trimethoprim-sulfamethoxazole.

**I.M.**

• Inject deeply into a large muscle.

## ACTION

May potentiate the effects of GABA, depress the CNS, and suppress the spread of seizure activity.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 10–20 min | 45–60 min | 2–6 hr |
| I.V. | 90 sec–5 min | Rapid | 2–6 hr |
| I.M. | 15 min | 15–60 min | 2–6 hr |

*Half-life:* 2 to 6 hours.

## ADVERSE REACTIONS

**CNS:** *oversedation, drowsiness,* amnesia, headache, involuntary movements, nystagmus, paradoxical behavior or excitement.
**CV:** variations in blood pressure and pulse rate.
**GI:** *nausea,* vomiting.
**Respiratory:** **APNEA,** *decreased respiratory rate, hiccups.*
**Other:** *pain at injection site.*

## INTERACTIONS

**Drug-drug.** *CNS depressants:* May cause apnea. Use together cautiously. Adjust dosage of midazolam if used with opiates or other CNS depressants.
*Diltiazem:* May increase CNS depression and prolonged effects of midazolam. Use lower dose of midazolam.
*Erythromycin:* May alter metabolism of midazolam. Use together cautiously.
*Fluconazole, itraconazole, ketoconazole, miconazole:* May increase and prolong midazolam level, CNS depression, and psychomotor impairment. Avoid using together.
*Hormonal contraceptives:* May prolong half-life of midazolam. Use together cautiously.
*Rifampin:* May decrease midazolam level. Monitor for midazolam effectiveness.
*Theophylline:* May antagonize sedative effect of midazolam. Use together cautiously.
*Verapamil:* May increase midazolam level. Monitor patient closely.
**Drug-herb.** *St. John's wort:* May decrease drug level. Discourage use together.
**Drug-food.** *Grapefruit juice:* May increase bioavailability of oral drug. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May cause additive CNS effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug and in those with acute angle-closure glaucoma, shock, coma, or acute alcohol intoxication.
• Use cautiously in patients with uncompensated acute illness and in elderly or debilitated patients.
**Black Box Warning** Pediatric dosages must be calculated on a mg/kg basis and all dosages should be titrated slowly. ■
**Alert:** Midazolam should only be administered by persons specifically trained in the use of anesthetics and the management of respiratory effects of anesthetics, including resuscitation of patients in the age-group being treated.
**Overdose S&S:** Excessive sedation, somnolence, confusion, impaired coordination, diminished reflexes, coma, altered vital signs.

## NURSING CONSIDERATIONS

**Black Box Warning** A qualified individual, other than the practitioner performing the procedure, should monitor patient throughout procedure. Have oxygen and resuscitation equipment available in case of severe respiratory depression. Excessive amounts and rapid infusion have been linked to respiratory arrest. Continuously monitor patient, including children taking syrup form, for life-threatening respiratory depression. ■
• Monitor blood pressure, heart rate and rhythm, respirations, airway integrity, and arterial oxygen saturation during procedure.

## PATIENT TEACHING

• Because drug diminishes patient's recall of events around the time of surgery, provide written information, family member instructions, and follow-up contact.

M

• Warn patient to avoid hazardous activities that require alertness or good coordination until effects of drug are known.

**SAFETY ALERT!**

## miglitol

MIG-lah-tall

Glyset

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Alpha-glucosidase inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS

*Tablets:* 25 mg, 50 mg, 100 mg

### INDICATIONS & DOSAGES

➤ **Adjunct to diet in patients with type 2 diabetes, alone or with a sulfonylurea**

*Adults:* 25 mg P.O. t.i.d. May start with 25 mg P.O. daily and increase gradually to t.i.d. to minimize GI upset; dosage may be increased after 4 to 8 weeks to 50 mg P.O. t.i.d. Dosage may then be further increased after 3 months, based on glycosylated hemoglobin level, to maximum of 100 mg P.O. t.i.d.

### ADMINISTRATION

**P.O.**

• Give drug with first bite of each main meal.

### ACTION

Lowers glucose level by inhibiting the alpha-glucosidases in the small intestine, which convert carbohydrates to glucose. Inhibiting these enzymes delays the digestion of carbohydrates after a meal, resulting in a smaller increase in postprandial glucose level.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–3 hr | Unknown |

*Half-life:* About 2 hours.

### ADVERSE REACTIONS

**GI:** *abdominal pain, diarrhea, flatulence.*
**Skin:** rash.

### INTERACTIONS

**Drug-drug.** *Digoxin, propranolol, ranitidine:* May decrease bioavailability of these drugs. Watch for loss of effect of these drugs and adjust dosage.
*Intestinal absorbents (such as charcoal), digestive enzyme preparations (such as amylase, pancreatin):* May reduce effect of miglitol. Avoid using together.

### EFFECTS ON LAB TEST RESULTS

• May decrease iron level.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components and in those with diabetic ketoacidosis, inflammatory bowel disease, colonic ulceration, partial intestinal obstruction, chronic intestinal diseases with marked disorders of digestion or absorption, or conditions that may deteriorate because of increased gas formation in the intestine.
• Contraindicated in those predisposed to intestinal obstruction and in those with creatinine level greater than 2 mg/dl.
• Use cautiously in patients also receiving insulin or a sulfonylurea because drug may increase hypoglycemic potential of these drugs.
***Overdose S&S:*** Transient increases in flatulence, diarrhea, and abdominal discomfort.

### NURSING CONSIDERATIONS

• In patients also taking insulin or a sulfonylurea, dosage adjustment of these drugs may be needed. Monitor patient for hypoglycemia.
• Diabetes management should include diet control, an exercise program, and regular testing of urine and glucose level.
• Monitor glucose level regularly, especially during situations of increased stress, such as infection, fever, surgery, or trauma.
• Monitor glycosylated hemoglobin level every 3 months to evaluate long-term glycemic control.
• Treat mild to moderate hypoglycemia with a ready form of sugar, such as glucose tablets or gel. Severe hypoglycemia may necessitate I.V. glucose or glucagon.
• Monitor patient for adverse GI effects.

## PATIENT TEACHING

- Stress importance of adhering to diet, weight reduction, and exercise instructions. Urge patient to have glucose and glycosylated hemoglobin levels tested regularly.
- Inform patient that drug treatment relieves symptoms but doesn't cure diabetes.
- Teach patient how to recognize high and low glucose levels.
- Instruct patient to have a source of glucose readily available to treat hypoglycemia.
- Advise patient that sucrose (table sugar, cane sugar) or fruit juices shouldn't be used to treat low-glucose reactions with this drug. Oral glucose (dextrose) or glucagon is necessary to increase glucose.
- Advise patient to seek medical advice promptly during periods of stress, such as fever, trauma, infection, or surgery, because dosage may have to be adjusted.
- Instruct patient to take drug three times daily with first bite of each main meal.
- Show patient how and when to monitor glucose level.
- Advise patient that adverse GI effects are most common during first few weeks of therapy and should improve over time.
- Urge patient to carry medical identification at all times.

# milnacipran hydrochloride

mil-NAY-sih-pran

Savella

*Therapeutic class:* Anti-fibromyalgia
*Pharmacologic class:* Selective serotonin and norepinephrine reuptake inhibitor
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 12.5 mg, 25 mg, 50 mg, 100 mg

## INDICATIONS & DOSAGES

➤ **Fibromyalgia**

*Adults:* Initially, 12.5 mg P.O. once daily; increase dosage to 12.5 mg b.i.d. on days 2 and 3, followed by 25 mg b.i.d. on days 4 to 7. Increase to 50 mg b.i.d. by day 7.

***Adjust-a-dose:*** For patients with creatinine clearance of 5 to 29 ml/minute, give 25 mg b.i.d.

## ADMINISTRATION

**P.O.**

- Give drug with or without food.

## ACTION

Unclear. Milnacipran is a potent inhibitor of neuronal norepinephrine and serotonin reuptake; however, it doesn't affect the uptake of dopamine or other transmitters.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–4 hr | 36–48 hr |

*Half-life:* 6 to 8 hours; active metabolite, 8 to 10 hours.

## ADVERSE REACTIONS

**CNS:** anxiety, depression, *dizziness*, *dysgeusia*, falls, fatigue, fever, *headache*, hypoesthesia, irritability, *insomnia*, migraine, paresthesia, ***seizures,*** stress, somnolence, tension headache, tremors.
**CV:** chest discomfort, chest pain, flushing, hypertension, palpitations, peripheral edema, tachycardia.
**EENT:** blurred vision.
**GI:** abdominal distention, abdominal pain, *constipation*, decreased appetite, diarrhea, dry mouth, flatulence, gastroesophageal reflux disease, dyspepsia, *nausea*, vomiting.
**GU:** cystitis, UTI; in men—dysuria, ejaculation disorder, ejaculation failure, erectile dysfunction, libido decrease, prostatitis, scrotal pain, testicular pain, testicular swelling, urethral pain, urinary hesitation, urine retention, urine flow decrease.
**Metabolic:** hypercholesterolemia, weight loss.
**Respiratory:** dyspnea, upper respiratory tract infection.
**Skin:** hyperhidrosis, pruritus, rash.
**Other:** chills, contusion, *hot flush*, night sweats, peripheral edema.

## INTERACTIONS

**Drug-drug.** *Clomipramine:* May cause euphoria and orthostatic hypotension when switching from clomipramine to milnacipran. Monitor patient closely.

M

*Clonidine:* May inhibit clonidine's effects. Use together cautiously.
*Digoxin:* May cause orthostatic hypotension and tachycardia. Avoid use together.
*Epinephrine, norepinephrine:* May cause paroxysmal hypertension and arrhythmia. Avoid use together.
*Lithium, other serotonergic drugs:* May cause serotonin syndrome (diarrhea, dysreflexia, fever, hallucinations, loss of coordination, nausea, tachycardia). Avoid use together.
*MAO inhibitors:* May cause hyperthermia, rigidity, myoclonus, autonomic instability, rapid fluctuations of vital signs, agitation, delirium, and coma. Avoid using drug within 2 weeks after MAO inhibitor therapy; wait at least 5 days after stopping milnacipran before starting MAO inhibitor.
**Drug-lifestyle.** *Alcohol use:* May enhance CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase liver function test values.
- May decrease sodium level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components, in those with uncontrolled narrow-angle glaucoma, and within 14 days of MAO inhibitor therapy.

***Alert:*** Serotonin syndrome, a potentially life-threatening condition, may occur, particularly with concomitant use of serotonergic drugs (including triptans and tramadol) and drugs that impair serotonin metabolism (including MAO inhibitors). Signs and symptoms of serotonin syndrome include mental status changes (agitation, coma, hallucinations), autonomic instability (hyperthermia, labile blood pressure, tachycardia), neuromuscular aberrations (hyperreflexia, incoordination), and diarrhea, nausea, and vomiting.

- Avoid use in patients with end-stage renal disease.
- Use cautiously in patients with a history of mania, seizures, severe hepatic impairment; or dysuria, in patients who consume substantial amounts of alcohol; and in those with hypertension or controlled angle-closure glaucoma.
- Use in pregnant women only if the benefit to the mother outweighs the risk to the fetus. It isn't known if drug appears in breast milk; discourage breast-feeding during therapy.
- Safety and efficacy in children haven't been established.

***Overdose S&S:*** Hypertension, cardiac arrest, decreased level of consciousness, dizziness, elevated liver function test results.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug may increase the risk of suicidal thinking and behavior in children, adolescents, and young adults with major depressive disorder or other psychiatric disorder. Drug isn't approved for use in children. ■

- At least 14 days should elapse between discontinuation of an MAO inhibitor and initiation of milnacipran therapy. Allow at least 5 days after stopping milnacipran before starting an MAO inhibitor.
- Monitor patient closely for worsening depression or suicidal behavior, especially during the first few months of therapy and with dosage adjustments.
- Decrease dosage gradually, and watch for signs and symptoms that may arise when drug is stopped, such as dysphoria, irritability, agitation, dizziness, sensory disturbances, anxiety, confusion, headache, lethargy, emotional lability, insomnia, hypomania, tinnitus, and seizures.
- Carefully monitor heart rate and blood pressure.
- Monitor patient for signs of hyponatremia (headache, difficulty concentrating, memory impairment, confusion, weakness, unsteadiness, hallucination, syncope, seizures, coma, respiratory arrest).
- Monitor liver function tests values and sodium level before and during therapy.

## PATIENT TEACHING

**Black Box Warning** Warn families and caregivers to immediately report signs and symptoms of worsening depression (such as agitation, irritability, insomnia, hostility, and impulsivity) and suicidal behavior. ■

- Advise patient to avoid taking nonsteroidal anti-inflammatory drugs and aspirin

while taking drug to reduce the risk of bleeding.
- Tell patient to avoid alcohol while taking drug.
- Instruct woman of childbearing age to notify prescriber if she becomes pregnant, is planning pregnancy during therapy, or is breast-feeding.
- Warn patient not to stop drug suddenly.
- Tell patient to consult prescriber before taking other prescription or OTC drugs.
- Warn patient to avoid hazardous activities that require alertness and good coordination until drug's effects are known.
- Tell patient that drug may be taken with or without food but that food may increase tolerability.
- Advise patient to regularly monitor blood pressure and pulse while taking drug.

**SAFETY ALERT!**

## milrinone lactate

MILL-ri-none

*Therapeutic class:* Inotrope
*Pharmacologic class:* Bipyridine phosphodiesterase inhibitor
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 1 mg/ml
*Injection (premixed):* 200 mcg/ml in $D_5W$

### INDICATIONS & DOSAGES

➤ **Short-term treatment of acutely decompensated heart failure**

*Adults:* Give first loading dose of 50 mcg/kg I.V. slowly over 10 minutes; then give continuous I.V. infusion of 0.375 to 0.75 mcg/kg/minute. Titrate infusion dose based on clinical and hemodynamic responses. Don't exceed 1.13 mg/kg/day.

***Adjust-a-dose:*** If creatinine clearance is 50 ml/minute, infusion rate is 0.43 mcg/kg/minute; if 40 ml/minute, infusion rate is 0.38 mcg/kg/minute; if 30 ml/minute, infusion rate is 0.33 mcg/kg/minute; if 20 ml/minute, infusion rate is 0.28 mcg/kg/minute; if 10 ml/minute, infusion rate is 0.23 mcg/kg/minute; and if 5 ml/minute, infusion rate is 0.2 mcg/kg/minute. Don't exceed 1.13 mg/kg/day.

### ADMINISTRATION

**I.V.**

▼ Give loading dose undiluted as a direct injection over 10 minutes.
▼ Prepare I.V. infusion solution using half-normal saline solution, normal saline solution, or $D_5W$. Prepare the 100-mcg/ml solution by adding 180 ml of diluent per 20-mg (20-ml) vial, the 150-mcg/ml solution by adding 113 ml of diluent per 20-mg (20-ml) vial, and the 200-mcg/ml solution by adding 80 ml of diluent per 20-mg (20-ml) vial.
▼ **Incompatibilities:** Bumetanide, furosemide, imipenem and cilastatin sodium, procainamide, torsemide.

### ACTION

Produces inotropic action by increasing cellular levels of cAMP and vasodilation by relaxing vascular smooth muscle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 5–15 min | 1–2 hr | 3–6 hr |

*Half-life:* 2½ to 3¾ hours.

### ADVERSE REACTIONS

**CNS:** headache.
**CV:** **VENTRICULAR ARRHYTHMIAS,** *ventricular ectopic activity,* ***sustained ventricular tachycardia, ventricular fibrillation,*** hypotension, nonsustained ventricular tachycardia.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

- May cause abnormal liver function test results.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Contraindicated for use in patients with severe aortic or pulmonic valvular disease in place of surgery and during acute phase of MI.
- Use cautiously in patients with atrial flutter or fibrillation because drug slightly shortens AV node conduction time and may increase ventricular response rate.

⚠ ***Overdose S&S:*** Hypotension.

### NURSING CONSIDERATIONS

- In patients with atrial flutter or fibrillation, give digoxin before milrinone therapy. Drug is typically given with digoxin and diuretics.
- Improved cardiac output may increase urine output. Reduce diuretic dosage when heart failure improves. Potassium loss may cause digitalis toxicity.
- Monitor fluid and electrolyte status, blood pressure, heart rate, and renal function during therapy. Excessive decrease in blood pressure requires stopping or slowing rate of infusion.
- Correct hypoxemia.

### PATIENT TEACHING

- Instruct patient to report adverse reactions to prescriber promptly, especially angina.
- Tell patient that drug may cause headache, which can be treated with analgesics.
- Tell patient to report discomfort at I.V. insertion site.

## minocycline hydrochloride

mi-noe-SYE-kleen

Dynacin, Minocin, Solodyn

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Tetracycline
*Pregnancy risk category D*

### AVAILABLE FORMS

*Capsules:* 50 mg, 75 mg, 100 mg
*Capsules (pellet-filled):* 50 mg, 100 mg
*Injection:* 100 mg
*Tablets:* 50 mg, 75 mg, 100 mg
*Tablets (extended-release):* 45 mg, 65 mg, 90 mg, 115 mg, 135 mg

### INDICATIONS & DOSAGES

➤ **Infections caused by susceptible gram-negative and gram-positive organisms (including *Haemophilus ducreyi, Yersinia pestis,* and *Campylobacter fetus*), *Rickettsiae* species, *Mycoplasma pneumoniae,* and *Chlamydia trachomatis;* psittacosis; granuloma inguinale**
*Adults:* 200 mg P.O. or I.V. initially; then 100 mg P.O. or I.V. every 12 hours. May use 100 or 200 mg P.O. initially; then 50 mg q.i.d.
*Children older than age 8:* Initially, 4 mg/kg P.O. or I.V.; then, 2 mg/kg P.O. or I.V. every 12 hours.

➤ **Gonorrhea in patients allergic to penicillin**
*Adults:* Initially, 200 mg P.O.; then 100 mg every 12 hours for at least 4 days. Obtain samples for follow-up cultures within 2 to 3 days after treatment.

➤ **Syphilis in patients allergic to penicillin**
*Adults:* Initially, 200 mg P.O.; then 100 mg every 12 hours for 10 to 15 days.

➤ **Meningococcal carrier state**
*Adults:* 100 mg P.O. every 12 hours for 5 days.

➤ **Uncomplicated urethral, endocervical, or rectal infection caused by *C. trachomatis* or *Ureaplasma urealyticum***
*Adults:* 100 mg P.O. every 12 hours for at least 7 days.

➤ **Uncomplicated gonococcal urethritis**
*Men:* 100 mg P.O. every 12 hours for 5 days.

➤ **Treatment of inflammatory lesions of nonnodular moderate to severe acne vulgaris**
*Adults and children age 12 and older:* 1 mg/kg extended release (Solodyn) P.O. once daily for 12 weeks.

➤ **Rheumatoid arthritis ♦**
*Adults:* 100 mg P.O. twice daily for up to 48 weeks.

***Adjust-a-dose:*** Decrease dosage in patients with renal impairment. Don't exceed 200 mg Minocin in 24 hours.

### ADMINISTRATION

**P.O.**

- Obtain specimen for culture and sensitivity tests before first dose. Begin therapy while awaiting results.
- Give drug with a full glass of water. Drug may be taken with food.
- Drug shouldn't be given within 1 hour of bedtime, to avoid esophageal irritation or ulceration.
- Give Solodyn at the same time each day, with or without food.
- Solodyn tablet must be swallowed whole and not crushed, chewed, or split.

**I.V.**

▼ Reconstitute powder with 5 ml sterile water for injection; further dilute to 500 to

1,000 ml with sodium chloride injection, dextrose injection, dextrose and sodium chloride injection, Ringer's injection, or Ringer's lactate injection. (Don't use solutions containing calcium because a precipitate may form.)
▼ Avoid rapid administration and don't administer with other drugs.
▼ Parenteral therapy is indicated only when oral therapy isn't adequate or tolerated. Institute oral therapy as soon as possible.

## ACTION

May be bacteriostatic by binding to microorganism's ribosomal subunits, inhibiting protein synthesis; may also alter the cytoplasmic membrane of susceptible microorganisms.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–4 hr | Unknown |
| P.O. (extended-release) | Unknown | 3½–4 hr | Unknown |
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 11 to 26 hours P.O., 15 to 23 hours I.V.

## ADVERSE REACTIONS

**CNS:** ***intracranial hypertension,*** headache, light-headedness, dizziness, vertigo.
**CV:** *thrombophlebitis*, pericarditis.
**GI:** *anorexia, diarrhea, nausea*, dysphagia, glossitis, epigastric distress, oral candidiasis, vomiting.
**Hematologic:** ***neutropenia, thrombocytopenia,*** eosinophilia, hemolytic anemia.
**Hepatic:** ***hepatotoxicity.***
**Musculoskeletal:** bone growth retardation in children younger than age 8.
**Skin:** *increased pigmentation, maculopapular and erythematous rashes, photosensitivity reactions, urticaria.*
**Other:** ***anaphylaxis,*** enamel defects, hypersensitivity reactions, permanent discoloration of teeth, superinfection.

## INTERACTIONS

**Drug-drug.** *Antacids (including sodium bicarbonate) and laxatives containing aluminum, magnesium, or calcium; antidiarrheals:* May decrease antibiotic absorption. Give antibiotic 1 hour before or 2 hours after these drugs.
*Ferrous sulfate and other iron products, zinc:* May decrease antibiotic absorption. Give drug 2 hours before or 3 hours after iron.
*Hormonal contraceptives:* May decrease contraceptive effectiveness and increase risk of breakthrough bleeding. Advise patient to use nonhormonal contraceptive.
*Isotretinoin:* May cause pseudomotor cerebri. Avoid giving shortly before, during, and shortly after minocycline therapy.
*Methoxyflurane:* May cause nephrotoxicity when given with tetracyclines. Avoid using together.
*Oral anticoagulants:* May increase anticoagulant effect. Monitor PT and INR, and adjust dosage.
*Penicillins:* May disrupt bactericidal action of penicillins. Avoid using together.
**Drug-lifestyle.** *Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

● May increase BUN and liver enzyme levels. May decrease hemoglobin level.
● May increase eosinophil count. May decrease platelet and neutrophil counts.
● May falsely elevate fluorometric test results for urine catecholamines. Parenteral form may cause false-positive results of copper sulfate test (Clinitest). May cause false-negative results in urine glucose tests using glucose oxidase reagent (Diastix or Chemstrip uG).

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or other tetracyclines. Solodyn tablets contraindicated in pregnancy, breast-feeding, or by persons of either gender attempting to conceive a child.
● Use cautiously in patients with impaired renal or hepatic function. Use of these drugs during last half of pregnancy and in children younger than age 8 may cause permanent discoloration of teeth, enamel defects, and bone growth retardation.
⚠ ***Overdose S&S:*** Dizziness, nausea, vomiting.

M

## NURSING CONSIDERATIONS

- Monitor renal and liver function test results.
- ***Alert:*** Check expiration date. Outdated or deteriorated drug may cause reversible nephrotoxicity (Fanconi syndrome).
- Don't expose drug to light or heat. Keep cap tightly closed.
- If large doses are given, therapy is prolonged, or patient is at high risk, monitor patient for signs and symptoms of superinfection.
- Check patient's tongue for signs of candidal infection. Stress good oral hygiene.
- Drug may discolor teeth in older children and young adults, more commonly when used as long-term treatment. Watch for brown pigmentation, and notify prescriber if it occurs.
- Photosensitivity reactions may occur within a few minutes to several hours after exposure. Photosensitivity lasts after therapy ends.
- ***Look alike–sound alike:*** Don't confuse Minocin with niacin or Mithracin.

## PATIENT TEACHING

- Tell patient to take entire amount of drug exactly as prescribed, even after he feels better.
- Instruct patient to take drug with a full glass of water. Drug may be taken with food. Tell patient not to take within 1 hour of bedtime to avoid esophageal irritation or ulceration.
- Warn patient to avoid driving or other hazardous tasks because of possible adverse CNS effects.
- Caution patient to avoid direct sunlight and ultraviolet light, wear protective clothing, and use sunscreen.
- Tell patient to take Solodyn at the same time each day, with or without food.
- Tell patient to swallow Solodyn tablet whole and not to crush, chew, or split tablet.
- Warn patient not to take more than 1 Solodyn tablet each day.

# minoxidil (topical)

mi-NOX-i-dill

Men's Rogaine ◇, Minoxidil Extra Strength for Men ◇, Rogaine Extra Strength for Men ◇, Theroxidil ◇, Women's Rogaine ◇

*Therapeutic class:* Hair-growth stimulant
*Pharmacologic class:* Direct-acting vasodilator
*Pregnancy risk category C*

## AVAILABLE FORMS

*Topical foam:* 5% ◇
*Topical solution:* 2% ◇, 5% ◇

## INDICATIONS & DOSAGES

➤ **Androgenetic alopecia**

*Adults:* 1 ml of solution or half a capful of foam applied to affected area b.i.d. Maximum daily dose is 2 ml of solution.

## ADMINISTRATION

**Topical**

- Don't use 5% solution in women.
- Dry hair and scalp thoroughly before application.

## ACTION

Stimulates hair growth, possibly by dilating arterial microcapillaries around hair follicles.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** headache, dizziness, faintness, lightheadedness.
**CV:** edema, chest pain, hypertension, hypotension, palpitations, increased or decreased pulse rate.
**EENT:** sinusitis.
**GI:** diarrhea, nausea, vomiting.
**GU:** UTI, renal calculi, urethritis.
**Metabolic:** weight gain.
**Musculoskeletal:** back pain, tendinitis.
**Respiratory:** bronchitis, upper respiratory infection.

**Skin:** *irritant dermatitis, dry skin or scalp, flaking, local erythema, pruritus,* allergic contact dermatitis, eczema, hypertrichosis, worsening of hair loss.

## INTERACTIONS

**Drug-drug.** *Petroleum jelly, topical corticosteroids, topical retinoids, other drugs that may increase skin absorption:* May increase risk of systemic effects of minoxidil. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or components of solution.
- Use cautiously in patients older than age 50 and in those with cardiac, renal, or hepatic disease.

## NURSING CONSIDERATIONS

- Patient needs to have normal, healthy scalp before beginning therapy because absorption of drug through irritated skin may cause adverse systemic effects.
- Treatment will most likely succeed in patients with balding area smaller than 4 inches (10 cm) that developed within past 10 years.

## PATIENT TEACHING

- Teach patient how to apply drug. Tell him to dry hair and scalp thoroughly before application and not to apply drug to other body areas. Tell patient not to use drug on irritated or sunburned scalp or with other drugs on scalp. Tell him to thoroughly wash hands after application.
- Warn patient to avoid inhaling any spray or mist from drug and to avoid spraying around eyes because solution contains alcohol and may be irritating.
- Inform patient that more frequent applications or using more than 2 ml daily won't increase hair growth but instead may increase adverse reactions. Tell patient not to double the dose for missed applications.
- Teach patient to monitor pulse rate and body weight.
- Advise patient that therapy will be prolonged and will continue for at least 4 months before clinical effects appear. Tell him that drug must be used daily for optimal results. Almost half of patients will experience moderate to dense hair growth.
- Tell patient that stopping drug may cause loss of new hair growth. New hair growth is usually fine and may be colorless but will resemble existing hair after continued treatment.

# mirtazapine

mer-TAH-zah-peen

Remeron, Remeron Soltab

*Therapeutic class:* Antidepressant
*Pharmacologic class:* Tetracyclic antidepressant
*Pregnancy risk category C*

## AVAILABLE FORMS

*Orally disintegrating tablets (ODTs):* 15 mg, 30 mg, 45 mg
*Tablets:* 7.5 mg, 15 mg, 30 mg, 45 mg

M

## INDICATIONS & DOSAGES

➤ **Depression**

*Adults:* Initially, 15 mg P.O. at bedtime. Maintenance dose is 15 to 45 mg daily. Adjust dosage at intervals of at least 1 week.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.
- Remove ODT from blister pack and immediately place on patient's tongue.
- ODT may be given with or without water.
- Don't split or crush ODT.

## ACTION

Thought to enhance central noradrenergic and serotonergic activity.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 hr | Unknown |

*Half-life:* About 20 to 40 hours.

## ADVERSE REACTIONS

**CNS:** *somnolence,* ***suicidal behavior,*** dizziness, asthenia, abnormal dreams, abnormal thinking, tremors, confusion.
**CV:** edema, peripheral edema.

**GI:** *increased appetite, dry mouth, constipation,* nausea.
**GU:** urinary frequency.
**Metabolic:** *weight gain.*
**Musculoskeletal:** back pain, myalgia.
**Respiratory:** dyspnea.
**Other:** flulike syndrome.

## INTERACTIONS

**Drug-drug.** *Diazepam, other CNS depressants:* May cause additive CNS effects. Avoid using together.
*MAO inhibitors:* May sometimes cause fatal reactions. Avoid using within 14 days of MAO inhibitor therapy.
**Drug-lifestyle.** *Alcohol use:* May cause additive CNS effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, cholesterol and triglyceride levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and within 14 days of MAO inhibitor therapy.

**Black Box Warning** Mirtazapine isn't approved for use in children. ▮

- Use cautiously in patients with CV or cerebrovascular disease, seizure disorders, suicidal thoughts, hepatic or renal impairment, or history of mania or hypomania.
- Use cautiously in patients with conditions that predispose them to hypotension, such as dehydration, hypovolemia, or antihypertensive therapy.
- Give drug cautiously to elderly patients; decreased clearance has occurred in this age group.

***Overdose S&S:*** Disorientation, drowsiness, impaired memory, tachycardia.

## NURSING CONSIDERATIONS

- Don't use within 14 days of MAO inhibitor therapy.
- Record mood changes. Watch for suicidal tendencies.

**Black Box Warning** Drug may increase risk of suicidal thinking and behavior in children to adolescents, and young adults ages 18 to 24 with major depressive or other psychiatric disorder. ▮

- Although agranulocytosis occurs rarely, stop drug and monitor patient closely if he develops a sore throat, fever, stomatitis, or other signs and symptoms of infection with a low WBC count.
- Lower dosages tend to be more sedating than higher dosages.

## PATIENT TEACHING

**Black Box Warning** Advise families and caregivers to closely observe patient for increasing suicidal thinking and behavior. ▮

- Caution patient not to perform hazardous activities if he gets too sleepy.
- Tell patient to report signs and symptoms of infection, such as fever, chills, sore throat, mucous membrane irritation, or flulike syndrome.
- Instruct patient not to use alcohol or other CNS depressants while taking drug.
- Stress importance of following prescriber's orders.
- Instruct patient not to take other drugs without prescriber's approval.
- Tell women of childbearing age to report suspected pregnancy immediately and to notify prescriber if breast-feeding.
- Instruct patient to remove ODTs from blister pack and place immediately on tongue. Tell the patient to be sure his hands are clean and dry if he touches the tablet.
- Advise patient not to break or split tablet.

# misoprostol

mye-soe-PROST-ole

Cytotec

*Therapeutic class:* Antiulcer
*Pharmacologic class:* Prostaglandin $E_1$ analogue
*Pregnancy risk category X*

## AVAILABLE FORMS

*Tablets:* 100 mcg, 200 mcg

## INDICATIONS & DOSAGES

➤ **To prevent NSAID-induced gastric ulcer in patients at high risk for complications from gastric ulcer and in patients with history of NSAID-induced ulcer**

*Adults:* 200 mcg P.O. q.i.d. with food; if not tolerated, decrease to 100 mcg P.O. q.i.d. Give dosage for duration of NSAID therapy.

### ADMINISTRATION

**P.O.**
- Give drug with food.
- Give last dose at bedtime.

### ACTION

A synthetic prostaglandin $E_1$ analogue that replaces gastric prostaglandins depleted by NSAID therapy, decreases basal and stimulated gastric acid secretion, and increases gastric mucus and bicarbonate production.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30 min | 60–90 min | 3 hr |

*Half-life:* 20 to 40 minutes.

### ADVERSE REACTIONS

**CNS:** headache.
**GI:** *abdominal pain, diarrhea,* constipation, dyspepsia, flatulence, nausea, vomiting.
**GU:** cramps, dysmenorrhea, hypermenorrhea, menstrual disorders, postmenopausal vaginal bleeding, spotting.

### INTERACTIONS

**Drug-food.** *Any food:* May decrease absorption rate of drug. However, manufacturer recommends that patient take drug with food.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in those allergic to prostaglandins, pregnant women, or those who are breast-feeding.
- Use with caution in patients with inflammatory bowel disease.

***Overdose S&S:*** Sedation, tremors, seizures, dyspnea, abdominal pain, fever, diarrhea, palpitations, hypotension, bradycardia.

### NURSING CONSIDERATIONS

**Black Box Warning** Take special precautions to prevent use of drug during pregnancy. Uterine rupture is linked to certain risk factors, including later trimester pregnancies, higher doses of the drug, prior cesarean delivery or uterine surgery, or five or more previous pregnancies. Make sure woman understands dangers of drug to herself and her fetus and that she receives both oral and written warnings about these dangers. Also, make sure she can comply with effective contraception and that the result of a pregnancy test performed within 2 weeks of starting therapy is negative. ▮
- Drug causes modest decrease in basal pepsin secretion.
- ***Look alike–sound alike:*** Don't confuse misoprostol with mifepristone.

### PATIENT TEACHING

- Instruct patient not to share drug.

**Black Box Warning** Remind pregnant woman that drug may cause miscarriage, often with potentially life-threatening bleeding. ▮

**Black Box Warning** Advise woman not to begin therapy until second or third day of next normal menstrual period. ▮
- Advise patient to take drug as prescribed for duration of NSAID therapy.
- Tell patient that diarrhea usually occurs early in the course of therapy and is usually self-limiting. Taking drug with food helps minimize the diarrhea.

M

### SAFETY ALERT!

## mitomycin (mitomycin-C)

mye-toe-MYE-sin

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Antineoplastic antibiotic
*Pregnancy risk category D*

### AVAILABLE FORMS

*Powder for injection:* 5-, 20-, 40-mg vials

### INDICATIONS & DOSAGES

Dosage and indications vary. Check treatment protocol with prescriber.

➤ **Disseminated adenocarcinoma of stomach or pancreas with other chemotherapeutic agents**

*Adults:* 10 to 20 mg/m$^2$ as an I.V. single dose. Repeat cycle at 15 mg/m$^2$ after 6 to

8 weeks when WBC and platelet counts have returned to normal.

***Adjust-a-dose:*** For patients with myelosuppression, if leukocytes are 2,000 to 2,999/$mm^3$ and platelets are 25,000 to 74,999/$mm^3$, give 70% of initial dose. If leukocytes are less than 2,000/$mm^3$ and platelets are less than 25,000/$mm^3$, give 50% of initial dose.

## ADMINISTRATION

**I.V.**

▼ Drug is a vesicant. Never give drug I.M. or subcutaneously.

▼ Preparing and giving drug may be mutagenic, teratogenic, or carcinogenic. Follow institutional policy to reduce risks.

▼ Using sterile water for injection, reconstitute drug in 5-mg vials with 10 ml, 20-mg vials with 40 ml, and 40-mg vials with 80 ml.

▼ Give drug into the side arm of a free-flowing I.V.

▼ When reconstituted with sterile water, solution is stable for 14 days under refrigeration and 7 days at room temperature. When diluted, drug is stable in $D_5W$ for no more than 4 hours, normal saline solution for no more than 48 hours, sodium lactate for no more than 24 hours.

▼ The combination of mitomycin (5 to 15 mg) and heparin (1,000 to 10,000 units) in 30 ml normal saline solution is stable for 72 hours at room temperature.

▼ Stop infusion immediately and notify prescriber if extravasation occurs because of potential for severe ulceration and necrosis.

▼ **Incompatibilities:** Aztreonam, bleomycin, cefepime, etoposide, filgrastim, gemcitabine, piperacillin sodium-tazobactam sodium, sargramostim, topotecan, vinorelbine.

## ACTION

Similar to an alkylating drug, cross-linking strands of DNA and causing an imbalance of cell growth, leading to cell death.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* About 50 minutes.

## ADVERSE REACTIONS

**CNS:** headache, neurologic abnormalities, confusion, drowsiness, fatigue, *fever*, pain.

**EENT:** blurred vision.

**GI:** mucositis, *nausea*, *vomiting*, *anorexia*, *diarrhea*, *stomatitis.*

**GU:** ***renal toxicity, hemolytic uremic syndrome.***

**Hematologic:** **THROMBOCYTOPENIA, LEUKOPENIA,** ***microangiopathic hemolytic anemia.***

**Respiratory:** ***interstitial pneumonitis, pulmonary edema,*** dyspnea, nonproductive cough, ***acute respiratory distress syndrome.***

**Skin:** cellulitis, induration, desquamation, pruritus, *pain at injection site*, *reversible alopecia*, purple bands on nails, rash, sloughing with extravasation.

**Other:** ***septicemia,*** ulceration.

## INTERACTIONS

**Drug-drug.** *Vinca alkaloids:* May cause acute respiratory distress when given together. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

• May increase BUN and creatinine levels. May decrease hemoglobin level.

• May decrease WBC and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug and in those with thrombocytopenia, coagulation disorders, or an increased bleeding tendency from other causes.

• Don't give to patients with serum creatinine level greater than 1.7 mg/dl.

## NURSING CONSIDERATIONS

**Black Box Warning** Administer drug under the supervision of a physician experienced with cancer chemotherapeutic agents. ■

**Black Box Warning** Bone marrow suppression is the most common and severe toxic effect. ■

***Alert:*** Extravasation may occur, causing cellulitis, ulceration, and tissue slough. If signs or symptoms of these conditions occur, stop infusion immediately and notify prescriber. Withdraw 3 to 5 ml of blood; then remove infusion needle. Treatment may include ice compresses, application of dimethyl sulfoxide, limb elevation, and

protecting site from friction. If skin necrosis develops, skin grafting may be necessary.
- Continue CBC and blood studies at least 8 weeks after therapy stops. Leukopenia and thrombocytopenia are cumulative. If WBC count falls below 2,000/$mm^3$ or granulocyte count falls below 1,000/$mm^3$, follow institutional policy for infection control in immunocompromised patients.
- To prevent bleeding, avoid all I.M. injections when platelet count is less than 100,000/$mm^3$.
- Anticipate need for blood transfusions to combat anemia.
- Monitor patient for dyspnea with nonproductive cough; chest X-ray may show infiltrates.
- Monitor renal function tests.
- Leukopenia may occur up to 8 weeks after therapy and may be cumulative with successive doses.

**Black Box Warning** Hemolytic uremic syndrome is characterized by microangiopathic hemolytic anemia, thrombocytopenia, and renal failure. Most cases occur at doses of 60 mg or more. ■

## PATIENT TEACHING

- Advise patient to report any pain or burning at site of injection during or after administration.
- Warn patient to watch for signs and symptoms of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell patient to take temperature daily.
- Inform patient that hair loss may occur but that it's usually reversible.

**SAFETY ALERT!**

# mitoxantrone hydrochloride

mye-toe-ZAN-trone

Novantrone

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* DNA-reactive agent; anthracenedione
*Pregnancy risk category D*

## AVAILABLE FORMS

*Injection:* 2 mg/ml

## INDICATIONS & DOSAGES

➤ **Combination initial therapy for acute nonlymphocytic leukemia**

*Adults:* Induction begins with 12 mg/$m^2$ I.V. daily on days 1 to 3, with 100 mg/$m^2$ daily of cytarabine on days 1 to 7 as a continuous 24-hour infusion. A second induction may be given if response isn't adequate. Maintenance therapy is 12 mg/$m^2$ on days 1 and 2, with cytarabine 100 mg/$m^2$ on days 1 to 5 as a continuous 24-hour infusion.

➤ **To reduce neurologic disability and frequency of relapse in chronic progressive, progressive relapsing, or worsening relapsing-remitting multiple sclerosis**

*Adults:* 12 mg/$m^2$ I.V. over 5 to 15 minutes every 3 months.

➤ **Advanced hormone-refractory prostate cancer**

*Men:* 12 to 14 mg/$m^2$ as a short I.V. infusion every 21 days. Drug is given as an adjunct to corticosteroid therapy.

## ADMINISTRATION

**I.V.**

▼ Preparing and giving drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.
▼ Dilute dose in at least 50 ml of normal saline solution for injection or $D_5W$ injection. Don't mix with other drugs.
**Black Box Warning** Give slowly into a free-flowing I.V. infusion of normal saline solution or $D_5W$ injection over at least 3 minutes. ■
**Black Box Warning** Never give subcutaneously, intra-arterially, or intramuscularly. ■
**Black Box Warning** Drug is not for intrathecal use. ■
**Black Box Warning** Severe local tissue damage may occur if there is extravasation. ■
▼ If extravasation occurs, stop infusion immediately and notify prescriber.
▼ Once vial is penetrated, undiluted solution may be stored for 7 days at room temperature or 14 days in refrigerator. Don't freeze.
▼ **Incompatibilities:** Amphotericin B, aztreonam, cefepime, doxorubicin liposomal, heparin sodium, hydrocortisone, other I.V. drugs, paclitaxel, piperacillin

sodium and tazobactam sodium, propofol, sargramostim.

## ACTION

Reacts with DNA, producing cytotoxic effect. Probably not specific to cell cycle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* Terminal half-life, 23 to 215 hours.

## ADVERSE REACTIONS

**CNS:** *fever, headache,* ***seizures.***
**CV:** ***arrhythmias,*** ECG abnormalities, ***heart failure,*** tachycardia.
**EENT:** conjunctivitis, sinusitis.
**GI:** *abdominal pain, bleeding, constipation, diarrhea, mucositis, nausea, stomatitis, vomiting.*
**GU:** *amenorrhea, menstrual disorder, UTI,* ***renal failure.***
**Hematologic:** ***myelosuppression,*** anemia.
**Hepatic:** jaundice.
**Metabolic:** hyperuricemia.
**Musculoskeletal:** back pain.
**Respiratory:** *cough, dyspnea, upper respiratory tract infection,* pneumonia.
**Skin:** *alopecia,* ecchymoses, local irritation or phlebitis, petechiae.
**Other:** *fungal infections,* ***sepsis.***

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, bilirubin, GGT, and uric acid levels. May decrease hemoglobin level and hematocrit.
- May decrease leukocyte and granulocyte counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.

**Black Box Warning** Evaluate left ventricular ejection fraction (LVEF) before initiating treatment and prior to administering each dose of mitoxantrone to patients with multiple sclerosis. All patients with multiple sclerosis who have finished treatment should receive yearly, quantitative LVEF evaluation to detect late-occurring cardiac toxicity.

- Use cautiously in patients with previous exposure to anthracyclines or other cardiotoxic drugs, previous radiation therapy to mediastinal area, or heart disease. Significantly myelosuppressed patients shouldn't receive drug unless benefits outweigh risks.

***Overdose S&S:*** Severe leukopenia.

## NURSING CONSIDERATIONS

**Black Box Warning** Administer under the supervision of a physician experienced with cytotoxic chemotherapy.

**Black Box Warning** Except when used to treat ANLL, mitoxantrone should generally not be given to patients with baseline neutrophil counts less than 1,500 cells/$mm^3$. Frequently monitor peripheral blood cell counts for all patients using drug.

- Closely monitor hematologic and laboratory chemistry parameters, including liver function studies. Obtain CBC and platelet count before each course of treatment. Patient may require blood transfusion or RBC or WBC colony-stimulating factors.
- Avoid all I.M. injections if platelet count falls below 50,000/$mm^3$.

**Black Box Warning** Use of drug has been associated with cardiotoxicity. Monitor left ventricular ejection fraction before initiating therapy and prior to each dose; risk of cardiotoxicity increases with cumulative dose of 140 mg/$m^2$, although toxicities may occur at any dose. Continue ongoing cardiac monitoring to detect late occurring cardiotoxicity.

- If severe nonhematologic toxicity occurs during first course, delay second course until patient recovers.

**Black Box Warning** Secondary AML has been reported with mitoxantrone therapy.

***Alert:*** Women with multiple sclerosis who are biologically capable of becoming pregnant and even if they are using birth control, should have a pregnancy test, and the results should be known, before receiving each dose.

## PATIENT TEACHING

- Advise patient to report any pain or burning at site of injection during or after administration.
- Tell patient that urine may appear blue-green within 24 hours after receiving drug

and that the whites of his eyes may turn blue. These effects are not harmful but may persist during therapy.
• Advise patient to watch for signs and symptoms of bleeding and infection.
• Recommend that women consult prescriber before becoming pregnant.

## modafinil

moe-DAFF-in-ill

Alertec†, Provigil

*Therapeutic class:* CNS stimulant
*Pharmacologic class:* Analeptic
*Pregnancy risk category C*
*Controlled substance schedule IV*

### AVAILABLE FORMS

*Tablets:* 100 mg, 200 mg

### INDICATIONS & DOSAGES

➤ **To improve wakefulness in patients with excessive daytime sleepiness caused by narcolepsy, obstructive sleep apnea-hypopnea syndrome, and shift-work sleep disorder**

*Adults and adolescents age 16 and older:* 200 mg P.O. daily, as single dose in the morning. Patients with shift-work sleep disorder should take dose about 1 hour before the start of their shift.

***Adjust-a-dose:*** In patients with severe hepatic impairment, give 100 mg P.O. daily, as single dose in the morning.

➤ **Multiple sclerosis–related fatigue ♦**

*Adults:* 50 mg P.O. b.i.d. for up to 3 months.

### ADMINISTRATION

**P.O.**

• Give drug without regard for food; however, food may delay effect of drug.

### ACTION

Unknown. Similar to action of sympathomimetics, including amphetamines, but drug is structurally distinct from amphetamines and doesn't alter release of dopamine or norepinephrine to produce CNS stimulation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–4 hr | Unknown |

*Half-life:* 15 hours.

### ADVERSE REACTIONS

**CNS:** *headache, nervousness, dizziness, insomnia,* fever, depression, anxiety, cataplexy, paresthesia, dyskinesia, hypertonia, confusion, syncope, amnesia, emotional lability, ataxia, tremor, mania, hallucination, ***suicidal ideation.***
**CV:** ***arrhythmias,*** hypotension, hypertension, vasodilation, chest pain.
**EENT:** *rhinitis,* pharyngitis, epistaxis, amblyopia, abnormal vision.
**GI:** *nausea,* diarrhea, dry mouth, anorexia, vomiting, mouth ulcer, gingivitis, thirst.
**GU:** abnormal urine, urine retention, abnormal ejaculation, albuminuria.
**Hematologic:** eosinophilia.
**Metabolic:** hyperglycemia.
**Musculoskeletal:** joint disorder, neck pain, neck rigidity.
**Respiratory:** ***asthma,*** dyspnea, lung disorder.
**Skin:** sweating.
**Other:** herpes simplex, chills.

### INTERACTIONS

**Drug-drug.** *Carbamazepine, phenobarbital, rifampin, and other inducers of CYP3A4:* May alter modafinil level. Monitor patient closely.
*Cyclosporine, theophylline:* May reduce levels of these drugs. Use together cautiously.
*Diazepam, phenytoin, propranolol, other drugs metabolized by CYP2C19:* May inhibit CYP2C19 and lead to higher levels of drugs metabolized by this enzyme. Use together cautiously; adjust dosage as needed.
*Hormonal contraceptives:* May reduce contraceptive effectiveness. Advise patient to use alternative or additional method of contraception during modafinil therapy and for 1 month after drug is stopped.
*Itraconazole, ketoconazole, other inhibitors of CYP3A4:* May alter modafinil level. Monitor patient closely.
*Methylphenidate:* May cause 1-hour delay in modafinil absorption. Separate dosage times.

*Phenytoin, warfarin:* May inhibit CYP2C9 and increase phenytoin and warfarin levels. Monitor patient closely for toxicity.
*Tricyclic antidepressants (such as clomipramine, desipramine):* May increase tricyclic antidepressant level. Reduce dosage of these drugs.

## EFFECTS ON LAB TEST RESULTS

- May increase glucose, GGT, and AST levels.
- May increase eosinophil count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with a history of left ventricular hypertrophy or ischemic ECG changes, chest pain, arrhythmias, or other evidence of mitral valve prolapse linked to CNS stimulant use.
- Use cautiously in patients with recent MI or unstable angina and in those with history of psychosis.
- Use cautiously and give reduced dosage to patients with severe hepatic impairment, with or without cirrhosis.
- Use cautiously in patients taking MAO inhibitors.
- Safety and efficacy in patients with severe renal impairment haven't been determined.
- Modafinil isn't approved for use in children younger than age 16 for any indication.

***Overdose S&S:*** Agitation or excitation, insomnia, slight or moderate elevations in hemodynamic parameters, aggressiveness, anxiety, confusion, decreased PT, diarrhea, irritability, nausea, nervousness, palpitations, sleep disturbances, tremor, bradycardia, chest pain, hypertension, tachycardia, hallucination, restlessness.

## NURSING CONSIDERATIONS

- Monitor hypertensive patients closely.
- Although single daily 400-mg doses have been well tolerated, the larger dose is no more beneficial than the 200-mg dose.

## PATIENT TEACHING

***Alert:*** Advise patient to stop drug and notify prescriber if rash, peeling skin, trouble swallowing or breathing, or other symptoms of allergic reaction occur. Rare cases of serious rash including Stevens-Johnson syndrome, toxic epidermal necrolysis, and drug rash with eosinophilia and hypersensitivity have been reported.
- Advise woman to notify prescriber about planned, suspected, or known pregnancy, or if she's breast-feeding.
- Caution patient that use of hormonal contraceptives (including depot or implantable contraceptives) together with modafinil tablets may reduce contraceptive effectiveness. Recommend an alternative method of contraception during modafinil therapy and for 1 month after drug is stopped.
- Instruct patient to confer with prescriber before taking prescription or OTC drugs to avoid drug interactions.
- Tell patient to avoid alcohol while taking drug.
- Warn patient to avoid activities that require alertness or good coordination until CNS effects of drug are known.

# mometasone furoate

moe-MEH-tah-zone

Asmanex Twisthaler

# mometasone furoate monohydrate

Nasonex

*Therapeutic class:* Antiasthmatic
*Pharmacologic class:* Glucocorticoid
*Pregnancy risk category C*

## AVAILABLE FORMS

*Inhalation powder:* 110 mcg/inhalation, 220 mcg/inhalation
*Nasal spray:* 50 mcg/spray

## INDICATIONS & DOSAGES

➤ **Maintenance therapy for asthma; asthma in patients who take an oral corticosteroid**

*Adults and children age 12 and older who previously used a bronchodilator or inhaled corticosteroid:* Initially, 220 mcg by oral inhalation every day in the evening. Maximum, 440 mcg/day.
*Adults and children age 12 and older who take an oral corticosteroid:* 440 mcg b.i.d. by oral inhalation. Maximum, 880 mcg/day.

Reduce oral corticosteroid dosage by no more than 2.5 mg/day at weekly intervals, beginning at least 1 week after starting mometasone. After stopping oral corticosteroid, reduce mometasone dose to lowest effective amount.
*Children 4 to 11 years:* 110 mcg by oral inhalation once daily in the evening.
➤ **Allergic rhinitis**
*Adults and children age 12 and older:* 2 sprays (50 mcg/spray) in each nostril once daily.
*Children ages 2 to 11:* 1 spray (50 mcg/spray) in each nostril once daily.
➤ **Nasal polyps**
*Adults:* 2 sprays (50 mcg/spray) in each nostril once daily to b.i.d.

## ADMINISTRATION

**Inhalational**
- Have patient breathe deeply and rapidly during administration.
- Have patient rinse his mouth after administration.

**Intranasal**
- Before initial use, prime nasal spray pump 10 times or until fine spray appears.
- Pump may be stored for 1 week without repriming. If unused for more than 1 week, reprime two times or until a fine spray appears.

## ACTION

Unknown, although corticosteroids inhibit many cells and mediators involved in inflammation and the asthmatic response.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Inhalation | Unknown | 1–2½ hr | Unknown |
| Intranasal | Unknown | Unknown | Unknown |

*Half-life:* 5 hours (oral); 5.8 hours (nasal).

## ADVERSE REACTIONS

**CNS:** *headache,* depression, fatigue, insomnia, pain.
**EENT:** *allergic rhinitis, pharyngitis,* dry throat, dysphonia, earache, epistaxis, nasal irritation, sinus congestion, sinusitis.
**GI:** abdominal pain, anorexia, dyspepsia, flatulence, gastroenteritis, nausea, oral candidiasis, vomiting.
**GU:** dysmenorrhea, menstrual disorder, UTI.
**Musculoskeletal:** arthralgia, back pain, myalgia.
**Respiratory:** *upper respiratory tract infection,* respiratory disorder.
**Other:** accidental injury, flulike symptoms, infection.

## INTERACTIONS

**Drug-drug.** *Ketoconazole:* May increase mometasone level. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its ingredients and in those with status asthmaticus or other acute forms of asthma or bronchospasm (as primary treatment).
- Use cautiously in patients at high risk for decreased bone mineral content (those with a family history of osteoporosis, prolonged immobilization, long-term use of drugs that reduce bone mass), patients switching from a systemic to an inhaled corticosteroid, and patients with active or dormant tuberculosis, untreated systemic infections, ocular herpes simplex, or immunosuppression.
- Use cautiously in breast-feeding women.

***Overdose S&S:*** Hypercorticism.

## NURSING CONSIDERATIONS

***Alert:*** Don't use for acute bronchospasm.
- Wean patient slowly from a systemic corticosteroid after he switches to mometasone. Monitor lung function tests, beta-agonist use, and asthma symptoms.

***Alert:*** If patient is switching from an oral corticosteroid to an inhaled form, watch closely for evidence of adrenal insufficiency, such as fatigue, lethargy, weakness, nausea, vomiting, and hypotension.
- After an oral corticosteroid is withdrawn, hypothalamic-pituitary-adrenal (HPA) function may not recover for months. If patient has trauma, stress, infection, or surgery during this HPA recovery period, he is particularly vulnerable to adrenal insufficiency or adrenal crisis.
- Because an inhaled corticosteroid can be systemically absorbed, watch for cushingoid effects.

- Assess patient for bone loss during long-term use.
- Watch for evidence of localized mouth infections, glaucoma, and immunosuppression.
- Use drug only if benefits to mother justify risks to fetus. If a woman takes a corticosteroid during pregnancy, monitor neonate for hypoadrenalism.
- Monitor elderly patients for increased sensitivity to drug effects.

### PATIENT TEACHING

- Instruct patient on proper use and routine care of the inhaler or nasal spray pump.
- Tell patient to use drug regularly and at the same time each day. If he uses it only once daily, tell him to do so in the evening.
- Caution patient not to use drug for immediate relief of an asthma attack or bronchospasm.
- Inform patient that maximal benefits might not occur for 1 to 2 weeks or longer after therapy starts; instruct him to notify his prescriber if his condition fails to improve or worsens.
- Tell patient that if he has bronchospasm after taking drug, he should immediately use a fast-acting bronchodilator. Urge him to contact prescriber immediately if bronchospasm doesn't respond to the fast-acting bronchodilator.

***Alert:*** If patient has been weaned from an oral corticosteroid, urge him to contact prescriber immediately if an asthma attack occurs or if he is experiencing a period of stress. The oral corticosteroid may need to be resumed.

- Warn patient to avoid exposure to chickenpox or measles and to notify prescriber if such contact occurs.
- Long-term use of an inhaled corticosteroid may increase the risk of cataracts or glaucoma; tell patient to report vision changes.
- Advise patient to write the date on a new inhaler on the day he opens it and to discard the inhaler after 45 days or when the dose counter reads "00."

## montelukast sodium

mon-tell-OO-kast

Singulair℞

*Therapeutic class:* Antiasthmatic
*Pharmacologic class:* Leukotriene-receptor antagonist
*Pregnancy risk category B*

### AVAILABLE FORMS

*Oral granules:* 4-mg packet
*Tablets (chewable):* 4 mg, 5 mg
*Tablets (film-coated):* 10 mg

### INDICATIONS & DOSAGES

➤ **Asthma, seasonal allergic rhinitis, perennial allergic rhinitis**

*Adults and children age 15 and older:* 10 mg P.O. once daily in evening.
*Children ages 6 to 14:* 5 mg chewable tablet P.O. once daily in evening.
*Children ages 2 to 5:* 4 mg chewable tablet or 1 packet of 4-mg oral granules P.O. once daily in the evening.
*Children ages 12 to 23 months (asthma only):* 1 packet of 4-mg oral granules P.O. once daily in the evening.
*Children ages 6 to 23 months (perennial allergic rhinitis only):* 1 packet of 4-mg oral granules P.O. once daily in the evening.

➤ **Prevention of exercise-induced bronchospasm**

*Adults and children age 15 and older:* 10 mg P.O. at least 2 hours before exercise. Patients already taking a daily dose shouldn't take an additional dose. Also, an additional dose shouldn't be taken within 24 hours of a previous dose.

### ADMINISTRATION

**P.O.**

- Give oral granules directly in the mouth, dissolved in 5 ml of cold or room temperature baby formula or breast milk, or mixed with a spoonful of cold or room temperature soft foods (use only applesauce, carrots, rice, or ice cream).
- Give oral granules without regard for food.

## ACTION

Reduces early and late-phase bronchoconstriction from antigen challenge.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. (chewable, granules) | Unknown | 2–2½ hr | 24 hr |
| P.O. (film-coated) | Unknown | 3–4 hr | 24 hr |

*Half-life:* 2¾ to 5½ hours.

## ADVERSE REACTIONS

**CNS:** *headache,* asthenia, dizziness, fatigue, fever.
**EENT:** dental pain, nasal congestion.
**GI:** abdominal pain, dyspepsia, infectious gastroenteritis.
**GU:** pyuria.
**Hematologic:** systemic eosinophilia.
**Respiratory:** cough.
**Skin:** rash.
**Other:** influenza, trauma.

## INTERACTIONS

**Drug-drug.** *Phenobarbital, rifampin:* May decrease bioavailability of montelukast because of hepatic metabolism induction. Monitor patient for effectiveness.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT and AST levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its ingredients.
- Use cautiously and with appropriate monitoring in patients whose dosages of systemic corticosteroids are reduced.

***Overdose S&S:*** Headache, vomiting, psychomotor hyperactivity, thirst, somnolence, mydriasis, hyperkinesia, abdominal pain.

## NURSING CONSIDERATIONS

- Assess patient's underlying condition, and monitor him for effectiveness.

***Alert:*** Don't abruptly substitute drug for inhaled or oral corticosteroids. Dose of inhaled corticosteroids may be reduced gradually.

***Alert:*** Drug isn't indicated for use in patients with acute asthmatic attacks, status asthmaticus, or as monotherapy for management of exercise-induced bronchospasm. Continue appropriate rescue drug for acute worsening.

- Drug may cause behavior and mood changes. Monitor patient and consider discontinuing drug if neuropsychiatric symptoms develop.

## PATIENT TEACHING

- Inform caregiver that the oral granules may be given directly into the child's mouth, dissolved in 1 teaspoon of cold or room-temperature baby formula or breast milk, or mixed in a spoonful of applesauce, carrots, rice, or ice cream.
- Tell caregiver not to open packet until ready to use and, after opening, to give the full dose within 15 minutes. Tell her that if she's mixing the drug with food, not to store excess for future use and to discard the unused portion.
- Advise patient to take drug daily, even if asymptomatic, and to contact his prescriber if asthma isn't well controlled.
- Warn patient not to reduce or stop taking other prescribed antiasthmatics without prescriber's approval.
- Advise patient to seek medical attention if short-acting inhaled bronchodilators are needed more often than usual during drug therapy.
- Warn patient that drug isn't beneficial in acute asthma attacks or in exercise-induced bronchospasm, and advise him to keep appropriate rescue drugs available.
- Warn patient that drug may cause behavior and mood changes, and to report development of these symptoms to prescriber.
- Advise patient with known aspirin sensitivity to continue to avoid using aspirin and NSAIDs during drug therapy.

***Alert:*** Advise patient with phenylketonuria that chewable tablet contains phenylalanine.

**SAFETY ALERT!**

## morphine hydrochloride

MOR-feen

Doloral†, M.O.S†, M.O.S.-S.R†

## morphine sulfate

Astramorph PF, Avinza, DepoDur, Duramorph PF, Infumorph, Kadian, M-Eslon†, M.O.S. Sulphate†, MS Contin, MSIR, Oramorph SR, RMS Uniserts, Roxanol, Statex†

*Therapeutic class:* Opioid analgesic
*Pharmacologic class:* Opioid
*Pregnancy risk category C*
*Controlled substance schedule II*

### AVAILABLE FORMS

**morphine hydrochloride**
*Oral solution:* 1 mg/ml†, 5 mg/ml†, 10 mg/ml†, 20 mg/ml†, 50 mg/ml†
*Suppositories:* 10 mg†, 20 mg†, 30 mg†
*Syrup:* 1 mg/ml†*, 5 mg/ml†*, 10 mg/ml†*, 20 mg/ml†*, 50 mg/ml†*

**morphine sulfate**
*Capsules (extended-release beads):* 30 mg, 45 mg, 60 mg, 75 mg, 90 mg, 120 mg
*Capsules (extended-release pellets):* 10 mg, 20 mg, 30 mg, 50 mg, 60 mg, 80 mg, 100 mg, 200 mg
*Injection (epidural):* 10 mg/ml
*Injection (with preservative):* 0.5 mg/ml, 1 mg/ml, 2 mg/ml, 4 mg/ml, 5 mg/ml, 8 mg/ml, 10 mg/ml, 15 mg/ml, 25 mg/ml, 50 mg/ml
*Injection (without preservative):* 0.5 mg/ml, 1 mg/ml, 10 mg/ml, 25 mg/ml
*Oral solution:* 10 mg/5 ml, 20 mg/5 ml, 20 mg/ml (concentrate), 100 mg/5 ml (concentrate)
*Soluble tablets:* 10 mg, 15 mg, 30 mg
*Suppositories:* 5 mg, 10 mg, 20 mg
*Tablets:* 15 mg, 30 mg
*Tablets (extended-release):* 15 mg, 30 mg, 60 mg, 100 mg, 200 mg

### INDICATIONS & DOSAGES

➤ **Moderate to severe pain**
*Adults:* 5 to 20 mg subcutaneously or I.M. or 5 to 15 mg I.V. every 4 hours p.r.n. Or, 5 to 30 mg P.O. or 10 to 20 mg P.R. every 4 hours p.r.n.

For continuous I.V. infusion, give loading dose of 15 mg I.V.; then continuous infusion of 0.8 to 80 mg/hour.

For extended-release tablet, give 15 or 30 mg P.O., every 8 to 12 hours.

For extended-release Kadian capsules used as a first opioid, give 10 or 20 mg P.O. every 12 hours; increase at rate of up to 20 mg every other day and individualize dosage.

For epidural injection, give 5 mg by epidural catheter; then, if pain isn't relieved adequately in 1 hour, give supplementary doses of 1 to 2 mg at intervals sufficient to assess effectiveness. Maximum total epidural dose shouldn't exceed 10 mg/24 hours.

For intrathecal injection, a single dose of 0.2 to 1 mg may provide pain relief for 24 hours (only in the lumbar area). Don't repeat injections.
*Children:* 0.1 to 0.2 mg/kg subcutaneously or I.M. every 4 hours. Maximum single dose, 15 mg.

➤ **Moderate to severe pain requiring continuous, around-the-clock opioid**
*Adults:* Individualize dosage of Avinza. For patients with no tolerance to opioids, begin with 30 mg Avinza P.O. daily; adjust dosage by no more than 30 mg every 4 days. When converting from another oral morphine form, individualize the dosage schedule according to patient's schedule.

➤ **Single-dose, epidural extended pain relief after major surgery**
*Adults:* Inject 10 to 15 mg (maximum 20 mg) DepoDur via lumbar epidural administration before surgery or after clamping of umbilical cord during cesarean section. May be injected undiluted or may be diluted up to 5 ml total volume with preservative-free normal saline solution.

### ADMINISTRATION

**P.O.**
- Oral solutions of various concentrations and an intensified oral solution (20 mg/ml) are available. Carefully note the strength given.
- Give morphine sulfate without regard to food.

• Oral capsules may be carefully opened and the entire contents poured into cool, soft foods, such as water, orange juice, applesauce, or pudding; patient should consume mixture immediately.

**Black Box Warning** Don't crush, break, or chew extended-release forms. ■

**Sublingual**

• For S.L. use, measure oral solution with tuberculin syringe. Give dose a few drops at a time to allow maximal S.L. absorption and minimize swallowing.

**I.V.**

▼ For direct injection, dilute 2.5 to 15 mg in 4 or 5 ml of sterile water for injection and give slowly over 4 to 5 minutes.

▼ For continuous infusion, mix drug with $D_5W$ to yield 0.1 to 1 mg/ml, and give by a continuous infusion device.

▼ In adults with severe, chronic pain, maintenance I.V. infusion is 0.8 to 80 mg/hour; sometimes higher doses are needed.

▼ Make sure an opioid antagonist is immediately available before administering I.V.

▼ **Incompatibilities:** Aminophylline, amobarbital, cefepime, chlorothiazide, fluorouracil, haloperidol, heparin sodium, meperidine, pentobarbital, phenobarbital sodium, phenytoin sodium, prochlorperazine, promethazine hydrochloride, sodium bicarbonate, thiopental.

**I.M.**

• Document injection site.

• Store injection solution at room temperature and protect from light.

• Solution may darken with age. Don't use if injection is darker than pale yellow, discolored, or contains precipitate.

**Subcutaneous**

• Document injection site.

• Store injection solution at room temperature and protect from light.

• Solution may darken with age. Don't use if injection is darker than pale yellow, discolored, or contains precipitate.

**Epidural**

• Don't mix DepoDur with other drugs. Once DepoDur is given, don't give any other drugs into epidural space for at least 48 hours. Don't use in-line filter during administration.

• Store DepoDur in refrigerator. Unopened vials can be stored at room temperature for up to 7 days. After drug is withdrawn from vial, it can be stored at room temperature for up to 4 hours before use.

**Rectal**

• Refrigeration of rectal suppository isn't needed.

## ACTION

Unknown. Binds with opioid receptors in the CNS, altering perception of and emotional response to pain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30 min | 1–2 hr | 4–12 hr |
| P.O. (extended-release) | 1–2 hr | 3–4 hr | 12–24 hr |
| I.V. | 5 min | 20 min | 4–5 hr |
| I.M. | 10–30 min | 30–60 min | 4–5 hr |
| Subcut. | 10–30 min | 50–90 min | 4–5 hr |
| P.R. | 20–60 min | 20–60 min | 4–5 hr |
| Epidural | 15–60 min | 15–60 min | 24 hr |
| Intrathecal | 15–60 min | 30–60 min | 24 hr |

*Half-life:* 2 to 3 hours.

M

## ADVERSE REACTIONS

**CNS:** *dizziness, euphoria, lightheadedness, nightmares, sedation, somnolence,* ***seizures,*** depression, hallucinations, nervousness, physical dependence, syncope.

**CV:** ***bradycardia, cardiac arrest, shock,*** hypertension, hypotension, tachycardia.

**GI:** *constipation, nausea, vomiting,* anorexia, biliary tract spasms, dry mouth, ileus.

**GU:** urine retention.

**Hematologic:** ***thrombocytopenia.***

**Respiratory:** ***apnea, respiratory arrest, respiratory depression.***

**Skin:** diaphoresis, edema, pruritus, skin flushing.

**Other:** decreased libido.

## INTERACTIONS

**Drug-drug.** *Cimetidine:* May increase respiratory and CNS depression when given with morphine sulfate. Monitor patient closely.

*CNS depressants, general anesthetics, hypnotics, MAO inhibitors, other opioid analgesics, sedatives, tranquilizers, tricyclic antidepressants:* May cause respiratory

depression, hypotension, profound sedation, or coma. Use together with caution, reduce morphine dose, and monitor patient response.
**Drug-lifestyle.** *Alcohol use:* May cause additive CNS effects. Warn patient to avoid alcohol.

## EFFECTS ON LAB TEST RESULTS

- May increase amylase level. May decrease hemoglobin level (morphine sulfate).
- May decrease platelet count.
- May cause abnormal liver function test values (morphine sulfate).

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with conditions that would preclude I.V. administration of opioids (acute bronchial asthma or upper airway obstruction).
- Contraindicated in patients with GI obstruction.
- Use with caution in elderly or debilitated patients and in those with head injury, increased intracranial pressure, seizures, chronic pulmonary disease, prostatic hyperplasia, severe hepatic or renal disease, acute abdominal conditions, hypothyroidism, Addison's disease, and urethral stricture.
- Use with caution in patients with circulatory shock, biliary tract disease, CNS depression, toxic psychosis, acute alcoholism, delirium tremens, and seizure disorders.

***Overdose S&S:*** Miosis, CNS depression, respiratory depression, apnea, flaccid skeletal muscles, bradycardia, hypotension, circulatory collapse, cardiac arrest, respiratory arrest, death.

## NURSING CONSIDERATIONS

- Reassess patient's level of pain at least 15 and 30 minutes after giving parenterally and 30 minutes after giving orally.
- Keep opioid antagonist (naloxone) and resuscitation equipment available.
- Monitor circulatory, respiratory, bladder, and bowel functions carefully. Drug may cause respiratory depression, hypotension, urine retention, nausea, vomiting, ileus, or altered level of consciousness regardless of the route. If respirations drop below 12 breaths/minute, withhold dose and notify prescriber.

**Black Box Warning** Morphine has an abuse liability similar to other opioid analgesics and may be misused, abused, or diverted. ■
**Black Box Warning** Kadian capsules are not for use on an as-needed basis. ■

- Preservative-free preparations are available for epidural and intrathecal use.

**Black Box Warning** When the epidural or intrathecal route is used, observe patients in a fully equipped and staffed environment for at least 24 hours after the initial dose. ■
**Black Box Warning** Infumorph is not recommended for single-dose administration. ■

- When drug is given epidurally, monitor patient closely for respiratory depression up to 24 hours after the injection. Check respiratory rate and depth every 30 to 60 minutes for 24 hours. Watch for pruritus and skin flushing.
- Morphine is drug of choice in relieving MI pain; may cause transient decrease in blood pressure.
- An around-the-clock regimen best manages severe, chronic pain.
- Morphine may worsen or mask gallbladder pain.
- Constipation is commonly severe with maintenance dose. Ensure that stool softener and/or stimulant laxative is ordered.
- Taper morphine sulfate therapy gradually when stopping therapy.
- ***Look alike–sound alike:*** Don't confuse morphine with hydromorphone or Avinza with Invanz.

## PATIENT TEACHING

- When drug is used after surgery, encourage patient to turn, cough, deep-breathe, and use incentive spirometer to prevent lung problems.
- Caution ambulatory patient about getting out of bed or walking. Warn outpatient to avoid driving and other potentially hazardous activities that require mental alertness until drug's adverse CNS effects are known.

**Black Box Warning** Drinking alcohol or taking drugs containing alcohol while taking extended-release capsules may cause additive CNS effects. Warn patient to read

labels on OTC drugs carefully and not to use alcohol in any form.
• Tell patient to swallow morphine sulfate whole or to open capsule and sprinkle beads or pellets on a small amount of applesauce immediately before taking.
***Alert:*** Warn patient not to crush, break, or chew extended-release forms.

**SAFETY ALERT!**

## morphine sulfate and naltrexone hydrochloride

MOR-feen and nal-TREX-own

Embeda

*Therapeutic class:* Opioid analgesic
*Pharmacologic class:* Opioid agonist-antagonist
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules:* 20 mg morphine and 0.8 mg naltrexone, 30 mg morphine and 1.2 mg naltrexone, 50 mg morphine and 2 mg naltrexone, 60 mg morphine and 2.4 mg naltrexone, 80 mg morphine and 3.2 mg naltrexone, 100 mg morphine and 4 mg naltrexone

### INDICATIONS & DOSAGES

➤ **Moderate to severe pain when a continuous, around-the-clock opioid analgesic is needed for an extended period of time**

*Adults:* Individualize dosage according to patient's previous analgesic treatment, general condition, concurrent medication, type and severity of pain, and degree of opioid tolerance. Initially, give lowest dose possible; titrate no more frequently than every other day to allow for stabilization before escalating dosage. If pain relief is inadequate, administer every 12 hours. The 100-mg morphine/4-mg naltrexone capsules are for use only in opioid-tolerant patients. First dose of Embeda may be taken with last dose of any immediate-release (short-acting) opioid medication because of extended-release characteristics of Embeda.
***Adjust-a-dose:*** For patients receiving other morphine preparations, convert by administering half of patient's daily morphine dose as Embeda every 12 hours or by administering total morphine dose as Embeda every 24 hours.

### ADMINISTRATION

**P.O.**
• If patient has difficulty swallowing whole capsule, open capsule, sprinkle pellets onto small amount of applesauce, and administer immediately. Caution patient not to chew pellets. Have patient rinse mouth to make sure all pellets are swallowed.
• Don't administer pellets through a nasogastric or gastric tube.

### ACTION

Selective mu agonist that produces analgesia and sedation by binding with the mu opioid receptor.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 7½ hr | Days |

*Half-life:* 29 hours.

### ADVERSE REACTIONS

**CNS:** anxiety, depression, dizziness, fatigue, headache, insomnia, irritability, lethargy, restlessness, sedation, *somnolence*, tremor.
**CV:** ***cardiac arrest,*** flushing, hypotension, peripheral edema, ***shock.***
**EENT:** dry mouth.
**GI:** abdominal pain, anorexia, *constipation*, decreased appetite, diarrhea, dyspepsia, flatulence, *nausea*, stomach discomfort, vomiting.
**Musculoskeletal:** arthralgia, muscle spasms.
**Respiratory:** ***apnea, respiratory arrest, respiratory depression.***
**Skin:** hyperhidrosis, pruritus.
**Other:** hot flush, chills.

### INTERACTIONS

**Drug-drug.** *Anticholinergics:* May cause urine retention, severe constipation, or paralytic ileus. Use together cautiously and monitor patient closely.
*Cimetidine:* May cause confusion and severe respiratory depression. Avoid use together.

*CNS depressants (antiemetics, general anesthetics, phenothiazines, sedative-hypnotics, other tranquilizers):* May cause respiratory depression, hypotension, profound sedation, or coma. Use together cautiously; reduce initial dosage of one or both agents by at least 50% and monitor patient closely.
*Diuretics:* May cause antidiuretic hormone release, rendering diuretics ineffective, and urine retention due to bladder sphincter spasm. Use together cautiously.
*MAO inhibitors:* May cause anxiety, confusion, significant respiratory depression, or coma. Avoid use together and within 14 days of stopping treatment with MAO inhibitors.
*Mixed agonist/antagonist opioid analgesics (butorphanol, nalbuphine, pentazocine):* May reduce analgesic effects and precipitate withdrawal symptoms. Avoid use together.
*Muscle relaxants:* May enhance neuromuscular blocking action of skeletal muscle relaxants, causing respiratory depression. Use together cautiously.
*P-glycoprotein inhibitors (such as quinidine):* May increase morphine level. Use together cautiously.
**Drug-lifestyle.** *Alcohol use:* May cause additive CNS effects. Warn patient to avoid alcohol.

## EFFECTS ON LAB TEST RESULTS

• May interfere with tests that use enzymes to detect opioids.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components and in those with significant respiratory depression, acute or severe bronchial asthma, or hypercapnia in unmonitored settings without resuscitative equipment.
• Contraindicated in patients with known or suspected paralytic ileus.
• Use cautiously in patients with COPD, cor pulmonale, decreased respiratory reserve, hypoxia, hypercapnia, head injury, increased intracranial pressure, shock, biliary tract disease including pancreatitis, CNS depression, toxic psychosis, acute alcoholism, or delirium tremens.
• Use caution in elderly and debilitated patients and in those with severe renal or hepatic insufficiency, Addison's disease, myxedema, hypothyroidism, prostatic hypertrophy, and urethral stricture.
***Overdose S&S:*** Respiratory depression, somnolence progressing to stupor or coma, skeletal muscle flaccidity, cold and clammy skin, constricted pupils, pulmonary edema, bradycardia, hypotension, death.

## NURSING CONSIDERATIONS

**Black Box Warning** Capsules contain pellets of morphine sulfate. The pellets shouldn't be crushed, dissolved, or chewed because drug will be released and absorbed rapidly; resulting dose may be fatal, especially in opioid-naïve patients. ■
***Alert:*** Drug isn't intended for use as an "as needed" analgesic.
**Black Box Warning** Morphine 100 mg/naltrexone 4 mg is for use in opioid-tolerant patients only. ■
• Drug has an abuse liability similar to other opioid analgesics and may be misused, abused, or diverted.
• Monitor circulatory, respiratory, bladder, and bowel functions carefully. Drug may cause respiratory depression, hypotension, urine retention, nausea, vomiting, constipation, ileus, or altered level of consciousness.
• Taper drug gradually when stopping therapy to avoid withdrawal symptoms.
• Keep opioid antagonist (naloxone, nalmefene) and resuscitation equipment available.

## PATIENT TEACHING

**Black Box Warning** Warn patient taking Embeda that consuming alcoholic beverages or prescription or nonprescription drugs containing alcohol may cause dose to be fatal. ■
***Alert:*** Tell patient to swallow capsules whole or open capsule and sprinkle pellets on small amount of applesauce immediately before taking; instruct patient that capsules shouldn't be crushed, dissolved, or chewed.
• Caution patient that drug has potential for abuse and should be protected from theft.
• Warn patient to avoid driving and other potentially hazardous activities that require

mental alertness until drug's effects are known.
• Caution ambulatory patient about getting out of bed or walking because drug may cause a drop in blood pressure with position change.
• Tell patient the importance of dietary changes, stool softeners, and laxatives to prevent constipation, a common adverse effect of drug.

## moxifloxacin hydrochloride (ophthalmic)

mocks-ah-FLOX-a-sin

Vigamox

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Fluoroquinolone
*Pregnancy risk category C*

### AVAILABLE FORMS

*Solution:* 0.5%

### INDICATIONS & DOSAGES

➤ **Bacterial conjunctivitis caused by susceptible strains of gram-positive and gram-negative organisms and *Chlamydia trachomatis***

*Adults and children age 1 and older:* 1 drop into affected eye t.i.d. for 7 days.

### ADMINISTRATION

**Ophthalmic**

• Place gentle pressure on lacrimal duct for 1 to 2 minutes after instilling drop.

### ACTION

Inhibits DNA gyrase and topoisomerase, preventing cell replication and division.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Unknown | Unknown | Unknown |

*Half-life:* 13 hours.

### ADVERSE REACTIONS

**CNS:** fever.
**EENT:** conjunctivitis, dry eyes, increased lacrimation, keratitis, ocular discomfort, pain, or pruritus, otitis media, pharyngitis, reduced visual acuity, rhinitis, subconjunctival hemorrhage.
**Respiratory:** increased cough.
**Skin:** rash.
**Other:** infection.

### INTERACTIONS

None reported.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or other fluoroquinolones.
• Use cautiously in pregnant or breast-feeding women.

### NURSING CONSIDERATIONS

• Systemic drug may cause serious hypersensitivity reactions. If allergic reaction occurs, stop drug and treat symptoms.
• Monitor patient for superinfection.
• Solution isn't for injection subconjunctivally or into anterior chamber of the eye.
• ***Look alike–sound alike:*** Don't confuse Vigamox with Avonex.

### PATIENT TEACHING

• Tell patient to stop drug and seek medical treatment immediately if evidence of hypersensitivity reaction develops, such as itching, rash, swelling of the face or throat, or difficulty breathing.
• Tell patient not to wear contact lenses during treatment.
• Instruct patient not to touch dropper tip to anything, including eyes and fingers.

## moxifloxacin hydrochloride (oral; injection)

mocks-ah-FLOX-a-sin

Avelox, Avelox I.V.

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Fluoroquinolone
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 400 mg/250 ml
*Tablets (film-coated):* 400 mg

## INDICATIONS & DOSAGES

➤ **Acute bacterial sinusitis caused by *Streptococcus pneumoniae, Haemophilus influenzae,* or *Moraxella catarrhalis***
*Adults:* 400 mg P.O. or I.V. every 24 hours for 10 days.

➤ **Complicated skin and skin-structure infections caused by methicillin-susceptible *Staphylococcus aureus, Escherichia coli, Klebsiella pneumoniae,* or *Enterobacter cloacae***
*Adults:* 400 mg P.O. or I.V. every 24 hours for 7 to 21 days.

➤ **Complicated intra-abdominal infection caused by *E. coli, Bacteroides fragilis, Streptococcus anginosis, Streptococcus constellatus, Enterococcus faecalis, Proteus mirabilis, Clostridium perfringens, Bacteroides thetaiotaomicron,* or *Peptostreptococcus* species**
*Adults:* 400 mg P.O. or I.V. every 24 hours for 5 to 14 days. Start with the I.V. form; switch to P.O. when appropriate.

➤ **Community-acquired pneumonia from multidrug-resistant *S. pneumoniae* (resistance to two or more of the following antibiotics: penicillin, second-generation cephalosporins, macrolides, trimethoprim-sulfamethoxazole, tetracyclines), *S. aureus, M. catarrhalis, H. influenzae, H. parainfluenzae, K. pneumoniae, Chlamydia pneumoniae, Legionella pneumophila,* or *Mycoplasma pneumoniae***
*Adults:* 400 mg P.O. or I.V. every 24 hours for 7 to 14 days.

➤ **Acute bacterial worsening of chronic bronchitis caused by *S. pneumoniae, H. influenzae, H. parainfluenzae, K. pneumoniae, S. aureus,* or *M. catarrhalis***
*Adults:* 400 mg P.O. or I.V. every 24 hours for 5 days.

➤ **Uncomplicated skin-structure or skin infection caused by *S. aureus* or *S. pyogenes***
*Adults:* 400 mg P.O. or I.V. every 24 hours for 7 days.

➤ **Hospital-acquired pneumonia ♦**
*Adults:* 400 mg I.V. once daily over 60 minutes, followed by switch to 400 mg P.O. once daily. Recommended duration of treatment is 7 to 8 days.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food. Give at same time each day.
- Space doses of antacids, sucralfate, multivitamins, and products containing aluminum, magnesium, iron, and zinc to avoid decreasing drug's therapeutic effects.
- Store drug at controlled room temperature.

**I.V.**

▼ Don't use if particulate matter is visible.
▼ Flush I.V. line with a compatible solution such as $D_5W$, normal saline, or Ringer's lactate solution before and after use.
▼ Give only by infusion over 1 hour. Avoid rapid or bolus infusion.
▼ **Incompatibilities:** Other I.V. drugs.

## ACTION

Interferes with action of enzymes needed for bacterial replication. Inhibits topoisomerases I (DNA gyrase) and IV, impairing bacterial DNA replication, transcription, repair, and recombination.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.V. | Unknown | 1–3 hr | Unknown |

*Half-life:* About 12 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, headache, malaise, insomnia, nervousness, anxiety, somnolence, tremor, vertigo.
**CV:** ***prolonged QT interval,*** palpitations, tachycardia.
**GI:** ***pseudomembranous colitis,*** abdominal pain, anorexia, constipation, diarrhea, dyspepsia, nausea.
**GU:** vaginal candidiasis, vaginitis.
**Hematologic:** ***leukopenia, thrombocytopenia, thrombocytosis,*** eosinophilia.
**Hepatic:** abnormal liver function, cholestatic jaundice.
**Musculoskeletal:** tendon rupture.
**Respiratory:** dyspnea.
**Skin:** injection site reaction, pruritus, rash (maculopapular, purpuric, pustular), sweating.
**Other:** allergic reaction.

## INTERACTIONS

**Drug-drug.** *Aluminum hydroxide, aluminum-magnesium hydroxide, calcium carbonate, didanosine, magnesium hydroxide, multivitamins, products containing zinc:* May interfere with GI absorption of moxifloxacin. Give moxifloxacin 4 hours before or 8 hours after these products.

*Class IA antiarrhythmics (such as procainamide, quinidine), class III antiarrhythmics (such as amiodarone, sotalol):* May increase risk of cardiac arrhythmias. Avoid using together.

*Drugs that prolong QT interval, such as antipsychotics, erythromycin, tricyclic antidepressants:* May have additive effect. Avoid using together.

*NSAIDs:* May increase risk of CNS stimulation and seizures. Avoid using together.

**Black Box Warning** *Steroids:* May increase risk of tendinitis and tendon rupture. Monitor patient for tendon pain or inflammation. ■

*Sucralfate:* May decrease absorption of moxifloxacin, reducing anti-infective response. If use together can't be avoided, give at least 6 hours apart.

*Warfarin:* May increase anticoagulant effects. Monitor PT and INR closely.

**Drug-lifestyle.** *Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase GGT, amylase, and LDH levels. May decrease hemoglobin level.
- May increase eosinophil count. May decrease PT and WBC count. May increase or decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Drug is associated with increased risk of tendinitis and tendon rupture, especially in patients older than age 60 and those with heart, kidney, or lung transplants. ■

- Contraindicated in patients hypersensitive to drug or other fluoroquinolones and in those with prolonged QT interval or uncorrected hypokalemia.
- Use cautiously in patients with ongoing proarrhythmic conditions, such as clinically significant bradycardia or acute myocardial ischemia.
- Use cautiously in patients who may have CNS disorders or risk factors for seizures.
- Safety and efficacy in children, adolescents younger than age 18, and pregnant or breast-feeding women haven't been established.

## NURSING CONSIDERATIONS

**Alert:** Monitor patient for adverse CNS effects, including seizures, dizziness, confusion, tremors, hallucinations, depression, and suicidal thoughts. If these occur, stop drug and notify prescriber.

- Monitor patient for hypersensitivity reactions, including anaphylaxis.
- If diarrhea develops during therapy, send stool specimen for *Clostridium difficile* test.

**Black Box Warning** Rupture of the Achilles and other tendons is linked to fluoroquinolone use. If pain, inflammation, or tendon rupture occurs, stop drug and notify prescriber. ■

## PATIENT TEACHING

- Instruct patient to take drug once daily, at the same time each day, without regard to meals.
- Tell patient to finish entire course of therapy, even if symptoms are relieved.
- Advise patient to drink plenty of fluids.
- Tell patient to space antacids, sucralfate, multivitamins, and products containing aluminum, magnesium, iron, and zinc to avoid decreasing drug's therapeutic effects.
- Instruct patient to contact prescriber and stop drug if he experiences allergic reaction, rash, heart palpitations, fainting, or persistent diarrhea.
- Direct patient to contact prescriber, stop drug, rest, and refrain from exercise if he experiences pain, inflammation, or tendon rupture.
- Warn patient that drug may cause dizziness and light-headedness. Tell patient to avoid hazardous activities, such as driving or operating machinery, until effects of drug are known.
- Instruct patient to avoid excessive sunlight exposure and ultraviolet light and to report photosensitivity reactions to prescriber.

# mupirocin

myoo-PIHR-oh-sin

Bactroban, Centany

*Therapeutic class:* Antibacterial (topical)
*Pharmacologic class:* Antibiotic
*Pregnancy risk category B*

## AVAILABLE FORMS

*Intranasal ointment:* 2%
*Topical cream:* 2%
*Topical ointment:* 2%

## INDICATIONS & DOSAGES

➤ **Impetigo**

*Adults and children:* Apply to affected areas t.i.d. for 1 to 2 weeks. Reevaluate patient in 3 to 5 days; may cover affected area with dressing.

➤ **Traumatic skin lesions infected with *Staphylococcus aureus* or *Streptococcus pyogenes***

*Adults and children:* Apply thin film t.i.d. for 10 days; may cover with gauze dressing, if needed. Reevaluate patient if improvement doesn't occur in 3 to 5 days.

➤ **To eradicate nasal colonization by methicillin-resistant *S. aureus* in adult patients and health care workers**

*Adults and children age 12 and older:* Divide ointment in single-use tube between nostrils (½ tube per nostril) b.i.d. for 5 days. After application, close nostrils by pressing together and releasing sides of nose repeatedly for 1 minute to spread ointment throughout nares.

## ADMINISTRATION

**Topical**

• Cosmetics and other skin products shouldn't be used on treated area.

**Intranasal**

• Other nasal products shouldn't be used with intranasal ointment.

## ACTION

Inhibits bacterial protein synthesis by reversibly and specifically binding to bacterial isoleucyl transfer-RNA synthetase.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** headache.
**EENT:** rhinitis, pharyngitis, burning or stinging with intranasal use.
**GI:** taste perversion, nausea, abdominal pain, ulcerative stomatitis.
**Respiratory:** upper respiratory tract congestion, cough with intranasal use.
**Skin:** burning, erythema with topical use, pain, pruritus, rash, stinging.

## INTERACTIONS

**Drug-drug.** *Chloramphenicol:* May interfere with the antibacterial action of mupirocin on RNA synthesis. Monitor patient for clinical effect.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components.
• Use cautiously in patients with burns or large open wounds and in those with impaired renal function because serious renal toxicity may occur.

## NURSING CONSIDERATIONS

• Drug isn't for ophthalmic or internal use.
• Prolonged use may cause overgrowth of nonsusceptible bacteria and fungi.
• Local reactions appear to be caused by polyethylene glycol vehicle.
• ***Look alike–sound alike:*** Don't confuse Bactroban with bacitracin, baclofen, or Bactrim.

## PATIENT TEACHING

• Tell patient to notify prescriber immediately if condition doesn't improve or gets worse in 3 to 5 days.
• Tell patient not to use other nasal products with intranasal ointment.
• Warn patient about local adverse reactions related to drug use.
• Caution patient not to use cosmetics or other skin products on treated area.

## muromonab-CD3

myoo-roh-MOH-nab

Orthoclone OKT3

*Therapeutic class:* Immunosuppressant
*Pharmacologic class:* Monoclonal antibody
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 1 mg/1 ml in 5-ml ampules

### INDICATIONS & DOSAGES

➤ **Acute allograft rejection in renal transplant patients; steroid-resistant hepatic or cardiac allograft rejection**

*Adults and children weighing more than 30 kg (66 lb):* 5 mg I.V. daily for 10 to 14 days.

*Children weighing 30 kg (66 lb) or less:* 2.5 mg I.V. daily for 10 to 14 days.

### ADMINISTRATION

**I.V.**

▼ Using aseptic technique, draw solution into syringe through low–protein-binding 0.2- or 0.22-micron filter. Discard filter and attach needle for I.V. bolus injection.
▼ Give bolus over less than 1 minute.
▼ Don't shake or freeze.
▼ **Incompatibilities:** Other I.V. drugs.

### ACTION

A murine monoclonal antibody that reacts in the T-lymphocyte membrane with CD3, needed for antigen recognition. Depletes blood of $CD3^+$ T cells, restoring allograft function and reversing rejection.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Unknown | 1 wk |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CNS:** *asthenia, fever, headache, tremor,* ***meningitis, seizures,*** confusion, depression, *dizziness,* fatigue, lethargy, malaise, nervousness, somnolence.
**CV:** *edema, hypertension, hypotension, tachycardia,* ***arrhythmia, bradycardia,*** chest pain, ***vascular occlusion,*** vasodilation.
**EENT:** photophobia, tinnitus.
**GI:** *diarrhea, nausea, vomiting,* abdominal pain, GI pain.
**GU:** renal dysfunction.
**Hematologic:** anemia, leukocytosis, ***leukopenia, thrombocytopenia.***
**Musculoskeletal:** arthralgia, myalgia.
**Respiratory:** *dyspnea,* hyperventilation, ***hypoxia,*** pneumonia, ***pulmonary edema,*** respiratory congestion, wheezing.
**Skin:** diaphoresis, pruritus, *rash.*

### INTERACTIONS

**Drug-drug.** *Immunosuppressants:* May increase risk of infection. Consider reducing immunosuppressant dosage. Use together cautiously.
*Indomethacin:* May increase muromonab-CD3 level, causing encephalopathy and other CNS effects. Monitor patient closely.
*Live-virus vaccines:* May increase replication and effects of vaccine. Use together cautiously.
**Drug-herb.** *Echinacea:* May decrease effect of muromonab. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

● May increase BUN and creatinine levels.
● May cause abnormal urine cytologic study results.

### CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or other products of murine (mouse) origin, in those who have history of seizures or are predisposed to seizures, in pregnant or breast-feeding women, and in patients with uncontrolled hypertension.
● Contraindicated in those with antimurine antibody titers of 1:1,000 or more or in uncompensated heart failure fluid overload, as evidenced by chest X-ray or weight gain greater than 3% the week before treatment.
⚠ ***Overdose S&S:*** Hyperthermia, severe chills, myalgia, vomiting, diarrhea, edema, oliguria, pulmonary edema, acute renal failure, hemolytic anemia, hemolytic uremic syndrome.

### NURSING CONSIDERATIONS

**Black Box Warning** Drug should be used only by physicians experienced in

immunosuppressive therapy and management of solid organ transplant patients. ■
• Never give I.M.
• Obtain chest X-ray within 24 hours before starting drug treatment.
• Assess patient for signs and symptoms of fluid overload before treatment.
**Black Box Warning** Anaphylactic or anaphylactoid reactions may occur following administration of any dose. Serious to life-threatening systemic, cardiovascular, and CNS reactions have occurred. Give therapy in facility equipped and staffed for cardiopulmonary resuscitation, where patient can be monitored closely. ■
• Most adverse reactions develop within 30 minutes to 6 hours after first dose.
• Before giving drug, pretreat patient with an antipyretic to reduce risk of pyrexia and chills. Treat temperature over 100° F (38° C) with antipyretics before giving drug, and evaluate risk of infection.
**Black Box Warning** Premedicate with methylprednisolone 8 mg/kg 1 to 4 hours before first dose to reduce the severity of infusion reaction. ■
• Patients may develop antibodies to drug, which can lead to loss of effectiveness and more severe adverse reactions if a second course is attempted.
• Use blood tests to monitor organ system functions periodically during treatment.

## PATIENT TEACHING

• Inform patient of expected adverse reactions.
• Reassure patient that reactions will diminish as treatment progresses.
• Tell patient to avoid people with infections because drug lowers resistance to infection.
• Advise women to avoid pregnancy during therapy.

# mycophenolate mofetil

my-koe-FIN-oh-late

CellCept

# mycophenolate mofetil hydrochloride

CellCept Intravenous

# mycophenolic acid (mycophenolate sodium)

Myfortic

*Therapeutic class:* Immunosuppressant
*Pharmacologic class:* Mycophenolic acid derivative
*Pregnancy risk category D*

## AVAILABLE FORMS

**mycophenolate mofetil**
*Capsules:* 250 mg
*Powder for oral suspension:* 200 mg/ml
*Tablets:* 500 mg
**mycophenolate mofetil hydrochloride**
*Injection:* 500 mg/vial
**mycophenolic acid**
*Tablets (extended-release):* 180 mg, 360 mg

## INDICATIONS & DOSAGES

➤ **To prevent organ rejection in patients receiving allogenic renal transplants**
*Adults:* 1 g I.V. or P.O. (regular-release) b.i.d. with corticosteroids and cyclosporine. Or, 720 mg extended-release tablets P.O. b.i.d. 1 hour before or 2 hours after food.
*Children age 5 to 16 (extended-release):* 400 mg/$m^2$ P.O. b.i.d. Maximum dose, 720 mg P.O. b.i.d.
*Children 3 months to 18 years:* For oral suspension, give 600 mg/$m^2$ P.O. b.i.d., maximum dose is 1 g b.i.d. Or, for patients with body surface area (BSA) of 1.25 to 1.5 $m^2$, give 750 mg (tablets or capsules) P.O. b.i.d. If BSA is greater than 1.5 $m^2$, give 1 g (tablets or capsules) P.O. b.i.d.
***Adjust-a-dose:*** For patients with severe chronic renal impairment outside of immediate posttransplant period, avoid doses above 1 g b.i.d. If neutropenia develops, interrupt or reduce dosage.

➤ **To prevent organ rejection in patients receiving allogenic cardiac transplant**
*Adults:* 1.5 g P.O. or I.V. b.i.d. with cyclosporine and corticosteroids.
➤ **To prevent organ rejection in patients receiving allogenic hepatic transplants**
*Adults:* 1 g I.V. b.i.d. over no less than 2 hours or 1.5 g P.O. b.i.d. with cyclosporine and corticosteroids.
***Adjust-a-dose:*** If neutropenia develops, stop or reduce dosage.

## ADMINISTRATION

**P.O.**
• Don't crush tablets; don't open or crush capsules.
• Avoid inhaling powder in capsule or having it contact skin or mucous membranes. If contact occurs, wash skin thoroughly with soap and water, and rinse eyes with water.
• The extended-release tablets are not interchangeable with other forms.

**I.V.**
▼ Reconstitute and dilute to 6 mg/ml using 14 ml of $D_5W$.
▼ Never give by rapid or bolus I.V. injection. Infuse drug over at least 2 hours.
▼ Use within 4 hours of reconstitution and dilution.
▼ **Incompatibilities:** Other I.V. drugs or solutions.

## ACTION

Inhibits proliferative response of T and B lymphocytes, suppresses antibody formation by B lymphocytes, and may inhibit recruitment of leukocytes into sites of inflammation and graft rejection.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 30–75 min | 7–18 hr |
| P.O. (extended-release) | Unknown | 1½–2¾ hr | 8–17 hr |
| I.V. | Unknown | Unknown | 10–17 hr |

*Half-life:* About 18 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia, fever, headache, pain, tremor,* dizziness, insomnia, ***progressive multifocal leukoencephalopathy.***
**CV:** *chest pain, edema, hypertension.*
**EENT:** pharyngitis.
**GI:** *abdominal pain, constipation, diarrhea, dyspepsia, nausea, oral candidiasis, vomiting,* ***hemorrhage.***
**GU:** *hematuria, UTI,* ***renal tubular necrosis.***
**Hematologic:** *anemia,* **LEUKOPENIA, THROMBOCYTOPENIA,** hypochromic anemia, leukocytosis.
**Metabolic:** *hypercholesterolemia, hyperglycemia,* ***hyperkalemia,*** *hypokalemia, hypophosphatemia.*
**Musculoskeletal:** *back pain.*
**Respiratory:** *cough, dyspnea, infection,* bronchitis, pneumonia.
**Skin:** *acne,* rash.
**Other:** *infection,* ***sepsis.***

## INTERACTIONS

**Drug-drug.** *Acyclovir, ganciclovir, other drugs that undergo renal tubular secretion:* May increase risk of toxicity for both drugs. Monitor patient closely.
*Antacids with magnesium and aluminum hydroxides:* May decrease mycophenolate absorption. Separate dosing times.
*Azathioprine:* Inhibits purine metabolism. Don't use together.
*Cholestyramine:* May interfere with enterohepatic recirculation, reducing mycophenolate bioavailability. Avoid using together.
*Phenytoin, theophylline:* May increase both drug levels. Monitor drug levels closely.
*Probenecid, salicylates:* May increase mycophenolate level. Monitor patient closely.
*Vaccines, live:* May decrease vaccine's effectiveness. Avoid using together.
**Drug-herb.** *Cat's claw, echinacea:* May increase immunostimulation. Discourage use together.
**Drug-food.** *Food:* May delay absorption of extended-release form. Advise patient to take on an empty stomach 1 hour before or 2 hours after a meal.

## EFFECTS ON LAB TEST RESULTS

• May increase cholesterol and glucose levels. May decrease phosphorus and hemoglobin levels. May increase or decrease potassium level.
• May decrease platelet count. May increase or decrease WBC count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, its ingredients, or mycophenolic acid and in patients sensitive to polysorbate 80.
- Use cautiously in patients with GI disorders.
- Oral suspension contains aspartame; use cautiously in patients with phenylketonuria or those who restrict intake of phenylalanine.

***Overdose S&S:*** Nausea, vomiting, diarrhea, neutropenia.

## NURSING CONSIDERATIONS

**Black Box Warning** Increased risk of infection and lymphoma may result from immunosuppression. ■

**Black Box Warning** Drug should only be use by health care providers experienced in immunosuppressive therapy and management of renal, cardiac, or hepatic transplant patients. ■

- Start drug therapy within 24 hours after transplantation. Use I.V. form in patients unable to take oral forms.
- I.V. form can be given for up to 14 days; switch patient to capsules or tablets as soon as oral drugs can be tolerated.

***Alert:*** Drug may cause progressive multifocal leukoencephalopathy (PML). Consider PML in patients reporting neurologic symptoms.

***Alert:*** Drugs causing immunosuppression increase the risk of opportunistic infections, including activation of latent viral infections such as BK virus–associated neuropathy, which may lead to serious outcomes, including kidney graft loss.

***Alert:*** Pure red cell aplasia (PRCA) has occurred in patients treated with this drug in combination with other immunosuppressants. Patients may experience fatigue, lethargy, or pallor. PRCA may be reversible with dose reduction or stopping drug. However, this may put graft at risk.

## PATIENT TEACHING

- Warn patient not to open or crush capsules nor to cut, crush, or chew extended-release tablets, but to swallow them whole on an empty stomach 1 hour before or 2 hours after a meal.
- Stress importance of following treatment as prescribed.
- Inform patient of the importance of follow-up visits and ongoing lab tests during therapy.
- Tell women to have a pregnancy test 1 week before therapy begins.

**Black Box Warning** Instruct woman to use two forms of contraception during therapy and for 6 weeks afterward, even if she has a history of infertility. Tell her to notify prescriber immediately if she suspects pregnancy. ■

**Black Box Warning** Warn patient of the increased risk of lymphoma and other malignancies. ■

# nabumetone

nah-BYOO-meh-tone

*Therapeutic class:* NSAID
*Pharmacologic class:* NSAID
*Pregnancy risk category C; D in 3rd trimester*

## AVAILABLE FORMS

*Tablets:* 500 mg, 750 mg

## INDICATIONS & DOSAGES

➤ **Rheumatoid arthritis, osteoarthritis**

*Adults:* Initially, 1,000 mg P.O. daily as a single dose or in divided doses b.i.d. Maximum, 2,000 mg daily.

***Adjust-a-dose:*** For patients with moderate or severe renal insufficiency the maximum starting dose should not exceed 500 or 750 mg P.O. once daily. With careful monitoring, daily doses may be increased to a maximum of 1,500 mg.

## ADMINISTRATION

**P.O.**

- Take drug with food, milk, or antacids to increase absorption.
- Limit alcohol intake to avoid risk of GI problems.

## ACTION

Unknown. Produces anti-inflammatory, analgesic, and antipyretic effects, possibly by inhibiting prostaglandin synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 9–12 hr | Unknown |

*Half-life:* About 24 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, fatigue, headache, insomnia, nervousness, somnolence.
**CV:** edema, vasculitis.
**EENT:** tinnitus.
**GI:** *abdominal pain, diarrhea, dyspepsia,* ***bleeding,*** anorexia, constipation, dry mouth, flatulence, gastritis, nausea, stomatitis, ulceration, vomiting.
**Respiratory:** dyspnea, pneumonitis.
**Skin:** increased diaphoresis, pruritus, rash.

## INTERACTIONS

**Drug-drug.** *Diuretics:* May decrease diuretic effectiveness. Monitor patient closely.
*Lithium, methotrexate:* May cause toxic levels of lithium or methotrexate. Use together cautiously.
*Warfarin, other highly protein-bound drugs:* May cause adverse effects from displacement of drugs by nabumetone. Use together cautiously.
**Drug-herb.** *Dong quai, feverfew, garlic, ginger, horse chestnut, red clover:* May cause bleeding. Discourage use together.
*White willow:* Herb and drug contain similar components. Discourage use together.
**Drug-food.** *Any food:* May increase absorption. Advise patient to take drug with food.
**Drug-lifestyle.** *Alcohol use:* May increase risk of additive GI toxicity. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients with hypersensitivity reactions and history of aspirin- or NSAID-induced asthma, urticaria, or other allergic-type reactions.
● Contraindicated in children and in pregnant women during third trimester of pregnancy.
**Black Box Warning** Contraindicated for the treatment of perioperative pain after CABG surgery.
● Use cautiously in elderly patients and patients with renal or hepatic impairment; heart failure, hypertension, or other conditions that may predispose patient to fluid retention; or a history of peptic ulcer disease.
***Overdose S&S:*** Lethargy, drowsiness, nausea, vomiting, epigastric pain, GI bleeding, coma, hypertension, acute renal failure, respiratory depression, anaphylaxis.

## NURSING CONSIDERATIONS

● Because NSAIDs impair synthesis of renal prostaglandins, they can decrease renal blood flow and lead to reversible renal impairment, especially in patients with renal or heart failure or liver dysfunction, in elderly patients, and in those taking diuretics. Monitor these patients closely.
● During long-term therapy, periodically monitor renal and liver function, CBC, and hematocrit; assess patients for signs and symptoms of GI bleeding.
**Black Box Warning** NSAIDs cause an increased risk of serious GI adverse events including bleeding, ulceration, and perforation of the stomach or intestines, which can be fatal. Elderly patients are at greater risk.
**Black Box Warning** NSAIDs may increase the risk of serious thrombotic events, MI, or stroke, which can be fatal. The risk may be greater with longer use or in patients with CV disease or risk factors for CV disease.

## PATIENT TEACHING

● Instruct patient to take drug with food, milk, or antacids. Drug is absorbed more rapidly when taken with food or milk.
● Advise patient to limit alcohol intake because using drug with alcohol increases the risk of GI problems.
● Teach patient signs and symptoms of GI bleeding, including blood in vomit, urine, or stool; coffee-ground vomit; and black, tarry stool. Tell him to notify prescriber immediately if any of these occurs.
● Warn patient against hazardous activities that require mental alertness until CNS effects are known.

N

● Advise patient that use of OTC NSAIDs in combination with nabumetone may increase the risk of GI toxicity.

## nadolol

nay-DOE-lol

Apo-Nadol†, Corgard

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Nonselective beta blocker
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 20 mg, 40 mg, 80 mg

### INDICATIONS & DOSAGES

➤ **Angina pectoris**

*Adults:* 40 mg P.O. once daily. Increase in 40- to 80-mg increments at 3- to 7-day intervals until optimal response occurs. Usual maintenance dose is 40 to 80 mg once daily; up to 240 mg once daily may be needed.

➤ **Hypertension**

*Adults:* 40 mg P.O. once daily. Increase in 40- to 80-mg increments until optimal response occurs. Usual maintenance dose is 40 to 80 mg once daily. Doses of 320 mg daily may be needed.

***Adjust-a-dose:*** If creatinine clearance is 31 to 50 ml/minute, change dosing interval to every 24 to 36 hours; if clearance is 10 to 30 ml/minute, every 24 to 48 hours; and if clearance is less than 10 ml/minute, every 40 to 60 hours.

➤ **Prevention of migraine ♦**

*Adults:* 80 to 240 mg P.O. daily for 2 to 18 months.

### ADMINISTRATION

**P.O.**

● Give drug without regard for food.
● Check apical pulse before giving drug. If slower than 60 beats/minute, withhold drug and call prescriber.
***Alert:*** Abruptly stopping drug may worsen angina and cause an MI. Reduce dosage gradually over 1 to 2 weeks.

### ACTION

Reduces cardiac oxygen demand by blocking catecholamine-induced increases in heart rate, blood pressure, and force of myocardial contraction. Depresses renin secretion.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–4 hr | 24 hr |

*Half-life:* About 20 to 24 hours.

### ADVERSE REACTIONS

**CNS:** fatigue, dizziness, fever.
**CV:** **BRADYCARDIA, HEART FAILURE,** *hypotension*, peripheral vascular disease, rhythm and conduction disturbances.
**GI:** nausea, vomiting, diarrhea, abdominal pain, constipation, anorexia.
**Respiratory:** *increased airway resistance.*
**Skin:** rash.

### INTERACTIONS

**Drug-drug.** *Antihypertensives:* May increase antihypertensive effect. Monitor blood pressure closely.
*Cardiac glycosides:* May cause excessive bradycardia and additive effects on AV conduction. Use together cautiously.
*Epinephrine:* May decrease the patient response to epinephrine for treatment of an allergic reaction. Monitor patient closely for decreased clinical effect.
*General anesthetics:* May increase hypotensive effects. Consider stopping nadolol before surgery.
*Insulin:* May mask symptoms of hypoglycemia, as a result of beta blockade (such as tachycardia). Use with caution in patients with diabetes.
*I.V. lidocaine:* May reduce hepatic metabolism of lidocaine, increasing the risk of toxicity. Give bolus doses of lidocaine at a slower rate and monitor lidocaine level closely.
*NSAIDs:* May decrease antihypertensive effect. Monitor blood pressure and adjust dosage.
*Oral antidiabetics:* May alter dosage requirements in previously stabilized diabetic patients. Monitor glucose closely.
*Phenothiazines:* May increase hypotensive effects. Monitor blood pressure.

*Prazosin:* May increase risk of orthostatic hypotension in the early phases of use together. Assist patient to stand slowly until effects are known.
*Reserpine:* May increase hypotension or bradycardia. Monitor patient for adverse effects, such as dizziness, syncope, and postural hypotension.
*Verapamil:* May increase effects of both drugs. Monitor cardiac function closely and decrease dosages as necessary.

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients with bronchial asthma, sinus bradycardia and greater than first-degree heart block, cardiogenic shock, and overt heart failure.
- Use cautiously in patients with heart failure, chronic bronchitis, emphysema, or renal or hepatic impairment and in patients undergoing major surgery involving general anesthesia.
- Use cautiously in diabetic patients because beta blockers may mask certain signs and symptoms of hypoglycemia.

**Black Box Warning** Exacerbation of ischemic heart disease may occur following abrupt withdrawal of drug. Exacerbation of angina and, in some cases, myocardial infarction have occurred after abrupt discontinuation of therapy. ■

⚠ ***Overdose S&S:*** Bradycardia, cardiac failure, hypotension, bronchospasm.

### NURSING CONSIDERATIONS
- Monitor blood pressure frequently. If patient develops severe hypotension, give a vasopressor, as prescribed.
- Drug masks signs and symptoms of shock and hyperthyroidism.

**Black Box Warning** If nadolol is to be discontinued after long-term administration, particularly in patients with ischemic heart disease, dosage should be gradually reduced over a period of 1 to 2 weeks and the patient carefully monitored. If angina markedly worsens or acute coronary insufficiency develops after drug cessation, nadolol should be temporarily restarted and other measures taken to appropriately manage unstable angina. Because coronary artery disease is common and may be unrecognized, don't discontinue nadolol therapy abruptly, even in patients treated only for hypertension. ■

### PATIENT TEACHING
- Explain importance of taking drug as prescribed, even when patient feels well.
- Teach patient how to check pulse rate and tell him to check it before each dose. If pulse rate is below 60 beats/minute, tell patient to notify prescriber.

**Black Box Warning** Warn patient not to stop drug suddenly. ■

## nafcillin sodium
naf-SIL-in

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Penicillinase-resistant penicillin
*Pregnancy risk category B*

### AVAILABLE FORMS
*Infusion:* 1 g, 2 g premixed or Add-Vantage vials

N

### INDICATIONS & DOSAGES
➤ **Systemic infection caused by susceptible organisms (methicillin-sensitive *Staphylococcus aureus*)**
*Adults:* 500 mg to 1 g I.V. every 4 hours, depending on severity of infection.
➤ **Acute or chronic osteomyelitis caused by susceptible organisms**
*Adults:* 1 to 2 g I.V. every 4 hours for 4 to 8 weeks.
➤ **Native valve endocarditis caused by susceptible organisms**
*Adults:* 2 g I.V. every 4 hours for 4 to 6 weeks, combined with gentamicin for first 3 to 5 days.

### ADMINISTRATION
**I.V.**
▼ Before giving drug, ask patient about allergic reactions to penicillin.
▼ Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.

▼ Check container for leaks, cloudiness, or precipitate before use. Discard if present.
▼ Give drug over 30 to 60 minutes.
▼ Change site every 48 hours to prevent vein irritation.
▼ Reconstituted vials of 10 to 40 mg/ml are stable for 24 hours at room temperature.
▼ **Incompatibilities:** Aminoglycosides, aminophylline, ascorbic acid, aztreonam, bleomycin, cytarabine, diltiazem, droperidol, gentamicin, hydrocortisone sodium succinate, insulin, labetalol, meperidine, methylprednisolone sodium succinate, midazolam, nalbuphine, pentazocine lactate, promazine, vancomycin, verapamil hydrochloride, vitamin B complex with C.

## ACTION

Inhibits cell-wall synthesis during bacterial multiplication.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |

*Half-life:* 30 to 90 minutes.

## ADVERSE REACTIONS

**CNS:** ***neurotoxicity.***
**CV:** thrombophlebitis, vein irritation.
**GI:** *nausea,* ***pseudomembranous colitis,*** diarrhea, vomiting.
**Hematologic:** ***agranulocytosis, leukopenia, neutropenia, thrombocytopenia,*** anemia, eosinophilia.
**Skin:** severe tissue necrosis.
**Other:** ***anaphylaxis,*** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Aminoglycosides:* May have synergistic effect; drugs are chemically and physically incompatible. Don't combine in same I.V. solution.
*Hormonal contraceptives:* May decrease contraceptive effectiveness. Advise use of additional form of contraception during therapy.
*Probenecid:* May increase nafcillin level. Probenecid may be used for this purpose.
*Rifampin:* May cause dose-dependent antagonism. Monitor patient closely.
*Tetracycline:* May decrease nafcillin's effectiveness. Avoid concurrent use.
*Warfarin:* May decrease effects of warfarin when used with nafcillin. Monitor PT and INR closely.

## EFFECTS ON LAB TEST RESULTS

• May decrease hemoglobin level and hematocrit.
• May decrease neutrophil, WBC, eosinophil, granulocyte, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or other penicillins.
• Safety and effectiveness in children haven't been established.
• Use cautiously in patients with GI distress and in those with other drug allergies (especially to cephalosporins) because of possible cross-sensitivity.
• Skin sloughing from subcutaneous extravasation has been reported.
***Overdose S&S:*** Neuromuscular hyperexcitability, seizures.

## NURSING CONSIDERATIONS

• If large doses are given or if therapy is prolonged, bacterial or fungal superinfection may occur, especially in elderly, debilitated, or immunosuppressed patients.
• Monitor sodium level because each gram of drug contains 2.9 mEq of sodium.
• Monitor WBC counts twice weekly in patients receiving drug for longer than 2 weeks. Neutropenia commonly occurs in the third week.
• An abnormal urinalysis result may indicate drug-induced interstitial nephritis.

## PATIENT TEACHING

• Tell patient to report burning or irritation at the I.V. site.
• Advise patient to notify prescriber if a rash develops or if signs and symptoms of superinfection appear, such as recurring fever, chills, and malaise.

**SAFETY ALERT!**

# nalbuphine hydrochloride

NAL-byoo-feen

Nubain†

*Therapeutic class:* Opioid analgesic
*Pharmacologic class:* Opioid agonist-antagonist, opioid partial agonist
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 10 mg/ml, 20 mg/ml

## INDICATIONS & DOSAGES

➤ **Moderate to severe pain**

*Adults:* For a patient of about 70 kg (154 lb), 10 to 20 mg subcutaneously, I.M., or I.V. every 3 to 6 hours p.r.n. Maximum, 160 mg daily.

➤ **Adjunct to balanced anesthesia**

*Adults:* 0.3 mg/kg to 3 mg/kg I.V. over 10 to 15 minutes; then maintenance doses of 0.25 to 0.50 mg/kg in single I.V. dose p.r.n.

***Adjust-a-dose:*** In patients with renal or hepatic impairment, decrease dosage.

## ADMINISTRATION

**I.V.**

▼ Inject slowly over at least 2 to 3 minutes into a vein or into an I.V. line containing a compatible, free-flowing I.V. solution, such as $D_5W$, normal saline solution, or lactated Ringer's solution.

▼ Respiratory depression can be reversed with naloxone. Keep resuscitation equipment available, particularly when giving I.V.

▼ **Incompatibilities:** Allopurinol, amphotericin B, cefepime, diazepam, docetaxel, ketorolac, methotrexate sodium, nafcillin, pentobarbital sodium, piperacillin and tazobactam sodium, promethazine, sargramostim, sodium bicarbonate, thiethylperazine.

**I.M.**

- Document injection site.
- Store vial in carton to protect from light.

**Subcutaneous**

- Document injection site.
- Store vial in carton to protect from light.

## ACTION

Unknown. Binds with opioid receptors in the CNS, altering perception of and emotional response to pain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 2–3 min | 30 min | 3–6 hr |
| I.M. | 15 min | 1 hr | 3–6 hr |
| Subcut. | 15 min | Unknown | 3–6 hr |

*Half-life:* 5 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness, headache, sedation, vertigo,* confusion, crying, delusions, depression, euphoria, hallucinations, hostility, nervousness, restlessness, speech disorders, unusual dreams.
**CV:** ***bradycardia,*** hypertension, hypotension, tachycardia.
**EENT:** blurred vision, dry mouth.
**GI:** biliary tract spasms, constipation, cramps, dyspepsia, nausea, vomiting.
**GU:** urinary urgency.
**Respiratory:** ***respiratory depression, asthma,*** dyspnea, ***pulmonary edema.***
**Skin:** burning, clamminess, diaphoresis, pruritus, urticaria.

## INTERACTIONS

**Drug-drug.** *CNS depressants, general anesthetics, hypnotics, MAO inhibitors, sedatives, tranquilizers, tricyclic antidepressants:* May cause respiratory depression, hypertension, profound sedation, or coma. Use together with caution, and monitor patient response.
*Opioid analgesics:* May decrease analgesic effect. Avoid using together.
**Drug-lifestyle.** *Alcohol use:* May cause additive effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with history of drug abuse and in those with emotional instability, head injury, increased intracranial pressure, impaired ventilation, MI accompanied by nausea and vomiting, upcoming biliary surgery, and hepatic or renal disease.

***Alert:*** Certain commercial preparations contain sodium metabisulfite.
***Overdose S&S:*** Respiratory depression, CV effects, CNS effects, somnolence, dysphoria.

## NURSING CONSIDERATIONS

- Reassess patient's level of pain at least 15 and 30 minutes after parenteral administration.
- Drug acts as an opioid antagonist and may cause withdrawal syndrome. For patients who have received long-term opioids, give 25% of the usual dose initially. Watch for signs of withdrawal.
***Alert:*** Drug causes respiratory depression, which at 10 mg is equal to respiratory depression produced by 10 mg of morphine.
- Monitor circulatory and respiratory status and bladder and bowel function. If respirations are shallow or rate is below 12 breaths/minute, withhold dose and notify prescriber.
- Constipation is commonly severe with maintenance therapy. Make sure stool softener or other stimulant laxative is ordered.
- Psychological and physical dependence may occur with prolonged use.

## PATIENT TEACHING

- Caution ambulatory patient about getting out of bed or walking. Warn outpatient to avoid driving and other hazardous activities that require mental alertness until drug's CNS effects are known.
- Teach patient how to manage troublesome adverse effects such as constipation.

# naloxone hydrochloride

nal-OX-one

*Therapeutic class:* Antidote
*Pharmacologic class:* Opioid antagonist
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 0.02 mg/ml, 0.4 mg/ml

## INDICATIONS & DOSAGES

➤ **Known or suspected opioid-induced respiratory depression, including that caused by pentazocine, propoxyphene methadone, nalbuphine and butorphanol**
*Adults:* 0.4 to 2 mg I.V., I.M., or subcutaneously. Repeat dose every 2 to 3 minutes, p.r.n. If patient doesn't respond after 10 mg have been given, question diagnosis of opioid-induced toxicity.
*Children age 1 month and older:* 0.01 mg/kg I.V.; then, second dose of 0.1 mg/kg I.V., if needed. If I.V. route isn't available, drug may be given I.M. or subcutaneously in divided doses.
*Neonates:* 0.01 mg/kg I.V., I.M., or subcutaneously. Repeat dose every 2 to 3 minutes, p.r.n.

➤ **Postoperative opioid depression**
*Adults:* 0.1 to 0.2 mg I.V. every 2 to 3 minutes, p.r.n. Repeat dose within 1 to 2 hours, if needed.
*Children:* 0.005 to 0.01 mg I.V. repeated every 2 to 3 minutes, p.r.n.

## ADMINISTRATION

**I.V.**
▼ Give continuous infusion to control adverse effects of epidural morphine.
▼ Dilute 2 mg of drug in 500 ml $D_5W$ or normal saline solution to yield a concentration of 0.004 mg/ml.
▼ Titrate rate to patient's response.
▼ If 0.02 mg/ml isn't available, adult concentration (0.4 mg) may be diluted by mixing 0.5 ml with 9.5 ml of sterile water for injection to make neonatal concentration (0.02 mg/ml).
▼ **Incompatibilities:** Alkaline solutions, amphotericin B cholesteryl sulfate, preparations containing bisulfite, sulfite, long-chain or high-molecular-weight anions.

**I.M.**
- Use mixtures within 24 hours. After 24 hours, discard.

**Subcutaneous**
- Use mixtures within 24 hours. After 24 hours, discard.

## ACTION

May displace opioid analgesics from their receptors (competitive antagonism); drug has no pharmacologic activity of its own.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 1–2 min | 5–15 min | Variable |
| I.M., Subcut. | 2–5 min | 5–15 min | Variable |

*Half-life:* 30 to 81 minutes in adults; 3 hours in neonates.

## ADVERSE REACTIONS
**CNS:** ***seizures,*** tremors.
**CV:** ***ventricular fibrillation,*** tachycardia, hypertension with higher than recommended doses, hypotension.
**GI:** nausea, vomiting.
**Respiratory:** ***pulmonary edema.***
**Skin:** diaphoresis.
**Other:** withdrawal symptoms in opioid-dependent patients with higher than recommended doses.

## INTERACTIONS
None significant.

## EFFECTS ON LAB TEST RESULTS
None reported.

## CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with cardiac irritability or opioid addiction. Abrupt reversal of opioid-induced CNS depression may result in nausea, vomiting, diaphoresis, tachycardia, CNS excitement, and increased blood pressure.

## NURSING CONSIDERATIONS
- Duration of action of the opioid may exceed that of naloxone, and patients may relapse into respiratory depression.
- Respiratory rate increases within 1 to 2 minutes.
- ***Alert:*** Drug is only effective for reversing respiratory depression caused by opioids and not for other drug-induced respiratory depression, including that caused by benzodiazepines.
- Patients who receive drug to reverse opioid-induced respiratory depression may exhibit tachypnea.
- Monitor respiratory depth and rate. Provide oxygen, ventilation, and other resuscitation measures.
- ***Look alike–sound alike:*** Don't confuse naloxone with naltrexone.

## PATIENT TEACHING
- Reassure family that patient will be monitored closely until effects of opioid resolve.

# naltrexone
nal-TREX-one

Vivitrol

# naltrexone hydrochloride
ReVia

*Therapeutic class:* Opioid cessation agent
*Pharmacologic class:* Opioid antagonist
*Pregnancy risk category C*

## AVAILABLE FORMS
**naltrexone**
*Injection:* 380 mg/vial dose kit
**naltrexone hydrochloride**
*Tablets:* 25 mg, 50 mg, 100 mg

## INDICATIONS & DOSAGES
➤ **Adjunct for maintaining opioid-free state in detoxified patients**
*Adults:* Initially, 25 mg P.O. If no withdrawal signs occur within 1 hour the patient may be started on 50 mg every 24 hours the following day. From 50 to 150 mg may be given daily, depending on schedule prescribed.
➤ **Alcohol dependence**
*Adults:* 50 mg P.O. once daily or 380 mg I.M. in the gluteal muscle once monthly.

## ADMINISTRATION
**P.O.**
- Keep container tightly closed and protect from light.

**I.M.**
- Use only the diluent, needles, and other components supplied with the dose kit. Don't substitute.
- Administer I.M. into gluteal muscle. Avoid giving I.V., subcutaneously, or inadvertently into fatty tissue. Monitor the injection site.

## ACTION

Probably reversibly blocks the effects of I.V. opioids by competitively occupying opiate receptors in the brain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 15–30 min | 1 hr | 24 hr |
| I.M. | Unknown | 2–3 days | >30 days |

*Half-life:* About 4 hours.

## ADVERSE REACTIONS

**CNS:** *insomnia, anxiety, nervousness, headache,* depression, dizziness, fatigue, somnolence.
**GI:** *nausea, vomiting, abdominal pain,* anorexia, constipation, increased thirst.
**GU:** delayed ejaculation, decreased potency.
**Hepatic:** ***hepatotoxicity.***
**Musculoskeletal:** *muscle and joint pain.*
**Skin:** *injection site reaction,* rash.
**Other:** chills.

## INTERACTIONS

**Drug-drug.** *Products that contain opioids:* May decrease effect of opioid. Avoid using together.
*Thioridazine:* May increase somnolence and lethargy. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

- May increase AST, ALT, and LDH levels.
- May increase lymphocyte count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or dependent on opioids, those receiving opioid analgesics, those who fail the naloxone challenge test or who have a positive urine screen for opioids, or those in acute opioid withdrawal.

**Black Box Warning** Contraindicated in patients with acute hepatitis or liver failure. Use cautiously in patients with mild hepatic disease or history of recent hepatic disease.

***Overdose S&S:*** Injection-site reaction, nausea, abdominal pain, somnolence, dizziness.

## NURSING CONSIDERATIONS

**Black Box Warning** Discontinue drug if patient develops symptoms and/or signs of acute hepatitis.

- Don't begin treatment for opioid dependence until patient receives naloxone challenge, a test of opioid dependence. If signs and symptoms of opioid withdrawal persist after naloxone challenge, don't give drug.
- Patient must be completely free from opioids before taking naltrexone or severe withdrawal symptoms may occur. Patients who have been addicted to short-acting opioids, such as heroin and meperidine, must wait at least 7 days after last opioid dose before starting drug. Patients who have been addicted to longer-acting opioids such as methadone should wait at least 10 days.
- In an emergency, patient may be given an opioid analgesic, but dose must be higher than usual to overcome naltrexone's effect. Watch for respiratory depression from the opioid; it may be longer and deeper.
- For patients expected to be noncompliant because of history of opioid dependence, use a flexible maintenance-dose regimen of 100 mg on Monday and Wednesday and 150 mg on Friday.
- Use drug only as part of a comprehensive rehabilitation program.
- ***Look alike–sound alike:*** Don't confuse naltrexone with naloxone.

## PATIENT TEACHING

- Advise patient to carry medical identification and to tell medical personnel that he takes naltrexone.
- Tell patient that drug can block the effects of opioids or opioid-like drugs, including heroin, pain medicine, antidiarrheals, or cough medicine.

***Alert:*** Warn patient if he uses large doses of heroin or any other opioid; serious injury, coma, or death can occur.

- Advise patient who previously used opioids that he may be more sensitive to lower doses of opioids once naltrexone therapy is stopped.

**Black Box Warning** Tell patient to report adverse effects, especially those related to liver injury, to prescriber immediately.

***Alert:*** Tell caregiver of alcohol-dependent patient to monitor him closely for signs of depression or suicide ideation and to report this immediately to prescriber.

- Give patient the names of nonopioid drugs that he can continue to take for pain, diarrhea, or cough.
- Tell patient to report pain, swelling, tenderness, induration, bruising, pruritis, or redness at the injection site.

## naphazoline hydrochloride

naf-AZ-oh-leen

Advanced Eye Relief ◇, AK-Con, Albalon, All Clear ◇, Clear Eyes ◇, Nafazair, Naphcon ◇, 20/20 Eye Drops ◇

*Therapeutic class:* Vasoconstrictor
*Pharmacologic class:* Sympathomimetic
*Pregnancy risk category C*

### AVAILABLE FORMS

*Ophthalmic solution:* 0.012% ◇, 0.03% ◇, 0.1%

### INDICATIONS & DOSAGES

➤ **Ocular congestion, irritation, itching**

*Adults:* Instill 1 or 2 drops into the conjunctival sac of affected eye(s) every 3 to 4 hours, up to q.i.d.

### ADMINISTRATION

**Ophthalmic**

- Store drug in tightly closed container.

### ACTION

Thought to cause vasoconstriction by local adrenergic action on the blood vessels of the conjunctiva.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | 10 min | Unknown | 2–6 hr |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CNS:** dizziness, headache, nervousness, weakness.
**EENT:** blurred vision, eye irritation, increased intraocular pressure, keratitis, lacrimation, photophobia, pupillary dilation, transient eye stinging.
**GI:** nausea.
**Skin:** diaphoresis.

### INTERACTIONS

**Drug-drug.** *Anesthetics:* Cyclopropane and halothane may sensitize the myocardium to sympathomimetics; local anesthetics may increase the absorption of topical drugs. Monitor patient for increased adverse effects.
*Beta blockers:* May cause more systemic adverse effects. Monitor patient for adverse systemic effects.
*MAO inhibitors, maprotiline, tricyclic antidepressants:* May cause hypertensive crisis if naphazoline is systemically absorbed. Use together cautiously.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug's ingredients and in those with acute angle-closure glaucoma.
- Use of 0.1% solution is contraindicated in infants and small children.
- Use cautiously in patients with hyperthyroidism, cardiac disease, hypertension, or diabetes mellitus.

### NURSING CONSIDERATIONS

- Drug is most widely used ocular decongestant.
- Rebound congestion and conjunctivitis may occur with frequent or prolonged use.

### PATIENT TEACHING

- Teach patient how to instill drug. Advise him to wash hands before and after instillation and to apply light finger pressure on lacrimal sac for 1 minute after drops are instilled. Warn him not to touch tip of dropper to eye or surrounding tissue.
- Warn patient not to exceed recommended dosage to avoid rebound congestion and conjunctivitis.
- Tell patient to notify prescriber if sun sensitivity, blurred vision, pain, or lid swelling develops.
- Instruct patient not to use OTC preparations longer than 72 hours without consulting prescriber.

## naproxen

na-PROX-en

EC-Naprosyn, Naprosyn✔, Novo-Naprox†, Nu-Naprox†

## naproxen sodium

Aleve ◇, Anaprox, Anaprox DS, Apo-Napro-Na† ◇, Naprelan, Novo-Naprox Sodium†

*Therapeutic class:* NSAID
*Pharmacologic class:* NSAID
*Pregnancy risk category B; D in 3rd trimester*

### AVAILABLE FORMS

**naproxen**
*Oral suspension:* 125 mg/5 ml
*Suppositories:* 500 mg†
*Tablets:* 200 mg, 250 mg, 375 mg, 500 mg
*Tablets (delayed-release):* 375 mg, 500 mg
*Tablets (extended-release):* 375 mg, 750 mg, 1,000 mg
**naproxen sodium**
*Capsules:* 200 mg ◇
*Tablets (controlled-release):* 412.5 mg, 550 mg
*Tablets (film-coated):* 220 mg ◇, 275 mg, 550 mg
*Note:* 275 mg of naproxen sodium contains 250 mg of naproxen.

### INDICATIONS & DOSAGES

➤ **Rheumatoid arthritis, osteoarthritis, ankylosing spondylitis, pain, dysmenorrhea, tendinitis, bursitis**
*Adults:* 250 to 500 mg naproxen b.i.d.; maximum, 1.5 g daily for a limited time. Or, 375 to 500 mg delayed-release EC-Naprosyn b.i.d. Or, 750 to 1,000 mg controlled-release Naprelan daily. Or, 275 to 550 mg naproxen sodium b.i.d.

➤ **Osteoarthritis, rheumatoid arthritis, ankylosing spondylitis**
*Adults:* One 500-mg suppository (can replace one P.O. dose of 1,000 mg) b.i.d.

➤ **Juvenile arthritis**
*Children:* 10 mg/kg P.O. in two divided doses.

➤ **Acute gout**
*Adults:* 750 mg naproxen P.O.; then 250 mg every 8 hours until attack subsides. Or, 825 mg naproxen sodium; then 275 mg every 8 hours until attack subsides.

➤ **Mild to moderate pain, primary dysmenorrhea**
*Adults:* 500 mg naproxen P.O.; then 250 mg every 6 to 8 hours up to 1.25 g daily. Or, 550 mg naproxen sodium; then 275 mg every 6 to 8 hours up to 1,375 mg daily. Or, 1,000 mg controlled-release Naprelan once daily. In patients older than age 65, don't exceed 400 mg daily.

### ADMINISTRATION

**P.O.**
• Take drug with food or milk to minimize GI upset. Drink a full glass of water or other liquid with each dose.
**P.R.**
• Not for use in children younger than age 16.

### ACTION

May inhibit prostaglandin synthesis to produce anti-inflammatory, analgesic, and antipyretic effects.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 2–4 hr | 7 hr |
| P.R. | Rapid | 2½ hr | Unknown |

*Half-life:* 10 to 20 hours.

### ADVERSE REACTIONS

**CNS:** dizziness, drowsiness, headache, vertigo.
**CV:** edema, palpitations.
**EENT:** *tinnitus*, auditory disturbances, visual disturbances.
**GI:** abdominal pain, constipation, diarrhea, dyspepsia, epigastric pain, heartburn, nausea, occult blood loss, peptic ulceration, stomatitis, thirst.
**GU:** ***renal failure.***
**Hematologic:** ecchymoses, increased bleeding time.
**Metabolic:** ***hyperkalemia.***
**Respiratory:** dyspnea.
**Skin:** diaphoresis, pruritus, purpura, rash, urticaria.

### INTERACTIONS

**Drug-drug.** *ACE inhibitors:* May cause renal impairment. Use together cautiously.

*Antihypertensives, diuretics:* May decrease effect of these drugs. Monitor patient closely.
*Aspirin, corticosteroids:* May cause adverse GI reactions. Avoid using together.
*Lithium:* May increase lithium level. Observe patient for toxicity and monitor level. Adjustment of lithium dosage may be required.
*Methotrexate:* May cause toxicity. Monitor patient closely.
*Oral anticoagulants, other sulfonylureas, highly protein-bound drugs:* May cause toxicity. Monitor patient closely.
*Probenecid:* May decrease elimination of naproxen. Monitor patient for toxicity.
**Drug-herb.** *Dong quai, feverfew, garlic, ginger, ginkgo, horse chestnut, red clover:* May cause bleeding, based on the known effects of components. Discourage use together.
*White willow:* Herb and drug contain similar components. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May cause adverse GI reactions. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN, creatinine, ALT, AST, and potassium levels.
- May increase bleeding time.
- May interfere with urinary 5-hydroxyindoleacetic acid and 17-hydroxycorticosteroid determinations.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with the syndrome of asthma, rhinitis, and nasal polyps.

**Black Box Warning** Naproxen (except controlled-release tablets) is contraindicated for the treatment of perioperative pain after CABG surgery. ■

- Patient should avoid drug during last trimester of pregnancy.
- Use cautiously in elderly patients and in patients with renal disease, CV disease, GI disorders, hepatic disease, or history of peptic ulcer disease.

***Overdose S&S:*** Drowsiness, heartburn, indigestion, nausea, vomiting, seizures.

## NURSING CONSIDERATIONS

- Because NSAIDs impair synthesis of renal prostaglandins, they can decrease renal blood flow and lead to reversible renal impairment, especially in patients with renal failure, heart failure, or liver dysfunction; in elderly patients; and in those taking diuretics. Monitor these patients closely.
- Monitor CBD and renal and hepatic function every 4 to 6 months during long-term therapy.

**Black Box Warning** NSAIDs cause an increased risk of serious GI adverse events including bleeding, ulceration, and perforation of the stomach or intestines, which can be fatal. Elderly patients are at greater risk. ■

**Black Box Warning** NSAIDs may increase the risk of serious thrombotic events, MI, or stroke, which can be fatal. The risk may be greater with longer use or in patients with CV disease or risk factors for CV disease. ■

- Because of their antipyretic and anti-inflammatory actions, NSAIDs may mask signs and symptoms of infection.
- Drug may have a heart benefit, similar to aspirin, in preventing blood clotting.

## PATIENT TEACHING

***Alert:*** Drug is available without prescription (naproxen sodium, 200 mg). Instruct patient not to take more than 600 mg in 24 hours. Dosage in patient older than age 65 shouldn't exceed 400 mg daily.

- Advise patient to take drug with food or milk to minimize GI upset. Tell him to drink a full glass of water or other liquid with each dose.
- Tell patient taking prescription doses for arthritis that full therapeutic effect may be delayed 2 to 4 weeks.
- Warn patient against taking naproxen and naproxen sodium at the same time.
- Teach patient signs and symptoms of GI bleeding, including blood in vomit, urine, or stool; coffee-ground vomit; and black, tarry stool. Tell him to notify prescriber immediately if any of these occurs.
- Caution patient that use with aspirin, alcohol, other NSAIDs, or corticosteroids may increase risk of adverse GI reactions.

N

• Warn patient against hazardous activities that require mental alertness until CNS effects are known.

## naratriptan hydrochloride

nar-ah-TRIP-tan

Amerge

*Therapeutic class:* Antimigraine
*Pharmacologic class:* Serotonin 5-$HT_1$ receptor agonist
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 1 mg, 2.5 mg

### INDICATIONS & DOSAGES

➤ **Acute migraine attacks with or without aura**

*Adults:* 1 or 2.5 mg P.O. as a single dose. If headache returns or responds only partially, dose may be repeated after 4 hours. Maximum, 5 mg in 24 hours.

***Adjust-a-dose:*** For patients with mild to moderate renal or hepatic impairment, reduce dosage. Maximum, 2.5 mg in 24 hours.

### ADMINISTRATION

**P.O.**

• Give drug without regard for food.
• Give drug whole; don't split or crush tablet.
• If no response occurs with first tablet, prescriber should be consulted before giving second tablet. If more relief is needed after first tablet (if a partial response occurs or headache returns), and prescriber has approved a second dose, give a second tablet (but not sooner than 4 hours after first tablet).

### ACTION

May act as an agonist at serotonin receptors on extracerebral intracranial blood vessels, which constricts the affected vessels, inhibits neuropeptide release, and reduces pain transmission in the trigeminal pathways.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–3 hr | Unknown |

*Half-life:* 6 hours.

### ADVERSE REACTIONS

**CNS:** paresthesia, dizziness, drowsiness, malaise, fatigue, vertigo, syncope.
**CV:** ***tachyarrhythmias, abnormal ECG changes, coronary artery vasospasm, transient myocardial ischemia, MI, ventricular tachycardia, ventricular fibrillation,*** palpitations, hypertension.
**EENT:** ear, nose, and throat infections, photophobia.
**GI:** nausea, hyposalivation, vomiting.
**Other:** sensations of warmth, cold, pressure, tightness, or heaviness.

### INTERACTIONS

**Drug-drug.** *Ergot-containing or ergot-type drugs (dihydroergotamine, methysergide), other 5-$HT_1$ agonists:* May prolong vasospastic reactions. Avoid using within 24 hours of naratriptan.
*Hormonal contraceptives:* May slightly increase naratriptan level. Monitor patient.
*SSRIs (fluoxetine, fluvoxamine, paroxetine, sertraline):* May cause weakness, hyperreflexia, and incoordination. Monitor patient.
**Drug-herb.** *St. John's wort:* May increase serotonergic effect. Discourage use together.
**Drug-lifestyle.** *Smoking:* May increase naratriptan clearance. Discourage smoking.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components, in those with prior or current cardiac ischemia, in those with cerebrovascular or peripheral vascular syndromes, and in those with uncontrolled hypertension.
• Contraindicated in elderly patients, patients with creatinine clearance below 15 ml/minute, patients with Child-Pugh grade C, and patients who have used ergot-containing, ergot-type, or other 5-$HT_1$ agonists within 24 hours.
• Use cautiously in patients with risk factors for coronary artery disease (CAD), such as hypertension, hypercholesterolemia, obesity, diabetes, smoking, strong family history of CAD, postmenopausal women,

and men older than age 40, unless patient is free from cardiac disease. Monitor patient closely after first dose.
• Use cautiously in patients with renal or hepatic impairment.
• Safety and efficacy of treating cluster headaches or more than four headaches in a 30-day period haven't been established.
***Overdose S&S:*** Chest pain, ischemic ECG changes.

### NURSING CONSIDERATIONS
• Assess cardiac status in patients who develop risk factors for CAD.
***Alert:*** Drug can cause coronary artery vasospasm and increased risk of cerebrovascular events.
• Drug isn't intended to prevent migraines or manage hemiplegic or basilar migraine.
• Use drug only when patient has a clear diagnosis of migraine.
***Alert:*** Combining drug with an SSRI or an SSNRI may cause serotonin syndrome. Symptoms include restlessness, hallucinations, loss of coordination, fast heartbeat, rapid changes in blood pressure, increased body temperature, hyperreflexia, nausea, vomiting, and diarrhea. Serotonin syndrome is more likely to occur when starting or increasing the dose of naratriptan, the SSRI, or the SSNRI.

### PATIENT TEACHING
• Instruct patient to take drug only as prescribed and to read the accompanying patient instruction leaflet before using drug.
• Tell patient that drug is intended to relieve, not prevent, migraines.
• Instruct patient to take dose soon after headache starts. If no response occurs with first tablet, tell him to seek medical approval before taking second tablet. Tell patient that if more relief is needed after first tablet (if a partial response occurs or headache returns), and prescriber has approved a second dose, he may take a second tablet (but not sooner than 4 hours after first tablet). Tell him not to exceed 2 tablets within 24 hours.
• Advise patient to increase fluid intake.
• Advise patient not to use drug if she suspects or knows that she's pregnant.
• Tell patient to alert prescriber about bothersome adverse effects.
• Tell patient to swallow tablet whole, and not to split, crush, or chew tablet.

## natalizumab
nah-tah-LIZ-yoo-mab

Tysabri

*Therapeutic class:* Immune response modifier
*Pharmacologic class:* Monoclonal antibody
*Pregnancy risk category C*

### AVAILABLE FORMS
*Injection:* 300 mg/15 ml single-use vials

### INDICATIONS & DOSAGES
➤ **To slow the accumulation of physical disabilities and reduce the frequency of clinical exacerbations in relapsing forms of multiple sclerosis (MS) for patients who failed to respond or were unable to tolerate other therapies. Or moderate to severe Crohn's disease in patients with inadequate response or intolerance to conventional therapy.**
*Adults:* 300 mg I.V. over 1 hour every 4 weeks.

### ADMINISTRATION
**I.V.**
▼ Dilute 300 mg in 100 ml normal saline solution.
▼ Invert I.V. bag gently to mix solution; don't shake.
▼ Infuse over 1 hour; don't give by I.V. push or bolus.
▼ Flush I.V. line with normal saline solution after infusion is complete.
▼ Refrigerate solution and use within 8 hours if not used immediately.
▼ **Incompatibilities:** Don't mix or infuse with other drugs. Don't use any diluent other than normal saline solution.

### ACTION
May block interaction between adhesion molecules on inflammatory cells and receptors on endothelial cells of vessel walls.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 7 to 15 days.

## ADVERSE REACTIONS

**CNS:** ***progressive multifocal leukoencephalopathy (PML),*** *depression, fatigue, headache,* somnolence, vertigo.
**CV:** chest discomfort.
**EENT:** tonsillitis.
**GI:** *abdominal discomfort, diarrhea, gastroenteritis.*
**GU:** *UTI, vaginitis,* amenorrhea, dysmenorrhea, irregular menstruation, urinary frequency, urinary urgency, ovarian cyst.
**Metabolic:** weight increase or decrease.
**Musculoskeletal:** *arthralgia,* extremity pain, muscle cramps, swollen joints.
**Respiratory:** *lower respiratory tract infection.*
**Skin:** *rash,* dermatitis, pruritus, urticaria, night sweats.
**Other:** hypersensitivity reaction, infusion-related reaction, *tooth infections,* herpes, infection, rigors, seasonal allergy, cholelithiasis.

## INTERACTIONS

**Drug-drug.** *Corticosteroids, immunosuppressants, TNF inhibitors:* May increase risk of infection. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

- May increase liver function test values and lymphocyte, monocyte, eosinophil, basophil, and nucleated RBC counts.
- May cause transient decrease in hemoglobin.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components or in those with current or past history of PML. Use with other immunosuppressants isn't recommended.
- Safety and efficacy in patients with chronic progressive MS haven't been established.

## NURSING CONSIDERATIONS

**Black Box Warning** Only prescribers registered in the TOUCH Prescribing Program may prescribe drug. Contact the TOUCH Prescribing Program at 1-800-456-2255. ■
- Report serious opportunistic and atypical infections to Biogen Idec at 1-800-456-2255 and to the FDA's MedWatch Program at 1-800-FDA-1088.
- The safety and efficacy of natalizumab treatment beyond 2 years are unknown.

**Black Box Warning** Drug may cause PML. Withhold drug immediately at the first signs or symptoms suggestive of PML. Symptoms include clumsiness; progressive weakness; and visual, speech, and sometimes personality changes. ■
- Obtain a brain MRI before starting therapy.

***Alert:*** Watch for evidence of hypersensitivity reaction during and for 1 hour after infusion, which may include dizziness, urticaria, fever, rash, rigors, pruritus, nausea, flushing, hypotension, dyspnea, and chest pain.
- If hypersensitivity reaction occurs, stop drug and notify prescriber.
- Patients who develop antibodies to drug have an increased risk of infusion-related reaction.
- Discontinue drug in patients with jaundice or other evidence of significant liver injury. Elevated serum hepatic enzymes and elevated total bilirubin levels may occur as early as 6 days after the first dose.

## PATIENT TEACHING

- Tell patient to read the "Medication Guide for Tysabri" before each infusion.
- Urge patient to immediately report progressively worsening symptoms persisting over several days, including changes in thinking, eyesight, balance, or strength.
- Advise patient to inform all health care providers caring for him that he's receiving this drug.
- Tell patient to schedule follow-up appointments with prescriber at 3 and 6 months after the first infusion, then at least every 6 months thereafter.
- Urge patient to immediately report rash, hives, dizziness, fever, shaking chills, or itching while drug is infusing or up to 1 hour afterward.
- Tell patient about the potential for liver injury.

## nateglinide

nah-TEG-lah-nyde

Starlix

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Meglitinide derivative
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 60 mg, 120 mg

### INDICATIONS & DOSAGES

➤ **Type 2 diabetes, as monotherapy, or with metformin or a thiazolidinedione**

*Adults:* 120 mg P.O. t.i.d. taken 1 to 30 minutes before meals. Patients near goal $HbA_{1c}$ when treatment is started may receive 60 mg P.O. t.i.d.

### ADMINISTRATION

**P.O.**

- Give drug 1 to 30 minutes before a meal.

### ACTION

Lowers glucose level by stimulating insulin secretion from pancreatic beta cells.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 20 min | 1 hr | 4 hr |

*Half-life:* About 1½ hours.

### ADVERSE REACTIONS

**CNS:** dizziness.
**GI:** diarrhea.
**Metabolic:** ***hypoglycemia.***
**Musculoskeletal:** back pain, arthropathy.
**Respiratory:** *upper respiratory tract infection,* bronchitis, coughing.
**Other:** flulike symptoms, accidental trauma.

### INTERACTIONS

**Drug-drug.** *Corticosteroids, rifamycins, sympathomimetics, thiazides, thyroid products:* May reduce hypoglycemic action of nateglinide. Monitor glucose level closely.
*MAO inhibitors, nonselective beta blockers, NSAIDs, salicylates:* May increase hypoglycemic action of nateglinide. Monitor glucose level closely.

### EFFECTS ON LAB TEST RESULTS

- May increase uric acid level.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, in those with type 1 diabetes or diabetic ketoacidosis, and in pregnant or breast-feeding patients.
- Use cautiously in patients with moderate to severe liver dysfunction or adrenal or pituitary insufficiency, and in elderly and malnourished patients.

⚠ ***Overdose S&S:*** Hypoglycemic symptoms.

### NURSING CONSIDERATIONS

- Don't use with glyburide or other oral antidiabetics; may use with metformin or a thiazolidinedione.
- Monitor glucose level regularly to evaluate drug's effectiveness.
- Observe patient for signs and symptoms of hypoglycemia. To minimize risk of hypoglycemia, make sure that patient has a meal immediately after dose. If hypoglycemia occurs and patient remains conscious, give him an oral form of glucose. If he's unconscious, treat with I.V. glucose.
- Risk of hypoglycemia increases with strenuous exercise, alcohol ingestion, or insufficient caloric intake.
- Symptoms of hypoglycemia may be masked in patients with autonomic neuropathy and in those who use beta blockers.
- Insulin therapy may be needed for glycemic control in patients with fever, infection, or trauma and in those undergoing surgery.
- Monitor glucose level closely when other drugs are started or stopped, to detect possible drug interactions.
- Periodically monitor $HbA_{1c}$ level.
- Drug's effectiveness may decrease over time.
- No special dosage adjustments are usually necessary in elderly patients, but some elderly patients may have greater sensitivity to glucose-lowering effect.

### PATIENT TEACHING

- Tell patient to take drug 1 to 30 minutes before a meal.

N

- Advise patient to skip the scheduled dose if he skips a meal to reduce risk of hypoglycemia.
- Instruct patient on risk of hypoglycemia, its signs and symptoms (sweating, rapid pulse, trembling, confusion, headache, irritability, and nausea), and ways to treat these symptoms by eating or drinking something containing sugar.
- Teach patient how to monitor and log glucose levels to evaluate diabetes control.
- Advise patient to notify prescriber for persistent low or high glucose level.
- Instruct patient to adhere to prescribed diet and exercise regimen.
- Explain possible long-term complications of diabetes and importance of regular preventive therapy.
- Encourage patient to wear a medical identification bracelet.

## nebivolol hydrochloride

neh-BIH-voh-lawl

Bystolic

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Beta blocker
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 2.5 mg, 5 mg, 10 mg, 20 mg

### INDICATIONS & DOSAGES

➤ **Hypertension**

*Adults:* Initially, 5 mg P.O. once daily. Increase at 2-week intervals to a maximum dose of 40 mg, if needed.

***Adjust-a-dose:*** For patients with severe renal impairment or moderate hepatic impairment, start with 2.5 mg P.O. once daily. Increase dose cautiously, if needed.

### ADMINISTRATION

**P.O.**

- May give drug without regard to food.

### ACTION

Selectively blocks beta$_1$-adrenergic receptors, reducing heart rate, myocardial contractility, and sympathetic tone. Nebivolol also reduces blood pressure by suppressing renin activity and decreasing peripheral vascular resistance.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1½–4 hr | Unknown |

*Half-life:* 12 to 19 hours.

### ADVERSE REACTIONS

**CNS:** asthenia, dizziness, fatigue, headache, insomnia, paresthesia.
**CV:** ***bradycardia,*** chest pain, peripheral edema.
**GI:** abdominal pain, diarrhea, nausea.
**Metabolic:** hypercholesterolemia, hyperuricemia.
**Respiratory:** dyspnea.
**Skin:** rash.

### INTERACTIONS

**Drug-drug.** *Clonidine:* May cause further decrease in blood pressure. Simultaneous withdrawal may cause life-threatening rebound hypertension. Discontinue nebivolol for several days before gradual tapering of clonidine.
*CYP2D6 inhibitors, such as fluoxetine, paroxetine, propafenone, quinidine:* May increase nebivolol level. Monitor blood pressure closely, and adjust nebivolol dose as needed.
*Digoxin, diltiazem, disopyramide, verapamil:* May increase the risk of bradycardia. Monitor patient's ECG and vital signs.
*Catecholamine-depleting drugs, such as, guanethidine, reserpine:* May cause bradycardia or severe hypotension. Monitor patient closely.

### EFFECTS ON LAB TEST RESULTS

- May increase BUN, uric acid, and triglyceride levels. May decrease HDL and cholesterol levels.
- May decrease platelet count.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and those with decompensated cardiac failure, severe bradycardia, second- or third-degree AV block, sick sinus syndrome (unless a permanent pacemaker is in place), cardiogenic shock, bronchial asthma or related bronchospastic conditions, or

severe hepatic impairment (greater than Child-Pugh B).
• Use cautiously in patients with compensated heart failure, in perioperative patients receiving anesthetics that depress myocardial function (such as cyclopropane and trichloroethylene), in diabetic patients receiving insulin or oral antidiabetics or subject to spontaneous hypoglycemia, in patients with severe renal impairment, and in patients with thyroid disease (use may mask hyperthyroidism and withdrawal may worsen it), pheochromocytoma, or peripheral vascular disease (may cause or worsen symptoms of arterial insufficiency).
***Overdose S&S:*** Bradycardia, hypotension, cardiac failure, fatigue, dizziness, hypoglycemia, vomiting, bronchospasm, heart block.

## NURSING CONSIDERATIONS

***Alert:*** Patients with a history of severe anaphylactic reaction to several allergens may be more reactive to repeated exposure to nebivolol (accidental, diagnostic, or therapeutic), and they may not respond to amounts of epinephrine typically used to treat allergic reactions.
• Check patient's blood pressure and heart rate often.
• Monitor hepatic and renal function test results.
• If nebivolol must be stopped, do so gradually over 1 to 2 weeks.
• Because beta blockers may mask tachycardia caused by hyperthyroidism, be sure to withdraw nebivolol gradually in patients with suspected thyrotoxicosis to avoid thyroid storm.
• Observe a diabetic patient closely because drug may mask evidence of hypoglycemia.
• If patient has heart failure, watch for worsening symptoms, renal dysfunction, or fluid retention. His diuretic dosage may need to be increased.
• Store drug at room temperature in a light-resistant container.

## PATIENT TEACHING

• Instruct patient not to stop drug suddenly but to notify prescriber about unpleasant adverse reactions. Explain that drug must be withdrawn gradually over 1 or 2 weeks.
• Caution patient to avoid driving and other tasks requiring alertness until his response to therapy is known.
• Tell patient to alert prescriber if he develops shortness of breath.
• Caution patient with diabetes or spontaneous hypoglycemia that drug may mask symptoms of low blood glucose level, especially increased heart rate.
• Urge women not to breast-feed during therapy.

**SAFETY ALERT!**

# nelarabine

neh-LAR-uh-been

Arranon

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* DNA demethylation agent; prodrug of cytotoxic deoxyguanosine
*Pregnancy risk category D*

## AVAILABLE FORMS

*Injection:* 5 mg/ml in 50-ml vial

## INDICATIONS & DOSAGES

➤ **T-cell acute lymphoblastic leukemia and T-cell lymphoblastic lymphoma in patients whose disease hasn't responded to or has relapsed after treatment with at least two chemotherapy regimens**
*Adults:* 1,500 mg/m$^2$ I.V. over 2 hours on days 1, 3, and 5. Repeat every 21 days.
*Children:* 650 mg/m$^2$ I.V. over 1 hour daily for 5 consecutive days. Repeat every 21 days.

## ADMINISTRATION

**I.V.**

**Black Box Warning** Drug is for I.V. use only.
▼ Wear gloves and protective clothing when preparing drug, and avoid skin contact.
▼ Transfer undiluted dose to a polyvinylchloride infusion bag or glass container.
▼ Once prepared, drug may be stored for 8 hours at 86° F (30° C).

▼ For adults, infuse dose over 2 hours; for children, infuse over 1 hour.
▼ Dispose of drug according to facility's protocol for hazardous waste.
▼ **Incompatibilities:** None reported.

## ACTION

Probably accumulates in leukemic cells, inhibiting DNA synthesis and causing cell death.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | 2 hr | 3–25 hr |

*Half-life:* Parent drug, 30 minutes; active metabolite, 3 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness, fatigue, fever, headache, hypoesthesia, paresthesias, peripheral neuropathy, rigors, somnolence,* ***demyelination peripheral neuropathies, seizures,*** abnormal gait, asthenia, ataxia, confusion, decreased level of consciousness, depression, insomnia, pain.
**CV:** *edema, petechiae,* chest pain, hypotension, sinus tachycardia.
**EENT:** blurred vision, epistaxis, sinusitis.
**GI:** *constipation, diarrhea, nausea, vomiting,* abdominal distention, abdominal pain, anorexia, stomatitis.
**Hematologic:** **FEBRILE NEUTROPENIA, LEUKOPENIA, NEUTROPENIA, THROMBOCYTOPENIA,** *anemia.*
**Metabolic:** ***hypoglycemia,*** dehydration, hyperglycemia, hypocalcemia, hypokalemia, ***hypomagnesemia.***
**Musculoskeletal:** *myalgia,* arthralgia, back pain, limb pain, muscle weakness.
**Respiratory:** *cough, dyspnea, pleural effusion,* wheezing.
**Other:** infection, weakness.

## INTERACTIONS

**Drug-drug.** *Live-virus vaccines:* Virus replication may occur; immunocompromised individuals may become ill. Don't give live-virus vaccines to immunocompromised patients.

## EFFECTS ON LAB TEST RESULTS

• May increase creatinine, transaminase, bilirubin, glucose, and AST levels. May decrease potassium, calcium, glucose, magnesium, albumin, and hemoglobin levels and hematocrit.
• May decrease WBC, platelet, and neutrophil counts.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in pregnant or breast-feeding women and in patients hypersensitive to drug or any of its components.
• Use cautiously if patient is receiving or has received intrathecal chemotherapy and in patients with severe renal or hepatic impairment.
***Overdose S&S:*** Severe neurotoxicity, myelosuppression, death.

## NURSING CONSIDERATIONS

**Black Box Warning** Administer under the supervision of a physician experienced with chemotherapy.
• Monitor CBC at baseline and regularly throughout treatment.
**Black Box Warning** Monitor patient for signs of severe neurotoxicity, including ataxia, coma, confusion, excessive somnolence, Guillain-Barré–like symptoms, peripheral neuropathy, and seizures. For NCI Common Toxicity Criteria grade 2 or higher, stop treatment. Patient may not fully recover even after drug is stopped.
• Take steps to prevent hyperuricemia caused by tumor lysis syndrome. Appropriate care includes hydration, alkalinization of body fluids, and allopurinol.

## PATIENT TEACHING

***Alert:*** Tell patient to immediately report tingling or numbness in hands or feet, problems with fine motor skills, unsteadiness when walking, weakness when getting out of a chair or climbing stairs, tripping while walking, or seizures. These may be signs of serious adverse effects.
• Explain the importance of regular blood tests to evaluate drug effectiveness and detect adverse effects.
• Tell patient to report being more tired or paler than usual, trouble breathing, unusual bruising or bleeding, or fever.
• Advise care when driving or operating hazardous machinery because drug may cause sleepiness or dizziness.

● Urge patient to avoid live-virus vaccines while taking this drug.

## nelfinavir mesylate

nell-FIN-ah-veer

Viracept

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Protease inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS

*Powder:* 50 mg/g powder in 144-g bottle
*Tablets:* 250 mg, 625 mg

### INDICATIONS & DOSAGES

➤ **HIV infection**

*Adults:* 1,250 mg b.i.d. or 750 mg P.O. t.i.d. with meals or light snack.

*Children ages 2 to 13:* 45 to 55 mg/kg P.O. b.i.d. or 25 to 35 mg/kg P.O. t.i.d. with meals or light snack; don't exceed 750 mg t.i.d.

➤ **To prevent infection after occupational exposure to HIV ♦**

*Adults:* 1,250 mg P.O. b.i.d. with two other antiretrovirals (zidovudine and lamivudine, lamivudine and stavudine, or didanosine and stavudine) for 4 weeks.

➤ **To prevent infection after nonoccupational exposure to HIV ♦**

*Adults:* 1,250 mg P.O. b.i.d. or 750 mg P.O. t.i.d. (in conjunction with two other antiretrovirals). Begin within 72 hours of exposure and continue for 28 days.

### ADMINISTRATION

**P.O.**

● Give oral powder to children unable to take tablets. May mix oral powder with small amount of water, milk, formula, soy formula, soy milk, or dietary supplements. Patient should consume entire amount.
● Don't reconstitute with water in the original container.
● Use reconstituted powder within 6 hours.
● Mixing with acidic foods or juice isn't recommended because of bitter taste.

### ACTION

An HIV-1 protease inhibitor, which prevents cleavage of the viral polyprotein, resulting in the production of immature, noninfectious virus.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–4 hr | Unknown |

*Half-life:* 3½ to 5 hours.

### ADVERSE REACTIONS

**CNS:** ***seizures, suicidal ideation.***
**GI:** *diarrhea,* ***pancreatitis,*** flatulence, nausea.
**Hematologic:** ***leukopenia, thrombocytopenia.***
**Hepatic:** ***hepatitis.***
**Metabolic:** ***hypoglycemia,*** dehydration, diabetes mellitus, hyperlipidemia, hyperuricemia.
**Skin:** rash.
**Other:** redistribution or accumulation of body fat.

### INTERACTIONS

**Drug-drug.** *Amiodarone, ergot derivatives, lovastatin, midazolam, pimozide, quinidine, simvastatin, triazolam:* May increase levels of these drugs, causing increased risk of life-threatening adverse events. Avoid using together.

*Atorvastatin:* May increase atorvastatin level. Use lowest possible dose or consider using pravastatin or fluvastatin instead.

*Azithromycin:* May increase azithromycin level. Monitor patient for liver impairment.

*Carbamazepine, phenobarbital:* May reduce the effectiveness of nelfinavir. Use together cautiously.

*Cyclosporine, sirolimus, tacrolimus:* May increase levels of these immunosuppressants. Use together cautiously.

*Delavirdine, HIV protease inhibitors (indinavir, saquinavir):* May increase levels of protease inhibitors. Use together cautiously.

*Didanosine:* May decrease didanosine absorption. Take nelfinavir with food at least 2 hours before or 1 hour after didanosine.

*Ethinyl estradiol:* May decrease contraceptive level and effectiveness. Advise patient to use alternative contraceptive measures during therapy.

*Methadone, phenytoin:* May decrease levels of these drugs. Adjust dosage of these drugs accordingly.

*Rifabutin:* May increase rifabutin level and decrease nelfinavir level. Reduce dosage of rifabutin to half the usual dose and increase nelfinavir to 1,250 mg b.i.d.
*Sildenafil:* May increase adverse effects of sildenafil. Caution patient not to exceed 25 mg of sildenafil in a 48-hour period.
**Drug-herb. *St. John's wort:*** May decrease drug level. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, alkaline phosphatase, bilirubin, GGT, amylase, CK, and lipid levels. May decrease hemoglobin level. May increase or decrease glucose level.
- May decrease WBC and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in patients receiving amiodarone, ergot derivatives, lovastatin, midazolam, pimozide, quinidine, simvastatin, or triazolam.
- Contraindicated in pregnant women unless no other treatment option exists because of the presence of the carcinogen ethyl methanesulfonate (EMS) in Viracept. Children currently receiving Viracept may continue, but children shouldn't be started on this drug.
- Use cautiously in patients with hepatic dysfunction or hemophilia types A or B. Monitor liver function test results.
- It's not known if drug appears in breast milk. Because safety hasn't been established, advise HIV-infected women not to breast-feed, to avoid transmitting virus to the infant.

## NURSING CONSIDERATIONS

- Drug dosage is the same whether drug is used alone or with other antiretrovirals.
- ***Look alike–sound alike:*** Don't confuse nelfinavir with nevirapine.

## PATIENT TEACHING

- Advise patient to take drug with food.
- Inform patient that drug doesn't cure HIV infection.
- Tell patient that long-term effects of drug are unknown and that there are no data stating that nelfinavir reduces risk of HIV transmission.
- Advise patient to take drug daily as prescribed and not to alter dose or stop drug without medical approval.
- If patient misses a dose, tell him to take it as soon as possible and then return to his normal schedule. Advise patient not to double the dose.
- Tell patient that diarrhea is the most common adverse effect and that it can be controlled with loperamide, if needed.
- Instruct patient taking hormonal contraceptives to use alternative or additional contraceptive measures while taking nelfinavir.
- Advise patient taking sildenafil about an increased risk of sildenafil-related adverse events, including low blood pressure, visual changes, and painful erections. Tell him to promptly report any symptoms. Tell him not to exceed 25 mg of sildenafil in a 48-hour period.
- Warn patient with phenylketonuria that powder contains 11.2 mg phenylalanine per gram.
- Advise patient to report use of other prescribed or OTC drugs because of possible drug interactions.

# neomycin sulfate

nee-o-MYE-sin

Neo-fradin

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Aminoglycoside
*Pregnancy risk category D*

## AVAILABLE FORMS

*Oral solution:* 125 mg/5 ml
*Tablets:* 500 mg

## INDICATIONS & DOSAGES

➤ **To suppress intestinal bacteria before surgery**

*Adults:* After saline cathartic, 1 g neomycin with 1 g erythromycin base P.O. at 1 p.m., 2 p.m., and 11 p.m. on day before 8 a.m. surgery; or 2 g neomycin with 2 g metronidazole P.O. at 7 p.m. and 11 p.m. on day preceding surgery.

➤ **Adjunctive treatment for hepatic coma**
*Adults:* 4 to 12 g P.O. daily in divided doses for 5 to 6 days; or 200 ml of 1% solution.

## ADMINISTRATION

### P.O.

● For preoperative disinfection, provide a low-residue diet and a cathartic immediately before therapy.

## ACTION

Inhibits protein synthesis by binding directly to the 30S ribosomal subunit; bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–4 hr | 8 hr |

*Half-life:* 2 to 3 hours.

## ADVERSE REACTIONS

**CNS:** ***neuromuscular blockage.***
**EENT:** *ototoxicity.*
**GI:** nausea, vomiting, diarrhea, malabsorption syndrome, *Clostridium difficile*–related colitis.
**GU:** ***nephrotoxicity,*** possible increase in urinary excretion of casts.

## INTERACTIONS

**Drug-drug.** **Black Box Warning** *Acyclovir, amphotericin B, cephalosporins, cidofovir, cisplatin, methoxyflurane, vancomycin, other aminoglycosides:* May increase nephrotoxicity. Monitor renal function test results. ■
**Black Box Warning** *Atracurium, pancuronium, rocuronium, vecuronium:* May increase effects of nondepolarizing muscle relaxants, including prolonged respiratory depression. Use together only when necessary, and expect to reduce dosage of nondepolarizing muscle relaxants. ■
*Digoxin:* May decrease digoxin absorption. Monitor digoxin level.
**Black Box Warning** *I.V. loop diuretics (such as furosemide):* May increase ototoxicity. Monitor patient's hearing. ■
*Oral anticoagulants:* May inhibit vitamin K–producing bacteria; may increase anticoagulant effect. Monitor PT and INR.

## EFFECTS ON LAB TEST RESULTS

● May increase BUN, creatinine, and nonprotein nitrogen levels.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to other aminoglycosides and in those with intestinal obstruction.
● Use cautiously in elderly patients and in those with impaired renal function, neuromuscular disorders, or ulcerative bowel lesions.
⚠ ***Overdose S&S:*** Neurotoxicity, ototoxicity, nephrotoxicity.

## NURSING CONSIDERATIONS

**Black Box Warning** Due to increased risk of nephrotoxicity, monitor renal function: urine output, specific gravity, urinalysis, BUN and creatinine levels, and creatinine clearance. Report to prescriber evidence of declining renal function. ■
**Black Box Warning** Due to increased risk of ototoxicity, evaluate patient's hearing before and during prolonged therapy. Notify prescriber if patient has tinnitus, vertigo, or hearing loss. Deafness may start several weeks after drug is stopped. ■
● Watch for signs and symptoms of superinfection, such as fever, chills, and increased pulse rate.
**Black Box Warning** Neuromuscular blockage and respiratory paralysis have been reported after administration of aminoglycosides. Monitor patient closely. ■
● For adjunctive treatment for hepatic coma, decrease patient's dietary protein and assess neurologic status frequently during therapy.
● The ototoxic and nephrotoxic properties of drug limit its usefulness.

## PATIENT TEACHING

● Instruct patient to report adverse reactions promptly.
● Encourage patient to maintain adequate fluid intake.

N

**SAFETY ALERT!**

# nesiritide

neh-SIR-ih-tide

Natrecor

*Therapeutic class:* Vasodilator
*Pharmacologic class:* Human B-type natriuretic peptide
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* Single-dose vials of 1.5 mg sterile, lyophilized powder

## INDICATIONS & DOSAGES

➤ **Acutely decompensated heart failure in patients with dyspnea at rest or with minimal activity**

*Adults:* 2 mcg/kg by I.V. bolus over 60 seconds, followed by continuous infusion of 0.01 mcg/kg/minute.

***Adjust-a-dose:*** If hypotension develops during administration, reduce dosage or stop drug. Restart drug at dosage reduced by 30% with no bolus doses.

## ADMINISTRATION

**I.V.**

▼ Reconstitute one 1.5-mg vial with 5 ml of diluent (such as $D_5W$, normal saline solution, 5% dextrose and 0.2% saline solution injection, or 5% dextrose and half-normal saline solution) from a prefilled 250-ml I.V. bag.

▼ Gently rock (don't shake) vial until solution becomes clear and colorless.

▼ Withdraw contents of vial and add back to the 250-ml I.V. bag to yield 6 mcg/ml. Invert the bag several times to ensure complete mixing, and use the solution within 24 hours.

▼ Use the formulas below to calculate bolus volume (2 mcg/kg) and infusion flow rate (0.01 mcg/kg/minute):

$$\text{Bolus volume (ml)} = 0.33 \times \text{patient weight (kg)}$$

$$\text{Infusion flow rate (ml/hr)} = 0.1 \times \text{patient weight (kg)}$$

▼ Before giving bolus dose, prime the I.V. tubing. Withdraw the bolus and give over 60 seconds through an I.V. port in the tubing.

▼ Immediately after giving bolus, infuse drug at 0.1 ml/kg/hour to deliver 0.01 mcg/kg/minute.

▼ Store drug at 68° to 77° F (20° to 25° C).

▼ **Incompatibilities:** Bumetanide, enalaprilat, ethacrynate sodium, furosemide, heparin, hydralazine, insulin, sodium metabisulfite.

## ACTION

Increases cyclic guanosine monophosphate (cGMP) level, relaxes smooth muscle, and dilates veins and arteries. Drug reduces pulmonary capillary wedge pressure and systemic arterial pressure in patients with heart failure.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 15 min | 1 hr | 3 hr |

*Half-life:* 18 minutes.

## ADVERSE REACTIONS

**CNS:** anxiety, confusion, dizziness, fever, headache, insomnia, paresthesia, somnolence, tremor.

**CV:** *hypotension*, ***bradycardia, ventricular tachycardia,*** angina, atrial fibrillation, AV node conduction abnormalities, ventricular extrasystoles.

**GI:** abdominal pain, nausea, vomiting.

**Hematologic:** anemia.

**Musculoskeletal:** back pain, leg cramps.

**Respiratory:** ***apnea,*** cough, hemoptysis.

**Skin:** injection site reactions, rash, pruritus, sweating.

## INTERACTIONS

**Drug-drug.** *ACE inhibitors:* May increase hypotension symptoms. Monitor blood pressure closely.

## EFFECTS ON LAB TEST RESULTS

● May increase creatinine level more than 0.5 mg/dl above baseline. May decrease hemoglobin level and hematocrit.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Contraindicated in patients with cardiogenic shock, systolic blood pressure below 90 mm Hg, low cardiac filling pressures, conditions in which cardiac output depends on venous return, or conditions that make vasodilators inappropriate, such as valvular stenosis, restrictive or obstructive cardiomyopathy, constrictive pericarditis, and pericardial tamponade.

***Overdose S&S:*** Excessive hypotension.

## NURSING CONSIDERATIONS

- Don't start drug at higher-than-recommended dosage because this may cause hypotension and may increase creatinine level.

***Alert:*** This drug may cause hypotension. Monitor patient's blood pressure closely, particularly if he also takes an ACE inhibitor.

***Alert:*** Drug binds to heparin, including the heparin lining of a coated catheter, decreasing the amount of nesiritide delivered. Don't give nesiritide through a central heparin-coated catheter.

- Drug may affect renal function. In patients with severe heart failure whose renal function depends on the renin-angiotensin-aldosterone system, treatment may lead to azotemia.
- Results of giving this drug for longer than 48 hours are unknown.

## PATIENT TEACHING

- Tell patient to report discomfort at I.V. site.
- Urge patient to report to prescriber symptoms of hypotension, such as dizziness, light-headedness, blurred vision, or sweating.
- Tell patient to report to prescriber other adverse effects promptly.

# nevirapine

neh-VEER-ah-pine

Viramune

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Nonnucleoside reverse transcriptase inhibitor
*Pregnancy risk category C*

## AVAILABLE FORMS

*Oral suspension:* 50 mg/5 ml
*Tablets:* 200 mg

## INDICATIONS & DOSAGES

➤ **Adjunct treatment in HIV-infected adults who have experienced clinical or immunologic deterioration; used with nucleoside analogue antiretrovirals**

**Black Box Warning** Adhere strictly to 14-day lead-in period with nevirapine 200-mg-daily dosing. ■

*Adults:* 200 mg P.O. daily for the first 14 days; then 200 mg P.O. b.i.d.

***Adjust-a-dose:*** For patients on dialysis, give an additional 200-mg dose after each dialysis treatment. Patients with a creatinine clearance equal to or greater than 20 ml/minute don't require dosage adjustment.

➤ **Adjunct treatment in HIV-infected children**

*Children age 8 and older:* 4 mg/kg P.O. once daily for first 14 days; then 4 mg/kg P.O. b.i.d. thereafter. Maximum daily dose is 400 mg.

*Children ages 2 months to 8 years:* 4 mg/kg P.O. once daily for first 14 days; then 7 mg/kg P.O. b.i.d. thereafter. Maximum daily dose is 400 mg.

## ADMINISTRATION

**P.O.**

- Use drug with at least one other antiretroviral.

## ACTION

Binds directly to reverse transcriptase and blocks RNA-dependent and DNA-dependent DNA polymerase activities by disrupting the enzyme's catalytic site.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 4 hr | Unknown |

*Half-life:* 25 to 30 hours.

## ADVERSE REACTIONS

**CNS:** fever, headache, paresthesia.
**GI:** nausea, abdominal pain, diarrhea, ulcerative stomatitis.
**Hematologic:** ***neutropenia.***
**Hepatic:** ***hepatitis.***
**Musculoskeletal:** myalgia.
**Skin:** *blistering, rash,* ***Stevens-Johnson syndrome.***

## INTERACTIONS

**Drug-drug.** *Drugs extensively metabolized by cytochrome P-450:* May lower levels of these drugs. Dosage adjustment of these drugs may be needed.
*Ketoconazole:* May decrease ketoconazole level. Avoid using together.
*Protease inhibitors or hormonal contraceptives:* May decrease levels of these drugs. Use together cautiously.
*Rifabutin, rifampin:* Dosage adjustment may be needed. Monitor patient closely.
*Warfarin:* May increase anticoagulant effect of warfarin. Monitor INR and adjust warfarin dose as needed.
**Drug-herb.** *St. John's wort:* May decrease drug level. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, GGT, and bilirubin levels. May decrease hemoglobin level.
- May decrease neutrophil count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Don't give to patients with severe hepatic impairment from drug accumulation.
- In patients with mild to moderate hepatic function, use cautiously; pharmacokinetics haven't been evaluated in these patients.
- Drug appears in breast milk. Don't use drug in breast-feeding women.

***Overdose S&S:*** Edema, erythema nodosum, fatigue, fever, headache, insomnia, nausea, pulmonary infiltrates, rash, vertigo, vomiting, weight decrease.

## NURSING CONSIDERATIONS

- Perform laboratory tests, including renal function tests, before therapy and regularly throughout.
- Increased AST or ALT levels or coinfection with hepatitis B or C at the start of therapy suggest a greater risk of hepatic adverse events.

**Black Box Warning** Severe and, in some cases, fatal hepatotoxicity, particularly in the first 18 weeks of treatment, has been reported and may occur in all patients, including those receiving the drug for postexposure prophylaxis, an approved use. Hepatotoxicity is often linked with rash and fever. Women and patients with higher $CD4^+$ cell counts are at increased risk. Women with $CD4^+$ cell counts greater than $250/mm^3$, including pregnant women receiving long-term treatment for HIV infection, are at considerably higher risk for hepatotoxicity. ■

- Monitor patient for signs and symptoms of hepatitis including rash. Closely monitor liver function tests at baseline and during the first 18 weeks of treatment; then monitor frequently thereafter.
- Perform liver function tests immediately if hepatitis or hypersensitivity reactions are suspected.

**Black Box Warning** Severe, life-threatening skin reactions, including fatalities, have occurred. The greatest risk of reaction is within the first 6 weeks of therapy. Monitor patient for blistering, oral lesions, conjunctivitis, muscle or joint aches, or general malaise. Especially look for a severe rash or rash accompanied by fever. Report these signs and symptoms to prescriber. Patients who experience a rash or hypersensitivity reactions must discontinue nevirapine and seek medical evaluation immediately. ■

***Alert:*** If hepatitis occurs, permanently stop drug and don't restart after recovery. In some cases, hepatic injury progresses anyway.

***Alert:*** Patients who have stopped therapy for more than 7 days should restart therapy as if receiving drug for the first time.

- Antiretroviral therapy may be changed if disease progresses while patient is receiving this drug.

● ***Look alike–sound alike:*** Don't confuse nevirapine with nelfinavir.

### PATIENT TEACHING

● Inform patient that drug doesn't cure HIV and that illnesses from advanced HIV infection still may occur. Explain that drug doesn't reduce risk of HIV transmission.
● Instruct patient to report rash immediately and to stop drug until told to resume.
● Tell patient with signs or symptoms of hepatitis (such as fatigue, malaise, anorexia, nausea, jaundice, liver tenderness or hepatomegaly, with or without initially abnormal transaminase levels) to stop drug and seek medical evaluation immediately.
● Stress importance of taking drug exactly as prescribed. If a dose is missed, tell patient to take the next dose as soon as possible and not to double next dose.
● Tell patient not to use other drugs unless approved by prescriber.
● Advise women of childbearing age that hormonal contraceptives and other hormonal methods of birth control shouldn't be used with this drug.

## niCARdipine hydrochloride

nye-KAR-de-peen

Cardene, Cardene I.V., Cardene SR

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Calcium channel blocker
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules:* 20 mg, 30 mg
*Capsules (sustained-release):* 30 mg, 45 mg, 60 mg
*Injection:* 2.5-mg/ml vial; 20 mg/200-ml, 40 mg/200-ml premixed bag

### INDICATIONS & DOSAGES

➤ **Chronic stable angina (used alone or with other antianginals)**

*Adults:* Initially, 20 mg immediate-release capsule P.O. t.i.d. Adjust dosage every 3 days based on patient response. Usual range, 20 to 40 mg t.i.d.

➤ **Hypertension**

*Adults:* Initially, 20 mg immediate-release capsule P.O. t.i.d.; range, 20 to 40 mg t.i.d. Or, 30 mg sustained-release capsule b.i.d.; range, 30 to 60 mg b.i.d. Adjust dosage every 3 days based on patient response. Or, for patient who can't take oral form, 5 mg/hour (50 ml/hour) I.V. infusion initially; then, increase by 2.5 mg/hour (25 ml/hour) every 5 minutes for rapid control or every 15 minutes for gradual control to maximum of 15 mg/hour (150 ml/hour).

### ADMINISTRATION

**P.O.**

● Give drug with or without food, but avoid giving with high-fat meal.
● Don't break or crush sustained-release capsules; they must be swallowed whole.

**I.V.**

▼ Dilute to a concentration of 0.1 mg/ml with $D_5W$, dextrose 5% in normal saline solution or half-normal saline solution, and normal saline solution or half-normal saline solution.
▼ Check premixed bags for leaks, solution clarity, and intact seal. Don't add other drugs to bag.
▼ Give by slow infusion.
▼ Closely monitor blood pressure during and after completion of infusion.
▼ If hypotension or tachycardia occurs, titrate infusion rate.
▼ Change peripheral infusion site every 12 hours to minimize risk of venous irritation.
▼ When switching to oral form, give first dose of t.i.d. regimen 1 hour before stopping infusion. If using a different oral drug, start it when infusion ends.
▼ If solution is kept at room temperature, use within 24 hours.
▼ **Incompatibilities:** Ampicillin sodium, ampicillin and sulbactam sodium, cefoperazone, ceftazidime, furosemide, heparin sodium, lactated Ringer's solution, sodium bicarbonate, thiopental.

### ACTION

Inhibits calcium ion influx across cardiac and smooth muscle cells but is more selective to vascular smooth muscle than

N

cardiac muscle. Drug also dilates coronary arteries and arterioles.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. (immediate-release) | 20 min | 1–2 hr | Unknown |
| P.O. (sustained-release) | 20 min | 1–4 hr | 12 hr |
| I.V. | Immediate | Immediate | Unknown |

*Half-life:* 2 to 4 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* dizziness, lightheadedness, asthenia.
**CV:** *peripheral edema, palpitations, flushing,* angina, tachycardia.
**GI:** nausea, abdominal discomfort, dry mouth.
**Skin:** rash.

## INTERACTIONS

**Drug-drug.** *Antihypertensives:* May increase antihypertensive effect. Monitor blood pressure closely.
*Cimetidine:* May decrease metabolism of calcium channel blockers. Monitor patient for increased pharmacologic effect.
*Cyclosporine:* May increase plasma level of cyclosporine. Monitor patient for toxicity.
**Drug-food.** *Grapefruit and grapefruit juice:* May increase bioavailability of nicardipine. Discourage use together.
*High-fat foods:* May decrease absorption of nicardipine. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with advanced aortic stenosis.
- Use cautiously in patients with hypotension, heart failure, or impaired hepatic and renal function.

***Overdose S&S:*** Hypotension, bradycardia, palpitations, flushing, drowsiness, confusion, slurred speech.

## NURSING CONSIDERATIONS

- Measure blood pressure frequently during initial therapy. Maximal response occurs about 1 hour after giving the immediate-release form and 2 to 4 hours after giving the sustained-release form. Check for orthostatic hypotension. Because large swings in blood pressure may occur based on drug level, assess antihypertensive effect 8 hours after dosing.
- Extended-release form is preferred because of improved compliance, fewer fluctuations in blood pressure, and less risk of death than with shorter-acting drugs.
- ***Look alike–sound alike:*** Don't confuse Cardene with Cardura or codeine.

## PATIENT TEACHING

- Tell patient to take oral form exactly as prescribed.
- Advise patient to report chest pain immediately. Some patients may experience increased frequency, severity, or duration of chest pain at beginning of therapy or during dosage adjustments.
- Tell patient to get up from a sitting or lying position slowly to avoid dizziness caused by a decrease in blood pressure.
- Tell patient drug may be taken with or without food but shouldn't be taken with high-fat foods.
- Tell patient to swallow sustained-release capsules whole; don't crush, break, or chew.

# NIFEdipine

nye-FED-i-peen

Adalat CC, Adalat XL†, Afeditab CR, Apo-Nifed†, Nu-Nifed†, Procardia, Procardia XL

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Calcium channel blocker
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 10 mg, 20 mg
*Tablets (extended-release):* 20 mg†, 30 mg, 60 mg, 90 mg

## INDICATIONS & DOSAGES

➤ **Vasospastic angina (Prinzmetal's or variant angina), classic chronic stable angina pectoris**

*Adults:* Initially, 10 mg short-acting capsule P.O. t.i.d. Usual effective dosage range is 10 to 20 mg t.i.d. Some patients may require up to 30 mg q.i.d. Maximum daily dose is 180 mg. Adjust dosage over 7 to 14 days to evaluate response. Or, 30 to 60 mg (extended-release tablets, except Adalat CC) P.O. once daily. Maximum daily dose is 120 mg. Adjust dosage over 7 to 14 days to evaluate response.

➤ **Hypertension**

*Adults:* 30 or 60 mg P.O. extended-release tablet once daily. Adjusted over 7 to 14 days. Doses larger than 90 mg (Adalat CC) and 120 mg (Procardia XL) aren't recommended.

## ADMINISTRATION

**P.O.**

- Don't give immediate-release capsules within 1 week of acute MI or in acute coronary syndrome.

***Alert:*** Don't use capsules S.L. to rapidly reduce severe high blood pressure because the result may be fatal.

- Give extended-release tablets whole; don't break or crush tablet.
- Don't give drug with grapefruit juice.
- Protect capsules from direct light and moisture and store at room temperature.

## ACTION

Thought to inhibit calcium ion influx across cardiac and smooth muscle cells, decreasing contractility and oxygen demand. Drug may also dilate coronary arteries and arterioles.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 20 min | 30–60 min | 4–8 hr |
| P.O. (extended) | 20 min | 6 hr | 24 hr |

*Half-life:* 2 to 5 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness, light-headedness, headache, weakness,* somnolence, syncope, nervousness.
**CV:** *flushing, peripheral edema,* ***heart failure, MI,*** hypotension, palpitations.
**EENT:** nasal congestion.
**GI:** *nausea,* diarrhea, constipation, abdominal discomfort.
**Musculoskeletal:** muscle cramps.
**Respiratory:** dyspnea, ***pulmonary edema,*** cough.
**Skin:** rash, pruritus.

## INTERACTIONS

**Drug-drug.** *Antiretrovirals, verapamil, cimetidine:* May decrease nifedipine metabolism. Monitor blood pressure closely and adjust nifedipine dosage as needed.
*Azole antifungals, erythromycin, nefazodone, quinupristin and dalfopristin, valproic acid:* May increase the effects of nifedipine. Monitor blood pressure closely and decrease nifedipine dosage as needed.
*Cyclosporine, tacrolimus:* May increase serum levels of these drugs and increase risk of toxicity. Monitor serum levels and adjust dosage as needed.
*Digoxin:* May cause elevated digoxin level. Monitor digoxin level.
*Diltiazem:* May increase the effects of nifedipine. Monitor patient closely.
*PDE5 inhibitors (such as sildenafil):* Increases risk of hypotension. Monitor blood pressure and adjust nifedipine dosage if needed.
*Phenytoin:* May reduce nifedipine metabolism. Monitor patient and adjust nifedipine dosage as needed.
*Propranolol, other beta blockers:* May cause hypotension and heart failure. Use together cautiously.
*Quinidine:* May decrease levels and effects of quinidine while increasing effects of nifedipine. Monitor heart rate and adjust nifedipine dose as needed.
*Rifamycins:* May decrease nifedipine levels. Monitor patient.
**Drug-herb.** *Ginkgo:* May increase effects of drug. Discourage use together.
*Ginseng:* May increase drug levels with possible toxicity. Discourage use together.
*Melatonin, St. John's wort:* May interfere with antihypertensive effect. Discourage use together.
**Drug-food.** *Grapefruit juice:* May increase bioavailability of drug. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, alkaline phosphatase, and LDH levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with heart failure or hypotension and in elderly patients. Use extended-release tablets cautiously in patients with severe GI narrowing.

⚠ ***Overdose S&S:*** Hypotension, dizziness, palpitations, flushing, nervousness.

## NURSING CONSIDERATIONS

- Monitor blood pressure and heart rate regularly, especially in patients who take beta blockers or antihypertensives.
- Watch for symptoms of heart failure.
- ***Look alike–sound alike:*** Don't confuse nifedipine with nimodipine or nicardipine.

## PATIENT TEACHING

- If patient is kept on nitrate therapy while nifedipine dosage is being adjusted, urge continued compliance. Patient may take S.L. nitroglycerin, as needed, for acute chest pain.
- Tell patient that chest pain may worsen briefly as therapy starts or dosage increases.
- Instruct patient to swallow extended-release tablets without breaking, crushing, or chewing them.
- Advise patient to avoid taking drug with grapefruit juice.
- Reassure patient taking the extended-release tablet that the wax mold may be passed in the stools. Assure him that drug has already been completely absorbed.
- Tell patient to protect capsules from direct light and moisture and to store at room temperature.

# nilotinib

nye-low-TIH-nibb

Tasigna

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Kinase inhibitor
*Pregnancy risk category D*

## AVAILABLE FORMS

*Capsules:* 150 mg, 200 mg

## INDICATIONS & DOSAGES

✳ ***NEW INDICATION:*** **Newly diagnosed, chronic-phase Philadelphia chromosome–positive chronic myelogenous leukemia**

*Adults:* 300 mg P.O. b.i.d.

➤ **Chronic and accelerated-phase Philadelphia chromosome–positive chronic myelogenous leukemia in patients resistant to or intolerant of imatinib**

*Adults:* 400 mg P.O. b.i.d., 12 hours apart.

***Adjust-a-dose:*** If QTcF interval exceeds 480 msec, withhold drug; it if returns to less than 450 msec and within 20 msec of baseline within 2 weeks, resume therapy at previous dose. If QTcF interval is 450 to 480 msec after 4 weeks, reduce dose to 400 mg once daily; if QTcF interval returns to more than 480 msec, stop therapy. If neutrophil count is less than 1,000/$mm^3$ or platelet count less than 50,000/$mm^3$, stop therapy. If neutrophil count exceeds 1,000/$mm^3$ and platelet count exceeds 50,000/$mm^3$ within 2 weeks, resume therapy at previous dose. If blood counts stay low for more than 2 weeks, reduce dose to 400 mg P.O. once daily. If serum amylase, lipase, bilirubin, or hepatic transaminase levels are grade 3 or greater, withhold drug; when levels return to grade 1 or less, resume therapy. Withhold drug with other clinically significant moderate or severe toxicity. When toxicity resolves, resume at 400 mg P.O. once daily; increase to 400 mg P.O. b.i.d. when clinically appropriate.

**Black Box Warning** Dosage reduction is recommended in patients with hepatic impairment. For mild to moderate impairment at baseline, initially give 300 mg b.i.d. If tolerated, may increase to 400 mg b.i.d. For severe hepatic impairment at baseline, initially give 200 mg b.i.d. May titrate to 300 mg b.i.d., then 400 mg b.i.d. as tolerated. ■

## ADMINISTRATION

**P.O.**

**Black Box Warning** Give with water on an empty stomach. Restrict food intake for at least 2 hours before and 1 hour after dose. Give capsule whole. ■

## ACTION

Stops leukemic cell lines by inhibiting Bcr-Abl kinase.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3 hr | Unknown |

*Half-life:* 17 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia, fatigue, fever, headache,* insomnia, dizziness, paresthesia.
**CV:** flushing, hypertension, palpitations, *peripheral edema,* ***prolonged QT interval.***
**EENT:** *nasopharyngitis,* vertigo.
**GI:** abdominal discomfort, *abdominal pain,* anorexia, *constipation, diarrhea,* dyspepsia, flatulence, *nausea, vomiting.*
**Hematologic:** anemia, **FEBRILE NEUTROPENIA, THROMBOCYTOPENIA, NEUTROPENIA, PANCYTOPENIA.**
**Hepatic:** elevated lipase level.
**Metabolic:** *hyperglycemia,* hyperkalemia, hypocalcemia, hypokalemia, ***hypomagnesemia,*** hyponatremia, *hypophosphatemia,* weight gain or loss.
**Musculoskeletal:** *arthralgia, myalgia, back pain, bone pain, limb pain, muscle spasms,* musculoskeletal chest pain, pain in extremities.
**Respiratory:** *cough,* dysphonia, *dyspnea,* exertional dyspnea.
**Skin:** alopecia, dry skin, eczema, erythema, hyperhidrosis, night sweats, *pruritus, rash,* urticaria.

## INTERACTIONS

**Drug-drug.** **Black Box Warning** *Antiarrhythmics and other drugs that prolong QTc interval:* May further prolong QTc interval. Avoid using together. ■
*CYP2C8, CYP2C9, CYP2D6, CYP3A4, UGT1A1 substrates, warfarin:* May increase levels of these drugs. Avoid using together.
*CYP3A4 inducers (carbamazepine, dexamethasone, phenobarbital, phenytoin, rifabutin, rifampin, rifapentin):* May decrease nilotinib level. Avoid using together, or consider increasing dosage.
**Black Box Warning** *CYP3A4 inhibitors (atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, voriconazole):* May increase nilotinib level. Avoid using together, or consider reducing dose to 400 mg daily. ■
*Midazolam:* May increase midazolam level. Avoid using together.
*P-glycoprotein substrates:* May increase nilotinib levels. Avoid using together.
**Drug-herb.** *St. John's wort:* May decrease nilotinib level. Avoid using together.
**Drug-food.** *Food:* May increase drug level. Avoid eating 2 hours before and 1 hour after taking dose.
*Grapefruit:* May increase drug level. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

- May increase lipase, bilirubin, alkaline phosphatase, AST, ALT, potassium, and creatinine levels. May decrease albumin, sodium, potassium, calcium, phosphate, and hemoglobin levels.
- May decrease neutrophil and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Contraindicated in patients with prolonged QT-interval syndrome, hypokalemia, and hypomagnesemia. Avoid use in patients with galactose intolerance, severe lactose deficiency, or glucose-galactose malabsorption. ■
**Black Box Warning** Obtain electrocardiogram (ECG) to monitor the QTc at baseline, 7 days after initiation, and periodically thereafter, as well as following any dose adjustments. ■
- Use cautiously in patients with hepatic impairment, elevated lipase levels, or a history of pancreatitis.

## NURSING CONSIDERATIONS

- Monitor patient's phosphate, potassium, calcium, and sodium levels before and during therapy. Monitor the complete blood count every 2 weeks for the first 2 months and then monthly thereafter.
- Assess patient for evidence of fluid retention, such as shortness of breath and swelling of hands, ankles, feet, or face.
- Check lipase, amylase, ALT, AST, and alkaline phosphatase levels periodically during therapy.

N

• If stopping a CYP3A4 inhibitor, allow an appropriate washout period before escalating the nilotinib dose.
• Caution women to avoid becoming pregnant during therapy because of the risk of fetal harm.
• It isn't known whether drug appears in breast milk. Advise women to avoid breast-feeding during therapy.
• Safety and efficacy haven't been established in children.

### PATIENT TEACHING

• Instruct patient to immediately report an irregular heartbeat, shortness of breath, or swelling of the hands, ankles, feet, or face.
• Urge patient to immediately notify prescriber about a sudden onset of abdominal pain, nausea, and vomiting.
• Tell patient to avoid grapefruit during therapy.
**Black Box Warning** Instruct patient to take drug with water, and to restrict food intake for at least 2 hours before and 1 hour after taking the drug.
• Advise women of childbearing age to use an effective form of contraception while taking nilotinib and to notify prescriber immediately if pregnancy occurs.
• Advise women to stop breast-feeding during therapy because of the risk of toxicity to infant.

## nimodipine

nye-MOE-dih-peen

*Therapeutic class:* Vasodilator
*Pharmacologic class:* Calcium channel blocker
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules:* 30 mg

### INDICATIONS & DOSAGES

➤ **To improve neurologic deficits after subarachnoid hemorrhage from ruptured intracranial berry aneurysm**
*Adults:* 60 mg P.O. every 4 hours for 21 days. Begin therapy within 96 hours after subarachnoid hemorrhage.

***Adjust-a-dose:*** For patients with hepatic failure, 30 mg P.O. every 4 hours for 21 days.

### ADMINISTRATION

**P.O.**
• If drug needs to be given via nasogastric (NG) tube, make a hole in each end of capsule with an 18G needle and extract contents into syringe. Empty syringe into patient's NG tube. Flush tube with 30 ml of normal saline solution according to manufacturer's directions.
**Black Box Warning** Don't give drug I.V. or by other parenteral routes. Death and serious, life-threatening adverse reactions have occurred. If using a needle to extract contents of capsule, make sure that drug isn't then given I.V. instead of P.O. Label the syringe "for oral use only" before withdrawing the contents of the capsule.
• Administer drug not less than 1 hour before or 2 hours after a meal.

### ACTION

Inhibits calcium ion influx across cardiac and smooth-muscle cells, decreasing myocardial contractility and oxygen demand; also dilates coronary and cerebral arteries and arterioles.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Unknown |

*Half-life:* 8 to 9 hours; may be 1 to 2 hours.

### ADVERSE REACTIONS

**CNS:** headache, psychic disturbances.
**CV:** hypotension, flushing, edema, tachycardia.
**GI:** nausea, diarrhea, abdominal discomfort.
**Musculoskeletal:** muscle cramps.
**Respiratory:** dyspnea, wheezing.
**Skin:** dermatitis, rash.

### INTERACTIONS

**Drug-drug.** *Antihypertensives:* May increase hypotensive effect. Monitor blood pressure.
*Calcium channel blockers:* May increase CV effects. Monitor patient closely.
*Cimetidine:* May increase nimodipine bioavailability. Monitor patient for adverse effects.

**Drug-food.** *Any food:* May decrease drug absorption. Advise patient to take drug on empty stomach and to avoid grapefruit juice.

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
- No known contraindications.
- Use cautiously in patients with hepatic failure.

⚠ ***Overdose S&S:*** Marked hypotension.

### NURSING CONSIDERATIONS
- Monitor blood pressure and heart rate in all patients, especially at start of therapy.

### PATIENT TEACHING
- Explain use of drug and review administration schedule with patient and family. Stress importance of compliance for maximum drug effectiveness.
- Instruct patient to report persistent or severe adverse reactions promptly.
- Tell patient not to drink grapefruit juice while taking this drug.

## nisoldipine
nye-SOHL-di-peen

Sular

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Calcium channel blocker
*Pregnancy risk category C*

### AVAILABLE FORMS
*Tablets (extended-release):* 8.5 mg, 17 mg, 20 mg, 25.5 mg, 30 mg, 34 mg, 40 mg

### INDICATIONS & DOSAGES
➤ **Hypertension**
*Adults:* Initially, 17 mg P.O. once daily, increased by 8.5 mg/week or at longer intervals, as needed. Usual maintenance dose is 17 to 34 mg daily. Doses of more than 34 mg daily aren't recommended. Or, initially, 20 mg P.O. once daily, increased by 10 mg per week or at longer intervals as needed. Usual maintenance dose is 20 to 40 mg daily. Doses of more than 40 mg daily aren't recommended.
*Patients older than age 65:* Initially, 8.5 or 10 mg P.O. once daily; adjust dosage as for other adults.
***Adjust-a-dose:*** For patients with impaired liver function, initially, 8.5 or 10 mg P.O. once daily; dosage is adjusted as for adults.

### ADMINISTRATION
**P.O.**
- Give drug whole; don't crush or split tablet.
- Don't give with high-fat meal or grapefruit products.

### ACTION
Prevents calcium ions from entering vascular smooth muscle cells, causing dilation of arterioles, which decreases peripheral vascular resistance.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 6–12 hr | 24 hr |

*Half-life:* 7 to 12 hours.

### ADVERSE REACTIONS
**CNS:** *headache,* dizziness.
**CV:** *peripheral edema,* vasodilation, palpitations, chest pain.
**EENT:** sinusitis, pharyngitis.
**GI:** nausea.
**Skin:** rash.

### INTERACTIONS
**Drug-drug.** *Cimetidine:* May increase bioavailability and peak nisoldipine level. Monitor blood pressure closely.
*CYP3A4 inducers such as phenytoin:* May decrease nisoldipine level. Avoid using together; consider alternative antihypertensive therapy.
*Quinidine:* May decrease bioavailability of nisoldipine. Adjust dosage accordingly.
**Drug-herb.** *Ma huang:* May decrease antihypertensive effects. Discourage use together.
*Peppermint oil:* May decrease drug effect. Discourage use together.
**Drug-food.** *Grapefruit products:* May increase drug level, increasing adverse reactions. Discourage use together.

N

*High-fat foods:* May increase peak drug level. Discourage use together.

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to dihydropyridine calcium channel blockers.
- Contraindicated in breast-feeding women.
- Use cautiously in patients with heart failure or compromised ventricular function, particularly those receiving beta blockers and those with severe hepatic dysfunction.

***Overdose S&S:*** Hypotension.

### NURSING CONSIDERATIONS
- Monitor frequency, duration, or severity of angina after starting calcium channel blocker therapy or at time of dosage increase. Report worsening of symptoms to prescriber immediately.
- Monitor blood pressure regularly, especially when starting therapy and during dosage adjustment.

### PATIENT TEACHING
- Tell patient to take drug as prescribed, even if he feels better.
- Advise patient to swallow tablet whole and not to chew, divide, or crush it.
- Remind patient not to take drug with a high-fat meal or with grapefruit products. Both may increase drug level in the body beyond intended amount.

## nitazoxanide
nye-te-ZOCKS-a-nide

Alinia

*Therapeutic class:* Antiprotozoal
*Pharmacologic class:* Antiprotozoal
*Pregnancy risk category B*

### AVAILABLE FORMS
*Oral suspension:* 100 mg/5 ml
*Tablets:* 500 mg

### INDICATIONS & DOSAGES
➤ **Diarrhea caused by *Cryptosporidium parvum* or *Giardia lamblia***

*Adults and children age 12 and older:* 500 mg P.O. with food every 12 hours for 3 days.
*Children ages 4 to 11:* Give 10 ml (200 mg) P.O. with food every 12 hours for 3 days.
*Children ages 1 to 3:* Give 5 ml (100 mg) P.O. with food every 12 hours for 3 days.

### ADMINISTRATION
**P.O.**
- Give drug with food.
- Discard unused suspension after 7 days.

### ACTION
May interfere with an enzyme-dependent electron transfer reaction, essential for anaerobic energy metabolism.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 1–4 hr | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS
**CNS:** headache.
**GI:** abdominal pain, diarrhea, nausea, vomiting.

### INTERACTIONS
**Drug-drug.** *Drugs that are highly protein-bound:* May compete for binding sites. Use together cautiously.

### EFFECTS ON LAB TEST RESULTS
- May increase creatinine and glutamate pyruvate transaminase levels.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to nitazoxanide.
- Use cautiously in patients with renal or hepatic dysfunction. Safety and effectiveness haven't been established in HIV-positive patients, other immunodeficient patients, or infants younger than age 1.

### NURSING CONSIDERATIONS
***Alert:*** A single tablet contains more of the drug than is recommended for pediatric doses and shouldn't be given to children age 11 or younger.

• Monitor glucose level in patients with diabetes who are taking the suspension.

### PATIENT TEACHING

• Tell caregiver or patient to give drug with food.
• Instruct caregiver or patient to keep container tightly closed and to shake it well before each use.
• Advise caregiver or patient that drug may be stored at room temperature.
• Advise caregiver or patient to discard suspension after 7 days.
• Inform diabetic patient or his caregiver that suspension contains 1.48 g of sucrose per 5 ml.

## nitrofurantoin macrocrystals

nye-troh-fyoo-RAN-toyn

Macrobid✐, Macrodantin

## nitrofurantoin microcrystals

Furadantin, Novo-Furantoin†

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Nitrofuran
*Pregnancy risk category B*

### AVAILABLE FORMS

**nitrofurantoin macrocrystals**
*Capsules:* 25 mg, 50 mg, 100 mg
**nitrofurantoin microcrystals**
*Oral suspension:* 25 mg/5 ml

### INDICATIONS & DOSAGES

➤ **UTIs caused by susceptible *Escherichia coli, Staphylococcus aureus,* enterococci; or certain strains of *Klebsiella* and *Enterobacter* species**
*Adults and children older than age 12 years:* 50 to 100 mg P.O. q.i.d. with meals and at bedtime. Or, 100 mg Macrobid P.O. every 12 hours for 7 days.
*Children ages 1 month to 12 years:* 5 to 7 mg/kg P.O. daily, divided q.i.d.

➤ **Long-term suppression therapy**
*Adults:* 50 to 100 mg P.O. daily at bedtime.
*Children:* 1 mg/kg P.O. daily in a single dose at bedtime or divided into two doses given every 12 hours.

### ADMINISTRATION

**P.O.**
• Obtain urine specimen for culture and sensitivity tests before giving. Repeat as needed. Begin therapy while awaiting results.
• Give drug with food or milk to minimize GI distress and improve absorption.

### ACTION

May interfere with bacterial enzyme systems and bacterial cell-wall formation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* 15 minutes to 1 hour.

### ADVERSE REACTIONS

**CNS:** ***ascending polyneuropathy with high doses or renal impairment,*** dizziness, drowsiness, headache, peripheral neuropathy.
**GI:** *anorexia, diarrhea, nausea, vomiting,* abdominal pain.
**GU:** overgrowth of nonsusceptible organisms in urinary tract.
**Hematologic:** ***agranulocytosis, hemolysis in patients with G6PD deficiency, thrombocytopenia.***
**Hepatic:** ***hepatic necrosis, hepatitis.***
**Metabolic:** ***hypoglycemia.***
**Respiratory:** ***asthmatic attacks, pulmonary sensitivity reactions.***
**Skin:** ***Stevens-Johnson syndrome,*** exfoliative dermatitis, maculopapular, erythematous, or eczematous eruption, pruritus, transient alopecia, urticaria.
**Other:** ***anaphylaxis,*** drug fever, hypersensitivity reactions.

### INTERACTIONS

**Drug-drug.** *Antacids containing magnesium:* May decrease nitrofurantoin absorption. Separate dosage times by 1 hour.
*Probenecid, sulfinpyrazone:* May inhibit excretion of nitrofurantoin, increasing drug levels and risk of toxicity. The resulting decreased urinary levels could lessen antibacterial effects. Avoid using together.
**Drug-food.** *Any food:* May increase absorption. Advise patient to take drug with food or milk.

N

## EFFECTS ON LAB TEST RESULTS

- May increase bilirubin and alkaline phosphatase levels. May decrease glucose level.
- May decrease granulocyte and platelet counts.
- May cause false-positive results in urine glucose tests using cupric sulfate (such as Benedict's reagent, Fehling's solution, or Chemstrip uG).

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in infants age 1 month and younger and in patients with anuria, oliguria, or creatinine clearance less than 60 ml/minute. Also contraindicated in pregnant patients at 38 to 42 weeks' gestation and during labor and delivery.
- Use cautiously in patients with renal impairment, asthma, anemia, diabetes mellitus, electrolyte abnormalities, vitamin B deficiency, debilitating disease, and G6PD deficiency.

***Overdose S&S:*** Vomiting.

## NURSING CONSIDERATIONS

- Drug may cause an asthma attack in patients with a history of asthma.
- Monitor fluid intake and output carefully. Treatment may turn urine brown or dark yellow.
- Monitor CBC, renal function, and pulmonary status regularly.

***Alert:*** Monitor patient for signs and symptoms of superinfection. Use of nitrofurantoin may result in growth of nonsusceptible organisms, especially *Pseudomonas* species.

- Monitor patient for pulmonary sensitivity reactions, including cough, chest pain, fever, chills, dyspnea, and pulmonary infiltration with consolidation or effusions.

***Alert:*** Hypersensitivity may develop when drug is used for long-term therapy.

- Some patients may experience fewer adverse GI effects with nitrofurantoin macrocrystals.
- Dual-release capsules (25 mg nitrofurantoin macrocrystals combined with 75 mg nitrofurantoin monohydrate) enable patients to take drug only twice daily.
- Continue treatment for 3 days after sterile urine specimens have been obtained.
- Store drug in amber container. Don't store in metals other than stainless steel or aluminum to avoid precipitation.

## PATIENT TEACHING

- Instruct patient to take drug for as long as prescribed, exactly as directed, even after he feels better.
- Tell patient to take drug with food or milk to minimize stomach upset.
- Instruct patient to report adverse reactions, especially peripheral neuropathy, which can become severe or irreversible.
- Alert patient that drug may turn urine dark yellow or brown.
- Warn patient not to store drug in metals other than stainless steel or aluminum.
- Advise patient not to use antacid preparations containing magnesium trisilicate.

**SAFETY ALERT!**

# nitroglycerin (glyceryl trinitrate)

nye-troe-GLIH-ser-in

Minitran, Nitro-Dur, Nitrolingual, NitroMist, Nitrostat, Nitro-Time, Trinipatch†

*Therapeutic class:* Antianginal
*Pharmacologic class:* Nitrate
*Pregnancy risk category C*

## AVAILABLE FORMS

*Aerosol (translingual):* 0.4 mg/metered spray
*Capsules (sustained-release):* 2.5 mg, 6.5 mg, 9 mg
*Injection:* 5 mg/ml; 100 mcg/ml, 200 mcg/ml, 400 mcg/ml
*Tablets (S.L.):* 0.3 mg (1/200 grain), 0.4 mg (1/150 grain), 0.6 mg (1/100 grain)
*Topical:* 2% ointment
*Transdermal:* 0.1 mg/hour, 0.2 mg/hour, 0.3 mg/hour, 0.4 mg/hour, 0.6 mg/hour, 0.8 mg/hour release rate

## INDICATIONS & DOSAGES

➤ **To prevent chronic anginal attacks**

*Adults:* 2.5 or 6.5 mg sustained-release capsule every 8 to 12 hours. Increase to an effective dose in 2.5- or 6.5-mg increments

b.i.d. to q.i.d. Or, use 2% ointment: Start dosage with ½-inch ointment, increasing by ½-inch increments until desired results are achieved. Range of dosage with ointment is ½ to 5 inches. Usual dose is 1 to 2 inches every 6 to 8 hours. Or, transdermal patch 0.2 to 0.4 mg/hour once daily.

➤ **Acute angina pectoris; to prevent or minimize anginal attacks before stressful events**

*Adults:* 1 S.L. tablet (1/200 grain, 1/150 grain, 1/100 grain) dissolved under the tongue or in the buccal pouch as soon as angina begins. Repeat every 5 minutes, if needed, for 15 minutes. Or, one or two metered-dose sprays Nitrolingual into mouth, preferably onto or under the tongue. Repeat every 3 to 5 minutes, if needed, to a maximum of three doses within a 15-minute period.

➤ **Hypertension from surgery, heart failure after MI, angina pectoris in acute situations, to produce controlled hypotension during surgery (by I.V. infusion)**

*Adults:* Initially, infuse at 5 mcg/minute, increasing as needed by 5 mcg/minute every 3 to 5 minutes until response occurs. If a 20-mcg/minute rate doesn't produce a response, increase dosage by as much as 20 mcg/minute every 3 to 5 minutes. Up to 100 mcg/minute may be needed.

## ADMINISTRATION

**P.O.**

● Give 30 minutes before or 1 to 2 hours after meals.

● Drug must be swallowed whole and not chewed.

**I.V.**

▼ Dilute with $D_5W$ or normal saline solution for injection. Concentration shouldn't exceed 400 mcg/ml.

▼ Always give with an infusion control device and titrate to desired response.

▼ Regular polyvinyl chloride tubing can bind up to 80% of drug, making it necessary to infuse higher dosages. A special nonabsorbent polyvinyl chloride tubing is available from the manufacturer. Always mix in glass bottles and avoid using a filter.

▼ Use the same type of infusion set when changing lines.

▼ When changing the concentration of infusion, flush the administration set with 15 to 20 ml of the new concentration before use. This will clear the line of the old drug solution.

▼ **Incompatibilities:** Alteplase, bretylium, hydralazine, levofloxacin, phenytoin sodium.

**Topical**

● To apply ointment, measure the prescribed amount on the application paper; then place the paper on any nonhairy area. Don't rub in. Cover with plastic film to aid absorption and to protect clothing. Remove all excess ointment from previous site before applying the next dose. Avoid getting ointment on fingers.

**Transdermal**

● Patch can be applied to any nonhairy part of the skin except distal parts of the arms or legs. (Absorption won't be maximal at distal sites.) Patch may cause contact dermatitis.

● A cardioverter/defibrillator shouldn't be discharged through a paddle electrode that overlies a nitroglycerin patch.

● Remove patch before defibrillation. Because of the aluminum backing on the patch, the electric current may cause arcing that can damage the paddles and burn the patient.

● When stopping transdermal treatment of angina, gradually reduce the dosage and frequency of application over 4 to 6 weeks.

**S.L.**

● Give tablet at first sign of attack. Patient should wet the tablet with saliva, place it under tongue until absorbed. Dose may be repeated every 5 minutes for a maximum of three doses. If drug doesn't provide relief, contact prescriber.

**Buccal**

● The tablet should be placed between the lip and gum above the incisors or between the cheek and gum. Tablets shouldn't be swallowed or chewed.

**Translingual**

● Patient using translingual aerosol form shouldn't inhale the spray but should release it onto or under the tongue. He should wait about 10 seconds or so before swallowing.

## ACTION

A nitrate that reduces cardiac oxygen demand by decreasing left ventricular end-diastolic pressure (preload) and, to a lesser

extent, systemic vascular resistance (afterload). Also increases blood flow through the collateral coronary vessels.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 20–45 min | Unknown | 3–8 hr |
| I.V. | Immediate | Immediate | 3–5 min |
| Topical | 30 min | Unknown | 2–12 hr |
| Transdermal | 30 min | Unknown | 24 hr |
| S.L. | 1–3 min | Unknown | 30–60 min |
| Buccal | 3 min | Unknown | 3–5 hr |
| Translingual | 2–4 min | Unknown | 30–60 min |

*Half-life:* About 1 to 4 minutes.

## ADVERSE REACTIONS

**CNS:** *headache, dizziness,* syncope, weakness.
**CV:** *orthostatic hypotension, tachycardia, flushing, palpitations.*
**EENT:** S.L. burning.
**GI:** nausea, vomiting.
**Skin:** cutaneous vasodilation, contact dermatitis, rash.
**Other:** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Alteplase:* May decrease tissue plasminogen activator-antigen level. Avoid using together; if unavoidable, use lowest effective dose of nitroglycerin.
*Antihypertensives:* May increase hypotensive effect. Monitor blood pressure closely.
*Heparin:* I.V. nitroglycerin may interfere with anticoagulant effect of heparin. Monitor PTT.
*Sildenafil, tadalafil, vardenafil:* May cause severe hypotension. Use of nitrates in any form with these drugs is contraindicated.
**Drug-lifestyle.** *Alcohol use:* May increase hypotension. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

• May falsely decrease values in cholesterol determination tests using the Zlatkis-Zak color reaction.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug.
• Contraindicated in patients with early MI (oral and sublingual), severe anemia, increased intracranial pressure, angle-closure glaucoma, orthostatic hypotension, allergy to adhesives (transdermal), or hypersensitivity to nitrates.
• I.V. nitroglycerin is contraindicated in patients hypersensitive to I.V. form, with cardiac tamponade, restrictive cardiomyopathy, or constrictive pericarditis.
• Use cautiously in patients with hypotension or volume depletion.
***Overdose S&S:*** Vasodilation, decreased cardiac output, venous pooling, hypotension, methemoglobinemia.

## NURSING CONSIDERATIONS

• Closely monitor vital signs during infusion, particularly blood pressure, especially in a patient with an MI. Excessive hypotension may worsen the MI.
• Monitor blood pressure and intensity and duration of drug response.
• Drug may cause headaches, especially at beginning of therapy. Dosage may be reduced temporarily, but tolerance usually develops. Treat headache with aspirin or acetaminophen.
• Tolerance to drug can be minimized with a 10- to 12-hour nitrate-free interval. To achieve this, remove the transdermal system in the early evening and apply a new system the next morning or omit the last daily dose of a buccal, sustained-release, or ointment form. Check with the prescriber for alterations in dosage regimen if tolerance is suspected.
• Wipe off nitroglycerin paste or remove patch before defibrillation to avoid patient burns.
• ***Look alike–sound alike:*** Don't confuse nitroglycerin with nitroprusside.

## PATIENT TEACHING

• Caution patient to take nitroglycerin regularly, as prescribed, and to have it accessible at all times.
***Alert:*** Advise patient that stopping drug abruptly causes spasm of the coronary arteries.
• Teach patient how to give the prescribed form of nitroglycerin.
• Tell patient to take S.L. tablet at first sign of attack. Patient should wet the tablet with saliva, place it under tongue until absorbed, and then sit down and rest. Dose may be repeated every 5 minutes for a maximum of

three doses. If drug doesn't provide relief, he should obtain medical help promptly.
- Advise patient who complains of a tingling sensation with S.L. drug to try holding tablet in cheek.
- Tell patient to take oral tablets on an empty stomach either 30 minutes before or 1 to 2 hours after meals, to swallow oral tablets whole, and not to chew tablets.
- Remind patient using translingual aerosol form that he shouldn't inhale the spray but should release it onto or under the tongue. Tell him to wait about 10 seconds or so before swallowing.
- Tell patient to place the buccal tablet between the lip and gum above the incisors or between the cheek and gum. Tablets shouldn't be swallowed or chewed.
- Tell patient to take an additional dose before anticipated stress or at bedtime if chest pain occurs at night.
- Urge patient using skin patches to dispose of them carefully because enough medication remains after normal use to be hazardous to children and pets.
- If patients using skin patches are scheduled for an MRI, advise them to notify the facility that they are wearing a patch.
- Advise patient to avoid alcohol.
- To minimize dizziness when standing up, tell patient to rise slowly. Advise him to go up and down stairs carefully and to lie down at the first sign of dizziness.

***Alert:*** Advise patient that use of sildenafil, tadalafil, or vardenafil with any nitrate may cause life-threatening low blood pressure. Use together is contraindicated.
- Tell patient to store drug in cool, dark place in a tightly closed container. Tell him to remove cotton from container because it absorbs drug.
- Tell patient to store S.L. tablets in original container or other container specifically approved for this use and to carry the container in a jacket pocket or purse, not in a pocket close to the body.

**SAFETY ALERT!**

## nitroprusside sodium

nye-troe-PRUSS-ide

Nipride†, Nitropress

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Vasodilator
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 50 mg/vial in 2-ml and 5-ml vials

### INDICATIONS & DOSAGES

➤ **To lower blood pressure quickly in hypertensive emergencies, to produce controlled hypotension during anesthesia, to reduce preload and afterload in cardiac pump failure or cardiogenic shock (may be used with or without dopamine)**

*Adults and children:* Begin infusion at 0.3 mcg/kg/minute I.V. and gradually titrate every few minutes to a maximum infusion rate of 10 mcg/kg/minute.

***Adjust-a-dose:*** Patients also taking other antihypertensives are extremely sensitive to nitroprusside. Titrate dosage accordingly. Use with caution in patients with severe renal impairment or hepatic insufficiency; use minimum effective dose.

### ADMINISTRATION

**I.V.**

▼ Prepare solution by dissolving 50 mg in 2 to 3 ml of $D_5W$ injection or according to manufacturer's instructions.

**Black Box Warning** Further dilute concentration in 250, 500, or 1,000 ml of $D_5W$ to provide solutions with 200, 100, or 50 mcg/ml, respectively. ■

▼ Reconstitute ADD-Vantage vials labeled as containing 50 mg of drug according to manufacturer's directions.

▼ Because drug is sensitive to light, wrap solution in foil or other opaque material; it's not necessary to wrap the tubing. Fresh solution has a faint brownish tint. Discard if highly discolored after 24 hours.

▼ Use an infusion pump. Drug is best given via piggyback through a peripheral line with no other drug. Don't titrate rate

of main I.V. line while drug is being infused. Even a small bolus can cause severe hypotension.
▼ Check blood pressure every 5 minutes during titration at start of infusion and every 15 minutes thereafter.
▼ If severe hypotension occurs, stop infusion; effects of drug quickly reverse. Notify prescriber.
▼ If possible, start an arterial pressure line. Regulate drug flow to desired blood pressure response.
▼ **Incompatibilities:** Amiodarone, atracurium besylate, bacteriostatic water for injection, levofloxacin. Don't mix with other I.V. drugs or preservatives.

## ACTION

Relaxes arteriolar and venous smooth muscle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | 1–2 min | 10 min |

*Half-life:* 2 minutes.

## ADVERSE REACTIONS

**CNS:** *headache, dizziness,* ***increased intracranial pressure,*** loss of consciousness, apprehension, restlessness.
**CV:** ***bradycardia,*** hypotension, tachycardia, palpitations, ECG changes, flushing.
**GI:** *nausea, abdominal pain,* ileus.
**Hematologic:** ***methemoglobinemia.***
**Metabolic:** acidosis, hypothyroidism.
**Musculoskeletal:** *muscle twitching.*
**Skin:** *diaphoresis,* pink color, rash.
**Other:** ***thiocyanate toxicity, cyanide toxicity,*** venous streaking, irritation at infusion site.

## INTERACTIONS

**Drug-drug.** *Antihypertensives:* May cause sensitivity to nitroprusside. Adjust dosage. *Ganglionic-blocking drugs, general anesthetics, negative inotropic drugs, other antihypertensives:* May cause additive effects. Monitor blood pressure closely. *Sildenafil, vardenafil:* May increase hypotensive effects. Avoid use together.

## EFFECTS ON LAB TEST RESULTS

- May increase creatinine level.
- May decrease RBC and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Contraindicated in those with compensatory hypertension (such as in arteriovenous shunt or coarctation of the aorta), inadequate cerebral circulation, acute heart failure with reduced peripheral vascular resistance, congenital optic atrophy, or tobacco-induced amblyopia.
- Use with extreme caution in patients with increased intracranial pressure.
- Use cautiously in patients with hypothyroidism, hepatic or renal disease, hyponatremia, or low vitamin B level.

***Overdose S&S:*** Hypotension, acidosis, cyanide or thiocyanate toxicity.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug may cause rapid decrease in blood pressure. Use drug only when available equipment and personnel allow blood pressure to be continuously monitored. ■
- Obtain baseline vital signs before giving drug; find out parameters prescriber wants to achieve.
- Keep patient in supine position when starting therapy or titrating drug.

**Black Box Warning** Giving excessive doses of 500 mcg/kg delivered faster than 2 mcg/kg/minute or using maximum infusion rate of 10 mcg/kg/minute for more than 10 minutes can cause cyanide toxicity. ■

***Alert:*** If patient is at risk, check thiocyanate level every 72 hours. Level higher than 100 mcg/ml may be toxic. If profound hypotension, metabolic acidosis, dyspnea, headache, loss of consciousness, ataxia, or vomiting occurs, stop drug immediately and notify prescriber.
- ***Look alike–sound alike:*** Don't confuse nitroprusside with nitroglycerin.

## PATIENT TEACHING

- Instruct patient to report adverse reactions promptly.
- Tell patient to alert nurse if discomfort occurs at I.V. insertion site.

# norelgestromin and ethinyl estradiol transdermal system

nor-el-JES-troe-min and ETH-i-nill

Ortho Evra

*Therapeutic class:* Contraceptive
*Pharmacologic class:* Estrogenic and progestogenic steroids
*Pregnancy risk category X*

## AVAILABLE FORMS

*Transdermal patch:* norelgestromin 6 mg and ethinyl estradiol 0.75 mg per patch, delivering 150 mcg norelgestromin and 20 mcg ethinyl estradiol daily

## INDICATIONS & DOSAGES

➤ **Contraception**

*Women:* Apply 1 patch weekly for 3 weeks. Apply each new patch on the same day of the week. Week 4 is patch-free and withdrawal bleeding is expected. On the day after week 4 ends, apply a new patch to start a new 4-week cycle. The patch-free interval between cycles should never be longer than 7 days.

## ADMINISTRATION

**Transdermal**

● Apply patch to a clean, dry area of the skin on the buttocks, abdomen, upper outer arm, or upper torso. Don't apply to the breasts or to skin that is red, irritated, or cut.

## ACTION

Combination hormonal contraceptives act by suppressing gonadotropins. The primary mechanism of this action is ovulation inhibition. However, changes in cervical mucus increase the difficulty of sperm entry into the uterus, and changes in the endometrium decrease the likelihood of implantation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Transdermal | Rapid | 2 days | Unknown |

*Half-life:* Ethinyl estradiol, 6 to 45 hours; norelgestromin, 28 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* emotional lability, dizziness, fatigue.
**CV:** ***thromboembolic events, MI,*** hypertension, edema, ***cerebral hemorrhage.***
**EENT:** contact lens intolerance, changes in corneal curvature.
**GI:** *nausea, abdominal pain,* vomiting, gallbladder disease, cholestatic jaundice.
**GU:** dysmenorrhea, changes in menstrual flow, vaginal candidiasis.
**Hepatic:** ***hepatic adenomas,*** benign liver tumors.
**Metabolic:** weight changes.
**Respiratory:** *upper respiratory tract infection.*
**Skin:** *application site reaction,* melasma, pruritus, acne.
**Other:** *breast tenderness, enlargement, or secretion.*

## INTERACTIONS

**Drug-drug.** *Acetaminophen, clofibric acid, morphine, salicylic acid, temazepam:* May decrease levels or increase clearance of these drugs. Monitor patient for lack of effect.
*Ampicillin, barbiturates, carbamazepine, felbamate, griseofulvin, oxcarbazepine, phenylbutazone, phenytoin, rifampin, tetracyclines, topiramate:* May reduce contraceptive effectiveness, resulting in unintended pregnancy or breakthrough bleeding. Encourage backup method of contraception if used together.
*Anticoagulants:* May increase or decrease effect of anticoagulant. Monitor patient and lab values.
*Ascorbic acid, atorvastatin, itraconazole, ketoconazole:* May increase hormone levels. Use together cautiously.
*Cyclosporine, prednisolone, theophylline:* May increase levels of these drugs. Monitor patient for adverse reactions.
*HIV protease inhibitors:* May affect contraceptive effectiveness and safety. Use together cautiously.
**Drug-herb.** *St. John's wort:* May reduce effectiveness of drug and cause breakthrough bleeding. Discourage use together.
**Drug-lifestyle.** *Smoking:* May increase risk of CV adverse effects, related to age and smoking 15 or more cigarettes daily. Urge patient not to smoke.

N

## EFFECTS ON LAB TEST RESULTS

- May increase circulating total thyroid hormone, triglyceride, other binding protein, sex hormone–binding globulin, total circulating endogenous sex steroid, corticoid, and factor VII, VIII, IX, and X levels. May decrease antithrombin III and folate levels.
- May decrease free $T_3$ resin uptake and glucose tolerance.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to any component of this drug and in those with past history of deep vein thrombosis or related disorder; current or past history of cerebrovascular or coronary artery disease; past or current known or suspected breast cancer, endometrial cancer, or other known or suspected estrogen-dependent neoplasia; or hepatic adenoma or cancer; and in those who are or may be pregnant.
- Contraindicated in patients with thrombophlebitis, thromboembolic disorders, valvular heart disease with complications, severe hypertension, diabetes with vascular involvement, headaches with focal neurologic symptoms, major surgery with prolonged immobilization, undiagnosed abnormal genital bleeding, cholestatic jaundice of pregnancy or jaundice with previous hormonal contraceptive use, or acute or chronic hepatocellular disease with abnormal liver function.
- Use cautiously in patients with CV disease risk factors, with conditions that might be aggravated by fluid retention, or with a history of depression.

***Overdose S&S:*** Nausea, vomiting, withdrawal uterine bleeding.

## NURSING CONSIDERATIONS

***Alert:*** Patients taking combination hormonal contraceptives may be at increased risk for thrombophlebitis, venous thrombosis with or without embolism, pulmonary embolism, MI, cerebral hemorrhage, cerebral thrombosis, hypertension, gallbladder disease, hepatic adenomas, benign liver tumors, mesenteric thrombosis, and retinal thrombosis.

- Increased risk of MI occurs primarily in smokers and women with hypertension, hypercholesterolemia, morbid obesity, and diabetes.
- Encourage women with a history of hypertension or renal disease to use a different contraceptive. If this drug is used, monitor blood pressure closely and stop use if hypertension occurs.
- Drug may be less effective in women who weigh 90 kg (198 lb) or more.

**Black Box Warning** Cigarette smoking increases the risk of serious adverse cardiac effects. The risk increases with age especially in women over 35, and in those who smoke 15 or more cigarettes daily.

- The risk of thromboembolic disease increases if therapy is used postpartum or postabortion.
- Birth control patch users may be at higher risk for developing serious blood clots versus birth control pill users.
- Rule out pregnancy if withdrawal bleeding fails to occur for two consecutive cycles.
- If skin becomes irritated, the patch may be removed and a new patch applied at a different site.
- Stop drug and notify prescriber at least 4 weeks before and for 2 weeks after an elective surgery that increases the risk of thromboembolism, and during and after prolonged immobilization. Teach the patient about alternative methods of contraception during this time.
- Stop drug and notify prescriber if patient has headaches, vision loss, proptosis, diplopia, papilledema, retinal vascular lesions, jaundice, or depression.

## PATIENT TEACHING

- Emphasize the importance of having regular annual physical examinations to check for adverse effects or developing contraindications.
- Tell patient that drug doesn't protect against HIV and other sexually transmitted diseases.
- Advise women to apply patch on the first day of menstrual cycle or the first Sunday of menstrual cycle.
- Advise patient to use a backup method of contraception for the first 7 days.
- Tell patient switching from estrogen-progestin oral contraceptives to apply first patch on the first day of withdrawal bleeding.

If no bleeding within 5 days of last hormonally active pill, advise patient to obtain a pregnancy test.
- Advise patient to immediately apply a new patch once the used patch is removed, on the same day of the week every 7 days for 3 weeks. Week 4 is patch free. Bleeding is expected to occur during this time.
- Tell patient to apply each patch to a clean, dry area of the skin on the buttocks, abdomen, upper outer arm, or upper torso. Tell patient not to apply to the breasts or to skin that's red, irritated, or cut.
- Tell patient to carefully fold the used patch in half so that it sticks to itself, before discarding.
- Tell women to immediately stop use if pregnancy is confirmed.
- Tell patient who wears contact lenses to report visual changes or changes in lens tolerance.
- Advise patient not to smoke while using the patch.
- Tell patient that if a patch becomes detached for less than one day, to reapply it or replace it immediately and continue the schedule. If the patch is detached for more than one day, a new cycle should be started and back-up contraception should be used for the first week.
- Stress that if patient isn't sure what to do about mistakes with patch use, she should use a backup method of birth control and contact her health care provider.
- Tell patient undergoing an MRI to alert facility that she's using a transdermal patch.

**SAFETY ALERT!**

## norepinephrine bitartrate (levarterenol bitartrate, noradrenaline acid tartrate)

nor-ep-i-NEF-rin

Levophed

*Therapeutic class:* Vasopressor
*Pharmacologic class:* Direct-acting adrenergic
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 1 mg/ml

### INDICATIONS & DOSAGES

➤ **To restore blood pressure in acute hypotension; severe hypotension during cardiac arrest**

*Adults:* Initially, 8 to 12 mcg/minute by I.V. infusion; then titrate to maintain systolic blood pressure at 80 to 100 mm Hg in previously normotensive patients and 40 mm Hg below preexisting systolic blood pressure in previously hypertensive patients. Average maintenance dose is 2 to 4 mcg/minute.

### ADMINISTRATION

**I.V.**

▼ Use a central venous catheter or large vein, such as the antecubital fossa, to minimize risk of extravasation. Give in $D_5W$ alone or $D_5W$ in normal saline solution for injection. Use continuous infusion pump to regulate infusion flow rate and a piggyback setup so I.V. line stays open if norepinephrine is stopped.

▼ Never leave patient unattended during infusion. Check blood pressure every 2 minutes until stabilized; then check every 5 minutes.

▼ During infusion, frequently monitor ECG, cardiac output, central venous pressure, pulmonary artery wedge pressure, pulse rate, urine output, and color and temperature of limbs. Titrate infusion rate based on findings and prescriber guidelines.

**Black Box Warning** Check site frequently for signs and symptoms of extravasation. If they appear, stop infusion immediately and call prescriber. To prevent sloughing and necrosis, use a fine hypodermic needle to infiltrate area with 5 to 10 mg phentolamine in 10 to 15 ml of normal saline solution. Also, check for blanching along course of infused vein, which may progress to superficial sloughing. ■

▼ Protect drug from light. Discard discolored solution or solution that contains precipitate. Solution will deteriorate after 24 hours.

▼ If prolonged therapy is needed, change injection site frequently.

▼ Avoid mixing with alkaline solutions, oxidizing drugs, or iron salts. The use of normal saline solution alone isn't

N

recommended because of the lack of oxidation protection.
▼ **Incompatibilities:** Alkaline-buffered antibiotics, aminophylline, amobarbital, chlorothiazide, chlorpheniramine, insulin, lidocaine, pentobarbital sodium, phenobarbital sodium, phenytoin sodium, ranitidine hydrochloride, sodium bicarbonate, streptomycin, thiopental, whole blood.

## ACTION

Stimulates alpha and $beta_1$ receptors in the sympathetic nervous system, causing vasoconstriction and cardiac stimulation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | 1–2 min after infusion |

*Half-life:* About 1 minute.

## ADVERSE REACTIONS

**CNS:** *headache,* anxiety, weakness, dizziness, tremor, restlessness, insomnia.
**CV:** ***bradycardia, severe hypertension, arrhythmias.***
**Respiratory:** ***asthma attacks,*** respiratory difficulties.
**Skin:** irritation with extravasation, necrosis and gangrene secondary to extravasation.
**Other:** ***anaphylaxis.***

## INTERACTIONS

**Drug-drug.** *Alpha blockers:* May antagonize drug effects. Avoid using together. *Antihistamines, atropine, ergot alkaloids, guanethidine, MAO inhibitors, methyldopa, oxytocics:* When given with sympathomimetics, may cause severe hypertension (hypertensive crisis). Avoid using together. *Inhaled anesthetics:* May increase risk of arrhythmias. Monitor ECG. *Tricyclic antidepressants:* May potentiate the pressor response and cause arrhythmias. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with mesenteric or peripheral vascular thrombosis, profound hypoxia, hypercarbia, or hypotension resulting from blood volume deficit.
- Contraindicated during cyclopropane and halothane anesthesia.
- Use cautiously in patients taking MAO inhibitors or tricyclic or imipramine-type antidepressants.
- Use cautiously in patients with sulfite sensitivity.

***Overdose S&S:*** Headache severe hypertension, reflex bradycardia, increased peripheral resistance, decreased cardiac output.

## NURSING CONSIDERATIONS

- Drug isn't a substitute for blood or fluid replacement therapy. If patient has volume deficit, replace fluids before giving vasopressors.
- Keep emergency drugs on hand to reverse effects of drug: atropine for reflex bradycardia, phentolamine to decrease vasopressor effects, and propranolol for arrhythmias.
- Notify prescriber immediately of decreased urine output.
- When stopping drug, gradually slow infusion rate. Continue monitoring vital signs, watching for possible severe drop in blood pressure.
- ***Look alike–sound alike:*** Don't confuse norepinephrine with epinephrine.

## PATIENT TEACHING

- Tell patient to report adverse reactions promptly.
- Advise patient to report discomfort at I.V. insertion site.

# norethindrone

nor-ETH-in-drone

Camila, Errin, Micronor, Nor-QD

# norethindrone acetate

Aygestin

*Therapeutic class:* Contraceptive
*Pharmacologic class:* Progestin
*Pregnancy risk category X*

## AVAILABLE FORMS

**norethindrone**
*Tablets:* 0.35 mg
**norethindrone acetate**
*Tablets:* 5 mg

## INDICATIONS & DOSAGES

➤ **Amenorrhea, abnormal uterine bleeding**

*Women:* 2.5 to 10 mg norethindrone acetate P.O. daily for 5 to 10 days, beginning in the assumed latter half of the menstrual cycle.

➤ **Endometriosis**

*Women:* 5 mg norethindrone acetate P.O. daily for 14 days; then increased by 2.5 mg daily every 2 weeks, up to 15 mg daily. Therapy may continue for 6 to 9 months or until breakthrough bleeding warrants temporary termination.

➤ **Contraception**

*Women:* Initially, 0.35 mg norethindrone P.O. on first day of menstruation; then 0.35 mg daily.

## ADMINISTRATION

**P.O.**

● Give drug at same time every day, continuously, with no interruption between pill packs.

## ACTION

Suppresses ovulation, possibly by inhibiting pituitary gonadotropin secretion, and forms thick cervical mucus.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* 5 to 14 hours.

## ADVERSE REACTIONS

**CNS:** depression, ***stroke,*** headache, mood swings.

**CV:** thrombophlebitis, ***pulmonary embolism,*** edema, ***thromboembolism.***

**EENT:** exophthalmos, diplopia.

**GI:** *bloating, abdominal pain or cramping.*

**GU:** *breakthrough bleeding*, dysmenorrhea, *amenorrhea*, cervical erosion, abnormal secretions.

**Hepatic:** cholestatic jaundice.

**Metabolic:** weight changes.

**Skin:** melasma, rash, acne, pruritus, alopecia, hirsutism, hemorrhagic skin eruptions.

**Other:** breast tenderness, enlargement, or secretion; premenstrual-like syndrome, ***anaphylactic reactions.***

## INTERACTIONS

**Drug-drug.** *Barbiturates, carbamazepine, fosphenytoin, phenytoin, rifampin:* May decrease progestin effects. Monitor patient for diminished therapeutic response.

**Drug-food.** *Caffeine:* May increase caffeine level. Urge caution.

**Drug-lifestyle.** *Smoking:* May increase risk of adverse CV effects. If smoking continues, may need alternative therapy.

## EFFECTS ON LAB TEST RESULTS

● May increase liver function test values. May alter coagulation factors and thyroid function tests.

● May decrease metyrapone test results.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in pregnant women, patients hypersensitive to drug, and patients with breast cancer, undiagnosed abnormal vaginal bleeding, severe hepatic disease, missed abortion, or current or previous thromboembolic disorders.

● Use cautiously in patients with diabetes, seizures, migraines, cardiac or renal disease, asthma, and depression.

## NURSING CONSIDERATIONS

● If switching from combined oral contraceptives to progestin-only pills (POPs), take the first POP the day after the last active combined pill.

● If switching from POPs to combined pills, take the first active combined pill on the first day of menstruation, even if the POP pack isn't finished.

***Alert:*** Norethindrone acetate is twice as potent as norethindrone. Norethindrone acetate shouldn't be used for contraception.

● Patients with menstrual disorders usually need preliminary estrogen treatment.

● Watch patient closely for signs of edema.

● Monitor blood pressure.

● ***Look alike–sound alike:*** Don't confuse Micronor with Micro-K or Micronase.

## PATIENT TEACHING

● According to FDA regulations, patient must read package insert explaining possible adverse effects before receiving first dose. Also, give patient verbal explanation.

• Tell patient to take drug at the same time every day when used as a contraceptive. If she's more than 3 hours late taking the pill or if she has missed a pill, she should take the pill as soon as she remembers, and then continue the normal schedule. Also tell her to use a backup method of contraception for the next 48 hours.
***Alert:*** Tell patient to report unusual symptoms immediately and to stop drug and notify prescriber about visual disturbances or migraine, or pain or numbness in her arms or legs.
• Teach women how to perform routine breast self-examination.
• Tell women to report suspected pregnancy to prescriber.
• Encourage patient to stop or reduce smoking because of the risk of CV complications.
• Tell patient with diabetes that glucose levels may be affected and to closely monitor her levels.
• Tell patient that drug does not protect against HIV or other sexually transmitted diseases.
• Tell patient that if she vomits soon after taking a pill to use a back-up method of birth control for 48 hours.

## nortriptyline hydrochloride

nor-TRIP-ti-leen

Aventyl, Pamelor℞*

*Therapeutic class:* Antidepressant
*Pharmacologic class:* Tricyclic antidepressant
*Pregnancy risk category D*

## AVAILABLE FORMS

*Capsules:* 10 mg, 25 mg, 50 mg, 75 mg
*Oral solution:* 10 mg/5 ml*

## INDICATIONS & DOSAGES

➤ **Depression**
*Adults:* 25 mg P.O. t.i.d. or q.i.d., gradually increased to maximum of 150 mg daily. Give entire dose at bedtime. Monitor level when doses above 100 mg daily are given.
*Adolescents and elderly patients:* 30 to 50 mg daily given once or in divided doses.

➤ **Postherpetic neuralgia ♦**
*Adults:* Mean dosage is between 58 and 89 mg P.O. for at least 5 weeks.

## ADMINISTRATION

**P.O.**
• Give drug without regard for food.
• Whenever possible, give full dose at bedtime.

## ACTION

Unknown. Increases the amount of norepinephrine, serotonin, or both in the CNS by blocking reuptake by the presynaptic neurons.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 7–8½ hr | Unknown |

*Half-life:* 18 to 24 hours.

## ADVERSE REACTIONS

**CNS:** *drowsiness, dizziness,* ***seizures, stroke,*** tremor, weakness, confusion, headache, nervousness, EEG changes, extrapyramidal syndrome, insomnia, nightmares, hallucinations, paresthesia, ataxia, agitation.
**CV:** *tachycardia,* ***heart block, MI,*** ECG changes, hypertension, hypotension.
**EENT:** *blurred vision,* tinnitus, mydriasis.
**GI:** *constipation,* dry mouth, nausea, vomiting, anorexia, paralytic ileus.
**GU:** *urine retention.*
**Hematologic:** ***agranulocytosis, thrombocytopenia,*** bone marrow depression, eosinophilia.
**Metabolic:** ***hypoglycemia,*** hyperglycemia.
**Skin:** rash, urticaria, photosensitivity reactions, diaphoresis.
**Other:** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Barbiturates, CNS depressants:* May enhance CNS depression. Avoid using together.
*Cimetidine,* ***fluoxetine, fluvoxamine, paroxetine, sertraline:*** May increase nortriptyline level. Monitor drug levels and patient for signs of toxicity.
*Clonidine:* May cause life-threatening hypertension. Avoid using together.
*Epinephrine, norepinephrine:* May increase hypertensive effect. Use together cautiously.

*MAO inhibitors:* May cause severe excitation, hyperpyrexia, or seizures, usually with high doses. Avoid using within 14 days of MAO inhibitor therapy.
***Quinolones:*** May increase the risk of life-threatening arrhythmias. Avoid using together.
**Drug-herb.** *Evening primrose oil:* May cause additive or synergistic effect, lowering seizure threshold and increasing the risk of seizure. Discourage use together.
*St. John's wort, SAM-e, yohimbe:* May cause serotonin syndrome and reduced drug level. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May enhance CNS depression. Discourage use together.
*Smoking:* May decrease drug level. Monitor patient for lack of effect.
*Sun exposure:* May increase risk of photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase or decrease glucose level.
- May increase eosinophil count and liver function test values. May decrease WBC, RBC, granulocyte, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and during acute recovery phase of MI; also contraindicated within 14 days of MAO inhibitor therapy.

**Black Box Warning** Nortriptyline isn't approved for use in children. ▮

- Use with extreme caution in patients with glaucoma, suicidal tendency, history of urine retention or seizures, CV disease, or hyperthyroidism and in those receiving thyroid drugs.

⚠ ***Overdose S&S:*** Cardiac arrhythmias, severe hypotension, shock, congestive heart failure, pulmonary edema, seizures, CNS depression, coma, ECG changes, confusion, restlessness, disturbed concentration, transient visual hallucinations, dilated pupils, agitation, hyperactive reflexes, stupor, drowsiness, muscle rigidity, vomiting, hypothermia, hyperpyrexia.

## NURSING CONSIDERATIONS

- Monitor patient for nausea, headache, and malaise after abrupt withdrawal of long-term therapy; these symptoms don't indicate addiction.
- Because patients using tricyclic antidepressants may suffer hypertensive episodes during surgery, stop drug gradually several days before surgery.
- If signs or symptoms of psychosis occur or increase, expect to reduce dosage. Record mood changes. Monitor patient for suicidal tendencies and allow him only a minimum supply of drug.

**Black Box Warning** Drug may increase the risk of suicidal thinking and behavior in children, adolescents, and young adults with major depressive disorder or other psychiatric disorder. ▮

- ***Look alike–sound alike:*** Don't confuse nortriptyline with amitriptyline.

## PATIENT TEACHING

**Black Box Warning** Advise families and caregivers to closely observe patient for increased suicidal thinking or behavior. ▮

- Advise patient to take full dose at bedtime whenever possible to reduce risk of dizziness upon standing quickly.
- Warn patient to avoid activities that require alertness and good coordination until effects of drug are known. Drowsiness and dizziness usually subside after a few weeks.
- Recommend use of sugarless hard candy or gum to relieve dry mouth. Saliva substitutes may be needed.
- Tell patient to consult prescriber before taking other prescription or OTC drugs.
- Warn patient not to stop drug suddenly.
- To prevent oversensitivity to the sun, advise patient to use sunblock, wear protective clothing, and avoid prolonged exposure to strong sunlight.

N

# nystatin

nye-STAT-in

Mycostatin, Nilstat

*Therapeutic class:* Antifungal
*Pharmacologic class:* Polyene macrolide
*Pregnancy risk category C*

## AVAILABLE FORMS

*Oral suspension:* 100,000 units/ml

*Powder (bulk):* 50, 150, or 500 million units; 1, 2, or 5 billion units
*Tablets:* 500,000 units
*Vaginal tablets:* 100,000 units

## INDICATIONS & DOSAGES

➤ **Intestinal candidiasis**
*Adults:* 500,000 to 1 million units P.O. as tablets t.i.d.

➤ **Oral candidiasis (thrush)**
*Adults and children:* 400,000 to 600,000 units P.O. as oral suspension q.i.d. for up to 14 days.
*Infants:* 200,000 units P.O. as oral suspension q.i.d.
*Low-birth-weight and premature infants:* 100,000 units P.O. oral suspension q.i.d.

➤ **Vaginal candidiasis**
*Adults:* 100,000 units, as vaginal tablets, inserted high into vagina, daily at bedtime for 14 days.

## ADMINISTRATION

**P.O.**
- To treat oral candidiasis, after the patient's mouth is clean of food debris, have him hold suspension in mouth for several minutes before swallowing. When treating infants, swab medication on oral mucosa.
- Suspension made with bulk powder contains no preservatives. Use immediately; don't store.
- Prescriber may instruct immunosuppressed patients to suck on vaginal tablets (100,000 units) because this provides prolonged contact with oral mucosa.

**Vaginal**
- Vaginal tablets can be used by pregnant patients up to 6 weeks before term to treat maternal infection that may cause oral candidiasis in neonates.

## ACTION

Probably binds to sterols in fungal cell membrane, altering cell permeability and allowing leakage of intracellular components.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., vaginal | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**GI:** transient nausea, vomiting, diarrhea.
**GU:** irritation, sensitization, vulvovaginal burning (vaginal form).
**Skin:** rash.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

- None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.

⚠ ***Overdose S&S:*** Nausea, GI upset.

## NURSING CONSIDERATIONS

- Drug isn't effective against systemic infections.

## PATIENT TEACHING

- Advise patient to continue taking drug for at least 2 days after signs and symptoms disappear. Consult prescriber for exact length of therapy.
- Instruct patient to continue therapy during menstruation.
- Explain that factors predisposing women to vaginal infection include use of antibiotics, hormonal contraceptives, and corticosteroids; diabetes; reinfection by sexual partner; and tight-fitting pantyhose. Encourage woman to wear cotton underwear.
- Instruct woman in careful hygiene for affected areas, including cleaning perineal area from front to back.
- Advise patient to report redness, swelling, or irritation.
- Tell patient, especially an older patient, that overusing mouthwash or wearing poorly fitting dentures may promote infection.

# octreotide acetate

ok-TREE-oh-tide

Sandostatin, Sandostatin LAR Depot

*Therapeutic class:* Growth hormone
*Pharmacologic class:* Synthetic octapeptide
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection ampules:* 50 mcg/ml, 100 mcg/ml
*Injection (single-dose vials):* 50 mcg/ml, 100 mcg/ml
*Injection (multidose vials):* 200 mcg/ml, 500 mcg/ml, 1,000 mcg/ml
*Injection for LAR (powder for suspension):* 10 mg/5 ml, 20 mg/5 ml, 30 mg/5 ml

## INDICATIONS & DOSAGES

➤ **Flushing and diarrhea from carcinoid tumors**

*Adults:* 100 to 600 mcg daily subcutaneously or I.V. in two to four divided doses for first 2 weeks of therapy. Usual daily dosage is 450 mcg. Base subsequent dosage on individual response.

➤ **Watery diarrhea from vasoactive intestinal polypeptide–secreting tumors (VIPomas)**

*Adults:* 200 to 300 mcg daily subcutaneously or I.V. in two to four divided doses for first 2 weeks of therapy. Base subsequent dosage on individual response but usually shouldn't exceed 450 mcg daily.

➤ **Acromegaly**

*Adults:* Initially, 50 mcg subcutaneously or I.V. t.i.d.; then adjust based on somatomedin C levels every 2 weeks. If Sandostatin LAR is used, give 20 mg I.M. (intragluteally) at 4-week intervals.

➤ **Dumping syndrome ♦**

50 to 100 mcg subcutaneously one to three times daily before meals. Or, 10 to 20 mg LAR depot I.M. monthly.

## ADMINISTRATION

**I.V.**

▼ For other uses, dilute in 50 to 200 ml $D_5W$ or normal saline solution and infuse over 15 to 30 minutes.
▼ Solution is stable for 24 hours.
▼ **Incompatibilities:** Total parenteral nutrition.

**I.M.**

- Don't use if particulates or discoloration are observed.
- Follow the mixing instructions included in the packaging and give immediately after mixing.
- Rotate injection sites.
- Avoid deltoid muscle injections. May cause significant discomfort.
- Never give the injectable suspension by I.V. or subcutaneous routes.

**Subcutaneous**

- Don't use if particulates or discoloration are observed.

***Alert:*** Don't use LAR Depot for subcutaneous administration.

## ACTION

Mimics action of naturally occurring somatostatin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Rapid | 30 min | <12 hr |
| I.M. | Unknown | 2–3 wk | Unknown |
| Subcut. | 30 min | 30 min | <12 hr |

*Half-life:* About 1½ hours; long-acting, unknown.

## ADVERSE REACTIONS

**CNS:** dizziness, fatigue, headache, lightheadedness.
**CV:** ***arrhythmias, bradycardia,*** conduction abnormalities, edema.
**EENT:** blurred vision.
**GI:** *abdominal pain or discomfort, diarrhea, gallbladder abnormalities, loose stools, nausea,* ***pancreatitis,*** constipation, fat malabsorption, flatulence, vomiting.
**GU:** pollakiuria, UTI.
**Metabolic:** ***hypoglycemia,*** hyperglycemia, hypothyroidism, suppressed secretion of growth hormone and gastroenterohepatic peptides (gastrin, vasoactive intestinal polypeptide, insulin, glucagon, secretin, motilin, and pancreatic polypeptide).
**Musculoskeletal:** backache, joint pain.
**Skin:** alopecia, erythema or pain at injection site, flushing, wheal.
**Other:** cold symptoms, flulike symptoms, pain or burning at subcutaneous injection site.

0

## INTERACTIONS

**Drug-drug.** *Beta blockers (such as propranolol):* May have additive effect and further lower heart rate. Decrease beta blocker dosage as needed.
*Bromocriptine:* May decrease bromocriptine availability. Monitor patient for effectiveness.
*Cyclosporine:* May decrease cyclosporine level. Monitor patient closely.
*CYP3A4-metabolized drugs (such as quinidine, terfenadine):* May decrease excretion of these drugs. Use with caution and reduce dosage as needed.
*Insulin, oral hypoglycemics:* May have decreased effectiveness from octreotide. Monitor patient and adjust dosage of hypoglycemics as needed.

## EFFECTS ON LAB TEST RESULTS

- May decrease vitamin $B_{12}$ level. May increase or decrease glucose level.
- May alter liver function test values.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in elderly patients, who may be more sensitive to drug.

***Overdose S&S:*** Hypoglycemia, flushing, dizziness, nausea.

## NURSING CONSIDERATIONS

- ***Look alike–sound alike:*** To avoid giving drug by the wrong route, don't confuse octreotide acetate injection with injectable depot suspension product.
- Monitor baseline thyroid function tests.
- Monitor IGF-I (somatomedin C) levels every 2 weeks. Dosage adjustments are based on this level.
- Periodically monitor laboratory tests, such as thyroid function, glucose, urine 5-hydroxyindoleacetic acid, plasma serotonin, and plasma substance P (for carcinoid tumors).
- Monitor patient regularly for gallbladder disease. Therapy may be related to the development of cholelithiasis because of its effect on gallbladder motility or fat absorption.
- Monitor patient closely for signs and symptoms of glucose imbalance. Patients with type 1 diabetes mellitus and those receiving oral antidiabetics or oral diazoxide may need dosage adjustments during therapy. Monitor glucose level.
- Drug may alter fluid and electrolyte balance; other therapies may need adjusting.
- Half-life may be altered in patients with end-stage renal failure who are receiving dialysis.
- ***Look alike–sound alike:*** Don't confuse Sandostatin with Sandimmune or Sandoglobulin.

## PATIENT TEACHING

- Urge patient to report signs and symptoms of abdominal discomfort immediately.
- Stress importance of the need for periodic laboratory testing during octreotide therapy.
- Advise patient that drug may restore fertility in some women with acromegaly and that she should use effective birth control if pregnancy isn't desired.
- Tell patient that drug may cause dizziness, drowsiness, or vision changes and that these symptoms may increase with alcohol use or certain other medications. Advise patient not to drive or perform hazardous tasks until drug's effects are known.
- Warn diabetic patient to monitor blood glucose level closely and to discuss results with prescriber before making dosage changes.

**SAFETY ALERT!**

***NEW DRUG***

# ofatumumab

oh-fuh-TOO-moo-mab

Arzerra

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Monoclonal antibody
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 100 mg/5-ml single-use vials

## INDICATIONS & DOSAGES

➤ **Chronic lymphocytic leukemia (CLL) refractory to fludarabine and alemtuzumab**

*Adults:* Initially, 300 mg I.V. infusion (dose 1), followed 1 week later by 2,000 mg I.V. weekly for 7 weeks (doses 2 through 8); then 4 weeks later give 2,000 mg I.V. weekly for 4 weeks (doses 9 through 12). Give acetaminophen 1,000 mg, an oral or I.V. antihistamine (cetirizine 10 mg or equivalent), and an I.V. corticosteroid (prednisolone 100 mg or equivalent) 30 minutes to 2 hours before treatment. May reduce corticosteroid dosage for doses 3 through 8 if a Grade 3 or greater infusion reaction didn't occur with preceding dose. For doses 10 through 12, give prednisolone 50 to 100 mg or equivalent if a Grade 3 or greater infusion reaction didn't occur with dose 9.
***Adjust-a-dose:*** For Grade 1, 2, or 3 infusion reaction, interrupt infusion. If reaction resolves or remains Grade 2 or less, infuse at half the previous infusion rate; if Grade 3, infuse at 12 ml/hour. If tolerated, may increase infusion rate after resuming infusion. For Grade 4 infusion reaction, discontinue therapy.

## ADMINISTRATION

### I.V.

▼ To prepare 300-mg dose, withdraw and discard 15 ml from 1,000-ml bag of normal saline solution. Withdraw 5 ml of drug from each of three vials and add to normal saline solution. Gently invert bag to mix solution.
▼ To prepare 2,000-mg dose, withdraw and discard 100 ml from 1,000-ml bag of normal saline solution. Withdraw 5 ml of drug from each of 20 vials and add to normal saline solution. Gently invert bag to mix solution.
▼ Inspect solution; discard if discolored, cloudy, or if particulate matter is present.
▼ Administer using infusion pump, in-line filter provided by manufacturer, and administration set containing polyvinyl chloride.
▼ Flush I.V. line with normal saline solution before and after each dose.
▼ Begin infusion within 12 hours of preparation; discard prepared solution after 24 hours.
▼ Begin dose 1 at 3.6 mg/hour (12 ml/hour) and dose 2 at 24 mg/hour (12 ml/hour) for 30 minutes; then, if no signs of toxicity, increase dose every 30 minutes to 25 ml/hour, 50 ml/hour, 100 ml/hour, and 200 ml/hour, respectively. For doses 3 through 12, begin infusion at 50 mg/hour (25 ml/hour). If no signs of toxicity, increase dose every 30 minutes to 50 ml/hour, 100 ml/hour, 200 ml/hour, and 400 ml/hour, respectively.
▼ **Incompatibilities:** Other I.V. medications.

## ACTION

Binds to normal and CLL B lymphocytes, causing cell lysis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 14 days.

## ADVERSE REACTIONS

**CNS:** *fatigue, fever,* headache, *insomnia.*
**CV:** hypertension, hypotension, peripheral edema, tachycardia.
**EENT:** nasopharyngitis, sinusitis.
**GI:** *diarrhea, nausea.*
**Hematologic:** *anemia,* **NEUTROPENIA,** ***thrombocytopenia.***
**Hepatic:** **HEPATITIS B REACTIVATION.**
**Musculoskeletal:** back pain, muscle spasm.
**Respiratory:** *bronchitis, cough, dyspnea, pneumonia, upper respiratory tract infection.*
**Skin:** hyperhidrosis, *rash,* urticaria.
**Other:** chills, herpes zoster infection, *infusion reactions,* ***sepsis.***

## INTERACTIONS

None reported.

## EFFECTS ON LAB TEST RESULTS

● May decrease neutrophil and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

● Use cautiously in patients with history of COPD, serious infusion reaction, neutropenia, thrombocytopenia, or hepatitis B.
● Live-virus vaccines are contraindicated during and following treatment.
● Use in pregnancy only if benefit outweighs risk to fetus.
● It isn't known if drug appears in breast milk. Because of the risk of adverse effects,

women shouldn't breast-feed while taking drug.
• Safety and efficacy in children haven't been established.

## NURSING CONSIDERATIONS

***Alert:*** Don't administer live-virus vaccines during or following treatment.
• Drug has been associated with small-intestine obstruction; perform a diagnostic evaluation if suspected.
***Alert:*** Monitor neurologic status closely for signs and symptoms of progressive multifocal leukoencephalopathy, a potentially fatal condition. Discontinue drug and consult neurologist if condition is suspected.
***Alert:*** Drug may cause serious infusion reactions (bronchospasm, dyspnea, laryngeal edema, pulmonary edema, flushing, hypertension, hypotension, syncope, cardiac ischemia, MI, back pain, abdominal pain, fever, rash, urticaria, and angioedema); monitor patient closely. Discontinue infusion and institute symptomatic treatment if reactions occur.
• Monitor patients with history of hepatitis B for signs and symptoms of active infection. Discontinue drug and administer appropriate treatment if active infection is suspected.
• Monitor CBC regularly during therapy; increase frequency of monitoring if Grade 3 or 4 cytopenias develop.

## PATIENT TEACHING

• Instruct patient to watch for signs and symptoms of infection (fever, sore throat, fatigue) and bleeding (easy bruising, pallor, petechiae, nosebleeds, bleeding gums, worsening weakness, tarry stools) and to report them to his prescriber.
• Teach the patient to take his temperature daily and to report any elevation to his prescriber.
• Advise patient to report signs and symptoms of infusion reactions, including fever, chills, rash, or breathing problems within 24 hours of infusion.
• Tell patient to report signs and symptoms of hepatitis, including worsening fatigue and yellowing of skin or eyes.
• Advise patient to report new or worsening abdominal pain or nausea or new neurologic symptoms, such as dizziness, confusion, loss of balance, difficulty talking or walking, and vision problems.
• Warn patient to avoid live-virus vaccines during and after treatment.
• Inform patient that periodic blood testing will be necessary during therapy.
• Caution woman of childbearing age to avoid becoming pregnant and to use effective contraception during therapy. Advise her to consult prescriber before becoming pregnant.

# ofloxacin (ophthalmic)

oh-FLOX-a-sin

Ocuflox

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Fluoroquinolone
*Pregnancy risk category C*

## AVAILABLE FORMS

*Ophthalmic solution:* 0.3%

## INDICATIONS & DOSAGES

➤ **Conjunctivitis caused by *Staphylococcus aureus, S. epidermidis, Streptococcus pneumoniae, Enterobacter cloacae, Haemophilus influenzae, Proteus mirabilis,* and *Pseudomonas aeruginosa***
*Adults and children older than age 1:* Give 1 or 2 drops in conjunctival sac every 2 to 4 hours daily while patient is awake, for first 2 days; then q.i.d. for up to 5 additional days.
➤ **Bacterial corneal ulcer caused by *S. aureus, S. epidermidis, S. pneumoniae, P. aeruginosa, Serratia marcescens,* and *Propionibacterium acnes***
*Adults and children older than age 1:* Give 1 or 2 drops every 30 minutes while patient is awake and 1 or 2 drops 4 and 6 hours after patient goes to bed on days 1 and 2. On day 3, 1 or 2 drops hourly while patient is awake; continue for 4 to 6 days. Then, 1 or 2 drops q.i.d. for an additional 3 days or until cured.

## ADMINISTRATION

**Ophthalmic**
• Apply light finger pressure on lacrimal sac for 1 minute after drug instillation.

## ACTION

Inhibits bacterial DNA gyrase, an enzyme needed for bacterial replication.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Unknown | Unknown | Unknown |

*Half-life:* 4 to 8 hours.

## ADVERSE REACTIONS

**EENT:** *transient ocular burning or discomfort,* chemical conjunctivitis or keratitis, eye dryness, eye pain, itching, lacrimation, periocular or facial edema, photophobia, redness, stinging.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other fluoroquinolones and in breast-feeding women.

## NURSING CONSIDERATIONS

- Stop drug if improvement doesn't occur within 7 days. Prolonged use may result in overgrowth of nonsusceptible organisms, including fungi.
- Solution isn't for injection into conjunctiva or anterior chamber of the eye.
- ***Look alike–sound alike:*** Don't confuse Ocuflox with Ocufen.

## PATIENT TEACHING

- If an allergic reaction occurs, tell patient to stop drug and notify prescriber. Serious acute hypersensitivity reactions may need emergency treatment.
- Tell patient to clean excessive discharge from eye area before application.
- Teach patient how to instill drops. Advise him to wash hands before and after instilling solution, and warn him not to touch tip of dropper to eye or surrounding tissue.
- Advise patient to apply light finger pressure on lacrimal sac for 1 minute after drug instillation.
- Tell patient not to share drug, washcloths, or towels with family members and to notify prescriber if anyone develops same signs or symptoms.
- Stress importance of compliance with recommended therapy.
- Warn patient not to use leftover drug for new eye infection.
- Remind patient to discard drug when it's no longer needed.

# ofloxacin (oral)

oh-FLOX-a-sin

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Fluoroquinolone
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 200 mg, 300 mg, 400 mg

## INDICATIONS & DOSAGES

➤ **Acute bacterial worsening of chronic bronchitis, uncomplicated skin and skin-structure infections, and community-acquired pneumonia**

*Adults:* 400 mg P.O. every 12 hours for 10 days.

➤ **Sexually transmitted infections, such as acute uncomplicated urethral and cervical gonorrhea, nongonococcal urethritis and cervicitis, and mixed infections of urethra and cervix**

*Adults:* For acute uncomplicated gonorrhea, 400 mg P.O. once as a single dose; for cervicitis and urethritis, 300 mg P.O. every 12 hours for 7 days.

➤ **Cystitis from *Escherichia coli, Klebsiella pneumoniae,* or other organisms**

*Adults:* 200 mg P.O. every 12 hours for 3 days (*E. coli* or *K. pneumoniae*), 200 mg P.O. every 12 hours for 7 days (other organisms).

➤ **Complicated UTI**

*Adults:* 200 mg P.O. every 12 hours for 10 days.

➤ **Prostatitis from *E. coli***

*Adults:* 300 mg P.O. every 12 hours for 6 weeks.

➤ **Pelvic inflammatory disease**

*Adults:* 400 mg P.O. every 12 hours with metronidazole for 10 to 14 days.

➤ **Moderate to severe traveler's diarrhea ♦**
*Adults:* 200 mg P.O. b.i.d. for 3 days.
***Adjust-a-dose:*** For patients with creatinine clearance less than 20 ml/minute, give first dose as recommended; then give subsequent doses at 50% of recommended dose every 24 hours. For patients with hepatic impairment, don't exceed 400 mg/day.

## ADMINISTRATION

**P.O.**
- Give drug without regard for meals but not at the same time as antacids and vitamins.
- Give drug with plenty of fluids.

## ACTION

Interferes with DNA gyrase, which is needed for synthesis of bacterial DNA. Spectrum of action includes many gram-positive and gram-negative aerobic bacteria, including *Enterobacteriaceae* and *Pseudomonas aeruginosa*.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 15–120 min | Unknown |

*Half-life:* 4 to 7½ hours.

## ADVERSE REACTIONS

**CNS:** ***seizures, increased intracranial pressure,*** dizziness, drowsiness, fatigue, fever, headache, insomnia, lethargy, malaise, nervousness, sleep disorders, visual disturbances.
**CV:** chest pain, phlebitis.
**GI:** *nausea,* ***pseudomembranous colitis,*** abdominal pain or discomfort, anorexia, constipation, diarrhea, dry mouth, dysgeusia, flatulence, vomiting.
**GU:** external genital pruritus in women, glycosuria, hematuria, proteinuria, vaginal discharge, vaginitis.
**Hematologic:** ***leukopenia, neutropenia,*** anemia, eosinophilia, leukocytosis.
**Metabolic:** ***hypoglycemia,*** hyperglycemia.
**Musculoskeletal:** body pain, tendon rupture.
**Skin:** photosensitivity, pruritus, rash.
**Other:** ***anaphylactoid reaction,*** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Aluminum hydroxide, aluminum–magnesium hydroxide, calcium carbonate, magnesium hydroxide:* May decrease effects of ofloxacin. Give antacid at least 6 hours before or 2 hours after ofloxacin.
*Antidiabetics:* May affect glucose level, causing hypoglycemia or hyperglycemia. Monitor patient closely.
*Didanosine (chewable or buffered tablets or pediatric powder for oral solution):* May interfere with GI absorption of ofloxacin. Separate doses by 2 hours.
*Hypoglycemic agents (oral), insulin:* Increases hypoglycemic action. Use cautiously.
*Iron salts:* May decrease absorption of ofloxacin, reducing anti-infective response. Separate doses by at least 2 hours.
**Black Box Warning** *Steroids:* May increase risk of tendinitis and tendon rupture. Monitor patient for tendon pain or inflammation. ■
*Sucralfate:* May decrease absorption of ofloxacin, reducing anti-infective response. If use together can't be avoided, separate doses by at least 6 hours.
*Theophylline:* May increase theophylline level. Monitor patient closely and adjust theophylline dosage as needed.
*Warfarin:* May prolong PT and INR. Monitor PT and INR.
**Drug-lifestyle.** *Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN, creatinine, and liver enzyme levels. May decrease hemoglobin level and hematocrit. May increase or decrease glucose level.
- May increase erythrocyte sedimentation rate and eosinophil count. May decrease neutrophil count. May increase or decrease WBC count.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Drug is associated with increased risk of tendinitis and tendon rupture, especially in patients older than 60 and those with heart, kidney, or lung transplants. ■
- Contraindicated in patients hypersensitive to drug or other fluoroquinolones.

• Use cautiously in pregnant patients and in those with seizure disorders, CNS diseases, such as cerebral arteriosclerosis, hepatic disorders, or renal impairment.
• Ofloxacin appears in breast milk in levels similar to those found in plasma. Safety hasn't been established in breast-feeding or pregnant women.
• Safety and efficacy in children younger than age 18 haven't been established.
***Overdose S&S:*** Nausea, vomiting, seizures, vertigo, dysgeusia, psychosis, dizziness, drowsiness, hot and cold flushes, facial swelling and numbness, slurred speech, mild to moderate disorientation.

## NURSING CONSIDERATIONS

**Black Box Warning** Rupture of tendons is linked to fluoroquinolone use. If pain, inflammation, or tendon rupture occurs, stop drug and notify prescriber. ■
***Alert:*** Patients treated for gonorrhea should be tested for syphilis. Drug isn't effective against syphilis, and treating gonorrhea may mask or delay syphilis symptoms.
• Periodically assess organ system functions during prolonged therapy.
• Monitor patient for overgrowth of nonsusceptible organisms.
• Monitor renal and hepatic studies and CBC in prolonged therapy.
• Monitor blood sugar closely.
• Monitor patient for adverse CNS effects, including dizziness, headache, seizures, or depression. Stop drug and notify prescriber if these effects occur.
• Monitor patient for hypersensitivity reactions. Stop drug and initiate supportive therapy, as indicated.

## PATIENT TEACHING

• Tell patient to drink plenty of fluids during drug therapy and to finish the entire prescription, even if he starts feeling better.
• Tell patient drug may be taken without regard to meals, but he shouldn't take antacids and vitamins at the same time as ofloxacin.
• Warn patient that dizziness and lightheadedness may occur. Advise caution when driving or operating hazardous machinery until effects of drug are known.
• Warn patient that hypersensitivity reactions may follow first dose; he should stop drug at first sign of rash or other allergic reaction and call prescriber immediately.
• Advise patient to avoid prolonged exposure to direct sunlight and to use a sunscreen when outdoors.

# olanzapine

oh-LAN-za-peen

Zyprexa🖋, Zyprexa Zydis

# olanzapine pamoate

Zyprexa Relprevv

*Therapeutic class:* Antipsychotic
*Pharmacologic class:* Dibenzapine derivative
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 10 mg
*Injection (extended-release):* 210-mg base/vial, 300-mg base/vial, 405-mg base/vial
*Tablets:* 2.5 mg, 5 mg, 7.5 mg, 10 mg, 15 mg, 20 mg
*Tablets (orally disintegrating):* 5 mg, 10 mg, 15 mg, 20 mg

## INDICATIONS & DOSAGES

➤ **Schizophrenia**
*Adults:* Initially, 5 to 10 mg P.O. once daily with the goal to be at 10 mg daily within several days of starting therapy. Adjust dose in 5-mg increments at intervals of 1 week or more. Most patients respond to 10 to 15 mg daily. Safety of dosages greater than 20 mg daily hasn't been established. Or, 150 to 300 mg (extended-release) I.M. every 2 weeks or 405 mg (extended-release) I.M. every 4 weeks.

➤ **Short-term treatment of acute manic episodes linked to bipolar I disorder**
*Adults:* Initially, 10 to 15 mg P.O. daily. Adjust dosage as needed in 5-mg daily increments at intervals of 24 hours or more. Maximum, 20 mg P.O. daily. Duration of treatment is 3 to 4 weeks.

➤ **Short-term treatment, with lithium or valproate, of acute mixed or manic episodes linked to bipolar I disorder**

*Adults:* 10 mg P.O. once daily. Dosage range is 5 to 20 mg daily. Duration of treatment is 6 weeks.

➤ **Long-term treatment of bipolar I disorder**

*Adults:* 5 to 20 mg P.O. daily.

***Adjust-a-dose:*** In elderly or debilitated patients, those predisposed to hypotensive reactions, patients who may metabolize olanzapine more slowly than usual (non-smoking women older than age 65) or may be more pharmacodynamically sensitive to olanzapine, initially, 5 mg P.O. Increase dose cautiously.

➤ **Agitation caused by schizophrenia and bipolar I mania**

*Adults:* 10 mg I.M. (short-acting) (range 2.5 to 10 mg). Subsequent doses of up to 10 mg may be given 2 hours after the first dose or 4 hours after the second dose, up to 30 mg I.M. daily. If maintenance therapy is required, convert patient to 5 to 20 mg P.O. daily.

***Adjust-a-dose:*** In elderly patients, give 5 mg I.M. In debilitated patients, in those predisposed to hypotension, and in patients sensitive to effects of drug, give 2.5 mg I.M.

➤ **Depressive episodes associated with bipolar I disorder**

*Adults:* 5 mg P.O. with fluoxetine 20 mg P.O. once daily in the evening. Dosage adjustments can be made based on efficacy and tolerability within ranges of olanzapine 5 to 12.5 mg and fluoxetine 20 to 50 mg.

➤ **Treatment-resistant depression**

*Adults:* 5 mg P.O. with 20 mg fluoxetine P.O. once daily in the evening. Dosage adjustments can be made based on efficacy and tolerability within ranges of olanzapine 5 to 20 mg and fluoxetine 20 to 50 mg.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.
- Don't crush or break orally disintegrating tablet (ODT).
- Place immediately on patient's tongue after opening package.
- ODT may be given without water.

**I.M.**

- Inspect I.M. solution for particulate matter and discoloration before administration.
- To reconstitute I.M. injection, dissolve contents of one vial with 2.1 ml of sterile water for injection to yield a clear yellow 5 mg/ml solution. Store at room temperature and give within 1 hour of reconstitution. Discard any unused solution.
- Olanzapine extended-release formula is intended for deep gluteal I.M. injection only.

## ACTION

May block dopamine and 5-$HT_2$ receptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 6 hr | Unknown |
| I.M. | Rapid | 15–45 min | Unknown |
| I.M. (extended release) | Unknown | 6 hr | Months |

*Half-life:* 21 to 54 hours; 30 days (extended release).

## ADVERSE REACTIONS

**CNS:** *somnolence, insomnia, parkinsonism, dizziness,* ***neuroleptic malignant syndrome, suicide attempt,*** abnormal gait, asthenia, personality disorder, akathisia, tremor, articulation impairment, tardive dyskinesia, fever, extrapyramidal events (I.M.).

**CV:** orthostatic hypotension, tachycardia, chest pain, hypertension, ecchymosis, peripheral edema, hypotension (I.M.).

**EENT:** amblyopia, rhinitis, pharyngitis, conjunctivitis.

**GI:** *constipation, dry mouth, dyspepsia,* increased appetite, increased salivation, vomiting, thirst.

**GU:** hematuria, metrorrhagia, urinary incontinence, UTI, amenorrhea, vaginitis.

**Hematologic:** ***leukopenia.***

**Metabolic:** *hyperglycemia,* weight gain.

**Musculoskeletal:** joint pain, extremity pain, back pain, neck rigidity, twitching, hypertonia.

**Respiratory:** increased cough, dyspnea.

**Skin:** sweating, injection site pain (I.M.).

**Other:** flulike syndrome, injury.

## INTERACTIONS

**Drug-drug.** *Antihypertensives:* May potentiate hypotensive effects. Monitor blood pressure closely.

*Carbamazepine, omeprazole, rifampin:* May increase clearance of olanzapine. Monitor patient.

*Ciprofloxacin:* May increase olanzapine level. Monitor patient for increased adverse effects.
*Diazepam:* May increase CNS effects. Monitor patient.
*Dopamine agonists, levodopa:* May cause antagonized activity of these drugs. Monitor patient.
*Fluoxetine:* May increase olanzapine level. Use together cautiously.
*Fluvoxamine:* May increase olanzapine level. May need to reduce olanzapine dose.
**Drug-herb.** *St. John's wort:* May decrease drug level. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May increase CNS effects. Discourage use together.
*Smoking:* May increase drug clearance. Urge patient to quit smoking.

## EFFECTS ON LAB TEST RESULTS

- May increase AST, ALT, GGT, CK, triglyceride, and prolactin levels.
- May increase eosinophil count. May decrease WBC count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.

**Black Box Warning** Sedation (including coma) or delirium have been reported following injections of danzapine extended-release formula. This drug must be administered in a registered health care facility with ready access to emergency response services. After each injection, patient must be observed at the health care facility by a health care provider for at least 3 hours. Olanzapine extended-release is available only through the restricted Zyprexa Relprevv Patient Care Program. ■

- Use cautiously in patients with heart disease, cerebrovascular disease, conditions that predispose patient to hypotension, history of seizures or conditions that might lower the seizure threshold, and hepatic impairment.
- Use cautiously in elderly patients, those with a history of paralytic ileus, and those at risk for aspiration pneumonia, prostatic hyperplasia, or angle-closure glaucoma.

***Overdose S&S:*** Agitation, aggressiveness, dysarthria, tachycardia, extrapyramidal symptoms, reduced level of consciousness, aspiration, cardiopulmonary arrest, cardiac arrhythmias, delirium, neuroleptic malignant syndrome, respiratory depression or arrest, seizures, hypertension, hypotension.

## NURSING CONSIDERATIONS

- ODTs contain phenylalanine.
- Monitor patient for abnormal body temperature regulation, especially if he exercises, is exposed to extreme heat, takes anticholinergics, or is dehydrated.
- Obtain baseline and periodic liver function test results.
- Monitor patient for weight gain.

***Alert:*** Watch for evidence of neuroleptic malignant syndrome (hyperpyrexia, muscle rigidity, altered mental status, autonomic instability), which is rare but commonly fatal. Stop drug immediately; monitor and treat patient as needed.

***Alert:*** Drug may cause hyperglycemia. Monitor patients with diabetes regularly. In patients with risk factors for diabetes, obtain fasting blood glucose test results at baseline and periodically.

***Alert:*** Monitor patient for symptoms of metabolic syndrome (significant weight gain and increased body mass index, hypertension, hyperglycemia, hypercholesterolemia, and hypertriglyceridemia).

- Monitor patient for mental status changes, sedation, coma, or delirium.
- Monitor patient for tardive dyskinesia, which may occur after prolonged use. It may not appear until months or years later and may disappear spontaneously or persist for life, despite stopping drug.
- Periodically reevaluate the long-term usefulness of olanzapine.

**Black Box Warning** Drug may increase risk of cardiovascular or infection-related death in elderly patients with dementia. Olanzapine isn't approved to treat patients with dementia-related psychosis. ■

- A patient who feels dizzy or drowsy after an I.M. injection should remain recumbent until he can be assessed for orthostatic hypotension and bradycardia. He should rest until the feeling passes.

***Alert:*** Drug may increase the risk of suicidal thinking and behavior in young adults ages 18 to 24 during the first 2 months of treatment.

0

● ***Look alike–sound alike:*** Don't confuse olanzapine with olsalazine or Zyprexa with Zyrtec.

### PATIENT TEACHING

● Warn patient to avoid hazardous tasks until full effects of drug are known.
● Warn patient against exposure to extreme heat; drug may impair body's ability to reduce temperature.
● Inform patient that he may gain weight.
● Advise patient to avoid alcohol.
● Tell patient to rise slowly to avoid dizziness upon standing up quickly.
● Inform patient that ODTs contain phenylalanine.
● Tell patient to peel foil away from ODT, not to push tablet through. Have patient take tablet immediately, allowing tablet to dissolve on tongue and be swallowed with saliva; no additional fluid is needed.
● Tell patient to take drug with or without food.
● Urge woman of childbearing age to notify prescriber if she becomes pregnant or plans or suspects pregnancy. Tell her not to breast-feed during therapy.

## olmesartan medoxomil

ol-ma-SAR-tan

Benicar

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Angiotensin II receptor antagonist
*Pregnancy risk category C; D in 2nd and 3rd trimesters*

### AVAILABLE FORMS

*Tablets:* 5 mg, 20 mg, 40 mg

### INDICATIONS & DOSAGES

✶ ***NEW INDICATION:*** **Pediatric hypertension**
*Children ages 6 to 16:* For children weighing 35 kg (77 lb) or more, initially, 20 mg P.O. daily, with maintenance dosage of 20 to 40 mg daily. For children weighing 20 to less than 35 kg (44 to less than 77 lb), initially, 10 mg P.O. daily, with maintenance dosage of 10 to 20 mg daily.

➤ **Hypertension**
*Adults:* 20 mg P.O. once daily if patient has no volume depletion. May increase dosage to 40 mg P.O. once daily if blood pressure isn't reduced after 2 weeks of therapy.
***Adjust-a-dose:*** In patients with possible depletion of intravascular volume (those with impaired renal function who are taking diuretics), consider using lower starting dose.

### ADMINISTRATION

**P.O.**
● Give drug without regard for food.
● Drug may be made into suspension by pharmacist if patient is unable to swallow pills.
● Refrigerate suspension, which may be stored for up to 4 weeks.
● Shake suspension well before use.

### ACTION

Blocks vasoconstrictor and aldosterone-secreting effects of angiotensin II by selectively blocking the binding of angiotensin II to the angiotensin I, or $AT_1$, receptor in the vascular smooth muscle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 1–2 hr | 24 hr |

*Half-life:* 13 hours.

### ADVERSE REACTIONS

**CNS:** headache.
**EENT:** pharyngitis, rhinitis, sinusitis.
**GI:** diarrhea.
**GU:** hematuria.
**Metabolic:** hyperglycemia, hypertriglyceridemia.
**Musculoskeletal:** back pain.
**Respiratory:** bronchitis, upper respiratory tract infection.
**Other:** flulike symptoms, accidental injury.

### INTERACTIONS

**Drug-herb.** *Ma huang:* May decrease antihypertensive effects. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

● May increase glucose, triglyceride, uric acid, liver enzyme, bilirubin, and CK levels. May decrease hemoglobin level and hematocrit.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to the drug or any of its components and in patients who are pregnant.

**Black Box Warning** Drug may cause fetal and neonatal complications and death when given to pregnant women after the first trimester. If patient taking drug becomes pregnant, stop drug immediately. ■

- Use cautiously in patients who are volume- or sodium-depleted, those whose renal function depends on the renin-angiotensin-aldosterone system (such as patients with severe heart failure), and those with unilateral and bilateral renal artery stenosis.
- It's unknown if drug appears in breast milk. Patient should stop either breast-feeding or using drug.
- Safety and efficacy in children haven't been established.

⚠ ***Overdose S&S:*** Hypotension, tachycardia, bradycardia.

## NURSING CONSIDERATIONS

- Symptomatic hypotension may occur in patients who are volume- or sodium-depleted, especially those being treated with high doses of a diuretic. If hypotension occurs, place patient supine and treat supportively. Treatment may continue once blood pressure is stabilized.
- If blood pressure isn't adequately controlled, a diuretic or other antihypertensive drugs also may be prescribed.
- Overdose may cause hypotension and tachycardia, along with bradycardia from parasympathetic (vagal) stimulation. Treatment should be supportive.
- Closely monitor patients with heart failure for oliguria, azotemia, and acute renal failure.
- Monitor BUN and creatinine level in patients with unilateral or bilateral renal artery stenosis.
- Although ACE inhibitors reduce blood pressure in all races, they reduce it less in blacks taking the ACE inhibitor alone. Black patients may have a more favorable response if drug is taken with a thiazide diuretic.

## PATIENT TEACHING

- Tell patient to take drug exactly as prescribed and not to stop taking it, even if he feels better.
- Tell patient to take drug without regard to meals.
- Tell patient to report to health care provider any adverse reactions promptly, especially light-headedness and fainting.
- Advise women of childbearing age of the consequences of second and third trimester exposure to drug and to immediately report pregnancy to health care provider.
- Inform diabetic patients that glucose readings may rise and that the dosage of their diabetes drugs may need adjustment.
- Warn patients that inadequate fluid intake, excessive perspiration, diarrhea, or vomiting may lead to an excessive drop in blood pressure, light-headedness, and possibly fainting.
- Instruct patients that other antihypertensives can have additive effects. Patient should inform his prescriber of all medications he's taking, including OTC drugs.

# olopatadine hydrochloride

oh-loh-PAT-ah-dine

Patanase

*Therapeutic class:* Antihistamine
*Pharmacologic class:* Histamine$_1$-receptor antagonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Nasal spray:* 665 mcg/100 ml

## INDICATIONS & DOSAGES

➤ **Seasonal allergic rhinitis**

*Adults and children age 12 and older:* 2 sprays into each nostril b.i.d.
*Children ages 6 to 11:* 1 spray into each nostril b.i.d.

## ADMINISTRATION

**Intranasal**

- Prime before use by releasing 5 sprays or until a fine mist appears.
- Reprime with 2 sprays when not used for more than 7 days.

## ACTION

Selectively antagonizes $H_1$-receptor activity.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Intranasal | Rapid | ¼–2 hr | Unknown |

*Half-life:* 8 to 12 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, fatigue, headache, malaise, somnolence.
**EENT:** nasal septum perforation, epistaxis, pharyngolaryngeal pain, postnasal drip, nasopharyngitis, throat irritation.
**GI:** *bitter taste*, dry mouth, thirst, abdominal pain, diarrhea, nausea.
**GU:** UTI, occult blood in urine.
**Respiratory:** cough, influenza.

## INTERACTIONS

**Drug-drug.** *CNS depressants:* May cause additive sedative effects. Use together cautiously.
**Drug-lifestyle.** *Alcohol:* May increase CNS depression. Discourage using together.

## EFFECTS ON LAB TEST RESULTS

- May increase CPK levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.

***Overdose S&S:*** Drowsiness (in adults), agitation and restlessness followed by drowsiness (in children).

## NURSING CONSIDERATIONS

- Monitor nasal passages for ulceration before and during therapy.
- Monitor for somnolence.
- Give drug only if benefit to mother outweighs risk to fetus.
- Appearance of drug in breast milk isn't known. Use only if benefits to mother outweigh risk to child.
- Safety and efficacy haven't been established in children under age 12.
- Use cautiously in elderly patients because they may have impaired liver, renal, or cardiac function.

## PATIENT TEACHING

- Advise patient or parent to read package instructions for drug use.
- Tell patient to prime the spray before initial use, and again when spray hasn't been used for more than 7 days.
- Caution patient to avoid hazardous activities until drug effects are known.
- Tell patient to notify prescriber if epistaxis or nasal ulcerations occur.
- Warn patient to avoid spraying drug into eyes.
- Advise patient to avoid alcohol use while taking drug.

# olsalazine sodium

ol-SAL-uh-zeen

Dipentum

*Therapeutic class:* Anti-inflammatory
*Pharmacologic class:* Salicylate
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 250 mg

## INDICATIONS & DOSAGES

➤ **Maintenance of remission of ulcerative colitis in patients intolerant of sulfasalazine**

*Adults:* 500 mg P.O. b.i.d. with meals.

## ADMINISTRATION

**P.O.**

- Give drug with food.

## ACTION

Unknown. After oral use, converts to 5-aminosalicylic acid (5-ASA or mesalamine) in the colon, where it has local anti-inflammatory effect.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Unknown |

*Half-life:* About 1 hour.

## ADVERSE REACTIONS

**CNS:** headache, depression, vertigo, dizziness, fatigue.
**GI:** *diarrhea*, nausea, *abdominal pain*, dyspepsia, bloating, anorexia.
**Musculoskeletal:** arthralgia.
**Skin:** rash, itching.

## INTERACTIONS

**Drug-drug.** *Anticoagulants:* May prolong PT or INR. Monitor bleeding study results.
**Drug-food.** *Any food:* May decrease GI irritation. Advise patient to take drug with food.

## EFFECTS ON LAB TEST RESULTS

• May increase ALT and AST levels.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to salicylates.
• Use cautiously in patients with asthma, hepatic impairment, and renal disease.

## NURSING CONSIDERATIONS

• Regularly monitor BUN and creatinine levels and urinalysis in patients with renal disease.
• Monitor liver enzyme levels in patients with hepatic impairment.
• Absorption of drug or its metabolites may cause renal tubular damage.
• Diarrhea sometimes occurs during therapy. Although diarrhea appears to be dose-related, it's difficult to distinguish from worsening of disease symptoms.
• Similar drugs have caused worsening of disease.
• ***Look alike–sound alike:*** Don't confuse olsalazine with olanzapine.

## PATIENT TEACHING

• Teach patient to take drug in evenly divided doses and with food to minimize adverse GI reactions.
• Instruct patient to report persistent or severe adverse reactions promptly.

# omalizumab

oh-mah-LIZ-uh-mab

Xolair

*Therapeutic class:* Antiasthmatic
*Pharmacologic class:* DNA-derived humanized immunoglobulin monoclonal antibody
*Pregnancy risk category B*

## AVAILABLE FORMS

*Powder for injection:* 150 mg in 5-ml vial

## INDICATIONS & DOSAGES

➤ **Moderate to severe persistent asthma in patients with positive skin test or in vitro reactivity to a perennial aeroallergen and whose symptoms aren't adequately controlled by inhaled corticosteroids**

*Adults and adolescents age 12 and older:* 150 to 375 mg subcutaneously every 2 or 4 weeks. Dose and frequency vary with pretreatment immunoglobulin E (IgE) level (international units/ml) and patient weight. Divide doses larger than 150 mg among more than one injection site.

## ADMINISTRATION

**Subcutaneous**

• Reconstitute with sterile water for injection only. Swirl gently, don't shake. Use 18 g needle to draw medication into syringe, then replace with a 25 g needle for administration.
• The lyophilized product takes 15 to 20 minutes to dissolve.
• The fully reconstituted product will appear clear or slightly opalescent and may have a few small bubbles or foam around the edge of the vial.
• Because the solution is slightly viscous, it may take 5 to 10 seconds to give.
• Use reconstituted solution within 4 hours if at room temperature or within 8 hours if refrigerated.

## ACTION

Inhibits binding of IgE to high-affinity receptor, on surface of mast cells and basophils, which limits release of allergic response mediators.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 7–8 days | Unknown |

*Half-life:* About 26 days.

## ADVERSE REACTIONS

**CNS:** *headache*, dizziness, fatigue, pain.
**EENT:** *pharyngitis*, *sinusitis*, earache.
**Musculoskeletal:** arm pain, arthralgia, fracture, leg pain.
**Respiratory:** *upper respiratory tract infection.*

**Skin:** *injection site reaction,* dermatitis, pruritus.
**Other:** *viral infections.*

## INTERACTIONS
None reported.

## EFFECTS ON LAB TEST RESULTS
- May increase IgE level.

## CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients severely hypersensitive to drug.
- Safety and effectiveness haven't been established in children younger than age 12.
- Drug should be given only in a health care setting under direct medical supervision because of the risk of anaphylaxis.

## NURSING CONSIDERATIONS
***Alert:*** Don't use this drug to treat acute bronchospasm or status asthmaticus.
- Don't abruptly stop systemic or inhaled corticosteroid when omalizumab therapy starts; taper the dose gradually and under supervision.
- Injection site reactions may occur, such as bruising, redness, warmth, burning, stinging, itching, hives, pain, induration, and inflammation. Most occur within 1 hour after the injection, last fewer than 8 days, and decrease in frequency with subsequent injections.

**Black Box Warning** Observe patient for at least 2 hours after the injection, and keep drugs available to respond to anaphylactic reactions. These reactions usually occur within 2 hours of subcutaneous injection; however, delayed reactions may occur up to 24 hours after administration. If the patient has a severe hypersensitivity reaction, stop treatment. ■

- Drug increases IgE level, so it can't be used to determine appropriate dosage during therapy or for 1 year after therapy ends.
- Patient medication guide must be given with each dose.

## PATIENT TEACHING
- Tell patients not to stop or reduce the dosage of any other asthma drugs unless directed by the prescriber. Patient medication guide must be given with each dose.
- Explain that patient may not notice an immediate improvement in asthma after therapy starts.

# omega-3–acid ethyl esters
oh-may-gah-three-ASS-id

Lovaza, Omacor

*Therapeutic class:* Antilipemic
*Pharmacologic class:* Ethyl ester
*Pregnancy risk category C*

## AVAILABLE FORMS
*Capsules:* 1 g

## INDICATIONS & DOSAGES
➤ **Adjunct to diet to reduce triglyceride levels 500 mg/dl or higher**
*Adults:* 4 g P.O. once daily or divided as 2 g b.i.d.

## ADMINISTRATION
**P.O.**
- Give drug without regard for meals.
- Capsules must be swallowed whole. Do not extract contents of capsule.

## ACTION
May reduce hepatic formation of triglycerides because two components of drug are poor substrates for the necessary enzymes. These components also block formation of other fatty acids.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS
**CNS:** pain.
**CV:** angina pectoris.
**GI:** altered taste, belching, dyspepsia.
**Musculoskeletal:** back pain.
**Skin:** rash.
**Other:** flulike syndrome, infection.

## INTERACTIONS
**Drug-drug.** *Anticoagulants:* May prolong bleeding time. Monitor patient.

## EFFECTS ON LAB TEST RESULTS

• May increase ALT and LDL cholesterol levels.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components.
• Use cautiously in patients sensitive to fish.

## NURSING CONSIDERATIONS

• Assess patient for conditions that contribute to increased triglycerides, such as diabetes and hypothyroidism, before treatment.
• Evaluate patient's current drug regimen for any drugs known to sharply increase triglyceride levels, including estrogen therapy, thiazide diuretics, and beta blockers. Stopping these drugs, if appropriate, may negate the need for drug.
• Continue diet and lifestyle modifications during treatment.
• Obtain baseline triglyceride levels to confirm that they're consistently abnormal before therapy; then recheck periodically during treatment. If patient has an inadequate response after 2 months, stop drug.
• Monitor LDL level to make sure it doesn't increase excessively during treatment.
• ***Look alike–sound alike:*** Don't confuse Lovaza with lorazepam or lovastatin.

## PATIENT TEACHING

• Explain that taking drug doesn't reduce the importance of following the recommended diet and exercise plan.
• Remind patient of the need for follow-up blood work to evaluate progress.
• Advise patient to notify prescriber about bothersome side effects.
• Tell patient to report planned or suspected pregnancy.

# omeprazole

oh-ME-pray-zole

Losec†, Prilosec✐

# omeprazole magnesium

Prilosec OTC ◇

*Therapeutic class:* Antiulcer
*Pharmacologic class:* Proton pump inhibitor
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules (delayed-release):* 10 mg, 20 mg, 40 mg
*Powder for oral suspension:* 20 mg/packet, 40 mg/packet
*Tablets (delayed-release):* 20 mg ◇

## INDICATIONS & DOSAGES

➤ **Symptomatic gastroesophageal reflux disease (GERD) without esophageal lesions**

*Adults:* 20 mg P.O., as delayed-release or oral suspension, daily for 4 weeks for patients who respond poorly to customary medical treatment, usually including an adequate course of $H_2$-receptor antagonists.
*Children ages 2 to 16 weighing 20 kg (44 lb) or more:* 20 mg P.O. daily.
*Children ages 2 to 16 weighing less than 20 kg:* 10 mg P.O. daily.

➤ **Erosive esophagitis and accompanying symptoms caused by GERD**

*Adults:* 20 mg P.O. daily for 4 to 8 weeks.
*Children ages 2 to 16 weighing 20 kg or more:* 20 mg P.O. daily.
*Children ages 2 to 16 weighing less than 20 kg:* 10 mg P.O. daily.

➤ **Maintenance of healing erosive esophagitis**

*Adults:* 20 mg P.O., as delayed-release or oral suspension, daily.
*Children ages 2 to 16 weighing 20 kg or more:* 20 mg P.O. daily.
*Children ages 2 to 16 weighing less than 20 kg:* 10 mg P.O. daily.

➤ **Pathologic hypersecretory conditions (such as Zollinger-Ellison syndrome)**

*Adults:* Initially, 60 mg P.O. daily; adjust dosage based on patient response. If daily

dose exceeds 80 mg, give in divided doses. Doses up to 120 mg t.i.d. have been given. Continue therapy as long as clinically indicated.

➤ **Duodenal ulcer (short-term treatment)**
*Adults:* 20 mg P.O., as delayed-release or oral suspension, daily for 4 to 8 weeks.

➤ ***Helicobacter pylori* infection and duodenal ulcer disease, to eradicate *H. pylori* with clarithromycin (dual therapy)**
*Adults:* 40 mg P.O. every morning with clarithromycin 500 mg P.O. t.i.d. for 14 days. For patients with an ulcer at start of therapy, give another 14 days of omeprazole 20 mg P.O. once daily.

➤ ***H. pylori* infection and duodenal ulcer disease, to eradicate *H. pylori* with clarithromycin and amoxicillin (triple therapy)**
*Adults:* 20 mg P.O. with clarithromycin 500 mg P.O. and amoxicillin 1,000 mg P.O., each given b.i.d. for 10 days. For patients with an ulcer at start of therapy, give another 18 days of omeprazole 20 mg P.O. once daily.

➤ **Short-term treatment of active benign gastric ulcer**
*Adults:* 40 mg P.O. once daily for 4 to 8 weeks.

➤ **Frequent heartburn (2 or more days a week)**
*Adults:* 20 mg P.O. Prilosec OTC once daily before breakfast for 14 days. May repeat the 14-day course every 4 months.

## ADMINISTRATION

**P.O.**

- Don't crush tablets or capsules. Capsules may be opened for patients who have difficulty swallowing.
- Give drug at least 1 hour before meals.

## ACTION

Inhibits proton pump activity by binding to hydrogen-potassium adenosine triphosphatase, located at secretory surface of gastric parietal cells, to suppress gastric acid secretion.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 30 min–2 hr | <3 days |

*Half-life:* 30 to 60 minutes.

## ADVERSE REACTIONS

**CNS:** asthenia, dizziness, headache.
**GI:** abdominal pain, constipation, diarrhea, flatulence, nausea, vomiting.
**Musculoskeletal:** back pain.
**Respiratory:** cough, upper respiratory tract infection.
**Skin:** rash.

## INTERACTIONS

**Drug-drug.** *Ampicillin esters, azole antifungals (such as ketoconazole), iron derivatives:* May cause poor bioavailability of these drugs because they need a low gastric pH for optimal absorption. Avoid using together.
*Benzodiazepines, diazepam, fosphenytoin, phenytoin, warfarin:* May decrease hepatic clearance, possibly leading to increased levels of these drugs. Monitor drug levels.
*Cilostazol:* May increase cilostazol level. Reduce cilostazol dosage.
*Clopidogrel:* May decrease antiplatelet activity. Avoid use together.
*Salicylates:* Enteric-coated forms may dissolve faster, increasing risk of gastric adverse effects. Use together cautiously.
**Drug-herb.** *Ginkgo biloba:* May decrease therapeutic effects of drug. Discourage use together.
*Male fern:* May inactivate herb. Discourage use together.
*Pennyroyal:* May change rate at which herb's toxic metabolites form. Ask patient about the use of herb, and discourage use together.
*St. John's wort:* May increase risk of sun sensitivity. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.

***Alert:*** There may be an increased risk of hip, wrist, and spine fractures associated with proton pump inhibitors.

- Use cautiously in patients with Bartter syndrome, hypokalemia, and respiratory alkalosis and in patients on a low-sodium diet.

• Long-term administration of bicarbonate with calcium or milk can cause milk-alkali syndrome.
***Overdose S&S:*** Confusion, drowsiness, blurred vision, tachycardia, nausea, vomiting, diaphoresis, flushing, headache, dry mouth.

## NURSING CONSIDERATIONS

• Dosage adjustments may be necessary in Asians and patients with hepatic impairment.
***Alert:*** Amoxicillin may trigger anaphylaxis in patients with a history of penicillin hypersensitivity.
• Drug increases its own bioavailability with repeated doses. Drug is unstable in gastric acid; less drug is lost to hydrolysis because drug increases gastric pH.
• Gastrin level rises in most patients during the first 2 weeks of therapy.
• ***Look alike–sound alike:*** Don't confuse Prilosec with Prozac, Prilocaine, or Prinivil.

## PATIENT TEACHING

• Tell patient to swallow tablets whole and not to open, crush, or chew them.
• Instruct patient to take drug at least 1 hour before meals.
• Caution patient to avoid hazardous activities if he gets dizzy.
• Advise patient that Prilosec OTC isn't intended to treat infrequent heartburn (one episode of heartburn a week or less), or for those who want immediate relief of heartburn.
• Inform patient that Prilosec OTC may take 1 to 4 days for full effect, although some patients may get complete relief of symptoms within 24 hours.

# ondansetron

Zuplenz

# ondansetron hydrochloride

on-DAN-sah-tron

Zofran, Zofran ODT

*Therapeutic class:* Antiemetic
*Pharmacologic class:* Selective serotonin ($5\text{-}HT_3$) receptor antagonist
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 2 mg/ml
*Oral solution:* 4 mg/5 ml
*Orally disintegrating tablets (ODTs):* 4 mg, 8 mg
*Oral soluble film:* 4 mg, 8 mg
*Premixed injection:* 32 mg/50 ml
*Tablets:* 4 mg, 8 mg, 24 mg

## INDICATIONS & DOSAGES

➤ **To prevent nausea and vomiting from highly emetogenic chemotherapy**
*Adults:* 24 mg P.O. 30 minutes before chemotherapy. Or, three successive 8-mg doses of oral soluble film given 30 minutes before start of single-day highly emetogenic chemotherapy.
*Children age 6 months to 18 years:* 0.15 mg/kg I.V. over 15 minutes beginning 30 minutes before chemotherapy. Give second dose of 0.15 mg/kg I.V. over 15 minutes 4 hours after first dose. Give third 0.15-mg/kg I.V. dose 8 hours after first dose.
➤ **To prevent nausea and vomiting from moderately emetogenic chemotherapy**
*Adults and children age 12 and older:* 8 mg P.O. 30 minutes before chemotherapy. Then, 8 mg P.O. 8 hours after first dose. Then, 8 mg every 12 hours for 1 to 2 days. Or, a single dose of 32 mg by I.V. infusion over 15 minutes beginning 30 minutes before chemotherapy. Or, three doses of 0.15 mg/kg I.V. For 3 dose regimen, give first dose 30 minutes before chemotherapy and subsequent doses 4 and 8 hours after first dose. Infuse drug over 15 minutes. Or, 8 mg oral soluble film 30 minutes before chemotherapy, followed by 8 mg oral soluble film 8 hours after first dose. Then give

8 mg oral soluble film every 12 hours for 1 to 2 days after completing chemotherapy.
*Children ages 4 to 11:* 4 mg P.O. or oral soluble film 30 minutes before chemotherapy. Then, 4 mg P.O. 4 and 8 hours after first dose. Then, 4 mg every 8 hours for 1 to 2 days.
*Infants and children ages 6 months to 11 years:* Three doses of 0.15 mg/kg I.V. Give first dose 30 minutes before chemotherapy; give subsequent doses 4 and 8 hours after first dose. Infuse drug over 15 minutes.

➤ **To prevent postoperative nausea and vomiting**

*Adults:* 4 mg undiluted solution for injection I.M. or I.V. over 2 to 5 minutes immediately before induction of anesthesia. Or, 16 mg P.O. or 2 successive 8-mg oral soluble films 1 hour before induction of anesthesia.
*Children ages 1 month to 12 years who weigh more than 40 kg (88 lb):* 4 mg I.V. as a single dose.
*Children ages 1 month to 12 years who weigh 40 kg or less:* 0.1 mg/kg I.V. as a single dose.

➤ **To prevent nausea and vomiting from radiation therapy in patients receiving total body irradiation, single high-dose fraction to abdomen, or daily fractions to abdomen**

*Adults:* 8 mg P.O. t.i.d. For patients receiving total body irradiation, give 8 mg P.O. or oral soluble film 1 to 2 hours before each fraction of radiation therapy each day. For patients receiving single high-dose fraction radiation therapy to the abdomen, give 8 mg P.O. or oral soluble film 1 to 2 hours before therapy, then every 8 hours for 1 to 2 days after completion of therapy. For patients receiving daily fractionated radiation therapy, give 8 mg P.O. or oral soluble film 1 to 2 hours before therapy, then every 8 hours for each day therapy is given.

***Adjust-a-dose:*** For patients with severe hepatic impairment, total daily dose shouldn't exceed 8 mg.

## ADMINISTRATION

**P.O.**

• Open blister of ODT just before use by peeling backing off. Don't push ODT through foil blister.
• For Zuplenz, open film pouch with dry hands and immediately place film on top of the tongue, where it will dissolve in 4 to 20 seconds. Then have patient swallow with or without liquid. Wash hands after giving Zuplenz.

**I.V.**

▼ If precipitate is noted in vial, shake vigorously until dissolved.
▼ Dilute drug in 50 ml of $D_5W$ injection or normal saline solution for injection.
▼ Drug is stable for up to 48 hours after dilution in $D_5W$, 5% dextrose in half-normal saline solution for injection, 5% dextrose in normal saline solution, and 3% sodium chloride solution for injection.
▼ Infuse over 15 minutes.
▼ **Incompatibilities:** Acyclovir sodium, allopurinol, aminophylline, amphotericin B, ampicillin sodium, ampicillin sodium and sulbactam sodium, cefepime, cefoperazone, dacarbazine with doxorubicin, dexamethasone sodium phosphate, droperidol, fluorouracil, furosemide, ganciclovir, lorazepam, meropenem, methylprednisolone sodium succinate, piperacillin sodium, sargramostim, sodium bicarbonate.

**I.M.**

• Document injection site.
• If precipitate is noted in vial, shake vigorously until dissolved.

## ACTION

May block 5-$HT_3$ in the CNS in the chemoreceptor trigger zone and in the peripheral nervous system on nerve terminals of the vagus nerve.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |
| I.V. | Immediate | 10 min | Unknown |
| I.M. | Unknown | 41 min | Unknown |

*Half-life:* 4 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness, fatigue, headache, malaise, sedation,* extrapyramidal syndrome, fever, *pain.*
**CV:** ***arrhythmias,*** chest pain.
**GI:** *constipation, diarrhea,* abdominal pain, decreased appetite, xerostomia.

**GU:** gynecologic disorders, urine retention.
**Respiratory:** hypoxia.
**Skin:** pruritus, rash.
**Other:** chills, injection site reaction.

## INTERACTIONS

**Drug-drug.** *Apomorphine:* May cause profound hypotension and loss of consciousness. Use together is contraindicated. *Drugs such as cimetidine that alter hepatic drug-metabolizing enzymes, phenobarbital, rifampin:* May change pharmacokinetics of ondansetron. No need to adjust dosage.
**Drug-herb.** *Horehound:* May enhance serotoninergic effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT and AST levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Rarely, transient electrocardiographic changes, including prolonged QT interval, have been reported. Monitor patient carefully.
- Use cautiously in patients with hepatic impairment.

***Overdose S&S:*** Sudden transient blindness, severe constipation, hypotension.

## NURSING CONSIDERATIONS

- Monitor liver function test results. Don't exceed 8 mg in patients with hepatic impairment.
- ***Look alike–sound alike:*** Don't confuse Zofran with Zosyn, Zantac, or Zoloft.

## PATIENT TEACHING

- Instruct patient to immediately report difficulty breathing after drug administration.
- Tell patient receiving drug I.V. to report discomfort at insertion site.
- For patient taking ODTs, tell him to open blister just before use by peeling backing off and not by pushing through foil blister, and tell him that taking it with liquid isn't required.
- Teach patient to place ODTs on tongue, allow to dissolve, then swallow with saliva.

**SAFETY ALERT!**

# oprelvekin

oh-PRELL-veh-kin

Neumega

*Therapeutic class:* Hematopoietic
*Pharmacologic class:* Recombinant human interleukin
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 5-mg single-dose vial with diluent

## INDICATIONS & DOSAGES

➤ **To prevent severe thrombocytopenia and reduce need for platelet transfusions after myelosuppressive chemotherapy with nonmyeloid malignancies**

*Adults:* 50 mcg/kg as single daily subcutaneous injection until postnadir platelet count is at least 50,000/$mm^3$. Treatment beyond 21 days per course isn't recommended. Begin dosing 6 to 24 hours after completion of chemotherapy. Discontinue drug at least 2 days before the start of the next planned cycle of chemotherapy.

***Adjust-a-dose:*** In patients with severe renal impairment (creatinine clearance less than 30 ml/minute), the recommended dosage is 25 mcg/kg.

## ADMINISTRATION

**Subcutaneous**

- Give drug in the abdomen, thigh, hip, or upper arm. Don't inject I.D. or intravascularly.
- Reconstitute each single-dose vial with 1 ml of supplied diluent. Avoid excessive or vigorous agitation. Discard unused portions.
- Use reconstituted drug within 3 hours.
- Store drug and diluent in refrigerator until ready to use. Don't freeze.

## ACTION

Directly stimulates proliferation of hematopoietic stem cells and megakaryocyte progenitor cells. Also induces megakaryocyte maturation, resulting in increased platelet production.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 3–5 hr | Unknown |

*Half-life:* 7 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia, headache, insomnia, dizziness,* paresthesia, *syncope.*
**CV:** **ATRIAL FLUTTER OR FIBRILLATION,** *tachycardia, palpitations, edema, vasodilation.*
**EENT:** *conjunctival injection,* blurred vision, eye hemorrhage, *pharyngitis, rhinitis.*
**GI:** *oral candidiasis, nausea, vomiting, diarrhea.*
**Hematologic:** anemia, *neutropenic fever.*
**Metabolic:** dehydration, hypocalcemia.
**Respiratory:** *dyspnea, cough, pleural effusions.*
**Skin:** *rash,* skin discoloration, exfoliative dermatitis.
**Other:** hypersensitivity reactions, allergic reaction, ***anaphylaxis,*** *neutropenic fever.*

## INTERACTIONS

**Drug-drug.** *Diuretics, ifosfamide:* May cause life-threatening hypokalemia. Closely monitor fluid and electrolyte status.

## EFFECTS ON LAB TEST RESULTS

- May increase fibrinogen and von Willebrand factor.
- May decrease calcium and hemoglobin levels and hematocrit.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Use drug cautiously in patients with heart failure because of fluid retention.

***Overdose S&S:*** Increased incidence of cardiovascular reactions.

## NURSING CONSIDERATIONS

- Closely monitor fluid and electrolyte status in patients receiving long-term diuretic therapy.
- Fluid retention can be severe; monitor patient closely.
- Obtain a CBC before chemotherapy and at regular intervals during drug therapy.

**Black Box Warning** Oprelvekin has caused allergic or hypersensitivity reactions, including anaphylaxis. Discontinue drug permanently in patients who develop allergic or hypersensitivity reaction. ■

## PATIENT TEACHING

- Instruct patient about appropriate preparation and administration of drug if he is going to self-administer.
- Warn patient about potential adverse reactions. Tell him to report any occurrence.
- Tell patient to keep drug refrigerated and not to reconstitute until just before use.
- Urge patient to call prescriber immediately if swelling, rapid heartbeat, or difficulty breathing occurs.
- Tell patient to report signs and symptoms of increased bleeding or bruising.

# orlistat

ORE-lah-stat

Alli ◇, Xenical

*Therapeutic class:* Antiobesity
*Pharmacologic class:* Lipase inhibitor
*Pregnancy risk category B*

## AVAILABLE FORMS

*Capsules:* 60 mg ◇, 120 mg

## INDICATIONS & DOSAGES

➤ **To manage obesity, including weight loss and weight maintenance with a reduced-calorie diet; to reduce risk of weight gain after previous weight loss**
*Adults and children ages 12 to 16:* 120 mg P.O. t.i.d. with or up to 1 hour after each main meal containing fat.
➤ **Weight loss (OTC formulation)**
*Adults age 18 and older:* One 60-mg capsule P.O. with each meal containing fat. Dosage shouldn't exceed 3 capsules a day.

## ADMINISTRATION

**P.O.**
- Give drug with each main meal containing fat (during or up to 1 hour after the meal).

## ACTION

Forms a bond with active site of gastric and pancreatic lipases, inactivating them. As a result, enzymes can't hydrolyze dietary triglycerides into absorbable free fatty acids and monoglycerides. The undigested triglycerides are not absorbed, resulting in caloric deficit.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* 1 to 2 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* dizziness, fatigue, sleep disorder, anxiety, depression.
**CV:** pedal edema.
**EENT:** otitis.
**GI:** *flatus with discharge, fecal urgency, fatty or oily stool, oily spotting, increased defecation, abdominal pain,* fecal incontinence, nausea, infectious diarrhea, rectal pain, vomiting.
**GU:** menstrual irregularity, vaginitis, UTI.
**Musculoskeletal:** *back pain, leg pain,* arthritis, myalgia, joint disorder, tendinitis.
**Respiratory:** *influenza, upper respiratory tract infection,* lower respiratory tract infection.
**Skin:** rash, dry skin.
**Other:** tooth and gingival disorders.

## INTERACTIONS

**Drug-drug. *Cyclosporine:*** May decrease cyclosporine levels, risking organ rejection in transplant patients. Avoid using together.
*Fat-soluble vitamins (such as vitamins A and E and beta-carotene):* May decrease absorption of vitamins. Separate doses by 2 hours.
*Warfarin:* May change coagulation values. Monitor INR.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those with chronic malabsorption syndrome or cholestasis.
- Use cautiously in patients with history of hyperoxaluria or calcium oxalate nephrolithiasis or those at risk for anorexia nervosa or bulimia.
- Use cautiously in patients receiving cyclosporine therapy because of potential changes in cyclosporine absorption related to variations in dietary intake.

## NURSING CONSIDERATIONS

- Exclude organic causes of obesity, such as hypothyroidism, before starting drug therapy.
- Drug is recommended for use in patients with an initial body mass index (BMI) of 30 or more or those with a BMI of 27 or more and other risk factors (such as hypertension, diabetes, or dyslipidemia).
***Alert:*** Drug may cause pancreatitis or, rarely, liver dysfunction, including liver failure. Monitor patient closely.
- In diabetic patients, dosage of oral antidiabetic or insulin may need to be reduced because improved metabolic control may accompany weight loss.
- As with other weight-loss drugs, potential for misuse exists in certain patients (such as those with anorexia nervosa or bulimia).
- ***Look alike–sound alike:*** Don't confuse Xenical with Xeloda.

## PATIENT TEACHING

- Advise patient to follow a nutritionally balanced, reduced-calorie diet that derives only 30% of its calories from fat. Tell him to distribute daily intake of fat, carbohydrate, and protein over three main meals. If a meal is occasionally missed or contains no fat, tell patient that dose of drug can be omitted.
- Advise patient to adhere to dietary guidelines. GI effects may increase when patient takes drug with high-fat foods, specifically when more than 30% of total daily calories come from fat.
- Drug reduces absorption of some fat-soluble vitamins and beta-carotene.
- Tell patient with diabetes that weight loss may improve his glycemic control, so dosage of his oral antidiabetic (such as a sulfonylurea or metformin) or insulin may need to be reduced during drug therapy.
- Tell women of childbearing age to inform prescriber if pregnancy or breast-feeding is planned during therapy.

• Advise patient to report signs and symptoms of liver injury, such as loss of appetite, itching, yellowing of skin, dark urine, light-colored stools, or right upper quadrant abdominal pain.

## oseltamivir phosphate

oz-el-TAM-ah-ver

Tamiflu

*Therapeutic class:* Antiviral
*Pharmacologic class:* Selective neuraminidase inhibitor
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules:* 30 mg, 45 mg, 75 mg
*Oral suspension:* 12 mg/ml after reconstitution

### INDICATIONS & DOSAGES

➤ **To prevent influenza during a community outbreak**

*Adults and adolescents age 13 and older:* 75 mg P.O. once daily for up to 6 weeks.
*Children age 1 to 12 who weigh more than 40 kg (88 lb):* 75 mg P.O. once daily for 10 days.
*Children age 1 to 12 who weigh more than 23 kg (51 lb) to 40 kg (88 lb):* 60 mg P.O. once daily for 10 days.
*Children age 1 to 12 who weigh more than 15 kg (33 lb) to 23 kg (51 lb):* 45 mg P.O. once daily for 10 days.
*Children age 1 to 12 who weigh less than 15 kg (33 lb):* 30 mg P.O. once daily for 10 days.

➤ **To treat influenza**

*Adults and adolescents age 13 and older:* 75 mg P.O. b.i.d. for 5 days. Begin treatment within 2 days of onset of influenza symptoms.
*Children ages 1 to 12 who weigh more than 40 kg (88 lb):* 75 mg P.O. b.i.d. for 5 days.
*Children ages 1 to 12 who weigh more than 23 kg (51 lb) to 40 kg (88 lb):* 60 mg P.O. b.i.d. for 5 days.
*Children ages 1 to 12 who weigh more than 15 kg (33 lb) to 23 kg (51 lb):* 45 mg P.O. b.i.d. for 5 days.
*Children ages 1 to 12 who weigh less than 15 kg (33 lb):* 30 mg P.O. b.i.d. for 5 days.
***Adjust-a-dose:*** For adults and adolescents with creatinine clearance of 10 to 30 ml/minute, reduce dosage to 75 mg P.O. once daily for 5 days.

➤ **To prevent influenza after close contact with infected person within 2 days of exposure; to prevent H1N1 influenza A ♦**

*Adults and adolescents age 13 and older:* 75 mg P.O. once daily for at least 10 days.
*Children age 1 and older who weigh more than 40 kg (88 lb):* 75 mg P.O. once daily for 10 days.
*Children age 1 and older who weigh 23 to 40 kg (51 to 88 lb):* 60 mg P.O. once daily for 10 days.
*Children age 1 and older who weigh 15 to 23 kg (33 to 51 lb):* 45 mg P.O. once daily for 10 days.
*Children age 1 and older who weigh 15 kg (33 lb) or less:* 30 mg oral suspension P.O. once daily for 10 days.
***Adjust-a-dose:*** For adults and adolescents with creatinine clearance of 10 to 30 ml/minute, reduce dosage to 75 mg P.O. every other day or 30 mg once daily.

➤ **To prevent H1N1 influenza A in children younger than age 12 months ♦**

*Children age 6 to 11 months:* 25 mg P.O. once daily for 10 days.
*Children age 3 to 5 months:* 20 mg P.O. once daily for 10 days.

➤ **To treat H1N1 influenza A ♦**

*Adults:* 75 mg P.O. b.i.d. for 5 days.
*Children age 1 and older who weigh more than 40 kg (88 lb):* 75 mg P.O. b.i.d. for 5 days.
*Children age 1 and older who weigh more than 23 kg (51 lb) to 40 kg (88 lb):* 60 mg P.O. b.i.d. for 5 days.
*Children age 1 and older who weigh more than 15 kg (33 lb) to 23 kg (51 lb):* 45 mg P.O. b.i.d. for 5 days.
*Children age 1 and older who weigh less than 15 kg (33 lb):* 30 mg P.O. b.i.d. for 5 days.
*Children age 6 to 11 months:* 25 mg P.O. b.i.d. for 5 days.
*Children age 3 to 5 months:* 20 mg P.O. b.i.d. for 5 days.
*Children younger than age 3 months:* 12 mg P.O. b.i.d. for 5 days.

## ADMINISTRATION

**P.O.**

- Give drug with meals to decrease GI adverse effects.
- Store at controlled room temperature (59° to 86° F [15° to 30° C]).
- Capsules may be opened and mixed with sweetened liquids such as chocolate syrup.

## ACTION

Inhibits influenza A and B virus enzyme neuraminidase, which is thought to play a role in viral particle aggregation and release from the host cell and appears to interfere with viral replication.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* 1 to 10 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, fatigue, headache, insomnia, vertigo.
**GI:** abdominal pain, diarrhea, *nausea*, vomiting.
**Respiratory:** bronchitis, cough.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

- None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in patients with chronic cardiac or respiratory diseases, or any medical condition that may require imminent hospitalization. Also use cautiously in patients with renal failure.
- It's unknown if drug or its metabolite appears in breast milk. Use only if benefits to patient outweigh risks to infant.

***Overdose S&S:*** Nausea, vomiting.

## NURSING CONSIDERATIONS

- Drug must be given within 2 days of onset of symptoms.
- Safety and effectiveness of repeated treatment courses haven't been established.

***Alert:*** Closely monitor patients with influenza for neuropsychiatric symptoms, such as hallucinations, delirium, and abnormal behavior. Risks and benefits of continuing drug should be evaluated.

## PATIENT TEACHING

- Instruct patient to begin treatment as soon as possible after appearance of flu symptoms.
- Inform patient that drug may be taken with or without meals. If nausea or vomiting occurs, he can take drug with food or milk.
- Tell patient that, if a dose is missed, he should take it as soon as possible. However, if next dose is due within 2 hours, tell him to skip the missed dose and take the next dose on schedule.
- Advise patient to complete the full course of treatment, even if symptoms resolve.
- Alert patient that drug isn't a replacement for the annual influenza vaccination. Patients for whom vaccine is indicated should continue to receive the vaccine each fall.

**SAFETY ALERT!**

# oxaliplatin

ox-ah-li-PLA-tin

Eloxatin

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Platinum coordination complex
*Pregnancy risk category D*

## AVAILABLE FORMS

*Solution for injection:* 5 mg/ml in 10-ml, 20-ml, and 40-ml single-use vials

## INDICATIONS & DOSAGES

➤ **First-line treatment of advanced colorectal cancer with 5-fluorouracil and leucovorin (5-FU/LV)**

*Adults:* On day 1, give 85 mg/m$^2$ oxaliplatin I.V. in 250 to 500 ml $D_5W$ and leucovorin 200 mg/m$^2$ I.V. in $D_5W$ simultaneously over 120 minutes, in separate bags using a Y-line, followed by 5-FU 400 mg/m$^2$ I.V. bolus over 2 to 4 minutes, followed by 600 mg/m$^2$ 5-FU I.V. infusion in 500 ml $D_5W$ over 22 hours.

On day 2, give 200 mg/m$^2$ leucovorin I.V. infusion over 120 minutes, followed by 400 mg/m$^2$ 5-FU I.V. bolus over 2 to 4 minutes, followed by 600 mg/m$^2$ 5-FU I.V. infusion in 500 ml $D_5W$ over 22 hours.

Repeat cycle every 2 weeks.

***Adjust-a-dose:*** In patients with unresolved and persistent grade 2 neurosensory events, reduce oxaliplatin to 65 mg/m$^2$. In those with persistent grade 3 neurosensory events, consider stopping drug. In patients recovering from grade 3 or 4 GI or hematologic events, reduce dose to 65 mg/m$^2$ and reduce dose of 5-FU by 20%. Delay dose until neutrophil count is $1.5 \times 10^9$/L or more and platelet count is $75 \times 10^9$/L or more.

➤ **With 5-FU/LV for the adjuvant treatment of stage III colon cancer in patients who have had complete resection of the primary tumor**

*Adults:* On day 1, give oxaliplatin, 85 mg/m$^2$ I.V. in 250 to 500 ml $D_5W$ and 200 mg/m$^2$ leucovorin I.V. infusion in $D_5W$, both over 120 minutes at the same time, in separate bags, using a Y-line. Follow with 5-FU 400 mg/m$^2$ I.V. bolus over 2 to 4 minutes, then 600 mg/m$^2$ 5-FU in 500 ml $D_5W$ as a 22-hour continuous infusion.

On day 2, give leucovorin, 200 mg/m$^2$ I.V. infused over 120 minutes, followed by 5-FU 400 mg/m$^2$ as an I.V. bolus over 2 to 4 minutes, then 600 mg/m$^2$ 5-FU in 500 ml $D_5W$ as a 22-hour infusion.

Repeat cycle every 2 weeks for a total of 6 months. Premedicate with antiemetics, with or without dexamethasone.

***Adjust-a-dose:*** For patients with persistent grade 2 neurotoxicity, consider an oxaliplatin dose reduction to 75 mg/m$^2$. For patients who recovered from grade 4 neutropenia, grade 3 or 4 thrombocytopenia, or a grade 3 or 4 GI event, reduce oxaliplatin to 75 mg/m$^2$ and 5-FU to a 300 mg/m$^2$ bolus and 500 mg/m$^2$ 22-hour infusion. Delay dose until neutrophils are $1.5 \times 10^9$/L or more and platelets are $75 \times 10^9$/L or more.

## ADMINISTRATION

### I.V.

▼ Preparing and giving drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.

▼ Reconstitute powder using sterile water for injection or $D_5W$. Add 10 ml to a 50-mg vial or 20 ml to a 100-mg vial, for a yield of 5 mg/ml. Never reconstitute with sodium chloride solution or other solution containing chloride.

▼ Reconstituted solutions must be further diluted in an infusion solution of 250 to 500 ml of $D_5W$.

▼ Inspect bag for particulate matter and discoloration before giving, and discard if present.

▼ Don't use needles or I.V. administration sets that contain aluminum because it displaces the platinum, causing it to lose potency and form a black precipitate.

▼ Give oxaliplatin and leucovorin over 2 hours at the same time in separate bags, using a Y-line. Extend the infusion time to 6 hours to decrease acute toxicities.

▼ Store unopened vials at room temperature. Reconstituted solutions are stable if refrigerated (36° to 46° F [2° to 8° C]) for up to 24 hours. After final dilution, solutions are stable for 6 hours at room temperature and up to 24 hours under refrigeration.

▼ **Incompatibilities:** Alkaline solutions or drugs such as 5-FU. Flush infusion line with $D_5W$ before giving any other drugs simultaneously.

## ACTION

Probably inhibits cell replication and transcription by forming platinum complexes that cross-link with DNA molecules. Not specific to cell cycle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 391 hours (gamma phase).

## ADVERSE REACTIONS

**CNS:** *pain, peripheral neuropathy, fatigue, headache,* dizziness, *insomnia, fever.*

**CV:** chest pain, ***thromboembolism,*** *edema, flushing, peripheral edema.*

**EENT:** *rhinitis,* pharyngolaryngeal dysesthesias, pharyngitis, epistaxis, abnormal lacrimation.

**GI:** *nausea, vomiting, diarrhea, stomatitis, abdominal pain, anorexia, constipation,*

*dyspepsia, taste perversion,* gastroesophageal reflux, flatulence, mucositis.
**GU:** dysuria, hematuria.
**Hematologic:** **FEBRILE NEUTROPENIA,** *anemia,* **LEUKOPENIA, THROMBOCYTOPENIA.**
**Hepatic:** veno-occlusive disease.
**Metabolic:** hypokalemia, dehydration.
**Musculoskeletal:** *back pain, arthralgia.*
**Respiratory:** *dyspnea, cough, upper respiratory tract infection,* hiccups, ***pulmonary toxicity.***
**Skin:** *injection site reaction,* rash, alopecia.
**Other:** ***anaphylaxis,*** *hand-foot syndrome, allergic reaction,* rigors.

## INTERACTIONS

**Drug-drug.** *Nephrotoxic drugs (such as gentamicin):* May decrease elimination of nephrotoxic drugs and increase gentamicin levels. Monitor patient for signs and symptoms of toxicity.

## EFFECTS ON LAB TEST RESULTS

- May increase creatinine, bilirubin, AST, and ALT levels. May decrease potassium and hemoglobin levels.
- May decrease neutrophil, WBC, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients allergic to drug or other platinum-containing compounds and in pregnant or breast-feeding patients.
- Use cautiously in patients with renal impairment or peripheral sensory neuropathy.

***Overdose S&S:*** Thrombocytopenia, dyspnea, wheezing, paresthesia, vomiting, chest pain, respiratory failure, bradycardia, dysesthesia, laryngospasm, myelosuppression, nausea, diarrhea, neurotoxicity.

## NURSING CONSIDERATIONS

- Administer drug under the supervision of a physician experienced in the use of cancer chemotherapeutic agents.
- Drug doesn't require patient prehydration.
- Give antiemetic with or without dexamethasone before drug to reduce nausea.
- Drug clearance is reduced in patients with renal impairment. Dosage adjustment for patients with renal impairment hasn't been established.
- Monitor CBC, platelet count, and liver and kidney function before each chemotherapy cycle.

**Black Box Warning** Monitor patient for hypersensitivity reactions, which may occur within minutes of administration. Keep epinephrine, corticosteroids, and antihistamines available.

- Monitor patient for injection site reaction; extravasation may occur.
- Monitor patient for neuropathy and pulmonary toxicity. Peripheral neuropathy may be acute or persistent. Acute neuropathy is reversible; it occurs within 2 days of dosing and resolves within 14 days. Persistent peripheral neuropathy occurs more than 14 days after dosing and causes paresthesias, dysesthesias, hypoesthesias, and other neurologic impairment that can interfere with daily activities (such as walking or swallowing).
- Avoid ice and cold exposure during infusion of drug because cold temperatures can worsen acute neurologic symptoms. Cover patient with a blanket during infusion.
- Diarrhea, dehydration, hypokalemia, and fatigue may occur more frequently in elderly patients.

## PATIENT TEACHING

- Inform patient of potential adverse reactions.
- Tell patient to avoid exposure to cold or cold objects (such as cold drinks or ice cubes), which can bring on or worsen acute symptoms of peripheral neuropathy. Advise patient to drink warm drinks, wear warm clothing, and cover any exposed skin (hands, face, and head). Have patient warm the air going into his lungs by wearing a scarf or ski mask. Have him wear gloves when touching cold objects (such as frozen foods, door knobs, or mailboxes).
- Tell patient to contact prescriber immediately if he has trouble breathing or experiences signs and symptoms of an allergic reaction, such as rash, hives, swelling of lips or tongue, or sudden cough.
- Tell patient to contact prescriber if fever, signs and symptoms of an infection, persistent vomiting, diarrhea, or signs and

symptoms of dehydration (thirst, dry mouth, light-headedness, and decreased urination) occur.

**SAFETY ALERT!**

## oxazepam

ox-AZ-e-pam

Novoxapam†, Oxpam†

*Therapeutic class:* Anxiolytic
*Pharmacologic class:* Benzodiazepine
*Pregnancy risk category D*
*Controlled substance schedule IV*

### AVAILABLE FORMS

*Capsules:* 10 mg, 15 mg, 30 mg

### INDICATIONS & DOSAGES

➤ **Alcohol withdrawal, severe anxiety**
*Adults:* 15 to 30 mg P.O. t.i.d. or q.i.d.
➤ **Mild to moderate anxiety**
*Adults and children older than age 12:* 10 to 15 mg P.O. t.i.d. or q.i.d.
*Elderly patients:* Initially, 10 mg t.i.d.; cautiously increase to 15 mg t.i.d. to q.i.d.
➤ **Severe anxiety syndromes; agitation; anxiety associated with depression**
*Adults and children older than age 12:* 15 to 30 mg P.O. t.i.d. or q.i.d.

### ADMINISTRATION

**P.O.**
• Give drug without regard for meals.

### ACTION

May stimulate GABA receptors in the ascending reticular activating system.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3 hr | Unknown |

*Half-life:* 5 to 13 hours.

### ADVERSE REACTIONS

**CNS:** *drowsiness*, *lethargy*, dizziness, vertigo, headache, syncope, tremor, slurred speech, changes in EEG patterns.
**CV:** edema.
**GI:** nausea.
**Hepatic:** ***hepatic dysfunction.***
**Skin:** rash.
**Other:** altered libido.

### INTERACTIONS

**Drug-drug.** *CNS depressants:* May increase CNS depression. Use together cautiously.
*Digoxin:* May increase digoxin level and risk of toxicity. Monitor patient closely.
**Drug-herb.** *Kava:* May increase sedation. Discourage use together.
**Drug-lifestyle.** ***Alcohol use:*** May cause additive CNS effects. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

• May increase liver function test values.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug; in pregnant women, especially in the first trimester; and in those with psychoses.
• Use cautiously in elderly patients and in those with history of substance abuse or in whom a decrease in blood pressure might lead to cardiac problems.
***Overdose S&S:*** Drowsiness, confusion, lethargy, ataxia, hypotonia, hypotension, hypnotic state, stage 1 to 3 coma, death.

### NURSING CONSIDERATIONS

• Monitor hepatic, renal, and hematopoietic function periodically in patients receiving repeated or prolonged therapy.
***Alert:*** Use of this drug may lead to abuse and addiction. Don't stop drug abruptly because withdrawal symptoms may occur.
• ***Look alike–sound alike:*** Don't confuse oxazepam with oxaprozin.

### PATIENT TEACHING

• Warn patient to avoid hazardous activities that require alertness or good coordination until effects of drug are known.
• Tell patient to avoid use of alcohol while taking drug.
• Notify patient that smoking may decrease drug's effectiveness.
• Warn patient not to stop drug abruptly because withdrawal symptoms may occur.
• Warn women of childbearing age to avoid use during pregnancy.

# oxcarbazepine

oks-car-BAZ-e-peen

Trileptal

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* Carboxamide derivative
*Pregnancy risk category C*

## AVAILABLE FORMS

*Oral suspension:* 300 mg/5 ml (60 mg/ml)
*Tablets (film-coated):* 150 mg, 300 mg, 600 mg

## INDICATIONS & DOSAGES

➤ **Adjunctive treatment of partial seizures in patients with epilepsy**

*Adults:* Initially, 300 mg P.O. b.i.d. Increase by a maximum of 600 mg daily (300 mg P.O. b.i.d.) at weekly intervals. Recommended daily dose is 1,200 mg P.O. divided b.i.d.

*Children ages 4 to 16:* Initially, 8 to 10 mg/kg daily P.O. divided b.i.d., not to exceed 600 mg daily. The target maintenance dose depends on patient's weight and should be divided b.i.d. If patient weighs between 20 and 29 kg (44 and 64 lb), target maintenance dose is 900 mg daily. If patient weighs between 29 and 39 kg (64 and 86 lb), target maintenance dose is 1,200 mg daily. If patient weighs more than 39 kg (86 lb), target maintenance dose is 1,800 mg daily. Target doses should be achieved over 2 weeks.

*Children ages 2 to 4:* Initially, 8 to 10 mg/kg P.O. daily divided b.i.d., not to exceed 600 mg daily. If patient weighs less than 20 kg (44 lb), a starting dose of 16 to 20 mg/kg may be considered. Maximum maintenance dosage should be achieved over 2 to 4 weeks and shouldn't exceed 60 mg/kg/day as a twice-daily regimen.

➤ **To change from multidrug to single-drug treatment of partial seizures in patients with epilepsy**

*Adults:* Initially, 300 mg P.O. b.i.d., while reducing dose of concomitant anticonvulsant. Increase oxcarbazepine by a maximum of 600 mg daily at weekly intervals over 2 to 4 weeks. Recommended daily dose is 2,400 mg P.O. divided b.i.d. Withdraw other anticonvulsant completely over 3 to 6 weeks.

*Children ages 4 to 16:* Initially, 8 to 10 mg/kg daily P.O. divided b.i.d., while reducing dose of concomitant anticonvulsant. Increase oxcarbazepine by a maximum of 10 mg/kg daily at weekly intervals to achieve the recommended daily dose shown in the table. Withdraw other anticonvulsant completely over 3 to 6 weeks.

➤ **To start single-drug treatment of partial seizures in patients with epilepsy**

*Adults:* Initially, 300 mg P.O. b.i.d. Increase dosage by 300 mg daily every third day to a daily dose of 1,200 mg divided b.i.d.

*Children ages 4 to 16:* Initially, 8 to 10 mg/kg daily P.O. divided b.i.d., increasing the dosage by 5 mg/kg daily every third day to the recommended daily dose range shown in the table.

**Recommended doses for monotherapy**

| *Weight (kg)* | *Dose (mg/day)* |
|---|---|
| 20 | 600–900 |
| 25 | 900–1,200 |
| 30 | 900–1,200 |
| 35 | 900–1,500 |
| 40 | 900–1,500 |
| 45 | 1,200–1,500 |
| 50 | 1,200–1,800 |
| 55 | 1,200–1,800 |
| 60 | 1,200–2,100 |
| 65 | 1,200–2,100 |
| 70 | 1,500–2,100 |

***Adjust-a-dose:*** If creatinine clearance is less than 30 ml/minute, start therapy at 150 mg P.O. b.i.d. (one-half usual starting dose) and increase slowly to achieve desired response.

➤ **Alcohol withdrawal syndrome ♦**

*Adults:* 600 to 1,800 mg P.O. in divided doses for 6 weeks to 6 months.

## ADMINISTRATION

**P.O.**

- Shake suspension well.
- Mix suspension with water or give directly from syringe.
- Suspension and tablets may be interchanged at equal doses.
- Give drug without regard for food.

## ACTION

Thought to prevent seizure spread in the brain by blocking voltage-sensitive sodium channels, and to produce anticonvulsant effects by increasing potassium conduction and modulating high-voltage activated calcium channels.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Variable | Unknown |

*Half-life:* About 2 hours for the drug; about 9 hours for the active metabolite. Children younger than age 8 have a 30% to 40% increase in clearance.

## ADVERSE REACTIONS

**CNS:** *abnormal gait, ataxia, dizziness, fatigue, headache, somnolence, tremor, vertigo,* ***aggravated seizures,*** abnormal coordination, agitation, amnesia, anxiety, asthenia, confusion, emotional lability, feeling abnormal, fever, hypesthesia, impaired concentration, insomnia, nervousness, speech disorder.
**CV:** chest pain, edema, hypotension.
**EENT:** *abnormal vision, diplopia, nystagmus,* abnormal accommodation, ear pain, epistaxis, pharyngitis, rhinitis, sinusitis.
**GI:** *abdominal pain, nausea, vomiting,* ***rectal hemorrhage,*** anorexia, constipation, diarrhea, dry mouth, dyspepsia, gastritis, taste perversion, thirst.
**GU:** urinary frequency, UTI, vaginitis.
**Metabolic:** hyponatremia, weight increase.
**Musculoskeletal:** back pain, muscular weakness.
**Respiratory:** *upper respiratory tract infection,* bronchitis, chest infection, coughing.
**Skin:** acne, bruising, hot flashes, increased sweating, purpura, rash.
**Other:** allergic reaction, infection, lymphadenopathy, toothache.

## INTERACTIONS

**Drug-drug.** *Carbamazepine, valproic acid, verapamil:* May decrease level of active metabolite of oxcarbazepine. Monitor patient and level closely.
*Felodipine:* May decrease felodipine level. Monitor patient closely.
*Hormonal contraceptives:* May decrease levels of ethinyl estradiol and levonorgestrel, reducing hormonal contraceptive effectiveness. Caution women of childbearing age to use alternative forms of contraception.
*Phenobarbital:* May decrease level of active metabolite of oxcarbazepine; may increase phenobarbital level. Monitor patient closely.
*Phenytoin:* May decrease level of active metabolite of oxcarbazepine; may increase phenytoin level in adults receiving high doses of oxcarbazepine. Monitor phenytoin level closely when starting therapy in these patients.
**Drug-lifestyle.** *Alcohol use:* May increase CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May decrease sodium and thyroxine levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.

## NURSING CONSIDERATIONS

***Alert:*** Between 25% and 30% of patients with history of hypersensitivity reaction to carbamazepine may develop hypersensitivities to oxcarbazepine. Ask patient about carbamazepine hypersensitivity and stop drug immediately if signs or symptoms of hypersensitivity occur.
***Alert:*** Closely monitor all patients taking or starting antiepileptic drugs for changes in behavior indicating worsening of suicidal thoughts or behavior or depression. Symptoms such as anxiety, agitation, hostility, mania, and hypomania may be precursors to emerging suicidality.
***Alert:*** Withdraw drug gradually to minimize potential for increased seizure frequency.
- Watch for signs and symptoms of hyponatremia, including nausea, malaise, headache, lethargy, confusion, and decreased sensation.
- Monitor sodium level in patients receiving oxcarbazepine for maintenance treatment, especially patients receiving other therapies that may decrease sodium levels.
- Oxcarbazepine use has been linked to several nervous system–related adverse reactions, including psychomotor slowing, difficulty with concentration, speech or language problems, somnolence, fatigue, and coordination abnormalities, such as ataxia and gait disturbances.

## PATIENT TEACHING

- Tell patient to take drug with or without food.
- Tell patient to contact prescriber before interrupting or stopping drug.
- Advise patient to report signs and symptoms of low sodium in the blood, such as nausea, malaise, headache, lethargy, and confusion.

***Alert:*** Multiorgan hypersensitivity reactions may occur. Tell patient to report fever and swollen lymph nodes to his prescriber.

***Alert:*** Serious skin reactions, including Stevens-Johnson syndrome and toxic epidermal necrosis, can occur. Advise patient to immediately report skin rashes to his prescriber.

- Caution patient to avoid driving and other potentially hazardous activities that require mental alertness until effects of drug are known.
- Instruct woman using hormonal contraceptives to use alternative form of contraception while taking drug.
- Tell patient to avoid alcohol while taking drug.
- Advise patient to inform prescriber if he has ever experienced hypersensitivity reaction to carbamazepine.

# oxybutynin chloride

ox-i-BYOO-ti-nin

Ditropan, Ditropan XL, Gelnique, Oxytrol

*Therapeutic class:* Urinary antispasmodic
*Pharmacologic class:* Antimuscarinic
*Pregnancy risk category B*

## AVAILABLE FORMS

*Syrup:* 5 mg/5 ml
*Tablets:* 5 mg
*Tablets (extended-release):* 5 mg, 10 mg, 15 mg
*Topical gel:* 10% in 1-g sachets
*Transdermal patch:* 36-mg patch delivering 3.9 mg/day

## INDICATIONS & DOSAGES

➤ **Uninhibited or reflex neurogenic bladder**

*Adults:* 5 mg P.O. b.i.d. to t.i.d., to maximum of 5 mg q.i.d.
*Children age 5 and older:* 5 mg P.O. b.i.d., to maximum of 5 mg t.i.d.

➤ **Overactive bladder**

*Adults:* Initially, 5 mg P.O. Ditropan XL once daily. Dosage adjustments may be made weekly in 5-mg increments, as needed, to maximum of 30 mg P.O. daily. Or, apply one patch twice weekly to dry, intact skin on the abdomen, hip, or buttock. Or, 1 g topical gel once daily applied to dry, intact skin on the abdomen, upper arms or shoulders, or thighs.

➤ **Symptoms of detrusor overactivity associated with a neurological condition (e.g. spina bifida)**

*Children age 6 and older:* 5 mg P.O. Ditropan XL once daily. May increase in 5-mg increments, as needed, to maximum of 20 mg P.O. daily.

## ADMINISTRATION

**P.O.**

- Don't crush extended-release tablets.
- Give extended-release tablets without regard for food.

**Topical**

- Use immediately after sachets are opened.
- Apply to dry, intact skin on the abdomen, upper arms or shoulders, or thighs.
- Rotate application sites.

**Transdermal**

- Apply to dry, intact skin on the abdomen, hip, or buttock.
- Avoid reapplication to the same site within 7 days.

## ACTION

Relaxes smooth muscle of bladder by antagonizing muscarinic receptors, relieving symptoms of overactive bladder.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30–60 min | 3–4 hr | 6–10 hr |
| P.O. (extended-release) | Unknown | 4–6 hr | 24 hr |
| Topical | Unknown | Unknown | Unknown |
| Transdermal | 24–48 hr | Varies | 96 hr |

*Half-life:* For tablets or oral solution, 2 to 3 hours; for extended-release tablets, 12 to 13 hours; for patch, 7 to 8 hours; for gel, 64 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, insomnia, restlessness, hallucinations, asthenia, fever, headache.
**CV:** *palpitations, tachycardia,* vasodilation.
**EENT:** mydriasis, cycloplegia, decreased lacrimation, amblyopia, blurred vision, dry eyes.
**GI:** *constipation, dry mouth,* nausea, vomiting, decreased GI motility.
**GU:** *urinary hesitancy, urine retention,* impotence.
**Skin:** rash, decreased diaphoresis.
**Other:** suppression of lactation.
**Transdermal patch**
**CNS:** fatigue, somnolence, headache.
**CV:** flushing.
**EENT:** abnormal vision.
**GI:** *dry mouth,* diarrhea, abdominal pain, nausea, flatulence.
**GU:** dysuria.
**Musculoskeletal:** back pain.
**Skin:** *pruritus,* erythema, vesicles, macules, rash, burning at application site.

## INTERACTIONS

**Drug-drug.** *Anticholinergics:* May increase anticholinergic effects. Use together cautiously.
*Atenolol, digoxin:* May increase levels of these drugs. Monitor drug levels closely.
*CNS depressants:* May increase CNS effects. Use together cautiously.
*CYP3A4 inhibitors (such as ketoconazole):* May alter oxybutynin concentration. Use together cautiously.
*Haloperidol:* May decrease haloperidol level. Monitor drug level closely.
**Drug-lifestyle.** *Alcohol use:* May increase CNS effects. Discourage use together.
*Exercise, hot weather:* May cause heatstroke. Advise patient to use with caution in hot weather.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those with myasthenia gravis, GI obstruction, untreated angle-closure glaucoma, megacolon, adynamic ileus, severe colitis, ulcerative colitis with megacolon, urine or gastric retention, or obstructive uropathy.
- Contraindicated in elderly or debilitated patients with intestinal atony and in hemorrhaging patients with unstable CV status.
- Use cautiously in elderly, pregnant, or breast-feeding patients and in those with autonomic neuropathy, reflux esophagitis, or hepatic or renal disease.
- Extended-release form is not recommended for children who can't swallow the tablet whole without chewing, dividing, or crushing, or children under 6 years.
- Use extended-release form cautiously in patients with bladder outflow obstruction, gastric obstruction, ulcerative colitis, intestinal atony, myasthenia gravis, or gastroesophageal reflux and in those taking drugs that worsen esophagitis (bisphosphonates).

***Overdose S&S:*** Restlessness, tremors, irritability, seizures, delirium, hallucinations, flushing, fever, dehydration, cardiac arrhythmias, vomiting, urine retention, hypotension or hypertension, respiratory failure, paralysis, coma.

## NURSING CONSIDERATIONS

- Before giving drug, get confirmation of neurogenic bladder by cystometry and rule out partial intestinal obstruction in patients with diarrhea, especially those with colostomy or ileostomy.
- If patient has UTI, treat him with antibiotics.
- Drug may aggravate symptoms of hyperthyroidism, coronary artery disease, heart failure, arrhythmias, tachycardia, hypertension, or prostatic hyperplasia.
- Obtain periodic cystometry as directed to evaluate response to therapy.
- Monitor patient for residual urine after voiding.
- ***Look alike–sound alike:*** Don't confuse Ditropan with diazepam or Dithranol or oxybutynin with Oxycontin.

## PATIENT TEACHING

- Warn patient to avoid hazardous activities, such as operating machinery or driving, until CNS effects of drug are known.
- Caution patient that using drug during very hot weather may cause fever or heatstroke because it suppresses sweating.

- Tell patient to swallow Ditropan XL whole and not to chew or crush it.
- Instruct patient to measure syrup with a teaspoon.
- Advise patient to store drug in tightly closed container at 59° to 86° F (15° to 30° C).
- Instruct patient using transdermal patch to change patch twice a week and to choose a new application site with each new patch to avoid the same site within 7 days. Warn patient to only wear one patch at a time. Tell patient to dispose of old patches carefully in the trash in a manner that prevents accidental application or ingestion by children and pets.
- Tell patient using transdermal patch to keep patch in sealed pouch until immediately before application, not to expose patch to sunlight, and to wear patch under clothing.
- Tell patient to remove patch before undergoing an MRI.
- Advise patient using topical gel to rotate application sites.
- Advise patient to avoid alcohol while taking drug.
- Tell patient that drug may cause dry mouth.

**SAFETY ALERT!**

## oxycodone hydrochloride

ox-i-KOE-done

ETH-Oxydose, M-Oxy, OxyContin🖋, Roxicodone, Supeudol†

*Therapeutic class:* Opioid analgesic
*Pharmacologic class:* Opioid
*Pregnancy risk category B*
*Controlled substance schedule II*

### AVAILABLE FORMS

*Capsules:* 5 mg
*Oral solution:* 5 mg/5 ml, 20 mg/ml
*Suppository:* 10 mg†, 20 mg†
*Tablets (controlled-release):* 10 mg, 15 mg, 20 mg, 30 mg, 40 mg, 60 mg, 80 mg
*Tablets (immediate-release):* 5 mg, 10 mg, 15 mg, 20 mg, 30 mg

### INDICATIONS & DOSAGES

➤ **Moderate to severe pain**

*Adults:* 5 to 30 mg immediate-release form P.O. every 6 hours. Or, 5 mg oral concentrate solution every 6 hours p.r.n. and individualize dosage. Or, one suppository P.R. three to four times daily p.r.n.

➤ **Moderate to severe pain in patients not currently receiving opioids, who need a continuous, around-the-clock analgesic for an extended period of time**

*Adults:* 10 mg controlled-release tablets P.O. every 12 hours. May increase dose every 1 to 2 days as needed.

***Adjust-a-dose:*** For elderly patients and patients with hepatic impairment, decrease initial starting dose by one-third to one-half.

### ADMINISTRATION

**P.O.**

- To minimize GI upset, give drug after meals or with milk.

**Black Box Warning** Swallow extended-release tablets whole. ▮

**Black Box Warning** The 60- and 80-mg controlled-release tablets, or a single 40-mg dose, or a total daily dose of more than 80 mg is limited to opioid-tolerant patients. ▮

- Patients taking the controlled-release form around-the-clock may need to take the immediate-release form for worsening of pain or prevention of incident pain.

**Rectal**

- Chill wrapped suppository in refrigerator for 30 minutes or under cold running water if too soft to administer.

### ACTION

Unknown. Binds with opioid receptors in the CNS, altering perception of and emotional response to pain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. (immediate-release) | 10–15 min | 1 hr | 3–6 hr |
| P.O. (controlled-release) | Unknown | 2½ hr | 12 hr |
| P.R. | Unknown | Unknown | Unknown |

*Half-life:* 2 to 3 hours; controlled-release, 4.5 hours.

## ADVERSE REACTIONS

**CNS:** clouded sensorium, dizziness, euphoria, light-headedness, physical dependence, sedation, somnolence.
**CV:** ***bradycardia,*** hypotension.
**GI:** *constipation, nausea, vomiting,* ileus.
**GU:** urine retention.
**Respiratory:** ***respiratory depression.***
**Skin:** diaphoresis, pruritus.

## INTERACTIONS

**Drug-drug.** *Anticoagulants:* Oxycodone hydrochloride products containing aspirin may increase anticoagulant effect. Monitor clotting times. Use together cautiously.
*CNS depressants, general anesthetics, hypnotics, MAO inhibitors, other opioid analgesics, sedatives, tranquilizers, tricyclic antidepressants:* May cause additive effects. Use together with caution. Reduce oxycodone dose and monitor patient response.
*CYP3A4 inhibitors such as azole antifungals (ketoconazole), macrolide antibiotics (erythromycin), protease inhibitors (ritonavir):* May increase oxycodone level, increase or prolong adverse effects, and cause fatal respiratory depression. Carefully monitor patient over extended period of time and adjust oxycodone dosage as needed.
**Drug-lifestyle.** *Alcohol use:* May cause additive effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase amylase and lipase levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Contraindicated in known or suspected paralytic ileus, significant respiratory depression, acute or severe bronchial asthma.
- Contraindicated in women immediately before and during labor and delivery, and in breast-feeding women.
- Use with caution in elderly and debilitated patients and in those with head injury, increased intracranial pressure, seizures, asthma, COPD, prostatic hyperplasia, severe hepatic or renal disease, acute abdominal conditions, urethral stricture, hypothyroidism, Addison's disease, and arrhythmias.

**Black Box Warning** Patients must be screened for increased risk of opioid abuse (personal or family history of substance abuse or mental illness) before being prescribed opioids. ■
**Black Box Warning** Oxycodone controlled-release tablets are indicated for the management of moderate to severe pain, when a continuous, around-the-clock opioid analgesic is needed for an extended period of time. They aren't intended for use as as-needed analgesics. ■
***Overdose S&S:*** CNS depression, respiratory depression, apnea, flaccid skeletal muscles, bradycardia, hypotension, circulatory collapse, cardiac arrest, respiratory arrest, death.

## NURSING CONSIDERATIONS

- Reassess patient's level of pain at least 15 and 30 minutes after administration.
- For full analgesic effect, give drug before patient has intense pain.
- Single-drug oxycodone solution or tablets are especially useful for patients who shouldn't take aspirin or acetaminophen.
- Monitor circulatory and respiratory status. Withhold dose and notify prescriber if respirations are shallow or if respiratory rate falls below 12 breaths/minute.
- Monitor patient's bladder and bowel patterns. Patient may need a stimulant laxative because drug has a constipating effect.
- For patients who are taking more than 60 mg daily, stop drug gradually to prevent withdrawal symptoms.
- Drug isn't intended for as-needed use or for immediate postoperative pain. Drug is indicated only for postoperative use if patient was receiving it before surgery or if pain is expected to persist for an extended time.

**Black Box Warning** Drug is potentially addictive and abused as much as morphine. Chewing, crushing, snorting, or injecting it can lead to overdose and death. ■
**Black Box Warning** All patients on opioids should be routinely monitored for signs and symptoms of misuse, abuse, and addiction. ■
- OxyContin CR has been formulated to prevent immediate access to full-dose

oxycodone by cutting, chewing, or breaking the tablet. Attempts to dissolve tablets will result in a gummy substance that can't be drawn-up into a syringe or injected.

### PATIENT TEACHING

- Instruct patient to take drug before pain is intense.
- Tell patient to take drug with milk or after eating.

**Black Box Warning** Tell patient to swallow extended-release tablets whole. ■

- Caution ambulatory patient about getting out of bed or walking. Warn outpatient to avoid driving and other hazardous activities that require mental alertness until drug's CNS effects are known.
- Advise patient to avoid alcohol use during therapy.
- Tell patient not to stop drug abruptly.

## oxymetazoline hydrochloride (intranasal)

ox-i-met-AZ-oh-leen

Afrin ◇, Dristan 12 Hour Nasal ◇, Duration ◇, Genasal ◇, Nasal Relief ◇, Neo-Synephrine 12 Hour Spray ◇, Nostrilla ◇, Sudafed OM Sinus Congestion ◇, Vicks Sinex ◇

*Therapeutic class:* Decongestant
*Pharmacologic class:* Sympathomimetic
*Pregnancy risk category C*

### AVAILABLE FORMS

*Nasal solution:* 0.05% ◇

### INDICATIONS & DOSAGES

➤ **Nasal congestion**

*Adults and children age 6 and older:* 2 to 3 sprays of 0.05% solution in each nostril b.i.d. Don't use for more than 3 days.

### ADMINISTRATION

**Intranasal**

- Don't exceed two doses in a 24-hour period.
- Have patient sit upright and tilt head back slightly.
- Have patient occlude opposite nostril during administration.
- Wait 1 to 2 minutes between sprays.
- Rinse tip of container with hot water and dry with a clean tissue.

### ACTION

Thought to cause local vasoconstriction of dilated arterioles, reducing blood flow and nasal congestion.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Intranasal | 5–10 min | 6 hr | <12 hr |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CNS:** anxiety, dizziness, headache, insomnia, restlessness.
**CV:** ***CV collapse,*** hypertension, palpitations.
**EENT:** dryness of nose and throat, increased nasal discharge, rebound nasal congestion or irritation, sneezing, stinging.
**Other:** systemic effects in children.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in children younger than age 6.
- Use cautiously in patients with hyperthyroidism, cardiac disease, hypertension, or diabetes mellitus.
- Use cautiously in those with difficulty urinating because of an enlarged prostate.

⚠ ***Overdose S&S:*** Hypertension, bradycardia, drowsiness, rebound hypotension.

### NURSING CONSIDERATIONS

- Monitor patient for rebound congestion or systemic effects.
- Don't give to children younger than age 6.

### PATIENT TEACHING

- Teach patient how to use drug.
- Caution patient not to share drug because this could spread infection.
- Tell patient not to exceed recommended dosage and to use only when needed.
- Inform patient that prolonged use may result in rebound congestion.

***Alert:*** Warn patient that excessive use may cause slow or rapid heart rate, high blood pressure, dizziness, and weakness.

## oxymetazoline hydrochloride (ophthalmic)

ox-i-met-AZ-oh-leen

OcuClear ◇, Visine L.R. ◇

*Therapeutic class:* Vasoconstrictor
*Pharmacologic class:* Direct-acting sympathomimetic amine
*Pregnancy risk category C*

### AVAILABLE FORMS

*Ophthalmic solution:* 0.025%

### INDICATIONS & DOSAGES

➤ **Relief from eye redness caused by minor eye irritation**

*Adults and children age 6 and older:* Instill 1 to 2 drops in affected eye every 6 hours, as needed.

### ADMINISTRATION

**Ophthalmic**

- Don't use if solution has become cloudy or changed color.
- Apply light finger pressure on lacrimal sac for 1 minute after drug instillation.
- Don't touch tip of dropper to any surface.

### ACTION

Acts on alpha-adrenergic receptors in the arterioles of the conjunctiva to produce vasoconstriction, resulting in decreased conjunctival congestion.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | 5 min | Unknown | 6 hr |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CNS:** headache, insomnia, lightheadedness, nervousness.
**CV:** irregular heartbeat, palpitations, tachycardia.
**EENT:** *transient stinging on first instillation*, blurred vision, increased intraocular pressure, keratitis, lacrimation, reactive hyperemia with excessive doses or prolonged use.
**Other:** trembling.

### INTERACTIONS

**Drug-drug.** *Anesthetics:* Cyclopropane and halothane may sensitize the myocardium to sympathomimetics; local anesthetics may increase the absorption of topical drugs. Monitor patient for increased adverse effects.
*Beta blockers:* May cause more systemic adverse effects. Monitor patient for adverse systemic effects.
*MAO inhibitors, maprotiline, tricyclic antidepressants:* If significant systemic absorption of oxymetazoline occurs, use together may increase pressor effect of oxymetazoline. Avoid using together.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those with angle-closure glaucoma.
- Use cautiously in patients with hyperthyroidism, cardiac disease, hypertension, eye disease, infection, or injury.

### NURSING CONSIDERATIONS

- Rebound congestion and conjunctivitis may occur with frequent or prolonged use.
- ***Look alike–sound alike:*** Don't confuse Visine with Visken.

### PATIENT TEACHING

- Teach patient how to instill drops. Advise him to wash hands before and after instillation, and warn him not to touch tip of dropper to eye or surrounding tissue.
- Instruct patient to apply light finger pressure on lacrimal sac for 1 minute after drug instillation.
- Advise patient to stop drug and consult prescriber if eye pain occurs, if vision changes, or if redness or irritation continues, worsens, or lasts for longer than 72 hours.

**SAFETY ALERT!**

# oxymorphone hydrochloride

ox-i-MOR-fone

Opana, Opana ER

*Therapeutic class:* Opioid analgesic
*Pharmacologic class:* Opioid
*Pregnancy risk category C; D if used for prolonged periods or high doses at term*
*Controlled substance schedule II*

## AVAILABLE FORMS

*Injection:* 1 mg/ml
*Tablets:* 5 mg, 10 mg
*Tablets (extended-release [ER]):* 5 mg, 7.5 mg, 10 mg, 15 mg, 20 mg, 30 mg, 40 mg

## INDICATIONS & DOSAGES

➤ **Moderate to severe pain**

*Adults:* 1 to 1.5 mg I.M. or subcutaneously every 4 to 6 hours p.r.n. Or, 0.5 mg I.V. every 4 to 6 hours p.r.n. Or, in opioid-naive patients, 10 to 20 mg P.O. every 4 to 6 hours. If needed, begin dosing at 5 mg P.O. and adjust based on patient response.

➤ **Moderate to severe pain in patients requiring continuous, around-the-clock opioid treatment for an extended period of time**

*Opioid-naive adults:* Using ER form, give 5 mg P.O. every 12 hours. Increase 5 to 10 mg every 12 hours every 3 to 7 days as needed and tolerated.

*Nonopioid-naive adults:* Patients taking Opana immediate-release tablets can be switched to Opana ER tablets by giving one-half the patient's total daily dose as Opana ER every 12 hours.

***Adjust-a-dose:*** For patients with mild hepatic impairment or creatinine clearance less than 50 ml/minute, start with the lowest possible dose and slowly increase as tolerated.

➤ **Analgesia during labor**

*Adults:* 0.5 to 1 mg I.M.

## ADMINISTRATION

**P.O.**

● Take tablets 1 hour before or 2 hours after a meal.

**Black Box Warning** Don't crush, break, chew, or dissolve ER tablets. ■

**Black Box Warning** ER tablets aren't for as-needed use. ■

**I.V.**

▼ Assess respiratory status before giving. Withhold dose and notify prescriber if respirations are shallow or rate falls below 12 breaths/minute.
▼ If necessary, dilute drug in normal saline solution.
▼ Give drug by direct I.V. injection.
▼ **Incompatibilities:** None reported.

**I.M.**

● Rotate administration sites and document.
● Assess respiratory status before giving. Withhold dose and notify prescriber if respirations are shallow or rate falls below 12 breaths/minute.

**Subcutaneous**

● Rotate administration sites and document.
● Assess respiratory status before giving. Withhold dose and notify prescriber if respirations are shallow or rate falls below 12 breaths/minute.

## ACTION

May bind with opioid receptors in the CNS, altering perception of and emotional response to pain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Varies | Varies | Varies |
| I.V. | 5–10 min | 15–30 min | 3–4 hr |
| I.M. | 10–15 min | 30–90 min | 3–6 hr |
| Subcut. | 10–20 min | 60–90 min | 3–6 hr |

*Half-life:* For parenteral, unknown. For ER tablets, 7 to 12 hours. For immediate-release tablets, 3 to 12 hours.

## ADVERSE REACTIONS

**CNS:** *clouded sensorium, dizziness, euphoria, headache, sedation, somnolence,* ***seizures,*** dysphoria, light-headedness, hallucinations, physical dependence, restlessness.
**CV:** *hypotension,* ***bradycardia.***
**EENT:** blurred vision, diplopia, miosis.
**GI:** *constipation, nausea, vomiting,* ileus.
**GU:** *urine retention.*
**Respiratory:** ***respiratory depression.***
**Skin:** increased sweating, pruritus.

## INTERACTIONS

**Drug-drug.** *Agonist or antagonist analgesics:* May reduce analgesic effect or

precipitate withdrawal symptoms. Don't use together.
*Anticholinergics:* May increase risk of urine retention or severe constipation, leading to paralytic ileus. Monitor patient for abdominal pain or distention.
*CNS depressants, general anesthetics, MAO inhibitors, phenothiazines, sedative hypnotics, tricyclic antidepressants:* May cause additive effects. Use together with caution and reduce opioid dosage.
**Black Box Warning** **Drug-lifestyle.** *Alcohol use:* Alcoholic beverages or medications containing alcohol may cause additive effects and result in a potentially fatal overdose of oxymorphone. Don't use together. ■

## EFFECTS ON LAB TEST RESULTS

- May increase amylase and lipase levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with acute asthma attacks, severe respiratory depression, upper airway obstruction, paralytic ileus, or those with moderate to severe hepatic impairment.
- Contraindicated in patients with pulmonary edema caused by a respiratory irritant.
- Use with caution in elderly or debilitated patients and in those with head injury, increased intracranial pressure, seizures, asthma, COPD, acute abdominal conditions, biliary tract disease (including pancreatitis), acute alcoholism, delirium tremens, prostatic hyperplasia, renal or mild hepatic impairment, urethral stricture, respiratory depression, hypothyroidism, Addison disease, and arrhythmias.

***Overdose S&S:*** Miosis, CNS depression, respiratory depression, apnea, flaccid skeletal muscles, bradycardia, hypotension, circulatory collapse, cardiac arrest, respiratory arrest, death.

## NURSING CONSIDERATIONS

- Keep opioid antagonist (naloxone) and resuscitation equipment available.
- Use of this drug may worsen gallbladder pain.
- Drug isn't for mild pain. For better effect, give drug before patient has intense pain.
- Monitor CV and respiratory status. Withhold dose and notify prescriber if respirations decrease or rate is below 12 breaths/minute.
- Monitor bladder and bowel function. Patient may need a stimulant laxative.

**Black Box Warning** Drug has an abuse liability similar to other opioid analgesics. Consider this when concerned about an increased risk of misuse, abuse, or diversion. ■

- ***Look alike–sound alike:*** Don't confuse oxymorphone with oxymetholone or oxycodone.

## PATIENT TEACHING

- Instruct patient to ask for drug before pain is intense. Inform patient that ER tablets must be taken around-the-clock.
- When drug is used I.M. or I.V. after surgery, encourage patient to turn, cough, and deep-breathe and to use incentive spirometer to avoid lung problems.
- Caution ambulatory patient about getting out of bed or walking. Warn outpatient to avoid driving and other hazardous activities that require mental alertness until drug's CNS effects are known.

**Black Box Warning** Caution patient not to consume alcohol or take any prescription or OTC drug containing alcohol with oral form as this can lead to an overdose. ■

**Black Box Warning** Warn patient not to crush, break, chew, or dissolve ER tablets; doing so may lead to a fatal overdose. ■

- Tell patient to take tablets 1 hour before or 2 hours after a meal.
- Instruct patient to keep tablets in a child-resistant container in a safe place. Accidental ingestion by a child can result in death.

# oxytocin, synthetic injection

ox-i-TOE-sin

Pitocin

*Therapeutic class:* Oxytocic
*Pharmacologic class:* Exogenous hormone
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 10 units/ml in 1-ml ampule, 1-ml, 3-ml, and 10-ml vials, or syringe

## INDICATIONS & DOSAGES

➤ **To induce or stimulate labor**

*Adults:* Initially, 10 units in 1,000 ml of $D_5W$ injection, lactated Ringer's, or normal saline solution I.V. infused at 0.5 to 2 milliunits/minute. Increase rate by 1 to 2 milliunits/minute at 30- to 60-minute intervals until normal contraction pattern is established. Decrease rate when labor is firmly established. Rates exceeding 9 to 10 milliunits/minute are rarely required.

➤ **To reduce postpartum bleeding after expulsion of placenta**

*Adults:* 10 to 40 units in 1,000 ml of $D_5W$ injection, lactated Ringer's, or normal saline solution I.V. infused at rate needed to control bleeding, which is usually 20 to 40 milliunits/minute. Also, 10 units may be given I.M. after delivery of placenta.

➤ **Incomplete or inevitable abortion**

*Adults:* 10 units I.V. in 500 ml of normal saline solution, lactated Ringer's, or dextrose 5% in normal saline solution. Infuse at 10 to 20 milliunits (20 to 40 drops)/minute. Don't exceed 30 units in 12 hours.

## ADMINISTRATION

**I.V.**

▼ Never give drug simultaneously by more than one route.

▼ To induce or stimulate labor, dilute drug by adding 10 units to 1 L of normal saline, lactated Ringer's, or $D_5W$ solution.

▼ To produce intense uterine contractions and reduce postpartum bleeding, dilute drug by adding 10 units to 500 ml of normal saline, lactated Ringer's, or $D_5W$ solution.

▼ Don't give bolus injection; use an infusion pump. Give drug only by piggyback infusion so that it may be stopped without interrupting I.V. line.

▼ **Incompatibilities:** Fibrinolysin (human), norepinephrine bitartrate, Normosol-M with dextrose 5%, plasmin, prochlorperazine, sodium bisulfite, warfarin sodium.

**I.M.**

● Drug isn't recommended for routine I.M. use, but 10 units may be given I.M. after delivery of placenta to control postpartum uterine bleeding.

● Never give drug simultaneously by more than one route.

## ACTION

Causes potent and selective stimulation of uterine and mammary gland smooth muscle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Unknown | 1 hr |
| I.M. | 3–5 min | Unknown | 2–3 hr |

*Half-life:* 3 to 5 minutes.

## ADVERSE REACTIONS

**Maternal**

**CNS:** ***subarachnoid hemorrhage, seizures, coma.***

**CV:** ***arrhythmias,*** hypertension, premature ventricular contractions.

**GI:** nausea, vomiting.

**GU:** ***abruptio placentae,*** tetanic uterine contractions, ***postpartum hemorrhage, uterine rupture,*** impaired uterine blood flow, pelvic hematoma, increased uterine motility.

**Hematologic:** ***afibrinogenemia, possibly related to postpartum bleeding.***

**Other:** ***anaphylaxis, death from oxytocin-induced water intoxication,*** hypersensitivity reactions.

**Fetal**

**CNS:** ***infant brain damage, seizures.***

**CV:** ***bradycardia, arrhythmias,*** PVCs.

**EENT:** neonatal retinal hemorrhage.

**Hepatic:** neonatal jaundice.

**Other:** ***low Apgar scores at 5 minutes, death.***

0

## INTERACTIONS

**Drug-drug.** *Cyclopropane anesthetics:* May cause less pronounced bradycardia and hypotension. Use together cautiously.
*Thiopental anesthetics:* May delay induction. Use together cautiously.
*Vasoconstrictors:* May cause severe hypertension if oxytocin is given within 3 to 4 hours of vasoconstrictor in patient receiving caudal block anesthetic. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Contraindicated when vaginal delivery isn't advised (placenta previa, vasa previa, invasive cervical carcinoma, genital herpes), when cephalopelvic disproportion is present, or when delivery requires conversion, as in transverse lie.
- Contraindicated in fetal distress when delivery isn't imminent, in prematurity, in other obstetric emergencies, and in patients with severe toxemia or hypertonic uterine patterns.
- Use cautiously during first and second stages of labor because cervical laceration, uterine rupture, and maternal and fetal death have been reported.
- Use cautiously, if at all, in patients with invasive cervical cancer and in those with previous cervical or uterine surgery (including cesarean section), grand multiparity, uterine sepsis, traumatic delivery, or overdistended uterus.

***Overdose S&S:*** Uterine hypersensitivity, tumultuous labor, uterine rupture, cervical and vaginal lacerations, postpartum hemorrhage, uteroplacental hypoperfusion, variable deceleration of fetal heart rate, fetal hypoxia, hypercapnia, perinatal hepatic necrosis, water intoxication, seizures, death.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug is only indicated for the medical, rather than the elective, induction of labor.

- Drug is used to induce or reinforce labor only when pelvis is known to be adequate, when vaginal delivery is indicated, when fetal maturity is assured, and when fetal position is favorable. Use drug only in hospital where critical care facilities and prescriber are immediately available.
- Monitor fluid intake and output. Antidiuretic effect may lead to fluid overload, seizures, and coma from water intoxication.
- Monitor and record uterine contractions, heart rate, blood pressure, intrauterine pressure, fetal heart rate, and character of blood loss every 15 minutes.
- Have 20% magnesium sulfate solution available to relax the myometrium.
- If contractions occur less than 2 minutes apart, exceed 50 mm, or last 90 seconds or longer, stop infusion, turn patient on her side, and notify prescriber.
- Drug doesn't cause fetal abnormalities when used as indicated.
- ***Look alike–sound alike:*** Don't confuse Pitocin with Pitressin.

## PATIENT TEACHING

- Explain use and administration of drug to patient and family.
- Instruct patient to report adverse reactions promptly.

**SAFETY ALERT!**

# paclitaxel

pak-leh-TAX-ell

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Taxoid
*Pregnancy risk category D*

## AVAILABLE FORMS

*Injection:* 6 mg/ml in 5-, 16.7-, 25-, 50-ml vials

## INDICATIONS & DOSAGES

➤ **AIDS-related Kaposi sarcoma**

*Adults:* 135 mg/m$^2$ I.V. over 3 hours every 3 weeks, or 100 mg/m$^2$ I.V. over 3 hours every 2 weeks.

***Adjust-a-dose:*** Don't give drug if baseline or subsequent neutrophil counts are less than 1,000/mm$^3$. Reduce subsequent doses by 20% for patients who experience neutrophil count 500/mm$^3$ for 1 week or longer. Patient also may need reduction in dexamethasone

premedication dose (10 mg P.O. instead of 20 mg P.O.) and start of a hematopoietic growth factor.

***Adjust-a-dose:*** For patients with hepatic impairment, reduce first 3-hour dose based on transaminase and bilirubin levels. If transaminase levels are less than 10 times upper limit of normal (ULN) and bilirubin levels are 1.25 times ULN or less, give 175 mg/m$^3$. If transaminase levels are less than 10 times ULN and bilirubin levels are 1.26 to 2 times ULN, give 135 mg/m$^2$. If transaminase levels are less than 10 times ULN and bilirubin levels are 2.01 to 5 times ULN, give 90 mg/m$^2$. If transaminase levels are 10 times ULN or more or bilirubin levels are more than 5 times ULN, don't use drug. For subsequent courses, base dosage adjustment on individual tolerance.

➤ **First-line and subsequent therapy for advanced ovarian cancer**

*Adults (previously untreated):* 175 mg/m$^2$ over 3 hours every 3 weeks, followed by cisplatin 75 mg/m$^2$; or, 135 mg/m$^2$ over 24 hours, followed by cisplatin 75 mg/m$^2$, every 3 weeks.

*Adults (previously treated):* 135 or 175 mg/m$^2$ I.V. over 3 hours every 3 weeks.

***Adjust-a-dose:*** For patients with hepatic impairment, reduce first 3-hour dose based on transaminase and bilirubin levels. If transaminase levels are less than 10 times upper limit of normal (ULN) and bilirubin levels are 1.25 times ULN or less, give 175 mg/m$^3$. If transaminase levels are less than 10 times ULN and bilirubin levels are 1.26 to 2 times ULN, give 135 mg/m$^2$. If transaminase levels are less than 10 times ULN and bilirubin levels are 2.01 to 5 times ULN, give 90 mg/m$^2$. If transaminase levels are 10 times ULN or more or bilirubin levels are more than 5 times ULN, don't use drug. For subsequent courses, base dosage adjustment on individual tolerance.

➤ **Breast cancer after failure of combination chemotherapy for metastatic disease or relapse within 6 months of adjuvant chemotherapy (previous therapy should have included an anthracycline unless contraindicated); adjuvant therapy for node-positive breast cancer given sequentially to standard doxorubicin-containing combination chemotherapy**

*Adults:* 175 mg/m$^2$ I.V. over 3 hours every 3 weeks for four cycles.

***Adjust-a-dose:*** For patients with hepatic impairment, reduce first 3-hour dose based on transaminase and bilirubin levels. If transaminase levels are less than 10 times upper limit of normal (ULN) and bilirubin levels are 1.25 times ULN or less, give 175 mg/m$^3$. If transaminase levels are less than 10 times ULN and bilirubin levels are 1.26 to 2 times ULN, give 135 mg/m$^2$. If transaminase levels are less than 10 times ULN and bilirubin levels are 2.01 to 5 times ULN, give 90 mg/m$^2$. If transaminase levels are 10 times ULN or more or bilirubin levels are more than 5 times ULN, don't use drug. For subsequent courses, base dosage adjustment on individual tolerance.

➤ **First treatment of advanced non–small-cell lung cancer for patients who aren't candidates for curative surgery or radiation**

*Adults:* 135 mg/m$^2$ I.V. infusion over 24 hours, followed by cisplatin 75 mg/m$^2$. Repeat cycle every 3 weeks.

***Adjust-a-dose:*** Subsequent courses shouldn't be repeated until neutrophil count is at least 1,500/mm$^3$ and platelet count is at least 100,000/mm$^3$. Reduce subsequent doses by 20% for patients who experience neutrophil count less than 500/mm$^3$ for a week or longer or severe peripheral neuropathy. For patients with hepatic impairment, adjust doses for the first courses of therapy as follows: For first 24-hour infusion if transaminase levels are less than two times the upper limit of normal (ULN) and bilirubin levels are 1.5 mg/dl or less, give 135 mg/m$^2$. If transaminase levels are two to less than 10 times ULN and bilirubin levels are 1.5 mg/dl or less, give 100 mg/m$^2$. If transaminase levels are less than 10 times ULN and bilirubin levels are 1.6 to 7.5 mg/dl, give 50 mg/m$^2$. If transaminase levels are 10 times ULN or more, or bilirubin levels are more than 7.5 mg/dl, don't use drug.

## ADMINISTRATION

**I.V.**

▼ Preparing and giving drug may be mutagenic, teratogenic, or carcinogenic. Follow institutional policy to reduce

P

risks. Mark all waste materials with CHEMOTHERAPY HAZARD labels.
▼ Prepare and store infusion solutions in glass containers. Undiluted concentrate shouldn't contact polyvinyl chloride I.V. bags or tubing.
▼ Dilute concentrate before infusion. Compatible solutions include normal saline solution for injection, $D_5W$, 5% dextrose in normal saline solution for injection, and 5% dextrose in Ringer's lactate injection. Dilute to yield 0.3 to 1.2 mg/ml. Diluted solutions are stable for 24 hours at room temperature. Prepared solution may appear hazy.
▼ Give through polyethylene-lined administration sets, and use an in-line 0.22-micron filter.
▼ Watch for irritation and infiltration; extravasation can cause tissue damage and necrosis.
▼ Closely monitor patient and vital signs during infusion, especially during the first hour.
▼ Store diluted solution in glass or polypropylene bottles, or use polypropylene or polyolefin bags.
▼ **Incompatibilities:** Amphotericin B, chlorpromazine, cisplatin, doxorubicin liposomal, hydroxyzine hydrochloride, methylprednisolone sodium succinate, mitoxantrone.

## ACTION

Prevents depolymerization of cellular microtubules, inhibiting normal reorganization of microtubule network needed for mitosis and other vital cellular functions.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* After 6- to 12-hour infusion, distribution and elimination half-lives average about 30 minutes and 6 hours, respectively. For 3-hour infusion, distribution and elimination half-lives average about 30 minutes and 2½ hours, respectively.

## ADVERSE REACTIONS

**CNS:** *peripheral neuropathy, asthenia.*
**CV:** ***bradycardia,*** *hypotension, abnormal ECG.*
**GI:** *nausea, vomiting, diarrhea, mucositis.*
**Hematologic:** NEUTROPENIA, LEUKOPENIA, THROMBOCYTOPENIA, *anemia,* BLEEDING.
**Musculoskeletal:** *myalgia, arthralgia.*
**Skin:** *alopecia, cellulitis and phlebitis at injection site.*
**Other:** hypersensitivity reactions, ***anaphylaxis,*** *infections.*

## INTERACTIONS

**Drug-drug.** *Carbamazepine, phenobarbital:* May increase metabolism and may decrease paclitaxel levels. Use together cautiously.
*Cisplatin:* May cause additive myelosuppressive effects. Give paclitaxel before cisplatin.
*Doxorubicin, cyclosporine, felodipine, ketoconazole:* May increase plasma levels of doxorubicin and its active metabolite, doxorubicinol. Use together cautiously.
*Drugs that inhibit cytochrome P-450, such as cyclosporine, dexamethasone, diazepam, etoposide,* ***ketoconazole,*** *quinidine, retinoic acid, teniposide, testosterone, verapamil, vincristine:* May increase paclitaxel level. Monitor patient for toxicity.

## EFFECTS ON LAB TEST RESULTS

● May increase alkaline phosphatase, AST, and triglyceride levels. May decrease hemoglobin level.
● May decrease neutrophil, WBC, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or polyoxyethylated castor oil (also known as Cremophor EL, a vehicle used in drug solution).
**Black Box Warning** Contraindicated those with baseline neutrophil counts below 1,500/$mm^3$ and platelet counts below 100,000/$mm^3$, or AIDS-related Kaposi sarcoma with baseline neutrophil counts below 1,000/$mm^3$. ■
● Use cautiously in patients with hepatic impairment.
⚠ ***Overdose S&S:*** Bone marrow suppression; sensory neurotoxicity; mucositis; acute ethanol toxicity (in children); CNS toxicity (in children).

## NURSING CONSIDERATIONS

**Black Box Warning** Administer drug under the supervision of a physician experienced with cancer chemotherapeutic agents. ■

• Patient may experience peripheral neuropathies, which may be cumulative and dose related. Patients with severe symptoms may need dosage reduction.

**Black Box Warning** To reduce risk or severity of hypersensitivity, patients must receive pretreatment with corticosteroids, such as dexamethasone, and antihistamines. Both $H_1$-receptor antagonists, such as diphenhydramine, and $H_2$-receptor antagonists, such as cimetidine or ranitidine, may be used. Fatal reactions have occurred despite premedication. ■

**Black Box Warning** Monitor blood counts often during therapy. Bone marrow toxicity is the most common and dose-limiting toxicity. Packed RBC or platelet transfusions may be needed in severe cases. Institute bleeding precautions, as indicated. ■

• Avoid all I.M. injections when platelet count is below 50,000/$mm^3$.

• If patient develops significant cardiac conduction abnormalities, use indicated therapy and continuous cardiac monitoring during therapy and subsequent infusions.

***Alert:*** When indicated, cisplatin dose should follow dose of paclitaxel.

• ***Look alike–sound alike:*** Don't confuse paclitaxel with paroxetine.

## PATIENT TEACHING

• Advise patient to report any pain or burning at site of injection during or after administration.

• Urge patient to watch for fever, sore throat, and fatigue and for easy bruising, nosebleeds, bleeding gums, or tarry stools. Tell patient to take temperature daily.

• Teach patient symptoms of peripheral neuropathy, such as a tingling or burning sensation or numbness in limbs, and to report these symptoms immediately.

• Warn patient that reversible hair loss will probably occur.

• Caution woman of childbearing age to avoid becoming pregnant during therapy. Recommend that she consult prescriber before becoming pregnant.

**SAFETY ALERT!**

# paclitaxel protein-bound particles

pak-leh-TAX-ell

Abraxane

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Taxoid
*Pregnancy risk category D*

## AVAILABLE FORMS

*Lyophilized powder for injection:* 100 mg in single-use vials

## INDICATIONS & DOSAGES

➤ **Metastatic breast cancer after failure of combination chemotherapy or relapse within 6 months of adjuvant chemotherapy (previous therapy should have included an anthracycline unless clinically contraindicated at the time)**

*Adults:* 260 mg/$m^2$ I.V. over 30 minutes every 3 weeks.

***Adjust-a-dose:*** For patients with severe sensory neuropathy or a neutrophil count less than 500/$mm^3$ for a week or longer, reduce dose to 220 mg/$m^2$. For recurring severe sensory neuropathy or severe neutropenia, reduce dose to 180 mg/$m^2$. For grade 3 (severe) sensory neuropathy, stop drug until condition improves to a grade 1 or 2 (mild to moderate); then restart at a reduced dose for the rest of treatment.

For patients with moderate hepatic impairment (serum bilirubin level 1.26 to 2 times upper limit of normal [ULN] and AST level 1 to 10 times ULN), recommended dosage is 200 mg/$m^2$/dose. For patients with severe hepatic impairment (serum bilirubin level 2.01 to 5 times ULN and AST level 1 to 10 times ULN), recommended dosage is 130 mg/$m^2$/dose initially; may be increased to 200 mg/$m^2$/dose as tolerated. Don't give to patients with very severe hepatic impairment (serum bilirubin level more than 5 times ULN or AST level more than 10 times ULN).

P

## ADMINISTRATION

### I.V.

▼ Because of drug's cytotoxicity, handle it cautiously and wear gloves. If drug contacts skin, wash area thoroughly with soap and water. If drug contacts mucous membranes, flush them thoroughly with water.

▼ Reconstitute the vial with 20 ml of normal saline solution to yield 5 mg/ml of drug. Direct the stream slowly, over at least 1 minute, onto the inside wall of the vial to avoid foaming. Let the vial sit for 5 minutes to ensure proper wetting of the powder. Gently swirl or turn the vial for at least 2 minutes until completely dissolved. If foaming occurs, let the solution stand for 15 minutes for the foam to subside. If particles are visible, gently invert the vial again to ensure complete resuspension. The solution should appear milky and uniform. Inject the correct dose into an empty polyvinyl chloride–type I.V. bag and use immediately.

▼ Give drug over 30 minutes.

▼ The suspension for infusion, when prepared in an infusion bag, is stable at room temperature and normal lighting for up to 8 hours.

▼ Store unopened vials at room temperature in the original package. Store reconstituted vials at 36° to 46° F (2° to 8° C) for up to 8 hours, protected from light.

▼ **Incompatibilities:** None known.

## ACTION

Prevents depolymerization of cellular microtubules, inhibiting reorganization of the microtubule network and disrupting mitosis and other vital cell functions.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 27 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia, sensory neuropathy.*
**CV:** *abnormal ECG, edema,* ***cardiac arrest,*** chest pain, ***supraventricular tachycardia, thromboembolism, thrombosis,*** hypertension, hypotension.
**EENT:** *visual disturbances.*
**GI:** *diarrhea, nausea, oral candidiasis, vomiting,* intestinal obstruction, ***ischemic colitis, pancreatitis, perforation,*** mucositis.
**Hematologic:** *anemia,* **NEUTROPENIA,** ***thrombocytopenia, bleeding.***
**Hepatic:** ***hepatic encephalopathy, hepatic necrosis.***
**Musculoskeletal:** *arthralgia, myalgia.*
**Respiratory:** ***pulmonary embolism,*** *cough, dyspnea, pneumonia, respiratory tract infection.*
**Skin:** *alopecia,* injection site reactions.
**Other:** *infections,* hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Cytochrome P-450 inhibitors:* May decrease paclitaxel metabolism. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

• May increase alkaline phosphatase, AST, bilirubin, creatinine, and GGT levels. May decrease hemoglobin level.
• May decrease neutrophil and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Contraindicated in patients with baseline neutrophil counts of under 1,500/mm$^3$.
• Don't retreat until neutrophil counts recover to more than 1,500/mm$^3$ and platelet count recovers to more than 100,000/mm$^3$.
• In patients with creatinine level over 2 mg/dl or bilirubin level over 1.5 mg/dl, use hasn't been studied.
***Overdose S&S:*** Bone marrow suppression; sensory neurotoxicity; acute ethanol toxicity (in children); CNS toxicity (in children).

## NURSING CONSIDERATIONS

**Black Box Warning** Give only under supervision of practitioner experienced in using chemotherapy in a facility that can manage complications of therapy.
**Black Box Warning** Don't substitute Abraxane for other forms of paclitaxel.
• Because drug contains human albumin, a remote risk exists of transmitting viruses and Creutzfeldt-Jakob disease.

- Assess patient for symptoms of sensory neuropathy and severe neutropenia.
- Monitor liver and kidney function test results.
- Monitor infusion site closely.

### PATIENT TEACHING

- Warn patient that alopecia commonly occurs but is reversible after therapy.
- Teach patient to recognize signs of neuropathy, such as tingling, burning, and numbness in arms and legs.
- Tell patient to report fever or other signs of infection, severe abdominal pain, or severe diarrhea.
- Advise patient to contact prescriber if nausea and vomiting persist or interfere with adequate nutrition. Reassure patient that an antiemetic can be prescribed.
- Explain that many patients experience weakness and fatigue, so it's important to rest. Tiredness, paleness, and shortness of breath may result from low blood counts, and patient may need a transfusion.
- To reduce or prevent mouth sores, remind patient to perform proper oral hygiene.
- Tell women to avoid becoming pregnant or breast-feeding and men to avoid fathering a child during therapy.

## paliperidone

pahl-ee-PEHR-ih-dohn

Invega

## paliperidone palmitate

Invega Sustenna

*Therapeutic class:* Antipsychotic
*Pharmacologic class:* Benzisoxazole derivative
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets (extended-release):* 1.5 mg, 3 mg, 6 mg, 9 mg
*Injection:* 39 mg, 78 mg, 117 mg, 156 mg, 234 mg

### INDICATIONS & DOSAGES

➤ **Schizophrenia and schizoaffective disorder**

*Adults:* 6 mg P.O. once daily in the morning; may increase or decrease dose by 3-mg increments to a range of 3 mg to 12 mg daily; don't exceed 12 mg per day. Or, 234 mg I.M. on treatment day 1 and 156 mg I.M. 1 week later, both administered in deltoid muscle. Recommended maintenance dosage is 117 mg I.M. monthly (range, 39 to 234 mg based on tolerability and efficacy). Adjustments may be made monthly. See manufacturer's instructions for missed dosage schedules.

***Adjust-a-dose:*** In patients with creatinine clearance of 50 to 80 ml/minute, initial dosage is 3 mg P.O. once daily and maximum dosage is 6 mg once daily; for patients with clearance of 10 to 49 ml/minute, initial dosage is 1.5 mg P.O. once daily and maximum dosage is 3 mg once daily. If using injectable form and clearance is 50 to 80 ml/minute, give 156 mg I.M. on day 1 and 117 mg I.M. 1 week later, followed by monthly injections of 78 mg.

### ADMINISTRATION

**P.O.**

- Don't crush or break tablets.

**I.M.**

- Inspect for particulate matter and discoloration.
- Inject slowly and deeply into muscle.
- Administer first two doses into deltoid muscle. After second dose, monthly maintenance doses can be given in deltoid or gluteal muscle.
- Injection is for single use only. Don't administer dose in divided injections.

### ACTION

May antagonize both central dopamine ($D_2$) and serotonin type 2 receptors; also alpha-1, alpha-2, and histamine-1 receptors. Drug is a major active metabolite of risperidone.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 24 hr | Unknown |
| I.M. | 24 hr | 13 days | 126 days |

*Half-life:* 23 hours. I.M. is 25 to 49 days.

### ADVERSE REACTIONS

**CNS:** *akathisia, headache, parkinsonism, somnolence,* anxiety, asthenia, dizziness, dystonia, extrapyramidal disorder, fatigue,

hypertonia, pyrexia, tremor, dyskinesia, hyperkinesia, *insomnia,* ***suicidal ideation.***
**CV:** abnormal T waves, hypertension, orthostatic hypotension, palpitations, sinus arrhythmia, tachycardia, **AV BLOCK,** *bundle branch block,* **PROLONGED QTc INTERVAL.**
**EENT:** blurred vision.
**GI:** abdominal pain, dry mouth, dyspepsia, nausea, salivary hypersecretion, vomiting, diarrhea, constipation.
**Metabolic:** blood insulin increases, hyperprolactinemia.
**Musculoskeletal:** back pain, extremity pain.
**Respiratory:** cough.
**Skin:** injection-site reaction.

## INTERACTIONS

**Drug-drug.** *Anticholinergics:* May worsen side effects. Use cautiously together.
*Antihypertensives:* May worsen orthostatic hypotension. Avoid using together.
*Central-acting drugs:* May worsen CNS side effects. Use cautiously together.
*Drugs that prolong QTc intervals, such as antiarrhythmics (quinidine, procainamide, amiodarone, sotalol), antipsychotics (chlorpromazine, thioridazine), quinolone antibiotics (moxifloxacin):* May further prolong QTc interval. Avoid using together.
*Levodopa, dopamine agonists:* May antagonize effects of these drugs. Use cautiously together.
**Drug-lifestyle.** *Alcohol use:* May worsen CNS side effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase insulin and prolactin levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to paliperidone or risperidone.

**Black Box Warning** Elderly patients with dementia-related psychosis treated with atypical or conventional antipsychotics are at increased risk for death. Antipsychotics aren't approved for the treatment of dementia-related psychosis.

- Contraindicated in patients with congenital long QT syndrome or history of cardiac arrhythmias.
- Contraindicated in patients with preexisting severe GI narrowing (esophageal motility disorders, small bowel inflammatory disease, short gut syndrome).
- Use cautiously in patients with a history of seizures or diabetes; those at risk for aspiration pneumonia; and those with bradycardia, hypokalemia, hypomagnesemia, CV disease, cerebrovascular disease, dehydration, or hypovolemia.
- Use cautiously in patients taking antihypertensives and drugs that lower the seizure threshold.
- Use cautiously in patients with history of suicide attempts.

***Overdose S&S:*** Extrapyramidal symptoms, unsteady gait, drowsiness, sedation, tachycardia, hypotension, prolonged QT interval.

## NURSING CONSIDERATIONS

- Establish tolerability with oral paliperidone or oral risperidone before initiating treatment with paliperidone injection.

***Alert:*** Monitor patient for atypical ventricular tachycardia, such as torsades de pointes, and ECG changes, particularly lengthening of the QT interval.

- Obtain baseline blood pressure before starting therapy and monitor pressure regularly. Watch for orthostatic hypotension.

***Alert:*** Watch for evidence of neuroleptic malignant syndrome (extrapyramidal effects, hyperthermia, autonomic disturbance), which is rare but deadly.

- Monitor patient for tardive dyskinesia; it may disappear spontaneously or persist for life, despite ending drug. Seek smallest dosage and shortest duration of treatment that produce a satisfactory clinical response. Periodically reassess need for continued treatment.

***Alert:*** Drug may cause hyperglycemia. Monitor patient with diabetes regularly. In patient with risk factors for diabetes, obtain fasting blood glucose test results at baseline and periodically.

- Monitor patient for seizure activity, especially if patient has conditions that lower the seizure threshold.
- Monitor patient for dysphagia that can lead to aspiration and aspiration pneumonia.

• Monitor patient for abnormal body temperature regulation, especially if he exercises, is exposed to extreme heat, takes anticholinergics, or is dehydrated.
• Monitor patient for somnolence and sedation. Antipsychotics, including paliperidone, have the potential to impair judgment, thinking, or motor skills.
• Dispense lowest appropriate quantity of drug, to reduce risk of overdose.

### PATIENT TEACHING

• Tell patient that remains of the tablet may appear in feces.
• Tell patient to swallow whole with liquids and not to chew, crush, or break tablets.
• Instruct the patient not to perform activities that require mental alertness until effects of drug are known.
• Warn patient to use caution in performing excessively strenuous activities because his body temperature may be disrupted.
• Advise patient that drug may lower blood pressure and to change positions slowly.
• Advise patient to seek medical attention if he experiences an erection lasting more than 4 hours.
• Instruct patient to contact prescriber before taking any other drugs to avoid potential interactions.
• Advise patient to avoid alcohol while taking this medication.
• Advise patient to contact prescriber if she becomes pregnant or wants to breast-feed.

## palonosetron hydrochloride

pal-on-OS-e-tron

Aloxi

*Therapeutic class:* Antiemetic
*Pharmacologic class:* Selective serotonin (5-$HT_3$) receptor antagonist
*Pregnancy risk category B*

### AVAILABLE FORMS

*Capsules:* 0.5 mg
*Injection:* 0.25 mg in 5-ml, single-use vial

### INDICATIONS & DOSAGES

➤ **To prevent acute nausea and vomiting from moderately or highly emetogenic chemotherapy or delayed nausea and vomiting from moderately emetogenic chemotherapy**

*Adults:* 0.25 mg given I.V. over 30 seconds, 30 minutes before chemotherapy starts. Drug is given on the first day of each cycle, no more than every 7 days. Or, one 0.5 mg capsule P.O. 1 hour prior to the start of chemotherapy.

➤ **To prevent postoperative nausea and vomiting for up to 24 hours following surgery**

*Adults:* 0.075 mg I.V. over 10 seconds immediately before anesthesia induction.

### ADMINISTRATION

**P.O.**

• May be given without regard to food.

**I.V.**

▼ Flush with normal saline solution before and after injection.
▼ Give by rapid I.V. injection through a peripheral or central I.V. line.
▼ **Incompatibilities:** Other I.V. drugs.

### ACTION

Antagonizes 5-$HT_3$ receptors in the GI tract and brain, which inhibits emesis caused by chemotherapy.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 30 min | Unknown | 5 days |
| P.O. | Unknown | 3 to 7 hr | Unknown |

*Half-life:* 40 hours I.V.; 25 to 67 hours P.O.

### ADVERSE REACTIONS

**CNS:** anxiety, dizziness, headache, weakness.
**CV:** ***bradycardia, nonsustained ventricular tachycardia,*** hypotension.
**GI:** constipation, diarrhea.
**Metabolic:** ***hyperkalemia.***

### INTERACTIONS

**Drug-drug.** *Antiarrhythmics or other drugs that prolong the QTc interval, diuretics that induce electrolyte abnormalities, high-dose anthracycline:* May increase risk of prolonged QTc interval. Use together cautiously.

### EFFECTS ON LAB TEST RESULTS

• May increase potassium level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patents hypersensitive to palonosetron or its ingredients.
- Use cautiously in patients hypersensitive to other 5-$HT_3$ antagonists, in those taking drugs that affect cardiac conduction, and in those with cardiac conduction abnormalities, hypokalemia, or hypomagnesemia.
- Safety and efficacy in children haven't been established.

## NURSING CONSIDERATIONS

- Before giving this drug, check patient's potassium level.
- Consider adding corticosteroids to the antiemetic regimen, particularly for patients receiving highly emetogenic chemotherapy.
- Make sure patient has additional antiemetics to take for breakthrough nausea or vomiting.
- If patient has cardiac conduction abnormalities, check the ECG before giving drug.

## PATIENT TEACHING

- Advise patient to take a different antiemetic for breakthrough nausea or vomiting, at the first sign of nausea rather than waiting until symptoms are severe.
- Urge patient with a history of cardiac conduction abnormalities to report any changes in drug regimen such as adding or stopping an antiarrhythmic.

# pamidronate disodium

pah-MIH-dro-nate

Aredia

*Therapeutic class:* Antiosteoporotic
*Pharmacologic class:* Bisphosphonate
*Pregnancy risk category D*

## AVAILABLE FORMS

*Powder for injection:* 30 mg/vial, 90 mg/vial
*Solution for injection:* 3 mg/ml, 6 mg/ml, 9 mg/ml, in 10-ml vials

## INDICATIONS & DOSAGES

➤ **Moderate to severe hypercalcemia from cancer (with or without bone metastases)**

*Adults:* Dosage depends on severity of hypercalcemia. Correct calcium level for albumin. Corrected calcium (CCa) level is calculated using this formula:

$$\underset{\text{(mg/dl)}}{\text{CCa}} = \underset{\text{(mg/dl)}}{\text{serum calcium}} + \underset{\text{(g/dl)}}{0.8\,(4 - \text{serum albumin})}$$

Patients with CCa levels of 12 to 13.5 mg/dl may receive 60 to 90 mg by I.V. infusion as a single dose over 2 to 24 hours. Patients with CCa levels greater than 13.5 mg/dl may receive 90 mg by I.V. infusion over 2 to 24 hours. Allow at least 7 days before retreatment to permit full response to first dose.

➤ **Moderate to severe Paget disease**

*Adults:* 30 mg I.V. as a 4-hour infusion on 3 consecutive days for total dose of 90 mg. Repeat cycle as needed.

➤ **Osteolytic bone metastases of breast cancer with standard antineoplastic therapy**

*Adults:* 90 mg I.V. infusion over 2 hours every 3 to 4 weeks.

➤ **Osteolytic bone lesions of multiple myeloma**

*Adults:* 90 mg I.V. over 4 hours once monthly.

## ADMINISTRATION

**I.V.**

▼ Reconstitute drug with 10 ml of sterile water for injection. After drug is completely dissolved, add to 250 ml (2-hour infusion), 500 ml (4-hour infusion), or 1,000 ml (up to 24-hour infusion) of half-normal or normal saline solution for injection or $D_5W$.

▼ Inspect solution for precipitate before use.

▼ Give drug only by I.V. infusion. Injecting a bolus may cause nephropathy.

▼ Infusions longer than 2 hours may reduce the risk of renal toxicity, particularly in patients with preexisting renal insufficiency.

▼ Solution is stable for 24 hours at room temperature.

▼ Store reconstituted drug at 36° to 46° F (2° to 8° C).

▼ **Incompatibilities:** Calcium-containing infusion solutions, such as Ringer's injection or lactated Ringer's solution.

## ACTION

An antihypercalcemic that inhibits resorption of bone but apparently not bone formation. Adsorbs to hydroxyapatite crystals in bone and may directly block calcium phosphate dissolution and mature osteoclast formation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* Alpha, 1½ hours; beta, 27¼ hours.

## ADVERSE REACTIONS

**CNS:** ***seizures,*** *fatigue,* somnolence, syncope, fever.
**CV:** ***atrial fibrillation,*** tachycardia, *hypertension, fluid overload.*
**GI:** *abdominal pain, anorexia, constipation, nausea, vomiting,* ***GI hemorrhage.***
**GU:** renal dysfunction, *urinary tract infection,* ***renal failure.***
**Hematologic:** ***leukopenia, thrombocytopenia,*** *anemia.*
**Metabolic:** hypophosphatemia, hypokalemia, ***hypomagnesemia,*** hypocalcemia.
**Musculoskeletal:** arthralgia, back pain, myalgia, osteonecrosis of the jaw.
**Skin:** *infusion-site reaction, pain at infusion site.*

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

- May increase creatinine level.
- May decrease phosphate, potassium, magnesium, calcium, and hemoglobin levels.
- May decrease WBC and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other bisphosphonates such as etidronate.

***Alert:*** There may be an increased risk of atypical fractures of the thigh in patients treated with biphosphonates.

- Contraindicated in pregnancy.
- Use with caution, considering risks versus benefits, in patients with renal impairment.

***Overdose S&S:*** High fever, hypotension, taste perversion, hypocalcemia.

## NURSING CONSIDERATIONS

- Assess hydration before treatment. Use drug only after patient has been vigorously hydrated with normal saline solution. In patients with mild to moderate hypercalcemia, hydration alone may be sufficient.
- Because drug can cause electrolyte disturbances, carefully monitor electrolyte levels, especially calcium, phosphate, and magnesium. Short-term use of calcium may be needed in patients with severe hypocalcemia. Also monitor CBC and differential count, creatinine and hemoglobin levels, and hematocrit.
- Carefully monitor patients with anemia, leukopenia, or thrombocytopenia during first 2 weeks of therapy.
- Monitor patient's temperature. Patient may experience a slight elevation for 24 to 48 hours after therapy.

***Alert:*** Because renal dysfunction may lead to renal failure, single doses shouldn't exceed 90 mg.

- Monitor creatinine level before each treatment.
- In patients treated for bone metastases who have renal dysfunction, withhold dose until renal function returns to baseline. Treating bone metastases in patients with severe renal impairment isn't recommended. For other indications, determine whether the potential benefit outweighs the potential risk.
- Severe musculoskeletal pain has been associated with biophosphate use and may occur within days, months, or years of start of therapy. When drug is stopped, symptoms may resolve partially or completely.
- Bisphosphonates can interfere with bone-imaging agents.

***Alert:*** Patients should have a dental examination with appropriate preventive dentistry before taking drug, especially those with risk factors, including cancer, chemotherapy, corticosteroid therapy, and poor oral hygiene.

- Use cautiously in breast-feeding women; it's unknown if drug appears in breast milk.

## PATIENT TEACHING

- Explain use and administration of drug to patient and family.

P

- Instruct patient to report adverse reactions promptly.
- Advise women to alert health care provider if pregnant or breast-feeding.

## pancreatin

PAN-kree-a-tin

Kutrase

*Therapeutic class:* Digestive enzyme
*Pharmacologic class:* Pancreatic enzyme
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules:* 2,400 units lipase, 30,000 units protease, 30,000 units amylase

### INDICATIONS & DOSAGES

➤ **Exocrine pancreatic secretion insufficiency; digestive aid in diseases related to deficiency of pancreatic enzymes, such as cystic fibrosis**

*Adults and children:* Dosage varies with condition treated. Usual first dose is 8,000 to 24,000 units of lipase activity P.O. before or with each meal or snack. Total daily dose also may be given in divided doses every 1 to 2 hours throughout.

### ADMINISTRATION

**P.O.**

- Give drug before or with meals and snacks.
- Don't crush enteric-coated forms. Capsules containing enteric-coated microspheres may be opened and sprinkled on a small quantity of cool, soft food. The food should be swallowed immediately, without chewing, and followed with a glass of water or juice.

### ACTION

Replaces endogenous exocrine pancreatic enzymes and aids digestion of starches, fats, and proteins.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | 1–2 hr |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**GI:** diarrhea with high doses, nausea.
**Skin:** perianal irritation.
**Other:** allergic reactions.

### INTERACTIONS

**Drug-drug.** *Antacids:* May counteract pancreatin's beneficial effect. Avoid using together.
*Oral iron supplement:* May reduce oral iron supplement level. Separate doses.

### EFFECTS ON LAB TEST RESULTS

- May increase uric acid level.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, pork protein, or pork enzymes and in those with acute pancreatitis or acute worsening of chronic pancreatitis.
- Use with caution in pregnant or breast-feeding women.

⚠ ***Overdose S&S:*** Diarrhea, transient intestinal upset.

### NURSING CONSIDERATIONS

- The different available products aren't interchangeable.
- To avoid indigestion, monitor patient's diet to ensure proper balance of fat, protein, and starch. Dosage varies according to degree of maldigestion and malabsorption, amount of fat in diet, and enzyme activity of individual preparations.
- Fewer bowel movements and improved stool consistency indicate effective therapy.
- Drug isn't effective in GI disorders unrelated to pancreatic enzyme deficiency.
- Enteric coating on some products may reduce available enzyme in upper portion of jejunum.

### PATIENT TEACHING

- Instruct patient to take drug before or with meals and snacks.
- Tell patient not to crush or chew enteric-coated forms. Capsules containing enteric-coated microspheres may be opened and sprinkled on a small quantity of cool, soft food. Stress importance of swallowing immediately, without chewing, and following with a glass of water or juice.

- Warn patient not to inhale powder form or powder from capsules; it may irritate skin or mucous membranes.
- Tell patient to store drug in airtight container at room temperature.
- Instruct patient not to change brands without consulting prescriber.

## pancrelipase

*Capsules (enteric-coated microspheres):* 4,000 units lipase; 25,000 units protease; 25,000 units amylase

P

**Pancrecarb MS8**
*Capsules (enteric-coated microspheres):* 8,000 units lipase; 45,000 units protease; 40,000 units amylase
**Viokase 16**
*Tablets:* 16,000 units lipase, 60,000 units protease, and 60,000 units amylase
**Zenpep**
*Capsules (enteric-coated beads):* 5,000 units lipase, 17,000 units protease, and 27,000 units amylase

## INDICATIONS & DOSAGES

➤ **Exocrine pancreatic secretion insufficiency; cystic fibrosis in adults and children; steatorrhea and other disorders of fat metabolism caused by insufficient pancreatic enzymes**
*Adults and children older than age 12:* Adjust dosage to patient's response. Usual first dosage 4,000 to 33,000 units of lipase with each meal.
*Children ages 7 to 12:* 4,000 to 12,000 units of lipase activity with each meal or snack. More can be taken, if needed.
*Children ages 1 to 6:* 4,000 to 8,000 units of lipase with each meal and 4,000 units of lipase with each snack.
*Children ages 6 months to 11 months:* 2,000 to 4,000 units of lipase with each meal.
✶ ***NEW INDICATION:*** **Exocrine pancreatic insufficiency due to chronic pancreatitis or pancreatectomy**
*Adults:* (Creon only) 72,000 units lipase while consuming at least 100 g of fat per day. Or, 500 lipase units/kg/meal. Adjust dosage to patient's response.

## ADMINISTRATION

**P.O.**
• Give drug before or with meals and snacks.
• Don't crush enteric-coated forms. Capsules containing enteric-coated microspheres may be opened and sprinkled on a small quantity of cool, soft food. Have patient swallow immediately, without chewing, and follow dose with glass of water or juice.
• For infants, mix powder with applesauce and give with meals. Avoid contact with or inhalation of powder because it may be highly irritating. Older children may swallow capsules with food.

## ACTION

Replaces endogenous exocrine pancreatic enzymes and aids digestion of starches, fats, and proteins.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Variable | Variable | Variable |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**GI:** *nausea*, cramping, diarrhea with high doses.

## INTERACTIONS

**Drug-drug.** *Antacids:* May destroy enteric coating and enhance degradation of pancrelipase. Avoid using together.
*Oral iron supplement:* May decrease iron response. Monitor patient for decreased effectiveness.

## EFFECTS ON LAB TEST RESULTS

• May increase uric acid level.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients with severe hypersensitivity to pork and in those with acute pancreatitis or acute worsening of chronic pancreatic diseases.
⚠ ***Overdose S&S:*** Transient intestinal upset, diarrhea.

## NURSING CONSIDERATIONS

***Alert:*** Use drug only for confirmed exocrine pancreatic insufficiency. It isn't effective in GI disorders unrelated to enzyme deficiency.
• Lipase activity is greater than with other pancreatic enzymes.
• Monitor patient's stools. Adequate replacement decreases number of bowel movements and improves stool consistency.
• Individual products aren't bioequivalent and shouldn't be interchanged without prescriber supervision.
• Dosage varies with degree of maldigestion and malabsorption, amount of fat in diet, and enzyme activity of individual preparations.

• Enteric coating on some products may reduce available enzyme in upper portion of jejunum.

### PATIENT TEACHING

• Instruct patient to take drug before or with meals and snacks, but always with food.
• Advise patient not to crush or chew enteric-coated forms. Capsules containing enteric-coated microspheres may be opened and sprinkled on a small quantity of cool, soft food. Stress importance of swallowing immediately, without chewing, and following with glass of water or juice.
• Warn patient not to inhale powder form or powder from capsules; it may irritate skin or mucous membranes.
• Tell patient to store drug in airtight container at room temperature.
• Instruct patient not to change brands without consulting prescriber.

**SAFETY ALERT!**

## pancuronium bromide

pan-kyoo-ROW-nee-uhm

*Therapeutic class:* Skeletal muscle relaxant
*Pharmacologic class:* Nondepolarizing neuromuscular blocker
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 1 mg/ml, 2 mg/ml

### INDICATIONS & DOSAGES

➤ **Adjunct to anesthesia to relax skeletal muscle, facilitate intubation, assist with mechanical ventilation**

*Adults and children age 1 month and older:* Initially, 0.04 to 0.1 mg/kg I.V.; then 0.01 mg/kg every 30 to 60 minutes.
*Neonates:* Individualize dosage.

### ADMINISTRATION

**I.V.**

**Black Box Warning** This drug should be administered by adequately trained individuals familiar with its actions, characteristics, and hazards. ▮

▼ Only staff skilled in airway management should use drug.

▼ Drug has no known effect on consciousness, pain threshold, or cerebration. To avoid patient distress, don't induce neuromuscular blockade before unconsciousness.
▼ Keep endotracheal equipment, ventilator, oxygen, atropine, edrophonium, epinephrine, and neostigmine immediately available.
▼ Store in refrigerator. Don't store in plastic containers or syringes, although plastic syringes may be used for administration.
▼ **Incompatibilities:** Alkaline solutions, barbiturates, diazepam, thiopental sodium.

### ACTION

Prevents acetylcholine from binding to receptors on the motor end plate, blocking neuromuscular transmission.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 30–45 sec | 3–4½ min | 35–65 min |

*Half-life:* About 2 hours.

### ADVERSE REACTIONS

**CV:** tachycardia, increased blood pressure.
**EENT:** excessive salivation.
**Musculoskeletal:** residual muscle weakness.
**Respiratory:** ***prolonged respiratory insufficiency or apnea.***
**Skin:** transient rashes.
**Other:** allergic or idiosyncratic hypersensitivity reactions.

### INTERACTIONS

**Drug-drug.** *Aminoglycosides (amikacin, gentamicin, neomycin, streptomycin, tobramycin), magnesium salts:* May increase the effects of nondepolarizing muscle relaxant, including prolonged respiratory depression. Use together only when necessary. Dose of nondepolarizing muscle relaxant may need to be reduced.
*Azathioprine:* May reverse neuromuscular blockade induced by pancuronium. Monitor patient.
*Beta blockers, clindamycin, general anesthetics (such as enflurane, halothane, isoflurane), ketamine, lincomycin, magnesium sulfate, polymyxin antibiotics (colistin, polymyxin B sulfate), quinidine, quinine, verapamil:* May enhance neuromuscular blockade, increasing skeletal muscle

P

relaxation and prolonging effect of pancuronium. Use together cautiously during and after surgery.
*Carbamazepine, phenytoin:* May decrease effects of pancuronium. May need to increase pancuronium dose.
*Diuretics:* May cause electrolyte imbalance or alter neuromuscular blockade. Monitor electrolytes before giving drug.
*Lithium, opioid analgesics:* May enhance neuromuscular blockade, increasing skeletal muscle relaxation and possibly causing respiratory paralysis. Use cautiously, and reduce dose of pancuronium.
*Succinylcholine:* May increase intensity and duration of neuromuscular blockade. Allow effects of succinylcholine to subside before giving pancuronium.
*Theophylline:* May produce a dose-dependent reversal of neuromuscular blocking effects. Monitor patient for clinical effect.
*Tricyclic antidepressants (TCAs):* May increase risk of ventricular arrhythmias in patients anesthetized with both halothane and pancuronium. Monitor ECG closely in patients taking TCAs before surgery.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to bromides, those with tachycardia, and those for whom even a minor increase in heart rate is undesirable.
- Use cautiously in elderly or debilitated patients; in patients with renal, hepatic, or pulmonary impairment; and in those with respiratory depression, myasthenia gravis, myasthenic syndrome related to lung cancer, dehydration, thyroid disorders, CV disease, collagen diseases, porphyria, electrolyte disturbances, hyperthermia, and toxemic states. Also, use large doses cautiously in patients undergoing cesarean section.

***Overdose S&S:*** Prolonged neuromuscular blockade.

## NURSING CONSIDERATIONS

- Dosage depends on anesthetic used, individual needs, and response. Dosages are representative and must be adjusted.
- Allow succinylcholine effects to subside before giving this drug.
- Monitor baseline electrolyte determinations (electrolyte imbalance can potentiate neuromuscular effects) and vital signs, especially respirations and heart rate.
- Measure fluid intake and output; renal dysfunction may prolong duration of action because 25% of drug is excreted unchanged in the urine.
- A nerve stimulator and train-of-four monitoring are recommended to confirm antagonism of neuromuscular blockade and recovery of muscle strength. Make sure there's some evidence of spontaneous recovery before attempting pharmacologic reversal with neostigmine.
- Monitor respirations closely until patient recovers fully from neuromuscular blockade, as indicated by tests of muscle strength (hand grip, head lift, and ability to cough).
- After spontaneous recovery starts, neuromuscular blockade may be reversed with an anticholinesterase (such as neostigmine or edrophonium), which is usually given with an anticholinergic (such as atropine).
- Drug doesn't cause histamine release or hypotension, but it may raise heart rate and blood pressure.
- Give analgesics for pain.

***Alert:*** Careful dosage calculation is essential. Always verify dosage with another health care professional.

## PATIENT TEACHING

- Explain all events and procedures to patient because he can still hear.

# panitumumab

pan-eh-TOO-moo-mab

Vectibix

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Monoclonal antibody
*Pregnancy risk category C*

## AVAILABLE FORMS

*Solution for infusion:* 20 mg/ml

## INDICATIONS & DOSAGES

➤ **Human epidermal growth factor receptor-expressing metastatic colorectal cancer with disease progression during or following fluoropyrimidine-, oxaliplatin-, and irinotecan-containing regimens**

*Adults:* 6 mg/kg I.V. infusion over 60 minutes every 14 days. For doses greater than 1,000 mg, infuse over 90 minutes.

***Adjust-a-dose:*** For patients with mild or moderate (grade 1 or 2) infusion reactions, reduce infusion rate by 50%. For patients with severe (grade 3 or 4) infusion reactions, stop drug permanently.

For skin toxicities grade 3 or greater, or if considered intolerable, stop drug. If toxicity doesn't improve to grade 2 or less within 1 month, permanently stop therapy. If toxicity improves to grade 2 or less, and patient is symptomatically improved after withholding 2 or fewer doses, restart treatment at 50% of original dose. If toxicity recurs, permanently stop drug. If toxicity doesn't recur, increase subsequent doses in increments of 25% of original dose until a 6-mg/kg dose is reached.

## ADMINISTRATION

**I.V.**

▼ Dilute drug using aseptic technique. The solution should be colorless but may contain white or translucent particles that will be filtered out during infusion. Don't shake vials.

▼ Withdraw drug and dilute to a total volume of 100 ml with normal saline solution. For doses higher than 1,000 mg, dilute to 150 ml. Final concentration shouldn't exceed 10 mg/ml. Use within 6 hours if stored at room temperature or within 24 hours if refrigerated. Dispose of any unused drug.

▼ Give by I.V. infusion using a pump with a low–protein-binding 0.2- or 0.22-micrometer in-line filter. Don't give by I.V. push or bolus.

▼ Flush I.V. line with normal saline solution before and after giving drug.

▼ Refrigerate vials, don't freeze. Protect from sunlight.

▼ **Incompatibilities:** Other I.V. drugs and solutions.

## ACTION

Inhibits actions between proteins and cell surface receptors that would normally allow proliferation of cells and new blood vessel growth.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Unknown | Unknown |

*Half-life:* 7½ days.

## ADVERSE REACTIONS

**CNS:** *chills, fatigue, fever.*
**CV:** *peripheral edema,* hypotension.
**EENT:** *eyelash growth, ocular toxicities, oral mucositis.*
**GI:** *abdominal pain, constipation, diarrhea, nausea, vomiting,* mucosal inflammation, stomatitis.
**Metabolic:** **HYPOMAGNESEMIA.**
**Respiratory:** *cough, pulmonary toxicity.*
**Skin:** *acne, acneiform dermatitis, dry skin, fissures, nail infection, pruritus, rash, redness,* ***skin exfoliation, skin toxicity.***
**Other:** ***anaphylaxis, severe infusion reaction,*** *general deterioration.*

## INTERACTIONS

None known.

## EFFECTS ON LAB TEST RESULTS

● May decrease calcium and magnesium levels.

## CONTRAINDICATIONS & CAUTIONS

● Use cautiously in patients with skin conditions, or preexisting lung or ocular disease.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug may cause severe infusion reactions, including anaphylaxis, bronchospasm, fever, chills, and hypotension. Monitor patient closely. Keep emergency treatment immediately available to treat severe infusion reactions. ■

**Black Box Warning** Monitor patient for severe dermatologic toxicities. Withhold or discontinue drug if severe dermatologic toxicities occur and monitor for inflammatory or infectious sequelae. ■

● Notify prescriber if patient develops severe eye or pulmonary toxicities. The drug may need to be stopped or the dose lowered.

P

• Drug-induced diarrhea can be especially severe when combined with other chemotherapy drugs. Monitor patient for dehydration. Using with the irinotecan, bolus 5-fluorouracil, leucovorin regimen isn't recommended.
• Monitor patient's electrolytes, especially calcium and magnesium, periodically during and for 8 weeks after treatment. Supplementation may be needed.

### PATIENT TEACHING

• Warn patient that drug can cause photosensitivity reactions and instruct him to wear a hat, sunscreen, and protective clothing, and to limit sun exposure.
• Warn patient about the risk of severe skin, eye, infusion-related, and pulmonary reactions. Advise him to report any skin changes, eye problems, or difficulty breathing to his prescriber.
• Diarrhea may be severe, especially if more than one chemotherapy drug is used. Remind patient to stay well hydrated.
• Tell women of childbearing age that contraception must be used during and for 6 months following treatment.
• Advise mothers to stop breast-feeding during and for 2 months after treatment ends.

## pantoprazole sodium

pan-TOE-pray-zol

Protonix, Protonix I.V.

*Therapeutic class:* Antiulcer
*Pharmacologic class:* Proton pump inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS

*Injection:* 40 mg/vial
*Suspension (delayed-release):* 40 mg
*Tablet (delayed-release):* 20 mg, 40 mg

### INDICATIONS & DOSAGES

➤ **Erosive esophagitis with gastroesophageal reflux disease (GERD)**
*Adults:* 40 mg P.O. once daily for up to 8 weeks. For patients who haven't healed after 8 weeks of treatment, another 8-week course may be considered.

➤ **Short-term treatment of GERD in patients who can't take delayed-release tablets orally**
*Adults:* 40 mg I.V. daily for 7 to 10 days.

➤ **Short-term treatment of GERD linked to history of erosive esophagitis**
*Adults:* 40 mg I.V. once daily for 7 to 10 days. Switch to P.O. form as soon as patient is able to take orally.

➤ **Long-term maintenance of healing erosive esophagitis and reduction in relapse rates of daytime and nighttime heartburn symptoms in patients with GERD**
*Adults:* 40 mg P.O. once daily.

➤ **Short-term treatment of pathologic hypersecretion caused by Zollinger-Ellison syndrome or other neoplastic conditions**
*Adults:* Individualize dosage. Usual dose is 80 mg I.V. every 12 hours for no more than 6 days. For those needing a higher dose, 80 mg every 8 hours is expected to maintain acid output below 10 mEq/hour. Maximum daily dose is 240 mg/day.

➤ **Long-term treatment of pathologic hypersecretory conditions, including Zollinger-Ellison syndrome**
*Adults:* Individualize dosage. Usual starting dose is 40 mg P.O. b.i.d. Adjust dose to a maximum of 240 mg/day. Stop I.V. drug when P.O. drug is warranted.

### ADMINISTRATION

**P.O.**
• Give drug without regard for food.
• Don't crush or split tablets.
• Give delayed-release suspension in apple sauce or apple juice 30 minutes prior to a meal.
• Do not split, chew, or crush granules for delayed-release oral suspension.

**I.V.**
▼ Safety and effectiveness of the I.V. form to start therapy for GERD are unknown.
▼ Reconstitute each vial with 10 ml of normal saline solution.
▼ Compatible diluents for infusion include normal saline solution, $D_5W$, or lactated Ringer's solution for injection.
▼ For patients with GERD, further dilute with 100 ml of diluent to yield 0.4 mg/ml.

▼ For patients with hypersecretion, combine two reconstituted vials and further dilute with 80 ml of diluent to a total volume of 100 ml, to yield 0.8 mg/ml.
▼ Infuse diluted solutions over 15 minutes at a rate of about 7 ml/minute.
▼ For a 2-minute infusion, give the reconstituted vials (final yield of about 4 mg/ml) over at least 2 minutes.
▼ The reconstituted solution may be stored for up to 2 hours and the diluted solutions for up to 22 hours at room temperature.
▼ **Incompatibilities:** Midazolam, zinc-containing products or solutions. Don't give another infusion simultaneously through the same line.

## ACTION

Inhibits proton pump activity by binding to hydrogen-potassium adenosine triphosphatase, located at secretory surface of gastric parietal cells, to suppress gastric acid secretion.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2½ hr | >24 hr |
| I.V. | 15–30 min | Unknown | 24 hr |

*Half-life:* 1 hour.

## ADVERSE REACTIONS

**CNS:** anxiety, asthenia, dizziness, headache, insomnia, migraine, pain.
**CV:** chest pain.
**EENT:** pharyngitis, rhinitis, sinusitis.
**GI:** abdominal pain, constipation, diarrhea, dyspepsia, eructation, flatulence, gastroenteritis, GI disorder, nausea, rectal disorder, vomiting.
**GU:** urinary frequency, UTI.
**Metabolic:** hyperglycemia, hyperlipemia.
**Musculoskeletal:** arthralgia, back pain, hypertonia, neck pain.
**Respiratory:** bronchitis, dyspnea, increased cough, upper respiratory tract infection, rhinitis.
**Skin:** rash.
**Other:** flulike syndrome, infection, injection-site reaction.

## INTERACTIONS

**Drug-drug.** *Ampicillin esters, iron salts, ketoconazole:* May decrease absorption of these drugs. Monitor patient closely and separate doses.
**Drug-herb.** *St. John's wort:* May increase risk of sunburn. Advise patient to avoid excessive sunlight exposure.
**Drug-lifestyle.** *Sunlight:* May increase risk of sunburn. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

● May increase glucose and lipid levels.
● May increase liver function test result values.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to any component of the formulation.
***Alert:*** There may be an increased risk of hip, wrist, and spine fractures associated with proton pump inhibitors.

## NURSING CONSIDERATIONS

● Symptomatic response to therapy doesn't preclude the presence of gastric malignancy.
● ***Look alike–sound alike:*** Don't confuse Protonix with Prilosec, Prozac, or Prevacid.

## PATIENT TEACHING

● Instruct patient to take exactly as prescribed and at about the same time every day.
● Advise patient that drug can be taken without regard to meals.
● Tell patient to swallow tablet whole and not to crush, split, or chew it.
● Tell patient that antacids don't affect drug absorption.

P

# paroxetine hydrochloride

pah-ROX-a-teen

Paxil, Paxil CR

# paroxetine mesylate

Pexeva

*Therapeutic class:* Antidepressant
*Pharmacologic class:* SSRI
*Pregnancy risk category D*

## AVAILABLE FORMS

*Suspension:* 10 mg/5 ml

*Tablets:* 10 mg, 20 mg, 30 mg, 40 mg
*Tablets (controlled-release):* 12.5 mg, 25 mg, 37.5 mg

## INDICATIONS & DOSAGES

➤ **Depression**
*Adults:* Initially, 20 mg P.O. daily, preferably in morning, as indicated. If patient doesn't improve, increase dose by 10 mg daily at intervals of at least 1 week to a maximum of 50 mg daily. If using controlled-release form, initially, 25 mg P.O. daily. Increase dose by 12.5 mg daily at weekly intervals to a maximum of 62.5 mg daily.
*Elderly patients:* Initially, 10 mg P.O. daily, preferably in morning, as indicated. If patient doesn't improve, increase dose by 10 mg daily at weekly intervals, to a maximum of 40 mg daily. If using controlled-release form, start therapy at 12.5 mg P.O. daily. Don't exceed 50 mg daily.

➤ **Obsessive-compulsive disorder (OCD)**
*Adults:* Initially, 20 mg P.O. daily, preferably in morning. Increase dose by 10 mg daily at weekly intervals. Recommended daily dose is 40 mg. Maximum daily dose is 60 mg.

➤ **Panic disorder**
*Adults:* Initially, 10 mg P.O. daily. Increase dose by 10 mg at no less than weekly intervals to maximum of 60 mg daily. Or, 12.5 mg Paxil CR P.O. as a single daily dose, usually in the morning, with or without food; increase dose at intervals of at least 1 week by 12.5 mg daily, up to a maximum of 75 mg daily.
***Adjust-a-dose:*** In elderly or debilitated patients and in those with severe renal or hepatic impairment, the first dose of Paxil CR is 12.5 mg daily; increase if indicated. Dosage shouldn't exceed 50 mg daily.

➤ **Social anxiety disorder (excluding Pexeva)**
*Adults:* Initially, 20 mg P.O. daily, preferably in morning. Dosage range is 20 to 60 mg daily. Adjust dosage to maintain patient on lowest effective dose. Or, 12.5 mg Paxil CR P.O. as a single daily dose, usually in the morning, with or without food. Increase dosage at weekly intervals in increments of 12.5 mg daily, up to a maximum of 37.5 mg daily.

➤ **Generalized anxiety disorder (excluding Pexeva)**
*Adults:* 20 mg P.O. daily initially, increasing by 10 mg per day weekly up to 50 mg daily.
***Adjust-a-dose:*** For debilitated patients or those with renal or hepatic impairment taking immediate-release form, initially, 10 mg P.O. daily, preferably in morning. If patient doesn't respond after full antidepressant effect has occurred, increase dose by 10 mg per day at weekly intervals to a maximum of 40 mg daily. If using controlled-release form, start therapy at 12.5 mg daily. Don't exceed 50 mg daily.

➤ **Posttraumatic stress disorder (excluding Pexeva)**
*Adults:* Initially, 20 mg P.O. daily. Increase dose by 10 mg daily at intervals of at least 1 week. Maximum daily dose is 50 mg P.O.

➤ **Premenstrual dysphoric disorder (PMDD)**
*Adults:* Initially, 12.5 mg Paxil CR P.O. as a single daily dose, usually in the morning, with or without food, daily or during the luteal phase of the menstrual cycle. Dose changes should occur at intervals of at least 1 week. Maximum dose is 25 mg P.O. daily.

➤ **Hot flashes (breast cancer)** ♦
*Adults:* 20 mg P.O. daily or nightly.

➤ **Hot flashes (menopausal)** ♦
*Adults:* 10 or 20 mg P.O. daily (immediate release) or 12.5 or 25 mg P.O. daily (controlled-release).

➤ **Diabetic neuropathy** ♦
*Adults:* Initially, 10 mg P.O. daily. Titrate dosage to 20 to 60 mg/day.

## ADMINISTRATION

**P.O.**
- Give drug without regard for food.
- Don't split or crush controlled-release tablets.

## ACTION

Thought to be linked to drug's inhibition of CNS neuronal uptake of serotonin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–8 hr | Unknown |
| P.O. (controlled-release) | Unknown | 6–10 hr | Unknown |

*Half-life:* About 24 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia, dizziness, headache, insomnia, somnolence, tremor, nervousness,* ***suicidal behavior,*** anxiety, paresthesia, confusion, agitation.
**CV:** palpitations, vasodilation, orthostatic hypotension.
**EENT:** lump or tightness in throat, blurred vision.
**GI:** *dry mouth, nausea, constipation, diarrhea,* flatulence, vomiting, dyspepsia, dysgeusia, increased or decreased appetite, abdominal pain.
**GU:** *ejaculatory disturbances, sexual dysfunction,* urinary frequency, other urinary disorders.
**Musculoskeletal:** myopathy, myalgia, myasthenia.
**Skin:** *diaphoresis,* rash, pruritus.
**Other:** *decreased libido,* yawning.

## INTERACTIONS

**Drug-drug.** *Amphetamines, buspirone, dextromethorphan, dihydroergotamine, lithium salts, meperidine, other SSRIs or SSNRIs (duloxetine, venlafaxine),* ***tramadol,*** *trazodone, tricyclic antidepressants, tryptophan:* May increase the risk of serotonin syndrome. Avoid combining drugs that increase the availability of serotonin in the CNS; monitor patient closely if used together.
*Cimetidine:* May decrease hepatic metabolism of paroxetine, leading to risk of adverse reactions. Dosage adjustments may be needed.
*Digoxin:* May decrease digoxin level. Use together cautiously.
*MAO inhibitors, such as phenelzine, selegiline, tranylcypromine:* May cause serotonin syndrome and signs and symptoms resembling neuroleptic malignant syndrome. Avoid using within 14 days of MAO inhibitor therapy.
*Phenobarbital, phenytoin:* May alter pharmacokinetics of both drugs. Dosage adjustments may be needed.
*Procyclidine:* May increase procyclidine level. Watch for excessive anticholinergic effects.
*Sumatriptan:* May cause weakness, hyperreflexia, and incoordination. Monitor patient closely.
*Theophylline:* May decrease theophylline clearance. Monitor theophylline level.
*Thioridazine:* May prolong QTc interval and increase risk of serious ventricular arrhythmias, such as torsades de pointes, and sudden death. Avoid using together.
*Tricyclic antidepressants:* May inhibit tricyclic antidepressant metabolism. Dose of tricyclic antidepressant may need to be reduced. Monitor patient closely.
*Triptans:* May cause serotonin syndrome (restlessness, hallucinations, loss of coordination, fast heartbeat, rapid changes in blood pressure, increased body temperature, overactive reflexes, nausea, vomiting, and diarrhea) or neuroleptic malignant syndrome–like reactions. Use cautiously, especially at the start of therapy and at dosage increases.
*Warfarin:* May cause bleeding. Use together cautiously.
**Drug-herb.** *St. John's wort:* May increase sedative-hypnotic effects. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May alter psychomotor function. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

P

- Contraindicated in patients hypersensitive to drug, within 14 days of MAO inhibitor therapy, and in those taking thioridazine.
**Black Box Warning** Contraindicated in children and adolescents younger than age 18.
- Use cautiously in patients with history of seizure disorders or mania and in those with other severe, systemic illness.
- Use cautiously in patients at risk for volume depletion and monitor them appropriately.
- Using drug in the first trimester may increase the risk of congenital fetal malformations; using drug in the third trimester may cause neonatal complications at birth. Consider the risk versus benefit of therapy.

⚠ ***Overdose S&S:*** Coma, confusion, dizziness, nausea, somnolence, tachycardia, tremor, vomiting, acute renal failure, aggressive reactions, bradycardia, dystonia,

hepatic necrosis, hypertension, hypotension, jaundice, manic reactions, mydriasis, myoclonus, rhabdomyolysis, seizures, serotonin syndrome, stupor, hepatic impairment, syncope, urine retention, ventricular arrhythmias.

## NURSING CONSIDERATIONS

- Patients taking Paxil CR for PMDD should be periodically reassessed to determine the need for continued treatment.
- If signs or symptoms of psychosis occur or increase, expect prescriber to reduce dosage. Record mood changes. Monitor patient for suicidal tendencies, and allow only a minimum supply of drug.

**Black Box Warning** Drug may increase the risk of suicidal thinking and behavior in children, adolescents, and young adults ages 18 to 24 during the first 2 months of treatment, especially in those with major depressive disorder or other psychiatric disorder. ■

- Monitor patient for complaints of sexual dysfunction. In men, they include anorgasmy, erectile difficulties, delayed ejaculation or orgasm, or impotence; in women, they include anorgasmia or difficulty with orgasm.

***Alert:*** Don't stop drug abruptly. Withdrawal or discontinuation syndrome may occur if drug is stopped abruptly. Symptoms include headache, myalgia, lethargy, and general flulike symptoms. Taper drug slowly over 1 to 2 weeks.

***Alert:*** Combining triptans with an SSRI or an SSNRI may cause serotonin syndrome or neuroleptic malignant syndrome–like reactions. Signs and symptoms of serotonin syndrome may include restlessness, hallucinations, loss of coordination, fast heartbeat, rapid changes in blood pressure, increased body temperature, overactive reflexes, nausea, vomiting, and diarrhea. Serotonin syndrome may be more likely to occur when starting or increasing the dose of triptan, SSRI, or SSNRI.

- ***Look alike–sound alike:*** Don't confuse paroxetine with paclitaxel, or Paxil with Doxil, paclitaxel, Plavix, or Taxol.

## PATIENT TEACHING

**Black Box Warning** Advise families and caregivers to closely observe patient for increased suicidal thinking and behavior. ■

- Tell patient that drug may be taken with or without food, usually in morning.
- Tell patient not to break, crush, or chew controlled-release tablets.
- Warn patient to avoid activities that require alertness and good coordination until effects of drug are known.
- Advise woman of childbearing age to contact prescriber if she becomes pregnant or plans to become pregnant during therapy or if she's currently breast-feeding.
- Tell patient to avoid alcohol and to consult prescriber before taking other prescription or OTC drugs or herbal medicines.
- Instruct patient not to stop taking drug abruptly.

**SAFETY ALERT!**

# pegaspargase (PEG-L-asparaginase)

peg-AHS-per-jays

Oncaspar

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Modified L-asparaginase
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 750 international units/ml

## INDICATIONS & DOSAGES

➤ **As part of a multidrug chemotherapy regimen in the treatment of acute lymphoblastic leukemia, and acute lymphoblastic leukemia with hypersensitivity to asparaginase**

*Adults and children older than 1 year:* 2,500 international units/$m^2$ I.V. or I.M. every 14 days.

## ADMINISTRATION

**I.V.**

▼ Give I.V. only if I.M. route is contraindicated.

▼ Drug may be a contact irritant, and solution must be handled and given with

care. Wear gloves. Avoid inhalation of vapors and contact with skin or mucous membranes, especially in the eyes. If contact occurs, wash with generous amounts of water for at least 15 minutes.
▼ Don't use if cloudy or contains precipitate. Avoid excessive agitation of drug; don't shake.
▼ Don't freeze or use drug that has been frozen because freezing destroys drug's effectiveness.
▼ Give over 1 to 2 hours in 100 ml of normal saline solution or $D_5W$ injection through an infusion that's already running.
▼ Discard unused portions. Use only one dose per vial; don't reenter vial.
▼ Don't use if stored at room temperature for longer than 48 hours. Keep refrigerated at 36° to 46° F (2° to 8° C).
▼ **Incompatibilities:** None reported, but don't mix with other I.V. drugs.

**I.M.**
• I.M. is the preferred route and is associated with lower incidence of adverse effects.
• When giving I.M., limit volume given at a single injection site to 2 ml. If volume to be given exceeds 2 ml, use multiple injection sites.

## ACTION

A modified version of the enzyme L-asparaginase that exerts cytotoxic effects by inactivating the amino acid asparagine, which tumor cells need to synthesize proteins.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V., I.M. | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** ***coma, seizures, status epilepticus,*** confusion, dizziness, emotional lability, fatigue, headache, malaise, paresthesia, parkinsonism, peripheral neuritis, somnolence, ***stroke.***
**CV:** hypertension, hypotension, peripheral edema, tachycardia.
**EENT:** epistaxis.
**GI:** ***pancreatitis,*** abdominal pain, anorexia, constipation, diarrhea, flatulence, mouth tenderness, mucositis, nausea, severe colitis, vomiting.
**GU:** ***renal failure,*** hematuria, increased urinary frequency, proteinuria, renal dysfunction, severe hemorrhagic cystitis.
**Hematologic:** ***agranulocytosis, disseminated intravascular coagulation, hemorrhage, leukopenia, pancytopenia, thrombocytopenia, thrombosis,*** easy bruising, hemolytic anemia.
**Hepatic:** ***liver failure,*** ascites, fatty changes in liver, hypoalbuminemia, jaundice.
**Metabolic:** ***hypoglycemia,*** hyperglycemia, hyperuricemia, hypoproteinemia, ***metabolic acidosis,*** uric acid nephropathy.
**Musculoskeletal:** arthralgia, cramps, joint stiffness, myalgia, musculoskeletal pain.
**Respiratory:** ***bronchospasm,*** cough, upper respiratory tract infection.
**Skin:** ecchymoses, erythema, erythema simplex, fungal changes, hand whiteness, injection pain or reaction, itching, localized edema, nail whiteness and ridging, petechial rash, purpura, rash, urticaria.
**Other:** ***anaphylaxis, sepsis, septic shock,*** hypersensitivity reactions, infection, night sweats.

## INTERACTIONS

**Drug-drug.** *Aspirin, dipyridamole, heparin, NSAIDs, warfarin:* May cause imbalances in coagulation factors, predisposing patient to bleeding or thrombosis. Use together cautiously.
*Methotrexate:* May interfere with action of methotrexate. Check patient for decreased effectiveness.
*Protein-bound drugs:* May increase toxicity of other drugs that bind to proteins and may interfere with enzymatic detoxification of other drugs, especially in the liver. Check for toxicity, and use together cautiously.

## EFFECTS ON LAB TEST RESULTS

• May increase BUN, creatinine, amylase, lipase, bilirubin, ALT, AST, uric acid, and ammonia levels. May decrease hemoglobin, sodium, and protein levels. May increase or decrease glucose level.
• May increase PT, INR, activated PTT, and thromboplastin. May decrease antithrombin III, WBC, RBC, platelet, and granulocyte counts.

P

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with pancreatitis or history of pancreatitis, in those who have had significant hemorrhagic events related to previous treatment with L-asparaginase, and in those with history of serious allergic reactions to drug, such as generalized urticaria, bronchospasm, laryngeal edema, hypotension, or other unacceptable adverse reactions.
- Use cautiously in patients with liver dysfunction; use only when clearly indicated in pregnant women.

***Overdose S&S:*** Elevated liver enzyme levels, rash.

## NURSING CONSIDERATIONS

- Take preventive measures (including adequate hydration) before starting treatment. Hyperuricemia may result from rapid lysis of leukemic cells.

***Alert:*** Monitor patient closely for hypersensitivity (including life-threatening anaphylaxis), especially those hypersensitive to other forms of L-asparaginase. Observe patient for 1 hour after giving drug and have emergency equipment and other drugs needed to treat anaphylaxis readily available. Moderate to life-threatening hypersensitivity requires stopping L-asparaginase.

- To assess effects of therapy, monitor patient's peripheral blood count and bone marrow. A drop in circulating lymphoblasts is often noted after therapy starts, sometimes accompanied by a marked rise in uric acid level.
- Obtain frequent amylase and lipase determinations to detect pancreatitis. Monitor patient's glucose level during therapy to detect hyperglycemia.
- Monitor patient for liver dysfunction when drug is used with hepatotoxic chemotherapeutic drugs.
- Drug may affect several plasma proteins; monitor fibrinogen, PT, INR, and PTT at baseline and periodically during and after treatment.
- ***Look alike–sound alike:*** Don't confuse pegaspargase with asparaginase.

## PATIENT TEACHING

- Inform patient of risk of hypersensitivity reactions and importance of reporting them immediately.
- Tell patient not to take other drugs, including OTC preparations, until approved by prescriber because risk of bleeding is higher when pegaspargase is given with drugs such as aspirin. Drug may also increase toxicity of other drugs.
- Urge patient to report signs and symptoms of infection (fever, chills, and malaise); drug may suppress the immune system.
- Caution women of childbearing age to avoid pregnancy and breast-feeding during therapy.

**SAFETY ALERT!**

# pegfilgrastim

peg-fill-GRASS-tim

Neulasta

*Therapeutic class:* Colony stimulating factor
*Pharmacologic class:* Hematopoietic
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 10-mg/ml single-use, preservative-free, prefilled syringes

## INDICATIONS & DOSAGES

➤ **To reduce frequency of infection in patients with nonmyeloid malignancies receiving myelosuppressive chemotherapy that may cause febrile neutropenia**

*Adults and children weighing more than 45 kg (99 lb):* 6 mg subcutaneously once per chemotherapy cycle. Don't give in period between 14 days before and 24 hours after administration of cytotoxic chemotherapy.

## ADMINISTRATION

**Subcutaneous**

- Let drug come to room temperature before giving.
- Don't shake.
- Don't use if discoloration or particulate matter is seen.
- Discard drug if left at room temperature for more than 48 hours.

## ACTION

Binds cell receptors to stimulate proliferation, differentiation, commitment, and end-cell function of neutrophils.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | Unknown | Unknown |

*Half-life:* 15 to 80 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness, fatigue, fever, headache, insomnia.*
**GI:** *abdominal pain, anorexia, constipation, diarrhea, dyspepsia, mucositis, nausea, stomatitis, taste perversion, vomiting.*
**Hematologic:** **GRANULOCYTOPENIA, NEUTROPENIC FEVER.**
**Musculoskeletal:** *arthralgia, bone pain, generalized weakness, myalgia, skeletal pain.*
**Skin:** *alopecia.*
**Other:** *peripheral edema.*

## INTERACTIONS

**Drug-drug.** *Lithium:* May increase the release of neutrophils. Monitor neutrophil counts closely.

## EFFECTS ON LAB TEST RESULTS

- May increase LDH, alkaline phosphatase, and uric acid levels.
- May decrease granulocyte count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to *Escherichia coli*–derived proteins, filgrastim, or any component of the drug. Don't use for peripheral blood progenitor cell mobilization.
- Use cautiously in patients with sickle cell disease, those receiving chemotherapy causing delayed myelosuppression, or those receiving radiation therapy.
- Infants, children, and adolescents who weigh less than 45 kg (99 lb) shouldn't receive the 6-mg single-use syringe dose. Safety and efficacy in children haven't been established.

***Overdose S&S:*** Leukocytosis.

## NURSING CONSIDERATIONS

***Alert:*** Splenic rupture may occur rarely. Assess patient who experiences signs or symptoms of left upper abdominal or shoulder pain for an enlarged spleen or splenic rupture.
- Obtain CBC and platelet count before therapy.
- Monitor patient's hemoglobin level, hematocrit, CBC, and platelet count, as well as LDH, alkaline phosphatase, and uric acid levels during therapy.
- Monitor patient for allergic-type reactions, including anaphylaxis, skin rash, and urticaria, which can occur with first or subsequent treatment.
- Evaluate patient with fever, lung infiltrates, or respiratory distress for ARDS. Notify prescriber if respiratory status worsens.
- Keep patient with sickle cell disease well hydrated, and monitor him for symptoms of sickle cell crisis.
- Pegfilgrastim may act as a growth factor for tumors.
- ***Look alike–sound alike:*** Don't confuse Neulasta with Neumega.

## PATIENT TEACHING

- Inform patient of the potential side effects of the drug.
- Tell patient to report signs and symptoms of allergic reactions, fever, or breathing problems.

***Alert:*** Rarely, splenic rupture may occur. Advise patient to immediately report upper left abdominal or shoulder tip pain.
- Tell patient with sickle cell disease to keep drinking fluids and report signs or symptoms of sickle cell crisis.
- Instruct patient or caregiver how to give drug if it's to be given at home.

**SAFETY ALERT!**

# peginterferon alfa-2a

peg-in-ter-FEER-on

Pegasys

*Therapeutic class:* Antiviral
*Pharmacologic class:* Biologic response modifier
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 180 mcg/1 ml single-dose vials; 180 mcg/0.5 ml prefilled syringes

## INDICATIONS & DOSAGES

➤ **Chronic hepatitis C with compensated hepatic disease in patients not previously treated with interferon alfa**

*Adults:* 180 mcg subcutaneously in abdomen or thigh, once weekly for 48 weeks. May be used with 800 to 1,200 mg ribavirin daily, divided b.i.d. depending on viral genotype.

➤ **Chronic hepatitis C (regardless of genotype) in HIV-infected patients who have not previously been treated with interferon**

*Adults:* 180 mcg subcutaneously in abdomen or thigh, once weekly for 48 weeks. May be used with 800 mg ribavirin P.O. daily divided b.i.d.

➤ **Chronic hepatitis B who have compensated liver disease and evidence of viral replication and liver inflammation**

*Adults:* 180 mcg subcutaneously in abdomen or thigh, once weekly for 48 weeks.

***Adjust-a-dose:*** For patients who experience moderate adverse reactions, decrease dose to 135 mcg subcutaneously once a week; for severe adverse reactions, decrease to 90 mcg subcutaneously once a week. For patients who experience hematologic reactions, if the absolute neutrophil count (ANC) is less than 750/mm$^3$, reduce dose to 135 mcg subcutaneously once a week; if the ANC is less than 500/mm$^3$, stop drug until ANC exceeds 1,000/mm$^3$ and restart at 90 mcg subcutaneously once a week. If platelet count is less than 50,000/mm$^3$, reduce dose to 90 mcg subcutaneously once a week; stop drug if platelet count drops below 25,000/mm$^3$. In patients with end-stage renal disease requiring hemodialysis, decrease dose to 135 mcg subcutaneously once a week. In chronic hepatitis C patients with ALT increases above baseline, decrease dose to 135 mcg subcutaneously once a week. For chronic hepatitis B patients with elevations in ALT more than five times the upper limit of normal (ULN), reduce dose to 135 mcg subcutaneously once a week or temporarily stop treatment; if less than 10 times the ULN, consider stopping treatment. For patients also taking ribavirin therapy, if hemoglobin level is less than 10 g/dl in patients with no cardiac disease, reduce ribavirin dose to 600 mg/day. If less than 8.5 g/dl in this population, stop ribavirin. If there is a greater than or equal to 2 g/dl decrease in hemoglobin level during any 4-week period in patients with history of stable cardiac disease, reduce ribavirin dose to 600 mg daily. If less than 12 g/dl despite 4 weeks at reduced dose, stop ribavirin. Don't use ribavirin in patients with a creatinine clearance less than 50 ml/minute.

## ADMINISTRATION

### Subcutaneous

- Vials and prefilled syringes are for single use only. Discard unused portion.
- Visually inspect drug for particulate matter and discoloration before administration; don't use if particulate matter is visible or product is discolored.

## ACTION

Causes reversible decreases in leukocyte and platelet counts, partially through stimulation of production of effector proteins in vitro.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 3–4 days | <1 wk |

*Half-life:* 80 hours.

## ADVERSE REACTIONS

**CNS:** *depression, dizziness, fatigue, headache, insomnia, irritability, pain, pyrexia,* anxiety, asthenia, concentration impairment, memory impairment.

**GI:** *abdominal pain, anorexia, diarrhea, nausea,* dry mouth, *vomiting.*

**Hematologic:** NEUTROPENIA, ***thrombocytopenia,*** *anemia,* LYMPHOPENIA.

**Musculoskeletal:** *arthralgia, myalgia,* back pain.

**Skin:** *alopecia, pruritus,* dermatitis, increased sweating, rash.

**Other:** *injection site reaction, rigors.*

## INTERACTIONS

**Drug-drug.** *Methadone:* May increase methadone level. Monitor patient closely and decrease methodone dosage as needed. *Nucleoside reverse transcriptase inhibitors (NRTIs):* May cause severe and potentially fatal hepatic decompensation. If used together in patients coinfected with HIV

who are taking NRTIs, monitor for toxicities.
*Ribavirin:* May cause additive hematologic toxicity. Monitor hematologic function.
*Theophylline, other drugs metabolized by CYP1A2:* May increase theophylline level and may interact with other drugs metabolized by this enzyme system. Monitor theophylline level and adjust dosage as needed.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT level. May decrease hemoglobin level and hematocrit.
- May decrease ANC, WBC, and platelet counts. May increase or decrease thyroid function test values.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to interferon alfa-2a or any components of formulation.
- Contraindicated in patients with autoimmune hepatitis or decompensated liver disease (with monoinfection or coinfection with HIV) before or during treatment with drug and in neonates and infants.
- Use cautiously in patients with a history of depression.
- Use cautiously in patients with baseline neutrophil counts less than 1,500/mm$^3$, baseline platelet counts less than 90,000/mm$^3$, or baseline hemoglobin level less than 10 g/dl.
- Use cautiously in patients with creatinine clearance less than 50 ml/minute.
- Use cautiously in patients with cardiac disease or hypertension, thyroid disease, autoimmune disorders, pulmonary disorders, colitis, pancreatitis, and ophthalmologic disorders.
- Use cautiously in elderly patients because they may be at increased risk for adverse reactions.

**Black Box Warning** Use cautiously in patients also taking ribavirin. Ribavirin may cause birth defects or fetal demise. Ribavirin is also known to cause hemolytic anemia which may worsen cardiac disease.

- Safety and effectiveness haven't been established in patients who have failed to respond to other alfa interferon treatments, in organ transplant recipients, and in patients who are also infected with hepatitis B.

***Overdose S&S:*** Fatigue, elevated liver enzyme levels, neutropenia, thrombocytopenia.

## NURSING CONSIDERATIONS

**Black Box Warning** Alpha interferons cause or aggravate fatal or life-threatening neuropsychiatric, autoimmune, ischemic, and infectious disorders. Monitor patients closely with periodic clinical and laboratory evaluations. Withdraw patients with persistently severe or worsening signs or symptoms of these conditions from therapy.

- Obtain CBC before treatment and monitor counts routinely during therapy. Stop drug in patients who develop severe decrease in neutrophil or platelet counts.
- Stop drug if uncontrollable thyroid disease, hyperglycemia, hypoglycemia, or diabetes mellitus occurs during treatment.
- If persistent or unexplained pulmonary infiltrates or pulmonary dysfunction occur, stop drug.
- Stop drug if signs and symptoms of colitis occur, such as abdominal pain, bloody diarrhea, and fever. Symptoms should resolve within 1 to 3 weeks.
- Stop drug if signs and symptoms of pancreatitis occur, including fever, malaise, and abdominal pain.
- Obtain baseline eye examination and periodically monitor eye exams during treatment. Stop drug if new or worsening eye disorders occur.
- Monitor patient with impaired renal function for interferon toxicity.
- Use in women of childbearing age only when effective contraception is being used.

## PATIENT TEACHING

- Advise patient to read medication guide that comes with drug.
- Teach patient proper way to give drug and dispose of needles and syringes.
- Tell patient to immediately report depression or suicidal ideation.
- Tell patient to report signs and symptoms of pancreatitis, colitis, eye disorders, or respiratory disorders.

• Advise patient to avoid driving or operating machinery if he feels dizzy, tired, confused, or sleepy.

**Black Box Warning** Tell male and female patients and their partners to take extreme care to avoid pregnancy during treatment and for 6 months after treatment stops. ■

**SAFETY ALERT!**

## peginterferon alfa-2b

peg-in-ter-FEER-on

PEG-Intron

*Therapeutic class:* Antiviral
*Pharmacologic class:* Biological response modifier
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 50 mcg/0.5 ml, 80 mcg/0.5 ml, 120 mcg/0.5 ml, 150 mcg/0.5 ml

### INDICATIONS & DOSAGES

➤ **Chronic hepatitis C in patients with compensated liver disease not previously treated with interferon alfa**

*Adults:* 1 mcg/kg subcutaneously once weekly for up to 1 year, on same day each week. The volume of PEG-Intron to be injected depends on the patient's weight and the vial strength used.

*Adults who weigh 137 to 160 kg (301 to 353 lb):* 150 mcg (0.5 ml) of 300-mcg/ml strength.

*Adults who weigh 107 to 136 kg (235 to 300 lb):* 120 mcg (0.5 ml) of 240-mcg/ml strength.

*Adults who weigh 89 to 106 kg (196 to 234 lb):* 96 mcg (0.4 ml) of 240-mcg/ml strength.

*Adults who weigh 73 to 88 kg (160 to 195 lb):* 80 mcg (0.5 ml) of 160-mcg/ml strength.

*Adults who weigh 57 to 72 kg (125 to 159 lb):* 64 mcg (0.4 ml) of 160-mcg/ml strength.

*Adults who weigh 46 to 56 kg (101 to 124 lb):* 50 mcg (0.5 ml) of 100-mcg/ml strength.

*Adults who weigh 45 kg (100 lb) or less:* 40 mcg (0.4 ml) of 100-mcg/ml strength.

➤ **Chronic hepatitis C in patients with compensated liver disease not previously treated with interferon alfa, combined with ribavirin**

*Adults:* 1.5 mcg/kg subcutaneously once weekly for 24 to 48 weeks on same day every week. The volume of PEG-Intron to be injected depends on the patient's weight and the vial strength used.

*Adults who weigh more than 85 kg (187 lb):* 150 mcg (0.5 ml) of 300-mcg/ml strength.

*Adults who weigh 76 to 85 kg (167 to 187 lb):* 120 mcg (0.5 ml) of 240-mcg/ml strength.

*Adults who weigh 61 to 75 kg (134 to 165 lb):* 96 mcg (0.4 ml) of 240-mcg/ml strength.

*Adults who weigh 51 to 60 kg (112 to 132 lb):* 80 mcg (0.5 ml) of 160-mcg/ml strength.

*Adults who weigh 40 to 50 kg (88 to 110 lb):* 64 mcg (0.4 ml) of 160-mcg/ml strength.

*Adults who weigh less than 40 kg (88 lb):* 50 mcg (0.5 ml) of 100-mcg/ml strength.

*Children ages 3 to 17:* 60 mcg/$m^2$ subcutaneously on same day every week.

***Adjust-a-dose:*** Decrease peginterferon alfa-2b dose by 50% in patients with WBC count less than 1,500/$mm^3$, neutrophil count less than 750/$mm^3$, or platelet count less than 80,000/$mm^3$. Oral ribavirin dose can be continued. If hemoglobin level is less than 10 g/dl, reduce oral ribavirin dose by 200 mg. Stop both drugs if hemoglobin level is less than 8.5 g/dl, WBCs less than 1,000/$mm^3$, neutrophil count less than 500/$mm^3$, or platelet count less than 50,000/$mm^3$. If symptoms improve and remain stable for 4 weeks, continue at present dose or resume previous dose.

If patient develops mild depression, continue peginterferon alfa-2b, but evaluate patient once weekly. In moderate depression, reduce peginterferon alfa-2b dose by 50% for 4 to 8 weeks and evaluate patient every week. In severe depression, stop peginterferon alfa-2b.

For patients with stable CV disease, decrease peginterferon alfa-2b dose by 50% and ribavirin dosage by 200 mg daily if hemoglobin level drops more than 2 g/dl in any 4-week period. Stop both drugs if

hemoglobin level goes below 12 g/dl after 4 weeks of reduced dosages.

Decrease dosage by 25% for creatinine clearance of 30 to 50 ml/minute and by 50% for creatinine clearance of 10 to 29 ml/minute. Discontinue for creatinine clearance of less than 10 ml/minute. Don't use with ribavirin if creatinine clearance is less than 50 ml/minute.

## ADMINISTRATION

### Subcutaneous

- To reconstitute the lyophilized peginterferon alfa-2b in the Redipen, hold the Redipen upright (dose button down) and press the two halves of the pen together until there is an audible click.
- Gently invert the pen to mix the solution. Don't shake.
- Keeping the pen upright, attach the supplied needle and select the appropriate peginterferon alfa-2b dose by pulling back on the dosing button until the dark bands are visible and turning the button until the dark band is aligned with the correct dose.
- The Redipen is for single use only.
- Reconstitute the peginterferon alfa-2b lyophilized product with only 0.7 ml of supplied diluent (sterile water for injection). Discard the remaining diluent.
- Swirl gently to dissolve completely.
- Use immediately after reconstitution or store for up to 24 hours at 36° to 46° F (2° to 8° C).
- **Incompatibilities:** Don't add any other medication to solutions containing peginterferon alfa-2b.

## ACTION

Binds to specific membrane receptors on the cell surface, inducing certain enzymes, suppressing cell proliferation, immunomodulating activities, and inhibiting virus replication in virus-infected cells. Increases levels of effector proteins and body temperature, and decreases leukocyte and platelet counts.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 15–44 hr | Unknown |

*Half-life:* 40 hours.

## ADVERSE REACTIONS

**CNS:** *anxiety, depression, dizziness, emotional lability, fatigue, fever, headache, insomnia, irritability,* ***suicidal behavior,*** hypertonia, malaise, agitation, nervousness.
**CV:** flushing, chest pain.
**EENT:** *pharyngitis,* sinusitis, rhinitis, conjunctivitis, blurred vision, dry mouth, taste perversion.
**GI:** *abdominal pain, anorexia, diarrhea, nausea,* dyspepsia, right upper quadrant pain, vomiting.
**GU:** menstrual disorder.
**Hematologic:** ***neutropenia, thrombocytopenia.***
**Hepatic:** hepatomegaly.
**Metabolic:** *weight loss,* hypothyroidism.
**Musculoskeletal:** *musculoskeletal pain, myalgia, arthralgia.*
**Respiratory:** cough, dyspnea.
**Skin:** *alopecia, dry skin, increased sweating, injection site inflammation or reaction, pruritus, rash,* injection site pain.
**Other:** *flulike symptoms, rigors, viral infection.*

## INTERACTIONS

*Drugs metabolized by CYP2C8, CYP2C9 (phenytoin, warfarin), or CYP2D6 (flecainide):* May decrease serum levels of these drugs. Monitor patient response and drug levels; adjust dosage as needed.
*Methadone:* May increase methadone level. Monitor patient closely and decrease methadone dosage as needed.
*Nucleoside reverse transcriptase inhibitors (NRTIs):* May cause severe and potentially fatal hepatic decompensation. If used together in patient coinfected with HIV, monitor patient for toxicities.

## EFFECTS ON LAB TEST RESULTS

- May increase serum bilirubin, uric acid, triglyceride, and ALT levels. May increase or decrease TSH level.
- May decrease hemoglobin.
- May decrease neutrophil and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or any of its components, in patients

P

with autoimmune hepatitis or decompensated liver disease, in those with diabetes or thyroid disorders that can't be controlled with medication, in patients who have failed to respond to other alfa interferon treatment or have had an organ transplant, and in those with HIV or hepatitis B virus.
• Use cautiously in patients with psychiatric disorders, diabetes mellitus, CV disease, creatinine clearance less than 50 ml/minute, pulmonary infiltrates, pulmonary function impairment, or autoimmune, ischemic, or infectious disorders.

## NURSING CONSIDERATIONS

• Obtain eye examination in patient with diabetes or hypertension before starting drug. Retinal hemorrhages, cotton-wool spots, and retinal artery or vein obstruction may occur.
**Black Box Warning** Drug may cause or aggravate fatal or life-threatening neuropsychiatric, autoimmune, ischemic, and infectious disorders. Monitor patients closely with periodic clinical and laboratory evaluations. In patient with persistently severe or worsening signs or symptoms of these conditions from therapy, withhold drug. In many but not all cases, these disorders resolve after stopping PEG-Intron therapy. ■
• Combination therapy with ritavirin is preferred over monotherapy because of better response rates, unless contraindication or intolerance exists.
**Black Box Warning** If used in combination therapy with ribavirin, ensure extreme care to avoid pregnancy. Also, monitor patient for worsening cardiac disease secondary to anemia. ■
• Drug may cause or aggravate hypothyroidism, hyperthyroidism, or diabetes.
• Perform ECG on patient with history of MI or arrhythmias before starting drug.
• Start treatment in patient who is well hydrated.
• Monitor patient with history of MI or arrhythmias closely for hypotension, arrhythmias, tachycardia, cardiomyopathy, and signs and symptoms of MI.
• Monitor patient for depression and other mental health disorders. If symptoms are severe, stop drug and refer patient for psychiatric care.
• Monitor patient for signs and symptoms of colitis, such as abdominal pain, bloody diarrhea, and fever. Stop drug if colitis occurs. Symptoms should resolve 1 to 3 weeks after stopping drug.
• Monitor patient for signs and symptoms of pancreatitis (due to elevated triglyceride levels) or hypersensitivity reactions, and stop drug if these occur.
• Monitor patient with pulmonary disease for dyspnea, pulmonary infiltrates, pneumonitis, and pneumonia.
• Monitor patient with renal disease for signs and symptoms of toxicity.
• Monitor CBC count, platelets count, and AST, ALT, bilirubin, and TSH levels before starting drug and periodically during treatment.
• Notify prescriber if severe neutropenia or thrombocytopenia occurs.
• Children may experience growth delays in height and weight.

## PATIENT TEACHING

• Teach patient the appropriate use of the drug and the benefits and risks of treatment. Tell patient that adverse reactions may continue for several months after treatment is stopped.
• Tell patient to immediately report symptoms of depression or suicidal thoughts.
• Instruct patient on importance of proper disposal of needles and syringes and caution him against reuse of old needles and syringes.
• Tell patient that drug won't prevent transmission of hepatitis C virus (HCV) to others and may not cure hepatitis C or prevent cirrhosis, liver failure, or liver cancer that may result from HCV infection.
• Advise patient that laboratory tests are needed before starting therapy and periodically thereafter.
• Tell patient to take drug at bedtime and to use fever-reducing drugs to decrease risk of flulike signs and symptoms.
• Inform breast-feeding patient of the potential for adverse reactions in infants. Tell her to either stop using drug or stop breast-feeding.

• Advise patient to brush teeth thoroughly at least twice a day, have regular dental exams, and rinse mouth thoroughly after emesis.
**Black Box Warning** Tell patient to avoid pregnancy. ■

**SAFETY ALERT!**

## pemetrexed

peh-meh-TREX-ed

Alimta

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Folate antagonist
*Pregnancy risk category D*

### AVAILABLE FORMS

*Injection:* 100 mg, 500 mg in single-use vials

### INDICATIONS & DOSAGES

➤ **Malignant pleural mesothelioma or non-small cell (non-squamous) lung cancer with cisplatin, in patients whose disease is unresectable or who aren't candidates for surgery**

*Adults:* 500 mg/m$^2$ I.V. over 10 minutes on day 1 of each 21-day cycle. Starting 30 minutes after pemetrexed infusion ends, give cisplatin 75 mg/m$^2$ I.V. over 2 hours.

➤ **Locally advanced or metastatic non–small-cell lung cancer after chemotherapy**

*Adults:* 500 mg/m$^2$ I.V. over 10 minutes on day 1 of each 21-day cycle.

***Adjust-a-dose:*** In patients who develop toxic reactions, adjust dosage according to the table.

| Toxic reaction | Dosage change |
|---|---|
| – Grade 3 (severe or undesirable) or grade 4 (life-threatening or disabling) diarrhea<br>– Diarrhea that warrants hospitalization<br>– Any grade 3 toxicity (except mucositis and increased transaminase levels)<br>– Any grade 4 toxicity (except mucositis)<br>– Platelet count ≥ 50,000/mm$^3$ and absolute neutrophil count <500/mm$^3$ | Give 75% of previous pemetrexed and cisplatin doses. |
| Platelet count <50,000/mm$^3$ | Give 50% of previous pemetrexed and cisplatin doses. |
| Grade 3 or 4 mucositis | Give 50% of previous pemetrexed dose and 100% of previous cisplatin dose. |
| Grade 2 (moderate) neurotoxicity | Give 100% of previous pemetrexed dose and 50% of previous cisplatin dose. |
| – Grade 3 or 4 neurotoxicity<br>– Any grade 3 or 4 toxicity (except increased transaminase levels) present after two dose reductions | Stop therapy. |

### ADMINISTRATION

**I.V.**

▼ Reconstitute 500-mg vial with 20 ml of preservative-free normal saline solution to yield 25 mg/ml.
▼ Swirl vial gently until powder is completely dissolved. Solution should be clear and colorless to yellow or yellow-green.
▼ Calculate appropriate dose, and further dilute with 100 ml normal saline solution.
▼ Give over 10 minutes.
▼ Reconstituted solution and dilution are stable for 24 hours refrigerated or at room temperature.
▼ **Incompatibilities:** Calcium-containing diluents including Ringer's or lactated Ringer's for injection; other drugs or diluents.

### ACTION

Disturbs cell replication by inhibiting several folate-dependent enzymes involved in nucleotide synthesis. When given with other antineoplastics, drug inhibits growth of mesothelioma cell lines.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 3½ hours.

### ADVERSE REACTIONS

**CNS:** *depression, fatigue, fever, neuropathy.*
**CV:** ***cardiac ischemia,*** *chest pain, edema,* ***emboli,*** thrombosis.

P

**EENT:** *pharyngitis,* conjunctivitis.
**GI:** *anorexia, constipation, diarrhea, nausea, stomatitis, vomiting,* esophagitis, painful, difficult swallowing, taste disturbance.
**GU:** ***renal failure.***
**Hematologic:** *anemia,* **LEUKOPENIA, NEUTROPENIA, THROMBOCYTOPENIA.**
**Metabolic:** dehydration.
**Musculoskeletal:** arthralgia, *myalgia.*
**Respiratory:** *dyspnea.*
**Skin:** *alopecia, rash.*
**Other:** allergic reaction, *infection.*

## INTERACTIONS

**Drug-drug.** *Nephrotoxic drugs, probenecid:* May delay pemetrexed clearance. Monitor patient.
*NSAIDs:* May decrease pemetrexed clearance in patients with mild to moderate renal insufficiency. For NSAIDs with short half-lives, avoid use for 2 days before, during, and 2 days after pemetrexed therapy. For NSAIDs with long half-lives, avoid use for 5 days before, during, and 2 days after pemetrexed therapy.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, and creatinine levels. May decrease hemoglobin level and hematocrit.
- May decrease absolute neutrophil, platelet, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with a history of severe hypersensitivity reaction to drug or its ingredients. Don't use in patients with creatinine clearance less than 45 ml/minute.

***Overdose S&S:*** Neutropenia, anemia, thrombocytopenia, mucositis, rash, infection with or without fever, diarrhea.

## NURSING CONSIDERATIONS

- Patient shouldn't start a new cycle of treatment unless absolute neutrophil count is 1,500 cells/$mm^3$ or more, platelet count is 100,000 cells/$mm^3$ or more, and creatinine clearance is 45 ml/minute or more.
- Patients with pleural effusion and ascites may need to have effusion drained before therapy.
- Monitor renal function, CBC, platelet count, hemoglobin level, hematocrit, and liver function test values.
- Assess patient for neurotoxicity, mucositis, and diarrhea. Severe symptoms may warrant dosage adjustment.

***Alert:*** To reduce the occurrence and severity of cutaneous reactions, give a corticosteroid, such as dexamethasone 4 mg P.O. b.i.d., the day before, the day of, and the day after giving this drug.

***Alert:*** To reduce toxicity, patient should take 350 to 1,000 mcg of folic acid daily, 5 days before therapy until 21 days after therapy.

***Alert:*** Give vitamin $B_{12}$ 1,000 mcg I.M. once during the week before the first dose and every three cycles thereafter. After the first cycle, vitamin injections may be given on the first day of the cycle.

## PATIENT TEACHING

- Inform patient that he may receive corticosteroids and vitamins before pemetrexed to help minimize its adverse effects.
- Tell patient to avoid NSAIDs for several days before, during, and after treatment.
- Urge patient to report adverse effects, especially fever, sore throat, infection, diarrhea, fatigue, and limb pain.
- It's unknown if drug appears in breast milk. Advise patient to stop breast-feeding during treatment.

# penicillin G benzathine (benzathine benzylpenicillin)

pen-i-SILL-in

Bicillin L-A, Permapen

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Natural penicillin
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 300,000 units/ml; 600,000 units/ml; 1.2 million units/2 ml; 2.4 million units/4 ml

## INDICATIONS & DOSAGES

➤ **Congenital syphilis**
*Children younger than age 2:*
50,000 units/kg (up to 2.4 million units) I.M. as a single dose.

➤ **Group A streptococcal upper respiratory tract infections**
*Adults:* 1.2 million units I.M. as a single injection.
*Children who weigh 27 kg (59.5 lb) or more:* 900,000 units I.M. as a single injection.
*Infants and children who weigh less than 27 kg:* 300,000 to 600,000 units I.M. as a single injection.

➤ **To prevent poststreptococcal rheumatic fever and glomerulonephritis**
*Adults and children:* 1.2 million units I.M. once monthly or 600,000 units I.M. every 2 weeks.

➤ **Syphilis of less than 1 year duration**
*Adults:* 2.4 million units I.M. as a single dose.
*Children younger than age 2:* 50,000 units/kg I.M. as a single dose. Don't exceed adult dosage.

➤ **Syphilis of more than 1 year duration**
*Adults:* 2.4 million units I.M. weekly for 3 weeks.

## ADMINISTRATION

**I.M.**
- Before giving drug, ask patient about allergic reactions to penicillin.
- Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
- Shake well before injecting.
- Give drug at least 1 hour before a bacteriostatic antibiotic.
- Inject deep into upper outer quadrant of buttocks in adults and in midlateral thigh in infants and small children. Rotate injection sites. Avoid injection into or near major nerves or blood vessels to prevent permanent neurovascular damage.
- Injection may be painful, but ice applied to the site may ease discomfort.

## ACTION

Inhibits cell-wall synthesis during bacterial multiplication.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.M. | Unknown | 13–24 hr | 1–4 wk |

*Half-life:* 30 to 60 minutes.

## ADVERSE REACTIONS

**CNS:** neuropathy.
**GI:** ***pseudomembranous colitis,*** enterocolitis, nausea, vomiting.
**GU:** interstitial nephritis, nephropathy.
**Hematologic:** ***agranulocytosis, leukopenia, thrombocytopenia,*** anemia, eosinophilia, hemolytic anemia.
**Skin:** exfoliative dermatitis, maculopapular rash.
**Other:** ***anaphylaxis,*** hypersensitivity reactions, sterile abscess at injection site.

## INTERACTIONS

**Drug-drug.** *Aminoglycosides:* Physical and chemical incompatibility. Give separately.
*Hormonal contraceptives:* May decrease hormonal contraceptive effectiveness. Advise use of additional form of contraception during therapy.
*Probenecid:* May increase penicillin level. Probenecid may be used for this purpose.
*Tetracycline:* May antagonize penicillin G benzathine effects. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level.
- May increase eosinophil count. May decrease platelet, WBC, and granulocyte counts. May cause positive Coombs' test results.
- May falsely decrease aminoglycoside level. May cause false-positive CSF protein test results. May alter urine glucose testing using cupric sulfate (Benedict's reagent).

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other penicillins.
- Inadvertent intravascular administration has resulted in severe neurovascular damage, including transverse myelitis with permanent paralysis and gangrene.
- Use cautiously in patients allergic to other drugs, especially to cephalosporins, because of possible cross-sensitivity.

⚠ ***Overdose S&S:*** Neuromuscular hyperexcitability, seizures.

## NURSING CONSIDERATIONS

***Alert:*** Bicillin L-A is the only penicillin G benzathine product indicated for sexually transmitted infections. Don't substitute Bicillin C-R because it may not be effective.

***Alert:*** Inadvertent I.V. use may cause cardiac arrest and death. Never give I.V.

- Drug's extremely slow absorption time makes allergic reactions difficult to treat.
- If large doses are given or if therapy is prolonged, bacterial or fungal superinfection may occur, especially in elderly, debilitated, or immunosuppressed patients.
- ***Look alike–sound alike:*** Don't confuse drug with Polycillin, penicillamine, or the various types of penicillin.

## PATIENT TEACHING

- Tell patient to report adverse reactions promptly.
- Inform patient that fever and increased WBC count are the most common reactions.
- Warn patient that I.M. injection may be painful but that ice applied to the site may ease discomfort.

# penicillin G potassium (benzylpenicillin potassium)

pen-i-SILL-in

Pfizerpen

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Natural penicillin
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 5 million units, 20 million units
*Premixed injection:* 1 million units/50 ml, 2 million units/50 ml, 3 million units/50 ml

## INDICATIONS & DOSAGES

➤ **Moderate to severe systemic infection**

*Adults and children age 12 and older:* Highly individualized; 1 to 30 million units I.M. or I.V. daily in divided doses every 2 to 6 hours or via continuous I.V. infusion.
*Children younger than age 12:* 100,000 to 400,000 units/kg I.M. or I.V. daily in divided doses every 4 to 6 hours.
*Infants older than 7 days:* 75,000 units/kg/day I.M. or I.V. (preferred route) in divided doses every 8 hours.
*Infants younger than 7 days:* 50,000 units/kg/day I.M. or I.V. (preferred route) in divided doses every 12 hours.

➤ **Anthrax**

*Adults:* 5 to 20 million units I.V. daily in divided doses every 4 to 6 hours, for at least 14 days after symptoms diminish. The average adult dosage is 4 million units every 4 hours or 2 million units every 2 hours.
*Children:* 100,000 to 150,000 units/kg/day I.V. in divided doses every 4 to 6 hours for at least 14 days after symptoms diminish.

➤ **Meningitis**

*Infants older than 7 days:* 200,000 to 300,000 units/kg/day I.M. or I.V. (preferred route) in divided doses every 6 hours.
*Infants younger than 7 days:* 100,000 to 150,000 units/kg/day I.M. or I.V. (preferred route) in divided doses every 12 hours.

➤ **Neurosyphilis**

*Adults:* 18 to 24 million units I.V. daily in divided doses every 4 hours for 10 to 14 days.

➤ **Syphilis (congenital and neurosyphilis)**

*Children after newborn period:* 200,000 to 300,000 units/kg/day I.V. in divided doses every 4 to 6 hours for 10 to 14 days.

➤ **Group B streptococcus infection**

*Infants younger than 7 days:* 100,000 units/kg/day I.M. or I.V. (preferred route) in divided doses every 12 hours.

***Adjust-a-dose:*** If creatinine clearance is 10 to 50 ml/minute, give the usual dose every 8 to 12 hours. If clearance is less than 10 ml/minute, give 50% of usual dose every 8 to 10 hours or the usual dose every 12 to 18 hours. If patient is uremic and creatinine clearance is more than 10 ml/minute, give full loading dose; then give half the loading dose every 4 to 5 hours for additional doses.

## ADMINISTRATION

**I.V.**

▼ Before giving drug, ask patient about allergic reactions to penicillin.
▼ Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.

▼ Reconstitute drug with sterile water for injection, $D_5W$, or normal saline solution for injection. Volume of diluent varies with manufacturer.
▼ For intermittent infusion in adults, give drug over 1 to 2 hours. For intermittent infusion in infants, give drug over 15 to 30 minutes.
▼ For continuous infusion, add reconstituted drug to 1 to 2 L of compatible solution. Determine how much fluid is needed and what the rate should be for a 24-hour period; then, add the drug to this fluid.
▼ Don't administer premixed solutions to patients requiring less than 1 million units per dose.
▼ **Incompatibilities:** Alcohol 5%, amikacin, aminoglycosides, aminophylline, amphotericin B sodium, chlorpromazine, dextran, dopamine, heparin sodium, hydroxyzine hydrochloride, lincomycin, metoclopramide, pentobarbital sodium, phenytoin sodium, prochlorperazine mesylate, promethazine hydrochloride, sodium bicarbonate, thiopental, vancomycin, vitamin B complex with C.

**I.M.**
● Before giving drug, ask patient about allergic reactions to penicillin.
● Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
● Give deep into large muscle; injection may be extremely painful.
● I.M. injection may be painful, but ice applied to the site may help alleviate discomfort.

## ACTION

Inhibits cell-wall synthesis during bacterial multiplication.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |
| I.M. | Unknown | 15–30 min | Unknown |

*Half-life:* 30 to 60 minutes.

## ADVERSE REACTIONS

**CNS:** ***seizures,*** agitation, anxiety, confusion, depression, dizziness, fatigue, hallucinations, lethargy, neuropathy.
**CV:** thrombophlebitis, ***cardiac arrest, arrhythmias.***
**GI:** ***pseudomembranous colitis,*** enterocolitis, nausea, vomiting.
**GU:** interstitial nephritis, nephropathy.
**Hematologic:** ***agranulocytosis, leukopenia, thrombocytopenia,*** anemia, eosinophilia, hemolytic anemia.
**Metabolic:** ***severe potassium poisoning.***
**Skin:** exfoliative dermatitis, maculopapular eruptions, pain at injection site.
**Other:** ***anaphylaxis,*** hypersensitivity reactions, overgrowth of nonsusceptible organisms.

## INTERACTIONS

**Drug-drug.** *Aminoglycosides:* Physically and chemically incompatible. Give separately.
*Colestipol:* May decrease penicillin G potassium level. Give penicillin G potassium 1 hour before or 4 hours after colestipol.
*Hormonal contraceptives:* May decrease hormonal contraceptive effectiveness. Advise use of additional form of contraception during therapy.
*Oral anticoagulants:* May increase risk of bleeding. Monitor PT and INR.
*Potassium-sparing diuretics:* May increase risk of hyperkalemia. Avoid using together.
*Probenecid:* May increase penicillin level. Probenecid may be used for this purpose.

## EFFECTS ON LAB TEST RESULTS

● May increase potassium level. May decrease hemoglobin level.
● May increase eosinophil count. May decrease platelet, WBC, and granulocyte counts. May cause positive Coombs' test result.
● May falsely decrease aminoglycoside levels. May cause false-positive CSF protein test result. May alter urine glucose testing using cupric sulfate (Benedict's reagent).

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or other penicillins.
● Use cautiously in patients with other drug allergies, especially to cephalosporins, because of possible cross-sensitivity.

● Use cautiously in patients with renal impairment.
**Overdose S&S:** Neuromuscular hyperexcitability, seizures.

### NURSING CONSIDERATIONS
● Monitor renal function closely. Patients with poor renal function are predisposed to high levels.
● Due to increased risk of electrolyte imbalances, monitor potassium and sodium levels closely in patients receiving more than 10 million units I.V. daily.
● Observe patient closely. With large doses and prolonged therapy, bacterial or fungal superinfection may occur, especially in elderly, debilitated, or immunosuppressed patients.
● **Look alike–sound alike:** Don't confuse drug with Polycillin, penicillamine, or the various types of penicillin.

### PATIENT TEACHING
● Tell patient to notify prescriber if rash, fever, or chills develop. A rash is the most common allergic reaction.
● Warn patient that I.M. injection may be painful but that ice applied to the site may help alleviate discomfort.

## penicillin G procaine (benzylpenicillin procaine)
pen-i-SILL-in

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Natural penicillin
*Pregnancy risk category B*

### AVAILABLE FORMS
*Injection:* 600,000 units/ml; 1.2 million units/2-ml vial

### INDICATIONS & DOSAGES
➤ **Moderate to severe systemic infection**
*Adults:* 600,000 to 1.2 million units I.M. daily for a minimum of 10 days.
*Children who weigh less than 27 kg (60 lb):* 300,000 units/day I.M.
➤ **Anthrax caused by *Bacillus anthracis*, including inhalation anthrax after exposure**
*Adults:* 1,200,000 units I.M. every 12 hours.
*Children:* 25,000 units/kg I.M.; not to exceed 1,200,000 units every 12 hours.
➤ **Cutaneous anthrax**
*Adults:* 600,000 to 1,000,000 units I.M. daily.
➤ **Syphilis (primary, secondary, and latent with negative spinal fluid)**
*Adults and children older than age 12:* 600,000 units/day I.M. for 8 days.
➤ **Syphilis (tertiary, neurosyphilis, and latent with positive spinal fluid or no spinal fluid examination)**
*Adults:* 600,000 units/day I.M. for 10 to 15 days.
➤ **Congenital syphilis (under 32 kg [70 lb] body weight)**
*Children:* 50,000 units/kg/day I.M. for 10 days.

### ADMINISTRATION
**I.M.**
● Before giving drug, ask patient about allergic reactions to penicillin.
● Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
● Give deep in upper outer quadrant of buttocks in adults; in midlateral thigh in small children. Rotate injection sites. Don't give subcutaneously. Don't massage injection site. Avoid injection near major nerves or blood vessels to prevent permanent neurovascular damage and tissue necrosis.
**Alert:** Inadvertent I.V. use may cause CNS toxicity and death. Toxic reaction may occur after one dose. Never give I.V.
● I.M. injection may be painful, but ice applied to the site may help alleviate discomfort.

### ACTION
Inhibits cell-wall synthesis during bacterial multiplication.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.M. | Unknown | 1–4 hr | 1–5 days |

*Half-life:* 30 to 60 minutes.

### ADVERSE REACTIONS
**CNS: *seizures*,** agitation, anxiety, confusion, depression, dizziness, fatigue, hallucinations, lethargy.

**GI:** ***pseudomembranous colitis,*** enterocolitis, nausea, vomiting.
**GU:** interstitial nephritis, nephropathy.
**Hematologic:** ***agranulocytosis, thrombocytopenia,*** hemolytic anemia, ***leukopenia,*** anemia, eosinophilia.
**Musculoskeletal:** arthralgia.
**Other:** ***anaphylaxis,*** hypersensitivity reactions, overgrowth of nonsusceptible organisms.

## INTERACTIONS

**Drug-drug.** *Aminoglycosides:* Physically and chemically incompatible. Give separately.
*Hormonal contraceptives:* May decrease hormonal contraceptive effectiveness. Advise use of additional form of contraception during therapy.
*Probenecid:* May increase penicillin level. Probenecid may be used for this purpose.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level.
- May increase eosinophil count. May decrease platelet, WBC, and granulocyte counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other penicillins.
- Use cautiously in patients with other drug allergies, especially to cephalosporins, because of possible cross-sensitivity. Some formulations contain sulfites, which may cause allergic reactions in sensitive people.

***Overdose S&S:*** Neuromuscular hyperexcitability, seizures.

## NURSING CONSIDERATIONS

***Alert:*** Continue postexposure treatment for inhalation anthrax for 60 days. Prescriber should consider the risk-benefit ratio of continuing penicillin longer than 2 weeks, compared with switching to another drug.

- Allergic reactions are hard to treat because of drug's slow absorption rate.
- Monitor renal and hematopoietic function periodically.
- If large doses are given or if therapy is prolonged, bacterial or fungal superinfection may occur, especially in elderly, debilitated, or immunosuppressed patients.
- Treatment duration depends on site and cause of infection.
- ***Look alike–sound alike:*** Don't confuse drug with Polycillin, penicillamine, or the various types of penicillin.

## PATIENT TEACHING

- Tell patient to report adverse reactions promptly. A rash is the most common allergic reaction.
- Warn patient that I.M. injection may be painful but that ice applied to the site may help alleviate discomfort.

# penicillin G sodium (benzylpenicillin sodium)

pen-i-SILL-in

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Natural penicillin
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 5 million-unit vial

## INDICATIONS & DOSAGES

➤ **Moderate to severe systemic infection**
*Adults and children age 12 and older:* 1 to 24 million units daily I.M. or I.V. in divided doses every 4 to 6 hours.
*Children younger than age 12:* 100,000 to 400,000 units/kg daily I.M. or I.V. in divided doses every 4 to 6 hours.
*Infants older than 7 days:* 75,000 units/kg/day I.M. or I.V. (preferred route) in divided doses every 8 hours.
*Infants younger than 7 days:* 50,000 units/kg/day I.M. or I.V. (preferred route) in divided doses every 12 hours.

➤ **Meningitis**
*Infants older than 7 days:* 200,000 to 300,000 units/kg/day I.M. or I.V. (preferred route) every 6 hours.
*Infants younger than 7 days:* 100,000 to 150,000 units/kg/day I.M. or I.V. (preferred route) in divided doses every 12 hours.

➤ **Neurosyphilis**
*Adults:* 18 to 24 million units I.V. daily in divided doses every 4 hours for 10 to 14 days.

P

***Adjust-a-dose:*** If creatinine clearance is 10 to 50 ml/minute, give the usual dose every 8 to 12 hours. If clearance is less than 10 ml/minute, give 50% of usual dose every 8 to 10 hours or the usual dose every 12 to 18 hours. If patient is uremic and creatinine clearance is more than 10 ml/minute, give full loading dose; then give half the loading dose every 4 to 5 hours for additional doses.

## ADMINISTRATION

**I.V.**

▼ Before giving drug, ask patient about allergic reactions to penicillin.
▼ Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
▼ Reconstitute drug with sterile water for injection, normal saline solution for injection, or $D_5W$. Check manufacturer's instructions for volume of diluent necessary to produce desired drug level.
▼ Give by intermittent infusion: Dilute drug in 50 to 100 ml, and give over 30 minutes to 2 hours every 4 to 6 hours.
▼ In neonates, infants, and children, give divided doses over 15 to 30 minutes.
▼ **Incompatibilities:** Aminoglycosides, amphotericin B, bleomycin, chlorpromazine, cytarabine, fat emulsions 10%, heparin sodium, hydroxyzine hydrochloride, invert sugar 10%, lincomycin, methylprednisolone sodium succinate, potassium chloride, prochlorperazine mesylate, promethazine hydrochloride.

**I.M.**

● Before giving drug, ask patient about allergic reactions to penicillin.
● Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
● Injection may be painful, but ice applied to site may help alleviate discomfort.

## ACTION

Inhibits cell-wall synthesis during bacterial multiplication.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |
| I.M. | Unknown | 15–30 min | Unknown |

*Half-life:* 30 to 60 minutes.

## ADVERSE REACTIONS

**CNS:** neuropathy, ***seizures,*** agitation, anxiety, confusion, depression, dizziness, fatigue, hallucinations, lethargy.
**CV:** ***heart failure,*** thrombophlebitis.
**GI:** enterocolitis, ischemic colitis, nausea, vomiting, ***pseudomembranous colitis.***
**GU:** nephropathy, interstitial nephritis.
**Hematologic:** hemolytic anemia, ***agranulocytosis, leukopenia, thrombocytopenia, anemia,*** eosinophilia.
**Musculoskeletal:** arthralgia.
**Other:** hypersensitivity reactions, ***anaphylaxis,*** overgrowth of nonsusceptible organisms, pain at injection site, vein irritation.

## INTERACTIONS

**Drug-drug.** *Aminoglycosides:* Physically and chemically incompatible. Give separately.
*Colestipol:* May decrease penicillin G sodium level. Give penicillin G sodium 1 hour before or 4 hours after colestipol.
*Hormonal contraceptives:* May decrease hormonal contraceptive effectiveness. Advise use of additional form of contraception during penicillin therapy.
*Oral anticoagulants:* May increase risk of bleeding. Monitor PT and INR.
*Probenecid:* May increase penicillin level. Probenecid may be used for this purpose.

## EFFECTS ON LAB TEST RESULTS

● May decrease hemoglobin level.
● May cause positive Coombs' test result. May increase eosinophil count. May decrease platelet, WBC, granulocyte, and RBC counts.
● May cause false-positive CSF protein test result. May falsely decrease aminoglycoside level. May alter urine glucose testing using cupric sulfate (Benedict's reagent).

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or other penicillins and in those on sodium-restricted diets.
● Use cautiously in patients with other drug allergies, especially to cephalosporins, because of possible cross-sensitivity.
⚠ ***Overdose S&S:*** Neuromuscular hyperexcitability, seizures.

### NURSING CONSIDERATIONS

- Observe patient closely. With large doses and prolonged therapy, bacterial or fungal superinfection may occur, especially in elderly, debilitated, or immunosuppressed patients.
- ***Look alike–sound alike:*** Don't confuse drug with Polycillin, penicillamine, or the various types of penicillin.

### PATIENT TEACHING

- Tell patient to report adverse reactions promptly.
- Instruct patient to report discomfort at I.V. site.
- Warn patient receiving I.M. injection that the injection may be painful but that ice applied to site may help alleviate discomfort.

## penicillin V potassium (phenoxymethyl penicillin potassium)

pen-i-SILL-in

Apo-Pen VK†, Novo-Pen-VK†, Nu-Pen-VK†, Penicillin VK, Veetids

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Natural penicillin
*Pregnancy risk category B*

### AVAILABLE FORMS

*Oral suspension:* 125 mg/5 ml, 250 mg/5 ml (after reconstitution)
*Tablets:* 250 mg, 500 mg
*Tablets (film-coated):* 250 mg, 500 mg

### INDICATIONS & DOSAGES

➤ **Mild to moderate systemic infections**
*Adults and children age 12 and older:* 125 to 500 mg or P.O. every 6 hours.
*Children younger than age 12:* 15 to 62.5 mg/kg P.O. daily in divided doses every 6 to 8 hours.

➤ **To prevent recurrent rheumatic fever**
*Adults and children:* 125 to 250 mg P.O. b.i.d.

➤ **To prevent inhalation anthrax after possible exposure**
*Adults:* 7.5 mg/kg P.O. q.i.d. Continue treatment until exposure is ruled out. If exposure is confirmed, continue treatment for 30 to 60 days. If vaccine is indicated, continue prophylaxis for 4 weeks and until third dose of vaccine has been given.
*Children younger than age 9:* 50 mg/kg P.O. daily given in four divided doses. Continue treatment until exposure is ruled out. If exposure is confirmed, continue treatment for 30 to 60 days. If vaccine is indicated, continue prophylaxis for 4 weeks and until third dose of vaccine has been given.

### ADMINISTRATION

**P.O.**

- Before giving drug, ask patient about allergic reactions to penicillins.
- Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
- Give drug with food if patient has stomach upset.

### ACTION

Inhibits cell-wall synthesis during bacterial multiplication.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 30–60 min | Unknown |

*Half-life:* 30 minutes.

### ADVERSE REACTIONS

**CNS:** neuropathy.
**GI:** *epigastric distress, nausea,* diarrhea, black hairy tongue, vomiting.
**GU:** nephropathy.
**Hematologic:** ***leukopenia, thrombocytopenia,*** eosinophilia, hemolytic anemia.
**Other:** ***anaphylaxis,*** hypersensitivity reactions, overgrowth of nonsusceptible organisms.

### INTERACTIONS

**Drug-drug.** *Hormonal contraceptives:* May decrease hormonal contraceptive effectiveness. Advise use of another form of contraception during therapy.
*Probenecid:* May increase penicillin level. Probenecid may be used for this purpose.

### EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level.
- May increase eosinophil count. May decrease platelet, WBC, and granulocyte counts.

P

• May alter results of turbidimetric test methods using sulfosalicylic acid, acetic acid, trichloroacetic acid, and nitric acid.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or other penicillins.
• Use cautiously in patients with GI disturbances and in those with other drug allergies, especially to cephalosporins, because of possible cross-sensitivity.
⚠ ***Overdose S&S:*** Neuromuscular hyperexcitability, seizures.

## NURSING CONSIDERATIONS

• Periodically assess renal and hematopoietic function in patients receiving long-term therapy.
• If large doses are given or if therapy is prolonged, bacterial or fungal superinfection may occur, especially in elderly, debilitated, or immunosuppressed patients.
• Amoxicillin is the preferred drug to prevent endocarditis because GI absorption is better and drug levels are sustained longer. Penicillin V is considered an alternate drug.
• ***Look alike–sound alike:*** Don't confuse drug with Polycillin, penicillamine, or the various types of penicillin.

## PATIENT TEACHING

• Instruct patient to take entire quantity of drug exactly as prescribed, even after he feels better.
• Tell patient to take drug with food if stomach upset occurs.
• Advise patient to notify prescriber if rash, fever, or chills develop. A rash is the most common allergic reaction.

# pentamidine isethionate

pen-TA-ma-deen

NebuPent, Pentam

*Therapeutic class:* Antiprotozoal
*Pharmacologic class:* Diamidine derivative
*Pregnancy risk category C*

## AVAILABLE FORMS

*Aerosol, injection, powder for injection:* 300-mg vial

## INDICATIONS & DOSAGES

➤ ***Pneumocystis jiroveci (carinii)* pneumonia**

*Adults and children age 4 months and older:* 3 to 4 mg/kg I.V. or I.M. once daily for 14 to 21 days.

➤ **To prevent *P. jiroveci (carinii)* pneumonia in high-risk patients**

*Adults and children capable of using a nebulizer effectively:* 300 mg by inhalation using a Respirgard II nebulizer once every 4 weeks.

➤ **Visceral leishmaniasis caused by *Leishmania donovani* ♦**

*Adults and children:* 2 to 4 mg/kg I.V. or I.M. once daily or once every other day for up to 15 doses.

➤ **Cutaneous leishmaniasis ♦**

*Adults and children:* 2 mg/kg I.M. every other day for seven doses or 3 mg/kg I.M. every other day for four doses.

## ADMINISTRATION

**I.V.**

▼ Reconstitute drug with 3 to 5 ml sterile water for injection.
▼ Dilute reconstituted drug in 50 to 250 ml $D_5W$.
▼ Infuse over at least 60 minutes.
▼ To minimize risk of hypotension, infuse drug slowly with patient lying down. Closely monitor blood pressure.
▼ **Incompatibilities:** Aldesleukin, cephalosporins, fluconazole, foscarnet, linezolid.

**I.M.**

• Reconstitute drug with 3 ml sterile water for a solution containing 100 mg/ml.
• Give deep into muscle.
• Patient may have pain and induration at injection site.
• Rotate injection sites.

**Inhalational**

• Give aerosol form only by Respirgard II nebulizer. Dosage recommendations are based on particle size and delivery rate of this device. To give aerosol, mix contents of one vial in 6 ml sterile water for injection. Don't use normal saline solution. Don't mix with other drugs.
• Don't use low-pressure (less than 20 pounds per square inch [psi]) compressors. The flow rate should be 5 to

7 L/minute from 40- to 50-psi air or oxygen source.

## ACTION

May interfere with biosynthesis of DNA, RNA, phospholipids, and proteins in susceptible organisms.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | 1 hr | Unknown |
| I.M. | Unknown | 30 min | Unknown |
| Inhalation | Unknown | Unknown | Unknown |

*Half-life:* 9 to 13 hours for I.M., about 6½ hours for I.V., unknown for inhalation.

## ADVERSE REACTIONS

**CNS:** confusion, hallucinations.
**CV:** *chest pain,* ***severe hypotension, ventricular tachycardia.***
**EENT:** *pharyngitis,* burning in throat (with inhaled form).
**GI:** *nausea, metallic taste, decreased appetite,* ***pancreatitis,*** anorexia.
**GU:** ***acute renal failure.***
**Hematologic:** ***leukopenia, thrombocytopenia,*** anemia.
**Metabolic:** ***hypoglycemia.***
**Respiratory:** ***bronchospasm.***
**Skin:** rash.
**Other:** *night sweats, sterile abscess, pain, induration at injection site.*

## INTERACTIONS

**Drug-drug.** *Aminoglycosides, amphotericin B, capreomycin, cisplatin, methoxyflurane, polymyxin B, vancomycin:* May increase risk of nephrotoxicity. Monitor renal function test results closely.
*Antineoplastics:* May cause additive bone marrow suppression. Use together cautiously; monitor hematologic study results.
*Drugs that prolong the QT interval (antipsychotics; antiarrhythmics, such as amiodarone, disopyramide, procainamide, quinidine, and sotalol; fluoroquinolones; macrolides; tricyclic antidepressants):* May cause additive effect. Use together cautiously; monitor patient for adverse cardiac effects.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN, creatinine, and potassium levels. May decrease hemoglobin level and hematocrit. May increase or decrease glucose level.
- May decrease WBC and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with history of anaphylactic reaction to drug.
- Use cautiously in patients with hypertension, hypotension, hypoglycemia, hypocalcemia, leukopenia, thrombocytopenia, anemia, diabetes, pancreatitis, Stevens-Johnson syndrome, or hepatic or renal dysfunction.
- Use cautiously in breast-feeding women; it's unknown if drug appears in breast milk.

***Overdose S&S:*** Renal and hepatic impairment, hypotension, cardiopulmonary arrest.

## NURSING CONSIDERATIONS

***Alert:*** Monitor glucose, creatinine, and BUN levels daily. After parenteral administration, glucose level may decrease initially; hypoglycemia may be severe in 5% to 10% of patients. After several months of therapy, this may be followed by hyperglycemia and type 1 diabetes mellitus, which may be permanent.
- Extravasation can lead to ulceration, tissue necrosis, or sloughing at injection site. Monitor I.V. site closely.
- Obtain the following tests before, during, and after therapy: CBC, platelet count, liver function, serum calcium, and ECG.
- In patients with AIDS, drug may produce less severe adverse reactions than sulfamethoxazole/trimethoprim.

## PATIENT TEACHING

- Instruct patient to use the aerosol device until the chamber is empty, which may take up to 45 minutes.
- Warn patient that I.M. injection is painful.
- Instruct patient to complete the full course, even if he's feeling better.

**SAFETY ALERT!**

# pentazocine hydrochloride

pen-TAZ-oh-seen

Talwin†

# pentazocine hydrochloride and naloxone hydrochloride

# pentazocine lactate

Talwin

*Therapeutic class:* Analgesic
*Pharmacologic class:* Opioid agonist-antagonist, opioid partial agonist
*Pregnancy risk category C*
*Controlled substance schedule IV*

## AVAILABLE FORMS

**pentazocine hydrochloride**
*Tablets:* 50 mg†
**pentazocine hydrochloride and naloxone hydrochloride**
*Tablets:* 50 mg pentazocine hydrochloride and 500 mcg naloxone hydrochloride
**pentazocine lactate**
*Injection:* 30 mg/ml

## INDICATIONS & DOSAGES

➤ **Moderate to severe pain**
*Adults:* 50 to 100 mg P.O. every 3 to 4 hours p.r.n. Maximum oral dose is 600 mg/day.
➤ **Moderate to severe pain; preoperative or preanesthetic supplement to surgical anesthesia**
*Adults and children older than age 12:* 30 mg I.M., I.V., or subcutaneously every 3 to 4 hours p.r.n. Maximum parenteral dose is 360 mg/day. Single doses above 30 mg I.V. or 60 mg I.M. or subcutaneously aren't recommended.
➤ **Labor**
*Adults and children older than age 12:* 30 mg I.M. as a single dose or 20 mg I.V. every 2 to 3 hours when contractions become regular for two to three doses.

## ADMINISTRATION

**P.O.**
● Give drug with aspirin or acetaminophen for additive analgesic effect.

**I.V.**
▼ Give drug slowly by direct I.V. injection.
**Black Box Warning** Pentazocine/naloxone, the oral form available in the United States, contains the opioid antagonist naloxone, which discourages illicit I.V. use. ■
▼ **Incompatibilities:** Alkaline solutions, aminophylline, amobarbital, glycopyrrolate, heparin sodium, nafcillin sodium, pentobarbital sodium, phenobarbital sodium, sodium bicarbonate.

**I.M.**
● Rotate injection sites to minimize tissue irritation.

**Subcutaneous**
● Rotate injection sites to minimize tissue irritation. If possible, avoid giving subcutaneously.

## ACTION

Unknown. Binds with opioid receptors in the CNS, altering perception of and emotional response to pain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 15–30 min | 1–3 hr | 2–3 hr |
| I.V. | 2–3 min | 15–30 min | 2–3 hr |
| I.M., Subcut. | 15–20 min | 30–60 min | 2–3 hr |

*Half-life:* 2 to 3 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness, euphoria, lightheadedness, sedation,* confusion, drowsiness, hallucinations, headache, psychotomimetic effects, visual disturbances.
**CV:** ***shock, circulatory depression,*** hypertension, hypotension.
**EENT:** dry mouth.
**GI:** *nausea, vomiting,* constipation.
**GU:** urine retention.
**Respiratory:** ***apnea, respiratory depression,*** dyspnea.
**Skin:** diaphoresis, induration, nodules, sclerosis at injection site, pruritus, sloughing.
**Other:** ***anaphylaxis,*** hypersensitivity reactions, physical and psychological dependence.

## INTERACTIONS

**Drug-drug.** *CNS depressants:* May cause additive effects. Use together cautiously.

*Fluoxetine:* May cause additive effects resulting in serotonin syndrome. Use together cautiously.
*Opioid analgesics:* May decrease analgesic effect. Avoid using together.
**Drug-lifestyle.** *Alcohol use:* May cause additive effects. Discourage use together.
*Smoking:* May increase requirements for pentazocine. Monitor drug's effectiveness.

### EFFECTS ON LAB TEST RESULTS
• May interfere with laboratory tests for urinary 17-hydroxycorticosteroids.

### CONTRAINDICATIONS & CAUTIONS
• Contraindicated in patients hypersensitive to drug or its components and in children younger than age 12.
• Use cautiously in patients with hepatic or renal disease, acute MI, head injury, increased intracranial pressure, and respiratory depression.

### NURSING CONSIDERATIONS
• Reassess patient's level of pain at least 15 and 30 minutes after parenteral administration and 30 minutes after oral administration.
• Drug may cause constipation. Assess bowel function and need for stool softeners or stimulant laxatives. Encourage fluids.
• Have naloxone readily available. Respiratory depression can be reversed with naloxone.
• Drug has opioid antagonist properties. May cause withdrawal syndrome in opioid-dependent patients.
• Psychological and physical dependence may occur with prolonged use.

### PATIENT TEACHING
• Instruct patient to ask for drug before pain is intense.
• Caution ambulatory patient about getting out of bed or walking. Warn outpatient to avoid driving and other hazardous activities that require mental alertness until drug's CNS effects are known.
• Advise patient to avoid alcohol during therapy.
• Instruct patient or family to report skin rash, disorientation, or confusion to prescriber.

## pentoxifylline
pen-tox-IH-fi-leen

Pentoxil, Trental✐

*Therapeutic class:* Hemorheologic drug
*Pharmacologic class:* Xanthine derivative
*Pregnancy risk category C*

### AVAILABLE FORMS
*Tablets (extended-release):* 400 mg

### INDICATIONS & DOSAGES
➤ **Intermittent claudication from chronic occlusive vascular disease**
*Adults:* 400 mg P.O. t.i.d. with meals. May decrease to 400 mg b.i.d. if GI and CNS adverse effects occur. If adverse effects persist, discontinue drug.

### ADMINISTRATION
**P.O.**
• Give drug whole; don't crush or split tablet.
• Give drug with meals to minimize GI upset.

### ACTION
Unknown. Improves capillary blood flow, probably by increasing RBC flexibility and lowering blood viscosity.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Unknown |

*Half-life:* About 30 to 45 minutes.

### ADVERSE REACTIONS
**CNS:** dizziness, headache.
**GI:** dyspepsia, nausea, vomiting.

### INTERACTIONS
**Drug-drug.** *Anticoagulants:* May increase anticoagulant effect. Monitor PT.
*Antihypertensives:* May increase hypotensive effect. May need to adjust dosage.
*Theophylline:* May increase theophylline level. Monitor patient closely.
**Drug-lifestyle.** *Smoking:* May cause vasoconstriction. Advise patient to avoid smoking.

P

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients intolerant to this drug or to methylxanthines, such as caffeine, theophylline, and theobromine, and in those with recent cerebral or retinal hemorrhage.

⚠ ***Overdose S&S:*** Flushing, hypotension, seizures, somnolence, loss of consciousness, fever, agitation.

### NURSING CONSIDERATIONS
- Drug's effects may be seen in 2 to 4 weeks. Continue treatment for at least 8 weeks.
- Drug is useful in patients who aren't good surgical candidates.
- Elderly patients may be more sensitive to drug's effects.
- ***Look alike–sound alike:*** Don't confuse Trental with Trandate.

### PATIENT TEACHING
- Advise patient to take drug with meals to minimize GI upset.
- Instruct patient to swallow tablet whole, without breaking, crushing, or chewing.
- Tell patient to report GI or CNS adverse reactions; prescriber may reduce dosage.
- Urge patient not to stop drug during the first 8 weeks of therapy unless directed by prescriber.

## perindopril erbumine
pur-IN-doh-pril

Aceon, Coversyl†

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* ACE inhibitor
*Pregnancy risk category C; D in 2nd and 3rd trimesters*

### AVAILABLE FORMS
*Tablets:* 2 mg, 4 mg, 8 mg

### INDICATIONS & DOSAGES
➤ **To reduce the risk of CV death or nonfatal MI in patients with stable coronary artery disease**

*Adults age 70 or younger:* 4 mg P.O. once daily for 2 weeks; then, increase as tolerated to 8 mg once daily.
*Elderly adults older than age 70:* Initially, 2 mg P.O. once daily for the first week; then, 4 mg once daily for the second week and 8 mg once daily after that, if tolerated.

➤ **Essential hypertension**
*Adults:* Initially, 4 mg P.O. once daily. Increase dosage until blood pressure is controlled or to maximum of 16 mg/day; usual maintenance dosage is 4 to 8 mg once daily; may be given in two divided doses.
*Adults older than age 65:* Initially, 4 mg P.O. daily as one dose or in two divided doses. Dosage may be increased by more than 8 mg/day only under close medical supervision.

***Adjust-a-dose:*** For renally insufficient patients with creatinine clearance 30 ml/minute or greater, initially 2 mg P.O. daily. Maximum daily maintenance dose is 8 mg. In patients taking diuretics, initially 2 to 4 mg P.O. daily as single dose or in two divided doses, with close medical supervision for several hours and until blood pressure has stabilized. Adjust dosage based on patient's blood pressure response.

### ADMINISTRATION
**P.O.**
- Give drug without regard for food.

### ACTION
Prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor. Less angiotensin II decreases peripheral arterial resistance, decreasing aldosterone secretion, which reduces sodium and water retention and lowers blood pressure.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Unknown |

*Half-life:* About 1 hour for perindopril; mean half-life, 3 to 10 hours, and terminal elimination half-life, 30 to 120 hours for perindoprilat.

### ADVERSE REACTIONS
**CNS:** *headache*, dizziness, asthenia, sleep disorder, paresthesia, depression, somnolence, nervousness, fever.
**CV:** palpitations, edema, chest pain, hypotension, abnormal ECG.

**EENT:** rhinitis, sinusitis, ear infection, pharyngitis, tinnitus.
**GI:** dyspepsia, diarrhea, abdominal pain, nausea, vomiting, flatulence.
**GU:** proteinuria, UTI, male sexual dysfunction, menstrual disorder.
**Metabolic:** ***hyperkalemia.***
**Musculoskeletal:** back pain, hypertonia, neck pain, joint pain, myalgia, arthritis, arm or leg pain.
**Respiratory:** *cough,* upper respiratory tract infection.
**Skin:** rash.
**Other:** viral infection, injury, seasonal allergy.

## INTERACTIONS

**Drug-drug.** *Diuretics:* May increase hypotensive effect. Monitor patient closely.
*Lithium:* May increase lithium level and risk of lithium toxicity. Use together cautiously; monitor lithium level.
*NSAIDs:* May decrease antihypertensive effects. Monitor blood pressure.
*Potassium-sparing diuretics (amiloride, spironolactone, triamterene), potassium supplements, other drugs capable of increasing potassium level (cyclosporine, heparin, indomethacin):* May increase hyperkalemic effect. Use together cautiously; monitor potassium level.
**Drug-herb.** *Capsaicin:* May cause cough. Discourage use together.
**Drug-food.** *Salt substitutes containing potassium:* May cause hyperkalemia. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

● May increase ALT, alkaline phosphatase, uric acid, cholesterol, and creatinine levels. May increase potassium level.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or other ACE inhibitors and in those with a history of angioedema caused by ACE inhibitor use.
**Black Box Warning** Use during pregnancy can cause injury and death to the developing fetus. When pregnancy is detected, stop drug as soon as possible. ■
● Use cautiously in patients with a history of angioedema unrelated to ACE inhibitor use.
● Use cautiously in patients with renal impairment, heart failure, ischemic heart disease, cerebrovascular disease, or renal artery stenosis and in those with collagen vascular disease, such as systemic lupus erythematosus or scleroderma.
***Overdose S&S:*** Hypotension.

## NURSING CONSIDERATIONS

● When used alone in black patients, drug affects blood pressure less than in other patients. Monitor blood pressure closely.
● Patients with a history of angioedema unrelated to ACE inhibitor use may be at increased risk for angioedema during therapy. Black patients are at a higher risk for angioedema regardless of prior ACE inhibitor use.
***Alert:*** If angioedema occurs, stop drug and observe patient until swelling disappears. Antihistamines may relieve swelling of the face and lips. Swelling of the tongue, glottis, or throat may cause life-threatening airway obstruction. Give prompt treatment, such as epinephrine.
● Monitor CBC with differential for agranulocytosis and neutropenia before therapy, especially in renally impaired patients with lupus or scleroderma.
● Monitor patient for hypotension when starting therapy and when adjusting dosage. If severe hypotension occurs, place patient in supine position and treat symptomatically.
● Severe hypotension can occur when drug is given with diuretics. If possible, stop diuretic 2 to 3 days before starting this drug. If impossible, use lower doses of either drug.
● In patient who is volume- or sodium-depleted from prolonged diuretic therapy, dietary sodium restriction, dialysis, diarrhea, or vomiting, correct fluid and sodium deficits before starting drug.
● Monitor renal function before and periodically throughout therapy.
● Monitor potassium level closely.

P

## PATIENT TEACHING

- Inform patient that throat and facial swelling, including swelling of the throat, can occur during therapy, especially with the first dose. Advise patient to stop taking drug and immediately report any signs or symptoms of swelling of face, extremities, eyes, lips, or tongue; hoarseness; or difficulty in swallowing or breathing.
- Advise patient to report promptly any sign or symptom of infection (sore throat, fever) or jaundice (yellowing of eyes or skin).
- Advise patient to avoid salt substitutes containing potassium unless instructed otherwise by prescriber.
- Caution patient that light-headedness may occur, especially during first few days of therapy. Advise patient to report light-headedness and, if fainting occurs, to stop drug and consult prescriber promptly.
- Caution patient that inadequate fluid intake or excessive perspiration, diarrhea, or vomiting can lead to an excessive drop in blood pressure.
- Advise woman of childbearing age of the consequences of second- and third-trimester exposure to drug. Advise her to notify prescriber immediately if she suspects pregnancy.

# permethrin

per-METH-rin

Elimite, Kwellada-P†, Nix ◇

*Therapeutic class:* Scabicide, pediculicide
*Pharmacologic class:* Pyrethroid
*Pregnancy risk category B*

## AVAILABLE FORMS

*Cream:* 5%
*Lotion:* 1%
*Topical liquid (cream rinse):* 1%

## INDICATIONS & DOSAGES

➤ **Infestation with *Pediculus humanus capitis* (head louse) and its nits**

*Adults and children age 2 and older:* Use after hair has been washed with shampoo, rinsed with water, and towel dried. Apply 25 to 50 ml of liquid to saturate hair and scalp. Allow drug to remain on hair for 10 minutes before rinsing off with water. Remove remaining nits with comb. Usually only one application is needed.

➤ **Infestation with *Sarcoptes scabiei***

*Adults and children age 2 months and older:* Thoroughly massage into the skin from the head to the soles. Treat infants on hairline, neck, scalp, temple, and forehead. Wash cream off after 8 to 14 hours.

## ADMINISTRATION

### Topical

- Usually only one application is needed.
- Don't use drug on eyes, eyelashes, eyebrows, nose, mouth, or mucous membranes.

## ACTION

Acts on parasite nerve cells to disrupt the sodium channel current, causing parasitic paralysis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | 10–15 min | Unknown | 10 days |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**Skin:** *burning, stinging,* edema, mild erythema, pruritus, scalp numbness or discomfort, scalp rash, tingling.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to pyrethrins, chrysanthemums, or components of drug.

⚠ ***Overdose S&S:*** Increased skin irritation and erythema.

## NURSING CONSIDERATIONS

- Combing of nits isn't needed for effectiveness, but drug package supplies a fine-tooth comb for cosmetic use and to decrease diagnostic confusion that may lead to retreatment.
- Retreat for lice if they are seen 7 days after first application.
- Treat sexual partners simultaneously.

### PATIENT TEACHING

- Explain that treatment may temporarily worsen signs and symptoms of head lice infestation, such as itching, redness, and swelling.
- Tell patient to disinfect headgear, comb and brush, scarves, coats, and bed linens by machine washing with hot water and machine drying for at least 20 minutes, using hot cycle. Tell him to seal nonwashable items in plastic bag for 2 weeks or spray with product designed to eliminate lice and their nits.
- Warn patient not to use drug on eyes, eyelashes, eyebrows, nose, mouth, or mucous membranes.
- Tell patient to warn other family members and sexual contacts about infestation.

## perphenazine

per-FEN-uh-zeen

*Therapeutic class:* Antipsychotic
*Pharmacologic class:* Phenothiazine
*Pregnancy risk category C*

### AVAILABLE FORMS

*Oral concentrate:* 16 mg/5 ml
*Tablets:* 2 mg, 4 mg, 8 mg, 16 mg

### INDICATIONS & DOSAGES

➤ **Psychosis in nonhospitalized patients**
*Adults and children older than age 12:* Initially, 4 to 8 mg P.O. t.i.d.; reduce as soon as possible to minimum effective dose.

➤ **Psychosis in hospitalized patients**
*Adults and children older than age 12:* Initially, 8 to 16 mg P.O. b.i.d., t.i.d., or q.i.d.; increase to 64 mg daily, as needed.

➤ **Severe nausea and vomiting**
*Adults:* 8 to 16 mg P.O. daily in divided doses to maximum of 24 mg.

➤ **Intractable hiccups**
*Adults and children older than age 12:* 8 to 16 mg P.O. daily in divided doses to a maximum of 24 mg.

### ADMINISTRATION

**P.O.**

- Dilute liquid concentrate with fruit juice, milk, carbonated beverage, or semisolid food just before giving. Don't use colas, black coffee, grape juice, apple juice, or tea because turbidity or precipitation may result.
- Protect drug from light. Slight yellowing of concentrate is common and doesn't affect potency. Discard markedly discolored solutions. Store tablets in a tight, light-resistant container.

### ACTION

May exert antipsychotic effects by blocking postsynaptic dopamine receptors in the brain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* 9 to 12 hours.

### ADVERSE REACTIONS

**CNS:** *extrapyramidal reactions, tardive dyskinesia,* ***seizures, neuroleptic malignant syndrome,*** sedation, pseudoparkinsonism, dizziness, drowsiness.
**CV:** *orthostatic hypotension,* tachycardia, ECG changes.
**EENT:** *blurred vision,* ocular changes, nasal congestion.
**GI:** *dry mouth, constipation,* nausea, vomiting, diarrhea.
**GU:** *urine retention,* dark urine, menstrual irregularities, inhibited ejaculation.
**Hematologic:** ***leukopenia, agranulocytosis, thrombocytopenia,*** eosinophilia, hemolytic anemia.
**Hepatic:** cholestatic jaundice.
**Metabolic:** weight gain.
**Skin:** *mild photosensitivity reactions,* allergic reactions, sterile abscess.
**Other:** gynecomastia.

### INTERACTIONS

**Drug-drug.** *Antacids:* May inhibit absorption of oral phenothiazines. Separate antacid and phenothiazine doses by at least 2 hours.
*Atropine, phosphorus insecticides:* May cause increased anticholinergic effects. Monitor patient cautiously.
*Barbiturates:* May decrease phenothiazine effect. Monitor patient.
*CNS depressants:* May increase CNS depression. Use together cautiously.
*Fluoxetine, paroxetine, sertraline, tricyclic antidepressants:* May increase

phenothiazine level. Monitor patient for increased adverse effects.
*Lithium:* May increase neurologic adverse effects. Monitor patient closely.
**Drug-herb.** *St. John's wort:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.
**Drug-lifestyle.** ***Alcohol use:*** May increase CNS depression, particularly psychomotor skills. Strongly discourage alcohol use.
*Sun exposure:* May increase risk of photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level and hematocrit.
- May increase liver function test values and eosinophil count. May decrease WBC, granulocyte, and platelet counts.
- May cause false-positive results for urinary porphyrin, urobilinogen, amylase, and 5-hydroxyindoleacetic acid tests and for urine pregnancy tests that use human chorionic gonadotropin.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with CNS depression, blood dyscrasia, bone marrow depression, liver damage, or subcortical damage; also contraindicated in those experiencing coma or receiving large doses of CNS depressants.
- Use cautiously in elderly or debilitated patients and in those taking other CNS depressants or anticholinergics.
- Use cautiously in patients with alcohol withdrawal, psychotic depression, suicidal tendency, severe adverse reactions to other phenothiazines, renal impairment, CV disease, or respiratory disorders.

***Overdose S&S:*** Stupor, coma, seizures in children, tachycardia, prolonged QRS or QT interval, AV block, torsades de pointes, ventricular arrhythmia, hypotension, cardiac arrest.

## NURSING CONSIDERATIONS

- Obtain baseline blood pressure measurements before starting therapy and monitor pressure regularly. Watch for orthostatic hypotension, especially with parenteral administration.
- Monitor patient for tardive dyskinesia, which may occur after prolonged use. It may not appear until months or years later and may disappear spontaneously or persist for life, despite ending drug.

***Alert:*** Watch for evidence of neuroleptic malignant syndrome (extrapyramidal effects, hyperthermia, autonomic disturbance), which is rare but deadly.

- Monitor therapy with weekly bilirubin tests during first month, periodic blood tests (CBCs and liver function tests), and ophthalmic tests (long-term use).
- Withhold dose and notify prescriber if jaundice, symptoms of blood dyscrasia (fever, sore throat, infection, cellulitis, weakness), or persistent extrapyramidal reactions (longer than a few hours) develop.

***Alert:*** Elderly patients with dementia-related psychosis treated with atypical or conventional antipsychotics are at increased risk for death. Antipsychotics aren't approved for the treatment of dementia-related psychosis.

- Don't withdraw drug abruptly unless severe adverse reactions occur.
- After abrupt withdrawal of long-term therapy, gastritis, nausea, vomiting, dizziness, tremor, feeling of warmth or cold, diaphoresis, tachycardia, headache, or insomnia may occur.

## PATIENT TEACHING

- Tell patient which beverages he may use to dilute oral concentrate.
- Warn patient to avoid activities that require alertness or good coordination until effects of drug are known. Drowsiness and dizziness usually subside after a few weeks.
- Tell patient to avoid alcohol while taking drug.
- Advise patient to report signs of urine retention or constipation.
- Tell patient to use sunblock and wear protective clothing to avoid oversensitivity to the sun.
- Advise patient to relieve dry mouth with sugarless gum or hard candy.

# phenazopyridine hydrochloride

fen-az-oh-PEER-i-deen

Azo-Gesic ◇, Azo-Standard ◇, Baridium ◇, Phenazo†, Pyridium, Urogesic, UTI-Relief

*Therapeutic class:* Urinary analgesic
*Pharmacologic class:* Urinary analgesic
*Pregnancy risk category B*

## AVAILABLE FORMS

*Tablets:* 95 mg ◇, 97.2 mg, 100 mg, 200 mg

## INDICATIONS & DOSAGES

➤ **Pain with urinary tract irritation or infection**

*Adults and children older than age 12:* 100 to 200 mg P.O. t.i.d. after meals for 2 days.

*Children ages 6 to 12:* 2 mg/kg P.O. daily in three equally divided doses after meals for 2 days.

## ADMINISTRATION

**P.O.**

- Give drug with meals to minimize GI distress.
- Don't crush tablets.

## ACTION

Unknown; exerts local anesthetic action on urinary mucosa.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** headache.
**EENT:** staining of contact lenses.
**GI:** nausea, GI disturbances.
**Hematologic:** hemolytic anemia, methemoglobinemia.
**Skin:** rash, pruritus.
**Other:** ***anaphylactoid reactions.***

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level and hematocrit.
- May alter Diastix or Chemstrip uG results and interfere with urinalysis and urinary ketone tests (Acetest or Ketostix).

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with glomerulonephritis, severe hepatitis, uremia, renal insufficiency, or pyelonephritis during pregnancy.

⚠ ***Overdose S&S:*** Methemoglobinemia, hemolytic anemia, renal and hepatic impairment.

## NURSING CONSIDERATIONS

- When drug is used with an antibacterial, therapy shouldn't extend beyond 2 days.
- Patients with red blood cell G-6–PD deficiency may be predisposed to hemolysis.
- ***Look alike–sound alike:*** Don't confuse Pyridium with pyridoxine.

## PATIENT TEACHING

- Advise patient that taking drug with meals may minimize GI distress.
- Caution patient to stop drug and notify prescriber immediately if skin or sclera becomes yellow-tinged, which may indicate drug accumulation from impaired renal excretion.
- Inform patient that drug colors urine red or orange and may stain fabrics and contact lenses.
- Tell diabetic patient to use Clinitest for accurate urine glucose test results. Also tell patient that drug may interfere with urinary ketone tests (Acetest or Ketostix).
- Advise patient that drug doesn't treat the infection and to notify prescriber if urinary tract pain persists. Tell him that drug shouldn't be used for long-term treatment.

**SAFETY ALERT!**

## phenobarbital (phenobarbitone)

fee-noe-BAR-bi-tal

Solfoton

## phenobarbital sodium

Luminal Sodium

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* Barbiturate
*Pregnancy risk category D*
*Controlled substance schedule IV*

### AVAILABLE FORMS

*Elixir:* 15 mg/5 ml*, 20 mg/5 ml*
*Injection:* 30 mg/ml, 60 mg/ml, 65 mg/ml, 130 mg/ml
*Tablets:* 15 mg, 16 mg, 30 mg, 60 mg, 100 mg

### INDICATIONS & DOSAGES

➤ **Anticonvulsant, febrile seizures**

*Adults:* 60 to 200 mg P.O. daily. For acute seizures, 100 to 320 mg I.M. or I.V., repeat in 6 hours as necessary.
*Children:* 3 to 6 mg/kg P.O. daily, usually divided every 12 hours. Drug can be given once daily, usually at bedtime. Or, 10 to 15 mg/kg daily I.V. or I.M.

➤ **Status epilepticus**

*Adults:* 100 to 320 mg I.V.
*Children* ♦ *:* 15 to 20 mg/kg I.V. over 10 to 15 minutes. May give additional 5-mg/kg doses every 15 to 30 minutes to a maximum of 30 mg/kg. Maintenance dosing as follows: For children older than age 12, give 1 to 3 mg/kg/day I.V. in one or two divided doses. For children ages 6 to 12, give 4 to 6 mg/kg/day I.V. in one or two divided doses. For children ages 1 to 5, give 6 to 8 mg/kg/day I.V. in one or two divided doses. For infants, give 5 to 6 mg/kg/day I.V. in one or two divided doses. For neonates, give 3 to 5 mg/kg/day I.V. in one or two divided doses.

➤ **Sedation**

*Adults:* 30 to 120 mg P.O., or 100 to 320 mg I.V. or I.M. daily in two or three divided doses. Maximum dose is 400 mg/24 hours.

➤ **Short-term treatment of insomnia**

*Adults:* 100 to 200 mg P.O. or 100 to 320 mg I.M. or I.V. at bedtime.

➤ **Preoperative sedation**

*Adults:* 100 to 200 mg I.M. 60 to 90 minutes before surgery.
*Children* ♦ *:* 1 to 3 mg/kg I.V. or I.M. 60 to 90 minutes before surgery.

### ADMINISTRATION

**P.O.**

● Give drug without regard for food.

**I.V.**

▼ I.V. route is used for emergency treatment only.
▼ Dilute drug in half-normal or normal saline, $D_5W$, lactated Ringer's, or Ringer's solution.
▼ If solution contains precipitate, don't use.
▼ Give slowly (no more than 60 mg/minute) under close supervision. Have resuscitation equipment available.
▼ Monitor respirations closely.
▼ Inadvertent intra-arterial injection can cause spasm of the artery and severe pain and may lead to gangrene.
▼ Up to 30 minutes may be required for maximum effect; allow time for anticonvulsant effect to develop to avoid overdose.
▼ **Incompatibilities:** Acidic solutions, amphotericin B, chlorpromazine, dimenhydrinate, diphenhydramine, ephedrine, hydralazine, hydrocortisone sodium succinate, hydromorphone, insulin, kanamycin, levorphanol, meperidine, morphine, norepinephrine, pentazocine lactate, phenytoin, prochlorperazine mesylate, promethazine hydrochloride, ranitidine hydrochloride, streptomycin, vancomycin.

**I.M.**

● Give I.M. injection deeply into large muscles. Superficial injection may cause pain, sterile abscess, and tissue sloughing.

### ACTION

As a barbiturate, may depress CNS and increase seizure threshold. As a sedative, may interfere with transmission of impulses from thalamus to cortex of brain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 8–12 hr | 10–12 hr |
| I.V. | 5 min | 30 min | 4–10 hr |
| I.M. | >5 min | >30 min | 4–10 hr |

*Half-life:* 5 to 7 days.

## ADVERSE REACTIONS

**CNS:** *drowsiness, lethargy, hangover,* paradoxical excitement in elderly patients, somnolence, changes in EEG patterns, physical and psychological dependence, pain.
**CV:** ***bradycardia,*** hypotension, syncope.
**GI:** nausea, vomiting.
**Respiratory:** ***respiratory depression, apnea.***
**Other:** injection-site reactions, ***angioedema.***

## INTERACTIONS

**Drug-drug.** *Chloramphenicol, MAO inhibitors:* May potentiate barbiturate effect. Monitor patient for increased CNS and respiratory depression.
*CNS depressants including opioid analgesics:* Excessive CNS depression. Monitor patient closely.
*Corticosteroids, doxycycline, estrogens and hormonal contraceptives, oral anticoagulants, tricyclic antidepressants:* May enhance metabolism of these drugs. Watch for decreased effect.
*Diazepam:* May increase effects of both drugs. Use together cautiously.
*Griseofulvin:* May decrease absorption of griseofulvin. Monitor effectiveness of griseofulvin.
*Mephobarbital, primidone:* May cause excessive phenobarbital level. Monitor patient closely.
*Metoprolol, propranolol:* May reduce the effects of these drugs. Consider an increased beta-blocker dose.
*Rifampin:* May decrease barbiturate level. Watch for decreased effect.
*Valproic acid:* May increase phenobarbital level. Watch for toxicity.
*Warfarin:* May increase warfarin metabolism and decrease effect. Monitor patient for decreased warfarin effect.
**Drug-herb.** *Evening primrose oil:* May increase anticonvulsant dosage requirement. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May impair coordination, increase CNS effects, and lead to death. Strongly discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May decrease bilirubin level.
- May cause false-positive phentolamine test result.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to barbiturates and in those with history of manifest or latent porphyria.
- Contraindicated in patients with hepatic or renal dysfunction, respiratory disease with dyspnea or obstruction, or nephritis.
- Use cautiously in patients with acute or chronic pain, depression, suicidal tendencies, history of drug abuse, fever, hyperthyroidism, diabetes mellitus, severe anemia, blood pressure alterations, CV disease, shock, or uremia, and in elderly or debilitated patients.

***Overdose S&S:*** Drowsiness, confusion, excitation, ataxia, vertigo, headache, coma, nystagmus, respiratory depression, cyanosis, hypotension, weak rapid pulse, cold and clammy skin, pulmonary edema, decreased urine formation, hypothermia, cardiac arrest.

## NURSING CONSIDERATIONS

- Therapeutic level is 15 to 40 mcg/ml.
- Elderly patients are more sensitive to drug's effects; drug may produce paradoxical excitement.
- Don't stop drug abruptly because this may worsen seizures. Call prescriber immediately if adverse reactions develop.
- First withdrawal symptoms occur within 8 to 12 hours and include anxiety, muscle twitching, tremor of hands and fingers, progressive weakness, dizziness, visual distortion, nausea, vomiting, insomnia, and orthostatic hypotension. Seizures and delirium may occur within 16 hours and last up to 5 days after abruptly stopping drug.
- Use for insomnia isn't recommended, and treatment shouldn't last longer than 14 days.
- Some products contain tartrazine; use cautiously in patients with aspirin sensitivity.

P

• EEG patterns show a change in low-voltage fast activity. Changes persist after therapy ends.
• The physiologic effects of drug may impair the absorption of cyanocobalamin Co 57.
• ***Look alike–sound alike:*** Don't confuse phenobarbital with pentobarbital.

### PATIENT TEACHING

• Ensure that patient is aware that drug is available in different milligram strengths and sizes. Advise him to check prescription and refills closely.
• Inform patient that full therapeutic effects aren't seen for 2 to 3 weeks, except when loading dose is used.
• Advise patient to avoid driving and other potentially hazardous activities that require mental alertness until drug's CNS effects are known.
• Warn patient and parents not to stop drug abruptly.
• Tell women using hormonal contraceptives to consider a nonhormonal form of birth control because drug may decrease effectiveness.

## phentermine hydrochloride

FEN-ter-meen

Adipex-P

*Therapeutic class:* Anorexiant
*Pharmacologic class:* Sympathomimetic amine
*Pregnancy risk category NR*
*Controlled substance schedule IV*

### AVAILABLE FORMS

*Capsules:* 30 mg, 37.5 mg
*Capsules (resin complex, sustained-release):* 15 mg, 30 mg
*Tablets:* 37.5 mg

### INDICATIONS & DOSAGES

➤ **Short-term adjunct in exogenous obesity**

*Adults:* 15 to 37.5 mg or 15 to 30 mg (as resin complex) P.O. daily as a single dose in the morning. Give Adipex-P before breakfast or 1 to 2 hours after breakfast.

### ADMINISTRATION

**P.O.**

• Give sustained-release capsule whole, at least 10 hours before bedtime.
• Give last dose of immediate-release capsule or tablet at least 4 to 6 hours before bedtime.

### ACTION

Unknown. Probably promotes nerve impulse transmission by releasing stored norepinephrine from nerve terminals in the brain, especially in the cerebral cortex and reticular activating system.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | 12–14 hr |

*Half-life:* 19 to 24 hours.

### ADVERSE REACTIONS

**CNS:** *insomnia,* overstimulation, headache, euphoria, dysphoria, dizziness.
**CV:** *palpitations, tachycardia,* increased blood pressure.
**GI:** dry mouth, dysgeusia, constipation, diarrhea, unpleasant taste, other GI disturbances.
**GU:** impotence.
**Skin:** urticaria.
**Other:** altered libido.

### INTERACTIONS

**Drug-drug.** *Acetazolamide, antacids, sodium bicarbonate:* May increase renal reabsorption. Monitor patient for enhanced effects.
*Ammonium chloride, ascorbic acid:* May decrease level and increase renal excretion of phentermine. Monitor patient for decreased phentermine effects.
*Hormonal contraceptives:* May reduce effectiveness of hormonal contraceptives. Advise patient to use alternative methods of contraception during treatment and for 1 month after discontinuation of therapy.
*Insulin, oral antidiabetics:* May alter antidiabetic requirements. Monitor glucose level.
*MAO inhibitors:* May cause severe hypertension or hypertensive crisis. Avoid using within 14 days of MAO inhibitor therapy.
**Drug-food.** *Caffeine:* May increase CNS stimulation. Discourage use together.

## EFFECTS ON LAB TEST RESULTS
None reported.

## CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to sympathomimetic amines, in those with idiosyncratic reactions to them, in agitated patients, and in those with hyperthyroidism, moderate-to-severe hypertension, advanced arteriosclerosis, symptomatic CV disease, or glaucoma.
- Contraindicated within 14 days of MAO inhibitor therapy.
- Use cautiously in patients with mild hypertension.

⚠ ***Overdose S&S:*** Restlessness, tremor, hyperreflexia, rapid respiration, confusion, assaultiveness, hallucinations, panic states, fatigue, depression, arrhythmias, hypertension, hypotension, circulatory collapse, nausea, vomiting, diarrhea, abdominal cramps, seizures, coma.

## NURSING CONSIDERATIONS
- Use drug with a weight-reduction program.
- Monitor patient for tolerance or dependence.
- ***Look alike–sound alike:*** Don't confuse phentermine with phentolamine.

## PATIENT TEACHING
- Tell patient to take sustained-release drug at least 10 hours before bedtime or last dose of immediate-release drug at least 4 to 6 hours before bedtime to avoid sleep interference.
- Advise patient to avoid products that contain caffeine. Tell him to report evidence of excessive stimulation.
- Warn patient that fatigue may result as drug effects wear off and that he'll need more rest.
- Warn patient that drug may lose its effectiveness over time.
- Tell patient to take sustained-release capsule whole and not to chew, crush, or open it.

# phentolamine mesylate
fen-TOLE-a-meen

Rogitine†

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Alpha blocker
*Pregnancy risk category C*

## AVAILABLE FORMS
*Injection:* 5 mg/ml, 10 mg/ml†

## INDICATIONS & DOSAGES
➤ **To aid in diagnosis of pheochromocytoma, to control or prevent hypertension before or during pheochromocytomectomy**

*Adults:* I.V. or I.M. diagnostic dose is 5 mg with close monitoring of blood pressure. Give 5 mg I.V. or I.M 1 to 2 hours before surgical removal of tumor. During surgery, patient may need an additional 5 mg I.V.

*Children:* I.V. diagnostic dose is 1 mg, and I.M. diagnostic dose is 3 mg with close monitoring of blood pressure. Give 1 mg I.V. or I.M 1 to 2 hours before surgical removal of tumor. During surgery, patient may need an additional 1 mg I.V.

➤ **To prevent dermal necrosis from norepinephrine extravasation**

*Adults:* Add 10 mg of phentolamine to each liter of solution containing norepinephrine; the pressor effect of norepinephrine is unaffected.

➤ **Dermal necrosis and sloughing after I.V. extravasation of norepinephrine or dopamine**

*Adults:* Infiltrate area with 5 to 10 mg phentolamine in 10 to 15 ml of normal saline solution. Must be done within 12 hours of extravasation.

## ADMINISTRATION
**I.V.**
▼ Reconstitute drug by adding 1 ml of sterile water for injection to vial containing 5 mg of drug; resulting solution contains 5 mg/ml of drug.
▼ Delay injection until effect of venipuncture on blood pressure has passed, then inject drug rapidly.

▼ For pheochromocytoma diagnosis, inject drug rapidly. Test result is positive if severe hypotension develops.
▼ **Incompatibilities:** None reported.

**I.M.**
• Reconstitute drug by adding 1 ml of sterile water for injection to vial containing 5 mg of drug.
• Document injection site.

## ACTION
Competitively blocks the effects of catecholamines on alpha-adrenergic receptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | <2 min | 15–30 min |
| I.M. | Unknown | <20 min | 30–45 min |

*Half-life:* 19 minutes (I.V.).

## ADVERSE REACTIONS
**CNS:** headache, *dizziness*, *weakness*, *flushing*, ***cerebrovascular occlusion,*** cerebrovascular spasm.
**CV:** *hypotension*, *tachycardia*, ***shock, arrhythmias, MI.***
**EENT:** *nasal congestion.*
**GI:** *diarrhea*, *nausea*, *vomiting.*

## INTERACTIONS
**Drug-drug.** *Ephedrine*, *epinephrine:* May cause excessive hypotension. Don't use together.

## EFFECTS ON LAB TEST RESULTS
None reported.

## CONTRAINDICATIONS & CAUTIONS
• Contraindicated in patients with hypersensitivity to drug and in those with angina, coronary artery disease, or MI or history of MI.
• Use cautiously in patients with gastritis or peptic ulcer.
***Overdose S&S:*** Arrhythmias, tachycardia, hypotension, shock.

## NURSING CONSIDERATIONS
• When drug is given as a diagnostic test for pheochromocytoma, check patient's blood pressure first; monitor blood pressure frequently during administration.
***Alert:*** Don't give epinephrine to treat phentolamine-induced hypotension because it may cause additional fall in blood pressure ("epinephrine reversal"). Use norepinephrine instead.
• ***Look alike–sound alike:*** Don't confuse phentolamine with phentermine.

## PATIENT TEACHING
• Explain use and administration of drug.
• Tell patient to report adverse reactions promptly.

**SAFETY ALERT!**

# phenylephrine hydrochloride (injection)
fen-ill-EF-rin

*Therapeutic class:* Vasoconstrictor
*Pharmacologic class:* Adrenergic
*Pregnancy risk category C*

## AVAILABLE FORMS
*Injection:* 10 mg/ml (1%)

## INDICATIONS & DOSAGES
➤ **Hypotensive emergencies during spinal anesthesia**
*Adults:* 0.2 mg I.V.; subsequent doses should be no more than 0.1 to 0.2 mg over the previous dose; don't exceed 0.5 mg in a single dose.
*Children:* 0.044 to 0.088 mg/kg I.M. or subcutaneously.
➤ **Prevention of hypotension during spinal anesthesia**
*Adults:* 2 to 3 mg I.M. or subcutaneously 3 to 4 minutes before injection of spinal anesthesia.
*Children:* 0.5 to 1 mg per 11 kg (25 lb) body weight I.M. or subcutaneously 3 to 4 minutes before injection of spinal anesthesia.
➤ **To prolong spinal anesthesia**
*Adults:* 2 to 5 mg added to anesthetic solution.
➤ **Vasoconstrictor for regional anesthesia**
*Adults:* 1 mg phenylephrine added to each 20 ml local anesthetic.
➤ **Mild to moderate hypotension**
*Adults:* 2 to 5 mg I.M. (dose ranges from 1 to 10 mg) or subcutaneously; repeat in 1 or 2 hours as needed and tolerated. First dose shouldn't exceed 5 mg. Or, 0.1 to

0.5 mg slow I.V., not to be repeated more often than 10 to 15 minutes.
*Children:* 0.1 mg/kg or 3 mg/$m^2$ I.M. or subcutaneously; repeat in 1 or 2 hours as needed and tolerated.

➤ **Severe hypotension and shock (including drug-induced)**
*Adults:* 10 mg in 250 to 500 ml of $D_5W$ or normal saline solution for injection. I.V. infusion started at 100 to 180 mcg/minute; then decrease to maintenance infusion of 40 to 60 mcg/minute when blood pressure stabilizes.

➤ **Paroxysmal supraventricular tachycardia**
*Adults:* Initially, 0.5 mg rapid I.V.; increase in increments of 0.1 to 0.2 mg. Use cautiously. Maximum single dose is 1 mg.

## ADMINISTRATION

**Black Box Warning** Practitioners should be completely familiar with drug before prescribing.

**I.V.**
▼ For direct injection, dilute 10 mg (1 ml) with 9 ml sterile water for injection to provide 1 mg/ml. Infusions are usually prepared by adding 10 mg of drug to 500 ml of $D_5W$ or normal saline solution for injection. The first I.V. infusion rate is usually 100 to 180 mcg/minute; maintenance rate is usually 40 to 60 mcg/minute.
▼ Use a central venous catheter or large vein, as in the antecubital fossa, to minimize risk of extravasation. Use a continuous infusion pump to regulate infusion flow rate.
▼ During infusion, frequently monitor ECG, blood pressure, cardiac output, central venous pressure, pulmonary artery wedge pressure, pulse rate, urine output, and color and temperature of limbs. Titrate infusion rate according to findings and prescriber guidelines. Maintain blood pressure slightly below patient's normal level. In previously normotensive patients, maintain systolic blood pressure at 80 to 100 mm Hg; in previously hypertensive patients, maintain systolic blood pressure at 30 to 40 mm Hg below usual level.
▼ Avoid abrupt withdrawal after prolonged I.V. infusions.

***Alert:*** To treat extravasation and prevent sloughing and necrosis, infiltrate site promptly with 10 to 15 ml of normal saline solution for injection containing 5 to 10 mg phentolamine. Use a fine needle.
▼ **Incompatibilities:** Alkaline solutions, iron salts, other metals, phenytoin sodium, thiopental sodium.

**I.M.**
- Don't give drug if solution is discolored or has particulate matter.
- Document injection site.
- Discard unused solution.

**Subcutaneous**
- Don't give drug if solution is discolored or has particulate matter.
- Document injection site.
- Discard unused solution.

## ACTION

Stimulates alpha receptors in the sympathetic nervous system, causing vasoconstriction.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Unknown | 15–20 min |
| I.M. | 10–15 min | Unknown | 30–120 min |
| Subcut. | 10–15 min | Unknown | 50–60 min |

*Half-life:* 2 to 3 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* excitability, restlessness, anxiety, nervousness, dizziness, weakness.
**CV:** ***bradycardia, arrhythmias,*** hypertension.
**Respiratory:** ***asthmatic episodes.***
**Skin:** tissue sloughing with extravasation.
**Other:** ***anaphylaxis,*** tachyphylaxis and decreased organ perfusion with continued use.

## INTERACTIONS

**Drug-drug.** *Alpha blockers, phenothiazines:* May decrease pressor response. Monitor patient closely.
*Atropine, guanethidine, oxytocics:* May increase pressor response. Monitor patient.
*Beta blockers:* May block cardiostimulation. Monitor patient closely.
*Halogenated hydrocarbon anesthetics, sympathomimetics:* May cause serious arrhythmias. Use together with caution.

P

*MAO inhibitors (phenelzine, tranylcypromine):* May cause severe headache, hypertension, fever, and hypertensive crisis. Avoid using together.
*Tricyclic antidepressants:* May potentiate pressor response and cause arrhythmias. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS
- May cause false-normal tonometry reading.

## CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug and in those with severe hypertension or ventricular tachycardia.
- Use with caution in elderly patients and in patients with heart disease, hyperthyroidism, severe atherosclerosis, bradycardia, partial heart block, myocardial disease, or sulfite sensitivity.

***Overdose S&S:*** Ventricular extrasystoles, short paroxysms of ventricular tachycardia, sensation of fullness in the head, tingling of the extremities.

## NURSING CONSIDERATIONS
- Drug causes little or no CNS stimulation.
- Drug may lower intraocular pressure in normal eyes or in open-angle glaucoma.
- Drug is used in OTC eyedrops and cold preparations for decongestant effects.

## PATIENT TEACHING
- Tell patient to report adverse reactions promptly.
- Instruct patient to report discomfort at I.V. insertion site.

# phenylephrine hydrochloride (intranasal)
fen-ill-EF-rin

4-Way Fast Acting ◇, Contac-D ◇, Little Noses Gentle Formula ◇, Neo-Synephrine ◇, Rhinall ◇, Vicks Sinex Ultra Fine Mist ◇

*Therapeutic class:* Vasoconstrictor
*Pharmacologic class:* Adrenergic
*Pregnancy risk category C*

## AVAILABLE FORMS
*Nasal solution:* 0.125%, 0.25%, 0.5%, 1%

## INDICATIONS & DOSAGES
➤ **Nasal congestion**
*Adults and children age 12 and older:* 2 to 3 drops or 2 to 3 sprays of 0.25% or 0.5% in each nostril every 4 hours, p.r.n. Don't use for longer than 3 to 5 days.
*Children ages 6 to 12:* 2 to 3 drops or 2 to 3 sprays of 0.25% solution in each nostril every 4 hours, p.r.n.
*Children ages 2 to 6:* 2 to 3 drops of 0.125% solution every 4 hours, p.r.n.

## ADMINISTRATION
### Intranasal
- Give 1% solution no more often than every 4 hours. Don't give the 1% solution to children younger than age 12 unless directed by prescriber.
- To instill nose drops, have patient lie down and tilt his head back. Insert dropper no more than ⅓ inch into nostril. Don't touch side of nose. Patient should remain supine with head back for 2 minutes after dose.
- Tilt patient's head back slightly to give nasal spray. Gently occlude opposite nostril.
- When giving more than one spray, wait 1 to 2 minutes between sprays.
- Rinse tip of spray under hot water and dry with a clean tissue.

## ACTION
Causes local vasoconstriction of dilated arterioles, reducing blood flow and nasal congestion.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Intranasal | Rapid | Unknown | 30 min–4 hr |

*Half-life:* Unknown.

## ADVERSE REACTIONS
**CNS:** dizziness, headache, nervousness, psychological disturbances, restlessness, tremor.
**CV:** *palpitations, tachycardia,* hypertension, pallor, PVCs.
**EENT:** dryness of nasal mucosa, rebound nasal congestion, transient burning or stinging.
**GI:** nausea.
**Other:** hypersensitivity reactions, sweating.

## INTERACTIONS

**Drug-drug.** *Beta blockers:* May cause hypertension, then bradycardia. Avoid using together.
*MAO inhibitors, methyldopa, tricyclic antidepressants:* May potentiate the pressor response of phenylephrine. Avoid using within 14 days of an MAO inhibitor.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with hyperthyroidism, marked hypertension, type 1 diabetes mellitus, cardiac disease, or advanced arteriosclerotic changes; in children with low body weight; and in elderly patients.

## NURSING CONSIDERATIONS

- Monitor patient for systemic adverse effects.
- Don't use in children who are younger than age 2.

## PATIENT TEACHING

- Teach patient how to use drug.
- Caution patient not to share drug because this could spread infection.
- Tell patient not to exceed recommended dosage and to use only when needed.
- Advise patient to contact prescriber if signs and symptoms persist longer than 3 days.
- Inform patient that prolonged use may result in rebound congestion.

# phenylephrine hydrochloride (ophthalmic)

fen-ill-EF-rin

AK-Dilate, Altafrin ◇, Mydfrin, Neofrin, OcuNefrin ◇, Refresh Redness Relief ◇

*Therapeutic class:* Mydriatic
*Pharmacologic class:* Sympathomimetic amine, adrenergic
*Pregnancy risk category C*

## AVAILABLE FORMS

*Ophthalmic solution:* 0.12%, 2.5%, 10%

## INDICATIONS & DOSAGES

➤ **Mydriasis without cycloplegia**
*Adults and children:* Instill 1 drop of 2.5% or 10% solution before examination. May repeat in 1 hour, as needed. May need to apply topical anesthetic before use to prevent stinging and dilution from lacrimation.

➤ **Mydriasis and vasoconstriction**
*Adults and adolescents:* Instill 1 drop of 2.5% or 10% solution.
*Children:* Instill 1 drop of 2.5% solution.

➤ **Chronic mydriasis**
*Adults and adolescents:* Instill 1 drop of 2.5% or 10% solution b.i.d. or t.i.d.
*Children:* Instill 1 drop of 2.5% solution b.i.d. or t.i.d.

➤ **Posterior synechiae (adhesion of iris)**
*Adults and children:* To prevent or break posterior synechiae in patients with anterior uveitis, instill 1 drop of 10% solution three or more times daily in combination with atropine sulfate ophthalmic solution or ointment. To prevent posterior synechiae after iridectomy, instill 1 drop of 10% solution once or twice daily; give in combination with atropine sulfate ophthalmic solution or ointment if inflammation is severe. Don't use 10% concentration in children younger than 1.

➤ **Minor eye irritations**
*Adults and children:* Instill 1 or 2 drops of the 0.12% solution in affected eye up to q.i.d., as needed.

## ADMINISTRATION

### Ophthalmic

- Don't touch tip of dropper to eye or surrounding tissue.
- Apply light finger pressure on lacrimal sac for 1 minute after instilling drug to minimize systemic absorption.
- Don't use brown solution or solution that contains precipitate.

## ACTION

Dilates the pupil by contracting the dilator muscle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Rapid | 10–90 min | 3–7 hr |

*Half-life:* Unknown.

P

## ADVERSE REACTIONS

**CNS:** brow ache, headache.
**CV:** *hypertension with 10% solution,* ***MI,*** palpitations, PVCs, tachycardia.
**EENT:** allergic conjunctivitis, blurred vision, increased intraocular pressure (IOP), keratitis, lacrimation, reactive hyperemia of eye, rebound miosis, transient eye burning or stinging on instillation.
**Skin:** dermatitis, diaphoresis, pallor.
**Other:** trembling.

## INTERACTIONS

**Drug-drug.** *Atropine (topical) , cyclopentolate , homatropine , scopolamine:* May increase pupil dilation. Use together cautiously.
*Beta blockers , MAO inhibitors:* May cause arrhythmias because of increased pressor effect. Use together cautiously.
*Levodopa:* May reduce mydriatic effect of phenylephrine. Use together cautiously.
*Tricyclic antidepressants:* May increase cardiac effects of epinephrine. Use together cautiously.
**Drug-lifestyle.** *Sun exposure:* May cause photophobia. Advise patient to wear sunglasses.

## EFFECTS ON LAB TEST RESULTS

• May lower IOP in normal eyes or in open-angle glaucoma; may cause false-normal tonometry readings.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug, in those with angle-closure glaucoma, and in those who wear soft contact lenses.
• Use cautiously in patients with marked hypertension, cardiac disorders, advanced arteriosclerotic changes, type 1 diabetes, or hyperthyroidism; in children with low body weight; and in elderly patients.

## NURSING CONSIDERATIONS

• Systemic adverse reactions are least likely with 0.12% and 2.5% solutions and most likely with 10% solution.
• ***Look alike–sound alike:*** Don't confuse Mydfrin with Midrin.

## PATIENT TEACHING

• Teach patient how to instill drug. Advise him to wash hands before and after instillation and to apply light finger pressure on lacrimal sac for 1 minute after drops are instilled. Warn him not to touch tip of dropper to eye or surrounding tissue.
• Warn patient not to exceed recommended dosage because systemic effects can result. Monitor blood pressure and pulse rate.
• Tell patient not to use brown solution or solution that contains precipitate.
• Warn patient to avoid hazardous activities, such as operating machinery or driving, until temporary blurring subsides.
• Advise patient to contact prescriber if condition persists longer than 12 hours after stopping drug.
• Advise patient to ease photophobia by wearing dark glasses.

# phenytoin (diphenylhydantoin)

FEN-i-toe-in

Dilantin 125, Dilantin Infatabs

# phenytoin sodium

Dilantin

# phenytoin sodium (extended)

Phenytek

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* Hydantoin derivative
*Pregnancy risk category D*

## AVAILABLE FORMS

**phenytoin**
*Oral suspension:* 125 mg/5 ml
*Tablets (chewable):* 50 mg
**phenytoin sodium**
*Injection:* 50 mg/ml (46 mg base)
**phenytoin sodium (extended)**
*Capsules:* 30 mg (27.6 mg base), 100 mg (92 mg base), 200 mg (184 mg base), 300 mg (276 mg base)

## INDICATIONS & DOSAGES

➤ **To control tonic-clonic (grand mal) and complex partial (temporal lobe) seizures**

*Adults:* Highly individualized. Initially, 100 mg P.O. t.i.d., increasing by 100 mg P.O. every 2 to 4 weeks until desired response is obtained. Usual range is 300 to 600 mg daily. If patient is stabilized with extended-release capsules, once-daily dosing with 300-mg extended-release capsules is possible as an alternative.

*Children:* 5 mg/kg or 250 mg/$m^2$ P.O. divided b.i.d. or t.i.d. Usual dose range is 4 to 8 mg/kg daily. Maximum daily dose is 300 mg.

➤ **For patient requiring a loading dose**

*Adults:* Initially, 1 g P.O. daily divided into three doses and given at 2-hour intervals. Or, 10 to 15 mg/kg I.V. at a rate not exceeding 50 mg/minute. Normal maintenance dosage is started 24 hours after loading dose.

*Children:* 500 to 600 mg P.O. in divided doses, followed by maintenance dosage 24 hours after loading dose.

➤ **To prevent and treat seizures occurring during neurosurgery**

*Adults:* 100 to 200 mg I.M. every 4 hours during and after surgery.

➤ **Status epilepticus**

*Adults:* Loading dose of 10 to 15 mg/kg I.V. (1 to 1.5 g may be needed) at a rate not exceeding 50 mg/minute; then maintenance dosage of 100 mg P.O. or I.V. every 6 to 8 hours.

*Children:* Loading dose of 15 to 20 mg/kg I.V., at a rate not exceeding 1 to 3 mg/kg/minute; then highly individualized maintenance dosages.

*Elderly patients:* May need lower dosages.

## ADMINISTRATION

**P.O.**

● Give divided doses with or after meals to decrease adverse GI reactions.

**I.V.**

▼ Clear tubing with normal saline solution. Use only clear solution for injection. A slight yellow color is acceptable.

▼ Mix with normal saline solution, if needed, and give as an infusion over 30 minutes to 1 hour, when possible.

▼ Infusion must begin within 1 hour after preparation and should run through an in-line filter.

▼ Check patency of catheter before giving. Monitor site for extravasation because it can cause severe tissue damage.

**Black Box Warning** Drug must be administered slowly. In adults, don't exceed 50 mg/minute I.V. In neonates, administer drug at a rate not exceeding 1 to 3 mg/kg/minute.

▼ If possible, don't give by I.V. push into veins on back of hand to avoid purple glove syndrome. Inject into larger veins or central venous catheter, if available.

▼ Check vital signs, blood pressure, and ECG during I.V. administration.

▼ Discard 4 hours after preparation. Don't refrigerate.

▼ **Incompatibilities:** Amikacin, aminophylline, amphotericin B, bretylium, cephapirin, ciprofloxacin, $D_5W$, diltiazem, dobutamine, enalaprilat, fat emulsions, hydromorphone, insulin (regular), levorphanol, lidocaine, lincomycin, meperidine, morphine sulfate, nitroglycerin, norepinephrine, other I.V. drugs or infusion solutions, pentobarbital sodium, potassium chloride, procaine, propofol, streptomycin, sufentanil citrate, theophylline, vitamin B complex with C. If giving as an infusion, don't mix drug with $D_5W$ because it will precipitate.

**I.M.**

● Give I.M. only if dosage adjustments are made; I.M. dose is 50% greater than oral dose.

● Be aware that drug may precipitate at injection site, cause pain, and be absorbed erratically.

## ACTION

May stabilize neuronal membranes and limit seizure activity either by increasing efflux or decreasing influx of sodium ions across cell membranes in the motor cortex during generation of nerve impulses.

P

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1½–12 hr | Unknown |
| P.O. (Phenytek) | Unknown | 4–12 hr | Unknown |
| I.V. | Immediate | 1–2 hr | Unknown |
| I.M. | Unknown | Unknown | Unknown |

*Half-life:* Varies with dose and concentration changes.

## ADVERSE REACTIONS

**CNS:** *ataxia, decreased coordination, mental confusion, slurred speech,* dizziness, headache, insomnia, nervousness, twitching.
**CV:** periarteritis nodosa.
**EENT:** *diplopia, nystagmus,* blurred vision.
**GI:** *gingival hyperplasia, nausea, vomiting,* constipation.
**Hematologic:** ***agranulocytosis, leukopenia, pancytopenia, thrombocytopenia,*** macrocythemia, megaloblastic anemia.
**Hepatic:** ***toxic hepatitis.***
**Metabolic:** hyperglycemia.
**Musculoskeletal:** osteomalacia.
**Skin:** ***Stevens-Johnson syndrome, toxic epidermal necrolysis,*** bullous or purpuric dermatitis, discoloration of skin if given by I.V. push in back of hand, exfoliative dermatitis, hypertrichosis, inflammation at injection site, lupus erythematosus, necrosis, pain, photosensitivity reactions, scarlatiniform or morbilliform rash.
**Other:** lymphadenopathy.

## INTERACTIONS

**Drug-drug.** *Acetaminophen:* May decrease the therapeutic effects of acetaminophen and increase the incidence of hepatotoxicity. Monitor for toxicity.
*Amiodarone, antihistamines, chloramphenicol,* ***cimetidine,*** *cycloserine, diazepam,* ***fluconazole, isoniazid,*** *metronidazole, omeprazole, phenylbutazone, salicylates,* ***sulfonamides, ticlodipine,*** *valproate:* May increase phenytoin activity and toxicity. Monitor patient for toxicity and adjust dose as needed.
*Atracurium, cisatracurium, pancuronium, rocuronium, vecuronium:* May decrease the effects of nondepolarizing muscle relaxant. May need to increase the nondepolarizing muscle relaxant dose.
*Barbiturates, carbamazepine, dexamethasone, diazoxide, folic acid, rifampin:* May decrease phenytoin activity. Monitor phenytoin level.
*Carbamazepine, cardiac glycosides, doxycycline, hormonal contraceptives, quinidine, theophylline, valproic acid:* May decrease effects of these drugs. Monitor patient.
***Cyclosporine:*** May decrease cyclosporine levels, risking organ rejection. Monitor cyclosporine levels closely and adjust dose as needed.
*Disulfiram:* May increase toxic effects of phenytoin. Monitor phenytoin level closely and adjust dose as needed.
*Lithium:* May increase toxicity of lithium, despite normal lithium levels. Monitor patient for adverse effects.
*Warfarin:* May increase effects of warfarin. Monitor patient for bleeding.
**Drug-food.** *Enteral tube feedings:* May interfere with absorption of oral drug. Stop enteral feedings for 2 hours before and 2 hours after drug use.
**Drug-lifestyle.** *Long-term alcohol use:* May decrease drug's activity. Strongly discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, GGT, and glucose levels. May decrease urinary 17-hydroxysteroid, 17-ketosteroid, and hemoglobin levels and hematocrit.
- May decrease platelet, WBC, RBC, and granulocyte counts.
- May increase urine 6-hydroxycortisol excretion. May decrease dexamethasone suppression and metyrapone test results.
- May falsely reduce protein-bound iodine or free $T_4$ level test results.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to hydantoin and in those with sinus bradycardia, SA block, second- or third-degree AV block, or Adams-Stokes syndrome.
- Use cautiously in patients with hepatic dysfunction, hypotension, myocardial insufficiency, diabetes, or respiratory depression; in elderly or debilitated patients; and in those receiving other hydantoin derivatives.
- Elderly patients tend to metabolize drug slowly and may need reduced dosages.

***Overdose S&S:*** Ataxia, dysarthria, nystagmus, hyperreflexia, lethargy, nausea, slurred speech, tremor, vomiting, coma, hypotension, circulatory and respiratory depression.

## NURSING CONSIDERATIONS

- Therapeutic dose usually increases during pregnancy.
- Asian patients who have tested positive for the allele HLA-B*1502 have a potentially increased risk of serious skin reactions, including Stevens-Johnson syndrome and toxic epidermal necrolysis. Monitor these patients carefully.
- If rash appears, stop drug. If rash is scarlatiniform or morbilliform, resume drug after rash clears. If rash reappears, stop therapy. If rash is exfoliative, purpuric, or bullous, don't resume drug.
- Don't stop drug suddenly because this may worsen seizures. Call prescriber immediately if adverse reactions develop.
- Monitor drug level. Therapeutic level is 10 to 20 mcg/ml.
- Allow at least 7 to 10 days to elapse between dosage changes.
- Monitor CBC and calcium level every 6 months, and periodically monitor hepatic function. If megaloblastic anemia is evident, prescriber may order folic acid and vitamin $B_{12}$.
- Maintain seizure precautions, as needed.
- Mononucleosis may decrease level. Watch for increased seizures.

***Alert:*** Closely monitor all patients for changes in behavior that may indicate worsening of suicidal thoughts or behavior or depression.

- Watch for gingival hyperplasia, especially in children.

***Alert:*** Doubling the dose doesn't double the level but may cause toxicity. Consult pharmacist for specific dosing recommendations.

- If seizure control is established with divided doses, once-daily dosing may be considered.
- ***Look alike–sound alike:*** Don't confuse phenytoin with mephenytoin or fosphenytoin or Dilantin with Dilaudid.

## PATIENT TEACHING

- Tell patient to notify prescriber if skin rash develops.
- Advise patient to avoid driving and other potentially hazardous activities that require mental alertness until drug's CNS effects are known.
- Advise patient not to change brands or dosage forms once he's stabilized on therapy.
- Dilantin capsules are the only oral form that can be given once daily. Toxic levels may result if any other brand or form is given once daily. Dilantin tablets and oral suspension should never be taken once daily.
- Tell patient not to use capsules that are discolored.
- Advise patient to avoid alcohol.
- Warn patient and parents not to stop drug abruptly.
- Stress importance of good oral hygiene and regular dental examinations. Surgical removal of excess gum tissue may be needed periodically if dental hygiene is poor.
- Caution patient that drug may color urine pink, red, or reddish brown.

# physostigmine salicylate (eserine salicylate)

fis-oh-STIG-meen

*Therapeutic class:* Antimuscarinic
*Pharmacologic class:* Cholinesterase inhibitor
*Pregnancy risk category C*

P

## AVAILABLE FORMS

*Injection:* 1 mg/ml

## INDICATIONS & DOSAGES

➤ **Reversal of drug-induced anticholinergic effects**

*Adults:* 0.5 to 2 mg slow I.V. or I.M. not to exceed 1 mg/minute I.V. repeated every 20 minutes as needed until patient responds or develops adverse cholinergic effects. Give additional 1 to 4 mg I.V. or I.M. every 30 to 60 minutes if life-threatening problems, such as coma, seizures, and arrhythmias, recur.

*Children:* Only for life-threatening situations. Give 0.02 mg/kg I.M. or slow I.V. at 0.5 mg/minute or slower, and repeat every 5 to 10 minutes until patient responds, adverse anticholinergic reactions develop, or a total dose of 2 mg has been given. Or, give 0.03 mg/kg or 0.9 mg/m$^2$, as needed. Maximum single dose is 0.5 mg.
***Adjust-a-dose:*** If excess sweating or nausea occurs, decrease dosage.

## ADMINISTRATION

**I.V.**
▼ Use only clear solution. Darkening may indicate loss of potency.
▼ Position patient to ease breathing. Keep atropine injection available.
▼ Give drug at controlled rate; use direct injection at no more than 1 mg/minute in adults or 0.5 mg/minute in children.
▼ Monitor vital signs frequently, especially respirations. Provide respiratory support, as needed.
▼ **Incompatibilities:** None reported.

**I.M.**
● Use only clear solution. Darkening may indicate loss of potency.

## ACTION

Inhibits acetylcholinesterase, blocking destruction of acetylcholine from the parasympathetic and somatic efferent nerves. Acetylcholine accumulates, promoting increased stimulation of the receptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 3–5 min | 5 min | 45 min–1 hr |
| I.M. | 3–5 min | 20–30 min | 45 min–1 hr |

*Half-life:* 1 to 2 hours.

## ADVERSE REACTIONS

**CNS:** *restlessness, excitability,* ***seizures,*** muscle weakness.
**CV:** ***bradycardia,*** hypotension, palpitations, irregular pulse.
**EENT:** miosis, lacrimation.
**GI:** *diarrhea, excessive salivation,* nausea, vomiting, epigastric pain.
**GU:** urinary urgency.
**Respiratory:** ***bronchospasm, bronchial constriction, respiratory paralysis,*** dyspnea.
**Skin:** diaphoresis.

## INTERACTIONS

**Drug-drug.** *Anticholinergics, atropine, local and general anesthetics, procainamide, quinidine:* May reverse cholinergic effects. Observe patient for lack of drug effect.
*Ganglionic blockers:* May decrease blood pressure. Avoid using together.
*Neuromuscular blockers (succinylcholine):* May increase neuromuscular blockade, respiratory depression. Use together cautiously.
**Drug-herb.** *Jaborandi tree, pill-bearing spurge:* May have additive effect. Ask patient about use of herbal remedies, and advise caution.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients with mechanical obstruction of the intestine or urogenital tract; in patients with asthma, gangrene, diabetes, CV disease, or vagotonia; and in patients receiving choline esters or depolarizing neuromuscular blockers.
● Use cautiously in pregnant patients and those with epilepsy, parkinsonism, or bradycardia.
● Discontinue drug if excessive salivation, emesis, urination, or defecation occurs.
***Overdose S&S:*** Cholinergic crisis (excess salivation and sweating, miosis, nausea, vomiting, diarrhea, bradycardia, hypotension or hypertension, confusion, seizures, coma, severe muscle weakness, paralysis, death).

## NURSING CONSIDERATIONS

***Alert:*** Watch closely for adverse reactions, particularly CNS disturbances. Raise side rails of bed if patient becomes restless or hallucinates. Adverse reactions may indicate drug toxicity.
● Effectiveness is typically immediate and dramatic but may be short-lived. Patient may need repeated dosages.
● Drug contains benzyl alcohol and has been associated with fatal "gasping syndrome" in premature infants.
● Drug contains sulfites, which may cause an allergic reaction in susceptible people.

### PATIENT TEACHING

- Inform patient of need for drug, explain its use and adverse reactions, and answer any questions or concerns.
- Tell patient to report adverse reactions promptly.
- Instruct patient to report discomfort at I.V. site.

## pilocarpine hydrochloride (ophthalmic)

pie-low-KAR-peen

Akarpine†, Carpine, Diocarpine†, Isopto Carpine†, Pilocar, Pilopine HS

## pilocarpine nitrate †

*Therapeutic class:* Miotic
*Pharmacologic class:* Direct-acting parasympathomimetic
*Pregnancy risk category C*

### AVAILABLE FORMS

**pilocarpine hydrochloride**
*Ophthalmic gel:* 4%
*Ophthalmic solution:* 0.25%, 0.5%, 1%, 2%, 3%, 4%, 5%, 6%
**pilocarpine nitrate**
*Ophthalmic solution:* 2%

### INDICATIONS & DOSAGES

➤ **Primary open-angle glaucoma**
*Adults and children:* Instill 1 or 2 drops every 6 to 8 hours; adjust concentration and frequency to control intraocular pressure (IOP). Or apply 1.3-cm (½-inch) ribbon of 4% gel into the lower conjunctival sac once daily at bedtime.

➤ **Mydriasis caused by mydriatic or cycloplegic drugs**
*Adults and children:* Instill 1 drop of 1% solution.

### ADMINISTRATION

**Ophthalmic**
- Don't touch tip of dropper to eye or surrounding tissue.
- Apply light finger pressure on lacrimal sac for 1 minute after instilling to minimize systemic absorption.
- If both solution and gel are used, the solution should be applied first; the gel is then applied at least 5 minutes later.

### ACTION

A cholinergic that causes contraction of iris sphincter muscles, resulting in miosis, and that produces ciliary spasm, deepening of the anterior chamber, and vasodilation of conjunctival vessels of the outflow tract.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | 10–30 min | 30–85 min | 4–8 hr |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CV:** hypertension, tachycardia.
**EENT:** *blurred vision, brow pain, myopia,* changes in visual field, ciliary spasm, conjunctival irritation, keratitis, lacrimation, lens opacity, periorbital or supraorbital headache, retinal detachment, salivation, transient stinging and burning.
**GI:** diarrhea, nausea, vomiting.
**Respiratory:** ***pulmonary edema,*** bronchiolar spasm.
**Other:** diaphoresis.

### INTERACTIONS

**Drug-drug.** *Carbachol , echothiophate:* May cause additive effects. Avoid using together.
*Cyclopentolate , ophthalmic belladonna alkaloids such as atropine , scopolamine:* May decrease pilocarpine's antiglaucoma effect and block mydriatic effects of these drugs. Avoid using together.
*Phenylephrine:* May decrease dilation by phenylephrine. Avoid using together.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in conditions in which cholinergic effects, such as constriction, are undesirable (acute iritis, some forms of secondary glaucoma, pupillary block glaucoma, or acute inflammatory disease of the anterior chamber).
- Use cautiously in patients with acute cardiac failure, bronchial asthma, peptic

P

ulcer, hyperthyroidism, GI spasm, urinary tract obstruction, and Parkinson disease.
***Overdose S&S:*** Excess salivation, tearing, sweating, nausea, vomiting, diarrhea, bronchial constriction.

## NURSING CONSIDERATIONS
- Monitor vital signs.
- ***Alert:*** Patients with hazel or brown irises may need stronger solutions or more frequent instillation because eye pigment may absorb drug.
- ***Look alike–sound alike:*** Don't confuse Isopto Carpine with Isopto Carbachol.

## PATIENT TEACHING
- Instruct patient to apply gel at bedtime because it will blur vision. Warn him to avoid hazardous activities, such as operating machinery or driving, until temporary blurring subsides.
- Teach patient how to instill drug. Advise him to wash hands before and after instillation and to apply light finger pressure on lacrimal sac for 1 minute after drops are instilled. Warn patient not to touch applicator tip to eye or surrounding tissue.
- Tell patient that if other glaucoma medications and gel are used at bedtime, to apply the drops first; the gel is then applied at least 5 minutes later.
- Warn patient that transient brow pain and nearsightedness are common at first but usually disappear in 10 to 14 days.
- Advise patient to carry medical identification at all times during therapy.

# pilocarpine hydrochloride (oral)

pye-loe-CAR-peen

Salagen

*Therapeutic class:* Cholinergic agonist
*Pharmacologic class:* Cholinergic agonist
*Pregnancy risk category C*

## AVAILABLE FORMS
*Tablets:* 5 mg, 7.5 mg

## INDICATIONS & DOSAGES
➤ **Xerostomia from salivary gland hypofunction caused by radiotherapy for cancer of head and neck**
*Adults:* 5 mg P.O. t.i.d.; may increase to 10 mg P.O. t.i.d., as needed.
➤ **Dry mouth in patients with Sjögren syndrome**
*Adults:* 5 mg P.O. q.i.d.
***Adjust-a-dose:*** For patients with moderate hepatic impairment, initial dose is 5 mg P.O. b.i.d. Adjust dose based on tolerance.
➤ **Keratoconjunctivitis sicea (dry eye syndrome)** ♦
*Adult:* 5 mg P.O. q.i.d. maximum of 30 mg/day.

## ADMINISTRATION
**P.O.**
- Don't give drug with a high-fat meal.

## ACTION
Cholinergic parasympathomimetic that increases secretion of salivary glands, eliminating dryness.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 20 min | 1 hr | 3–5 hr |

*Half-life:* 45 minutes to 1½ hours.

## ADVERSE REACTIONS
**CNS:** *asthenia, dizziness, headache,* tremor.
**CV:** *flushing,* hypertension, tachycardia, edema.
**EENT:** *abnormal vision, rhinitis, sinusitis,* lacrimation, amblyopia, pharyngitis, voice alteration, conjunctivitis, epistaxis.
**GI:** *nausea,* dyspepsia, diarrhea, abdominal pain, vomiting, dysphagia, taste perversion.
**GU:** *urinary frequency.*
**Musculoskeletal:** myalgia.
**Skin:** *sweating,* rash, pruritus.
**Other:** *chills.*

## INTERACTIONS
**Drug-drug.** *Beta blockers:* May increase risk of conduction disturbances. Use together cautiously.
*Drugs with anticholinergic effects:* May antagonize anticholinergic effects. Use together cautiously.

*Drugs with parasympathomimetic effects:* May result in additive pharmacologic effects. Monitor patient closely.
**Drug-food.** *High-fat meals:* May reduce drug absorption. Discourage patient from eating high-fat meals.

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to pilocarpine, in breast-feeding women, in those with uncontrolled asthma, and in those for whom miosis is undesirable, as in acute iritis or angle-closure glaucoma.
- Use in severe hepatic insufficiency isn't recommended.
- Use cautiously in patients with CV disease, controlled asthma, chronic bronchitis, COPD, cholelithiasis, biliary tract disease, nephrolithiasis, cognitive or psychiatric disturbances, or in pregnant women.
- Safety and effectiveness of drug in children haven't been established.

***Overdose S&S:*** CV depression, bronchoconstriction, death.

### NURSING CONSIDERATIONS
- Examine patient's fundus carefully before beginning therapy because retinal detachment may occur in patients with retinal disease.
- Monitor patient for signs and symptoms of toxicity: headache, visual disturbance, lacrimation, sweating, respiratory distress, GI spasm, nausea, vomiting, diarrhea, AV block, tachycardia, bradycardia, hypotension, hypertension, shock, mental confusion, arrhythmia, and tremors. Immediately notify prescriber of suspected toxicity.

### PATIENT TEACHING
- Warn patient that driving ability may be impaired, especially at night, by drug-induced visual disturbances.
- Advise patient to drink plenty of fluids to prevent dehydration.
- Tell elderly patient with Sjögren syndrome that he may be especially prone to urinary frequency, diarrhea, and dizziness.
- Advise patient not to take drug with a high-fat meal.

## pimecrolimus
py-meck-roh-LY-mus

Elidel

*Therapeutic class:* Immunosuppressant (topical)
*Pharmacologic class:* Topical immunomodulator
*Pregnancy risk category C*

### AVAILABLE FORMS
*Cream:* 1% 30-g, 60-g, and 100-g tubes. Base contains benzyl alcohol, cetyl alcohol, oleyl alcohol, and stearyl alcohol.

### INDICATIONS & DOSAGES
➤ **Short- and intermittent long-term treatment of mild to moderate atopic dermatitis in nonimmunocompromised patients in whom the use of other conventional therapies is deemed inadvisable, or in patients with inadequate response to or intolerance of conventional therapies**
*Adults and children age 2 and older:* Apply a thin layer to the affected skin b.i.d. and rub in gently and completely.

### ADMINISTRATION
**Topical**
- Drug may be used on all skin surfaces, including the head, neck, and intertriginous areas.
- Clear infections at treatment sites before using.
- Don't use with occlusive dressing.

### ACTION
Unknown. Inhibits T-cell activation and prevents the release of inflammatory cytokines and mediators from mast cells.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS
**CNS:** *headache, fever.*
**EENT:** *nasopharyngitis,* otitis media, sinusitis, pharyngitis, tonsillitis, eye infection, nasal congestion, rhinorrhea,

P

sinus congestion, rhinitis, epistaxis, conjunctivitis, earache.
**GI:** gastroenteritis, abdominal pain, vomiting, diarrhea, nausea, constipation, loose stools.
**GU:** dysmenorrhea.
**Musculoskeletal:** back pain, arthralgias.
**Respiratory:** *upper respiratory tract infections, bronchitis, cough,* ***asthma,*** pneumonia, wheezing, dyspnea.
**Skin:** *application site reaction (burning, irritation, erythema, pruritus),* skin infections, impetigo, folliculitis, molluscum contagiosum, herpes simplex, varicella, papilloma, urticaria, acne.
**Other:** *influenza,* flulike illness, hypersensitivity, toothache, bacterial infection, staphylococcal infection, viral infection.

## INTERACTIONS

**Drug-drug.** *Cytochrome P-450 inhibitors (such as erythromycin, itraconazole, ketoconazole, fluconazole, calcium channel blockers):* May affect metabolism of pimecrolimus. Use together cautiously.
**Drug-lifestyle.** *Natural or artificial sunlight exposure:* May worsen atopic dermatitis. Advise patient to avoid or minimize sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components, in patients with Netherton syndrome, and in immunocompromised patients.
- Contraindicated in patients with active cutaneous viral infections or infected atopic dermatitis.

**Black Box Warning** Contraindicated in children under age 2.

- Use cautiously in patients with varicella zoster virus infection, herpes simplex virus infection, or eczema herpeticum.
- Safety of use in pregnant women hasn't been established.

## NURSING CONSIDERATIONS

***Alert:*** Use drug only after other therapies have failed because of the risk of cancer.

**Black Box Warning** Long-term safety hasn't been established. Avoid continuous long-term use of drug and limit application to areas of involvement of atopic dermatitis.

- If symptoms persist longer than 6 weeks, reevaluate the patient.
- May cause local symptoms such as skin burning. Most local reactions start within 1 to 5 days after treatment, are mild to moderately severe, and last no longer than 5 days.
- Monitor patient for lymphadenopathy. If lymphadenopathy occurs and its cause is unknown, or if the patient develops acute infectious mononucleosis, consider stopping drug.
- Drug use may cause papillomas or warts. Consider stopping drug if papillomas worsen or don't respond to conventional treatment.
- It's unknown if drug appears in breast milk. Serious adverse reactions may occur in breast-feeding infants exposed to drug. Patient should either stop breast-feeding or stop treatment.

## PATIENT TEACHING

- Inform patient that this drug is for external use only and that he should use it as directed.
- Tell patient to report adverse reactions.
- Tell patient not to use with an occlusive dressing.
- Instruct patient to wash hands after application if hands are not treated.
- Tell patient to stop therapy after signs and symptoms have resolved. If symptoms persist longer than 6 weeks, tell him to contact his prescriber.
- Tell patient to resume treatment at first signs of recurrence.
- Stress that patient should minimize or avoid exposure to natural or artificial sunlight (including tanning beds and UVA-UVB treatment) while using this drug.
- Tell patient to expect application site reactions but to notify his prescriber if reaction is severe or persists for longer than 1 week.

**SAFETY ALERT!**

# pioglitazone hydrochloride

pie-oh-GLIT-ah-zohn

Actos✔

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Thiazolidinedione
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 15 mg, 30 mg, 45 mg

## INDICATIONS & DOSAGES

➤ **Type 2 diabetes, alone or with a sulfonylurea, metformin, or insulin**

*Adults:* Initially, 15 or 30 mg P.O. once daily. Maximum daily dose, if used alone or in combination therapy, is 45 mg.

***Adjust-a-dose:*** For patients taking pioglitazone with insulin, reduce insulin by 10% to 25% if patient reports hypoglycemia or if glucose level is less than 100 mg/dl.

➤ **Polycystic ovary syndrome** ♦

*Adults:* 15 to 30 mg P.O. once daily.

## ADMINISTRATION

**P.O.**

• Give drug without regard for meals.

## ACTION

Lowers glucose level by decreasing insulin resistance and hepatic glucose production. Improves sensitivity of insulin in muscle and adipose tissue.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30 min | ≤2 hr | Unknown |

*Half-life:* 3 to 7 hours.

## ADVERSE REACTIONS

**CNS:** headache.
**CV:** *edema,* ***heart failure.***
**EENT:** sinusitis, pharyngitis, macular edema.
**Hematologic:** anemia.
**Metabolic:** ***hypoglycemia with combination therapy, aggravated diabetes,*** weight gain.
**Musculoskeletal:** myalgia, fractures.
**Respiratory:** *upper respiratory tract infection.*
**Other:** tooth disorder.

## INTERACTIONS

**Drug-drug.** *Atorvastatin:* May decrease atorvastatin and pioglitazone levels. Monitor patient and glucose level.
*Gemfibrozil:* May increase pioglitazone level. Monitor patient and glucose level.
*Hormonal contraceptives:* May decrease level of hormonal contraceptives, reducing contraceptive effectiveness. Advise patient taking drug and hormonal contraceptives to consider additional birth control measures.
*Ketoconazole:* May inhibit pioglitazone metabolism. Monitor glucose level more frequently.
**Drug-herb.** *Burdock, dandelion, eucalyptus, marshmallow:* May increase hypoglycemic effects. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May alter glycemic control and increase risk of hypoglycemia. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

• May increase ALT, HDL, LDL, and total cholesterol levels. May decrease glucose, triglyceride, hematocrit, and hemoglobin levels.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Contraindicated in patients with symptomatic heart failure and in those with New York Heart Association (NYHA) Class III or IV heart failure. ▮

• Contraindicated in patients hypersensitive to drug or its components and in those with type 1 diabetes, diabetic ketoacidosis, active liver disease, ALT level greater than two and a half times the upper limit of normal, and in those who experienced jaundice while taking troglitazone.

**Black Box Warning** Use cautiously in patients with edema or heart failure or patients at risk for heart failure. ▮

• Use during pregnancy only if the benefit justifies risk to fetus; insulin is the preferred antidiabetic during pregnancy.

• Safety and efficacy of drug in children haven't been evaluated.

## NURSING CONSIDERATIONS

***Alert:*** Measure liver enzyme levels at start of therapy, every 2 months for first year of therapy, and periodically thereafter. Obtain liver function test results in patients

who develop signs and symptoms of liver dysfunction, such as nausea, vomiting, abdominal pain, fatigue, anorexia, or dark urine. Stop drug if patient develops jaundice or if liver function test results show ALT level greater than three times the upper limit of normal.

**Black Box Warning** Drug can cause fluid retention, leading to or worsening heart failure. Observe patients carefully for signs and symptoms of heart failure (including excessive, rapid weight gain, dyspnea, and/or edema). If these signs and symptoms develop, the heart failure should be managed according to the current standards of care. Also, stopping or reducing dose of pioglitazone must be considered. ■

- Hemoglobin level and hematocrit may drop, usually during first 4 to 12 weeks of therapy.
- Management of type 2 diabetes should include diet control. Because caloric restrictions, weight loss, and exercise help improve insulin sensitivity and help make drug therapy effective, these measures are essential for proper diabetes management.
- Watch for hypoglycemia, especially in patients receiving combination therapy. Dosage adjustments of these drugs may be needed.
- Monitor glucose level regularly, especially during situations of increased stress, such as infection, fever, surgery, and trauma.
- Risk of fractures (forearm, hand, wrist, foot, ankle, fibula, and tibia) in female patients receiving long-term treatment is increased. Give only if risk outweighs benefits.
- ***Look alike–sound alike:*** Don't confuse pioglitazone with rosiglitazone.

### PATIENT TEACHING

- Instruct patient to adhere to dietary instructions and to have glucose and glycosylated hemoglobin levels tested regularly.
- Teach patient taking pioglitazone with insulin or oral antidiabetics the signs and symptoms of hypoglycemia.
- Advise patient to notify prescriber during periods of stress, such as fever, trauma, infection, or surgery, because dosage may need adjustment.
- Instruct patient how and when to monitor glucose level.
- Notify patient that blood tests of liver function will be performed before therapy starts, every 2 months for the first year, and periodically thereafter.
- Tell patient to report unexplained nausea, vomiting, abdominal pain, fatigue, anorexia, and dark urine immediately because these symptoms may indicate liver problems.
- Warn patient to contact his health care provider if he has signs or symptoms of heart failure (unusually rapid increase in weight or swelling, shortness of breath).
- Advise anovulatory, premenopausal women with insulin resistance that therapy may cause resumption of ovulation; recommend using contraception.
- Tell patient to have regular eye exams and to report any visual changes immediately.

## piperacillin sodium and tazobactam sodium

pie-PER-us-sil-in and taz-oh-BAK-tem

Tazocin†, Zosyn

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Extended-spectrum penicillin, beta-lactamase inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS

*Powder for injection:* 2 g piperacillin and 0.25 g tazobactam per vial, 3 g piperacillin and 0.375 g tazobactam per vial, 4 g piperacillin and 0.5 g tazobactam per vial

### INDICATIONS & DOSAGES

➤ **Moderate to severe infections from piperacillin-resistant, piperacillin and tazobactam-susceptible, beta-lactamase–producing strains of microorganisms in appendicitis (complicated by rupture or abscess) and peritonitis caused by *Escherichia coli, Bacteroides fragilis, B. ovatus, B. thetaiotaomicron, B. vulgatus;* skin and skin-structure infections caused by *Staphylococcus aureus;* postpartum endometritis or pelvic inflammatory**

**disease caused by *E. coli;* moderately severe community-acquired pneumonia caused by *Haemophilus influenzae***
*Adults:* 3.375 g (3 g piperacillin/0.375 g tazobactam) every 6 hours as a 30-minute I.V. infusion. Duration of treatment is usually 7 to 10 days.

➤ **Appendicitis, peritonitis**
*Children weighing more than 40 kg (88 lb) with normal renal function:* 3.375 g (3 g piperacilin/0.375 g tazobactam) every 6 hours by I.V. infusion for 7 to 10 days.
*Children age 9 months and older weighing 40 kg or less with normal renal function:* 100 mg piperacillin/12.5 mg tazobactam/kg of body weight every 8 hours by I.V. infusion.
*Children age 2 to 9 months:* 80 mg piperacillin/10 mg tazobactam/kg of body weight every 8 hours by I.V. infusion.
***Adjust-a-dose:*** If creatinine clearance is 20 to 40 ml/minute, give 2.25 g (2 g piperacillin/0.25 g tazobactam) every 6 hours; if less than 20 ml/minute, give 2.25 g (2 g piperacillin/0.25 g tazobactam) every 8 hours. In continuous ambulatory peritoneal dialysis (CAPD) patients, give 2.25 g (2 g piperacillin/0.25 g tazobactam) every 12 hours. In hemodialysis patients, give 2.25 g (2 g piperacillin/0.25 g tazobactam) every 12 hours with a supplemental dose of 0.75 g (0.67 g piperacillin/0.08 g tazobactam) after each dialysis period.

➤ **Moderate to severe nosocomial pneumonia caused by piperacillin-resistant, beta–lactamase-producing strains of *S. aureus* and by piperacillin and tazobactam-susceptible *Acinetobacter baumannii, H. influenzae, Klebsiella pneumoniae,* and *Pseudomonas aeruginosa***
*Adults:* 4.5 g (4 g piperacillin/0.5 g tazobactam) every 6 hours with aminoglycoside. Patients with *P. aeruginosa* should continue aminoglycoside treatment; if *P. aeruginosa* isn't isolated, aminoglycoside treatment may be stopped. Duration of treatment is usually 7 to 14 days.
***Adjust-a-dose:*** If creatinine clearance is 20 to 40 ml/minute, give 3.375 g (3 g piperacillin/0.375 g tazobactam) every 6 hours; if less than 20 ml/minute, give 2.25 g (2 g piperacillin/0.25 g tazobactam) every 6 hours. In CAPD patients, give 2.25 g (2 g piperacillin/0.25 g tazobactam) every 8 hours. In hemodialysis patients, give 2.25 g (2 g piperacillin/0.25 g tazobactam) every 8 hours with a supplemental dose of 0.75 g (0.67 g piperacillin/0.08 g tazobactam) after each dialysis period.

## ADMINISTRATION

**I.V.**
▼ Before giving drug, ask patient about allergic reactions to penicillins.
▼ Obtain specimen for culture and sensitivity tests before giving first dose. Therapy may begin while awaiting results.
▼ Reconstitute each gram with 5 ml of diluent, such as sterile or bacteriostatic water for injection, normal saline solution for injection, bacteriostatic normal saline solution for injection, $D_5W$, dextrose 5% in normal saline solution for injection, or dextran 6% in normal saline solution for injection.
▼ Shake until dissolved.
▼ Further dilute to 50 to 150 ml before infusion.
▼ Use drug immediately after reconstitution.
▼ Stop any primary infusion during administration, if possible.
▼ Infuse over at least 30 minutes.
▼ Discard unused drug in single-dose vials after 24 hours if stored at room temperature or 48 hours if refrigerated.
▼ Change I.V. site every 48 hours.
▼ Diluted drug is stable in I.V. bags for 24 hours at room temperature or for 1 week refrigerated.
▼ **Incompatibilities:** Acyclovir sodium, aminoglycosides, amphotericin B, chlorpromazine, cisatracurium, cisplatin, dacarbazine, daunorubicin, dobutamine, doxorubicin, doxycycline hyclate, droperidol, famotidine, ganciclovir, gemcitabine, haloperidol lactate, hydroxyzine hydrochloride, idarubicin, lactated Ringer's solution, minocycline, mitomycin, mitoxantrone, nalbuphine, prochlorperazine edisylate, promethazine hydrochloride, streptozocin, vancomycin.

P

## ACTION

Inhibits cell-wall synthesis during bacterial multiplication.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |

*Half-life:* About 1 hour.

## ADVERSE REACTIONS

**CNS:** *headache, insomnia,* fever, ***seizures,*** agitation, anxiety, dizziness, pain.
**CV:** ***arrhythmia,*** chest pain, edema, hypertension, tachycardia.
**EENT:** rhinitis.
**GI:** *diarrhea, constipation, nausea,* ***pseudomembranous colitis,*** abdominal pain, dyspepsia, stool changes, vomiting.
**GU:** candidiasis, interstitial nephritis.
**Hematologic:** ***leukopenia, neutropenia, thrombocytopenia,*** anemia, eosinophilia.
**Respiratory:** dyspnea.
**Skin:** pruritus, rash.
**Other:** ***anaphylaxis,*** hypersensitivity reactions, inflammation, phlebitis at I.V. site.

## INTERACTIONS

**Drug-drug.** *Hormonal contraceptives:* May decrease contraceptive effectiveness. Advise use of another form of contraception during therapy.
*Oral anticoagulants:* May prolong effectiveness. Monitor PT and INR closely.
*Probenecid:* May increase piperacillin level. Probenecid may be used for this purpose.
*Vecuronium:* May prolong neuromuscular blockade. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level.
- May increase eosinophil count. May decrease neutrophil, platelet, and WBC counts.
- May cause false-positive result for urine glucose tests using copper reduction method such as Clinitest.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other penicillins.
- Use cautiously in patients with bleeding tendencies, uremia, hypokalemia, and allergies to other drugs, especially cephalosporins, because of possible cross-sensitivity.

***Overdose S&S:*** Neuromuscular hyperexcitability, seizures.

## NURSING CONSIDERATIONS

- Because peritoneal dialysis removes 6% of the piperacillin dose and 21% of the tazobactam dose, and hemodialysis removes 30% to 40% of a dose in 4 hours, additional doses may be needed after each dialysis period.
- If large doses are given or if therapy is prolonged, bacterial or fungal superinfection may occur, especially in elderly, debilitated, or immunosuppressed patients.
- Drug contains 2.35 mEq sodium/g of piperacillin. Monitor patient's sodium intake and electrolyte levels.
- Monitor hematologic and coagulation parameters.
- Patients with cystic fibrosis may have a higher rate of fever and rash. Monitor these patients closely.

## PATIENT TEACHING

- Tell patient to report adverse reactions promptly.
- Tell patient to alert a health care professional about discomfort at the I.V. site.

# pirbuterol acetate

peer-BYOO-ter-ole

Maxair Autohaler

*Therapeutic class:* Bronchodilator
*Pharmacologic class:* Beta$_2$ agonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Inhaler:* 0.2 mg/metered dose

## INDICATIONS & DOSAGES

➤ **To prevent and reverse bronchospasm; asthma**

*Adults and children age 12 and older:* 1 or 2 inhalations (0.2 to 0.4 mg), repeated every 4 to 6 hours. Don't exceed 12 inhalations daily.

## ADMINISTRATION

### Inhalational

- Shake well before using. "Test spray" pirbuterol inhaler into the air before using for the first time and when the aerosol hasn't been used for a prolonged period.
- If more than one inhalation is ordered, wait 1 minute between inhalations.
- Have patient hold his breath for 10 seconds after inhalation, then exhale slowly.
- Give corticosteroid inhaler 5 minutes after bronchodilator.

## ACTION

Relaxes bronchial smooth muscle by stimulating beta$_2$ receptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Inhalation | 5 min | 30–60 min | 5 hr |

*Half-life:* About 2 hours.

## ADVERSE REACTIONS

**CNS:** tremor, nervousness, dizziness, insomnia, headache, vertigo.
**CV:** tachycardia, palpitations, chest tightness.
**EENT:** dry or irritated throat.
**GI:** nausea, vomiting, diarrhea, dry mouth.
**Respiratory:** cough.

## INTERACTIONS

**Drug-drug.** *Beta blockers, propranolol:* May decrease bronchodilating effects. Avoid using together.
*MAO inhibitors, tricyclic antidepressants:* May potentiate action of beta agonist on vascular system. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients unusually responsive to sympathomimetic amines and patients with CV disorders, hyperthyroidism, diabetes, and seizure disorders.

***Overdose S&S:*** Exaggeration of adverse reactions, hypokalemia, seizures, angina, hypertension, hypotension, arrhythmias, fatigue, malaise, insomnia, cardiac arrest, sudden death.

## NURSING CONSIDERATIONS

- Monitor patient for increased pulse or blood pressure during therapy.
- Stop drug immediately and notify prescriber if paradoxical bronchospasm occurs.
- The likelihood of paradoxical bronchospasm is increased with the first use of a new canister.
- Notify prescriber of decreasing effectiveness of the drug.

## PATIENT TEACHING

- Give the following instructions for using Autohaler:
  – Remove mouthpiece cover by pulling down lip on back cover. Inspect mouthpiece for foreign objects. Locate "Up" arrows and air vents.
  – Hold Autohaler upright so that arrows point up; raise lever until it snaps into place.
  – Hold Autohaler around the middle, and shake gently several times.
  – Continue to hold upright, and be careful not to block air vents at bottom. Exhale normally before use.
  – Seal lips around mouthpiece. Inhale deeply through mouthpiece with steady, moderate force to trigger release of the drug. You'll hear a click and feel a soft puff when drug is released. Continue to take a full, deep breath.
  – Take Autohaler away from mouth when done inhaling. Hold breath for 10 seconds; then exhale slowly.
  – Continue to hold Autohaler upright while lowering lever. Lower lever after each puff. If additional puffs are ordered, wait 1 minute before repeating process to obtain the next puff.
- Have patient clean inhaler per manufacturer's instructions.
- If patient also uses a corticosteroid inhaler, tell him to use the bronchodilator first, and then wait about 5 minutes before using the corticosteroid. This allows the bronchodilator to open air passages for maximal effectiveness of the corticosteroid.
- Instruct patient to call prescriber if bronchospasm increases after using drug.
- Advise patient to seek medical attention if a previously effective dosage doesn't control symptoms; this may signal worsening of disease.

P

# pitavastatin

pih-tav-a-STAT-in

Livalo

*Therapeutic class:* Antilipemic
*Pharmacologic class:* HMG-CoA reductase inhibitor
*Pregnancy risk category X*

## AVAILABLE FORMS

*Tablets:* 1 mg, 2 mg, 4 mg

## INDICATIONS & DOSAGES

➤ **Adjunctive therapy with diet to reduce total and LDL cholesterol and apolipoprotein B triglyceride levels, and to increase HDL cholesterol level in patients with primary hyperlipidemia and mixed dyslipidemia**

*Adults:* Initially, 2 mg P.O. daily. May increase dosage as needed, to maximum of 4 mg P.O. daily.

***Adjust-a-dose:*** For patients with creatinine clearance of 30 to 60 ml/minute, start with 1 mg P.O. daily; maximum dosage is 2 mg daily. If clearance is less than 30 ml/minute, avoid use if patient isn't receiving dialysis.

## ADMINISTRATION

**P.O.**

- May be given without regard to food.

## ACTION

Inhibits HMG-CoA reductase, a hepatic enzyme that's needed for cholesterol biosynthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Unknown |

*Half-life:* 12 hours.

## ADVERSE REACTIONS

**GI:** constipation, diarrhea.
**Musculoskeletal:** back pain, myalgia, extremity pain, ***rhabdomyolysis.***

## INTERACTIONS

**Drug-drug.** *Cyclosporine:* May increase pitavastatin level. Use together is contraindicated.
*Erythromycin:* May increase pitavastatin levels. Don't exceed 1 mg pitavastatin daily.
*Fibrates (such as gemfibrozil, niacin):* May increase risk of myopathy. Use together cautiously; consider reducing pitavastatin dosage when combined with niacin.
*Protease inhibitor combinations (such as lopinavir/ritonavir):* May increase pitavastatin level. Avoid using together.
*Rifampin:* May increase pitavastatin levels. Don't exceed 2 mg pitavastatin daily.
**Drug-herb.** *Herbal cholesterol-lowering products:* May increase pitavastatin levels. Discourage using together.
**Drug-food.** *Grapefruit juice:* May increase pitavastatin levels and increase risk of adverse effects, including rhabdomyolysis and myopathy. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

- May increase AST, ALT, and CK levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those with active liver disease.
- Contraindicated in pregnant and breast-feeding women.
- Avoid use in patients taking cyclosporine.
- Use cautiously in elderly patients and in those with renal impairment, inadequately treated hypothyroidism, or a history of myopathy or rhabdomyolysis.
- Safety and efficacy in children haven't been established.

## NURSING CONSIDERATIONS

- Start pitavastatin only after diet and other nondrug therapies have proved ineffective.
- Monitor PT and INR in patients taking warfarin when pitavastatin is added.
- Monitor liver function test results and CK levels before therapy is started, 12 weeks after therapy is initiated, after a dosage change, and periodically thereafter.
- Discontinue drug if myopathy develops or if CK level markedly increases.
- Temporarily withhold drug if patient develops sepsis; hypotension; dehydration; severe metabolic, endocrine, or electrolyte disorders; uncontrolled seizures; or trauma, or if patient requires major surgery. These

conditions may predispose patient to myopathy or rhabdomyolysis.
• Adjust dosage about every 4 weeks.

### PATIENT TEACHING

• Tell patient that drug may be taken without regard to meals.
• Explain the importance of controlling serum lipid levels. Teach appropriate dietary management (restricting total fat and cholesterol intake), weight control, and exercise.
• Advise women of childbearing age to use birth control while taking pitavastatin and to discuss future pregnancy and breast-feeding plans with their health care provider.
• Advise patient to report unexplained muscle pain, tenderness, or weakness, especially if accompanied by fever or malaise.
• Advise patient that blood tests to check liver enzyme levels will be needed at 12 weeks after the start of therapy, after a dosage increase, and periodically thereafter.

## plasma protein fractions

Plasmanate, Plasma-Plex, Protenate

*Therapeutic class:* Plasma volume expander
*Pharmacologic class:* Plasma protein
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 5% (50 mg/ml) solution in 50-ml, 250-ml, 500-ml vials

### INDICATIONS & DOSAGES

➤ **Shock**

*Adults:* Varies with patient's condition and response, but usual dose is 250 to 500 ml I.V. (12.5 to 25 g protein), usually no faster than 10 ml/minute.

### ADMINISTRATION

**I.V.**

▼ Check expiration date before using. Don't use solutions that are cloudy, contain sediment, or have been frozen. Discard solutions in containers that have been open for longer than 4 hours because solution contains no preservatives.
▼ Don't give more than 250 g or 5,000 ml in 48 hours.
▼ If patient is dehydrated, give additional fluids P.O. or I.V.
▼ Store at room temperature—no more than 86° F (30° C). Don't freeze.
▼ **Incompatibilities:** Protein hydrolysates, solutions containing alcohol, norepinephrine bitartrate.

### ACTION

Supplies colloid to the blood and expands plasma volume. Primary constituent is albumin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CNS:** headache.
**CV:** hypotension, ***vascular overload,*** tachycardia, flushing.
**GI:** nausea.
**Musculoskeletal:** back pain.
**Skin:** urticaria.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients with severe anemia or heart failure and in those undergoing cardiac bypass.
• Use cautiously in patients with hepatic or renal failure, low cardiac reserve, or restricted sodium intake.

### NURSING CONSIDERATIONS

• Hypotension risk is greater when infusion rate exceeds 10 ml/minute.
• Monitor blood pressure. Be prepared to slow or stop infusion if hypotension suddenly occurs. Vital signs should return to normal gradually; assess them hourly.
• Watch for signs of vascular overload (heart failure or pulmonary edema).
***Alert:*** Watch for hemorrhage or shock after surgery or injury. A rapid increase in

blood pressure may cause bleeding that isn't apparent at lower pressures.
- Report decreased urine output.
- Drug contains 130 to 160 mEq of sodium per liter.

### PATIENT TEACHING
- Explain use of drug to patient and family.
- Tell patient to report adverse reactions promptly.
- Reassure patient that, because of manufacturing process, risk of HIV, hepatitis, Creutzfeldt-Jacob disease or West Nile virus transmission is extremely low.

## plerixafor
pleh-RIX-uh-for

Mozobil

*Therapeutic class:* Hematopoieitic
*Pharmacologic class:* CXCR4 chemokine receptor inhibitor
*Pregnancy risk category D*

### AVAILABLE FORMS
*Injection:* 20-mg/ml single-use vial

### INDICATIONS & DOSAGES
➤ **To mobilize hematopoietic stem cells for collection and subsequent autologous transplantation in patients with non-Hodgkin lymphoma and multiple myeloma**
*Adults:* 0.24 mg/kg (actual body weight) subcutaneously once daily beginning about 11 hours before apheresis for up to 4 consecutive days. Begin treatment after patient receives 4 days of granulocyte-colony stimulating factor (G-CSF) therapy.

### ADMINISTRATION
**Subcutaneous**
- Inspect vials for particulate matter and discoloration before administration; don't use if there is particulate matter or if solution is discolored.

### ACTION
Inhibits CXCR4 chemokine receptor, blocking binding of SDF-1 alpha, resulting in leukocytosis and rise in circulating progenitor cells.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 30–60 min | Unknown |

*Half-life:* 3 to 5 hours.

### ADVERSE REACTIONS
**CNS:** *dizziness, fatigue, headache,* insomnia, malaise.
**EENT:** dry mouth, oral hypoesthesia.
**GI:** abdominal distention, abdominal pain, constipation, *diarrhea,* dyspepsia, flatulence, *nausea, vomiting.*
**Hematologic:** leukocytosis, ***thrombocytopenia.***
**Musculoskeletal:** *arthralgia,* musculoskeletal pain.
**Skin:** erythema, hyperhidrosis, *injection-site reactions (erythema, hematoma, hemorrhage, induration, inflammation, irritation, pain, paresthesia, pruritus, rash, swelling, urticaria).*

### INTERACTIONS
None reported.

### EFFECTS ON LAB TEST RESULTS
- May increase leukocyte count.
- May decrease platelet count.

### CONTRAINDICATIONS & CAUTIONS
- Avoid use in patients with leukemia.
- Drug may harm fetus. Use in pregnant women only if benefit to mother outweighs risk to fetus.
- It isn't known if drug appears in breast milk. Patient should discontinue drug or discontinue breast-feeding.
- Safe and effective use in children hasn't been established.

***Overdose S&S:*** GI disorders, vasovagal reactions, orthostatic hypotension, syncope.

### NURSING CONSIDERATIONS
- Monitor WBC and platelet counts; watch for leukocytosis and thrombocytopenia.

***Alert:*** Splenic rupture may occur rarely. Assess patient experiencing left upper abdominal or shoulder pain for enlarged spleen or splenic rupture.
- Drug may cause tumor cell release from marrow when used in combination with G-CSF. Tumor cells may subsequently be

collected and reinfused, the effects of which are unknown.
• Vasovagal reactions, orthostatic hypotension, and syncope may occur after subcutaneous injection. Monitor patient closely.
• OTC medications may be effective in treating injection-site reactions.

### PATIENT TEACHING
• Advise patient to immediately report upper left abdominal or shoulder tip pain because these may be signs of splenic rupture.
• Demonstrate to patient or caregiver how to give drug if given at home.
• Advise women of childbearing age to use effective means of contraception while taking drug.
• Tell patient or caregiver to report signs and symptoms of hypersensitivity reaction (such as hives, periorbital swelling, or shortness of breath) or hypoxia (severe shortness of breath; blue skin color around the mouth, fingers, and toes; or confusion or decreased consciousness).
• Inform patient that drug may cause diarrhea, nausea, vomiting, flatulence, and abdominal pain. Tell patient how to manage these signs and symptoms and to report if they become severe.
• Instruct patient to immediately report symptoms of vasovagal reactions, such as orthostatic hypotension or fainting.

## polyethylene glycol (PEG)
pol-ee-ETH-ih-leen

GlycoLax, MiraLax

*Therapeutic class:* Laxative
*Pharmacologic class:* Osmotic drug
*Pregnancy risk category C*

### AVAILABLE FORMS
*Powder:* single-dose 17-g packets; 16-ounce (255-g), 24-ounce (527-g) containers

### INDICATIONS & DOSAGES
➤ **Short-term treatment of occasional constipation**
*Adults:* 17 g (about 1 heaping tablespoon) powder P.O. daily.

### ADMINISTRATION
**P.O.**
• Before giving, rule out bowel obstruction in patients who have nausea, vomiting, abdominal pain, or distention.
• Dissolve powder in 8 ounces (240 ml) of water, juice, soda, coffee, or tea.

### ACTION
Causes water to be retained in stool.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 48–96 hr | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS
**GI:** abdominal bloating, cramping, diarrhea, excess stool frequency, flatulence, nausea.

### INTERACTIONS
**Drug-drug.** *Drugs containing polyethylene glycol:* May cause urticaria. Monitor patient.

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
• Contraindicated in patients allergic to drug and those with known or suspected bowel obstruction.
⚠ ***Overdose S&S:*** Diarrhea.

### NURSING CONSIDERATIONS
• It may take 2 to 4 days before a bowel movement occurs.
• Drug should be taken for 2 weeks or less to avoid risk of laxative dependence.
• Occasional use as directed doesn't affect absorption or secretion of glucose or electrolytes.
• Prolonged, frequent, or excessive use may cause electrolyte imbalance and laxative dependence.
• Drug may be more likely to cause diarrhea in older patients.

### PATIENT TEACHING
• Explain that proper eating habits and lifestyle changes may produce more regular bowel movements. Tell patient to eat

adequate amounts of dietary fiber, drink ample fluids, and get appropriate exercise.
- If patient uses bottled form of drug, urge him to measure each 17-g dose using the measuring cup provided in the package. If patient uses drug packets, each one contains 17 g.
- Instruct patient to dissolve dose in 8 ounces of water, juice, soda, coffee, or tea.
- Inform patient that it may take 2 to 4 days to produce a bowel movement.
- Warn patient that taking more than the recommended dose can cause dehydration and severe diarrhea.
- Tell patient that drug should be used for 2 weeks or less to avoid risk of laxative dependence.
- Urge patient to report unusual cramping, bloating, or diarrhea.

## polyethylene glycol (PEG) and electrolyte solution

pol-ee-ETH-ih-leen

Colyte, Go-Evac, GoLYTELY, MoviPrep, NuLYTELY, OCL, TriLyte

*Therapeutic class:* Laxative
*Pharmacologic class:* Polyethylene glycol (PEG) nonabsorbable solution
*Pregnancy risk category C*

### AVAILABLE FORMS

*Powder for oral solution:* 4 L dose of solution contains PEG 3350 (17.6 mmol/L), sodium (125 mmol/L), sulfate (40 mmol/L; Colyte 80 mmol/L), chloride (35 mmol/L), bicarbonate (20 mmol/L), and potassium (10 mmol/L)
*Oral solution:* PEG 3350 (6 g), sodium sulfate decahydrate (1.29 g), sodium chloride (146 mg), potassium chloride (75 mg), sodium bicarbonate (168 mg), polysorbate-80 (30 mg) per 100 ml (OCL)

### INDICATIONS & DOSAGES

➤ **Bowel preparation before GI examination**

*Adults:* 240 ml P.O. every 10 minutes until 4 L are consumed or until watery stool is clear. Typically, give 4 hours before examination, allowing 3 hours for drinking and 1 hour for bowel evacuation.

### ADMINISTRATION

**P.O.**
- Use tap water to reconstitute powder. Shake vigorously to dissolve all powder. Refrigerate reconstituted solution, but use within 48 hours.
- Chilling solution improves palatability.
- Give solution early in the morning if patient is scheduled for a midmorning examination. Oral solution induces diarrhea (onset 30 to 60 minutes) that rapidly cleans the bowel, usually within 4 hours.
- When using to prepare for barium enema, give solution the evening before the examination to avoid interfering with barium coating of the colonic mucosa.
- If given to semiconscious patient or to patient with impaired gag reflex, take care to prevent aspiration.
- Give drug at least 2 hours after solid food.

### ACTION

PEG 3350, a nonabsorbable solution, acts as an osmotic. Sodium sulfate greatly reduces sodium absorption. The electrolyte level causes virtually no net absorption or secretion of ions.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | Variable | Variable |

*Half-life:* None.

### ADVERSE REACTIONS

**EENT:** rhinorrhea.
**GI:** *abdominal fullness, bloating, cramps, nausea, vomiting.*
**Skin:** allergic reaction, anal irritation, dermatitis, urticaria.

### INTERACTIONS

**Drug-drug.** *Oral drugs:* May decrease absorption if given within 1 hour of starting therapy. Give at least 2 to 3 hours before starting therapy.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with GI obstruction or perforation, gastric retention, toxic colitis, or megacolon.

⚠ ***Overdose S&S:*** Diarrhea.

### NURSING CONSIDERATIONS

- No major shifts in fluid or electrolyte balance have been reported.
- Patient preparation for barium enema may be less satisfactory with this solution because it may interfere with the barium coating of the colonic mucosa using the double-contrast technique.

### PATIENT TEACHING

- Tell patient to fast for 3 to 4 hours before taking solution, and thereafter to drink only clear fluids until examination is complete.
- Tell patient to improve drug's taste by chilling.
- Warn patient about adverse reactions.

## posaconazole

pahs-ah-KON-ah-zall

Noxafil

*Therapeutic class:* Antifungal
*Pharmacologic class:* Triazole antifungal
*Pregnancy risk category C*

### AVAILABLE FORMS

*Oral suspension:* 40 mg/ml

### INDICATIONS & DOSAGES

➤ **Prevention of invasive *Aspergillus* and *Candida* infections in high-risk immunocompromised patients**

*Adults and children age 13 and older:* 200 mg (5 ml) P.O. t.i.d. with a full meal or a liquid nutritional supplement; duration of therapy is based on recovery from neutropenia or immunosuppression.

➤ **Oropharyngeal candidiasis**

*Adults and children age 13 and older:* 100 mg (2.5 ml) P.O. b.i.d. on first day, then 100 mg (2.5 ml) once daily for 13 days with a full meal or a liquid nutritional supplement.

➤ **Oropharyngeal candidiasis resistant to itraconazole or fluconazole treatment**

*Adults and children age 13 and older:* 400 mg (10 ml) P.O. b.i.d. with a full meal or a liquid nutritional supplement; duration of treatment is based on severity of underlying disease and patient response.

### ADMINISTRATION

**P.O.**

- Give drug with a full meal or a liquid nutritional supplement.
- Shake the suspension well before giving it.
- Measure doses using calibrated spoon provided with the drug, which has two markings, one for 2.5 ml and one 5 ml. After patient takes dose, fill spoon with water and have him drink it to ensure a full dose.
- Store oral suspension at room temperature.

### ACTION

Blocks the synthesis of ergosterol, a vital component of the fungal cell membrane.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3–5 hr | Unknown |

*Half-life:* 35 hours.

### ADVERSE REACTIONS

**CNS:** anxiety, *dizziness, fatigue, fever, headache, insomnia,* weakness.
**CV:** *edema, hypertension, hypotension, tachycardia.*
**EENT:** *epistaxis, pharyngitis,* altered taste, blurred vision.
**GI:** *abdominal pain, constipation, diarrhea, dyspepsia, mucositis, nausea, vomiting.*
**GU:** **VAGINAL HEMORRHAGE.**
**Hematologic:** *anemia, petechiae,* **FEBRILE NEUTROPENIA, NEUTROPENIA, THROMBOCYTOPENIA.**
**Hepatic:** *bilirubinemia.*
**Metabolic:** *anorexia, hyperglycemia, hypokalemia,* ***hypomagnesemia,*** hypocalcemia.
**Musculoskeletal:** *arthralgia, back pain, musculoskeletal pain.*
**Respiratory:** *cough, dyspnea,* upper respiratory tract infection.
**Other:** *bacteremia, CMV infection, herpes simplex, rigors.*

### INTERACTIONS

**Drug-drug.** *Cimetidine, phenytoin:* May decrease level and effectiveness of posaconazole. Avoid using together.
*Calcium channel blockers, cyclosporine, HMG-CoA reductase inhibitors,*

P

*midazolam, phenytoin, sirolimus, tacrolimus, vinca alkaloids:* May increase levels of these drugs. Reduce dosages, increase monitoring of levels, and observe patient for adverse effects.
*Rifabutin:* May decrease level and efficacy of posaconazole while increasing rifabutin level and risk of toxicity. Avoid using together. If unavoidable, monitor patient for uveitis, leukopenia, and other adverse effects.
**Drug-food.** *Food, liquid nutritional supplements:* May greatly enhance absorption of drug. Always give drug with liquid supplement or food.

## EFFECTS ON LAB TEST RESULTS

- May increase AST, ALT, bilirubin, creatinine, alkaline phosphatase, and glucose levels. May decrease potassium, magnesium, and calcium levels.
- May decrease WBC, RBC, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in patients taking ergot derivatives, pimozide, or quinidine.
- Use cautiously in patients hypersensitive to other azole antifungals, patients with potentially proarrhythmic conditions, and patients with hepatic or renal insufficiency.
- Safe use in children younger than age 13 hasn't been established.

## NURSING CONSIDERATIONS

- Correct electrolyte imbalances, especially potassium, magnesium, and calcium imbalances, before therapy.
- Monitor patient for signs and symptoms of electrolyte imbalance including a slow, weak, or irregular pulse; ECG change; nausea; neuromuscular irritability; and tetany.
- Obtain baseline liver function tests, including bilirubin level, before therapy and periodically during treatment. Notify prescriber if patient develops signs or symptoms of hepatic dysfunction.
- Monitor patient who has severe vomiting or diarrhea for breakthrough fungal infection.

## PATIENT TEACHING

- If patient can't take a liquid supplement or eat a full meal, instruct him to notify prescriber. A different anti-infective may be needed, or monitoring may need to be increased.
- Tell patient to notify prescriber about an irregular heartbeat, fainting, or severe diarrhea or vomiting.
- Explain the signs and symptoms of liver dysfunction, including abdominal pain, yellowing skin or eyes, pale stools, and dark urine.
- Urge patient to contact the prescriber or pharmacist before taking other prescription or OTC drugs, and herbal or dietary supplements.
- Tell patient to shake the suspension well before taking it.
- Instruct patient to measure doses using the spoon provided with the drug. Household spoons vary in size and may yield an incorrect dose.
- Point out that the calibrated spoon has two markings: one for 2.5 ml and one for 5 ml. Make sure patient understands which mark to use for his prescribed dose.
- After patient takes dose, tell him to fill the spoon with water and drink it, to ensure a full dose. Tell him to clean the spoon with water before putting it away.

# potassium acetate

*Therapeutic class:* Potassium supplement
*Pharmacologic class:* Potassium salt
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 2 mEq/ml in 20-, 50-, and 100-ml vials, 4 mEq/ml in 50-ml vial

## INDICATIONS & DOSAGES

➤ **Hypokalemia**
*Adults:* No more than 20 mEq/hour in concentration of 40 mEq/L or less. Total 24-hour dose shouldn't exceed 150 mEq (3 mEq/kg in children).
➤ **To prevent hypokalemia**
*Adults:* Dosage is individualized to patient's needs, not to exceed 150 mEq daily. Give

as an additive to I.V. infusions. Usual dose is 20 mEq/L, infused at no more than 20 mEq/hour.
*Children:* Individualize dose; don't exceed 3 mEq/kg daily. Give as an additive to I.V. infusions.

## ADMINISTRATION

**I.V.**
▼ Use only in life-threatening hypokalemia or when oral replacement isn't feasible.
▼ Don't give undiluted potassium. Maximum infusion rate is 1 mEq/kg/hour.
▼ Don't add potassium to a hanging bag. Mix well to avoid layering.
▼ To prevent pain, use largest peripheral vein and a well-placed small-bore needle.
▼ Give only by infusion, never I.V. push or I.M. Watch for pain and redness at infusion site.
▼ Give slowly as diluted solution; rapid infusion may cause fatal hyperkalemia.
▼ **Incompatibilities:** None reported.

## ACTION

Replaces potassium and maintains potassium level.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** paresthesia of limbs, listlessness, mental confusion, weakness or heaviness of legs, flaccid paralysis, pain, fever.
**CV:** ***arrhythmias, cardiac arrest, heart block,*** ECG changes, hypotension.
**GI:** nausea, vomiting, abdominal pain, diarrhea.
**Metabolic:** ***hyperkalemia.***
**Respiratory:** ***respiratory paralysis.***
**Skin:** redness at infusion site.

## INTERACTIONS

**Drug-drug.** *ACE inhibitors, potassium-sparing diuretics:* May increase risk of hyperkalemia. Use together with caution.
*Digoxin:* May cause digoxin toxicity from hypokalemia if drug is stopped. Stop potassium cautiously if patient is taking digoxin.

**Drug-food.** *Potassium-containing salt substitutes:* May increase risk of hyperkalemia. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

● May increase potassium level.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients with severe renal impairment with oliguria, anuria, or azotemia.
● Contraindicated in those with untreated Addison's disease, acute dehydration, heat cramps, hyperkalemia, hyperkalemic form of familial periodic paralysis, or conditions linked to extensive tissue breakdown.
● Use cautiously in patients with cardiac disease or renal impairment.
⚠ ***Overdose S&S:*** Paresthesia, flaccid paralysis, listlessness, confusion, weakness and heaviness of legs, hypotension, cardiac arrhythmias, heart block, ECG changes, cardiac arrest.

## NURSING CONSIDERATIONS

● During therapy, monitor ECG, renal function, fluid intake and output, and potassium, creatinine, and BUN levels. Never give potassium postoperatively until urine flow is established.
● Many adverse reactions may reflect hyperkalemia.
● ***Look alike–sound alike:*** Potassium preparations aren't interchangeable; verify preparation before use.

## PATIENT TEACHING

● Explain use and administration to patient and family.
● Tell patient to report adverse effects, especially pain at insertion site.

# potassium bicarbonate

Effer-K, Klor-Con/EF, K-Lyte DS

*Therapeutic class:* Potassium supplement
*Pharmacologic class:* Potassium salt
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets (effervescent):* 25 mEq, 50 mEq

## INDICATIONS & DOSAGES

➤ **To prevent hypokalemia**

*Adults and children:* Initially, 20 mEq P.O. daily, in divided doses. Adjust dosage, as needed.

➤ **Hypokalemia**

*Adults and children:* 40 to 100 mEq P.O. divided into two to four daily doses. Don't exceed 150 mEq P.O. daily in adults and 3 mEq/kg daily P.O. in children.

## ADMINISTRATION

**P.O.**

- Dissolve tablets completely in 4 to 8 ounces of cold water.
- Available in lime, fruit punch, citrus, or orange.

## ACTION

Replaces potassium and maintains potassium level.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 4 hr | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** paresthesia of limbs, listlessness, confusion, weakness or heaviness of legs, flaccid paralysis.

**CV:** ***arrhythmias,*** ECG changes, hypotension, ***heart block, cardiac arrest.***

**GI:** *nausea, vomiting, abdominal pain,* diarrhea.

## INTERACTIONS

**Drug-drug.** *ACE inhibitors, digoxin, potassium-sparing diuretics:* May cause hyperkalemia. Use with extreme caution. Monitor potassium levels.

## EFFECTS ON LAB TEST RESULTS

- May increase potassium level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with severe renal impairment with oliguria, anuria, or azotemia; untreated Addison's disease; or acute dehydration, heat cramps, hyperkalemia, hyperkalemic form of familial periodic paralysis, or other conditions linked to extensive tissue breakdown.
- Use cautiously in patients with cardiac disease or renal impairment.

***Overdose S&S:*** ECG changes, weakness, flaccidity, respiratory paralysis, cardiac arrhythmias.

## NURSING CONSIDERATIONS

- Don't give potassium supplements postoperatively until urine flow has been established.

***Alert:*** Potassium preparations aren't interchangeable; verify preparation before use. Never switch potassium products without prescriber's order. Potassium chloride can't be given instead of potassium bicarbonate.

- Use I.V. potassium chloride when oral replacement isn't feasible.
- Monitor fluid intake and output and BUN, potassium, and creatinine levels.

## PATIENT TEACHING

- Tell patient to take drug with meals and sip slowly over 5 to 10 minutes.
- Tell patient to report adverse effects.
- Warn patient not to use salt substitutes at the same time, except with prescriber's permission.

**SAFETY ALERT!**

## potassium chloride

Cena-K, Gen-K, K 10†, Kaon-Cl, Kaon-Cl-10, Kay Ciel, K-Dur 10, K-Dur 20, K-Lor, Klor-Con, Klor-Con 8, Klor-Con 10, Klor-Con/25, Klor-Con M10, Klor-Con M15, Klor-Con M20, Klotrix, K-Lyte/Cl, K-Tab, K-Vescent, Micro-K, Micro-K 10, Micro-K LS, Potasalan, Pro-600 K SRT†, Slow K†, Slow Pot†

*Therapeutic class:* Potassium supplement

*Pharmacologic class:* Potassium salt

*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules (controlled-release):* 8 mEq, 10 mEq

*Injection concentrate:* 1.5 mEq/ml, 2 mEq/ml

*Injection for I.V. infusion:* 0.1 mEq/ml, 0.2 mEq/ml, 0.3 mEq/ml, 0.4 mEq/ml
*Oral liquid:* 20 mEq/15 ml, 40 mEq/15 ml
*Powder for oral administration:* 20 mEq/packet, 25 mEq/packet
*Tablets (controlled-release):* 6.7 mEq, 8 mEq, 10 mEq, 20 mEq
*Tablets (extended-release):* 8 mEq, 10 mEq, 15 mEq, 20 mEq

## INDICATIONS & DOSAGES

➤ **To prevent hypokalemia**

*Adults and children:* Initially, 16 to 24 mEq of potassium supplement P.O. daily, in divided doses. Adjust dosage, as needed, based on potassium levels.

➤ **Hypokalemia**

*Adults and children:* 40 to 100 mEq P.O. in two to four divided doses daily. Maximum dose of diluted I.V. potassium chloride is 40 mEq/L at 10 mEq/hour. Don't exceed 200 mEq daily in adults and 3 mEq/kg daily in children. Further doses are based on potassium levels and blood pH. Give I.V. potassium replacement only with monitoring of ECG and potassium level.

➤ **Severe hypokalemia**

*Adults and children:* Dilute potassium chloride in a suitable I.V. solution of less than 80 mEq/L, and give at no more than 40 mEq/hour.

Further doses are based on potassium level. Don't exceed 400 mEq I.V. daily in adults and 3 mEq/kg I.V. daily in children. Give I.V. potassium replacement only with monitoring of ECG and potassium level.

## ADMINISTRATION

**P.O.**

- Make sure powders are completely dissolved before giving.
- Enteric-coated tablets are not recommended because of increased risk of GI bleeding and small-bowel ulcerations.
- Tablets in wax matrix may lodge in the esophagus and cause ulceration in cardiac patients with esophageal compression from an enlarged left atrium. Use sugar-free liquid form in these patients and in those with esophageal stasis or obstruction. Have patient sip slowly to minimize GI irritation.
- Don't crush sustained-release forms.

**I.V.**

▼ Use only when oral replacement isn't feasible or when hypokalemia is life-threatening.
▼ Give by infusion only, never I.V. push or I.M. Give slowly as dilute solution; rapid infusion may cause fatal hyperkalemia.
▼ If burning occurs during infusion, decrease rate.
▼ **Incompatibilities:** Amikacin, amoxicillin, amphotericin B, azithromycin, diazepam, dobutamine, ergotamine, etoposide with cisplatin and mannitol, fat emulsion 10%, methylprednisolone, penicillin G, phenytoin, promethazine.

## ACTION

Replaces potassium and maintains potassium level.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |
| I.V. | Immediate | Immediate | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** paresthesia of limbs, listlessness, confusion, weakness or heaviness of limbs, flaccid paralysis.
**CV:** *postinfusion phlebitis,* ***arrhythmias, heart block, cardiac arrest,*** ECG changes, hypotension.
**GI:** nausea, vomiting, abdominal pain, diarrhea.
**Metabolic:** ***hyperkalemia.***
**Respiratory:** ***respiratory paralysis.***

## INTERACTIONS

**Drug-drug.** *ACE inhibitors, digoxin, potassium-sparing diuretics:* May cause hyperkalemia. Use together with extreme caution. Monitor potassium level.

## EFFECTS ON LAB TEST RESULTS

- May increase potassium level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with severe renal impairment with oliguria, anuria, or azotemia; with untreated Addison's disease; or with acute dehydration, heat cramps, hyperkalemia, hyperkalemic form of

P

familial periodic paralysis, or other conditions linked to extensive tissue breakdown.
• Use cautiously in patients with cardiac disease or renal impairment.
⚠ ***Overdose S&S:*** ECG changes, weakness, flaccidity, respiratory paralysis, cardiac arrhythmias, death.

## NURSING CONSIDERATIONS
• Patients at an increased risk of GI lesions include those with scleroderma, diabetes, mitral valve replacement, cardiomegaly, or esophageal strictures, and in elderly or immobile patients.
• Drug is commonly used orally with potassium-wasting diuretics to maintain potassium levels.
• Monitor ECG and electrolyte levels during therapy.
• Monitor renal function. After surgery, don't give drug until urine flow is established.
• Many adverse reactions may reflect hyperkalemia.
• Patient may be sensitive to tartrazine in some of these products.
• ***Look alike–sound alike:*** Potassium preparations aren't interchangeable; verify preparation before use and don't switch products.

## PATIENT TEACHING
• Teach patient how to prepare powders and how to take drug. Tell patient to take with or after meals with full glass of water or fruit juice to lessen GI distress.
• Teach patient signs and symptoms of hyperkalemia, and tell patient to notify prescriber if they occur.
• Tell patient to report discomfort at I.V. insertion site.
• Warn patient not to use salt substitutes concurrently, except with prescriber's permission.
• Tell patient not to be concerned if wax matrix appears in stool because the drug has already been absorbed.

# potassium gluconate
Kaon*, Kaylixir*

*Therapeutic class:* Potassium supplement
*Pharmacologic class:* Potassium salt
*Pregnancy risk category C*

## AVAILABLE FORMS
*Elixir:* 20 mEq/15 ml*
*Tablets:* 500 mg (83 mg potassium) ♢, 595 mg (99 mg potassium) ♢

## INDICATIONS & DOSAGES
➤ **To prevent hypokalemia**
*Adults and children:* Initially, 20 mEq of potassium supplement P.O. daily, in divided doses. Adjust dosage, as needed, based on potassium level.
➤ **Hypokalemia**
*Adults and children:* 40 to 100 mEq P.O. divided into two to four daily doses. Use I.V. potassium chloride when oral replacement isn't feasible. Don't exceed 150 mEq P.O. daily in adults and 3 mEq/kg daily P.O. in children.

## ADMINISTRATION
**P.O.**
• Have patient sip liquid potassium slowly to minimize GI irritation.
• Give drug with meals, with a full glass of water or fruit juice.

## ACTION
Replaces potassium and maintains intracellular and extracellular potassium levels.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | 4 hr |

*Half-life:* Unknown.

## ADVERSE REACTIONS
**CNS:** paresthesia of limbs, listlessness, confusion, weakness or heaviness of legs, flaccid paralysis.
**CV:** ***arrhythmias,*** ECG changes.
**GI:** *nausea, vomiting, abdominal pain,* diarrhea.

### INTERACTIONS
**Drug-drug.** *ACE inhibitors, digoxin, potassium-sparing diuretics:* May cause hyperkalemia. Use with caution. Monitor potassium level.

### EFFECTS ON LAB TEST RESULTS
- May increase potassium level.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients with severe renal impairment with oliguria, anuria, or azotemia; untreated Addison's disease; or acute dehydration, heat cramps, hyperkalemia, hyperkalemic form of familial periodic paralysis, or other conditions linked to extensive tissue breakdown.
- Use cautiously in patients with cardiac disease or renal impairment.

***Overdose S&S:*** ECG changes, weakness, flaccidity, respiratory paralysis, cardiac arrhythmias, death.

### NURSING CONSIDERATIONS
***Alert:*** Give oral potassium supplements with caution because different forms deliver varying amounts of potassium. Never switch products without prescriber's order.
- Don't give potassium supplements postoperatively until urine flow has been established.
- Monitor ECG, fluid intake and output, and BUN, potassium, and creatinine levels.

### PATIENT TEACHING
- Advise patient to sip liquid potassium slowly to minimize GI irritation. Also tell him to take drug with meals, with a full glass of water or fruit juice.
- Warn patient not to use potassium gluconate with a salt substitute, except with prescriber's permission.
- Teach patient signs and symptoms of hyperkalemia, and tell him to notify prescriber if they occur.

## potassium iodide
po-TASS-ee-um

Iosat ◇, Pima, saturated solution (SSKI), strong iodine solution (Lugol's solution), ThyroSafe ◇, ThyroShield ◇

*Therapeutic class:* Antihyperthyroid
*Pharmacologic class:* Salt of stable iodine
*Pregnancy risk category D*

### AVAILABLE FORMS
*Oral solution (Lugol's solution):* iodine 5% and potassium iodide 10%
*Oral solution (SSKI):* 1 g/ml
*Oral solution (ThyroShield):* 65 mg/ml
*Syrup (Pima):* 325 mg/5 ml
*Tablets:* 65 mg, 130 mg

### INDICATIONS & DOSAGES
➤ **To prepare for thyroidectomy**
*Adults and children:* 2 to 6 drops strong iodine solution P.O. t.i.d. for 10 days before surgery; or 1 to 5 drops SSKI in water P.O. t.i.d. after meals for 10 days before surgery.

➤ **Thyrotoxic crisis**
*Adults and children:* 500 mg P.O. every 4 hours (about 10 drops of SSKI); or 1 ml of strong iodine solution t.i.d. Give at least 1 hour after the first dose of propylthiouracil or methimazole.

➤ **Radiation protectant for thyroid gland (strong iodine solution)**
*Adults and children age 1 and older:* 130 mg P.O. daily as directed by public health authorities. Start no later than 3 to 4 hours after exposure. Avoid repeat dosing, if possible, in pregnant or breast-feeding women.
*Infants up to age 1:* 65 mg P.O. daily as directed by public health authorities. Start no later than 3 to 4 hours after exposure.

➤ **Radiation protectant for thyroid gland (ThyroShield)**
*Adults and children ages 12 to 18 weighing at least 68 kg (150 lb):* 130 mg (2 ml) P.O. every 24 hours as directed by public health authorities. Start no later than 3 to 4 hours after exposure. Avoid repeat dosing in pregnant or breast-feeding women.

P

*Children ages 3 to 12 or children ages 12 to 18 weighing less than 68 kg (150 lb):* 65 mg (1 ml) P.O. every 24 hours as directed by public health authorities. Start no later than 3 to 4 hours after exposure.
*Children ages 1 month to 3 years:* 32.5 mg (0.5 ml) P.O. every 24 hours as directed by public health authorities. Start no later than 3 to 4 hours after exposure.
*Neonates from birth to 1 month:* 16.25 mg (0.25 ml) P.O. every 24 hours as directed by public health authorities. Start no later than 3 to 4 hours after exposure. Avoid repeat dosing, if possible.

➤ **Expectorant**
*Adults:* 5 to 10 ml (325 mg to 650 mg) Pima P.O. t.i.d. Or, 300 to 600 mg SSKI P.O. t.i.d. to q.i.d.
*Children:* 2.5 to 5 ml (162.5 mg to 325 mg) Pima P.O. t.i.d.

## ADMINISTRATION

**P.O.**
- Dilute oral solution in 120 to 240 ml water, milk, or fruit juice, and give after meals to prevent gastric irritation, hydrate patient, and mask salty taste.
- Give iodides through straw to avoid tooth discoloration.
- Store in light-resistant container.

## ACTION

Inhibits thyroid hormone formation, limits iodide transport into the thyroid gland, and blocks thyroid hormone release. Also decreases mucus viscosity by enhancing the secretion of respiratory fluids.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | <24 hr | 10–15 days | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** fever.
**EENT:** periorbital edema.
**GI:** nausea, vomiting, diarrhea, inflammation of salivary glands, burning mouth and throat, sore teeth and gums, *metallic taste*.
**Metabolic:** ***potassium toxicity.***
**Skin:** acneiform rash.
**Other:** hypersensitivity reactions (including ***angioedema***).

## INTERACTIONS

**Drug-drug.** *ACE inhibitors, potassium-sparing diuretics:* May cause hyperkalemia. Avoid using together.
*Antithyroid drugs:* May increase hypothyroid or goitrogenic effects. Monitor patient closely.
*Lithium carbonate:* May cause hypothyroidism. Use together cautiously.
**Drug-food.** *Iodized salt, shellfish:* May alter drug's effectiveness. Urge caution.

## EFFECTS ON LAB TEST RESULTS

- May increase potassium level.
- May alter thyroid function test results.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with tuberculosis, acute bronchitis, iodide hypersensitivity, or hyperkalemia. Some formulations contain sulfites, which may cause allergic reactions in hypersensitive patients.
- Use cautiously in patients with hypocomplementemic vasculitis, goiter, or autoimmune thyroid disease.

***Overdose S&S:*** Gastroenteritis, abdominal pain, diarrhea (sometimes bloody), death from circulatory collapse caused by shock, corrosive gastritis, or asphyxiation from swelling of the glottis or larynx.

## NURSING CONSIDERATIONS

**Black Box Warning** Potassium iodide should be used during a nuclear radiation emergency only when recommended by public officials. It should not be taken more than once every 24 hours.
- The FDA doesn't recommend prophylaxis with potassium iodide for a radiation emergency in adults over age 40 unless a large internal radiation dose is anticipated.
- For thyrotoxicosis, first iodine dose is given at least 1 hour after first dose of propylthiouracil and methimazole.

***Alert:*** Earliest signs of delayed hypersensitivity reactions caused by iodides are irritation and swollen eyelids.
- Signs of an iodide hypersensitivity reaction include angioedema, cutaneous and mucosal hemorrhage, fever, arthralgia, lymph node enlargement, and eosinophilia.
- Monitor patient for iodism, which can cause metallic taste, burning in mouth

and throat, sore teeth and gums, increased salivation, coryza, sneezing, eye irritation with swelling of eyelids, severe headache, productive cough, GI irritation, diarrhea, rash, or soreness of the pharynx, larynx, and tonsils.

### PATIENT TEACHING

- Show patient how to mask salty taste of oral solution. Tell him to take all forms of drug after meals.
- ***Alert:*** Warn patient that sudden withdrawal may precipitate thyroid crisis.
- ***Alert:*** Teach patient signs and symptoms of potassium toxicity, including confusion, irregular heart beat, numbness, tingling, pain or weakness of hands or feet, and tiredness.
- Tell patient to ask prescriber about using iodized salt and eating shellfish. These foods contain iodine and may alter drug's effectiveness.
- Tell patient not to increase the amount of potassium through diet.
- Tell patient to stop drug and notify prescriber if epigastric pain, rash, metallic taste, nausea, or vomiting occurs.

## pralidoxime chloride (2-PAM chloride, 2-pyridine-aldoxime methochloride)

pra-li-DOX-eem

Protopam Chloride

*Therapeutic class:* Antidote
*Pharmacologic class:* Quaternary ammonium oxime
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 1 g/20 ml in 20-ml vial

### INDICATIONS & DOSAGES

➤ **Antidote for organophosphate poisoning**

*Adults:* 1 to 2 g in 100 ml of normal saline solution by I.V. infusion over 15 to 30 minutes. If not practical or pulmonary edema is present, give dose as a 5% solution in sterile water by slow I.V. push over at least 5 minutes. Repeat in 1 hour if muscle weakness persists. Additional doses may be given cautiously. I.M. or subcutaneous injection may be used if I.V. isn't feasible.

*Children age 16 and younger (I.V. dosing):* Give loading dose of 20 to 50 mg/kg (maximum 2 g) I.V. over 15 to 30 minutes, followed by 10 to 20 mg/kg/hour by continuous I.V. infusion. Or, give initial dose of 20 to 50 mg/kg I.V. over 15 to 30 minutes. May give second dose of 20 to 50 mg/kg I.V. in 1 hour if muscle weakness persists. May repeat dose every 10 to 12 hours p.r.n. Maximum is 2 g/dose. Or, if pulmonary edema is present or it isn't practical to give intermittent or continuous I.V. infusions, give dose of 20 to 50 mg/kg as 50-mg/ml solution in water by I.V. push slowly over 5 minutes. If muscle weakness persists, additional doses may be given every 10 to 12 hours.

*Children age 16 and younger with mild symptoms who weigh 40 kg (88 lb) or more (I.M. dosing):* Give 600 mg I.M. If symptoms persist after 15 minutes, give second dose of 600 mg I.M. If symptoms persist 15 minutes after second dose, give third dose of 600 mg I.M. Maximum combined dose for three injections is 1,800 mg. If patient develops severe symptoms at any time after first dose, administer second and third doses in rapid succession. For severe symptoms, give all three doses of 600 mg I.M. each in rapid succession for total combined dose of 1,800 mg.

*Children age 16 and younger with mild symptoms who weigh less than 40 kg (88 lb) (I.M. dosing):* Give 15 mg/kg I.M. in anterolateral thigh. If symptoms persist after 15 minutes, give second dose of 15 mg/kg I.M. If symptoms persist after second dose, give third dose of 15 mg/kg I.M. If patient develops severe symptoms at any time after first dose, give second and third doses in rapid succession. For severe symptoms, give all three doses of 15 mg/kg I.M. each in rapid succession. Maximum combined dose for three injections is 45 mg/kg.

➤ **Cholinergic crisis in myasthenia gravis**

*Adults:* 1 to 2 g I.V.; then 250 mg I.V. every 5 minutes, p.r.n.

P

## ADMINISTRATION

**I.V.**

▼ Reconstitute by adding 20 ml of sterile water for injection to vial containing 1 g of drug.
▼ Dilute by adding 100 ml of normal saline solution.
▼ Infuse over 15 to 30 minutes. Too-rapid infusion may cause tachycardia, laryngospasm, and muscle rigidity.
▼ **Incompatibilities:** None reported.

**I.M.**

● Visually inspect parenteral drug products for particulate matter and discoloration before administration, whenever solution and container permit.

**Subcutaneous**

● Visually inspect parenteral drug products for particulate matter and discoloration before administration, whenever solution and container permit.

## ACTION

Reactivates cholinesterase inactivated by organophosphorus pesticides and related compounds, permitting degradation of accumulated acetylcholine and facilitating normal functioning of neuromuscular junctions.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | 5–15 min | Unknown |
| I.M. | Unknown | 10–20 min | Unknown |
| Subcut. | Unknown | Unknown | Unknown |

*Half-life:* 1½ hours.

## ADVERSE REACTIONS

**CNS:** dizziness, headache, drowsiness.
**CV:** tachycardia.
**EENT:** blurred vision, diplopia, impaired accommodation.
**GI:** nausea.
**Musculoskeletal:** muscle weakness.
**Respiratory:** hyperventilation.
**Other:** mild to moderate pain at injection site.

## INTERACTIONS

**Drug-drug.** *Barbiturates:* May increase anticholinesterase level. Use together cautiously to treat seizures.

## EFFECTS ON LAB TEST RESULTS

● May increase liver enzyme levels.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug.
● Use cautiously in patients with myasthenia gravis (overdose may trigger myasthenic crisis) and in those with impaired renal function.
● Safety and effectiveness in children have not been established.

***Overdose S&S:*** Dizziness, blurred vision, diplopia, headache, impaired accommodation, nausea, tachycardia.

## NURSING CONSIDERATIONS

● Initially, remove secretions, maintain patent airway, and institute mechanical ventilation, if needed. After dermal exposure to organophosphate, remove patient's clothing and wash his skin and hair with sodium bicarbonate, soap, water, and alcohol as soon as possible. A second washing may be needed. When washing patient, wear protective gloves and clothes to avoid exposure.
● Draw blood for cholinesterase level before giving drug.
● Use drug only in hospitalized patients; have respiratory and other supportive measures available. If possible, obtain accurate medical history and chronology of poisoning. Give drug as soon as possible after poisoning; drug is most effective if started within 24 hours after exposure.
● To improve muscarinic effects and block accumulation of acetylcholine from organophosphate poisoning in adults, give atropine 2 to 4 mg I.V. with pralidoxime if cyanosis isn't present; if cyanosis is present, give atropine I.M. Give atropine every 5 to 10 minutes until signs of atropine toxicity (flushing, tachycardia, dry mouth, blurred vision, excitement, delirium, and hallucinations) appear; maintain atropinization for at least 48 hours.
● Observe patient for 48 to 72 hours if he ingested poison. Delayed absorption may occur from lower bowel. It's difficult to distinguish between toxic effects produced by atropine or organophosphate compounds and those resulting from pralidoxime.

• In a patient with myasthenia gravis being treated for overdose of cholinergics, watch for signs of rapid weakening. He can pass quickly from cholinergic crisis to myasthenic crisis and need more cholinergics to treat myasthenia. Keep edrophonium available for differentiating diagnoses.
• Avoid use of aminophylline, morphine, phenothiazine-like tranquilizers, reserpine, succinylcholine, and theophylline in patients with organophosphate poisoning.
• Drug isn't effective against poisoning caused by phosphorus, inorganic phosphates, or organophosphates with no anticholinesterase activity.
• ***Look alike–sound alike:*** Don't confuse pralidoxime with pramoxine or pyridoxine.

### PATIENT TEACHING

• Explain use and administration of drug to patient and family.
• Tell patient to report adverse effects.
• Caution patient treated for organophosphate poisoning to avoid contact with insecticides for several weeks.

## pramipexole dihydrochloride

pram-ah-PEX-ole

Mirapex, Mirapex ER

*Therapeutic class:* Antiparkinsonian
*Pharmacologic class:* Nonergot dopamine agonist
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 0.125 mg, 0.25 mg, 0.5 mg, 0.75 mg, 1 mg, 1.5 mg
*Tablets (extended-release):* 0.375 mg, 0.75 mg, 1.5 mg, 3 mg, 4.5 mg

### INDICATIONS & DOSAGES

➤ **Signs and symptoms of idiopathic Parkinson disease**

*Adults:* Initially, 0.375 mg P.O. daily in three divided doses. Adjust doses slowly (not more often than every 5 to 7 days) over several weeks until desired therapeutic effect is achieved. Maintenance dosage is 1.5 to 4.5 mg daily in three divided doses. Or, 0.375 mg (extended-release form) P.O. once daily. May titrate dosage gradually, first to 0.75 mg P.O. daily, then by 0.75-mg increments to maximum recommended dosage of 4.5 mg/day.

***Adjust-a-dose:*** For patients with creatinine clearance over 60 ml/minute, first dosage of immediate-release tablets is 0.125 mg P.O. t.i.d., up to 1.5 mg t.i.d. For those with clearance of 35 to 59 ml/minute, first dosage is 0.125 mg P.O. b.i.d., up to 1.5 mg b.i.d. For those with clearance of 15 to 34 ml/minute, first dosage is 0.125 mg P.O. daily, up to 1.5 mg daily. If using extended-release tablets, in patients with clearance of 30 to 50 ml/minute, initially give dose every other day. Use caution and assess response and tolerability before increasing to daily dosing after 1 week and before titration. Titrate dosage in 0.375-mg increments up to 2.25 mg/day; no more frequently than at weekly intervals. Don't use extended-release tablets in patients with clearance of less than 30 ml/minute or in hemodialysis patients.

➤ **Moderate to severe primary restless leg syndrome (immediate-release only)**

*Adults:* 0.125 mg P.O. daily, 2 to 3 hours before bedtime. May increase after 4 to 7 days to 0.25 mg P.O. daily, as needed. May increase again after 4 to 7 days to 0.5 mg P.O. daily, if needed.

***Adjust-a-dose:*** For patients with creatinine clearance 20 to 60 mg/minute, increase the duration between titration steps to 14 days.

### ADMINISTRATION

**P.O.**

• Give drug with or without food; giving with food may reduce nausea.

### ACTION

Thought to stimulate dopamine receptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 2 hr | 8–12 hr |

*Half-life:* 8 to 12 hours.

### ADVERSE REACTIONS

**CNS:** *asthenia, confusion, dizziness, dream abnormalities, dyskinesia, extrapyramidal syndrome, hallucinations, insomnia, somnolence,* amnesia, akathisia, drowsiness, delusions, dystonia, gait abnormalities,

hypoesthesia, hypertonia, myoclonus, paranoid reaction, malaise, sleep disorders, thought abnormalities, fever.
**CV:** *orthostatic hypotension,* chest pain, peripheral edema.
**EENT:** accommodation abnormalities, diplopia, rhinitis, vision abnormalities.
**GI:** *constipation, nausea,* dry mouth, anorexia, dysphagia.
**GU:** erectile dysfunction, urinary frequency, UTI, urinary incontinence.
**Metabolic:** weight loss.
**Musculoskeletal:** arthritis, bursitis, myasthenia, twitching.
**Respiratory:** dyspnea, pneumonia.
**Skin:** skin disorders.
**Other:** *accidental injury,* decreased libido, general edema.

## INTERACTIONS

**Drug-drug.** *Cimetidine, diltiazem, quinidine, quinine, ranitidine, triamterene, verapamil:* May decrease pramipexole clearance. Adjust dosage as needed.
*Dopamine antagonists:* May reduce pramipexole effectiveness. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in renally impaired patients.
- Use cautiously in breast-feeding women. It's unknown if drug appears in breast milk.

## NURSING CONSIDERATIONS

- If drug must be stopped, withdraw over 1 week.
- Drug may cause orthostatic hypotension, especially during dosage increases. Monitor patient carefully.
- Adjust dosage gradually to achieve maximal therapeutic effect, balanced against the main adverse effects of dyskinesia, hallucinations, somnolence, and dry mouth.

## PATIENT TEACHING

- Instruct patient not to rise rapidly after sitting or lying down because of risk of dizziness.
- Caution patient to avoid hazardous activities until CNS response to drug is known.
- Tell patient to use caution before taking drug with other CNS depressants.
- Tell patient (especially elderly patient) that hallucinations may occur.
- Advise patient to take drug with food if nausea develops.
- Tell woman to notify prescriber if she is or will be breast-feeding.
- Advise patient that it may take 4 weeks for effects of drug to be noticed because of slow adjustment schedule.

**SAFETY ALERT!**

# pramlintide acetate

PRAM-lin-tyde

Symlin

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Human amylin analogue
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 0.6 mg/ml in 5-ml vials, 1 mg/ml in 1.5-ml and 2.7-ml multidose pen injectors

## INDICATIONS & DOSAGES

➤ **Adjunct to insulin in patients with type 1 diabetes**

*Adults:* Initially, 15 mcg subcutaneously before meals of more than 250 calories or 30 g of carbohydrates. Reduce preprandial rapid-acting or short-acting insulin dose, including fixed-mix insulin such as 70/30, by 50%. Increase pramlintide dose by 15-mcg increments every 3 days if no nausea occurs, to a maintenance dose of 30 to 60 mcg. Adjust insulin dose as needed.
***Adjust-a-dose:*** If significant nausea at 45 or 60 mcg persists, decrease to 30 mcg. If nausea persists at 30 mcg, consider stopping.

➤ **Adjunct to insulin in patients with type 2 diabetes, with or without a sulfonylurea or metformin**
*Adults:* Initially, 60 mcg subcutaneously immediately before major meals. Reduce preprandial rapid-acting or short-acting insulin dose, including fixed-mix insulin, by 50%. Increase pramlintide dose to 120 mcg if no significant nausea occurs for 3 to 7 days. Adjust insulin dose as needed.
***Adjust-a-dose:*** If significant nausea persists at 120 mcg, decrease to 60 mcg.

## ADMINISTRATION

**Subcutaneous**
- Before starting drug, review patient's $HbA_{1c}$ level, recent blood glucose monitoring data, hypoglycemic episodes, current insulin regimen, and body weight.
- To give drug, use a U-100 insulin syringe, preferably a 0.3-ml size.
- Give each dose subcutaneously into abdomen or thigh. Rotate injection sites, and use site separate from insulin site used at same time.
- Don't mix drug with any type of insulin; give drug as separate injection.
- Drug concentration in pen injector is higher than in vials. Don't transfer drug to syringe for administration.
- Refrigerate pen injectors and unopened and opened vials. Contents of opened vials should be used within 28 days and those of unopened vials before expiration date.

## ACTION

Slows rate at which food leaves the stomach, reducing the initial postprandial increase in glucose level. Decreases hyperglycemia by reducing postprandial glucagon level and reduces total caloric intake by reducing appetite.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Unknown | 19–21 min | Unknown |

*Half-life:* About 48 minutes each (parent drug and active metabolite).

## ADVERSE REACTIONS

**CNS:** dizziness, fatigue, *headache.*
**EENT:** pharyngitis.
**GI:** abdominal pain, *anorexia, nausea, vomiting.*
**Metabolic:** ***hypoglycemia.***
**Musculoskeletal:** arthralgia.
**Respiratory:** cough.
**Skin:** injection site reaction.
**Other:** allergic reaction, *accidental injury.*

## INTERACTIONS

**Drug-drug.** *ACE inhibitors, disopyramide, fibrates, fluoxetine, MAO inhibitors, oral antidiabetics, pentoxifylline, propoxyphene, salicylates, sulfonamide antibiotics:* May increase risk of hypoglycemia. Monitor glucose level closely.
*Alpha glucosidase inhibitors (such as acarbose), anticholinergics (such as atropine, tricyclic antidepressants, benztropine):* May alter GI motility and slow intestinal absorption. Avoid using together.
*Beta blockers, clonidine, guanethidine, reserpine:* May mask signs of hypoglycemia. Monitor glucose level closely.
*Oral drugs dependent on rapid onset of action (such as analgesics):* May delay absorption because of slowed gastric emptying. If rapid effect is needed, give oral drug 1 hour before or 2 hours after pramlintide.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components, including metacresol, and in patients with gastroparesis or hypoglycemia unawareness.
- Don't use in patients noncompliant with current insulin and glucose monitoring regimen, patients with a glycosylated hemoglobin ($HbA_{1c}$) level greater than 9%, patients with severe hypoglycemia during the previous 6 months, and patients who take drugs that stimulate GI motility.
- Use cautiously in pregnant or breast-feeding women and in elderly patients.

***Overdose S&S:*** Severe nausea, vomiting, diarrhea, vasodilation, dizziness.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug may increase the risk of insulin-induced severe hypoglycemia, particularly in patients with type 1 diabetes. The risk of severe hypoglycemia

P

is highest within the first 3 hours after an injection.
- Symptoms of hypoglycemia may be masked in patients with a long history of diabetes, diabetic nerve disease, or intensified diabetes control.
- Notify prescriber of severe nausea and vomiting. A reduced dose may be needed.
- If patient has persistent nausea or recurrent, unexplained hypoglycemia that requires medical assistance, stop drug.
- If patient doesn't comply with glucose monitoring or drug dosage adjustments, stop drug.

### PATIENT TEACHING
- Teach patient how to take drug exactly as prescribed, at mealtimes. Explain that it doesn't replace daily insulin but may lower the amount of insulin needed.
- Explain that a meal is considered more than 250 calories or 30 g of carbohydrates.
- Caution patient not to mix drug with insulin; instruct him to give the injections at separate sites.
- Instruct patient not to change doses of pramlintide or insulin without consulting prescriber.
- Instruct patient not to transfer drug from pen injector to syringe. Drug in pen injector is a higher concentration than in vial.
- Tell patient to refrain from driving, operating heavy machinery, or performing other risky activities where he could hurt himself or others, until it's known how drug affects his glucose level.
- Caution patient about possibility of severe hypoglycemia, particularly within 3 hours after injection.
- Teach patient and family members the signs and symptoms of hypoglycemia, including hunger, headache, sweating, tremor, irritability, and difficulty concentrating.
- Instruct patient and family members what to do if patient develops hypoglycemia.
- Tell patient to report to prescriber severe nausea and vomiting.
- Advise women of childbearing age to tell the prescriber if they are, could be, or are planning to become pregnant.
- Teach patient how to handle unplanned situations, such as illness or stress, low or forgotten insulin dose, accidental use of too much insulin or drug, not enough food, or missed meals.
- Tell patient to refrigerate pen injectors and unopened and opened vials. Contents of opened vials should be used within 28 days and those of unopened vials before expiration date.

## prasugrel
PRAH-soo-grel

Effient®

*Therapeutic class:* Antiplatelet
*Pharmacologic class:* ADP-induced platelet aggregation inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS
*Tablets:* 5 mg, 10 mg

### INDICATIONS & DOSAGES
➤ **To reduce thrombotic events in patients with acute coronary syndrome (ACS) (unstable angina and non-ST-elevation MI) managed with percutaneous coronary intervention [PCI]); to reduce thrombotic events in patients with ACS (ST-elevation MI) managed with primary or delayed PCI**
*Adults:* Initially, single 60-mg loading dose; then 10 mg P.O. once daily. Patient should also take aspirin 75 to 325 mg P.O. daily.
***Adjust-a-dose:*** For adults weighing less than 60 kg (132 lb), consider reducing dosage to 5 mg P.O. once daily.

### ADMINISTRATION
**P.O.**
- May give drug with or without food.
- Don't break tablets.

### ACTION
Inhibits platelet activation and aggregation through irreversible binding of its active metabolite to the P2Y12 class of ADP receptors on platelets.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 30 min | 5–9 days |

*Half-life:* 7 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, fatigue, headache, fever.
**CV:** atrial fibrillation, bradycardia, hypertension or hypotension, peripheral edema.
**GI:** ***GI bleeding,*** nausea, diarrhea.
**EENT:** epistaxis.
**Hematologic:** ***bleeding,*** leukopenia, ***thrombotic thrombocytopenic purpura.***
**Metabolic:** hypercholesterolemia, hyperlipidemia.
**Musculoskeletal:** back pain, extremity pain.
**Respiratory:** cough, dyspnea.
**Skin:** rash.
**Other:** noncardiac chest pain.

## INTERACTIONS

**Drug-drug.** *NSAIDs (long-term use), warfarin:* May increase the risk of bleeding. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

- May increase cholesterol and lipid levels.
- May decrease WBC and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Contraindicated in patients with pathologic bleeding (such as peptic ulcer or intracranial hemorrhage) and in those with a history of transient ischemic attack or stroke. ■

**Black Box Warning** In patients age 75 and older, prasugrel is generally not recommended because of the increased risk of intracranial and fatal bleeding and uncertain benefit, except in high-risk situations (patients with diabetes or a history of prior MI). In these situations, drug's effect appears to be greater and its use may be considered. ■

**Black Box Warning** Use cautiously in patients who weigh less than 60 kg because of the increased risk of bleeding. ■

- Use cautiously in patients at risk for increased bleeding from trauma, surgery, or other pathologic conditions and in those with severe hepatic impairment.

***Overdose S&S:*** Bleeding due to impaired clotting ability.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug may cause significant, sometimes fatal bleeding. Suspect bleeding in patient who is hypotensive and has recently undergone PCI, coronary artery bypass graft (CABG), or other surgical procedure. Manage bleeding without stopping drug, if possible. Stopping drug within first few weeks after ACS occurrence increases the risk of further cardiovascular events. ■

- Monitor patient for unusual bleeding or bruising.
- Drug should be taken with aspirin (75 to 325 mg) daily.

**Black Box Warning** Discontinue drug 7 days before CABG. Don't start drug if patient is likely to undergo urgent CABG. ■

- Bleeding associated with CABG may be treated with transfusion of blood products, such as RBCs and platelets; however, platelets may be ineffective if given within 6 hours of loading dose or within 4 hours of maintenance dose.

***Alert:*** Drug may cause fatal thrombotic thrombocytopenic purpura (thrombocytopenia, hemolytic anemia, neurologic signs and symptoms, renal dysfunction, and fever) that requires urgent treatment, including plasmapheresis.

## PATIENT TEACHING

- Advise patient that drug can be taken without regard to food.
- Inform patient that he will bruise more easily and that it may take longer than usual to stop bleeding.
- Instruct patient to report prolonged or excessive bleeding or blood in his stool or urine.
- Advise patient to inform health care providers that he's taking prasugrel before scheduling surgery or taking new drugs.

P

# pravastatin sodium (eptastatin)

prah-va-STA-tin

Pravachol✐

*Therapeutic class:* Antilipemic
*Pharmacologic class:* HMG-CoA reductase inhibitor
*Pregnancy risk category X*

## AVAILABLE FORMS

*Tablets:* 10 mg, 20 mg, 40 mg, 80 mg

## INDICATIONS & DOSAGES

➤ **Primary and secondary prevention of coronary events; hyperlipidemia**

*Adults:* Initially, 40 mg P.O. once daily at the same time each day, with or without food. Adjust dosage every 4 weeks, based on patient tolerance and response; maximum daily dose is 80 mg.

➤ **Heterozygous familial hypercholesterolemia**

*Adolescents ages 14 to 18:* Give 40 mg P.O. once daily.

*Children ages 8 to 13:* Give 20 mg P.O. once daily.

***Adjust-a-dose:*** In patients with renal or hepatic dysfunction, start with 10 mg P.O. daily. In patients taking immunosuppressants, begin with 10 mg P.O. at bedtime and adjust to higher dosages with caution. Most patients treated with the combination of immunosuppressants and pravastatin receive up to 20 mg pravastatin daily.

## ADMINISTRATION

**P.O.**

- Give drug without regard for meals.

## ACTION

Inhibits HMG-CoA reductase, an early (and rate-limiting) step in cholesterol biosynthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 60–90 min | Unknown |

*Half-life:* 1¼ to 2¼ hours.

## ADVERSE REACTIONS

**CNS:** dizziness, fatigue, headache.
**CV:** chest pain.
**EENT:** rhinitis.
**GI:** *nausea*, abdominal pain, constipation, diarrhea, flatulence, heartburn, vomiting.
**GU:** ***renal failure caused by myoglobinuria,*** urinary abnormality.
**Musculoskeletal:** *localized muscle pain,* ***rhabdomyolysis,*** myalgia, myopathy, myositis.
**Respiratory:** common cold, cough.
**Skin:** rash.
**Other:** flulike symptoms, influenza.

## INTERACTIONS

**Drug-drug.** *Azole antifungals (such as fluconazole, ketoconazole), fibric acid derivatives (such as gemfibrozil), niacin:* May increase risk of severe myopathy or rhabdomyolysis. Avoid using together.
*Cholestyramine, colestipol:* May decrease pravastatin level. Give pravastatin 1 hour before or 4 hours after these drugs.
*Hepatotoxic drugs:* May increase risk of hepatotoxicity. Avoid using together.
**Drug-herb.** *Eucalyptus, jin bu huan, kava:* May increase the risk of hepatotoxicity. Discourage use together.
*Red yeast rice:* May increase risk of adverse reactions because herb contains compounds similar to those in drug. Discourage use together.
**Drug-food.** *Oat bran:* May decrease effectiveness of pravastatin. Separate administration times as much as possible.
**Drug-lifestyle.** *Alcohol use:* May increase risk of hepatotoxicity. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, CK, alkaline phosphatase, and bilirubin levels.
- May alter thyroid function test values.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with active liver disease or conditions that cause unexplained, persistent elevations of transaminase levels.
- Contraindicated in pregnant and breast-feeding women and in women of childbearing age.
- Use cautiously in patients who consume large quantities of alcohol or have history of liver disease.
- Safety and efficacy in children younger than age 8 haven't been established.

## NURSING CONSIDERATIONS

- Patient should follow a diet restricted in saturated fat and cholesterol during therapy.
- Use in children with heterozygous familial hypercholesterolemia if LDL cholesterol level is at least 190 mg/dl, or if LDL cholesterol is at least 160 mg/dl and patient has either a positive family history of premature CV disease or two or more other CV disease risk factors.
- Obtain liver function test results at start of therapy and then periodically. A liver biopsy

may be performed if elevated liver enzyme levels persist.
● ***Look alike–sound alike:*** Don't confuse Pravachol with Prevacid or propranolol.

### PATIENT TEACHING
● Advise patient who is also taking a bile-acid resin such as cholestyramine to take pravastatin at least 1 hour before or 4 hours after taking resin.
● Tell patient to notify prescriber of adverse reactions, particularly muscle aches and pains.
● Teach patient about proper dietary management of cholesterol and triglycerides. When appropriate, recommend weight control, exercise, and smoking cessation programs.
● Inform patient that it will take up to 4 weeks to achieve full therapeutic effect.
***Alert:*** Tell woman of childbearing age to stop drug and notify prescriber immediately if she is or may be pregnant or if she's breast-feeding.

## prazosin hydrochloride
PRA-zo-sin

Minipress

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Alpha blocker
*Pregnancy risk category C*

### AVAILABLE FORMS
*Capsules:* 1 mg, 2 mg, 5 mg

### INDICATIONS & DOSAGES
➤ **Mild to moderate hypertension**
*Adults:* Test dose is 1 mg P.O. at bedtime to prevent first-dose syncope (severe syncope with loss of consciousness). First dosage is 1 mg P.O. b.i.d. or t.i.d. Dosage may be increased slowly. Maximum daily dose is 20 mg. Maintenance dosage is 6 to 15 mg daily in divided doses. Some patients need larger dosages (up to 40 mg daily).

If other antihypertensives or diuretics are added to therapy, decrease prazosin dosage to 1 to 2 mg t.i.d. and readjust to maintenance dosage.

➤ **Pediatric hypertension ♦**
*Children ages 1 to 17:* Initially, 0.05 to 0.1 mg/kg P.O. t.i.d. Maximum dosage is 0.5 mg/kg P.O. t.i.d.

### ADMINISTRATION
**P.O.**
● Give drug without regard for meals.

### ACTION
Unknown. Thought to act by blocking alpha-adrenergic receptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30–90 min | 2–4 hr | 7–10 hr |

*Half-life:* 2 to 4 hours.

### ADVERSE REACTIONS
**CNS:** *dizziness, first-dose syncope,* headache, drowsiness, nervousness, paresthesia, weakness, depression, vertigo.
**CV:** orthostatic hypotension, palpitations, edema.
**EENT:** blurred vision, conjunctivitis, epistaxis, nasal congestion.
**GI:** vomiting, diarrhea, abdominal cramps, nausea.
**GU:** urinary frequency.
**Musculoskeletal:** arthralgia, myalgia.
**Respiratory:** dyspnea.
**Skin:** rash.

### INTERACTIONS
**Drug-drug.** *Acebutolol, atenolol, betaxolol, carteolol, esmolol, metoprolol, nadolol, pindolol, propranolol, sotalol, timolol:* May increase the risk of orthostatic hypotension in the early phases of use together. Help patient stand slowly until effects are known.
*Diuretics:* May increase frequency of syncope with loss of consciousness. Advise patient to sit or lie down if dizziness occurs.
*Verapamil:* May increase prazosin level. Monitor patient closely.
**Drug-herb.** *Butcher's broom:* May reduce effect. Discourage use together.
*Ma huang:* May decrease antihypertensive effects. Discourage use together.

### EFFECTS ON LAB TEST RESULTS
● May increase levels of BUN, uric acid, and urinary metabolite of norepinephrine and vanillylmandelic acid.

P

• May increase liver function test values. May alter results of screening tests for pheochromocytoma.
• May cause positive antinuclear antibody titer.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or other alpha blockers.
• Use cautiously in patients receiving other antihypertensives.
***Overdose S&S:*** Profound drowsiness, depressed reflexes, hypotension.

## NURSING CONSIDERATIONS

• Monitor patient's blood pressure and pulse rate frequently.
• Elderly patients may be more sensitive to drug's hypotensive effects.
• Compliance might be improved with twice-daily dosing. Discuss dosing change with prescriber if compliance problems are suspected.
***Alert:*** If first dose is more than 1 mg, first-dose syncope may occur.

## PATIENT TEACHING

• Warn patient that dizziness may occur with first dose. If he experiences dizziness, tell him to sit or lie down. Reassure him that this effect disappears with continued dosing.
• Caution patient to avoid driving or performing hazardous tasks for the first 24 hours after starting this drug or increasing the dose.
• Tell patient not to suddenly stop taking drug, but to notify prescriber if unpleasant adverse reactions occur.
• Advise patient to minimize low blood pressure and dizziness upon standing by rising slowly and avoiding sudden position changes. Dry mouth can be relieved by chewing gum or sucking on hard candy or ice chips.

# prednisoLONE

pred-NISS-oh-lone

Prelone

# prednisoLONE acetate

Flo-Pred

# prednisoLONE sodium phosphate

Orapred, Orapred ODT, Pediapred

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Glucocorticoid, mineralocorticoid
*Pregnancy risk category C*

## AVAILABLE FORMS

**prednisolone**
*Syrup:* 5 mg/5 ml, 15 mg/5 ml*
*Tablets:* 5 mg
**prednisolone acetate**
*Oral suspension:* 5 mg/5 ml, 15 mg/5 ml
**prednisolone sodium phosphate**
*Oral solution:* 5 mg/5 ml, 10 mg/5 ml, 15 mg/5 ml
*Orally disintegrating tablets (ODTs):* 10 mg, 15 mg, 30 mg

## INDICATIONS & DOSAGES

➤ **Severe inflammation, immunosuppression**
***prednisolone***
*Adults:* 5 to 60 mg P.O. daily.
*Children:* 0.14 to 2 mg/kg/day P.O. in 3 or 4 divided doses (4 to 60 mg/$m^2$/day).
***prednisolone acetate, prednisolone sodium phosphate***
*Adults:* 5 to 60 mg P.O. daily in divided doses b.i.d., t.i.d., or q.i.d.
*Children:* Initially, 0.14 to 2 mg/kg daily, or 4 to 60 mg/$m^2$ or P.O. daily, divided t.i.d. or q.i.d.
➤ **Uncontrolled asthma in those taking inhaled corticosteroids and long-acting bronchodilators**
*Children:* 1 to 2 mg/kg/day prednisolone sodium phosphate or prednisolone acetate P.O. in single or divided doses. Continue short course (or "burst" therapy) until child achieves a peak expiratory flow rate of 80% of his personal best, or until symptoms

resolve. This usually requires 3 to 10 days of treatment but can take longer. Tapering the dose after improvement doesn't necessarily prevent relapse.

➤ **Acute exacerbations of multiple sclerosis**

*Adults and children:* 200 mg/day prednisolone sodium phosphate or prednisolone acetate P.O. as single or divided dose for 7 days; then 80 mg every other day for 1 month.

➤ **Nephrotic syndrome**

*Children:* 60 mg/m$^2$ daily prednisolone sodium phosphate or prednisolone acetate P.O., divided t.i.d. for 4 weeks, followed by 4 weeks of single-dose alternate-day therapy at 40 mg/m$^2$/day.

## ADMINISTRATION

**P.O.**

- Give drug with food to reduce GI irritation. Patient may need another drug to prevent GI irritation.
- Don't cut or crush ODTs.

## ACTION

Not clearly defined. Decreases inflammation, mainly by stabilizing leukocyte lysosomal membranes; suppresses immune response; stimulates bone marrow; and influences protein, fat, and carbohydrate metabolism.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 1–2 hr | 3–36 hr |

*Half-life:* 2 to 4 hours.

## ADVERSE REACTIONS

**CNS:** *euphoria, insomnia,* ***pseudotumor cerebri, seizures,*** psychotic behavior, vertigo, headache, paresthesia.

**CV:** ***arrhythmias, heart failure, thromboembolism,*** hypertension, edema, thrombophlebitis.

**EENT:** cataracts, glaucoma.

**GI:** *peptic ulceration,* ***pancreatitis,*** GI irritation, increased appetite, nausea, vomiting.

**GU:** menstrual irregularities, increased urine calcium levels.

**Metabolic:** hypokalemia, hyperglycemia, carbohydrate intolerance, hypercholesterolemia, hypocalcemia.

**Musculoskeletal:** growth suppression in children, muscle weakness, osteoporosis.

**Skin:** hirsutism, delayed wound healing, acne, various skin eruptions.

**Other:** ***acute adrenal insufficiency,*** susceptibility to infections, cushingoid state, after increased stress or abrupt withdrawal after long-term therapy.

**After abrupt withdrawal:** rebound inflammation, fatigue, weakness, arthralgia, fever, dizziness, lethargy, depression, fainting, orthostatic hypotension, dyspnea, anorexia, ***hypoglycemia. After prolonged use, sudden withdrawal may be fatal.***

## INTERACTIONS

**Drug-drug.** *Aspirin, indomethacin, other NSAIDs:* May increase risk of GI distress and bleeding. Use together cautiously.

*Barbiturates, carbamazepine, fosphenytoin, phenytoin, rifampin:* May decrease corticosteroid effect. Increase corticosteroid dosage.

*Cyclosporine:* May increase toxicity and risk of seizures. Monitor patient closely.

*Drugs that deplete potassium, such as thiazide diuretics and amphotericin B:* May enhance potassium-wasting effects of prednisolone. Monitor potassium level.

*Oral anticoagulants:* May alter dosage requirements. Monitor PT and INR closely.

*Salicylates:* May decrease salicylate level. Monitor patient for lack of salicylate effectiveness.

*Skin-test antigens:* May decrease response. Postpone skin testing until therapy is completed.

*Toxoids, vaccines:* May decrease antibody response and may increase risk of neurologic complications. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

- May increase glucose and cholesterol levels. May decrease $T_3$, $T_4$, potassium, and calcium levels.
- May decrease $^{131}I$ uptake and protein-bound iodine levels in thyroid function tests. May alter skin-test results. May cause false-negative results in nitroblue tetrazolium test for systemic bacterial infections.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its ingredients, in those with systemic fungal infections, and in those receiving immunosuppressive doses together with live-virus vaccines.
- Use with caution in patients with recent MI.
- Use cautiously in patients with GI ulcer, renal disease, hypertension, osteoporosis, diabetes mellitus, hypothyroidism, cirrhosis, active hepatitis, diverticulitis, nonspecific ulcerative colitis, recent intestinal anastomoses, thromboembolic disorders, seizures, myasthenia gravis, heart failure, tuberculosis, ocular herpes simplex, emotional instability, and psychotic tendencies or in breast-feeding women.

***Overdose S&S:*** Abnormal fat deposits, accentuated menopausal symptoms, acne, adrenal insufficiency, decreased glucose tolerance, decreased resistance to infection, dry scaly skin, ecchymosis, excessive appetite, fluid retention, fractures, headache, hypertrichosis, hypokalemia, increased blood pressure, increased sweating, menstrual disorder, mental symptoms, moon face, negative nitrogen balance with delayed bone and wound healing, neuropathy, osteoporosis, peptic ulcer, pigmentation, striae, tachycardia, thinning scalp hair, thrombophlebitis, weakness, weight gain; hepatomegaly, abdominal distention (in children).

## NURSING CONSIDERATIONS

- Determine whether patient is sensitive to other corticosteroids.
- Always adjust to lowest effective dose.
- Drug may be used for alternate-day therapy.
- Most adverse reactions to corticosteroids are dose- or duration-dependent.
- Monitor patient's weight, blood pressure, and electrolyte level.
- Monitor patient for cushingoid effects, including moon face, buffalo hump, central obesity, thinning hair, hypertension, and increased susceptibility to infection.
- Watch for depression or psychotic episodes, especially during high-dose therapy.
- Diabetic patient may need increased insulin; monitor glucose level.
- Give patient low-sodium diet that's high in potassium and protein. Give potassium supplements as needed.
- Drug may mask or worsen infections, including latent amebiasis.
- Elderly patients may be more susceptible to osteoporosis with long-term use.
- Gradually reduce dosage after long-term therapy.
- ***Look alike–sound alike:*** Don't confuse prednisolone with prednisone.

## PATIENT TEACHING

- Tell patient not to stop drug abruptly or without prescriber's consent.
- Instruct patient to take oral form of drug with food or milk.
- Teach patient signs and symptoms of early adrenal insufficiency: fatigue, muscle weakness, joint pain, fever, anorexia, nausea, shortness of breath, dizziness, and fainting.
- Instruct patient to carry medical identification that includes prescriber's name and name and dosage of drug and indicates his need for supplemental systemic glucocorticoids during stress.
- Warn patient on long-term therapy about cushingoid effects and the need to notify prescriber about sudden weight gain or swelling.
- Tell patient to report slow healing.
- Advise patient receiving long-term therapy to consider exercise or physical therapy. Also, tell him to ask prescriber about vitamin D or calcium supplement.
- Instruct patient to avoid exposure to infections and to notify prescriber if exposure occurs.
- Tell patient to avoid immunizations while taking drug.

***Alert:*** Tell patient not to cut, crush, or chew ODTs.

- Instruct patient not to remove the ODT from the blister pack until he's ready to take it. The tablet can be swallowed whole or allowed to dissolve on the tongue with or without water.
- Tell patient to store Orapred in the refrigerator at 36° to 46° F (2° to 8° C).

## prednisoLONE acetate (suspension)

pred-NISS-oh-lone

Omnipred, Pred Forte, Pred Mild

## prednisoLONE sodium phosphate (solution)

*Therapeutic class:* Anti-inflammatory (ophthalmic)
*Pharmacologic class:* Corticosteroid
*Pregnancy risk category C*

### AVAILABLE FORMS

**prednisolone acetate**
*Ophthalmic suspension:* 0.12%; 1%
**prednisolone sodium phosphate**
*Ophthalmic solution:* 0.9%, 0.11%

### INDICATIONS & DOSAGES

➤ **Inflammation of palpebral and bulbar conjunctiva, cornea, and anterior segment of globe**
*Adults:* 1 or 2 drops into eye. In severe conditions, may be used hourly, tapering as inflammation subsides. In mild or moderate inflammation or when a favorable response is attained in severe conditions, dosage may be reduced to 1 or 2 drops every 3 to 12 hours.

### ADMINISTRATION

**Ophthalmic**
- Shake suspension and check dosage before giving to ensure correct strength. Store in tightly covered container.
- Apply light finger pressure on lacrimal sac for 1 minute after instillation.

### ACTION

Suppresses edema, fibrin deposition, capillary dilation, leukocyte migration, capillary proliferation, and collagen deposition.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**EENT:** cataracts, corneal ulceration, discharge, discomfort, foreign body sensation, glaucoma worsening, increased intraocular pressure (IOP), increased susceptibility to viral or fungal corneal infection, interference with corneal wound healing, optic nerve damage with excessive or long-term use, visual acuity and visual field defects.
**Other:** adrenal suppression with excessive or long-term use, systemic effects.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with acute, untreated, purulent ocular infections; acute superficial herpes simplex (dendritic keratitis); vaccinia, varicella, or other viral or fungal eye diseases; or ocular tuberculosis.
- Use cautiously in patients with corneal abrasions that may be contaminated (especially with herpes).

### NURSING CONSIDERATIONS

- ***Look alike–sound alike:*** Don't confuse prednisolone with prednisone.

### PATIENT TEACHING

- Teach patient how to instill drops. Advise him to wash hands before and after instillation, and warn him not to touch tip of dropper to eye or surrounding area.
- Advise patient to apply light finger pressure on lacrimal sac for 1 minute after instillation.
- Tell patient on long-term therapy to have IOP tested frequently.
- Tell patient not to share drug, washcloths, or towels with family members and to notify prescriber if anyone develops same signs or symptoms.
- Stress importance of compliance with recommended therapy.
- Tell patient to notify prescriber if improvement doesn't occur within several days or if pain, itching, or swelling of eye occurs.
- Warn patient not to use leftover drug for new eye inflammation because serious problems may occur.

P

## predniSONE

PRED-ni-sone

Prednisone Intensol*, Winpred†

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Adrenocorticoid
*Pregnancy risk category C*

### AVAILABLE FORMS

*Oral solution:* 5 mg/5 ml*, 5 mg/ml (concentrate)*
*Tablet:* 1 mg, 2.5 mg, 5 mg, 10 mg, 20 mg, 50 mg

### INDICATIONS & DOSAGES

➤ **Severe inflammation, immunosuppression**
*Adults and children:* 5 to 60 mg P.O. daily in single dose or as two to four divided doses. Maintenance dose given once daily or every other day. Dosage must be individualized.

➤ **Contact dermatitis; poison ivy**
*Adults:* Initially, 30 mg (six 5-mg tablets); taper by 5 mg daily until 21 tablets have been given.

➤ **Acute exacerbations of multiple sclerosis**
*Adults and children:* 200 mg P.O. daily for 7 days; then 80 mg P.O. every other day for 1 month.

➤ **Advanced pulmonary tuberculosis**
*Adults:* 40 to 60 mg P.O. daily; taper over 4 to 8 weeks.

➤ **Tuberculosis meningitis**
*Adults:* 1 mg/kg P.O. daily for 30 days; taper over several weeks.

➤ **Adjunctive treatment in *Pneumocystis carinii* pneumonia in patients with AIDS ♦**
*Adults and children age 13 and older:* 40 mg P.O. b.i.d. for 5 days; then 40 mg P.O. daily for 5 days; then 20 mg P.O. daily for 11 days or until completion of anti-infective therapy.

### ADMINISTRATION

**P.O.**
• Unless contraindicated, give drug with food to reduce GI irritation. Patient may need another drug to prevent GI irritation.
• Solution may be diluted in juice or other flavored diluent or semisolid food such as applesauce before using.

### ACTION

Not clearly defined. Decreases inflammation, mainly by stabilizing leukocyte lysosomal membranes; suppresses immune response; stimulates bone marrow; and influences protein, fat, and carbohydrate metabolism.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Variable | Variable | Variable |

*Half-life:* 18 to 36 hours.

### ADVERSE REACTIONS

**CNS:** *euphoria, insomnia,* psychotic behavior, ***pseudotumor cerebri,*** vertigo, headache, paresthesia, ***seizures.***
**CV:** ***heart failure,*** hypertension, edema, ***arrhythmias,*** thrombophlebitis, ***thromboembolism.***
**EENT:** cataracts, glaucoma.
**GI:** *peptic ulceration,* ***pancreatitis,*** GI irritation, increased appetite, nausea, vomiting.
**GU:** menstrual irregularities, increased urine calcium level.
**Metabolic:** hypokalemia, hyperglycemia, carbohydrate intolerance, hypercholesterolemia, hypocalcemia.
**Musculoskeletal:** growth suppression in children, muscle weakness, osteoporosis.
**Skin:** hirsutism, delayed wound healing, acne, various skin eruptions.
**Other:** cushingoid state, susceptibility to infections, ***acute adrenal insufficiency,*** after increased stress or abrupt withdrawal after long-term therapy.
**After abrupt withdrawal:** rebound inflammation, fatigue, weakness, arthralgia, fever, dizziness, lethargy, depression, fainting, orthostatic hypotension, dyspnea, anorexia, ***hypoglycemia. After prolonged use, sudden withdrawal may be fatal.***

### INTERACTIONS

**Drug-drug.** *Aspirin, indomethacin, other NSAIDs:* May increase risk of GI distress and bleeding. Use together cautiously.
*Barbiturates, carbamazepine, fosphenytoin, phenobarbital, phenytoin, rifampin:* May

decrease corticosteroid effect. Increase corticosteroid dosage.
*Cyclosporine:* May increase toxicity and cause seizures. Monitor patient closely.
*Oral anticoagulants:* May alter dosage requirements. Monitor PT and INR closely.
*Potassium-depleting drugs, such as thiazide diuretics and amphotericin B:* May enhance potassium-wasting effects of prednisone. Monitor potassium level.
*Salicylates:* May decrease salicylate level. Monitor patient for lack of salicylate effectiveness.
*Skin-test antigens:* May decrease response. Postpone skin testing until therapy is completed.
*Toxoids, vaccines:* May decrease antibody response and may increase risk of neurologic complications. Avoid using together.
*Troleandomcyin, ketoconazole:* May inhibit the metabolism of corticosteroids and decrease their clearance. Titrate the dose of corticosteroid to avoid toxicity.

## EFFECTS ON LAB TEST RESULTS

- May increase glucose and cholesterol levels. May decrease $T_3$, $T_4$, potassium, and calcium levels.
- May decrease $^{131}I$ uptake and protein-bound iodine values in thyroid function tests. May cause false-negative results in nitroblue tetrazolium test for systemic bacterial infections. May alter reactions to skin tests.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its ingredients, in those with systemic fungal infections, and in those receiving immunosuppressive doses together with live-virus vaccines.
- Use cautiously in patients with recent MI, GI ulcer, renal disease, hypertension, osteoporosis, diabetes mellitus, hypothyroidism, cirrhosis, active hepatitis, diverticulitis, nonspecific ulcerative colitis, recent intestinal anastomoses, thromboembolic disorders, seizures, myasthenia gravis, heart failure, tuberculosis, ocular herpes simplex, emotional instability, and psychotic tendencies or in breast-feeding women.

## NURSING CONSIDERATIONS

- Determine whether patient is sensitive to other corticosteroids.
- Drug may be used for alternate-day therapy.
- Always adjust to lowest effective dose.
- Most adverse reactions to corticosteroids are dose- or duration-dependent.
- For better results and less toxicity, give a once-daily dose in the morning.
- Drug may be used in conjunction with mineralocorticoids when needed.
- Monitor patient's blood pressure, sleep patterns, and potassium level.
- Weigh patient daily; report sudden weight gain to prescriber.
- Monitor patient for cushingoid effects, including moon face, buffalo hump, central obesity, thinning hair, hypertension, and increased susceptibility to infection.
- Watch for depression or psychotic episodes, especially during high-dose therapy.
- Diabetic patient may need increased insulin; monitor glucose level.
- Elderly patients may be more susceptible to osteoporosis with long-term use.
- Drug may mask or worsen infections, including latent amebiasis.
- Unless contraindicated, give low-sodium diet that's high in potassium and protein. Give potassium supplements as needed.
- Gradually reduce dosage after long-term therapy.
- ***Look alike–sound alike:*** Don't confuse prednisone with prednisolone or primidone.

## PATIENT TEACHING

- Tell patient not to stop drug abruptly or without prescriber's consent.
- Instruct patient to take drug with food or milk.
- Teach patient signs and symptoms of early adrenal insufficiency: fatigue, muscle weakness, joint pain, fever, anorexia, nausea, shortness of breath, dizziness, and fainting.
- Instruct patient to carry or wear medical identification indicating his need for supplemental systemic glucocorticoids during stress. It should include prescriber's name and name and dosage of drug.
- Warn patient on long-term therapy about cushingoid effects (moon face, buffalo

P

hump) and the need to notify prescriber about sudden weight gain or swelling.
• Advise patient receiving long-term therapy to consider exercise or physical therapy. Also, tell patient to ask prescriber about vitamin D or calcium supplement.
• Tell patient to report slow healing.
• Advise patient receiving long-term therapy to have periodic eye examinations.
• Instruct patient to avoid exposure to infections and to contact prescriber if exposure occurs.

## pregabalin

pray-GAB-ah-lin

Lyrica℞

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* CNS drug
*Pregnancy risk category C*
*Controlled substance schedule V*

### AVAILABLE FORMS

*Capsules:* 25 mg, 50 mg, 75 mg, 100 mg, 150 mg, 200 mg, 225 mg, 300 mg
*Oral solution:* 20 mg/ml

### INDICATIONS & DOSAGES

➤ **Fibromyalgia**

*Adults:* 75 mg P.O. b.i.d. (150 mg/day). May increase to 150 mg b.i.d. (300 mg/day) within 1 week, based on patient response. If pain relief insufficient with 300 mg/day increase to 225 mg b.i.d. (450 mg/day).

➤ **Diabetic peripheral neuropathy**

*Adults:* Initially, 50 mg P.O. t.i.d. May increase to 100 mg P.O. t.i.d. within 1 week.

➤ **Postherpetic neuralgia**

*Adults:* Initially, 75 mg P.O. b.i.d. or 50 mg P.O. t.i.d. May increase to 300 mg/day in two or three equally divided doses within 1 week. If pain relief insufficient after 2 to 4 weeks, may increase to 300 mg b.i.d. or 200 mg t.i.d.

➤ **Partial onset seizures**

*Adults:* Initially, 75 mg P.O. b.i.d. or 50 mg P.O. t.i.d. Range, 150 to 600 mg/day. Dosage may be increased to maximum 600 mg/day.

***Adjust-a-dose:*** If creatinine clearance is 30 to 60 ml/minute, give 75 to 300 mg/day in two or three divided doses. If clearance is 15 to 30 ml/minute, give 25 to 150 mg/day in one dose or divided into two doses. If clearance is less than 15 ml/minute, give 25 to 75 mg/day in one dose. If patient undergoes hemodialysis, give one supplemental dose according to these guidelines. If patient takes 25 mg daily, give 25 or 50 mg. If patient takes 25 to 50 mg daily, give 50 or 75 mg. If patient takes 75 mg daily, give 100 or 150 mg.

### ADMINISTRATION

**P.O.**

• Give drug without regard for food.
• Don't stop drug abruptly. Instead, taper gradually over at least 1 week.

### ACTION

May contribute to analgesic and anticonvulsant effects by binding to sites in CNS.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1½–3 hr | Unknown |

*Half-life:* 6½ hours.

### ADVERSE REACTIONS

**CNS:** *ataxia, dizziness, somnolence, tremor,* abnormal gait, abnormal thinking, amnesia, anxiety, asthenia, confusion, depersonalization, euphoria, headache, hypesthesia, hypertonia, incoordination, myoclonus, nervousness, nystagmus, pain, paresthesia, stupor, twitching, vertigo.
**CV:** *edema,* ***PR interval prolongation.***
**EENT:** blurred or abnormal vision, conjunctivitis, diplopia, eye disorder, otitis media, tinnitus.
**GI:** *dry mouth,* abdominal pain, constipation, flatulence, gastroenteritis, vomiting.
**GU:** anorgasmia, impotence, urinary incontinence, urinary frequency.
**Metabolic:** **HYPOGLYCEMIA,** *weight gain,* increased or decreased appetite.
**Musculoskeletal:** arthralgia, back and chest pain, leg cramps, myalgia, myasthenia, neuropathy.
**Respiratory:** bronchitis, dyspnea.
**Skin:** ecchymosis, pruritus.
**Other:** *accidental injury, infection,* allergic reaction, decreased libido, flu syndrome.

### INTERACTIONS

**Drug-drug.** *CNS depressants:* May have additive effects on cognitive and gross motor function. Monitor patient for increased dizziness and somnolence. *Pioglitazone, rosiglitazone:* May cause additive fluid retention and weight gain. Monitor patient closely.
**Drug-lifestyle.** *Alcohol use:* May have additive depressant effects on cognitive and gross motor function. Discourage alcohol use.

### EFFECTS ON LAB TEST RESULTS

- May increase CK level.
- May decrease platelet count.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in patients with New York Heart Association class III or class IV heart failure.

***Overdose S&S:*** Exaggerated adverse effects.

### NURSING CONSIDERATIONS

***Alert:*** Monitor patient for signs and symptoms of angioedema (including swelling of face, mouth, and neck), which may compromise breathing. Discontinue drug immediately if angioedema occurs.
- Monitor patient's weight and fluid status, especially if he has heart failure.
- Check for changes in vision.

***Alert:*** Watch for signs of rhabdomyolysis, such as dark, red, or cola-colored urine; muscle tenderness; generalized weakness; or muscle stiffness or aching.

### PATIENT TEACHING

- Explain that drug may be taken without regard to food.
- Warn patient not to stop drug abruptly.
- Caution patient to avoid hazardous activities until drug's effects are known.
- Instruct patient to watch for weight changes and water retention.
- Advise patient to report vision changes and malaise or fever accompanied by muscle pain, tenderness, or weakness.
- Tell women to immediately report planned or suspected pregnancy.
- Tell a man who plans to father a child that he should consult prescriber about possible risks to fetus.
- If patient has diabetes, urge him to inspect his skin closely for ulcer formation.

## primaquine phosphate

PRIM-uh-kween

*Therapeutic class:* Antimalarial
*Pharmacologic class:* Aminoquinoline
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 26.3 mg (equivalent to 15-mg base)

### INDICATIONS & DOSAGES

**Black Box Warning** Prescribers should be completely familiar with this drug before prescribing.

➤ **Relapsing *Plasmodium vivax* malaria, eliminating symptoms and infection completely; to prevent relapse**

*Adults:* 15 mg base P.O. daily for 14 days. Begin therapy during the last 2 weeks of, or after, a course of suppression with chloroquine or comparable drug.

### ADMINISTRATION

**P.O.**

***Alert:*** Drug dosage may be discussed in "mg" or "mg base"; be aware of the difference.
- Give drug with meals.

### ACTION

May bind to and alter the properties of DNA in susceptible parasites.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–3 hr | Unknown |

*Half-life:* 4 to 10 hours.

### ADVERSE REACTIONS

**GI:** nausea, vomiting, epigastric distress, abdominal cramps.
**Hematologic:** ***hemolytic anemia, leukopenia, methemoglobinemia.***

## INTERACTIONS

**Drug-drug.** *Aluminum salts, magnesium:* Decreases GI absorption. Separate dose times.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level.
- May decrease RBC count. May increase or decrease WBC count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with systemic diseases in which agranulocytosis may develop, such as lupus erythematosus or rheumatoid arthritis, and in those taking a bone marrow suppressant, quinacrine, or hemolytic drugs.
- Use cautiously in patients with previous idiosyncratic reaction involving hemolytic anemia, methemoglobinemia, or leukopenia; in those with a family or personal history of favism; and in those with erythrocytic G6PD or nicotinamide-adenine-dinucleotide (NADH) methemoglobin reductase deficiency.

***Overdose S&S:*** Abdominal cramps, anemia, burning epigastric distress, CNS and cardiovascular disturbances, cyanosis, methemoglobinemia, moderate leukocytosis or leukopenia, vomiting, granulocytopenia, acute hemolytic anemia, acute hemolysis.

## NURSING CONSIDERATIONS

- Use drug with a fast-acting antimalarial such as chloroquine to reduce possibility of drug-resistant strains.
- Obtain frequent blood studies and urinalysis in light-skinned patients taking more than 30 mg base daily, dark-skinned patients taking more than 15 mg base daily, and patients with severe anemia or suspected sensitivity.
- Monitor patient for markedly darkened urine and for suddenly reduced hemoglobin level or erythrocyte or leukocyte count, which suggest impending hemolytic reactions. Stop drug immediately and notify prescriber.
- Safe use during pregnancy hasn't been established.

## PATIENT TEACHING

- Instruct patient to take drug with meals to minimize stomach upset. If nausea, vomiting, or stomach pain persists, tell patient to notify prescriber.
- Tell patient to report to prescriber chills, fever, chest pain, and bluish skin discoloration; these signs and symptoms may suggest a hemolytic reaction.
- Tell patient to stop drug and notify prescriber immediately if urine darkens markedly.
- Stress importance of completing full course of therapy.

# primidone

PRI-mi-done

Mysoline, Sertan†

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* Barbiturate analogue
*Pregnancy risk category D*

## AVAILABLE FORMS

*Tablets:* 50 mg, 250 mg

## INDICATIONS & DOSAGES

➤ **Tonic-clonic, complex partial, and simple partial seizures**

*Adults and children age 8 and older:* Initially, 100 to 125 mg P.O. at bedtime on days 1 to 3; then 100 to 125 mg P.O. b.i.d. on days 4 to 6; then 100 to 125 mg P.O. t.i.d. on days 7 to 9, followed by maintenance dose of 250 mg P.O. t.i.d. Maintenance dose may be increased to 250 mg q.i.d., if needed. Dosage may be increased to maximum of 2 g daily in divided doses.

*Children younger than age 8:* Initially, 50 mg P.O. at bedtime for 3 days; then 50 mg P.O. b.i.d. for days 4 to 6; then 100 mg P.O. b.i.d. for days 7 to 9, followed by maintenance dose of 125 to 250 mg P.O. t.i.d. or 10 to 25 mg/kg daily in divided doses.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.

## ACTION

Unknown. Some activity may be caused by phenylethylmalonamide and phenobarbital, which are active metabolites.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3–4 hr | Unknown |

*Half-life:* 5 to 15 hours.

## ADVERSE REACTIONS

**CNS:** *ataxia, drowsiness,* emotional disturbances, fatigue, hyperirritability, vertigo.
**EENT:** *diplopia,* nystagmus.
**GI:** *nausea, vomiting,* anorexia.
**GU:** erectile dysfunction.
**Skin:** morbilliform rash.

## INTERACTIONS

**Drug-drug.** *Acetazolamide, succinimide:* May decrease primidone level. Monitor level.
*Anticoagulants, felodipine:* May decrease the effects of these drugs. Adjust doses as needed.
*Carbamazepine:* May increase carbamazepine level and decrease primidone and phenobarbital levels. Watch for toxicity.
*CNS depressants:* May cause additive CNS depression. Avoid using together.
*Corticosteroids, doxycycline:* May decrease the effects of these drugs. Avoid using together, if possible.
*Hormonal contraceptives:* May decrease the effectiveness of contraceptives. Recommend alternative birth control method.
*Isoniazid:* May increase primidone level. Monitor level.
*Metoprolol, propranolol,* ***other beta blockers:*** May reduce effects of these drugs. Consider increasing beta-blocker dose.
*Phenytoin:* May stimulate conversion of primidone to phenobarbital. Watch for increased phenobarbital effect.
*Valproic acid:* May increase primidone levels. Decrease primidone dose as needed.
**Drug-lifestyle.** *Alcohol use:* May impair coordination, increase CNS effects, and cause death. Strongly discourage alcohol use with this drug.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level.
- May alter liver function test values. May decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to phenobarbital and in those with porphyria.

## NURSING CONSIDERATIONS

***Alert:*** Closely monitor all patients for changes in behavior that may indicate worsening of suicidal thoughts or behavior or depression.
- Don't withdraw drug suddenly because seizures may worsen. Notify prescriber immediately if adverse reactions develop.
- Therapeutic level of primidone is 5 to 12 mcg/ml. Therapeutic level of phenobarbital is 15 to 40 mcg/ml.
- Monitor CBC and routine blood chemistry every 6 months.
- Brand interchange isn't recommended because of documented bioequivalence problems for primidone products marketed by different manufacturers.
- ***Look alike–sound alike:*** Don't confuse primidone with prednisone or Prinivil.

## PATIENT TEACHING

- Advise patient to avoid driving and other potentially hazardous activities that require mental alertness until drug's CNS effects are known.
- Warn patient and parents not to stop taking drug suddenly.
- Tell patient that full therapeutic response may take 2 weeks or longer.
- Advise women of childbearing age to discuss drug therapy with prescriber if considering pregnancy.
- Caution women of childbearing age that breast-feeding is contraindicated while taking this drug.

P

## probenecid

proe-BEN-e-sid

*Therapeutic class:* Uricosuric
*Pharmacologic class:* Sulfonamide derivative
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 500 mg

## INDICATIONS & DOSAGES

➤ **Adjunct to penicillin therapy**

*Adults and children weighing more than 50 kg (110 lb):* 500 mg P.O. q.i.d.

*Children ages 2 to 14 or weighing 50 kg or less:* Initially, 25 mg/kg P.O.; then 40 mg/kg/day in divided doses q.i.d.

➤ **Alternate therapy for uncomplicated gonorrhea**

*Adults:* 4.8 million units aqueous procaine penicillin G I.M. (divided into two injected doses at one visit) or 3.5 g ampicillin P.O. plus probenecid 1 g P.O.

➤ **Hyperuricemia of gout, gouty arthritis**

*Adults:* 250 mg P.O. b.i.d. for first week; then 500 mg b.i.d., to maximum of 2 to 3 g daily. Review maintenance dose every 6 months and reduce by increments of 500 mg, if indicated.

## ADMINISTRATION

**P.O.**

● To minimize GI distress, give drug with milk, food, or antacids. If unrelieved, consider reducing dosage.

## ACTION

Blocks renal tubular reabsorption of uric acid, increasing excretion, and inhibits active renal tubular secretion of many weak organic acids, such as penicillins and cephalosporins.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–4 hr | Unknown |

*Half-life:* 3 to 8 hours after 500-mg dose; 4 to 17 hours after larger doses.

## ADVERSE REACTIONS

**CNS:** fever, *headache*, dizziness.
**CV:** flushing.
**GI:** anorexia, nausea, vomiting, sore gums.
**GU:** urinary frequency, renal colic, nephrotic syndrome, costovertebral pain.
**Hematologic:** ***aplastic anemia,*** hemolytic anemia, anemia.
**Hepatic:** ***hepatic necrosis.***
**Skin:** dermatitis, pruritus.
**Other:** worsening of gout, hypersensitivity reactions including, ***anaphylaxis.***

## INTERACTIONS

**Drug-drug.** *Acyclovir, cephalosporins, clofibrate, dapsone, ketamine, lorazepam, meclofenamate, penicillin, rifampin, sulfonamides, thiopental:* May increase levels of these drugs. Use together cautiously.

*Allopurinol:* May increase uric acid–lowering effects. May be used to therapeutic advantage.

*Methotrexate:* May impair excretion of methotrexate, causing increased level, effects, and toxicity of methotrexate. Monitor methotrexate level closely and adjust dosage accordingly.

*Nitrofurantoin:* May increase toxicity and reduce effectiveness of nitrofurantoin. Reduce probenecid dose.

*NSAIDs:* May increase NSAID toxicity. Avoid using together.

*Salicylates:* May inhibit uricosuric effect of probenecid, causing urate retention. Avoid using together.

*Sulfonylureas:* May increase hypoglycemic effect. Monitor glucose level closely. Dosage may need to be adjusted.

*Zidovudine:* May increase zidovudine level and toxicity symptoms. Monitor patient.

**Drug-lifestyle.** *Alcohol use:* May increase urate level. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

● May decrease hemoglobin level and hematocrit.
● May falsely elevate theophylline level.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug and in those with uric acid kidney stones or blood dyscrasias; also contraindicated in patients with an acute gout attack and in children younger than age 2.
● Use cautiously in patients with peptic ulcer or renal impairment.
● Use cautiously in patients with sulfa allergy because probenecid is a sulfonamide derivative.

## NURSING CONSIDERATIONS

● Force fluids to maintain minimum daily output of 2 to 3 L. Alkalinize urine with sodium bicarbonate or potassium citrate. These measures prevent hematuria, renal

colic, urate stone development, and costovertebral pain.
• Don't use to treat gout until acute attack subsides. Drug has no analgesic or anti-inflammatory effects and is of no value during acute gout attacks.
• Monitor BUN and renal function test results periodically in long-term therapy.
• Drug is suitable for long-term use; no cumulative effects or tolerance have been reported.
• Drug is ineffective in patients with glomerular filtration rate below 30 ml/minute.
• Drug may increase frequency, severity, and length of acute gout attacks during first 6 to 12 months of therapy. Appropriate therapy may be used preventively during first 3 to 6 months.
• ***Look alike–sound alike:*** Don't confuse probenecid with Procanbid.

### PATIENT TEACHING

• Instruct patient with gout to take drug regularly to prevent recurrence.
• Tell patient to visit prescriber regularly so that uric acid can be monitored and dosage adjusted, if needed. Lifelong therapy may be needed in patients with hyperuricemia.
• Advise patient with gout to avoid all drugs that contain aspirin, which may precipitate gout. Acetaminophen may be used for pain.
• Instruct patient to drink at least 6 to 8 glasses of water per day.
• Urge patient with gout to avoid alcohol; it increases urate level.
• Tell patient with gout to limit intake of foods high in purine, such as anchovies, liver, sardines, kidneys, sweetbreads, peas, and lentils. Also tell him to identify and avoid other foods that may trigger gout attacks.
• Because drug may be prescribed with an antibiotic, instruct patient to take all medicine as prescribed.

## procainamide hydrochloride

proe-KANE-a-myed

Apo-Procainamide†, Procan SR†

*Therapeutic class:* Antiarrhythmic
*Pharmacologic class:* Procaine derivative
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules†:* 250 mg, 375 mg, 500 mg
*Injection:* 500 mg/ml
*Tablets (extended-release)†:* 250 mg, 500 mg, 750 mg

### INDICATIONS & DOSAGES

➤ **Symptomatic PVCs, life-threatening ventricular tachycardia**

For oral therapy, start at 50 mg/kg/day P.O. of conventional capsules in divided doses every 3 hours until therapeutic level is reached. For maintenance, substitute extended-release form to deliver the total daily dose divided every 6 hours or extended-release form at a dose of 50 mg/kg P.O. in two divided doses every 12 hours.
*Adults:* 100 mg every 5 minutes by slow I.V. push, no faster than 25 to 50 mg/minute, until arrhythmias disappear, adverse effects develop, or 500 mg has been given. Usual effective loading dose is 500 to 600 mg. Or, give a loading dose of 500 to 600 mg I.V. infusion over 25 to 30 minutes. Maximum total dose is 1 g. When arrhythmias disappear, give continuous infusion of 2 to 6 mg/minute. If arrhythmias recur, repeat bolus as above and increase infusion rate.

For I.M. administration, give 50 mg/kg divided every 3 to 6 hours; if arrhythmias occur during surgery, give 100 to 500 mg I.M.

➤ **To convert atrial fibrillation or paroxysmal atrial tachycardia ♦**

*Adults:* 1.25 g P.O. of conventional capsules. If arrhythmias persist after 1 hour, give additional 750 mg. If no change occurs, give 500 mg to 1 g P.O. every 2 hours until arrhythmias disappear or adverse effects occur. Maintenance dose is 1 g extended-release every 6 hours.

*Children:* 15 to 50 mg/kg/day P.O. divided every 3 to 6 hours. Maximum dose 4 g daily.
***Adjust-a-dose:*** For patients with renal or hepatic dysfunction, decrease dose or increase dosing interval, as needed.

## ADMINISTRATION

**P.O.**

***Alert:*** Don't crush the extended-release tablets.

**I.V.**

▼ Vials for I.V. injection contain 1 g of drug: 100 mg/ml (10 ml) or 500 mg/ml (2 ml).
▼ Dilute with compatible I.V. solution, such as $D_5W$ injection, and give with the patient supine at a rate not exceeding 25 to 50 mg/minute. Keep patient supine during I.V. administration.
▼ Attend patient receiving infusion at all times. Use an infusion-control device to give infusion precisely.
▼ Monitor blood pressure and ECG continuously during I.V. administration. Watch for prolonged QTc intervals and QRS complexes, heart block, or increased arrhythmias. If such reactions occur, withhold drug, obtain rhythm strip, and notify prescriber immediately. If drug is given too rapidly, hypotension can occur. Watch closely for adverse reactions during infusion, and notify prescriber if they occur.
▼ **Incompatibilities:** Bretylium, esmolol, ethacrynate, milrinone, phenytoin sodium.

**I.M.**

● I.M. injections are a substitute for oral administration in patients who are not allowed anything by mouth. Oral dosing should be resumed as soon as possible.

## ACTION

Decreases excitability, conduction velocity, automaticity, and membrane responsiveness with prolonged refractory period. Larger than usual doses may induce AV block.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 90–120 min | Unknown |
| I.V. | Immediate | Immediate | Unknown |
| I.M. | 10–30 min | 15–60 min | Unknown |

*Half-life:* About 2½ to 4¾ hours.

## ADVERSE REACTIONS

**CNS:** *fever,* ***seizures,*** hallucinations, psychosis, giddiness, confusion, depression, dizziness.
**CV:** *hypotension,* ***bradycardia, AV block, ventricular fibrillation, ventricular asystole.***
**GI:** abdominal pain, nausea, vomiting, anorexia, diarrhea, bitter taste.
**Skin:** *maculopapular rash, urticaria, pruritus, flushing.*
**Other:** *lupuslike syndrome,* **ANGIONEUROTIC EDEMA.**

## INTERACTIONS

**Drug-drug.** *Amiodarone:* May increase procainamide level and toxicity and have additive effects on QTc interval and QRS complex. Avoid using together.
*Anticholinergics:* May increase antivagal effects. Monitor patient closely.
*Anticholinesterases:* May decrease effect of anticholinesterases. Anticholinesterase dosage may need to be increased.
*Beta blockers, ranitidine, trimethoprim:* May increase procainamide level. Watch for toxicity.
*Cimetidine:* May increase procainamide level. Avoid using together if possible. Monitor procainamide level closely and adjust the dosage as necessary.
***Macrolides and related antibiotics (azithromycin, clarithromycin, erythromycin, telithromycin):*** May prolong the QT interval. Use with caution. Avoid use with telithromycin.
*Neuromuscular blockers:* May increase skeletal muscle relaxant effect. Monitor patient closely.
*Quinidine, disopyramide:* May enhance antiarrhythmic and hypotensive effects. Avoid using together.
***Quinolones:*** Life-threatening arrhythmias, including torsades de pointes, can occur. Avoid using together; sparfloxacin is contraindicated.
*Thioridazine, ziprasidone:* May prolong QTc interval. Avoid using together.
**Drug-herb.** *Jimsonweed:* May adversely affect CV function. Discourage use together.
*Licorice:* May prolong QTc interval. Urge caution.

**Drug-lifestyle.** *Alcohol use:* May reduce drug level. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, alkaline phosphatase, LDH, and bilirubin levels.
- May cause positive antinuclear antibody (ANA) titers and positive direct antiglobulin (Coombs') tests.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to this drug and related drugs.
- Contraindicated in those with complete, second- or third-degree heart block in the absence of an artificial pacemaker. Also contraindicated in those with myasthenia gravis, systemic lupus erythematosus, or atypical ventricular tachycardia (torsades de pointes).
- Contraindicated in patients with lupus erythematosus, as aggravation of symptoms is likely.
- Use with extreme caution in patients with ventricular tachycardia during coronary occlusion.
- Use cautiously in patients with heart failure or other conduction disturbances, such as bundle-branch heart block, sinus bradycardia, or digoxin intoxication, and in those with hepatic or renal insufficiency.

**Black Box Warning** Use cautiously in patients with blood dyscrasias or bone marrow suppression. ■

***Overdose S&S:*** Progressive widening of QRS complex, prolonged QT and PR intervals, lowered R and T waves, increasing AV block, ventricular ectopy, ventricular tachycardia, hypotension, CNS depression, tremor, respiratory depression.

## NURSING CONSIDERATIONS

**Black Box Warning** Because of its proarrhythmic effects, procainamide should be reserved for patients with life-threatening ventricular arrhythmias. ■

- Digitalize or cardiovert patients with atrial flutter or fibrillation before therapy with procainamide to prevent ventricular rate acceleration in patient.
- Monitor level of drug and its active metabolite N-acetylprocainamide (NAPA). To suppress ventricular arrhythmias, therapeutic levels of procainamide are 4 to 8 mcg/ml; therapeutic levels of NAPA are 10 to 30 mcg/ml.
- Monitor ECG closely. If QRS widens more than 25% or marked prolongation of the QTc interval occurs, check for overdosage.
- Hypokalemia predisposes patient to arrhythmias. Monitor electrolytes, especially potassium level.
- Elderly patients may be more likely to develop hypotension. Monitor blood pressure carefully.

**Black Box Warning** Agranulocytosis, bone marrow depression, neutropenia, hypoplastic anemia, and thrombocytopenia have been noted in patients during the first 12 weeks of therapy. It is recommended that CBCs be performed at weekly intervals for the first 3 months of therapy, and periodically thereafter. ■

**Black Box Warning** Perform CBCs promptly if patient develops signs of infection, bruising, or bleeding. If hematologic disorder is identified, discontinue drug. Blood counts usually return to normal within 1 month of discontinuation. ■

**Black Box Warning** Positive ANA titer is common in about 60% of patients who don't have symptoms of lupuslike syndrome. This response seems to be related to prolonged use, not dosage. May progress to systemic lupus erythematosus if drug isn't stopped. ■

## PATIENT TEACHING

- Stress importance of taking drug exactly as prescribed. This may require use of an alarm clock for nighttime doses.
- Instruct patient to report fever, rash, muscle pain, diarrhea, bleeding, bruises, or pleuritic chest pain.
- Tell patient not to crush or break extended-release tablets.
- Reassure patient who is taking extended-release form that a wax-matrix "ghost" from the tablet may be passed in stools. Drug is completely absorbed before this occurs.

P

**SAFETY ALERT!**

# procarbazine hydrochloride

proe-KAR-buh-zeen

Matulane

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Methylhydrazine derivative
*Pregnancy risk category D*

## AVAILABLE FORMS

*Capsules:* 50 mg

## INDICATIONS & DOSAGES

➤ **Adjunct treatment of Hodgkin lymphoma (stages III and IV), other cancers using nitrogen mustard, vincristine, procarbazine, prednisone (known as MOPP) regimen**

*Adults:* 2 to 4 mg/kg P.O. daily in single dose or divided doses for first week. Then, 4 to 6 mg/kg daily until WBC count falls below 4,000/$mm^3$, platelet count falls below 100,000/$mm^3$, or maximum response is obtained. Maintenance dose is 1 to 2 mg/kg daily after bone marrow recovery. For MOPP regimen, 100 mg/$m^2$ daily P.O. for first 14 days of 28-day cycle. Treat with minimum of six cycles of MOPP plus two to three cycles of consolidation chemotherapy.
*Children:* 50 mg/$m^2$ P.O. daily for first week; then 100 mg/$m^2$ until response or toxicity occurs. Maintenance dose is 50 mg/$m^2$ P.O. daily after bone marrow recovery.

## ADMINISTRATION

**P.O.**

● Give drug at bedtime and in divided doses to decrease nausea and vomiting.

## ACTION

Unknown. Thought to inhibit DNA, RNA, and protein synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* 10 minutes.

## ADVERSE REACTIONS

**CNS:** ataxia, *hallucinations*, ***coma,*** confusion, depression, dizziness, headache, insomnia, nervousness, neuropathy, nightmares, paresthesia, syncope, ***seizures.***
**CV:** flushing, hypotension, tachycardia.
**EENT:** nystagmus, photophobia, retinal hemorrhage, diplopia, hearing loss.
**GI:** *nausea*, *vomiting*, abdominal pain, anorexia, constipation, diarrhea, dry mouth, dysphagia, ***hematemesis, melena,*** stomatitis.
**GU:** hematuria, nocturia, urinary frequency.
**Hematologic:** ***anemia, bleeding tendency, leukopenia, thrombocytopenia,*** eosinophilia, hemolytic anemia.
**Hepatic:** ***hepatotoxicity,*** jaundice.
**Respiratory:** *pleural effusion,* cough, pneumonitis.
**Skin:** dermatitis, hyperpigmentation, pruritus, rash, reversible alopecia.
**Other:** ***secondary malignancies,*** allergic reaction, gynecomastia, herpes outbreak.

## INTERACTIONS

**Drug-drug.** *CNS depressants:* May cause additive depressant effects. Avoid using together.
*Digoxin:* May decrease digoxin level. Monitor digoxin level closely.
*Drugs high in tyramine, local anesthetics, MAO inhibitors, sympathomimetics, tricyclic antidepressants:* May cause tremor, palpitations, and increased blood pressure. Monitor patient closely.
*Levodopa:* May cause sudden hypertensive crisis. Don't give within 2 to 4 weeks of procarbazine.
*Methotrexate:* The nephrotoxicity of methotrexate may be increased. Wait 72 hours or longer between giving the final dose of procarbazine and starting a high-dose methotrexate infusion.
**Drug-food.** *Caffeine:* May result in arrhythmias and severe hypertension. Discourage caffeine intake.
*Foods high in tyramine (cheese, Chianti):* May cause tremor, palpitations, and increased blood pressure. Monitor patient closely; advise him to avoid or limit intake.
**Drug-lifestyle.** *Alcohol use:* Mild disulfiram-like reaction may cause

flushing, headache, nausea, and hypotension. Warn patient to avoid alcoholic beverages.

### EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level.
- May increase eosinophil count. May decrease platelet, RBC, and WBC counts.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with inadequate bone marrow reserve as shown by bone marrow aspiration.
- Use cautiously in patients with impaired hepatic or renal function.

***Overdose S&S:*** Nausea, vomiting, diarrhea, enteritis, hypotension, tremors, seizures, coma.

### NURSING CONSIDERATIONS

**Black Box Warning** Give drug only under the supervision of a physician experienced with potent antineoplastic drugs. Adequate clinical and laboratory facilities should be available. ▮

- Monitor CBC and platelet counts.
- Bone marrow depression begins 2 to 8 weeks after the start of treatment.
- Avoid all I.M. injections when platelet count is below 50,000/$mm^3$.
- Stop drug and notify prescriber if patient becomes confused or develops paresthesia or other neuropathy.
- The manufacturer recommends that if radiation or chemotherapeutic agents with bone marrow depressant activity have been used, give patient a 1-month interval without such therapy before beginning procarbazine therapy.

### PATIENT TEACHING

- To decrease nausea and vomiting, advise patient to take drug at bedtime and in divided doses.
- Tell patient to watch for fever, sore throat, fatigue, easy bruising, nosebleeds, bleeding gums, or tarry stools. Tell patient to take temperature daily.
- Warn patient to avoid alcohol during therapy. Urge him to stop drug and check with prescriber immediately if, after drinking alcohol, he experiences chest pain, rapid or irregular heartbeat, severe headache, or stiff neck.
- Instruct patient to avoid OTC medications that contain sympathomimetics and to avoid foods and drinks high in tyramine, such as wine, tea, coffee, cola, cheese, and bananas.
- Warn patient to avoid hazardous activities that require alertness and good motor coordination until CNS effects of drug are known.
- Caution women of childbearing age to avoid becoming pregnant during therapy and to consult prescriber before becoming pregnant.

## prochlorperazine

proe-klor-PER-a-zeen

Compro

## prochlorperazine edisylate

## prochlorperazine maleate

Nu-Prochlor†, Procomp

*Therapeutic class:* Antiemetic
*Pharmacologic class:* Dopamine antagonist
*Pregnancy risk category C*

P

### AVAILABLE FORMS

**prochlorperazine**
*Suppository:* 25 mg
**prochlorperazine edisylate**
*Injection:* 5 mg/ml
*Suppository:* 25 mg
**prochlorperazine maleate**
*Tablets:* 5 mg, 10 mg, 25 mg

### INDICATIONS & DOSAGES

➤ **To control preoperative nausea**

*Adults:* 5 to 10 mg I.M. 1 to 2 hours before induction of anesthesia; repeat once in 30 minutes, if needed. Or, 5 to 10 mg I.V. 15 to 30 minutes before induction of anesthesia; repeat once, if needed.

➤ **Severe nausea and vomiting**

*Adults:* 5 to 10 mg P.O., t.i.d. or q.i.d.; 25 mg P.R., b.i.d.; or 5 to 10 mg I.M., repeated every 3 to 4 hours, as needed. Maximum I.M. dose is 40 mg daily. Or, 2.5 to 10 mg I.V. at no more than 5 mg/minute.

*Children who weigh 18 to 39 kg (39 to 86 lb):* 2.5 mg P.O. or P.R., t.i.d.; or 5 mg P.O. or P.R., b.i.d. Maximum, 15 mg daily. Or, 0.132 mg/kg by deep I.M. injection. Control is usually achieved with one dose.
*Children who weigh 14 to 17 kg (30 to 38 lb):* 2.5 mg P.O. or P.R., b.i.d. or t.i.d. Maximum, 10 mg daily. Or, 0.132 mg/kg by deep I.M. injection. Control is usually achieved with one dose.
*Children who weigh 9 to 13 kg (20 to 29 lb):* 2.5 mg P.O. or P.R. once daily or b.i.d. Maximum, 7.5 mg daily. Or, 0.132 mg/kg by deep I.M. injection. Control is usually achieved with one dose.

➤ **To manage symptoms of psychotic disorders in nonhospitalized patients**
*Adults:* Usual dosage is 25 mg P.O. t.i.d. After 1 to 2 days, may increase dosage by 20 to 50 mg twice weekly until symptoms resolve. After 2 weeks, reduce dosage to lowest effective maintenance dose. Usual maintenance dose is 200 mg/day.

➤ **To manage symptoms of severe psychosis**
*Adults:* For nonhospitalized patients, 25 mg I.M.; repeat dose in 1 hour p.r.n. Once symptoms are controlled, give 25 to 50 mg P.O. t.i.d. For hospitalized patients, give 25 mg I.M.; repeat in 1 hour p.r.n. May increase I.M. doses over several days to maximum of 400 mg every 4 to 6 hours until symptoms subside; then begin oral doses up to 500 mg/day.

➤ **Nonpsychotic anxiety**
*Adults:* 5 to 10 mg P.O., t.i.d., or q.i.d.

## ADMINISTRATION

**P.O.**
- Dilute oral solution with tomato juice, fruit juice, milk, coffee, carbonated beverage, tea, water, or soup. Or, mix with pudding.
- To prevent contact dermatitis, avoid getting concentrate solution on hands or clothing.

**I.V.**
▼ Add 20 mg of drug per liter of $D_5W$ and normal saline solution, 15 to 30 minutes before induction of anesthesia.
▼ Infuse slowly; rate shouldn't exceed 5 mg/minute. Maximum parenteral dose is 40 mg daily.
▼ To prevent contact dermatitis, avoid getting injection solution on hands or clothing.
▼ **Incompatibilities:** Aldesleukin, allopurinol, amifostine, aminophylline, amphotericin B, ampicillin sodium, aztreonam, calcium gluconate, chloramphenicol sodium succinate, chlorothiazide, dexamethasone sodium phosphate, dimenhydrinate, etoposide, filgrastim, fludarabine, foscarnet, furosemide, gemcitabine, heparin sodium, hydrocortisone sodium succinate, hydromorphone, ketorolac, solutions containing methylparabens, midazolam hydrochloride, morphine, penicillin G potassium, penicillin G sodium, pentobarbital, phenobarbital sodium, phenytoin sodium, piperacillin sodium and tazobactam sodium, solutions containing propylparabens, thiopental, vitamin B complex with C.

**I.M.**
- For I.M. use, inject deeply into upper outer quadrant of gluteal region.
- Don't give by subcutaneous route or mix in syringe with another drug.
- To prevent contact dermatitis, avoid getting injection solution on hands or clothing.
- Store in light-resistant container. Slight yellowing doesn't affect potency; discard extremely discolored solutions.

**Rectal**
- Protect from light.

## ACTION

Acts on the chemoreceptor trigger zone to inhibit nausea and vomiting; in larger doses, it partially depresses vomiting center.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30–40 min | Unknown | 3–12 hr |
| I.V. | Unknown | Unknown | Unknown |
| I.M. | 10–20 min | Unknown | 3–4 hr |
| P.R. | 1 hr | Unknown | 3–4 hr |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *extrapyramidal reactions*, dizziness, EEG changes, pseudoparkinsonism, sedation.
**CV:** *orthostatic hypotension*, ECG changes, tachycardia.

**EENT:** *blurred vision, ocular changes.*
**GI:** *constipation, dry mouth,* increased appetite.
**GU:** *urine retention,* dark urine, inhibited ejaculation, menstrual irregularities.
**Hematologic:** ***agranulocytosis, transient leukopenia.***
**Hepatic:** cholestatic jaundice.
**Metabolic:** weight gain.
**Skin:** *mild photosensitivity reactions,* allergic reactions, exfoliative dermatitis.
**Other:** gynecomastia, hyperprolactinemia.

## INTERACTIONS

**Drug-drug.** *Antacids:* May inhibit absorption of oral phenothiazines. Separate antacid and phenothiazine doses by at least 2 hours.
*Anticholinergics, including antidepressants and antiparkinsonians:* May increase anticholinergic activity and may aggravate parkinsonian symptoms. Use together cautiously.
*Barbiturates:* May decrease phenothiazine effect. Monitor patient for decreased antiemetic effect.
**Drug-herb.** *Dong quai, St. John's wort:* May increase risk of photosensitivity. Advise patient to avoid excessive sun exposure.
*Kava:* May increase risk of dystonic reactions. Discourage use together.
**Drug-lifestyle.** ***Alcohol use:*** May increase CNS depression, particularly psychomotor skills. Strongly discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May decrease WBC and granulocyte counts.
- May cause false-positive results for urinary porphyrins, urobilinogen, amylase, and 5-hydroxyindoleacetic acid, and false-positive results in urine pregnancy tests using human chorionic gonadotropin. May cause abnormal liver function test results.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to phenothiazines and in patients with CNS depression, including those in a coma.
- Contraindicated during pediatric surgery, when using spinal or epidural anesthetic or adrenergic blockers, and in children younger than age 2.
- Use cautiously in patients with impaired CV function, glaucoma, seizure disorders, and Parkinson disease; in those who have been exposed to extreme heat; and in children with acute illness.

***Overdose S&S:*** Dystonic reactions, CNS depression, agitation, restlessness, seizures, ECG changes, cardiac arrhythmias, fever, hypotension, dry mouth, ileus.

## NURSING CONSIDERATIONS

- Watch for orthostatic hypotension, especially when giving drug I.V.
- Monitor CBC and liver function studies during long-term therapy.

***Alert:*** Use drug only when vomiting can't be controlled by other measures or when only a few doses are needed. If more than four doses are needed in 24 hours, notify prescriber.

## PATIENT TEACHING

- Teach patient what to use to dilute oral solution.
- Advise patient to wear protective clothing when exposed to sunlight.
- Tell patient to call prescriber if more than four doses are needed within 24 hours.

# promethazine hydrochloride

proe-METH-a-zeen

Phenadoz, Promethegan

*Therapeutic class:* Antiemetic
*Pharmacologic class:* Phenothiazine
*Pregnancy risk category C*

P

## AVAILABLE FORMS

*Injection:* 25 mg/ml, 50 mg/ml
*Suppositories:* 12.5 mg, 25 mg, 50 mg
*Syrup:* 6.25 mg/5 ml*
*Tablets:* 12.5 mg, 25 mg, 50 mg

## INDICATIONS & DOSAGES

➤ **Motion sickness**

*Adults:* 25 mg P.O. or P.R. taken 30 minutes to 1 hour before departure. May repeat dose 8 to 12 hours later p.r.n. Then, 25 mg P.O. b.i.d. on successive travel days.
*Children older than age 2:* 12.5 to 25 mg P.O. or P.R. 30 minutes to 1 hour before

departure. May repeat dose 8 to 12 hours later p.r.n.

➤ **Nausea and vomiting**

*Adults:* 12.5 to 25 mg P.O., I.M., or P.R. every 4 to 6 hours p.r.n.

*Children older than age 2:* 12.5 to 25 mg P.O. or P.R. every 4 to 6 hours p.r.n. Or, 6.25 to 12.5 mg I.M. every 4 to 6 hours p.r.n.

➤ **Rhinitis, allergy symptoms**

*Adults:* 25 mg P.O. or P.R. at bedtime; or, 12.5 mg P.O. or P.R. t.i.d. and at bedtime.

*Children older than age 2:* 25 mg P.O. or P.R. at bedtime; or, 6.25 to 12.5 mg P.O. or P.R. t.i.d.

➤ **Nighttime sedation**

*Adults:* 25 to 50 mg P.O., I.M., or P.R. at bedtime. Or, 25 mg I.V. at bedtime.

*Children older than age 2:* 12.5 to 25 mg P.O., I.M., or P.R. at bedtime.

➤ **Adjunct to analgesics for routine preoperative or postoperative sedation**

*Adults:* 25 to 50 mg I.M., P.O. or P.R. Or, 25 mg I.V.

*Children older than age 2:* 0.5 to 1.1 mg/kg P.O., I.M., or P.R.

## ADMINISTRATION

**P.O.**

● Reduce GI distress by giving drug with food or milk.

**I.V.**

▼ If solution is discolored or contains a precipitate, discard.

▼ Give injection through a free-flowing I.V. line.

***Alert:*** Don't give at a concentration above 25 mg/ml or a rate above 25 mg/minute.

▼ Don't give I.V. solution subcutaneously or intra-arterially.

▼ **Incompatibilities:** Aldesleukin, allopurinol, aminophylline, amphotericin B, cephalosporins, chloramphenicol sodium succinate, chloroquine phosphate, chlorothiazide, diatrizoate, dimenhydrinate, doxorubicin liposomal, foscarnet, furosemide, heparin sodium, hydrocortisone sodium succinate, iodipamide meglumine (52%), iothalamate, ketorolac, methohexital, morphine, nalbuphine, penicillin G potassium and sodium, pentobarbital sodium, phenobarbital sodium, phenytoin sodium, thiopental, vitamin B complex.

**I.M.**

***Alert:*** I.M. injection is the preferred parenteral route. Inject deep I.M. into large muscle mass. Rotate injection sites.

**Rectal**

● If suppository is too soft, place wrapped in refrigerator for 15 minutes or run under cold water.

## ACTION

Phenothiazine derivative that competes with histamine for $H_1$-receptor sites on effector cells. Prevents, but doesn't reverse, histamine-mediated responses. At high doses, drug also has local anesthetic effects.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 15–60 min | Unknown | <12 hr |
| I.V. | 3–5 min | Unknown | <12 hr |
| I.M., P.R. | 20 min | Unknown | <12 hr |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *drowsiness, sedation,* confusion, sleepiness, dizziness, disorientation, extrapyramidal symptoms.

**CV:** hypotension, hypertension.

**EENT:** *dry mouth,* blurred vision.

**GI:** nausea, vomiting.

**GU:** urine retention.

**Hematologic:** ***leukopenia, agranulocytosis, thrombocytopenia.***

**Metabolic:** hyperglycemia.

**Respiratory:** ***respiratory depression, apnea.***

**Skin:** photosensitivity, rash.

## INTERACTIONS

**Drug-drug.** *Anticholinergics, tricyclic antidepressants:* May increase anticholinergic effects. Avoid using together.

*CNS depressants:* May increase sedation. Use together cautiously. If used together, reduce opiate dose by at least 25% to 50%, and reduce barbiturate dose by at least 50%.

*Epinephrine:* May block or reverse effects of epinephrine. Use other pressor drugs instead.

*Levodopa:* May decrease antiparkinsonian action of levodopa. Avoid using together.

*Lithium:* May reduce GI absorption or enhance renal elimination of lithium. Avoid using together.
*MAO inhibitors:* May increase extrapyramidal effects. Avoid using together.
*Quinolones:* May cause life-threatening arrhythmias. Avoid using together.
**Drug-herb.** *Yohimbe:* May increase risk of herb toxicity. Ask patient about use of herbal remedies, and recommend caution.
**Drug-lifestyle.** *Alcohol use:* May increase sedation. Discourage use together.
*Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid extensive sunlight exposure and to use sunblock.

## EFFECTS ON LAB TEST RESULTS

- May increase hemoglobin level and hematocrit.
- May decrease WBC, platelet, and granulocyte counts.
- May prevent, reduce, or mask positive result in diagnostic skin test. May cause false-positive or false-negative pregnancy test result. May interfere with blood grouping in the ABO system.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, those who have experienced adverse reactions to phenothiazines, breast-feeding women, comatose patients, and acutely ill or dehydrated children.

**Black Box Warning** Contraindicated in children younger than age 2 because of the potential for fatal respiratory depression. Use the lowest effective dose in children older than age 2 and avoid administering with drugs that can cause respiratory depression.

- Use cautiously in patients with asthma or pulmonary, hepatic, or CV disease and in those with intestinal obstruction, prostatic hyperplasia, bladder-neck obstruction, angle-closure glaucoma, seizure disorders, CNS depression, and stenosing or peptic ulcerations.

***Overdose S&S:*** Hypotension, respiratory depression, ataxia, athetosis, Babinski reflex, hyperreflexia, hypertonia, dry mouth, fixed dilated pupils, flushing, GI symptoms, seizures, sudden death; hyperexcitability, nightmares (in children).

## NURSING CONSIDERATIONS

***Alert:*** Perivascular extravasation, unintentional intra-arterial injection, intraneuronal or perineuronal infiltration of the drug may result in irritation and tissue damage, including gangrene.

- Monitor patient for neuroleptic malignant syndrome: altered mental status, autonomic instability, muscle rigidity, and hyperpyrexia.
- Stop drug 4 days before diagnostic skin testing because antihistamines can prevent, reduce, or mask positive skin test response.
- Drug is used as an adjunct to analgesics, usually to increase sedation; it has no analgesic activity.
- Drug may be mixed with meperidine in same syringe.
- In patients scheduled for a myelogram, stop drug 48 hours before procedure. Don't resume drug until 24 hours after procedure because of the risk of seizures.

## PATIENT TEACHING

- Tell patient to take oral form with food or milk.
- When treating motion sickness, tell patient to take first dose 30 to 60 minutes before travel; dose may be repeated in 8 to 12 hours, if necessary. On succeeding days of travel, patient should take dose upon arising and with evening meal.
- Warn patient to avoid alcohol and hazardous activities that require alertness until CNS effects of drug are known.
- Inform patient that sugarless gum, hard candy, or ice chips may relieve dry mouth.
- Warn patient about possible photosensitivity reactions. Advise use of a sunblock.

P

# propafenone hydrochloride

proe-PAF-a-non

Rythmol, Rythmol SR

*Therapeutic class:* Antiarrhythmic
*Pharmacologic class:* Sodium channel antagonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules (extended-release):* 225 mg, 325 mg, 425 mg

*Tablets (immediate-release):* 150 mg, 225 mg, 300 mg

## INDICATIONS & DOSAGES

➤ **To suppress life-threatening ventricular arrhythmias such as sustained ventricular tachycardia; to prevent paroxysmal supraventricular tachycardia (PSVT) and paroxysmal atrial fibrillation or flutter**

*Adults:* Initially, 150 mg immediate-release tablet P.O. every 8 hours. May increase dosage every 3 or 4 days to 225 mg every 8 hours. If needed, increase dosage to 300 mg every 8 hours. Maximum daily dose, 900 mg.

➤ **To prolong time until recurrence of symptomatic atrial fibrillation**

*Adults:* Initially, 150-mg immediate-release tablet P.O. every 8 hours. May increase dosage after 3 days to 225- to 300-mg immediate-release tablet P.O. every 8 hours. Maximum dosage is 900 mg/day. Or, 225 mg extended-release capsule P.O. every 12 hours. May increase dose after 5 days to 325 mg P.O. every 12 hours. May increase dose to 425 mg every 12 hours.

***Adjust-a-dose:*** For patients with hepatic impairment, reduce initial dose of immediate-release tablets by 70% to 80%.

## ADMINISTRATION

**P.O.**

- Give drug with food, to minimize adverse GI reactions.
- Don't crush or open the extended-release capsules.

## ACTION

Reduces inward sodium current in cardiac cells, prolongs refractory period in AV node, and decreases excitability, conduction velocity, and automaticity in cardiac tissue.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. (immediate-release) | Unknown | 3½ hr | Unknown |
| P.O. (extended-release) | Unknown | 3–8 hr | Unknown |

*Half-life:* Estimated at 10 to 32 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness*, anxiety, ataxia, drowsiness, fatigue, headache, insomnia, syncope, tremor, weakness.

**CV:** ***heart failure, bradycardia, arrhythmias, ventricular tachycardia, premature ventricular contractions, ventricular fibrillation,*** atrial fibrillation, bundle-branch block, angina, chest pain, edema, first-degree AV block, hypotension, increased QRS complex, intraventricular conduction delay, palpitations.

**EENT:** blurred vision.

**GI:** *nausea*, *vomiting*, abdominal pain or cramps, constipation, diarrhea, dyspepsia, anorexia, flatulence, dry mouth, unusual taste.

**Musculoskeletal:** arthralgia.

**Respiratory:** dyspnea.

**Skin:** rash, diaphoresis.

## INTERACTIONS

**Drug-drug.** *Antiarrhythmics, paroxetine, sertraline:* May increase risk of prolonged QTc interval. Monitor patient closely.

*Beta blockers (metoprolol, propranolol):* May decrease metabolism of these drugs. Adjust dosage of beta blocker as needed.

*Cimetidine:* May increase propafenone levels. Monitor patient for adverse effects and toxicity.

*Cyclosporine,* ***digoxin:*** May increase levels of these drugs, causing toxicity. Monitor patient closely; dosage adjustment may be necessary.

*Desipramine, haloperidol, imipramine, venlafaxine:* May decrease metabolism of these drugs. Monitor patient closely.

*Lidocaine:* May decrease lidocaine metabolism. Monitor patient for increased CNS adverse effects and lidocaine toxicity.

*Local anesthetics:* May increase risk of CNS toxicity. Monitor patient closely.

*Mexiletine:* May decrease mexiletine metabolism, increasing level and adverse reactions. Monitor mexiletine level and patient closely.

*Phenobarbital, rifampin:* May increase propafenone clearance. Watch for decreased antiarrhythmic effect.

*Quinidine:* May decrease propafenone metabolism; may be useful in certain patients refractory to propafenone and

quinidine monotherapy. Monitor patient closely.
***Ritonavir:*** May increase propafenone level, causing life-threatening arrhythmias. Avoid using together.
*Theophylline:* May decrease theophylline metabolism. Monitor theophylline level and ECG closely.
*Warfarin:* May increase warfarin level. Monitor PT and INR closely, and adjust warfarin dose as needed.
**Drug-food.** *Grapefruit juice:* May increase drug level. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, and AST levels.
- May cause positive ANA titers.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with severe or uncontrolled heart failure; cardiogenic shock; SA, AV, or intraventricular disorders of impulse conduction without a pacemaker; bradycardia; marked hypotension; bronchospastic disorders; or electrolyte imbalances.
- Use cautiously in patients with a history of heart failure because drug may weaken the contraction of the heart.
- Use cautiously in patients taking other cardiac depressants and in those with hepatic or renal impairment.
- Use cautiously in patients with myasthenia gravis; may cause exacerbation.

***Overdose S&S:*** Hypotension, somnolence, bradycardia, intra-atrial and intraventricular conduction disturbance.

## NURSING CONSIDERATIONS

**Black Box Warning** Because of its proarrhythmic effects, propafenone should be reserved for patients with life-threatening ventricular arrhythmias. ■

***Alert:*** Perform continuous cardiac monitoring at start of therapy and during dosage adjustments. If PR interval or QRS complex increases by more than 25%, reduce dosage.

- If using with digoxin, frequently monitor ECG and digoxin level.
- Pacing and sensing thresholds of artificial pacemakers may change; monitor pacemaker function.
- Agranulocytosis may develop during the first 2 to 3 months of therapy. If patient has an unexplained fever, monitor leukocyte count.

## PATIENT TEACHING

- Stress importance of taking drug exactly as prescribed.
- Tell patient not to double the dose if he misses one, but to take the next dose at the usual time.
- Tell patient to report adverse reactions promptly, including fever, sore throat, chills, and other signs and symptoms of infection.
- Instruct patient to notify prescriber if prolonged diarrhea, sweating, vomiting, or loss of appetite or thirst occurs; these may cause an electrolyte imbalance.
- Tell patient not to crush, chew, or open the extended-release capsules.

**SAFETY ALERT!**

# propofol

PRO-puh-fole

Diprivan, Fresenius Propoven

*Therapeutic class:* Hypnotic
*Pharmacologic class:* Phenol derivative
*Pregnancy risk category B*

P

## AVAILABLE FORMS

*Injection:* 10 mg/ml in ampules, vials, and prefilled syringes

## INDICATIONS & DOSAGES

➤ **To induce anesthesia**

*Adults younger than age 55 classified as American Society of Anesthesiologists (ASA) Physical Status (PS) category I or II:* 2 to 2.5 mg/kg. Give in 40-mg boluses every 10 seconds until desired response is achieved.
*Children ages 3 to 16 classified as ASA I or II:* 2.5 to 3.5 mg/kg over 20 to 30 seconds.
***Adjust-a-dose:*** In geriatric, debilitated, hypovolemic, or ASA PS III or IV patients, give half the usual induction dose, in 20-mg boluses, every 10 seconds. For cardiac anesthesia, give 20 mg (0.5 to 1.5 mg/kg) every 10 seconds until desired response is achieved. For neurosurgical patients, give

20 mg (1 to 2 mg/kg) every 10 seconds until desired response is achieved.

➤ **To maintain anesthesia**

*Healthy adults younger than age 55:* 0.1 to 0.2 mg/kg/minute (6 to 12 mg/kg/hour). Or, 20- to 50-mg intermittent boluses, p.r.n.

*Healthy children ages 3 to 16:* 125 to 300 mcg/kg/minute (7.5 to 18 mg/kg/hour).

***Adjust-a-dose:*** In geriatric, debilitated, hypovolemic, or ASA PS III or IV patients, give half the usual maintenance dose (0.05 to 0.1 mg/kg/minute or 3 to 6 mg/kg/hour). For cardiac anesthesia with secondary opioid, 100 to 150 mcg/kg/minute; low dose with primary opioid, 50 to 100 mcg/kg/minute. For neurosurgical patients, 100 to 200 mcg/kg/minute (6 to 12 mg/kg/hour).

➤ **Monitored anesthesia care**

*Healthy adults younger than age 55:* Initially, 100 to 150 mcg/kg/minute (6 to 9 mg/kg/hour) for 3 to 5 minutes or a slow injection of 0.5 mg/kg over 3 to 5 minutes. For maintenance dose, give infusion of 25 to 75 mcg/kg/minute (1.5 to 4.5 mg/kg/hour), or incremental 10- or 20-mg boluses.

***Adjust-a-dose:*** In geriatric, debilitated, or ASA PS III or IV patients, give 80% of usual adult maintenance dose. Don't use rapid bolus.

➤ **To sedate intubated intensive care unit (ICU) patients**

*Adults:* Initially, 5 mcg/kg/minute (0.3 mg/kg/hour) for 5 minutes. Increments of 5 to 10 mcg/kg/minute (0.3 to 0.6 mg/kg/hour) over 5 to 10 minutes may be used until desired sedation is achieved. Maintenance rate, 5 to 50 mcg/kg/minute (0.3 to 3 mg/kg/hour).

## ADMINISTRATION

### I.V.

▼ Maintain aseptic technique when handling the solution. Drug can support the growth of microorganisms; don't use if solution might be contaminated.

▼ Protect drug from light. Shake well.

▼ Dilute only with $D_5W$. Don't dilute to less than 2 mg/ml.

▼ Don't use if emulsion shows evidence of separation.

▼ Don't infuse through a filter with a pore size smaller than 5 microns. Give via larger veins in arms to decrease injection site pain.

▼ Titrate drug daily to maintain minimum effective level. Allow 3 to 5 minutes between dosage adjustments to assess effects.

▼ Discard tubing and unused portions of drug after 12 hours.

▼ **Incompatibilities:** Other I.V. drugs, blood and plasma.

## ACTION

Unknown. Rapid-acting I.V. sedative-hypnotic.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | <40 sec | Unknown | 10–15 min |

*Half-life:* Initial (distribution) phase, about 2 to 10 minutes; second (redistribution) phase, 21 to 70 minutes; terminal (elimination) phase, 1½ to 31 hours.

## ADVERSE REACTIONS

**CNS:** dystonic or choreiform movement.

**CV:** ***bradycardia,*** *hypotension,* hypertension, decreased cardiac output.

**Metabolic:** hyperlipemia.

**Respiratory:** **APNEA,** ***respiratory acidosis.***

**Skin:** rash.

**Other:** *burning or stinging at injection site.*

## INTERACTIONS

**Drug-drug.** *Inhaled anesthetics (such as enflurane, halothane, isoflurane), opioids (alfentanil, fentanyl, meperidine, morphine), sedatives (such as barbiturates, benzodiazepines, chloral hydrate, droperidol):* May increase anesthetic and sedative effects and further decrease blood pressure and cardiac output. Monitor patient closely.

**Drug-herb.** *St. John's wort:* May prolong anesthetic effects. Advise patient to stop using herb 5 days before surgery.

## EFFECTS ON LAB TEST RESULTS

● May increase lipid levels.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or its components (including egg lecithin, soybean oil, and glycerol), in pregnant women (because it may cause fetal depression), and in those unable to undergo general anesthesia or sedation.

● Use cautiously in patients who are hemodynamically unstable or who have seizures, disorders of lipid metabolism, or increased intracranial pressure.
● Because drug appears in breast milk, avoid using in breast-feeding women.
⚠ ***Overdose S&S:*** Cardiorespiratory depression.

## NURSING CONSIDERATIONS

● If drug is used for prolonged sedation in ICU, urine may turn green.
● For general anesthesia or monitored anesthesia care sedation, trained staff not involved in the surgical or diagnostic procedure should give drug. For ICU sedation, persons skilled in managing critically ill patients and trained in cardiopulmonary resuscitation and airway management should give drug.
● Continuously monitor vital signs.
***Alert:*** The FDA issued an alert after receiving reports of chills, fever, and body aches in several clusters of patients shortly after patients received propofol for sedation or general anesthesia. Various lots of the drug were tested, but no toxins, bacteria, or other signs of contamination were found. The FDA advises all health care providers to carefully follow the handling and use sections of the prescribing information for this drug. They recommend that all patients be evaluated for possible reactions following use of the drug, and that anyone experiencing signs of acute febrile reactions be evaluated for possible bacterial sepsis. They ask that any adverse events following the use of propofol be reported to MedWatch.
● Monitor patient at risk for hyperlipidemia for elevated triglyceride levels.
● Drug contains 0.1 g of fat (1.1 kcal)/ml. Reduce other lipid products if given together.
● Drug contains ethylenediaminetetraacetic acid (EDTA), a strong metal chelator. Consider supplemental zinc during prolonged therapy.
● When giving drug in the ICU, assess patient's CNS function daily to determine minimum dose needed.
● Stop drug gradually to prevent abrupt awakening and increased agitation.
● ***Look alike–sound alike:*** Don't confuse Diprivan with Ditropan or Dipivefrin.

## PATIENT TEACHING

● Advise patient that performance of activities requiring mental alertness may be impaired for some time after drug use.

**SAFETY ALERT!**

# propranolol hydrochloride

proe-PRAN-oh-lol

Inderal🖋, Inderal LA🖋, InnoPran XL, Novopranol†

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Nonselective beta blocker
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules (extended-release):* 60 mg, 80 mg, 120 mg, 160 mg
*Injection:* 1 mg/ml
*Oral solution:* 4 mg/ml, 8 mg/ml
*Tablets:* 10 mg, 20 mg, 40 mg, 60 mg, 80 mg

## INDICATIONS & DOSAGES

➤ **Angina pectoris**
*Adults:* Total daily doses of 80 to 320 mg P.O. when given b.i.d., t.i.d., or q.i.d. Or, one 80-mg extended-release capsule daily. Dosage increased at 3- to 7-day intervals.
➤ **To decrease risk of death after MI**
*Adults:* 180 to 240 mg P.O. daily in divided doses beginning 5 to 21 days after MI has occurred. Usually given t.i.d. or q.i.d.
➤ **Supraventricular, ventricular, and atrial arrhythmias; tachyarrhythmias caused by excessive catecholamine action during anesthesia, hyperthyroidism, or pheochromocytoma**
*Adults:* 1 to 3 mg by slow I.V. push, not to exceed 1 mg/minute. After 3 mg have been given, another dose may be given in 2 minutes; subsequent doses, no sooner than every 4 hours. Usual maintenance dose is 10 to 30 mg P.O. t.i.d. or q.i.d.
➤ **Hypertension**
*Adults:* Initially, 80 mg P.O. daily in two divided doses or extended-release form

P

once daily. Increase at 3- to 7-day intervals to maximum daily dose of 640 mg. Usual maintenance dose is 120 to 240 mg daily or 120 to 160 mg daily as extended-release. For InnoPran XL, dose is 80 mg P.O. once daily at bedtime. Give consistently with or without food. Adjust to maximum of 120 mg daily if needed. Full effects are seen in about 2 to 3 weeks.

➤ **Essential tremor**

*Adults:* 40 mg (tablets or oral solution) P.O. b.i.d. Usual maintenance dose is 120 to 320 mg daily in three divided doses.

➤ **Hypertrophic subaortic stenosis**

*Adults:* 20 to 40 mg P.O. t.i.d. or q.i.d.; or 80 to 160 mg extended-release capsules once daily.

➤ **Adjunct therapy in pheochromocytoma**

*Adults:* 60 mg P.O. daily in divided doses with an alpha blocker 3 days before surgery.

➤ **Prevention of migraine**

Initially, 80 mg P.O. daily in divided doses. May increase to 160 to 240 mg/day.

## ADMINISTRATION

### P.O.

- Give drug consistently with meals. Food may increase absorption of propranolol.
- Compliance may be improved by giving drug twice daily or as extended-release capsules. Check with prescriber.
- Check blood pressure and apical pulse before giving drug. If hypotension or extremes in pulse rate occur, withhold drug and notify prescriber.

### I.V.

▼ For direct injection, give into a large vessel or into the tubing of a free-flowing, compatible I.V. solution; don't give by continuous I.V. infusion.

▼ Drug is compatible with $D_5W$, half-normal saline solution, normal saline solution, and lactated Ringer's solution.

▼ Infusion rate shouldn't exceed 1 mg/minute.

▼ Double-check dose and route. I.V. doses are much smaller than oral doses.

▼ Monitor blood pressure, ECG, central venous pressure, and heart rate and rhythm frequently, especially during I.V. administration. If patient develops severe hypotension, notify prescriber; a vasopressor may be prescribed.

▼ For overdose, give I.V. isoproterenol, I.V. atropine, or glucagon; refractory cases may require a pacemaker.

▼ **Incompatibilities:** Amphotericin B, diazoxide.

## ACTION

Reduces cardiac oxygen demand by blocking catecholamine-induced increases in heart rate, blood pressure, and force of myocardial contraction. Drug depresses renin secretion and prevents vasodilation of cerebral arteries.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30 min | 60–90 min | 12 hr |
| P.O. (extended) | Unknown | 6–14 hr | 24 hr |
| I.V. | Immediate | 1 min | 5 min |

*Half-life:* About 4 hours; 8 hours for InnoPran XL.

## ADVERSE REACTIONS

**CNS:** *fatigue, lethargy,* fever, vivid dreams, hallucinations, mental depression, lightheadedness, dizziness, insomnia.

**CV:** *hypotension,* ***bradycardia, heart failure, intensification of AV block,*** intermittent claudication.

**GI:** abdominal cramping, constipation, diarrhea, nausea, vomiting.

**Hematologic:** ***agranulocytosis.***

**Respiratory:** ***bronchospasm.***

**Skin:** rash.

## INTERACTIONS

**Drug-drug.** *Aminophylline:* May antagonize beta-blocking effects of propranolol. Use together cautiously.

*Amiodarone, diltiazem, verapamil:* May cause hypotension, bradycardia, and increased depressant effect on myocardium. Use together cautiously.

*Cardiac glycosides:* May reduce the positive inotrope effect of the glycoside. Monitor patient for clinical effect.

*Cimetidine, fluoxetine:* May inhibit metabolism of propranolol. Watch for increased beta-blocking effect.

*Epinephrine:* May cause severe vasoconstriction. Monitor blood pressure and observe patient carefully.

*Glucagon, isoproterenol:* May antagonize propranolol effect. May be used therapeutically and in emergencies.
*Haloperidol:* May cause cardiac arrest. Avoid using together.
*Insulin, oral antidiabetics:* May alter requirements for these drugs in previously stabilized diabetics. Monitor patient for hypoglycemia.
*Lidocaine:* May reduce clearance of lidocaine. Monitor lidocaine level closely.
***Phenothiazines (chlorpromazine, thioridazine):*** May increase risk of serious adverse reactions of either drug. Use with thioridazine is contraindicated. If chlorpromazine must be used, monitor patient's pulse and blood pressure; decrease propranolol dose as needed.
*Propafenone, quinidine:* May increase propranolol level. Monitor cardiac function, and adjust propranolol dose as needed.
**Drug-herb.** *Betel palm:* May decrease temperature-elevating effects and enhanced CNS effects. Discourage use together.
*Ma huang:* May decrease antihypertensive effects. Discourage use together.
**Drug-lifestyle.** *Alcohol:* May increase propranolol level. Discourage alcohol use.
*Cocaine use:* May increase angina-inducing potential of cocaine. Inform patient of this interaction.

## EFFECTS ON LAB TEST RESULTS

- May increase $T_4$, BUN, transaminase, alkaline phosphatase, potassium, and LDH levels. May decrease $T_3$ level.
- May decrease granulocyte count.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Abrupt withdrawal of drug may cause exacerbation of angina or myocardial infarction. To discontinue drug, gradually reduce dosage over a few weeks. Because coronary artery disease may be unrecognized, don't discontinue drug abruptly, even when taken for other indications. ■

- Contraindicated in patients with known hypersensitivity to drug, bronchial asthma, sinus bradycardia and heart block greater than first-degree, cardiogenic shock, and overt and decompensated heart failure (unless failure is secondary to a tachyarrhythmia that can be treated with propranolol).
- Use cautiously in patients with hepatic or renal impairment, Wolff-Parkinson-White syndrome, nonallergic bronchospastic diseases, or hepatic disease and in those taking other antihypertensives.
- Use cautiously in patients who have diabetes mellitus because drug masks some symptoms of hypoglycemia.
- In patients with thyrotoxicosis, use drug cautiously because it may mask the signs and symptoms. Abrupt withdrawal may exacerbate symptoms of hyperthyroidism, including thyroid storm.
- Elderly patients may experience enhanced adverse reactions and may need dosage adjustment.
- Use cautiously in pregnant women because drug may be associated with small placenta and congenital anomalies.

***Overdose S&S:*** Bradycardia, cardiac failure, hypotension, bronchospasm.

## NURSING CONSIDERATIONS

- Drug masks common signs and symptoms of shock and hypoglycemia.
- Monitor black patients for expected therapeutic effects; dosage adjustments may be necessary.

***Alert:*** Don't stop drug before surgery for pheochromocytoma. Before any surgical procedure, tell anesthesiologist that patient is receiving propranolol.

- ***Look alike–sound alike:*** Don't confuse propranolol with Pravachol. Don't confuse Inderal with Inderide, Isordil, Adderall, or Imuran.

## PATIENT TEACHING

- Caution patient to continue taking this drug as prescribed, even when he's feeling well.
- Instruct patient to take drug with food.

***Alert:*** Tell patient not to stop drug suddenly because this can worsen chest pain and trigger a heart attack.

P

## propylthiouracil (PTU)

proe-pill-thye-oh-YOOR-a-sill

PTU Propyl-Thyracil†

*Therapeutic class:* Antihyperthyroid
*Pharmacologic class:* Thyroid hormone antagonist
*Pregnancy risk category D*

### AVAILABLE FORMS

*Tablets:* 50 mg, 100 mg†

### INDICATIONS & DOSAGES

**Black Box Warning** Reserve drug for patients who can't tolerate methimazole and in whom radioactive iodine therapy or surgery isn't appropriate.

➤ **Hyperthyroidism**

*Adults:* 300 to 400 mg P.O. daily in three divided doses at 8-hour intervals. Patients with severe hyperthyroidism or very large goiters may need initial dose of 600 to 900 mg daily. Continue until patient is euthyroid; then start maintenance dose of 100 to 150 mg P.O. daily in three divided doses every 8 hours.

*Children age 6 and older:* Initially, 50 mg P.O. daily in divided doses every 8 hours. Carefully titrate upward.

➤ **Hyperthyroidism ♦**

*Children older than age 10:* Initially, 150 to 300 mg or 150 mg/$m^2$ P.O. daily in divided doses. Continue until patient is euthyroid. Individualize maintenance dose.

*Children ages 6 to 10:* Initially, 50 to 150 mg P.O. daily in divided doses every 8 hours. Continue until patient is euthyroid. Individualize maintenance dose. Or, 5 to 7 mg/kg/day P.O. or 150 to 200 mg/$m^2$/day P.O. in divided doses every 8 hours. Maintenance dose is one-third to two-thirds the initial dose beginning when patient is euthyroid.

*Neonates:* 5 to 10 mg/kg P.O. daily in divided doses t.i.d.

➤ **Thyrotoxic crisis**

*Adults:* 200 mg P.O. every 4 to 6 hours on first day; after symptoms are fully controlled, gradually reduce dosage to usual maintenance levels.

### ADMINISTRATION

**P.O.**

- Give in three equally divided doses about 8 hours apart.
- Give drug with meals to reduce adverse GI reactions.
- Store drug in light-resistant container.

### ACTION

Inhibits oxidation of iodine in thyroid gland, blocking ability of iodine to combine with tyrosine to form $T_4$, and may prevent coupling of monoiodotyrosine and diiodotyrosine to form $T_4$ and $T_3$.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 60–90 min | Unknown |

*Half-life:* 1 to 2 hours.

### ADVERSE REACTIONS

**CNS:** headache, drowsiness, vertigo, paresthesia, neuritis, neuropathies, CNS stimulation, depression, fever.
**CV:** vasculitis.
**EENT:** visual disturbances, loss of taste.
**GI:** diarrhea, *nausea*, *vomiting*, epigastric distress, salivary gland enlargement.
**GU:** nephritis.
**Hematologic:** ***agranulocytosis, leukopenia, thrombocytopenia, aplastic anemia.***
**Hepatic:** jaundice, ***hepatotoxicity.***
**Metabolic:** dose-related hypothyroidism.
**Musculoskeletal:** arthralgia, myalgia.
**Skin:** rash, urticaria, skin discoloration, pruritus, erythema nodosum, exfoliative dermatitis, lupuslike syndrome.
**Other:** lymphadenopathy.

### INTERACTIONS

**Drug-drug.** *Aminophylline, oxtriphylline, theophylline:* May decrease clearance of these drugs. Dosage may need to be adjusted.
*Cardiac glycosides:* May increase glycoside level. Dosage may need to be reduced.
*Potassium iodide:* May decrease response to drug. Dosage of antithyroid drug may need to be increased.
***Warfarin:*** May increase anticoagulation. Monitor PT and INR.
**Drug-food.** *Iodized salt, shellfish:* May alter drug's effectiveness. Urge caution.

### EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level.
- May decrease granulocyte, WBC, and platelet counts and liothyronine uptake.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in breast-feeding women.

**Black Box Warning** Not recommended for use in children except in rare instances in which methimazole isn't well tolerated and surgery or radioactive iodine therapy isn't appropriate. ■

- Use cautiously in pregnant patients.

***Overdose S&S:*** Nausea, vomiting, epigastric distress, headache, fever, arthralgia, pruritus, edema, pancytopenia, agranulocytosis, exfoliative dermatitis, hepatitis, neuropathies, CNS stimulation or depression.

### NURSING CONSIDERATIONS

**Black Box Warning** Because of risk of fetal abnormalities associated with methimazole, propylthiouracil may be treatment of choice when an antithyroid drug is indicated during or just before first trimester. ■

- Pregnant women may need less drug as pregnancy progresses. Monitor thyroid function studies closely. Thyroid hormone may be added to regimen. Drug may be stopped during last few weeks of pregnancy.

***Alert:*** Patients older than age 40 may have an increased risk of agranulocytosis.

- Watch for hypothyroidism (mental depression, cold intolerance, and hard, nonpitting edema); adjust dosage.
- Monitor CBC periodically to detect impending leukopenia, thrombocytopenia, and agranulocytosis.

***Alert:*** Stop drug and notify prescriber if severe rash develops or cervical lymph nodes enlarge.

**Black Box Warning** Severe liver injury or acute liver failure may occur in patients taking drug; monitor patient closely. ■

- Monitor hepatic function. Stop drug if transaminase levels are greater than three times the upper limit of normal.
- ***Look alike–sound alike:*** Don't confuse propylthiouracil with Purinethol.

### PATIENT TEACHING

- Instruct patient to take drug with meals.
- Warn patient to report fever, sore throat, mouth sores, and skin eruptions.
- Tell patient to report unusual bleeding or bruising.
- Tell patient to ask prescriber about using iodized salt and eating shellfish. These foods contain iodine and may alter effectiveness of drug.
- Teach patient to watch for signs and symptoms of hypothyroidism (unexplained weight gain, fatigue, cold intolerance) and to notify prescriber if they occur.

## protamine sulfate

PROE-ta-meen

*Therapeutic class:* Antidote
*Pharmacologic class:* Heparin antagonist
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 10 mg/ml

### INDICATIONS & DOSAGES

➤ **Heparin overdose**

*Adults:* Base dosage on venous blood coagulation studies, usually 1 mg neutralizes not less than 100 units of heparin. Give by slow I.V. injection over 10 minutes in doses not to exceed 50 mg.

### ADMINISTRATION

**I.V.**

▼ Have emergency equipment available to treat anaphylaxis or severe hypotension.
▼ Give slowly by direct injection. Excessively rapid administration may cause acute hypotension, bradycardia, pulmonary hypertension, dyspnea, transient flushing, and a feeling of warmth.
▼ **Incompatibilities:** Cephalosporins, diatrizoate meglumine 52% and diatrizoate sodium 8%, diatrizoate sodium 60%, ioxaglate meglumine 39.3% and ioxaglate sodium 19.6%, penicillins.

### ACTION

Forms a physiologically inert complex with heparin sodium.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 30–60 sec | Unknown | 2 hr |

*Half-life:* Unknown.

### ADVERSE REACTIONS
**CNS:** lassitude.
**CV:** ***bradycardia, circulatory collapse,*** hypotension, transient flushing.
**GI:** nausea, vomiting.
**Respiratory:** ***acute pulmonary hypertension,*** dyspnea, ***pulmonary edema.***
**Other:** ***anaphylaxis, anaphylactoid reactions,*** feeling of warmth.

### INTERACTIONS
None significant.

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
• Contraindicated in patients hypersensitive or intolerant to drug.
***Overdose S&S:*** Bleeding.

### NURSING CONSIDERATIONS
• Base postoperative dose on coagulation studies, and repeat activated PTT time 15 minutes after administration.
• Calculate dosage carefully. One milligram neutralizes 100 units of heparin, depending on salt (heparin calcium or heparin sodium) and source of heparin (beef or pork).
• Risk of hypersensitivity reaction increases in patients hypersensitive to fish, in vasectomized or infertile men, and in patients taking protamine-insulin products.
• Monitor patient continually.
• Watch for spontaneous bleeding (heparin rebound), especially in dialysis patients and in those who have undergone cardiac surgery.
• Drug may act as an anticoagulant in very high doses.
• ***Look alike–sound alike:*** Don't confuse protamine with Protopam or ProAmatine.

### PATIENT TEACHING
• Explain use and administration of drug to patient and family.
• Tell patient to report adverse effects.

## protein C concentrate
Ceprotin

*Therapeutic class:* Anticoagulant
*Pharmacologic class:* Protein C replacement
*Pregnancy risk category C*

### AVAILABLE FORMS
*Vials:* 500 international units, 1,000 international units

### INDICATIONS & DOSAGES
➤ **Venous thrombosis and purpura fulminans in patients with severe congenital protein C deficiency**
*Adults, neonates and pediatric patients:* Initially for acute episodes and short-term prophylaxis, 100 to 120 international units/kg IV; then, 60 to 80 international units/kg I.V. every 6 hours for subsequent three doses to maintain peak protein C activity of 100%. Maintenance dose of 45 to 60 international units/kg I.V. every 6 to 12 hours to maintain trough protein C activity levels above 25%.
➤ **Long-term prevention of venous thrombosis and purpura fulminans**
*Adults, neonates, and pediatric patients:* 45 to 60 international units/kg I.V. every 12 hours to maintain trough protein C activity levels above 25%.
***Adjust-a-dose:*** Dose is adjusted based on severity of protein C deficiency, plasma level of protein C, and the patient's age and condition.

### ADMINISTRATION
**I.V.**
▼ Refrigerate drug and diluent until ready for use; don't use drug unless a vacuum is present in vial. If no vacuum is present, contact Baxter at 1-888-CEPROTIN (237-7684).
▼ Reconstitute drug with provided sterile water for injection using double-ended transfer needle; remove transfer needle and gently swirl vial until all powder is dissolved.
▼ After reconstitution, solution is colorless to slightly yellowish and clear; don't use if discolored, or if particles are visible.

▼ Use within 3 hours of reconstitution.
▼ Withdraw contents of vial using a filter needle and then change to a suitable needle or infusion set to give.
▼ Give I.V. at a maximum rate of 2 ml/minute; in children with body weight of less than 10 kg, injection rate shouldn't exceed 0.2 ml/kg/minute.
▼ **Incompatibilities:** None.

## ACTION

Temporarily increases protein C plasma levels in deficient patients; replacement of protein C in protein C–deficient patients controls or prevents thrombotic complications.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | 30 to 60 min | Unknown |

*Half-life:* About 10 hours.

## ADVERSE REACTIONS

**CNS:** *fever,* light-headedness, restlessness.
**CV:** *hypotension.*
**Respiratory:** ***hemothorax.***
**Skin:** itching, rash.
**Other:** hypersensitivity reaction, hyperhidrosis.

## INTERACTIONS

**Drug-drug.** *Oral anticoagulants (vitamin K antagonists):* May suppress protein C activity. Continue protein C replacement until adequate anticoagulation occurs; start with lower dose of oral anticoagulant and adjust incrementally. Monitor patient closely.
*Tissue plasminogen activator:* Use together may increase bleeding risk. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

● Use cautiously in patients with allergies to mouse protein or heparin.

## NURSING CONSIDERATIONS

● Only prescribers experienced in using coagulation factors or inhibitors should initiate treatment.
● Monitor protein C levels regularly to achieve desired therapeutic effect.
● As a plasma product, this drug may potentially transmit disease; report any signs or symptoms of infection to prescriber and to the Baxter Corporation at 1-866-888-2472.
● Vaccinate patient against hepatitis A and B if he will need repeated courses of protein C replacement.
● Drug contains heparin; monitor patient's platelet count for signs of heparin-induced thrombocytopenia.
● Drug contains up to 200 mg sodium per dose; monitor sodium level in patients with renal impairment or on a low-sodium diet.
● Perform serum coagulation studies and check protein C levels routinely throughout treatment.

## PATIENT TEACHING

● Instruct patient to alert prescriber of signs or symptoms of infection, bleeding, or hypersensitivity.
● Inform patient on a low-sodium diet that the maximum daily dose contains more than 200 mg of sodium.
● Reassure patient that, because of manufacturing process, risk of HIV, hepatitis, Creutzfeldt-Jacob disease, or West Nile virus transmission is extremely low.

# pseudoephedrine hydrochloride

soo-dow-e-FED-rin

Allergy Care ◇, Congestaid ◇, ElixSure Children's Congestion ◇, Genaphed ◇, KidKare ◇, Silfedrine ◇, Simply Stuffy ◇, Sudafed ◇

*Therapeutic class:* Decongestant
*Pharmacologic class:* Adrenergic
*Pregnancy risk category C*

P

## AVAILABLE FORMS

**pseudoephedrine hydrochloride**
*Capsules:* 30 mg ◇, 60 mg ◇
*Drops:* 7.5 mg/0.8 ml ◇
*Oral solution:* 15 mg/5 ml ◇, 30 mg/5 ml ◇
*Syrup:* 15 mg/5 ml ◇
*Tablets:* 30 mg ◇, 60 mg ◇
*Tablets (chewable):* 15 mg ◇
*Tablets (extended-release):* 120 mg ◇, 240 mg ◇

## INDICATIONS & DOSAGES

➤ **To decongest nose and eustachian tubes**

*Adults and children older than age 12:* 60 mg P.O. every 4 to 6 hours; or 120 mg P.O. extended-release tablet every 12 hours; or 240 mg P.O. extended-release tablet once daily. Maximum dosage is 240 mg daily.
*Children ages 6 to 12:* 30 mg P.O. every 4 to 6 hours. Maximum dosage is 120 mg daily.
*Children ages 2 to 5:* 15 mg P.O. every 4 to 6 hours. Maximum dosage is 60 mg daily.

## ADMINISTRATION

**P.O.**

- Don't crush or break extended-release forms.

## ACTION

Stimulates alpha receptors in the respiratory tract, constricting blood vessels, shrinking swollen nasal mucous membranes, increasing airway patency, and reducing tissue hyperemia, edema, and nasal congestion.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30 min | 30–60 min | 4–12 hr |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *anxiety, nervousness,* dizziness, headache, insomnia, transient stimulation, tremor.
**CV:** *palpitations,* ***arrhythmias, CV collapse,*** tachycardia.
**GI:** anorexia, dry mouth, nausea, vomiting.
**GU:** difficulty urinating.
**Respiratory:** ***respiratory difficulties.***
**Skin:** pallor.
**Other:** diaphoresis.

## INTERACTIONS

**Drug-drug.** *Antihypertensives:* May inhibit hypotensive effect. Monitor blood pressure closely.
*MAO inhibitors (phenelzine, tranylcypromine):* May cause severe headache, hypertension, fever, and hypertensive crisis. Avoid using together and within 14 days of MAO inhibitor use.
*Methyldopa, reserpine:* May increase pressor response. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with severe hypertension or severe coronary artery disease, in those receiving MAO inhibitors, and in breast-feeding women. Extended-release forms are contraindicated in children younger than age 12.
- Use cautiously in patients with hypertension, cardiac disease, diabetes, glaucoma, hyperthyroidism, and prostatic hyperplasia.

⚠ ***Overdose S&S:*** Hypertension, bradycardia, drowsiness, rebound hypotension.

## NURSING CONSIDERATIONS

- Elderly patients are more sensitive to drug's effects. Extended-release tablets shouldn't be given to elderly patients until safety with short-acting preparations has been established.

## PATIENT TEACHING

- Tell patient not to crush or break extended-release forms.
- Warn against using OTC products containing other sympathomimetics.
- Instruct patient not to take drug within 2 hours of bedtime because it can cause insomnia.
- Tell patient to stop drug and notify prescriber if he becomes unusually restless.

# pyrethrins and piperonyl butoxide

pi-RETH-rinz and PI-per-oh-nel

A-200 ◇, Pronto ◇, Pyrinyl Plus ◇, R & C† ◇, RID ◇, Tisit ◇

*Therapeutic class:* Pediculicide
*Pharmacologic class:* Pyrethrin
*Pregnancy risk category C*

## AVAILABLE FORMS

*Lotion:* pyrethrins 0.3% and piperonyl butoxide 2%
*Mousse:* pyrethrins 0.33% and piperonyl butoxide 4%
*Shampoo:* pyrethrins 0.33% and piperonyl butoxide 4%

*Shampoo and conditioner:* pyrethrins 0.33% and piperonyl butoxide 3%
*Topical gel:* pyrethrins 0.3% and piperonyl butoxide 3%

## INDICATIONS & DOSAGES

➤ **Infestations of head, body, and pubic (crab) lice and their eggs**

*Adults and children:* Apply to hair, scalp, or other infested areas until entirely wet. Allow to remain for 10 minutes but no longer. Wash thoroughly with warm water and soap or shampoo. Remove dead lice and eggs with fine-tooth comb. Repeat treatment in 7 to 10 days to kill newly hatched lice; don't use more than two applications within 24 hours.

## ADMINISTRATION

**Topical**

- Don't apply to open areas, acutely inflamed skin, eyebrows, eyelashes, face, eyes, mucous membranes, or urethral opening. If accidental contact with eyes occurs, flush with water and notify prescriber.
- Stop using drug, wash it off skin, and notify prescriber immediately if skin irritation develops.
- All preparations contain petroleum distillates.

## ACTION

Acts as contact poison that disrupts parasite's nervous system, causing parasite's paralysis and death.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**Skin:** *irritation with repeated use*, edema, erythema, eczema, pruritus, urticaria.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, ragweed, or chrysanthemums.
- Use cautiously in infants and small children.

## NURSING CONSIDERATIONS

- Apply topical corticosteroids or give oral antihistamines if dermatitis develops from scratching.
- Discard container by wrapping in several layers of newspaper.
- Inspect all family members daily for at least 2 weeks for infestation.
- Drug isn't effective against scabies.
- Treat sexual contacts simultaneously.

## PATIENT TEACHING

- Instruct patient not to apply to open areas, acutely inflamed skin, eyebrows, eyelashes, face, eyes, mucous membranes, or urethral opening. If accidental contact with eyes occurs, advise patient to flush with water and notify prescriber.
- Warn patient not to swallow or inhale vapors from the drug.
- Tell patient to stop using drug, wash it off skin, and notify prescriber immediately if skin irritation develops. All preparations contain petroleum distillates.
- Instruct patient to change all clothing and bed linens after drug is washed off body. Tell him to disinfect washable items by machine washing in hot water and drying on hot cycle for at least 20 minutes. Other items can be dry-cleaned and sealed in plastic bags for 2 weeks, or treated with products made for this purpose.
- Teach patient to remove dead parasites with a fine-tooth comb.
- Tell patient to repeat treatment in 7 to 10 days to kill any newly hatched eggs.
- Urge patient to warn other family members and sexual partners so that they can be examined for the presence of lice.

P

# pyridostigmine bromide

peer-id-oh-STIG-meen

Mestinon*, Mestinon-SR†, Regonol

*Therapeutic class:* Muscle stimulant
*Pharmacologic class:* Cholinesterase inhibitor
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 5 mg/ml
*Syrup:* 60 mg/5 ml*
*Tablets:* 30 mg (for military use only), 60 mg
*Tablets (extended-release):* 180 mg

## INDICATIONS & DOSAGES

➤ **Antidote for nondepolarizing neuromuscular blockers**

*Adults:* 10 to 20 mg I.V., preceded by atropine sulfate 0.6 to 1.2 mg I.V.

➤ **Myasthenia gravis**

*Adults:* 60 to 120 mg P.O. every 3 or 4 hours. Average dosage is 600 mg daily, but dosages up to 1,500 mg daily may be needed. For I.M. or I.V. use, give 1/30 of oral dose. Dosage must be adjusted for each patient, based on response and tolerance. Or, 180 to 540 mg extended-release tablets P.O. daily or b.i.d., with at least 6 hours between doses.

➤ **Preexposure prophylaxis against the deadly effects of nerve agent soman**

*Adults in military combat:* 30 mg P.O. every 8 hours, starting at least several hours before soman exposure.

***Adjust-a-dose:*** Smaller doses may be required in patients with renal disease. Adjust dosage to achieve desired effect.

## ADMINISTRATION

**P.O.**

- Don't crush extended-release tablets.
- If patient has trouble swallowing, give syrup form. If patient can't tolerate sweet flavor, give over ice chips.

**I.V.**

▼ Don't use solution if it contains particulate matter or is discolored.

▼ Position patient to ease breathing. Keep atropine injection available, and be prepared to give it immediately.

▼ Monitor vital signs frequently, especially respirations. Provide respiratory support as needed.

▼ Give injection no faster than 1 mg/minute. Rapid infusion may cause bradycardia and seizures.

▼ If patient's muscle weakness is severe, prescriber will determine if it results from drug toxicity or worsening myasthenia gravis. Test dose of edrophonium I.V. will aggravate drug-induced weakness but will temporarily relieve disease-induced weakness.

▼ **Incompatibilities:** Alkaline solutions.

**I.M.**

- Don't use solution if it contains particulate matter or is discolored.

## ACTION

Inhibits acetylcholinesterase, blocking destruction of acetylcholine from the parasympathetic and somatic efferent nerves. Acetylcholine accumulates, promoting increased stimulation of the receptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 20–30 min | 2 hr | 3–6 hr |
| P.O. (extended-release) | 30–60 min | 1–2 hr | 6–12 hr |
| I.V. | 2–5 min | Unknown | 2–4 hr |
| I.M. | 15 min | Unknown | 2–4 hr |

*Half-life:* 1 to 3 hours, depending on route.

## ADVERSE REACTIONS

**CNS:** headache with high doses, weakness, syncope.
**CV:** ***bradycardia, cardiac arrest,*** hypotension, thrombophlebitis.
**EENT:** miosis, rhinorrhea.
**GI:** *nausea, vomiting,* abdominal cramps, diarrhea, excessive salivation, increased peristalsis.
**GU:** urinary frequency, urinary urgency.
**Musculoskeletal:** muscle cramps, muscle fasciculations, muscle weakness, tingling in extremities.
**Respiratory:** ***bronchospasm, bronchoconstriction,*** increased bronchial secretions.
**Skin:** rash, diaphoresis.

## INTERACTIONS

**Drug-drug.** *Aminoglycosides:* May prolong or enhance muscle weakness. Use together cautiously.
*Anticholinergics, atropine, corticosteroids, general or local anesthetics, magnesium, procainamide, quinidine:* May antagonize cholinergic effects. Observe patient for lack of drug effect.
*Ganglionic blockers:* May increase risk of hypotension. Monitor patient closely.
*Succinylcholine:* May prolong the phase I block of the depolarizing muscle relaxant. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to anticholinesterases or bromides and in those with mechanical obstruction of the intestinal or urinary tract.
- Use cautiously in patients with bronchial asthma, bradycardia, arrhythmias, epilepsy, recent coronary occlusion, vagotonia, renal impairment, hyperthyroidism, or peptic ulcer.
- Use cautiously in patients taking beta blockers for hypertension or glaucoma.
- Use cautiously in pregnant and breast-feeding women; drug appears in breast milk.

## NURSING CONSIDERATIONS

***Alert:*** If taken immediately before or during soman exposure, drug may be ineffective and may worsen soman's effects. At the first sign of soman poisoning, stop drug and immediately start atropine and pralidoxime.
- Stop all other cholinergics before giving this drug.
- Monitor and document patient's response after each dose. Optimum dosage is difficult to judge.

***Alert:*** Regonol contains benzyl ethanol preservative, which may cause toxicity in neonates if given in high doses.
- ***Look alike–sound alike:*** Don't confuse pyridostigmine with physostigmine.

## PATIENT TEACHING

- When giving drug for myasthenia gravis, stress importance of taking exactly as prescribed, on time, in evenly spaced doses. For extended-release tablets, tell patient to take at same time each day, at least 6 hours apart.
- Advise patient not to crush or chew extended-release tablets.
- Explain that patient may have to take drug for life.
- Advise patient to wear or carry medical identification that identifies his myasthenia gravis.
- Stress to military personnel importance of taking nerve agent antidotes, atropine and pralidoxime, rather than this drug at the first sign of nerve-agent poisoning.

# pyrimethamine

pihr-ih-METH-ah-meen

Daraprim

*Therapeutic class:* Antimalarial
*Pharmacologic class:* Folic acid antagonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 25 mg

## INDICATIONS & DOSAGES

➤ **To prevent and control transmission of malaria**

*Adults and children age 10 and older:* 25 mg P.O. weekly for 6 to 10 weeks or longer after leaving malaria-endemic areas.
*Children ages 4 to 10:* Give 12.5 mg P.O. weekly continued for 6 to 10 weeks or longer after leaving malaria-endemic areas.
*Infants and children younger than age 4:* Give 6.25 mg P.O. weekly continued for 6 to 10 weeks or longer after leaving malaria-endemic areas.

➤ **Acute attacks of malaria**

*Adults and children age 10 and older:* 25 mg P.O. daily for 2 days with a sulfonamide. Clinical cure should be followed with 25 mg P.O. once weekly for at least 10 weeks. Or, 50 mg P.O. daily for 2 days; then 25 mg once weekly for at least 10 weeks.

*Children ages 4 to 10:* Give 25 mg P.O. once daily for 2 days; then 12.5 mg once weekly for at least 10 weeks.

➤ **Toxoplasmosis**

*Adults:* Initially, 50 to 75 mg P.O. with 1 to 4 g of a sulfonamide of the sulfapyrimidine type; continue for 1 to 3 weeks. After 3 weeks, reduce dosage by half and continue for 4 to 5 weeks.

*Children:* Initially, 1 mg/kg/day P.O. in two equally divided doses for 2 to 4 days; then 0.5 mg/kg daily for 4 weeks, along with a sulfonamide at a pediatric dosage.

## ADMINISTRATION

**P.O.**

- Patient should take first preventive dose 1 to 2 days before traveling.
- Give drug with meals.

## ACTION

Blocks creation of folic acid, which is required for the reproduction of the infecting organism. Sulfadoxine competitively inhibits use of PABA.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1½–8 hr | 2 wk |

*Half-life:* 4 days.

## ADVERSE REACTIONS

**CV:** ***arrhythmias.***
**GI:** anorexia, vomiting, atrophic glossitis.
**Hematologic:** ***agranulocytosis, aplastic anemia, leukopenia, thrombocytopenia, pancytopenia,*** megaloblastic anemia.
**Skin:** ***Stevens-Johnson syndrome.***
**Other:** ***hypersensitivity reactions,*** hyperphenylalaninemia.

## INTERACTIONS

**Drug-drug.** *Lorazepam:* May increase risk of hepatotoxicity. Avoid using together.
*PABA:* May decrease action against toxoplasmosis. May need to adjust dosage.
*Sulfamethoxazole and trimethoprim, methotrexate, sulfonamides:* May increase risk of bone marrow suppression. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level.
- May decrease granulocyte, WBC, platelet, and RBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Pyrimethamine is contraindicated in patients hypersensitive to drug and in those with megaloblastic anemia from folic acid deficiency.
- Contraindicated in infants younger than age 2 months and in pregnant (at term) and breast-feeding women.
- Use cautiously after treatment with chloroquine and in patients with impaired hepatic or renal function, severe allergy or bronchial asthma, G6PD deficiency, or seizure disorders (smaller doses may be needed).

⚠ ***Overdose S&S:*** Abdominal pain, nausea, vomiting, hematemesis, excitability, respiratory depression, circulatory collapse.

## NURSING CONSIDERATIONS

- Pyrimethamine alone isn't recommended for malaria. Use drug with faster-acting antimalarials, such as chloroquine, for 2 days to start transmission control and suppressive cure.
- For toxoplasmosis, obtain twice-weekly blood counts, including platelets, because usual dosages approach toxic levels. If signs of folic- or folinic-acid deficiency develop, reduce dosage or stop drug and give parenteral folinic acid (leucovorin) until blood counts return to normal.
- Adverse drug reactions related to sulfadiazine are similar to those related to sulfonamides.
- When used for toxoplasmosis in patients with AIDS, therapy may be lifelong.

## PATIENT TEACHING

- Instruct patient to take drug with meals.
- Inform patient with toxoplasmosis of importance of frequent laboratory studies and compliance with therapy. Tell patient he may need long-term therapy.
- Tell patient to take first preventive dose 1 to 2 days before traveling.

## quetiapine fumarate

kwe-TIE-ah-peen

Seroquel✓, Seroquel XR

*Therapeutic class:* Antipsychotic
*Pharmacologic class:* Dibenzothiazepine derivative
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 25 mg, 50 mg, 100 mg, 200 mg, 300 mg, 400 mg
*Tablets (extended-release):* 50 mg, 150 mg, 200 mg, 300 mg, 400 mg

### INDICATIONS & DOSAGES

➤ **Schizophrenia**

*Adults:* Initially, 25 mg P.O. b.i.d., with increases in increments of 25 to 50 mg b.i.d. or t.i.d. on days 2 and 3, as tolerated. Target range is 300 to 400 mg daily divided into two or three doses by day 4. Further dosage adjustments, if indicated, should occur at intervals of not less than 2 days. Dosage can be increased or decreased by 25 to 50 mg b.i.d. Effect generally occurs at 150 to 750 mg daily. Safety of dosages over 800 mg daily hasn't been evaluated.

Or, 300 mg/day extended-release tablets P.O. once daily, preferably in the evening. Titrate within a dose range of 400 to 800 mg/day, depending on the response and tolerance of the individual. Increase at intervals as short as 1 day and in increments of 300 mg/day.

*Adolescents ages 13 to 17:* Total daily dosage for initial 5 days of therapy is 50 mg P.O. on day 1, then 100 mg on day 2, then 200 mg on day 3, then 300 mg on day 4, and 400 mg on day 5. Then adjust dosage within the recommended range of 400 to 800 mg daily. Make adjustments in increments of no greater than 100 mg/day. Effectiveness of therapy for longer than 6 weeks hasn't been evaluated.

***Adjust-a-dose:*** Elderly patients: Titrate on immediate-release formula, starting at 25 mg/day. Use slow titration and regular monitoring; may be switched to extended-release formulation when stabilized on 200 mg/day. In patients with hepatic impairment, initial dose is 25 mg daily. Increase daily in increments of 25 to 50 mg daily to an effective dose; may be switched to extended-release formulation when stabilized on 200 mg/day. For debilitated patients and those with hypotension, consider lower dosages and slower adjustment.

➤ **Monotherapy and adjunct therapy with lithium or divalproex for the short-term treatment of acute manic episodes associated with bipolar I disorder; adjunct maintenance therapy with lithium or divalproex**

*Adults:* Initially, 50 mg P.O. b.i.d. Increase dosage in increments of 100 mg daily in two divided doses up to 200 mg P.O. b.i.d. on day 4. May increase dosage in increments no greater than 200 mg daily up to 800 mg daily by day 6. Usual dose is 400 to 800 mg daily. For maintenance therapy with lithium or divalproex, continue treatment at the dosage required to maintain symptom remission.

Or, start with 300 mg (extended-release) P.O. on day 1 and 600 mg P.O. on day 2 once daily in the evening. Dosage may be adjusted between 400 and 800 mg beginning on day 3.

***Adjust-a-dose:*** Elderly patients: Titrate on immediate release formula, starting at 25 mg/day. Use slow titration and regular monitoring. In patients with hepatic impairment, initial dose is 25 mg daily. Increase daily in increments of 25 to 50 mg daily to an effective dose. For debilitated patients and those with hypotension, consider lower dosages and slower adjustment.

➤ **Bipolar I disorder, acute manic episodes**

*Children ages 10 to 17:* Total daily dosage for initial 5 days of therapy is 50 mg P.O. on day 1, then 100 mg on day 2, then 200 mg on day 3, then 300 mg on day 4, and 400 mg on day 5. After day 5, adjust dosage within recommended range of 400 to 600 mg/day. Effectiveness of therapy for longer than 3 weeks hasn't been evaluated.

➤ **Depression associated with bipolar disorder**

*Adults:* Initially, 50 mg P.O. once daily at bedtime; increase on day 2 to 100 mg; increase on day 3 to 200 mg; increase on day 4 to maintenance dose of 300 mg.

***Adjust-a-dose:*** Elderly patients: Titrate on immediate-release formula, starting at 25 mg/day. Use slow titration and regular monitoring. In patients with hepatic impairment, initial dose is 25 mg daily. Increase daily in increments of 25 to 50 mg daily to an effective dose. For debilitated patients and those with hypotension, consider lower dosages and slower adjustment.

➤ **Major depressive disorder, adjunctive therapy**

*Adults:* 50 mg P.O. (extended-release) once daily in the evening. On day 3, may increase dosage to 150 mg P.O. once daily in the evening. Dosages ranging from 150 to 300 mg/day have proved effective.

➤ **Obsessive-compulsive disorder ♦**

*Adults:* 50 mg P.O. daily; increase dosage based on therapeutic effect and tolerance. Continue for 1 to 2 years before tapering; then reduce dosage by 10% to 25% every 1 to 2 months.

## ADMINISTRATION

**P.O.**

- Don't break or crush extended-release tablets.
- Give drug without regard for food; give extended-release tablets without food or with a light meal (about 300 calories).
- Schizophrenic patients who are currently being treated with divided doses of the immediate-release form may be switched to extended-release tablets at the equivalent total daily dose taken once daily. Individual dosage adjustments may be necessary. Those requiring less than 200 mg/dose should remain on the immediate-release form.

## ACTION

Blocks dopamine and serotonin 5-$HT_2$ receptors. Its action may be mediated through this antagonism.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1½ hr | Unknown |
| P.O. extended-release | Unknown | 6 hr | Unknown |

*Half-life:* 6 hours; extended-release, 7 to 12 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness, headache, somnolence,* ***neuroleptic malignant syndrome, seizures,*** hypertonia, dysarthria, asthenia, *agitation.*
**CV:** orthostatic hypotension, tachycardia, palpitations, peripheral edema.
**EENT:** ear pain, pharyngitis, rhinitis.
**GI:** dry mouth, dyspepsia, abdominal pain, constipation, anorexia, vomiting.
**Hematologic:** ***leukopenia.***
**Metabolic:** *weight gain,* hyperglycemia.
**Musculoskeletal:** back pain.
**Respiratory:** increased cough, dyspnea.
**Skin:** rash, diaphoresis.
**Other:** flulike syndrome.

## INTERACTIONS

**Drug-drug.** *Antihypertensives:* May increase effects of antihypertensives. Monitor blood pressure.
*Carbamazepine, glucocorticoids, phenobarbital, phenytoin, rifampin, thioridazine:* May increase quetiapine clearance. May need to adjust quetiapine dosage.
*CNS depressants:* May increase CNS effects. Use together cautiously.
*Dopamine agonists, levodopa:* May antagonize the effects of these drugs. Monitor patient.
*Erythromycin, fluconazole, itraconazole, ketoconazole:* May decrease quetiapine clearance. Use together cautiously.
*Lorazepam:* May decrease lorazepam clearance. Monitor patient for increased CNS effects.
**Drug-lifestyle.** *Alcohol use:* May increase CNS effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase liver enzyme, cholesterol, triglyceride, and glucose levels. May decrease $T_4$ and thyroid-stimulating hormone levels.
- May decrease WBC count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its ingredients.
- Use cautiously in patients with CV disease, cerebrovascular disease, conditions that predispose to hypotension, a history of seizures or conditions that lower the seizure threshold, and conditions in which core body temperature may be elevated.

• Use cautiously in patients at risk for aspiration pneumonia.
**Black Box Warning** Drug isn't approved for use in children younger than age 10 (immediate release) or younger than age 18 (extended release). ■
***Overdose S&S:*** Drowsiness, hypotension, sedation, tachycardia, hypokalemia, first-degree heart block.

## NURSING CONSIDERATIONS

• Dispense lowest appropriate quantity of drug to reduce risk of overdose.
**Black Box Warning** Drug isn't indicated for use in elderly patients with dementia-related psychosis because of increased risk of death from CV disease or infection. ■
***Alert:*** Watch for evidence of neuroleptic malignant syndrome (extrapyramidal effects, hyperthermia, autonomic disturbance), which is rare but deadly.
• Monitor patient for tardive dyskinesia, which may occur after prolonged use. It may not appear until months or years later and may disappear spontaneously or persist for life, despite ending drug.
• Hyperglycemia may occur in patients taking drug. Monitor patients with diabetes regularly.
• Monitor patient for weight gain.
***Alert:*** Monitor patient for symptoms of metabolic syndrome (significant weight gain and increased body mass index, hypertension, hyperglycemia, hypercholesterolemia, and hypertriglyceridemia).
• Drug use may cause cataract formation. Obtain baseline ophthalmologic examination and reassess every 6 months.
**Black Box Warning** Drug (immediate-release tablets) may increase the risk of suicidal thinking and behavior in children, adolescents, and young adults ages 18 to 24, especially during the first few months of treatment, especially in those with major depressive or other psychiatric disorder. ■

## PATIENT TEACHING

• Warn patient about risk of dizziness when standing up quickly. The risk is greatest during the 3- to 5-day period of first dosage adjustment, when resuming treatment, and when increasing dosages.
• Tell patient to avoid becoming overheated or dehydrated.
• Warn patient to avoid activities that require mental alertness until effects of drug are known, especially during first dosage adjustment or dosage increases.
• Remind patient to have an eye examination at start of therapy and every 6 months during therapy to check for cataracts.
• Tell patient to notify prescriber about other prescription or OTC drugs he's taking or plans to take.
• Tell women of childbearing age to notify prescriber about planned, suspected, or known pregnancy.
• Advise women not to breast-feed during therapy.
• Advise patient to avoid alcohol while taking drug.
• Tell patient to take drug with or without food.
• Tell patient not to crush, chew, or break extended-release tablets.
• Tell patient to take extended-release tablets without food or with a light meal.

# quinapril hydrochloride

KWIN-ah-pril

Accupril✐

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* ACE inhibitor
*Pregnancy risk category C; D in 2nd and 3rd trimesters*

Q

## AVAILABLE FORMS

*Tablets:* 5 mg, 10 mg, 20 mg, 40 mg

## INDICATIONS & DOSAGES

➤ **Hypertension**
*Adults:* Initially, 10 to 20 mg P.O. daily. Dosage may be adjusted based on patient response at intervals of about 2 weeks. Most patients are controlled at 20, 40, or 80 mg daily as a single dose or in two divided doses. If patient is taking a diuretic, start therapy with 5 mg daily.
*Elderly patients:* For patients older than age 65, start therapy at 10 mg P.O. daily.
***Adjust-a-dose:*** For adults with creatinine clearance over 60 ml/minute, initially,

10 mg maximum daily; for clearance of 30 to 60 ml/minute, 5 mg; for clearance of 10 to 30 ml/minute, 2.5 mg.

➤ **Heart failure**

*Adults:* If patient is taking a diuretic, give 5 mg P.O. b.i.d. initially. If patient isn't taking a diuretic, give 10 to 20 mg P.O. b.i.d. Dosage may be increased at weekly intervals. Usual effective dose is 20 to 40 mg daily in two equally divided doses.

***Adjust-a-dose:*** For patients with creatinine clearance over 30 ml/minute, first dose is 5 mg daily; if clearance is 10 to 30 ml/minute, 2.5 mg.

## ADMINISTRATION

**P.O.**

- Give drug 1 hour before or 2 hours after meals, or with a light meal.
- Don't give drug with a high-fat meal because this may decrease absorption of drug.

## ACTION

Prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor. Less angiotensin II decreases peripheral arterial resistance, decreasing aldosterone secretion, which reduces sodium and water retention and lowers blood pressure.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 2–6 hr | 24 hr |

*Half-life:* 25 hours.

## ADVERSE REACTIONS

**CNS:** headache, dizziness, fatigue, depression.

**CV:** ***hypertensive crisis,*** hypotension, chest pain.

**GI:** abdominal pain, vomiting, nausea, diarrhea.

**Metabolic:** ***hyperkalemia.***

**Musculoskeletal:** back pain, myalgia.

**Respiratory:** dry, persistent, tickling, nonproductive cough, dyspnea.

**Skin:** rash.

## INTERACTIONS

**Drug-drug.** *Diuretics, other antihypertensives:* May cause excessive hypotension. Stop diuretic or reduce dose of quinapril, as needed.

*Lithium:* May increase lithium level and lithium toxicity. Monitor lithium level.

*NSAIDs:* May decrease antihypertensive effects. Monitor blood pressure.

*Potassium-sparing diuretics, potassium supplements:* May cause hyperkalemia. Monitor patient closely.

*Tetracycline:* May decrease absorption if taken with quinapril. Avoid using together.

**Drug-herb.** *Capsaicin:* May cause cough. Discourage use together.

*Ma huang:* May decrease antihypertensive effects. Discourage use together.

**Drug-food.** *Salt substitutes containing potassium:* May cause hyperkalemia. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase potassium, BUN, and creatinine levels.
- May increase liver function test values.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to ACE inhibitors and in those with a history of angioedema related to treatment with an ACE inhibitor.

**Black Box Warning** Use during pregnancy can cause injury and death to the developing fetus. When pregnancy is detected, stop drug as soon as possible.

- Use cautiously in patients with impaired renal function.

***Overdose S&S:*** Hypotension.

## NURSING CONSIDERATIONS

- Assess renal and hepatic function before and periodically throughout therapy.
- Monitor blood pressure for effectiveness of therapy.
- Monitor potassium level. Risk factors for the development of hyperkalemia include renal insufficiency, diabetes, and concomitant use of drugs that raise potassium level.
- Although ACE inhibitors reduce blood pressure in all races, they reduce it less in blacks taking the ACE inhibitor alone. Black patients should take drug with a thiazide diuretic for a better response.
- ACE inhibitors appear to increase risk of angioedema in black patients.
- Other ACE inhibitors have caused agranulocytosis and neutropenia. Monitor CBC

with differential counts before therapy and periodically thereafter.

### PATIENT TEACHING

- Advise patient to report signs of infection, such as fever and sore throat.
- *Alert:* Facial and throat swelling (including swelling of the larynx) may occur, especially after first dose. Advise patient to report signs or symptoms of breathing difficulty or swelling of face, eyes, lips, or tongue.
- Light-headedness can occur, especially during first few days of therapy. Tell patient to rise slowly to minimize effect and to report signs and symptoms to prescriber. If he faints, patient should stop taking drug and call prescriber immediately.
- Inform patient that inadequate fluid intake, vomiting, diarrhea, and excessive perspiration can lead to light-headedness and fainting. Tell him to use caution in hot weather and during exercise.
- Tell patient to avoid salt substitutes. These products may contain potassium, which can cause high potassium level in patients taking quinapril.
- Advise women of childbearing age to notify prescriber if pregnancy occurs. Drug will need to be stopped.
- Tell patient to avoid taking with a high-fat meal because this may decrease absorption of drug.

## quinidine gluconate

KWIN-i-deen

## quinidine sulfate

*Therapeutic class:* Antiarrhythmic
*Pharmacologic class:* Cinchona alkaloid
*Pregnancy risk category C*

### AVAILABLE FORMS

**quinidine gluconate (62% quinidine base)**
*Injection:* 80 mg/ml
*Tablets (extended-release):* 324 mg
**quinidine sulfate (83% quinidine base)**
*Injection:* 190 mg/ml†
*Tablets:* 200 mg, 300 mg
*Tablets (extended-release):* 300 mg

### INDICATIONS & DOSAGES

➤ **Atrial flutter or fibrillation**
*Adults:* 300 to 400 mg quinidine sulfate or equivalent base P.O. every 6 hours. Or, 200 mg P.O. every 2 to 3 hours for five to eight doses, increased daily until sinus rhythm is restored or toxic effects develop. Maximum, 3 to 4 g daily.

➤ **Paroxysmal supraventricular tachycardia**
*Adults:* 400 to 600 mg P.O. gluconate every 2 to 3 hours until toxic adverse reactions develop or arrhythmia subsides.

➤ **Premature atrial and ventricular contractions, paroxysmal AV junctional rhythm, paroxysmal atrial tachycardia, paroxysmal ventricular tachycardia, maintenance after cardioversion of atrial fibrillation or flutter**
*Adults:* Test dose is 200 mg P.O. or I.M. Quinidine sulfate or equivalent base 200 to 400 mg P.O. every 4 to 6 hours or 600 mg quinidine sulfate extended-release every 8 to 12 hours; or 324 mg quinidine gluconate extended-release tablets every 8 to 12 hours; or quinidine gluconate 800 mg (10 ml of commercially available solution) added to 40 ml of $D_5W$, infused I.V. at 0.25 mg/kg/minute.

➤ **Severe *Plasmodium falciparum* malaria**
*Adults:* 10 mg/kg gluconate I.V. diluted in 250 ml normal saline solution and infused over 1 to 2 hours; then begin a continuous infusion of 0.02 mg/kg/minute for at least 24 hours, and until parasitemia is reduced to less than 1% and oral therapy can be started. Or, give a loading dose of 24 mg/kg of quinidine gluconate I.V. diluted in 250 ml of normal saline and infused over 4 hours; then 4 hours later, give maintenance dose of 12 mg/kg of quinidine gluconate given by I.V. infusion over 4 hours at 8-hour intervals until three maintenance doses have been given and parasitemia is reduced to less than 1% and oral quinidine sulfate can be initiated.
*Children:* 10 mg/kg gluconate I.V. over 1 to 2 hours; then continuous infusion of 0.02 mg/kg/minute for up to 72 hours or until parasitemia is reduced to 1% or less, whichever comes first. For patients able to swallow pills, maintenance therapy may

be given P.O. with quinine sulfate every 8 hours in divided doses of same quinine base amount.

***Adjust-a-dose:*** In patients with hepatic impairment or heart failure, reduce dosage.

## ADMINISTRATION

**P.O.**

- Give drug with food to avoid adverse GI reactions.
- Don't crush or open extended-release tablets. If necessary, scored tablets may be broken in half to adjust quinidine dose.
- Don't give drug with grapefruit juice.

**I.V.**

- For quinidine gluconate infusion to treat atrial fibrillation or flutter in adults, dilute 800 mg (10 ml of injection) with 40 ml $D_5W$ and infuse at up to 0.25 mg/kg/minute.
- For quinidine gluconate infusion to treat malaria, dilute in 5 ml/kg (usually 250 ml) normal saline solution and infuse over 1 to 2 hours, followed by a continuous maintenance infusion.
- During infusion, continuously monitor patient's blood pressure and ECG.
- Adjust rate so that the arrhythmia is corrected without disturbing the normal mechanism of the heartbeat.
- Never use discolored (brownish) quinidine solution.
- Store drug away from heat and direct light.
- **Incompatibilities:** Alkalies, amiodarone, atracurium besylate, furosemide, heparin sodium, iodides.

**I.M.**

- Never use discolored (brownish) quinidine solution.
- Quinidine gluconate I.M. is no longer recommended for arrhythmias because of erratic absorption.
- Store drug away from heat and direct light.

## ACTION

A class IA antiarrhythmic with direct and indirect (anticholinergic) effects on cardiac tissue. Decreases automaticity, conduction velocity, and membrane responsiveness; prolongs effective refractory period; and reduces vagal tone.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1–3 hr | 1–6 hr | 6–8 hr |
| I.V. | Immediate | Immediate | Unknown |
| I.M. | Unknown | 30–90 min | Unknown |

*Half-life:* 5 to 12 hours.

## ADVERSE REACTIONS

**CNS:** *vertigo, fever, headache, lightheadedness,* ataxia, confusion, depression, dementia.
**CV:** *ECG changes, tachycardia,* ***PVCs, ventricular tachycardia, atypical ventricular tachycardia, complete AV block, aggravated heart failure,*** hypotension.
**EENT:** *tinnitus,* blurred vision, diplopia, photophobia.
**GI:** *diarrhea, nausea, vomiting,* anorexia, excessive salivation, abdominal pain.
**Hematologic:** ***thrombocytopenia, agranulocytosis,*** hemolytic anemia.
**Hepatic:** ***hepatotoxicity.***
**Respiratory:** ***acute asthmatic attack, respiratory arrest.***
**Skin:** rash, petechial hemorrhage of buccal mucosa, pruritus, urticaria, photosensitivity reactions.
**Other:** *cinchonism,* ***angioedema,*** lupus erythematosus.

## INTERACTIONS

**Drug-drug.** *Antacids, sodium bicarbonate:* May increase quinidine level. Monitor patient for increased effect.
***Amiloride:*** May increase the risk of arrhythmias. If use together can't be avoided, monitor ECG closely.
*Amiodarone:* May increase quinidine level, producing life-threatening cardiac arrhythmias. Monitor quinidine level closely if use together can't be avoided. Adjust quinidine as needed.
***Azole antifungals:*** May increase the risk of cardiovascular events. Use together is contraindicated.
*Barbiturates, phenytoin, rifampin:* May decrease quinidine level. Monitor patient for decreased effect.
*Cimetidine:* May increase quinidine level. Monitor patient for increased arrhythmias.
***Digoxin:*** May increase digoxin level after starting quinidine therapy. Monitor digoxin level.

*Drugs that prolong the QT interval (antipsychotics, disopyramide, procainamide, tricyclic antidepressants, sotalol):* May have additive effect with quinidine and cause life-threatening cardiac arrhythmias. Avoid using together when possible.
*Fluvoxamine, nefazodone, tricyclic antidepressants:* May increase antidepressant level, thus increasing its effect. Monitor patient for adverse reactions.
***Macrolides and related antibiotics (azithromycin, clarithromycin, erythromycin, telithromycin):*** May cause additive effects or prolongation of the QT interval. Use with caution. Avoid use with telithromycin.
*Neuromuscular blockers:* May potentiate effects of these drugs. Avoid use of quinidine immediately after surgery.
*Nifedipine:* May decrease quinidine level. May need to adjust dosage.
*Other antiarrhythmics (such as lidocaine, procainamide, propranolol):* May increase risk of toxicity. Use together cautiously.
***Protease inhibitors (nelfinavir, ritonavir):*** May significantly increase quinidine levels and toxicity. Use together is contraindicated.
***Quinolones:*** Life-threatening arrhythmias, including torsades de pointes, can occur. Avoid using together.
*Verapamil:* May decrease quinidine clearance and cause hypotension, bradycardia, AV block, or pulmonary edema. Monitor blood pressure and heart rate.
*Warfarin:* May increase anticoagulant effect. Monitor patient closely.
**Drug-herb.** *Jimsonweed:* May adversely affect CV function. Discourage use together.
*Licorice:* May have additive effect and prolong QT interval. Urge caution.
**Drug-food.** *Grapefruit:* May delay absorption and onset of action of drug. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level.
- May decrease platelet and granulocyte counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with idiosyncrasy or hypersensitivity to quinidine or related cinchona derivatives.
- Contraindicated in those with myasthenia gravis, intraventricular conduction defects, digoxin toxicity when AV conduction is grossly impaired, abnormal rhythms caused by escape mechanisms, complete AV block, history of drug-induced torsades de pointes, and history of prolonged QT interval syndrome.
- Contraindicated in patients who developed thrombocytopenia after exposure to quinidine or quinine.
- Use cautiously in patients with asthma, muscle weakness, or infection accompanied by fever because hypersensitivity reactions to drug may be masked.
- Use cautiously in patients with hepatic or renal impairment because systemic accumulation may occur.

***Overdose S&S:*** Depressed mental function, headache, nausea, vomiting, diarrhea, abdominal pain, tachyarrhythmias, depressed cardiac automaticity and conduction, hypotension, heart failure, hypokalemia, acidosis.

## NURSING CONSIDERATIONS

- Check apical pulse rate and blood pressure before therapy. If extremes in pulse rate are detected, withhold drug and notify prescriber at once.

***Alert:*** For atrial fibrillation or flutter, give quinidine only after AV node has been blocked with a beta blocker, digoxin, or a calcium channel blocker to avoid increasing AV conduction.

- Anticoagulant therapy is commonly advised before quinidine therapy in long-standing atrial fibrillation because restoration of normal sinus rhythm may result in thromboembolism caused by dislodgment of thrombi from atrial wall.
- Monitor patient for atypical ventricular tachycardia, such as torsades de pointes and ECG changes, particularly widening of QRS complex, widened QT and PR intervals.

***Alert:*** When changing route of administration or oral salt form, prescriber should alter dosage to compensate for variations in quinidine base content.

***Alert:*** Hospitalize patients with severe malaria in an intensive care setting, with continuous monitoring. Decrease infusion

rate if quinidine level exceeds 6 mcg/ml, uncorrected QT interval exceeds 0.6 seconds, or QRS complex widening exceeds 25% of baseline.
- Monitor liver function test results during first 4 to 8 weeks of therapy.
- Monitor quinidine level. Therapeutic levels for antiarrhythmic effects are 4 to 8 mcg/ml.
- Monitor patient response carefully. If adverse GI reactions occur, especially diarrhea, notify prescriber. Check quinidine level, which is increasingly toxic when greater than 10 mcg/ml. GI symptoms may be decreased by giving drug with meals or aluminum hydroxide antacids.
- ***Look alike–sound alike:*** Don't confuse quinidine with quinine or clonidine.

## PATIENT TEACHING

- Stress importance of taking drug exactly as prescribed and taking it with food if adverse GI reactions occur.
- ***Alert:*** Instruct patient not to crush or chew extended-release tablets. If necessary, he may break scored tablets in half to adjust quinidine dose.
- Tell patient to avoid grapefruit juice because it may delay drug absorption and inhibit drug metabolism.
- Advise patient to report persistent or serious adverse reactions promptly, especially signs and symptoms of quinidine toxicity (ringing in the ears, visual disturbances, dizziness, headache, nausea).

# quinupristin and dalfopristin

QUIN-uh-pris-tin and DALF-oh-pris-tin

Synercid

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Streptogramin
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 500 mg/10 ml (150 mg quinupristin and 350 mg dalfopristin)

## INDICATIONS & DOSAGES

**Black Box Warning** **Serious or life-threatening infections with vancomycin-resistant *Enterococcus faecium* bacteremia under the FDA's accelerated approval regulations for use in life-threatening conditions when other therapies aren't available.**

*Adults and adolescents age 16 and older:* 7.5 mg/kg I.V. over 1 hour every 8 hours. Length of treatment depends on site and severity of infection.

➤ **Complicated skin and skin-structure infections caused by methicillin-susceptible *Staphylococcus aureus* or *Streptococcus pyogenes***

*Adults and adolescents age 16 and older:* 7.5 mg/kg I.V. over 1 hour every 12 hours for at least 7 days.

## ADMINISTRATION

**I.V.**

▼ Reconstitute powder for injection by adding 5 ml of either sterile water for injection or $D_5W$ and gently swirling vial by manual rotation to ensure dissolution; avoid shaking to limit foaming. Reconstituted solutions must be further diluted within 30 minutes.

▼ Add appropriate dose of reconstituted solution to 250 ml of $D_5W$, according to patient's weight, to yield no more than 2 mg/ml. This diluted solution is stable for 5 hours at room temperature or 54 hours if refrigerated.

▼ Flush line with $D_5W$ before and after each dose.

▼ Fluid-restricted patients with a central venous catheter may receive dose in 100 ml of $D_5W$. This concentration isn't recommended for peripheral venous administration.

▼ If moderate to severe peripheral venous irritation occurs, consider increasing infusion volume to 500 or 750 ml, changing injection site, or infusing by a central venous catheter.

▼ Give all doses by I.V. infusion over 1 hour. An infusion pump or device may be used to control infusion rate.

▼ **Incompatibilities:** Saline and heparin solutions.

## ACTION

The two antibiotics work synergistically to inhibit or destroy susceptible bacteria

through combined inhibition of protein synthesis in bacterial cells. Without the ability to manufacture new proteins, the bacterial cells are inactivated or die.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* Quinupristin, 1 hour; dalfopristin, ¾ hour.

## ADVERSE REACTIONS

**CNS:** headache, pain.
**CV:** thrombophlebitis.
**GI:** diarrhea, nausea, vomiting.
**Musculoskeletal:** arthralgia, myalgia.
**Skin:** *edema at infusion site, inflammation, infusion site reaction, pain at infusion site,* pruritus, rash.

## INTERACTIONS

**Drug-drug.** *Cyclosporine:* May lower metabolism; may increase drug level. Monitor cyclosporine level.
*Drugs metabolized by CYP3A4, such as carbamazepine, delavirdine, diazepam, diltiazem, disopyramide, docetaxel, indinavir, lidocaine, lovastatin, methylprednisolone, midazolam, nevirapine, nifedipine, paclitaxel, ritonavir, tacrolimus, verapamil, vinblastine:* May increase levels of these drugs, which could increase both their therapeutic effects and adverse reactions. Use together cautiously.
*Drugs metabolized by CYP3A4 that may prolong the QTc interval, such as quinidine:* May decrease metabolism of these drugs, prolonging QTc interval. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

- May increase AST, ALT, and bilirubin levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other streptogramin antibiotics.
- Safety and efficacy haven't been established in patients younger than age 16.
- Use only during pregnancy if clearly needed. Use cautiously in breast-feeding women.

## NURSING CONSIDERATIONS

- Drug isn't active against *Enterococcus faecalis*. Blood cultures are needed to avoid misidentifying *E. faecalis* as *E. faecium*.
- Because drug may cause mild to life-threatening pseudomembranous colitis, consider this diagnosis in patient who develops diarrhea during or after therapy.
- Adverse reactions, such as arthralgia and myalgia, may be reduced by decreasing dosage interval to every 12 hours.
- Because overgrowth of nonsusceptible organisms may occur, monitor patient closely for signs and symptoms of superinfection.
- Monitor liver function test results during therapy.

## PATIENT TEACHING

- Advise patient to immediately report irritation at I.V. site, pain in joints or muscles, and diarrhea.
- Tell patient about importance of reporting persistent or worsening signs and symptoms of infection, such as pain or redness.

# rabeprazole sodium

rah-BEH-pray-zol

Aciphex✐

*Therapeutic class:* Antiulcer
*Pharmacologic class:* Proton pump inhibitor
*Pregnancy risk category B*

R

## AVAILABLE FORMS

*Tablets (delayed-release):* 20 mg

## INDICATIONS & DOSAGES

➤ **Healing of erosive or ulcerative gastroesophageal reflux disease (GERD)**
*Adults:* 20 mg P.O. daily for 4 to 8 weeks. Additional 8-week course may be considered, if needed.

➤ **Maintenance of healing of erosive or ulcerative GERD**
*Adults:* 20 mg P.O. daily.

➤ **Healing of duodenal ulcers**
*Adults:* 20 mg P.O. daily after morning meal for up to 4 weeks.

➤ **Pathologic hypersecretory conditions, including Zollinger-Ellison syndrome**
*Adults:* 60 mg P.O. daily; may be increased, as needed, to 100 mg P.O. daily or 60 mg P.O. b.i.d.
➤ **Symptomatic GERD, including daytime and nighttime heartburn**
*Adults:* 20 mg P.O. daily for 4 weeks. Additional 4-week course may be considered, if needed.
*Children age 12 and older:* 20 mg P.O. daily for up to 8 weeks.
➤ ***Helicobacter pylori* eradication, to reduce the risk of duodenal ulcer recurrence**
*Adults:* 20 mg P.O. b.i.d., combined with amoxicillin 1,000 mg P.O. b.i.d. and clarithromycin 500 mg P.O. b.i.d., for 7 days.

## ADMINISTRATION

**P.O.**
- Don't crush or split tablets.
- Give drug without regard for food.

## ACTION

Blocks proton pump activity and gastric acid secretion by inhibiting gastric hydrogen-potassium adenosine triphosphatase (an enzyme) at secretory surface of gastric parietal cells.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | <1 hr | 2–5 hr | >24 hr |

*Half-life:* 1 to 2 hours.

## ADVERSE REACTIONS

**CNS:** headache, pain, dizziness.
**CV:** edema.
**EENT:** pharyngitis, dry mouth.
**GI:** abdominal pain, constipation, diarrhea, flatulence.
**Hepatic:** elevated liver enzyme levels, *hepatitis, hepatic encephalopathy.*
**Musculoskeletal:** arthralgia, myalgia.
**Other:** infection.

## INTERACTIONS

**Drug-drug.** *Clarithromycin:* May increase rabeprazole level. Monitor patient closely.
*Cyclosporine:* May inhibit cyclosporine metabolism. Use together cautiously.
*Digoxin, ketoconazole, other gastric pH-dependent drugs:* May decrease or increase drug absorption at increased pH values. Monitor patient closely.
*Warfarin:* May inhibit warfarin metabolism. Monitor PT and INR.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, other benzimidazoles (lansoprazole, omeprazole), or components of these formulations.
- In *H. pylori* eradication, clarithromycin is contraindicated in pregnant women, patients hypersensitive to macrolides, and those taking pimozide; amoxicillin is contraindicated in patients hypersensitive to penicillin.
- Use cautiously in patients with severe hepatic impairment.

## NURSING CONSIDERATIONS

- Consider additional courses of therapy if duodenal ulcer or GERD isn't healed after first course of therapy.
- If *H. pylori* eradication is unsuccessful, do susceptibility testing. If patient is resistant to clarithromycin or susceptibility testing isn't possible, expect to start therapy using a different antimicrobial.

***Alert:*** Amoxicillin may trigger anaphylaxis in patients with a history of penicillin hypersensitivity.
- Symptomatic response to therapy doesn't preclude presence of gastric malignancy.

***Alert:*** Patients treated for *H. pylori* eradication have developed pseudomembranous colitis with nearly all antibiotics, including clarithromycin and amoxicillin. Monitor patient closely.

## PATIENT TEACHING

- Explain importance of taking drug exactly as prescribed.
- Advise patient to swallow delayed-release tablet whole and not to crush, chew, or split.
- Inform patient that drug may be taken without regard to meals.

## rabies immune globulin, human

RAY-beez

HyperRab S/D, Imogam Rabies-HT

*Therapeutic class:* Antibody
*Pharmacologic class:* Immune serum
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 150 international units/ml in 2-ml, 10-ml vials

### INDICATIONS & DOSAGES

➤ **Rabies exposure**

*Adults and children:* 20 international units/kg I.M. at time of first dose of rabies vaccine. If anatomically feasible, up to the full dose is used to infiltrate wound area; remainder is given I.M. in a different site.

### ADMINISTRATION

**I.M.**

- Give large volumes (5 ml) in adults only. The deltoid is the preferred area of injection.
- Don't give more than 5 ml I.M. at one injection site; divide doses over 5 ml and give at different sites.

### ACTION

Provides passive immunity to rabies.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.M. | 24 hr | Unknown | Unknown |

*Half-life:* About 24 days.

### ADVERSE REACTIONS

**CNS:** slight fever, headache, malaise.
**Skin:** pain, redness, and induration at injection site.

### INTERACTIONS

**Drug-drug.** *Immunosuppressive agents (corticosteroids, chloroquine):* May interfere with the active antibody response to rabies vaccine. Avoid using together. If used together, do serologic testing for rabies antibody.
*Live-virus vaccines (measles, mumps, or rubella):* May interfere with response to vaccine. Postpone immunization, if possible.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Repeated doses of rabies immune globulin are contraindicated in patients who have started to receive rabies vaccine immunization.
- Use with caution in patients hypersensitive to thimerosal or history of systemic allergic reactions to human immunoglobulin preparations; also use cautiously in those with immunoglobulin A deficiency.

### NURSING CONSIDERATIONS

- Obtain history of animal bites, allergies, and reactions to immunizations. Have epinephrine 1:1,000 ready to treat anaphylaxis.
- Clean wound thoroughly with soap and water; this is best prophylaxis against rabies.
- Ask patient when last tetanus immunization was received; many prescribers order a booster at this time.
- Use only with rabies vaccine and immediate local treatment of wound. Don't give rabies vaccine and rabies immune globulin in same syringe or at same site. Give as soon as possible after exposure or through day 7. After day 8, antibody response to culture vaccine has occurred.
- Don't give live-virus vaccines within 3 months of rabies immune globulin.
- ***Look alike–sound alike:*** This immune serum provides passive immunity. Don't confuse with rabies vaccine, a suspension of killed microorganisms that confers active immunity. The two drugs are often used together prophylactically after exposure to rabid animals.

### PATIENT TEACHING

- Inform patient that local reactions may occur at injection site. Instruct him to notify prescriber promptly if reactions persist or become severe.
- Tell patient that a tetanus shot also may be needed.
- Instruct patient in wound care.

**SAFETY ALERT!**

# radioactive iodine (sodium iodide, $I^{131}$)

Hicon, Sodium Iodide $I^{131}$
Therapeutic

*Therapeutic class:* Radiopharmaceutical
*Pharmacologic class:* Thyroid hormone antagonist
*Pregnancy risk category X*

## AVAILABLE FORMS

All radioactivity concentrations are determined at time of calibration.
**Sodium Iodide $^{131}$I Therapeutic**
*Capsules:* Radioactivity range 0.75 to 100 mCi/capsule
*Oral solution:* Radioactivity range 3.5 to 150 mCi/vial
*Concentrated oral solution:* 1,000 mCi/ml

## INDICATIONS & DOSAGES

➤ **Hyperthyroidism**
*Adults:* Usual dosage is 4 to 10 mCi P.O. Dosage is based on estimated weight of thyroid gland and thyroid uptake. Repeat treatment after 6 weeks, based on $T_4$ level.

➤ **Thyroid cancer**
*Adults:* Initially, 50 to 100 mCi P.O., with subsequent doses of 100 to 200 mCi. Dosage is based on estimated malignant thyroid tissue and metastatic tissue as determined by total body scan. Repeat treatment according to clinical status.

## ADMINISTRATION

**P.O.**
● Institute full radiation precautions. Have patient use proper disposal methods when coughing and expectorating. After dose for hyperthyroidism, patient's urine and saliva are slightly radioactive for 24 hours; vomitus is highly radioactive for 6 to 8 hours.
● After dose for thyroid cancer, patient's urine, saliva, and perspiration are radioactive for 3 days. Isolate patient and observe these precautions: Don't allow pregnant personnel to care for patient; provide disposable eating utensils and linens; instruct patient to save urine in lead container for 24 to 48 hours; limit contact with patient to 30 minutes per shift per person on day 1, and increase time, as needed, to 1 hour on day 2 and longer on day 3.

## ACTION

Limits thyroid hormone secretion by destroying thyroid tissue. Affinity of thyroid tissue for radioactive iodine facilitates uptake of drug by cancerous thyroid tissue that has metastasized to other sites in the body.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 60–90 min | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CV:** chest pain, tachycardia.
**EENT:** *fullness in neck,* pain on swallowing, sore throat.
**GI:** nausea, vomiting.
**Hematologic:** anemia, blood dyscrasia, ***leukopenia, thrombocytopenia.***
**Metabolic:** hypothyroidism, radiation-induced thyroiditis.
**Respiratory:** cough.
**Skin:** rash, pruritus, urticaria, temporary thinning of hair.
**Other:** radiation sickness, allergic-type reactions.

## INTERACTIONS

**Drug-drug.** *Lithium carbonate:* May cause hypothyroidism. Use together cautiously.

These drugs may interfere with the action of $^{131}$I and should be withheld for the specified time before the $^{131}$I dose is given:
*Adrenocorticoids:* 1 week.
*Benzodiazepines:* 1 month.
*Cholecystographic drugs:* 6 to 9 months.
*Contrast media that contain iodine:* 1 to 2 months.
*Products containing iodine, including topical drugs, and vitamins:* 2 weeks.
*Salicylates:* 1 to 2 weeks.
Also, the uptake of radioiodide will be affected by the use of thyroid and antithyroid drugs.

## EFFECTS ON LAB TEST RESULTS

● May decrease hemoglobin, $T_4$, and thyroid-stimulating hormone levels. May

increase or decrease protein-bound iodine level.
• May decrease platelet and WBC counts. May alter $^{131}$I thyroid uptake.

### CONTRAINDICATIONS & CAUTIONS
• Contraindicated in women who are or may become pregnant or are breast-feeding.
• Contraindicated in a patient who is vomiting or has diarrhea.

### NURSING CONSIDERATIONS
• All antithyroid drugs and thyroid preparations must be stopped 1 week before $^{131}$I dose. If this isn't possible, patient may receive thyroid-stimulating hormone for 3 days before $^{131}$I dose.
• Measure the dose by a radioactivity calibration system immediately before administration.
• Sodium iodide $^{131}$I is not typically used for treatment of hyperthyroidism in patients younger than age 30.
• When treating women of childbearing age, give dose during menstruation or within 7 days afterward.
• After therapy for hyperthyroidism, patient shouldn't resume antithyroid drugs but should continue propranolol or other drugs used to treat symptoms of hyperthyroidism until onset of full $^{131}$I effect (usually 6 weeks).
• Monitor thyroid function by $T_4$ and thyroid-stimulating hormone levels.

### PATIENT TEACHING
• Tell patient to fast overnight before therapy and to drink as much fluid as possible for 48 hours afterward.
• Instruct patient about appropriate radiation exposure precautions to use after receiving drug.
• Warn patient who's discharged fewer than 7 days after $^{131}$I dose for thyroid cancer to avoid close contact with small children and not to sleep in same room with another person for 7 days after treatment.
• Teach patient the signs and symptoms of hypothyroidism (unexplained weight gain, fatigue, cold intolerance) and instruct him to notify prescriber if they occur.

## raloxifene hydrochloride
rah-LOX-i-feen

Evista✐

*Therapeutic class:* Antiosteoporotic
*Pharmacologic class:* Selective estrogen receptor modulator
*Pregnancy risk category X*

### AVAILABLE FORMS
*Tablets:* 60 mg

### INDICATIONS & DOSAGES
➤ **To prevent or treat osteoporosis; to reduce the risk of invasive breast cancer in postmenopausal women with osteoporosis and postmenopausal women at high risk for invasive breast cancer**
*Postmenopausal women:* 60 mg P.O. once daily.

### ADMINISTRATION
**P.O.**
• Give drug without regard for food.
• Stop drug at least 72 hours before prolonged immobilization and resume only after patient is fully mobilized.

### ACTION
Reduces resorption of bone and decreases overall bone turnover. These effects on bone are manifested as reductions in serum and urine levels of bone turnover markers and increases in bone mineral density.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | 24 hr |

*Half-life:* 27½ hours.

### ADVERSE REACTIONS
**CNS:** depression, insomnia, fever, migraine.
**CV:** chest pain.
**EENT:** *sinusitis*, pharyngitis, laryngitis.
**GI:** nausea, dyspepsia, vomiting, flatulence, gastroenteritis, abdominal pain.
**GU:** vaginitis, UTI, cystitis, leukorrhea, endometrial disorder, vaginal bleeding.
**Metabolic:** weight gain.
**Musculoskeletal:** *arthralgia*, myalgia, arthritis, leg cramps.

R

**Respiratory:** increased cough, pneumonia.
**Skin:** rash, diaphoresis.
**Other:** *infection, flulike syndrome, hot flashes,* breast pain, peripheral edema.

## INTERACTIONS

**Drug-drug.** *Cholestyramine:* May cause significant reduction in absorption of raloxifene. Avoid using together.
*Highly protein-bound drugs (such as clofibrate, diazepam, diazoxide, ibuprofen, indomethacin, naproxen):* May interfere with binding sites. Use together cautiously.
*Warfarin:* May cause a decrease in PT. Monitor PT and INR closely.

## EFFECTS ON LAB TEST RESULTS

- May increase calcium, inorganic phosphate, total protein, albumin, hormone-binding globulin, and apolipoprotein A levels. May decrease total and LDL cholesterol levels and apolipoprotein B levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in women hypersensitive to drug or its components; in women who are pregnant, planning to get pregnant, or breast-feeding; and in children.

**Black Box Warning** Increased risk of venous thromboembolism and death from stroke. Contraindicated in women with a history of, or active venous thromboembolism. Consider the risk-benefit balance in women at risk for stroke.

- Use cautiously in patients with severe hepatic impairment.
- Safety and efficacy of drug haven't been evaluated in men.

***Overdose S&S:*** Leg cramps, dizziness, ataxia, flushing, rash, tremors, vomiting, elevated alkaline phosphatase level.

## NURSING CONSIDERATIONS

- Watch for signs of blood clots. Greatest risk of thromboembolic events occurs during first 4 months of treatment.
- Watch for breast abnormalities; drug doesn't eliminate risk of breast cancer.
- Effect on bone mineral density beyond 2 years of drug treatment isn't known.
- Use with hormone replacement therapy or systemic estrogen hasn't been evaluated and isn't recommended.

## PATIENT TEACHING

- Advise patient to avoid long periods of restricted movement (such as during traveling) because of increased risk of venous thromboembolic events.
- Inform patient that hot flashes or flushing may occur and that drug doesn't aid in reducing them.
- Instruct patient to practice other bone loss-prevention measures, including taking supplemental calcium and vitamin D if dietary intake is inadequate, performing weight-bearing exercises, and stopping alcohol consumption and smoking.
- Tell patient that drug may be taken without regard for food.
- Advise patient to report unexplained uterine bleeding or breast abnormalities during therapy.
- Explain adverse reactions and instruct patient to read patient package insert before starting therapy and each time prescription is renewed.

# raltegravir potassium

rahl-TEH-gra-vear

Isentress

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* HIV integrase strand transfer inhibitor
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 400 mg

## INDICATIONS & DOSAGES

➤ **HIV-1 infection, with other antiretrovirals, in treatment-experienced and treatment-naive patients who have continued HIV-1 replication despite antiretroviral therapy**

*Adults and children age 16 and older:* 400 mg P.O. b.i.d. When administered concomitantly with rifampin, give 800 mg P.O. b.i.d.

## ADMINISTRATION

**P.O.**

- Give drug without regard for meals.

## ACTION
Inhibits HIV-1 integrase, an enzyme required for HIV-1 replication.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 3 hr | Unknown |

*Half-life:* About 9 hours.

## ADVERSE REACTIONS
**CNS:** headache, fever, fatigue, dizziness.
**GI:** nausea, abdominal pain, vomiting.
**Hematologic:** anemia, ***neutropenia, thrombocytopenia.***
**Metabolic:** hyperglycemia.
**Musculoskeletal:** asthenia, myopathy, ***rhabdomyolysis.***
**Skin:** lipodystrophy.

## INTERACTIONS
**Drug-drug.** *Atazanavir:* May increase raltegravir level. Use together cautiously.
*UGT1A1 inhibitors, such as rifampin:* May decrease raltegravir level. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS
- May increase bilirubin, AST, ALT, alkaline phosphatase, amylase, lipase, glucose, and CK levels. May decrease hemoglobin level.
- May decrease neutrophil and platelet counts.

## CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in patients taking drugs known to cause myopathy or rhabdomyolysis such as statins.
- Use cautiously in elderly patients, especially those with hepatic, renal, and cardiac insufficiency.

## NURSING CONSIDERATIONS
- Perform laboratory tests, including CBC, platelet count, and liver function studies, before therapy and regularly throughout.
- Use drug with at least one other antiretroviral.
- Drug should be reserved for patients who demonstrate resistance to other regimens.
- Watch for signs of myopathy.
- Give drug to pregnant women only if the potential benefit justifies the risk to the fetus.
- Register pregnant women for monitoring of maternal-fetal outcomes by calling the Antiretroviral Pregnancy Registry at 1-800-258-4263.
- Safety and efficacy haven't been establish in children younger than age 16.
- Breast-feeding isn't recommended during therapy.

## PATIENT TEACHING
- Inform patient that drug doesn't cure HIV infection. He may continue to develop opportunistic infections and other complications of HIV infection, and transmission of HIV to others through sexual contact or blood contamination is still possible.
- Advise patient to use barrier protection during sexual intercourse.
- Tell women that breast-feeding isn't recommended during therapy.
- Advise patient to immediately report worsening symptoms or unexplained muscle pain, tenderness, or weakness while taking the drug.
- Instruct patient to avoid missing any doses to decrease the risk of developing HIV resistance.
- Tell patient if a dose is missed to take the next dose as soon as possible and not to double the next dose.
- Advise patient to report use of other drugs, including OTC drugs; this drug interacts with other drugs.
- Tell patient that drug may be taken without regard for meals.

**SAFETY ALERT!**

# ramelteon
rah-MELL-tee-on

Rozerem

*Therapeutic class:* Hypnotic
*Pharmacologic class:* Melatonin receptor agonist
*Pregnancy risk category C*

## AVAILABLE FORMS
*Tablets:* 8 mg

## INDICATIONS & DOSAGES

➤ **Insomnia characterized by trouble falling asleep**

*Adults:* 8 mg P.O. within 30 minutes of bedtime.

## ADMINISTRATION

**P.O.**

- Don't give drug with or immediately after a high-fat meal.
- Give drug within 30 minutes of bedtime.

## ACTION

Acts on receptors believed to maintain the circadian rhythm underlying the normal sleep-wake cycle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | ½–1½ hr | Unknown |

*Half-life:* Parent compound, 1 to 2½ hours; metabolite M-II, 2 to 5 hours.

## ADVERSE REACTIONS

**CNS:** complex sleep-related behaviors, depression, dizziness, fatigue, headache, somnolence, worsened insomnia.
**GI:** diarrhea, impaired taste, nausea.
**Musculoskeletal:** arthralgia, myalgia.
**Respiratory:** upper respiratory tract infection.
**Other:** ***anaphylaxis, angioedema,*** flulike symptoms.

## INTERACTIONS

**Drug-drug.** *CNS depressants:* May cause excessive CNS depression. Use together cautiously.
*Fluconazole (strong CYP2C9 inhibitor), ketoconazole (strong CYP3A4 inhibitor), weak CYP1A2 inhibitors:* May increase ramelteon level. Use together cautiously.
*Fluvoxamine (strong CYP1A2 inhibitor):* May increase ramelteon level. Avoid use together.
*Rifampin (strong CYP enzyme inducer):* May decrease ramelteon level. Monitor patient for lack of effect.
**Drug-food.** *Food (especially high-fat meals):* May delay time to peak drug effect. Tell patient to take drug on an empty stomach.
**Drug-lifestyle.** *Alcohol use:* May cause excessive CNS depression. Discourage alcohol use.

## EFFECTS ON LAB TEST RESULTS

- May increase prolactin level.
- May alter blood cortisol and testosterone levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in those hypersensitive to drug or its components. Don't use in patients taking fluvoxamine or in those with severe hepatic impairment, severe sleep apnea, or severe COPD.
- Use cautiously in patients with depression or moderate hepatic impairment.

## NURSING CONSIDERATIONS

***Alert:*** Anaphylaxis and angioedema may occur as early as the first dose. Monitor patient closely.

- Thoroughly evaluate the cause of insomnia before starting drug.
- Assess patient for behavioral or cognitive disorders.
- Drug doesn't cause physical dependence.

## PATIENT TEACHING

***Alert:*** Warn patient that drug may cause allergic reactions, facial swelling, and complex sleep-related behaviors, such as driving, eating, and making phone calls while asleep. Advise patient to report these adverse effects.

- Instruct patient to take dose within 30 minutes of bedtime.
- Tell patient not to take drug with or after a heavy meal.
- Caution against performing activities that require mental alertness or physical coordination after taking drug.
- Caution patient to avoid alcohol while taking drug.
- Tell patient to consult prescriber if insomnia worsens or behavior changes.
- Urge women to consult prescriber if menses stops, libido decreases, or galactorrhea or fertility problems develop.

# ramipril

ra-MI-pril

Altace

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* ACE inhibitor
*Pregnancy risk category C; D in 2nd and 3rd trimesters*

## AVAILABLE FORMS

*Capsules:* 1.25 mg, 2.5 mg, 5 mg, 10 mg
*Tablets:* 1.25 mg, 2.5 mg, 5 mg, 10 mg

## INDICATIONS & DOSAGES

➤ **Hypertension**

*Adults:* Initially, 2.5 mg P.O. once daily for patients not taking a diuretic, and 1.25 mg P.O. once daily for patients taking a diuretic. Increase dosage, if needed, based on patient response. Maintenance dose is 2.5 to 20 mg daily as a single dose or in divided doses.
***Adjust-a-dose:*** For patients with creatinine clearance less than 40 ml/minute, give 1.25 mg P.O. daily. Adjust dosage gradually based on response. Maximum daily dose is 5 mg.

➤ **Heart failure after an MI**

*Adults:* Initially, 2.5 mg P.O. b.i.d. If hypotension occurs; decrease dosage to 1.25 mg P.O. b.i.d. Adjust as tolerated to target dosage of 5 mg P.O. b.i.d.
***Adjust-a-dose:*** For patients with creatinine clearance less than 40 ml/minute, give 1.25 mg P.O. daily. Adjust dosage gradually based on response. Maximum dosage is 2.5 mg b.i.d.

➤ **To reduce risk of MI, stroke, and death from CV causes**

*Adults age 55 and older:* 2.5 mg P.O. once daily for 1 week, then 5 mg P.O. once daily for 3 weeks. Increase as tolerated to a maintenance dose of 10 mg P.O. once daily.
***Adjust-a-dose:*** In patients who are hypertensive or who have recently had an MI, daily dose may be divided.

## ADMINISTRATION

**P.O.**

- Give drug without regard for meals.
- Open capsule and sprinkle contents on a small amount of applesauce or mix with 4 oz of water or apple juice. Give to patient immediately.

## ACTION

Prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor. Less angiotensin II decreases peripheral arterial resistance, decreasing aldosterone secretion, which reduces sodium and water retention and lowers blood pressure.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1–2 hr | 1–3 hr | 24 hr |

*Half-life:* 13 to 17 hours.

## ADVERSE REACTIONS

**CNS:** headache, dizziness, fatigue, asthenia, malaise, light-headedness, vertigo, syncope.
**CV:** *hypotension,* ***heart failure, MI,*** postural hypotension, angina pectoris, chest pain, edema.
**GI:** nausea, vomiting, diarrhea.
**Metabolic:** ***hyperkalemia,*** hyperglycemia, weight gain.
**Musculoskeletal:** arthralgia, arthritis, myalgia.
**Respiratory:** dyspnea, dry, persistent, tickling, nonproductive cough.
**Other:** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Diuretics:* May cause excessive hypotension, especially at start of therapy. Stop diuretic at least 3 days before therapy begins, increase sodium intake, or reduce starting dose of ramipril.
*Insulin, oral antidiabetics:* May cause hypoglycemia, especially at start of ramipril therapy. Monitor glucose level closely.
*Lithium:* May increase lithium level. Use together cautiously and monitor lithium level.
*Nesiritide:* May increase hypotensive effects. Monitor blood pressure.
*NSAIDs:* May decrease antihypertensive effects. Monitor blood pressure.
*Potassium-sparing diuretics, potassium supplements:* May cause hyperkalemia; ramipril attenuates potassium loss. Monitor potassium level closely.
**Drug-herb.** *Capsaicin:* May cause cough. Discourage use together.

R

*Ma huang:* May decrease antihypertensive effects. Discourage use together.
**Drug-food.** *Salt substitutes containing potassium:* May cause hyperkalemia; ramipril attenuates potassium loss. Discourage use of salt substitutes during therapy.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN, creatinine, bilirubin, liver enzymes, glucose, and potassium levels. May decrease hemoglobin level and hematocrit.
- May decrease RBC and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to ACE inhibitors and in those with a history of angioedema related to treatment with an ACE inhibitor.

**Black Box Warning** Use during pregnancy can cause injury and death to the developing fetus. When pregnancy is detected, stop drug as soon as possible. ■

- Use cautiously in patients with renal impairment.

***Overdose S&S:*** Hypotension.

## NURSING CONSIDERATIONS

- Monitor blood pressure regularly for drug effectiveness.
- Closely assess renal function in patients during first few weeks of therapy. Regular assessment of renal function is advisable. Patients with severe heart failure whose renal function depends on the renin-angiotensin-aldosterone system have experienced acute renal failure during ACE inhibitor therapy. Hypertensive patients with unilateral or bilateral renal artery stenosis also may show signs of worsening renal function during first few days of therapy. Dose reduction or drug stoppage may be necessary.
- Although ACE inhibitors reduce blood pressure in all races, they reduce it less in blacks taking the ACE inhibitor alone. Black patients should take drug with a thiazide diuretic for a more favorable response.
- ACE inhibitors appear to increase risk of angioedema in black patients.
- Monitor CBC with differential counts before therapy and periodically thereafter.
- Drug may reduce hemoglobin and WBC, RBC, and platelet counts, especially in patients with impaired renal function or collagen vascular diseases (systemic lupus erythematosus or scleroderma).
- Monitor potassium level. Risk factors for the development of hyperkalemia include renal insufficiency, diabetes, and concomitant use of drugs that raise potassium level.

## PATIENT TEACHING

- Tell patient to notify prescriber if any adverse reactions occur. Dosage adjustment or stoppage of drug may be needed.

***Alert:*** Rarely, swelling of the face and throat (including swelling of the larynx) may occur, especially after first dose. Advise patient to report signs or symptoms of breathing difficulty or swelling of face, eyes, lips, or tongue.

- Inform patient that light-headedness can occur, especially during the first few days of therapy. Tell him to rise slowly to minimize this effect and to report signs and symptoms to prescriber. If he faints, patient should stop taking drug and call prescriber immediately.
- Tell patient that if he has difficulty swallowing capsules, he can open drug and sprinkle contents on a small amount of applesauce.
- Advise patient to report signs and symptoms of infection, such as fever and sore throat.
- Tell patient to avoid salt substitutes. These products may contain potassium, which can cause high potassium level in patients taking ramipril.
- Tell women of childbearing age to notify prescriber if pregnancy occurs. Drug will need to be stopped.

## ranitidine hydrochloride

ra-NYE-te-deen

Acid Reducer† ◇, Nu-Ranit†, Zantac✐*, Zantac-C†, Zantac 75 ◇, Zantac 150 ◇, Zantac 300

*Therapeutic class:* Antiulcer
*Pharmacologic class:* $H_2$ receptor antagonist
*Pregnancy risk category B*

### AVAILABLE FORMS

*Infusion:* 1 mg/ml in 50-ml containers
*Injection:* 25 mg/ml
*Syrup:* 15 mg/ml*
*Tablets:* 75 mg ◇, 150 mg ◇, 300 mg
*Tablets (effervescent):* 25 mg, 150 mg

### INDICATIONS & DOSAGES

➤ **Active duodenal and gastric ulcer**

*Adults:* 150 mg P.O. b.i.d. or 300 mg daily at bedtime. Or, 50 mg I.V. or I.M. every 6 to 8 hours. Maximum daily I.V. dose, 400 mg. Or, 150 mg by continuous infusion at 6.25 mg/hour over 24 hours.
*Children ages 1 month to 16 years:* For duodenal and gastric ulcers only, 2 to 4 mg/kg P.O. b.i.d., up to 300 mg/day.

➤ **Maintenance therapy for duodenal or gastric ulcer**

*Adults:* 150 mg P.O. at bedtime.
*Children ages 1 month to 16 years:* 2 to 4 mg/kg P.O. daily, up to 150 mg daily.

➤ **Pathologic hypersecretory conditions, such as Zollinger-Ellison syndrome (ZES)**

*Adults:* 150 mg P.O. b.i.d.; doses up to 6 g or more frequent intervals may be needed in patients with severe disease. Or, infuse continuously at 1 mg/kg/hour. After 4 hours, if patient remains symptomatic or gastric acid output is greater than 10 mEq/hour, increase dose in increments of 0.5 mg/kg/hour and recheck gastric acid output. Doses up to 2.5 mg/kg/hour and infusion rates up to 220 mg/hour have been used.

➤ **Gastroesophageal reflux disease**

*Adults:* 150 mg P.O. b.i.d.
*Children ages 1 month to 16 years:* 5 to 10 mg/kg P.O. daily given as two divided doses.

➤ **Erosive esophagitis**

*Adults:* 150 mg P.O. q.i.d. Maintenance dosage is 150 mg P.O. b.i.d.
*Children ages 1 month to 16 years:* 5 to 10 mg/kg P.O. daily given as two divided doses.

➤ **Heartburn**

*Adults and children age 12 and older:* 75 mg of Zantac 75 P.O. as symptoms occur, up to 150 mg daily, not to exceed 2 weeks of continuous treatment.

***Adjust-a-dose:*** For patients with creatinine clearance below 50 ml/minute, 150 mg P.O. every 24 hours or 50 mg I.V. every 18 to 24 hours.

### ADMINISTRATION

**P.O.**

● Give once-daily dose at bedtime.

**I.V.**

▼ To prepare I.V. injection, dilute 2 ml (50 mg) ranitidine with compatible I.V. solution to a total volume of 20 ml, and inject over at least 5 minutes. Compatible solutions include sterile water for injection, normal saline solution for injection, $D_5W$, or lactated Ringer's injection.
▼ To give drug by intermittent I.V. infusion, dilute 50 mg (2 ml) in 100 ml compatible solution and infuse at a rate of 5 to 7 ml/minute. The premixed solution is 50 ml and doesn't need further dilution. Infuse over 15 to 20 minutes.
▼ For continuous infusion to treat active duodenal or gastric ulcer, dilute 150 mg in 250 ml of $D_5W$. For hypersecretory conditions such as ZES, dilute with $D_5W$ or other compatible solution to no more than 2.5 mg/ml.
▼ After dilution, solution is stable for 48 hours at room temperature.
▼ Store I.V. injection at 39° to 86° F (4° to 30° C). Store premixed containers at 36° to 77° F (2° to 25° C).
▼ **Incompatibilities:** Amphotericin B, atracurium, cefazolin, cefoxitin, ceftazidime, cefuroxime, chlorpromazine, clindamycin phosphate, diazepam, ethacrynate sodium, hetastarch, hydroxyzine, insulin, methotrimeprazine, midazolam, norepinephrine, pentobarbital sodium, phenobarbital, phytonadione.

R

## ACTION

Competitively inhibits action of histamine on the $H_2$ at receptor sites of parietal cells, decreasing gastric acid secretion.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 1–3 hr | 13 hr |
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 2 to 3 hours.

## ADVERSE REACTIONS

**CNS:** headache, malaise, vertigo.
**EENT:** blurred vision.
**Hepatic:** jaundice.
**Other:** ***anaphylaxis, angioedema,*** burning and itching at injection site.

## INTERACTIONS

**Drug-drug.** *Antacids:* May interfere with ranitidine absorption. Stagger doses, if possible.
*Diazepam:* May decrease absorption of diazepam. Monitor patient closely.
*Glipizide:* May increase hypoglycemic effect. Adjust glipizide dosage, as directed.
*Procainamide:* May decrease renal clearance of procainamide. Monitor patient closely for toxicity.
*Warfarin:* May interfere with warfarin clearance. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

- May increase creatinine and ALT levels.
- May cause false-positive results in urine protein tests using Multistix.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and those with acute porphyria.
- Use cautiously in patients with hepatic dysfunction. Adjust dosage in patients with impaired renal function.

***Overdose S&S:*** Exaggeration of adverse reactions, abnormal gait, hypotension.

## NURSING CONSIDERATIONS

- Assess patient for abdominal pain. Note presence of blood in emesis, stool, or gastric aspirate.
- Drug may be added to total parenteral nutrition solutions.
- ***Look alike–sound alike:*** Don't confuse ranitidine with rimantadine; don't confuse Zantac with Xanax or Zyrtec.

## PATIENT TEACHING

- Instruct patient on proper use of OTC preparation, as indicated.
- Remind patient to take once-daily prescription drug at bedtime for best results.
- Instruct patient to take without regard to meals because absorption isn't affected by food.
- Urge patient to avoid cigarette smoking because this may increase gastric acid secretion and worsen disease.
- Advise patient to report abdominal pain, blood in stool or emesis, black, tarry stools, or coffee-ground emesis.

# ranolazine

ran-OH-lah-zeen

Ranexa®

*Therapeutic class:* Antianginal
*Pharmacologic class:* Cardiovascular drug
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets (extended-release):* 500 mg, 1,000 mg

## INDICATIONS & DOSAGES

➤ **Chronic angina**

*Adults:* Initially, 500 mg P.O. b.i.d. Increase, if needed, to maximum of 1,000 mg b.i.d.

## ADMINISTRATION

**P.O.**

- Give drug without regard for meals.
- Give drug whole; don't crush or cut tablets.
- Don't give drug with grapefruit juice.

## ACTION

May result from increased efficiency of myocardial oxygen use when myocardial metabolism is shifted away from fatty acid oxidation toward glucose oxidation. Antianginal and anti-ischemic properties don't

decrease heart rate or blood pressure and don't increase myocardial work.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 2–5 hr | Unknown |

*Half-life:* 7 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, headache.
**CV:** palpitations, peripheral edema, syncope.
**EENT:** tinnitus, vertigo.
**GI:** abdominal pain, constipation, dry mouth, nausea, vomiting.
**Respiratory:** dyspnea.

## INTERACTIONS

**Drug-drug.** *Antipsychotics or tricyclic antidepressants metabolized by CYP2D6:* May increase levels of these drugs. Dosage reduction may be needed.
*Cyclosporine, paroxetine, ritonavir:* May increase ranolazine level. Use cautiously together, and monitor patient for increased adverse effects.
*Digoxin:* May increase digoxin level. Monitor digoxin level periodically; digoxin dosage may need to be reduced.
*Diltiazem, HIV protease inhibitors, ketoconazole and other azole antifungals, macrolide antibiotics (azithromycin, erythromycin), verapamil, other CYP3A inhibitors:* May increase ranolazine level and prolong QT interval. Avoid using together.
*Drugs that prolong the QT interval (antiarrhythmics, such as dofetilide, quinidine, and sotalol), antipsychotics, such as Thorazine and ziprasidone:* May increase the risk of prolonged QT interval. Use cautiously together.
*Rifabutin, rifampin, rifapentine, other CYP3A inducers (carbamazepine, phenobarbital, phenytoin):* May reduce plasma concentration of ranolazine to subtherapeutic levels. Don't use together.
*Simvastatin:* May increase simvastatin level. Monitor patient for adverse effects, and decrease simvastatin dosage as needed.
**Drug-herb.** *St. John's wort:* May reduce plasma concentration of ranolazine to subtherapeutic levels. Don't use together.
**Drug-food.** *Grapefruit:* May increase drug level and prolong QT interval. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase creatinine and BUN levels. May decrease hemoglobin and $HbA_{1c}$ levels and hematocrit.
- May decrease eosinophil count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients taking QT interval–prolonging drugs, CYP3A inducers (including rifampin, phenobarbital) or CYP3A inhibitors (including clarithromycin, ketoconazole, nelfinavir), and in patients with ventricular tachycardia, hepatic impairment, or a prolonged QT interval.
- Use cautiously in patients with renal impairment.
- It isn't known whether drug appears in breast milk. Patient should either stop breast-feeding or stop the drug.

## NURSING CONSIDERATIONS

***Alert:*** Drug prolongs the QT interval according to the dose. If drug is given with other drugs that prolong the QTc interval, torsades de pointes or sudden death may occur. Don't exceed maximum dosage.
- Obtain baseline ECG and monitor subsequent ECG for prolonged QT interval. Measure the QTc interval regularly.
- If patient has renal insufficiency, monitor blood pressure closely.

## PATIENT TEACHING

- Teach patient about this drug's potential to affect the heart's rhythm. Advise patient to immediately report palpitations or fainting.
- Urge patient to tell prescriber about all other prescription or OTC drugs or herbal supplements he takes.
- Tell patient that he should keep taking other drugs prescribed for angina.
- Tell patient that drug may be taken with or without food.
- Advise patient to avoid grapefruit juice while taking this drug.

***Alert:*** Warn patient that tablets must be swallowed whole and not crushed, broken, or chewed.
- Explain that drug won't stop a sudden anginal attack; advise him to keep other treatments, such as S.L. nitroglycerin, readily available.

R

• Tell patient to avoid activities that require mental alertness until effects of the drug are known.

## rasagiline mesylate

reh-SAH-jih-leen

Azilect®

*Therapeutic class:* Antiparkinsonian
*Pharmacologic class:* Irreversible, selective MAO inhibitor type B
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 0.5 mg, 1 mg

### INDICATIONS & DOSAGES

➤ **Idiopathic Parkinson disease, as monotherapy or with levodopa**

*Adults:* As monotherapy, 1 mg P.O. once daily. As adjunctive therapy, initial dose is 0.5 mg P.O. once daily. May increase to 1 mg P.O. once daily.

***Adjust-a-dose:*** If patient has mild hepatic impairment or takes a CYP1A2 inhibitor such as ciprofloxacin, give 0.5 mg once daily.

### ADMINISTRATION

**P.O.**

• Give drug without regard for food.

### ACTION

Unknown. May increase extracellular dopamine level in the CNS, improving neurotransmission and relieving signs and symptoms of Parkinson disease.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Variable | 1 hr | 1 wk |

*Half-life:* 3 hours.

### ADVERSE REACTIONS

**Monotherapy**

**CNS:** *dizziness, falls, headache,* depression, fever, hallucinations, malaise, paresthesia, syncope, vertigo.
**CV:** *chest pain,* angina pectoris, postural hypotension.
**EENT:** gingivitis.
**GI:** anorexia, diarrhea, dyspepsia, gastroenteritis, vomiting.
**GU:** albuminuria, impotence.
**Hematologic:** ***leukopenia.***
**Musculoskeletal:** arthralgia, arthritis, neck pain.
**Respiratory:** asthma, flu syndrome, rhinitis.
**Skin:** alopecia, ***carcinoma,*** ecchymosis, vesiculobullous rash.
**Other:** allergic reaction, decreased libido.

**Combined with levodopa**

**CNS:** *confusion, falls, headache,* abnormal dreams, amnesia, ataxia, dyskinesia, dystonia, hallucinations, paresthesia, somnolence, sweating.
**EENT:** epistaxis, gingivitis.
**GI:** *nausea,* abdominal pain, anorexia, constipation, diarrhea, dry mouth, dyspepsia, dysphagia, vomiting, weight loss.
**GU:** albuminuria.
**Hematologic:** ***hemorrhage,*** anemia.
**Musculoskeletal:** arthralgia, arthritis, bursitis, hernia, leg cramps, myasthenia, neck pain, tenosynovitis.
**Respiratory:** dyspnea.
**Skin:** ***carcinoma,*** ecchymosis, pruritus, rash, ulcer.
**Other:** infection.

### INTERACTIONS

**Drug-drug.** *Ciprofloxacin and other CYP1A2 inhibitors:* May double rasagiline level. Decrease rasagiline dosage to 0.5 mg daily.
*Levodopa:* May increase rasagiline level. Watch for dyskinesia, dystonia, hallucinations, and hypotension, and reduce levodopa dosage if needed.
*SSRIs, SSNRIs, tricyclic antidepressants:* May cause severe or fatal CNS toxicity. Stop rasagiline for at least 14 days before starting an antidepressant. Stop fluoxetine for 5 weeks before starting rasagiline.
**Drug-herb.** *St. John's wort:* May cause severe reaction. Strongly discourage use together.
**Drug-food.** *Foods with very high levels of tyramine (more than 150 mg), such as aged cheeses:* May cause hypertensive reaction. Urge patient to avoid aged cheeses such as Stilton cheese.

## EFFECTS ON LAB TEST RESULTS

- May increase liver enzyme levels.
- May decrease WBC count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with pheochromocytoma, those with moderate to severe hepatic impairment, and those taking amphetamines, cold products, dextromethorphan, ephedrine, MAO inhibitors, meperidine, methadone, phenylephrine, propoxyphene, pseudoephedrine, sympathomimetic amines, or tramadol.
- Use cautiously in patients with mild hepatic impairment and in pregnant or breast-feeding women.

***Overdose S&S:*** Drowsiness, dizziness, faintness, irritability, hyperactivity, agitation, severe headache, hallucinations, trismus, opisthotonos, seizures, coma, rapid and irregular pulse, hypertension, hypotension and vascular collapse, precordial pain, respiratory depression and failure, hyperpyrexia, diaphoresis, cool and clammy skin.

## NURSING CONSIDERATIONS

- Orthostatic hypotension may occur during first 2 months of therapy; help patient to rise from a reclining position.
- Notify prescriber if patient experiences adverse effects; levodopa dose may need to be reduced.
- Examine the patient's skin periodically for possible melanoma because of drug's associated risk of skin cancer.
- Notify prescriber if patient is having elective surgery, drug should be stopped at least 2 weeks before.

## PATIENT TEACHING

- Explain the risk of hypertensive crisis if patient ingests foods containing very high levels of tyramine while taking rasagiline. Give patient a list of these foods and products.
- Tell patient to contact prescriber if hallucinations occur.
- Urge patient to watch for skin changes that could suggest melanoma and to have periodic skin examinations by a health professional.
- Instruct patient to maintain his usual dosage schedule if he misses a dose and not to double the next dose to make up for a missed one.

**SAFETY ALERT!**

# repaglinide

re-PAG-lah-nyde

Prandin

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Meglitinide
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 0.5 mg, 1 mg, 2 mg

## INDICATIONS & DOSAGES

➤ **Type 2 diabetes alone or with metformin or a thiazolidinedione**

*Adults:* For patients not previously treated or whose $HbA_{1c}$ is below 8%, starting dose is 0.5 mg P.O. taken about 15 minutes before each meal. For patients previously treated with glucose-lowering drugs and whose $HbA_{1c}$ is 8% or more, first dose is 1 to 2 mg P.O. with each meal. Recommended dosage range is 0.5 to 4 mg with meals b.i.d., t.i.d., or q.i.d. Maximum daily dose is 16 mg.

Determine dosage by glucose response. May double dosage up to 4 mg with each meal until satisfactory glucose response is achieved. At least 1 week should elapse between dosage adjustments to assess response to each dose.

Metformin or a thiazolidinedione may be added if repaglinide monotherapy is inadequate; no repaglinide dosage adjustment is necessary.

***Adjust-a-dose:*** In patients with severe renal impairment, starting dose is 0.5 mg P.O. with meals.

## ADMINISTRATION

**P.O.**

- Give drug before meals, usually 15 minutes before start of meal; however, time can vary from immediately preceding meal to up to 30 minutes before meal.

## ACTION

Stimulates insulin release from beta cells in the pancreas by closing ATP-dependent

R

potassium channels in beta cell membranes, which causes calcium channels to open. Increased calcium influx induces insulin secretion; the overall effect is to lower glucose level.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30 min | 1 hr | Unknown |

*Half-life:* 1 hour.

## ADVERSE REACTIONS

**CNS:** *headache,* paresthesia.
**CV:** angina.
**EENT:** rhinitis, sinusitis.
**GI:** constipation, diarrhea, dyspepsia, nausea, vomiting.
**GU:** UTI.
**Metabolic: HYPOGLYCEMIA,** hyperglycemia.
**Musculoskeletal:** arthralgia, back pain.
**Respiratory:** bronchitis, *upper respiratory tract infection.*
**Other:** tooth disorder.

## INTERACTIONS

**Drug-drug.** *Barbiturates, carbamazepine, rifampin:* May increase repaglinide metabolism. Monitor glucose level.
*Beta blockers, chloramphenicol, coumarin derivatives, MAO inhibitors, NSAIDs, other drugs that are highly protein bound, probenecid, salicylates, sulfonamides:* May increase hypoglycemic action of repaglinide. Monitor glucose level.
*Calcium channel blockers, corticosteroids, estrogens, fosphenytoin, hormonal contraceptives, isoniazid, nicotinic acid, phenothiazines, phenytoin, sympathomimetics, thiazides and other diuretics, thyroid products:* May produce hyperglycemia, resulting in a loss of glycemic control. Monitor glucose level.
*Clarithromycin:* May increase repaglinide levels. Adjust repaglinide dosage.
*Erythromycin, itraconazole, ketoconazole, miconazole, similar inhibitors of CYP3A4:* May inhibit repaglinide metabolism. Monitor glucose level.
*Gemfibrozil:* May increase repaglinide levels. Avoid using together, if possible. Monitor glucose level and adjust repaglinide dosage, if indicated.
**Drug-herb.** *Burdock, dandelion, eucalyptus, marshmallow:* May increase hypoglycemic effects. Discourage use together.
**Drug-food.** *Grapefruit juice:* May inhibit metabolism of drug. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May alter glycemic control, most commonly causing hypoglycemia. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase or decrease glucose level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its inactive ingredients and in those with type 1 diabetes or diabetic ketoacidosis.
- Drug isn't indicated for use in combination with NPH insulin.
- Use cautiously in elderly, debilitated, or malnourished patients and in those with hepatic, adrenal, or pituitary insufficiency.

***Overdose S&S:*** Hypoglycemia, severe hypoglycemic reactions (coma, seizures, neurologic impairment).

## NURSING CONSIDERATIONS

- Increase dosage carefully in patients with impaired renal function or renal failure requiring dialysis.
- Metformin may be added if repaglinide alone is inadequate.
- Drug may increase CV mortality compared with diet alone or diet plus insulin.
- Monitor patient for loss of glycemic control, especially during stress, such as fever, trauma, infection, or surgery.
- Hypoglycemia may be difficult to recognize in elderly patients and in patients taking beta blockers.
- When switching to a different oral hypoglycemic, begin new drug on day after last dose of repaglinide.
- ***Look alike–sound alike:*** Don't confuse Prandin with Avandia.

## PATIENT TEACHING

- Stress importance of diet and exercise with drug therapy.
- Discuss symptoms of hypoglycemia with patient and family.

- Encourage patient to keep regular appointments and have his $HbA_{1c}$ level checked every 3 months to determine long-term glucose control.
- Tell patient to take drug before meals, usually 15 minutes before start of meal; however, time can vary from immediately preceding meal to up to 30 minutes before meal.
- Tell patient that, if a meal is skipped or added, he should skip dose or add an extra dose of drug for that meal, respectively.
- Instruct patient to monitor glucose level carefully and tell him what to do when he's ill, undergoing surgery, or under added stress.
- Advise women planning pregnancy to first consult prescriber. Insulin may be needed during pregnancy and breast-feeding.
- Teach patient to carry candy or other simple sugars to treat mild hypoglycemia episodes. Patient experiencing severe episode may need emergency treatment.
- Advise patient to avoid alcohol, which lowers glucose level.

## retapamulin

re-te-PAM-ue-lin

Altabax

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Pleuromutilin
*Pregnancy risk category B*

### AVAILABLE FORMS

*Topical ointment:* 1%

### INDICATIONS & DOSAGES

➤ **Impetigo**

*Adults and children age 9 months and older:* Apply a thin layer to affected area b.i.d. for 5 days.

### ADMINISTRATION

**Topical**

- Wash hands before and after application, and use glove if available.
- Affected area may be covered with sterile bandage or gauze if needed.

### ACTION

Inhibits bacterial protein synthesis in methicillin-susceptible *Staphylococcus aureus* or *S. pyogenes.*

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Within 24 hr | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CNS:** headache, pyrexia.
**GI:** diarrhea, nausea.
**Respiratory:** nasopharyngitis.
**Skin:** application site irritation, eczema, pruritus.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

- May increase creatinine phosphokinase levels.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Safety and efficacy in children under age 9 months haven't been established.
- Safety and efficacy in pregnant and breast-feeding women haven't been established.

### NURSING CONSIDERATIONS

- To reduce drug resistance or superinfection, treat infection only from organisms proven to be susceptible to this drug.
- Monitor the site for local irritation; if the reaction is severe, wipe the drug off the skin and don't reapply.
- Don't apply drug to mucous membranes.

### PATIENT TEACHING

- Tell patient to wash his hands before and after application, and to use a glove if available.
- Tell patient to notify prescriber if his condition doesn't improve in 3 to 4 days, or if a local reaction develops.
- Advise patient to continue using drug for entire prescribed course of therapy.
- Warn patient that drug is for external use only.

**SAFETY ALERT!**

# reteplase, recombinant

RET-ah-place

Retavase

*Therapeutic class:* Thrombolytic
*Pharmacologic class:* Tissue plasminogen activator
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 10.4 units (18.1 mg)/vial. Supplied in a kit with components for reconstitution for two single-use vials

## INDICATIONS & DOSAGES

➤ **To manage acute MI**

*Adults:* Double-bolus injection of 10 + 10 units. Give each bolus I.V. over 2 minutes. If complications, such as serious bleeding or anaphylactoid reaction, don't occur after first bolus, give second bolus 30 minutes after start of first.

➤ **Catheter occlusion ♦**

*Adults:* 0.4 units/lumen with a dwell time of 20 to 30 minutes.

## ADMINISTRATION

**I.V.**

▼ Reconstitute drug according to manufacturer's instructions using items provided in kit and sterile water for injection, without preservatives. Make sure reconstituted solution is colorless; resulting concentration is 1 unit/ml. If foaming occurs, let vial stand for several minutes. Inspect for precipitation. Use within 4 hours of reconstitution; discard unused portions.

▼ Give as a double-bolus injection. If bleeding or anaphylactoid reaction occurs after first bolus, notify prescriber; second bolus may be withheld.

▼ **Incompatibilities:** Other I.V. drugs.

## ACTION

Enhances cleavage of plasminogen to generate plasmin, which leads to fibrinolysis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 13 to 16 minutes.

## ADVERSE REACTIONS

**CNS:** ***intracranial hemorrhage.***
**CV:** ***arrhythmias, cholesterol embolization, hemorrhage.***
**GI:** ***hemorrhage.***
**GU:** hematuria.
**Hematologic:** ***bleeding tendency,*** anemia.
**Other:** bleeding at puncture sites, hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Heparin, oral anticoagulants, platelet inhibitors (abciximab, aspirin, dipyridamole, eptifibatide, tirofiban):* May increase risk of bleeding. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

- May increase PT, PTT, and INR.
- May alter coagulation study results.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with active internal bleeding, known bleeding diathesis, history of stroke, recent intracranial or intraspinal surgery or trauma, severe uncontrolled hypertension, intracranial neoplasm, arteriovenous malformation, or aneurysm.
- Use cautiously in patients with previous puncture of noncompressible vessels; in those with recent (within 10 days) major surgery, obstetric delivery, organ biopsy, GI or GU bleeding, or trauma; in those with cerebrovascular disease, systolic blood pressure 180 mm Hg or higher or diastolic pressure 110 mm Hg or higher, and conditions that may lead to left heart thrombus, including mitral stenosis, acute pericarditis, subacute bacterial endocarditis, and hemostatic defects.
- Use cautiously in those with diabetic hemorrhagic retinopathy, septic thrombophlebitis, and other conditions in which bleeding would be difficult to manage.
- Use cautiously in patients age 75 and older and in breast-feeding women.

## NURSING CONSIDERATIONS

- Drug remains active in vitro and can lead to degradation of fibrinogen in sample, changing coagulation study results. Collect blood samples with chloromethylketone at 2-micromolar concentrations.

• Drug may be given to menstruating women.
• Carefully monitor ECG during treatment. Coronary thrombolysis may cause arrhythmias linked with reperfusion. Be prepared to treat bradycardia or ventricular irritability.
• Closely monitor patient for bleeding. Avoid I.M. injections, invasive procedures, and nonessential handling of patient. Bleeding is the most common adverse reaction and may occur internally or at external puncture sites. If local measures don't control serious bleeding, stop anticoagulant and notify prescriber. Withhold second bolus of reteplase.
• Potency is expressed in units specific to reteplase and isn't comparable with other thrombolytics.
• Avoid use of noncompressible puncture sites during therapy. If an arterial puncture is needed, use an arm vessel that can be compressed manually. Apply pressure for at least 30 minutes; then apply a pressure dressing. Check site frequently.

### PATIENT TEACHING

• Explain use and administration of drug to patient and family.
• Tell patient to report adverse reactions immediately.

## $Rh_o$(D) immune globulin, human (IGIM)

IGIM HyperRHO S/D Full Dose, HyperRHO S/D Mini-Dose, MICRhoGAM, RhoGAM

## $Rh_o$(D) immune globulin intravenous, human (IGIV)

IGIV Rhophylac, WinRho SDF

*Therapeutic class:* Immune globulin
*Pharmacologic class:* Immune globulin
*Pregnancy risk category C*

### AVAILABLE FORMS

**IGIM**
*Injection:* 300 mcg of $Rh_o$(D) immune globulin/vial (standard dose); 50 mcg of $Rh_o$(D) immune globulin/vial (microdose)

**IGIV**
*Injection:* 120 mcg, 300 mcg, 500 mcg, 1,000 mcg, 3,000 mcg

### INDICATIONS & DOSAGES

➤ **Rh exposure after abortion, miscarriage, ectopic pregnancy, or childbirth**
*Adults:* Transfusion unit or blood bank determines fetal packed RBC volume entering patient's blood; one vial IGIM is given I.M. if fetal packed RBC volume is less than 15 ml. More than one vial I.M. may be needed if severe fetomaternal hemorrhage occurs; must be given within 72 hours after delivery or miscarriage.

➤ **To prevent Rh antibody formation after abortion or miscarriage**
*Adults:* Consult transfusion unit or blood bank. One IGIM microdose vial I.M. will suppress immune reaction to 2.5 ml $Rh_o$(D)-positive RBCs. Ideally, give within 3 hours, but may be given up to 72 hours after abortion or miscarriage.

➤ **Rh exposure after abortion, amniocentesis after 34 weeks' gestation, or other manipulations past 34 weeks' gestation with increased risk of Rh isoimmunization**
*Adults:* 120 mcg IGIV, given I.V. or I.M. within 72 hours of delivery, miscarriage, or manipulation.

➤ **To suppress Rh isoimmunization during pregnancy**
*Adults:* 300 mcg I.V. or I.M. at 28 weeks' gestation. If given early in pregnancy, give additional doses at 12-week intervals to maintain adequate levels of passively acquired anti-Rh antibodies. Then, within 72 hours of delivery, give 120 mcg I.M. or I.V. If 72 hours have elapsed, give drug as soon as possible, up to 28 days.

➤ **Incompatible blood transfusion**
*Adults:* 600 mcg I.V. every 8 hours or 1,200 mcg I.M. every 12 hours until total dose given. Total dose depends on volume of packed RBCs or whole blood infused. Consult blood bank or transfusion unit at once; must be given within 72 hours.

➤ **Idiopathic thrombocytopenic purpura in $Rh_o$(D) antigen-positive adults**
*Adults:* Initially, 50 mcg/kg I.V. as single dose or divided into two doses on separate days. If hemoglobin level is less than

R

10 g/dl, reduce first dose to 25 to 40 mcg/kg. Then, give 25 to 60 mcg/kg I.V. as needed to elevate platelet counts with specific individually determined dosage.

## ADMINISTRATION

**I.V.**

▼ Reconstitute vials containing 600 or 1,500 units with 2.5 ml of 0.8% sodium chloride diluent provided by the manufacturer and vials containing 5,000 units with 8.5 ml of 0.8% sodium chloride diluent provided by the manufacturer. Slowly inject normal saline solution onto wall of vial and gently swirl until lyophilized pellet is dissolved. Don't shake.

▼ Give injection over 3 to 5 minutes.

▼ **Incompatibilities:** Other I.V. drugs.

**I.M.**

● IGIM preparations aren't for I.V. use.

● Give preferably in the anterolateral aspect of the upper thigh and the deltoid muscle of the upper arm.

## ACTION

Mechanism of action not completely known. Suppresses active antibody response and formation of anti-$Rh_o$(D) antibodies in $Rh_o$(D)-negative, $D^u$-negative persons exposed to Rh-positive blood. $Rh_o$(D) immune globulin I.V. may block platelet destruction in $Rh_o$(D) antigen–positive adults.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V., I.M. | Unknown | Unknown | Unknown |

*Half-life:* 24 to 30 days.

## ADVERSE REACTIONS

**CNS:** *fever, headache, chills,* dizziness, weakness.

**Skin:** discomfort at injection site.

**Other:** ***anaphylaxis.***

## INTERACTIONS

**Drug-drug.** *Live-virus vaccines:* May interfere with response. Postpone immunization for 3 months, if possible.

## EFFECTS ON LAB TEST RESULTS

● May affect the results of blood typing, the antibody screening test, and Coombs' test.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in $Rh_o$(D)-positive or $D^u$-positive patients and in those previously immunized to $Rh_o$(D) blood factor. Contraindicated in patients with anaphylactic or severe systemic reaction to human globulin.

● Use extreme caution when giving drug to patients with immunoglobulin A deficiency.

## NURSING CONSIDERATIONS

**Black Box Warning** Intravascular hemolysis (IVH) has been associated with WinRho SDF in patients with immune thrombocytopenic purpura (ITP). IVH can lead to severe anemia, multisystem organ failure, and death. ITP patients treated with WinRho SDF must be monitored in a health care setting for at least 8 hours after drug administration. ■

● Patients with immunoglobulin A deficiency may develop immunoglobulin A antibodies and have anaphylactic reaction; prescriber must weigh benefits of treatment against risk of hypersensitivity reactions before giving.

● Obtain history of allergies and reactions to immunizations. Keep epinephrine 1:1,000 ready to treat anaphylaxis.

***Alert:*** Immediately after delivery, send a sample of neonate's cord blood to laboratory for typing and crossmatching. Confirm if mother is $Rh_o$(D)-negative and $D^u$-negative. Give drug to mother only if infant is $Rh_o$(D)- or $D^u$-positive. Administration must occur within 72 hours of delivery.

● This immune serum provides passive immunity to patient exposed to $Rh_o$(D)-positive fetal blood during pregnancy and prevents formation of maternal antibodies (active immunity), which would endanger future $Rh_o$(D)-positive pregnancies.

● Postpone vaccination with live-virus vaccines for 3 months after administration of $Rh_o$(D) immune globulin.

● Minidose preparations are recommended for patient undergoing abortion or miscarriage up to 12 weeks' gestation unless she is $Rh_o$(D)-positive or $D^u$-positive or has Rh antibodies, or unless the father or fetus is Rh-negative.

## PATIENT TEACHING

- Explain how drug protects future $Rh_o(D)$-positive fetuses if used because of pregnancy, or explain other use, if indicated.
- Warn patient about adverse reactions related to drug.
- Reassure patient receiving this drug that there's no risk of HIV transmission.

**Black Box Warning** Advise patients treated with WinRho SDF for ITP to immediately report back pain, shaking chills, fever, discolored urine, and hematuria. ■

# ribavirin

rye-ba-VYE-rin

Copegus, Rebetol, RibaPak, Ribaspheres, Virazole

*Therapeutic class:* Antiviral
*Pharmacologic class:* Synthetic nucleoside
*Pregnancy risk category X*

## AVAILABLE FORMS

*Capsules:* 200 mg
*Oral solution:* 40 mg/ml
*Powder to be reconstituted for inhalation:* 6 g in 100-ml glass vial
*Tablets:* 200 mg, 400 mg, 500 mg, 600 mg

## INDICATIONS & DOSAGES

➤ **Hospitalized infants and young children infected by respiratory syncytial virus (RSV)**

*Infants and young children:* Solution in concentration of 20 mg/ml delivered via the Viratek Small Particle Aerosol Generator (SPAG-2) and mechanical ventilator or oxygen hood, face mask, or oxygen tent at a rate of about 12.5 L of mist/minute. Treatment is given for 12 to 18 hours/day for at least 3 days, and no longer than 7 days.

➤ **Chronic hepatitis C in patients with compensated liver disease previously untreated with interferon alfa or who have relapsed following interferon alfa therapy**

**Black Box Warning** Ribavirin alone isn't effective for treatment of chronic hepatitis C. ■

*Adults who weigh more than 75 kg (165 lb):* 1,200 mg Rebetol P.O. divided b.i.d. (600 in morning, 600 mg in evening) with interferon alfa-2b, 3 million units subcutaneously three times weekly. Or, 1,200 mg Copegus with 180 mcg of peginterferon alfa-2a.

*Adults who weigh 75 kg or less:* 1,000 mg Rebetol P.O. daily in divided dose (400 mg in morning, 600 mg in evening) with interferon alfa-2b, 3 million units subcutaneously three times weekly. Or, 1,000 mg Copegus with 180 mcg of peginterferon alfa-2a.

*Children age 3 and older who weigh 50 to 61 kg (110 to 134 lb):* 400 mg P.O. (Rebetol) every morning and 400 mg P.O. every evening with interferon alfa-2b, 3 million units/$m^2$ subcutaneously three times weekly.

*Children age 3 and older who weigh 37 to 49 kg (81 to 108 lb):* 200 mg P.O. (Rebetol) every morning and 400 mg P.O. every evening with interferon alfa-2b, 3 million units/$m^2$ subcutaneously three times weekly.

*Children age 3 and older who weigh 25 to 36 kg (55 to 79 lb):* 200 mg P.O. (Rebetol) every morning and 200 mg P.O. every evening with interferon alfa-2b, 3 million units/$m^2$ subcutaneously three times weekly.

➤ **Chronic hepatitis C in patients with compensated liver disease not previously treated with interferon alfa**

**Black Box Warning** Ribavirin alone isn't effective for treatment of chronic hepatitis C. ■

*Adults with viral genotypes 1 or 4 who weigh 75 kg (165 lb) or more (Copegus):* 1,200 mg P.O. daily in two divided doses with 180 mcg peginterferon alfa-2a for 48 weeks.

*Adults with viral genotypes 1 or 4 who weigh less than 75 kg (Copegus):* 1,000 mg P.O. daily in two divided doses with 180 mcg peginterferon alfa-2a for 48 weeks.

*Adults with viral genotypes 2 or 3 (Copegus):* 800 mg P.O. daily in two divided doses with 180 mcg peginterferon alfa-2a for 24 weeks.

***Adjust-a-dose:*** In patient with no cardiac disease history and hemoglobin level less than 10 g/dl, reduce dosage to 600 mg daily (200 mg in a.m., 400 mg in p.m.). If hemoglobin level is less than 8.5 g/dl,

R

stop drug. In patient with history of stable cardiac disease and whose hemoglobin level falls 2 g/dl or more during any 4-week period, reduce dosage to 600 mg daily (200 mg in a.m., 400 mg in p.m.). If hemoglobin level is less than 12 g/dl after 4 weeks of reduced dosage, stop drug.

➤ **Chronic hepatitis C (regardless of genotype) in HIV-infected patients who haven't previously been treated with interferon**

*Adults:* 800 mg Copegus P.O. daily given in two divided doses with peginterferon alfa-2a, 180 mcg subcutaneously weekly for 48 weeks.

***Adjust-a-dose:*** In patient with no cardiac history and hemoglobin level less than 10 g/dl, reduce dosage to 600 mg daily (200 mg in a.m., 400 mg in p.m.) for adults and 7.5 mg/kg daily for children. If hemoglobin level is less than 8.5 g/dl, stop drug. In patient with cardiac history and whose hemoglobin level falls 2 g/dl or more during any 4-week period, reduce dosage to 600 mg daily (200 mg in a.m., 400 mg in p.m.) for adults and 7.5 mg/kg daily for children. If hemoglobin level is less than 12 g/dl after 4 weeks of reduced dosage, stop drug.

## ADMINISTRATION

**Inhalational**

- Give by the Viratek SPAG-2 only. Don't use any other aerosol-generating device.
- Use sterile USP water for injection, not bacteriostatic water. Water used to reconstitute this drug must not contain any antimicrobial product.
- Discard solutions placed in the SPAG-2 unit at least every 24 hours before adding newly reconstituted solution.
- Store reconstituted solutions at room temperature for 24 hours.

**P.O.**

- Give drug without regard for meals at the same time every day.

***Alert:*** Capsules should never be opened, crushed, or broken.

## ACTION

Inhibits viral activity by an unknown mechanism, possibly by inhibiting RNA and DNA synthesis by depleting intracellular nucleotide pools.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Inhalation | Unknown | Unknown | Unknown |
| P.O. | Unknown | 2 hr | Unknown |

*Half-life:* First phase, 9¼ hours; second phase, 40 hours.

## ADVERSE REACTIONS

**CV:** ***bradycardia, cardiac arrest.***
**EENT:** conjunctivitis.
**Hematologic:** anemia, reticulocytosis.
**Respiratory:** ***apnea, bronchospasm,*** bacterial pneumonia, ***pneumothorax, pulmonary edema,*** worsening respiratory state.

## INTERACTIONS

**Drug-drug.** *Acetaminophen, antacids that contain magnesium, aluminum, or simethicone, aspirin, cimetidine:* May affect drug level. Monitor patient.
*Didanosine:* May increase toxicity. Avoid using together.
*Stavudine, zidovudine:* May decrease antiretroviral activity. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, and bilirubin levels. May decrease hemoglobin level.
- May increase reticulocyte count.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Aerosol form contraindicated in patients hypersensitive to drug, and isn't indicated for use in adults. ■
**Black Box Warning** Ribavirin may cause hemolytic anemia and worsen cardiac disease, leading to potentially fatal MI. ■
**Black Box Warning** Oral form is contraindicated in patients hypersensitive to drug, pregnant women, men whose partners are pregnant or may become pregnant within 6 months, patients with thalassemia major or sickle cell anemia, patients with a history of significant or unstable cardiac disease, and patients whose creatinine clearance is less than 50 ml/minute. ■
**Black Box Warning** In infants, aerosolized ribavirin has been associated with sudden deterioration of respiratory function. Monitor respiratory function carefully

and stop treatment if sudden respiratory deterioration occurs. ■
• Use cautiously in elderly patients and patients with hepatic or renal insufficiency.
⚠ ***Overdose S&S:*** Increased severity of adverse reactions.

## NURSING CONSIDERATIONS

**Aerosol form**
***Alert:*** The long-term and cumulative effects to health care personnel exposed to this form aren't known. Eye irritation and headache may occur. Advise pregnant women to avoid unnecessary exposure.
**Black Box Warning** Monitor ventilator function frequently. Drug may precipitate in ventilator, causing equipment to malfunction with serious consequences. ■
• This form is indicated only for severe lower respiratory tract infection caused by RSV. Although you should begin treatment while awaiting test results, an RSV infection must be documented eventually.
• Most infants and children with RSV infection don't require treatment with antivirals because the disease is commonly mild and self-limiting. Premature infants or those with cardiopulmonary disease experience RSV in its severest form and benefit most from treatment with ribavirin aerosol.
**Oral form**
• Don't start therapy until a negative pregnancy test is confirmed in patient or partner of patient; they should take a pregnancy test every month during therapy and for 6 months afterward.
• Women or female partner of patient should use two reliable forms of contraception before and during treatment and for 6 months afterward.
• Report pregnancies that occur during treatment by calling 800-593-2214.
• Monitor hematologic status, liver function, and thyroid-stimulating hormone level at baseline and throughout therapy.
***Alert:*** Monitor patient for suicidal ideation, severe depression, hemolytic anemia, bone marrow suppression, autoimmune and infective disorders, pulmonary dysfunction, pancreatitis, and diabetes.
• Stop drug if pulmonary infiltrates or severe pulmonary impairment occur.

## PATIENT TEACHING

• Inform parents of need for drug, and answer any questions.
• Encourage parents to immediately report any subtle change in child.
• Inform patient that oral form may be taken without regard to meals but should be taken in a consistent manner.

# rifabutin

rif-ah-BYOO-tin

Mycobutin

*Therapeutic class:* Antituberculotic
*Pharmacologic class:* Semisynthetic ansamycin
*Pregnancy risk category B*

## AVAILABLE FORMS

*Capsules:* 150 mg

## INDICATIONS & DOSAGES

➤ **To prevent disseminated *Mycobacterium avium* complex in patients with advanced HIV infection**
*Adults:* 300 mg P.O. daily as a single dose or divided b.i.d.
***Adjust-a-dose:*** For patients with creatinine clearance of less than 30 ml/minute, reduce rifabutin dosage by 50%.

## ADMINISTRATION

**P.O.**
• For patient who has difficulty swallowing, mix drug with soft foods such as applesauce.
• Patient experiencing GI adverse effects, such as nausea or vomiting, may divide total daily dose into two doses and take with food.

## ACTION

Inhibits DNA-dependent RNA polymerase in susceptible bacteria, blocking bacterial protein synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–4 hr | Unknown |

*Half-life:* About 2 days.

## ADVERSE REACTIONS

**CNS:** headache, fever, insomnia.
**EENT:** eye inflammation.
**GI:** dyspepsia, eructation, flatulence, diarrhea, nausea, vomiting, abdominal pain, anorexia, taste perversion.
**GU:** *discolored urine.*
**Hematologic:** ***neutropenia, leukopenia, thrombocytopenia,*** eosinophilia.
**Musculoskeletal:** myalgia.
**Skin:** *rash.*

## INTERACTIONS

**Drug-drug.** *Benzodiazepines, beta blockers, buspirone,* ***corticosteroids***, ***cyclosporine***, *delavirdine, doxycycline, fluconazole, hydantoins, indinavir, itraconazole, ketoconazole, losartan, macrolides, methadone, morphine, nelfinavir, quinidine, quinine,* ***tacrolimus***, *theophylline, tricyclic antidepressants, zolpidem:* May decrease effectiveness of these drugs. Monitor patient for drug effects.
*Hormonal contraceptives:* May decrease contraceptive effectiveness. Tell patient to use another form of birth control.
*Indinavir:* May increase rifabutin level. Decrease rifabutin dosage by 50%.
***Ritonavir:*** May increase the risk of rifabutin hematologic toxicity. Use together is contraindicated.
***Voriconazole:*** May decrease therapeutic effects of voriconazole while increasing the risk of rifabutin adverse effects. Use together is contraindicated.
*Warfarin:* May decrease effectiveness of warfarin. May require higher dosages of anticoagulants. Monitor PT and INR.
**Drug-food.** *High-fat foods:* May reduce rate but not extent of absorption. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase aminotransferase level.
- May decrease neutrophil, WBC, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other rifamycin derivatives, such as rifampin, and in patients with active tuberculosis because single-drug therapy with rifabutin increases risk of inducing bacterial resistance to both rifabutin and rifampin.
- Use cautiously in patients with neutropenia and thrombocytopenia.

## NURSING CONSIDERATIONS

- In patients with neutropenia or thrombocytopenia, obtain baseline hematologic studies and repeat periodically.
- ***Look alike–sound alike:*** Don't confuse rifabutin with rifampin or rifapentine.

## PATIENT TEACHING

- Instruct patient to take drug for as long as prescribed, exactly as directed, even after feeling better.
- Tell patient experiencing GI adverse effects, such as nausea or vomiting, to divide total daily dose into 2 doses and to take with food.
- Tell patient that drug may cause brownish orange staining of urine, feces, sputum, saliva, tears, and skin. Tell him to avoid wearing soft contact lenses because they may be permanently stained.
- Instruct patient to report sensitivity to light, excessive tears, or eye pain immediately.
- Advise patient to report tingling and joint stiffness, swelling, or tenderness.
- Advise patients using hormonal contraceptives to change to nonhormonal birth control because rifabutin may decrease hormonal contraceptive effectiveness.

# rifampin (rifampicin)

RIF-am-pin

Rifadin, Rimactane, Rofact†

*Therapeutic class:* Antituberculotic
*Pharmacologic class:* Semisynthetic rifamycin
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 150 mg, 300 mg
*Powder for injection:* 600 mg

## INDICATIONS & DOSAGES

➤ **Pulmonary tuberculosis, with other antituberculotics**

*Adults:* 10 mg/kg P.O. or I.V. daily in single dose. Give oral doses 1 hour before or 2 hours after meals with a full glass of water. Maximum daily dose is 600 mg.
*Children age 5 and older:* 10 to 20 mg/kg P.O. or I.V. daily in single dose. Give oral doses 1 hour before or 2 hours after meals with a full glass of water. Maximum daily dose is 600 mg. Give with other antituberculotics.

➤ **Meningococcal carriers**
*Adults:* 600 mg P.O. or I.V. every 12 hours for 2 days; or 600 mg P.O. or I.V. once daily for 4 days.
*Children ages 1 month to 12 years:* 10 mg/kg P.O. or I.V. every 12 hours for 2 days, not to exceed 600 mg/day; or 20 mg/kg once daily for 4 days.
*Neonates:* 5 mg/kg P.O. or I.V. every 12 hours for 2 days.

## ADMINISTRATION

**P.O.**
• Give drug with at least one other antituberculotic.
• For best absorption, give capsules 1 hour before or 2 hours after meals.
• For the patient who can't tolerate capsules on an empty stomach, give drug with meals and a full glass of water.
• For patients who have difficulty swallowing capsules or when lower doses are needed, consult pharmacist for preparation of an oral suspension.

**I.V.**
▼ Reconstitute drug with 10 ml of sterile water for injection to yield 60 mg/ml.
▼ Add to 100 ml of $D_5W$ and infuse over 30 minutes, or add to 500 ml of $D_5W$ and infuse over 3 hours.
▼ When dextrose is contraindicated, dilute with normal saline solution for injection.
▼ Once prepared, dilutions in $D_5W$ are stable for up to 4 hours and dilutions in normal saline solution are stable for up to 24 hours at room temperature.
▼ **Incompatibilities:** Diltiazem, minocycline, other I.V. solutions.

## ACTION

Inhibits DNA-dependent RNA polymerase, which impairs RNA synthesis; bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–4 hr | Unknown |
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 1¼ to 5 hours.

## ADVERSE REACTIONS

**CNS:** headache, fatigue, drowsiness, behavioral changes, dizziness, mental confusion, generalized numbness, ataxia.
**CV:** ***shock.***
**EENT:** visual disturbances, exudative conjunctivitis.
**GI:** ***pancreatitis, pseudomembranous colitis,*** epigastric distress, anorexia, nausea, vomiting, abdominal pain, diarrhea, flatulence, sore mouth and tongue.
**GU:** ***acute renal failure,*** hemoglobinuria, hematuria, menstrual disturbances.
**Hematologic:** ***thrombocytopenia, transient leukopenia,*** eosinophilia, hemolytic anemia.
**Hepatic:** ***hepatotoxicity.***
**Metabolic:** hyperuricemia.
**Musculoskeletal:** osteomalacia.
**Respiratory:** shortness of breath, wheezing.
**Skin:** pruritus, urticaria, rash.
**Other:** flulike syndrome, discoloration of body fluids, porphyria exacerbation.

## INTERACTIONS

**Drug-drug.** *Acetaminophen, amiodarone, analgesics, anticonvulsants, barbiturates, beta blockers, cardiac glycosides, chloramphenicol, clofibrate,* ***corticosteroids,*** ***cyclosporine,*** *dapsone, delavirdine, diazepam, digoxin, disopyramide, doxycycline, enalapril, fluoroquinolones, hormonal contraceptives, hydantoins, losartan, methadone, mexiletine, midazolam, nifedipine, ondansetron, opioids, progestins, propafenone, quinidine,* ***ritonavir,*** *sulfonylureas,* ***tacrolimus,*** *theophylline, tocainide, triazolam, tricyclic antidepressants, verapamil, zidovudine, zolpidem:* May decrease effectiveness of these drugs. Monitor effectiveness.
*Anticoagulants:* May increase requirements for anticoagulant. Monitor PT and INR closely and adjust dosage of anticoagulants.
*Halothane:* May increase risk of hepatotoxicity. Monitor liver function test results.

R

*Isoniazid:* May increase risk of hepatotoxicity. Monitor liver function test results.
*Ketoconazole, para-aminosalicylate sodium:* May interfere with absorption of rifampin. Separate doses by 8 to 12 hours.
*Macrolide antibiotics, protease inhibitors:* May inhibit rifampin metabolism but increase metabolism of other drug. Monitor patient for clinical and adverse effects.
*Probenecid:* May increase rifampin levels. Use together cautiously.
***Voriconazole:*** May decrease voriconazole's therapeutic effects while increasing the risk of rifampin adverse effects. Use together is contraindicated.
**Drug-lifestyle.** *Alcohol use:* May increase risk of hepatotoxicity. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, alkaline phosphatase, bilirubin, and uric acid levels. May decrease hemoglobin level.
- May increase eosinophil counts. May decrease platelet and WBC counts.
- May alter standard folate and vitamin $B_{12}$ assay results.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to rifampin or related drugs.
- Use cautiously in patients with liver disease.
- Use in pregnant women only if potential benefit justifies potential risk to fetus.

***Overdose S&S:*** Nausea; vomiting; abdominal pain; pruritus; headache; increasing lethargy; unconsciousness; transient increases in liver enzyme or bilirubin levels; brownish red or orange discoloration of skin, urine, sweat, saliva, tears, and feces; facial or periorbital edema; hypotension; tachycardia; ventricular arrhythmias; seizures; cardiac arrest; liver enlargement; jaundice.

## NURSING CONSIDERATIONS

- Monitor hepatic function, hematopoietic studies, and uric acid levels. Drug's systemic effects may asymptomatically raise liver function test results and uric acid level.
- Watch for and report to prescriber signs and symptoms of hepatic impairment.
- Drug may cause hemorrhage in neonates and mother when drug is given during last few weeks of pregnancy. Monitor clotting parameters closely, and treat with vitamin K as needed.
- ***Look alike–sound alike:*** Don't confuse rifampin with rifabutin or rifapentine.

## PATIENT TEACHING

- Instruct patient who can't tolerate capsules on an empty stomach to take drug with meals and a full glass of water.
- Advise patient who is unable to swallow capsules whole that an oral suspension can be prepared by the pharmacist.
- Warn patient that he may feel drowsy and that drug can turn body fluids red-orange and permanently stain contact lenses.
- Advise women using hormonal contraceptives to consider another form of birth control.
- Advise patient to contact prescriber if he experiences fever, loss of appetite, malaise, nausea, vomiting, dark urine, or yellow discoloration of the eyes or skin.
- Advise patient to avoid alcohol during drug therapy.

# rifapentine

rif-ah-PIN-ten

Priftin

*Therapeutic class:* Antituberculotic
*Pharmacologic class:* Synthetic rifamycin
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets (film-coated):* 150 mg

## INDICATIONS & DOSAGES

➤ **Pulmonary tuberculosis (TB), with at least one other antituberculotic to which the isolate is susceptible**

*Adults and children age 12 and older:* During intensive phase of short-course therapy, 600 mg P.O. twice weekly for 2 months, with an interval between doses of at least 3 days (72 hours). During continuation phase of short-course therapy, 600 mg P.O. once weekly for 4 months,

combined with isoniazid or another drug to which the isolate is susceptible.

## ADMINISTRATION

### P.O.

• Give drug with pyridoxine (vitamin $B_6$) in malnourished patients; in those predisposed to neuropathy, such as alcoholics and diabetics; and in adolescents.
***Alert:*** Give drug with appropriate daily companion drugs. Compliance with all drug regimens, especially with daily companion drugs on the days when rifapentine isn't given, is crucial for early sputum conversion and protection from relapse of TB.

## ACTION

Inhibits DNA-dependent RNA polymerase in susceptible strains of *Mycobacterium tuberculosis*. Demonstrates bactericidal activity against the organism both intracellularly and extracellularly.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 5–6 hr | Unknown |

*Half-life:* 13 hours.

## ADVERSE REACTIONS

**CNS:** headache, dizziness, pain.
**CV:** hypertension.
**GI:** anorexia, nausea, vomiting, dyspepsia, diarrhea.
**GU:** hyperuricemia, pyuria, proteinuria, hematuria, urinary casts.
**Hematologic:** ***leukopenia, neutropenia,*** anemia, ***thrombocytosis.***
**Metabolic:** *hyperuricemia.*
**Musculoskeletal:** arthralgia.
**Respiratory:** hemoptysis.
**Skin:** rash, pruritus, acne, maculopapular rash.

## INTERACTIONS

**Drug-drug.** *Antiarrhythmics (disopyramide, mexiletine, quinidine, tocainide), antibiotics (chloramphenicol, clarithromycin, dapsone, doxycycline, fluoroquinolones), anticonvulsants (phenytoin), antifungals (fluconazole, itraconazole, ketoconazole), barbiturates, benzodiazepines (diazepam), beta blockers, calcium channel blockers (diltiazem, nifedipine, verapamil), cardiac glycosides, clofibrate,* ***corticosteroids,*** *haloperidol, HIV protease inhibitors (indinavir, nelfinavir, ritonavir, saquinavir), hormonal contraceptives,* ***immunosuppressants (cyclosporine, tacrolimus),*** *levothyroxine, opioid analgesics (methadone), oral anticoagulants (warfarin), oral hypoglycemics (sulfonylureas), progestins, quinine, reverse transcriptase inhibitors (delavirdine, zidovudine), sildenafil, theophylline, tricyclic antidepressants (amitriptyline, nortriptyline):* May decrease activity of these drugs because of cytochrome P-450 enzyme metabolism. May need to adjust dosage.
***Ritonavir:*** May decrease ritonavir levels. Carefully monitor patient's response.

## EFFECTS ON LAB TEST RESULTS

• May increase uric acid, ALT, and AST levels. May decrease hemoglobin level.
• May increase platelet count. May decrease neutrophil and WBC counts.
• May alter folate and vitamin $B_{12}$ assay results.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to rifamycins (rifapentine, rifampin, or rifabutin).
• Use drug cautiously and with frequent monitoring in patients with liver disease.
***Overdose S&S:*** Heartburn, headache, increased urinary frequency, transient increase in AST, pruritus.

## NURSING CONSIDERATIONS

• Rifamycin antibiotics may cause hepatotoxicity. Obtain baseline liver function test results before therapy.
• If used during the last 2 weeks of pregnancy, drug may lead to postnatal hemorrhage in mother or infant. Monitor clotting parameters closely if drug is used at that time.
• ***Look alike–sound alike:*** Don't confuse rifapentine with rifabutin or rifampin.

## PATIENT TEACHING

• Stress importance of strict compliance with this drug regimen and that of daily companion drugs, as well as needed follow-up visits and laboratory tests.
• Advise women to use nonhormonal birth control methods.

R

- Tell patient to take drug with food if nausea, vomiting, or GI upset occurs.
- Instruct patient to report to prescriber fever, appetite loss, malaise, nausea, vomiting, darkened urine, yellowish skin and eyes, joint pain or swelling, or excessive loose stools or diarrhea.
- Instruct patient to protect pills from excessive heat.
- Tell patient that drug may turn body fluids red-orange and permanently stain contact lenses.

## rifaximin

reh-FACKS-ah-men

Xifaxan

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Rifamycin antibacterial
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 200 mg, 550 mg

### INDICATIONS & DOSAGES

➤ **Traveler's diarrhea from noninvasive strains of *Escherichia coli***
*Adults and children age 12 and older:* 200 mg P.O. t.i.d. for 3 days.
➤ **Hepatic encephalopathy**
*Adults:* 550 mg P.O. b.i.d.
➤ **Irritable bowel syndrome ♦**
*Adults:* 400 mg P.O. b.i.d. or t.i.d. for 10 days.

### ADMINISTRATION

**P.O.**
- Give drug without regard for food.

### ACTION

Binds to the beta-subunit of bacterial DNA-dependent RNA polymerase, which inhibits bacterial RNA synthesis and kills *E. coli*.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | ½–4 hr | Unknown |

*Half-life:* 1.8 to 4.8 hours.

### ADVERSE REACTIONS

**CNS:** depression, dizziness, fatigue, fever, headache.
**CV:** peripheral edema.
**EENT:** nasopharyngitis.
**GI:** ascites, abdominal pain, constipation, defecation urgency, flatulence, nausea, rectal tenesmus, vomiting.
**Hematologic:** anemia.
**Musculoskeletal:** arthralgia, muscle spasms.
**Respiratory:** dyspnea.
**Skin:** rash, pruritus.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to rifaximin or any rifamycin antibacterial.

### NURSING CONSIDERATIONS

- Don't use drug in patients whose illness may be caused by *Campylobacter jejuni*, *Shigella*, or *Salmonella*.
***Alert:*** Don't use drug in patients with blood in the stool, diarrhea with fever, or diarrhea from pathogens other than *E. coli*.
- Stop drug if diarrhea worsens or lasts longer than 24 to 48 hours. The patient may need a different antibiotic.
- Patients who have diarrhea after antibiotic therapy may have pseudomembranous colitis, which may range from mild to life-threatening.
- Monitor patient for overgrowth of nonsusceptible organisms.

### PATIENT TEACHING

- Explain that drug may be taken with or without food.
- Tell patient to take all the prescribed drug, even if he feels better before the drug is finished.
- Advise patient to notify his prescriber if diarrhea worsens or lasts longer than 1 or 2 days after starting treatment. A different treatment may be needed.
- Tell patient to call the prescriber if he develops a fever or has blood in his stool.
- Explain that this drug is only for treating diarrhea caused by contaminated foods or

beverages while traveling and not for any other type of infection.
• Caution patient not to share this drug with others.

## riluzole

RILL-you-zole

Rilutek

*Therapeutic class:* Neuroprotector
*Pharmacologic class:* Benzothiazole
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 50 mg

### INDICATIONS & DOSAGES

➤ **Amyotrophic lateral sclerosis**

*Adults:* 50 mg P.O. every 12 hours, taken on empty stomach 1 hour before or 2 hours after a meal.

### ADMINISTRATION

**P.O.**

• Give drug at least 1 hour before or 2 hours after meals to improve bioavailability.

### ACTION

May protect motor neurons from excitotoxic effects of glutamate by inhibiting glutamate release, inactivating some sodium channels, and interfering with transmitter binding.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* 12 hours with repeated doses.

### ADVERSE REACTIONS

**CNS:** *asthenia*, headache, aggravation reaction, hypertonia, depression, dizziness, insomnia, malaise, somnolence, vertigo, circumoral paresthesia.
**CV:** hypertension, tachycardia, palpitations, orthostatic hypotension, phlebitis, peripheral edema.
**EENT:** rhinitis, sinusitis.
**GI:** *nausea*, abdominal pain, vomiting, dyspepsia, anorexia, diarrhea, flatulence, stomatitis, dry mouth, oral candidiasis.
**GU:** UTI, dysuria.
**Metabolic:** weight loss.
**Musculoskeletal:** back pain, arthralgia.
**Respiratory:** *decreased lung function*, increased cough.
**Skin:** pruritus, eczema, alopecia, exfoliative dermatitis.
**Other:** tooth disorder.

### INTERACTIONS

**Drug-drug.** *Allopurinol, methyldopa, sulfasalazine:* May increase risk of hepatotoxicity. Monitor liver function closely.
*CYP1A2 inducers (omeprazole, rifampin):* May increase riluzole elimination. Dosage increase may be needed.
*CYP1A2 inhibitors (amitriptyline, caffeine, phenacetin, quinolones, theophylline):* May decrease riluzole elimination. Watch for adverse effects.
**Drug-food.** *Any food:* May decrease drug bioavailability. Advise patient to take drug 1 hour before or 2 hours after meals.
*Charbroiled foods:* May increase elimination of drug. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May increase risk of hepatotoxicity. Discourage excessive use.
*Smoking:* May increase drug elimination. Discourage patient from smoking.

### EFFECTS ON LAB TEST RESULTS

• May increase AST, ALT, bilirubin, and GGT levels.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients with history of severe hypersensitivity to drug or its components.
• Use cautiously in patients with hepatic or renal dysfunction, in elderly patients, and in women and Japanese patients who may have lower metabolic capacity to eliminate drug than men and white patients, respectively.
⚠ ***Overdose S&S:*** Methemoglobinemia.

### NURSING CONSIDERATIONS

• Elevated baseline liver function studies (especially bilirubin) rule out therapy. Perform liver function studies periodically during therapy. In many patients, drug may increase aminotransferase level; if level exceeds five times upper limit of normal or if clinical jaundice develops, notify prescriber.

R

### PATIENT TEACHING

- Tell patient to take drug at same time each day. If a dose is missed, tell him to take next tablet when planned.
- Instruct patient to take drug on an empty stomach to facilitate full dose absorption.
- Instruct patient to report fever to prescriber, who may order a WBC count.
- Warn patient to avoid hazardous activities until CNS effects of drug are known and to limit alcohol use during therapy.
- Tell patient to store drug at room temperature, protect from bright light, and keep out of children's reach.

## risedronate sodium

rah-SED-dro-nate

Actonel

*Therapeutic class:* Antiosteoporotic
*Pharmacologic class:* Bisphosphonate
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 5 mg, 30 mg, 35 mg, 150 mg

### INDICATIONS & DOSAGES

➤ **To prevent and treat postmenopausal osteoporosis**

*Women:* 5-mg tablet P.O. once daily, or 35-mg tablet once weekly.

➤ **To prevent or treat postmenopausal osteoporosis when fewer dosing days are desirable**

*Adults:* 75 mg P.O. on 2 consecutive days for a total of 2 tablets each month. Or, one 150 mg tablet P.O. once each month.

➤ **To increase bone mass with osteoporosis**

*Men:* One 35-mg tablet P.O. once weekly.

➤ **Glucocorticoid-induced osteoporosis in patients taking 7.5 mg or more of prednisone or equivalent glucocorticoid daily**

*Adults:* 5 mg P.O. daily.

➤ **Paget disease**

*Adults:* 30 mg P.O. daily for 2 months. If relapse occurs or alkaline phosphatase level doesn't normalize, may repeat treatment course 2 months or more after completing first treatment course.

***Adjust-a-dose:*** Don't use if creatinine clearance is less than 30 ml/minute.

### ADMINISTRATION

**P.O.**

- Give drug at least 30 minutes before the first food or drink of the day, other than water. Give with 6 to 8 ounces of water while patient is sitting or standing.
- Warn patient against lying down for 30 minutes after taking drug.

### ACTION

Reverses the loss of bone mineral density by reducing bone turnover and bone resorption. In patients with Paget disease, drug causes bone turnover to return to normal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | Unknown | Unknown |

*Half-life:* 1½ hours to 20 days.

### ADVERSE REACTIONS

**CNS:** asthenia, *headache*, depression, dizziness, insomnia, anxiety, neuralgia, vertigo, hypertonia, paresthesia, *pain*.
**CV:** *hypertension*, CV disorder, angina pectoris, chest pain, peripheral edema.
**EENT:** pharyngitis, rhinitis, sinusitis, cataract, conjunctivitis, otitis media, amblyopia, tinnitus.
**GI:** *nausea*, *diarrhea*, *abdominal pain*, flatulence, gastritis, rectal disorder, constipation.
**GU:** *UTI*, cystitis.
**Hematologic:** ecchymosis, anemia.
**Musculoskeletal:** *arthralgia*, neck pain, *back pain*, myalgia, bone pain, leg cramps, bursitis, tendon disorder.
**Respiratory:** dyspnea, pneumonia, bronchitis.
**Skin:** *rash*, pruritus.
**Other:** *infection*, tooth disorder.

### INTERACTIONS

**Drug-drug.** *Aspirin, NSAIDs:* May increase risk of gastric ulcers. Use cautiously together.
*Calcium supplements, antacids that contain calcium, magnesium, or aluminum:* May interfere with risedronate absorption. Advise patient to separate dosing times.

**Drug-food.** *Any food:* May interfere with absorption of drug. Advise patient to take drug at least 30 minutes before first food or drink of the day (other than water).

### EFFECTS ON LAB TEST RESULTS

• May decrease calcium and phosphorus levels.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to any component of the product, in hypocalcemic patients, in patients with creatinine clearance less than 30 ml/minute, and in those who can't stand or sit upright for 30 minutes after administration.
**Alert:** There may be an increased risk of fractures of the thigh in patients treated with biphosphonates.
• Use cautiously in patients with upper GI disorders, such as dysphagia, esophagitis, and esophageal or gastric ulcers.
**Overdose S&S:** Hypocalcemia, hypophosphatemia.

### NURSING CONSIDERATIONS

• Risk factors for the development of osteoporosis include family history, previous fracture, smoking, a decrease in bone mineral density below the premenopausal mean, a thin body frame, White or Asian race, and early menopause.
• Monitor patient for osteonecrosis of the jaw. Associated risk factors include invasive dental procedures, cancer diagnosis, concomitant treatment such as chemotherapy and steroids, poor oral hygiene, and preexisting dental disease. If signs or symptoms occur, stop drug and refer patient to oral surgeon.
**Alert:** Drug may cause dysphagia, esophagitis, and esophageal or gastric ulcers. Monitor patient for symptoms of esophageal disease.
• Severe musculoskeletal pain has been associated with biophosphate use and may occur within days, months, or years of start of therapy. When drug is stopped, symptoms may resolve partially or completely.
• Give supplemental calcium and vitamin D if dietary intake is inadequate. Because calcium supplements and drugs containing calcium, aluminum, or magnesium may interfere with risedronate absorption, separate dosing times.
• Bisphosphonates can interfere with bone-imaging agents.

### PATIENT TEACHING

• Explain that drug may reverse bone loss by stopping more bone loss and increasing bone strength.
• Caution patient about the importance of adhering to special dosing instructions.
• Tell patient not to chew or suck the tablet because doing so may irritate his mouth.
• Advise patient to contact prescriber immediately if he develops GI discomfort (such as difficulty or pain when swallowing, retrosternal pain, or severe heartburn).
• Advise patient to take calcium and vitamin D if dietary intake is inadequate, but to take them at a different time than risedronate.
• Advise patient to stop smoking and drinking alcohol, as appropriate. Also, advise patient to perform weightbearing exercise.
• Tell patient to store drug in a cool, dry place, at room temperature, and away from children.
• Urge patient to read the Patient Information Guide before starting therapy.
• Tell patient if he misses a dose of the 35-mg tablet, he should take 1 tablet on the morning after he remembers and return to taking 1 tablet once a week, as originally scheduled on his chosen day. Patient shouldn't take 2 tablets on the same day.

R

## risperidone

ris-PEER-i-dohn

Risperdal✐, Risperdal Consta

*Therapeutic class:* Antipsychotic
*Pharmacologic class:* Benzisoxazole derivative
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 12.5 mg, 25 mg, 37.5 mg, 50 mg
*Solution:* 1 mg/ml
*Tablets:* 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg

*Tablets (orally disintegrating):* 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg

## INDICATIONS & DOSAGES

**➤ Schizophrenia**

*Adults:* Drug may be given once or twice daily. Initial dosing is generally 2 mg P.O. daily. Increase dosage at intervals not less than 24 hours, in increments of 1 to 2 mg/day, as tolerated, to a recommended dose of 4 to 8 mg/day. Periodically reassess to determine the need for maintenance treatment with an appropriate dose. Maximum dose is 16 mg/day.

*Adolescents ages 13 to 17:* Start treatment with 0.5 mg P.O. once daily, given as a single daily dose in either the morning or evening. Adjust dose, if indicated, at intervals not less than 24 hours, in increments of 0.5 or 1 mg/day, as tolerated, to a recommended dose of 3 mg/day. There are no data to support use beyond 8 weeks.

**➤ 12-week parenteral therapy for schizophrenia**

*Adults:* Establish tolerance to oral risperidone before giving I.M. Give 25 mg deep I.M. into the buttock every 2 weeks, alternating injections between the two buttocks. Adjust dose no sooner than every 4 weeks. Maximum, 50 mg I.M. every 2 weeks. Continue oral antipsychotic for 3 weeks after first I.M. injection, then stop oral therapy.

***Adjust-a-dose:*** Patients with hepatic or renal impairment: Titrate slowly to 2 mg P.O.; if tolerated, give 25 mg I.M. every 2 weeks, or give initial dose of 12.5 mg I.M. Continue oral form of risperidone (or another antipsychotic drug) with the first injection and for 3 subsequent weeks to maintain therapeutic drug levels.

**➤ Monotherapy or combination therapy with lithium or valproate for 3-week treatment of acute manic or mixed episodes from bipolar I disorder**

*Adults:* 2 to 3 mg P.O. once daily. Adjust dose by 1 mg daily. Dosage range is 1 to 6 mg daily. Or, 25 mg I.M. every 2 weeks. Some patients may benefit from a higher dose of 37.5 or 50 mg.

***Adjust-a-dose:*** In elderly or debilitated patients, hypotensive patients, or those with severe renal or hepatic impairment, start with 0.5 mg P.O. b.i.d. Increase dosage by 0.5 mg b.i.d. Increase in dosages above 1.5 mg b.i.d. should occur at least 1 week apart. Subsequent switches to once-daily dosing may be made after patient is on a twice-daily regimen for 2 to 3 days at the target dose.

*Children and adolescents ages 10 to 17:* 0.5 mg P.O. as a single daily dose in either the morning or evening. Adjust dose, if indicated, at intervals not less than 24 hours, in increments of 0.5 or 1 mg/day, as tolerated, to a recommended dose of 2.5 mg/day.

**➤ Irritability, including aggression, self-injury, and temper tantrums, associated with an autistic disorder**

*Adolescents and children age 5 and older who weigh 20 kg (44 lb) or more:* Initially, 0.5 mg P.O. once daily or divided b.i.d. After 4 days, increase dose to 1 mg. Increase dosage further in 0.5-mg increments at intervals of at least 2 weeks.

*Children age 5 and older who weigh less than 20 kg:* Initially, 0.25 mg P.O. once daily or divided b.i.d. After 4 days, increase dose to 0.5 mg. Increase dosage further in 0.25-mg increments at intervals of at least 2 weeks. Increase cautiously in children who weigh less than 15 kg (33 lb).

**➤ Tourette syndrome ♦**

*Adults and children:* Initially, 0.5 to 1 mg P.O. daily. Titrate by 0.5 or 1 mg every 5 days. Average dose is less than 4 mg daily; maximum dose 6 to 9 mg daily.

**➤ Obsessive-compulsive disorder ♦**

*Adults:* 0.5 or 1 mg P.O. daily and increased by 0.5 to 1 mg weekly. Continue for 1 to 2 years before tapering; then may reduce dosage by 10% to 25% every 1 to 2 months.

## ADMINISTRATION

**P.O.**

- Give drug without regard for meals.
- Open package for orally disintegrating tablets (ODTs) immediately before giving by peeling off foil backing with dry hands. Don't push tablets through the foil.
- Phenylalanine contents of ODTs are as follows: 0.5-mg tablet contains 0.14 mg phenylalanine; 1-mg tablet contains 0.28 mg phenylalanine; 2-mg tablet contains 0.56 mg phenylalanine; 3-mg tablet contains 0.63 mg

phenylalanine; 4-mg tablet contains 0.84 mg phenylalanine.

**I.M.**

- Continue oral therapy for the first 3 weeks of I.M. injection therapy until injections take effect, then stop oral therapy.
- To reconstitute I.M. injection, inject premeasured diluent into vial and shake vigorously for at least 10 seconds. Suspension appears uniform, thick, and milky; particles are visible, but no dry particles remain. Use drug immediately, or refrigerate for up to 6 hours after reconstitution. If more than 2 minutes pass before injection, shake vigorously again. See manufacturer's package insert for more detailed instructions.
- Refrigerate I.M. injection kit and protect it from light. Drug can be stored at temperature less than 77° F (25° C) for no more than 7 days before administration.

## ACTION

Blocks dopamine and 5-$HT_2$ receptors in the brain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Unknown |
| I.M. | 3 wk | 4–6 wk | 7 wk |

*Half-life:* 3 to 20 hours.

## ADVERSE REACTIONS

**CNS:** *akathisia, somnolence, dystonia, headache, insomnia, agitation, anxiety, pain, parkinsonism,* ***neuroleptic malignant syndrome, suicide attempt,*** dizziness, fever, hallucination, mania, impaired concentration, abnormal thinking and dreaming, tremor, hypoesthesia, fatigue, depression, nervousness, *parkinsonism.*

**CV:** tachycardia, chest pain, orthostatic hypotension, peripheral edema, syncope, hypertension.

**EENT:** *rhinitis,* sinusitis, pharyngitis, abnormal vision, ear disorder (I.M.).

**GI:** *constipation, nausea, vomiting, dyspepsia, abdominal pain,* anorexia, dry mouth, increased saliva, diarrhea.

**GU:** urinary incontinence, increased urination, abnormal orgasm, vaginal dryness.

**Metabolic:** *weight gain, hyperglycemia,* weight loss.

**Musculoskeletal:** arthralgia, back pain, leg pain, myalgia.

**Respiratory:** coughing, dyspnea, upper respiratory infection.

**Skin:** rash, dry skin, photosensitivity reactions, acne, injection site pain (I.M.).

**Other:** tooth disorder, toothache, injury, decreased libido.

## INTERACTIONS

**Drug-drug.** *Antihypertensives:* May enhance hypotensive effects. Monitor blood pressure.

*Azole antifungal (such as fluconazole, itraconazole, ketoconazole):* May increase risperidone plasma level. Monitor clinical response and adjust risperidone dosage.

*Carbamazepine:* May increase risperidone clearance and decrease effectiveness. Monitor patient closely.

*Clozapine:* May decrease risperidone clearance, increasing toxicity. Monitor patient closely.

*CNS depressants:* May cause additive CNS depression. Use together cautiously.

*Dopamine agonists, levodopa:* May antagonize effects of these drugs. Use together cautiously and monitor patient.

*Fluoxetine, paroxetine:* May increase the risk of risperidone's adverse effects, including serotonin syndrome. Monitor patient closely and adjust risperidone dose, as needed.

**Drug-lifestyle.** *Alcohol use:* May cause additive CNS depression. Discourage use together.

*Sun exposure:* May increase risk of photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase prolactin level. May decrease hemoglobin level and hematocrit.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in breast-feeding women.
- Use cautiously in patients with prolonged QT interval, CV disease, cerebrovascular disease, dehydration, hypovolemia, history of seizures, or conditions that could affect metabolism or hemodynamic responses.
- Use cautiously in patients exposed to extreme heat.

R

● Use caution in patients at risk for aspiration pneumonia.
● Use I.M. injection cautiously in those with hepatic or renal impairment.
⚠ ***Overdose S&S:*** Drowsiness, sedation, tachycardia, hypotension, extrapyramidal symptoms, QT-interval prolongation, seizures, torsades de pointes.

## NURSING CONSIDERATIONS

***Alert:*** Obtain baseline blood pressure measurements before starting therapy, and monitor pressure regularly. Watch for orthostatic hypotension, especially during first dosage adjustment.
**Black Box Warning** Fatal cardiovascular or infectious adverse events may occur in elderly patients with dementia. Drug isn't safe or effective in these patients.
● Monitor patient for tardive dyskinesia, which may occur after prolonged use. It may not appear until months or years later and may disappear spontaneously or persist for life, despite stopping drug.
***Alert:*** Watch for evidence of neuroleptic malignant syndrome (extrapyramidal effects, hyperthermia, autonomic disturbance), which is rare but can be fatal.
● Life-threatening hyperglycemia may occur in patients taking atypical antipsychotics. Monitor patients with diabetes regularly.
***Alert:*** Monitor patient for symptoms of metabolic syndrome (significant weight gain and increased body mass index, hypertension, hyperglycemia, hypercholesterolemia, and hypertriglyceridemia).
● Periodically reevaluate drug's risks and benefits, especially during prolonged use.
● Monitor patient for weight gain.
● ***Look alike–sound alike:*** Don't confuse risperidone with reserpine.

## PATIENT TEACHING

● Warn patient to avoid activities that require alertness until effects of drug are known.
● Warn patient to rise slowly, avoid hot showers, and use other precautions to avoid fainting when starting therapy.
● Advise patient to use caution in hot weather to prevent heatstroke.
● Tell patient to take drug with or without food.
● Instruct patient to keep the ODT in the blister pack until just before taking it. After opening the pack, dissolve the tablet on tongue without cutting or chewing. Use dry hands to peel apart the foil to expose the tablet; don't attempt to push it through the foil.
● Tell patient to use sunblock and wear protective clothing outdoors.
● Advise women not to become pregnant or to breast-feed for 12 weeks after the last I.M. injection.
● Advise patient to avoid alcohol during therapy.

# ritonavir

ri-TON-ah-veer

Norvir

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Protease inhibitor
*Pregnancy risk category B*

## AVAILABLE FORMS

*Capsules:* 100 mg
*Oral solution:* 80 mg/ml*
*Tablets:* 100 mg

## INDICATIONS & DOSAGES

➤ **HIV infection, with other antiretrovirals**

*Adults:* 600 mg P.O. b.i.d. with meals. To reduce adverse GI effects, begin with 300 mg P.O. b.i.d. and increase by 100 mg b.i.d. at 2- to 3-day intervals.
*Children older than age 1 month:* 350 to 400 mg/m$^2$ P.O. b.i.d.; don't exceed 600 mg P.O. b.i.d. Initially, start with 250 mg/m$^2$ b.i.d. and increase by 50 mg/m$^2$ P.O. every 12 hours at 2- to 3-day intervals. If children can't reach b.i.d. doses of 400 mg/m$^2$ because of adverse effects, consider alternate therapy.

## ADMINISTRATION

**P.O.**

● Give drug with meals.
● Oral solution may be mixed with chocolate milk or enteral nutrition therapy liquids within 1 hour of dosing.

• When giving oral solution to children, use a calibrated dosing syringe, if possible.

## ACTION

An HIV-1 and HIV-2 protease inhibitor. Drug binds to the protease-active site and inhibits activity of the enzyme, preventing cleavage of the viral polyproteins and causing formation of immature, noninfectious viral particles.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–4 hr | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *asthenia*, ***generalized tonic-clonic seizure,*** anxiety, circumoral paresthesia, confusion, depression, dizziness, fever, headache, insomnia, malaise, pain, paresthesia, peripheral paresthesia, somnolence, thinking abnormality.
**CV:** syncope, vasodilation.
**EENT:** pharyngitis.
**GI:** *diarrhea*, *nausea*, *taste perversion*, *vomiting*, ***pancreatitis, pseudomembranous colitis,*** abdominal pain, anorexia, constipation, dyspepsia, flatulence.
**Hematologic:** ***leukopenia, thrombocytopenia.***
**Hepatic:** ***hepatitis.***
**Metabolic:** ***diabetes mellitus,*** weight loss.
**Musculoskeletal:** arthralgia, myalgia.
**Skin:** sweating.
**Other:** hypersensitivity reactions, fat redistribution or accumulation.

## INTERACTIONS

**Drug-drug.** **Black Box Warning** *Alfuzosin, amiodarone, bepridil, ergot derivatives, flecainide, midazolam, pimozide, propafenone, quinidine, triazolam, voriconazole:* May cause life-threatening adverse reactions. Use together is contraindicated. ■
*Atovaquone, divalproex, lamotrigine, phenytoin, warfarin:* May decrease levels of these drugs. Use together cautiously and monitor drug levels closely.
*Beta blockers, disopyramide, fluoxetine, mexiletine, nefazodone:* May increase levels of these drugs, causing cardiac and neurologic events. Use together cautiously.
*Bupropion, buspirone, calcium channel blockers, carbamazepine, clonazepam, clorazepate, cyclosporine, desipramine, dexamethasone, diazepam,* ***digoxin,*** *dronabinol, estazolam, ethosuximide, flurazepam, lidocaine, methamphetamine, metoprolol, perphenazine, prednisone, propoxyphene, quinine, risperidone, sirolimus, SSRIs, tacrolimus, tricyclic antidepressants, thioridazine, timolol, tramadol, zolpidem:* May increase levels of these drugs. Use cautiously together and consider decreasing the dosage of these drugs by almost 50%. Monitor therapeutic levels.
*Clarithromycin:* May increase clarithromycin level. If creatinine clearance is 30 to 60 ml/minute, reduce clarithromycin dose by 50%. If creatinine clearance is less than 30 ml/minute, reduce clarithromycin dose by 75%.
***Clozapine, piroxicam:*** May increase levels and toxicity of these drugs. Avoid using together.
*Delavirdine:* May increase ritonavir level. Adjusted dose recommendations aren't established. Use together cautiously.
*Didanosine:* May decrease didanosine absorption. Separate doses by 2½ hours.
*Disulfiram, metronidazole:* May increase risk of disulfiram-like reactions because ritonavir formulations contain alcohol. Monitor patient.
*Ethinyl estradiol:* May decrease ethinyl estradiol level. Use an alternative or additional method of birth control.
*Fluticasone:* May significantly increase fluticasone exposure, significantly decreasing cortisol concentrations and causing systemic corticosteroid effects (including Cushing's syndrome). Don't use together, if possible.
*HMG-CoA reductase inhibitors:* May cause large increase in statin levels, resulting in myopathy. Avoid using with lovastatin and simvastatin. Use cautiously with atorvastatin. Consider using fluvastatin or pravastatin.
*Indinavir:* May increase indinavir levels. Use together cautiously.
*Ketoconazole, itraconazole:* May increase levels of these drugs. Don't exceed 200 mg/day of these drugs.

R

*Meperidine:* May decrease levels of meperidine and its metabolite. Dosage increases and long-term use together aren't recommended because of CNS effects. Use cautiously together.
*Methadone:* May decrease methadone levels. Consider increasing methadone dosage.
*PDE5 inhibitors (sildenafil, tadalafil, vardenafil):* May increase levels of PDE5 inhibitor, causing hypotension, syncope, visual changes, or prolonged erection. Use together cautiously and increase monitoring for adverse reactions. Tell patient not to exceed 25 mg of sildenafil in a 48-hour period, 10 mg of tadalafil in a 72-hour period, or 2.5 mg of vardenafil in a 72-hour period.
***Rifabutin:*** May increase rifabutin levels. Monitor patient and reduce rifabutin daily dosage by at least 75% of usual dose.
***Rifampin, rifapentine:*** May decrease ritonavir levels. Consider using rifabutin.
*Saquinavir:* May increase saquinavir plasma levels. Adjust dose by taking saquinavir 400 mg b.i.d. and ritonavir 400 mg b.i.d.
*Saquinavir:* May prolong QT and PR intervals. Avoid concomitant use in patients with history of prolonged QT interval and in those already receiving drugs known to prolong QT interval (Class I or Class III antiarrythmics).
*Theophylline:* May decrease theophylline levels. Increase dose based on blood levels.
*Trazodone:* May increase trazodone level causing nausea, dizziness, hypotension and syncope. Avoid using together. If unavoidable, use cautiously and lower trazodone dose.
**Drug-herb.** ***St. John's wort:*** May substantially reduce drug levels. Discourage use together.
**Drug-food.** *Any food:* May increase absorption. Advise patient to take drug with food.
**Drug-lifestyle.** *Smoking:* May decrease drug levels. Discourage smoking.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, GGT, glucose, triglyceride, lipid, CK, and uric acid levels. May decrease hemoglobin level and hematocrit.
- May decrease WBC, RBC, platelet, and neutrophil counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in patients with hepatic insufficiency.
- Safety and effectiveness in children younger than 1 month haven't been established.
- It's unknown if ritonavir appears in breast milk. Use cautiously in breast-feeding women.

***Overdose S&S:*** Paresthesia, renal failure with eosinophilia, alcohol-related toxicity with oral solution.

## NURSING CONSIDERATIONS

- Patients beginning regimens with ritonavir and nucleosides may improve GI tolerance by starting ritonavir alone and then adding nucleosides before completing 2 weeks of ritonavir.
- ***Look alike–sound alike:*** Don't confuse Norvir with Norvasc.

## PATIENT TEACHING

- Inform patient that drug doesn't cure HIV infection. He may continue to develop opportunistic infections and other complications of HIV infection. Drug hasn't been shown to reduce the risk of transmitting HIV to others through sexual contact or blood contamination.
- Caution patient to take drug as prescribed and not to adjust dosage or stop therapy without first consulting prescriber.
- Tell patient that taste of oral solution may be improved by mixing it with chocolate milk, Ensure, or Advera within 1 hour of the scheduled dose.
- Instruct patient to take drug with a meal to improve absorption.
- Tell patient that if a dose is missed, he should take the next dose as soon as possible. If a dose is skipped, he shouldn't double the next dose.
- Advise patients taking a PDE5 inhibitor for erectile dysfunction to promptly report hypotension, dizziness, visual changes, and prolonged erection to their prescriber.

Caution against exceeding the recommended reduced dosage.
• Advise patient to report use of other drugs, including OTC drugs; this drug interacts with many drugs.

**SAFETY ALERT!**

## rituximab

ri-TUX-i-mab

Rituxan

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Monoclonal antibody
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 10 mg/ml in 10-ml and 50-ml single-use, sterile vials

### INDICATIONS & DOSAGES

➤ **Previously untreated, follicular CD20-positive, B-cell non-Hodgkin lymphoma (NHL) with cyclophosphamide, vincristine, and prednisolone (CVP) chemotherapy regimen**
*Adults:* 375 mg/m$^2$ I.V. given on day 1 of each CVP cycle, for up to eight doses.

➤ **Previously untreated low-grade, CD20-positive, B-cell NHL following first-line treatment with CVP chemotherapy**
*Adults:* For patients who fail to progress after six to eight cycles of CVP chemotherapy, give 375 mg/m$^2$ I.V. once weekly for four doses every 6 months for up to 16 doses.

✶ ***NEW INDICATION:*** **CD20-positive chronic lymphocytic leukemia (CLL) in combination with fludarabine and cyclophosphamide**
*Adults:* 375 mg/m$^2$ I.V. given day before combination treatment. Then give 500 mg/m$^2$ I.V. on day 1 of cycles two through six in combination with fludarabine and cyclophosphamide (every 28 days).

➤ **Relapsed or refractory low-grade or follicular, CD20-positive, B-cell NHL**
*Adults:* Initially, 375 mg/m$^2$ I.V. once weekly for four or eight doses. Retreatment for patients with progressive disease, 375 mg/m$^2$ I.V. infusion once weekly for four doses.

➤ **With ibritumomab tiuxetan (Zevalin) for relapsed or refractory low-grade, follicular or transformed B-cell NHL**
*Adults:* 250 mg/m$^2$ I.V. 4 hours before Zevalin In-III infusion. Repeat in 7 to 9 days, 4 hours before Zevalin Y-90 infusion.

➤ **With methotrexate to reduce the signs and symptoms of moderate to severely active rheumatoid arthritis in patients who have had an inadequate response to one or more tumor necrosis factor antagonists**
*Adults:* Two 1,000 mg I.V. infusions 2 weeks apart. To reduce the incidence and severity of infusion reactions, give methylprednisolone 100 mg I.V., or its equivalent, 30 minutes before each infusion.

➤ **Diffuse large B-cell, CD20-positive, non-Hodgkin lymphoma, given with cyclophosphamide-adriamycin-oncovin-prednisone, known as CHOP, or other anthracycline-based chemotherapy regimens**
*Adults:* 375 mg/m$^2$ I.V. given on day 1 of each chemotherapy cycle for up to eight infusions.

### ADMINISTRATION

**I.V.**
▼ Give acetaminophen and diphenhydramine before each infusion.
▼ Protect vials from direct sunlight.
▼ Give as an infusion; don't give as I.V. push or bolus.
▼ Begin infusion at rate of 50 mg/hour. If no hypersensitivity or infusion-related events occur, increase rate by 50 mg/hour every 30 minutes, to maximum of 400 mg/hour. Start subsequent infusions at 100 mg/hour and increase by 100 mg/hour every 30 minutes, to maximum of 400 mg/hour as tolerated.
▼ Dilute to yield 1 to 4 mg/ml in bag of $D_5W$ or normal saline solution. Gently invert bag to mix solution.
▼ Discard unused portion left in vial.
▼ Diluted solutions are stable for 24 hours if refrigerated and for 12 hours at room temperature.
▼ **Incompatibilities:** Other I.V. drugs.

R

## ACTION

A murine and human monoclonal antibody directed against CD20 antigen found on the surface of normal and malignant B lymphocytes. Binding to this antigen mediates the lysis of the B cells.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Variable | Variable | 6–12 mo |

*Half-life:* Varies widely, possibly because of differences in tumor burden among patients and changes in CD-positive B-cell populations upon repeated therapy.

## ADVERSE REACTIONS

**CNS:** *asthenia, fever, headache,* agitation, dizziness, fatigue, hypesthesia, hypertonia, insomnia, malaise, nervousness, pain, paresthesia, somnolence, vertigo.
**CV:** *hypotension,* ***arrhythmias, bradycardia,*** chest pain, edema, flushing, hypertension, peripheral edema, tachycardia, ***heart failure.***
**EENT:** conjunctivitis, lacrimation disorder, rhinitis, sinusitis, sore throat.
**GI:** *nausea,* abdominal pain or enlargement, anorexia, diarrhea, dyspepsia, taste perversion, vomiting, ***bowel perforation.***
**GU:** ***acute renal failure.***
**Hematologic:** **LEUKOPENIA,** ***neutropenia, thrombocytopenia,*** anemia.
**Metabolic:** hyperglycemia, hypocalcemia, weight decrease.
**Musculoskeletal:** arthritis, back pain, myalgia.
**Respiratory:** ***bronchospasm,*** bronchitis, cough increase, dyspnea.
**Skin:** *pruritus, rash,* **SEVERE MUCOCUTANEOUS REACTIONS,** pain at injection site, urticaria.
**Other:** *chills, rigors,* **ANGIOEDEMA,** ***infusion reaction,*** infection, ***tumor lysis syndrome,*** tumor pain.

## INTERACTIONS

**Drug-drug.** *Cisplatin:* May cause renal toxicity. Monitor renal function tests.
*Live-virus vaccines:* Virus replication may occur. Avoid vaccination with live-virus vaccines.

## EFFECTS ON LAB TEST RESULTS

- May increase glucose and LDH levels. May decrease calcium and hemoglobin levels.
- May decrease WBC, platelet, and neutrophil counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with type I hypersensitivity or anaphylactic reactions to murine proteins or components of drug.
- Use cautiously in patients at high risk for hepatitis B viral infection. Hepatitis B reactivation with fulminant hepatitis, hepatic failure, and death have occurred.

## NURSING CONSIDERATIONS

**Black Box Warning** Deaths from infusion reactions have occurred. Eighty percent of fatal reactions are associated with the first infusion. Monitor patient for infusion reaction complex, including hypoxia, pulmonary infiltrates, acute respiratory distress syndrome, MI, or cardiogenic shock. ■
- Monitor patient closely for signs and symptoms of hypersensitivity. Have drugs, such as epinephrine, antihistamines, and corticosteroids available to immediately treat such a reaction.
- Monitor patient's blood pressure closely during infusion. If hypotension, bronchospasm, or angioedema occurs, stop infusion and restart at half the rate when symptoms resolve.
- Withhold antihypertensives 12 hours before infusion because transient hypotension may occur.
- If serious or life-threatening arrhythmias occur, stop infusion. If patient develops significant arrhythmias, monitor cardiac function during and after subsequent infusions.

**Black Box Warning** Severe mucocutaneous reactions (including toxic epidermal necrolysis, Stevens-Johnson syndrome, paraneoplastic pemphigus, and lichenoid or vesiculobullous dermatitis) may occur 1 to 13 weeks after administration. Avoid further infusions and promptly start treatment of the skin reaction. ■
- Infusion-related reactions are most severe with the first infusion. Subsequent infusions are generally well tolerated.

**Black Box Warning** Acute renal failure requiring dialysis has been reported in the setting of tumor lysis syndrome (TLS) following treatment of patients with NHL. ■

• Patients at high risk for TLS may receive prophylactic allopurinol and hydration to correct hyperuricemia. Monitor renal function and fluid balance and correct electrolyte abnormalities.
• *Pneumocystis carinii* pneumonia and antiherpetic viral prophylaxis is recommended for patients with CLL during and for up to 12 months after treatment.
**Black Box Warning** JC virus infection resulting in progressive multifocal leukoencephalopathy has been reported in patients within 12 months of their last rituximab infusion. Monitor patient for new-onset neurologic manifestations. ■
• Obtain CBC at regular intervals and more frequently in patients in whom cytopenias develop.
• Monitor patients at risk for hepatitis B closely. Discontinue drug at first sign of hepatitis B infection.
• Monitor patient for abdominal pain. Bowel obstruction and perforation have occurred with chemotherapy.

### PATIENT TEACHING

• Tell patient to report symptoms of hypersensitivity, such as itching, rash, chills, or rigor, during and after infusion.
• Urge patient to watch for fever, sore throat, fatigue, easy bruising, nosebleeds, bleeding gums, abdominal pain, or tarry stools. Tell him to take temperature daily.
• Advise breast-feeding women to stop breast-feeding until drug levels are undetectable.

## rivastigmine tartrate

riv-ah-STIG-meen

Exelon, Exelon Patch

*Therapeutic class:* Anti-Alzheimer
*Pharmacologic class:* Cholinesterase inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS

*Capsules:* 1.5 mg, 3 mg, 4.5 mg, 6 mg
*Solution:* 2 mg/ml
*Transdermal patch:* 4.6 mg/24 hours, 9.5 mg/24 hours

### INDICATIONS & DOSAGES

**➤ Mild to moderate Alzheimer's dementia**

*Adults:* Initially, 1.5 mg P.O. b.i.d. with food. If tolerated, may increase to 3 mg b.i.d. after 2 weeks. After 2 weeks at this dose, may increase to 4.5 mg b.i.d. and 6 mg b.i.d., as tolerated. Effective dosage range is 6 to 12 mg daily; maximum, 12 mg daily. Or, 4.6 mg/24 hours transdermal patch. After 4 weeks, if tolerated, increase to 9.5 mg/24 hours transdermal patch.

**➤ Mild to moderate dementia associated with Parkinson's disease**

*Adults:* Initially, 1.5 mg P.O. b.i.d. May increase, as tolerated, to 3 mg b.i.d., then 4.5 mg b.i.d., and finally to 6 mg b.i.d. after a minimum of 4 weeks at each dose. Or, 4.6 mg/24 hours transdermal patch. After 4 weeks, if tolerated, increase to 9.5 mg/24 hours transdermal patch.

### ADMINISTRATION

**P.O.**

• Give drug with food in the morning and evening.
• Solution may be taken directly or mixed with small glass of water, cold fruit juice, or soda.
• Capsule and solution doses are interchangeable.

**Transdermal**

• Apply patch once daily to clean, dry, hairless skin on the upper or lower back, upper arm, or chest, in a place not rubbed by tight clothing.
• Change the site daily, and don't use the same site within 14 days.
• Press patch firmly into place until the edges stick well.

### ACTION

Thought to increase acetylcholine level by inhibiting cholinesterase enzyme, which causes acetylcholine hydrolysis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | 12 hr |
| Transdermal | Unknown | 8 hr | 24 hr |

*Half-life:* 1½ hours (oral); 3 hours (transdermal).

## ADVERSE REACTIONS

**CNS:** *headache, dizziness,* syncope, fatigue, asthenia, malaise, somnolence, tremor, insomnia, confusion, depression, anxiety, hallucinations, aggressive reaction, vertigo, agitation, nervousness, delusion, paranoid reaction, pain.
**CV:** hypertension, chest pain, peripheral edema, ***bradycardia.***
**EENT:** rhinitis, pharyngitis.
**GI:** *nausea, vomiting, diarrhea, anorexia, abdominal pain,* dyspepsia, constipation, flatulence, eructation.
**GU:** UTI, incontinence.
**Metabolic:** weight loss.
**Musculoskeletal:** back pain, arthralgia, bone fracture.
**Respiratory:** upper respiratory tract infection, cough, bronchitis.
**Skin:** increased sweating, rash.
**Other:** *accidental trauma,* flulike symptoms.

## INTERACTIONS

**Drug-drug.** *Anticholinergics:* May decrease effectiveness of anticholinergic. Monitor patient for expected therapeutic effects.
*Bethanechol, succinylcholine, other neuromuscular-blocking drugs or cholinergic antagonists:* May have synergistic effect. Monitor patient closely.
*NSAIDs:* May increase gastric acid secretions. Monitor patient for symptoms of active or occult GI bleeding.
**Drug-lifestyle.** *Smoking:* May increase drug clearance. Discourage smoking.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, other carbamate derivatives, or other components of the drug.
- Use cautiously in patients with history of cardiovascular disease, GI bleeding, seizure disorder, genitourinary conditions, asthma, or obstructive pulmonary disease.

***Overdose S&S:*** Nausea, vomiting, excessive salivation, sweating, bradycardia, hypotension, respiratory depression, syncope, seizures, muscle weakness.

## NURSING CONSIDERATIONS

- Expect significant GI adverse effects (such as nausea, vomiting, anorexia, and weight loss). These effects are less common during maintenance doses.
- Monitor patient for evidence of active or occult GI bleeding.
- Dramatic memory improvement is unlikely. As disease progresses, the benefits of drug may decline.
- Monitor patient for severe nausea, vomiting, and diarrhea, which may lead to dehydration and weight loss.
- Carefully monitor patient with a history of GI bleeding, NSAID use, arrhythmias, seizures, or pulmonary conditions for adverse effects.
- If adverse reactions, such as diarrhea, loss of appetite, nausea, or vomiting, occur with patch, stop use for several days, then restart at the same or lower dose. If treatment is interrupted for more than several days, restart patch at the lowest dose and retitrate.
- Patients weighing less than 50 kg (110 lb) may experience more adverse reactions when using the transdermal patch.
- When switching from an oral form to the transdermal patch, patients on a total daily dose of less than 6 mg can be switched to 4.6 mg/24 hours. Patients taking 6 to 12 mg orally can switch to the 9.5 mg/24 hour patch. The patch should be applied on the day after the last oral dose.

## PATIENT TEACHING

- Tell caregiver to give drug with food in the morning and evening.
- Advise patient that memory improvement may be subtle and that drug more likely slows future memory loss.
- Tell patient to report nausea, vomiting, or diarrhea.
- Tell patient to consult prescriber before using OTC drugs.
- Tell patient to apply patch once daily to clean, dry, hairless skin in a place not rubbed by tight clothing.
- Teach patient that the recommended sites for patch placement include the upper or lower back, upper arm, or chest.
- Tell patient to change the site daily and not to use the same site within 14 days.

• Tell patient to press the patch firmly into place until the edges stick well.

## rizatriptan benzoate

rih-zah-TRIP-tan

Maxalt, Maxalt-MLT

*Therapeutic class:* Antimigraine
*Pharmacologic class:* Serotonin 5-$HT_1$ receptor agonist
*Pregnancy risk category C*

### AVAILABLE FORMS

*Orally disintegrating tablets (ODTs):* 5 mg, 10 mg
*Tablets:* 5 mg, 10 mg

### INDICATIONS & DOSAGES

➤ **Acute migraine headaches with or without aura**

*Adults:* Initially, 5 or 10 mg P.O. If first dose is ineffective, may give another dose at least 2 hours after first dose; maximum, 30 mg in 24 hours. For patients receiving propranolol, 5 mg P.O.; maximum, 15 mg in 24 hours.

### ADMINISTRATION

**P.O.**

• Give drug with or without food, although food may delay onset of drug action.
• Give tablet with plenty of fluid.
• Give ODT with or without fluid.
• For Maxalt-MLT, remove blister pack from pouch and remove drug from blister pack immediately before use. Tablet shouldn't be popped out of blister pack; carefully peel away package with dry hands, place tablet on patient's tongue, and let tablet dissolve until it can be swallowed with saliva.

### ACTION

May act as an agonist at serotonin receptors on extracerebral intracranial blood vessels, which constricts the affected vessels, inhibits neuropeptide release, and reduces pain transmission in the trigeminal pathways.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 60–90 min | Unknown |

*Half-life:* 2 to 3 hours.

### ADVERSE REACTIONS

**CNS:** dizziness, headache, somnolence, paresthesia, asthenia, fatigue, decreased mental acuity, euphoria, tremor, pain.
**CV:** ***coronary artery vasospasm, transient myocardial ischemia, MI, ventricular tachycardia, ventricular fibrillation,*** chest pain, pressure, or heaviness, palpitations, flushing.
**EENT:** neck, throat, and jaw pain.
**GI:** dry mouth, nausea, diarrhea, vomiting.
**Respiratory:** dyspnea.
**Other:** hot flashes, warm or cold feelings.

### INTERACTIONS

**Drug-drug.** *Ergot-containing or ergot-type drugs (dihydroergotamine, methysergide), other 5-$HT_1$ agonists:* May prolong vasospastic reactions. Avoid using within 24 hours of rizatriptan.
*MAO inhibitors:* May increase rizatriptan level. Avoid using within 2 weeks of MAO inhibitor.
*Propranolol:* May increase rizatriptan level. Reduce rizatriptan dose to 5 mg.
*SSRIs (fluoxetine, fluvoxamine, paroxetine, sertraline):* May cause weakness, hyperreflexia, and incoordination. Monitor patient.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components and in those with a history or symptoms of ischemic heart disease, coronary artery vasospasm (Prinzmetal's variant angina), or other significant underlying CV disease.
• Contraindicated in patients with uncontrolled hypertension; within 24 hours of another 5-$HT_1$ agonist, drug containing ergotamine, or ergot-type drug, such as dihydroergotamine or methysergide; or within 2 weeks of MAO inhibitor.
• Contraindicated in patients with hemiplegic or basilar migraine.
• Use cautiously in patients with risk factors for coronary artery disease (CAD), such as hypertension, hypercholesterolemia, smoking, obesity, diabetes, strong family history of CAD, postmenopausal women,

R

or men older than age 40, unless patient is free from cardiac disease. Monitor patient closely after first dose.
• Use cautiously in patients with hepatic or renal impairment.
• Safety and efficacy in children are unknown.
• Safety of treating more than four headaches in 30 days hasn't been established.
***Overdose S&S:*** Dizziness, somnolence, syncope, bradycardia, vomiting, third-degree AV block, hypertension, other more serious cardiovascular symptoms.

## NURSING CONSIDERATIONS
• Assess CV status in patients who develop risk factors for CAD during treatment.
• Use drug only when patient has a clear diagnosis of migraine.
• Don't use drug to prevent migraines or to treat hemiplegic or basilar migraine or cluster headaches.
***Alert:*** Combining drug with an SSRI or an SSNRI may cause serotonin syndrome. Symptoms include restlessness, hallucinations, loss of coordination, fast heartbeat, rapid changes in blood pressure, increased body temperature, hyperreflexia, nausea, vomiting, and diarrhea. Serotonin syndrome is more likely to occur when starting or increasing the dose of this drug, the SSRI, or the SSNRI.
• The ODTs contain phenylalanine.

## PATIENT TEACHING
• Inform patient that drug doesn't prevent migraine headache.
• For Maxalt-MLT, tell patient to remove blister pack from pouch and remove drug from blister pack immediately before use. Tablet shouldn't be popped out of blister pack; tell patient to carefully peel away package with dry hands, place tablet on tongue, and allow tablet to dissolve. Tablet is then swallowed with saliva. No water is needed or recommended. Tell patient that ODT doesn't relieve headache more quickly.
• Instruct patient to take regular tablets with plenty of fluid.
• Advise patient that, if headache returns after first dose, he may take a second dose at least 2 hours after the first dose. Warn against taking more than 30 mg in a 24-hour period.
• Inform patient that drug may cause sleepiness and dizziness, and warn him to avoid hazardous activities until effects are known.
• Tell patient that food may delay onset of drug action.
• Advise patient to notify prescriber about suspected or known pregnancy.
• Instruct patient not to breast-feed during therapy because effects on the infant are unknown.
• Warn patients with phenylketonuria that ODTs contain phenylalanine.

# romiplostim
roh-mih-PLOH-stim

Nplate

*Therapeutic class:* Hematopoietic
*Pharmacologic class:* Thrombopoietin (TPO) receptor agonist
*Pregnancy risk category C*

## AVAILABLE FORMS
*Injection:* 250-mcg, 500-mcg single-use vials

## INDICATIONS & DOSAGES
➤ **Thrombocytopenia in patients with chronic immune idiopathic thrombocytopenic purpura (ITP) who have had an insufficient response to corticosteroids, immunoglobulins, or splenectomy**
*Adults:* Initially, 1 mcg/kg subcutaneously once weekly. Adjust dosage in increments of 1 mcg/kg to maintain platelet count of $50 \times 10^9$/L or higher, as needed to reduce the risk of bleeding. Maximum dosage is 10 mcg/kg weekly. If platelet count is more than $200 \times 10^9$/L for 2 consecutive weeks, reduce dosage by 1 mcg/kg. Withhold drug if platelet count exceeds $400 \times 10^9$/L. Continue to assess platelet count weekly. After platelet count has fallen to less than $200 \times 10^9$/L, resume therapy at dosage reduced by 1 mcg/kg. Discontinue if platelet count doesn't increase after 4 weeks at maximum dosage.

## ADMINISTRATION

### Subcutaneous

- Use aseptic technique to reconstitute drug using preservative-free sterile water for injection. Add 0.72 ml to the 250-mcg vial and 1.2 ml to the 500-mcg vial for a final concentration of 500 mcg/ml. Gently swirl and invert (don't shake) to mix; solution becomes clear and colorless. Discard solution if particulate matter or discoloration remains after 2 minutes.
- Store reconstituted solution at room temperature or refrigerate for up to 24 hours. Protect from light.
- Discard unused portion of the single-use vial.
- Calculate the dose and administer via a syringe with graduations to 0.01 ml.
- **Incompatibilities:** Bacteriostatic water for injection.

## ACTION

Increases platelet count by binding to and activating the TPO receptor.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Rapid | 7–50 hr | 2–3 wk |

*Half-life:* 1 to 34 days.

## ADVERSE REACTIONS

**CNS:** *dizziness*, *headache*, *insomnia*, paresthesia.
**GI:** *abdominal pain*, dyspepsia.
**Musculoskeletal:** *arthralgia*, *extremity pain*, *myalgia*, shoulder pain.

## INTERACTIONS

None reported.

## EFFECTS ON LAB TEST RESULTS

- May increase platelet count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with renal or hepatic impairment.
- Use in pregnancy only if the benefit to the mother outweighs the risk to the fetus. Breast-feeding isn't recommended during therapy.

***Overdose S&S:*** Thromboembolic complications.

## NURSING CONSIDERATIONS

- Drug is available through a restricted distribution program called the Nplate NEXUS Program. To enroll, call 1-877-675-2831. Report serious adverse effects to this number or to the FDA Med Watch program at 1-800-FDA-1088.
- Monitor CBC and peripheral blood smear before therapy, weekly during dosage titration, and monthly during maintenance therapy. Drug increases the risk of bone marrow reticulin formation and bone marrow fibrosis.
- Monitor CBC for at least 2 weeks after discontinuation of therapy; platelet count may fall to levels lower than before initiation of therapy.
- Drug should only be used in patients with ITP who are at risk for bleeding. Don't use drug to normalize platelet count.
- Monitor patients for signs and symptoms of a thromboembolic event.
- Drug may increase the risk of hematologic malignancies.

## PATIENT TEACHING

- Instruct patient to report bruising or bleeding while taking drug.
- Tell patient that he will need to have blood drawn to check his platelet count every week and that his dosage may be changed as needed. When his prescriber decides to keep the dosage the same, he'll need to have his platelet count checked monthly. When drug is stopped, he'll need to have his platelet count checked weekly for at least 2 weeks to make sure his platelet count hasn't dropped significantly.
- Advise patient to notify prescriber if he has had surgery to remove his spleen, or if he has a history of blood clots, bleeding, or bone marrow problems.
- Teach patient to avoid situations that may increase the risk of bleeding, such as missing a dose.
- It's unknown if drug affects fetus. Patient should tell her prescriber if she thinks she may be pregnant or plans to become pregnant.

# ropinirole hydrochloride

row-PIN-ah-roll

Requip, Requip XL

*Therapeutic class:* Antiparkinsonian
*Pharmacologic class:* Nonergot dopamine agonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg, 5 mg
*Tablets (extended-release):* 2 mg, 4 mg, 6 mg, 8 mg, 12 mg

## INDICATIONS & DOSAGES

➤ **Idiopathic Parkinson disease**

*Adults:* Initially, 0.25 mg P.O., t.i.d. Increase dose by 0.25 mg t.i.d. at weekly intervals for 4 weeks. After week 4, dosage may be increased by 1.5 mg daily divided t.i.d.; at weekly intervals, up to 9 mg daily divided t.i.d.; then dosage may be increased by up to 3 mg daily divided t.i.d.; at weekly intervals, up to 24 mg daily divided t.i.d. For extended-release form, starting dosage is 2 mg P.O. once daily for 1 to 2 weeks. May increase by 2 mg/day at 1-week or longer intervals. Maximum dosage is 24 mg/day. To switch from immediate-release to extended-release, use the following table:

| *Immediate-release total daily dosage* | *Extended-release total daily dosage* |
|---|---|
| 0.75 to 2.25 mg | 2 mg |
| 3 to 4.5 mg | 4 mg |
| 6 mg | 6 mg |
| 7.5 to 9 mg | 8 mg |
| 12 mg | 12 mg |
| 15 to 18 mg | 16 mg |
| 21 mg | 20 mg |
| 24 mg | 24 mg |

*Elderly patients:* Adjust dosages individually, according to patient response; clearance may be reduced in these patients.

➤ **Moderate to severe restless leg syndrome (immediate-release)**

*Adults:* Initially, 0.25 mg P.O. 1 to 3 hours before bedtime. May increase dose as needed and tolerated after 2 days to 0.5 mg, then to 1 mg by the end of the first week. May further increase dose as needed and tolerated as follows: week 2, give 1 mg once daily. Week 3, give 1.5 mg once daily. Week 4, give 2 mg once daily. Week 5, give 2.5 mg once daily. Week 6, give 3 mg once daily. And week 7, give 4 mg once daily. All doses should be taken 1 to 2 hours before bedtime.

## ADMINISTRATION

**P.O.**

- Give drug with food if nausea occurs.

## ACTION

Thought to stimulate dopamine (D2) receptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | 6 hr |

*Half-life:* 6 hours.

## ADVERSE REACTIONS

**Early Parkinson disease (without levodopa)**

**CNS:** *dizziness, fatigue, somnolence, syncope,* hallucinations, aggravated Parkinson disease, headache, confusion, hyperkinesia, hypoesthesia, vertigo, amnesia, impaired concentration, malaise, asthenia, pain.
**CV:** orthostatic hypotension, orthostatic symptoms, hypertension, edema, chest pain, extrasystoles, atrial fibrillation, palpitations, tachycardia, flushing.
**EENT:** pharyngitis, abnormal vision, eye abnormality, xerophthalmia, rhinitis, sinusitis.
**GI:** *nausea, vomiting, dyspepsia,* dry mouth, flatulence, abdominal pain, anorexia, constipation.
**GU:** UTI, impotence.
**Respiratory:** bronchitis, dyspnea, yawning.
**Other:** *viral infection,* increased sweating, peripheral ischemia.

**Advanced Parkinson disease (with levodopa)**

**CNS:** *dizziness, somnolence, headache, hallucinations,* aggravated parkinsonism, insomnia, abnormal dreaming, confusion, tremor, anxiety, nervousness, amnesia, paresis, paresthesia, syncope, pain.
**CV:** hypotension.
**EENT:** diplopia.

**GI:** *nausea*, abdominal pain, dry mouth, vomiting, constipation, diarrhea, dysphagia, flatulence, increased saliva.
**GU:** UTI, pyuria, urinary incontinence.
**Hematologic:** anemia.
**Metabolic:** weight decrease, suppressed prolactin.
**Musculoskeletal:** *dyskinesia*, arthralgia, arthritis, hypokinesia.
**Respiratory:** upper respiratory tract infection, dyspnea.
**Skin:** increased sweating.
**Other:** *falls*, injury, viral infection.
**Restless leg syndrome**
**CNS:** *fatigue*, *somnolence*, *dizziness*, vertigo, paresthesia.
**CV:** peripheral edema.
**EENT:** *nasopharyngitis*, nasal congestion.
**GI:** *nausea*, *vomiting*, diarrhea, dyspepsia, dry mouth.
**Musculoskeletal:** arthralgia, muscle cramps, extremity pain.
**Respiratory:** cough.
**Skin:** increased sweating.
**Other:** influenza.

## INTERACTIONS

**Drug-drug.** *Cimetidine, ciprofloxacin, fluvoxamine, inhibitors or substrates of CYP1A2, ritonavir:* May alter ropinirole clearance. Adjust ropinirole dose if other drugs are started or stopped during treatment.
*CNS depressants:* May increase CNS effects. Use together cautiously.
*Dopamine antagonists (neuroleptics), metoclopramide:* May decrease ropinirole effects. Avoid using together.
*Estrogens:* May decrease ropinirole clearance. Adjust ropinirole dosage if estrogen therapy is started or stopped during treatment.
*Warfarin:* May increase anticoagulation. Monitor coagulation parameters and adjust warfarin dosage as needed.
**Drug-lifestyle.** *Alcohol use:* May increase sedative effect. Discourage use together.
*Smoking:* May increase drug clearance. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

• May increase BUN and alkaline phosphatase levels. May decrease hemoglobin level.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug.
• Use cautiously in patients with severe hepatic or renal impairment.
***Overdose S&S:*** Nausea, dizziness, visual hallucinations, hyperhidrosis, claustrophobia, chorea, palpitations, asthenia, nightmares, vomiting, increased coughing, fatigue, syncope, vasovagal syncope, dyskinesia, agitation, chest pain, orthostatic hypotension, somnolence, confusion.

## NURSING CONSIDERATIONS

***Alert:*** Monitor patient carefully for orthostatic hypotension, especially during dosage increases.
• Drug may potentiate the adverse effects of levodopa and may cause or worsen dyskinesia. Dosage may be decreased.
• Although not reported with ropinirole, other adverse reactions reported with dopaminergic therapy include hyperpyrexia, fibrotic complications, and confusion, which may occur with rapid dosage reduction or withdrawal of drug.
• Patient may have syncope, with or without bradycardia. Monitor patient carefully, especially for 4 weeks after start of therapy and with dosage increases.
• When used for Parkinson disease, withdraw drug gradually over 7 days.
• When used for restless leg syndrome, stop drug without tapering.

## PATIENT TEACHING

• Advise patient to take drug with food if nausea occurs.
• Inform patient (especially elderly patient) that hallucinations can occur.
• Instruct patient not to rise rapidly after sitting or lying down because of risk of dizziness, which may occur more frequently early in therapy or when dosage increases.
• Sleepiness can occur early in therapy. Warn patient to minimize hazardous activities until CNS effects of drug are known.
• Advise patient to avoid alcohol.
• Tell woman to notify prescriber about planned, suspected, or known pregnancy; also tell her to inform prescriber if she's breast-feeding.

R

**SAFETY ALERT!**

# rosiglitazone maleate

roh-zee-GLIT-ah-zohn

Avandia℞

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Thiazolidinedione
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 2 mg, 4 mg, 8 mg

## INDICATIONS & DOSAGES

➤ **Type 2 diabetes, alone or with a sulfonylurea, metformin, or insulin**

*Adults:* Initially, 4 mg P.O. daily in the morning or in divided doses b.i.d. (morning and evening). Increase to 8 mg P.O. daily or in divided doses b.i.d. if fasting glucose level doesn't improve after 8 to 12 weeks of treatment.

***Adjust-a-dose:*** For patients stabilized on insulin, continue the insulin dose when rosiglitazone therapy starts. Don't use rosiglitazone doses greater than 4 mg daily with insulin. Decrease insulin dose by 10% to 25% if patient reports hypoglycemia or if fasting glucose level falls to below 100 mg/dl. Adjust based on glucose-lowering response.

➤ **Polycystic ovary syndrome ♦**

*Adults:* 2 to 8 mg P.O. daily in one to two divided doses as monotherapy or in combination therapy.

## ADMINISTRATION

**P.O.**

***Alert:*** Check liver enzyme levels before therapy starts. Don't use drug in patients with increased baseline liver enzyme levels.

• Give drug without regard for food.

## ACTION

Lowers glucose level by improving insulin sensitivity.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Unknown |

*Half-life:* 3 to 4 hours.

## ADVERSE REACTIONS

**CNS:** headache, fatigue.
**CV:** edema, ***worsening heart failure.***
**EENT:** sinusitis.
**GI:** diarrhea.
**Hematologic:** anemia.
**Metabolic:** hyperglycemia, weight gain.
**Musculoskeletal:** back pain, fractures.
**Respiratory:** upper respiratory tract infection.
**Other:** accidental injury.

## INTERACTIONS

**Drug-drug.** *Fluvoxamine, gemfibrozil, ketoconazole, trimethoprim:* May increase rosiglitazone levels, increasing hypoglycemic effects and other adverse reactions. Monitor glucose; dosage adjustment may be necessary.

*Insulin:* May increase incidence of edema. Monitor patient.

*Rifampin:* May decrease rosiglitazone levels. Monitor glucose; dosage adjustment may be necessary.

## EFFECTS ON LAB TEST RESULTS

• May increase glucose, HDL, LDL, total cholesterol, and ALT levels. May decrease hemoglobin level and hematocrit.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components.

***Alert:*** Due to the increased risk of cardiovascular events such as MI and stroke, use of this drug is restricted to patients who are currently benefiting from therapy and to patients who are unable to achieve glucose control with other medication and who are unable to take pioglitazone.

**Black Box Warning** Contraindicated in patients with symptomatic heart failure or those with established New York Heart Association Class III or IV heart failure.

• Contraindicated in patients with active liver disease, increased baseline liver enzyme levels (ALT level greater than two and a half times upper limit of normal), type 1 diabetes, or diabetic ketoacidosis and in those who experienced jaundice while taking troglitazone.

**Black Box Warning** Use cautiously in patient with underlying heart disease or those at high risk for MI. ■
• Don't start drug in patients experiencing acute coronary syndrome.
• Use cautiously in patients with edema or heart failure.

## NURSING CONSIDERATIONS

***Alert:*** Monitor liver enzyme levels every 2 months for first 12 months and periodically thereafter. If ALT level becomes elevated, recheck as soon as possible. Stop drug if levels remain elevated.
**Black Box Warning** Drug can cause fluid retention leading to or worsening heart failure. Monitor patients for signs and symptoms of heart failure. Notify prescriber if any deterioration in cardiac status occurs. ■
• Management of type 2 diabetes should include diet control. Because caloric restriction, weight loss, and exercise help improve insulin sensitivity and effectiveness of drug therapy, these measures are essential to proper diabetes treatment.
• Check glucose and glycosylated hemoglobin levels periodically to monitor therapeutic response to drug.
• Hemoglobin level and hematocrit may drop during therapy, usually during first 4 to 8 weeks. Increases in total cholesterol, low-density lipoprotein, and high-density lipoprotein levels and decreases in free fatty acid level also may occur.
• For patients inadequately controlled with a maximum dose of a sulfonylurea or metformin, add rosiglitazone to, rather than substitute it for, a sulfonylurea or metformin.
• Drug may increase the incidence of bone fractures (most common in the arm, hand, and foot) in women.
• ***Look alike–sound alike:*** Don't confuse rosiglitazone with pioglitazone; or Avandia with Prandin.

## PATIENT TEACHING

• Advise patient that drug can be taken with or without food.
• Notify patient that blood will be tested to check liver function before therapy starts, every 2 months for first 12 months, and then periodically thereafter.
• Tell patient to immediately notify prescriber about unexplained signs and symptoms, such as nausea, vomiting, abdominal pain, fatigue, anorexia, or dark urine; these may indicate liver problems.
• Tell patient to immediately notify prescriber of changes in vision as this may indicate macular edema.
• Warn patient to contact his health care provider about signs or symptoms of heart failure (unusually rapid increase in weight or swelling, shortness of breath).
***Alert:*** Warn patients with underlying heart disease or those at high risk for an MI that they're at an increased risk for an MI while on rosiglitazone. Patient should notify his health care provider of any change in cardiac condition.
• Recommend use of contraceptives to premenopausal, anovulatory women with insulin resistance because ovulation may resume with therapy.
• Advise patient that management of diabetes includes diet control, calorie restriction, weight loss, and exercise, and that these measures improve effectiveness of drug therapy.
• Instruct patient to monitor glucose level carefully and tell him what to do when he's ill, undergoing surgery, or under added stress.

# rosuvastatin calcium

row-SUE-va-sta-tin

Crestor✒

*Therapeutic class:* Antilipemic
*Pharmacologic class:* HMG-CoA reductase inhibitor
*Pregnancy risk category X*

R

## AVAILABLE FORMS

*Tablets:* 5 mg, 10 mg, 20 mg, 40 mg

## INDICATIONS & DOSAGES

➤ **Risk reduction in patients without clinical evidence of CHD but with multiple risk factors**
*Adults:* Initially, 10 mg P.O. once daily; 5 mg P.O. once daily in patients needing less aggressive LDL-cholesterol reduction.

For aggressive lipid reduction (LDL greater than 190 mg/dl) initially, 20 mg P.O. once daily. Increase as needed to maximum of 40 mg P.O. daily. Dosage may be titrated every 2 to 4 weeks, based on lipid levels.

✷ ***NEW INDICATION:*** **Children with heterozygous familial hypercholesterolemia after failing an adequate trial of diet therapy**

*Children ages 10 to 17:* 5 to 20 mg P.O. daily. Dosage may be titrated every 4 weeks or more, based on lipid levels.

➤ **Adjunct to diet to reduce LDL cholesterol, total cholesterol, apolipoprotein B, non-HDL cholesterol, and triglyceride (TG) levels and to increase HDL cholesterol level in patients with primary hypercholesterolemia (heterozygous familial and nonfamilial) and mixed dyslipidemia (Fredrickson types IIa and IIb); adjunct to diet to treat elevated TG level (Fredrickson type IV); adjunct to diet to treat primary dysbetalipoproteinemia**

*Adults:* Initially, 10 mg P.O. once daily; 5 mg P.O. once daily in patients needing less aggressive LDL cholesterol level reduction or those predisposed to myopathy. For aggressive lipid lowering when LDL is greater than 190 mg/dl, initially, 20 mg P.O. once daily. Increase as needed to maximum of 40 mg P.O. daily. Dosage may be titrated every 2 to 4 weeks, based on lipid levels.

➤ **Adjunct to diet to slow atherosclerosis progression in patients with elevated cholesterol**

*Adults:* Initially, 10 mg P.O. daily. Increase as needed every 2 to 4 weeks based on lipid levels, to maximum of 40 mg daily.

➤ **Adjunct to lipid-lowering therapies; to reduce LDL cholesterol, apolipoprotein B, and total cholesterol levels in homozygous familial hypercholesterolemia**

*Adults:* Initially, 20 mg P.O. once daily. Maximum, 40 mg once daily.

***Adjust-a-dose:*** If creatinine clearance is less than 30 ml/minute, initially, 5 mg once daily; don't exceed 10 mg once daily. For Asian patients, initial dose is 5 mg. For patients also taking cyclosporine, limit rosuvastatin dose to 5 mg once daily. For patients taking combination of lopinavir or gemfibrozil and ritonavir, limit rosuvastatin dose to 10 mg once daily.

## ADMINISTRATION

**P.O.**

- Give drug without regard for meals.
- Wait 2 hours after giving dose to give aluminum- or magnesium-containing antacid.

## ACTION

Inhibits HMG-CoA reductase, increases LDL receptors on liver cells, and inhibits hepatic synthesis of very–low-density lipoprotein.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3–5 hr | Unknown |

*Half-life:* About 19 hours.

## ADVERSE REACTIONS

**CNS:** anxiety, asthenia, depression, dizziness, headache, insomnia, neuralgia, pain, paresthesia, vertigo.
**CV:** angina pectoris, chest pain, hypertension, palpitations, peripheral edema, vasodilation.
**EENT:** pharyngitis, rhinitis, sinusitis.
**GI:** abdominal pain, constipation, diarrhea, dyspepsia, flatulence, gastritis, gastroenteritis, nausea, periodontal abscess, vomiting.
**GU:** UTI.
**Hematologic:** anemia, ecchymosis.
**Metabolic:** diabetes mellitus.
**Musculoskeletal:** arthralgia, arthritis, back pain, hypertonia, myalgia, neck pain, pathologic fracture, pelvic pain.
**Respiratory:** asthma, bronchitis, dyspnea, increased cough, pneumonia.
**Skin:** pruritus, rash.
**Other:** accidental injury, flulike syndrome, infection.

## INTERACTIONS

**Drug-drug.** *Amiodarone:* May increase risk of rhabdomyolysis. Avoid use of simvastatin dose greater than 20 mg/day.
*Antacids:* May decrease rosuvastatin level. Give antacids at least 2 hours after rosuvastatin.
*Atazanavir/ritonavir, lopinavir/ritonavir:* These drug combinations increase exposure to rosuvastatin. Limit dose of rosuvastatin to 10 mg once daily.

*Cimetidine, ketoconazole, spironolactone:* May decrease level or effect of endogenous steroid hormones. Use together cautiously.
***Cyclosporine:*** May increase rosuvastatin level and risk of myopathy or rhabdomyolysis. Don't exceed 5 mg of rosuvastatin daily. Watch for evidence of toxicity.
*Fenofibrate, gemfibrozil:* May increase rosuvastatin level and risk of myopathy or rhabdomyolysis. Don't exceed 10 mg of rosuvastatin once daily. Watch for evidence of toxicity.
*Hormonal contraceptives:* May increase ethinyl estradiol and norgestrel levels. Watch for adverse effects.
*Niacin:* May increase risk of myopathy or rhabdomyolysis. Decrease rosuvastatin dosage and monitor patient closely.
*Warfarin:* May increase INR and risk of bleeding. Monitor INR, and watch for evidence of increased bleeding.
**Drug-lifestyle.** *Alcohol use:* May increase risk of hepatotoxicity. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase CK, transaminase, glucose, glutamyl transpeptidase, alkaline phosphatase, and bilirubin levels. May decrease hemoglobin level and hematocrit.
- May cause thyroid function abnormalities, dipstick-positive proteinuria, and microscopic hematuria.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to rosuvastatin or its components, pregnant or breast-feeding patients, patients with active liver disease, and those with unexplained persistently increased transaminases.
- Use cautiously in patients who drink substantial amounts of alcohol or have a history of liver disease and in those at increased risk for myopathies, such as those with renal impairment, advanced age, or hypothyroidism.
- Use cautiously in Asian patients because they have a greater risk of elevated drug levels.

***Overdose S&S:*** Unexplained muscle pain, tenderness or weakness, especially with malaise or fever.

## NURSING CONSIDERATIONS

- Before therapy starts, assess patient for underlying causes of hypercholesterolemia, including poorly controlled diabetes, hypothyroidism, nephrotic syndrome, dyslipoproteinemias, obstructive liver disease, drug interaction, and alcoholism.
- Before therapy starts, advise patient to control hypercholesterolemia with diet, exercise, and weight reduction.
- Test liver function before therapy starts, 12 weeks afterward, 12 weeks after any increase in dosage, and twice a year routinely. If AST or ALT level persists at more than three times the upper limit of normal, decrease dose or stop drug.

***Alert:*** Rarely, rhabdomyolysis with acute renal failure has developed in patients taking drugs in this class, including rosuvastatin.

- Patients who are 65 or older, have hypothyroidism, or have renal insufficiency may be at a greater risk for developing myopathy while receiving a statin.
- Notify prescriber if CK level becomes markedly elevated or myopathy is suspected, or if routine urinalysis shows persistent proteinuria and patient is taking 40 mg daily.
- Withhold drug temporarily if patient becomes predisposed to myopathy or rhabdomyolysis because of sepsis, hypotension, major surgery, trauma, uncontrolled seizures, or severe metabolic, endocrine, or electrolyte disorders.

## PATIENT TEACHING

- Instruct patient to take drug exactly as prescribed.
- Teach patient about diet, exercise, and weight control.
- Tell patient to immediately report unexplained muscle pain, tenderness, or weakness, especially if accompanied by malaise or fever.
- Instruct patient to take drug at least 2 hours before taking aluminum- or magnesium-containing antacids.

***Alert:*** Tell female patient to stop drug and notify prescriber immediately if she is or may be pregnant or if she's breast-feeding.

R

# rufinamide

roo-FIN-nah-mide

Banzel

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* Triazole derivative
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 200 mg, 400 mg

## INDICATIONS & DOSAGES

➤ **Adjunct treatment of seizures associated with Lennox-Gastaut syndrome**

*Adults:* Initially, 200 to 400 mg P.O. b.i.d. Increase dosage by 400 to 800 mg/day every 2 days to 3,200 mg daily in divided doses.

*Children age 4 and older:* Initially, 5 mg/kg b.i.d. Increase dosage by 10 mg/kg every other day to 45 mg/kg or 3,200 mg (whichever is less) daily in divided doses.

***Adjust-a-dose:*** Dialysis clears drug by 30%; dosage adjustment may be necessary.

## ADMINISTRATION

**P.O.**

- Give drug with food.
- Tablets may be split or crushed.

## ACTION

May limit seizure activity by prolonging the inactive status of sodium channels in cortical neurons.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 46 hr | Unknown |

*Half-life:* 6 to 10 hours.

## ADVERSE REACTIONS

**CNS:** aggression, anxiety, ataxia, attention disturbance, dizziness, *fatigue*, gait disturbance, *headache*, psychomotor hyperactivity, seizure, *somnolence*, tremor, vertigo.

**EENT:** blurred vision, diplopia, ear infection, nasopharyngitis, nystagmus, sinusitis.

**GI:** constipation, decreased appetite, dyspepsia, increased appetite, *nausea*, upper abdominal pain, *vomiting*.

**Musculoskeletal:** back pain.

**Respiratory:** bronchitis.

**Skin:** pruritus, rash.

**Other:** flulike symptoms.

## INTERACTIONS

**Drug-drug.** *Carbamazepine:* May decrease effectiveness of both drugs. Use together cautiously.

*Ethinyl estradiol and norethindrone:* May decrease effectiveness of these drugs. Patient should use a nonhormonal form of contraception.

*Lamotrigine:* May decrease lamotrigine level. Monitor patient closely.

*Phenobarbital, phenytoin:* May increase levels of these drugs and decrease rufinamide's effect. Use together cautiously.

*Primidone:* May decrease rufinamide level. Use together cautiously.

*Triazolam:* May decrease triazolam level. Use together cautiously.

*Valproate:* May increase rufinamide level. Titrate valproate dosage slowly.

**Drug-lifestyle.** *Alcohol:* May cause additive CNS effect. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with familial short QT syndrome and in those with severe hepatic impairment.
- Use cautiously in patients with mild to moderate hepatic impairment.
- Use drug in pregnant women only if benefit to mother outweighs risk to fetus.
- It isn't known if drug appears in breast milk. Because of risk of serious adverse reactions in infant, patient should either stop breast-feeding or stop drug.
- Safety and efficacy in children younger than age 4 haven't been established.

***Overdose S&S:*** CNS depression.

## NURSING CONSIDERATIONS

- Administer drug with food.

***Alert:*** Drug may increase the risk of suicidal thinking and behavior. Monitor patient closely.

- Don't stop drug suddenly because this may worsen seizures.
- Take appropriate safety precautions in patient with seizures.

- Monitor CBC periodically.
- Monitor patient closely for multiorgan hypersensitivity reaction (fever, rash). If reaction is suspected, discontinue drug and begin alternative treatment.

### PATIENT TEACHING

- Tell patient to take drug with food.
- Advise patient to avoid alcohol.
- Tell patient to take drug only as prescribed.
- Warn patient and caregivers not to stop drug abruptly.
- Tell patient to notify prescriber if rash or fever develops.
- Because drug may cause dizziness and somnolence, warn patient to avoid driving and other potentially hazardous activities that require mental alertness until drug's CNS effects are known.
- Advise women of childbearing age to notify prescriber immediately if pregnant or intending to become pregnant.
- Caution women of childbearing age to avoid breast-feeding while taking drug.
- Advise women taking hormonal contraceptives to use an alternative nonhormonal method of birth control while taking drug because hormonal contraceptives may be ineffective.

## salmeterol xinafoate

sal-MEE-ter-ol

Serevent Diskus

*Therapeutic class:* Bronchodilator
*Pharmacologic class:* Long-acting selective beta$_2$ agonist
*Pregnancy risk category C*

### AVAILABLE FORMS

*Inhalation powder:* 50 mcg/blister

### INDICATIONS & DOSAGES

➤ **Long-term maintenance of asthma; to prevent bronchospasm in patients with nocturnal asthma or reversible obstructive airway disease who need regular treatment with short-acting beta agonists**

*Adults and children age 4 and older:*
1 inhalation (50 mcg) b.i.d. in the morning and evening, about 12 hours apart.

➤ **To prevent exercise-induced bronchospasm**

*Adults and children age 4 and older:*
1 inhalation (50 mcg) at least 30 minutes before exercise. Additional doses shouldn't be taken for at least 12 hours.

➤ **COPD or emphysema**

*Adults:* 1 inhalation (50 mcg) b.i.d. in the morning and evening, about 12 hours apart.

### ADMINISTRATION

**Inhalational**

- Give drug 30 to 60 minutes before exercise to prevent exercise-induced bronchospasm.
- Don't use a spacer device with this drug.

### ACTION

Unclear. Selectively activates beta$_2$ receptors, which results in bronchodilation; also, blocks the release of allergic mediators from mast cells lining the respiratory tract.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Inhalation | 30–48 min | 3 hr | 12 hr |

*Half-life:* 5½ hours; xinafoate salt, 11 days.

### ADVERSE REACTIONS

**CNS:** headache, sinus headache, tremor, nervousness, giddiness, paresthesia, sleep disturbance, fever.
**CV:** ***ventricular arrhythmias,*** tachycardia, palpitations.
**EENT:** *nasopharyngitis,* pharyngitis, hoarseness, nasal cavity or sinus disorder.
**GI:** nausea, vomiting, diarrhea, heartburn.
**Musculoskeletal:** joint and back pain, myalgia.
**Respiratory:** *upper respiratory tract infection,* ***bronchospasm,*** cough, lower respiratory tract infection.
**Other:** hypersensitivity reactions, rash, urticaria, flulike symptoms.

### INTERACTIONS

**Drug-drug.** *Antiarrhythmics (such as amiodarone, disopyramide, sotalol), chlorpromazine, dolasetron, droperidol, moxifloxacin, pentamidine, pimozide, tacrolimus, thioridazine, ziprasidone:* May prolong QT

S

interval and increase risk of life-threatening cardiac arrhythmias. Monitor QT interval closely.
*Beta agonists, other methylxanthines, theophylline:* May cause adverse cardiac effects with excessive use. Monitor patient.
*CYP3A inhibitors: (ketoconazole, ritonavir):* May increase cardiac effects. Avoid use together.
*Diuretics:* May worsen hypokalemia and ECG changes. Use cautiously together.
*MAO inhibitors:* May cause risk of severe adverse CV effects. Avoid use within 14 days of MAO inhibitor therapy.
*Tricyclic antidepressants:* May cause risk of moderate to severe adverse CV effects. Use together with caution.

## EFFECTS ON LAB TEST RESULTS
None reported.

## CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug or its ingredients.

***Alert:*** Don't use drug with other medications containing long acting beta$_2$ agonists.
- Use cautiously in patients unusually responsive to sympathomimetics and those with coronary insufficiency, arrhythmias, hypertension, other CV disorders, thyrotoxicosis, hepatic impairment, or seizure disorders.

***Overdose S&S:*** Exaggeration of adverse reactions, hypokalemia, seizures, angina, hypertension, hypotension, dry mouth, muscle cramps, dizziness, fatigue, insomnia, ventricular arrhythmias, cardiac arrest, sudden death.

## NURSING CONSIDERATIONS
**Black Box Warning** Drug may increase the risk of asthma-related death. Only use salmeterol as additional therapy for patients whose condition is not adequately controlled on other medications or patients whose disease severity warrants initiation of treatment with 2 maintenance therapies. ■
- Drug isn't indicated for acute bronchospasm.

***Alert:*** Monitor patient for rash and urticaria, which may signal a hypersensitivity reaction.
- ***Look alike–sound alike:*** Don't confuse Serevent with Serentil.

## PATIENT TEACHING
- Remind patient to take drug at about 12-hour intervals for optimal effect and to take drug even when feeling better.
- If patient is taking drug to prevent exercise-induced bronchospasm, tell him to take it 30 to 60 minutes before exercise.

***Alert:*** Tell patient drug shouldn't be used to treat acute bronchospasm. He must use a short-acting beta agonist, such as albuterol, to treat worsening symptoms.

***Alert:*** Rare serious asthma episodes or asthma-related deaths may occur in patients using salmeterol. Black patients may be at greater risk.
- Tell patient to contact prescriber if the short-acting agonist no longer provides sufficient relief or if he needs more than 4 inhalations daily. This may be a sign that the asthma symptoms are worsening. Tell him not to increase the dosage of salmeterol.
- If patient takes an inhaled corticosteroid, he should continue to use it regularly. Warn patient not to take other drugs without prescriber's consent.
- If patient takes the inhalation powder (in a multidose inhaler), instruct him not to exhale into the device. He should activate and use it only in a level, horizontal position.
- Tell patient not to use the dry-powder multidose inhaler with a spacer.
- Instruct patient never to wash the mouthpiece or any part of the dry-powder multidose inhaler; it must be kept dry.

# sapropterin dihydrochloride
SAP-roh-TEHR-in die-high-droh-KLOR-ighd

Kuvan

*Therapeutic class:* Phenylalanine reducer
*Pharmacologic class:* Enzyme cofactor
*Pregnancy risk category C*

## AVAILABLE FORMS
*Tablets:* 100 mg

## INDICATIONS & DOSAGES

➤ **Hyperphenylalaninemia caused by tetrahydrobiopterin-responsive phenylketonuria (PKU)**

*Adults and children age 4 and older:* Initially, 10 mg/kg P.O. once daily with food. If phenylalanine level hasn't decreased from baseline after 4 weeks, increase dose to 20 mg/kg. Stop treatment if patient has no response after 4 weeks at 20 mg/kg.

## ADMINISTRATION

**P.O.**

- Give with food at same time each day.
- Dissolve tablets in 120 to 240 ml water or apple juice and give within 15 minutes.
- Tablets may be crushed or stirred to help them dissolve faster.
- If tablet pieces remain in cup, add small amount of water or juice, stir, and have patient drink.
- If dose is missed, give missed dose as soon as possible but never give more than one dose per day.

## ACTION

Activates residual phenylalanine hydroxylase to improve the oxidative metabolism of phenylalanine.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Varies | Unknown | 24 hr |

*Half-life:* About 7 hours.

## ADVERSE REACTIONS

**CNS:** fever, *headache*, ***seizures, spinal cord injury.***
**CV:** ***MI,*** peripheral edema.
**EENT:** nasal congestion, *pharyngolaryngeal pain, rhinorrhea.*
**GI:** abdominal pain, diarrhea, gastritis, nausea, vomiting.
**GU:** polyuria, ***testicular cancer.***
**Hematologic:** ***neutropenia.***
**Respiratory:** cough, *upper respiratory tract infection.*
**Skin:** rash.
**Other:** contusion, infection.

## INTERACTIONS

**Drug-drug.** *Drugs that alter folate metabolism (such as methotrexate):* May decrease sapropterin effects. Use together cautiously.
*Levodopa:* May worsen neurologic symptoms. Use together cautiously.
*Phosphodiesterase-5 inhibitors (sildenafil, tadalafil, vardenafil):* May cause hypotension. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

- May decrease neutrophil count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in patients with hepatic impairment and in breast-feeding women.

⚠ ***Overdose S&S:*** Mild headache, dizziness.

## NURSING CONSIDERATIONS

- Give drug only under supervision of practitioner experienced in treating PKU. Monitor phenylalanine level before and during treatment.
- Monitor patient's neurologic status and renal and hepatic function test results.
- Watch patient for signs of infection.
- Protect tablets from moisture. Store at room temperature in a tightly closed container.
- Use only when potential benefits to the mother outweigh risk to the fetus.
- It isn't known whether drug appears in breast milk.
- Because of potential harm to the infant, patient should either stop breast-feeding or stop drug, taking into account the drug's importance to the mother.
- Safety and effectiveness haven't been established in children younger than age 4.

## PATIENT TEACHING

- Advise patient to follow a phenylalanine-restricted diet.
- Tell patient to take drug with food at about the same time each day.
- Instruct patient to dissolve tablet in 4 to 8 ounces of water or apple juice and to take within 15 minutes.
- Advise patient that small pieces of tablet may float on water or juice. Tell him that this is normal and that the liquid is safe to swallow.

S

- Tell patient to report fever or other signs of infection.
- Caution women to avoid becoming pregnant and to notify prescriber if pregnancy is suspected.
- Advise women not to breast-feed during therapy because drug may appear in breast milk.
- Tell patient to store drug in a tightly sealed container at room temperature.

## saquinavir mesylate

sa-KWEN-ah-veer

Invirase

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Protease inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS

*Capsules (hard gelatin):* 200 mg
*Tablets (film-coated):* 500 mg

### INDICATIONS & DOSAGES

➤ **Adjunct treatment of advanced HIV infection in selected patients**

*Adults and adolescents age 16 and older:* 1,000 mg P.O. b.i.d. given at the same time with 100 mg ritonavir P.O. b.i.d.

### ADMINISTRATION

**P.O.**

- Give drug with food or within 2 hours of a full meal to increase drug absorption.

### ACTION

Inhibits the activity of HIV protease and prevents the cleavage of HIV polyproteins, which are essential for HIV maturation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* 1 to 2 hours.

### ADVERSE REACTIONS

**CNS:** fatigue, fever.
**GI:** diarrhea, *nausea*, ***pancreatitis,*** abdominal pain, constipation, vomiting.
**Hematologic:** ***pancytopenia, thrombocytopenia.***
**Musculoskeletal:** musculoskeletal pain.
**Respiratory:** bronchitis, pneumonia, sinusitis.
**Skin:** rash, pruritus, eczema.

### INTERACTIONS

**Drug-drug.** *Amiodarone, bepridil, ergot derivatives, flecainide, midazolam, pimozide, propafenone, quinidine, rifampin, triazolam:* May cause serious or life-threatening reactions. Use together is contraindicated.
*Amprenavir:* May decrease amprenavir level. Use together cautiously.
*Carbamazepine, phenobarbital, phenytoin:* May decrease saquinavir level. Avoid using together.
*Delavirdine:* May increase saquinavir level. Use cautiously and monitor hepatic enzymes. Decrease dose when used together.
*Dexamethasone:* May decrease saquinavir level. Avoid using together.
*Efavirenz:* May decrease levels of both drugs. Avoid using together.
*HMG-CoA reductase inhibitors:* May increase levels of these drugs, which increases risk of myopathy, including rhabdomyolysis. Avoid using together.
*Indinavir, lopinavir and ritonavir combination, nelfinavir, ritonavir:* May increase saquinavir level. Use together cautiously.
*Macrolide antibiotics, such as clarithromycin:* May increase levels of both drugs. Use together cautiously.
*Nevirapine:* May decrease saquinavir level. Monitor patient.
*PDE5 inhibitors (sildenafil, tadalafil, vardenafil):* May increase levels of these drugs. Reduce dose and frequency of PDE5 inhibitor and monitor patient closely for adverse reactions.
*Rifabutin, rifampin:* May decrease saquinavir level. Use with rifabutin cautiously. Don't use with rifampin.
*Ritonavir:* May prolong QT and PR intervals. Avoid concomitant use in patients with history of prolonged QT interval and in those already receiving drugs known to prolong QT interval (Class I or Class III antiarrythmics).
**Drug-herb.** *Garlic supplements,* ***St. John's wort:*** May substantially reduce drug level, causing loss of therapeutic effects. Discourage use together.

**Drug-food.** *Any food:* May increase drug absorption. Advise patient to take drug with food.
*Grapefruit juice:* May increase drug level. Tell patient to take with liquid other than grapefruit juice.

### EFFECTS ON LAB TEST RESULTS
• May decrease WBC, RBC, and platelet counts.

### CONTRAINDICATIONS & CAUTIONS
• Contraindicated in patients hypersensitive to drug or its components and in those taking amiodarone, bepridil, ergot derivatives, flecainide, midazolam, pimozide, propafenone, quinidine, rifampin, or triazolam.
• Safety of drug hasn't been established in pregnant or breast-feeding women or in children younger than age 16.
⚠ ***Overdose S&S:*** Throat pain.

### NURSING CONSIDERATIONS
• Evaluate CBC, platelets, electrolytes, uric acid, liver enzymes, and bilirubin before therapy begins and at appropriate intervals throughout therapy.
• If serious toxicity occurs during treatment, stop drug until cause is identified or toxicity resolves. Drug may be resumed without dosage modifications.
• Monitor patient's hydration if adverse GI reactions occur.

### PATIENT TEACHING
• Advise patient to take drug with food or within 2 hours of a full meal to increase drug absorption.
• Instruct patient to avoid missing any doses, to decrease the risk of developing HIV resistance.
• Inform patient that drug doesn't cure HIV infection, that opportunistic infections and other complications of HIV infection may continue to occur, and that transmission of HIV to others through sexual contact or blood contamination is still possible.
• Advise patient to keep an updated list of the drugs he's taking and to contact his prescriber before using any prescription or OTC drug because of the many interactions.

**SAFETY ALERT!**

## sargramostim (GM-CSF; granulocyte-macrophage colony-stimulating factor)
sar-GRAM-oh-stim

Leukine

*Therapeutic class:* Colony-stimulating factor
*Pharmacologic class:* Hematopoietic
*Pregnancy risk category C*

### AVAILABLE FORMS
*Powder for injection:* 250 mcg
*Solution for injection:* 500 mcg/ml*

### INDICATIONS & DOSAGES
➤ **To accelerate hematopoietic reconstitution after autologous or allogenic bone marrow transplantation in patients with malignant lymphoma or acute lymphoblastic leukemia or in patients with Hodgkin lymphoma**
*Adults:* 250 mcg/$m^2$ daily given as 2-hour I.V. infusion beginning 2 to 4 hours after bone marrow transplantation. Continue until absolute neutrophil count (ANC) is more than 1,500/$mm^3$ for 3 consecutive days.
➤ **Neutrophil recovery following chemotherapy in acute myelogenous leukemia**
*Adults age 55 and older:* Initially, 250 mcg/$m^2$ I.V. once daily over 4 hours beginning day 11 or 4 days following completion of induction therapy; initiate only if bone marrow is hypoplastic with less than 5% blasts on day 10. If a second induction cycle is needed, begin sargramostim 4 days after completing chemotherapy and only if bone marrow is hypoplastic with less than 5% blasts. Continue until the ANC is more than 1,500/$mm^3$ for 3 consecutive days or for a maximum of 42 days.
➤ **Mobilization of peripheral blood progenitor cells (PBPC)**
*Adults:* 250 mcg/$m^2$ by continuous I.V. infusion over 24 hours or by subcutaneous injection once daily. Continue through PBPC collection.

S

➤ **Post-PBPC transplantation**
*Adults:* 250 mcg/$m^2$ by continuous I.V. infusion over 24 hours or by subcutaneous injection once daily beginning immediately following PBPC infusion; continue until ANC is more than 1,500/$mm^3$ for 3 consecutive days.
➤ **Bone marrow transplantation failure or engraftment delay**
*Adults:* 250 mcg/$m^2$ as a 2-hour I.V. infusion daily for 14 days. This course of therapy may be repeated after 7 days of no therapy. If engraftment still hasn't occurred, a third course of 500 mcg/$m^2$ daily I.V. for 14 days may be attempted after another therapy-free 7 days.
***Adjust-a-dose:*** Stimulation of marrow precursors may result in rapid rise of WBC count. If blast cells appear or increase to 10% or more of WBC count or if the underlying disease progresses, stop therapy. If ANC is above 20,000/$mm^3$ or if platelet count is above 500,000/$mm^3$, temporarily stop drug or reduce dose by 50%.

## ADMINISTRATION

**I.V.**
▼ Reconstitute with 1 ml of sterile or bacteriostatic water for injection. Direct stream of sterile water against side of vial and gently swirl contents to minimize foaming. Avoid excessive or vigorous agitation or shaking.
▼ Dilute in normal saline solution. If drug yield is below 10 mcg/ml, add human albumin at final concentration of 0.1% to saline solution before adding sargramostim to prevent adsorption to components of the delivery system. To yield 0.1% human albumin, add 1 mg human albumin to each milliliter of saline solution (dilute 1 ml of 5% human albumin in 50 ml of saline solution).
▼ Don't use in-line filter.
▼ Give as soon as possible after mixing and no later than 6 hours after reconstituting.
▼ **Incompatibilities:** Other I.V. drugs, unless specific compatibility data are available.

**Subcutaneous**
● Further dilution of injection or reconstituted solution isn't needed.

## ACTION

Induces cellular responses by binding to specific receptors on surfaces of target cells.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 15 min | 1–3 hr | Unknown |
| Subcut. | 15 min | 2–4 hr | Unknown |

*Half-life:* About 1 hour (I.V.); about 3 hours (subcutaneous).

## ADVERSE REACTIONS

**CNS:** *asthenia, CNS disorders, fever, headache, malaise.*
**CV:** **HEMORRHAGE,** *edema, peripheral edema, hypertension,* ***supraventricular arrhythmias,*** *pericardial effusion.*
**GI:** *anorexia, diarrhea, GI disorders, nausea, stomatitis, vomiting,* ***GI hemorrhage.***
**GU:** *urinary tract disorder,* abnormal kidney function.
**Hematologic:** *blood dyscrasias.*
**Hepatic:** *liver damage.*
**Musculoskeletal:** *arthralgias.*
**Respiratory:** *dyspnea, lung disorders,* pleural effusion.
**Skin:** *alopecia, pruritus, rash.*
**Other:** **SEPSIS,** *mucous membrane disorder.*

## INTERACTIONS

**Drug-drug.** *Corticosteroids, lithium:* May increase myeloproliferative effects of sargramostim. Use cautiously together.

## EFFECTS ON LAB TEST RESULTS

● May increase BUN, creatinine, AST, ALT, alkaline phosphatase, bilirubin, glucose, and cholesterol levels. May decrease calcium and albumin levels.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or its components or to yeast-derived products and in those with excessive leukemic myeloid blasts in bone marrow or peripheral blood.
● Giving within 24 hours of chemotherapy or radiation is contraindicated.
● Use cautiously in patients with cardiac disease, hypoxia, fluid retention, pulmonary infiltrates, heart failure, or impaired renal or hepatic function because these conditions may be worsened.

• Safety and efficacy haven't been established in children.
**Overdose S&S:** Dyspnea, malaise, nausea, fever, rash, sinus tachycardia, headache, chills.

## NURSING CONSIDERATIONS
• If severe adverse reactions occur, reduce dose by 50% or temporarily stop drug and notify prescriber. Resume therapy when reactions decrease. Transient rash and local reactions at injection site may occur.
• Solution for injection contains benzyl alcohol, which has been associated with fatal "gasping syndrome" in neonates. Don't administer to neonates.
• Rapidly dividing progenitor cells may be sensitive to cytotoxic therapies, making the drug ineffective; don't give within 24 hours of last dose of chemotherapy or within 12 hours of last dose of radiotherapy.
• Monitor CBC with differential, including examination for presence of blast cells, biweekly.
• Drug accelerates myeloid recovery in patients receiving bone marrow that is either unpurged or purged by anti-B cell monoclonal antibodies more than in those who receive bone marrow that is chemically purged.
• Drug may produce a limited response in transplant patients who have received extensive radiotherapy or who have received other myelotoxic drugs.
• Drug can act as a growth factor for any tumor type, particularly myeloid malignant disease.

## PATIENT TEACHING
• Review administration schedule with patient and caregivers, and address their concerns.
• Urge patient to report adverse reactions promptly.

**SAFETY ALERT!**

# saxagliptin
sax-ah-GLIP-ten

Onglyza

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Dipeptidyl peptidase-4 (DPP-4) enzyme inhibitor
*Pregnancy risk category B*

## AVAILABLE FORMS
*Tablets:* 2.5 mg, 5 mg

## INDICATIONS & DOSAGES
➤ **Adjunct to diet and exercise to improve glycemic control in type 2 diabetes**
*Adults:* 2.5 or 5 mg P.O. once daily.
**Adjust-a-dose:** For patient with creatinine clearance of 50 ml/minute or less, give 2.5 mg P.O. once daily; if patient requires dialysis, give drug after treatment.

## ADMINISTRATION
**P.O.**
• Give drug with or without food.

## ACTION
Inhibits DPP-4, an enzyme that rapidly inactivates incretin hormones, which play a part in the body's regulation of glucose. By increasing active incretin levels, drug helps to increase insulin release and decrease circulating glucose.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 hr | Unknown |

*Half-life:* 2½ hours.

## ADVERSE REACTIONS
**CNS:** headache.
**CV:** facial edema, peripheral edema.
**EENT:** sinusitis.
**GI:** abdominal pain, gastroenteritis, vomiting.
**GU:** UTI.
**Metabolic:** hypoglycemia.
**Respiratory:** upper respiratory tract infection.
**Skin:** urticaria.

S

## INTERACTIONS

**Drug-drug.** *Strong CYP3A4/5 inhibitors (atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin):* May increase saxagliptin level. Reduce dosage to 2.5 mg P.O. daily.

## EFFECTS ON LAB TEST RESULTS

- May decrease lymphocyte count.

## CONTRAINDICATIONS & CAUTIONS

- Use cautiously in patients taking secretagogues (such as sulfonylureas) because of increased risk of hypoglycemia.
- Use cautiously in pregnant and breast-feeding women.
- Safety and efficacy in children haven't been established.

## NURSING CONSIDERATIONS

- Monitor blood glucose level and watch for signs and symptoms of hypoglycemia.
- Monitor glycosylated hemoglobin level periodically to assess long-term glycemic control.
- Assess renal function before starting drug and periodically thereafter.
- Management of type 2 diabetes should also include diet control and exercise. Because calorie restriction, weight loss, and exercise help improve insulin sensitivity and help make drug therapy effective, these measures are essential for proper diabetes management.
- ***Look alike–sound alike:*** Don't confuse saxagliptin with sitagliptin.

## PATIENT TEACHING

- Tell patient drug may be taken with or without food.
- Advise patient that drug isn't a substitute for diet and exercise and that it's important to follow a prescribed dietary and physical activity routine and to monitor glucose levels.
- Inform patient and family members of the signs and symptoms of hypoglycemia and hyperglycemia and the steps to take should these occur, including notifying the prescriber.
- Tell patient to notify prescriber during periods of stress, such as fever, infection, or surgery, because dosage may need adjustment.

# scopolamine (hyoscine)

skoe-POL-a-meen

Transderm-Scop, Scopace

# scopolamine hydrobromide (hyoscine hydrobromide)

Scopolamine Hydrobromide Injection

*Therapeutic class:* Antispasmodic
*Pharmacologic class:* Belladonna alkaloid, antimuscarinic
*Pregnancy risk category C*

## AVAILABLE FORMS

**scopolamine**
*Tablets:* 0.4 mg
*Transdermal patch:* 1.5 mg/2.5 $cm^2$ (1 mg/72 hours)
**scopolamine hydrobromide**
*Injection:* 0.3 mg, 0.4 mg, 0.86 mg and 1 mg/ml

## INDICATIONS & DOSAGES

➤ **Spastic states, postencephalitic parkinsonism, and as a CNS depressant**
*Adults:* 0.4 to 0.8 mg P.O.; adjust dosage and frequency to individual needs.

➤ **Delirium, preanesthetic sedation, and obstetric amnesia with analgesics**
*Adults:* 0.3 to 0.65 mg I.V., I.M., or subcutaneously 30 to 60 minutes before or with other agents at the time of anesthesia. Dilute solution with sterile water for injection before giving I.V.
*Children:* 0.006 mg/kg I.V., I. M., or subcutaneously 30 to 60 minutes before or with other agents at the time of anesthesia. Maximum dose, 0.3 mg. Dilute solution with sterile water for injection before giving I.V.

➤ **To prevent postoperative nausea and vomiting**
*Adults:* Apply 1 transdermal patch the evening before scheduled surgery. To minimize exposure to newborns, apply patch 1 hour before cesarean birth. Keep patch in place for 24 hours following surgery.

➤ **To prevent nausea and vomiting from motion sickness**
*Adults:* One Transderm-Scop, formulated to deliver 1 mg scopolamine over 3 days, applied to the skin behind the ear at least 4 hours before antiemetic is needed. Or, 0.3 to 0.65 mg hydrobromide I.V., I.M. or subcutaneously, t.i.d. or q.i.d., as needed. Or, 0.25 to 0.8 mg P.O. 1 hour before exposure to motion. Further doses of 0.25 to 0.8 mg may be given t.i.d., as needed.

## ADMINISTRATION

**P.O.**
● Give 30 to 60 minutes before a meal, but may be given with food if stomach upset occurs.

**I.V.**
▼ For direct injection, dilute with sterile water and inject at ordered rate through patent I.V. line. Intermittent and continuous infusions aren't recommended.
▼ Protect I.V. solutions from freezing and light, and store at room temperature.
▼ **Incompatibilities:** Alkalies, anticholinergics, methohexital.

**I.M.**
● Rotate injection sites and document.
● Only use clear solution.

**Transdermal**
● Keep in foil wrapper until ready to use.
● Wear gloves to apply or remove patch.
● Place patch behind ear, on clean, dry, hairless area.
● If patch is dislodged, replace with a new one.

**Subcutaneous**
● Rotate injection sites and document.
● Only use clear solution.

## ACTION

Inhibits muscarinic actions of acetylcholine on autonomic effectors innervated by postganglionic cholinergic neurons. May affect neural pathways originating in the inner ear to inhibit nausea and vomiting.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.M. | 1 hr | 1–2 hr | 4–6 hr |
| I.V. | 10 min | 50–80 min | 2 hr |
| Transdermal | 4 hr | Unknown | 72 hr |
| Subcut. | Unknown | Unknown | Unknown |

*Half-life:* 8 hours.

## ADVERSE REACTIONS

**CNS:** disorientation, restlessness, irritability, dizziness, drowsiness, headache, confusion, hallucinations, delirium, impaired memory.
**CV:** ***paradoxical bradycardia,*** palpitations, tachycardia, flushing.
**EENT:** dilated pupils, blurred vision, photophobia, increased intraocular pressure, difficulty swallowing.
**GI:** *constipation, dry mouth, epigastric distress, nausea, vomiting.*
**GU:** urinary hesitancy, urine retention.
**Respiratory:** bronchial plugging, depressed respirations.
**Skin:** rash, dryness, contact dermatitis with transdermal patch.
**Other:** heat intolerance.

## INTERACTIONS

**Drug-drug.** *Amantadine, antihistamines, antiparkinsonians, disopyramide, glutethimide, meperidine, phenothiazines, procainamide, quinidine, tricyclic antidepressants:* May increase risk of adverse CNS reactions. Avoid using together.
*Antacids:* May decrease oral absorption of anticholinergics. Separate doses by 2 or 3 hours.
*Atenolol:* May increase pharmacologic effects of atenolol. Monitor patient for adverse effects.
*CNS depressants:* May increase risk of CNS depression. Monitor patient closely.
**Drug-herb.** *Jaborandi tree:* May decrease drug effects. Discourage use together.
*Pill-bearing spurge:* May decrease drug effects. Inform patient of this interaction.
*Squaw vine:* May decrease metabolic breakdown. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May increase risk of CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients with angle-closure glaucoma, obstructive uropathy, obstructive disease of the GI tract, asthma, chronic pulmonary disease, myasthenia gravis, paralytic ileus, intestinal atony,

S

unstable CV status in acute hemorrhage, tachycardia from cardiac insufficiency, or toxic megacolon.
• Contraindicated in patients hypersensitive to belladonna or barbiturates.
• Use cautiously in patients with autonomic neuropathy, hyperthyroidism, coronary artery disease, arrhythmias, heart failure, hypertension, hiatal hernia with reflux esophagitis, hepatic or renal disease, known or suspected GI infection, or ulcerative colitis.
• Use cautiously in children.
• Use cautiously in patients in hot or humid environments; drug can cause heatstroke.
***Overdose S&S:*** Lethargy, somnolence, coma, confusion, agitation, hallucinations, leukocytosis, seizures, visual disturbances, dry flushed skin, dry mouth, decreased bowel sounds, urine retention, tachycardia, hypertension, supraventricular arrhythmias, circulatory or respiratory collapse, death.

## NURSING CONSIDERATIONS

• Raise side rails as a precaution because some patients become temporarily excited or disoriented and some develop amnesia or become drowsy. Reorient patient, as needed.
• Tolerance may develop when therapy is prolonged.
• Atropine-like toxicity may cause dose-related adverse reactions. Individual tolerance varies greatly.
***Alert:*** Overdose may cause curare-like effects such as respiratory paralysis. Keep emergency equipment available.

## PATIENT TEACHING

• Advise patient to apply patch the night before a planned trip. Transdermal method releases a controlled therapeutic amount of drug. Transderm-Scop is effective if applied 2 or 3 hours before experiencing motion but is more effective if applied 12 hours before.
• Instruct patient to remove one patch before applying another.
• Instruct patient to wash and dry hands thoroughly before and after applying the transdermal patch (on dry skin behind the ear) and before touching the eye because pupil may dilate. Tell patient to discard patch after removing it and to wash application site thoroughly.
• Tell patient that if patch becomes displaced, he should remove it and apply another patch on a fresh skin site behind the ear.
• Alert patient to possible withdrawal signs or symptoms (nausea, vomiting, headache, dizziness) when transdermal system is used for longer than 72 hours.
• Advise patient that eyes may be more sensitive to light while wearing patch. Advise patient to wear sunglasses for comfort.
• Warn patient to avoid activities that require alertness until CNS effects of drug are known.
• Instruct patient to ask pharmacist for brochure that comes with the transdermal product.
• Instruct patient that, if he requires an MRI, to inform the facility that he is wearing a transdermal patch.
• Urge patient to report urinary hesitancy or urine retention.

# scopolamine hydrobromide

skoe-POL-a-meen

Isopto Hyoscine

*Therapeutic class:* Mydriatic
*Pharmacologic class:* Antimuscarinic, anticholinergic
*Pregnancy risk category C*

## AVAILABLE FORMS

*Ophthalmic solution:* 0.25%

## INDICATIONS & DOSAGES

➤ **Cycloplegic refraction**

*Adults:* Instill 1 or 2 drops of 0.25% solution 1 hour before refraction.
*Children:* Instill 1 drop of 0.25% solution b.i.d. for 2 days before refraction.

➤ **Iritis, uveitis**

*Adults:* Instill 1 or 2 drops of 0.25% solution once daily to q.i.d.

## ADMINISTRATION

**Ophthalmic**

• Don't touch tip of dropper to eye or surrounding tissue.

• Apply light finger pressure on lacrimal sac for 1 minute after instilling drug to minimize systemic absorption.

## ACTION

Leaves the pupil under unopposed adrenergic influence, causing it to dilate.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Rapid | 15–45 min | <1 wk |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** acute psychotic reactions, confusion, delirium, hallucinations, headache, somnolence.
**CV:** edema, tachycardia.
**EENT:** *blurred vision, photophobia,* conjunctivitis, eye dryness, increased intraocular pressure, ocular congestion with prolonged use, transient stinging and burning.
**GI:** dry mouth.
**Skin:** contact dermatitis, dryness.

## INTERACTIONS

**Drug-lifestyle.** *Sun exposure:* May cause photophobia. Advise patient to wear sunglasses.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug and in those with shallow anterior chamber, angle-closure glaucoma, or adhesions between the iris and lens.
• Use cautiously in patients with cardiac disease and in elderly patients.
⚠ ***Overdose S&S:*** Exaggerated adverse effects.

## NURSING CONSIDERATIONS

• Observe patients closely for adverse CNS effects, such as disorientation and delirium.
• Drug may be used in patients sensitive to atropine because it's faster acting and has a shorter duration of action and fewer adverse reactions.

## PATIENT TEACHING

• Teach patient how to instill drug. Advise him to wash hands before and after instillation and to apply light finger pressure on lacrimal sac for 1 minute after drops are instilled. Warn him to avoid touching tip of dropper to eye or surrounding tissue.
• Warn patient to avoid hazardous activities, such as operating machinery or driving, until temporary blurring subsides.
• Advise patient to ease sun sensitivity by wearing dark glasses.
• Instruct patient to carry medical identification at all times during therapy.
• Tell parents to avoid getting drug into child's mouth.

# selegiline

se-LEH-ge-leen

Emsam

# selegiline hydrochloride (L-deprenyl hydrochloride)

Eldepryl, Zelapar

*Therapeutic class:* Antiparkinsonian
*Pharmacologic class:* MAO inhibitor
*Pregnancy risk category C*

## AVAILABLE FORMS

**selegiline**
*Transdermal system:* 6 mg/24 hours, 9 mg/24 hours, 12 mg/24 hours
**selegiline hydrochloride**
*Capsules:* 5 mg
*Orally disintegrating tablets (ODTs):* 1.25 mg
*Tablets:* 5 mg

## INDICATIONS & DOSAGES

➤ **Adjunctive treatment with levodopa and carbidopa in managing signs and symptoms of Parkinson disease**
*Adults:* 10 mg P.O. daily divided as 5 mg at breakfast and 5 mg at lunch. After 2 or 3 days, gradual decrease of levodopa and carbidopa dosage may be needed. Or, if using ODTs, start with 1.25 mg P.O. once daily before breakfast and without liquid. Increase to 2.5 mg daily after at least 6 weeks, if tolerated and needed.

➤ **Major depressive disorder**
*Adults:* Apply one patch daily to dry intact skin on the upper torso, upper thigh, or upper arm. Initially, use 6 mg/day. Increase, if needed, in increments of 3 mg/day at intervals of 2 or more weeks. Maximum daily dose, 12 mg.
*Elderly patients:* 6 mg daily.

## ADMINISTRATION

**P.O.**
- Don't give food or liquids for 5 minutes before and after giving ODTs.
- Don't push ODTs through the foil backing; peel the backing off and gently remove the tablet.

**Transdermal**
- Apply patch to dry, intact skin on the upper torso, upper thigh, or outer surface of the upper arm once every 24 hours.
- Don't cut the transdermal patch into smaller pieces.

## ACTION

May inhibit MAO type B (mainly found in the brain) and dopamine metabolism. At higher-than-recommended doses, drug nonselectively inhibits MAO, including MAO type A (mainly found in the intestine). May also directly increase dopaminergic activity by decreasing the reuptake of dopamine into nerve cells.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 30–120 min | Unknown |
| Transdermal | Unknown | Unknown | 24 hr |

*Half-life:* Selegiline, 2 to 10 hours; N-desmethyldeprenyl, 2 hours; L-amphetamine, 17¾ hours; L-methamphetamine, 20½ hours.

## ADVERSE REACTIONS

**Transdermal form**
**CNS:** *headache*, *insomnia*.
**CV:** chest pain, hypotension, orthostatic blood pressure.
**GI:** diarrhea, dry mouth, dyspepsia.
**Metabolic:** weight gain, weight loss.
**Respiratory:** pharyngitis, sinusitis.
**Skin:** *application site reaction*, rash.

**Oral form**
**CNS:** *dizziness*, agitation, delusions, loss of balance, depression, increased bradykinesia, involuntary movements, headache, confusion, hallucinations, vivid dreams, insomnia, syncope, pain.
**CV:** ***arrhythmias,*** orthostatic hypotension, hypertension, new or increased angina.
**EENT:** pharyngitis, rhinitis.
**GI:** *nausea*, dry mouth, abdominal pain, diarrhea.
**Musculoskeletal:** leg cramps, myalgia, back pain.
**Respiratory:** dyspnea.
**Skin:** rash, ecchymosis.

## INTERACTIONS

**Drug-drug.** *Bupropion; cyclobenzaprine; dextromethorphan; meperidine; methadone; mirtazapine; MAO inhibitors; sympathomimetic amines, including amphetamines, cold products, and weight-loss preparations containing vasoconstrictors; tramadol; tricyclic antidepressants:* May cause hypertensive crisis. Separate use by at least 2 weeks.
*Carbamazepine, oxcarbazepine:* May increase selegiline levels. Use together is contraindicated.
*Citalopram, duloxetine, fluoxetine, fluvoxamine, nefazodone, paroxetine, sertraline, venlafaxine:* May cause serotonin syndrome (CNS irritability, shivering, and altered consciousness). Separate use by at least 2 weeks (5 weeks if switching to or from fluoxetine).
*Hormonal contraceptives:* May increase plasma selegiline level and increase adverse reactions. Monitor patient closely.
**Drug-herb.** *Ginseng:* May cause headache, tremors, or mania. Discourage use together.
*St. John's wort:* May cause increased serotonergic effects. Warn patient against use together.
**Drug-food.** *Foods high in tyramine:* May cause hypertensive crisis especially at increased doses. Provide patient with a list of foods to avoid.

## EFFECTS ON LAB TEST RESULTS

- May cause positive result for amphetamine on urine drug screen.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, in patients with pheochromocytoma, and in those taking bupropion,

carbamazepine, cyclobenzaprine, dextromethorphan, duloxetine, methadone, meperidine, mirtazapine, MAO inhibitors, oxcarbazepine, propoxyphene, SSRIs, sympathomimetics, tramadol, tricyclic antidepressants, venlafaxine.
• Don't use oral drug with the transdermal system.
**Black Box Warning** Selegiline isn't approved for use in children. Emsam shouldn't be used in children under age 12, even when administered with dietary modifications. ▮
***Overdose S&S:*** Drowsiness, dizziness, faintness, irritability, hyperactivity, agitation, severe headache, hallucinations, trismus, opisthotonos, seizures, coma, rapid and irregular pulse, hypertension, hypotension and vascular collapse, precordial pain, respiratory depression and failure, hyperpyrexia, diaphoresis, cool and clammy skin.

## NURSING CONSIDERATIONS

***Alert:*** Some patients experience increased levodopa adverse reactions when it's used with selegiline and need a 10% to 30% reduction of levodopa and carbidopa dosage.
**Black Box Warning** Drug may increase the risk of suicidal thinking and behavior in children, adolescents, and young adults ages 18 to 24, especially during the first few months of treatment, especially in those with major depressive or other psychiatric disorder. ▮
• Monitor patients with major depressive disorder for worsening of symptoms and of suicidal behavior, especially during the first few weeks of treatment and during dosage changes.
• ***Look alike–sound alike:*** Don't confuse selegiline with Stelazine or Eldepryl with enalapril.

## PATIENT TEACHING

• Warn patient to move cautiously or change positions slowly at start of therapy because he may become dizzy or lightheaded.
• Caution patient to avoid driving and other hazardous activities that require mental alertness until the drug's effects are known.
• Advise patient not to take drug in the evening because doing so may cause insomnia.
• Advise patient not to overindulge in tyramine-rich foods or beverages. If using a 9 mg/day or higher transdermal system, avoid these products all together.
• Advise patient to avoid liquids for 5 minutes before and after taking ODTs.
***Alert:*** Warn patient about the many drugs, including OTC drugs, that may interact with this drug and about the need to consult a pharmacist or his prescriber before using them.
• Teach patient and family the signs and symptoms of hypertensive crisis including severe headache, sore or stiff neck, nausea, vomiting, sweating, rapid heartbeat, dilated pupils, and photophobia.
**Black Box Warning** Advise family members to watch patient for anxiety, agitation, insomnia, irritability, hostility, and aggressiveness and to report these immediately to prescriber. ▮
• Tell patient to avoid exposing transdermal system to direct external heat sources, such as heating pads, electric blankets, hot tubs, heated water beds, and prolonged sunlight.
• Tell patient to stop using the transdermal system 10 days before having surgery requiring general anesthesia.
• Tell patient not to cut the transdermal system into smaller pieces.
• Advise women planning pregnancy or breast-feeding to first contact prescriber.

# sertaconazole nitrate

sir-tah-KAHN-uh-zole

Ertaczo

*Therapeutic class:* Antifungal
*Pharmacologic class:* Imidazole
*Pregnancy risk category C*

S

## AVAILABLE FORMS

*Topical cream:* 2%

## INDICATIONS & DOSAGES

➤ **Interdigital tinea pedis caused by *Trichophyton rubrum, Trichophyton mentagrophytes,* or *Epidermophyton floccosum* in immunocompetent patients**
*Adults and children age 12 and older:* Apply cream b.i.d. to affected areas between

toes and healthy surrounding areas for 4 weeks.

### ADMINISTRATION

**Topical**

- Avoid use of occlusive coverings.

### ACTION

May inhibit CYP-dependent synthesis of ergosterol. The lack of ergosterol in the cell membrane causes alterations in cell-wall permeability and osmotic instability, leading to fungal cell injury and death.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**Skin:** application site reaction, burning, contact dermatitis, dryness, erythema, hyperpigmentation, tenderness.

### INTERACTIONS

None known.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, its components, or other imidazoles.
- Use cautiously in pregnant or breast-feeding women.
- Efficacy and safety haven't been established for children younger than age 12.

### NURSING CONSIDERATIONS

- Before treatment starts, diagnosis should be confirmed by direct microscopic examination of infected tissue in potassium hydroxide solution or by culture on an appropriate medium.
- Use drug only on skin; not for ophthalmic, oral, or vaginal use.
- If condition hasn't improved after 2 weeks, review diagnosis.
- Stop drug if skin irritation or sensitivity develops.

### PATIENT TEACHING

- Warn patient to stop using drug if he develops increased irritation, redness, itching, burning, blistering, swelling, or oozing at site of application.
- Caution patient that drug is for external use on skin only. Discourage contact with eyes, nose, mouth, and other mucous membranes.
- If cream is to be applied after bathing, tell patient to dry affected area thoroughly before application.
- Tell patient to wash hands after applying cream.
- Urge patient to use drug for full duration of treatment, even if symptoms have improved.
- Instruct patient to notify prescriber if condition worsens or fails to improve.
- Caution patient to avoid occlusive coverings unless directed by prescriber.
- Teach patient proper foot hygiene.

## sertraline hydrochloride

SIR-trah-leen

Apo-Sertraline†, Zoloft℞

*Therapeutic class:* Antidepressant
*Pharmacologic class:* SSRI
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules †:* 25 mg, 50 mg, 100 mg
*Oral concentrate*:* 20 mg/ml
*Tablets:* 25 mg, 50 mg, 100 mg

### INDICATIONS & DOSAGES

➤ **Depression**

*Adults:* 50 mg P.O. daily. Adjust dosage as needed and tolerated; dosage range is 50 to 200 mg daily.

➤ **Obsessive-compulsive disorder**

*Adults:* 50 mg P.O. once daily. If patient doesn't improve, increase dosage, up to 200 mg daily.

*Children ages 6 to 17:* Initially, 25 mg P.O. daily in children ages 6 to 12, or 50 mg P.O. daily in adolescents ages 13 to 17. Increase dosage, as needed, up to 200 mg daily at intervals of no less than 1 week.

➤ **Panic disorder**
*Adults:* Initially, 25 mg P.O. daily. After 1 week, increase dose to 50 mg P.O. daily. If patient doesn't improve, increase dose to maximum of 200 mg daily.
➤ **Posttraumatic stress disorder**
*Adults:* Initially, 25 mg P.O. once daily. Increase dosage to 50 mg P.O. once daily after 1 week. Increase at weekly intervals to a maximum of 200 mg daily. Maintain patient on lowest effective dose.
➤ **Premenstrual dysphoric disorder**
*Adults:* Initially, 50 mg daily P.O. either continuously or only during the luteal phase of the menstrual cycle. If patient doesn't respond, dose may be increased 50 mg per menstrual cycle, up to 150 mg daily for use throughout the menstrual cycle or 100 mg daily for luteal-phase doses. If a 100-mg daily dose has been established with luteal-phase dose, use a 50-mg daily adjustment for 3 days at the beginning of each luteal phase.
➤ **Social anxiety disorder**
*Adults:* Initially, 25 mg P.O. once daily. Increase dosage to 50 mg P.O. once daily after 1 week of therapy. Dose range is 50 to 200 mg daily. Adjust to the lowest effective dosage and periodically reassess patient to determine the need for long-term treatment.
***Adjust-a-dose:*** For patients with hepatic disease, use lower or less-frequent doses.

## ADMINISTRATION

**P.O.**
- Give drug without regard for food.
- Don't use oral concentrate dropper, which is made of rubber, for a patient with latex allergy.
- Mix oral concentrate with 4 oz (118 ml) of water, ginger ale, lemon-lime soda, lemonade, or orange juice only, and give immediately.

## ACTION

Thought to be linked to drug's inhibition of CNS neuronal uptake of serotonin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 4–8 hr | Unknown |

*Half-life:* 26 hours.

## ADVERSE REACTIONS

**CNS:** *fatigue, headache, tremor, dizziness, insomnia, somnolence,* ***suicidal behavior,*** paresthesia, hypesthesia, nervousness, anxiety, agitation, hypertonia, pain.
**CV:** palpitations, chest pain, hot flashes.
**GI:** *dry mouth, nausea, diarrhea, loose stools, dyspepsia,* vomiting, constipation, thirst, flatulence, anorexia, abdominal pain, increased appetite.
**GU:** *male sexual dysfunction.*
**Musculoskeletal:** myalgia.
**Skin:** rash, pruritus, diaphoresis.

## INTERACTIONS

**Drug-drug.** *Amphetamines, buspirone, dextromethorphan, dihydroergotamine, lithium salts, meperidine, other SSRIs or SSNRIs (duloxetine, venlafaxine), sumatriptan,* ***tramadol****, trazodone, tricyclic antidepressants, tryptophan:* May increase the risk of serotonin syndrome. Avoid combinations of drugs that increase the availability of serotonin in the CNS; monitor patient closely if used together.
*Benzodiazepines, tolbutamide:* May decrease clearance of these drugs. Significance unknown; monitor patient for increased drug effects.
*Cimetidine:* May decrease clearance of sertraline. Monitor patient closely.
*Disulfiram:* Oral concentrate contains alcohol, which may react with drug. Avoid using together.
*MAO inhibitors, such as phenelzine, selegiline, tranylcypromine:* May cause serotonin syndrome or signs and symptoms resembling neuroleptic malignant syndrome. Avoid using within 14 days of MAO inhibitor therapy.
*Pimozide:* May increase pimozide level. Avoid using together.
*Triptans:* May cause serotonin syndrome (restlessness, hallucinations, loss of coordination, fast heartbeat, rapid changes in blood pressure, increased body temperature, hyperreflexia, nausea, vomiting, and diarrhea) or neuroleptic malignant syndrome–like reactions. Use cautiously, with close monitoring, especially at the start of treatment and during dosage adjustments.

S

*Warfarin, other highly protein-bound drugs:* May increase level of sertraline or other highly protein-bound drug. May increase PT, or INR may increase by 8%. Monitor patient closely; monitor PT and INR.
**Drug-herb.** *St. John's wort:* May cause additive effects and serotonin syndrome. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT and AST levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Contraindicated in patients taking pimozide or MAO inhibitors or within 14 days of MAO inhibitor therapy.
- Use cautiously in patients at risk for suicide and in those with seizure disorders, major affective disorder, or diseases or conditions that affect metabolism or hemodynamic responses.
- Use in third trimester of pregnancy may cause neonatal complications at birth. Consider the risk versus benefit of treatment during this time.

**Black Box Warning** Sertraline isn't approved for use in children except those with obsessive-compulsive disorder.

***Overdose S&S:*** Somnolence, vomiting, tachycardia, nausea, dizziness, agitation, tremor, bradycardia, bundle-branch block, coma, seizures, delirium, hallucinations, hypertension, hypotension, manic reactions, pancreatitis, prolonged QT interval, serotonin syndrome, stupor, syncope.

## NURSING CONSIDERATIONS

- Give sertraline once daily, either in morning or evening, with or without food.
- Make dosage adjustments at intervals of no less than 1 week.
- Record mood changes. Monitor patient for suicidal tendencies and allow only a minimum supply of drug.

**Black Box Warning** Drug may increase the risk of suicidal thinking and behavior in children, adolescents, and young adults with major depressive disorder or other psychiatric disorder.

- Don't use the oral concentrate dropper, which is made of rubber, for a patient with latex allergy.

***Alert:*** Combining triptans with an SSRI or an SSNRI may cause serotonin syndrome or neuroleptic malignant syndrome–like reactions. Signs and symptoms of serotonin syndrome may include restlessness, hallucinations, loss of coordination, fast heart beat, rapid changes in blood pressure, increased body temperature, overactive reflexes, nausea, vomiting, and diarrhea. Serotonin syndrome may be more likely to occur when starting or increasing the dose of triptan, SSRI, or SSNRI.

## PATIENT TEACHING

**Black Box Warning** Advise families and caregivers to closely observe patient for increased suicidal thinking and behavior.

- Advise patient to use caution when performing hazardous tasks that require alertness.
- Tell patient to avoid alcohol and to consult prescriber before taking OTC drugs.
- Advise patient to mix the oral concentrate with 4 oz (½ cup) of water, ginger ale, lemon-lime soda, lemonade, or orange juice only, and to take the dose right away.
- Instruct patient to avoid stopping drug abruptly.

## sevelamer carbonate

seh-VELL-ah-meer

Renvela

## sevelamer hydrochloride

Renagel

*Therapeutic class:* Hypophosphatemic
*Pharmacologic class:* Polymeric phosphate binder
*Pregnancy risk category C*

## AVAILABLE FORMS

**sevelamer carbonate**
*Oral suspension:* 0.8-g, 2.4-g packets
*Tablets (film-coated):* 800 mg
**sevelamer hydrochloride**
*Tablets (film-coated):* 400 mg, 800 mg

## INDICATIONS & DOSAGES

➤ **To control phosphorus level in chronic kidney disease patients on dialysis**

*Adults not taking a phosphate binder:* Initially, 800 to 1,600 mg (one to two 800-mg tablets or two to four 400-mg tablets) with each meal, based on phosphorus level. If phosphorus level is greater than 5.5 and less than 7.5 mg/dl, start with 800 mg t.i.d. with meals. If phosphorus level is greater than or equal to 7.5 and less than 9 mg/dl, start with two 800-mg tablets t.i.d., or three 400-mg tablets t.i.d. with meals. If phosphorus level is greater than or equal to 9 mg/dl, start with 1,600 mg t.i.d. (two 800-mg tablets or four 400-mg tablets) with meals.

*Adults switching from calcium acetate:* Initially, if taking one 667-mg calcium acetate tablet per meal, start with 800 mg per meal. If taking two 667-mg calcium acetate tablets per meal, start with two 800-mg tablets or three 400-mg tablets per meal. If taking three 667-mg calcium acetate tablets per meal, start with three 800-mg tablets or five 400-mg tablets per meal.

***Adjust-a-dose:*** If phosphorus level is greater than 5.5 mg/dl, increase by one tablet per meal at 2-week intervals. If phosphorus level is 3.5 to 5.5 mg/dl, maintain current dose. If phosphorus level is less than 3.5 mg/dl, decrease dose by one tablet per meal.

## ADMINISTRATION

**P.O.**

- Don't cut, crush, or allow patient to chew tablets.
- Mix powder packets with appropriate amount of water as directed. Stir mixture vigorously (it doesn't dissolve) and have patient drink entire preparation within 30 minutes.
- Give drug with meals.
- Drug may bind to other drugs and decrease their bioavailability. Give other drugs 1 hour before or 3 hours after this drug.
- Take special precautions when using antiarrhythmics or anticonvulsants with this drug.

## ACTION

Inhibits intestinal phosphate absorption and decreases phosphorus levels.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *headache, pain,* fever.
**CV:** *hypertension,* ***thrombosis.***
**GI:** *diarrhea, dyspepsia, vomiting, nausea,* constipation, flatulence.
**EENT:** *nasopharyngitis.*
**Musculoskeletal:** *limb pain, arthralgia,* back pain.
**Respiratory:** *bronchitis, dyspnea,* increased cough, upper respiratory infection.
**Skin:** *pruritus.*

## INTERACTIONS

**Drug-drug.** *Ciprofloxacin:* May decrease the effectiveness of ciprofloxacin. Give 1 hour before or 3 hours after sevelamer.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those with hypophosphatemia or bowel obstruction.
- Use cautiously in patient with dysphagia, swallowing disorders, severe GI motility disorders, or major GI tract surgery.

## NURSING CONSIDERATIONS

- Monitor calcium, bicarbonate, and chloride levels.
- Watch for symptoms of thrombosis (numbness or tingling of limbs, chest pain, shortness of breath), and notify prescriber if they occur.

## PATIENT TEACHING

- Instruct patient to take with meals and to adhere to prescribed diet.

***Alert:*** Inform patient that tablets must be taken whole because contents expand in water. Tell him not to cut, crush, or chew.

- Tell patient to take other drugs as directed, but they must be taken either 1 hour before or 3 hours after sevelamer.

S

● Inform patient about common adverse reactions. Teach patient signs and symptoms of thrombosis, such as numbness, tingling in arms or legs, or chest pain, and to report these immediately.

## sildenafil citrate (oral for erectile dysfunction)

sill-DEN-ah-fill

Revatio, Viagra

*Therapeutic class:* Erectile dysfunction drug
*Pharmacologic class:* Phosphodiesterase type-5 inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS

*Tablets:* 20 mg, 25 mg, 50 mg, 100 mg

### INDICATIONS & DOSAGES

➤ **Erectile dysfunction**

*Adults younger than age 65:* About 1 hour before sexual activity, 50 mg P.O., p.r.n. Dosage range is 25 to 100 mg based on effectiveness and tolerance. Maximum is 100 mg or one dose daily.
*Elderly patients (age 65 and older):* 25 mg P.O., as needed, about 1 hour before sexual activity. Dosage may be adjusted based on patient response. Maximum is one dose daily.
***Adjust-a-dose:*** For adults with hepatic or severe renal impairment, 25 mg P.O. about 1 hour before sexual activity. Dosage may be adjusted based on patient response. Maximum is one dose daily.

### ADMINISTRATION

**P.O.**

● For most rapid absorption, give to patient on empty stomach.

### ACTION

Increases effect of nitric oxide by inhibiting phosphodiesterase type 5 ($PDE_5$), which is responsible for degradation of cyclic guanosine monophosphate (cGMP) in the corpus cavernosum. When sexual stimulation causes local release of nitric oxide, inhibition of $PDE_5$ by sildenafil causes increased levels of cGMP in the corpus cavernosum, resulting in smooth muscle relaxation and inflow of blood to the corpus cavernosum.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 15–30 min | 30–120 min | 4 hr |

*Half-life:* 4 hours.

### ADVERSE REACTIONS

**CNS:** *headache,* ***seizures,*** anxiety, dizziness, somnolence, vertigo.
**CV:** ***MI, sudden cardiac death, ventricular arrhythmias, cerebrovascular hemorrhage, transient ischemic attack,*** hypotension, flushing.
**EENT:** diplopia, temporary vision loss, decrease or loss of hearing, tinnitus, ocular redness or bloodshot appearance, increased intraocular pressure, retinal vascular disease, retinal bleeding, vitreous detachment or traction, paramacular edema, photophobia, altered color perception, blurred vision, burning, swelling, pressure, nasal congestion.
**GI:** *dyspepsia,* diarrhea.
**GU:** hematuria, prolonged erection, priapism, UTI.
**Musculoskeletal:** arthralgia, back pain.
**Respiratory:** respiratory tract infection.
**Skin:** rash.
**Other:** flulike syndrome.

### INTERACTIONS

**Drug-drug.** *Beta blockers, loop and potassium-sparing diuretics:* May increase sildenafil metabolite level. Monitor patient.
*Cytochrome P-450 inducers, rifampin:* May reduce sildenafil level. Monitor effect.
*Delavirdine, protease inhibitors:* May increase sildenafil level, increasing risk of adverse events, including hypotension, visual changes, and priapism. Reduce initial sildenafil dose to 25 mg.
*Hepatic isoenzyme inhibitors (such as cimetidine, erythromycin, itraconazole, ketoconazole):* May reduce sildenafil clearance. Avoid using together.
*Isosorbide, nitroglycerin:* May cause severe hypotension. Use of nitrates in any form with sildenafil is contraindicated.
**Drug-food.** *Grapefruit:* May increase drug level, while delaying absorption. Advise patient to avoid using together.

*High-fat meal:* May reduce absorption rate and peak level of drug. Advise patient to take drug on empty stomach.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those taking organic nitrates.
- Use cautiously in patients age 65 and older; in patients with hepatic or severe renal impairment, retinitis pigmentosa, bleeding disorders, or active peptic ulcer disease; in those who have suffered an MI, a stroke, or life-threatening arrhythmia within last 6 months; in those with history of cardiac failure, coronary artery disease, uncontrolled high or low blood pressure, or anatomic deformation of the penis (such as angulation, cavernosal fibrosis, or Peyronie disease); and in those with conditions that may predispose them to priapism (such as sickle cell anemia, multiple myeloma, or leukemia).

### NURSING CONSIDERATIONS

***Alert:*** Systemic vasodilatory properties cause transient decreases in supine blood pressure and cardiac output (about 2 hours after ingestion).

***Alert:*** Serious CV events, including MI, sudden cardiac death, ventricular arrhythmias, cerebrovascular hemorrhage, transient ischemic attack, and hypertension, may occur with drug use. Most, but not all, of these incidents involve CV risk factors. Many events occur during or shortly after sexual activity; a few occur shortly after drug use without sexual activity, and others occur hours to days after drug use and sexual activity.

- Drug isn't indicated for use in neonates, children, or women.

### PATIENT TEACHING

- Advise patient that drug shouldn't be used with nitrates under any circumstances.
- Advise patient of potential cardiac risk of sexual activity, especially in presence of CV risk factors. Instruct patient to notify prescriber and refrain from further activity if such symptoms as chest pain, dizziness, or nausea occur when starting sexual activity.
- Warn patient that erections lasting longer than 4 hours and priapism (painful erections lasting longer than 6 hours) may occur, and tell him to seek immediate medical attention. Penile tissue damage and permanent loss of potency may result if priapism isn't treated immediately.
- Inform patient that drug doesn't protect against sexually transmitted diseases; advise patient to use protective measures such as condoms.
- Tell patient receiving HIV medications that he's at increased risk for sildenafil adverse events, including low blood pressure, visual changes, and priapism, and that he should promptly report such symptoms to his prescriber. Tell him not to exceed 25 mg of sildenafil in 48 hours.
- Instruct patient to take drug 30 minutes to 4 hours before sexual activity; maximum benefit can be expected less than 2 hours after ingestion.
- Advise patient that drug is most rapidly absorbed if taken on an empty stomach.
- Inform patient that impairment of color discrimination (blue, green) may occur and to avoid hazardous activities that rely on color discrimination.
- Instruct patient to notify prescriber of vision or hearing changes.
- Advise patient that drug is effective only in presence of sexual stimulation.
- Caution patient to take drug only as prescribed.

## sildenafil citrate (oral for pulmonary arterial hypertension)

sill-DEN-ah-fill

Revatio

*Therapeutic class:* Pulmonary vasodilator
*Pharmacologic class:* Cyclic guanosine monophosphate (cGMP)-specific phosphodiesterase type-5, or PDE5, inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS

*Injection:* 10 mg/12.5 ml single-use vials
*Tablets:* 20 mg

## INDICATIONS & DOSAGES

➤ **To improve exercise ability and delay clinical worsening in patients with World Health Organization group I pulmonary arterial hypertension (PAH)**

*Adults:* 20 mg P.O. t.i.d., 4 to 6 hours apart. Or 10 mg I.V. bolus t.i.d.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.
- Don't give to patients taking nitrates.

**I.V.**

▼ Inspect solution visually for particulate matter and discoloration before administering.

▼ Don't give to patients taking nitrates.

▼ Ten-milligram I.V. dose is equivalent to 20-mg oral dose.

## ACTION

Increases cGMP level by preventing its breakdown by phosphodiesterase, prolonging smooth muscle relaxation of the pulmonary vasculature, which leads to vasodilation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 15–30 min | 30–120 min | 4 hr |
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 4 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* dizziness, fever.
**CV:** *flushing,* hypotension.
**EENT:** blurred vision, burning, epistaxis, impaired color discrimination, photophobia, rhinitis, sinusitis.
**GI:** *dyspepsia,* diarrhea, gastritis.
**Musculoskeletal:** myalgia.
**Skin:** erythema.

## INTERACTIONS

**Drug-drug.** *Alpha blockers:* May cause symptomatic hypotension. Consider dosage reduction.
*Amlodipine:* May further reduce blood pressure. Monitor blood pressure closely.
*Bosentan:* May decrease sildenafil level. Monitor patient.
*CYP3A4 and CYP2C9 inducers, rifampin:* May reduce sildenafil level. Monitor effect.
*Hepatic isoenzyme inhibitors (such as cimetidine, erythromycin, itraconazole, ketoconazole):* May increase sildenafil level. Avoid using together.
*Isosorbide, nitroglycerin:* May cause severe hypotension. Use of nitrates in any form is contraindicated during therapy.
*Protease inhibitors (ritonavir):* May significantly increase sildenafil level. Don't use together.
*Vitamin K antagonists:* May increase risk of bleeding (primarily epistaxis). Monitor patient.
**Drug-food.** *Grapefruit:* May increase drug level, while delaying absorption. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those taking organic nitrates.
- Don't use in patients with pulmonary veno-occlusive disease.
- Use cautiously in patients with resting hypotension, severe left ventricular outflow obstruction, autonomic dysfunction, and volume depletion.
- Use cautiously in elderly patients; in patients with hepatic or severe renal impairment, retinitis pigmentosa, bleeding disorders, or active peptic ulcer disease; in those who have suffered an MI, stroke, or life-threatening arrhythmia in last 6 months; in those with history of coronary artery disease causing unstable angina or of uncontrolled high or low blood pressure; in those with deformation of the penis or with conditions that may cause priapism (such as sickle cell anemia, multiple myeloma, or leukemia); and in those taking bosentan.
- It's unknown if drug appears in breast milk. Use cautiously in breast-feeding women.
- Safety and efficacy in children haven't been established.

## NURSING CONSIDERATIONS

- The serious CV events linked to this drug's use in erectile dysfunction mainly involve patients with underlying CV disease

who are at increased risk for cardiac effects related to sexual activity.
- Patients with PAH caused by connective tissue disease are more prone to epistaxis during therapy than those with primary pulmonary hypertension.
- P.O. and I.V. doses aren't equivalent.
- I.V. use is for patients with PAH currently unable to take oral medications.

***Alert:*** Don't substitute Viagra for Revatio because there isn't an equivalent dose.

### PATIENT TEACHING
- Warn patient that drug should never be used with nitrates, or Viagra or other PDE5 inhibitors for erectile dysfunction.
- Advise patient to rise slowly from lying down.
- Inform patient that drug can be taken with or without food.
- Warn patient that discrimination between colors, such as blue and green, may become impaired during therapy; warn him to avoid hazardous activities that rely on color discrimination.
- Instruct patient to notify prescriber of decrease or loss of hearing, tinnitus, visual changes, dizziness, or fainting.
- Caution patient to take drug only as prescribed.

## silodosin
sigh-low-DOSE-in

Rapaflo

*Therapeutic class:* BPH drug
*Pharmacologic class:* $Alpha_1$ blocker
*Pregnancy risk category B*

### AVAILABLE FORMS
*Capsules:* 4 mg, 8 mg

### INDICATIONS & DOSAGES
➤ **To improve symptoms of BPH**
*Men:* 8 mg P.O once daily.
***Adjust-a-dose:*** For patients with creatinine clearance of 30 to 50 ml/minute, give 4 mg once daily.

### ADMINISTRATION
**P.O.**
- Give drug once daily with a meal.

### ACTION
Causes relaxation of smooth muscles in the prostate and bladder tissues by antagonizing postsynaptic $alpha_1$ adrenoreceptors, thereby improving urine flow and reducing signs and symptoms of BPH.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2.6 hr | Unknown |

*Half-life:* 5 to 21 hours.

### ADVERSE REACTIONS
**CNS:** asthenia, dizziness, headache, insomnia.
**CV:** orthostatic hypotension.
**EENT:** nasal congestion, nasopharyngitis, rhinorrhea, sinusitis.
**GI:** abdominal pain, diarrhea.
**GU:** *retrograde ejaculation.*

### INTERACTIONS
**Drug-drug.** *Alpha blockers:* May cause interactions. Avoid use together.
*Antihypertensives:* May cause dizziness and orthostatic hypotension. Use together cautiously and monitor patient for adverse reactions.
*Moderate CYP3A4 inhibitors (such as diltiazem, erythromycin, verapamil):* May increase silodosin level. Use together cautiously.
*Strong CYP3A4 inhibitors (such as clarithromycin, itraconazole, ketoconazole, ritonavir):* May increase silodosin level. Don't use together.
*Strong P-glycoprotein inhibitors (such as cyclosporine, ketoconazole):* May increase silodosin levels. Don't use together.

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients with severe renal or hepatic impairment and in those taking strong CYP3A4 inhibitors.

***Overdose S&S:*** Orthostatic hypotension.

### NURSING CONSIDERATIONS
- Because BPH and prostate cancer cause similar signs and symptoms, prostate cancer should be ruled out before the start of silodosin therapy.

- Monitor patient for orthostatic hypotension. Carefully monitor older patients for hypotension because risk of orthostatic hypotension increases with age.
- Don't use drug to treat hypertension.
- Current or previous use of an alpha blocker may predispose patient to floppy-iris syndrome during cataract surgery.

### PATIENT TEACHING

- Tell patient to take silodosin with the same meal each day.
- Warn patient about possible hypotension, and explain that it may cause dizziness.
- Caution patient against driving or operating hazardous machinery until drug's effects are known.
- If patient needs cataract surgery, advise him to inform ophthalmologist that he is taking or has taken silodosin.

## silver sulfadiazine

sul-fa-DYE-a-zeen

Dermazin†, Flamazine†, Silvadene, SSD, SSD AF, Thermazene

*Therapeutic class:* Antibacterial (topical)
*Pharmacologic class:* Broad-spectrum sulfonamide
*Pregnancy risk category B*

### AVAILABLE FORMS

*Cream:* 1%

### INDICATIONS & DOSAGES

➤ **To prevent or treat wound infection in second- and third-degree burns**

*Adults:* Apply 1/16-inch ribbon of cream to clean, debrided wound daily or b.i.d. Burn areas should be covered with cream at all times. Reapply to areas from which it has been removed by patient activity.

### ADMINISTRATION

**Topical**

- Use sterile application technique to prevent wound contamination.
- Discard darkened cream because drug is ineffective.
- This drug isn't for ophthalmic use.

### ACTION

Acts on cell membrane and cell wall; it's bactericidal for many gram-positive and gram-negative organisms.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**GU:** interstitial nephritis.
**Hematologic:** ***leukopenia.***
**Metabolic:** altered serum osmolality.
**Skin:** ***erythema multiforme,*** burning, pain, pruritus, rash, skin discoloration, skin necrosis.

### INTERACTIONS

**Drug-drug.** *Topical proteolytic enzymes:* May inactivate enzymes. Avoid using together.
**Drug-lifestyle.** *Sun exposure:* May cause photosensitivity. Advise patient to avoid excessive sun exposure.

### EFFECTS ON LAB TEST RESULTS

- May decrease WBC count.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with G6PD deficiency.
- Contraindicated in pregnant women at or near term and in premature or full-term neonates during first 2 months after birth. Drug may increase possibility of kernicterus.

***Alert:*** Use cautiously in patients hypersensitive to sulfonamides.

### NURSING CONSIDERATIONS

- Use drug only on affected areas. Keep these areas medicated at all times.
- Bathe patient daily, if possible.
- Inspect patient's skin daily, and note any changes. Notify prescriber if burning or excessive pain develops.
- Monitor sulfadiazine levels and renal function, and check urine for sulfa crystals in patients with extensive burns.
- Tell prescriber if hepatic or renal dysfunction occurs; drug may need to be stopped.

● Leukopenia usually resolves without intervention and doesn't always require stopping drug.
● Absorption of propylene glycol (contained in the cream) can interfere with serum osmolality.

### PATIENT TEACHING
● Instruct patient to promptly report adverse reactions, especially burning or excessive pain with application.
● Inform patient of need for frequent blood and urine tests to watch for adverse effects.
● Tell patient that he may develop sensitivity to the sun.
● Tell patient to continue treatment until satisfactory healing occurs or until site is ready for grafting.

## simethicone
sye-METH-ih-kone

Alka-Seltzer ◇, Flatulex ◇, Gas-Aid ◇, Gas Relief ◇, Gas-X ◇, Gas-X Extra Strength ◇, Genasyme ◇, Infacol† ◇, Maalox Anti-Gas Extra Strength ◇, Maalox Anti-Gas Regular Strength ◇, Mylanta Gas ◇, Mylanta Gas Relief Extra Strength ◇, Mylicon ◇, Ovol†, Ovol Drops†, Pediacol† ◇, Phazyme ◇, Phazyme-125 ◇, Phazyme-166 Maximum Strength ◇

*Therapeutic class:* Antiflatulent
*Pharmacologic class:* Polydimethylsiloxanes
*Pregnancy risk category C*

### AVAILABLE FORMS
*Capsules:* 125 mg ◇, 180 mg ◇
*Drops:* 40 mg/0.6 ml ◇
*Strips (orally disintegrating):* 62.5 mg ◇
*Tablets:* 40 mg ◇, 55 mg† ◇, 60 mg ◇, 80 mg ◇, 95 mg ◇, 125 mg ◇
*Tablets (chewable):* 80 mg ◇, 125 mg ◇

### INDICATIONS & DOSAGES
➤ **Flatulence, functional gastric bloating**
*Adults and children older than age 12:* 40 to 125 mg P.O. after each meal and at bedtime, up to 500 mg daily. For drops, 40 to 80 mg P.O. after each meal and at bedtime, up to 500 mg daily.
*Children ages 2 to 12:* 40 mg after meals and at bedtime, up to 240 mg daily.

### ADMINISTRATION
**P.O.**
● Shake drops well before giving.
● Fill the dropper to the ordered dosage level and then give slowly into the infant's mouth, toward the inner cheek.
● The dosage can also be mixed with 1 ounce of cool water, infant formula, or juice.

### ACTION
Disperses or prevents formation of mucus-surrounded gas pockets in the GI tract.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Immediate | Immediate | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS
**GI:** belching, flatus.

### INTERACTIONS
None significant.

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
● Contraindicated in patients hypersensitive to drug.
● For infant colic, safety is unknown.

### NURSING CONSIDERATIONS
● Drug doesn't prevent gas formation.
● ***Look alike–sound alike:*** Don't confuse simethicone with cimetidine.

### PATIENT TEACHING
● Tell patient to chew tablet before swallowing.
● Tell parent that drops may be mixed with 1 ounce of cool water, infant formula, or juice.
● Advise patient that changing positions often and walking will help pass flatus.

S

## simvastatin (synvinolin)

sim-va-STAH-tin

Zocor®

*Therapeutic class:* Antilipemic
*Pharmacologic class:* HMG-CoA reductase inhibitor
*Pregnancy risk category X*

### AVAILABLE FORMS

*Tablets:* 5 mg, 10 mg, 20 mg, 40 mg, 80 mg

### INDICATIONS & DOSAGES

➤ **To reduce risk of death from CV disease and CV events in patients at high risk for coronary events, to reduce total and LDL cholesterol, apolipoprotein B, and triglyceride levels, and increase HDL cholesterol level in patients with primary hyperlipidemia and mixed dyslipidemia; to reduce triglyceride levels; to reduce triglyceride levels and VLDL cholesterol level in patients with dysbetalipoproteinemia**

*Adults:* Initially, 20 to 40 mg P.O. daily in evening. In patients at high risk for a coronary heart disease event due to existing coronary heart disease, diabetes, peripheral vascular disease, or history of stroke, the recommended initial dose is 40 mg P.O. daily. Adjust dosage every 4 weeks based on patient tolerance and response. Maximum, 80 mg daily.

➤ **To reduce total and LDL cholesterol levels in patients with homozygous familial hypercholesterolemia**

*Adults:* 40 mg daily in evening; or, 80 mg daily in three divided doses of 20 mg in morning, 20 mg in afternoon, and 40 mg in evening.

➤ **Heterozygous familial hypercholesterolemia**

*Children ages 10 to 17:* Give 10 mg P.O. once daily in the evening. Maximum, 40 mg daily.

***Adjust-a-dose:*** For patients taking cyclosporine or danazol, begin with 5 mg P.O. simvastatin daily; don't exceed 10 mg P.O. simvastatin daily. In patients taking fibrates or niacin, maximum is 10 mg P.O. simvastatin daily. In patients taking amiodarone or verapamil, maximum is 20 mg P.O. simvastatin daily. In patients with severe renal insufficiency, start with 5 mg P.O. daily.

### ADMINISTRATION

**P.O.**

- Give drug in the evening.

### ACTION

Inhibits HMG-CoA reductase, an early (and rate-limiting) step in cholesterol biosynthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | Unknown |

*Half-life:* 3 hours.

### ADVERSE REACTIONS

**CNS:** asthenia, headache.
**GI:** abdominal pain, constipation, diarrhea, dyspepsia, flatulence, *nausea*, *vomiting*.
**Respiratory:** upper respiratory tract infection.

### INTERACTIONS

**Drug-drug.** *Amiodarone*, ***verapamil:*** May increase risk of myopathy and rhabdomyolysis. Don't exceed 20 mg simvastatin daily.

***Cyclosporine****, danazol, fibrates:* May increase risk of myopathy and rhabdomyolysis. Avoid using together; if unavoidable, monitor patient closely and don't exceed 10 mg simvastatin daily.

*Digoxin:* May slightly increase digoxin level. Closely monitor digoxin levels at the start of simvastatin therapy.

***Diltiazem:*** May decrease metabolism of HMG-CoA reductase inhibitor, increasing toxicity. Monitor patient for adverse effects and report unexplained muscle pain. Avoid simvastatin doses greater than 40 mg daily.

*Fluconazole, itraconazole, ketoconazole,* ***macrolides (azithromycin, clarithromycin, erythromycin, telithromycin):*** May increase simvastatin level and adverse effects. Avoid using together or, if it can't be avoided, suspend simvastatin therapy for course of treatment.

*Hepatotoxic drugs:* May increase risk for hepatotoxicity. Avoid using together.

***Nefazodone, protease inhibitors (amprenavir, atazanavir, indinavir, lopinavir and ritonavir, nelfinavir, ritonavir, saquinavir):*** May inhibit metabolism of simvastatin and increase the risk of adverse effects, including rhabdomyolysis. Avoid using together.
*Niacin:* May increase risk of myopathy and rhabdomyolysis with niacin dose of 1 g/day or more. Chinese patients are at particular risk and shouldn't receive simvastatin 80 mg with lipid-modifying dose of niacin-containing products.
*Warfarin:* May slightly enhance anticoagulant effect. Monitor PT and INR when therapy starts or dose is adjusted.
**Drug-herb.** *Eucalyptus, jin bu huan, kava:* May increase risk of hepatotoxicity. Discourage use together.
*Red yeast rice:* May increase risk of adverse events or toxicity because it contains similar components to those in drugs. Discourage use together.
**Drug-food.** *Grapefruit juice:* Large amounts (greater than 1 quart/day) may increase drug levels, increasing risk of adverse effects including myopathy and rhabdomyolysis. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May increase risk of hepatotoxicity. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, and CK levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with active liver disease or conditions that cause unexplained persistent elevations of transaminase levels.
- Contraindicated in pregnant and breast-feeding women and in women of childbearing age.
- Use cautiously in patients who consume large amounts of alcohol or have a history of liver disease.

## NURSING CONSIDERATIONS

- Patient should follow a diet restricted in saturated fat and cholesterol during therapy.
- Obtain liver function test results at start of therapy and then periodically. A liver biopsy may be performed if enzyme elevations persist.
- A daily dose of 40 mg significantly reduces risk of death from coronary heart disease, nonfatal MIs, stroke, and revascularization procedures.
- ***Look alike–sound alike:*** Don't confuse Zocor with Cozaar.

## PATIENT TEACHING

- Instruct patient to take drug in the evening.
- Teach patient about proper dietary management of cholesterol and triglycerides. When appropriate, recommend weight control, exercise, and smoking cessation programs.
- Tell patient to inform prescriber if adverse reactions occur, particularly muscle aches and pains or tenderness or weakness with malaise or fever.

***Alert:*** Tell woman to stop drug and notify prescriber immediately if she is or may be pregnant or if she's breast-feeding.

# sirolimus

sir-AH-lih-mus

Rapamune

*Therapeutic class:* Immunosuppressant
*Pharmacologic class:* Immunosuppressant
*Pregnancy risk category C*

## AVAILABLE FORMS

*Oral solution:* 1 mg/ml
*Tablets:* 0.5 mg, 1 mg, 2 mg

## INDICATIONS & DOSAGES

➤ **With cyclosporine and corticosteroids, to prevent organ rejection in patients receiving renal transplants**
*Adults and adolescents:* Initially, 6 mg P.O. as one-time dose as soon as possible after transplantation; then maintenance dose of 2 mg P.O. once daily. For patients with high immunologic risk, may give up to 15 mg P.O. on day 1 after transplantation, then 5 mg/day P.O. beginning on day 2 after transplantation.

Maximum daily dose shouldn't exceed 40 mg. If a daily dose exceeds 40 mg due to a loading dose, give the loading dose over

2 days. Monitor trough concentrations at least 3 to 4 days after a loading dose.
*Children age 13 and older who weigh less than 40 kg (88 lb):* First dose is 3 mg/m$^2$ P.O. as one-time dose after transplantation; then 1 mg/m$^2$ P.O. once daily.
***Adjust-a-dose:*** For patients with mild to moderate hepatic impairment, reduce maintenance dose by about one-third. It isn't necessary to reduce loading dose. Two to 4 months after transplant in patients with low to moderate risk of graft rejection, taper off cyclosporine over 4 to 8 weeks. While tapering cyclosporine, adjust sirolimus dose every 1 to 2 weeks to obtain levels between 12 and 24 nanograms/ml. Base dosage adjustments on clinical status, tissue biopsies, and laboratory findings.

## ADMINISTRATION

**P.O.**

- Give drug consistently either with or without food.
- Patients should swallow tablets whole. Don't crush or split tablets.
- Dilute oral solution before use. After dilution, use immediately and discard oral solution syringe.
- When diluting oral solution, empty correct amount into glass or plastic (not Styrofoam) container holding at least ¼ cup (60 ml) of either water or orange juice. Don't use grapefruit juice or any other liquid. Stir vigorously and have patient drink immediately. Refill container with at least ½ cup (120 ml) of water or orange juice, stir again, and have patient drink all contents.
- A slight haze may develop during refrigeration, which doesn't affect potency of drug. If haze develops, bring to room temperature and shake until haze disappears.
- Store away from light, and refrigerate at 36° to 46° F (2° to 8° C). After opening bottle, use contents within 1 month. If needed, store bottles and pouches at room temperature (up to 77° F [25° C]) for several days. Drug may be kept in oral syringe for 24 hours at room temperature.

## ACTION

Inhibits T-cell activation and proliferation that occurs in response to antigenic and cytokine stimulation. Also inhibits antibody formation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–3 hr | Unknown |

*Half-life:* About 62 hours.

## ADVERSE REACTIONS

**CNS:** *fever, headache.*
**CV:** *chest pain, edema, hypertension, peripheral edema,* tachycardia, ***thrombosis.***
**EENT:** epistaxis.
**GI:** *abdominal pain, constipation, diarrhea, nausea,* ascites.
**GU:** *UTI,* ***toxic nephropathy,*** dysuria, glycosuria, hematuria, *hemolytic uremic syndrome, polynephritis.*
**Hematologic:** *anemia,* **THROMBOCYTOPENIA,** ***leukopenia, thrombotic thrombocytopenia purpura,*** ecchymosis.
**Hepatic:** ***hepatic artery thrombosis, hepatotoxicity.***
**Metabolic:** *hypercholesteremia,* **HYPERKALEMIA,** *hyperlipidemia, hypokalemia, hypophosphatemia,* ***hypoglycemia, acidosis, diabetes mellitus,*** dehydration, hypercalcemia, hyperglycemia.
**Musculoskeletal:** *arthralgia, back pain,* bone necrosis, myalgia.
**Respiratory:** *atelectasis, cough, dyspnea, upper respiratory tract infection,* ***interstitial lung disease, asthma,*** bronchitis, ***hypoxia,*** lung edema, pleural effusion, pneumonia.
**Skin:** *acne, rash,* fungal dermatitis, pruritus, ***melanoma, squamous cell carcinoma, basal cell carcinoma.***
**Other:** ***sepsis,*** abnormal healing, including fascial dehiscence and anastomotic disruption (wound, vascular, airway, ureteral, biliary), abscess, flu syndrome, infection, lymphadenopathy, lymphocele, hypersensitivity reactions, ***angioedema,*** herpes simplex, herpes zoster.

## INTERACTIONS

**Drug-drug.** *Aminoglycosides, amphotericin B, other nephrotoxic drugs:* May increase risk of nephrotoxicity. Use with caution.
*Bromocriptine, cimetidine, clarithromycin, clotrimazole, danazol, erythromycin, fluconazole, indinavir, itraconazole, metoclopramide, nicardipine, ritonavir, verapamil,*

*other drugs that inhibit CYP3A4:* May increase blood levels of sirolimus. Monitor sirolimus levels closely.
*Carbamazepine, phenobarbital, phenytoin, rifabutin, rifapentine, other drugs that induce CYP3A4:* May decrease blood levels of sirolimus. Monitor patient closely.
***Cyclosporine:*** May increase sirolimus level and toxicity. Give sirolimus 4 hours after cyclosporine; monitor levels and adjust dose, as needed.
*Diltiazem:* May increase sirolimus levels. Monitor sirolimus level, as needed.
*HMG-CoA reductase inhibitors or fibrates:* May increase risk of rhabdomyolysis with the combination of sirolimus and cyclosporine. Monitor patient closely.
*Ketoconazole:* May increase rate and extent of sirolimus absorption. Avoid using together.
*Live-virus vaccines:* May reduce vaccine effectiveness. Avoid using together.
*Rifampin:* May decrease sirolimus level. Alternative therapy to rifampin may be prescribed.
**Drug-herb.** *St. John's wort:* May decrease sirolimus levels. Discourage use together.
**Drug-food.** *Grapefruit juice:* May decrease drug metabolism. Discourage use together.
**Drug-lifestyle.** *Sun exposure:* May increase risk of skin cancer. Advise patient to avoid sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN, creatinine, liver enzyme, cholesterol, and lipid levels. May increase or decrease phosphate, potassium, and glucose levels.
- May increase RBC count. May decrease platelet count. May increase or decrease WBC count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to active drug, its derivatives, or components of product.
- Use cautiously in patients with hyperlipidemia and impaired liver or renal function.

**Black Box Warning** Safety and effectiveness of sirolimus as immunosuppressive therapy haven't been established in liver or lung transplant patients. ■

***Overdose S&S:*** Exaggerated adverse effects.

## NURSING CONSIDERATIONS

**Black Box Warning** Using this drug with tacrolimus or cyclosporine may cause hepatic artery thrombosis, leading to graft loss and death in liver transplant patients. ■

**Black Box Warning** Only those experienced in immunosuppressive therapy and management of renal transplant patients should prescribe drug. ■

***Alert:*** Drugs causing immunosuppression increase the risk of opportunistic infections, including activation of latent viral infections such as BK virus–associated neuropathy, which may lead to serious outcomes, including kidney graft loss.

***Alert:*** This drug has been associated with angioedema; using it with ACE inhibitors increases the risk. Monitor the patient closely.

- Use drug in regimen with cyclosporine and corticosteroids; have patient take drug 4 hours after cyclosporine dose.
- Cyclosporine withdrawal in patients with high risk of graft rejection isn't recommended. This includes patients with Banff grade III acute rejection or vascular rejection before cyclosporine withdrawal, those who are dialysis dependent, those with serum creatinine level greater than 4.5 mg/dl, black patients, patients with retransplants or multiorgan transplants, and patients with high panel of reactive antibodies.
- After transplantation, give antimicrobial prophylaxis for *Pneumocystis jiroveci (carinii)* for 1 year and for cytomegalovirus for 3 months.

**Black Box Warning** Patients taking drug are more susceptible to infection and lymphoma. ■

- Monitor renal function tests because use with cyclosporine may cause creatinine level to increase. Adjustment of immunosuppressive regimen may be needed.
- Monitor cholesterol and triglyceride levels. Treatment with lipid-lowering drugs during therapy isn't uncommon. If hyperlipidemia is detected, additional interventions, such as diet and exercise, should begin.

S

- Check for rhabdomyolysis.
- Monitor drug levels in patients age 13 and older who weigh less than 40 kg (88 lb), patients with hepatic impairment, those also receiving drugs that induce or inhibit CYP3A4, and patients in whom cyclosporine dosing is markedly reduced or stopped.
- Monitor patient for impaired or delayed wound healing, including wound dehiscence, and fluid accumulation, including edema, lymphedema, pleural effusion, ascites, and pericardial effusion.

## PATIENT TEACHING

- Teach patient how to properly store, dilute, and give drug.
- Advise woman about risks during pregnancy. Tell her to use effective contraception before and during therapy and for 12 weeks after stopping therapy.
- Tell patient to take drug consistently with or without food to minimize absorption variability.
- Tell patient to take drug 4 hours after cyclosporine to avoid drug interactions.
- Advise patient to wash area with soap and water if drug solution touches skin or mucous membranes.

**SAFETY ALERT!**

# sitagliptin phosphate

sit-ah-GLIP-ten

Januvia

*Therapeutic class:* Antidiabetic
*Pharmacologic class:* Dipeptidyl peptidase-4 (DPP-4) enzyme inhibitor
*Pregnancy risk category B*

## AVAILABLE FORMS

*Tablets:* 25 mg, 50 mg, 100 mg

## INDICATIONS & DOSAGES

➤ **To improve glycemic control in type 2 diabetes, alone or with metformin or a thiazolidinedione**

*Adults:* 100 mg P.O. once daily.

***Adjust-a-dose:*** For patients with creatinine clearance of 30 to 49 ml/minute, give 50 mg once daily; for patients with clearance less than 30 ml/minute or end-stage renal disease with hemodialysis or peritoneal dialysis, give 25 mg once daily. Give without regard to timing of dialysis session.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.

## ACTION

Inhibits DPP-4, an enzyme that rapidly inactivates incretin hormones, which play a part in the body's regulation of glucose. By increasing and prolonging active incretin levels, the drug helps to increase insulin release and decrease circulating glucose.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 1–4 hr | Unknown |

*Half-life:* About 12½ hours.

## ADVERSE REACTIONS

**CNS:** headache.
**EENT:** nasopharyngitis.
**GI:** abdominal pain, nausea, diarrhea.
**Metabolic:** ***hypoglycemia.***
**Respiratory:** upper respiratory tract infection.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

- May increase creatinine level.
- May increase WBC count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with type 1 diabetes or diabetic ketoacidosis.
- Contraindicated in patients with a history of hypersensitivity to sitagliptin.
- Use cautiously in patients with moderate to severe renal insufficiency or a history of pancreatitis and in those taking other antidiabetics.
- Safety and effectiveness of drug in children haven't been evaluated.

## NURSING CONSIDERATIONS

- In elderly patients and those at risk for renal insufficiency, periodically assess renal function.

• Monitor glycosylated hemoglobin level periodically to assess long-term glycemic control.
• Management of type 2 diabetes should include diet control. Because caloric restrictions, weight loss, and exercise help improve insulin sensitivity and help make drug therapy effective, these measures are essential for proper diabetes management.
• Watch for hypoglycemia, especially in patients receiving combination therapy.
• ***Look alike–sound alike:*** Don't confuse sitagliptin with saxagliptin.

## PATIENT TEACHING

• Tell patient that drug isn't a substitute for diet and exercise and that it's important to follow a prescribed dietary and physical activity routine and to monitor his glucose levels.
• Inform patient and family members of the signs and symptoms of hyperglycemia and hypoglycemia and the steps to take if these symptoms occur.
• Provide patient with information on complications associated with diabetes and ways to assess for them.
• Tell patient to notify prescriber during periods of stress, such as fever, infection, or surgery; dosage may need adjustment.
• Tell patient drug may be taken without regard for food.

# sodium bicarbonate

Arm & Hammer Baking Soda ◇, Neut, Soda Mint ◇

*Therapeutic class:* Antacid
*Pharmacologic class:* Alkalinizer
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 4% (2.4 mEq/5 ml), 4.2% (5 mEq/10 ml), 5% (297.5 mEq/500 ml), 7.5% (8.92 mEq/10 ml and 44.6 mEq/50 ml), 8.4% (10 mEq/10 ml and 50 mEq/50 ml)
*Powder:* 30 mg/½ tsp ◇
*Tablets:* 325 mg ◇, 650 mg ◇

## INDICATIONS & DOSAGES

➤ **Metabolic acidosis**
*Adults and children:* Dosage depends on blood carbon dioxide content, pH, and patient's condition; usually, 2 to 5 mEq/kg I.V. infused over 4- to 8-hour period. Or 7,800 mg to 15,600 mg (12 to 24 650-mg tablets) dissolved in 1 to 2 L of water and consumed over 1 hour.

➤ **Urinary alkalinization**
*Adults:* Initially, 3,900 mg P.O.; then 1,300 mg to 2,600 mg every 4 hours; dosage based on urine pH.

➤ **Antacid**
*Adults and children older than age 6:* 300 mg to 2 g P.O. up to q.i.d. taken with glass of water. Or 30 mg (½ tsp) oral powder in 120 ml water every 2 hours up to 6 doses daily for patients under age 60, or 3 doses daily for patients over age 60.

➤ **Cardiac arrest**
*Adults:* Administer according to results of arterial blood pH, partial pressure of arterial carbon dioxide, and calculated base deficit. Usual dose is 200 to 300 mEq of bicarbonate given as 7.5% or 8.4% solution. Then redetermine serum pH and bicarbonate concentration.
*Children younger than age 2:* 1 mEq/kg (1 ml/kg of 8.4% solution) I.V. slowly followed by 1 mEq/kg every 10 minutes of arrest. Don't give more than 8 mEq/kg I.V. total; a 4.2% solution may be preferred.

➤ **Prevention of contrast media nephrotoxicity ♦**
*Adults:* 154 mEq/L at 3 ml/kg/hour I.V. for 1 hour before contrast administration, followed by an infusion of 1 ml/kg/hour for 6 hours after the procedure.

## ADMINISTRATION

**P.O.**
• Not for use with sodium-restricted diet.
• May be given without regard to meals.

**I.V.**
▼ Drug isn't routinely used in cardiac arrest because it may produce a paradoxical acidosis from carbon dioxide production. It shouldn't be routinely given during the early stages of resuscitation unless acidosis is clearly present.

S

▼ The 4% form is usually used for neutralizing I.V. drugs such as erythromycin. Consult pharmacist before use.
▼ Flush I.V. line thoroughly between medications.
▼ **Incompatibilities:** Alcohol 5% in dextrose 5%; allopurinol; amino acids; amiodarone; amobarbital; amphotericin B; ascorbic acid injection; atropine; bupivacaine; calcium salts; carbenicillin; carboplatin; carmustine; cefotaxime; chlorpromazine; ciprofloxacin; cisatracurium; cisplatin; codeine; corticotropin; dextrose 5% in lactated Ringer's injection; diazepam; diltiazem; dobutamine; dopamine; doxapram; doxorubicin liposomal; doxycycline; epinephrine hydrochloride; fat emulsion 10%; fenoldopam; glycopyrrolate; hetastarch; hydromorphone; idarubicin; imipenem-cilastatin sodium; inamrinone; Ionosol B, D, or G with invert sugar 10%; isoproterenol; labetalol; lactated Ringer's injection; levorphanol; leucovorin calcium; lidocaine; magnesium sulfate; meperidine; meropenem; metaraminol; methylprednisolone sodium succinate; metoclopramide; midazolam; morphine sulfate; MVI-12 multivitamin; nafcillin; nalbuphine; nitrofurantoin; norepinephrine bitartrate; ondansetron; oxacillin; penicillin G potassium; pentazocine lactate; pentobarbital sodium; procaine; Ringer's injection; sargramostim; 1/6 M sodium lactate; streptomycin; succinylcholine; thiopental; ticarcillin disodium and clavulanate potassium; vancomycin; verapamil; vinca alkaloids; vitamin B complex with vitamin C. Drug inactivates catecholamines, such as norepinephrine, dobutamine, and dopamine, and it forms precipitate with calcium. Don't mix with these drugs, and flush line thoroughly.

## ACTION

Restores buffering capacity of the body and neutralizes excess acid.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |
| I.V. | Immediate | Immediate | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** tetany.
**CV:** edema.
**GI:** gastric distention, belching, flatulence.
**Metabolic:** hypokalemia, ***metabolic alkalosis,*** hypernatremia, hyperosmolarity with overdose.
**Skin:** pain and irritation at injection site.

## INTERACTIONS

**Drug-drug.** *Anorexiants, flecainide, mecamylamine, methenamine, quinidine, sympathomimetics:* May decrease renal clearance of these drugs and increase risk of toxicity. Monitor patient closely for toxicity. *Chlorpropamide, lithium, methotrexate, salicylates, tetracycline:* May increase urine alkalinization, increase renal clearance of these drugs, and decrease their effect. Monitor patient closely for drug's effect. *Enteric-coated drugs:* May be released prematurely in stomach. Avoid using together. *Ketoconazole:* May decrease ketoconazole absorption. Separate use by at least 2 hours.

## EFFECTS ON LAB TEST RESULTS

- May increase sodium and lactate levels.
- May decrease potassium level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with metabolic or respiratory alkalosis and in those with hypocalcemia in which alkalosis may produce tetany, hypertension, seizures, or heart failure.
- Contraindicated in patients losing chloride because of vomiting or continuous GI suction and in those receiving diuretics that produce hypochloremic alkalosis. Oral drug is contraindicated for acute ingestion of strong mineral acids.
- Use with caution in patients with renal insufficiency, heart failure, or other edematous or sodium-retaining condition.

***Overdose S&S:*** Alkalosis, hyperirritability, tetany.

## NURSING CONSIDERATIONS

- To avoid risk of alkalosis, obtain blood pH, partial pressure of arterial oxygen, partial pressure of arterial carbon dioxide, and electrolyte levels. Tell prescriber laboratory results.

### PATIENT TEACHING

● Tell patient not to take drug with milk because doing so may cause high levels of calcium in the blood, abnormally high alkalinity in tissues and fluids, or kidney stones.

**SAFETY ALERT!**

## sodium chloride

Slo-Salt

*Therapeutic class:* Electrolyte replacement
*Pharmacologic class:* Sodium salt
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* Half-normal saline solution 25 ml, 50 ml, 150 ml, 250 ml, 500 ml, 1,000 ml; normal saline solution 2 ml, 3 ml, 5 ml, 10 ml, 20 ml, 25 ml, 30 ml, 50 ml, 100 ml, 150 ml, 250 ml, 500 ml, 1,000 ml; 3% sodium chloride solution 500 ml; 5% sodium chloride solution 500 ml; 14.6% sodium chloride solution 20 ml, 40 ml, 200 ml; 23.4% sodium chloride solution 30 ml, 50 ml, 100 ml, 200 ml
*Tablets:* 650 mg, 1 g, 2.25 g ◇
*Tablets (slow-release):* 600 mg ◇

### INDICATIONS & DOSAGES

➤ **Fluid and electrolyte replacement in hyponatremia caused by electrolyte loss or in severe salt depletion**

*Adults:* Dosage is individualized. Use 3% or 5% solution only with frequent electrolyte level determination and only slow I.V. Don't exceed 100 ml/hour or 400 ml/24 hour. For 0.45% solution, dose according to deficiencies, over 18 to 24 hours. For 0.9% solution, dose according to deficiencies, over 18 to 24 hours.

➤ **Prevention of heat prostration**

*Adults:* 1 g P.O. with each glass of water, or as directed by prescriber.

### ADMINISTRATION

**P.O.**

● For treatment of heat cramps, give dose with each glass of water.

**I.V.**

▼ Don't confuse 14.6% form with 23.4% form when adding to parenteral nutrient solutions with normal saline solution for injection, and never give without diluting. Read label carefully.
▼ Infuse 3% and 5% solutions slowly and cautiously to avoid pulmonary edema. Use only for critical situations, and observe patient continually. Infuse through central line, if possible.
▼ In neonates, never use the bacteriostatic injection.
▼ If infusing peripherally, infuse into the largest vein possible, using a well-placed small-bore needle to prevent pain. Infuse slowly.
▼ **Incompatibilities:** Amphotericin B, chlordiazepoxide, diazepam, fat emulsion, mannitol, methylprednisolone sodium succinate, phenytoin sodium.

### ACTION

Replaces sodium and chloride and maintains levels.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |
| I.V. | Immediate | Immediate | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CV:** ***aggravation of heart failure,*** thrombophlebitis, edema when given too rapidly or in excess.
**Metabolic:** hypernatremia, ***aggravation of existing metabolic acidosis with excessive infusion.***
**Respiratory:** ***pulmonary edema.***
**Skin:** local tenderness, tissue necrosis at injection site.
**Other:** abscess.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

● May increase sodium level. May decrease potassium level.
● May cause electrolyte imbalance.

S

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with conditions in which sodium and chloride administration is detrimental.
- Sodium chloride 3% and 5% injections contraindicated in patients with increased, normal, or only slightly decreased electrolyte levels.
- Use cautiously in elderly or postoperative patients and in patients with preeclampsia, heart failure, circulatory insufficiency, renal dysfunction, or hypoproteinemia.

***Overdose S&S:*** Water retention, edema, loss of potassium, acidosis.

## NURSING CONSIDERATIONS

- Monitor electrolyte levels.

## PATIENT TEACHING

- Explain use and administration of drug to patient and family.
- Tell patient to report adverse reactions promptly.

***Alert:*** Tell elderly patients and patients with heart failure, circulatory insufficiency, renal dysfunction, or malnutrition to consult prescriber before taking OTC tablets.

- Advise patient to follow prescriber or product label directions carefully.
- Tell patient that wax matrix of slow-release tablets may appear in stool.

# sodium ferric gluconate complex

Ferrlecit

*Therapeutic class:* Iron supplement
*Pharmacologic class:* Macromolecular iron complex; hematinic
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 62.5 mg elemental iron (12.5 mg/ml) in 5-ml ampules

## INDICATIONS & DOSAGES

➤ **Iron deficiency anemia in patients receiving long-term hemodialysis and supplemental erythropoietin**

*Adults:* 10 ml (125 mg elemental iron) I.V. over 1 hour. Most patients need minimum cumulative dose of 1 g elemental iron given over more than eight sequential dialysis treatments to achieve a favorable hemoglobin or hematocrit response.

*Children age 6 and older:* 1.5 mg/kg (maximum 125 mg) I.V. over 1 hour during 8 consecutive hemodialysis treatments.

## ADMINISTRATION

**I.V.**

▼ Drug contains benzyl alcohol. Don't use in neonates.

▼ For adults, dilute in 100 ml normal saline solution; for children, dilute in 25 ml normal saline solution. Give immediately over 1 hour.

▼ Alternatively, give undiluted at a rate not to exceed 1 ml/minute (12.5 mg/minute) at the end of dialysis.

▼ Life-threatening hypersensitivity reactions, such as CV collapse, cardiac arrest, bronchospasm, oral or pharyngeal edema, dyspnea, angioedema, urticaria, and pruritus—sometimes linked to pain and muscle spasm of chest or back—may occur during infusion. Have adequate supportive measures readily available. Monitor patient closely during infusion.

▼ After rapid administration, profound hypotension with flushing, light-headedness, malaise, fatigue, weakness, or severe chest, back, flank, or groin pain may occur; these symptoms aren't hypersensitivity reactions. Monitor patient closely during infusion.

▼ **Incompatibilities:** Other I.V. drugs. Don't add drug to parenteral nutrition solutions for infusion.

## ACTION

Restores total body iron content, which is critical for normal hemoglobin synthesis and oxygen transport.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Varies | Unknown |

*Half-life:* 1 hour in healthy, iron-deficient adults.

## ADVERSE REACTIONS

**CNS:** asthenia, headache, fatigue, malaise, *dizziness*, paresthesia, agitation, insomnia, somnolence, syncope, pain, chills, fever.

**CV:** *hypotension, hypertension,* tachycardia, ***bradycardia,*** angina, chest pain, ***MI,*** edema, flushing.
**EENT:** conjunctivitis, abnormal vision, rhinitis.
**GI:** *nausea, vomiting, diarrhea,* rectal disorder, dyspepsia, eructation, flatulence, melena, abdominal pain.
**GU:** urinary tract infection.
**Hematologic:** anemia.
**Metabolic:** ***hyperkalemia, hypoglycemia,*** hypokalemia, hypervolemia.
**Musculoskeletal:** myalgia, arthralgia, back pain, arm pain, *cramps.*
**Respiratory:** *dyspnea,* coughing, upper respiratory tract infection, pneumonia, pulmonary edema.
**Skin:** pruritus, increased sweating, rash, *injection site reaction.*
**Other:** infection, rigors, flu syndrome, ***sepsis, carcinoma,*** hypersensitivity reactions, lymphadenopathy.

## INTERACTIONS

**Drug-drug.** *ACE inhibitors:* May cause sensitivity reactions. Stop I.V. iron if sensitivity reactions occur.
*Oral iron preparations:* May reduce absorption of oral iron preparations. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

- May decrease glucose and hemoglobin levels. May increase or decrease potassium level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components (such as benzyl alcohol) and in those with iron overload or anemias not related to iron deficiency.
- Don't use in patients with ferritin levels greater than 1,000 nanograms/ml.
- Use cautiously in elderly patients.

***Overdose S&S:*** Abdominal pain, diarrhea, vomiting, pallor or cyanosis, lassitude, drowsiness, hyperventilation, cardiovascular collapse.

## NURSING CONSIDERATIONS

***Alert:*** Dosage is expressed in milligrams of elemental iron.

- Drug shouldn't be used in patients with iron overload, which often occurs in hemoglobinopathies and other refractory anemias.
- Monitor ferritin level, iron saturation, hemoglobin level, and hematocrit.
- In hemodialysis patients, adverse reactions may be related to dialysis itself or to chronic renal failure.
- Check with patient about other potential sources of iron, such as OTC iron preparations and iron-containing multiple vitamins with minerals.

## PATIENT TEACHING

- Abdominal pain, diarrhea, vomiting, drowsiness, and rapid breathing may indicate iron poisoning. Urge patient to notify prescriber immediately.

# sodium phosphate monohydrate and sodium phosphate dibasic anhydrous

OsmoPrep, Visicol

*Therapeutic class:* Laxative
*Pharmacologic class:* Osmotic laxative
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 1.5 g sodium phosphate (1.102 g sodium phosphate monohydrate and 0.398 g sodium phosphate dibasic anhydrous)

## INDICATIONS & DOSAGES

➤ **To cleanse the bowel before colonoscopy (Visicol)**

*Adults age 18 and older:* 40 tablets taken in the following manner: The evening before the procedure, 3 tablets P.O. with at least 8 ounces of clear liquid every 15 minutes, for a total of 20 tablets. The last dose will be only 2 tablets. The day of the procedure, 3 tablets P.O. with at least 8 ounces of clear liquid every 15 minutes, for a total of 20 tablets, starting 3 to 5 hours before the procedure. The last dose will be only 2 tablets.

S

➤ **To cleanse the bowel before colonoscopy (OsmoPrep)**
*Adults age 18 and older:* 32 tablets taken in the following manner: The evening before the procedure 4 tablets P.O. with 8 ounces of clear liquid every 15 minutes for a total of 20 tablets. 3 to 5 hours before the procedure take 4 tablets P.O. with at least 8 ounces of clear liquid every 15 minutes for a total of 12 tablets.

## ADMINISTRATION

**P.O.**
- Give each dose with at least 8 ounces of clear liquid.

## ACTION

Induces diarrhea by causing large amounts of water to be drawn into the colon, promoting rapid and effective evacuation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | Varies | 1–3 hr |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** dizziness, headache.
**GI:** abdominal bloating, abdominal pain, nausea, vomiting.

## INTERACTIONS

**Drug-drug.** *Any drugs:* Reduces absorption of these drugs. Separate doses.

## EFFECTS ON LAB TEST RESULTS

- May increase phosphorus level (typically normalizes 48 to 72 hours after giving drug). May decrease potassium and calcium levels.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Drug has been linked to permanent renal impairment, especially in patients older than age 55; in those with hypovolemia, bowel obstruction, active colitis, or baseline kidney disease; and in patients taking drugs that affect kidney function.

- Contraindicated in patients hypersensitive to sodium phosphate or any of its ingredients. Avoid giving drug to patients with heart failure, ascites, unstable angina, gastric retention, ileus, acute intestinal obstruction, pseudo-obstruction, severe chronic constipation, bowel perforation, acute colitis, toxic megacolon, or hypomotility syndrome (hypothyroidism, scleroderma).
- Use cautiously in patients with a history of electrolyte abnormalities, current electrolyte abnormalities, or impaired renal function. Also use cautiously in patients who take drugs that can induce electrolyte abnormalities or prolong the QT interval.
- Use cautiously in elderly patients because they may be more sensitive to drug effects.

## NURSING CONSIDERATIONS

- Correct electrolyte imbalances before giving drug.
- As with other sodium phosphate cathartic preparations, this drug may induce colonic mucosal ulceration.
- Monitor patient for signs of dehydration.
- Don't repeat administration within 7 days.
- No enema or laxative is needed in addition to drug. Patients shouldn't take any additional purgatives, particularly those that contain sodium phosphate.

***Alert:*** Administration of other sodium phosphate products has caused death from significant fluid shifts, electrolyte abnormalities, and cardiac arrhythmias. Patients with electrolyte disturbances have an increased risk of prolonged QT interval. Use drug cautiously in patients who are taking other drugs known to prolong the QT interval.

## PATIENT TEACHING

- Urge patient to drink at least 8 ounces of clear liquid with each dose. Inadequate fluid intake may lead to excessive fluid loss and hypovolemia.
- Tell patient to drink only clear liquids for at least 12 hours before starting the purgative regimen.
- Caution patient against taking an additional enema or laxative, particularly one that contains sodium phosphate. Warn patient to take drug only as prescribed.
- Tell patient that undigested or partially digested Visicol or OsmoPrep tablets and other drugs may appear in the stool.

# sodium phosphates

Fleet Enema ◇, Pedialax

*Therapeutic class:* Laxative
*Pharmacologic class:* Acid salt
*Pregnancy risk category NR*

## AVAILABLE FORMS

*Enema:* 9.5 g sodium phosphate and 3.5 g sodium phosphate hepta hydrate/66 ml, 160 mg/ml sodium phosphate and 60 mg/ml sodium biphosphate ◇

## INDICATIONS & DOSAGES

➤ **Constipation**

*Adults and children age 12 and older:* 133 ml (1 bottle) Fleet Enema P.R. as an enema once in 24 hours.
*Children ages 5 to 11:* 66 ml (1 bottle) Pedialax P.R. as an enema once in 24 hours.
*Children age 2 to younger than age 5:* 33 ml (½ bottle) Pedialax P.R. as an enema once in 24 hours.

## ADMINISTRATION

**Rectal**

- Follow instructions accompanying enema.

## ACTION

Saline laxative that produces an osmotic effect in the small intestine by drawing water into the intestinal lumen.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.R. | 5–10 min | With effect | With effect |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** headache.
**GI:** *abdominal cramping*, nausea, vomiting, diarrhea, peritanal irritation, bloating, flatulence.
**Other:** laxative dependence with long-term or excessive use.

## INTERACTIONS

**Drug-drug.** *ACE inhibitors, angiotensin receptor blockers, diuretics, lithium, NSAIDs:* May affect electrolyte levels. Monitor patient carefully.

## EFFECTS ON LAB TEST RESULTS

- May increase sodium and phosphate levels. May decrease electrolyte level with prolonged use.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients on sodium-restricted diets and in patients with intestinal obstruction, intestinal perforation, edema, heart failure, megacolon, impaired renal function, or signs and symptoms of appendicitis or acute surgical abdomen, such as abdominal pain, nausea, or vomiting.
- Use cautiously in patients with large hemorrhoids or anal abrasions.

***Overdose S&S:*** Severe electrolyte disturbances, dehydration, hypovolemia, QT interval prolongation, cardiac arrhythmias, multiorgan failure, death.

## NURSING CONSIDERATIONS

- Before giving drug for constipation, determine whether patient has adequate fluid intake, exercise, and diet.

***Alert:*** Up to 10% of sodium content of drug may be absorbed.
***Alert:*** Severe electrolyte imbalances may occur if recommended dosage is exceeded.

## PATIENT TEACHING

- Teach patient about dietary sources of fiber, including bran and other cereals, fresh fruit, and vegetables.
- Warn patient about adverse reactions, and stress importance of using drug only for short-term therapy.
- Instruct patient in proper administration of enema.
- Advise patient not to take more than one enema in 24 hours.
- Warn patient to stop using drug and notify physician if rectal bleeding occurs or if drug fails to work.

S

## sodium polystyrene sulfonate

pol-ee-STYE-reen

Kayexalate, Kionex, SPS

*Therapeutic class:* Potassium-removing resin
*Pharmacologic class:* Cation-exchange resin
*Pregnancy risk category C*

### AVAILABLE FORMS

*Powder:* 1-lb jar (3.5 g/tsp)
*Suspension:* 15 g/60 ml*

### INDICATIONS & DOSAGES

➤ **Hyperkalemia**

*Adults:* 15 g P.O. daily to q.i.d. in water or sorbitol (3 to 4 ml/g of resin). Or, mix powder with appropriate medium—aqueous suspension or diet appropriate for renal failure—and instill through a nasogastric tube. Or, 30 to 50 g (120 to 200 ml) of sorbitol every 6 hours as warm emulsion deep into sigmoid colon (20 cm).

### ADMINISTRATION

**P.O.**

- Don't heat resin; this impairs drug's effect. Mix resin only with water or sorbitol for P.O. use. Never mix with orange juice (high potassium content) to disguise taste.
- Chill oral suspension for greater palatability.
- Oral administration is preferred because drug should remain in intestine for at least 30 minutes.
- If sorbitol is given, mix with resin suspension.
- Consider giving in solid form. Resin cookie and candy recipes are available; ask pharmacist or dietitian to supply.

**Rectal**

- Premixed forms (SPS and others) are available. If preparing manually, mix polystyrene resin only with water or sorbitol for rectal use. Don't use mineral oil for P.R. administration to prevent impaction; ion exchange needs aqueous medium. Sorbitol content prevents impaction.
- Prepare P.R. dose at room temperature. Stir emulsion gently during administration.
- Use #28 French rubber tube for rectal dose; insert 20 cm into sigmoid colon. Tape tube in place. Or, consider an indwelling urinary catheter with a 30-ml balloon inflated distal to anal sphincter to aid in retention. This is especially helpful for patients with poor sphincter control. Use gravity flow. Drain returns constantly through Y-tube connection. Place patient in knee-chest position or with hips on pillow for a while if back leakage occurs.
- After P.R. administration, flush tubing with 50 to 100 ml of nonsodium fluid to ensure delivery of all drug. Flush rectum to remove resin.
- Prevent fecal impaction in elderly patients by giving resin P.R. Give cleansing enema before P.R. administration. Have patient retain enema for 6 to 10 hours if possible, but 30 to 60 minutes is acceptable.

### ACTION

Exchanges sodium ions for potassium ions in the intestine: 1 g of sodium polystyrene sulfonate is exchanged for 0.5 to 1 mEq of potassium; the resin is then eliminated. Much of the exchange capacity is used for calcium, magnesium, and possibly fats and proteins.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., P.R. | 2–12 hr | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**GI:** *constipation, diarrhea with sorbitol emulsions,* fecal impaction, anorexia, gastric irritation, nausea, vomiting.
**Metabolic:** hypokalemia, hypocalcemia, ***hypomagnesemia,*** sodium retention.

### INTERACTIONS

**Drug-drug. *Antacids and laxatives containing magnesium and calcium:*** May cause systemic alkalosis and reduce potassium exchange capability. Avoid using together. If it can't be avoided, separate doses by several hours.

### EFFECTS ON LAB TEST RESULTS
• May increase sodium level. May decrease potassium, calcium, and magnesium levels.

### CONTRAINDICATIONS & CAUTIONS
• Contraindicated in patients hypersensitive to drug and in those with hypokalemia.
• Use cautiously in patients with severe heart failure, severe hypertension, or marked edema. Drug provides 100 mg sodium/g.

### NURSING CONSIDERATIONS
• Watch for constipation with oral or nasogastric administration. Give 10 to 20 ml of 70% sorbitol syrup every 2 hours, p.r.n. to produce one or two watery stools daily.
• Monitor potassium level at least once daily. Treatment may result in potassium deficiency and is usually stopped when potassium is reduced to 4 or 5 mEq/L.
• Watch for signs of hypokalemia: irritability, confusion, arrhythmias, ECG changes, severe muscle weakness or even paralysis, and digitalis toxicity in digitalized patients.
• When hyperkalemia is severe, polystyrene resin alone isn't adequate for lowering potassium. Dextrose 50% with regular insulin I.V. push may also be given.
• Watch for symptoms of other electrolyte deficiencies (magnesium, calcium) because drug is nonselective. Monitor calcium level in patients receiving sodium polystyrene therapy for more than 3 days. Supplementary calcium may be needed.
• Watch for sodium overload. Drug contains about 100 mg sodium/g. About one-third of resin's sodium is retained.

### PATIENT TEACHING
• Explain use and administration of drug to patient.
• Advise patient to report adverse reactions promptly.
• Teach patient about low-potassium diet.

## solifenacin succinate
sole-ah-FEN-ah-sin

VESIcare

*Therapeutic class:* Urinary antispasmodic
*Pharmacologic class:* Antimuscarinic
*Pregnancy risk category C*

### AVAILABLE FORMS
*Tablets (film-coated):* 5 mg, 10 mg

### INDICATIONS & DOSAGES
➤ **Overactive bladder with urinary urgency, frequency, and urge incontinence**
*Adults:* 5 mg P.O. once daily. May increase to 10 mg once daily if 5-mg dose is well tolerated.
***Adjust-a-dose:*** If creatinine clearance is less than 30 ml/minute or the patient has moderate liver impairment (Child-Pugh score B), or drug is taken concurrently with CYP3A4 inhibitors, maintain the dose at 5 mg.

### ADMINISTRATION
**P.O.**
• Give drug without regard for food.
• Drug should be swallowed whole with liquid.

### ACTION
Relaxes smooth muscle of bladder by antagonizing muscarinic receptors, relieving symptoms of overactive bladder.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3–8 hr | Unknown |

*Half-life:* 2 to 3 days.

### ADVERSE REACTIONS
**CNS:** depression, dizziness, fatigue.
**CV:** hypertension, leg swelling.
**EENT:** blurred vision, dry eyes, pharyngitis.
**GI:** *constipation, dry mouth,* dyspepsia, nausea, upper abdominal pain, vomiting.
**GU:** urinary retention, UTI.
**Respiratory:** cough.
**Other:** influenza.

S

## INTERACTIONS

**Drug-drug.** *Drugs that prolong the QT interval:* May increase the risk of serious cardiac arrhythmias. Monitor patient and ECG closely.
*Potent CYP3A4 inhibitors (such as ketoconazole):* May increase solifenacin levels. Don't exceed solifenacin dose of 5 mg daily when used together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in patients with urine or gastric retention or uncontrolled narrow-angle glaucoma. Don't use in patients with severe hepatic impairment (Child-Pugh score C).
- Use cautiously in patients with a history of prolonged QT interval, those being treated for narrow-angle glaucoma, and those with bladder outflow obstruction, decreased GI motility, renal insufficiency, or moderate liver impairment.

***Overdose S&S:*** Anticholinergic effects (fixed and dilated pupils, blurred vision, failure of heel-to-toe examination, tremors, dry skin).

## NURSING CONSIDERATIONS

- Assess bladder function, and monitor drug effects.
- If patient has bladder outlet obstruction, watch for urine retention.
- Monitor patient for decreased gastric motility and constipation.
- Safety and effectiveness are similar in older and younger adults, but levels and half-life may be increased in the elderly.

## PATIENT TEACHING

- Explain that drug may cause blurred vision. Tell patient to use caution when performing hazardous activities or tasks that require clear vision until effects of the drug are known.
- Discourage use of other drugs that may cause dry mouth, constipation, urine retention, or blurred vision.
- Urge patient to notify prescriber about abdominal pain or constipation that lasts 3 days or longer.
- Tell patient that drug decreases the ability to sweat normally, and advise cautious use in hot environments or during strenuous activity.
- Tell patient to swallow tablet whole with liquid.
- Inform patient that drug may be taken with or without food.

# somatropin

soe-ma-TROE-pin

Genotropin, Genotropin Miniquick, Humatrope, Norditropin, Norditropin FlexPro, Norditropin NordiFlex, Nutropin, Nutropin AQ, Omnitrope, Saizen, Serostim, Serostim LQ, Tev-Tropin, Zorbtive

*Therapeutic class:* Growth hormone
*Pharmacologic class:* Anterior pituitary hormone
*Pregnancy risk category B (Genotropin, Omnitrope, Saizen, Serostim, Zorbtive); C (Humatrope, Norditropin, Nutropin, Nutropin AQ, Tev-Tropin)*

## AVAILABLE FORMS

*Genotropin injection:* 1.5 mg (about 4.5 international units/vial), 5.8 mg (about 17.4 international units/vial), 13.8 mg (about 41.4 international units/vial)
*Genotropin Miniquick injection:* 0.2 mg/vial, 0.4 mg/vial, 0.6 mg/vial, 0.8 mg/vial, 1 mg/vial, 1.2 mg/vial, 1.4 mg/vial, 1.6 mg/vial, 1.8 mg/vial, 2 mg/vial
*Humatrope injection:* 5 mg (about 15 international units/vial), 6 mg (18 international units/cartridge), 12 mg (36 international units/cartridge), 24 mg (72 international units/cartridge)
*Norditropin injection:* 5 mg/1.5 ml cartridges, 10 mg/1.5 ml cartridges, 15 mg/1.5 ml cartridges, 30 mg/3 ml cartridges
*Nutropin injection:* 5 mg (about 15 international units/vial), 10 mg (about 30 international units/vial)
*Nutropin AQ injection:* 10 mg (about 30 international units/vial)

*Omnitrope injection:* 1.5 mg (about 4.5 international units/vial), 5.8 mg/vial, 5 mg/1.5 ml injection cartridge, 10 mg/1.5 ml injection cartridge
*Saizen injection:* 5 mg (about 15 international units/vial), 8.8 mg/vial (about 26.4 international units/vial)
*Serostim injection:* 4 mg (about 12 international units/vial), 5 mg (about 15 international units/vial), 6 mg (about 18 international units/vial)
*Serostim LQ injection:* 6 mg (about 18 international units) per 0.5 ml
*Tev-Tropin injection:* 5 mg (15 international units/vial)
*Zorbtive injectioin:* 8.8 mg (approximately 26.4 international units/vial)

## INDICATIONS & DOSAGES

➤ **Long-term treatment of growth failure in children with inadequate secretion of endogenous growth hormone (GH)**
*Children:* 0.18 mg/kg Humatrope subcutaneously weekly, divided equally and given on 3 alternate days, six times weekly or once daily. Or, 0.3 mg/kg Nutropin or Nutropin AQ subcutaneously weekly in daily divided doses; in pubertal patients, a weekly dosage of 0.7 mg/kg (Nutropin or Nutropin AQ) in daily divided doses may be used. Or, 0.06 mg/kg Saizen I.M. or subcutaneously three times weekly. Or, 0.024 to 0.034 mg/kg Norditropin subcutaneously six to seven times weekly. Or, 0.16 to 0.24 mg/kg Genotropin subcutaneously weekly, divided into six or seven doses. Or, up to 0.1 mg/kg Tev-Tropin subcutaneously three times weekly.

➤ **Growth failure from chronic renal insufficiency up to time of renal transplantation**
*Children:* Up to 0.35 mg/kg/week Nutropin or Nutropin AQ subcutaneously divided into daily doses.

➤ **Long-term treatment of short stature from Turner syndrome**
*Children:* Up to 0.375 mg/kg/week Humatrope, Nutropin, or Nutropin AQ subcutaneously divided into equal doses given three to seven times weekly. Or, up to 0.067 mg/kg/day Norditropin subcutaneously.

➤ **Short stature in children with Noonan syndrome**
*Children:* Up to 0.066 mg/kg/day Norditropin subcutaneously.

➤ **Long-term treatment of growth failure in children with Prader-Willi syndrome diagnosed by genetic testing**
*Children:* 0.24 mg/kg Genotropin subcutaneously weekly, divided into six to seven doses.

➤ **Replacement of endogenous GH in adult patients with GH deficiency**
*Adults:* Initially, not more than 0.006 mg/kg Humatrope, Nutropin, or Nutropin AQ subcutaneously daily. May be increased to maximum of 0.0125 mg/kg Humatrope daily.

Nutropin or Nutropin AQ dosages may be increased to maximum of 0.025 mg/kg daily in patients younger than age 35 or 0.0125 mg/kg daily in patients older than age 35. Or, starting dosages not exceeding 0.04 mg/kg Genotropin subcutaneously weekly, divided into six to seven doses, may be increased at 4- to 8-week intervals to a maximum dose of 0.08 mg/kg subcutaneously weekly, divided into six to seven doses. Initially, not more than 0.005 mg/kg Saizen daily. May increase after 4 weeks to a maximum dose of 0.01 mg/kg daily based on patient tolerance and clinical response.

➤ **AIDS wasting or cachexia**
*Adults and children who weigh more than 55 kg (121 lb):* 6 mg Serostim or Serostim LQ subcutaneously at bedtime.
*Adults and children who weigh 45 to 55 kg (99 to 121 lb):* 5 mg Serostim or Serostim LQ subcutaneously at bedtime.
*Adults and children who weigh 35 to 45 kg (77 to 99 lb):* 4 mg Serostim or Serostim LQ subcutaneously at bedtime.
*Adults and children who weigh less than 35 kg:* 0.1 mg/kg/day Serostim or Serostim LQ subcutaneously at bedtime.

➤ **Long-term treatment of growth failure in children born small for gestational age (SGA) who don't catch up by age 2**
*Children:* 0.48 mg/kg Genotropin subcutaneously weekly, divided into six to seven doses.

➤ **Short stature in children born SGA who don't catch up by age 2 to 4**
*Children:* Up to 0.067 mg/kg/day Norditropin or Humatrope subcutaneously.

S

➤ **Idiopathic short stature**
*Children:* Up to 0.37 mg/kg Humatrope subcutaneously weekly, divided into six to seven equal doses.
➤ **Short bowel syndrome**
*Adults:* 0.1 mg/kg/day Zorbtive subcutaneously daily for 4 weeks. Maximum dosage, 8 mg/day.

## ADMINISTRATION

**I.M.**
• To prepare solution, inject supplied diluent into vial containing drug by aiming stream of liquid against wall of glass vial. Then swirl vial gently until contents are completely dissolved. Don't shake vial.
• After reconstitution, make sure solution is clear. Don't inject solution if it's cloudy or contains particles.
• For patients on hemodialysis, give drug before bedtime or 3 to 4 hours after dialysis. For long-term cycling peritoneal dialysis, give drug in the morning after completion of dialysis. For long-term ambulatory peritoneal dialysis, give drug in the evening at the time of the overnight exchange.
• Store reconstituted drug in refrigerator; use within 14 days.
• If patient develops sensitivity to diluent, reconstitute drug with sterile water for injection. When drug is reconstituted in this way, use only one reconstituted dose per vial, refrigerate solution if it isn't used immediately after reconstitution, use reconstituted dose within 24 hours, and discard unused portion.
***Alert:*** When administering to newborn, reconstitute with sterile water for injection.

**Subcutaneous**
• To prepare solution, inject supplied diluent into vial containing drug by aiming stream of liquid against wall of glass vial. Then swirl vial gently until contents are completely dissolved. Don't shake vial.
• After reconstitution, make sure solution is clear. Don't inject solution if it's cloudy or contains particles.
• For patients on hemodialysis, give drug before bedtime or 3 to 4 hours after dialysis. For long-term cycling peritoneal dialysis, give drug in the morning after completion of dialysis. For long-term ambulatory peritoneal dialysis, give drug in the evening at the time of the overnight exchange.
• Rotate injection sites.
• Store reconstituted drug in refrigerator; use within 14 days.
• If patient develops sensitivity to diluent, reconstitute drug with sterile water for injection. When drug is reconstituted in this way, use only one reconstituted dose per vial, refrigerate solution if it isn't used immediately after reconstitution, use reconstituted dose within 24 hours, and discard unused portion.
***Alert:*** When administering to newborn, reconstitute with sterile water for injection.

## ACTION

Purified GH of recombinant DNA origin that stimulates skeletal, linear, muscle, and organ growth.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.M., subcut. | Unknown | 3–5 hr | 12–48 hr |

*Half-life:* Varies by route and brand. Refer to manufacturer's drug label.

## ADVERSE REACTIONS

**CNS:** headache, weakness, paresthesia, fatigue.
**CV:** mild, transient edema.
**EENT:** *otitis media.*
**Hematologic:** ***leukemia.***
**Metabolic:** mild hyperglycemia, hypothyroidism.
**Musculoskeletal:** localized muscle pain, arthralgia, stiffness of extremities.
**Respiratory:** *upper respiratory tract infection.*
**Skin:** injection site pain.
**Other:** antibodies to GH.

## INTERACTIONS

**Drug-drug.** *Corticotropin, corticosteroids:* Long-term use may inhibit growth response to GH. Monitor patient for lack of effect.
*Insulin, oral antihyperglycemic agents:* Somatropin may decrease insulin sensitivity. Antihyperglycemic agent dosage may need adjustment.

## EFFECTS ON LAB TEST RESULTS

• May increase glucose, inorganic phosphorus, alkaline phosphatase, and parathyroid hormone levels.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients with closed epiphyses, preproliferative or severe nonproliferative diabetic retinopathy, active malignancy, or an active underlying intracranial lesion.
• For patients hypersensitive to either metacresol or glycerin, don't use supplied diluent to reconstitute Humatrope.
• Contraindicated (Genotropin only) in patients with Prader-Willi syndrome who are severely obese or have severe respiratory impairment.
• Don't begin therapy in patients with acute critical illness due to complications following open heart or abdominal surgery, trauma, or acute respiratory failure.
• Use cautiously in children with hypothyroidism and in those with GH deficiency caused by intracranial lesion.
• Use cautiously in patients with diabetes.
⚠ ***Overdose S&S:*** Fluid retention, hypoglycemia followed by hyperglycemia, glucose intolerance, gigantism, acromegaly.

## NURSING CONSIDERATIONS

• Frequently examine children with hypothyroidism and those whose GH deficiency is caused by an intracranial lesion for progression or recurrence of underlying disease.
***Alert:*** In patients with Prader-Willi syndrome who are morbidly obese and in those with a history of respiratory impairment, sleep apnea, or unidentified respiratory infection, therapy may be life-threatening. Assess patients with Prader-Willi syndrome for sleep apnea and upper airway obstruction before treatment. Interrupt treatment if signs of upper airway obstruction occur.
• Monitor patient with Prader-Willi syndrome for signs of respiratory infection.
• Monitor child's height regularly. Regular checkups, including monitoring of blood and radiologic studies, are also needed.
• Monitor patient's glucose level regularly because GH may induce a state of insulin resistance.
• Excessive glucocorticoid therapy inhibits somatropin's growth-promoting effect. Patients with coexisting corticotropin deficiency should have their glucocorticoid replacement dosage carefully adjusted to avoid growth inhibition.
• Watch for slipped capital femoral epiphysis or progression of scoliosis in patients with rapid growth.
• Monitor results of periodic thyroid function tests for hypothyroidism; condition may need thyroid hormone treatment. Laboratory measurements of thyroid hormone may change.
• Patient should have ophthalmic exams to monitor for intracranial hypertension before therapy (to establish baseline) and periodically thereafter.
• Only adults with GH deficiency alone or together with multiple hormone deficiencies from pituitary or hypothalamic disease, surgery, radiation, or trauma or those who were GH deficient as children and have been confirmed GH deficient as adults can take Saizen.
• ***Look alike–sound alike:*** Don't confuse somatropin with somatrem or sumatriptan.

## PATIENT TEACHING

• Inform parents that child with endocrine disorders (including GH deficiency) may have an increased risk of slipped capital epiphyses. Tell parents to notify prescriber if they notice their child limping.
• Instruct patients with diabetes to monitor glucose level closely and report changes to prescriber.
• Stress importance of close follow-up care.

S

# sorafenib

sohr-uh-FEN-ib

Nexavar🖋

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Multi-kinase inhibitor
*Pregnancy risk category D*

## AVAILABLE FORMS

*Tablets:* 200 mg

## INDICATIONS & DOSAGES

➤ **Advanced renal cell carcinoma, hepatocellular carcinoma**

*Adults:* 400 mg P.O. b.i.d. at least 1 hour before or 2 hours after eating. Continue until disease progresses or unacceptable toxicity occurs.

***Adjust-a-dose:*** If grade 2 skin toxicity (pain and swelling with normal activities) develops, continue treatment and use topical drugs to relieve symptoms. If symptoms don't improve in 1 week or if they occur a second or third time, stop treatment until toxicity resolves to grade 0 or 1 (able to perform daily activities). Resume treatment at 400 mg daily or every other day. At fourth occurrence of grade 2 toxicity, stop treatment. If grade 3 skin toxicity (ulceration, blistering, severe, debilitating pain of hands and feet) or a second occurrence develops, stop treatment until toxicity resolves to grade 0 or 1. Resume treatment at 400 mg daily or every other day. At third occurrence of grade 3 toxicity, stop treatment.

## ADMINISTRATION

**P.O.**

- Give drug with water, 1 hour before or 2 hours after a meal.

## ACTION

Decreases tumor cell proliferation by interacting with multiple intracellular and cell-surface kinases that may influence growth of new blood vessels into a tumor.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3 hr | Unknown |

*Half-life:* 1 to 2 days.

## ADVERSE REACTIONS

**CNS:** *asthenia, fatigue, headache, neuropathy,* depression, pyrexia.
**CV:** flushing, *hypertension.*
**EENT:** *hoarseness.*
**GI:** *abdominal pain, anorexia, constipation, diarrhea, nausea, vomiting,* dyspepsia, dysphagia, mucositis, stomatitis.
**GU:** erectile dysfunction.
**Hematologic:** *bleeding,* ***hemorrhage, leukopenia, lymphopenia, neutropenia, thrombocytopenia,*** anemia.
**Metabolic:** *weight loss,* hypothyroidism.
**Musculoskeletal:** *joint pain,* arthralgia, myalgia.
**Respiratory:** *cough, dyspnea.*
**Skin:** *alopecia, dry skin, erythema, hand-foot reaction, pruritus, rash,* acne, exfoliative dermatitis.
**Other:** flulike illness.

## INTERACTIONS

**Drug-drug.** *CYP2B6 or CYP2C8 substrates:* May increase levels of these drugs. Use cautiously together.
*CYP3A4 inducers (such as carbamazepine, dexamethasone, phenobarbital, phenytoin, rifampin):* May increase sorafenib metabolism and decrease its effects. Monitor patient.
*Docetaxel, doxorubicin, drugs metabolized by the UGT1A1 pathway (such as irinotecan):* May increase levels of these drugs. Use cautiously together.
*Warfarin:* May increase the risk of bleeding. Monitor PT, INR, and patient for bleeding.
**Drug-herb.** *St. John's wort:* May decrease drug effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase TSH, lipase, amylase, transaminase, and bilirubin levels. May decrease phosphate levels.
- May decrease RBC, WBC, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients severely hypersensitive to drug or its components.
- Use cautiously in patients with bleeding disorders, healing wounds, current or previous hand-foot skin reactions, or liver, renal, or cardiac disease, such as hypertension, cardiac ischemia, or a history of MI.

***Overdose S&S:*** Diarrhea, dermatologic events.

## NURSING CONSIDERATIONS

- To avoid serious drug interactions, take a careful drug history.
- Monitor patient closely for hand-foot skin reaction, especially during the first 6 weeks of treatment.
- Measure blood pressure weekly during the first 6 weeks of treatment to check for hypertension.

- If patient is scheduled for major surgery, inform the surgeon that patient is taking this drug; therapy should be stopped. Monitor incision for adequate healing before restarting.
- Monitor patient for symptoms of cardiac ischemia.
- Assess patient for unusual bruising or bleeding.
- Provide patient with contact information for cancer support groups and instructions for managing adverse effects.

***Alert:*** Warn women to avoid pregnancy during and for 2 weeks following treatment.

## PATIENT TEACHING

- Tell patient to swallow tablet whole, with water, 1 hour before or 2 hours after a meal.
- Advise patient to keep appointments for blood tests and blood pressure checks.
- Explain that hair loss, nausea, vomiting, diarrhea, and fatigue are common.
- Inform patient that mild to moderate skin reactions are common. Tell him to notify prescriber if they occur. If they're severe, treatment may have to be stopped or dosage reduced. Urge patient to report pain, redness, blisters, or skin ulceration to prescriber immediately.
- Tell patient to report bleeding episodes right away.
- Tell patient to notify prescriber if chest pain or other serious heart problems develop.

***Alert:*** Drug may cause serious birth defects or fetal death. Advise women not to become pregnant during treatment and for at least 2 weeks after. Men should also avoid fathering children at this time.

# sotalol hydrochloride

SOH-ta-lol

Betapace, Betapace AF, Rylosol†

*Therapeutic class:* Antiarrhythmic
*Pharmacologic class:* Nonselective beta blocker
*Pregnancy risk category B*

## AVAILABLE FORMS

*Solution for injection:* 15 mg/ml

**Betapace**
*Tablets:* 80 mg, 120 mg, 160 mg, 240 mg
**Betapace AF**
*Tablets:* 80 mg, 120 mg, 160 mg

## INDICATIONS & DOSAGES

➤ **Documented, life-threatening ventricular arrhythmias**

*Adults:* Initially, 80 mg Betapace P.O. b.i.d. Increase dosage every 3 days as needed and tolerated. Most patients respond to 160 to 320 mg/day, although some patients with refractory arrhythmias need up to 640 mg/day. Or, 75 mg I.V. once or twice daily based on creatinine clearance. After 3 days, dosage may be increased to 75 to 150 mg I.V. once daily or every 12 hours based on clearance. For refractory life-threatening arrhythmias, dosage may be increased to 225 to 300 mg I.V. once daily or every 12 hours.

***Adjust-a-dose:*** For oral route, if creatinine clearance is 30 to 60 ml/minute, increase dosage interval to every 24 hours; if clearance is 10 to 29 ml/minute, increase interval to every 36 to 48 hours; and if clearance is less than 10 ml/minute, individualize dosage. For I.V. route, if clearance is 40 to 59 ml/minute, give I.V. drug once daily; don't give if clearance is less than 40 ml/minute.

➤ **To maintain normal sinus rhythm or to delay recurrence of atrial fibrillation or atrial flutter in patients with symptomatic atrial fibrillation or flutter who are currently in sinus rhythm**

*Adults:* 80 mg Betapace AF P.O. b.i.d. Increase dosage as needed to 120 mg P.O. b.i.d. after 3 days if the QTc interval is less than 500 msec. Maximum dose is 160 mg P.O. b.i.d. Or, 75 mg I.V. once daily or every 12 hours based on clearance. After 3 days, dosage may be increased to 112.5 to 150 mg I.V. once daily or every 12 hours based on clearance.

***Adjust-a-dose:*** For oral route, if creatinine clearance is 40 to 60 ml/minute, increase dosage interval to every 24 hours; if clearance is less than 40 ml/minute, Betapace AF is contraindicated. For I.V. route, if clearance is 40 to 59 ml/minute, give I.V. drug once daily; don't give if clearance is less than 40 ml/minute.

## ADMINISTRATION

**P.O.**

● Give 1 hour before or 2 hours after meals or antacids.

**I.V.**

▼ Dilute drug with normal saline, $D_5W$, or Ringer's lactate in a volume of 100 to 250 ml.

▼ Use an infusion pump to administer drug at a constant rate over 5 hours.

## ACTION

Depresses sinus heart rate, slows AV conduction, decreases cardiac output, and lowers systolic and diastolic blood pressure. Drug also has class III antiarrhythmic action potential's duration and prolongation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2½–4 hr | Unknown |
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 12 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia, headache, dizziness, weakness, fatigue, light-headedness,* sleep problems.

**CV:** *chest pain, palpitations,* ***bradycardia, arrhythmias, heart failure, AV block, proarrhythmic events (including polymorphic ventricular tachycardia, PVCs, ventricular fibrillation),*** edema, ECG abnormalities, hypotension.

**GI:** *nausea, vomiting,* diarrhea, dyspepsia.

**Metabolic:** hyperglycemia.

**Respiratory:** *dyspnea,* ***bronchospasm.***

## INTERACTIONS

**Drug-drug.** *Antiarrhythmics:* May increase drug effects. Avoid using together.

*Antihypertensives, catecholamine-depleting drugs (such as guanethidine, reserpine):* May increase hypotensive effects or cause marked bradycardia. Monitor blood pressure and pulse closely.

*Calcium channel blockers:* May increase myocardial depression. Avoid using together.

*Clonidine:* May enhance rebound effect after withdrawal of clonidine. Stop sotalol several days before withdrawing clonidine.

*Drugs that prolong the QT interval (Class I and III antiarrhythmics, bepridil, phenothiazines, tricyclics):* May cause excessive QT prolongation. Monitor QT interval.

*General anesthetics:* May increase myocardial depression. Monitor patient closely.

*Insulin, oral antidiabetics:* May cause hyperglycemia and may mask signs and symptoms of hypoglycemia. Adjust dosage accordingly.

***Macrolides and related antibiotics (azithromycin, clarithromycin, erythromycin, telithromycin):*** May cause additive effects or prolong the QT interval. Use with caution. Avoid use with telithromycin.

*Prazosin:* May increase the risk of orthostatic hypotension. Assist patient to stand slowly until effects are known.

***Quinolones:*** May cause life-threatening arrhythmias, including torsades de pointes. Avoid using together.

*Theophylline:* May decrease bronchodilating effects. Avoid using together.

**Drug-food.** *Any food:* May decrease absorption by 20%. Advise patient to take on empty stomach.

## EFFECTS ON LAB TEST RESULTS

● May increase glucose level.

● May cause false-positive catecholamine level.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug.

● Contraindicated in those with severe sinus node dysfunction, sinus bradycardia, second- and third-degree AV block unless patient has a pacemaker, congenital or acquired long QT-interval syndrome, cardiogenic shock, uncontrolled heart failure, creatinine clearance of less than 40 ml/minute, serum potassium level of less than 4 mEq/L, and bronchial asthma.

● Use cautiously in patients with renal impairment or diabetes mellitus (beta blockers may mask signs and symptoms of hypoglycemia).

⚠ ***Overdose S&S:*** Bradycardia, bronchospasm, heart failure, hypoglycemia, hypotension, asystole, prolongation of the QT interval, torsades de pointes, ventricular tachycardia, death.

## NURSING CONSIDERATIONS

**Black Box Warning** Because proarrhythmic events may occur at the start of therapy and during dosage adjustments, patients should be hospitalized for a minimum of 3 days in a facility that can provide calculations of creatinine clearance, continuous electrocardiographic monitoring, and cardiac resuscitation. Calculate creatinine clearance prior to dosing. ▮

**Black Box Warning** The baseline QTc interval must be less than or equal to 450 msec before starting sotolol. If QT interval is 500 msec or more, dosage or frequency must be decreased or drug discontinued. ▮

- Assess patient for new or worsened symptoms of heart failure.
- Although patients receiving I.V. lidocaine may start sotalol therapy without ill effects, withdraw other antiarrhythmics before therapy begins. Sotalol therapy typically is delayed until two or three half-lives of the withdrawn drug have elapsed. After withdrawing amiodarone, give sotalol only after QT interval normalizes.
- Adjust dosage slowly, allowing 3 days between dosage increments for adequate monitoring of QT intervals and for drug levels to reach a steady-state level.

**Black Box Warning** Don't substitute Betapace for Betapace AF. ▮

- Monitor electrolytes regularly, especially if patient is receiving diuretics. Electrolyte imbalances, such as hypokalemia or hypomagnesemia, may enhance QT-interval prolongation and increase the risk of serious arrhythmias such as torsades de pointes.
- ***Look alike–sound alike:*** Don't confuse sotalol with Stadol.

## PATIENT TEACHING

- Explain to patient that he will need to be hospitalized for initiation of drug therapy.
- Stress need to take drug as prescribed, even when he is feeling well. Caution patient against stopping drug suddenly.
- Caution patient against using OTC drugs and decongestants while taking drug.
- Because food and antacids can interfere with absorption, tell patient to take drug on an empty stomach, 1 hour before or 2 hours after meals or antacids.

# spironolactone

speer-on-oh-LAK-tone

Aldactone, Novospiroton†

*Therapeutic class:* Diuretic
*Pharmacologic class:* Potassium-sparing diuretic; aldosterone receptor antagonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 25 mg, 50 mg, 100 mg

## INDICATIONS & DOSAGES

**Black Box Warning** Use spironolactone only for those conditions for which it's indicated. Avoid unnecessary use. ▮

➤ **Edema due to heart failure, hepatic cirrhosis, or nephrotic syndrome**
*Adults:* Initially, 100 mg P.O. daily given as a single dose or in divided doses. Usual range is 25 to 200 mg P.O. daily.

➤ **Hypertension**
*Adults:* 50 to 100 mg P.O. daily or in divided doses. Some practitioners use a lower dose range of 25 to 50 mg daily and add another antihypertensive to the regimen, rather than continually increasing this drug.

➤ **Diuretic-induced hypokalemia**
*Adults:* 25 to 100 mg P.O. daily.

➤ **To detect primary hyperaldosteronism**
*Adults:* 400 mg P.O. daily for 4 days (short test) or 3 to 4 weeks (long test). If hypokalemia and hypertension are corrected, a presumptive diagnosis of primary hyperaldosteronism is made.

➤ **To manage primary hyperaldosteronism**
*Adults:* 100 to 400 mg P.O. daily. Use lowest effective dose.

➤ **Severe heart failure (Class III or IV), as adjunct to ACE inhibitor or loop diuretic, with or without cardiac glycoside**
*Adults:* 25 mg P.O. daily if serum potassium level is 5 mEq/L or less and serum creatinine level is 2.5 mg/dl or less. May increase to 50 mg P.O. daily as clinically indicated.
***Adjust-a-dose:*** Patients who don't tolerate 25 mg daily may have dosage decreased to every other day.

S

➤ **Hirsutism** ♦
*Women:* 50 to 200 mg P.O. daily.

## ADMINISTRATION

**P.O.**
- To enhance absorption, give drug with meals.
- Give drug in morning to prevent nocturia. If second dose is needed, give it with food in early afternoon.
- Protect tablets from light.

## ACTION

Antagonizes aldosterone in the distal tubules, increasing sodium and water excretion.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1–2 days | 2–3 days | 2–3 days |

*Half-life:* 1¼ to 2 hours.

## ADVERSE REACTIONS

**CNS:** headache, drowsiness, lethargy, confusion, ataxia.
**GI:** diarrhea, ***gastric bleeding,*** ulceration, cramping, gastritis, vomiting.
**GU:** inability to maintain erection, menstrual disturbances.
**Hematologic:** ***agranulocytosis.***
**Metabolic:** ***hyperkalemia,*** dehydration, hyponatremia, mild acidosis.
**Skin:** urticaria, hirsutism, maculopapular eruptions.
**Other:** ***anaphylaxis,*** gynecomastia, breast soreness, drug fever.

## INTERACTIONS

**Drug-drug.** *ACE inhibitors, indomethacin, other potassium-sparing diuretics, potassium supplements:* May increase risk of hyperkalemia. Use together cautiously, especially in patients with renal impairment. Monitor potassium level.
*Anticoagulants:* May decrease anticoagulant effects. Monitor PT and INR.
*Aspirin and other salicylates:* May block diuretic effect of spironolactone. Watch for diminished spironolactone response.
*Digoxin:* May alter digoxin clearance, increasing risk of toxicity. Monitor digoxin level.
**Drug-herb.** *Licorice:* May block ulcer-healing and aldosterone-like effects of herb; may increase risk of hypokalemia. Discourage use together.
**Drug-food.** *Potassium-rich foods, such as citrus fruits and tomatoes, salt substitutes containing potassium:* May increase risk of hyperkalemia. Urge caution.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN and potassium levels. May decrease sodium level.
- May decrease granulocyte count.
- May alter fluorometric determinations of plasma and urinary 17-hydroxycorticosteroid levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with anuria, acute or progressive renal insufficiency, or hyperkalemia.
- Use cautiously in patients with fluid or electrolyte imbalances, impaired renal function, or hepatic disease, or in pregnant women.

⚠ ***Overdose S&S:*** Drowsiness, confusion, rash, nausea, vomiting, dizziness, diarrhea, hyperkalemia.

## NURSING CONSIDERATIONS

- Monitor electrolyte levels, fluid intake and output, weight, and blood pressure.
- Monitor elderly patients closely, who are more susceptible to excessive diuresis.
- Inform laboratory that patient is taking spironolactone because drug may interfere with tests that measure digoxin level.
- Drug is less potent than thiazide and loop diuretics and is useful as an adjunct to other diuretic therapy. Diuretic effect is delayed 2 to 3 days when used alone.
- Maximum antihypertensive response may be delayed for up to 2 weeks.
- Watch for hyperchloremic metabolic acidosis, especially in patients with hepatic cirrhosis.
- ***Look alike–sound alike:*** Don't confuse Aldactone with Aldactazide.

## PATIENT TEACHING

- Instruct patient to take drug in morning to prevent need to urinate at night. If second dose is needed, tell him to take it with food in early afternoon.

***Alert:*** To prevent serious hyperkalemia, warn patient to avoid excessive ingestion of potassium-rich foods (such as citrus fruits, tomatoes, bananas, dates, and apricots), salt substitutes containing potassium, and potassium supplements.
- Caution patient not to perform hazardous activities if adverse CNS reactions occur.
- Advise men about possible breast tenderness or enlargement.

## stavudine (2′ 3′-didehydro-3-deoxythymidine, d4T)

stay-VYOO-deen

Zerit

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Nucleoside reverse transcriptase inhibitor
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules:* 15 mg, 20 mg, 30 mg, 40 mg
*Oral solution:* 1 mg/ml

### INDICATIONS & DOSAGES

➤ **HIV-infection, with other antiretrovirals**

*Adults who weigh 60 kg (132 lb) or more:* 40 mg P.O. every 12 hours.
*Adults who weigh less than 60 kg:* 30 mg P.O. every 12 hours.
*Children who weigh 60 kg or more:* 40 mg P.O. every 12 hours.
*Children who weigh 30 kg (66 lb) to 60 kg:* 30 mg P.O. every 12 hours.
*Neonates 14 days and older and children who weigh less than 30 kg:* 1 mg/kg P.O. every 12 hours.
*Neonates age 13 days and younger:* 0.5 mg/kg P.O. every 12 hours.
***Adjust-a-dose:*** For patients experiencing peripheral neuropathy, stop temporarily; then resume therapy at 50% recommended dose. Stop therapy if neuropathy recurs. For patients with creatinine clearance 26 to 50 ml/minute, adjust dosage to 20 mg (if weight exceeds 60 kg) or 15 mg (if weight is less than 60 kg) P.O. every 12 hours; if clearance is 10 to 25 ml/minute, 20 mg (if weight exceeds 60 kg) or 15 mg (if weight is less than 60 kg) P.O. every 24 hours.

### ADMINISTRATION

**P.O.**
- Give drug without regard for meals.

### ACTION

A thymidine nucleoside analogue that prevents replication of retroviruses, including HIV, by inhibiting the enzyme reverse transcriptase and causing termination of DNA chain growth.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Unknown |

*Half-life:* 1 to 2 hours.

### ADVERSE REACTIONS

**CNS:** *asthenia, fever,* anxiety, headache, malaise, motor weakness, nervousness, *peripheral neuropathy.*
**GI:** *abdominal pain, anorexia, diarrhea, nausea, vomiting,* ***pancreatitis,*** constipation.
**Hematologic:** ***neutropenia, thrombocytopenia,*** anemia.
**Hepatic:** ***hepatotoxicity,*** severe hepatomegaly with steatosis.
**Metabolic:** ***lactic acidosis,*** weight loss.
**Musculoskeletal:** myalgia.
**Respiratory:** *dyspnea.*
**Skin:** *diaphoresis, pruritus, rash.*
**Other:** *chills.*

### INTERACTIONS

**Drug-drug.** *Didanosine, hydroxyurea:* Coadministration may increase risk for lactic acidosis, hepatotoxicity, pancreatitis, or peripheral neuropathy. Monitor closely for adverse effects.
*Methadone:* May decrease stavudine absorption and level. Separate dosage times and monitor patient for clinical effect if drugs must be used together.
*Zidovudine:* May inhibit phosphorylation of stavudine. Avoid using together.

### EFFECTS ON LAB TEST RESULTS

- May increase ALT and AST levels. May decrease hemoglobin level.
- May decrease neutrophil and platelet count.

S

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug.

**Black Box Warning** Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported. ▮

• Use cautiously in patients with renal impairment or history of peripheral neuropathy. Adjust dosage for creatinine clearance of less than 50 ml/minute; adjust dosage or stop drug in patients with peripheral neuropathy.

**Black Box Warning** Use cautiously in pregnant women; fatal lactic acidosis may occur in pregnant women who receive stavudine and didanosine with other antiretrovirals. ▮

***Overdose S&S:*** Peripheral neuropathy, hepatic toxicity.

## NURSING CONSIDERATIONS

**Black Box Warning** Due to increased risk of pancreatic toxicity, monitor patient for signs and symptoms of pancreatitis, especially if he takes stavudine with didanosine or hydroxyurea. If patient has pancreatitis, reinstate drug cautiously. ▮

• Monitor liver function test results.

***Alert:*** Motor weakness mimicking the signs and symptoms of Guillain-Barré syndrome (including respiratory failure) in HIV patients taking stavudine with other antiretrovirals may occur, especially in patients with lactic acidosis. Monitor patient for characteristics of lactic acidosis, including generalized fatigue, GI problems, tachypnea, and dyspnea. Patients with these symptoms should promptly interrupt antiretroviral therapy and rapidly receive a full medical workup. Consider permanently stopping drug. Symptoms may continue or worsen when drug is stopped.

***Alert:*** Peripheral neuropathy may be the major dose-limiting adverse effect; it may or may not resolve after drug is stopped.

• Monitor CBC results and creatinine.

## PATIENT TEACHING

• Tell patient that drug may be taken without regard to meals.

• Warn patient not to take other drugs for HIV or AIDS unless prescriber has approved them.

• Inform patient that drug doesn't cure HIV infection, that opportunistic infections and other complications of HIV infection may still occur, and that transmission of HIV to others through sexual contact or blood contamination is still possible.

• Teach patient signs and symptoms of peripheral neuropathy (pain, burning, aching, weakness, or pins and needles in the limbs) and tell him to report these immediately.

• Tell patient to report symptoms of lactic acidosis, including fatigue, GI problems, dyspnea, or tachypnea.

• Tell patient to report symptoms of pancreatitis, including abdominal pain, nausea, vomiting, weight loss, or fatty stools.

• Tell patient to monitor weight patterns and report weight loss or gain.

# succimer

SUX-i-mer

Chemet

*Therapeutic class:* Chelating agent
*Pharmacologic class:* Heavy metal chelator
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 100 mg

## INDICATIONS & DOSAGES

➤ **Lead poisoning in children with lead levels greater than 45 mcg/dl**

*Children:* Initially, 10 mg/kg or 350 mg/m$^2$ every 8 hours for 5 days. Because capsules come only in 100 mg, round dose to nearest 100 mg, as appropriate (see table). Then reduce frequency of administration to every 12 hours for another 14 days.

| *Weight in kg (lb)* | *Dose (mg)* |
|---|---|
| >45 (>100) | 500 |
| 35–44 (76–100) | 400 |
| 24–34 (56–75) | 300 |
| 16–23 (36–55) | 200 |
| 8–15 (18–35) | 100 |

## ADMINISTRATION

**P.O.**

• If necessary, open capsule and sprinkle contents on small amount of soft food. Or,

pour beads from capsule onto a spoon, have patient swallow them, and follow that with a fruit drink.

## ACTION

A chelating drug that forms water-soluble complexes with lead and increases its excretion in urine.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | Unknown |

*Half-life:* 48 hours.

## ADVERSE REACTIONS

**CNS:** *drowsiness, dizziness, sensorimotor neuropathy, sleepiness, paresthesia, headache.*
**CV:** ***arrhythmias.***
**EENT:** plugged ears, cloudy film in eyes, otitis media, watery eyes, sore throat, rhinorrhea, nasal congestion.
**GI:** *nausea, vomiting, diarrhea, anorexia, abdominal cramps, hemorrhoidal symptoms, metallic taste in mouth, loose stools.*
**GU:** decreased urination, difficult urination, proteinuria.
**Hematologic:** ***neutropenia,*** increased platelet count, intermittent eosinophilia.
**Musculoskeletal:** *leg, kneecap, back, stomach, rib, or flank pain.*
**Respiratory:** cough, head cold.
**Skin:** papular rash, herpetic rash, mucocutaneous eruptions, pruritus.
**Other:** *flulike syndrome,* candidiasis.

## INTERACTIONS

**Drug-drug.** *Other chelating drugs (such as edetate calcium disodium):* May cause unknown adverse effects. Separate administration times by 4 weeks.

## EFFECTS ON LAB TEST RESULTS

- May increase AST, ALT, alkaline phosphatase, and cholesterol levels.
- May increase eosinophil and platelet counts.
- May cause false-positive urine ketone results.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with compromised renal function.

## NURSING CONSIDERATIONS

- Measure severity of poisoning by initial lead level and by rate and degree of rebound of lead level. Use severity as a guide for more frequent lead monitoring.
- Monitor patient at least once weekly for rebound lead levels. Elevated levels and associated symptoms may return rapidly after drug is stopped because of redistribution of lead from bone to soft tissues and blood.
- Monitor transaminase levels before and at least weekly during therapy. Transient mild elevations may occur.
- Course of treatment lasts 19 days and may be repeated if indicated by weekly monitoring of lead levels.
- Minimum of 2 weeks between courses is recommended unless high lead levels indicate need for immediate therapy.
- Don't give with other chelating drugs. Patient who has received edetate calcium disodium with or without dimercaprol may use succimer after a 4-week interval.

## PATIENT TEACHING

- Explain drug use and administration to parents and child. Stress importance of complying with frequent blood tests.
- Tell parents of young child who can't swallow capsules that capsule can be opened and its contents sprinkled on a small amount of soft food. Or, beads from capsule may be poured on a spoon and followed with a fruit drink.
- Tell parents to give child adequate fluids.
- Assist parents with identifying and removing sources of lead in child's environment. Chelation therapy isn't a substitute for preventing further exposure.
- Tell parents to notify prescriber if rash occurs. Tell them allergic or other mucocutaneous reactions may occur each time drug is used.

S

**SAFETY ALERT!**

## succinylcholine chloride (suxamethonium chloride)

SUK-seh-nil-KOH-leen

Anectine, Anectine Flo-Pack, Quelicin

*Therapeutic class:* Skeletal muscle relaxant
*Pharmacologic class:* Depolarizing neuromuscular blocker
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 20 mg/ml, 100 mg/ml
*Powder for infusion:* 500-mg vial, 1-g vial

### INDICATIONS & DOSAGES

➤ **Adjunct to anesthesia to relax skeletal muscles for surgery and orthopedic manipulations; to facilitate intubation and assist with mechanical ventilation; to lessen muscle contractions in pharmacologically or electrically induced seizures**

*Adults:* 0.6 mg/kg I.V. given over 10 to 30 seconds. Dosage range is 0.3 to 1.1 mg/kg. For longer response, give continuous infusion at 0.5 to 10 mg/minute, or give 0.04 to 0.07 mg/kg intermittently, as needed, to maintain relaxation. Or, 2.5 to 4 mg/kg I.M. Maximum I.M. dose is 150 mg.
*Children:* 1 to 2 mg/kg I.V. or 3 to 4 mg/kg I.M. Maximum I.M. dose is 150 mg.

### ADMINISTRATION

**I.V.**

▼ Only staff skilled in airway management should use drug.
▼ Give test dose of 5 to 10 mg after patient has been anesthetized. If no respiratory depression or transient depression for up to 5 minutes, then patient can metabolize drug, and it's OK to continue. Don't give if patient develops respiratory paralysis sufficient to need endotracheal intubation. (Recovery should occur within 30 to 60 minutes.)
▼ Use within 24 hours after reconstitution.
▼ Store injectable form in refrigerator. Store powder form at room temperature in tightly closed container.
▼ **Incompatibilities:** Alkaline solutions, barbiturates, nafcillin, sodium bicarbonate, solutions with pH above 4.5, thiopental sodium.

**I.M.**

● Inject deeply, preferably high into deltoid muscle.
● Store injectable form in refrigerator. Store powder form at room temperature in tightly closed container.

### ACTION

Binds with a high affinity to cholinergic receptors, prolonging depolarization of the motor end plate and ultimately producing muscle paralysis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | 30–60 sec | 1–2 min | 4–10 min |
| I.M. | 2–3 min | Unknown | 10–30 min |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CV:** ***arrhythmias, bradycardia, cardiac arrest,*** tachycardia, hypertension, hypotension, flushing.
**EENT:** increased intraocular pressure.
**GI:** excessive salivation.
**Metabolic:** ***hyperkalemia.***
**Musculoskeletal:** *postoperative muscle pain,* muscle fasciculation, jaw rigidity.
**Respiratory:** ***apnea, bronchoconstriction, prolonged respiratory depression.***
**Skin:** rash.
**Other:** allergic or idiosyncratic hypersensitivity reactions, ***anaphylaxis, malignant hyperthermia, rhabdomyolysis with acute renal failure.***

### INTERACTIONS

**Drug-drug.** *Aminoglycosides, anticholinesterases (such as echothiophate, edrophonium, neostigmine, physostigmine, pyridostigmine), aprotinin, general anesthetics (such as enflurane, halothane, isoflurane), glucocorticoids, hormonal contraceptives, lidocaine, lithium, magnesium, oxytocin, polymyxin antibiotics (such as colistin, polymyxin B sulfate), procainamide, quinine:* May enhance neuromuscular blockade, increasing skeletal muscle relaxation and potentiating effect.

Use together cautiously during and after surgery.
*Cardiac glycosides:* May cause arrhythmias. Use together cautiously.
*Cyclophosphamide, lithium, MAO inhibitors:* May enhance neuromuscular blockade and prolong apnea. Use together cautiously.
*Opioid analgesics:* May enhance neuromuscular blockade, increasing skeletal muscle relaxation and possibly causing respiratory paralysis. Use together cautiously.
*Parenteral magnesium sulfate:* May enhance neuromuscular blockade, may increase skeletal muscle relaxation, and may cause respiratory paralysis. Use together cautiously, preferably at reduced doses.
**Drug-herb.** *Melatonin:* May potentiate blocking properties of drug. Ask patient about herbal remedy use, and recommend caution.

## EFFECTS ON LAB TEST RESULTS

- May increase myoglobin and potassium levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with abnormally low plasma pseudocholinesterase levels, angle-closure glaucoma, personal or family history of malignant hyperthermia, myopathies with elevated CK levels, acute major burns, multiple trauma, skeletal muscle denervation, upper motor neuron injury, or penetrating eye injuries.
- Drug may contain benzyl alcohol. Avoid use in neonates.
- Use cautiously in elderly or debilitated patients; in patients receiving quinidine or cardiac glycoside therapy; in patients with hepatic, renal, or pulmonary impairment; in those with respiratory depression, severe burns or trauma, electrolyte imbalances, hyperkalemia, paraplegia, spinal CNS injury, stroke, degenerative or dystrophic neuromuscular disease, myasthenia gravis, myasthenic syndrome related to lung cancer, dehydration, thyroid disorders, collagen diseases, porphyria, fractures, muscle spasms, eye surgery, and pheochromocytoma. Also, use large doses cautiously in patients undergoing cesarean section.

***Overdose S&S:*** Prolonged neuromuscular blockade.

## NURSING CONSIDERATIONS

- Drug has no known effect on consciousness, pain threshold, or cerebration. To avoid patient distress, don't induce neuromuscular blockade before unconsciousness.
- Dosage depends on anesthetic used, individual needs, and response. Recommended dosages must be individually adjusted.

**Black Box Warning** Drug may cause acute rhabdomyolysis with hyperkalemia followed by ventricular arrhythmias, cardiac arrest, and death after administration to apparently healthy children who have undiagnosed skeletal muscle myopathy. Institute treatment for hyperkalemia when a healthy appearing infant or child develops cardiac arrest soon after administration of succinylcholine. In children, drug should be reserved for use in emergency intubation, for instances when securing the airway is necessary, or for intramuscular use when a suitable vein is inaccessible. ■

- Children may be less sensitive to drug than adults.
- Succinylcholine is the drug of choice for procedures less than 3 minutes and for orthopedic manipulations; use cautiously with fractures or dislocations.
- Monitor baseline electrolyte determinations and vital signs. Check respirations every 5 to 10 minutes during infusion.
- Monitor respirations closely until tests of muscle strength (hand grip, head lift, and ability to cough) indicate full recovery from neuromuscular blockade.

***Alert:*** Don't use reversing drugs. Unlike nondepolarizing drugs, neostigmine or edrophonium may worsen neuromuscular blockade.

- Repeated or continuous infusions aren't advisable; they may cause reduced response or prolonged muscle relaxation and apnea.
- Give analgesics for pain.
- Keep airway clear. Have emergency respiratory support equipment (endotracheal equipment, ventilator, oxygen, atropine, and epinephrine) immediately available.

***Alert:*** Careful dosage calculation is essential. Always verify dosage with another health care professional.

S

### PATIENT TEACHING
- Explain all events and procedures to patient because he can still hear.
- Reassure patient that postoperative stiffness is normal and will soon subside.

## sucralfate
soo-KRAL-fayt

Carafate®

*Therapeutic class:* Antiulcer
*Pharmacologic class:* Gastrointestinal protectant
*Pregnancy risk category B*

### AVAILABLE FORMS
*Suspension:* 1 g/10 ml
*Tablets:* 1 g

### INDICATIONS & DOSAGES
➤ **Short-term (up to 8 weeks) treatment of duodenal ulcer**
*Adults:* 1 g P.O. q.i.d. 1 hour before meals and at bedtime.
➤ **Maintenance therapy for duodenal ulcer**
*Adults:* 1 g P.O. b.i.d.

### ADMINISTRATION
**P.O.**
- Shake suspension well before pouring.
- Following administration, flush nasogastric tube with water to ensure passage into stomach.
- Give drug on an empty stomach 1 hour before or 2 hours after meals.

### ACTION
Probably adheres to and protects surface of ulcer by forming a barrier.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | 6 hr |

*Half-life:* 6 to 20 hours.

### ADVERSE REACTIONS
**GI:** *constipation.*

### INTERACTIONS
**Drug-drug.** *Antacids:* May decrease binding of drug to gastroduodenal mucosa, impairing effectiveness. Separate doses by 30 minutes.
*Cimetidine, digoxin, fosphenytoin, ketoconazole, phenytoin, quinidine, ranitidine, tetracycline, theophylline:* May decrease absorption. Separate doses by at least 2 hours.
*Ciprofloxacin, levofloxacin, moxifloxacin, ofloxacin:* May decrease absorption of these drugs, reducing anti-infective response. If use together can't be avoided, give at least 6 hours apart.
*Diclofenac:* May decrease effectiveness of diclofenac. Monitor patient response.
*Warfarin:* May decrease anticoagulant effect. Monitor effectiveness and adjust dosage as necessary.

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
- Use cautiously in patients with chronic renal failure.

⚠ ***Overdose S&S:*** Dyspepsia, abdominal pain, nausea, vomiting.

### NURSING CONSIDERATIONS
- Drug is minimally absorbed and causes few adverse reactions.
- Monitor patient for severe, persistent constipation.
- Drug is as effective as cimetidine in healing duodenal ulcer.
- Drug contains aluminum but isn't classified as an antacid. Monitor patient with renal insufficiency for aluminum toxicity.

### PATIENT TEACHING
- Tell patient to take sucralfate on an empty stomach, 1 hour before each meal and at bedtime.
- Instruct patient to continue prescribed regimen to ensure complete healing. Pain and other ulcer signs and symptoms may subside within first few weeks of therapy.
- Urge patient to avoid cigarette smoking, which may increase gastric acid secretion and worsen disease.
- Antacids may be used while taking drug, but separate doses by 30 minutes.

## sulfacetamide sodium 1%

sul-fah-SEE-tah-mide

## sulfacetamide sodium 10%

AK-Sulf, Bleph-10, Cetamide

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Sulfonamide
*Pregnancy risk category C*

### AVAILABLE FORMS

*Ophthalmic ointment:* 10%
*Ophthalmic solution:* 10%

### INDICATIONS & DOSAGES

➤ **Inclusion conjunctivitis, corneal ulcers, chlamydial infection**

*Adults and children:* 1 or 2 drops into lower conjunctival sac every 2 to 3 hours. Increase interval as condition responds. The usual duration of treatment is 7 to 10 days. Apply 0.5 inch of 10% ointment into conjunctival sac t.i.d. to q.i.d. and at bedtime. Ointment may be used at night along with drops during the day.

➤ **Trachoma**

*Adults and children:* 2 drops into lower conjunctival sac every 2 hours with systemic sulfonamide or tetracycline.

### ADMINISTRATION

**Ophthalmic**

- Store drug away from heat in tightly closed, light-resistant container.
- Apply light finger pressure on lacrimal sac for 1 minute after drops are instilled.
- Wait at least 5 to 10 minutes before instilling other eyedrops.

### ACTION

Bacteriostatic; bactericidal in high concentrations. Prevents uptake of PABA, a metabolite of bacterial folic acid synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**EENT:** burning, eye itching, headache or brow pain, pain on instillation of drops, periorbital edema, photophobia, slowed corneal wound healing with ointment, bacterial and fungal corneal ulcers.
**Other:** overgrowth of nonsusceptible organisms.

### INTERACTIONS

**Drug-drug.** *Gentamicin (ophthalmic):* May cause in vitro antagonism. Avoid using together.
*Silver preparations:* May cause precipitate formation. Avoid using together.
**Drug-lifestyle.** *Sun exposure:* May cause photophobia. Advise patient to avoid excessive sunlight exposure.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to sulfonamides and children younger than age 2 months.
- Contraindicated in epithelial herpes simplex keratitis, vaccinia, varicella, and many other viral diseases of the cornea and conjunctiva; in mycobacterial or fungal diseases of ocular structures; and after uncomplicated removal of a corneal foreign body (corticosteroid combinations).
- Use cautiously in patients with severe dry eye. Ointment may have a negative effect on corneal epithelial healing.

### NURSING CONSIDERATIONS

- Drug is often used with oral tetracycline to treat trachoma and inclusion conjunctivitis.
- Concomitant use with topical corticosteroids may mask clinical signs and symptoms of infection and ineffective treatment. Monitor patient closely.
- ***Look alike–sound alike:*** Don't confuse Bleph-10 (sulfacetamide sodium) with Blephamide (sulfacetamide sodium and prednisolone acetate).

### PATIENT TEACHING

- Tell patient to clean excessive discharge from eye area before application.
- Teach patient how to instill drops or apply ointment. Advise him to wash hands before and after applying ointment or solution

S

and not to touch tip of dropper to eye or surrounding tissue.
- Instruct patient to apply light finger pressure on lacrimal sac for 1 minute after drops are instilled.
- Warn patient that eyedrops burn slightly.
- Advise patient to watch for and report signs and symptoms of sensitivity (itching lids, swelling, or constant burning).
- Tell patient to wait at least 5 to 10 minutes before instilling other eyedrops.
- Warn patient that solution may stain clothing.
- Tell patient to minimize sensitivity to sunlight by wearing sunglasses and avoiding prolonged exposure to sunlight.
- Advise patient not to use discolored solution.
- Tell patient not to share drug, washcloths, or towels with family members and to notify prescriber if anyone develops same signs or symptoms.
- Stress importance of compliance with recommended therapy.
- Advise patient to alert prescriber if no improvement occurs.

## sulfADIAZINE

sul-fa-DYE-a-zeen

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Sulfonamide
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 500 mg

### INDICATIONS & DOSAGES

➤ **Asymptomatic meningococcal carrier**
*Adults:* 1 g P.O. every 12 hours for 2 days.
*Children ages 1 to 12:* 500 mg P.O. every 12 hours for 2 days.
*Children ages 2 to 12 months:* 500 mg P.O. daily for 2 days.

➤ **To prevent rheumatic fever, as an alternative to penicillin**
*Children who weigh more than 30 kg (66 lb):* 1 g P.O. daily.
*Children who weigh less than 30 kg:* 500 mg P.O. daily.

➤ **Adjunctive treatment for toxoplasmosis**
*Adults:* 1 to 1.5 g P.O. q.i.d. Maximum, 6 g daily. Usually given with pyrimethamine.
*Children:* 100 to 200 mg/kg P.O. daily. Maximum, 6 g daily. Usually given with pyrimethamine.

➤ **Nocardiosis**
*Adults:* 4 to 8 g P.O. daily given in divided doses for at least 6 weeks.

### ADMINISTRATION

**P.O.**
- Before giving drug, ask patient if he's allergic to sulfa drugs.
- Give patient a glass of water with each dose, and encourage him to drink plenty of water each day to prevent urine crystals.

### ACTION

Inhibits formation of dihydrofolic acid from PABA, decreasing bacterial folic acid synthesis; bacteriostatic.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 4–6 hr | Unknown |

*Half-life:* Adults, 17 hours; children, 24 hours.

### ADVERSE REACTIONS

**CNS:** ***seizures,*** depression, hallucinations, headache.
**GI:** *diarrhea*, *nausea*, *vomiting*, abdominal pain, anorexia, stomatitis, pancreatitis.
**GU:** ***toxic nephrosis with oliguria and anuria,*** crystalluria, hematuria.
**Hematologic:** ***agranulocytosis, aplastic anemia, leukopenia, thrombocytopenia,*** hemolytic anemia, megaloblastic anemia.
**Hepatic:** jaundice.
**Skin:** *generalized skin eruption,* ***erythema multiforme, Stevens-Johnson syndrome, toxic epidermal necrolysis,*** exfoliative dermatitis, photosensitivity reactions, pruritus, urticaria.
**Other:** ***anaphylaxis,*** drug fever, hypersensitivity reactions, serum sickness.

### INTERACTIONS

**Drug-drug.** *Cyclosporine:* May decrease cyclosporine level and increase risk of nephrotoxicity. Monitor cyclosporine level.
*Drugs containing PABA:* May inhibit antibacterial action. Avoid using together.

*Hormonal contraceptives:* May decrease contraceptive effectiveness and increase risk of breakthrough bleeding. Advise patient to use a nonhormonal contraceptive.
*Methotrexate:* May increase methotrexate level. Monitor methotrexate level.
*Oral antidiabetics:* May increase hypoglycemic effect. Monitor glucose level.
*Phenytoin:* May increase phenytoin level. Monitor phenytoin level.
*Thiazide diuretics:* May increase diuretic effects. Monitor urine output.
***Warfarin:*** May increase anticoagulant effect. Monitor patient for bleeding; monitor PT and INR.
**Drug-herb.** *Dong quai, St. John's wort:* May cause photosensitivity reaction. Advise patient to avoid excessive sunlight exposure.
**Drug-lifestyle.** *Sun exposure:* May cause photosensitivity reaction. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase bilirubin, BUN, creatinine, and transaminase levels. May decrease hemoglobin level.
- May increase eosinophil count. May decrease PT and fibrinogen, granulocyte, platelet, and WBC counts.
- May alter results of urine glucose tests that use cupric sulfate (Benedict's reagent or Chemstrip uG).

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to sulfonamides, those with porphyria, infants younger than age 2 months (except in congenital toxoplasmosis), pregnant women at term, and breast-feeding women.
- Use cautiously and in reduced doses in patients with impaired hepatic or renal function, bronchial asthma, history of multiple allergies, G6PD deficiency, and blood dyscrasia.

***Overdose S&S:*** Dizziness, headache, drowsiness, unconsciousness, pyrexia, anorexia, nausea, vomiting, colic, hematuria, crystalluria; blood dyscrasias and jaundice (late signs).

## NURSING CONSIDERATIONS

- Give drug on schedule to maintain constant level.
- Monitor patient for signs and symptoms of blood dyscrasia (purpura, ecchymoses, sore throat, fever, and pallor) and report to prescriber immediately.
- Promptly report rash, sore throat, fever, cough, mouth sores, or iris lesions—early signs and symptoms of erythema multiforme, which may progress to life-threatening Stevens-Johnson syndrome, or of blood dyscrasias.
- Monitor urine cultures, CBCs, and urinalyses before and during therapy.
- Monitor renal and liver function test results.
- Watch for signs and symptoms of superinfection, such as fever, chills, and increased pulse.
- Folic or folinic acid may be used during rest periods in toxoplasmosis therapy to reverse hematopoietic depression or anemia caused by pyrimethamine and sulfadiazine.
- Monitor fluid intake and output. Maintain intake between 3,000 and 4,000 ml daily for adults to produce output of 1,500 ml daily. If fluid intake isn't adequate to prevent crystalluria, sodium bicarbonate may be given to alkalinize urine. Monitor urine pH daily.
- ***Look alike–sound alike:*** Don't confuse sulfadiazine with sulfasalazine. Don't confuse sulfonamides.

## PATIENT TEACHING

- Tell patient to take drug as prescribed, even if he feels better.
- Urge patient to drink a glass of water with each dose, plus plenty of water each day to prevent urine crystals.
- Instruct patient to report adverse reactions promptly.
- Warn patient to avoid prolonged exposure to sunlight, wear protective clothing, and use sunscreen.

S

## sulfamethoxazole and trimethoprim

sul-fa-meth-OX-a-zole and tri-meth-O-prim

Apo-Sulfatrim†, Apo-Sulfatrim DS†, Bactrim*, Bactrim DS✔, Novo-Trimel†, Novo-Trimel DS†, Nu-Cotrimox†, Protrin DF†, Septra, Septra DS, Sulfatrim*, Trisulfa DS†

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Sulfonamide and folate antagonist
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* trimethoprim 16 mg/ml and sulfamethoxazole 80 mg/ml in 5-ml vials
*Oral suspension:* trimethoprim 40 mg and sulfamethoxazole 200 mg/5 ml*
*Tablets (double-strength):* trimethoprim 160 mg and sulfamethoxazole 800 mg
*Tablets (single-strength):* trimethoprim 80 mg and sulfamethoxazole 400 mg

### INDICATIONS & DOSAGES

➤ **Shigellosis or UTIs caused by susceptible strains of *Escherichia coli, Proteus* (indole positive or negative), *Klebsiella,* or *Enterobacter* species**

*Adults:* 160 mg trimethoprim/800 mg sulfamethoxazole P.O. every 12 hours for 10 to 14 days in UTIs and for 5 days in shigellosis. If indicated, give I.V. 8 to 10 mg/kg/day, based on trimethoprim component, divided b.i.d. to q.i.d. every 6, 8, or 12 hours for 5 days for shigellosis or up to 14 days for severe UTIs. Maximum daily dose is 960 mg trimethoprim.
*Children age 2 months and older:* 8 mg/kg/day, based on trimethoprim component P.O., in two divided doses every 12 hours for 10 days for UTIs and 5 days for shigellosis. If indicated, give I.V. 8 to 10 mg/kg/day based on trimethoprim component, in two to four divided doses every 6, 8, or 12 hours for up to 14 days for severe UTIs and 5 days for shigellosis. Don't exceed adult dose.

➤ **Otitis media in patients with penicillin allergy or penicillin-resistant infection**

*Children age 2 months and older:* 8 mg/kg/day, based on trimethoprim component P.O., in two divided doses every 12 hours for 10 days.

➤ **Chronic bronchitis, upper respiratory tract infections**

*Adults:* 160 mg trimethoprim and 800 mg sulfamethoxazole P.O. every 12 hours for 14 days.

➤ **Traveler's diarrhea**

*Adults:* 160 mg trimethoprim and 800 mg sulfamethoxazole P.O. b.i.d. for 5 days.

➤ **To prevent *Pneumocystis jiroveci (carinii)* pneumonia**

*Adults:* 160 mg of trimethoprim/800 mg sulfamethoxazole P.O. daily.
*Children age 2 months and older:* 150 mg/$m^2$ trimethoprim and 750 mg/$m^2$ sulfamethoxazole P.O. daily in two divided doses on 3 consecutive days each week.

➤ ***P. jiroveci (carinii)* pneumonia**

*Adults and children older than age 2 months:* 15 to 20 mg/kg/day based on trimethoprim I.V. or P.O. in three or four divided doses for 14 to 21 days.

***Adjust-a-dose:*** For patients with creatinine clearance of 15 to 30 ml/minute, reduce daily dose by 50%. Don't give to those with creatinine clearance less than 15 ml/minute.

### ADMINISTRATION

**P.O.**

- Before giving drug, ask patient if he's allergic to sulfa drugs.
- Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
- Give drug with 8 oz. (240 ml) of water to patient with an empty stomach.

**I.V.**

▼ Before giving drug, ask patient if he's allergic to sulfa drugs.
▼ Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
▼ Don't give by rapid infusion or bolus injection.
▼ Dilute each 5 ml of concentrate in 75 to 125 ml of $D_5W$. Don't mix with other drugs or solutions.
▼ Infuse slowly over 60 to 90 minutes.
▼ Don't refrigerate; use within 6 hours if diluted in 125 ml, within 4 hours if diluted

in 100 ml, and within 2 hours if diluted in 75 ml.
▼ Discard solution if it's cloudy or crystallized.
▼ Never give drug I.M.
▼ **Incompatibilities:** Cisatracurium, fluconazole, foscarnet, linezolid, midazolam, verapamil, vinorelbine.

## ACTION

Sulfamethoxazole inhibits formation of dihydrofolic acid from PABA; trimethoprim inhibits dihydrofolate reductase formation. Both decrease bacterial folic acid synthesis and are bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–4 hr | Unknown |
| I.V. | Immediate | 1–1½ hr | Unknown |

*Half-life:* Trimethoprim, 8 to 11 hours; sulfamethoxazole, 10 to 13 hours.

## ADVERSE REACTIONS

**CNS:** ***seizures,*** apathy, aseptic meningitis, ataxia, depression, fatigue, hallucinations, headache, insomnia, nervousness, tinnitus, vertigo.
**CV:** thrombophlebitis.
**GI:** ***pancreatitis, pseudomembranous colitis,*** *diarrhea*, *nausea*, *vomiting*, abdominal pain, anorexia, stomatitis.
**GU:** ***toxic nephrosis with oliguria and anuria,*** crystalluria, hematuria, interstitial nephritis.
**Hematologic:** ***agranulocytosis, aplastic anemia, leukopenia, thrombocytopenia,*** hemolytic anemia, megaloblastic anemia.
**Hepatic:** ***hepatic necrosis,*** jaundice.
**Musculoskeletal:** arthralgia, muscle weakness, myalgia.
**Respiratory:** pulmonary infiltrates.
**Skin:** *generalized skin eruption*, ***erythema multiforme, Stevens-Johnson syndrome, toxic epidermal necrolysis,*** exfoliative dermatitis, photosensitivity reactions, pruritus, urticaria.
**Other:** ***anaphylaxis,*** drug fever, hypersensitivity reactions, serum sickness.

## INTERACTIONS

**Drug-drug.** *Cyclosporine:* May decrease cyclosporine level and increase nephrotoxicity risk. Avoid using together.
*Dofetilide:* May increase dofetilide level and effects. May increase risk of prolonged QT-interval syndrome and fatal ventricular arrhythmias. Avoid using together.
*Hormonal contraceptives:* May decrease contraceptive effectiveness and increase risk of breakthrough bleeding. Advise patient to use a nonhormonal contraceptive.
*Methotrexate:* May increase methotrexate level. Monitor methotrexate level.
*Oral antidiabetics:* May increase hypoglycemic effect. Monitor glucose level.
*Phenytoin:* May inhibit hepatic metabolism of phenytoin. Monitor phenytoin level.
***Warfarin:*** May increase anticoagulant effect. Monitor patient for bleeding; monitor PT and INR.
**Drug-herb.** *Dong quai, St. John's wort:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.
**Drug-lifestyle.** *Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

● May increase aminotransferase, bilirubin, BUN, and creatinine levels. May decrease hemoglobin level.
● May decrease granulocyte, platelet, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to trimethoprim or sulfonamides.
● Contraindicated in those with creatinine clearance less than 15 ml/minute, porphyria, or megaloblastic anemia from folate deficiency.
● Contraindicated in pregnant women at term, breast-feeding women, and infants younger than age 2 months.
● Use cautiously and in reduced dosages in patients with creatinine clearance of 15 to 30 ml/minute, severe allergy or bronchial asthma, G6PD deficiency, or blood dyscrasia.
⚠ ***Overdose S&S:*** Headache, drowsiness, unconsciousness, pyrexia, depression, confusion, anorexia, colic, nausea, vomiting, diarrhea, hematuria, crystalluria; blood dyscrasias and jaundice (late signs).

S

## NURSING CONSIDERATIONS

***Alert:*** Double-check dosage, which may be written as trimethoprim component.

***Alert:*** "DS" product means "double strength."

- Monitor renal and liver function test results.
- Promptly report rash, sore throat, fever, cough, mouth sores, or iris lesions—early signs and symptoms of erythema multiforme, which may progress to life-threatening Stevens-Johnson syndrome, or blood dyscrasias.
- Watch for signs and symptoms of superinfection, such as fever, chills, and increased pulse.

***Alert:*** Adverse reactions—especially hypersensitivity reactions, rash, and fever—occur much more frequently in patients with AIDS.

## PATIENT TEACHING

- Tell patient to take drug as prescribed, even if he feels better.
- Encourage patient to drink plenty of fluids to prevent crystalluria and kidney stone formation.
- Tell patient to report adverse reactions promptly.
- Instruct patient receiving drug I.V. to report discomfort at I.V. insertion site.
- Advise patient to avoid prolonged sun exposure, wear protective clothing, and use sunscreen.
- Instruct patient to take oral form with 8 ounces (240 ml) of water on an empty stomach.

# sulfasalazine (salazosulfapyridine, sulphasalazine)

sul-fuh-SAL-uh-zeen

Azulfidine, Azulfidine EN-tabs, Salazopyrin†, EN-Tabs†

*Therapeutic class:* Anti-inflammatory
*Pharmacologic class:* Sulfonamide, salicylate
*Pregnancy risk category B*

## AVAILABLE FORMS

*Oral suspension:* 250 mg/5 ml
*Tablets:* 500 mg
*Tablets (delayed-release):* 500 mg

## INDICATIONS & DOSAGES

➤ **Mild to moderate ulcerative colitis, adjunctive therapy in severe ulcerative colitis, Crohn's disease**

*Adults:* Initially, 3 to 4 g P.O. daily in evenly divided doses not exceeding 8 hours; usual maintenance dose is 2 g P.O. daily in divided doses every 6 hours. Dosage may be started with 1 to 2 g, with gradual increase to minimize adverse effects.

*Children 6 years and older:* Initially, 40 to 60 mg/kg P.O. daily, divided into three to six doses; then 30 mg/kg daily in four doses. Dosage may be started at lower dose if GI intolerance occurs.

➤ **Rheumatoid arthritis in patients who have responded inadequately to salicylates or NSAIDs**

*Adults (delayed-release tablets):* 2 g P.O. daily in evenly divided doses. To reduce possible GI intolerance, start at 0.5 to 1 g daily.

➤ **Polyarticular-course juvenile rheumatoid arthritis in patients who have responded inadequately to salicylates or other NSAIDs**

*Children age 6 and older (delayed-release tablets):* 30 to 50 mg/kg P.O. daily in two divided doses. Maximum dose is 2 g daily. To reduce possible GI intolerance, start with one-quarter to one-third of planned maintenance dose and increase weekly until reaching maintenance dose at 1 month.

## ADMINISTRATION

**P.O.**

- Give drug with food to decrease GI irritation.

## ACTION

Unknown.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3–12 hr | Unknown |

*Half-life:* 6 to 8 hours.

## ADVERSE REACTIONS

**CNS: *seizures,*** headache, depression, hallucinations.

**GI:** *nausea, vomiting, diarrhea,* abdominal pain, anorexia, stomatitis.
**GU:** ***toxic nephrosis with oliguria and anuria,*** crystalluria, hematuria, oligospermia, infertility.
**Hematologic:** ***agranulocytosis, leukopenia, thrombocytopenia, aplastic anemia,*** megaloblastic anemia, hemolytic anemia.
**Hepatic:** ***hepatotoxicity,*** jaundice.
**Skin:** *generalized skin eruption,* ***erythema multiforme, Stevens-Johnson syndrome, epidermal necrolysis,*** exfoliative dermatitis, photosensitivity reaction, urticaria, pruritus.
**Other:** *serum sickness, drug fever,* ***anaphylaxis,*** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Antibiotics:* May alter action of sulfasalazine by changing intestinal flora. Monitor patient closely.
*Digoxin:* May reduce absorption of digoxin. Monitor patient closely.
*Folic acid:* May decrease absorption. Monitor patient.
*Iron:* May decrease levels of sulfasalazine caused by iron chelation. Monitor patient closely.
*Methotrexate:* May displace methotrexate from protein-binding sites and decrease renal clearance. Monitor patient for hematologic toxicity and adverse GI events, especially nausea.
*Oral anticoagulants:* May increase anticoagulant effect. Watch for bleeding.
*Oral antidiabetics:* May increase hypoglycemic effect. Monitor glucose levels.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT and AST levels. May decrease hemoglobin level.
- May decrease granulocyte, platelet, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its metabolites, in those with porphyria or intestinal and urinary obstruction, and in children younger than age 2.
- Use cautiously and in reduced doses in patients with impaired hepatic or renal function, severe allergy, bronchial asthma, or G6PD deficiency.

***Overdose S&S:*** Nausea, gastric distress, abdominal pain, drowsiness, seizures.

## NURSING CONSIDERATIONS

- Therapeutic response in patients with rheumatoid arthritis may occur as soon as 4 weeks after starting therapy, but it may take up to 12 weeks in others.
- Drug may cause urine discoloration.

***Alert:*** Stop drug immediately and notify prescriber if patient shows signs and symptoms of hypersensitivity.

- ***Look alike–sound alike:*** Don't confuse sulfasalazine with sulfisoxazole, salsalate, or sulfadiazine.

## PATIENT TEACHING

- Instruct patient to take drug after eating and to space doses evenly.
- Warn patient to avoid ultraviolet light; drug may increase risk of sunburn. Advise patient to use sunscreen and wear protective clothing if outside for more than a short time and to avoid sunlamps and tanning booths.
- Advise patient that drug may produce an orange-yellow discoloration of skin and urine and may cause contact lenses to turn yellow.
- Tell patient to drink plenty of water and to swallow tablets whole without crushing or chewing.
- Advise patient that he will need blood and urine tests to monitor treatment and that it's important to keep laboratory and doctor appointments.

# sumatriptan succinate

sue-mah-TRIP-tan

Imitrex✐

*Therapeutic class:* Antimigraine
*Pharmacologic class:* Serotonin 5-$HT_1$ receptor agonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 6 mg/0.5 ml in 0.5-ml prefilled syringes and vials
*Nasal solution:* 5 mg/0.1 ml, 10 mg/0.1 ml, 20 mg/0.1 ml
*Tablets:* 25 mg, 50 mg, 100 mg (base)†

## INDICATIONS & DOSAGES

➤ **Acute migraine attacks (with or without aura)**

*Adults:* For injection, 6 mg subcutaneously; maximum dose is two 6-mg injections in 24 hours, separated by at least 1 hour.

For tablets, 25 to 100 mg P.O., initially. If desired response isn't achieved in 2 hours, may give second dose of 25 to 100 mg. Additional doses may be used in at least 2-hour intervals. Maximum daily dose, 200 mg.

For nasal spray, give 5 mg, 10 mg, or 20 mg once in one nostril; may repeat once after 2 hours, for maximum daily dose of 40 mg.

➤ **Migraines ♦**

*Children and adolescents:* For nasal spray, give 5 mg, 10 mg, or 20 mg in one nostril; may repeat once after 2 hours for a maximum daily dosage of 40 mg.

➤ **Cluster headache**

*Adults:* 6 mg subcutaneously. Maximum recommended dose is two 6-mg injections in 24 hours, separated by at least 1 hour.

***Adjust-a-dose:*** In patients with hepatic impairment, the maximum single oral dose shouldn't exceed 50 mg.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.
- Give drug whole; don't crush or break tablet.

**Subcutaneous**

- Redness or pain at injection site should subside within 1 hour after injection.

**Intranasal**

- Have patient blow his nose before use.
- Give medication on inhalation in one nostril, while blocking the other nostril.

## ACTION

May act as an agonist at serotonin receptors on extracerebral intracranial blood vessels, which constricts the affected vessels, inhibits neuropeptide release, and reduces pain transmission in the trigeminal pathways.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30 min | 90 min | Unknown |
| Subcut. | 10 min | 12 min | Unknown |
| Intranasal | Rapid | 1–2 hr | Unknown |

*Half-life:* About 2 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness, vertigo,* drowsiness, headache, anxiety, malaise, fatigue.

**CV:** ***atrial fibrillation, ventricular fibrillation, ventricular tachycardia, coronary artery vasospasm, transient myocardial ischemia, MI,*** pressure or tightness in chest.

**EENT:** discomfort of throat, nasal cavity or sinus, mouth, jaw, or tongue, altered vision.

**GI:** abdominal discomfort, dysphagia, diarrhea, nausea, vomiting, unusual or bad taste (nasal spray).

**Musculoskeletal:** myalgia, muscle cramps, neck pain.

**Respiratory:** upper respiratory inflammation and dyspnea (P.O.).

**Skin:** *injection site reaction, tingling,* diaphoresis, flushing.

**Other:** *warm or hot sensation, burning sensation,* heaviness, pressure or tightness, tight feeling in head, cold sensation, numbness.

## INTERACTIONS

**Drug-drug.** *Ergot and ergot derivatives, other 5-HT$_1$ agonists:* May prolong vasospastic effects. Don't use within 24 hours of sumatriptan therapy.

*MAO inhibitors:* May reduce sumatriptan clearance. Avoid using within 2 weeks of MAO inhibitor. Use injection cautiously and decrease sumatriptan dose.

*SSRIs:* May cause weakness, hyperreflexia, and incoordination. Monitor patient closely if use together can't be avoided.

**Drug-herb.** *Horehound:* May enhance serotonergic effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase liver enzyme levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with hypersensitivity to drug or its components; those with history, symptoms, or signs of ischemic cardiac, cerebrovascular (such as stroke or transient ischemic attack), or peripheral vascular syndromes (such as ischemic bowel disease); significant underlying CV diseases, including angina pectoris, MI, and silent myocardial ischemia; uncontrolled hypertension; or severe hepatic impairment.

- Contraindicated within 24 hours of another 5-HT agonist or drug containing ergotamine and within 2 weeks of MAO inhibitor.
- Use cautiously in woman who is or may become pregnant.
- Use cautiously in patient with risk factors for coronary artery disease (CAD), such as postmenopausal women, men older than age 40, or patients with hypertension, hypercholesterolemia, obesity, diabetes, smoking, or family history of CAD.

### NURSING CONSIDERATIONS

***Alert:*** When giving drug to patient at risk for CAD, give first dose in presence of other medical personnel. Rarely, serious adverse cardiac effects can follow administration.

***Alert:*** Combining drug with an SSRI or an SSNRI may cause serotonin syndrome. Symptoms include restlessness, hallucinations, loss of coordination, fast heartbeat, rapid changes in blood pressure, increased body temperature, hyperreflexia, nausea, vomiting, and diarrhea. Serotonin syndrome may occur when starting or increasing the dose of drug, SSRI, or SSNRI.

- After subcutaneous injection, most patients experience relief in 1 to 2 hours.
- ***Look alike–sound alike:*** Don't confuse sumatriptan with somatropin.

### PATIENT TEACHING

- Inform patient that drug is intended only to treat migraine attacks, not to prevent them or reduce their occurrence.
- If patient is pregnant or may become pregnant, tell her not to use drug but to discuss with prescriber the risks and benefits of using drug during pregnancy.
- Tell patient that drug may be taken any time during a migraine attack, as soon as signs or symptoms appear.
- Review information about drug's injectable form, which is available in a spring-loaded injector system for easier patient use. Make sure patient understands how to load the injector, give the injection, and dispose of used syringes.

***Alert:*** Tell patient to tell prescriber immediately about persistent or severe chest pain. Warn him to stop using drug and to call prescriber if he develops pain or tightness in the throat, wheezing, heart throbbing, rash, lumps, hives, or swollen eyelids, face, or lips.

- Teach patient to blow his nose before use. The patient should block other nostril while inhaling gently during administration. He should keep his head upright and breathe gently for 10 to 20 seconds after dose is given.
- Teach patient to select subcutaneous administration sites with adequate subcutaneous tissue thickness.

## sunitinib malate

soo-NIH-tih-nib

Sutent✐

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Protein-tyrosine kinase inhibitor
*Pregnancy risk category D*

### AVAILABLE FORMS

*Capsules:* 12.5 mg, 25 mg, 37.5 mg, 50 mg

### INDICATIONS & DOSAGES

➤ **GI stromal tumor that's progressing despite imatinib therapy or because patient is intolerant of imatinib; advanced renal cell carcinoma**

*Adults:* 50 mg P.O. once daily for 4 weeks, followed by 2 weeks off the drug. Repeat cycle.

***Adjust-a-dose:*** Increase or decrease dosage in 12.5-mg increments based on individual safety and tolerability.

### ADMINISTRATION

**P.O.**

- Give drug without regard for meals.

### ACTION

A multi-kinase inhibitor targeting several receptor tyrosine kinases, which are involved in tumor growth, pathologic angiogenesis, and metastatic progression of cancer.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 6–12 hr | Unknown |

*Half-life:* 40 to 60 hours; primary metabolite, 80 to 110 hours.

S

## ADVERSE REACTIONS

**CNS:** *asthenia, dizziness, fatigue, fever, headache, peripheral neuropathy.*
**CV:** ***decreased left ventricular ejection fraction, thromboembolic events,*** *hypertension,* peripheral edema.
**EENT:** increased lacrimation, periorbital edema.
**GI:** ***GI perforation, pancreatitis,*** abdominal pain, *altered taste, anorexia,* appetite disturbance, burning sensation in mouth, *constipation, diarrhea,* dyspepsia, flatulence, *mucositis,* nausea, oral pain, *stomatitis,* vomiting.
**Hematologic:** **BLEEDING, LEUKOPENIA, LYMPHOPENIA, NEUTROPENIA, THROMBOCYTOPENIA,** anemia.
**Metabolic:** *dehydration, hypernatremia, hyperuricemia, hypokalemia,* ***hyperkalemia,*** hyponatremia, hypophosphatemia, hypothyroidism.
**Musculoskeletal:** *arthralgia, back pain, limb pain, myalgia.*
**Respiratory:** *cough, dyspnea.*
**Skin:** *alopecia, dry skin, hair color changes, hand-foot syndrome, rash, skin discoloration,* skin blistering.
**Other:** ***adrenal insufficiency,*** hypothyroidism.

## INTERACTIONS

**Drug-drug.** *CYP3A4 inducers (such as carbamazepine, dexamethasone, phenobarbital, phenytoin, rifabutin, rifampin, rifapentine):* May decrease sunitinib level and effects. If use together can't be avoided, increase sunitinib dosage to 87.5 mg daily. *Strong CYP3A4 inhibitors (such as atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, voriconazole):* May increase sunitinib level and toxicity. If use together can't be avoided, decrease sunitinib dosage to 37.5 mg daily.
**Drug-herb.** *St. John's wort:* May cause an unpredictable decrease in drug level. Discourage use together.
**Drug-food.** *Grapefruit:* May increase drug level. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase AST, ALT, alkaline phosphatase, total and indirect bilirubin, amylase, lipase, creatinine, uric acid, and TSH levels. May decrease phosphorus and hemoglobin levels and hematocrit. May increase or decrease potassium and sodium levels.
- May decrease RBC, neutrophil, lymphocyte, leukocyte, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or any of its components.
- Don't use in patients with non–small cell lung cancer.
- Use cautiously in patients with electrolyte imbalance or a history of hypertension, QT-interval prolongation, concurrent antiarrhythmic use, bradycardia, MI, angina, coronary artery bypass graft, symptomatic heart failure, stroke, transient ischemic attack, or pulmonary embolism.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug may cause severe, sometimes fatal, hepatoxicity. Monitor liver function before and during each cycle of therapy. ■

***Alert:*** Drug may cause CV events, including heart failure, myocardial disorders, and cardiomyopathy, which may be fatal. Monitor CV status closely.

- Obtain CBC with platelet count and serum chemistries, including phosphate level, before each treatment cycle.
- Obtain baseline evaluation of ejection fraction in all patients before treatment. If patient had a cardiac event in the year before treatment, check ejection fraction periodically.
- Interrupt therapy or decrease dose in patients with an ejection fraction less than 50% and more than 20% below baseline.
- Monitor patient's blood pressure closely. If severe hypertension occurs, notify prescriber. Treatment may need to be held until blood pressure is controlled.
- Monitor patient for signs and symptoms of heart failure, especially if he has a history of heart disease.
- If patient has seizures, he may have reversible posterior leukoencephalopathy syndrome. Signs and symptoms include hypertension, headache, decreased alertness, altered mental functioning, and vision loss. Stop treatment temporarily.

- If patient will be undergoing surgery or suffers trauma or severe infection, assess him for adrenal insufficiency (muscle weakness, weight loss, depression, salt craving, low blood pressure).
- Provide antiemetics or antidiarrheals as needed for adverse GI effects.

***Alert:*** Drug may cause bleeding in GI tract, urinary tract, respiratory tract, and brain, which may be fatal. Monitor patient and CBC closely.

### PATIENT TEACHING

- Advise patient to keep appointments for blood tests and periodic heart function evaluations.
- Tell patient about common adverse effects, such as diarrhea, nausea, vomiting, fatigue, mouth pain, and taste disturbance.
- Inform patient about changes that may occur in skin and hair, including color changes and dry, red, blistering skin of the hands and feet.
- Urge patient to tell prescriber about all prescribed and OTC drugs or herbal supplements.
- Warn patient not to consume grapefruit during therapy.
- Tell patient to notify his prescriber about unusual bleeding, trouble breathing, wheezing, severe or prolonged diarrhea or vomiting, or swelling of the hands or lower legs.

## tacrolimus

tack-ROW-lim-us

Prograf

*Therapeutic class:* Immunosuppressant
*Pharmacologic class:* Macrolide
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules:* 0.5 mg, 1 mg, 5 mg
*Injection:* 5 mg/ml

### INDICATIONS & DOSAGES

➤ **To prevent organ rejection in allogenic liver, kidney, or heart transplant (with corticosteroids)**

*Adults:* For patients who can't take drug orally, give 0.03 to 0.05 mg/kg/day (liver or kidney) or 0.01 mg/kg/day (heart) I.V. as continuous infusion at least 6 hours after transplant. Switch to oral therapy as soon as possible, with first dose 8 to 12 hours after stopping I.V. infusion. For renal transplant, give oral dose within 24 hours of transplantation after renal function has recovered. Initial P.O. dosages: For liver transplant, give 0.1 to 0.15 mg/kg daily in two divided doses every 12 hours; for kidney transplant, give 0.2 mg/kg daily (in combination with azathioprine) or 0.1 mg/kg daily (in combination with mycophenolate mofetil and interleukin-2 receptor agonist) in two divided doses every 12 hours; for heart transplant, give 0.075 mg/kg daily in two divided doses every 12 hours. Adjust dosages based on patient response.

*Children (liver transplant only):* Initially, 0.03 to 0.05 mg/kg daily I.V. as continuous infusion; then 0.15 to 0.2 mg/kg daily P.O. on schedule similar to that of adults, adjusted as needed.

***Adjust-a-dose:*** Give lowest recommended P.O. and I.V. dosages to patients with renal or hepatic impairment.

### ADMINISTRATION

**P.O.**

- Give drug 1 hour before or 2 hours after a meal.
- Don't give with grapefruit juice.

**I.V.**

▼ Dilute drug with normal saline solution for injection or $D_5W$ injection to 0.004 to 0.02 mg/ml before use.

▼ Monitor patient continuously during first 30 minutes and frequently thereafter for signs and symptoms of anaphylaxis.

▼ Store diluted infusion solution for up to 24 hours in glass or polyethylene containers. Don't store drug in a polyvinyl chloride container because of decreased stability and potential for extraction of phthalates.

▼ **Incompatibilities:** Solutions or I.V. drugs with a pH above 9, such as acyclovir and ganciclovir.

### ACTION

Exact mechanism unknown. Inhibits T-cell activation, which results in immunosuppression.

T

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.V. | Unknown | 1½–3 hr | Unknown |

*Half-life:* 33 to 56 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia, delirium, fever, headache, insomnia, pain, paresthesia, tremor,* ***coma.***
**CV:** *peripheral edema,* hypertension.
**GI:** *abdominal pain, anorexia, ascites, constipation, diarrhea, nausea, vomiting.*
**GU:** *abnormal renal function, oliguria, UTI.*
**Hematologic:** **THROMBOCYTOPENIA,** *anemia, leukocytosis.*
**Metabolic:** *hyperglycemia,* **HYPERKALEMIA,** *hypokalemia,* **HYPOMAGNESEMIA.**
**Musculoskeletal:** *back pain.*
**Respiratory:** *atelectasis, dyspnea, pleural effusion.*
**Skin:** *burning, photosensitivity, pruritus, rash,* alopecia.

## INTERACTIONS

**Drug-drug.** ***Azole antifungals****, bromocriptine, cimetidine, clarithromycin, cyclosporine, danazol, diltiazem, erythromycin, methylprednisolone, metoclopramide, nicardipine, protease inhibitors (nelfinavir, ritonavir), proton pump inhibitors (lansoprazole, omeprazole), verapamil:* May increase tacrolimus level. Watch for adverse effects.
*Carbamazepine, phenobarbital, phenytoin,* ***rifamycins:*** May decrease tacrolimus level. Monitor effectiveness of tacrolimus.
*Cyclosporine:* May increase risk of excess nephrotoxicity. Avoid using together.
*Immunosuppressants (except adrenal corticosteroids):* May oversuppress immune system. Monitor patient closely, especially during times of stress.
*Inducers of cytochrome P-450 enzyme system:* May increase tacrolimus metabolism and decrease blood levels. Dosage adjustment may be needed.
*Inhibitors of cytochrome P-450 enzyme system (phenobarbital, phenytoin, rifampin):* May decrease tacrolimus metabolism and increase blood level. Dosage adjustment may be needed.
*Live-virus vaccines:* May interfere with immune response to live-virus vaccines. Postpone routine immunizations.
*Nephrotoxic drugs, such as aminoglycosides, amphotericin B, cisplatin, cyclosporine:* May cause additive or synergistic effects. Monitor patient closely. Don't use tacrolimus simultaneously with cyclosporine. Stop cyclosporine at least 24 hours before starting tacrolimus.
*Potassium-sparing diuretics:* May cause severe hyperkalemia. Don't use together.
*Sirolimus:* May increase risk of wound healing complications, renal impairment, and insulin-dependent post-transplant diabetes mellitus in heart transplant patients. Avoid using together.
*Ziprasidone, drugs that prolong QT interval (amiodarone, moxifloxacin):* May cause cardiac arrhythmias, including torsades de pointes. Use together is contraindicated.
**Drug-herb.** ***St. John's wort:*** May decrease drug level. Discourage use together.
**Drug-food.** *Any food:* May inhibit drug absorption. Urge patient to take drug on empty stomach.
*Grapefruit juice:* May increase drug level. Discourage patient from taking together.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN, creatinine, and glucose levels. May decrease magnesium and hemoglobin levels. May increase or decrease potassium level and cause abnormal liver function test values.
- May decrease WBC and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- I.V. form is contraindicated in patients hypersensitive to castor oil derivatives.

***Overdose S&S:*** Exaggerated adverse effects.

## NURSING CONSIDERATIONS

**Black Box Warning** Patient has increased risk for infections, lymphomas, and other malignant diseases. Only health care providers experienced in immunosuppressive therapy and management of organ transplant patients should use this drug. ■

**Alert:** Drugs causing immunosuppression increase the risk of opportunistic infections, including activation of latent viral infections (such as BK virus–associated neuropathy and JC virus–associated progressive multifocal leukoencephalopathy), which may lead to serious, even fatal outcomes.
**Alert:** Because of risk of anaphylaxis, use injection only in patients who can't take oral form. Keep epinephrine 1:1,000 and oxygen available.
• Children with normal renal and hepatic function may need higher dosages than adults.
• Patients with hepatic or renal dysfunction should receive lowest dosage possible.
• Use with adrenal corticosteroids for all indications. For heart transplant patients, also use with azathioprine or mycophenolate mofetil.
• Don't use tacrolimus simultaneously with cyclosporine. Stop either drug at least 24 hours before initiating the other.
• Monitor patient for signs and symptoms of neurotoxicity and nephrotoxicity, especially if patient is receiving a high dose or has renal or hepatic dysfunction.
• Monitor patient for signs and symptoms of hyperkalemia, such as palpitations and muscle weakness or cramping. Obtain potassium levels regularly. Avoid potassium-sparing diuretics during drug therapy.
• Monitor patient's glucose level regularly. Also monitor patient for signs and symptoms of hyperglycemia, such as dizziness, confusion, and frequent urination. Treatment of hyperglycemia may be needed. Insulin-dependent posttransplant diabetes may occur; in some cases, it's reversible.

## PATIENT TEACHING

• Advise patient to check with prescriber before taking other drugs during therapy.
• Urge patient to report adverse reactions promptly.
• Tell diabetic patient that glucose levels may increase.

# tacrolimus (topical)

## AVAILABLE FORMS

*Ointment:* 0.03%, 0.1%

## INDICATIONS & DOSAGES

➤ **Moderate to severe atopic dermatitis in patients unresponsive to other therapies or unable to use other therapies because of potential risks**
*Adults:* Thin layer of 0.03% or 0.1% strength applied to affected areas b.i.d. and rubbed in completely.
*Children age 2 and older:* Thin layer of 0.03% strength applied to affected areas b.i.d. and rubbed in completely.

## ADMINISTRATION

**Topical**
• In patients with infected atopic dermatitis, clear infections at treatment site before using drug.
• Don't use with occlusive dressings.
• Use only the 0.03% ointment in children ages 2 to 15.

## ACTION

Unknown. Probably acts as an immune system modulator in the skin by inhibiting T-lymphocyte activation, which causes immunosuppression. Drug also inhibits the release of mediators from mast cells and basophils in skin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *headache,* hyperesthesia, asthenia, insomnia, *fever,* pain.
**CV:** peripheral edema.
**EENT:** *otitis media, pharyngitis,* rhinitis, sinusitis, conjunctivitis.

T

**GI:** diarrhea, vomiting, nausea, abdominal pain, gastroenteritis, dyspepsia.
**GU:** dysmenorrhea.
**Musculoskeletal:** back pain, myalgia.
**Respiratory:** *increased cough,* ***asthma,*** pneumonia, bronchitis.
**Skin:** *burning, pruritus, erythema, infection, herpes simplex,* eczema herpeticum, pustular rash, *folliculitis,* urticaria, maculopapular rash, fungal dermatitis, acne, sunburn, tingling, benign skin neoplasm, vesiculobullous rash, dry skin, varicella zoster, herpes zoster, eczema, exfoliative dermatitis, contact dermatitis.
**Other:** *flulike symptoms, accidental injury, infection,* facial edema, alcohol intolerance, periodontal abscess, cyst, *allergic reaction.*

## INTERACTIONS

**Drug-drug.** ***Calcium channel blockers, cimetidine, CYP3A4 inhibitors (erythromycin, itraconazole, ketoconazole, fluconazole):*** May interfere with effects of tacrolimus. Use together cautiously.
*Tacrolimus (systemic):* May increase toxicity. Use together cautiously and decrease dosage as needed.
**Drug-lifestyle.** *Sun exposure:* May cause phototoxicity. Advise patient to avoid excessive sunlight or artificial ultraviolet light exposure.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.

**Black Box Warning** Don't use in children less than 2 years of age. Only 0.03% ointment is indicated for children 2 to 15 years of age. ■

- Don't use in immunocompromised patients or in patients with Netherton syndrome or generalized erythroderma.

***Alert:*** Use only after other therapies have failed because of the risk of cancer.

## NURSING CONSIDERATIONS

**Black Box Warning** Use drug only for short-term or intermittent long-term therapy. Rare cases of malignancy have been reported. ■

- If signs and symptoms of atopic dermatitis don't improve within 6 weeks, reevaluate patient to confirm the diagnosis.
- Use of this drug may increase the risk of varicella zoster, herpes simplex virus, and eczema herpeticum.
- Consider stopping drug in patients with lymphadenopathy if cause is unknown or acute mononucleosis is diagnosed.
- Monitor all cases of lymphadenopathy until resolution.
- Local adverse effects are most common during the first few days of treatment.

## PATIENT TEACHING

- Advise patient to read medication guide that comes with drug.
- Tell patient to wash hands before and after applying drug and to avoid applying drug to wet skin.
- Urge patient not to use bandages or other occlusive dressings.
- Tell patient not to bathe, shower, or swim immediately after application because doing so could wash the ointment off.
- Tell patient to stop treatment when the signs and symptoms resolve.
- Advise patient to avoid or minimize exposure to natural or artificial sunlight.
- Caution patient not to use drug for any disorder other than that for which it was prescribed.
- Encourage patient to report adverse reactions.
- Tell patient to store the ointment at room temperature.

# tadalafil

tah-DAL-ah-fill

Adcirca, Cialis

*Therapeutic class:* Erectile dysfunction drug
*Pharmacologic class:* Phosphodiesterase type-5 inhibitor
*Pregnancy risk category B*

## AVAILABLE FORMS

*Tablets (film-coated):* 2.5 mg, 5 mg, 10 mg, 20 mg

## INDICATIONS & DOSAGES

➤ **Erectile dysfunction (Cialis)**

*Adults:* 10 mg P.O. as a single dose, as needed, before sexual activity. Range is 5 to 20 mg, based on effectiveness and tolerance. Maximum is one dose daily. Or 2.5 mg P.O. once daily without regard to timing of sexual activity. May increase to 5 mg P.O. daily.

***Adjust-a-dose:*** If creatinine clearance is 31 to 50 ml/minute, starting dosage is 5 mg once daily and maximum is 10 mg once every 48 hours. If clearance is 30 ml/minute or less, maximum is 5 mg once every 72 hours. Patients with Child-Pugh category A or B shouldn't exceed 10 mg daily. Patients taking potent cytochrome P-450 inhibitors (such as erythromycin, itraconazole, ketoconazole, and ritonavir) shouldn't exceed one 10-mg dose every 72 hours; the once-daily dose shouldn't exceed 2.5 mg.

➤ **Pulmonary arterial hypertension (Adcirca)**

*Adults:* 40 (two 20-mg tablets) P.O. once daily. Dividing dose over course of the day isn't recommended.

***Adjust-a-dose:*** For patients with creatinine clearance of 31 to 80 ml/minute, start with 20 mg P.O. once daily. Avoid use in patients with creatinine clearance less than 30 ml/minute. Consider starting dose of 20 mg P.O. once daily in patients with Child-Pugh category A or B. In patients receiving ritonavir for at least 1 week, start at 20 mg P.O. once daily and increase to 40 mg as tolerated. Don't use Adcirca when starting ritonavir; stop Adcirca at least 24 hours before starting ritonavir. After at least 1 week, may give 20 mg P.O. once daily and increase to 40 mg as tolerated.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.

## ACTION

Increases cGMP levels, prolongs smooth muscle relaxation, and promotes blood flow into the corpus cavernosum.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Immediate | ½–6 hr | Unknown |

*Half-life:* 17½ hours.

## ADVERSE REACTIONS

**CNS:** dizziness, *headache.*

**CV:** flushing, hypertension.

**EENT:** decrease or loss of hearing, nasal congestion, tinnitus, nasopharyngitis.

**GI:** *dyspepsia,* abdominal pain, diarrhea, gastroesophageal reflux, gastroenteritis, *nausea.*

**Musculoskeletal:** *back pain,* limb pain, myalgia.

**Respiratory:** bronchitis, cough, upper respiratory tract infection.

## INTERACTIONS

**Drug-drug.** *Alpha blockers (except 0.4 mg tamsulosin daily), nitrates:* May enhance hypotensive effects. Use together is contraindicated.

*Potent cytochrome P-450 inhibitors (such as erythromycin, itraconazole, ketoconazole, ritonavir):* May increase tadalafil level. Don't exceed a 10-mg dose of Cialis every 72 hours.

*Rifampin and other cytochrome P-450 inducers:* May decrease tadalafil level. Monitor patient closely.

**Drug-food.** *Grapefruit:* May increase drug level. Discourage use together.

**Drug-lifestyle.** *Alcohol use:* May increase risk of headache, dizziness, orthostatic hypotension, and increased heart rate. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those taking nitrates or alpha blockers (other than tamsulosin 0.4 mg once daily).
- Drug isn't recommended for patients with Child-Pugh category C, unstable angina, angina that occurs during sexual intercourse, New York Heart Association class II or greater heart failure within past 6 months, uncontrolled arrhythmias, hypotension (lower than 90/50 mm Hg), uncontrolled hypertension (higher than 170/100 mm Hg), stroke within past 6 months, or an MI within past 90 days.
- Drug isn't recommended for patients whose cardiac status makes sexual activity

T

inadvisable or for those with hereditary degenerative retinal disorders.
• Use cautiously in patients taking potent cytochrome P-450 inhibitors (such as erythromycin, itraconazole, ketoconazole, and ritonavir) and in patients with bleeding disorders, significant peptic ulceration, or renal or hepatic impairment.
• Use cautiously in patients with conditions predisposing them to priapism (such as sickle cell anemia, multiple myeloma, and leukemia), anatomical penis abnormalities, or left ventricular outflow obstruction.
• Use cautiously in elderly patients, who may be more sensitive to drug effects.

## NURSING CONSIDERATIONS

***Alert:*** Sexual activity may increase cardiac risk. Evaluate patient's cardiac risk before he starts taking drug.
• Before patient starts drug, assess him for underlying causes of erectile dysfunction.
• Transient decreases in supine blood pressure may occur.
• Prolonged erections and priapism may occur.

## PATIENT TEACHING

• Warn patient that taking drug with nitrates could cause a serious drop in blood pressure, which increases the risk of heart attack or stroke.
• Tell patient to seek immediate medical attention if chest pain develops after taking the drug.
• Tell patient that drug doesn't protect against sexually transmitted diseases and that he should use protective measures.
• Urge patient to seek emergency medical care if his erection lasts more than 4 hours.
• Tell patient to take drug about 60 minutes before anticipated sexual activity. Explain that drug has no effect without sexual stimulation.
• Warn patient not to change dosage unless directed by prescriber.
• Caution patient against drinking large amounts of alcohol while taking drug.
• Instruct patient to notify prescriber of vision or hearing changes.

**SAFETY ALERT!**

# tamoxifen citrate

ta-MOX-i-fen

APO-Tamox†, Nolvadex-D†, Tamofen†

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Nonsteroidal antiestrogen
*Pregnancy risk category D*

## AVAILABLE FORMS

*Tablets:* 10 mg, 20 mg

## INDICATIONS & DOSAGES

➤ **Advanced breast cancer in women and men**
*Adults:* 20 mg to 40 mg P.O. daily; divide doses of more than 20 mg per day b.i.d.
➤ **Adjunct treatment of breast cancer**
*Women:* 20 mg to 40 mg P.O. daily for 5 years; divide doses of more than 20 mg per day b.i.d.
➤ **To reduce breast cancer occurrence**
*High-risk women:* 20 mg P.O. daily for 5 years.
➤ **Ductal carcinoma in situ (DCIS) after breast surgery and radiation**
*Adults:* 20 mg P.O. daily for 5 years.
➤ **Gynecomastia ♦**
*Adults:* 20 mg P.O. daily for 1 to 12 months.
➤ **Oligospermia ♦**
*Adults:* 10 mg P.O. b.i.d. for up to 18 months. Most effective when used in combination with testosterone.

## ADMINISTRATION

**P.O.**
• Drug is a hormonal agent and is considered a potential teratogen. Follow safe-handling procedures.
• Give drug without regard to food.

## ACTION

Unknown. Drug is selective estrogen-receptor modulator.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 mo–Several mo | Unknown | Several wk |

*Half-life:* Distribution phase, 7 to 14 hours; terminal phase, more than 7 days.

## ADVERSE REACTIONS

**CNS:** ***stroke,*** confusion, weakness, sleepiness, headache.
**CV:** *fluid retention, hot flashes,* ***thromboembolism.***
**EENT:** corneal changes, cataracts, retinopathy.
**GI:** *nausea, vomiting, diarrhea.*
**GU:** *amenorrhea, irregular menses, vaginal discharge,* ***endometrial cancer, uterine sarcoma,*** vaginal bleeding.
**Hematologic:** ***leukopenia, thrombocytopenia.***
**Hepatic:** ***hepatic necrosis,*** fatty liver, cholestasis.
**Metabolic:** *hypercalcemia, weight gain or loss.*
**Musculoskeletal:** brief worsening of pain from osseous metastases.
**Respiratory:** ***pulmonary embolism (PE).***
**Skin:** *skin changes,* rash, alopecia.
**Other:** temporary bone or tumor pain.

## INTERACTIONS

**Drug-drug.** *Bromocriptine:* May elevate tamoxifen level. Monitor patient closely.
*Coumarin-type anticoagulants:* May significantly increase anticoagulant effect. Monitor patient, PT, and INR closely.
*CYP3A4 inducers (such as rifampin):* May increase tamoxifen metabolism and may lower drug levels. Monitor patient for clinical effects.
*Cytotoxic drugs:* May increase risk of thromboembolic events. Monitor patient.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN, calcium, $T_4$, and liver enzyme levels.
- May decrease WBC and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Contraindicated as therapy to reduce risk of breast cancer in high-risk women who also need anticoagulants or in women with history of deep vein thrombosis or PE.
- Use cautiously in patients with leukopenia or thrombocytopenia.

***Overdose S&S:*** Tremors, hyperreflexia, unsteady gait, dizziness, seizures, prolonged QT interval.

## NURSING CONSIDERATIONS

- Monitor lipid levels during long-term therapy in patients with hyperlipidemia.
- Monitor calcium level. At start of therapy, drug may compound hypercalcemia related to bone metastases.
- Women should have baseline and periodic gynecologic examinations because of a slight increased risk of endometrial cancer.
- Women should have periodic eye exams because of increased risk of cataracts, retinal vein thrombosis, and retinopathy.
- Monitor CBC closely in patients with leukopenia or thrombocytopenia.
- Rule out pregnancy before therapy.
- Patient may initially experience worsening symptoms.
- Adverse reactions are usually minor and well tolerated.
- In postmenopausal women, karyopyknotic index of vaginal smears and various degrees of estrogen effect of Papanicolaou smears may vary.

**Black Box Warning** Women who are at high risk for breast cancer or who have DCIS and are taking drug to reduce risk may experience life-threatening endometrial cancer, uterine sarcoma, stroke, or PE. The benefits of drug outweigh its risks in women already diagnosed with breast cancer. ■

## PATIENT TEACHING

- Reassure patient that acute worsening of bone pain during therapy usually indicates drug will produce good response. Give analgesics to relieve pain.
- Strongly encourage women who are taking or have taken drug to have regular gynecologic exams because drug may increase risk of uterine cancer.
- Encourage women to have annual mammograms and breast exams.
- Advise patient to use a barrier form of contraception because short-term therapy induces ovulation in premenopausal women.
- Instruct patient to report vaginal bleeding or changes in menstrual cycle.
- Caution women to avoid becoming pregnant during therapy and first 2 months after stopping drug. Advise consulting prescriber before becoming pregnant.

T

- Advise patient that breast cancer risk assessment tools are available and that she should discuss her concerns with her prescriber.
- Tell patient to report symptoms of stroke, such as headache, vision changes, confusion, difficulty speaking or walking, and weakness of face, arm, or leg, especially on one side of the body.
- Tell patients to report symptoms of PE, such as chest pain, difficulty breathing, rapid breathing, sweating, and fainting.
- Advise patient to report vision changes.

## tamsulosin hydrochloride

tam-soo-LOE-sin

Flomax

*Therapeutic class:* BPH drug
*Pharmacologic class:* Alpha blocker
*Pregnancy risk category B*

### AVAILABLE FORMS

*Capsules:* 0.4 mg

### INDICATIONS & DOSAGES

➤ **BPH**

*Adults:* 0.4 mg P.O. once daily, given 30 minutes after same meal each day. If no response after 2 to 4 weeks, increase dosage to 0.8 mg P.O. once daily.

➤ **Adjunctive treatment of ureteral stones ♦**

*Adults:* 0.4 mg P.O. daily for up to 6 weeks or until expulsion.

### ADMINISTRATION

**P.O.**

- Don't crush or open capsules.
- Give drug 30 minutes after same meal each day.

### ACTION

Selectively blocks alpha receptors in the prostate, leading to relaxation of smooth muscles in the bladder neck and prostate, improving urine flow and reducing symptoms of BPH.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 4–5 hr | 9–15 hr |

*Half-life:* 9 to 13 hours.

### ADVERSE REACTIONS

**CNS:** *dizziness, headache,* asthenia, insomnia, somnolence, syncope, vertigo.
**CV:** chest pain, orthostatic hypotension.
**EENT:** *rhinitis,* amblyopia, pharyngitis, sinusitis.
**GI:** diarrhea, nausea.
**GU:** decreased libido, abnormal ejaculation, priapism.
**Musculoskeletal:** back pain.
**Respiratory:** increased cough.
**Other:** *infection,* tooth disorder.

### INTERACTIONS

**Drug-drug.** *Alpha blockers:* May interact with tamsulosin. Avoid using together.
*Cimetidine:* May decrease tamsulosin clearance. Use together cautiously.
*Warfarin:* Limited studies are inconclusive. Use together cautiously.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in patients with serious or life-threatening sulfa allergy.

⚠ ***Overdose S&S:*** Severe headache.

### NURSING CONSIDERATIONS

- Monitor patient for decreases in blood pressure.
- Symptoms of BPH and prostate cancer are similar; rule out prostate cancer before starting therapy.
- If treatment is interrupted for several days or more, restart therapy at the 0.4 mg P.O. once daily dose.
- ***Look alike–sound alike:*** Don't confuse Flomax with Fosamax or Volmax.

### PATIENT TEACHING

- Instruct patient not to crush, chew, or open capsules.
- Tell patient to rise slowly from chair or bed when starting therapy and to avoid situations in which injury could occur as a result of fainting. Advise him that drug may cause sudden drop in blood pressure, especially after first dose or when changing doses.

- Inform patient about the rare, but serious, possibility of priapism.
- Instruct patient not to drive or perform hazardous tasks for 12 hours after first dose or changes in dose until response can be monitored.
- Tell patient to take drug about 30 minutes after same meal each day.
- Advise patient considering cataract surgery to inform the ophthalmologist that he is taking the drug. Floppy iris syndrome may occur during surgery.

**SAFETY ALERT!**

# tapentadol hydrochloride

tah-PEN-tah-dol

Nucynta

*Therapeutic class:* Analgesic
*Pharmacologic class:* Centrally acting synthetic opioid analgesic
*Pregnancy risk category C*
*Controlled substance schedule II*

## AVAILABLE FORMS

*Tablets:* 50 mg, 75 mg, 100 mg

## INDICATIONS & DOSAGES

➤ **Moderate to severe acute pain**

*Adults:* 50 to 100 mg P.O every 4 to 6 hours, as needed for pain. On day 1, may give second dose in 1 hour if first dose is ineffective. Adjust subsequent dosing to maintain adequate pain control. Maximum daily dose, 700 mg on day 1; 600 mg on subsequent days.

***Adjust-a-dose:*** For patients with moderate hepatic impairment, initially give 50 mg P.O. every 8 hours. Maximum, three doses in 24 hours; the interval between doses should be no less than 8 hours. Drug isn't recommended for patients with severe hepatic or renal impairment.

## ADMINISTRATION

**P.O.**

- Give drug with or without food.

## ACTION

Unknown. Thought to work by possessing mu-opioid agonist activity and inhibiting norepinephrine reuptake in the brain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 1¼ hr | Unknown |

*Half-life:* 4 hours.

## ADVERSE REACTIONS

**CNS:** abnormal dreams, anxiety, ***CNS depression,*** confusion, *dizziness*, fatigue, insomnia, lethargy, *somnolence*, tremor.
**EENT:** nasopharyngitis.
**GI:** constipation, decreased appetite, dry mouth, dyspepsia, *nausea*, *vomiting*.
**GU:** UTI.
**Musculoskeletal:** arthralgia.
**Respiratory:** ***respiratory depression,*** upper respiratory tract infection.
**Skin:** hot flushes, hyperhidrosis, pruritus, rash.

## INTERACTIONS

**Drug-drug.** *CNS depressants (antiemetics, general anesthetics, hypnotics, opioid analgesics, phenothiazines, sedatives, tranquilizers):* May cause additive CNS effects. Reduce dosage of one or both drugs and monitor patient closely.
*MAO inhibitors:* May cause adverse CV events. Avoid use together. Avoid giving drug within 14 days of MAO inhibitor use.
*MAO inhibitors, selective serotonin reuptake inhibitors, serotonin and norepinephrine reuptake inhibitors, tricyclic antidepressants:* May cause serotonin syndrome (mental changes, tachycardia, labile blood pressure, hyperthermia, hyperreflexia, incoordination, nausea, vomiting, diarrhea). Avoid use together.
*Serotonergics (SNRIs, SSRIs, TCAs, triptans):* May cause potentially life-threatening serotonin syndrome. Avoid use together.
**Drug-lifestyle.** *Alcohol use:* May increase CNS effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with significant respiratory depression, or acute or severe bronchial asthma in unmonitored settings or when resuscitative equipment isn't available.

T

• Contraindicated in patients who have or are suspected of having paralytic ileus and in those receiving MAO inhibitors.
• Avoid use in patients with head injury and increased intracranial pressure.
• Use cautiously in patients with conditions accompanied by hypoxia, hypercapnia, or decreased respiratory reserve (such as asthma, chronic obstructive pulmonary disease, cor pulmonale, severe obesity, sleep apnea syndrome, myxedema, kyphoscoliosis, CNS depression, coma, or upper airway obstruction).
• Use cautiously in patients with a history of seizures, hepatic impairment, or biliary tract disease, including acute pancreatitis, and in elderly and debilitated patients.
• Safety and efficacy during pregnancy haven't been established. Use only if the benefits to the mother outweigh the risk to the fetus. It isn't known if drug appears in breast milk. However, because of the risk of serious adverse reactions, breastfeeding isn't recommended.
***Overdose S&S:*** CNS and respiratory depression, hypotension, bradycardia, hypothermia, shock, apnea, cardiopulmonary arrest.

## NURSING CONSIDERATIONS

• Keep opioid antagonist (naloxone) available.
• Monitor vital signs, respiratory status, and level of consciousness closely; drug may cause respiratory depression. If respiratory rate drops below 12 breaths/minute, hold dose and notify prescriber.
• Reassess patient's level of pain 15 to 30 minutes after giving dose.
• Avoid using drug immediately before and during labor and delivery. Monitor for respiratory depression in newborns of mothers who have been taking drug.
***Alert:*** Drug has the potential for addiction and abuse. Chewing, crushing, snorting, or injecting it can lead to overdose and death.
• Taper dosage gradually to prevent withdrawal symptoms (anxiety, sweating, insomnia, rigors, pain, nausea, tremors, diarrhea, upper respiratory symptoms, piloerection, and hallucinations).
• Prevent constipation with the use of stool softeners or senna preparations at the start of therapy.
• Drug may cause spasm of the sphincter of Oddi and may worsen pain in patients with biliary disease, including pancreatitis.

## PATIENT TEACHING

• Instruct patient to ask for drug before pain is intense and to report episodes of breakthrough pain.
• Advise ambulatory patients to use caution when getting out of bed or walking.
• Warn patient to avoid driving and other hazardous activities that require mental alertness until drug's CNS effects are known.
• Warn patient not to crush, break, chew, or dissolve tablets.
• Instruct patient to keep tablets in a child-resistant container in a safe place because accidental ingestion by a child can result in death.
• Caution patient not to consume alcohol or take drugs containing alcohol; doing so may lead to fatal overdose.
• Inform patient that drug has the potential for abuse. Advise patient to protect drug from theft.
• Tell women of childbearing age to consult prescriber if pregnant or considering becoming pregnant.
• Advise breast-feeding women to choose an alternative method of feeding infants during therapy.
• Advise patient not to stop drug abruptly.

# telavancin

tell-uh-VAN-sin

Vibativ

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Lipoglycopeptide
*Pregnancy risk category C*

## AVAILABLE FORMS

*Lyophilized powder for injection:* 250-mg, 750-mg single-use vials

## INDICATIONS & DOSAGES

➤ **Complicated skin and skin-structure infections caused by susceptible gram-positive organisms, such as *Staphylococcus aureus*, methicillin-resistant *S. aureus*, *Streptococcus pyogenes*, *Streptococcus agalactiae*, *Streptococcus agi-nosus* group, or *Enterococcus faecalis* (vancomycin-susceptible isolates only)**

*Adults:* 10 mg/kg I.V. infusion once every 24 hours for 7 to 14 days.

***Adjust-a-dose:*** For patients with creatinine clearance of 30 to 50 ml/minute, give 7.5 mg/kg every 24 hours; if clearance is 10 to 29 ml/minute, give 10 mg/kg every 48 hours.

## ADMINISTRATION

**I.V.**

▼ Reconstitute 250-mg vial with 15 ml sterile water for injection and 750-mg vial with 45 ml sterile water for injection. Solutions of $D_5W$ and normal saline solution for injection also may be used. Mix thoroughly; reconstitution may take up to 20 minutes.

▼ Further dilute doses of 150 mg to 800 mg in 100 to 250 ml of $D_5W$, normal saline solution, or lactated Ringer's solution before infusion. Further dilute doses less than 150 mg or greater than 800 mg to a final concentration of 0.6 to 8 mg/ml.

▼ Inspect for particulate matter before infusion.

▼ Infuse drug over 60 minutes.

▼ Reconstituted solution is stable for 4 hours at room temperature or 72 hours if refrigerated.

▼ Diluted I.V. solution is stable for 4 hours at room temperature or 72 hours if refrigerated (includes reconstituted time).

▼ **Incompatibilities:** Other I.V. drugs. If line is used for other I.V. drugs, flush with $D_5W$, normal saline solution or lactated Ringer's solution before and after infusion.

## ACTION

Inhibits bacterial cell-wall synthesis by binding to the bacterial cell membrane and disrupting its function.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* About 8 hours.

## ADVERSE REACTIONS

**CNS:** dizziness.
**GI:** abdominal pain, decreased appetite, diarrhea, *nausea*, *taste disturbance*, *vomiting.*
**GU:** *foamy urine.*
**Skin:** generalized pruritus, infusion-site pain, infusion-site erythema, rash.
**Other:** rigors.

## INTERACTIONS

None reported.

## EFFECTS ON LAB TEST RESULTS

● May falsely increase PT, INR, PTT, activated clotting time, and Xa factor.
● May falsely affect urine qualitative dipstick protein assays and quantitative dye methods, such as pyrogallol red-molybdate.

## CONTRAINDICATIONS & CAUTIONS

● Use cautiously in patients with renal impairment. Avoid use in patients with prolonged QTc interval, uncompensated heart failure, or severe left ventricular hypertrophy.
***Alert:*** Women of childbearing age should have a pregnancy test before therapy.
● Avoid use during pregnancy unless the risks to the mother outweigh the potential risks to the fetus.
● Register pregnant women exposed to drug in the national registry by calling 1-888-658-4228.
● It isn't known if drug appears in breast milk. Use cautiously in breast-feeding women.
● Safety and efficacy in children haven't been established.

## NURSING CONSIDERATIONS

● Monitor renal function before and during therapy.
***Alert:*** Rapid I.V. infusion may cause "red-man syndrome" (flushing of the upper body, urticaria, pruritus, or rash).
● If diarrhea develops, test patient for *Clostridium difficile* infection.

T

- Watch for signs and symptoms of superinfection, such as continued fever, chills, and increased pulse rate.
- Reduce dosage in elderly patients who have diminished renal function.

## PATIENT TEACHING

- Advise women of childbearing age to use an effective method of birth control during therapy.
- Advise women not to breast-feed while taking drug.
- Tell patient to notify prescriber if he has a history of kidney problems, heart problems (including QTc interval prolongation), or diabetes before starting drug.
- Tell patient not to skip doses or to stop treatment without notifying prescriber.
- Tell patient to notify prescriber if diarrhea develops during treatment or within 2 months of completing treatment.

# telbivudine

tell-BIV-you-deen

Tyzeka, Sebivo†

*Therapeutic class:* Antiviral
*Pharmacologic class:* Nucleoside reverse transcriptase inhibitor
*Pregnancy risk category B*

## AVAILABLE FORMS

*Oral solution:* 100 mg/5 ml
*Tablets:* 600 mg

## INDICATIONS & DOSAGES

➤ **Chronic hepatitis B**

*Adults and children age 16 or older:* 600 mg P.O. daily.

***Adjust-a-dose:*** If creatinine clearance is 30 to 49 ml/minute, give 600-mg tablet every 48 hours or 20 ml of oral solution once daily; if creatinine clearance is less than 30 ml/minute and patient doesn't require dialysis, give 600-mg tablet every 72 hours or 10 ml of oral solution once daily. For patients with end-stage renal disease, give 600-mg tablet every 96 hours after dialysis.

## ADMINISTRATION

**P.O.**

- Give drug without regard for meals.

## ACTION

Inhibits HBV replication by interrupting DNA polymerase activity.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Immediate | 1–4 hr | Unknown |

*Half-life:* 40 to 49 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, insomnia, fatigue, headache, pyrexia.
**EENT:** pharyngolaryngeal pain.
**GI:** abdominal pain, abdominal distention, diarrhea, dyspepsia, nausea.
**Hematologic:** NEUTROPENIA.
**Musculoskeletal:** myalgia, arthralgia, back pain, *myopathy*.
**Respiratory:** cough.
**Other:** pruritus, rash.

## INTERACTIONS

**Drug-drug.** *Other drugs that alter renal function (aminoglycosides, cyclosporine, NSAIDs, tacrolimus, vancomycin):* May increase risk of nephrotoxicity and cause decreased telbivudine elimination. Monitor renal function closely and adjust drug dose if necessary.

## EFFECTS ON LAB TEST RESULTS

- May increase CK, ALT, AST, lipase, creatinine, and lactate levels.
- May increase neutrophil count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in those with renal impairment.
- Use cautiously in those with lamivudine-resistant hepatitis B infection.
- Give drug to pregnant women only if potential benefit outweighs fetal risk. Register patient in the Antiretroviral Pregnancy Registry by calling 1-800-258-4263 to monitor fetal outcomes.
- Drug may appear in breast milk. Don't use drug in breast-feeding women.

• Safety and efficacy in children haven't been established.

## NURSING CONSIDERATIONS

• Monitor hepatic and renal function test results for liver transplant patients.
**Black Box Warning** The patient may develop lactic acidosis and severe hepatomegaly with steatosis during treatment. Risk factors include female gender, obesity, and concurrent antiretroviral therapy. ▮
• Monitor patient for symptoms of myopathy.
**Black Box Warning** Stopping telbivudine may cause worsening of hepatitis B. Monitor hepatic function closely during therapy and for several months after stopping the drug. Therapy may need to be restarted. ▮

## PATIENT TEACHING

• Teach patient to report immediately signs and symptoms of lactic acidosis, such as weakness, muscle pain, difficulty breathing, nausea and vomiting, coldness in arms and legs, dizziness, lightheadedness, and fast or irregular heartbeat.
• Advise patient not to change the dose or stop the drug because symptoms may worsen.
• Teach patient to report signs and symptoms of worsening liver disease, such as jaundice, dark urine, light-colored stool, decreased appetite, nausea, and stomach pain.
• Remind the patient that telbivudine won't cure HBV and doesn't stop the spread of HBV to others.

# telithromycin

teh-lith-roh-MY-sin

Ketek

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Ketolide
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 300 mg, 400 mg

## INDICATIONS & DOSAGES

➤ **Mild to moderate community-acquired pneumonia caused by *S. pneumoniae* (including multidrug-resistant isolates), *H. influenzae*, *M. catarrhalis*, *Chlamydophila pneumoniae*, or *Mycoplasma pneumoniae***
*Adults:* 800 mg P.O. once daily for 7 to 10 days.
➤ **Sinusitis** ♦
*Adults:* 800 mg P.O. once daily for 5 to 14 days or for 7 days after symptoms resolve.
***Adjust-a-dose:*** In patients with creatinine clearance less than 30 ml/minute, including those on dialysis, give 600 mg P.O. once daily. On dialysis days, give after session. In patients with clearance less than 30 ml/minute and hepatic impairment, give 400 mg once daily.

## ADMINISTRATION

**P.O.**
• Give drug with or without food.

## ACTION

Inhibits bacterial protein synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Unknown |

*Half-life:* 10 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, headache.
**EENT:** blurred vision, difficulty focusing, diplopia.
**GI:** *diarrhea*, loose stools, nausea, taste disturbance, vomiting.

## INTERACTIONS

**Drug-drug.** *Antiarrhythmics (amiodarone, bretylium, disopyramide):* May increase risk of life-threatening cardiac arrhythmias. Avoid using together.
*Atorvastatin, lovastatin, simvastatin:* May increase levels of these drugs, increasing the risk of myopathy. Avoid using together.
*Benzodiazepines (midazolam):* May increase benzodiazepine level. Monitor patient closely and adjust benzodiazepine dosage.

T

*CYP3A4 inhibitors (itraconazole, ketoconazole):* May increase telithromycin level. Monitor patient closely.
*CYP3A4 inducers (carbamazepine, phenobarbital, phenytoin):* May decrease telithromycin level. Avoid using together.
*Digoxin:* May increase digoxin level. Monitor digoxin level.
*Drugs metabolized by the cytochrome P-450 system (carbamazepine, cyclosporine, hexobarbital, phenytoin, sirolimus, tacrolimus):* May increase levels of these drugs, increasing or prolonging their effects. Use together cautiously.
*Ergot alkaloid derivatives such as ergotamine:* May increase the risk of ergot toxicity, characterized by severe peripheral vasospasm and dysesthesia. Avoid using together.
*Metoprolol:* May increase metoprolol level. Use together cautiously.
*Oral anticoagulants:* May increase anticoagulant effect. Monitor PT and INR.
*Pimozide:* May increase pimozide level. Avoid using together.
***Rifamycins:*** May significantly decrease telithromycin level. Avoid using together.
*Sotalol:* May decrease sotalol level. Monitor patient for lack of effect.
*Theophylline:* May increase theophylline level and cause nausea and vomiting. Separate doses by 1 hour.

## EFFECTS ON LAB TEST RESULTS

- May increase AST and ALT levels.
- May increase platelet count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to telithromycin or any macrolide antibiotic. Also contraindicated in patients taking pimozide.

**Black Box Warning** Contraindicated in patients with myasthenia gravis due to increased risk of life-threatening respiratory failure.

- Don't use in patients with congenitally prolonged QTc interval; those with ongoing proarrhythmic conditions, such as uncorrected hypokalemia, hypomagnesemia, or bradycardia; or those taking class IA antiarrhythmics, such as quinidine or procainamide, or class III antiarrhythmics such as dofetilide.
- Use cautiously in patients with a history of drug-induced hepatitis or jaundice and in breast-feeding women.

## NURSING CONSIDERATIONS

- Visual disturbances may occur, particularly in women and patients younger than age 40. Adverse visual effects occur most often after the first or second dose, last several hours, and sometimes return with later doses.
- Monitor patient for signs or symptoms of liver problems, including jaundice, pale stools, darkened urine, and abdominal pain.
- This drug may cause loss of consciousness. Monitor the patient closely.
- Patients with diarrhea may have pseudomembranous colitis.
- This drug may prolong the QTc interval. Rarely, an irregular heartbeat may cause the patient to faint.

## PATIENT TEACHING

- Tell patient to take entire amount of drug exactly as directed, even if he feels better.
- Tell patient that drug can be taken with or without food.
- Explain that this drug may cause visual disturbances. Caution patient to avoid hazardous activities.
- Tell patient to report diarrhea or any episodes of fainting that occur while taking this drug.
- Advise patient to immediately report signs of liver problems to prescriber.

# telmisartan

tell-mah-SAR-tan

Micardis

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Angiotensin II receptor antagonist
*Pregnancy risk category C; D in 2nd and 3rd trimesters*

## AVAILABLE FORMS

*Tablets:* 20 mg, 40 mg, 80 mg

## INDICATIONS & DOSAGES

➤ **Hypertension (used alone or with other antihypertensives)**

*Adults:* 40 mg P.O. daily. Blood pressure response is dose-related over a range of 20 to 80 mg daily.

✶ ***NEW INDICATION:*** **Cardiovascular risk reduction in patients at high risk and unable to take ACE inhibitors**

*Adults age 55 and older:* 80 mg P.O. once daily.

## ADMINISTRATION

**P.O.**

● Give drug without regard to meals.

## ACTION

Blocks vasoconstricting and aldosterone-secreting effects of angiotensin II by preventing angiotensin II from binding to the angiotensin I receptor.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 30–60 min | 24 hr |

*Half-life:* 24 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, pain, fatigue, headache.
**CV:** chest pain, hypertension, peripheral edema.
**EENT:** pharyngitis, sinusitis.
**GI:** *nausea*, abdominal pain, diarrhea, dyspepsia.
**GU:** UTI.
**Musculoskeletal:** back pain, myalgia.
**Respiratory:** cough, upper respiratory tract infection.
**Other:** flulike symptoms.

## INTERACTIONS

**Drug-drug.** *ACE inhibitors:* May affect renal function and cause acute renal failure. Monitor patient closely.
*Digoxin:* May increase digoxin level. Monitor digoxin level closely.
*Warfarin:* May decrease warfarin level. Monitor INR.
**Drug-herb.** *Ma huang:* May decrease antihypertensive effects. Discourage use together.
**Drug-food.** *Salt substitutes containing potassium:* May cause hyperkalemia. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

● May increase liver enzyme levels.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or its components.
● Use cautiously in patients with biliary obstruction disorders or renal and hepatic insufficiency and in those with an activated renin-angiotensin system, such as volume- or sodium-depleted patients (for example, those being treated with high doses of diuretics).

**Black Box Warning** Use during pregnancy can cause injury and death to the developing fetus. When pregnancy is detected, stop drug as soon as possible. ■

⚠ ***Overdose S&S:*** Hypotension, dizziness, tachycardia, bradycardia.

## NURSING CONSIDERATIONS

● Monitor patient for hypotension after starting drug. Place patient supine if hypotension occurs, and give I.V. normal saline, if needed.
● Most of the antihypertensive effect occurs within 2 weeks. Maximal blood pressure reduction is usually reached after 4 weeks. Diuretic may be added if blood pressure isn't controlled by drug alone.
***Alert:*** In patients whose renal function may depend on the activity of the renin-angiotensin-aldosterone system (such as those with severe heart failure), drug may cause oliguria or progressive azotemia and (rarely) acute renal failure or death.
● Drug isn't removed by hemodialysis. Patients undergoing dialysis may develop orthostatic hypotension. Closely monitor blood pressure.
● Monitor patients with impaired hepatic function carefully.

## PATIENT TEACHING

● Instruct patient to report suspected pregnancy to prescriber immediately.
● Inform women of childbearing age of the consequences of second and third trimester exposure to drug.
● Advise breast-feeding women about risk of adverse drug effects in infants and the need to stop either drug or breast-feeding.

T

• Tell patient that if he feels dizzy or has low blood pressure on standing, he should lie down, rise slowly from a lying to standing position, and climb stairs slowly.
• Tell patient that drug may be taken without regard to meals.
• Tell patient not to remove drug from blister-sealed packet until immediately before use.

**SAFETY ALERT!**

## temazepam

te-MAZ-e-pam

Restoril℞

*Therapeutic class:* Hypnotic
*Pharmacologic class:* Benzodiazepine
*Pregnancy risk category X*
*Controlled substance schedule IV*

### AVAILABLE FORMS

*Capsules:* 7.5 mg, 15 mg, 22.5 mg, 30 mg

### INDICATIONS & DOSAGES

➤ **Short-term treatment (7 to 10 days) of insomnia**

*Adults:* 15 to 30 mg P.O. at bedtime.
*Elderly or debilitated patients:* 7.5 mg P.O. at bedtime until individualized response is determined.

### ADMINISTRATION

**P.O.**

• Give drug 15 to 30 minutes before bedtime.
• Give drug without regard for food.

### ACTION

Probably acts on the limbic system, thalamus, and hypothalamus of the CNS to produce hypnotic effects.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | 3–18 hr |

*Half-life:* 10 to 17 hours.

### ADVERSE REACTIONS

**CNS:** complex sleep-related behaviors, drowsiness, dizziness, lethargy, disturbed coordination, daytime sedation, confusion, nightmares, vertigo, euphoria, weakness, headache, fatigue, nervousness, anxiety, depression, minor changes in EEG patterns (usually low-voltage fast activity).
**EENT:** blurred vision.
**GI:** diarrhea, nausea, dry mouth.
**Other:** ***anaphylaxis, angioedema,*** physical and psychological dependence.

### INTERACTIONS

**Drug-drug.** *Antacids (aluminum-hydroxide containing):* May decrease or delay sedative effects. Monitor patient closely.
*CNS depressants:* May increase CNS depression. Use together cautiously.
*Hormonal contraceptives:* May increase temazepam clearance. Monitor patient closely.
*Theophylline:* May decrease sedative effects. Monitor patient closely.
**Drug-herb.** *Calendula, hops, kava, lemon balm, passion flower, skullcap, valerian:* May enhance sedative effect of drug. Discourage use together.
**Drug-lifestyle.** ***Alcohol use:*** May cause additive CNS effects. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

• May increase liver function test values.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in pregnant patients and those hypersensitive to drug or other benzodiazepines.
• Use cautiously in patients with chronic pulmonary insufficiency, impaired hepatic or renal function, severe or latent depression, suicidal tendencies, and history of drug abuse.
***Overdose S&S:*** Somnolence, impaired coordination, slurred speech, confusion, coma, decreased reflexes, hypotension, seizures, respiratory depression, apnea.

### NURSING CONSIDERATIONS

***Alert:*** Monitor patient closely. Anaphylaxis and angioedema may occur as early as the first dose.
• Assess mental status before starting therapy and reduce doses in elderly patients; these patients may be more sensitive to drug's adverse CNS effects.
• Take precautions to prevent hoarding by patients who are depressed, suicidal, or

drug-dependent or who have history of drug abuse.
• Don't stop drug abruptly as this may cause withdrawal symptoms (cramps, seizures, tremor, and sweating). To discontinue drug, follow a gradual dosage-tapering schedule.
• ***Look alike–sound alike:*** Don't confuse Restoril with Vistaril.

## PATIENT TEACHING

***Alert:*** Warn patient that drug may cause allergic reactions, facial swelling, and complex sleep-related behaviors, such as driving, eating, and making phone calls while asleep. Advise patient to report these adverse effects.
• Tell patient to avoid alcohol during therapy.
• Caution patient to avoid performing activities that require mental alertness or physical coordination.
• Warn patient not to stop drug abruptly if taken for 1 month or longer.
• Tell patient that onset of drug's effects may take as long as 2 to 2¼ hours.

**SAFETY ALERT!**

# temozolomide

teh-moh-ZOH-loh-mide

Temodar

*Therapeutic class:* Diuretic
*Pharmacologic class:* Alkylating agent
*Pregnancy risk category D*

## AVAILABLE FORMS

*Capsules:* 5 mg, 20 mg, 100 mg, 140 mg, 180 mg, 250 mg
*Injection:* 100 mg

## INDICATIONS & DOSAGES

➤ **Newly diagnosed glioblastoma in combination with radiation therapy**
*Adults:* Initially, 75 mg/m$^2$ I.V. infusion or P.O. daily for 42 days. Maintenance dose is 150 mg/m$^2$ I.V. infusion or P.O. on days 1 to 5 of a 28-day cycle for six cycles; may increase dose to 200 mg/m$^2$ for cycles two to six if common toxicity criteria (CTC) is grade 2 or less, absolute neutrophil count (ANC) is $1.5 \times 10^9$/L or more, and platelet count is $100 \times 10^9$/L or more. If dose was increased in cycle two, maintain dose at 200 mg/m$^2$ for days 1 to 5 of subsequent cycles, unless toxicity occurs. If dose wasn't increased in cycle two, don't increase in subsequent cycles.

➤ **Refractory anaplastic astrocytoma**
*Adults:* Initially, 150 mg/m$^2$ I.V. infusion or P.O. daily for five days of a 28-day treatment cycle. May increase dose to 200 mg/m$^2$ for five days of a 28-day treatment cycle, if nadir and day 1 of next cycle ANC is $1.5 \times 10^9$/L or more and platelet count is $100 \times 10^9$/L or more.
***Adjust-a-dose:*** For CTC grade 2, ANC 0.5 to $1.4 \times 10^9$/L, or platelet count 10 to $99 \times 10^9$/L during concurrent radiation therapy, interrupt therapy until CTC is grade 1 or less, ANC is $1.5 \times 10^9$/L or more, and platelet count is $100 \times 10^9$/L or more. For CTC grade 3, ANC less than $1 \times 10^9$/L, or platelet count less than $50 \times 10^9$/L, reduce maintenance dose by one level; however, don't reduce below 100 mg/m$^2$. Discontinue therapy if CTC is grade 3 or 4, ANC is less than $0.5 \times 10^9$/L, or platelet count is less than $10 \times 10^9$/L.

## ADMINISTRATION

**P.O.**
• Give drug on an empty stomach to reduce nausea or vomiting. Bedtime administration may be advised.
• An antiemetic may be administered before or after giving drug.
• Don't open capsules or allow patient to chew them.

**I.V.**
▼ Preparing and giving parenteral drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.
▼ Reconstitute vial with 41 ml sterile water for injection and gently swirl vial.
▼ For infusion, withdraw proper dose of solution using aseptic technique; then transfer it into an empty 250 ml PVC infusion bag. Administer by I.V. infusion over 90 minutes using an infusion pump.
▼ Discard cloudy, particulate solution.

T

▼ Reconstituted solution is stable at room temperature for 14 hours (including the 90-minute infusion time).
▼ **Incompatibilities:** Other I.V. diluents, medications, and additives.

## ACTION

Undergoes rapid nonenzymatic conversion to a reactive compound. This compound alkalizes the cell's DNA, causing cell death.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.V. | Unknown | 1 hr | 7 days |

*Half-life:* About 2 hours.

## ADVERSE REACTIONS

**CNS:** *amnesia,* anxiety, *confusion,* depression, *dizziness, fatigue, headache, hemiparesis, insomnia, memory impairment,* paresthesia, paresis, ***seizures,*** somnolence, weakness.
**CV:** *peripheral edema.*
**EENT:** abnormal vision, *blurred vision,* diplopia, pharyngitis, sinusitis, *taste perversion.*
**GI:** *abdominal pain, anorexia, constipation, diarrhea, dysphagia, nausea, stomatitis, vomiting.*
**GU:** incontinence, UTI.
**Hematologic:** decreased hemoglobin, **LEUKOPENIA, LYMPHOPENIA, NEUTROPENIA, THROMBOCYTOPENIA.**
**Metabolic:** *adrenal hypercorticism,* weight gain.
**Musculoskeletal:** *abnormal coordination,* abnormal gait, *arthralgia, asthenia, back pain,* myalgia.
**Respiratory:** *cough, dyspnea,* upper respiratory tract infection.
**Skin:** *alopecia, dry skin, itching, rash.*
**Other:** breast pain, *viral infection, fever.*

## INTERACTIONS

**Drug-drug.** *Valproic acid:* May increase temozolomide drug levels. Use together cautiously.
**Drug-food.** *Any food:* May decrease drug absorption. Advise patient to take drug on an empty stomach.

## EFFECTS ON LAB TEST RESULTS

• May decrease hemoglobin level and WBC, neutrophil, lymphocyte, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug, its components, or dacarbazine (because both drugs are metabolized to the same reactive compound).
• Use cautiously in patients taking other drugs that cause myelosuppression, such as carbamazepine, phenytoin, and sulfamethoxazole and trimethoprim.
• Use cautiously in patients with a history of *Pneumocystis carinii* pneumonia, myelodysplastic syndrome, secondary malignancies, or severe renal or hepatic impairment.
• Drug can cause fetal harm when given to pregnant women. Use only when benefit to the mother outweighs risk to the fetus. Women shouldn't breast-feed while taking drug.
***Overdose S&S:*** Pancytopenia, fever, multisystem organ failure, death.

## NURSING CONSIDERATIONS

• Monitor vital signs and intake and output.
• Monitor CBC with differential before and after each cycle and at least weekly during therapy.
• Monitor patients, especially those receiving corticosteroids, for lymphopenia and *P. carinii* pneumonia.
• Oral and I.V. doses are equivalent when I.V. dose is infused over 90 minutes.
• Give antiemetic as prescribed to prevent nausea and vomiting.
• Monitor patients for signs and symptoms of another malignancy.

## PATIENT TEACHING

• Tell patient to swallow capsule whole with a glass of water and not to open or chew capsule. If capsule opens accidentally, caution patient to avoid inhaling the powder or getting it on the skin or mucous membranes. If powder contacts the skin or mucous membranes, advise patient to flush the area with water immediately.
• Instruct women of childbearing age to use contraceptive measures while taking drug or if male partner is receiving therapy.
• Inform patient that common side effects include nausea, vomiting, diarrhea, constipation, and hair loss.

• Advise patient to avoid exposure to people with infections.
• Tell patient to report signs of infection (fever, sore throat, fatigue) and bleeding (easy bruising, bleeding gums, nosebleeds, tarry stools).

**SAFETY ALERT!**

## temsirolimus

TEM-seer-OLE-ih-muss

Torisel

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Kinase inhibitor
*Pregnancy risk category D*

### AVAILABLE FORMS

*I.V. solution:* 25 mg/ml

### INDICATIONS & DOSAGES

➤ **Advanced renal cell carcinoma**

*Adults:* 25 mg I.V. over 30 to 60 minutes once weekly until disease progresses or unacceptable toxicity occurs. Give diphenhydramine, 25 to 50 mg I.V. 30 minutes before each dose.

***Adjust-a-dose:*** In patients with an absolute neutrophil count of less than 1,000/$mm^3$, a platelet count of less than 75,000/$mm^3$, or National Cancer Institute Common Terminology Criteria for Adverse Events grade 3 or greater adverse reactions, hold dose. Once toxicities have resolved to grade 2 or less, drug may be restarted, with dose reduced by 5 mg weekly to dose no lower than 15 mg/week.

### ADMINISTRATION

**I.V.**

▼ Refrigerate drug and protect from light.
▼ Prepare solution only in glass, polypropylene, or polyolefin containers. Don't use polyvinyl chloride containers or administration sets.
▼ Inject 1.8 ml of provided diluent into vial of temsirolimus 25 mg/ml injection. The temsirolimus vial contains an overfill of 0.2 ml (30 mg per 1.2 ml). The drug concentration of the resulting solution is 10 mg/ml. A total volume of 3 ml will be obtained, including the overfill. Mix well.
▼ Further dilute in a 250-ml container (glass, polyolefin, or polyethylene) of normal saline solution. Mixture is stable for up to 24 hours at room temperature.
▼ Give drug using a polyethylene-lined administration set. Using an infusion pump, infuse drug over 30 to 60 minutes through an in-line filter of 5 microns or less.
▼ Complete infusion within 6 hours of second dilution.
▼ Always use diluent provided to prevent precipitation. Stability with solutions other than normal saline hasn't been evaluated.
▼ **Incompatibilities:** Other I.V. drugs.

### ACTION

Binds to an intracellular protein, which halts the cell cycle, reducing tumor size.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | End of infusion | Unknown |

*Half-life:* 17.3 hours.

### ADVERSE REACTIONS

**CNS:** *asthenia,* depression, *dysgeusia, headache, insomnia, pain, pyrexia.*
**CV:** *chest pain, edema,* hypertension, *hyperlipidemia, hypertriglyceridemia,* ***venous thromboembolism,*** thrombophlebitis.
**EENT:** conjunctivitis, *pharyngitis, rhinitis.*
**GI:** *abdominal pain, anorexia,* ***bowel perforation,*** *constipation, diarrhea, mucositis, nausea, vomiting.*
**GU:** *UTI,* ***renal failure.***
**Hematologic:** *anemia,* **THROMBOCYTOPENIA, LEUKOPENIA.**
**Metabolic:** **HYPERGLYCEMIA,** *hypophosphatemia, weight loss.*
**Musculoskeletal:** *arthralgia, back pain, myalgia.*
**Respiratory:** *cough, rhinitis, pharyngitis, dyspnea, epistaxis,* ***interstitial lung disease,*** pneumonia, ***pulmonary embolism,*** respiratory tract infection.
**Skin:** *acne, dry skin, nail disorder, pruritus, rash.*
**Other:** *chills,* hypersensitivity reaction, impaired wound healing, *infections.*

T

## INTERACTIONS

**Drug-drug.** *ACE inhibitors:* Potential for angioedema. Monitor patient for difficulty swallowing, tongue swelling, and difficulty breathing.
*Anticoagulants:* May increase risk of bleeding. Use cautiously together and monitor bleeding times closely.
*CYP3A4 inducers (such as carbamazepine, dexamethasone, phenobarbital, phenytoin, rifabutin, rifampin, rifampicin):* May decrease temsirolimus level. Avoid using together, if possible. If not, increase temsirolimus dose up to 50 mg/week, as needed.
*CYP3A4 inhibitors (such as atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, voriconazole):* May increase temsirolimus level. Avoid using together, if possible. If not, decrease dose to 12.5 mg/week as needed.
*Live-virus vaccines (such as bacillus Calmette Guérin; intranasal influenza; measles, mumps, rubella; oral polio; TY21a typhoid, varicella; yellow fever):* May increase risk of infection. Avoid using together.
*Sunitinib:* May cause dose-limiting toxicity. Monitor patient carefully.
**Drug-herb.** *St. John's wort:* May decrease temsirolimus level. Discourage use together.
**Drug-food.** *Grapefruit juice:* May increase sirolimus levels, a metabolite of temsirolimus. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, AST, creatinine, glucose, total bilirubin, total cholesterol, and triglyceride levels. May decrease phosphorus, potassium, and hemoglobin levels.
- May decrease lymphocyte, neutrophil, platelet, and leukocyte counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its metabolites (including sirolimus), polysorbate 80, or any other components.
- Contraindicated in pregnancy; may cause fetal harm.
- Use cautiously in men with partners of childbearing potential. Use of reliable birth control is recommended throughout treatment and for 3 months after.
- Use cautiously in patient with CNS tumors or anticoagulation therapy because of increased risk of intracerebral bleeding.
- Use cautiously in patients with hyperglycemia, hyperlipidemia, thrombocytopenia, immunosuppression, or infections, especially during postoperative period.
- It's unknown if drug or its metabolites appear in breast milk. Patient should either stop breast-feeding or stop drug.

***Overdose S&S:*** Thrombosis, bowel perforation, interstitial lung disease, seizures, psychosis.

## NURSING CONSIDERATIONS

- Doses larger than 25 mg increase the risk of serious adverse effects. No specific treatment exists; monitor patient carefully.
- Because hypersensitivity reactions are common, give diphenhydramine 25 to 50 mg or a histamine 2 receptor antagonist (such as famotidine 20 mg or ranitidine 50 mg I.V.) 30 minutes before infusion.
- If reaction occurs, stop infusion and monitor patient for 30 to 60 minutes or more. As ordered, treatment may resume at a slower rate (up to 60 minutes).
- Monitor laboratory values regularly.
- Expect elevated triglyceride or cholesterol levels during treatment; start lipid-lowering medication as needed.
- Watch carefully for evidence of infection, especially after surgery.
- Monitor patient carefully for possible interstitial lung disease, bowel perforation, and renal failure.

## PATIENT TEACHING

- Urge patient to give a complete list of all drugs he takes, to avoid potentially dangerous interactions.
- Inform patient that temsirolimus therapy increases the risk of renal failure.
- Explain that patient will need regular blood tests during therapy.
- Inform patient of the possibility of serious allergic reaction and tell him to report immediately any facial swelling or difficulty breathing.

• Tell patient that increased blood glucose is likely and may require the start or increase of insulin or other hypoglycemic agent. Tell him to report excessive thirst or increased volume or frequency of urination.
• Tell patient that increased triglycerides and cholesterol levels are likely and may require the start of or increase in lipid-lowering agents.
• Urge patient not to miss any infusion appointments to maintain effectiveness of treatment.
• Instruct patient to immediately report any infection, open wound, breathing problem, new abdominal pain, blood in stool, or other bleeding.
• Advise patient to avoid live vaccines and close contact with those who have received live vaccines.
• Tell women (and men with partners of childbearing age) to use reliable contraception during treatment and for 3 months after last dose.
• Tell patient and partners to notify prescriber right away about possible or confirmed pregnancy.
• Tell women to consult prescriber before breast-feeding.

**SAFETY ALERT!**

## tenecteplase

teh-NEK-ti-plaze

TNKase

*Therapeutic class:* Thrombolytic
*Pharmacologic class:* Recombinant tissue plasminogen activator
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 50 mg

### INDICATIONS & DOSAGES

➤ **To reduce risk of death from an acute MI**

*Adults who weigh 90 kg (198 lb) or more:* 50 mg (10 ml) by I.V. bolus over 5 seconds.
*Adults who weigh 80 to less than 90 kg (176 to 198 lb):* 45 mg (9 ml) by I.V. bolus over 5 seconds.
*Adults who weigh 70 to just under 80 kg (154 to 176 lb):* 40 mg (8 ml) by I.V. bolus over 5 seconds.
*Adults who weigh 60 to just under 70 kg (132 to 154 lb):* 35 mg (7 ml) by I.V. bolus over 5 seconds.
*Adults who weigh less than 60 kg (132 lb):* 30 mg (6 ml) by I.V. bolus over 5 seconds.
Maximum dose is 50 mg.

### ADMINISTRATION

**I.V.**

▼ Use syringe prefilled with sterile water for injection, and inject the entire contents into drug vial. Gently swirl solution once mixed. Don't shake. Visually inspect product for particulate matter before administration.
▼ Draw up the appropriate dose needed from the reconstituted vial with the syringe and discard any unused portion. Give drug immediately, or refrigerate and use within 8 hours.
▼ Give drug in a designated line. Flush dextrose-containing lines with normal saline solution before administration.
▼ Give the drug rapidly over 5 seconds.
▼ **Incompatibilities:** Solutions containing dextrose, other I.V. drugs.

### ACTION

Binds to fibrin and converts plasminogen to plasmin. The specificity to fibrin decreases systemic activation of plasminogen and the resulting breakdown of circulating fibrinogen.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |

*Half-life:* 20 minutes to 2 hours.

### ADVERSE REACTIONS

**CNS:** ***stroke, intracranial hemorrhage.***
**EENT:** pharyngeal bleeding, epistaxis.
**GI:** ***GI bleeding.***
**GU:** hematuria.
**Skin:** *hematoma.*
**Other:** bleeding at puncture site.

### INTERACTIONS

**Drug-drug.** *Anticoagulants (heparin, vitamin K antagonists), drugs that alter platelet function (acetylsalicylic acid, dipyridamole,*

T

*glycoprotein IIb/IIIa inhibitors, NSAIDs):* May increase risk of bleeding when used before, during, or after tenecteplase use. Use together cautiously.

### EFFECTS ON LAB TEST RESULTS

- May increase PT, PTT, and INR.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with active internal bleeding; history of stroke; intracranial or intraspinal surgery or trauma during previous 2 months; intracranial neoplasm, aneurysm, or arteriovenous malformation; severe uncontrolled hypertension; or bleeding diathesis.
- Use cautiously in patients who have had recent major surgery (such as coronary artery bypass graft), organ biopsy, obstetric delivery, or previous puncture of noncompressible vessels.
- Use cautiously in pregnant women, patients age 75 and older, and patients with recent trauma, recent GI or GU bleeding, high risk of left ventricular thrombus, acute pericarditis, systolic blood pressure 180 mm Hg or higher or diastolic pressure 110 mm Hg or higher, severe hepatic dysfunction, hemostatic defects, subacute bacterial endocarditis, septic thrombophlebitis, diabetic hemorrhagic retinopathy, or cerebrovascular disease.

### NURSING CONSIDERATIONS

- Begin therapy as soon as possible after onset of MI symptoms.
- Avoid noncompressible arterial punctures and internal jugular and subclavian venous punctures. Minimize all arterial and venous punctures during treatment.
- Avoid I.M. use.
- Give heparin but not in the same I.V. line.
- Monitor patient for bleeding. If serious bleeding occurs, stop heparin and antiplatelet drugs immediately.

***Alert:*** Use exact patient weight for dosage. An overestimation in patient weight can lead to significant increase in bleeding or intracerebral hemorrhage.

- Monitor ECG for reperfusion arrhythmias.
- A life-threatening cholesterol embolism is rarely caused by thrombolytics. Signs and symptoms may include livedo reticularis (blue toe syndrome), acute renal failure, gangrenous digits, hypertension, pancreatitis, MI, cerebral infarction, spinal cord infarction, retinal artery occlusion, bowel infarction, and rhabdomyolysis.

### PATIENT TEACHING

- Advise patient about proper dental care to avoid excessive gum bleeding.
- Tell patient to report any adverse effects or excessive bleeding immediately.
- Explain use of drug to patient and family.

## tenofovir disoproxil fumarate

te-NOE-fo-veer

Viread

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Nucleotide reverse transcriptase inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS

*Tablets:* 300 mg as the fumarate salt (equivalent to 245 mg of tenofovir disoproxil)

### INDICATIONS & DOSAGES

➤ **HIV-1 infection, with other antiretrovirals**

*Adults:* 300 mg P.O. once daily. For adults weighing more than 60 kg (132 lb) who are taking didanosine concomitantly, reduce didanosine dose to 250 mg.

➤ **Chronic hepatitis B**

*Adults:* 300 mg P.O. once daily.

***Adjust-a-dose:*** For patients with creatinine clearance of 30 to 49 ml/minute, 300 mg P.O. every 48 hours. For a clearance of 10 to 29 ml/minute, 300 mg P.O. twice weekly. For patients receiving hemodialysis, 300 mg P.O. every 7 days or after a total of about 12 hours of hemodialysis. Give dose after session. There are no recommendations for patients with a creatinine clearance of less than 10 ml/minute not receiving hemodialysis.

### ADMINISTRATION

**P.O.**

- Give without regard to food.

• For patients receiving tenofovir and didanosine (enteric-coated form), give under fasted conditions or with a light meal (less than 400 kcal, 20% fat). Buffered form of didanosine taken with tenofovir should be given under fasted conditions.

## ACTION

Hydrolyzed to produce tenofovir, a nucleoside analogue of adenosine monophosphate that yields tenofovir diphosphate. Tenofovir diphosphate inhibits HIV replication.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *asthenia, headache, pain,* fever, peripheral neuropathy.
**GI:** *nausea,* abdominal pain, dyspepsia, *diarrhea,* vomiting.
**Hematologic:** ***neutropenia.***
**Hepatic:** hepatomegaly.
**Metabolic:** hyperglycemia, ***lactic acidosis.***
**Musculoskeletal:** arthralgia, back pain, myalgia.
**Skin:** *rash.*

## INTERACTIONS

**Drug-drug.** *Atazanavir:* May decrease atazanavir levels, causing resistance. Give both drugs with ritonavir.
***Didanosine (buffered or enteric-coated form):*** May increase didanosine bioavailability. Monitor patient for didanosine-related adverse effects, such as bone marrow suppression, GI distress, and peripheral neuropathy. Give under fasted conditions.
*Drugs that reduce renal function or compete for renal tubular secretion (acyclovir, cidofovir, ganciclovir, valacyclovir, valganciclovir):* May increase levels of tenofovir or other renally eliminated drugs. Monitor patient for adverse effects.

## EFFECTS ON LAB TEST RESULTS

• May increase amylase, AST, ALT, CK, serum and urine glucose, creatinine, phosphate, and triglyceride levels.
• May decrease neutrophil count.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to any component of the drug.
• Use very cautiously in patients with risk factors for liver disease or with hepatic impairment.
• Don't use triple antiretroviral therapy with abacavir, lamivudine, and tenofovir as new regimen for naive or pretreated patient with HIV infection because of high rate of early virologic resistance.
• Use in pregnant women only if benefits clearly outweigh risks.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug may cause lactic acidosis and hepatomegaly with steatosis, even fatal cases. These effects may occur without elevated transaminase levels. Risk factors include long-term antiretroviral use, obesity, and being female. Monitor all patients closely. ■
**Black Box Warning** Severe acute exacerbations of hepatitis have been reported in hepatitis B–infected patients after antihepatitis B therapy has stopped. Monitor hepatic function closely for at least several months. Resumption of therapy may be warranted. ■
• Drug may cause body fat to accumulate and be redistributed, resulting in central obesity, peripheral wasting, and buffalo hump. Monitor patient for changes in body fat.
• Drug may be linked to osteomalacia and decreased bone mineral density and increased creatinine and phosphaturia levels. Monitor patient carefully during long-term treatment.
• Drug may lead to decreased HIV RNA level and CD4 + cell counts.
• In elderly patients, use drug cautiously because these patients may be taking other drugs and may be at higher risk for decreased renal function.
• Because of a high rate of early virologic resistance, triple antiretroviral therapy with abacavir, lamivudine, and tenofovir shouldn't be used as new regimen for naive or pretreated patient with HIV infection. Monitor patients currently controlled with this regimen and those who use this regimen

T

with other antiretrovirals, and consider a different therapy.

### PATIENT TEACHING

- Instruct patient to take drug with a meal to enhance bioavailability.
- Inform patient that drug doesn't cure HIV infection, that opportunistic infections and other complications of HIV infection may still occur, and that transmission of HIV to others through sexual contact or blood contamination is still possible.
- If patient takes tenofovir and didanosine (buffered or enteric-coated form), instruct him to take these drugs on an empty stomach.
- Tell patient to report adverse effects, including nausea, vomiting, diarrhea, flatulence, and headache.

## terazosin hydrochloride

ter-AY-zoe-sin

Hytrin®

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Alpha blocker
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules:* 1 mg, 2 mg, 5 mg, 10 mg
*Tablets:* 1 mg, 2 mg, 5 mg, 10 mg

### INDICATIONS & DOSAGES

➤ **Hypertension**

*Adults:* Initially, 1 mg P.O. at bedtime. Dosage may be increased gradually based on response. Usual dosage range is 1 to 5 mg daily. Maximum recommended dose is 20 mg daily.
*Children ages 1 to 17:* Initially, 1 mg P.O. daily. Maximum dosage is 20 mg P.O. daily.

➤ **Symptomatic BPH**

*Adults:* Initially, 1 mg P.O. at bedtime. Dosage may be titrated to 2, 5, or 10 mg once daily to achieve optimal response. Most patients need 10 mg daily for optimal response.

### ADMINISTRATION

**P.O.**

- Give drug without regard for meals.

### ACTION

Improves urine flow in patients with BPH by blocking alpha-adrenergic receptors in the bladder neck and prostate, relieving urethral pressure. Drug also reduces peripheral vascular resistance and blood pressure via arterial and venous dilation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 15 min | 2–3 hr | 24 hr |

*Half-life:* About 12 hours.

### ADVERSE REACTIONS

**CNS:** *headache*, *dizziness*, asthenia, first-dose syncope, nervousness, paresthesia, somnolence.
**CV:** *peripheral edema*, palpitations, orthostatic hypotension, tachycardia, atrial fibrillation.
**EENT:** *nasal congestion*, sinusitis, blurred vision.
**GI:** nausea.
**GU:** impotence, priapism.
**Hematologic:** ***thrombocytopenia.***
**Musculoskeletal:** back pain, muscle pain.
**Respiratory:** dyspnea.

### INTERACTIONS

**Drug-drug.** *Antihypertensives:* May cause excessive hypotension. Use together cautiously.
**Drug-herb.** *Butcher's broom:* May decrease drug effect. Discourage use together.
*Ma huang:* May decrease antihypertensive effects. Discourage use together.

### EFFECTS ON LAB TEST RESULTS

- May decrease total protein and albumin levels. May decrease hemoglobin level and hematocrit.
- May decrease WBC and platelet counts.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.

⚠ ***Overdose S&S:*** Hypotension.

### NURSING CONSIDERATIONS

- Monitor blood pressure frequently.

***Alert:*** If terazosin is stopped for several days, readjust dosage using first dosing regimen (1 mg P.O. at bedtime).

## PATIENT TEACHING

- Tell patient not to stop drug suddenly, but to notify prescriber if adverse reactions occur.
- Warn patient to avoid hazardous activities that require mental alertness, such as driving or operating heavy machinery, for 12 hours after first dose.
- Tell patient that light-headedness can occur, especially during the first few days of therapy. Advise him to rise slowly to minimize this effect and to report signs and symptoms to prescriber.

# terbinafine hydrochloride (oral)

ter-BIN-ah-fin

Lamisil

*Therapeutic class:* Antifungal
*Pharmacologic class:* Synthetic allylamine derivative
*Pregnancy risk category B*

## AVAILABLE FORMS

*Oral granules (packets):* 125 mg, 187.5 mg
*Tablets:* 250 mg

## INDICATIONS & DOSAGES

➤ **Fingernail and toenail onychomycosis caused by dermatophytes (tinea unguium)**

*Adults:* 250 mg P.O. once daily for 6 weeks for fingernail infection and 12 weeks for toenail infection.

➤ **Tinea capitis**

*Adults:* 250 mg P.O. once daily for 6 weeks (granules only).
*Children age 4 and older:* One dose of granules daily for 6 weeks based on body weight. For <25 kg, give 125 mg; 25 to 35 kg, 187.5 mg; >35 kg, 250 mg.

## ADMINISTRATION

**P.O.**

- Obtain pretreatment transaminase levels for all patients taking drug. Tablets aren't recommended for patients with acute or chronic liver disease.
- Give tablets without regard for food.
- Sprinkle entire contents of granule packet on a spoonful of nonacidic food, such as pudding or mashed potatoes. Have patient swallow spoonful without chewing.

## ACTION

Prevents biosynthesis of ergosterol, causing a deficiency of this essential component of fungal cell membranes.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 hr | Unknown |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *headache.*
**EENT:** vision disturbances.
**GI:** taste disturbances, diarrhea, dyspepsia, abdominal pain, nausea, flatulence.
**Hematologic:** ***neutropenia, thrombocytopenia.***
**Hepatic:** hepatobiliary dysfunction, including cholestatic jaundice.
**Skin:** ***Stevens-Johnson syndrome, toxic epidermal necrolysis,*** rash, pruritus, urticaria.
**Other:** ***anaphylaxis,*** hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *Antiarrhythmics class type 1C (flecainide) and beta blockers:* Inhibit drugs metabolized by CYP2D6 isozyme. Monitor patient carefully and decrease dosage as necessary.
*Caffeine:* May decrease caffeine clearance. Use cautiously together.
*Cimetidine:* May decrease clearance of terbinafine by one-third. Avoid using together.
*Cyclosporine:* May increase cyclosporine clearance. Monitor cyclosporine level.
*SSRIs (paroxetine, venlafaxine):* May increase SSRI levels. Monitor patient carefully and adjust SSRI dosage as necessary.

## EFFECTS ON LAB TEST RESULTS

- May increase AST and ALT levels.
- May decrease neutrophil and lymphocyte counts.

T

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug, pregnant or breast-feeding women, those with liver disease, and those with creatinine clearance less than 50 ml/minute.
***Overdose S&S:*** Abdominal pain, dizziness, frequent urination, headache, nausea, rash, vomiting.

## NURSING CONSIDERATIONS

***Alert:*** Rarely, patients may suffer life-threatening liver failure.
● Monitor CBC and hepatic enzyme levels in patients receiving drug for longer than 6 weeks. Stop drug if hepatobiliary dysfunction or cholestatic hepatitis develops.
● ***Look alike–sound alike:*** Don't confuse terbinafine with terbutaline or Lamisil with Lamictal.

## PATIENT TEACHING

● Inform patient that successful treatment may take 10 weeks for toenail infections and 4 weeks for fingernail infections.
● Tell patient to immediately report vision disturbances (changes in the ocular lens and retina may occur) as well as persistent nausea, anorexia, fatigue, vomiting, right upper quadrant pain, jaundice, dark urine, or pale stools.
● Teach patient to sprinkle entire contents of granule packet on spoonful of nonacidic food, such as pudding or mashed potatoes, and to swallow without chewing.

# terbinafine hydrochloride (topical)

ter-BIN-ah-fin

Lamisil ◇, Lamisil AT ◇

*Therapeutic class:* Antifungal
*Pharmacologic class:* Allylamine derivative
*Pregnancy risk category B*

## AVAILABLE FORMS

*Cream:* 1% ◇
*Gel:* 1% ◇
*Spray:* 1% ◇

## INDICATIONS & DOSAGES

➤ **Athlete's foot, tinea versicolor**
*Adults and children age 12 and older:* Apply b.i.d. for at least 1 week, but no longer than 4 weeks.
➤ **Jock itch, ringworm**
*Adults and children age 12 and older:* Apply once daily for at least 1 week, but no longer than 4 weeks.

## ADMINISTRATION

**Topical**
● Wash affected area with soap and water and dry completely before application.
● Don't apply an occlusive dressing without a specific order.
● This drug isn't for ophthalmic use. Avoid contact with mucous membranes.

## ACTION

Fungicidal; selectively inhibits an early step in synthesis of sterols used by fungi for cell-wall synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* About 21 hours.

## ADVERSE REACTIONS

**Skin:** irritation, pruritus, skin exfoliation.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug or its components and in breast-feeding women.

## NURSING CONSIDERATIONS

● Observe patient for 2 to 6 weeks after therapy is complete to determine whether treatment was successful; review diagnosis if condition persists.
● Drug isn't intended for oral, ophthalmic, or vaginal use.
● ***Look alike–sound alike:*** Don't confuse terbinafine with terbutaline. Don't confuse Lamisil with Lamictal.

### PATIENT TEACHING

- Teach patient proper use of drug. Tell him to wash affected area with soap and water and dry completely before applying.
- Advise patient to use only as directed for full recommended course, even if signs and symptoms disappear, and not to apply near eyes, mouth, or mucous membranes or to use occlusive dressings unless so directed.
- Instruct patient with athlete's foot to wear well-fitting, ventilated shoes.
- Tell patient to wash hands after applying.
- Tell patient to stop drug and contact prescriber if irritation or sensitivity develops.
- Tell patient to store drug between 41° and 86° F (5° and 30° C).

## terbutaline sulfate

ter-BYOO-ta-leen

*Therapeutic class:* Bronchodilator
*Pharmacologic class:* $Beta_2$ agonist
*Pregnancy risk category B*

### AVAILABLE FORMS

*Injection:* 1 mg/ml
*Tablets:* 2.5 mg, 5 mg

### INDICATIONS & DOSAGES

➤ **Bronchospasm in patients with reversible obstructive airway disease**

*Adults and children age 13 and older:* 0.25 mg subcutaneously. Repeat in 15 to 30 minutes, p.r.n. Maximum, 0.5 mg in 4 hours. If patient fails to respond to second dose, consider other measures.

*Adults and adolescents older than age 15:* 2.5 to 5 mg P.O. t.i.d. every 6 hours while awake. Maximum, 15 mg daily.

*Children ages 12 to 15:* 2.5 mg P.O. t.i.d. every 6 hours while awake. Maximum, 7.5 mg daily.

➤ **Preterm labor ♦**

*Adults:* 2.5 to 10 mcg/minute I.V. Increase dosage at 10 to 20 minute intervals until desired effects are achieved. Effective maximum recommended dosage ranges from 17.5 to 30 mcg/minute. Continue infusion for 12 hours after contractions cease. After I.V. therapy is complete oral therapy can be initiated at 2.5 to 10 mg P.O. every 4 to 6 hours. Or, 0.25 mg subcutaneously every 20 minutes to 3 hours for up to 48 hours.

### ADMINISTRATION

**P.O.**

- Give drug without regard for food.

**I.V.**

- ▼ Give only by infusion pump.
- ▼ Protect drug from light. Don't use if discolored.

**Subcutaneous**

- Give subcutaneous injections into the side of the deltoid.
- Protect drug from light. Don't use if discolored.

### ACTION

Relaxes bronchial smooth muscle by stimulating $beta_2$ receptors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30 min | 2–3 hr | 4–8 hr |
| Subcut. | 15 min | 30 min | 1½–4 hr |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**CNS:** *nervousness, tremor, drowsiness, dizziness, headache,* weakness.
**CV:** *palpitations,* ***arrhythmias,*** tachycardia, flushing.
**GI:** *vomiting, nausea,* heartburn.
**Metabolic:** hypokalemia.
**Respiratory:** ***paradoxical bronchospasm with prolonged use,*** dyspnea.
**Skin:** diaphoresis.

### INTERACTIONS

**Drug-drug.** *Cardiac glycosides, cyclopropane, halogenated inhaled anesthetics, levodopa:* May increase risk of arrhythmias. Monitor patient closely, and avoid using together with levodopa.

*CNS stimulants:* May increase CNS stimulation. Avoid using together.

*MAO inhibitors:* When given with sympathomimetics, may cause severe hypertension (hypertensive crisis). Avoid using together.

*Propranolol, other beta blockers:* May block bronchodilating effects of terbutaline. Avoid using together.

### EFFECTS ON LAB TEST RESULTS

- May decrease potassium level.

T

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug or sympathomimetic amines.
- Use cautiously in patient with CV disorders, hyperthyroidism, diabetes, or seizure disorders.

***Overdose S&S:*** Seizures, angina, hypertension, hypotension, tachycardia, arrhythmias, nervousness, headache, tremors, dry mouth, palpitations, nausea, dizziness, fatigue, insomnia, hypokalemia.

### NURSING CONSIDERATIONS
- Drug may reduce the sensitivity of spirometry for the diagnosis of bronchospasm.
- Withhold drug and notify prescriber if patient's heart rate is greater than 120 beats/minute.
- Monitor patient for circulatory overload.
- ***Look alike–sound alike:*** Don't confuse terbutaline with tolbutamide or terbinafine.

### PATIENT TEACHING
- Make sure patient and caregivers understand why patient needs drug.
- Remind patient to separate oral doses by 6 hours.

## terconazole
ter-CONE-uh-zole

Terazol 3, Terazol 7

*Therapeutic class:* Antifungal
*Pharmacologic class:* Triazole derivative
*Pregnancy risk category C*

### AVAILABLE FORMS
*Vaginal cream:* 0.4%, 0.8%
*Vaginal suppositories:* 80 mg

### INDICATIONS & DOSAGES
➤ **Vulvovaginal candidiasis**

*Adults:* One applicatorful of cream or 1 suppository inserted into vagina at bedtime; 0.4% cream used for 7 consecutive days; 0.8% cream or 80-mg suppository for 3 consecutive days. Repeat course, if needed, after reconfirmation by smear or culture.

### ADMINISTRATION
**Vaginal**
- Insert drug high in vagina (unless patient is pregnant).
- Store drug at room temperature.

### ACTION
May increase *Candida* cell membrane permeability.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Vaginal | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS
**CNS:** *headache,* fever.
**GI:** abdominal pain.
**GU:** dysmenorrhea, genital pain, vulvovaginal burning.
**Skin:** pruritus, irritation, photosensitivity.
**Other:** body aches.

### INTERACTIONS
None significant.

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug or its inactive ingredients.

### NURSING CONSIDERATIONS
- Therapeutic effect of drug is unaffected by menstruation or hormonal contraceptive use.
- ***Look alike–sound alike:*** Don't confuse terconazole with tioconazole.

### PATIENT TEACHING
- Advise patient to continue treatment during menstrual period. However, tell her not to use tampons.
- Instruct patient to insert drug high in vagina (except during pregnancy).
- Tell patient to use drug for full treatment period prescribed. Explain how to prevent reinfection.
- Instruct patient to notify prescriber and stop drug if fever, chills, other flulike signs and symptoms, or sensitivity develops.
- Caution patient to refrain from sexual intercourse during treatment.

• Tell patient that drug base may react with latex, causing decreased effectiveness of condoms and diaphragms (for up to 72 hours after treatment is completed).
• Instruct patient to store drug at room temperature.

## teriparatide (rDNA origin)

tehr-ih-PAHR-uh-tide

Forteo

*Therapeutic class:* Antiosteoporotic
*Pharmacologic class:* Recombinant human parathyroid hormone (PTH)
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 20 mcg/dose in multidose prefilled pen

### INDICATIONS & DOSAGES

➤ **Osteoporosis in postmenopausal women at high risk for fracture; primary or hypogonadal osteoporosis in men at high risk for fracture; glucocorticoid-induced osteoporosis in men and women**
*Adults:* 20 mcg subcutaneously in thigh or abdominal wall once daily.

### ADMINISTRATION

**Subcutaneous**
• Inspect solution before giving.
• Drug is a colorless, clear liquid.
• Don't use if solid particles are present or if the solution is cloudy or colored.
• Give while patient is in a sitting position to avoid orthostatic hypotension.
• Discard the pen after the 28-day use period, even if some unused solution still remains.

### ACTION

Promotes new bone formation, skeletal bone mass, and bone strength by regulating calcium and phosphorus metabolism in bones and kidneys.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | Rapid | 30 min | 3 hr |

*Half-life:* 1 hour.

### ADVERSE REACTIONS

**CNS:** asthenia, depression, dizziness, headache, insomnia, *pain,* syncope, vertigo.
**CV:** angina pectoris, hypertension, orthostatic hypotension.
**EENT:** pharyngitis, rhinitis.
**GI:** constipation, diarrhea, dyspepsia, nausea, tooth disorder, vomiting.
**Metabolic:** hypercalcemia.
**Musculoskeletal:** *arthralgia,* leg cramps, neck pain.
**Respiratory:** dyspnea, increased cough, pneumonia.
**Skin:** rash, sweating.

### INTERACTIONS

**Drug-drug.** *Calcium supplements:* May increase urinary calcium excretion. Dosage may need adjustment.
*Digoxin:* May predispose hypercalcemic patient to digitalis toxicity. Use together cautiously.

### EFFECTS ON LAB TEST RESULTS

• May increase calcium and uric acid levels. May decrease phosphorus level.
• May increase urinary calcium and phosphorus excretion.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to teriparatide or its components.
**Black Box Warning** Contraindicated in patients at increased risk for osteosarcoma, such as those with Paget disease or unexplained alkaline phosphatase elevations, children, and young adults with open epiphyses, and patients who have had skeletal radiation.
• Contraindicated in patients with bone metastases, a history of skeletal malignancies, hypercalcemia, or metabolic bone diseases other than osteoporosis; and in patients with hypercalcemia.
• Use cautiously in patients with active or recent urolithiasis or hepatic, renal, or cardiac disease, or hypotension.
• Don't use in nursing mothers.
⚠ ***Overdose S&S:*** Hypercalcemia, orthostatic hypotension, nausea, vomiting, dizziness, headache.

T

## NURSING CONSIDERATIONS

**Black Box Warning** Because of the risk of osteosarcoma, give drug only to patients for whom benefits outweigh risk. ■

- Treatment shouldn't exceed 2 years.
- If patient may have urolithiasis or hypercalciuria, measure urinary calcium excretion before treatment.
- Monitor patient for orthostatic hypotension, which may occur within 4 hours of dosing.
- Monitor calcium level. If persistent hypercalcemia develops, stop drug and evaluate possible cause.

## PATIENT TEACHING

- Instruct patient on proper use and disposal of prefilled pen.
- Tell patient not to share pen with others.
- Advise patient to remain in a sitting position while taking drug to prevent orthostatic hypotension.
- Advise patient to sit or lie down if drug causes a fast heart beat, light-headedness, or dizziness. Tell patient to report persistent or worsening symptoms.
- Urge patient to report persistent symptoms of hypercalcemia, which include nausea, vomiting, constipation, lethargy, and muscle weakness.
- Tell patient to discard pen after 28-day use period, even if some unused solution remains.

# testosterone

tes-TOS-te-rone

Striant, Testopel

# testosterone cypionate

Depo-Testosterone

# testosterone enanthate

Delatestryl

*Therapeutic class:* Hormone replacement
*Pharmacologic class:* Androgen
*Pregnancy risk category X*
*Controlled substance schedule III*

## AVAILABLE FORMS

**testosterone**
*Blister packs (buccal; extended-release):* 30 mg
*Pellets (subcutaneous implant):* 75 mg
**testosterone cypionate**
*Injection (in oil):* 100 mg/ml, 200 mg/ml
**testosterone enanthate**
*Injection (in oil):* 200 mg/ml

## INDICATIONS & DOSAGES

➤ **Hypogonadism**
*Men:* 50 to 400 mg cypionate or enanthate I.M. every 2 to 4 weeks. Or, 150 to 450 mg (2 to 6 pellets) implanted subcutaneously every 3 to 6 months. Or, apply 1 buccal system (30 mg) to the gum region just above the incisor tooth on either side of the mouth, b.i.d., morning and evening about 12 hours apart. Alternate sides of the mouth with each application.

➤ **Delayed puberty**
*Men and boys:* 50 to 200 mg enanthate I.M. every 2 to 4 weeks for 4 to 6 months.

➤ **Metastatic breast cancer**
*Women 1 to 5 years after menopause:* 200 to 400 mg enanthate I.M. every 2 to 4 weeks.

## ADMINISTRATION

**I.M.**
- Store I.M. preparations at room temperature. If crystals appear, warm and shake bottle to disperse them.
- Inject deep into upper outer quadrant of gluteal muscle. Rotate injection sites; report soreness at site.

**Subcutaneous**
- In most men, the pellets are implanted in an area on the anterior abdominal wall.

**Buccal**
- The buccal system should be placed in the gum region just above the incisor tooth on either side of the mouth.
- Have the patient rotate sides of the mouth with each administration.
- Make sure the patient doesn't chew or swallow the buccal system.
- The buccal system should remain in place until the next dosing. Check placement after toothbrushing, mouthwash use, eating, and drinking.
- To remove the system, gently slide it downward from the gum toward the tooth.

## ACTION

Stimulates target tissues to develop normally in androgen-deficient men. May have

some antiestrogen properties, making it useful in treating certain estrogen-dependent breast cancers.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.M. | Unknown | 10–100 min | Unknown |
| Subcut. | Unknown | Unknown | 3–6 mo |
| Buccal | Unknown | 10–12 hr | 2–4 hr |

*Half-life:* 10 to 100 minutes.

## ADVERSE REACTIONS

**CNS:** headache, anxiety, depression, paresthesia, sleep apnea.
**CV:** edema.
**GI:** nausea, gum or mouth irritation, bitter taste, gum pain, tenderness, or edema, taste perversion (with buccal application).
**GU:** amenorrhea, oligospermia, decreased ejaculatory volume, priapism.
**Hematologic:** polycythemia, ***suppression of clotting factors.***
**Hepatic:** reversible jaundice, ***cholestatic hepatitis.***
**Metabolic:** hypernatremia, ***hyperkalemia,*** hypercalcemia, hyperphosphatemia, hypercholesterolemia.
**Skin:** pain, induration at injection site, local edema, acne.
**Other:** androgenic effects in women, gynecomastia, hypersensitivity reactions, hypoestrogenic effects in women, excessive hormonal effects in men, male pattern baldness.

## INTERACTIONS

**Drug-drug.** *Corticosteroids:* May increase risk of edema. Use together cautiously, especially in patients with cardiac or hepatic disease.
*Hepatotoxic drugs:* May increase risk of hepatotoxicity. Monitor liver function closely.
*Insulin, oral antidiabetics:* May decrease glucose level; may alter dosage requirements. Monitor glucose level in diabetic patients.
*Oral anticoagulants:* May increase sensitivity; may alter dosage requirements. Monitor PT and INR; decrease anticoagulant dose if necessary.
*Oxyphenbutazone:* May increase oxyphenbutazone level. Monitor patient.

## EFFECTS ON LAB TEST RESULTS

- May increase sodium, potassium, phosphate, cholesterol, liver enzyme, calcium, creatinine, and serum PSA levels. May decrease thyroxine-binding globulin, total $T_4$ levels, serum creatinine, and 17-ketosteroid levels.
- May increase RBC count and resin uptake of $T_3$ and $T_4$.
- May cause abnormal glucose tolerance test results.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with hypercalcemia or cardiac, hepatic, or renal decompensation.
- Contraindicated in men with breast or prostate cancer and in pregnant or breast-feeding women.
- Use cautiously in elderly patients.

***Overdose S&S:*** Stroke (with enanthate injection).

## NURSING CONSIDERATIONS

- Unless contraindicated, use with high-calorie, high-protein diet. Give small, frequent meals to help avoid nausea.
- Don't give to women of childbearing age until pregnancy is ruled out.
- Cypionate and enanthate are long-acting solutions.
- Monitor patient's liver function, PSA, cholesterol, and high-density lipoprotein periodically.
- Check hemoglobin and hematocrit levels periodically.
- In patients with metastatic breast cancer, hypercalcemia usually indicates progression of bone metastases. Report signs and symptoms of hypercalcemia.
- Report evidence of virilization in women. Androgenic effects include acne, edema, weight gain, increased hair growth, hoarseness, clitoral enlargement, decreased breast size, changes in libido, male pattern baldness, and oily skin or hair.
- Watch for hypoestrogenic effects in women (flushing; diaphoresis; vaginitis, including itching, drying, and burning; vaginal bleeding; menstrual irregularities).
- Watch for excessive hormonal effects in men and boys. In prepubertal boy, watch for premature epiphyseal closure, acne,

T

priapism, growth of body and facial hair, and phallic enlargement. In postpubertal men, watch for testicular atrophy, oligospermia, decreased ejaculatory volume, impotence, gynecomastia, and epididymitis.
• Monitor patient's weight and blood pressure routinely.
• Monitor prepubertal boys by X-ray for rate of bone maturation.
• The treatment of hypogonadal men with testosterone esters may potentiate sleep apnea. Monitor patients with risk factors such as obesity or chronic lung diseases.
***Alert:*** Therapeutic response in breast cancer is usually apparent within 3 months. If disease progresses, stop drug.
• Androgens may alter results of laboratory studies during therapy and for 2 to 3 weeks after therapy ends.
• ***Look alike–sound alike:*** Don't confuse testosterone with testolactone.
***Alert:*** Testosterone salts aren't interchangeable.

## PATIENT TEACHING

• Make sure patient understands importance of using an effective nonhormonal contraceptive during therapy.
• Instruct patient to stop drug immediately and notify prescriber if pregnancy is suspected.
• Review signs and symptoms of virilization with woman, and instruct her to notify prescriber if they occur.
• Advise women to wear cotton underwear and to wash after intercourse to decrease risk of vaginitis.
• Instruct men to notify prescriber about priapism, reduced ejaculatory volume, or gynecomastia.
• Warn diabetic patient to be alert for hypoglycemia and to notify prescriber if it occurs.
• Instruct boys using testosterone for delayed puberty to have X-rays of hand and wrist obtained every 6 months during treatment.
• Tell patient to report sudden weight gain.
• Warn patient that drug shouldn't be used to enhance athletic performance.
• Instruct patient how to use the buccal system.
• Advise patient to avoid dislodging buccal system and ensure that the system is in place after toothbrushing, use of mouthwash, and eating or drinking.
• Tell men not to chew or swallow buccal system.

# testosterone transdermal

Androderm, AndroGel, Testim

*Therapeutic class:* Androgen
*Pharmacologic class:* Androgen
*Pregnancy risk category X*
*Controlled substance schedule III*

## AVAILABLE FORMS

*1% gel:* 25 mg, 50 mg per unit dose; 1.25 g per nonaerosol metered pump
*Transdermal system:* 2.5 mg/day, 5 mg/day

## INDICATIONS & DOSAGES

➤ **Primary or hypogonadotropic hypogonadism**

*Men:* One or two Androderm patches applied to back, abdomen, arm, or thigh nightly for total dosage of 5 mg daily. Dose may be increased to 7.5 mg once daily or decreased to 2.5 mg once daily, depending upon a.m. serum testosterone levels. Or, initially, 50 mg of testosterone gel applied every morning to shoulders, upper arms, or abdomen. Don't apply Testim to abdomen. Check testosterone level after about 2 weeks. If response is inadequate, may increase AndroGel to 75 mg daily. Then, adjust to 100 mg (either gel) if needed. Or, for AndroGel pump, 5 g (4 pumps) applied every morning to shoulders, upper arms, or abdomen. Check testosterone level after about 2 weeks. If response is inadequate, may increase to 7.5 g (6 pumps) daily or from 7.5 g to 10 g (8 pumps) daily.

## ADMINISTRATION

**Transdermal**

• Wear gloves when handling patches. Fold used patches with adhesive sides together to discard.
• Apply patch nightly to clean, dry, intact skin of the back, abdomen, upper arms, or thighs only and not to scrotum or bony prominences.

**Topical**

● Fully prime the AndroGel pump by pumping three times before first use. Discard that gel.
● Wear gloves to apply gel to clean, dry, intact skin of the shoulders, upper arms, or abdomen only and not to scrotum or bony prominences. Testim shouldn't be applied to the abdomen.
● Application in the morning is preferable.

## ACTION

Releases testosterone, which stimulates target tissues to develop normally in androgen-deficient men.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Transdermal, topical | Unknown | 2–4 hr | 2 hr after removal |

*Half-life:* 10 to 100 minutes.

## ADVERSE REACTIONS

**CNS:** ***stroke,*** asthenia, depression, headache, sleep apnea.
**GI:** ***GI bleeding.***
**GU:** prostatitis, prostate abnormalities, UTI.
**Hepatic:** ***cholestatic hepatitis,*** reversible jaundice.
**Metabolic:** hypernatremia, hyperkalemia, hypercalcemia, hyperphosphatemia, hypercholesterolemia.
**Skin:** *pruritus, blister under patch,* acne irritation, allergic contact dermatitis, burning.
**Other:** gynecomastia, breast tenderness, flulike syndrome.

## INTERACTIONS

**Drug-drug.** *Corticosteroids:* May increase risk of edema. Use together cautiously, especially in patients with cardiac or hepatic disease.
*Insulin:* May alter insulin dosage requirements. Monitor glucose level.
*Oral anticoagulants:* May alter anticoagulant dosage requirements. Monitor PT and INR.
*Oxyphenbutazone:* May increase oxyphenbutazone level. Monitor patient.
*Propranolol:* May increase propranolol clearance. Monitor patient.

## EFFECTS ON LAB TEST RESULTS

● May increase sodium, potassium, phosphate, cholesterol, liver enzyme, calcium, and creatinine levels and resin uptake of $T_3$ and $T_4$. May decrease total $T_4$ levels.
● May increase RBC count.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug, in women, in men with known or suspected breast or prostate cancer, and in patients with CV, renal, or hepatic disease.
● Use cautiously in elderly men.

## NURSING CONSIDERATIONS

**Black Box Warning** Virilization in children and women can occur after secondary exposure to transdermal application sites on men. Women and children should avoid contact with application sites. ■
● Periodically assess liver function test results, lipid profiles, hemoglobin level, hematocrit (with long-term use), and levels of prostatic acid phosphatase and prostate-specific antigen.
● Watch for excessive hormonal effects.

## PATIENT TEACHING

● Tell patient to fully prime the AndroGel pump by pumping three times before first use and to discard that gel.
● Tell patient to apply gel or patch to clean, dry, intact skin of the shoulders, upper arms, or abdomen only and not to scrotum or bony prominences. Testim shouldn't be applied to the abdomen. Tell him that he can first pump gel into his hand.
● Tell patient using patch to apply it at night.
● Tell patient using gel to apply in the morning.
**Black Box Warning** Tell patient to wash his hands thoroughly after using product and to cover treated area with clothing. ■
● Instruct patient that patch must be changed every 24 hours.
● For best results, advise patient not to swim or shower for at least 5 hours after applying gel. Showering or swimming at least 1 hour after applying, if done infrequently, should have minimal effects on drug absorption.
● Tell patient that if the patch falls off, it may be reapplied. If patch falls off and can't

T

be reapplied, and it has been worn at least 12 hours, a new patch may be applied at the next application time.
- Warn diabetic patient that drug may decrease glucose level and to be alert for hypoglycemia.
- Advise patient to report persistent erections, nausea, vomiting, changes in skin color, ankle swelling, or sudden weight gain to prescriber.
- Tell patient that women and children should avoid contact with his application sites.
- Tell patient that Androderm doesn't have to be removed during sexual intercourse or while showering.
- Tell patient undergoing an MRI to alert the facility that he is using a transdermal patch.

## tetanus immune globulin, human

BayTet

*Therapeutic class:* Prophylaxis drug
*Pharmacologic class:* Immune globulin
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 250-unit vial or syringe

### INDICATIONS & DOSAGES

➤ **Postexposure prevention of tetanus after injury, in patients whose immunization is incomplete or unknown**

*Adults and children:* 250 units deep I.M. injection.

➤ **Tetanus**

*Adults and children:* Single doses of 3,000 to 6,000 units I.M. have been used. Optimal dosage schedules haven't been established.

### ADMINISTRATION

**I.M.**
- Don't give I.V. or intradermally.
- Don't give in gluteal area.

### ACTION

Provides passive immunity to tetanus.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.M. | Unknown | 2–3 days | 4 wk |

*Half-life:* About 28 days.

### ADVERSE REACTIONS

**CNS:** slight fever, pain.
**GU:** ***nephrotic syndrome.***
**Musculoskeletal:** stiffness.
**Skin:** erythema at injection site.
**Other:** ***anaphylaxis, angioedema,*** hypersensitivity reactions.

### INTERACTIONS

**Drug-drug.** *Live-virus vaccines:* May interfere with response. Postpone administration of live-virus vaccines for 3 months after giving tetanus immune globulin.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with thrombocytopenia or other coagulation disorders that would contraindicate I.M. injection unless benefits outweigh risks.
- Use cautiously in patients with history of previous systemic allergic reactions after giving human immunoglobulin preparations and in those allergic to thimerosal.

⚠ ***Overdose S&S:*** Pain and tenderness at injection site.

### NURSING CONSIDERATIONS

- Obtain history of injury, tetanus immunizations, last tetanus toxoid injection, allergies, and reactions to immunizations. Keep epinephrine 1:1,000 available to treat hypersensitivity reaction.
- Tetanus immune globulin is used only if wound is more than 24 hours old or patient has had fewer than two tetanus toxoid injections.
- Thoroughly clean wound and remove all foreign matter.
- ***Look alike–sound alike:*** Don't confuse drug with tetanus toxoid. Tetanus immune globulin isn't a substitute for tetanus toxoid, which should be given at same time to produce active immunization. Don't give at same site as toxoid.
- Antibodies remain at effective levels for about 4 weeks, several times the duration of equine antitetanus antibodies, thereby protecting patients for incubation period of most tetanus cases.

- Don't give live-virus vaccines for 3 months after giving tetanus immune globulin.

### PATIENT TEACHING

- Warn patient about local adverse reactions related to drug.
- Instruct patient to report serious adverse reactions promptly.
- Advise patient to complete full series of tetanus immunizations.
- Instruct patient to take acetaminophen to reduce fever and to apply cool compresses at injection site for comfort.

## tetrabenazine

teh-tra-BEN-ah-azine

Xenazine

*Therapeutic class:* Anti-chorea drug
*Pharmacologic class:* Monoamine depleter
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 12.5 mg, 25 mg

### INDICATIONS & DOSAGES

➤ **Chorea associated with Huntington's disease**

*Adults:* Initially 12.5 mg P.O. daily in the morning. After 1 week, increase dose to 12.5 mg P.O. b.i.d. Titrate dose by 12.5 mg at weekly intervals, as needed. Maximum single dose, 25 mg. If dose of 37.5 to 50 mg is needed, administer t.i.d. Patients requiring more than 50 mg/day should be genotyped for CYP2D6 metabolism.

***Adjust-a-dose:*** In patients who are extensive or intermediate CYP2D6 metabolizers, slowly titrate doses above 50 mg at weekly intervals by 12.5 mg as needed and tolerated. Maximum daily dose is 100 mg; maximum single dose, 37.5 mg. In patients who are poor CYP2D6 metabolizers, maximum daily dose is 50 mg; maximum single dose, 25 mg.

### ADMINISTRATION

**P.O.**

- Give drug without regard to meals.

### ACTION

Thought to reversibly deplete monoamines from nerve terminals.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 1–1½ hr | Unknown |

*Half-life:* Metabolite α-HTBZ, 4 to 8 hours; β-HTBZ, 2 to 4 hours.

### ADVERSE REACTIONS

**CNS:** *sedation, somnolence, insomnia, depression, anxiety, extrapyramidal symptoms, fatigue, falling,* balance difficulty, parkinsonism, bradykinesia, dizziness, irritability, obsessive reaction, dysarthria, unsteady gait, headache.
**GI:** *nausea,* vomiting.
**GU:** dysuria.
**Metabolic:** decreased appetite.
**Respiratory:** *upper respiratory infection,* dyspnea, bronchitis.
**Skin:** head laceration, ecchymosis.

### INTERACTIONS

**Drug-drug.** *CYP2D6 inhibitors (fluoxetine, paroxetine, quinidine):* May increase metabolite exposure. Reduce tetrabenazine dose as directed.
*Drugs that prolong QTc interval (amiodarone, chlorpromazine, moxifloxacin, procainamide, quinidine, sotalol, thioridazine, ziprasidone):* May cause arrhythmias. Avoid use together.
*Monoamine oxidase inhibitors:* May increase risk of serious, sometimes fatal adverse reactions. Avoid using together.
*Neuroleptic drugs (chlorpromazine, haloperidol, olanzapine, risperidone):* May increase risk of neuroleptic malignant syndrome and extrapyramidal effects. Use together cautiously.
*Reserpine:* May increase effects of tetrabenazine. Wait 20 days after stopping reserpine therapy before starting tetrabenazine.
**Drug-lifestyle.** *Alcohol:* May increase sedative effects. Discourage using together.

### EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, and serum prolactin levels.

T

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Contraindicated in patients who are actively suicidal and in those with depression who aren't receiving treatment or aren't being adequately treated. ■

• Contraindicated in those with hepatic impairment and in those receiving a monoamine oxidase inhibitor or reserpine. Use cautiously in patients at risk for aspiration pneumonia. Avoid use in patients with congenital long QT syndrome and in those with a history of arrhythmias.

***Overdose S&S:*** Acute dystonia, oculogyric crisis, nausea, vomiting, sweating, sedation, hypotension, confusion, diarrhea, hallucinations, inflammatory response, tremors.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug may increase the risk for depression and suicidal thinking. Monitor patient closely. Patient who requires more than 50 mg/day should be genotyped for CYP2D6 metabolism. ■

***Alert:*** Watch for signs of neuroleptic malignant syndrome (extrapyramidal effects, hyperthermia, autonomic disturbance), which is rare but commonly fatal. Drug may worsen mood, cognition, rigidity, and functional capacity. If these findings persist, reevaluate the need for the drug.

• Monitor for dysphagia; patient may be at increased risk for aspiration.

• Monitor electrocardiogram; drug may increase QTc interval.

• Monitor prolactin and estrogen levels. Elevated prolactin levels and low estrogen levels may increase the risk for osteoporosis.

• Patient should receive regular ophthalmologic exams during therapy.

• If drug is stopped without tapering, monitor patient for chorea, which may occur within 12 to 18 hours after last dose.

• If restarting drug within 5 days of last dose, restart at previous dosage; if more than 5 days, retitrate dose.

• It isn't known if drug appears in breast milk. Because of potential adverse effects to infant, patient should stop taking the drug or stop breast-feeding.

• Use cautiously in elderly patients.

## PATIENT TEACHING

• Advise patient to avoid hazardous activities that require alertness and good psychomotor coordination until the effects of drug are known.

**Black Box Warning** Advise patient and his family to immediately report mood swings or suicidal thoughts. ■

• Warn patient to avoid alcohol during therapy.

• Tell women of childbearing age to notify practitioner immediately if pregnancy occurs or about any plans to become pregnant or to breast-feed.

# tetracycline hydrochloride

tet-ra-SYE-kleen

Apo-Tetra†, JAA-Tetra†, Nu-Tetra†, Sumycin

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Tetracycline
*Pregnancy risk category D*

## AVAILABLE FORMS

*Capsules:* 100 mg, 250 mg, 500 mg
*Oral suspension:* 125 mg/5 ml
*Tablets:* 250 mg, 500 mg

## INDICATIONS & DOSAGES

➤ **Infections caused by susceptible gram-negative and gram-positive organisms, including *Haemophilus ducreyi, Yersinia pestis, Campylobacter fetus, Rickettsiae* species, *Mycoplasma pneumoniae,* and *Chlamydia trachomatis;* psittacosis; granuloma inguinale**

*Adults:* 1 g to 2 g/day P.O. divided b.i.d. or q.i.d depending on the severity of infection.
*Children older than age 8:* 25 to 50 mg/kg P.O. daily, in divided doses every 6 hours.

➤ **Uncomplicated urethral, endocervical, or rectal infections caused by *C. trachomatis***

*Adults:* 500 mg P.O. q.i.d. for at least 7 days.

➤ **Brucellosis**

*Adults:* 500 mg P.O. every 6 hours for 3 weeks with 1 g of streptomycin I.M. every 12 hours for first week; once daily for second week.

➤ **Gonorrhea in patients allergic to penicillin**
*Adults:* 500 mg P.O. every 6 hours for 7 days.
➤ **Syphilis in patients allergic to penicillin**
*Adults and adolescents:* 500 mg P.O. q.i.d. for 15 days. If infection has lasted 1 year or longer, treat for 30 days.
➤ **Acne (severe; long-term therapy)**
*Adults and adolescents:* Initially, 250 mg P.O. every 6 hours; then 125 to 500 mg daily or every other day.
➤ ***Helicobacter pylori* infection**
*Adults:* 500 mg P.O. every 6 hours for 10 to 14 days with other drugs, such as metronidazole, bismuth subsalicylate, amoxicillin, or omeprazole.

## ADMINISTRATION

**P.O.**
• Obtain specimen for culture and sensitivity tests before giving first dose. Begin therapy while awaiting results.
• Effectiveness is reduced when drug is given with milk or other dairy products, antacids, or iron products. For best drug absorption, give drug with a full glass of water on an empty stomach, at least 1 hour before or 2 hours after meals.
• Give drug at least 1 hour before bedtime to prevent esophageal irritation or ulceration.

## ACTION

May exert bacteriostatic effect by binding to the 30S and possibly 50S ribosomal subunits of microorganisms, thus inhibiting protein synthesis. May also alter the cytoplasmic membrane of susceptible microorganisms.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–4 hr | Unknown |

*Half-life:* 6 to 11 hours.

## ADVERSE REACTIONS

**CNS:** ***intracranial hypertension,*** dizziness, headache.
**CV:** pericarditis.
**EENT:** sore throat.
**GI:** *diarrhea, epigastric distress, nausea,* anorexia, dysphagia, enterocolitis, esophagitis, glossitis, oral candidiasis, stomatitis, vomiting.
**GU:** inflammatory lesions in anogenital region.
**Hematologic:** ***neutropenia, thrombocytopenia,*** eosinophilia.
**Musculoskeletal:** *bone growth retardation in children younger than age 8.*
**Skin:** *candidal superinfection, increased pigmentation, maculopapular and erythematous rash, photosensitivity reactions, urticaria.*
**Other:** enamel defects, hypersensitivity reactions, permanent discoloration of teeth.

## INTERACTIONS

**Drug-drug.** ***Antacids and laxatives containing aluminum, magnesium, or calcium; antidiarrheals containing kaolin, pectin, or bismuth subsalicylate:*** May decrease antibiotic absorption. Give antibiotic 1 hour before or 2 hours after these drugs.
***Digoxin:*** May increase digoxin absorption. Monitor digoxin levels and monitor patient for signs of toxicity.
*Ferrous sulfate and other iron products, zinc:* May decrease antibiotic absorption. Give tetracycline 2 hours before or 3 hours after these products.
*Hormonal contraceptives:* May decrease contraceptive effectiveness and increase risk of breakthrough bleeding. Advise patient to use nonhormonal contraceptive.
*Methoxyflurane:* May cause severe nephrotoxicity. Avoid using together.
*Oral anticoagulants:* May increase anticoagulant effects. Monitor PT and INR, and adjust anticoagulant dosage.
*Penicillins:* May interfere with bactericidal action of penicillins. Avoid using together.
**Drug-food.** ***Dairy products:*** May decrease antibiotic absorption. Give antibiotic 1 hour before or 2 hours after eating or drinking dairy products.
**Drug-lifestyle.** *Sun exposure:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

• May increase BUN and liver enzyme levels.
• May increase eosinophil count. May decrease platelet and neutrophil counts.

T

• May falsely elevate fluorometric test results for urine catecholamines. May cause false-negative results in urine glucose tests using glucose oxidase reagent (Diastix or Chemstrip uG).

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or other tetracyclines.
• Some tetracyclines may contain sulfites and are contraindicated in patients with sulfite hypersensitivity.
• Use cautiously in patients with renal or hepatic impairment. Avoid using or use cautiously during last half of pregnancy and in children younger than age 8 because drug may cause permanent discoloration of teeth, enamel defects, and bone growth retardation.
⚠ ***Overdose S&S:*** Dizziness, nausea, vomiting.

## NURSING CONSIDERATIONS

***Alert:*** Check expiration date. Using outdated or deteriorated drug has been linked to severe reversible nephrotoxicity (Fanconi syndrome).
• Don't expose drug to light or heat.
• If large doses are given, therapy is prolonged, or patient is at high risk, monitor patient for signs and symptoms of superinfection.
• In patients with renal or hepatic impairment, monitor renal and liver function test results if drug is used.
• Check patient's tongue for signs of candidal infection. Emphasize good oral hygiene.
• Drug isn't indicated for treatment of neurosyphilis.
• Photosensitivity reactions may occur within a few minutes to several hours after sun exposure. Photosensitivity lasts after therapy ends.

## PATIENT TEACHING

• Tell patient to take drug exactly as prescribed, even after he feels better, and to take entire amount prescribed.
• Explain that effectiveness is reduced when drug is taken with milk or other dairy products, antacids, or iron products. For best drug absorption, tell patient to take each dose with a full glass of water on an empty stomach, at least 1 hour before or 2 hours after meals. Also tell him to take it at least 1 hour before bedtime to prevent esophageal irritation or ulceration.
• Warn patient to avoid direct sunlight and ultraviolet light, wear protective clothing, and use sunscreen.
• Advise patient to promptly report adverse reactions to prescriber.

# tetrahydrozoline hydrochloride (intranasal)

tet-rah-hi-DRAZ-oh-leen

Tyzine

*Therapeutic class:* Decongestant
*Pharmacologic class:* Sympathomimetic
*Pregnancy risk category C*

## AVAILABLE FORMS

*Nasal solution:* 0.05%, 0.1%

## INDICATIONS & DOSAGES

➤ **Nasal congestion**

*Adults and children older than age 6:* 2 to 4 drops or 3 to 4 sprays of 0.1% solution in each nostril no more than every 3 hours, p.r.n.
*Children ages 2 to 6:* Give 2 to 3 drops of 0.05% solution in each nostril no more than every 3 hours, p.r.n.

## ADMINISTRATION

**Intranasal**

• Instill nose drops with patient in lateral head-low position.
• Give spray with patient's head tilted back slightly. Wait 1 to 2 minutes between sprays.
• Rinse spray tip in hot water and dry with a clean tissue.

## ACTION

Thought to cause local vasoconstriction of dilated arterioles, reducing blood flow and nasal congestion.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Intranasal | Few min | Unknown | 4–8 hr |

*Half-life:* Unknown.

### ADVERSE REACTIONS
**EENT:** rebound nasal congestion, sneezing, transient burning or stinging, mucosal dryness.

### INTERACTIONS
**Drug-drug.** *Bromocriptine, catechol-O-methyltransferase inhibitors, such as tolcapone:* May increase the effects of these drugs. Monitor patient for increased clinical response and adverse effects.
*MAO inhibitors:* May cause headache, hypertension, and hyperpyrexia. Avoid using tetrahydrozoline within 14 days of stopping an MAO inhibitor.
*Tricyclic antidepressants:* May decrease the effects of tetrahydrozoline. Monitor patient for clinical effect.
**Drug-herb.** *St. John's wort:* May increase adverse effects of herb. Discourage use together.

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug and in children younger than age 2. The 0.1% solution is contraindicated in children younger than age 6.
- Use cautiously in patients with hyperthyroidism, hypertension, or diabetes mellitus.

***Overdose S&S:*** Hypertension, bradycardia, drowsiness, rebound hypotension, shock, profuse sweating.

### NURSING CONSIDERATIONS
- Drug should be used for only 3 to 5 days.
- Overdose in young children may cause oversedation.

### PATIENT TEACHING
- Teach patient how to use drug.
- Caution patient not to share drug because this could spread infection.
- Tell patient not to exceed recommended dosage and to use only as needed for 3 to 5 days.

## tetrahydrozoline hydrochloride (ophthalmic)
tet-rah-hi-DRAZ-oh-leen

Altazine ◇, Murine Tears Plus ◇, Opti-Clear ◇, Optigene 3 ◇, Redness Reliever ◇, Visine ◇

*Therapeutic class:* Vasoconstrictor
*Pharmacologic class:* Sympathomimetic
*Pregnancy risk category NR*

### AVAILABLE FORMS
*Ophthalmic solution:* 0.05% ◇

### INDICATIONS & DOSAGES
➤ **Conjunctival congestion, irritation, and allergic conditions**
*Adults:* Instill 1 to 2 drops in affected eye up to q.i.d., or as directed by prescriber.

### ADMINISTRATION
**Ophthalmic**
- Apply light finger pressure on lacrimal sac for 1 minute after drops are instilled.
- Don't touch tip of dropper to any surface.

### ACTION
Thought to cause vasoconstriction by local adrenergic action on the blood vessels of the conjunctiva.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Few min | Unknown | 1–4 hr |

*Half-life:* Unknown.

### ADVERSE REACTIONS
**CNS:** dizziness, drowsiness, headache, insomnia, tremor.
**CV:** ***arrhythmias.***
**EENT:** eye irritation, increased intraocular pressure, keratitis, lacrimation, pupillary dilation, transient eye stinging.

### INTERACTIONS
**Drug-drug.** *Anesthetics:* Cyclopropane and halothane may sensitize the myocardium to sympathomimetics; local anesthetics may increase the absorption of topical drugs. Monitor patient for increased adverse effects.

T

*Beta blockers:* May cause more systemic adverse effects. Monitor patient for adverse systemic effects.
*Guanethidine, MAO inhibitors, tricyclic antidepressants:* May cause hypertensive crisis if tetrahydrozoline is systemically absorbed. Avoid using together.

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug or its components and in those with angle-closure glaucoma or other serious eye disease.
- Use cautiously in patients with hyperthyroidism, heart disease, hypertension, or diabetes mellitus.

### NURSING CONSIDERATIONS
- Rebound congestion may occur with frequent or prolonged use.

***Alert:*** Don't confuse Visine with Visken.

### PATIENT TEACHING
- Teach patient how to instill drug. Advise him to wash hands before and after instillation and to apply light finger pressure on lacrimal sac for 1 minute after drops are instilled. Warn him not to touch tip of dropper to eye or surrounding tissue.
- Warn patient not to exceed recommended dosage to avoid rebound congestion.
- Tell patient to stop drug and notify prescriber if redness or irritation persists or increases or if no relief occurs within 2 days.
- Warn patient not to share eyedrops.

## theophylline
thee-OFF-i-lin

*Immediate-release liquids*
Elixophyllin*

*Immediate-release tablets*
Theolair

*Timed-release tablets*
Theochron

*Timed-release capsules*
Theo-24

*Therapeutic class:* Bronchodilator
*Pharmacologic class:* Xanthine derivative
*Pregnancy risk category C*

### AVAILABLE FORMS
*Capsules (extended-release):* 100 mg, 125 mg, 200 mg, 300 mg, 400 mg
*$D_5W$ injection:* 200 mg in 50 ml or 100 ml; 400 mg in 100 ml, 250 ml, 500 ml, or 1,000 ml; 800 mg in 500 ml or 1,000 ml
*Syrup:* 80 mg/15 ml*
*Tablets:* 125 mg, 250 mg
*Tablets (extended-release):* 100 mg, 200 mg, 300 mg, 400 mg, 450 mg, 600 mg

### INDICATIONS & DOSAGES
Extended-release preparations shouldn't be used to treat acute bronchospasm.

➤ **Parenteral theophylline (preferred route) for acute bronchospasm in patients not currently receiving theophylline**
*Loading dose:* 4.6 mg/kg ideal body weight over 30 minutes; then maintenance infusion.
*Nonsmoking adults younger than age 60 and children older than age 16:* 0.4 mg/kg/hour (maximum 900 mg daily).
*Nonsmoking children ages 12 to 16:* 0.5 mg/kg/hour (maximum 900 mg daily).
*Children ages 12 to 16 who smoke and children ages 9 to 12:* 0.7 mg/kg/hour.
*Children ages 1 to 9:* 0.8 mg/kg/hour.
*Infants ages 6 weeks to 1 year:* Calculate mg/kg/hour dosage as follows: $0.008 \times$ (age in weeks) $+ 0.21$.
*Neonates older than 24 days:* 1.5 mg/kg every 12 hours to achieve target theophylline concentration of 7.5 mcg/ml.

*Neonates 24 days old and younger:* 1 mg/kg every 12 hours to achieve a target theophylline concentration of 7.5 mcg/ml.
***Adjust-a-dose:*** For adults older than age 60, give 0.3 mg/kg/hour, up to a maximum of 17 mg/hour. For adults with heart failure, cor pulmonale, sepsis with multiorgan failure, or shock, give 0.2 mg/kg/hour, up to a maximum infusion rate of 17 mg/hour unless serum theophylline concentrations are monitored at 24-hour intervals. Maximum daily dose is 400 mg.

➤ **Oral theophylline for acute bronchospasm in patients not currently receiving theophylline**

*Adults age 60 and younger, children ages 16 and older, and children ages 1 to 15 weighing 45 kg (99 lb) or more:* 5 mg/kg P.O., then 300 mg P.O. daily in divided doses every 6 to 8 hours for 3 days. If tolerated, increase to 400 mg P.O. daily in divided doses every 6 to 8 hours. If necessary, dosage may be increased after 3 days to 600 mg P.O. daily in divided doses every 6 to 8 hours.
*Children ages 1 to 15 weighing less than 45 kg:* 5 mg/kg P.O., then 12 to 14 mg/kg (maximum 300 mg) P.O. daily in divided doses every 4 to 6 hours for 3 days. If tolerated, increase to 16 mg/kg (maximum 400 mg) P.O. daily in divided doses every 4 to 6 hours. After 3 days, if necessary, increase to 20 mg/kg (maximum 600 mg) P.O. daily in divided doses every 4 to 6 hours.
***Adjust-a-dose:*** For children ages 1 to 15 with risk factors for reduced theophylline clearance or for whom serum concentrations can't be monitored, give 5 mg/kg P.O., then 12 to 14 mg/kg (maximum 300 mg) P.O. daily in divided doses every 4 to 6 hours for 3 days. If tolerated, increase to 16 mg/kg (maximum 400 mg) P.O. daily in divided doses every 4 to 6 hours. For children age 16 and older and adults with risk factors for reduced theophylline clearance or for whom serum concentrations can't be monitored, give 5 mg/kg P.O., then 300 mg P.O. daily in divided doses every 6 to 8 hours for 3 days. If tolerated, increase to 400 mg P.O. daily in divided doses every 6 to 8 hours.

➤ **Chronic bronchospasm using 8- to 12-hour extended-release preparations**

*Adults age 60 or younger, children age 16 and older, and children ages 6 to 15 weighing more than 45 kg:* 300 mg P.O. daily in divided doses every 8 to 12 hours for 3 days. If tolerated, increase to 400 mg P.O. in divided doses every 8 to 12 hours. After 3 more days, if necessary, increase dose to 600 mg P.O. daily in divided doses every 8 to 12 hours.
*Children ages 6 to 15 weighing less than 45 kg:* 12 to 14 mg/kg (maximum 300 mg) daily in divided doses every 8 to 12 hours for 3 days. If tolerated, increase to 16 mg/kg (maximum 400 mg) daily in divided doses every 8 to 12 hours. After 3 more days, if necessary, increase to 20 mg/kg (maximum 600 mg) daily in divided doses every 8 to 12 hours.
***Adjust-a-dose:*** For children ages 6 to 15 with risk factors for reduced theophylline clearance or for whom serum concentrations can't be monitored, give 12 to 14 mg/kg (maximum 300 mg) daily in divided doses for 3 days. If tolerated, increase to a maximum of 16 mg/kg (maximum 400 mg) P.O. daily in divided doses every 8 to 12 hours. For children age 16 and older and adults age 60 or younger or for whom serum concentrations can't be monitored, give 300 mg P.O. daily in divided doses every 8 to 12 hours. After 3 days, if necessary, increase to maximum of 400 mg P.O. daily in divided doses every 8 to 12 hours. For adults older than age 60, the recommended maximum daily dose is 400 mg P.O. per day in divided doses every 8 to 12 hours unless symptoms continue and peak serum concentration is less than 10 mcg/ml. Administer dosages greater than 400 mg P.O. daily cautiously.

## ADMINISTRATION

**P.O.**

- Each 0.5 mg/kg P.O. loading dose will increase drug level by 1 mcg/ml.
- Give drug with full glass of water after meals, if needed, to relieve GI symptoms, although taking with food delays absorption.
- Give drug around-the-clock, using extended-release product at bedtime.
- Don't dissolve or crush extended-release products. Small children unable to swallow

T

these can ingest (without chewing) the contents of capsules sprinkled over soft food.
● Administer extended-release formulas in a consistent manner, either always with or always without food.

**I.V.**
▼ Each 0.5 mg/kg I.V. loading dose will increase drug level by 1 mcg/ml.
▼ Use commercially available infusion solution, or mix in $D_5W$ solution.
▼ Use infusion pump for continuous infusion.
▼ **Incompatibilities:** Ascorbic acid, ceftriaxone, cimetidine, hetastarch, phenytoin.

## ACTION

Inhibits phosphodiesterase, the enzyme that degrades cAMP, resulting in relaxation of smooth muscle of the bronchial airways and pulmonary blood vessels.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 15–60 min | 1–2 hr | Unknown |
| P.O. (extended) | 15–60 min | 4–7 hr | Unknown |
| I.V. | 15 min | 15–30 min | Unknown |

*Half-life:* Adults, 7 to 9 hours; smokers, 4 to 5 hours; children, 3 to 5 hours; premature infants, 20 to 30 hours.

## ADVERSE REACTIONS

**CNS:** *restlessness, dizziness, insomnia,* ***seizures,*** headache, irritability, muscle twitching.
**CV:** *palpitations, sinus tachycardia,* ***arrhythmias,*** extrasystoles, flushing, marked hypotension.
**GI:** *nausea, vomiting,* diarrhea, epigastric pain.
**Metabolic:** urinary catecholamines.
**Respiratory:** ***respiratory arrest,*** tachypnea.

## INTERACTIONS

**Drug-drug.** *Adenosine:* May decrease antiarrhythmic effect. Higher doses of adenosine may be needed.
*Allopurinol, calcium channel blockers,* ***cimetidine,*** *disulfiram, influenza virus vaccine, interferon,* ***macrolides (such as erythromycin),*** *methotrexate,* ***mexiletine,*** *oral contraceptives,* ***quinolones (such as ciprofloxacin):*** May decrease hepatic clearance of theophylline; may increase theophylline level. Monitor levels closely and adjust theophylline dose.
*Barbiturates, ketoconazole, nicotine,* ***phenytoin, rifamycins:*** May enhance metabolism and decrease theophylline level; may increase phenytoin metabolism. Monitor patient for decreased therapeutic effect; monitor levels and adjust dosage.
*Carbamazepine, isoniazid, loop diuretics:* May increase or decrease theophylline level. Monitor theophylline level.
*Carteolol, pindolol, propranolol, timolol:* May act antagonistically, reducing the effects of one or both drugs; may reduce elimination of theophylline. Monitor theophylline level and patient closely.
*Ephedrine, other sympathomimetics:* May exhibit synergistic toxicity with these drugs, predisposing patient to arrhythmias. Monitor patient closely.
*Lithium:* May increase lithium excretion. Monitor patient closely.
*Tetracyclines:* May enhance the adverse effects of theophylline. Monitor patient closely.
**Drug-herb.** *Cacao tree:* May inhibit drug metabolism. Discourage use together.
*Cayenne:* May increase risk of drug toxicity. Advise patient to use together cautiously.
*Ephedra:* May increase risk of adverse reactions. Discourage use together.
*Guarana:* May cause additive CNS and CV effects. Discourage use together.
*Ipriflavone:* May increase risk of drug toxicity. Advise patient to use together cautiously.
*St. John's wort:* May decrease drug level. Discourage use together.
**Drug-food.** *Any food:* May cause accelerated drug release from extended-release products. Tell patient to take extended-release products on an empty stomach.
*Caffeine:* May decrease hepatic clearance of drug and increase drug level. Monitor patient for toxicity.
**Drug-lifestyle.** *Alcohol use:* Decreases theophylline clearance and increases risk of adverse reactions. Discourage use together.
*Smoking:* May increase elimination of drug, increasing dosage requirements. Monitor drug response and level.

### EFFECTS ON LAB TEST RESULTS

- May increase free fatty acid level and blood glucose.
- May falsely elevate theophylline level in the presence of acetaminophen, furosemide, phenylbutazone, probenecid, theobromine, caffeine, tea, chocolate, and cola, depending on assay used.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to xanthine compounds (caffeine, theobromine) and in those with active peptic ulcer or poorly controlled seizure disorders.
- Use cautiously in young children, infants, neonates, elderly patients, and those with COPD, cardiac failure, cor pulmonale, renal or hepatic disease, peptic ulceration, hyperthyroidism, diabetes mellitus, glaucoma, severe hypoxemia, hypertension, compromised cardiac or circulatory function, angina, acute MI, or sulfite sensitivity.

***Overdose S&S:*** Seizures; arrhythmias; elevated CK, myoglobin, and calcium levels; elevated leukocyte count; decreased phosphorus and magnesium levels; acute MI; urine retention in men with obstructive uropathy.

### NURSING CONSIDERATIONS

- Dosage may need to be increased in cigarette smokers and in habitual marijuana smokers because smoking causes drug to be metabolized faster.
- Monitor vital signs; measure and record fluid intake and output. Expect improved quality of pulse and respirations.
- Patients metabolize xanthines at different rates; dosage is determined by monitoring response, tolerance, pulmonary function, and drug level. Drug levels range from 10 to 20 mcg/ml; toxicity may occur at levels above 20 mcg/ml.

***Alert:*** Evidence of toxicity includes tachycardia, anorexia, nausea, vomiting, diarrhea, restlessness, irritability, and headache. If these signs occur, check drug level and adjust dosage, as indicated.

- ***Look alike–sound alike:*** Don't confuse extended-release form with regular-release form.
- ***Look alike–sound alike:*** Don't confuse Theolair with Thyrolar.

### PATIENT TEACHING

- Supply instructions for home care and dosage schedule.
- Warn patient not to dissolve, crush, or chew extended-release products. Small children unable to swallow these can ingest (without chewing) the contents of capsules sprinkled over soft food.
- Tell patient to relieve GI symptoms by taking oral drug with full glass of water after meals, although food in stomach delays absorption.
- Warn patient to take drug regularly, only as directed. Patients tend to want to take extra "breathing pills."
- Inform elderly patient that dizziness is common at start of therapy.
- Urge patient to tell prescriber about any other drugs taken. OTC drugs or herbal remedies may contain ephedrine or theophylline salts; excessive CNS stimulation may result.
- If a smoker quits, tell him to inform prescriber. Dosage reduction may be needed to prevent toxicity.

## thioridazine hydrochloride

thye-oh-RYE-da-zeen

*Therapeutic class:* Antipsychotic
*Pharmacologic class:* Phenothiazine
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 10 mg, 25 mg, 50 mg, 100 mg

### INDICATIONS & DOSAGES

➤ **Schizophrenia in patients who don't respond to treatment with at least two other antipsychotic drugs**

*Adults:* Initially, 50 to 100 mg P.O. t.i.d., increase gradually to 800 mg daily in divided doses, as needed.

*Children:* Initially, 0.5 mg/kg daily in divided doses. Increase gradually to optimal therapeutic effect; maximum dose is 3 mg/kg daily.

### ADMINISTRATION

**P.O.**

- Give drug without regard to food.
- If stomach upset occurs, give with food.

## ACTION

Unknown. A piperidine phenothiazine that probably blocks postsynaptic dopamine receptors in the brain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* 20 to 40 hours.

## ADVERSE REACTIONS

**CNS:** *tardive dyskinesia, sedation,* ***neuroleptic malignant syndrome,*** EEG changes, dizziness.
**CV:** *orthostatic hypotension,* ***prolonged QTc interval, torsades de pointes,*** ECG changes, tachycardia.
**EENT:** *ocular changes, blurred vision,* retinitis pigmentosa.
**GI:** *dry mouth, constipation,* increased appetite.
**GU:** *urine retention,* dark urine, menstrual irregularities, inhibited ejaculation.
**Hematologic:** ***transient leukopenia, agranulocytosis,*** hyperprolactinemia.
**Hepatic:** cholestatic jaundice.
**Metabolic:** weight gain.
**Skin:** *mild photosensitivity reactions,* allergic reactions.
**Other:** gynecomastia, galactorrhea.

## INTERACTIONS

**Drug-drug.** *Antacids:* May inhibit absorption of oral phenothiazines. Separate dosages by at least 2 hours.
***Antiarrhythmics (amiodarone, bretylium, disopyramide, dofetilide, procainamide, quinidine, sotalol), duloxetine, fluoxetine, fluvoxamine, paroxetine, pimozide,*** *pindolol, propranolol, other drugs that inhibit CYP2D6 enzyme,* ***quinolones:*** May inhibit metabolism of thioridazine; may cause arrhythmias resulting from QTc interval prolongation. Use together is contraindicated.
*Barbiturates:* May decrease phenothiazine effect. Monitor patient.
*Centrally acting antihypertensives:* May decrease antihypertensive effect. Monitor blood pressure.
*Lithium:* May decrease phenothiazine effect and increase neurologic adverse effects. Monitor patient closely.
*Other CNS depressants:* May increase CNS depression. Use together cautiously.
**Drug-herb.** *St. John's wort:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.
**Drug-lifestyle.** *Alcohol use:* May increase CNS depression, particularly psychomotor skills. Strongly discourage use together.
*Sun exposure:* May increase risk of photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase liver enzyme levels.
- May decrease granulocyte and WBC counts.
- May cause false-positive results for urinary porphyrin, urobilinogen, amylase, and 5-hydroxyindoleacetic acid tests and for urine pregnancy tests that use human chorionic gonadotropin.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with CNS depression, coma, or severe hypertensive or hypotensive cardiac disease.
- Contraindicated in patients taking fluvoxamine, propranolol, pindolol, fluoxetine, drugs that inhibit CYP2D6 enzyme, or drugs that prolong the QTc interval.
- Contraindicated in patients with reduced levels of CYP2D6 enzyme, those with congenital long QT interval syndrome, or those with history of cardiac arrhythmias.
- Use cautiously in elderly or debilitated patients and in patients with hepatic disease, CV disease, respiratory disorders, hypocalcemia, seizure disorders, or severe reactions to insulin or electroconvulsive therapy.
- Use cautiously in those exposed to extreme heat or cold (including antipyretic therapy) or organophosphate insecticides.

***Overdose S&S:*** Cardiac arrhythmias, hypotension, shock, ECG changes, increased QT and PR intervals, nonspecific ST and T-wave changes, bradycardia, sinus tachycardia, AV block, ventricular tachycardia, ventricular fibrillation, torsades de pointes, myocardial depression, sedation, extrapyramidal symptoms, confusion, agitation, hypothermia, hyperthermia, restlessness, seizures, areflexia, coma, mydriasis, miosis, dry skin, dry mouth, nasal congestion, urine retention, blurred vision, respiratory

depression, apnea, pulmonary edema, hypomotility, constipation, ileus, oliguria, uremia.

## NURSING CONSIDERATIONS

***Alert:*** Before therapy, obtain baseline ECG and potassium level. Patients with a QTc interval greater than 450 msec shouldn't receive drug. Patients with a QTc interval greater than 500 msec should stop drug.

**Black Box Warning** Thioridazine has been shown to prolong the QTc interval and may cause torsade de pointes–type arrhythmias and sudden death. Reserve thioridazine for the treatment of schizophrenic patients who fail to show an acceptable response to adequate courses of treatment with other antipsychotics. ■

- Monitor patient for tardive dyskinesia, which may occur after prolonged use. It may not appear until months or years later and may disappear spontaneously or persist for life, despite ending drug.

***Alert:*** Elderly patients with dementia-related psychosis treated with atypical or conventional antipsychotics are at increased risk for death. Antipsychotics aren't approved for the treatment of dementia-related psychosis.

***Alert:*** Watch for evidence of neuroleptic malignant syndrome (extrapyramidal effects, hyperthermia, autonomic disturbance), which is rare but commonly deadly.

- Monitor periodic blood tests (CBCs and liver function tests) and ophthalmic tests (long-term use).
- Withhold dose and notify prescriber if jaundice, blood dyscrasia (fever, sore throat, infection, cellulitis, weakness), or persistent extrapyramidal reactions develop, especially in children or pregnant women.
- Don't stop drug abruptly unless required by severe adverse reactions.
- After abrupt withdrawal of long-term therapy, gastritis, nausea, vomiting, dizziness, tremor, feeling of warmth or cold, diaphoresis, tachycardia, headache, or insomnia may occur.
- ***Look alike–sound alike:*** Don't confuse thioridazine with Thorazine.

## PATIENT TEACHING

- Warn patient to avoid activities that require alertness until effects of drug are known.
- Tell patient to watch for dizziness when standing quickly. Advise patient to change positions slowly.
- Instruct patient to report symptoms of dizziness, palpitations, or fainting to prescriber.
- Tell patient to avoid alcohol use.
- Have patient report signs of urine retention, constipation, or blurred vision.
- Tell patient that drug may discolor the urine.
- Advise patient to relieve dry mouth with sugarless gum or hard candy.
- Instruct patient to use sunblock and to wear protective clothing outdoors.

**SAFETY ALERT!**

# thiotepa (TESPA, triethylenethiophosphoramide, TSPA)

thye-oh-TEE-pa

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Alkylating drug
*Pregnancy risk category D*

## AVAILABLE FORMS

*Injection:* 15- and 30-mg vials

## INDICATIONS & DOSAGES

➤ **Breast and ovarian cancers, lymphoma, Hodgkin lymphoma**

*Adults:* 0.3 to 0.4 mg/kg I.V. every 1 to 4 weeks.

➤ **Bladder tumor**

*Adults:* 30 to 60 mg in 30 to 60 ml of normal saline solution instilled in bladder for 2 hours once weekly for 4 weeks.

➤ **Neoplastic effusions**

*Adults:* 0.6 to 0.8 mg/kg intracavitarily every 1 to 4 weeks.

## ADMINISTRATION

**I.V.**

▼ Preparing and giving drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.

T

▼ Reconstitute with 1.5 ml of sterile water for injection in 15-mg vial or 3 ml in 30-mg vial to yield 10 mg/ml. Don't reconstitute with other solutions.
▼ Further dilute with normal saline solution for injection. If larger volume is desired, further dilute with sodium chloride solution, $D_5W$, dextrose 5% in normal saline solution for injection, Ringer's injection, or lactated Ringer's injection.
▼ If solution appears grossly opaque or has a precipitate, discard it. Make sure solutions are clear to slightly opaque. To eliminate haze, filter solutions through a 0.22-micron filter before use.
▼ If pain occurs at insertion site, dilute drug further or use a local anesthetic to reduce pain. Make sure drug doesn't infiltrate.
▼ Use solutions within 8 hours.
▼ Refrigerate and protect dry powder from direct sunlight to avoid possible drug breakdown.
▼ **Incompatibilities:** Cisplatin, filgrastim, minocycline, vinorelbine.

**Intravesical**

• Preparing and giving drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.
• For bladder instillation, dehydrate patient 8 to 10 hours before therapy. Instill drug into bladder by catheter; ask patient to retain solution for 2 hours. If discomfort is too great with 60 ml, reduce volume to 30 ml. Reposition patient every 15 minutes for maximum area contact.

**Intracavitary**

• Preparing and giving drug may be mutagenic, teratogenic, or carcinogenic. Follow facility policy to reduce risks.
• For intracavitary instillation, drug may be given through the same tubing used to remove the fluid from the cavity involved.

## ACTION

Cross-links strands of cellular DNA and interferes with RNA transcription, causing an imbalance of growth that leads to cell death. Not specific to cell cycle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V., topical | Unknown | Unknown | Unknown |

*Half-life:* 2¼ hours.

## ADVERSE REACTIONS

**CNS:** headache, dizziness, fatigue, weakness, fever.
**EENT:** blurred vision, conjunctivitis.
**GI:** *nausea, vomiting,* abdominal pain, anorexia, stomatitis.
**GU:** amenorrhea, decreased spermatogenesis, dysuria, increased urine levels of uric acid, urine retention, hemorrhagic cystitis (with intravesical administration).
**Hematologic:** ***leukopenia, thrombocytopenia, neutropenia,*** anemia.
**Respiratory:** ***laryngeal edema.***
**Skin:** dermatitis, alopecia, pain at injection site, urticaria, rash.
**Other:** hypersensitivity reactions, ***including anaphylaxis.***

## INTERACTIONS

**Drug-drug.** *Anticoagulants, aspirin, NSAIDs:* May increase risk of bleeding. Avoid using together.
*Myelosuppressives:* May increase myelosuppression. Monitor patient.
*Neuromuscular blockers:* May prolong muscular paralysis. Monitor patient.
*Other alkylating drugs, irradiation therapy:* May intensify toxicity rather than enhance therapeutic response. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

• May increase uric acid level. May decrease pseudocholinesterase and hemoglobin levels.
• May decrease lymphocyte, platelet, WBC, RBC, and neutrophil counts.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug, in breast-feeding patients, and in those with severe bone marrow, hepatic, or renal dysfunction.
• Use in pregnant women only when benefits to mother outweigh risk of teratogenicity.
• Use cautiously in patients with mild bone marrow suppression and renal or hepatic dysfunction.
⚠ ***Overdose S&S:*** Hematopoietic toxicity, bleeding.

## NURSING CONSIDERATIONS

• Monitor CBC weekly for at least 3 weeks after last dose.

- If patient's WBC count drops below 3,000/mm$^3$ or if platelet count falls below 150,000/mm$^3$, stop drug and notify prescriber. If WBC count falls below 2,000/mm$^3$ or granulocyte count falls below 1,000/mm$^3$, follow institutional policy for infection control in immunocompromised patients.
- Monitor uric acid level. To prevent hyperuricemia with resulting uric acid nephropathy, give allopurinol along with adequate hydration.
- Therapeutic effects are commonly accompanied by toxicity.
- To prevent bleeding, avoid all I.M. injections when platelet count is below 50,000/mm$^3$.
- Give blood transfusions for cumulative anemia.

## PATIENT TEACHING

- Advise patient to watch for signs and symptoms of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell patient to take temperature daily. Tell patient to report even mild infections.
- Instruct patient to avoid OTC products containing aspirin or NSAIDs.
- Advise women to stop breast-feeding during therapy because of risk of toxicity to infant.
- Caution women of childbearing age to consult prescriber before becoming pregnant.

# thiothixene

thye-oh-THIX-een

Navane

*Therapeutic class:* Antipsychotic
*Pharmacologic class:* Thioxanthene
*Pregnancy risk category C*

## AVAILABLE FORMS

**thiothixene**
*Capsules:* 1 mg, 2 mg, 5 mg, 10 mg

## INDICATIONS & DOSAGES

➤ **Mild to moderate psychosis**
*Adults and children age 12 and older:* Initially, 2 mg P.O. t.i.d. Increase gradually to 15 mg daily, as needed.

➤ **Severe psychosis**
*Adults and children age 12 and older:* Initially, 5 mg P.O. b.i.d. Increase gradually to 20 to 30 mg daily, as needed. Maximum dose is 60 mg daily.

## ADMINISTRATION

**P.O.**
- Give drug without regard to food.

## ACTION

Unknown. Probably blocks dopamine receptors in the brain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* 20 to 40 hours.

## ADVERSE REACTIONS

**CNS:** *extrapyramidal reactions, drowsiness, tardive dyskinesia,* ***neuroleptic malignant syndrome,*** restlessness, agitation, insomnia, sedation, EEG changes, pseudoparkinsonism, dizziness, dystonia.
**CV:** *hypotension,* tachycardia, ECG changes.
**EENT:** *blurred vision,* ocular changes, nasal congestion.
**GI:** *dry mouth, constipation.*
**GU:** *urine retention,* menstrual irregularities, breast enlargement, inhibited ejaculation.
**Hematologic:** ***agranulocytosis, transient leukopenia,*** leukocytosis.
**Hepatic:** jaundice.
**Metabolic:** weight gain, hyperprolactinemia.
**Skin:** *mild photosensitivity reactions,* allergic reactions, exfoliative dermatitis.
**Other:** gynecomastia.

## INTERACTIONS

**Drug-drug.** *CNS depressants:* May increase CNS depression. Use together cautiously.
**Drug-lifestyle.** *Alcohol use:* May increase CNS depression. Discourage use together. *Sun exposure:* May increase risk of photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase liver enzyme levels.

T

● May increase or decrease WBC counts. May decrease granulocyte counts.
● May cause false-positive results for urinary porphyrin, urobilinogen, amylase, and 5-hydroxyindoleacetic acid tests and for urine pregnancy tests that use human chorionic gonadotropin.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients hypersensitive to drug and in those with CNS depression, circulatory collapse, coma, or blood dyscrasia.
● Use with caution in patients with history of seizure disorder and in those undergoing alcohol withdrawal.
● Use cautiously in elderly or debilitated patients and in those with CV disease (may cause sudden drop in blood pressure), hepatic disease, heat exposure, glaucoma, or prostatic hyperplasia.
● Drug isn't recommended for use in children younger than age 12.
***Overdose S&S:*** Muscular twitching, drowsiness, dizziness, CNS depression, rigidity, weakness, torticollis, tremor, increased salivation, dysphagia, hypotension, gait disturbances, coma.

## NURSING CONSIDERATIONS

● Monitor patient for tardive dyskinesia, which may occur after prolonged use; it may not appear until months or years later, and may disappear spontaneously or persist for life, despite stopping drug.
***Alert:*** Watch for evidence of neuroleptic malignant syndrome (extrapyramidal effects, hyperthermia, autonomic disturbance), which is rare but deadly.
● Monitor periodic CBCs, liver function tests, and renal function tests; and ophthalmic tests for long-term use.
● Watch for orthostatic hypotension. Keep patient supine for 1 hour after drug administration, and tell him to change positions slowly.
● Withhold dose and notify prescriber if jaundice, blood dyscrasia (fever, sore throat, infection, cellulitis, weakness), or persistent extrapyramidal reactions develop, especially in pregnant women.
**Black Box Warning** Elderly patients with dementia-related psychosis treated with atypical or conventional antipsychotics are at increased risk for death. Antipsychotics aren't approved for the treatment of dementia-related psychosis. ■
● Don't withdraw drug abruptly unless severe adverse reactions occur.
● After abrupt withdrawal of long-term therapy, gastritis, nausea, vomiting, dizziness, tremor, feeling of warmth or cold, diaphoresis, tachycardia, headache, or insomnia may occur.
● ***Look alike–sound alike:*** Don't confuse Navane with Nubain or Norvasc.

## PATIENT TEACHING

● Warn patient to avoid activities that require alertness until effects of drug are known.
● Tell patient to watch for dizziness upon standing quickly. Advise him to change positions slowly.
● Tell patient to avoid alcohol use during therapy.
● Have patient report signs of urine retention, constipation, or blurred vision.
● Instruct patient to use sunblock and to wear protective clothing outdoors.

# tiagabine hydrochloride

tye-AG-ah-been

Gabitril Filmtabs

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* Gamma aminobutyric acid (GABA) enhancer
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 2 mg, 4 mg, 8 mg, 12 mg, 16 mg

## INDICATIONS & DOSAGES

➤ **Adjunctive treatment of partial seizures in patients taking enzyme-inducing anticonvulsants (carbamazepine, phenytoin, primidone, phenobarbital)**
*Adults:* Initially, 4 mg P.O. once daily. Total daily dose may be increased by 4 to 8 mg at weekly intervals until clinical response or up to 56 mg daily. Give total daily dose in divided doses b.i.d. to q.i.d.

*Children ages 12 to 18:* Initially, 4 mg P.O. once daily. Total daily dose may be increased by 4 mg at beginning of week 2 and thereafter by 4 to 8 mg per week until clinical response or up to 32 mg daily. Give total daily dose in divided doses b.i.d. to q.i.d.

***Adjust-a-dose:*** For patients with hepatic impairment, reduce first and maintenance doses or increase dosing intervals. For patients not taking enzyme-inducing anticonvulsants, use lower doses and slower titration.

## ADMINISTRATION

**P.O.**

- Give drug with food.

## ACTION

Unknown. May act by facilitating the effects of the inhibitory neurotransmitter GABA. By binding to recognition sites linked to GABA uptake carrier, drug may make more GABA available.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 45 min | 7–9 hr |

*Half-life:* 7 to 9 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia*, *dizziness*, *nervousness*, *somnolence*, abnormal gait, agitation, ataxia, confusion, depression, difficulty with concentration and attention, difficulty with memory, emotional lability, hostility, insomnia, language problems, paresthesia, speech disorder, tremor, pain.
**CV:** vasodilation.
**EENT:** nystagmus, pharyngitis.
**GI:** *nausea*, abdominal pain, diarrhea, increased appetite, mouth ulceration, vomiting.
**Musculoskeletal:** generalized weakness, myasthenia.
**Respiratory:** increased cough.
**Skin:** pruritus, rash.

## INTERACTIONS

**Drug-drug.** *Carbamazepine*, *phenobarbital*, *phenytoin:* May increase tiagabine clearance. Monitor patient closely.
*CNS depressants:* May enhance CNS effects. Use together cautiously.

**Drug-lifestyle.** *Alcohol use:* May enhance CNS effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.

***Alert:*** Drug may cause new-onset seizures and status epilepticus in patients without a history of epilepsy. In these patients, stop drug and evaluate for underlying seizure disorder. Drug shouldn't be used for off-label uses.

- Use cautiously in patients with psychiatric symptoms.
- Use cautiously in breast-feeding women.

***Overdose S&S:*** Somnolence, impaired consciousness, agitation, confusion, speech difficulty, hostility, depression, weakness, myoclonus, seizures, coma, ataxia, drowsiness, tremors, disorientation, vomiting, temporary paralysis, respiratory depression.

## NURSING CONSIDERATIONS

***Alert:*** Closely monitor all patients taking or starting antiepileptic drugs for changes in behavior indicating worsening of suicidal thoughts or behavior or depression. Symptoms such as anxiety, agitation, hostility, mania, and hypomania may be precursors to emerging suicidality.

- Withdraw drug gradually unless safety concerns require a more rapid withdrawal because sudden withdrawal may cause more frequent seizures.

***Alert:*** Use of anticonvulsants, including tiagabine, may cause status epilepticus and sudden unexpected death in patients with epilepsy.

- Patients who aren't receiving at least one enzyme-inducing anticonvulsant when starting tiagabine may need lower doses or slower dosage adjustment.
- Monitor patient for cognitive and neuropsychiatric symptoms, including impaired concentration, speech or language problems, confusion, somnolence, and fatigue.
- Drug may cause moderately severe to incapacitating generalized weakness, which resolves after dosage is reduced or drug stopped.

T

● ***Look alike–sound alike:*** Don't confuse tiagabine with tizanidine; both have 4-mg starting doses.

### PATIENT TEACHING

● Advise patient to take drug only as prescribed.
● Tell patient to take drug with food.
● Warn patient that drug may cause dizziness, somnolence, and other signs and symptoms of CNS depression. Advise patient to avoid driving and other potentially hazardous activities that require mental alertness until drug's CNS effects are known.
● Tell woman of childbearing age to call prescriber if she becomes pregnant or plans to become pregnant during therapy.
● Instruct woman of childbearing age to notify prescriber if she's planning to breast-feed because drug may appear in breast milk.

## ticarcillin disodium and clavulanate potassium

tie-kar-SIL-in and KLAV-yoo-lan-nayt

Timentin

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Extended-spectrum penicillin, beta-lactamase inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS

*Injection:* 3 g ticarcillin and 100 mg clavulanic acid in 3.1-g vials
*Premixed:* 3.1 g/100 ml

### INDICATIONS & DOSAGES

➤ **Gynecologic infection**

*Women who weigh 60 kg (132 lb) or more:* For moderate infections, 200 mg/kg (ticarcillin component) I.V. daily in divided doses every 6 hours. For severe infections, 300 mg/kg (ticarcillin component) I.V. daily in divided doses every 4 hours.
*Women who weigh less than 60 kg:* 200 to 300 mg/kg (ticarcillin component) I.V. daily in divided doses every 4 to 6 hours.

➤ **Lower respiratory tract, urinary tract, bone and joint, intra-abdominal, or skin and skin-structure infection and septicemia caused by beta-lactamase–producing strains of bacteria or by ticarcillin-susceptible organisms**

*Adults and children who weigh more than 60 kg (132 lb):* 3.1 g (Timentin) by I.V. infusion every 4 to 6 hours.
*Adults and children ages 3 months to 16 years who weigh less than 60 kg:* 200 mg/kg (ticarcillin component) I.V. daily in divided doses every 6 hours. For severe infections, 300 mg/kg (ticarcillin component) I.V. daily in divided doses every 4 hours.
***Adjust-a-dose:*** If creatinine clearance is 30 to 60 ml/minute, dosage is 2 g I.V. every 4 hours; if clearance is 10 to 29 ml/minute, 2 g I.V. every 8 hours; if clearance is less than 10 ml/minute, 2 g I.V. every 12 hours; if clearance is less than 10 ml/minute and patient has hepatic dysfunction, 2 g I.V. every 24 hours. For patients receiving peritoneal dialysis or hemodialysis, give a loading dose of 3.1 g I.V. and then maintenance doses of 3.1 g I.V. every 12 hours for patients receiving peritoneal dialysis or 2 g I.V. every 12 hours for patients receiving hemodialysis. Supplement with 3.1 g after each hemodialysis session.

### ADMINISTRATION

**I.V.**

▼ Before giving, ask patient about allergic reactions to penicillin.
▼ Obtain specimen for culture and sensitivity tests. Begin therapy while awaiting results.
▼ Give drug at least 1 hour before a bacteriostatic antibiotic.
▼ Reconstitute drug with 13 ml of sterile water for injection or normal saline solution for injection. Further dilute to a maximum of 10 to 100 mg/ml (based on drug component).
▼ Infuse over 30 minutes.
▼ **Incompatibilities:** Aminoglycosides, amphotericin B, azithromycin, cisatracurium, other anti-infectives, sodium bicarbonate, topotecan, vancomycin.

## ACTION

Inhibits cell-wall synthesis during bacterial multiplication.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | Unknown |

*Half-life:* 1 hour.

## ADVERSE REACTIONS

**CNS:** ***seizures,*** headache, giddiness, neuromuscular excitability.
**CV:** phlebitis, vein irritation.
**EENT:** taste and smell disturbances.
**GI:** ***pseudomembranous colitis,*** diarrhea, flatulence, epigastric pain, nausea, stomatitis, vomiting.
**Hematologic:** ***leukopenia, neutropenia, thrombocytopenia,*** anemia, eosinophilia, hemolytic anemia.
**Metabolic:** hypernatremia, hypokalemia.
**Skin:** ***Stevens-Johnson syndrome,*** pain at injection site, pruritus, rash.
**Other:** ***anaphylaxis,*** hypersensitivity reactions, overgrowth of nonsusceptible organisms.

## INTERACTIONS

**Drug-drug.** *Hormonal contraceptives:* May decrease contraceptive effectiveness. Advise use of another form of contraception during therapy.
*Methotrexate:* May increase risk of methotrexate toxicity. Monitor methotrexate concentrations twice a week for first 2 weeks.
*Oral anticoagulants:* May increase risk of bleeding. Monitor PT and INR.
*Probenecid:* May increase ticarcillin level. Probenecid may be used for this purpose.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, alkaline phosphatase, LDH, and sodium levels. May decrease potassium and hemoglobin levels.
- May increase eosinophil count. May decrease platelet, WBC, and granulocyte counts.
- May alter results of turbidimetric tests that use sulfosalicylic acid, trichloroacetic acid, acetic acid, or nitric acid.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other penicillins.
- Use cautiously in patients with other drug allergies, especially to cephalosporins because of possible cross-sensitivity, and in those with impaired renal function, hemorrhagic conditions, hypokalemia, or sodium restriction. Drug contains 4.5 mEq sodium/g.

***Overdose S&S:*** Neuromuscular hyperexcitability, seizures.

## NURSING CONSIDERATIONS

- Check CBC and platelet counts frequently. Drug may cause thrombocytopenia.
- Monitor PT and INR in patients taking oral anticoagulants.
- Monitor potassium and sodium levels.
- If large doses are given or if therapy is prolonged, bacterial or fungal superinfection may occur, especially in elderly, debilitated, or immunosuppressed patients.

## PATIENT TEACHING

- Tell patient to report adverse reactions promptly.
- Instruct patient to report discomfort at I.V. site.
- Advise patient to limit salt intake during drug therapy because of high sodium content.

# ticlopidine hydrochloride

tye-KLOH-pih-deen

*Therapeutic class:* Antiplatelet
*Pharmacologic class:* Platelet aggregation inhibitor
*Pregnancy risk category B*

## AVAILABLE FORMS

*Tablets:* 250 mg

## INDICATIONS & DOSAGES

➤ **To reduce risk of thrombotic stroke in patients who have had a stroke or stroke precursors**

*Adults:* 250 mg P.O. b.i.d. with meals.

➤ **Adjunct to aspirin to prevent subacute stent thrombosis in patients having coronary stent placement**

*Adults:* 250 mg P.O. b.i.d., combined with antiplatelet doses of aspirin. Start therapy after stent placement and continue for up to

30 days. If prescribed longer than 30 days, use is off-label.

## ADMINISTRATION

**P.O.**

- Give drug with meals.

## ACTION

Unknown. An antiplatelet that probably blocks adenosine diphosphate–induced platelet-to-fibrinogen and platelet-to-platelet binding.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 hr | Unknown |

*Half-life:* About 12½ hours after single dose; 4 to 5 days after multiple doses.

## ADVERSE REACTIONS

**CNS:** ***intracranial bleeding,*** dizziness, peripheral neuropathy.
**GI:** *diarrhea,* abdominal pain, anorexia, bleeding, dyspepsia, flatulence, nausea, vomiting.
**GU:** dark urine, hematuria.
**Hematologic:** ***agranulocytosis, aplastic anemia, immune thrombocytopenia, neutropenia, pancytopenia.***
**Skin:** ***thrombocytopenic purpura,*** ecchymoses, pruritus, rash, urticaria.
**Other:** hypersensitivity reactions, postoperative bleeding.

## INTERACTIONS

**Drug-drug.** *Antacids:* May decrease ticlopidine level. Separate doses by at least 2 hours.
*Aspirin:* May increase effect of aspirin on platelets. Use together cautiously.
*Cimetidine:* May decrease clearance of ticlopidine and increase risk of toxicity. Avoid using together.
*Digoxin:* May decrease digoxin level. Monitor digoxin level.
*Phenytoin:* May increase phenytoin level. Monitor patient closely.
*Theophylline:* May decrease theophylline clearance and risk of toxicity. Monitor patient closely and adjust theophylline dosage.
**Drug-herb.** *Ginkgo biloba:* May cause additive antiplatelet effects. Use caution when administering together.
*Red clover:* May cause bleeding. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, alkaline phosphatase, cholesterol, and triglyceride levels.
- May decrease neutrophil, WBC, RBC, platelet, and granulocyte counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with severe hepatic impairment, hematopoietic disorders, active pathologic bleeding from peptic ulceration, or active intracranial bleeding.
- Use cautiously and with close monitoring of CBC and WBC differentials, watching for signs and symptoms of neutropenia and agranulocytosis.

***Overdose S&S:*** Increased bleeding time, increased ALT level.

## NURSING CONSIDERATIONS

- Because of life-threatening adverse reactions, use drug only in patients who are allergic to, can't tolerate, or have failed aspirin therapy.
- Obtain baseline liver function test results before therapy.

**Black Box Warning** Ticlopidine can cause life-threatening hematologic adverse reactions, including neutropenia/agranulocytosis, thrombotic thrombocytopenic purpura (TTP), and aplastic anemia. Severe hematologic adverse reactions may occur within a few days of the start of therapy. During first 3 months of treatment, monitor patient for symptoms of neutropenia or TTP; discontinue drug immediately if they occur. ■

- Determine CBC and WBC differentials prior to initiating therapy and repeat every 2 weeks until end of third month.
- Monitor liver function test results and repeat if dysfunction is suspected.
- Thrombocytopenia has occurred rarely. Stop drug in patients with platelet count of 80,000/$mm^3$ or less. If needed, give methylprednisolone 20 mg I.V. to normalize bleeding time within 2 hours.
- When used preoperatively, drug may decrease risk of graft occlusion in patients receiving coronary artery bypass grafts and

reduce severity of drop in platelet count in patients receiving extracorporeal hemoperfusion during open heart surgery.

### PATIENT TEACHING

- Tell patient to take drug with meals.
- Warn patient to avoid aspirin and aspirin-containing products unless directed to by prescriber and to check with prescriber or pharmacist before taking OTC drugs.
- Explain that drug will prolong bleeding time and that patient should report unusual or prolonged bleeding. Advise patient to tell dentists and other health care providers that he takes ticlopidine.
- Stress importance of regular blood tests. Because neutropenia can result with increased risk of infection, tell patient to immediately report signs and symptoms of infection, such as fever, chills, or sore throat.
- If drug is being substituted for a fibrinolytic or anticoagulant, tell patient to stop those drugs before starting ticlopidine therapy.
- Advise patient to stop drug 10 to 14 days before undergoing elective surgery.
- Tell patient to immediately report to prescriber yellow skin or sclera, severe or persistent diarrhea, rashes, bleeding under the skin, light-colored stools, or dark urine.

## tigecycline

tye-gah-SYE-klin

Tygacil

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Glycylcycline antibacterial
*Pregnancy risk category D*

### AVAILABLE FORMS

*Lyophilized powder:* 50-mg vial

### INDICATIONS & DOSAGES

➤ **Community-acquired bacterial pneumonia**

*Adults:* Initially, 100 mg I.V.; then 50 mg I.V. every 12 hours for 7 to 14 days. Infuse drug over 30 to 60 minutes.

➤ **Complicated skin or skin-structure infection; complicated intra-abdominal infection**

*Adults:* Initially 100 mg I.V.; then 50 mg every 12 hours for 5 to 14 days. Infuse drug over 30 to 60 minutes.

➤ **Hospital-acquired pneumonia** ♦

*Adults:* Initially, 100 mg I.V.; then 50 mg I.V. every 12 hours for 13 to 20 days.

***Adjust-a-dose:*** For patients with severe hepatic impairment, give initial dose of 100 mg I.V. and then 25 mg I.V. every 12 hours.

### ADMINISTRATION

**I.V.**

▼ Assess patient for tetracycline allergy before therapy.
▼ Obtain specimen for culture and sensitivity tests before first dose. Begin therapy while awaiting results.
▼ Reconstitute powder with 5.3 ml of normal saline solution or $D_5W$ to yield 10 mg/ml. Gently swirl the vial until the powder dissolves.
▼ Immediately withdraw the dose from the vial and add it to 100 ml of normal saline solution or $D_5W$. The maximum concentration is 1 mg/ml.
▼ Inspect the solution for particulates and discoloration (green or black) before giving. Reconstituted solution should be yellow or orange.
▼ Immediately dilute reconstituted drug.
▼ Use a dedicated I.V. line or a Y-site, and flush the line with normal saline or $D_5W$ before and after infusion.
▼ Infuse the drug over 30 to 60 minutes.
▼ Store unopened vials at room temperature in the original package. Store diluted solution at room temperature for up to 6 hours, or refrigerate for up to 24 hours.
▼ **Incompatibilities:** Amphotericin B, chlorpromazine, methylprednisolone, and voriconazole.

### ACTION

Inhibits protein translation in bacteria by binding to the 30S ribosomal unit.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 27 to 42 hours.

## ADVERSE REACTIONS

**CNS:** asthenia, dizziness, fever, headache, insomnia, pain.
**CV:** phlebitis.
**GI:** *diarrhea*, *nausea*, *vomiting*, abdominal pain, constipation, dyspepsia.
**Hematologic:** ***thrombocytopenia,*** anemia, leukocytosis.
**Metabolic:** hyperglycemia, hypokalemia, hypoproteinemia.
**Musculoskeletal:** back pain.
**Respiratory:** cough, dyspnea.
**Skin:** local reaction, pruritus, rash, sweating.
**Other:** ***sepsis,*** abnormal healing, abscess, allergic reaction, infection.

## INTERACTIONS

**Drug-drug.** *Hormonal contraceptives:* May decrease contraceptive's effectiveness. Advise patient to use nonhormonal form of contraception during treatment.
*Warfarin:* May increase risk of bleeding. Monitor INR.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, amylase, bilirubin, BUN, creatinine, LDH, and AST and ALT levels. May decrease potassium, protein, calcium, sodium, and hemoglobin levels and hematocrit. May increase or decrease glucose levels.
- May increase WBC count and INR. May prolong activated PTT and PT. May decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients with severe hepatic impairment and in those hypersensitive to tetracycline antibiotics. Also use cautiously as monotherapy in patients with complicated intra-abdominal infections caused by intestinal perforation.
- Use cautiously in breast-feeding women. Use during pregnancy only if potential benefit justifies potential risk to fetus.

***Overdose S&S:*** Nausea, vomiting.

## NURSING CONSIDERATIONS

- If patient develops diarrhea, monitor him closely for pseudomembranous colitis.
- If patient has abdominal infection caused by intestinal perforation, monitor for sepsis.
- Monitor liver function tests.
- Monitor patient for symptoms of dangerous toxicities of tetracyclines, such as photosensitivity, pseudotumor cerebri, pancreatitis, and antianabolic action (increased BUN level, azotemia, acidosis, and hypophosphatemia).

## PATIENT TEACHING

- Tell patient that drug is used to treat only bacterial infections, not viral.
- Advise patient to take the full course of treatment, even if he feels better after a few days of therapy.
- Tell patient to report burning or pain at the I.V. site.
- Tell woman of childbearing age to avoid becoming pregnant during treatment. Urge those who use hormonal contraception to also use barrier contraception during treatment.
- Advise woman to notify her health care provider if pregnancy is suspected or confirmed.

# timolol maleate

tye-MOE-lol

Betimol, Istalol, Timoptic, Timoptic-XE

*Therapeutic class:* Antiglaucoma
*Pharmacologic class:* Nonselective beta blocker
*Pregnancy risk category C*

## AVAILABLE FORMS

*Ophthalmic gel:* 0.25%, 0.5%
*Ophthalmic solution:* 0.25%, 0.5%

## INDICATIONS & DOSAGES

➤ **To reduce intraocular pressure (IOP) in ocular hypertension or open-angle glaucoma**

*Adults:* Initially, 1 drop of 0.25% solution in each affected eye b.i.d.; maintenance dosage is 1 drop once daily. If no response, instill 1 drop of 0.5% solution in each affected eye b.i.d. If IOP is controlled, reduce dosage to 1 drop daily. Or, 1 drop of gel in each

affected eye once daily. Or, for Istalol, initially 1 drop 0.5% solution in each affected eye once daily in the morning. If response is unsatisfactory, concomitant therapy may be considered.

## ADMINISTRATION

### Ophthalmic

- Don't touch tip of dropper to eye or surrounding tissue.
- Apply light finger pressure on lacrimal sac for 1 minute after instilling drug to minimize systemic absorption.
- Give other ophthalmic drugs at least 10 minutes before giving gel form of drug.

## ACTION

Thought to reduce formation, and possibly increase outflow, of aqueous humor.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | 30 min | 1–2 hr | 12–24 hr |

*Half-life:* Unknown.

## ADVERSE REACTIONS

**CNS:** *syncope,* ***stroke,*** confusion, depression, dizziness, fatigue, hallucinations, lethargy, headache.
**CV:** *hypotension,* ***arrhythmia, bradycardia, cardiac arrest, heart block, heart failure,*** palpitations, slight reduction in resting heart rate, hypertension.
**EENT:** *burning and stinging,* blepharitis, conjunctivitis, decreased corneal sensitivity with long-term use, diplopia, keratitis, minor eye irritation, ptosis, visual disturbances, discharge, tearing, ocular pain, itching.
**Metabolic:** hyperglycemia, hyperuricemia.
**Respiratory:** ***bronchospasm in patients with history of asthma,*** dyspnea, respiratory infection.

## INTERACTIONS

**Drug-drug.** *Aminophylline, theophylline:* May act antagonistically, reducing effects of one or both drugs; may also reduce elimination of theophylline. Monitor theophylline level and patient closely.
*Calcium channel blockers, cardiac glycosides, quinidine:* May increase risk of adverse cardiac effects if large amounts of timolol are systemically absorbed. Use together cautiously.
*Cimetidine:* May increase beta blocker effects. Consider another $H_2$ agonist or decrease dose of beta blocker.
*Epinephrine:* May cause a hypertensive episode, followed by bradycardia. Stop beta blocker 3 days before starting epinephrine. Monitor patient closely.
*Insulin, oral antidiabetic agents:* May mask symptoms of hypoglycemia (such as tachycardia) as a result of beta blockade. Use together cautiously in patients with diabetes.
*Oral beta blockers:* May increase ocular and systemic effects. Use together cautiously.
*Prazosin:* May increase risk of orthostatic hypotension in early phases of use together. Assist patient to stand slowly until effects are known.
*Reserpine, other catecholamine-depleting drugs:* May increase hypotensive and bradycardia-induced effects. Avoid using together.
*Verapamil:* May increase effects of both drugs. Monitor cardiac function closely and decrease dosages as necessary.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN, potassium, glucose, and uric acid levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with bronchial asthma, sinus bradycardia, second- or third-degree AV block, cardiac failure, cardiogenic shock, or history of bronchial asthma or severe COPD.
- Use cautiously in patients with nonallergic bronchospasm, chronic bronchitis, emphysema, diabetes mellitus, hyperthyroidism, or cerebrovascular insufficiency.

***Overdose S&S:*** Bradycardia, bronchospasm, dizziness, headache, shortness of breath, cardiac arrest.

## NURSING CONSIDERATIONS

- Monitor diabetic patients carefully. Systemic beta-blocking effects can mask some signs and symptoms of hypoglycemia.
- Some patients may need a few weeks of treatment to stabilize pressure-lowering

T

response. Determine IOP after 4 weeks of treatment.
• Drug can be used safely in patients with glaucoma who wear conventional polymethylmethacrylate (PMMA) hard contact lenses.
• ***Look alike–sound alike:*** Don't confuse timolol with atenolol, or Timoptic with Viroptic.

## PATIENT TEACHING

• Teach patient how to instill drops. Advise him to wash hands before and after instillation and to apply light finger pressure on lacrimal sac for 1 minute after drops are instilled. Warn patient not to touch tip of dropper to eye or surrounding tissue.
• Instruct patient using gel to invert container and shake once before each use. Also tell him to use other ophthalmic drugs at least 10 minutes before applying gel.
• Tell patient to instill drug without contact lenses in place. Lenses may be reinserted about 15 minutes after drug use.
• Drug may be absorbed systemically and produce signs and symptoms of beta blockade. Advise patient to monitor pulse rate and report slow rate to prescriber.
• Tell patient to report difficulty breathing or chest pain to prescriber.

**SAFETY ALERT!**

# tinidazole

teh-NID-ah-zol

Tindamax

*Therapeutic class:* Antiprotozoal
*Pharmacologic class:* Antiprotozoal
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 250 mg, 500 mg

## INDICATIONS & DOSAGES

**Black Box Warning** Use tinidazole only for the conditions for which it's indicated. ■

➤ **Bacterial vaginosis in nonpregnant adult women**
*Adults:* 2 g once daily for 2 days with food, or 1 g once daily for 5 days with food.

➤ **Trichomoniasis caused by *Trichomonas vaginalis***
*Adults:* 2 g P.O. as a single dose taken with food. Sexual partners should be treated at the same time with the same dose.

➤ **Giardiasis caused by *Giardia lamblia (G. duodenalis)***
*Adults:* 2 g P.O. as a single dose taken with food.
*Children older than age 3:* Give 50 mg/kg (up to 2 g) as a single dose taken with food.

➤ **Intestinal amebiasis caused by *Entamoeba histolytica***
*Adults:* 2 g P.O. daily for 3 days, taken with food.
*Children older than age 3:* Give 50 mg/kg (up to 2 g) P.O. daily for 3 days, taken with food.

➤ **Amebic liver abscess (amebiasis)**
*Adults:* 2 g P.O. daily for 3 to 5 days, taken with food.
*Children older than age 3:* Give 50 mg/kg (up to 2 g) P.O. daily for 3 to 5 days, taken with food.

***Adjust-a-dose:*** For patients receiving hemodialysis, give an additional dose equal to one-half the recommended dose after the hemodialysis session.

## ADMINISTRATION

**P.O.**
• Give drug with food to minimize adverse GI effects.
• For children who can't swallow pills, crush tablet into fine powder and mix with artificial cherry syrup.

## ACTION

For *Trichomonas*, drug reduces the compound's nitro group into a free nitro radical that may be responsible for the antiprotozoal activity. Mechanism of action against *Giardia* and *Entamoeba* is unknown.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1½ hr | Unknown |

*Half-life:* 12 to 14 hours.

## ADVERSE REACTIONS

**CNS:** ***seizures,*** dizziness, fatigue, headache, malaise, weakness.
**GI:** anorexia, constipation, cramps, dyspepsia, metallic taste, nausea, vomiting.

## INTERACTIONS

**Drug-drug.** *Cyclosporine, tacrolimus:* May increase cyclosporine or tacrolimus level. Monitor closely for toxicity, including headache, nausea, vomiting, nephrotoxicity, and electrolyte abnormalities.
*Disulfiram:* May cause psychotic reactions and may increase abdominal cramping, nausea, vomiting, headaches, and flushing. Separate doses by 2 weeks.
*Drugs that induce CYP-450, such as fosphenytoin, phenobarbital, phenytoin, and rifampin:* May increase tinidazole elimination. Monitor patient.
*Drugs that inhibit CYP-450, such as cimetidine and ketoconazole:* May prolong tinidazole half-life and decrease clearance. Monitor patient.
*Fluorouracil:* May decrease fluorouracil clearance, increasing adverse effects without added benefit. Monitor patient for rash, nausea, vomiting, stomatitis, and leukopenia.
*Fosphenytoin, phenytoin:* May prolong phenytoin half-life and decrease clearance of I.V. drug. Monitor patient for toxicity.
*Lithium:* May increase lithium level. Monitor patient; monitor lithium and creatinine levels.
*Oxytetracycline:* May counteract tinidazole. Assess patient for lack of effect.
*Warfarin and other oral anticoagulants:* May increase anticoagulant effect. Anticoagulant dosage may need adjustment during and for up to 8 days after tinidazole therapy.
**Drug-herb.** *St. John's wort:* May increase or decrease drug level. Discourage use together.
**Drug-lifestyle.** *Use of alcohol and alcohol-containing products:* May increase abdominal cramps, nausea, vomiting, headaches, and flushing. Avoid using together and for 3 days after stopping drug.

## EFFECTS ON LAB TEST RESULTS

- May increase AST, ALT, glucose, LDH, and triglyceride levels.
- May decrease WBC count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, its component, or other nitroimidazole derivatives.
- Contraindicated in pregnant women during first trimester.
- Use cautiously in patients with CNS disorders, the elderly, and in those with blood dyscrasias or hepatic dysfunction.

## NURSING CONSIDERATIONS

- If therapy exceeds 3 days, monitor children closely.
- Patient should take drug with food to minimize adverse GI effects.

***Alert:*** If abnormal neurologic signs, such as seizures or numbness of the arms or legs, occur, stop drug immediately.

- If candidiasis develops during therapy, the patient may need an antifungal.
- Women shouldn't breast-feed during therapy and for 3 days after the last dose.
- An elderly patient may have decreased liver or kidney function or other medical conditions and may be taking other drugs that may affect dosage.

## PATIENT TEACHING

- Tell patient to take drug with food.

***Alert:*** Tell patient to report to prescriber seizures and numbness in arms or legs.

- Warn patient not to drink alcohol or use alcohol-containing products while taking drug and for 3 days afterward.
- Advise woman to immediately notify her prescriber if she becomes pregnant.
- Tell woman to stop breast-feeding during therapy and for 3 days after the last dose.
- If patient is being treated for a sexually transmitted infection, explain that his sexual partners should be treated at the same time.

**SAFETY ALERT!**

T

# tinzaparin sodium

ten-ZAH-pear-in

Innohep

*Therapeutic class:* Anticoagulant
*Pharmacologic class:* Low–molecular-weight heparin
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 20,000 anti-factor Xa international units/ml in 2-ml multidose vials. Each

vial contains 3.1 mg/ml sodium metabisulfite and 10 mg/ml benzyl alcohol.

## INDICATIONS & DOSAGES

➤ **Symptomatic deep vein thrombosis with or without pulmonary embolism**

*Adults:* 175 anti-factor Xa international units/kg of body weight subcutaneously once daily for at least 6 days and until patient is adequately anticoagulated with warfarin sodium (INR of at least 2) for 2 consecutive days. Start warfarin sodium therapy when appropriate, usually within 1 to 3 days of tinzaparin initiation. Volume of dose to be given may be calculated as follows:

Patient's weight in kg × 0.00875 ml/kg = Volume to be given in ml

## ADMINISTRATION

**Subcutaneous**

- Use an appropriate calibrated syringe to ensure correct withdrawal of volume of drug from vials.
- When giving drug, have patient lie or sit down. Give by deep subcutaneous injection into abdominal wall. Introduce whole length of needle into skinfold held between thumb and forefinger. Make sure to hold skinfold throughout injection.
- Alternate injection sites between right and left anterolateral and posterolateral abdominal wall. Record location.
- To minimize bruising, don't rub injection site after administration.
- Store at room temperature.

## ACTION

Inhibits reactions that lead to blood clotting, including formation of fibrin clots, and helps to inactivate coagulation factor Xa and thrombin. Drug also induces release of tissue factor pathway inhibitor, which may contribute to the antithrombotic effect.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Subcut. | 2–3 hr | 4–5 hr | 18–24 hr |

*Half-life:* 3 to 4 hours.

## ADVERSE REACTIONS

**CNS:** ***cerebral or intracranial bleeding,*** headache, dizziness, insomnia, confusion, fever, pain.

**CV:** ***arrhythmias, MI, thromboembolism,*** chest pain, hypotension, hypertension, tachycardia, dependent edema, angina pectoris.

**EENT:** epistaxis, ocular hemorrhage.

**GI:** ***GI hemorrhage,*** anorectal bleeding, constipation, flatulence, hematemesis, nausea, vomiting, dyspepsia, retroperitoneal or intra-abdominal bleeding, melena.

**GU:** ***vaginal hemorrhage,*** dysuria, hematuria, UTI, urine retention.

**Hematologic:** ***granulocytopenia, thrombocytopenia, agranulocytosis, pancytopenia, hemorrhage,*** anemia.

**Musculoskeletal:** back pain, hemarthrosis.

**Respiratory:** ***pulmonary embolism,*** pneumonia, respiratory disorder, dyspnea.

**Skin:** bullous eruption, cellulitis, *injection site hematoma*, pruritus, purpura, rash, skin necrosis, wound hematoma, bullous eruption.

**Other:** ***allergic reaction, fetal death, spinal or epidural hematoma,*** hypersensitivity reaction, infection, impaired healing, congenital anomaly, ***fetal distress.***

## INTERACTIONS

**Drug-drug.** *Oral anticoagulants, platelet inhibitors (such as dextran, dipyridamole, NSAIDs, salicylates, sulfinpyrazone), thrombolytics:* May increase risk of bleeding. Use together cautiously. If drugs must be given together, monitor patient.

**Drug-herb.** *Angelica (dong quai), boldo, bromelains, capsicum, chamomile, dandelion, danshen, devil's claw, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, licorice, meadowsweet, onion, passion flower, red clover, willow:* May increase risk of bleeding. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase AST and ALT levels. May decrease hemoglobin level.
- May decrease granulocyte, platelet, RBC, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to tinzaparin sodium or other low–molecular-weight heparins, heparin, sulfites, benzyl alcohol, or pork products.
- Contraindicated in patients with active major bleeding and in those with history of heparin-induced thrombocytopenia.
- Use cautiously in patients with increased risk of hemorrhage, such as those with bacterial endocarditis; uncontrolled hypertension; diabetic retinopathy; congenital or acquired bleeding disorders, including hepatic failure and amyloidosis; GI ulceration; or hemorrhagic stroke.
- Use cautiously in patients who have recently undergone brain, spinal, or ophthalmologic surgery, and in those being treated with platelet inhibitors.
- Use drug with care in elderly patients and patients with renal insufficiency, whose elimination of the drug may be reduced.
- Use cautiously in breast-feeding women; it's unknown if drug appears in breast milk.

***Overdose S&S:*** Bleeding complications, nosebleeds, hematuria, tarry stools, easy bruising, petechial hemorrhages, frank bleeding.

## NURSING CONSIDERATIONS

- Drug isn't intended for I.M. or I.V. administration, nor should it be mixed with other injections or infusions.

***Alert:*** Don't interchange drug (unit to unit) with heparin or other low–molecular-weight heparins.

- Monitor platelet count during therapy. Stop drug if platelet count goes below 100,000/$mm^3$.
- Periodically monitor CBC count and stool tests for occult blood during treatment.
- Drug may affect PT and INR levels. Patient also receiving warfarin should have blood for PT and INR drawn just before next scheduled dose of tinzaparin.
- Drug contains sodium metabisulfite, which may cause allergic reactions in susceptible people.

**Black Box Warning** Patients who receive epidural or spinal anesthesia or spinal puncture are at increased risk of epidural or spinal hematoma, which may result in long-term or permanent paralysis. Monitor these patients closely for neurologic impairment. ■

***Alert:*** If woman becomes pregnant while taking drug, warn her of potential risks to the fetus. Cases of fatal "gasping syndrome" may occur in premature neonates when large amounts of benzyl alcohol are given.

## PATIENT TEACHING

- Explain to patient importance of laboratory monitoring to ensure effectiveness of drug while maintaining safety.
- Teach patient warning signs of bleeding and instruct him to report these signs immediately.
- Advise patient to consult with prescriber before starting any herbal therapy; many herbs have anticoagulant, antiplatelet, or fibrinolytic properties.
- Caution patient to use soft toothbrush and electric razor to prevent cuts and bruises.
- Instruct patient that warfarin will be started when appropriate, within 1 to 3 days of therapy. Explain importance of warfarin and the monitoring for safety and effectiveness.

# tiotropium bromide

tye-oh-TROH-pee-um

Spiriva

*Therapeutic class:* Bronchodilator
*Pharmacologic class:* Anticholinergic
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules for inhalation:* 18 mcg

## INDICATIONS & DOSAGES

✷ ***NEW INDICATION:*** **To reduce COPD exacerbations**

*Adults:* 2 oral inhalations of 1 capsule (18 mcg) once daily using HandiHaler inhalation device.

➤ **Maintenance treatment of bronchospasm in COPD, including chronic bronchitis and emphysema**

*Adults:* 2 oral inhalations of 1 capsule (18 mcg) once daily using the HandiHaler inhalation device.

## ADMINISTRATION

**Inhalational**

- Give capsules only by oral inhalation with the HandiHaler device.
- Open capsule blister immediately before use.
- Capsules aren't for oral ingestion.

## ACTION

Competitive, reversible inhibition of muscarinic receptors leads to bronchodilation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Inhalation | 30 min | 3 hr | >24 hr |

*Half-life:* 5 to 6 days.

## ADVERSE REACTIONS

**CNS:** depression, paresthesia.
**CV:** ***angina pectoris,*** chest pain, edema.
**EENT:** *sinusitis,* cataract, dysphonia, epistaxis, glaucoma, laryngitis, pharyngitis, rhinitis.
**GI:** *dry mouth,* abdominal pain, constipation, dyspepsia, gastroesophageal reflux, stomatitis, vomiting.
**GU:** UTI.
**Metabolic:** hypercholesterolemia, hyperglycemia.
**Musculoskeletal:** arthritis, leg pain, myalgia, skeletal pain.
**Respiratory:** *upper respiratory tract infection,* cough.
**Skin:** rash.
**Other:** *accidental injury,* allergic reaction, candidiasis, flulike syndrome, herpes zoster, infections.

## INTERACTIONS

**Drug-drug.** *Anticholinergics:* May increase the risk of adverse reactions. Avoid using together.

## EFFECTS ON LAB TEST RESULTS

- May increase cholesterol and glucose levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to atropine, its derivatives, ipratropium, or any component of the product.
- Use cautiously in women who are pregnant or breast-feeding, patients with creatinine clearance of 50 ml/minute or less, or patients with angle-closure glaucoma, prostatic hyperplasia, or bladder neck obstruction.
- Use cautiously in patients with severe hypersensitivity to milk protein.

***Overdose S&S:*** Change in mental status, tremors, abdominal pain, severe constipation.

## NURSING CONSIDERATIONS

***Alert:*** Use drug for maintenance treatment of COPD, not for acute bronchospasm.
- Watch for evidence of hypersensitivity (especially angioedema) and paradoxical bronchospasm.
- ***Look alike–sound alike:*** Don't confuse Spiriva with Inspra.

## PATIENT TEACHING

- Inform patient that drug is for maintenance treatment of COPD and not for immediate relief of breathing problems.

***Alert:*** Explain that capsules are for inhalation and shouldn't be swallowed.
- Provide full instructions for the HandiHaler device.
- Tell patient not to get powder in his eyes.
- Review signs and symptoms of hypersensitivity (especially angioedema) and paradoxical bronchospasm. Tell patient to stop the drug and contact the prescriber if they occur.
- Advise patient to report eye pain, blurred vision, visual halos, colored images, or red eyes immediately.
- Tell patient to keep capsules in sealed blisters and to remove each capsule just before use. Caution against storing capsules in the HandiHaler device.
- Instruct patient to store capsules at 77° F (25° C) and not to expose them to extreme temperatures or moisture.

## tipranavir

tih-PRAN-uh-veer

Aptivus

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Protease inhibitor
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules:* 250 mg
*Oral solution:* 100 mg/ml

### INDICATIONS & DOSAGES

➤ **HIV-1 in patients with viral replication who are highly treatment experienced or have HIV-1 strains resistant to multiple protease inhibitors**

*Adults:* 500 mg P.O. twice daily with 200 mg of ritonavir twice daily. Give with or without food.

*Children ages 2 to 18:* Tipranavir 14 mg/kg with ritonavir 6 mg/kg (or tipranavir 375 mg/m$^2$ with ritonavir 150 mg/m$^2$) b.i.d., not to exceed dosage of tipranavir 500 mg with ritonavir 200 mg b.i.d. For children who develop intolerance or toxicity, prescribers may consider decreasing dosage to tipranavir 12 mg/kg with ritonavir 5 mg/kg b.i.d. provided the virus isn't resistant to multiple protease inhibitors.

### ADMINISTRATION

**P.O.**

- Give with 200 mg ritonavir and other antiretrovirals.
- Give drug with or without food.
- Do not freeze or refrigerate oral solution.

### ACTION

Inhibits virus-specific processing of polyproteins in HIV-1 infected cells, preventing formation of mature virions.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3 hr | Unknown |

*Half-life:* 5 to 6 hours.

### ADVERSE REACTIONS

**CNS:** dizziness, fatigue, headache, insomnia, malaise, peripheral neuropathy, pyrexia, sleep disorder, somnolence.

**GI:** *diarrhea,* ***pancreatitis,*** abdominal distention, abdominal pain, dyspepsia, flatulence, GERD, nausea, vomiting.
**GU:** renal insufficiency.
**Hematologic:** ***neutropenia, thrombocytopenia,*** anemia.
**Hepatic:** ***hepatic failure, hepatitis.***
**Metabolic:** anorexia, decreased appetite, dehydration, diabetes mellitus, facial wasting, hyperglycemia, weight loss.
**Musculoskeletal:** muscle cramps, myalgia.
**Respiratory:** cough, dyspnea.
**Skin:** *rash,* acquired lipodystrophy, exanthem, lipoatrophy, lipohypertrophy, pruritus.
**Other:** flulike illness, hypersensitivity, reactivation of herpes simplex and varicella zoster.

### INTERACTIONS

**Drug-drug.** *Amiodarone, bepridil, flecainide, propafenone, quinidine:* May increase levels of these drugs and risk of life-threatening arrhythmias. Avoid using together.
*Atorvastatin:* May increase levels of both drugs. Start with lowest dose of atorvastatin, and monitor patient closely or consider other drugs.
*Clarithromycin:* May increase levels of both drugs. If patient's creatinine clearance is 30 to 60 ml/minute, decrease clarithromycin dose by 50%. If patient's creatinine clearance is less than 30 ml/minute, decrease clarithromycin dose by 75%.
*Cyclosporine, sirolimus, tacrolimus:* May cause unpredictable interaction. Monitor drug levels closely until they've stabilized.
*Desipramine:* May increase desipramine level. Decrease dose and monitor desipramine level.
*Diltiazem, felodipine, nicardipine, nisoldipine, verapamil:* May cause unpredictable interaction. Use together cautiously, and monitor patient closely.
*Disulfiram, metronidazole:* May cause disulfiram-like reaction. Use together cautiously.
*Ergot derivatives (dihydroergotamine, ergonovine, ergotamine, methylergonovine):* May cause acute ergot toxicity, including peripheral vasospasm and ischemia of extremities. Avoid using together.

T

*Estrogen-based hormone therapy:* May decrease estrogen level, and rash may occur. Monitor patient carefully. Advise using nonhormonal contraception.
*Fluoxetine, paroxetine, sertraline:* May increase levels of these drugs. Adjust dosages as needed.
*Glimepiride, glipizide, glyburide, pioglitazone, repaglinide, tolbutamide:* May affect glucose levels. Monitor glucose level carefully.
*Lovastatin, simvastatin:* May increase risk of myopathy and rhabdomyolysis. Avoid using together.
*Meperidine:* May increase normeperidine metabolite. Avoid using together.
*Methadone:* May decrease methadone level by 50%. Consider increased methadone dose.
*Midazolam, triazolam:* May cause prolonged or increased sedation or respiratory depression. Don't use together.
*Pimozide:* May cause life-threatening arrhythmias. Avoid using together.
*Rifabutin:* May increase rifabutin level. Decrease rifabutin dose by 75%.
*Rifampin:* May lead to loss of virologic response and resistance to tipranavir and other protease inhibitors. Avoid using together.
*Sildenafil, tadalafil, vardenafil:* May increase levels of these drugs. Use together cautiously. Tell patient not to exceed 25 mg sildenafil in 48 hours, 10 mg tadalafil every 72 hours, or 2.5 mg vardenafil every 72 hours.
*Valproic acid:* May reduce valproic acid plasma level. Use with caution.
*Warfarin:* May cause unpredictable reaction. Check INR often.
**Drug-herb.** *St. John's wort:* May lead to loss of virologic response and resistance to this drug and other antiretrovirals. Warn patient to avoid using together.

## EFFECTS ON LAB TEST RESULTS

- May increase total cholesterol, triglyceride, blood glucose, amylase, lipase, ALT, and AST levels.
- May decrease WBC count.

## CONTRAINDICATIONS & CAUTIONS

**Black Box Warning** Administration of tipranavir with ritonavir 200 mg has been associated with fatal and nonfatal intracranial hemorrhage, clinical hepatitis, and hepatic decompensation. ■
- Contraindicated in patients hypersensitive to any ingredients of the product, patients with moderate (Child-Pugh class B) and severe (Child-Pugh class C) hepatic insufficiency, and patients taking drugs that depend on CYP3A for clearance, such as amiodarone, bepridil, ergot derivatives (dihydroergotamine, ergonovine, ergotamine, methylergonovine), flecainide, midazolam, pimozide, propafenone, quinidine, and triazolam.
- Use cautiously in patients with sulfonamide allergy, diabetes, liver disease, hepatitis B or C, or hemophilia A or B.

## NURSING CONSIDERATIONS

***Alert:*** Don't give drug to treatment-naive patients.
- To be effective, drug must be given with 200 mg ritonavir and with other antiretrovirals.

***Alert:*** Monitor patient for signs and symptoms of intracranial hemorrhage, including headache, nausea and vomiting, change in mental status, speech or balance difficulties, and seizures.
***Alert:*** Obtain thorough patient drug history. Many drugs may interact with tipranavir.
- Monitor liver function tests at start of treatment and often during treatment.
- Assess for evidence of hepatitis, such as fatigue, malaise, anorexia, nausea, jaundice, bilirubinemia, acholic stools, liver tenderness, and hepatomegaly.
- If patient develops signs or symptoms of hepatitis, notify prescriber.

**Black Box Warning** Patients with chronic hepatitis B or C are at increased risk of hepatotoxicity. ■
- In diabetic patients, monitor glucose level closely; hyperglycemia may occur.
- Obtain baseline cholesterol and triglyceride levels at start of and periodically during therapy.
- Monitor patient for cushingoid symptoms, such as central obesity, buffalo hump, peripheral wasting, facial wasting. and breast enlargement.

• Use cautiously in elderly patients because they are more likely to have decreased organ function, multidrug therapy, and other illnesses.

### PATIENT TEACHING

• Explain that drug doesn't cure HIV infection and doesn't reduce the risk of transmitting the virus to others.
***Alert:*** Many drugs may interfere with this drug. Urge patient to tell prescriber about all prescription drugs, OTC drugs, and herbal products he takes.
• Tell patient that drug is effective only when taken with ritonavir and other antiretrovirals.
• Urge patient to stop drug and contact prescriber if he has evidence of hepatitis, such as fatigue, malaise, anorexia, nausea, jaundice, bilirubinemia, acholic stools, or liver tenderness.
• If woman uses hormonal contraceptives, advise use of barrier contraception.
• Tell patient that redistribution or accumulation of body fat may occur.
• Advise women that breast-feeding isn't recommended during therapy.

**SAFETY ALERT!**

## tirofiban hydrochloride

tye-row-FYE-ban

Aggrastat

*Therapeutic class:* Antiplatelet
*Pharmacologic class:* Glycoprotein (GP) IIb/IIIa receptor antagonist
*Pregnancy risk category B*

### AVAILABLE FORMS

*Injection:* 25-ml and 50-ml vials (250 mcg/ml), 250-ml and 500-ml premixed vials (50 mcg/ml)

### INDICATIONS & DOSAGES

➤ **Acute coronary syndrome, with heparin or aspirin, including patients who are to be managed medically and those undergoing percutaneous transluminal coronary angioplasty (PTCA) or atherectomy**

*Adults:* I.V. loading dose of 0.4 mcg/kg/minute for 30 minutes; then continuous I.V. infusion of 0.1 mcg/kg/minute. Continue infusion through angiography and for 12 to 24 hours after PTCA or atherectomy.
***Adjust-a-dose:*** If creatinine clearance is less than 30 ml/minute, use a loading dose of 0.2 mcg/kg/minute for 30 minutes; then continuous infusion of 0.05 mcg/kg/minute. Continue infusion through angiography and for 12 to 24 hours after PTCA or atherectomy.

### ADMINISTRATION

**I.V.**

▼ Dilute injections of 250 mcg/ml to same strength as 500-ml premixed vials (50 mcg/ml) as follows: Withdraw and discard 100 ml from a 500-ml bag of sterile normal saline solution or $D_5W$ and replace this volume with 100 ml of tirofiban injection (from four 25-ml vials or two 50-ml vials); or withdraw 50 ml from a 250-ml bag of sterile normal saline solution or $D_5W$ and replace this volume with 50 ml of tirofiban injection (from two 25-ml vials or one 50-ml vial), to yield 50 mcg/ml.
▼ Inspect solution for particulate matter before giving, and check for leaks by squeezing the inner bag firmly. If bag leaks or particles are visible, discard solution.
▼ Avoid use of noncompressible sites (such as subclavian or jugular veins).
▼ Heparin and tirofiban may be given through the same I.V. catheter. Tirofiban may be given through the same I.V. line as dopamine, lidocaine, potassium chloride, and famotidine.
▼ Discard unused solution 24 hours after the start of infusion.
▼ Store drug at room temperature. Protect from light.
▼ **Incompatibilities:** Diazepam.

### ACTION

Reversibly binds to the GP IIb/IIIa receptor on human platelets and inhibits platelet aggregation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | Immediate | 4–6 hr |

*Half-life:* About 2 hours.

T

## ADVERSE REACTIONS

**CNS:** dizziness, fever, headache.
**CV:** ***bradycardia, coronary artery dissection,*** edema, vasovagal reaction.
**GI:** *occult bleeding,* nausea.
**Hematologic:** *bleeding,* ***thrombocytopenia.***
**Musculoskeletal:** leg pain.
**Skin:** sweating.
**Other:** *bleeding at arterial access site,* pelvic pain.

## INTERACTIONS

**Drug-drug.** *Anticoagulants such as warfarin, aspirin, clopidogrel, dipyridamole, heparin, NSAIDs, thrombolytics, ticlopidine:* May increase risk of bleeding. Monitor patient closely.
*Levothyroxine, omeprazole:* May increase tirofiban renal clearance. Monitor patient.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level and hematocrit.
- May decrease platelet count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Contraindicated in those with active internal bleeding or history of bleeding diathesis within the previous 30 days and in those with history of intracranial hemorrhage, intracranial neoplasm, arteriovenous malformation, aneurysm, thrombocytopenia after previous exposure to drug, stroke within 30 days, or hemorrhagic stroke.
- Contraindicated in those with history, symptoms, or findings suggestive of aortic dissection; severe hypertension (systolic blood pressure higher than 180 mm Hg or diastolic blood pressure higher than 110 mm Hg); acute pericarditis; major surgical procedure or severe physical trauma within previous month; or concomitant use of another parenteral GP IIb/IIIa inhibitor.
- Use cautiously in patients with increased risk of bleeding, including those with hemorrhagic retinopathy or platelet count less than 150,000/$mm^3$.
- Safety and efficacy of drug haven't been studied in patients younger than age 18.

***Overdose S&S:*** Bleeding.

## NURSING CONSIDERATIONS

- Monitor hemoglobin level, hematocrit, and platelet count before starting therapy, 6 hours after loading dose, and at least daily during therapy. If thrombocytopenia occurs, notify prescriber.
- Give drug with aspirin and heparin.
- Monitor patient for bleeding.

***Alert:*** The most common adverse effect is bleeding at the arterial access site for cardiac catheterization.

- The risk of bleeding may decrease with early sheath removal and by keeping the access site immobile. The sheath may be removed during infusion, but only after heparin has been stopped and its effects largely reversed.
- Minimize use of arterial and venous punctures, I.M. injections, urinary catheters, and nasotracheal and nasogastric tubes.
- Elderly patients have a higher risk of bleeding complications.
- ***Look alike–sound alike:*** Don't confuse Aggrastat with argatroban.

## PATIENT TEACHING

- Explain that drug is a blood thinner used to prevent chest pain and heart attack.
- Explain that risk of serious bleeding is far outweighed by the benefits of drug.
- Instruct patient to report chest discomfort or other adverse effects immediately.
- Tell patient that frequent blood sampling may be needed to evaluate therapy.

# tizanidine hydrochloride

tis-AN-i-deen

Zanaflex

*Therapeutic class:* Skeletal muscle relaxant
*Pharmacologic class:* Imidazoline derivative, centrally acting alpha$_2$-adrenergic agonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 2 mg, 4 mg, 6 mg
*Tablets:* 2 mg, 4 mg

## INDICATIONS & DOSAGES

➤ **Acute and intermittent management of increased muscle tone with spasticity**

*Adults:* Initially, 4 mg P.O. every 6 to 8 hours, as needed, to maximum of three doses in 24 hours. Dosage can be increased gradually in 2- to 4-mg increments, reaching optimum dose over 2 to 4 weeks. Maximum, 36 mg daily.

***Adjust-a-dose:*** For patients with renal insufficiency (creatinine clearance less than 25 ml/minute), reduce dosage. If higher dosages are needed, increase individual doses rather than frequency.

## ADMINISTRATION

**P.O.**

• Give drug consistently with or without food for same absorption rate and effect.

## ACTION

Unknown. Acts as an $alpha_2$ agonist. May reduce spasticity by increasing presynaptic inhibition of motor neurons at the level of the spinal cord.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | 3–6 hr |

*Half-life:* 2½ hours; metabolites, 20 to 40 hours.

## ADVERSE REACTIONS

**CNS:** *somnolence, sedation, asthenia, dizziness,* speech disorder, dyskinesia, nervousness, hallucinations.
**CV:** *hypotension,* ***bradycardia.***
**EENT:** amblyopia, pharyngitis, rhinitis.
**GI:** *dry mouth,* constipation, vomiting.
**GU:** *UTI,* urinary frequency.
**Hepatic:** hepatic injury.
**Other:** infection, flulike syndrome.

## INTERACTIONS

**Drug-drug.** *Acetaminophen:* May delay acetaminophen absorption time. Monitor patient for clinical effect.
*Antihypertensives, other alpha agonists such as clonidine:* May cause hypotension; monitor patient closely. Avoid using together.
*Baclofen, benzodiazepines, other CNS depressants:* May have additive CNS depressant effects. Avoid using together.
*CYP1A2 inhibitors (amiodarone, acyclovir, cimetidine, ciprofloxacin, famotidine, fluoroquinolones, fluvoxamine, mexiletine, propafenone, ticlodipine, verapamil, zileuton):* May cause significant increases in tizanidine levels. Use together should be avoided; use of ciprofloxacin or fluvoxamine with tizanidine is contraindicated.
*Oral contraceptives:* May decrease tizanidine clearance. Reduce tizanidine dosage.
**Drug-lifestyle.** *Alcohol use:* May increase CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

• May increase AST and ALT levels.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug.
• Use of potent CYP1A2 inhibitors ciprofloxacin and fluvoxamine with tizanidine is contraindicated.
• Use cautiously in patients who are taking antihypertensives, in those with renal and hepatic impairment, in pregnant or breast-feeding women, and in elderly patients.
• Safety and effectiveness in children haven't been established.
⚠ ***Overdose S&S:*** Lethargy, somnolence, confusion, coma, bradycardia, hypotension, respiratory depression, depressed cardiac function.

## NURSING CONSIDERATIONS

***Alert:*** The capsules and tablets are bioequivalent only if taken on an empty stomach.
• Obtain liver function test results before treatment; during treatment at 1, 3, and 6 months; and then periodically thereafter.
***Alert:*** Stop drug gradually, especially in patients taking high doses for a prolonged period. Decrease dose slowly to minimize the potential for rebound hypertension, tachycardia, and hypertonia.
• ***Look alike–sound alike:*** Don't confuse tizanidine with tiagabine; both have 4-mg starting doses.

## PATIENT TEACHING

• Caution patient to avoid alcohol and activities that require alertness. Drug may cause drowsiness.

T

- Inform patient that dizziness upon standing quickly can be minimized by rising slowly and avoiding sudden position changes.
- Advise patient not to suddenly stop taking medication.

## tobramycin

toe-bra-MYE-sin

AKTob, Tobrex

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Aminoglycoside
*Pregnancy risk category B*

### AVAILABLE FORMS

*Ophthalmic ointment:* 0.3%
*Ophthalmic solution:* 0.3%

### INDICATIONS & DOSAGES

➤ **External ocular infections by susceptible bacteria**

*Adults and children:* In mild to moderate infections, instill 1 or 2 drops into affected eye every 4 hours, or apply 1-cm strip of ointment every 8 to 12 hours. In severe infections, instill 2 drops into infected eye every 60 minutes until condition improves; then reduce frequency. Or, apply 1-cm strip of ointment every 3 to 4 hours until condition improves; then reduce frequency to b.i.d. to t.i.d.

### ADMINISTRATION

**Ophthalmic**

- When two different ophthalmic solutions are used, allow at least 10 minutes between instillations.
- Apply light finger pressure on lacrimal sac for 1 minute after drops are instilled.
- Apply ointment to conjunctiva. Don't let tube touch eye.

### ACTION

Thought to inhibit protein synthesis; usually bactericidal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Unknown | Unknown | Unknown |

*Half-life:* 2 to 3 hours.

### ADVERSE REACTIONS

**EENT:** blurred vision with ointment, burning or stinging on instillation, conjunctival erythema, increased lacrimation, lid itching or swelling.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

None reported.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other aminoglycosides.

⚠ ***Overdose S&S:*** Punctate keratitis, erythema, tearing, edema, lid itching.

### NURSING CONSIDERATIONS

***Alert:*** Tobramycin ophthalmic solution isn't for injection.

- If topical ocular tobramycin is given with systemic tobramycin, carefully monitor levels.
- Prolonged use may result in overgrowth of nonsusceptible organisms, including fungi.
- ***Look alike–sound alike:*** Don't confuse tobramycin with Trobicin or Tobrex with TobraDex.

### PATIENT TEACHING

- Tell patient to clean excessive discharge from eye area before application.
- Teach patient how to instill drops or apply ointment. Advise him to wash hands before and after applying and to avoid touching tip of dropper to eye or surrounding tissue.
- Instruct patient to apply light finger pressure on lacrimal sac for 1 minute after drops are instilled.
- Tell patient to wait at least 10 minutes before instilling other eyedrops.
- Advise patient to watch for itching lids, swelling, or constant burning. Tell him to stop drug and notify prescriber if these signs and symptoms develop.
- Tell patient not to share drug, washcloths, or towels with family members and to notify prescriber if anyone develops same signs or symptoms.
- Stress importance of compliance with recommended therapy.

# tobramycin sulfate

toe-bra-MYE-sin

TOBI

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Aminoglycoside
*Pregnancy risk category D*

## AVAILABLE FORMS

*Multidose vials (pediatric):* 10 mg/ml, 40 mg/ml
*Nebulizer solution (for inhalation):* 300 mg/5 ml
*Prefilled syringe (pediatric):* 40 mg/ml
*Premixed parenteral injection for infusion:* 60 mg or 80 mg in normal saline solution

## INDICATIONS & DOSAGES

➤ **Serious infection by sensitive strains of *Escherichia coli, Proteus, Klebsiella, Enterobacter, Serratia, Morganella morganii, Staphylococcus aureus, Citrobacter, Pseudomonas,* or *Providencia***

*Adults:* 3 mg/kg/day I.M. or I.V. in divided doses. For life-threatening infections, give up to 5 mg/kg/day in divided doses every 6 to 8 hours; reduce to 3 mg/kg daily as soon as clinically indicated.

*Children older than age 1 week:* 6 to 7.5 mg/kg/day I.M. or I.V., divided t.i.d. or q.i.d.

*Neonates younger than age 1 week or premature infants:* Up to 4 mg/kg/day I.V. or I.M. in two equal doses every 12 hours.

***Adjust-a-dose:*** For patients with renal impairment, give loading dose of 1 mg/kg; then give decreased doses at 8-hour intervals or same dose at prolonged intervals. For hemodialysis patients, give 50% of the normal dose after dialysis and adjust according to serum concentrations. For patients with severe cystic fibrosis, initial dose is 10 mg/kg/day I.V. or I.M., divided q.i.d.

➤ **To manage cystic fibrosis patients with *Pseudomonas aeruginosa***

*Adults and children age 6 and older:* 300 mg via nebulizer every 12 hours for 28 days. Continue cycle of 28 days on drug and 28 days off.

## ADMINISTRATION

**I.V.**

▼ Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
▼ For adults, dilute in 50 to 100 ml of normal saline solution or $D_5W$; use a smaller volume for children.
▼ Keep reconstituted solution in refrigerator and use within 96 hours.
▼ Infuse over 20 to 60 minutes.
▼ After infusion, flush line with normal saline solution or $D_5W$.
▼ Obtain blood for peak level 30 minutes after infusion stops; draw blood for trough level just before next dose. Don't collect blood in a heparinized tube because of incompatibility.
▼ **Incompatibilities:** Allopurinol; amphotericin B; azithromycin; beta-lactam antibiotics; cefepime; clindamycin; dextrose 5% in Isolyte E, M, or P; heparin sodium; hetastarch; indomethacin; propofol; sargramostim; solutions containing alcohol.

**I.M.**

● Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
● Obtain blood for peak level 1 hour after I.M. injection; draw blood for trough level just before next dose. Don't collect blood in a heparinized tube because of incompatibility.

**Inhalational**

● Obtain specimen for culture and sensitivity tests before giving. Begin therapy while awaiting results.
● Give nebulizer solution over 10 to 15 minutes using handheld Pari LC Plus reusable nebulizer with DeVilbiss Pulmo-Aide compressor.

## ACTION

Generally bactericidal. Inhibits protein synthesis by binding directly to the 30S ribosomal subunit.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | 30 min | 8 hr |
| I.M. | Unknown | 30–60 min | 8 hr |
| Inhalation | Unknown | Unknown | Unknown |

*Half-life:* 2 to 3 hours.

T

## ADVERSE REACTIONS

**CNS:** ***seizures,*** headache, lethargy, confusion, disorientation, fever.
**EENT:** *ototoxicity, hoarseness, pharyngitis.*
**GI:** vomiting, nausea, diarrhea.
**GU:** ***nephrotoxicity,*** possible increase in urinary excretion of casts.
**Hematologic:** anemia, eosinophilia, ***leukopenia, thrombocytopenia, agranulocytosis.***
**Metabolic:** electrolyte imbalances.
**Musculoskeletal:** muscle twitching.
**Respiratory:** ***bronchospasm.***
**Skin:** rash, urticaria, pruritus.

## INTERACTIONS

**Drug-drug.** **Black Box Warning** *Acyclovir, amphotericin B, cephalosporins, cidofovir, cisplatin, methoxyflurane, vancomycin, other aminoglycosides:* May increase nephrotoxicity. Monitor renal function test results. ■

*Atracurium, pancuronium, rocuronium, vecuronium:* May increase effects of nondepolarizing muscle relaxants, including prolonged respiratory depression. Use together only when necessary, and expect to reduce dosage of nondepolarizing muscle relaxant.

*Dimenhydrinate:* May mask symptoms of ototoxicity. Monitor patient's hearing.

*General anesthetics:* May increase neuromuscular blockade. Monitor patient for increased clinical effects.

**Black Box Warning** *I.V. loop diuretics such as furosemide:* May increase ototoxicity. Monitor patient's hearing. ■

***Parenteral penicillins:*** May inactivate tobramycin in vitro. Don't mix together.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN, creatinine, nonprotein nitrogen, and urine urea levels. May decrease calcium, magnesium, and potassium levels.
- May increase eosinophil count. May decrease WBC and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other aminoglycosides.
- Use cautiously in patients with impaired renal function or neuromuscular disorders and in elderly patients.

***Overdose S&S:*** Nephrotoxicity, dizziness, tinnitus, vertigo, loss of high-tone hearing acuity, neuromuscular blockade, respiratory failure, respiratory paralysis.

## NURSING CONSIDERATIONS

- Weigh patient and review renal function studies before therapy.

***Alert:*** Evaluate patient's hearing before and during therapy. If patient complains of tinnitus, vertigo, or hearing loss, notify prescriber.

- Don't dilute or mix with dornase alpha in a nebulizer.
- Unrefrigerated drug, which is normally slightly yellow, may darken with age. This doesn't affect product quality.
- Avoid exposing ampules to intense light.

**Black Box Warning** Peak levels over 12 mcg/ml and trough levels over 2 mcg/ml may increase the risk of toxicity. Reserve higher peak levels for cystic fibrosis patients, who need a greater lung penetration. ■

**Black Box Warning** Due to increased risk of nephrotoxicity, monitor renal function: urine output, specific gravity, urinalysis, creatinine clearance, and BUN and creatinine levels. Notify prescriber about signs and symptoms of decreasing renal function. ■

**Black Box Warning** Aminoglycosides can cause fetal harm when administered to pregnant women. ■

- Watch for signs and symptoms of superinfection, such as continued fever, chills, and increased pulse rate.
- If no response occurs in 3 to 5 days, therapy may be stopped and new specimens obtained for culture and sensitivity testing.
- ***Look alike–sound alike:*** Don't confuse tobramycin with Trobicin.

## PATIENT TEACHING

- Instruct patient to report adverse reactions promptly.
- Caution patient not to perform hazardous activities if adverse CNS reactions occur.
- Encourage patient to maintain adequate fluid intake.

- Teach patient how to use and maintain nebulizer.
- Tell patient using several inhaled therapies to use this drug last.
- Instruct patient not to use if the inhalation solution is cloudy or contains particles or if it has been stored at room temperature for longer than 28 days.

✳ NEW DRUG

## tocilizumab

toe-sih-LIZ-oo-mab

Actemra

*Therapeutic class:* Antiarthritic
*Pharmacologic class:* Interleukin-6 receptor inhibitor
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 80 mg/4 ml, 200 mg/10 ml, 400 mg/20 ml single-use vials

### INDICATIONS & DOSAGES

➤ **As monotherapy or with methotrexate or other disease-modifying antirheumatic drugs (DMARDs), except biological DMARDs such as tumor necrosis factor (TNF), for moderately to severely active rheumatoid arthritis when response to one or more TNF antagonists is inadequate**

*Adults:* Initially, 4 mg/kg I.V. over 60 minutes every 4 weeks. May increase dosage to 8 mg/kg based on clinical response.

***Adjust-a-dose:*** For patients with neutropenia or thrombocytopenia, reduce dosage to 4 mg/kg. For patients with liver enzyme levels greater than one to three times the upper limit of normal (ULN), reduce dosage to 4 mg/kg or interrupt drug until levels normalize. For liver enzyme levels greater than three to five times ULN, stop drug until levels are less than three times ULN and then restart at 4 mg/kg. Discontinue drug for persistent levels greater than three times ULN.

### ADMINISTRATION

**I.V.**

▼ Withdraw normal saline from 100-ml container in volume equal to drug dose, slowly add drug to infusion bag, then gently invert bag to mix solution. Allow diluted solution to reach room temperature before infusion.
▼ Don't use solution if it's discolored or contains particulate matter.
▼ Store diluted solution at 36° F to 46° F (2° C to 8° C) or room temperature for up to 24 hours; protect from light.
▼ Administer infusion over 60 minutes; infusion must be administered with infusion set. Don't administer as I.V. push or bolus.
▼ **Incompatibilities:** Don't infuse in same line with other I.V. drugs.

### ACTION

Inhibits interleukin-6 mediated inflammatory processes by decreasing inflammatory markers such as C-reactive protein, rheumatoid factor, and erythrocyte sedimentation rate.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* 11 to 13 days.

### ADVERSE REACTIONS

**CNS:** dizziness, headache.
**CV:** hypertension.
**EENT:** nasopharyngitis.
**GI:** gastritis, mouth ulceration, upper abdominal pain.
**Hematologic:** ***thrombocytopenia.***
**Respiratory:** bronchitis, upper respiratory tract infection.
**Skin:** pruritus, rash, urticaria.
**Other:** ***antibody development, malignancy,*** infection.

### INTERACTIONS

**Drug-drug.** *Biological DMARDs (anti-CD20 monoclonal antibodies, interleukin-1 receptor antagonists, TNF antagonists):* May increase risk of serious infection. Don't use together.
*Cyclosporine, theophylline, warfarin:* May decrease drug levels. Monitor levels closely and adjust dosage as needed.
*CYP3A4 substrates (atorvastatin, lovastatin, omeprazole, hormonal contraceptives, simvastatin):* May affect levels of these drugs. Avoid use together.

T

*Live-virus vaccines:* No data are available on secondary transmission of infection from live-virus vaccine. Avoid using together.

### EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, and lipid levels.
- May decrease platelet and neutrophil counts.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components. Avoid use in those with active infection, active hepatic disease, or hepatic impairment.
- Use cautiously in patients who have been exposed to tuberculosis (TB), in those with history of chronic or recurrent infection, serious or opportunistic infection, or underlying conditions that increase risk of infection. Use cautiously in those who have resided or traveled in areas with endemic TB or mycosis.
- Use cautiously in patients at risk for GI perforation.
- For patients older than age 65 being treated with tocilizumab, give drug cautiously because serious infections are more common in this population.
- Use in pregnancy only if benefit to patient outweighs risk to fetus. It isn't known if drug appears in breast milk. Because of risk of serious adverse reactions, women should stop drug or stop breast-feeding.

### NURSING CONSIDERATIONS

**Black Box Warning** Sepsis or serious infections, including TB and bacterial, invasive fungal, viral, and other opportunistic infections, may occur. Monitor patient closely and stop drug if infection becomes serious. ■

**Black Box Warning** Patient should be evaluated, and treated if necessary, for latent TB before start of therapy. ■

- Suspect GI perforation in patient with new-onset abdominal symptoms.
- Monitor liver function studies, lipid levels, and neutrophil and platelet counts every 4 to 8 weeks during therapy.
- Ensure availability of appropriate supportive measures to treat possible hypersensitivity reaction.
- Drug may increase risk of malignancy.
- Monitor patient closely for signs and symptoms of demyelinating disorders.
- Recommended immunizations (except live-virus vaccines) should be brought up-to-date before beginning therapy.

### PATIENT TEACHING

***Alert:*** Warn patient to seek immediate medical attention if abdominal pain or signs and symptoms of infection occur.

- Instruct patient to have TB screening before therapy.
- Advise woman to consult prescriber if she becomes pregnant or plans to breast-feed.
- Tell patient to avoid exposure to infections.
- Remind patient to contact prescriber before scheduling surgery.
- Advise patient to avoid live-virus vaccines during therapy.

## tolcapone

toll-KAP-own

Tasmar

*Therapeutic class:* Antiparkinsonian
*Pharmacologic class:* Catechol-O-methyltransferase (COMT) inhibitor
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 100 mg, 200 mg

### INDICATIONS & DOSAGES

➤ **Adjunct to levodopa and carbidopa for signs and symptoms of idiopathic Parkinson disease in patients who have symptom fluctuation or haven't responded to other adjunctive treatment**

*Adults:* Initially, 100 mg P.O. t.i.d. with levodopa and carbidopa. Recommended daily dosage is 100 mg P.O. t.i.d. Levodopa dosage may need to be reduced by 20% to 30% to minimize risk of dyskinesias. Maximum, 600 mg daily. Stop drug if patient shows no benefit within 3 weeks.

### ADMINISTRATION

**P.O.**

- Give drug without regard for food.

• Give first dose of the day with first daily dose of levodopa and carbidopa.

## ACTION

May reversibly inhibit COMT when given with levodopa and carbidopa, increasing levodopa bioavailability. This causes a more constant dopaminergic stimulation in the brain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 hr | Unknown |

*Half-life:* 2 to 3 hours.

## ADVERSE REACTIONS

**CNS:** *dyskinesia, sleep disorder, dystonia, excessive dreaming, somnolence, confusion, headache, hallucinations,* dizziness, fever, hyperkinesia, hypertonia, fatigue, falling, syncope, balance loss, depression, tremor, speech disorder, paresthesia, agitation, irritability, mental deficiency, hyperactivity, hypokinesia.
**CV:** *orthostatic complaints,* chest pain, chest discomfort, palpitations, hypotension.
**EENT:** pharyngitis, tinnitus, sinus congestion.
**GI:** *nausea, anorexia, diarrhea, vomiting,* flatulence, constipation, abdominal pain, dyspepsia, dry mouth.
**GU:** UTI, urine discoloration, hematuria, micturition disorder, urinary incontinence, impotence.
**Hepatic:** ***hepatotoxicity.***
**Musculoskeletal:** *muscle cramps,* stiffness, arthritis, neck pain.
**Respiratory:** bronchitis, dyspnea, upper respiratory tract infection.
**Skin:** increased sweating, rash.
**Other:** influenza, hyperpyrexia.

## INTERACTIONS

**Drug-drug.** *CNS depressants:* May cause additive effects. Monitor patient closely.
*Desipramine, SSRIs, tricyclic antidepressants:* May increase risk of adverse effects. Use together cautiously.
*Nonselective MAO inhibitors (phenelzine, tranylcypromine):* May cause hypertensive crisis. Avoid using together.
*Warfarin:* May cause increased warfarin level. Monitor INR and adjust warfarin dosage as needed.

## EFFECTS ON LAB TEST RESULTS

• May increase liver function test values.

## CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components and in those with history of drug-related confusion and nontraumatic rhabdomyolysis or hyperpyrexia.
**Black Box Warning** Tolcapone therapy shouldn't be initiated if patient exhibits clinical evidence of liver disease or two ALT or AST values greater than the upper limit of normal. Drug is contraindicated in those previously withdrawn from drug because of drug-induced hepatocellular injury. ■
**Black Box Warning** Use cautiously in patients with severe dyskinesia or dystonia. ■
• Use cautiously in patients with severe renal impairment and in breast-feeding women.
⚠ ***Overdose S&S:*** Nausea, vomiting, dizziness.

## NURSING CONSIDERATIONS

**Black Box Warning** Because of risk of liver toxicity, stop treatment if patient shows no benefit within 3 weeks. ■
**Black Box Warning** Because of fatal hepatic failure risk, use drug only in patients taking levodopa and carbidopa who don't respond to or who aren't appropriate candidates for other adjunctive therapies. If drug is discontinued because of hepatocellular injury, don't reintroduce. ■
**Black Box Warning** Make sure patient provides written informed consent before taking drug. ■
**Black Box Warning** Monitor liver function test results before starting drug, every 2 weeks for the first year of therapy, every 4 weeks for the next 6 months, and then every 8 weeks thereafter. If the dose is increased to 200 mg t.i.d., obtain liver enzyme levels before increasing dose and then resume monitoring as described. Also, discontinue treatment if ALT or AST level exceeds the upper limit of normal or if clinical signs and symptoms suggest the onset of hepatic failure. ■
• Because drug is highly protein bound, it isn't significantly removed during dialysis.

T

• Monitor patient for orthostatic hypotension and syncope.

### PATIENT TEACHING

• Advise patient to take drug exactly as prescribed.
**Black Box Warning** Teach patient to immediately report the signs and symptoms of liver injury (yellow eyes or skin, fatigue, loss of appetite, persistent nausea, itching, dark urine, or right upper abdominal tenderness). ■
• Warn patient about risk of dizziness upon standing up quickly; tell him to stand up cautiously.
• Advise patient to avoid hazardous activities until CNS effects of drug are known.
• Tell patient that nausea may occur early in therapy.
• Inform patient that diarrhea is common, sometimes occurring 2 to 12 weeks after therapy begins, and usually resolves when therapy stops.
• Advise patient about risk of increased problems making voluntary movements or impaired muscle tone.
• Inform patient that hallucinations may occur.
• Tell women to notify prescriber about planned, suspected, or known pregnancy.
• Inform patient that drug may be taken without regard to meals.

## tolterodine tartrate

toll-TEAR-oh-deen

Detrol✐, Detrol LA

*Therapeutic class:* Urinary antispasmodic
*Pharmacologic class:* Antimuscarinic
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules (extended-release):* 2 mg, 4 mg
*Tablets:* 1 mg, 2 mg

### INDICATIONS & DOSAGES

➤ **Overactive bladder in patients with symptoms of urinary frequency, urgency, or urge incontinence**

*Adults:* 2-mg tablet P.O. b.i.d. or 4-mg extended-release capsule P.O. daily. Dose may be reduced to 1-mg tablet P.O. b.i.d. or 2-mg extended-release capsule P.O. daily, based on patient response and tolerance.
***Adjust-a-dose:*** For patients with significantly reduced hepatic or renal function or those taking a potent CYP3A4 inhibitor, 1-mg tablet P.O. b.i.d. or 2-mg extended-release capsule P.O. daily.

### ADMINISTRATION

**P.O.**
• Give extended-release capsules with liquid to be swallowed whole.

### ACTION

Relaxes smooth muscle of bladder by antagonizing muscarinic receptors, relieving symptoms of overactive bladder.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | Unknown |
| P.O. (extended-release) | Unknown | 2–6 hr | Unknown |

*Half-life:* 2 to 4 hours; about 8 hours with hepatic impairment.

### ADVERSE REACTIONS

**CNS:** headache, fatigue, paresthesia, vertigo, dizziness, nervousness, somnolence.
**CV:** hypertension, chest pain.
**EENT:** abnormal vision, xerophthalmia, pharyngitis, rhinitis, sinusitis.
**GI:** *dry mouth*, abdominal pain, constipation, diarrhea, dyspepsia, flatulence, nausea, vomiting.
**GU:** dysuria, micturition frequency, urine retention, UTI.
**Metabolic:** weight gain.
**Musculoskeletal:** arthralgia, back pain.
**Respiratory:** bronchitis, coughing, upper respiratory tract infection.
**Skin:** pruritus, rash, erythema, dry skin.
**Other:** flulike syndrome, accidental injury, fungal infection, infection.

### INTERACTIONS

**Drug-drug.** *Antifungals (itraconazole, ketoconazole, miconazole), CYP3A4 inhibitors (such as clarithromycin and erythromycin):* May increase tolterodine level. Don't give more than 1-mg tablet b.i.d. or

2-mg extended-release capsule daily of tolterodine if used together.
*Fluoxetine:* May increase tolterodine level. Monitor patient. No dosage adjustment is needed.

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug or its components and in those with uncontrolled angle-closure glaucoma or urine or gastric retention.
- Use cautiously in patients with significant bladder outflow obstruction, GI obstructive disorders (such as pyloric stenosis), controlled angle-closure glaucoma, and hepatic or renal impairment.

***Overdose S&S:*** Dry mouth, severe central anticholinergic effects, QT interval prolongation.

### NURSING CONSIDERATIONS
- Assess baseline bladder function and monitor therapeutic effects.
- Monitor patient for residual urine after voiding.

### PATIENT TEACHING
- Tell patient that sugarless gum, hard candy, or saliva substitute may help relieve dry mouth.
- Advise patient to avoid driving or other potentially hazardous activities until visual effects of drug are known.
- Advise women to stop breast-feeding during therapy.
- Instruct patient to immediately report signs of infection, urine retention, or GI problems.
- Tell patient taking extended-release form to swallow capsule whole and take with liquids.

## tolvaptan
tol-VAP-tan

Samsca

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Selective vasopressin receptor antagonist
*Pregnancy risk category C*

### AVAILABLE FORMS
*Tablets:* 15 mg, 30 mg

### INDICATIONS & DOSAGES
➤ **Hypervolemic and euvolemic hyponatremia (serum sodium level less than 125 mEq/L and symptomatic hyponatremia) in hospitalized patients, including those with heart failure, cirrhosis, or syndrome of inappropriate antidiuretic hormone**
*Adults:* Initially, 15 mg P.O once daily. After 24 hours, may increase to 30 mg P.O. once daily, to maximum dosage of 60 mg P.O. once daily.

### ADMINISTRATION
**P.O.**
- Give drug with or without food.
- Avoid restricting fluids during the first 24 hours of therapy.
- Patient should avoid grapefruit and grapefruit juice during therapy.

### ACTION
Antagonizes the effect of vasopressin, causing an increase in urine excretion, which results in an increase in free water clearance, a decrease in urine osmolality, and ultimately an increase in serum sodium level.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 2–4 hr | 2–4 hr | Unknown |

*Half-life:* 12 hours.

### ADVERSE REACTIONS
**CNS:** asthenia, fever, ***stroke.***
**CV:** ***intracardiac thrombus, pulmonary embolism, ventricular fibrillation.***
**EENT:** *dry mouth, thirst.*
**GI:** anorexia, constipation, nausea.

T

**GU:** *polyuria, urinary frequency,* urethral hemorrhage, vaginal hemorrhage.
**Hematologic:** ***disseminated intravascular coagulation.***
**Metabolic:** hyperglycemia, ***diabetic ketoacidosis.***
**Musculoskeletal:** ***rhabdomyolysis.***
**Respiratory:** ***respiratory failure.***
**Other:** ***deep vein thrombosis.***

## INTERACTIONS

**Drug-drug.** *CYP3A inducers (barbiturates, carbamazepine, phenytoin, rifabutin, rifampin, rifapentin):* May decrease tolvaptan level. Avoid using together.
*Moderate CYP3A inhibitors (aprepitant, diltiazem, erythromycin, fluconazole, verapamil):* May increase tolvaptan level. Don't use together.
*P-gp inhibitors (such as cyclosporine):* May increase tolvaptan levels. Reduce tolvaptan dosage.
*P-gp substrates (digoxin):* May increase digoxin level. Monitor the patient, and adjust digoxin dosage as needed.
**Drug-herb.** *St John's wort:* May decrease drug level. Don't use together.
**Drug-food.** *Grapefruit juice:* May increases drug level. Don't use together.

## EFFECTS ON LAB TEST RESULTS

- May increase glucose level.
- May prolong prothrombin time.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with hypovolemic hyponatremia and in those who require urgent rise in serum sodium level, are anuric, or are unable to sense or appropriately respond to thirst.
- Contraindicated in patients receiving strong CYP3A inhibitors.
- Use cautiously in patients with cirrhosis and dehydration, and in those receiving hypertonic saline solution.
- Use in pregnant women only if benefit to mother outweighs risk to fetus. It isn't known if drug appears in breast milk. Patient shouldn't breast-feed during therapy.

⚠ ***Overdose S&S:*** Polyuria, thirst, dehydration, hypovolemia.

## NURSING CONSIDERATIONS

**Black Box Warning** Initiate and reinitiate drug in hospital setting where serum sodium level can be monitored closely. ■
**Black Box Warning** Don't correct hyponatremia too rapidly; doing so may cause osmotic demyelination resulting in dysarthria, mutism, dysphagia, lethargy, affective changes, spastic quadriparesis, seizures, coma, and death. Slower correction may be necessary in patients with severe malnutrition, alcoholism, or advanced liver disease. ■

- Monitor sodium level and neurologic status regularly during therapy.
- Monitor potassium level in patients with potassium level greater than 5 mEq/L who are taking drugs known to increase potassium level.

## PATIENT TEACHING

- Advise patient to promptly report difficulty speaking or swallowing, drowsiness, mood changes, trouble controlling body movement, or seizures.
- Advise patient to drink when thirsty to prevent dehydration.
- Tell patient not to stop or restart the drug on his own; the drug should only be restarted in the hospital where sodium level can be monitored closely.

# topiramate

toe-PIE-rah-mate

Topamax

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* Sulfamate-substituted monosaccharide
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules, sprinkles:* 15 mg, 25 mg
*Tablets:* 25 mg, 50 mg, 100 mg, 200 mg

## INDICATIONS & DOSAGES

➤ **Initial monotherapy for partial-onset or primary generalized tonic-clonic seizures**
*Adults and children age 10 or older:* Recommended daily dose is 400 mg P.O.

divided b.i.d. (morning and evening). To achieve this dosage, adjust as follows: first week, 25 mg P.O. b.i.d.; second week, 50 mg P.O. b.i.d.; third week, 75 mg P.O. b.i.d.; fourth week, 100 mg P.O. b.i.d.; fifth week, 150 mg P.O. b.i.d.; and sixth week, 200 mg P.O. b.i.d.

➤ **Adjunct treatment for partial-onset or primary generalized tonic-clonic seizures**

*Adults:* Initially, 25 to 50 mg P.O. daily; increase gradually by 25 to 50 mg/week until an effective daily dose is reached. Adjust to recommended daily dose of 200 to 400 mg P.O. in two divided doses for adults with partial seizures or 400 mg P.O. in two divided doses for adults with primary generalized tonic-clonic seizures.

*Children ages 2 to 16:* Initially, 1 to 3 mg/kg daily given at bedtime for 1 week. Increase at 1- or 2-week intervals by 1 to 3 mg/kg daily in two divided doses to achieve optimal response. Recommended daily dose is 5 to 9 mg/kg, in two divided doses.

➤ **Lennox-Gastaut syndrome**

*Children ages 2 to 16:* Initially, 1 to 3 mg/kg daily given at bedtime for 1 week. Increase at 1- or 2-week intervals by 1 to 3 mg/kg daily in two divided doses to achieve optimal response. Recommended daily dose is 5 to 9 mg/kg, in two divided doses.

➤ **To prevent migraine headache**

*Adults:* Initially, 25 mg P.O. daily in evening for first week. Then, 25 mg P.O. b.i.d. in morning and evening for second week. For third week, 25 mg P.O. in morning and 50 mg P.O. in evening. For fourth week, 50 mg P.O. b.i.d. in morning and evening.

***Adjust-a-dose:*** If creatinine clearance is less than 70 ml/minute, reduce dosage by 50%. For hemodialysis patients, supplemental doses may be needed to avoid rapid drops in drug level during prolonged dialysis treatment.

➤ **Bulimia nervosa ♦**

*Adults:* 25 mg P.O. daily for the first week; then titrate by 25 to 50 mg/week to maximum of 400 mg/day.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.
- Crushed or broken tablets have a bitter taste.
- Capsules may be opened and contents sprinkled on a teaspoon of soft food. Patient should swallow immediately without chewing.

## ACTION

Unknown. May block a sodium channel, potentiate the activity of GABA, and inhibit kainate's ability to activate an amino acid receptor.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 hr | Unknown |

*Half-life:* 21 hours.

## ADVERSE REACTIONS

**CNS:** anxiety, asthenia, *ataxia*, *confusion*, *difficulty with memory*, *dizziness*, *fatigue*, *nervousness*, *paresthesia*, *psychomotor slowing*, *somnolence*, *speech disorders*, *tremor*, ***generalized tonic-clonic seizures, suicide attempts,*** abnormal coordination, aggressive reaction, agitation, apathy, depression, depersonalization, difficulty with concentration, attention, or language, emotional lability, euphoria, fever, hallucination, hyperkinesia, hypertonia, hypoesthesia, hypokinesia, insomnia, malaise, mood problems, personality disorder, psychosis, stupor, vertigo.

**CV:** chest pain, edema, palpitations, vasodilation.

**EENT:** *abnormal vision*, *diplopia*, *nystagmus*, conjunctivitis, epistaxis, eye pain, hearing problems, pharyngitis, sinusitis, tinnitus.

**GI:** *anorexia*, *nausea*, abdominal pain, constipation, diarrhea, dry mouth, dyspepsia, flatulence, gastroenteritis, gingivitis, taste perversion, vomiting.

**GU:** amenorrhea, dysuria, dysmenorrhea, hematuria, impotence, intermenstrual bleeding, leukorrhea, menstrual disorder, menorrhagia, urinary frequency, renal calculi, urinary incontinence, UTI, vaginitis.

**Hematologic:** ***leukopenia,*** anemia.

**Metabolic:** *decreased weight*, increased weight.

**Musculoskeletal:** arthralgia, back or leg pain, muscle weakness, myalgia, rigors.

**Respiratory:** *upper respiratory tract infection*, bronchitis, coughing, dyspnea.

T

**Skin:** acne, alopecia, increased sweating, pruritus, rash.
**Other:** body odor, breast pain, decreased libido, flulike syndrome, hot flashes, lymphadenopathy.

## INTERACTIONS

**Drug-drug.** *Carbamazepine:* May decrease topiramate level. Monitor patient.
*Carbonic anhydrase inhibitors (acetazolamide, dichlorphenamide):* May cause renal calculus formation. Avoid using together.
*CNS depressants:* May cause CNS depression and other adverse cognitive and neuropsychiatric events. Use together cautiously.
*Hormonal contraceptives:* May decrease efficacy. Report changes in menstrual patterns. Advise patient to use another contraceptive method.
*Phenytoin:* May decrease topiramate level and increase phenytoin level. Monitor levels.
*Valproic acid:* May decrease valproic acid and topiramate level. Monitor patient.
**Drug-lifestyle.** *Alcohol use:* May cause CNS depression and other adverse cognitive and neuropsychiatric events. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase liver enzyme levels. May decrease bicarbonate and hemoglobin levels and hematocrit.
- May decrease WBC count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Use cautiously in breast-feeding or pregnant women and in those with hepatic impairment.
- Use cautiously with other drugs that predispose patients to heat-related disorders, including other carbonic anhydrase inhibitors and anticholinergics.

***Overdose S&S:*** Abdominal pain, abnormal coordination, agitation, blurred vision, seizures, depression, diplopia, dizziness, drowsiness, hypotension, lethargy, impaired mentation, speech disturbance, stupor, severe metabolic acidosis.

## NURSING CONSIDERATIONS

***Alert:*** Closely monitor all patients taking or starting antiepileptic drugs for changes in behavior indicating worsening of suicidal thoughts or behavior or depression. Symptoms such as anxiety, agitation, hostility, mania, and hypomania may be precursors to emerging suicidality.
- If needed, withdraw anticonvulsant (including topiramate) gradually to minimize risk of increased seizure activity.
- Monitoring topiramate level isn't necessary.
- Drug may infrequently cause oligohidrosis and hyperthermia, mainly in children. Monitor patient closely, especially in hot weather.
- Drug may cause hyperchloremic, nonanion gap metabolic acidosis from renal bicarbonate loss. Factors that may predispose patients to acidosis, such as renal disease, severe respiratory disorders, status epilepticus, diarrhea, surgery, ketogenic diet, or drugs, may add to topiramate's bicarbonate-lowering effects.
- Measure baseline and periodic bicarbonate levels. If metabolic acidosis develops and persists, consider reducing the dose, gradually stopping the drug, or alkali treatment.
- Drug is rapidly cleared by dialysis. A prolonged period of dialysis may cause low drug level and seizures. A supplemental dose may be needed.
- Stop drug if patient experiences acute myopia and secondary angle-closure glaucoma.
- ***Look alike–sound alike:*** Don't confuse Topamax with Toprol-XL, Tegretol, or Tegretol-XR.

## PATIENT TEACHING

- Tell patient to drink plenty of fluids during therapy to minimize risk of forming kidney stones.
- Advise patient not to drive or operate hazardous machinery until CNS effects of drug are known. Drug can cause sleepiness, dizziness, confusion, and concentration problems.
- Tell women of childbearing age that drug may decrease effectiveness of hormonal contraceptives. Advise women using

hormonal contraceptives to report change in menstrual patterns.
- Tell patient to avoid crushing or breaking tablets because of bitter taste.
- Inform patient that drug can be taken without regard to food.
- Tell patient that capsules may either be swallowed whole or carefully opened and contents sprinkled on a teaspoonful of soft food. Tell patient to swallow immediately without chewing.
- Tell patient to notify prescriber immediately if he experiences changes in vision.

**SAFETY ALERT!**

## topotecan hydrochloride

toh-poh-TEE-ken

Hycamtin

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* DNA topoisomerase inhibitor
*Pregnancy risk category D*

### AVAILABLE FORMS

*Capsules:* 0.25 mg, 1 mg
*Injection:* 4-mg single-dose vial (preservative-free)

### INDICATIONS & DOSAGES

➤ **Relapsed small-cell lung cancer (SCLC) in patients with a prior complete or partial response who are at least 45 days from the end of first-line chemotherapy**

*Adults:* 2.3 mg/m$^2$/day P.O. once daily for 5 consecutive days. Repeat every 21 days. Round the calculated dose to the nearest 0.25 mg.

***Adjust-a-dose:*** For patients with moderate renal impairment (creatinine clearance 30 to 49 ml/min) give 1.8 mg/m$^2$-day. Hold subsequent courses until neutrophils are greater than 1,000 cells/mm$^3$, platelets are greater than 100,000 cells/mm$^3$, and hemoglobin is 9 g/dl or more. Reduce the dose for subsequent courses to 0.4 mg/m$^2$/day for patients who experience severe neutropenia (neutrophils less than 500 cells/mm$^3$ associated with fever or infection or lasting 7 days or more), neutropenia (neutrophils 500 to 1,000 cells/mm$^3$ lasting beyond day 21 of the treatment course), platelet count below 25,000 cells/mm$^3$, or grade 3 or 4 diarrhea.

➤ **With cisplatin, stage-IVB recurrent or persistent cervical cancer unresponsive to surgery or radiation**

*Adults:* 0.75 mg/m$^2$ by I.V. infusion over 30 minutes on days 1, 2, and 3, followed by 50 mg/m$^2$ cisplatin by I.V. infusion on day 1. Repeat cycle every 21 days. Adjust subsequent doses of drug based on hematologic toxicities.

➤ **Metastatic carcinoma of the ovary after failure of first or subsequent chemotherapy; small-cell lung cancer–sensitive disease after failure of first-line therapy**

*Adults:* 1.5 mg/m$^2$ I.V. infusion given over 30 minutes daily for 5 consecutive days, starting on day 1 of a 21-day cycle. Give a minimum of four cycles.

***Adjust-a-dose:*** For patients with creatinine clearance of 20 to 39 ml/minute, decrease dosage to 0.75 mg/m$^2$. If severe neutropenia occurs, decrease dosage by 0.25 mg/m$^2$ for subsequent courses or give granulocyte colony-stimulating factor after subsequent course (before resorting to dosage reduction) starting from day 6 of course (24 hours after completion of topotecan administration).

### ADMINISTRATION

**P.O.**
- Avoid direct contact with capsule contents.
- Give drug without regard to food.
- Do not crush or divide the capsules.
- If patient vomits after taking dose, do not give a replacement dose.

**I.V.**
- ▼ Protect unopened vials from light.
- ▼ Reconstitute each 4-mg vial with 4 ml sterile water for injection. Dilute appropriate volume of reconstituted solution in either normal saline solution or $D_5W$ before giving.
- ▼ Lyophilized form contains no antibacterial preservative; use reconstituted product immediately.
- ▼ Monitor insertion site during infusion. Extravasation has been linked to mild local reactions, such as erythema and bruising.

T

▼ When giving topotecan with cisplatin, always give topotecan first.
▼ If stored at 68° to 77° F (20° to 25° C) and exposed to normal lighting, reconstituted drug is stable for 24 hours.
▼ **Incompatibilities:** Dexamethasone, fluorouracil, mitomycin, ticarcillin disodium, and clavulanate potassium.

## ACTION

Interacts with topoisomerase I, inducing reversible single-strand DNA breaks. Drug binds to the topoisomerase I–DNA complex and prevents relegation of these single-strand breaks.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |
| P.O. | Unknown | 1–2 hr | Unknown |

*Half-life:* 2 to 3 hours I.V.; 3 to 6 hours P.O.

## ADVERSE REACTIONS

**CNS:** *asthenia, fatigue, fever, headache.*
**GI:** *abdominal pain, anorexia, constipation, diarrhea, nausea, stomatitis, vomiting.*
**Hematologic:** *anemia,* **LEUKOPENIA, NEUTROPENIA, THROMBOCYTOPENIA.**
**Hepatic:** ***hepatotoxicity.***
**Musculoskeletal:** *back and skeletal pain.*
**Respiratory:** *coughing, dyspnea.*
**Skin:** *alopecia,* rash.
**Other:** ***sepsis.***

## INTERACTIONS

**Drug-drug.** *Cisplatin, cytotoxic agents:* May increase severity of myelosuppression. Use together with extreme caution. Dosage reductions may be needed.
*Granulocyte colony-stimulating factor:* May prolong duration of neutropenia. If granulocyte colony-stimulating factor is to be used, don't start it until day 6 of the course, 24 hours after completion of topotecan treatment.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, and bilirubin levels. May decrease hemoglobin level.
- May decrease WBC, platelet, and neutrophil counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those with severe bone marrow depression.
- Contraindicated in pregnant or breast-feeding women.
- Safety and effectiveness of drug in children haven't been established.

***Overdose S&S:*** Bone marrow suppression.

## NURSING CONSIDERATIONS

***Alert:*** Give drug only under the supervision of a physician experienced with cancer chemotherapeutic agents.
**Black Box Warning** Before first course of therapy is started, patient must have baseline neutrophil count more than 1,500/$mm^3$ and platelet count more than 100,000/$mm^3$. ■

- Monitor peripheral blood counts frequently. Don't give subsequent courses until neutrophil count recovers to more than 1,000 cells/$mm^3$, platelet count recovers to more than 100,000/$mm^3$, and hemoglobin level recovers to more than 9 mg/dl (with transfusion, if needed).
- Prepare drug under vertical laminar flow hood; wear gloves and protective clothing. If drug solution contacts skin, wash immediately and thoroughly with soap and water. If mucous membranes are affected, flush areas thoroughly with water.
- Bone marrow suppression indicates toxic levels of topotecan. The nadir occurs at about 11 days. Neutropenia isn't cumulative over time.
- Duration of thrombocytopenia is about 5 days, with nadir at 15 days. The nadir for anemia is 15 days. Blood or platelet transfusions may be needed.
- WBC colony-stimulating factors may promote cell growth and decrease risk for infection.

***Alert:*** Drug may cause interstitial lung disease, which may be fatal. Monitor patient for cough, fever, dyspnea, and hypoxia; stop drug if they occur.

## PATIENT TEACHING

- Urge patient to report promptly sore throat, fever, chills, or unusual bleeding or bruising.

- Caution women to avoid pregnancy or breast-feeding during therapy.
- Teach patient and family about drug's adverse reactions and need for frequent monitoring of blood counts.
- Advise patient that capsules can be taken without regard to food.
- Tell patient not to chew, crush, or divide capsules; they should be swallowed whole.

**SAFETY ALERT!**

## toremifene citrate

tore-EM-ah-feen

Fareston

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Nonsteroidal antiestrogen
*Pregnancy risk category D*

### AVAILABLE FORMS

*Tablets:* 60 mg

### INDICATIONS & DOSAGES

➤ **Metastatic breast cancer in postmenopausal women with estrogen receptor–positive or estrogen receptor–unknown tumors**

*Adults:* 60 mg P.O. once daily. Continue until disease progresses.

### ADMINISTRATION

**P.O.**

- Drug is a hormonal agent and is considered a potential teratogen. Follow safe-handling procedures.
- Give drug without regard for meals.

### ACTION

A nonsteroidal triphenylethylene with antiestrogenic effect; competes with estrogen for binding sites in the tumor, which blocks the tumor's growth-stimulating effects of endogenous estrogen.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 3 hr | Unknown |

*Half-life:* About 5 days.

### ADVERSE REACTIONS

**CNS:** dizziness, fatigue, depression.
**CV:** edema, ***thromboembolism, heart failure, MI, pulmonary embolism,*** *hot flashes.*
**EENT:** visual disturbances, glaucoma, dry eyes, *cataracts.*
**GI:** *nausea,* vomiting.
**GU:** *vaginal discharge,* vaginal bleeding.
**Hepatic:** ***hepatotoxicity.***
**Metabolic:** hypercalcemia.
**Skin:** *sweating.*

### INTERACTIONS

**Drug-drug.** *Calcium-elevating drugs such as hydrochlorothiazide:* May increase risk of hypercalcemia. Monitor calcium level closely.
*Coumarin-like anticoagulants such as warfarin:* May prolong PT and INR. Monitor PT and INR closely.
*CYP3A4 enzyme inducers such as carbamazepine, phenobarbital, and phenytoin:* May increase toremifene metabolism rate. Monitor patient closely.
*CYP3A4-6 enzyme inhibitors such as erythromycin, and ketoconazole:* May increase toremifene metabolism rate. Monitor patient closely.

### EFFECTS ON LAB TEST RESULTS

- May increase calcium and liver enzyme levels.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with history of thromboembolic disease and endometrial hyperplasia.

⚠ ***Overdose S&S:*** Vertigo, headache, dizziness, nausea, vomiting, reversible hallucinations, and ataxia.

### NURSING CONSIDERATIONS

- Obtain periodic CBC, calcium levels, and liver function tests.
- Monitor calcium level closely during first weeks of treatment in patients with bone metastases because of increased risk of hypercalcemia.

### PATIENT TEACHING

- Instruct patient to take drug exactly as prescribed.

T

- Advise patient that doses may be taken without regard for meals.
- Warn patient not to stop therapy without consulting prescriber.
- Inform patient about vaginal bleeding and other adverse effects; tell her to notify prescriber if bleeding occurs.
- Warn patient that tumor flare-up syndrome may occur during first weeks of therapy. Reassure her that this doesn't indicate treatment failure.
- Advise patient to report leg or chest pain, severe headache, visual changes, or shortness of breath.
- Counsel women about risks of becoming pregnant during therapy.

## torsemide

TOR-seh-mide

Demadex

*Therapeutic class:* Diuretic
*Pharmacologic class:* Loop diuretic
*Pregnancy risk category B*

### AVAILABLE FORMS

*Injection:* 10 mg/ml
*Tablets:* 5 mg, 10 mg, 20 mg, 100 mg

### INDICATIONS & DOSAGES

➤ **Diuresis in patients with heart failure**

*Adults:* Initially, 10 to 20 mg P.O. or I.V. once daily. If response is inadequate, double dose until desired effect is achieved. Maximum, 200 mg daily.

➤ **Diuresis in patients with chronic renal failure**

*Adults:* Initially, 20 mg P.O. or I.V. once daily. If response is inadequate, double dose until response is obtained. Maximum, 200 mg daily.

➤ **Diuresis in patients with hepatic cirrhosis**

*Adults:* Initially, 5 to 10 mg P.O. or I.V. once daily with an aldosterone antagonist or a potassium-sparing diuretic. If response is inadequate, double dose until desired effect is achieved. Maximum, 40 mg daily.

➤ **Hypertension**

*Adults:* Initially, 5 mg P.O. daily. Increased to 10 mg if needed and tolerated after 4 to 6 weeks. Add another antihypertensive if response is still inadequate.

### ADMINISTRATION

**P.O.**

- To prevent nocturia, give drug in the morning.

**I.V.**

- ▼ Inspect ampules for precipitate or discoloration before use.
- ▼ Give by direct injection over at least 2 minutes. Rapid injection may cause ototoxicity. Don't give more than 200 mg at a time.
- ▼ Drug may be given as a continuous infusion.
- ▼ Drug remains stable for 24 hours at room temperature when mixed in $D_5W$, normal saline solution, or half-normal saline solution.
- ▼ **Incompatibilities:** Solutions with pH below 8.3. Flush line with normal saline before and after administration to avoid incompatibility.

### ACTION

Enhances excretion of sodium, chloride, and water by acting on the ascending loop of Henle.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 1–2 hr | 6–8 hr |
| I.V. | 10 min | 1 hr | 6–8 hr |

*Half-life:* 3½ hours.

### ADVERSE REACTIONS

**CNS:** asthenia, dizziness, headache, nervousness, insomnia.
**CV:** ECG abnormalities, chest pain, edema, orthostatic hypotension.
**EENT:** rhinitis, sore throat.
**GI:** *excessive thirst*, diarrhea, constipation, nausea, dyspepsia.
**GU:** excessive urination, impotence.
**Metabolic:** *electrolyte imbalances including hypokalemia and* ***hypomagnesemia, dehydration,*** hypochloremic alkalosis, hyperuricemia, hypercholesterolemia.
**Musculoskeletal:** arthralgia, myalgia.
**Respiratory:** cough.

## INTERACTIONS

**Drug-drug.** *Aminoglycoside antibiotics, cisplatin:* May increase ototoxicity. Use together cautiously.
*Amphotericin B, corticosteroids, metolazone:* May increase risk of hypokalemia. Monitor potassium level.
*Anticoagulants:* May enhance anticoagulant activity. Use together cautiously.
*Antidiabetics:* May decrease hypoglycemic effect, resulting in higher glucose level. Monitor glucose level.
*Chlorothiazide, chlorthalidone, hydrochlorothiazide, indapamide, metolazone:* May cause excessive diuretic response, resulting in serious electrolyte abnormalities or dehydration. Adjust doses carefully, and monitor patient closely for signs and symptoms of excessive diuretic response.
*Cholestyramine:* May decrease absorption of torsemide. Separate doses by at least 3 hours.
*Digoxin:* Electrolyte imbalance caused by diuretic may lead to digoxin-induced arrhythmia. Use together cautiously.
*Lithium:* May increase lithium level and cause toxicity. Use together cautiously and monitor lithium level.
*NSAIDs:* May decrease effects of loop diuretics. Use together cautiously.
*Probenecid:* May decrease diuretic effect. Avoid using together.
*Salicylates:* May decrease excretion, possibly leading to salicylate toxicity. Avoid using together.
*Spironolactone:* May decrease renal clearance of spironolactone. Use together cautiously.
**Drug-herb.** *Dandelion:* May interfere with drug activity. Discourage use together.
*Licorice:* May cause unexpected rapid potassium loss. Discourage use together.
**Drug-lifestyle.** *Sun exposure:* May cause photosensitivity. Advise patient to take precautions.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN, creatinine, cholesterol, glucose, and uric acid levels. May decrease potassium and magnesium levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other sulfonamide derivatives and in those with anuria.
- Use cautiously in patients with hepatic disease and related cirrhosis and ascites; sudden changes in fluid and electrolyte balance may precipitate hepatic coma in these patients.

***Overdose S&S:*** Dehydration, hypovolemia, hypotension, hypokalemia, hypochloremic alkalosis, hemoconcentration.

## NURSING CONSIDERATIONS

- Monitor fluid intake and output, electrolyte levels, blood pressure, weight, and pulse rate during rapid diuresis and routinely with long-term use. Drug can cause profound diuresis and water and electrolyte depletion.
- Watch for signs of hypokalemia, such as muscle weakness and cramps.
- Consult prescriber and dietitian about providing a high-potassium diet or potassium supplement. Foods rich in potassium include citrus fruits, tomatoes, bananas, dates, and apricots.
- Monitor elderly patients, who are especially susceptible to excessive diuresis with potential for circulatory collapse and thromboembolic complications.
- ***Look alike–sound alike:*** Don't confuse torsemide with furosemide.

## PATIENT TEACHING

- Tell patient to take drug in morning to prevent the need to urinate at night.
- Advise patient to change positions slowly to prevent dizziness and to limit alcohol intake and strenuous exercise in hot weather to prevent dizziness.
- Advise patient to immediately report ringing in ears because it may indicate toxicity.
- Tell patient to report weakness, cramping, nausea, and dizziness.
- Tell patient to check with prescriber or pharmacist before taking OTC drugs.
- Advise patient that drug may cause photosensitivity, and tell him to take precautions with sun exposure.

T

# tramadol hydrochloride

TRAM-uh-dohl

Rybix ODT, Ryzolt, Ultram, Ultram ER

*Therapeutic class:* Analgesic
*Pharmacologic class:* Synthetic, centrally active analgesic
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 50 mg
*Tablets (extended-release):* 100 mg, 200 mg, 300 mg
*Tablets (orally disintegrating):* 50 mg

## INDICATIONS & DOSAGES

➤ **Moderate to moderately severe chronic pain**

*Adults age 17 and older:* Initially, 25 mg P.O. in the morning. Adjust by 25 mg every 3 days to 100 mg/day (25 mg q.i.d.). Thereafter, adjust by 50 mg every 3 days to reach 200 mg/day (50 mg q.i.d.). Thereafter, give 50 to 100 mg P.O. every 4 to 6 hours p.r.n. Maximum, 400 mg daily. Or, 50 to 100 mg orally disintegrating tablets (ODTs) P.O. every 4 to 6 hours p.r.n. Adjust by 50 mg every 3 days to 200 mg/day (50 mg q.i.d.). Thereafter give 50 to 100 mg P.O. every 4 to 6 hours p.r.n. Maximum dose is 400 mg daily.

*Adults age 18 and older not taking tramadol immediate-release tablets or ODTs:* 100 mg P.O. once daily. Titrate by 100 mg every 5 days to relieve pain. Do not exceed 300 mg/day.

***Adjust-a-dose:*** If creatinine clearance is less than 30 ml/minute, increase dose interval to every 12 hours; maximum is 200 mg daily. For patients with cirrhosis, give 50 mg every 12 hours. For patients older than age 75, maximum is 300 mg daily in divided doses.

## ADMINISTRATION

**P.O.**

- Give drug without regard for meals.
- ER tablets must be swallowed whole; don't break or crush tablets.
- ODTs may be taken with or without water.
- Place ODTs on tongue until dissolved (about 1 minute). Don't chew, break, or split them.

## ACTION

Unknown. Thought to bind to opioid receptors and inhibit reuptake of norepinephrine and serotonin.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 hr | Unknown |
| P.O. (ER) | Unknown | 12 hr | Unknown |

*Half-life:* 6 to 7 hours; ER, 8 to 9 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness, headache, somnolence, vertigo,* ***seizures,*** anxiety, asthenia, CNS stimulation, confusion, coordination disturbance, euphoria, malaise, nervousness, sleep disorder.
**CV:** vasodilation.
**EENT:** visual disturbances.
**GI:** *constipation, nausea, vomiting,* abdominal pain, anorexia, diarrhea, dry mouth, dyspepsia, flatulence.
**GU:** menopausal symptoms, proteinuria, urinary frequency, urine retention.
**Musculoskeletal:** hypertonia.
**Respiratory:** ***respiratory depression.***
**Skin:** diaphoresis, pruritus, rash.

## INTERACTIONS

**Drug-drug.** *Carbamazepine:* May increase tramadol metabolism. Patients receiving long-term carbamazepine therapy up to 800 mg daily may need up to twice the recommended tramadol dose.
*CNS depressants, opioids:* May cause additive effects. Use together cautiously; tramadol dosage may need to be reduced.
*Cyclobenzaprine, MAO inhibitors, neuroleptics, other opioids, tricyclic antidepressants:* May increase risk of seizures. Monitor patient closely.
*Quinidine:* May increase level of tramadol. Monitor patient closely.
***SSRIs:*** May increase risk of serotonin syndrome. Use cautiously and monitor patient for adverse effects.
**Drug-lifestyle.** *Alcohol, illicit drug use:* May have additive effects. Use cautiously together.

## EFFECTS ON LAB TEST RESULTS

- May increase liver enzyme level.
- May decrease creatinine and hemoglobin levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or other opioids, in breast-feeding women, suicidal patients, and in those with acute intoxication from alcohol, hypnotics, centrally acting analgesics, opioids, or psychotropic drugs.

***Alert:*** Serious hypersensitivity reactions can occur, usually after the first dose. Patients with history of anaphylactic reaction to codeine and other opioids may be at increased risk.

- Use cautiously in patients at risk for seizures or respiratory depression; in patients with increased intracranial pressure or head injury, acute abdominal conditions, or renal or hepatic impairment; or in patients with physical dependence on opioids.

***Alert:*** Use cautiously in patients taking tranquilizers or antidepressants and in those who abuse alcohol or suffer from depression or emotional disturbance because of the increased risk of suicide.

***Overdose S&S:*** Lethargy, somnolence, stupor, coma, seizures, skeletal muscle flaccidity, respiratory depression, cool clammy skin, miosis, bradycardia, hypotension, cardiac arrest, death.

## NURSING CONSIDERATIONS

- Reassess patient's level of pain at least 30 minutes after administration.
- Monitor CV and respiratory status. Withhold dose and notify prescriber if respirations are shallow or rate is below 12 breaths/minute.
- Monitor bowel and bladder function. Anticipate need for stimulant laxative.
- For better analgesic effect, give drug before onset of intense pain.
- Monitor patients at risk for seizures. Drug may reduce seizure threshold.
- In the case of an overdose, naloxone may also increase risk of seizures.
- Monitor patient for drug dependence. Drug can produce dependence similar to that of codeine or dextropropoxyphene and thus has potential for abuse.
- Withdrawal symptoms may occur if drug is stopped abruptly. Reduce dosage gradually.
- ***Look alike–sound alike:*** Don't confuse tramadol with trazodone or trandolapril.

## PATIENT TEACHING

- Tell patient to take drug as prescribed and not to increase dose or dosage interval unless ordered by prescriber.
- Caution ambulatory patient to be careful when rising and walking. Warn outpatient to avoid driving and other potentially hazardous activities that require mental alertness until drug's CNS effects are known.
- Advise patient to check with prescriber before taking OTC drugs because drug interactions can occur.
- Warn patient not to stop the drug abruptly.

# trandolapril

tran-DOLE-ah-pril

Mavik

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* ACE inhibitor
*Pregnancy risk category C; D in 2nd and 3rd trimesters*

## AVAILABLE FORMS

*Tablets:* 1 mg, 2 mg, 4 mg

## INDICATIONS & DOSAGES

➤ **Hypertension**

*Adults:* For patients not taking a diuretic, initially 2 mg P.O. for a black patient and 1 mg P.O. for all other races, once daily. If control isn't adequate, increase dosage at intervals of at least 1 week. Maintenance doses for most patients range from 2 to 4 mg daily. Some patients taking once-daily doses of 4 mg may need b.i.d. doses. For patients also taking a diuretic, initially, 0.5 mg P.O. once daily. Subsequent dosage adjustment is based on blood pressure response.

➤ **Heart failure or ventricular dysfunction after MI**

*Adults:* Initially, 1 mg P.O. daily, adjusted to 4 mg P.O. daily. If patient can't tolerate 4 mg, continue at highest tolerated dose.

T

***Adjust-a-dose:*** If creatinine clearance is below 30 ml/minute or patient has hepatic cirrhosis, first dose is 0.5 mg daily.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.
- Don't give antacid 1 hour before or up to 2 hours after dose.

## ACTION

Thought to inhibit ACE, reducing angiotensin II formation, which decreases peripheral arterial resistance, decreases aldosterone secretion, reduces sodium and water retention, and lowers blood pressure. Drug is converted in the liver to the prodrug, trandolaprilat.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 4 hr | 1–10 hr | 24 hr |

*Half-life:* 5 to 10 hours; longer in patients with renal impairment.

## ADVERSE REACTIONS

**CNS:** *dizziness,* headache, fatigue, syncope, stroke.
**CV:** *hypotension,* ***bradycardia,*** chest pain, intermittent claudication.
**GI:** ***pancreatitis,*** dyspepsia, diarrhea.
**Hematologic:** ***neutropenia, leukopenia.***
**Metabolic:** ***hyperkalemia,*** hyponatremia.
**Musculoskeletal:** myalgia.
**Respiratory:** *persistent, nonproductive cough;* dyspnea.
**Skin:** rash, pruritus.

## INTERACTIONS

**Drug-drug.** *Azathioprine:* May increase risk of anemia or leukopenia. Monitor hematologic studies.
*Diuretics:* May cause excessive hypotension. Stop diuretic or reduce first dosage of trandolapril.
*Lithium:* May increase lithium level and lithium toxicity. Avoid using together; monitor lithium level.
*NSAIDs:* May decrease antihypertensive effects. Monitor blood pressure.
*Potassium-sparing diuretics, potassium supplements:* May cause hyperkalemia. Monitor potassium level closely.
**Drug-herb.** *Capsaicin:* May cause cough. Discourage use together.
*Ma huang:* May decrease antihypertensive effects. Discourage use together.
**Drug-food.** *Salt substitutes containing potassium:* May cause hyperkalemia. Discourage use of salt substitutes.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN, creatinine, potassium, and liver enzyme levels. May decrease sodium level.
- May decrease neutrophil and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with a history of angioedema related to previous treatment with an ACE inhibitor.

**Black Box Warning** Use during pregnancy can cause injury and death to the developing fetus. When pregnancy is detected, stop drug as soon as possible.

- Use cautiously in patients with impaired renal function, heart failure, or renal artery stenosis.
- Safety and effectiveness of drug in children haven't been established.
- Don't use drug in breast-feeding women.

***Overdose S&S:*** Severe hypotension.

## NURSING CONSIDERATIONS

- Monitor potassium level closely.
- Watch for hypotension. Excessive hypotension can occur when drug is given with diuretics. If possible, stop diuretic therapy 2 to 3 days before starting trandolapril to decrease potential for excessive hypotension response. If drug doesn't adequately control blood pressure, diuretic therapy may be started again cautiously.
- Assess patient's renal function before and periodically throughout therapy.
- Other ACE inhibitors have been reported to cause agranulocytosis and neutropenia. Monitor CBC with differential before therapy, especially in patients with collagen vascular disease and impaired renal function.
- Although drug reduces blood pressure in patients of all races, drug reduces pressure less in blacks taking this drug alone. Blacks

should take drug with a thiazide diuretic for a more favorable response.

***Alert:*** Angioedema involving the tongue, glottis, or larynx may be fatal because of airway obstruction. Give appropriate therapy, including epinephrine 1:1,000 (0.3 to 0.5 ml) subcutaneously; have resuscitation equipment for maintaining a patent airway readily available. The risk of angioedema is higher in blacks.

- If patient develops jaundice, stop drug under prescriber's advice because, although rare, ACE inhibitors have been linked to a syndrome of cholestatic jaundice, fulminant hepatic necrosis, and death.

## PATIENT TEACHING

- Instruct patient to report yellowing of skin or eyes.
- Advise patient to report fever and sore throat (signs of infection), easy bruising or bleeding; swelling of the tongue, lips, face, eyes, mucous membranes, or extremities; difficulty swallowing or breathing; hoarseness; and nonproductive, persistent cough.
- Tell patient to avoid salt substitutes during drug therapy. These products may contain potassium, which can cause high potassium level in patients taking drug.
- Tell patient that light-headedness can occur, especially during first few days of therapy. Advise him to rise slowly to minimize this effect and to report it immediately.
- Advise patient to use caution in hot weather and during exercise. Inadequate fluid intake, vomiting, diarrhea, and excessive perspiration can lead to light-headedness and fainting.
- Tell women of childbearing age to report suspected pregnancy immediately. Drug will need to be stopped.
- Advise patient planning to undergo surgery or receive anesthesia to inform prescriber that he is taking this drug.
- Tell patient drug may be taken with or without food.
- Instruct patient not to take an antacid 1 hour before or up to 2 hours after dose.

**SAFETY ALERT!**

# trastuzumab

trass-too-ZOO-mab

Herceptin

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Monoclonal antibody
*Pregnancy risk category D*

## AVAILABLE FORMS

*Lyophilized powder for injection:* 440 mg/vial

## INDICATIONS & DOSAGES

➤ **Metastatic breast cancer in patients whose tumors overexpress the human epidermal growth factor receptor 2 (HER2) protein**

*Adults:* Loading dose of 4 mg/kg I.V. over 90 minutes. If tolerated, continue with 2 mg/kg I.V. weekly as 30-minute infusion. If patient hasn't previously received one or more chemotherapy regimens for their metastatic disease, drug is given with paclitaxel.

➤ **After surgical resection of HER2-overexpressing node-positive or node-negative breast cancer**

*Adults:* During treatment with paclitaxel, docetaxel, or docetaxel/carboplatin, give loading dose of 4 mg/kg I.V. over 90 minutes. Then, 2 mg/kg I.V. over 30 minutes weekly during chemotherapy for the first 12 weeks (paclitaxel or docetaxel) or 18 weeks (docetaxel/carboplatin). Continue trastuzumab 6 mg/kg I.V. over 30 to 90 minutes every 3 weeks for a total of 52 weeks.

➤ **As single agent after surgical resection of HER2-overexpressing breast cancer within 3 weeks of completion of multimodality, anthracycline-based chemotherapy**

*Adults:* Initial dose, 8 mg/kg I.V. over 90 minutes. Then, 6 mg/kg I.V. over 30 to 90 minutes every 3 weeks for a total of 52 weeks.

T

## ADMINISTRATION

### I.V.

▼ Reconstitute drug in each vial with 20 ml of bacteriostatic water for injection, 1.1% benzyl alcohol preserved, as supplied, to yield a multidose solution containing 21 mg/ml. Don't shake vial during reconstitution. Make sure reconstituted preparation is colorless to pale yellow and free of particulates. Immediately after reconstitution, label vial with expiration 28 days from date of reconstitution.

▼ If patient is hypersensitive to benzyl alcohol, reconstitute drug with sterile water for injection, use immediately, and discard unused portion. Avoid use of other reconstitution diluents.

▼ Determine dose based on loading dose of 4 mg/kg or maintenance dose of 2 mg/kg. Calculate volume of 21-mg/ml solution and withdraw this amount from vial and add it to an infusion bag containing 250 ml of normal saline solution. Don't use $D_5W$ or dextrose-containing solutions. Gently invert bag to mix solution.

▼ Don't give as I.V. push or bolus.

▼ Infuse loading dose over 90 minutes. If well tolerated, infuse maintenance doses over 30 minutes.

▼ Vials are stable at 36° to 46° F (2° to 8° C). Discard reconstituted solution after 28 days. Don't freeze drug that has been reconstituted. Store solution of drug diluted in normal saline solution for injection at 36° to 46° F (2° to 8° C) before use; it's stable for up to 24 hours.

▼ **Incompatibilities:** Other I.V. drugs or dextrose solutions.

## ACTION

A recombinant DNA-derived monoclonal antibody that selectively binds to HER2, inhibiting proliferation of tumor cells that overexpress HER2.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* Range, 1 to 32 days; mean, 5¾ days.

## ADVERSE REACTIONS

**CNS:** *asthenia, dizziness, fever, headache, insomnia, pain,* depression, neuropathy, paresthesia, peripheral neuritis.

**CV:** *peripheral edema,* ***heart failure,*** hypotension, tachycardia.

**EENT:** *pharyngitis, rhinitis,* sinusitis.

**GI:** *abdominal pain, anorexia, diarrhea, nausea, vomiting.*

**GU:** UTI.

**Hematologic:** ***leukopenia,*** anemia, neutropenia.

**Musculoskeletal:** *back pain,* arthralgia, bone pain.

**Respiratory:** *dyspnea, increased cough.*

**Skin:** *rash,* acne.

**Other:** **ANAPHYLAXIS,** *chills, flulike syndrome, infection,* allergic reaction, herpes simplex.

## INTERACTIONS

**Drug-drug.** *Anthracyclines, cyclophosphamide:* May increase cardiotoxicity. Use together very cautiously.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level.
- May decrease WBC count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to the drug.
- Use cautiously in elderly patients, in patients hypersensitive to drug or its components, and in those with cardiac dysfunction.
- Use with extreme caution in patients with pulmonary compromise, symptomatic intrinsic pulmonary disease (such as asthma, COPD), or extensive tumor involvement of the lungs.

**Black Box Warning** Exposure to drug during pregnancy can result in oligohydraminos, in some cases complicated by pulmonary hypoplasia and neonatal death. ■

- Safety and effectiveness of drug in children haven't been established.

## NURSING CONSIDERATIONS

**Black Box Warning** Before beginning therapy, patient should undergo thorough baseline cardiac assessment, including history and physical examination and methods to identify risk of cardiotoxicity. ■

**Black Box Warning** Assess patient for signs and symptoms of cardiac dysfunction,

especially if he is receiving drug with anthracyclines and cyclophosphamide. ▮
• Check for dyspnea, increased cough, paroxysmal nocturnal dyspnea, peripheral edema, or $S_3$ gallop. Treatment may be stopped in patients who develop a significant decrease in left ventricular function.
• Monitor patient receiving both drug and chemotherapy closely for cardiac dysfunction or failure, anemia, leukopenia, diarrhea, and infection.
• Drug is only for patients with metastatic breast cancer whose tumors have HER2 protein overexpression.
**Black Box Warning** Drug can cause serious infusion reactions and pulmonary toxicity. Interrupt infusion if patient experiences dyspnea or clinically significant hypotension. Strongly consider discontinuation for patients who develop anaphylaxis, angioedema, pneumonitis, or acute respiratory distress syndrome. ▮
• Check for first-infusion symptom complex, commonly consisting of chills or fever. Give acetaminophen, diphenhydramine, and meperidine (with or without reducing rate of infusion). Other signs or symptoms include nausea, vomiting, pain, rigors, headache, dizziness, dyspnea, hypotension, rash, and asthenia and occur infrequently with subsequent infusions.

### PATIENT TEACHING
• Tell patient about risk of first-dose infusion-related adverse reactions.
• Urge patient to notify prescriber immediately if signs or symptoms of heart problems occur, such as shortness of breath, increased cough, or swelling in arms or legs. Tell patient that these effects can occur after infusion is complete.
• Instruct patient to report adverse effects to prescriber.
• Advise women to stop breast-feeding during drug therapy and for 6 months after last dose of drug.

## travoprost
TRA-voe-prost

Travatan, Travatan Z

*Therapeutic class:* Antiglaucoma
*Pharmacologic class:* Prostaglandin analogue
*Pregnancy risk category C*

### AVAILABLE FORMS
*Ophthalmic solution:* 0.004%

### INDICATIONS & DOSAGES
➤ **To reduce intraocular pressure (IOP) in patients with open-angle glaucoma or ocular hypertension who can't tolerate or who respond inadequately to other IOP-lowering drugs**
*Adults:* One drop in conjunctival sac of each affected eye once daily at bedtime.

### ADMINISTRATION
**Ophthalmic**
• Don't touch tip of dropper to eye or surrounding tissue.
• Apply light finger pressure on lacrimal sac for 1 minute after instilling drug to minimize systemic absorption.
• If using more than one ophthalmic drug, give them at least 5 minutes apart.
• Store drug between 36° and 77° F (2° and 25° C).

### ACTION
Thought to reduce IOP by increasing uveoscleral outflow.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Ophthalmic | Unknown | 30 min | Unknown |

*Half-life:* 45 minutes.

### ADVERSE REACTIONS
**CNS:** anxiety, depression, headache, pain.
**CV:** ***bradycardia,*** angina pectoris, chest pain, hypertension, hypotension.
**EENT:** *eye discomfort, eye pain, eye pruritus, decreased visual acuity, foreign body sensation, ocular hyperemia,* abnormal vision, blepharitis, blurred vision, cataract, conjunctival hyperemia, conjunctivitis, dry eye, eye disorder, iris discoloration,

T

keratitis, lid margin crusting, photophobia, sinusitis, subconjunctival hemorrhage, tearing.
**GI:** dyspepsia, GI disorder.
**GU:** prostate disorder, urinary incontinence, UTI.
**Metabolic:** hypercholesterolemia.
**Musculoskeletal:** arthritis, back pain.
**Respiratory:** bronchitis.
**Other:** accidental injury, cold syndrome, infection.

## INTERACTIONS

**Drug-herb.** *Areca, jaborandi:* May increase effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase cholesterol level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, benzalkonium chloride (Travatan), or other drug components; in pregnant women or women trying to become pregnant; and in those with angle-closure, inflammatory, or neovascular glaucoma.
- Use cautiously in patients with renal or hepatic impairment, active intraocular inflammation (iritis, uveitis), or risk factors for macular edema.
- Use cautiously in aphakic patients and pseudophakic patients with a torn posterior lens capsule.

## NURSING CONSIDERATIONS

- Temporary or permanent increased pigmentation of the iris and eyelid may occur as well as increased pigmentation and growth of eyelashes.
- Patient should remove contact lenses before instilling drug and reinsert them 15 minutes after administration.
- If a pregnant woman or a woman attempting to become pregnant accidentally comes in contact with drug, thoroughly cleanse the exposed area with soap and water immediately.
- Travatan contains benzalkonium chloride. Travatan Z does not.

## PATIENT TEACHING

- Teach patient how to instill drops, and advise him to wash hands before and after instilling solution. Warn him not to touch tip of dropper to eye or surrounding tissue.
- Advise patient to apply light finger pressure on lacrimal sac for 1 minute after instillation to minimize systemic absorption of drug.
- Tell patient to remove contact lenses before administration and explain that he can reinsert them 15 minutes afterward.
- Tell patient receiving treatment in only one eye about potential for increased iris pigmentation, eyelid darkening, and increased length, thickness, pigmentation, or number of lashes in the treated eye.
- If eye trauma or infection occurs or if eye surgery is needed, advise patient to seek medical advice before continuing to use the multidose container.
- Advise patient to immediately report eye inflammation or lid reactions.
- If patient is using more than one ophthalmic drug, tell him to apply them at least 5 minutes apart.
- Stress importance of compliance with recommended therapy.
- If a pregnant woman or a woman attempting to become pregnant accidentally comes in contact with drug, tell her to thoroughly cleanse the exposed area with soap and water immediately.

# trazodone hydrochloride

TRAYZ-oh-dohn

Oleptro

*Therapeutic class:* Antidepressant
*Pharmacologic class:* Triazolopyridine derivative
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 50 mg, 100 mg, 150 mg, 300 mg
*Tablets (extended-release):* 150 mg, 300 mg

## INDICATIONS & DOSAGES

➤ **Depression**

*Adults:* Initially, 150 mg P.O. daily in divided doses; then increased by 50 mg daily every 3 to 4 days, as needed. Dose ranges from 150 to 400 mg daily. Maximum, 600 mg daily for inpatients and

400 mg daily for outpatients. Or, 150 mg P.O. once daily (extended-release form). May increase by 75 mg/day every 3 days. Maximum dosage is 375 mg P.O. daily.

➤ **Insomnia** ♦

*Adults:* 50 to 100 mg P.O. daily.

➤ **Prevention of migraine** ♦

*Adults:* 100 mg P.O. daily.

## ADMINISTRATION

**P.O.**

- Give drug after meals or a light snack for optimal absorption and to decrease risk of dizziness.
- Give extended-release tablets at the same time each day, preferably at bedtime, on an empty stomach.
- Extended-release tablets can be swallowed whole or broken along the score line.
- Don't crush or allow patient to chew extended-release tablets.

## ACTION

Unknown. Inhibits CNS neuronal uptake of serotonin; not a tricyclic derivative.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | Unknown |
| P.O. (extended-release) | Unknown | 9 hr | Unknown |

*Half-life:* First phase, 3 to 6 hours; second phase, 5 to 9 hours. Extended-release tablets, 10 hours.

## ADVERSE REACTIONS

**CNS:** *drowsiness, dizziness,* nervousness, fatigue, confusion, tremor, weakness, hostility, anger, nightmares, vivid dreams, headache, insomnia, syncope.

**CV:** orthostatic hypotension, tachycardia, hypertension, shortness of breath, ECG changes.

**EENT:** blurred vision, tinnitus, nasal congestion.

**GI:** dry mouth, dysgeusia, constipation, nausea, vomiting, anorexia.

**GU:** urine retention, priapism possibly leading to impotence, hematuria.

**Hematologic:** anemia.

**Skin:** rash, urticaria, diaphoresis.

**Other:** decreased libido.

## INTERACTIONS

**Drug-drug.** *Amphetamines, buspirone, dextromethorphan, dihydroergotamine, lithium salts, meperidine, SSRIs or SSNRIs (duloxetine, venlafaxine), sumatriptan, tramadol, tricyclic antidepressants, tryptophan:* May increase the risk of serotonin syndrome. Avoid combining drugs that increase the availability of serotonin in the CNS; monitor patient closely if used together.

*Antihypertensives:* May increase hypotensive effect of trazodone. Antihypertensive dosage may need to be decreased.

*Clonidine, CNS depressants:* May enhance CNS depression. Avoid using together.

*CYP3A4 inducers (carbamazepine):* May reduce trazodone level. Monitor patient closely; may need to increase trazodone dose.

*CYP3A4 inhibitors (ketoconazole):* May slow the clearance of trazodone and increase trazodone level. May cause nausea, hypotension, and fainting. Consider decreasing trazodone dose.

*Digoxin, phenytoin:* May increase levels of these drugs. Watch for toxicity.

*MAO inhibitors:* Effects unknown. Use together with extreme caution.

***Protease inhibitors (amprenavir, atazanavir, fosamprenavir, indinavir, lopinavir and ritonavir, nelfinavir, ritonavir, saquinavir):*** May increase trazodone levels and adverse effects. Monitor patient and adjust trazodone dose, as needed.

*Warfarin:* May increase PT. Adjust warfarin dosage as needed.

**Drug-herb.** *Ginkgo biloba:* May cause sedation. Discourage use together.

*St. John's wort:* May cause serotonin syndrome. Discourage use together.

**Drug-lifestyle.** *Alcohol use:* May enhance CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT and AST levels. May decrease hemoglobin level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.

**Black Box Warning** Trazodone isn't approved for use in children.

- Use cautiously in patients with cardiac disease or in the initial recovery phase of MI and in patients at risk for suicide.

T

***Overdose S&S:*** Priapism, respiratory arrest, seizures, ECG changes, drowsiness, vomiting.

## NURSING CONSIDERATIONS

- Monitor patient for signs and symptoms of serotonin syndrome (mental status changes, tachycardia, labile blood pressure, hyperreflexia, incoordination, nausea, vomiting, diarrhea) or neuroleptic malignant syndrome (hyperthermia, muscle rigidity, rapidly fluctuating vital signs, mental status change). If these signs and symptoms occur, immediately discontinue trazodone and any other serotonergic, antidopaminergic, or antipsychotic drugs.
- Record mood changes. Monitor patient for suicidal tendencies and allow only minimum supply of drug.

**Black Box Warning** Drug may increase the risk of suicidal thinking and behavior in children, adolescents, and young adults ages 18 to 24, especially during the first few months of treatment, especially those with major depressive disorder or other psychiatric disorder. ■

- ***Look alike–sound alike:*** Don't confuse trazodone hydrochloride with tramadol hydrochloride.

## PATIENT TEACHING

***Alert:*** Tell patient to report a persistent, painful erection (priapism) right away because he may need immediate intervention.

- Warn patient to avoid activities that require alertness and good coordination until effects of drug are known. Drowsiness and dizziness usually subside after first few weeks.

**Black Box Warning** Teach caregivers how to recognize signs and symptoms of suicidal tendency or suicidal thoughts. ■

- Tell patient to take extended-release tablets at bedtime on an empty stomach.
- Advise patient not to crush or chew extended-release tablets. Tell him that, if needed, tablets can be broken in half along the score line.

# treprostinil sodium

tra-PROS-tin-ill

Remodulin, Tyvaso

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Vasodilator
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 1 mg/ml, 2.5 mg/ml, 5 mg/ml, 10 mg/ml in 20-ml vials
*Solution for inhalation:* 1.74 mg/2.9-ml ampule

## INDICATIONS & DOSAGES

➤ **To reduce symptoms caused by exercise in patients with New York Heart Association class II to IV pulmonary arterial hypertension (PAH)**

*Adults:* Initially, 1.25 nanogram/kg/minute by continuous subcutaneous infusion. If patient doesn't tolerate initial dose, reduce infusion rate to 0.625 nanogram/kg/minute. Increase by 1.25 nanogram/kg/minute each week for the first 4 weeks and then by no more than 2.5 nanogram/kg/minute each week for the remaining duration of infusion. Experience with treprostinil dosages exceeding 40 nanogram/kg/minute is limited. May be given I.V. through a central catheter if subcutaneous route isn't tolerated.

***Adjust-a-dose:*** For patients with mild or moderate hepatic insufficiency, initially, 0.625 nanogram/kg ideal body weight per minute by continuous I.V. infusion, and increase cautiously. Or, initially, 3 breaths (18 mcg) per treatment session four times a day, approximately 4 hours apart. Dosage should be increased by 3 breaths in 1- to 2-week intervals as tolerated to target maintenance dosage of 9 breaths (54 mcg) four times a day. If 3 breaths aren't tolerated initially, decrease to 1 or 2 breaths and increase as tolerated.

➤ **To decrease the rate of clinical deterioration in patients requiring transition from epoprostenol sodium (Flolan)**

*Adults:* Start treprostinil at 10% of the current epoprostenol dose; increase dose as the epoprostenol dose is reduced. Decrease epoprostenol dose in 20% increments

and increase treprostinil in 20% increments, always maintaining a total dose of 110% of epoprostenol starting dose. Once epoprostenol is at 20% of starting dose and treprostinil is at 90%, decrease epoprostenol to 5% and increase treprostinil to 110%. Finally, stop epoprostenol and maintain treprostinil dose at 110% of epoprostenol starting dose plus an additional 5% to 10% as needed. Change rate based on individual patient response. Treat worsening of PAH symptoms with increases in treprostinil dose. Treat adverse effects associated with prostacyclin and prostacyclin analogues with decreases in epoprostenol dose.

## ADMINISTRATION

### I.V.

▼ Give I.V. through a central venous catheter only if subcutaneous route isn't tolerated.
▼ Dilute with either sterile water for injection or normal saline solution.
▼ Inspect for particulate matter and discoloration before giving.
▼ Give by continuous infusion through a surgically placed indwelling central venous catheter, using an infusion pump designed for I.V. drug delivery.
▼ To avoid potential interruptions in drug delivery, make sure patient has immediate access to a backup infusion pump and infusion sets.
▼ Diluted drug is stable at room temperature for up to 48 hours.
▼ **Incompatibilities:** Other I.V. drugs.

### Subcutaneous

● Preferred route is continuous subcutaneous infusion via a self-inserted subcutaneous catheter, using an infusion pump designed for subcutaneous drug delivery.
● The infusion pump should be small and lightweight; adjustable to about 0.002 ml/hour; have occlusion/no delivery, low-battery, programming-error, and motor-malfunction alarms; have delivery accuracy of ±6% or better; and be positive-pressure driven.
● The reservoir should be made of polyvinyl chloride, polypropylene, or glass.

### Inhalation

● One ampule contains sufficient volume for all four treatment sessions in a single day.
● Oral inhalation is intended for use with the Optineb-ir Model ON-100/7.
● Before the first treatment of the day, empty entire ampule into medicine cup of inhalation device.
● Cap the device and store upright between treatments.
● Clean the medicine cup and discard any remaining drug at the end of the day. Clean device daily.
● Avoid skin and eye contact with treprostinil.
● Drug shouldn't be ingested orally.
● Don't mix treprostinil with other medications in the nebulizer.
● To avoid potential interruptions in drug therapy, make sure patient has access to back-up Optineb-ir device.

## ACTION

Directly vasodilates pulmonary and systemic arterial vascular beds and inhibits platelet aggregation.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |
| Subcut. | Rapid | Unknown | Unknown |
| Inhalation | Rapid | Unknown | Unknown |

*Half-life:* 2 to 4 hours I.V. and subcut., 4 hours inhalation.

## ADVERSE REACTIONS

**CNS:** dizziness, fatigue, *headache.*
**CV:** *vasodilation,* ***right ventricular heart failure,*** chest pain, edema, hypotension.
**GI:** *diarrhea, nausea.*
**Musculoskeletal:** *jaw pain.*
**Respiratory:** dyspnea.
**Skin:** *infusion site pain, infusion site reaction, rash,* pallor, pruritus.

## INTERACTIONS

**Drug-drug.** *Anticoagulants:* May increase risk of bleeding. Monitor patient closely for bleeding.
*Antihypertensives, diuretics, vasodilators:* May worsen reduction in blood pressure. Monitor blood pressure.

T

### EFFECTS ON LAB TEST RESULTS
None reported.

### CONTRAINDICATIONS & CAUTIONS
- Contraindicated in patients hypersensitive to drug or structurally related compounds.
- Use cautiously in patients with hepatic or renal impairment and in elderly patients.
- Use cautiously in pregnant and breast-feeding women. Use only if clearly needed.

***Overdose S&S:*** Diarrhea, flushing, headache, hypotension, nausea, vomiting.

### NURSING CONSIDERATIONS
- Assess the patient's ability to accept, place, and care for a subcutaneous catheter and to use an infusion pump.
- During use, a single reservoir syringe can be given for up to 72 hours at 98.6° F (37° C).
- Don't use a single vial longer than 14 days after the initial introduction to the vial.
- Start treatment in setting where adequate monitoring and emergency care are available.
- Increase dose if patient doesn't improve or symptoms worsen, and decrease if drug effects become excessive or unacceptable infusion site symptoms develop.
- Avoid abrupt withdrawal or sudden large dose reductions because PAH symptoms may worsen.

### PATIENT TEACHING
- Inform patient that he'll need to continue therapy for a prolonged period, possibly years.
- Tell patient that subsequent disease management may require I.V. therapy.
- Inform patient that many side effects, such as labored breathing, fatigue, and chest pain, may be related to the underlying disease.
- Tell patient that the most common local reactions are pain, redness, tissue hardening, and rash at the infusion site.
- Tell patient that a backup infusion pump or Optineb-ir device must be available to avoid interruption in therapy.
- Instruct patient in proper administration of inhalation solution and use and cleaning of device.

## tretinoin (retinoic acid, vitamin A acid)
TRET-i-noyn

Atralin, Avita, Rejuva-A†, Renova, Retin-A, Retin-A Micro, StieVA-A†

*Therapeutic class:* Antiacne
*Pharmacologic class:* Retinoid
*Pregnancy risk category C*

### AVAILABLE FORMS
*Cream:* 0.02%, 0.025%, 0.05%, 0.1%
*Gel:* 0.05%, 0.01%, 0.025%
*Microsphere gel:* 0.04%, 0.1%

### INDICATIONS & DOSAGES
➤ **Acne vulgaris**
*Adults and children:* Clean affected area and lightly apply once daily at bedtime.
➤ **Adjunctive use in the mitigation of fine facial wrinkles in patients who use comprehensive skin care and sunlight avoidance programs (Renova)**
*Adults:* Apply a small, pea-sized amount (¼ inch or 5 mm in diameter) to cover the entire face lightly, once daily in the evening.

### ADMINISTRATION
**Topical**
- Clean area thoroughly before application and avoid getting drug in eyes, mouth, or mucous membranes.

### ACTION
Inhibits comedones by increasing epidermal cell mitosis and turnover.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Unknown | Unknown | Unknown |

*Half-life:* Unknown.

### ADVERSE REACTIONS
**Skin:** *feeling of warmth, slight stinging, local erythema, peeling,* chapping, swelling, blistering, crusting, temporary hyperpigmentation or hypopigmentation.

### INTERACTIONS
**Drug-drug.** *Topical drugs containing benzoyl peroxide, resorcinol, salicylic acid, or*

*sulfur:* May increase risk of skin irritation. Avoid using together.
*Topical minoxidil or photosensitizing drugs (fluoroquinolones, phenothiazines, sulfonamides, tetracyclines, thiazides):* May increase risk of skin irritation. Avoid using together.
**Drug-lifestyle.** *Abrasive cleansers, cream depilatories, medicated cosmetics, skin preparations containing alcohol, waxes:* May increase risk of skin irritation. Discourage use together.
*Sun exposure:* May increase photosensitivity reaction. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those with sunburn.
- Use cautiously in patients with eczema.

***Overdose S&S:*** Marked redness, skin peeling, skin discomfort.

## NURSING CONSIDERATIONS

- Initially, drug may be applied every 2 to 3 days using a lower concentration to reduce irritation.
- Relapses typically occur within 3 to 6 weeks after therapy is stopped.
- ***Look alike–sound alike:*** Don't confuse tretinoin with trientine.

## PATIENT TEACHING

- Instruct patient to clean area thoroughly before application and to avoid getting drug in eyes, mouth, or mucous membranes.
- Tell patient to wash hands after application.
- Tell patient to wash face with mild soap no more than b.i.d. or t.i.d. Warn patient against using strong or medicated cosmetics, soaps, or other skin cleansers. Also advise him to avoid topical products containing alcohol, astringents, spices, and lime because they may interfere with drug's actions.
- Tell patient using drug for treatment of fine wrinkles to wait 20 minutes after washing face to apply drug, and to avoid washing face or applying another skin product or cosmetic for 1 hour after application.
- Tell patient that normal use of cosmetics is allowed.
- Advise patient not to stop drug if temporary worsening of inflammatory lesions occurs. If severe local irritation develops, advise patient to stop drug temporarily and notify prescriber. Dosage will be readjusted when application is resumed. Some redness and scaling are normal reactions.
- Warn patient that he may experience increased sensitivity to wind or cold temperatures.
- Instruct patient to minimize exposure to sunlight or ultraviolet rays during treatment. If he becomes sunburned, he should delay therapy until sunburn subsides. Tell patient who can't avoid exposure to sunlight to use SPF-15 sunblock and to wear protective clothing.
- Warn patient that he may have a temporary increase in lesions, which will improve in 2 to 3 weeks.

# triamcinolone acetonide (injection)

trye-am-SIN-oh-lone

Kenalog-10, Kenalog-40, Trivaris

# triamcinolone hexacetonide

Aristospan Intra-articular, Aristospan Intralesional

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Glucocorticoid
*Pregnancy risk category C*

T

## AVAILABLE FORMS

**triamcinolone acetonide**
*Injection (suspension):* 10 mg/ml, 40 mg/ml
*Injection (gel suspension):* 80 mg/ml
**triamcinolone hexacetonide**
*Injection (suspension):* 5 mg/ml (intralesional); 20 mg/ml (intra-articular)

## INDICATIONS & DOSAGES

➤ **Severe inflammation, immunosuppression**
*Adults:* 60 mg acetonide I.M., then 20 to 100 mg I.M. acetonide as needed every

6 weeks, if possible. Or, 1 mg acetonide into lesions. Or, initially, 2.5 to 15 mg acetonide into joints (depending on joint size) or soft tissue; then may increase to 40 mg for larger areas. For Trivaris, doses up to 10 mg (smaller areas) and up to 40 mg (larger areas) have usually been sufficient. A local anesthetic is commonly injected with triamcinolone into the joint. For hexacetonide, up to 0.5 mg (of 5 mg/ml suspension) intralesional or sublesional injection per square inch of affected skin. Additional injections based on patient's response. Or, 2 to 20 mg (using the 20 mg/ml suspension) via intra-articular injection. Repeat every 3 to 4 weeks.

*Children older than age 12:* Initially, 60 mg acetonide I.M.; repeat with additional I.M. doses of 20 to 100 mg, as needed, at 6 week intervals, if possible.

*Children ages 6 to 12:* 0.03 to 0.2 mg/kg acetonide, or 1 to 6.25 mg/m$^2$ I.M. 1- to 7-day intervals.

## ADMINISTRATION

**I.M.**

- Give deep into gluteal muscle. Rotate injection sites to prevent muscle atrophy.
- Don't use 10 mg/ml strength for this route.

**Intra-articular**

- Strict aseptic technique is mandatory.
- Prior use of a local anesthetic may be desirable.
- Each syringe of Trivaris should only be used for a single treatment.

**Intralesional**

- Strict aseptic technique is mandatory.
- Inject directly into the lesion intradermally or subcutaneously.
- It is preferable to use a tuberculin syringe and small-bore needle (not smaller than 24 gauge)

## ACTION

Not clearly defined. Decreases inflammation, mainly by stabilizing leukocyte lysosomal membranes; suppresses immune response; stimulates bone marrow; and influences protein, fat, and carbohydrate metabolism.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.M., intra-articular, intralesional | Variable | Variable | Variable |

*Half-life:* 18 to 36 hours.

## ADVERSE REACTIONS

**CNS:** *euphoria, insomnia,* ***pseudotumor cerebri, seizures,*** headache, paresthesia, psychotic behavior, vertigo.

**CV:** ***arrhythmias, heart failure, thromboembolism,*** hypertension, edema, thrombophlebitis.

**EENT:** cataracts, glaucoma.

**GI:** ***pancreatitis,*** *peptic ulceration,* GI irritation, increased appetite, nausea, vomiting.

**GU:** menstrual irregularities, increased urine calcium level.

**Metabolic:** hypokalemia, hyperglycemia and carbohydrate intolerance, hypercholesterolemia, hypokalemia, hypocalcemia.

**Musculoskeletal:** growth suppression in children, muscle weakness, osteoporosis.

**Skin:** hirsutism, delayed wound healing, acne, various skin eruptions.

**Other:** ***acute adrenal insufficiency,*** cushingoid state, susceptibility to infections after increased stress or abrupt withdrawal after long-term therapy.

**After abrupt withdrawal:** ***after prolonged use, sudden withdrawal may be fatal;*** rebound inflammation, fatigue, weakness, arthralgia, fever, dizziness, lethargy, depression, fainting, orthostatic hypotension, dyspnea, anorexia, ***hypoglycemia.***

## INTERACTIONS

**Drug-drug.** *Antidiabetics:* May increase blood glucose level. Adjust dosage of antidiabetics as needed.

*Aspirin, indomethacin, other NSAIDs:* May increase risk of GI distress and bleeding. Use together cautiously.

*Barbiturates, carbamazepine, fosphenytoin, phenytoin, rifampin:* May decrease corticosteroid effect. Increase corticosteroid dosage.

*Cyclosporine:* May increase toxicity and seizures. Monitor patient closely.

*Ketoconazole, macrolide antibiotics:* May decrease metabolism or clearance of triamcinolone, respectively. Decrease triamcinolone dose or dosing interval if needed.

*Oral anticoagulants:* May alter dosage requirements. Monitor PT and INR closely.
*Potassium-depleting drugs, such as thiazide diuretics and amphotericin B:* May enhance potassium-wasting effects of triamcinolone. Monitor potassium level.
*Salicylates:* May decrease salicylate level. Monitor patient for lack of salicylate effectiveness.
*Skin-test antigens:* May decrease response. Postpone skin testing until after therapy.
*Toxoids, vaccines:* May decrease antibody response and increase risk of neurologic complications. Defer routine administration of vaccines or toxoids until corticosteroid therapy is discontinued, if possible.

## EFFECTS ON LAB TEST RESULTS

- May increase glucose and cholesterol levels. May decrease potassium and calcium levels.
- May decrease $^{131}I$ uptake and protein-bound iodine values in thyroid function tests. May alter reactions to skin tests.
- May cause false-negative results in nitroblue tetrazolium test for systemic bacterial infections.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its ingredients, in patients with cerebral malaria, in those with systemic fungal infections, and in those receiving immunosuppressive doses together with live-virus vaccines.
- Use cautiously in patients with recent MI, GI ulcer, renal disease, hypertension, osteoporosis, diabetes mellitus, hypothyroidism, cirrhosis, diverticulitis, nonspecific ulcerative colitis, recent intestinal anastomoses, thromboembolic disorders, seizures, myasthenia gravis, active hepatitis, lactation, heart failure, tuberculosis, ocular herpes simplex, emotional instability, or psychotic tendencies.

## NURSING CONSIDERATIONS

- Determine whether patient is sensitive to other corticosteroids.
- Drug isn't used for alternate-day therapy.
- Always adjust to lowest effective dose.
- Most adverse reactions to corticosteroids are dose- or duration-dependent.
- Monitor patient's weight, blood pressure, and electrolyte level.
- Monitor patient for cushingoid effects, such as moon face, buffalo hump, central obesity, thinning hair, hypertension, and increased susceptibility to infection.
- Watch for allergic reaction to tartrazine in patients sensitive to aspirin.
- Watch for depression or psychotic episodes, especially during high-dose therapy.
- Diabetic patient may need increased insulin dosage; monitor glucose level.
- Drug may mask or worsen infections, including latent amebiasis.
- Elderly patients may be more susceptible to osteoporosis with long-term use.
- Unless contraindicated, give low-sodium diet that's high in potassium and protein. Give potassium supplements as needed.
- Gradually reduce dosage after long-term therapy. Drug may affect patient's sleep.
- ***Look alike–sound alike:*** Don't confuse triamcinolone with Triaminic.

## PATIENT TEACHING

- Tell patient not to stop drug abruptly or without prescriber's consent.
- Teach patient signs and symptoms of early adrenal insufficiency: fatigue, muscle weakness, joint pain, fever, anorexia, nausea, shortness of breath, dizziness, and fainting.
- Instruct patient to carry medical identification that includes prescriber's name and drug's name and dosage and indicates his need for supplemental systemic glucocorticoids during stress.
- Warn patient on long-term therapy about cushingoid effects (moon face, buffalo hump) and the need to notify prescriber about sudden weight gain and swelling.
- Tell patient to report slow healing.
- Advise patient receiving long-term therapy to consider exercise or physical therapy. Also, tell patient to ask prescriber about vitamin D or calcium supplement.
- Instruct patient to avoid exposure to infections and to notify prescriber if exposure occurs.

T

# triamcinolone acetonide (intranasal)

trye-am-SIN-oh-lone

Nasacort AQ

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Corticosteroid
*Pregnancy risk category C*

## AVAILABLE FORMS

*Nasal spray:* 55 mcg/spray

## INDICATIONS & DOSAGES

➤ **Treatment of nasal symptoms of seasonal and perennial allergic rhinitis**

*Adults and children 12 years and older:* 2 sprays in each nostril daily; may decrease to 1 spray in each nostril daily for allergic disorders. Adjust to minimum effective dosage.

*Children ages 6 to 11:* 1 spray in each nostril daily. Maximum dosage is 2 sprays in each nostril daily. Adjust to minimum effective dosage.

*Children ages 2 to 5:* 1 spray in each nostril daily.

***Adjust-a-dose:*** Start elderly patients at lower end of dosing range.

## ADMINISTRATION

**Intranasal**

- Shake well before each use.
- Release 5 sprays into the air to prime before first use. Reprime if not used for 2 weeks or more.

## ACTION

Unknown. A glucocorticoid with anti-inflammatory properties.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Intranasal | Unknown | 1½–4 hr | Unknown |

*Half-life:* AQ form, about 3 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* fever.
**EENT:** *nasal irritation,* burning, dry mucous membranes, epistaxis, irritation, nasal and sinus congestion, otitis media, pharyngitis, rhinitis, sinusitis, sneezing, stinging, throat discomfort.
**GI:** dyspepsia, nausea, vomiting.
**Respiratory:** ***asthma symptoms,*** cough.

## INTERACTIONS

None significant.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components and in those with untreated mucosal infection.
- Use with caution, if at all, in patients with active or quiescent tuberculous infection of respiratory tract and in patients with untreated fungal, bacterial, or systemic viral infection or ocular herpes simplex.
- Use cautiously in patients already receiving systemic corticosteroids because of increased likelihood of hypothalamic-pituitary-adrenal axis suppression.
- Use cautiously in breast-feeding women and in those with recent nasal septal ulcers, nasal surgery, or trauma because drug may inhibit wound healing.

***Overdose S&S:*** GI upset, nasal irritation, headache.

## NURSING CONSIDERATIONS

***Alert:*** Excessive doses may cause signs and symptoms of hyperadrenocorticism and adrenal axis suppression; stop drug slowly.

- To decrease risk of adverse effects, individualize drug dosage and titrate to minimum effective dosage.
- Discontinue drug if symptom relief hasn't occurred after 3 weeks of treatment.
- ***Look alike–sound alike:*** Don't confuse triamcinolone with Triaminicin.

## PATIENT TEACHING

- Urge patient to read patient instruction sheet contained in each package before using drug for first time.
- Teach patient to prime pump before first use.
- To instill, instruct patient to shake container before use, blow nose to clear nasal passages, tilt head slightly forward, and insert nozzle into nostril, pointing away from septum. Tell him to hold other nostril closed and inhale gently while spraying. Next,

have patient shake container and repeat procedure in other nostril.
• Instruct patient to avoid getting aerosol in eyes. If this occurs, tell him to rinse with copious amounts of cool tap water.
• Stress importance of using drug on a regular schedule because its effectiveness depends on regular use. Warn patient not to exceed prescribed dosage because serious adverse reactions can occur.
• Tell patient to notify prescriber if signs and symptoms don't diminish or if condition worsens in 2 to 3 weeks.
• Warn patient to avoid exposure to chickenpox or measles and, if exposed, to notify prescriber.
• Instruct patient to watch for and report signs and symptoms of nasal infection. Drug may need to be stopped and appropriate local therapy given.

## triamcinolone acetonide (topical)

trye-am-SIN-oh-lone

Kenalog, Triacet, Triderm

*Therapeutic class:* Corticosteroid
*Pharmacologic class:* Corticosteroid
*Pregnancy risk category C*

### AVAILABLE FORMS

*Aerosol:* 0.2 mg/2-second spray
*Cream:* 0.025%, 0.1%, 0.5%
*Dental paste:* 0.1%
*Lotion:* 0.025%, 0.1%
*Ointment:* 0.025%, 0.1%, 0.5%
*Paste:* 0.1%

### INDICATIONS & DOSAGES

➤ **Inflammation and pruritus from corticosteroid-responsive dermatoses**
*Adults and children:* Clean area; apply aerosol, cream, lotion, or ointment sparingly b.i.d. to q.i.d. Rub in lightly. Or, 3 or 4 applications of spray daily.
➤ **Inflammation from oral lesions**
*Adults and children:* Apply paste at bedtime and, if needed, b.i.d. or t.i.d., preferably after meals. Apply small amount without rubbing; press to lesion in mouth until thin film develops.

### ADMINISTRATION

**Topical**
• Gently wash skin before applying. To avoid skin damage, rub in gently, leaving a thin coat. When treating hairy sites, part hair and apply directly to lesions.
• Don't apply near eyes or in ear canal.
• When using aerosol near the face, cover patient's eyes and warn against inhaling spray. Aerosol contains alcohol and may cause irritation or burning when used on open lesions. Don't spray longer than 3 seconds or from closer than 6 inches (15 cm) to avoid freezing tissues.
• Occlusive dressings may be used in severe or resistant dermatoses.

### ACTION

Unclear. Diffuses across cell membranes to form complexes with cytoplasmic receptors, showing anti-inflammatory, antipruritic, vasoconstrictive, and antiproliferative activity. Considered a medium-potency (0.025% and 0.1% cream, ointment, lotion) and high-potency (0.5% cream, ointment) drug, according to vasoconstrictive properties.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Topical | Several hr | Unknown | >1 wk |

*Half-life:* Unknown.

### ADVERSE REACTIONS

**GU:** glycosuria.
**Metabolic:** hyperglycemia.
**Skin:** burning, pruritus, irritation, dryness, erythema, folliculitis, hypertrichosis, hypopigmentation, acneiform eruptions, perioral dermatitis, allergic contact dermatitis, *maceration, secondary infection, atrophy, striae, miliaria with occlusive dressings.*
**Other:** ***hypothalamic-pituitary-adrenal axis suppression,*** Cushing syndrome.

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

• May increase glucose level.

T

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.
- Contraindicated in the presence of fungal, viral, or bacterial infections of the mouth or throat (paste).
- Don't use as monotherapy in primary bacterial infections (impetigo, paronychia, erysipelas, cellulitis, angular cheilitis), treatment of rosacea, perioral dermatitis, or acne.
- Don't use very-high-potency or high-potency agents on the face, groin, or axilla areas.
- Drug isn't for ophthalmic use.
- Use cautiously in pregnant or breast-feeding women.

⚠ ***Overdose S&S:*** Systemic effects (including reversible HPA axis suppression, Cushing syndrome, hyperglycemia, glycosuria.)

## NURSING CONSIDERATIONS

- Stop drug and tell prescriber if skin infection, striae, or atrophy occur.
- If antifungal or antibiotic combined with corticosteroid fails to provide prompt improvement, stop corticosteroid until infection is controlled.
- Systemic absorption is likely with the use of occlusive dressings, prolonged treatment, or extensive body surface treatment.
- Avoid using plastic pants or tight-fitting diapers on treated areas in young children. Children may absorb larger amounts of drug and be more susceptible to systemic toxicity.

## PATIENT TEACHING

- Teach patient or family member how to apply drug.
- If an occlusive dressing is ordered, advise patient to leave it in place for no longer than 12 hours each day and not to use the dressing on infected or weeping lesions.
- Tell patient to stop drug and report signs of systemic absorption, skin irritation or ulceration, hypersensitivity, infection, or lack of improvement.

**SAFETY ALERT!**

# triazolam

trye-AY-zoe-lam

Halcion

*Therapeutic class:* Hypnotic
*Pharmacologic class:* Benzodiazepine
*Pregnancy risk category X*
*Controlled substance schedule IV*

## AVAILABLE FORMS

*Tablets:* 0.125 mg, 0.25 mg

## INDICATIONS & DOSAGES

➤ **Short-term treatment (7 to 10 days) of insomnia**

*Adults:* 0.125 to 0.5 mg P.O. at bedtime. Reevaluate patient if drug is used for longer than 2 to 3 weeks.

*Elderly or debilitated patients:* 0.125 mg P.O. at bedtime; increase, as needed, to 0.25 mg P.O. at bedtime.

## ADMINISTRATION

**P.O.**

- Give drug without regard for food, but avoid giving with grapefruit or grapefruit juice.

## ACTION

Unknown. Probably acts on the limbic system, thalamus, and hypothalamus of the CNS to produce hypnotic effects.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | 1½–5½ hr |

*Half-life:* 1½ to 5½ hours.

## ADVERSE REACTIONS

**CNS:** complex sleep-related behaviors, drowsiness, amnesia, ataxia, depression, dizziness, headache, lack of coordination, mental confusion, nervousness, physical or psychological dependence, rebound insomnia.

**GI:** nausea, vomiting.

**Other:** ***anaphylaxis, angioedema.***

## INTERACTIONS

**Drug-drug.** *Cimetidine, erythromycin, fluoxetine, fluvoxamine, isoniazid, nefazodone, ranitidine:* May increase triazolam level. Avoid using with azole antifungals or nefazodone. Watch for increased sedation if used with other drugs.
*CNS depressants:* May cause excessive CNS depression. Use together cautiously.
*Diltiazem:* May increase CNS depression and prolonged effects of triazolam. Reduce triazolam dose.
*Fluconazole, itraconazole, ketoconazole, miconazole:* May increase and prolong drug level, CNS depression, and psychomotor impairment. Avoid using together.
**Drug-herb.** *Calendula, hops, kava, lemon balm, passion flower, skullcap, valerian:* May enhance sedative effect of drug. Discourage use together.
**Drug-food.** *Grapefruit:* May delay onset and increase drug effects. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May cause additive CNS effects. Discourage use together.
*Smoking:* May increase metabolism and clearance of drug. Advise patient who smokes to watch for decreased effectiveness of drug.

## EFFECTS ON LAB TEST RESULTS

- May increase liver function test values.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in pregnant patients and those hypersensitive to benzodiazepines.
- Use cautiously in patients with impaired hepatic or renal function, chronic pulmonary insufficiency, sleep apnea, mental depression, suicidal tendencies, or history of drug abuse.
- Use cautiously in breast-feeding women.

***Overdose S&S:*** Somnolence, impaired coordination, slurred speech, confusion, coma, decreased reflexes, hypotension, seizures, respiratory depression, apnea.

## NURSING CONSIDERATIONS

***Alert:*** Anaphylaxis and angioedema may occur as early as the first dose; monitor the patient closely.
- Assess mental status before starting therapy and reduce doses in elderly patients; these patients may be more sensitive to drug's adverse CNS effects.
- Monitor CBC, chemistry, and urinalysis.
- Take precautions to prevent hoarding or overdosing by patients who are depressed, suicidal, or drug-dependent or who have history of drug abuse.
- Minor changes in EEG patterns (usually low-voltage fast activity) may occur during and after therapy.
- ***Look alike–sound alike:*** Don't confuse Halcion with Haldol or halcinonide.

## PATIENT TEACHING

***Alert:*** Warn patient that drug may cause allergic reactions, facial swelling, and complex sleep-related behaviors, such as driving, eating, and making phone calls while asleep. Advise patient to report these adverse effects.
- Warn patient not to take more than prescribed amount; overdose can occur at total daily dose of 2 mg (or four times highest recommended amount).
- Tell patient to avoid alcohol use while taking drug.
- Warn patient not to stop drug abruptly after taking for 2 weeks or longer.
- Caution patient to avoid performing activities that require mental alertness or physical coordination.
- Inform patient that drug doesn't tend to cause morning drowsiness.
- Tell patient that rebound insomnia may occur for 1 or 2 nights after stopping therapy.

# trifluoperazine hydrochloride

trye-floo-oh-PER-eh-zeen

*Therapeutic class:* Antipsychotic
*Pharmacologic class:* Phenothiazine
*Pregnancy risk category NR*

## AVAILABLE FORMS

*Tablets (regular and film-coated):* 1 mg, 2 mg, 5 mg, 10 mg

## INDICATIONS & DOSAGES

➤ **Anxiety states**

*Adults:* 1 to 2 mg P.O. b.i.d. Maximum, 6 mg daily. Don't give drug for longer than 12 weeks for anxiety.

➤ **Schizophrenia, other psychotic disorders**

*Adults and children older than age 12:* 2 to 5 mg P.O. b.i.d., gradually increased until therapeutic response occurs. Most patients respond to 15 to 20 mg P.O. daily, although some may need 40 mg daily or more.

*Children ages 6 to 12:* For hospitalized or closely supervised patients, 1 mg P.O. daily or b.i.d.; may increase gradually to 15 mg daily, if needed.

## ADMINISTRATION

**P.O.**

- Give drug without regard for meals.

## ACTION

Unknown. A piperazine phenothiazine that probably blocks dopamine receptors in the brain.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |

*Half-life:* 20 to 40 hours.

## ADVERSE REACTIONS

**CNS:** *extrapyramidal reactions, tardive dyskinesia,* ***neuroleptic malignant syndrome,*** pseudoparkinsonism, dizziness, drowsiness, insomnia, fatigue, headache.

**CV:** *orthostatic hypotension,* tachycardia, ECG changes.

**EENT:** *blurred vision,* ocular changes.

**GI:** *dry mouth, constipation,* nausea.

**GU:** *urine retention,* menstrual irregularities, inhibited ejaculation.

**Hematologic:** ***transient leukopenia, agranulocytosis.***

**Hepatic:** cholestatic jaundice.

**Metabolic:** weight gain.

**Skin:** *photosensitivity reactions,* allergic reactions, rash.

**Other:** gynecomastia.

## INTERACTIONS

**Drug-drug.** *Antacids:* May inhibit absorption of oral phenothiazines. Separate antacid and phenothiazine doses by at least 2 hours.

*Barbiturates, lithium:* May decrease phenothiazine effect. Monitor patient.

*Centrally acting antihypertensives:* May decrease antihypertensive effect. Monitor blood pressure.

*CNS depressants:* May increase CNS depression. Use together cautiously.

*Propranolol:* May increase propranolol and trifluoperazine levels. Monitor patient.

*Warfarin:* May decrease effect of oral anticoagulants. Monitor PT and INR.

**Drug-herb.** *St. John's wort:* May cause photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

**Drug-lifestyle.** ***Alcohol use:*** May increase CNS depression, particularly psychomotor skills. Strongly discourage alcohol use.

*Sun exposure:* May increase risk of photosensitivity reactions. Advise patient to avoid excessive sunlight exposure.

## EFFECTS ON LAB TEST RESULTS

- May increase liver enzyme levels.
- May decrease WBC and granulocyte counts.
- May cause false-positive results for urinary porphyrin, urobilinogen, amylase, and 5-hydroxyindoleacetic acid tests and for urine pregnancy tests that use human chorionic gonadotropin.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to phenothiazines and in those with CNS depression, coma, bone marrow suppression, or liver damage.
- Use cautiously in elderly or debilitated patients and in patients with CV disease (may decrease blood pressure), seizure disorder, glaucoma, or prostatic hyperplasia; also, use cautiously in those exposed to extreme heat.
- Use only in children who are hospitalized or under close supervision.

⚠ ***Overdose S&S:*** Neck muscle spasms sometimes progressing to torticollis, extensor rigidity of back muscles, carpopedal spasm, trismus, swallowing difficulty, somnolence, coma, agitation, restlessness, seizures, ECG changes, cardiac arrhythmias, fever, autonomic reactions.

## NURSING CONSIDERATIONS

- Watch for orthostatic hypotension. Keep patient supine for 1 hour after giving drug, and tell him to change positions slowly.
- Monitor patient for tardive dyskinesia, which may occur after prolonged use. It may not appear until months or years later and may disappear spontaneously or persist for life, despite ending drug.

***Alert:*** Watch for evidence of neuroleptic malignant syndrome (extrapyramidal effects, hyperthermia, autonomic disturbance), which is rare but deadly.

- Monitor periodic CBC and liver function tests, and ophthalmic tests (long-term use).
- Withhold dose and notify prescriber if jaundice, signs and symptoms of blood dyscrasia (fever, sore throat, infection, cellulitis, weakness), or persistent extrapyramidal reactions (longer than a few hours) develop, especially in children or pregnant women.

***Alert:*** Elderly patients with dementia-related psychosis treated with atypical or conventional antipsychotics are at increased risk for death. Antipsychotics aren't approved for the treatment of dementia-related psychosis.

- Don't withdraw drug abruptly unless severe adverse reactions occur.
- After abrupt withdrawal of long-term therapy, gastritis, nausea, vomiting, dizziness, tremor, feeling of warmth or cold, diaphoresis, tachycardia, headache, insomnia, anorexia, muscle rigidity, altered mental status, or evidence of autonomic instability may occur.
- ***Look alike–sound alike:*** Don't confuse trifluoperazine with triflupromazine.

## PATIENT TEACHING

- Warn patient to avoid activities that require alertness until effects of drug are known.
- Tell patient to avoid alcohol while taking drug.
- Tell patient to report signs of urine retention or constipation.
- Tell patient to use sunblock and to wear protective clothing outdoors.
- Advise patient to relieve dry mouth with sugarless gum or hard candy.
- Warn patient to report sudden sore throat or other signs and symptoms of infection.

# trimethobenzamide hydrochloride

trye-meth-oh-BEN-za-mide

Tigan

*Therapeutic class:* Antiemetic
*Pharmacologic class:* Anticholinergic
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 300 mg
*Injection:* 100 mg/ml

## INDICATIONS & DOSAGES

➤ **Nausea and vomiting**

*Adults:* 300 mg P.O. t.i.d. or q.i.d.; or 200 mg I.M. When treating postoperative nausea and vomiting, repeat I.M. dose after 1 hour.

## ADMINISTRATION

**P.O.**

- Adjust dosage according to indication, severity, and patient response.

**I.M.**

- For I.M. use, reduce pain and local irritation by injecting deep into upper outer quadrant of gluteal region.

## ACTION

Probably acts on the chemoreceptor trigger zone to inhibit nausea and vomiting.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 10–20 min | Unknown | 3–4 hr |
| I.M. | 15–35 min | Unknown | 2–3 hr |

*Half-life:* 7 to 9 hours.

## ADVERSE REACTIONS

**CNS:** *drowsiness,* ***coma, seizures,*** depression, disorientation, dizziness with large doses, headache, parkinsonian-like symptoms.
**CV:** hypotension.
**EENT:** blurred vision.
**GI:** diarrhea.
**Hepatic:** jaundice.
**Musculoskeletal:** muscle cramps.
**Other:** hypersensitivity reactions.

T

## INTERACTIONS

**Drug-drug.** *CNS depressants:* May cause additive CNS depression. Avoid using together.
**Drug-lifestyle.** *Alcohol use:* May cause additive CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug. Suppositories contraindicated in patients hypersensitive to benzocaine hydrochloride or similar local anesthetic. I.M. form is contraindicated in children.
- Use cautiously in children. Extrapyramidal (parkinsonlike) signs and symptoms may be confused with undiagnosed cause of vomiting, such as Reye syndrome or other encephalopathy.
- Drugs like trimethobenzamide, with the potential for hepatic toxicity, may worsen the course of Reye syndrome.

## NURSING CONSIDERATIONS

- Drug may mask signs and symptoms of toxic drug overdose, intestinal obstruction, brain tumor, or other conditions.
- Drug may cause pain, stinging, burning, redness, or swelling at I.M. injection site. Withhold drug if skin hypersensitivity reaction occurs.
- ***Look alike–sound alike:*** Don't confuse Tigan with Ticar.

## PATIENT TEACHING

- Advise patient of possible drowsiness and dizziness; caution against performing hazardous activities requiring alertness until CNS effects of drug are known.

# trospium chloride

TROZ-pee-um

Sanctura, Sanctura XR

*Therapeutic class:* Urinary antispasmodic
*Pharmacologic class:* Antimuscarinic
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules (extended-release):* 60 mg
*Tablets:* 20 mg

## INDICATIONS & DOSAGES

➤ **Overactive bladder with symptoms of urinary urge incontinence, urgency, and frequency**

*Adults younger than age 75:* 20 mg P.O. b.i.d. taken on an empty stomach or at least 1 hour before a meal. Or 60 mg extended release capsule P.O. daily in morning.
***Adjust-a-dose:*** For adults age 75 and older, reduce dosage to 20 mg P.O. once daily based on patient tolerance. If patient's creatinine clearance is less than 30 ml/minute, give 20 mg P.O. once daily at bedtime. Extended release form is not recommended if creatinine clearance is less than 30 ml/minute.

## ADMINISTRATION

**P.O.**

- Give at least 1 hour before meals or on an empty stomach.
- Give extended release form with water on an empty stomach at least 1 hour before meal.

## ACTION

Relaxes smooth muscle of bladder by antagonizing muscarinic receptors, relieving symptoms of overactive bladder.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 5–6 hr | Unknown |

*Half-life:* About 20 hours.

## ADVERSE REACTIONS

**CNS:** fatigue, headache.
**EENT:** dry eyes.

**GI:** *constipation, dry mouth,* abdominal pain, dyspepsia, flatulence.
**GU:** urine retention.

## INTERACTIONS

**Drug-drug.** *Anticholinergics:* May increase dry mouth, constipation, or other adverse effects. Monitor patient.
*Digoxin, metformin, morphine, procainamide, pancuronium, tenofovir, vancomycin:* May alter elimination of these drugs or trospium, increasing levels. Monitor patient closely.
**Drug-food.** *High-fat foods:* May significantly decrease absorption. Give drug at least 1 hour before meals or on an empty stomach.
**Drug-lifestyle.** *Alcohol use:* May increase drowsiness. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to the drug or any of its ingredients and in those with or at risk for urine retention, gastric retention, or uncontrolled narrow-angle glaucoma.
- Use cautiously in patients with significant bladder outflow obstruction, obstructive GI disorders, ulcerative colitis, intestinal atony, myasthenia gravis, renal insufficiency, moderate or severe hepatic impairment, or controlled narrow-angle glaucoma.

⚠ ***Overdose S&S:*** Severe anticholinergic effects, tachycardia, mydriasis.

## NURSING CONSIDERATIONS

- Assess patient to determine baseline bladder function, and monitor patient for therapeutic effects.
- Monitor patient for residual urine after voiding.
- If patient has bladder outflow obstruction, watch for evidence of urine retention.
- Monitor patient for decreased gastric motility and constipation.
- Elderly patients typically need a reduced dosage because they have an increased risk of anticholinergic effects.

## PATIENT TEACHING

- Tell patient to take drug on an empty stomach or at least 1 hour before meals.
- Tell patient to take extended release form with water in the morning on an empty stomach, at least one hour before a meal.
- Discourage use of other drugs that may cause dry mouth, constipation, blurred vision, or urine retention.
- Tell patient that alcohol may increase drowsiness and fatigue. Urge him to avoid excessive alcohol consumption while taking trospium.
- Explain that drug may decrease sweating and increase the risk of heatstroke when used in hot environments or during strenuous activities.
- Urge patient to avoid activities that are hazardous or require mental alertness until he knows how the drug affects him.

**SAFETY ALERT!**

# urokinase

yoor-oh-KIN-ase

*Therapeutic class:* Thrombolytic
*Pharmacologic class:* Enzyme
*Pregnancy risk category B*

## AVAILABLE FORMS

*Injection:* 250,000 international units/vial (with 25 mg mannitol, 25 mg albumin)

## INDICATIONS & DOSAGES

➤ **Lysis of acute massive pulmonary embolism and of pulmonary embolism with unstable hemodynamics**

*Adults:* For I.V. infusion only by constant infusion pump. For priming dose, give 4,400 international units/kg with normal saline solution or $D_5W$ solution at a rate of 90 ml/hour, over 10 minutes, followed by 4,400 international units/kg/hour at a rate of 15 ml/hour for 12 hours. Then give continuous I.V. infusion of heparin and oral anticoagulants.

➤ **Lysis of coronary artery thrombi following an acute MI**

*Adults:* After bolus dose of heparin ranging from 2,500 to 10,000 units, infuse 6,000 international units/minute urokinase into occluded artery for up to 2 hours. Average

total dose is 500,000 international units. Start drug within 6 hours after symptoms start.

## ADMINISTRATION

### I.V.

▼ Reconstitute according to manufacturer's directions using sterile water for injection. Gently roll vial; don't shake. Don't use bacteriostatic water for injection to reconstitute; it contains preservatives. Dilute further with normal saline solution or $D_5W$ solution before infusion. Filter urokinase solutions through a 0.45-micron or smaller cellulose-membrane filter before administration. Discard unused solution. Total volume of fluid given by I.V. infusion shouldn't exceed 195 ml.

▼ Heparin by continuous infusion may be started concurrently or within 3 to 4 hours after urokinase has been stopped to prevent recurrent thrombosis.

▼ **Incompatibilities:** Other I.V. drugs.

## ACTION

Converts plasminogen to plasmin by directly cleaving peptide bonds at two different sites, causing fibrinolysis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Immediate | 20 min–4 hr | 12–24 hr |

*Half-life:* 10 to 20 minutes.

## ADVERSE REACTIONS

**CNS:** fever.
**CV:** ***reperfusion arrhythmias,*** tachycardia, transient hypotension or hypertension.
**GI:** nausea, vomiting.
**Hematologic:** ***bleeding.***
**Respiratory:** ***bronchospasm,*** minor breathing difficulties.
**Skin:** phlebitis at injection site, rash.
**Other:** ***anaphylaxis,*** chills.

## INTERACTIONS

**Drug-drug.** *Anticoagulants, aspirin, dipyridamole, indomethacin, NSAIDs, phenylbutazone, other drugs affecting platelet activity:* May increase risk of bleeding. Monitor patient.

## EFFECTS ON LAB TEST RESULTS

- May decrease hematocrit.
- May increase PT, PTT, and INR.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with a history of hypersensitivity to the drug; active internal bleeding; recent (within 2 months) cerebrovascular accident, or intracranial or intraspinal surgery; recent trauma including cardiopulmonary resuscitation; intracranial neoplasm, arteriovenous malformation, or aneurysm; severe uncontrolled hypertension, or known bleeding diatheses.
- Contraindicated with I.M. injections and other invasive procedures.
- Use cautiously in patients with recent (within 10 days) major surgery, obstetric delivery, organ biopsy, previous puncture of noncompressible vessels, or serious GI bleeding. Also use cautiously in patients with a high likelihood of left heart thrombus (mitral stenosis with atrial fibrillation), subacute bacterial endocarditis, hemostatic defects including those secondary to severe hepatic or renal disease, pregnancy, cerebrovascular disease, diabetic hemorrhagic retinopathy, or any other condition in which bleeding constitutes a significant hazard or would be particularly difficult to manage because of its location.

**Black Box Warning** Thrombolytic therapy should be considered in all situations in which the benefits to be achieved outweigh the risk of potentially serious hemorrhage. When internal bleeding does occur, it may be more difficult to manage than that which occurs with conventional anticoagulant therapy. ■

## NURSING CONSIDERATIONS

**Black Box Warning** Urokinase therapy should be instituted as soon as possible after onset of pulmonary embolism, preferably no later than 7 days after onset. For treatment of coronary artery thrombosis associated with evolving transmural MI, therapy should be instituted within 6 hours of symptom onset. Any delay in instituting lytic therapy to evaluate the effect of heparin decreases the potential for optimal efficacy. ■

- Give other drugs through separate I.V. line.
- Have aminocaproic acid and cross-matched and crosstyped RBCs, whole blood, plasma expanders (other than dextran) available for bleeding. Keep corticosteroids, epinephrine, and antihistamines available for allergic reactions.
- Drug may be given to menstruating women.
- Only prescribers with extensive experience in thrombotic disease management should use drug and only in facilities where clinical and laboratory monitoring can be performed.
- Monitor patient for excessive bleeding every 15 minutes for first hour; every 30 minutes for second through eighth hours; then once every 4 hours. Pretreatment with drugs affecting platelets places patient at high risk of bleeding.
- Monitor pulse, color, and sensation of arms and legs every hour.
- Although risk of hypersensitivity reactions is low, monitor patient.
- Keep a laboratory flow sheet on patient's chart to monitor PTT, PT, thrombin time, hemoglobin level, and hematocrit.
- Monitor vital signs and neurologic status. Don't take blood pressure in legs because doing so could dislodge a clot.
- Keep venipuncture sites to a minimum; use pressure dressing on puncture sites for at least 15 minutes.
- Avoid I.M. injections.
- Keep involved limb in straight alignment to prevent bleeding from infusion site.
- Because bruising is more likely during therapy, avoid unnecessary handling of patient, and pad side rails.
- Rarely, orolingual edema, urticaria, cholesterol embolization, and infusion reactions causing hypoxia, cyanosis, acidosis, and back pain may occur.

### PATIENT TEACHING

- Explain use and administration of drug to patient and family.
- Instruct patient to report adverse reactions promptly.

## valacyclovir hydrochloride

val-ah-SYE-kloe-ver

Valtrex✐

*Therapeutic class:* Antiviral
*Pharmacologic class:* Synthetic purine nucleoside
*Pregnancy risk category B*

### AVAILABLE FORMS

*Tablets:* 500 mg, 1,000 mg

### INDICATIONS & DOSAGES

➤ **Herpes zoster infection (shingles)**
*Adults:* 1 g P.O. t.i.d. for 7 days.
***Adjust-a-dose:*** For patients with creatinine clearance of 30 to 49 ml/minute, give 1 g P.O. every 12 hours; if clearance is 10 to 29 ml/minute, give 1 g P.O. every 24 hours; if clearance is less than 10 ml/minute, give 500 mg P.O. every 24 hours.

➤ **First episode of genital herpes**
*Adults:* 1 g P.O. b.i.d. for 10 days.
***Adjust-a-dose:*** For patients with creatinine clearance of 10 to 29 ml/minute, give 1 g P.O. every 24 hours; if clearance is less than 10 ml/minute, give 500 mg P.O. every 24 hours.

➤ **Recurrent genital herpes in immunocompetent patients**
*Adults:* 500 mg P.O. b.i.d. for 3 days, given at the first sign or symptom of an episode.
***Adjust-a-dose:*** For patients with creatinine clearance of 29 ml/minute or less, give 500 mg P.O. every 24 hours.

➤ **Long-term suppression of recurrent genital herpes**
*Adults:* 1 g P.O. once daily. In patients with a history of nine or fewer recurrences per year, use alternative dose of 500 mg once daily.

➤ **Patients with HIV and $CD4^+$ cell count of 100 cells/$mm^3$**
*Adults:* 500 mg P.O. b.i.d.
***Adjust-a-dose:*** For patients with creatinine clearance of 29 ml/minute or less, 500 mg P.O. every 24 hours (every 48 hours if patient has nine or fewer occurrences per year).

➤ **Cold sores (herpes labialis)**
*Adults:* 2 g P.O. every 12 hours for two doses.

V

*Children age 12 and older:* 2 g b.i.d. for 1 day taken 12 hours apart.
***Adjust-a-dose:*** For patients with creatinine clearance of 30 to 49 ml/minute, give 1 g every 12 hours for two doses; if clearance is 10 to 29 ml/minute, give 500 mg every 12 hours for two doses; if clearance is less than 10 ml/minute, give 500 mg as a single dose.
➤ **To reduce transmission of genital herpes in patients with history of nine or fewer occurrences per year**
*Adults:* 500 mg P.O. daily for source partner.
➤ **Chickenpox**
*Children age 2 to 18:* 20 mg/kg P.O. t.i.d. for 5 days. Maximum dose is 1 g t.i.d.

## ADMINISTRATION

**P.O.**
- Give drug without regard for meals.

## ACTION

Rapidly converts to acyclovir, which in turn becomes incorporated into viral DNA, thereby terminating growth of the DNA chain; inhibits viral DNA polymerase, causing inhibition of viral replication.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30 min | Unknown | Unknown |

*Half-life:* 2½ to 3¼ hours.

## ADVERSE REACTIONS

**CNS:** *headache*, depression, dizziness.
**GI:** *nausea*, abdominal pain, diarrhea, vomiting.
**GU:** dysmenorrhea.
**Musculoskeletal:** arthralgia.

## INTERACTIONS

**Drug-drug.** *Cimetidine*, *probenecid:* May reduce rate but not extent of conversion of valacyclovir to acyclovir and may decrease renal clearance of acyclovir, thus increasing acyclovir level. Monitor patient for acyclovir toxicity.

## EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, ALT, AST, and creatinine levels. May decrease hemoglobin level.
- May decrease platelet and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to or intolerant of valacyclovir, acyclovir, or components of the formulation.

***Alert:*** Drug isn't recommended for use in patients with HIV infection or in bone marrow or renal transplant recipients because thrombotic thrombocytopenic purpura and hemolytic uremic syndrome may occur in these patients at doses of 8 g/day.
- Use cautiously in elderly patients, those with renal impairment, and those receiving other nephrotoxic drugs. Monitor renal function test results.
- Give drug to pregnant woman only if potential benefits outweigh fetal risk.
- If patient is breast-feeding, drug may need to be stopped.
- Safety and effectiveness in prepubertal children haven't been established.

***Overdose S&S:*** Precipitation of acyclovir in renal tubules.

## NURSING CONSIDERATIONS

- Safety and effectiveness of therapy beyond 6 months haven't been established.
- Start treatment for herpes zoster infection at earliest signs or symptoms. It's most effective when started within 48 hours of onset of rash.
- ***Look alike–sound alike:*** Don't confuse valacyclovir (Valtrex) with valganciclovir (Valcyte).

## PATIENT TEACHING

- Inform patient that drug may be taken without regard for meals.
- Teach patient the signs and symptoms of herpes infection (rash, tingling, itching, and pain), and advise him to notify prescriber immediately if they occur. Treatment should begin as soon as possible after symptoms appear, preferably within 48 hours of the onset of zoster rash.
- Tell patient that drug isn't a cure for herpes but may decrease the length and severity of symptoms.

## valganciclovir

val-gan-SYE-kloe-veer

Valcyte

*Therapeutic class:* Antiviral
*Pharmacologic class:* Synthetic nucleoside
*Pregnancy risk category C*

### AVAILABLE FORMS

*Oral solution:* 50 mg/ml
*Tablets:* 450 mg

### INDICATIONS & DOSAGES

➤ **To prevent CMV disease in heart, kidney, and kidney-pancreas transplantation in patients at high risk (donor CMV seropositive or recipient CMV seronegative)**

*Adults:* For patients with a heart or kidney-pancreas transplant, give 900 mg P.O. once daily starting within 10 days of transplantation until 100 days post-transplantation. For patients with a kidney transplant, give 900 mg P.O. daily starting within 10 days of transplantation until 200 days post-transplantation.

➤ **To prevent CMV disease in pediatric kidney and heart transplant patients at high risk**

*Children age 4 months to 16 years:* Give dose once daily starting within 10 days of transplantation until 100 days posttransplantation based on BSA and creatinine clearance (modified Schwartz formula).

$$\text{Dose (mg)} = 7 \times \text{BSA} \times \text{creatinine clearance}$$

***Adjust-a-dose:*** For pediatric patients, the maximum calculated creatinine clearance (modified Swartz formula) to be used is 150 ml/minute/1.73 $m^2$, even if the calculated value is greater. The maximum pediatric dose is 900 mg, even if the calculated dose is greater.

➤ **Active CMV retinitis in patients with AIDS**

*Adults:* 900 mg P.O. b.i.d. with food for 21 days; maintenance dose is 900 mg P.O. daily with food.

***Adjust-a-dose:*** For patients with creatinine clearance of 40 to 59 ml/minute, induction dosage is 450 mg b.i.d.; maintenance dosage is 450 mg daily. If clearance is 25 to 39 ml/minute, induction dosage is 450 mg daily; maintenance dosage is 450 mg every 2 days. If clearance is 10 to 24 ml/minute, induction dosage is 450 mg every 2 days; maintenance dosage is 450 mg twice weekly.

### ADMINISTRATION

**P.O.**

- Give drug with food.

### ACTION

Converted to the active drug ganciclovir, which inhibits replication of CMV.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–3 hr | Unknown |

*Half-life:* 4 hours.

### ADVERSE REACTIONS

**CNS:** *headache, insomnia, pyrexia,* ***seizures,*** agitation, confusion, hallucinations, paresthesia, peripheral neuropathy, psychosis.
**EENT:** *retinal detachment.*
**GI:** *abdominal pain, diarrhea, nausea, vomiting.*
**Hematologic:** **NEUTROPENIA,** *anemia,* ***aplastic anemia, bone marrow depression, pancytopenia, thrombocytopenia.***
**Other:** ***sepsis,*** catheter-related infection, hypersensitivity reactions, local or systemic infections.

### INTERACTIONS

**Drug-drug.** *Didanosine:* May increase absorption of didanosine. Monitor patient closely for didanosine toxicity.
*Immunosuppressants, zidovudine:* May enhance neutropenia, anemia, thrombocytopenia, and bone marrow depression. Monitor CBC results.
*Mycophenolate mofetil:* May increase levels of both drugs in renally impaired patients. Use together cautiously.
*Probenecid:* May decrease renal clearance of ganciclovir. Monitor patient for ganciclovir toxicity.

V

**Drug-food.** *Any food:* May increase drug absorption. Give drug with food.

## EFFECTS ON LAB TEST RESULTS

- May decrease hemoglobin level and hematocrit.
- May decrease neutrophil, platelet, RBC, and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to valganciclovir or ganciclovir. Don't use in patients receiving hemodialysis.
- Drug isn't indicated for use in liver transplant patients.
- The safety and effectiveness of drug for the prevention of CMV disease in other solid organ transplant patients, such as lung transplant patients, haven't been established.
- Use cautiously in patients with cytopenias and in those who have received immunosuppressants or radiation.

***Overdose S&S:*** Bone marrow depression, renal toxicity.

## NURSING CONSIDERATIONS

- Adhere to dosing guidelines for valganciclovir because ganciclovir and valganciclovir aren't interchangeable and overdose may occur.

**Black Box Warning** Toxicities include severe leukopenia, neutropenia, anemia, pancytopenia, bone marrow depression, aplastic anemia, and thrombocytopenia. Don't use if patient's absolute neutrophil count is less than 500/mm$^3$, platelet count is less than 25,000/mm$^3$, or hemoglobin level is less than 8 g/dl. ■

- Monitor CBC, platelet counts, and creatinine level or creatinine clearance values frequently during treatment.
- Cytopenia may occur at any time during treatment and increase with continued use. Counts usually recover 3 to 7 days after stopping drug.
- No drug interaction studies have been conducted but, because drug is converted to ganciclovir, assume that drug interactions will be similar.

**Black Box Warning** In animal studies, drug was carcinogenic and teratogenic and caused aspermatogenesis. ■

- ***Look alike–sound alike:*** Don't confuse valganciclovir hydrochloride (Valcyte) with valacyclovir (Valtrex).

## PATIENT TEACHING

- Tell patient to take drug with food.
- Tell patient to follow dosage instructions precisely. Ganciclovir capsules and valganciclovir tablets aren't interchangeable.
- Advise patient that blood tests are needed during treatment. Doses may need to be adjusted based on blood counts.
- Tell woman of childbearing potential to use contraception during treatment. Tell man to use barrier contraception during and for 90 days after treatment.
- Advise patient that ganciclovir is a carcinogen.
- Tell patient that CNS effects (seizures, ataxia, dizziness) can occur and to use care in driving or operating machinery.
- Advise patient that this drug isn't a cure for CMV retinitis and that the condition may recur. Tell patient to see an ophthalmologist at least every 4 to 6 weeks during treatment.

## valproate sodium

val-PROH-ayt

Depacon

## valproic acid

Depakene, Stavzor

## divalproex sodium

Depakote✓, Depakote ER, Depakote Sprinkle✓, Epival†

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* Carboxylic acid derivative
*Pregnancy risk category D*

## AVAILABLE FORMS

**valproate sodium**
*Injection:* 100 mg/ml
*Syrup:* 250 mg/5 ml
**valproic acid**
*Capsules:* 250 mg
*Capsules (delayed-release):* 125 mg, 250 mg, 500 mg

*Syrup:* 200 mg/5 ml
*Tablets (enteric-coated):* 200 mg, 500 mg
**divalproex sodium**
*Capsules (sprinkle):* 125 mg
*Tablets (delayed-release):* 125 mg, 250 mg, 500 mg
*Tablets (extended-release):* 250 mg, 500 mg

## INDICATIONS & DOSAGES

➤ **Simple and complex absence seizures, mixed seizure types (including absence seizures)**
*Adults and children:* Initially, 15 mg/kg P.O. or I.V. daily; then increase by 5 to 10 mg/kg daily at weekly intervals up to maximum of 60 mg/kg daily. Don't use Depakote ER in children younger than age 10.

➤ **Complex partial seizures**
*Adults and children age 10 and older:* 10 to 15 mg/kg Depakote or Depakote ER P.O. or valproate sodium I.V. daily; then increase by 5 to 10 mg/kg daily at weekly intervals, up to 60 mg/kg daily.

➤ **Mania**
*Adults:* Initially, 750 mg Depakote daily P.O. in divided doses, or 25 mg/kg Depakote ER once daily. Adjust dosage based on patient's response; maximum dose for either form is 60 mg/kg daily. Or, give Stavzor 750 mg P.O. daily in divided doses. Maximum recommended dosage is 60 mg/kg/day.

➤ **To prevent migraine headache**
*Adults:* Initially, 250 mg delayed-release divalproex sodium P.O. b.i.d. Some patients may need up to 1,000 mg daily. Or, 500 mg Depakote ER P.O. daily for 1 week; then 1,000 mg P.O. daily. Or, give Stavzor 250 mg P.O. b.i.d. Some patients may benefit from 1,000 mg/day. Maximum recommended dosage is 60 mg/kg/day.

***Adjust-a-dose:*** For elderly patients, start at lower dosage. Increase dosage more slowly and with regular monitoring of fluid and nutritional intake, and watch for dehydration, somnolence, and other adverse reactions.

## ADMINISTRATION

**P.O.**
- Give drug with food or milk to reduce adverse GI effects.
- Don't mix syrup with carbonated beverages; mixture may be irritating to oral mucosa.
- Don't give syrup to patients who need sodium restriction. Check with prescriber.
- Capsules may be swallowed whole or opened and contents sprinkled on a teaspoonful of soft food. Patient should swallow immediately without chewing.

**I.V.**
- I.V. use is indicated only in patients who can't take drug orally. Switch patient to oral form as soon as feasible; effects of I.V. use for longer than 14 days are unknown.
- Dilute valproate sodium injection with at least 50 ml of a compatible diluent. It's physically compatible and chemically stable in $D_5W$, normal saline, and lactated Ringer's solution for 24 hours.
- Infuse drug over 60 minutes at no more than 20 mg/minute and at the same frequency as oral dosage.
- Monitor drug level, and adjust dosage as needed.
- **Incompatibilities:** None reported.

## ACTION

Unknown. Probably facilitates the effects of the inhibitory neurotransmitter GABA.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 15 min–4 hr | Unknown |
| I.V. | Unknown | 1 hr | Unknown |

*Half-life:* 6 to 16 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia, dizziness, headache, insomnia, nervousness, somnolence, tremor,* abnormal thinking, amnesia, ataxia, depression, emotional upset, fever.
**CV:** chest pain, edema, hypertension, hypotension, tachycardia.
**EENT:** *blurred vision, diplopia,* nystagmus, pharyngitis, rhinitis, tinnitus.
**GI:** *abdominal pain, anorexia, diarrhea, dyspepsia, nausea, vomiting,* ***pancreatitis,*** constipation, increased appetite.
**Hematologic:** ***bone marrow suppression, hemorrhage, thrombocytopenia,*** bruising, petechiae.
**Hepatic:** ***hepatotoxicity.***
**Metabolic:** hyperammonemia, weight gain or loss.
**Musculoskeletal:** back and neck pain.
**Respiratory:** bronchitis, dyspnea.

**Skin:** *alopecia,* ***erythema multiforme, hypersensitivity reactions, Stevens-Johnson syndrome,*** rash, photosensitivity reactions, pruritus.
**Other:** *flulike syndrome, infection.*

## INTERACTIONS

**Drug-drug.** *Aspirin, chlorpromazine, cimetidine, erythromycin, felbamate:* May cause valproic acid toxicity. Use together cautiously and monitor drug level.
*Benzodiazepines, other CNS depressants:* May cause excessive CNS depression. Avoid using together.
***Carbamazepine:*** May cause carbamazepine CNS toxicity; may decrease valproic acid level and cause loss of seizure control. Use together cautiously, if at all. Monitor patient for seizure activity and toxicity during therapy and for at least 1 month after stopping either drug.
***Lamotrigine:*** May increase lamotrigine level; may decrease valproate level. Monitor levels closely.
*Phenobarbital:* May increase phenobarbital level; may increase clearance of valproate. Monitor patient closely.
*Phenytoin:* May increase or decrease phenytoin level; may decrease valproate level. Monitor patient closely.
*Rifampin:* May decrease valproate level. Monitor level of valproate.
*Warfarin:* May displace warfarin from binding sites. Monitor PT and INR.
*Zidovudine:* May decrease zidovudine clearance. Avoid using together.
**Drug-lifestyle.** *Alcohol use:* May cause excessive CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ammonia, ALT, AST, and bilirubin levels.
- May increase eosinophil count and bleeding time. May decrease platelet, RBC, and WBC counts.
- May cause false-positive results for urine ketone levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with hepatic disease or significant hepatic dysfunction, and in patients with a urea cycle disorder (UCD).

**Black Box Warning** Avoid use in women who may become pregnant. Valproate can cause teratogenic effects such as neural tube defects.

- Safety and efficacy of Depakote ER in children younger than age 10 haven't been established.

***Overdose S&S:*** Somnolence, heart block, deep coma.

## NURSING CONSIDERATIONS

- Obtain liver function test results, platelet count, and PT and INR before starting therapy, and monitor these values periodically.

***Alert:*** Closely monitor all patients taking or starting antiepileptic drugs for changes in behavior indicating worsening of suicidal thoughts or behavior or depression. Symptoms such as anxiety, agitation, hostility, mania, and hypomania may be precursors to emerging suicidality.

- Adverse reactions may not be caused by valproic acid alone because it's usually used with other anticonvulsants.
- When converting adults and children age 10 and older with seizures from Depakote to Depakote ER, make sure the extended-release dose is 8% to 20% higher than the regular dose taken previously. See manufacturer's package insert for more details.
- Divalproex sodium has a lower risk of adverse GI reactions.
- Never withdraw drug suddenly because sudden withdrawal may worsen seizures. Call prescriber at once if adverse reactions develop.

**Black Box Warning** Fatal hepatotoxicity may follow nonspecific symptoms, such as malaise, fever, anorexia, facial edema, vomiting, weakness, and lethargy. If these symptoms occur during therapy, notify prescriber at once because patient who might be developing hepatic dysfunction must stop taking drug. Perform liver function tests prior to therapy and at frequent intervals, especially during the first 6 months.

**Black Box Warning** Patients at high risk for hepatotoxicity include those with congenital metabolic disorders, mental retardation, or

organic brain disease; those taking multiple anticonvulsants; and children younger than age 2.
• Notify prescriber if tremors occur; a dosage reduction may be needed.
• Monitor drug level. Therapeutic level is 50 to 100 mcg/ml.
• When converting patients from a brand-name drug to a generic drug, use caution because breakthrough seizures may occur.
***Alert:*** Sometimes fatal, hyperammonemic encephalopathy may occur when starting valproate therapy in patients with urea cycle disorder (UCD). Evaluate patients with UCD risk factors before starting valproate therapy. Patients who develop symptoms of unexplained hyperammonemic encephalopathy during valproate therapy should stop drug, undergo prompt appropriate treatment, and be evaluated for underlying UCD.
• ***Look alike–sound alike:*** Don't confuse Depakote with Depakote ER.

### PATIENT TEACHING

• Tell patient to take drug with food or milk to reduce adverse GI effects.
• Advise patient not to chew capsules; irritation of mouth and throat may result.
• Tell patient that capsules may be either swallowed whole or carefully opened and contents sprinkled on a teaspoonful of soft food. Tell patient to swallow immediately without chewing.
• Tell patient and parents that syrup shouldn't be mixed with carbonated beverages; mixture may be irritating to mouth and throat.
• Tell patient and parents to keep drug out of children's reach.
• Warn patient and parents not to stop drug therapy abruptly.
**Black Box Warning** Cases of life-threatening pancreatitis have been reported in children and adults receiving valproate shortly after initial use, as well as after several years of use. Warn patients and guardians that abdominal pain, nausea, vomiting, and anorexia can be symptoms of pancreatitis that require prompt medical evaluation.
• Advise patient to avoid driving and other potentially hazardous activities that require mental alertness until drug's CNS effects are known.
• Instruct patient or parents to call prescriber if malaise, weakness, lethargy, facial swelling, loss of appetite, or vomiting occurs.
• Tell woman to call prescriber if she becomes pregnant or plans to become pregnant during therapy.

## valsartan

val-SAR-tan

Diovan✔

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Angiotensin II receptor antagonist
*Pregnancy risk category C; D in 2nd and 3rd trimesters*

### AVAILABLE FORMS

*Tablets:* 40 mg, 80 mg, 160 mg, 320 mg

### INDICATIONS & DOSAGES

➤ **Hypertension (used alone or with other antihypertensives)**
*Adults:* Initially, 80 or 160 mg P.O. once daily. Expect to see a reduction in blood pressure in 2 to 4 weeks. If additional antihypertensive effect is needed, dose may be increased to 160 or 320 mg daily, or a diuretic may be added. (Addition of a diuretic has a greater effect than dosage increases beyond 80 mg.) Usual dosage range is 80 to 320 mg daily.
*Children ages 6 to 16:* Initially, 1.3 mg/kg P.O. daily. Adjust according to patient response up to 2.7 mg/kg or 160 mg daily.
➤ **New York Heart Association class II to IV heart failure**
*Adults:* Initially, 40 mg P.O. b.i.d.; increase as tolerated to 80 mg b.i.d., and then to target dose of 160 mg b.i.d.
➤ **To reduce CV death in stable post-MI patients with left ventricular failure or dysfunction**
*Adults:* 20 mg P.O. b.i.d. Initial dose may be given as soon as 12 hours after MI. Increase dose to 40 mg b.i.d. within 7 days. Increase subsequent doses, as tolerated, to target dose of 160 mg b.i.d.

V

## ADMINISTRATION

**P.O.**

- Give drug without regard for food.
- Pharmacists may prepare suspension for children unable to swallow pills.
- Shake suspension at least 10 seconds before pouring. Store suspension at room temperature for 30 days or in refrigerator for 75 days.

## ACTION

Blocks the binding of angiotensin II to receptor sites in vascular smooth muscle and the adrenal gland, which inhibits the pressor effects of the renin-angiotensin-aldosterone system.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 2 hr | 2–4 hr | 24 hr |

*Half-life:* 6 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness,* headache, insomnia, fatigue, vertigo.
**CV:** edema, hypotension, orthostatic hypotension, syncope.
**EENT:** rhinitis, sinusitis, pharyngitis, blurred vision.
**GI:** abdominal pain, diarrhea, nausea, dyspepsia.
**GU:** renal impairment.
**Hematologic:** ***neutropenia.***
**Metabolic:** hyperkalemia.
**Musculoskeletal:** arthralgia, back pain.
**Respiratory:** upper respiratory tract infection, cough.
**Other:** ***angioedema,*** viral infection.

## INTERACTIONS

**Drug-drug.** *Lithium:* May increase lithium level. Monitor lithium level and patient for toxicity.
*Potassium supplements, potassium-sparing diuretics, other angiotensin II blockers:* May increase potassium level. May also increase creatinine level in heart failure patients. Avoid using together.
**Drug-herb.** *Ma huang:* May decrease antihypertensive effects. Discourage use together.
**Drug-food.** *Salt substitutes containing potassium:* May increase potassium level. May also increase creatinine level in heart failure patients. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase potassium, BUN, and creatinine levels.
- May decrease neutrophil count.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Contraindicated in breast-feeding women.

**Black Box Warning** Drugs that act directly on the renin-angiotensin system can cause injury and even death to the developing fetus. When pregnancy is detected, stop drug as soon as possible. ■

- Use cautiously in patients with renal or hepatic disease.
- Safety and efficacy of drug haven't been established in children less than age 6 and children of any age with GFR less than 30 ml/minute/1.73 $m^2$.

***Overdose S&S:*** Hypotension, tachycardia, bradycardia, decreased level of consciousness, circulatory collapse.

## NURSING CONSIDERATIONS

- Watch for hypotension. Excessive hypotension can occur when drug is given with high doses of diuretics.
- Correct volume and sodium depletions before starting drug.
- Suspension has 1.6 times greater exposure than tablets. Patients may require a higher dose if switched to tablets.

## PATIENT TEACHING

- Tell women of childbearing age to notify prescriber if pregnancy occurs. Drug will need to be stopped.
- Advise patient that drug may be taken without regard for food.

## vancomycin hydrochloride

van-koh-MYE-sin

Vancocin

*Therapeutic class:* Antibiotic
*Pharmacologic class:* Glycopeptide
*Pregnancy risk category C; B for capsules only*

### AVAILABLE FORMS

*Capsules:* 125 mg, 250 mg
*Powder for injection:* 500-mg vials, 750-mg vials, 1-g vials
*Premixed:* 500 mg/100 ml, 1 g/200 ml

### INDICATIONS & DOSAGES

➤ **Serious or severe infections when other antibiotics are ineffective or contraindicated, including those caused by methicillin-resistant *Staphylococcus aureus, S. epidermidis,* or diphtheroid organisms**

*Adults:* 500 mg I.V. every 6 hours or 1 g I.V. every 12 hours.
*Children:* 10 mg/kg I.V. every 6 hours.
*Neonates and young infants:* 15 mg/kg I.V. loading dose; then 10 mg/kg I.V. every 12 hours if child is younger than age 1 week or 10 mg/kg I.V. every 8 hours if age is older than 1 week but younger than 1 month.
*Elderly patients:* 15 mg/kg I.V. loading dose. Subsequent doses are based on renal function and drug levels.

➤ **Antibiotic-related pseudomembranous *Clostridium difficile* and *S. enterocolitis***

*Adults:* 125 to 500 mg P.O. every 6 hours for 7 to 10 days.
*Children:* 40 mg/kg P.O. daily, in divided doses every 6 hours for 7 to 10 days. Maximum daily dose is 2 g.

➤ **Endocarditis prophylaxis**

*Adults:* 1 g I.V. slowly over 1 to 2 hours, completing infusion 30 minutes before procedure.
*Children:* 20 mg/kg I.V. over 1 to 2 hours, completing infusion 30 minutes before procedure.

***Adjust-a-dose:*** In renal insufficiency, adjust dosage based on degree of renal impairment, drug level, severity of infection, and susceptibility of causative organism. Initially, give 15 mg/kg, and adjust subsequent doses as needed. One possible schedule is as follows: If creatinine level is less than 1.5 mg/dl, give 1 g every 12 hours. If creatinine level is 1.5 to 5 mg/dl, give 1 g every 3 to 6 days. If creatinine level is greater than 5 mg/dl, give 1 g every 10 to 14 days. Or, if GFR is 10 to 50 ml/minute, give usual dose every 3 to 10 days, and if GFR is less than 10 ml/minute, give usual dose every 10 days.

➤ **Bacterial endocarditis from methicillin-resistant or methicillin-susceptible staphylococci in patients with native cardiac valves**

*Adults:* 30 mg/kg I.V. daily given in two divided doses for 4 to 6 weeks. Doses over 2 g require monitoring of drug level.

### ADMINISTRATION

**P.O.**

● Obtain specimen for culture and sensitivity tests before giving. Because of the emergence of vancomycin-resistant enterococci, reserve use of drug for treatment of serious infections caused by gram-positive bacteria resistant to beta-lactam anti-infectives.
***Alert:*** Oral form is ineffective for systemic infections.
● Oral solution is stable for 2 weeks if refrigerated.

**I.V.**

▼ Obtain specimen for culture and sensitivity tests before giving. Because of the emergence of vancomycin-resistant enterococci, reserve use of drug for treatment of serious infections caused by gram-positive bacteria resistant to beta-lactam anti-infectives.
▼ This form is ineffective for pseudomembranous (*Clostridium difficile*) diarrhea.
▼ Reconstitute 500-mg vial with 10 ml or 1-g vial with 20 ml sterile water for injection to provide a solution containing 50 mg/ml.
▼ For infusion, further dilute 500 mg in 100 ml or 1 g in 200 ml normal saline solution for injection or $D_5W$, and infuse over 60 minutes; if dose is greater than 1 g, infuse over 90 minutes.
***Alert:*** Rapid infusion (over several minutes) has been associated with hypotension, shock and, rarely, cardiac arrest.

V

▼ Check site daily for phlebitis and irritation. Severe irritation and necrosis can result from extravasation.
▼ Refrigerate solution after reconstitution and use within 14 days.
▼ **Incompatibilities:** Albumin, alkaline solutions, aminophylline, amobarbital, amphotericin B, aztreonam, cephalosporins, chloramphenicol, chlorothiazide, corticosteroids, dexamethasone sodium phosphate, foscarnet, heavy metals, heparin, hydrocortisone, idarubicin, methotrexate, nafcillin, omeprazole, penicillin G potassium, pentobarbital, phenobarbital, phenytoin, piperacillin, piperacillin sodium and tazobactam sodium, sargramostim, sodium bicarbonate, ticarcillin disodium, ticarcillin disodium and clavulanate potassium, vitamin B complex with C, warfarin.

## ACTION

Hinders bacterial cell-wall synthesis, damaging the bacterial plasma membrane and making the cell more vulnerable to osmotic pressure. Also interferes with RNA synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | Unknown | Unknown |
| I.V. | Immediate | Immediate | Unknown |

*Half-life:* 6 hours.

## ADVERSE REACTIONS

**CNS:** fever, pain.
**CV:** hypotension, thrombophlebitis at injection site.
**EENT:** ototoxicity, tinnitus.
**GI:** ***pseudomembranous colitis,*** nausea.
**GU:** ***nephrotoxicity.***
**Hematologic:** ***leukopenia, neutropenia,*** eosinophilia.
**Respiratory:** dyspnea, wheezing.
**Skin:** red-man syndrome (with rapid I.V. infusion).
**Other:** ***anaphylaxis,*** chills, superinfection.

## INTERACTIONS

**Drug-drug.** *Aminoglycosides, amphotericin B, cisplatin, pentamidine:* May increase risk of nephrotoxicity and ototoxicity. Monitor renal function and hearing function tests.

*Nondepolarizing muscle relaxants:* May enhance neuromuscular blockade. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

- May increase BUN and creatinine levels.
- May increase eosinophil counts. May decrease neutrophil and WBC counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.
- Use cautiously in patients receiving other neurotoxic, nephrotoxic, or ototoxic drugs; in patients older than age 60; and in those with impaired hepatic or renal function, hearing loss, or allergies to other antibiotics.

## NURSING CONSIDERATIONS

- Patients with renal dysfunction need dosage adjustment. Monitor blood levels to adjust I.V. dosage.
- Obtain hearing evaluation and renal function studies before therapy.
- Monitor patient's fluid balance and watch for oliguria and cloudy urine.
- Monitor patient carefully for red-man syndrome, which can occur if drug is infused too rapidly. Signs and symptoms include maculopapular rash on face, neck, trunk, and limbs and pruritus and hypotension caused by histamine release. If wheezing, urticaria, or pain and muscle spasm of the chest and back occur, stop infusion and notify prescriber.
- Don't give drug I.M.
- Monitor renal function (BUN, creatinine and creatinine clearance levels, urinalysis, and urine output) during therapy.
- Monitor patient for signs and symptoms of superinfection.
- Have patient's hearing evaluated during prolonged therapy.
- For staphylococcal endocarditis, give for at least 4 weeks.

## PATIENT TEACHING

- Tell patient to take entire amount of drug exactly as directed, even after he feels better.
- Instruct patient receiving drug I.V. to report discomfort at I.V. insertion site.
- Tell patient to report ringing in ears.

• Tell patient to report adverse reactions to prescriber immediately.

## vardenafil hydrochloride

var-DEN-ah-fill

Levitra✔, Staxyn

*Therapeutic class:* Erectile dysfunction drug
*Pharmacologic class:* Phosphodiesterase type-5 inhibitor
*Pregnancy risk category B*

### AVAILABLE FORMS

*Tablets (film-coated):* 2.5 mg, 5 mg, 10 mg, 20 mg
*Tablets (orally disintegrating):* 10 mg

### INDICATIONS & DOSAGES

➤ **Erectile dysfunction**

*Adults:* 10 mg P.O. as a single dose, as needed, 1 hour before sexual activity. Dosage range is 5 to 20 mg, based on effectiveness and tolerance. Maximum, one dose daily.

***Adjust-a-dose:*** For patients with Child-Pugh category B and patients age 65 and older, first dose is 5 mg daily, as needed. Don't exceed 10 mg daily in patients with hepatic impairment.

### ADMINISTRATION

**P.O.**

• Give drug without regard for food.
• Place orally disintegrating tablet on the tongue to disintegrate. Have patient take without water.

### ACTION

Increases cGMP levels, prolongs smooth muscle relaxation, and promotes blood flow into the corpus cavernosum.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Immediate | 30–120 min | Unknown |

*Half-life:* 4 to 5 hours.

### ADVERSE REACTIONS

**CNS:** *headache,* dizziness.
**CV:** *flushing.*
**EENT:** decrease or loss of hearing, tinnitus, rhinitis, sinusitis.
**GI:** dyspepsia, nausea.
**Musculoskeletal:** back pain.
**Other:** flulike syndrome.

### INTERACTIONS

**Drug-drug.** *Alpha blockers:* May enhance hypotensive effects. Start concomitant treatment only if patient is stable on alpha-blocker therapy.
*Antiarrhythmics of class IA (quinidine, procainamide) and class III (amiodarone, sotalol):* May prolong QTc interval. Avoid using together.
*Erythromycin, indinavir, itraconazole, ketoconazole, ritonavir:* May increase vardenafil level. Reduce dose of vardenafil. If taken with ritonavir, reduce and extend dosage interval to once every 72 hours.
*Nitrates:* May enhance hypotensive effects. Use together is contraindicated.
**Drug-food.** *High-fat meals:* May reduce peak level of drug. Discourage use with a high-fat meal.

### EFFECTS ON LAB TEST RESULTS

• May increase CK level.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or its components and in those taking nitrates or alpha blockers.
• Contraindicated in patients with unstable angina, hypotension (systolic less than 90 mm Hg), uncontrolled hypertension (over 170/110 mm Hg), stroke, life-threatening arrhythmia, an MI within past 6 months, severe cardiac failure, Child-Pugh category C, end-stage renal disease requiring dialysis, congenital QTc-interval prolongation, or hereditary degenerative retinal disorders.
• Use cautiously in patients with bleeding disorders or significant peptic ulceration.
• Use cautiously in those with anatomical penis abnormalities or conditions that predispose patient to priapism (such as sickle cell anemia, multiple myeloma, or leukemia).

⚠ ***Overdose S&S:*** Back pain or myalgia, abnormal vision.

V

## NURSING CONSIDERATIONS

***Alert:*** Sexual activity may increase cardiac risk. Evaluate patient's cardiac risk before he starts taking drug.

- Before patient starts drug, assess for underlying causes of erectile dysfunction.
- Transient decreases in supine blood pressure may occur.
- Prolonged erections and priapism may occur.

## PATIENT TEACHING

- Tell patient that drug doesn't protect against sexually transmitted diseases and that he should use protective measures.
- Advise patient that drug is absorbed most rapidly if taken on an empty stomach.
- Tell patient to notify prescriber about vision or hearing changes.
- Urge patient to seek immediate medical care if erection lasts more than 4 hours.
- Tell patient to take drug 60 minutes before anticipated sexual activity. Explain that drug has no effect without sexual stimulation.
- Warn patient not to change dosage unless directed by prescriber.
- Tell patient to stop drug and seek medical attention if he experiences sudden vision loss in one or both eyes or sudden decrease in or loss of hearing.

# varenicline tartrate

vah-RENN-ih-kleen

Chantix

*Therapeutic class:* Smoking cessation aid
*Pharmacologic class:* Nicotinic acetylcholine receptor partial agonist
*Pregnancy risk category C*

## AVAILABLE FORMS

*Tablets:* 0.5 mg, 1 mg

## INDICATIONS & DOSAGES

➤ **Smoking cessation**

*Adults:* Starting 1 week before patient stops smoking, give 0.5 mg P.O. once daily on days 1 through 3. Days 4 through 7, give 0.5 mg P.O. b.i.d. Day 8 through the end of week 12, give 1 mg P.O. b.i.d. If patient successfully stops smoking, give an additional 12-week course to help with long-term success.

***Adjust-a-dose:*** In patient with severe renal impairment, 0.5 mg P.O. once daily. Adjust as needed to maximum of 0.5 mg b.i.d. In patient with end-stage renal disease who is undergoing dialysis, 0.5 mg once daily.

## ADMINISTRATION

**P.O.**

- Give drug with full glass of water after a meal.

## ACTION

Blocks the effects of nicotine by binding at alpha$_4$ beta$_2$ neuronal nicotinic acetylcholine receptors. Drug also provides some of nicotine's effects to ease withdrawal.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 4 days | 3–4 hr | 24 hr |

*Half-life:* 24 hours.

## ADVERSE REACTIONS

**CNS:** *abnormal dreams, headache, insomnia,* altered attention or emotions, anxiety, asthenia, depression, dizziness, fatigue, irritability, lethargy, malaise, nightmares, restlessness, sensory disturbance, sleep disorder, somnolence.
**CV:** chest pain, edema, hot flush, hypertension.
**EENT:** altered taste, epistaxis.
**GI:** *nausea,* abdominal pain, constipation, diarrhea, dry mouth, dyspepsia, flatulence, gingivitis, vomiting.
**GU:** menstrual disorder, polyuria.
**Metabolic:** decreased appetite, increased appetite, thirst.
**Musculoskeletal:** arthralgia, back pain, muscle cramps, myalgia.
**Respiratory:** dyspnea, upper respiratory tract disorder.
**Skin:** rash.
**Other:** flulike illness.

## INTERACTIONS

**Drug-drug.** *Cimetidine:* May decrease renal clearance of varenicline. Monitor patient closely.

*Nicotine-replacement therapy:* May increase nausea, vomiting, dizziness, dyspepsia, and fatigue. Monitor patient closely.

### EFFECTS ON LAB TEST RESULTS

- May increase liver function test values.

### CONTRAINDICATIONS & CAUTIONS

- Use cautiously in pregnant or breast-feeding women, elderly patients, and patients with severe renal impairment or pre-existing psychiatric illness.
- Not recommended for use in children younger than age 18.

### NURSING CONSIDERATIONS

- Assess patient's readiness and motivation to stop smoking.

**Black Box Warning** Monitor patient for changes in behavior, agitation, depressed mood, hostility, suicidal ideation, suicidal behavior and worsening of pre-existing psychiatric illness and report immediately. ■

- Notify prescriber if patient develops intolerable nausea; dosage reduction may be needed.
- Temporarily monitor levels of drugs—such as theophylline, warfarin, and insulin—after patient stops smoking to be sure levels are still within therapeutic range.

### PATIENT TEACHING

- Provide patient with educational materials and needed counseling.
- Instruct patient to choose a date to stop smoking and to begin treatment 1 week before this date.
- Advise patient to take each dose with a full glass of water after eating.
- Teach patient to gradually increase the dose over the first week to a target of 1 mg in the morning and 1 mg in the evening.
- Explain that nausea and insomnia are common and usually temporary. Urge him to contact the prescriber if adverse effects are persistently troubling; a dosage reduction may help.
- Urge patient to continue trying to abstain from smoking if he has early lapses after successfully quitting.
- Tell patient that dosages of other drugs he takes may need adjustment when he stops smoking.
- Advise patient to use caution when driving or operating machinery until effects of the drug are known.

**Black Box Warning** Instruct patient and family to monitor patient for changes in behavior and mood including agitation, depression, hostility, suicidal ideation or behavior, and worsening of preexisting psychiatric illness; stop drug and report changes to healthcare provider immediately. ■

- If woman plans to become pregnant or to breast-feed, explain the risks of smoking and the risks and benefits of taking drug to aid smoking cessation.

## vasopressin (ADH)

vay-soe-PRESS-in

*Therapeutic class:* Antidiuretic hormone
*Pharmacologic class:* Posterior pituitary hormone
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 20 units/ml

### INDICATIONS & DOSAGES

➤ **Nonnephrogenic, nonpsychogenic diabetes insipidus**

*Adults:* 5 to 10 units I.M. or subcutaneously b.i.d. to q.i.d., p.r.n. Or, intranasally (aqueous solution used as spray or applied to cotton balls) in individualized dosages, based on response.

*Children:* 2.5 to 10 units I.M. or subcutaneously b.i.d. to q.i.d., p.r.n. Or, intranasally (aqueous solution used as spray or applied to cotton balls) in individualized doses.

➤ **To prevent and treat abdominal distention**

*Adults:* Initially, 5 units I.M.; give subsequent injections every 3 to 4 hours, increasing to 10 units, if needed. Children may receive reduced dosages. Or, for adults, aqueous vasopressin 5 to 15 units subcutaneously at 2 hours before and again at 30 minutes before abdominal radiography or kidney biopsy.

V

➤ **Abdominal roentgenography**
*Adults:* 2 injections of 10 units each I.M. or subcutaneously, given 2 hours and ½ hour before films are exposed.
➤ **Esophageal varices ♦**
*Adults:* Initially, 0.2 to 0.4 units/minute I.V.; increase to 0.9 units/minute as needed. For intra-arterial infusion, 0.1 to 0.5 units/minute.
➤ **Pulseless cardiac arrest ♦**
*Adults:* One dose of 40 units I.V. or intraosseously may replace either the first or second epinephrine dose.
➤ **Septic shock and vasodilatory shock ♦**
*Adults:* 0.01 to 0.04 units/minute by I.V. infusion.

## ADMINISTRATION

**I.V.**
▼ For I.V. or intra-arterial infusion, dilute aqueous vasopressin in normal saline solution or $D_5W$ to a concentration of 0.1 to 1 unit/ml.

**I.M.**
● Warm the vial in your hands, and mix until the hormone is distributed throughout the solution before administration.
● Rotate injection sites to prevent tissue damage.

**Subcutaneous**
● Warm vial in hands, and mix until the hormone is distributed throughout the solution before administration.
● Rotate injection sites to prevent tissue damage.

**Intranasal**
● Give drug intranasally on cotton pledgets, by nasal spray, or by dropper. Determine dosage and interval between treatments for each patient.

## ACTION

Increases permeability of the renal tubular epithelium to adenosine monophosphate and water; the epithelium promotes reabsorption of water and produces a concentrated urine.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |
| I.M., subcut., intranasal | Unknown | Unknown | 2–8 hr |

*Half-life:* 10 to 20 minutes.

## ADVERSE REACTIONS

**CNS:** tremor, headache, vertigo.
**CV:** vasoconstriction, ***arrhythmias, cardiac arrest, myocardial ischemia,*** circumoral pallor, ***decreased cardiac output,*** angina in patients with vascular disease.
**GI:** abdominal cramps, nausea, vomiting, flatulence.
**Respiratory:** ***bronchoconstriction.***
**Skin:** diaphoresis, cutaneous gangrene, urticaria.
**Other:** ***anaphylaxis,*** water intoxication.

## INTERACTIONS

**Drug-drug.** *Carbamazepine, chlorpropamide, clofibrate, fludrocortisone, tricyclic antidepressant, urea:* May increase antidiuretic response. Use together cautiously.
*Demeclocycline, heparin, lithium, norepinephrine:* May reduce antidiuretic activity. Use together cautiously.
*Ganglionic blocking agents:* May increase sensitivity to pressor effects. Monitor patient and blood pressure.
**Drug-lifestyle.** *Alcohol use:* May reduce antidiuretic activity. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

● Contraindicated in patients allergic to vasopressin or any of its components and in those with chronic nephritis and nitrogen retention.
● Use cautiously in children; elderly patients; pregnant women; patients with preoperative or postoperative polyuria; and those with seizure disorders, migraines, asthma, CV disease, heart failure, renal disease, goiter with cardiac complications, arteriosclerosis, or fluid overload.
⚠ ***Overdose S&S:*** Water intoxication.

## NURSING CONSIDERATIONS

***Alert:*** Extravasation may result in severe tissue damage. If signs or symptoms of extravasation occur, stop infusion immediately and notify prescriber. If possible, withdraw 3 to 5 ml of blood to remove some of the drug and then remove infusion needle.

Delineate infiltrated area on patient's skin with felt-tip marker and elevate the arm above the heart. Avoid pressure or friction. Signs of necrosis may need surgical treatment.
• Monitor patient for hypersensitivity reactions, including urticaria, angioedema, bronchoconstriction, and anaphylaxis.
• Synthetic desmopressin is sometimes preferred because of its longer duration of action and less frequent adverse reactions. Desmopressin also is available commercially as a nasal solution.
• Drug may be used for transient polyuria from ADH deficiency in neurosurgery or head injury.
• Use minimum effective dose to reduce adverse reactions.
• Give with 1 or 2 glasses of water to reduce adverse reactions and improve therapeutic response.
• Monitor urine specific gravity and fluid intake and output to aid evaluation of drug effectiveness.
• Monitor ECG and fluid or electrolyte status at periodic intervals.
• To prevent possible seizures, coma, and death, observe patient closely for early evidence of water intoxication, including drowsiness, listlessness, headache, confusion, and weight gain.
• Water intoxication may be treated with water restriction and temporary withdrawal of drug until polyuria occurs. Severe water intoxication may require osmotic diuresis with mannitol, hypertonic dextrose, or urea, alone or with furosemide.
• Monitor blood pressure of patient taking vasopressin twice daily. Watch for excessively elevated blood pressure or lack of response to drug, which may be indicated by hypotension. Also, monitor weight daily.
• ***Look alike–sound alike:*** Don't confuse vasopressin with desmopressin.

### PATIENT TEACHING

• Instruct patient to rotate injection sites to prevent tissue damage.
• Tell patient to report adverse reactions, drowsiness, listlessness, and headache to prescriber promptly.
• Tell patient to avoid alcohol and OTC drugs unless approved by prescriber.
• Tell patient to restrict water intake. However, such side effects as skin blanching, abdominal cramps, and nausea may be reduced by drinking 1 to 2 glasses of water at the time of administration.

## venlafaxine hydrochloride

vin-lah-FACKS-in

Effexor✔, Effexor XR✔

*Therapeutic class:* Antidepressant
*Pharmacologic class:* SSNRI
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules (extended-release):* 37.5 mg, 75 mg, 150 mg
*Tablets:* 25 mg, 37.5 mg, 50 mg, 75 mg, 100 mg
*Tablets (extended-release):* 37.5 mg, 75 mg, 150 mg, 225 mg

### INDICATIONS & DOSAGES

➤ **Depression**

*Adults:* Initially, 75 mg P.O. daily in two or three divided doses with food. Increase as tolerated and needed by 75 mg daily every 4 days. For moderately depressed outpatients, usual maximum is 225 mg daily; in certain severely depressed patients, dose may be as high as 375 mg daily. For extended-release capsules, 75 mg P.O. daily in a single dose. For some patients, it may be desirable to start at 37.5 mg P.O. daily for 4 to 7 days before increasing to 75 mg daily. Dosage may be increased by 75 mg daily every 4 days to maximum of 225 mg daily.

➤ **Generalized anxiety disorder**

*Adults:* Initially, 75 mg extended-release capsule P.O. daily in a single dose. For some patients, it may be desirable to start at 37.5 mg P.O. daily for 4 to 7 days before increasing to 75 mg daily. Dosage may be increased by 75 mg daily every 4 days to maximum of 225 mg daily.

➤ **Panic disorder**

*Adults:* Initially, 37.5 mg extended-release capsule P.O. daily for 1 week, then increase dose to 75 mg daily. If patient isn't responding, may increase dose by up to 75 mg/day

V

in no less than weekly intervals, as needed, to a maximum dose of 225 mg daily.

➤ **Social anxiety disorder**

*Adults:* Initially, 75 mg extended-release capsule daily as a single dose.

***Adjust-a-dose:*** For patients with renal impairment, reduce daily amount by 25%. For those undergoing hemodialysis, reduce daily amount by 50% and withhold dose until dialysis is completed. For patients with hepatic impairment, reduce daily amount by 50%.

➤ **Hot flashes ♦**

*Adults:* 12.5 mg (immediate-release) P.O. b.i.d. for 4 weeks. Or, 37.5 to 150 mg (extended-release) P.O. daily for up to 3 months.

## ADMINISTRATION

**P.O.**

- Give drug with food and a full glass of water.
- Give capsule whole; if patient can't swallow whole, open and sprinkle contents on spoonful of applesauce; mix and give immediately. Follow with a full glass of water.

## ACTION

May increase the amount of norepinephrine, serotonin, or both in the CNS by blocking their reuptake by the presynaptic neurons.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1–2 hr | Unknown |

*Half-life:* 5 hours.

## ADVERSE REACTIONS

**CNS:** *asthenia, headache, somnolence, dizziness, nervousness, insomnia,* ***suicidal behavior,*** anxiety, tremor, abnormal dreams, paresthesia, agitation.

**CV:** hypertension, tachycardia, vasodilation.

**EENT:** blurred vision.

**GI:** *nausea, constipation, dry mouth, anorexia,* vomiting, diarrhea, dyspepsia, flatulence.

**GU:** *abnormal ejaculation,* impotence, urinary frequency, impaired urination.

**Metabolic:** weight loss, hyponatremia.

**Skin:** *diaphoresis,* rash.

**Other:** yawning, chills, infection.

## INTERACTIONS

**Drug-drug.** *MAO inhibitors, such as phenelzine, selegiline, tranylcypromine:* May cause serotonin syndrome and signs and symptoms resembling neuroleptic malignant syndrome. Avoid using within 14 days of MAO inhibitor therapy.

***Tramadol, sibutramine, sumatriptan, trazodone:*** May cause serotonin syndrome. Monitor patient closely.

*Triptans:* May cause serotonin syndrome (restlessness, hallucinations, loss of coordination, fast heartbeat, rapid changes in blood pressure, increased body temperature, hyperreflexia, nausea, vomiting, and diarrhea) or neuroleptic malignant syndrome–like reactions. Use cautiously and with increased monitoring at the start of therapy and with dose increase.

*Warfarin:* May increase PT, PTT, or INR. Monitor these lab values and patient closely.

**Drug-herb.** *St. John's wort:* May cause serotonin syndrome. Monitor patient closely.

*Yohimbe:* May cause additive stimulation. Urge caution.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or within 14 days of MAO inhibitor therapy.

**Black Box Warning** Venlafaxine isn't approved for use in children. ■

- Use cautiously in patients with renal impairment, diseases or conditions that could affect hemodynamic responses or metabolism, and in those with history of mania or seizures.
- Use in third trimester of pregnancy may be associated with neonatal complications at birth. Consider the risk versus benefit of treatment during this time.

⚠ ***Overdose S&S:*** Altered level of consciousness, tachycardia, mydriasis, seizures, vomiting, ECG changes, hypotension, liver necrosis, rhabdomyolysis, serotonin syndrome, vertigo, death.

## NURSING CONSIDERATIONS

**Alert:** Closely monitor patients being treated for depression for signs and symptoms of clinical worsening and suicidal ideation, especially at the beginning of therapy and with dosage adjustments. Symptoms may include agitation, insomnia, anxiety, aggressiveness, or panic attacks. **Black Box Warning** Drug may increase the risk of suicidal thinking and behavior in children, adolescents, and young adults ages 18 to 24, especially during the first few months of treatment, especially those with major depressive disorder or other psychiatric disorder. ■

- Carefully monitor blood pressure. Drug therapy may cause sustained, dose-dependent increases in blood pressure. Greatest increases (averaging about 7 mm Hg above baseline) occur in patients taking 375 mg daily.
- Monitor patient's weight, particularly underweight, depressed patients.

**Alert:** Combining triptans with an SSRI or an SSNRI may cause serotonin syndrome or neuroleptic malignant syndrome–like reactions. Signs and symptoms of serotonin syndrome may include restlessness, hallucinations, loss of coordination, fast heartbeat, rapid changes in blood pressure, increased body temperature, overactive reflexes, nausea, vomiting, and diarrhea. Serotonin syndrome may be more likely to occur when starting or increasing the dose of triptan, SSRI, or SSNRI.

## PATIENT TEACHING

- If medication is to be stopped, inform patient who has received drug for 6 weeks or longer that drug will be stopped gradually by tapering dosage over a 2-week period, as instructed by prescriber. Patient shouldn't abruptly stop taking the drug. **Black Box Warning** Warn family members to closely monitor patient for signs of worsening condition or suicidal ideation. ■
- Warn patient to avoid hazardous activities that require alertness and good coordination until effects of drug are known.
- Tell patient to avoid alcohol and to consult prescriber before taking other prescription or OTC drugs.
- Advise woman of childbearing age to contact prescriber if she becomes pregnant or intends to become pregnant during therapy or if she's breast-feeding.
- Tell patient to take each dose with food and a full glass of water.
- Tell patient that if he can't swallow capsule whole, he may carefully open it and sprinkle contents on a spoonful of applesauce, mix, and take immediately. Follow with a full glass of water.

# verapamil hydrochloride

ver-AP-a-mill

Apo-Verap†, Calan✐, Covera-HS, Isoptin SR✐, Novo-Veramil†, Nu-Verap†, Verelan✐, Verelan PM

*Therapeutic class:* Antihypertensive
*Pharmacologic class:* Calcium channel blocker
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules (extended-release):* 100 mg, 120 mg, 180 mg, 200 mg, 240 mg, 300 mg
*Capsules (sustained-release):* 120 mg, 180 mg, 240 mg, 360 mg
*Injection:* 2.5 mg/ml
*Tablets:* 40 mg, 80 mg, 120 mg
*Tablets (extended-release):* 120 mg, 180 mg, 240 mg
*Tablets (sustained-release):* 120 mg, 180 mg, 240 mg

## INDICATIONS & DOSAGES

➤ **Vasospastic angina (Prinzmetal's or variant angina); unstable angina; classic chronic, stable angina pectoris; chronic atrial fibrillation**

*Adults:* Starting dose is 80 to 120 mg P.O. t.i.d. Increase dosage at daily or weekly intervals as needed. Some patients may require up to 480 mg daily. For Covera-HS, initial dose is 180 mg/day P.O. at bedtime. Dosage range is 180 to 540 mg/day P.O. at bedtime.

➤ **To prevent paroxysmal supraventricular tachycardia**

*Adults:* 80 to 120 mg P.O. t.i.d. or q.i.d.

V

➤ **Supraventricular arrhythmias**
*Adults:* 0.075 to 0.15 mg/kg (5 to 10 mg) by I.V. push over 2 minutes with ECG and blood pressure monitoring. Repeat dose of 0.15 mg/kg (10 mg) in 30 minutes if no response occurs.
*Children ages 1 to 15:* Give 0.1 to 0.3 mg/kg as I.V. bolus over 2 minutes; not to exceed 5 mg. Repeat dose in 30 minutes if response is inadequate.
*Children younger than age 1:* Give 0.1 to 0.2 mg/kg as I.V. bolus over 2 minutes with continuous ECG monitoring. Repeat dose in 30 minutes if no response occurs.
➤ **Digitalized patients with chronic atrial fibrillation or flutter**
*Adults:* 240 to 320 mg P.O. daily, divided t.i.d. or q.i.d.
➤ **Hypertension**
*Adults:* 240 mg extended-release tablet P.O. once daily in the morning. If response isn't adequate, give an additional 120 mg in the evening or 240 mg every 12 hours, or an 80-mg immediate-release tablet t.i.d. If using Verelan PM, 200 mg P.O. daily at bedtime. May increase to 300 mg at bedtime if response is inadequate. Maximum dose is 400 mg. If using Covera-HS, 180 mg P.O. daily at bedtime. May increase to 240 mg daily if response is inadequate. Subsequent dosage adjustments may be made in 120-mg increments up to a maximum of 480 mg at bedtime.
➤ **To prevent migraines ♦**
*Adults:* 160 to 320 mg P.O. daily in three to four divided doses.

## ADMINISTRATION

**P.O.**
● Pellet-filled capsules may be given by carefully opening the capsule and sprinkling the pellets on a spoonful of applesauce. This should be swallowed immediately without chewing, followed by a glass of cool water to ensure all the pellets are swallowed.
● Give long-acting forms of the drug whole; don't crush or break tablet.

**I.V.**
▼ This form is contraindicated in patients receiving I.V. beta blockers and in those with ventricular tachycardia.
▼ Inject directly into a vein or into the tubing of a free-flowing, compatible solution, such as $D_5W$, half-normal saline solution, normal saline solution, Ringer's solution, or lactated Ringer's solution.
▼ Give doses over at least 2 minutes (3 minutes in elderly patients) to minimize the risk of adverse reactions.
▼ Monitor ECG and blood pressure continuously.
▼ **Incompatibilities:** Albumin, aminophylline, amphotericin B, ampicillin sodium, sulfamethoxazole and trimethoprim, dobutamine, hydralazine, nafcillin, oxacillin, propofol, sodium bicarbonate, solutions with a pH greater than 6.

## ACTION

Not clearly defined. A calcium channel blocker that inhibits calcium ion influx across cardiac and smooth-muscle cells, thus decreasing myocardial contractility and oxygen demand; it also dilates coronary arteries and arterioles.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 30 min | 1–2 hr | 8–10 hr |
| P.O. (extended) | 30 min | 5–9 hr | 24 hr |
| I.V. | Immediate | 1–5 min | 1–6 hr |

*Half-life:* 6 to 12 hours.

## ADVERSE REACTIONS

**CNS:** dizziness, headache, asthenia, fatigue, sleep disturbances.
**CV:** *transient hypotension,* ***heart failure, bradycardia, AV block, ventricular asystole, ventricular fibrillation,*** peripheral edema.
**GI:** *constipation,* nausea, diarrhea, dyspepsia.
**Respiratory:** dyspnea, pharyngitis, ***pulmonary edema,*** rhinitis, sinusitis, upper respiratory infection.
**Skin:** rash.

## INTERACTIONS

**Drug-drug.** *Beta blockers,* ***digoxin:*** May increase effects of both drugs. Monitor cardiac function closely and decrease doses as needed.
*Amiodarone:* May cause bradycardia and decrease cardiac output. Monitor patient closely.
*Antihypertensives, quinidine:* May cause hypotension. Monitor blood pressure.

*Carbamazepine:* May increase levels of carbamazepine. Monitor patient for toxicity and adjust dosage as needed.
*Cyclosporine:* May increase cyclosporine level. Monitor cyclosporine level.
*Disopyramide, flecainide:* May cause heart failure. Avoid using together.
***Dofetilide:*** May increase dofetilide level. Avoid using together.
*HMG-CoA reductase inhibitors (atorvastatin, lovastatin, simvastatin):* May elevate plasma concentrations of these drugs. If coadministration can't be avoided, administer conservative dose of the HMG-CoA reductase inhibitor.
*Lithium:* May decrease or increase lithium level. Monitor lithium level.
*Phenytoin:* May decrease effects of verapamil. Monitor patient closely and adjust dose as needed.
*Rifampin:* May decrease oral bioavailability of verapamil. Monitor patient for lack of effect.
*Neuromuscular-blocking drugs:* May potentiate the activity of these drugs. Monitor neuromuscular function and adjust dosages of either drug as needed.
*Sirolimus, tacrolimus:* May increase levels of these drugs. Monitor drug levels closely and adjust dosage as needed.
*Theophylline:* May decrease clearance of theophylline. Monitor for signs of theophylline toxicity.
**Drug-herb.** *Black catechu:* May cause additive effects. Discourage use together.
***St. John's wort:*** May decrease drug level and effect. Discourage use together.
*Yerba maté:* May decrease clearance of herb's methylxanthines and cause toxicity. Urge caution.
**Drug-food.** *Grapefruit juice:* May increase drug level. Discourage use together.
**Drug-lifestyle.** *Alcohol use:* May enhance the effects of alcohol. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, alkaline phosphatase, and bilirubin levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with severe left ventricular dysfunction, cardiogenic shock, second- or third-degree AV block or sick sinus syndrome except in presence of functioning pacemaker, atrial flutter or fibrillation and accessory bypass tract syndrome, severe heart failure (unless secondary to therapy), and severe hypotension.
- I.V. form is contraindicated in patients receiving I.V. beta blockers and in those with ventricular tachycardia.
- Use cautiously in elderly patients and in those with increased intracranial pressure or hepatic or renal disease.

***Overdose S&S:*** Hypotension, increasing AV block.

## NURSING CONSIDERATIONS

- Patients receiving beta blockers should receive lower doses of this drug. Monitor these patients closely.
- When clinically advisable, have the patient perform vagal maneuvers before giving drug.
- Monitor blood pressure at the start of therapy and during dosage adjustments. Assist patient with walking because dizziness may occur.
- If signs and symptoms of heart failure occur, such as swelling of hands and feet and shortness of breath, notify prescriber.
- Monitor liver function test results during prolonged treatment.
- ***Look alike–sound alike:*** Don't confuse Verelan with Vivarin, Voltaren, or Virilon.

## PATIENT TEACHING

- Instruct patient to take oral form of drug exactly as prescribed.
- Tell patient that long-acting forms shouldn't be crushed or chewed.
- Caution patient against abruptly stopping drug.
- If patient continues nitrate therapy during oral verapamil dosage adjustment, urge continued compliance. S.L. nitroglycerin may be taken, as needed, for acute chest pain.
- Encourage patient to increase fluid and fiber intake to combat constipation. Give a stool softener.
- Drug significantly inhibits alcohol elimination. Advise patient to avoid or severely limit alcohol use.

V

● Inform patient taking Covera-HS that the outer shell of the drug may be excreted in feces.

## vigabatrin

veye-gah-BA-trin

Sabril

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* GABA transaminase inhibitor
*Pregnancy risk category C*

### AVAILABLE FORMS

*Tablets:* 500 mg
*Powder for oral solution:* 500 mg

### INDICATIONS & DOSAGES

➤ **Refractory complex partial seizures**

*Adults and children age 16 and older:* Initially, 500 mg P.O. b.i.d. May increase dosage by 500 mg weekly to maximum of 1,500 mg P.O. b.i.d.

➤ **Infantile spasms**

*Infants and children age 1 month to 2 years:* 50 mg/kg/day P.O. given in 2 divided doses. Maximum dose is 150 mg/kg/day.

***Adjust-a-dose:*** For patients with creatinine clearance of 51 to 80 ml/minute, reduce dosage by 25%; for clearance of 31 to 50 ml/minute, decrease dosage by 50%; for clearance of 11 to 30 ml/minute, decrease dosage by 75%.

### ADMINISTRATION

**P.O.**

● Drug may be given with or without food.
● The entire contents of the appropriate number of packets (500 mg/packet) of powder should be emptied into an empty cup, and should be dissolved in 10 ml of cold or room temperature water per packet using the 10-ml oral syringe supplied with the medication. The concentration of the final solution is 50 mg/ml.

### ACTION

Precise mechanism unknown. Thought to control seizures by inhibiting GABA transaminase, the enzyme responsible for metabolizing the inhibitory neurotransmitter GABA, thereby increasing GABA levels in the CNS.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 1 hr | Unknown |

*Half-life:* 7½ hours.

### ADVERSE REACTIONS

**CNS:** abnormal behavior, *abnormal coordination*, abnormal dreams, abnormal thinking, anxiety, asthenia, attention disturbance, *confusion*, ***seizures,*** *depression*, *dizziness*, dysarthria, expressive language disorder, *fatigue*, fever, *headache*, hyperreflexia, hypoesthesia, hyporeflexia, insomnia, *irritability*, lethargy, malaise, *memory impairment*, nervousness, paresthesia, peripheral neuropathy, postictal state, sedation, sensory disturbance, sensory loss, sinus headache, *somnolence*, status epilepticus, *tremor*, vertigo.
**CV:** chest pain, peripheral edema.
**EENT:** asthenopia, *blurred vision*, *diplopia*, *nystagmus*, eye pain, *nasopharyngitis*, *pharyngolaryngeal pain*, tinnitus, toothache, visual field defect.
**GI:** abdominal distention, constipation, *diarrhea*, dyspepsia, *nausea*, stomach discomfort, upper abdominal pain, vomiting.
**GU:** *dysmenorrhea*, erectile dysfunction, UTI.
**Metabolic:** increased appetite, *weight gain.*
**Musculoskeletal:** *arthralgia*, back pain, contusion, extremity pain, *gait disturbance*, joint sprain, myalgia, muscle spasm, muscle twitching.
**Respiratory:** bronchitis, *cough*, influenza, pulmonary congestion, upper respiratory tract infection.
**Skin:** rash, wound secretion.
**Other:** thirst.

### INTERACTIONS

**Drug-drug.** *Clonazepam:* May increase clonazepam level. Use together cautiously. *Phenytoin:* May increase phenytoin level. Monitor drug levels.

### EFFECTS ON LAB TEST RESULTS

● May decrease hemoglobin, hematocrit, and RBC count.
● May decrease ALT and AST levels. May increase amino acid levels in urine.

## CONTRAINDICATIONS & CAUTIONS

- Use cautiously in patients with a history of vision problems, magnetic resonance imaging abnormalities, neurotoxicity, depression, suicidal behavior or ideation, or anemia.
- Avoid use during pregnancy unless benefit to mother outweighs risk to fetus.
- Drug appears in breast milk. Because of the risk of serious adverse effects in breast-fed infants, patient should stop either breast-feeding or drug.
- Safety and efficacy in children younger than age 16 haven't been established.

***Overdose S&S:*** Unconsciousness, coma, drowsiness, vertigo, psychosis, apnea, respiratory depression, bradycardia, agitation, irritability, confusion, headache, hypotension, abnormal behavior, increased seizure activity, status epilepticus, speech disorder.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug may cause progressive and permanent bilateral concentric visual field constriction and reduce visual acuity. Risk of visual impairment increases with use and may continue after drug is discontinued. Because of risk of permanent vision loss, drug is available only through the SHARE program. Prescribers, pharmacists, and patients must enroll by calling 1-888-45-SHARE. A visual exam should be performed before, every 3 months during, and 3 to 6 months after therapy. ■

***Alert:*** Closely monitor all patients taking or starting therapy with antiepileptics for changes in behavior indicating worsening suicidal thoughts or behavior or depression. Symptoms such as anxiety, agitation, hostility, mania, and hypomania may be precursors to emerging suicidality.

- Discontinue drug if patient fails to comply with therapy.
- Discontinue drug within 3 months if patient shows no improvement.

***Alert:*** Don't withdraw drug suddenly. For adults, taper by decreasing daily dose by 1,000 mg/day, weekly until discontinued. For infants and children, decrease the daily dose at a rate of 25 to 50 mg/kg every 3 to 4 days.

- Monitor patient closely for such adverse reactions as dizziness, which may lead to falls.
- Drug may cause anemia, somnolence, fatigue, peripheral neuropathy, peripheral edema, and weight gain. Monitor patient closely.
- Monitor ALT and AST levels; drug decreases levels, making these measurements unreliable for detecting early hepatic injury.

## PATIENT TEACHING

- Advise patient that drug may be taken without regard to food.
- Instruct patient to read the manufacturer's medication guide before starting treatment and before each prescription refill.
- Warn patient that drug may cause dizziness and somnolence and that he should avoid driving or other hazardous activities until drug's effects are known.
- Inform patient that drug may cause vision loss and explain the importance of regular eye exams and of immediately reporting vision changes.
- Advise patient to call prescriber and not to stop drug suddenly if adverse reactions occur.
- Tell women of childbearing age to notify prescriber if she becomes pregnant or plans to become pregnant while taking vigabatrin. If a woman becomes pregnant during therapy, encourage her to enroll in the NAAED Pregnancy Registry at 1-888-233-2334.
- Inform patient who is breast-feeding that drug appears in breast milk and that she should use another method of feeding the baby.

### SAFETY ALERT!

**vinBLAStine sulfate (VLB)**
vin-BLAS-teen

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Vinca alkaloid
*Pregnancy risk category D*

## AVAILABLE FORMS

*Injection:* 10-mg vials (lyophilized powder), 1 mg/ml in 10-ml and 25-ml vials

V

## INDICATIONS & DOSAGES

➤ **Breast or testicular cancer, Hodgkin and malignant lymphoma, choriocarcinoma, lymphosarcoma, mycosis fungoides, Kaposi sarcoma, histiocytosis**

*Adults:* 3.7 mg/m$^2$ I.V. weekly. May increase to maximum dose of 18.5 mg/m$^2$ I.V. weekly based on response. Don't repeat dose if WBC count is below 4,000/mm$^3$. Increase dosage at weekly intervals in increments of 1.8 mg/m$^2$ until desired therapeutic response is obtained, WBC count decreases to 3,000/mm$^3$, or maximum weekly dose of 18.5 mg/m$^2$ is reached.

***Adjust-a-dose:*** For patients with serum bilirubin level of 1.5 to 3 mg/dl and AST level of 60 to 180 units/L, give 50% of usual dose. For patients with serum bilirubin level of 3 to 5 mg/dl, give 25% of usual dose. For patients with serum bilirubin level greater than 5 mg/dl and AST level greater than 180 units/L, don't administer. For patients with recent exposure to radiation therapy or chemotherapy, single doses usually don't exceed 5.5 mg/m$^2$. Once a dose is determined to produce a WBC count below 3,000/mm$^3$, give maintenance doses of one increment less than this amount at weekly intervals.

## ADMINISTRATION

**I.V.**

▼ Preparing and giving drug may be mutagenic, teratogenic, or carcinogenic. Follow institutional policy to reduce risks.

▼ Reconstitute drug in 10-mg vial with 10 ml of bacteriostatic saline solution for injection. This yields 1 mg/ml. Don't use other diluents. Protect solution from light.

▼ Inject drug directly into tubing of running I.V. line over 1 minute.

**Black Box Warning** Make sure catheter is properly positioned in vein. Drug is a vesicant; if extravasation occurs, stop infusion immediately and notify prescriber. The manufacturer recommends that moderate heat be applied to area of leakage. Local injection of hyaluronidase may help disperse drug. Moderate heat may be applied on and off every 2 hours for 24 hours. Drug is fatal if given intrathecally; it's for I.V. use only. ■

▼ Drug reconstituted with diluent containing preservatives is stable for 28 days if refrigerated. Immediately discard any unused portion of solution reconstituted with diluent that doesn't contain preservatives.

▼ **Incompatibilities:** Cefepime, doxorubicin, furosemide, heparin.

## ACTION

Arrests mitosis in metaphase, blocking cell division.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* Initial phase, 3 minutes; second phase, 1½ hours; terminal phase, 25 hours.

## ADVERSE REACTIONS

**CNS:** *numbness, paresthesia, peripheral neuropathy and neuritis,* ***seizures, stroke,*** depression, headache.

**CV:** ***MI,*** hypertension.

**EENT:** pharyngitis.

**GI:** *anorexia, constipation, ileus, nausea, stomatitis, vomiting,* abdominal pain, bleeding ulcer, diarrhea.

**Hematologic:** *anemia,* ***leukopenia, thrombocytopenia.***

**Metabolic:** *weight loss,* hyperuricemia.

**Musculoskeletal:** *loss of deep tendon reflexes, muscle pain and weakness,* jaw pain.

**Respiratory:** ***acute bronchospasm,*** shortness of breath.

**Skin:** *irritation, phlebitis,* cellulitis, reversible alopecia, vesiculation and necrosis with extravasation.

**Other:** SIADH.

## INTERACTIONS

**Drug-drug.** ***Azole antifungals, erythromycin,*** *other drugs that inhibit cytochrome P-450 pathway:* May increase toxicity of vinblastine. Monitor patient closely for toxicity.

*Mitomycin:* May increase risk of bronchospasm and shortness of breath. Monitor patient's respiratory status.

*Ototoxic drugs, such as platinum-containing antineoplastics:* May cause temporary or permanent hearing impairment. Monitor hearing function.

*Phenytoin:* May decrease plasma phenytoin level. Monitor phenytoin level closely.

### EFFECTS ON LAB TEST RESULTS

- May increase uric acid and bilirubin levels. May decrease hemoglobin level.
- May decrease WBC and platelet counts.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with severe leukopenia or bacterial infection or in patients hypersensitive to the drug.
- Use cautiously in patients with hepatic dysfunction.

***Overdose S&S:*** Exaggerated effects, neurotoxicity.

### NURSING CONSIDERATIONS

- To reduce nausea, give antiemetic before drug.
- Don't give drug into a limb with compromised circulation.

***Alert:*** After giving drug, be alert for development of life-threatening acute bronchospasm. If this occurs, notify prescriber immediately. Reaction is most likely to occur in patients who are also receiving mitomycin.

- Monitor patient for stomatitis. If stomatitis occurs, stop drug and notify prescriber.
- Assess bowel activity. Give laxatives as indicated. Stool softeners may be used prophylactically.
- Don't repeat dosage more frequently than every 7 days or severe leukopenia will occur. Nadir occurs on days 4 to 10 and lasts another 7 to 14 days.
- Assess patient for numbness and tingling in hands and feet. Assess gait for early evidence of footdrop.
- Drug is less neurotoxic than vincristine.
- Stop drugs known to cause urine retention for first few days after therapy, particularly in elderly patients.
- ***Look alike–sound alike:*** Don't confuse vinblastine with vincristine or vinorelbine.

### PATIENT TEACHING

- Tell patient to report evidence of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell patient to take temperature daily.
- Urge patient to report pain, swelling, burning, or any unusual feeling at injection site during infusion.
- Warn patient that hair loss may occur but that it's usually temporary.
- Caution women to avoid pregnancy during therapy.
- Tell patient that pain may occur in jaw and in the organ with the tumor.

**SAFETY ALERT!**

## vinCRIStine sulfate (VCR)

vin-KRIS-teen

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Vinca alkaloid
*Pregnancy risk category D*

### AVAILABLE FORMS

*Injection:* 1 mg/ml in 1-ml, 2-ml, 5-ml multidose vials; 1 mg/ml in 1-ml, 2-ml, 5-ml preservative-free vials

### INDICATIONS & DOSAGES

➤ **Acute lymphoblastic and other leukemias, Hodgkin lymphoma, malignant lymphoma, neuroblastoma, rhabdomyosarcoma, Wilms tumor**

*Adults:* 1.4 mg/m$^2$ I.V. weekly. Typical weekly dose is 2 mg.

*Children who weigh more than 10 kg (22 lb):* 1 to 2 mg/m$^2$ I.V. weekly.

*Children who weigh 10 kg and less or with body surface area less than 1 m$^2$:* Initially, 0.05 mg/kg I.V. weekly.

***Adjust-a-dose:*** For patients with direct bilirubin over 3 mg/dl, reduce dose by 50%. If serum bilirubin level is 3 to less than 5 mg/dl, give 25% of usual dose.

### ADMINISTRATION

**I.V.**

▼ Preparing and giving drug may be mutagenic, teratogenic, or carcinogenic. Follow institutional policy to reduce risks.

▼ Inject directly into tube of running I.V. line of normal saline or dextrose in water only, slowly over 1 minute.

**Black Box Warning** Make sure catheter is positioned correctly in vein. Drug is a vesicant; if it extravasates, stop infusion immediately and notify prescriber. Apply

V

heat on and off every 2 hours for 24 hours. Drug is fatal if given intrathecally; it is for I.V. use only. ■
▼ If protocol requires a continuous infusion, use a central line.
▼ All vials contain 1 mg/ml solution; refrigerate them.
▼ **Incompatibilities:** Cefepime, furosemide, idarubicin, sodium bicarbonate.

## ACTION

Arrests mitosis in metaphase, blocking cell division.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* Initial phase, 4 minutes; second phase, 2¼ hours; terminal phase, 3½ days.

## ADVERSE REACTIONS

**CNS:** *loss of deep tendon reflexes, paresthesia, peripheral neuropathy,* ***coma, seizures,*** ataxia, cranial nerve palsies, fever, headache, sensory loss.
**CV:** hypertension, hypotension.
**EENT:** blindness, diplopia, hoarseness, optic and extraocular neuropathy, photophobia, ptosis, visual disturbances, vocal cord paralysis.
**GI:** *constipation, cramps, nausea, stomatitis, vomiting,* ***intestinal necrosis,*** anorexia, diarrhea, dysphagia, ileus that mimics surgical paralytic ileus.
**GU:** dysuria, polyuria, SIADH, urine retention.
**Hematologic:** ***leukopenia, thrombocytopenia,*** anemia.
**Metabolic:** hyponatremia, weight loss.
**Musculoskeletal:** *cramps, jaw pain, muscle weakness.*
**Respiratory:** ***acute bronchospasm,*** dyspnea.
**Skin:** *phlebitis,* cellulitis at injection site, rash, reversible alopecia, severe local reaction following extravasation.

## INTERACTIONS

**Drug-drug.** *Asparaginase:* May decrease hepatic clearance of vincristine. Use together also may result in additive neurotoxicity. Monitor patient for toxicity.
*Digoxin:* May decrease digoxin's effects. Monitor digoxin level.
*Mitomycin:* May increase frequency of bronchospasm and acute pulmonary reactions. Monitor patient's respiratory status.
*Ototoxic drugs:* May potentiate loss of hearing. Use together with caution.
*Phenytoin:* May reduce phenytoin level. Monitor phenytoin level closely.

## EFFECTS ON LAB TEST RESULTS

- May decrease sodium and hemoglobin levels. May increase uric acid level.
- May decrease WBC and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with demyelinating form of Charcot-Marie-Tooth syndrome.
- Don't give to patients who are receiving radiation therapy through ports that include the liver.
- Use cautiously in patients with hepatic dysfunction, neuromuscular disease, or infection.

***Overdose S&S:*** Exaggerated effects, death.

## NURSING CONSIDERATIONS

- Don't use the 5-mg vials for single doses.

***Alert:*** Patient also taking mitomycin has a higher risk of life-threatening bronchospasm. Monitor him after dose, and notify prescriber immediately if it occurs.

***Alert:*** Drug is considered a vesicant. If signs or symptoms of extravasation occur, stop infusion immediately and notify prescriber. Extravasation site may need to be injected with hyaluronidase.

- Watch for hyperuricemia, especially in patients with leukemia or lymphoma. Maintain hydration and give allopurinol to prevent uric acid nephropathy. Watch for toxicity.
- If SIADH develops, fluid restriction may be needed. Monitor fluid intake and output.
- Because of risk of neurotoxicity, don't give drug more often than once weekly. Children are more resistant to neurotoxicity than adults. Neurotoxicity is dose related and usually reversible.

• Elderly patients and those with underlying neurologic disease may be more susceptible to neurotoxic effects.
• Monitor patient for Achilles tendon reflex depression, numbness, tingling, footdrop or wristdrop, difficulty walking, ataxia, and slapping gait. Monitor his ability to walk on heels. Support him while walking.
• Monitor bowel function. Give stool softener, laxative, or water before giving dose. Constipation may be an early sign of neurotoxicity.
• Stop drugs known to cause urine retention, particularly in elderly patients, for first few days after therapy.
• ***Look alike–sound alike:*** Don't confuse vincristine with vinblastine or vinorelbine.

## PATIENT TEACHING

• Advise patient to report any pain or burning at site of injection during or after administration.
• Tell patient to report evidence of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell patient to take temperature daily.
• Warn patient that hair loss may occur, but explain that it's usually temporary.
• Caution women to avoid becoming pregnant during therapy and to consult prescriber before becoming pregnant.

**SAFETY ALERT!**

# vinorelbine tartrate

vin-oh-REL-been

Navelbine

*Therapeutic class:* Antineoplastic
*Pharmacologic class:* Semisynthetic vinca alkaloid
*Pregnancy risk category D*

## AVAILABLE FORMS

*Injection:* 10 mg/ml, 50 mg/5 ml

## INDICATIONS & DOSAGES

➤ **Alone or as adjunct therapy with cisplatin for first-line treatment of ambulatory patients with nonresectable advanced non–small-cell lung cancer (NSCLC); alone or with cisplatin in stage IV of NSCLC; with cisplatin in stage III of NSCLC**

*Adults:* 30 mg/m$^2$ I.V. weekly. In combination treatment, 25 mg/m$^2$ I.V. weekly with cisplatin given every 4 weeks at a dose of 100 mg/m$^2$. Or, 30 mg/m$^2$ I.V. weekly in combination with cisplatin, given on days 1 and 29, then every 6 weeks at a dose of 120 mg/m$^2$.

***Adjust-a-dose:*** If granulocyte count is 1,000/mm$^3$ to 1,499/mm$^3$, give 50% of dose. If less than 1,000/mm$^3$, dose is withheld. For patients who develop hyperbilirubinemia, adjust dosage as follows: If total bilirubin is 2.1 to 3 mg/dl, give 50% of starting dose; if total bilirubin is greater than 3 mg/dl, give 25% of starting dose.

## ADMINISTRATION

**I.V.**

▼ Drug may be a contact irritant; handle and give with care. Wear gloves. Avoid inhaling vapors and allowing contact with skin or mucous membranes, especially those of the eyes. In case of contact, wash with generous amounts of water for at least 15 minutes.
▼ Dilute drug before use to 1.5 to 3 mg/ml with $D_5W$ or normal saline solution in a syringe. Or, dilute to 0.5 to 2 mg/ml in an I.V. bag.
▼ Give drug I.V. over 6 to 10 minutes into side port of a free-flowing I.V. line that is closest to I.V. bag; then flush with 75 to 125 ml or more of $D_5W$ or normal saline solution.
▼ Monitor site for irritation and infiltration because drug can cause localized tissue damage, necrosis, and thrombophlebitis. **Black Box Warning** Make sure catheter is properly positioned in vein. If extravasation occurs, stop drug immediately and inject remaining dose into a different vein; notify prescriber. Drug is fatal if given intrathecally; it's for I.V. use only. ■
▼ Drug may be stored for up to 24 hours at room temperature.
▼ **Incompatibilities:** Acyclovir, allopurinol, aminophylline, amphotericin B, ampicillin sodium, cefazolin, ceftriaxone, cefuroxime, fluorouracil, furosemide, ganciclovir, methylprednisolone, mitomycin,

V

piperacillin, sodium bicarbonate, thiotepa, sulfamethoxazole and trimethoprim.

## ACTION

Exerts its primary antineoplastic effect by disrupting microtubule assembly, which in turn disrupts spindle formation and prevents mitosis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. | Unknown | Unknown | Unknown |

*Half-life:* About 27 to 43½ hours.

## ADVERSE REACTIONS

**CNS:** *asthenia, fatigue, peripheral neuropathy.*
**CV:** chest pain, phlebitis.
**GI:** *anorexia, constipation, diarrhea, nausea, stomatitis, vomiting.*
**Hematologic:** *anemia,* ***agranulocytosis, bone marrow suppression, granulocytopenia, thrombocytopenia,*** **LEUKOPENIA.**
**Hepatic:** hyperbilirubinemia.
**Musculoskeletal:** arthralgia, jaw pain, loss of deep tendon reflexes, myalgia.
**Respiratory:** dyspnea, shortness of breath.
**Skin:** *alopecia, injection pain or reaction,* rash.

## INTERACTIONS

**Drug-drug.** *Cisplatin:* May increase risk of bone marrow suppression when used with cisplatin. Monitor hematologic status closely.
*Cytochrome P-450 inhibitors:* May decrease metabolism of vinorelbine. Watch for increased adverse effects.
*Mitomycin:* May cause pulmonary reactions. Monitor respiratory status closely.
*Paclitaxel:* May increase risk of neuropathy. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

- May increase bilirubin level. May decrease hemoglobin level.
- May increase liver function test values. May decrease granulocyte, WBC, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with pretreatment granulocyte count below 1,000/mm$^3$ and in patients hypersensitive to the drug.
- Use with caution in patients whose bone marrow may have been compromised by previous exposure to radiation therapy or chemotherapy or whose bone marrow is still recovering from chemotherapy.
- Use with caution in patients with hepatic impairment.
- Safety and effectiveness in children haven't been established.

***Overdose S&S:*** Paralytic ileus, stomatitis, esophagitis, bone marrow aplasia, sepsis, paresis, death.

## NURSING CONSIDERATIONS

**Black Box Warning** Drug should be administered under the supervision of a physician experienced in the use of cancer chemotherapeutic agents.

**Black Box Warning** Check patient's granulocyte count before giving; make sure count is 1,000/mm$^3$ or higher before giving drug.

- If count is lower, withhold drug and notify prescriber. Granulocyte count nadir occurs between days 7 and 10.
- In patients with hepatic impairment, monitor liver enzyme levels.
- Patient may receive injections of WBC colony-stimulating factors to promote cell growth and decrease risk of infection.

***Alert:*** Monitor deep tendon reflexes; loss may represent cumulative toxicity.

- Monitor patient closely for hypersensitivity.
- As a guide to the effects of therapy, monitor patient's peripheral blood count and bone marrow.
- ***Look alike–sound alike:*** Don't confuse vinorelbine with vinblastine or vincristine.

## PATIENT TEACHING

- Advise patient to report any pain or burning at site of injection.
- Instruct patient not to take other drugs, including OTC preparations, until approved by prescriber.
- Tell patient to report evidence of infection (fever, sore throat, fatigue) and bleeding (easy bruising, nosebleeds, bleeding gums, tarry stools). Tell him to take temperature daily.

- Advise patient to report increased shortness of breath, cough, abdominal pain, or constipation.
- Caution women to avoid becoming pregnant during therapy.

## voriconazole

vor-ah-KON-ah-zole

Vfend

*Therapeutic class:* Antifungal
*Pharmacologic class:* Synthetic triazole
*Pregnancy risk category D*

### AVAILABLE FORMS

*Oral suspension:* 40 mg/ml (after reconstitution)
*Powder for injection:* 200 mg
*Tablets:* 50 mg, 200 mg

### INDICATIONS & DOSAGES

➤ **Esophageal candidiasis**

*Adults and children age 12 and older who weigh 40 kg (88 lb) or more:* 200 mg P.O. every 12 hours. Treat for a minimum of 14 days and for at least 7 days after symptoms resolve.

*Adults and children age 12 and older who weigh less than 40 kg:* 100 mg P.O. every 12 hours. Treat for a minimum of 14 days and for at least 7 days after symptoms resolve.

➤ **Invasive aspergillosis; serious infections caused by *Fusarium* species and *Scedosporium apiospermum* in patients intolerant of or refractory to other therapy**

*Adults and children age 12 and older:* Initially, 6 mg/kg I.V. every 12 hours for two doses; then maintenance dose of 4 mg/kg I.V. every 12 hours. If patient can't tolerate 4-mg dose, decrease to 3 mg/kg. Switch to P.O. form as tolerated, using the maintenance dosages shown here.

*Adults and children age 12 and older who weigh 40 kg or more:* 200 mg P.O. every 12 hours. May increase to 300 mg P.O. every 12 hours, if needed. If unable to tolerate the 300-mg dose, reduce dose in 50-mg decrements to a minimum of 200 mg every 12 hours.

*Adults and children age 12 and older who weigh less than 40 kg:* 100 mg P.O. every 12 hours. May increase to 150 mg P.O. every 12 hours, if needed. If unable to tolerate the 150-mg dose, reduce dose to 100 mg every 12 hours.

➤ **Candidemia in nonneutropenic patients; *Candida* infections of the kidney, abdomen, bladder wall, or wounds and disseminated skin infections**

*Adults and children age 12 and older:* Initially, 6 mg/kg I.V. every 12 hours for two doses, then 3 to 4 mg/kg I.V. every 12 hours for maintenance, depending on severity of the infection. If patient can't tolerate 4-mg dose, decrease to 3 mg/kg. Switch to P.O. form as tolerated, using the maintenance dosages shown here.

*Adults and children age 12 and older who weigh 40 kg or more:* 200 mg P.O. every 12 hours. May increase to 300 mg P.O. every 12 hours, if needed. If unable to tolerate the 300-mg dose, reduce dose in 50-mg decrements to a minimum of 200 mg every 12 hours.

*Adults and children age 12 and older who weigh less than 40 kg:* 100 mg P.O. every 12 hours. May increase to 150 mg P.O. every 12 hours, if needed. If unable to tolerate the 150-mg dose, reduce dose to 100 mg every 12 hours.

Treat patients with candidemia for at least 14 days after symptoms resolve or after the last positive culture result, whichever is longer.

***Adjust-a-dose:*** For patients in Child-Pugh classes A or B, decrease the maintenance dosage by 50%. In patients with a creatinine clearance of less than 50 ml/minute, use oral form instead of I.V. form to prevent accumulation of a component of the I.V. mixture. In patients also receiving phenytoin, increase maintenance dose of voriconazole to 5 mg/kg I.V. every 12 hours, or increase P.O. dose from 100 mg to 200 mg (in patients weighing 40 kg or less) or from 200 mg to 400 mg (in patients weighing more than 40 kg).

### ADMINISTRATION

**P.O.**

- Give tablets or oral suspension at least 1 hour before or 1 hour after a meal.

V

• For the oral suspension, use only the dispenser provided in the medication package.
• Don't mix oral suspension with other drugs or beverages.
• Discard unused portion of suspension after 14 days.

**I.V.**

▼ In patients with creatinine clearance less than 50 ml/minute, use I.V. form cautiously. Change to oral form is recommended.
▼ Reconstitute the powder with 19 ml of water for injection to obtain a volume of 20 ml of clear concentrate containing 10 mg/ml of drug. Discard the vial if a vacuum doesn't pull the diluent into the vial. Shake the vial until all the powder is dissolved. Use the reconstituted solution immediately.
▼ Further dilute the 10-mg/ml solution to 5 mg/ml or less. Follow the manufacturer's instructions for diluting.
▼ Infuse over 1 to 2 hours at 5 mg/ml or less and a maximum hourly rate of 3 mg/kg/hour.
▼ **Incompatibilities:** Blood products, electrolyte supplements, 4.2% sodium bicarbonate infusion.

## ACTION

Inhibits the cytochrome P-450–dependent synthesis of ergosterol, a vital component of fungal cell membranes.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.V. | Immediate | 1–2 hr | 12 hr |

*Half-life:* Depends on dose.

## ADVERSE REACTIONS

**CNS:** fever, headache, hallucinations, dizziness.
**CV:** tachycardia, hypertension, hypotension, vasodilatation.
**EENT:** *abnormal vision*, photophobia, chromatopsia, dry mouth.
**GI:** abdominal pain, nausea, vomiting, diarrhea.
**Hepatic:** cholestatic jaundice.
**Metabolic:** hypokalemia, hypomagnesemia.
**Skin:** rash, pruritus.
**Other:** chills, peripheral edema.

## INTERACTIONS

**Drug-drug.** *Benzodiazepines, calcium channel blockers, methadone, sulfonylureas, vinca alkaloids:* May increase levels of these drugs. Adjust dosages of these drugs; monitor patient for adverse reactions.
***Carbamazepine, long-acting barbiturates, rifabutin, rifampin,*** *ritonavir (high-dose therapy):* May decrease voriconazole level. Use together is contraindicated.
*Cyclosporine, tacrolimus:* May increase levels of these drugs. Adjust dosages; monitor levels.
***Efavirenz:*** May significantly decrease voriconazole levels while significantly increasing efavirenz levels. Use together is contraindicated.
*Ergot alkaloids (such as ergotamine), sirolimus:* May increase levels of these drugs. Use together is contraindicated.
*HIV protease inhibitors (amprenavir, nelfinavir, ritonavir, saquinavir), nonnucleoside reverse transcriptase inhibitors (delavirdine):* May increase levels of both drugs. Monitor patient for adverse reactions and toxicity.
*HMG-CoA reductase inhibitors (atorvastatin, fluvastatin, lovastatin, pravastatin, rosuvastatin, simvastatin):* May increase levels and adverse effects, including rhabdomyolysis, of these drugs. Monitor patient closely and reduce dose of HMG-CoA reductase inhibitor as needed.
*Omeprazole:* May increase omeprazole level. When initiating voriconazole therapy in patients already receiving omeprazole, reduce omeprazole dose by one-half.
*Oral contraceptives containing ethinyl estradiol and norethindrone:* May increase levels and adverse effects of these drugs. Monitor patient closely.
*Phenytoin:* May decrease voriconazole level and increase phenytoin level. Increase voriconazole maintenance dose; monitor phenytoin level.
*Pimozide, quinidine:* May increase levels of these drugs, leading to torsades de pointes and prolonged QT interval. Use together is contraindicated.
*Warfarin:* May significantly increase PT. Monitor PT and other anticoagulant test results.

**Drug-herb.** *St. John's wort:* May increase drug level. Discourage use together.
**Drug-lifestyle.** *Sun exposure:* May cause photosensitivity. Advise patient to avoid excessive sunlight exposure.

### EFFECTS ON LAB TEST RESULTS

- May increase alkaline phosphatase, AST, ALT, bilirubin, and creatinine levels. May decrease potassium and hemoglobin levels and hematocrit.
- May decrease platelet, WBC, and RBC counts.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components; in those with rare, hereditary galactose intolerance, Lapp lactase deficiency, or glucose-galactose malabsorption; and in those taking carbamazepine, efavirenz, ergot alkaloid, a long-acting barbiturate, pimozide, quinidine, rifabutin, rifampin, ritonavir, or sirolimus.
- Correct electrolyte disturbances before initiating therapy.
- Use cautiously in patients hypersensitive to other azoles.

***Overdose S&S:*** Photophobia.

### NURSING CONSIDERATIONS

- Infusion reactions, including flushing, fever, sweating, tachycardia, chest tightness, dyspnea, faintness, nausea, pruritus, and rash, may occur as soon as infusion starts. If reaction occurs, notify prescriber; infusion may need to be stopped.
- Monitor liver function test results at start of and during therapy. Monitor patients who develop abnormal liver function test results for more severe hepatic injury. If patient develops signs and symptoms of liver disease, drug may need to be stopped.
- If treatment lasts longer than 28 days, vision changes may occur.

### PATIENT TEACHING

- Tell patient to take oral form at least 1 hour before or 1 hour after a meal.
- Tell patient taking the oral suspension to only use the dispenser provided with the medication pack.
- Advise patient not to mix oral suspension with other drugs or beverages.
- Tell patient to discard any unused portion of suspension after 14 days.
- Advise patient to avoid driving or operating machinery while taking drug, especially at night, because vision changes, including blurring, photophobia, and changes in color perception may occur.
- Tell patient to avoid strong, direct sunlight during therapy.
- Advise patient to avoid becoming pregnant during therapy because of the risk of fetal harm.

**SAFETY ALERT!**

## warfarin sodium

WAR-far-in

Coumadin✐, Jantoven

*Therapeutic class:* Anticoagulant
*Pharmacologic class:* Coumarin derivative
*Pregnancy risk category X*

### AVAILABLE FORMS

*Powder for injection:* 2 mg/ml
*Tablets:* 1 mg, 2 mg, 2.5 mg, 3 mg, 4 mg, 5 mg, 6 mg, 7.5 mg, 10 mg

### INDICATIONS & DOSAGES

➤ **Pulmonary embolism, deep vein thrombosis, MI, rheumatic heart disease with heart valve damage, prosthetic heart valves, chronic atrial fibrillation**
*Adults:* 2 to 5 mg P.O. or I.V. daily for 2 to 4 days; then dosage based on daily PT and INR. Usual maintenance dosage is 2 to 10 mg P.O. or I.V. daily.

### ADMINISTRATION

**P.O.**

- Draw blood to establish baseline coagulation parameters before therapy. PT and INR determinations are essential for proper control. INR range for chronic atrial fibrillation is usually 2 to 3.
- Give drug at same time daily.

**I.V.**

▼ Draw blood to establish baseline coagulation parameters before therapy. PT and INR determinations are essential for

W

proper control. INR range for chronic atrial fibrillation is usually 2 to 3.
▼ I.V. form may be ordered in rare instances when oral therapy can't be given.
▼ Reconstitute powder with 2.7 ml sterile water, or as instructed in manufacturer guidelines.
▼ Give as a slow bolus injection over 1 to 2 minutes into a peripheral vein.
▼ Because onset of action is delayed, heparin sodium is often given during the first few days of treatment of embolic disease. Blood for PT and INR may be drawn at any time during continuous heparin infusion.
▼ **Incompatibilities:** Aminophylline, ammonium chloride, bretylium tosylate, ceftazidime, cimetidine, ciprofloxacin, dobutamine, esmolol, gentamicin, heparin sodium, labetalol, lactated Ringer's injection, metronidazole, promazine, Ringer's injection, vancomycin.

## ACTION

Inhibits vitamin K–dependent activation of clotting factors II, VII, IX, and X, formed in the liver.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Within 24 hr | 4 hr | 2–5 days |
| I.V. | Within 24 hr | <4 hr | 2–5 days |

*Half-life:* 20 to 60 hours.

## ADVERSE REACTIONS

**CNS:** *fever,* headache, asthenia, coma, dizziness, fatigue, lethargy, loss of consciousness, paresthesia, syncope.
**CV:** angina syndrome, hypotension, systemic cholesterol microembolization, vasculitis.
**GI:** abdominal pain, diarrhea, flatulence, bloating, nausea, vomiting, taste perversion.
**GU:** enhanced uric acid excretion, hematuria, excessive menstrual bleeding.
**Hematologic:** ***hemorrhage.***
**Hepatic:** ***hepatitis,*** jaundice, cholestatic hepatic injury.
**Skin:** dermatitis, urticaria, necrosis, alopecia, *rash.*
**Other:** hypersensitivity, allergic reactions, including ***anaphylactic reactions***.

## INTERACTIONS

**Drug-drug.** *Acetaminophen:* May increase bleeding with long-term therapy (more than 2 weeks) at high doses (more than 2 g/day) of acetaminophen. Monitor patient very carefully.
*Allopurinol,* ***amiodarone,*** ***anabolic steroids,*** *anticoagulants (argatroban, bivalirudin),* ***azole antifungals,*** *aspirin, beta blockers (atenolol, propranolol), cephalosporins, chloramphenicol, cimetidine,* ***danazol,*** *diazoxide, diflunisal, disulfiram, erythromycin, ethacrynic acid, felbamate,* ***fibric acids,*** ***fluoxymesterone,*** ***fluoroquinolones,*** *furosemide, glucagon, HMG-CoA reductase inhibitors (fluvastatin, lovastatin, simvastatin), heparin, influenza virus vaccine, isoniazid,* ***lansoprazole,*** *macrolide antibiotics (azithromycin, clarithromycin, erythromycin), meclofenamate, methimazole, methyldopa, methylphenidate,* ***methyltestosterone,*** ***metronidazole,*** ***nalidixic acid,*** *neomycin (oral),* ***NSAIDs,*** *omeprazole,* ***oxandrolone,*** *pentoxifylline, propafenone, propoxyphene, propylthiouracil, quinidine, quinolones (ciprofloxacin, levofloxacin, norfloxacin, ofloxacin),* ***salicylates,*** *selective COX-2 inhibitors (celecoxib, rofecoxib, valdecoxib), SSRIs,* ***sulfinpyrazone,*** *sulfamethoxazole and trimethoprim,* ***sulfonamides,*** *tamoxifen, tetracyclines, thiazides, thrombolytics,* ***thyroid drugs,*** *ticlopidine, tramadol, vitamin E, valproic acid, zafirlukast:* May increase anticoagulant effect. Monitor patient carefully for bleeding. Reduce anticoagulant dosage as directed.
*Aprepitant, ascorbic acid,* ***barbiturates,*** *bosentan, carbamazepine, clozapine, corticosteroids, corticotropin, cyclosporine, dicloxacillin, ethchlorvynol, griseofulvin, haloperidol, meprobamate, mercaptopurine, nafcillin, oral contraceptives containing estrogen, protease inhibitors (indinavir, ritonavir), raloxifene, ribavirin, rifampin, spironolactone, sucralfate, thiazide diuretics, trazodone, vitamin K:* May decrease PT and INR with reduced anticoagulant effect. Monitor PT and INR carefully. Increase warfarin dosage, as needed.
*Chloral hydrate, cyclophosphamide, phenytoin, propylthiouracil, ranitidine:* May increase or decrease PT and INR. Monitor PT and INR carefully.

*Cholestyramine:* May decrease response when given too closely together. Give 6 hours after oral anticoagulants.
*Sulfonylureas (oral antidiabetics):* May increase hypoglycemic response. Monitor glucose levels.
**Drug-herb.** *Agrimony, anise, arnica flower, asafoetida, bogbean, boldo, bromelain, buchu, capsicum, celery, chamomile, clove, dandelion, danshen, devil's claw, dong quai, fenugreek, feverfew, garlic, ginger,* ***ginkgo, ginseng,*** *horse chestnut, horseradish, licorice, meadowsweet, motherwort, onion, papain, parsley, passion flower, quassia, red clover, Reishi mushroom, rue, sweet clover, turmeric, white willow:* May increase risk of bleeding. Discourage use together.
*Angelica (dong quai):* May significantly prolong PT and INR. Discourage use together.
*Coenzyme Q10, ginseng, St. John's wort:* May reduce action of warfarin. Ask patient about use of herbal remedies, and advise caution.
*Green tea:* May decrease anticoagulant effect caused by vitamin K content of green tea. Advise patient to minimize variable consumption of green tea and other foods or nutritional supplements containing vitamin K.
**Drug-food.** ***Cranberry juice:*** May increase risk of severe bleeding. Discourage use together.
*Foods, multivitamins, and other enteral products containing vitamin K:* May impair anticoagulation. Tell patient to maintain consistent daily intake of foods containing vitamin K.
**Drug-lifestyle.** *Alcohol use:* May enhance anticoagulant effects. Tell patient to avoid large amounts of alcohol.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT and AST levels.
- May increase INR, PT, and PTT.
- May falsely decrease theophylline level.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with bleeding from the GI, GU, or respiratory tract; aneurysm; cerebrovascular hemorrhage; severe or malignant hypertension; severe renal or hepatic disease; subacute bacterial endocarditis, pericarditis, or pericardial effusion; or blood dyscrasias or hemorrhagic tendencies.
- Contraindicated during pregnancy, threatened abortion, eclampsia, or preeclampsia, and after recent surgery involving large open areas, eye, brain, or spinal cord; recent prostatectomy; major regional lumbar block anesthesia, spinal puncture, or diagnostic or therapeutic invasive procedures.
- Avoid using in patients with a history of warfarin-induced necrosis; in unsupervised patients with senility, alcoholism, or psychosis; or in situations in which there are inadequate laboratory facilities for coagulation testing.
- Use cautiously in patients with diverticulitis, colitis, mild or moderate hypertension, or mild or moderate hepatic or renal disease; with drainage tubes in any orifice; with regional or lumbar block anesthesia; with heparin-induced thrombocytopenia and deep venous thrombosis; or in conditions that increase risk of hemorrhage.
- Use cautiously in breast-feeding women.

***Overdose S&S:*** Blood in stools or urine, excessive bruising, persistent oozing from superficial injuries, excessive menstrual bleeding, melena, petechiae.

## NURSING CONSIDERATIONS

**Black Box Warning** Warfarin can cause major or fatal bleeding, which is more likely to occur during the starting period and with a higher dose. Regularly monitor INR in all patients. Consider more frequent INR monitoring in those at high risk for bleeding. ■

- Avoid all I.M. injections.
- Regularly inspect patient for bleeding gums, bruises on arms or legs, petechiae, nosebleeds, melena, tarry stools, hematuria, and hematemesis.
- Check for unexpected bleeding in breast-fed children of women who take this drug.
- Monitor patient for purple-toes syndrome, characterized by a dark purple or mottled color of the toes; may occur 3 to 10 weeks, or even later, after start of therapy.

***Alert:*** Withhold drug and call prescriber at once in the event of fever or rash (signs of severe adverse reactions).

- Effect can be neutralized by oral or parenteral vitamin K.
- Elderly patients and patients with renal or hepatic failure are especially sensitive to drug's effect.
- ***Look alike–sound alike:*** Don't confuse Coumadin with Avandia, Cardura, or Kemadrin.

## PATIENT TEACHING

- Stress importance of complying with prescribed dosage and follow-up appointments. Tell patient to carry a card that identifies his increased risk of bleeding.
- **Black Box Warning** Tell patient and family to watch for signs of bleeding or abnormal bruising and to call prescriber at once if they occur. ■
- Warn patient to avoid OTC products containing aspirin, other salicylates, or drugs that may interact with warfarin unless ordered by prescriber.
- Advise patient to consult with prescriber before initiating any herbal therapy; many herbs have anticoagulant, antiplatelet, or fibrinolytic properties.
- Tell patient to consult a prescriber before using miconazole vaginal cream or suppositories. Abnormal bleeding and bruising have occurred.
- Instruct woman to notify prescriber if menstruation is heavier than usual; she may need dosage adjustment.
- Tell patient to use electric razor when shaving and to use a soft toothbrush.
- Tell patient to read food labels. Food, nutritional supplements, and multivitamins that contain vitamin K may impair anticoagulation.
- Tell patient to eat a daily, consistent diet of food and drinks containing vitamin K, because eating varied amounts may alter anticoagulant effects.

# zafirlukast

zah-FUR-luh-kast

Accolate

*Therapeutic class:* Antiasthmatic
*Pharmacologic class:* Leukotriene-receptor antagonist
*Pregnancy risk category B*

## AVAILABLE FORMS

*Tablets:* 10 mg, 20 mg

## INDICATIONS & DOSAGES

➤ **Prevention and long-term treatment of asthma**

*Adults and children age 12 and older:* 20 mg P.O. b.i.d.
*Children ages 5 to 11:* 10 mg P.O. b.i.d.

## ADMINISTRATION

**P.O.**

- Give drug 1 hour before or 2 hours after meals.

## ACTION

Selectively competes for leukotriene-receptor sites, blocking inflammatory action.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 3 hr | Unknown |

*Half-life:* 10 hours.

## ADVERSE REACTIONS

**CNS:** *headache*, asthenia, dizziness, pain, fever.
**GI:** abdominal pain, diarrhea, dyspepsia, gastritis, nausea, vomiting.
**Musculoskeletal:** back pain, myalgia.
**Other:** accidental injury, infection.

## INTERACTIONS

**Drug-drug.** *Aspirin:* May increase zafirlukast level. Monitor patient for adverse effects.
*Erythromycin, theophylline:* May decrease zafirlukast level. Monitor patient for decreased effectiveness.
*Warfarin:* May increase PT. Monitor PT and INR, and adjust anticoagulant dosage.

**Drug-food.** *Food:* May reduce rate and extent of drug absorption. Advise patient to take drug 1 hour before or 2 hours after a meal.

### EFFECTS ON LAB TEST RESULTS
• May increase liver enzyme levels.

### CONTRAINDICATIONS & CAUTIONS
• Contraindicated in patients hypersensitive to drug.
• Use cautiously in elderly patients and those with hepatic impairment.
• Use in pregnant women only if clearly needed. Don't use in breast-feeding women.
⚠ ***Overdose S&S:*** Rash, upset stomach.

### NURSING CONSIDERATIONS
***Alert:*** Reducing oral corticosteroid dose has been followed in rare cases by eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or neuropathy, sometimes as Churg-Strauss syndrome.
• Drug isn't indicated to reverse bronchospasm in acute asthma attacks.
• Drug may cause behavior and mood changes. Monitor patient and consider discontinuing drug if neuropsychiatric symptoms develop.

### PATIENT TEACHING
• Tell patient that drug is used for long-term treatment of asthma and to keep taking it even if symptoms resolve.
• Advise patient to continue taking other antiasthmatics, as prescribed.
• Instruct patient to take drug 1 hour before or 2 hours after meals.
• Warn patient that drug may cause behavior and mood changes, and to report development of these symptoms to prescriber.
• Teach patient to report rare but serious signs and symptoms of hepatic dysfunction (right upper quadrant abdominal pain, nausea, fatigue, lethargy, pruritus, jaundice, flulike symptoms, anorexia).

**SAFETY ALERT!**

## zaleplon
ZAL-ah-plon

Sonata

*Therapeutic class:* Hypnotic
*Pharmacologic class:* Pyrazolopyrimidine
*Pregnancy risk category C*
*Controlled substance schedule IV*

### AVAILABLE FORMS
*Capsules:* 5 mg, 10 mg

### INDICATIONS & DOSAGES
➤ **Short-term treatment (7 to 10 days) of insomnia**
*Adults:* 10 mg P.O. daily at bedtime; may increase to 20 mg as needed. Low-weight adults may respond to 5-mg dose. Limit use to 7 to 10 days. Reevaluate patient if drug is used for more than 2 to 3 weeks.
***Adjust-a-dose:*** For elderly or debilitated patients, initially, 5 mg P.O. daily at bedtime; doses of more than 10 mg aren't recommended. For patients with mild to moderate hepatic impairment or those also taking cimetidine, 5 mg P.O. daily at bedtime.

### ADMINISTRATION
**P.O.**
• Don't give drug after a high-fat or heavy meal.

### ACTION
A hypnotic with chemical structure unrelated to benzodiazepines that interacts with the GABA-benzodiazepine receptor complex in the CNS. Modulation of this complex is thought to be responsible for sedative, anxiolytic, muscle relaxant, and anticonvulsant effects of benzodiazepines.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1 hr | 1 hr | 3–4 hr |

*Half-life:* 1 hour.

### ADVERSE REACTIONS
**CNS:** complex sleep-related behaviors, headache, amnesia, anxiety, asthenia, depersonalization, depression, difficulty

Z

concentrating, dizziness, fever, hallucinations, hypertonia, hypesthesia, malaise, migraine, nervousness, paresthesia, somnolence, tremor, vertigo.
**CV:** chest pain, peripheral edema.
**EENT:** abnormal vision, conjunctivitis, ear discomfort, epistaxis, eye discomfort, hyperacusis, smell alteration.
**GI:** abdominal pain, anorexia, colitis, constipation, dry mouth, dyspepsia, nausea.
**GU:** dysmenorrhea.
**Musculoskeletal:** arthritis, back pain, myalgia.
**Respiratory:** bronchitis.
**Skin:** photosensitivity reactions, pruritus, rash.
**Other:** ***anaphylaxis, angioedema.***

## INTERACTIONS

**Drug-drug.** *Carbamazepine, phenobarbital, phenytoin, rifampin, other CYP3A4 inducers:* May reduce zaleplon bioavailability and peak level by 80%. Consider using a different hypnotic.
*Cimetidine:* May increase zaleplon bioavailability and peak level by 85%. Use an initial zaleplon dose of 5 mg.
*CNS depressants (imipramine, thioridazine):* May cause additive CNS effects. Use together cautiously.
**Drug-food.** *High-fat foods, heavy meals:* May prolong absorption, delaying peak drug level by about 2 hours; may delay sleep onset. Advise patient to avoid taking with meals.
**Drug-lifestyle.** *Alcohol use:* May increase CNS effects. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients with severe hepatic impairment.
- Use cautiously in elderly, depressed, or debilitated patients, in breast-feeding women, and in patients with compromised respiratory function.

***Overdose S&S:*** Drowsiness, confusion, lethargy, ataxia, hypotension, respiratory depression, coma, death.

## NURSING CONSIDERATIONS

***Alert:*** Monitor patient closely. Anaphylaxis and angioedema may occur as early as the first dose.
- Because drug works rapidly, give immediately before bedtime or after patient has gone to bed and has had difficulty falling asleep.
- Closely monitor patients who have compromised respiratory function caused by illness or who are elderly or debilitated because they are more sensitive to respiratory depression.
- Start treatment only after carefully evaluating patient because sleep disturbances may be a symptom of an underlying physical or psychiatric disorder.
- Adverse reactions are usually dose-related. Consult prescriber about dose reduction if adverse reactions occur.

## PATIENT TEACHING

***Alert:*** Warn patient that drug may cause allergic reactions, facial swelling, and complex sleep-related behaviors, such as driving, eating, and making phone calls while asleep. Advise patient to report these adverse effects.
- Advise patient that drug works rapidly and should only be taken immediately before bedtime or after he has gone to bed and has had trouble falling asleep.
- Advise patient to take drug only if he will be able to sleep for at least 4 undisturbed hours.
- Caution patient that drowsiness, dizziness, light-headedness, and coordination problems occur most often within 1 hour after taking drug.
- Advise patient to avoid performing activities that require mental alertness until CNS adverse reactions are known.
- Advise patient to avoid alcohol use while taking drug and to notify prescriber before taking other prescription or OTC drugs.
- Tell patient not to take drug after a high-fat or heavy meal.
- Advise patient to report sleep problems that continue despite use of drug.
- Notify patient that dependence can occur and that drug is recommended for short-term use only.

- Warn patient not to abruptly stop drug because of the risk of withdrawal symptoms, including unpleasant feelings, stomach and muscle cramps, vomiting, sweating, shakiness, and seizures.
- Notify patient that insomnia may recur for a few nights after stopping drug but should resolve on its own.
- Warn patient that drug may cause changes in behavior and thinking, including outgoing or aggressive behavior, loss of personal identity, confusion, strange behavior, agitation, hallucinations, worsening of depression, or suicidal thoughts. Tell patient to notify prescriber immediately if these symptoms occur.

## zanamivir

zan-AM-ah-ver

Relenza

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Selective neuraminidase inhibitor
*Pregnancy risk category C*

### AVAILABLE FORMS

*Powder for inhalation:* 5 mg/blister

### INDICATIONS & DOSAGES

➤ **Uncomplicated acute illness caused by influenza virus A and B in patients who have had symptoms for no longer than 2 days; treatment of H1N1 influenza A**

*Adults and children age 7 and older:* 2 oral inhalations (one 5-mg blister per inhalation for total dose of 10 mg) b.i.d. using the dry-powder inhalation device for 5 days. Give two doses on first day of treatment, allowing at least 2 hours to elapse between doses. Give subsequent doses about 12 hours apart (in the morning and evening) at about the same time each day.

➤ **Prevention of influenza in a household setting; prevention of H1N1 influenza A**

*Adults and children age 5 and older:* 2 oral inhalations (one 5-mg blister per inhalation for total dose of 10 mg) once daily for 10 days.

➤ **Prevention of influenza in a community setting**

*Adults and adolescents ages 12 to 16:* 2 oral inhalations (one 5-mg blister per inhalation for total dose of 10 mg) once daily for 28 days.

### ADMINISTRATION

**Inhalational**

- Dry-powder inhaler should be kept level when patient loads and inhales drug. Patient should check inside the mouthpiece of the inhaler before each use to make sure it's free of foreign objects.
- Patient should exhale fully before putting the mouthpiece in his mouth; then, keeping the dry-powder inhaler level, he should close his lips around the mouthpiece and inhale steadily and deeply. Patient should hold his breath for a few seconds after inhaling to keep drug in lungs.

### ACTION

Inhibits neuraminidase on the surface of the influenza virus, altering virus particle aggregation and release.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| Inhalation | Unknown | 1–2 hr | Unknown |

*Half-life:* 2½ to 5¼ hours.

### ADVERSE REACTIONS

**CNS:** dizziness, headache.
**EENT:** ear, nose, and throat infections, nasal signs and symptoms, sinusitis.
**GI:** diarrhea, nausea, vomiting.
**Respiratory:** ***bronchospasm,*** bronchitis, cough.
**Skin:** serious rash.
**Other:** ***anaphylaxis.***

### INTERACTIONS

None significant.

### EFFECTS ON LAB TEST RESULTS

- May increase CK and liver enzyme levels.
- May decrease lymphocyte and neutrophil counts.

### CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components.

Z

● Not recommended for patients with severe or decompensated COPD, asthma, or other underlying respiratory disease.

### NURSING CONSIDERATIONS

● For a patient with underlying respiratory disease, have a fast-acting bronchodilator readily available and carefully monitor respiratory status. Patients using an inhaled bronchodilator for asthma simultaneously with this drug should use the bronchodilator first.
● Start drug within 48 hours of symptoms or as prevention after household contact, within 36 hours, or community outbreak, within 5 days.
● Drug doesn't replace annual influenza vaccine.
● Monitor patient for bronchospasm and decline in lung function. Stop drug in such situations.
● Closely monitor patients with influenza for signs and symptoms of abnormal behavior. If neuropsychiatric symptoms occur, risks and benefits of continuing treatment should be evaluated.

### PATIENT TEACHING

● Tell patient to carefully read the instructions for the dry-powder inhalation device.
● Teach parents how to give the drug to a child and to properly supervise use.
● Advise patient to keep the dry-powder inhaler level when loading and inhaling drug. Tell him to always check inside the mouthpiece of the dry-powder inhaler before each use to make sure it's free of foreign objects.
● Tell patient to exhale fully before putting the mouthpiece in his mouth; then, keeping the dry-powder inhaler level, to close his lips around the mouthpiece and inhale steadily and deeply. Advise patient to hold his breath for a few seconds after inhaling to help drug stay in the lungs.
● Instruct patient simultaneously using a bronchodilator with this drug to use the bronchodilator first. Tell patient to have a fast-acting bronchodilator readily available in case of wheezing.
***Alert:*** Advise all patients to immediately report worsening of respiratory symptoms, wheezing, shortness of breath, and bronchospasm.
● Advise patient that it's important to finish the entire treatment course.
● Tell patient that drug doesn't reduce the risk of transmitting the influenza virus to others.

## zidovudine (azidothymidine, AZT, Compound S)

zid-oh-VEW-den

Novo-AZT†, Retrovir

*Therapeutic class:* Antiretroviral
*Pharmacologic class:* Nucleoside reverse transcriptase inhibitor
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules:* 100 mg
*Injection:* 10 mg/ml
*Syrup:* 50 mg/5 ml
*Tablets:* 300 mg

### INDICATIONS & DOSAGES

➤ **HIV infection, with other antiretrovirals**

*Adults:* 600 mg daily P.O. in divided doses, with other antiretrovirals. If patient is unable to tolerate oral drug, give 1 mg/kg I.V. over 1 hour five to six times daily.
*Children ages 6 weeks to less than 18 years:* Do not exceed the recommended adult dose. For patients weighing 30 kg (66 lb) or more, give 300 mg P.O. b.i.d. or 200 mg P.O. t.i.d. For patients weighing 9 to less than 30 kg (20 to less than 66 lb), give 9 mg/kg P.O. b.i.d. or 6 mg/kg P.O. t.i.d. For patients weighing 4 to less than 9 kg (9 to less than 20 lb), give 12 mg/kg P.O. b.i.d. or 8 mg/kg P.O. t.i.d.

➤ **To prevent maternal-fetal transmission of HIV**

*Pregnant women at more than 14 weeks' gestation:* 100 mg P.O. five times daily until the start of labor. Then, 2 mg/kg I.V. over 1 hour followed by a continuous I.V. infusion of 1 mg/kg/hour until the umbilical cord is clamped.
*Neonates:* 2 mg/kg P.O. every 6 hours starting within 12 hours after birth and

continuing until 6 weeks old. Or, give 1.5 mg/kg via I.V. infusion over 30 minutes every 6 hours.

***Adjust-a-dose:*** In patients with significant anemia (hemoglobin level less than 7.5 g/dl or more than 25% below baseline) or significant neutropenia (granulocyte count less than 750 cells/$mm^3$ or more than 50% below baseline), interrupt therapy until evidence proves marrow has recovered. In patients receiving hemodialysis or peritoneal dialysis, give 100 mg P.O. or 1 mg/kg I.V. every 6 to 8 hours. For patients with mild to moderate hepatic dysfunction or liver cirrhosis, daily dose may need to be reduced.

## ADMINISTRATION

**P.O.**

- Drug should be taken on an empty stomach. To avoid esophageal irritation, patient should take drug with adequate fluids while sitting upright.
- Capsules shouldn't be kept in the kitchen, bathroom, or other places that may be damp or hot. Heat and moisture may cause the drug to break down and affect the intended results.

**I.V.**

- ▼ Give by this route only until oral drug can be tolerated.
- ▼ Remove the calculated dose from the vial; add to $D_5W$ to achieve a concentration no greater than 4 mg/ml.
- ▼ Infuse drug over 1 hour at a constant rate. Avoid rapid infusion or bolus injection.
- ▼ Protect undiluted vials from light.
- ▼ Give diluted solution within 24 hours if stored at room temperature or 48 hours if refrigerated.
- ▼ **Incompatibilities:** Biological or colloidal solutions, such as blood products or protein-containing solutions; meropenem.

## ACTION

Nucleoside reverse transcriptase inhibitor that inhibits replication of HIV by blocking DNA synthesis.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O., I.V. | Unknown | 30–90 min | Unknown |

*Half-life:* 1 hour.

## ADVERSE REACTIONS

**CNS:** *asthenia, dizziness, fever, headache, malaise,* ***seizures,*** insomnia, paresthesia, somnolence.
**GI:** *anorexia, nausea, vomiting,* ***pancreatitis,*** abdominal pain, constipation, diarrhea, dyspepsia, taste perversion.
**Hematologic:** ***agranulocytosis, severe bone marrow suppression, thrombocytopenia,*** anemia.
**Hepatic:** *hepatomegaly.*
**Metabolic:** ***lactic acidosis.***
**Musculoskeletal:** myalgia.
**Respiratory:** *cough,* wheezing.
**Skin:** *rash,* diaphoresis.

## INTERACTIONS

**Drug-drug.** *Acetaminophen:* May decrease bioavailability of zidovudine. Adjust zidovudine dosage, as needed.
*Atovaquone, fluconazole, methadone, probenecid, trimethoprim, valproic acid:* May increase bioavailability of zidovudine. May need to adjust dosage.
*Doxorubicin, ribavirin, stavudine:* May have antagonistic effects. Avoid using together.
*Ganciclovir, interferon alfa, other bone marrow suppressive or cytotoxic drugs:* May increase hematologic toxicity of zidovudine. Use together cautiously.
*Methadone:* May increase zidovudine level. Monitor patient for myalgia, fever, and rash.
*Phenytoin:* May alter phenytoin level and decrease zidovudine clearance by 30%. Monitor patient closely.

## EFFECTS ON LAB TEST RESULTS

- May increase ALT, AST, alkaline phosphatase, and LDH levels. May decrease hemoglobin level.
- May decrease granulocyte and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug.

**Black Box Warning** Use cautiously and with close monitoring in patients with advanced symptomatic HIV infection and in those with severe bone marrow depression. Use of this drug has been associated with

Z

hematologic toxicity, including neutropenia and severe anemia. ■
• Use cautiously in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and in those with renal insufficiency. Monitor renal and liver function tests.
**Black Box Warning** Prolonged use has been associated with myopathy. ■
***Overdose S&S:*** Fatigue, headache, vomiting, hematologic disturbances.

## NURSING CONSIDERATIONS

**Black Box Warning** Although rare, lactic acidosis without hypoxemia and severe hepatomegaly with steatosis may occur. Notify prescriber if patient develops unexplained tachypnea, dyspnea, or a decrease in bicarbonate level. Therapy may need to be suspended until lactic acidosis is ruled out. ■
• Monitor blood studies every 2 weeks to detect anemia or agranulocytosis. Patients may need reduced dosage or temporary stop to therapy.
• Drug may temporarily decrease morbidity and mortality in certain patients with AIDS.
***Alert:*** Drug is a potential teratogen. Follow safe-handling procedures when preparing, administering, or dispensing this drug.
• ***Look alike–sound alike:*** Don't confuse Retrovir with ritonavir.

## PATIENT TEACHING

• Instruct patient to take drug on an empty stomach. To avoid esophageal irritation, tell patient to take drug while sitting upright and with adequate fluids.
• Tell patient to take drug exactly as directed and not to share it with others.
• Remind patient to comply with the dosage schedule. Suggest ways to avoid missing doses, perhaps by using an alarm clock.
• Tell patient that dosages vary among patients and not to change his dosing instructions unless directed to do so by his prescriber.
• Warn patient not to take other drugs for AIDS unless prescriber has approved them.
• Advise patient that monotherapy isn't recommended and to discuss any questions with prescriber.
• Advise patient that blood transfusions may be needed during therapy because of drug-related anemia.
• Tell patient that his gums may bleed. Recommend good mouth care with a soft toothbrush.
• Advise pregnant, HIV-infected patient that drug therapy only reduces the risk of HIV transmission to her newborn. Long-term risks to infants are unknown.
• Tell patient not to keep capsules in the kitchen, bathroom, or other places that may be damp or hot. Heat and moisture may cause the drug to break down and affect the intended results.
• Advise health care worker considering prophylactic use after occupational exposure (such as needlestick injury) that drug's safety and effectiveness haven't been established.

# ziprasidone hydrochloride

zih-PRAZ-i-done

Geodon

# ziprasidone mesylate

Geoden

*Therapeutic class:* Antipsychotic
*Pharmacologic class:* Benzisoxazole derivative
*Pregnancy risk category C*

## AVAILABLE FORMS

*Capsules:* 20 mg, 40 mg, 60 mg, 80 mg
*I.M. injection:* 20 mg/ml single-dose vials (after reconstitution)

## INDICATIONS & DOSAGES

➤ **Symptomatic treatment of schizophrenia**

*Adults:* Initially, 20 mg b.i.d. with food. Dosages are highly individualized. Adjust dosage, if necessary, no more frequently than every 2 days; to allow for lowest possible doses, the interval should be several weeks to assess symptom response. Effective dosage range is usually 20 to 80 mg b.i.d. Maximum dosage is 100 mg b.i.d.

➤ **Rapid control of acute agitation in schizophrenic patients**
*Adults:* 10 to 20 mg I.M. as needed, up to a maximum dose of 40 mg daily. Doses of 10 mg may be given every 2 hours; doses of 20 mg may be given every 4 hours.
➤ **Acute bipolar mania, including manic and mixed episodes, with or without psychotic features; maintenance treatment of bipolar I disorder as an adjunct to lithium or valproate**
*Adults:* 40 mg P.O. b.i.d., with food, on day 1. Increase to 60 to 80 mg P.O. b.i.d., with food, on day 2; then adjust dosage based on patient response from 40 to 80 mg b.i.d., with food.

## ADMINISTRATION

**P.O.**
• Always give drug with food for optimal effect.
**I.M.**
• To prepare I.M. ziprasidone, add 1.2 ml of sterile water for injection to the vial and shake vigorously until drug is completely dissolved.
• Don't mix injection with other medicinal products or solvents other than sterile water for injection.
• Inspect parenteral drug products for particulate matter and discoloration before administration.
• The effects of giving I.M. for more than 3 consecutive days are unknown. If long-term therapy of drug is necessary, switch to P.O. as soon as possible.
• Store injection at controlled room temperature, 59° to 86° F (15° to 30° C) in dry form, and protect from light. After reconstituting, it may be stored away from light for up to 24 hours at 59° to 86° F (15° to 30° C) or up to 7 days refrigerated, 36° to 46° F (2° to 8° C).

## ACTION

May inhibit dopamine and serotonin-2 receptors, causing reduction in schizophrenia symptoms.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | 1–3 days | 6–8 hr | 12 hr |
| I.M. | Unknown | 1 hr | Unknown |

*Half-life:* 2¼ to 7 hours.

## ADVERSE REACTIONS

**CNS:** *dizziness, headache, somnolence,* ***suicide attempt,*** akathisia, dizziness, extrapyramidal symptoms, hypertonia, asthenia, dystonia (P.O.), anxiety, insomnia, agitation, cogwheel rigidity, paresthesia, personality disorder, psychosis, speech disorder (I.M.).
**CV:** ***bradycardia, QT interval prolongation,*** orthostatic hypotension, tachycardia, chest pain (P.O.), hypertension, vasodilation (I.M.).
**EENT:** rhinitis, abnormal vision (P.O.).
**GI:** *nausea,* constipation, dyspepsia, diarrhea, dry mouth, anorexia, abdominal pain, ***rectal hemorrhage,*** vomiting, dyspepsia, tooth disorder (I.M.).
**GU:** dysmenorrhea, priapism (I.M.).
**Metabolic:** hyperglycemia.
**Musculoskeletal:** myalgia (P.O.), back pain (I.M.).
**Respiratory:** cough (P.O.).
**Skin:** rash (P.O.), injection site pain, furunculosis, sweating (I.M.).
**Other:** flulike syndrome (I.M.).

## INTERACTIONS

**Drug-drug.** ***Antiarrhythmics (amiodarone, bretylium, disopyramide, dofetilide, procainamide, quinidine, sotalol), arsenic trioxide, dolasetron, droperidol, levomethadyl, mefloquine, pentamidine, phenothiazines, pimozide, quinolones, tacrolimus:*** May increase the risk of life-threatening arrhythmias. Use together is contraindicated.
*Antihypertensives:* May enhance hypotensive effects. Monitor blood pressure.
***Carbamazepine:*** May decrease ziprasidone level. May need to increase ziprasidone dose to achieve desired effect.
*Drugs that decrease potassium or magnesium such as diuretics:* May increase risk of arrhythmias. Monitor potassium and magnesium levels if using these drugs together.
*Itraconazole, ketoconazole:* May increase ziprasidone level. May need to reduce ziprasidone dose to achieve desired effect.

## EFFECTS ON LAB TEST RESULTS

None reported.

Z

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug and in those with recent MI or uncompensated heart failure.
- Contraindicated in those with history of prolonged QT interval or congenital long QT interval syndrome and in those taking other drugs that prolong QT interval, such as dofetilide, sotalol, quinidine, other class IA and III antiarrhythmics, mesoridazine, thioridazine, chlorpromazine, droperidol, pimozide, sparfloxacin, gatifloxacin, moxifloxacin, halofantrine, mefloquine, pentamidine, arsenic trioxide, levomethadyl acetate, dolasetron mesylate, probucol, and tacrolimus.

**P.O.**

- Contraindicated in patients with a history of QT interval prolongation or congenital QT syndrome and in those taking other drugs that prolong QT interval.
- Use cautiously in patients with history of seizures, bradycardia, hypokalemia, or hypomagnesemia; in those with acute diarrhea; and in those with conditions that may lower the seizure threshold (such as Alzheimer's dementia).
- Use cautiously in patients at risk for aspiration pneumonia.
- Don't use drug in breast-feeding women.

**I.M.**

- Contraindicated in schizophrenic patients already taking P.O. ziprasidone.
- Use cautiously in elderly and renally or hepatically impaired patients.

***Overdose S&S:*** Sedation, slurred speech, transitory hypertension, anxiety, extrapyramidal symptoms, somnolence, tremor.

## NURSING CONSIDERATIONS

**Black Box Warning** In elderly patients with dementia-related psychosis, drug isn't indicated for use because of increased risk of death from CV events or infection. ■

***Alert:*** Hyperglycemia may occur. Monitor patients with diabetes regularly. Patients with risk factors for diabetes should undergo fasting blood glucose testing at baseline and periodically. Monitor all patients for symptoms of hyperglycemia, including excessive hunger or thirst, frequent urination, and weakness. Hyperglycemia may be reversible when drug is stopped.

***Alert:*** Monitor patient for symptoms of metabolic syndrome (significant weight gain and increased body mass index, hypertension, hyperglycemia, hypercholesterolemia, and hypertriglyceridemia).

- Stop drug in patients with a QTc interval more than 500 msec.
- Dizziness, palpitations, or syncope may be symptoms of a life-threatening arrhythmia such as torsades de pointes. Provide CV evaluation and monitoring in patients who experience these symptoms.
- Don't give to patients with electrolyte disturbances, such as hypokalemia or hypomagnesemia, because these increase the risk of arrhythmia.
- Patient taking an antipsychotic may develop life-threatening neuroleptic malignant syndrome (hyperpyrexia, muscle rigidity, altered mental status, and autonomic instability) or tardive dyskinesia. Assess abnormal involuntary movement before starting therapy, at dosage changes, and periodically thereafter, to monitor patient for tardive dyskinesia.
- Monitor patient for abnormal body temperature regulation, especially if he is exercising strenuously, is exposed to extreme heat, is also receiving anticholinergics, or is subject to dehydration.
- Symptoms may not improve for 4 to 6 weeks.

## PATIENT TEACHING

- Tell patient to take drug with food.
- Tell patient to immediately report to prescriber signs or symptoms of dizziness, fainting, irregular heartbeat, or relevant heart problems.
- Advise patient to report any recent episodes of diarrhea, abnormal movements, sudden fever, muscle rigidity, or change in mental status.
- Advise patient that symptoms may not improve for 4 to 6 weeks.

## zoledronic acid

zoh-leh-DROH-nik

Reclast, Zometa

*Therapeutic class:* Antiosteoporotic
*Pharmacologic class:* Bisphosphonate
*Pregnancy risk category D*

### AVAILABLE FORMS

*Injection as ready to infuse solution (Reclast):* 5 mg/100 ml
*Injection (Zometa):* 4 mg/5-ml vial

### INDICATIONS & DOSAGES

➤ **Hypercalcemia caused by malignancy**

*Adults:* 4 mg (Zometa) by I.V. infusion over at least 15 minutes. If albumin-corrected calcium level doesn't return to normal, may repeat 4 mg. Let at least 7 days pass before retreatment to allow a full response to the first dose.

➤ **Multiple myeloma and bone metastases of solid tumors in conjunction with standard antineoplastics**

*Adults:* 4 mg (Zometa) I.V. infused over at least 15 minutes every 3 to 4 weeks. Treatment duration depends on type of cancer. Use for prostate cancer only after it has progressed after treatment with at least one course of hormonal therapy. Give patients an oral calcium supplement of 500 mg and a multiple vitamin containing 400 international units of vitamin D daily.

***Adjust-a-dose:*** For patients with creatinine clearance of 50 to 60 ml/minute, give 3.5 mg. If 40 to 49 ml/minute, give 3.3 mg. If 30 to 39 ml/minute, give 3 mg. For patients with normal baseline creatinine level but an increase of 0.5 mg/dl and in those with abnormal baseline creatinine level who have an increase of 1 mg/dl, withhold drug. Resume treatment only when creatinine level has returned to within 10% of baseline value. If creatinine clearance is less than 30 ml/minute, don't give drug.

➤ **Paget disease of bone (osteitis deformans)**

*Adults:* 5 mg (Reclast) by I.V. infusion over at least 15 minutes. Give through a vented infusion line. May repeat if relapse occurs. Patient also needs 1,500 mg elemental calcium and 800 international units vitamin D daily, especially during the 2 weeks after dosing.

➤ **Treatment of osteoporosis in men; to reduce the incidence of fractures in postmenopausal women with osteoporosis and a recent low-trauma hip fracture; to prevent osteoporosis in postmenopausal women; to treat and prevent glucocorticoid-induced osteoporosis in patients expected to be treated for at least 12 months**

*Adults:* 5 mg (Reclast) by I.V. infusion over no less than 15 minutes once a year.

***Adjust-a-dose:*** Treatment with Reclast in patients with severe renal impairment (creatinine clearance less than 35 ml/minute) isn't recommended. Monitor serum creatinine level before each dose.

### ADMINISTRATION

**I.V.**

**Zometa**

▼ For patient with creatinine clearance greater than 60 ml/minute, withdraw 5 ml to obtain 4 mg of drug and mix in 100 ml of normal saline solution or $D_5W$. For patient with creatinine clearance of 60 ml/minute or less, withdraw 4.4 ml for the 3.5-mg dose, 4.1 ml for the 3.3-mg dose, or 3.8 ml for the 3-mg dose.

▼ Give as I.V. infusion over at least 15 minutes.

▼ If drug not used immediately after reconstitution, refrigerate solution and give within 24 hours.

**Reclast**

▼ Reclast is infused over not less than 15 minutes given at a constant infusion rate. Give as a single I.V. solution through a separate vented infusion line.

▼ If refrigerated, allow the refrigerated solution to reach room temperature before administration.

▼ After opening, solution is stable for 24 hours at 36° to 46° F (2° to 8° C).

▼ **Incompatibilities:** Solutions containing calcium (such as lactated Ringer's solution) or other I.V. drugs.

### ACTION

Inhibits bone resorption, probably by inhibiting osteoclast activity and osteoclastic

Z

resorption of mineralized bone and cartilage. Decreases calcium release induced by the stimulatory factors produced by tumors.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| I.V. (Zometa) | Unknown | Unknown | 7–28 days |
| I.V. (Reclast) | Unknown | Unknown | Unknown |

*Half-life:* Alpha is 0.23 hours; beta is 1.75 hours for early distribution. Terminal half-life is 167 hours.

## ADVERSE REACTIONS

**CNS:** *headache,* anxiety, somnolence, *insomnia,* confusion, agitation, *depression, paresthesia, hypoesthesia, fatigue, weakness, dizziness, fever.*
**CV:** *hypotension, hypertension,* atrial fibrillation, *leg edema.*
**GI:** *nausea, constipation, diarrhea, abdominal pain, vomiting, anorexia,* dysphagia, *increased appetite.*
**GU:** ***increased creatinine level,*** *urinary infection, candidiasis.*
**Hematologic:** anemia, ***granulocytopenia, neutropenia, thrombocytopenia.***
**Metabolic:** *decreased calcium, phosphate, and* ***magnesium*** *levels; dehydration; weight decrease.*
**Musculoskeletal:** *skeletal pain, arthralgia, myalgia, back pain,* osteonecrosis of the jaw.
**Respiratory:** *dyspnea, cough,* pleural effusion.
**Skin:** alopecia, dermatitis, rash.
**Other:** **PROGRESSION OF CANCER,** *rigors,* infection, influenza.

## INTERACTIONS

**Drug-drug.** *Aminoglycosides , loop diuretics:* May have additive effects that lower calcium level. Use together cautiously, and monitor calcium level.
*Nephrotoxic drugs, such as NSAIDs:* Renal toxicity may be greater in patients with renal impairment. Use Reclast cautiously with other potentially nephrotoxic drugs. Monitor serum creatinine before each dose.
*Thalidomide:* May increase risk of renal dysfunction in patients with multiple myeloma. Use together cautiously.

## EFFECTS ON LAB TEST RESULTS

- May increase creatinine level.
- May decrease calcium, phosphorus, magnesium, potassium, and hemoglobin levels and hematocrit.
- May decrease RBC, WBC, and platelet counts.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug, other bisphosphonates, or any of its ingredients, in patients with hypercalcemia of malignancy whose creatinine level is more than 4.5 mg/dl, in patients with bone metastases and a creatinine level of more than 3 mg/dl, and in breast-feeding women.

***Alert:*** There may be an increased risk of fractures of the thigh in patients treated with biphosphonates.

- Reclast is contraindicated in patients with hypocalcemia. Patients must be adequately supplemented with calcium and vitamin D.
- Use cautiously in elderly patients and those with aspirin-sensitive asthma because other bisphosphonates have been linked to bronchoconstriction in aspirin-sensitive patients with asthma.

***Overdose S&S:*** Hypocalcemia, hypophosphatemia, hypomagnesemia.

## NURSING CONSIDERATIONS

- Reclast contains the same active ingredient found in Zometa, used for oncology indications. A patient being treated with Zometa shouldn't be treated with Reclast.
- Hydrate patient adequately before giving; urine output should be about 2 L daily.
- Each vial of Zometa contains 220 mg mannitol and 24 mg sodium citrate.

***Alert:*** Because of the risk of decreased renal function progressing to renal failure, don't exceed 4 mg as a single dose of Zometa and always infuse over at least 15 minutes.

- Monitor calcium, phosphate, magnesium, and creatinine levels carefully. Correct decreased calcium, phosphorus, and magnesium levels using I.V. calcium gluconate, potassium and sodium phosphate, and magnesium sulfate.
- Monitor renal function closely. Patients with renal impairment may be at a greater risk for adverse reactions.

***Alert:*** Patients, especially those who have cancer or poor oral hygiene or who are

receiving chemotherapy or corticosteroids, should have a dental exam with appropriate preventive dentistry before therapy.
• Osteonecrosis of the jaw has been reported rarely in postmenopausal osteoporosis patients treated with bisphosphonates, including zoledronic acid. All patients should have a routine oral exam before treatment and be monitored while on therapy.
• Severe incapacitating bone, joint, and muscle pain may occur. Withhold future doses of Reclast if severe symptoms occur. When drug is stopped, symptoms may resolve partially or completely.

### PATIENT TEACHING
• Review the use and administration of drug with patient and family.
• Instruct patient to report adverse effects promptly.
• Explain the importance of periodic laboratory tests to monitor therapy and renal function.
• If a woman becomes pregnant or is breast-feeding, advise her to alert prescriber.

## zolmitriptan
zohl-mah-TRIP-tan

Zomig, Zomig ZMT

*Therapeutic class:* Antimigraine
*Pharmacologic class:* Serotonin 5-$HT_1$ receptor agonist
*Pregnancy risk category C*

### AVAILABLE FORMS
*Nasal spray:* 5 mg
*Tablets (immediate-release):* 2.5 mg, 5 mg
*Tablets (oral disintegrating):* 2.5 mg, 5 mg

### INDICATIONS & DOSAGES
➤ **Acute migraine headaches**
*Adults:* Initially, 2.5 mg or less P.O. Break a 2.5-mg immediate-release tablet in half if a lower dose is needed. Increase to 5 mg per dosage, as needed. If using orally disintegrating tablets (ODTs), initially, 2.5 mg P.O. Or, 1 spray (5 mg) into nostril. If headache returns after first dose, give a second dose at least 2 hours after the first dose. Maximum dosage is 10 mg in 24 hours.
***Adjust-a-dose:*** In patients with hepatic disease, use doses less than 2.5 mg. Don't use ODTs because they shouldn't be broken in half, or nasal spray because 5 mg is the lowest deliverable dose.

### ADMINISTRATION
**P.O.**
• Give ODT immediately after opening.
• Don't break or crush ODT.
• ODT dissolves on tongue and is swallowed with saliva; fluid isn't needed.
**Intranasal**
• Don't test the spray before use.

### ACTION
May act as an agonist at serotonin receptors on extracerebral intracranial blood vessels, which constricts the affected vessels, inhibits neuropeptide release, and reduces pain transmission in the trigeminal pathways.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2 hr | 3 hr |
| Intranasal | 5 min | 3 hr | Unknown |

*Half-life:* 3 hours.

### ADVERSE REACTIONS
**CNS:** *dizziness,* somnolence, vertigo, hypesthesia, paresthesia, asthenia, pain.
**CV:** ***coronary artery vasospasm, transient myocardial ischemia, MI, ventricular tachycardia, ventricular fibrillation,*** palpitations, pain, tightness, pressure, or heaviness in chest.
**EENT:** *pain, tightness, or pressure in the neck, throat, or jaw.*
**GI:** dry mouth, dyspepsia, dysphagia, nausea.
**Musculoskeletal:** myalgia, myasthenia.
**Skin:** sweating.
**Other:** warm or cold sensations.

### INTERACTIONS
**Drug-drug.** *Cimetidine:* May double half-life of zolmitriptan. Monitor patient closely.
*Ergot-containing drugs, other triptans:* May cause additive effects. Avoid using within 24 hours of almotriptan.

Z

*Hormonal contraceptives, propranolol:* May increase zolmitriptan level. Monitor patient closely.
***MAO inhibitors:*** May increase zolmitriptan level. Avoid using within 2 weeks of MAO inhibitor.
*SSRIs:* May cause additive serotonin effects, resulting in weakness, hyperreflexia, or incoordination. Monitor patient closely if given together.

## EFFECTS ON LAB TEST RESULTS

- May increase glucose levels.

## CONTRAINDICATIONS & CAUTIONS

- Contraindicated in patients hypersensitive to drug or its components, pregnant or breast-feeding patients, and those with uncontrolled hypertension, hemiplegic or basilar migraine, ischemic heart disease (angina pectoris, history of MI or documented silent ischemia), symptoms of ischemic heart disease (coronary artery vasospasm, including Prinzmetal's variant angina), or other significant heart disease.
- Contraindicated within 24 hours of other triptans or drugs containing ergot or within 2 weeks of stopping MAO inhibitor.
- Use cautiously in patients with liver disease and in those who may be at risk for coronary artery disease (such as postmenopausal women or men older than age 40) or those with risk factors, such as hypertension, hypercholesterolemia, obesity, diabetes, smoking, or family history.

***Overdose S&S:*** Sedation.

## NURSING CONSIDERATIONS

- Drug isn't intended for preventing migraines or treating hemiplegic or basilar migraines.
- Safety of drug hasn't been established for cluster headaches.

***Alert:*** Combining drug with an SSRI or an SSNRI may cause serotonin syndrome. Signs and symptoms may include restlessness, hallucinations, loss of coordination, fast heartbeat, rapid changes in blood pressure, increased body temperature, overactive reflexes, nausea, vomiting, and diarrhea. Serotonin syndrome may be more likely to occur when starting or increasing the dose of drug, SSRI, or SSNRI.

## PATIENT TEACHING

- Tell patient that drug is intended to relieve, not prevent, signs and symptoms of migraine.
- Advise patient to take drug as prescribed and not to take a second dose unless instructed by prescriber. Tell patient if a second dose is indicated and permitted, he should take it 2 hours after first dose.
- Instruct patient to release the ODTs from the blister pack just before taking; tablet should dissolve on tongue.
- Advise patient not to break the ODTs in half.
- Advise patient to immediately report pain or tightness in the chest or throat, heart throbbing, rash, skin lumps, or swelling of the face, lips, or eyelids.
- Tell woman not to take drug if she is or may become pregnant.

**SAFETY ALERT!**

# zolpidem tartrate

ZOL-pih-dem

Ambien®, Ambien CR, Edluar, Zolpimist

*Therapeutic class:* Hypnotic
*Pharmacologic class:* Imidazopyridine
*Pregnancy risk category C*
*Controlled substance schedule IV*

## AVAILABLE FORMS

*Oral spray:* 5 mg/actuation
*Tablets:* 5 mg, 10 mg
*Tablets (extended-release):* 6.25 mg, 12.5 mg
*Tablets (S.L.):* 5 mg, 10 mg

## INDICATIONS & DOSAGES

➤ **Short-term management of insomnia**
*Adults:* 10 mg immediate-release or 12.5 mg extended-release P.O. immediately before bedtime.
***Adjust-a-dose:*** For elderly or debilitated patients and those with hepatic insufficiency, 5 mg P.O. immediately before bedtime. Or, 6.25 mg of extended-release form. Maximum daily dose is 10 mg immediate-release and 6.25 mg extended-release.

## ADMINISTRATION

**P.O.**

- For rapid sleep onset, drug should not be taken with or immediately after meals.
- Don't crush, break, or divide extended-release tablets.
- Place S.L. tablet under tongue to disintegrate. Patient shouldn't swallow tablet or take with water.
- Prime oral spray pump before first use or if the pump hasn't been used for 14 days.
- Pump spray directly over tongue. Have patient press down fully to make sure full dose is delivered.

## ACTION

Although drug interacts with one of three identified GABA-benzodiazepine receptor complexes, it isn't a benzodiazepine. It exhibits hypnotic activity and minimal muscle relaxant and anticonvulsant properties.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Rapid | 30–120 min | Unknown |

*Half-life:* 2½ hours.

## ADVERSE REACTIONS

**CNS:** *headache,* amnesia, change in dreams, complex sleep-related behaviors, daytime drowsiness, depression, dizziness, hangover, lethargy, light-headedness, nervousness, sleep disorder.
**CV:** palpitations.
**EENT:** pharyngitis, sinusitis.
**GI:** abdominal pain, constipation, diarrhea, dry mouth, dyspepsia, nausea, vomiting.
**Musculoskeletal:** arthralgia, myalgia.
**Skin:** rash.
**Other:** ***anaphylaxis, angioedema,*** back or chest pain, flulike syndrome, hypersensitivity reactions.

## INTERACTIONS

**Drug-drug.** *CNS depressants:* May cause excessive CNS depression. Use together cautiously.
*Rifampin:* May decrease effects of zolpidem. Avoid using together, if possible. Consider another hypnotic.
**Drug-lifestyle.** *Alcohol use:* May cause excessive CNS depression. Discourage use together.

## EFFECTS ON LAB TEST RESULTS

None reported.

## CONTRAINDICATIONS & CAUTIONS

- No known contraindications.
- Use cautiously in patients with compromised respiratory status.
- Complex behaviors such as "sleep driving" (driving while not fully awake after taking a sedative-hypnotic with subsequent amnesia of the event) have been reported. These can occur with therapeutic doses, although the use of alcohol and other CNS depressants appears to increase the risk. Strongly consider discontinuing drug if patient reports such an event.

***Overdose S&S:*** Impaired consciousness, somnolence, coma, CV or respiratory compromise, death.

## NURSING CONSIDERATIONS

***Alert:*** Anaphylaxis and angioedema may occur as early as the first dose. Monitor patient closely.

- Use drug only for short-term management of insomnia, usually 7 to 10 days.
- Use the smallest effective dose in all patients.
- Take precautions to prevent hoarding by patients who are depressed, suicidal, or drug-dependent, or who have a history of drug abuse.
- ***Look alike–sound alike:*** Don't confuse Ambien with Amen.

## PATIENT TEACHING

***Alert:*** Warn patient that drug may cause allergic reactions, facial swelling, and complex sleep-related behaviors, such as driving, eating, and making phone calls while asleep. Advise patient to report these adverse effects.

- For rapid sleep onset, instruct patient not to take drug with or immediately after meals.
- Instruct patient to take drug immediately before going to bed; onset of action is rapid.
- Tell patient to avoid alcohol use while taking drug.
- Tell patient to place the S.L. tablet under the tongue and allow the tablet to disintegrate. Tell the patient not to swallow, chew,

Z

break, or split the tablet, or take the tablet with water.
***Alert:*** Tell patient not to crush, chew, or divide the extended-release tablets.
• Instruct patient to prime the spray pump before first use or if the pump hasn't been used for 14 days.
• Tell patient to aim the spray directly over the tongue and press down fully to make sure the full dose is delivered.
• Caution patient to avoid performing activities that require mental alertness or physical coordination during therapy.

## zonisamide

zoh-NISS-a-mide

Zonegran

*Therapeutic class:* Anticonvulsant
*Pharmacologic class:* Sulfonamide
*Pregnancy risk category C*

### AVAILABLE FORMS

*Capsules:* 25 mg, 50 mg, 100 mg

### INDICATIONS & DOSAGES

➤ **Adjunct therapy for partial seizures in adults with epilepsy**

*Adults and children older than age 16:* Initially, 100 mg P.O. as a single daily dose for 2 weeks. Then, dosage may be increased to 200 mg daily for at least 2 weeks. Dosage can be increased to 300 mg and 400 mg P.O. daily, with the dose stable for at least 2 weeks to achieve steady state at each level. Doses can be given once or twice daily, except for the daily dose of 100 mg at start of therapy. Maximum recommended dose is 600 mg daily.
***Adjust-a-dose:*** For patients with renal or hepatic impairment, titrate dosages more slowly and monitor patients more frequently.

### ADMINISTRATION

**P.O.**
• Give drug without regard for food.
• Don't crush or open capsule.

### ACTION

May stabilize neuronal membranes and suppress neuronal hypersynchronization, which prevents seizures.

| Route | Onset | Peak | Duration |
|---|---|---|---|
| P.O. | Unknown | 2–6 hr | Unknown |

*Half-life:* 63 hours.

### ADVERSE REACTIONS

**CNS:** *dizziness, headache, somnolence,* ***seizures, status epilepticus,*** agitation or irritability, anxiety, asthenia, ataxia, confusion, depression, difficulties in concentration or memory, difficulties in verbal expression, fatigue, hyperesthesia, incoordination, insomnia, mental slowing, nervousness, paresthesia, schizophrenic or schizophreniform behavior, speech disorders, tremor.
**EENT:** amblyopia, diplopia, pharyngitis, rhinitis, taste perversion, tinnitus, nystagmus.
**GI:** *anorexia,* abdominal pain, constipation, diarrhea, dry mouth, dyspepsia, nausea, vomiting.
**GU:** kidney stones.
**Hematologic:** ecchymoses.
**Metabolic:** weight loss.
**Respiratory:** cough.
**Skin:** pruritus, rash.
**Other:** accidental injury, flulike syndrome.

### INTERACTIONS

**Drug-drug.** *Drugs that induce or inhibit CYP3A4:* May change zonisamide level; phenytoin, carbamazepine, phenobarbital, and valproate increase zonisamide clearance. Monitor patient closely.

### EFFECTS ON LAB TEST RESULTS

• May increase BUN and creatinine levels.

### CONTRAINDICATIONS & CAUTIONS

• Contraindicated in patients hypersensitive to drug or to sulfonamides.
• Contraindicated in those with glomerular filtration rate less than 50 ml/minute.
• Use cautiously in patients with renal and hepatic dysfunction or kidney stones.
• Use cautiously in patients with history of psychiatric symptoms.
• Use cautiously with other drugs that predispose patients to heat-related disorders, including but not limited to carbonic anhydrase inhibitors and drugs with anticholinergic activity.

• Safety and efficacy in children younger than age 16 haven't been established; children are at increased risk for oligohidrosis and hyperthermia caused by zonisamide.
***Overdose S&S:*** CNS symptoms, coma, bradycardia, hypotension, respiratory depression.

## NURSING CONSIDERATIONS

***Alert:*** Rarely, patients receiving sulfonamides have died because of severe reactions, such as Stevens-Johnson syndrome, fulminant hepatic necrosis, aplastic anemia, otherwise unexplained rashes, and agranulocytosis. If signs and symptoms of hypersensitivity or other serious reactions occur, stop drug immediately and notify prescriber.
***Alert:*** Closely monitor all patients taking or starting antiepileptic drugs for changes in behavior indicating worsening of suicidal thoughts or behavior or depression. Symptoms such as anxiety, agitation, hostility, mania, and hypomania may be precursors to emerging suicidality.
• If patient develops acute renal failure or a significant sustained increase in creatinine or BUN level, stop drug and notify prescriber.
• Drug can cause metabolic acidosis, especially in those with predisposing conditions or therapies. This risk is more frequent and severe in younger patients. Measure serum bicarbonate level before starting treatment and periodically during treatment, even in the absence of symptoms.
• Don't stop drug abruptly because this may cause increased seizures or status epilepticus; reduce dosage or stop drug gradually.
• Achieving steady-state levels may take 2 weeks.
• Monitor patient for signs and symptoms of hypersensitivity.
• Increase fluid intake and urine output to help prevent kidney stones, especially in patients with predisposing factors.
• Monitor renal function periodically.
• Monitor patient for cognitive and neuropsychiatric adverse reactions, including psychomotor slowing, difficulty with concentration, speech or language problems (especially word-finding difficulties), somnolence or fatigue, depression, and psychosis.

## PATIENT TEACHING

• Tell patient to take drug with or without food and not to bite or break capsule.
• Advise patient to call prescriber immediately if rash develops or seizures worsen.
• Tell patient to contact prescriber immediately if he develops sudden back or abdominal pain, pain when urinating, bloody or dark urine, fever, sore throat, mouth sores or easy bruising, decreased sweating, fever, depression, or speech or language problems.
• Tell patient to drink 6 to 8 glasses of water a day.
• Caution patient that this drug can cause drowsiness and not to drive or operate dangerous machinery until drug's effects are known.
• Advise patient not to stop taking drug without prescriber's approval.
• Instruct women of childbearing age to call prescriber if pregnant or breast-feeding or planning to become pregnant or breast-feed.
• Advise women of childbearing age to use contraceptives while taking drug.

# Appendices

## Pregnancy risk categories

The FDA has assigned a pregnancy risk category to each drug based on available clinical and preclinical information. The five categories (A, B, C, D, and X) reflect a drug's potential to cause birth defects. Although drugs should ideally be avoided during pregnancy, sometimes they're needed; this rating system permits rapid assessment of the risk-benefit ratio. Drugs in category A are generally considered safe to use in pregnancy; drugs in category X are generally contraindicated.

- A: Adequate studies in pregnant women have failed to show a risk to the fetus.
- B: Animal studies haven't shown a risk to the fetus, but controlled studies haven't been conducted in pregnant women; or animal studies have shown an adverse effect on the fetus, but adequate studies in pregnant women haven't shown a risk to the fetus.
- C: Animal studies have shown an adverse effect on the fetus, but adequate studies haven't been conducted in humans. The benefits from use in pregnant women may be acceptable despite potential risks.
- D: There is positive evidence of human fetal risk, but the potential benefits of use in pregnant women may be acceptable despite the risks (such as in a life-threatening situation or a serious disease for which safer drugs can't be used or are ineffective).
- X: Studies in animals or humans show fetal abnormalities, or adverse reaction reports indicate evidence of fetal risk. The risks involved clearly outweigh potential benefits.

## Controlled substance schedules

Drugs regulated under the jurisdiction of the Controlled Substances Act of 1970 are divided into the following groups or schedules:

- Schedule I (C-I): High abuse potential and no accepted medical use. Examples include heroin and LSD.
- Schedule II (C-II): High abuse potential with severe dependence liability. Examples include opioids, amphetamines, and some barbiturates.
- Schedule III (C-III): Less abuse potential than schedule II drugs and moderate dependence liability. Examples include nonbarbiturate sedatives, nonamphetamine stimulants, anabolic steroids, and limited amounts of certain opioids.
- Schedule IV (C-IV): Less abuse potential than schedule III drugs and limited dependence liability. Examples include some sedatives, anxiolytics, and nonopioid analgesics.
- Schedule V (C-V): Limited abuse potential. This category includes mainly small amounts of opioids, such as codeine, used as antitussives or antidiarrheals. Under federal law, limited quantities of certain C-V drugs may be purchased without a prescription directly from a pharmacist if allowed under specific state statutes. The purchaser must be at least age 18 and must furnish suitable identification. All such transactions must be recorded by the dispensing pharmacist.

# Quick guide to combination drugs

This guide lists trade names and generic ingredients of common combination drugs.

**222†:** aspirin, codeine phosphate, and caffeine citrate
**282 MEP†:** aspirin, codeine phosphate, caffeine citrate, and meprobamate
**292†:** aspirin, codeine phosphate, and caffeine citrate
**Accuretic:** quinapril and hydrochlorothiazide
**Aceta with Codeine:** acetaminophen and codeine phosphate
**Activella:** ethinyl estradiol and norethindrone acetate
**ACTOPlus MET:** pioglitazone hydrochloride and metformin hydrochloride
**ACTOPlus MET XR:** pioglitazone hydrochloride and metformin hydrochloride
**Adderall:** dextroamphetamine sulfate, dextroamphetamine saccharate, amphetamine aspartate, and amphetamine sulfate
**Advicor:** niacin and lovastatin
**Advil Cold and Sinus Caplets ◊:** pseudoephedrine hydrochloride and ibuprofen
**Aggrenox:** aspirin and dipyridamole
**AK-Poly-Bac ◊:** polymyxin B sulfate and bacitracin zinc
**Alavert Allergy & Sinus D-12 Hour ◊:** loratadine and pseudoephedrine sulfate
**Aldactazide:** spironolactone and hydrochlorothiazide
**Alka-Seltzer Gold ◊:** sodium bicarbonate, citric acid, and potassium bicarbonate
**Alka-Seltzer Original ◊:** aspirin, citric acid, and phenylalanine
**Allegra-D ◊:** fexofenadine hydrochloride and pseudoephedrine sulfate
**Allerest Maximum Strength Tablets ◊:** pseudoephedrine hydrochloride and chlorpheniramine maleate
**Aludrox ◊:** aluminum hydroxide and magnesium hydroxide
**Anexsia:** acetaminophen and hydrocodone bitartrate
**Angeliq:** drospirenone and estradiol
**Arthrotec:** diclofenac sodium and misoprostol
**Ascriptin ◊:** aspirin, magnesium hydroxide, aluminum hydroxide, and calcium carbonate
**Atacand HCT:** candesartan cilexetil and hydrochlorothiazide
**Atripla:** efavirenz, emtricitabine, and tenofovir disoproxil fumarate
**Avalide:** irbesartan and hydrocholorothiazide
**Avandamet:** rosiglitazone hydrochloride and metformin hydrochloride
**Avandaryl:** glimepiride and rosiglitazone hydrochloride
**AZOR:** amlodipine and olmesartan medoxomil
**Benicar HCT:** olmesartan medoxomil and hydrochlorothiazide
**BenzaClin:** clindamycin and benzoyl peroxide
**Benzamycin:** erythromycin and benzoyl peroxide
**Bicillin C-R:** penicillin G benzathine and procaine
**BiDil:** isosorbide dinitrate and hydralazine
**Blephamide Sterile Ophthalmic Ointment:** sulfacetamide sodium and prednisolone acetate
**Bronkaid Dual Action Tablets:** ephedrine sulfate and guaifenesin
**Caduet:** amlodipine and atorvastatin
**Cafergot:** ergotamine tartrate and caffeine
**Capital with Codeine:** acetaminophen and codeine phosphate
**Capozide:** captopril and hydrochlorothiazide
**Children's Advil Cold ◊:** pseudoephedrine and ibuprofen
**Chlor-Trimeton Allergy-D ◊:** chlorpheniramine maleate and pseudoephedrine sulfate
**Citracal + D ◊:** calcium with cholecalciferol
**Claritin-D:** loratadine and pseudoephedrine
**ClimaraPro:** estradiol and levonorgestrel
**Clorpres:** chlorthalidone and clonidine hydrochloride

**Co-Gesic:** acetaminophen and hydrocodone bitartrate
**Col-Probenecid:** colchicine and probenecid
**Combigan:** brimonidine tartrate and timolol maleate
**CombiPatch:** estradiol and norethindrone
**Combivent:** ipratropium bromide and albuterol
**Combivir ✔:** lamivudine and zidovudine
**Comvax:** *Haemophilus* b PRP, *Neisseria meningitidis* OMPC, and hepatitis B surface antigen
**Contac Severe Cold & Flu Caplets ♢:** acetaminophen, dextromethorphan hydrobromide, pseudoephedrine hydrochloride, and chlorpheniramine maleate
**Coricidin 'D' Cold, Flu, & Sinus ♢:** chlorpheniramine maleate, acetaminophen, and pseudoephedrine sulfate
**Coricidin HBP Cold & Flu ♢:** chlorpheniramine maleate and acetaminophen
**Cortisporin Ophthalmic Suspension:** polymyxin B sulfate, neomycin sulfate, and hydrocortisone
**Corzide:** nadolol and bendroflumethiazide
**Cyclomydril Ophthalmic:** cyclopentolate hydrochloride and phenylephrine hydrochloride
**DAPTACEL:** diphtheria toxoid, tetanus toxoid, and acellular pertussis vaccine adsorbed
**Decadron Phosphate with Xylocaine:** dexamethasone phosphate and lidocaine hydrochloride
**Deconamine ♢:** pseudoephedrine hydrochloride and chlorpheniramine maleate
**Dical-D ♢:** calcium (as phosphate tribasic) with cholecalciferol
**Di-Gel Advanced ♢:** magnesium hydroxide and calcium carbonate, and simethicone
**Diovan HCT ✔:** valsartan and hydrochlorothiazide
**Donnatal**: atropine sulfate, scopolamine hydrobromide, hyoscyamine sulfate, and phenobarbital
**Donnatal Elixir:** atropine sulfate, scopolamine hydrobromide, ethanol, hyoscyamine hydrobromide or sulfate, and phenobarbital
**Dristan Sinus Caplets ♢:** pseudoephedrine hydrochloride and ibuprofen
**Duac:** clindamycin and benzoyl peroxide
**Duetact:** pioglitazone and glimepiride
**Dyazide:** triamterene and hydrochlorothiazide
**Dyflex-G Tablets:** dyphylline and guaifenesin
**Dyline-GG Tablets:** dyphylline and guaifenesin
**Empirin with Codeine:** aspirin and codeine phosphate
**Endocet:** acetaminophen and oxycodone hydrochloride
**Entex PSE:** pseudoephedrine and guaifenesin
**Epiduo:** benzoyl peroxide and adapalene
**Epzicom:** abacavir and lamivudine
**Estratest:** esterified estrogens and methyltestosterone
**Excedrin ♢:** aspirin, acetaminophen, and caffeine
**Excedrin P.M. ♢:** acetaminophen and diphenhydramine
**Exforge:** amlodipine besylate and valsartan
**Exforge HCT:** amlodipine, valsartan, and hydrochlorothiazide
**Extra Strength Alka-Seltzer ♢:** aspirin, citric acid, and sodium bicarbonate
**Femhrt:** ethinyl estradiol and norethindrone acetate
**Ferro-Sequels ♢:** ferrous fumarate and docusate sodium
**Fioricet:** acetaminophen, butalbital, and caffeine
**Fioricet with Codeine:** acetaminophen, butalbital, caffeine, and codeine
**Fiorinal:** aspirin, butalbital, and caffeine
**Fiorinal with Codeine:** aspirin, butalbital, caffeine, and codeine
**Gaviscon Tablets:** aluminum hydroxide and magnesium trisilicate
**Gelusil Tablets ♢:** aluminum hydroxide, magnesium hydroxide, and simethicone
**Glucovance:** glyburide and metformin
**Haley's M-O ♢:** mineral oil and magnesium hydroxide
**Helidac:** bismuth subsalicylate, metronidazole, and tetracycline hydrochloride

**Hyzaar:** losartan and hydrochlorothiazide
**Inderide LA:** propranolol hydrochloride and hydrochlorothiazide
**Janumet:** sitagliptin and metformin hydrochloride
**Kaodene Nonnarcotic ◇:** kaolin and pectin in bismuth subsalicylate liquid
**Kapectolin ◇:** kaolin and pectin in suspension
**Librax:** chlordiazepoxide hydrochloride and methscopolamine nitrate
**Limbitrol:** chlordiazepoxide and amitriptyline
**Lopressor HCT:** metoprolol tartrate and hydrochlorothiazide
**Lorcet:** acetaminophen and hydrocodone bitartrate
**Lortab ✐:** acetaminophen and hydrocodone bitartrate
**Lotensin HCT:** benazepril and hydrochlorothiazide
**Lotrel:** amlodipine and benazepril hydrochloride
**Lotrisone:** clotrimazole and betamethasone dipropionate
**Maalox Suspension ◇:** aluminum hydroxide, magnesium hydroxide, and simethicone
**Maalox TC Suspension ◇:** aluminum hydroxide and magnesium hydroxide
**Magnaprin ◇:** aspirin, magnesium hydroxide, aluminum hydroxide, and calcium carbonate
**Maxitrol Ointment/Ophthalmic Suspension:** dexamethasone, neomycin sulfate, and polymyxin B sulfate
**Maxzide:** triamterene and hydrochlorothiazide
**Metaglip:** glipizide and metformin
**Metimyd Ophthalmic Ointment/Suspension:** sulfacetamide sodium and prednisolone acetate
**Micardis HCT:** telmisartan and hydrochlorothiazide
**Midrin:** isometheptene mucate, dichloralphenazone, and acetaminophen
**Minizide:** prazosin and polythiazide
**Monopril HCT:** fosinopril sodium and hydrochlorothiazide
**Motrin Sinus Headache Tablets:** pseudoephedrine hydrochloride and ibuprofen
**Murocoll 2:** scopolamine hydrobromide and phenylephrine hydrochloride
**Mycolog-II:** triamcinolone acetonide and nystatin
**Mylanta ◇:** aluminum hydroxide, magnesium hydroxide, and simethicone
**Neosporin G.U. Irrigant:** neomycin sulfate and polymyxin B sulfate
**Neosporin Ophthalmic Ointment:** polymyxin B sulfate, neomycin sulfate, and bacitracin zinc
**Neosporin Ophthalmic Solution:** polymyxin B sulfate, neomycin sulfate, and gramicidin
**Neosporin Plus Pain Relief Ointment ◇:** polymyxin B sulfate, bacitracin zinc, and neomycin sulfate
**Neutra-phos ◇:** phosphorus, sodium, potassium
**Norco:** acetaminophen and hydrocodone bitartrate
**Norgesic:** orphenadrine citrate, aspirin, and caffeine
**Novo-gesic C8†:** acetaminophen, codeine phosphate, and caffeine
**Opcon-A Ophthalmic Solution ◇:** naphazoline hydrochloride and pheniramine maleate
**Ornex No Drowsiness Caplets ◇:** acetaminophen and pseudoephedrine hydrochloride
**Pepcid Complete ◇:** calcium carbonate, magnesium hydroxide, and famotidine
**Percocet:** acetaminophen and oxycodone hydrochloride
**Percodan:** aspirin, oxycodone hydrochloride, and oxycodone terephthalate
**Polysporin Ophthalmic Ointment:** polymyxin B sulfate and bacitracin zinc
**Polytrim Ophthalmic:** trimethoprim sulfate and polymyxin B sulfate
**Posture-D ◇:** calcium (as phosphate tribasic) with cholecalciferol
**PrandiMet:** repaglinide and metformin hydrochloride
**Pred-G S.O.P.:** prednisolone acetate and gentamicin sulfate equivalent to gentamicin base
**Prefest:** estradiol and norgestimate
**Premphase:** conjugated estrogens and medroxyprogesterone
**Prempro:** conjugated estrogen and medroxyprogesterone

**Prevpac:** lansoprazole, amoxicillin, and clarithromycin
**Prinzide:** lisinopril and hydrochlorothiazide
**Prosed/DS Tablets:** methenamine, phenyl salicylate, methylene blue, benzoic acid, atropine sulfate, and hyoscyamine sulfate
**PYLERA:** bismuth subcitrate potassium, metronidazole, and tetracycline hydrochloride
**Pyridium Plus:** phenazopyridine, butabarbital, and hyoscyamine
**Quinaretic:** quinapril hydrochloride and hydrochlorothiazide
**Reprexain:** hydrocodone bitartrate and ibuprofen
**Rifamate:** isoniazid and rifampin
**Rifater:** isoniazid, rifampin, and pyrazinamide
**Riopan ◇:** magaldrate and simethicone
**Roxicet:** acetaminophen and oxycodone hydrochloride
**Roxilox:** acetaminophen and oxycodone hydrochloride
**Semprex-D:** acrivastine and pseudoephedrine hydrochloride
**Senokot-S ◇:** docusate sodium and sennosides
**Simcor:** niacin and simvastatin
**Sinus-Relief ◇:** acetaminophen and pseudoephedrine hydrochloride
**Sinutab Maximum Strength Without Drowsiness ◇:** acetaminophen and pseudoephedrine hydrochloride
**Soma Compound:** carisoprodol and aspirin
**Soma Compound with Codeine:** carisoprodol, aspirin, and codeine phosphate
**Suboxone:** buprenorphine and naloxone
**Symbicort:** budesonide and formoterol fumarate dihydrate
**Symbyax:** olanzapine and fluoxetine
**Tarka:** trandolapril and verapamil
**Tekturna HCT:** aliskiren hemifumarate and hydrochlorthiazide
**Tenoretic:** atenolol and chlorthalidone
**Terak with Polymyxin B Sulfate Ophthalmic Ointment:** polymyxin B sulfate and oxytetracycline hydrochloride
**Teveten HCT:** eprosartan and hydrochlorothiazide
**Titralac Plus ◇:** calcium carbonate and simethicone
**TobraDex:** dexamethasone and tobramycin
**Treximet:** sumatriptan and naproxen sodium
**Triaminic Cold & Allergy ◇:** pseudoephedrine hydrochloride and chlorpheniramine maleate
**TriHIBIT:** *Haemophilus* b conjugated to inactivated tetanus toxoid diphtheria toxoid, tetanus toxoid, and acellular pertussis vaccine adsorbed
**Trizivir:** abacavir sulfate, zidovudine, and lamivudine
**Truvada:** emtricitabine and tenofovir
**Tussionex Pennkinetic:** chlorpheniramine polistirex and hydrocodone polistirex.
**Twinrix:** inactivated hepatitis A and recombinant HBsAg protein
**Tylenol PM Extra Strength ◇:** acetaminophen and diphenhydramine
**Tylenol with codeine:** acetaminophen and codeine phosphate
**Tylox:** acetaminophen and oxycodone hydrochloride
**Ultracet ✒:** acetaminophen and tramadol hydrochloride
**Uniretic:** moexipril hydrochloride and hydrochlorothiazide
**Urimax Tablets:** methenamine, sodium biphosphate, phenyl salicylate, methylene blue, and hyoscyamine sulfate
**Vanquish ◇:** aspirin, acetaminophen, caffeine, aluminum hydroxide, and magnesium hydroxide
**Vaseretic:** enalapril maleate and hydrochlorothiazide
**Vasocidin Ophthalmic Solution:** sulfacetamide sodium and prednisolone phosphate
**Vicodin ✒:** acetaminophen and hydrocodone bitartrate
**Vicoprofen:** hydrocodone bitartrate and ibuprofen
**Vytorin ✒:** ezetimibe and simvastatin
**Zestoretic:** lisinopril and hydrochlorothiazide
**Ziac:** bisoprolol fumarate and hydrochlorothiazide

**Zincfrin ♢:** phenylephrine hydrochloride and zinc sulfate

**Zydone:** acetaminophen and hydrocodone bitartrate

**Zyrtec-D 12-hour Extended-Release Tablets:** cetirizine hydrochloride and pseudoephedrine hydrochloride

## AMPHETAMINES

### Adderall
### Adderall XR

*Controlled Substance Schedule II*

#### GENERIC COMPONENTS

**Tablets**

*5 mg:* 1.25 mg dextroamphetamine sulfate, 1.25 mg dextroamphetamine saccharate, and 1.25 mg amphetamine aspartate, and 1.25 mg amphetamine sulfate

*7.5 mg:* 1.875 mg dextroamphetamine sulfate, 1.875 mg dextroamphetamine saccharate, 1.875 mg amphetamine aspartate, and 1.875 mg amphetamine sulfate

*10 mg:* 2.5 mg dextroamphetamine sulfate, 2.5 mg dextroamphetamine saccharate, 2.5 mg amphetamine aspartate, and 2.5 mg amphetamine sulfate

*12.5 mg:* 3.125 mg dextroamphetamine sulfate, 3.125 mg dextroamphetamine saccharate, 3.125 mg amphetamine aspartate, and 3.125 mg amphetamine sulfate

*15 mg:* 3.75 mg dextroamphetamine sulfate, 3.75 mg dextroamphetamine saccharate, 3.75 mg amphetamine aspartate, and 3.75 mg amphetamine sulfate

*20 mg:* 5 mg dextroamphetamine sulfate, 5 mg dextroamphetamine saccharate, 5 mg amphetamine aspartate, and 5 mg amphetamine sulfate

*30 mg:* 7.5 mg dextroamphetamine sulfate, 7.5 mg dextroamphetamine saccharate, 7.5 mg amphetamine aspartate, and 7.5 mg amphetamine sulfate

**Capsules (extended-release)**

*5 mg:* 1.25 mg dextroamphetamine sulfate, 1.25 mg dextroamphetamine saccharate, 1.25 mg amphetamine aspartate, and 1.25 mg amphetamine sulfate

*10 mg:* 2.5 mg dextroamphetamine sulfate, 2.5 mg dextroamphetamine saccharate, 2.5 mg amphetamine aspartate, and 2.5 mg amphetamine sulfate

*15 mg:* 3.75 mg dextroamphetamine sulfate, 3.75 mg dextroamphetamine saccharate, 3.75 mg amphetamine aspartate, and 3.75 mg amphetamine sulfate

*20 mg:* 5 mg dextroamphetamine sulfate, 5 mg dextroamphetamine saccharate, 5 mg amphetamine aspartate, and 5 mg amphetamine sulfate

*25 mg:* 6.25 mg dextroamphetamine sulfate, 6.25 mg dextroamphetamine saccharate, 6.25 mg amphetamine aspartate, and 6.25 mg amphetamine sulfate

*30 mg:* 7.5 mg dextroamphetamine sulfate, 7.5 mg dextroamphetamine saccharate, 7.5 mg amphetamine aspartate, and 7.5 mg amphetamine sulfate

#### DOSAGES

**Narcolepsy**

*Adults and children age 12 and older:* Initially, 10 mg immediate-release tablet daily. Increase by 10 mg weekly to maximum dose of 60 mg in 2 or 3 divided doses every 4 to 6 hours.

*Children ages 6 to 12:* Initially, 5 mg immediate-release tablet P.O. daily. Increase by 5 mg at weekly intervals to maximum dose of 60 mg in divided doses.

**Attention deficit hyperactivity disorder**

*Adults:* Initially, 5 mg P.O. once or twice daily. May increase in 5-mg increments at weekly intervals. Maximum dose is 40 mg/day. Or, 10 mg extended-release capsule P.O. once daily in a.m. May increase by 10 mg at weekly intervals. Maximum dose is 30 mg/day.

*Adolescents ages 13 to 17:* Initially, 10 mg extended-release capsule P.O. daily. Increase after 1 week to 20 mg daily if needed.

*Children age 6 and older:* Initially, 5 mg immediate-release tablet P.O. daily or b.i.d. Increase by 5 mg at weekly intervals until optimal response. Dosage should rarely exceed 40 mg.

*Children ages 6 to 12:* Give 10 mg extended-release capsule P.O. daily in a.m. Increase by 5 to 10 mg in weekly intervals to a maximum dose of 30 mg.

*Children ages 3 to 5:* Initially, 2.5 mg immediate-release tablet P.O. daily. Increase by 2.5 mg at weekly intervals until optimal response. Divide total daily dose into 2 or 3 doses and give 4 to 6 hours apart.

## ANALGESICS

### Anexsia 5/500
### Co-Gesic
### Lorcet HD
### Panacet 5/500
### Vicodin 🖋

*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
500 mg acetaminophen and 5 mg hydrocodone bitartrate

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 to 2 tablets every 4 to 6 hours. Maximum dosage, 8 tablets in 24 hours.

### Anexsia 7.5/325
### Norco 7.5/325

*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
325 mg acetaminophen and 7.5 mg hydrocodone bitartrate

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 to 2 tablets every 4 to 6 hours. Maximum dosage, 12 tablets in 24 hours.

### Anexsia 10/660
### Vicodin HP

*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
660 mg acetaminophen and 10 mg hydrocodone bitartrate

**DOSAGES**
**Arthralgia, bone pain, dental pain, headache, migraine, moderate pain**
*Adults:* 1 tablet every 4 to 6 hours. Maximum dosage, 6 tablets in 24 hours.

### Capital with Codeine
### Tylenol with Codeine Elixir

*Controlled Substance Schedule V*

**GENERIC COMPONENTS**
120 mg acetaminophen and 12 mg codeine phosphate/5 ml

**DOSAGES**
**Mild to moderate pain**
*Adults and children 12 years and older:* 15 ml every 4 hours as needed.

### Endocet 5/325
### Percocet 5/325
### Roxicet

*Controlled Substance Schedule II*

**GENERIC COMPONENTS**
325 mg acetaminophen and 5 mg oxycodone hydrochloride

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 tablet every 6 hours. Maximum dosage, 12 tablets in 24 hours.

### Endocet 7.5/325
### Percocet 7.5/325

*Controlled Substance Schedule II*

**GENERIC COMPONENTS**
325 mg acetaminophen and 7.5 mg oxycodone hydrochloride

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 tablet every 6 hours. Maximum dosage, 8 tablets in 24 hours.

## Endocet 7.5/500
## Percocet 7.5/500
*Controlled Substance Schedule II*

**GENERIC COMPONENTS**
500 mg acetaminophen and 7.5 mg oxycodone hydrochloride

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 tablet every 6 hours. Maximum dosage, 8 tablets in 24 hours.

## Endocet 10/325
## Percocet 10/325
*Controlled Substance Schedule II*

**GENERIC COMPONENTS**
325 mg acetaminophen and 10 mg oxycodone hydrochloride

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 tablet every 6 hours. Maximum dosage, 6 tablets in 24 hours.

## Fioricet with Codeine
*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
325 mg acetaminophen, 50 mg butalbital, 40 mg caffeine, and 30 mg codeine phosphate

**DOSAGES**
**Headache, mild to moderate pain**
*Adults:* 1 to 2 capsules every 4 hours. Maximum dosage, 6 capsules in 24 hours.

## Fiorinal with Codeine
*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
325 mg aspirin, 50 mg butalbital, 40 mg caffeine, and 30 mg codeine phosphate

**DOSAGES**
**Headache, mild to moderate pain**
*Adults:* 1 to 2 tablets or capsules every 4 hours. Maximum dosage, 6 tablets or capsules in 24 hours.

## Lorcet Plus
*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
650 mg acetaminophen and 7.5 mg hydrocodone bitartrate

**DOSAGES**
**Arthralgia, bone pain, dental pain, headache, migraine, moderate pain**
*Adults:* 1 to 2 tablets every 4 hours. Maximum dosage, 6 tablets in 24 hours.

## Lortab 5/500 ✐
*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
500 mg acetaminophen and 5 mg hydrocodone bitartrate

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 to 2 tablets every 4 to 6 hours. Maximum dosage, 8 tablets in 24 hours.

## Lortab 7.5/500
*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
500 mg acetaminophen and 7.5 mg hydrocodone bitartrate

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 tablet every 4 to 6 hours. Maximum dosage, 8 tablets in 24 hours.

## Lortab 10/500
*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
500 mg acetaminophen and 10 mg hydrocodone bitartrate

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 tablet every 4 to 6 hours. Maximum dosage, 6 tablets in 24 hours.

## Lortab Elixir
*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
167 mg acetaminophen and 2.5 mg/5 ml hydrocodone bitartrate

**DOSAGES**
**Moderately severe pain**
*Adults:* 15 ml every 4 to 6 hours. Maximum dosage, 90 ml/day.

## Norco 5/325
*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
325 mg acetaminophen and 5 mg hydrocodone bitartrate

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 to 2 tablets every 4 to 6 hours. Maximum dosage, 12 tablets in 24 hours.

## Norco 325/10
*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
325 mg acetaminophen and 10 mg hydrocodone bitartrate

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 tablet every 4 to 6 hours. Maximum dosage, 6 tablets in 24 hours.

## Percocet 2.5/325
*Controlled Substance Schedule II*

**GENERIC COMPONENTS**
325 mg acetaminophen and 2.5 mg oxycodone hydrochloride

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 to 2 tablets every 4 to 6 hours. Maximum dosage, 12 tablets in 24 hours.

## Percocet 10/650
*Controlled Substance Schedule II*

**GENERIC COMPONENTS**
650 mg acetaminophen and 10 mg oxycodone hydrochloride

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 tablet every 4 hours. Maximum dosage, 6 tablets in 24 hours.

## Percodan
*Controlled Substance Schedule II*

**GENERIC COMPONENTS**
325 mg aspirin, 4.5 mg oxycodone hydrochloride, and 0.38 mg oxycodone terephthalate

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 tablet every 6 hours. Maximum dosage, 12 tablets in 24 hours.

## Roxicet 5/500
## Roxilox
## Tylox
*Controlled Substance Schedule II*

**GENERIC COMPONENTS**
500 mg acetaminophen and 5 mg oxycodone hydrochloride

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 tablet every 6 hours.

## Roxicet Oral Solution
*Controlled Substance Schedule II*

**GENERIC COMPONENTS**
325 mg acetaminophen and 5 mg/5 ml oxycodone hydrochloride

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 5 ml every 6 hours. Maximum dosage, 60 ml in 24 hours.

## Talacen
*Controlled Substance Schedule IV*

**GENERIC COMPONENTS**
650 mg acetaminophen and 25 mg pentazocine hydrochloride

**DOSAGES**
**Mild to moderate pain**
*Adults:* 1 tablet every 4 hours. Maximum dosage, 6 tablets in 24 hours.

## Talwin NX
*Controlled Substance Schedule IV*

**GENERIC COMPONENTS**
0.5 mg naloxone and 50 mg pentazocine hydrochloride

**DOSAGES**
**Moderate to severe pain**
*Adults:* 1 to 2 tablets every 3 to 4 hours. Maximum dosage, 12 tablets daily.

## Tylenol with Codeine No. 2
*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
300 mg acetaminophen and 15 mg codeine phosphate

**DOSAGES**
**Fever, mild to moderate pain**
*Adults:* 1 to 2 tablets every 4 hours. Maximum dosage, 12 tablets in 24 hours.

## Tylenol with Codeine No. 3 ✐
*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
300 mg acetaminophen and 30 mg codeine phosphate

**DOSAGES**
**Fever, mild to moderate pain**
*Adults:* 1 to 2 tablets every 4 hours. Maximum dosage, 12 tablets in 24 hours.

## Tylenol with Codeine No. 4
*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
300 mg acetaminophen and 60 mg codeine phosphate

**DOSAGES**
**Fever, mild to moderate pain**
*Adults:* 1 tablet every 4 hours. Maximum dosage, 6 tablets in 24 hours.

## Tylox 5/500
*Controlled Substance Schedule II*

**GENERIC COMPONENTS**
500 mg acetaminophen and 5 mg oxycodone hydrochloride

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 capsule every 6 hours. Maximum dosage, 8 capsules in 24 hours.

## Vicodin ES ✐
*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
750 mg acetaminophen and 7.5 mg hydrocodone bitartrate

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 tablet every 4 to 6 hours. Maximum dosage, 5 tablets in 24 hours.

***NEW DRUG***

## Vimovo

**GENERIC COMPONENTS**
**Tablets**
375 mg naproxen and 20 mg esomeprazole
500 mg naproxen and 20 mg esomeprazole

**DOSAGES**
**Osteoarthritis, rheumatoid arthritis, ankylosing spondylitis, to decrease risk of gastric ulcer development**
*Adults:* 1 tablet P.O. b.i.d.

## Zydone 5/400

*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
400 mg acetaminophen and 5 mg hydrocodone bitartrate

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 to 2 tablets every 4 to 6 hours. Maximum dosage, 8 tablets in 24 hours.

## Zydone 7.5/400

*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
400 mg acetaminophen and 7.5 mg hydrocodone bitartrate

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 tablet every 4 to 6 hours. Maximum dosage, 6 tablets in 24 hours.

## Zydone 10/400

*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
400 mg acetaminophen and 10 mg hydrocodone bitartrate

**DOSAGES**
**Moderate to moderately severe pain**
*Adults:* 1 tablet every 4 to 6 hours. Maximum dosage, 6 tablets in 24 hours.

# ANTIACNE DRUGS

## Epiduo

**GENERIC COMPONENTS**
**Topical gel**
2.5% benzoyl peroxide and 0.1% adapalene

**DOSAGES**
*Adults and children age 12 and older:* Apply a thin film to affected areas of the face or trunk once daily after washing.

## Estrostep Fe

**GENERIC COMPONENTS**
**Tablets**
1 mg norethindrone and 20 mcg ethinyl estradiol, 1 mg norethindrone and 30 mcg ethinyl estradiol, or 1 mg norethindrone and 35 mcg ethinyl estradiol and 75 mg ferrous fumarate

**DOSAGES**
**Acne vulgaris**
*Women older than age 15:* 1 tablet P.O. daily.

## Ortho Tri-Cyclen

**GENERIC COMPONENTS**
**Tablets**
0.18 mg norgestimate and 35 mcg ethinyl estradiol
0.215 mg norgestimate and 35 mcg ethinyl estradiol
0.25 mg norgestimate and 35 mcg ethinyl estradiol

**DOSAGES**
**Acne**
*Women older than age 15:* 1 tablet P.O. daily.

✶ NEW DRUG

### Veltin

**GENERIC COMPONENTS**
**Topical gel**
Clindamycin phosphate 1.2% and tretinoin 0.025%

**DOSAGES**
**Acne vulgaris**
*Adults and children age 12 and older:* Apply pea-size amount to cover entire affected area once daily in evening. Avoid eyes, lips, and mucous membranes.

## ANTIBACTERIALS

### erythromycin ethylsuccinate and sulfisoxazole

**GENERIC COMPONENTS**
**Granules for oral suspension**
Erythromycin ethylsuccinate (equivalent of 200 mg erythromycin activity) and 600 mg sulfisoxazole per 5 ml when reconstituted according to manufacturer's directions

**DOSAGES**
**Acute otitis media**
*Children:* 50 mg/kg/day erythromycin and 150 mg/kg/day sulfisoxazole in divided doses q.i.d. for 10 days. Give without regard to meals. Refrigerate after reconstitution; use within 14 days.

## ANTIDIABETICS

### ActoPlus Met
### ActoPlus Met XR

**GENERIC COMPONENTS**
**Tablets**
15 mg pioglitazone and 500 mg metformin hydrocloride
15 mg pioglitazone and 850 mg metformin hydrochloride
**Tablets (extended-release)**
15 mg pioglitazone and 1,000 mg extended-release metformin hydrochloride
30 mg pioglitazone and 1,000 mg extended-release metformin hydrochloride

**DOSAGES**
**Adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes**
*Adults:* 15 mg pioglitazone with 500 mg metformin or 15 mg pioglitazone with 850 mg metformin P.O. once or twice daily with food. Maximum dosage is 45 mg pioglitazone with 2,550 mg metformin per day. Or, 15 mg pioglitazone with 1,000 mg metformin extended-release or 30 mg pioglitazone with 1,000 mg metformin extended-release P.O. once daily with evening meal. Maximum dosage of extended-release formula is 45 mg pioglitazone with 2,000 mg metformin extended-release per day.

### Avandamet

**GENERIC COMPONENTS**
**Tablets**
2 mg rosiglitazone and 500 mg metformin
2 mg rosiglitazone and 1 g metformin
4 mg rosiglitazone and 500 mg metformin
4 mg rosiglitazone and 1 g metformin

**DOSAGES**
**Adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes**
*Adults:* 4 mg rosiglitazone with 500 mg metformin, once per day or in divided doses. Not for initial therapy; adjust using individual drugs alone then switch to the appropriate dosage of the combination product. See package insert for details on adjusting dosage based on use of other drugs and previous dosage levels.

### Glucovance

**GENERIC COMPONENTS**
**Tablets**
1.25 mg glyburide and 250 mg metformin
2.5 mg glyburide and 500 mg metformin
5 mg glyburide and 500 mg metformin

**DOSAGES**
**As initial therapy as adjunct to diet and exercise to improve glycemic control in patients with type 2 diabetes; as second-line therapy when diet, exercise, and initial treatment with a sulfonylurea or metformin don't achieve glycemic control**
*Adults:* 1 or 2 tablets P.O. daily or b.i.d. with meals.

### Metaglip

**GENERIC COMPONENTS**
**Tablets**
2.5 mg glipizide and 250 mg metformin
2.5 mg glipizide and 500 mg metformin
5 mg glipizide and 500 mg metformin

**DOSAGES**
**Adjunct to diet and exercise to improve glycemic control in patients with type 2 diabetes**
*Adults:* 1 tablet per day with a meal; adjust dose based on patient response. Maximum dose, 20 mg glipizide with 2,000 mg metformin daily.

### PrandiMet

**GENERIC COMPONENTS**
**Tablets**
1 mg repaglinide and 500 mg metformin
2 mg repaglinide and 500 mg metformin

**DOSAGES**
**Adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes**
*Adults:* Individualize dosage based on patient's current regimen. Can be administered two to three times daily up to maximum daily dose of 10 mg repaglinide and 2,500 mg metformin.

## ANTIGOUT DRUGS

### Col-Probenecid

**GENERIC COMPONENTS**
**Tablets**
500 mg probenecid and 0.5 mg colchicine

**DOSAGES**
**Gouty arthritis**
*Adults:* 1 tablet P.O. daily for 1 week, then 1 tablet P.O. b.i.d. Adjust dosage based on symptoms and uric acid levels. Maximum dosage, 4 tablets daily.

## ANTIHYPERTENSIVES

### Accuretic
### Quinaretic

**GENERIC COMPONENTS**
**Tablets**
10 mg quinapril and 12.5 mg hydrochlorothiazide
20 mg quinapril and 12.5 mg hydrochlorothiazide
20 mg quinapril and 25 mg hydrochlorothiazide

**DOSAGES**
**Hypertension**
*Adults:* 1 tablet P.O. per day in the morning. Adjust drug using the individual products, then switch to appropriate dosage of the combination product.

### Atacand HCT

**GENERIC COMPONENTS**
**Tablets**
16 mg candesartan and 12.5 mg hydrochlorothiazide
32 mg candesartan and 12.5 mg hydrochlorothiazide

**DOSAGES**
**Hypertension**
*Adults:* 1 tablet P.O. daily in the morning.

Adjust dosage using the individual products, then switch to appropriate dosage.

## Avalide

### GENERIC COMPONENTS

**Tablets**
150 mg irbesartan and 12.5 mg hydrochlorothiazide
300 mg irbesartan and 12.5 mg hydrochlorothiazide
300 mg irbesartan and 25 mg hydrochlorothiazide

### DOSAGES

**Hypertension**
*Adults:* 1 tablet P.O. daily. Adjust dosage with individual products, then switch to combination product when patient's condition is stabilized. Maximum daily dose, 300 mg irbesartan and 25 mg hydrochlorothiazide.

## Azor

### GENERIC COMPONENTS

**Tablets**
5 mg amlodipine and 20 mg olmesartan medoxomil
5 mg amlodipine and 40 mg olmesartan medoxomil
10 mg amlodipine and 20 mg olmesartan medoxomil
10 mg amlodipine and 40 mg olmesartan medoxomil

### DOSAGES

**Hypertension**
*Adults:* Initially, 5 mg amlodipine with 20 mg olmesartan P.O. once daily for 1 to 2 weeks. Titrate as needed up to maximum of 10 mg amlodipine with 40 mg olmesartan once daily.

## Benicar HCT

### GENERIC COMPONENTS

**Tablets**
20 mg olmesartan and 12.5 mg hydrochlorothiazide
40 mg olmesartan and 12.5 mg hydrochlorothiazide
40 mg olmesartan and 25 mg hydrochlorothiazide

### DOSAGES

**Hypertension**
*Adults:* 1 tablet P.O. per day in the morning. Adjust dosage using the individual products, then switch to the combination product when patient's adjustment schedule is stable.

## Capozide

### GENERIC COMPONENTS

**Tablets**
25 mg captopril and 15 mg hydrochlorothiazide
50 mg captopril and 15 mg hydrochlorothiazide
25 mg captopril and 25 mg hydrochlorothiazide
50 mg captopril and 25 mg hydrochlorothiazide

### DOSAGES

**Hypertension**
*Adults:* 1 to 2 tablets P.O. daily, in the morning. Adjust dosage using the individual products, then switch to the combination product when patient's adjustment schedule is stable. Maximum daily dose is 150 mg captopril or 50 mg hydrochlorothiazide.

## Clorpres

### GENERIC COMPONENTS

**Tablets**
15 mg chlorthalidone and 0.1 mg clonidine hydrochloride
15 mg chlorthalidone and 0.2 mg clonidine hydrochloride
15 mg chlorthalidone and 0.3 mg clonidine hydrochloride

### DOSAGES

**Hypertension**
*Adults:* 1 to 2 tablets per day P.O. in the morning. Adjust dosage using the individual products, then switch to the

combination product when patient's adjustment schedule is stable.

## Corzide

### GENERIC COMPONENTS

**Tablets**

40 mg nadolol and 5 mg bendroflumethiazide
80 mg nadolol and 5 mg bendroflumethiazide

### DOSAGES

**Hypertension**

*Adults:* 1 tablet P.O. per day in the morning. Adjust dosage using the individual products, then switch to the combination product when patient's adjustment schedule is stable.

## Diovan HCT

### GENERIC COMPONENTS

**Tablets**

80 mg valsartan and 12.5 mg hydrochlorothiazide
160 mg valsartan and 12.5 mg hydrochlorothiazide
160 mg valsartan and 25 mg hydrochlorothiazide
320 mg valsartan and 12.5 mg hydrochlorothiazide
320 mg valsartan and 25 mg hydrochlorothiazide

### DOSAGES

**Hypertension**

*Adults:* 1 tablet per day P.O. Not for initial therapy; start using each component first.

## Exforge

### GENERIC COMPONENTS

**Tablets**

5 mg amlodipine besylate and 160 mg valsartan
5 mg amlodipine besylate and 320 mg valsartan
10 mg amlodipine besylate and 160 mg valsartan
10 mg amlodipine besylate and 320 mg valsartan

### DOSAGES

**Hypertension**

*Adults:* Initially, 5 mg amlodipine with 160 mg valsartan P.O. once daily. Increase after 1 to 2 weeks to a maximum of 10 mg amlodipine with 320 mg valsartan P.O. once daily.

## Exforge HCT

### GENERIC COMPONENTS

**Tablets**

5 mg amlodipine besylate, 160 mg valsartan, and 12.5 mg hydrochlorothiazide
10 mg amlodipine besylate, 160 mg valsartan, and 12.5 mg hydrochlorothiazide
5 mg amlodipine besylate, 160 mg valsartan, and 25 mg hydrocholorothiazide
10 mg amlodipine besylate, 160 mg valsartan, and 25 mg hydrochlorothiazide
10 mg amlodipine besylate, 320 mg valsartan, and 25 mg hydrochlorothiazide

### DOSAGES

**Hypertension**

*Adults:* Give dose P.O. once daily. Dosage may be increased after 2 weeks. Maximum recommended dosage is 10 mg amlodipine, 320 mg valsartan, and 25 mg hydrochlorothiazide.

## fosinopril and hydrochlorothiazide

### GENERIC COMPONENTS

**Tablets**

10 mg fosinopril and 12.5 mg hydrochlorothiazide
20 mg fosinopril and 12.5 mg hydrochlorothiazide

### DOSAGES

**Hypertension**

*Adults:* 1 tablet P.O. per day in the morning. Adjust dosage using the individual products, then switch to appropriate dosage of the combination product.

## Hyzaar

### GENERIC COMPONENTS
**Tablets**
50 mg losartan and 12.5 mg hydrochlorothiazide
100 mg losartan and 12.5 mg hydrochlorothiazide
100 mg losartan and 25 mg hydrochlorothiazide

### DOSAGES
**Hypertension**
*Adults:* 1 tablet per day P.O. in the morning. Not for initial therapy; start using each component and if desired effects are obtained, Hyzaar may be used.

## Inderide

### GENERIC COMPONENTS
**Tablets**
40 mg propranolol hydrochloride and 25 mg hydrochlorothiazide

### DOSAGES
**Hypertension**
*Adults:* 1 tablet P.O. b.i.d. Adjust dosage using the individual products, then switch to the combination product when patient's adjustment schedule is stable. Maximum total daily dose shouldn't exceed 160 mg propranolol and 50 mg hydrochlorothiazide

## Lopressor HCT

### GENERIC COMPONENTS
**Tablets**
50 mg metoprolol and 25 mg hydrochlorothiazide
100 mg metoprolol and 25 mg hydrochlorothiazide

### DOSAGES
**Hypertension**
*Adults:* 1 tablet P.O. per day. Adjust dosage using the individual products, then switch to the combination product when patient's adjustment schedule is stable.

## Lotensin HCT

### GENERIC COMPONENTS
**Tablets**
5 mg benazepril and 6.25 mg hydrochlorothiazide
10 mg benazepril and 12.5 mg hydrochlorothiazide
20 mg benazepril and 12.5 mg hydrochlorothiazide
20 mg benazepril and 25 mg hydrochlorothiazide

### DOSAGES
**Hypertension**
*Adults:* 1 tablet per day P.O. in the morning. Adjust dosage using the individual products, then switch to the combination product when patient's adjustment schedule is stable.

## Lotrel

### GENERIC COMPONENTS
**Capsules**
2.5 mg amlodipine and 10 mg benazepril
5 mg amlodipine and 10 mg benazepril
5 mg amlodipine and 20 mg benazepril
5 mg amlodipine and 40 mg benazepril
10 mg amlodipine and 20 mg benazepril
10 mg amlodipine and 40 mg benazepril

### DOSAGES
**Hypertension**
*Adults:* 1 tablet P.O. daily in the morning. Monitor patient for hypertension and adverse effects closely over first 2 weeks and regularly thereafter.

## methyldopa and hydrochlorothiazide

### GENERIC COMPONENTS
**Tablets**
250 mg methyldopa and 15 mg hydrochlorothiazide
250 mg methyldopa and 25 mg hydrochlorothiazide

**DOSAGES**
**Hypertension**
*Adults:* 1 tablet P.O. daily, in the morning. Adjust dosage using the individual products, then switch to the combination product when patient's adjustment schedule is stable.

## Micardis HCT

**GENERIC COMPONENTS**
**Tablets**
40 mg telmisartan and 12.5 mg hydrochlorothiazide
80 mg telmisartan and 12.5 mg hydrochlorothiazide
80 mg telmisartan and 25 mg hydrochlorothiazide

**DOSAGES**
**Hypertension**
*Adults:* 1 tablet P.O. per day; may be adjusted up to 160 mg telmisartan and 25 mg hydrochlorothiazide, based on patient's response.

## Prinzide
## Zestoretic

**GENERIC COMPONENTS**
**Tablets**
10 mg lisinopril and 12.5 mg hydrochlorothiazide
20 mg lisinopril and 12.5 mg hydrochlorothiazide
20 mg lisinopril and 25 mg hydrochlorothiazide

**DOSAGES**
**Hypertension**
*Adults:* 1 tablet per day P.O. taken in the morning. Adjust dosage using the individual products, then switch to the combination product when patient's adjustment schedule is stable.

## Tarka

**GENERIC COMPONENTS**
**Tablets**
1 mg trandolapril and 240 mg verapamil
2 mg trandolapril and 180 mg verapamil
2 mg trandolapril and 240 mg verapamil
4 mg trandolapril and 240 mg verapamil

**DOSAGES**
**Hypertension**
*Adults:* 1 tablet P.O. per day, taken with food. Adjust dosage using the individual products, then switch to the combination product when patient's adjustment schedule is stable. Make sure that patient swallows tablet whole. Don't cut, crush, or allow him to chew.

*** NEW DRUG**

## Tekamlo

**GENERIC COMPONENTS**
**Tablets**
150 mg aliskiren hemifumarate and 5 mg amlodipine besylate
150 mg aliskiren hemifumarate and 10 mg amlodipine besylate
300 mg aliskiren hemifumarate and 5 mg amlodipine besylate
300 mg aliskiren hemifumarate and 10 mg amlodipine besylate

**DOSAGES**
**Hypertension**
*Adults:* 1 tablet P.O. daily. Initiate therapy with 150 mg aliskiren and 5 mg amlodipine. Titrate as needed to maximum of 300 mg aliskiren and 10 mg amlodipine. Tekamlo may be substituted for its titrated components.

## Tekturna HCT

**GENERIC COMPONENTS**
**Tablets**
150 mg aliskiren and 12.5 mg hydrochlorothiazide
150 mg aliskiren and 25 mg hydrochlorothiazide
300 mg aliskiren and 12.5 mg hydrochlorothiazide
300 mg aliskiren and 25 mg hydrochlorothiazide

**DOSAGES**
**Hypertension**
*Adults:* 1 tablet P.O. daily. Initiate therapy with 150 mg aliskiren and 12.5 mg hydrochlorothiazide. Titrate up as needed to a maximum of 300 mg aliskiren and 25 mg hydrochlorothiazide.

## Tenoretic

**GENERIC COMPONENTS**
**Tablets**
50 mg atenolol and 25 mg chlorthalidone
100 mg atenolol and 25 mg chlorthalidone

**DOSAGES**
**Hypertension**
*Adults:* 1 tablet P.O. daily in the morning. Adjust dosage using the individual products, then switch to appropriate dosage of the combination product.

## Teveten HCT

**GENERIC COMPONENTS**
**Tablets**
600 mg eprosartan and 12.5 mg hydrochlorothiazide
600 mg eprosartan and 25 mg hydrochlorothiazide

**DOSAGES**
**Hypertension**
*Adults:* 1 tablet P.O. each day. Establish dosage with each component alone before using the combination product; if blood pressure isn't controlled on 600 mg/25 mg tablet, 300 mg eprosartan may be added each evening.

✱ NEW DRUG

## Tribenzor

**GENERIC COMPONENTS**
**Tablets**
5 mg amlodipine besylate, 12.5 mg hydrochlorothiazide, and 20 mg olmesartan medoxomil
5 mg amlodipine besylate, 12.5 mg hydrochlorothiazide, and 40 mg olmesartan medoxomil
5 mg amlodipine besylate, 25 mg hydrochlorothiazide, and 40 mg olmesartan medoxomil
10 mg amlodipine besylate, 12.5 mg hydrochlorothiazide, and 40 mg olmesartan medoxomil
10 mg amlodipine besylate, 25 mg hydrochlorothiazide, and 40 mg olmesartan medoxomil

**DOSAGES**
**Hypertension**
*Adults:* 1 tablet P.O. daily. Adjust dosage of individual products; then switch to combination product. May increase dosage after 2 weeks. Maximum recommended dose is 10 mg amlodipine, 25 mg hydrochlorothiazide, and 40 mg olmesartan.

✱ NEW DRUG

## Twynsta

**GENERIC COMPONENTS**
**Tablets**
5 mg amlodipine besylate and 40 mg telmisartan
5 mg amlodipine besylate and 80 mg telmisartan
10 mg amlodipine besylate and 40 mg telmisartan
10 mg amlodipine besylate and 80 mg telmisartan

**DOSAGES**
**Hypertension**
*Adults:* 1 tablet P.O. daily. Substitute for its individually titrated components or initiate therapy with 5 mg amlodipine and 40 mg telmisartan or 5 mg amlodipine and 80 mg telmisartan. May increase dosage after at least 2 weeks to maximum dose of 10 mg amlodipine and 80 mg telmisartan.

### Uniretic

**GENERIC COMPONENTS**
**Tablets**
7.5 mg moexipril and 12.5 mg hydrochlorothiazide
15 mg moexipril and 12.5 mg hydrochlorothiazide
15 mg moexipril and 25 mg hydrochlorothiazide

**DOSAGES**
**Hypertension**
*Adults:* Give ½ to 2 tablets per day. Not for initial therapy. Adjust dose to maintain appropriate blood pressure.

### Vaseretic

**GENERIC COMPONENTS**
**Tablets**
5 mg enalapril maleate and 12.5 mg hydrochlorothiazide
10 mg enalapril maleate and 25 mg hydrochlorothiazide

**DOSAGES**
**Hypertension**
*Adults:* 1 to 2 tablets per day P.O. in the morning. Adjust dosage using the individual products, then switch to the combination product when patient's adjustment schedule is stable.

### Ziac

**GENERIC COMPONENTS**
**Tablets**
2.5 mg bisoprolol and 6.25 mg hydrochlorothiazide
5 mg bisoprolol and 6.25 mg hydrochlorothiazide
10 mg bisoprolol and 6.25 mg hydrochlorothiazide

**DOSAGES**
**Hypertension**
*Adults:* 1 tablet daily P.O. in morning. Initial dose is 2.5/6.25 mg tablet P.O. daily. Adjust dosage within 1 week; optimal antihypertensive effect may require 2 to 3 weeks.

## ANTIMIGRAINE DRUGS

### Cafergot
### Migergot

**GENERIC COMPONENTS**
**Tablets**
1 mg ergotamine tartrate and 100 mg caffeine
**Suppositories**
2 mg ergotamine tartrate and 100 mg caffeine

**DOSAGES**
**Prevention and treatment of migraine headache**
Adults: 2 tablets P.O. at the first sign of attack. Follow with 1 tablet every 30 minutes, if needed. Maximum dose is 6 tablets per attack. Don't exceed 10 tablets per week. Or, 1 suppository P.R. at first sign of attack; follow with second dose after 1 hour, if needed. Maximum dose is 2 suppositories per attack. Don't exceed 5 suppositories per week. Don't combine this drug with ritonavir, nelfinavir, indinavir, erythromycin, clarithromycin, or troleandomycin, as serious vasospasm could occur.

### Treximet

**GENERIC COMPONENTS**
**Tablets**
85 mg sumatriptan and 500 mg naproxen sodium

**DOSAGES**
**Migraine headache**
*Adults:* 1 tablet P.O. at first sign of migraine. May follow with 1 tablet 2 hours later. Maximum dosage is 2 tablets/24 hours.

## ANTIPLATELET DRUGS

### Aggrenox

**GENERIC COMPONENTS**
**Capsules**
25 mg aspirin and 200 mg dipyridamole

**DOSAGES**
**Reduce stroke risk**
*Adults:* 1 capsule P.O. b.i.d. in the morning and evening. Swallow capsule whole; may be taken with or without food.

## ANTIRETROVIRALS

### Combivir

**GENERIC COMPONENTS**
**Tablets**
150 mg lamivudine and 300 mg zidovudine

**DOSAGES**
**Treatment of HIV infection**
*Adults and children weighing 30 kg (66 lb) or more:* 1 tablet P.O. b.i.d.

### Epzicom

**GENERIC COMPONENTS**
**Tablets**
600 mg abacavir with 300 mg lamivudine

**DOSAGES**
**Treatment of HIV infection**
*Adults:* 1 tablet P.O. daily, taken without regard to food and in combination with other antiretrovirals.

### Trizivir

**GENERIC COMPONENTS**
**Tablets**
300 mg abacavir sulfate, 150 mg lamivudine, and 300 mg zidovudine

**DOSAGES**
**Treatment of HIV infection**
*Adults and adolescents who weigh 40 kg (88 lb) or more:* 1 tablet P.O. b.i.d., alone or with other antiretrovirals.

### Truvada

**GENERIC COMPONENTS**
**Tablets**
200 mg emtricitabine with 300 mg tenofovir

**DOSAGES**
**Treatment of HIV infection**
*Adults and adolescents weighing more than 40 kg (88 lb):* 1 tablet P.O. daily, taken without regard to food and in combination with other antiretrovirals.

## ANTIULCER DRUGS

### Helidac

**GENERIC COMPONENTS**
**Tablets**
262.4 mg bismuth subsalicylate, 250 mg metronidazole, and 500 mg tetracycline hydrochloride

**DOSAGES**
**Active duodenal ulcers associated with *Helicobacter pylori* infection**
*Adults:* 2 chewable bismuth subsalicylate tablets, 1 metronidazole tablet, and 1 tetracycline capsule P.O. q.i.d. for 14 days along with a prescribed $H_2$ antagonist.

### Prevpac

**GENERIC COMPONENTS**
**Daily administration pack**
Two 30-mg lansoprazole capsules, four 500-mg amoxicillin capsules, and two 500-mg clarithromycin tablets

**DOSAGES**
**Eradication of *Helicobacter pylori* infection**
*Adults:* Divide pack equally to take twice daily, morning and evening.

### Pylera

**GENERIC COMPONENTS**
**Capsules**
140 mg bismuth subcitrate potassium, 125 mg metronidazole, and 125 mg tetracycline hydrochloride

**DOSAGES**
**Eradication of *Helicobacter pylori* infection; active duodenal ulcers associated with *H. pylori* infection**
*Adults:* Give each dose (which includes all 3 capsules) P.O. q.i.d. after meals and at bedtime for 10 days with omeprazole 20 mg P.O. b.i.d. for 10 days.

## BENIGN PROSTATIC HYPERPLASIA DRUGS

**✱NEW DRUG**

### Jalyn

**GENERIC COMPONENTS**
**Capsules**
0.5 mg dutasteride and 0.4 mg tamsulosin hydrochloride

**DOSAGES**
**Treatment of symptomatic benign prostatic hyperplasia**
*Adult men:* 1 capsule P.O. daily 30 minutes after same meal each day. Capsules should be swallowed whole.

## DIURETICS

### Aldactazide

**GENERIC COMPONENTS**
**Tablets**
25 mg spironolactone and 25 mg hydrochlorothiazide
50 mg spironolactone and 50 mg hydrochlorothiazide

**DOSAGES**
**Edema or hypertension**
*Adults:* One to eight 25-mg spironolactone and 25-mg hydrochlorothiazide tablets daily. Or, one to four 50-mg spironolactone and 50-mg hydrochlorothiazide tablets daily.

### amiloride and hydrochlorothiazide

**GENERIC COMPONENTS**
**Tablets**
5 mg amiloride and 50 mg hydrochlorothiazide

**DOSAGES**
**Edema or hypertension**
*Adults:* 1 to 2 tablets per day with meals.

### Dyazide

**GENERIC COMPONENTS**
**Capsules**
37.5 mg triamterene and 25 mg hydrochlorothiazide

**DOSAGES**
**Edema or hypertension**
*Adults:* 1 to 2 tablets daily.

### Maxzide

**GENERIC COMPONENTS**
**Tablets**
37.5 mg triamterene and 25 mg hydrochlorothiazide
75 mg triamterene and 50 mg hydrochlorothiazide

**DOSAGES**
**Edema or hypertension**
*Adults:* 1 tablet daily.

# HEART FAILURE DRUGS

## BiDil

### GENERIC COMPONENTS
**Tablets**
20 mg isosorbide dinitrate and 37.5 mg hydralazine

### DOSAGES
**Adjunct to standard heart failure therapy**
*Adults:* 1 to 2 tablets P.O. t.i.d.

# LIPID-LOWERING DRUGS

## Advicor

### GENERIC COMPONENTS
**Tablets**
20 mg lovastatin and 500 mg niacin
20 mg lovastatin and 750 mg niacin
20 mg lovastatin and 1,000 mg niacin
40 mg lovastatin and 1,000 mg niacin

### DOSAGES
**Treatment of hypercholesterolemia and mixed dyslipidemia**
*Adults:* 1 tablet daily P.O. at night.

## Simcor

### GENERIC COMPONENTS
**Tablets**
500 mg niacin extended-release and 20 mg simvastatin
500 mg niacin extended-release and 40 mg simvastatin
750 mg niacin extended-release and 20 mg simvastatin
1,000 mg niacin extended-release and 20 mg simvastatin
1,000 mg niacin extended-release and 40 mg simvastatin

### DOSAGES
**Treatment of primary hypercholesterolemia and mixed dyslipidemia or hypertriglyceridemia**
*Adults:* For patients naive or switching from immediate-release niacin, 500 mg niacin extended-release and 20 mg simvastatin P.O. daily. Initial dose for patients already receiving extended-release niacin shouldn't exceed 2,000 mg niacin extended-release and 40 mg simvastatin. Maintenance dose is 1,000 mg niacin extended-release and 20 mg simvastatin to 2,000 mg niacin extended-release and 40 mg simvastatin. Give drug at bedtime with low-fat snack.

## Vytorin ✐

### GENERIC COMPONENTS
**Tablets**
10 mg ezetimibe with 10, 20, 40, or 80 mg simvastatin

### DOSAGES
**Homozygous familial hypercholesterolemia and primary hyperlipidemia**
*Adults:* 1 tablet daily, taken in the evening in combination with a cholesterol-lowering diet and exercise. Dosage of simvastatin in the combination may be adjusted based on patient response. If given with a bile sequestrant, must be given at least 2 hours before or 4 hours after the bile sequestrant.

# MENOPAUSE DRUGS

## Activella
## Femhrt

### GENERIC COMPONENTS
**Tablets**
2.5 mcg ethinyl estradiol and 0.5 mg norethindrone acetate (Femhrt)
5 mcg ethinyl estradiol and 1 mg norethindrone acetate (Femhrt)
0.5 mg ethinyl estradiol and 0.1 mg norethindrone acetate (Activella)
1 mg ethinyl estradiol and 0.5 mg norethindrone acetate (Activella)

**DOSAGES**
**Signs and symptoms of menopause; to prevent osteoporosis**
*Women with intact uterus:* 1 tablet P.O. daily.

### Prefest

**GENERIC COMPONENTS**
**Tablets**
1 mg estradiol and 0.09 mg norgestimate

**DOSAGES**
**Moderate to severe symptoms of menopause; to prevent osteoporosis**
*Women with intact uterus:* 1 tablet per day P.O. (3 days of pink tablets: estradiol alone; followed by 3 days of white tablets: estradiol and norgestimate combination; continue cycle uninterrupted).

### Premphase

**GENERIC COMPONENTS**
**Tablets**
0.625 mg conjugated estrogens; 0.625 mg conjugated estrogens with 5 mg medroxyprogesterone

**DOSAGES**
**Moderate to severe symptoms of menopause; to prevent osteoporosis**
*Women with intact uterus:* 1 tablet per day P.O. Use estrogen alone on days 1 to 14 and estrogen-medroxyprogesterone tablet on days 15 to 28.

### Prempro

**GENERIC COMPONENTS**
**Tablets**
0.3 mg conjugated estrogen and 1.5 mg medroxyprogesterone
0.45 mg conjugated estrogen and 1.5 mg medroxyprogesterone
0.625 mg estrogen and 2.5 mg medroxyprogesterone
0.625 mg conjugated estrogen and 5 mg medroxyprogesterone

**DOSAGES**
**Symptoms of menopause; to prevent osteoporosis**
*Women with intact uterus:* 1 tablet per day P.O.

## MISCELLANEOUS CARDIAC DRUGS

### Caduet

**GENERIC COMPONENTS**
**Tablets**
2.5 mg amlodipine with 10 mg, 20 mg, or 40 mg atorvastatin
5 mg amlodipine with 10 mg, 20 mg, 40 mg, or 80 mg atorvastatin
10 mg amlodipine with 10 mg, 20 mg, 40 mg, or 80 mg atorvastatin

**DOSAGES**
**Treatment of hypertension, chronic stable angina, or suspected vasospastic angina in patients with primary hypercholesterolemia and mixed dyslipidemia or hypertriglyceridemia**
*Adults, boys, and postmenarchal girls age 10 and older:* Determine the most effective dose for each component. Then select the most appropriate combination product.

## OPIOID AGONISTS

### Suboxone

*Controlled Substance Schedule III*

**GENERIC COMPONENTS**
**Sublingual tablets**
2 mg buprenorphine and 0.5 mg naloxone
8 mg buprenorphine and 2 mg naloxone

**DOSAGES**
**Opioid dependence**
*Adults:* 12 to 16 mg S.L. once daily, after induction with S.L. buprenorphine.

## PSYCHOTHERAPEUTICS

### Limbitrol
### Limbitrol DS

**GENERIC COMPONENTS**
**Tablets**
5 mg chlordiazepoxide and 12.5 mg amitriptyline
10 mg chlordiazepoxide and 25 mg amitriptyline

**DOSAGES**
**Severe depression**
*Adults:* 10 mg chlordiazepoxide with 25 mg amitriptyline 3 to 4 times per day up to 6 times daily. For patients who don't tolerate the higher doses, 5 mg chlordiazepoxide with 12.5 mg amitriptyline 3 to 4 times per day. Reduce dosage after initial response.

### perphenazine and amitriptyline

**GENERIC COMPONENTS**
**Tablets**
2 mg perphenazine and 10 mg amitriptyline
2 mg perphenazine and 25 mg amitriptyline
4 mg perphenazine and 10 mg amitriptyline
4 mg perphenazine and 25 mg amitriptyline
4 mg perphenazine and 50 mg amitriptyline

**DOSAGES**
**Treatment of anxiety, agitation, or depression**
*Adults:* 2 to 4 mg perphenazine with 10 to 50 mg amitriptyline 3 to 4 times daily. Reduce dosage after initial response.

### Symbyax

**GENERIC COMPONENTS**
**Capsules**
3 mg olanzapine and 25 mg fluoxetine
6 mg olanzapine and 25 mg fluoxetine
6 mg olanzapine and 50 mg fluoxetine
12 mg olanzapine and 25 mg fluoxetine
12 mg olanzapine and 50 mg fluoxetine

**DOSAGES**
**Treatment of bipolar 1 disorder or depression**
*Adults:* 1 capsule daily in the evening. Begin with 6 mg/25 mg capsule and adjust according to efficacy and tolerability.

## RESPIRATORY TRACT DRUGS

### Claritin-D 24 Hour

**GENERIC COMPONENTS**
**Extended-release tablets**
10 mg loratadine and 240 mg pseudoephedrine

**DOSAGES**
**Seasonal allergic rhinitis**
*Adults:* 1 tablet every day.

### Combivent

**GENERIC COMPONENTS**
**Metered dose inhaler**
18 mcg ipratropium bromide and 90 mcg albuterol

**DOSAGES**
**Bronchospasm with COPD in patients who require more than a single bronchodilator**
*Adults:* Two inhalations q.i.d. Not for use during acute attack. Use caution with known sensitivity to atropine, soy, or peanuts.

**✱ NEW DRUG**

### Dulera

**GENERIC COMPONENTS**
**Oral inhalation**
mometasone furoate (100 or 200 mcg) and formoterol fumarate dihydrate 5 mcg

**DOSAGES**
**Asthma**
*Adults and children age 12 and older:* 2 inhalations twice daily. Starting dose is based on prior asthma therapy.

## loratadine and pseudoephedrine ◊

### GENERIC COMPONENTS

**Extended-release tablets**
5 mg loratadine and 120 mg pseudoephedrine

### DOSAGES

**Seasonal allergic rhinitis**
*Adults:* 1 tablet every 12 hours.

## Symbicort

### GENERIC COMPONENTS

**Aerosol inhalation**
80 mcg budesonide and 4.5 mcg formoterol fumarate per actuation
160 mcg budesonide and 4.5 mcg formoterol fumarate per actuation

### DOSAGES

**Asthma, chronic obstructive pulmonary disease**
*Adults and children age 12 and older:* 2 inhalations twice daily.

## *Haemophilus* b conjugate vaccines

## *Haemophilus* b conjugate vaccine, diphtheria CRM 197 protein conjugate (HbOC)

HibTITER

## *Haemophilus* b conjugate vaccine, diphtheria toxoid conjugate (PRP-D)

Prohibit

## *Haemophilus* b conjugate vaccine, meningococcal protein conjugate, hepatitis B

Comvax

## *Haemophilus* b conjugate vaccine, meningococcal protein conjugate (PRP-OMP)

PedvaxHIB

## *Haemophilus* b conjugate, tetanus toxoid conjugate (PRP-T)

ActHIB

*Pharmacologic class:* vaccine
*Pregnancy risk category C*

### AVAILABLE FORMS

***Haemophilus influenzae type b* (HIB) conjugate vaccine, diphtheria CRM 197 protein conjugate**
*Injection:* 10 mcg of purified HIB saccharide and about 25 mcg CRM 197 protein per 0.5 ml

**HIB conjugate vaccine, diphtheria toxoid conjugate**
*Injection:* 25 mcg of HIB capsular polysaccharide and 18 mcg of diphtheria toxoid protein per 0.5 ml

**HIB conjugate vaccine, hepatitis B**
*Injection:* 7.5 mcg of HIB capsular polysaccharide and 5 mcg hepatitis B surface antigen per 0.5 ml

**HIB conjugate vaccine, meningococcal protein conjugate**
*Injection:* 7.5 mcg of HIB PRP and 125 mcg *N. meningitides* OMPC per 0.5 ml

**HIB conjugate vaccine, tetanus toxoid conjugate**
*Injection:* 10 mcg HIB capsular polysaccharide, 24 mcg tetanus toxoid

### INDICATIONS & DOSAGES

➤ **Immunization against HIB infection**

***Conjugate vaccine, diphtheria $CRM_{197}$ protein conjugate***
*Infants:* 0.5 ml I.M. at age 2 months. Repeat at 4 months and 6 months. Give booster dose at age 15 months.
*Previously unvaccinated children ages 15 months to 6 years:* 0.5 ml I.M. Booster dose isn't needed.
*Previously unvaccinated infants ages 12 to 14 months:* 0.5 ml I.M. Give booster dose at age 15 months (but no sooner than 2 months after first vaccination).
*Previously unvaccinated infants ages 7 to 11 months:* 0.5 ml I.M. Repeat in 2 months, for a total of two doses. Give booster dose at age 15 months (but no sooner than 2 months after last vaccination).
*Previously unvaccinated infants ages 2 to 6 months:* 0.5 ml I.M. Repeat in 2 months and again in 4 months for total of three doses. Give booster at age 15 months.

***Conjugate vaccine, diphtheria toxoid conjugate***
*Previously unvaccinated children ages 15 to 71 months:* 0.5 ml I.M. Booster dose isn't needed.

***Conjugate vaccine, hepatitis B***
*Infants born to HBsAg negative mothers:* 0.5 ml I.M. at ages 2, 4, and 12 to 15 months for a total of three doses. Infants who received a dose of hepatitis B vaccine at or shortly after birth can still receive the full three-dose series of Comvax.

***Conjugate vaccine, meningococcal protein conjugate***
*Infants:* 0.5 ml I.M. at age 2 months; repeat at age 4 months. Give booster dose at age 12 months.

†Canada

*Previously unvaccinated children ages 15 months to 6 years:* 0.5 ml I.M. Booster dose isn't needed.

Premature infants follow same schedule as full-term infants.

*Previously unvaccinated infants ages 12 to 14 months:* 0.5 ml I.M. Give booster dose at age 15 months (but no sooner than 2 months after first vaccination).

*Previously unvaccinated infants ages 7 to 11 months:* 0.5 ml I.M.; repeat in 2 months. Give booster dose at age 15 months (but no sooner than 2 months after last vaccination).

*Previously unvaccinated infants ages 2 to 6 months:* 0.5 ml I.M.; repeat in 2 months. Give booster dose at age 12 months.

***Conjugate vaccine, tetanus toxoid conjugate***

*Infants:* 0.5 ml I.M. at age 2 months. Repeat at ages 4 and 6 months. Give booster doses at ages 15 to 18 months.

*Previously unvaccinated infants ages 7 to 11 months:* 0.5 ml I.M. Repeat in 2 months, for a total of two doses. Give booster doses at ages 15 to 18 months.

*Previously unvaccinated infants ages 12 to 14 months:* 0.5 ml I.M. Repeat in 2 months, for a total of two doses.

## Diphtheria and tetanus toxoids and acellular pertussis vaccine adsorbed (DTaP)

Daptacel, Infanrix, TRIPACEL†, Tripedia

## Tetanus toxoid and reduced diphtheria toxoid and acellular pertussis vaccine adsorbed (Tdap)

ADACEL, Boostrix

*Pharmacologic class:* vaccine/toxoid
*Pregnancy risk category C*

### AVAILABLE FORMS

**DTaP**

***Daptacel***

*Injection:* 15 limit flocculation (Lf) units diphtheria toxoid, 5 Lf units tetanus toxoid, 10 mcg pertussis toxoid adsorbed per 0.5 ml

***Infanrix***

*Injection:* 25 Lf units diphtheria toxoid, 10 Lf units tetanus toxoid, 25 mcg inactivated pertussis toxins adsorbed per 0.5 ml

***Tripedia***

*Injection:* 6.7 Lf units diphtheria toxoid, 5 Lf units tetanus toxoid, 46.8 mcg acellular pertussis vaccine adsorbed per 0.5 ml

**TDAP**

***Adacel***

*Injection:* 5 Lf units tetanus toxoid, 2 Lf units diphtheria toxoid, 2.5 mcg detoxified pertussis toxins adsorbed per 0.5 ml

***Boostrix***

*Injection:* 5 Lf units tetanus toxoid, 2.5 Lf units diphtheria toxoid, 8 mcg inactivated pertussis toxins adsorbed per 0.5 ml

### INDICATIONS & DOSAGES

➤ **Primary immunization (Daptacel, Infanrix, Tripedia)**

*Children ages 6 weeks to 7 years:* 0.5 ml I.M. 4 to 8 weeks apart for three doses (6 to 8 weeks for Daptacel) and a fourth dose at least 6 months after the third dose.

➤ **Booster immunization**

*Children ages 6 weeks to 7 years:* Daptacel may be given to complete the immunization series in children who have received at least one dose of whole-cell DTP vaccine.

Infanrix is indicated as a fifth dose in children ages 4 to 6 before entering school in those who received at least one dose of whole-cell DTP vaccine, unless the fourth dose was given after the fourth birthday.

If Tripedia was used for the first four doses, a fifth dose is recommended at age 4 to 6 before entering school. If the fourth dose was given after age 4, a fifth dose isn't needed.

*Adults and children age 11 to 64 (ADACEL):* 0.5 ml I.M. as a single dose at least 5 years after the last DTaP vaccination.

*Children and adolescents age 10 to 18 (Boostrix):* 0.5 ml I.M. as a single dose at least 5 years after the last DTaP vaccination.

†Canada

## Diphtheria and tetanus toxoids, acellular pertussis adsorbed, hepatitis B (recombinant), and inactivated poliovirus vaccine combined

Pediarix

*Pharmacologic class:* vaccine/toxoid
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 0.5-ml single-dose vials and disposable, prefilled Tip-Lok syringes

### INDICATIONS & DOSAGES

➤ **Active immunization**

*Children ages 6 weeks to 7 years:* Primary series is three 0.5-ml doses I.M. at 6- to 8-week intervals (preferably 8), usually starting at age 2 months; may start at age 6 weeks.

## Diphtheria and tetanus toxoids, acellular pertussis adsorbed, and inactivated poliovirus combination vaccine (DTap/IPV)

Kinrix

*Pharmacologic class:* vaccine/toxoid
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 25 limit flocculation (Lf) units diphtheria toxoid, 10 Lf tetanus toxoid, 25 mcg inactivated pertussis toxin (PT), 25 mcg filamentous hemagglutinin, 8 mcg pertactin, 40 D-antigen units type 1 poliovirus (Mahoney), 8 D-antigen units type 2 poliovirus (MEF-1), 32 D-antigen units/0.5 ml type 3 poliovirus (Saukett)

### INDICATIONS & DOSAGES

➤ **Active immunization against diphtheria, tetanus, pertussis, and poliomyelitis as the fifth dose in the DTaP vaccine series and the fourth dose in the IPV series in those whose previous DTaP vaccine doses have been with Infanrix (diphtheria and tetanus toxoids and acellular pertussis vaccine adsorbed) and/or Pediarix (diphtheria and tetanus toxoids, acellular pertussis adsorbed, hepatitis B [recombinant], and IPV vaccine combined) for first three doses and Infanrix for fourth dose**

*Children ages 4 through 6:* 0.5 ml I.M., preferably in the deltoid muscle of the upper arm.

## Diphtheria and tetanus toxoids, acellular pertussis adsorbed, inactivated poliovirus, and *Haemophilus influenzae* type b conjugate vaccine combined

Pentacel

*Pharmacologic class:* vaccine/toxoid
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 15 limit flocculation (Lf) diphtheria toxoid, 5 Lf tetanus toxoid, 20 mcg pertussis toxin detoxified, 20 mcg filamentous hemagglutinin, 3 mcg pertactin, 5 mcg fimbriae types 2 and 3, 40 D-antigen units type 1 inactivated poliovirus (Mahoney), 8 D-antigen units type 2 inactivated poliovirus (MEF-1), 32 D-antigen units type 3 inactivated poliovirus (Saukett), and 10 mcg lyophilized polyribosyl-ribitol-phosphate of *H. influenzae* type b bound to tetanus toxoid 24 mcg/0.5 ml.

### INDICATIONS & DOSAGES

➤ **Active immunization against diphtheria, tetanus, pertussis, poliomyelitis, and invasive disease caused by H. influenzae type b**

*Children age 6 weeks to 4 years (prior to 5th birthday):* 0.5 ml I.M. Approved for administration as a four-dose series at ages 2, 4, 6, and 15 through 18 months. The first dose may be given as early as age 6 weeks.

†Canada

## Hepatitis A vaccine, inactivated

Havrix, Vaqta

*Pharmacologic class:* vaccine
*Pregnancy risk category C*

### AVAILABLE FORMS

**Havrix**
*Injection:* 720 enzyme-linked immunosorbent assay (ELISA) units (ELU)/0.5 ml; 1,440 ELU/ml
**Vaqta**
*Injection:* 25 units/0.5 ml, 50 units/ml

### INDICATIONS & DOSAGES

➤ **Active immunization against hepatitis A virus; with immune globulin, to prevent hepatitis A in those exposed to virus or who travel to endemic areas**
*Adults:* 1,440 ELU Havrix or 50 units Vaqta I.M. as single dose. For booster dose, give 1,440 ELU Havrix 6 to 12 months after first dose or 50 units Vaqta I.M. 6 to 18 months after first dose. Booster is recommended for prolonged immunity.
*Children ages 12 months to 18 years:* 720 ELU Havrix or 25 units Vaqta I.M. as single dose. Then, give booster dose of 720 ELU Havrix 6 to 12 months after first dose or 25 units Vaqta I.M. 6 to 18 months after first dose. Booster is recommended for prolonged immunity.

## Hepatitis B vaccine, recombinant

Engerix-B, Recombivax HB, Recombivax HB Dialysis Formulation

*Pharmacologic class:* vaccine
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 5 mcg HBsAg/0.5 ml (Recombivax HB, pediatric and adolescent form with or without preservative); 10 mcg HBsAg/0.5 ml (Engerix-B, pediatric and adolescent form); 10 mcg HBsAg/ml (Recombivax HB, adult form); 20 mcg HBsAg/ml (Engerix-B, adult form); 40 mcg HBsAg/ml (Recombivax HB dialysis form)

### INDICATIONS & DOSAGES

➤ **Immunization against infection from all known subtypes of hepatitis B virus (HBV), primary preexposure prophylaxis against HBV, postexposure prophylaxis when given with hepatitis B immune globulin (HBIG)**
***Engerix-B***
*Adults age 20 and older:* Initially, 20 mcg I.M.; then second dose of 20 mcg I.M. after 30 days. A third dose of 20 mcg I.M. is given 6 months after the first dose.
***Adjust-a-dose:*** For adults undergoing dialysis or receiving immunosuppressants, initially, 40 mcg I.M. (divided into two 20-mcg doses and given at different sites). Then second dose of 40 mcg I.M. in 30 days, a third dose after 2 months, and final dose of 40 mcg I.M. 6 months after first dose.
*Adolescents ages 11 to 19:* Initially, 10 mcg (pediatric and adolescent form) I.M.; then second dose of 10 mcg I.M. 30 days later. Give third dose of 10 mcg I.M. 6 months after first dose. Or, 20 mcg (adult form) I.M.; then second dose of 20 mcg I.M. 30 days later. Give third dose of 20 mcg I.M. 6 months after first dose.
*Neonates and children up to age 10:* Initially, 10 mcg I.M.; then second dose of 10 mcg I.M. 30 days later. Give third dose of 10 mcg I.M. 6 months after first dose.
***Recombivax HB***
*Adults age 20 and older:* Initially, 10 mcg I.M.; then second dose of 10 mcg I.M. after 30 days. Give third dose of 10 mcg I.M. 6 months after first dose.

For adults undergoing dialysis, initially, 40 mcg I.M. (use dialysis form, which contains 40 mcg/ml); then second dose of 40 mcg I.M. in 30 days, and final dose of 40 mcg I.M. 6 months after first dose. A booster or revaccination may be indicated if anti-HBs level is below 10 mIU/ml 1 to 2 months after third dose.
*Infants, children, and adolescents age 19 or younger:* Initially, 5 mcg I.M.; then second dose of 5 mcg I.M. after 30 days. Give third dose of 5 mcg I.M. 6 months after first dose. Or, in adolescents ages 11 to 15, give 10 mcg (1 ml adult form) I.M.;

†Canada

then second dose of 10 mcg 4 to 6 months later.
*Infants born of HBsAg-positive mothers or mothers of unknown HbsAg status:* Initially, 5 mcg I.M.; then second dose of 5 mcg I.M. after 30 days. Give third dose of 5 mcg I.M. 6 months after first dose.
*Infants born of HBsAg-negative mothers:* Initially, 5 mcg I.M.; then second dose of 5 mcg I.M. after 30 days. Give third dose of 5 mcg I.M. 6 months after first dose.
*Note:* If the mother is found to be HbsAg-positive within 7 days of delivery, also give the infant a dose of HBIG (0.5 ml) in the opposite anterolateral thigh.

➤ **Chronic hepatitis C infection**

***Engerix-B***
*Adults:* Initially, 20 mcg I.M.; then second dose of 20 mcg I.M. after 30 days. Give third dose of 20 mcg I.M. 6 months after first dose.

## Human papillomavirus recombinant vaccine, bivalent

Cervarix

*Pharmacologic class:* vaccine
*Pregnancy risk category B*

### AVAILABLE FORMS

*Injection:* 0.5 ml single-dose vial

### INDICATIONS & DOSAGES

➤ **To prevent cervical cancer, cervical intraepithelial neoplasia (CIN) grade 2 or worse and adenocarcinoma in situ, and CIN grade 1 caused by human papilloma virus types 16 and 18**
*Women and girls ages 10 to 25:* 0.5 ml I.M. given as three doses. Give second injection 2 months after first, then give third injection 6 months after first.

## Human papillomavirus recombinant vaccine, quadrivalent

Gardasil

*Pharmacologic class:* virus antigen
*Pregnancy risk category B*

### AVAILABLE FORMS

*Injection:* 0.5 ml single-dose vial

### INDICATIONS & DOSAGES

➤ **To prevent cervical cancer, genital warts, cervical adenocarcinoma in situ, and cervical, vulval, and vaginal intraepithelial neoplasias caused by human papillomavirus types 6, 11, 16, and 18**
*Women and girls ages 9 to 26:* Three separate I.M. injections of 0.5 ml each. Give second injection 2 months after first, then give third injection 6 months after the first.

➤ **To prevent genital warts due to HPV types 6 and 11**
*Males ages 9 to 26:* Three separate I.M. injections of 0.5 ml each. Give second injection 2 months after first, then give third injection 6 months after first.

## Influenza virus vaccine live

Afluria, Agriflu, Fluarix, FluLaval, Fluvirin, Fluzone, Fluzone High-Dose

*Pharmacologic class:* vaccine
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 0.25 ml single-dose syringes (Fluzone); 0.5 ml single-dose syringes (Afluria, Agriflu, Fluarix, Fluvirin, Fluzone, Fluzone High-Dose); 5 ml multidose vials (Afluria, FluLaval, Fluvirin, Fluzone)

### INDICATIONS & DOSAGES

➤ **Active immunization to prevent disease caused by influenza A and B viruses**
*Adults:* 0.5 ml I.M. as a single dose.
*Children age 9 and older:* 0.5 ml I.M. as a single dose (Afluria, Fluarix, Fluvirin, Fluzone).

†Canada

*Children ages 3 to 8:* 0.5 ml I.M. as a single dose (Afluria, Fluarix, Fluzone). Repeat at least 1 month later for those receiving influenza vaccine for first time or who were vaccinated for first time last season with only one dose.
*Children ages 4 to 8:* 0.5 ml I.M. as a single dose (Fluvirin). Repeat at least 1 month later for those receiving influenza vaccine for first time or who were vaccinated for first time last season with only one dose.
*Children ages 6 months to 35 months:* 0.25 ml I.M. as a single dose (Afluria, Fluzone). Repeat at least 1 month later for those receiving influenza vaccine for first time or who were vaccinated for first time last season with only one dose.
*Elderly patients (age 65 and older):* 0.5 ml I.M. as a single dose (Fluzone High-Dose).

## Influenza virus vaccine live, intranasal

FluMist

*Pharmacologic class:* vaccine
*Pregnancy risk category C*

### AVAILABLE FORMS

*Intranasal spray:* 0.2 ml

### INDICATIONS & DOSAGES

➤ **Active immunization to prevent disease caused by influenza A and B viruses**
*Adults younger than age 50 and children older than age 9:* 0.2-ml intranasal dose (0.1 ml in each nostril) once each season.
*Children ages 2 through 8 not previously vaccinated with FluMist:* Two intranasal doses of 0.2 ml (0.1 ml in each nostril) at least 1 month apart for the first season.
*Children ages 2 through 8 previously vaccinated with FluMist:* 0.2-ml intranasal dose (0.1 ml in each nostril) once each season.

## Japanese encephalitis virus vaccine

Ixiaro

*Pharmacologic class:* vaccine
*Pregnancy risk category B*

### AVAILABLE FORMS

*Injection:* 6 mcg/0.5 ml

### INDICATIONS & DOSAGES

➤ **To prevent disease caused by Japanese encephalitis virus**
*Adults age 17 and older:* Two doses of 0.5 ml I.M. 28 days apart.

## Measles, mumps, and rubella virus vaccine, live

M-M-R II

*Pharmacologic class:* vaccine
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* Single-dose vial containing at least 1,000 tissue culture infective doses ($TCID_{50}$), 20,000 $TCID_{50}$ of mumps strain, and 1,000 $TCID_{50}$ rubella virus per 0.5-ml dose.

### INDICATIONS & DOSAGES

➤ **Routine immunization**
*Adults:* 0.5 ml subcutaneously. Patients born after 1957 should receive two doses at least 1 month apart.
*Children:* 0.5 ml subcutaneously. A two-dose schedule is recommended, with first dose given between 12 to 15 months (6 to 12 months in high-risk areas) and second dose given either at ages 4 to 6 or 11 to 12.

†Canada

## Measles, mumps, rubella, and varicella (MMRV) virus vaccine, live, attenuated

ProQuad

*Pharmacologic class:* vaccine
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* Single-dose vial containing at least 3.00 $\log_{10}$ measles $TCID_{50}$, 4.30 $\log_{10}$ mumps $TCID_{50}$, 3.00 $\log_{10}$ rubella $TCID_{50}$, and at least 3.99 $\log_{10}$ varicella PFU per 0.5-ml dose.

### INDICATIONS & DOSAGES

➤ **Routine immunization**

*Children ages 12 months to 12 years:* 0.5 ml subcutaneously. At least 1 month should elapse between a dose of a measles-containing vaccine and a dose of MMRV vaccine. If a second dose of a varicella-containing vaccine is required, at least 3 months should elapse between administration of the two doses.

## Measles virus vaccine, live

Attenuvax

*Pharmacologic class:* vaccine
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* Single-dose vial containing not less than 1,000 tissue culture infective doses ($TCID_{50}$) of measles virus derived from the more attenuated line of Enders attenuated Edmonston strain (grown in chick embryo culture); available in 10- and 50-dose vials

### INDICATIONS & DOSAGES

➤ **Immunization**

*Adults and children ages 12 to 15 months and older:* 0.5 ml (1,000 units) subcutaneously. A two-dose schedule is recommended, with first dose given at 15 months (12 months in high-risk areas) and second dose given at ages 4 to 6 or 11 to 12.

➤ **Measles outbreak control**

*Adults:* Revaccinate school personnel born in or after 1957 if they lack evidence of measles immunity. If outbreak is in a medical facility, revaccinate all workers born in or after 1957 if they lack evidence of immunity.

*Children:* If cases occur in children younger than age 1, vaccinate children as young as age 6 months. Revaccinate all students and siblings if they lack documentation of measles immunity.

## Meningococcal (groups A, C, Y, and W-135) polysaccharide diphtheria toxoid conjugate vaccine (MCV4)

Menactra

## Meningococcal polysaccharide vaccine, groups A, C, Y and W-135 combined (MPSV4)

Menomune A/C/Y/W-135, Menveo (Men ACWY-CRM)

*Pharmacologic class:* vaccine
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* 0.5 ml single-dose vials

### INDICATIONS & DOSAGES

➤ **Active immunization for the prevention of invasive meningococcal disease caused by *Neisseria meningitidis* serogroups A, C, Y, W-135**

*Adults and children ages 2 to 55:* 0.5 ml I.M. MCV4 as a single dose, preferably in the deltoid muscle.

*Adults and children older than age 2:* 0.5 ml subcutaneously MPSV4 as a single dose, preferably in the upper-outer triceps area.

*Adults and children ages 11 to 55:* 0.5 ml Menveo I.M. as single dose, preferably into deltoid muscle.

†Canada

## Mumps virus vaccine, live
Mumpsvax

*Pharmacologic class:* vaccine
*Pregnancy risk category C*

### AVAILABLE FORMS
*Injection:* Single-dose vial containing at least 20,000 tissue culture infective doses ($TCID_{50}$) of attenuated mumps virus derived from Jeryl Lynn mumps strain (grown in chick embryo culture) per 0.5 ml and vial of diluent; single-dose vial containing at least 5,000 $TCID_{50}$ of the U.S. Reference Mumps Virus in each 0.5 ml

### INDICATIONS & DOSAGES
➤ **Immunization**
*Adults and children age 1 and older:* Two doses recommended for both children and adults, separated by at least 4 weeks. 0.5 ml (20,000 units) subcutaneously.

Not recommended in children younger than age 12 months; revaccinate children vaccinated before age 12 months. Routine childhood immunization at ages 12 to 15 months and a second dose at ages 4 to 6 years.

## palivizumab
Synagis

*Pharmacologic class:* monoclonal antibody
*Pregnancy risk category C*

### AVAILABLE FORMS
*Injection:* 50-mg, 100-mg vials

### INDICATIONS & DOSAGES
➤ **Prevention of serious lower respiratory tract disease caused by respiratory syncytial virus (RSV)**
*High-risk infants age 24 months and younger:* 15 mg/kg I.M. monthly throughout RSV season. Give first dose before commencement of RSV season.

## Pneumococcal vaccine, polyvalent
Pneumovax 23

## 7-valent conjugate vaccine
Prevnar

## 13-valent conjugate vaccine
Prevnar 13

*Pharmacologic class:* vaccine
*Pregnancy risk category C*

### AVAILABLE FORMS
*Injection:* 25 mcg each of 23 polysaccharide isolates/0.5 ml (Pneumovax), 2 mcg each of 6 polysaccharide isolates, and 4 mcg of polysaccharide isolate/0.5 ml (Prevnar); 2.2 mcg each of *Streptococcus pneumoniae* serotypes 1, 3, 4, 5, 6A, 7F, 9V, 14, 18C, 19A, 19F, and 23F saccharides and 4.4 mcg of serotype 6B saccharides (Prevnar 13).

### INDICATIONS & DOSAGES
➤ **Pneumococcal immunization**
*Adults and children age 2 and older:* 0.5 ml, Pneumovax I.M. or subcutaneously.
➤ **Immunization against *Streptococcus pneumoniae* and otitis media (Prevnar)**
*Infants ages 6 weeks to 6 months:* 0.5 ml I.M. at 2 month intervals for three doses, then a fourth dose of 0.5 ml I.M. at 12 to 15 months.
*Children ages 7 to 11 months, previously unvaccinated:* 0.5 ml I.M.; three doses with at least 4 weeks between first and second doses, and 8 weeks between second and third doses.
*Children age 12 to 23 months, previously unvaccinated:* Two doses of 0.5 ml I.M. at least 2 months apart.
*Children age 24 months to 9 years, previously unvaccinated:* 0.5 ml I.M. as single dose.
*Healthy children ages 24 to 59 months who have not completed any recommended schedule for pneumococcal vaccine:* 0.5 ml I.M. (one dose).
*Children with underlying medical conditions, ages 24 to 59 months, who have received three doses:* 0.5 ml I.M. (one dose).

†Canada

*Children with underlying medical conditions, ages 24 to 59 months, who have received less than 3 doses:* 0.5 ml I.M.; two doses at least 8 weeks apart.

➤ **Immunization against *S. pneumoniae* and otitis media (Prevnar 13)**

*Infants ages 6 weeks to 15 months:* 0.5 ml I.M. for a total of four doses at 2, 4, 6, and 12 to 15 months of age.

*Children ages 7 to 11 months, previously unvaccinated:* 0.5 ml I.M.; three doses with at least 4 weeks between first and second doses, and 8 weeks between second and third doses.

*Children ages 12 to 23 months, previously unvaccinated:* Two doses of 0.5 ml I.M at least 2 months apart.

*Children ages 24 months to 5 years, previously unvaccinated:* 0.5 ml I.M. as a single dose.

*Children who have received one or more doses of Prevnar (7-valent conjugate vaccine):* Complete the four-dose immunization series with 13-valent conjugate vaccine.

*Children ages 15 months through 5 years who have previously received four doses of Prevnar:* 0.5 mL I.M as a single dose.

## Poliovirus vaccine, inactivated (IPV)

IPOL

*Pharmacologic class:* vaccine
*Pregnancy risk category C*

### AVAILABLE FORMS

*0.5-ml prefilled syringe:* Mixture of three types of poliovirus (types 1, 2, and 3) grown in tissue culture

### INDICATIONS & DOSAGES

➤ **Poliovirus immunization**

*Unvaccinated adults:* 0.5 ml subcutaneously or I.M.; give second dose 4 to 8 weeks later. Give third dose 6 to 12 months later.

*Children:* 0.5 ml subcutaneously or I.M. at ages 2 months and 4 months. Give third dose at ages 6 to 18 months. Give a reinforcing dose of 0.5 ml subcutaneously before entry into school at ages 4 to 6.

## Rabies vaccine, human diploid cell (HDCV)

Imovax Rabies, RabAvert

*Pharmacologic class:* vaccine
*Pregnancy risk category C*

### AVAILABLE FORMS

*I.M. injection:* 2.5 international units rabies antigen/ml, in single-dose vial with diluent

### INDICATIONS & DOSAGES

➤ **Postexposure antirabies immunization**

*Adults and children:* Five 1-ml doses of HDCV I.M. Give first dose as soon as possible after exposure; give additional doses on days 3, 7, 14, and 28 after first dose. If no antibody response occurs after this primary series, booster dose is recommended.

➤ **Postexposure antirabies immunization in previously immunized people**

*Adults and children:* 1 ml I.M. immediately and 1 ml I.M. 3 days later.

➤ **Preexposure preventive immunization for persons in high-risk groups**

*Adults and children:* Three 1-ml injections I.M. Give first dose on day 0 (first day of therapy), second dose on day 7, and third dose on day 21 or 28.

## Rotavirus, live

Rotarix, RotaTeq

*Pharmacologic class:* vaccine
*Pregnancy risk category C*

### AVAILABLE FORMS

*Lyophilized powder for oral suspension:* Rotavirus human 89-12 strain (G1P[8] type); $\geq 10^6$ cell culture infective dose per 1 ml (after reconstitution)

*Oral suspension:* Rotavirus outer capsid protein ($2.2 \times 10^6$ infectious units of G1, $2.8 \times 10^6$ infectious units of G2, $2.2 \times 10^6$ infectious units of G3, $2 \times 10^6$ infectious units of G4, and $2.3 \times 10^6$ infectious units of rotavirus attachment protein P1A[8]) per 2 ml

†Canada

### INDICATIONS & DOSAGES

➤ **Prevention of rotavirus gastroenteritis**

***RotaTeq***

*Children ages 6 to 12 weeks:* 2 ml P.O. Give second dose 4 weeks later, followed by third dose at 10 weeks. Do not give third dose after the patient reaches 32 weeks of age.

***Rotarix***

*Infants ages 6 to 24 weeks:* Give first dose of 1 ml P.O. at age 6 weeks. Give another 1-ml dose P.O. after at least 4 weeks. The two-dose series should be completed by age 24 weeks.

## Rubella virus vaccine, live attenuated (RA 27/3)

Meruvax II

*Pharmacologic class:* vaccine
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* Single-dose vial containing not less than 1,000 tissue culture infective doses ($TCID_{50}$) of Wistar RA 27/3 strain of rubella virus (propagated in human diploid cell culture)

### INDICATIONS & DOSAGES

➤ **Rubella immunization**

*Adults and children age 1 and older:* 0.5 ml or 1,000 units subcutaneously. Give second dose at least 1 month later. Follow routine childhood schedule of first dose at 12 to 15 months of age and second dose at 4 to 6 years of age.

## tetanus toxoid, adsorbed

## tetanus toxoid, fluid

*Pharmacologic class:* vaccine
*Pregnancy risk category C*

### AVAILABLE FORMS

**tetanus toxoid, adsorbed**

*Injection:* 5 limit flocculation (Lf) units inactivated tetanus/0.5-ml dose, in 0.5-ml syringes and 5-ml vials

**tetanus toxoid, fluid**

*Injection:* 4 Lf units inactivated tetanus/7.5-ml vials

### INDICATIONS & DOSAGES

➤ **Primary immunization to prevent tetanus**

*Adults and children age 7 and older:* 0.5 ml (adsorbed) I.M. 4 to 8 weeks apart for two doses; then give third dose 6 to 12 months after second.

*Children ages 6 weeks to 6 years:* Although use isn't recommended in children younger than age 7, the following dosage schedule may be used: 0.5 ml (adsorbed) I.M. for two doses, each 4 to 8 weeks apart, followed by a third dose 6 to 12 months after the second dose. Diphtheria and tetanus toxoids and acellular pertussis vaccine adsorbed (DTaP) is recommended for active immunization in children younger than age 7.

➤ **Booster dose to prevent tetanus**

*Adults and children age 7 and older:* 0.5 ml I.M. at 10-year intervals.

➤ **Postexposure prevention of tetanus**

*Adults:* For a clean, minor wound, give emergency booster dose if more than 10 years have elapsed since last dose. For all other wounds, give booster dose if more than 5 years have elapsed since last dose.

## varicella virus vaccine

Varivax

*Pharmacologic class:* vaccine
*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection:* Single-dose vial containing 1,350 plaque-forming units of Oka/Merck varicella virus (live)

### INDICATIONS & DOSAGES

➤ **To prevent varicella zoster (chickenpox) infections**

*Adults and children age 13 and older:* 0.5 ml subcutaneously; then, second 0.5-ml dose 4 to 8 weeks later.

*Children ages 1 to 12:* 0.5 ml subcutaneously.

†Canada

## zoster vaccine, live
Zostavax

*Pharmacologic class:* vaccine, live attenuated
*Pregnancy risk category C*

### AVAILABLE FORMS
*Injection:* Lyophilized vaccine of 19,400 plaque-forming units in a single-dose vial with supplied diluent

### INDICATIONS & DOSAGES
➤ **Prevention of herpes zoster (shingles)**
*Adults age 60 and older:* One reconstituted vial subcutaneously as a single dose preferably in the upper arm.

## vitamin A (retinol)

Aquasol A, Palmitate-A

*Pregnancy risk category A if dose is under 800 mcg retinol equivalents; C if dose exceeds 800 mcg retinol equivalents; X for Aquasol*

### AVAILABLE FORMS

*Capsules:* 10,000 international units ♢, 15,000 international units ♢, 25,000 international units
*Injection:* 2-ml vials (50,000 international units/ml with 0.5% chlorobutanol, polysorbate 80, butylated hydroxyanisole, butylated hydroxytoluene)
*Tablets:* 5,000 international units ♢

### INDICATIONS & DOSAGES

➤ **RDA**

*Men and boys older than age 14:* Give 900 mcg retinol equivalent (RE) or 3,000 international units.
*Women and girls older than age 14:* Give 700 mcg RE or 2,330 international units.
*Children ages 9 to 13:* Give 600 mcg RE or 2,000 international units.
*Children ages 4 to 8:* Give 400 mcg RE or 1,330 international units.
*Children ages 1 to 3:* Give 300 mcg RE or 1,000 international units.
*Infants ages 7 to 12 months:* 500 mcg RE or 1,665 international units.
*Neonates and infants younger than age 6 months:* 400 mcg RE or 1,330 international units.
*Pregnant women ages 14 to 18:* Give 750 mcg RE or 2,500 international units.
*Pregnant women ages 19 to 50:* Give 770 mcg RE or 2,564 international units.
*Breast-feeding women ages 14 to 18:* Give 1,200 mcg RE or 4,000 international units.
*Breast-feeding women ages 19 to 50:* Give 1,300 mcg RE or 4,330 international units.

➤ **Severe vitamin A deficiency**

*Adults and children older than age 8:* Give 100,000 international units I.M. or 100,000 to 500,000 international units P.O. for 3 days; then 50,000 international units P.O. or I.M. daily for 2 weeks, followed by 10,000 to 20,000 international units P.O. for 2 months. Follow with adequate dietary nutrition and RE vitamin A supplements.
*Children age 8 and younger:* 17,500 to 35,000 international units I.M. daily for 10 days.

➤ **Maintenance dose to prevent recurrence of vitamin A deficiency**

*Children ages 1 to 8:* Give 5,000 to 10,000 international units P.O. daily for 2 months; then adequate dietary nutrition and RE vitamin A supplements.

## vitamin B complex

## cyanocobalamin (vitamin $B_{12}$)

Big ShotB12, CaloMist, Crystamine, Crysti 1000, Cyanoject, Cyomin, Nascobal, Rubesol-1000, Twelve Resin-K

## hydroxocobalamin (vitamin $B_{12}$)

CYANOKIT, Hydro-Crysti-12, LA-12

*Pregnancy risk category A; C if dose exceeds RDA*

### AVAILABLE FORMS

**cyanocobalamin**
*Injection:* 100 mcg/ml, 1,000 mcg/ml
*Intranasal spray:* 25 mcg/spray, 500 mcg/spray

*Tablets* ◊*:* 25 mcg ◊, 50 mcg ◊, 100 mcg ◊, 250 mcg ◊, 500 mcg ◊, 1,000 mcg ◊, 5,000 mcg ◊
*Lozenges:* 50 mcg ◊, 100 mcg ◊, 250 mcg ◊, 500 mcg ◊
**hydroxocobalamin**
*Injection:* 1,000 mcg/ml; 2.5 g/vial

## INDICATIONS & DOSAGES

➤ **RDA for cyanocobalamin**
*Adults and children age 14 and older:* 2.4 mcg.
*Children ages 9 to 13:* Give 1.8 mcg.
*Children ages 4 to 8:* Give 1.2 mcg.
*Children ages 1 to 3:* Give 0.9 mcg.
*Infants ages 6 months to 1 year:* 0.5 mcg.
*Neonates and infants younger than age 6 months:* 0.4 mcg.
*Pregnant women:* 2.6 mcg.
*Breast-feeding women:* 2.8 mcg.

➤ **Vitamin $B_{12}$ deficiency from inadequate diet, subtotal gastrectomy, or other condition, disorder, or disease, except malabsorption, related to pernicious anemia or other GI disease**
*Adults:* 30 mcg hydroxocobalamin I.M. daily for 5 to 10 days, depending on severity of deficiency. Maintenance dose is 100 to 200 mcg I.M. once monthly or 500 mcg gel intranasally once weekly. For subsequent prophylaxis, advise adequate nutrition and daily RDA vitamin B12 supplements.
*Children:* 1 to 5 mg hydroxocobalamin in single doses of 100 mcg I.M. over 2 or more weeks, depending on severity of deficiency. Maintenance dose is 60 mcg/month I.M. For subsequent prophylaxis, advise adequate nutrition and daily RDA vitamin B12 supplements.

➤ **Pernicious anemia or vitamin $B_{12}$ malabsorption**
*Adults:* Initially, 100 mcg cyanocobalamin I.M. or subcutaneously daily for 6 to 7 days. If response is observed, 100 mcg I.M. or subcutaneously every other day for 7 doses, then 100 mcg every 3 to 4 days for 2 to 3 weeks; then 100 mcg I.M. or subcutaneously once monthly.

➤ **Maintenance therapy for remission of pernicious anemia after I.M. vitamin $B_{12}$ therapy in patients without nervous system involvement; dietary deficiency, malabsorption disorders, and inadequate secretion of intrinsic factor**
*Adults:* Initially, one spray in one nostril once weekly (Nascobal). Give at least 1 hour before or after hot foods or liquids. Or one spray in each nostril daily (total daily dose of 50 mcg CaloMist). May increase to one spray in each nostril twice daily (total daily dose of 100 mcg) as needed.

➤ **Prevention of methylmalonic aciduria**
*Mothers and their neonates:* 5,000 mcg cyanocobalamin I.M. daily to the mother prepartum, then 1,000 mcg I.M. daily to the neonate for 11 days, with a protein-restricted diet.

➤ **Methylmalonic aciduria**
*Neonates:* 1,000 mcg cyanocobalamin I.M. daily.

➤ **Schilling test flushing dose**
*Adults and children:* 1,000 mcg hydroxocobalamin I.M. as single dose.

➤ **Cyanide poisoning**
*Adults:* Initially, 5 g I.V. over 15 minutes. Based on patient's condition may repeat 5 g dose I.V. over 15 minutes to 2 hours.

# folic acid (vitamin $B_9$)

Folvite

*Pregnancy risk category A*

## AVAILABLE FORMS

*Injection:* 10-ml vials (5 mg/ml with 1.5% benzyl alcohol, 5 mg/ml with 1.5% benzyl alcohol and 0.2% ethylenediaminetetraacetic acid)
*Tablets:* 0.4 mg ◊, 0.8 mg ◊, 1 mg

## INDICATIONS & DOSAGES

➤ **RDA**

*Adults and children age 14 and older:* Give 400 mcg.
*Children ages 9 to 13:* Give 300 mcg.
*Children ages 4 to 8:* Give 200 mcg.
*Children ages 1 to 3:* Give 150 mcg.
*Infants ages 7 months to 1 year:* 80 mcg.
*Neonates and infants younger than age 6 months:* 65 mcg.
*Pregnant women:* 600 mcg.
*Breast-feeding women:* 500 mcg.

➤ **Megaloblastic or macrocytic anemia from folic acid or other nutritional deficiency, hepatic disease, alcoholism, intestinal obstruction, or excessive hemolysis**

*Adults and children age 4 and older:* 0.4 to 1 mg P.O., I.M., or subcutaneously daily. After anemia caused by folic acid deficiency is corrected, proper diet and RDA supplements are needed to prevent recurrence.
*Children younger than age 4:* Up to 0.3 mg P.O., I.M., or subcutaneously daily.
*Pregnant and breast-feeding women:* 0.8 mg P.O., I.M., or subcutaneously daily.

➤ **To prevent fetal neural tube defects during pregnancy**

*Adults:* 0.4 mg P.O. daily.

➤ **To prevent megaloblastic anemia during pregnancy to prevent fetal damage**

*Adults:* Up to 1 mg P.O., I.M., or subcutaneously daily throughout pregnancy.

➤ **Test for folic acid deficiency in patients with megaloblastic anemia without masking pernicious anemia**

*Adults and children:* 0.1 to 0.2 mg P.O. or I.M. for 10 days while maintaining a diet low in folate and vitamin $B_{12}$.

# leucovorin calcium (citrovorum factor, folinic acid)

*Pregnancy risk category C*

## AVAILABLE FORMS

*Injection:* 1-ml ampule (3 mg/ml with 0.9% benzyl alcohol); 10 mg/ml in 5-ml vial; 50-mg, 100-mg, 350-mg, 500-mg vials for reconstitution (contains no preservatives)
*Tablets:* 5 mg, 15 mg, 25 mg

## INDICATIONS & DOSAGES

➤ **Overdose of folic acid antagonist (methotrexate, trimethoprim, or pyrimethamine)**

*Adults and children:* I.M. or I.V. dose equivalent to weight of antagonist given. For methotrexate overdose, up to 75 mg I.V. infusion within 12 hours, followed by 12 mg I.M. every 6 hours for four doses. For adverse effects after average doses of methotrexate, 6 to 12 mg I.M. every 6 hours for four doses.

➤ **Leucovorin rescue after high methotrexate dose in treatment of malignant disease**

*Adults and children:* 10 mg/m$^2$ P.O., I.M., or I.V. every 6 hours until methotrexate level falls below $5 \times 10^{-8}$ M.

➤ **Megaloblastic anemia from congenital enzyme deficiency**

*Adults and children:* 3 to 6 mg I.M. daily.

➤ **Folate-deficient megaloblastic anemia**

*Adults and children:* Up to 1 mg I.M. daily. Duration of treatment depends on hematologic response.

➤ **To prevent hematologic toxicity from pyrimethamine or trimethoprim therapy**

*Adults and children:* 400 mcg to 5 mg I.M. with each dose of folic acid antagonist. Oral dosages of 10 to 35 mg once daily or 25 mg once weekly may also be used.

➤ **Hematologic toxicity from pyrimethamine or trimethoprim therapy**

*Adults and children:* 5 to 15 mg I.M. daily.

➤ **Palliative treatment of advanced colorectal cancer**

*Adults:* 20 mg/m$^2$ I.V.; then fluorouracil 425 mg/m$^2$ I.V. or 200 mg/m$^2$ I.V. (over 3 minutes or longer) followed by fluorouracil 370 mg/m$^2$ daily for 5 consecutive days. Repeat at 4-week intervals for two additional courses; then at intervals of 4 to 5 weeks, if tolerated.

## niacin (nicotinic acid, vitamin $B_3$)
Niacor ◊, Niaspan ◊, Slo-Niacin ◊

## niacinamide ◊ (nicotinamide ◊)

*Pregnancy risk category A; C if dose exceeds RDA*

### AVAILABLE FORMS
**niacin**
*Capsules (timed-release):* 250 mg ◊, 500 mg
*Tablets:* 50 mg ◊, 100 mg ◊, 250 mg ◊, 500 mg
*Tablets (extended-release):* 250 mg ◊, 400 ◊, 500 mg ◊, 750 mg ◊, 1,000 mg ◊
**niacinamide**
*Tablets:* 50 mg ◊, 100 mg ◊, 125 mg ◊, 250 mg ◊, 500 mg ◊

### INDICATIONS & DOSAGES
➤ **RDA**
*Adult men and boys ages 14 to 18:* Give 16 mg.
*Adult women and girls ages 14 to 18:* Give 14 mg.
*Children ages 9 to 13:* Give 12 mg.
*Children ages 4 to 8:* Give 8 mg.
*Children ages 1 to 3:* Give 6 mg.
*Infants ages 7 months to 1 year:* 4 mg.
*Neonates and infants younger than age 6 months:* 2 mg.
*Pregnant women:* 18 mg.
*Breast-feeding women:* 17 mg.
➤ **Pellagra**
*Adults:* Initially, 500 mg P.O. daily at bedtime. Titrate to patient response and tolerance. Maximum dose is 2,000 mg daily.
*Children:* 100 to 300 mg P.O. daily in divided doses.
➤ **Niacin deficiency**
*Adults:* Up to 100 mg P.O. daily.
➤ **Hyperlipidemias, especially with hypercholesterolemia**
*Adults:* 250 mg P.O. daily at bedtime. Increase at 4- to 7-day intervals up to 1.5 to 2 g P.O. daily divided b.i.d. to t.i.d. Maximum 6 g daily. Or, 1 to 2 g extended-release tablets P.O. daily at bedtime.

## paricalcitol
Zemplar

*Pregnancy risk category C*

### AVAILABLE FORMS
*Capsules:* 1 mcg, 2 mcg, 4 mcg
*Injection:* 2 mcg/ml, 5 mcg/ml

### INDICATIONS & DOSAGES
➤ **To prevent or treat secondary hyperparathyroidism in patients with stage 3 or 4 chronic kidney disease**
*Adults:* Initial dose is based on baseline intact parathyroid hormone (iPTH) levels. If iPTH is less than or equal to 500 picograms (pg)/ml, give 1 mcg P.O. daily or 2 mcg P.O. three times weekly, no more often than every other day. If iPTH is greater than 500 pg/ml, give 2 mcg P.O. daily or 4 mcg P.O. three times weekly, no more often than every other day. Adjust dose at 2- to 4-week intervals, based on iPTH levels.
➤ **To prevent or treat secondary hyperparathyroidism in patients with chronic renal failure**
*Adults:* 0.04 to 0.1 mcg/kg (2.8 to 7 mcg) I.V. no more often than every other day during dialysis. Doses as high as 0.24 mcg/kg (16.8 mcg) may be safely given. If satisfactory response isn't observed, increase dosage by 2 to 4 mcg at 2- to 4-week intervals.

## pyridoxine hydrochloride (vitamin $B_6$)
Aminoxin, Vitelle Nestrex

*Pregnancy risk category A; C if dose exceeds RDA*

### AVAILABLE FORMS
*Injection:* 100 mg/ml
*Tablets:* 25 mg ◊, 50 mg ◊, 100 mg ◊, 250 mg ◊, 500 mg ◊
*Tablets (enteric-coated):* 20 mg ◊

### INDICATIONS & DOSAGES
➤ **RDA**
*Adults ages 19 to 50:* Give 1.3 mg.

*Men age 51 and older:* 1.7 mg.
*Women age 51 and older:* 1.5 mg.
*Boys ages 14 to 18:* Give 1.3 mg.
*Girls ages 14 to 18:* Give 1.2 mg.
*Children ages 9 to 13:* Give 1 mg.
*Children ages 4 to 8:* Give 0.6 mg.
*Children ages 1 to 3:* Give 0.5 mg.
*Infants ages 7 months to 1 year:* 0.3 mg.
*Neonates and infants younger than age 6 months:* 0.1 mg.
*Pregnant women:* 1.9 mg.
*Breast-feeding women:* 2 mg.

➤ **Dietary vitamin $B_6$ deficiency**
*Adults:* 100 to 200 mg P.O. daily. Or, 10 to 20 mg I.M. or I.V. daily for several weeks; then maintenance dose is 2 to 5 mg daily for several weeks.

➤ **Seizures related to vitamin $B_6$ deficiency or dependency**
*Children and neonates:* 10 to 100 mg I.V. or I.M. in single dose.

➤ **To prevent vitamin $B_6$ deficiency during drug therapy with isoniazid or penicillamine**
*Adults:* 10 to 50 mg P.O. daily.

➤ **Antidote for isoniazid poisoning**
*Adults:* 4 g I.V.; then 1 g I.M. every 30 minutes until amount of pyridoxine given equals amount of isoniazid ingested.

## sodium fluoride

Fluor-A-Day†, Fluoritab, Fluorodex, Flura, Flura-Drops, Flura-Loz, Karidium, Luride, Luride, Lozi-Tabs, Luride-SF, Lozi-Tabs, Pediaflor, Pedi-Dent†, Pharmaflur, Pharmaflur df, Pharmaflur 1.1, Phos-Flur

## sodium fluoride, topical

*Pregnancy risk category NR*

### AVAILABLE FORMS

**Sodium fluoride**
*Drops:* 0.125 mg/drop, 0.25 mg/drop, 0.2 mg/ml, 0.5 mg/ml
*Lozenges:* 1 mg
*Tablets:* 1 mg
*Tablets (chewable):* 0.25 mg, 0.5 mg, 1 mg

**Sodium fluoride, topical**
*Gel:* 0.1%, 0.5%, 1.2%, 1.23%
*Gel Drops:* 0.5%
*Rinse:* 0.02% ◊, 0.04% ◊

### INDICATIONS & DOSAGES

➤ **To prevent dental caries**
*Adults and children older than age 6:* Give 5 to 10 ml of rinse or thin ribbon of gel applied to teeth with toothbrush or mouth trays for at least 1 minute at bedtime.

***If fluoride ion level in drinking water is less than 0.3 parts/million (ppm)***
*Children ages 6 to 16:* Give 1 mg P.O. daily.
*Children ages 3 to 5:* Give 0.5 mg P.O. daily.
*Infants and children ages 6 months to 2 years:* 0.25 mg P.O. daily.

***If fluoride ion level in drinking water is 0.3 to 0.6 ppm***
*Children ages 6 to 16:* Give 0.5 mg P.O. daily.
*Children ages 3 to 5:* Give 0.25 mg P.O. daily.

## thiamine hydrochloride (vitamin $B_1$)

Betaxin†, Thiamiject†, Thiamilate

*Pregnancy risk category A; C if dose exceeds RDA*

### AVAILABLE FORMS

*Injection:* 100 mg/ml
*Tablets:* 50 mg ◊, 100 mg ◊, 250 mg ◊, 500 mg
*Tablets (enteric-coated):* 20 mg ◊

### INDICATIONS & DOSAGES

➤ **RDA**
*Adult men:* 1.2 mg.
*Adult women:* 1.1 mg.
*Boys ages 14 to 18:* Give 1.2 mg.
*Girls ages 14 to 18:* Give 1.2 mg.
*Children ages 9 to 13:* Give 0.9 mg.
*Children ages 4 to 8:* Give 0.6 mg.
*Children ages 1 to 3:* Give 0.5 mg.
*Infants ages 7 months to 1 year:* 0.3 mg.

*Neonates and infants younger than age 6 months:* 0.2 mg.
*Pregnant women:* 1.4 mg.
*Breast-feeding women:* 1.4 mg.

➤ **Beriberi**
*Adults:* Depending on severity, 5 to 20 mg I.M. t.i.d. for 2 weeks; then dietary correction and multivitamin supplement containing 5 to 30 mg thiamine daily for 1 month.
*Children:* Depending on severity, 10 to 25 mg I.V. or I.M. daily. For noncritically ill children, 10 to 50 mg P.O. daily in divided doses for several weeks with adequate diet.

➤ **Wet beriberi with myocardial failure**
*Adults and children:* 10 to 20 mg I.V. t.i.d.

➤ **Wernicke encephalopathy**
*Adults:* Initially, 100 mg I.V.; then 50 to 100 mg I.V. or I.M. daily until patient is consuming a regular balanced diet.

## vitamin C (ascorbic acid)

Ascor L 500, Cecon ◊, Cevi-Bid ◊, Dull-C ◊, Flavorcee ◊, N'ice ◊, Vicks Vitamin C Drops ◊, Vita-C ◊

*Pregnancy risk category A; C if dose exceeds RDA*

### AVAILABLE FORMS

*Capsules:* 500 mg ◊
*Capsules (timed-release):* 500 mg ◊, 1,000 mg ◊
*Crystals:* 1,000 mg/¼ tsp ◊
*Injection:* 500 mg/ml
*Lozenges:* 60 mg ◊
*Oral solution:* 100 mg/ml ◊
*Powder:* 60 mg/¼ tsp ◊, 1,060 mg/¼ tsp ◊
*Tablets:* 250 mg ◊, 500 mg ◊, 1,000 mg ◊, 1,500 mg ◊
*Tablets (timed-release):* 500 mg ◊, 1,000 mg ◊

### INDICATIONS & DOSAGES

➤ **RDA**
*Men age 19 and older:* 90 mg.
*Women age 19 and older:* 75 mg.
*Boys ages 14 to 18:* Give 75 mg.
*Girls ages 14 to 18:* Give 65 mg.
*Children ages 9 to 13:* Give 45 mg.
*Children ages 4 to 8:* Give 25 mg.
*Children ages 1 to 3:* Give 15 mg.
*Infants ages 7 months to 1 year:* 50 mg.
*Neonates and infants up to age 6 months:* 40 mg.
*Pregnant women:* 80 to 85 mg.
*Breast-feeding women:* 115 to 120 mg.

➤ **Frank and subclinical scurvy**
*Adults:* Depending on severity, 100 to 250 mg P.O., I.V., I.M., or subcutaneously daily; then 70 to 150 mg daily for maintenance.
*Children:* Depending on severity, 100 to 300 mg P.O., I.V., I.M., or subcutaneously daily; then at least 30 mg daily for maintenance.

➤ **Extensive burns, delayed fracture or wound healing, postoperative wound healing, severe febrile or chronic disease states**
*Adults:* 300 to 500 mg I.V., I.M., or subcutaneously daily for 7 to 10 days; 1 to 2 g daily for extensive burns.
*Children:* 100 to 200 mg P.O., I.V., I.M, or subcutaneously daily.

➤ **To acidify urine**
*Adults:* 4 to 12 g P.O. daily in divided doses.

➤ **Macular degeneration**
*Adults:* 500 mg daily in combination with beta carotene, vitamin E, zinc, and copper.

## vitamin D

## cholecalciferol (vitamin $D_3$)
Delta-D ◊, Maximum-D

## ergocalciferol (vitamin $D_2$)
Calciferol, Drisdol

*Pregnancy risk category A; C if dose exceeds RDA*

### AVAILABLE FORMS
**cholecalciferol**
*Capsules:* 250 mcg (10,000 international units)
*Tablets:* 10 mcg (400 international units), 25 mcg (1,000 international units)
**ergocalciferol**
*Capsules:* 1.25 mg (50,000 international units)
*Injection:* 12.5 mg (500,000 international units)/ml
*Oral liquid:* 200 mcg (8,000 international units)/ml in 60-ml dropper bottle ◊

### INDICATIONS & DOSAGES
➤ **RDA for cholecalciferol or ergocalciferol**
*Adults older than age 70:* Give 15 mcg (600 international units).
*Adults ages 51 to 70:* Give 10 mcg (400 international units).
*Infants, children, and adults up to age 50:* Give 5 mcg (200 international units).
*Pregnant or breast-feeding women:* 5 mcg (200 international units).

➤ **Rickets and other vitamin D deficiency diseases**
*Adults:* Initially, 10,000 international units P.O. or I.M. daily; expect to increase, based on response, to maximum of 500,000 international units daily.
*Children:* 1,500 to 5,000 international units P.O. or I.M. daily for 2 to 4 weeks; repeat after 2 weeks, if needed. Or, give single dose of 600,000 international units. After correction of deficiency, maintenance includes adequate diet and RDA supplements.

➤ **Hypoparathyroidism**
*Adults:* 625 mcg to 5 mg ergocalciferol P.O. daily with calcium supplement
*Children:* 1.25 mg to 5 mg of ergocalciferol P.O. daily with calcium supplement.

➤ **Familial hypophosphatemia**
*Adults:* 250 mcg to 1.5 mg P.O. daily of ergocalciferol with phosphate supplement.
*Children:* 1 to 2 mg P.O. daily of ergocalciferol with phosphate supplement, increased in 250- to 500-mcg increments at 3- to 4-month intervals based on response.

## vitamin D analogue

## doxercalciferol
Hectorol

*Pregnancy risk category B*

### AVAILABLE FORMS
*Capsules:* 0.5 mcg, 2.5 mcg
*Injection:* 2 mcg/ml

### INDICATIONS & DOSAGES
➤ **Secondary hyperparathyroidism in dialysis patients with chronic kidney disease**
*Adults:* Initially, 10 mcg P.O. three times weekly at dialysis. Adjust dosage as needed to lower intact parathyroid hormone (iPTH) levels to 150 to 300 picograms (pg)/ml. Increase dose by 2.5 mcg at 8-week intervals if iPTH level hasn't decreased by 50% and fails to reach target range. Maximum dose is 20 mcg P.O. three times weekly. If iPTH levels fall below 100 pg/ml, suspend drug for 1 week; then give dose of at least 2.5 mcg less than last dose Or, 4 mcg I.V. bolus 3 times a week at the end of dialysis about every other day. Adjust dose as needed to lower iPTH levels to 150 to 300 pg/ml. Dosage may be increased by 1 to 2 mcg at 8-week intervals if the iPTH level isn't decreased by 50% and fails to reach target range. Maximum dose is 18 mcg weekly. If iPTH levels go below 100 pg/ml, suspend

drug for 1 week, then resume at a dose that's at least 1 mcg P.O. lower than the last dose.

➤ **Secondary hyperparathyroidism in predialysis patients with stage 3 or 4 chronic kidney disease**

*Adults:* 1 mcg P.O. daily. Adjust dosage as needed to lower iPTH levels to 35 to 70 pg/ml for stage 3 or 70 to 110 pg/ml for stage 4. Increase dosage at 2-week intervals by 0.5 mcg if levels are above 70 pg/ml for stage 3 or above 110 pg/ml for stage 4. If level falls below 35 pg/ml for stage 3 or 70 pg/ml for stage 4, suspend treatment for 1 week, then give dose at least 0.5 mcg lower than last dose. Maximum dose, 3.5 mcg daily.

## vitamin E (tocopherols)

Aquasol E ◊

*Pregnancy risk category A*

### AVAILABLE FORMS

*Capsules:* 100 international units ◊, 200 international units ◊, 400 international units ◊, 600 international units ◊, 1,000 international units ◊
*Drops:* 50 international units/ml
*Tablets:* 100 international units ◊, 200 international units ◊, 400 international units ◊, 500 international units ◊, 600 international units ◊, 1,000 international units ◊

### INDICATIONS & DOSAGES

*Note*: RDAs for vitamin E have been converted to α-tocopherol equivalents (α-TE). One α-TE equals 1 mg of D-α tocopherol, or 1.49 international units.

➤ **RDA**

*Adults and children ages 14 to 18:* Give 15 mg.
*Children ages 9 to 13:* Give 11 mg.
*Children ages 4 to 8:* Give 7 mg.
*Children ages 1 to 3:* Give 6 mg.
*Infants ages 7 months to 1 year:* 5 mg.
*Neonates and infants younger than age 6 months:* 4 mg.
*Pregnant women:* 15 mg.
*Breast-feeding women:* 19 mg.

## vitamin K analogue

## phytonadione (vitamin $K_1$)

AquaMEPHYTON, Mephyton

*Pregnancy risk category C*

### AVAILABLE FORMS

*Injection (emulsion):* 2 mg/ml, 10 mg/ml
*Tablets:* 5 mg

### INDICATIONS & DOSAGES

➤ **RDA**

*Men age 19 and older:* 120 mcg.
*Women age 19 and older, including pregnant and breast-feeding women:* 90 mcg.
*Children ages 14 to 18:* Give 75 mcg.
*Children ages 9 to 13:* Give 60 mcg.
*Children ages 4 to 8:* Give 55 mcg.
*Children ages 1 to 3:* Give 30 mcg.
*Infants ages 7 months to 1 year:* 2.5 mcg.
*Neonates and infants younger than age 6 months:* 2 mcg.

➤ **Hypoprothrombinemia caused by vitamin K malabsorption, drug therapy, or excessive vitamin A dosage**

*Adults:* Depending on severity, 2.5 to 25 mg P.O., I.M., or subcutaneously, repeated and increased up to 50 mg as needed.

➤ **Hypoprothrombinemia caused by effect of oral anticoagulants**

*Adults:* 2.5 to 10 mg P.O., I.M., or subcutaneously, based on PT and INR; repeat if needed within 12 to 48 hours after oral dose or within 6 to 8 hours after parenteral dose.

➤ **To prevent hemorrhagic disease of newborn**
*Neonates:* 0.5 to 1 mg I.M. within 1 hour after birth.

➤ **Hemorrhagic disease of newborn**
*Neonates:* 1 mg subcutaneously or I.M. Higher doses may be needed if mother has been receiving oral anticoagulants.

# Therapeutic drug monitoring guidelines

| Drug | Laboratory test monitored | Therapeutic ranges of test |
|---|---|---|
| aminoglycoside antibiotics (amikacin, gentamicin, tobramycin) | Amikacin peak<br>Amikacin trough<br>Creatinine<br>Gentamicin, tobramycin peak<br>Gentamicin, tobramycin trough | 20–30 mcg/ml<br>1–8 mcg/ml<br>0.6–1.3 mg/dl<br>6–10 mcg/ml<br><2 mcg/ml |

***** For those areas marked with asterisks, the following values can be used:

Hemoglobin: Women: 12–16 g/dl
Men: 14–18 g/dl
Hematocrit: Women: 37%–48%
Men: 42%–52%
RBCs: 4–5.5 $\times$ $10^6$/mm$^3$
WBCs: 5–10 $\times$ $10^3$/mm$^3$

Differential: Neutrophils: 45%–74%
Bands: 0%–8%
Lymphocytes: 16%–45%
Monocytes: 4%–10%
Eosinophils: 0%–7%
Basophils: 0%–2%

| Monitoring guidelines |
| --- |
| Wait until after the third dose is given to check drug levels. Obtain blood for peak level 30 minutes after I.V. infusion ends or 60 minutes after I.M. administration. For trough levels, draw blood just before next dose. Dosage may need to be adjusted accordingly. Recheck after three doses. Monitor creatinine and BUN levels and urine output for signs of decreasing renal function. Monitor urine for increased proteins, cells, and casts. |
| Monitor creatinine, BUN, and electrolyte levels at least weekly during therapy. Regularly monitor blood counts and liver function test results during therapy. |
| Monitor WBC with differential before therapy, monthly during the first 3 to 6 months, then periodically for the first year. Monitor renal function and potassium level periodically. |
| Monitor WBC with differential weekly during therapy. Specimen cultures and sensitivities will determine the cause of the infection and the best treatment. |
| Check renal function and hematologic values before starting therapy and at least annually thereafter. If the patient has impaired renal function, don't use metformin because it may cause lactic acidosis. Monitor response to therapy by periodically evaluating fasting glucose and glycosylated hemoglobin levels. A patient's home monitoring of glucose levels helps monitor compliance and response. |
| Monitor blood counts and platelets before therapy, monthly during the first 2 months, then yearly. Liver function, BUN, and urinalysis should be checked before and periodically during therapy. |
| Before starting, patient must have a baseline WBC count of at least 3,500/$mm^3$ and a baseline absolute neutrophil count (ANC) of at least 2,000/$mm^3$. During the first 6 months of therapy, monitor patient weekly. If acceptable WBC and ANC values are maintained, reduce monitoring to every other week. After 6 months of monitoring without leukopenia, monitor every 4 weeks. WBC count and ANC must be monitored weekly for at least 4 weeks after stopping drug. |
| Monitor electrolyte and glucose levels regularly during long-term therapy. |

Bands: 0%–8%
Lymphocytes: 16%–45%
Monocytes: 4%–10%
Eosinophils: 0%–7%
Basophils: 0%–2%

| Monitoring guidelines |
| --- |
| Check digoxin levels just before the next dose or at least 6 to 8 hours after the last dose. To monitor maintenance therapy, check drug levels at least 1 to 2 weeks after therapy is initiated or changed.<br>Make any adjustments in therapy based on entire clinical picture, not solely on drug levels. Also, check electrolyte levels and renal function periodically during therapy. |
| After therapy is initiated or changed, monitor the hematocrit twice weekly for 2 to 6 weeks until stabilized in the target range and a maintenance dose determined. Monitor hematocrit regularly thereafter. |
| Check drug level 8 to 10 days after therapy is initiated or changed. Periodically monitor CBC with differential, liver function tests, and urinalysis. |
| Therapy is usually withdrawn after 3 months if response is inadequate. Patient must be fasting to measure triglyceride levels. Periodically obtain blood counts during the first 12 months. |
| When drug is given by continuous I.V. infusion, check PTT every 4 hours in the early stages of therapy, and daily thereafter. When drug is given by deep subcutaneous injection, check PTT 4 to 6 hours after injection, and daily thereafter. Periodically during therapy, check platelet counts and hematocrit and test for occult blood in stools. |
| Perform liver function tests at baseline, 6 to 12 weeks after therapy is initiated or changed, and about every 6 months thereafter. If adequate response isn't achieved within 6 weeks, consider changing the therapy. |
| A patient's home monitoring of glucose levels helps measure compliance and response.<br>Glycosylated hemoglobin level is a good measure of long-term control. |
| Use a serum or urine pregnancy test with a sensitivity of at least 25 milli-international units/ml. Perform one test before therapy and a second test during the first 5 days of the menstrual cycle before therapy begins or at least 11 days after the last unprotected act of sexual intercourse, whichever is later. Repeat pregnancy tests monthly. Obtain baseline liver function tests and lipid levels; repeat every 1 to 2 weeks until a response is established (usually 4 weeks). |

Bands: 0%–8%
Lymphocytes: 16%–45%
Monocytes: 4%–10%
Eosinophils: 0%–7%
Basophils: 0%–2%

| Monitoring guidelines |
|---|
| Obtain baseline CBC with differential and platelet count. Repeat weekly, especially if more than 2 weeks of therapy are received. Monitor liver function tests and amylase and lipase levels during therapy. |
| Checking drug levels is crucial to the safe use of the drug. Obtain level immediately before next dose. Monitor level twice weekly until stable. Once at steady state, level should be checked weekly; when the patient is on the appropriate maintenance dose, levels should be checked every 2 or 3 months. Monitor CBC; creatinine, electrolyte, and fasting glucose levels; and thyroid function test results before therapy starts and periodically thereafter. |
| Monitor drug levels according to dosing protocol. Monitor CBC with differential, platelet count, and liver and renal function test results more frequently when therapy starts or changes and when methotrexate levels may be elevated, such as when the patient is dehydrated. |
| Obtain baseline liver function tests and monitor closely during the first 12 weeks of therapy. Continue to monitor regularly during therapy. Check CBC with differential and platelet count before therapy and periodically during therapy. Monitor lipid levels during efavirenz therapy. Monitor amylase level during efavirenz and delavirdine therapy. |
| Monitor drug level immediately before next dose and 7 to 10 days after therapy starts or changes. Obtain a CBC at baseline and monthly early in therapy. Watch for toxic effects at therapeutic levels. Adjust the measured level for hypoalbuminemia or renal impairment, which can increase free drug levels. |
| Measure drug levels 6 to 12 hours after a continuous infusion is started or immediately before the next oral dose. Combined procainamide and NAPA levels can be used as an index of toxicity when renal impairment exists. Obtain CBC, liver function tests, and ANA titer periodically during longer-term therapy. |

| | Glycosylated hemoglobin | 4%–7% of total hemoglobin |
| theophylline | Theophylline | 10–20 mcg/ml |
| thiazolidinediones (rosiglitazone, pioglitazone) | Fasting glucose | 70–110 mg/dl |
| | Glycosylated hemoglobin | 4%–7% of total hemoglobin |
| | Liver function | * |
| thyroid hormones | Thyroid function tests | TSH: 0.2–5.4 microunits/ml<br>$T_3$: 80–200 nanogram/dl<br>$T_4$: 5.4–11.5 mcg/dl |
| valproate sodium, valproic acid, divalproex sodium | Ammonia | 15–45 mcg/dl |
| | Amylase | 35–118 international units/L |
| | BUN | 5–20 mg/dl |
| | CBC with differential | ***** |
| | Creatinine | 0.6–1.3 mg/dl |
| | Liver function | * |
| | Platelet count | 150–450 $\times$ $10^3$/mm$^3$ |
| | PTT | 10–14 seconds |
| | Valproic acid | 40–100 mcg/ml |
| vancomycin | Creatinine | 0.6–1.3 mg/dl |
| | Vancomycin | 20–40 mcg/ml (peak)<br>5–15 mcg/ml (trough) |
| warfarin | INR | For an acute MI, atrial fibrillation, treatment of pulmonary embolism, prevention of systemic embolism, tissue heart valves, valvular heart disease, or prophylaxis or treatment of venous thrombosis: 2–3<br>For mechanical prosthetic valves or recurrent systemic embolism: 2.5–3.5 |

***** For those areas marked with asterisks, the following values can be used:

Hemoglobin: Women: 12–16 g/dl
Men: 14–18 g/dl
Hematocrit: Women: 37%–48%
Men: 42%–52%
RBCs: 4–5.5 $\times$ $10^6$/mm$^3$
WBCs: 5–10 $\times$ $10^3$/mm$^3$
Differential: Neutrophils: 45%–74%
Bands: 0%–8%
Lymphocytes: 16%–45%
Monocytes: 4%–10%
Eosinophils: 0%–7%
Basophils: 0%–2%

| Monitoring guidelines |
| --- |
| Obtain levels immediately before next oral dose and 30 to 35 hours after therapy starts or changes. Periodically obtain blood counts, liver and kidney function test results, and electrolyte levels. |
| Monitor response to therapy by periodically evaluating fasting glucose and glycosylated hemoglobin levels. Patient should monitor glucose levels at home to help measure compliance and response. |
| Obtain drug levels right before next dose of sustained-release oral product and at least 2 days after therapy starts or changes. |
| Monitor response by evaluating fasting glucose and hemoglobin $A_{1c}$ levels. Obtain baseline liver function test results, and repeat tests periodically during therapy. |
| Monitor thyroid function test results every 2 to 3 weeks until appropriate maintenance dose is determined and annually thereafter. |
| Monitor liver function test results, ammonia level, coagulation test results, renal function test results, CBC, and platelet count at baseline and periodically during therapy. Liver function test results should be closely monitored during the first 6 months. |
| Drug levels may be checked with the third dose administered, at the earliest. Draw peak levels 1.5 to 2.5 hours after a 1-hour infusion or I.V. infusion is complete. Draw trough levels within 1 hour of the next dose administered. Renal function can be used to adjust dosing and intervals. |
| Check INR daily, beginning 3 days after therapy starts. Continue checking it until therapeutic goal is achieved, and monitor it periodically thereafter. Also, check level 7 days after change in dose or start of a potentially interacting therapy. |

* For those areas marked with one asterisk, the following values can be used:
ALT: 7–56 units/L
AST: 5–40 units/L
Alkaline phosphatase: 17–142 units/L
LDH: 140–280 units/L
GGT: <40 units/L
Total bilirubin: 0.2–1 mg/dl

# Cytochrome P-450 enzymes and common drug interactions

Cytochrome P-450 enzymes, identified by "CYP" followed by numbers and letters identifying the enzyme families and subfamilies, are found throughout the body (primarily in the liver) and are important in the metabolism of many drugs. This table lists common drug-drug interactions based on substrates, inducers, and inhibitors that can influence drug metabolism.

| CYP enzyme | Substrates |
|---|---|
| 1A2 | acetaminophen, aminophylline, amitriptyline, betaxolol, caffeine, chlordiazepoxide, clomipramine, clozapine, cyclobenzaprine, desipramine, diazepam, doxepin, flutamide, fluvoxamine, haloperidol, imipramine, mirtazapine, naproxen, olanzapine, pimozide, propranolol, ropinirole, tacrine, theophylline, verapamil, warfarin, zileuton, zolmitriptan |
| 2C9 | alosetron, amiodarone, amitriptyline, bosentan, carvedilol, clomipramine, dapsone, diazepam, diclofenac, flurbiprofen, fluvastatin, glimepiride, glipizide, ibuprofen, imipramine, indomethacin, losartan, mirtazapine, montelukast, naproxen, omeprazole, phenytoin, pioglitazone, ritonavir, sildenafil, tolbutamide, torsemide, vardenafil, voriconazole, warfarin, zafirlukast, zileuton |
| 2C19 | amitriptyline, carisoprodol, celecoxib, citalopram, clomipramine, cyclophosphamide, desogestrol, diazepam, doxepin, escitalopram, esomeprazole, fenofibrate, fluoxetine, glyburide, imipramine, irbesartan, lansoprazole, mephenytoin, omeprazole, pantoprazole, pentamidine, phenytoin, phenobarbital, rabeprazole, voriconazole, warfarin |
| 2D6 | amitriptyline, amphetamine, aripiprazole, atomoxetine, betaxolol, captopril, carvedilol, chlorpheniramine, chlorpromazine, clomipramine, clozapine, codeine, cyclobenzaprine, delavirdine, desipramine, dextromethorphan, donepezil, doxepin, fentanyl, flecainide, fluoxetine, fluphenazine, fluvoxamine, haloperidol, hydrocodone, imipramine, labetalol, loratadine, maprotiline, meperidine, methadone, methamphetamine, metoprolol, mexiletine, mirtazapine, morphine, nefazodone, nortriptyline, oxycodone, paroxetine, perphenazine, procainamide, propafenone, propranolol, risperidone, tamoxifen, thioridazine, timolol, tolterodine, tramadol, trazodone, venlafaxine |
| 3A | albuterol, alfentanil, alprazolam, amiodarone, amitriptyline, amlodipine, amprenavir, aripiprazole, atazanavir, atorvastatin, bosentan, bromocriptine, buspirone, busulfan, carbamazepine, chlordiazepoxide, chlorpheniramine, citalopram, clarithromycin, clomipramine, clonazepam, clorazepate, cocaine, colchicine, corticosteroids, cyclophosphamide, cyclosporine (neural), dapsone, delavirdine, dexamethasone, diazepam, diltiazem, disopyramide, docetaxel, doxepin, doxorubicin, doxycycline, efavirenz, enalapril, eplerenone, ergotamine, erythromycin, escitalopram, esomeprazole, estrogens, ethosuximide, etoposide, felodipine, fentanyl, fexofenadine, finasteride, flurazepam, flutamide, fluvastatin, haloperidol, ifosfamide, imatinib, imipramine, indinavir, isosorbide, isradipine, itraconazole, ketamine, ketoconazole, lansoprazole, lidocaine, loratadine, losartan, lovastatin, methadone, methylprednisolone, miconazole, midazolam, mirtazapine, montelukast, nefazodone, nevirapine, nicardipine, nifedipine, nimodipine, nisoldipine, ondansetron, paclitaxel, pantoprazole, pioglitazone, pravastatin, prednisone, quinidine, quinine, rabeprazole, rifabutin, ritonavir, saquinavir, sertraline, sildenafil, simvastatin, tacrolimus, tamoxifen, teniposide, testosterone, tolterodine, trazodone, triazolam, troleandomycin, vardenafil, verapamil, vinca alkaloids, voriconazole, warfarin, zileuton, zolpidem |

| Inducers | Inhibitors |
|---|---|
| carbamazepine, cigarette smoking, insulin, omeprazole, phenobarbital, phenytoin, primidone, rifampin, ritonavir | atazanavir, caffeine, cimetidine, ciprofloxacin, clarithromycin, enoxacin, erythromycin, fluvoxamine, grapefruit juice, interferon, isoniazid, ketoconazole, levofloxacin, mexiletine, norethindrone, norfloxacin, omeprazole, paroxetine, tacrine, ticlopidine, zileuton |
| carbamazepine, phenobarbital, phenytoin, primidone, rifampin | amiodarone, atazanavir, chloramphenicol, cimetidine, co-trimoxazole, delavirdine, disulfiram, fluconazole, fluoxetine, fluvastatin, fluvoxamine, isoniazid, itraconazole, ketoconazole, lovastatin, metronidazole, omeprazole, ritonavir, sertraline, sulfinpyrazone, ticlopidine, trimethoprim, zafirlukast |
| carbamazepine, phenytoin, prednisone, rifampin | cimetidine, delavirdine, esomeprazole, felbamate, fluconazole, fluoxetine, fluvoxamine, ketoconazole, lansoprazole, omeprazole, sertraline, ticlopidine, topiramate |
| carbamazepine, dexamethasone, phenobarbital, phenytoin, primidone | amiodarone, bupropion, celecoxib, chloroquine, chlorpheniramine, cimetidine, citalopram, cocaine, delavirdine, fluoxetine, fluphenazine, fluvoxamine, haloperidol, methadone, nefazodone, paroxetine, perphenazine, propafenone, quinidine, quinine, ritonavir, rosiglitazone, sertraline, terbinafine, thioridazine, venlafaxine |
| barbiturates, carbamazepine, glucocorticoids, griseofulvin, nafcillin, nevirapine, oxcarbazepine, phenytoin, primidone, rifabutin, rifampin | amprenavir, atazanavir, bromocriptine, clarithromycin, cimetidine, cyclosporine (neural), danazol, delavirdine, diltiazem, erythromycin, fluconazole, fluoxetine, fluvoxamine, fosamprenavir, grapefruit juice, imatinib, indinavir, isoniazid, itraconazole, ketoconazole, metronidazole, miconazole, nefazodone, nelfinavir, nicardipine, nifedipine, norfloxacin, omeprazole, prednisone, quinidine, quinine, rifabutin, ritonavir, saquinavir, sertraline, troleandomycin, verapamil, zafirlukast |

# Drugs that prolong the QTc interval

Changes in a patient's heart rate can affect the QT interval of his ECG. To account for such changes, you can use a formula such as the one below. Such formulas let you determine the corrected QT (QTc) interval.

$$\frac{\text{QT interval}}{\sqrt{\text{R-R internal}}} = \text{QTc interval}$$

For men younger than age 55, a normal QTc interval is 350 to 430 msec; for women younger than age 55, a normal QTc interval is 350 to 450 msec.

A prolonged QTc interval may cause fatal arrhythmias, including ventricular tachycardia and torsades de pointes. The causes of a prolonged QTc interval include disorders such as hypokalemia, hypomagnesemia, renal failure, and heart failure. These drugs may also cause an abnormal QTc interval.

albuterol
amantadine
amiodarone
arformoterol
aripiprazole
arsenic trioxide
artemether/lumefantrine
azithromycin
celecoxib
chloral hydrate
chloroquine
chlorpromazine
clarithromycin
clindamycin
clozapine
cyclobenzaprine
degarelix
diphenhydramine
disopyramide
dofetilide
dolasetron
domperidone
doxorubicin
dronedarone
droperidol
efavirenz
erythromycin
famotidine
felbamate
fexofenadine
flecainide
fluconazole
fluphenazine
formoterol
foscarnet
fosphenytoin
furosemide
gemifloxacin
granisetron
halofantrine
haloperidol
halothane
hydroxyzine
ibutilide
iloperidone
indapamide
isoproterenol
isradipine
itraconazole
ketoconazole
levofloxacin
levomethadyl
lithium
maprotiline
mefloquine
mesoridazine
methadone
moexipril
moxifloxacin
naratriptan
nicardipine
nilotinib
octreotide
ofloxacin
ondansetron
oxytocin
palonosetron
papaverine
pentamidine
perphenazine
prednisolone
prednisone
procainamide
propafenone
quetiapine
quinidine
quinine
ranolazine
risperidone
salmeterol
serotonin reuptake inhibitors
sotalol
sparfloxacin
sulfamethoxazole
sumatriptan
tacrolimus
tamoxifen
telithromycin
terbutaline
tetrabenazine
thioridazine
tizanidine
trazodone
tricyclic antidepressants
trimethoprim
trifluoperazine
vardenafil
vasopressin
voriconazole
vorinostat
ziprasidone
zolmitriptan

# Dialyzable drugs

The amount of a drug removed by dialysis differs among patients and depends on several factors, including the patient's condition, the drug's properties, length of dialysis and dialysate used, rate of blood flow or dwell time, and purpose of dialysis. This table indicates the effect of conventional hemodialysis on selected drugs.

| Drug | Level reduced by hemodialysis |
|---|---|
| acebutolol | Yes |
| acetaminophen | Yes (may not influence toxicity) |
| acetazolamide | No |
| acetylcysteine | Yes |
| acyclovir | Yes |
| albuterol | No |
| allopurinol | Yes |
| alprazolam | No |
| amantadine | No |
| amikacin | Yes |
| amiodarone | No |
| amitriptyline | No |
| amlodipine | No |
| amoxicillin | Yes |
| amoxicillin and clavulanate potassium | Yes |
| amphotericin B | No |
| ampicillin | Yes |
| ampicillin and sulbactam sodium | Yes |
| aprepitant | No |
| arsenic trioxide | No |
| ascorbic acid | Yes |
| aspirin | Yes |
| atenolol | Yes |
| atorvastatin | No |
| atropine | No |
| auranofin | No |
| azathioprine | Yes |
| aztreonam | Yes |
| bivalirudin | Yes |
| bumetanide | No |
| bupropion | No |
| buspirone | No |
| busulfan | Yes |

| Drug | Level reduced by hemodialysis |
|---|---|
| captopril | Yes |
| carbamazepine | No |
| carbenicillin | Yes |
| carboplatin | Yes |
| carisoprodol | Yes |
| carmustine | No |
| carvedilol | No |
| cefaclor | Yes |
| cefadroxil | Yes |
| cefazolin | Yes |
| cefepime | Yes |
| cefotaxime | Yes |
| cefotetan | Yes (only by 20%) |
| cefoxitin | Yes |
| cefpodoxime | Yes |
| ceftazidime | Yes |
| ceftibuten | Yes |
| ceftizoxime | Yes |
| ceftriaxone | No |
| cefuroxime | Yes |
| cephalexin | Yes |
| cephradine | Yes |
| chloral hydrate | Yes |
| chlorambucil | No |
| chloramphenicol | Yes (very small amount) |
| chlordiazepoxide | No |
| chlorpheniramine | Yes |
| chlorpromazine | No |
| chlorthalidone | No |
| cimetidine | Yes |
| ciprofloxacin | Yes (only by 10%) |
| cisplatin | No |
| clavulanic acid | Yes |
| clindamycin | No |
| clofibrate | No |

| Drug | Level reduced by hemodialysis |
|---|---|
| clonazepam | No |
| clonidine | No |
| clorazepate | No |
| cloxacillin | No |
| codeine | No |
| colchicine | No |
| cortisone | No |
| cyclophosphamide | Yes |
| deferoxamine | Yes |
| desloratadine | No |
| dexamethsone | No |
| dexlansoprazole | No |
| diazepam | No |
| diazoxide | Yes |
| diclofenac | No |
| dicloxacillin | No |
| didanosine | No |
| digoxin | No |
| digoxin immune Fab | No |
| diltiazem | No |
| diphenhydramine | No |
| dipyridamole | No |
| dopamine | No |
| doripenem | Yes |
| doxazosin | No |
| doxepin | No |
| doxorubicin | No |
| doxycycline | No |
| eltrombopag | No |
| emtricitabine | Yes |
| enalapril | Yes |
| enoxaparin | No |
| epoetin alfa | No |
| ertapenem | Yes |
| erythromycin | Yes (only by 20%) |
| ethacrynic acid | No |
| ethambutol | Yes (only by 20%) |
| ethosuximide | Yes |
| famciclovir | Yes |
| famotidine | No |
| fenoprofen | No |
| filgrastim | No |

| Drug | Level reduced by hemodialysis |
|---|---|
| flecainide | No |
| fluconazole | Yes |
| flucytosine | Yes |
| fluorouracil | No |
| fluoxetine | No |
| flurazepam | No |
| foscarnet | Yes |
| fosinopril | No |
| furosemide | No |
| gabapentin | Yes |
| ganciclovir | Yes |
| gemcitabine | Yes |
| gemfibrozil | No |
| gemifloxacin | Yes |
| gentamicin | Yes |
| glipizide | No |
| glyburide | No |
| guanfacine | No |
| haloperidol | No |
| heparin | No |
| hydralazine | No |
| hydrochlorothiazide | No |
| hydroxyzine | No |
| ibuprofen | No |
| ifosfamide | Yes |
| imipenem | Yes |
| imipramine | No |
| indapamide | No |
| indomethacin | No |
| insulin | No |
| irbesartan | No |
| iron dextran | No |
| isoniazid | No |
| isosorbide | Yes |
| isradipine | No |
| kanamycin | Yes |
| ketoconazole | No |
| labetalol | No |
| lacosamide | Yes (by 50%) |
| lamivudine | No |
| lansoprazole | No |
| lapatinib | No |

| Drug | Level reduced by hemodialysis |
|---|---|
| levetiracetam | Yes |
| levocetirizine | No |
| levofloxacin | No |
| lidocaine | No |
| linezolid | Yes |
| lisinopril | Yes |
| lithium | Yes |
| lomefloxacin | No |
| lomustine | No |
| loratadine | No |
| lorazepam | No |
| mannitol | No |
| maraviroc | Yes |
| mefenamic acid | No |
| meperidine | No |
| meprobamate | Yes |
| mercaptopurine | Yes |
| meropenem | Yes |
| mesalamine | Yes |
| metformin | Yes |
| methadone | No |
| methotrexate | Yes |
| methyldopa | Yes |
| methylprednisolone | Yes |
| metoclopramide | No |
| metolazone | No |
| metoprolol | Yes |
| metronidazole | Yes |
| mexiletine | Yes |
| miconazole | No |
| midazolam | No |
| minocycline | No |
| minoxidil | Yes |
| misoprostol | No |
| morphine | No |
| nabumetone | No |
| nadolol | Yes |
| nafcillin | No |
| nalmefene | No |
| naltrexone | No |
| naproxen | No |
| nelfinavir | No |
| nicardipine | No |
| nifedipine | No |
| nimodipine | No |
| nitazoxanide | No |
| nitrofurantoin | Yes |
| nitroglycerin | No |
| nitroprusside | Yes |
| nizatidine | No |
| norfloxacin | No |
| nortriptyline | No |
| octreotide | Yes |
| ofloxacin | Yes |
| olanzapine | No |
| omeprazole | No |
| oxazepam | No |
| paclitaxel | No |
| paroxetine | No |
| penicillin G | Yes |
| pentamidine | No |
| pentazocine | Yes |
| pentobarbital | No |
| perindopril | Yes |
| phenobarbital | Yes |
| phenylbutazone | No |
| phenytoin | No |
| piperacillin | Yes |
| prazosin | No |
| prednisone | No |
| pregabalin | Yes |
| primidone | Yes |
| procainamide | Yes |
| promethazine | No |
| propranolol | No |
| protriptyline | No |
| pseudoephedrine | No |
| pyrazinamide | Yes |
| pyridoxine | Yes |
| quinapril | No |
| quinidine | No |

| Drug | Level reduced by hemodialysis |
|---|---|
| quinine | No |
| ramipril | No |
| ranitidine | Yes |
| rifampin | No |
| ritodrine | Yes |
| rituximab | No |
| rosiglitazone | No |
| rufinamide | Yes (by 30%) |
| salsalate | Yes |
| saxagliptin | Yes |
| sertraline | No |
| sotalol | Yes |
| stavudine | Yes |
| streptomycin | Yes |
| sucralfate | No |
| sulbactam | Yes |
| sulfamethoxazole | Yes |
| sulfisoxazole | No |
| sulindac | No |
| tazobactam | Yes |
| telbivudine | Yes (by 23%) |
| temazepam | No |
| theophylline | Yes |
| ticarcillin | Yes |
| ticarcillin and clavulanate | Yes |
| timolol | No |
| tirofiban | Yes |
| tobramycin | Yes |
| tocainide | Yes |
| tolbutamide | No |
| topiramate | Yes |
| topotecan | Yes |
| torsemide | No |
| tramadol | No |
| trandolapril | Yes |
| trazodone | No |
| triazolam | No |
| trimethoprim | Yes |
| valacyclovir | Yes |
| valganciclovir | Yes |
| valproic acid | No |
| valsartan | No |
| vancomycin | Yes |
| venlafaxine | No |
| verapamil | No |
| vigabatrin | Yes |
| warfarin | No |
| zolpidem | No |
| zonisamide | Yes |

## Abbreviations to avoid

The Joint Commission requires every health care facility to develop a list of approved abbreviations for staff use. Certain abbreviations should be avoided because they're easily misunderstood, especially when handwritten. The Joint Commission has identified a minimum list of dangerous abbreviations, acronyms, and symbols. This do-not-use list includes the following items.

| Official "Do Not Use" List[1] | | |
|---|---|---|
| **Do not use** | **Potential problem** | **Use instead** |
| U (unit) | Mistaken for "0" (zero), the number "4" (four) or "cc" | Write "unit" |
| IU (International Unit) | Mistaken for IV (intravenous) or the number 10 (ten) | Write "International Unit" |
| Q.D., QD, q.d., qd (daily) | Mistaken for each other | Write "daily" |
| Q.O.D., QOD, q.o.d, qod (every other day) | Period after the Q mistaken for "I" and the "O" mistaken for "I" | Write "every other day" |
| Trailing zero (X.0 mg)*<br>Lack of leading zero (.X mg) | Decimal point is missed | Write X mg<br>Write 0.X mg |
| MS | Can mean morphine sulfate or magnesium sulfate | Write "morphine sulfate"<br>Write "magnesium sulfate" |
| $MSO_4$ and $MgSO_4$ | Confused for one another | |

[1]Applies to all orders and all medication-related documentation that is handwritten (including free-text computer entry) or on pre-printed forms.
***Exception:** A "trailing zero" may be used only where required to demonstrate the level of precision of the value being reported, such as for laboratory results, imaging studies that report size of lesions, or catheter/tube size. It may not be used in medication orders or other medication-related documentation.

*(continued)*

**Additional Abbreviations, Acronyms and Symbols**
(For possible future inclusion in the Official "Do Not Use" List)

| Do not use | Potential problem | Use instead |
|---|---|---|
| > (greater than)<br>< (less than) | Misinterpreted as the number "7" (seven) or the letter "L"<br>Confused for one another | Write "greater than"<br>Write "less than" |
| Abbreviations for drug names | Misinterpreted due to similar abbreviations for multiple drugs | Write drug names in full |
| Apothecary units | Unfamiliar to many practitioners<br>Confused with metric units | Use metric units |
| @ | Mistaken for the number "2" (two) | Write "at" |
| cc | Mistaken for U (units) when poorly written | Write "mL" or "ml" or "milliliters" ("mL" is preferred) |
| μg | Mistaken for mg (milligrams) resulting in one thousand-fold overdose | Write "mcg" or "micrograms" |

# Herbal supplements

If your patient is taking an herbal supplement, ask him some general questions, such as why he's taking the herb and how long he has been taking it. Find out if the condition he's trying to treat has been diagnosed. If so, is he taking or has he taken prescription or OTC drugs for the condition?

If your patient is taking a prescription or OTC drug and an herbal supplement, explain that drug–herb interactions can occur, and advise him to report any unusual signs or symptoms.

For nursing considerations and patient-teaching information on specific herbal supplements, see the table below.

| Herb and reported uses | Nursing considerations | Patient teaching |
|---|---|---|
| **Aloe**<br>• Burns and skin irritation<br>• Cathartic<br>• To ease discomfort of defecation | • Herb's laxative effects are apparent within 10 hours of ingestion.<br>• Monitor patient for signs of dehydration. Elderly patients are particularly at risk.<br>• Monitor electrolyte levels, especially potassium, after long-term use.<br>• If patient is using herb topically, monitor wound for healing. | • Caution patient that if he delays seeking medical diagnosis and treatment, his condition could worsen.<br>• If patient is taking digoxin or another drug to control his heart rate, a diuretic, or a corticosteroid, warn him not to take herb without consulting his health care provider.<br>• Advise patient not to take herb for longer than 1 to 2 weeks at a time without consulting his health care provider.<br>• Advise patient against use during pregnancy. |
| **Chamomile**<br>• Antibacterial, antiviral<br>• Diarrhea, flatulence, stomatitis, motion sickness<br>• Hemorrhagic cystitis<br>• Sedation, relaxation<br>• Skin inflammation, wounds, burns | • **ALERT:** Patients sensitive to ragweed and chrysanthemums or other Compositae family members (arnica, yarrow, feverfew, tansy, artemisia) may be more susceptible to contact allergies and anaphylaxis. Patients with hay fever or bronchial asthma caused by pollens are more susceptible to anaphylactic reactions. | • Advise patient against use during pregnancy.<br>• If patient is taking an anticoagulant, advise him not to use herb because of possible enhanced anticoagulant effects.<br>• Advise patient that herb may enhance an allergic reaction or make existing symptoms worse in susceptible patients.<br>• Instruct parent not to give herb to any child before checking with an experienced practitioner. |
| **Cranberry**<br>• Asthma<br>• Fever<br>• Kidney stones<br>• UTI | • Tinctures may contain up to 45% alcohol.<br>• Herb's ability to prevent bacteria from adhering to the bladder wall seems important in preventing UTIs.<br>• Herb is safe for pregnant and breast-feeding women.<br>• When consumed regularly, herb may be effective in reducing the frequency of bacteriuria with pyuria in women with recurrent UTIs. | • Advise patient that an appropriate antibiotic is usually needed to treat an active UTI.<br>• If patient is using herb to prevent a UTI, advise him to notify his health care provider if signs or symptoms of a UTI appear.<br>• If patient has diabetes, inform him that the juice contains sugar but that sugar-free supplements and juices are available.<br>• Only the unsweetened, unprocessed juice is effective in preventing bacteria from adhering to the bladder wall. |

*(continued)*

| Herb and reported uses | Nursing considerations | Patient teaching |
|---|---|---|
| **Echinacea**<br>• Abscesses, burns, eczema, skin ulcers<br>• Immune system stimulant<br>• Prevention of common cold, upper respiratory infections<br>• Upper respiratory tract infection | • Daily dose depends on the preparation and potency but shouldn't exceed 8 weeks. Consult specific manufacturer's instructions for parenteral administration, if applicable.<br>• Herb is considered supportive treatment for infection; it shouldn't be used in place of antibiotic therapy.<br>• Herb is usually taken at the first sign of illness and continued for up to 14 days. Regular prophylactic use isn't recommended.<br>• A liquid preparation is recommended because herb is thought to function in the mouth and should have direct contact with the lymph tissues at the back of the throat. | • Advise patient not to delay seeking appropriate medical evaluation for a prolonged illness.<br>• Advise patient that prolonged use may result in overstimulation of the immune system and possible immune suppression. Herb shouldn't be used longer than 14 days for supportive treatment of infection.<br>• The herb should be stored away from direct light.<br>• Warn patients to keep all herbal products away from children and pets. |
| **Ephedra**<br>• Appetite suppressant<br>• Asthma<br>• Chills, cough, cold, flu, fever, headache, edema, nasal congestion<br>• CV stimulant<br>• Respiratory tract diseases, mild bronchospasm | • Compounds containing herb may be linked to several deaths and more than 800 adverse effects, many of which appear to be dose related.<br>• Patients with eating disorders may abuse this herb.<br>• **ALERT:** Pills containing herb have been combined with other stimulants such as caffeine and sold as "natural" stimulants in weight loss products. Death from overstimulation may occur.<br>• Signs and symptoms of toxic reaction include diaphoresis, dilated pupils, muscle spasms, fever, and cardiac and respiratory failure.<br>• If overdose occurs, perform gastric lavage and give activated charcoal. Treat spasms with diazepam, replace electrolytes with I.V. fluids, and prevent acidosis with sodium bicarbonate infusions. | • Advise patient not to use this herb in place of getting the proper medical evaluation for a prolonged illness.<br>• **ALERT:** The FDA has banned the sale of dietary supplements containing this herb because of unreasonable risk of injury or illness.<br>• Advise patient with thyroid disease, hypertension, CV disease, or diabetes to avoid using herb.<br>• Advise patient not to use herb. Dosages that are purported to produce psychoactive or hallucinogenic effects are toxic to the heart.<br>• Advise patient to watch for adverse reactions, particularly chest pain, shortness of breath, palpitations, dizziness, and fainting.<br>• Warn patient to keep all herbal products away from children and pets. |
| **Feverfew**<br>• Abortifacient<br>• Asthma<br>• Menstrual cramps<br>• Migraine headache<br>• Mouthwash<br>• Psoriasis<br>• Rheumatoid arthritis<br>• Tranquilizer | • If patient is taking an anticoagulant, monitor appropriate coagulation values, such as INR, PTT, and PT. Also, observe patient for abnormal bleeding.<br>• Rash or contact dermatitis may indicate sensitivity to herb. Patient should stop use immediately.<br>• Abruptly stopping the herb may cause "postfeverfew syndrome," involving tension headaches, insomnia, joint stiffness and pain, and lethargy. | • Use during pregnancy isn't recommended.<br>• Educate patient about the risk of abnormal bleeding when combining herb with an anticoagulant, such as warfarin or heparin, or an antiplatelet, such as aspirin or another NSAID.<br>• Caution patient that a rash or abnormal skin alteration may indicate an allergy to herb. Instruct patient to stop taking the herb if a rash appears. |
| **Flax**<br>• Atherosclerosis prevention<br>• Cancer prevention<br>• Constipation | • When herb is used internally, it should be taken with more than 5 oz of liquid per tablespoon of flaxseed. | • Warn patient not to treat chronic constipation or other GI disturbances or ophthalmic injury with herb before seeking appropriate medical evaluation because doing so |

| Herb and reported uses | Nursing considerations | Patient teaching |
|---|---|---|
| **Flax** *(continued)*<br>• Diarrhea<br>• Diverticulitis<br>• Externally as poultice for skin inflammation<br>• Irritable bowel syndrome | • Cyanogenic glycosides may release cyanide; however, the body only metabolizes these to a certain extent. At therapeutic doses, flax doesn't elevate cyanide ion level.<br>• Although herb may decrease a patient's cholesterol level or increase bleeding time, it isn't necessary to monitor cholesterol level or platelet aggregation. | may delay diagnosis of a potentially serious medical condition.<br>• Discourage use during pregnancy.<br>• Instruct patient to drink plenty of water when taking flaxseed.<br>• Instruct patient not to take any drug for at least 2 hours after taking herb. |
| **Garlic**<br>• Atherosclerosis prevention<br>• Cholesterol and triglyceride levels reduction<br>• Colds, coughs, fever, and sore throat<br>• GI tract cancers prevention<br>• HDL cholesterol level increase<br>• MI and stroke prevention | • Herb isn't recommended for patients with diabetes, insomnia, pemphigus, organ transplants, or rheumatoid arthritis or for postsurgical patients.<br>• Consuming excessive amounts of raw garlic increases the risk of adverse reactions.<br>• Monitor patient for signs and symptoms of bleeding.<br>• Herb may lower glucose level. If patient is taking an antidiabetic, watch for signs and symptoms of hypoglycemia, and monitor his glucose level.<br>• **ALERT:** Advise parents not to use oil to treat inner ear infection in children. | • Advise patient not to delay seeking appropriate medical evaluation because doing so may delay diagnosis of a serious medical condition.<br>• Advise patient to consume herb in moderation, to minimize the risk of adverse reactions.<br>• Discourage heavy use of herb before surgery.<br>• If patient is using herb to lower his cholesterol levels, advise him to notify his health care provider and to have his cholesterol levels monitored.<br>• Advise patient that using herb with anticoagulants may increase the risk of bleeding.<br>• If patient is using herb as a topical antiseptic, avoid prolonged exposure to the skin because burns can occur. |
| **Ginger**<br>• Antiemetic<br>• Anti-inflammatory, antiarthritic<br>• Antispasmodic<br>• Antitumorigenic<br>• Colic, flatulence, indigestion<br>• Hypercholesterolemia, burns, ulcers, depression, impotence, liver toxicity | • Adverse reactions are uncommon.<br>• Monitor patient for signs and symptoms of bleeding. If patient is taking an anticoagulant, monitor PTT, PT, and INR carefully.<br>• Use in pregnant patients is questionable, although small amounts used in cooking are safe. It's unknown if ginger appears in breast milk.<br>• Herb may interfere with the intended therapeutic effect of conventional drugs.<br>• If overdose occurs, monitor patient for arrhythmias and CNS depression. | • If woman is pregnant, advise her to consult an experienced practitioner before using herb medicinally.<br>• Educate patients to look for signs of bleeding, such as nosebleeds or excessive bruising.<br>• Warn patient to keep all herbal products away from children and pets. |
| **Ginkgo**<br>• Cerebral insufficiency, dementia, and circulatory disorders<br>• Headaches, asthma, colitis, impotence, depression, altitude sickness, tinnitus, cochlear deafness, vertigo, premenstrual | • Extracts are considered standardized if they contain 24% flavonoid glycosides and 6% terpene lactones.<br>• Treatment should continue for at least 6 to 8 weeks, but therapy beyond 3 months isn't recommended.<br>• **ALERT:** Seizures have been reported in children after ingestion of more than 50 seeds. | • If patient is taking the herb for motion sickness, advise him to begin taking it 1 to 2 days before taking the trip and to keep taking it for the duration of his trip.<br>• Inform patient that the therapeutic and toxic components of ginkgo can vary significantly from product to product. Advise him to obtain herb from a reliable source. |

| Herb and reported uses | Nursing considerations | Patient teaching |
|---|---|---|
| **Ginkgo** *(continued)*<br>syndrome, macular degeneration, diabetic retinopathy, and allergies<br>• Pancreatic cancer and schizophrenia adjunct | • Patients must be monitored for possible adverse reactions, such as GI problems, headaches, dizziness, allergic reactions, and serious bleeding.<br>• Toxicity may cause atonia and adynamia.<br>• Patients must be monitored for potential drug interactions, especially if taking antiplatelet or anticoagulant drugs. | • Warn patient to keep all herbal products away from children and pets.<br>• Advise patient to stop use at least 2 weeks before surgery. |
| **Ginseng, Asian**<br>• Fatigue and lack of concentration, atherosclerosis, bleeding disorders, colitis, diabetes, depression, and cancer<br>• Health and strength recovery after sickness or weakness | • The German Commission E doesn't recommend using herb for longer than 3 months.<br>• Herb may strengthen the body and increase resistance to disease.<br>• **ALERT:** Reports have circulated of a severe reaction known as the ginseng abuse syndrome in patients taking more than 3 g/day for up to 2 years: Increased motor and cognitive activity with diarrhea, nervousness, insomnia, hypertension, edema, and skin eruptions. | • Inform patient that the therapeutic and toxic components can vary significantly from product to product. Advise him to obtain herb from a reliable source. |
| **Green tea**<br>• To prevent cancer, hyperlipidemia, atherosclerosis, dental caries, headaches<br>• Wounds, skin disorders, stomach disorders, and infectious diarrhea<br>• CNS stimulant, mild diuretic, antibacterial, topical astringent | • Daily consumption should be limited to fewer than 5 cups, or the equivalent of 300 mg of caffeine, to avoid the adverse effects of caffeine.<br>• Prolonged high caffeine intake may cause restlessness, irritability, insomnia, palpitations, vertigo, headache, and adverse GI effects.<br>• The adverse GI effects of chlorogenic acid and tannin can be avoided if milk is added to the tea mixture.<br>• The tannin content in tea increases the longer it's left to brew; this increases the antidiarrheal properties of the tea.<br>• The first signs of a toxic reaction are vomiting and abdominal spasm. | • Advise patient that heavy consumption may be associated with esophageal cancer secondary to the tannin content in the mixture.<br>• Tell patient that the first signs of toxic reaction are vomiting and abdominal spasm.<br>• Tell patient that herb interferes with iron absorption from supplements or multivitamins. |
| **Hawthorn**<br>• Atherosclerosis<br>• Blood pressure regulation<br>• Cardiotonic and sedative<br>• Mild heart conditions | • High doses may cause hypotension and sedation. Monitor patient for CNS adverse effects, and monitor blood pressure.<br>• Herb may interfere with digoxin's effects or serum monitoring.<br>• Observe patient closely for adverse reactions, especially adverse CNS reactions. | • Advise patient that when he fills a prescription, he should tell the pharmacist of any herb or dietary supplement he's taking.<br>• Warn patient to keep all herbal products away from children and pets. |
| **Horse chestnut**<br>• Analgesic, anticoagulant, antipyretic, astringent, expectorant, and tonic | • **ALERT:** The nuts, seeds, twigs, sprouts, and leaves of horse chestnut are poisonous and can be lethal.<br>• Standardized formulations remove most of the toxins and standardize the amount of aescin. | • Inform patient that the FDA considers herb unsafe and that death may occur.<br>• Advise patient not to confuse horse chestnut with sweet chestnut, used as a food. |

| Herb and reported uses | Nursing considerations | Patient teaching |
|---|---|---|
| **Horse chestnut** *(continued)*<br>• Chronic venous insufficiency, varicose veins, leg pain, tiredness, tension, and leg swelling and edema<br>• Lymphedema, hemorrhoids, and enlarged prostate<br>• Skin ulcers, phlebitis, leg cramps, cough, and diarrhea | • Signs and symptoms of toxicity include loss of coordination, salivation, hemolysis, headache, dilated pupils, muscle twitching, seizures, vomiting, diarrhea, depression, paralysis, respiratory and cardiac failure, and death.<br>• Monitor patient for signs of toxicity.<br>• Monitor glucose level in patients taking antidiabetics for hypoglycemia. | • Warn patient to keep the herb away from children. Consumption of amounts of leaves, twigs, and seeds equaling 1% of a child's weight may be lethal. |
| **Kava**<br>• Nervous anxiety, stress, and restlessness<br>• Skin diseases, including leprosy<br>• Intestinal problems, otitis, and abscesses<br>• Urogenital infections, including chronic cystitis, venereal disease, uterine inflammation, menstrual problems, and vaginal prolapse<br>• Wound healing, headaches, seizure disorders, the common cold, respiratory tract infection, tuberculosis, and rheumatism | • Patient shouldn't use herb with conventional sedative-hypnotics, anxiolytics, MAO inhibitors, other psychopharmacologic drugs, levodopa, or antiplatelet drugs without first consulting a health care provider.<br>• Use for longer than 3 months may be habit forming.<br>• Herb can cause drowsiness and may impair motor reflexes.<br>• Patients should avoid taking herb with alcohol because of increased risk of CNS depression and liver damage.<br>• Periodic monitoring of liver function tests and CBC may be needed.<br>• Toxic doses can cause progressive ataxia, muscle weakness, and ascending paralysis, all of which resolve when herb is stopped. Extreme use (more than 300 g per week) may increase GGT levels. | • Tell patient oral use is probably safe for 3 months or less, but use for longer than 3 months may be habit forming.<br>• Warn patient to avoid taking herb with alcohol because of increased risk of CNS depression and liver damage.<br>• **ALERT:** Tell patient that the FDA has linked herb to liver problems including cirrhosis, hepatitis, and liver failure. Herb users should immediately contact their health care provider if their skin or eyes begin to yellow, or they experience severe itching, easy bruising, dark urine, or bloody vomit.<br>• Advise patient against use during pregnancy. |
| **Melatonin**<br>• Insomnia, jet lag, shift-work disorder, blind entrainment, immune system enhancement, tinnitus, depression, and benzodiazepine withdrawal<br>• Cancer therapy adjunct, antiaging product, and pregnancy and cluster headaches preventative<br>• Skin protection against ultraviolet light | • Monitor patient for excessive daytime drowsiness.<br>• May increase human growth hormone levels. | • Warn patient to avoid hazardous activities until full extent of CNS depressant effect is known.<br>• If patient wishes to conceive, tell her that herb may have a contraceptive effect. However, herb shouldn't be used as birth control.<br>• Although no chemical interactions have been reported, tell patient that herb may interfere with therapeutic effects of conventional drugs.<br>• Warn patient about possible additive effects if taken with alcohol.<br>• Advise patient not to use herb for prolonged periods because safety data aren't available. |

| Herb and reported uses | Nursing considerations | Patient teaching |
|---|---|---|
| **Milk thistle**<br>• Dyspepsia, liver damage from chemicals, Amanita mushroom poisoning, supportive therapy for inflammatory liver disease and cirrhosis, loss of appetite, and gall bladder and spleen disorders<br>• Liver protectant | • Mild allergic reactions may occur, especially in people allergic to members of the Astertaceae family, including ragweed, chrysanthemums, marigolds, and daisies.<br>• Don't confuse seeds or fruit with other parts of the plant or with blessed thistle. | • Warn women not to take this herb while pregnant or breast-feeding.<br>• Tell patient to stay alert for possible allergic reactions, especially if allergic to ragweed, chrysanthemums, marigolds, or daisies.<br>• Warn patient not to take herb for liver inflammation or cirrhosis before seeking appropriate medical evaluation because doing so may delay diagnosis of a potentially serious medical condition. |
| **Passion flower**<br>• Sedative, hypnotic, analgesic, antispasmodic, menstrual cramps, pain, migraines<br>• Neuralgia, generalized seizures, hysteria, nervous agitation, and insomnia<br>• Topically for cuts and bruises | • Monitor patient for possible adverse CNS effects.<br>• A disulfiram-like reaction may produce nausea, vomiting, flushing, headache, hypotension, tachycardia, ventricular arrhythmias, and shock leading to death.<br>• Patients with liver disease and alcoholics shouldn't use herbal products that contain alcohol. | • Because sedation is possible, caution patient to avoid hazardous activities.<br>• Warn patient not to take herb for chronic pain or insomnia before seeking medical attention because doing so may delay diagnosis of a potentially serious medical condition.<br>• Caution pregnant patient to avoid this herb. |
| **Saw palmetto**<br>• BPH and coughs and congestion from colds, bronchitis, or asthma<br>• Mild diuretic, urinary antiseptic, and astringent | • Herb should be used cautiously for conditions other than BPH because data about its effectiveness in other conditions are lacking.<br>• Obtain a baseline prostate-specific antigen (PSA) value before patient starts taking herb because it may cause a false-negative PSA result.<br>• Saw palmetto may not alter prostate size.<br>• Laboratory values didn't change significantly in clinical trials using dosages of 160 mg to 320 mg daily. | • Warn patient not to take herb for bladder or prostate problems before seeking medical attention because doing so could delay diagnosis of a potentially serious medical condition.<br>• Tell patient to take herb with food to minimize GI effects.<br>• Caution patient to promptly notify health care provider about new or worsened adverse effects.<br>• Warn women to avoid herb if planning pregnancy, if pregnant, or if breast-feeding. |
| **St. John's wort**<br>• Mild to moderate depression, anxiety, sciatica, and viral infections, including herpes simplex virus, hepatitis C, influenza virus, murine cytomegalovirus, and poliovirus<br>• Bronchitis, asthma, gallbladder disease, nocturnal enuresis, gout, and rheumatism | • Recommended duration of therapy for depression is 4 to 6 weeks; if no improvement occurs, a different therapy should be considered.<br>• Monitor patient for response to herbal therapy, as evidenced by improved mood and lessened depression.<br>• By using standardized extracts, patient can better control the dosage. Studies have used forms of standardized 0.3% hypericin as well as hyperforin-stabilized version of the extract. | • Instruct patient to consult a health care provider for a thorough medical evaluation before using herb.<br>• If patient takes herb for mild to moderate depression, explain that several weeks may pass before effects occur. Tell patient that a new therapy may be needed if no improvement occurs in 4 to 6 weeks.<br>• Inform patient that herb interacts with many other prescription and OTC products and may reduce their effectiveness. |

| Herb and reported uses | Nursing considerations | Patient teaching |
|---|---|---|
| **St. John's wort** *(continued)* | • Serotonin syndrome may cause dizziness, nausea, vomiting, headache, epigastric pain, anxiety, confusion, restlessness, and irritability.<br>• Because herb decreases the effect of certain prescription drugs, watch for signs of drug toxicity if patient stops using the herb. Drug dosage may need to be reduced.<br>• Herb has mutagenic effects on sperm and egg cells. It shouldn't be used by pregnant patients, women planning pregnancy, or men wishing to father a child. | • Tell patient that herb may cause increased sensitivity to direct sunlight. Recommend protective clothing, sunscreen, and limited sun exposure.<br>• Inform patient that a sufficient wash-out period is needed after stopping an antidepressant before switching to herb.<br>• Tell patient to report adverse effects to a health care provider.<br>• Warn patient to keep all herbal products away from children and pets. |
| **Tea tree oil**<br>• Contusions, inflammation, myalgia, burns, hemorrhoids, and vitiligo<br>• Tonsillitis and lotion for dermatoses | • Because of systemic toxicity, herb shouldn't be used internally.<br>• Essential oil should be used externally only after being diluted.<br>• Herb may cause burns or itching in tender areas and shouldn't be used around nose, eyes, and mouth.<br>• 100% pure essential oil is rarely used and should be used only with close supervision by a health care provider. | • Explain that a few drops are sufficient in mouthwash, shampoo, or sitz bath.<br>• Caution patient not to apply oil to wounds or to skin that's dry or cracked.<br>• Warn patient to keep all herbal products away from children and pets. |

# Drugs that shouldn't be crushed or chewed

This list contains names of drugs and their respective forms that shouldn't be crushed or chewed because of their special pharmaceutical formulations or characteristics.

Accutane (Capsule)
Aciphex (Tablet)
Actiq (Lozenge)
Actonel (Tablet)
Adalat CC (Tablet)
Adderall XR (Capsule)
AeroHist Plus (Tablet)
Afeditab CR (Tablet)
Allegra-D (Tablet)
Allfen Jr (Capsule, tablet)
Alpophen (Tablet)
Alprazolam ER (Tablet)
Altoprev (Tablet)
Ambien CR (Tablet)
Aptivus (Capsule)
Aquatab C (Tablet)
Aquatab D (Tablet)
Arthrotec (Tablet)
Asacol (Tablet)
Ascriptin A/D (Tablet)
Augmentin XR (Tablet)
Avinza (Capsule)
Avodart (Capsule)
Azulfidine EN-tabs (Tablet)
Bayer-Enteric-Coated (Caplet)
Bayer Low Adult (Tablet)
Bayer Regular Strength (Caplet)
Bellahist-D LA (Tablet)
Biaxin XL (Tablet)
Bidhist (Tablet)
Bidhist-D (Tablet)
Biltricide (Tablet)
Biohist LA (Tablet)
Bisac-Evac (Tablet)
Bisacodyl (Tablet)
Bisa-Lax (Tablet)
Boniva (Tablet)
Bromfed PD (Capsule)
Budeprion SR (Tablet)
Calan SR (Tablet)
Carbatrol (Capsule)
Cardene SR (Capsule)
Cardizem (Tablet)
Cardizem CD (Capsule)
Cardizem LA (Tablet)
Cardura XL (Tablet)
Cartia XT (Capsule)
Cefaclor-Extended Release (Tablet)
Ceftin (Tablet)
Cefuroxime (Tablet)
CellCept (Capsule, tablet)
Charcoal Plus (Tablet)
Chlor-Trimeton 12 Hour (Tablet)
Cipro XR (Tablet)
Claritin-D 12 Hour (Tablet)
Claritin-D 24 Hour (Capsule)
Colestid (Tablet)
Commit (Lozenge)
Concerta (Tablet)
Cotazym-S (Capsule)
Covera-HS (Tablet)
Creon 5, 10, 20 (Capsule)
Crixivan (Capsule)
Cymbalta (Capsule)
Cytovene (Capsule)
Cytoxan (Tablet)
Depakene (Capsule)
Depakote (Tablet)
Depakote ER (Tablet)
Detrol LA (Capsule)
Dilacor XR (Capsule)
Dilatrate-SR (Capsule)
Dilt-CD (Capsule)
Diltia XT (Capsule)
Dilt-XR (Capsule)
Ditropan XL (Tablet)
Doxidan (Tablet)
DriHist SR (Tablet)
Drisdol (Capsule)
Drixoral Allergy Sinus (Tablet)
Drixoral Cold/Allergy (Tablet)

Drixoral Nondrowsy (Tablet)
Droxia (Capsule)
Drysec (Tablet)
Dulcolax (Capsule, tablet)
DynaCirc CR (Tablet)
EC-Naprosyn (Tablet)
Ecotrin Adult Low Strength (Tablet)
Ecotrin Maximum Strength (Tablet)
Ecotrin Regular Strength (Tablet)
E.E.S. 400 (Tablet)
Effexor XR (Capsule)
Efidac/24 (Tablet)
Entocort EC (Capsule)
Equetro (Capsule)
Eryc (Capsule)
Ery-Tab (Tablet)
Erythrocin Stearate (Tablet)
Erythromycin Base (Tablet)
Evista (Tablet)
Feen-a-mint (Tablet)
Feldene (Capsule)
Fentora (Tablet)
Feosol (Tablet)
Feratab (Tablet)
Fergon (Tablet)
Fero-Grad 500 mg (Tablet)
Ferro-Sequels (Tablet)
Flagyl ER (Tablet)
Fleet Laxative (Tablet)
Flomax (Capsule)
Focalin XR (Capsule)
Fosamax (Tablet)
Geocillin (Tablet)
Gleevec (Tablet)
Glipizide (Tablet)
Glucophage XR (Tablet)
Glucotrol XL (Tablet)
Glumetza (Tablet)
Guaifenesin/
Pseudoephedrine (Tablet)
Halfprin 81 (Tablet)
Heartline (Tablet)
Hydrea (Capsule)
Imdur (Tablet)
Inderal LA (Capsule)
Indocin SR (Capsule)
Innopran XL (Capsule)
Invega (Tablet)
Isodril Sublingual (Tablet)
Isoptin SR (Tablet)
Isosorbide Dinitrate
Sublingual (Tablet)
Isosorbide SR (Tablet)
Kadian (Capsule)
Kaletra (Tablet)
Kaon CL-10 (Tablet)
Keppra (Tablet)
Ketek (Tablet)
Klor-Con (Tablet)
Klor-Con M (Tablet)
Klotrix (Tablet)
K-Lyte (Tablet)
K-Lyte CL (Tablet)
K-Lyte DS (Tablet)
K-Tab (Tablet)
Lescol XL (Tablet)
Levbid (Tablet)
Levsinex Timecaps (Capsule)
Lexxel (Tablet)
Lialda (Tablet)
Lipram 4500 (Capsule)
Lipram PN 10, 16, 20 (Capsule)
Lipram UL 12, 18, 20 (Capsule)
Liquibid-D 1200 (Tablet)
Liquibid-PD (Tablet)
Lithobid (Tablet)
Mestinon Timespan (Tablet)
Metadate CD (Capsule)
Metadate ER (Tablet)
Methylin ER (Tablet)
Micro K Extendcaps (Capsule)
Modane (Tablet)
Morphine sulfate-Extended
Release (Tablet)
Morphine sulfate and naltrexone-
Extended-release (Capsule)
Motrin (Tablet)
MS Contin (Tablet)
Mucinex (Tablet)
Mucinex DM (Tablet)
Myfortic (Tablet)
Naprelan (Tablet)
Nexium (Capsule)

Niaspan (Tablet)
Nicotinic Acid (Capsule, tablet)
Nifedical XL (Tablet)
NitroQuick (Tablet)
Nitrostat (Tablet)
Norpace CR (Capsule)
Opana ER (Tablet)
Oracea (Capsule)
Oramorph SR (Tablet)
OxyContin (Tablet)
Pancrease MT (Capsule)
Pancrecarb MS (Capsule)
Pancrelipase (Capsule)
Paxil CR (Tablet)
Pentasa (Capsule)
Plendil (Tablet)
Prevacid (Capsule)
Prevacid SoluTab (Tablet)
Prilosec (Capsule)
Prilosec OTC (Tablet)
Procardia XL (Tablet)
Propecia (Tablet)
Proquin XR (Tablet)
Proscar (Tablet)
Protonix (Tablet)
Prozac Weekly (Tablet)
Ranexa (Tablet)
Razadyne ER (Capsule)
Renagel (Tablet)
Ritalin LA (Capsule)
Ritalin SR (Tablet)
Rythmol SR (Capsule)
Sinemet CR (Tablet)
Slo-Niacin (Tablet)
Solodyn (Tablet)
Somnote (Capsule)
Sprycel (Tablet)
Strattera (Capsule)
Sudafed 12 hour (Capsule)
Sudafed 24 hour (Capsule)
Sular (Tablet)
Taztia XT (Capsule)
Tegretol-XR (Tablet)
Temodar (Capsule)
Tessalon Perles (Capsule)
Theo-24 (Capsule)
Tiazac (Capsule)
Topamax (Capsule, tablet)
Toprol XL (Tablet)
Tracleer (Tablet)
Trental (Tablet)
Tylenol Arthritis (Tablet)
Ultram ER (Tablet)
Uniphyl (Tablet)
Uroxatral (Tablet)
Valcyte (Tablet)
Verapamil SR (Tablet)
Verelan (Capsule)
Verelan PM (Capsule)
VesiCare (Tablet)
Videx EC (Capsule)
Voltaren XR (Tablet)
VoSpire ER (Tablet)
Wellbutrin SR, XL (Tablet)
Xanax XR (Tablet)
ZORprin (Tablet)
Zyban (Tablet)

# Avoiding common drug errors: Best practices and prevention

In addition to following your institution's administration policies, you can help prevent errors in drug administration by reviewing these common errors and ways to prevent them. The Joint Commission, the Institute for Safe Medication Practices (ISMP), and the FDA also maintain resources to help improve drug safety.

| Topic | Error | Best practices and prevention |
|---|---|---|
| **Drug orders** | | |
| Pharmacy computer system | The system may not detect all unsafe orders. | • Don't rely on the pharmacy computer system to detect all unsafe orders.<br>• Before giving a drug, understand the correct indication, dosage, and potential adverse effects.<br>• Consult the pharmacist if there is any question, and verify the information using a current drug reference. |
| Confusing drug names | Many drugs have names that look alike–sound alike and may easily be mistaken one for the other. | • Be aware of the drugs your patient takes regularly, and question any deviations from his routine.<br>• Take your time and read the label carefully.<br>• Consult the ISMP list of look alike–sound alike drugs.<br>• Be aware of tall man lettering, which helps differentiate similar drug names. |
| Abbreviations | Using dangerous abbreviations can result in giving the wrong drug or wrong dose, by the wrong route, or at the wrong time. | • Don't abbreviate drug names.<br>• Be aware of The Joint Commission's official "Do not use" list of drug abbreviations to avoid (see *Abbreviations to avoid*, page 1483).<br>• Consult your facility's list of approved abbreviations and the ISMP's list of "Error-prone abbreviations, symbols, and dose designations" (www.ismp.org/tools/**errorproneabbreviations**.pdf). |
| Unclear order | A drug order with incomplete or unclear information can result in giving the wrong drug or wrong dose, by the wrong route, or at the wrong time. | • Keep in mind that each order should specify the correct drug name, dosage, route, and frequency of administration.<br>• Clarify all incomplete or unclear orders with the prescriber. |
| Inadvertent overdose | A prescriber may write an order for a combination drug such as acetaminophen/opioid analgesic tablets without realizing the total acetaminophen dose could be toxic (exceed 4 g). | • Note the amount of acetaminophen in each combined formulation.<br>• Be aware of pharmacy substitutions because acetaminophen amounts may vary.<br>• Warn patients not to take additional drugs that contain acetaminophen. |
| Anticoagulants | Lack of standardization for drug naming, labeling, and packaging can create confusion. Dosing regimens, assay methods, narrow therapeutic ranges, complex drug interactions, and drug monitoring create high potential for complications. | • Keep current with the different dosing, assay methods, drug interactions, monitoring methods, and reversal regimens for each anticoagulant given.<br>• Be especially aware of the correct doses and indications for neonates and children.<br>• Teach patients to manage their therapy appropriately. |

| Topic | Error | Best practices and prevention |
|---|---|---|
| **Drug preparation** | | |
| Crushing drugs for oral or enteral administration | Crushing certain oral or enteral drugs may:<br>• alter the drug's effects, causing overdose or other adverse reactions<br>• result in skin irritation or other adverse reactions for the preparer<br>• produce teratogenic effects in pregnant women. | • Use a liquid formulation instead of crushing a drug whenever possible.<br>• Before crushing a drug, always check with the pharmacist and established references, such as the ISMP's list of "Oral dosage forms that should not be crushed" (www.ismp.org/tools/do**notcrush**.pdf). |
| Solution color change or particulate matter | Unusual appearance may indicate that:<br>• the drug has been improperly stored or manufactured<br>• the drug has expired<br>• the wrong drug was provided by the pharmacy. | • Closely examine all solutions before giving them and know what their appearance should be.<br>• If you note a color change, contact the pharmacist who dispensed the solution and report it.<br>• Don't give a drug until verifying that the drug has been correctly labeled and that it is safe to give. |
| Incorrect drug storage | Incorrect storage may change a drug's physical properties or result in its being inadvertently administered. | • Follow your facility's policy for storing drugs.<br>• Always store drugs in the appropriate container, in the appropriate place, at the appropriate temperature. |
| Incomplete or incorrect drug labels | Incorrect or incomplete labeling can result in giving the wrong drug, formulation, or dose. | • Never give a drug whose label is incomplete or incorrect. Notify the pharmacy immediately and obtain the correctly labeled drug.<br>• Label all medications, medication containers, and other solutions on and off the sterile field. |
| **Drug administration** | | |
| Using a parenteral syringe for oral or enteral drugs | Using a parenteral syringe with a luer-lock to prepare small amounts of oral or enteral drugs can result in misadministration because the drug could be accidentally injected into an I.V. line. | • Always use special oral syringes to give oral or enteral drugs. Their hubs won't support a needle and they don't have a luer-lock, so they can't be attached to I.V. lines. |
| Infusion pump safety problems | Problems with infusion pumps (used to deliver controlled fluids, drugs, and nutrients) can cause fluid overload or administration of inaccurate doses. | • Make sure you know how to safely operate an infusion pump. Consult your facility's policy on proper usage.<br>• Before beginning an infusion, always verify that the pump is working properly. Make sure all alarms are functional and never bypass them.<br>• Double-check all dosing. |
| Calculation errors | Dosage calculation errors can cause significant patient harm, especially with "high alert" medications, and in neonates and children. | • Be aware of medications that are considered high alert.<br>• Write out the mg/kg or mg/$m^2$ dose and the calculated dose as a safeguard.<br>• Whenever a prescriber provides a calculation, double-check it and document that the dose was verified in the medical record.<br>• Use only approved abbreviations, and be aware of the placement of decimal points. |

| Topic | Error | Best practices and prevention |
|---|---|---|
| Herbal supplements | Because herbal supplements aren't subject to the same quality assurance standards as drugs, their labels may be misrepresented and their effects and interactions with drugs may not be well studied. | • Always assess and document all drugs and herbal supplements that the patient is taking in his medical record.<br>• Monitor the patient carefully, and report unusual adverse reactions.<br>• Consult a drug reference for known drug-herb interactions. |

# Pediatric drugs commonly involved in drug errors

According to the Joint Commission, the rate of medication errors for pediatric and adult inpatients is similar, but potentially harmful errors occur almost three times as frequently in children. One of the most common errors that occur in hospitalized children is administering the incorrect pediatric dosage. Here are some of the medications most commonly involved in medication errors as reported to the national voluntary medication error reporting system, MEDMARX®, with their FDA-approved dosages.

| Medication | Indication | Route | Usual dosage |
|---|---|---|---|
| albuterol sulfate | Bronchospasm in children with reversible obstructive airway disease | P.O. (immediate-release tablets and extended-release tablets) | • *Children older than age 12:* Initially, 2 or 4 mg (immediate-release tablets) P.O. t.i.d. or q.i.d. If patient fails to respond, may increase dosage to maximum of 8 mg P.O. q.i.d. Or, 8 mg (extended-release tablets) P.O. every 12 hours. If patient fails to respond, increase dosage cautiously to maximum of 16 mg P.O. every 12 hours.<br>• *Children ages 6 to 12:* Initially, 2 mg (immediate-release tablets) P.O. t.i.d. or q.i.d. May increase dosage cautiously but total daily dosage shouldn't exceed 24 mg/day (given in divided doses). Or, 4 mg (extended-release tablets) P.O. every 12 hours. If control of reversible airway isn't achieved with optimized asthma therapy, may cautiously increase dosage to maximum of 12 mg P.O. every 12 hours. |
| | Bronchospasm in children with reversible obstructive airway disease | P.O. (syrup) | • *Children older than age 14:* Initially, 2 mg (1 teaspoonful) or 4 mg (2 teaspoonfuls) P.O. t.i.d. or q.i.d. If patient fails to respond, dosage may be cautiously increased to maximum of 8 mg P.O. q.i.d.<br>• *Children ages 6 to 14:* Initially, 2 mg (1 teaspoonful) P.O. t.i.d. or q.i.d. If patient fails to respond, dosage may be increased to maximum of 24 mg/day given in divided doses.<br>• *Children age 2 to younger than age 6:* Initially, 0.1 mg/kg P.O. t.i.d. Initial dose shouldn't exceed 2 mg (1 teaspoonful) P.O. t.i.d. If patient fails to respond, may increase dosage to 0.2 mg/kg P.O. t.i.d. Maximum dosage is 4 mg (2 teaspoonfuls) P.O. t.i.d. |

| Medication | Indication | Route | Usual dosage |
|---|---|---|---|
| ceftriaxone sodium | Acute bacterial otitis media in children younger than age 12 | I.M. | • *Children:* Give single dose of 50 mg/kg I.M. Maximum dosage is 1 g. |
| | Serious infections (including skin and skin-structure infections) other than meningitis | I.V. infusion over at least 30 minutes or I.M. | • *Children younger than age 12:* 50 to 75 mg/kg I.M. or I.V. in divided doses every 12 hours. Continue for at least 2 days after signs and symptoms of infection have disappeared. Usual duration of therapy is 4 to 14 days. Maximum dosage is 2 g/day. |
| | Meningitis | I.V. infusion over at least 30 minutes or I.M. | • *Children younger than age 12:* Initially, 100 mg/kg (not to exceed 4 g) I.M. or I.V. Thereafter, give total daily dose of 100 mg/kg/day I.M. or I.V. for 7 to 14 days. Maximum dosage is 4 g daily. Daily dose may be administered once a day or in equally divided doses every 12 hours. |
| dopamine | Hypotension, low cardiac output, poor perfusion of vital organs, shock | I.V. (continuous infusion) | • *Children:* Initially, 2 to 5 mcg/kg/minute I.V. in patients who are likely to respond to modest increments of heart force and renal perfusion. In more severely ill patients, begin I.V. infusion at 5 mcg/kg/minute. In more severely ill patients, increase dosage gradually, using 5- to 10-mcg/kg/minute increments, up to 20 to 50 mcg/kg/minute as needed. If doses greater than 50 mcg/kg/minute are required, check urine output frequently. Should urine flow begin to decrease in the absence of hypotension, consider reducing dopamine dosage. More than 50% of patients have been satisfactorily maintained on doses of less than 20 mcg/kg/minute. Patients treated with MAO inhibitors within 2 to 3 weeks before administration of dopamine should receive initial doses of dopamine not greater than one-tenth of usual dose. |
| fentanyl | To manage persistent, chronic pain only in opioid-tolerant patients (children receiving at least 60 mg/day of morphine P.O.) | Transdermal | • *Children age 2 and older:* When converting to transdermal system, base first dose on the daily dose, potency, and characteristics of the current opioid therapy; reliability of the relative potency estimates used to calculate the needed dose; degree of opioid tolerance; and patient's condition. Each patch is worn for 72 hours; dosage may be increased 3 days after first dose and then no sooner than every 6 days thereafter. |
| gentamicin sulfate | Serious infections caused by sensitive strains of *Pseudomonas aeruginosa, Escherichia coli, Proteus, Klebsiella, Serratia,* or *Staphylococcus* | I.V. infusion over 30 minutes to 2 hours or I.M. | • *Children:* 2 to 2.5 mg/kg I.V. or I.M. every 8 hours.<br>• *Infants and neonates:* 2.5 mg/kg I.V. or I.M. every 8 hours.<br>• *Premature or full-term neonates age 1 week or younger:* 2.5 mg/kg I.V. or I.M. every 12 hours. |

| Medication | Indication | Route | Usual dosage |
|---|---|---|---|
| heparin | Thrombosis | I.V. | • *Children:* Initially, 50 units/kg I.V., followed by continuous I.V. infusion that delivers 100 units/kg every 4 hours or 20,000 units/$m^2$/24 hours. |
| morphine sulfate | Analgesia | I.V. | • *Children:* 50 to 100 mcg (0.05 to 0.1 mg)/kg I.V., administered very slowly. Not to exceed 10 mg/dose. |
| | | I.M. or subcutaneously | • *Children:* 0.1 to 0.2 mg/kg I.M. or subcutaneously every 4 hours. Maximum dosage is 15 mg. |
| | Preanesthetic medication | I.M. or subcutaneously | • *Children age 1 and older:* 0.1 mg/kg subcutaneously or I.M. Maximum dosage is 10 mg. |
| vancomycin | Endocarditis or staphylococcal infections | I.V. | • *Children age 1 month and older:* 10 mg/kg/dose I.V. every 6 hours. Administer over at least 60 minutes. |
| | Endocarditis | I.V. | • *Neonates:* Initially, 15 mg/kg I.V., followed by 10 mg/kg I.V. every 12 hours for neonates in the first week of life and every 8 hours thereafter up to the age of 1 month. Administer over 60 minutes. In premature infants, longer dosing intervals may be necessary. |
| | Pseudomembranous colitis or staphylococcal enterocolitis | P.O. | • *Children:* 40 mg/kg/day P.O. in three or four divided doses for 7 to 10 days. Maximum dosage is 2 g/day. |

## Elder care medication tips

Age-related changes can alter the way older people absorb, distribute, metabolize, and eliminate medications compared to younger adults or children. Medication dosages and routes may need adjustment in order to optimize the patient's response to medication and help prevent adverse reactions. Understanding how age-related factors can alter how an older patient's body uses medication will help you plan and implement your patient's medication regimen and monitor his response appropriately. The table below describes how age-related factors can change the pharmacokinetics of medications in older adults.

| Pharmacokinetics | Age-related change | Effect on pharmacokinetics |
|---|---|---|
| Absorption | Diminished quality and quantity of digestive enzymes | ↓ |
| | Increased gastric pH | ↑ or ↓ |
| | Decreased GI motility and emptying time | ↓ |
| | Decreased GI blood flow | ↓ |
| | Diminished number of absorbing cells | ↓ |
| Distribution | Diminished cardiac output and reserve | ↓ |
| | Diminished blood flow to target organs and tissues | ↓ |
| | Decreased lean body mass | ↓ |
| | Increased adipose tissue | ↑ or ↓ |
| | Decreased circulating plasma proteins | ↓ |
| | Decreased total body water | ↓ |
| Metabolism | Decreased liver size | ↓ |
| | Diminished intestinal and portal vein blood flow | ↓ |
| Excretion | Decreased glomerular filtration rate | ↓ |
| | Decreased renal tubular secretion | ↓ |
| | Decreased renal blood flow from renovascular occlusive disease, microvascular nephropathy, heart failure | ↓ |

## alcaftadine

al-CAFF-tuh-deen

Lastacaft

*Pharmacologic class:* Histamine$_1$-receptor antagonist
*Pregnancy risk category B*

### AVAILABLE FORMS

*Ophthalmic solution:* 0.25% (2.5 mg/ml)

### INDICATIONS & DOSAGES

➤ **Prevention of itching associated with allergic conjunctivitis**

*Adults and children age 2 and older*: Instill 1 drop in each eye once daily.

## alglucosidase alfa

AL-gloo-KOH-sih-dase

Lumizyme

*Pharmacologic class:* lysosomal glycogen-specific enzyme
*Pregnancy risk category B*

### AVAILABLE FORMS

*Powder for I.V. infusion:* 50 mg/vial

### INDICATIONS & DOSAGES

➤ **Late (noninfantile)-onset Pompe disease (GAA deficiency) without evidence of cardiac hypertrophy**

*Adults and children age 8 and older:* 20 mg/kg I.V. infusion over 4 hours every 2 weeks. Initial infusion rate is 1 mg/kg/hour; may increase in stepwise manner by 2 mg/kg/hour every 30 minutes, if tolerated, to maximum rate of 7 mg/kg/hour. Obtain vital signs at each step increase. May stop or slow infusion rate temporarily in event of infusion reactions.

**SAFETY ALERT!**

## cabazitaxel

ka-baz-ih-TAX-el

Jevtana

*Pharmacologic class:* taxoid
*Pregnancy risk category D*

### AVAILABLE FORMS

*Injection:* 60 mg/1.5 ml

### INDICATIONS & DOSAGES

➤ **In combination with prednisone for hormone-refractory metastatic prostate cancer previously treated with docetaxel-containing treatment regimen**

*Adults:* 25 mg/m$^2$ I.V. over 1 hour every 3 weeks. Give oral prednisone 10 mg daily throughout cabazitaxel therapy. Premedicate at least 30 minutes before each dose of cabazitaxel with the following I.V. medications to reduce risk or severity of hypersensitivity: antihistamine (dexchlorpheniramine 5 mg, or diphenhydramine 25 mg or equivalent antihistamine), corticosteroid (dexamethasone 8 mg or equivalent steroid), and $H_2$ antagonist (ranitidine 50 mg or equivalent $H_2$ antagonist). Antiemetic prophylaxis is recommended and can be given P.O. or I.V. as needed.

***Adjust-a-dose:*** For patients with neutrophil count of less than 1,500 cells/mm$^3$, withhold drug. Reduce subsequent doses of cabazitaxel to 20 mg/m$^2$ for patients who experience severe neutropenia (neutrophil count of less than 500 mg/mm$^3$ for 1 week or longer) or neutropenic fever. Also reduce dosage to 20 mg/m$^2$ if patient experiences at least 7 stools/day or incontinence or need for parenteral support for dehydration.

**SAFETY ALERT!**

## pazopanib
pa-ZOH-pa-nib

Votrient

*Pharmacologic class:* multi-tyrosine kinase inhibitor
*Pregnancy risk category D*

### AVAILABLE FORMS
*Tablets:* 200 mg, 400 mg

### INDICATIONS & DOSAGES
➤ **Advanced renal cell carcinoma**
*Adults*: 800 mg P.O. daily.
***Adjust-a-dose:*** For patients with moderate hepatic impairment, give 200 mg P.O. daily. Drug isn't recommended for patients with severe hepatic impairment.

**SAFETY ALERT!**

## pralatrexate
PRAL-ah-TREX-ate

Folotyn

*Pharmacologic class:* folate analogue metabolic inhibitor
*Pregnancy risk category D*

### AVAILABLE FORMS
*Injection:* 20-mg/1 ml, 40-mg/2 ml single-use vials

### INDICATIONS & DOSAGES
➤ **Relapsed or refractory peripheral T-cell lymphoma**
**Adults:** 30 mg/m$^2$ I.V. push over 3 to 5 minutes weekly for 6 weeks in 7-week cycles until disease progresses or unacceptable toxicity develops.
***Adjust-a-dose:*** For grade 2 mucositis, omit dose; after recovery to grade 1 or less, resume at prior dose. For grade 2 recurrence or grade 3 mucositis, omit dose; after recovery, resume at 20 mg/m$^2$. For grade 4 mucositis, discontinue therapy. For platelet count of less than 50,000/mm$^3$ or absolute neutrophil count (ANC) of 500 to 1,000/mm$^3$ lasting 1 week, omit dose; after recovery, resume at prior dose. For platelet count of less than 50,000/mm$^3$ for 2 weeks, omit dose; after recovery, resume at 20 mg/m$^2$. For platelet count of less than 50,000/mm$^3$ for 3 weeks, discontinue therapy. For ANC of 500 to 1,000/mm$^3$ with fever or ANC of less than 500/mm$^3$ lasting 1 week, omit dose and give granulocyte-colony stimulating factor (G-CSF) or granulocyte-macrophage colony stimulating factor (GM-CSF) support; after recovery, continue prior dose along with G-CSF or GM-CSF support. For ANC of 500 to 1,000/mm$^3$ with fever or ANC of less than 500/mm$^3$ recurring or lasting 2 weeks, omit dose and give G-CSF or GM-CSF support; after recovery, resume at 20 mg/m$^2$ along with G-CSF or GM-CSF support. For ANC of 500 to 1,000/mm$^3$ with fever or ANC of less than 500/mm$^3$ lasting 3 weeks or for a second occurrence, discontinue therapy. For grade 3 toxicity, omit dose; after recovery to grade 2 or less, resume dose at 20 mg/m$^2$. For grade 4 toxicity, discontinue therapy.

**SAFETY ALERT!**

## romidepsin
roh-mih-DEP-sin

Istodax

*Pharmacologic class:* histone deacetylase inhibitor
*Pregnancy risk category D*

### AVAILABLE FORMS
*Injection:* 10-mg vial

### INDICATIONS & DOSAGES
➤ **Cutaneous T-cell lymphoma in patients who have received at least one prior systemic therapy**
*Adults:* 14 mg/m$^2$ by I.V. infusion over 4 hours on days 1, 8, and 15 of 28-day cycle. Repeat every 28 days if effective and well tolerated.
***Adjust-a-dose:*** For grade 2 or 3 toxicity, delay treatment until toxicity returns to baseline, grade 1, or less; then restart drug at 14 mg/m$^2$; for grade 4 toxicity, restart dose at 10 mg/m$^2$. Discontinue drug if grade

3 or 4 toxicities recur after dosage reduction. For grade 3 or 4 neutropenia or thrombocytopenia, delay treatment until absolute neutrophil count is at least $1.5 \times 10^9$ or platelet count is at least $75 \times 10^9$; then restart drug at 14 mg/m$^2$. For grade 4 febrile neutropenia or thrombocytopenia requiring platelet transfusion, delay treatment until toxicity returns to baseline, grade 1, or less; then permanently reduce dosage to 10 mg/m$^2$.

## ulipristal acetate

yew-lih-PRISS-tal

Ella

*Pharmacologic class:* progesterone agonist/antagonist emergency contraceptive
*Pregnancy risk category X*

### AVAILABLE FORMS

*Tablets*: 30 mg

### INDICATIONS & DOSAGES

➤ **Prevention of pregnancy following unprotected intercourse or known or suspected contraceptive failure**

*Women of childbearing age:* 1 tablet P.O. as soon as possible within 120 hours (5 days) after unprotected intercourse or known or suspected contraceptive failure.

## ustekinumab

YOO-stih-KIN-eh-mab

Stelara

*Pharmacologic class:* monoclonal antibody
*Pregnancy risk category B*

### AVAILABLE FORMS

*Injection:* 45-mg/0.5 ml, 90-mg/ml single-use vials

### INDICATIONS & DOSAGES

➤ **Moderate to severe plaque psoriasis in patients who are candidates for phototherapy or systemic therapy**

*Adults weighing more than 100 kg (220 lb):* Initially, 90 mg subcutaneously. Repeat dose in 4 weeks, followed by maintenance dose of 90 mg every 12 weeks.
*Adults weighing 100 kg or less:* Initially, 45 mg subcutaneously. Repeat dose in 4 weeks, followed by maintenance dose of 45 mg subcutaneously every 12 weeks.

## velaglucerase alfa

vel-uh-GLOO-ser-ase

VPRIV

*Pharmacologic class:* hydrolytic lysosomal glucocerebroside-specific enzyme
*Pregnancy risk category B*

### AVAILABLE FORMS

*Injection:* 200 unit/vial, 400 unit/vial

### INDICATIONS & DOSAGES

➤ **Long-term enzyme replacement in patients with type 1 Gaucher disease**

*Adults and children age 4 and older:* 60 units/kg I.V. infused over 60 minutes every other week.
